"The flock of the lamb farmer consists almost uniformly of 100 ewes, kept as well as his pastures will admit of. Amongst those eight or ten rams are put in the beginning of June. Many of the ewes will impregnate by the end of July, it being natural to this kind of sheep to take the ram at an early period, and this tendency on their part, becomes periodical; so that a much better chance of early lambs is had from being in the habit of breeding them from those untied. If, after this month, any ewes seem not to have been tupped, the anxiety of the farmer to obtain the high prices of the early market, suggests the expedient of hurrying the flock about the barn or a small enclosed yard, till they are considerably heated and fatigued, at which crisis a number of rams are introduced, and the ewes treated in this manner, in most instances, present the farmer, in the month of January, with the expected result of his experiment.

"The lambs at a fortnight old, are separated from the dams, and placed in small pens in the lamb house. This is by some constructed in three apartments; one divided into pens for lambs of different ages, the other two communicating with this, and also with the farm yard; the one to receive the dams of the lambs that are in the pens, the other to receive the dams of those that have been sold off.

"Into these two divisions the ewes, as here distinguished, are respectively driven twice a day. The dams of the lambs sold off; or, as they may be termed, the nurses, are brought out separately, and held for the lambs to suck them. They are then put away, and the lambs are let into the adjoining apartment to their own dams. While the lamb is very young, it is incapable of using much milk, and the ewe will it is likely afford sufficient for its sustenance; but as it increases in strength,

assistance from the cow becomes necessary; and, beginning with a quarter of a pint, each lamb, before it becomes sufficiently fat, will come to use more than a pint of cow's milk at a meal, and that twice a day, exclusive of the milk of the ewe. The regular practice is to divide the twentyfour hours by four equal periods, and to feed the lambs with ewe's and cow's milk alternately, at intervals of six hours. This for the time requires constant attention, night and morning, and on that the success of the feeding principally depends. This attention must be directed to another object also, as well as their feeding, unless great cleanliness and regular warmth is particularly observed, the lambs will never thrive.

"The best lamb feeders have board floors to their pens, contrived to let all moisture pass through, and be drained away, so that the lambs lie always dry and warm, upon wheat straw, which is preferred to any other for this purpose. At about six weeks old, or sooner, they are fit for the butcher, and produce, according to the time of sale, from 20s. to two guineas and a half a piece, (from \$44 to \$118). The lowest prices take place late in the season, when the ewes have plenty of grass, which increases their milk, and renders the assistance of the cow unnecessary; but at the early season, when the ewe's milk would be so valuable, it is unaccountable that some greater exertion is not made to supply them with turnips, or other artificial food, which would preclude the necessity of encroaching upon the dairy, at least to the present extent. The foregoing method, includes all the rules observed by the chief farmers in the lamb trade,—a practice which has caused much wonder, and the success of which has been imputed to such various mysteries, but, except in the contrivance of the barn, which is certainly made use of, the whole is comprised in regularity and cleanliness.—*Genesee Farmer.*

PIGS AND PIGGERIES.

The improvements which are annually taking place in Agriculture, are seen and felt as much in the attention that is now paid to the rearing and fattening of good farm stock, as anything.

We are pleased to see that the Hog comes in for a share of the attention, and there seems to be at this moment a peculiar enquiry throughout the whole Union, what breed is the best, and how can they be best and most profitably managed?

The increased culture of roots, enables those who raise large quantities of them to multiply the tenants of the sty, inasmuch as they are enabled to feed them and keep them in a healthy growing state at a cheaper rate in many regions, by feeding them with these, than they can by grain. The hog seems to be a sort of omnivorous animal, that is, like his friend, protector, murderer and devourer, man, he can eat almost anything; but the food which appears to be most congenial to him, is roots, nuts and seeds or grains.

That roots were designed to enter largely into his diet, is plainly indicated by the formation of his snout and his habits of using it. Give him a chance and he will soon demonstrate to you that he not only knows where to find them, but how to dispose of them.

They are not so well calculated to fatten him as they are to give him health and strength—to keep him alive and active; but they are a very useful ingredient in the fattening process, and when com-

bined with grain, may enter largely into his diet while preparing him for slaughter.

Fruits also, are very grateful to his palate, as apples are now coming very generally into use, as an article of food for the swine of the farm. Cooling his food, whatever it may be, has been found by experience to be a great improvement. Hence any one who may be desirous of rearing and fattening pork to the best advantage, should prepare a piggery or building, devoted exclusively for the business. The style and fashion of this building need not be very splendid, though every one must consult his own taste and means, in regard to it. Three requisites, however, should be attended to: viz.—It should be convenient—it should be warm—it should be tight and dry. The size should be according to the number that you wish to keep. As a general rule in building or enclosing, a circle will take the least stuff, and a square the next least quantity, and a parallelogram more than either. For instance, a circle twenty feet in diameter, will require nearly sixtythree feet of fence or boards to enclose it. A square twenty feet each way, will require eighty feet, this will contain a little more area than the circle; but a parallelogram which shall contain as much area as the square (400 feet say forty feet long and ten feet wide, will require one hundred feet to enclose it.

A circle is somewhat difficult to construct, but square is very easy. Suppose you erect a building twenty feet square and have your pens on the outside—three of the sides will give you space enough to accommodate and feed thirty swine. You can have your wood, steamers, boilers and vat in the twenty feet room and feed them all without going out of the room by having a lid or trap door to lift up and give you a chance to the trough. If you can have it placed on the side of a hill where water can be obtained easily, and have cellar dug into the hill, the floor of which shall be on a level with the floor of your boiling room, will be very convenient, but if not, a cellar below may be made in the usual manner and a granary the chamber above.

Some years ago there was a communication published in the American Farmer, from Mr Ingersoll of Roxbury, and subsequently in the Farmer and Gardener, respecting the management of a piggery which gives the most systematic and methodic manner of managing swine that we have anywhere seen, and we shall publish it soon for the benefit of some of our readers, who we know are seeking information on this subject.—*Maine Farmer.*

(From the Maine Farmer.)

EVERY FAMILY SHOULD KEEP A PIG

MR EDITOR,—I am not much of a farmer, but have done something at it, and will, with your leave through the columns of your valuable paper, give your readers a statement of my success in raising pigs.

I believe the business of pork raising, is not sufficiently attended to by most of our farmers, as the principal cause is, they do not reckon the profit or calculate the difference, between raising pork or beef. Pork is not only raised in less than half the time that is required to raise beef; but it yields a much larger profit.

In July of 1836, I purchased a sow pig, for which I paid \$2, which I still keep. She has been principally fed on what strops and swill that has been

made about the house, and has had nothing else, except while she had a litter of pigs upon her. She run in the pasture three or four months in the summer. The whole expense of keeping her including taxes, interest, &c., has not exceeded 25 dollars to the present time, and the first litter of pigs she brought, all died. The second litter of nine, were sold in August, at \$2 00 each, \$18 00
 The 3d litter of nine—(2 died) 7 sold in February, 1838, at \$3 21 00
 The 4th litter of eleven, sold in August, 1838, at \$2 22 00
 The sow is now worth 30 00
 The interest on the money received for pigs, would be about 3 00

\$94 00

Deduct for cost and keeping of sow, &c. 25 00

Profit, \$69 00

It should also be observed, that the last litter of pigs might have been sold for \$3 each, but as that is a very high price and I was fortunate in losing none of them, I let my neighbors have them at two.

This, Mr Editor, I think is a fair statement of the facts, and the expense of keeping is as highly rated as it should be, for I do not think that five dollars worth of food has been given her, except swill from the house, that would have been otherwise thrown away.

Now Mr Editor, should not every family keep one pig at least, to eat up the offal that is so frequently thrown out of doors, especially by persons who reside in villages and large towns?

The only way to relieve hard times, is by production or by economising what is already produced.

M. M.

Bangor, Dec. 1838.

(From the Plymouth Memorial.)

WHEAT.

MR PRINTER,—Your readers will recollect reading in your paper some time last spring, sundry articles in which the question was fully discussed, "Is it best for the farmers of Massachusetts to sow wheat or plant Indian corn?" Not being satisfied with theory, I resolved to test the question by practice; and falling in with a friend of mine, who seemed to be a little touched with the wheat fever, I agreed with him that he should faithfully try an experiment by cultivating wheat, and I would as faithfully try my luck with Indian corn. The object of troubling you now, is to give the result of both experiments to the public, and let each reader make such comment as shall best suit himself.

On the 5th of May last I commenced ploughing an eight acre field, in addition to my usual ploughing, that the experiment might not interfere with the rest of my farming. I paid cash for all the labor, and gave the current price for my laborers' services. The field had not been ploughed for fifteen years, had never been manured, nor used for any other purpose than raising corn and rye once in eight or ten years, and for pasture when not cultivated. I put no manure on it and platted it in the usual way, making the rows of corn run both ways, about four feet apart, and putting four kernels in a hill. The worms and birds troubled it some and I planted the missing hill with beans, and the result follows :

Dr.—To ploughing eight acres,	\$24,00
Furrowing,	1,50
Planting,	8,00
Seed corn,	1,25
Scare crows,	1,00
Cultivating both ways,	3,00
Hoeing,	18,00
Cultivating 2d time,	3,00
Hoeing 2d time,	10,00
Hoeing in rye,	20,00
Cutting stalks,	8,00
Harvesting corn,	40,00
Do. stalks,	2,00
Do. pumpkins,	1,00
Do. beans,	25
	<hr/> \$141,00

Deduct half last hoeing as belonging to rye crop, 10,00
 \$131,00

Cr.—By 250 bushels sound corn,	\$250,00
25 do small corn,	12,50
800 pumpkins,	25,00
4 tons stalks,	40,00
Husks and butts,	30,00
Beans,	2,50
	<hr/> \$360,00

Deduct expenses, 131,00

Profits, \$229,00

My friend selected an acre of meadow ground, which had been planted the year before, and he manured it heavy with good manure from his stable and pig pen, and the whole expense of ploughing, sowing, seed, and manuring, calling the manure one dollar a load, was \$53,00.

This wheat was the best of any in town; he harvested, and measured it with care, and found he had thirteen and a half bushels.

As wheat has no established price in this place, each one must cypher out the profits for himself.

Perhaps I ought to remark that the season has been favorable for Indian corn, and unfavorable for wheat; but I shall continue my corn experiments from year to year, and hope the sowers of wheat will do the same, and give publicity to the results—it is desirable that every farmer should know what his neighboring farmers are about. Real improvements should be seized upon and put in practice; but we ought to beware of theories until they have been well tested by experiment. The loss of a whole crop to a farmer is a serious matter, therefore if any crop be doubtful he should plant but a part of his field with it. Such as are not able to lose should scatter their chances. My present impression is, that upon sandy land, no crop is so certain, upon an average of many years, as Indian corn. If I find myself mistaken I will tell the public of it. SYLVANUS BOURNS.
Indian Neck Farm, Nov. 16, 1838.

THINGS A FARMER SHOULD NOT DO.

1. A farmer should never undertake to cultivate more land than he can do thoroughly; half-tilled land is growing poorer; well tilled land is constantly improving.

2. A farmer should never keep more cattle, horses, sheep or hogs, than he can keep in good order; an animal in high order the first of December, is already half wintered.

3. A farmer should never depend on his neighbor, for what he can by care and good management produce on his own farm; he should never beg fruit while he can plant trees, or borrow tools when he can make or buy; a high authority has said, the borrower is a servant to the lender.

4. The farmer should never be so immersed in political matters as to forget to sow his wheat, dig his potatoes and bank up his cellar; nor should he be so inattentive to them as to be ignorant of those great questions of national and state policy which will always agitate, more or less, a free people.

5. A farmer should shun the doors of a bank as he would the approach of the plague or cholera; banks are for traders and men of speculation, and theirs is a business with which farmers have little to do.

6. A farmer should never be ashamed of his calling; we know that no man can be entirely independent, yet the farmer should remember, that if any one is said to possess that enviable distinction, he is the man.

7. No farmer should allow the reproach of neglecting education to lie against himself or family, if knowledge is power, the beginning of it should be early and deeply laid in the district school.

8. A farmer should never use ardent spirits as a drink; if, while undergoing severe fatigue and the hard labor of the summer he would enjoy robust health, let him be temperate in all things.

9. A farmer never should refuse a fair price for anything he wants to sell; we have known a man who had several hundred bushels of wheat to dispose of, refuse 8s. because he wanted 8.6d. and after keeping his wheat six months, was glad to get 6s. 6d. for it.

10. A farmer should never allow his wood house to be emptied of wood during the summer season; if he does, when winter comes, in addition to cold fingers, he must expect to encounter the chilling looks of his wife, and perhaps be compelled, in a series of lectures, to learn that the man who burns green wood has not mastered the A B C of domestic economy.

11. A farmer should never allow a window to be filled with red cloaks, tattered coats, and old hats; if he does he will most absurdly acquire the reputation of a man who carries long at the whiskey, leaving his wife and children to starve at home.—*Com. School Assis.*

CURE FOR THE STING OF A WASP OR BEE.—A Liverpool paper states as follows; "A few days ago happening to be in the country, we witnessed the efficacy of the remedy of a sting of a wasp mentioned in one of our late papers.

A little boy was stung severely and was in great torture, until an onion was applied to the part affected, when the cure was instantaneous. This important and simple remedy cannot be too generally known, and we pledge ourselves to the fact above stated."

Endeavor to be first in thy calling, whatever it be; neither let any one go before thee in well doing; nevertheless do not envy the merits of another, but improve thine own talent.

Before you give way to anger, try to find a reason for not being angry.

NEW ENGLAND FARMER, AND GARDENER'S JOURNAL.

BOSTON, WEDNESDAY, DECEMBER 19, 1838.

AGRICULTURAL INTELLIGENCE.

We had anticipated the pleasure this week of giving to our readers the report of the Trustees of the Massachusetts Agricultural Society on improved machinery and agricultural implements; but the report has not yet been made, though it is believed that a decision has been had. Any remarks of ours before that shall have been done would be premature.

The committee on Farms, of the Massachusetts Agricultural Society, have received as many as thirteen applications for the premiums, which they offer for the best cultivated farms; and others were presented, which did not come within the time prescribed for their presentation. The Rev. Morrill Allen of Pembroke, Mass. one of the best farmers in the state, and highly competent to the duty, was deputed some time since by the Trustees to visit every claimant and his premises, with a view to obtain direct, explicit, and full answers to the several queries proposed by the Board, and inquire into other matters pertinent to the subject. On account of the number of entries the matter cannot be hastily disposed of. A report, we believe, may be expected in the course of the next month; and we shall have the pleasure, as soon as it can be obtained, to lay it before our readers. The sum to be disbursed, six hundred dollars in four premiums, is certainly for this object highly liberal; and as these premiums will in all probability be continued, we cannot but hope they will induce a much more extended and active competition; and wake up the farmers in every part of the Commonwealth. The agriculture of Massachusetts is improved and is improving; but it has not yet got in sight of the point, which we are persuaded it may reach. When the brave General Miller, at the battle of Lud's Lane, in the last war, was ordered to advance and drive the enemy from their post in the face of many and most formidable difficulties, his answer was "I'll try." He did try, and accomplish what he undertook. We recommend this motto for every farmer's coat of arms; and where this rule is observed and this spirit is felt in its activity and power, only use the means of success, and success is certain, wherever success is practicable. If the load seems large and the ascent steep, then, "Farmers! hitch on more team, put your shoulders to the wheel and go ahead." But don't stay there, kneel deep in the slough, at the foot of the hill, where your great-grandfather left the team, crying out that you never can get up. Hout! man, don't let the sun go down upon your sloth.

II. C.

INDIAN CORN.

We have accounts reaching us in every direction, of the abundant and excellent crops of Indian corn raised the last year in every part of the State. Some of our friends we think must feel a little conscience-smitten when they remember what they said last year in disparagement of the corn crop, with what disdain they spoke of it, and how many of them pretended that it was time to give it up. Fifty, sixty, eighty bushels are not uncommon in various parts of the State; and some we believe have reached a hundred. The season, to be sure, was highly favorable to the crop; but many other seasons have been, and we have reason to believe and hope, will be, as favorable. Let us review now some wholesome truths respecting this crop.

First, then, it is as certain a crop as can be cultivated.

It has failed among us but twice for the last twenty-two years; and then the failure was not universal; but innumerable farmers in the State in favorable locations and with early and selected varieties, obtained their usual crops.

Secondly, there is no product that is more valuable; and that will yield more nutritious food for man and beast than this crop. There is no product of more general use; none which the oil itself is more valuable. There is no one more permanent in its value. We have in our possession an ear of corn produced in the year 1806, as sound as on the day when it was gathered in the field. We believe there is nothing produced, which, of equal weight, will make more milk, bread, beef, mutton, pork; or that can be cooked in a greater variety of agreeable forms; or that furnishes more healthful and nutritious sustenance. It is said of revolutions that they never go backward; and therefore we despair of the return of the blessed days of the good old Indian bambocks, on which as fair children and as bright and healthy and happy and intelligent men and women have been raised as were ever made out of good Dr Alcott's cold buck-wheat flap-jacks, or Dr Graham's saw-dust sponge cakes; or your very fine finest superfine Genesee best brand, mixed up with as much alum as the best Parisian baker knows how to put with it, and doubled and twisted and braided according to the perfection of his art; and about as substantial as a good slice of soap suds, well beat up.

Thirdly, We believe that, excepting the fancy crops, broom-corn, beet-sugar, silk, and small fruits, no crop can be raised to greater profit. Pretty extended inquiries fully satisfy us that with labor at one dollar per day, the fodder of an acre of Indian corn well cured, and twenty-five bushels of corn at the average price will pay for the cultivation of an acre, including labor, manure, rent of land and gathering, and such cultivation may be ordinarily expected to yield fifty to sixty bushels of corn, and more under favorable circumstances. From twenty-five to thirty-five bushels of Indian corn may be ordinarily calculated upon then as the net profit upon an acre of corn in Massachusetts under good husbandry; and we believe as much as we live, that in most cases this return might be much increased. Fifty dollars an acre for land through the State, which would produce this would be considered perhaps a high valuation.

We might say much more on this subject; but this we shall reserve for another time and place. II. C.

SUMMARY OF THE WEEK.

We propose during the sessions of Congress and the Legislature of the Commonwealth, to give our readers some sketch of such public measures and passing events as are of general interest and importance. Whatever may be our own private predilections or opinions, we shall consider it as inconsistent with the character of the New England Farmer to express them in any doubtful or questionable matter through its columns; and our sole aim will be to give a candid and authentic statement of facts. We have been requested to do this by readers, who were gratified with the summaries of the last winter; and while steering among the hostile fleets of administration and opposition, of banks and no banks, of abolitionism and anti-abolitionism, and as many other isms as can be made out of the alphabet, we shall regard ourselves only as a humble news-boat and sail always under a white flag.

Congress assembled on Monday the 3d inst.; and the message was delivered on Tuesday. It justly portrays a condition of national prosperity, which even the most jaundiced eye of party must look upon with grateful and patriotic pride. Differences of opinion on all subjects

are to be expected. The love of power, the ambition of distinction, and the greedy desire of the emoluments of office are probably as strong and prevalent with one party as another. The imputation of corrupt motives to individuals and to parties is one of the deepest of slanders; and always congenial to minds conscious of their own corruption and venality. Undoubtedly the motives of men are often corrupt and wholly venal; but there is one consideration, which intelligent and candid minds will not lose sight of in making up their judgment, that it is as much the interest of men in power to govern well as it is of those subject to the power to be well governed; and that at least in all questionable cases, it is but matter of common justice to presume upon good rather than corrupt designs. Embarked in the same ship, we must sink or swim together; and the engineer upon the machinery is likely to be the first victim of his own folly, or neglect, or misconduct.

No measures of great importance will be under way until after the appointment of the several committees. Mr Adams has brought forward the project of a law to prevent duelling in the District of Columbia; and a string of resolutions censuring the conduct of the Minister at the Court of St James, in his challenge of Mr O'Connell, the Irish member of Parliament.

In Congress the last week little has been done excepting the passage of resolutions on the subject of slavery and abolition. These resolutions deny the right of Congress to legislate on the subject in the States, Territories, or even in the District of Columbia; and require that all petitions, resolutions, motions, or memorials in regard to slavery shall be laid on the table without being either read or referred. This being "laid on the table" is a process of inhumation somewhat like being buried alive without benefit of clergy. It certainly does not seem to be regular christian burial. Whether such bodies could be resuscitated, if perchance they should be exhumed, remains to be seen. Perhaps some of the gentlemen of the "Humane Society" may one day try their hands at it. The resolutions in the case were passed by large majorities.

PENNSYLVANIA. Affairs at Harrisburg remain in a snarl. How the tangled web will be unravelled does not appear. The presence of the military has very much cooled the fierceness of the belligerents; and the adverse parties in passing put their elbows in, and take off their hats to each other. The Senate is organized, but there are two Houses of Representatives in session; and the Senate seems as yet undetermined to which it shall offer its hand. Political bigamy, in Pennsylvania, we suppose, is no more lawful than in private life; and in our next we shall probably have the pleasure to announce the selection, and, we hope, auspicious celebration of the nuptials. H. C.

ROLLING RIDGE, or Four and Twenty Chapters, is the title of a new publication of 266 duodecimo pages, which has been laid upon our table. "The chapters" of this little work have been written to illustrate in an open, familiar manner, the comparative happiness of a life passed in rural scenes and employments, and in the practice of virtuous deeds, over that enjoyed in the scenes of high fashionable dissipation, or in low debasing life. We commend the work to the perusal of our juvenile readers, believing the scenes and characters the writer has aimed to sketch will not fail to interest them. The scenes are principally laid in New York and Brattleboro', Vermont, and well calculated to amuse, as well as instruct, particularly those who are engaged in agriculture, and fond of rural life. The work is for sale by Crocker & Brewster, the publishers, and other booksellers in Boston.

BRIGHTON MARKET.—MONDAY, Dec. 17, 1838.

Reported for the New England Farmer.

At Market 625 Beef Cattle, 1500 Sheep, and 500 Swine. About 125 Beef Cattle unsold.

Prices.—Beef Cattle.—Last week's prices were not supported, and we reduce our quotations. First quality, \$7 50 a \$7 75. Second quality, \$6 75 a \$7 25. Third quality, \$5 25 a \$6 50.

Sheep.—We quote lots at \$2 25, \$2 50, \$2 75, \$3 00 and \$3 50.

Swine.—Lots to peddle were sold at 6 for sows, and 7 for barrows. At retail, 7 a 8 1-2.

Tulips Ranunculuses, Anemones, Auriculas, Carnations, Plectites, Pinks, and Geraniums.

H. GROOM, of Walworth, near London, England, by appointment Florist to Her Majesty Queen Victoria, begs respectfully to call the attention of his friends and the admirers of flowers in America generally, to his extensive collection of the above flowers, which from his having been very successful in their cultivation this season he can offer at very moderate prices. He would particularly recommend to those persons about commencing the growth of the Tulip (which in England is becoming very fashionable) the under collections in beds, as it is by far the cheapest mode of purchasing them.

Tulips arranged in beds with their names
First Class.
 A bed of 30 rows containing 210 bulbs including several of the newest varieties, - - - - - £15
 A bed of 45 rows, - - - - - £21
 A bed of 60 rows, - - - - - 25 guineas

Second Class.
 A bed of 30 rows including many fine sorts, - - - £10
 A bed of 45 rows, - - - - - £14
 A bed of 60 rows, - - - - - £17 10s

Tulips not arranged.
 100 Superfine sorts with their names from £7 7s to £13
 Superfine mixtures, from - - - - - 7s 6d to 21s

Ranunculuses.
 100 Superfine sorts, with their names from £3 3s to £5 5s
 Superfine mixtures, from - - - - - 5s to 21s per 100

Anemones.
 100 Superfine sorts with their names, - - - £3 10s
 Superfine double mixtures from 10s 6d to 21s per 100

Auriculas.
 25 Superfine sorts with their names, - - - £3 18s 6d
 Catalogues with the prices of the other articles may be had on application.

Orders received by **JOSEPH BRECK & CO.**
 Nov. 1. eow.

TULIPS, RANUNCULUSES, PINKS AND VIOLAS.

S. WALKER, of Roxbury, offers for sale in beds, or in such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland, France and England, and which yearly additions have and will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superb Tulips, will do well to make a selection for themselves when the bulbs are in bloom, (about the 1st of June.) The prices will conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices in the country where the bulbs were raised, and cheaper than the like quality can be imported.

Tulips in beds of from 30 to 100 rows, containing from 210 to 700 bulbs, or by the dozen, 100 or 1000.

Viola grandiflora—Pansy, or Heartsease. Upwards of 2000 superb varieties will be exhibited and offered for sale, when the Tulips are in bloom.

Ranunculuses—fine mixtures, at from \$2 to 85 per 100.
Pinks—fine named varieties, from 25 cents to \$1 each.
 For particulars apply to **S. WALKER**, or to **JOSEPH BRECK & CO.** eow

MORUS MULTICAULIS.

Constantly on hand in small quantities, at the lowest market price. Orders directed to Messrs Winship, Brighton, Mass. or left at N. E. Farmer Office, will receive immediate attention. The plants will be safely packed and forwarded to any part of the country.

Dec. 19.

FOR SALE.

A pair of large size dark red oxen, very handsome and well matched, and move quick; valuable to any person who has considerable work. Also, a large size cow, white spotted, with short horns. Apply to **A. J. ALLEN**, Newton West Parish, or at 65 State St. Boston.

2wis

Dec. 12, 1838.

GREEN'S PATENT STRAW CUTTER.

Joseph Breck & Co. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle, not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use, to get out of order.

FRUIT AND ORNAMENTAL TREES, MULBERRIES, &c

Nursery of **William Kenrick.**

The Catalogue of Fruit and Ornamental Trees for 1838 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Peaches, Cherries, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and Peaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honey suckles; Pæonies, Dahlias and other Herbaceous Flowering Plants.

100,000 MORUS MULTICAULIS are now offered for sale; the trees genuine and well sized, will be ready for delivery at the cities of Boston, New York and Philadelphia, in October next, at prices fair, and varying with the size, and the quantity which may be desired. Also, Bronza and other varieties.

Mulberry and other trees, when so ordered, will be securely packed for safe transportation to distant places, and all orders promptly executed, on application to **B. D. BARCK**, Commission Store, No. 132 Water Street, New York, **M. S. PEWELL**, Seed Store, No. 7 Arch Street, Philadelphia, or to the subscriber, Nonantum Hill, Newton, near Boston.

August 1, 1838. **WILLIAM KENRICK.**

BONE MANURE.

The subscriber desires to inform his friends and the public that he has been in the Bone business more than ten years, and has spent much time and money to ascertain how bones may be converted to the best use, and is fully satisfied that they form the most powerful stimulant that can be applied to the earth as a manure. He offers for sale ground bone at a low price, and is ready to receive orders to any amount, which will be promptly attended to.

Orders may be left at my manufactory, near Tremont road, in Roxbury, or at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, Boston.

Sept. 20. **NAHUM WARD.**

NOTICE.

A person now in the Nursery business, on a limited scale, who has peculiar advantages for its extension, not possessed by any other individual in this country, wishes to connect himself with some person who can furnish a small capital sufficient to make the business both pleasant and profitable. Inquire at the office of the **N. E. Farmer.**

FARM FOR SALE.

A Farm situated in the south westerly part of Townsend on the road leading from Townsend west village to Worcester. Said farm contains 110 acres of land divided into mowing and pasturing, and a large share of wood and timber; a one story house, with two front rooms, kitchen, buttery, and two bed rooms well finished; parlor papered; wood house; well, under cover, forty feet barn, and shed, a large sheep house, fifteen by thirty feet, a large cooper shop, and another small house well finished, on the lower floor; a good aqueduct which comes into the barn yard, and a good orchard.

The subscriber will sell a part or all, and give possession this fall or winter, or next spring. Those who wish to buy, will do well to call on the subscriber, who lives on the premises, and look for themselves. **ASA H. ADAMS.**

Nov. 29, 1838.

MISCELLANEOUS.

THE IVY.

Why love the Ivy? hast thou seen,
As winter's day fell chill and drear,
Its glossy robe of richest green
Hang graceful 'mid the forest bare?
Emblem of Hope, which still can bless,
When all around is comfortless.

Why love the Ivy? take thy stand
In grauer's desolated hall,
And o'er the work of Time's rude hand
How decently its dark wreaths fall—
Emblem of Pity's mantle laid
Over some wreck by sorrow nane.

Why love the ivy? mark you oak,
Leafless and bleached by rain and wind,
How Ivy lends a sheltering cloak,
Around its old limbs closely twined—
Emblem of earthly comforts gone,
And heaven's own role of peace put on.

The star which lights life's dreariest waste,
The balm which soothes its darkest woe,
And life's dim cheerless evening grace
By the calm hope a Christiana knows—
These in their emblem joined approve
The Ivy's claim on human love.

DARBY AND THE RAM.

'Twas one of those days when the sun in its perpendicular altitude looks at two sides of the hedge at once—a lovely midsummer day—when nature was laughing till her sides ached, and mother earth, in her gayest mood, was lavishing her promises and her smiles to her often ungrateful children, the lambs were skipping to and fro within their enclosed pastures, and the cows, with grave and matron aspect, were lolling in the sun, and ruminating their already gathered repast—everything seemed happy except the Shepherd Darby.

Poor fellow! A "green and yellow melancholy," had settled on his manly cheek; his grief he revealed not, but "concealment, like a worm" the bud," preyed upon his spirits; he stalked about the field like a ghost, or leaned upon his crook in silent despair.

Lord Applefield and Squire Buckthorn were riding past to dinner. "I wonder," said his lordship to the squire, what can be the matter with my shepherd Darby. He seems in a galloping consumption, and were I to lose him, I would not see his like again for many a long day. He is the most honest, steady, careful creature in the world, and never told a lie in his life."

"Never told a lie in his life! Good! Why, my lord, do you really believe such nonsense?"

"Decidedly I do. I know your opinion is not very favorable as to the moral character of our dependants, yet there are some among them not unworthy of trust."

They now advanced nearer, and his lordship held up his whip as a signal, and over bounded Darby. "Well, Darby, that shower we had last night, served the pastures."

"It did, my lord, and the cows will give a larger meal, and require milking earlier this evening, through means of it."

"Dardy, bring over my favorite ram, that this gentleman may see it."

"Yes, my lord. Hallo, Sweeper, away for Ball-

face." In a few minutes the dog hunted the ram up from the flock. "That's a clever turn, my worthy," said the squire, "here's half a crown to drink."

"Thanks to your honor," said Darby, "but the worth of that in strong drink will serve me a year, and yet I will spend it in drink all in one night."

"Explain this riddle, Darby."

"Why, sir, when I feel myself merry enough without it, where's the use in taking it? That stream can slake my thirst as well. Yet, I'll not speak for others—many a one there are, who must have strong drink to give them false spirits. On them will I spend it, to open their hearts, and make them forget their day's toil."

"You are a worthy fellow, and a philosopher," said Lord Applefield, with a look of triumph, as he and the squire rode off. "What say you to my shepherd now?"

"A mighty plausible fellow, indeed! Yet proud as you are of him, my lord, I bet a score of sheep that before two days, I'll make him tell you a barefaced lie, out and out."

"Done!" said his lordship; the wager was laid, and the squire set out on his lie-making expedition.

He soon ascertained the cause of Darby's melancholy. There had been a quarrel between him and the girl of his heart, the lovely Cauthleen. Pride prevented a reconciliation, though both would have given the world to be in each other's arms. To her the squire bent his steps, succeeded in drawing out the secret that she loved Darby a heart and a half, and then artfully upbraiding her with unkindness in neglecting the "worthy young fellow," who was dying with love for her, contrived to inveigle her, by a series of falsehoods, into a plan to get reconciled to Darby, and while in the height of his happiness, to coax the ram from him. It succeeded next day to admiration—and the laughing girl tripped home, leading the animal with a kerchief taken from her solitary bosom.

Darby was now left to solitary reflection. The hour was rapidly approaching when his lordship usually took his round, and he would infallibly miss his favorite ram—what was to be done? To tell a lie appeared to his honest mind, the very essence of degradation—to *equivocate* was meanness execrable—yet an excuse must be had! A sudden thought seized him—he resolved to see how a lie would look before he told it; and planting his crook in the field, and placing his hat on it, in order to personate himself, he retired to a distance, and in the character of his lordship, hailed the effigy as follows:

"Good morrow, Darby."

"Good morrow, my lord."

"How are the flocks to-day, Darby?"

"Pretty fair, my lord?"

"Darby," I don't see my favorite ram—where is he?"

"Oh, my lord, he—he—he."

"He what, Darby?"

"He was drown-ed—my—my lord!"

"Darby, if I did not know your general character for carelessness, I should feel exceedingly annoyed, but I presume it was an accident. Send the fat and hide up to the castle."

"That won't do!" murmured Darby, slowly turning away. He resolved to try it again.

"Good morrow, Darby."

"Good morrow, my lord."

"Are the flocks well to-day, Darby?"

"Bravely, my lord"

"And my ram, Darby, where is he?"

"My lord, he—he—"

"Is there anything wrong? Tell me at once."

"He was sto—len, my—lord."

"Stolen! stolen! I saw him this morning as I was riding past! When was he stolen?"

"That won't do either," exclaimed the poor shepherd, as he turned away the second time. "Cruel, cruel Cauthleen!"

Something seemed to whisper to him, "Try if perhaps the truth will do!" Fresh courage animated his desponding mind, and wheeling about he recommenced the colloquy, and on coming to the usual interrogation, "Where's the ram," he dropped on his knees, and exclaimed, "Oh, my lord, I had a falling out with my sweetheart, and she would not make it up with me unless I made a present of your lordship's favorite ram. Discharge me, my lord, do with me what you please, but I could not bring myself to tell your lordship a lie!"

"That will do!" shouted Darby, springing from his knees, and walking up and down with a feeling of honest exultation. He had scarcely time to compose himself, when his lordship and the squire appeared. Darby, on the usual interrogation being put, dropped on his knees and told "the truth, the whole truth, and nothing but the truth;" and instead of seeing a frown gathering on his lordship's countenance, he beheld him turn with a look of triumph towards the squire, while he exclaimed,

"An honest man's the noblest work of God!"

The readers are informed, in conclusion, that the squire's forfeited sheep were given to Cauthleen as a dowry, and in taking the hand of her shepherd, she promised never again to put his truth and constancy to so severe a trial.

DURHAM CATTLE.—The Lexington Intelligencer of the 14th September says, there have been two sales of short horn Durham cattle in the neighborhood, being the stock of Maslin and Samuel Smith, Esqs. At the sale of the latter, a cow and sucking calf sold for \$2,100. Another at \$1,350—others at \$1,100, \$1,000, &c. The whole stock of Samuel Smith sold for between \$20,000 and \$30,000.

BET SUGAR.—Preparations are making to manufacture beet sugar in Northampton, the coming season. In Northampton, about 12 acres are under cultivation, which will average 15 to 20 tons the acre, but when better understood, a larger crop may be expected. In French Flanders an average crop is 15 tons to the acre, but 30 tons are often produced; and in that country, it is said, that even among the poorer classes, no other than refined sugar is used. In Prussia the average crop is 16 tons to the acre, but in England, it is 30 tons, and a first rate crop 50 tons to the acre.

[NO. 25.

AGRICULTURAL.

ADDRESS

OF HENRY STEVENS,

At the Caledonia Cattle Fair, holden at St Johnsbury, Vermont, Sept. 27, 1838.

GENTLEMEN,—The subject which I have chosen for discussion on the present occasion, is somewhat different, and perhaps not so immediately connected with the object of this society, as that of rearing large cattle, fine sheep, sleek horses, and fat swine, or that of ploughing, sowing, and harvesting. However, the subject which I am about to discuss, is of the utmost importance, and one immediately connected with the agricultural interest of our State and county. I hope you will manifest as much patience as practicable. For a few weeks past, I have endeavored as far as possible, in connection with my ordinary business, to ascertain the quantity of wool produced in Vermont; the quantity necessary for domestic consumption, and the cost of woollens necessary for the inhabitants of this State per annum.

I propose to show the amount of wool and woollen goods, imported from foreign countries into the United States for the year ending Sept. 30th, 1836.

To show the probable amount of woollen goods of foreign production and manufacture, consumed by the inhabitants of this State;

That if all the wool which was shorn from 1,662,334 sheep, the number stated by the general list in 1837, would have been sold for all it would have sold for at our dwellings, it would but about pay for that portion of imported woollen goods consumed the past year by the inhabitants of this State. That if the present quantity of wool shorn in this State, could be sold for fifty cents per pound in cash, a further sum of 1,500,000, would be necessary to furnish with the necessary woollens for the year to come;

That the present quantity of wool in Vermont will but about supply the inhabitants for the coming year;

That capital for manufacturing and mechanical purposes can be vested in the interior of a country with a greater prospect of success than on the seaboard;

That it is as necessary that Vermont should pursue such a policy in relation to her manufacturing and mechanical interests as to render her independent of the sister States as is proper for the United States to render themselves independent of foreign governments.

It appears from the Secretary of the Treasury's annual report of the commerce and navigation of the United States for the year ending September 30th, 1836, that there were imported into the United States from foreign countries, wool and woollen manufactures to the amount of \$24,579,885, which is the cost of the goods at the place from whence imported. To this sum I add sixtyfive per cent. for

duties, insurance, freight, tonnage, importers and retailers' profits, which would amount to 15,976,925. This sum added to the original cost makes 40,556,811. This is what the wool and woollen goods, of foreign growth and manufacture, cost the inhabitants of the United States during the past year. Suppose there are 15,000,000 inhabitants in the United States, the cost of woollen goods, for foreign manufactures would amount to more than \$2,70 for every individual admitting there were 300,000 in this State, and that we used no more than our proportion of foreign woollens, then the imported woollen goods cost the inhabitants of this State \$810,000. Gentlemen, be cool, be considerate, I ask how are we to pay this enormous sum, which we must pay this fall?—we have had a long credit, the importer must have his pay. Nick Biddle has said that every farthing of this foreign debt must be paid. I propose that the farmers of Vermont agree to sell our wool at our dwellings to whomsoever this debt is due at 33 cents per pound. By the general list of this State for 1837, we then had 1,662,334 sheep, allowing each sheep to produce on an average two and half pounds, we should have had 2,915,585 pounds of wool, this at 33 cts per pound amount to \$962,143, which on this calculation would pay the cost of the foreign woollen goods consumed in this State the past year, and there would remain \$152,143, to divide among our inhabitants; or shall we adopt another plan to pay this great debt due for foreign woollen goods? If you are of an opinion that wool is too low at 33 cts. per pound, at home, and would rather keep it for your own use, I propose that we let these creditors have one fifth of our neat cattle of two years old and older. By the general list of 1837, we had 219,021 cattle of two or more years old; admitting that one fifth of them are good beef and fit for market, we should have for sale 43,804 cattle. This number at \$20 a head at home, would come to \$876,080, which would pay our debt to the merchants and importers of woollen goods consumed the past year, and leave a balance of \$60,080. Gentlemen, with these facts before us, I again ask what shall be done? It being a very hard case, suppose we ask for a credit for a part by way of a compromise, and offer the merchants or importers of woollen goods, all our horses which are entered in the list, as worth less than \$25; 20,000 horses at \$20 a piece would pay \$400,000, and the balance we can pay at a future date when the surplus revenue under the new law becomes due this State, which will nearly pay the balance of \$60,080. The latter would probably be the best bargain, if we could save our wool, beef, pork and butter for our purposes, or our own use. By the general list of 1837, we then had in this State 1,000,000 sheep. By the list of 1837, we have 1,662,334 sheep, as I have before stated, produced 2,915,585 pounds of wool. This quantity will be about 215,585 pounds more than what is absolutely necessary for the consumption of the inhabitants of this State. Now it is my opinion that nine pounds of wool for each person is as little as we can do with—I mean for all pur-

poses, for which wool is used from the mop to the broadcloth coat. If I am wrong, gentlemen who have raised up families will please correct me. There being 300,000 inhabitants in this State, each requiring nine pounds of wool, we need 2,007,000 pounds of it a year, leaving only 215,585 of wool for sale of the clip of 1837. Again, I proposed to show that if we now had on hand the clip of 1837, and could sell the same at 50 cts. per pound a further sum of more than \$1,500,000, besides that sum to supply us with necessary woollens for the year to come. Admitting that all the wool in Vermont of the clip of 1838 could be sold at 50 cts. per pound to the manufacturers of Massachusetts, what sum should we be obliged to pay them for collecting and freighting our wool to Massachusetts, and for manufacturing and bringing back the manufactured articles in the state we want them? I say sixty cents per pound will be no more than a moderate compensation. We are to be charged with all proper expenses, including the shrinkage, and all other expenses from when it leaves in wool till it returns manufactured goods; according to this calculation while we have our wool manufactured out of the State, we must pay the manufacturers of other States \$1,620,000. The quantity of wool needed for domestic supply per year being 2,700,000, at 50 cts per pound amounts to \$1,350,000, which two sums amount to 2,970,000—being the actual cost of woollen goods a year for the inhabitants of this State.

But we have the \$1,457,792, the price of the whole clip of 1837 to pay this sum. Pursue this subject a step further, how are we to pay the manufacturer of Massachusetts, New Hampshire or Rhode Island, for this service? They are doing that for us, which we ought to do for ourselves. Hence is a debt of \$1,620,000 for manufacturing your clothing; draw your purses. More than five dollars are wanted from every individual to pay for manufacturing the woollens now on your persons; you cannot pay it. The whole bank stocks of this State actually paid in, will not do it. If you turn out one fifth of your cattle at \$20 per head; amounting to \$876,080 and 20,000 old horses at \$20 per head amounting to \$400,000 there will still remain \$344,000 due to make up the sum of \$1,620,000 for manufacturing in other States; and this too every year. I repeat, gentlemen, keep cool—can you live and prosper under this free trade system? Can you furnish the raw material exchange it for the manufactured goods? No, you never can. All your banks may discount, give, ten, twenty for every dollar of solid coin they can keep in their vaults, and we must still continue to be a miserable and oppressed people.

Capital for manufacturing, and mechanical purposes can be vested in the interior of a country with greater prospect of success than on the seaboard. Time will not permit me, at this time, to go into detail on this proposition. I refer you to the price paid at Lowell, Andover, Amesbury, Waltham, Pawtucket, as well as many other places in the vicinity of the sea-board for water privileges,

timber and other materials to build with. Compare the prices of water power, adjoining land for building, materials to build with, with those to be had in almost every town in this State, and you will find there is seventy-five per cent. in favor of the interior. There is water power enough in the county of Caledonia, and on Connecticut river adjoining, to turn every water wheel in the United States, yes, and what is this unoccupied water power now worth, except perhaps to grind a little wheat and corn, provender, and to make some oat meal; there is not only a saving in the price of water power, and materials to build with, in favor of the interior, but the saving in the daily contingent expenses, pertaining to a manufacturing establishment will pay the freight to and from market; laborers can sustain themselves much cheaper in the interior of a country than on the sea board. It is an established principle in political economy that the spindle and the loom can nowhere be so advantageously employed as at the tail of the plough. We farmers in the interior without manufacturers and mechanics are like farmers without tools. We can never prosper. Brother farmers it is necessary that Vermont should pursue a policy in relation to her agricultural manufacturing, and mechanical interests to render herself independent of her sister States, as for the United States to render themselves independent of foreign governments. From what has been hastily said, you must have come to the conclusion with me that this proposition merits a careful consideration, but to discuss it in all its bearings in so short a time as is now allowed me cannot be expected. I contend that every principle, which has ever been published by writers on political economy in favor of protecting the industry of a National Government, are equally applicable to protect the industry of a single State. True the several States of the United States, form but one community. Congress having power to pass such laws in relation to the general government as they may deem proper as to admitting articles from foreign governments. The several States have reserved to themselves the privilege of collecting a revenue for all State purposes. You may as well tax a man who appears otherwise than clad in the growth and manufacture of this State as to tax his watch, chaise, or horse. Again, by the present law of this State, all necessary household furniture is exempt from attachment on debts. It would be well if this law was so altered that after 1840 all household furniture, not the production and manufacture of this State (except cotton,) over and above the value of \$50, to each family should be subject to attachment on debts contracted after that date. Some policy of this description, if pursued by our legislature, would have a tendency to encourage the manufacturing and mechanical interest of this State. It has thus far been the policy of this State (with few exceptions,) as relates to our intercourse with the sister States, to encourage that ruinous doctrine free trade.

This State has never done anything of any consequence to encourage the manufacturing and mechanical interest. True, the legislature passed a law at an early period saying what should be the length of the hand reel for reeling woollen, linen and tow yarn; they also granted a lottery to Matthew Lyon, to enable him to raise 600 bushels of wheat by which to enlarge his furnace, so as to cast sugar kettles; another was granted to Haswell and Russell to raise a sum sufficient to erect a Paper Mill at Bennington, so as to manufacture

paper for school books in the State. The tickets were advertised to be sold for rags to work up, thus they created a market for their rags, and saved in the State the money that had usually gone to buy school books. The General Assembly several years since, I believe in the time of the non-intercourse or embargo, passed a joint resolution saying, that it should be considered ungentlemanlike, for a member of the house, or of the council to appear in his seat otherwise than clad in the growth, production and manufacture of this State. We farmers must keep in mind the 30th of July 1842, when the tariff or compromise law, so called, is to remain at only 20 per cent. duties. Are we to abide that compromise? I for one say yes; provided the government will be that economical as to paying all expenses from duties received on imported foreign merchandise; the income from the sale of public lands had ought to be divided among the several States. If the people of the United States abide the compromise, it is next to adopting the liberal system, or free trade. And if the people continue to consume such vast quantities of foreign production, and manufactures, ruin and wretchedness must and will follow. I believe it to be the best for the people of this State to abide the compromise, and to adopt the restrictive system so far as we can constitutionally. The General Assembly can as well pass laws to protect the industry of the people of this State, as to protect our deers on our mountains, or the pickerel in our ponds, or the muskrat in our rivers, as well as to offer bounties for the destroying the fox, the wild cat, or crows; as well as to prohibit the administering of extra judicial oaths. Industry and economy, the great sources of wealth, cannot be too much encouraged and supported. Happily for this State, they in numerous instances, are enlisted in the service of manufacturers and mechanics.— These valuable and important classes of our fellow citizens have a just demand on the General Assembly for every reasonable encouragement and support; their pursuits are practicable patriotism, and whilst our national, and State parchments establish our independence of right, their measures more solid are establishing for us an independence indeed. Industrious manufacturers and mechanics when employed upon things really useful do laudable service to the public; they are constantly adding to the wealth, strength or convenience of the great whole. We find in the American Annals, an account of the anniversary of a society for encouraging industry held 1753, on which occasion Boston common presented a novel sight. In the afternoon about 300 young female spinsters, decently dressed appeared on the common at their spinning wheels; the wheels were placed regularly in three rows, and a female was seated at each wheel, the weavers also appearing cleanly dressed, in garments of their own weaving. One of them working a loom on a stage, was carried on men's shoulders, attended with music; an immense number of spectators were present at this interesting spectacle. The Rev. Dr Cooper preached a discourse, and a collection was made for the benefit of the institution. Ladies of Boston whirling three hundred spinning wheels! These were afterwards the matrons who refused British tea, and who never saw a piano. Wonder, if a thousand delicate ladies could now be seen in the city, at their piano's, where one old fashioned rosy dandel could be found at the healthy exercise of the spinning wheel? T. Jefferson, in his letter to Benjamin Austin, Jan 9,

1816, says—That to be independent for the comforts of life, we must fabricate them for ourselves. We must now place the manufacturer by the side of the agriculturist. The grand enquiry now is shall we make our own comforts, or go without them, at the will of foreign nations; he therefore who is now against domestic manufacture, must be for reducing us either to dependence on that nation, or to be clothed in skins, and to live like wild beasts in dens and caverns.

Experience has taught me that manufactures are now as necessary to our independence as to our comfort. Situated, as we are, in the interior of our country, it is of course very expensive transporting our produce to market from many parts of the State, and when we arrive there we must take and give their own prices. It must therefore, be for our interest to raise and manufacture every article this country will produce, and that may be in value nineteen twentieths of our necessities, and purchase no more foreign goods than real necessity requires, until we have more articles for export than the value of what we want to purchase.

We farmers now furnish the manufacturer of Massachusetts with wool at from 28 to 36 cents per pound, and young men and young women to make it up. And in addition to this, the banks of this State keep constantly deposited in the banks of our cities about one half of their capital paid in, of which the city banks discount to the manufacturer in their neighborhood to enable them to work up perhaps the very wool bought of us. Firstly, we do wrong by selling our wool, so long as the same is needed for domestic consumption. The General Assembly have from the days of the old Vermont State Bank, permitted the banks to deposit in the banks on the sea board, which deposits have at a times been considered equal to specie in vault. By reason of the banks of this State depositing a large portion of their capital in the city banks, has a direct tendency to increase the introduction of foreign merchandise, and the manufacturers of our sister States into this State, greatly to the injury of the agricultural interest of the State. The people have long been accustomed to the present evil practices of the banks, which practices, the General Assembly had long since ought to have corrected. I expect the only reason why our banks are required to keep up their deposits in the city banks is, the balance of trade is greatly against us and always will be so long as we sell the raw material, and the General Assembly neglect to encourage the agricultural and manufacturing, and mechanical interests. Unquestionably, more than five fifths of the actual bank capital in this State employed in the mercantile business, in purchasing merchandise. The manufactures of our sister States or of foreign countries, brought into this State and sold to our citizens for our beef, our butter, or cheese, for our pork, for wool, as I have once said, more than nineteen twentieths of our merchandise which you and I should consider unnecessary, we ought to manufacture and create for ourselves. So long as the General Assembly permits this free trade system to continue, so long will our banks keep their deposits in the city bank. And so long there never will be a time that the holders of their bills can convert them into a solid coin at their counters. Nothing but that capital called confidence, has thus far sustained our banks without specie in their vaults. There is a principle laid down by writers on political economy that give any assurance to a community of retail

ing any amount of specie, who create the raw material and exchange it for the manufactured articles. Hamilton says; "manufacturing establishments not only occasion a positive augmentation of the produce of a community, but contribute essentially to render it greater than it would possibly be without them." Again, "the substitution of foreign for domestic manufactures is a transfer to foreign nations [or our sister States] of the advantage accruing from the employment of machinery in the modes in which it is capable of being employed with the most utility and the greatest interests."

Said Jefferson: "If a manufactory be established in any rich and fertile country, by conveying a number of people in one place who must all be fed by the farmer, without interfering with any of his necessary operations; they establish a ready market for the productions of his farm, and thus throw money into his hands and add a spirit of energy to his cultures." Says Hamilton: "The uniform appearance of an abundance of specie, as the concomitant of a flourishing state of manufactures, and of the reverse, where they do not prevail, afford a strong presumption of their favorable operation upon the wealth of a country. Russia made the pernicious experiment of the liberal system. In two years it overspread the empire with distress and bankruptcy, and she was obliged to abandon it. The Emperor Alexander's description of the effects of the innovation, ought to operate in terror on other nations and states. He says that the nation that adopts the liberal system affords a continual encouragement to the manufacturers of other countries [or States] and its own manufactures perish in the struggle which they are not able to maintain." Again he says: "It is with the most lively feelings of regret we acknowledge, that it is our proper experience which enables us to trace this picture. The evils it details have been realized in Russia and Poland since the act of the seventh and nineteenth of December, 1818. Agriculture without a market, industry without protection, languish and decline. Specie exported, and the most solid commercial houses are shaken. Again, it is only after these losses have come to their height, after events have proved that our agriculture and commerce, as well as our manufacturing industry, are not only paralyzed, but brought to the brink of ruin."

Many more extracts I might make, but time will not permit.

Can it be possible, that the farmers of this State will continue to pursue so ruinous a policy as they have heretofore pursued—sell their wool and buy the manufactured article? I wish that the guardian angel of our country would write, in great capital letters on the outer door of every husbandman—The woman who manufactures for her own household and one piece of goods to sell, doth more to retain the solid coin in our State than all the banks or the greatest financiers.

(From the Cultivator.)

EXPERIMENT IN PLANTING POTATOES.

EDITOR CULTIVATOR,—

Dear Sir—I have made a small experiment on potatoes this season, that may be useful. I selected a bushel of very small ones, and planted them in seven drilled rows, eleven rods long, the ground in fine order, ridged, and well cultivated during the growth.

Another bushel of largest size, I planted, one

half in one row, whole, along side of the others; then cut the other half into three or four pieces each, and planted in two rows; the land and cultivation all the same.

The extreme drought that we have suffered, renders it unnecessary to speak of the amount of the yield, except comparatively.

The two rows of cut seed produced three baskets full—the one row of uncut produced two and a half baskets full, and the seven rows of small seed produced fourteen baskets full. But mark, like the seed, was the crop. The vines of the small seed were ever small spindling vines, and the tubers were likewise. The vines of the uncut showed the rankest growth, but the difference in the general size of the tubers in the cut or uncut rows, was not much in favor of the uncut. Call the basket a bushel, and the result is easier stated. One bushel of small seed, produced fourteen bushels of small potatoes—half a bushel of large seed, planted upon one-seventh quantity of ground, produced two and half bushels of large ones—and half a bushel of large seed, cut, planted upon two-sevenths of the quantity of ground, produced three bushels of large ones.

The seed, when I planted it, was worth 75 cents a bushel—the crop, when dug, was worth 37 1-2 to 50 cents a bushel—the cost of seed in each row of small seed, 10 1-2 cents—the worth of the product 75—just seven fold in money and 14 in measure. The cost of the uncut seed 37 1-2 cents to one row—the worth of the product \$1,25, being worth 12 1-2 cents more per bushel than the small ones, making three and one-third fold in money, and five in measure. The cut seed cost 18 3-4 cents to the row, and the product worth 75 cents, making four fold in money, and six-fold in measure.

If the experiment is a fair criterion to base an opinion upon, the result shows to my mind, the following data.

If seed is high, ground plenty, and the crop wanted for stock, plant small seed.

If seed is plenty, ground scarce, and the crop wanted for family use, and future seed, plant large seed, without cutting.

If seed is scarce, ground plenty, and the crop wanted for family use, and future seed, plant large seed, and cut them. Am I right in my conclusions?

These rows as above stated, 11 rods long, are at the rate of 78 to the acre, 3 feet apart. The large uncut potatoes were planted at the rate of 39 bushels to the acre; the product 195. The large cut, were planted at the rate of 19 1-2 bushels to the acre; the product 117. The small ones were planted at the rate of 14 bushels to the acre; the product 156. For my own part, I shall in future plant large potatoes whole. I would like yours and your correspondents' opinions and experiments. Your friend, SOLON ROBINSON.
Lake C. H. la. Oct. 15, 1838.

REMARKS.—The Conductor will at present only remark, that the choice between cut and uncut potatoes, should depend somewhat, he thinks, upon the kind of potato planted. Some kinds, having but few eyes, may advantageously be planted whole; while other kinds, having many eyes, as the Rohan, fortyfold, &c. are best planted in sets, or pieces. We have counted 47 eyes in a Rohan, all of which it is presumed, would grow, and give 47 stalks to a hill. It will at once be perceived, that instead of producing in size like the seed, the progeny must

necessarily be small, both for want of food and want of room. In this case, we venture to say, if the tuber was cut into 20 sets, and each planted separate, the value of the product would be twenty fold greater than if the whole potato was planted in a single hill. We have chosen this strong case, the better to illustrate the distinction we would make. Small seed almost invariably produces small stalks, and small stalks are a pretty sure indication of small tubers.

ADVICE TO PARENTS.

There is nothing so destructive to the *morals* and we may add, to the *peace* of any community as the neglect of parents, rich or poor, to teach their sons the importance of being early engaged in some active employment. Too many of the citizens of every place, under the influence of a *false pride*, suffer their sons, after quitting their academical studies, to lounge about the public offices and taverns of their place of residence, rather than cause them to engage in some important branch of the mechanical art, or force them by the dint of their own industry and energies, to seek their fortune in some other pursuit. Nothing is more detestable in our eye than to see a healthy good looking youth breaking loose from the restraints of honorable industry, returning to his father's domicile for support, and *loafing* it about, rather than be pursuing some occupation which will not only support himself, but give gratification to his worthy parents. We would say to every father who has such a son, be he rich or poor,—rather drive him to "cut his cord of wood a day," than suffer him to spend his time in idleness. "An idle head is the devil's workshop." That youth, therefore, who has nothing to do, is very apt to become a *tattler*, a *slanderer*, and a *liar*, or something worse, and make himself the pest of the community in which he may reside.—*Frederick Times and Dem. Adv.*

CHILBLAINS.

Many people are troubled during the cold weather, with a kind of inflammation of the feet called chilblains.

They are caused by getting the feet or certain parts of them chilled by cold or wet, which deranges the action of the small capillary vessels, and brings on a passive inflammation, as it is called, accompanied with slight swelling, and severe burning and itching. In order to remedy the trouble, some application should be made that will stimulate the vessels and rouse them up to healthy action.—Anything that will do this will generally effect a cure.

Tincture of Iodine has been used,—very weak aquafortis or oil of vitriol,—weak spirits of ammonia—tincture of cantharides in liquid opoidilod— and such like stimulating washes will be found useful, and relieve this uncomfortable complaint.—*Maine Farmer.*

A tremendous rattlesnake was lately killed in Huntsville, Alabama. It measured 11 feet, 9 inches—19 inches round the body in the largest place. It had 83 rattle! the rattles forming 3 feet 8 inches of the tail. The snake weighed 37 1-2 lbs. and yielded 5 quarts of oil. So says the account, which is hardly creditable.

(From the London Farmer's Magazine for October.)

ON THE BEST MEANS OF PERMANENTLY IMPROVING THE CLASS OF CLAY SOILS.

Clay soils are distinguished by their adhesiveness. They stick to the feet when damp, they imbibe moisture slowly, but do not transmit it freely for the use of plants, and when strong clay soils are brought quickly from a wet to a dry state, they approach to the state of bricks previous to their being burned. Clay soils are tilled with difficulty when too dry, and when too wet this operation has the same effect as the tempering of clay has, in the art of brick making.

The tillage of such land in a proper state is therefore of the greatest importance, and this is best performed when it is neither too wet nor too dry.

Poor thin clays upon a retentive subsoil are the most unprofitable; the expense of their cultivation, under the present system is great, being frequently equal to the value of the produce and sometimes far above it. Their natural produce is coarse grass of very light value, fit only for young beasts.

Clay soils are best calculated for the production of plants that have fibrous roots, particularly wheat, beans, oats, vetches, clover, cabbage, grass, &c.

While the light sandy soils have been greatly improved by the adoption of a new system of culture, the poor clays remain in the same state they were in a century ago, without any increase to their productiveness; indeed they are rather in a worse state than formerly. It is therefore supposed by some agriculturists, that as there have been no improvements in the clay soils, while there has been so great an increase in the productiveness of sandy soils that the clays are not susceptible of improvement with the least chance of a proper return.

There is no doubt but a better system could be adopted for the cultivation of such strong clay soils than that which is pursued in the common fields, and on the clays of Bedford, Huntingdon, Cambridge, and other counties on the malm, gault, oak-tree, clunch, Oxford and blue lias clays.

The course of cropping adopted in the common fields and on thin clay, is summer fallow, if dugged, wheat, and then beans; or without dung, barley, then oats, then fallow again, and this is the same as it was 100 years ago.

The chief cause of thus neglecting the clay soils is the difficulty and expense of cultivating them and of converting them into pasture, after having been long kept under this system of arable cultivation. It is difficult to convert such land into good pasture, but it has been overcome and the best and most profitable results have followed.

There is a much greater difficulty in getting a poor, cold, clay farm lot, than one consisting of a poor sandy soil. The capital and ability required for the former being not only much greater, and of a higher order, but the risk is also much more in cultivating the clay, than the sand, as the mode of improving the land and securing good crops on sandy soils by claying is easy and certain, and the turnip and sheep husbandry cannot be adopted on clays.

Besides, the system of cultivating light sand or loamy soils has been so long established, and the Norfolk or four-field system has now become so much the beaten track, that it would be difficult

for the farmers who have been brought up to it, to leave off, although a better one were shown them.

The turnip, and sheep system, however, cannot be adopted on clay soils, till they are completely drained and subsoil ploughed, and till sand or light and porous matter be added to alter their texture.

Some new impulse must be given to agricultural speculations before the cold wet clay soil will ever attain that degree of improvement which they are capable of, and which has been effected in the sandy and peaty soils.

The landlords should encourage tenants with capital and talent, by letting farms at low rents under improving leases, similar to the building leases granted in great towns; and binding them by certain covenants to improve the land by complete subsoil drainage and the application of alternatives; and by a proper mode of culture, to convert a certain portion of the arable land into pasture under a particular mode found to be the best and surest for effecting its amelioration. Permanent improvement undertaken by an intelligent and industrious farmer under the security of an improving lease is the best and most profitable mode of permanently improving land.

Perhaps Lord Kames's mode of letting land for this object is the best, with additional covenants binding the tenant to improve, by altering the texture of such soils as would be improved by it. It ought ever to be kept in mind, that the only true and systematic stimulus to improvement of any kind, is the certainty of profit in the outlay of capital. This is the main spring to all our exertions; without the certainty of occupying his improvements for such a length of time as will enable him to reap the advantage of his outlay, we may be assured that no man will either invest his own capital, or be inclined to borrow money to be laid out in the improvement of another man's estate.

There is no doubt, however, but thin clay soils could be easily improved, and, perhaps, in a much greater degree than the sandy soils have been during the last 40 years; and the surface may yet be seen clothed with a rich herbage which shall vie with that of other soils in producing the best cheese, beef, and mutton.

Clay soils will produce pasture just in proportion to the quantity of decaying active vegetable matter in their composition. If this be abundant, the crop will be rich and luxuriant; and the decaying fibrous roots will form a dry, porous soil, giving a sufficient depth for the rain to sink through the subsoil, where it will run off by the furrow drains. If there be little vegetable matter in the soil, the moisture will make the earthy matter in it collapse and adhere together; and it will form a cold, wet, sterile clay, producing little else but carian grass of little value.

Pasture on clay soils should never be converted into arable culture, unless the application of skill and capital, will not only repay the additional expense of the culture, but also tend to increase the permanent productiveness of the soil. Without a proper application of skill, capital, and industry on such land, the converting it into arable culture will only tend to diminish the produce, if the free produce under the artificial culture falls short of that which nature itself afforded.

Much may be learned from the practice of market gardeners, in the neighborhood of London and elsewhere. They have two methods of trenching

their land. When the soil and subsoil are good to a great depth, they turn the surface under and fetch up a fire-brick spit from below to constitute the surface for so many years; but when the subsoil is poor or strong clay, they bastard trench it, as they call it; that is, they throw the surface spit forward, always keeping it uppermost, and dig the subsoil by turning it over in the trench without moving it from its place.

Their object in this trenching their clay soils is to get depth for the rain-water to descend, and to give a greater depth of moisture to the roots of plants in dry weather, and for the superabundant moisture in weather to descend below the roots of plants, and run off to the drain.

If we perfectly drain thin clay soil by furrow draining, and deepen the subsoil by trenching with the spade or the subsoil plough, making it pervious to the moisture which falls on it, that it may immediately sink to a depth below the reach of the roots of the plants, the cultivated surface will be dry, and if we reduce the tenacity of the soil by applying to it those light or sandy substances, which when well incorporated with it, will make and keep the soil permanently porous and friable, then the land which before produced only a poor crop of carnation grass, or if arable, of oats, will now produce an abundant crop of wheat, beans, oats, clover, and even turnips; and if properly laid down and full of manure will form a rich pasturage for any kind of stock.

When clay soils have dry pervious subsoils, they become darker in color from the repeated application of manures, and under a proper system of cultivation they lose their adhesiveness, and become loamy soil, producing the most fruitful crops of wheat, beans, clover, vetches, cabbage, and naturally produce the best and richest herbage for dairy cows. The milk from cows fed on such pasture produces more cheese and butter than the milk from cows fed on a sandy soil, and of a better quality.

Anything which will produce permanent friability in clay soils, such as sand, lime, burnt clay loess light vegetable matter, or long unfermented manure, will alter its texture and improve its quality.

When tenacious soils are completely subsoil drained, and a system of deep or subsoil ploughing is adopted, every time when the land is in summer fallow, if the soil be deepened and the subsoil made more porous; and if never ploughed when too wet, and a full portion of vegetable manure be given to the soil, and well mixed with it, a mechanical effect will be produced, which will change the nature and texture of the soil, and give to it that friability which is so essential in all productive soils. The rain that falls on it will now percolate through it to the depth of the new formed subsoil and thence to the furrow drains.

The soil now receives the circulation of the air which is carried on by the rains filling up the interstices which the air previously occupied, and the complete drainage draws off all the superabundant water as it falls. By this operation the earth again receives a fresh supply of air from the atmosphere, which promotes a chemical as well as mechanical action in the soil, and hastens the decomposition of the air and water, as well as the vegetable and animal manure it contains, and thus a liberal supply of the nourishment necessary for the growth of plants is obtained.

Soil that is principally composed of calcareous

matter, in minute divisions, becomes a most tenacious stubborn soil; and, under certain circumstances, as sterile as the most worthless clay. Calcareous matter, therefore, although reckoned a valuable constituent in a soil, becomes an evil when it composes the greater part of it.

Calcareous clay, when thoroughly dried, falls to pieces like burnt lime, whenever it is again wetted. Every poor clay soil may be much improved by tarring and burning the surface, after it has been completely drained.

This is the first step that ought to be taken towards ameliorating such a soil, and the more clayey the soil is, the deeper ought the soil to be burnt. When the burnt surface is mixed with the soil to the depth of the furrow, it acts as a coarse sand, and makes it more friable and porous, by converting the matter, which was before damp and adhesive, into a dry, friable, warm soil, permanently improved and capable of producing luxuriant crops of every kind.

If we can get depth and friability to the subsoil of strong adhesive clay, we thereby prevent stagnant water from injuring the roots, and give to the plants the liberty of sending their roots to a greater depth in search of nourishment.

In all rich soils there is vegetable matter in every state of decay, and the greater this portion of decaying vegetable matter is in strong clay soils, the greater is its productive powers. Besides this, decomposing vegetable matter will tend to keep strong clay land loose, friable, and porous.

WATERING PLACES.

Every farmer should endeavor to have a good watering place for his stock. Some indeed have great inconveniences to contend with in this respect; but in most cases where the watering place is bad, it is owing to sheer negligence. Stock of every kind need a good supply of pure water, and if they do not have it they cannot thrive, nor be kept in good condition. In order for creatures to drink conveniently, the water should be in a trough elevated a little from the surface of the ground. When the water is in a brook, pond or spring, the ice and snow generally accumulates around it to a great depth, and if it is shovelled out, it is liable to be blown in again in a short time. When animals have to stoop down and then with difficulty reach the water, they frequently get much less than they want, as it is attended with great exertion. Some young or weak ones are often driven away by the stronger, so that sometimes they do not get any water.

In most all cases the watering place, even when it is a poor one, is where the water descends, and by carrying it in a spout a short distance, it will attain a sufficient elevation, and may then be discharged into a trough; that will be a convenient place to accommodate the poor thirsty beasts, who will amply reward their owners for the trifling expense. In many cases water can be conducted in a spout from a spring or brook in the side of the bank, so as to prevent its freezing in the winter, until it is high enough to go into a trough. Now is the time for farmers to attend to this business who have not already done it.—*Yankee Farmer.*

Two hundred of the sons of New England in Louisville, Ky. have formed a Pilgrim Society; intending each year to celebrate the landing of the fathers on Plymouth rock.

EGGS AND POULTRY.

Among all nations, and throughout all grades of society, eggs have been a favorite food. But in all our cities, and particularly in winter, they are held at such prices that few families can afford to use them at all; and even those who are in easy circumstances, consider them too expensive for common food.

There is no need of this. Every family or nearly every family, can with very little trouble, have eggs in plenty during the whole year; and of all the animals domesticated for the use of man, the common dunghill fowl is capable of yielding the greatest possible profit to the owner.

In the month of November, I; ut apart eleven hens and cocks, gave them a small chamber in the woodhouse, defended from storms, and with an opening to the south.

Their food, water and lime were placed on shelves convenient for them, with warm nests and chalk nest eggs in plenty. These hens continued to lay eggs through the winter. From these eleven hens I received an average of six eggs daily during the winter; and whenever any one of them was disposed to set, viz. as soon as she began to cluck, she was separated from the others by a grated partition, and her apartment darkened; these cluckers were well attended and well fed; they could see and partially associate through their grates with the other fowls, and as soon as any one of these prisoners began to sing, she was liberated, and would very soon lay eggs. It is a pleasant recreation to feed and tend a bevy of laying hens; they may be tamed so as to follow the children and will lay in any box.

Egg shells contain lime, and in winter, when the earth is bound with frost or covered with snow, if lime is not provided for them, they will not lay, or if they do, the eggs must of necessity be without shells. Old rubbish lime, from chimnies and old buildings is proper, and only needs to be broken for them. They will often attempt to swallow pieces of lime plaster as large as walnuts.

I have often heard it said that wheat is the best grain for them, but I doubt it; they will sing over Indian corn with more animation than over any other grain. The singing hen will certainly lay eggs, if she finds all things agreeable to her; but the hen is much a prude, as watchful as a weasel, and as fastidious as a hypocrite; she must, she will have secrecy and mystery about her nest; all eyes but her own must be averted; follow her or watch her and she will forsake her nest, and stop laying; she is best pleased with a box covered at the top, with a backside aperture for light, and a side door by which she can escape unseen.

A farmer may keep an hundred fowls in his barn, may suffer them to trample upon and destroy his mows of wheat and other grains, and still have fewer eggs than the cottager who keeps a single dozen, who provides secret nests, chalk eggs, pounded brick, plenty of pounded lime, plenty of Indian corn, water and gravel for them; and who takes care that his hens are not disturbed about their nests. Three chalk eggs in a nest are better than a single nest egg, and large eggs please them. I have often smiled to see them fondle round and lay into a nest of geese eggs. Pullets commence laying earlier in life where nests and eggs are plenty and when others are chuckling around them.

A dozen dunghill fowls, shut up away from other means of obtaining food, will require something

more than a quart of Indian corn a day; I think fifteen bushels a year a fair provision for them. But more or less, let them always have enough by them; and after they have become habituated to find enough, at all times a plenty in their little manger, they take but a few kernels at a time, except just before retiring to roost, when they will take nearly a spoonful in their crops; but just so sure as their provision comes to them scanted or irregularly, so sure they will raven up a whole crop full at a time, and will stop laying.

A single dozen fowls, properly attended, will furnish a family with more than 2,000 eggs in a year, and 100 full grown chickens for fall and winter stores. The expense of feeding the dozen fowls will not amount to eighteen bushels of Indian corn. They may be kept in cities as well as in the country, and will do as well shut up the year round as to run at large; and a grated room well lighted, 10 feet by 5, partitioned from any stable or other out-house, is sufficient for the dozen fowls, with their roosting places, nests and feeding troughs.

At the proper season, viz. in the spring of the year, five or six hens will hatch at the same time, and fifty or sixty chickens given to one hen. Two hens will take care of 100 chickens well enough, until they begin to climb their little stick roosts; they should then be separated from the hens entirely, they will wander less, and do better away from the fowls. I have often kept the chickens on my garden; they keep the May bugs and other insects away from vines, &c.

In cases of confining fowls in summer, it should be remembered that a ground room should be chosen: or it will do just as well to set into their pen, boxes of dried sand or kiln-dried, well pulverized earth, for them to wallow in, in warm weather.—*Indiana Farmer.*

(From the Genesee Farmer.)

MOLASSES FROM APPLES BY STEAMING.

The following excellent method of making use of apples, for the two-fold purpose of obtaining molasses from them and converting the remainder into excellent food for farm stock, has just been described to us by a friend. The apples are placed in a hogshead made tight for the purpose, and subjected to the operation of the steam. The saccharine juice soon begins to ooze from them, and drops down to the bottom of the hogshead into a vessel, covering the bottom, placed there for that purpose, from which it passes off to proper receivers. This juice is subsequently evaporated by boiling. Sour apples only have been experimented on in this way. The quantity of molasses obtained from them is ten gallons for every fifteen bushels of apples, or a gallon from a bushel and a half. This molasses differs from sweet apple molasses in possessing a peculiar tart flavor.

The apples, remaining in the hogshead, being softened and well cooked, are mixed with bran or meal, and thus constitute an excellent article of food for hogs and cattle. J. J. T.

Dr Poyen was making converts, at the last dates, in Ware village, to Animal Magnetism. He pulled an ugly tooth from the jaws of a factory girl, without even awakening her. The account is certified by Dr Goodrich and other citizens.

**NEW ENGLAND FARMER,
AND GARDENER'S JOURNAL.**

BOSTON, WEDNESDAY, DECEMBER 26, 1838.

**The New England Farmer, and
Gardener's Journal,**

Volume *Scirententh*,—commencing July 11, 1838.
Back numbers can be furnished. Published by
JOSEPH BRECK & Co., No. 52, North Market
Street, Boston.

TO THE PUBLIC,—

The proprietors and publishers of the New England Farmer ask leave respectfully to present their claims upon the continued patronage of the agricultural community. "Small aud acquaintance be forgot?" The New England Farmer was commenced sixteen years ago by the late lamented Mr Fessenden. The project of a newspaper exclusively to the concerns and interests of agriculture was at that time a project entirely novel in New England; the success of which was altogether questionable. He brought to it the treasures of his practical knowledge; his careful observation; his varied experience; and his persevering and exact inquiry. It soon rose into public esteem, and continued a favorite of the public until his death. The vast amount of learned, practical, and useful information contained in its volumes fully justify the patronage, which it has received; as it is confidently believed that in this respect no work has been more distinguished; and the same number of volumes is not to be found, which are richer in varied, sound, useful, and practical knowledge.

No pains or labor have been spared since the death of this excellent friend of the farming interest, this friend of every social interest, and every useful enterprise, to maintain the high character of this journal and to extend its usefulness. These efforts, from the approbation generally expressed, have not been without success; and this success is an encouragement to persevere and to redouble these efforts. This we promise; and respectfully ask therefore the continued patronage of a reading, a working, and intelligent public.

The proprietors of the N. E. Farmer would scrupulously avoid any invidious comparisons with other agricultural papers, and desire to enter into no competition or rivalry; but they confidently believe that no paper of the same number of pages, within the last year, has presented a larger amount of original matter or of interesting practical intelligence; and their selections have been made from extensive facilities, both at home and abroad; with as much judgment as they can exercise.

They will continue to do their best. The Commissioner of Agricultural Survey will render all the aid consistent with his public engagements, and make it the vehicle of all his communications with the public. The various agricultural and horticultural societies in the state will present all their reports through its pages; and some of the best farmers in New England will continue to enrich its columns with their valuable contributions.

The proprietors hold in utter disdain all mean arts, intrigues or misrepresentations, or fallacious promises with a view to obtain patronage. These would be wholly inconsistent with the principles and character which the Farmer has always maintained.

The Farmer hitherto has been eminently a family paper. Its pages have never been stained with a statement, sentiment, or expression, which would raise a blush of shame on the cheek of modesty, or infuse a poison in the uncorrupted mind. We pledge ourselves that in all these respects it shall not forfeit its high reputation.

Having been the pioneer of agricultural improvement and intelligence in the State and country, and, without the inclination if it had the power, to drive others from the field, it respectfully asks only a reasonable portion of the harvest of which it sowed the seed, and in regard to which has performed its full share in the cultivation of the crop.

The New England Farmer and Gardener's Journal is published weekly, in quarto form, making a handsome volume of 316 pages with an index, at two dollars and fifty cents, in advance, or three dollars at the close of the year.

Editors of papers with whom we exchange will do us a favor to publish this communication.

Boston, Dec. 26, 1838.

MR STEVENS' ADDRESS.

We have the pleasure of presenting in this week's Farmer the address of Henry Stevens, Esq. of Barnet, Vt., delivered before an agricultural society in that part of the country. We have the pleasure of knowing Mr Stevens. Few men are more competent to give sound practical instruction on practical subjects. He has taken a strong interest in all enterprises, for the public improvement in his vicinity. He discusses in this address the important subject of wool-growing; and shows the magnitude of this interest in his own State. He shows likewise the benefits yet in prospect for the wool-growing interest by demonstrating that Vermont is as yet far from meeting her own home demands. He shows likewise the importance of establishing manufactories in Vermont, where living and labor are comparatively cheap; the raw material at hand; and an ample and inexhaustible water power directly at hand. Such plain, useful, statistical addresses as these, so full of valuable facts and important and well-founded calculations cannot fail to arrest the attention of reflecting and practical men.

Vermont is eminently a growing State; and its main dependence in an agricultural vocation, must be on its raising of live stock, its wool, and its dairy produce. It should not neglect to raise what of bread its immediate wants may require; but grain-growing, from its climate and the broken character of its land, must be a small interest compared with the former objects. The population of Vermont in enterprise, general intelligence, good conduct and good manners, is excellent. The early population of this Commonwealth, was not of the best description. While in a state of outlawry, it was a kind of city of refuge and for a time the shelter of those, whose profligacy and crimes compelled them to flee from the neighboring States. At this period it is said, that a clergyman in his parochial rounds one day inquired of a small Vermontese boy, "into what state the fall of man brought mankind?" to which the child replied with as much truth as simplicity, "into the State of Vermont." But these times have long since passed away and these generations have gone with them. Vermont at the present time it is believed in the general character and improvement of its population is behind no State in the Union.

H. C.

(For the New England Farmer.)

Weston, Dec. 18, 1838.

MR BRECK,—

I send you some of the African Prince, and Scotch Apples, which I wish you to try the goodness of, and give their merits to the public, if you think they deserve it. I received the tree of the Scotch apple of Mr Allen, a Scotchman, who Robert B. Thomas speaks of boarding with in his journal published in his almanack of 1836. There is no other tree in this vicinity of this variety. Mr Allen always called it his apple, and gave it the above name; it is a good bearer and thrifty growing tree.

grafted several trees from the old one last year. The fruit will keep until April.

Yours, with respect,
J. WARREN.

REMARKS.—We have tested the quality of Mr Warren apples and find them to be superior varieties. The flavor of the Scotch apple is decidedly the best—we recognize it as the Nonesuch, or a variety very much like it, which is deservedly ranked among the best of winter fruits not much cultivated; it is of fair size and handsome appearance, and well suited for the dessert; the color dark and light red, finely variegated, excepting when exposed to the shade, which is a greenish yellow.

The African Prince is a beautiful fruit to look at, of large size and good shape, and where exposed to the sun a very dark red. It is juicy, sprightly, good flavor, but for our own taste a little too tart; it would be well liked by many for the dessert, and it must be highly prized by all for cooking.

We find it rather difficult to describe flavors, not being much in the way of discussing the merits of a great variety of fruits. But if any of our readers will follow the liberal example of our friend Warren, we will do our best, these long winter evenings, by the way of proving their fruits, and be much obliged in the bargain. J. B.

SUMMARY OF THE WEEK.

PENNSYLVANIA.—The Harrisburg difficulties are not adjusted. There are two houses of representatives sitting in session, both pressing their claims to a legal recognition. It does not yet appear how these difficulties will be settled. Heaven preserve the State from a civil war but the sky is cloudy. The military has been withdrawn from Harrisburg; and the short days and cold weather favor a cool and dispassionate adjustment of difficulties. Fires in a city are not likely to spread rapidly or extensively when the roofs are covered with snow.

CANADA.—Affairs in Upper Canada are in a most unhappy condition. Another unsuccessful invasion here made from Detroit, and the beautiful village of Sandwich opposite Detroit laid waste by fire. The invasion was abortive, and many lives have been lost. In such cases if those who undertake them are successful they are called patriots; if they fail, rebels. The latter seem likely to be the established cognomen of the party. The prisoners are crowded with the criminal and the suspected. The prisoners are tried by Courts Martial, because jurie would not agree to convict; and the language is doing fearful work.

Public improvements are everywhere advancing with great rapidity. Steamboats and railroads bring distant places into the immediate vicinity of each other. The British government are proposing to establish a steam communication with the bay of Panama, and propose a railroad over the isthmus of Darien. Formerly when a grave citizen of Boston proposed to make a journey to New York he deemed it necessary to make his will and "put up a note at church" for his safe return. Now he goes to New York and returns; and he does little more than tell his family they need not wait for him at dinner.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Dec. 15, 1838.

M. P. Sawyer, Esq. exhibited the "Hooper Apple," produced on the farm of Mr Moses Little at Turkey Hill in Newbury, a beautiful and good fruit, of a red color, and medium size, origin unknown.

Mr Jonathan Warren of Weston, exhibited the African pince, Parks, and American Nonsuch apples, or more properly the Nonsuch of Boston and vicinity. The committee beg leave to observe that this is decidedly distinct from the English Nonsuch described by Forsyth and paid, also different from many apples of the same name cultivated in various parts of our own country.

Mr Manning exhibited the following apples, Danvers' Inter Sweet, Pennock Red Winter (Cox No. 78) Bell-waver (Cox No. 33), and Chaumontell pears.

E. M. Richards, Esq. exhibited the Wine apple (Cox No. 34), and the Bicknell or Quince pear for baking, so another apple, name unknown.

Mr Aspinwall of Brookline, exhibited a pear, the produce of a tree received from France as the "Monieur," was immediately recognized as the Burgomaster described in Kenrick's New American Orchardist, page 134. We remark of this pear that although as regards taste it is only second rate, yet its large size, healthy appearance, and abundant bearing, render it very desirable either for the fruit garden or orchard. We further remark, in order to remove erroneous impressions, that notwithstanding this pear was received from Europe, under the name now bears, it is entirely distinct from the true Burgomaster of Bauman's catalogue, and of the London Horticultural Society.

For the Committee,
ROBERT MANNING.

NOTICE.

A meeting of the Committee of the Mass. Hort. Soc'y on Fruits, will be held at the Hall of the Society, on Saturday, 29th inst. at 10 o'clock, A. M. for the purpose of awarding the premiums on fruits, for the present year. A punctual attendance is requested.

For the Committee,
WILLIAM KENRICK, Chairman.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass., in a shaded Northernly exposure, week ending December 23.

DECEMBER, 1835.	7 A.M.	12 M.	5 P.M.	Wind.

FARM IN BROOKLINE.

For sale a farm situated in Brookline, about four miles from Boston, containing thirty acres of first rate Tillage Land, and thirty acres of Woodland and pasture—with a good House in complete repair; Barn, Chaise-house, Corn-barn, Shed, &c.

The Farm will be sold low, together with the Stock, Hay, Tools, &c. if applied for soon, at No. 30, North Market St. Boston, or Roxbury Street, near Boston line. **JOHN HUNT.**
Dec. 26, 1835.

FARM FOR SALE.

A Farm situated in the southwesterly part of Townsend, on the road leading from Townsend west village to Worcester. Said Farm contains 110 acres of land divided into mowing and pasturing, and a large share of wood and timber; and one story house, with two front rooms, kitchen, buttery, and two bed rooms, well finished; parlor papered; wood house; well, under cover, forty feet barn, and shed, a large sheep house, fifteen by thirty feet, a large cooper shop, and another small house well finished, on the lower floor; a good aqueduct which comes into the barn yard, and a good orchard.

The subscriber will sell a part, or all, and give possession this fall or winter, or next spring. Those who wish to buy, will do well to call on the subscriber, who lives on the premises, and look for themselves. **ASA H. ADAMS.**
Nov. 29, 1835.

GREEN'S PATENT STRAW CUTTER.

Joseph Breck & Co. at the New England Agricultural Warehouse and Seed Store, Nos 51 and 52 North Market Street have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle, not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use, to get out of order.

FRUIT AND ORNAMENTAL TREES, MULBERRIES, &c

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1838 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Peaches, Cherries, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and Peaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeysuckles; Paeonies, Dahlias and other Herbaceous Flowering Plants.

100,000 MORUS MULTICAULIS are now offered for sale at the cities of Boston, New York and Philadelphia, in October next, at prices fair, and varying with the size, and the quantity which may be desired. Also, Broussa and other varieties.

Mulberry and other trees, when so ordered, will be securely packed for safe transportation to distant places, and all orders promptly executed, on application to B. D. BRACK, Commission Store, No. 132 Water Street, New York, M. S. POWELL, Seed Store, No. 7 Arch Street, Philadelphia, or to the subscriber, Nonantum Hill, Newton, near Boston. **WILLIAM KENRICK.**
August 1, 1835.

MORUS MULTICAULIS.

Constantly on hand in small quantities, at the lowest market price. Orders directed to Messrs Winship, Brighton, Mass. or left at N. E. Farmer Office, will receive immediate attention. The plants will be safely packed and forwarded to any part of the country.
Dec. 19.

FOR SALE.

A pair of large size dark red oxen, very handsome and well matched, and move quick; valuable to any person who has considerable work. Also, a large size cow, white spotted, with short horns. Apply to A. J. ALLEN, Newton West Parish, or at 63 State St. Boston. **2wis**
Dec. 12, 1835.

NOTICE.

A person now in the Nursery business, on a limited scale, who has peculiar advantages for its extension, not possessed by any other individual in this country, wishes to connect himself with some person who can furnish a small capital sufficient to make the business both pleasant and profitable. Inquire at the office of the N. E. Farmer. **Nov. 21, 1835.**

BONE MANURE.

The subscriber desires to inform his friends and the public that he has been in the Bone business more than ten years, and has spent much time and money to ascertain how bones may be converted to the best use, and is fully satisfied that they form the most powerful stimulant that can be applied to the earth as a manure. He offers for sale ground lene at a low price, and is ready to receive orders for any amount, which will be promptly attended to.

Orders may be left at my manufactory, near Tremont road, in Roxbury, or at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, Boston. **Sept. 20. NAHUM WARD.**

MISCELLANEOUS.

(From the Maine Farmer.)

An emigrant who went from New England to the "Far West," and there lost his wife, his child, and his own health, by complaints incident to the climate, sends us the following

LAMENT.

I sigh for the land I have left far behind,
The land of my fathers, my birth, and my childhood,
For relatives dear, and for friends that were kind,
For the hills and the dales, and the New England wild-wood,—
The cool spring that gushed from the side of the hill,
The old oak tree that o'er-shadowed the same,
Where the pitcher of stone so often was filled
To gladden our palates, when from labor we came.
Are the themes of my thoughts by night and by day,
While in the far west, now drear and alone,
For thee, sweet New England, I ardently pray.
Could I once more enjoy the vigor and health
Thy bounty can give and thy climate bestow,
I never again should sigh for the wealth
That from the famed prairies abundantly flow.

SHORT SERMONS FOR FARMERS.

No. 1.

The Heavens declare the glory of God; the firmament showeth forth his handy work. Day unto day uttereth speech. Night unto night showeth knowledge of God.

It has been said of an undevout astronomer that he is mad. If, in the familiar contemplation of the heavenly orbs, their countless numbers, their eternal brilliancy, their arrangement, magnitude, and distances, their mutual relations, and dependence; and above all their sublime harmony, all acting upon, and acted upon by, each other, and performing their various revolutions with an exactness so perfect, that the variation of even a second of time would throw everything into confusion; and all subject to that mighty and unceasing and universal law of gravitation, which holds in its place the largest planet and balances the minutest atom floating in a subbeam, if, I say, a mind familiar with these objects and laws can fail to acknowledge their divine Author and look up with profound veneration to the great mind which contrived and the mighty energy, which upholds and directs all things, it may justly be pronounced insane and diseased; overclouded by a darkness, which is impenetrable; perverted by prejudices, upon which truth is powerless; perhaps corrupted by a moral obliquity, which is incurable.

The farmer stands in a relation to nature similar to that, which the astronomer holds to the heavenly body. His daily occupation is to him as vast as with the vegetable and animal world; with the infinite variety of their productions, and their multi-form and important uses; with their artificial and spontaneous creations; with the laws, which regulate their germination, progress, and maturity; with the various influences of times and seasons, sun and air, rain and snow, dews and frosts; with the miraculous operation and effects of manures and

cultivation; with the intermixture and improvement of plants and animals; with the profound mysteries of procreation, growth, and the endless succession of life; with the various grades and forms of animated existence; with the provision made for the subsistence and the happiness of all; with the universal and inexorable laws of progress, change, and decay, as propitious and necessary as those of life and growth; and above all with the universal capacity of happiness, and the infinite prodigality of beauty, which pervades every part of creation from the most minute to the largest and most sublime.

There is everything in nature to lead the intelligent and reflecting mind up to the Creator; to that august and profound intellect which fashioned, and that mighty power which created, and that never-ceasing Providence, which controls and sustains all things. The creation has been rightly denominated God's earliest revelation of himself. The pages of this divine volume are everywhere radiant with instruction. Before the eye of the farmer this book stands always open. It speaks to his understanding and to his affections. He that hath ears to hear, let him hear. He that hath eyes to see let him open them to this wonderful and universal revelation. Cultivating a spirit of habitual devotion, and looking upon the whole creation around him as the great theatre of the divine power and beneficence, every object will wear a new aspect. Every employment will become sanctified. Every bounty and blessing will be received with a new and more grateful relish. His heart will expand with a higher devotion to God and a wider benevolence to man. He will then understand and appreciate the elevated rank assigned him in the creation; and the privileged and blessed ministry, which devolves on himself in the beneficent administration of the divine Providence. H. C.

REVOLUTIONARY ANECDOTE.—We have gleaned from the publications of the day, the following anecdotes of former times. The first relates to the battle of Bunker's Hill—and is from the pen of A. H. Everett, Esq.:

"The veteran Pomeroy, to whom I have already particularly adverted, and who at this time held no commission in the line, when he heard the pealing artillery, felt it as a summons to action, and could not resist the inclination to repair to the field. He accordingly requested Gen. Ward to lend him a horse, and taking his musket, set off at full speed for Charlestown. On reaching the neck, and finding it enfiladed by a hot and heavy fire of round, bar and chain shot from the British batteries, he began to be alarmed, not, fellow citizens, as you might well suppose, for his own safety, but for that of General Ward's horse! Horses, fellow citizens, as I have already remarked, were at this time almost as rare and precious as the noble animal that rode upon them. To have lost or exposed his borrowed horse to the caprice of the British storm, and to dream for a moment of shrinking from it himself, the conqueror of Baron Dieskau dismounted, and delivering Gen. Ward's horse to a sentry, shouldered his musket and marched very coolly on foot across the neck. On reaching the hill, he took his place at the rail-fence. His person was known to the soldiers, and the name of Pomeroy rang with enthusiastic shouts along the line!"

It was during the last war, when the vessels of Admiral Gordon were making their way up the

Potomac, that a negro woman was arraigned in court of Virginia for killing one of her own sex and color; she had been committed for murder, but the evidence went clearly to establish the deed to be manslaughter, inasmuch as it was done in sudden heat, and without malice afore-thought. The attorney for the commonwealth waived the prosecution for murder, but quoted British authorities to show that she might be convicted of manslaughter though committed for murder. The counsel for the accused rose, and in a most solemn manner asked the court if it was a thing ever heard of that an individual, accused of one crime and acquitted, should be arraigned immediately for another under the same prosecution? At intervals—hoon boom, boom, went the British cannon—"British authorities!" exclaimed the counsel; "British authorities, gentlemen! Is there any one upon this bench so dead to the feelings of patriotism, as at such a moment to listen to British authorities when the British cannon is shaking the very wall of your courthouse to their foundation." This appeal was too cogent to be resisted! Up jumped one of the justices, and protested that "it was not to be borne; let the prisoner go; away with your British authorities!" The counsel for the accused rubbed his hands and winked at the attorney; the attorney stood aghast; his astonishment was too great for utterance, and the negro was half way home before he recovered from his amazement.

THE BUSH COW.—A remarkably curious animal has just arrived in this country from Sierra Leone, which is attracting a good deal of attention among naturalists. It resembles in form a common cow, but is thinly covered with coarse hair of a dirty yellow color with tufts of the same hanging down at equal distances over her broad pendulous ears, and has altogether a most singular appearance. It comes from the interior of Western Africa, and is but little known even to the natives, who call it the Bush Cow. No other specimen has ever been brought to Europe, nor the colonists of Sierra Leone all acquainted with it, and it is believed to be quite undescribed. It has been deposited for the present at the Surrey Zoological Gardens.—*London Farmer's Magazine.*

FAST DRIVING.—"Coachman," said an outside passenger, to one who was driving at a furious rate over one of the most mountainous roads in the north of England, "have you no consideration for our lives and limbs?" "What are your lives and limbs to me?" was the reply;—"I am behind my time!"

Sunday, Nov. 25th, was the coldest day in November for 26 years.

MR INGERSOLL'S PIGGERY.

"Honor and shame from no condition rise,
Act well your part, there all the honor lies."

[We have the satisfaction to publish the following account of the most perfect system of breeding wine, that has fallen under our observation. We have visited the establishment which it describes, and heard with pleasure the explanations of its intelligent owner, upon the different parts of his plan. And from our desire to profit by his experience, we subsequently requested him to give us a written description of his Piggery, and the management hereof, which he promptly furnished, in a letter that invited us to pursue our inquiries, and these procured for us the more ample details contained in his second letter. It was our wish to publish these communications soon after they were received, but we could not obtain his express permission to make that use of them; therefore, we have withheld his letters from the press until the present moment, when we are assured that the cause of his eluctance has ceased to exist; and that his plan may now be made public, without any prejudice to his interests, or violation of his wishes. This system challenges our admiration, and we cheerfully render it to his head and heart. How few of us take equal care of superior animals! And there are not many who carry equal method into their most important avocations—errors, which may justly be ascribed to defective education. It is easy to perceive in every part of Mr Ingersoll's proceeding, that confidence which merchants feel in the employment of capital at some risk, and heavy charges, for the production of a probable and fair, although remote profit, through a definite channel. With such hopes and calculations, education had made him familiar, whilst it gave him habits of critical investigation that must ever secure to their possessor eventual success in any occupation to which he may devote himself. As a farmer, we perceive that he has derived a handsome livelihood from the cultivation of a few acres of land, and the employment of a small capital, in connexion therewith; whilst there are many proprietors of princely estates, who can scarcely contrive to banish want from their domains. We have pointed to the chief cause of such painful deficiencies—it remains for parents to diminish their number in future times, by taking present and suitable means to qualify their children to pursue their respective occupations with benefit to their families, and advantage to society. And whilst we are zealously laboring to amass property for our offspring, let us not be unmindful of their intellectual treasures, but remember always that the improvement of these can alone teach them how to enjoy and augment the wealth that we may give.]—*Edit. Am. Far.*

Brookline, Oct. 30th, 1831.

DEAR SIR,—

I have, this evening, received your favor,

dated 1st inst., inclosing some valuable seeds, and two numbers of your publication, for which I beg you to accept my acknowledgments. I should feel mortified that your interesting journal should have been published near three years, without my availing myself of its information—the fact is, I have been a subscriber through our mutual friends, Messrs. Wells and Lilley, from the beginning.

I am happy to hear of the safe arrival of the pigs, and more gratified that you are pleased with them. It will give me great pleasure to send the boars you wish in the spring; and they shall, as you desire, be of different parentage from those you already have. I am fully satisfied, from repeated trials, that a fine race of animals cannot be kept up by breeding *in and in*; and I have both in my sheep and swine, two distinct families, which are crossed with each other. And except to supply the number of each kind I want to breed from, the individuals of the same family are never allowed to come together. By attention and strict adherence to this plan of crossing, where both kinds are good, I have a fine healthy stock. The animals are improved, both in size and symmetry, and their disposition to get very fat, at an early age, has been increased. At twelve month old, the pigs you saw in my various pens, averaged 280 lbs.; and many of them exceeded 300 lbs. each. This weight as they were fed almost entirely upon vegetable was very satisfactory. A larger race has been often recommended to me by my neighbors. But a large race would not only require more food, but it must also be of much richer, and of more expensive quality. Boiled cabbages, turnips, and other vegetables, whose acreable produce is large, and which constitute the principal sustenance of my own breed, would make but poor returns when given to a larger framed animal. My establishment consists of twelve breeding sows and two boars, that are kept as long as they bring fine litters of pigs—failing in this, they are fitted, and their places supplied by others of the year old, before they are put to the male. The sows are put with the boars the 1st of April, and the 1st of October, and farrow twice a year. Their inside pens are eight feet by five, and their outside pens are three by four feet. About the time they are expected to bring forth, the styes are littered with straw cut into chaff, very fine, that the little pigs may be dry and warm, without being entangled with long straw, and thus destroyed. The litters are always regulated, so as to leave not more than eight pigs to any one sow, either by changing their mothers, when necessary, soon after their birth, or by removing supernumeraries. I have always found a family of eight pigs at a month old, worth more than one of twelve; their growth being so much greater. From each outside pen the pigs have access through a small hole, to a common yard, which is always kept well littered; in which they play—and where dry corn is placed in shallow troughs to induce them to eat as early as possible. Each party knows their mother, and they find their respective pens without difficulty. These pigs are

always weaned the 1st of October, at six or eight weeks old, that the sows may be again in the way of their duty, and my system progress. From these pigs I select seventy-two, and dispose of the rest. They are put into twelve pens, containing six each, and are fed with the best food my swill trough affords, six times per day, for the first month, and three times per day afterwards. The inside pens are six feet square, and the outside four feet by six, both planked, with a quick descent for the dirt, &c. to be carried off. Much, indeed, everything depends upon their sleeping dry and warm, and being well littered, and kept perfectly clean. In these pens they remain six months, or until October and April, when they are all transferred to the fattening pens, and their places supplied by the newly weaned pigs. The fattening pens are planked—there is a cellar under them, and each pig is allowed an area of about twelve square feet to live in; for these there are no outside pens. The fattening pens are cleaned out every morning, and fresh litter given. For three months the pigs in them are fed from the swill trough as store pigs; at the end of which time, say January and July, their fattening commences, which consists in adding, for each of them three quarts of cracked corn to their daily allowance of vegetables, for three months, when they are killed as near the first of October and the first of April as may be. Thus you will observe the 1st of October, and the 1st of April are busy days in my Piggery, as the little pigs are then weaned, the sows again put to the boars, the fat hogs sold off, the store pigs removed to the fattening pens and my system completed.

To feed this stock, consisting of
72 pigs from one to six months old, and
72 pigs from six to twelve months old, and
12 old sows, and
2 boars; in all

158 mouths—we boil a kettle of vegetables, containing six bushels, to which is added one bushel of cracked corn three times a day, and after putting this mass into the swill trough and mixing it intimately, we add as much water as will make 112 gallons, or for each bushel of vegetables and corn sixteen gallons. This swill is then distributed *sweet and warm* to the stock, morning, noon and night, with great regularity, in the following proportions, viz:

In October, November, and December—to each of 72 pigs, from one to three months old, one gallon; and to each of 72 pigs, from six to nine months old, three gallons.

In July, February and March—to each of 72 pigs, from three to six months old, two gallons; and to each of 72 pigs, from nine to twelve months old, 2 gallons, with 3 quarts of corn.

In April, May and June—to each of 72 pigs, from six to nine months old, 3 gallons; and to each of 72 pigs, from one to three months old, one gallon.

In July, August and September—to each of 72 pigs, from 9 to 12 months old, 2 gallons; and to

each of 72 pigs, from 3 to 6 months old, 3 gallons with 3 quarts of corn.

8 galls.

8 galls.

And these eight gallons, divided by their terms, or four, show that on an average, throughout the year, two gallons are required daily per head for the 144 pigs; or equal to 288 gallons; and to our twelve breeding sows, and two boars, we give per day, three gallons each, or equal to 42 gallons, making, altogether, an aggregate of 330 gallons; thus quite consuming our three menses of 112 gallons each. By the different ages of the pigs, as above combined, we have a constant and daily call for the same quantity of swill through the year, so that our business proceeds with perfect regularity.

Baltimore, Nov. 21st, 1835.

DEAR SIR,—

Your detailed account of the management of your Piggery, has afforded me great pleasure and instruction. And your very obliging offer to send me a list of the vegetables raised for your monthly supply, tempts me, not only to ask for it, but for some other explanations which you likewise proffer. I am anxious to have a summary view of the total quantity of each and every kind of food used in your Piggery per annum—the cost of raising or purchasing the food—the extent of land on which it is, or might be raised—the labor of feeding and attending at other times—the annual weight and value of the pork killed—the usual number and value of supernumerary pigs—the probable value of your farm, of the food consumed—and the quantity and quality of the manure saved or produced, as well as the cost of an equivalent in manure, if otherwise obtainable. I have, you see, some curiosity; but I persuade myself, that it cannot give one so systematic as yourself, any trouble to answer me on each of those points, and in a way to show me by a glance of the eye, that it is better for you to convert your vegetables and corn into pork and manure and sell vegetables; whilst I shall, at the same time, be taught economy and method by your precept and example, which I will endeavor to observe, and imitate at my breeding establishment. I feel somewhat at a loss as to the manner of building my pens; and on the inclosed paper, you will see doubts exemplified in rough diagrams; your correction on these would particularly oblige me. It is my desire to build them in a long narrow shed; on one side of my barn yard; and to have at one end, cooking and vegetable apartments.

At your request, I am induced to ask whether it would not be better, that it is to say, cheaper, to steam than to boil your vegetables? I have seen it stated in the explanations of Scotch implements, published by their Board of Agriculture, in the year 1814, that one person by a simple apparatus, may steam in an hour, food enough, say of potatoes, to feed fifty horses a day, at 32 lbs. for each horse. And I had quite concluded to procure a boiler and steaming box from Scotland, on the strength of that statement.

I have been led to make some inquiries of you in this letter, from an attempt to push your proceedings to their results; as you will see by the enclosed estimates, which will best define the most of my inquiries.

Do you give the swill warm in summer as well as in winter? Do you spay your sow pigs, or put

fattening sows to the boar, shortly previous to killing? Have you used the mangel wurtzel and observed its comparative value or relish? I think highly of it, and wish that it may be fairly tried by every farmer in this country. In our climate it is more certain and productive than any other root. On this head I beg leave, however, to refer you, for my opinions, to No. 5, Vol. iii. of the American Farmer, in the notes on Mr Cooper's account of his several crops. And I remain truly, sir, your obliged and obedient servant,

JOHN SKINNER.

NATHANIEL INGERSOLL, Esq.

Estimate of Food, Fuel, Labor, &c. employed at Mr Ingersoll's Piggery, per annum.

6 bushels of vegetables, roots, &c. three times per day—18 bushels per diem, for 365 days—to 6570 bushels per annum, which at 25 cts. per bushel,	\$1542 50
1 bushel of corn 3 times a day added to the above for 365 days, equals	1095 bu.
13 1-2 bushels or 3 quarts per day, given to each of 144 fattening hogs, for three months or 90 days	1215
Corn per annum 2310 50 c.	1155 00
Fuel 1 1-2 cords per month, sawing, &c. 18 cords,	100 00
Labor one man and one boy, wages and board,	250 00
Yearly value bestowed on Piggery, Dr.	\$3147 50
<i>Cr. by Pork and Pigs sold.</i>	
142 hogs at 280 lbs. 39, 760 lbs. at 6 cts.	\$2385 60
24 pigs, one by each sow, at each farrow, over and above 9 suckled, \$1,	24 00
	2409 60
	\$737 90

Showing a difference lost by using the food in the piggery, instead of marketing it; provided the corn and vegetables are valued at a price at which they could be marketed free of expense, and also return manure enough to keep up the fertility of the soil, which I presume might be done near this city, if not near Boston.

And if this is practicable near Boston would not the sale of vegetables and purchase of manure, be attended with less care than the piggery, and be more certain? At what price is the manure of stables to be had at Boston, say per load, of given cubic feet, when unrotted? And do your owners of market farms, who have been successful and long established, buy manure, and at what rate? An elucidation of my attempt to estimate your operations, will give me the marketable value of your vegetables at home and in Boston, as well as an idea of the expense of converting them into money by direct sale, all which will be very acceptable and useful to me personally, if you can find time conveniently to furnish it.

Estimate of Land and Labor, required for the Piggery, &c. &c.

For 2310 bushels corn for piggery, at 40 bushels per acre,	68 acres.
--	-----------

For 6600 bushels vegetables, 500 bushels per acre,
 14 acres |

Acres for piggery,
 72 |

For the farm purpose to support 2 horses and two oxen, say grain and grass,
 16 acres. |

Pasturing, orchards, lots, &c.
 12 acres |

Acres,
 100 |

Labor required to cultivate 100 acres as above, say 2 hands, 12 months wages and board,
 \$300 00 |

For additional labor, spring, summer and fall, suppose to be equal to the expense of 6 hands for six months, or 3 for a year,
 \$450 00 |

Annual labor, say
 \$750 00 |

A farm of 100 acres of first rate character might be worth \$100 per acre,
 \$10,000 00 |

And the increase of value, attributable to augmenting population, would be more than equivalent to the wear and tear of utensils and stock employed.

The interest might therefore be considered as rent,
 \$600 00 |

Add for taxes,
 25 00 |

And for labor as above,
 750 00 |

\$1375 00 |

Then the farmer for his time may be considered as earning on a permanent scale, over and above interest, on his capital, by his piggery, for his own support, provided the manure keeps up the fertility of his soil, about

 1034 60 |

*\$2409 60 |

*Mr Ingersoll's reply is omitted this week for want of room.

SMITHSONIAN LEGACY.

We give below a highly interesting extract from a letter of a correspondent of the New York Herald on the subject of establishing an Agricultural School.

We have likewise received a circular from a gentleman at Washington, which we herewith subjoin, and who we presume is the gentleman referred to by the correspondent of the Herald.

Washington City, Dec. 14th, 1838.

TO THE EDITOR OF THE N. E. FARMER,—

Sir—The bequest of the late Mr Smithson, of London, for the establishment of an institution for the diffusion of useful knowledge, in which Congress have been appointed as executors in the application of said fund, induced me to submit a memorial accompanied with drawings and estimates for the necessary buildings, live-stock, apparatus, &c. &c., to that honorable body; detailing a complete plan for the organization of an Agricultural School, combining theoretical as well as practical exercise for youth intended to pursue this useful science.

My motive of addressing you is, to solicit your favor and influence in this object, knowing the interest you take in promoting the science of agriculture.

Very respectfully yours &c.

CHARLES LEWIS FLEISCHMAN.

The history of the Smithsonian legacy is probably well known to our readers. Mr. Smithson of London, an Englishman, who is not known, it is believed, ever to have been in this country, dying a few years since, left by will a very large property to the United States for the diffusion of useful knowledge and the extension of the means and advantages of a practical education. Mr. Rush was sent to England by the government to get possession of the property, which he succeeded in doing. The property is stated to amount to half a million of dollars. The application of the income of the fund is now the great question presented to Congress. This question is matter of much more difficulty than merely receiving the money. We shall wait with some impatience to see the plan submitted to Congress and reported on by the committee; and on some future occasion, we shall be prepared to give our own notions, humble and imperfect as they may be. The plan proposed and its outlines of which are given in the letter of the feralid appears very well on paper; but we apprehend the difficulty of executing it will be very great. Perhaps it will prove too cumbersome, and propose too much. We will not, however, decide prematurely. The danger to be feared is that the money will fall into the hands of theoretical instead of practical men, and prove in the end of little utility. If the offices connected with any such institution should under any circumstances come to be matters of mere political favoritism, there can be little hope of its utility, let the party in power be who they may.

(From the New York Herald.)

PRIVATE CORRESPONDENCE.

THE SMITHSONIAN BEQUEST.

Washington, Dec. 17th, 1838.

The best method of executing the benevolent design of Smithson, who bequeathed half a million of dollars to the United States to be expended in the diffusion of knowledge, begins to excite a good deal of interest, and has claimed the attention of several intelligent and scientific men in our country.

The communications received by the Secretary of State in answer to interrogatories sent by that officer to a number of scientific men in the United States, have been referred to a select committee, of which Mr. J. Q. Adams is the chairman, and who, we presume, will bestow upon it much of his attention. A friend has communicated to me the outline of the plan recommended by a German, which I mentioned in my last; but whether it will be adopted or not, I am not prepared to say. It was presented to-day by Mr. Adams.

This plan contemplates the establishment of an institute in this city to serve as a nursery of scientific agriculturalists for the U. S.—to consist of one hundred pupils at a time, to be gradually increased from the profits of the farm; the lectures to be free, and the price of board moderate, as half the number of pupils are to be practically employed daily on the farm. In the first or principal compartment of this Institute will be taught, 1st, *Agronomy*, which treats of the different primitive earths, and other elements of which the soil is composed. 2d, *Agriculture*, which teaches the cultivation of the respective soils in such a manner as to produce the most perfect crops. This is subdivided into chemical and mechanical agriculture. 3d, *Vegetable Productions*, teaching the culture of grasses,

leguminous field plants, roots, vines, mulberry trees, fruit trees, &c. 4th, *The Animals* used and raised by the agriculturalists, &c. 5th, *Economy*, or the manner of arranging and conducting a farm. In the secondary compartment, the following branches are to be taught, viz: Veterinary, Technological agriculture, culture of forest trees, agricultural architecture, and civil engineering as connected with agriculture. The auxiliary sciences to be taught, are Chemistry, Natural Philosophy, Mineralogy, and Geology, Botany, and Physiology, Zoology and Meteorology; the Mathematical Sciences, Drawing of machines, animals, plants and landscapes. For the purpose of illustrating all these sciences, there must be an extensive farm, with a field for experiments, work-shops, beet sugar manufactory, mills, &c.—a botanical garden, a collection of the best implements, or models of them; a library; a cabinet of minerals properly arranged according to their chemical character—an apparatus for mathematical and physical instruction; a collection of skeletons of domestic animals for the study of comparative anatomy; a collection of seeds and insects and a laboratory. The farm which is to serve for the practical illustration of the theory is to consist of 640 acres in cultivation, to be divided into two equal portions, to show the systems of rotations. One hundred acres of meadow, to show how natural meadows can be improved by draining, irrigation, manuring, &c. Eighty acres of pasture, to show the difference between natural and artificial pasture, and the manner of improving it—four acres for a vineyard—four acres for a hop yard—forty acres for experimental fields, to show how to cultivate plants useful in agriculture, to try new ones, and for experiments on manures, rotations of crops, and new agricultural implements—a vegetable garden of six acres—a mulberry plantation of six acres—an orchard and nursery of twenty acres—five hundred acres of woodland, to show the cultivation of forest trees, the mode of preparing charcoal, &c., and a botanical garden of three acres.

The pupils admitted into this establishment are to be taught to forge, to shoe a horse, to make a wheel and wagon, to stock a plough, to build out-houses, &c. The number of pupils at the commencement is not to exceed 100—to be at least 14 years of age at the time of admission—of good moral habits—to possess an ordinary English education, and be capable of comprehending a popular course of lectures. They are to be divided into three classes. The third or free class is not to exceed 20 in number—must stay two years—perform the work of the farm, and receive their tuition, boarding and lodging free. The second class is not to exceed 60—must also stay two years, to acquire the theory and practice of agriculture, and all the auxiliary sciences. The first class is to consist of 20 pupils, who have been two years in the third class, and who desire to perfect themselves for professors of similar establishments. This class is to have the superintendance of the other pupils. The officers of the institute are a director, who has the entire direction and control of the establishment; a treasurer and two clerks, five professors and a teacher of the lower branches. The practical manipulations are to be illustrated by a superintendent of the farm, a superintendent of the stable, who teaches riding and breaking horses; a superintendent of the sugar beet manufactory, a machinist, gardener, shepherd, &c.

The total cost and expense of purchasing the

lands, erecting the building, buying stock, &c. are estimated at \$150,000, and \$140,000 are to be invested at six per cent. and out of the proceeds the salaries of the Professors and officers are to be paid. If this should be adopted, it will be the only institution of the kind in the United States, and the first attempt ever made by Congress to promote the most valuable and important branch of our national industry and wealth. The other plans consist, I believe, of the old fashioned universities, &c. and systems of free lectures. The great difficulty will be so to arrange any institution as to prevent it from being filled with mere partisans, and used for mere party purposes, as every public institution under the control of the Government now is. I understand there are even now party menials from abroad looking out for professorships in this institution; but I trust, if these poor tools of party are to be paid at all, they will be paid not out of the money of a benevolent Englishman, but out of the public Treasury, which those now in power seem to think belongs to them and their supporters exclusively, and which they are permitted to steal, pilfer, and squander as they please.

ANECDOTE OF DOGS.—We find in the Belfast (Me.) Republican Journal the following interesting anecdote, illustrating the wonderful sagacity of dogs. It is certainly equal to anything of the kind which we have seen for some time—and bears away the palm from Jesse the Gleaner:

“My uncle was the owner of a very fine dog of the mongrel kind, which was remarkable for his domestic habits and quiet disposition. One afternoon in summer, the family were sitting near the open door when on a sudden the dog sprang out of the house, and without any apparent provocation, seized a boy who was at that moment passing the house, threw him down, tore and bit him very severely in many places. Medical aid was called,—the physician assured the lad that his wounds were dangerous—this with other inducements made for this purpose, prevailed upon the lad to disclose whether he had ever abused or injured the dog in any way. He related that some days previous, he, in company with three other lads, had, out of pure mischief, caught the dog, whipped him, and otherwise maltreated and abused him rather unmercifully; and that the dog as soon as he was released, made off without any attempt to revenge the injuries which they had inflicted upon him. Before these facts were known and the time the dog assaulted the lad, the gentleman who related the anecdote was requested by his uncle to take down the gun and shoot the dog who had then returned to the house and was very quietly reposing himself after the conflict. No sooner was this direction given, than the dog arose and stealthily leaving the house, was not seen near the premises for a fortnight ensuing, at the end of which, when all supposed that poor “Lion” had been sacrificed for his castigation of the boy, he returned; the boy having recovered from his injuries, and the anger of his master and others interested had abated—the lad certainly having learned a good lesson, and the dog displaying no small share of shrewdness and cunning throughout the whole transaction. The foregoing facts will be readily recognized at Union (Lincoln Co.) where they transpired some years since.

The average weight of cotton this year produced to an acre is estimated at 64 lbs.

(From the Cultivator.)

A LOOKING-GLASS.

J. BUEL, Esq.—

Dear Sir—When I was a boy, I can well remember how I used to be induced to wash my smutty face, by having a looking-glass held before my eyes. For the same purpose, I have extracted the following picture of "a farmer," from the writings of that most eccentric and excellent writer, "Samuel Slick," in the hopes that if any of your readers should happen to see any part of himself therein, that he will improve by the view. Here it is.

"That critter, when he built that crack of a house, (they call 'em a half house here,) intended to add as much more to it some of these days, and accordingly put his chimney outside, to save the new part as well as the old. He has been too "busy" ever since, you see, to remove the banking put there the first fall, to keep the frost out of the cellar, and consequently it has rotted the sills off, and the house has fell away from the chimney, and he has had to prop it up with great sticks of timber, to keep it from coming down on its knees altogether. All the winders are boarded up, but one, and that might as well be, for 'tittle light can penetrate them old hats and red flannel petticoats. Look at the barn; its broken back roof has let the garble eends fall in, where they stand staring at each other, as if they would like to come closer together (and no doubt they soon will), to consult with that was best to be done to gain their standing in the world. Now look at the stock; there's your "improved short horns." Them dirty looking, half starved geese, and them draggel-tailed fowls that are so poor the foxes would be ashamed to steal them—that little lantern jawed, long legged, rabbit eared runt of a pig, that's so weak it can't curl its tail up—that old cow frame standing there with her eyes shut, and looking for all the world as tho' she's contemplating her latter end (and with good reason too), and that other reddish yellow, long wooled varmint, with his locks higher than his belly, that looks as if he had come to her funeral, and which by way of distinction, his owner calls a horse—is all "the stock," I guess, that this farmer supports upon a hundred acres of as good natural soil as 'ever laid out door. Now there's a specimen of "Native Stock." I reckon he'll migrate to a warmer climate soon, for you see while he was waiting to finish that thing you see the hen's roosting on, that he calls a sled, he's had to burn up all the fence round the house, but there's no danger of cattle breaking into his fields, and his old muley has learnt how to sneak round among the neighbors' fields o' nights, looking for an open gate or bars, to snatch a mouthful now and then. For if you was to mow that meadow with a razor and rake it with a fine tooth comb, you couldn't get enough to winter a grasshopper. 'Spose we drive up to the door and have a word of chat with Nick Bradshaw, and see if he is as promising as outside appearances indicate.

Observing us from the only light of glass remaining in the window, Nick lifted the door and laying it aside, emerged from his kitchen parlor and smoke house, to reconnoitre. He was a tall, well built, athletic man, of great personal strength and surprising activity, who looked like a careless good natured fellow, fond of talking, and from the appearance of the little black pipe which stuck in one corner of his mouth, equally so of smoking;

and as he appeared to fancy us to be candidates, no doubt he was already enjoying in prospective the comforts of a neighboring tap room. Just look at 'em—Happy critter—his hat crown has lost the top out, and the rim hangs like the bail of a bucket. His trowsers and jacket show clearly that he has had clothes o' other colors in other days. The untan'd moccasin on one foot, which contrasts with the old shoe on the other, shows him a friend to domestic manufactures; and his beard is no bad match for the woolly horse yonder. See the waggerish independent sort of a look the critter has, with his hat on one side and hands in his breeches pockets, contemplating the beauties of his farm. You may talk about patience and fortitude, philosophy and christian resignation, and all that sort of thing till your tired, but—ah, here he comes. "Morning Mr Bradshaw—how's all home to-day? Right comfortable, (mark that—comfort in such a place,) I give thanks—come, light and come in. I'm sorry can't feed your horse—but the fact is, tan't bin no use to try to raise no crops, late years, for body don't git half paid for their labor, these hard times. I raised a nice bunch of potatoes last year, and as I couldn't get nothing worth while for 'em in the fall, I tho't I'd keep 'em till spring. But as frost set in, while I was down town 'lection time, the boys didn't fix up the old cel ar door, and this infernal cold winter froze 'em all. It's them what you smell now, and I've just been telling the old woman that we must turn too and carry them out of the cellar, 'fore long they'll make some of us sick like enough—for there's no telling what may happen to a body late years. And if the next legislator don't do something for us, the Lord knows but the whole country will starve, for it seems as tho' the land now a days won't raise nothing. It's actually *run out*. Why, I should think by the look of things round your neighbor Horton's that his land produced pretty well. Why, yes—and it's a miracle too, how he gets it—for every body round here said, when he took up that tract, it was the poorest in the town. There are some folks that thinks he has dealings with the "black art," for't does seem as tho' the more he work'd his land, the better it got.

Now, here was a mystery—but an easy explanation of Mr Slick soon solved the matter, at least to my mind. The fact is, says Mr Slick, a great deal of this country is *run out*. And if it want for the linc, marsh-mud, sea weed, salt sand, and what not, they've got here in such quantities, and a few Horton's to apply it, the whole country would *run out* and dwindle away to just such great, good natured, good-for-nothing, do-nothing fellows as this Nick Bradshaw, and his woolly horse, and woolless sheep, and crotless farm, and comfortless house, if indeed such a great wind rack of loose lumber, is worthy the name of a house.

Now, by way of contrast to all this, do you see that neat little cottage looking house on yonder humnock, away to the right there, where you see those beautiful shade trees. The house is small, but it is a *whole* house. That's what I call about right—flanked on both sides by an orchard of best grafted fruit—a tidy flower garden in front, that the galls see to, and a most grand sarce garden just over there, where it takes the wash of the buildings, nicely sheltered by that bunch of shrubbery. Then see them everlasting big barns—and by gosh, there goes fourteen dairy cows—as sleek as moles. Them flowers, honeysuckles and rose bushes, shows what sort of a family lives there,

just as plain as straws show which way the win blows.

"Them galls, an't 'tarnally racing round to quilt and husking frolics, their feet exposed in thin slip to the mud, and their honor to a thinner protector. No, no—take my word for 't—when you see gall busy about such things to home, they are what our old minister used to call "right minded." See things keep them busy, and when folks are bus about their own business, they've no time to go into mischief. It keeps them healthy, too, and cheerful as larks. I've a mind w'll 'light here, an view this citizen's improvements, and we shall b welcomed to a neat substantial breakfast, that would be worthy to be taken as a pattern by any farmer' wife in America.

We were met at the door by Mr Horton, wh greeted my friend Slick with the warm salutation of an old acquaintance, and expressed the satisfaction natural to one habitually hospitable, for th honor of my visit. He was a plain, healthy, intelligent looking man, about fifty, dressed as a farmer should be, with the stamp of a "HOMESPUN," legible upon every garment, not forgetting a very hand some silk handkerchief, the work throughout of hi oldest daughter. The room into which we wer ushered, bore the same stamp of neatness and comfort that the outside appearance indicated. A substantial homemade carpet covered the floor, and well filled book-case and writing desk, were in th right place, among the contents of which, I observed several Agricultural periodicals. I wa particularly struck with the scrupulously neat appropriate attire of the wife and two intelligent interesting daughters, that were busily engaged in the morning operations of the dairy. After partaking of an excellent substantial breakfast, M Horton invited us to walk over his farm, which the small, was every part in such a fine state of cultivation, that he did not even express a fear of "starving, unless the legislature did something, to keep the land from running out."

We bade adieu to this happy family, and proceeded on our journey fully impressed with the contrast between a good and bad farmer, and for my own part, perfectly satisfied with the manner th Mr Slick had taken to impress it indelibly upon my own mind.

Mr Slick seemed wrapped in contemplation o the scenes of the morning for a long time. A length he broke forth in one of his happy strains "The bane of this country, 'Squire, and indee of all America, is having TOO MUCH LAND—they *run over* more ground than they can cultivate—and crop the land year after year, without manure till it is no wonder that "it's *run out*." A very large portion of land in America has been "run out," by repeated grain crops, and bad husbandry until a great portion of this great country is in a fair way to be ruined. The two Carolinas and Varginny are covered with places that are "run out," and are given up as ruined, and there are a plagey site too many such places all over New England, and a great many other states. We havn't the surplus of wheat that we used to have, in the United States, and it 'll never be so plenty while there are so many Nick Bradshaw's in the country.

The fact is this, 'Squire, education is duceply neglected. True, we have a site of schools and colleges, but they an't the right kind. The same Nick Bradshaw has been clean through one on 'em, and 'twas there that he learnt that infernal

ty habit of drinking and smoking, that has been the ruin of him ever since. I would'nt give an old fashioned swing tail clock, to have my son go to college where he could'nt work enough to arn his wn living and larn how to work it right tu.

It actily frightens me, when I think how the land is worked and skinned, till they take the gizzard out on't, when it might be growing better every ay. Thousands of acres every year are turned out to barrens, while an everlasting stream of our folks are streaking it off "to the new country," where about half on 'em after wading about among the tadpoles, to catch cat fish enough to live on a ear or two, actily shake themselves to death with that everlasting cuss of all new countries, the fever and agur. It's a melancholy fact, 'Squire, tho' our cople don't seem to be sensible of it, and you nor may not live to see it, but if this awful robbin' of posterity goes on for another hundred years, as it has for the last, among the farmers, we'll be a nation of paupers. Talk about the legislature doing something, I'll tell you what I'd have them do. 'aint a great parcel of guide boards, and nail 'em up over every legislature, church, and school-house loor in America, with these words on 'em in great letters, "THE BEST LAND IN AMERICA, BY CONSTANT CROPPING, WITHOUT MANURE, WILL RUN OUT." And I'd have 'em, also, provide means to arn every child how to read it, cause it's no use to try to larn the old ones—they're tu sot in their ways. They are on the constant stretch with the and they have, and all the time trying to git more, without improving any on't. Yes, yes, yes, *too much and* is the ruin of us all.

Although you will find a thousand more good things among the writings of "The Clockmaker," I hope you will not look for a *literal* copy of the foregoing. And if ever this meets the eye of the writer of the "Saying and doings of Samuel Slick," beg him to excuse me for the liberty I have taken with his own language. I remain your agricultural friend.

SOLON ROBINSON.

Lake C. H. Ia. Oct. 12, 1838.

SELF EDUCATION.

The subjoined account of a most extraordinary and successful instance of self-education under great difficulties deserves to be inserted in every paper in the country. It shows what may be accomplished by industry and perseverance united with a strong determination and a passionate attachment to a good object. The learned Gifford, one of the best classical scholars in England, was an apprentice to the shoemaker's trade; and in his passionate study of mathematics slud himself up in hours stolen from sleep, in a garret, and worked out his problems with an awl on some of the waste leather of the shop. We design to revert to this subject again, but have at present only time for the annexed letter.

"It is a great mistake to suppose that it is necessary to be a professional man in order to have leisure to indulge a taste for reading. Far otherwise. I believe the mechanic, engineer, the husbandman, the trader, have quite as much leisure as the average of men in the learned profession. I know some men busily engaged in the different callings of active life, whose minds are well stored with various useful knowledge acquired from books. There would be more such men, if education in our common schools were, as it well might be, of a higher order; and if Common School Libraries,

well furnished, were introduced into every district, as I trust in due time they will be. It is surprising, sir, how much may be effected, even under the most unfavorable circumstances, for the improvement of the mind, by a person resolutely bent on acquisition of knowledge. A letter has lately been put into my hands, bearing date the 6th of September, so interesting in itself, and so strongly illustrative of this point, that I will read a portion of it; though it was written, I am sure, without the least view to publicity:

'I am the youngest (says the writer) of many brethren, and my parents were poor. My means of education were limited to the advantages of a district school, and those again were circumscribed by my father's death, which deprived me at the age of fifteen of these scanty opportunities which I had previously enjoyed. A few months after his decease, I apprenticed myself to a blacksmith in my native village. Thither I carried an indomitable taste for reading, which I had previously acquired through the medium of the society library—all the historical works in which I had at that time perused. At the expiration of a little more than half my apprenticeship, I suddenly conceived the idea of studying Latin. Through the assistance of an elder brother, who had himself obtained a collegiate education by his own exertions, I completed my Virgil during the evenings of one winter. After some time devoted to Cicero, and a few other Latin authors, I commenced the Greek; at this time it was necessary that I should devote every hour of daylight, and a part of the evening, to do the duties of my apprenticeship. Still I carried my Greek grammar in my hat, often found a moment, when I was heating some large iron, when I could place my book open before me against the chimney of my forge, and go through with *tupto, tuptois, tupei*, and, unperceived by my fellow apprentices, and to my confusion of face, with the detrimental effect to the charge in my fire. At evening I sat down unassisted, to the Iliad of Homer, twenty books of which measured my progress in that language during the evenings of another winter. I next turned to the modern languages, and was much gratified to learn that my knowledge of Latin furnished me with a key to the literature of most of the languages of Europe. This circumstance gave a new impulse to the desire of acquainting myself with the philosophy, derivation, and affinity of the different European tongues. I could not be reconciled to limit myself in these investigations to a few hours after the arduous labors of the day. I therefore laid down my hammer and went to New Haven, where I recited to native teachers in French, Spanish, German and Italian. I returned at the expiration of two years to the forge, bringing with me such books in those languages as I could procure. When I had read these books through, I commenced the Hebrew, with an awakened desire of examining another field; and by assiduous application, I was enabled in a few weeks to read this language with such facility that I allotted it to myself as a task to read two chapters in the Hebrew Bible before breakfast each morning; this and an hour at noon being all the time that I could devote to myself during the day. After becoming somewhat familiar with this language, I looked around me for the means of initiating myself into the fields of oriental literature, and to my deep regret and concern I found my progress in this direction hedged in by the want of requisite books. I began immediately to devise

means of obviating this obstacle; and after many plans, I concluded to seek a place as a sailor on board some ship bound to Europe, thinking in this way to have opportunities of collecting at different ports such works in the modern and oriental languages as I found necessary for this object. I left the forge at my native place to carry this plan into execution.

I travelled on foot to Boston, a distance of more than a hundred miles, to find some vessel bound to Europe. In this I was disappointed, and while revolving in my mind what steps next to take, I accidentally heard of the American Antiquarian Society in Worcester. I immediately bent my steps towards this place. I visited the hall of the American Antiquarian Society, and found there, to my infinite gratification, such a collection of ancient, modern and orientan languages, as I never before conceived to be collected in one place; and, sir, you may imagine with what sentiments of gratitude I was affected, when upon evincing a desire to examine some of these rich and rare works, I was kindly invited to unlimited participation in all the benefits of this noble institution. Availing myself of the kindness of the directors, I spent three hours daily at the hall, which, with an hour at noon and about three in the evening, make up the portion of the day which I appropriate to my studies, the rest being occupied in arduous manual labor. Through the facilities afforded by this institution, I have added so much to my previous acquaintance with the ancient, modern, and orientan languages, as to be able to read upwards of FIFTY of them with more or less facility."

I trust, Mr President, I shall be pardoned by the ingenious author of this letter, and the gentleman to whom it is addressed, (W. Lincoln, Esq. of Worcester,) for the liberty which I have taken, unexpected I am sure by both of them, in thus making it public. It discloses a resolute purpose of improvement under obstacles and difficulties of no ordinary kind, which excites my admiration, I may say my veneration. It is enough to make one who has had good opportunities for education, hang his head in shame."

Newton, Dec. 28th, 1838.

TO THE EDITOR OF THE N. E. FARMER,—

Sir—I have read with much pleasure the address of Mr Henry Stevens, delivered at the Cattle Fair in Vermont. It contains a good share of sound sense. It ought to be read by every man, woman and child in the U. S. A. It convinces me that it is full time for the people in America to be a little more patriotic by wearing American manufactured articles. Let us at once form societies in every town for the purpose of pledging each and all to appear on the 4th of July next in garments of American manufactures. Let the ladies in New England set the example, and I will be bound that the gentlemen will soon follow and join the same society. And on that day let the tables be spread in every town with domestic fruit and wine. Then may it be truly said that we can live independent from all nations.

ENCOURAGE ONE ANOTHER.

CORN CROP.—John Plaisted of Gardiner, Me. raised last summer, upon an acre and a quarter of ground, one hundred and sixty bushels of corn in the ear—equivalent to eighty bushels of shelled corn. So says the Maine Farmer.

**NEW ENGLAND FARMER,
AND GARDENER'S JOURNAL.**

BOSTON, WEDNESDAY, JANUARY 2, 1839.

NOTICE.

The subscriber, Commissioner of Agricultural Survey, has taken, for the winter, an office at No. 52 North Market street, over the office of the New England Farmer and Agricultural Seed store, where he will be happy to see his agricultural friends on the business of his appointment.

HENRY COLMAN.

Jan. 1, 1839.

THE CLOSE OF THE YEAR.

This number, though it does not complete our volume, yet closes our labors for the year eighteen hundred and thirty eight. We beg leave to offer to our readers our cordial congratulations that Divine Providence has hitherto spared their lives, and gives them the prospect of entering upon a new period of active duty and sanguine enterprise.

We are not disposed to moralize on this occasion farther than to remind our readers of the great truth that experience should serve as the guide of the future; and that to the sagacious and intelligent mind the lessons of memory are great and certain sources of discretion and wisdom. He is blind to his highest interests, he has yet to look for the substantial elements of future happiness and progressive improvement, who does not make the teachings of his experience the beacons to warn him of dangers which surround his path; and stimulants to increased activity in duty; mementoes of the rapid progress of time, and familiar instructors as to the true and best ends of life.

The inquisitive and reflecting mind becomes early impressed with the great truth that this world is not under the dominion of a blind and capricious chance, as though every man's fate or fortune were placed in a sealed paper in a lottery wheel promiscuously with the fortunes of all other men; and to be selected from thence in the form of a blank or a prize as some boy with his eyes bandaged may happen to draw this or the other number. There are fixed laws and principles active in the constitution of external nature, and in man's own physical, mental, and moral constitution, whose operation is determined, inexorable, and irresistible; which cannot be transcended, or violated, or neglected by man with impunity; and conformity to which is ultimately and always certain of its compensation.

The highest wisdom of man is to conform his purposes and actions to these laws; and thus make them available and subservient to his honorable and just designs. The greatest folly and madness is to act in defiance of them, a struggle in which man is sure of defeat and loss and ruin. The courtiers of king Canute in their debasing sycophancy assured him that even the ocean would bow to his command. To demonstrate their folly and meanness he ordered them to place his chair on the beach when the tide was at the ebb; and seating himself in it commanded his flatterers to stand by and see if at his edict the flood tide would refuse to come back at the proper hour. But it is not in any earthly despot, let him be ever so strongly entrenched in power, to put aside the course of nature, or with barriers mountain high to check the gentlest rise of the returning wave.

The Creator in his beneficence has given us sagacity and experience to reveal to us these great laws of our constitution. Let us be thankful that we can avail ourselves of their aid and power.

"There is a tide in the affairs of men,
If taken at the flood, leads on to fortune,
But if omitted, all our life is bound in shallows
And in miseries."

"Let's take the instant by the forward top
For we are old and our quick'et decay
The inaudible and noiseless foot of time
Steals, ere we can effect them."

H. C.

We have been favored by a friend with the following beautiful epitome of a sermon to which we had the pleasure of listening on Sunday afternoon. It was at the close of the year, and the preacher urged upon his hearers like Paul on his arrival near Rome, "to thank God and take courage," to look back with gratitude for the goodness, which has brought them thus far on their journey; and to enter upon a new year with courage and hope; a courage resting upon a consciousness of their own strength to do what God requires of them, and a hopeful and firm trust in his beneficent providence to order the future with a wise and merciful regard to their highest good.

SERMON FOR THE NEW YEAR.

"Take courage"—and the onward road—
Nor cast one lingering look behind;
Let hope be with thee—"trust in God,"
And thou that onward path shalt find
A way of happiness and peace,
Of present good—of future bliss.

Oh! think how many perils thou
Hast vanquished by thine energy,
And say if thou wilt meet them now
Determined they shall bend to thee,
Or if thou wilt prefer to live
Despondency's unpitied slave.

What though misfortune's heavy hand
Hath struck thee with unerring aim,
"Take courage"—for thou still dost stand
As rich, in all, but in the name,
As ere thy wealth—so long thy stay,
By one rude breath was swept away.

And what though sickness—ay, and death,
Have o'er thy threshold wildly trod,
Hear what the great apostle saith,
"Take courage—place thy trust in God,"—
Press onward—though thy heart be given
With pain and woe—press on to Heaven!

Thy home is Heaven!—then why should earth,
And earth-born cares, molest thy peace?
Let buoyant Hope, and gentle Mirth,
Thy soul sustain—thy joys increase.
From doubt and error, still keep free,
Nor listen to Despondency.

THE BOSTON CULTIVATOR

We see announced a new agricultural paper to be issued weekly; to be called the Boston Cultivator, and to be edited by the veteran farmer, Wm. Buckminster, Esq. of Framingham. Mr. Buckminster is the inventor of a corn planter, which performs its work admirably; and of a grass-seed sower, which bids fair to prove useful. Time will show what it is worth. He now proposes to sow the seeds of agricultural knowledge and improvement in the public mind. We sincerely wish him an abundant harvest; but whether he has any improved machinery for doing this is matter of inquiry for the Board of Education.

The most remarkable feature in the prospectus is the announcement that "the Boston Cultivator will contain a quarter more matter than the New England Farmer. We sincerely hope that the matter which it will contain will be three quarters better; and that of course will make the Boston Cultivator twice as good as the New England Farmer. Now as we mean to do our best with the N. E. Farmer, we hope we do not presume too much in predicting that the Boston Cultivator will be highly deserving of public patronage. We trust, however, we shall be pardoned for saying that this announcement sounds a little too much like the cracking of the whip of an opposition stage driver. The respectable Editor of the Boston Cultivator may be assured that we drive on opposition line; and shall not race with him; nor cross his path; nor steal the names from his passenger book, gentlemanly trick, which some persons may possibly have heard of; nor carry for less than he does for the sake of underbidding him. This stepping upon another man's shoulder, when a crowd are pressing into a door with a view of getting in advance, certainly marks a proficient in gymnastics; and is doubtless to be received with all due gratitude by the individual whose shoulder is used for a stepping stone to another man's enterprise. We take this occasion to inform the public that the New England Farmer does not contain as much by one quarter as a week's numbers of the New York Express or the New York Courier and Inquirer.

NOTICE.

An adjourned meeting of the Committee of the Mass Hort. Society on Fruits, will be held at the hall of the Society on Saturday, the 5th inst. at 10 o'clock A. M. for the purpose of awarding the premiums on fruits for the present year. A punctual attendance is requested.

For the Committee,

WILLIAM KENRICK, *Chairman.*

Jan. 1, 1839.

THE NEW ENGLAND FARMER AND GARDENER'S JOURNAL.

Volume Seventeenth,—commencing July 11, 1838
Back numbers can be furnished. Published by
JOSEPH BRECK & Co., No. 52, North Market
Street, Boston.

TO THE PUBLIC,—

The proprietors and publishers of the New England Farmer ask leave respectfully to present their claims upon the continued patronage of the agricultural community.

"Shall old acquaintance be forgot?" The New England Farmer was commenced sixteen years ago by the late lamented Mr. Fessenden. The project of a newspaper devoted exclusively to the concerns and interests of agriculture was at that time a project entirely novel in New England; the success of which was altogether questionable. He brought to it the treasures of his practical knowledge; his careful observation; his varied experience; and his persevering and exact inquiry. It soon rose into public esteem, and continued a favorite of the public until his death. The vast amount of learned, practical, and useful information contained in its volumes fully justify the patronage, which it has received; as it is confidently believed that in this respect no work has been more distinguished; and the same number of volumes is not to be found, which are richer in varied, sound, useful, and practical knowledge.

No pains or labor have been spared since the death of this excellent friend of the farming interest, this friend of every social interest, and every useful enterprise, to maintain the high character of this journal and to extend its usefulness. These efforts, from the approbation generally expressed, have not been without success; and this success is an encouragement to persevere and to redouble these efforts. This we promise; and respectfully ask therefore the continued patronage of a reading, a working, and intelligent public.

The proprietors of the N. E. Farmer would scrupulously avoid any invidious comparisons with other agri-

ditional papers, and desire to enter into no competition or rivalry; but they confidently believe that no paper of the same number of pages, within the last year, has presented a larger amount of original matter or of interesting practical intelligence; and their selections have been made from extensive facilities, both at home and abroad; and as much judgment as they can exercise.

They will continue to do their best. The Commissioner of Agricultural Survey will render all the aid consistent with his public engagements, and make it the vehicle of all his communications with the public. The various agricultural and horticultural societies in the state will present all their reports through its pages; and some of the best farmers in New England will continue to enrich its columns with their valuable contributions.

The proprietors hold in utter disdain all mean arts, intrigues or misrepresentations, or fallacious promises with a view to obtain patronage. These would be wholly inconsistent with the principles and character which the paper has always maintained.

The Farmer hitherto has been eminently a family paper. Its pages have never been stained with a statement, intimation, or expression, which would raise a blush of shame on the cheek of modesty, or infuse a poison in the corrupted mind. We pledge ourselves that in all these respects it shall not forfeit its high reputation.

Having been the pioneer of agricultural improvement and intelligence in the State and country, and, without exception, if it had the power, to drive others from a field, it respectfully asks only a reasonable portion of the harvest of which it sowed the seed, and in regard to which has performed its full share in the cultivation of the crop.

The New England Farmer and Gardener's Journal is published weekly, in quarto form, making a handsome volume of 416 pages with an index, at two dollars and by cents, in advance, or three dollars at the close of the year.

Editors of papers with whom we exchange will do us favor to publish this communication.
Boston, Dec. 26, 1838.

BRIGHTON MARKET.—MONDAY, Dec. 24, 1838.
Reported for the New England Farmer.

At Market 570 Beef Cattle, 75 Stores, 3800 Sheep, and 360 Swine. About 130 Beef Cattle unsold.

PRICES—Beef Cattle.—Last week's prices were hard-supported for a like quality. A few better cattle are at market, and brought about our highest quotations of last week. We quote, First quality, \$7 50, second quality, \$6 75 a \$7 25. Third quality, \$5 25 a 6 50.

Sheep.—"Dull." We notice the sale of lots at \$2 50, 2 62, \$2 67, \$2 84, \$2 92, \$3 12, \$3 33 and \$3 50.

Swine.—No lots to peddle were sold and there is no demand. One entire lot was last week sold for 5 1-4 or sows, and 6 for barrows. At retail, 6 1-2 a 8.

MONDAY, Dec. 31, 1838.

At Market, 530 Beef Cattle, (including 130 unsold at week,) 100 Stores, 4000 Sheep, and 200 Swine; all 16 Swine were reported last week. About 150 Beef Cattle unsold.

PRICES—Beef Cattle.—Last week's prices were for most of the qualities not supported. We quote, First quality, \$7 25 a \$7 50. Second quality, \$6 50 a \$7 00. Third quality, \$5 25 a \$6 50.

Sheep.—"Dull." We notice the sale of lots at \$2 50, 2 75, \$2 80, \$3 00, \$3 25 and \$3 33.

Swine.—No lots were sold to peddle and there appeared to be no demand for lots. A few were retained at 8.

Statement of Brighton Market, for 1838.

25,830 Beef Cattle, sales estimated at	\$1,317,330
9,573 Stores	" " 315,909

MULBERRY TREES.

WM. PRINCE & SONS will make sales of trees and cuttings of the genuine Chinese Morus Multicaulis, Morus Expansa, Alpina, Bronssa, Canton and other varieties, deliverable to the purchasers at such period in the Spring, as is convenient to them, and will enter into contracts accordingly.

Prices and terms for the trees and cuttings will be forwarded to all who may apply for them by mail, as well as prices of Silk Worms' Eggs, Mulberry Seeds, &c. The Multicaulis trees are remarkably vigorous, and as we first imported the genuine tree, purchasers are sure of obtaining the genuine kind. It is from this cause and from the great attention paid by them, that the trees that they have sold, have given universal satisfaction.

Dec. 20, 1838. 2m Flushing, near New York.

CARTER'S GUIDE BOARD BRANDS.

A very useful article for country towns; they consist of an Alphabet of letters, with a series of figures, hands, &c. of suitable size, (forty pieces in number) well packed in a box. A set of brands would probably serve a town for a century, and supply the necessary guide boards. The letters are burnt into the board, with a neat brand and may be read at a great distance and will endure until the board perishes. Every town should be supplied with a set of these brands, and if used in their poor houses, the guide boards would cost merely nothing.

TULIPS, RANUNCULUSES, PINKS AND VIOLAS.

S. WALKER of Roxbury, offers for sale in beds, or in such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland and England, to which yearly additions have and will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superb Tulips, will do well to make a selection for themselves when the bulbs are in bloom, (about the 1st of June.) The prices which conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices, in the country where the bulbs were raised, and cheaper than the like quality can be imported.

Tulips in beds of from 30 to 100 rows, containing from 210 to 700 bulbs, or by the dozen, 100 or 1000.

Viola grandiflora—Pansy, or Heartsease. Upwards of 2000 superb varieties will be exhibited and offered for sale, when the Tulips are in bloom.

Ranunculuses—fine mixtures, at from \$2 to \$5 per 100. *Pinks*—fine named varieties, from 25 cents to \$1 each. For particulars apply to S. WALKER, or to JOSEPH BRECK & CO. eow

WANTED.

A man and his wife, to go to Virginia, on a silk farm, some knowledge of the cultivation of the mulberry will be necessary. To such a person liberal encouragement will be given. Apply at the N. E. Farmer Office, 51 & 52 North Market Street. Jan. 2, 1839.

MORUS MULTICAULIS.

Constantly on hand in small quantities, at the lowest market price. Orders directed to Messrs. Winslip, Brighton, Mass. or left at N. E. Farmer Office, will receive immediate attention. The plants will be safely packed and forwarded to any part of the country.
Dec. 19.

WANTED.

No. 51 of Volume 14 of the N. E. Farmer for which a fair price will be given at the New England Farmer Office.

BONE MANURE.

The subscriber desires to inform his friends and the public that he has been in the Bone business more than ten years, and has spent much time and money to ascertain how bones may be converted to the best use, and is fully satisfied that they form the most powerful stimulant that can be applied to the earth as a manure. He offers for sale ground bone at a low price, and is ready to receive orders for any amount, which will be promptly attended to.

Orders may be left at my manufactory, near Tremont road, in Roxbury, or at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, Boston.
Sept. 20. NAHUM WARD.

MISCELLANEOUS.

(From the Salem Register.)

We have been requested to publish this morning the following lines, written by a young sailor, some years ago, who has since found a watery grave:

THANKSGIVING DAY.

The fire burns bright in my father's hall,
And the family circle draw round at his call,
His table is loaded with luxury's store,
His wine cup and flagon are both running o'er.
My table's a cotton bale; wine I have none,
My heat I derive from the rays of the sun;
On salt beef and biscuit my hunger I stay,
For I'm on the wide ocean on *Thanksgiving Day*.

The young and the gay have met in the hall,
And manhood and beauty both vie at the ball;
They merrily dance to the brisk viol's sound,
While the bright beams of health are gleaming around.
No music have I but the North-western gale,
No dance, save the dance of the waves as I sail;
From the smiles of the fair I am far, far away,
On the broad bosomed ocean, on *Thanksgiving Day*.

The priest in the temple has opened the book,
And offered thanksgivings and prayers for his flock;
Loud anthems ascend, and sweet songs of praise,
As the full choir their voices in harmony raise.
But I have a temple more splendid by far,
Its ceiling bespangled with many a star;
With its azure girl wreath, and its sea-girt floor,
A place for a creature his God to adore;
For the voice of his children is heard when they pray,
In the midst of the Ocean, on *Thanksgiving Day*.

A GREAT DISCOVERY.

One of the greatest inventions of the age, is that, of recent date, of machinery for the preparation of flax for spinning, after the manner in which cotton is spun. We have been favored with a circular from the "Delaware Manufacturing Company," setting forth the prospects and designs of that company. It is engaged in the manufacture at this time of the lint or "short staple," which is the prepared state of the flax for the spinner or manufacturer. The advantages of the "short staple" system for manufacturing flax are stated as follows:

1. There is no loss of fibre, as no tow is required to be taken out—all the lint is converted to linen of the finest quality, [by the old mode, of brackling, spinning with the fingers, &c., there was a loss of from three quarters to seven-eighths of the original weight.]
2. The expense of labor required to convert it into cloth, is reduced to one-tenth the former cost.
3. The expense of bleaching in the flax [as it is done on the new system] is much less than the cloth, [according to the old,] and is not so liable to be injured in the process.
4. The operation of bleaching in the cloth takes from it a considerable weight of glutinous matter, and consequently leaves the goods open, and the thread soft twisted. On the other hand, by the short system, the glutinous matter is extracted before it is spun, and the thread will of course be in much more solid.

With the circular we received a specimen of

the prepared flax. The texture resembles cotton somewhat, and looks to be what it professes, prepared for spinning. It would greatly astonish our kind old grandmother spinsters, whose greatest delight is to be seated by their little "flax wheels," with the lump of flax wound upon bowed sticks at its head, resembling the old fashioned Dutch cap. They would no doubt have an involuntary sigh at the prospect of the abolishment of that important machine in the economy of the homestead, the little buzzing flax wheel.

This invention is to the North what the cotton gin was to the South. Our valleys too are getting raising flax, and we may congratulate Virginia upon this interesting discovery. Revolutions are taking place daily—not of blood—but in the arts, the sciences and in morals. A few years may perhaps set aside all our discoveries and customs as antiquarian, and inutile.—*Richmond Compiler*.

ARTIFICIAL SHOWERS.—Stand back Animal Magnetism, and all the rest of the train of humbugs, and give precedence to Mr Espy, who has petitioned Congress to be appointed *Commissioner of the Storms*. With all the gravity of a genius seeking a patent for a new washing machine, Mr Espy, of Philadelphia, has sent a memorial to the Senate, representing that he is the inventor of a machine with which he can raise a thunder cloud at a moment's notice; aye, and tap it too; and then extract from it such a plentiful rain as shall not only moisten the dry and parched earth, but swell the Ohio river to such a magnitude that it shall be navigable for steamboats at all seasons of the year. But the mortal who has such a tremendous power in his hands, is a fool to beg patronage from any body. Let him station his machine at the door of the Capitol some day, and just as the members of Congress are passing out after an adjournment, "pelt them heartily" with rain, and they will soon beg of him to accept any favors they may have to give. But he needs no aid from government. So great is the number of people who are dissatisfied with the laws and operations of nature, that he would never lack employment, if he can only perform what he promises. A friend of ours has got on his premises a beautiful site for a mill; a large basin seems to have been scooped out purposely for a pond; and he often laments that it is not furnished with even a small stream of water. The manufacturers, too, will be ready to contract with him for a constant supply of water at all seasons of the year. Then, again, there are country towns that wish to be converted into sea-ports. Why the man who can construct a good navigable river from Worcester to Long Island Sound, or Narraganset Bay, so that steamboats can come from the ocean up into the Heart of the Commonwealth, is terribly beside himself to be caught laying at the doors of the Capitol, Gulliver among Lilliputians, begging like a sick girl for a cup of water. Out on such an arrant impostor; his own actions belie his professions!—*Worcester Palladium*.

THE BOSTON ALMANAC FOR 1839.—This sterling little volume, edited by S. N. Dickinson, and published by Thomas Groom—is just issued from the press and for sale at the bookstores in this city. It is a very servicable pocket Companion to a citizen in the country as well as a citizen in Boston. As an annual, it is inferior to none in its usefulness, as well as its typographical appearance. It con-

tains, besides the information furnished by almanacs generally, a large amount of information highly interesting to all. The labor and care of collecting such an amount of information must be immense and we hope the public will duly appreciate it usefulness.

HARD LABOR AND LONG LIFE.—A young man at the age of eighteen years in 1714, was condemned to the galleys in France, on account of high crime, for the long period of one hundred years, which was probably intended by the Judge to confine him for life. Remarkable as it may appear, in 1814, the man being in perfect health, after an unremitting series of hardships of an entire century, was discharged, being exactly one hundred and eighteen years old. On visiting Lyons, he laid claim to an estate which belonged to his family. M. Bertholin, the possessor, who considers his title undoubted, by the advice of his own lawyer, paid the old heir 4,500*l.* to settle the business and free his property from embarrassment.

LIBERTY ON BOTH SIDES.—A ragged military officer, and a still more badly legged negro, met at the bar of a public house, where the following conversation took place: "Cuff, you're a good honest fellow, and I like to compliment a man what lived an honest life if he is black; you shall take a glass of drink with me Cuff." "Well, captain, I's berry dry, so I won't be ugly 'bout it; son niggers is too proud to drink with militia officer but when he's sober he jis as good as nigger—'pecially when de nigger's dry."

Tulips, Ranunculus, Anemones, Auriculas, Carnations, Peonies, Pinks, and Geraniums.

THOMAS GROOM, of Walworth, near London, England, by a pointment Florist to Her Majesty Queen Victoria, begs respectfully to call the attention of his friends and the admirers of flowers in America generally, to his extensive collection of the above flowers, which from his having been very successful in their cultivation this season he can offer at moderate prices. He would particularly recommend to the persons about commencing the growth of the Tulip (which in England is becoming very fashionable) the under conditions in beds, as it is by far the cheapest mode of purchase them.

Tulips arranged in beds with their names	
First Class.	
A bed of 30 rows containing 210 bulbs including several	the newest varieties, - - - - - £
A bed of 15 rows, - - - - -	25 guineas
A bed of 60 rows, - - - - -	£17 1
Second Class.	
A bed of 30 rows including many fine sorts, - - -	£
A bed of 15 rows do - - - - -	£17 1
A bed of 60 rows do - - - - -	£17 1
Tulips not arranged.	
100 Superfine sorts with their names from - - -	£7 7s to £
Superfine mixtures, from - - - - -	7s 6d to 2
Ranunculus's.	
100 Superfine sorts, with their names from £3 3s to £5	
Superfine mixtures, from - - - - -	5s to 21s per 1
Anemones.	
100 Superfine sorts with their names, - - - - -	£9 1
Superfine double mixtures, from - - - - -	10s 6d to 21s per 1
Auriculas.	
25 Superfine sorts with their names, - - - - -	£3 13s
Catalogues with the prices of the other articles may had on application.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at 3*o* per ann payable at the end of the year—but those who pay will sixty days from the time of subscribing are entitled to a deduction of 5*o* cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS.

17 SCHOOL STREET. BOSTON.

SUPPLEMENT TO THE NEW ENGLAND FARMER, AND GARDENER'S JOURNAL.

PUBLISHED BY JOSEPH BRECK & CO., NO. 52 NORTH MARKET STREET, (AGRICULTURAL WAREHOUSE.)

BOSTON, WEDNESDAY EVENING, JANUARY 2, 1839.

**NEW ENGLAND
AGRICULTURAL WAREHOUSE
AND
SEED STORE,
NOS. 51 & 52 NORTH MARKET STREET,
BOSTON.
JOSEPH BRECK & CO.**

We take the liberty to forward to the subscribers of the N. E. Farmer, this sheet, containing extracts from our Annual Catalogue of Garden Seeds and Implements, which we trust will prove acceptable to all. The catalogue in question has been published with considerable expense and trouble, and we desire to give every farmer an opportunity to possess it. It contains 80 pages. Those who wish for it in full, can have a copy by applying to the New England Seed Store and Agricultural Warehouse.

In connexion with our Seed and Implement Store, we have a garden of twenty acres, where we raise, under our own inspection, Garden, Flower Seeds, and Herbaceous Plants. From the long experience the senior partner of the house has had in this department, we flatter ourselves that we shall be able to furnish seeds of genuine sorts, unmixed by other varieties. As it would be impossible to raise every variety of seed pure, in the same garden, part of our supplies are raised by responsible growers, in whom we have perfect confidence, and whose grounds are open at all times for our inspection.

Such Seeds as cannot be raised successfully in our own country, we import from the best European houses.

We are thus enabled to furnish a full assortment, and of the best quality, Seeds of every description.

We shall be able, at all times, to execute orders from the British Provinces, West Indies, or Southern States, with promptness and at satisfactory prices. Dealers in Seeds, and Country traders, supplied, at wholesale and retail, on the best terms.

Persons who wish for seeds to sell again can be supplied at a liberal discount, with boxes of

various sizes, containing a complete assortment of Seed, mostly used in a kitchen garden, neatly put up in small papers, labelled and sealed, ready for retail, with printed directions on each package, for its management; and every sort warranted to be of the very best quality.

GRASS SEEDS at wholesale and retail at the lowest market prices.

FRUIT, AND ORNAMENTAL TREES, SHRUBS, GRAPE VINES, and all Nursery productions, furnished at one day's notice, and when requested can be packed in mats or boxes so as to be safely sent to Europe or any part of America.

VEGETABLE SEEDS.

ARTICHOKE.

ASPARAGUS. Large Early Dutch—Large White Reading—Gravesend—Battersea.

PEANS.

ENGLISH DWARFS. Broad Windsor—Early Mazagan—Green Nonpareil—Horse—Sword Long pod.

KIDNEY DWARF, OR STRING. Early China Dwarf—Early Quaker—Early Mohawk—Early Yellow Cranberry—Early Yellow Six Weeks—Large White Kidney Dwarf—Red Cranberry Dwarf—Marrow, or Thousand to One—White Cranberry Dwarf.

POLE OR RUNNING. Large White Lima—Small White Lima, or Saba—Large Scarlet Runners—Large White Dutch Runners—White Dutch Case Knife—Red Cranberry—White Cranberry—Yellow Cranberry—London Horticultural, (very fine.)

BETT. Early Blood Turnip Rooted—Early White Scarkey—Long Blood Red—Yellow Turnip Rooted—Mangel Wurtzel—French Sugar, or Amber Beet.

BORECOLE.

BROCCOLI. Early Purple—Early White—Large Purple Cape—White Cape, or Cauliflower—Brimstone, or Portsmouth.

BRUSSELS SPROUTS.

CABBAGES. Early York—Early Low Dutch—Early London Battersea—Early Sugar Loaf—Yellow Savoy—Large Cape Savoy—Green Gloze Savoy—Large Late Drumhead—Large Bergen, or Great American—Large Scotch—Large Green Glazed—Red Dutch (for pickling)—Turnip rooted, (below ground)—Turnip rooted, or Arabian, (above ground.)

CARAWAY.

CARROT. Early Horn—Altringham—Purple—Long Orange.

CALIFLOWER. Early Dutch—Large Late.

CELEERY. Large White Solid—Large White Hollow—Rose colored Solid—New Silver Giant—Celeriac, or Turnip rooted.

CHERVIL.

CITHIVES, or CIVES.

CITRON.

CORN SALAD, or VETTICOST.

CRESS. Curled, or Pepperglass—Broad-leaved Garden—Water.

CUCUMBER. Early Frame—Early Short Prickly—Early Green Cluster—Long White Spined—Long Green Turkey—Long White Turkey—Long Green Prickly—Ghirkin, or West India, (for pickling.)

EGG PLANT. Purple, (best for culinary purposes)—White, (ornamental)

ENDIVE, or SUCCORY. Green Curled—White Curled—Broad-leaved Batavian.

GARDEN BURNET.

GARLICK SETTS.

INDIAN CORN. Early Canadian—Early Jefferson—Tuscarora—Golden Sioux—Large Flint White—Sweet, or Sugar, Raripite, (best for boiling)—Nonpareil, or Pearl, (curious and beautiful.)

KALE. Green curled Scotch—Sea.

LEEK. Large Scotch—London.

LETTUCE. Early curled Silesia—(early)—Royal Cape, (very finest, large tender heads)—Tennisball, or Rose, (early, small heads)—Large Drumhead—Magnum Bonum Cos—Green Head, or Saxony Cabbage—Large Imperial—Brown Dutch—Ice Cos—White Cos, or Leaf—Green Cos—Hammersmith.

MARTYNSIA.

MELON.

MUSK MELONS. Persian, Greenflesh—Nutmeg, do.—Green Citron, do.—Pine Apple, do.—Pomegraate, or Musk, (small)—Minorco—Large Cantaloupe.

WATER MELONS. Long Carolina—Large Round—Apple-seeded, (early.)

MUSTARD. White or English—Brown.

NASTURTIUM.

OKRA.

ONION. White Portugal—Large Red—Yellow—Silver Skinned.

PARSLEY. Curled, or double—Dwarf Curled, (very much curled)—Hamburg, or Large rooted.

PARSNIP. Large Dutch swelling—Guernsey.

PEAS. Earliest Dwarf Peas. (finest early)—Early Washington, or True May, 2 feet—Early Double-blossomed Frame, 3 feet high—Early Frame, 2½ feet—Early Golden Hotspur, 3 feet—Early Carlton, 3 feet—Cedo Nullis, 2 feet, (extra variety)—Dwarf Blue Imperial, 1½ feet—Dwarf Scymetar, (new variety)—Knight's Dwarf Marrow, 2½ feet—Bishop's Early Dwarf, 1 foot—Dwarf Spanish, or Fan, 1 foot—Dwarf Blue Prussian, 3½ feet—Dwarf Sugar, (entire pods) 3 feet—Tall Crooked-pod Sugar, (entire pods) 4 feet—Matchless, or True Tall Marrowfat, 5 feet—Marrowfat, 3½ feet—Knight's Tall Marrow, 6 feet—Woodford's New Tall Prolific, 5 feet.

PEPPER. Long, or Cayenne—Squash, (thick skin)—Cherry or West India.

PUMPKIN. Large Cheese—Connecticut Field—Finest Family—Mammoth.

RADISH. Early Frame—Early Short-top Scarlet, (finest)—Early Long Salmon—Purple Short-top—Cherry, or Scarlet Turnip rooted—Violet-colored Turnip rooted—White Turnip rooted—Long White Summer, or Naples—Fack Fall, or Spanish, (for winter use).

RHUBARB.

SALSIFY, or VEGETABLE OYSTER.

SKIRRET.

SCORZONERA.

SORREL.

SPINACH, or SPINAGE. Round-leaved, or Summer—Prickly-leaved, or Fall—New Zealand.

SQUASH. Early Orange—Early Scollop Bush—Early Long Warded—Canada Crook-neck—Commodore Porter's Valparaiso—Long Yellow Crook-neck—Acora—Early Lemon.

TOMATO.

TURNIP. (Those distinguished with a * are best for family use.) Early white Dutch*—Early Garden Stone*—White Flat, or Gloze—Green Round, or Green Top—Red Round,* or Red Top—Swan's Egg*—Large English Norfolk—Long Tankard, or Hanover*—Long Yellow French*—Yellow Maltese,* concave at bottom—Yellow Aberdeen—Yellow Stone,* or Orange—Yellow Swedish, Russia, or Ruta Baga—Dale's New Hybrid.

AGRICULTURAL IMPLEMENTS.

THE Agricultural Warehouse has been established in Boston about seventeen years, and has become so extensive and of so much importance to the community, as to induce the proprietors to continue and extend it in all its various branches for the accommodation of experimental and scientific Farmers, by the introduction of new and useful implements of Husbandry, and to furnish the practical farmer with the best tools for his business. An establishment of this kind not only serves the above purpose but as a deposite for the inventive artisan to place his articles for sale. The proprietors do not hesitate to say, that among the great variety of articles on hand at this establishment, many are found far superior in form and construction and better adapted to the purpose for which they are intended than any which have been in use in this country.

It was remarked by Sir John Sinclair that the introduction of new Agricultural implements into a district is often a matter of the greatest difficulty, owing to the ignorance, the prejudice and obstinacy of farm laborers, many farmers, therefore, very absurdly retain their old implements though convinced of their inferiority, rather than sour the temper of their laborers by attempting to introduce new ones.

In many cases, however, they have succeeded; by attention and perseverance, and by rewarding their laborers, many new implements have been brought into general use.

WILLIS'S STATIONARY HORSE POWER, AND CORN CRACKER ATTACHED.

WILLIS'S PORTABLE HORSE POWER.

Willis's Improved Horse Power, for driving all kinds of machinery such as Cider Mills, Winnowing Mills, Straw and Hay Cutters, Threshing Machines, Corn Shellers, Grindstones, &c.

FARNHAM'S IMPROVED PATENT GRATER CIDER MILL.

The improvement in this mill is in grinding, or rather grating the apples very fine, so that all the juice is pressed out; and produces a greater quantity of liquor from the same quantity of pomace. The above mills are in extensive operation, and very much approved of.—They will grind two bushels of apples per minute, and no way liable to get out of order.

With little attention it can be made one of the best vegetable grinders for grinding or cutting food for animals.

CIDER SCREWS.

Patent Cast Iron Cider Screw. This is a new article and far surpasses any thing of the kind ever introduced; they are much more powerful than the wooden screws.

HALE'S IMPROVED HORSE POWER.

This Horse power is calculated to propel any kind of machinery, or Agricultural implement, such as Threshing Machines, Cider Mills, Corn Sheller, Grindstones, &c. &c.; is very simple in its construction, occupies but the small space of nine feet by two, and can easily be transported from one place to another, the improvements made on this Horse Power, render it the most superior article, for this purpose, now in use.

HALE'S PATENT THRESHING MACHINE.

The best machine now in use, will thresh from 75 to 100 bushels per day, in the best possible manner.

GREEN'S PATENT STRAW CUTTER.

Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent features of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made

and put together very strongly. It is therefore not so liable as the complicated machines in general use, to get out of order.

BOYNTON'S PATENT DOUBLE CYLINDER STRAW CUTTER.

This is a new and useful article for cutting fodder for horses or cattle. The advantage of this machine is the ease and expedition with which it cuts hay, straw, or corn stalks; doing the work at the rate of two bushels per minute, with the greatest ease.

WILLIS'S IMPROVED PATENT VERTICAL HAY AND STRAW CUTTER.

This Straw and Hay Cutter which has been in use for several years, is found from experience to be the best Machine, for the purpose that has been invented. They are made of the best materials and workmanship, constructed on the best mechanical principles. The knives being placed in such a manner, as to operate as a drawing stroke; cuts very free and easy, and not liable to get out of order; will readily cut thirty bushels per hour; it is fed and worked by one man, which is not the case with many other machines.

The Straw Cutter is a machine well worth the attention of every farmer, and should be in common use with every person feeding stock, and from the great improvement and simplicity of the machines now in use the work is done with great ease and facility. It is a subject of great regret to every friend of the agricultural interest, that these machines are not in more general use. Every farmer who is disposed to use his fodder to the best possible advantage, and preserve his animals in the best health, in all cases cuts their fodder. For further explanation of the profits and advantages arising from cutting fodder, the following statement is given:—
Mr Benjamin Hale's account of the savings made by the use of Straw Cutters, employed to cut Hay and Straw as Fodder for Horses.

Mr Hale is proprietor of a line of stages running between Newburyport and Boston. He says—
The whole amount of hay purchased from April 1, to Oct. 1, 1816, (six months,) and used at the stage stable, was

\$25 per ton (the lowest price at which hay was purchased in 1816) \$300 00
 from Oct. 1, 1816, to April 1, 1817, whole amount of hay and straw purchased for, and consumed by the same number of horses, viz.
T. cwt. qrs. lbs.
 Straw 1 13 3 10 \$160 32
 Hay 13 14 1 00 \$350 00
 \$510 23
 Deduct on hand April 1, 1817, by estimation, four tons more than there was Oct. 1, 1816, at \$25 per ton, \$100 00 410 23

Saving by the use of the Straw Cutter, four months of the last six months, or the difference in expense in feeding with cut fodder and that which is cut.

Whole amount of hay used for the horses of the Salem stage, twenty-five in number, from April 1. to Oct. 1, 1816. viz. at thirty dollars per ton (the lowest price in Salem)

Whole amount consumed by the same number of horses, from Oct. 1, 1816, to April 1, 1817.
T. cwt. qrs. lbs.
 Straw 15 13 0 0 \$187 80
 Hay 2 15 0 0 \$100 00
 267 80

Saving in using chopped fodder five months, 391 20
 Total saving in using the straw cutter nine months, viz. at Newburyport, four months, 359 77
 At Salem five months, 391 20

Total, \$780 97

The members of the Board of Trustees of the Massachusetts Agricultural Society, to whom the above account was communicated by Mr Hale, were informed by that gentleman, that he used no more grain from Oct. 316, to April, 1817, than was used from April 1816 to Oct. 1816.

REMARKS.—There is not only much saving and gain in cutting fodder, when hay is low, but the animals is kept in better health, more particularly old horses, and such as have been injured in their wind.

WILLIS'S IMPROVED GUILLOTINE STRAW CUTTER,

A very simple and effective machine, no way liable to get out of order. Cuts hay, straw, or corn stalks with perfect ease, and at a rapid rate; a firm, good and cheap machine for small work, say four to six horses. It is just the article that has been wanting to take the place of the old fashioned Dutch Cutter.

EASTMAN'S CYLINDRICAL KNIFE STRAW AND HAY CUTTER.

These machines, made by Eastman of Baltimore, are constructed on a large and extensive scale, and are designed for very large and extensive plantations or farms. They are calculated to be used by hand or horse power, and are very efficient and powerful.

COMMON DUTCH AND HAND CUTTING MACHINES.

These machines which are in very common use, and known to every practical farmer, are considered good machines for small farms and stables.

POPE'S THRESHING MACHINE.

Pope's Threshing Machine was invented by the late Joseph Pope, Esq. of Hallowell, Me., and has been in successful operation in different parts of the country for many years. It is found to operate well for all kinds of grain, and is well adapted for cleaning rice.

PLOUGHS.

This implement, one of the oldest and most useful employed on a farm, has undergone of late years, a wonderful change in all its most essential parts, and has been greatly improved. The Cast Iron Plough is now most generally used among the best farmers, and considered decidedly the best. Among the different ploughs now made of cast iron, Howard's stand unrivalled. They have been used at the different Cattle Shows, and Ploughing Matches, and have in all cases been approved by them. At the Brighton Cattle Show at the exhibition in October, 1832, they received the premium of \$10, awarded as being the best plough presented.

Extract from the Report of the Committee.

"The Ploughs were all of cast iron, and by six of the most approved manufacturers. The one by Mr Charles Howard of Hingham, was a superior implement, considerable improvements having recently been made by him, in making the mould board much longer than usual, and swelling the breast of the share, so as to make every part bear equally, by which means the plough runs more true and steady, is always free from carrying forward any earth, and wears perfectly bright; and being made on mathematical principles, he informed the committee he could make the different sizes always the same."

JOHN PRICE,
 EBENEZER HEATH,
 JOHN BAKER, 3d.

The duty of awarding a premium "To the Plough which shall be adjudged best of all those used at the Ploughing Match," devolved on the two committees, and they agreed unanimously to award to Mr Charles Howard of Hingham, for his new and improved Plough, \$10.

GORHAM PARSONS,
Chairman of Single Teams.
 JOHN PRICE,
Chairman of Double Teams.

SIDE HILL PLOUGH. This plough, for which a premium was given at Brighton, is found to be a very great improvement on the ploughs now in use, for working on side hills. The mouldboard is so constructed as to shift on each side, as may be required, by turning on the underside of the plough as the team turns at each end of the furrow.

HOWARD'S IMPROVED DOUBLE MOULD-BOARD PLOUGH. This plough is well calculated for furrowing out land—splitting hills—ploughing between corn, potatoes, and vegetable cultivation, to great advantage. A great labor saving machine, saves nearly all the hoeing of corn or potatoes.

PLOUGHSHARES.

Wrought and Cast Iron Ploughshares of all sizes fitted and prepared in such manner, as to be at all times ready and fit for immediate use.

CULTIVATORS.

HOWARD'S IMPROVED FIXED AND EXPANDING CULTIVATORS, of all sizes. The cultivator is an implement that is coming into very general use in all parts of the country, and serves in a great measure in lieu of hoeing. The teeth are so constructed as to raise the ground, and leaves it very light and free for cultivation, and at the same time destroys the weeds.

These Cultivators are best adapted to free and easy ground, for running through rows of corn, potatoes and vegetables of all kinds, and used in the cultivation of Hops, instead of the plough and hoe, and are found far superior to either. It is likewise well adapted to harrow in grain and grass seed; and for the many uses to which this implement may be applied, it must be considered one of the most valuable and useful tools that are used on a farm, and is coming into very general use.

This certifies that I have used Howard's Cultivator, and find it a much better article to work among corn and potatoes, than any machine that I have ever tried; it clears the weeds between the rows, much more effectually than either plough or harrow, and saves a great deal of labor.

BENJ. WHEELER.

HAND CULTIVATOR.

This is a very useful article for going between vegetables, in order to keep down the weeds. A man, with one of these machines, will do more work than four or five with the hoe.

ENGLISH SCARIFIER.

One of the most useful articles to be found on a farm. It is used on grass ground to admit the air and moisture to the roots of the grass. They are very much esteemed in the old countries.

TRANSPLANTING TROWEL AND FORK.

This little garden implement is indispensable, particularly to a lady in her flower garden, being useful in every instance in transplanting and removing plants of every description.

DAVIS'S IMPROVED PATENT DIRT SCRAPER.

This road or dirt scraper invented by Shadrach Davis, is used to great advantage in removing dirt or gravel, more particularly, in stony lands, from the peculiar construction of the points, which are similar to those of a plough point. They enter the ground very free and easy, fill and discharge themselves, and are easily managed by one horse or yoke of oxen. Ploughing is not necessary where these shovels are used.

We the undersigned hereby certify that we have used Davis's patent plough pointed road and dirt scraper, and we consider it a great improvement on the common road scraper, and can, with confidence recommend it to the public, as being superior to any implement of the kind we have ever used, particularly in sandy and stony land, being so constructed as to load itself without the use of ploughing, which is common in using the old fashioned dirt scraper; we consider it one of the greatest labor saving implements to the road maker that can be used, and as such, we fully recommend it to the public.

ABM. WASHBURN, *Bridgewater.*

HENRY S. PACKARD, *North Dartmouth.*

BRADFORD HOWLAND, *South Dartmouth.*

CHANDLER'S IMPROVED DOUBLE HARROW.

This Harrow is so constructed as to be in two parts, and joined together by hinges on two straight centre pins, so that one part can be raised and swung over on the other half as occasion requires. Its advantage over the common Harrows is, that it is less liable to be stopped, as one side may be elevated or turned to a perpendicular position, while the other side proceeds horizontally; it may thus be drawn nearer to rocks, trees, &c. It will likewise better adapt itself to ridges, hollows, and uneven land.

HARROW TEETH of all sizes, steel or iron.

CARRIAGE LIFTER.

Or levers, for raising wagons, carts, or carriages of all kinds, or for raising loads, pressing goods, &c.; being a small handy implement it can be taken in a carriage or travelling, and found very convenient and handy for the purpose. Carriage wrenches are likewise very convenient and handy travelling companions, and should always be at hand.

LOCK'S GARDEN AND FIELD ROLLERS.

It is found by our best practical and scientific farmers that grass seed, sown in the fall requires to be rolled in the spring as soon as the ground is in fit order, otherwise the small plants, being but slightly rooted, leave up by the frost and suffer perhaps total destruction. Among the many uses to which the roller may be applied, none perhaps would be more valuable than rolling grass land in the spring. Fall sown grass seed and grain are liable to be winter killed, or destroyed by frost; but when rolled in, there will be less danger either from frost or drought, if the seed is well covered with a harrow and the ground is well rolled. If the ground is very mellow, the large sized wooden roller is preferred, as it presses the ground more direct, and renders the surface more regular and even, and moves easier. For garden rollers or gravel walks, the stone or iron rollers are preferred.

The Rollers vary in price, according to the size.

GAULT'S PATENT CHURN.

Which has been in use for several years, is the most approved and convenient churn now in use. The particular advantage is the ease and facility with which it can be worked. From its quick and powerful motion it will produce the greatest quantity of butter from the same quantity of cream; is easy to clean and no way liable to get out of order.

MR. FESSENDEN, *Editor of the New England Farmer.*

Sir—In answer to the inquiry respecting the Gault's Churn which I purchased at the Agricultural Warehouse, I give it as my decided opinion, that they are the best churns I have ever seen in use. They are very convenient to keep clean, bring the butter very easy, and require not more than 15 to 20 minutes to do a churning.

Respectfully yours,

B. REYNOLDS.

Sharon, June 15, 1834.

STONE CHURNS. A small article well calculated for small dairies.

PHILADELPHIA BARREL CHURNS, of different sizes.

GARDEN REELS AND LINES.

These reels and lines are not only very convenient for the gardener in laying out his borders, beds and alleys, but absolutely necessary where he intends to preserve due order and regulation.

CHEESE PRESSES.

SHAKER'S IMPROVED SELF-GOVERNING CHEESE PRESSES. These Presses are so constructed that they govern and regulate themselves, without weights, and are far the best presses now in use.

LEAVITT'S IMPROVED CHEESE PRESS, which is so constructed that seven or fourteen pounds weight will press any common sized cheese.

SELF CHEESE PRESSES.

A new and useful article lately improved by the Shakers. It needs no weights, as the lift of the cheese is sufficient to press itself. It is so constructed that it puts on just such weight as is required for a large or small cheese.

CHEESE HOOPS—different sizes.

CHEESE CLOTHS.

DITCHING KNIVES AND SPADES.

These Knives are calculated for cutting ditches, trimming low swamp land, and found very useful for the purposes.

SCYTHES.

TAFT'S PATENT CAST STEEL CONCAVE SCYTHES, are found to be much superior to any other scythe now used. From their peculiar form they have a very free and easy running stroke and being concave present a thin edge. They are easily ground and kept in good order. From the peculiar construction of these scythes the edge is always left true in the middle of the scythe.

ALSO,

Metcalf's improved double set, agricultural Scythes, likewise Phillips, Messer & Colby's, all first rate scythes.

REVOLVING HORSE RAKE.

The Revolving Rake which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake.

COMMON HORSE RAKE.

The great objection to this Rake is in having to stop the horse to unload, when a sufficient quantity of Hay is collected for a winrow, it taking at least three times as long to unload as it does to load, and although this Rake costs much less in the first place than the Revolving Rake, it is much the dearest article in the end.

HAY AND MANURE FORKS.

No one implement has undergone so thorough an investigation and improvement, as the Hay and Manure Fork. Since the first introduction or use of these articles, great improvement has been made in the form of them; and the quality of the steel from which they are made. Among the most approved Manure Forks in use, are those of Willis' cast steel, manufactured from one piece, in which no welding is necessary. These forks have been in common use for twelve years. They are so well tempered as to have that degree of elasticity, that they discharge the manure with the greatest ease; they are in no way liable to clog or foul, and are very strong and durable. Also, N. B. Harlow's Improved Shear Steel Manure and Hay Forks, splendid articles.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they

have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one.

SCOTT KEITH & CO.'S IMPROVED CAST IRON PUMP.

This pump was invented by Jesse Reed of Bridgewater, and proves to be the most simple and best constructed pump that is in use, being made of Cast Iron, which is considered the best metal which water can pass through, is very durable and cheap. It has metal boxes so constructed, that in raising the handle, the lower box or valve is opened, and the water let off, which prevents its freezing. They are so plain and simple in their construction, that they can be put up or taken down by any common workman, and no way liable to get out of order. They are attached to lead pipes, and are well calculated for all domestic purposes.

PATENT BRASS SYRINGE.

Willis' Improved Patent Brass Syringe for watering plants, grape vines and small trees. This syringe may be used on all occasions when watering is necessary or for using a solution prepared for the purpose to prevent mildew on grape vines.

DOUBLE ACTING FORCE PUMP.

This pump is constructed of the most durable materials and of any capacity required. It stands upright like a common pump, and while it draws the water from a well with the requirement of but moderate power, a medium size will force it in a steady stream at the rate of over 60 gallons a minute to the roof of a four story house.

ROLLER FORCING PUMP.

This pump is intended as a substitute for the Iron and Copper pumps now in use, for wells, cisterns, &c., throwing from 10 to 30 gallons per minute, and occupying but little space. It is attached to an iron frame so that it is easily secured in any situation required. It is so made as to let off the water to prevent its freezing, and by attaching a pipe, the water can be forced to any part of the house or building, and in case of fire, will answer a good purpose, as a fire engine.

HALE'S IMPROVED ROTARY PUMP.

This pump which is a great improvement upon the various rotary pumps now in use, is very plain and simple in its construction and no way liable to get out of order; but works with great ease and facility, throws a constant and regular stream by a very simple operation of a crank, and is calculated for all kinds of domestic purposes, as well as for Green Houses, Factories, &c.

LIGHTNING RODS AND GLASS BLOCKS.

From the repeated, and almost daily occurrences, which happen from the effect of lightning, occasioning death and destruction of much property, it is a matter of surprise that every farmer does not have attached to his dwelling house and barn, a lightning rod and guarded in the best possible manner,—which is done by passing the rod through glass blocks, which are constructed for the purpose.

POMROY'S PATENT SPRING STAPLE,

For securing horses. The improvement in this staple, is such, that if the horse is cast, or in any way entangled he can disengage and free himself. Many fine and valuable horses are lost for the want of this self regulating staple.

SAYLE'S GARDEN ENGINES.

A splendid article, will throw a constant stream of water to the distance of 50 or 60 feet, with great force, and in case of fire would be a good substitute for a fire engine. The most perfect article for the purpose ever introduced.

HORTICULTURAL CHESTS,

With a complete set of Garden tools, a very useful article for ladies or gentlemen; the tools are all fitted to one handle, and the handle screwed together so that all the tools may be packed into the chest, and locked up; every lady or gentleman that is fond of gardening should be furnished with a Tool Chest.

WILLIS'S IMPROVED DOUBLE OPERATING CORN SHELLER.

The most perfect and substantial article that has been introduced for the purpose; this machine can be worked by hand, or any other power, and will shell two ears of corn at the same time; they are highly approved by all that have used them.

PATENT CORN SHELLER.

A Corn Sheller is one of the most convenient and labor saving implements that the practical farmer has in use. Various machines for this purpose have been invented. It can be used in all cases for large or small sized ears. It is very simple in its construction, and durable in its operation, and no way liable to get out of order; one man can work it to good advantage, tho' a man to turn and a boy to feed it, works it much better than one alone. They are so light and portable, as to be easily removed from place to place, and one machine will serve for several families or even the inhabitants of a small town.

WILLIS'S SEED SOWER.

This machine is calculated to sow all kinds of Garden seed, such as Mangel Wurzel, Ruta Baga, Turnips, Carrots, Parsnips, Onions, Beets, &c. being simple in its construction, and certain in its operation. The saving of seed in this implement is quite sufficient to pay the cost of it in one season, and the seed is sown much more regular and even.

WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible man-

ner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing his seeds, and have it done in a much better manner; it opens the furrow, drops the seed, covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurzel, Turnips, Carrots, Frets, Parsnips, Onions, &c. It is highly recommended by a great number of persons who have used it the present season.

PATENT FIRE PROOF WROUGHT IRON SALAMANDER SAFES.

These Safes have been several times tested, and found to answer completely, the purpose for which they are designed.

In order to test their resistance of heat, one was placed in a Furnace in Wall Street, New York, and a blast kept up for 18 hours sufficient to melt the stones of which the furnace was constructed, consuming 72 bushels charcoal, and the safe with its contents, came out completely safe and uninjured. Also a trial was made in State street, Boston, by placing in the same furnace, one of Scott's Asbestos safes, one of Gaylor's Double, and one of the Salamander safes; and a blast applied to each, consuming 150 bushels charcoal, and the result was, that Scott's Asbestos, and Gaylor's Double safes, were completely destroyed with their contents in less than two hours, and the Salamander remained in the furnace 14 hours, and then came forth uninjured, and turned out the books and papers in a perfect state.

NEW PATENT WINNOWING MACHINE.

Hulmes' Improved Winnowing Machine is one of the best that is in use. It is very plain and simple in its construction, and very powerful in its operation; it is well calculated for cleaning all kinds of grain, and may be applied to many other purposes—such as cleaning rice, coffee, &c.

VEGETABLE CUTTER.

Willis's Improved Vegetable Cutter for cutting large & small roots. The great objection to all other machines, is their cutting the roots into slices, which makes almost impossible for the cattle to get hold of them; this machine with a little alteration, cuts them into large & small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to ten bushels of roots per minute. No farmer should be without one of these machines.

WILLIS'S IMPROVED SUGAR MILL.

Willis's Improved Sugar Mill for grinding the cane and other sugars; one of the best labor saving machines that has been introduced for our friends in a grocery business. It will grind with ease a box of or hundred pounds of sugar in twenty minutes, leaving the grain of the sugar in the most perfect order for tanning.

HARRIS'S IMPROVED PAINT MILL.

This Mill can be used by hand, horse or any other power and works to great advantage. From the very simple and simple manner of its construction it is easily taken to pieces and cleaned. It is used with great facility, and is considered one of the best and most useful mills in use.

BARK AND PLASTER MILLS.

THE TROY BARK AND PLASTER MILLS. These mills are altered and much improved from the old fashioned mill which has been in use for many years.

BROOKS'S PATENT SILK SPINNING MACHINE.

Brooks's silk spinning and reeling machine, is found to be a very simple and easy operating machine, and yet one of the most perfect that has been invented for the purpose of reeling and twisting silk from the cocoons, and manufacturing it into sewing silk. By the different arrangements of this machine, it will operate upon a single or double thread, as may be required, and prepare it for twisting or weaving. Experience has fully proved that by uniting the filaments of silk as they are drawn from the cocoons, wet in their natural glutinous substance before they are dry, the thread is more firm, smooth and stronger. The simplicity of the machine, and the very easy way in which it is used, brings it within the comprehension and capacity of any person to use it.

WILLIS'S IMPROVED SAUSAGE FILLER.

This machine which is intended for filling sausages is one of the most convenient and expeditious things for the purpose that can be conceived of. One man will do more in preparing and filling sausages with this machine, than ten men can in the old manner of working them.

DUTCHER'S PATENT COOKING STOVE.

For burning wood or coal, is one of the most economical and perfect articles for family use yet introduced, it having an open grate and yet answering all the purpose for cooking. The grate is made so to rise or fall, that when the fire gets low the grate can be raised directly under the boilers. It has been highly recom-

mended by a great number of persons who used them last season.

GRINDSTONES, ON FRICTION ROLLERS.

Grindstones of different sizes hung on friction rollers and moved with a foot treader, are found to be a great improvement on the present mode of hanging grindstones. The ease with which they move upon the rollers, renders them very easy to turn with the foot, by which the labor of one man is saved, and the person in the act of grinding can govern the stone more to his mind by having the complete control of his work. Stones hung in this manner are becoming daily more in use, and wherever used give universal satisfaction. The rollers can be attached to stones hung in the common way.

FAMILY HAND MILL.

Willis's Improved Patent Family or Plantation Mill, calculated for grinding corn, coffee, &c.; has a small balance wheel which regulates its operation, and causes it to work fine and easy.

SPRINGER'S HORIZONTAL MILL is for the same purpose.

CORN AND COB CRACKER

This Mill, which is calculated for grinding cob and corn together, is found to make the best provender and the most economical food for fattening hogs or horses. It is so constructed as to be used with a common grist mill or separate, as circumstances may require, and may be worked by a single horse or any other power. From thirty to forty bushels per hour have been ground in these mills.

EDGING AND TRIMMING KNIVES.

These Knives are used for cutting and trimming grass flats, borders, &c. They are found to be one of those handy and useful tools which every gardener should have.

BEE HIVES.

Dr Thatcher's Improved Bee Hive, for affording the most effectual security against the ravages of the Bee-moth, and keeping the bees dry and comfortable during winter. The honey can be taken without destroying the bees.

SMITH'S SUBSOIL PLOUGH, IMPROVED.

The most astonishing effects appear to have been produced by the invention of the above machine. It is an necessary accompaniment to draining, and is also well calculated to make the most unproductive soil, fertile and profitable. By breaking the subsoil without bringing it to the surface, renders it pervious both to air and water, and after a few years, by a greater depth of ploughing, the subsoil is mixed with the upper and is found to be so completely changed in its nature as to be capable of producing every species of grain.

MAJOR WHEELER'S PARING PLOUGH, IMPROVED.

The object of this plough is to take off the top of meadow and peat lands, for the purpose of reclaiming them. From one to two acres can be pared in a day, and in the course of two or three days, if the weather is pleasant, it will be dry enough to burn. In this way meadow or peat land may be made to produce large crops of hay, &c.

CAST STEEL AND COMMON AXES.

This article among our farmers, is one of the most useful implements ever invented. Underhill's cast steel axes, have been considered the best, and most approved in form and shape, and are warranted in every respect to be one of the best quality. They are finished in the most perfect manner, and ground to a fine smooth cutting edge.

Hatchets, cleavers, and many other tools, made by workmen, and different finished in the same manner.

FESSENDEN'S PATENT LAMP TEA KETTLE.

This lamp apparatus for heating water, &c. has been found very useful in small families, and for such persons as may wish to have Tea, Coffee, Eggs, or any other small articles boiled, without the trouble of making a wood or coal fire.

ROGERS' PATENT METALLIC HONE AND STRAP,

A superior article for Razors, Penknives, &c. &c.

STAMPS.

Of all descriptions, for marking and branding the farmer's tools, of which every farmer who is in the habit of lending and accommodating his neighbors and friends, as all farmers are and must be, should have every tool marked with his name. This prevents the loss of many tools, and much inquiry and trouble among neighbors.

CARTER'S GUIDE BOARD BRANDS.

A very useful article for country towns; they consist of an alphabet of letters, with a series of figures, hands, &c. of suitable size, (forty pieces in number,) well packed in a box. A set of brands would probably serve a town for a century, and supply the necessary guide boards. The letters are burnt into the board, with a neat brand and may be read at a great distance and will endure until the board perishes. Every town should be supplied with a set of these brands, and if used in their poor houses, the guide boards would cost merely nothing.

PRUNING CHISELS AND SAWS.

Of all the implements that are used on a farm, there are none used to more profit and advantage than the Pruning Knife and Saw. Too many of our fruit and ornamental trees are suffered to run to wood; in this circumstance, we have less fruit and of an inferior quality.

SWITCHING BILL.

This article is much used in England in pruning and clearing hedges, and is a good article as a substitute for the pruning saw and chisel, and can be used with more expedition.

FRUIT SHEARS,

Attached to a pole, are for the purpose of taking fruit from the extreme branches of trees or such parts as are not to be come at conveniently in any other way. They are found to be very convenient and useful. They are likewise used for taking off scions, &c.

FRUIT GATHERERS.

A very useful article for gathering fruit, more especially for a gentleman or lady who wishes to collect a few articles of fruit for the table.

CRANBERRY RAKE.

A very useful article for gathering Cranberry. One person with a rake will do more than six or eight can in the same time, gathering by hand.

CURRY COMBS, AND BRASS TEETH CATTI CARDS.

Patent and common curry combs, and cards with brass teeth—no stock farm should ever be kept without a good supply of these articles and constant use be made of them.

- Axe Handles.
- Post Augers.
- Pick Axes.
- Post Spoons.
- Stable Door Hasps.
- Iron Bars.
- Churn Drills.
- Hand Drills and Hammers.
- Steel and Iron Bull Rings.
- Trace and Ox Chain.
- Hoe and Trunk Chains.
- Chains for Securing Cattle.
- Flagg's Brick Press.
- Iron Castings.
- Hay Pullers
- Friction Rollers.
- Wagons, Ox & Horse Carts.
- Wheel Barrows.
- Hand Engines.
- Watering Pots.
- Improved Safety Lamps.
- Barn and Hand Lanters.

FRESH GARDEN SEEDS.

JOSEPH BRECK & Co. would inform their friends and the public that they have received a full assortment of Garden Seeds, and offer them to their customers, with the full assurance that they will prove satisfactory, being all of the growth of 1848. Also, a great variety of Flower and Herb Seeds numerous to mention.

ROHAN POTATOES.

We have received a supply of this celebrated and productive potato; and offer them for sale at the N. England Agricultural Warehouse, and Seed Store, No. 51 and 52 North Market street.

CHINESE TREE CORN,

We can furnish the Chinese Tree Corn, described by Grant Thorburn of New York as being a very productive and valuable variety.

J. BRECK & CO

NEW ENGLAND FARMER,

AND GARDENER'S JOURNAL.

PUBLISHED BY JOSEPH BRECK & CO., NO. 52 NORTH MARKET STREET, (AGRICULTURAL WAREHOUSE.)

VOL. XVII.]

BOSTON, WEDNESDAY EVENING, JANUARY 9, 1839.

[NO. 27.

AGRICULTURAL.

We do not know how to give more pleasure than by the republication of the following, which came to us in the form of a pamphlet. It is by the author of "Twice Told Tales," whose pen ought not to be suffered to get dry. It is imaginative, instructive, patriotic, beautiful. How it puts to shame the garbage in the form of rhyme which news carriers have been accustomed to circulate on New Year's Day.

THE SISTER YEARS.

Being the *Carrier's Address to the Patrons of the Salem Gazette, for the first of January, 1839.*

Last night, between eleven and twelve o'clock, when the Old Year was leaving her final foot-prints on the borders of Time's empire, she found herself in possession of a few spare moments, and sat down—in all places in the world—on the steps of our new City Hall. The wintry moonlight showed that she looked weary of body, and sad of heart, like many another wayfarer of earth. Her garments having been exposed to much foul weather and rough usage, were in very ill condition; and as the surly of her journey had never before allowed her to take an instant's rest, her shoes were so worn as to be scarcely worth the mending. But, after nudging only a little distance further, this poor Old Year was destined to enjoy a long, long sleep. I forgot to mention, that when she seated herself on the steps, she deposited by her side a very capacious band-box, in which, as is the custom among travellers of her sex, she carried a great deal of valuable property. Besides this luggage, there was a folio book under her arm, very much resembling the annual volume of a newspaper. Placing this volume across her knees, and resting her elbows upon it, with her forehead in her hands, the weary, bedraggled, world-worn Old Year heaved a heavy sigh, and appeared to be taking no very pleasant retrospect of her past existence.

While she thus awaited the midnight knell, that was to summon her to the innumerable sisterhood of departed years, there came a young maiden treading lightly on tip-toe along the street, from the direction of the Railroad Depot. She was evidently a stranger, and perhaps had come to town by the evening train of cars. There was a smiling cheerfulness in this fair maiden's face, which bespoke her fully confident of a kind reception from the multitude of people, with whom she was soon to form acquaintance. Her dress was rather too airy for the season, and was bedizened with fluttering ribbons and other vanities, which were likely soon to be rent away by the fierce storms, or to fade in the hot sunshine, amid which she was to pursue her changeful course. But still she was a wonderfully pleasant looking figure, and had so much promise and such an indescribable hopefulness in her aspect, that hardly anybody could meet her without anticipating some very desirable thing—the consummation of some long sought good—

from her kind offices. A few dismal characters there may be, here and there about the world, who have so often been trifled with by young maidens as promising as she, that they have now ceased to pin any faith upon the skirts of the New Year. But, for my own part, I have great faith in her; and should I live to see fifty more such, still, from each of those successive sisters, I shall reckon upon receiving something that will be worth living for.

The New Year—for this young maiden was no less a personage—carried all her goods and chattels in a basket of no great size or weight, which hung upon her arm. She greeted the disconsolate Old Year with great affection, and sat down beside her on the steps of the City Hall, waiting for the signal to begin her rambles through the world. The two were own sisters, being both grand daughters of Time; and though one looked so much older than the other, it was rather owing to hardships and trouble than to age, since there was but a twelvemonth's difference between them.

"Well, my dear sister," said the New Year, after the first salutations, "you look almost tired to death. What have you been about during your sojourn in this part of Infinite Space?"

"Oh, I have it all recorded here in my Book of Chronicles," answered the Old Year, in a heavy tone. "There is nothing that would amuse you; and you will soon get sufficient knowledge of such matters from your own personal experience. It is but tiresome reading."

Nevertheless, she turned over the leaves of the folio, and glanced at them by the light of the moon, feeling an irresistible spell of interest in her own biography, although its incidents were remembered without pleasure. The volume, though she termed it her Book of Chronicles, seemed to be neither more nor less than the SALEM GAZETTE for 1838; in the accuracy of which journal this sagacious Old Year had so much confidence, that she deemed it needless to record her doings with her own pen.

"My whole history," continued she, "is here set down by a very able and faithful secretary of mine; and, now that I have no further use for his services, I would recommend you to employ him on the same footing!"

"What are his politics?" inquired the New Year, with an air of grave deliberation, and a dubious expression of countenance. "Not Whig, I trust."

"Whig—to the back bone," answered her elder sister; "and whatever your own opinions may be, his are not very likely to change. But, at any rate, his narratives of fact may pretty safely be depended on, and you may gain from this volume a compendious summary of my efforts and achievements, my good and evil fortune; and, in some degree, of my thoughts and feelings throughout my earthly career. Men will not look back to me as a very distinguished Year, in any part of the world."

"What have you been doing in the political way?" asked the New Year.

"Why my course here in the United States," said the Old Year—"though perhaps I ought to blush at the confession—my political course, I must acknowledge, has been rather vacillatory, sometimes inclining towards the Whigs—then causing the Administration party to shout for triumph—and now again uplifting what seemed the almost prostrate banner of the Opposition; so that historians will hardly know what to make of me, in this respect. But the *Loco Focos*!"

"I do not like these party nicknames," interrupted her sister, who seemed remarkably touchy about some points, "Perhaps we shall part in better humor, if we avoid any political discussion."

"With all my heart," replied the Old Year, who had already been tormented half to death with squabbles of this kind. "I care not if the names of Whig or Tory, with their interminable brawls about Banks and the Sub Treasury, Abolition, Texas, the Florida War, and a million of other topics—which you will learn soon enough for your own comfort—I care not, I say, if no whisper of these matters ever reaches my ears again. Yet they have occupied so large a share of my attention, that I scarcely know what else to tell you. There has indeed been a curious sort of war on the Canadian border, where blood has streamed in the names of Liberty and Patriotism; but it must remain for some future, perhaps far distant Year, to tell whether or no those holy names have been rightfully invoked. Nothing so much depresses me, in my view of mortal affairs, as to see high energies wasted, and human life and happiness thrown away, for ends that appear oftentimes unwise; and still oftener remain unaccomplished. But the wisest people and the best keep a steadfast faith that the progress of mankind is onward and upward, and that the toil and anguish of the path serve to wear away the imperfections of the Immortal Pilgrim, and will be felt no more, when they have done their office."

"Perhaps," cried the hopeful New Year—"perhaps I shall see that happy day!"

"I doubt whether it be so close at hand," answered the Old Year, gravely smiling. "You will soon grow weary of looking for that blessed consummation, and will turn for amusement (as has frequently been my own practice) to the affairs of some sober little city, like this of Salem. Here we sit, on the steps of the new City Hall, which has been completed under my administration, and it would make you laugh to see how the game of politics, of which the Capitol at Washington is the great chess-board, is here played in miniature. Burning Ambition finds its fuel here; here Patriotism speaks boldly in the people's behalf; and virtuous Economy demands retrenchment in the emoluments of a lamp-lighter; here the Aldermen range their senatorial dignity around the Mayor's chair of state, and the Common Council feel that they have liberty in charge. In short, human weakness and strength, passion and policy, man's

tendencies, his aims and modes of pursuing them, his individual character, and his character in the mass, may be studied almost as well here as on the theatre of nations; and with this great advantage, that, be the lesson ever so disastrous, its Lilliputian scope still makes the beholder smile."

"Have you done much for the improvement of the city?" asked the New Year. "Judging from what little I have seen, it appears to be ancient and time-worn."

"I have opened the Railroad," said the elder year, "and half a dozen times a day, you will hear the bell (which once summoned the Monks of a Spanish Convent to their devotions,) announcing the arrival or departure of the cars. Old Salem now wears a much livelier expression than when I first beheld her. Strangers ramble down from Boston by hundreds at a time. New faces throng in Essex street. Railroad hacks and omnibuses rattle over the pavements. There is a perceptible increase of oyster-shops, and other establishments for the accommodation of a transitory diurnal multitude. But a more important change awaits the venerable town. An immense accumulation of musty prejudices will be carried off by the free circulation of society. A peculiarity of character, of which the inhabitants themselves are hardly sensible, will be rubbed down and worn away by the attrition of foreign substances. Much of the result will be good; there will likewise be a few things not so good. Whether for better or worse, there will be a probable diminution of the moral influence of wealth, and the sway of an aristocratic class, which, from an era far beyond my memory, has held firmer dominion here than in any other New England town."

The Old Year, having talked away nearly all of her little remaining breath, now closed her Book of Chronicles, and was about to take her departure. But her sister detained her a while longer, by inquiring the contents of the huge band-box, which she was so painfully lugging along with her.

"These are merely a few trifles," replied the Old Year, which I have picked up in my rambles, and am going to deposit, in the receptacle of things past and forgotten. We sisterhood of Years never carry anything really valuable out of the world with us. Here are patterns of most of the fashions which I brought into vogue, and which have already lived out their allotted term. You will supply their place, with others equally ephemeral. Here, put up in little China pots, like rouge, is a considerable lot of beautiful women's bloom, which the disconsolate fair ones owe me a bitter grudge for stealing. I have likewise a quantity of men's dark hair, instead of which, I have left grey locks, or none at all. The tears of widows and other afflicted mortals, who have received comfort during the last twelve months, are preserved in some dozen of essence bottles, well corked and sealed. I have several bundles of love-letters, eloquently breathing an eternity of burning passion, which grew cold and perished, almost before the ink was dry. Moreover, here is an assortment of many thousand broken promises, and other broken ware, all very light and packed into little space. The heaviest articles in my possession are a large parcel of disappointed hopes, which, a little while ago, were buoyant enough to have inflated Mr Lauriat's balloon.

"I have a fine lot of hopes here in my basket," remarked the New Year. "They are a sweet-smelling flower—a species of rose."

"They soon lose their perfume," replied the

sombre Old Year. "What else have you brought to insure a welcome from the discontented race of mortals?"

"Why, to say the truth, little or nothing else," said her sister, with a smile—"save a few new Annuals and Almanacks, and some New Year's gifts for the children. But I heartily wish well to poor mortals, and mean to do all I can for their improvement and happiness."

"It is a good resolution," rejoined the Old Year; "and, by the way, I have a plentiful assortment of good resolutions, which have now grown so stale and musty, that I am ashamed to carry them any further. Only for fear that the city authorities would send constable Mansfield, with a warrant after me, I should toss them into the street at once. Many other matters go to make up the contents of my band-box; but the whole lot would not fetch a single bid, even at an auction of worn out furniture; and as they are worth nothing either to you or anybody else, I need not trouble you with a longer catalogue."

"And must I also pick up such worthless luggage in my travels?" asked the New Year.

"Most certainly—and well if you have no heavier load to bear," replied the other. "And now, my dear sister, I must bid you farewell, earnestly advising and exhorting you to accept no gratitude nor good will from this peevish, unreasonable, inconsiderate, ill-intending and worse-behaving world. However warmly its inhabitants may seem to welcome you, yet, do what you may, and lavish on them what means of happiness you please, they will still be complaining—still craving what it is not in your power to give,—still looking forward to some other Year for the accomplishment of projects which ought never to have been formed, and which if successful, would only provide new occasions of discontent. If these ridiculous people ever see anything tolerable in you, it will be after you are gone forever."

"But I," cried the fresh-hearted New Year, "I shall try to leave men wiser than I find them. I will offer them freely whatever good gifts Providence permits me to distribute, and will tell them to be thankful for what they have, and humbly hopeful for more; and surely, if they are not absolute fools, they will condescend to be happy, and will allow me to be a happy Year. For my happiness must depend on them."

"Alas for you, then, my poor sister!" said the Old Year, sighing, as she uplifted her burden. "We grand children of Time are born to trouble. Happiness, they say, dwells in the mansions of Eternity; but we can only lead mortals thither, step by step, with reluctant murmurings, and ourselves must perish on the threshold. But hark! My task is done."

The clock in the tall steeple of Dr Emerson's church struck twelve; there was a response from Dr Flint's, in the opposite quarter of the city; and while the strokes were yet dropping into the air, the Old Year either fitted or faded away—and not the wisdom and might of Angels, to say nothing of the remorseful yearnings of the millions who had used her ill, could have prevailed with that departed Year to return one step. But she, in the company of Time and all her kindred, must hereafter hold a reckoning with mankind. So shall it be, likewise, with the maidenly New Year, who, as the clock ceased to strike, arose from the steps of the City Hall, and set out rather timorously on her earthly course.

"A happy New Year!" cried a watchman, eyeing her figure very questionably, but without the least suspicion that he was addressing the New Year in person.

"Thank you kindly!" said the New Year; and she gave the watchman one of the roses of hope from her basket. "May this flower keep a sweet smell, long after I have bidden you good bye."

Then she stepped on more briskly through the silent streets; and such as were awake at the moment, heard her foot-fall, and said—"The New Year is come!" Wherever there was a knot of midnight roisterers, they quaffed her health. She sighed, however, to perceive that the air was tainted—as the atmosphere of this world must continually be—with the dying breaths of mortals who had lingered just long enough for her to bury them. But there were millions left alive, to rejoice at her coming; and so she pursued her way with confidence, strewing emblematic flowers on the door-step of almost every dwelling which some persons will gather up and wear in their bosoms, and others will trample under foot. The Carrier Boy can only say further, that, early this morning, she filled his basket with New Year's Addresses, assuring him that the whole city, with our new Mayor, and the Aldermen and Common Council at its head, would make a general rush to secure copies. Kind Patrons, will not you redeem the pledge of the NEW YEAR?

We have unusual pleasure in presenting the readers of the N. E. Farmer with the agricultural address of Josiah T. Marshall of Watertown, N. Y. He speaks of himself in the beginning of the address as a mariner and shipmaster. It has almost grown into a proverb that such men always make good farmers. The habits of command, of intelligent and exact observation, of order and discipline, and energy and perseverance under difficulties, elements of character which are of indispensable importance in the successful management of a ship and its crew and the prosecution of an important voyage, qualify a man for the management of a farm, enable him to avail himself of the best aid and counsel, and in some good measure supply the want of experience. The address indicates a reflecting and cultivated mind. It is true, sensible, instructive, and eloquent. H. C.

AN ADDRESS.

Delivered before an Agricultural Meeting at Plossis, Jefferson county, N. Y., on the 26th September, 1858. By JOSIAH T. MARSHALL.

By the partiality of your Executive Committee, I have been called upon to address you at this time. The occasion on which we have assembled, is one of novelty and interest. So far as we know, the meeting of this day may be deemed an experimental one. County Fairs have been common throughout our land. But to-day a *Town*—a new town, just in the infancy of its being—has sent its inhabitants to mingle in an Agricultural Festival. We have come together to see each other's faces; to amicably compete for prizes on the products of our labor; to seek improvement and pleasure. How fitting the time in which we meet! The harvest is past, the summer is ended, and through the abounding goodness of the Great Creator, peace and plenty are within our borders.

I have felt embarrassment, my friends, in selecting a topic for your contemplation at this time. It

s not my design to attempt to instruct you on matters pertaining to practical agriculture. I am not competent to do this, even if it were my wish. Some three years ago I came among you ignorant of the details of farming. My boyhood was passed in a crowded city, and the most I then knew of Agriculture was in the results which were brought to the market place. My early manhood was spent upon the ocean, and while you were familiar with the use of the plough, the flail, and the scythe; and when before you was falling the primeval forest, and the wilderness was made "to sing" for you, I was ploughing the main, familiar with the duties and toils of the seafaring life. While he among you who could swing most hardily the axe, and could plough the straightest furrow was entitled to the highest honor, I was among those who deemed him the most worthy of repute who could the quickest pass the weather earing; and who, when the mighty midnight tempest was on the ship, could keep her steadfast to her course. In short, you are at home, on a farm, while I should be a stranger. This difference in our early experience bids me venture no advice on practical farming.

I come, then, to discuss this simple topic, viz; THE DIGNITY OF THE AGRICULTURAL OCCUPATION.

On this point I may dwell with some little claim upon your attention; for to my mind there is no clearer proposition, than that the Farmers of this nation are a class which sustains a position in our social system far higher than any of the other secular occupations. For many reasons they may be justly deemed the Glory, the Strength, the Excellency of Society.

Let us cursorily notice a few things which go to make up the dignity of which I speak.

Its Numerical Strength.—It is a fair calculation that seven-eighths of the population of civilized countries belong to this class; the other eighth occupying the ranks of commerce, of manufactures, and of the liberal pursuits. It is estimated that in this country five-sixths of the people are agriculturists. This shows us that farmers are the great strength of society; indeed, that they are society itself; holding in their hands the majority of wealth, of physical power, of political and social influence. It is clearly within their option to mould all our institutions, as may please them, to control the ballot box, and make our national and state laws. No one other class of citizens can compare with them in point of numbers. They are the mass of the people, the bone and sinew, the great Constituent Element of the body politic.

The Antiquity of this occupation is another element of its intrinsic dignity.

There is a peculiar interest attached to that which has come down to our time from other and distant ages. This is well. We may very properly pay deep respect to that which is ancient. Aged institutions, like aged men, claim our veneration. We love the old clock that ticked behind the door of our forefathers, and the moth-cankered Bible into which they looked for the words of eternal life. The "old oaken bucket which hangs in the well," whence the men of other days have quaffed, has a sort of sacredness in our estimation by reason of its age. Oh, yes; even the venerable oaks under which we sat in the spring time of our days, are looked upon with a feeling approaching to awe. And, as I before said, this is well. In the rage for innovation, when the cry is, "who will show us any new thing?" it is no trifling

mercy that there is in our natures an instinctive veneration for things that are ancient. This serves as a bulwark, feeble indeed though it be, against the Vandal warfare which the present seems to wage upon the past.

And if any occupation has dignity on this account, agriculture is the one. It was instituted in the very infancy of our earth, by the Divine command. Eden was its home, God its great patron. The farmer of our day follows the same business that did some of the patriarchs. In every age of the world it hath been followed. Commerce and the arts are younger sisters indeed. The oldest histories extant of the Chinese, Egyptians, Phenicians, indeed of all nations, tell us that this occupation was the chief one of the world. The Egyptians believed, and believed rightly too, that agriculture was of super-human invention, and even worshipped the ox for his services as a co-laborer.

It is dignified because of its usefulness to community. The most of all human sustenance is drawn from the bosom of mother earth. Whatever we eat or wear comes thence. Were agriculture to cease its operations, by necessary consequence all other occupations must at once cease. Were other occupations to stop, it need not vitally affect that of the husbandman. No doubt it would embarrass him, and render his toil less pleasant, and his results less certain. But still he is measurably independent of others, while others cannot be independent of him. It is the great staple of national prosperity, and the political economist fails not to note, that a nation's wealth is, after all best estimated by the actual products which come from her soil. The husbandman carries food to our cities to sustain the millions of traffickers there; he gives provisions to all engaged in our country's defence, whether on shore or on sea; the young and the old, the poor and the rich, alike wait upon him for supply of corn and meat. At his hands the busy manufactory receives its cotton, its wool, its grain. In fine, we may look abroad in every direction and perceive the truth of my assertion, that, if agriculture cease its work all other occupations must be stopped.

By common consent the *producers* of human good, whether for the body or the mind, are the most valuable portions of society. Those who do not actually produce, or add something to the general welfare of the human family, unless incapacitated by Providence, are unworthy an equal rank with the producers. On this point there is no mistake. The brainless goddess, Fashion, whose opinions change oftener than does the wind, may assert that Idleness, if clothed in the fine raiment, is a worthy condition; but the universal verdict of common sense gives the lie to her position. Men need not actually till the soil, and yet be producers of good to their fellow men. The various secular pursuits advance the general welfare, by reciprocity. But, after all, the agriculturist is the main wheel of the whole system; and hence his essential superiority.

(To be continued.)

LARGE EAR OF CORN.—Mr Charles James, has sent us an ear of yellow or northern corn, measuring 14 inches in length, and 7 inches in circumference. It has 16 rows of grain, which is well formed and sound. He states that many other ears may be found in his field, of equal size.—*Wisconsin Cultivator.*

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Dec. 29, 1838.

Mr John Clapp of South Reading, exhibited the Nonsuch and a fine red apple, one of the new seedlings produced by Henry Corse, Esq. of Montreal.

From Hon. Peter C. Brooks of Medford, Apples name unknown, beautiful and good.

Mr John M. Ives of Salem exhibited the following apples: Wellington; Michael Henry Pippin, Swaar, and the Carthouse or Gilpin. For the purpose of drawing the attention of amateurs to this fruit so celebrated at the south, we make the following extract from Mr Cox's description.

"No. 92, *Carthouse or Gilpin.* It is highly esteemed for its excellence as a table apple late in the Spring, it is a most abundant bearer, the fruit is small, the color a deep red, sometimes a little streaked with yellow, the skin of a polished smoothness, the form inclines to an oblong, the flesh is very firm, yellow and rich, not fit for eating until midwinter, when it becomes juicy, tender and finely flavored."

Mr George Newhall of Dorchester exhibited the Hubbardston, and Boston Nonsuch, and two sorts of apples, unnamed; one of them a small bright red fruit, with yellow flesh, and of an extraordinary rich and agreeable flavor.

Mr S. Walker of Roxbury exhibited Boston Nonsuch apples.

Mr L. P. Grosvenor exhibited the Spitzemburg, Chandler, Nonsuch, and Winter Queen apples.

Mr E. M. Richards exhibited the following apples: Moore's Sweeting, Baldwin, Gardener Sweeting, Winesap Cox No. 89, Pomme d' Api Cox No. 28, and another apple of a yellow color unnamed.

Mr Richards also exhibited Princes St Germaine, Easter Beurte, and L'Echasserie Pears; the L'Echasserie is one of our best winter fruits; it has always been held in high estimation, and deserves to be so, as it is often confounded with the Ambrette, and in some collections still cultivated by that name. The committee take this opportunity to make the following remarks: The leaf of the L'Echasserie is long, narrow, and the edges are indented, the young shoots are weak, and bent at every bud. The leaf of the Ambrette is smooth at the edges, the shoots are strong, nearly straight and slightly downy. By paying attention to the above, cultivators will soon be able to discriminate between the two trees, either by the winter's wood, or summer foliage.

For the Committee,

ROBERT MANNING.

CABBAGE MOLASSES.—A writer in the Genesee Farmer says—"This fall we succeeded in an experiment of obtaining molasses from the stumps and hearts of cabbage, in the manner following: Chopped the cabbage fine, and then boiled it soft; then strained it and boiled the juice nearly a whole day, and obtained good thick molasses, with the exception that it had a little flavor of the cabbage."

The *exception*, we are inclined to think, is rather fatal to every extensive repetition of this experiment. Not that we have any aversion to the flavor of a good cabbage; but we should much prefer molasses without that flavor. Everything in its place. Cabbage with ham and corned beef, and molasses with hasty-pudding, are excellent.

MR INGERSOLL'S PIGGERY.

(Concluded.)

Brookline, Dec. 24th, 1835.

DEAR SIR,—

I received your favor of the 21st ult., a long time after its date, and not until it was much worn and chafed with its travels ere it reached me. I will endeavor to answer your enquiries in detail. The following is a "summary view of the total quantity of each kind of food used in my piggery per annum," and the months in which they are used; beginning with the 1st of July, which is about the time I begin to depend upon summer vegetables, viz:

<i>July and August</i> —Mangel wurtzel, roots, and tops being the thinnings from two squares each, containing 32 rods, Summer squashes, Early cabbages,	bush.	
<i>September, October and November</i> —Winter squashes or pumpkins, Large drum head cabbages, Trimmings of mangel wurtzel turnips, &c. &c.		800 200 100
<i>December, January, February, March, April</i> —Mangel wurtzel,* (roots) Carrots, Ruta бага, Cabbages,		700 800 150
<i>May</i> —Parsnips which are left in the ground during the winter, and allowed to grow in the spring, until their tops are from 4 to 6 inches high, when they are daily dug as wanted, and all boiled,		500
<i>June</i> —Potatoes, Early lettuce, peas, chopped up vines and pods when the peas are full grown, though still green,		250
	Bushels,	6550

We always mix the vegetables by boiling some of either kind in each kettle.

My farming, or rather gardening, goes upon the principle of cultivating but little ground, and by great attention to get large crops, and in some instances two from the same land. The form of one piece constantly in cultivation is an oblong, thus divided with an alley or walk 4 feet wide in the centre.

No. 1. Of the upper side was sowed this year with mangel wurtzel, thinned out several times as described in a former letter, and finally cabbage plants set out two feet apart, (for winter crop,) taken from square No. 3, of the lower side.

No. 2. Has now a crop of parsnips left to grow the next spring, to furnish food for the mouth of May. The frost, however severe, does not injure them, and they are very much liked by the hogs. The advantage of preserving without trouble through the winter makes them valuable.

No. 3. Upper side, produced parsnips that were dug in the month of May, and 4th of June was sowed with carrots. Produce 237 bushels of the short kind.

No. 1. Of the lower side was cropped with carrots this year; of the long orange kind. Produce 245 bushels.

No. 2. Bore the crop of mangel wurtzel I described to you in a former letter.

No. 3. Cabbages.—The ground was laid out in 8 beds, 4 rods long, and 1 wide; the 12th June, it was sowed with Poinfret cabbage seed, in rows 2 feet asunder. They were thinned out, as plants were wanted to set other places, so as finally to stand 2 feet apart. Produce 500 bushels.

This piece of land is constantly cropped in such routine, that the same vegetable occupies the same square once in three years. Each square is annually manured with well rotted hog dung, and always at the rate of 4 cart loads for 40 cubic feet. The cabbage square has in addition 20 bushels of unslacked wood ashes.

The aggregate produce this year of the whole 6 squares, or 1-5 acres was as follows, viz:

8 1-2 rods wide

Upper Side.

No. 1. Mangel wurtzel tops and roots all boiled together,	510 bush.
Cabbages transplanted	500 do.
	1010 bush.
No. 2. Now filled with parsnips—no doubt,	500 do.
No. 3. Carrots,	237 do.

Lower Side.

No. 1. Carrots,	248 do.
No. 2. Mangel wurtzel,	523 do.
No. 3. Poinfret cabbages,	500 do.
	Bushels, 3098

Upon the borders of this garden ground, which is one rod wide, I have a row of fruit trees. Under them we have lettuce, early cabbages, ruta бага for transplanting, and such vegetables as our family require. But upon the plat above described nothing grows to shade the crops devoted to the piggery.

A second piece of ground, contains a square acre, and is divided into 4 equal parts and cropped in this manner, viz:

- 1-4 acre, early potatoes and peas for family use.
- 1-4 acre, those not wanted, are chopped up, vines and all, and boiled in June. This land is cleared soon enough for a crop of transplanted Swedish turnips, or ruta бага.
- 1-4 acre, summer squash. Produce 200 bushels.
- 1-4 acre carrots. Produce 310 bushels.
- 1-4 acre, cabbages. do. 560 do.

These two pieces of land are my sheet anchor—they are highly cultivated and neatly dressed without a weed allowed to seed upon them.

I annually cultivate besides, 3 acres of field land by breaking up 1-2 acres, and laying down the same quantity. These 3 acres are cropped as follows, viz:

1 acre potatoes,	250 to 300 bushels.
1 acre winter squash or pumpkins,	700 to 900 bushels.
1-2 acre cabbages	1000 bushels.
1-4 acre mangel wurtzel	250 {
	Roots, tops &c given to sheep and cows.
1-4 acre carrots,	250
	2500 bushels.

These crops are an average for the last 3 years My whole farm, (if it deserves that name,) is only 21 acres, within a ring fence. Of which one acre or more is occupied by buildings, yards, and approaches to them.

To carry on all my operations I keep two hired men through the year, one of whom however, does the duty of house servant at the same time; and I hire besides day laborers and cattle to plough, to amount of 150 dollars more. It occupies about the whole time of one man, to take care of my stock, consisting of 160 hogs, 60 sheep, 1 chaise horse, 1 cart horse, and one cow; though they are both together, and when the animals are fed, are employed in the gardens in summer, and in winter getting out manure for the next season.

In answer to your question respecting the "probable marketable value of the vegetables on my farm," I would observe that the kinds and quantity of many which I raise, could not be sold at all; for instance, the mangel wurtzel, ruta бага and all the tops and trimmings of others. Mr Quincy tells me, he this year sells carrots in Boston, after carrying them 8 miles, at 9 dollars per ton, or 18 cents per bushel. Cabbages are sold by the load at 4 cents each, or about 8 or 10 cents per bushel Parsnips and winter squashes must be retailed, and pumpkins in any quantities would not sell for anything.

To answer your question about market gardeners I have endeavored to recollect who among my neighbors have been successful and long established in that line, and I cannot select a single individual who has not driven his own cart to market, until he had sons old enough to take his place, and thus by attending to the minutiae of the business prevented that fraud and deception, that a gentleman farmer cannot easily avoid. When I first bought my estate, I sat up a market cart, got a stout horse, and a man well recommended, but my daily receipts kept growing less and less; my man and horse were out late every evening, and after a vexatious and mortifying experiment, I was convinced, that I must either find a market for my vegetables upon the place, and under my own eyes, or give it up as a losing concern—for I could not bring my mind to the constant and daily competition, for trifling sums, which a man habituated to it from infancy, rather takes pleasure in.

Manure bought in Boston, costs them two dollars per buck load, of 62 or 63 cubic feet, trod hard and moderately heaped, in its unrotted state. The expense of carting put at the lowest rate, cannot cost the farmer less than \$1 50 per load, and when they bring it on hire, they charge \$2 50. My whole stock annually furnishes three hundred

* Cabbages and mangel wurtzel used first.

uch loads, which after using all I want, find a eady sale among the market gardeners in my neighborhood at 3 dollars per load, they taking it away with their own teams.

This manure is without any mixture of pond and, sods, &c. which, had I access to such materials, might be very profitably increased.

As it respects steaming, instead of boiling vegetables, the only expense saved is fuel, for the same labor is necessary in filling and discharging them. Our laboring people require to have their work simplified as much as possible, and their judgment not often called into exercise. Were I to tell my man to steam 18 bushels of vegetables, and to give one-third of them 3 times a day to the stock, the consequence would be, that a much greater quantity would be given at one time than in other, and though the whole would be consumed in the course of the day, still the inequality of feeding would be hurtful. Besides in winter, particularly the swill, must be very warm, which could not be at night with vegetables steamed in the morning. Upon the whole therefore, I prefer to say to him, "fill the kettle with vegetables, and after they are boiled away sufficiently to make room, put in one bushel of cracked corn and oats, and give the whole for breakfast," thus making out his exact line of duty, and leaving nothing to his discretion.

I give the swill warm in summer, and almost hot in winter, and always sweet and fresh. In conversation with Dr. Derby, he argued upon the propriety of feeding with sour food, and that cold. I have formerly tried it and satisfied myself it was wrong. Pigs may be habituated to eat it; but place this cold stuff in a trough, and a good smoking hot breakfast of mine in another beside it, and I will venture to say, they will soon show a preference.

I never spay sows, because *we have no one who knows the mode*, which is to be regretted. They are sometimes admitted to the boar a few weeks before killing.

In yours received yesterday, through Wells and Lilly, you ask my opinion of the Byfield breed of hogs. As breeders they are the worst I know. The sows have small litters and destroy them oftentimes by laying down without any care. They are long coarse haired animals and very apt to be mangy, nevertheless to mix with almost any other breed, a Byfield boar is valuable, being a quiet race and disposed to get fat at an early age.

The Bedford is a hardier kind, and make good nurses. But for our uses have too much lean meat in proportion to their fat—their hams from that circumstance are excellent—a cross between a Byfield boar, and a Bedford sow furnishes a profitable and handsome stock.

Inclosed is a sketch of my piggery. I thought it might assist you in determining the mode of building yours—I find mine convenient, and know not, that I could alter it advantageously.

I have thus, my dear sir, attempted to give a comprehensive answer to your interrogatories; if there is yet anything not perfectly clear to you I shall be happy to explain.

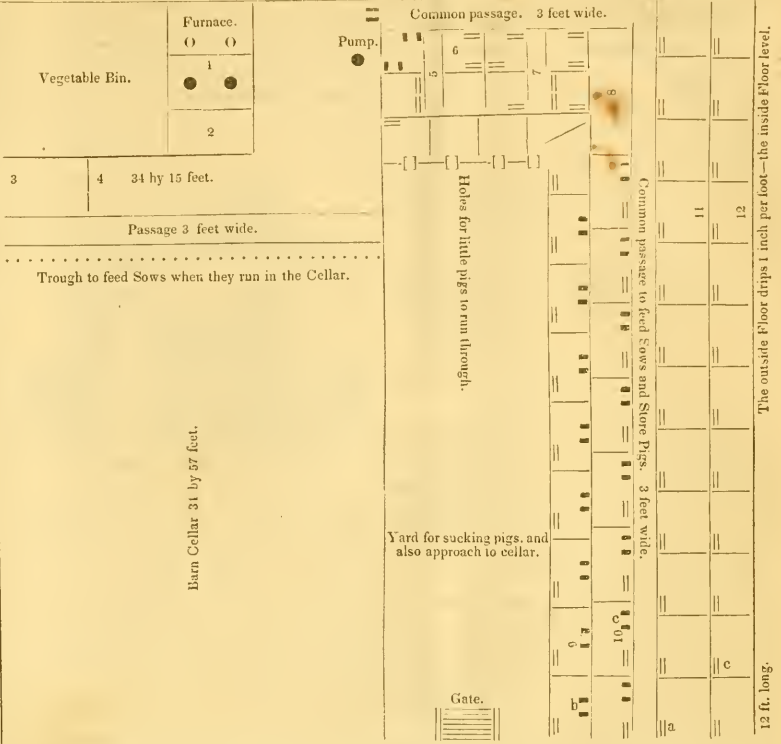

My letter has run on to a great length, but your politeness, I trust, will excuse it.

Your obedient

Humble servant,

NATHANIEL INGERSOLL.

J. S. SKINNER, Esq.

EXPLANATION.

1. Boilers.
 2. Swill Trough.
 3. Vegetable Bin.
 4. Boiling House and Vegetable Bin.
 5. Passage to feed.
 6. Small pens for sows to pig in, in cold weather.
 7. Passage to feed.
 8. Grain Bin.
 9. Outside pens for sows—4 feet by 7 1-2.
 10. Inside pens for sows—7 1-2 feet long by 5 wide.
 11. Inside pens for store pigs—6 feet square.
 12. Outside pens for store pigs—4 feet by 6.
- a. Troughs.
b. Door.
c. Trough Door.

I have found it necessary to have communication with all the pens, from the principal *inside* passages

for the facility of moving the sows and store pigs, because outside doors are apt to be frozen down in winter. The spaces at the ends of the troughs, are therefore sliding doors, as all others are. The 4 pens near the boiling house, are made tight with covers, for sows to farrow, in very severe weather. The hogs are all fed from the common passage under cover. They eat more comfortable, and the troughs are never filled up with rain or snow. The outside pens of the sows, when they have pigs, are cleared into a cart, and the manure carted away, that the yard for sucking pigs, may always be clean—and where they will soon learn to eat whole corn, if placed in shallow troughs. They have holes sufficiently large for them to run out of.

Since you were here, I have been obliged to new lay the floor of my piggery, and have now arranged the pens conformable to the above sketch. I have also dug a well in the boiling house, and have the nose of the pump placed high enough to carry water into the kettles. Should my spring fail, I shall by spouts, conduct the water that falls in rain upon the building, into the well. My fattening hogs, you will recollect, are fed upon the barn floor, and cleaned into the cellar, where the sows run before they pig.

"Won't you write some lines on me?" said a scoffer to a roguish poet. "Certainly, sir," answered the other with a polite bow. As soon as the other's back was turned, he chalked the word "sheep stealer," between his shoulders.

NEW ENGLAND FARMER, AND GARDENER'S JOURNAL.

BOSTON, WEDNESDAY, JANUARY 9, 1839.

NOTICE.

The subscriber, Commissioner of Agricultural Survey, has taken, for the winter, an office at No. 52 North Market street, over the office of the New England Farmer and Agricultural Seed store, where he will be happy to see his agricultural friends on the business of his appointment.

He may be ordinarily found at his office from 9 to 12 M.; and his agricultural friends will find his office open at all times of day, and the agricultural publications and papers of the country at hand for their perusal.

HENRY COLMAN.

Jan. 1, 1839.

FOR THE NEW YEAR.

The commencement of a year it always deemed a proper occasion for the forming of good resolutions and plans of future conduct. We shall not discuss the moral duties or uses of such occasions. We are far from thinking this would be out of place in a Farmer's newspaper; but it does not come immediately within our sphere. Our main business is with business men, and our present object concerns business arrangements at the commencement of the year.

We are talking of the commencement of the year; and yet it is already someways on its journey, and a fifty-second part of it is gone. This cannot be recalled. The power of omnipotence, we speak it with reverence, cannot make it as though it had not been. But it would be madness and folly on that account to forego our good purposes; or to wait until another year before we begin the execution of plans of whose propriety and utility we are convinced. "What thou doest, do quickly." Now is the time. Beyond now no man is sure of the power or the inclination to do anything; and if instead of a fifty-second a fifth part of the year should have passed away, let it never be considered too late to begin the execution of a wise and useful purpose.

In looking at the general conduct and management of farmers, nothing strikes one more forcibly than the almost entire absence of all arrangement or system, all exactness and accounts. Few men make any definite plan for the management of their farms, but are wholly under the direction, if direction it may be called, of caprice or accident. Few men measure their land, their seed, or their crops. Few keep any account of the manure applied, or the labor expended upon any crop. Few know what they buy; what they sell; and whether in the application, use, or sale of their produce there is a gain or a loss. If you ask why this is not done, the general answer is, "that we get so little from our farms, that we are ashamed to do it; or we should discover that our farms are running us in debt, and therefore we are unwilling to do it; or it is so much trouble that we cannot do it." These replies are all unreasonable and futile. They are not such as to satisfy an intelligent and honest mind. It is not a question of half so much importance whether we get much or little as whether we get all that we can get, and whether we get so much as to compensate fully the labor applied and the expense incurred in the cultivation. A farmer, who farms for mere pastime or amusement, or who having other resources is satisfied with the few ordinary supplies and conveniences, which almost any farm will furnish with little labor or expenses, must not complain, if the account of his farm should be short and meagre. He has

no reason to expect anything else. But a farmer, who is one truly and exclusively, whose dependence is on his farm, whose business is with his farm, ought not to be satisfied until his farm is made to produce all that it is capable of producing; and a farmer, who does this, will seldom have occasion to be mortified at the result. In most cases there is no doubt it will much exceed his expectations. We know that farmers in general will give a different account from this. The first reason for their doing so is that many of them, who profess to know, do not know accurately how the case stands with them. They *imagine*, they *think*, they *guess*, they *conjecture*, they "lump the matter," as it is often termed; but they keep no accounts, and they make out no particular, detailed, and faithful statement of the case. Another reason is, they seldom give the farm any credit for the comforts and supplies, which it furnishes to the family without charge or notice. Let them have to buy all these things in a city where every ounce of butter, every pound of pork, every half peck of potatoes, every bunch of onions, and every pint of milk is to be weighed, measured, and paid for; and then they can form a more just estimate of what is to be credited to the farm. In judging of the proceeds or result of his farming, the farmer in general reckons only what he sells for cash; and makes no account of house-rent, fuel, bread, pork, beef, tallow, vegetables, milk, &c. &c., which are used for his family and with which oftentimes much of his labor is paid for. Such omissions are certainly unjust to the farm, and prevent the exhibition of a true result.

If it be true in the next place, as many sometimes assert, that if they keep an exact account of their farming, it would be found that their farms are running them in debt, this is the strongest of all reasons why they should keep accounts, and why they should look often into these accounts. It is great folly to pursue any business whatever which cannot be pursued only at a certain loss. A man, who believes himself year after year continually sinking deeper and deeper into debt, must be sensible that he is doing a great injustice to others; and in most cases must become at last irretrievably involved. Such instances do indeed occur; and a man, who knowingly suffers himself to become involved, when he might avoid it, has no justification; and a man, who permits himself to contract debts, which he has at the time no reasonable expectation of ever being able to discharge, commits an act, which is more immoral and criminal than burglary or highway robbery. If a man, therefore, entertains a slight suspicion that his farming is yearly involving him in debt, and he has no resources but from the farm to meet those debts, these are the strongest reasons why as a man of common honor and principle he should keep the most exact accounts, that he may save himself from the portending bankruptcy and shipwreck. In most cases however, we regard such excuses for not keeping farm accounts as mere pretences without any just foundation. Men often find that their farming is unprofitable and involves them in debt. But in most cases this is not so properly to be charged to the farm as to a want of skill, of industry, of frugality; or to a neglect to make the best use of the means which a man possesses; or to an improvidence, ignorance, or mismanagement, which would cause a like failure in any business.

The other reason, which men give why they do not keep farm accounts, that this would take too much time and trouble, is one which an industrious and business-man ought to be ashamed to give; and which few respectable farmers would give, if they had once made the experiment. In this matter everything depends on arrangement and system. After matters are once methodized, half an hour a day will in general keep accurately,

any farm account in the State. This attention and time however, must be given to it every day. If put off from day to day with the intention of doing up a week's work at a time many things will be forgotten or overlooked; the matters to be remembered and noted will become accumulated and entangled; and things will soon fall into irretrievable confusion. Fix a time of day and of every day when it shall be done; say, for example immediately after supper, and let it be a rule with you to do it as fixed and inviolable as your going to bed and your getting up. It will then occupy little time; it will cost comparatively no trouble; and it will be such a source of satisfaction and advantage to you as to compensate tenfold any pains or trouble it may require.

At the commencement of the year, and while the season compels the farmer to remit the labors of the field, with all possible respect, we advise the farmer, to lay out the plan of the coming year's work. Look over your farm and determine what you will do with any and every piece of it; what crops you will raise; where you will raise, and how you will raise them. Determine that as far as your means extend, not a single acre or half acre shall remain unoccupied or unproductive. Determine as nearly as you can what manure you have to apply and how you will apply it; and what labor you will require and can afford to employ. Look at your seeds that you may reasonably determine whether you have what you will want, in order that if deficient, you may be able to supply yourself early, while you can make a judicious selection, and not leave the supply of this primary want to a time, when you may not be able to supply yourself, or must take what you can get, not what you would choose. Look next at your utensils and see that they are in the condition for use; and having laid your plans, prepare everything for a start as soon as spring shall give the word; and not when the stageman's horn is blowing under your window have then to dress yourself and pack your trunk. Having got everything in this wise and careful condition of preparation determine that you will keep a farm journal or diary, and begin it now. Take an account of stock and of produce on hand. Keep an account of every day's weather and employment; where you were; what you did; who helped you; how you did it. Charge the farm with all expenses of labor, tools, manure, stock, and seeds. Credit the farm with all its returns of every description. Measure every bushel of vegetables and grain. Weigh every pound of butter and cheese. Ascertain the ordinary amount of milk used for a day or a week that you may average the amount for the season, unless you choose to measure it out to your own family as you would to a buyer. Estimate honestly your loads of hay, corn-fodder, and straw, and keep an account of them. Disregard no minute details. Many little matters make large matters. Weigh your fattening and growing animals occasionally, that you may ascertain their gain; and sometimes by such means determine the important questions of the comparative value of different kinds of feed and management. In short, let nothing connected with your farm escape your attention, and then at the close of the year you will have the enviable satisfaction of knowing where you stand and how you stand; of determining those important questions which are continually coming up to the farmer as to what is profitable and what is unprofitable; what is the best way of doing a thing and what things are best to be done. At the close of the year, you will feel like a man, who when he has returned from a journey will be able to tell his friends and neighbors, where he has been, and what he has seen, and what he has done; and not like a man, making the same journey half asleep or half intoxicated, who sees nothing and knows nothing; spends as much time on the road as the other man; pays as much for his passage;

offers as much from fatigue; wears out his clothes, wastes his money, and perhaps from dissatisfaction with himself and a consciousness of criminal neglect, keeps himself all the time in bad humor; his milk is curdled; his coffee is thick; his bed is hard; he abuses the horses, he scolds the driver, and quarrels with the passengers; and returns to begin the journey of another year without being any wiser, or richer, or happier than when he set out;—but give him rest, for here no man stops by the way; and under such circumstances the end of the next stage for such a man is easily foreseen. Not so the farmer, who knows what he is about; observes what he does; notes every occurrence; compares one thing with another; lays his plans wisely; pursues them calmly but steadily; and when he comes to the end of the year, can give you a perfect chart of his voyage with all his course and every variation laid down upon it; and when he reaches the port, has all his accounts made up, his cargo with every package marked, weighed, labelled and invoiced; and his books ready for the application of the trial balance. The satisfaction which such wise and prudent management brings to the individual himself is an ample equivalent for his labor; and the benefit which such an example of wise forethought and prudent conduct confers upon the community is direct, permanent, and immeasurable.

H. C.

SUMMARY OF THE WEEK.

No events of particular importance present themselves to be noticed. Congress appear to be mainly occupied in talking about some large rats, who have made "pretty considerable" holes in some of the bags of the Treasury and abstracted freely of their contents. Whether the rat was asleep, or has lost her feline character and become more lamblike in her disposition, or whether long familiarity with some of the rats had given rise as often among other animals, to a tender and indulgent regard to her; or by what means they baffled her vigilance are questions, which naturally arise among different members of the family who owned the meal. Whether this sort of granaries will answer, whether the rats are not likely in future times, where the bags are scattered about in various directions over the whole farm, to be too much even for the best mousers; and whether Uncle Sam shall build stone granaries all over his premises, are questions, which certainly there is no need of being in a hurry to settle, while we can have eight dollars apiece per day during the inquiry.

BRIGHTON MARKET.—MONDAY, January 7, 1839.
Reported for the New England Farmer.

At Market, 450 Beef Cattle, (including 75 unsold last week,) 2000 Sheep, and 100 Swine; the Swine have been several times before reported. 100 Beef Cattle unsold.

Prices.—Beef Cattle.—We quote to correspond with last week, viz: First quality, \$7 25 a \$7 50. Second quality, \$6 50 a \$7 00. Third quality, \$5 25 a \$6 50. Sheep.—We notice sales at \$2 75, \$3 00, \$3 50, \$3 75, and \$5 00. Swine.—A lot to close at G. A lot to peddle at G and 7. At retail, G 1-2 a 8.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending January 6.

AMERICAN SILK GROWER'S GUIDE.

On the art of raising the mulberry and silk and the system of successive crops in each season; second edition; enlarged and improved by William Kenrick. Just published and for sale by Joseph Breck & Co., at the Seed Store and Agricultural Warehouse, Nos. 51 and 52 North Market Street. Jan. 9, 1839.

GREEN'S PATENT STRAW CUTTER.

Joseph Breck & Co. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street have for sale, Green's Patent Straw, Hay and Strk Cutter, operating on a mechanical principle, not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use, to get out of order.

MULBERRY TREES.

WM. PRICE & SOSS will make sales of trees and cuttings of the genuine Chinese Morus Multicaulis, Morus Expansa, Alpine, Broussa, Canton and other varieties, deliverable to the purchasers at such period in the Spring, as is convenient to them, and will enter into contracts accordingly.

Prices and terms for the trees and cuttings will be forwarded to all who may apply for them by mail, as well as prices of Silk Worms' Eggs, Mulberry Seeds, &c. The Multicaulis trees are remarkably vigorous, and as we first imported the genuine tree, purchasers are sure of obtaining the genuine kind. It is from this cause, and from the great attention paid by them, that the trees that they have sold, have given universal satisfaction. Dec. 20, 1838. 2m Flushing, near New York.

WANTED.

A man and his wife, to go to Virginia, on a silk farm, some knowledge of the cultivation of the mulberry will be necessary. To such a person liberal encouragement will be given. Apply at the N. E. Farmer Office, 51 & 52 North Market Street. Jan. 2, 1839.

MORUS MULTICAULIS.

Constantly on hand in small quantities, at the lowest market price. Orders directed to Messrs Winship, Brighton, Mass. or left at N. E. Farmer Office, will receive immediate attention. The plants will be safely packed and forwarded to any part of the country. Dec. 19.

CARTER'S GUIDE BOARD BRANDS.

A very useful article for country towns; they consist of an alphabet of letters, with a series of figures, hands, &c. of suitable size, (forty pieces in number) well packed in a box. A set of brands would probably serve a town for a century, and supply the necessary guide boards. The letters are burnt into the board, with a most brand and may be read at a great distance and will endure until the board perishes. Every town should be supplied with a set of these brands, and if used in their poor houses, the guide boards would cost merely nothing.

BONE MANURE.

The subscriber desires to inform his friends and the public that he has been in the Bone business more than two years, and has spent much time and money to ascertain how bones may be converted to the best use, and is fully satisfied that they form the most powerful stimulant that can be applied to the earth as a manure. He offers for sale ground bone at low prices, and is ready to receive orders to any amount, which will be promptly attended to.

Orders may be left at my manufactory, near Tremont road, in Roxbury, or at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, Boston. Sept. 20. NAHUM WARD.

MISCELLANEOUS.

THE FARMER.

Of all pursuits man invented,
The ploughman is the best contented;
His calling's good, his profits high,
And on his labors all rely.
Mechanics all by him are fed,
Of him the merchants seek their bread;
His hand gives meat to everything,
Up from the beggar to the king.
The milk and honey, corn and wheat,
Are by his labors made complete.
Our clothes from him must first arise,
To deck the foe, to dress the wise;
We then by vote may justly state,
The ploughman's rank among the great—
More independent than them all,
That dwell upon this earthly ball.
All hail, ye farmers, young and old!
Push on your plough with courage bold;
Your wealth arises from your clod,
Your independence from your God.
If then the plough supports the nation,
And men of rank in every station,
Let kings to farmers make a bow,
And every man procure a plough.

AMERICAN FARMER.

THE GRAND DUKE AND THE JEW.

A ROMANCE OF REAL LIFE.

The following singular story, which was current among the English residents in St Petersburg, at the coronation of the present Emperor of Russia, has been narrated to us by a person newly arrived from that part of the continent.

In the early part of the year 1826, an English gentleman, from Akmetcht in the Crimea, having occasion to travel to France on business of importance, directed his course by way of Warsaw, in Poland. About an hour after his arrival in that city, he quitted the tavern in which he had been taking refreshment, to take a walk through the streets. While sauntering in front of one of the public buildings, he met with an elderly gentleman of a grave aspect and courteous demeanor. After a mutual exchange of civilities, they got into a conversation, during which, with the characteristic frankness of an Englishman, he told the stranger who he was, where from, and whither he was going. The other, in the most friendly manner, invited him to share the hospitalities of his house, till such time as he found it convenient to resume his journey—adding, with a smile, that it was not improbable but he might visit the Crimea himself in the course of that year, when, perhaps, he might require a similar return. The invitation was accepted, and he was conducted to a splendid mansion, elegant without, and rich and commodious within.

Unbounded liberality on the part of the Pole, produced unbounded confidence on the part of the Englishman. The latter had a small box of jewels of great value, which he had carried about his person from the time of his leaving home—finding that mode of conveyance both hazardous and inconvenient in a town, he requested his munificent host to deposit it in a place of security till he should be ready to go away. At the expiration of three days, he prepared for his departure, and on asking for his box, how was he amazed when the old gentleman, with a countenance exhibiting the

utmost surprise, replied, "What box?" "Why, the small box of jewels which I gave you to keep for me?" "My dear sir, you must surely be mistaken; I never, really, saw nor heard of such a box." The Englishman was petrified. After recovering himself a little, he requested he would call his wife, she having been present when he received it. She came, and on being questioned, answered in exact union with her husband—expressed the same surprise—and benevolently endeavored to persuade her distracted guest that it was a mere hallucination. With mingled feelings of horror, astonishment, and despair, he walked out of the house and went to the tavern at which he had put up on his arrival at Warsaw. There he related his mysterious story, and learned that his iniquitous host was the richest Jew in Poland. He was advised, without delay, to state the case to the Grand Duke, who fortunately happened at that time to be in Warsaw.

He accordingly waited on him, and with little ceremony, was admitted to an audience. He briefly laid down the case, and Constantine, "with a greedy ear devoured up his discourse." Constantine expressed his astonishment—told him he knew the Jew, having had extensive money transactions with him—that he had always been respectable, and of an unblemished character. "However," he added, "I will use every legitimate means to unveil the mystery." So saying, he called on some gentlemen who were to dine with him that day, and despatched a messenger with a note to the Jew, requesting his presence. Aaron obeyed the summons. "Have you no recollection of having received a box of jewels from the hand of this gentleman?" said the Duke. "Never, my lord," was the reply. "Strange, indeed. Are you perfectly conscious," turning to the Englishman, "that you gave the box as stated?" "Quite certain, my lord." Then addressing himself to the Jew—"This is a very singular case, and I feel it my duty to use singular means to ascertain the truth—is your wife at home?" "Yes, my lord." "Then," continued Constantine, "Here is a sheet of paper, and here is a pen, proceed to write a note to your wife in such terms as I shall dictate." Aaron lifted the pen. "Now," said this second Solomon, "commence by saying, 'All is discovered! There is no resource left but to deliver up the box. I have owned the fact in the presence of the Grand Duke.'" A tremor shook the frame of the Israelite, and the pen dropped from his fingers. But instantly recovering himself, he exclaimed, "That is impossible, my lord. That would be directly implicating myself." "I give you my word of honor," said Constantine, "in presence of every one in the room, that what you write shall never be used as an instrument against you, farther than the effect it produces on your wife. If you are innocent you have nothing to fear—but if you persist in not writing it, I will hold it as a proof of your guilt."

With a trembling hand, the terrified Jew wrote out the note, folded it up, and as he was desired, sealed it with his own signet. Two officers were despatched with it to his house, and when Sarah glanced over its contents, she swooned and sunk to the ground. The box was delivered up and restored to its owner—and the Jew suffered the punishment his villany deserved. He was sent to Siberia.

INDIAN WHEAT.—A. W. Stockbridge of Byron, Me. raised last summer from two quarts of Indian

Wheat, seven bushels and two quarts. After it was mowed and nearly dry, there came a storm of rain, and wasted probably half a bushel or more of it.

The writer who communicated this to the editor of the Maine Farmer says— "This is more than a common yield. It was sowed upon one eighth of an acre, the soil dry and sandy, but it received a pretty good dressing of manure. It was sowed about the middle of June, and harvested near the middle of September. This is the moderate yield of one hundred and thirteen bushels from one, thus bringing forth, even in this country, 'some an hundred fold.' We find it good to fatten hogs, and it also makes very good warm bread."

The editor of the Farmer adds—"Many millers do not understand the mode of grinding this kind of grain. They crush it, hull and flour, all very fine. This makes the flour bitter and unpalatable whereas it should only be cracked open so as to let the flour out and the hull remain whole.—*Courier.*"

FRUIT AND ORNAMENTAL TREES, MULBERRIES &c

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1838 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears Apples, Plums, Peaches, Cherries, Quinces Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and Peaches now ready is particularly large. Also, Ornamental Trees, Shrubs Roses, Honeyuckles; Pæonies, Dahlias and other Herbaceous Flowering Plants.

100,000 MORTUS MULTICAULIS are now offered for sale; the trees green and fine, will be ready for delivery at the cities of Boston, New York and Philadelphia, in October next, at prices fair, and varying with the size, and the quantity which may be desired. Also, Broussa and other varieties.

Mulberry and other trees, when so ordered, will be securely packed for safe transportation to distant places, and all orders promptly executed, on application to B. D. BAECK Commission Store, No. 132 Water Street, New York, M. S. PEWELL, Seed Store, No. 7 Arch Street, Philadelphia, or to the subscriber, Noanatum Hill, Newton, near Boston. August 1, 1838. WILLIAM KENRICK.

FARM FOR SALE.

A Farm situated in the southwest part of Townsend on the road leading from Townsend west village to Worcester ter. Said farm contains 110 acres of land divided into mowing and pasturing, and a large share of wood and timber; one story house, with two front rooms, kitchen, buttery, and two bed rooms well finished; parlor papered; wood house well, under cover, forty feet barn, and shed, a large sheep house, fifteen by thirty feet, a large cooper shop, and another small house well finished, on the lower floor; a good aqueduct which comes into the barn yard, and a good orchard.

The subscriber will sell a part or all, and give possessor this fall or winter, or next spring. Those who wish to buy will do well to call on the subscriber, who lives on the premises, and look for themselves. ASA H. ADAMS. Nov. 29/1838.

FARM IN BROOKLINE.

For sale a farm situated in Brookline, about four miles from Boston, containing forty acres of first rate Tillage Land and thirty acres of Woodland and pasture—with a good House in complete repair; Barn, Chaise-louise, Corn-barn Shed, &c.

The Farm will be sold low, together with the Stock, Hay Tools, &c. if applied for soon, at No. 39, North Market St. Boston, or Roxbury Street, near Boston line. Dec. 26, 1838. JOHN HUNT.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

AGRICULTURAL.

AN ADDRESS.

Delivered before an Agricultural Meeting at Plessis, Jefferson county, N. Y., on the 26th September, 1838. By JOSIAH T. MARSHALL.

(Concluded.)

Let us now turn our attention for a moment to the *Political Dignity* of this class.

By this I have no allusion to any party divisions. Oligies are one thing, party is another; the same is the fact that religion is one thing and sectarianism another. In my proposition I mean their *importance in perpetuating the welfare and independence of our nation*. This is a theme on which I should delight to linger and expatiate for hours. No man of patriotism or humanity can contemplate it without feelings of intense interest. It is a theme worthy the pulpit and the Senate, the fireside and the forum, and should enter into the teachings of our schools.

The history of the world teaches us this lesson: that with wise laws, good morals, and simplicity of living among the mass of the people, a nation may not only rise to power and happiness, but very enjoy these blessings. And the same teacher tells us that a nation's foundations are sapped when a departure is made from these principles. Let the laws be entrenched upon in any degree, or the morals of the many be adulterated, or extravagance of living among them take the place of simplicity, and an inroad is made upon the general happiness and strength. In high places, as among the very wealthy, these evils may exist, and work a permanent injury to the State, for the reason that the number of such persons bears an exceedingly small proportion to the great body. But let the evil leaven spread itself into the mass, and ruin will inevitably ensue. Look, for a moment, at Persia, led on by Cyrus to the conquest of empires, see her victorious banners floating throughout Egypt, Asia Minor, Babylon, and Assyria. For a time she was mistress of the world. And why was this? Because of all the then existing nations she alone had a population whose strength lay in the comparative purity of their morals, and their sobriety of living. From the earliest boyhood to manhood, her youth were allowed no food but bread and resses, and no drink but the limpid water that gurgled from the rock. Their schools were those of virtue. The ear of the king was open to the nearest of his subjects. All might enter their complaints to him, and be sure of redress. The principle of equal rights was there, though under the form of a monarchy. The subject, the meanest subject, might also advise the monarch; but lest he thousand political quacks that then, as now, infested the community, might consume that time a compounding nostrums which should be spent at the plough, the adviser was caused to stand upon a wedge of gold when offering his advice. If his counsel promoted the general good, the

wedge of gold was his reward; if it did not, he received a public whipping. Thus sustained by a simple minded, frugal, temperate yeomanry, that nation went on in a bold career of conquest. But silently, and by imperceptible degrees, the mass became corrupted. The iron strength of her people was sapped; imbecility, and want of courage, consequent upon luxurious living, took the place of firm and manly daring, and before a handful of Greeks she fell to rise no more.

Thus it was, in turn, with Republican Greece, that Confederation of Independent States, whose political organization was so nearly like our own. So long as her people cherished the homely virtues of which I allude, she stood, the glory of the world, in Arms, in Arts, in Agriculture. But the canker-worm of luxury went to its silent work, and what the combined powers of antagonist nations could not do, it effected; and Greece sank like lead amid the waters of the past. She has a name to live, it is true, but she is dead—twice dead in all that pertains to national greatness!

But time would fail to enumerate the thousand proofs of the position under notice which come up from the melancholy history of the past. Alas! for that nation, however powerful and seemingly prosperous she may now be, which has not a virtuous yeomanry.

There is in this country especial need that we be guarded on this point. The ease with which our citizens can obtain the means of luxury, and the great multiplication of cities and villages, which are congenial to its development, give additional weight to our proposition. These considerations give political dignity to the agricultural class; for their homes are generally the abode of simplicity, frugality, and morality. Let them continue such, and the elements of national perpetuity will never be wanting. There will be some, indeed many, in our cities and larger communities, of those who will spend their health and wealth in riotous living; but comparatively speaking, these are few, and of no important consideration. They are *fungi*, or eschars, upon the great body, which, though not to be desired, are not to prove vitally injurious if the mass remain pure. Hence, agriculturists, you are the leaven which shall keep wholesome the lump.

A second feature of your political importance is found in the *comparatively equal distribution of property among you*. The great principle of our Constitution is, that all men are essentially equal. Our theory is, that no distinction of privileges should be known or tolerated. And in precise proportion as this sentiment is recognized and applied in a community, is true Republicanism existent. All admit the theory to be a beautiful one, and the mind cannot conceive of a political proposition so perfect and desirable as is implied in its true spirit and scope. It is the perfection of human government; and it is given the citizens of this Republic to work out the great problem, whether it be susceptible of application to mankind.—The proposition is admitted by all men, everywhere,

to be true in the abstract. The crowned and mitred heads of Europe admit this, but they say it cannot work in the detail. They forget that *whatever* is wise, and just, and lovely in the abstract, must necessarily be so in the practical application. They assume it to be a fact that men cannot long govern themselves by laws of their own making, and executive officers of their own choosing. But it is for the members of your profession in this nation, to prove that intelligent men can carry on an efficient and just government; and that of all modes of national rule ours is the most desirable. Remember, I pray you, that the stake is one of amazing magnitude. On the result of American liberty depends that of the serfs, and tenants, and peasants of all Europe, and perhaps of Asia too. You have in keeping, it may be, the political rights of millions upon millions beyond the sea. As success or defeat shall attend our experiment will they be freemen or serfs.

In the *comparatively equal distribution of property among farmers*, I see a most momentous consideration connected with this point. The corner stone of the Orders of European aristocracy is the monopoly of the soil. On this it rests as on an adamantine base. Let the same land which is held by the nobility be parcelled out into small free-holders, and let the tillers of the soil become free-holders, instead of tenants, and the privileged Orders must tomorrow come down and stand beside their neighbors. It is obvious that the Great Proprietor of the universe desires that men should not only enjoy essential equality in outward good, but that the soil should be sacred to common use. Hence the distribution of land under the Mosaic economy and the Jubilee provision, which were designed to prevent the soil from passing into the hands of monopolists. It was the marked intention to establish, and keep up, an independent yeomanry. Upon this depended the strength of the Jewish nation. This was their sheet-anchor; and so long as it was regarded in its spirit, as well as in its letter, that people were the happiest, most healthy the best clothed and fed, of any on earth. They had little need of commerce, for their wants were simple and provided for from their own beautiful vineyards, and olive-groves, and folds. They lived in harmony and peace, a nation of agriculturists. To this general doctrine, namely: the Divine wish that mankind should enjoy essential equality in outward good, the New Testament seems to add its seal; if not in its letter, in its spirit. It does not, it is true, give special enactments on this point, as did the Old. But be it remembered, that this is in accordance with the general plan which distinguishes the latter from the former dispensation. The Old Code was minute and detailed, specifying with nice and technical accuracy, the precepts and their correspondent penalties. The New Code marked down in letters of living light, certain great principles; and as it aware of the increased facilities which were soon thereafter to be enjoyed by the world for diffusing knowledge, and for testing conflicting sentiments, it made these the rule

of action on all points. Hence the absence of those minute specifications of precept relative to the conduct of mankind. A mighty gain accrued to man in this exchange. He was like the ancient mariner, who, becoming possessed of the magnetic influence, no longer needs his promontories, his capes, his various land-marks, to guide him over the sea. Yet not less clearly than the Old Testament do we find it in the New, that man's essential equality with his fellow man is the desire of the Creator. To this it may be added, that all correct views of parental impartiality offer their corroboration. And if history tells us, with unequivocal language, that in the multiplication of the number of independent freeholders lies an element of this equality, we may conclude that it is the Divine wish that they be increased. Distant, far distant, be the day, when the welfare of our beloved country shall be confided to a few who shall own the soil, while those who till it should be but tenants. And when I see the agriculturist of moderate means coming forward, and entering into fee-simple possession of the acres he cultivates, I rejoice in hope for the perpetuity of Free Institutions.

In the development which this occupation gives to the bodily powers, may be found no unimportant element of its dignity.

The continuous use of the various agricultural implements, and the necessary exposure to the weather, give energy and pliancy to the muscular system, far more effectually than did the ancient Gymnasia to the Athenian youth. It is a noble object to raise up a nation of manly men, capable not only of subduing the wilderness, but of defending our firesides and homes. It is no small consideration in the comparative merits of a given pursuit, to know its general effects on the bodily powers. Perhaps the greatest evil that grows out of the Factory system of Great Britain is its obvious and acknowledged tendency to deteriorate the operatives engaged in it, corporeally considered. Sooner or later this truth will flash upon the public mind there, with intense interest. It is believed that the amount of disease in that nation at this day, bears a greater proportion to the population than it has at any former period of her history; while at the same time the science of living and the medical art, have been on the advance. This is, beyond question true, of those diseases which follow in the train of in-door pursuits and sedentary life.

This point is worthy of further notice, unimportant as it may seem. For who does not know of the wonderful intimacy that exists between the mind and the body. Let the latter be healthy and well developed, and, generally speaking, the judgment of the individual is good; his reason clear; his temper calm; his courage firm. In time of alarm, of war, of sudden extremity, they are the men most to be depended upon. Look in upon the family circle of such a person. The ruddy hue of health—a color more beautiful than art can supply—mentles the cheek of his children. His offspring are inheritors of a vigorous constitution, a legacy more to be desired than rubies, and which no wealth can buy. On the other hand, let the body be puny, of soft and yielding muscle, incapable of energetic movement, and how intimately does the mind sympathise! It lacks decision, forecast, patient endurance, and calmness in moments of alarm. The passions are easily excited, and the poor man suffers worse than a thousand deaths. I am aware that there are exceptions to this general remark. Now

and then an individual is to be seen, whose frail tabernacle seems just crumbling into a thousand fragments, while his mental energies are vigorous, and his passions calm and subdued. But these are triumphs over nature; the subjection of the animal to the spiritual man. Thus reasoning, I affirm that the topic under notice is not among the minor benefits that are the result of the agricultural occupation. To my mind, it is a strange infatuation that leads us to seek the improvement of the various orders of the lower animals, while we honor not that department of life which tends to the corporeal improvement of man. In the strong-armed yeomanry of our nation, and in their capacity for bodily endurance, we have a pledge of safety and defence.

The Moral and Intellectual tendency of this Pursuit stamps it with dignity.

From the light of reason and Revelation we may unequivocally decide that the temporary sojourn of man upon earth is simply as preparatory to other states of being. We also perceive that our stay here is limited to a few years. Today we mingle with the busy multitude; tomorrow the places that now know us, know no more. But the most interesting consideration is, that our characters are receiving the elements of their future existence, be those good or bad. Although death will bring a change upon our corporeal organization, we have no reason to suppose it will upon our moral and spiritual. By this I do not wish to refer to any controverted theological point, but simply to note a fact which seems in accordance with sound philosophy. Indeed, we often find an honest monitor within, that whispers to us that we are all,—the oldest and the youngest—in the very childhood of our being. And when in the process of time we shall pass away from this lower world to the next, in the series of progressive development, we shall find that we in truth "knew but in part." We shall wonder at our exceeding ignorance while we were here. Happy for us, if now we lay this to heart; and irrespective of creeds or sects, examine the moral relations we bear to our Creator, and to our fellow men. Remember that I am advocating no particular system of religious belief. This is not an occasion for such a course. I am only desirous that we now take a general view of our relations to a Higher being. To my mind, the noblest form of man is that in which the individual fulfils every relation of life with calm and humble propriety, and at the same time intelligently examines his higher hopes, and performs his more exalted duties.

And herein may be perceived an element of the Dignity of the Agricultural Occupation. In this school, as I conceive, man may learn the noblest of moral lessons, and may hold peculiarly near converse with his Maker. Every day is teaching him faith—that King of virtues. When he casts abroad the seed and buries it beneath the ground, and sees it die there, what is it but faith and confidence in the Great Unseen that bids him wait in hope that there shall come up thence the tender blade, the ear, the full grain in the ear? What but faith and confidence can whisper encouragement to him when, as now the cold blasts of Autumn sweep o'er the earth, and strip the trees of their beautiful robes of green, and seals up the ground, the brook, the river? Ah, he knows that the time for the singing of birds shall come; that seed-time shall not fail. And though winter may long linger in the lap of Spring, and it seem that summer would

never come, the promise is relied on, and the Agriculturist waits, not in hope, but in certainty. Yes, my friends, all among this listening group who shall live through the few months before us, will see the sun return again to make us glad by his warmth and splendor. Yonder forest shall again put on its green vestments; yonder fields shall wave with grain; the children shall ramble in your woods and pick the wild flower and the berry. Oh yes, He that holds the planets in their course hath promised, and it shall stand fast! Indeed, all the operations of husbandry tend to teach the farmer faith and confidence in the Divine Being.

It is the school of *Patience* too. This trait is a cardinal element of a well adjusted character; and that pursuit which shall the best develop it, has a marked feature of excellence. The tendency of this age, indeed, of all ages, is to try to precipitate results. By this I mean that man is in a hurry to accomplish his ends. This leads to feverish ambition; to greedy speculation; to hazardous experiments; to restlessness and anxiety; all unfriendly to the higher virtues. That patience is a noble element of the moral constitution, scarcely need be asserted. We instinctively honor the man who lays down his plan of action and patiently pursues it to the end. It is to be admired in the highest and the lowest; in the man who sits at the helm of State, pursuing amid obloquy and reproach, the plan he deems for his country's good, and in the patient mother who sits day by day, and night by night, watching the dying child. To my view, this topic deserves more than a cursory glance. To educate man to be patient, seems to be a leading design of the Creator. Hence it is that no desirable results appear to be extemporeaneous. The man must first be a child, and pass through a long course of corporeal and mental development.—The rich harvest-field, waving with golden grain, must undergo a long and laborious culture. It must be cleared, sown, reaped,—the rain, the sun, and the fertilizing dew must by turns pass upon it before the desired result can come, and the husbandman can bear it to his garner, shouting "harvest home." That tree laden with fruit has been many, many, years in reaching the period in which it gives its juicy reward to the hand that placed the tiny seed within the ground. The raft of timber which floats down yonder river, to be made into ships and houses, is the product of a century's growth. Indeed, all things are the result of slow progression. It is a law, divinely established, an immutable. And that occupation whose tendency is to bring the mind into harmony and beat with this great principle, is pre-eminently desirable. That this is necessarily the case in your pursuits is evident. I know not a single desirable end attainable in it, but there must first be a comparatively long preparation. All that you eat, or wear, or sell, or possess, is the product of this law. In all your work this trait is constantly finding development. Let our country and our times be the scene and era of great trials, straits and difficulties, and in the patient endurance of men thus trained, we find a pledge that all which foresight and perseverance can accomplish will be done. Our national character is impulsive and ardent. It is this which leads to over-speculation, and periodical commercial embarrassment; and it is a pleasing reflection that in the class of men I now address, a bulwark of patience is thrown up to restrain its turbulence. By these remarks, I find no fault with our national ardor. No. It is the patient enterprise girding

our t6ritory with canals and railroads, and leading on the genius of civilization to a home on the Rocky Mountains. I only wish to rejoice that a balance wheel to this spirit is somewhere to be found.

Industry, frugality, temperance, being necessary to the worldly success of the farmer, are found to thrive in this society. In no other department are these better rewarded, and in none is the penalty of a departure from them so certain. "The soul of the sluggard desireth, and hath nothing"—"The sluggard will not plough, therefore shall he beg in harvest"—are truths as applicable to the husbandman now as they were when the royal preacher pronounced them.

In other particulars under this general head, Agriculture will bear a triumphant comparison with other secular callings. I do not include the clerical profession for that may be termed a sacred one. Look at that of the law for a moment. In its practice there is a necessary liability to high excitement of the passions. The fact that its field of labor is that of disputed points, and that a valuable consideration is at stake, and that there is uncertainty as to the issue, makes it a profession which addresses itself to all that is excitable in our nature. I do not say that its members are always thus excited in its practice, but that they are exceedingly liable to be so is clear. Still, that profession has its features of interest. A noble lawyer, one who looks beyond his own gain, and endeavors, with candor and honesty, to adjust rather than to make wider the difficulties among men, is a noble member of community. But though such men are to be found, my general proposition, that the legal profession is an exciting one, is true.

The merchant, too, occupies a station in which he suffers from some of the tendencies alluded to. His gains are measurably uncertain. He cannot generally calculate with certainty upon results. The produce in which he deals may rise or fall; the goods upon his shelves may be more in quantity than the demand; and he cannot always rely upon prompt payment from his customers. This latter contingency seriously affects him; for at times he may see bankruptcy staring him in the face, as a consequence. But allowing that no extreme result like this occur, the very uncertainty consequent upon ever varying markets tends to a feverish state of mind, to which the man of the soil may be a stranger.

So with the medical man. He is the community's bond-slave, noble and philanthropic as is his intrinsic position in society. By night, by day, in fair weather and in foul, he must ride upon his often ill-requited errand of good. And rarely indeed can he calculate with certainty upon a specific income from his services. The contingencies of his profession are not friendly to the maturing of the calm and patient sentiments, as compared with that of the husbandman.

A passing remark may be thrown in as regards the intellectual advantages of the agricultural occupation. The condition and habits of life of the farmer, lead him to reason as do all true philosophers, namely, from facts. He comes not in contact with the hair-splitters of the schools. He instinctively reasons from cause to effect, and backward from effect to cause;—the only true logic, by the way, that is abroad; a logic which is oftener found by the farmer's fireside than in the temples of Aquinas. They are not men of the *copia verborum*, it is true, their mind being busy with truth,

rather than with its philological garb. The farmer sees in his department of labor a thousand things which he cannot understand, and it thus becomes a habit with him to spend but little time in agitating subtle points. He is content with pursuing inquiries on matters of obvious importance, and on which success will attend the reasoning of manly common sense. Hence his mind is in a healthy tone: and on matters of common concernment, as at the ballot box, or on the jury, and in the various social relations, his judgment is to be relied on. I have mingled much with men of every condition in all countries, and have a hundred times declared that if my *all* were at stake I would rather call to the jury twelve independent farmers than any twelve men from the other occupations. I believe they are the most accustomed to calm, sober, and intelligent thinking.

The remarks I have made apply with much propriety to the first settlers of a country. Of this class a large majority of this audience is composed. The first settler is the pioneer of civilization. He must go in advance of all others. Without his hardy energy, and his willingness to undergo the peculiar privations attendant upon the clearing of a new country, but little land would be possessed by man; and the human family would be crowded into the narrow neighborhood of the sea-coast. Once our whole vast territory was a solitary wilderness. The wild Indian roamed the forest, and gathered a precarious living by the toils of the chase. These noble rivers, these nobler lakes, were solitary. No keel, save that of the bark canoe, marked its pathway upon them; no voice save the wild fowl's, and the war-whoop, woke the long and dead silence. But the pioneer settler pressed his way hither, and before his axe, and his nerved arm, the wilderness fell, and beauty and comfort followed in his train. And now while I speak, the same process is going on all around. He who shall come after us, and shall pass through this territory a few years hence, shall find these rough and stump-filled fields like a garden. Yes, to you who are engaged in clearing the land all owe a debt. And when I ride along at the calm and still hour of summer twilight, and see the pillar of blue smoke rising up from the half-cleared field of the pioneer, I involuntarily exclaim, how much more desirable are such monuments of praise than are the mausoleums, and pagodas, and sculptured marbles which stand in the Old World in commemoration of the warrior's prowess or the tyrant's reign. Truly these are the "men of the iron-nerve."

(To be continued.)

THE POTATO.—The climate and soil of Maine, like Nova Scotia, and other British provinces, north, seems peculiarly adapted to that mealy esculent root, the potato, so indispensable to the table and so excellent a substitute for bread. In fact, there is nothing that can supply its place, and it is itself a great nutritional element of life—as we see in the ruddy Irish people, who live on this wholesome food, and butter-milk, scarcely less nutritive and healthy. The people of Ireland, after all we hear of starvation, never need complain of that, nor would they, while they can have their cow and their potato patch, whether the luxury of the knowing little pig is superadded or not to give a *gusto* to their repast.

Maine potatoes, from the immense quantities exported this year from the soil of their lake and

river borders, and sent South, seem to threaten to take the lead even of the Irish, Nova Scotia, and Lancashire. If the qualities are improved to the degree the soil and climate admit, Maine has a mine of gold in reserve, surpassing her timber lands. She is now getting a return for the flour she was indebted to the South for last year. It is a doubt in our minds whether a luscious mealy potato is not full as wholesome as bread, though not having as much nutriment—we mean bread such as is generally baked for us, often doughy and indigestible, as well as sour and adulterated. Certainly, the West Indians are idolatrous worshippers of Ireland's vegetable jewel;—and with all the yams, sweet potatoes, bread fruit, &c. of the farinaceous tribe that daily garnish their sumptuous tables, each in itself excellent in its way, they cannot live without the potato of the North, which is generally ten times more valuable than the orange, the pine, &c. that we prize so much. It is considered as the peach is deemed by us, and is to food in general what that is to the dessert. Long live the Potato!—*N. Y. Star.*

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Jan. 5, 1839.

Pears.—A large and beautiful fruit, oblong and somewhat truncated in form, of a yellow color and breaking—tolerable only for dessert, but must prove fine for baking, by George Brown, Esq. of Beverly.

Apples.—Chandler apple, by Mr Grosvenor, a first rate red winter fruit.

A large red fruit of fine flavor and very beautiful; much resembling the Baldwin; by John Prince, Esq. of Roxbury.

For the Committee,

WILLIAM KENRICK, *Chairman.*

Saturday, Jan. 12, 1839.

EXHIBITION OF FLOWERS.

Mr William E. Carter, of the Botanic Garden, Cambridge, presented a seedling *Camellia japonica* variety, for which the specific of *convoluta* was suggested. A flower of much merit, and the foliage large and very beautiful.

For the Committee,

S. WALKER, *Chairman.*

In feeding horses with grain, the proper quantity of the respective kinds is regulated by weight, for in this proportion are the different kinds considered nutritious. As for example, we give to a horse per day, half a bushel of oats, the weight of which is 17 lbs., and if we wish to change to other grain, as barley, rye, or Indian corn, the same weight will suffice: and as these grains are much heavier than oats, a proportionate less quantity by measure, will suffice. Another rule, deemed important, is this that whenever heavier grain is substituted for oats, a quantity of fine cut straw should be added, as a substitute for the husk of the oats. This induces a more perfect digestion of the grain.

A CHUCKLE.—We learn from the Pickwick papers, that when a man bleeds inwardly, it is a dangerous thing for himself—but when he *laughs* inwardly, it bodes no good to other people.

(For the New England Farmer.)

CAPIAUMONT AND FREDERIC DE WURTEMBERG.

I have perused with much attention, the remarks of Mr Lowell, in your valuable journal of the 7th Nov. last; but my answer has been thus far deferred, owing to my recent journey and long absence at the south.

Hitherto it seems to have been a point, admitted on all sides, and as I believe doubted by none in this country, that the fruit which was sent by Mr Knight, as the Capiaumont, was one and the same fruit, as that of the same name which is figured and described as the Capiaumont, in the Pomological Magazine; and that both were one and identical. Lately, however, having considered the subject more attentively, I have arrived at the conclusion that those two fruits are distinct and separate, and thus far I now fully agree with Mr Lowell, that the fruit which is there figured and described in that publication is in reality the *true Beurre Capiaumont*. Here then, I must now freely and candidly admit that Mr Lowell must be right. But that this fruit is *not* identical, as has been heretofore believed by some, with that Capiaumont which was sent by Mr Knight to Mr Lowell in 1823, is what I shall now attempt to prove. Also, that the Capiaumont of Mr Knight, which was thus sent hither by him with the wrong name, is in reality none other than the *true "Frederic de Wurtemberg" of Van Mons*, and that this, and no other, is its only true and proper name.

1st. The Capiaumont of the Pomological Magazine is figured and described as a "*middle sized fruit*"—its height 3-4 inches by about 2-1/2 inches in breadth. The Chevalier Parmentier, in his list of fruits, to which Mr Lowell has referred, has also described it as a fruit of "*middle size*"—so also has Mr Thomson, in his Descriptive Catalogue of the fruits grown in the garden of the London Hort. Society. Both those writers, have classed this fruit with the *Citron des Carmes, Beurre Crap-paux, St Ghlislain, Sucre Vert, Suisse*, &c. all which are designated by them as fruits of "*middle size*." While each, and all of those authorities concur in describing the Jargonelle (of the English) and Easter Beurre, the Marie Louise, Passe Colmar, and Napoleon, as of "*large size*." In the Pomological Magazine, this last named fruit is figured as containing full twice the volume of the true Capiaumont. Now we all know that the Capiaumont of Mr Knight is also a *large fruit*; in similar soils and situations, its height and its breadth being fully as great, if not greater, than any of those, kinds above named, which all those authors have called "*large fruits*."

2d. The color of the fruit as described in the Pomological Magazine is "a fine clear cinnamon, fading into yellow in the shade, and acquiring a rich bright red next the sun." But Mr Thomson, whose pre-eminent accuracy and intelligence are so fully acknowledged by the editors of that publication, has since described the same fruit, in the descriptive catalogue of fruits of the garden of the London Society, and perhaps with greater accuracy, as "*brownish red*." But this description evidently belongs not to the Capiaumont of Mr Knight, which is very peculiar as well as beautiful, and of a *brilliant or splendid red* next the sun; no fruit is more so that I have ever seen; the color yellow in the shade.

3d. The wood of the pear sent by Mr Knight, is

of *yellow color* and strong—its color much resembling that of the Williams Bonchretien, or Bartlett. The leaves expanded, *not recurv d*: their color corresponding with the basis of the fruit—and of the wood, is also yellow, which color they retain with but little change, till they fall in autumn. But, according to the colored engraving in the Pomological Magazine, the wood of the true Capiaumont is *dark crimson brown*, and is thus described in that work—"Wood clear reddish brown, sprinkled with white spots." But this description does not apply to the wood of the tree sent by Mr Knight. The leaves also appear to differ as much from those of the Capiaumont of Mr Knight as does the wood, and are there described as follows—"Leaves ob-long, narrow, much folded and recurved."

In the year 1823, or spring of 1824, I received specimen trees of the Capiaumont from Messrs. Prince & Sons, which they had obtained from the most correct sources known to them in Europe—the wood *brownish red, or dark brownish crimson*, and conforming to the colored engraving and description in the Pomological Magazine. In the next year I sent to them again, and received trees of appearance similar, from this same source, as did Mr Manning in the previous years. These circumstances awakened our suspicions until we became fully convinced that great error existed somewhere, either in regard to these specimen trees received of Messrs. Prince, or in the tree which was sent by Mr Knight. To satisfy ourselves more fully on this point, about the year 1831 or 1835, we sent direct to Mr Thomson, of the garden of the London Horticultural Society for scions of the *true Capiaumont*; at the same time we also sent to Dr Van Mons, for scions of this same fruit. These we received from both sources, and all conforming in the color of the wood to those before received of Messrs. Prince & Sons, and also to the description and colored engraving in the volume above named:—the wood of but medium strength and *dark brownish red*;—or of a color full as dark & no much resembling the wood of the St Ghlislain, the Easter Beurre and the Belle de Flanders.

In Feb, 1837 we received specimen trees of near two hundred names of pears from Messrs Baumann of Bolwiller and from another source near Paris, and the most correct sources then known to us in France, and amongst these was found, by name, the *Beurre Capiaumont*. These trees being inoculated on the quince stock, have since borne fruit, both here and at Mr Ives'; the fruit of "*middle size*," and turbinate, or, conforming in appearance to the description of the fruit in the English publication;—the wood also of the same *dark red complexion* as of all the specimens before received, of Messrs. Prince and Thomson and of Dr Van Mons. In all the trees of this kind, as I have particularly noticed, the leaves late in autumn assume a color corresponding with that of the wood, becoming of a dark red dye.

Thus have I attempted to prove, not by assumption alone, but by evidence, that the Capiaumont which was sent as such, by Mr Knight to Mr Lowell in 1823, is *not the true Capiaumont*. Here then are the facts, the concurrent foreign testimonies,—of the Pomological Magazine, of the intelligent Mr Thomson of the garden of the London Society—of some of the most intelligent men of France—also of Dr Van Mons and of Flanders. Were it necessary here, I might again add also the testimony on this point of M. De Wael.

It now only remains to show what the Capiaumont thus sent by Mr Knight *actually is*, or to show

by evidence which we believe most true and conclusive, that the "*Frederic de Wurtemberg*" is its only and proper name.

In my former communication, I have stated, that when about four years since, I was at Salcin, Mr Manning had called my attention to a tree received by him in that year from Messrs. Buel & Wilson as the "*Roi de Wurtemberg*;"—and believed to have been received by them amongst other kinds which they had obtained from the garden of the London Horticultural Society. This tree, on inspection, we both pronounced to be the same, in all its likeness and similitude, as the Capiaumont which was sent by Mr Knight; it has since borne fruit, which has been exhibited, and proves to be identically the same as that received of him. Since that time we have sent direct to Dr Van Mons of Louvain in Flanders, for scions of the "*Frederic de Wurtemberg*," and he also has sent us the scions of the "*Wurtemberg*," and these same scions engrained by Mr Manning, have also produced fruit which has been exhibited by him, and which proves to be identically the same with the "*Roi de Wurtemberg*" previously received from Mr Buel, and also the same as the fruit sent by Mr Knight as the Capiaumont in 1823.

No reason seems to remain for the basis of the supposition, that any mistake could have occurred on the part of Dr Van Mons, at the time he sent us the "*Wurtemberg*," *originated as it was by himself*, since it proves to be identical with the fruit of the same name which was sent by Judge Buel, and by him obtained from another source. This concurring testimony seems the more perfect and complete, coming at once as these specimens did from two opposite sources and distant points.

Mr Lowell appears to doubt, whether the *Frederic de Wurtemberg* existed, or had a being, at the date of 1820—and seemingly for no other reason than because it is not to be found in the list of M. Parmentier of 1824. He observes on this point—"I prove that Mr Knight must have had this pear in 1820, probably in 1818. Can Mr Kenrick show that the *Frederic de Wurtemberg* then existed? I need not spend words to show that Mr Knight could not have sent me a pear which had no being!! This is not a frivolous or captious objection; for M. Parmentier was requested in 1824 to make a list of all the pears he then knew. He did, and the London Society voted him their gold medal of the value of ten guineas for it. In that list the *Roi de Wurtemberg* and the *Frederic de Wurtemberg* are not found."

To the above I reply, that the *Wurtemberg* is not the only fine fruit which then had a being, though unknown to M. Parmentier at the time he formed his list in 1824, and therefore omitted by him from this cause; the Angouleme, our own far famed Seckel, and many others, could be named, which are also of this number, and omitted in that list from this same cause.

At what period of time the *Wurtemberg* was originated, I am at present unable to say, but that it had existence previous to 1820, cannot as I think, with reason be doubted; as it certainly is sufficiently evident that it did exist previous to the date of M. Parmentier's list in 1824. This I infer from a notice of this fruit in the abridged descriptive catalogue of fruits contained in the collection of Dr Van Mons, which was printed at Louvain in 1823. In that catalogue, at page 26, mention is made of the "*Frederic de Wurtemberg*;" as a kind originated by Van Mons himself, and so named by

him at the particular request of the King. This notice occurs in the *premier* or 1st series, which includes many of the old kinds as well as new. But all of those kinds which were then but of a very recent date, are enumerated only in the 2d and 3d series of that work.

WILLIAM KENRICK.

Nonantum Hill, Jan. 1, 1839.

IMPORTANT IMPROVEMENTS IN MAKING BEET SUGAR.

The editors of the *New York Observer* have been favored with the following letter from Hon. H. L. Ellsworth, commissioner of patents, to a friend in New York, with permission to publish it.

Washington, Oct. 10th, 1838.

DEAR SIR,—Since your leaving the city, I have had the perusal of a late paper published in Paris, containing a communication from M. Michael Chevalier, on the subject of Beet Sugar. It would indeed seem that we must soon approach perfection, so quickly is one improvement crowding upon another! The difficult and tedious process of ordinary evaporation, with all the concomitants of blood, animal carbon, &c. &c. are to be dispensed with, and instead of three, four, and five per cent., nine per cent. is to be surely obtained in less time and with half the expense; in addition to this, the common sugar is refined without any new solution, or even changing the moulds.

Desiccation, or drying of beets, has been recommended. This is certainly the correct principle, as such noxious matter is carried off by evaporation and the bulk of the beet is reduced five-sixths, enabling the farmer, who lives at a distance from the factory, to transport his produce with trifling expense. Experiments made before the French Academy, show that there are in 100 pounds of beet, 85 pounds of water, 10 5-10ths pounds of sugar, 5-10ths of mucilage, and 4 pounds of fibrous matter. This was extracted by M. Beyrand in eight minutes, by the aid of heat and pressure. In the Dutchy of Baden the slower process is adopted, and one better suited to large establishments. M. Schuetzenbach, at Baden, cuts the beets into pieces one-third of an inch apart, by a vertical knife. These are again subdivided by other sharp knives. As soon as they come in contact with the warm air they curl up, and lose all their adhesive property, (so common to some vegetables) and allow a free circulation of heat in the kiln. Kilns are heated to 34 or 40 Reaumur. The apparatus of Mr S. is simple. The cutting machine costs not more than \$100. One half a horse power is sufficient to propel this, and working every day for three months, it cuts 1,000,000 kilograms, equal to 1,093 tons.

A stove, or kiln, 10 feet long by 9 feet high, during 24 hours dries 3000 pounds of beets, and consumes 420 lbs. of charcoal. Three such stoves or kilns would dry all that would be cut with the above machine. Mr S. reduces the dry beet to a coarse powder, and stows this away in casks or bins, sprinkling it with lime. In this manner it will keep perfectly good a long time. When it is wanted for manufacture, a small quantity of water is added to it, which produces sweet water, which is easily evaporated by Roth's apparatus, without any other preparation. The first crystallization produces what is called "a good fourth," which after a second crystallization makes a common sugar.

The advantages of this method are such, that beets in 1837 (less rich than former years,) yielded 8 per cent. of sugar, instead of 5 per cent., which was the highest by the old process.

A great desideratum is now obtained of making refined sugar by the aid of pressure in three days, without a change of the moulds! In the old mode it required three weeks.

The researches of a young chemist of Toulouse, promise great advantages. He has invented a new saccharometer, by which he can discover to a fiftieth part, the richness of the saccharine matter in beets, and all other substances containing crystallizable sugar. As I remarked before, 100 pounds of beets contain 10 pounds of sugar, allowing one per cent. for waste, nine per cent. remains. To dry the beet and extract the sugar, does not cost over ten francs: add to this, the cost of the beet twelve francs—twentytwo francs; making ninety pounds of sugar cost \$1 50-100 or five cents per pound; and, for refining and other contingencies 50 per cent., and excellent refined French sugar costs only about 7 cents a pound.

To perfect the present inventions the French Government have offered premiums to discover the best method of drying the beet—extracting the sugar—converting raw sugar into refined, without changing the moulds, also for the best saccharometer.

What greater encouragement is needed, if these discoveries can be brought to this country. How desirable is it, that there should be an agricultural bureau added to some department of the Government to watch over these interests. No country has neglected the laboring classes who till the ground so much as our own—but I will not enlarge on this point, for Congress seem disposed to take up the matter, and will I trust do something corresponding to the magnitude of the subject.

When we consider that our rich lands yield 20 tons of beets per acre, equal to 40,000 lbs., and that nine per cent. would give 3,600 lbs. of sugar, leaving a valuable residuum for agricultural purposes, we must congratulate those whose means have so long denied them the full enjoyment of one of the greatest luxuries of life, and congratulate our country too, on such additional means of making us independent.

Since writing the foregoing, I have learned that Mr Charles L. Fleischmann, a naturalized citizen of the U. S. and for the last two years a resident of this city, has in preparation a paper on this subject, showing the present state of the manufacture of beet sugar on the continent, which will soon be laid before the public. Mr Fleischmann is a native of Bavaria. He was educated in the Royal and Polytechnical schools at Schleissheim, near Munich, and in consequence of his attainments was on his graduating, appointed Inspector of the Public Domain, and director of the estates of Count Seinscham, which comprise twentyfour villages. Should any company be formed in this country, for the cultivation of the Beet, and the manufacture of sugar, I know of no one so admirably fitted by his education and experience, for the service of such an association; and I say this, less from a personal regard and respect which I entertain for Mr Fleischmann, than from the earnest wish I feel for the early and successful introduction, on an extensive scale, of this new source of national wealth into our country. With great regard,

(Signed) H. L. ELLSWORTH.

WATERING CATTLE IN THE WINTER.

Perhaps it would excite the surprise of many of our readers, should we assert that cattle generally suffer more from thirst in winter, than during the heat of summer. Yet there is strong reason to believe that this is to a great extent the case. Cattle whose winter food consists entirely of hay, straw, and other dry materials, need a plentiful and frequent supply of pure fresh water. This many do not obtain, as nearly all running streams are covered with ice, so cattle are obliged to wander a considerable distance from the yard to the watering place, through deep snows or over a slippery path, exposed to the annoyance of dogs, or to be gored by other cattle, and rather than endure this, they often suffer much from a want of water. It has been ascertained that a bullock, who has water at command, will drink it eight times a day. It should always therefore be easy of access to cattle at all times; and not on a distant part of the farm, or in the open road, so that in order that cattle may help themselves to it, you are obliged to leave your gate open, or burn-yard bars down, and thus your yard is thronged with vagrant colts and other ill-bred animals, who take possession of whatever fodder they can lay their mouths upon, and pay no regard to the rights of *meum* and *tuum*. Dr Anderson says that he knew a man who became very rich by being great in little matters, that is attending carefully to things which other men consider of too little consequence to claim their notice; and this man always made it a point to see that his cattle, particularly his milch cows, should have a constant supply of the purest water.—*Farmer's Calendar.*

MILLET.—The more experience we have with this production, the better we are pleased with it, and the fact of the deficiency of the pastures the present season urges us to suggest the propriety of farmers introducing its culture into their respective systems of husbandry. How fortunate it would be for those who are now compelled to feed out their winter stock of hay, had they been so fortunate as to flush up a few acres of their harvest fields, after the grain was cut off, and put it down in millet, to cut and feed their stock. Two acres of it in good ground, would yield grass enough to soil twenty head of cattle six weeks, and carry them in good condition into the middle of autumn. Should such precaution be taken in future, and the necessity for the use of it as green food not occur, it could be suffered to ripen its seed for market, which, after being threshed out, would leave a large quantity of excellent provender to add to the winter stock.

But whether drought should occur or not, if cut and given to the milch cows, from its succulence and nutritious qualities, it would greatly add to the yield and quality of the milk and butter, and thereby increase the revenue of the dairy.—*Farmer and Gardener.*

A new mode of furnishing masts to steam vessels, by which they may be set up or taken down, when required, in less than two hours, has lately been invented in France, a description of which was read to the Academy des Sciences. The improvement consists in making the masts of numbers of sheet spars, capable of being so well joined as to equal the solidity of ordinary masts.

NEW ENGLAND FARMER,
AND GARDENER'S JOURNAL.

BOSTON, WEDNESDAY, JANUARY 16, 1839.

NOTICE.

The subscriber, Commissioner of Agricultural Survey, has taken, for the winter, an office at No. 52 North Market street, over the office of the New England Farmer and Agricultural Seed store, where he will be happy to see his agricultural friends on the business of his appointment.

He may be ordinarily found at his office from 9 to 12 M.; and his agricultural friends will find his office open at all times of day, and the agricultural publications and papers of the country at hand for their perusal.

HENRY COLMAN.

Jan. 1, 1839.

NEW ENGLAND FARMER, AND SEED STORE.

We regret to find, that, with some of our friends, misapprehensions have prevailed as to the course which the Farmer has pursued in notices of or omissions to notice agricultural improvements, and that unfavorable inferences have been made as to its impartiality and disinterestedness in the great cause to which it has now been for sixteen years steadily devoted. We are happy to go into this subject; and ask only a candid and just verdict, after all the evidence of the case is in.

It has been said, that the New England Farmer has refused to notice improvements made in ploughs by some of their contemporaries, and to publish communications respecting them, lest the commendation of some other plough might injure the sale of Howard's plough, of which the proprietors of the New England Farmer are the manufacturers, and the owners of the patent right. This is an error. It is not true that the New England Farmer has ever declined or refused to publish communications of an intelligent character, and respectable in manner, in reference to any plough, to any agricultural implement, or to any agricultural improvement whatever. It has not done it. It does not wish or design to do it. On the contrary it invites such communications; and promises a fair field to any temperate discussion of any subject connected with agriculture, seeking to correct error; to remove prejudice; and in any and every way to advance science and improvement. So far from wishing to stifle light on these subjects by covering it with a bushel, we would anxiously lift it as high as our little candlestick will enable us to raise it, that it may give light to all that are in the house. This was the course pursued by the cautious and lamented founder of this journal, who belonged emphatically to the family of the Searchers and Inquirers after truth; and who had not only no connexion by blood or affinity with the Knowall family, but as far as his exemplary benevolence and courtesy would permit him to do it, he even disdained their acquaintance. If we therefore should be recreant or faithless in any measure to the cause of free discussion and free inquiry in relation to all agricultural matters in the New England Farmer, we should be afraid that we should see his ghost at the foot of the bed frowning upon us after we had blown out the light; and we should get no sleep that night.

The ground of the misapprehension we suppose has been this. We have in some cases declined inserting in our journal the business advertisements of other agricultural publishers and seed and machine dealers. As the New England Farmer is not an advertising paper, excepting incidentally, we have never felt bound to admit

advertisements of any kind in any case; and in the next place, we have felt at liberty to give our own the preference, and have not always had room enough for them; but have many times been under the necessity of suspending or excluding our own for the sake of giving our subscribers more editorial matter and more general reading.

We will say in justice to ourselves, that we have no prejudice nor ill-humor towards any of our contemporaries engaged in the same line of business with ourselves. We shall not begrudge them any honest success; nor envy them any success obtained by dishonest means, if perchance they should in an evil hour be tempted to resort to any such means, an occurrence the possibility of which we do not mean to affirm or even to insinuate. We wish them well. Competition is the life of trade; and in an honorable rivalry, who shall do the most and the best for the cause of agriculture, we are always ready to engage. We mean to sell the best seeds and the best implements that can be had; and on the most liberal terms. If any will do better than we do in this matter, we shall drive the spurs home and lay on the whip, and see if we cannot keep still ahead. We will not crowd our neighbors from the course nor bolt ourselves. The horse we ride as seedsmen and machinists is the American Eclipse. He has been long known on the turf; and therefore we do not think it necessary to say any more of his speed or bottom. They will speak for themselves. We are no jockies and we disdain all tricks. We ask for the purse only when it is fairly won.

The New England Farmer as the pioneer of agricultural intelligence in New England and the United States will hold its columns open to every intelligent and practical agriculturist, who will favor us with the result of his inquiries or experience. It will not of course be supposed that we endorse all the sentiments, opinions, or theories, which we publish. This cannot be expected of us though we do not always take pains either to deny or refute them. Our opinions shall not be withheld, where the occasion demands their expression, and where they have been made up upon fair inquiry and full evidence. The reports of all committees of Agricultural Societies in relation to anything connected with the subject shall always be cheerfully given to the public as soon as received, without alteration or abatement. We shall be anxious not to propagate errors of opinion in any form or under any circumstances, where they would do harm. Rather than do this we should prefer at any time that our "whole form should be thrown into *pi*." Our great object being the advancement of a sound and profitable agriculture, we shall bend all our forces to this point; and cherishing nothing but gratitude to our benefactors, whose kindness we highly appreciate, and good will to our competitors, whose honest success we hope will stimulate us to new exertions in the common cause, we shall take care whatever happens to our form that nothing shall throw our good humor into *pi*.

THE PROPRIETORS OF THE NEW ENGLAND
FARMER, AGRICULTURAL WAREHOUSE
AND SEED STORE.—No. 52 NORTH
MARKET STREET, BOSTON.

SUMMARY OF THE WEEK.

CONGRESS.—No measure of importance has yet been matured in either house of Congress. The disposition of the Smithsonian bequest, amounting to half a million of dollars, for the purposes of education, has been under consideration. We can only express the hope that a plan of the most liberal character will be matured and adopted.

STATE LEGISLATURE.—The government of the State for the current year has been completely organized; and

the message of the Governor received. It is a document full of interest to the citizens of the Commonwealth. The condition of the finances of the State are particularly commended to the attention of the Legislature. There are few things more perilous to prudence and virtue in States as well as individuals than too much money or too much credit. Improvidence grows up in such cases like weeds from a compost heap. We have got somewhat into debt. The most disagreeable item, and one of the largest, is our county expenses, which we suppose are occasioned by prosecutions for crimes or infractions of the law. The natural inference from this fact is a painful one. From an inquiry proposed in the Senate we shall know more of this matter presently. When we know more, we shall say more. We say now only in passing, that the great object of wise and humane Legislators should be to prevent rather than to punish crime. In this benevolent work we console ourselves with the belief that the world is advancing. May a merciful Providence speed its progress.

THE BOSTON CULTIVATOR.

We have been honored with a notice from the Boston Cultivator, which perhaps deserves a passing remark. Whether the promise in the prospectus was that the Cultivator should contain a quarter more matter or the sheet be a quarter larger than the New England Farmer, does not constitute a remarkable difference. If it were to be a quarter larger it was a fair inference that it would contain a quarter more, as the Cultivator would hardly offer it as an inducement to subscribe that it was to contain a quarter more blank margin than the Farmer. This is a beautiful example of special pleading, which we think could have been learnt nowhere else but at the bar of some Justice's court.

The insinuation that we were disposed to steal his title by saying in our address, that the N. E. Farmer was eminently a family paper, is admirably well timed when the facts are considered. There is a point in the case which we think will puzzle his forensic sagacity to dispose of. The address to the public in the N. E. Farmer in which it is said that the New England Farmer has been eminently a family paper, was published on the 26th of December. The prospectus of the Cultivator first appeared in the Boston Courier of the 25th of December. The first number of the Cultivator was issued the 2d of January. Now how could we know that the Cultivator was to be called a family paper before it was announced to the public. We should like to be informed by what art the sex is to be ascertained before the child is born. If the Boston Cultivator will teach this philosophy it will certainly contain a good deal more matter than the N. E. Farmer, and we shall cheerfully recommend it to Col. Stone of the New York Commercial and all the disciples of Dr Poyen and Miss Gleason.

We are entirely disposed to keep the peace; and do assure the respected editor of the Cultivator in perfect good humor that we shall not come near him again even with a friction match; and that at least while the weather remains cool we hope his milk will not sour. We shall be happy to exchange papers with him and will cheerfully pay him any boot which either the superior size or character of the Cultivator will in his own judgment authorize him to demand. Instructed by his example we will behave as well as we know how. When Judge Spooner, formerly of Plymouth, a man pre-eminent for his suavity and courtesy, in passing through his barnyard one morning, was knocked down by a ram, his politeness did not even then forsake him; but brushing the dirt from his clothes and taking his hat in his hand he made a low bow to the assailant and in the gentlest tones besought him—Don't butt again, Mr Rammy! Don't butt again,

Mr Rammy! How can we do better than to follow this good deacon's christian pattern. We bow, therefore, respectfully to the editor of the Cultivator and beg him to relax the muscles of his neck and raise his head. And don't butt again Mr Cultivator! Don't butt again!

THE "UNCHRISTENED CORRESPONDENT."
OF THE N. E. FARMER.

ERRATUM.—In our last number we spoke of the beautiful New Year's Address of the Carrier of the Salem Gazette as "p'athetic." The printer, who we presume is a blazing patriot, could make nothing else of it but patriotic. What a goose! We hope the gentle author did not see this blunder. The mistakes of these fellows are outrageous. "Our sufferings is intolerable." There is a frightful boy in the office, while the printers from time immemorial have called by a very bad name. From their mistakes we should not be surprised to find, if we could pull their stockings off, that our compositor and proof reader belonged to the same family. They certainly play the deuce with our manuscripts.

FOR SALE, A FIRST RATE FARM.

Well situated on the road leading from the Theological Seminary in Andover, to the old Boston road; lately owned by Peter F. Shed, and well known as the David Blunt Farm, containing 70 acres, more or less. There is about 20 acres of good Woodland within sight of the house. The remainder of the farm is in good condition, and is generally considered, by those acquainted with it, to be "a garden spot." There are from 300 to 500 apple trees on the place, independently of other fruit trees of great value. The farm is well watered, the buildings in first rate order, and there are upon it three wells of excellent, soft water. It is well situated for a gentleman wishing for a residence in the country, being retired, and yet in the immediate vicinity of the public Schools and the Theological Seminary;—or for the farmer, who wishes to raise vegetables for market, the land being all good, and markets near. It lies about half a mile from the Ballard Vale Factory, one mile from the Rail Road depot, and nine miles from Lowell. There are upon the place about ten cords of manure. The conditions of sale will be liberal, the owner being obliged on account of ill health, to go South.—For particulars, inquire of the subscriber, on the premises.

ANDREW B. STIMPSON.
Andover, January 15, 1839. 4w

MONOGRAPHY OF THE CAMELLIA.

Just published and for sale by Joseph Breck & Co. at the Agricultural Warehouse and Seed Store, a Monography of the Genus Camellia, or an Essay on its Culture, Description and Classification, illustrated by two Synoptical Tables: the first containing the names of two hundred and seventy varieties, with the color and form of the flowers, the species or variety which have produced them, the place of their origin, and the period of their introduction into Europe; and the second presents two ascending gamuts, in which are painted the shades of color peculiar to the known Camellias, with their specific denominations. By the Abbe Berlesse, member of several French and foreign learned societies. Translated from the French by Henry A. S. Dearborn.
Jan. 15, 1839.

WANTED.

A skilful, honest, industrious farmer and kitchen gardener to take a farm in the county of Bristol, near to the Providence market, to take and manage on shares, a pretty extensive establishment for raising and selling hay, corn, vegetables, fruit, milk, pigs and poultry. No one will be received without the best recommendations. Apply at the N. E. Farmer Office.
C. WEEKS.
Jan. 15, 1839.

WANTED.

In the Seed Garden, connected with the New England Agricultural Warehouse, a first rate farmer; one who has some knowledge of the management of hot beds would be preferred. Inquire at the N. E. Farmer Office, Nos 51 & 52 North Market St.
JOSEPH BRECK & CO.

NOTICE.

A person now in the Nursery business, on a limited scale, who has peculiar advantages for its extension, not possessed by any other individual in this country, wishes to connect himself with some person who can furnish a small capital, sufficient to make the business both pleasant and profitable. Inquire at the office of the N. E. Farmer.
Nov. 21, 1838.

BRIGHTON MARKET.—MONDAY, January 11, 1839.

Reported for the New England Farmer.

At Market, 210 Beef Cattle, 75 Steers and 600 Sheep.
Prices.—Beef Cattle.—We quote to correspond with last week, viz: First quality, \$7 25 a \$7 50 Second quality, \$6 50 a \$7 00. Third quality, \$5 25 a \$6 50.
Sheep.—Lots were taken at \$2 75, \$3 00, \$3 50, \$3 75 and \$5 00.

Swine.—None at Market, and not in demand.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending January 13.

Tulips Ranunculuses, Anemones, Auriculas, Carnations, Picotees, Pinks, and Geraniums.

H. GROOM, of Walworth, near London, England, by appointment Florist to Her Majesty Queen Victoria, begs respectfully to call the attention of his friends and the admirers of flowers in America generally, to his extensive collection of the above flowers, which from his having been very successful in their cultivation this season, he can offer at very moderate prices. He would particularly recommend to those persons about commencing the growth of the Tulip (which in England is becoming very fashionable) the under collections in beds, as it is by far the cheapest mode of purchasing them.

Tulips arranged in beds with their names.

First Class.
A bed of 30 rows containing 210 bulbs including several of the newest varieties, - - - - - £15
A bed of 45 rows, - - - - - £21
A bed of 60 rows, - - - - - 25 guineas

second Class.
A bed of 30 rows including many fine sorts, - - - £10
A bed of 45 rows, - - - - - £14
A bed of 60 rows, - - - - - £17 10s

Tulips not arranged.
100 Superfine sorts with their names from £7 7s to £13
Superfine mixtures, from - - - 7s 6d to 21s
Ranunculuses.
100 Superfine sorts, with their names from £3 3s to £5 5s
Superfine mixtures, from 5s to 21s per 100
Anemones.
100 Superfine sorts with their names, - - - £3 10s
Superfine double mixtures from 10s 6d to 21s per 100
Auriculas.
25 Superfine sorts with their names, - £3 13s 6d
Catalogues with the prices of the other articles may be had on application.

Orders received by JOSEPH BRECK & CO.
Nov. 1. cow.

FARM FOR SALE.

A Farm situated in the westerly part of Townsend, on the road leading from Townsend west village to Worcester. Said farm contains 110 acres of land divided into mowing and pasturing, and a large share of wood and timber, one story house, with two front rooms, kitchen, buttry, and two bed rooms well finished; parlor papered; wood house; well, under cover, forty feet barn, and shed, a large sheep house, fifteen by thirty feet, a large cooper shop, and another small house well finished, on the lower floor; a good aqueduct, which comes into the barn yard, and timber land. The subscriber will sell a part or all, and give possession this fall or winter, or next spring. Those who wish to buy, will do well to call on the subscriber, who lives on the premises, and look for themselves. ASA H. ADAMS.
Nov. 29 1838.

CARTER'S GUIDE BOARD BRANDS.

A very useful article for country towns; they consist of an alphabet of letters, with a series of figures, hands, &c. of suitable size, (forty pieces in number) well packed in a box. A set of brands would probably serve a town for a century, and supply the necessary guide boards. The letters are burnt into the board, with a neat braud and may be read at a great distance, and will endure until the board perishes. Every town should be supplied with a set of these brands, and if used in their poor houses, the guide boards would cost merely nothing.

BONE MANURE.

The subscriber desires to inform his friends and the public that he has seen in the Bone business more than ten years, and has spent much time and money to ascertain how bones may be converted to the best use, and is fully satisfied that they form the most powerful stimulant that can be applied to the earth as a manure. He offers for sale ground bone at a low price, and is ready to receive orders to any amount, which will be promptly attended to.

Orders may be left at my manufactory, near Tremont road, in Roxbury, or at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, Boston.
Sept. 20. NAHUB.

MISCELLANEOUS.

(From the New York Journal of Commerce.)

MY FATHER'S HALF-BUSHEL.

My Father's HALF-BUSHEL comes off to my mind,
And wakens deep feelings of various kind;
'Twas an honest half-busnel—a noble half-busnel,
It held a half-busnel of thirtytwo quarts!

When I think of that busnel—my Father's half-busnel,
That dear old half-busnel—so honest and true!
Then look at the bushels, our city half-bushels,
Little dandy-half-bushels, it makes one feel blue!

Oh! my Father's half-busnel—that country half-busnel,
Its like, or my Father's—oh when shall I see?
'Twas a blessed half-busnel, and he a bless'd man,
For he fill'd his half-busnel, and something threw free!

Alas! I've long search'd for their likeness in vain!
Scarc a man, or half-busnel, but what gives me pain,
So unlike to my Father's, their measures, and measure,
My life is nigh robb'd of all peace and all pleasure!

Yet all the half-bushels, if mean, are not small;
I'm vex'd with the great ones the most, after all.
Oh, mark out that Ash-man's next time he shall call,
'Tis a monstrous half-busnel—holds quarts sixtyfour;
Do send the base rascal away from your door!

'Tis a fact I am stating, no slanders I utter,
But who can forbear, when cheated, to mutter?
In New York, a barrel (I pray you, don't laugh)
WO'ST HOLD SO MUCH ASHES, AS 'TATERS, BY HALF!

Zounds! what are the lawyers, and what are the laws,
But bug-bears and phantoms, mere feathers or straws?
Unless half-bushels are all made as one,
Like Father's half-busnel, I say we're undone!
New York, Dec. 11, 1838. J. B. II.

DOINGS PERFORMED BY A GOOD FARMER.—The approach of winter always induces the thoughtful, careful, and industrious farmer to look about him to see that he is prepared to meet so boisterous and inclement a season of the year in the best possible manner. His windows, his doors, and the roofs of his buildings, are all examined, and, if necessary made tight and secure. His barn and stables are looked to and put in good order. His sheep, hogs, and poultry have all comfortable, dry lodgings prepared for them in due season, for he knows that no animal can thrive and do well, that is not well housed, and well fed, and every way made clean and comfortable. His potatoes, his sugar beets, his turnips, and all his winter fruits and vegetables are well secured against frost, and placed in such positions that ready access can be had to them when necessary, without subjecting them to danger of injury by exposure to the weather. His fuel is so arranged and prepared for current use, that his family can procure it without any unnecessary exposure to the rude blasts of winter. His fields and meadows are kept closed during the winter and early part of spring, so that animals may not be permitted to ramble over them and injure his grounds. His barn yard is so arranged that his cattle never leave it during the period of winter feeding, by which means he saves all their manure for the nourishment of his crops. His implements of husbandry and tools are all

carefully housed and arranged in good order, so that they can be had when wanted for use. His garden, in which not a weed has been permitted to perfect and scatter its seed during the autumn, is thrown up into ridges about eighteen inches high, separated only by trenches extending from end to end of the beds; this he knows exposes to the meliorating influence of the frost, destroys the grubs and worms which seek refuge during the winter deep in the ground, and induces the ground moles to look for dryer and warmer lodgings elsewhere. By this plan of ridging his garden in the fall, as soon as the frost is out in the spring, his beds are dry and warm, and admit of being levelled and worked at once, long before flat, wet ground, can with propriety, be moved by the spade; this enables his family to have a supply of garden vegetables several weeks earlier than those who have less intelligence or industry; the deeper till and more thorough pulverization of the soil, also increases the growth of his plants, and enables them the better to protect themselves against the contingencies of either very dry or very wet seasons.

During the evenings, that are now growing long, his wife and daughters are industriously engaged in light but necessary household duties, while the boys are reading instructive, useful books, and among them the Farmer's Cabinet occupies a conspicuous place, both on account of its variety and its practical utility; this furnishes texts for rational and improving conversation which cultivates and improves their minds and warms their affections, and produces on them even a greater effect, than ridging and trenching the garden does on the vegetables.—*Farmer's Cabinet.*

DECEMBER DISEASES.—The principal disorders of the past month were of an inflammatory nature most frequently occurring about the throat and air-passages, sometimes extending to the lining of the branches of the wind-pipe, occasioning cough, hoarseness, thirst, lassitude, want of appetite, &c., denominated *cold* or *catarth*, according as they are more or less severe.

Every nation is furnished with so many remedies for complaints of this kind, handed down by mothers to daughters, from the old times of simple living and long life, that it would not be becoming in us to intrude our advice where it is not wanted.

A cold, however, it should be borne in mind, though in itself a slight disease, is often the forerunner of that highly dangerous and generally fatal complaint, consumption. The inflammation is communicated from the lining membrane of the lungs to their substance; causing ulceration; and hectic fever succeeds.

Sometimes it occasions asthma, or dropsy in the chest. It should not, therefore, be neglected; but only the most simple precautions, except when the disease is of peculiar severity, are requisite.

Diseases in this month are peculiarly prevalent among children, who are apt to overload their stomachs with cakes, pies and plum-puddings—three most dire offenders in these days, producing not diarrhoeas and pneumonic fevers in little children, but dyspepsia, gout, apoplexy, and all the diseases of repletion in great ones. All complaints which result from too rich, too stimulating, or too abundant a diet, are more numerous at this season than at any other.

Visceral obstructions are frequent at the ap-

proach of winter, and should be counteracted by a cooling regimen. Ripe fruits, and acidulated liquids may be used with freedom, but a dry diet should be carefully avoided. Colds at this season usually end in lung fevers, and typhus commences its inroads; the clothing therefore should be warm, and every kind of exposure most strictly guarded against: for in spite of all its festivities, December is a dangerous month; its coldness though generally agreeable, is frequently damp and penetrating and its dinners, routs and hilarities—those are enemies of blue devils and potent shorteners of the human vigour—often lead to worse diseases than they can cure, and to more melancholy thoughts than they can dissipate.—*Boston Medical Intelligencer.*

TULIPS, RANUNCULUSES, PINKS AND VIOLAS.

S. WALKER, of Roxbury, offers for sale in beds, or in such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland, France and England, to which yearly additions have and will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superb Tulips, will do well to make a selection for themselves when the bulbs are in bloom, (about the 1st of June.) The prices will conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices, in the country where the bulbs were raised, and cheaper than the like quality can be imported.

Tulips in beds of from 30 to 100 rows, containing from 310 to 700 bulbs, or by the dozen, 100 or 1000.

Fruit grandiflora—*Pansy*, or *Heartsease*. Upwards of 2000 superb varieties will be exhibited and offered for sale, when the Tulips are in bloom.

Ranunculuses—fine mixtures, at from \$2 to \$5 per 100.

Pinks—fine named varieties, from 25 cents to \$1 each. For particulars apply to S. WALKER, or to JOSEPH BRECK & CO. eow

FRUIT AND ORNAMENTAL TREES, MULBERRIES &c

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1838 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Peaches, Cherries, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and Peaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeyuckles; Peonies, Dahlias and other Herbaceous Flowering Plants.

100,000 MORUS MULTICAULIS are now offered for sale; the trees genuine and fine, will be ready for delivery at the cities of Boston, New York and Philadelphia, in October next, at prices fair, and varying with the size, and the quantity which may be desired. Also, Broussa and other varieties.

Mulberry and other trees, when so ordered, will be securely packed for safe transportation to distant places, and all orders promptly executed, on application to B. D. BAKER, Commission-Store, No. 132 Water Street, New York, M. S. POWELL, Seed Store, No. 7 Arch Street, Philadelphia, or to the subscriber, Nonantum Hill, Newton, near Boston. August 1, 1838. WILLIAM KENRICK.

FARM IN BROOKLINE.

For sale a farm situated in Brookline, about four miles from Boston, containing forty acres of first-rate Tillage Land and thirty acres of Woodland and pasture—with a good House in complete repair; Barn, Chaise-house, Corn-barn Shed, &c.

The Farm will be sold low, together with the Stock, Hay Tools, &c. if applied for soon, at No. 30, North Market St. Boston, or Roxbury Street, near Boston line.

Dec. 26, 1838.

JOHN HUNT.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at 83 per annum payable at the end of the year. But those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

AGRICULTURAL.

We consider the subjoined document of so much importance that we think we cannot do a better service to the community than (agreeably to our promise) to lay it at large before them. The main points were given under our editorial head in the last number, but they will be found worthy of a second and a third perusal. The introduction of the beet cultivation and beet sugar manufacture in this country will constitute a much more important era in its agriculture than the introduction of the turnip husbandry into England.

To the honorable the Senate and House of Representatives of the United States of America in Congress assembled:

The memorial of Charles Lewis Fleischmann, a naturalized citizen of the United States, RESPECTFULLY REPRESENTS:

The existence of crystallizable sugar in the beet root was discovered by the German chemist Margraf, in the year 1747. He communicated the results of his experiments to the Royal Academy of Sciences at Berlin; pointed out the importance which his discovery would have on agriculture and industry, and endeavored to bring it into practice; but at that time, the price of sugar being moderate, chemistry not enough advanced to modify the complicated operations, and the spirit of enterprise not sufficiently awakened to make it an object of speculation, the discovery remained without being put into practical use until the year 1796, (forty-nine years afterwards,) when Achard, another Prussian chemist, repeated the experiments of Margraf, modified them, and erected the first manufactory at Kunnern, in Germany.

The results of Achard's manipulation created great sensation all over Europe, particularly in France, where the chemists re-examined the process of Achard, simplified it, and made it more practicable and profitable in its results.

These simplified manipulations were adopted by enthusiastic speculators, full of sanguine expectations, peculiar to the French character; but the results were not satisfactory, as the immensely large and costly manufactories were partly established in places where the soil was not sufficiently productive, where fuel was scarce and high, the market distant, and the operations directed by men who had not the least idea of agriculture—a science necessarily connected with the manufacture of the beet sugar—no practical knowledge of an entirely new process, and a most imperfect apparatus. The consequence of these obstacles was a complete failure, which induced the opinion over the whole world, that the extraction of sugar from the beet, though correct in theory, was impracticable on a large scale.

This, however, was not the opinion of enlightened men; they saw the causes of failure in their true light, and endeavored to overcome and to correct them. The political events of 1812 accelerated

the development of this new branch of industry; the French Government, in want of a substitute for the colonial sugar, encouraged the manufacture of the beet sugar, by establishing four large manufactories and five chemical schools, entirely for the purpose of experiments, and teaching the best method of extraction.

In 1814, these manufactories were in full operation and flourishing, when the peace of Europe allowed the importation of the colonial sugar into France, causing a destructive shock to the manufacturers of indigenous sugar, which none but immense fortunes could endure, and created, again, the belief that the manufacture of the beet sugar could never come in competition with the colonial.

This might have been the final catastrophe of the manufacture of the beet sugar, had it not been for the efforts made to revive it again by some wealthy and enlightened manufacturers.

These efforts, however, did not arise entirely from the patriotic desire to promote the welfare of France, (as now pretended,) but partly to prevent the loss of immense capitals invested in buildings, apparatus, farms, &c. Moreover, the manufacturers knew there was yet five or six per cent. more to gain by an improved operation.

This it was that gave a new start to this favorite branch of industry; and chemistry, particularly adapted to improve the art and manufacture, assisted in simplifying the process, and discovered the mode of *reviving* animal charcoal so as to admit of its being repeatedly used, while the improved apparatus helped to economize labor and fuel; and all this, combined with a wonderful perseverance, reduced the expenses of the fabrication, and enabled the old establishments to continue in operation, even when the price of colonial sugar was very low. This created confidence and a rapid increase of establishments.

The cultivation of the beet has had the most beneficial influence on agriculture; as, in the last year, more than eighty thousand acres of land were planted in beet, producing about one million of tons of this root; and, as generally rotations of four crops are adopted, it brought at least three million two hundred thousand acres of land under the highest cultivation.

The following table shows the rapid increase of the manufactories, and the quantity produced, in France.

	100,000 cwt.	beet sugar produced
In 1825, 103 manufactories,	100,000	
1831, 200 "	220,000	" "
1836, 543 "	950,000	" "
1837, 600 "	1,000,000	" "

Or 50,000 tons of beet sugar.

The manufacture of indigenous sugar did not affect the demand for colonial sugar, as the consumption continually increased until the year 1835, as appears by a table from the Journal of Commerce of 1836, viz:

	Consumption of colonial sugar	Consumption of beet sugar.
In 1825,	61,255,232 francs.	4,000,000 francs.
1831,	67,542,792	10,000,000
1832,	62,669,638	15,000,000
1835,	69,000,000	30,000,000

But in the year 1836, France imported only 75,120 tons of colonial sugar—a diminution of 15,630 tons in one year; a *quantum* too large not to alarm the proprietors of the sugar plantations in the French colonies, and particularly in Martinique, who looked, some years ago, with an ironical smile at the beet sugar manufacturer. They, who have ridiculed and caricatured every improvement in this branch of industry, felt themselves forced to send, in 1835, Baron de Cools, with the following proposition to the French Government, viz: demand—

1. Diminution of the duties upon French colonial sugar of 50 per cent., and a proportional reduction of duties upon the foreign colonial sugar.

2. The permission to export the colonial sugar direct to a foreign market.

3. A careful examination and investigation how the French colonial and beet sugar manufactories can be equally taxed.

The latest news from France states that the Government came, finally, to the conclusion of an equal taxation upon the indigenous and colonial sugar, as may be seen from the following extract from a New York paper (Morning Courier and New York Enquirer of December 18, 1838,) dated

(By the Ville de Lyons.)

Paris, Oct. 30, 1838.

“A branch of industry, (the offspring of necessity under the empire,) the production of sugar from beet-root, has engaged much attention in France, and has been carried on with success, and to a vast extent. The natural consequence has been, that sugar, the produce of the French colonies, which is burthened with a very large duty on importation into France, *was beaten out of the market*. Appeals were made by the suffering colonists to the Government, repeatedly, representing the distress into which they had fallen from this circumstance; the irredeemable ruin that would necessarily fall upon them if the present tariff were maintained, and soliciting relief. After a variety of expedients to evade a decision on the point, the Government has just come to the resolution of proposing to the Chambers, (which are to meet on the 24th December,) to reduce the import duty on colonial sugar by 8 1-4 francs per cwt., which, with a precisely similar excise duty levied on the beet-root, or home-grown sugar, will, they say, suffice to reopen the market to the colonies.”

Such is the state and result of the indigenous sugar manufacture in France.

What is the progress of this branch of industry in the other parts of Europe?

England, (the mother of colonies,) which was very much prejudiced against the manufacture of indigenous sugar, seems to see, in the adoption of it, the only means of improving the physical and moral condition of man in her colonies; and she has already overcome some of her prejudices, and has begun to establish manufactories. The following article, taken from the London Mechanics' Magazine of 1836, (No. 169,) will show its progress:

"A refinery of sugar from the beet-root is being erected at Thames bank, Chelsea, which, it is expected, will be in operation in about six weeks. In the vicinity of the metropolis, during the past summer, a great many acres of land have been put into cultivation with the root at Wandsworth and other places. The machinery will be principally on the plans of the vacuum-pans, and a pure refined sugar will be produced from the juice by the first process of evaporation, after it has simply undergone the process of discolorization. Another part of the premises is appropriated to the manufacture of coarse brown paper from the refuse, for which it is extensively used in France. In case the Government do not interfere, and, by rendering the product excisable, retard or prohibit its manufacture, several individuals have it in contemplation to establish refineries in different parts of the kingdom for purifying sugar, which may be produced in agricultural districts for domestic or foreign use. A refinery has lately been established at Belfast, in the vicinity of which town upwards of two hundred acres of land have been put into cultivation with the beet-root for the manufacture of sugar.

Russia, which adopts every useful improvement in manufacture, has, in the southern departments, large manufactories of beet sugar, by which she expects to furnish some of the Asiatic markets with this article. So have Bohemia, Hungary, Austria, and Switzerland large beet sugar manufactories, in the most flourishing condition.

The Germans, though the discoverers of the crystallizable sugar in the beet-root, until 1836 made very little progress in its manufacture. This is to be ascribed as well to the continual war with France, which checked every improvement, as to the uncertainty of the business itself. The Germans, well aware and well informed of every improvement made abroad, never found it sufficiently lucrative to embark in it: but it seems that this nation, which has given the world so many great and important discoveries, was destined to bring its own discovery of the extraction of the sugar from the beet to perfection. This was accomplished by Mr Schuizenbach, of the Grand Duchy of Baden. Schuizenbach re-examined carefully Margraf's experiments, and found that the first experiment of this great chemist, made eighty-nine years ago, is the best method, when modified, to produce, with less labor and expense, eight pounds of white refined sugar out of one hundred pounds of the raw beet-root. This improvement it is which will, in a short space of time, exclude all the colonial sugar from the European market, as well as our own. This improvement, also, will change the condition of millions of men in the colonies.

The opinion and judgment of a nation, jealous of every discovery or improvement made in other countries, and especially in this branch of industry, in which it has sacrificed millions of francs for its perfection, will serve as a proof of the importance of the new improvement. These new discoveries are detailed in an article which appeared in the *Journal des Debats Politiques et Littéraires*, in Paris, dated the 10th July, 1838, by Michel Chevalier, viz:

"It would seem that the spirit which was manifested in the days of the Revolution, has been transferred from the political arena, and is exerting itself in that of industry. At this time the manufacture of sugar from beets is on the point of undergoing a metamorphosis which, as it appears, will

change all the condition of its existence, extend its influence, not only to the consumption, but also to the production of that article.

"Until now, a series of operations has been applied to the extracting of sugar from the beet, which, though simple enough in appearance, are in reality complicated and delicate; which demand not only a great number of intelligent and skilful workmen, but also require considerable material to be operated upon; and which, again, consume costly articles, such as milk, blood, animal charcoal, &c.

"In the former process the sugar beet was scraped; the pulp pressed by means of an hydraulic press. The juice so obtained underwent defecation, or the separation of the albuminous and mucilaginous elements, and then the clarification and evaporation. Once concentrated, the sirup underwent crystallization, which furnished the raw sugar; and this then had to be refined before it could be admitted on our tables.

"Since its origin, the process of extracting the sugar has always been the main point, but it has been modified and improved in the details; so much so, that our manufacturers, who were ruining themselves when the sugar was at six francs the pound, are becoming rich at the low price of twenty sous per pound. At this time the scraping, pressing, defecation, clarifying, and evaporating were attended with difficulties, which it required a great length of time to subdue. The loss in manufacturing was enormous, as only from three to five parts of sugar were obtained from a hundred pounds of beets, instead of ten pounds, which are contained in the root.

"With the assistance of chemical analysis, it was ascertained that this evil proceeded from the presence of a certain quantity of acid, of divers coloring, mucilaginous, and gelatinous matters suspended in the juice. The presence of these mischievous substances injures the sugar, prevents it from crystallizing, sometimes destroys it, and causes it to yield only poor molasses. To prevent these injurious effects, different agents have been used, which were found more or less efficacious. Apparatus was constructed, which accelerated the manufacture, and diminished the time during which the sugar is in contact with these injurious substances; but the inquiry was never made whether it were possible to separate the sugar from those foreign bodies, or at least to neutralize or paralyze their destructive power, before the juice is extracted.

"The new process, first alluded to, was discovered in the grand duchy of Baden, by Mr Schuizenbach, of Carlsruhe. The experiments introduced a method of manufacturing the sugar which was adopted by several manufacturers on the right bank of the Rhine, and which is already in vigorous operation.

"Like all ideas which are destined to accomplish revolutions in manufactures, as well as in politics, that which serves as basis to the new process is simple. The operation of drying the beets immediately after they are taken from the field, is now the first step in the process. By this operation, the mucilaginous matter, which is an integral part of the beet, loses the property of dissolving in water; this drying stops also the fermentation which takes place during the preservation of the beets in cellars or in the heap, and likewise prevents the formation of acids, which were created at the expense

of the sugar, and which embarrassed the manufacture of beet sugar.

"When the beets are once dried, the sugar is easily obtained by mixing them with a small quantity of water, which produces a solution of sugar and a very small proportion of other bodies, and which, by the process of evaporation, gives at once a good product, which can be easily refined.

"In a word, the elementary operation of the desiccation acts with the power of exorcism; drives from the juice all injurious substance which were the former causes of evil in this manufacture.

"This fact being once understood, and duly verified by experiments on a large scale, it was then important to bring it to perfection by an easy practical manipulation. This is what the *Societe d'Encouragement* is about to undertake, and the with every chance of complete success. This is already much more than mere expectation, because the problems which it has proposed are already more than half solved, and the entire solution of them is scarcely a matter of doubt; so that the manufacture of the sugar from beets is about to be built on a new basis.

"The *Societe d'Encouragement* have offered the following prizes for the promotion of this manufacture:

"1. One of 4,000 francs for the best process for the desiccation of the beets.

"2. One of 4,000 francs for the best treatment of the dried beet for the extraction of the raw sugar.

"3. One of 4,000 francs for the conversion of the raw into refined sugar, without taking it out of the mould.

"4. One of 3,000 francs for an analysis of the beet root, &c.

"5. One of 3,000 francs for the invention of a saccharometer, which should be so constructed as to be easily applied, and to have the property of showing immediately the quantity of crystallizable sugar contained in the fluid under trial. A contrivance of this kind, which would be a sure guide for the farmer, and for the workman in manufactories, indicating to the former the proper time to collect his crop of beets, and to the latter how to manage his operations, would be of immense value.

"When these five prizes are gained, the theoretical and practical renovation of the manufacture of beet sugar will be radically accomplished in all its forms.

"To the question, *Will this be effected?* it may be safely answered that existing facts scarcely allow of the expression of a doubt that such will be the case.

"The problem of the complete and rapid desiccation by an economical process has presented very formidable difficulties. *This drying may be denominated the corner-stone of the new system;* but this problem is far from being insoluble; on the contrary, it ought to be regarded as solved.

"In one of the last sessions of the *Societe d'Encouragement*, Mr Beyrand, of Marseilles, presented beets cut in slices, which were dried in eight minutes by the combined action of pressure and heat, effected by two cylinders, heated to 100 degrees by steam. This result will appear more prodigious when we consider that 100 parts of beets contain 84 parts of water.

"The beets, prepared after Mr Beyrand's method, preserve all their sweetness. Mr Schuizenbach,

of Baden, dries the beets by a slow process, probably less perfect than Mr Heyrand's method; but the result is already excellent, and favors the application on a large scale. In the manufacture of Mr Schutzenbach, the beets are cut in small thin slices, and, as soon as they come in contact with the air, they bend and roll up, and lose the property of sticking together, which gives the hot air of a kiln (to which they are brought immediately after they are cut) a free circulation in all directions around them. The temperature of these kilns is from 30 to 40 degrees Reaumur, (from 90.5 to 122 degrees Fahrenheit.)

Mr Schutzenbach's apparatus of desiccation is very economical. The machine for cutting the beets costs only from 400 to 500 francs, and half a horse power is sufficient to put it in operation. Such a machine, when at work every day for three months, will cut one million killogrammes of beets, (about 1,000 tons,) which would be a sufficient supply for a large manufactory. A kiln, about 10 feet by 9, and 9 feet high, dries, in 24 hours, 3,000 pounds of beets, and consumes only 420 pounds of charcoal. Three such kilns would be sufficient to dry all the beets cut by one machine during twelve hours.

"In the manufactory of Mr Schutzenbach the dry beets are reduced to a coarse powder, sprinkled over with lime, and stored away in casks. When the sugar is to be extracted, this coarse powder is mixed with water, which produces a liquor marking twenty-nine degrees on the saccharometer; and when evaporated with Roth's apparatus, this liquor yields, without any other preparation at the first crystallization, a raw sugar, known in commerce by the name of *bonne quatrieme*, which, after a second crystallization, becomes *bonne commune*. The advantage of this new method is such, that the beets raised at Esslingen, in Germany, in 1837, (less rich in sugar than the preceding year,) yielded more than eight per cent. of crystallizable sugar, instead of five, which was the highest product by the old process; and, in the proportion as the gain on sugar increases, the expenses decrease; so much so, that eight pounds, now obtained, costs less than formerly four or five from 100 pounds of beets.

"Two important points are then attained: first, how to dry the beet; and second, how to extract the sugar from it.

"To refine the raw sugar, without taking it out from the moulds in which the sirup was placed to crystallize, and which always causes the loss of a considerable quantity of sugar, appears to be a question equally advanced. Recent experiments, on a large scale, show that raw sugar washed in moulds, with pressure, gives, in the short space of three days, a perfect refined article, which formerly required from two to three weeks to effect.

"In regard to the analysis of the beet in its divers states of maturity, nothing has yet been attempted; but this is a task which chemists can at any time accomplish, and the prize held out for it will induce many a chemist to undertake it; and it will not be long before we know to what extent the constituent parts of the sugar-beet develop themselves simultaneously, and which is the most favorable moment for collecting them for the manufacture of sugar.

"In regard to an exact saccharometer, of a simple and practical construction, with the aid of which all manufacturers can ascertain, to a fiftieth part, the richness of the saccharine matter in beets, and

of all other substances, containing crystallizable sugar, the learned researches of a young chemist, M. Peligot, promise great success. Lime and baryte have the property to combine with crystallizable sugar, and form together an insoluble composition, in which, nevertheless, the sugar does not alter, and is easily separated from it. In bringing this fact to a simple mechanical operation, no doubt is left that the quantity of sugar contained in beet sirup can be ascertained with the greatest nicety.

"The problems proposed by the *Societe d'Encouragement* are at this time almost solved. It does not any longer propose to discover a new method, but only to perfect the processes which are already verified, by an application on a large scale. Among the advantages which are derived from the renovation of the manufacture of the beet sugar, is the extension of the culture of the beet-root; because it will be easy for every farmer to send his dry product to any market, far or near, as the weight of the raw beet is reduced, by the process of desiccation, to less than one sixth part. The beet can now be raised anywhere, however distant from the manufactory; and, reciprocally, it is possible to establish manufactories in all parts of France, to concentrate them in such places where fuel is plenty and at a low price; whereas, at present, the manufacture is only possible close to a field fertile enough to produce beets. Another important fact: 1,000 pounds of beets contain 100 pounds of sugar. The price of beets is about 12 francs; the expense of drying and extracting the sugar would not exceed 10 francs, (this is sufficiently proved by experiments;) making the total amount 22 francs. Suppose that one-tenth of the sugar is lost, the manufacturer would have 90 pounds of sugar for 22 francs, or 100 pounds for less than 25 francs. Allowing for small expenses, &c., 50 per cent. the sugar (the refined sugar of this country) could be delivered to the consumer for 38 centimes, (or 7 1-2 cents,) per pound.

"This will create a revolution in the consumption of sugar, as well as in the division of the branches of industry, over the whole globe; then, instead of importing sugar from the southern regions, it will be left for us to furnish them.

MICHEL CHEVALIER."

Another proof of the practicability and great advantage of this improvement, is the enthusiasm with which it was adopted and put into operation by the Germans themselves, who are generally very careful and prudent in all their speculations. They have already established extensive manufactories on the Rhine.

The importance of Mr Schutzenbach's discovery is best proved by chemical analysis and examination of the physiology of plants. This analysis of the beet-root shows that 100 parts of the root contain—

86.3 parts of water,
3.2 parts fibrous matter,
10.0 parts of crystallizable sugar,
0.5 parts of mucilage.

By the new process, the water in the beet is evaporated, and there remain only 13.7 parts of dry substances, which consist of the sugar, mucilage, and fibrous matter.

The sugar dissolves in cold or warm water almost instantaneously.

The mucilage is indissoluble in water; when in

a dry state and mixed with water, it only swells to a slimy matter.

The fibrous matter is indissoluble, and has neither in the old nor new process any injurious influence.

From this analysis we learn that the mucilage is the only substance which causes all the difficulties of the extraction of sugar. The principal process consists, then, in the separation of the mucilage from the sugar. But is this mixture a work of nature, or the result of the manipulations? or does the cellular tissue, of which the beet-root is formed contain the sugar in its pure state, separated from the mucilage?

These are questions as to the physiology of the beet, which were first suggested by Raspail, a French chemist, (in his work on the physiology of plants, Paris, 1837,) and he solved these important problems by the following microscopic experiments:

"When a thin slice of the red beet-root is brought under the focus of a microscope, it will be observed that the texture of the beet is formed of hexagonal cells, transparent, and of a purple color; these cells are crossed by white ones, four or five times longer than the purple cells; this tissue of white cells is crossed again by bundles of opaque cylinders, of a gray color, through which the spirals (*elements generateurs*) are observed.

When a drop of acid (*acide sulphurique albumineux*, which has the property of coloring saccharine substances purple) is put on this thin slice, the colors change; the part which was purple turns yellowish, the long cells remain white, but the opaque cylinders become purple."

From this it follows that the cells, naturally purple, enclose the coloring matter and the mucilage, and the opaque cylinders the sugar in its pure state. Thus the mucilage in the beet-root is separated by nature from the sugar, and mixed during the manipulation, which caused all the difficulties of the extraction in the old process, when the mucilage was combined with the sugar in grating, pressing, and even in defecation.

To separate this five-tenths parts of mucilage which the beet contains, occasioned not only the loss of considerable sugar, but also labor, fuel, and costly material, as, for instance, animal charcoal, blood, &c.

The new process acts entirely in conformity with the results of scientific investigation, and the whole process is reduced to a simple operation, which gives a sure gain of 8 per cent. of white refined sugar from 100 pounds of the raw beet-root.

The beets are now cut in thin slices, dried before any fermentation can take place, ground to fine powder, so that all the cells are broken apart, and mixed with water, which dissolves the sugar before the mucilage begins to swell. The pure uncolored liquor obtained is evaporated, and the sirup brought into moulds to crystallize.

These statements should be considered as a sufficient proof of the infallibility and practicability of the new improvement; and the introduction and general adoption of it in this country would be of the highest importance to the welfare of its population.

Some enterprising citizens of the United States sent agents to France to investigate the manipulations of this branch of industry; but the results have yet effected very little, and the sugar produced from the beet in this country is of no great account, which arises probably from the want of skilful and

intelligent operators in the former complicated manipulations. But, at present, in Europe, the manipulations are reduced to a process much simpler than brewing of common table beer, which can be comprehended and performed by every person. The period is not far distant when farmers will produce their own sugar, or at least raise and dry the beet ready for the manufacturer.

The general argument against the introduction of this branch of industry, that labor is too high in the United States, is incorrect, when we consider the other great advantages which the United States have over every other country on the globe in almost every business, and especially in this branch of industry:

1st. The United States possess a climate which suits the beets better than any climate of Europe, because the summers are excessively warm, which increases the saccharine property of the beet-root.

2d. Plenty of cheap and rich land, subject to but small tax.

3d. Inexhaustible stores of fuel, from which the great natural watercourses, railroads, and canals branch, over the whole Union.

4th. Well-constructed labor-saving machines of all descriptions.

5th. An intelligent population, which, when once acquainted with this branch of industry, will soon bring it to great perfection—a population understanding the use and management of machinery, and famous for improvements and inventions.—Whereas, in Europe, the land is overtaxed, high in price, and therefore the interest upon it considerable; subject to tithes and other feudal burdens; while the fuel is scarce and valuable, and its transportation high and slow. The population are entirely unacquainted with labor-saving machines, and possess very little mechanical ingenuity, while their enterprise is prohibited by the excise laws of their petty governments.

It is obvious that America overbalances, with its advantages, the low prices of labor in Europe; and that she is able not only to provide herself with all the sugar wanted for home consumption, but also to supply other countries.

The sugar now produced in Louisiana averages only about 4 1-2 pounds per head for the population of the United States, or about 70,000,000 pounds annually, which is but a small part of our consumption, as enormous sums are yearly paid to foreign countries for sugar, as the following table shows, viz:

1832, imported into the United States,	\$2,933,688
1833, do. do.	4,752,343
1834, do. do.	5,537,829
1835, do. do.	6,206,184
1836, do. do.	12,514,551

This sum will annually increase in proportion as the population augments and their comforts and means improve.

By the adoption of this new branch of industry, the sums at present paid for imported sugar would be in a short time a clear gain to the country; its agriculture would be improved, and thousands of acres of exhausted and deteriorated land would be again taken up and improved. To procure the necessary manure for this purpose, the farmer would be obliged to increase his live-stock, which would find, during the winter season, plenty of food in the residuum of the manufactory. It would increase the consumption of sugar among the less

wealthy class, and would make their condition of life more comfortable, and of consequence, greatly extend the population of the country.

The manufacture of sugar is not confined to the beet and cane only. In Hungary there are at present manufactories which make sugar from pumpkins. The following article, translated from the Hanoverian Communicator, 1837, gives the particulars, as follows:

"A manufacturer in Hungary, for three years past, has used pumpkins for the manufacture of sugar. We have seen raw and refined sugar, also sirup from this manufactory, and found the refined sugar equal to the colonial in every respect. The raw sugar is crystalline, coarse-grained, light-colored, and of more agreeable (melon-like) flavor than the common raw beet sugar; the sirup is of a blackish-green color, and has also a melon-like flavor, but is suitable for consumption. The juice, obtained by pressure, yields, on an average, six per cent. of sugar; but the water-melon of the south of Hungary is still more productive than the pumpkin of the north. The sugar obtained from the pumpkin is always considerable, whether the fruit has been raised on rich or poor land. The manipulation is said to be more simple than the manufactory of beet sugar, and requires less attention, as the pulp and the juice may stand for three weeks without getting sour or losing any quantity of sugar. The juice, during the process of evaporation, does not rise in the boilers, and is not so liable to be burnt. The residuum is very good food for cattle. One acre produces 650 cwt. of pumpkins; twenty pumpkins yield sufficient seed for one acre of ground. From the remaining seed a very good table oil of about sixteen per cent. can be obtained.

MARQUARDT."

Indian corn, at the period of tasselling, yields just half as much sugar as the sugar-cane; and it is astonishing that this well-known fact did not induce persons to plant corn especially for that purpose.

To make use of green corn and pumpkins profitably, and to improve the crop of beet in quality and quantity, the following plan is therefore, suggested, which would keep a manufactory in operation all the year round:

We know that the beet requires a deep soil, sufficiently provided with decomposed manure, as when planted in green manure they yield much less sugar, and the operation is rendered more difficult; to prepare the field properly for the beet, it should be well manured, (no matter in what state the manure may be applied), ploughed, and planted in corn and pumpkins, and worked regularly as long as the pumpkins leave room for the horse-hoe. When the corn begins to form the tassel, it should be cut off, and the sugar extracted from it. The pumpkin has then all the influence of the sun to come to full maturity, and should be used, when ripe, for sugar. The following year the field would be in first-rate order for the beet, and the following rotation of crops, viz:

Indian corn and pumpkins, with manure, } for sugar,
Beets,
Barley,
Clover,
Wheat.

An acre of good cultivated land yields, on an average, twenty tons of the beet-root. Beets were sold this fall, near Boston, for \$5 per ton.

One ton of beets yields, when treated after the new method, 180 lbs. of white refined sugar. The cost of manufacturing a ton of beets into sugar would be, at a very high estimate, \$6. One hundred and eighty pounds of refined beet sugar would cost \$11, or 6 1-10 cents per pound, for which we now pay, at the lowest rate, 16 cents.

Mr Norbert Rillieux, of New Orleans, has recently invented an apparatus for reducing saccharine liquids, which has been patented in the United States, and is already tested.

This apparatus surpasses Howard's and Roth's, or any other invention of this description, not only in simplicity and cheapness, but also in the arrangement in the boiling of sugar, according with the laws of science and economy.

The liquor is reduced by two vertical cylinders, heated by steam, over which the sirup is distributed in small quantities. One of the cylinders operates under a vacuum, and entirely evaporates the condensed liquor by a low degree of heat, to hinder the formation of molasses—an improvement of the highest importance, which, till now, has never been accomplished. The sirup can be increased to any degree of the saccharometer desired, which is performed by the most ingenious and simple contrivance of a differential thermometer. This apparatus will greatly facilitate the manufacture of sugar, in regard to the economy of labor, fuel, and time, and the perfection of the product. This apparatus will rank among the most ingenious and important inventions.

The production of indigenous sugar in France was one of the main pillars of Napoleon's continental system; and the successful extraction of sugar from the beet was relied on as the surest guaranty of its stability.

That branch of productive industry, therefore, which the first statesman and captain of the age regarded alike as the means of conquest and the source of wealth and independence, cannot be considered a matter of indifference to the Government of this great and growing republic, whose duty and privilege it is to watch over the interest and welfare of its citizens—a Government aspiring to no conquest, yet whose enviable distinction it is to be regarded as the last hope of freedom—the last asylum of liberty.

The information imparted in the preceding pages, collected as it is from the most authentic sources it is hoped will be regarded as of the highest importance to any and every government charged with the duty of promoting the great interests of a nation.

Having traced the history and progress of the manufacture of the beet sugar, from its first discovery in Europe to the present time, through all its varied experiments and decreasing expenses, until no longer requiring the bounty of Government, but yielding a revenue, the only remaining inquiry is, how shall the American people avail themselves of the important advantages of this new source of national wealth and industry?

To acquire a correct and minute knowledge of this new branch of industry, (now practically unknown in this country,) it is necessary to visit Hungary, Germany, France, and England, in order to examine all the recent and important discoveries and improvements relating to the manufacture of beet sugar. To accomplish this object, it would require the following qualifications:

1. A thorough knowledge of the old method of

tracting sugar from the beet, and every apparatus thereto used.

2. A thorough knowledge of agriculture, in order to ascertain the precise cost of the production of the raw material, the influence which it has on the different systems of agriculture, and the economy in regard to the feeding of cattle, &c.

3. A knowledge of chemistry and physics.

4. A knowledge of the languages of the different countries to be visited, and a thorough acquaintance with technical and vulgar terms in mechanics and agriculture, as well as the *patois* of the countries.

5. A knowledge of mechanics and the art of drawing, in order to be able to delineate any apparatus at first sight, and at a glance, as manufacturers are not always willing to have their apparatus examined minutely.

CHARLES LEWIS FLEISCHMANN,

Graduate of the

Royal Agricultural Institute of Batavia.

Patent Office, Washington, Dec. 27, 1838.

Massachusetts Horticultural Society.

Saturday, Jan. 19, 1839.

A meeting was held at the Hall, Mr Prince, Vice President, in the chair. The Committee on Premiums made the following report, which was accepted:

PREMIUMS AWARDED BY THE MASSACHUSETTS HORTICULTURAL SOCIETY.

In pursuance of a resolve of the Massachusetts Horticultural Society, for awarding certain premiums on the best specimens of fruits, which may have been exhibited during the year 1838, the committee to whom that subject has been referred, beg leave to report, that the premiums be awarded as follows:

Pears.—To Mr Samuel Downer, for the best Summer pears, including the Julienne, Bloodgood and Dearborn's Seedlings, a premium of \$5 00

To Mr Robert Manning, for the best Autumn pears, including the Franceval d' Ete, Hazel, Belle Lucrative, Golden Bourre of Bilboa, St Ghislain, Marie Louise, Jalousey, Washington, Louise Bonne de Jersey, &c. a premium of 5 00

To Mr Aaron D. Williams, for the best Summer Seedling pear, a premium of 5 00

Apples.—To Mr E. M. Richards, for the best Summer apples, including William's Early, Benoni, Early Sweet Bow, Early Harvest and Early Red Juneating, a premium of 5 00

To Mr Joshua Gardner of Dorchester, for the best Autumn apples, the Gravenstein and others, a premium of 5 00

To Mr B. V. French, for the best Winter apples, including the Yellow Bellflower, Murphy and Danvers Winter Sweet, a premium of 5 00

Cherries.—To Mr Samuel Downer, for the best cherries, Downer's Red Seedling cherry, a premium of 5 00

Peaches.—To Mr J. L. L. F. Warren, for the best peaches of open culture. Specimens Early Royal George and George IV., a premium of 5 00

To Mr M. P. Sawyer of the city, for the best peaches raised under glass, a premium of 5 00

Plums.—To Mr S. R. Johnson, for the best plums, including the Bolmer's Washington and Green Gage, a premium of 5 00

To Mr Samuel Pond for the next best, being fine specimens of Bolmer's Washington, Prince's Imperial Gage and Duane's Purple, a *gratuity* of 5 00

Nectarines.—To Mr Thomas Mason, for the best nectarines, a premium of 4 00

Quinces.—To Mr E. M. Richards, for the best quinces, Orange and Pear Shaped, a premium of 5 00

Grapes.—To Dr J. C. Howard, for the best foreign grapes grown under glass, including the Black Hamburg and White Chasselas, a premium of 10 00

To Mr William Oliver, for the best foreign grapes, out of door culture, the White Chasselas, a premium of 5 00

To Mr Thomas Lee, for the best native grapes, (Elsinburg,) a premium of 5 00

Gooseberries.—To Mr Samuel Walker, for the best dessert gooseberries, included in these were Hopley's Globe, Gascoigne, Warrington Red, Wellington, Golden Gourd, Whitesmith and Princess Royal, a premium of 5 00

Raspberries.—To Mr J. L. L. F. Warren, for the best Red and White Antwerp raspberries, a premium of 5 00

Strawberries.—To Mr Vose, President of the Society, for the best strawberries, Downton and Keen's Seedling, a premium of 5 00

To Mr Rufus Howe, for the best Early Virginia and Bath Scarlet strawberries, a *gratuity* of 5 00

To Mr J. L. L. F. Warren, for the best Methven Castle strawberries, and some other fine kinds, including a new variety raised by him from the seeds of the Methven Castle, a *gratuity* of 5 00

To Messrs Hovey & Co., for a new Seedling strawberry, raised by them from the seed, a *gratuity* of 5 00

Currants.—To Mr A. D. Weld of Roxbury, for the best White and Red currants, a premium of 2 00

Musk Melon.—To Mr Vose, President of the Society, for the best Green Fleshed Melons; these were the Persian, Minorca, Rock, and Cantaloupe, a premium of 3 00

To Messrs S. & G. Hyde, for the best Watermelons, a premium of 3 00

For the Committee,

WILLIAM KENRICK, *Chairman.*

And on motion of Mr Downer, it was voted that the reports on Vegetables and Flowers be also inserted.

The Committee on Flowers beg leave to report, that they have awarded the following premiums, viz.:

Roses.—For the best display, to Col. Wilder \$5 00
Do 24 hardy varieties, do 3 00
Do 12 do A. Aspinwall 2 00
Do 12 China, S. R. Johnson 3 00

Hyalcinths.—Best display, Hovey & Co. 5 00

Carnations.—Best display, Messrs Winships 5 00
Do six varieties, Thos. Mason 3 00
Do Seedling, W. Meller 3 00

Pinks.—Best display, S. Walker 5 00
Do Seedling, Wm. Meller 3 00

Tulips.—Best display 12 varieties, S. Walker 8 00

Violas.—Best display, S. Walker 5 00

Do Seedling do 3 00

Geraniums.—Best display, Col. Wilder 5 00

do Seedling, W. Meller 3 00

Herbaceous Plants.—Gratuity to

Dr J. C. Howard 5 00

Hovey & Co. .5 00

S. Walker 5 00

A gratuity to Mr D. Haggerston for fine specimens of Alpina Mutan 5 00

Do to Mr W. E. Carter, for Seedling Phlox alba 5 00

86 00

Per order,
S. WALKER, *Chairman.*

The Vegetable Committee award the following premiums, viz.:

For the best specimens of

Cucumbers.—To J. L. L. F. Warren \$4 00

Beets.—S. Sweetser 2 00

Rhubarb.—S. Pond 3 00

Celery.—Dr J. C. Howard 2 00

Beans.—(Lima) R. Ward 3 00

Squashes.—S. Pond 3 00

Cauliflowers.—J. L. L. F. Warren 3 00

Brocoli.—Do. 3 00

Peas.—Rufus Howe 4 00

SAMUEL POND, *Chairman.*

Dec. 1838.

On motion of Mr Richards, seconded by Mr Downer, the Fruit Committee's report was amended by adding "to Mr A. D. Williams \$5 premium for his seedling pear"—and that it make part of the report.

The following communication was received from the President with other documents:

To the Editor of the N. E. Farmer,—

The Massachusetts Horticultural Society have recently received from the Chevalier Soulange Bodin, the distinguished proprietor of the Horticultural Garden of Fromont, the enclosed notice, in relation to the *Morus Multicaulis*, and the means by which the shoots of that valuable plant may be forwarded to distant places for distribution, and by which its cultivation may be extended and increased.

I have thought that at the present period, when the culture of silk and the growth of the mulberry tree, are exciting so deep an interest in various parts of the country, it might be interesting to many of the readers of your valuable journal to know at how cheap a rate these shoots may be imported from France, and if it be practicable to receive them here in a state of good preservation, as in the opinion of those familiar with the subject it is believed they may be, it might prove to be the means of a very rapid increase of this variety of the mulberry tree in the United States.

With much respect,

Your obedient servant,

ELIJAH VOSE.

Dorchester, Jan. 21, 1839.

JARDIN DE FROMONT.

MURIER MULTICAULE.

(*Multicaulis Mulberry Tree.*)

The plants of the new Mulberry Tree, the Murier Multicaule, having been exhausted in all

other parts of France, and multiplied applications being made for them from foreign countries, the Director of the Jardin de Fromont has decided to bring into sale the numerous Saplings annually produced from the stock of this valuable tree, and which have obtained for it the specific and descriptive name it bears. These shoots detached from the parent root in the autumn, are prepared in the form of slips of different heights, according to their growth, and are sent in their full lengths, with all their buds, closely compressed in cases, filled up with moss, rather dry than moist, and will thus be preserved during a long journey or voyage without decaying or suffering from either heat or cold. The shoots, on their arrival at their destination, being recut and divided individually, immediately before being planted, into slips containing two or three buds each, according to their growth, will, on the requisite precautions in planting being taken, preserve all the freshness and vigor they possessed when detached from the stem, and will take root as readily as if they had only been just severed.

The price of these shoots from the Murier Multicaule, thus prepared and packed for transport, is 315 fr. a thousand (package included,) and these will produce at least three thousand slips, without reckoning the buds.

The establishment is prepared to furnish any quantity of these shoots, either immediately or in the autumn of 1839, on receiving orders, with bills on a banker or any other house in Paris.

These shoots of the Murier Multicaule are far preferable for long journeys or voyages to slips which have been cut; because, having fewer issues for the sap, they are not liable to have this great principle of life and vegetation, so indispensable for their taking root, exhausted by way.

The rearers of Silkworms in France and the United States of America are informed that they may be supplied with a very great number of this new species of Mulberry Tree at the Jardin de Fromont.

The director of this establishment is from this time able to enter into a contract for furnishing any quantity of these trees that may be required for planting in 1839.

All orders and other communications should be addressed *franco* "au Directeur du Jardin de Fromont, a Ris (Seine-et-Oise). FRANCE.

The meeting then was dissolved.

E. WESTON, Jr., *Rec. Sec.*

EXHIBITION OF FRUITS.

Saturday, Jan. 19, 1839.

Lady apple, very beautiful specimen by, Mr Manning.

Baldwin and Nonsuch apples—handsome specimens, by Mr Walker.

For the Committee,

WILLIAM KENRICK, *Chairman.*

Cheerfulness and activity do not often accompany vicious habits. The ale-house is the resort of the person who knows not what else to do with himself. The promoting innocent and meaning amusements, is part of a schoolmaster's most serious business.—*Central Society of Education.*

The Countess of Haddington, in 1705, sold her jewels that she might be enabled to plant her estates with valuable and ornamental trees; we think she possessed both good sense and good taste in her choice of ornaments.

NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JANUARY 30, 1839.

NEW ENGLAND FARMER AND HORTICULTURAL REGISTER.

We hereby announce to the public that the New England Farmer and Horticultural Register, hitherto existing as two distinct publications, are now united in one;—we trust the union will prove satisfactory to the subscribers of the latter work, and send this day, the New England Farmer and Horticultural Register in its stead to those who have not taken the N. E. Farmer. Those who are not disposed to take it will please return the paper by the next mail. Those who retain the paper will be considered as subscribers.

The New England Farmer and Horticultural Register will be published weekly in quarto form, making a handsome volume of 416 pages, with an index, at two dollars and fifty cents, in advance, or three dollars at the close of the year.

Boston, Jan. 30th, 1839.

J. BRECK & CO.

Kennebunk, Jan. 8, 1839.

TO THE EDITOR OF THE N. E. FARMER,—

Dear Sir—Though personally a stranger, I take the liberty to make some inquiries of you on a subject of some interest to me as a cultivator of the soil. I am unacquainted with any practical farmer round about Boston, or would not trouble you with my inquiries.

I wish to inclose my farm with the *Hawthorn Hedge*, and am anxious to obtain some information as to the mode of planting and cultivating the plant. I have frequently seen some very fine looking hedges of this plant round about Boston, though I am not aware that it has ever been introduced into this State. I wish to know if seed can be obtained in Boston, and if it should not be convenient for you to give me the information I need on this subject, I should be greatly obliged if you will put this into the hands of some gentleman that will write me on the subject. A knowledge where the seed could be obtained, if nothing more, would be esteemed a great favor; the price usually paid for it, &c. I wish to plant about two hundred rods of this hedge early in the spring—if spring is the time it should be planted. Any information on the subject would be very gratefully received. I am ignorant how the ground should be prepared; in fact ignorant of almost everything respecting its cultivation.

I am, dear sir, with great respect,

Your obt^s serv^t,

JAMES OSBORN.

N. B. Perhaps it may be the usual practice of those who make these hedges to transplant from nurseries of Hawthorn planted for the purpose. If this should be the case, could plants of a suitable size be obtained round about Boston, and what the usual price per thousand? How many years from planting before the thorn is large enough to answer the purpose of fence? Yours,

J. O.

We have neither space nor time to give as full an answer to this letter as we desire. Nothing can be more beautiful than a live fence or hedge; but like everything else valuable, the cultivation and management require knowledge, skill, and experience. A straggling, untrimmed hedge, full of gaps, and overrun with weeds, is ex-

ceedingly offensive; but the eye rests with delight upon one that is in perfect order.

There are three kinds of hawthorn which are used for the purpose of fences.

1st. The common European Hawthorn or White thorn (*Crataegus Oxyacantha*) 2d. The Cockspur Hawthorn (*Crataegus crusgalli*) 3. The Maple-leaved Hawthorn (*Crataegus cordata*.) The first is of foreign origin; the two latter are indigenous. The leaf of the first is far more beautiful than of the two last; but it puts out late in the season; and it sheds its leaves much earlier. The two latter form beautiful and substantial fences. The Cockspur thorn is much used in Delaware, and the stage road used to pass through miles of this fence. The Maple-leaved Hawthorn has been cultivated to a considerable extent by Josiah Quincy, Esq. at his farm in Quincy. These fences have all suffered much from the mice in winter, whose ravages are favored by our deep, drifting, and long continued snows, to which they are not subject in England; and the European Hawthorn from a worse pest than this, and that is the apple tree borer, a worm which has proved signally destructive to the live fences among us. We are not apprised whether this worm has attacked the two other kinds of thorns, but we know no reason why he should not have done it. These plants should be set in double rows in what is called the quincunx order, that is, about eight inches apart in the row, and the plants in one row opposite the spaces in the other; a single row is hardly deemed sufficient for protection against our cattle, who are accustomed to roam at large in utter disregard of fences and enclosures.

As to the inquiry about raising the plants from seed, the seed or haws can be obtained at a proper season without difficulty; but they will not germinate until the second year, and they require skillful management the first year. We therefore advise our correspondent to obtain the plants of about two years old; and this may be done at many of the nurseries in the country. The maple-leaved hawthorn may be obtained at Georgetown, D. C., and probably at Philadelphia, New York, and Albany; it may be also, at the excellent establishment of the Messrs Winships at Brighton; but we have not ascertained the fact. The white or English hawthorn, as there is no duty upon the article, though it can be had here, may probably be imported from England, or Scotland at half the expense for which it can be obtained here, freight included. We imported some ourselves some years since, and presume things have not altered in this matter.

Of the proper mode of cultivating a hedge or live fence, we have not now space to go into it; but if desired, will give hereafter all necessary directions. A good deal of preparation and care are requisite that the hedge may do well.

There are other plants, which are used with advantage. The common red cedar makes a substantial and permanent fence, and requires about seven years before it becomes impregnable. The buckthorn (*Rhamnus cathartica*) is of quick growth, easy cultivation, and makes a most beautiful fence. When well set and well grown it would be proof against cattle; but it is not so formidable to them as a white thorn hedge. Nothing can be more ornamental. The plants may be obtained of Piek^g Dodge, Esq. or E. H. Derby, Esq. of Salem, who has one of the handsomest specimens of this fence to be found in the State;—probably at other places. The seed is easily procured at the proper season in different parts of the country as the plant is not uncommon. The triple thorned locust (*Gleditzia triacanthos*) makes a substantial and impregnable fence, when well plashed and interlocked. It is strong, but the foliage is not thick or large enough to make it handsome.

H. C.

THE MULBERRY FANTASIES AND THE TRANSFORMATIONS OF SAGO.

We hazarded a prediction a few weeks since that the wooden nutmeg gentry would soon be along with silk-worm eggs made out of yellow bees-wax and dropped on the best hot pressed letter paper, for sale to the amateurs. We had not a strong confidence then that our prophecy was so near its fulfillment as it now seems to be. The Northampton Courier of the last week announces that Bass wood cuttings have been sold there for cuttings of the *Morus Multicaulis*; and we have to add, that a friend of ours received last week a small phial of what was said to be mulberry seed as a sample of twenty-five pounds which the person who sent it, had on hand for sale, wishing to know the price and prospects. This sample of mulberry seed is nothing more nor less than sago; and, we beg leave to add, a very fair sample of much of the *humbegger* (we wish we could find a better word) that is going on in this very same mulberry seed and egg and tree business. "There are none so blind as those who will not see;" and in this mulberry speculation, as in many other of the speculations of the day, we see but too strongly exemplified the spirit of the old homely saying, "The de'il may take the hindmost."

BRIGHTON MARKET.—MONDAY, January 23, 1839.

Reported for the New England Farmer.
At Market, 370 Beef Cattle and 850 Sheep.
Prices.—*Beef Cattle*.—First quality, \$7 75 a \$8 00. Second quality, \$7 00 a \$7 50. Third quality, \$5 75 a \$6 50.

Sheep.—1 ots were sold at \$2 75, \$3 00, \$3 25, \$3 50, \$4 00, \$4 25, and \$5 25.

We noticed one prime Ox from Worcester County, sold for \$9 pr. hd.

The great Ox *Olympus* was sold today by Mr Wellington to Mr Hall, of Woburn, for \$650.

THERMOMETRICAL.

A FARMER WANTED.

The subscriber is desirous of making a permanent arrangement with a young man who has a small family and is thoroughly acquainted with practical farming, to take charge of a first rate farm in the Connecticut Valley, only a few miles from Hartford. Said farm is also within one and a half miles of one of the most thriving manufacturing villages in the State, and a ready and good market may there be found for the produce of the farm.

To a young man of industrious habits and good principles and who is competent to take the direction of a large farm, such an opportunity rarely offers itself; as the owner will not sell it, and an arrangement for a term of years might be relied upon.

Any young man who is possessed of the above qualifications may meet with encouragement by calling upon the subscriber at No. 12 Long Wharf, or by addressing a line through the Post Office. ISAAC C. ANDREWS.

AMERICAN SILK GROWER'S GUIDE.
On the art of raising the mulberry and silk and the system of successive crops in each season; second edition; enlarged and improved by William Kenrick. Just published and for sale by Joseph Breck & Co., at the Seed Store and Agricultural Warehouse, Nos. 51 and 52 North Market Street. Jan. 9, 1839.

FRUIT AND ORNAMENTAL TREES, MULBERRIES &c

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1839 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and of Teaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeysuckles, Paeonies, Daffodils and other Herbaceous Flowering Plants. 10,000 Cockspar at Newcastle Thorns. 10,000 Buckthorns.

Morus Multicaulis, and other Malheries; the trees genuine and fine, at prices fair, and varying with the size, and the quantity which may be desired.

Fruit and all other trees, when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston. January 30, 1839.

SHAKERS' SEEDS AND HERBS.

WIGHT & GIBSON, No. 44 Hanover Street, under the American House, (opposite Elm Street,) are appointed by the United States at Harvard, Mass, as their agents for the sale of all kinds of *Garden Seeds*, raised and put up with directions for culture, by Jonathan Chandler.

Prices, the same as when sold by the society or their travelling agent.

Herbs, Roots, Extracts, &c. for sale as above. January 30, 1839. 4m18

MONOGRAPHY OF THE CAMELLIA.

Just published and for sale by Joseph Breck & Co. at the Agricultural Warehouse and Seed Store, a Monography of the Genus *Camellia*, or an Essay on its Culture, Description and Classification, illustrated by two Synoptical Tables: the first containing the names of two hundred and seventy varieties, with the color and form of the flowers, the species and the period of their introduction into Europe; and the second presents two ascending gamuts, in which are painted the shades of color peculiar to the known *Camellias*, with their specific denominations. By the Abbe Berlesse, member of several French and foreign learned societies. Translated from the French by Henry A. S. Dearborn. Jan. 15, 1839.

MORUS MULTICAULIS.

Constantly on hand in small quantities, at the lowest market price. Orders directed to Messrs Winship, Brighton, Mass. or left at N. E. Farmer Office, will receive immediate attention. The plants will be safely packed and forwarded to any part of the country. Dec. 19.

TO BE LET.

The subscriber offers to lease for the term of three, five or seven years, his dwelling house and gardens in South Salem, either with, or without any portion of the adjoining farm lands. The gardens, &c. contain about six acres, in a high state of cultivation, well stocked with flowers, fruit and ornamental trees; two green houses, filled with the choicest green house plants, and grapes in full bearing; a forcing wall, with seed and tool rooms, a convenient gardener's lodge, and a large tea house; sufficient may be sold annually from the garden to pay the whole rent. The dwelling house is large and convenient, commanding a fine view of the sea, and is within three fourths of a mile from the centre of the city of Salem. The above offers a desirable situation either for a gentleman's residence, or for a public garden or boarding-house.

Also, to let for three, five or seven years, the farm house and barns, which are large and commodious, with the whole or part of the farm, consisting of over two hundred acres of land of the best quality, with a large orchard of grafted fruit—it is abundantly supplied with sea manure, and located near four market towns. The whole estate has a full supply of pure water. Apply to the subscriber on the premises. Jan. 23, 1839. E. HERSHEY DERBY.

SILK WORMS' EGGS.

Preserved with great care, producing sulphur colored cocoons; the worm from this kind of egg would their cocoons the last season in twenty eight days. Specimens of the cocoons may be seen at the Agricultural Warehouse, if desired. Apply to JOHN SULLIVAN.

WANTED.

A skilful, honest, industrious farmer and kitchen gardener to take a farm in the county of Bristol, near to the Providence market, to take and manage on shares, a pretty extensive establishment for raising and selling hay, corn, vegetables, fruit, milk, pigs and poultry. No one will be received without the best recommendations. Apply at the N. E. Farmer Office. C. WEEKS. Jan. 15, 1839.

BONE MANURE.

The subscriber desires to inform his friends and the public that he has been in the Bone business more than 27 years, and has spent much time and money to ascertain how bones may be converted to the best use, and is fully satisfied that they form the most powerful stimulant that can be applied to the earth as a manure. He offers for sale ground bone at a low price, and is ready to receive orders to any amount, which will be promptly attended to.

Orders may be left at my manufactory, near Tremont road, in Roxbury, or at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, Boston. Sept. 20. NAHUM WARD.

MISCELLANEOUS.

(From the Newark (N. J.) Daily Advertiser.)

THE WIFE AT HOME.

It has been one of my most serious apprehensions, that in the multitude of our societies and public combinations, men and women might chance to forget that they have anything to do individually. We have societies to take care of our health, and societies to take care of our kitchens. Alms giving, so far as done at all, is done chiefly by wholesale. Perhaps we may see the day when we shall dine together, like the Spartans, and when all family cookery and education shall be done upon the large scale.

These thoughts were brought to my mind with great force than common, a few days since, upon my making a visit to the house of Mrs Nelson, the wife of a reputable farmer, a few miles from our village. If I were to attempt a portrait of this excellent lady, I should fill a volume; I can only give a sketchy outline. Mrs Nelson is, in the American as well as the English sense, a fine woman. Temperance, early rising, industry, and above all serene cheerfulness of soul, have left on her cheek at forty, those roses which fashion and excitement often blast before fifteen. But what I took my pen to notice, was that truly feminine and christian trait of my good friend—she is a *keeper at home*. Though I have been a church-going man many years, I do not remember to have heard any one of our clergy enlarge upon this scripture phrase; and yet the older I grow the more meaning there seems to be in it. The best women in the world are those who stay at home, such is the opinion of the best judges, to wit, their husbands. The worst women are those who have no home, or who love all other places better; such is the verdict of those who meet them abroad. A wife in the house is as indispensable as a steersman at the wheel. Who can count up the cases where poor fellows have been ruined by their wives!

This is a hard saying, but if it were softened, it would be less true. Surely it is no disrespect to the better sex to point at these rare exceptions, which like the dim tarnish on the face of the moon, make the other tracks look all the brighter. After you shall have exaggerated to the utmost the number and the faults of the gadding, gossiping, and idle women, we still have a million of American house-wives, brightening a million homes and hearts. Mrs Nelson is one of them. Her husband is not the meekest man in the country, nor by nature the most hospitable, but she makes up for all, like the credit side of an account. In the exercise of the passive virtues, she finds her greatest happiness. She holds it to be one of the very first duties of life to render her home delightful, first to her husband, next to her children, and then to all who may enter her hospitable doors. Early in life, she observed that several of her husband's intimate acquaintances were becoming irregular in their habits, she and Nelson talked it over at length. He being a rough man, declared it to be his intention to break off all intimacy with Lang and Shepherd, on the spot. "O no! husband," said she, "that would be cruel, remember the proverb, 'A soft word breaketh the bone.' Let me alone to bring them to their bearings; at any rate, give me a month for an experiment." "You! Mary," he exclaimed in astonishment, "you amaze me; surely you will not follow them to the bar-room, as Jemi-

ma Murphy does her goodman." "No," said his wife laughing, "but we women have some secrets left still. Wait but a month."

The month rolled round. Nelson had hard work to refrain from falling upon the two men violently, but he waited to see the issue, and even kept out of their way that the incantation might be uninterrupted. At the close of less than the three weeks Lang and Shepherd were two of the most quiet, orderly, and domestic men in the neighborhood. "Why Mary," said Nelson, "what in the world have you done to them?"—"I? husband! I have not exchanged words with them for weeks!" "Then you have had some witchcraft at work?" "Not I," she replied; "the story is soon related, I had observed for a long time that their honies were growing dismal, and I often told Mrs Lang what I feared concerning her husband. Indeed I had heard you tell of his repeating over his glass that abominable saying, 'the devil's at home.' After my conversation with you, I set to work—not on the husbands, but their wives. Simple creatures! they scarcely knew what I meant. They wished indeed that the men would spend more time at home, and even wept about their late hours and rum drinking. But they were not prepared for my telling them that they must redouble the attractions of their own fireside and table—make the cheer better—the fire brighter—the children cleaner—the welcome heartier; call in a pleasant neighbor to tea—have a little singing in the evening, and even invite to a comfortable supper two or three of the husband's tavern cronies. The thing took admirably. The wives triumphed, and I hope you are satisfied."

Though it is likely Nelson did not just then suspect it, this was the very course which had proved successful in saving himself from ruinous habits. And most earnestly is it to be wished that all our towns and villages were filled with such wives as honor and love the family institution! Every one has made the observation that there are many more women who are religious, than men; but the final cause of this has not so often been remarked. Divine providence by this discriminating favor to the one sex, pours influence into the social fountain. As are the mothers of a nation, so will be the sons and, in a measure, the husbands. But to exercise full influence; the wife must be a keeper at home. She will find enough to employ her longest days, in the endless circle of household cares. While she will welcome the evening visitor, and often enlarge her frugal hoard for the bevy of friends, or even join in the social party or the cheerful sleigh ride, these things will be the exceptions not the rule. So living, she will give happiness to an ever increasing circle. "Her children arise up and call her blessed; her husband also and he praiseth her."

C. Q.

RECIPE FOR INDIAN CAKE.—A correspondent furnishes us with the following recipe for making that excellent Yankee viand, an Indian cake:

Take three cups of Indian meal, three cups of flour, three quarters of a cup of molasses, two teaspoons full of saleratus stirred in the molasses until it foams—add a little salt and mix it with cold water the thickness of pound cake. Then bake it.

Drunkenness turns a man out of himself and substitutes a beast.

FOR SALE, A FIRST RATE FARM,

Well situated on the road leading from the Theological Seminary in Andover, to the old Boston road; lately owned by Peter F. Shed, and well known as the David Blunt Farm containing 70 acres, more or less. There is about 20 acres of good Woodland within sight of the house. The remainder of the farm is in good condition, and is generally considered by those acquainted with it, to be "a garden spot." There are from 300 to 500 apple trees on the place, independent of other fruit trees of great value. The farm is well walled and watered, the buildings, in first rate order, and there are upon it three wells of excellent, soft water. It is well situated for a gentleman wishing for a residence in the country, being retired, and yet in the immediate vicinity of the public schools and the Theological Seminary; or if the farmer, who wishes to raise vegetables for market, the land being all good, and markets near. It lies about half a mile from the Ballard Vale Factory, one mile from the Rai Road depot, and nine miles from Lowell. There are upon the place about ten cords of manure.

The conditions of sale will be liberal, the owner being obliged on account of ill health, to go South.—For particulars, inquire of the subscriber, on the premises.

ANDREW B. STIMPSON.

Andover, January 15, 1839.

4w

FARM FOR SALE.

A Farm situated in the southwesterly part of Townsend on the road leading from Townsend west village to Worcester. Said farm contains 110 acres of land divided into mowing and pasturing, and a large share of wood and timber; one story house, with two front rooms, kitchen, buttry, and two bed rooms well finished; parlor papered; wood house well, under cover, forty five feet, and shed, a large sheep house, fifteen by thirty feet, a large cooper shop, and another small house well finished, on the lower floor, a good quantity which comes into the barn yard, and a good orchard.

The subscriber will sell a part or all, and give possession this fall or winter, or next spring. Those who wish to buy will do well to call on the subscriber, who lives on the premises, and look for themselves.

Nov. 29, 1838.

ASA H. ADAMS.

MULBERRY TREES.

WM. PAINCE & SONS will make sales of trees and cuttings of the genuine Chinese *Morus Multicaulis*, *Morus Expansus*, *Alpine*, *Broussa*, *Canton* and other varieties, deliverable to the purchasers at such period in the Spring, as is convenient to them, and will enter into contracts accordingly.

Prices and terms for the trees and cuttings will be forwarded to all who may apply for them by mail, as well as prices of Silk Worms' Eggs, Mulberry Seeds, &c. The Multicaulis trees are remarkably vigorous, and as we first imported the genuine tree, purchasers are sure of obtaining the genuine kind. It is from this cause and from the great attention paid by them, that the trees that they have sold, have given universal satisfaction.

Dec. 20, 1838.

AGRICULTURAL.

(From the Journal of the Franklin Institute.)

In the part which the soil acts in the process of vegetation. Memoir read at the Academy of Sciences, by J. PELLETIER.

Translated from the Journal de Pharmacie, for the Journal of the Franklin Institute, by J. GRISCOM.

The ground is the support and nurse of plants; at its bosom, by means of roots, they seek for and find a portion of their nourishment. But to this end, so simple and obvious, are attached questions of a complicated nature, and of the highest interest to physiology and agriculture. With one, among others, I have been particularly arrested, and it has been the object of my meditations. Before I state upon it, permit me to bring into view some facts which appear to be necessary to the discussion of it.

The earth is not an elementary substance. Its exterior bed, the residence of plants, is formed of various metallic oxides, silica, alumina, lime, to which are often joined magnesia and the oxide of iron. It contains, moreover, the detritus of organic matters which had before possessed life and existence. Thus constituted, and under the influence of air, water and imponderable fluids, the earth is eminently fit for the development of germs deposited in its bosom, and to the growth of the vegetables which flourish upon it.

The necessity of the presence of organic matter, to constitute a soil, endowed in the highest degree with vegetative force, cannot be considered doubtful. In vain did Tull, in 1773, attempt to maintain that distinct earthy particles formed the sole nourishment of the plant. This theory was returned by the positive experiments of Duhamel who had at first embraced it. Nevertheless, if it is certain that the presence of organic matter is a condition of fertility, we may still ask whether it is so essential a condition—such a *sine qua non*—that a plant cannot vegetate in a soil totally deprived of organic matter, particularly if other circumstances, such as the presence of water and carbonic acid, be united with it.

Numerous experiments have been made to resolve this question. Many of them are contradictory. The greater portion, from the high interest which they involve, ought to be discussed and repeated with care. But another question not less important, and which I think ought to be first ascertained, is this: *What influence have soils themselves in the act of vegetation?* To this question I present confine myself.

A vegetable soil, in its normal state, must be considered a mixture of various earths, that is, of metallic oxides.

Every soil devoted to agriculture, is in general, says Chaptal, formed of a mixture of silica, lime and alumina, and in support of this assertion he cites various analyses.*

Davy confirms this statement in his Agricultural Chemistry, and, in fact, not a single instance of a fertile soil has occurred, which consisted of only one earth, or even of two, such as lime and siliceous siliceous and alumina, alumina and lime.

In another passage in his *Chimie Agricole*, Chaptal expresses himself thus:

“A mixture of lime, siliceous and alumina forms the basis of a good soil; but that it may possess all the desirable qualities of good land, these ingredients must exist in certain proportions, which analysis of the best soil can only establish.

If we consult the analysis of the most fertile soils, we find that fertility diminishes in proportion to the predominance of either of these principal earths, and that it becomes almost null when the mixture has the properties of only one of them.”

Complexity of composition is therefore, in general, a condition of fertility in a vegetable soil. The loose earth which we find in valleys arising from the decomposition of primitive rocks, makes generally an excellent soil. Now we know that granite, composed of quartz, feldspar and mica, and frequently amphibole, must yield by its composition, a soil containing silica, lime, alumina and a little magnesia and sometimes potash. Soils originating, on the contrary, from the decomposition of more simple rocks, siliceous limestone, for example, are lighter, and suitable only for a limited number of plants; they require, says Chaptal, to be enriched, and are valuable only in moist climates. Land originating in the decomposition of trap, basalt and other rocks of complicated elements, possesses, on the contrary, great natural fertility.

“Rivers,” he further adds, “receive in their courses other streams whose mud is mingled with its own, and it often happens that the united sediment of two rivers possesses greater fertility than that of either separately.”

This then appears to be an established fact, that

Coarse Siliceous	30	56
Silica,	26	14
Alumina,		30
Carbonate of Lime,		100

A fertile soil in Middlesex gave Davy—Siliceous Sand 3.5; the remaining 2.5 consisted of

Carbonate of Lime,	28
Silica,	32
Alumina,	29
Analysis of a fertile soil in Touraine:	
Sand,	49
Silica,	16
Alumina,	10
Carbonate of Lime,	25
	100

A very fertile compost, formed by Tillet consisted of clay 3-8, pulverised limestone 2-5, sand 2-8, corresponding to

Coarse Siliceous	25
Silica,	21
Alumina,	16.50
Carbonate of Lime,	37.50
	100

a soil (independently of organic matter) is the more fertile as its composition is more heterogeneous.

If we seek for an explanation of this fact, we find in authors only vague opinions and doubts; the greater number merely state the facts without attempting an explanation.

Agricultural chemists, who indulge more in theory, appear to regard the cause of fertility as dependent on the physical character of the soil rather than on its chemical constitution. Thus Davy having observed that different soils attract moisture with different degrees of energy, and having discovered, as he believed, that the most hygroscopic soils were the most fertile, he ascribes their superior fertility chiefly to this property. But Davy has not proved that the hygroscopic force of a soil bears any given relation to its composition.

If this attraction of moisture were the principal cause of fertility (abating the influence of manures) we perceive no necessity for the combination of the three earths in the constitution of a soil of the first quality. Indeed a certain quantity of alumina in a soil otherwise entirely siliceous, or entirely calcareous, a certain proportion between the adhesive and the loose or sandy portions, would be sufficient to confer this hygroscopic quality, and of course the fertility of the soil. But we have nothing to confirm this supposition.

The hygroscopic quality of a ternary soil may then be considered as an *element* of fertility, but only a secondary element, subordinate to its chemical composition.

The property of becoming more or less heated by the rays of the sun, which appeared to Davy to hold a relation to the fertility of different soils, appears to me to be also a secondary cause. In the cases referred to by him there was a mixture of black mould, and he did not sufficiently consider its fertilizing action as a manure upon the soil.

To me, it appears evident, that the mixture of the various earths which compose a soil, acts upon vegetation and determines its fertility by an *electro-chemical force*, whose action has been clearly recognized in other circumstances, but not yet brought into view in the case now under consideration. In the first place, let us observe, that it is a fact, though the truth may have escaped observers, or rather, it has not yet been brought under a formula, that the silica, alumina and lime which enter into a good vegetable soil, must not be combined with each other, but simply mixed, the lime being in the state of a carbonate. A triple silicate of lime or alumina, in which the siliceous, lime and alumina should be in the proportions which constitute the best arable land, could not, even if thoroughly divided, furnish a soil essentially adapted to vegetation. If, in a fertile soil, composed of a mixture of lime, alumina and silica, a combination between these three oxides should begin to take place, the ground would become cold and sterile. Now, it is certain, that in a mixture of these three ingredients, a force

* A fertile soil in Sweden was found by Bergman to consist of:

does exist which tends combine them. The silica and alumina are, in relation to the lime, electro-negative bodies, and in their presence the lime must acquire a contrary electricity. According as external or mechanical movements of the soil, or other foreign causes, shall bring these molecules within greater or less distances from each other, and group them in various ways, electrical piles will be established, discharges will take place, producing various tensions, and the earth will thus, if we may use the term, become animated. The electric fluid which pervades it will excite the stamata of the radical fibrils, determine the play of the organs, and the absorption of the fluids requisite to the nourishment of the plant. The radical fibrils, and the capillary roots impregnated with moisture, will become so many electrical conductors, engaged in transmitting electricity, certainly as necessary to life as light and caloric.

The merit of a theory is, that it accounts for observed facts, enables us to foresee what will take place under particular circumstances likely to happen, and indicates the considerations which it may be desirable to bring about with a view to useful results.

Let us inquire whether the theory now presented, fulfils these conditions:

Suppose a chalky soil. To improve it, we add argillaceous marl; i. e. to the lime which predominates we add silica and alumina. *To the positive element which we found alone, we add the negative elements which we found deficient.*

Will it here be said, that "chalk is so compact that the roots cannot penetrate it, or so split up that water passes through it like a riddle, and that the marling is simply designed to change this physical condition?"

But, if the object was merely to divide the chalk, in order to change its physical condition, a calcareous sand would accomplish this object, and yet it never came into the head of an agriculturist to improve his chalk by limestone, while Jordan de Saint-Memin produced a magnificent vegetation by a mixture of chalk with heath sand.

In a piece of ground belonging to Chaptal, the soil was clayey and rather barren; below was a layer of black earth. Chaptal went to work empirically, dug up the ground and mixed the two beds together. *Contrary to his expectations, the sterility was increased.* It was not till the fifth year that the ground acquired a common degree of fertility, that is, when all the iron had passed to the state of peroxide, and the land, black as it was, had become of a deep, bright yellow. Chaptal asks, if, in this case, the black oxide is injurious to vegetation, either by itself, or in reference to the oxygen.

In our theory, the fact explains itself, and might have been foreseen; the black oxides of iron (fer oxide d'Haüy) is a combination of protoxide and sesquioxide of iron, a substance *indifferent* in relation to silica and alumina. Exposed to the air, the combination is destroyed, the iron passes to the state of peroxide, susceptible of union with silica and alumina. Yet, under such circumstances, it was not worth while to mingle the two beds, since five years were lost in attaining a common degree of fertility.

The theory which we have adopted, is applicable, likewise, in the happiest manner, to the opera-

tion called marling. Marl is not a simple mixture of silica and alumina with more or less of carbonate of lime. Its base is argillaceous and calcareous silicates; some mineralogists consider it even as an oryctognosical species.* It is on this account that plants cannot vegetate in marl which has been long exposed to the air, even when the silica, alumina and lime are in the proportions which form good arable land. By exposure to the air, carbonic acid *destroys the combination* which existed between the earths, and it is then, and then only, that marl will enrich the soil. In this case, if the negative element prevails, as in the case of argillaceous marls, it becomes excellent for calcareous soils; and marls called calcareous are in their turn advantageous for argillo-sandy land.

It has been remarked, that the alkaline and earthy salts, which, in a certain quantity, injure vegetation, produce a good effect when employed in small doses. Chemists and farmers have sought to explain this action of saline compounds. Some have thought that certain salts were good for plants, as some are for animals—that salts, and even earths, formed part of the food of vegetables; others, on the contrary, that they act principally as stimulants to vegetation. Without denying that earthy substances may enter into the constitution of a vegetable, to unite and give strength to the parts that are to support the organs, like phosphate of lime in the bones of quadrupeds, I may remark, that with a few exceptions, the presence of any salt is not absolutely necessary to vegetation. Thus, for example, borage and lettuce, whose extracts contain much nitre when they grow in highly manured soils, do not contain any sensible portion of it when cultivated without dung. I therefore rather incline to the opinion of physiologists, who think with M. Decandolle, that salts act as excitants or stimulants. But, what is the meaning of excitation? At the present day, science no longer admits of those vague explanations which consist of nothing but words. I understand by excitation, the eminent property of conducting electricity which salts communicate to water. It is in this manner, as it appears to me, that nitrate of potash acts, in the prodigious energy which it gives to vegetation. It is probable in this way that sulphate of lime acts; that is to say, by rendering the water a better conductor, though, in this case, the effects appear to me to be complicated, and to be worthy of direct experiment.

Thus far, for greater simplicity, we have considered lime as free, in speaking of the mixture of silica, alumina, and lime, which constitute a soil; now the lime is in the state of carbonate, but it does not, in that state cease to be an electro-positive element in relation to silica and alumina. This circumstance allows us to explain an important vegeto-physiological fact. The carbon in vegetables is produced mostly, if not entirely, by the decomposition of the carbonic acid which they absorb not only from the air, but from the ground: such is the opinion of the celebrated Decandolle. This carbonic acid, furnished by the ground, appears to enter into the vegetable at the moment of its liberation, probably dissolved in the water which the soil contains. It is absorbed by the spongioles of the radicles; it ascends with the sap, urged forward as by a *vis a tergo*. But how is this carbonic acid produced? In certain manured soils,

and in superficial portions of the earth, penetrated by the air, we may conceive it to be formed by the re-action of oxygen upon the carbon of organic detritus; but at those great depths which are attained by the roots of oaks and cedars of a hundred years old, how can the carbonic acid be developed? How can the oxygen and organic matter penetrate to such depths? In our theory there is no difficulty. Carbonic acid comes from the lime, on which the silica and alumina act slowly but continuously to form silicates.*

Thus, then, at certain depths, and under influences but little understood, silica would decompose carbonate of lime, while at the surface of the earth, and under the influence of exterior agents, the silicates would be decomposed by carbonic acid produced by the re-action of the oxygen of the air on organic detritus—an admirable and providential rotation, which re-establishes the equilibrium, and incessantly tends to the rejuvenescence of nature.

The last corollary of my theory—the decomposition of silicates by exterior agents, and particularly by carbonic acid, cannot be called in question. It has been established by M. Becquerel, under circumstances in which the force of cohesion might seem to present a serious obstacle. I allude to the decomposition of the feldspar of granite, and the formation of kaolin. The analogy is here so strong that I must render the homage of my first conception to the distinguish academicien I have just cited.

The fact of the decomposition of carbonate of lime by silica in the interior of the earth is equally supported by experiment and observation. And, first, if, in proceeding to the analysis of a vegetable soil, when the coarser siliceous sand has been separated by agitation and deposition, and the carbonate of lime has been removed by weak acids, we examine the finer terrene substance which has resisted the weak acids, we find that it is not alumina, as Chaptal indicates, nor silica, as is stated in various works, but that it consists principally of veritable silicates of lime, of alumina, and of oxide of iron.

Still, it may be objected that these silicates are anterior to all vegetation; that to prove their recent formation and daily production, requires direct experiments. These direct experiments are among the objects which I wish to undertake. They require much time. But to prove truth, are we to depend solely upon new experiments peculiar to him who advocates it, and are we forbidden to rely on the labors of our predecessors? Certainly not. I may therefore again refer to the interesting researches of M. Becquerel, and bring into view those mineral species which he has formed in his laboratory, and which present all the characters of their natural congeners. Neither can I omit to mention the important fact of the artificial formation of feldspar by Cagnard de Latour.

* Animal manures may contribute to the decomposition of silicates, not only by the carbonic acid which they form by absorbing oxygen from the air, but in producing such substances as the *FAT ACIDS*, which have a tendency to unite with the lime and to eliminate the silica which is combined with it. M. Raspail, whose talents we are glad to acknowledge, without sharing in all his scientific opinions, appears to us to have explained the siliceous petrifications that are found in chalk, in a very happy manner by the action of animals entombed in siliceous calcareous beds.—*Physiol. Vegetale*, t. 2. p. 339.

* G. Diet. d' Agriculture, article *Craie*.

* Brochant's Mineralogy.

There is still another objection which may be made to the theory now presented. If, in this mixed state, the earth acts by the virtue of electro-chemical forces, why are three earths requisite to the construction of a good soil? Ought not silica and lime, or lime and alumina to be sufficient to produce, in each element of the mixture, an opposite electricity? It is easy to answer this objection also, by a reliance upon facts well known to mineralogists: it is certain that the binary silicates are more rare in nature than the ternary silicates, and that their mass in particular is less powerful: silica has therefore a greater tendency to combine with lime and alumina together than with either of these earths separately. Hence, we may perceive, that the union of the three becomes necessary to constitute a soil endowed with the highest degree of vegetative power.

If the ideas which I now submit to the academy, appear to deserve any attention, I propose, on the return of the favorable season, to renew the inquiry, and to devote myself to the labor of positive experiment—experiments, which, whatever may be their results in reference to my theory, will at least have the advantage of eliciting facts which may be friendly to agriculture, that science which is so prominently stamped with the character of utility.

We have at once, upon perusal, determined to enrich the pages of the N. E. Farmer with the subjoined Dictionary of Terms used in agriculture—fully persuaded that it will prove highly interesting and useful. It is made out with great precision and perspicuity, the very first excellence in all writings designed to be useful. It does honor to the ably conducted agricultural journal in which appears, the Genesee Farmer, a paper, we must say, without disparagement to any other, conducted with eminent scientific and practical talent, and which we do not hesitate to recommend to every farmer in the United States as worth to him ten times its cost.

H. C.

Abarding. This a term applied by some agricultural writers to the crumbling down of earth from the effects of frost. This process is seen most on fall ploughed lands, and is an efficient agent in ameliorating and rendering fit for cultivation heavy or clay soils.

Abrasion. The wearing away, by running water, of earths, rocks, &c. the banks, or the bottom of streams, and the result of which is the deposit of alluvium.

Absorption. The process by which plants and animals are nourished is called absorption. In most plants this office is performed by the roots, and it is through the vessels called spongioles, with which the roots are terminated, that absorption takes place. In aquatic plants, the water which affords the nourishment is absorbed with facility from every part of their surface. By causing the roots to imbibe colored liquid the general course of the sap may be traced with considerable accuracy.

Acids. Bodies that have usually a sour taste, and corrosive qualities. Some acids appear only in a fluid state, gaseous as carbonic acid, or liquid as sulphuric acid; others are crystallized, as the boracic, benzoic, &c. Of the acids, the only one that has much influence on vegetation is the carbonic.

Acclimating. Plants are endowed with a power of gradually accommodating themselves to the

temperature or climate in which they are placed, unless the change is at once so great as to suspend their vital functions altogether. This process is called acclimating. Plants will bear removal better from a warm climate to one of lower temperature, than from a cold to a warm one. As instances in plants, we may mention the potato, the bean, the melon, and among fruits the peach and apricot. The cucumber affords an instance of the effect of acclimation. It is grown in the open air at Cairo and at Petersburg; at Carracas and at Quebec.

Aeration. An important change effected on the sap of plants, by the action of light. It consists in the decomposition of carbonic acid gas, which is either brought to the leaves of plants by the sap, or absorbed directly from the atmosphere. The substance of all plants is mostly carbon, and as carbon in its common state, however minutely divided, is never taken up by the sap of plants, this most essential ingredient is obtained in the form of the carbonic gas, from which the oxygen is separated by the leaves under the action of light, leaving the carbon ready for assimilation, or conversion into vegetable fibre. That this process is performed by the green substance of the leaves or stem, is evident from the fact that if a leaf is bruised or its vitality destroyed, its substance is no longer capable of decomposing carbonic gas in the light, or absorbing oxygen in the dark. The necessity of this aeration of sap for the purpose of ripening fruit, or maturing vegetation, may be seen in some fruit trees, the plum for instance, in which an excessive quantity of fruit causes a premature fall of the leaves, after which, owing to this loss of the organs of aeration, the fruit never ripens, but remains immature and worthless. The necessity of the leaves for aeration, or perfecting the juices of plants, shows the absurdity of plucking or injuring the leaves of any plant before it is ripe, topping corn, &c., under the idea of hastening maturity, or increasing the product. Attempts to improve on nature must be failures.

After-grass. The grass grown on meadows after they are mown. The usual practice among farmers is to feed this off by cattle or sheep, and in some cases so closely as to nearly destroy the roots of the grass. Unless the turf is close, and the meadow rich, it is better to not feed at all, or very lightly. For cropping after-grass, sheep are better than cattle, since, though their bite may be closer, they do not injure the roots with their feet like the former. If mown a second time for rowen, it is called

After-math. On rich meadows, or where manure can be had in abundance, for top dressing, a second mowing may be justifiable, and the grass so cut, if well cured, is much relished and eaten with avidity by ewes, calves, and other animals that are apt to become poor under ordinary management. The practice of the second mowing, however, like after feeding, is not to be recommended on the whole; experience proving that the injury grass roots always receive from mowing, is increased by the second cutting. Necessity alone can render after feeding or mowing justifiable or proper.

Agriculture. In the most extended use of this term, it is made to embrace all the operations made use of to obtain food for man, whether from the field, the orchard, or the garden. In its proper and limited sense, it means the cultivation of the soil, which is the great source of wealth. The first

want of man was food; the place to obtain it was the earth; hence the origin of agriculture; and in proportion to his wants, and the ease or the difficulty with which they can be supplied, is his progress in agriculture. Where the wants of man are supplied by the spontaneous productions of the earth, as in parts of Africa, or in the South Sea Islands; or where the inhabitants expect no food from the earth, as among the Esquimaux, or Somolies, their agriculture is unknown. It is only where exertion is necessary to procure food from the earth, that wants abound; that wealth is increased; and that agriculture becomes a science, and assumes its proper place as the basis and precursor of civilization, society and order: All history proves that such is the fact. The creation of wealth belongs to agriculture. Food must be had, and the value of every other article depends directly or remotely on the amount of food it will procure. The skill of the mechanic may improve; the enterprise of the merchant may exchange; but the origin belongs to the earth, and the cost and the profit is alike determined by the result of agriculture.

Science has within a few years done much in aid of agriculture; not that many positive discoveries have in the first place been made by the sciences, of which the agriculturist has availed himself; but the cause of certain results before known to the farmer, have been revealed by chemical or other researches, and thus the means of more certainty and in many more cases of producing the same results has been obtained. On this is based the improved system of agriculture. Where the earths are not in due proportion, it is impossible to make or keep the soil in a productive state. The nature of the earths is now inquired into, and their balance maintained by a rotation of crops, or the application of such matters as shall prevent exhaustion, or restore fertility to such as have been improperly treated. The capability of the earth in affording food, when properly tilled, is but imperfectly understood. Now and then instances occur in which either by skill or accident these powers are developed to the surprise of all; but what is done in one case may be done in others; and when agriculture is what it should be, when the tilage of the soil, and the application of proper manures shall be better understood, the results that now astonish will become common, and while the labor shall be diminished the product will be vastly increased.

(To be continued.)

ITEMS IN DOMESTIC ECONOMY.

To preserve fresh meat, killed early in winter, through cold weather, bury it in snow—the best way is to place alternate layers of meat and snow in a tub or barrel, and keep it in a cool place. The meat should be a little frozen first. Several days warm weather will not affect it; and if kept in an ice house, it may be not only preserved through winter, but during the following spring.

Hams cannot be kept with ease or certainty unless the flat bone, near the centre of the inner side which joins on the other bones of the ham by a ball and socket, be first carefully removed. Where this has been neglected, although every other care has been taken, failures and loss has followed.

Oats are more beneficial to horses if ground; and hay, if chopped fine.

FLORICULTURE.

THE PROPERTIES OF FLOWERS.

The advancement of floriculture has always been an object of the first importance with us. We have taken more pains with it than with any other branch of horticulture or gardening, because it would be followed with advantage by a larger class, and by persons in all grades of society. The Horticultural Journal has paid great attention to the properties of flowers, with a view of teaching the amateur what is necessary to render him a successful exhibitor, and confirming the more experienced, but perhaps wavering, professional gardener in some fixed principles. It is desirable that all persons should be united upon the value of fancy flowers, and, of course, upon the standard of perfection by which such value shall be estimated. The Metropolitan Society has done more towards fixing this standard than all the Horticultural and Floral Societies put together. The rules laid down by that society have been followed, or professed to be followed, by almost every establishment, describing the name of Floral or Horticultural, in the kingdom, and it has been of great service to the science. The properties of flowers were, at one time, valued by no set rules of propriety, by no consistent attribute of beauty. The whims and fancies of particular individuals pronounced particular points estimable, without considering whether such points increased the splendor of a flower; whereas the points insisted upon by the Metropolitan Society, without a single exception, increased the beauty of a flower even to ordinary eyes. Thus it was that roundness and flatness in the bloom of a pansy were said to be the standard of perfection; place side by side a pansy of the old shape, and one nearly approaching the circle, unbroken through the petals, overlapping each other and tolerably flat, the most unpractised eye will see the richness of one compared with the other, and though there are none quite round or quite flat, there are many which approach both, and they are the more valuable in proportion to their near approach. Again, the properties of the dahlia are equally well defined, the nearer the shape approaches two-thirds of a ball the better. Everybody can understand this definition of the property of a dahlia. It is true, that to become this form, the petals must be broad, round ended, short, and imbricate well, free from notch, plenty of them, and the centre not over bloomed; but these are details. If the flower be two-thirds of a ball, the detail is sure to be good, for if the petals be narrow or pointed, or long, the flower cannot be well formed. A tulip has been equally as well defined as to property, and very fortunately, for the flowers which were bearing high prizes were perverting the taste of the growers; and it will take some years to correct it. Nevertheless, the rule laid down by the Metropolitan Society cannot be mistaken. The desired form, when expanded, is from one-third to one-half of a hollow ball, forming, as a matter of course, a perfectly round shallow cup; for, as the beauty of a tulip is in the inside, no other form will so well display it. The tulip must, however, possess one quality without which it will be now set down as valueless. The white or the yellow must be of one uniform shade or tint, without stain, to the very centre. In this case, as in the other, the most ordinary observer, who may know nothing about tulips, shall, nevertheless, in a moment decide that

the clear round flower is more beautiful than one that is stained or not round. Upon this principle should the value of all such productions be estimated. We do not mean that every body should be able to appreciate all the points of a good flower; but that the leading ones, especially the form, should be that most likely to please the world. The auricula is a flower equally requiring a proper estimation of properties, and equally indebted to the Metropolitan Society for published rules by which to regulate them. The chief point here again is *form*. To be quite round and quite flat, like a counter, would be perfection; but here the colors form a much more important feature than in other flowers, for the auricula will come all green like a calix, or all white and mealy, without any distinct color. It has been, therefore, necessary to state that there should be several divisions of color; the small tube in the centre should be bright yellow—the circle round this perfectly white—the next circle should be a distinct color, lilac, violet, purple, blue, brown, or dark approaching to black, and very unbroken—and the outer circle of all green, grey, or white; and in proportion as all these form distinct circles, and the individual pips are flat, &c. does the value of the flower increase. There is another property estimated in London and its vicinity more than in the country. The Metropolitan Society consider it a leading property that the auricula should form a bold truss of seven pips or flowers at the least: in the country they do not require more than five. Thus many flowers will do for the country that would not do in the metropolis.

In roses, novelty seems to have been the leading point, and many growers have discovered novelty where nobody else could; but there are properties as essential to a good rose, as to any other flower, novelty forming one of them. A rose should be strongly perfumed—the petals should be thick, round, and plentiful; the color bright, and the flower double; the more of these properties possessed by a rose, the better it is. Hundreds, however, are in cultivation so nearly resembling each other, so nearly approaching to single, so weak in their perfume, and so straggling in their growth, as to make every amateur who has purchased largely repent truly that he has been governed by fine names, instead of fine qualities. Geraniums have come in for their share of attention as to properties. The majority of them have petals so narrow, that, as there are but five, they divide and form an irregular star; they ought, like the heart's-ease, to be wide enough to lap over each other, and form a whole and nearly circular flower, rather campanulated than otherwise. These ought to come in trusses, comprising at least six or eight blooms each, and forming good close heads. Bright colors, novel pencilling, and deep dark spots on the upper petals, are in great esteem; but the best at present, for form and style of growth, is Dennis's Perfection, though the color is deficient. Others asserted to be *as well formed and better colored*, are said to have been raised and coming out, if not out already, and indeed we have observed several bright and good flowers very closely approach it, but we confess we have not seen any fully up to the point; and though, as we have said before, the coloring is deficient, we have not seen any one so complete in form of flowers, beauty of truss, and general style of growth. The principal object we have in view here is to show that, in the estimate of properties by the Metropolitan Society

of Florists, regard is had to those points which please everybody; that in fact, taken in a general way, an ordinary flower placed by the side of a flower approaching the standard of perfection laid down, shall appear inferior to ordinary observers—that the properties estimated as valuable to the connoisseur shall enlist among its admirers all persons of taste, whether florists or not; and who we resume this subject to go into details, we shall be able also to show, that there is a good reason to be made apparent to common observers, for every point esteemed by the society as essential to a good flower. In tulip growers we have observed more whimsical notions than among any other class of florists. But such is the advantage, of setting even the experienced cultivator upon a right course with regard to the properties of flowers, that there are sorts which bore a great price now hardly cared for, and others which bore no price at a gradually becoming favorite. The uncertainty of the bloom will always render the possession of a bed of flowers a source of anxious pleasure, because there are varieties usually stained at the bottom, and therefore worthless, but which sometimes come very clean and fine, and they are the grand beyond description. Nine times out of ten a *Siam* will beat a *Louis*, but the tenth time the *Louis* may come without its usual stain at the bottom, and then it is a sight worth travelling miles for. But *Louis* has never won at the Metropolitan Society's shows, and we doubt if it ever will, because, if one does happen to come clear, which not twice in a century, we might as well persuade a grower to cut off his own head as to cut his blood to exhibit. *Pompe funebre*, a valuable or rather high-priced flower, is certainly a worse flower the Polyphemus, in every stage, from blight to perfection, and as a single flower in competition it will not create a moment's doubt. The Metropolitan Society's rules would enable a man; who never saw flowers, to judge which was the best, and there is no small difficulty, when old cultivators are selected for judges, to keep them from giving the prizes to dear flowers instead of those of good property. These, however, are difficulties easily got over, as we conclude for the present by congratulating the general cultivator of flowers upon the great advantages derived from coming to a general understanding upon what are esteemed the real properties of flowers.—*London Horticultural Journal*.

LILIES.

In a number of last year's *Annales des Jardins Amateurs*, a description is given of two varieties of the lily genus, which may prove interesting to some of our horticultural friends. One of them the *lilium lancifolium punctatum*, a variety of the *L. Broussartii*. It is described as about six feet high, with leaves about six to eight inches long the flowers exceedingly firm and large; each of the six petals six or seven inches long; the color of a snow white with spots of a beautiful rose color for a short space dashed over it; the surplus part of the lower end of each petal is of a most lovely snow white, and terminates in a point in the thorns, which are alternate and large; in the other there the summits are a little longer and are turned in a spiral; the appearance of each flower, to the number of six or seven (and many more when the plant is very strong) presents a vast and super corolla of white, in the centre of which is placed enclosed in a circle of swan's down, a large and magnificent green star, whose rays divide a sort

nilky white tinged with rose; the stamens are long and well divided, and the anthers are transverse, long, and well defined; their orange tint, mixed with purple, adds much to the magnificence of the flower. The other sort is the *L. lancifolium album vel Candidum*, another variety of the *lilium Broussartii*, is not so high, and is altogether of a snow white; both varieties have a strong odor of vanilla: both were brought from Japan in 1824, by the celebrated Dutch horticulturist, M. Van Siebold. They were cultivated at Gand, from whence they were distributed to the chief establishments in Flanders. They flourished last year, for the first time, at Paris, at two establishments. One, that of M. Rey, of Kogel, and the other belonging to MM. Celso. The two plants are declared in the French work to be still rare, and most likely to become a decided ornament to pleasure grounds and ornamental gardens, as being equal to any thing that can be seen in June or July. These lilies are multiplied by off-sets and from seed, provided they give any in their new climate, as they do in Japan. This genus is become so rich in numbers and varieties during the last ten years, that it ought to be easy to enrich it still more by means of artificial impregnations. The two varieties alluded to above are particularly well adapted for this experiment, as their anthers seem made for it. The account recommends the precaution of not putting out plants of these kinds, unless an individual of each has been kept safely in the conservatory. The price at which they must be purchased for some years warrants this care, as not only may the plants be taken off by severe weather, but they may be attacked by insects and destroyed. The writer of the notice declares that he is not aware if the propagation of these lilies by off-sets is abundant or not. It might be possible to propagate them also, by slips of leaves with an end to them, and by choosing the time most favorable to the experiment. Two or three failures should not discourage the horticulturist; yet in this instance a great difficulty presents itself, inasmuch as these lilies do not, like all the woody tribes, present eyes in the axil of the leaf, and whenever this is found to be the case, the most expert grafters are at fault.

The French writer mentions that he had seen at the end of May, in the open air, the *lilium longiflorum* of less height than the *lilium Candidum*, yet with flowers equally dazzling for their whiteness, and of double dimensions, and of a most sweet odor. This plant is for sale at Rey's (of Kogel) establishment.

There is a third variety of the *lilium Broussartii*, described with purple flowers, but which had not appeared when the account was written. It was doubtful whether it was the *lilium lancifolium rubrum* or the *lilium lancifolium speciosum*. It was also in the above gardens, and described as of great beauty.—*Lon. Hort. Jour.*

PRESERVATION OF DAHLIAS.

The winter of 1837-8 was so severe, that many persons lost their dahlias. The frost penetrated into cellars, orangeries, and even caves. The usual mode of preserving them was totally ineffectual, for a great number of roots were found frozen hard. However, we have learnt a mode which is practised in France, and is found to succeed perfectly. A dry spot is chosen out in the garden or grounds, and a pit is dug there five or six feet in width and four feet deep. The length depends on the quan-

tity of roots which are to be placed there. When the pit is three feet deep, it is narrowed, three or four inches at each side, in order to obtain a ledge or resting place, for a purpose to be mentioned hereafter. The bulbs are then well wiped after the stalk is cut off in the usual way, leaving three or four inches, to which a number is attached in wood or lead. The bulbs are arranged side by side, the head upwards* in the pit. They are then covered with old boards, resting on the ledge spoken of above. If boards are not at hand, any old pieces of wood can be made to serve and prevent the earth passing through. The earth is then thrown back into the pit and well pressed down. If exceedingly severe frost is expected, leaves, litter, or grass can be thrown over all. By this proceeding the dahlias are sure to be safe. It sometimes happens, that the stalks to which the thickets are attached, continue to live. We have seen some this year in bud as large as candles, which succeeded perfectly.—*London Horticultural Journal.*

CARE OF FARMING TOOLS.

A topic not yet sufficiently enforced on the attention of farmers, is the wasteful negligence evinced in the exposure of agricultural implements to the injuries of the seasons. The sled curling and cracking by the side of the wall in summer, and the cart half buried in snow and seasoning in the winter storms, are symptoms of waste and extravagance which ripen into a consumption, to be hastened to premature termination by the visits of the sheriffs. The whole secret of wealth consists in economy, and the prudent care of those small rills which without great vigilance, are slipping through the chinks of the woven purse; and it may be considered quite as safe to predict that none of these slovenly gentlemen will be prosperous, as to write in the style of the calendar soothsayers, through pages of the month of January, "expect snow about these days." The price of the time lost when it is most valuable, in putting the exposed articles in proper repair, not speaking of the cost of the materials and the interruption of business, would defray the expenses of erecting ten such cheap sheds as would cover them from the storms, protect them from decay, and keep them ready for immediate use.—*National Egis.*

(For the New England Farmer.)

The Baron de Humboldt in his "Political Essay on the Kingdom of New Spain," mentions that it would be of great importance to Europe to procure the kind of potato which is cultivated on the plain of Santa Fe, and at Quito. He says that he has seen them of a spherical form of more than three decimetres (from twelve to thirteen inches) in diameter, and of a much better taste than any on the European continent. Comparing them with English potatoes, he observes, that the Bogota potatoes contain less water, and are very farinaceous and of an extremely agreeable taste.

The plain of Santa Fe is computed at 8190 feet of elevation. A late writer gives 8615 feet for the city of Bogota; and Malte-Brun says that

* This we venture to affirm is exactly wrong, for by reversing it every inclination to moisture drains out of the hollow stalk and prevents a common occurrence—the rolling of the crowns, which prevents their breaking.—*Editor.*

Quito is 1480 toises (or 9331 feet) above the ocean. The climate consequently is very cool. Humboldt mentions the potato among the plants which are cultivated on the highest and coldest part of the Andes, and Mexican Cordilleras.

Do you, Mr Editor, or any of your correspondents, know anything about the Bogota potatoes? Or do you know any one who can be applied to to introduce them?
SOLANUM.

EXHIBITION OF FRUIT.

Joseph S. Cabot, Esq. of Salem, exhibited the following pears: Chaumontel Coxo No. 46, Beurre Diez, Coffin's Vergoulose, Wilkinson and Lewis; the committee make the following remarks: the Wilkinson pear, so excellent in its season, had been kept so far beyond its usual period of maturity, as to have become tasteless.

Coffin's Vergoulose was obtained by the late Mr Samuel Hyde of Newton, from the garden of Mrs Coffin, who had received it from the nursery of Messrs William Prince & Sons of Flushing, under the name of "Vergoulose." When the tree came into fruit, it was found not to correspond with the description of that variety; and Mr Hyde on introducing it into his nursery, gave it the name by which it is now cultivated. It is a good fruit in its season, which is October and November, although not decidedly first rate.

The Lewis pear has not, we think, received that consideration from amateurs which it merits; we have heard it spoken of in no very flattering terms. This has arisen no doubt, from its having been seen in a bad season, or when not at its proper period of maturity. The tree is of vigorous growth and very productive, and so far as our experience goes it is a first rate table fruit from November till March, and is worthy of a place in any collection however select.

Benj. V. French, Esq. exhibited the beautiful Pomme d'Api, Wellington and Monstrous Pippin apples.

For the Committee,
ROBERT MANNING.

RAILROADS AND FARMERS.

The Wilmington, N. C. Herald states that Mr Lewis Cogdell, who lives at Wayne, seven miles from the track of the Wilmington and Raleigh railroad, delivered in the Wilmington market, at 2 o'clock, on the 11th December last, 64 Hogs, all of which were killed and dressed after sunset on the day previous; also several bales of cotton which were packed on the morning of the 11th. The distance travelled by wagon and by railroad was 94 miles.

Such despatch is worthy of public notice and proclaim the advantages of the railroad system more loudly than a thousand theories and fine spun arguments.

The best way to keep winter apples, is to barrel them. This perfectly excludes rats and mice, and preserves them in a great measure from the air.

The whiteness of ivory handle knives may be restored by rubbing them with fine sand paper or emery.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, FEBRUARY 6, 1839.

A CARD.

The Commissioner of Agricultural Survey has imported for gratuitous distribution among the farmers in the Legislature, some wheat from Portugal, called "Trigo Trimestre," and said to be an early and valuable variety. The earliest and best was ordered.

He has likewise imported for the same purpose, a quantity of German Teasle seed. The German Teasles are much superior to those raised among us; and bring usually one hundred per cent. more in the market.

He hopes to receive before the adjournment of the Legislature some of the best wheats grown in Sicily and Italy, for which he sent some time since. He has likewise obtained for distribution two bushels of ears of what he deems by much the finest variety of Indian corn, that he has ever seen. It ripened perfectly the two cold years; and yielded the last year at the rate of seventy-five bushels to the acre. He will show a sample of this corn at the next agricultural meeting on Thursday evening.

He has likewise the pleasure to acknowledge the receipt of several other varieties of Indian corn valuable for their abundant yield and early maturity; and samples of Ohio corn, which ripened well the last year in our latitude.

He is indebted to some agricultural friends on Connecticut river, always enterprising in this good cause, for samples of the growth of corn, oats, and wheat, from the luxuriant intervals of that favored land, which would do honor to the prairies of Illinois or the bottom lands of the Ohio.

He acknowledges with much pleasure the receipt of beautiful specimens of the cultivated grasses in his vicinity, from Levi Bartlett, Esq. of Warner, N. H. which show what intelligent husbandry can do even in a State which our chivalrous friends of the south consider as under the curse of producing nothing but granite and ice, of iron frosts, and snow clad summits. Massachusetts, Maine, New Hampshire and Vermont, if they will but be true to themselves, will find no occasion to envy the cotton and rice fields of the south with the curse of slave labor brooding over them; nor the luxuriance of the Western alluvions with the accompaniments of bilious fevers and intermittents.

He has received likewise from Dracut, an ingenious and improved cultivator, to be moved by hand, for garden use; an excellent drill barrow from Sheffield; and a corn planter and seed sower from the enterprising and intelligent husbandman, C. Bennett of Albany.

He has likewise obtained from Hampshire county, a steam boiler for cooking food for swine and cattle, of an excellent construction, with an ingenious arrangement for preventing any accidents from the excess of steam. This apparatus is in operation on the farm of T. Plunkett, Esq. Pittsfield, whose farm is one of the best and one of the best managed in Massachusetts. The whole is of reasonable expense; and is there found to work well—performing its business in good time and at a small expense of fuel.

This will be found at the office of the Agricultural Commissioner, at No. 52 North Market street, over the New England Farmer Office, where he will be happy to receive the visits of his friends the farmers, during the sitting of the Legislature, and of others interested in agricultural improvements.

HENRY COLMAN,

Feb. 6, 1839.

Com. of Ag'l. Survey.

AGRICULTURAL MEETINGS.

The second agricultural meeting was holden at the State House on Wednesday evening of the last week and was well attended. The Hon. Isaac C. Bates of the Council in the chair.

Several gentlemen were kind enough to give their opinions and the results of their experience in the cultivation of wheat; and their views in respect to legislative encouragement in the form of bounty. Dr Charles Jackson, the learned geologist of Maine, and who has been employed by Massachusetts to examine the condition and character of the lands in Maine, which belong to this State, gave a great deal of highly interesting and valuable information respecting that territory; and showed its extraordinary capacities for the production of wheat. He descanted likewise fully on the use and importance of lime in the soil; and spoke of the influence of electricity in the process of vegetation. Rev. Mr Perry of Bradford, one of the most intelligent and philosophical observers of nature, stated several facts in regard to the cultivation of wheat in his vicinity; and followed out some of the suggestions of Dr Jackson in regard to the connexion of electricity with vegetation, a subject as yet almost wholly in the dark. Rev. Allen Putnam of Danvers, an intelligent and close observer as well as a practical farmer, entered upon the discussion mainly in opposition to a legislative bounty upon wheat, from the inequality of its operation. The Hon. Mr Thaxter, and Mr Hosmer of the Council, and Col. Adams of Newbury, formerly of the Senate, and other gentlemen, rendered the meeting highly interesting by their remarks.

We should have been happy to have given an extended report of the remarks of the several gentlemen, but are desirous of using the information elicited in another form.

It was unanimously resolved to hold another meeting on Thursday of this week at the same place and hour, when a general attendance of farmers and others interested in agriculture is hoped for and solicited. The subjects proposed for conversation are Indian Corn and other grain crops.

H. C.

MR EDITOR,—

Without much experience in matters belonging to a farm, I have provided myself with cards, curry combs and brushes for my cattle, supposing them necessary, feeling that cattle should be kept clean—thus far my object has been accomplished and my cattle appear nearly as clean, as in June—now sir, I should not trouble you had I not lately discovered that I may have been at an unnecessary expense in providing, and subjected to a loss of time in using the articles above mentioned.

I have heard me practical farmers, men of sound minds, judicious, merciful, and other good qualities, and those from whom I should obtain knowledge; and sir, I find that some of them use but very little, and others not at all—the card, comb, &c. Learning these facts, and feeling that a merciful man should be merciful to his beasts, I am led to enquire on this subject,—I have doubts—Is it not cruel to be often scratching and rubbing? Is not the thick coat often seen on cattle in the winter necessary to shield them from the cold? Do, Mr Editor, let us have light on this subject.

In reply to the above communication, we think our friend's conscience on the score of humanity may be quite relieved, unless his curry-combs are too sharp; and sometimes they are so sharp and laid on so severely as to bring blood. This is cruel. The animal is provided, by a kind and beneficent guardian, with a thicker coat in winter than in summer; but with all his currying, unless

he uses tweezers or pincers, he cannot start this coat until the spring comes and nature itself indicates the proper season for taking off their flannels. The insensible perspiration and excretions passing off by the pores of the skin amounts almost to as much as is disposed of by other evacuations. It is important therefore that these outlets should be kept open; but this can be done only in proportion as the skin is kept clean. If we examine the habits of animals, even the most filthy, we never see them lying down in their own filth and ordure. It is cruel therefore, by tying them up, to compel them to do it any further than is unavoidable. There can be no doubt that all animals are healthier and happier for being kept in a cleanly condition; and that a good combing and currying and cleaning, unless it is done in a severe and inhuman manner, is a real luxury to them.

As to the circumstance of our correspondent's having many neighbors, whose habits in this matter are anything but careful and cleanly, we can find him a great many perfect specimens of this kind all over the State. The pretence of suffering their cattle to remain in this condition is only an apology for their own indolence and neglect. We can find without difficulty many considerable stocks of the human species, both calves and old and worn out cattle, where the same delicious system of leaving the hair uncombed and the skin unwashed has been pursued from day to day and year to year. Many of them seem never to have been washed since the time of their birth, and little prospect of ever being washed again until they are laid out. No comb ever passes through their heads except one formed by their fingers, and then only occasionally in pursuit of some fugitives from justice; and very likely they would get cold, if the fresh surface of the skin could by some thorough process be brought suddenly to an exposure to the external air. But we cannot say we have any strong preferences for this mode of training children; and we have not a doubt, if the bills of health and mortality could be examined with reference to this point, it would appear that a great proportion of diseases prevail in such locations; and an extraordinary mortality results from the foul skins, the foul air, and the foul habits in which such people live.

H. C.

LIVE FENCES.

Since our last, in reply to the inquiries of Mr Osborn, in relation to Hedges or Live Fences, we have had the pleasure of a visit and a written communication from Dr Shurtleff, whose farm is in Chelsea, and whose success has been eminent in the cultivation of live fences. He has made a large extent of this kind of fence. He prefers the American maple thorn, (*Crataegus cordata*) to any other. He says he has never had a plant bored or hurt by worms—Some plants which he set out last Spring grew from 2 to 3 per cent; and his loss under unfavorable circumstances was not one per cent. The plants may be obtained of Josiah Pierce, Linnean Hill, near Washington city, for five dollars per 1000; and a deviation from this price is made where 10,000 are taken. Dr Shurtleff states that his hedge did not cost him 50 cts per rod. We presume in this estimate he made no account of the expense of protecting fences. His hedge required eight years to make an impregnable fence. He says it can be done in half the time. A full account of his operations may be found in the N. E. Farmer, vol. ix. pages 209, 228, 267, 273. Mr Kenrick of Newton, advertises the Cockspar Thorn and the Buck-Thorn as for sale. We are not informed whether he has also the American Maple Thorn. His advertisement before escaped our notice. We presume he has also the American Maple Thorn among his multiplied varieties.

H. C.

BRIGHTON MARKET.—MONDAY, Feb. 4, 1859.

Reported for the New England Farmer.
At Market, 275 Beef Cattle and 1100 Sheep.
Prices.—Beef Cattle.—Last week's prices were fully sustained, and we quote to correspond; First quality, 7 75 a \$8 00. Second quality, \$7 00 a \$7 50. Third quality, \$5 75 a \$6 50.
Sheep.—Sales quick; lots were taken at \$3 00, \$3 50, \$3 88, \$4 17, \$4 50, \$5 00, \$6 00 and \$7 00.
Swine.—None at market and not in demand.

THERMOMETRICAL.

Reported for the New England Farmer.
Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded northerly exposure, week ending February 3.

A BOAR FOR SALE.

The Subscribers are authorized to sell a boar, half Berkshire; he is large of his age, being twenty months old. Price \$75. Apply to
Feb. 6. ep **JOSEPH BRECK & CO.**

SCIONS OF FRUIT TREES.

Scions of a great variety of Apples, Pears, Plums, and cherries, from bearing Trees, which have been proved at the botanical Garden, Salem, Mass., for sale by the subscriber.
Feb. 6. 6p **ROBERT MANNING.**

A FARMER WANTED.

The subscriber is desirous of making a permanent arrangement with a young man who has a small family and is otherwise acquainted with practical farming, to take charge of a first rate farm in the Connecticut Valley, only a few miles from Hartford. Said farm is also within one and a half miles of one of the most thriving manufacturing villages in the State, and a ready and good market may there be found for the produce of the farm.

To a young man of industrious habits and good principles ad who is competent to take the direction of a large farm, such an opportunity rarely offers itself; as the owner will sell it, and an arrangement for a term of years might be had upon.

Any young man who is possessed of the above qualifications may meet with encouragement by calling upon the subscriber at No. 12 Long Wharf, or by addressing a line through the Post Office.
Jan. 23, 1859. **ISAAC C. ANDREWS.**

AMERICAN SILK GROWER'S GUIDE.

On the art of raising the mulberry and silk and the system of successive crops in each season; second edition; enlarged and improved by William Kenrick. Just published and for sale by Joseph Breck & Co., at the Seed Store and Agricultural Warehouse, Nos. 51 and 52 North Market Street.
Jan. 9, 1859

TO BE LET.

The subscriber offers to lease for the term of three, five or seven years, his dwelling house and gardens in South Salem, either with, or without any portion of the adjoining farm lands. The gardens, &c. contain about six acres, in a high state of cultivation, well stocked with flowers, fruit and ornamental trees; two green houses, filled with the choicest green house plants, and grapes in full bearing; a forcing sal, with seed and tool rooms, a convenient gardener's lodge, and a large ice house; sufficient may be sold annually for use in garden to pay the whole rent. The dwelling house is large and convenient, commanding a fine view of the sea, and is within three fourths of a mile from the centre of the city of Salem. The above offers a desirable situation either for a gentleman's residence, or for a public garden or boarding house.

Also, to let for three, five or seven years, the farm house and barns, which are large and commodious, with the whole part of the farm, consisting of over two hundred acres of land of the best quality, with a large orchard of grafted fruit—it is abundantly supplied with sea manure, and located near four market towns. The whole estate has a full supply of pure water. Apply to the subscriber on the premises.
Jan. 23, 1859. **E. HERSHEY.**

Tulips, Ranunculuses, Anemones, Auriculas, Carnations, Picotees, Pinks, and Geraniums.

H. GROOM, of Walworth, near London, England, by appointment Florist to Her Majesty Queen Victoria, begs respectfully to call the attention of his friends and the admirers of flowers in America generally, to his extensive collection of the above flowers, which from his having been very successful in their cultivation this season he can offer at very moderate prices. He would particularly recommend to those persons about commencing the growth of the Tulip (which in England is becoming very fashionable) the order collections in beds, as it is by far the cheapest mode of purchasing them.

Tulips arranged in beds with their names.
First Class.
A bed of 30 rows containing 210 bulbs including several of the newest varieties, £15
A bed of 45 rows, £21
A bed of 60 rows, 25 guineas
Second Class.
A bed of 30 rows including many fine sorts, £10
A bed of 45 rows do £14
A bed of 60 rows do £17 10s
Tulips not arranged.
100 Superfine sorts with their names from £7 7s to £13
Superfine mixtures, from 7s 6d to 21s
Ranunculuses.
100 Superfine sorts, with their names from £3 3s to £5 5s
Superfine mixtures, from 5s to 25s per 100
Anemones.
100 Superfine sorts with their names, £3 10s
Superfine double mixtures, from 10s 6d to 21s per 100
Auriculas.
25 Superfine sorts with their names, £3 12s 6d
Catalogues with the prices of the other articles may be had on application.
Orders received by **JOSEPH BRECK & CO.**
Nov. 1. eow.

TULIPS, RANUNCULUSES, PINKS AND VIOLAS.

S. WALKER, of Roxbury, offers for sale in beds, or in such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland, France and England, to which yearly additions have and will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superb Tulips, will do well to make a selection for themselves when the bulbs are in bloom, (about the 1st of June.) The prices will conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices, in the country where the bulbs were raised, and cheaper than the like quality can be imported.

Tulips in beds of from 30 to 100 rows, containing from 210 to 700 bulbs, or by the dozen, 100 or 1000.
Viola grandiflora—Pansy, or Heartsease. Upwards of 2000 superb varieties will be exhibited and offered for sale, when the Tulips are in bloom.
Ranunculuses—fine mixtures, at from £2 to \$5 per 100.
Pinks—fine named varieties, from 25 cents to \$1 each.
For particulars apply to **S. WALKER**, or to **JOSEPH BRECK & CO.**

SHAKERS' SEEDS AND HERBS.

WIGHT & GIBSON, No. 44 Hanover Street, under the American House, (the late Elm Street) are appointed by the United Society at Harvard, Mass., as their agents for the sale of all kinds of Garden Seeds, raised and put up with directions for culture, by Jonathan Chandler.
Prices, the same as when sold by the society or their travelling agent.
Herbs, Roots, Extracts, &c. for sale as above.
January 30, 1859. 4mis

FRUIT AND ORNAMENTAL TREES, MULBERRY TREES, &c.

Nursery of **William Kenrick**.
The Catalogue of Fruit and Ornamental Trees for 1859 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and of Peaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honey suckles, Pæonies, Dahlias and other Lichæaceous Flowering Plants.
10,000 Cocks-pur or Newcastle Thorns.
10,000 Buckthorns.
Morus Multicaulis, and other Mulberries; the trees genuine and fine, at prices fair, and varying with the size, and the quantity which may be desired.
Fruit and all other trees, when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.
WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston.
January 30, 1859.

SILK WORMS' EGGS.

Preserved with much care, producing sulphur colored cocoons; the worm from this kind of egg would their cocoons the last season in twenty eight days. Specimens of the cocoons may be seen at the Agricultural Warehouse, if desired.

BONE MANURE.

The subscriber desires to inform his friends and the public that he has been in the Bone business more than ten years, and has spent much time and money to ascertain how long it may be converted to the best use, and is fully satisfied that they form the most powerful stimulant that can be applied to the earth as a manure. He offers for sale ground bone at a low price, and is ready to receive orders in any amount, which will be promptly attended to.
Orders may be left at my manufactory, near Tremont road, in Roxbury, or at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, Boston.
Sept. 20. **NAIUM WARD.**

MISCELLANEOUS.

Some wise-acre, we shall not say who, for that might be quite too personal for us, insisted that Massachusetts never could be worked up into poetry, without spoiling the web. The subjoined from a friend to whose kindness we have been several times obliged and should be right glad to go much deeper into this kind of debt, has sent us the subjoined, with which we are happy to store our poetic bow; and which show that, in spite of all previous assertions and contradictions, the work is done; and Massachusetts is completely dovetailed into very good rhyme and sentiment.

For the New England Farmer.

Massachusetts!—can it be,
Hath no poet named thy name,
Holy land of liberty,
Highest on the roll of fame?

Had I a pen with power to turn,
"The thoughts that breathe, to words that burn,"
Thou, Massachusetts, should not be
Neglected by sweet poetry.

Oh! I would raise a thrilling strain
O'er mountain, valley, hill and plain,
Till every eye should turn to see
Whence the loud sounding minstrelsy.

Then would I point to fame's bright scroll
And bid them read the glorious roll
Of Massachusetts' heroes,—men
Who fought and freely died, to gain
A spot where man might still be free,
A resting place for Liberty!

And I would bid Religion tell,
With earnest voice and beaming eye,
How Massachusetts' martyrs fell,
Content in such a cause to die;
That we, their children, ne'er should be
The victims of stern bigotry;
That each might worship without strife,
In his own way, the God of life.

High themes are these, and worthy too
Of all the noblest bard can do,
Worthy the power,—which now is not—
The magic power of Scotland's Scott.

Were I a favored son of song,
And did such power to me belong,
I would not rest—nor night, nor day—
Till the dark stain were washed away;
Till Massachusetts' themes should dwell
On every tongue in this wide land;
Till Massachusetts' praise should swell
From Brunswick's line to Texas' strand.

Talk of her "cold and barren soil,
Which ill rewards the ploughman's toil"—
I would not give her coldest hill
For all the warmth of southern plains;
The right her "barren soil" to till
For all the southern's slave-made gains.
Her "cold and barren soil" yields health,
Content and freedom—if not wealth.

No! Massachusetts, let me bide
Within thy borders still;
I love thy verdant mountain side,
Its crystal stream, and sparkling rill,

Its bracing air, its beautiful woods;—
And oh! I love the swelling floods
Which ocean bears, with joyous rear,
In tribute to thy rock bound shore.

I love to tread the Pilgrim land,
To muse where first that holy band,
On Plymouth-rock, or Plymouth-sand,
In freedom worshipped God.

I love to walk on Bunker's height,
Where right the battle fought with might,
And broke oppression's rod.

I love to think that on thy breast,
Dear Massachusetts, I shall rest,
That where my father's grave is made,
There shall his son in peace be laid.

THE LADY OF THE FIRST GOVERNOR OF VERMONT.—Thomas Chittenden, the first Governor of Vermont, who was a plain farmer alike remarkable for strong native powers of mind, and the republican simplicity with which he conducted everything in his public duties and in his domestic establishment, was once visited by a party of travelling fashionables from one of our cities. When the hour of dinner arrived, Mrs Chittenden, to the astonishment of her lady guests, went out and blew a tin horn for the workmen, who soon arrived; when, to the still greater surprise, and even horror, of these fair city, the whole company—governor, his lady, guests, workmen and all—were invited to sit down together to the substantial meal which had been provided for the occasion. After dinner was over the ladies were left by themselves, and one of the guests thought she would gently take Mrs Chittenden to task for this monstrous violation of the rules of city gentility to which she had been, as she thought, so unbecomingly made a victim.

"You do not generally sit down to the same table with your workmen, I suppose, Mrs Chittenden?" she commenced.

"Why," replied the governor's lady, whose quick wit instantly appreciated the drift of the other, "I am almost ashamed to say we generally do, but I intend soon to amend in this particular. I was telling the governor this very morning, that it was an absolute shame that the workmen, who did all the hard labor, should fare no better than we, who sit so much of the time in the house, earning little or nothing; and I am determined hereafter to set two tables—the first and best for the workmen, and the last and poorest for the governor and myself."—*Green Mountain Emporium.*

RUM COLOR.—In one of the New England parishes, since the commencement of the reform in temperance, at a meeting held for the transaction of business, a proposition was introduced and carried for painting the meeting house. Of course it was necessary to decide what color it should be painted. One proposed one color, and another, another, and reasons were offered for each. At last says one; Mr Moderator, I move that it be painted rum color, and I will give my reasons.—"There is Captain _____, who sits near you, has had his face painted Rum color these fifteen years, and it grows brighter and brighter every year."

FOR SALE, A FIRST RATE FARM.

Well situated on the road leading from the Theological Seminary in Andover, to the old Boston road; lately owned by Peter F. Shed, and well known as the David Blunt Farm, containing 70 acres more or less. There is about 20 acres of good Woodland within sight of the house. The remainder of the farm is in good condition, and is generally considered, by those acquainted with it, to be "a garden spot." There are from 500 to 600 apple trees on the place, independent of other fruit trees of great value. The farm is well walled and watered, the buildings in first rate order, and there are upon it three wells of excellent, soft water. It is well situated for a gentleman wishing for a residence in the country, being retired, and yet in the immediate vicinity of the public Schools and the Theological Seminary;—or for the farmer, who wishes to raise vegetables for market, the land being all good, and markets near. It lies about half a mile from the Ballard Vale Factory, one mile from the Railroad depot, and nine miles from Lowell. There are upon the place about ten cords of manure.

The conditions of sale will be liberal, the owner being obliged on account of ill health, to go South.—For particulars, inquire of the subscriber, on the premises.

ANDREW B. STIMPSON.

Andover, January 15, 1839.

4W

FARM FOR SALE.

A Farm situated in the southwesterly part of Townsend, on the road leading from Townsend west village to Worcester. Said farm contains 110 acres of land divided into mowing and pasturing, and a large share of wood and timber, a one story house, with two front rooms, kitchen, buttry, and two bed rooms well finished; parlor papered; wood house; well, under cover, forty feet long, and shed, a large sheep house, fifteen by thirty feet, a large cooper shop, and another small house well finished, on the lower floor; a good aqueduct which comes into the barn yard, and a good orchard.

The subscriber will sell a part or all, and give possession this fall or winter, or next spring. Those who wish to buy, will do well to call on the subscriber, who lives on the premises, and look for themselves. ASA H. ADAMS.

Nov. 29, 1838.

MULBERRY TREES.

Wm. PRINCE & SONS will make sales of trees and cuttings of the genuine Chinese Mulberry, Maliculis, Morus Europæica, Alpine, Broussa, Canton and other varieties, deliverable to the purchasers at such period in the Spring, as is convenient to them, and will enter into contracts accordingly.

Prices and terms for the trees and cuttings will be forwarded to all who may apply for them by mail, as well as prices of Silk Worms' Eggs, Mulberry Seeds, &c. The Mulliculis trees are remarkably vigorous, and as we first imported the genuine tree, purchasers are sure of obtaining the genuine kind. It is from this source and from the great attention paid by them, that the trees that they have sold, have given universal satisfaction.

Dec. 20, 1838.

2m

Flushing, near New York.

FARM IN BROOKLINE.

For sale a farm situated in Brookline, about four miles from Boston, containing forty acres of first rate Tillage Land, and thirty acres of Woodland and pasture—with a good House in complete repair; Barn, Chaise-house, Corn barn, Shed, &c.

The Farm will be sold low, together with the Stock, Hay, Tools, &c. if applied for soon, at No. 30, North Market St. Boston, or Roxbury Street, near Boston line.

Dec. 26, 1838.

JOHN HUNT.

NOTICE.

A person now in the Nursery business, on a limited scale, who has peculiar advantages for its extension, not possessed by any other individual in this country, wishes to connect himself with some person who can furnish a small capital, sufficient to make the business both pleasant and profitable. Inquire at the office of the N. E. Farmer.

Nov. 21, 1838.

WANTED.

In the Seed Garden, connected with the New England Agricultural Warehouse, a first rate farmer; one who has some knowledge of the management of hot beds would be preferred. Inquire at the N. E. Farmer Office, Nos. 51 & 52 North Market St.

AGRICULTURAL.

AN ADDRESS,

Before the Essex Agricultural Society, at Topsfield,
September 27, 1838, at their Annual Cattle Show.
By LEONARD WITHINGTON.

GENTLEMEN,—

The cardinal doctrine of revelation, by which it is said to be necessary to salvation, is not so peculiar to christianity as either divines or infidels have been disposed to make it. It is a general law of our moral existence, that whatever we pursue should be the development of some inward principle, some plan, some conception, which leads to prosperity or disappointment, according as it is founded in truth or in error. In a rational being, there must always be some thinking before their acting. The most superficial and impetuous always form some plan; and as the eye directs the mind, the mind must always lead our material faculties. Hence man becomes the creature of faith. He acts by faith because he has the powers of reason. He foresees, or thinks he foresees the direction of the road before he pursues it. True faith is faith in the truth; and, as there is truth in all the other results of life as well as religion—blessings to foreseen before they are gained, and appreciated before they are sought—hence it comes to pass that faith is the source of practice in all the pursuits of life; in war; in peace; in arts; in sciences; in taking a journey, or crossing the ocean; in coloring a picture, or shaping a statue; in tilling a field, or in raising a flower;—wherever the inward idea must go before the outward manifestation, there man is and must be, the creature of faith; and it is by his faith that he procures his spiritual as well as his eternal salvation. Faith, in all other things as well as religion, may be considered as consisting of two parts: first, a foresight of the truth, and, secondly, the confidence we have in that truth as the fountain of our well-being. We sometimes use faith as expressing a naked assent to truth; and sometimes throw the stress and meaning on the ardor, the confidence, the energy of action, which the truth, when seen to be important, is found to inspire. These ingredients, you are aware, go to make the notion of theological faith. But it is exactly with respect to faith in other things. No man is acted with energy, the parent of success, in the pursuit, who did not first suppose that he saw the truth inspiring his activity, and did not believe its vast importance to his own welfare, or that mankind. We must see the golden apple on the highest bough of the tree; we must believe in its worth and attainability before we shall climb to reach it. Take the case of Columbus as an illustration. He had formed in his mind the great idea of a Western continent; he had a vivid conception of the splendor of the discovery, could it once be made; and he added a third ingredient, that he himself was the chosen instrument to make it.

With this complex idea burning in his mind and heart, he chased his object through the tardy courts of princes; through the broken promises of an illiberal patronage; through every discouragement that envy and opposition could throw in his way. In vain did the tempest arise; in vain did his little, miserable ships totter on these a; in vain did the unknown ocean spread out its everlasting breadth of waves and skies; in vain did men conspire against him; and even his faithful needle, as if it had caught their treachery, wandered from the pole;—the light within was still shining; the bright conception was still strong in his mind. Neither his assent to the truth, nor his confidence in it, were for a moment lost; and we may say of him, as of many a poor sinner in a more important case, that *his faith made him whole*. O happy is that man, who, in a world of error, has seized some invisible truth, some immortal principle, on which his mind can rest and roll, like the world on its axis; and find in it a guiding light to safety and happiness amidst the prejudices and dissensions of mankind.

We are republicans; and republicanism is acting out some great idea which is the inward object of our FAITH.

We read in the bible that the Israelites were commanded, if they made an altar to God they should not make it of *heaven stone*—if they lifted up a *tool* upon it, it was polluted; they were not to go up with steps upon it. What is this altar, but the central idea of the national system made visible? a material form, always to remind them of the religious simplicity, which they were ever to have in view. Every nation may be said, in some sense, to have such an altar erected; an altar, which they are always to contemplate and before which they should constantly kneel when they ask their choicest blessings from Heaven. Had a national altar stood in Greece, so far from being composed of *unheaven stone*, the wonderful art of the statuary would have been especially lavish upon upon it; it would have been an emblem of that supreme devotion to beauty, for which that people were distinguished, and which was at once their glory and their ruin. Had it been in Rome, it might have been of *unheaven stone*, indeed, but the helmet and the shield would have hung around it; the triumphal arch might have led the suppliant to its base; the trumpet might have sounded, whilst its smoke was ascending, and even the blood of human victims might have tinged its horns. We too have our altar, erected with the same simplicity; that is, our whole system is the unfolding of a predominant idea, the inheritance from the past, which we are to contemplate and carry to perfection. Our success depends on the purity with which we preserve the altar, and the ardor with which we worship before it. Though the altar be plain, and even homely, we must see in it an earthly—*celestial beauty*; and tread the turf around it with sacred feelings of reverence and love. We must believe, when we offer our simplest, republican sa-

crifices, the smoke of our native incense will not be rejected by God.

Yes—to be a good republican it needs faith; it is necessary for the prelusive experiment. It is well known, for ages past, the masses of men have been rising. Ever since the establishment of corporations and boroughs in the middle ages, in every political convulsion, the result has been to increase the influence of the many and diminish the oppression of the few. Our Government is one of the last efforts of these long operating causes; it was established, not for a few families, not for a titled aristocracy, nor for a king, but for him that drives the chisel and him that holds the spade; and it supposes the possibility of that dubious and much-doubted attainment in human nature,—that he, who earns his bread by the sweat of his brow, may yet be a thinking being; choose his own religion and make his own laws, as well as obey them. History perhaps has very little to produce this faith of which we have been speaking. Our brightest visions must be borrowed from the future. Our hopes are founded on what man *may be*; not on what he *has been*. We read, it is true of ancient republics; but they resemble us only in a generic name. There never was a republic that WENT FOR MAN; or was founded on the rights of man. They all formed a conventional idea of the citizen; and never went for that inheritor of will and reason, that responsible being, who derives his immortal gift from, and is accountable chiefly to God. Why should we be forever talking of Athens and Rome; of Athens with its 20,000 citizens and 400,000 slaves; of Rome, not only with its slaves, but with its myriad of idle citizens, fed from the public treasury;* and where we are told, even before the age of Cicero, there were not more than 2000 citizens who had what might be called an estate.† Were these republics founded on the rights of man? Were their partial experiments, when fully unfolded, calculated to produce much confidence in our own?

The soul must animate the body; the plan must go before the execution; the theory must guide the action; and confidence in what is possible and true must inspire the perseverance that leads to success. We often hear it lamented that so many evils should mar the beauty of our rising morn. Ah, these clouds! these fogs; these curtains of darkness over the rising sun! The mob; the radical; the popular delusion; the impracticable plan and the still more absurd execution; the libel; the inflammatory press; the sage that will not write and the fool that will; the midnight cau-

* The number of slaves at Athens is somewhat uncertain, as it is attested to, not by cotemporary but later authors; at Rome they never dared to enumerate them; in both places the right of suffrage was partial; and at Rome, when least partial, led to ruin.

† See Cicero De Officiis, Book II. Sec. 21. It was the speech of a very moderate tribune in the age of Gracchus, *non esse in civitate duo millia hominum, qui rem haberent*. It might have been an *electioneering* speech.

cus and the premature nomination; the demagogue in office and the general spread of political corruption; a surplus revenue in the midst of national bankruptcy; and the dreadful shakings of credit in the commercial world; the jealousies between the opposite parts of our republic; the jostling of the wheels in our delicate and complex machine; all these are evils—earthquakes, which shake our moral ground; and yet it seems to me the chief evil of these mortifying calamities is not seen. The chief evil is, that they go to destroy that confidence in the permanency of our institutions, which is of itself a part of their spirit. Every bad election; every wild experiment; every mob in a great city; every act of political injustice, tends to destroy that FAITH which is at once the spring of our activity and the source of our salvation. If I can discern aright the signs of the times, we are now in danger from a wide-spreading skepticism respecting the stability of republican institutions and even the value of liberty itself. It is the dry-rot, which has seized the beams of the building, from the sills to the ridge-pole; and however silent in its progress, is seen in its mortal effects. It is astonishing how many are infected with this criminal distrust. It quenches all enthusiasm; it destroys all principle; it leads to political corruption; it makes parties a mere contest for place; in a word, it cuts off the stream of action in its head-spring, and leaves to the citizen, in his prospects, a dreary and fountainless waste. Alas! this political infidelity has crept from heart to heart, until it has become more extensive than we allow ourselves to confess. How different is this spirit from that of the last generation! Then all was credulity, principle, confidence, enthusiasm. Every oration, on the Fourth of July, was filled with the most fulsome promises. A great empire! A free people! An intelligent majority! Wise rulers! The best of laws! A new example! An imitating world!! Such were the first visions of a newborn nation. Now the note is entirely changed. Presumption has been followed by despair; and it is to be feared, that as some disastrous facts have weakened the principle, so the weaker principle may produce new facts, still more disastrous, until exertion ceases and Liberty is lost.

The cures of these evils are many; but a very important one must come from a well-ordered and well-regulated agriculture.

Society has often been compared to a pyramid, which owes its durability not only to solid materials, but to its skillful shape. Agriculture is the base; the ground is the fruitful mother of the best of our comforts. And it is necessary, for the welfare of any nation, that the majority of its citizens should follow the profession of tilling it. It produces the raw material. Thence come the bread and meat and wool, which nourish and clothe our bodies. It is the silent steward of the Great Father of nature, offering a kind of temporal omnipresence to the solicitations and wants of its inhabitants; various in its gifts; permanent in its location; reasonable in its restitutions and most just in its rewards.* No man that was willing to cultivate the earth and thence derive his support by the sweat of his brow, ever perished by hunger; and no nation, whose citizens kept the ranks of this profession proportionally supplied, was ever known to perish by wars or treasons, or commercial confusions; by

banks or bankruptcy; by discontents and factions within; or by invasions and foes from abroad. Not that following agriculture is itself a virtue or forsaking it essentially a vice; but a due replenishing of this employment is an indication of a healthful state in the public sentiment. It shows that the foundation of the mountain is broad; and that the top thereof, though lofty, may alike defy the electric fires and the sweeping winds of the summer and the winter cloud.

Such is the imperfect character of our most solemn investigations and so greatly are we blinded by party spirit and passion, that whenever we are called (as we think) to oppose and overthrow any public institutions, we inflame our zeal by exposing all their defects and allowing none of their excellencies. Never was there a revolution when the merits of a conquered dynasty were carefully estimated by the victorious party. Even in institutions where the balance of evils is on the whole great, it is always found, when they are abolished, that some unthought of benefit, is lost, by a removal; nor is it until long after the excitement of the change is passed away that mankind can foot the account and fairly estimate the exact magnitude of their loss and gain.

So it was in our American revolution. We rejected the institutions of Great Britain. We threw off those aristocratic chains, they were binding upon us. We altered the foundations of society; and liberty started on a new career of more daring experiments. She was wider in her sweep; deeper in her franchises; more radical in her maxims. She professed to comprehend all men in her offered privileges and blessings. It was freedom in manners as well as in laws; her powerful sun, now in the meridian, was to melt away the last foe of restrictive ice and set every human creature on the career of wisdom as the waves dance together on the sea in equal space and freedom. But it is now found that this universal enterprise has its evils. There is danger, that the necessary professions should not be kept full; that multitudes should forsake the plough for the pen; that the splendid professions should be chosen rather than the useful:—I have some suspicion that, in our present constitution of manners, even the multitudes of colleges in New England may be an evil; certainly no man should hope to hide his laziness under a pretended love for literature and religion.

In the old system of *casts*, whether seen in its severity as it was established in the East, or mitigated as found in the Gothic governments of later Europe, there was a latent purpose, which they accomplished by establishing and we lose by abandoning them. Perhaps we ought not to contend for the son's following the profession of his father invariably, as in ancient Egypt. But perhaps also the passes to distinction may be too free and be no test of exertion or ability. At any rate, it is no libel on modern liberty to say, with all her blessings, she mixes some evils; and one is her influence on the professions. In the universality of her invitations she may inspire too many with a fatal ambition. The prizes may be too few, the candidates too many. If a man can trade or acquire the learned professions without the check of a previous capital, or, as an offset, without the exhibition of great industry and abilities, why of course freedom opens the door to desperate experiments. These must fail; and the private ruin must finally shake the government. It is like opening the doors of a privileged assembly to a

promiscuous crowd—there will be a rush. The inverted cone of Society, instead of standing on its natural base, will tremble and spin on its almost pointed top.

(From the Genesee Farmer.)

DICTIONARY OF TERMS USED IN AGRICULTURE,
AND IN THE SCIENCES MOST INTIMATELY CONNECTED WITH ITS ADVANCEMENT.

(Continued.)

Air. In a state of purity, air consists of nitrogen and oxygen, in the proportion of 76 of the former and 23 of the latter, but as it exists in the atmosphere, it contains about one part in 500 of carbonic gas, and also aqueous vapor in the form of an elastic fluid, the proportion varying from the merest trifle, to 11 grains in a cubic foot. Air acts a most important part in the processes of germination, and subsequent vegetation, not only furnishing the oxygen required to decompose the carbonic gas consumed by the plants, but the most of the gas itself. The water held in the air is also easily parted with, and hence the great advantage of aeration or frequently stirring the earth, to bring its particles in contact with the atmosphere. A square foot of earth in a solid form exposes but a small surface to the action of the air, and hence absorbs from the atmosphere but little; pulverized this mass, and the surface exposed to the action of the air is increased a million fold, and its powers of absorption from the atmosphere in the same proportion. This shows the absurdity of those who refuse in hot dry weather to stir the earth around plants under the apprehension that it will render them more dry. Multiplying the absorbing surface by stirring the earth is the only way of obtaining the moisture which in greater or less quantity always rises in the atmosphere.

Albumen. A colorless insipid fluid, coagulating at a heat of 120°, existing in the leaves, juices and fruits of most plants, but most abundant in animal products. The white of eggs is nothing but pure albumen, and the blood contains large quantities of the substance. Its principal use in domestic economy, is in clarifying or cleansing fluids; such as sugars, &c. for which purpose it is unrivalled. Milk contains albumen, and hence it sometimes used for cleansing syrup, but it is inferior to the white of eggs. These, carefully incorporated with a fluid when cold, and then submitted to a coagulating heat, will lift all impurities to the surface, where they can be easily taken off by skimming. Albumen is more abundant in the bark of the red or slippery elm, than in any other vegetable product, hence its value for medicinal purposes. Albumen is composed of carbon 52, oxygen 23, hydrogen 7, and nitrogen 15.

Albumum. Wood of trees is usually composed of three distinct parts; the pith or central part having a loose spongy texture; the heart-wood the most durable and valuable part of the tree and the sap wood or albumum. This last is usually whiter than the heart-wood, is more porous and through it the circulation of the sap is principally performed. It is the soonest attacked by the borer or powder pest, and in exposed situations it always first to decay.

Alcohol. The purely spirituous part of all liquors. It is the product of vinous fermentation, and ca

* *Justissima tellus*, is Virgil's fine expression. II Georgic. 460 line.

is derived from all substances capable of such fermentation. It is the intoxicating principle of liquors, and few nations have been found so rude as not to have found some means of producing it. Alcohol is produced principally by the distillation of wine, molasses, and grain. The product of the first is brandy, the second rum, and the third whiskey or gin. Alcohol is of much use in the arts, but it has, by its general use, produced a most unhappy effect on the happiness and morals of multitudes. Perhaps greater quantities of distilled spirits are used by the nations that border on the Baltic than in any other part of the world, and here they are principally produced from the distillation of potatoes. Pure alcohol consists of hydrogen 13.70; carbon 51.98; and oxygen 34.32.

Algae. One of the families of plants into which Jussieu divided the vegetable kingdom. They are defined to be plants of which the roots, leaves and stem, are all one. The remains of algae are abundant in a fossil state in the shale of many parts of New York, and their decomposition may have contributed to the fertility of the strata in which they exist.

Alkali. A substance usually extracted from plants; and distinguished by the following properties: It has an acrid and corrosive taste and power; it changes vegetable blue to green, red to a purple, yellow to a red brown, and purple reduced to an acid to its original color. It is most used in the arts of neutralising acids. It is the best known in the shape of potash, and soda. These unite with oils and animal fat, and form soap. Lime is assessed of alkaline properties, which gives it its principal value in many cases. Alkaline substances have been divided into volatile and fixed; the latter being known as ammonia, the fixed as potash or soda. Modern chemists have divided them to 3 classes: 1, those with a metallic base combined with oxygen, potash, soda and lithia; 2, that which contains no oxygen, as ammonia; and 3, one containing oxygen, hydrogen and carbon, as onitric acid, circuta, morphia, &c.

Alluvion. Land deposited by the action of rivers; either at the mouths in lakes or the sea, or on the banks in their passages to these receptacles. It is usually must be of the richer and higher parts of the regions drained by the river at deposits it, it is the most fertile of soils, and the most valuable, when it can be drained, or rendered secure from floods. Nearly the whole of Holland is alluvial. In this country the vast tract on both sides of the Mississippi, for a great distance from its mouth, is of this character; but owing to its annual submersion is of comparatively little value. Perhaps there is no river in the United States in proportion to its length and volume, that has so much valuable alluvion on its borders as the Genesee.

Alumine. One of the earths most important to the agriculturist, and entering largely into the composition of all rocks, clays, and loams. It was formerly termed *argill*, or argillaceous earth, but R. H. Davy's discoveries led to the belief that it is a metallic base combined with oxygen. It is used nearly pure in the Corundum; porcelain and kaolin contain about one-half of this earth, and it may be obtained pure from the alum commerce, by chemical processes. Alumine is a principle that gives the peculiar tenacity and elastic nature to clays; rendering them heavy and impervious to water, in proportion to the quantity refined in them. Alumine has a great affinity for

water, hence clay lands are usually more cold and wet, and more difficult to cultivate than those into which it enters in less proportions. Its presence in soils is, however, absolutely necessary to prevent porosity; and when combined in due proportion with the other principal earths, it constitutes one of the surest ingredients of a fertile soil. Much attention has of late been paid to the amelioration of clay soils, and of all the methods tried, thorough draining has proved the easiest and most effective. When clay land is drained, its texture is changed; and the plants it naturally produces, as well as those it is made capable of producing, are of a higher and more valuable kind. Alumine is of much use in the arts; it is extensively employed as a cleansing powder; as a mordant in dyeing; and is the basis of bricks, crucibles and porcelain.

(To be continued.)

(From the Genesee Farmer.)

ON WINTERING CALVES.

MR. TUCKER.—To winter calves it requires the first rate of care and attention to have them live and do well through our long and dreary winters. I believe the best method to winter calves, is to stable them. It requires much more care and attention to winter calves out in the storms, and they will need more food and are more liable to freeze than they would be if they were stabled in a warm stable. The most of farmers in this vicinity, keep their calves out in the coldest place they can procure, and say they will do better than in a warm stable where the storms cannot beat upon them and fill their hair full of snow and ice. I know of a great many farmers in this section, that always have the first rate of calves, and on asking them the cause of having so much better calves than their neighbors, they will tell you they stabled them in winter. Such men will always have good cattle, and it does not cost them half as much as it does those who winter their calves in the coldest place they can produce in their barn yards, thinking they will do better than to have a warm and comfortable stable to lay in through the long and cold winter nights. There are many farmers in our country that pretend to raise calves by letting them go to a stack of hay, that was stacked for the purpose in the summer, and there the calves are obliged to gnaw upon the stack to obtain sustenance, until there is danger of the stack falling upon them; then the farmer is obliged to remove them to another, and so on through the winter; and when spring arrives, the calves are almost reduced to skeletons, (scarcely able to walk.) Now calves kept in this way, cost more and will not look half so well when spring comes. A great many farmers pursue this method because it saves labor, and a great deal of trouble too. Some suppose calves need no water in the winter, but in my opinion, they need water as much as our cows or oxen. If there is no water in the lot where farmers keep their calves, they ought to have a trough, and carry them water at least once a day. When calves are once wintered through, there is no danger of them in future; they will thrive and grow into money as fast as anything a farmer can have. There is no easier way for a farmer to enjoy a pleasant and quiet life than to raise stock. All that is required of him is to see that his cattle are well taken care of, and have plenty to eat. Nothing looks so handsome as to see in the spring of the year, a lot of calves, and all in good condition to thrive through

during the summer. If calves are well taken care of in winter, there is no danger but what they will look fine in the spring, and make far better cattle when they arrive at three years old. The beginning is what decides the future life of calves, if the farmer commences aright, and keeps his calves from the cold storms of winter, he will have good calves and good cattle too; and will not cost the farmer any more than if he had turned his calves out to a stack and let them obtain their sustenance as well as they could, and if they weathered through, well enough, if not all the same.

Thus we can see the different opinions that farmers pursue in our happy and prosperous country upon wintering calves, and after all there is only one true and just method of wintering calves, to have them look handsome and in a thriving condition when winter has passed away, and spring has come with all its attendant beauties. W. S. T.

South Venice, N. Y. Jan. 15, 1839.

(From the Mechanic and Farmer.)

PENOBSCOT FARMING.

The last number of our paper contained a report of the committee on crops of the Penobscot Agricultural Society. From this report, and the statements of cultivators connected with the same, it will be seen that the last season forty-two bushels and nine quarts of good wheat, was raised on one acre and two and a half rods; one hundred and ninety-five bushels of sound ears of corn, twenty bushels of beans and two cords of pumpkins raised on two acres; eighty bushels of oats on one acre; two hundred bushels of ruta baga turnips on one-fourth of an acre; four thousand three hundred and twenty-five pounds of carrots on one-eighth of an acre. These statements, which may be relied upon, prove beyond a doubt, the excellent quality of our soil, and the certainty, that by persevering industry and intelligence, our farmers may compete successfully with those of any part of New England, if not with the most favored of the western States.

We ask the attention of our readers to these statements, and would propose the question whether it is worth while to leave a soil thus productive in a land of health, good roads, schools and a settled and cultivated society, for a land of indefinite hope, without the blessings which New England possesses in its established institutions.

Massachusetts Horticultural Society.

Saturday, Feb. 2, 1839.

EXHIBITION OF FLOWERS.

Mr Wm. E. Carter, of the Botanic Garden, Cambridge, presented three seedling *Camellia japonica*, viz.:

No. 1. A single flower of good color (crimson) slightly variegated with white.

No. 2. Similar to the English *Ammoniflora*.

No. 3. Variety *Lawrencea*, a fine double flower; rose colored spotted with white. With the lover of delicate things, and with the ladies particularly, we think this variety must be a favorite.

For the Committee,
S. WALKER, Chairman.

There were upwards of 18,000 packages of domestic cottons exported from Boston to various foreign ports, during the year 1835.

FLORICULTURE.

CULTIVATION OF DAHLIAS IN FRANCE.

Scarcely any plant owes more to the care of the horticulturist than the dahlia, as it is by extreme care and perseverance united, that the numerous varieties which we possess have been obtained. Our French brethren seem to be of this opinion, for the *Annales des Jardiniers Amateurs* thus remarks, in a late number, when speaking of sowing fresh seed every year.—*Lon. Hort. Jour.*

"It is in this annual care in putting down seeds, that the rose trees, the camellias, the pæonia arborea, the rhododendrons, the azaleas, &c., have taken so large a place within the last thirty years. But in the present day, those flowers which were the admiration of our forefathers, such as the auricula, the primrose, the hyacinth, the tulip, the ranunculus, the anemones, the pink, &c., would undoubtedly be dethroned by the plants imported at a later period, without even excepting the European rose tree, were it not for those amateurs who have remained faithful to them, and rendered them that scientific assistance which has progressively made them obtain a greater number of varieties, and improved those varieties which our forefathers only obtained by chance. It is, therefore, easy to explain why in remote days one or two conquests made here and there, amongst a great number, caused so much noise, and at the same time why the progress and improvement in plants marched at so slow a pace.

The peonies and roses particularly remained for centuries in the gardens of our forefathers, even before they ever thought of propagating them by seed. It was necessary for Linnæus, who was the first to clearly explain the generation of plants, to instil at the same time the necessity of applying the principles he laid down to flowers and domestic shrubs. However, history informs us that, centuries before the immortal Linnæus, the Arabs, more experienced naturalists than the Europeans, were perfectly aware that the fruits proceeded from the fecundation of the flowers, and that they distinguished with the greatest intelligence the different sexes. A proof that they possessed this knowledge is seen in the fact that they used to destroy, during their wars, the male plants, without which the female plants (as in the palm-tree, where the sexes are separated by individuals) could no longer present, in their fructification, the food of which it was their object to deprive their enemies. Without going so far back, it will be found that nearly all the gardeners of Europe, in temperate climates, where well aware that the melon, when they cultivated it in their gardens, presented, under the same species, the male flowers and the female flowers separated. At that time, and even now, many persons pluck off, as false flowers, those without which the good flowers, as they called the others, could not receive vitality for their produce, and consequently could give no melons.

In our fields (of France) it is well known, from time immemorial, that flax, like the palm-tree, has the male completely distinct from the female; and notwithstanding the assistance which our country has obtained in agricultural science, now widely spread and protected, it is a most extraordinary fact that the male plant passes for the female, and *vice versa*. Notwithstanding that these facts were known, neither agriculture nor horticulture, both of which are very backward in the greater part of our

provinces, drew any important advantages from the marriage of plants, until the lucky attempts of modern days.

It is in consequence of science having made more rapid progress in Holland, Belgium, and above all in England, under the effective protection of the government and of rich private individuals, that we are at this present day, tributaries to these foreign countries for our finest fancy plants.

It is only within the last three or four years, after twenty-five years cultivation, that we have come to the knowledge of what a fine dahlia is. For one that we obtained almost by chance, our brethren, the English horticulturists, with their artificial fecundations, obtain hundreds.

In the year which has just terminated, it is the dahlias of England which obtained the greatest honors among the plants of our most distinguished amateurs, and it is to them that we shall be obliged to have recourse this autumn, to ensure the late conquests in dahlias, as well as camellias, in which, however, we hope to shine next year.

If we are obliged to obtain from our neighbors the most precious and remarkable dahlias, until such time as we shall be able to equal them, let us in the mean while strive to obtain the greatest advantage from their fine plants, by crossing them with our own.

We have already stated that, to shine, it is not sufficient for an amateur merely to collect the most numerous varieties, nor even the finest kinds, no more than it is sufficient to possess all the words of a language in order to write with correctness and elegance. The distribution of plants in the parterre also requires the utmost attention, and may deserve admiration in many respects. It is therefore necessary that a bed should be well distributed in all its parts, and that the plants should be selected with taste, and placed at proper and suitable distances; first, according to their nature; and, secondly, according to the most perfect rules of taste, as to their size, beauty of form, their colors and foliage, and their rotation of bloom and flower.

The celebrated Mehl, as harmonious a composer as he was a zealous horticulturist, compared tastefully distributed flower beds, sometimes to the delightful music of Mozart, at other times to the impressive and classical poetry of the great Corneille. Without rising so high, we compare the distribution of a rich and well combined collection of dahlias to the finest compositions of our most brilliant writers; whilst the plantations without taste, and in mass, are like the mingled advertisements of a newspaper.

It was to avoid this bad taste in the plantations that, last year, we endeavored more than ever to notice and describe the finest varieties of dahlias. To succeed better in this attempt we assorted the flowers, placed them one by the side of the other, whenever we could procure them. This method we found to be the most rational plan for properly marking out the position of each.

Supposing that a collection was to be planted in three rows, we should, as a matter of course, place three or four feet distance between three parallel lines; and four feet between each variety, which we should plant in quinccunx.*

In the first line, or that nearest to the walk, we

* This arrangement causes the plants to give the appearance of four pips and a centre one, like the five of hearts in a pack of cards. This appearance is seen from whatever side the collection is viewed.

should plant the dwarf dahlias, that is to say, those of two or three feet, and we should take care to alternate those of two feet with those of three, so as more effectually to indent the line of the summits of the plants. We should also choose, independently of the heights of the stalks, the different varieties whose flowers, within a few lines, offered the same diameter; we should then place these varieties so as to separate them from other plants, whose color, and even forms, would agree too nearly with those of their neighbors, either on the side or rear, so that the eye should not be shocked with the monotony of too many similar plants in the same line.

If we were not rich enough in varieties to form this first line, with plants in flower of nearly the same diameter, we should commence this row so that the various sizes were in gradation from the commencement to the centre, where should be the highest flowers, the others then diminishing to the end of each line at the other extremity: from which would follow that from the two extremities to the centre, the flowers would present themselves gradually rising; and on the same principle we should plant in the second line the dahlias of three feet and a half to four or five feet, and in the third row the dahlias of five feet and a half to six feet.

By this arrangement of a bed into three stages, the flower of each individual is set off by its neighbor, both from the opposition of the forms, as well as the contrast of the colors. In a second bed of two lines we would place such dahlias as were remarkable for fine flowers, but which could not find a place in the other arrangement, either because their colors had been seen before, or because their height rendered them ineligible. An excellent horticulturist, M. Lernie, puts down such plants in large squares or circles, the tallest in the centre, and the others graduated according to their size. A noble centre for one of these beds would be the 'Duke of Bedford,' from six to seven feet high, with a diameter of six inches, and a chesnut purple color of rich velvet. Flowers, with exceedingly large flowers, might be placed in triangle, or a quarter of a circle. Large plants should stand at the angles, as well as in the centre. But, whether the plants are placed in triangles, or squares, or oblongs, or half rounds, or any other shape, we hold it requisite to place on the same line flowers of the same diameter (alternating them only when the general effect will be thereby increased, and to vary or contrast the colors as much as possible.)

(From the Magazine of Horticulture.)

ON THE CULTIVATION OF THE CAULIFLOWER.

Your Magazine having, by this time, an extensive circulation through the different states in the Union, it is not (in my humble opinion) unreasonable to suppose, that, through the perusal of its pages, by your numerous subscribers a greater amount of practical knowledge has been obtained, of the most approved methods of cultivating and propagating rare and choice flowering plants, than could, in any other way, have been so easily acquired.

I beg leave, therefore, to depart from the beaten track, and offer you a few brief and practical remarks on the propagation and cultivation of the cauliflower, which is not only a very curious flower

to examine, but is, when properly cooked, one of the most delicious and delicate vegetables of the whole *brassica* or cabbage tribe. The flower alone is the part for which the plant is cultivated; the flower buds form a close round head, and very white, and a good flower will measure from six to ten inches in diameter; but if the flower is cut after it has begun to expand or open, it will, of course, appear larger than what I have stated; but it should be known, that it is by no means so valuable as it was in its firm, close state.

Cauliflowers are raised from seed, sown as early in the spring, on a warm southern aspect, as the first leaves the ground; and, for the autumn crop, the first week in June, on a northern aspect. Half an ounce of seed, if good, will be sufficient to sow a bed four feet wide, by ten or twelve in length. The soil for the seed bed ought to be light and in good heart, but not too rich with manure; but those who have frames and glass lights could forward the plants at least six weeks, by making a slight hot-bed, and covering the manure about six inches with good fresh mellow loam. About the middle of March sow the seed, being mindful to secure the frame all round with dry litter, laying boards on the top of it to keep out the rain or snow, as well as to secure the soil in the frame from the frost, which might, otherwise, penetrate through and freeze it. Supposing that the seed is sown in a frame, and it having been secured as before advised, the plants will soon make their appearance, when plenty of air must be given, every day when the weather will admit of it, by propping up the glass, in order to make them strong and healthy. The plants by the middle of April will be ready to transplant, which might be done in the same frame they were sown in, if there is not another at hand, by first taking up the plants, carefully, with a trowel, and carrying them to some warm sheltered spot, until you get the frame ready. All that would be necessary to be done, is to remove the soil from the bed, and then to fork it well over, adding a little more manure if the bed is cold; but if the bed has any heat in it, no more will be requisite, as a slight warmth is all that is wanted. After the manure has been nicely levelled with the fork, and beat down solid, replace the soil and rake it smooth; then provide yourself with a board, the width of the frame, placing it on the soil to stand on, in order to prick out the plants about four inches apart; select the strongest first, and so go on, until all of them are transplanted.

As soon as the plants begin to grow, give an abundance of air, every fine day, and water when the ground appears dry. Every warm day, the glass should be taken entirely off the frame. If the weather is fine about the 20th of May, the plants may be put out in the ground, which should be prepared for their reception, to fruit or head. A mellow, loamy soil should be prepared, that has had a bountiful supply of well decomposed or rotten manure; holes may be opened about two and a half feet apart, from centre to centre, and about twelve in diameter, taking out six or eight inches of the soil, and filling it with the kind of manure spoken of, and mixing the under soil and the manure well together. By taking the plants carefully from the bed, with a hollow trowel, they will receive but a trifling check, if any, when transplanted.

The plants must now be kept in a growing state, by giving them plenty of manure water (which might be easily obtained in any farmer's yard) three

or four times a week, if there should be a continuance of hot dry weather. This is where the whole secret lies, in the growing of the cauliflower, i. e., to keep the plants growing from the time of planting, until you perceive the flower has attained a sufficient size for cutting.

If the seed is sown in the open ground in June, a similar mode of culture should be followed in the transplanting, and final planting, as recommended above. These plants will not begin to show their heads or blossoms until late in the autumn; but if any of them should not complete their growth, they will do nearly as well as in the open ground, if placed in a good cellar where there is a good portion of light. Remove them carefully, and place the roots in good earth, and the operation is completed.

Plants for producing an early crop in the spring, should be protected in cold frames during the winter. The seed should be sown the latter part of July, or the beginning of August. The plants may be set out in No. 2 pots; and upon the approach of cold weather, they should be set in a frame and protected from frost. Take advantage of every warm day in January and February, to open the frame, and in the month of March they may be removed to a declining hot-bed, where they should be turned out of the pots into the soil. Here they may remain until the middle or latter part of April, when they may be removed to a warm spot in the open ground, as before advised. If a hollow trowel is used, and the plants are taken up with a good ball of earth, they will not suffer in transplanting. Hoe and water, if the weather should be dry, and by the end of May, or early in June, fine heads of flowers may be obtained, thus keeping up a succession the year round. In large private establishments, or where they are raised for the market, they may be grown in deep frames, where they will be fit for cutting the latter part of April. At Mr Cushing's, cauliflowers are cut for the table as early as March, and the supply kept up the whole season by successive sowings, as here recommended. A good mellow soil, and plenty of water, during our hot summers, are the only requisites to ensure fine heads of flowers.

In another article, I shall give the cultivation of that fine vegetable, the Brussels sprouts.

Yours, J. W. RUSSELL.

Mount Auburn, Cambridge, Jan. 1839.

(From the Plymouth Rock.)

BONE MANURE.

In this section of the country, where nature has not been profuse in the distribution of fertile fields, rich alluvials, or verdant prairies; and where we have no overflowing Nile to meet the drafts annually made by the husbandman, on the soil he cultivates, it is a question of no small importance to the farmer, how he can, with the least expense and in the most permanent manner, restore his fields to their wonted fertility. This subject has engaged the attention of many able writers in the agricultural periodicals of the day, with incalculable benefit to the community. Lime, Plaster, Ashes, Marl, Salt, &c., have each their advocates, and there remains no doubt that they are all valuable as a manure, when properly applied. But as my object at this time is to treat on Bone Manure, I will confine myself to that subject.

Having seen many favorable notices of bone

manure, I was induced early last May to send to the manufactory of Mr Ward, at Roxbury, and purchase twelve bushels, in order to test its utility on crops. It was too late in the season to expect any satisfactory result on wheat or grass lands, and the severe drought which nearly destroyed my corn, rendered it impossible for me to judge of its efficacy on this crop. But of its good effect on Mangel wurtzel, ruta bagas, beets, beans, &c., I can speak with confidence.

In order that the bone manure might acquire a degree of heat, about a week before applying it I mixed four bushels of crushed bones with an equal quantity of ashes, and having sprinkled it sufficiently with water, let it remain in a heap. On the 23d of May I selected about one fourth of an acre of light sandy land, and after giving it a liberal dressing of good mud compost it was ploughed, rolled, harrowed and drilled for mangel wurtzel. The preparation of bone manure in the incipient stage of fermentation, was strewed in small quantities in the first row (a single handful for the space of three feet) and omitting it in the next, it was placed only in alternate rows; the seed was then planted and carefully covered with the hoe, which, owing to its being gathered before it was perfectly ripe, did not germinate well, there was not half plants enough where the bone manure was applied, and where there was none, not half as many; in due season the vacancies were planted with ruta bagas. These came up well, but through the season of drought those rows which received a sprinkling of bone manure, exhibited a decided superiority of appearance,—although its long continuance had nearly destroyed my hopes of a crop worth harvesting, when on the 25th of August, we were favored with a bountiful shower of rain and hail, and although the hail made sad havoc with the leaves, which had the appearance of having been in a pitched battle, yet from this time their growth was very rapid, at harvesting we had four bushels of mangel wurtzels, and two bushels of ruta bagas in each row where the bone manure was applied, and in those rows where it was omitted, we had but one bushel of each, and this difference was uniform through the whole. My whole crop measured about one hundred bushels; my deductions from this experiment are these: Had I applied bone manure to the whole crop which would have cost in addition about one dollar and fifty cents, I should have raised fifty bushels more of those vegetables, which would have cost me three cents per bushel and which are worth at least twentyfive cents per bushel for stock; making a difference of eleven dollars, on this small patch. A like difference was observable where applied to beets, French turnips and beans, in all these experiments the effects were truly astonishing, and established in my mind the fact, that "bone manure is one of the most powerful stimulants, that can be applied to the earth as a manure."

HORACE COLLAMORE.

Pembroke, Jan. 21st, 1839.

The oftener carpets are shaken, the longer they last, as the particles of dirt and sand which collect upon them grind the threads. Sweeping them also wears them.

To remove ice from door steps, throw on salt; it will cause the ice to crack and become loose, when it may be easily removed.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, FEBRUARY 13, 1839.

AGRICULTURAL MEETINGS.

The third agricultural meeting was holden at the State House on Thursday evening; and was well attended. The subjects announced for the evening were the Bread Grains, and matters incidental to them; and the discussion called up several gentlemen, whose remarks were gratifying and instructive.

The Commissioner of Agricultural Survey, after a brief statement of the proposed subject for conversation, made some general remarks as to the value of Indian Corn, its various uses, its comparative certainty and the improvements made in its cultivation. He then exhibited what he deemed the finest specimens of Indian Corn, for this latitude which he had ever seen. This corn is a twelve rowed corn and of a larger size than the Dutton corn. If there be any objection to it, it is an objection which lies against all the sorts of corn, the ears of which are large. The cob retains too much moisture; and though it may appear to be perfectly sound and dried, yet when stored in the bin it is not uncommon for it to become mouldy. This sample, which was represented as only a fair specimen of the whole field, appeared perfectly sound; and there is no doubt that each of these ears would yield, if shelled, more than half a pint of corn. The history of this corn is, that a single ear three or four years ago was brought from the northern part of New Hampshire, beyond the White Hills, by Mr. Munroe of Lexington, and presented by him to E. Phinney, Esq., the distinguished and well known cultivator of that town. By him it was planted and carefully nursed. It was small when first received compared with its present size. This year, and the specimen shown was of the crop of this year, the field was planted from the 10th to the 20th of May; and the corn was ripe and harvested from the 10th to the 20th of August. The season last year was extremely propitious to the soundness and perfect ripening of corn, but this ripened well the two cold years; and yielded this year at the rate of 75 bushels to the acre. We have been asked by what name it is designated; as yet it is without any distinctive cognomen. We do not know by what name more honorable or respected among the farmers, it can be called, nor what name seems more appropriate in reference to the circumstances under which it has been brought to this degree of perfection, than to call it the Phinney Corn.

Several gentlemen then went into the discussion; and made statements of the results of their own cultivation. Formerly, and that within the memory of many now living, the raising of fifty bushels of corn on an acre would have been deemed an impossibility. But many fields could be referred to in Massachusetts, which the last year have averaged seventyfive and eighty bushels to an acre. We have it upon testimony, which would be deemed ample and conclusive in any court of law, that in many cases over one hundred bushels have been produced upon an acre. In the western parts of the State two gentlemen in the same town produced one hundred and twenty bushels to an acre. The Agricultural Society in Plymouth, a few years since, bestowed a premium upon a farmer for having raised one hundred and thirtysix bushels to the acre.

It was remarked by one gentleman at the above meeting that he had no desire to hear of these extraordinary crops. His wish was to know the average yield. Now we differed from him entirely. We are very desirous

always to ascertain the highest degree of perfection to which the cultivation of any crop can be carried. What has been done can be done. If there be any mode by which our staple crops can be doubled, how important it is that we should know that mode. If this can be done without doubling the expenses of the cultivation and the costs of the product, and by means which are or can be brought within the reach of any farmer, we know of nothing more important than to learn such facts, excepting to ascertain fully the mode by which they have been brought about; and to excite the farmers to do likewise. There is with many persons an incredulity in relation to this subject, the possibility of raising one hundred bushels of corn upon an acre of land, which is wholly incorrigible. What has been often certified as matter of actual measurement upon the most respectable authority, it would seem was equally entitled to credit with other matters resting upon like testimony. We can find persons without number who do not believe that sixty bushels were ever grown upon an acre of ground. They are of that class of persons who lack all confidence in human testimony; and who never believe that anything can be done which they themselves have not accomplished. With minds thus constituted argument or proof multiplied upon argument and proof avail but little. The Messrs Pratt of Whitesboro, New York, aver that they have produced over one hundred and sixty bushels to the acre. Who shall say that the fact is impossible. The evidence by which it is attested is perfectly credible.

A few years ago a reverend and most highly respected friend of ours, resident at Martha's Vineyard, was accustomed to state that he used to plant twentyfive acres of corn, which averaged him about ten bushels to the acre. Those days have long since gone by; and the son of the same gentleman, one of the most observing and intelligent farmers in the State, now states that he commonly obtains on the same ground forty and fifty bushels of corn and from twentyfive to thirty of wheat to an acre.

We regard the crop of Indian corn as the most important product of the State; and as adapted in itself to be the foundation of the most improved and successful husbandry. Every possible encouragement therefore should be given to its cultivation. There is no grain crop which will furnish the same amount of food for man and beast; there is none which returns more material for enriching the soil; and there is no crop of more simple cultivation, liable to fewer accidents and injuries, and more certain of success.

The meeting was adjourned to Thursday next at the same time and place, and at the suggestion of a gentleman present, who thought that such an arrangement would encourage the attendance of many farmers in the vicinity, it was voted that the meeting should be opened precisely at 7 o'clock, and close at nine. The public are much indebted to the distinguished gentleman, who has presided at these meetings; who by his reasonable promptings and suggestions has elicited much information; and communicated much from his own long and careful observation and experience. He has followed the plough; and he is therefore well qualified to speed the plough. His example and lead in this case are doing a substantial service to the great cause.

H. C.

EXTRAORDINARY PRODUCT.—The subjoined rests upon unquestionable testimony.

Statement of Potatoes and Carrots raised the past season on one and an half acres of land, by Horace Clapp, Housville, N. Y.

520 bushels of potatoes, some of which weighed 2 lbs. 2 oz. each; 1340 bushels of Carrots, some of which measured 2 feet 10 inches in length. The particulars of soil and cultivation are not given.

H. C.

SUMMARY OF PUBLIC INTELLIGENCE.

Congress have now been in session since the first Monday in December, and yet no measure of great importance has been matured. Some persons say they did not intend to do anything. Others say that from an incongruous mixture of parties in the house they cannot do anything. Others, perhaps with a good deal of truth declare that they have nothing to do. There is one act which it requires no extraordinary sagacity to predict the will do before the 4th of March comes round; and that is vote the appropriation for their own pay. A sort of surgical committee of Congress are making an examination of a bad case of defalcation in New York. They have found out that the horse is stolen; and they know who rode him away. They know too that he carried double; but they are not quite certain how much was carried away in his saddle bags. The thieves are out or chased; and the committee will no doubt according to the sage counsel always given in such cases by the I-told-you-so family, advise, now that the horse is stolen, that the stable door should be kept shut.

Our own Legislature are occupied with that vexatious subject, the License Law. This has proved a sad bone of contention, and bids fair to be picked quite clean. But after all the barking and growling over it, who will carry it off in triumph does not as yet appear. Would it not be well to give the law a fair trial? It is certainly rather a novelty in the history of legislation to repeal a law obviously of such great and universal importance, before it has gone into operation. The evil which this law proposes to check, abate, or annihilate, all considerate persons will agree, is indeed the greatest with which a community was ever afflicted. The prevalence of a fatal epidemic, which should decimate our population, would be a minor calamity compared with the crimes, disturbances, miseries, and deaths which have flowed from this prolific source. A fire which lay every house in the city of Boston in ashes would be a small evil compared with the wretchedness and vice, which have sprung from drunkenness within the last twentyfive years in that single city, if this could be shown to us in the aggregate, and in all its infinitely various ramifications and results. In such a case as this it is for every man to look at the matter as it is; and as far as possible to divest himself of every bias of private interest; and every influence which might pervert or corrupt his judgment. We have no party or private feelings in the matter. We would call no harsh names. We would impute no corrupt motives. We would disdain no man's opinions. But shall this terrible conflagration burn on; or is an enlightened, humane, christian community never to reach a period, when rising in all the majesty of its moral power, it will declare and decree that it shall be extinguished? The indifference with which some persons seem to contemplate the subject is truly melancholy. It reminds one of the infatuation of an individual whose well was near his front door, and had been without a curb for twenty years. Upon being remonstrated with for suffering it to remain in this dangerous condition, he replied, "why I never lost but one child down it."

(From the Yankee Farmer.)

REMEDY FOR SPRAINS, BRUISES, &c.

As it frequently happens that severe swellings occur from bruises, sprains, &c., I take the liberty to send you a recipe which has, in various instances, within my own sphere of observation, produced the most rapid and extraordinary relief. It was tried a few days ago, upon the foot of a gentleman who was suffering agony from a violent sprain, and afforded instantaneous relief. I have used it with great success in dispelling fistulous swellings.

pon horses. It has never, with me, failed to reduce the swelling unless pus had formed. Its simplicity has caused it to be rejected by some, but as it can do no harm, and as the materials are at hand, it can at least be tried. It is a mixture of one pint of soft soap; a pint of good vinegar; a handful of common salt, and a table spoonful of powdered nitre; put them into a common white basin, and bathe the part affected. I have never used it where the skin is abraded, as most probably violent pain would ensue. If, upon trial, you deem it worthy of publication, shall be pleased to see it in the pages of the widely circulating Cultivator.

T. F. NELSON.

Virginia, 1838.

MASSACHUSETTS HORTICULTURAL SOCIETY.
EXHIBITION OF FRUITS.

Pears—Chaumontelle, in fine condition, from Mr E. Bartlett.

Apples—Ortley Pippin and Newton Pippin, each kind from Mr B. V. French and Mr E. Bartlett; Pearmain, from Mr Bartlett; Chandler and Queen Ann, from Mr A. P. Grosvenor.

There are but few apples that would be preferred to be Chandler, and perhaps none have ever been exhibited by this society which surpass in flavor the Ortley Pippin. The Chandler is a different apple from one called by that name in Kenrick's Book of Fruits.

For the Committee

L. P. GROSVENOR.

In answer to the inquiries of a "Patron," we would remark that the back volumes of the N. E. Farmer can be furnished at \$3 25 per volume, bound.

Postage on the Silk Grower's Guide will be about 21 cents instead of the covers. Price 50 cents.

BRIGHTON MARKET.—MONDAY, Feb. 11, 1839.

Reported for the New England Farmer.

At Market, 225 Beef Cattle and 850 Sheep.
Prices.—Beef Cattle.—An advance was effected and we quote to correspond; First quality, \$8 00 a \$8 50. Second quality, \$7 50 a \$8 00. Third quality, \$6 00 a \$7 00.
Sheep.—We notice the sale of lots as follows: \$3 17, \$4 25, \$4 50, \$5 00, and \$6 50.
Swine—None at market.

THERMOMETRICAL.

FARM IN GROTON FOR SALE.

The subscriber offers for sale, his farm in Groton, Mass., consisting of about 200 acres, much of it first rate land, and a highly cultivated and productive condition. There are two dwelling houses, and commodious barns, and the place may easily be divided into two good farms. It is well stocked with fruit; with an abundance of fuel for use and sale, and excellent water. It is difficult to find a place combining more advantages in respect to comfort or profit. It will be sold on eligible terms. Inquire at the N. E. Farmer Office or of the subscriber on the premises.

WILLIAM SALISBURY.

A BOAR FOR SALE.

The Subscribers are authorized to sell a bear, half Berkshire, he is large of his age, being twenty months old. Price \$75. Apply to

JOSEPH BRECK & CO.

FOR SALE.

The farm belonging to the estate of the late Jotham Bush, situated in the centre of Boylston, 7 miles from Worcester, containing about 125 acres of land, part of which is in a high state of cultivation, mostly fenced with stone wall and supplied with never failing water. The house is spacious, elegant and commodious, with two wells of superior and never failing water. The situation is not surpassed by any in the vicinity. The barns are large and in good repair. About 25 tons of first quality hay, the grain stock, and farming utensils will be sold with the farm, if wanted by the purchaser. Also, the outlands, a mile distant, may be purchased with the homestead, if desired; consisting of about 125 acres of choice intervale, plan, and wood land, situated by the Nashua river. For further particulars, inquire of Thomas Bond, Esq. of Springfield, John W. Bush of Hardwick, or of the subscriber on the premises. JOTHAM BUSH.
Boylston, Feb. 13, 1839. 3w

AMERICAN SILK GROWER'S GUIDE.

On the art of raising the mulberry and silk and the system of successive crops in each season; second edition; enlarged and improved by William Kenrick. Just published and for sale by Joseph Breck & Co., at the Seed Store and Agricultural Warehouse, Nos. 51 and 52 North Market Street.
Jan 9, 1839

TO BE LET.

The subscriber offers to lease for the term of three, five or seven years, his dwelling house and gardens in South Salem, either with, or without any portion of the adjoining farm lands. The gardens, &c. contain about six acres, in a high state of cultivation, well stocked with flowers, fruit and ornamental trees; two green houses, filled with the choicest green house plants, and grapes in full bearing; a forcing wall, with seed and tool rooms, a convenient gardener's lodge and a large ice house; sufficient may be sold annually from the garden to pay the whole rent. The dwelling house is large and convenient, commanding a fine view of the sea, and is within three fourths of a mile from the centre of the city of Salem. The above offers a desirable situation either for a gentleman's residence, or for a public garden or boarding-house.

Also, to let for three, five or seven years, the farm house and barns, which are large and commodious, with the whole or part of the farm, consisting of over two hundred acres of land of the best quality, with a large orchard of grafted fruit — it is abundantly supplied with sea manure, and located near four market towns. The whole estate has a full supply of pure water. Apply to the subscriber on the premises.
Jan. 23, 1839. E. HERSY DERBY.

SHAKERS' SEEDS AND HERBS.

WIGHT & GIBSON, No. 44 Hanover Street, under the American House, (opposite Elm Street,) are appointed by the United Society at Harvard, Mass, as their agents for the sale of all kinds of Garden Seeds, raised and put up with directions for culture, by Jonathan Chandler.
Prices the same as when sold by the society or their traveling agent.
Herbs, Roots, Extracts, &c. for sale as above.
January 30, 1839. 4ms

FRUIT AND ORNAMENTAL TREES, MULBERRIES, &c.

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1839 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries, Ornamental Trees, Shrubs, Roses, Honeysuckles, Peonies, Dahlias and other Herbaceous Flowering Plants, 10,000 Cockspur or Newcastle Thorns.

Morus Multicaulis, and other Mulberries; the trees genuine and fine, at prices fair, and varying with the size, and the quantity which may be desired.
Fruit and all other trees, when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.
WILLIAM KENRICK.
Nonantum Hill, Newton, near Boston.
January 30, 1839.

SILK WORMS' EGGS.

Preserved with much care, producing sulphur colored cocoons; the worm from this kind of egg would their cocoons the last season in twenty eight days. Specimens of the cocoons may be seen at the Agricultural Warehouse, if desired. Apply to JOHN SULLIVAN.

SCIONS OF FRUIT TREES.

Scions of a great variety of Apples, Pears, Plums, and Cherries, from bearing Trees, which have been proved at the Pomological Garden, Salem, Mass., for sale by the subscriber.

BONE MANURE.

The subscriber desires to inform his friends and the public that he has been in the Bone business more than ten years, and has spent much time and money to ascertain how bones may be converted to the best use, and is fully satisfied that they form the most powerful stimulant that can be applied to the earth as a manure. He offers for sale ground bone at a low price, and is ready to receive orders to any amount, which will be promptly attended to.
Orders may be left at my manufactory, near Tremont road, in Roxbury, or at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, Boston.
Sept. 20. NATHAN WARD.

RECIPE FOR MAKING CAKES.

VERIFIED BY S. A. A.

If there's a lady in this learned land,
Upon her tea board wishes something grand—
Let her take this advice;

Here's a cake, whose flavor's past dispute—
The most fastidious palate needs must suit;

Two pounds of flour from freshly gathered wheat,
One half a pound of butter that is sweet,
White sugar of the same weight—
A pint of milk, three eggs, a little yeast—
Such as is fresh, 'tis said is always best
A relish to create.

Part of the flour and milk and yeast mix well,
And let it stand till it doth plainly tell
'Tis as the other—light.
The butter then, the eggs and sugar stir
Together nicely—as you would prefer
Pound cake on bridal night.

The last along with balance of your flour,
To the first mixture you shall gently pour,
And let them once more stand
That the grand compound may become as light
The merest glance assure you it is right,
Then put it in the pan.

To rise your cakes fit for a courtier's table,
Requires, I judge, as near as I am able—
Five hours, or thereabout;
Then you will have, or I'm no judge, I ween,
As wholesome confits as were ever seen,
For levee or for route.

P. S. A lady at my elbow hints,
That as a stick improves a rent in chintz,
Salt makes the dough less tough.
Use it, or not, I deem it little matter,
Since cakes like capons, never need be better,
When they are good enough.

WHAT A GOOD FARMER HATES.

He hates long stories and short ears of corn,
A costly farm house and a shabby barn;
More curs than pigs, no hocks, but many guns,
Sore toes, tight boots, and paper duns.

He hates tight lacing and loose conversation,
Abundant gab, and little information;
The fool who sings in bed, and snores in meeting,
Who laughs while talking, and who talks while eating.

THE WAY TO SETTLE DIFFICULTIES.

Two neighbors (who by the way were brothers by marriage) had a difficulty respecting their partition fences. Although they had mutually erected a substantial fence four and one half feet in height on the line separating the sheep pasture of one, from the grainfield of the other, yet the lambs would creep through the crevices and destroy the grain.

Each asserted it to be the duty of the other to chink the fence—after the usual preliminaries of demands, refusals, threats, challenges, and mutual

recrimination, they resolved to try the "glorious uncertainty of the law"—they were however persuaded by their friends to the more amicable mode of submitting the difference to the final determination of a very worthy and intelligent neighbor, who was forthwith conducted to the scene of trouble, and in full view of the premises, each party in turn, in a speech of some length, urged his claim, asserted his rights, and set forth the "law and the facts"—at the conclusion of which the arbitrator very gravely remarked: "Gentlemen, this case involves questions of great nicety and importance not only to the parties in interest, but to the community at large, and it is my desire to take suitable time for deliberation and also for advisement with those who are learned in the law and most expert in the customs of good neighbors; in the mean time however, I will just clap a billet or two of wood into the sheep holes"—and in ten minutes time with his own hands he effectually closed every gape.

The parties silently retired, each evidently heartily ashamed of his own folly and obstinacy. The umpire has never been called upon to pronounce final judgment in the case—so the law remains unsettled to this day.—*Vermont Patriot.*

A GOOD WIFE.—She loves home, believing with Milton, that—

"The wife, where danger and dishonor lurks,
Safest and seemliest by her husband stays,
Who guards her, or with her the worst endures."

The place of woman is eminently at the fire-side. It is at home you must see her, to know what she is. It is less material what she is abroad; but what she is in the family circle is all important. It is bad merchandise in any department of trade to pay a premium for other men's opinions. In matrimony, he who selects a wife for the applause or wonder of his neighbors, is in a fair way toward domestic bankruptcy. Having got a wife, there is but one rule—*honor and love her.* Seek to improve her understanding and her heart. Strive to make her more and more such a one as you can cordially respect. Shame on the brute, in man's shape, who can affront or vex, not to say neglect, the woman who has embarked with him for life,—“for better, for worse,” and whose happiness, if severed from his smiles, must be unnatural and monstrous. I find, I am proud of nothing in America so much as our American wives.—*Bangor Courier.*

MISFORTUNES OF THE POOR.—The slightest misfortunes of the great, the most imaginary un-easiness of the rich, are aggravated with all the power of eloquence, and held up to engage our attention and sympathetic sorrow; the poor weep unheeded, persecuted by every subordinate species of tyranny, and every law which gives others security becomes an enemy to them. Tenderness without a capacity of relieving, only makes the man who feels it, more wretched than the object who sues for assistance.—*Goldsmith.*

SLIPPERY PLACES.—A fellow coming out of a tavern one icy morning, rather blue, fell on the door step. Trying to regain his footing, he remarked, "If, as the bible says, the wicked stand on slippery places, I must belong to a different class, for it is more than I can do."

FOR SALE, A FIRST RATE FARM.

Well situated on the road leading from the Theological Seminary in Andover, to the old Boston road; lately owned by Peter F. Shed, and well known as the David Blunt Farm, containing 70 acres more or less. There is about 20 acres of good Woodland within sight of the house. The remainder of the farm is in good condition, and is generally considered, by those acquainted with it, to be "a garden spot." There are from 300 to 500 apple trees on the place, independently of other fruit trees of great value. The farm is well watered and fenced, the buildings in first rate order, and there are upon it three wells of excellent, soft water. It is well situated for a gentleman wishing for a residence in the country, being retired, and yet in the immediate vicinity of the public Schools and the Theological Seminary;—or for the farmer, who wishes to raise vegetables for market, the land being good and the markets near. It lies about half a mile from the Ballard Vnle Factory, a mile from the New Farm, Road depot, and nine miles from Lowell. There are upon the place about ten cords of manure.

The conditions of sale will be liberal, the owner being obliged on account of ill health, to go South.—For particulars, inquire of the subscriber, on the premises.

ANDREW B. STIMPSON.

Andover, January 15, 1839.

4w

FARM FOR SALE.

A Farm situated in the southwesterly part of Townsend on the road leading from Townsend west village in Worcester. Said farm contains 110 acres of land divided into woods and pasturing, and a large share of wood and timber; a one story house, with two front rooms, kitchen, buttery, and two bed rooms well finished; parlor papered; wood house well, under cover, forty feet barn, and shed, a large sheep house, fifteen by thirty feet, a large cooper shop, and another small house well finished, on the lower floor; a good gage duct which comes into the barn yard, and a good orchard.

The subscriber will sell a part or all, and give possession this fall or winter, or next spring. Those who wish to buy will do well to call on the subscriber, who lives on the premises, and look for themselves. ASA H. ADAMS.

Nov. 29, 1838.

MULBERRY TREES.

WM. PRINCE & SONS will make sales of trees and cuttings of the genuine Chinese Morus Multicaulis, Morus Europaea, Alpine, Broussa, Cnaton and other varieties, deliverable to the purchasers at such period in the Spring, as is convenient to them, and will enter into contracts accordingly.

Pricing and terms for the trees and cuttings will be forwarded to all who may apply for them by mail, as well as prices of Silk Worms' Eggs, Mulberry Seeds, &c. The Multicaulis trees are remarkably vigorous, and as we first imported the genuine tree, purchasers are sure of obtaining the genuine kind. It is from this cause and from the great attention paid by them, that the trees that they have sold, have given universal satisfaction.

Dec. 20, 1838.

Flushing, near New York.

FARM IN BROOKLINE.

For sale a farm situated in Brookline, about four miles from Boston, containing forty acres of first rate Tillage Land and thirty acres of Woodland and pasture with a good House in complete repair; Barn, Chaise-house, Corn-barn, Shed, &c.

The Farm will be sold low, together with the Stock, Hay, Tools, &c. if applied for soon, at No. 30, North Market St. Boston, or Roxbury Street, near Boston line.

Dec. 25, 1838.

JOHN HUNT.

NOTICE.

A person now in the Nursery business, on a limited scale, who has peculiar advantages for its extension, not possessed by any other individual in this country, wishes to connect himself with some person who can furnish a small capital, sufficient to make the business both pleasant and profitable. Inquire at the office of the N. E. Farmer.

Nov. 21, 1838.

WANTED.

In the Seed Garden, connected with the New England Agricultural Warehouse, a first rate farmer; one who has some knowledge of the management of hot beds would be preferred. Inquire at the N. E. Farmer Office, Nos. 51 & 52 North Market St.

AGRICULTURAL.

AN ADDRESS,

before the Essex Agricultural Society, at Topsfield, September 27, 1838, at their Annual Cattle Show, By LEONARD WITHINGTON.

(Concluded.)

There is another evil. No heterogeneous composition can last. We have retained the *idea* of a old system with the form of the new. They are destructive of each other. There is a silent spirit, which tinges our fancy and tinctures all our eas of gradation and eminence. It still seems to y that one profession shall be more honorable d profitable than another, while at the same time, eory and in practice, we throw the doors wide en and make all alike accessible to every class. he consequence is there is a pressure to those hich are esteemed the more desirable professions. nterprise and honor are confined to narrow chan- ls. An anecdote will explain what I mean. wo advertisements were recently published in a ighboring city; one for a clerk in a store; the her for an apprentice to learn the blacksmith's de. The number of applicants for the former ce was fifty; for the latter, not one.

But how shall we avert the evil? It is certain cannot reverse our republican institutions; nor ture the ancient ranks. Some plan must be de- sed within the sphere of manners, more suitable e spirit of the age; more gentle in its opera- ns; more salutary and healing in its effects. o elucidate this point is our main inquiry.

In the *First* place, then, we must bring our man- rs and our political theory more into harmony. r creed must sanction our practice, and our prac- ce must be in conformity to the spirit of our creed. e must not attempt to put the *new wine into old tles*; else the bottles break and the wine runneth t and the bottles perish; or, in plain language, e republican spirit must be put into the republi- n forms; and we must be content to take the stem, the whole system and nothing but the sys- n, with all its blessings and attendant evils. If men are born free and equal; and all professions e alike honorable, then say so at once; and leave e balance of the relative numbers to be regula- l by the relative profits; as it certainly will be, not controlled by these subtle, coloring ideas, herited from other ages and antiquated systems. wo grand ideal powers are now brought into ental collision, and are shooting their moral am- nition across the Atlantic. On the one side, r theory is deeply felt among the powers of Eu- e. It produced the French Revolution; and is ll producing a deeper revolution, though silent, the vision of eastern politicians. On the other nd, their commercial monopolies, their institu- ns and manners are exercising a deep influence er us. It is felt in the traveller; the summer itant; the steam boat; their newspapers; their bates; their titles; their reviews; their wit and

their metaphysics. Even the late coronation of the queen Victoria was not without effect. The whole system of commercial wants and supplies grows up from these social forms and supplies them. Every cargo of fashionable goods creates a taste and leads to an expense, unfavorable to republican-ism. For my part, though no friend to sudden innovation and wishing to place myself as far as possible from the spirit of modern radicalism, I am compelled to say, that it is my wish, that every-thing, in this western world, should radiate from one great central idea; that we might have republican manners; republican fortunes;* republican books; and republican eloquence; that everything might be latently blended with that spirit, which shall be the improvement and recognizes the equality of man. Let the central altar be built with un- polished stones and be tinged with the crimson of our own rustic sacrifices.

Education too should take a shape from our public prospects. Every father and tutor should educate his son or pupil with reference to the condition, which his country imposes and the duties she requires.

In the *Second* place, we must see the true causes of high prices of our native productions. It is a warning voice, calling us to survey the tendency of things. The original mode of trade among men, was by barter; but the tendency to philosophical generalization, among thinking men, was found in the affairs of trade; and money was invented, analogous to general terms in reasoning. By this wonderful substitute, we find the relative powers of skill and industry among mankind. It is a kind of thermometer to show us when the production is wanted and when the supply is too great. We foresee the approach of famine by the rise of prices; and commerce pours in her cargoes in the destitute spot. The balance too among the professions is kept by the same cause. How wonderful it is, among the caprices and tastes of individuals, the millions of a nation, acting on no patient examination and from no general statistics, how wonderful it is, that the relative numbers in the various employments are kept as well as they are. No man, not even the philosopher, can tell what proportion the number of shoemakers should bear to the number of tailors; or how these professions are actually balanced; but every youth, when about to learn a trade, can ask whether it is likely to be profitable. Thus prices become the marks and figures on the great scale of adjustment; and the scale would be perfect, were not these prices disturbed by accidental causes.

* That is, small fortunes, not sufficient to enable the possessor to indulge in the conventional beauties of fashion, but to lead him to every natural, eternal beauty, which improves the taste and mends the heart. Still it must be remembered, that some large fortunes are wanted even in republics, on the principles of public spirit, or whence must come our capital for great improvements? I had the benefit, the other day, of a railroad, which cost 500,000 dollars, not a cent of which came or could come from my poor pocket.

When then flour is ten dollars per barrel; Indian corn one dollar twentyfive cents per bushel; potatoes fifty cents; and other native productions in the same ratio, what is it, but the social thermometer, indicating by its infallible mercury that the proportion among the professions is not kept; that some employments call loudly for hands? It is certainly disgraceful for a nation, situated like our own, to daily pray professedly for its daily bread, and yet not be willing to raise it.

The laws of nature must be kept; and they all point us, in their severest inflictions during probation, to the noble reward that waits on reformation. But *Thirilly*. The human mind is, after all, governed by some very fine and invisible threads, which, though delicate in their texture, are strong in their effects. There is a latent impression of elegance, grace, beauty, which a young man gets early in life, from a thousand indefinite causes, powerfully determining him in the choice of his profession. Woe to that man, who sees, in his youthful morning, the rainbow settle on the wrong hill; and is doomed to pursue it through life over unfordable streams and up impracticable heights. There is an idea of the *beautiful* in morals and in life, to *kalon*, the fond image from which emanates our strongest desires, and around which play our brightest dreams of felicity. It is this, which coloring all the operations of reason, governs the man; decides his choice; inflames his energy; increases his skill, and gives him the elements of success. One man finds it on the ocean; another on the land; one in war; another in peace; one in science; another in poetry. Petrarch had his Laura; and it has been seriously doubted whether she ever had flesh and blood; whether she ever existed out of poetry; whether the bard did not embody his own fancies and give to *an airy nothing a local habitation and a name*. In a certain sense, every man has his Laura; who fills his imagination, and leads him through life. Every man has some ideal of perfection and happiness after which he always reaches, though never grasping; and which modifies his pleasures and his pains from his cradle to his tomb. In vain does reason speak; in vain does experience warn; in vain may you balance against his ideal visions the collected utilities of life; if a man does not, in some degree, reach his contemplated goal, he is poor in the midst of abundance, and wanders a wretch through the world. Nor is it the young and imaginative alone that are governed by these ideal forms; the most cool and avaricious feel their power. *Their* Laura is not the same as Petrarch's; they will not write sonnets to her praise—certainly not *such* sonnets—but their views are just as ideal; and the phantom they pursue assumes her beauty and her power, solely from her relation to their temper and taste. It is not the material gold that absorbs the miser's lusts; to him, as to other men, it is worthless dross; it is the ideal of being a rich man; it is the laurel of a Cæsar shading his dwelling and adorning his tomb.

If a certain style of living seem essential to our

happiness; and in the competitions of life, we are left to fall short of it; no philosophy, and, I had almost said, no religion, can save the strongest mind from a degree of disappointment.

Now it was the policy of antiquity to give agriculture the first place among the professions; I allude not to pastoralists; but retrospective pleasure with which, from the courts of princes and in an age of refinement, men look back upon incredible scenes of virtue in Elysian fields of bliss. But the most sober calculators, the orator and the historian, delighted to relate the story of Cincinnatus, passing from his plough to victory and from victory back to the plough—*triumphalis agricola*. The possibility of uniting the highest mental qualities, with that practical skill which makes the *desert blossom like the rose*, was strongly inculcated. It was the leading article of ancient faith; and must be so again. The man, who makes agriculture, not merely productive, but honorable, who surrounds his farm with the images of the most attractive happiness; who dwells in a neat abode, such as republican wisdom might build and republican simplicity ought to desire; who, in addition to the song of the robin, can make the music of contentment flow around his calm abode; can unite it with the intelligence of a citizen who knows his rights and is determined to defend them: who shows that *this business* is favorable to mental culture and as fair a road as any to political eminence;—such a man does more to encourage the profession than all other causes combined. He touches the springs of action in their centre and blesses his country and mankind. He plants the laurel beside the plough, and allures thousands to come, and after having toiled within its fragrance, to sit beneath its shade.*

There is still a fourth expedient. The return of those, who have been disappointed in the learned professions or commerce, to agriculture; and being happy in the return. Your father's farm!—it supported your cradle and may perhaps be destined to inclose your grave. I am aware, that these resump-tions of an old employment have not always been successful. The body long disused to labor, melts beneath the Summer sun; aches as it follows the plough; and the soft hand, which has worn the glove, becomes blistered as it handles the pitchfork or the spade. The stillness, too, of a country life, so soothing at a distance, becomes tasteless when it is the forced choice of men, who have toiled the mart and been honored in banks. Even the song of the robin, which warbled so sweetly in

* After all, mankind, especially the young, will be governed by their ideas of the beautiful more than utility; in politics, morals, religion, and general life: not would a benevolent man wish to exterminate this fundamental principle of our nature. But there is all the difference in the world, between conventional beauty, the beauty of fashion and expense; and that, which is simple, natural and eternal. Let us look at a few particulars:—a rich shawl to a young lady's eye is beautiful; so is a rose. But the one is a conventional beauty; the other a natural. The one lasts while the fashion lasts; the other, i. e. its essential beauty, until flowers shall be no more. Take the fluctuations of female dress: sometimes its beauty depends solely on the fashion; sometimes it approaches to the everlasting laws of nature. The old stays and high-heeled shoes of Queen Anna's day, were mere conventional beauties; the Grecian dress is natural and essentially beautiful. Now it seems to me, what we are to seek is—that cheap, simple, essential beauty, which promotes the progress of mental refinement, but never leads to the expense which plunges families and nations in ruin. Let the conventional and natural meet in one hue of inseparable union.

pastorals, becomes harsh discord when a man hears it from a house, under a heavy mortgage; and it is the only music, which his poverty can afford. But let us not be discouraged; life is a conquest over difficulties. These returning farmers; these prodigals, who, having spent their substance, at last go home to their father's house; these shipwrecked mariners on the golden sea of Fortune, who swim to the shore on the last shivered plank—after all, have some advantages. They have increased their skill; they know mankind; they have seen the world; and should they be endowed with genius and glow with a new ambition—what discoveries might they not make! Though the triumphs of mechanical skill have as yet been chiefly confined to manufactures, and some say can never be exhibited in agriculture, yet as an offset to this advantage, there is the composition; the improvement of soils. What a field is here open! How little do we know of it! How important the pursuit! How rich the reward! All the difference there is between ten bushels of corn to the acre and an hundred, is before us to awaken our invention and activity; and suppose a Newton, a Davy, a Franklin, a Whitney, to be thrown on such exigencies, how would the treasures of nature be opened! How would the best spots for the largest crops be sought out and found. Let no man despair of reaping his substance in his last days from the rugged earth, who retains either of those best instruments, a healthful body or a vigorous mind.

My Fellow Citizens, I rejoice, on the whole, in the exhibition of this society, and believe its tendency to be good. It reflects credit on the wisdom and philanthropy of the men who support it. Anything that turns our attention to the great foundation of our social happiness, must be beneficial. But, I am deeply impressed with the conviction, that we need a revolution in our ideas of public and private life.

The road of enterprise must be new laid—new paved—and conduct to other objects. We are still misled by certain ideas of refinement and felicity descending to us from the Gothic ages. The public hive must have more working bees and fewer drones; and what is of equal importance, the drones must cease to engross the profits and the honors. The late convulsions in the commercial world are not without their moral. They point to a different source of prosperity. Instead of thinking that all talent is to be employed on the sea or in speculation, we must turn it to a new channel; it must guide the plough; improve the soil, and carry agricultural skill to its last perfection. We shall always be an enterprising nation; I hope we shall always be a moral one. But that enterprise must flow in a wider channel; that morality must be founded on a better faith. Perhaps it would not be impossible to describe the circle that bounds the last expansion of the republican idea. When two young men, entering on life with equal abilities and virtues, would not turn up a copper for the choice of a profession to ensure their future success and distinction, then, and not till then, will the republican idea be carried out to its full perfection.

"Marm, mayn't I go and play horse today?"

"No, child, you must stay in the house."

"Now, look here, marm, if you don't let me, I'll go and catch the measles—I know a big boy that's got 'em prime!"

Extracts from Dr Jackson's Second Report on the Geology of the State of Maine.

AGRICULTURAL GEOLOGY.

GEOLOGICAL ORIGIN, DISTRIBUTION, CHEMICAL COMPOSITION AND CAPABILITIES OF SOILS.

Considering the vital importance of a correct knowledge of the science and art of Agriculture upon which man depends for his daily bread, we shall willingly avail ourselves of any information that may throw light upon the principles, by which we are to be guided in practical operations.

It cannot be concealed that agriculture in this country is far below the standard attained in Europe, and that by their more scientific methods, the French, German and Italian farmers are enabled to raise larger crops, so as to supply us with man articles of agricultural produce, at a lower rate than we have been able to grow them upon our own soil, and this too has been effected by people whose soil costs vastly more than ours.

It is well known, that for several years past, large quantities of wheat, barley, Indian corn and beans have been imported into this country from France, Germany, Venetian Lombardy, Tuscany and Egypt while at the same time, orders have been sent out from France for the purchase of our refuse bones and the bone black of sugar refineries—substances used in that country for improving the soil. Thus strange as it may seem, the French farmers send to this country for manure, and supply us with bread, while many remain ignorant of the value of those very substances so eagerly sought for by our foreign brethren!

European science has been brought to bear upon the art of agriculture, and hence the improvements are rapidly progressing there; while we have as yet done but little towards the development of the most important of arts.

I know that many intelligent farmers deem "book-farming" as useless, and their remarks are certainly worthy of our attention, and we may perhaps remove their objections. Good books on the subject record the experience of many excellent practical farmers, and concentrate all the information that is scattered in various parts of the world, while at the same time they give general rules by which we are to be guided in practice. What then is the objection that has been raised against such knowledge? It will be found that there are few such books in existence, although there are materials enough on record to furnish a good treatise, and those books that have appeared, are deficient in some of the most essential particulars, they are so technical that those who are unacquainted with the elements of science cannot understand them. There are also imperfections in the certificates and rules, owing to no analysis having been made of the soils in question.

So also our own farmers are unacquainted with the composition of their own soils. Hence we account for the uncertainty of the results obtained by those who make trials of new methods in farming, and we ought not to be surprised at their frequent failures.

If, however, all the conditions of the problem were understood by both parties, farmers would readily join hands with their scientific co-laborers and the art of agriculture would soon become certain as any other art, while, by the application of scientific principles, the business would become of a more exalted character, and assume its true rank in the consideration of all men.

In order to make rational experiments in farming, it is essential that the composition of the soil should be known, and then we can act understandingly in our operations. In order to amend a soil, that knowledge is absolutely necessary, otherwise we might destroy its fertility, by the processes intended for its amelioration, and thus be subjected to disappointment and chagrin.

Mineralogy, geology and chemistry come to our aid, and serve to indicate the nature of various soils, while sure indications are readily discoverable or the amendment of those which are sterile.

Agriculture is of so great importance to the community, that we should not allow our knowledge of it to rest upon mere empiricism. It ought to be exalted to the rank of true science, and then it will become one of the most honorable, as it is one of the most useful of arts, and even the most highly educated men will then be proud to rank as scientific farmers.

Let us now examine the subject more in detail, and ascertain how much light we may obtain from the science of geology, that may serve to guide us in our researches.

We have first to consider the geological origin of soils.

Every attentive person must have observed, that solid rocks, exposed to the combined action of air, water, and different degrees of temperature, undergo decomposition and disintegration, so that they crumble into powder, and that some rocks decay more rapidly than others, owing to their structure, or mineralogical composition. If a rock is porous, or stratified in its structure, water infiltrates into it, and on freezing, expands with such power, as to tear the surface of the rock to pieces, so that it readily crumbles. When fire runs through the forest, it heats the surface of the rocks, and by the irregular expansion produced, they are shivered into fragments.

The action of running water and friction of stones, also serve to grind the rocks into powder, by attrition of their surfaces, and the detritus is borne along by the streams, and deposited in low lands, or along their borders.

When a rock contains iron pyrites, or sulphuret of iron, that mineral, by the action of air and water, decomposes, and forms copperas, or sulphate of iron, and the sulphuric acid of that substance acts powerfully on some of the ingredients of the rock, and causes its rapid decomposition. Any person, who has been on Iron Mine Hill, in Gardiner, will fully understand how rapid is this operation, and may there see its results. The oxidizing power of the atmosphere, also, acts powerfully upon the surface of those rocks, which have for one of their components, the prot-oxides of the metals, iron and manganese, and as those oxides take up another portion of oxygen, they increase in bulk, become brown or black, and the stone falls into fragments.

These are a few of the causes now in action, which modify the solid crust of the globe, and it appears that their effects are far more important, than we might at first imagine. Whoever looks upon the muddy waters of the Mississippi, Ganges, Po, the Rhine, and the Rhone, or reads the calculations respecting the enormous quantity of matter brought down from the mountains by those rivers, will at once appreciate the modifying influence of those causes which are continually wearing down the solid matter that forms the mass of our mountains.

Geology teaches us that such causes were formerly in more powerful operation, and that the ancient world was, from its infancy, subject to violent catastrophes accompanied by powerful inroads of the sea; oceanic currents and tumultuous waves laving for many successive periods rushed over the land, and beaten the loftiest crags of the highest mountains. We should then naturally expect, that the earth would present ample testimony of the action of these powerful causes of disintegration of the rocks, and we do observe that a large portion of the loose materials upon the surface, bear proofs of aqueous action and mechanical abrasion. By those ancient convulsions, the detritus of the solid rocks was prepared, and forming the various soils, which we observe, the earth was rendered capable of yielding its rich stores of vegetation, on which a large proportion of the animated creatures depend for their food. From the foundation of the everlasting hills, the CREATOR began to prepare the world for the habitation of his noblest creature, man, and converted a portion of the solid rocks into soils, which were given as the field of human labor, and to the progenitor of our race it was commanded that he should till the soil.

If we take up a handful of earth, and examine it attentively, we shall readily discover such mineral ingredients, as denote the rocks from which it originated. Thus we discover in a soil numerous spangles of mica, grains of quartz, and white or brown earthy looking particles, which are felspar: besides which, we remark a considerable portion of fine brown powder, which being examined with a microscope is found to be composed of the same minerals, more finely pulverised, and mixed with the brown oxide of iron. It will be at once understood, that such a soil arises from the disintegration and decomposition of granite rocks, and that the oxide of iron was derived from the pyrites, or the prot-oxide of iron, contained in that rock.

A soil arising from the decomposition of gneiss, possesses similar characters, only the mica is more abundant.

Soils from mica slate are made up of a large proportion of mica, mixed with grains of quartz.

Sienite, and hornblende rock, produce a dark brown soil, in which there is but little quartz, and a great deal of felspar, and decomposed hornblende.

Greenstone trap-rocks form by their decomposition a brown soil, which contains pieces of the undecomposed rock, but the component minerals in the soil itself, are rarely so distinct as to be discoverable. This soil is a warm kind of loam, soft and spongy, easily compressed into smaller dimensions by the pressure of the hand, but not adhesive like clay. It is peculiarly adapted to the growth of potatoes, and is a luxuriant soil for most of our ordinary produce.

Slate-rocks form a soil of a blue color, in which numerous undecomposed fragments of the rock may be discovered. When transported by water, it is deposited in the state of tough blue clay.

Limestone forms various colored soils, according to the nature of the impurities it contains. They are generally of a light yellowish brown color, from admixture of a certain proportion of oxide of iron. This is especially the case with those soils derived from the argillo-ferruginous limestone.

Calcareous soils, if they are rich in carbonate of lime, may be distinguished by their effervescence with acids, and the quantity of this substance may

be estimated by the loss of weight which indicates the proportion of carbonic acid, that has been expelled, and since the carbonic acid always occurs in the ratio of nearly 44 per cent. to 56 per cent. of lime, it is easy, by a proportional calculation, to ascertain the quantity of that mineral in the soil.

It more frequently happens, that there is so minute a quantity of carbonate of lime in the soil, as to require a minute chemical analysis for its detection, and few farmers have either leisure or means of such an operation. Examples of such analyses will be presently laid before you.

Talcose slate-rocks, when decomposed, form a light brown soil, in which particles of the rock are discoverable, and on analysis, a considerable quantity of the silicate of magnesia is found, which is one of the chief components of talc.

Red sandstone, on disintegration, forms soil composed almost entirely of grains of quartz, with oxide of iron, and clay, with a few spangles of undecomposed mica.

Grauwacke, or conglomerate, when disintegrated, produces a light grey soil, full of smooth rounded pebbles, which originate from undecomposed components of the rock.

Red porphyry is very slow of decomposition, and forms a bright and red fine powder, filled with angular fragments of the rock.

I have thus distinguished and described the appearances which characterise those soils that arise immediately from the decay of solid rocks, and various characteristic specimens of each variety may be seen in the cabinet arranged for the use of the State.

(To be continued.)

ASHES.—Of all things to make grass grow, ashes beats; this you may depend upon, for I have tried it often, and it has never failed yet. Just collect as much of it together as you can,—the more the better—and spread it over your grass grounds, and see if I am not correct in my assertion. It is said by some people, that it is the potash which is in it that produces the effect, and I strongly suspect they are right in this matter; for two years ago, suspecting that to be the case, I procured some potash from an apothecary, which cost five cents a pound, and dissolved it with water, and put it over the ground with a watering pot, just for an experiment; and you would have been surprised to see how luxuriantly the grass grew where it was put. Now, I should like some of the intelligent farmers, who take your paper, to try an experiment with potash this spring, and inform your readers of the result through the Cabinet. Some say it is excellent for Indian corn. This might also be tried. My object is to make plenty of grass grow; for I find, if we can do that, we can accomplish everything we desire in agriculture, because with that we can feed stock, and by that means make manure. What cannot be done by industrious and intelligent farmers? I say industrious and intelligent, because without these two qualities, a man had better quit farming at once, and try to find out some business soon, that can be carried on to profit without these indispensable qualifications to a farmer; and when the discovery is made, I hope it will be communicated through your paper; for I should like to embark in such business, as I am well adapted to it by nature.—*Farmer's Cabinet.*

(From the Genesee Farmer.)

DICTIONARY OF TERMS USED IN AGRICULTURE,

AND IN THE SCIENCES MOST INTIMATELY CONNECTED WITH ITS ADVANCEMENT.

(Continued.)

Ammonia. Volatile alkali. It is a transparent, colorless gas, of about half the weight of common water, with an exceedingly pungent smell, extinguishes flame, and is fatal to life. Its old name was "spirits of hearts-horn." To the agriculturist, ammonia is particularly interesting from the fact that those substances that contain the most of it are the most efficient manures, and act with the most certainty and promptness. Ammonia is produced from soft or fluid animal substances while in the process of decomposition, and this change is rapid in proportion to the quantity of earthy salts they contain. "It is particularly to the developments of ammoniacal gas," says Chaptal, "which, combined with gelatine, passes into plants, that we can attribute the wonderful effect produced upon vegetation by certain animal substances." These substances are the animal manures, the urine, *poudrette*, the bones, horns, hair, &c. The urine of the animal contains in muriates and carbonate of ammonia about 20 per cent., besides 11 per cent. of phosphate of lime and sulphate of potash, or 30 per cent. of the most active manure yet discovered; and the saving and proper distribution of it forms an important item in Flemish husbandry. The larvæ left after the cocoons are reeled in the extensive silk manufactories of France and Italy, are considered invaluable as a manure. Their excellence is owing to the ammonia they contain, which in them Chaptal found to exceed in quantity that of any other animal substance.

Analysis. To determine the value of any soil, or to be able to correct any fault in the original constitution, or any deficiency arising from improper cultivation, it is necessary that the nature and proportion of the substances composing it should be understood. In agriculture this examination is termed analysis; and in its simplest, yet still effectual method, may be practised by every farmer. The implements required are a pair of scales, accurate to the tenth part of a grain; a crucible; some muriatic acid, and a few small vessels of china or glass.

The earth to be tested by the farmer should be taken from a few inches below the surface, and be an average specimen of the field, or the soil to be examined. The quantity to be examined say 2 or 400 grains, is to be slightly pulverized or well mixed together. Put of this, 200 grains in a crucible, and heat it to 300 of Fahrenheit, or bake it in an oven heated for bread for 15 minutes; cool and weigh. This will show the absorbent power of the soil, and as this is depending mainly on the animal and vegetable matter, if the loss is considerable it is a decisive proof in this respect of fertility. The absorbent power varies from 4 to 12 per cent.

After weighing, heat it again in the crucible to a red heat, and until the mass shows no bright or sparkling particles, stirring it with a glass or iron rod; cool and weigh, and the loss will be the animal and vegetable matter in the soil.

Take 200 grains of the dried earth, mix it thoroughly with a gill of water by stirring it for several minutes. Let it stand for 3 minutes, and turn

off the muddy water into another glass. Dry the sediment in the first glass at a high heat, weigh, and it gives the silica contained in the soil. Let the water turned off settle clear, turn it off, dry at a high heat and weigh; this gives the alumine or clay.

Put into a suitable glass or flask, one fourth of a gill of muriatic acid and water in equal proportions, and balance the scales carefully. Put into this mixture, 100 grains of the earth, let it stand till all effervescence has ceased, which will sometimes be an hour or more; carefully note the weight required to again balance the scales, and that may be set down as the weight of carbonic gas expelled, say 6 grains. Then as 45 is to 55 so is this weight to that of the base, or the lime. In this case the lime would be 7 1-3 per cent.

To ascertain if earth contains iron, stir the muriatic acid and water with a strip of oak bark, and if iron is present in the liquid the bark will turn dark. To ascertain the quantity, put in prussiate of potash till it no longer forms a blue precipitate, let it settle, heat the deposit to redness, carefully weigh the remainder, which is oxide of iron.

To determine the presence of gypsum, take 400 grains of earth, mix one-third the quantity of powdered charcoal, keep it at a red heat in a crucible for half an hour. Then boil the earth in a pint of water for 30 minutes, filter the liquor and expose it for some days in an open vessel. A white deposit will be sulphate of lime, and the weight will determine the proportion.

These processes are all simple, and can be performed by any one. By them we obtain—first, the absorbent power; 2d, the amount of animal and vegetable matter; 3d, the silica or sand; 4th, the alumine or clay; 5th, the carbonate of lime; 6th, the oxides of iron; and 7th, the gypsum or plaster of Paris. The salts exercise a great influence on vegetation; but as they principally depend on the animal and vegetable matter in the soil, and as the determining their qualities and kinds are too difficult for the analysis of the farmer, the processes are omitted. The above ingredients are all that exert a marked influence on the fertility of soils, and on their proper proportion its goodness depends. If soils contain too much silica or gravel, they are porous; and if too much clay, retentive. The last is usually the worst fault, and may be known by the water standing upon it after rains, remaining unsettled for a long time, owing to the clay held in solution. Wheat winter kills on such soils; or calcareous gravelly ones rarely. Good soils usually contain from 65 to 75 of silica; from 10 to 16 of alumine; from 4 to 10 of lime, and varying proportions of vegetable matters, animal and mineral salts, &c. The analysis of soils forms one of the most decided steps in the improvement of agriculture, as it clearly points out what is wanting to remedy any defect and give ease of working, and abundance in product. Every farmer should understand the nature and composition of his soils, and may do so, with little time, and at a mere trifle of expense.

Animalcula. The microscope has opened to the observation of man a race of beings so small as to be utterly invisible to the naked eye, yet endowed with all the functions of vitality and perfectly organized animals. Some of these are called Infusoria; from being always found in water where plants are decaying, and some *Diatomee*, but all included under the term animalcula. They have long been regarded more as objects of mere curi-

osity than anything else; but recent discoveries seem to indicate that these minute insects have had an important influence in modifying the crusts of the earth, and giving it the character it now possesses. Mountains of flinty rock in Silecia have been found by Eberenbel to be wholly composed of the shells of animalcula; and in this country masses of remains of the infusoria have been found several hundred yards in extent. Unlike the shells of the molusca and testacea, which are lime, the shells of these invisible animals are found to be unchanged by fire, and composed of pure silica. All bodies of long stagnant water such as those where peat is found, or bog earth deposited, abounds with infusoria, and Prof. Bailey of West Point has found at the bottom of peat earth and in it, immense quantities of these minute remains. It is a curious fact that animals invisible in themselves to the eye, should be able in the course of centuries to form mountains, change the face of continents, and exert an influence by no means trifling on the labors and productive industry of man.

Annual. This term is applied to plants that arrive at maturity in a single year and then perish. The stem of annuals is generally of rapid growth, porous, and abounding in the juices necessary to the perfection of the seeds in a single season. The herbage of some plants is annual, while the roots are perennial, or remain from year to year. Maize is an example of a proper annual; the grasses, of perennial roots, with annual herbage.

Aphis. A family of insects that prey extensively on plants, and are endowed with such astonishing power of reproduction, that though insignificant as individuals they are formidable in their numbers, and in most years occasion more or less loss to the agriculturist. The congregations of aphides consists in spring and summer of apterous and living less individuals, and of nymphæ with undeveloped wings. They have no mouths but are provided with beak-like suckers which they insert into plants, and feed on the juices. Almost every cultivated plant or tree has its peculiar family of aphid; and those trees or shrubs that are wild, or found only in the depths of the forest, cannot claim exemption. What is called the apple tree louse, is an aphid; and on lifting the scale-like covering, the depredator, and its implement of suction, can be seen. Another species infests the tender shoots of grafts, and the thrifty shoots of the apple and other fruit trees, and if allowed to multiply unchecked produces great injury. The American blight, as it is called in England, or the *ophis hanata* of the entomologist, is a destructive species, when permitted to make a lodgment on the apple tree, but fortunately the cotton covering in which it is enveloped renders it easy to discover, and thus timely put the fruit grower on his guard. In passing through the Tomawanda swamp near Lockport to Batavia in 1838, the Alder, *glauca*, that lined the road was literally loaded in places with a species of aphid, the long cottony filaments of which, erect in air, seemed to be waved at will, and simultaneously, giving a most singular aspect to the branches on which colonies were planted. The turnip is greatly infested with the aphid, as is the rose, feniel, parsley, and many other plants cultivated for use or ornament. The aphid, while fixed by its sucker to the branch or the leaf, elaborates a sweet honey-like fluid, clear as water, and this is projected at will from two tubes in the hinder part of the body. We have seen in the sunshine, these drops falling like the spray of a waterfall, from a

fruit tree on the leaves of which millions of the aphids were feeding. It is for this substance that colonies of the aphids are so frequently visited by the ant, which drinks the sweet fluid as it is thrown out by the aphids. Soapsuds, and a strong decoction of tobacco, have been deemed most effectual in destroying them; though when a foothold is once obtained, from their rapid multiplication, extermination is difficult.

Apiary. The place or building in which bees are kept, is termed an apiary; and where these industrious insects are kept for profit, or for observation, much care is sometimes taken in this department of domestic management. There is no question that the keeping of bees, may be made a source of considerable profit at very little expense, as their food costs nothing, and a residence is provided with the very hive in which they are placed. Movable apiaries are common in eastern countries; and a long boat, with a hundred swarms of bees on board, accompanied by the owner, may be seen floating down the Danube, the Po, or the Nile, anchoring where materials for honey promise to be abundant; and moving onward when the district is exhausted of its sweets. Among farmers, too little attention is usually paid to the apiary; the hives being left exposed to the storms and cold of winter, and the intense heat of summer, without protection. Bees, like other domesticated creatures will well repay care and attention.

(To be continued.)

(From Chamber's Edinburgh Journal.)

MAKING AND SALTING BUTTER.

The following notes on this subject are by an individual (a female) who has been personally engaged in the preparation of butter for fifty years:

Some time ago I observed in the Journal a comparison between Dutch and English Butter. Could the particulars of the Dutch method be obtained, it would be a very desirable acquisition; but I apprehend the superiority of their butter is chiefly owing to the pastures, and an unremitting attention to the duties of the dairy. In our own country, the pasture affects in a high degree the quality of the butter, old pasture produces much richer butter than new; and on some hilly grounds where wild flowers and certain kinds of grass abound the flavor is much finer than on low grounds, where the pasture is more luxurious.

In the want of better information regarding this very necessary article of domestic comfort, I am induced to send you a few remarks, which may perhaps induce others who are better informed to do the same, so that the most approved methods of curing butter may, by the medium of your widely circulated paper, be known throughout the length and breadth of the land.

As a preliminary, I must beg the indulgence of being very particular, for the whole process is made up of small things, the neglect of one of which might affect the whole. I also wish it to be understood that my observations are chiefly adapted for the use of small establishments, where from three to six cows are kept. It is inferred that everything in the dairy is conducted with the most strict regard to cleanliness. It ought to be a cool, dry, well aired place, free from all damp and bad smells. It is a great mistake to suppose that the art of making good butter consists merely in having it properly churned, thoroughly washed and sufficiently salted. All this may be most pointedly

done, and yet the butter turn out very bad. The main thing, and it must never be lost sight of, is to keep the milk in all its stages from contracting the least degree of taint. By taint I do not mean sourness. Sourness will not injure the butter; on the contrary, it greatly facilitates churning; and to obtain this in winter when cream is slow to sour, it is necessary to place it for twenty-four hours before churning, within the influence of a fire, and to stir it thoroughly two or three times during this period.

Cream ought never to remain on milk above thirty-six hours. This I consider to be a very important point, for if, by any omission, cream be suffered to remain for a longer time on milk, it is sure to contract an old bitter taint; and it would be more true economy to pour such cream into the pig's trough than to introduce it into the churn, as it will spoil the whole. A properly loaded stone jar is better than a wooden vessel for keeping cream, because wood is more apt than stone ware to get mouldy; a slight mould soon communicates itself to the cream, and of course to the butter.

A wooden rod must be continually kept in the jar, and every time cream is added, the contents must be stirred from top to bottom with the rod. This is very essential, for if neglected the cream first put in will gradually rise to the top, and so get tainted. Cream ought never to be kept above five days; but four is still safer for butter than it is to be salted.

If the atmosphere at the time of churning be above fifty-four degrees, one quart of the coldest spring water to every three gallons of cream, put into the churn at commencing, will be a great advantage, and will injure neither butter nor milk. If there be the slightest cause for suspecting that the butter has suffered from hasty churning in warm weather, it ought to be salted for present use, and not put into the kit with keeping butter.

Butter on being taken out of the churn, ought to be instantly washed in spring water until the water comes off colorless. After this, the sooner it is salted the better. In salting, use the best English salt, such as is used in the curing of herrings. To three parts of salt, add one part of loaf sugar, both finely pounded, and perfectly well mixed. One ounce of this to sixteen ounces of butter is the proper quantity. Let it be thoroughly incorporated with the butter. In cleaning and salting butter, a stout creaming dish is preferable to the hands.

Kits made of wood are much superior to stone-ware in keeping of butter. The top of the kit ought to be about one-fourth narrower than the bottom, and the wood nearly one inch in thickness. A thin wooded kit is not so favorable for preserving butter.

In the process of salting, a little salt and water ought to cover the butter from the first, and a piece of thin linen should also be spread over it. The sides of the kit must be daily wetted with thin salt and water, by which mould is prevented from forming on the empty part of the kit during the time of filling. The kit ought to be filled within one inch of the top, and kept constantly covered by linen, and a pickle of salt and water. Butter is apt to rise above the pickle. This is easily prevented by turning over the butter a dinner plate. By placing a weight on the lid, the plate will be kept down. The kits must be kept on a cool, airy shelf of the dairy, not on the floor, and occasionally

moved a little round. Butter for keeping, may with safety be salted during all the time the cows are on pasture. It is a most useful thing to have a slate in the dairy, whereon to note down the date and produce of every churning; also what is salted or otherwise; and these notes to be set down occasionally in a book. A jar of ready made pickle, just strong enough to move an egg, but not so strong as to cause it to swim to the top, ought always to be kept in the dairy. Have also at hand a can of prepared salt and sugar, to be kept in a dry place, as the dairy will be too damp. The kits ought to be all numbered, and those first salted should be first used.

I have still to beg your indulgence for a few thoughts suggested by the above observations. In this enlightened age, when each class of the community is vying with the rest in improving the commodity which comes under their immediate care, it is surprising that public attention has been so little turned to the improvement of the mode of salting butter. The same complaints from the same cause are constantly to be heard, and there the matter rests, and so it will rest, unless general attention be directed to it, and a decided effort be made. Nothing is wanting to remove this grievance but a few slight attentions. There is no additional toil; no additional expense. What a pity then it is, that those to whose care the preparing of this article is entrusted, cannot bethink themselves to bestow these slight attentions. They should take into consideration the comfort of thousand of decent householders, who are both able and willing to pay for a wholesome article, but who have no alternative, but either to use the butter that is offered for sale, or to want it altogether. There is another consideration which ought to have its own weight, namely, the honor of their country; and one, however humble, should think themselves too insignificant to contribute to this. It is the many that make a whole; and if we always throw our influence on the right side, we have the satisfaction at least of having done what we can to create the happiness of our fellow creatures.

The famous Pickman farm, in Salem, the best in the country, is lined round the borders of the fields, with engrafted apple trees. These trees are very thrifty, deriving most of their nourishment from the ground under the walls, which keep the soil loose, warm and moist, and preserve the roots of the trees from external injury. The trees in this situation are an ornament to the farm, while they are no hindrance to the farmer in cultivating his field, nor injury to the crops by withdrawing nourishment, like those in the interior of the field. Yet those trees round the field are believed to yield a greater profit than the annual crop within, with a labor necessarily bestowed upon it—and the annual sales of the apples and fruit on this farm are said to be enough to purchase a farm of moderate dimensions in the interior of the State.—*Newburyport Herald.*

THE LARGEST AND FINEST HOG.—The Albany Argus says the palm must be awarded to the hog, imported when four weeks old, by Erastus Corning, Esq., raised on his farm near Albany. It was of the Cheshire breed, and three years old at the time it was slaughtered, and weighed, when dressed, nearly eight hundred pounds. This was a "whole hog."

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, FEBRUARY 20, 1839.

STATE PATRONAGE OF AGRICULTURE.

What claims has the agricultural interest upon the government; and what can the government do for the improvement and advancement of its agriculture? These are questions always entitled to serious consideration; and which often engage the attention of those reflecting and patriotic minds, who desire the welfare and improvement of the community.

The first duty of every wise and just government is to encourage and protect labor. Labor constitutes the only means of subsistence and is the producer of all wealth. "The king is served by the labors of the field." Every individual in the community, from the highest to the lowest, is sustained by agricultural labor. All the arts of life, all the embellishments of life, all that society possesses or gains, all that it can gain or possess, its food, its clothing, its means of comfort, enjoyment, luxury, improvement, all are dependent upon labor; and primarily upon agricultural labor. We do not mean to claim for it an importance to which it is not fully entitled. We do not design to speak invidiously or disparagingly of any other department of labor. We respect honest and useful industry applied in any form, which the wholesome customs or proper wants or innocent gratifications of society render necessary or desirable. But agricultural labor lies at the bottom. Like the stomach among the members in the old Latin fable, it sustains the whole; the limbs all sympathize with it; they are affected by whatever affects it; and they flourish or decay, not only the limbs but the highest faculties of the mind also, according as that may suffer or be in health; as that may be fed or starved; be nourished or abused.

What would manufactures be without agriculture? Whence comes the raw material about which manufacturers are employed; and how is the living power sustained by which everything is put in motion? What would commerce be without agriculture? In what is commerce employed, what is its very end; what constitutes the life of commerce, but the transportation and exchange of the products of agriculture.

We might claim something in favor of agricultural labor on the score of morals. But we have no disposition to suggest offensive comparisons. Agricultural labor is conducive to health; is unattended with any distrust of its moral rectitude and utility; calls forth none of the bad passions of our nature; presents no temptations to injustice or fraud; attaches men to their homes and their country; inspires self-respect and self-dependence; and by a direct and substantial increase, we might more properly say, creation of the means of subsistence and comfort, adds as directly to the general comfort and welfare of the whole community. In a wisely governed republic then, agricultural labor will be fostered, patronized, improved; and all will be done that can be done to render it productive; to stimulate agricultural effort and enterprise; and to render it in as high a degree as possible respectable and honored.

We should be glad to indulge much farther in these general considerations; but they are familiar and not needed. We proposed to say a few words about the agriculture of Massachusetts; and the patronage, which the State government has shown towards it.

It is often said that Massachusetts is not suited to agriculture; and that she must mainly depend on her manufactures. Her manufacturing industry is surprisingly

great. The statistical returns gave two years ago the amount of her productive industry as equal to ninetyone millions of dollars. It is well understood that many of these returns were essentially defective. In some cases a return lower than the truth was given, from an unwillingness with the parties interested to be exposed to a calculation of profits; in some from a fear of increasing the valuation of the town in the State estimate; in some from neglect and indifference; and from some mean distrust of the purposes for which these estimates were asked. It is certain therefore, that, if a perfect return had been given, the amount would have been considerably increased. We have no means of ascertaining the whole amount of the agricultural produce of the State; but we believe that its amount, if it could be approached even with tolerable exactness, would create as much surprise as the sum total of her mechanical industry. We cannot but hope that under the auspices of a Board of Agriculture this will presently be accomplished. We shall only say in this case, from careful personal observation we are persuaded that the agricultural products of Massachusetts might with advantage be increased ten fold. We refer in this case particularly to bread grains, to the cultivation of esculent vegetables, to her dairy produce, and to her pork and beef. We advert only to one fact, which has been fully established to our own satisfaction; and which we hope to be able to establish as fully to the satisfaction of the public. The fact to which we refer is this: That there is not a single crop raised in Massachusetts, under good cultivation, in any part of the State, which, excepting in extraordinary cases, does not yield more than ten per cent. profit to the proprietor of the soil, even when labor, including the board of the laborer, is charged at one dollar per day. If it should be asked why, under these circumstances, it does not prove more productive and profitable than it is, we answer that this is owing to reasons, entirely independent of the capacities of the soil; but upon which we shall enter at another time and in another place.

We believe in the perfect capacity of Massachusetts to raise her own wheaten bread and all her bread grains; and to produce them with an ample profit upon labor. This is our creed, which for aught we can see, we think we shall be ready to sign in good faith as often as our respected friends at Andover are required to subscribe theirs.

It will be said that we have made a trial of the wheat cultivation; and that it has proved a failure. The bounty which was expected to reach fifty thousand dollars, and, in the sanguine anticipations of some men, even vastly more than this, will fall short of ten thousand, as it is now said by the chairman of the Committee of Agriculture. But some of the occasions of the failure of the wheat crop arose from circumstances, wholly independent of the capacities of the soil; for some of these a perfect remedy or preventive has been discovered. In many cases the wheat crop failed from the severity of the drought. Other crops suffered severely. The potato crop was not even half a crop in any part of the State. In many cases the wheat crop failed from the attacks of the grain worm. For this we believe a perfect preventive is discovered. In some cases it suffered from the rust occasioned by the peculiar state of the weather, when the wheat was in a condition most susceptible to injury. Against this, of course, no human skill or sagacity could afford any protection. Separate from these cases, facts and experiments of the most decisive character have come to our knowledge which fully satisfy us, that with due care and by a proper and not a difficult mode of cultivation, which we shall hereafter fully detail, the wheat crop may be regarded as certain a crop as any grown in the State; and every farmer in the State

may calculate with as much confidence upon raising his wheat as his potatoes.

The wheat bounty of the last year has done an immense service in turning the public attention particularly to the cultivation of this important crop; in introducing into the State wheat seeds of various kinds and of the best description; in inducing the most exact observation in regard to the mode of culture, to the injuries to which the plant is liable, and the causes or occasions of its failure. We are satisfied farther that owing to these observations and inquiries and the general attention which the whole subject has received, the certainty of growing it here to advantage has been determined and the true method fully tested. All this we think is an immense gain to the State; very far more important than the numerical amount of bushels, which have been gathered. These are the effects of the small bounty given by the law of the last year. How far it may be desirable to continue this bounty for another year or years, we perhaps are in duty bound to submit entirely to those by whom the decision is to be made. At any rate we shall not now enter upon it; but have other views in regard to the legislative patronage of the agricultural interest, which we may suggest at a more convenient season.

H. C.

AGRICULTURAL MEETING.

The fourth Agricultural meeting was held at the Representatives Chamber on Thursday evening last. Hon. Mr. Thaxter of the Council being in the chair, in the necessary absence of Mr. Bates. The subject announced for the evening was that of Manures. The Commissioner of Agriculture submitted to the meeting two valuable communications—one from Dr. C. T. Jackson, the Geologist of Maine, on the subject of soils for wheat, the application of lime, and its effects upon the soil; and the other from I. Whipple, Esq. of Lovell, on the use of saltpetre, and the advantages, which, within his own experience, have resulted from it.

The intelligent and skilful editor of the Boston Cultivator, Wm. Buckminster, Esq. of Framingham, stated that in his opinion the experiments of Mr. Whipple in relation to saltpetre would have been much more satisfactory, if it had been applied by itself, and not in conjunction with other manure. This may be so; yet under the circumstances in which it was applied, and with the fact that the beneficial effects of this application were visible for six years after it was put on the land, the presumption in favor of its efficacy is certainly very strong. The value of saltpetre, however, as a most powerful manure is not now to be for the first time determined. We have many facts in this case directly to the point, but have not now room to enlarge on them.

Mr. Buckminster also controverted the doctrine of Dr. Jackson, that manures are sometimes lost by infiltration in the subsoil; but that their benefit was derived, to use his own expression, "from leeching up and not leeching down." These doctrines of Mr. Buckminster were ably opposed by Dr. Keep of Boston, who is well skilled in chemistry and geology, and came successfully to the defence of his absent friend Jackson. Dr. Keep is not ignorant of agricultural matters, having been brought up in that New England Eden, the alluvions of Connecticut river. Dr. Keep as an accomplished dentist among us, has long been distinguished for his skill in extracting roots of teeth; and in this case he showed himself quite competent to go to the root of other matters.

Other gentlemen took part in the discussion; and it is proposed to continue the subject at the next Farmer's Meeting on the ensuing Thursday at the same place at 7 o'clock. These conversations have proved highly interesting and must be useful. It is pleasant to see intelligent minds thus brought into collision, where there is no room nor occasion, even in the utterance of the most opposite opinions, for any ill language or ill-humor. Truth is the great and exclusive object of all minds, which have tasted the genuine spirit of philosophy; and in the collision of such minds the sparks which are elicited irradiate but do not burn where they chance to fall.

H. C.

MISCELLANEOUS.

The following piece of poetry, or parts of it, appeared in the N. E. Farmer a few weeks since. It has returned to us from the Hartford Commercial Courant very much improved, but by whom it does not say. We think it will be read with pleasure by every one.

THE FARMER.

Wake up my muse! wake up my soul!
Survey the globe from pole to pole,
To what employment shall I bow?
Pursue the arts or hold the plough?
Upon a just and strict attention,
The plough appears a high invention
The great Messiah, when he wrought,
Made yokes and ploughs as we are taught;
Mogul, renown'd of India's land,
First takes the plough into his hand,
His millions then in honor toil
To pulverize the fertile soil.
The fam'd Elisha you'll allow,
He drove the ox or held the plough,
The rugged earth he rent and tore,
With oxen numbered twenty four.
Immortal Job, more rich and grand
Than any in the eastern land,
He launched his plough, the earth gave way,
His thousand oxen rent the clay;
Of all pursuits by men invented,
The ploughman is the best contented;
Although his profits are not high,
Yet on his labors all rely;
Mechanics all by him are fed,
Of him the merchant seeks his bread;
His hands give food to every thing,
Up from the beggar to the king.
Our clothes from him must all arise,
To deck the pop or dress the wise.
We then by vote may justly state,
The ploughman ranks among the great;
More independent than them all,
Who dwell upon this earthly ball.
All hail ye farmers young and old!
Push on your ploughs with courage bold;
Your wealth arises from your clod,
Your independence from your God:
If then the plough supports the nation,
And men of every rank and station,
Let kings to farmers make their bow,
And never speak against the plough.

(From the Farmer's Cabinet.)

INDUSTRY, PROMPTNESS AND PUNCTUALITY CROWNED WITH SUCCESS.

Stephen Girard, the great merchant and banker, was also a great and successful farmer. He owned a farm of several hundred acres of land within a few miles of Philadelphia, the cultivation of which he superintended with his usual industry and acuteness. This farm was his principal hobby; for every day, at one o'clock precisely, his gig was waiting for him at his counting-house door, and as soon as the clock struck one he started for his farm in the Neck, not suffering any matter whatever to interfere with his daily visit. During the afternoon he gave his personal attention to the various agricultural affairs requiring it, plying his own hands to any and every kind of business that was in season. In the evening he returned to the city to

lodge, and the return of daylight, the next morning, would find him again engaged in the labors of his farm, which he would intermit so as to be in the city by nine o'clock to attend to his extensive and well managed commercial and banking concerns, and at one o'clock he was again on his way to his farm. He followed out this routine for twenty or thirty years, permitting no part of his business to suffer from neglect or want of attention. His farm presented a perfect model for imitation. His grain fields, grass ground, orchard, and garden exhibited the most luxuriant and perfect appearance, while his stock of every kind, and poultry in all their varieties, were the finest and most perfect that were to be found in the country.

A distinguished foreigner, then resident in this country, on a particular occasion, had some special financial business to transact with the great banker, and 12 o'clock was fixed upon for making his visit for that purpose, but he did not arrive till the clock had struck one, he was too late, the great banker was gone to his farm, and he followed after; on his arrival he was kindly and courteously received; he was waited on over the farm and through the barn-yard, but not a word could be extracted from Mr Girard on the subject of his mission. He could now think or talk of nothing but agriculture and rural affairs, and his friend had to return to the city and learn to be more punctual to his engagements in future.

On an occasion, many years since, the city authorities were making an improvement at Market street wharf, and there was a large quantity of rich earth that had been accumulating there for a long series of years, to be removed, and any person was permitted to haul away as much of it as he chose without charge. It was deemed a good compost or manure, and no person knew better the value of manure than the rich merchant; he soon had his team at work removing it to his farm; an acquaintance of his who saw him superintending his work, remonstrated with him on account of the avidity and industry with which he engaged in what his friend thought so small a concern; "Oh," says he, "Mr ———, I work today if I die tomorrow."

RULES OF THE GOSSIPING CLUB.—Any member of the society who shall be convicted of knowing more of his own business than another's, shall be expelled from the society without a hearing.

No member shall sit down to his own table, until he has ascertained to a certainty, what his neighbors within three doors of either side of his house, have to eat—whether they have paid for the same, and if not, if they expect to.

Every member who shall see two or three persons engaged in conversation, shall place himself between them until he has heard all they have to say, and report the same accordingly.

Every member who shall see a gentleman visiting a lady more than twice, shall circulate the news that they are going to be married; and said members are forthwith required to report all manner of things about the gentleman, to the lady, and ditto about the lady, to the gentleman. This will break up matches, and afford much good gossip.

The Pittsburg Navigation and Fire Insurance Company make a deduction of five per cent. on the premium of insurance on steamboats, on board of which no spirituous liquors are used.

FARM FOR SALE.

A Farm situated in the westerly part of Townsend, on the road leading from Townsend west village to Worcester. Said farm contains 110 acres of land divided into mowing and pasturing, and a large share of wood and timber; a one story house, with two front rooms, kitchen, buttery, and two led rooms well finished; parlor papered; wood house; well, under cover, forty feet high, and shed, a large sheep house, fifteen by thirty feet, a large cooper shop, and another which has been well finished, on the lower floor; a good aqueduct which comes into the barn yard, and a good orchard.

The subscriber will sell a part or all, and give possession this fall or winter, or next spring. Those who wish to buy will do well to call on the subscriber, who lives on the premises, and look for themselves. ASA H. ADAMS.
Nov. 29, 1833.

FOR SALE, A FIRST RATE FARM.

Well situated on the road leading from the Theological Seminary in Andover, to the old Boston road; lately owned by Peter F. Shed, and well known as the David Blunt Farm, containing 70 acres more or less. There is about 20 acres of good Woodland within sight of the house. The remainder of the farm is in good condition, and is generally considered, by those acquainted with it, to be "a garden spot." There are from 300 to 500 apple trees on the place, independently of other fruit trees of great value. The farm is well walled and watered, the buildings in first rate order, and there are upon it three wells of excellent, soft water. It is well situated for a gentleman wishing for a residence in the country, being retired from the immediate vicinity of the public Schools and the Theological Seminary—or for the farmer, who wishes to raise vegetables for market, the land being all good, and markets near. It lies about half a mile from the Ballard Vale Factory, one mile from the Rail Road depot, and nine miles from Lowell. There are upon the place about ten cords of manure.

The conditions of sale will be liberal, the owner being obliged on account of ill health, to go South.—For particulars, inquire of the subscriber, on the premises.
ANDREW B. STIMPSON.
4W

Andover, January 16, 1839.

FARM IN BROOKLINE.

For sale a farm situated in Brookline, about four miles from Boston, containing four acres of first rate Tillage Land, and thirty acres of Woodland and pasture—with a good House in complete repair; Barn, Chaise-house, Corn-barn, Shed, &c.

The Farm will be sold low, together with the Stock, Hay, Tools, &c. if applied for soon, at No. 30, North Market St. Boston, or Roxbury Street, near Boston line.
Dec. 26, 1833. JOHN HUNT.

TULIPS, RANUNCULUSES, PINKS AND VIOLAS.

S. WALKER, of Roxbury, offers for sale in beds, or in such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland, France and England, to which yearly additions have and will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superb Tulips, will do well to make a selection for themselves when the bulbs are in bloom, (about the 1st of June.) The prices will conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices, in the country where the bulbs were raised, and cheaper than the like quality can be imported.

Tulips in beds of from 30 to 100 rows, containing from 210 to 700 bulbs, or by the dozen, 100 or 1000.

Viola grandiflora—Pansy, or Heartscuse. Upwards of 2000 superb varieties will be exhibited and offered for sale, when the Tulips are in bloom.

Ranunculuses—five mixtures, at from \$2 to \$5 per 100.

Pinks—five named varieties, from 25 cents to \$1 each.
For particulars apply to S. WALKER, or to JOSEPH BRECK & CO.

VEGETABLE PHYSIOLOGY AND THE CULTURE OF FOREST TREES.

The following correspondence, which we have been permitted to publish, contains some interesting facts in relation to Vegetable Physiology and the culture of forest trees.

Hampden, Penobscot Co. Maine. }
May 14, 1838. }

GENERAL DEARBORN,

DEAR SIR—Having been much instructed by your letters on planting forest trees, recently published by a committee of the citizens of Bangor, who are at this moment, you know, all alive to the subject, it has occurred to me that I may venture without any especial introduction, to communicate to you the details of some very recent observations in relation to the form and growth of our forest trees, which I believe to be new, and possibly entitled to a more extended examination than may be had on this or any other single position, assured that, if nothing interesting shall be found in them, I may find an apology for the trouble of this letter in the motive which has induced it.

The fact that the trunks of our trees, especially the lower portions of them, are not cylindrical, but elliptical is, I suppose, familiar with every one in this timber growing, and timber cutting country.

But that these ellipses are *parallel with each other*, and that this form and this arrangement are not the consequences of accident, or of local and partial, but of causes constant and uniform in their operation, are truths, which, as far as I know, have thus far escaped the notice of horticulturists and others curious in these matters.

Measuring last week, a row of Elms planted in 1820, for the information of a friend in Bangor, I observed that the trunks were not only elliptical, or this I had frequently noticed, but that the ellipses were parallel, and that the course of the longest diameter was about 30° to 32° east of south and west of north, on the true meridian, and that the southeasterly curve was the *quickest* or more elongated than that on the opposite side.

As the form of these trees might possibly be affected by their too close, or crowded positions, in the row which is east and west, I proceeded to measure a large number of trees of various kinds, some of them standing in open ground, others in a thick grove, and others on the margin of the thick wood with open ground on one side only. In these various situations, the trees were taken promiscuously rejecting only such as were misshaped by accident. No difference material to the principle could be perceived, either in the form or in the direction of the ellipses.

It is important here to remark that the largest roots and most thrifty branches are evidently disposed with reference to the longest diameter of the ellipses—the strongest and most extended of these to the southeastward.

The form of the trunk, then, is very clearly referable to the disposition of the principal roots and branches and is a necessary consequence of the reciprocal action of these upon each other. But why this peculiar and uniform disposition of the roots and branches, is an enquiry not so readily answered. And should it be deemed worthy any farther pursuit, I beg that the following circumstances may be kept in view.

The line of the ellipses is nearly perpendicular to the line of the sea coast. It is also nearly in a line with our most violent southeasterly winds, and not many degrees from that of our northwesterly.

It is a very familiar fact that our rivers and water courses have a decided influence upon the trees in their vicinity, inducing an unusually abundant and vigorous vegetation on the water side. How far the humidity of the sea, combined with the general warmth of the morning sun, may influence one side of trees, at a distance of 20 or 30 miles, I will not undertake to conjecture, but while I do not presume to give any precise value to this circumstance, I think it worth keeping in view in any farther investigation, till farther observation shall determine.

That the strong winds alluded to, by constantly, or very frequently, agitating the tree and trying its strength, should induce corresponding efforts to resist their force and to extend its supports, enlarge its trunk in the line of assault, and lessen the volume of branches and foliage in the lateral directions, so as to present the least possible surface to the action of the assailant. All this is very intelligible because it is in accordance with the uniform operations of nature. But if this were the sole cause of the phenomena in question, it were difficult to understand why these arrangements should not conform more exactly with the almost uniform current of these winds. If however the causes suggested shall be found to unite their slightly varying forces to produce the effects, it will be seen that they respectively modify without overcoming each other. The direction of the ellipses, is in a line inclining from the perpendicular of the coast, towards the line of the S. E. and N. W. winds, but coincident with neither.

Most respectfully, Sir,

Your very obedient servant,
JEDEDIAH HERRICK.

This table shows the greatest, the least, and the average difference of diameter in the order expressed, the difference being a proportion of the longest diameter.

20 Elms,	1-5	1-28	1-11	of the longest diameter.
15 Oaks,	1-7	1-30	1-15	" " "
9 Firs,	1-6	1-46	1-25	" " "
4 Birches,	1-5	1-9	1-7	" " "
4 Baswood,	1-5	1-11	1-7	" " "
3 Beaches,	1-8	1-12	1-10	" " "
3 Hemlocks,	1-12	1-18	1-15	" " "

4 other Hemlocks were found to be nearly cylindrical.

Hawthorn Cottage, }
Roxbury, May 16, 1838. }

DEAR SIR—I am extremely obliged to you, for the very interesting facts, which you have so kindly communicated, in relation to the contour of the trunk and the extension of the branches and roots of forest trees. They were new to me, and I do not recollect to have seen any allusion, in the works on botany and vegetable physiology, to the elliptical form of the cross section of the main stem, which from the statement you have made, appears to be universally the case, and to have been long and generally known, to the "timber-cutting" citizens of Maine. The cause of that peculiarity seems, however, to be sufficiently apparent. You state, that the longest diameter of the ellipse is in a direction from north 30° to 32° west, to south 30° to 32° east; and that the branches and roots, as well as the elliptical section of the tree are elongated, in a southeasterly direction.

Now, it has been established, by experiment, that a south-easterly exposition is the most eligible for the fronts of green-houses, as that affords the best opportunity to the plants, for receiving the earliest morning rays of the sun, and for enjoying them for the longest period, and especially, at those seasons of the year, when their vivifying influence is most required and congenial. The line, therefore, which has been found preferable to all others for the facade of green-houses, or the direction of such walls, as are intended to favor the growth of fruits and other vegetables, is very nearly perpendicular to that, which nature, it seems, has so remarkably indicated, from the manner in which forest trees are disposed to extend their vegetation.

Every person who has resided in the country must have observed, that on the south-easterly slopes or sides of hills, embankments, ponds, rivers, streams, buildings, and close fences, vegetation commences sooner in the spring and is more actively kept up during the season, than in any of the other exposures.

But there is another cause, besides the more direct effect of the solar heat, which powerfully aids vegetation, in such positions,—the protection afforded by the various artificial and natural barriers that have been named, against the cold and blighting north west winds, which have such a deleterious effect on all kinds of plants, as well as rendering our winters so terrifically rigorous, our springs so backward, our autumns so premature, and so many days, of even our summers too cold for the complete fructification and maturity of nearly all the vegetable productions, which are objects of attention to the farmer and horticulturist. The vast regions of perpetual ice and snow, which extend from the pole towards the borders of the United States, with the mighty range of the Rocky mountains, towering into the heights of uninterrupted congelation, and the lateness of the period when the ice and snow disappear from the great lakes, and immense forests, reaching within even our own bounds, have a direct and powerful tendency to render the north-western wind, the most prevalent, at least, through-

out New England, and all the states and territories which extend westward, from the Hudson, to the base of the Rocky mountains; and which are so fatal to the hopes and labors of the cultivators of the soil. The latter therefore have endeavored to guard against their withering and destructive ravages, by structures of various kinds, as well as to invite the first beams of the sun, to smile upon their cherished families of the vegetable realm.

Have not the forest trees made a like effort and are not the results in harmony with these well-established principles? Vegetable physiology has made great progress within the last half century; and more recently, the laws by which it is regulated, have been clearly illustrated, by numerous experiments in England, France and Switzerland. A tree is now considered, by the most able and distinguished writers on this subject, either as an *aggregate* of as many *distinct plants*, as there are *buds* on its branches, or as *one being*, analogous to what is called, when speaking of animals, an *individual*; but in both cases, the mode of nutrition and increment is the same. The elementary substances being liquified are conveyed in the sap through the albumen, and exposed to the light, air and heat of the sun, on the upper surface of the leaf, where are exhaled those vapors and gases which are not conducive to the health, or support of the plant, and others elaborated, or inspired from the atmosphere indispensable to the formation of wood, bark, fruit, gums, rosins, oils, aromas and saccharine or other matter peculiar to the several species, which are transmitted by the returning circulation, that commences on the inferior side of the leaf, and descends in such a manner in the cortex, as to create through the medium of the cambium, all the ligneous and other parts and substances, which have been named.

As these vessels, which like the arteries and veins in animals, conduct the sap, from the spongioles of the roots to the highest leaf, and bark through the cortex, are separate and independent, for each bud, throughout the whole extent of the tree, as so many isolated plants, those which are most favorably situated for receiving the earliest and greatest portion of heat and light, will be the soonest in active operation, and continue to exercise their functions, for the longest time, during each day and from the dawn of spring, until the autumnal frosts terminate all vegetation in the foliage; consequently the roots and branches, as well as the side of the trunk, on which those vessels are arranged, will increase faster and for a longer period, and thus produce results, which you have actually verified. Besides the trunk of the tree is, itself, a thick and impervious wall to protect the sap vessels and other parts of vegetation, of each bud belonging to the south eastern side of the tree from the blasting winds of the north west,—while it is also a vast combination of delicate pipes which are constantly conducting heat from the earth—that grand and inexhaustible reservoir of caloric, and distributing it throughout the whole mass, and to the end of the minutest twig, whenever the temperature of external air is below that of the earth, or the surface of the latter is frozen, but not so deep, as to reach the extremities of all the roots.

The theory I have attempted to establish has been based on the facts presented in your letter, and the practical operations of the cultivators of the earth, as well as the accredited principles of vegetable physiology, the known effects of heat, light and air on plants, the characteristics of our climate

and the general laws of nature in all her wonderful works; but whether it affords a satisfactory explanation of the phenomenon, which you have been the first to announce, I am not sufficiently confident to affirm; and have presented it, rather with the hope, that others, more competent, may be induced to make greater researches, and give the subject that thorough examination which it so eminently merits.

I am ever highly gratified in becoming acquainted with those, who have a love for trees and a taste for their cultivation; it is therefore pleasing to have commenced a correspondence, on a subject of such congenial interest.

In a country so eminently favored as this, by the vast number of the beautiful and magnificent varieties of trees which embellish our forests, compared with those which are indigenous to Europe, it is not a little surprising, that a deeper interest has not been developed, for rendering them tributary to the health, comfort and pleasure of the people, by considering them as indispensable to the completeness of a country residence and the public edifices, squares, grounds and highways, as are any of the appendages, which are deemed useful, ornamental or agreeable in either.

It is time that some portion of the population should begin to plant, and foster trees, and not all continue united with those, who are for the indiscriminate destruction of our superb native groves. When I resided on the banks of the Kennebeck river, as a boy, the county of Kennebeck was as much a wilderness and lumbering region, as any on the waters of the Penobscot river; but so reckless and wide spreading has been the devastation of every variety of tree, and in which work of repentance, the farmers have been so actively conspicuous, that many of them are now obliged to go many miles for their fuel, and pay a high price for it. These lessons of sad experience should not be neglected; and the gentlemen of Bangor, who have with such commendable zeal, formed an association for ornamenting that young and thrifty city, with trees, appear determined to leave honorable memorials, that they have not been either heedless of the errors of the past generations, negligent of the interests of the present, or indifferent to those of the future.

Such demonstrations of an enlightened and munificent public spirit are worthy of all praise; and may their meritorious example induce the citizens of all our towns, to exclaim, with the determined energy of the venerable Evelyn, "LET US ALSO RISE UP AND PLANT." With great esteem,
Your most obedient servant.

J. HERRICK, Esq.

H. A. S. DEARBORN.

(From the Farmer's Cabinet.)

POULTRY.

The rearing of poultry produces much profit on a small investment.

Those who increased their stock of poultry during the last year, have been reaping a rich reward in return for their increased attention to this interesting branch of domestic economy. It has brought a very generous price, and eggs have not been less liberally paid for. Many chubby boys and rosy checked girls have often had their heart made glad, when "father" has returned from market, and announced the grand price for which he sold the turkeys, the ducks, the chickens and the eggs; for there is in many farmers' families a perquisite arising from sales of this description of stock, which ensures to the younger branches of the family as a

reward for their ingenuity, care and industry, in attending to the rearing and protecting the poultry, and an encouragement to future good conduct and obedience.

The multitude of grass-hoppers which inundated the country last summer, with myriads of other insects, furnished an abundant supply of meat for the fowls without apparently reducing the supply of it, and there was but little necessity for giving them other descriptions of food during the season.

The farmer who regularly attends market, sold during the last year poultry and eggs to the amount of about one hundred and fifty dollars, and the expense incurred in their production was so small as scarcely to be appreciable; this should encourage others to do likewise, and they will have their reward proportionate to their works.

Guinea fowls make an agreeable variety in a poultry yard, and they furnish more eggs than common hens; they sell well in market without being picked, and their vigilance in guarding against danger, and the great alarm they sound when it approaches, so terrifies the hawk, that he rarely ventures to pounce on a chicken when guinea fowls are in the vicinity. Some people rear and keep them on purpose to guard the poultry from the depredations of their enemies, and it is thought they find their interest promoted by it. Rome was once preserved, it is said, by the noise made by geese producing an alarm amongst the inhabitants in time to preserve them from their enemies, who were approaching. The writer of this recollects a case that occurred many years since of a barn being preserved from being fired by an incendiary, by a flock of geese, which were aroused from their slumbers by him as he was about to execute his vile purpose: this was afterwards testified to by an accomplice in the intended mischief. I state these facts in order to let young people know that geese have been of some use in the world besides furnishing us with good feather beds, and quills to make pens.

Those who design to profit by rearing poultry the approaching season, should give attention to it early in the spring and follow it up with vigilance and care until the young ones are well feathered, when they will require but little attention. There should be always a shelter provided for fowls whether they be old or young, and those farmers who are destitute of proper winter quarters for their poultry should not let another season pass by without making suitable provision to protect them from the inclemency of the weather; for with proper winter protection eggs would be abundant all the year, and what pays a better profit than eggs?

OVA.

(From the Review of "Loudon's Arboretum, in the Loudon Quarterly.")

By the far greater part of Mr Loudon's work consists of what may be called a descriptive catalogue of all the trees and shrubs which will grow in the open air in Britain, illustrated by engravings on wood. This catalogue is arranged according to the natural system, beginning with the *Clematis*, and other ligneous plants of the order *Ranunculaceae*, and taking in succession all the other orders which contain either trees or shrubs. According to this arrangement, one of the first trees described is the *Evergreen Magnolia*, so well known for the splendor and fragrance of its blossoms. This fine tree appears to have been first brought to Europe, from the banks of the Mississippi, in 1732, by a French officer of marines, who planted it in his native place, Maillardiere, about four miles from Nantes,

Here the *Magnolia* grew and flourished; but its introducer having died, little notice was taken of it, and when observed, it was supposed to be only some variety of the common *Laurel*, which it resembled in its leaves. Thirty years afterwards it flowered, and was then discovered by M. Bonami, professor of Botany at Nantes, to be the *Magnolia Grandiflora* of Linnæus. At a meeting of the states of Bretagne, held at Nantes in September, 1760, M. Bonami presented a branch of this *Magnolia* in flower to the Princess de Rohan Chabot, —and it excited so much admiration that its fame shortly after reached the ears of Louis XV. The monarch was then ornamenting his garden at the Petit Trianon, and had there some small plants of the *Magnolia Grandiflora*, which had in the mean time been re-introduced into Europe by one of the English collectors; and when Louis heard that he had in his own dominions a tree of this rare exotic 40 feet high, which was covered with blossoms every year, he sent two of his gardeners to examine it, with orders to transport it to Versailles, if they could ensure its living. This *it* was a formidable obstacle; and the gardeners reporting that they feared it would not survive its removal, it was suffered to remain at Mailladiere. Thirty years more brought the Revolution, and amidst the general destruction even the poor *Magnolia* did not escape; it was mutilated in the war of La Vendee, and its branches cut for fire-wood; the house near which it stood was afterwards burnt down, and the magnolia was scorched and withered by the flames. It partially recovered, and still survives, though now only the wreck of what it was.

In this manner Mr Loudon proceeds to mingle anecdotes of celebrated trees with his descriptions of the genera to which they belong; and there is scarcely a genus from which a similar extract might not be made.

In his chapter on the *Lime-tree*, Mr Loudon mentions one at Knowle, which covers nearly a quarter of an acre. The vast lower branches have rested their extremities on the soil, rooted into it, and sent up a circle of young trees, surrounding the parent. The outer branches of these in their turn stretch out, rest upon the ground, and take root, forming a second circle of trees, from 30 to 40 feet high, and their outer branches again are beginning to dispose themselves so as to form a third circle. This very remarkable tree stands on a lawn in an ancient geometrical garden, and must be at least two centuries old;—the soil is a deep sandy loam. The largest *Lime-Tree* in England is that in Moor Park, Hertfordshire, now the property of the Marquis of Westminster: it is 100 feet high, with a head 122 feet in diameter, divided into nineteen immense limbs. There are many very curious *Lime-Trees* on the continent, one of which, at Neustadt on the Rhine, has a trunk 54 feet in girth with several enormous branches, which are supported on 108 pillars. In the centre of the tree is a kind of summer-house, which is reached by a flight of steps. In the hollow of the branches earth has been placed, and gooseberry bushes have been planted, the fruit of which is sold to visitors.

When speaking of the different kinds of willows, Mr Loudon gives the history of the *Weeping willow*, which was first known in Europe, by its being introduced in "A View of the Village of Tonnau, drawn by John Nicohoff, July 3, 1655, on his way to Pekin, with the embassy which the Dutch sent to the Emperor of China in that year." Pope is generally said to have first introduced the weeping

willow into England; but this, Mr Loudon informs us, cannot be strictly correct, as it is included in a catalogue of British trees, published in 1692. The story respecting Pope is, that he, "happening to be with Lady Suffolk, when that lady received a present from Spain, or, according to some, from Turkey, observed that some of the pieces of witly bound round it appeared as though they would vegetate; and taking them up, said, 'Perhaps these may produce something that we have not in England.' Whereupon, he planted one of them in his garden at Twickenham. Which became the weeping willow there, afterwards so celebrated."

Napoleon's willow is a variety of the common *Weeping Willow*. It appears that the willow is not indigenous to St. Helena; but that, when General Beaton was Governor in that island, he introduced it among a great number of other trees and shrubs from England.

"He had the greatest difficulty in preserving his plantations from the numerous goats which abounded in the island; yet several of the trees survived, and attained a timber-like size. Among these was the tree of *Salix Babylonica*, which has since been called Napoleon's Willow. This tree grew among other trees, on the side of a valley near a spring; and, having attracted the notice of Napoleon, he had a seat placed under it, and used to go and sit there very frequently, and have water brought to him from the adjoining fountain. About the time of Napoleon's death, in 1821, a storm it is said, shattered the willow in pieces; and, after the interment of the emperor, Madame Bertrand planted several cuttings of this tree on the outside of the railing which surrounds his grave; and placed within it, on the stone, several flower pots, with hearts-ease and forget-me-not. In 1828, we are informed, these willows were found in a dying state, and twentyeight young ones were, in consequence, placed near the tomb, which was at that time surrounded with a profusion of scarlet-blossomed Pelargeniums. A correspondent, who was at St. Helena in 1834, says one of the willows was then in a flourishing condition; but another, who was there in 1835, describes it as fast going to decay, owing to the number of pieces carried away by visitors. In what year a cutting of this willow was brought to England for the first time, we have not been able to ascertain; but it appears probable that it may have been in the year 1823, and that one of the oldest plants is that in the gardens of the Roebuck tavern on Richmond Hill, which as it appears by a white marble tablet affixed to it, was taken from the tree in that year. Since that period it has become fashionable to possess a plant of the true Napoleon's Willow; and, in consequence, a great many cuttings have been imported, and a number of plants sold by the London nurserymen."

The famous tree near Lichfield, long known as "Johnson's Willow" (*Salix Russelliana* Smith), is generally supposed to have been planted by Dr Johnson; but in fact the tree had attained a large size when the Doctor was a young man. He tells us himself that "it was the delight of his early and waning life," and he never failed to visit it whenever he went to Lichfield. The tree was measured by the Doctor's desire in 1781, when it was supposed to be nearly a century old, and the circumference of its branches was upwards of 200 feet. It stood near the foot path between the city and Stow Hill, the residence of "Molly Ashton;" and we well remember its venerable appearance.

Of the Oak, its uses and value.—"Any Oak in

a good soil and situation," says South a practical planter, "will in seventyfive years from the acorn contain a ton of timber, or a load and a half of square timber. The same Oak at one hundred and fifty years of age will contain about eight tons of timber, or twelve loads of square timber." By the report of the Commissioners of Land Revenue respecting Timber, printed by order of the House of Commons, it appears that a 74 gun ship contains about 2,000 tons, which, at the rate of a load and a half to a ton, would give 3,000 loads of timber; and would consequently require 2,000 trees of seventyfive years' growth, or 250 of one hundred and fifty years' growth. It has also been calculated that, as not more than forty Oaks, containing a load and a half of timber in each can stand upon an acre, fifty acres are required to produce the Oaks necessary for every 74 gun ship. In plantations made for profit, few Oaks are allowed to stand more than from seventyfive to one hundred, or at most one hundred and fifty years, and the above are the average dimensions of Oaks at the first and last of these ages; the first being, as we have already observed, that at which Oak trees are usually cut for ship-building. Instances are, indeed, on record, of remarkable Oaks producing from thirty to forty, and sometimes even fifty tons of timber each; but these trees must have been the growth of centuries. In the mansion at Tredegar Park, Monmouthshire, there is said to be a room fortytwo feet long and twentyseven feet broad, the floor and wainscot of which were the produce of a single Oak tree grown on the estate.

The oldest oak in England is supposed to be the Parliament Oak, (so called from the tradition of Edward I. holding a Parliament under its branches,) in Clipstone Park, belonging to the Duke of Portland; this park being almost the most ancient in the island. It was a park before the conquest, and seized as such by the conqueror. The tree is supposed to be 1500 years old. The tallest oak in England was the property of the same nobleman—it was called *Duke's Walking Stick*—higher than Westminster Abbey—and stood till of late years. The largest oak in England is the Calthorpe Oak, Yorkshire; it measures seventyeight feet in circumference, where the trunk meets the ground. The *Three Shire Oak* at Worksop, was so called from covering parts of Yorkshire, Nottingham, and Derby: it had the greatest expanse of any recorded in this island, dropping over 777 square yards. The most productive oak was that of Gelonos, in Monmouthshire, felled in 1810. Its bark brought 200*l.* and its timber 670*l.*

Massachusetts Horticultural Society.

Saturday, Feb. 16, 1839.

EXHIBITION OF FRUITS.

B. W. Froesch, Esq. exhibited the following apples; American Nonsuch, Ortley, and Newtown Pippin.

Samuel Downer, Esq. exhibited beautiful specimens of the Baldwin and Newtown Pippin Apples. Samuel Walker, Esq., exhibited the American Nonsuch Apples.

Enoch Bartlett, Esq., exhibited the Winter Pearmain, and Rhode Island Greening Apples.

Mr Manning exhibited the yellow Bellflower, and Woolman's Long Pippin Cox No. 124.

Mr George Newhall again exhibited a basket of Isabella Grapes, in fine order. We are informed by this gentleman that he preserves them in good condition during the winter, by packing them in cotton, in jars closely covered.

For the Committee. ROBERT MANNING.

(From the Genesee Farmer.)

DICTIONARY OF TERMS USED IN AGRICULTURE,

AND IN THE SCIENCES MOST INTIMATELY CONNECTED WITH ITS ADVANCEMENT.

(Continued.)

Aquatic. Plants that live and flourish in the water are termed aquatic. There are also aquatic animals and birds. All our lakes, rivers and the ocean, furnish specimens of aquatic plants, some of which are of great use and value. A large part of the soda of commerce is obtained from a sea weed, which, drifted ashore, is dried and burned for the soda of the ashes. Hundreds of square miles in the equatorial Atlantic, at some seasons of the year, are covered with this marine vegetation. Some sea weeds, as the alga, that grow as they float in the water, attain a length of several hundred feet. The rice plant of the East Indies and the Carolinas, is an aquatic plant, and probably contributes as much to human subsistence as any plant on the globe. The wild rice, *Zizania aquatica*, of our northern lakes and rivers, is of great service to the native tribes of those regions, feeding the immense quantities of water fowls of all kinds that visit and breed in those inhospitable climes, as well as furnishing food to the natives themselves when their usual supplies from other sources fail them. The flags, rushes, and other grasses that grow in the waters of the lakes, or other quiet waters, the pond lily, &c. are further examples of aquatic plants.

Argillaceous. A term applied to soils in which clay forms a principal ingredient. It was derived from *argil* or clayey, as aluminous from alumine. In agriculture, argillaceous and aluminous are words of the same import, and mean soils or earth in which clay predominates. "Analysis" shows how the proportion can be determined.

Artesian. A kind of well made by boring through the successive strata of the earth until water is found. This name is derived from Artois in France, where the system of boring was first successfully adopted. By penetrating the rocky crust of earth in this way, the water frequently rises to the surface, and flows a living stream; in other cases it rises so as to be obtained without difficulty. In this country wells have been bored to the depth of a thousand feet, and those of 500 or 760 are not uncommon. Various products are obtained from the earth in this way. In Albany a valuable mineral spring has been reached by boring. The great quantities of water at the Kenhwa salines are obtained from Artesian wells. Springs of carbonated hydrogen, that burn with a perpetual flame; and immense reservoirs of petroleum, (the Seneca oil of commerce) have been discovered while boring for salt or for fresh water. Artesian wells have been sunk in the deserts between Cairo and Suez, and abundant supplies of water obtained; and wherever the borings have been properly and perseveringly conducted, either in this or foreign countries, water has usually been procured.

Artichoke. Two plants of this name are cultivated for food; the first *Cynara scolymus*, is chiefly cultivated in Europe for culinary purposes. The part that is eaten is the receptacle of the flower, divested of the unopened florets, and the bristles that separate them. The head thus prepared is boiled plain and eaten with melted butter and pepper, and is deemed wholesome and nutritious.

These *bottoms*, as they are termed, are also made into a variety of dishes, stewed and highly seasoned. The other plant, is the one known as the Jerusalem artichoke, *Helianthus tuberosus*, and is cultivated for the root alone. It is a species of sunflower, grows wild in several parts of South America, and the root is potato shaped. The roots are valuable as a food for animals, and are not unpalatable to man. They are found in most of our gardens, an improper place for them, as they are apt to spread, and are somewhat difficult to eradicate. In this country few attempts have been made at their field culture, but those have been profitable. In highly cultivated grounds in England and Holland, they have been found extremely productive, 70 or 80 tons of the roots having been gathered from a single acre. Their flavor is much like that of the former artichoke, when boiled and prepared for the table, and they are very valuable for feeding hogs and store pigs.

(To be continued.)

(From the Farmer's Cabinet.)

PLANTING TREES.

Those who won't dig must beg, and those who won't plant should not be permitted to partake of the fruits of other men's planting.

All of us have partaken of the fruits of the labors of those who have preceded us, and we are all under obligations to render some service to those who may succeed us.

The labor and expense of planting and rearing a few fruit and ornamental trees, and shrubs, is so trifling, that no one would suppose that the most indolent and penurious person in the community could be deterred by it from procuring and setting out a dozen or more the ensuing spring.

There is a pleasure and satisfaction connected with the performance of such a duty as this, which furnishes an ample compensation for the expenditure of muscle and money, independent of any benefit to be hereafter derived from it.

No person, it is believed, ever planted a fruit tree, or grape-vine, without feeling a secret consciousness that he had rendered a service of an important character either to his own family, or to others that might come after him.

It is the peculiar characteristic of the truly pious and good, to take pleasure in promoting and increasing the comfort, the happiness and the interests of their fellow men.

"There is no part of husbandry which is more commonly neglected than that of planting trees, without which they can neither expect fruit, ornament or delight from their labors. But they seldom do this till they begin to grow wise, that is, till they begin to grow old, and find by experience the prudence and necessity of it. When Ulysses, after a ten years absence, was returned from Troy, and found his aged father in the field planting trees, he asked him, 'Why, being now so far advanced in years, he would put himself to the fatigue and labor of planting that, of which he was never likely to enjoy the fruit.' The good old man, taking him for a stranger, gently replied, 'I plant against my son Ulysses comes home.' The application is obvious, and instructive both to young and old."

Determine now without delay the trees and shrubs you will set out in the spring, ascertain where the best and handsomest can be obtained, and suffer no ordinary circumstances to prevent you from executing so important a determination,

as that of doing some good in the world before you are called upon to give up your stewardship, which may possibly be before another annual period for planting trees comes round.

Let parents encourage their children, and children plead with their parents, to progress with the good work of planting fruit and ornamental trees, shrubs and vines, as soon as the spring opens; and then our farms and farm houses will soon exchange that dull, comfortless aspect, which is so obvious in many places, for a more cheering and exhilarating exhibition of the fruits of industry, care and good taste, and travellers as they pass by will enquire,

Who dwells in this delightful place
Distinguished for its perfect grace?

R.

(From the Albany Cultivator.)

CUTTING CORN STALK FODDER — THE GRUB WORM — DOCTORING FRUIT TREES — ROOT CULTURE.

Williamstown, Mass. Dec. 20th, 1838.

HON. J. BUEL—Dear Sir—I have not the happiness either to bear the honorable title, or to share the enviable labors, of the *professional farmer*; yet having been accustomed in early life to the occupations of the field, for which I still retain a relish, and having made it for several years my relaxation to supervise the general conduct of a little farm, whose details are carried out by proxy, my sympathies are in a measure with the cultivators of the soil, and I feel a sufficient degree of interest in whatever pertains to the *improvement* of any branch of the great agricultural economy. That material advances have been made within the last few years in this most ancient and important of all the arts, I think, admits not of a doubt; and that the most considerable agent in effecting such a change, has been the prevalence of *mutual information* during this period, I hold to be alike unquestionable.

Entertaining opinions like these, it will not be thought strange if I feel an inclination to contribute my "*mite*," (if indeed I turn not out to be more *miteless* than the "*widow*,") towards the still further promotion of what has been by some denominated "*book-farming*." It is in compliance with such an inclination that I submit to your inspection the following items, the "*raw material*" of which I find in my "*Farmers' Journal*," If you deem them of consequence enough to merit a place in your columns, please to present them to your readers; and otherwise, give them a place among such other "*crumbs*" (unfit for "*the dogs*,") as you cast under your table, and pardon me for inflicting upon you the misery of giving them a bootless perusal.

Item First—Cutting Corn Fodder for Cattle. Having occasion, about the middle of November, 1836, to pass through your city, and stopping for an hour at Bement's Hotel, I had an accidental opportunity of witnessing the operation of a "*Green's Straw Cutter*;" and so well was I pleased at first sight with its execution, that I proceeded immediately to Thorburn's and made a purchase. Feeling a *little bit streaked*, as "*Slickville*" would say, after getting it home, lest some of the more "*knowing ones*" among my neighbors, should take it into their "*bump of self-esteem*" to underrate my wisdom in parting with thirty round dollars for a little machine," which Sampson would have pocketed just in the way we common folks do a jack-knife, I made some haste to get it into effective operation, working up hay and straw for my horses, and stalks

for my cattle. Of this latter article, I had on hand the produce of some 4 1-2 acres, heavy growth, and I directed my man to prepare of it daily a quantity sufficient for the *keep* (your pardon Dr Webster,) of five cows; which quantity proved not to vary much from ten bushels, and occupied in the preparation from one to one and a half hours per day. On this allowance, with pretty uniformly a little oat straw in the yard at noon, my cows were kept until some time in April, when the supply was exhausted. I never wish to have my cows winter better. Of the fodder thus prepared, (cut simply, and neither brined, salted nor steamed,) and fed to them in mangers in their stalls, they consumed by measure, five parts out of six; the rejected portion consisting entirely of the largest *buts*. These were thrown daily into the yard, as refuse, a measure to be placed entirely to the score of mismanagement, for had they been left in the mangers, and the allowance shortened a little, I am since convinced, they would have totally disappeared.

At one and a half hours per day, for four months the time consumed in preparing the fodder amounts to seven and a half days; which at four shillings per day, will make the *expense of cutting* \$5. The *savings in the fodder* cannot be fairly estimated at less than one-third of the whole, or the entire keeping of 12-3 cows (so "Colburn" cuts up cattle,) for four months. This being equal to the keeping of one cow for 6-2-3 months may be quickly set down at the current value of two tons of good hay, say \$20. Clear profit, \$15. But this is not all. The *improvement of the manure*, consequent on this mode of feeding the stalks, instead of casting them whole into the yard after the common practice, is of itself almost an equivalent for all the extra expense.

The 1st of December, 1837, I commenced in the same way, on the produce of four acres, (very heavy growth of the large Dutton,) except that I fed it to 20 two year olds. These had previously eaten no hay, and I instructed my man to keep them rather close for the first few days, in order to induce them to clear their mangers. In this I succeeded so completely, that at the end of feeding the stalks, I could say without hesitation, I did not believe, that of the whole supply, a *pound to the ton* had been wasted by *rejection*. From beginning to end, a single shovel full of leavings had not been removed from the mangers, and at the end, a shovel full could not have been obtained from them. These cattle were also allowed a little straw once a day in the yard. A short time previous to their commencing on the stalks, they were purchased in the neighborhood, at \$17 1-2 per head. When they had finished them, some two months after, I could have readily sold the whole of them at \$25 per head. Advance on their aggregate value, \$150. I have not yet been laughed at for purchasing the Straw Cutter; and should I, by any accident, be deprived of the one I now have, I would run the risk of being laughed at, and pay \$100 for another, could I not obtain it cheaper. I understand, however, that the price of the article is getting reduced, in which I very much rejoice, as I should like to see it introduced generally.

I should have remarked before, that my stalks are uniformly cut at the ground, which practice of course I fully approve. The largest bnts are cut without difficulty, and in no way injure the knives of the cutter. These I have hitherto been under the necessity of sharpening no oftener than once in twelve months, though the amount of work done by them, in hay, straw and stalks, has amounted to not

less than from ten to fifteen or twenty tons per year. To facilitate the operations of the machine, I annex to it a *false apron* for the purpose of receiving the stalks, the *true* one being of insufficient dimensions, and occasionally *clear the spaces between the knives*, with an instrument kept at hand for this purpose.

Perhaps, from what has been advanced above, I may be thought by some to have a *strong motive* for recommending "Green's Straw Cutter." I certainly have, sir; and an equally strong one for speaking in favor of any other cutter that will do the same execution, and consequently afford the same profit to the owner. The only inducement I have to say a word in favor of any machine of the kind, is to be found alone in the results of the above detailed experiments.

Item Second—A great Enemy to Corn, as many a desolated field of the last season can bear me witness, is the cut worm, or black grub. To prevent the depredations of this unwelcome visiter last spring, I caused each hill of my corn, immediately after planting, to receive a common handful of good live *ashes*, and another immediately after weeding. This proved however to present no obstacle to the progress of the enemy, and I soon discovered that my whole field was more than decimated, and the work of destruction advancing briskly. I therefore ordered my men, as a last resort to "prepare for war"—to "sharpen their finger ends," and set at once about exulting the marauders. For several days it seemed as if "a whole procession came to each one's funeral," but at length victory wreathed the brow of perseverance; and the precaution having been taken to replace each foe dislodged with a suitable quantity of good seed corn, I soon had the pleasure to see my field restored, in a good measure, to its original order and beauty, there being seldom a vacancy in a piece of four acres. The latest planted came to maturity, (the white flint being the variety used for replanting,) and the produce of the field was estimated at 45 bushels to the acre. Had I not pursued the course above indicated, I am confident that the average of the crop would not have exceeded 30 bushels to the acre. By the process of "grubbing," then, I secured an increase, in the produce of the four acres, of 60 bushels of good sound corn. The time consumed in the operation was probably equal to about eight days. Eight times five Yankee shillings is \$6, 67. Sixty bushels of corn at ninety cents per bushel, is \$54. Difference, \$47, 33. From this deduct the further expenses of harvesting, &c. &c. (not forgetting, however, that the stalks are worth something,) and there will still be left a remainder well worth pocketing by any small farmer. I would therefore recommend it to "the profession," whenever annoyed by the above mentioned enemy, to "go and do likewise."

Item Third—"Doctoring" Fruit Trees. Very often does it happen that a valuable young fruit tree is sacrificed for want of a little "doctoring." Some time in the latter part of June last, a street-running cow, through the inadvertency of a lad on the premises, gained admission, just at evening, into my fruit-yard. Attracted by the appearance of a fine Bolner plum tree, five years from the nursery, full of luxuriant foliage and young wood, and richly laden with its first offering of fruit, she made a rude attack upon it, broke it down to the ground, and before the mischief "got wind," succeeded in stripping it entirely of its young wood, one of its largest branches, and nearly all of its fruit. My

vexation on discovering the accident was extreme. It was a favorite tree, and I had watched over its growth for years, with an unusual interest: it had now come forward into full bearing, and already had my "mouth watered" in anticipation of its exquisite fruit. But there lay my "castle," in pitiful ruins. I had no hope whatever of repairing the misfortune. So with a length of visage that bore no mean comparison with that of the luckless cow, I turned me away to comfort myself as well as I could with that wonderful nostrum "What cannot be cured, must still be endured." By the next morning, however, I had made up my mind to *attempt a cure*. "There is nothing like trying." I accordingly commenced by examining the wound. The tree was broken quite down, about two inches from the ground, and all that held the root and stock (or "soul and body") together, was a thin slip of wood, not larger, to speak safely, than my smallest finger; and even from this, the *bark* was severed for nearly three inches. A pretty bad patient, surely; however, I proceeded, raised it up to a little more than a perpendicular position, and confined it firmly in different directions, by several thongs, made fast to stakes which I had driven for the purpose. By placing the tree in this position, I brought the bark into the closest possible contact with the slip from which it had been dissevered; and by confining it thus in different directions, prevented the winds from racking and twisting it, and frustrating my intention of reuniting the parts. I next proceeded to lay over the entire fracture a thorough coating of grafting wax, to exclude the *air*, and finished the operation by raising a cone of fresh clay loam, to the height of eighteen inches about the stock, to avert the influence of the *sun*, not only from the wax, but also from that part of the stock contiguous to the wound. To my surprise, I discovered within a week, that it was putting forth fresh leaves and new wood. This it continued to do, and even to *ripen a number of plums*, which I had left upon its mutilated branches. At length by the middle of October, I had the pleasure to see its new wood pushed, in numerous instances, to the length of six or eight inches, and to *taste of its fruit completely matured*. Having taken the further precaution to give it another good dressing of loam, I am now fully confident that it will outlive the winter, and another spring "go on its way rejoicing."

Item Fourth—A peep at Root Culture. On the 18th day of October last, I took from 108 feet of ground, in my garden, 7 1-2 bushels, large measure, of mangold wurtzel, being at the rate of 3,025 bushels to the acre; and from 90 feet, four bushels of carrots, being at the rate of 1,936 bushels to the acre. This teaches me what I, J, K, or any body else, *might do* on a larger scale. Respectfully,

ASAHEL FOOTE.

CONSIDERATE HUMANITY. It is stated in the Baltimore Sun that the late Isaac McKim, has made provision for the continuance of his copper mill and his shipping interest to a certain remote period, which will enable many an honest man in his employ, to be continued in his honest labor without being thrown on the world at a moment's notice.

A farmer in the northern part of Scotland some forty years ago, when turnip culture was beginning to creep into the country, sowed a head ridge for the use of the public; and put up a label with this inscription.—"You are requested to steal out of this spot!"—*Quarterly Journal of Agriculture*.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, FEBRUARY 27, 1839.

AGRICULTURAL MEETING.

The fifth agricultural meeting was holden on Thursday evening last, and was as well attended as any former one, showing an undiminished interest in agricultural inquiry and improvement. The Hon. Mr. Thaxter of the Council was in the chair.

The subject previously announced for discussion was MANURES, but as a gentleman from the interior, not a member of the Legislature as has been stated, but a mere visitor to the city, was present and would not be present at the succeeding meeting, it was deemed best, with the consent of the meeting to suspend the subject of manures and take up the subject of silk, with which the gentleman referred to, Mr. Smith of Amherst, was perhaps as practically familiar as any farmer in the state. Much interesting information was expected from him and the meeting were not disappointed. In a sensible, intelligent and plain manner he detailed fully his own experience in the culture of silk, gave his views of the probable future progress, success, and profits of the business; and replied to various inquiries, which several gentlemen saw fit to propose to him. He was followed by the Rev. Mr. Field of Charlemont, a member of the house, who at the request of the chair, obliged the meeting by a detail of his notions and experience.

Mr. Smith began the business of the silk culture in 1831 and then purchased one ounce of mulberry seed. He has used seven or eight different varieties of worms and has fed from most of the different kinds of trees.

He expressed a diffidence in giving his opinion of the different sorts of mulberry; but it was quite apparent that he thought the *morus multicaulis* unsuited to our climate; and preferred to all others the Canton, the seeds of which he procured from Dr. Stebbins of Northampton, who obtained them through the missionaries, who had penetrated into the hilly country of Pekin where they procured this seed. This tree is easily propagated by cuttings; its foliage is large and substantial; and it has suffered very little from the winter. The white mulberry will make as good silk as any feed which can be given to the worms; and the only objection is the smallness of the leaves and the consequent increased labor in collecting them. To the question whether he could collect more weight of foliage from the *morus multicaulis* than from other trees, he replied that he could collect 30 lbs from the *morus multicaulis* or the Canton, when he could get only 10 lbs from the white mulberry. He was not familiar with the Broussa which he deemed only a variety of the white mulberry, of much value though its leaves were comparatively small, and it could be propagated only from seed. He pronounced the Alpine a highly valuable tree; but he stated that it was the result merely of a selection of the best plants for size and beauty of foliage from great numbers raised from the Canton or Asiatic seed, and that the name of Alpine is wholly an arbitrary designation of the best plants and not the designation of any new kind. He considers the *morus multicaulis* as furnishing from its very rapid growth in our latitude a leaf which contains too much water, and was liable to produce disease in the worms. He says his own experience and observation have taught him that the worm requires a difference in the nature of its feed according to its age. At its first coming out it needs a very tender leaf; and as it advances it requires a leaf much more substantial; that in short its appetite and wants corres-

pond to the progress of vegetation in the tree, the leaves at first being tender and acquiring in their progress to maturity more and more substance. He purchased at one time the *morus multicaulis* plants to the amount of 475 dollars, but they would not answer his purposes. They could not be left out in the ground in winter and he had lost many of them in the cellar. He prefers to set his trees in hedge rows or clumps, keeping them low and not suffer them to become standard trees. He thinks the best mode of gathering the leaves of the white mulberry is to cut the tops and then pick off the leaves; but there is danger of destroying the young worms if too much foliage was laid upon them. He considers it an easy and interesting labor for females and young persons.

The silk worm has five ages and periods of moulting; after the last moulting the worm requires 4-5ths of his whole feed. When begun to be fed he should be fed with the young leaf. Every day's hatching is to be kept by itself, and the worms are not to be fed on the fourth day of their lives. He thinks that there is no injury accruing from giving his worms wet leaves. They must not be fed with leaves that have been heated, but he deems it oftentimes of use to give the worms wet leaves and with that view very often sprinkles his leaves with a pailful of water to 100 lbs of leaves. Too dry a room is injurious to the worm. He does not hesitate to give them wet leaves in all stages of their growth.

He says that many losses occur from covering the worms too closely when they are young; and that every day's hatching should be kept by itself.

In speaking of the profits of the business he says that in 1837 he employed young women from Mansfield to whom he paid three dollars per week. They raised and reeled twenty-three pounds. The time occupied was nine weeks. The wages paid were forty-eight dollars. The bounty received from the state was thirty-two dollars.

One pound of silk may be got from 3000 worms of the yellow kind, if well fed. Of the white cocoons 5000 are required to a pound; and their work is completed in four weeks.

The best time to hatch the worms is determined by the condition of the feed. He advises to a hatching once in ten days. The hatching may be kept back by keeping the eggs in an ice cellar on the ice. Mr. Smith has confidence that if the eggs can be subjected to the action of frost by any artificial means they may be hatched the same season they are laid.

The great dangers to the worms in the silk room are from red ants, and mice, and rats. Against the latter predators the cat is the only security. Against the ants he uses chloride of lime; and quick lime spread round the stands.

Rev. Mr. Field of Charlemont has been ten years engaged in the culture of silk. He tried the Canton mulberry, but they perished in the winter. Mr. Smith says he probably had the seed of 1834, which came from a different part of China from that to which he refers.

Mr. Field confines himself to the white mulberry, which he believes will prove as valuable as any for our use and climate. The setting of the plants is a matter of importance. They should be so placed that the ground can be cultivated and manured. If the soil is well cultivated and enriched the leaf of the white mulberry will be very much increased in size. He advises to placing them in rows twenty feet apart; and the plants four or five feet apart in the rows. In his experience the labor of one hand five or six weeks will produce and prepare nine or ten lbs. of silk, which will give not much less than one hundred dollars.

Mr. Field has never ventured to give his worms wet

leaves under the common apprehension that they would be injurious or fatal.

We have given this rough and miscellaneous detail of the remarks of these gentlemen who have had several years experience on a subject which is now every where exciting great and deserved attention. When the mulberry tree fever has somewhat abated and men have come to their sober senses and the cultivators of silk take the field in place of the jockies and speculators in mulberry trees, bass wood cuttings, sago, &c. &c. we may expect this great business will advance with all reasonable success and profit. There will undoubtedly be many disappointments; and those farmers, who expect in two or three years to hold their ploughs in silk gloves and those housewives, who are calculating to wipe their dishes with silken towels, will we think find themselves in an error. But we verily believe that to a certain extent and in a domestic way the business will be highly productive and furnish employment and subsistence to many women, children and aged persons who might otherwise find it too easy to occupy their time usefully or earn their daily bread. We believe that it is destined to be a great interest of the country; and that the soil, and climate, and habits of New England are adapted to produce the article in abundance and of a superior quality. The subject of manures was afterwards briefly alluded to: but as the time was far spent, it was agreed to postpone the further discussion to the next meeting, to be holden on Thursday next at the usual time and place.

To an inquiry whether it were advisable to continue these meetings, there was a unanimous affirmation; and a suggestion on the part of some that they should be holden twice instead of once a week. H. C.

THE WAR BREEZE.

Farmer U. S. and Farmer J. B., whose farms are adjoining, have for some time been disputing about the right to a piece of land lying between them; and as to the place where the line should run. They left it to an umpire to determine the line according to the deeds; but he, too indolent to examine the claims, took his pencil and drew an arbitrary line on the plan, which satisfied neither party. They have since that time been trying hard by civil negotiation, in the only proper way for reasonable men and gentlemen to adjust the controversy. In the mean time it would seem but reasonable that no encroachments should be made on the land by either party but that it should remain untouched that the interests of neither party should be prejudiced. But it seems some scandalous thieves belonging to it said to farmer B. but probably of both parties, certainly however not with the countenance of either, have undertaken to plunder the timber and produce. This kindles the ire of farmer S. He holds a secret council in his family and goes down by force and arms to drive these trespassers from the ground and to take violent possession of the disputed ground, without giving his neighbor B. the smallest intimation of his designs. He then raises a war cry and rouses his family and all his neighbors by the thunders of his indignation and proceeds in battle array to take possession if he can get it, of the piece of land in controversy. Now there is no complaint against the good temper or good disposition of farmer B; and a very serious question arises, whether this is really the most likely and the best way to settle this business?

In plain English, Maine has declared war against Great Britain; has summoned her troops into the field, and now with ten thousand men is marching against the British. The British on the other side are collecting their forces and perhaps before the ink of this sheet is dry, a collision may have taken place and human blood be shed. When this occurs God only knows where it may end. When a fire is kindled in a dry stubble, or a combustible neighborhood, who can say where it shall reach or how it shall be put out.

A good many serious questions and considerations arise out of this matter. Has Maine a right to declare war and by her own acts involve the whole country in a bloody conflict?

Will England submit to have the territory taken from her by force; and will she be more likely to negotiate at

the point of the bayonet than with peaceable remon- strance? Suppose we should get full possession of the territory in dispute, does that settle the matter?

Suppose we come into conflict with the British troops, and kindle the horrible fire of war, will it not at once ex- tend along the whole line and produce a general con- flagration, and fill the borders of the two countries with out- rage, carnage and murder?

Would the possession of all Upper and Lower Canada and the provinces of Nova Scotia and New Brunswick be the tenth part of an equivalent for the expense, and bloodshed and misery of even a three years war with England?

War is a game at which two parties play. What a pity it is that those, who move the men on the chess board should not themselves be the men to be moved; and that they who declare the war should not be com- pelled to do the fighting; and that Governor Fairfield and his brave legislators should not be ordered at once to march through the deep morasses up to their knees in clay and mud; to sleep in the pine swamps night after night, live upon raw pork; leave their comfortable homes and families, neglect their farms, and then stand in the front rank to be shot at or bayoneted for eight dollars a month!

Worse than all this, how horrible is it that two neigh- boring nations, enlightened, moral, prosperous, christian na- tions, should go to killing each other and spreading a flood of scalding misery among the people, opening a volcano and pouring out torrents of burning lava over peaceful villages, all for what? for the settlement of a dis- pute already in the train of negotiation about a parcel of wild land. Alas, is there no hope for human nature!

H. C.

NOTICE.—A stated meeting of the Massachusetts Horti- cultural Society, will be holden at its rooms in Tremont Street, on Saturday, March 23, at 11 A. M.

E. WESTON, Jr., Recording Secretary.
February 26, 1839.

BRIGHTON MARKET.—MONDAY, Feb. 25, 1839.
Reported for the New England Farmer.

At Market, 420 Beef Cattle, 8 pair working Oxen, 15 Cows and Calves and 1200 Sheep. 120 Beef Cattle unsold.

PRICES.—Beef Cattle.—In consequence of the storm, and the large number at market, former prices were not sustained. Cows were very unequal and, on some qualities the decline was considerable. We quote First quality, \$8 00 a \$8 25. Second quality, \$7 25 a \$7 75. Third quality, \$6 00 a \$7 00.

Working Oxen.—We notice sales at \$94, \$110, and \$125.

Cows and Calves.—Sales were made at \$35, 42, \$50, \$65, \$70, and \$80.

Sheep.—Dull. Lots were sold at \$3 25, \$4 00, \$4 25, \$4 75, \$5 50, and \$6 50.

Steine.—None at market and not in demand.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded northerly exposure, week ending February 24.

WANTS A SITUATION.

A Gardener who understands the management of a Green House, Hot Beds, &c. has had long experience in the business, and can produce the best recommendations. Apply at the New England Farmer Office.

JOSEPH BRECK & CO.

FARM IN GROTON FOR SALE.

The subscriber offers for sale, his farm in Groton, Mass., consisting of about 200 acres, much of it first rate land, and in a highly cultivated and productive condition. There are two dwelling houses, and commodious barns, and the place may easily be divided into two good farms. It is well stock- ed with fruit, with an abundance of fuel for use and sale, and excellent water. It is difficult to find a place combining more advantages in respect to comfort or profit. It will be sold on eligible terms. Inquire at the N. E. Farmer Office or of the subscriber on the premises.

Feb. 13, 1839. WILLIAM SALISBURY.

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most promi- nent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

FOR SALE.

The farm belonging to the estate of the late Jotham Bush, situated in the centre of Boylston, 7 miles from Worcester, containing about 125 acres of land, part of which is in a high state of cultivation, mostly fenced with stone wall and sup- plied with never failing water. The house is spacious, elegant and commodious, with two wells of superior and never failing water. The situation is not surpassed by any in the vicinity. The barns are large and in good repair. About 25 tons of first quality hay, the grain stock, and farming utensils will be sold with the farm, if wanted by the purchaser. Also, the outlands, a mile distant, may be purchased with the homestead, if desired; consisting of about 125 acres of choice intervals, plain, and wood land, situated by the Nash- ua river. For further particulars, inquire of Thomas Bond, Esq. of Springfield, John W. Bush of Hardwick, or of the subscriber on the premises. JOTHAM BUSH.
Boylston, Feb. 13, 1839. 3W

AMERICAN SILK GROWER'S GUIDE.

On the art of raising the mulberry and silk and the system of successive crops in each season; second edition; enlarged and improved by William Kenrick. Just published and for sale by Joseph Breck & Co., at the Seed Store and Agricultural Warehouse, Nos. 51 and 62 North Market Street.
Jan 9, 1839.

BONE MANURE.

The subscriber desires to inform his friends and the public that he has been in the Bone business more than ten years, and has spent much time and money to ascertain how bones may be converted to the best use, and is fully satisfied that they form the most powerful stimulant that can be applied to the earth as a manure. He offers for sale ground bone at a low price, and is ready to receive orders to any amount, which will be promptly attended to.

Orders may be left at my manufactory, near Tremont road, in Roxbury, or at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, Boston.
Sept. 20. NAHUM WARD.

A BOAR FOR SALE.

The Subscribers are authorized to sell a boar, half Berkshire; he is large of his age, being twenty months old. Price \$75. Apply to

MISCELLANEOUS.

WHAT A FARMER WANTS.

The Farmer wants a stable mind,
A purpose sure and steady,
To patient industry inclined—
For business always ready.

Good careful habits well infixed,
And judgment acting clearly,
To sift out truths with error mixed,
Though it should cost him dearly.

He wants a neat and prudent wife,
Who when he earns, can save it;
Who kindly soothes the care of life,
(Best gift of him who gave it.)

He wants a snug and tidy farm,
And health and strength together;
A house and barn to keep all warm
In cold and rainy weather.

Heaven's blessing then must crown the whole.
Or all his hopes are blasted;
But with this resting on his soul,
The purest joys are tasted.

He then enjoys a bliss, unknown
To those the world calls greatest;
Known only to the good alone,
The earliest and the latest.

(From Dr Humphrey's Tour.)

THAMES TUNNEL. The great want of a thoroughfare across the Thames, somewhere between London Bridge and Greenwich Hospital, suggested the idea of a *Tunnel*, under the bed of the river, which was commenced several years ago, about midway between the two. From various adverse causes it has advanced but slowly and irregularly; and it was not when I visited it, more than half completed. Two or three times, the superincumbent waters have broken through, to the great discouragement of the company, and even threatening to put a final stop to the enterprise. But by great labor and expense, the breaches were stopped, and the water was pumped out.

It is agreed on all hands, that if this immense work could be finished and secured against the irruptions of the river, it would be a great convenience, as the navigation of the Thames will not permit the erection of a bridge in that part of the city; and the river is so constantly clogged up with all kinds of water-craft, that to keep a ferry open would be quite impossible. When the work was first undertaken, it was regarded by many as visionary and impracticable; and the hopes of the most sanguine were nearly annihilated by the first cataract, which drove out the terrified workmen, and in a few minutes filled up the vast excavation. The undertaking has proved much more costly than was anticipated, and for a very considerable time the work was suspended entirely for want of funds. But at the last session of Parliament, a handsome grant was made to help carry it forward, and when I was there, the long arches again resounded with the heavy blows, and busy hum of the workmen.

You can see the *Tunnel* as you see every thing else in England, whether finished, unfinished or in ruins, by paying your shilling, more or less, at the

gate, and buying a guide book at twice its value—though the latter condition is not quite imperative. A shaft is sunk to the depth of fifty or sixty feet, on the south bank of the river, over which a temporary building has been erected, and you descend into the *Tunnel* by a winding staircase. Before it can be opened, the excavation must of course, be carried out a great deal further from the river, to get a convenient slope for heavy transportation. At the bottom of the stairs the *Tunnel* commences. It is ten or twelve feet in height, and wide enough for two carriage ways, and side walks, and separated by a row of massive pillars and arches. The sides and transverse arches, as you stand at the entrance, and by the help of lamps, look down these subterranean galleries, being built of the most substantial masonry, have every appearance of being perfectly secure, as far as they are finished, which is about 600 feet, nearly or quite to the middle of the river. Some even now doubt, whether this *Tunnel* will ever be finished; but I can see no insuperable difficulty in the way. As I have elsewhere remarked, our English kinsfolk are commonly much less in a *hurry* than we are; but they possess the virtue of perseverance in an eminent degree; and I have little doubt that some half a dozen years hence, they will be passing under the bed of their largest river with as much composure and safety as they now pass over London bridge. Whenever that arrives, the *Tunnel* will be of immense value to the lower part of the Metropolis.

It does not follow, as I am quite well advised, that, because every American who visits London finds a great many things to admire, or to marvel at, he can put them down upon paper so as to make them equally interesting to his countrymen at home. But I have ventured just to mention some half dozen of these trifles as specimens of the thousand *nugae* which arrest your attention in your daily perambulations of that vast Metropolis.

THE DRAY HORSES of London are animals of prodigious size and power. They resemble elephants, more than they do the ordinary breed of horses in the country. A gentleman told me he had three of them, that were worth at least a hundred pounds, that is about *five hundred dollars*, apiece. The best of these noble animals, especially those owned by the great brewers, are worth even more than this. How lamentable that they should be unconsciously employed in the distribution of poison to so many thousands of families! This leads me to say, that some of the breweries in London are immense establishments. In their vats a strong swimmer might find abundant room to tire himself. I shudder when I contemplate the probability that a single one of them will destroy more thousands, than fell in both the battles of Austerlitz and Waterloo. When will the governments and people of Great Britain and the United States be convinced, that it is as bad at least to kill a hundred men with strong drink, as to take the life of one man with a pistol or a dagger? How will posterity wonder at the obtuseness of our moral sensibilities in regard to the making and vending of alcoholic poison! Let but the meanest citizen of either country be murdered in cold blood, and you shall see the whole community roused as one man, to pursue and bring the criminal to justice; but let thousands perish under the slow tortures of intoxicating drinks, and where is the *posse comitatus* to arrest those who sold them the deadly poison? Where is even the public opinion, which effectually

frowns upon the trade of dealing out "death and damnation" to the high and the low, the rich and the poor?

The Police of London is very numerous and extremely well organized. This useful corps amounting, if I was rightly informed, to four thousand or more, are found in the streets at all hour of the day, as well as the night. They are distinguished by a plain blue uniform, with a little trimming upon the collar. You meet them at every turn, and judging from my own experience, they are very civil to strangers. As I often found difficult to make my way from one part of this vast city to another, I soon learned to inquire of the first *police man* I met, as I was quite sure he would be both able and willing to direct me. If you speak to any other person whom you happen to meet he may be as much of a stranger as yourself. And if you step into the nearest shop you may, or may not, obtain the information you want. I ought to say, however, that if those whom you address can address you, they will. I very rarely receive a short and gruff answer—and not unfrequently would the person spoken to, insist upon going with me into the street, or to the next corner, to make his directions more definite. Such attentions in the midst of an immense and bewildering city you cannot but appreciate and remember. You have map, it is true, and you can, if you will, study it so as to get a tolerably correct notion of all the principal streets and squares of the town,—but I never could have patience to sit down and find the place wanted, just as I was going out to meet an engagement—and then, one half the courts and cross streets are not to be found upon the map at all. There is nothing which cools the wrath of coachmen, carmen, and omnibus drivers, so effectually when they find themselves jammed together, pell mell, in Cheap-side, or Black-frisars, and begin to vociferate, and brandish their long whips—nothing brings down their high temper, like the appearance of a police man: "Do you stop there, and do you turn a little to the right, and you a little to the left and you, sir, go with me to the office yonder." Thus he clears away every obstruction almost in a moment, and the waves roll on as before.

TO BE LET.

The subscriber offers to lease for the term of three, five or seven years, his dwelling house and gardens in South Salem either with, or without any portion of the adjoining farm lands. The gardens, &c. contain about six acres, in a high state of cultivation, well stocked with flowers, fruit and ornamental trees; two green houses, filled with the choicest green house plants, and grapes in full bearing; a forcing wall, with seed and tool rooms, a convenient gardener's lodge and a large ice house; sufficient may be sold annually from the garden to pay the whole rent. The dwelling house is large and convenient, commanding a fine view of the sea and is within three fourths of a mile from the centre of the city of Salem. The above offers a desirable situation either for a gentleman's residence, or for a public garden or boarding-house.

Also, to let for three, five or seven years, the farm house and barns, which are large and commodious, with the whole or part of the farm, consisting of over two hundred acres of land of the best quality, with a large orchard of grafted fruit—it is abundantly supplied with sea manure, and located near four market towns. The whole estate has a full supply of pure water. Apply to the subscriber on the premises. Jan. 23, 1839. E. HERSTY DERBY.

N. E. FARMER.

AN ADDRESS,

Delivered at the Annual Cattle Shows of the Worcester and the Hampshire, Hampden, and Franklin Agricultural Societies, Massachusetts. October, 1838. By HENRY COLMAN, Commissioner for the Agricultural Survey of the State.

This address is published in the *New England Farmer* at the request of the Worcester Agricultural Society as communicated in their vote.

MR PRESIDENT, AND GENTLEMEN OF THE AGRICULTURAL SOCIETY: Among the subjects of appropriate considerations on such an occasion as this, it is difficult to select any one, the full discussion of which would not exceed the limits to which be crowded engagements of the day oblige me to restrict myself. I can promise nothing more than a few hints for other minds to work up at their pleasure.

Our social duties and obligations devolve upon is a serious responsibility. A man among men should remember that every thing human concerns him. The privileged citizen of a free community, owes to that community the ardent and active devotion of his affections and talents to its welfare and improvement and prosperity. "The country expects every man to do his duty."

In passing a few days since through a pine forest, I was led to admire the enormous size of some of the hills, raised by these most humble but indefatigable laborers. To them they were like Egyptian pyramids to us. During the last week a skillful pliarian showed me his bee-hive. The glass sides admitted of an inspection of its wonderful interior, its perfect architecture, its hurrying, active, happy population, and their vast accumulations of wealth to use and to spare; vast indeed compared with the capacities of the agents by whom these accumulations were made.

Two years since, I traversed the great Erie canal from one end to the other; I floated on the waters of the Ohio canal; and I returned to the sea shore by the Pittsburgh and Pennsylvania canals and rail-roads. What a magnificent excursion! What mighty triumphs of art and labor are here. What a moving of the affections! what an expanding of the imagination! How many beautiful and splendid visions have floated before the mind, which were here surpassed by the great realities. Here were mountains levelled and valleys filled. Here were deep basins excavated, and noble and long-stretching embankments, which rivalled the neighboring hills. Here were rivers, hundreds of miles in length, flowing at man's pleasure, and in channels formed by his hands. Here were streams crossing streams on beautifully arched aqueducts. Here were mountains of granite pierced through and through, and a passage opened through the heart of adamantine barriers for vehicles freighted with human life. Here were deep inland oceans mingling their waters with the mighty sea that sweeps from pole to pole; and bearing upon their

quiet tides ten thousand floating and deeply ladenarks; myriads of human beings, active in the pursuits of business or pleasure; accumulations of wealth from the deep and tangled recesses of the forest, now first springing into life under the touch of civilization, from the glittering fields of polar ice, and from the shores of the Western Ocean; accumulations, whose growing extent defies all calculation. All this, too, is the work of a little animal of the ordinary height of sixty inches, with only two feet and two hands, and of an average duration of life less than twenty years. His mighty implements in these great exploits, were only a kind of Robinson-Crusoe assortment, a hoe, a pickaxe, and a spade. Such are the great results of intelligent, concentrated, persevering labor; achievements of our own times, and scarcely a quarter of a century old.

These results are wonderful. They are no miraculous creation. They are the fruits of the labor of individuals, applied in its most minute forms, and at successive times. When De Witt Clinton first struck a spade little bigger than a man's two hands into the ground; and said, "This shall bring the mighty waters of Lake Superior into the ocean, and the vast, and as yet unimagined treasures of the great West shall float upon their descending current," few minds could believe that this was any other than "such stuff as dreams are made of." But the prediction was accomplished and in his day. The thundering cannon never sent a more electrifying peal, than when its successive acclamations along the whole bright line announced, that the nuptial union between the vast lakes of the north, and the beautiful Atlantic was consummated. Never was a gladder note poured into the patriot's ear since the Declaration of 1776, than the assurance which then fell upon it, that these internal communications, these glittering silver bands, were to form the strong bonds of friendly union and sympathy with those distant territories now brought into such near conjunction; territories before scarcely known to each other by name, now shaking hands with each other as next-door neighbors.

Such are the great results of Labor. How can I better occupy the short time with which you are kind enough to indulge me, than in speaking more about this mighty agent in the affairs of men; and especially in its reference to the cultivation of the earth, that great art, the basis of all other arts, whose festival we this day celebrate. What further I have to say, then, shall be about labor; agricultural labor; labor in Massachusetts.

Massachusetts! what delightful and precious associations cluster around that honored name. If there is no poetry, there is to the children of Massachusetts always music in the name; and if the poets never could weave it into verse, where is there a true son of this mother, who has not felt the very name—especially if heard in a foreign land,—strike, with a touch of melody, the chords of the soul?

Massachusetts is with many a despised land. Many will tell you with disdain that "her territory

is little larger than a pocket handkerchief; irregular in its shape; on the east like a long man in a Procrustean bed, not daring to stretch himself at full length; on the west rising into almost inaccessible mountains, bristling with firs. Here are wide tracts of blowing sand; and here again long extended and solitary pitch-pine plains. Here deep and undrained morasses, and there piles of granite, or rolling boulders, or fields covered thickly with stones as a recently dug and unpicked patch of potatoes with its produce." Then, too, they continue; "the soil is thin and cold; it yields nothing but by hard labor and incessant manuring; and the wretched people must work or starve. The climate, too, is dreadful. There are the cold east winds in the spring, which come over you like the scraping of a new-filed saw; the bitter north-westers, which try the firmness of your muscles; and the early autumnal frosts, and the driving and bristled snow, which so often, without any reverence for persons, comes between the wind and your nobility. And then, too, the people; what are they but a pack of workers, rough-handed farmers, mechanics, shoemakers, manufacturers, and traders, and their vulgar wives and daughters, who condescend to use their needles and dabble in soap suds, and presume to come from the kitchen into the parlor; so that a chivalrous gentleman of the genuine cockney stamp and of the last impression, finds himself as little at home among them as the monkey of the menagerie in his regimentals, when he found himself in the farmer's cattle yard. Then comes their insufferable ambition. Why there is not a mother that is not dreaming of it, nor a father that is not working hard that his son may be qualified to be Governor of the Commonwealth, or a delegate to Congress, or perhaps rise as high as to be member of the General Court and Justice of the Peace." Such are the terms in which some men would portray our beloved Commonwealth. Now allow a son of hers—would to heaven he were worthy of his descent,—to speak of her as in truth he can; but that must be very different from what he would if he had the power to do her justice.

The territory of Massachusetts is comparatively small; but it is capable of sustaining from its own products in ease and comfort a population four times as great as now inhabits it. Look at her productive industry in the mechanic arts! Who, before the ascertainment of the fact, could have imagined that the annual value of her domestic manufactures exceeded ninety millions of dollars? The amount of her agricultural productions, could its statistics be ascertained, would present as astounding results. Yet the development of her agricultural resources and capacities has hardly been begun. Let us look at one of the most populous counties in the state of an agricultural character. The whole number of acres in the county of Essex exceeds two hundred and seventy thousand. Of this only fourteen thousand are under tillage. Only ten thousand, exclusive of that which is in roads or water, are considered as unimprovable; but

thirtyfour thousand, though capable of improvement, are unimproved; and upwards of one hundred thousand acres are in wood or pasturage. Now parts of this county have produced in repeated instances more than one hundred bushels of corn to the acre, more than thirty of wheat, more than eight hundred of carrots, more than nine hundred of Swedish turnip, more than five hundred of potatoes, and more than four tons of hay. These facts rest upon unquestionable testimony. The redemption of waste lands, in the county to which I refer, has in several instances of extensive improvements, increased its products twenty times in quantity and value; and has raised the value of the lands in many cases from five dollars to one hundred dollars per acre.

"The bounds of Massachusetts are irregular;" strange that nature should not have conformed more exactly to the rules of art and confined herself to right lines. The indentation of her shores however forms many valuable inlets and harbors, where her enterprising mariners find shelter and anchorage. Even her sandy shores and plains are not without their fertile spots. There is many an oasis in the deserts; and with the animal and vegetable deposits thrown up by the moving sea, even her sterile fields are made in many cases highly productive. The mountains, which form her western boundary, are not without their advantages. They constitute our dairy and grazing districts. They furnish the richest pasturage, and few of them are incapable of the cultivation of the most valuable grasses, esculent vegetables, oats, barley and Indian corn. Some of these hill-towns are advancing more rapidly in wealth than many of the towns embracing the richest alluvions of our valleys. Their inhabitants breathe an air, which gives strength and elasticity to their muscles, and spreads the vermilion hues of health over their countenances. They drink of the gushing spring, which pours its crystal streams from the sides of their mountains, for a draught of which many a settler on the verdant and beautiful prairies of the west would gladly give bushels of his wheat; and oftentimes, when I have followed the flight of an adventurous settler to his eagle's nest on some of our loftiest summits, I have been sure to find the abode of plenty and independence. Of the soils of Massachusetts, though we have our thin and hungry portions, we have little land, capable of it which will not amply repay the labor and expense of cultivation. Our morasses and peat meadows, when subjected to the operations of a skilful husbandry, become eminently productive. Our sandy plains are yet to undergo the quickening process, of no doubtful efficacy, of plaster and clover; and in many cases even our roughest granite pastures, which seem almost to defy cultivation, have been brought under the scythe, sometimes at an enormous expense, and yet in the end a profitable outlay. I have yet to discover the instance of a single agricultural improvement in the State, managed with judgment, skill and economy, which has not afforded an ample remuneration for the expense incurred, and always much more than double its value. In some cases this value has been enhanced a hundred-fold. In this matter it would be easy to give facts upon facts, but time does not admit of it.

Of the climate of Massachusetts it is enough to say that epidemic diseases are scarcely known among us; that we have no unhealthy districts of country; that a higher standard of health has not been reached in the known world. To the tem-

perate, industrious and virtuous, no part of the world presents a fairer chance for the continuance of the physical and intellectual powers.

Of her social and political condition, I will speak only of the great and essential elements. What can we ask more, then, than that all labor should be voluntary; that the fruits of honest industry should belong to those, who have produced them; that religious liberty should be enjoyed in its widest latitude; that justice should be carefully and promptly administered, and accessible to the most humble and the least protected; that the dominion of the law should be unquestioned; that the burdens of society should press with a weight too light even to be perceived, by the honest citizen any more than the beautiful element, which constantly surrounds him; that property should be very equally divided, and the various avenues to business be open to all; that a true equality should reign every where; that education, simple and liberal, should freely proffer its advantages to all; that property and distinction should be alike accessible to all; that the rights of one should operate no prejudice to the lawful success of another; and lastly, that the people should be sovereign, and every man, be he high or low, rich or poor, should be directly responsible to the public judgment. In all these substantial elements of social order and good, what community has ever surpassed our own?

Of the picturesque beauty of the scenery of Massachusetts, few even of her own children are fully conscious. In the general neatness and comfort of her dwellings; in the beauty and thrift of her numerous villages; in the improved taste, and every where the increasing attention paid to rural embellishments; in the neat cottage exhibiting its white front and its Venetian blinds on the side of some beautiful hill, or on the margin of some peaceful lake, its door yawning crowded with ornamental trees, its piazzas trellised with vines, and its avenues decorated with flowers; in the school house which meets you so often at the division of the roads, crowded with its courteous, happy, and buoyant congregation; in the lyceums, academies, and colleges for the higher departments of learning, which present themselves in such frequent vicinity; in the village church, which lifts its glittering spire from the midst of some umbrageous valley, perhaps by the banks of some flowing stream, the traveller who sympathises in what is beautiful in itself, and delicious and refreshing from its associations, will be constantly charmed and gratified as he passes over our blessed territory. Or is he in search of the picturesque and the romantic, let him follow round our indented sea-shore and traverse its hard-trodden beaches, where the ocean is continually pouring out its phosphorescent jewels at his feet; let him ascend some of the beautiful prominences in the vicinity of the capital; let him follow the course of the Merrimack and mark its deep and broken current, the many portions which occasionally open their glistening surface to the eye as he traverses its rich and cultivated shores; let him come into your own county and observe its improved summits, covered in the season of vegetable luxuriance with their rich herbage, their bending crops, and their numerous herds; let him visit some of your charming lakes and remark them, when, on their thickly fringed sides, the gorgeousness of their autumnal foliage is reflected in all its variegated brilliancy from their mirrored surface; let him pass over to the valley of the Connecticut,

and from its mounts Holyoke or Sugar Loaf, Pocumtuck or Round Hill, let him cast his eye over these extended valleys of exuberant fertility, of high cultivation, and of indescribable magnificence and splendor; let him follow up the Deerfield in its winding course through the beautiful valley of Charlemont, and among the gathering and deep clad mountains of Zoar; and as he ascends the Hoosic mountain from the east, let him trace the romantic passage of this wayward stream by the silver radiance of its waters as they find their passage through the deep and dense and frowning mountains which at every step seem determined to resist their progress; let him pursue his journey until he reaches the western descent of the Hoosic range; and let him stop at this striking spot and mark the unrivalled beauty and sublimity of the valley and mountain scenery as it first bursts upon the view; let him take his stand where the Hoosic and the Housatonic rise in the close vicinity of each other, and follow down their winding currents until they pass beyond the boundaries of the state; let him from whatever point he may choose, look down upon the exquisitely beautiful valleys of Williamstown, of Lakesboro', of Pittsfield, of Lee, of Hop-brook, of Stockbridge, of Lenox, of Great Barrington, of Sheffield, of Richmond, and of Egremont; and if his eye is not enchanted, his affections warmed, his taste improved, his imagination illumined and lifted up, it is because he has not the common attributes of humanity.

Such, fellow citizens, is the territory, in which divine providence has in its beneficence east your lot. I will not disturb the grateful and honest pleasure with which you contemplate your own goods, by any invidious comparison with the condition of others less favored. It is enough for us to know our own blessings; to acknowledge, to secure, and to extend them. This is to be done by labor; labor of the heart, of the head, and of the hands. Man was formed for labor. Physical exertion is indispensable to physical energy and activity; and physical energy and activity are the essential conditions of intellectual greatness and power.

(To be continued.)

IRISH CHARACTER.—In the midst of those most lawless burnings and destruction of property, the genuine Irish peasantry scrupulously honest in his intercourse with his neighbors, faithful to death in his attachments, an incorruptible follower, with a heart that beats with rude but impulsive sympathy for the sufferings of others, and glows with a genuine but understood ill love of country. Yet these characters are sometimes murderers, outlaws, ready for every violence—his hand armed against civilization when civilization becomes armed against him—and the whole tenor of his life at variance with the best interests of society. The world may make its conventional virtues and vices, and civil associations may dictate forms, but the source of good is in the feelings and affections of the animal. Even when bad government turns them aside from their natural career and enforces disordered reaction, the Irish make themselves a code of morality which fits them for the untoward difficulties of their position.—*Lady Morgan.*

The Northampton Courier says that a farmer in Hadley, last year raised upon two acres of meadow land, 57 1-2 bushels of sound wheat. When re-measured this spring, it was less in amount from waste and shrinkage, but what he had was sold for seed at \$2 50 per bushel, and produced him the handsome sum of one hundred and twentyfive dollars!

(From the Genesee Farmer)

DICTIONARY OF TERMS USED IN AGRICULTURE,

AND IN THE SCIENCES MOST INTIMATELY CONNECTED WITH ITS ADVANCEMENT.

(Continued.)

Ashes. When wood is burned in a position that excludes the air, the product is coal; if combustion is performed in the open air the produce is ashes. Ashes by being leached, or having warm water passed through them, are deprived of the alkali they contain, and this is obtained in the shape of potash or soda, by evaporation. Different wood, and plants, vary much in the quantity of ashes and alkali they produce; the fir, beech and poplar, ranking the lowest, and the box, willow, elm, wornwood and fumitory the highest. The leached ashes of several kinds of grain, were found by Ruckert, to be constituted as follows:

	<i>Silica.</i>	<i>Lime.</i>	<i>Alumina.</i>
Ashes of Wheat,	48	37	15
Oats,	68	26	6
Barley,	69	16	15
Rye,	63	21	16
Potatoes,	4	66	30
Red clover,	37	33	30

Leached ashes are found to be an excellent manure applied to soils that are light, or such as are inclining to be sour; the alkali correcting the acid with which such soils, as the vegetation grows, abound. In some instances crops of grain, roots and grass have been nearly doubled by their use; and no skillful agriculturist permits their waste.

Asparagus. A plant cultivated in gardens and deservedly esteemed for its value as an article of food, when properly prepared. Its value is also greatly enhanced by the early season at which it is produced. It is the young shoots of the plant, as they attain the height of some four or six inches above the earth, that are used for food, and these are cut slanting upwards, about two inches below the surface. Asparagus is usually grown in beds, and requires a soil very rich and deep, and if not so naturally, it must be made so by trenching and manuring with fine manure or compost, before the plants, which are raised from the seed, are put into it. They may set in rows eighteen inches distance, and ten inches in the row, or in squares at one foot distance. The beds during the winter are secured from frost, and the plants prepared for an early start by a covering of straw or litter. The beds must be loosened in the spring, and a coating of mould saturated with liquid manure worked in, has been found a capital dressing. A few plants are not cut but reserved for seed, to keep a supply of young plants for the beds. In a favorable soil, an asparagus bed, when established, and properly attended to, will last many years. The plants are usually allowed to stand three years before they are cut; some, however, commence on the second year. They are boiled and eaten with butter, as are green peas, &c. The asparagus offers a striking instance of the effect produced on plants by cultivation. In some parts of Europe it is found growing wild on the sea shore, its stem not thicker than a goose quill, and only a few inches in height. The cultivated plant is sometimes found three-fourths of an inch in diameter, and grows to six feet in height. In the neighborhood of cities or villages asparagus is cultivated as a source of great profit; and it should find a place in every kitchen garden.

Atmosphere. That mass of thin, elastic, and usually invisible fluid, in which the earth floats, and with which that and other bodies are surrounded. The height of the atmosphere is calculated at 46 miles; its pressure on the earth to be equal to that of a column of water 32 1-2 feet high, and on the body of a middling sized man at 32,440 pounds. The density of the atmosphere diminishes in geometrical, while the height increases in arithmetical progression. In all the functions of animal and vegetable life, the atmosphere acts a most important part. It is composed of oxygen and hydrogen, carbonic gas, aqueous vapor, and a minute quantity of hydrogen. In addition to these permanent ingredients, it contains a multitude of other substances, in the form of vapor or gas, varying in kind and quantity according to circumstances, but all exercising more or less an influence on the animal and vegetable kingdoms. Of those that affect the animal, that undetermined something called *miasma*, which produces disease to such an extent as to render some of the most fertile districts of the globe scarcely habitable, may be adduced; and of those that act on the vegetable, the ammoniacal products, the result of fermentation, may be mentioned. By stirring the earth, the absorption of these atmospheric agents is greatly promoted, and the consequent vegetation of plants proportionably accelerated.

Awns. The long bristle-like terminations of the envelope of the kernel in some kinds of plants, is termed the *awn* or beard. It is particularly conspicuous in some kinds of winter wheat, in most varieties of spring wheat, and in all the kinds of barley. Wheat without beards can be converted into the bearded, and vice versa, by changing the sowing from autumn to spring, or from spring to autumn. Of all grains, barley is the most liberally provided with this formidable appendage.

Azote. A gas, which constitutes the most important portion of the air, and is sometimes called nitrogen, because one of the most essential properties of its base is, that in conjunction with oxygen, it composes nitric acid. Though in itself fatal to animal life, it abounds in animal substances, and forms ammonia with their hydrogen when burned. The great difference between animal and vegetable substance lies in this, the former contains azote, and the latter is destitute of it. Owing to its feeble affinity for other substances, the number of compounds into which azote enters is small, and its influence on agriculture, with the exception of its effect when combined with animal matter, proportionably limited.

Bacon. The flesh of swine that has been subjected to the process of smoking over a wood fire, is termed bacon; but the parts to which this term is most usually applied, and which are usually chosen for bacon, are the hams, and the cheeks or jowls. A good ham is one of the most excellent kinds of food, and this goodness in a great measure is depending on their preparation. The kinds most celebrated, are the Westphalia, principally brought from Hamburg; the Hampshire, from England; and in the United States, the Virginia or Southern ham generally. It is not known that there is any thing peculiar in the feeding or pickling the Hamburg hams; but their superiority is attributed to the manner in which they are smoked. This is performed in large chambers in the third or fourth stories of buildings, to which the smoke is conducted in tubes from fires of oak or maple chips in the cellar of the building. In passing this dis-

tance, the vapor which smoke usually holds, is deposited, and the hams are perfectly dry and cool during the whole process. The Hampshire bacon is made from pork not scalded in dressing, but deprived of the hair by quick fires of straw or other combustible materials. This singeing is repeated two or three times as the case may require, when the hog is cut up, pickled and carefully smoked. These hams are particularly hard and fine, which is attributed to the skin not having been softened by scalding. The Virginia or Southern hams are supposed to owe much of their superior flavor to the animals being allowed to run at large the most of the time of feeding; to their being much in the woods, and wild, giving more firmness to the muscle; and to their feeding much on acorns and other products of the forests. Virginia hams are usually small, the hogs themselves rarely weighing over two hundred; and the pickling and smoking performed in the best manner. The great defects in smoking, commonly are, the hams are too near the fire; and the house is too tight. The hams are in consequence kept too warm from the fire, and the condensation of the vapor keeps them wet. Dryness while smoking is indispensable to good bacon.

Bark. Modern writers on vegetable physiology divide plants into *xerogenous* and *endogenous*; in the first of which the additions that constitute growth are made successively on the exterior side of the parts from which they proceed; and in the last the growth is the result of additions made internally. The trees of northern regions, such as the pine, oak, and elm, belong to the first class; the trees of tropical climes, such as the palm, cane, bamboo, and all grain bearing plants, belong to the last. The first named trees or plants, only have a proper bark. In this class of vegetables, every year adds a new layer of wood which is the *albumum*; and a new layer of bark, which is denominated the *liber*. Bark, then, is divided into three parts; the inner layer called the liber; the zone of successive outer layers called the cellular envelop; and the exterior surface of this envelop, which is termed the epidermis. A cross section of the bark of the basswood or elm, will exhibit this structure in perfection. The bark exercises an important influence in preserving plants from the effect of frost, and the albumum from injury, and cannot be removed without inflicting severe or fatal injuries to the trees. A healthy and clear bark is essential to a vigorous growth; and an occasional wash of soap, lime, or ashes, is found beneficial, when trees are attacked by insects or mosses.

(To be continued.)

MAMMOTH HOG.

Robt. Alexander, a substantial farmer from Jackson, Washington county, has raised and sold to George Swartz of this city, for \$200, a "leettle the largest" hog that was ever dreamt of. This noble porker is now two years and eight months old, and weighs sixteen hundred pounds. It is supposed by good judges that he will lose 150 pounds in *dressing*, which will leave his useful weight 1450 pounds. He measures 8 feet 9 inches in length, and is regarded by *connoisseurs* as the largest animal of his race, ever raised in America. This is the second hog that Mr Alexander has raised to the enormous weight of over 1400 pounds.—*Albany paper.*

He is a thriftless farmer who buys any thing which his farm can produce.

(From the Genesee Farmer.)

IMPROVED BREEDS OF SWINE.

The production of pork is one of the most valuable and important staples of the farmers of the United States; and the swine of our country are scarcely second in value, as farm stock, to the entire amount of its neat cattle. Besides converting the offal and coarser and less valuable of the farm products into a marketable commodity in the feeding of swine, the richest and most luxuriant grain of the country is usually devoted to their preparation for market; and throughout the whole interior, in the pork crop of the farmer is combined the surplus of his root cultivation, and the net proceeds of his coarser grains: the gross result of all depending on the final proceeds of his pork account.

This is a very important matter for the farmer. The entire *modus operandi* of rural economy is more or less concerned in a subject so interesting in its results of profit or loss; and is entitled, I fancy to infinitely more consideration than is usually bestowed upon it.

With most of our farmers, even at the present day, particularly in the western country, among that numerous and wide-spread class whose principal dependence is on their pork crop for reward, a hog is simply a—hog—the name comprising all of excellence in the animal necessary to produce the article of pork required. The brute in question, for it deserves no softer name, is indigenous to the country. It exists in the streets of our cities, in the highways of our ordinary farming districts, and in the forests of the west and south—and in every cornfield and potato ground too, of the regions which they inhabit at all, provided the fences enclosing them be not remarkably close and of an extraordinary height. Their chief excellencies are, the possession of a surpassingly active and vigorous lever power in the poll and snout, acting by an ingenious co-operation of the spinal and nasal muscles; a celerity of speed, equalled only by the fox, or the hound, in a chase; and an indomitable propensity to all evil, conclusively illustrative of their lineage from a conspicuous race of scripture date. And this is the material from which is produced, in more than three-fourths of the United States, and indeed in almost the entire continent of America, the vast supplies of pork which are annually sold, purchased and consumed in the land!

Important improvements, and wonderful changes, have been introduced in most of our breeds of domestic animals and farming stock; but less in our swine than in any other. Why this universal neglect in the improvement of an animal furnishing us with our richest meats, and adapted to consume, in the most profitable manner, not only to the farmer, but to the common house-keeper, the offal of both the harvest and the kitchen, is not easy of answer, unless it be that its remarkable propensities of shifting for itself in its semi-savage condition, render it more acceptable to those who consider that every thing pillaged from their neighbors, or from the public, is so much direct benefit to themselves. This perhaps is an uncharitable solution of the problem; but I feelingly appeal to those who, having a due regard to neighborhood comfort, and to individual right, if any other reason will account for the legions of miserable, starved, and mischievous brutes running at large, disgracing the name of even a—hog, and infesting almost the entire land.

Nor are the characteristics above named the only objections to the common swine of our country. They are huge and gross feeders; equally gluttonous in offensive animal offal, even to carrion, as in vegetable food and grains. Measured by well chosen and approved physiological rules, and none other will or can be admitted by true economy, utility, or common sense, the animal in question will be found utterly inadequate in comparison, to the main purposes of the farmer or housekeeper for profit. From fifty to one hundred per cent. more food, as the case may be, is required to make a given quantity of pork of inferior quality, both in taste, and marketable varieties, from the common hog, than is required in the improved breeds of our swine. This fact has been so often demonstrated that it needs no further confirmation, as all those who are conversant with the subject will readily testify. My own experience for many years is satisfactory on this point, and with all intelligent men, and practical farmers, no doubt exists upon the subject.

Within the last three or four years, the public attention has become much awakened to the necessity of a reform in this important branch of agriculture, and following the rapid spirit of improvement in our neat stock by the importation of many valuable breeds of short horn cattle from abroad, and their dissemination throughout our country, the better and more approved breeds of swine have been eagerly sought after, and to a considerable extent introduced into many sections of the Union. Among our truly intelligent and thrifty farmers, the spirit of acquisition in all improved breeds of animals was never so active, and I imagine that it only needs the dissemination of fact and information among them, to draw their attention yet more closely to it.

So important does the question of a thorough improvement in the swine of the United States appear, as connected with not only the quality of our pork, but as a means of the absolute saving of hundreds of thousands, if not millions, of dollars annually to our farmers, that, since I have commenced the subject, I feel disposed, even at the expense of prolixity, to speak of some of our most approved breeds of swine; yet I shall discourse of nothing but such as I know and have tried by actual demonstration, and such as I can with entire confidence declare to be worthy of attention.

As first among the most desirable breeds, I name the

IMPROVED CHINESE.

These animals in their purity, are exceedingly scarce in the country. They may exist in several parts of the United States, but I know of them now at only one farm in this region. I first purchased a pair of Caleb N. Bement, Esq. of Albany, in the fall of 1833, he having obtained them of Mr Dunn of that city, who many years before, procured the breed from New Jersey. At the time I purchased these of Mr Bement, he had many others of

the kind, and I then thought, as the fact has since proved, that he placed altogether too low an estimate on their value as an *original stock* for the improvement of other breeds. That gentleman has for some years past, I believe, been entirely out of the breed, having turned his attention almost exclusively to the breeding of Berkshires.

The principal and most important characteristics of this breed are, their exceeding quietness of disposition and habit; round and perfect proportions; tolerable length of body; delicacy of bone and limb; smallness of head, legs and feet; lighter in the offal parts than any other breed whatsoever; and a propensity to take on fat to a greater extent with less food than probably any other animal in existence. They are in fact the *beau ideal* of hogs! In size they are only middling, weighing at nine months old from 180 to 200; and at fifteen to eighteen months, 250 to 400 pounds; depending much upon their previous keep and fattening. Of the original pair which I purchased, the sow still survives, a good breeder, weighing in fair condition about 200 pounds. The boar at the age of four years, was overgrown with fat, and useless, although kept only on grass in summer and with low food in winter. He died when five years old, and his usual weight was about 400 lbs. One of their descendants is now four years old past, and has arrived at the same condition, being useless for breeding purposes. Numbers of their progeny have been scattered far and wide over the country. I bred many of them on my own farm, but the calls were too incessant for me to part with them, and not being conveniently located for their distribution, I parted with nearly my entire stock a year or two since, to Mr A. B. Allen, who has bred them extensively for sale on his farm on the Niagara River, two miles below Black Rock. I have fattened many of this breed, mostly mixed with English blood, and a few full blood, and I never made pork with equal economy, and of such perfect quality as from these. It is the breed slightly mixed with some other, that I would always select for the purposes of my own farm, and I feel warranted in saying, without fear of contradiction, that a cross of the China is the most valuable of any other in the country for economical pork making.

With all their perfections they are objected to by some; and entire frankness in the matter demands that their objections should be noticed. The first of these is, their want of size. That has been already stated. It is not an objection in my view. If they had longer legs, which would spoil them, this objection would not be so apparent. Others object to their lack of hardihood and want of constitution. If an entire absence of hog-like ferocity, and the greatest amenity of disposition of which the animal is susceptible, together with the love of a warm and snug shelter in the inclement season, instead of a wild burrow in a fallen tree top, or an ability to *burglar* itself into luxury at any sacrifice to its owner or his neighbor, be faults, then truly have the China pigs most grievous ones; for they love a shelter and a home in winter; and it is dangerous to life for their young to come into this breathing world in very cold weather—the first of April to the first of May being early enough for a litter of full bred China pigs to see the light. I know of no other vices with which they may be charged, unless it be the *lack of bristles*, and a total aversion to run, or to jump a fence, even two feet high, or to be rapidly driven. The sows are universally good and careful nurses, having from six

o nine pigs, rarely ten at a birth; which, if decently fed, they raise with abundant ease. Indeed, I know of no *fault* with the *pure Improved China Hog*: and still I consider them with all their good qualities, in their purity, not exactly the animal for the pork making farmer. Were I to direct him what to do to raise his breed of hogs to the greatest pitch of excellence, I would say—no matter what his breed may now be, if not of the approved varieties—in the Northern States, where his stock is fed in pens, with ground or cooked food—“Cross your stock with China, and keep crossing it, no matter how high, until they fail in size or vigor, and then go to the Berkshire or something else; but still let the main ingredient of the animal be China blood.” The continual tendency of hogs, as of most other animals is, without great care, to deteriorate; to grow coarse and wastey; and I know of no cross which so readily brings them back into snug and correct proportions as the China.

I have had various crosses of these upon other breeds of swine, and I have never known an instance where they were not improved by the China blood. The size of the crossed China is large; frequently double that of the pure blood, varying from three to four hundred pounds at eighteen months old, and *always* excellent. Even in the first cross upon the wild woods hog, the produce is astonishingly altered, and the second makes an admirable animal, with great constitution and hardihood, accompanied by the quiet disposition and fattening propensities of the parent China. More need not be said in praise of the China hog. Since I first obtained them, by judicious selections they have been continually improving in their appearance and good qualities, and I fearlessly challenge the country for finer specimens of Chinese swine than can be shown from my former stock, now at Mr A.'s farm.

If I have placed the China pig *first* in estimation it is because I think him better fitted than any other to *improve*, as a first cross, the condition of our country swine generally; but for some purposes and in the opinion of many of our farmers, particularly the large grazing and pork feeders of the west, the

BERKSHIRE HOG

possesses properties of far greater attraction. In the description of this animal, I shall claim for him no refinement of character, or particular placidity of temper; for, so far as I have been acquainted, he is as much of a hog as any other variety within my knowledge. These have been so often and so well described and figured in the agricultural papers by my friend BEMENT, of Albany, who has a large herd of them, that my account will be a short one. Their main properties are, larger size, weighing from three to five hundred pounds at eighteen months and two years old; and at a much earlier age I should not think they would so profitably fatten; great vigor, constitution and muscular action; but withal, an aptitude and quickness to fatten rare-

ly equalled in most other large breeds; extraordinary length of body; breadth of carcass; light offal; large, well shaped ham; and in fine an excellent pork hog. They are a darker spotted than the China, being in most cases nearly black, but without bristles, or with very slight ones. The sows are prolific breeders, having from eight to fifteen pigs at a birth. They have the usually ravenous disposition and character of the common hog, sometimes devouring not only their own young, but whatever other feeble and inoffensive small animals may come within their reach. They are good nurses, and a sucking Berkshire pig can rarely be excelled in beauty by any creature of the kind. They are strong, and coarse feeders; exceedingly hardy; good travellers (a desirable quality for the western country, where the farmer drives his fat hogs to market instead of butchering them at home;) are remarkably well calculated to follow fattening cattle through the corn fields, and to thrive on roots and coarse grains. They have obtained extensive celebrity on account of their great size, and other good qualities, and are, beyond question, with those who desire *extraordinary large*, as well as fine animals, the best *pure blooded* swine in the country. They have an increasing popularity; are sold in many instances at enormous prices, and will probably be multiplied, as they ought to be, throughout the United States.

Yet good as are these animals, they can be much improved by a cross of the China. They are antipodes in character and disposition; but each possessing excellencies of a peculiar and desirable kind, and when mingled with a cross of the Berkshire boar and China sow, the produce is the most perfect that the swine family, numerous as it is, can boast. I have had them, and have seen them elsewhere extensively crossed, and always with entire success. To the China is added, size, vigor, hardihood, and length of carcass; and to the Berkshire, docility, quietude of habit and disposition, delicacy of bone, limb and muscle, and a remarkable propensity to fatten—in fine, the best hog in the world! I never have yet witnessed such beautiful specimens of the swine family, as those of the Berkshire and China cross. When once made it may be followed up on either side, according to the fancy of the breeder; but let the cross be made either way, it cannot be amiss. I would therefore say to the farmer, if you would have the finest of hogs and the best quality of pork, procure both the China and the Berkshire, and you can never be at fault in possessing a perfect breed.

There is still another variety of swine which exists in this neighborhood, and which I deem too valuable to omit a passing notice of, while discussing this important matter. Their origin is partly owing to accident, and partly to my own love of innovating, as they were first produced upon my own farm, and have since been so successfully bred and substantiated as to claim the merit of a distinct variety. They originated from a cross with a most valuable large white English breed, and the improved China. They were bred several years on my own farm, where some of them now remain, but they are principally kept as breeding stock, together with the China and Berkshire varieties, by Mr A. B. Allen. He has given them the appropriate name of the

TUSCARORAS,

and by a careful and judicious system of selections and breeding, he has brought them to great perfection. They combine in all particulars, except in

delicacy and firmness of bone, the good qualities of the China. They are longer bodied, nearly double their size, yet smaller considerably than the Berkshire, and will weigh 300 to 500 lbs at eight-months old. They fatten equally as well when six or nine months old as the China, are lighter colored, being usually light spotted, the white predominating. They have the tranquil pleasant habits of the Chinese, without the uneasy, predatory propensities of the Berkshires, and are in all particulars just what the farmer of our Northern and Middle States would desire for a good stock and pork hog.

In fine, I do not know that I can better conclude this long story, than by saying, that in small and delicate breeds the China is the most perfect; in the large and grosser sorts, the Berkshire is decidedly preferable; but, for a *good, honest, quiet, every day hog*, the Tuscarora is, after all, equal, if not superior to either. At any rate if you possess nothing but the common breed, try one or all of these, and you cannot but be essentially benefited. A notice of other varieties must be left for a future paper. ULMUS.

FINANCES OF MAINE.

It would seem from the subjoined statement of the finances of Maine, that this grown-up daughter of Massachusetts is even much more of a spendthrift than her good old mother. It appears that a considerable amount of her past expenditures has arisen from her liberal bounty on the growing of wheat; and that the calculations of future expenditures are predicated upon a large bounty to be paid on the production of corn and wheat. This after all is a most judicious expenditure and in the result highly profitable to the State. If Maine will dig from her own soil nearly a million dollars worth of bread stuff for her inhabitants, by the payment of a hundred thousand dollars bounty, without which bounty not half of this amount would have been produced, the balance is altogether in favor of the State; to say nothing of its moral effects in the stimulus given to wholesome industry the encouragement to agricultural enterprise; and especially in the proud consciousness of self-dependence, and independence, which necessarily follows this development of the immense resources of the soil of that rising Commonwealth.

The amount paid from the Treasury of Maine during the last year, in bounties on Wheat, raised within the State, was \$77,998 89. The amount which will be required to pay the bounty on Wheat and Corn the ensuing year, is estimated to be 125,000, or 150,000 dollars. The whole expenditures for the past year amounted to \$448,199, of which \$62,660 were on account of the public debt. Of the receipts \$348,795 were from loans, and \$48,146 from the Bank tax, which is appropriated to the school fund. The present amount of the funded debt of the State is \$584,250.

The receipts of the Treasury for 1830 are estimated by the Treasurer, to amount to \$134,723, and the ordinary expenses of the government for the year, \$560,842.

MAXIMS.

1. He is no husbandman who does any work in the day time that can be done in the night, except in stormy weather.
2. He is worse who does on work days what he might do on holidays: and
3. He is worst of all who, in a clear sky, works within doors, rather than in the field.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MARCH 6, 1839.

AGRICULTURAL MEETING.

The sixth meeting was holden at the Representatives' Hall on Thursday last, and was fully attended; Mr Bates of the Council in the chair.

The subject of consideration was manures, and the discussion was principally confined to lime and ashes. A communication from Dr Dana on the subject of ashes, and presenting interesting facts and valuable information was read by the Commissioner of Agriculture and will appear hereafter in his reports.

Several gentlemen took part in the discussion and detailed many valuable facts. Mr Buckminster of Framingham, Mr Abbot of Westford, Dr Keep of Boston, Dr Stebbins of Swansey, Mr Carleton of Danvers, Mr Danforth of Pittsfield, gave their views and experience. The chairman, Mr Bates, communicated some valuable information as to the use of ashes for broom corn, it being considered equal to any manure which could be applied to the crop. It is applied in a small handful or large spoonful to a hill either at the time of planting or after the plant has come up.

It is not convenient at this moment to give a full report of the remarks made and the facts stated. The general impression or experience was adverse to the use of lime, little effect having been as yet perceived from its application; and in some cases a positively injurious effect. The effect of ashes and of lime is undoubtedly much the same; and that is to render the insoluble food of plants soluble, so as to prepare it to be taken up by their roots. But the operation of ashes is much quicker than that of lime from its greater solubility. Ashes effect a sudden, fine a permanent improvement. The amount of any earthy ingredient taken up by the plant is very small indeed. Of the essential benefit of the application of lime to lands in certain proportions and under certain circumstances no intelligent and experienced mind can entertain a doubt. Its mode of application however, and its mode of operation are matters in which we want all the light which science and experience can give. It is not surprising that mistakes should be made and disappointments occur; but these furnish new motives for further inquiry and more exact experiment.

The next agricultural meeting will be holden at the same hour and place on Thursday evening next. The subject proposed for conversation is the redemption of wheat lands, whether sand plains, salt marshes or peat-bogs. This will of course lead to the further discussion of the application of these and other manures; and it is hoped the attendance will be full. Very great pleasure has been derived and we have no doubt great improvement will be promoted by these occasional meetings. Nothing is more desirable in these cases than that farmers who have facts to communicate, should communicate them; and the conversation be as free as possible.

H. C.

CROP OF CORN.

With the subjoined letter I received a trace of as beautiful ears of corn of the Dutton variety as I have ever seen, and was assured that it was only a fair specimen of the crop. The letter is a private one but I hope the liberty I take in publishing it will be excused. The suggestions in regard to coal ashes, or ashes as a preventive of the ravages of the wire worm; and the use of manure from salt hay are deserving of attention; and will, I hope,

lead to the disclosure or observation of other facts of a similar nature; and which should be given to the public as contributions to the general stock of agricultural knowledge.

H. C.

WEST NEEDHAM, FEBRUARY 15th, 1839.

To the Commissioner of Agricultural Survey,

DEAR SIR—I send you a sample of some corn which was grown the last season, the seed of which I obtained from Judge Buel. He sent me two bushels of ears of the Dutton corn. I received it last April, let a neighbor have one half, the other half I shelled; and had half a bushel, and planted it between the 14th and 20th May on three acres of ground; one half acre of it came up well, the remainder two and a half acres the yellow wire worm, as we call them, destroyed one third part of the corn that was planted, by eating into the kernel just after sprouting. Some part of the ground where the worms ate, I planted the second time but it did not amount to much. On the half acre that the worms did not infest I had thirtysix bushels. On the three acres together I had one hundred and fifty bushels of shelled corn according to measurement. The reason I assign for the worms not eating in the half acre is that the manure that was put into the hill was mixed with hard coal ashes. The whole three acres were in one piece and manured in the hill about five cords to an acre of barn manure and pond muck mixed in compost, except the half acre that was mixed with ashes. The land is what we call plain land; loamy soil not in high cultivation. The corn was not fit to harvest until September. Although the season was very dry the corn was green through the season. I did not know a leaf to roll, when adjoining fields suffered very much with the drought, I assign the reason partly to the soil and ploughing deep; and partly to the barn manure which is made a considerable part from salt hay.

Yours, with respect,
BENJ. SLACK
MR HENRY COLEMAN.

SILK CULTURE.

We have received three books on the Silk Culture from Mr Kenrick, Mr Cobb and Mr Whitmarsh, one from each; of which the first moment of leisure we shall give an account. The silk business properly so speaking can be expected to make very little progress, while the mulberry tree speculation is going on. This speculation however may be expected indirectly to aid the silk business; as it will fill the country with the first requisite, the means of supporting the "operatives." While this speculation however is rife, every species of fraud, which can be introduced into it, will be likewise going on in a kind of "under-tow;" and many vexatious disappointments may be looked for. We have already heard of frauds in this matter, with men who claim to be respectable, which make us blush for human nature. We say to those who are disposed to engage in the business with a view to ultimate and reasonable success, "keep yourselves cool; look before you leap; wait until the boat gets to the wharf before you spring for the shore; and be sure when you do jump, that it is solid land on which you intend to place your feet and build your fire; and not on Simbad's island which proved only the back of a floating whale. The silk business is certain to succeed in the country, only as every other business that is worthy of success can succeed, by knowledge, skill, prudence, frugality, perseverance and industry; but the idea, which really seems to have added the brains of some men, of planting a morus multicaulis tree at night, and going out the next morning and finding half a dozen pair of silk gloves and hose with laced cloaks dangling from the branches, and perhaps, if the wheel of fashion has got far enough round for that, to find besides a pair of black

silk breeches with diamond knee buckles fastened to the strap on the same tree, partakes a little too much of the romantic for such sober people as we are to encourage.

Mr Whitmarsh's opinions are professedly grounded upon experience and observation. His experience is eight years old; and his observation embraces the best silk district in France and Italy. He states one fact with emphatical distinctness; that the seed of no mulberry can be expected with confidence to produce its like; although he does not commit himself by naming any particular tree, the inference from his advice and observation is strongly against the morus multicaulis for our northern latitudes. Our columns are open to any fair and calm discussion of these matters.

H. C.

THE WAR IN MAINE.

We are sorry that just after our Geologist had given us such charming accounts of the wheat soils on the Arostook, our possession of it should be made matter of violent question; and that our brother farmers in Maine instead of being engaged in stacking their grain in these fields should be occupied in the far less profitable and less welcome employment of stacking their arms. We are as sorry to say that the prospect of peace is not cloudless. The general government are evidently disposed to adjust the misunderstanding by negotiation; but when will this negotiation begin and when will it end? Will Maine agree to it? Having marched her troops up the hill, will she be satisfied with marching them down again? If she refuses to withdraw her troops, can the general government compel her to withdraw them? and how can that be done but by direct collision? If she refuses to withdraw them, and the government fail to compel her to withdraw them, will Great Britain ever consent to negotiate, while Maine holds armed possession of the territory in dispute? Can the fire of war be lighted up in that territory and not extend along the whole line? and the come misery and wretchedness and crime and outrage over the whole country, like the inundation of one of our mighty rivers. Suppose we have a general war with Great Britain, shall we be able to carry our point without negotiation? Admit, as we have no doubt that she is in the wrong; admit her rapacity for conquest and the extension of her empire in every possible direction for which she has always been notorious, do we soberly expect to whip her into the traces? What is to be the cost of a war to Maine suppose success certain after a three years' conflict? What is to be the cost of a war to our commercial, cotton and manufacturing interests? We might go on to ask these questions until the sun comes back again to the spot where he now is, but it is not necessary. We have our own opinion on all these matters; but in the Farmer they are contraband and cannot be admitted. War is no child's play. A battalion of troops drawn up in their clean-washed regimentals, in front of the State House on Boston Common, with their sparkling armor and their gilded epaulettes, and all the charms of the soul-stirring bugle and the deep toned drum filling the air in the month of June is a very pretty affair. But a battalion of men calling themselves christians, with the ferocity of tigers dealing death from a thousand blazing cannon among men like themselves strewing the fields broadcast with the mutilated, the dying and the dead, and then raising their arms crimsoned with human gore in the fiendlike exultation of conquest, make one shudder with horror, and distrust one's own identity as a human being; and ask in the tone of the angel in Franklin's fable, "who coming down to the earth in the time and on the very spot of a battle between two fleets in the West Indies, when he saw the decks of the ships bespattered with blood and brains, and saw the headless trunks rolling about and the scattered and smoking limbe,

d heard the roar of cannon and saw the piercing of the
yonets in boarding, whether this can be earth, or
hether indeed it is not h—ll?" H. C.

LARGE CALF.

Jabez Smith, Esq. of East Needham, informs us, that he
s raised a bull calf now 9 months old, which weighs
tween 700 and 800 pounds. He is of English blood,
d of perfect symmetry. The calf is offered for sale,
d may be seen on the premises.

BRIGHTON MARKET.—MONDAY, March 4, 1839.

Reported for the New England Farmer.
At Market, 320 Beef Cattle, (including 80 unsold
st week.) 80 St. Ires. 20 Cows and Calves, and 300
heep. 100 Beef Cattle unsold.

Prices.—Beef Cattle.—The prices obtained last week
r like quality were hardly sustained. We make our
otations without much alteration. First quality, \$9 00
\$e 25. Second quality, \$7 25 a \$7 75. Third quali-
y, \$5 00 a \$7 00.

Stores.—Very few sales.
Cotes and Calves.—Not half at Market were sold.
Ve notice the following sales, \$30, \$40, \$52.
Sheep.—Dull. Lots were sold at \$4 00, \$4 50,
nd \$6 00.

THERMOMETRICAL.

Reported for the New England Farmer.
Range of the Thermometer at the Garden of the proprietors
f the New England Farmer, Brighton, Mass. in a shaded
ortly exposure, week ending March 3.

Table with 4 columns: MARCH, 1839, 7 A.M., 12 M., 5 P.M., Wind. Rows include Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday.

WINSHIP'S NURSERIES, BRIGTON.

Just received from England and France, a rare collection
f Plants, viz:
Pears, Plums, Peaches, Apricots, Gooseberries, Pear
ocks, Purple Beach, English Elms, Japan Jinge Trees.
Striped, Myrtle leaved, Gold margined, and Weeping
riped Box Trees.
Common silver leaf, Fine do., Upright Golden, Smooth
eaved Golden, Balance do., Plain Screw do. do., Cameli-
a leaved do., Marginal and Hedgehog Hollies.
Portugal, English, Long narrow leaved, and short do. do.
aureles.
Azaleas, Rhododendrons, Thorns, Eglantines, 100 varieties
ew Roses, Oranges, Camellias, and various kinds of Green-
ouse Plants.
Orders will be promptly executed and forwarded to any
art of the country.

Orders may be left with JOSEPH BRECK & CO. or for-
warded by mail to Messrs. WINSHIP, Brighton, Mass.
Brighton, March 4.

FARM FOR SALE.

For sale a valuable farm, situated in Newton, half a mile
rom the Upper Falls Village and ten miles from Boston.
The farm comprises about 100 acres of land, one third of
hich is covered with a thrifty growth of wood and fencing
umber. It has a good well of water, besides a never failing
brook which passes through the farm. The buildings are
of ample size, and in good repair. A lot of about ten acres
of the land near the buildings, is on a level plain of superior
quality for the growth of the mulberry tree. For particulars
quire of Miss Ann Bent, 214 Washington Street, or of E. F.
Woodward, near the premises.
Boston, March 5, 1839.

FARM FOR SALE.

In Fitchburg; for a description of the same, see Massachu-
setts Spy. Apply to P. Williams, on the premises or to N. L.
Williams, No. 2 Montgomery Place, Boston.
March 6, 1839.

A BOAR FOR SALE.

The Subscribers are authorized, to sell a boar, half Berk-
shire; he is large of his age, being twenty months old.
Price \$75. Apply to
Feb. 6. ep JOSEPH BRECK & CO.

MULBERRY SEED.

Brussa Mulberry Seed, fresh and warranted good, for sale
by ROBERT G. SHAW & Co.
Feb. 20. 51 Commercial Wharf.

FRUIT TREES, &C.

Pears, Plums, Raspberries, Roses, &c.

The subscribers have recently received, per the Switzer-
land from Harve, a large assortment of the choicest varieties
of Pear and Plum Trees, from one of the best Nurseries in
France, together with a small Collection of superb French
Roses, all in excellent order for transplanting; which they
offer for sale at the New England Agricultural Warehouse
and Seed Store, No. 52 North Market Street. The Pear and
Plums are from 6 to 7 feet high, and will be sold at \$1 00
each.

PLUMS.

Downtown's Imperatrice Pordregon

2000 Red do do do
1000 Franconia do do (very fine.)
Orders received for Fruit and Ornamental Trees at Nur-
sery prices. JOSEPH BRECK & CO.

BRUSSA MULBERRY SEED.

We offer for sale a small quantity of Brussa Mulberry
Seed, by the pound or ounce, which may be relied on as true
and genuine. This variety of Mulberry is much superior to
the Morus Multicaulis, for this climate, being perfectly
hardy; said to be even more hardy than the common white.
JOSEPH BRECK & CO.

WANTS A SITUATION.

A Gardener who understands the management of a Green
House, Hot Beds, &c. has had long experience in the busi-
ness, and can produce the best recommendations. Apply at
Feb 27. JOSEPH BRECK & CO.

FARM IN GROTON FOR SALE.

The subscriber offers for sale, his farm in Groton, Mass.,
consisting of about 220 acres, much of it first rate land, and
in a highly cultivated and productive condition. There are
two dwelling houses, and commodious barns, and the place
may easily be divided into two good farms. It is well stock-
ed with fruit; with an abundance of fuel for use and sale,
and excellent water. It is difficult to find a place combining
so many advantages in respect to comfort or profit. It will be
so then eligible terms. Inquire at the N. E. Farmer Office
or to the subscriber on the premises.
Feb. 13, 1839. WILLIAM SALISBURY.

BONE MANURE.

The subscriber desires to inform his friends and the public
that he has been in the Bone business more than ten years,
and has spent much time and money to ascertain how bones
may be converted to the best use, and is fully satisfied that
they form the most powerful stimulant that can be applied to
the earth as a manure. He offers for sale ground bone at a
low price, and is ready to receive orders to any amount, which
will be promptly attended to.

Orders may be left at my manufactory, near Tremont road,
in Roxbury, or at the New England Agricultural Warehouse
and Seed Store, No. 52 North Market Street, Boston.
Sept. 20. NAHUM WARD.

Cherries, from bearing Trees, which have been proved in the
Pomological Garden, Salem, Mass., for sale by the subscri-
ber. Feb. 6. 6p ROBERT MANNING.

MISCELLANEOUS.

[From the New York Evening Star.]

THE NORTH WIND.

From the frozen North I come,
Where I'm nursed by the polar snow;
Arousing from my icy home,
Over the earth I blow.

I blow high in the air,
And the storm cloud hurries by,
And land and sea both speak of me,
With many a piercing cry.

With many a mighty crash
Widely the forest roars,
And furiously the white waves dash
Against the rocky shores.

With a sudden gust I raise the dust
High in the chilly air,
Then on I blow, and bank the snow
And drift it every where!

I rock the tall steeple—
I twirl the glittering vane,
Then roaring hoarse I slam the doors
And shatter the window pane!

I strew the leaves about the plain,
And strip them from the tree;
E'en the giant oaks with sudden strokes
All bow their heads to me.

Full well the farmer knows my force,
And the wanderer of the sea,
When I wreck the vessel on its course,
Or prostrate lay the tree.

I howl o'er the snow-clad farm,
I sweep the smooth barn floor,
And snore and sire crowd round the fire
As I crack at the cottage door.

Then wrap your cloak about you,
Or I'll tell you what I'll do;
I'll freeze your nose, I'll freeze your toes,
And I'll freeze your fingers too!

THE DEAF, DUMB AND BLIND.

In the Report of the Trustees of the Asylum for the Blind, last year, particular mention was made of a deaf, dumb, and blind girl, named Laura Bridgman, then a pupil of blind the Asylum, and a promise was given of further notice of her case. The Report of the present year contains the following account:—

It has been ascertained beyond the possibility of a doubt, that she cannot see a ray of light, cannot hear the least sound, and never exercises her sense of smell, if she has any. Thus her mind dwells in darkness and stillness, as profound as that of a closed tomb at midnight. Of beautiful sights, and sweet sounds, and pleasant odors, she has no conception; nevertheless she seems as happy and playful as a bird or a lamb; and the employment of her intellectual faculties, the acquirement of a new idea, gives her a vivid pleasure, which is plainly marked in her expressive features. She never seems to repine, but has all the buoyancy and gaiety of childhood. She is fond of fun and frolic, and when playing with the rest of the children, her shrill laugh sounds loudest of the group.

When left alone, she seems very happy if she has her knitting or sewing, and will busy herself for hours: if she has no occupation, she evidently amuses herself by imaginary dialogues, or recalling past impressions; she counts with her fingers, or spells out names of things which she has recently learned, in the manual alphabet of the deaf mutes. In this lonely self-communion she reasons, reflects, and argues: if she spells a word wrong with the fingers of her right hand, she instantly strikes it with her left, as her teacher does, in sign of disapprobation; if right then she pats herself upon the head and looks pleased. She sometimes purposely spells a word wrong with the left hand, looks roguish for a moment and laughs, and then with the right hand strikes the left, as if to correct it.

During the year she has attained great dexterity in the use of the Manual Alphabet of the deaf mutes: and she spells out the words and sentences which she knows, so fast and so dextrally, that only those accustomed to this language can follow with the eye, the rapid motions of her fingers.

But wonderful as is the rapidity with which she writes her thoughts upon the air, still more so is the ease and accuracy with which she reads the words thus written by another, grasping their hand in hers, and following every movement of her fingers, as letter after letter convey their meaning to her mind. It is in this way that she converses with her blind playmates; and nothing can more forcibly show the power of mind in forcing matter to its purpose, than a meeting between them. For, if great talent and skill are necessary for two pantomimés to paint their thoughts and feelings by the movements of the body, and the expression of the countenance, how much greater the difficulty when darkness shrouds them both, and the one can hear no sound!

When Laura is walking through a passage way, with her hands spread before her, she knows instantly every one she meets, and passes them with a sign of recognition; but if it be a girl of her own age, and especially one of her favorites, there is instantly a bright smile of recognition—an intertwining of arms—a grasping of hands—and a swift telegraphing upon the tiny fingers, whose rapid evolutions convey the thoughts and feelings from the outposts of mind to those of the other. There are questions and answers—exchanges of joy or sorrow—there are kissings and partings—just as between little children with all their senses.

One such interview is a better refutation of the doctrine, that mind is the result of sensation, than folios of learned argument. If those philosophers who consider man as only the most perfect animal, and attribute his superiority to his senses, be correct, then a dog or a monkey should have mental power quadruple that of Laura Bridgman, who has but one sense.

We would not be understood to say that this child has the same amount of knowledge that others of her age have; very far from it; she is nine years of age, and yet her knowledge of language is not greater than a common child of three years. There has been no difficulty in communicating knowledge of facts—positive qualities of bodies—numbers, &c.; but the words expressive of them, which other children learn by hearing, as they learn to talk, must all be communicated to Laura by a circuitous and tedious method. In all the knowledge which is acquired by the perceptive faculties, she is of course backward; because, previous

to her coming here, her perceptive faculties were probably less exercised in one week, than those of common children are in one hour.

What may be termed her moral nature, however, her sentiments and affections, her sense of propriety, of right, of property, &c., is equally well developed as those of other children.

She is now able to understand simple sentences expressive of action, as "shut the door," "give me a book," for she does not know the force of the particles, *the* and *a*, any more than a prattling infant, who understands—give cake—but puts in *me* and *a* from imitation, without knowing their meaning; or than many a child in school understands the difference between noun and verb, though he has gone through all the parsing exercises and can give a rule for every thing about it.—*Boston Courier.*

TULIPS, RANUNCULUSES, PINKS AND VIOLAS.

S. WALKER, of Roxbury, offers for sale in beds, or in such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland, France and England, to which yearly additions have and will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superb Tulips, will do well to make a selection, for themselves when the bulbs are in bloom, (about the 1st of June.) The prices will conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices, in the country where the bulbs were raised, and cheaper than the like quality can be imported.

Tulips in beds of from 30 to 100 rows, containing from 210 to 700 bulbs, or by the dozen, 100 or 1000.

Viola grandiflora—Pansy, or Heartsease. Upwards of 2000 superb varieties will be exhibited and offered for sale, when the Tulips are in bloom.

Ranunculuses—five mixtures, at from \$2 to \$5 per 100.

Tulips—five named varieties, from 25 cents to \$1 each.

For particulars apply to S. WALKER, or to JOSEPH BRECK & CO. eow

Tulips Ranunculuses, Anemones, Auriculas, Carnations, Picotees, Pinks, and Geraniums.

H. CROOM, of Waltham, near London, England, by appointment Florist to Her Majesty Queen Victoria, begs respectfully to call the attention of his friends and the admirers of flowers in America generally, to his extensive collection of the above flowers, which from his having been very successful in their cultivation this season he can offer at very moderate prices. He would particularly recommend to those persons about commencing the growth of the Tulip (which in England is becoming very fashionable) the under collections in beds, as it is by far the cheapest mode of purchasing them.

Tulips arranged in beds with their names

First Class.
A bed of 20 rows containing 210 bulbs including several of the newest varieties, - - - - - £15
A bed of 45 rows, - - - - - £21
A bed of 60 rows, - - - - - 25 guineas

Second Class.
A bed of 30 rows including many fine sorts, - - - £10
A bed of 45 rows do - - - £14
A bed of 60 rows do - - - £17 10s

Tulips not arranged.
100 Superfine sorts with their names from £7 7s to £13
Superfine mixtures, from - - - 7s 6d to 21s

Ranunculuses.
100 Superfine sorts, with their names from £3 3s to 25 5s
Superfine mixtures, from - - - 5s to 21s per 100

Anemones.
100 Superfine sorts with their names, - - - £3 10s
Superfine double mixtures from 10s 6d to 21s per 100

Auriculas.
25 Superfine sorts with their names, - - - £3 13s 6d
Catalogues with the prices of the other articles may be had on application.

AGRICULTURAL.

AN ADDRESS,

Delivered at the Annual Cattle Shows of the Worcester and the Hampshire, Hampden, and Franklin Agricultural Societies, Massachusetts. October, 1838. By HENRY COLMAN, Commissioner for the Agricultural Survey of the State.

(Continued.)

Agricultural labor is the basis and instrument of wealth. The laboring man is the original producer of all the wealth in the community, and in the world. The almost creative power with which God has endowed man, by which he casts the seed into the ground and by his fostering care matures the harvest, is among the most wonderful attributes of his nature. Let the children of luxury and fashion disdain, if so they choose, the humble labors of agriculture; for all they enjoy and possess they are first of all indebted to the agricultural laborer; and the very money in which they think they compensate him for his toil, and with which he in his simplicity is so easily satisfied, until the modern invention of fictitious capital and of the anticipations of future results in the form of bills of credit, was only the representative of the accumulations of his own previous labor. All the burdens of society are sustained, all its taxes are paid, all its improvements are effected by agricultural and mechanical labor. The manufacturers, who prepare the products of the earth for the use and convenience of man, or construct implements and machines by which man's toil is abridged, or his capacities of production extended, must be considered in the light of producers. The learned professions seem to be made necessary only by the follies or imprudences, or wickedness of mankind. The professors of the fine arts, the artists, are the mere embellishments of the social edifice, beautiful and charming when in their proper place. The intellectual teachers of the community, when they perform their high duties faithfully and philosophically, exalt the condition of man and multiply his capacities for labor and enjoyment. Agriculture and the mechanic arts are most largely indebted to science for their productiveness and utility. But one of these are producers in the proper sense of that term. All the burdens and all the support of the community fall upon labor. Nor do the accumulations of the labor of other years in the form of money; nor the bestowment of permanent funds or public uses; nor the discovery of a gold or silver mine; nor pecuniary endowments for any benevolent or moral purpose in the form of vested funds, in any respect abridge or alleviate labor. Capital itself in any form, if brought into active use, only a new demand upon labor. Capital itself, and its accumulations be ever so great, of itself will produce nothing. It is labor only that can render it productive, and that in truth pays all the income which is supposed to be derived from it.

When by a liberal endowment provision is made in the form of permanent funds for the support of some public institution, it is often said that nothing farther will be needed; but the intelligent observer will perceive that these funds will produce nothing of themselves farther than to stimulate production; and that, not by any intrinsic efficacy, but by a mere political and conventional agency; but all production must come from labor; and this too from labor applied to the earth. Not infrequently we hear the passengers in a stage coach complain of the slowness and refractoriness of the overloaded, jaded, and half-fed horses, and of their own fatigues and sufferings even on a jaunt of pleasure. In some cases, if it were practicable, it would be only just that such persons should be put into the traces, and the horses into the carriage. But, "have they not a right to complain if they will? Do they not feed the horses?" Yes and whip them too. But will they not remember, that the very feed by which these horses are sustained, is the product of fields which these same horses ploughed. The whipping is a pure gratuity; and is to be received doubtless with all due gratitude. Labor, physical labor is the great instrument of all subsistence, of all wealth and of many of our pleasures. Think of this, ye children of luxury and fashion! When you repose on your beds of down; when you traverse your magnificent halls with their soft carpets, their festooned tapestry, their gilded cornices, their glittering lamps; when you set down to your overloaded boards, steaming with every luxury from every clime; when you challenge the passers by to admire your pillared palaces; your ornamented grounds; your luxuriant gardens; and the ten thousand appendages of beauty and taste with which you stand surrounded, remember that all this is the produce of labor; daily, hourly, nightly toil; of the swinging of many a tired and lacerated muscle; of the sweat of many a reeking and haggard brow. Happy if it be not an abused and unrequited toil. Yours is in many cases only the labor of enjoyment.

I will not farther detain you with other illustrations of the value and importance of labor, with which every department of society is full. I do not complain of labor as an evil. Through the pride and insolence, through the avarice, or inhumanity, or recklessness of some who hold the power it may be made, it often is made, a dreadful evil. But the necessity of physical and mental exertion is a beneficent arrangement of divine providence; and a situation involving no necessity of personal exertion and labor, neither physical nor mental, is never a subject for envy.

What then is the duty of an enlightened and just community, towards labor; agricultural labor in particular?

I do not begin by asking you to compensate it. This, a just and beneficent providence will take care of, if you do not interfere by your avarice or your injustice, to rob it of its proper wages. Say what we please of the unproductive returns of agricul-

tural labor even in Massachusetts, boast as much as we choose of the exuberant crops of the virgin West, or the reeking vegetation of Southern climes; this I assert with confidence, that the returns of agricultural labor even in Massachusetts, afford as ample a compensation as a reasonable mind can ask. This I could establish by irrefragable evidence, did the time admit; but it will be my province to do it in another form. I will refer, however to two established facts. From the returns of hundreds of as intelligent farmers as are to be found in the state I have ascertained the fact, that charging labor at one dollar per day for a man, and the same for a single team, in a six years course of two manured crops and four unmanured, say for example potatoes, corn, small grain and grasses, that after paying the interest upon the land at fifty dollars per acre, and taking only a fair average of crops under good cultivation, it gives a return of fifteen to twenty per cent. per year. This, when especially the greater security is taken into view, and all the wasted capital and risks and losses on the other are brought into the account, is as good a return as has been gathered from any commercial or manufacturing stock in the country, in the same length of time, extraordinary circumstances always excepted.

The other fact to which I refer, none of you will controvert. In my intercourse with the farmers of Massachusetts, I can recall hundreds of instances of competence and substantial independence where the owners began life without a dollar, in comparatively poor and inauspicious locations, and by the labor of their own hands have supplied their own wants, reared and well-educated numerous families; and now, free from debt and with all the ordinary comforts of life, are set down to enjoy the calm evening of age, free from corroding cares, in the grateful acknowledgment of that kind providence which has led them thus far on the journey, in a soothing and cheering retrospect of the past, and in humble and animating hopes for the future. Massachusetts is every where, even in what would seem to be its most inhospitable localities, dotted over with these examples of rural comfort and independence. But pecuniary compensation is not the only nor the best compensation with which a wise and beneficent providence requites intelligent, well directed, persevering, and honest labor. Health of body and health of mind; calm repose at night; interesting and ever varying occupation; the spurtings of hope; the satisfactions of harvest; the exquisite pleasure of dispensing; the consciousness of honorable self dependence and useful exertion; the pleasure of eating bread raised by one's own hand, and of wearing the products of your own flocks; the exercise of a generous hospitality without stint; the freedom from anxious cares; and the charming and delightful conviction that in multiplying the products of the earth, and in beautifying and fertilizing the little spot which God permits you to occupy, you are directly, constantly and effectually contributing to the public welfare, happiness and improvement, and stimulating and forming

those around you to habits of useful industry, these are the best compensations of honest labor; these are rewards which no golden standard can measure.

I have said that labor will secure its own compensation, under the just laws of divine providence if you do not divert its overflowing streams of just recompense from their proper channels, nor drain them before they reach their true owner; nor demand unjustly for your own ease and luxury, the unreasonable appropriation of his time and talents and earnings, because you have the power to enforce it; nor when he asks for the bread and the fish which his toil or his perils have earned, throw out to him only a stone or a scorpion, though you may pretend the stone is a diamond, and dazzle his vision with the gilded scales of the reptile.

Let me speak in this case without a figure. In a community approaching any thing like a perfect condition, as there should be no idleness, so there would be no want. No man, woman, or child, capable of rendering by honest labor some service to the community, should be excused from that labor; least of all should they be relieved from supplying as far as possible, his or her own wants. That all should be served, then all should serve. It is easy to say what should be; but in the present condition of human nature, we must be content with the most humble approaches to such a standard. When we consider what a large portion of most communities are living without producing a single dollar by honest industry, and living too in luxury, we cannot but admit that unjust burdens are imposed upon the honest and laborious. No one should be exempted from taking his share of the burdens of the community, and rendering his service for its benefit. I would complain of no man who loses his time and talents of body or mind for the common good or happiness, in any innocent form, whether of pleasure or of profit, of use or of ornament, in which the community chooses to be benefited. But every man, woman and child, should labor in some honest profession, trade, or business, or they should be cut off from the privileges of the community. Labor should be honorable. Idleness should be such a disgrace as to be sure to lose a man his caste in society. While no provision should be spared to make those comfortable, who through misfortune, incapacity, or advanced age, are incapable of providing for themselves, a man living without honest occupation, deserves little better than the house of correction, or the penitentiary, where the state should furnish him with honest occupation; and as to the idle and profligate and wasteful and dissipated, before industry should be taxed with their support, they should die in the streets, whether with ruffle shirts on, or no shirts on. So likewise would I annul all your eleemosynary provisions for the gratuitous support of those, who are not unable but not willing to support themselves, for these are all unjust taxes upon labor. But it is idle to talk of these Utopian schemes of reform.

Some things however, are practicable. The community may do much to secure to their lawful owner the honest wages of industry by removing the facilities and temptations to corrupt and wasteful, and immoral expenditure. As a virtuous, just, and christian community, the government are particularly bound by every principle of duty, to abate and remove the facilities of intoxicating liquors. Hundreds of hundreds of valuable farms, teeming with the products of industry, have been gradually

drawn in and engulfed in this dreadful maelstrom of ruin; and whole families have sunk with them, striking with horror and agony a whole community, and robbing it of its best treasures. Here then the government are bound to interpose, as matter of self protection and of common humanity. I am for no party in this case. I go for the cause of temperance, and for that only. In a case where humanity, bleeding, suffering humanity calls so loudly upon us, where broken-hearted wives and distracted mothers, and abused, deserted, and suffering children come in crowds to ask for mercy and pity at our hands, and where the ground steaming with the fresh-shed blood of murdered wives and children, fallen by the hands of the drunkard, cries to us in shrieks of agony, for God's sake, for the sake of all that is humane and just, do not let any miserable, selfish, party, passionate considerations on either side blind our eyes to the path of right, or prevent our keeping in it. This is no case for passion, but for solemn duty. If the law regulating licenses passed at the last session of the Legislature, and which is now agitating the commonwealth to its centre, be good, let it be maintained; if wrong, let us reject it. If the people approve it, let us lend our aid to sustain it; if otherwise, we should seek its repeal, for it is in vain to attempt any reformation wholly in opposition to the public sentiment. This too I say farther, and in perfect sincerity, that if any man or any party will propose any measure less objectionable or more proper—more effectual to the suppression of this dreadful vice, this wholesale plunderer of the earnings of labor, we should instantly send in our cordial adhesion.

There is another protection that honest labor asks at the hands of the community; and that is, that it should not be robbed of its earnings by any fraudulent form in which these wages are paid. The laboring classes are more than any other class in the community interested in the condition of the currency. It represents their earnings; formerly it represented only the actual accumulations of labor; now, by an invention of modern times in the form of bills of credit, it anticipates contingent profits and represents what is expected to be earned. The credit system has been to the country the source of great advantages and improvements; but all the abuses which it has suffered, and all the losses, which those abuses have occasioned, have fallen directly and entirely upon labor.

Banks, in their legitimate design, were intended for the safe use of the accumulations of previous labor, in the form of capital, in order to stimulate and assist honest industry and enterprise; and in a young country where the means of wealth are so abundant, to create a capital for immediate use by a reasonable reliance on future returns. No object could be more just and useful, and no scheme better devised under a safe and honest direction. No one could question the safety and propriety of such an operation, where the loan of this quick capital was secured by an undisputed lien upon real property of equal and certain value. The only difficulty lies in the creation of a purely fictitious capital and the extension of credit upon contingencies. It is obvious that these operations could only be safe when after a thorough consideration of probabilities and chances, such loans correspond with the power of the borrower to meet his demand fully and certainly, when the time of the loans should expire. This could only be determined by the occupation of the debtor, his habits,

skill, enterprise, and character; and it was the clearest dictate of prudence and justice, as well for the creditor as the debtor, to keep always far within the limits of safety. Had this always been done, all would have been well. But when banks are instituted without any substantial capital honestly paid in, and in the true spirit of the law "to remain there as part of the capital of the bank;" when credit is extended beyond all safe and reasonable limits; when capital is loaned not for the aid of honest industry and private and public improvements, but for the purpose of enhancing the nominal value of property on which no labor is expended, and no improvements are made or even designed to be made; when a flood of irresponsible paper is thrown upon the community for purposes not of honest trade, but of gambling and speculation, then comes the terrible and disastrous explosions of the last year. Their labor is every where tickled and lulled by soft and magnificent promises, while her pockets are picked by the gross, ostentatious villany and frauds. It is clearly the duty of the government to protect the laboring portion of the community against such wholesale treachery. It is hoped that the country has learnt a lesson of wisdom which it will not soon forget. The flood of unsubstantial, fictitious capital, which was poured out upon the country three years since, could it be followed out in all its ramified and various consequences, led beyond a question to frauds, any crimes, and licentiousness, and losses, and miseries which the most brilliant successes of honest trade even for a quarter of a century, could hardly atone for. Next to a bank that cannot pay because it never had any thing to pay with, is a bank that puts it out of its own power to meet its promise; and maintain its honor, by its own improvident and extravagant issues and loans. It is a novel measure of right when the law of obligations among individuals may be violated by corporations with impunity; and there is some little ground to doubt the soundness of the discretion, when justice is only acquits the delinquent on account of the necessities of his condition, necessities it may be his own voluntary creation, and the powerful temptations to which he was exposed, in many cases temptations of his own procuring, but disrobing herself of her high dignity, commends him for the adroitness of his delinquency.

(To be concluded.)

We thank an esteemed friend for the following communications, and like poor Oliver Twist, "v humbly ask for more." There is much more where this came from; and it is that true charity which does not impoverish but enriches the donor. I will have at least in such contributions the delightful consciousness of being useful. The fact referred to in the last paragraph of engrafting the tomato upon the potato vine is a curious one; as the tomatoes on top, and the potatoes at the bottom of the same vine is a sort of mermaid cultivation which if not useful is at least amusing.

Translated from the "Bon Jardinier" of 1838.

THE POTATO. *Solanum tuberosum.*

We speak of this plant only to remind gardeners that it is well to plant when it can be done, so of the earliest varieties in a good exposure, in order to obtain the root as early as possible. What is the object no manure must be used, and the land chosen should be a dry, sandy soil. The planting is done in March, (in France,) and on the 1

of each hill a handful of litter is laid to protect the shoots when just above ground, from the cold. The *heteroclit*, the *early dwarf*, the *August tuber*, and the *fine early*, a new variety received from America by Villanorin, and excellently suited to early planting.

We take this occasion to observe that the potato is easily propagated by sprouts, and to point out a very simple method which is in use among some gardeners. In March large potatoes are laid on a bed and covered with a glass frame. They soon throw out sprouts in abundance, which are separated when from 6 to 10 inches long, and 3-4 covered with soft well prepared earth in a favorable exposure, only the extremities of the shoots being left out of ground, on which a little light straw must be laid to guard against cold.

Here it is customary to eat only the tubers of the potato, but Loudon tells us that according to Dr Clark, the tops of the stalks or vines are eaten in Sweden, boiled, and are considered a delicacy.

TOMATO, love apple, *Solanum lycopersicum*. An annual from Mexico. (From the same.)

Sown early, under glass, to be transplanted to the open garden, under a south exposure, when the danger of frost has ceased, at 24 or 30 inches distance. When the plants are 15 inches long, they are fastened to a prop or trellis; when two or three feet long the growth is stopped by nipping off the extremity of the plant. Afterwards the secondary shoots are nipped, just above the flowers. When there is a good number of fruits, half grown, the leaves are partly stripped, and the new shoots cut off. In the latter part of the season the leaves are completely stripped, that the fruit may be entirely exposed to the sun. It wants a deal of water in summer.

Some gardeners in the neighborhood of Paris raise early tomatoes in the following manner. Sown in January under glass. Transplant in February, also under glass, when the plant is strong enough. The bed must be kept at a high temperature by stoves, at the same time the inside of the boxes must be guarded from moisture as much as possible. In March they are again set out, finally, on a new bed, two and a half feet wide, which receives two rows, in quincunx order. A bell glass is put over each and the air admitted when the weather allows. The glasses not to be taken away till the middle of May. About three weeks after setting, all but two branches are removed, which are attached to a string going from one end of the bed to the other. When the plant is strong and the fruits are formed, it is nipped off above the second or third bunch. They ripen from the end of June, through July. For this purpose an early variety with criped leaves is employed.

Of the tomato there are several varieties; the *large red*, which is furrowed, most cultivated for the kitchen; *large yellow*, a new and fine subvariety of the last; *small red*, *small yellow*, the *pear tomato* and the *cherry tomato*. The seeds retain the power of germinating for 3 or 4 years. The tomato is successfully grafted on the potato, by the herbaceous graft of Tschudy. In this way a crop of potatoes is obtained, under ground, and a crop of tomatoes from the vines.

The oftener carpets are shaken, the longer they last, as the particles of dirt and sand which collect upon them grind the threads. Sweeping them also wears them.

(From the Old Colony Memorial.)

ROTATION OF CROPS.

It is a principle well understood among scientific farmers, that ameliorating or enriching and exhausting crops should alternate or follow each other in succession.—Green crops, such as Beets, Turnips, Carrots, Cabbage, Potatoes, &c., which on account of their broad system of leaves, draw much of their nourishment from the atmosphere, are called enriching or ameliorating crops.—White crops—Corn, Rye, Wheat, Oats, Barley, &c., whose leaves become dry, receive nothing from the atmosphere, but draw all their support from the soil, while ripening their seed, are called exhausting crops.

As the success of the farmer in a great measure depends upon a judicious system of Rotation—and as this subject has not engaged the attention of more able writers, (in this section of the country) whose deep researches and longer experience has better qualified them for the important task, I will venture to suggest a system of rotation for a farm of twentyeight acres of land suitable for convertible husbandry, divided into seven lots of four acres each; we will suppose it all in sward. The first year, after liberally dressing four acres with green unfermented manure, we will plough, roll, harrow, and plant with Indian corn and potatoes. The second year we will take up four acres more, going through the same process; and on the first four acres, with additional manure, we will raise some of the green crops, Ruta Baga, Mangold Wurtzel, and Carrots. The third year we will take up another four acres and lay down the first with grass and some of the white crops, as Wheat, Rye, Oats or Barley, and so on, until we have gone through the seven lots when we will commence again with the first (in the same manner) which will then have lain four years in grass; and we venture to predict that a farm managed in this manner, with a tolerable dressing of manure, for the two first crops, will increase in fertility and yield an annual profit that will richly repay the labor and expense. But the question may arise, where am I to get manure to dress eight acres yearly? Make it. The man is not worthy to be called a farmer, who cannot, with five head of cattle and two hogs, make two hundred loads yearly. Cart into your barn-yard and hog-stye, mud, loam, leaves, straw, &c. &c. Judge Buel says, "the importance of every species of vegetable and animal matter as a manure for the soil may be made apparent to every farmer by a few plain considerations. Every kind of animal matter is derived originally from vegetables, and is convertible again into vegetables—and every part of a vegetable is in like manner convertible into new plants. The elementary matters of a species of vegetable, are always the same; that is, a stock of wheat or a stock of corn grown this year, contain the same materials, and in about the same proportions as they did last year. These materials which constitute the wheat or corn crop, are principally drawn from the soil, and consequently the fertility of the soil is diminished in proportion to the number and amount of the crops which are carried off. However rich therefore a soil may be naturally, it must be evident that every crop serves to diminish its fertility—that it becomes poorer and poorer every year, until it is no longer worth cultivating, unless fertility is kept up by restoring the vegetable matter or a large portion of them, which have been carried off. We have all seen this proved in numerous instances under the old

system of farming. To prevent decrease of fertility is one of the improvements of modern husbandry; and it is prevented by manuring and alternating crops. Under the old system the rich lands of the west will deteriorate till they are no better than those of the Atlantic border—under the system of manuring and alternating the ordinary lands of Flanders have been made to maintain their natural fertility for hundreds of years, and those of China for thousands of years, and many of our worn out lands are now being in like manner renovated." C.

Mattakes, Feb. 20.

(From the Pontiac Courier.)

BLOODY MURRAIN.

Many cattle in this state, Ohio, and the Western states generally, die of a disorder called Bloody Murrain. Some years since, I lost a fine ox by this disease. As far as I know it has baffled all attempts that have been made heretofore to effect a cure and has been considered fatal.

Last week, one of my oxen was attacked violently with this disorder. I supposed he would die as a matter of course, but unwilling to lose such an excellent animal without doing any thing to save his life, and being advised to try coppers, I went to look for some, and happening to observe a paper of alum, the thought struck me of mixing the two together, and make an experiment with them. I mixed about half an ounce of each, (coppers and alum) in about a quart of hot water, which was put in a bottle and given to the ox. In about 12 hours, finding it had helped him, I repeated the dose, with the most happy effect, as in a few hours afterwards he ate some bran that was offered him. He is now quite well, although very weak from the discharge of blood which attends the disease.

The publication of the above may benefit my brother farmers, and I would therefore request you to insert it in the Courier. Yours, &c.,

ELISHA SHILDEN.

Waterford, Jan. 22, 1839.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, March 2, 1839.

Benjamin V. French Esq. exhibited the following apples; *Mela Carla*, Royal, Bourassa, and Fearn's Pippin. Also King's Bonchretien Pear. This Pear was imported from France among a large collection of fruits, by the late Hon. Rufus King. The original name was lost; it was introduced to notice by the late James Bloodgood of Flushing, N. Y. who gave it the name by which it is now cultivated. It is of second rate quality, and valuable only in the absence of the finer varieties.

Mr Manning exhibited, Pennock's red winter, the Danvers Winter Sweet, and one unnamed variety from France.

A basket of beautiful red apples (unnamed) were sent by Judge Heard; they had much the appearance of the Spitzemburg, but could not positively be identified as that variety; they will undergo further investigation.

For the Committee,

ROBERT MANNING,

N. E. FARMER.

We are well acquainted with Low's work, an account of which, given by an esteemed correspondent, is subjoined. We concur in all which is said in its favor; and are happy to learn that it is to be reprinted in numbers with all due despatch in the Rural Library published regularly in New York; and at a price more than 75 per cent. less than the cost of the English copy. We avail ourselves of this opportunity to commend to our brother farmers, with a high opinion of its usefulness and the strongest wishes for its success, this same Rural Library, which is designed to embrace the best standard works in agriculture, and is published by Saml. Fleet in New York at a very reasonable rate. We are authorized to say that the publishers of the N. E. Farmer will be happy to act as agents for this or any other agricultural works published in the country.

H. C.

ELEMENTS OF PRACTICAL AGRICULTURE,

Comprehending the Cultivation of Plants; the Husbandry of Domestic Animals; and the Economy of the Farm. By DAVID LOW, Esq. F. R. S. E. Professor of Agriculture in the University of Edinburgh. 1 vol. 8vo 2d Edition with alterations and additions, and above 200 wood cuts.

To the Editor of the N. E. Farmer.

SIR.—A wish to extend to others who may not be immediately able to procure the book for themselves, a portion of the gratification which I have found in its perusal; and a desire to make some return in kind for the pleasure as well as improvement which I have never failed to derive from the columns of your paper; have induced me to forward you the following brief notice of the work, whose title forms the heading of the present communication.

To give you an idea of the expectations with which I entered on the perusal of the book, and of the spirit by which the accompanying critique might consequently be supposed to be determined, it will be sufficient to say, that I had fully before my mind's eye, the sensation which its first edition produced on either side of the Atlantic, that its author was not only one of the most distinguished members of a society, which, as you not long since remarked, did more for the agricultural improvement of Scotland, than any other similar institution that could be named, had effected for that of any other country in the world, but that he was one of the professors of an university whose chairs have been honored for the last fifty years, as they continue to be graced at the present moment, by master spirits in every department of human learning. It will readily be conceived, that a work which could justify the anticipations, such remembrances were calculated to excite, can hardly be unworthy of your notice or of the attention of your readers. That it has done something more even, will I presume be apparent from the following coup d'œil, the only sort of notice consistent with the space which in periodicals like the Farmer can be allotted to such purposes.

The title page (perhaps from those suggestions of modesty which men who have least need, are always the most inclined to listen to) gives by no means, so satisfactory an idea of the nature of the contents as it might be very easily made to do.

The author, in his introduction, notices for the purpose of exposing its precipitancy and nonsense,

one of those mistakes in which the ignorant and the educated, those who admit as well as those who deny the advantages of book farming, would be most likely to agree, viz. that a knowledge of the system of agriculture of our country, or, what is the same thing to every individual who has not travelled and seen for himself, an acquaintance with the publications in which that system and the reasons on which it is founded are explained, is of no use to the agriculturists of another country whose climate and productions are greatly if not, loosely speaking, altogether different.

This is an idea so prevalent amongst those who, from their very numbers must long continue to influence the agricultural character of these states, that I shall leave professor Low to settle the matter with them in the best way he can, and you, and your fellow-laborers in the different sections of the union, to allow for those deficiencies which the limits of his undertaking did not allow him to fill up.

He says in the introduction already alluded to, "However different may be the natural productions of countries, and however necessary it may be that the farmer adapt his operations to these differences, yet there are rules and maxims in the art, common to the husbandry of all countries; and he who is thoroughly acquainted with one good system of practice, applicable to any one of the situations in which the farmer may be placed, has the means by an easy analogy, of applying his knowledge to other, and even dissimilar ones." And in another paragraph the person who could manage a farm on the banks of the Tweed, could hardly fail of success on the banks of the Ohio or *vice versa*.

Before entering on the details of the first great division of the work, the author takes a rapid and condensed survey of the facts which geology has contributed for the illustration of the theory of the formation of soils—of the aids which chemistry has given by analysis, and practice has confirmed by experience—of explaining the nature, operation and means of increasing manures—or for preserving or increasing the productive powers of the soil—of the implements of every kind necessary to the work of the farm, and of the necessity of such a degree of knowledge of the principles on which they are constructed as would at once enable the farmer to correct the mistakes of ignorant mechanics or supply the want of skill of his own workmen—of the operations of tillage—preparation of the land for crops—succession of crops—illustrated by wood cuts wherever the nature of the object in view rendered the thing necessary or desirable.

Then comes the cultivation of plants to which all I have mentioned, though containing a mass of curious and instructive matter gleaned from the practical husbandry of every civilized nation on the face of the earth for which it would be idle to look in any other single publication extant, is only considered an introduction, rendered necessary by the comparative perfection to which the science and art of agriculture have been brought within our day.

In this section we are inducted into the best known modes of cultivating every kind of plant which man has ever yet devoted to the promotion of his comfort, his luxury or his interest. The habit or birth-place of each individual—the latitude and longitude to which its production may be extended—the probable results as to profit or loss of acclimating in climates where they do not nat-

urally, grow the plants and vegetables of other countries which fashion or habit has made necessary of all, &c. &c.

In the husbandry of domestic animals we are supplied with all the details as to the breeding, rearing, and improvement in this line which the most judicious experiments and persevering experience under every variety of circumstances could be expected to collect on such a subject. The sketch, for as such it is only given in connexion with the principal object of the work, until the time will allow the author to amplify it into a more comprehensive form, must be particularly valuable to all American farmers who are devoting particular attention to the improvement of their stock.

The economy of the farm lays down principles which may be modified to suit any object to be desired for the erection of buildings, the division into lots for the most easy attainments of the cords that should be kept in view, the construction of fences, gates, &c. The capital necessary for the successful and profitable management of a farm. The necessities without which no farmer should enter on the cultivation of ground. The proportion of live stock to the extent of farm—expense and produce of the same—operations of the farm in the order of time. Showing the most judicious and profitable way of disposing of every month, week, day and hour of the year. In the words of the Edinburgh Philosophical Journal, "No work on agriculture has appeared in our time which will bear a comparison with this excellent, and we would say classical work, of Professor Low. It will become the manual of practical agriculture for the British empire; and the judicious views and sound rules of our author will unquestionably prove beneficial to the agriculturists of other countries." D. W. C.

Westchester Co.

The agricultural public will feel themselves much indebted for the subjoined communication. The facts to which it refers are astonishing; but nature is full of such wonders. The cause assigned for the curious facts, which are here referred to we are disposed to regard not only as possible, but highly probable. The effects which are here supposed to follow the toil of these diminutive and humble laborers need not excite any surprise, when we recur for a moment to the immense coral reefs to be found in various part of the tropical regions and the large islands of the Pacific, resting upon these coral formations and the abodes of a large population, the basis or sub-stratum of which islands are the product of the indefatigable labors of the little and humble coral insect. It would seem to be almost a law of divine Providence that the greatest effects should spring from the humblest causes.

We owe an apology to our esteemed correspondent for delaying the publication of this valuable article. He may be assured that though postponed it was not neglected; and that we shall always heartily welcome his communications. H. C.

PROVIDENCE JAN. 14, 1839.

MR COLMAN—I have condensed the following article from a communication upon the formation of vegetable mould, made to the Geological Society of London, by Mr Darwin, and inserted a paragraph or two of my own. The season will soon recur, when opportunities will be presented to those who delight in observing the curious phenom-

na of the animated world to refute or confirm the views herein contained.

Mr Darwin states that his attention was called to the subject of his communication by Mr Wedgewood of Staffordshire, who showed him several fields, which a few years before, had been covered with lime, and others with burnt marl and cinders. These substances are now buried several inches beneath the surface, though the fields have remained undisturbed since they received the top dressings.

Previously to fifteen years since one of the fields was waste land; but at that time it was drained, trowed, ploughed and well covered with burnt marl and cinders. It has not since been disturbed and now supports a tolerably good pasture. The section here was, turf half an inch thick, mould two inches and a half, a layer one and a half inch thick, composed of fragments of burnt marl, (conspicuous from their bright red color, and some of considerable size, viz. one inch by half broad, and a quarter thick,) of cinders and a few quartz pebbles mingled with earth; lastly, about four and a half inches beneath the surface was the original, black, peaty soil. Thus beneath a layer nearly four inches thick of fine particles of earth, mixed with some vegetable matter, those substances now occurred, which fifteen years before, had been spread on the surface. Mr Darwin states that the appearance in all cases were as if the fragments had, as the farmers believe, worked themselves down. It does not, however, appear at all possible that either the powdered lime or the fragments of burnt marl and the pebbles could sink through compact earth to some inches beneath the surface and still remain in a continuous layer. Nor is it probable that the decay of the grass, although adding to the surface some of the constituent parts of the mould, should separate, in so short a time, the fine from the coarse earth, and accumulate the former on those objects which so lately were strewn on the surface. Mr D. also remarks, that in fields near towns, which did not appear to have been ploughed, he had often been surprised by finding pieces of pottery and bones some inches below the turf; in a similar manner on the mountains of Chili he had been perplexed by noticing elevated marine shells, covered by earth, in situations where rain could not have washed it on them.

In the spring of 1835 a boggy field was so thickly covered by sand that the surface appeared of a red color; but the sand is now overlaid by three quarters of an inch of soil. About eighty years ago a field was manured with marl; and it has since been ploughed, but it is not known at what exact period. An imperfect layer of the marl now exists at the depth, very carefully measured from the surface, of 12 inches in some places, and 14 in others, the difference corresponding to the top and hollows of the ridges or butts. It is certain that the marl was buried before the field was ploughed because the fragments are not scattered through the soil, but constitute a layer, which is horizontal, and therefore not parallel to the undulations of the ploughed surface. No plough moreover, could reach the marl in its present position, as the furrows in this neighborhood are never more than eight inches in depth. Thus in eighty years the marl has been covered with a bed of fine earth averaging 13 inches in thickness.

The explanation of these circumstances, as suggested by Mr Wedgewood to the author, although it might at first appear trivial, he did not doubt was the correct one, viz. that the whole is due to the

digestive process by which the common earth worm is supported. On carefully examining between the blades of grass in the fields above described, the author found that there was scarcely a space of two inches square without a heap of the cylindrical castings of worms. It is well known that worms swallow ear by matter, and that having separated the serviceable portion, they eject at the mouth of their burrows the remainder in little intestine-shaped heaps.

The worm is unable to swallow coarse particles, and as it would naturally avoid pure lime, the fine earth lying beneath either the cinders and burnt marl, or the powdered lime, would, by a slow process, be removed, and thrown up to the surface. This supposition is not imaginary, for in the field in which cinders had been spread out only half a year before, Mr Darwin actually saw the castings of the worms heaped on the smaller fragments. Nor is the agency so trivial as it at first might be thought, the great number of earth worms making up for the insignificant quantity of work which each performs.¹⁷

Any one may satisfy himself of the immense multitudes of these creatures that are at work in nearly every field, meadow and pasture, by careful observation in the spring.* Not unfrequently in two or three nights, in favorable weather for their operations, a large tract of land will be covered entirely by their ejected matter. Observing, some years since, the vast number of little earth heaps that had been formed in a single night, and that not a single worm was to be seen in the day time, I provided myself with a lantern on a dark drizzly night, and was surprised to find the whole surface of a large yard literally covered with them. It was absolutely impossible to cross the yard without crushing thousands of them to death, provided however you walked with as little noise as possible, for by stamping the foot, every worm over a considerable area disappeared in an instant.

Thus we perceive what insignificant agents are employed in the economy of nature in effecting important modifications in the condition of nearly the whole superficial covering of the earth. These facts have hitherto been disregarded and it is not improbable that their value is as yet very imperfectly appreciated. O. M.

REPORT

of the Committee of the Massachusetts Agricultural Society on Vegetable and Grain crops.

The committee of the trustees of the Massachusetts Agricultural Society, "On Vegetable and Grain Crops," recommend that premiums be paid to the following persons, viz.

To John Moorehead of Marshfield, co. of Plymouth, for his crop of carrots—632 bushels on one acre. \$30

To Jona. F. Southwick of Uxbridge, co. of Worcester, for his crop of Ruta Baga—825 bushels to the acre. 30

*An ingenious and observing friend informs me that he has never seen the earth worm in new or uncultivated fields. Is this fact universal?

This fact I believe is not universal. I think I have seen them in new lands; though the places in which they are most commonly to be met with and in greatest abundance, are places that are surcharged with rotten manure and decayed vegetable matter; and especially, if such places abound in moisture, as in places where soap suds and the wash of the house is thrown. It is their well known habit to come to the top of the ground in the evening after a warm rain; possibly because they can then work to the greatest advantage.

To Amos Sheldon, of Beverly, co. of Essex, for his crop of Indian corn—being 80 bushels on one acre. \$30

The statements in these cases, the committee advise to have published as a part of this report.

Mr John L. Cooper of Sheffield, co. of Berkshire, offered a claim for the premium on winter wheat—35 4-5 bushels, which was found inadmissible from the want of a certificate as to the quantity of land—an essential document.

Mr Tristram Little of Newbury, presented a claim for the premium for the "greatest quantity of vegetables for home consumption and not for sale." The quantity was too small in the opinion of the committee, to merit the premium.

The same gentleman sent in a statement of a small experiment as to compost manure,—which we consider too small to attract the public notice much, and not minute enough to deserve a premium.

The committee regret, as they have done for years past, that so few of our intelligent agriculturists have made application for the handsome premiums—more than twenty in number—offered by the society for vegetable and grain crops. They wonder at it the more as the past season proved a bountiful one for all grains, and for all vegetables excepting potatoes. A great portion of the articles on which premiums were proposed, now enter into the common husbandry of the state as food for animals. This almost total absence of claims the committee have reason to believe is owing more to inattention to the advertisement of the society, than to any other cause.

The statements of the several claimants detailing their method of cultivation will follow without delay.

J. Moorehead's account of Carrot Crop.

MARSHFIELD NOV. 12th, 1838.

B. GUILD Esq.—SIR—I send you the amount of a crop of carrots raised by me the present season on one acre of land, which was planted with carrots in 1837. The produce was eleven tons and one half. I planted the same piece the present season with carrots; the manure used was a mixture of barn yard manure and kelp; the quantity was 50 loads of one horse. I carted out my manure about the middle of May, I spread my manure and ploughed about the 24th and 25th of May. Began to plant June 1st—finished June 7th. I hoed my carrots first time from June 27 to July 2d. I began to weed July 3d, finished weeding July 20th; I began to weed 2d time July 24th, finished weeding August 9th. I harvested my carrots from November 5 to November 13, the carrots were dug up and put in small heaps and carefully separated from sand, and all of them weighed in Fairbanks' patent hay scales; the produce was thirty-five thousand four hundred pounds; the seed sown was the common carrot, excepting about 100 bushels of the blood red carrot, these were planted in drill; 14 inches apart on a perfect level surface.

Submitted with respect,

JOHN MOOREHEAD.

Hams cannot be kept with ease or certainty unless the flat bone near the centre of the inner side which joins on the other bones of the ham by a ball and socket, be first carefully removed. Where this has been neglected, although every other care has been taken, failures and loss have followed.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MARCH 13, 1839.

AGRICULTURAL MEETING.

The seventh agricultural meeting was attended at the Representatives' Hall on Thursday. The subject of conversation was the redemption of waste land; sand, salt-marsh, bog or peat. The discussion was animated and instructive.

The commissioner read to the meeting several interesting communications on the subject of reclaiming lands, among others from Mr Moore of Concord; Mr Fay of Marlboro; Mr —— of Chelmsford; Mr Brown of Saugus; Dr Bancroft of Groton, and Mr Pinney of Lexington. Each of these gentlemen had had much practical experience in the matter; and the communications were interesting and instructive.

Mr Brown's communication stated an extraordinary improvement in the recovery of six acres of swamp. Before he commenced his operations this tract for any useful purpose, was worthless. With the courage of a man exactly fitted to drive off the trespassers from the disputed territory, or to follow Putnam's wolf into his den, he began this improvement; first by ditching and draining; and then by the extraction of the stumps, and roots, and logs. He extracted logs in some cases sixty feet in length; and found three tiers of stumps or roots, lying one above the other. He ultimately succeeded in clearing his land and dug out two hundred measured cords of wood and sold most of it in charcoal, from this six acres. His land is now brought into a highly productive state, and is not overvalued at one hundred and twenty-five dollars per acre. The whole expenses attending this improvement were \$18 dollars, and the balance in favor of the experiment was \$394.23. The whole statement in all its details and particulars will presently be given to the public.

Mr Moore at Concord has been equally successful, though his expenditures have been far less. The extensive meadows to the south east of the beautiful village of Concord were of no productive value, and indeed were offensive to the sight. By ditching, draining; removing the bushes, paring, turning the sod, spreading loam and sand, with some manure intermixed, he has obtained large crops of grass and corn. From 81 rods of this meadow, which he was induced to measure merely as matter of trial, he obtained this year 3305 lbs. of well made hay; and from other parts at the rate of more than ninety bushels of corn to the acre.

Mr Fay's improvements have been considerable and successful. The first experiment of cutting up all the turf and piling it in stacks, and then burning these stacks, and spreading the ashes was found to be too expensive for profit. He now merely turns the sod over, and as soon as it becomes dry burns it as it lies, and the ashes are already placed where it is desired they should be.

Dr Bancroft's method is to pare where hassocks abound and putting them in stacks burn them and spread the ashes. In other cases he ploughs his land and plants potatoes on the inverted green sward, carrying on an abundance of sand and gravel, and sometimes loam to bury his seed of potatoes without making any hole for them. In this way he gets the surface in the course of the season reduced and prepared to receive the grass seed, or otherwise he plants a second time. His lands required occasional manuring; but are rendered highly productive. In no part of the state perhaps have there been finer improvements made in the redemption of this species of land

than in Groton; and it is rather striking to observe that in the immediate vicinity of and adjoining to land on which the most beautiful and productive improvements have been made there are large lots of land of the same character as this was, remaining in the dog-in-the-manger state, which the owners through a strange perversity will neither improve themselves, nor suffer others to improve.

Mr Pinney's improvements have been extensive, substantial and extraordinarily successful. He ditches and drains his lands, especially by cutting drains round the margin of his swamps, which communicate with the main ditch, as it is well known that much of the water, with which these swamps are filled, is either top-water or comes from springs in the neighboring hills; he then completely inverts the sod and lays it flat, rolling it where it is practicable. He does this with a plough prepared for that purpose if the nature of the land admits of it; or otherwise with a bog hoe, and it can be done in this way at the rate of about 20 dollars per acre. He sometimes takes advantage of the season; and when the frost is sufficiently out of the ground for the plough to penetrate about three inches, he turns over with success and ease this land, upon which he could not go with a team, if the frost were entirely out. After the land is completely ditched and drained and the sod completely inverted and rolled, he applies about 20 loads of compost manure to the acre and sows his grass seed; and the land yields abundantly. He deems this kind of land, after such improvements are completed, as the most productive land among us. Formerly he was accustomed to sell this land at the rate of three dollars per square rod for the right of digging the peat two spits or about five feet deep—this would give 4-0 dollars per acre—he considers it now more valuable to be kept for grass.

These are very important statements, and their communications will be given to the public; and the whole subject of the improvement of these lands fully treated in the commissioner's report on the agriculture of Middlesex.

The meeting was afterwards addressed by Dr Stearns of Sudbury, who gave an instructive account of his improvements of the marginal lands round his peat meadows and swamps by under-ground draining;—by Dr Stebbins of Swansea, who gave an account of the redemption of the lands at Hoboken, N. Y.;—by Mr Pearce of Martha's Vineyard, who spoke of the improvements effected on his farm by the use of lime; by Dr Keep, who wished to explain more fully the views on the use of lime which he formerly gave to the meeting, and which he thought had been misapprehended; by Mr Buckminster of Framingham, who detailed his improvements by inverting the green sward on marginal lands without draining, and applying compost of loam and ashes; and by a gentleman from Taunton, who gave an agreeable statement of his own improvements, mingled with some interesting sketches of his personal history, in his struggles to subdue his father's prejudices. The father having passed from the gristle of youth into the bone of manhood, it was very difficult to make him take up the line of march in the course of modern improvements. It was however the good fortune of the son to succeed; and to compel from him the last acknowledgment, which an old man ever willingly makes, that the young do know something which their fathers did not.

The meeting broke up at the appointed hour with an evident impatience for another session. It was agreed therefore to adjourn the meeting to the ensuing Thursday at the usual hour and place, and the subject suggested for discussion were the cultivation of roots and fruit trees.

H. C.

THE WHEAT BOUNTY.

Agreeably to an order of the House of Representatives, the Secretary of State presented to that body on Saturday, an abstract of the returns of the bounties paid for Wheat, by the several towns in the Commonwealth showing the quantity of Wheat raised in each town for which the bounty has been claimed and allowed,—the number of claimants in each of said towns, the amount allowed upon such claims, the names of the towns for which no claims have been received, and the names of the towns whose claims were disallowed. The abstract was ordered to be printed for the use of the House.

It appears from this abstract that returns have been received from 221 towns; the number of claimants 3633 the number of bushels of Wheat raised (for which the bounty has been claimed) 97,195 1-2; and the whole amount allowed \$9421 92.

From 76 towns no returns were received. Of those 1 was in the county of Suffolk, 21 in Essex, 20 in Middlesex, 2 in Worcester, 4 in Hampden, 2 in Berkshire, 8 in Norfolk, 4 in Bristol, 4 in Plymouth, 10 in Barnstable. From ten towns, the returns were not made in compliance with the law.

RAW AND COOKED FOOD FOR SWINE.

MR EDITOR—Suppose I had six pigs or shoats to winter, all of the same breed, age and weight. Three of them I place in a dark, warm pen and the other three in a similar one. I have one hundred bushels of potatoes to keep them on which I divide equally, and feed three with them raw and the other three with them boiled or steamed in such quantities that both parcels will be exhausted in one day, giving them all as much water as they will drink and no other food. Which three of the pigs will be in the best flesh or condition when the potatoes are all consumed, those fed on raw or those fed on cooked potatoes.

It is known that cooked potatoes will digest easier and pass out of the system sooner than they will before they are cooked, therefore will not those fed on raw potatoes do better, or lay on flesh, while the others are hungry?

I merely put this question for the consideration of your readers.

A man recently told me that he put a quantity of potatoes into his barn and let them freeze, and they have continued frozen and he has put them into his boiler to cook in that state and his swine never did better on potatoes that had not been frozen. It will probably be a convenience to those who have small cellars, to leave their potatoes up where they will freeze, but if they are suffered to thaw they will lose their value. This however, may be regulated by covering them in the barn floor until the weather gets pretty cold and then expose them for a night, they can then be kept through the winter. If raw potatoes will keep store swine in better flesh than cooked ones, the same principle will apply to apples, pumpkins, squashes, and all kind of roots.—Maine Farmer.

SECOND REPORT ON THE AGRICULTURE OF MASSACHUSETTS.

The Second Report of the Commissioner of Agricultural Survey has been some days in the press, and will soon make its appearance. The publication has been retarded by the publication of many other public documents, which were under the immediate action of the legislature.

H. C.

BRIGHTON MARKET.—MONDAY, March 11, 1839.

Reported for the New England Farmer. At Market, 250 Beef Cattle, (including 50 unsold this week) 10 pairs of Working Oxen. 20 Cows and calves, and 750 Sheep. Prices.—Beef Cattle.—We advance our quotations to inform to subscribers. First quality, \$25 a \$27. Second quality, \$23 a \$25. Third quality, \$20 a \$22. Working Oxen.—A few sales effected, price not able. Cows and Calves.—"Dull." We notice a few sales. 30, \$35, \$42, \$55, and \$60. Sheep.—"Dull." Several lots were sold for less than any cost in the country. Lots were taken for \$3 75, 4 25, \$5 00, \$5 50. Swine.—None at market. One or two lots will be at Brighton next week.

THERMOMETRICAL.

Reported for the New England Farmer. Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded orderly exposure, week ending March 10.

Table with 5 columns: MARCH, 1839, 7 A.M., 12 M., 5 P.M., Wind. Rows include Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday.

PRIZE WHEAT.

The Whittington New White Wheat, which obtained the "Medal" at the Liverpool Agricultural Meeting.

The attention of Agriculturalists is again called to this very valuable, prolific and perfectly hardy description of White Wheat. The prominent properties of which are its ripening much earlier with length and strength of straw, largeness of ear and grain, and its superior milling qualities, which can be attested by several well known Searley Millers. The introducer of it strongly recommends, if the soil be rich and kindly, that very little or no manure be applied, the origin of this Wheat was three ears, discovered on a mountain in Scotland, and the Propagator, Mr Whittington, a practical Agriculturalist, Land Agent and Valuer for 40 years, is perfectly satisfied, from the impartial trials he has made, during six years on "poor soils," of its growing more Straw than any other kinds, "of its superiority to standing the weather," and not degenerating in the produce or quality that he intends for the future to sow no other sort.

The introducer of it strongly recommends, if the soil be rich and kindly, that very little or no manure be applied, the origin of this Wheat was three ears, discovered on a mountain in Scotland, and the Propagator, Mr Whittington, a practical Agriculturalist, Land Agent and Valuer for 40 years, is perfectly satisfied, from the impartial trials he has made, during six years on "poor soils," of its growing more Straw than any other kinds, "of its superiority to standing the weather," and not degenerating in the produce or quality that he intends for the future to sow no other sort.

N. B. We have on hand a small quantity of the WHITTINGTON Wheat, which is decidedly the finest article of the kind we have ever seen. Those who are desirous of trying it, can have a small parcel, not exceeding one pint each, if application is made for it soon. JOSEPH BRECK & CO. March 13.

FRESH SEED.

Just received at the New England Agricultural Warehouse and Seed Store, fresh lots of the following kinds of seeds. Rohan Potatoes Chinese or Tree Corn Dutton Small Canada, Early White Potatoes Early Jefferson Varieties of Spring Wheat Buck Tuscorara and Sweet Corn Indian Barley, Bedford Oats And a full supply of Peas, Beans, &c. JOSEPH BRECK & CO. March 13.

FARM FOR SALE.

A Corn, Grain and Dairy Farm, situated in Westford, about nine miles from Lowell, and one mile west of the Meeting House and Academy, on a road from Westford to Groton, and twenty miles from Boston, and containing one hundred and fifty acres of tillage, mowing, pasturing and orcharding, and fifty acres of wood and timber land, all except the wood land lying together, and that but a short distance from the tillage land. The buildings are a two story house, wood and chase house, cider house, and barn ninety feet long, with two sheds. It has a valuable peach orchard, pear, plum and cherry trees, with many valuable grafted apple trees. It is well fenced, principally with stone wall. The whole will be sold together, or in parts to suit purchasers. For further particulars inquire of LUTHER HALL, under the Seaman's Bethel, North Square, Boston, or of RUFUS PATTEEN, on the premises. March 13.

FARM FOR SALE OR TO LET.

The subscriber offers for sale or to let, a farm situated on Charles River, in the north part of Newton, and near the Newton Chemical Works. It contains fifty acres or upwards of good land, and has on it a good house and other buildings. It is a pleasant situation on the bank of a country seat, or its vicinity to the Waltham Factories an excellent location for a market or vegetable farm. Forty acres can be added to the above, if desired. March 13. 4wis* SETH BEMIS, Watertown.

FOR SALE.

A new milk goat, of a superior breed, producing milk like cream; well calculated for the invalid, or for a vessel for a long voyage. Inquire at this office. March 13.

FARM FOR SALE.

For sale a valuable farm, situated in Newton, half a mile from the Upper Falls Village and ten miles from Boston. The farm comprises about 100 acres of land, one third of which is covered with a thrifty growth of wood and fencing timber. It has a good well of water, besides a never failing brook which passes through the farm. The buildings are of ample size, and in good repair. A lot of about ten acres of the land near the buildings, is on a level plain of superior quality for the growth of the mulberry tree. For particulars inquire of Miss Ann Bent, 214 Washington Street, or of E. F. Woodward, near the premises. Boston, March 6, 1839.

AMERICAN SILK GROWER'S GUIDE.

On the art of raising the mulberry and silk and the system of successive crops in each season; second edition; enlarged and improved by William Kearick. Just published and for sale by Joseph Breck & Co., at the Seed Store and Agricultural Warehouse, Nos. 51 and 52 North Market Street. Jan 9, 1839

MULBERRY SEED.

Brussa Mulberry Seed, fresh and warranted good, for sale by ROBERT G. SHAW & Co. 51 Commercial Wharf. Feb. 20.

WANTS A SITUATION.

A Gardener who understands the management of a Green House, Hot Beds, &c. has had long experience in the business, and can produce the best recommendations. Apply at the New England Farmer Office. Feb 27. JOSEPH BRECK & CO.

FARM IN GROTON FOR SALE.

The subscriber offers for sale, his farm in Groton, Mass., consisting of about 200 acres, much of it first rate land, and in a highly cultivated and productive condition. There are two dwelling houses, and common barns, and the place may easily be divided into two good farms. It is well stocked with fruit; with an abundance of fuel for use and sale, and excellent water. It is difficult to find a place combining more advantages in respect to comfort or profit. It will be so then eligible terms. Inquire at the N. E. Farmer Office or to the subscriber on the premises. WILLIAM SALISBURY. Feb. 13, 1839.

BONE MANURE.

The subscriber desires to inform his friends and the public that he has been in the Bone business more than ten years, and has spent much time and money in ascertaining how bones may be converted to the best use, and is fully satisfied that they form the most powerful stimulant that can be applied to the earth as a manure. He offers for sale ground loam at a low price, and is ready to receive orders in any amount, which will be promptly attended to. Orders may be left at my manufactory, near Tremont road, in Roxbury, or at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, Boston. Sept. 20. NAHUM WARD.

WHOLESALE PRICES CURRENT

Table with columns for goods (ASHES, BEANS, BEEF, etc.), units (barrel, bushel, etc.), and prices. Includes sub-header 'CORRECTED WITH GREAT CARE, WEEKLY.'

PROVISION MARKET.

Table with columns for goods (HAMS, PORK, BUTTER, etc.), units (pound, dozen, etc.), and prices. Includes sub-header 'RETAIL PRICES.'

SCIONS OF FRUIT TREES.

Scions of a great variety of Apples, Pears, Plums, and Cherries, from bearing Trees, which have been proved at the Pomological Garden, Salem, Mass., for sale by the subscriber. Feb. 6. 6p ROBERT MANNING.

MISCELLANEOUS.

SMITHFIELD MARKET.

An account of the Smithfield Market in England from a publication entitled "The Voice of Humanity."

In Smithfield market there is not room to tie up to the rails much more than half of the cattle sent there for sale! The remainder are disposed of by being formed in groups of about twenty in each, into "rings" or "off-droves," as such divisions are termed. About two o'clock in the morning the Smithfield barbarities are at the height, and the constables, being sent into the market in the daytime only, are consequently not in attendance. The drovers surround the unfortunate bullocks which cannot be tied up in the market, and commence by aiming with their bludgeons blows at their heads, to avoid which they endeavor to hide their heads by keeping them towards the ground. On attempting to run backwards, the bullocks are restrained by blows upon their hocks and legs, together with the application of goads; whilst if they venture to lift up the head, a dozen bludgeons are instantly hammering on it, until again lowered to the ground. This scene of barbarity is continued until every bullock, however refractory, obstinate, stupid, or dangerous at first, has been disciplined to stand quietly in a ring—their heads in the centre, their bodies diverging outward like the radii of a circle: this is done that they may conveniently be handled by the butchers. The barbarity of Smithfield is at its height during the night; but in the daytime, by seeing the process by which one or more bullocks, when sold, are driven out of a "ring" or "off-drove,"—and observing the hammerings with bludgeons on the head; the thrusting the goads into the nostrils of the animals to make them move backwards, after similar instruments had been applied to urge them in the contrary direction by witnessing the mode of re-forming the "rings" or "off-droves," which are constantly broken through by the withdrawal of purchased animals as well as by the passing and repassing of carts and drays, some faint idea may be formed of the amount of needless barbarity inflicted, and of the consequent deterioration of the meat. The deterioration of the meat has been calculated at no less a sum than 100,000*l.* per annum, notwithstanding the care which the drovers take to strike chiefly where there is no flesh interposed between the skin and the bone; where the animal feels most acutely but there is no black mark to tell tales.—"I have lived fourteen years in Smithfield," said a very intelligent witness, "and I find it perfectly impossible to sleep in the front of my house on Sunday night. The cruelty practised upon the cattle, in beating them into the 'rings,' no person can believe who has not seen it; and, as it is a matter very easily to be seen, I hope some of the committee (now sitting) will see it personally. Supposing a salesman to have twenty beasts (which could not be tied up), he will have them all with their heads in and their tails out; they form a ring and in order to discipline them to stand in that manner, the drovers are obliged to goad them behind and knock them upon the noses. They strike them with great force upon the nose, and form them cruelly behind, by which means they round themselves into a 'ring,' so that, at the period I speak of, there is a great deal of unnecessary cruelty. At length the cattle will stand in that manner, so perfectly disciplined, that, at breakfast-time there shall be twenty or thirty 'rings' of this kind

standing in the middle of the market. If the 'ring' is broken by any means, they are all in the greatest anxiety to get in again; and when the drovers are obliged to separate these "rings," and drive the cattle away, they have a great deal of trouble, and the labor of the men is excessive to get one single beast out. Indeed, if you can conceive first getting the cattle into 'a ring,' as I have stated, and if one is sold out of the ring at eleven in the day, the beast is ordered to be driven through fifteen hundred cattle, whichever way he goes out of the market, and the man is goading that beast all the way—if you can conceive men compelled to exercise this cruelty, they will not be very delicate of the manner in which they use it after a time!"

Another witness, who had been "a salesman about eight years," thus described the scene:—

"I have stood behind eight of these off-droves, and the cruelty which is necessarily exercised to get them to stand properly is very great indeed, and which by tying up, might be totally removed, and is the cause of the great complaint which exists of the bruises and the wildness of the different animals when passing through the streets. I will describe simply the manner in which it arises. Perhaps more than an hour's violence has been exercised towards the cattle, to get them to stand about twenty in each circle,—and during the whole of this time they are beaten, now about the hocks and then about the head. If the head turns outward, they are beat about the head till they are turned inward. The great cause of the inhumanity described arises from this circumstance, that when a bullock is driven, perhaps from the centre of the market, by the butchers' drovers, that bullock will run into five, six, seven, eight, or nine of the droves before he gets out of the market: perhaps in every one of the droves that bullock is beat about the head for ten minutes before he can be got out of it again, and then he runs to another drove, from the circumstance of having been so beat about in the early part of the morning. Consequently, perhaps, this bullock is beat out of ten droves before he gets out of the market, to the very great injury of the animal. He is often beaten nearly or quite blind; and when it gets into the public streets, the bullock, irritated by the violence committed, scarcely conscious where he is, runs at any thing, or over every thing, or through every thing. All this would be entirely prevented, if there were room to tie each bullock separately up."

WINSHIP'S NURSERIES, BRIGTON.

Just received from England and France, a rare collection of Plants, viz:

Pears, Plums, Peaches, Apricots, Gooseberries, Pear Stocks, Purple Beach, English Elms, Japan Junco Trees.

Striped, Myrtle leaved, Gold margined, and Weeping striped Box Trees.

Common silver leaf, Fine do. do., Upright Golden, Smooth leaved Golden, Balance do. do., Plain Screw do. do., Camellia leaved do., Marginal and Hedgehog Hollies.

Portugal, English, Long narrow leaved, and short do. do. Laurels.

Azaleas, Rhododendrons, Thorns, Eglantine, 100 varieties new Roses, Oranges, Camellias, and various kinds of Greenhouse Plants.

Orders will be promptly executed and forwarded to any part of the country.

Orders may be left with JOSEPH BRECK & CO. or forwarded by mail to Messrs. WINSHIP, Brighton, Mass. Brighton, March 4.

BRUSSA MULBERRY SEED.

We offer for sale a small quantity of Brussa Mulberry Seed, by the pound or ounce, which may be relied on as true and genuine. This variety of Mulberry is much superior to the Morus Multicaulis, for this climate, being perfectly hardy; said to be even more hardy than the common white.

JOSEPH BRECK & CO.

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.

2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.

3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.

4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

FRUIT AND ORNAMENTAL TREES, MULBERRIES &c.

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1839 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and of Teaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeysuckles, Pæonies, Dahlias and other Herbaceous Flowering Plants.

10,000 Cockspur or Newcastle Thorns.

10,000 Buckthorns.

Morus Multicaulis, and other Mulberries: the trees genuine and fine, at prices fair, and varying with the size, and the quantity which may be desired.

Fruit and all other trees, when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston.

January 30, 1839.

SILK WORMS' EGGS

Preserved with much care, producing sulphur colored cocoons; the worm from this kind of egg would throw its cocoons the last season in twenty eight days. Specimens of the cocoons may be seen at the Agricultural Warehouse, if desired. Apply to JOHN SULLIVAN.

SHAKERS' SEEDS AND HERBS.

WIGHT & GIBSON, No. 44 Hanover Street, under the American House, (opposite Elm Street), are appointed by the United Society at Harvard, Mass. as their agents for the sale of all kinds of Garden Seeds, raised and put up with directions for culture, by Jonathan Chandler.

Prices, the same as when sold by the society or their travelling agent.

Herbs, Roots, Extracts, & for sale as above.

January 23, 1839.

N. E. FARMER.

AN ADDRESS,

Delivered at the Annual Cattle Shows of the Worcester and the Hampshire, Hampden, and Franklin Agricultural Societies, Massachusetts. October, 1838. By HENRY COLMAN, Commissioner for the Agricultural Survey of the State.

(Concluded.)

I fear I have already too far trespassed upon your indulgence, and yet I have scarcely approached my subject. I will touch then but one or two other topics; and that as briefly as the case admits.

It is the duty of the community to elevate the laboring classes; to change them from mere drudges, machines, and beasts of burden, into intelligent and self-governed agents, who understand their rights and duties; and who shall be able to comprehend the great interests of the social compact, and their own relations to society. Education is the great elevating power to be applied. In a country where political rank is unknown, education and improved talents make the distinctions, which give character, respectability, and influence. Science is important to the farmer as a help to his art. All the great improvements in agriculture, which have ever taken place, have originated with men of enlarged and improved minds. All the important inventions by which the toil of the husbandman is facilitated or abridged, have sprung from cultivated minds. How can there be a doubt that science has yet in store for intelligent husbandry, many most important discoveries? Science as a source of recreation and pleasure, demands the attention of farmers. Many of the operations of labor to which they are called, do not wholly engross the mind; and mental cultivation of the highest order may go hand in hand with labor. In our climate the long evenings of winter furnish valuable opportunities of intellectual improvement, and need science as in ample, a safe, and a beautiful resource.

The proper and best objects of education, the true nature of a really valuable education for the laboring classes, are not generally or well understood. The first object of education should be to enable a man to provide for himself; to understand his own constitution, physical and mental, to take care of his own health, and especially to teach him the use, and to entice and stimulate him to the exertion and development of his own powers. The physical sciences, the practical and mechanic arts, the science of human nature and human history, the condition of the world, the advances of the human mind, the discoveries and improvements which are constantly taking place, moral science, political science, these should constitute the great subjects of education. It might be supposed that in this enumeration I should have given the first place to religion. We know so little, properly speaking, of religion, that it can scarcely be called a science. We may say of an undevout farmer as of an invidious astronomer, that he is deficient in acuteness of perception or in soundness of mind. All science

is properly religious. It all leads up to the great artist who created the universe; and the infinite spirit who kindled the human intellect; and the mighty mind, which comprehends all knowledge. The study of the holy scriptures will inspire devotion, purify the affections, impart consolation, and elevate the hopes and purposes of the heart. But what is commonly called doctrinal theology, I care not of whatever sect, is commonly too full of absurdities and puerilities, to deserve the attention of those intelligent and philosophical minds, which are capable of wide, comprehensive, noble and elevated thoughts. The religion of purity, justice, truth, kindness, humanity, faith in God, in his providence, his moral government, and in a future life, as revealed in nature and confirmed in the gospel, comprehends what is mainly important in the education of the laboring population in any of the departments of society.

Classical learning, so called, which occupies now a large portion of the best years of those who pursue it, excepting as matter of mere taste, pastime, or embellishment, is of little substantial use to any one. It is a notorious fact, and in my opinion sufficiently disgraceful to the boasted wisdom of the age, that at least two thirds of the young persons, who enjoy the best advantages of a liberal and classical education, and come out adorned with the highest honors of our colleges and universities, are even then incapable of keeping themselves from starvation; and have then to begin to learn the practical arts of life; and the remaining third are able to do it, not from any thing they have learned at these places of education, but from what they were compelled perhaps by stern necessity to learn elsewhere.

What shall I say of the other sex? I shall not enter upon the vexed and alarming questions of our times concerning the equality of talent, or the measure of political rights. It is not for me to settle such controversies; or even, non-combatant as I have always been, "to enter the disputed territory either as a traveller or a squatter." I can only say that in some of my agricultural excursions I have seen women driving teams and men with their sleeves turned up breaking the cheese-curd. Neither of them seemed to me very gracefully employed. I could have wished that the hands of the fair one should have held only those silken reins, which the sex know so well how to manage after the nag is once bitted and bridled; as to the man, I should greatly have preferred to have seen him at the tail of the plough. In matters of taste, however, we are not to dispute, for it is not possible to agree.

Female education is a most important subject, and I am not willing to trifle with it; but in many and some of them our most fashionable seminaries, the course of education least of any thing, is suited to qualify them for the appropriate duties of wives, mothers, and housekeepers. The spinning wheel has long since been exiled to the garret, and it is proposed now to send the needle to keep it company. The family of the Do-littles of both

sexes, is an old established family among us. The family of the Do-nothings is fast coming into notoriety. This is a miserable progeny arising from too frequent intermarriages, within the forbidden lines of consanguinity of the Do-little family; an unquestionable cause of degeneracy, as every farmer knows.

Pardon me, if I relate a homely anecdote. Some time since an honest fellow, who had lived in the "half scissor state" for a length of time, was strongly inclined to change his forlorn condition. Placing his affections on a comely damsel, he got, in common parlance, "the refusal of her," and was permitted to take her home and try her household qualifications. He kept her a fortnight; but as she could neither spit his meat, nor make a pudding, nor mend his coat, he carried her back. He was prosecuted for breach of promise; and the subject being left to the decision of a mutual umpire, he was amerced in the sum of seventy dollars and some cents. Had it been seven times seventy, he would have felt himself lucky to escape so; for what is an honest farmer the better, who most get his living by the sweat of his brow, though ever so much a man of taste, if he could have given the original statue of the Venus de Medici given him to set up in his kitchen. Let's wife would be better than this, for she might be of some use in saving his pork.

This ridiculous system of bringing up our daughters is as pernicious to health as to usefulness. They are feeble and withering like plants grown in a cellar. We seem entirely to have lost sight of the great truth that intellectual energy is intimately dependent on physical energy; that power of mind like power of muscle, can only be acquired by habitual and strong efforts and exercise; that in our ambition to make our daughters ladies, we are in danger of making them mere toys, fit only, like the waxen virgins hawked about our streets, to be kept in glass cases and set up in a spare chamber; that under such training, by the inflexible laws of our physical constitution the whole race must decline, of which decline some persons not wanting in sagacity declare, that even now they see the portentous signs. We should remember a more affecting truth, which some may see written in their book of fate in tears of blood; that as mental energy depends on physical energy, so likewise moral strength and moral purity are closely dependent upon mental determination and force. It is often asked, how shall we find employment for our daughters? I answer, while some few of the old race are lingering among us to show us how things were done in their day, go back to the old system of supplying from the resources of the farm, as far as it can be done all the wants of the household. Go back to the old system of household manufactures. Not the better for being old, but the better for being sanctioned by long and decisive experience. Who is there that would not feel a higher pride in wearing a garment spun and woven by the hands of his wife or daughter, than in putting on the brightest robe that ever graced the

shoulders of an Asiatic prince? With early hours, a discreet arrangement of time, and established habits of industry, there would then be ample opportunity for reading and intellectual improvement; and for social pleasures. If this can be done only at what some persons choose to call a pecuniary loss, a point which is by no means fully settled, it would be a certain moral gain, with which no pecuniary consideration should be put in comparison. But I fear I am talking only to deaf ears. This, I think I hear you say, is only the querulousness and garrulity of age. Forgive me, I pray you for remembering "the days of auld lang syne."

In the last place, let it be the desire of every man who has at heart the welfare, honor, and good morals of the community, to render labor respectable. To do this effectually, let those who labor prove themselves worthy of respect. Honor your calling; that your calling may honor you.

This can only be done by intelligence, temperance, industry, integrity, and piety. It is the singular privilege of the agricultural condition, that it is in general far removed from the harassing vexations and the perilous temptations of trade and commerce, the seductive allurements of political ambition, the frivolities of fashion, and the heartless and shameless enormities of licentiousness and dissipation. Know the unspeakable value of such seclusion; and guard with a sleepless jealousy the honor of your profession.

Farmers! To your country you owe high duties: On your virtue rest its hopes; the defence and the security of its precious liberties. You are fixtures to the soil. Other men may at pleasure transfer their residence, interests and affections. It is not so with you. Your interests and fortunes are indissolubly entwined with the interests and fortunes of your country. Do your duty to your country then as men. Standing as the pillars of the social edifice, let it not totter or fall through your weakness or neglect.

Farmers of Massachusetts! love, honor, defend, and cherish the land of your birth. She is the sepulchre of your fathers; men as brave and as true as ever flourished on any soil. She is the living home of the intelligent, the accomplished, the industrious, the useful, the patriotic, the benevolent, the pious. She is to be possessed by succeeding millions, in whom your blood shall continue to circulate. Make her what she should be. Let her go down to future generations improved by your industry; enriched by your gains; adorned by your taste; illuminated by your wisdom; elevated and sanctified by your virtue; and like the brightest star in her own beautiful hemisphere to the wandering mariner, let her stand out as the never changing, and ever shining guide to the home of truth, of liberty, and of unaffected and unadulterated religion.

We have the pleasure herewith of presenting the able and interesting report of the committee of The Massachusetts Agricultural Society on Farms. It comes mainly from a practised hand and is full of instructive remarks.

The committee consisted of

WILLIAM PRESCOTT,
P. C. BROOKS,
E. H. DERBY,
E. PHINNEY,
D. WEBSTER,
JOHN WELLES,
JOHN C. GRAY.

The trustees empowered a gentleman highly competent—Rev. Morrill Allen of Pembroke—to visit all the farms, which had been entered for premiums, and to report to the Trustees the replies which he obtained to the printed interrogatories and any incidental information which he might obtain or deem proper to give.

The commissioner of agricultural survey, as it seemed to be his duty, was active in circulating the proposals of the society; and in inducing many persons to enter the list as competitors. He will not say whether the judgment of the Trustees conforms to his own views or otherwise, because this he is not called upon to do; and it would be impertinent in this case to obtrude his opinions. It would be next to a miracle if the decision of the Board should give universal satisfaction. He has no doubt that they have performed their extremely difficult and responsible duty with a fixed determination and anxious desire to do impartial justice. The commissioner however feels that it is but just to himself to state, that although he was instrumental in inducing applications, the Trustees, with a proper and kind regard for the delicacy of his position, have never consulted him on the matter of any one of the claims or farms in any respect whatever; and he was as ignorant as any one of the competitors of what their decision was or was to be until the report was put into his hands for publication.

II. C.

REPORT

Of the Committee of the Mass. Agricultural Society on Farms.

The Committee of the Massachusetts Society for Promoting Agriculture, for awarding premiums for the best cultivated farms, have carefully examined the several statements made by the respective claimants, and report as follows.

Believing that heretofore the want of competition among farmers may have been in some measure occasioned by the inconsiderable amount of the premiums offered, the trustees determined at the commencement of the past season, by an offer of what they considered, very liberal premiums, to excite the attention of our most successful and enterprising farmers and to induce them to offer their claims. With a view also of saving the claimants the task, (often considered an unpleasant one,) of reducing their statements to writing, the trustees were at the expense of sending an intelligent, and faithful agent to every gentleman who had made known his intention of claiming a premium, whose duty it was to receive upon his own farm, and at the fireside of each farmer, his answers to the several questions proposed by the trustees. Still the number of applicants is small, very small compared with the many excellent farmers that may be found in the commonwealth; and these though highly respectable in point of merit, as producers, may not perhaps in all respects be considered the best farmers in the state.

Considering the unfortunate prejudice that exists in the minds of many against receiving instruction from books, on the subject of agriculture, the trustees were desirous of presenting to the farming community much valuable information through a medium less extensible, information in a less distrustful shape, coming directly from practical cultivators of the soil. It is no doubt owing in some measure to the existence of this prejudice against what are termed book farmers, or, in other

words, against scientific farming, that so many of our most enlightened and enterprising agriculturists withhold from the public the beneficial results of their labors. This ought not so to be. Who more than the cultivator of the soil, requires the light of knowledge to guide him in his arduous duties, to give confidence to action, and a successful result to his labors? We have our schools and colleges, learned professors, and extensive libraries, to qualify our young men for the learned professions, while the humble votary of agriculture, whose art contributes more to the support of society, than all the other arts united, and, more than any other requires the aid of science, is left to feel his way in the dark, with nothing to guide him, but vague conjecture, or blind tradition. Hardly a town in the commonwealth which has not its social library, filled with books giving instruction upon every subject but that of agriculture; while nine tenths, if not ninety-nine hundredths, of its readers are to a greater or less extent, cultivators of the soil. Almost every village in the state has its lyceum, and its lyceum lectures; and yet how seldom do farmers, who constitute a great majority of the hearers, get from these sources any information on a subject, which is not only most interesting to them, but to the whole community? They listen with profound attention, and are no doubt much edified with descriptions of the exact dimensions of the pyramids of Egypt, or the crusades of Peter the hermit, while the subjects most intimately connected with their every day occupations, such as the composition, structure, and mode of treating the different kinds of soils, the method of producing and applying the various kinds of manure, the best mode of renovating and improving their worn out fields, rotation of crops, and the numerous branches of science immediately connected with agriculture, are seldom if ever touched.

The claims of the several applicants for premium are so nearly balanced, that the committee, after bestowing great labor upon the subject, have found it extremely difficult to discriminate as to the superior merits of either. They are all good farmers—all of that safe, calculating class, whose every effort seems to aim, with a good degree of certainty, at a moderately profitable result, risking no expenditure where the issue may be uncertain, hazarding no experiment where there is a possibility of defeat. This is judicious, and highly commendable in those who do not possess the means to justify them in pursuing a more adventurous course. This, however, from their own acknowledged thrift, is not the case with some, who have claimed, and are entitled to the bounty of the society. Experimental farming, we are aware, is viewed with a suspicious eye by the cautious capitalist; and the man who hazards his capital in agricultural experiments, is considered on the high road to bankruptcy, and looked upon by too many as a rash enthusiast. And yet it is to the discoveries, which experimentalists have made, that we are indebted for much of the progress made in agriculture.

The merits of the several claimants being considered by the committee so nearly equal, they recommend that the premiums be not awarded, as proposed by the trustees. At the same time they do not feel justified in withholding any part of the amount offered, but bestow the whole in the shape of gratuities upon such of the claimants as, after much consideration, they have concluded to be the most meritorious.

The farm of Levi Goodrich, of Pittsfield, con-

vols. of 200 acres, and a pasture of 123 acres in a neighboring town. Soil a gravelly loam—about 50 acres of interval overflowed in the spring by the waters of the Housatonic river—51 acres under the plough—spreads and ploughs in 20 loads of green manure to the acre—ploughs greenward in the fall—sows rye in the fall, or oats in the spring. The second year, manures and plants with corn, potatoes, or turnips: and the third year sows with spring grain, and stocks to grass. Many prefer turning over sward land in the spring, say from the first to the middle of May, after the grass shall have started a few inches. The reasons are, that generally a greater quantity of vegetable matter is turned under, the sod will turn over smoother in the spring than in autumn, the grass is much less likely to spring up between the furrow slices, which materially injures the crop, and lastly the worms, which commonly abound in grass ground, are less likely to injure the crop. The reason must be obvious to every farmer. Finding no green substance in land turned over in the fall to feed upon, they invariably seize upon the growing crop. Where the green sward has been thus turned over in the spring, after the grass has started it is said, and is within the experience of some of our members,—that injury from the worm does not occur, but when this is done in autumn it is rarely otherwise.

The rotation adopted by Mr Goodrich we do not entirely approve. Successful culture greatly depends upon a correct and systematic rotation of crops. It will be found that a very considerable saving of labor and manure, an increase of crops, and a continually improving soil are the certain results. A repetition of similar crops upon the same fields, together with an injudicious use of the plough, have reduced many a farmer's grounds to barren wastes. One crop should never be followed by another which requires the same elements of matter for its nourishment. Two grain crops therefore should not succeed each other upon the same field, without the intervention of a root, or some other crop, depending for its growth upon different nutritive properties of the soil. If we were to take the liberty of suggesting to Mr Goodrich a course of culture, it would be one in some measure differing from that pursued by him. We should recommend that he turn over his sward land in the month of May, and instead of 20 loads of green stable manure, to spread on 20 loads of compost to the acre, made by mixing his green manure with double the quantity of his alluvial peat or swamp mud. A load of this compost well rotted down, has been found, by repeated experiment, when well mixed by the use of the harrow, or cultivator, with the fresh earth which has been turned up, to produce as great crops of grain or roots, and as durable in its effects, as the same quantity of green stable manure. If the first crop should be corn, the second should be potatoes, or roots, followed by wheat, or rye, with grass seed, or with grass seed alone. If the first crop be roots, the second should be wheat, or rye, or corn followed in the fall or spring, with grass seed. During all this the sod should not be disturbed, and no other ploughing but the first turning over of the green sward. The portion of the hard pan turned up will in this way be kept on top, and enriched by mixing with the compost, and by exposure to the enriching properties of the atmosphere. It will be perceived that, by this method, there will be a great saving of labor and manure, there being but one ploughing, and one dressing of compost, for the

production of two crops, and laying the ground to grass; and in addition to these advantages, the soil will be deepened and enriched. Sward land when turned over, should not be turned back by cross ploughing, until the vegetable matter which is turned under, shall have entirely decomposed, nor until the commencement of a second rotation. By cross ploughing the portion of fresh earth which is brought to the top, and which is so essential to the crop, especially to a wheat or rye crop, is turned back to where it was brought from, and the vegetable matter and light mould is brought again to the top, to be wasted by the winds, or washed away by rains. Deep ploughing is indispensable to good husbandry, especially in the culture of a wheat crop. By a chemical analysis it has been ascertained, that in a tract of country resembling in all respects the rough, hard soil of our own state, the hard pan, or subsoil, has more of the elements of fertility than the top soil, divested of its vegetable and animal matter. It contains twice as much of the carbonate of lime, and other fertilizing qualities, as are found in the top soil. This circumstance may account for the fact, that we have never known a crop of wheat, either in Massachusetts or Maine, to fail, when the seed has been sown upon the inverted sward, where the ploughing has been deep, either as a first, or second crop in the rotation.

Mr Goodrich sowed 6 acres of summer wheat, two of which were upon land planted the year previous with Ruta Baga, and gave twenty bushels to the acre. The other four acres were on land sowed to Rye the previous year, and yielded but ten bushels to the acre. This speaks loudly in favor of rotation. The great difference in the two parts of the field could not probably be caused so much by the extra manuring on the part of the field sowed with Ruta Baga, as by the change of crops, and the circumstance, which was no doubt the fact, that the ground appropriated to roots the year before, was ploughed much deeper than the part sowed to rye.

Mr Goodrich's crop of Ruta Baga was a fair one. We regret that he had not given us a few more particulars relating to this crop, such as the nature of the soil, the kind and quantity of manure used, expense of cultivation, &c. The value of this root is but little known by the bulk of our farmers, and its cultivation being but of recent date, compared with most other crops, would seem to render a greater particularity as to the mode and expense of culture, the more necessary. On soils which are suited to this crop, and there are very few which are not, we are confident that no crop, to a certain extent, will be found to yield so profitable returns for the labor and manure expended. When the abundant yield and the various uses, to which Ruta Baga may be applied, are considered, it is surprising that this article is not held in higher estimation by our farmers. Oxen and cows may be fattened on these alone, with a small allowance of hay—milk cows will double their quantity of milk, when fed with a moderate portion of these roots—young cattle will thrive when kept upon the poorest hay if allowed a small quantity of them—horses may be kept in good working condition by giving them half the amount in value of these roots, that would be required to keep them in the same condition on grain—swine may be kept in a healthy, growing state, when given to them cooked, and for sheep, whether store, or fattening, they are the very best food they can have. Add to all these, they are an excellent vegetable for the table, and may be kept almost the whole year round. The

soil best adapted to this crop is no doubt a deep, moist loam: and yet the greatest crop we have ever seen, was produced upon rather a high sandy knoll. The green sward was turned over after taking off a crop of hay, at the rate of 25 cart loads of compost to the acre spread upon the surface, and the seed sowed upon the inverted sod, which was not disturbed in the cultivation of the crop; a quantity of saltpetre was sowed on broad cast at the rate of 100 lbs to the acre, just before planting, the effect of which was, not only to prevent injury from worms, but greatly to promote the growth of the roots. We recommend to every farmer to have his field of Ruta Baga; no crop leaves the ground in better condition for the one that follows, and none gives him a more profitable return.

The quantity of grass seed sowed to the acre by Mr Goodrich, we have no hesitation in saying is much too small—only 4 quarts of herd's grass and 4 lbs of clover seed! not a quarter part of what it should be. Half a bushel or 3 pecks of herd's grass, a bushel of red top, and 8 lbs of clover seed to the acre we think little enough. By a liberal supply of grass seed, every inch of the ground is occupied, and the crop of hay not only much heavier, but greatly improved in quality. Farmers make a great mistake in supposing that they injure the crop of hay by heavy seeding. Thin seeding admits the growth of weeds. The hay is coarse and strawy, and much less nutritious. The increased value of the crop, by thick sowing, will pay ten fold for the extra quantity of seed.

With these exceptions, we think highly of the skill and enterprise exhibited by Mr Goodrich in the management of his farm. His fields, taken together, produce large crops, and indicate a high state of culture. By a judicious application of labor, united with a good share of agricultural skill, he has enabled himself to present a striking instance of profitable farming. The committee therefore recommend that a gratuity of one hundred and twenty-five dollars be paid Mr Goodrich.

The farm of Mr Caleb Wetherbee of Marlborough presents some strong claims to the favorable notice of your committee. His farm when he commenced operations upon it, was very rough and stony, having a naturally strong and productive soil. By his own personal exertions, he has made the rough places smooth, and has reclaimed large tracts of swamp land to good English meadow; and is still zealously engaged in the same praiseworthy business, and adding much to the annual increase of his farm.

We cannot however pass over unnoticed what we consider some striking defects in his mode of culture. He breaks up his sward land in autumn, the next spring plants with potatoes—if planted with corn the worms would destroy it—plants for two succeeding years with corn, and then sows down to grass with grain. As a remedy for the evil suffered from worms, we recommend turning over his green sward in May, after the grass has started—roll down, spread on compost, harrow well in the same direction with the furrows, and plant corn upon the inverted sod the first season. The worm will find food enough without resorting to the corn. Planting grain crops in succession is a manifest violation of the rules of good husbandry. Mr W's crops of corn are pretty good, and we have no doubt, that by a proper attention to a correct system of rotation, putting on the same quantity of manure he now applies, he may nearly double his crops of grain, and save one half the labor now

bestowed; and in addition to these advantages his soil will be greatly and permanently improved. On this point we speak with confidence, because our opinion is the result of many years practice.

Mr Wetherbee's method of reclaiming wet meadows and swamp lands, we think is attended with too great expense; but this is not the greatest objection. The process is ineffectual. Covering with sand or gravel, with heavy manuring, may give good crops of grass for two or three years; after this the wild grasses, and coarse herbage will find their way through the covering, and grow with increased vigor, and entirely supplant the cultivated grasses, when the whole must be covered again or abandoned as worthless. Why should we lose the benefit of the rich vegetable mould upon the surface of our peat and swamp lands by burying it under a mass of unproductive gravel or sand? Our wet peat grounds in this way may in time, by covering them deep enough, be converted into coal mines, but they will never become permanent English meadows.

After thoroughly draining by marginal and centre ditches, the best course is to turn over the turf on top in the month of August or September, with a plough having a wrought iron share, ground to a sharp edge, follow with the bog hoe, and level what the plough has left uneven. Late in November, or a short time before severe frosts set in, put on compost made of two parts of loam, clay, or vegetable mould to one of stable manure, twenty cart loads to the acre, sow the grass seed, and roll or bush it in. In this way, if the weather in September be dry, all the coarse and wild grasses will be completely exterminated, and a firm, compact surface is given, which will yield great crops of clean English hay for many year with an occasional top dressing. If the ground be too wet and miry to admit of ploughing it, the whole may be turned over with the bog hoe. The expense of this will not exceed \$20 to the acre, at the usual price of labor.

The zealous and praiseworthy exertions of Mr Wetherbee, we think however entitle him to the favorable notice of the trustees, and we accordingly recommend that a gratuity of one hundred dollars be paid to him.

Mr William Pomroy of Northfield has a farm of 90 acres—a very productive one for its size, and well managed. From 21 1-2 acres of grass land, he takes 60 tons of hay, a great crop—and seventy-five bushels of corn to the acre—plants his corn upon inverted green sward, without manure except plaster of Paris and ashes put into the hills, which he states is done more for the purpose of preventing injury from worms than to assist the growth of the corn. Three years out of five, has put nothing in the hills, depending entirely upon the decomposed vegetable matter which is turned and kept under. This is an important fact, and goes far to establish our theory in regard to the management of sward land. It is to this cause, we apprehend, more than to any other, that the great fertility of his grounds, and his abundant crop of hay is to be attributed. It also shows that the belief in the fertilizing properties contained in the sub-soil is not without foundation. The committee however regret that Mr Pomroy has not given a more particular account of his crop and management in the second and third years after turning over his sward land. His preference for turning in dried clover, rather than green, with his wheat or rye stubble may be well founded. The suggestion is new to us, and contrary to the popular no-

tion on this subject. We do not feel entirely satisfied with the reason assigned for his preference; but never having tried it, we cannot speak with confidence. That green clover and all other green substances lose some of their fertilizing qualities by drying, cannot be doubted; and why the fermentation of green clover beneath the surface should render his soil, which he says is "loam bordering on sand," "cold and heavy," we profess not to understand.

The systematic method pursued by Mr Pomroy, in the management of his farm is worthy of much praise. The committee recommend that Mr Pomroy be paid a gratuity of seventyfive dollars.

Mr Nathl. S. Bennet, of Framingham, has a farm of 92 acres, which he cultivates at a small expense—breaks up his sward land in August, cross ploughs in April, spreads 25 loads of green manure on the acre, harrows it in, and plants his corn. Turning over green sward in August he thinks a perfect remedy for the corn or cut worm. This may be the effect, but we should probably differ with him as to the cause which produces this effect. By ploughing so early in the season, the grass has time to spring up, and grow before winter, between the furrows, and when he cross ploughs in the spring, the young grass furnishes a sufficiency of food for the worms, and therefore the corn is not injured by them. As a remedy not only for worms, but for much useless labor, we recommend to him to turn over his green sward in the spring, and never to cross plough before planting, if he is desirous of benefiting his crops, and preserving the fertility of his soil. We think there is a great want of economy in applying long manure to the surface, when much of its fertilizing properties is lost by evaporation. By mixing his long manure with his peat mud, he will have compost to spread upon the surface, which will be much less liable to waste.

Mr Bennet has tried irrigation, but abandoned it because "the water was too pure"—a very novel objection. Water from springs is sometimes found to be impregnated with mineral qualities which prove injurious to grass, but this is the first time we have known it objected to on account of its too great purity. Farmers differ in opinion as to the beneficial effects of irrigation. This difference arises, we apprehend, from the different situations of the land, upon which the experiment has been made. On land which is level or nearly so, from which the water does not move off quickly, it will inevitably drown and destroy the cultivated, or English grasses, and introduce in their place a wild kind of sour grass, which may be said to be worthless. On the other hand when the water is thrown upon grass land from which it moves off quick, it invariably is attended with a good effect, however "pure" the water may be. The very abundant rains which fell in the months of April and May, 1837, killed the grass upon hundreds of acres of level mowing grounds in the vicinity of Boston, while the side hills, whose declivity formed an angle of not less than two degrees with the plane of the horizon, were greatly benefited by the abundant rains. Many farmers supposed their grass was "winter killed," when it was very apparent to a close observer, that it was killed by the water's remaining on the surface, and becoming stagnant. In order that irrigation should be made useful, the water as soon as it reaches the level part of a field or that which is nearly so, should be collected into drains and conducted off.

Mr Bennet has bestowed immense labor upon

his fields, which were once very rough. His buildings and fences are in fine order—these, with his 800 grafted apple trees, and some hundreds of other fruit trees, do him great credit, and entitle him, in the opinion of the committee, to a gratuity of fifty dollars.

Mr Salisbury, of Groton, considering the obstacles he has had to encounter, has been very successful in bringing a worn out farm into a very productive condition. His operations, with some few exceptions, we think highly judicious, and if persevered in with energy, will soon amply compensate him. His plan for the improvement of his stock, is highly commendable, and should be followed by every farmer. If our farmers every year would raise the calves of their best cows, we are confident they would find it to be not only the surest, but much the cheapest method of enhancing the value of their stock of cattle. The committee recommend that a gratuity of fifty dollars be paid to Mr Salisbury.

Mr William Welles of Shelburn, we think is well entitled to the appellation of a good farmer. His rotation of crops is less exceptionable than that of any one, whose claim for premium has been presented. His method of ploughing and cultivating sward ground, accords with our views, with the exception of spreading, and lightly harrowing in his green manure from the stable. This we think is bad economy, and must be attended with a loss of much of its fertilizing properties. Green manure, if ever applied, should be turned under with the plough. There is no danger that the roots of the plants will not reach it, and if its nourishing qualities are ever thrown out, they will ascend; and never until the laws of gravitation are altered, will they descend. We think Mr Welles' crop of corn and potatoes would have been greatly benefited by making his long manure into compost, and spreading it on the surface, and mixing it well with the harrow or cultivator. We are of opinion that Mr Welles should be allowed a gratuity of fifty dollars.

Mr Peter Fay of Southborough has a valuable farm, which he manages with much skill, and profit, and is deserving of a gratuity of fifty dollars.

Mr Joshua R. Lawton, of Great Barrington has a farm of 173 acres, beside woodland. He makes a free use of gypsum, as many others do in Berkshire. He gives more attention to composts, than is common in the place where he resides, and has to a great extent renovated his farm in a few years. The committee think him deserving a gratuity of fifty dollars.

Mr William Buckminster, of Framingham, has a farm of 150 acres—exclusive of woodland. His merit as a farmer, and his efforts in various ways to aid the cause of agriculture, entitle him in the judgment of the committee, to a gratuity of fifty dollars.

The committee are aware that it is the practice of many judicious agriculturists to break up in the fall for their corn or potato crops, as it lessens their spring work, and the earth may be thought to be rendered more mellow by freezing and thawing. The committee, however, from the experience and careful observation of some of their number, are satisfied that the spring is much to be preferred to the fall, to plough for corn or root crops, and respectfully request their brother farmers in the country to make the experiment. The committee will only add that every suggestion that appears to

be new in this report, is made with the sole view of inviting experiment and improving our modes of culture, and they have no doubt that they will receive all the attention and weight which they deserve.

The committee recommend that the statements of those to whom gratuities have been made should be published, with this report in the *New England Farmer*. All which is respectfully submitted

By the Committee.

BEET SUGAR IN FRANCE.

A very warm dispute is now going on in France between the West India planters and the raisers and manufacturers of beet sugar. The planters are contending for the reduction of duties upon foreign sugar, while the beet-sugar party demand the continued protection of the government of the domestic product, by high duties on foreign sugar, as matter of right and essential to the prosecution of the growth and manufacture of beet sugar. We give below some extracts from a letter of a correspondent of the *New York American*, which we believe to the astonishment of many of our readers, will show the vast extent of the product and the immense interests involved in the case. We regret that we had not room for the insertion of the whole letter. We have selected that portion which is particularly agricultural.

"The beet-root planters and manufacturers make out a very plausible and imposing case. They appeal to the original efforts and sacrifices in the doubtful enterprise; to the costly and elaborate processes in science and art; to the studied incitement and encouragement from the national and departmental authorities; to the political value of their success in rendering France independent for an article which has become a necessary of life. They rely upon such statistics as the following. The capital vested in the business is not less than sixty millions of francs—fifty thousand workmen are employed during the winter, in the factories; of these, great and small, there are six hundred; the product, this year, is one hundred and ten millions of pounds, more than half the consumption of France; the culture spreads over a space of 60,000 hectares, (the hectare being 2.47, 1143 acres;) a multitude of other and very diversified branches of industry are now vitally connected with this one so extended. In the departments where it has been established, sloth and mendicity have given place to labor and comfort. Even a single large beet-root-farm and factory has, in every case, changed the whole face of things, in a district, as if by enchantment. Indeed, if we may credit the instances quoted, the ameliorations would appear wonderful and admirable. On the 17th inst., a large manufacturer, addressing the Supreme Council, related that on an estate where, formerly, he employed seven servants only, and could scarcely feed one hundred sheep, he fed a thousand, and employed fifty workmen, since he had introduced there the beet-root culture. Such facts are calculated to make a deep impression on the Council, and all who know how much agriculture has suffered and remains behind-hand in France from many causes. A writer for the *Journal des Debats*, (17th inst.) in an able and curious article on the *Irrigation of the Fields* enumerates those causes, and adds—"France every body agrees, is essentially an agricultural nation; and still, notwithstanding the superiority of our soil and climate—notwithstanding the abundance and admirable

distribution of our springs, our streams and rivers—our soil does not yield, proportionably, the fourth of the product of that of England."

The beet-root party protest that the smallest reduction of the duty on the West India sugar would irretrievably ruin the domestic manufacture; and they contend that the Executive has not legal faculty to make any change by ordinance; the whole subject belonging to the legislative power. The question was fully discussed and voted at the last session; and when a duty of 10 francs per 100 kilogrammes, (the kilogramme being 2055 lbs. avoirdupois,) for the first year, and 15 for the second, was imposed upon the indigenous sugar, it was implied that no alteration was to be attempted within two years at least. Upon that presumption, new fields had been planted; new factories erected; large investments hazarded.

The domestic manufacturers are not unwilling that the Colonies be allowed to carry their sugar to other countries, for then, in due time, they would get possession of the whole French market; but the Colonial delegates observe—"if we have solicited that privilege, it is because we despaired of relief in France; the measure showed the hardship of our condition; it did not argue that we relied upon the efficacy of the privilege; we felt driven to the necessity of seeking any chance—taking any price for our products where it could be obtained." Perish the Colonies, provided we prosper, is the import of much that has been enumerated on the side of the home-manufacturer.

Both parties menace the Government with their respective fifty or sixty thousand workmen. I have given you a specimen of this, in the language of the trading body of Paris. The subjoined article from a newspaper of St. Quentin, a large manufacturing town of the Department de L'Aisne, is another of like import. "Strong symptoms break out of the discontent which the news of an early reduction of the duty on Colonial sugars has excited in our meridian. The manufacturers of native sugar have met, and many of them have proposed, in the event of the threatened measure, that the excisemen should be prevented from entering the manufactories, and levying the tax to which indigenous manufacture is subject." This proposed forcible resistance to the law indicates a spirit which the Government must defy. Nullification has its advocates every where, and on both sides of the Tariff question. Lafayette quotes a maxim of Bernadotte, that the French should be ruled "with an iron hand and a velvet glove."

DISPUTED TERRITORY IN MAINE.

The subjoined is an extract from the report of the commissioners sent by order of the state of Maine to examine the territory now in controversy between the United States and Great Britain. We think it will be interesting to our readers.

"The soil in the region round about the Northwest angle of Nova Scotia, and on the line, appears to be of excellent quality, covered with a heavy growth of fir, spruce, yellow, black and white birch, mountain ash, cherry trees and a very few pines. In some places the hard wood predominates, but more generally the evergreen, particularly in the vallies. The soil is free from stones of any considerable size, and rocks and ledges, none appearing above the surface, and where trees have been turned up by the wind, the soil appears to be of a reddish color, in which are intermixed fragments of reddish sand stone and slate.

"The land on the river St. John and its tributaries is also of excellent quality; the soil is generally of a deep rich loam and free from stones; the ridges or swells of land are covered with a heavy growth of timber. But few inhabitants are settled upon it, perhaps three thousand or thereabouts, and where they cultivate it, their labor is abundantly rewarded, in the large crops of wheat, barley, buckwheat, oats, potatoes, hay, &c. Its great freedom from stones, renders the cultivation easy. Pine timber is abundant on the river St. John and its branches, all of which are navigable for the transportation of supplies and the driving of logs nearly to their sources; and there is also an abundance of water power for mills. The resources of the country are great; whether its soil or its timber be considered, no equal portion of the state bears any comparison to it, and more than one half of the whole pine timber in the state is upon it.

"It may also be worthy of a passing remark, that the southeasterly lake at the head of the Alagash river is higher probably thirty feet, than a lake opposite called Webster's pond, at the head of one of the branches of the east branch of Penobscot river. The distance from lake to lake, is half a mile, the land is low, and to every appearance a canal may be cut across at a small expense. If a dam were to be built at the outlet of the Bannchenungemook lake, and a canal cut, the timber, from a great tract, which abounds in excellent pine timber, may be sent down the Penobscot river.

ICE AND ICE HOUSES.

In answer to your request for information as to the best plan of building ice houses, I will merely inform you that I have an ice house that has been used by my family for about fifty years, and has never failed to preserve an abundance of ice for our supplies. It is about 16 by 12 feet, and judging from recollection, for it is now nearly half full, is about 16 feet deep. It was probably dug down to the sand or gravel, is walled like an ordinary cellar, the wall extended about 3 feet above the level of the adjacent ground, and earth thrown against it nearly to the roof. This serves to preserve a uniform temperature and prevents leakage from rain, &c. The bottom of the cellar is supplied with pieces of timber, say 8 by 8 inches thick, which are placed about 6 inches apart and this protects the ice from the influence of the earth below. When the ice is being put in I take care to have the bottom and sides, well provided with clean dry straw, and have the ice occasionally broken fine, and when the house is full I have it well covered up with the same material. This is all that is necessary to be particular about. As the straw is a non-conductor of caloric, and the ice being well imbedded therein does not melt in the warmest weather. Many years ago this house was lined with board which was only useful as a harbor for rats. The lining gradually decayed and has long since been removed, and still the ice is kept as well as ever. Give your ice a dry cellar and plenty of rye straw, and rest assured you will require neither tar nor pulverized charcoal, nor boards to keep it cool.

A PHIL. CO. FARMER.

EXTRAORDINARY COW. A cow, the property of Mr P. Kent of Springfield, Ms. during sixty days commencing June last, gave one thousand three hundred and forty-six quarts of milk! averaging twenty-five and a quarter quarts of milk per day. The largest yield was eleven quarts in the morning and eleven in the evening.

**NEW ENGLAND FARMER,
AND HORTICULTURAL REGISTER.**

BOSTON, WEDNESDAY, MARCH 20, 1839.

AGRICULTURAL MEETING.

The eighth agricultural meeting was held on Thursday evening at the Representatives' Hall. B. V. French, Esq. of Braintree was called to the chair. The meeting was fully attended and a strong interest manifested in the objects of the meeting.

The commissioner of agricultural survey read the report of the trustees of the Massachusetts Agricultural Society awarding premiums on farms, amounting in the whole to six hundred dollars. This report is inserted in full in this day's Farmer; and will be read with pleasure and improvement. The observations contained in it on the redemption of waste lands or peat meadows, on the cultivation of root-crops, and on the raising of wheat will particularly command the attention of the farmers; and they are commended to the attention of farmers particularly as coming from an individual as thorough in his observations and as practical in his knowledge of agriculture as any one among us.

The meeting then proceeded to the discussion of the topics assigned for the evening; which were vegetable root-crops.

The report above named placed the value of ruta baga for fattening cattle, for milch cows, for swine and for horses at a very high rate. Mr Brigham of Westboro expressed himself as strongly differing from the opinions expressed in the report in respect to their value. He was disposed to value roots at a high rate; but there was danger that farmers might expect too much from them; and he wished to guard them against disappointment. He had in the course of his farming raised from 1000 to 1100 bushels to an acre of ruta baga; and of carrots from 700 to 1200 bushels.

He had used his ruta baga for cows in milk. They will not double the quantity of milk as the report stated; but they will increase it considerably. He thinks however that the quality of the milk is injured by their use; and that the milk of cows fed upon them will produce but little cream. He had found them of use in fattening beef. On the whole however he deemed them greatly inferior to carrots. Carrots he estimated very highly. They were difficult or rather expensive in cultivation, but if successful they amply repaid any expense or labor bestowed on them. They were an excellent crop for horses. He did not coincide in the opinion, stated by the commissioner, of Mr Merrill of Lee, who said that for feeding horses he should prefer one hundred bushels of carrots and one hundred bushels of oats to two hundred bushels of oats; yet he deemed them excellent and much the best root crop raised among us. He had found it likewise much easier to keep carrots than to keep ruta baga. Of their value for fattening beef or swine he had no knowledge.

Mr Danforth of Pittsfield stated a case within his own knowledge in which the raising of carrots cost at the rate of eight cents per bushel. Other gentlemen stated that they had been produced in the state in large quantities at the rate of 6 1-4 cents per bushel.

Mr Abbot of Westford was disposed to value ruta baga much higher for milch cows than Mr Brigham. In his own experience for the increase of butter, where he had tried cows in successive weeks upon pumpkins and ruta baga, the increase of butter in the use of the latter root was as 14 to 10. A gentleman of Portsmouth N. H. within his knowledge had compared the value of carrots with potatoes in fattening beef; and in this experiment thirty

bushels of potatoes proved equal to sixty of carrots. It would have been very instructive if Mr Abbot could have given the particulars of both of these experiments more fully; this we hope he will do, and we shall be happy to make the N. E. Farmer the vehicle of such communications.

Mr Perry of Bradford spoke next of the value of roots. In relation to the keeping of vegetables he thought a good deal depended on the nature of the soil in which the cellar, where they were stored, was dug. It often happens, he says, that ruta baga will not keep in the same cellar in which potatoes and carrots may be kept. Of the value of ruta baga he gave an illustration by an anecdote in which he was a party. He had been accustomed to supply a neighbor of his with milk. His neighbor inquired one time why the milk was not as good and as rich as it had been. Now this inquiry was made at a time when he had ceased to give his cows ruta baga, with which before they had been liberally supplied.

Mr Buckminster spoke highly of the value of roots; but seems to be as hostile to potatoes as the late William Cobbett; from which it is but natural to infer that he has no Irish blood in him. He deems grain crops an exhausting crop and potatoes particularly so. He thinks the evil complained of by which the milk was injured in its taste was occasioned by giving the animals too much.

The chairman stated that within his experience it would be safe to feed a bushel per day to an animal, provided they were kept at the same time on salt-hay.

Mr Buckminster pronounced potatoes a very exhausting crop and the cultivation not to be encouraged. To an inquiry as to the amount of potatoes usually raised per acre he replied from one hundred to one hundred and fifty bushels, and gave it as his belief that the crop in Framingham did not exceed one hundred bushels. (We think the farmers in Framingham ought to be indicted if they allow him to tell such a story as this about them another year.)

Mr Bruce of Grafton was disposed to defend the potato crop; and pleasantly remarked that if he obtained not more than one hundred bushels per acre he should be quite disposed to give them up. In his own cultivation he considered 200 bushels a light crop—350 bushels a good crop. He had raised 564 bushels to the acre, and was accustomed to use 40 bushels of whole potatoes for seed. He is accustomed to plant them in hills. He said the crop of one of his neighbors had exceeded 700 bushels to the acre. These were certainly cogent arguments in reply to the Framingham farmers.

Potatoes are without question an exhausting crop, and return little to the land, the tops amounting to a small matter. In our practice they are far from being an ameliorating crop, because they are cultivated in the most slovenly manner; they are in many cases not hoed more than once, and the weeds afterward usually abound and cover the ground with their seeds. This however is altogether the fault of the cultivator and not the crop. In neat and clean husbandry and at a yield of four hundred bushels to the acre, (and with less than this even the Framingham farmers ought not to be satisfied) they are a valuable crop; and an acre of potatoes will furnish a great amount of most nutritious food for man and beast; though Cobbett insists upon it they are nothing but so much dirt and water.

Mr Denney of Westboro stated that he had fed his cows with carrots and ruta baga; and that in changing from carrots to ruta baga the quality of the milk immediately became deteriorated.

Some incidental conversation then arose in respect to the preparation of seed corn with tar as a protection against crows. Mr Denney recommended 1-2 pint of tar to a peck of seed corn. Mr Buckminster prefers to plant

his seed corn without any preparation. Mr Bruce and Mr Pease of Martha's Vineyard stated within their own knowledge the injury from tarring, so that the seed was lost. There is undoubtedly some risk in tarring seed corn. Too much tar may be applied. If the weather should prove very dry immediately after planting, it may be prevented from coming up. But we have known it in many cases successfully employed, though we do not consider it a certain preventive against the crows. We once knew a man, who after having cleaned his brasses with rotten-stone and rum, tipped the remainder into his stomach, by way we suppose of putting the saucer away clean. The crows when very sorely pressed by appetite will sometimes swallow even the tarred corn.

The chairman stated that the cut worm to which reference was also made does all his mischief from the 15th to the 20th of May. This is an interesting fact and will, we hope, be the subject of careful observation.

No time was left for the discussion of another subject which had been proposed, that is, the cultivation of fruit trees; and it was decided that this and the subject of agricultural improvements should be presented at the next meeting to be held on Thursday next at the usual time and place.

The chairman expressed his strong satisfaction in these meetings, and thought they must be highly conducive to the public benefit. He even went so far as to insinuate that they might be as conducive to improvement and the public good as some of the sessions held in the same room by day light. On this matter we express no opinion. We only say that the interest in these meetings has gone on increasing from the beginning; that it is a relief to go to a meeting where the sole object is the diffusion of knowledge and the public improvement; where the waters are not perpetually lashed into a storm by some miserable party passion or strife; and that the information and pleasure obtained have been an ample compensation for the time occupied. H. C.

LEGISLATURE.

The legislature have at last taken the bull by the horns and are fully engaged in the discussion of the License Law, as it is termed, of the last session. The committee sat a long time upon it; but every feather it is believed was pulled out of the chicken, which they hatched, almost as soon as he was brought into the house. Various amendments have been introduced and piled one upon the other to such a height, that there was so much danger of the whole building tumbling by its own weight, that it was deemed necessary on Saturday to take all the old stuff and commit it to seven master-builders to bring in a new frame on Monday morning. This they have done; but whether with any more success than before remains to be seen.

The house of representatives have voted to include wine among the prohibited articles, and to place it in the company where it belongs; for in truth a large portion of the liquor which goes under the name of wine is but disguised brandy or rum with a little coloring matter thrown in. Whether this is introduced by duty; or by the enemies of the old law with a view to make it absolutely intolerable, remains questionable. We have sometimes seen three libbers fellows get on to the same horse. The consequence was either that he could not go at all; or becoming restive he would kick and rear and throw them all off.

We cannot say we look at the subject with unconcern. We have no wish to encroach upon any man's rights or honest pleasures. But we do pray to God continually, that he would deliver us from this curse of curses, drunkenness and intemperance; this vial of divine wrath, which seems to embody the evils and miseries of all the seven vials spoken of in the book of Revelation.

We care not what measure is adopted so that the infamous and accursed tipping shops and grogeries throughout the land may be broken up; these profane fountains of evil as dreadful in its devastations upon society as the lava flowing from the crater of Mount Vesuvius upon the surrounding country; these dreadful vortices, turbid and

cherous maelstroms, in which daily and hourly reputation, character, principle, honor, innocence, integrity, appress are engulphed; these bloody altars, where daily and hourly parents, wives, children, friends, all right hopes, all cheering prospects, all affecting and tender relations, all that is dear, lovely and valuable in life, a character and in society, are without hesitation sacrificed. H. C.

BRITTON MARKET.—MONDAY, March 18, 1839.

Reported for the New England Farmer.
At Market, 310 Beef Cattle, 12 pairs of Working Oxen, 15 Cows and Calves, 100 Stores, 800 Sheep, and 30 Swine. Several lots Sheep and about 40 Beef Cattle unsold.

Prices.—*Beef Cattle*.—We quote First quality, \$8 25 \$8 75 Second quality, \$7 75 a \$8 25. Third quality, \$5 50 a \$7 50.

Working Oxen.—Sales noticed, \$110, \$115, \$125. *Cows and Calves*.—\$33, \$38, \$40, \$46, and \$55. *Stores*.—We noticed the sale of Heifers to calve in a few months at from \$22 to \$25.

Sheep.—"Dull" We quote lots at \$1 00, \$4 25, \$5 50, and \$5 75.

Swine.—Not enough were at market to establish prices.

THERMOMETRICAL.

Reported for the New England Farmer.
Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass., in a shaded & sheltered exposure, week ending March 17.

HOUSEHOLD FURNITURE,

Farming Utensils, &c., at Auction.

Will be sold at public auction, on Thursday, March 21, 5 39, at 1 o'clock, P. M., at the residence of LOT WHEEL- YRIGHTE Esq., "Nonantum Hill," Brighton, the following articles, viz:

1 Ox Wagon and Ox Cart, new wheels; 1 Horse Wagon and Horse Cart, with ladders and harness; 1 Ox or Horse Bed and Tongue; 1 Harrow, Cart, Bodies, heavy Roller; 1 garden ditto, Ploughs, Hoes, Spades, Scythes, Chains, Gardening Tools, &c.

Household Furniture, consisting of Mahogany Chairs, Tables, Looking Glasses, Painted Chairs, Bedsteads, Washstands, Old Casks, Boxes, Tubs, &c.

Also, 1 Chaise, brass mounted Harness. 1 Carriall and Harness.

Terms Cash. L. L. MASON, Auc^r.
Brighton, March 20, 1839.

MORUS MULICAULIS.

JOSEPH DAVENPORT will personally attend to the selling of the largest lot of *Morus Mulicaulis* ussoid in the United States, after the first of April next, at his plantation five miles southwest of the city of Hartford. The sale of his splendid lot of trees has been delayed till the present in consequence of his unexpected absence since last fall. He invites purchasers to call on him, in person, so far as consistent, as they may better select for themselves; yet all orders sent to the city Post Office, will be executed with all possible care and dispatch. His long experience will enable him to reckon on in a manner that will ensure safety to any part of the Hartford, Ct., March 20, 1839.

NEW BOOKS.

The American Fruit Garden Companion, being a practical treatise on the propagation and culture of fruit, adapted to the Northern and Middle States. By E. Sayers, Gardener. The American Flower Garden Companion. By E. Sayers, Gardener. Whitmarsh on the Mulberry Tree and Silk Worm. Cobb's Silk Manual. The American Silk Grower's Guide, by Willinn Kenrick. For sale at the New England Farmer Office. March 20. JOSEPH BRECK & CO.

MAN AND BOY.

Wanted a man who is acquainted with vegetable and fruit gardening; he must be of good moral character, active, constantly industrious, and a temperance man—he is wanted for the season, and perhaps he can secure a permanent situation. Also—A good boy, he must be willing to give his whole time and attention, and he will be thoroughly instructed in the business—he must produce good recommodations—none other need apply. March 20.

SHEEP AT AUCTION.

Will be sold auction on Friday the 5th day of April next, at 10 o'clock, A. M., the flock of fine Saxony Sheep, of Rejoice Newton, Esq., at his farm in Worcester, in such lots as may suit purchasers. It consist of,

- 120 Ewes with lamb.
- 100 Yearling Ewes and Wethers, very fine and healthy.
- 7 Yearling Bucks of the best blood.
- 8 Older Bucks, selected from the best flocks.
- 300 Wethers and Ewes not with lamb.

This flock has been improved for several years with great care and expense, and is believed to afford as good an opportunity for obtaining the best stock as any flock in the country. T. W. & C. P. BANCROFT, Auc^rs.

March 20, 1839.

FRUIT TREES, &c.

Pears, Plums, Raspberries, Roses, &c.

The subscribers have recently received, per the Switzerland from Harve, a large assortment of the choicest varieties of Pear and Plum Trees, from one of the best Nurseries in France, together with a small Collection of superb French Roses, all in excellent order for transplanting, which they offer for sale at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street. The Pear and Plums are from 6 to 7 feet high, and will be sold at \$1 00 each.

PLUMS.

- Downton's Imperatrice
- New Orleans
- Old Orleans
- Green Gage
- Golden Drop
- Early Monsieur
- Late Monsieur
- Perdregou
- Isleworth
- Reine Claude
- Mirabelle petite
- Mirabelle grosse
- St Catherine
- Royal du Tours

ROSES.

- Red Moss, \$1 50
- White Unique, 1 00
- Phillip I, 1 00
- Josephine Antoinette, 1 00
- Palmyra, 1 00
- Striped Unique, very rare, 3 00
- Cristata, 1 00
- De Roi, 1 00
- Madame Hardy, 1 25
- Perpetual d'anger, 1 00

STOCKS.

10 000 Pear Stocks; 10 000 Plum Stocks, \$20 per thousand. ALSO. 500 pound French Lucerne, 600 pound Sugar Beet.

ALSO ON HAND.

- 1000 White Antwerp Raspberry Plants.
 - 2000 Red do do do
 - 1000 Franconia do do (very fine).
- Orders received for Fruit and Ornamental Trees at Nursery prices. JOSEPH BRECK & CO.

FARM FOR SALE.

A Corn, Grain and Dairy Farm, situated in Westford, about nine miles from Lowell, and one mile west of the Meeting House and Academy, on the road from Westford to Groton, and twenty-six miles from Boston, and containing one hundred and fifty acres of tillage, mowing, pasturing and orcharding, and fifty acres of wood and timber land, all except the wood land lying together, and that but a short distance from the tillage land. The buildings are a two story house, wood and chaise house, cider house, and barn ninety feet long, with two sheds. It has a valuable peach orchard, pear, plum and cherry trees, with many valuable grafted apple trees. It is well fenced, principally with stone wall. The whole will be sold together, or in parts to suit purchasers. For further particulars inquire of LUTHER HALL, under the Seaman's Bethel, North Square, Boston, or of RUFUS PATTEN, on the premises. March 13.

FOR SALE.

A new milch goat, of a superior breed, producing milk like cream; well calculated for the invalid, or for a vessel for a long voyage. Inquire at this office. March 13.

MISCELLANEOUS.

From the Baltimore Transcript.

WASHING DAY.

Monday has come; what means this stir and hurly,
This noise and hubbub round the town, I pray?
The whole creation seems all in a hurry:
Why, know you not, Sir? this is *washing day*.

See pails and kettles in confusion flying;
With water by the hog-head cold and hot;
Some garments on the line are pinned and drying,
Some in the *suds* and others in the *put*.

Tou hallowed day! and thou, long famous kitchen,
With what eventful doings dost thou teem!
Hissing and bubbling, pulling, shaking, stitching;
Nor is it strange, for all things *go by s'cam*.

But look again, with what tremendous splashing
Maidens and dames the dirty garments rub.
Oh! there's no beauty like a woman *washing*;
Bending in grace above a *well-filled tub*.

Oh! what vast cleansings, o'er how vast a region,
Are going forward on this far-famed day:
Woolen and flax, with cotton clothes, a legion,
All find a hand to *wash their stains away*.

But no to those who without rhyme or reason,
Neglect their washing when the weather's fair;
Like other idlers they may lose their season,
And so on Sunday have no *clothes to wear*.

(From Illinois and the West)

ILLINOIS.

Much has been said and written about the face of country, climate, soil, &c., of Illinois, but after all, no true impression has been conveyed to eastern people thereof. For my own part, I found myself quite at fault, although I had taken especial pains to inform myself both by reading and conversation with those who were well acquainted therewith. And I believe it beyond any one's power to give any description of the face of the country, which shall convey anything like an adequate idea to a stranger. It is perfectly unique—totally unlike, in general and in detail, anything in New England. It is called a level, flat country, and it is, compared to the eastern states, but not as level as it has been described. Its prairies, in particular, have been represented as exceedingly flat and even, and we have supposed an area of from ten to fifteen or thirty miles of an unbroken plain, with no elevations or depressions, more than are met with on our extensive salt marshes. But the country is all unequal—not precipitous—and the prairies present a continual change of tables and sloughs, while the timbers are broken by high knolls and deep ravines. Besides, I had supposed that the tables in the rolling prairies all ran in parallel lines and equal distances from each other, whereas they are of all sizes and shapes, and lay in every direction in the same prairie, thereby affording a greater variety, and greater facilities for cultivation, etc. etc. The timber on the “bottoms,” is dense and heavy, and tangled with a most luxuriant growth of vines, shrubs, briars and rank grass. These bottoms are on all the rivers and creeks, skirting the prairies and making beautiful belts in every direction through the country. Besides these, there are “barrens,” or “oak openings,” as

they are called, which are composed of large trees of the various kinds of oak, hickory, maple, elm, &c. These trees are quite sparsely scattered around, making a most beautiful park, entirely free from under-brush, and the ground is covered with a luxuriant growth of grass and flowers. The openings are all on unequal—nay, broken ground—high abrupt hills and gentle swells, alternated by deep precipitous ravines or most picturesque valleys of perfectly easy access even with a carriage. Nothing can exceed the beauty of these unique forests—no art of man's device could have accomplished on so grand a scale a work so perfectly splendid and enchanting. The soil of these barrens is a fine silicious loam and not more than from eight inches to eighteen in depth, but rich and well adapted to produce the lighter grains and corn, with a careful culture. The secret of the openings lies in the annual conflagrations which pass over all the prairies and barrens of the west. This yearly burning consumes all the new trees and shrubs, and leaves the ground entirely unnumbered. The old trees, likewise, are annually diminishing in number. Scarcely a tree but is marked with fire, and when once the bark is penetrated by the fire, and the wood of the tree seared, the fire takes a readier and deeper hold thereon, until at last it overpowers and destroys it, and the tree falls with a startling crash, and generally consumes before the fire dies out, unless a violent rain extinguishes it, and leaves it for food for the next annual passage of the devouring element. I beheld many a line of ashes, marking the spot where the entire trunk of a massy oak was consumed the previous autumn.

These barrens are the resort of birds of various note and plumage, and all the wild animals found in this country, such as wolves, deer, foxes, rabbits, &c. &c.

The “bluffs” are abrupt elevations, generally in the immediate neighborhood of, and are to be found, I believe, on all the rivers and on each side. Generally they approach the river, but upon one side in a place, while on the opposite lie the heavy timbered bottom lands from a mile to six in width. In the course of twenty, sixty, or an hundred miles the bluffs and bottoms change sides—or, to speak more accurately, the river changes to the other side of the bottom, which is bounded on each side by these bluffs. These bluffs are from one hundred to two hundred feet high, intersected with deep ravines at right angles to the river, and are composed of limestone, which often forms bold perpendicular cliffs of great height and regularity. The bluffs are generally crowned with “oak openings,” and present to the traveller as he passes up and down the river, a most picturesque and charming scene.

And what shall I say of the prairies—those immense sea-fields, clothed with their heavy robe of green, and dotted and slashed with gold and azure, vermilion and orange, white and violet, reflected from flowers of every size and shape, bewildering the traveller with their intense beauty, their rich and endless variety.

The prairies are of two kinds, and are distinguished as rolling and flat. The rolling prairies are gently and irregularly undulating, having swells of twenty to sixty feet high, and of all lengths and breadths; between which are sloughs, called in the dialect of the place “*sloos*.” They are low and swampy, and are of the same character of similar places in New England meadows called *runs*. If a small ditch be carried through these

“*sloos*,” a fine running stream will be produced, which will last nearly or quite the year round, affording plenty of water for cattle. There is scarcely a prairie without this kind provision of nature. These prairies are beautiful to the eye of a stranger, but their unbroken monotony tires the senses, especially when covered with the decayed growth of the former summer, clothed with a garment of snow, or blackened by the recent conflagration. Extravagant stories of the luxuriant growth of the grass have been circulated at the east, as indeed everything pertaining to this wonderful country has naturally enough assumed an exaggerated tone. In the bottom prairies, the grass occasionally reaches the top of a man's head as he sits on his horse—a rank coarse grass unfit for the purposes of feeding—but in the common open prairies from two to three and a half feet is a fair average; in the sloughs it often exceeds this by a foot or even more.

These prairies, as well as the barrens and bottoms, afford exhaustless ranges for cattle, horses, and swine, and the prairies abundant grass for the scythe, all without cost or labor of fencing. The prairie grass is coarse, but greatly loved by cattle, and makes, when well cured, an excellent fodder for the winter.

WINSHIP'S NURSERIES, BRIGTON.

Just received from England and France, a rare collection of Plants, viz:

Pears, Plums, Peaches, Apricots, Gooseberries, Pear Stocks, Purple Beach, English Elms, Japan Junco Trees, Striped, Myrtle leaved, Gold margined, and Weeping striped Box Trees.

Common silver leaf, Fine do. do., Upright Golden, Smooth leaved Golden, Balance do. do., Plain Screw do. do., Camellia leaved do., Marginal and Hedgehog Hollies.

Portugal, English, Long narrow leaved, and short do. do., Laurels.

Azaleas, Rhododendrons, Thorns, Eglantine, 100 varieties new Roses, Oranges, Camellias, and various kinds of Green-house Plants.

Orders will be promptly executed and forwarded to any part of the country.

Orders may be left with JOSEPH BRECK & CO. or forwarded by mail to Messrs. WINSHIP, Brighton, Mass.

Brighton, March 4.

BRUSSA MULBERRY SEED.

We offer for sale a small quantity of Brussa Mulberry Seed, by the pound or ounce, which may be relied on as true and genuine. This variety of Mulberry is much superior to the Morus Multicaulis, for this climate, being perfectly hard; said to be even more hardy than the common white. JOSEPH BRECK & CO.

FRUIT AND ORNAMENTAL TREES, MULBERRIES, &c.

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1839 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and of Peaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeysuckles, Pionies, Dahlias and other Herbaceous Flowering Plants.

10,000 Cocksbur or Newcastle Thorns.
10,000 Buckthorns.
Morus Multicaulis, and other Mulberries; the trees genuine and true, at prices fair, and varying with the size, and the quantity which may be desired.

Fruit and all other trees, when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.

VOL. XVII.]

BOSTON, WEDNESDAY EVENING, MARCH 27, 1839.

[NO. 38.]

N. E. FARMER.

For the New England Farmer.

MR BRECK.—Within a few days, I have received several letters and pamphlets, with a small package of eggs, of a new species of silk worm, from the Messrs Winship,—the estimable proprietors of the celebrated nursery in Brighton, which had been presented to them, by captain Charles Hunt, commander of the ship Switzerland, which has recently arrived in Boston, from France; and I was requested to make such a disposition of them, as would be most beneficial to the country.

By the letter from J. H. Mey, Esq. of Paris, to captain Hunt, and which is herewith submitted for publication, it will be perceived, that the silk worm eggs, from which the sample transmitted were derived, have been lately introduced into France; and from an article in the first number of "Le Propagateur de L'Industrie de la Soie," to which Mr Mey alludes, it appears, that they were brought from Bengal, by captain Vaillant in the corvette Bonite.

I shall translate from the Propagateur for the next number of the New England Farmer, the account of an experiment, which was made by Baron D' Hambres-Firmis, in rearing a small colony of these oriental strangers, at the request of the Minister of Agriculture and Commerce, from whom some of the eggs, that had been just brought from India were received; and I will at the same time, deposit with Mr Colman, the agricultural commissioner of the state, the eggs, confided to me for distribution among such persons as are engaged in the silk culture, as may be desirous of making an experiment, to ascertain whether this species of the precious family of the silk manufacturing insects, will be an acquisition to them and the country, or not; and also an engraved sheet, containing accurate and beautifully colored representations of the insect, in all its various stages and transformations, from the moment it leaves the egg, until it reaches the perfect winged state.

There is an advertisement of the Chevalier Soulange Bodin, announcing that he has for sale, at his celebrated establishment of Fromont, plants of the *Morus Multicaulis*, *Camellia*, *Rhododendron*, *Magnolia*, *Azalea*, *Rose*, *Dahlia* and *Chrysanthemum*, which you will please to publish until the first of May.

The eminent services, which the Chevalier Bodin has rendered to horticulture, by his extensive and admirably conducted experimental garden and school at Fromont, and his numerous publications, on the science and art of horticulture, in all its interesting departments, have rendered him highly distinguished and most deservedly honored, in both hemispheres: and whoever may desire to obtain any plants, from his vast nurseries, can rely, with confidence, on receiving the best samples, which are to be procured in France, of all the varieties, of fruit, forest and ornamental trees and shrubs, which are cultivated in that kingdom.

Captain Hunt is entitled to the gratitude of his

fellow citizens, for his honorable exertions to subserve the interests of his country, in one of its most important branches of industry. Such rare instances of fidelity to the republic, among the thousands of Americans who visit every portion of the globe, are deserving of the highest commendation; for the introduction of a single new plant, seed or product, which may give employment to any portion of the people, is often of more momentous consequence, to the prosperity of agriculture, manufactures, and navigation, than the annual importations of our whole commercial fleet. Such was the case with the cotton seed, and may be with the silk worm and *morus multicaulis*. Nantucket may well be proud of such an intelligent and patriotic nautical commander, who has evinced a disposition and has a mind sufficiently enlightened and discriminating to ascertain, that the introduction of the minute egg of an insect, may be more creditable to himself, and beneficial to the United States, than a return from the coast of Japan, after the accomplishment of the most successful whaling expedition, that ever made glad the hearts of the bold, hardy and adventurous mariners, of the storm-beaten island, of the illustrious Penn's exemplary and meritorious disciples.

Mr Mey, who is a citizen of South Carolina, has well earned the thanks of his countrymen, by his active zeal to promote their interests; and it is desirable, that other gentlemen, who have as favorable opportunities, to transmit, whatever may be valuable to their native land, would imitate his generous attention to really *useful* or *interesting* objects, as well as to the worthless pageantries which amuse and occupy most of the time, of too many of our ever wandering, yet mere sight-seeing and profitless tourists; who, if they do bring home some foreign article, it is often the fragment of some ancient work of art, and in the acquisition of which they have evinced their *refined taste* in the Elgian manner, by mutilating a superb temple, column or statue, in the acquisition. A book, or painting, or any whole and complete object, no matter how small, is worth all the baubles and pieces of stone, which illustrate the profound researches, of the innumerable "lookers on," male and female, which our modern Viennas annually send forth; and who if they "have swam in a gondola" on the canals of Venice, have satisfied their lofty notions of foreign travel.

Very respectfully your

Most obedient servant,

H. A. S. DEARBORN.

HAWTHORN COTTAGE,

Roxbury, March, 14, 1839.

Paris, January 16, 1839.

Captain Hunt commander of the ship Switzerland,

SIR—Since you left this city, I have subscribed to a work, which treats exclusively of the silk worm and the cultivation of the mulberry tree, which I send to you, that you may present it to your society, and if they choose they can write to me to subscribe for them. The cost is but eight francs per annum.

I have been promised a species of silk worm, which laid eggs, that hatched immediately after. This is but lately known, and a report will be made of it, at our next meeting of the horticultural society; so that you have the latest information on the subject, and which but few Frenchmen yet know. If I can, I will send you, by the same conveyance, some of these eggs, which were brought here by the Bonite, captain La Vaillant; and these are the only eggs produced here from them.

On the 18th of June, 48 eggs produced, at the end of 40 days 12 cocoons. These cocoons produced eggs, which hatched in a cellar, where they were placed, and were removed to a hot house on the 18th of August, where the heat was up to 147 by Fahrenheit's thermometer. The first day 24 hatched, the next 25, and on the 21st they were all hatched, producing 1036 worms. The first cocoons were small, pointed and soft, the second much larger and solid. The color of the silk was white, yellow, and greenish-yellow, or rather yellow with a tinge of green. The 12 cocoons produced but one male, and another male was procured to fecundate the rest.

I think the species, which it is said produces many crops in its native country, will be valuable, therefore take care of them. I also send a sketch of the different stages of the worm, the eggs of which I beg you will endeavor to distribute.*

Thursday 3 o'clock, P. M, Jan. 17. I have succeeded in procuring the Sina species of worm, Syrean mixed. If they can be separated, when hatched it would be better, as they are two different kinds. Keep the eggs, which are in a tin box, in a cool place, that they may not hatch before the time, you have leaves to feed them with. I think you may have three crops in Boston, with the aid of the *morus multicaulis* leaves.

I am respectfully,

Your obedient servant.

J. H. MEY.

SERICICULTURE.

MR BRECK.—I promised, in the communication which I sent you on the 14th inst., to furnish additional information, in relation to the Bengal silk worm, and annexed are translations from the numbers of the Propagateur, of the several accounts, which have been given of that insect.

The Propagateur is a monthly journal, which has been established at Rodez, the capital of Aveyron, by a society of agriculturists and manufacturers, for the special purpose of extending and perfecting the culture of the mulberry and the management of silk worms, in the southern departments of France. It is under the direction of M. Amans Carrier, who is eminently qualified for the station. The first number was published in July last, which with those for the other five months of the year,

* It is possible that this silk worm is the variety which is mentioned in an article I furnished for the 12th number of the first volume of your Horticultural Register, as being chiefly cultivated in India, for it yields six crops in a year.

H. A. S. D.

have been received through the kindness of J. H. Mey, Esq. and captain Charles Hunt.

No work has appeared in Europe or this country which is destined to be so interesting and valuable to sericulturists, as the Propagateur; for it will contain the results of experiments, made by the most intelligent and experienced gentlemen of France, who are deeply concerned in that important branch of national industry, to which it is consecrated; and who chiefly reside in the very region, where it has been so long and successfully prosecuted, and where unexampled exertions are being made, to render it more profitable to themselves and beneficial to their country.

From a careful examination of the very able and instructive communications, with which the numbers are enriched, it is apparent that the attention of the government, as well as that of the cultivators and manufacturers of silk has been roused in an unprecedented manner, within a few years: and that there is a more extensive and zealous co-operation than has been witnessed, since Oliver de Serres, introduced the white mulberry into France,—“a tree,” as the eloquent Bourdon justly remarks, “which is so full of the blessings of God.”

Pecuniary premiums, and gold medals have been offered, experimental plantations, magnaneries, and filatures established, and normal schools founded, and placed under the superintendence of able professors and skilful machinists, by the government, in many of the departments; and Henry Bourdon, appointed a special agent, to visit annually all the departments where silk has been or is becoming an object of culture, whose duty it is to make detailed reports, of whatever is worthy of notice, to the minister of public works, agriculture and commerce; and so favorable has been the influence of these enlightened and liberal measures, it may be confidently assumed, that this precious and beautiful branch of rural economy, has made such rapid strides, that the product of indigenous silk has been increased, at least, thirty per cent.: and if the same patriotic policy and spirit, by which the sovereign and people are now actuated, is continued, it will be doubled within a few years.

The first great cause of the attention of the government being roused, and the cultivators of silk so intensely excited, was the publications of the illustrious Dandolo, in 1817 on the “Art of rearing the silk worm,” and his establishment of a practical school at Varese, for teaching the best method of managing mulberry plantations and silk worms, which became the resort of young men from all parts of Italy and France, and who gave the name of Dodorolites to the improved structures which they erected on the model of that at Varese for the accommodation of the colonies of silk worms.

Bonafous, Pillaro, and numerous other distinguished scientific men, and practical cultivators, in various parts of France, actively co-operated with Dandolo to improve the methods of conducting mulberry plantations and the education of silk worms. Gonsoul invented the apparatus, now universally adopted in the large filatures, for heating with steam, the basins of water, in which the cocoons are placed to be reeled; by which the silk is more perfectly cleansed of the gum, is more uniform in size, perfect in color and beautiful, and its strength, elasticity and splendor increased. For this discovery and several others, of vast utility in science and the arts he received medals and diplo-

mas and other marks of distinction from the government; and on transmitting to him the Cross of the Legion of Honor, the minister of agriculture and commerce, emphatically observed, in the official note, which accompanied it: “THIS DECORATION WAS GAINED ON THE BATTLE-FIELD OF INDUSTRY.”

The cultivators of silk have been enabled to wonderfully increase the product of their establishments, by the improvements for artificially heating and ventilating the magnaneries, which Darcet, Beauvais and Combe have made known; and the movable tables, contrived by Vasseur, as substitutes for shelves, and other modes of accommodating the silk-worms during their growth and labors, and to aid the ventilation, seem to have perfected the whole apparatus for the most successful mode of conducting the magnaneries, and have been considered so valuable,—as from 50 to 75 per cent. of space is gained thereby—that he has been rewarded by an appropriate gold medal.

Thus, notwithstanding the active rivalry which has been maintained by the silk manufacturers of Great Britain, and the encouragement which has been offered to those of Russia, Sweden, Austria, Prussia, Belgium and Switzerland by their respective sovereigns, and the importations of manufactured articles from India and China, the manufactures of France have continued to increase, and the value of the fabrics, which are annually made at Paris, Tours, Lyons, St Etienne, St Chamond, Avignon, and Nismes, is estimated at 200,000,000 of francs.

But after all the great efforts which have been made to extend the culture of the mulberry and the rearing of silk-worms, in the middle and northern, as well as the southern departments of the kingdom, there is annually imported into France from Italy, Turkey, India and China, large quantities of raw silk.

It will be perceived from the following statements, made by Baron d' Hombres-Firmas, Viscount De Retz and Mr Puvis, that it is evident the eggs of several varieties of silk-worms were brought from Bengal by the *Bonite*; and that from the small number submitted to experiment, and the unfavorable circumstances attending them, there has not yet been a fair opportunity of ascertaining whether either will be considered an acquisition or not; and it will require another year to test the character of each race. From these circumstances it is very desirable and important, that the persons who may receive portions of the eggs sent by Mr Mey, should carefully separate the cocoons of the various kinds of worms which may appear, to enable them to obtain eggs of those species which present the best characteristics.

There is a very interesting article by Mr Audouin, of the Institute, in the fifth number of the Propagator, on the cause of a very fatal epidemic, called the Muscardine, which often appears among the silk-worms, and the mode of preventing its ravages, which I shall translate and send to you for publication.

Very respectfully,
Your most ob't serv't.

II. A. S. DEARBORN.

Hawthorn Cottage, Roxbury, }

REPORT

Of an experiment on the culture of the silk-worm of Bengal, made at Alais, in the Department of

Gard, by the Baron D' Hombres-Firmas, Chevalier of the Legion of Honor, correspondent of the Institute, and of the Royal Agricultural Society, &c.

The Minister of Agriculture and Commerce, having been pleased to send me some of the silk worm eggs which were brought from Bengal by Captain Vaillant, in the corvette *Bonite*, I submit a summary account of the lit^{le} experiment which I have made.

Generally, in our part of the country, the crop of cocoons has been indifferent this year, and it is a great calamity. The late frosts destroyed nearly all the leaves of the mulberry trees, which had just been developed; and we were unable to feed the silk-worms, which had begun to hatch; it therefore became necessary to throw them away, as well as the eggs which were in motion, or ready to open.

My experiment was made in my apartment, where the temperature was kept sufficiently high, and the air continually renewed. I found daily in my garden a few handfuls of tender leaves, which furnished numerous repasts to my silk-worms.

The eggs which I received were still attached to the paper on which they had been laid by the insects in Bengal. Those which had made the voyage in vases hermetically sealed, were marked No. 1, those which were put into bamboo cases, No. 2, and the others, which were merely enveloped in paper, No. 3.

On examining the eggs with a magnifying glass, many of them appeared flatted, and several had a small depression in the middle. Nearly half of them did not hatch. I often examined the Bengal eggs and compared them with those which were destined for our farmers; but the latter had been well liberated, while the others were passing the equator; it is to this cause, that I attribute their hatching spontaneously, and is probably the reason why seven-fifteenths of them perished.

On the 14th of April, I perceived some little worms among my three parcels of eggs, and immediately placed them in the hot-house to protect them. The hatching continued for several days, and consequently the worms were of unequal size, which I arranged in several divisions without seeking to equalize them by causing some to fast and giving more heat and food to those which were the latest, as is done in our large establishments.

My worms, when hatched, were about two millimetres long, and were black and hairy; they had more than doubled in size at the first moulting; as they increased, they appeared spotted, and then whitish, and resembled, perfectly, our common silk worms, except that they were smaller, and when ready to ascend, they were of the size of the latter at their fourth change.

Some died after the fourth change, without my being able to ascertain the cause of the disease. I had 203 cocoons, 52 of which were yellow and 151 white. The cocoons are very small, elongated and pointed, and of the kind which are called satin or velvety, and but little esteemed; some of them are sufficiently firm, but still light; it required ten of the most beautiful to weigh 12 grammes.

The cocoons of our country appear in every respect, preferable to those of Bengal, in the opinion of our silk reelers, to whom I shew them; but they think, with me, that it is not from the first experiment, and made on so small a scale, that we ought to decide. I shall carefully preserve the eggs of this crop, and hope to succeed better next year.

Alais, June 15, 1838.

Extract of a letter from Baron D'Hombres-Firmas—to M. Anans Carrier, the Director of the Propagateur.

Aiais, Dec. 25, 1838.

In the report which you have published, on the experiment I made in rearing the silk worm of Bengal, from eggs, transmitted to me by the minister, I supposed that a long voyage and the great heat they had endured, and the destruction of the leaves of the mulberry by a late frost, were the cause of the little success which I obtained.

My cocoons were small, pointed, light, and of a velvety tissue. Judge then of my surprise, on learning that the Viscount de Retz had received from Mr Henry Bourdon a few of the Bengal eggs, and that he had obtained large cocoons, of a beautiful form, an excellent tissue, and heavier than those of our country. We inhabit the same region, our mulberry trees are nearly of the same kind, and I think I managed my worms as well as he could have done those, under his care; therefore, I am induced to suppose, that from the mere form of my cocoons, we have reared two distinct varieties of silk worms; and I have been convinced that is the case, since I have read in the *Bulletin of the Royal Agricultural Society of Lyons*, that Mr Audouin, who was present at a meeting of that institution, explained, in the same manner, the different results and the varied forms of the cocoons, produced from the eggs brought into France by the *Bonite*. That learned entomologist observed, "that neither Mr Gaudichand, nor the commander of the corvette, knew the veritable source of these eggs, which originated in Italy, from whence the Bengalese have annually received them. It is possible that some of those were of a more recent kind, and there had not been sufficient time to change their character: such may be the cause of the difference, which the cocoons present." Mr Audouin adds, that "the cocoons which he has seen are fusiform"—that is to say, elongated and pointed, as were those which my worms produced.

Extract of a letter from Mr Pavis, President of the Agricultural Society of Bourg, in the Department of Ain, dated October 1st, 1833.

We have received a very small number of silk worm eggs, which were brought from Bengal by the Corvete *Bonite*. But few of them hatched, after being exposed in a warm and humid position, for twenty-five days. The varieties of worms were very different and of unequal size; some were white and others black, and they produced white and yellow cocoons. We have carefully preserved the eggs, which have been obtained by our experiment, but the insects were too few to separate the varieties.

The eggs brought by the *Bonite* have been extensively distributed, and some cultivators have received sufficient quantities to enable them to separate and distinguish the diverse races.

Mr John Kenworthy brought to our office this week, eighteen pounds of butter, of an excellent quality, which Mrs Kenworthy made this week, from the milk given in seven days by one cow. The cow is a modest American animal, with no great pretensions, but which, like most American females, is better than she looks, though she looks well enough for anybody. Mr Kenworthy's place is near the Friend's Asylum, Oxford township. So much for treating the cows well.—*U. S. Gazette.*

For the New England Farmer.

STATEMENT RESPECTING PREMIUM CORN CROP.

Beverly, Dec. 3, 1838.

To BENJ. GUILD, Esq.—Sir: Agreeable to my promise, on Saturday, I herewith send you an account of one acre of corn raised by me this season. This acre was a part of a field of eight acres planted to corn. I confess that I feel a great deal of diffidence in presenting a crop so far inferior to what many others have presented before, but as the crop, taking the whole field together, was a good one, and so even that we were at loss to know where to select an acre to measure, I thought it might not be amiss to give you an account of it. If the Committee should think it worth their notice, it will be well; if otherwise, I shall not be disappointed, as the ground was not such as I should have selected for the purpose of producing an extra crop, nor did I expect it until near the time of harvesting. The kind of land is wet, and what is generally denominated cold land. It was sown down to grass with grain six years ago last Spring. At the time of sowing down, it was thrown into beds with the plough, to turn off the surplus water received from a large hill on one side of it. The product of 1837 was about one ton of hay to the acre. It was not broken up until the Spring of 1838: no manure has been applied since it was sown down to grass, until this year. In September, 1837, forty cords of compost were carted on the eight acres and thrown into fifteen heaps. In the latter part of the winter and spring of 1833, thirty two cords of stable manure were carted and placed in small heaps for the purpose of spreading to be turned under the sward. The quantity of seed was about 14 quarts to the acre. The ground was ploughed from the 15th to the 20th of May, and harrowed twice before furrowing; it was then furrowed twice in a row, 42 inches apart one way, with a double mouldboard plough; the compost was then placed in the drills: commenced planting the 20th, and finished the 25th of May: about the 10th of June, the cultivator was passed twice between the rows, which was followed by the double mouldboard plough; then weeded and hoed: the 1st of July, the double mouldboard plough was again passed through twice between the rows and again hoed: nothing more was done until the stalks were fit to top, which was done when the leaves began to turn yellow; the corn was cut up and carted to the barn, and husked the 10th of October. The whole product of one acre was weighed on the 1st day of December, with a patent balance, and the result was, 150 baskets containing 40 lbs. each, and 3 lbs. over, or 6003 lbs. Another acre of the same field was weighed the same day, and gave 5520 lbs.; after it was weighed, 40 lbs. was shelled, and gave 33 lbs. of shelled corn.

The estimated cost for the cultivation of one acre is as follows, viz:

5 cords compost manure at \$3 on the field	\$15 00
4 do. stable do. at 5	20 00
Ploughing 2 50; Harrowing twice 2 00	4 50
Furrowing twice in a row	1 50
2 hands placing compost in drills, one day	1 50
Yoke of oxen and cart one day	1 00
2 hands one day dropping and covering	1 50
1 hand, Cultivator, and horse one day	1 50
1 hand, plough and horse 1-2 day	75
2 hands hoeing one day	1 50
1 hand, plough and horse one day	1 50
2 hands hoeing one day	1 50

Topping, binding and shocking stalks 1 50
Harvesting 6 00

\$59 25

Deduct for benefit of manure for succeeding crops 17 50

\$41 75

Corn fodder, equal to 1 ton of English hay 15 00

4952 lbs. shelled corn, at \$1 10 for sixty lbs. 90 79

105 79

Net profit \$64 04
AMOS SHIELDEN.

I hereby certify that I assisted in the cultivation and measuring the above land, and the harvesting, and measuring of the above corn, and that the whole statement is correct according to the best of my knowledge.

TIMOTHY ROBERTS.

I hereby certify that I measured the above land, and that it contained no more than one acre.

JOHN PORTER, 2d, Sworn Surveyor.

VACCINE MATTER.—We have recently learned some interesting facts relating to vaccination. Mr Estlin, a distinguished surgeon of Bristol, England, has succeeded in obtaining a new supply of vaccine matter, directly from the cow. In the early part of August last, he learned that the disease existed in some cows on a farm in Gloucestershire, and repairing immediately to the place, found it in a proper state for furnishing matter for inoculation in a young woman who had taken it in milking. With this matter he inoculated a child on the 11th of August, and obtained a perfect case of kine pock disease. The succession has been carefully preserved, and the matter has been freely distributed by Mr Estlin to different parts of the world. Some was sent to Dr Jackson, of this city, taken from the tenth succession of cases. Dr Jackson and Dr Putnam have succeeded in introducing the disease here with this matter, and have freely communicated the matter to their professional brethren, who are now using it pretty extensively; so that matter of the eleventh and twelfth generation from the cow, can readily be obtained.

It is an interesting question how far the disease thus introduced resembles the kine pock that we have long had among us; and the answer is most satisfactory, for so far as can be observed, it is perfectly the same. There has not of course been time to test the question by practical observations, as to its greater or less power in preventing small pox, but in its course, and appearance, there is no appreciable difference. This new introduction of kine pock matter, though a circumstance of great interest to the medical profession, and to the community, does not weaken, but greatly strengthens the confidence which may be placed in genuine vaccination, as it has been practised among us for forty years past.

We learn that the Massachusetts Medical Society voted the last year to supply all its Fellows, at the annual meeting in May, with fresh kine pock matter; and the Fellows of the Society agreed to vaccinate gratuitously one day in each week in the month of June, annually, all who shall apply to them for that purpose. If our whole population are not vaccinated hereafter, it will not be the fault of the medical profession.—*Boston Daily Advertiser.*

REPORT

On providing for the Appointment of a Board of Board of Agriculture, and a State Chemist, together with a Minority Report.

SINATE, March 14, 1837.

The Committee on Agriculture to whom was referred an order "to inquire into the expediency of providing by law for the appointment of a Board of Agriculture and also for the appointment of a State Chemist" have considered the same and submit the following report.

It has long been the settled policy of the government of Massachusetts to encourage agriculture. To foster industry and encourage agriculture was, at the adoption of the Constitution, pointed out as among the important duties of future legislatures, and perhaps the wisdom of those to whom we are indebted for that instrument, is no where more conspicuously manifest than in enjoining this duty. Of its necessity and the soundness of its policy two of the most powerful nations of Europe presented at that time illustrious examples.

Spain with the wealth of the Indies poured into her lap for successive centuries was becoming poor and fast sinking under her system of letting agriculture take care of itself. Gathering rich harvests of gold and silver from the new world, the more valuable and enduring harvests of domestic industry were neglected and forgotten, and gilded pauperism and splendid degradation were the fast appearing legitimate fruits; evincing the justice of an over-ruling power, whether considered as the result of idleness at home, or avenging retribution for national treachery and injustice abroad.

On the other hand, the policy of England was of an opposite character and producing opposite results. With a protected and encouraged agriculture to sustain her manufacturing industry, she was laying deep the foundations of her power, and fast rising in the scale of empire, and strengthening herself for a tug in latter times, with the captain whose will was law to continental Europe; who gave kingdoms as mere keepsakes, and infusing into the millions of his conscripts the spirit of martial madness, trampled nations to silence in his grasp at universal dominion. From this contest, expensive, protracted and bloody, almost beyond precedent, by uniting industry in her fields and workshops, she came out, dictating terms of peace, her resources comparatively but little impaired, and the riches of her people almost undiminished; demonstrating the position, that the basis of true national strength consists more in the science of peaceful arts, than in the art and science of war—less in well appointed armies, than in a well appointed agriculture.

Agriculture is not only the basis of national strength and wealth, but it is also the basis of civilization and social life. Christianity itself, after repeated attempts without the aid of agriculture, has failed to civilize the American savage; nor have its influences, without the same aid, been more successful in preventing the relapse to a state of barbarism of the once civilized Asiatic. The culture of the earth is as necessary also to sustain social life, as is the culture of the mind to sustain civil liberty; and as truly as the fall of our free institutions would follow the entire neglect of education, so truly will the dissolution of civil society follow the abandonment of agriculture. The agricultural skill of any people is nearly a correct indication of the amount and permanency of their social comforts, for it is only that portion of all the

densely populated parts of the earth, where some degree of skilful agriculture is practised, that is never visited by famine.

Although as an art, agriculture is coeval with our race; as a science it is yet in its infancy, and opens an extensive field for discovery and improvement. It may be reduced to principles as certain as those of almost any other science, by carefully collecting the results of similar combinations of circumstances.

Science has shed its light freely and abundantly upon other interests, and cannot its rays be brought to bear more directly and fully upon that of agriculture? It should assist the hands that guide the ploughshare and pruning-hook, as well as those that hold the tiller or drive the shuttle.

The production of an ear of grain or a blade of grass is as much the effect of cause, as is the explosion of a steam engine, and although the connection between cause and effect may not be as easily traced in one case as in the other, its existence is no less certain; nor is its investigation less a proper subject for scientific inquiry, or of scarcely less importance in a public point of view. If the latter has effected the destruction of a multitude, the former has been as necessary to the sustenance of millions. Science, or demonstrative knowledge, is as necessary for the agriculturist as for the navigator. Without it the farmer is a mere machine, pursuing the path trod by his fathers, and surrounded by a trackless ocean of uncertainty, into which, however he may avoid it with instinctive dread, he is occasionally plunged much to his discomfort and loss. This would not be the case if he clearly understood the principles on which production is founded; then he might step out of the beaten path with safety, the trackless course would be as certain as that of the mariner guided by his compass; he could feed his roots, grains and grasses with their appropriate food and calculate results with certainty, except as varied by accident or season; his dependence would be upon known principles, established truths, rather than tradition. Let him clearly understand the deficiency of his soil, and what aliment it is necessary to present to the germinating plant to bring it to perfection, and what is necessary to counteract or neutralize a superabundant or deleterious substance existing in the soil, and he will produce his crop of grain with as much certainty and facility, aside from extraneous causes, as the architect can erect a granary in which to store it. It is this knowledge which the farmer wants, and he can get it only by the aid of chemistry. It is this knowledge which the farmer must have in some good degree, before his profession will stand where nature designed it to stand—the first among the first. No occupation is more healthful or useful, and none is better calculated to expand the mind and develop the noblest qualities of man. Although his avocation is laborious, the toil of the intelligent farmer is far from servile drudgery. A sense of inferiority of profession he cannot feel, for no other stands nearer creative power, or is first the recipient of the Creator's bounty. In the great laboratory of nature he aids according to his intelligence in the transmutation of various substances otherwise useless, to grains and fruits, the product of field and garden for supplies of necessity, of comfort, or of luxury; and what mind in employment so elevated but must in some measure lose its contracting power? or who can better appreciate the lustrous beauty of the "bow in the cloud," the

bright seal of the promise that "seed time and harvest shall not cease," than those that sow the seed and labor for that harvest, without which, the foundations of society must be broken up, the minister come down from the altar, and the judge from the bench, to seek subsistence, perchance from river or forest?

The value of the agricultural products of the Commonwealth, compared with the value of the products of other branches of industry, it is believed, would present the importance of the farming interest in a strong point of view. Unfortunately a bill for the obtaining of these statistics was lost in the last legislature, and that important fact,—the relative value of our agriculture, which should be well known, and well understood,—remains a matter of conjecture.

It is estimated from statistics of the British empire, that the annual return from the land and farming stock of the united kingdom is £174,029,088, and the annual return from the property in manufacture is £262,085,100, the manufacturing product bearing to the agricultural product nearly the proportion that five does to nine.

As the manufactures of Massachusetts are principally the growth of but little more than thirty years, it would be considered wonderful if on examination they were found to bear the proportion to our agriculture that those of the united kingdom do to theirs, but unless they exceed that proportion, it will be seen by referring to the statistical returns of our manufactures in 1837, and taking those returns of eighty-six and a quarter millions of dollars to indicate the true product of our manufactures, that the products of the land and farming stock of Massachusetts in that year could not have been less than one hundred and fifty-five millions of dollars. However much or little dependence may be placed on this estimate, it can hardly be doubted that the magnitude of our agricultural interest is not appreciated.

By the last census the population of the State was about 700,000. Of this number not less than 400,000 are supposed to be engaged in agriculture, and dependent directly and entirely upon that source for subsistence. Of the remaining 300,000 a very considerable number are more or less engaged in the same pursuit a part of their time; and as all engaged in manufacturing and commercial operations are deeply interested in the success of the farmer, as it affects the price and facility of obtaining agricultural products, your Committee believe they may safely assume that no branch of domestic industry is more important. They also believe that no one is more susceptible of improvement, and, so far as improvement goes, that no one is so much neglected.

The labor that would purchase a bushel of corn thirty years ago, will now purchase only about the same quantity; whereas the labor that would purchase a yard of cotton cloth thirty years ago will now purchase at least four yards of as good quality. This advance in the value of labor, when applied to the purchase of cotton cloth, arises from improvements during the time specified, by introducing labor-saving machinery, and directing more science and skill to the production of the cotton and the manufacture of the cloth; and if improvements to the same extent had been made in the production of corn, the results would have been the same, without diminishing the profits of the producer.

The same general result will be the effect of

the same cause when acting on any or all the products of labor. All improvements, whether by the aid of economy, science or skill, or of labor-saving implements applied to production, increase the value of labor, the only capital of many of our citizens, and in the aggregate the great capital of the Commonwealth; a capital which wise legislators will always encourage in seeking investment at home, at least when, all things considered, it can be done with better advantage than abroad. A case will be mentioned to show the advantage that may be derived from a scientific and thorough investigation of a subject, that is supposed to be pretty well understood. It also accounts for the great advance which manufactures have made over agriculture, and points out the necessity and propriety of the aid of government to assist in settling questions of importance to our farmers, which, from involving an expense of perhaps a few hundred dollars, their limited capital cannot meet; and unless the government aid them, they must from necessity be content to plod along in the old path, save the adoption of some few improvements, which slight research and invention bring to light.

Recently a manufacturing company incurred an outlay of not less than five thousand dollars, for agency and expenses attending a series of experiments to solve a question relative to some part of their process. The solution of the original query was a saving to the company of its whole cost in about one year, and other matters unlooked for, which came in incidentally during the investigation, effected a further saving to an equal amount during the same year; it was also the acquisition of knowledge that must bear upon all their future operations to which it had reference, and this all, in a branch of manufactures where it was generally supposed that further improvements were hardly to be expected. If such results can be realized in such cases, what may be expected from investigations in the young science of agriculture, a science that has hardly obtained a name and place among the sciences?

Aside from the general want of chemical knowledge applicable to their profession, but few individual farmers can meet the expense, that would be necessary to a thorough investigation of many subjects that have a permanent and important bearing upon their success. And it is believed that they cannot reasonably be required to do so, when it is considered that their success is so closely connected with the success of every other valuable interest in the Commonwealth, that men of all other professions and pursuits are hardly less interested in the matter than farmers themselves. And if any subject whatever will justify the special attention of the Legislature, and, if need be, an especial appropriation from the treasury of the Commonwealth, on the ground that the whole people are deeply interested in its success, your Committee are of opinion that it is the subject which they now have under consideration.

Our means for improvement are far from being limited. The geological survey of the State by Professor Hitchcock has brought to light treasures more valuable than mines of gold, and if the facts and suggestions submitted in his second report are duly attended to and improved, the survey cannot fail to be the commencement of an era in our agriculture—the laying of the first stone in the foundation of an improved structure that will sustain and secure the best interests of the Commonwealth.

In addition to lime, marl and other mineral substances of great value to the farmer, large quantities of guano, or the principle that gives fertility to soils, is found to exist in the vegetable deposits of our swamps and lowlands. This fact is a most important one to the farmers of the Commonwealth. It discloses to us the truth that there exists in almost every neighborhood, abundant means of recouping our wasted soil. A kind Providence has garnered up these immense magazines of food for vegetables to restore fertility for us, to those grounds that were exhausted in sustaining our fathers, while in council laying the foundations of our free institutions, and in the field battling for the right of man to self-government. Compared with theirs, ours is a time of leisure, and duty requires that we avail ourselves of the means put into our hands of improving our physical condition, until the necessities and comforts of life are in as full measure enjoyed by all within our borders, as the freedom which they wrought out for us, and in no other way can we so well execute the trust committed us while holding on to their bequests.

The mere knowledge of the fact, however, that this enriching matter, which contains the constituent principles of our grains and grasses, exists so abundantly, is of comparatively little practical utility, unless accompanied with the proper knowledge of disengaging it from the useless or deleterious substances with which it is combined, and fitting it for the wants of vegetation. To obtain this knowledge requires the aid of a practical chemist, and there is little doubt that with this aid, manure, which has properly been termed "the sinews of husbandry," can be furnished abundant as the wants of our soil, and cheaper than by any other means. The expense incurred for a lifetime of service of a practical agricultural chemist, would be a cheap purchase for the Commonwealth, at which to put our farmers in possession of the information that would enable them to make the most economical and efficient application of this material, which we are assured contains in greater abundance, than can be drawn from any other source, the enriching properties furnished by the most expensive manures. It has been accumulating for ages, and held in reserve until farmers begin to learn that a renovated field under a judicious system of cultivation will give the most profitable succession of crops, and at the same time amply furnish the means of perpetuating and increasing its own fertility. Under these circumstances the interest of the cultivator affords the strongest guaranty that if fertility is once restored to those fields that are reduced, we may feel well assured that they will never again become exhausted as they have been; but increasing in fruitfulness, and supplying the wants of increasing multitudes, will continue to give "seed to the sower and bread to the eater," as long as peace and security allow the farmer to gather his sheaves, and preside at his own harvest-home.

The luck of our swamps from different localities may very considerably differ in the number and proportions of its constituent parts, and accordingly require very different treatment to fit it for the farmer's use. A chemist employed by the State, under the direction of a Board of Agriculture, would undoubtedly spend some time to great advantage in determining the best mode of treatment applicable to the whole, or to the different localities, as should be found necessary.

The whole subject of manures, whether animal,

vegetable, mineral or compound, and the best method of compounding, would also properly and no doubt profitably, engage his attention. A more general, and if possible a more perfect analysis of our soils, would also be of great utility. Indeed it is hardly possible that a competent chemist should be employed under the direction of a competent board without rendering immense service to the farmers of the Commonwealth.

A Board of Agriculture, composed of scientific and practical men, properly selected from different sections of the State, would be likely to secure the public confidence and respect. Their recommendations of improved implements, or improved modes of culture, or of improvements of any kind, if judicious, would soon secure the most favorable attention of farmers, and give a fresh impulse to production. Agricultural implements, purporting to be improvements, are often to their injury forced upon the attention of farmers, by those interested in the sale. This would not as frequently be the case, were a competent board to obtain the confidence of farmers and become the channel through which real improvements alone might be expected to find favor. The recommendation of the board would be found no less convenient for the vendor of a real improvement, than for the farmer, who possesses in a more limited degree, the means of comparing and deciding important questions of this kind to his own satisfaction.

(To be concluded.)

STATEMENT RESPECTING PREMIUM CARROT CROP.

To the Massachusetts Agricultural Society, }
Marshfield, November 17th, 1858. }

MR GUILD—SIR—I send you the number of days' work done on one acre of carrots and one acre of beets. I find it the most difficult part of my statement.

We the undersigned, John Moorehead, Sen. and John Moorehead, Jr. do believe to the best of our knowledge that the whole number of days' work performed on one acre of carrots and one acre of beets, was one hundred and twenty-six, viz.

Weeding and hoeing,	72
Harvesting,	54
	126

JOHN MOOREHEAD, Sen.
JOHN MOOREHEAD, Jr.

My help in cultivating the above carrots and beets was one boy in his 17th year. I only hired 3 days' help of one man until harvesting.

TRAVELLING.—Surely, said Pat, the Yankees are great travellers; they travel sixty or seventy miles a day, while I have hard work to travel twenty-five or thirty; but there is not so great a difference, after all, for they don't more than half travel the ground over, while I travel both parts of the road for the most part.

ARKANSAS BAGGAGE.—"Boy run up stairs, to No. — and bring down my baggage—hurry, I'm about moving."

"What is your baggage, massa, and what is he?"

"Why three pistols, a pack of cards, a Bowie knife and one shirt. You'll find them all under my pillow."—*Picayune.*

NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MARCH 27, 1839.

We have received the prospectus of the Rhode Island Society, for the promotion of domestic industry, of their cattle show and ploughing match and exhibition of manufactures to be held at Pawtucket on Wednesday the 9th of October next. We shall give it a full insertion before long. This society is entitled to great credit for their zeal and activity in the cause of an improved agriculture.

We have the same acknowledgments to make in respect to the Plymouth Agricultural Society, whose cattle show and exhibition are appointed for the 16th of October at Bridgewater. Their prospectus shall have a seasonable insertion.

These annual exhibitions have done an immense service to the state; and will, we hope, excite increased attention and interest. The premiums are in general upon a sufficiently liberal and judicious scale; but the honor of obtaining one of their book premiums is worth very much more than their pecuniary donations.

BOUNTY ON SILK.

The Secretary of State by the direction of the House has laid before the Legislature the amount paid in the form of bounties, since the act of 11th April, 1836.

The returns embrace the names and residence of the claimants; the number of pounds of cocoons raised; the number of pounds of silk reeled; the number of pounds thrown; and the amount of bounty granted in each instance.

The highest quantity of cocoons raised is 615 lbs and of silk reeled is 52 lbs 8 oz. We will give the names of a few of the principal growers of silk.

	Cocoons raised.	Silk reeled and thrown.
Ancory Holman, Bolton,	615 lbs.	52 lbs 8oz.
Benjamin Walker, Rehoboth,	277	
Timothy Smith, Anherst,	156	60
Rowden Hoar, Littleton,	153 8 oz.	
Jonas Holland, Belchertown,	183	
J. Bodnan, Williamstown,	182	
Roswell Rice, Charlemont,	97 8	19
Joseph Field, "	76 8	16 4
Cyrus Smith, South Hadley,	70	
John Perry, Wales,	69	6

And several others, whose names may be ascertained by a reference to the secretary's report.

We subjoin the aggregate for the four years.—

Year when the War-rants were drawn.	Pounds of Co-coons.	Pounds of Silk reeled.	Pounds of Silk thrown.	Total amount of Bounty allowed
1836	613.2	36.10	11.2	\$85 20
1837	1001.8	109.1	65.11	\$127 51
1838	1854.15	149.9	140.9	\$30 52
March 6, 1839	2031	190.6	79.8	\$97 99
	6100.9	525.10	296.14	\$1201 22

Secretary's Office, March 14, 1839.

This great interest is just in its infancy. As we have always believed and said, it is destined to be one of the great interests of the country; but we must wait patiently until the mulberry speculation has ceased or at least abated before much progress can be made in the raising of silk. Of the decline of the disease there is at present little prospect. A sale of mulberry trees the last week has gone far beyond any which have been made before. We shall venture no predictions; but calmly wait the event.

AGRICULTURAL MEETING.

The ninth agricultural meeting was held on Thursday last at the State House, and was very fully attended; the interest in these meetings having increased from the beginning; and the conviction of their utility having at

every meeting been strengthened. Rev. Mr Abbot of Westford in the chair.

The subjects announced for the evening were fruit trees and agricultural improvements, but the attention of the meeting was confined to the former subject.

Mr Buckminster went largely into the subject. He expressed his opinion of the value of apples for the feed of stock; but was of opinion that they might be over-estimated, and thought it as important to state the cases of failure as of success. He himself had been disappointed. He had turned ten hogs into an orchard in the fall, kept them a month in the orchard; they had apples in plenty; but they lost condition. (This seems so contrary to almost universal experience that we are apprehensive there must be some mistake or error in management. One gentleman suggests that they had no salt given to them in that time, which he deems necessary to their thrift.) Mr B. thought that sour apples should not be given raw. If apples are worth half as much as potatoes they ought to be raised. He has known them sold often at 4 cents and 6 cents per bushel.

Orchards in general are very badly neglected. The grass must be kept from the roots; as a tree checked in its growth, can no more be recovered than a stunted animal. The land must be kept as rich as for Indian corn; no manure must be placed in contact with the roots; the soil must be kept moist, and litter of one kind or another must be placed round the tree to keep the ground loose. The growth of the trees must not be forced too much. He has made them grow a foot in a season. The tap root must not be "headed" down. The tap roots must be preserved. The trees must not be staked; and it is best that they should be shaken and loosened by the wind; they will not mind it after they get used to it. (This is very probable, as was the case with the eels after they got used to being skinned. After a short time, it is very likely the poor trees, under such circumstances, would not mind any thing.) Small trees are much better for transplanting than large ones. We prune too much. If you would have trees bear fruit, enrich them. Trees should be set by the road side; of kinds not likely to be plundered. Trees that stand by the wall will bear more than those by the road side. Trees are much enriched by the washings of the road. Trees may be advantageously planted in clusters within a rod of each other. The prunings will afford a large amount of wood. Trees may be washed with lye, which will not hurt the body of the tree. It is said that a farmer who plants an orchard, is working for future generations. But he may expect to derive immediate benefit. He has gathered fruit from his trees in four years from planting. Our climate differs from England, and we are in the practice of pruning our trees too much.

To inquiries put to him whether trees should be planted in the spring, he replied yes; and that it would be well to take them up and keep them a month before setting out. (He did not say that they might get used to being kept up all the time.) The neglect of raising sweet apples arose from there not being the same demand for them as others; and sweet apples are more certain bearers than others.

A good deal of discussion arose then as to the expediency of placing stones round trees with a view to prevent evaporation, which was upon the whole deemed prejudicial to the trees. Inquiries arose then on the subject of raising trees from cuttings; but no facts were given to establish the practicability of the process.

Mr Nichols, of Danvers, went largely into the cultivation of fruit. We have no room to do them justice. Trees are destroyed by bearing too early. Trees which bear once in two years do not grow in the non-bearing year, but are then recruiting their strength. Engrafted

trees die comparatively early. He has trees of natural fruit now in bearing on his farm 150 years old.

When trees are engrafted five or six feet above the ground, the tree grows faster than the scion, and the scion often suffers. Trees should be engrafted when very small in the nursery; and it is best to engraft them upon the roots.

He deems wax a very bad application for grafts; as he expressed it poisonous to the tree. He prefers a composition of clay and dung. In his own experience, grafts thus set have grown twice as fast as those set in wax.

The tarring of trees is the only effectual remedy within his knowledge, against the canker worm. The application of leaden troughs to trees with oil in them to prevent the ascent of the worm, is a troublesome and in a large orchard an impracticable process. Small trees are liable to be injured by tarring. Old trees will not suffer by it. (The best mode of applying tar which I have seen, is first to put a belt of clay mortar on the tree, and then to tar on that. This, when the season of danger is past may be easily removed, and is not likely to bind the tree. H. C.)

Mr Nichols spoke of engrafting cherry trees. The scion is to be cut early, and kept until the first of May; it is then to be placed under the bark; and in this way is likely to live. A cherry tree must not be engrafted by splitting the wood. He has engrafted cherry trees successfully the first part of April. The cement which he has used has been clay mixed with horse dung and horse hair, which has remained for three years.

Much incidental conversation arose, in which Mr Bruce, of Grafton, Dr Stebbins, of Swansea, Dr Keep, of Boston, Rev Mr Field, of Charlemont, Mr Denny, of Westboro', the chairman, and others, took part, on the subject of grapes, mulberry trees, and other kindred topics, which we regret our inability to report in the present paper.

Gentlemen seemed very reluctant to make this the last meeting; and as the coming Thursday would be Fast Day, it was voted to adjourn to the next Monday evening, to continue the subject of fruit trees and the value of apples and fruit for stock. H. C.

MR BRECK—That eminent horticulturist the chevalier Soulange Bodin desires me to make known "in all parts of America" that he will have for disposal at the Jardin de Fromont, at Ris, near Paris, next autumn, the following desirable productions. As a means of complying with his wishes, I avail myself of the very extensive circulation of your valuable paper.

MARSHALL P. WILDER.

Hawthorn Grove, }
Dorchester. }

1st. 250,000 morus multicaulis from 2 to 4 feet high. Very fine.

2d. 400 ounces seed, or silk worms eggs, of the fine kind called "Sina," of which I am at this time by an arrangement with M. Camille Beauvais, the exclusive proprietor. This seed can only be had of me at the price of twenty francs per ounce.

TO CORRESPONDENTS.

We have to acknowledge ourselves obligated to several correspondents, who may be assured, we do not mean to neglect them; and duly appreciate their kindness.

Philo Corax will shortly make his appearance, and others will follow.

We have received likewise a communication post-marked Providence, requesting information respecting the cultivation of carrots. The letter has no place of date, and the signature is absolutely illegible. If the writer will do us the favor to give us a "local habitation and a name," the Commissioner will have the pleasure to transmit him a copy of his Report which will be published this week; and in which he will find this subject particularly treated. H. C.

BRIGHTON MARKET.—MONDAY, March 25, 1839.

Reported for the New England Farmer.
At Market, 200 Beef Cattle. 20 Cows and Calves. 600 Sheep, and 680 Swine. 35 Beef Cattle unsold.
Prices.—*Beef Cattle.*—We advance our quotations to conform to sales. First quality, \$8 50 a \$9 00 Second quality, \$8 00 a \$8 50. Third quality, \$6 75 a \$7 75.
Cows and Calves.—Dull. We noticed sales at \$23, \$33, \$37, \$42, \$48, and \$50.
Sheep.—We quote lots at \$4 25, \$5 50, and \$6 25.
Swine.—Lots to peddle were taken at 8 and 9 and 9 and 10. At retail from 9 to 11.

THERMOMETRICAL.

Reported for the New England Farmer.
Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending March 24.

MARCH, 1839.	7 A.M.	12 M.	5 P.M.	Wind.	
Monday,	18	32	40	36	N. E.
Tuesday,	19	32	36	34	N.
Wednesday,	20	24	24	26	N.
Thursday,	21	25	36	34	E.
Friday,	22	32	42	41	N. E.
Saturday,	23	34	46	44	N. W.
Sunday,	24	34	44	38	W.

FOR NEW YORK.

Cabin Fare \$3—Deck Fare, \$1 50.
The Steamer JOHN W. RICHMOND, Capt. Wm. H. Townsend, will leave Providence, on MONDAYS and THURSDAYS, at 4 o'clock, P. M.
[] Cars to meet the boat, will leave Boston at half past 2 o'clock, P. M.
Mondays and Thursdays, will be her regular days of leaving Providence, until further notice.
For more information, apply to S. Q. COCHRAN, 30 Congress Street, Boston.
N. B. Freight taken at 6 cents per cubic foot.
March 27.

MORUS MULTICAULIS,

For sale, at the Garden of Fromont, near Paris, France, 160,000 of the *Morus Multicaulis*. These Mulberry Trees are 2, 3 and 4 feet in height and of the first growth, deliverable either at Paris or Bordeaux, in the course of the Autumn of 1839. Orders for the above must be addressed to the Director of the Garden of Fromont at Ris, Seine et Oise, France, or to J. H. Mey, of South Carolina, at Paris, to the care of J. C. Durillier & Co. Paris, with an order on a Banker, at Paris, for the amount which will be immediately attended to, and the plants put up in the best order.
The Garden of Fromont, has also, large quantities of the Mulberry Morati and other new kinds, as well as the newest varieties of Camellias, Rhododendrons, Magnolias, Azaleas, Rose Trees, Dahlias, Chrysanthemums, &c. &c.
Immediate application should be made for the Mulberry Trees.
For further particulars, apply to James Ailger & Co., Charleston, South Carolina; C. W. Karthous & Co., Baltimore; John Bohlen, Philadelphia, and C. C. Meien & Co., New York.
Paris, France, January 1, 1839.

EARLY AND LATE PEAS.

For sale at the N. E. Agricultural Warehouse and Seed Store, a choice assortment of Early Peas, consisting of—
Cedo Nulli, extra fine and Early Charlton, early.
Knights' Fail Marrow,
Knights' Dwarf do.
Early Washington,
Dwarf Sugar,
Russell's Early Dwarf,
Falli Sugar, eatable pods,
Bishop's do. do.
Fall Late Marrow Fats,
Early English Frame,
Dwarf do do.
Blue Imperial,
Blue Prussian,
Woodford's Tall Marrow.
In addition to our usual stock of Peas, we have recently received a few varieties of very superior Peas from England, viz:—
Marquis of Hastings, extra fine Marrow,
Early White Warwick, early and fine,
Cedo Nulli, very early,
Waterloo Blue, fine large blue,
Groom's Improved Blue,
White Scimitar.
All of which are remarkably fine, and are considered as some of the most desirable varieties cultivated here or in England.
JOSEPH BRECK & CO.
March 27.

BADEN CORN,

Rohan Potatoes, Chinese or Tree Corn, and Withington's New White Wheat, for sale at the N. E. Agricultural Warehouse and Seed Store.
JOSEPH BRECK & CO.
March 27.

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.
He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel: put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.
Also, ground Oyster Shells.
Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 62 North Market Street, or through the Post Office will receive prompt attention.
March 27. NATHUM WARD.

HO! FOR ILLINOIS.

To a first rate man, well acquainted with trade, who can command a ready capital of from \$3,000 to \$6,000, who is desirous of locating himself in one of the most beautiful and healthy situations on Rock River, in Illinois, where he can join a New England Colony, and engage in Mercantile and Agricultural pursuits, with a rare prospect of success, a first rate opening offers itself, and may be heard of by addressing a line (post paid) through the City Post Office, to
X. Y. Z.
N. B. An exchange of Western property, for real estate in New England, a good stock may be effected.
March 27. 3w

PEAR, PLUM, GRAPE VINES, & C.

1000 Pear Trees of the most approved kinds;
1000 Plum Trees, of the most approved kinds and extra size—many of them have borne the past season;
500 Quince Trees;
3000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hamburg, Sweetwater, Pond's Seedling;
30,000 Giant Asparagus Roots;
5000 Willmot's Early Kubarb or Pie Plant, lately introduced;
Also—a good assortment of Gooseberries, Roses, &c. of different kinds;
All orders left at this office, or with the subscriber at Cambridge-port, or in Mr Lynch's laggage wagon box, at Gould & Howe's, No. 8 Faneuil Hall, will meet with immediate attention.
SAMUEL POND,
March 27. Cambridge-port, Mass.

Lined Oil Meal. Teel Seed Oil Meal.

For sale by G. & H. STEARNS, who have removed to No 5 Merchants Row.
March 27. 1m

SHEEP AT AUCTION.

Will be sold auction on the Friday the 5th day of April next, at 10 o'clock, A. M., the flock of fine Saxony Sheep, of Rejoice Newton, Esq., at his farm in Worcester, in such lots as may suit purchasers. It consist of,
120 Ewes with lamb.
100 Yearling Ewes and Wethers, very fine and healthy.
7 Yearling Bucks of the best blood.
8 Older Bucks, selected from the best flocks.
100 Wethers and Ewes not with lamb.
This flock has been improved for several years with great care and expense, and is believed to afford as good an opportunity for obtaining the best stock as any flock in the country.
T. W. & C. P. BANCROFT, Aucrs.
March 20, 1839.

NEW BOOKS.

The American Fruit Garden Companion, being a practical treatise on the propagation and culture of fruit, adapted to the Northern and Middle States. By E. Sayers, Gardener.
The American Flower Garden Companion. By E. Sayers, Gardener.
Whitmarsh on the Mulberry Tree and Silk Worm.
Cobb's Silk Manual.
The American Silk Grower's Guide, by William Kenrick.
For sale at the New England Farmer Office.
March 20. JOSEPH BRECK & CO.

MAN AND BOY.

Wanted a man who is acquainted with vegetable and fruit gardening; he must be of good moral character, active, constantly industrious, and a temperance man—he is wanted for the season, and perhaps he can secure a permanent situation.
Also—a good boy, he must be willing to give his whole time and attention, and he will be thoroughly instructed in the business—he must produce good recommendations—none other need apply.
March 20.

FOR SALE.

A new milk goat, of a superior breed, producing milk like cream; well calculated for the invalid, or for a vessel for a long voyage. Inquire at this office.
March 13.

MISCELLANEOUS.

(From the Newark Daily Advertiser.)

LIFE IN THE PRAIRIES.

INTERESTING CORRESPONDENCE.—We have been politely furnished with the following letter from Mr C. C. Smith of Smithtown, (Illinois), to a friend in Philadelphia, and we trust it will prove the forerunner of many more from the same distinguished observer of men and things in the West. Mr S. is a brother of the honorable John Smith, of Jacksonville:

From Mr Smith, of Smithsburg, Smith county, Illinois, to John Thomson, Esq., of Philadelphia.

DEAR THOMSON.—As you cannot by possibility have an idea of what prairie mud is, you must be answerably ignorant of what I have suffered in toiling from Polegrove, our county seat, to this home of mine. It was knee deep every step, and, then, so tenacious—so viscous—not even the chemical terminology would express the treacle and tar-mixture through which I have passed. But home is home; and though I have a stump in my parlor, and see daylight through the windward side of my log-house, yet I assure you there is a comfort even in this. It is something to be monarch of all he surveys; it is something to have overcome difficulties. Every man respects himself the more for having lived through a real scuffle; and, then, one's wife and children, when healthy and happy, are as delectable in a wilderness as any where else. There! just as I write, I hear the sharp percussion of two rifles. It is Charles and Tom returning, no doubt, with wild meat enough to serve one of your Arch street dinner-parties for ten times. There is something in that. A bear and a wild turkey give us a painful pleasure in the chase, and then are sustenance to us, and afford talk to the children for day after day. I wish Tripes and his sister, in Spruce street, who have got to be vegetable mongers, and think all meat poison, would try their luck for a month or so on this side of the Wabash; they would surely die of chagrin at the explosion of their theory. For, when they should be presented to a family of wild frontier rangers, fellows who have well-nigh forgotten the taste of wheat, whose riestest loaf is corn ash-cake, and who use jerked beef or venison with their tea, and have flesh, flesh, flesh, from Christmas till Christmas, they would see as stout, noble, tight-nerved, broad-backed, six foot backwoodsman as ever turned out of the forests of Pannonia; men that never saw a doctor, unless some wandering missionary happened to be a "Thompsonian," and who are as likely to live to eighty years as the no-meat and no drink folks are to survive this winter.

Jones has gone. He made no impression on our sort of people. Rely upon it, these Western lads, to use their own slang, have cut their eye-teeth; and it is a poor speculation to send us your refuse wares. I told Jones, long ago, that if he would contentedly jog on as book-keeper, he would soon be able to get into a better berth. But what ruined him with Piltzer & Firth was, his indolence, his want of interest in what he was doing. You say he was honest and punctual—so he was; but then he was dead. I have known him to sit like a wax-work for two hours over the same page of his ledger. Such a man can't possibly live here. Every one is on the alert. It is this that characterizes the new States. You see it in the air of the people; you hear it in their outre phraseology. They

are courageous, independent, and full of resources, from the very necessity of the case. I am convinced that the strong points of human nature, good and bad, were never brought out more decidedly than in these States. Plenty of strong food, plenty of hard work, high hope, perpetual novelty, ample room for every kind of expansion, carelessness of the opinions of others, conflict with real dangers, and the hardness produced by outdoor athletic performances—these are what make the men of Tennessee and Kentucky the most energetic as they are the largest specimens of the *lomo sapiens*. The same occurs in Maine, Vermont, and Michigan. It is the exact antipodes of Chestnut street in every particular. Take a city chit, who wears a ring, and whisker enough for a bear, and a flash coat worth fifty dollars, and exhibit him to a genuine boy of the woods, and the latter would deal as gently with him as with a young opossum, and as much wonder at his prettiness. Now the whiskered and the scented one has his uses; you would not readily put him on a forlorn hope, or ask his aid if you were drowning; but he plays a good part at a *soiree*, and stands gracefully behind a counter, and forks his chopped meat with exemplary precision; yet I should not wish to see him here; he would think our ways rough and our clothes intolerable. Jones, without being effeminate, was what we call helpless, and he has gone home. O, for a keg of pickled oysters! Before the winter has locked every thing up, try to contrive a way for the two or three books which Grigg promised to box. The lame boy does very well in the wood-yard, but we need one or two lads of all work. The mail-boy comes within three miles once a week.

Adieu.

Your true friend,

C. C. SMITH.

SCIONS OF FRUIT TREES.

Scions of a great variety of Apples, Pears, Plums, and Cherries, from bearing Trees, which have been proved at the Pomological Garden, Salem, Mass., for sale by the subscriber.

ROBERT MANNING.

FARM FOR SALE OR TO LET.

The subscriber offers for sale or to let, a farm situated on Charles River, in the north part of Newton, and near the Newton Chemical Works. It contains fifty acres or upwards of good land, and has on it a good house and other buildings. Its pleasant situation on the bank of the river renders it a desirable place for a country seat, or its vicinity to the Waltham Factories an excellent location for a market or vegetable farm. Forty acres can be added to the above, if desired.

SETH BEMIS, Watertown.

FARM FOR SALE.

For sale a valuable farm, situated in Newton, half a mile from the Upper Falls Village and ten miles from Boston. The farm comprises about 100 acres of land, one third of which is covered with a thriving growth of wood and fencing timber. It has a good well of water, besides a never failing brook which passes through the farm. The buildings are of ample size, and in good repair. A lot of about ten acres of the land near the buildings, is on a level plain of superior quality for the growth of the mulberry tree. For particulars inquire of Miss Ann Bent, 214 Washington Street, or of E. P. Woodward, near the premises.

Boston, March 6, 1839.

if

MORUS MULICAULIS.

JOSEPH DAVENPORT will personally attend to the selling of the largest lot of *Morus Mulicaulis* unsold in the United States, after the first of April next, at his plantation five miles southwest of the city of Hartford. The sale of this splendid lot of trees has been delayed till the present in consequence of his unexpected absence since last fall. He invites purchasers to call on him, in person, so far as consistent, as they may better select for themselves; yet all orders sent to the city Post Office, will be executed with all possible care and dispatch. His long experience will enable him to pack them in a manner that will ensure safety to any part of the country.

Hartford, Ct., March 20, 1839.

PRIZE WHEAT.

The *Whittington New White Wheat*, which obtained the "Medal" at the Liverpool Agricultural Meeting.

The attention of Agriculturalists is again called to this very valuable, prolific and perfectly hardy description of White Wheat. The prominent properties of which are its ripening much earlier with length and strength of straw, largeness of ear and grain, and its superior milling qualities which can be attested by several well known Surrey Millers. The introducer of it is strongly recommended, if the soil be rich and kindly, that very little or no manure be applied, in origin of this Wheat was three ears, discovered on a mountain in Switzerland; and the Propagator, Mr Whittington, a practical Agriculturalist, gave a great and valuable result. It is so perfectly satisfied, from the impartial trials he has made during six years on "poor soils," of its growing more Straw than any other kinds, "of its superiority in standing the weather," and not degenerating in the produce or quality that he intends for the future, to sow no other sort.

Twelve bushels sown on ordinary wet land in common cultivation, last year produced 30 bushels, and a similar sowing on light land gave an equally favorable result. The present prospects despite the season, are equally flattering. Two bushels per acre have been found an abundant Sowing, on account of its great disposition to Tiller, several single grains having produced each from 30 to 40 ears, the length of many being from 5 to 7 inches and very few under 4 inches.

Has this year been satisfactorily proved by three disinterested Farmers to be a most rapid sowing, and superior spring wheat, sown so late as the middle of March, it was on the 10th of July in full ear, and calculated to produce at least 32 to 35 bushels per acre! Mr Mouat, of Stoke, near Guilford, "Transplanted" on the 10th of March, without Manure or Water, and quite unknown to Mr W. a quantity of this wheat from a sowing in the Autumn, and which may now be seen in every respect equal to the latter, and far surpassing several other kinds growing alongside. The various essays by impartial parties combined with an unusually severe Winter and unpropitious Spring, prove this to be the most desirable wheat of the day.—*English Paper.*

N. B. We have on hand a small quantity of the WHITTINGTON WHEAT, which is decidedly the finest article of the kind we have ever seen. Those who are desirous of trying it, can have a small parcel, not exceeding one pint each, if application is made for it soon.

FRESH SEED.

Just received at the New England Agricultural Warehouse and Seed Store, fresh lots of the following kinds of seed.

Rohan Potatoes	Chinese or Tree Corn
St Helena "	Dutton "
Early White Potatoes	Small Canada, "
Varieties of Spring Wheat	Early Jefferson "
" Luck "	Tuscorara and Sweet Corn
" Indian "	Barley, Bedford Oats
And a full supply of Peas, Beans, &c.	

March 13.

JOSEPH BRECK & CO.

FARM IN GROTON FOR SALE.

The subscriber offers for sale, his farm in Groton, Mass., consisting of about 200 acres, much of it first rate land, and in a highly cultivated and productive condition. There are two dwelling houses and commodious barns, and the place may easily be divided into two good farms. It is well stocked with fruit, with an abundance of fuel for use and sale, and excellent water. It is difficult to find a place combining more advantages in respect to comfort or profit. It will be so then eligible terms. Inquire at the N. E. Farmer Office or to the subscriber on the premises.

[At our request we have been politely furnished by the author with the following extracts. They are sensible, instructive and eloquent. We are happy to enrich our columns with them; and we hope he will do us the kindness to furnish us with the other parts of the address.]

EXTRACTS FROM AN ADDRESS

Delivered at Pittsfield, on the 4th of October last, before the Berkshire Agricultural Society, at their Anniversary, by the Hon. LESTER FILLEY, President of said Society.

GENTLEMEN,—There is another topic, not intimately connected, perhaps, with the prominent subject of this Address, but lying at the foundation of all permanent agricultural improvements, to which your attention is solicited. The researches of the learned Professor, acting under a commission from the Executive of this Commonwealth, who has recently re-examined this county with reference to economical Geology, have disclosed the mineral elements of fertility without which putrescent, animal and vegetable substances, the proper aliments of vegetation, are temporary and irregular in their effects. The marl deposits which he has discovered in several places, and their probable existence in other localities, are important accessions to our agricultural resources.

The value of lime, the basis of marl, as well in a caustic state as in its chemical union with some of the acids, has, in many places, been properly appreciated.

However well the other essential earthy constituents of the soil may be adjusted, if calcareous matter be absent, lasting fertility cannot be expected. For evidence of the effects of the restoration of this element to the soil of which, by long cropping and cultivation, it had been exhausted, we need not look beyond the limits of our own country, the silicious barrens of New Jersey, the sands upon the shores of the Chesapeake and Delaware, and the pine plains of Virginia reduced to sterility by improvident husbandry, are becoming fruitful through the agencies, chemical and mechanical, of this substance. To her marl pits southern New Jersey is indebted for her corn fields and her clover leys—to her lime beds Pennsylvania may, in some of her most prosperous counties, give full credit for her extensive wheat harvests. Our own soil, reposing in the main upon beds of lime rock, strange as it may seem, yields upon analysis no notable proportion of this fertilizing mineral. May not the productiveness of our lands, tillage and grazing, be increased and prolonged by adopting the means employed by our neighbors of New Jersey and Pennsylvania? This is a question which some of us may be compelled to answer practically in the affirmative, if we continue to pursue the present system of cultivation and rely solely upon the usual sources of renovation and fertility. The supplies of the stable and barn yard sweepings will keep a small portion only of the lands, which

we occupy and pretend to improve, in their present state of fertility, unless some substance be applied which shall check their too rapid decomposition and fix in the soil the enriching properties which they evolve. To accomplish this, lime, in a calcined state, or in the form of marl, must be employed. Within this county the experiments made with this substance are comparatively few, and in some instances, I am aware, they have not been attended with the success anticipated. Quick and abundant returns have been expected; it has been applied where there was a deficiency of the components of the vegetable structure and expected to supply the absent elements, or at least in their absence to perform their duties. The processes of the experiment have been conducted in an unskillful manner, in ignorance of the nature or without regard to the modes of action of the substance. Many of the failures which attend inexperience in the outset have occurred, and a distrust in the efficacy ascribed to it, has been produced—a distrust which a better acquaintance with the subject and knowledge, the results of experiments by others, would readily dissipate. If, as has been ascertained by close and accurate observation, no soil can be made permanently fertile where calcareous matter is not present; it must be applied to no inconsiderable portion of our lands. The best mode of its application, the quantities in which, and the seasons at which it can be most advantageously used, experience alone can determine; it may turn out after all that very little depends upon the mode or time of application—that all its purposes will be answered, if its deficiencies be supplied.

The lands of England are dressed with one or two hundred bushels to the acre, applied in intervals of eight or ten years; those of France with forty or fifty bushels every other year, and the results, in both cases, are substantially the same. By us it has principally been used in compost, and in that form has invariably succeeded where the soil had not been previously sufficiently charged with it, and where it has been accompanied with a due amount of putrescent matter.

It is true that its appropriate functions in the economy of vegetation, the precise manner in which it acts, are not as well understood as that of vegetable and animal matter used as a manure, nor need it be for all useful and practical purposes. It may be more properly left to the chemist and philosopher to find out whether its effects are produced by its centering into the composition of the plant and becoming a portion of its organic structure, or preparing other substances for their reception by living vegetable organs, or by stimulating those organs to earnest and vigorous activity, or by the co-operation of all these causes.

The circumstance which renders the recently discovered marls of this county more interesting, in an agricultural respect, than they otherwise might be, is the difficulty and expense with which our lime stone is rendered available; owing either to their texture or composition, great and long continued heat is required to reduce them to a calcined state.

The cost of the fuel, necessary to reduce it to powder, is the formidable item of charge in the account; this is continually increasing. The large demands made upon our forests by the iron manufacturing and other processes in the arts requiring the application of heat, will diminish the amount and enhance the value of fuel, unless prevented by its introduction from abroad, or by wiser methods of renovation than yet have been employed. Could lime be burned at less than one cent a bushel, and sold at the kilns for 6 1-4 cents a bushel, as is the case at Barnegat, according to the last report of the Geological Surveyor of the State of New York, there might be less necessity for looking to our marl beds for the calcareous matter required in the operations of husbandry—still lime in its quick or caustic state, will always be required in certain processes of agriculture. Ligneous fibrous roots, hard vegetable substances, and consolidated peats upon which atmospheric agents and the usual solvents produce no impression, are readily broken down and rendered soluble and useful by its action. It prepares for immediate use without diminishing essentially their efficacy unfermented manures, but it destroys the living fibre unless used with intermixtures which will modify its action; it must therefore be used with a cautious regard as well to its deleterious as to its beneficial operations. Not so with marl or lime in its effete state, it has never been known to injure the growing plant except when used in excess, or without a proper regard to its appropriate admixture with the aliments of plants. It expels those fell acids from the earth which eradicate the nutritious and useful grasses and introduce sorrel, mullein and other sour and useless herbage. It hastens the decomposition of that portion of the food of vegetables which is of difficult solution, and upon which the other decomposing agents act too slowly if at all, and it ameliorates and modifies the texture of the soil by loosening it when too compact for the free penetration of the rootlets and by rendering adhesive when too loose to retain the requisite quantity of moisture. That these are some of its effects has been proved by experiments so careful and oft repeated that no room is left for doubt. Extensive tracts of cultivable lands, in this county, are faulty, either because too aluminous and compact to be readily permeable by water, or too sandy and loose to retain either the moisture or the manures which may be put upon them for any considerable period. If the season be too wet the Eastern Hills do not produce their usual quantity or quality of grass. If too dry, the silicious plains of Sheffield fail to furnish their expected returns. That both may be corrected by lime in some of its forms, and the last by marls of the precise character found among us, there can be no question. The wonderful changes which have been wrought in the agriculture of some of the Middle and Southern States by the use of this fossil—the luxuriant harvests gathered from fields originally barren, or rendered so by unskillful, improvident management—the extirpation of weeds, which either had rendered foul or

supplanted the cultivated crops, all owing to the effects of this mineral, should induce us to make a series of experiments to test its efficacy here. There are not, as in some instances, intermingled with it foreign ingredients to counteract its effects or injure vegetation. The learned Geological Surveyor of the State says, "The Berkshire marls appear to me to be some of the richest and best that ever occur." If, as is stated by those who have both the science and the practice necessary to true deductions, they are valuable only for the calcareous matter which they contain. The analyses of the Surveyor prove them unusually valuable. Of the ten specimens submitted to close analytical tests, the smallest product was 46 and the largest 95 per cent. of carbonate of lime, or clear calcareous matter. The deposits are overlaid by a rich covering of vegetable matter which has been growing and decaying for an indefinite period—and which, intermingled with the marl below it, would form a rich and valuable dressing for meadow grounds or crops of annual cultivation. Upon exposure to the air marl readily dissolves and is converted into powder fit for use.

All who have experimented successfully with this mineral, concur in the opinion that it should not be applied till reduced either by natural or artificial agents to a powdered state. If permitted to remain in masses upon the soil it will fail in a degree at least of producing the desired results. As the action of this, as well as other mineral alkalis, is complex, different upon different soils, and in its combination with other substances upon the same soil, and the laws which control its action are not yet thoroughly learned and cannot at once be ascertained, close observation of all the circumstances accompanying experiments should be made, and it should not be rejected because patience and critical attention are required for a full knowledge of its effects. Others have succeeded, most wonderfully, and their conclusions may be quite safely adopted, so far as they are applicable to our climate, the texture and composition of our soils, the crops which we grow, and the modes of cultivation which we have established. Upon our own experience mainly should we rely. We are Yankees and the world dare not deny to us the skill and ingenuity necessary to accomplish whatever skill and ingenuity can perform.

The earth, in wisdom infinite, in kindness most tenderly, has been fashioned and adjusted to the varied conditions of the sensitive and rational beings whose abode it is.

All things, rightly understood and wisely used, contribute bounteously to human happiness and to the moral and intellectual elevation of the human species.

At the conclusion of his six days work, the Omnipotent Architect proclaimed it good. It teems with benevolence—it is clothed with beauty—all around and upon it beneficently shines celestial light, the reflected radiance of the bright throne of love and kindness upon which the superintending Father of all is seated. No element of the materials of his work is frail or useless. Every thing which our hands can reach, or upon which our intellectual power can act, may be made subservient to our pleasure and improvement. All things are created for the use of man. If they be not applied to the purposes of their creation, ours is the sin and folly. If we starve amidst the elements of food, because too indolent to learn their combination and relations, and nature's economy in their

conversion to pleasant and healthful aliments, the penalty will in no measure transcend the crime. To us, among the breathing things of earth, as the structure of the organs which digest them clearly indicate, belong the finer fruits. To live on mast, to browse and drive away the lower animals from their husks, is brutish meanness. The field in which the husbandman is set at work, embraces the world, and all around it, the relations and the associations of life and happiness, with material things, are his to study and apply; the air which he breathes his cornfields inhale and appropriate to their use; the light which uncovers the enchanting prospects around him, gives to his wheatfields their sweetness and clothes them in green—the water which slakes his thirst, is drunk with equal eagerness by his parched herbage; and the electric flash which makes him tremble, shakes from the clouds their fatness upon his lean and arid pastures. The agencies of air and light, and moisture and electricity, as co-workers with him in the business of husbandry, are his own peculiar and appropriate studies. How animating, how elevating is the business of agriculture, when it walks hand in hand with such interesting, ennobling studies. In this way science is made to do and get good—science ploughs, and sows, and reaps, and scatters the fruits of the harvests in profusion all over the world. Away then with the entities and quiddities, the monads and molecules of Plato and Aristotle about which a starving, uncomfortable, stationary world quarrelled for two thousand years. Away with the fruitless abstractions of the closet, with the deductions of musty canons scholastic and folly.

To nature's teachings let us listen—the natural sciences let us study, and apply them too, to the rational purposes of life—for the advancement of human happiness and human virtue. Then may the visions of the poet be realized—"Then may we look up through nature." I repeat it,—“through nature up to nature's God.”

MASSACHUSETTS AGRICULTURAL SOCIETY FARM REPORTS.

No. 1. Levi Goodrich of Pittsfield Mass. to whom was awarded the premium 125 dollars.

The answers are in reply to the questions proposed in the circular of the Massachusetts Society to the several claimants.

1st. I have 200 acres of land exclusive of wood land. I have also a farm of pasture land containing 123 acres lying in the town of Dalton about 3 miles from my home farm.

2d. The soil of my farm consists of sand, gravel and loam.

3d. I consider the best method of improving the different soils above mentioned is to plough and manure with a rotation of crops.

4th. I till about 50 acres of land I have this year

14	acres of Rye,
6	“ summer Wheat,
13	“ Oats,
1	“ Rye and Oats,
11-2	“ Peas,
3	“ Corn,
8	“ Potatoes,
5	“ Ruta Baga

51 1-2 acres in all.

I manure all the land where I have hoed crops at the rate of about 20 loads per acre.

5th. My manure is applied in its long or green state.

6th. I spread and plough in the manure on the land where I plant corn, potatoes and turnips.

7th. My method of cultivating green sward, is, to plough in the fall and sow small grain, either rye in the fall, or oats in the spring; the next year manure and plant corn, potatoes or ruta bagas; and the 3d year sow spring grain and stock down to grass.

8th. I mow from 40 to 50 acres of upland, that will average about 2 tons of hay per acre.

9th. Irrigate none.

10th. After my ploughed land is manured I put all the manure I can spare on the low meadows, think it increases the quantity and improves the quality of the hay.

11th. I mow about 50 acres of meadow that is flowed by the Housatonic river; the quality of the hay is excellent for sheep, or cattle, excepting a few loads of coarse hay on some low spots. It produces about 2 tons of hay per acre at the first crop, and a part of it produces a good crop of rowen.

12th. About 20 acres of my meadow was 7 years ago a useless swamp, covered with alder and willow bushes, black ash and pine stumps in abundance, the timber had been cut off before I purchased the farm. It was so wet and soft that cattle could not go through it in the summer. I first drained it by ditching; then took all the brush out root and branch, then levelled it with the boghoe and sowed on about 12 quarts of herds-grass and red top seed per acre. The whole expense was about 25 dollars per acre, it is now well worth 100 dollars per acre.

13th. I planted only 3 acres of corn this year, the land was sowed to rye last year, the stubble was ploughed in the fall, coarse straw manure from the sheep yard spread on in the spring and ploughed in; the land was furrowed 3 feet apart one way for the rows, the other way the rows were planted about 20 inches apart, it was planted the 12th of May, 2 acres of it was the little Canada corn; the produce was 96 baskets per acre weighing 46 lbs per basket in the ear. It was perfectly ripe and dry the 30th of August. The other one acre was a large sort of eight and ten rowed corn, which ripened about a fortnight later, but was a much better crop. It produced 152 baskets weighing 46 lbs per basket in the ear; these baskets will make something more than half a bushel of shelled corn. The produce of this acre will not vary much from 20 bushels.

14th. I planted 8 acres of potatoes this year; a part of the land was green sward ploughed in the spring spread on manure and harrowed, the potatoes planted were of the variety called Burr potatoes. The produce was about 200 bushels per acre, two acres of oat stubble was ploughed in the fall, 20 loads of manure per acre spread on in the spring and ploughed in, planted the Burr potatoes the rows 3 feet one way and 20 inches the other making 47 hills on a rod. The produce was 450 bushels per acre, for which I received of the B. A. Society the first premium for the best 2 acres of potatoes in the county. This season has been unfavorable for potatoes, and the crops in this part of the country are lighter than usual. Last year I had 560 bushels per acre.

15th. I planted 5 acres of ruta baga they are not yet gathered; I think they will yield about 700 bushels per acre; I feed them to fat cattle; milch cows and sheep.

16th. I sowed 14 acres of winter rye on upland meadow. It was mowed in July, the sward turned over and harrowed. The first week in September I sowed 1 1-4 bushels per acre. It will produce about 16 bushels per acre. I sowed 6 acres of summer wheat; 2 acres of it was on land where I had ruta bagas last year: the land was rich and the crop, though some injured by the weevil, was good; will produce about 20 bushels per acre; sowed the tea wheat; I sowed 4 acres of wheat on where I had winter rye; the crop was as I expected rather light, about 10 bushels per acre. I sowed 1 1-2 bushel per acre; half of the piece was sowed with the tea wheat and the other half with the old fashioned bearded wheat. The bearded wheat was the stoutest straw and largest kernel but was more injured by the weevil. There is not much difference in the yield. If the weevil should disappear as I hope it will, the bearded wheat will be the best kind to cultivate. I prepared all my seed wheat by washing it in brine and rolling it in lime.

17th. I have laid down 10 acres to grass this year, sowed 4 quarts of herdsgrass and 4 quarts of clover seed per acre with spring grain sowed in hay.

18th. For the purpose of making manure I carry muck and earth into my yards in the fall and gather all the leaves I can conveniently for litter.

19th. I keep 6 oxen, 8 cows, 12 young cattle, 700 sheep and 4 horses through the year. I have barns and sheds sufficient to house all my stock. I have cellars under 3 of my barns for the purpose of storing vegetables for feeding stock. The manure is not covered excepting what falls under the sheds.

20th. My cows are of the native crossed with the Durham breed. The calves that I raise are taken from the cows at 3 days old and fed with new milk 2 weeks; then with skimmed milk or whey with half a pint of meal stirred into the mess of each calf twice a day until they are 12 weeks old; then they are turned into good pasture where they will do very well until winter; they are then stabled and fed with hay, cut straw and ruta baga grated fine and mixed with the cut hay or straw.

21st. I am not able to tell how much butter and cheese we have made this year. I have kept 8 cows; they are good and in good order and I think have done well for milk. My family is large, and we use all the milk, butter and cheese we want, and sell some.

22d. and 23d. I wintered 5 swine they are of the Byfield or Moco breed, they are not yet slaughtered. I think they will weigh 400 lbs. per head by the first of December when they will be 19 months old. My hogs are fed on raw potatoes principally with a little bran mixed with the slop of the house until the first of October, when I commence boiling potatoes and pumpkins, mixing provender made of oats and peas or oats and rye, with which they are fatted, adding a little dry corn the last four weeks.

24th. I take from my hogstyes about 30 loads of manure in a year. It is made from leaves, straw, potato tops, weeds and any vegetable substance that comes handy to throw in.

25th. I employ 1 man and a boy in the winter, and 3 men and 2 boys in the summer, besides my own 2 hands which are yet able and willing to labor.

26th. I have about 100 apple trees of the natural fruit; most of them are old and are decaying. In the year 1832 I fenced off two acres of land and

prepared it for a fruit yard. I sent to Albany and got a choice selection of fruit trees of various kinds. They lived and appeared very promising until the cold winter of 1834 when they all perished. I think I shall make another trial next spring, and hope for better success.

27th. I have no fruit trees excepting apple trees.

28th. None to be attacked by insects.

29th. I have used no ardent spirits for the last 6 years and there has been none on my farm, and I hope never will be again. I had some difficulty in getting help in haying and harvesting the first year that I commenced doing without it. I have no trouble about it now for no man that I hire expects it. I am satisfied from experience that I am better without it, and my hired men are more contented and will do more work, and do it better without the use of ardent spirits than with it.

Pittsfield.

LEVI GOODRICH.

MR LITTLE'S STATEMENT ON COMPOST MANURE.

Newbury Nov. 28, 1838.

To the Trustees of the Massachusetts Agricultural Society.

GENTLEMEN—Your inquiries respecting compost manure I think one of great importance to the farmer and gardener. After thirty or forty years of experience in making and applying the same, your correspondent must acknowledge that he has not arrived at any degree of perfection, (however this he thinks he has learnt that composts are more valuable in warm and dry, than in wet and cold seasons.) Not reading your communication in season, my last experiment does not meet your requirement in every particular. In September 1837, I hauled from a brook thirty ox cart loads of mud; about two thirds of the same was put down in a pile on the margin of the brook, the other third was drawn into the barn and hog yards; and mixed with about the same quantity of yard manure. Some time in November or December following, about three fourths of that at the brook was hauled on to one half acre of land and put down in small heaps. That in the yard was at the same time hauled and put in one pile on the same land; there was drawn from the yard, and barn cellar about ten loads and put in a heap, on land adjoining of the same quality. Both parts had been planted with Indian corn the year previous; in April following the mud that was in heaps was spread, and seven loads of the yard manure was spread on the other half of the land and both ploughed in. That in the heaps was overhauled and well mixed together. About the 12th of May the land was ploughed again, then furrowed three and a half feet apart, the compost was put in the furrows as far as it would go; still there remained nine furrows which were supplied with the remainder of the yard manure, the seed corn was the eight rowed yellow sort of the early kind, which was planted on the manure in the furrow about five thousand hills on an acre. It was hoed three times, after the last hoeing which was in July, I sowed with my hand half a pound of turnip seed and covered the same with my cultivator. I spent about one and half day thinning the turnips, the corn was harvested about the 20th of September, the product was one hundred and thirty bushels of ears of perfectly sound corn. At the time of gathering the corn I was out of health and my sons to make short work cut it all together. But from the appearance standing in the field the corn was as much larger on the compost as the turnips which were harvested between the 20th and 25th of Oc-

tober; six rows filled a cart on the yard manure, and five the same cart on the compost, and there was four hundred and seventyfive bushels of handsome turnips. If you will take the trouble to look back you will find that a part of the mud was left on the bank of the brook, which was mixed with unslacked lime in proportion of one bushel to a load and spread on land sowed with barley; by the side there was spread one load mixed with ten bushel of leached ashes; then I left a space without dressing. The land was all of equal quality and had been cultivated alike the year before; my intention at the time of sowing was, to keep the parts separate, but the wind brought the dressed parts down, which separation could not be done at the time of cutting. While growing I could see no material difference in the two first parts; the other was inferior.

As to the expense of the turnip crop we think the tops amply paid the cost of seed and labor. The injury done the land we think but small, as they belong to that class of vegetables that draw largely from the atmosphere. Respectfully yours,
TRISTRAM LITTLE.

Massachusetts Horticultural Society.

Saturday, March 23, 1839.

EXHIBITION OF FRUITS.

Apples from John M. Ives' Nursery on Dearborn street Salem.

Carthouse or Gilpin No. 92 of Cox. A fine juicy and highly esteemed table apple, late in the spring.

Bullock's Pippin or Sheep-nose, No. 40 of Cox, an indifferent fruit.

Michael-Henry Pippin, No. 74 Cox. This New Jersey fruit which ripens in November, and is then highly flavored, will keep well until spring when it loses its acidity and becomes a fine sweet apple—it is a good bearer and the fruit hangs upon the tree late in the fall.

Swaar, No. 101 of Cox. This apple which does not exactly answer the description in Cox, is a handsome formed and rather large sized fruit, juicy, but not high flavored.

Wellington. A fine fruit, remarkably juicy, very acid, and a great bearer producing its fruit in clusters, and improves for the table as the spring advances.

From Job Sumner, Roxbury, a fine dark red apple, nearly black and sweet.

St. Germain pears, in fine preservation and flavor, from the garden of Benjamin Bussey, Esq., Summer street, Boston.

For the Committee,

B. V. FRENCH.

Saturday, March 30, 1839.

EXHIBITION OF FLOWERS.

From S. Walker, Esq., Roxbury, seedling viola, grandiflora variety, of a new character—black ground with a bright orange eye, most beautifully shaded with crimson purple; thought by the members of the committee who examined it to be much the prettiest variety they have ever seen.

For the Committee,

D. HAGERSTON.

EXHIBITION OF VEGETABLES.

Mr James L. L. F. Warren of Brighton, presented two bunches of Radishes which we understand to be a sample of 20 bunches gathered this morning, and of 50 bunches gathered this week from a bed 2 1-2 by 40 feet. Estimated crop, 200 bunches.

For the Committee,

S. WALKER, Chairman.

REPORT

On providing for the Appointment of a Board of Agriculture, and a State Chemist, together with a Minority Report.

(Concluded.)

The great importance of improved implements of husbandry, your committee believe is not duly appreciated. An instance will be mentioned, of somewhat recent occurrence, of which they have personal knowledge. A field in common was divided between two neighbors and platted with corn. As it had been previously subjected to the same treatment, the line of division was supposed to give each party an equal chance for a crop. The same variety and from the same parcel of corn was planted in the two cases, and in both cases the after cultivation was seasonable and similar. In one case a new plough of improved construction—but hardly known in some parts of the State—was used, and a crop of fortyfive bushels per acre obtained. In the other case a new plough of a pattern that is in extensive use in some parts of the State, was used, and a crop of thirtyfive bushels per acre obtained, and this with the additional expense of at least two dollars in labor to remedy the defects in the ploughing. Here were ten bushels of corn and two dollars in labor, in the cropping of a single acre, gained, without any other assignable cause, than, to say the most, the skillful use of an improved plough—and that, perhaps, not the best—over the common use of a plough, certainly not the worst, and by many considered good. No manure was used in either case, and the gain and saving by the improved plough was fully equal to the whole expense of making the crop, yet old ploughs will be used. Farmers have been imposed upon and disgusted so much with patterns got up without skill or science, or apparently the least knowledge of, or reference to, the principles involved in the case—improvements from bad to worse—that in many cases they look with distrust upon everything that bears the name of improvement. The removal of this prejudice is a matter of no little consequence, and would be attended with the happiest results. The amount of labor misapplied, as may be inferred from the case cited, is an immense tax upon the industry of the Commonwealth, and the saving or beneficial application of it will tend directly, in proportion to its amount, to swell the aggregate wealth of the State, as well as promote the interest of individuals; and the Committee believe that no measure is more likely to accomplish this desirable object than the operations of a judicious Board of Agriculture.

Indeed the plough, which lays at the foundation of all good husbandry, or improvement in cultivation, affords of itself, matter sufficient to justify the appointment of a board. To examine new claims, and determine among them and the great variety of patterns already in existence—by accurate and careful experiment on philosophical principles—which is best for the various descriptions of work, would be of great service to farmers who have not the means necessary to institute a just comparison. It is of great importance that this implement should possess other qualities than merely that of being made of cast-iron. If it is not yet discovered, there is undoubtedly, some certain angle of elevation and curve of share and mould-board best calculated to raise and turn the sod in the easiest and most perfect manner, and if the investigation of the subject should result in discovering which now in use is best, or in the

invention and general use of a still more perfect pattern; the benefit to the farming interest could not easily be calculated; for if the operation of ploughing is not well performed, no after cultivation practised in our fields, however laborious it may be, can remedy the defect: a loss of labor, a waste of the energies of the soil, and a diminution of crop are the almost inevitable results. The committee would urge the importance of the subject as a reason for going so far into particulars.

The establishment of a Board whose duty it shall be to suggest, from time to time, for the consideration of the Legislature, such measures as the interests of our agriculture may require, and to devise means for its improvement, and indeed, to have a general inspection of the whole subject, is certainly a more systematic method of proceeding, and much more likely to meet promptly the reasonable demands of this great interest, than the present method of appointing a committee of the Legislature for a single session to whose notice specified subjects only are committed.

In constituting the board it is of the first importance that it should embrace men of thorough chemical knowledge applicable to agriculture, as well as scientific and skillful practical farmers; as it is only by the combination of science to plan, with skill to execute, that improvements are to be expected, and from a board of intelligent men thus constituted, is it too much to expect the advancement of the agricultural interest? No question can arise connected with agriculture however important or difficult that would be likely to be disposed of any other way, better than by reference to a board thus constituted. The subject of bounties, premiums and appropriations for the improvement of agriculture, would properly engage their attention, and had the board existed a year since, perhaps the money paid from the treasury for bounty on wheat the past season, would have taken a different destination, for the same reason that the merchant will not invest in purchases that will yield but twentyfive per cent. when he can as well invest where it will give fifty in the same time.

The committee will not attempt to anticipate all the objections that may possibly be brought in opposition to their views on this subject. The principal, and, as they believe the only real ground of objection is the expense. Perhaps it will be said that, in the present state of our treasury, we cannot afford the appropriation necessary to carry out the measure. In reply, the committee would say, that we cannot afford to remain ignorant of our resources. It is a false economy that interposes to prevent a judicious and necessary expenditure. In this case it is like the economy of the merchant who refuses the expense of a compass for the ship in which he embarks his wealth; the amount to be expended is almost nothing, compared with the object to be secured. If, as is believed to be the case, the products of our farm stock, and of our soil and the labor applied to it, amount to one hundred millions of dollars annually; an increase of this product of one per cent., if it can be effected by an improved application of the same amount of labor and expense—and who acquainted with the subject can doubt that much more can be done—will give a clear saving to individuals of one million of dollars, and increase the aggregate wealth of the State by that amount annually. One half of one per cent. of this saving would keep a chemist in the constant employ of the Commonwealth, meet all the expense of the board, and

leave a considerable surplus to promote the general object. It is wasteful extravagance in effect to continue the reaping of scanty harvests, where means of improvement abound. If we do indeed—as we are assured by our intelligent geological surveyor—possess in exhaustless abundance the means of cheaply enriching our farms, we cannot afford to remain ignorant of the process.

To leave the procuring of these desired results to individual enterprise, is to delay the reception of a great public good until it can be secured at individual expense, or a loss of many thousands to save a few hundreds. It is reversing one of the primary objects of our government, drawing in, instead of carrying out, the principle of encouraging industry.

To increase our resources, may be as wise and may as effectually relieve our treasury from future embarrassment, as cutting off necessary expenses. It certainly will be more effectual in furnishing means to carry out the broad plans of general education and general benevolence adopted by former Legislatures. These plans, which justly make one proud to hail from Massachusetts, require and will continue to require, large appropriations of money. They tell for the intelligence and glory of the Commonwealth, and the patriot and philanthropist must rejoice in their continuance.

The great objects of the board should be to devise and execute, under the sanction of the Legislature, measures to develop our agricultural resources, and add to our substantial wealth—the value of our soil;—to bring science to the aid of our farmers, and increase the value and the reward of labor. These objects are worthy the appointment of the board; and—to accomplish them is worthy the highest efforts of those who may be called to the trust, and merits the co-operation of every farmer, and the good wishes of every citizen of the Commonwealth.

With these views, the committee recommend the adoption of the following resolutions.

For the Committee,

WILLIAM CLARK, Jr.

Resolved, That there be appointed by the Governor with the advice and consent of the Council, one person from each congressional district in the Commonwealth, who shall constitute a Board of Agriculture, and shall hold their offices for the term of three years, and all vacancies in the Board shall be filled in the same manner as the original appointment is made; the Governor shall also appoint the first meeting of the Board. The Board shall meet in Boston once at least during the session of the Legislature, and as much oftener, not exceeding three times in each year, as they may think necessary, and at such place as they may determine. They shall elect from their own number, a president and secretary, and may adopt rules for their own regulation. The Board shall elect a chemist, fix the compensation for his services, and direct his labors in making such investigations, experiments, and analyses, as in their opinion will best develop the agricultural resources of the Commonwealth, and render the most effective assistance to the farmer. It shall be the duty of the Board to suggest for the consideration of the Legislature such measures as the interests of agriculture may require, and report the same with a detailed statement of their transactions and investigations to the Governor annually.

Resolved, That the members of the Board of

Agriculture shall receive the same compensation for travel and attendance, which is now paid county commissioners, and the Governor shall draw his warrant therefor accordingly.

MINORITY REPORT.

In SENATE, March 16, 1839.

The undersigned, a minority of the Committee on Agriculture, to whom was committed an order of the Senate of February 12th, with instructions to consider the expediency of establishing a Board of Agriculture, and the appointment of a State Chemist, has considered that subject, and a majority of the committee have reported that it is expedient. The undersigned concurs with a majority of the committee in their statement of the vast importance of agriculture, and of its immense benefits. It is surely the cultivation and the productions of the earth, which gives us our wealth, prosperity and subsistence, in a far greater degree than from all other sources from which wealth is created. The producers are the only class of men who add to the wealth of the nation; all others being mere speculators on their labors. These being the opinions of the undersigned, it is his desire to aid in any measure, having for its object the promotion of individual and national wealth, and having a direct tendency to benefit the hard-handed yeomanry of Massachusetts, who, of all people in the State, deserve encouragement, and have had the least of it from the Legislature.

It will not be denied but that the measures proposed, were they properly directed and applied, might produce beneficial results. Yet it is doubted whether they would in any great degree compare with the expense incurred. Past experience is a teacher by no means to be disregarded. And if the course hitherto adopted to aid the practical farmer, is still to be pursued, it is rendered nearly certain that the appointment of a Board of Agriculture and State Chemist, as recommended by a majority of the committee, will not promote the object intended.

The agricultural survey, now in progress, is evidence to the undersigned, of the misapplication of the revenues of the State; and may afford evidence, that a State Chemist would derive more benefit from his salary than would the farmers from his researches.

If the agricultural societies have failed to afford the benefits anticipated, it may well be doubted whether any greater would result from a Board of Agriculture, especially if the members of the board are to be selected from mere theorists in agriculture. The appropriations and expenditures of the State are now, for the agricultural survey, agricultural societies, and those of natural history, about eight thousand dollars per annum, which does not operate to favor the practical and laborious farmer, to be at all compared to the expenditure. And in the present exhausted state of the treasury, there ought not to be any increase of expenditure of doubtful utility, the result of which will be to throw a heavy burthen on the farmer, who must soon be compelled by taxation to yield from his hard earned gains his quota of tax, for paying salaries, and other expenditures of the State of the like nature, which are rapidly increasing, and if continued, must in a few years be oppressive.

With these views, and other considerations, which the undersigned will forbear to mention, while yielding to no one in the high estimation of the farmers, and believing them to be the most

substantial portion of the community, whose moral worth is almost universally overlooked by other portions of the community, entertaining also the greatest respect for the opinions of the majority of the committee, still he is compelled to come to a different conclusion from them, and to hope the measures proposed by the majority may not be adopted.

The undersigned being clearly of opinion, that the interests of the farmers will be better promoted by being left without legislative interference, either by direct attempts to aid them, or by conferring on others special privileges by acts of incorporation which in effect, abridges the natural rights of others.

Which is respectfully submitted by
SETH WHITMARSH.

PROVISION OF FUNDS FOR COMMON SCHOOLS IN MAINE.

Maine, it seems, has acted wisely with the money of the United States given as her share of the surplus. She has sown seed which will not fail to yield an abundant harvest; and the advantages of her sound and discreet management will be continually multiplying and expanding themselves.

We are sorry ever to speak ill of our own relations and family, but it is to the everlasting disgrace of Massachusetts, that when the means of securing the highest and most permanent benefits to the State were placed within her reach, in the way of advancing public improvements or of extending most largely the means of education, she, from miserable motives of party policy, refused to avail herself of them, and distributed this magnificent donation from the general government among the towns; and not a few of the towns divided it among the people in small sums. One town, for example, where being divided per capita, the sum received amounted to less than three dollars per head, it was loaned out upon the notes of individuals for two dollars and some cents each, and for the sole reason of evading the law, at one per cent. interest. For all good to come of such a disposition it might as well, in many cases it had better, have been thrown into the sea.

Massachusetts complained loudly of the late administration of the national government for refusing and preventing all measures of internal improvement. It seems, however, when they had the means of pursuing this system in their own State, and at their own pleasure, with an ineffable indiscretion, to use no harder language, they chose to throw all the advantages away; and refused to devote one cent to any public improvement. We admire consistency wherever we find it. H. C.

The revenues derived from the U. S. Deposit fund, and which are applicable to the purposes of education, are stated to be as follows:

Int. on deposites in banks in 1837,	70,709 33
do. on mortgages in 1837,	13,426 59
do. on do. in Oct. 1838,	266,445 97

\$350,581 89

After paying the annual appropriations from this revenue for schools, academies and colleges, there will remain \$127,581 89 to be invested as capital for the school fund; which will make the total capital of that fund 2,076,000. Hereafter, the addition to the capital of the school fund, from the revenue of the U. States Deposit, will be about 50,000 annually.

SAVINGS BANKS.

Benevolence never devised an institution, which in the present condition of society, is adapted to do more good than the institutions for savings. They save to those, who have earned it by hard labor, a vast amount of money, which for want of some place of safe keeping would otherwise be squandered. They encourage and stimulate most powerfully industry, frugality, and temperance.— They awaken a sentiment of self-confidence and self-respect, the great elements of virtue; and could we but trace in all their ramified consequences, the vast benefits which have sprung from them, they would exhibit an amount and harvest of good beyond that of many of the most popular and beneficent institutions in the community which are more strictly denominated charitable.

Institutions for Savings.—The following results are shown by the returns of the 34 Savings Institutions in Massachusetts, showing their condition on the last Saturday of October last.

Number of depositors,	33,063
Amount of deposites,	\$4,869,362 59
Invested in Bank Stocks,	1,426,183 72
Depositos in banks,	568,787 09
Loans on Bank Stocks,	536,981 13
Invested in Public Funds,	70,000 00
Loans on Public Scrip,	10,000 00
Loans on Mortgage,	1,121,300 18
Loans to Counties or Towns,	465,247 69
Loans on Personal Securities,	672,117 97
Cash on hand,	144,262 00
Dividends for the year,	248,039 07
Annual Expenses,	18,329 11

These vast amounts have grown out of the collection and saving of sums of twentyfive cents and upwards, and very few of them from the laying aside of more than five or ten dollars at any one time. H. C.

(For the New England Farmer.)

AUTUMNAL MARROW SQUASH.

Salem, March.

MR EDITOR,—

This vegetable was introduced here six years since. Six seeds were received from Mrs Tucker near Northampton, enclosed in a letter to her nephew, Mr Geo. C. Cook of Salem, by the name of Vegetable Marrow; this being, however, the name of a summer squash long since cultivated in Europe, of a gourd shape, the name Autumnal was applied to it here. I have endeavored to ascertain its origin but without success; it is probably a hybrid, accidentally produced in that section of the country. This variety, when pure, averages from 8 to 10 lbs. They are so inclined to mix with the tribe of squashes (the crook-neck excepted) that they are fast disappearing from our gardens; the course which I have taken to preserve this variety pure has been to sow a few seeds very late in summer, as far from all others as possible. One of the most singular effects produced by mixing the Autumnal Marrow with the Valparaiso is, that after the first season they will produce a large, coarse grained and very sweet squash, and the seed from the said mixture in the following season generally a small and worthless variety. The true Autumnal Marrow will, in a favorable season, be fit for the table in six weeks from its setting fruit; and is then an excellent summer squash, and we still consider it, when pure, the finest winter squash known. Yours, J. M. I.

NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, APRIL 3, 1839.

GREAT PRODUCT OF CORN.

We publish with much pleasure, the following account of a remarkable produce of corn in Upper Canada,—remarkable and extraordinary it would be for any latitude or location. The authority is undoubted. We invite the particular attention of the farmers to the opinion expressed, that corn may be forwarded three weeks by frequent hoeings. We believe for general utility, there never was a more valuable plant came out of the earth, than Indian Corn; and we have been always anxious that its cultivation should be rendered as perfect as possible. We are yet far from having reached that point. We have now for two or three years been urging upon our friends the matter of hoeing their corn very frequently, until the ear is perfectly formed, and keeping the ground, by ploughing and cultivating one way, always loose and fresh. We hope some one will at least make the experiment upon a small scale, and for reasons which we have not time or room at this moment to give, we have no doubt that it would be attended with the best effects. We have heard that in some parts of the West, forty acres or more of corn are allotted to the care of a man; and as soon as it comes up, he is sent into it with his horse and kept there daily until the ears are perfectly formed; and this with the greatest advantage. We much wish that the experiment of such cultivation might be tried; which may as well be done on one quarter of an acre, as on forty acres. We have the strongest faith in its success.

H. C.

Montreal, Dec. 20, 1838.

Sir.—Yours relating to corn, is duly received.—My corn field is 2½ by 222 feet, soil gravelly, slightly tinctured with clay, dry; old land; this is the seventh crop in succession. Manured each year; the last spring we split the hills, and gathered the roots, and burnt them off the previous year, then put on a good coat of manure, ploughed it in, harrowed and opened the drills with a light plough, 2 ½ feet apart.

On the 19th May, put 1 ½ bushels of seed in a tub, poured hot water on it until it became too hot to stir with my hand. I let it steep about two hours, and then stirred in as much plaster as would adhere to the kernels, and planted the same day, in hills 16 to 18 inches apart, five to seven kernels in a hill. On the 5th June, the corn was fairly above the ground. On the 11th, passed a small plough between the rows lightly, turning the little mould that we raised, to the middle, and took great care that every stalk should stand upright, care also being taken to move the whole surface of the ground.

We harrowed and hoed it, the week following, and again, the week after that. I would here observe, that corn can be brought to maturity (I believe) two or three weeks earlier, by frequent hoeing, than by the old way of hoeing twice. I do not make high hills, but lightly disperse the earth near the corn, and supply its place with earth from the middle of the rows, leaving the surface nearly flat. The harrow that I use, is triangular; the sides about three feet long, with five teeth or pins, 5-8 of an inch square, iron, and a scraper or hoe, 15 inches long, extending across the heel of the harrow, 1 3-4 inch wide, drawn to an edge, turned up at each end, long enough to cut the same depth as the pins; to steady and give it weight, I put a small plough upon it, making it harrow and cut earth two to three inches deep; the hoe acting same as a Dutch weeding hoe, but by slight lifting, you obtain the full benefit of the sun and air to the roots.

On the 1st day of September, we cut up at the roots, a quantity for seed; and on the 6th the remainder of the field, and set it up in stacks to dry or ripen. We husked it out the last week of September, and found we had four hundred and ten bushels of ears of good sound corn, and thirty bushels of small ears and soft

corn, nearly all of which was dry enough to grind, making 410 bushels of ears, exclusive of the quantity gathered for seed, the half of which I sent you in cask Number 1.

I have disposed of the product as follows:

Shelled 78 bushels, of which 18 bushels meal,	} 421 bushels.
and 30 in corn equal to 156 bushels,	
50 bushels sent you,	
100 bushels sold for seed,	
85 bushels on hand,	
30 bushels fed to pigs,	

We attempted to take off the suckers, but found that we broke down so much corn, that we let them take their chance with the rest.

Note.—The gentleman who has been kind enough to lend us the above communication states, that though he put from five to seven kernels in a hill, yet where they came up well, they were selected and thinned out so as to leave only three remaining, which were deemed sufficient, considering that the rows were only two and a half feet apart; and the hills only 18 inches. The crop fell a little short of 150 bushels to the acre.

A quantity of this corn has been received, and is for sale at the Agricultural Warehouse and N. E. Farmer Office, No. 52 North Market Street. Coming so far from the north, it must be a highly valuable acquisition.

ERRORS.

"The Rev. Mr Colman who reports for the New England Farmer, the talkings of the farmers who meet at the State House weekly, has greatly mistook our words and our meaning. We presume this is all unintentional—but we are reported as saying "the tap-root (of apple trees) must not be "headed down!" We said the top, or leading shoot should never be headed down after the tree was taken from the nursery at two or three years growth—that the tap-root served to strengthen and support the tree and we saw no advantage in lopping it off.

Again, he reports us as saying "that it would be well to take them up and keep them a month before setting out, (he did not say that they might get used to being kept up all the time.)"

Now could the Rev. gentleman understand us to say any such thing? If he could it must be because he is not familiar with nursery terms, or nursery practices.

If his reports for the use of the state are of this character we must go elsewhere for facts."

The above is from the Boston Cultivator of the last week and is sufficiently complimentary. Now we will not be drawn into a controversy with this belligerent editor, who seems to have his hands full in taking care of others of his contemporaries. The insinuation however in the last paragraph is such that we shall at least give our friends the means of properly estimating its force. In respect to many things which are said, it is desirable to know, who says them.

First then, in regard to the "tap root of a tree being headed down" an expression in our report ascribed to Mr B. We have no doubt that he uttered these words, for the simple reason that our notes of his speech were taken at the moment of its delivery; and without any inclination, indeed with an utter repugnance, to misrepresent him, we can only say that we meant, to misrepresent the identical words, which fell from his mouth. What his denial of having used this language is worth will appear in the sequel. We confess that with our "ignorance of nursery terms and nursery practices" we considered it a pleasant Hibernianism. We remembered likewise that one of the towns in Middlesex co. some years since voted "to erect a well on the town hill;" and it was not for us to debate with any of the literati of Middlesex in regard either to matters of grammar or taste. Whether however this was Irish or Gibberish we aimed to report the gentleman truly; and have quite as much confidence in our own notes taken at the time, as in his recollections of some days old.

In respect to the second charge of misrepresentation, that "it would be well to take up trees which were to be transplanted and keep them a month before setting out," the gentleman on Friday night expressly admitted that he used this very language. How does he presume then to come forward and deny it? He says that he added that the roots of the trees should be protected and the trees kept in a damp cellar until ready to be

planted. Well, we neither affirmed nor denied that which every child in the country of ten years old would know. Nor did we add that he did not say that trees must not be baked, nor boiled, nor roasted before setting out. It was not necessary that we should either affirm or deny any of this. He expressly stated that it was best to take the tree up and keep it a month before should be replanted "with a view to check its growth." Now if we had the presumption to think that in a homely way we could make him understand the ease we should say that this is the point of the whole matter that a tree will flourish better for having its growth checked by removal. We yield entirely his right to his opinion in this case; but why should he refuse to us the liberty of conscientious dissent?

From motives of convenience trees are often taken up in the fall after vegetation has ceased, their roots carefully packed with clay and soil, and they are kept securely until spring. When trees are to be sent a considerable distance, or where the land is not in readiness to receive, as early as it is desirable to remove them it is best to take them up before vegetation in the spring commences; and taking care to secure the roots from injury from light, heat, drought, or frost, they may be kept with safety until the proper time of planting. Who does not know this? who denies that it doubts it? But that as a general principle a tree will grow better "for having its growth checked" by being taken out of the ground and not planted again for a month, do what you may with the roots, we cannot without further light admit even upon this ocular authority. We have set out with our own hands many hundreds of trees and with as good success as our neighbors; and we believe that whenever circumstances admit of it, it is decidedly best to replant the tree as soon as may be after being taken up. So far from its being necessary to check its growth, we should be glad so speedily and carefully to remove the tree, that it should not be conscious of getting out of one bed into another; or as the excellent orchardist from Watertown, said the other night, that "the tree should be removed and never know it."

We promised to show in conclusion how, from his own statements, the authority of this writer is to be estimated. We have no disposition to question his veracity. We have no disposition or reason to suggest or think, that he is not a man of truth. We know very well likewise, that in extempore speaking, a man is sometimes led to say what he does not mean to say, and liable to forget what he has said. Where a man however, cannot remember for five minutes what he has said, it is hardly safe for such an individual to charge others with misrepresentation him.

Now we do distinctly state, that on Friday evening last, Mr B. did make certain particular statements as to the depth of ploughing which he deemed advisable; and that when these statements, in language as near as possible to that which he used, were referred to by the Commissioner in five minutes after he had uttered them, he, Mr B, peremptorily denied having used any such expressions or conveyed any such meaning. Unfortunately however, for his recollection, two gentlemen of unquestionable intelligence and veracity, rose at once and declared that they understood him to say precisely what the Commissioner stated that he had said. We have likewise the assurance of two other gentlemen of equal respectability, whose names are at his service, that they also so understood him. As we have no doubt we can give him the authority of twenty others to the same effect, if these are not sufficient. Under such circumstances, we respectfully suggest to him that a little more diffidence in charging others with misrepresentation, would not be out of place. We should regret to fail in any proper respect towards him. He has given a good deal of interest to our agricultural meetings; and we have often listened to him with pleasure and instruction. We wish him all possible success in his new vocation, and as wide a circulation to his paper as its merits may justly claim. But we give him distinctly to understand, that such insinuations as are contained in the last paragraph of the above quotation, are not to be tolerated among gentlemen; and unretreated, will as far as our honorable selves are concerned, effectually secure him from all misrepresentation, and from any representation or notice whatever.

H. C.

The communication from Agricola, relative to the Report of the Massachusetts Agricultural Society on Farms, will appear in our next, together with an answer from one of the committee.

BRIGHTON MARKET.—Monday, April 1, 1859.

Reported for the New England Farmer.

At Market, 290 Beef Cattle. 12 Pairs Working ewes. 18 Cows and Calves 510 Sheep, and 320 wigs. 50 Beef Cattle unsold.

Prices.—*Beef Cattle.*—Last week's prices were sustained in the afternoon. We quote, First quality, \$7 75 a \$9 00. Second quality, \$6 00 a \$8 50. Third quality, \$6 75 a \$7 75.

Working Oxen.—Sales were made at \$100, \$115, 125, \$132 50, \$140, and \$150.

Cows and Calves.—Sales were noticed at \$30, \$32, \$35, \$42, \$56, and \$60.

Sheep.—Lots at \$1 25, \$4 02, \$5 50, and \$6 50.

Swine.—One lot at 9 and 10, one at 9 1-1 and 10 1-4, one at 9 1-2 and 10 1-2, and one at 10 3-4, barrows. Large hogs were sold for a less price. At retail 10 to 12.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded northerly exposure, week ending March 31.

WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, invented the last season; and one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great time in difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of soil and not sow a single seed; but not so with this; it is so land and not so a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at the farmer can save one quarter the expense of the common way of sowing his seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Parsnips, Onions, Corn, &c. It is highly recommended by a great number of persons who have used it in the present season. For sale at the N. E. Agricultural Warehouse and Seed Store by **JOSEPH BRECK & CO.** April 3.

SAYLE'S GARDEN ENGINE.

For sale at the New England Agricultural Warehouse, Nos. 51 and 52 North Market Street, Sayle's Garden Engines. This Engine is a splendid article, and will throw a constant stream of water to the distance of 50 or 60 feet, with great force, and in case of fire would be a good substitute for a fire engine. It is the most perfect article for the purpose ever introduced. **JOSEPH BRECK & CO.** April 3.

PEAR TREES FOR SALE.

At the Pomological Garden, Salem, Mass., a good collection of Standard Pear Trees, all of which have been proved. They comprise the choicest of the old and new varieties.

Also—Scions of Fruit Trees.

Scions of a great variety of Apples, Pears, Plums, and Cherries, from bearing Trees, for sale by the subscriber. **ROBERT MANNING.** April 3.

BUCK THORNS.

For sale at the New England Farmer Office by **JOSEPH BRECK & CO.** April 3.

MORUS MULICAULIS.

For sale, at the Garden of Fromont, near Paris, France, 150,000 of the *Morus Mulicaulis*. These Mulberry Trees are 2, 3 and 4 feet in height and of the first growth, delivered either at Paris or Bordeaux, in the course of the Autumn of 1859. Orders for the above must be addressed to the Director of the Garden of Fromont at Ris, Seine et Oise, France, or to J. H. Mey, of South Carolina, at Paris, to the care of J. C. Darillier & Co. Paris, with an order on a Banker, at Paris, for the amount which will be immediately attended to, and the plants put up in the best order.

The Garden of Fromont, has also, large quantities of the Mulberry Morati and other new kinds, as well as the newest varieties of Camellias, Rhododendrons, Magnolias, Azaleas, Roses, Trees, Delphiniums, Chrysanthemums, &c. &c. Immediate application should be made for the Mulberry Trees.

For farther particulars, apply to James Ailger & Co., Charleston, South Carolina; C. W. Karthous & Co., Baltimore; John Boblen, Philadelphia, and C. C. Meien & Co., New York.

Paris, France, January 1, 1859.

EARLY AND LATE PEAS.

For sale at the N. E. Agricultural Warehouse and Seed Store, a choice assortment of Early Peas, consisting of—Cedo Nulli, extra fine and Early Charlton, Early Warwick, do. do. Knights' Dwarf Marrow, Fall Sugar, eatable pods, Russell's Early Dwarf, Fall Late Marrow Fats, Bishop's do. do. Dwarf do do. Early English Frame, Blue Imperial, Early Golden Hotspur, Woodford's Tall Marrow, Blue Prussian, Rye, northern, Barley, Oats, northern, (prime)

In addition to our usual stock of Peas, we have recently received a few varieties of very superior Peas from England, viz:

Marquis of Hastings, extra fine Marrow, Early White Warwick, early and fine, Cedo Nulli, very early, Waterloo Blue, fine large blue, Groom's Improved Blue, White Scimitar. All of which are remarkably fine, and are considered as some of the most desirable varieties cultivated here or in England. **JOSEPH BRECK & CO.** March 27.

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 25 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells. Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention. **NAHUM WARD.** March 27.

PEAR, PLUM, GRAPE VINES, & C.

1000 Pear Trees of the most approved kinds; 1000 Plum Trees, of the most approved kinds and extra size—many of them have borne the past season; 500 Quince Trees; 3000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hamburg, Sweetwater, Pond's seedling; 30,000 Giant Asparagus Roots; 5000 Wilmo's Early Rhubarb or Pie Plant, lately introduced; Also—a good assortment of Gooseberries, Roses, &c. of different kinds; All orders left at this office, or with the subscriber at Cambridge-port, or in Mr Lynch's baggage wagon box, at Gould & Howe's, No. 8 Faneuil Hall, will meet with immediate attention. **SAMUEL POND,** Cambridge-port, Mass. March 27.

SHEEP AT AUCTION.

Will be sold auction on Friday the 5th day of April next, at 10 o'clock, A. M., the flock of fine Saxony Sheep, of Rejoice Newton, Esq., at his farm in Worcester, in such lots as may suit purchasers. It consist of, 120 Ewes with lamb, 100 Yearling Ewes and Wethers, very fine and healthy, 7 Yearling Bucks of the best blood, 8 Older Bucks, selected from the best flocks, 100 Wethers and Ewes not with lamb.

This flock has been improved for several years with great care and expense, and is believed to afford as good an opportunity for obtaining the best stock as any flock in the country. **T. W. & C. P. BANCROFT, Auc'trs.** March 20, 1859.

WANTED.

A few Hives of Bees at the New England Farmer Office. **JOSEPH BRECK & CO.** March 20.

MISCELLANEOUS.

For the New England Farmer.

GREASE.

"My theme is homely—what of that?
All do confess 'tis rich and fat"

OLD DOGGREL.

Do you know farmer *Rub hard*, that craving old wight?
He 's all an acquisitive bump.

How active for thrif! yet, for spending withal,
You find him, "as still as a stump."

He has carts, he has wagons, and barrows, and gates;

But his implements give him no peace,
For, while they are moving, they screech and they scream,
Because *Rub* affords them no *grease*.

But in farmer *Brightall*, so hearty and cheer,
A character different you see.

'Tis not all for self that his hands are engaged;
And his heart is e'er open and free.

A generous living he grudges to none;

And he says,— "would you jog on in peace,
Then never withhold this expense of a great;
We can't go ahead without *grease*."

"Tis surely the case with each one of us all,
Let wishes be whatever they may,

Some friction or other our movements impedes,
Unless we will smooth it away.

Economy, prudence, both very good friends,

For our health, for our purse, for our peace,
And they too persuade us there's ne'er a bit lost,
Should we spend a few shillings for *grease*.

Mechanics, and merchants, professionals too,

Are all but so many machines,

With their wheels and their gudgeons, their sockets and
slides.

And their cranks and their rollers and pins.

Some operate easy, while others rub hard,

And some too all action will cease,
Because they is lacking this "unguent of joy;"
In plain phraseology—*grease*.

A poet's a Grahamite,—living on air;—

His exercise all in the skies.

In a feathered sedan, with the *MUSES* in train,

Alto Pean! through ether he lies

Allons! ah! Pegasus now lags on his way,

Refusing his speed to increase;

Still falters;—the vehicle comes to a stand;—

The poet, alas! has no *grease*.

AGRICOLA.

The English, Scotch and Irish.—It has been well
said, I know not by whom, that an Englishman is
never happy but when he is miserable; and that
a Scotchman is never at home, but when he is abroad;
and that an Irishman is never at peace but when he is
at war.—*The Original.*

Man and Woman.—Man is strong; woman is
beautiful. Man is daring and confident; woman is
diffident and unassuming. Man is great in action;
woman in suffering. Man shines abroad;
woman at home. Man talks to convince; woman
to persuade and please. Man has a rugged heart;
woman a soft and tender one. Man prevents misery;
woman relieves it. Man has science; woman
taste. Man has judgment; woman sensibility.
Man is a being of justice; woman of mercy.—
Sat. Mag.

Source of Falsehood.—It is more from careless-

ness about truth, than from intentional lying that
there is so much falsehood in the world.—*Dr
Johnson.*

Conversation.—Conversation should be pleasant
without scurrility, witty without affectation, free
without indecency, learned without conceitedness,
novel without falsehood.—*Shakspeare.*

Education of Children.—The education of a
child is principally derived from its own observation
of the actions, the words, the voice, the looks, of
those with whom it lives.—*Bp. Jebb.*

Comforts of the Poor.—The poor man has his
wife and children about him; and what has the
rich man more? He has the same enjoyment of
their society, the same solicitude for their welfare,
the same pleasure in their good qualities, improve-
ment and success: their connection with him is as
strict and intimate, their attachment as strong,
their gratitude as warm. I have no propensity to
envy any one, least of all the rich and great; but
if I were disposed to this weakness, the subject of
my envy would be a healthy young man, in full
possession of his strength and faculties, going forth
in a morning to work for his wife and children, or
bringing them home his wages at night.—*Paley.*

Time.—There is no saying that shocks me so
much, as that which I hear very often, that a man
does not know how to pass time. It would have
been but ill spoken by Methuselah in the nine
hundred and sixty-ninth year of his life.—*Cowley.*

Source of Cheerfulness.—No man's spirits were
ever hurt by doing his duty. On the contrary, one
good action, one temptation resisted and overcome,
one sacrifice of desire or interest, purely for con-
science' sake, will prove a cordial for weak and
low spirits beyond what either indulgence, or di-
version, or company can do for them.—*Paley.*

The Humble-minded.—They who are truly hum-
ble-minded have no quarrels, give no offence, con-
tend with no one in wrath and bitterness; still
more impossible is it for them to *insult* any man,
under any circumstances.—*Paley.*

A *SISTER.*—He who has never known a sister's
kind ministrations, nor felt his heart warming be-
neath her endearing smile and love beaming eye,
has been unfortunate indeed. It is not to be won-
dered at if the fountains of pure feeling flow in
his bosom but sluggishly, or if the gentle emotions
of his nature be lost in the sterner attributes of
mankind.

"That man has grown up among kind affection-
ate sisters," I once heard a lady of much observa-
tion and experience, remark.

"And why do you think so?" said I.

"Because of the rich development of all the
tender feelings of the heart."

A sister's influence is felt, even in manhood's
riper years and the heart of him who has grown
cold in its chilly contact with the world—will
warm and thrill with pure enjoyment as some
incident awakens within him the soft tones, the glad
melodies of his sister's voice,—and he will turn
from purposes which a warped and false philosophy
had reasoned into expediency, and even weep for
the gentle influences which moved him in his earli-
er years.

The first division of Pennsylvania militia, under
the command of Major General Patterson, have
volunteered their services to the President, under
the act recently passed by Congress, to raise fifty
thousand men.

FRUIT TREES, &c.

Pears, Plums, Raspberries, Roses, &c.
The subscribers have recently received, per the *Switzer*
land from Harve, a large assortment of the choicest varieties
of Pear and Plum Trees, from one of the best Nurseries in
France, together with a small Collection of superb French
Roses, all in excellent order for transplanting, which they
offer for sale at the New England Agricultural Warehouse
and Seed Store, No. 52 North Market Street. The Pear and
Plum are from 6 to 7 feet high, and will be sold at \$1 00
each.

[NO. 40.]

N. E. FARMER.

The subjoined communication from Dr C. T. Jackson, the learned geologist of Maine, deserves particular attention; and I am happy to make the N. E. Farmer the medium of its communication to the public. The subject to which it relates is constantly taking stronger hold upon the public attention. Let New Englanders never "give up the ship;" nor despair of making her agriculture as improved, as beautiful and productive as it is capable of being rendered. She need not, if she will do herself justice, dread for a moment a competition even with the most favored regions in any of the departments of human industry and skill; and every unfolding of her resources will serve to exalt the respect and to strengthen the attachment of her children to their native home. H. C.

Boston, Feb. 8, 1839.

MR HENRY COLMAN, *Agricultural Commissioner*,—

Dear Sir,—Having viewed with great interest the exertions which you and your scientific collaborer, Prof. Hitchcock, have made in behalf of agriculture and the treatment of soils of Massachusetts, I beg leave to offer for your consideration a few remarks on the influence of lime in amending soils so as to render them more capable of producing heavy crops of wheat.

The favorable influence of calcareous matter in the production of the crops above mentioned, has long since been fully recognized; but I am of opinion that farmers do not sufficiently value the effects produced by a very small per centage of lime in the soil. It has been too commonly supposed that enormous quantities were requisite to produce the desired effect, which according to my observations, is not the case, for I find that even in the apparently insignificant proportion of one per cent. that carbonate of lime exerts a beneficial effect, and that where the proportion amounts to from two to four per cent. the soil is decidedly luxuriant in cereal grains.

Let me then call your attention to the actual amount of carbonate of lime contained in a cubic foot of soil assuming its mean specific gravity to be 2,400,* that of water being 1,000.

A cubic foot of water weighs nearly 1000 oz., and hence a cubic foot of soil at the above specific gravity will weigh 2400 oz., which number of ounces being divided by 16, gives the number of pounds equal to 175 to the cubic foot. Allowing one per cent. of carbonate of lime in the soil, we shall have 1.75 lb. to the cubic foot of soil.

If it contained four per cent. of carbonate of lime we shall have four pounds to the cubic foot.

Since, however, the soil is rarely accessible to the roots of plants below the depth of six inches, we will allow in the first case .87 lb. or the amount in one-half cubic foot, and in the second 2 lbs. for the same depth. We see then that an apparently trifling per cent. of carbonate of lime in a soil

* See the specific gravity of soils of Mass. Prof. Hitchcock's Report.

amounts really to a large quantity when we consider the area in which it exists.

The influence of lime is probably not yet fully understood, for besides combining with certain animal and vegetable matters forming compounds *gradually soluble*, and by that means retained in a proper condition for the constant supply of plants, and entering also into the composition of all grains and grasses; it evidently acts also in a chemical and physical manner in the soil, and upon the rootlets and spongioles of the plants exciting by a gradual electric power the endosmosis or internal impulse of liquids through the membranes forming the spongioles and cellulules of the plants. Researches in this department of agricultural science offer a rich harvest of discovery to the physiologist and chemist, but little having yet been done. I have long since projected a series of experiments to elucidate some of the obscure and intricate laws which regulate the above mentioned functions, but constant absence from home during the summer months has as yet prevented my carrying them into full effect.

The influence of vegetable matters in soils has, I believe, been too commonly over-rated, and the effects of animal manures is not yet fully understood. If vegetable humus, soluble and insoluble geine were the sole requisites for luxuriant vegetation, our peat bogs should have been covered with the most abundant crops. The fact is however otherwise, and peat alone, although nearly pure vegetable matter, is known to be almost barren, and it is found sometimes when used without addition of other matters, to exert a most unfavorable influence on vegetation. Pure silex, alumina, lime or gypsum, are also totally barren; but a combination of these ingredients with a small proportion of vegetable matter produces a luxuriant soil. Peat, by proper management, is capable of being converted into a most valuable manure; but it is essential that it should be saturated with earthy or alkaline bases, and this is most easily effected, as I have formerly described, by making a compost of peat, animal manure and lime, in successive layers, so as to generate a large quantity of ammonia, which combines with the acid matters of the peat and also forms with the carbonic acid gas extricated a large quantity of carbonate of ammonia, which is absorbed by the peat, and is one of the most powerful saline manures.

Geate of lime alone is but little soluble, but is perhaps by that very reason retained more permanently in the soil and is gradually absorbed by the rootlets of plants.

Phosphoric acid generally exists in peat, and is by the action of calcareous matter converted into the phosphate of lime, one of the essential constituents of grain. Phosphate of alumina, as suggested by my scientific friend, Dr S. L. Dana, also exists in some soils, and by chemical reaction phosphate of lime may be formed and enter into the composition of the plants by absorption. Animal manures contain both the phosphate and carbonate of lime, and by fermentation carbonate of ammonia

is also formed, large quantities of which is lost in the usual mode of keeping barn yard manures uncovered and exposed to rain.

The loss of the saline matters of manures by *solution* and *infiltration* is vastly greater than is commonly supposed by farmers. The evaporation to which so much loss is attributed is but a drop in the bucket in comparison with that of solution. Some maintain that manures never penetrate beyond the depth of a few inches; but this is a great error. The most important ingredients, viz. the soluble salts penetrate the earth to enormous depths, and we find animal matters in the well waters of Boston, 150 feet below the surface. I know also of instances where deep well water, formerly free from saline and animal matters, became charged with them two years after the top soil had been cultivated and dressed with animal manures. Hence it is evident that since all the fresh water of our wells infiltrates from the top soil that the soluble salts, whether of animal, vegetable or mineral nature, will be dissolved and carried down by the action of water, and they are, as I know, easily detected in the water at great depths. Hence the value of a clay substratum in our fields where the soils are porous; and the facts coincide with theory as I have frequently had occasion to observe.

Saline matters act 1st, according to their nature as nutriments to the plants or by rendering soluble certain substances which are alimentary. 2d. By their stimulant and electro-motive power by exciting the irritability of the plant, and by producing electro-motive or endosmotic action in the spongioles and cellulules. 3d. By stimulating the foliage of plants to absorb a larger amount of carbonic acid from the atmosphere, the latter property being possessed by salts which are not in themselves nutritions.

Thus small quantities of sea salt, gypsum, sulphate of soda, nitre, &c., act in the latter mode, and they should never be put upon the field until the germination of the seed is completed, nor before the second leaves of certain plants put forth; nor should they be thrown on the soil at the time when the seed is about to ripen, since these salts act wholly upon the *foliage* and promote the absorption of carbonic acid, a gas which is necessarily given off during the ripening action. Hence but very small quantities of saline stimuli are to be used, and they ought to be spread broad cast in powder at the time of the first hoeing of the field, after the foliage has acquired some development.

I would also mention in relation to saline manures that we must be governed in a measure as to the application by considering the native *habitat* of the plants under cultivation, and the composition of the soils in question. It is evident that if we would cultivate plants of a maritime origin in the interior of the country that marine salt will exert a beneficial tendency. Thus asparagus is a well known plant of maritime origin, requiring the use of sea salt for its full development. Cabbages will also

require a small quantity of salt from similar reasons.

Grass lands in the interior have their crops much augmented and also improved in flavor, by sprinkling salt over the soil.

In short, whenever we wish most fully to develop the foliage of plants and to render them more rich and palatable to animals, saline manures may be advantageously used.

In central France some very satisfactory experiments have been made upon this subject by Prof. Le Coq of Clermont-ferrand, and he finds that common marine salt in the proportion of from 150 to 300 pounds to the acre, according to the soil, using most on humid tracts, exerts a most beneficial influence. He advises the application of saline manures in small quantities, applied at two successive periods after the first foliage and before inflorescence.

I shall have occasion hereafter to present the farmers with the result of this physiologist's researches, and have not time now to enter more fully into details, sufficient having been said to serve as data for experimental trials.

Lime is the most useful of all our mineral amendments to soils, and by proper applications it may be rendered of immense value to the husbandman. Our peat bogs, by easy operations, are capable of furnishing materials for replenishing the vegetable matters as they are exhausted, and of serving as absorbents to retain saline matters possessing great fertilizing powers. I have an abundance of facts on this point, and numerous chemical analyses of soils, showing the improvements which are to be made in their cultivation. They are, however, too numerous here to recapitulate, and they will be fully stated in my Third Annual Report on the Geology of Maine, now ready for the press.

I congratulate you and the country on the new impetus which agriculture has received in its progress, by the combined researches of enterprising farmers and their scientific co-laborers. All important as is this greatest and first of arts, it cannot fail to delight every philanthropist to discover undeniable proofs of its rapid advancement and increased respectability as a department of human labor.

The time will come when distinguished scientific farmers will hold a high rank in the consideration of mankind, a rank belonging to them not only for their practical improvements, but for the elevated standing which they give their noble art.

Rural labor will be sweetened by the refined pleasures of science, and the field will present to the opened eyes of the farmer new worlds to conquer, while his own intellectual and moral powers will be enlarged and improved by the contemplation of phenomena at once revealing *supreme intelligence, unbounded goodness*, attributes of DIVINE POWER everywhere present in nature and calculated to excite our admiration and love.

Yours most respectfully,

C. T. JACKSON.

[For the New England Farmer.]

Dedham, April 1, 1839.

MR EDITOR—In the communication below there is a notice of the *Morus Erpansa*, by my friend, D. Benedict, Esq., of Rhode Island, to whom I sold a variety of mulberry trees last fall. I have never had any personal experience with the *Morus Erpansa*, but as a tree suited to our New England cli-

mate, I believe it has high claims, which will be noticed in my future publications.

Respectfully your friend and serv't,

J. H. COBB.

J. H. Cobb, Esq.—Sir: The last edition of your Silk Manual I have perused with interest and satisfaction, and most cheerfully recommend it to all who are desirous of information on this new and interesting subject. Your account of the origin and character of the different kinds of mulberry trees, especially of the far-famed *Multicaulis*, is new and interesting. But there is one variety of trees, and in my opinion, one which in the end will be found the best of the whole, not excepting the exuberant *Multicaulis*, especially for northern latitudes, I was surprised to find you have entirely omitted. As there are but few of them yet in the country, it probably has not come under your observation, as it was not familiar with me until less than a year ago.

The *Morus Erpansa* is the botanical name of the tree to which I refer.

Late last spring, by the recommendation of William Prince & Sons, and as a matter of experiment, I took a hundred of them from their nursery, which the year before were imported from France. They had stood in Prince's garden one winter, and the same in pine, without any shelter or protection, and all have lived as well as our native trees. In one season some of them grew from four to about eight feet trees, and to all appearance they will grow to any height desired. The leaves are the largest of any variety which I have seen, except the *Multicaulis*; they are very glossy and thick, and very agreeable to the worms. I fed worms enough the past season to grow upwards of three hundred pounds of cocoons, and in the course of my feeding, used all the varieties of leaves at present grown with us, and none of them were eaten more greedily or cleanly than those of the *Morus Erpansa*. I intend to increase my stock of this variety, and am fully satisfied that as their superior excellence is known, they will become favorites with the cultivators of the mulberry tree for permanent use, as none of the precautions are needful for this species of tree, which the *Multicaulis* in cold regions now does, and in all probability will continue to require. From what country or latitude the tree originated, or when it was introduced into the country, I have not yet ascertained. As you are a student in these matters, in your next edition which I hope may soon be called for, you will confer a favor on the public, to give this excellent tree a place in your historical detail, and call their attention to its superior claims.

Yours, respectfully,

DAVID BENEDICT.

Pawtucket, R. I. March 22, 1839.

We proceed in the publication of Premium Farm Reports—intending to give them to the public with as much despatch as the state of our columns admits. They will be read, we are persuaded, with much interest. We give them without regard to any order, as is most convenient; but we shall very soon wind off the worsted. The subjoined account is from Mr Fay, in Southboro', who received a gratuity of fifty dollars.

H. C.

A Schedule of Peter Fay's Farm, situated in Southborough, in Worcester county, Mass., 1838.

Question I. Answer—one hundred and fifty acres.

2. It consists of loam, gravelly loam and gravel, and the under stratum a clay gravel.

3. The best method of improving my land—the plough is decidedly the best.

4. I till about eighteen acres, and I put twenty-five loads of manure to an acre on that which I plant with corn and potatoes.

5. I apply it both in its long or green state and in compost.

6. I do both spread and plough in the manure put upon fields to be planted with corn and potatoes and also put it into the hills.

7. My method of cultivating green sward is by ploughing it at any part of the year and of frequently harrowing the same the year previous to its being planted.

8. I mow from thirty to thirty-two acres of upland and averaging two to two and half tons to an acre.

9. I irrigate about four acres, commencing about the first of May, and allow the water to flow about one month, and I think I get about one-fourth more in quantity, and the quality not as good.

10. I do manure the land that I irrigate, and a part of my other land that I mow, once in two years, and I put twelve loads of compost manure to the acre.

11. I have mowed about ten acres of land not suitable for the plough, and the quality of the hay very ordinary, and producing more than five tons upon the same present season.

12. My method of reclaiming my low land has been to dig out the stones and then to smooth or level the same, and give it a top dressing of loam or gravelly loam or gravel and then compost manure, and by seeding of herds grass, red top or clover, and roll in the same. On bog or peat meadow I never have performed any operations.

13. I have planted nine acres of corn the present season; my method of preparing the ground has been, of ploughing the same fine in the spring, then harrowing it, then carting on my manure and spreading it, then ploughing in the manure fine, and then rolling the land where it will admit, if not bushing it. Six acres of it I have cultivated in this way, by putting ten loads of long or green manure to an acre, and fourteen loads of compost manure in the hills, and planted the same in hills three feet and six inches apart each way. And on the three acres in addition to the ten loads of long or green manure to an acre, I spread fifteen loads of compost manure to an acre by putting the loads between the long or green manure, and ploughing in the same and not manuring it in the hills; hills four feet and six inches apart from east to west, and three feet apart from north to south. I soaked about one half of my corn in water about twenty-four hours and rolled the same in gypsum; the other half I planted dry without any preparation. When I planted my corn I put a table spoonful of gypsum into each hill, and when the corn had come up I put six bushels of wood ashes, lime and gypsum around the corn upon the hill, in the proportion of one half ashes, one fourth lime and one fourth gypsum to an acre upon the said nine acres. I used the cultivator instead of the plough among my corn and hoed the same three times, and made the hills of a small flat form.

14. I have planted five acres of potatoes the present year, four acres of which I ploughed the land fine in the spring, then harrowed it, ploughed it the second time fine, then spread twenty loads of compost manure on the acre and harrowed it in,

furrowed the ground four feet and six inches apart north and south and three feet apart east and west, and planted them the first week in May, when the ground froze every night, and on the north side of the wall the ground did not thaw through the day; when I planted the potatoes, I put a table spoonful of gypsum into each hill, and when the vine made its appearance through the ground, I put twelve bushels of wood ashes, lime and gypsum on the hills in the proportion of one half ashes, one fourth lime, and one fourth gypsum; I ploughed and hoed them three times. The produce was one hundred and sixty bushels to the acre. The kinds, a part of them a red potato called among us here the Rutland, and a part of them were the blue potato: the soil a gravelly loam.

The one acre was a green sward ploughed in about the middle of May, this spring, then harrowed the land and spread twentyfive loads of long or green manure to the acre, and planted it in rows three feet and six inches apart each way; ploughed and hoed the same twice: the soil was a gravelly loam: the produce one hundred bushels to the acre. The hot and dry weather in the month of August, was very severe with my potato crop upon both fields, and the product not half of an usual crop. The kinds of potatoes were the same as planted upon my other field.

15. I have among the corn in one of my fields of about three and a half acres, the English turnip, where my corn was very much injured by the crows, and the growth is extremely promising, but I have not harvested them now.

16. None this year of winter grain; of spring grain three acres and three quarters. The ground was prepared by ploughing it fine, then harrowing it, then cross ploughed it, then rolled it, sowed the grain and got it in with the cultivator; put no manure upon my land in the spring; the land the season previous having been planted with a potato crop; sowed two and a half bushels to an acre. My grain was all of wheat of the Black Sea kind, except one half bushel, and that was of the Italian; the soil of a gravelly loam of a hard pan bottom; my method of preparing the grain was by washing all the foul seed therefrom, then put the grain into baskets and let it drain until dry, then put the grain into tubs and soaked it in as strong a solution of salt and water as could be made to dissolve in the water at a heat of one hundred and twenty degrees, and soaked the same ten minutes, then took it out upon a floor and raked in as much of dry lime as would adhere to the grain. When the grain was up about three or four inches in height, I sowed eighteen bushels of wood ashes, lime and gypsum, in the proportion of one half ashes, one fourth lime and one fourth gypsum to an acre; this dressing is highly valuable to the wheat crop and to the succeeding crops of grass, and visible for a number of years, and one of the cheapest and best manures used.

The half bushel of Italian wheat was sowed upon the same field side by side of the Black Sea wheat, and the same process of preparing the land and seed was had as with the Black Sea wheat, and the produce was about the same with the Black Sea wheat, and the crop when ripe for harvest was one week later than the Black Sea wheat. The crop of both kinds was twenty bushels to an acre, and the last year I raised thirtyfive bushels to an acre of the Black Sea wheat; my wheat was sown the last week in April.

17. I have laid down three acres and three

fourths of an acre to grass the present season; I sowed the seed on the first day of May; my usual practice of seeding is, half a bushel of herds grass, one peck of red-top, and ten pounds of clover seed to an acre, and I sowed the same quantity this year; and was sown with the grain crop after the grain was got in with the cultivator and then rolled in.

18. The means and manner of collecting and making manure, are from my cattle and hogs, and by digging the loam out from undermy walls where I new set them or make new walls; the loam and sand beside the roads and from loam pits in my pastures, and the same carried into my barn yard.

19. I keep six oxen, twenty six cows, no young cattle, two horses, sheep none. One of my barns is 84 feet long and 30 feet wide, one other barn 50 feet long, 36 feet wide, and 20 feet posts, and a cellar under two-thirds of the same; one-third part of said cellar occupied for my hogs to lie under in the winter. Manure not covered.

20. My cows are all of the native breed.

21. I have raised no calves. I have fattened all my calves for the market this year and for several years past; I have fattened 37 calves for the market this year, which have brought me at my house \$317; but I am convinced that I am pursuing a wrong course, and I intend to raise ten or twelve of my best calves yearly in future.

22. Of butter I have made up to the 15th day of October the present year, twentyfive hundred pounds, and of cheese only for my own consumption, six hundred and fifty pounds of two meal and four meal and none of new milk.

23. Of swine I have on hand three old ones and twentytwo pigs; I intend to fat the three old ones and seventeen of the pigs, and keep five of the pigs through the winter for breeders; my swine are all of the native breed, and I make my pigs weigh on an average at ten months old, when dressed for the market, three hundred pounds, and have for many years past. I fattened seven thousand and one hundred pounds of pork the last year, and sold six thousand and five hundred pounds of the same, which brought me six hundred and fifty dollars.

24. I feed my swine through the summer upon the skim milk and whey from my dairy, and give them no meal in the summer; I fat them upon corn and potatoes; I boil my potatoes and mash them fine and make the composition in the proportion of one bushel of potatoes and half a bushel of meal, and keep my hogs dry and warm, and keep them well littered with straw, which is of the utmost importance in the fattening of hogs.

25. I have a yard in front of my barns, 100 feet in length by 75 feet in depth, where my cattle and swine all yard through the summer and winter; and I get from 300 to 400 loads of manure a year from the same, meaning all that I make of long or green manure and of compost. The materials are of loam, sand that I cart into the yard in the autumn after I have taken the manure out, and of meadow hay, straw and corn stover that I throw out into my yard for my cattle in the winter for them to pick over. It is decidedly the best way that cattle and swine be yarded together for the making of manure.

26. I employ upon my farm three men for eight months, commencing on the first of April, and one man in the winter, and one man three months by the day; I have paid fourteen, sixteen and seventeen dollars by the month for the eight months, and

from five to six shillings by the day, and boarded said men.

27. I have five hundred of engrafted apple trees and from two to three hundred trees not engrafted.

28. I have 42 pear, 35 peach, 25 plum, 14 cherry, 8 apricot, and 4 almond trees.

29. My trees have never been attacked by the canker worm, to my knowledge; the borer has destroyed one apricot tree and four or five apple trees; I have not taken any means to destroy them.

30. I do not use any nor allow any ardent spirits on my farm, and have not for the last five years.

[For the New England Farmer.]

STURBRIDGE, Feb. 12, 1839.

MR EDITOR.—As it is a pleasure for farmers to communicate their ideas to each other, I think it is a great benefit and even a duty we owe to each other to gather up all fragments that nothing be lost. I offer you two short articles for publication, if you think them worth notice.

1. *On the Culture of Cabbages.*—About thirty years since the snow fell a considerable depth, early in the season, without much frost in the ground, and continued on the ground until late in spring, and many of the cabbage stumps in my cabbage ground lived through the winter. In April I ploughed the ground, turning in the old stumps. The first of May I began setting out early cabbage plants, and finding many of the old stumps had sprouted, and one of the red kind in particular; the sprouts had the appearance of a plant grown from the seed.

I examined and found the sprout came out of the stump very near to the root, while others farther up the stump were in a situation soon to blossom. I broke off all but the one nearest the root, and cultivated that in the way I did the other plants. In the fall I had a very large and handsome head. I carried it into the cellar, and set it out the next spring with the same success as before, and then continued setting out the same stump with others with it, two years more, from all which I had good heads.

I have set out stumps, occasionally, ever since, and always had good heads; therefore, I recommend it to the public as a good practice for raising cabbages for early fall use. I find in this method most kinds, except red cabbage, will be too early to keep through the winter.

My method is to cut them off near to the roots, leaving three or four eyes on the stumps, and set them out early in the spring, setting them in the ground slanting, say a slant of fortyfive degrees, then cover the end of the stump quite over with loose mould; when the sprouts get to the height of three inches, by pulling open the leaves you may easily ascertain those that will go to seed by the appearance of blossoms. Break off all of this description, leave only one without the appearance of blows and you will be likely to have good cabbages.

I have good red cabbages in my cellar this day raised by the method above described.

GARDINER WATKINS.

EARLY POTATOES.—The Easton (Maryland) Gazette notices a sample of forward Irish potatoes, grown this season, in the open ground, and now fit for use.

SERICICULTURE.

Ma BRECK—I enclose a translation of an article from the Propagateur, of Rodez, on a disease which prevails in France among silk-worms, called the *Muscardine*, and another in relation to the *movable tables*, for magnaneries, invented by Mr Vasseur, which is considered a very important addition to those establishments. I regret that there was not a description of the tables given, for it may be very desirable to adopt them in this country. The discovery was first made known, and its advantages tested, last summer; but so ample is the testimony in their favor, that there does not appear to be a doubt, as to the great benefit, which has thus been conferred upon the cultivators of silk. I have written to a gentleman in Paris, to obtain and transmit to me, a particular description of the movable tables, and shall hasten to communicate the information I may receive.

The culture of the mulberry tree and the rearing of silk worms having excited unusual attention in France and Italy, within a few years; numerous works have been published on those subjects, and the authors have found it convenient to adopt the appropriate and expressive term of *Sericiculture*, as including whatever relates to both of the branches of that rural industry. It is derived from *Sericum*. The ancients being ignorant of the exact mode in which silk was produced, and having received it from the *Seres*, a people who inhabited that indefinite portion of Scythia, which they called *Serica*, but which is now known as China, the Romans gave the name of *Sericum* to that precious material.

This word having been used in the articles translated from the Propagateur and which appeared in the Farmer of the 27th ult. as well as in those which are annexed, the above explanation has been deemed necessary.

Very respectfully,

Your most ob't serv't,

H. A. S. DEARBORN.

Huethorn Cottage,
Rozbury, March 29, 1839.

THE SILK WORM.

The contagious disease called the Muscardine, examined by Mr Audouin of the Institute.

The short visit which Mr Audouin recently made to our city, has been beneficial to the amateurs of natural history, and still more so to agriculturalists, to whom he has given information, as to the best means to be employed to prevent the ravages to their grape vines by the *Pyralis*. This learned professor, who has devoted his attention to insects which are injurious to agriculture, has made the most curious researches in relation to a contagious disease, which frequently occasions the destruction of all the silk worms in a magnanery. The culture of the latter being a recent branch of industry, in our department, and where it is destined to advance, we shall endeavor to give an analysis of the ingenious experiments, which have been undertaken by Mr Audouin, for discovering a fact in natural history, which is not only very curious, but fertile in the most important results to those, who are engaged in rearing silk worms.

There exists a disease called *Muscardine*, which successively attacks all the silk worms in a magnanery, and is transmitted from one to another. The nature of this disease, its development and propagation, has long been a mystery, which it has

often been attempted to solve, but the veil has now been rent, as will be perceived by relating the experiments made by Mr Audouin.

What is the nature or real cause of the disease called the *Muscardine*?

The cause is the development of a vegetable which establishes itself as a parasite, in the subcutaneous tissue of the worm, and occasions its death in a few days, when the numerous filaments which it sends out, have filled and interlaced, with an inextricable net-work, all the oleaginous tissue of the insect.

What can be more astonishing than this vegetable, which is produced at the expense of an *animal, living body*, and ultimately perishes by causing the death of that very body in which it grows. It is an entirely new species, and appears to be placed in some manner, between the animal and vegetable realms.

This plant, which is of the genus *botrytes* (*cryptogamia*) is developed in the oleaginous subcutaneous tissue of the silk worm and rapidly extends its radicles, which branch off in a thousand directions. The worm perishes in six or seven days after being inoculated with the disease. The dead worm is, at first, soft and flaccid, soon becomes stiff and is covered with a white mealy dust, which is nothing more than the sporules or seed of the plant, supported by little stems which have pierced the pores of the skin. These sporules or seeds are so many germs of new plants; and being absorbed by the healthy worms, soon develop among them new plants, which is called the disease.

Let us come to the proof. Mr Audouin took on the point of a needle some of this white dust, which covered the body of a dead worm, with which he inoculated under the skin, another worm, as well as a chrysalis and a perfect winged insect, each of which in their turn, were covered with this white dust, being the fructification of the plant with which they had been inoculated.

This cryptogamia does not grow after the death of the insect, but only during its life, and causes the death of the insect by the development of its roots; and if this white dust does not always appear after the death of the insect, it is because the vegetable had not acquired sufficient maturity to produce its sporules or seeds. The whole progress of the growth of the vegetable can be seen by the aid of a microscope, in the insect which has been inoculated with the muscardine. The numerous radicles are multiplied from day to day; the oleaginous globules and the trachea gradually disappear and are replaced by the roots from which rise up, after the death of the insect, through the pores of the skin, little stems, and exhibit the sporules in the form of white dust.

It was not sufficient for Mr Audouin to have proved by repeated inoculations, that the muscardine was contagious, and that it was occasioned by the development of a vegetable—he has proved that it can be spontaneously produced, in all places, when certain circumstances are united to favor its development; it is thus that the larva of the *saperda* [Longicornus; the capricornus of Linn.] placed in situations filled with humid moss and submitted to various temperatures, have been spontaneously infected with muscardine; from whence he concludes that this disease is not peculiar to silk worms, but can be propagated from the silk worm to other insects, and *vice versa*; and that in all these transmissions, the cryptogamia and the

disease which it produces, undergoes no change. In fact the vegetable can be reproduced, not only by sporules, but even in an artificial manner, by grafting certain parts of it, as its roots for example, upon the oleaginous tissue, and which extends itself much more rapidly by this mode of infection, and produces a much more sudden death than by the sporules.

This disease being now so well known, the means for protecting the silk worm from its ravages may be easily provided. First, it is necessary to prevent the atmospheric circumstances which produce it in the magnaneries; that is to say, a humid temperature, passing alternately from cold to hot; second, all contact between the healthy and diseased worms is to be avoided; third, sprinkle with the sulphate of copper the tables, shelves, or whatever else the diseased worms have been in contact with—a process which was introduced by Mr Berard of Montpellier; and be particularly minute in attentions to cleaning.—*Extract from the Journal of Charente Inferieure.*

L. S.

Member of the Society of Natural Sciences at Rochelle.

FACTS IN RELATION TO THE NEW PROCESS OF MR VASSEUR, OF CHARMES, IN THE DEPARTMENT OF ARDECHE.

Valence, July 18, 1839.

The Agricultural Society of Drome, at a meeting on the 16th of this month, at which the Prefect presided, Mr Vasseur, of Charmes, was called upon to present the proofs, of what he had publicly advanced, in relation to the education of silk worms, which was done, and they were so conclusive, that there no longer remains a doubt that the results hitherto considered incredible, which were obtained, was in consequence of the substitution of movable tables.

The cocoons produced from the eggs of Dauphine, which required only 132 to make a pound, have yielded in the steam filatures of Messrs Blanchon father and sons, in Chomerac, at the rate of one pound of silk for ten pounds seven ounces, or 1369 cocoons. Those obtained from Italian eggs, 173 of which weighed a pound, yielded, in the steam filature of Mr Demichoux, in Flanac, a pound of silk from eight pounds two ounces, or 1405 cocoons. The leaves consumed were in the following proportions: the silk worms of Dauphine made from 1272 pounds a quintal of cocoon; those of Italy consumed only 1200 pounds of leaves for a quintal. Mr Vasseur has deposited with the officers of the society, samples of the silk, and letters from the able proprietors of the filatures which we have named.

These results are immense. They establish this fact; that the cultivators of silk have not produced half as much as may be obtained from their magnaneries. In the steam filatures, about 3000 cocoons are required for a pound of silk, and Mr Vasseur has obtained the same quantity from 1369. There is, consequently, a result in favor of the cultivation; which shows a gain of half the quantity of leaves, of labor, space, and expense of all kinds, besides the advantage derived to the proprietors of the filatures, who obtain a more beautiful quality of silk, with a great economy in labor, as 1369 cocoons are reeled in less time than is required for 3000. This is the principal point of view in which the discovery of the movable tables should be considered,—an invention which enables each worm to produce double the quantity of silk which has hitherto

erto been obtained. Mr Vasseur has designated the persons who furnished the eggs of Dauphine and Italy. They have reared silk worms from the same kind of eggs in the old manner, and both had complete success, but still, the weight of the cocoons and that of the silk was much less.

By this augmentation of product, the income from that branch of industry in France will be doubled. How important then is this invention, if the experiments of the next year shall remove all doubts upon the subject; and we know that the experiment will be extensively made, for the proprietors of estates in the Departments Drome, Ardeche, Isere, and Van have determined to adopt the apparatus of Mr Vasseur.

But it is not necessary to wait until next year to be assured that there is gained at least 75 per cent. in the space which the worms occupy, besides the saving in labor, while the attendants perform all that is required to be done, in feeding and managing the silk worms without changing their position, and the ventilation is as perfect as can be desired.—*Extract from the Courier of Drome and Ardeche.*

CORRESPONDENCE.

We are very happy to lay before our readers the subjoined correspondence. We do not know who 'Agricola' is, but his letter shows an inquisitive and intelligent mind, which always augurs well for improvement. Indeed without it there can be no improvement. Our respected correspondent who replies to him, deems his language harsh and his tone rather imperative. As far as it can be ascertained, we are to judge of things of this sort by the temper of mind from which they proceed. Now the language might have been more courteous and yet need not have lost anything in strength; but still we do not believe any offence was intended or thought of. We are so selfish that we should have been willing some offence should be given, if nothing short of this tone would have brought out the excellent reply which is here subjoined. It is directly to the point; and confirmed as it is by practice as well as theory; by long experience and most careful and intelligent observation, we cannot doubt that it will be received, with the particular attention which it justly claims.

H. C.

TO THE EDITOR OF THE NEW ENGLAND FARMER:

Sir—In the "Report of the Committee of the Massachusetts Agricultural Society on Farms," printed in the New England Farmer of the 20th instant, there is a statement or recommendation by the committee, which is unintelligible to me, and which one of my agricultural friends was unable to explain. It is this: "Turn over sward land in May, and manure it with compost, which is to be mixed with the soil by the harrow or cultivator. If the first crop be corn, the second should be potatoes or roots, followed by wheat or rye, with grass seed, or with grass seed alone. During all this, the sod should not be disturbed, and no other ploughing but the first turning over of the sward. By this method there will be a great saving of labor, there being but one ploughing for two crops, and laying the ground to grass." Here is a course of cultivation for three years, during all which time the ground is to be ploughed but once, and that before the first crop only. It may be possible, though not a little difficult, to plant potatoes and cover them

with the hoe alone, without any previous preparation of the ground, in the spring of the second year; but I know not how root crops could be sown without such preparation. The difficulty of sowing the wheat or rye with or without grass seed, the third season, will be still greater, inasmuch as the ground would be harder from the effect of the winter's rains and snow; the grains or seeds might indeed be scattered on the surface, but they would never get under it so as to vegetate. If the committee have any process in view to take the place of ploughing, harrowing, &c., it ought to have been stated. The recommendation contained in the report is so manifestly absurd and impracticable, that I think something more must have been intended, and hope that the wanted information will be forthcoming, to enlighten those who do not know how to take things for granted which are not expressed in clear and distinct terms.

Yours,

AGRICOLA.

[For the N. E. Farmer.]

MR BRACK—Your correspondent 'Agricola' appears to meet with some difficulty in comprehending the recommendation of the committee of the Massachusetts Agricultural Society on Farms, in relation to the ploughing and management of green sward. The committee are charged with recommending a course of culture "manifestly absurd and impracticable." If there be any pleasure greater than that of receiving information, it is that derived from a communication of it to others; and I shall not, therefore, allow my feelings to be so far disturbed by the peculiar language used by "Agricola," as to deprive me of that pleasure. I will only say that it would seem to me to be a course more consistent with candor, to examine a subject with which he professes not to be acquainted, before denouncing it as absurd and impracticable; and further, that harsh and uncourteous terms furnish no aid either in eliciting or defending truth.

I am willing to acknowledge that the error of not being sufficiently explicit, is one which is not unfrequently made by those who undertake to communicate information on subjects with which they themselves are perfectly familiar. They are too apt to forget that a more particular and detailed account of any process they may recommend, is necessary to enable those less acquainted with the subject to understand it.

The writer of the "Report" had for many years pursued the course therein recommended in relation to the management and culture of swarded land, and had again and again communicated the particulars of the process, as well as the results of his experiments, to the public. He might therefore be, in some measure, excused for not treating the subject as one entirely new and for the first time broached to the public. The explanation, however, demanded by "Agricola," I will give with pleasure, glad of any apology for repeating what I have so often stated, while there is a single farmer in the community by whom the subject is not fully understood. Such has been the almost magical effect upon our wasted and worn out fields, of turning over the green sward and keeping it undisturbed during the rotation of crops, that I know not how I can render a more essential service to my brother cultivators of the soil, than by enforcing its claims upon their attention.

"Agricola" supposes it will be "difficult to plant potatoes and cover them with the hoe alone, without any previous preparation of the ground in the

spring of the second year," and "the difficulty of sowing the wheat or rye the third year, will be still greater," &c.

In preparing the ground for a second crop nothing more than the cultivator or harrow is necessary, and these to be used in such a way as not to disturb the soil. These will furnish a great abundance of matter for covering the potatoes. The decomposing sod which is kept down, will be found on examining it in the second or third year of the course, to be exceedingly mellow and lighter than it could possibly be made by the plough, and to be filled with the roots and giving nourishment to the plants. Now then, if the vegetable matter and the light vegetable mould which are turned and kept under, keep the sod mellow, and all above is well stirred by the cultivator and harrow, where is the difficulty of finding earth to cover the potatoes planted or the wheat and rye that is sown? In this way the whole mass is kept mellow to the depth of the first and only ploughing, and in fine condition for the growth of corn, potatoes or wheat, and particularly so for what is termed a "root crop." If desirable, I can see no objection to the use of a light horse plough in the second and third years' cultivation, provided the plough does not go so deep as to disturb the sod. I have, however, always found the cultivator and harrow sufficient for the purpose of pulverizing the top.

Lerington, March 26, 1839.

THE CROW AND THE WIRE WORMS.

MR COLMAN—Dear Sir—In the Farmer of the 6th, I see you insert a very interesting letter from a gentleman of West Needham, giving an account of his success in raising the Dutton corn. The destruction of a large portion of his crop, by the wire worm, brought to my mind a fact which I not long since had from an observing gentleman of Maine.

Some years ago he noticed a field of grass which lay between a sandy gullied road and a river, to be completely destroyed by the ravages of what he called the wire worm. The whole roots of the green sward were eaten off, horizontally, just below the surface, so that the turf might be rolled off as in winnows. He observed the destruction with much curiosity and some apprehension, as his own fields lay close by, on the other side of the road. Day after day, as he rode by, he scared up from the sloping sides of a gully that ran between the ruined field and the road, great numbers of crows, who, as soon as he had passed, immediately settled on the same place again. He also watched the fields on the opposite side, but was gratified and not a little relieved, to find no traces of the worms there among the grass. Apparently they never crossed the road. After a while, there were no worms to be found, and no crows to be scared from the sides of the gully.

Very truly yours,

PHILCORAX.

LARGE RETURN FROM ROHAN POTATO.—Mr Ebenezer Stedman, of Newburyport, purchased of J. Brack & Co., at the Agricultural Warehouse, the last spring, five pounds of Rohan Potato. He planted them in hills, four feet apart, three eyes in a hill. He thinks two eyes would be enough. He states that from these he raised 525 lbs. At 20 cents per lb., the present price, his crop is worth \$105 00.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, APRIL 10, 1839.

AGRICULTURAL MEETING.

The twelfth Agricultural Meeting, and the last for the season, was held on Tuesday evening, 2d inst., and was fully attended, the interest in these meetings having been kept up until the last; and a strong wish expressed that they might be renewed another season. We have neglected to give a full report of the two former meetings; and we can now do no more than to gather up the fragments which remain, that nothing be lost.

At the tenth meeting the subjects of discussion were the cultivation of fruit trees, and the application of fruit to the feeding of stock. Two or three gentlemen detailed fully their experience; and of this we shall attempt to record only the most material facts.

Mr Stone, of Watertown, well known as an experienced and successful cultivator of fruit, went largely into the subject; and was examined and cross-examined with no small measure of legal acumen by several gentlemen present; and as closely as almost any witness that was ever brought upon the stand. He showed himself fully possessed on the subject, and communicated much valuable instruction.

Mr Stone spoke of having been for years accustomed to feed apples to his stock. He had sometimes made from one hundred to one hundred and fifty barrels of cider in a year; but having been disappointed in the market for his cider, he had given of late his apples to his stock. He had often fed out in a season from 1000 to 1200 bushels. The apples which he has been accustomed to give his cattle consisted principally of sour russetings, Baldwin, and nonesuch. They were the refuse after those, which were fit for the market, had been selected. His orchards consist mainly of engrafted fruit, with some common cider apples.

The apples are given raw. When the cold weather comes on they are put in the barn or the mill-house and sufficiently covered with salt hay to protect them from the frost. To his cows he usually gives one bushel per day; to his horses one peck at night; to his oxen as many as they are disposed to eat. In this way he considers his apples of equal value for feed as potatoes, bushel for bushel. The effect was that the cows under this feed increased their yield of milk; and he made from them more butter from November to January than at any other season; and they held out their milk well. His cattle never appeared better than on this feed; and they continued to improve as the season advanced. His cows became fat, and they had nothing but apples and hay; usually they had one feed of rowen per day; and for the rest of the time salt meadow or common swale hay. In one case he fattened a yoke of oxen upon this feed exclusively; and he thinks never with more success. In one instance he kept a cow in this way and sold her in February for seven and a half dollars per hundred lbs. He has found them equally beneficial to swine, which he has very successfully fattened upon sour apples with a small amount of slop or swill.

Mr Brigham, of Westboro', gave next his experience of the value of apples as feed for stock. Four years since he came in possession of an orchard, the fruit of which was fit only for making cider. He was then faithless in respect to the value of apples for feeding stock. He purchased six shoats and kept them four months upon sour apples. These apples were boiled.

For the first week his swine lost flesh; after that time they continued to gain flesh and in four months doubled their weight. He has not been able however to fatten his swine upon them; but he has never fed them to his swine raw. He takes pains to assort his apples and feeds upon them until the first February. His stock will not eat them raw after having been accustomed to them cooked. With a small proportion of meal added he has found them highly useful. He has fed his cows successfully with apples. He tried first one cow, which he fed twice a day with sour apples. In three weeks after he added another cow and then another. The milk and cream were much increased and the butter improved. He has fed apples for two months and a half to a dairy stock of sixteen cows; and greatly to advantage in respect to the cream and milk. He usually gives out from 500 to 700 bushels; and his allowance to his cows is half a bushel per day each. He does not estimate them as highly as potatoes. He thinks he can give with safety to a cow as many apples as she will eat; but it is not so with potatoes. Sour apples, he thinks, should undergo a fermentation before they are used. He thinks all feed for swine should be fermented; but he deems potatoes of double the value of apples for swine; for milk cows he deems apples of equal value as potatoes. He has never been accustomed to salt his apples for his swine, which some farmers deem important.

Other gentlemen stated their experience of the value of apples as feed for stock. This is a modern, and it must be admitted a very important discovery.

The opinions and experience of these two observing and practical farmers are certainly of great importance. We have many similar facts tending as strongly to the same point from various parts of the state, and they all go to show the advantages which are to accrue from cultivating more extensively, than ever yet has been done, this most agreeable, nutritious and valuable fruit. There are, on almost every farm, places difficult of or ineligible for cultivation, which might as well as not, without prejudice or inconvenience be appropriated to the cultivation of these fruits; and if, when produced, they are even half as useful as potatoes, the ease with which they are produced and the abundance in which they grow, recommend them most strongly to the cultivation of the farmers. H. C.

We have received from John Benson, Esq. a few Dillingham potatoes as a sample. They are the product of an eastern region, but we are not able to say whether from our own territory or Nova Scotia, or the territory which belongs neither to the one nor the other. There is no dispute however, about the quality of the potatoes, come from where they may. They are of the very first rate, and farmers would do well to try some of them for seed; though it is pretty well established if we would raise as good potatoes as are raised at the east, we must have the eastern latitude and the eastern soil. Potatoes in order to be of the first quality, require a cool and moist climate and a new soil. An article of such universal use, an indispensable on the tables of the poor and the rich, and furnishing as large an amount of human and brute food as can be grown upon an acre, cannot receive too much attention in its improvement and cultivation.

The Rohan potato is likely to maintain its character as far the most productive potato ever known; and from its superior quality, as we have tested, in soils not remarkably favorable to excellence of quality, there is reason to hope that, planted in some localities, it will prove of the very best description. H. C.

We shall give further reports of the proceedings of the last Agricultural meeting, but abstain at this time from deficiency of room. Dr Keep has promised give us his interesting and instructive remarks on carcasses manures, in detail and in full.

The Commissioner of Agricultural Survey has received, through the politeness of Gen. Dearborn, a gentleman disinterestedly and enthusiastically devoted to every work of public improvement, and to whom the horticultural and agricultural community are most largely indebted, the silk-worm eggs procured through Mr May and received by Capt Hunt. They are particularly mentioned in the N. E. Farmer of March 27th. They are but few in number, but he will take pains to distribute them in a way to accomplish the public-spirited view of the gentlemen who procured them. H. C.

EXPLANATION.

Some of our friends have inquired in regard to a remark in our last paper, respecting the cultivation of corn at the West, how one man could be expected to manage a lot of forty acres? We give the account as received on responsible authority, and not on personal observation. On the new lands at the West, they are not troubled with weeds, and no manure is applied. The sward is completely inverted, and the corn planted. After that no hilling is ever done, and all that is simeer at it, to keep the ground loose. A man and horse devoted to this object, would find no difficulty in going over such a lot of land many times in the course of the season with a cultivator, so as to maintain the soil in fine tilth. Nothing like this can be expected to be done with us; but an experiment upon a small scale, is exceedingly desirable.

The second Report on the Agriculture of Massachusetts, has been published by order of the government. Some few extra copies, printed at the expense of Messrs Joseph Breck & Co., and Weeks, Jordan & Co., may be found for sale at their respective stores.

CHINESE METHOD OF SOWING MULBERRY SEED.

The subjoined we received from an authentic source as the method practised in China for sowing and sowing the Mulberry Seed. At this time it will have a peculiar interest. H. C.

Directions for the Mulberry Seed by Ah-ho.—Fill a cotton bag with the seed, wet it with cold water, (not soaked,) and let it remain slightly wet; it will then sprout. Sprinkle the earth and proceed to sow it on the surface, covering it with a little drier tender grass. Should be two or three feet high before being transplanted.

PROFITABLE PIGS.—Pigs are as grateful as any other class of animals, for they give liberally in proportion as they receive. Mr J. C. Loomis, of Whately, slaughtered a sow in November last, which after having nineteen pigs in the course of five months, weighed four hundred eighteen pounds when dressed. One of her pigs, not ten months old, was recently slaughtered, which weighed three hundred and seventy pounds.

Mr Chapin, of Chicopee, sold his big ox which weighs 2800 pounds, to Mr Horatio Sargent, of Springfield, for three hundred dollars.

ERRATA.—We regret very much the occurrence of the subjoined errors in the address of the Hon. Mr. Wiley, in the last Farmer. In page 375, middle column, line 13th from bottom, for centering in read entering—the 53d from bottom, for Barnat read Bancroft. In read entering—the 53d from bottom, for the 53d, after page 300, first column, line 13th from top, delete—the 53d, after tenderly insert paternal. Middle column, line 15th, for scoldatic and folly, read and scholastic folly.

BRIGHTON MARKET.—MONDAY, April 8, 1839.

Reported for the New England Farmer.
 At Market, 205 Beef Cattle, including 25 unsold last week, 15 Pairs Working Oxen, 20 Cows and Calves, 5 Sheep, and 1175 Swine.
Prices.—Beef Cattle.—A disposition was manifested the drovers in the morning to obtain higher prices without much success. The market closed without such variation. We quote, First quality, \$8 75 a \$9 00, good quality, \$8 00 a \$8 50. Third quality, \$6 75 a 7 75.
Working Oxen.—We noticed several sales ordinary, \$8, \$8 2, \$90 and \$100.
Sheep.—One lot at \$4 50 and \$5 00, and one at \$5 00 and \$6 75.
Swine.—Several lots to peddle, large size, at 8 7-8 a 7-8. Also, at 9 for sows and 10 for barrows. Several lots of large barrows at 9; at retail 10 to 11 1-2.

THERMOMETRICAL.

Reported for the New England Farmer.
 Range of the Thermometer at the Garden of the proprietors the New England Farmer, Brighton, Mass. in a shaded northerly exposure, week ending April 7.

WINSHIPS'S BRIGTON NURSERIES,

AND BOTANIC GARDENS.
 Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c.
 Orders addressed to Messrs WINSHIPS, Brighton, Mass., will be promptly executed, and forwarded to any part of this or other countries.
 April 10.

GRAPE VINES.

150 Sweet Water Grape Vines.
 200 Isabella, " "
 150 Catawba, " "
 100 Black Hamburg Grape Vines.
 1000 Asparagus Roots.
 100 Early Wilmet Rhubarb Roots.
 200 Common

Also—Strawberry Plants of the following choice kinds: Iveshen Castle, Bath Scarlet, Hawthorn, English Wood, fourthly, &c. Raspberries, Franconia White and Red, gooseberries—Currants—Flowering Shrubs and Plants of all kinds supplied at short notice, by
JOSEPH BRECK & CO.
 April 10. 51 and 52 North Market Street.

Just received at the New England Farmer Office, the annual Report on the Agriculture of Massachusetts, by Henry Colman, Commissioner for the the Agricultural Survey of the State. For sale by
JOSEPH BRECK & CO.
 April 10. 51 and 52 North Market St.

NOTICE.

The subscribers, publishers of the Indiana Farmer, at Indianapolis, have in connection a Book and Seed Store and a field of eight acres adjoining for a seed garden; but wishing to devote their time and attention more exclusively to the interests of their paper and the printing business, they offer or sale their Garden and Book and Seed department, and to rent the store they occupy, favorably situated in the business part of the town.
 A person acquainted with the seed and horticultural business would find this a desirable location for a permanent establishment, not exceeded by any in the west. For further information inquire of the publishers of the New England Farmer, or of the subscribers by letter.
OSBORN & WILLETS.
 April 10.

A BULL WANTED.

Wanted a young Bull, of the short horned Durham breed, old enough to be used the present season. Apply to
JOSEPH BRECK & CO.
 April 10.

SAYLE'S GARDEN ENGINE.

For sale at the New England Agricultural Warehouse, Nos. 51 and 52 North Market Street, Sayle's Garden Engines. This Engine is a splendid article, and will throw a constant stream of water to the distance of 50 or 60 feet, with great ease, and in case of fire would be a good substitute for a fire engine. It is the most perfect article for the purpose ever introduced.
JOSEPH BRECK & CO.
 April 3.

WILLIS'S LATEST IMPROVED SEED SOWER

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing his seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Kuba Beans, Mangold, Watered Turnips, Carrots, Beets, Parsnips, Onions, Corn, &c. It is highly recommended by a great number of persons who have used it the present season. For sale at the N. E. Agricultural Warehouse and Seed Store by
JOSEPH BRECK & CO.
 April 3.

EARLY AND LATE PEAS.

For sale at the N. E. Agricultural Warehouse and Seed Store, a choice assortment of Early Peas, consisting of—
 Cedo Nulli, extra fine and Early Charlton, early.
 Knights' Tall Marrow, Early Warwick, do. do.
 Early Washington, Dwarf Sugar, eatable pods, Russell's Early Dwarf, Fall Late Marrow Peas, Bishop's do. do. Dwarf, do do. Early English Frame, Blue Imperial, Early Golden Hantspur, Woodford's Tall Marrow, Blue Prussian.
 In addition to our usual stock of Peas, we have recently received a few varieties of very superior Peas from England, viz:
 Marquis of Hastings, extra fine Marrow, Early White Warwick, early fine and, Cedo Nulli, very early, Waterloo Blue, fine large blue, Gronn's Improved Blue, White Scimitar.
 All of which are remarkably fine, and are considered as some of the most desirable varieties cultivated here or in England.
JOSEPH BRECK & CO.
 March 27.

FRUIT TREES, & C.

Pears, Plums, Raspberries, Roses, &c.
 The subscribers have recently received, per the Switzerland from Harve, a large assortment of the choicest varieties of Pear and Plum Trees, from one of the best Nurseries in France, together with a small Collection of superb French Roses, all in excellent order for transplanting, which they offer for sale at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street. The Pear and Plums are from 6 to 7 feet high, and will be sold at \$1 00 each.

MISCELLANEOUS.

ILLINOIS AND THE WEST.

We have already gratified our readers, as we have no doubt, with some extracts from the work under the above title. It is a book, which in a small compass, contains much useful information in an agreeable style; and from the interest now taken in this growing empire at the West, cannot fail to attract deserved attention. Being written from actual observation rather than compiled, it has a double value. It contains the actual impressions and observations of an observing and sensible man.

We extract some general remarks on the state of the society and provision for education in Illinois.

"A very false opinion of the literature and morality, as well as of the opportunities for education at the west, prevails to such an extent among well informed people at the east, that I deem it not inexpedient to devote a chapter to these subjects, by which I hope to promote juster and more favorable views. I suppose it is generally understood in New England, that the large towns and cities in Illinois and other parts of the west, are tolerably well supplied with literary men in all the professions. But it is as generally supposed that the smaller inland towns and villages, and especially the agricultural portions, are exceedingly destitute of talent or literature. Such, I know, was in some degree my own impression; and I well remember bearing a fifth-rate lawyer in Boston, who was making arrangements for quitting the place where promotion was beyond hope, speak of his expectations of success here in such a manner as plainly showed that he expected nothing less than a judgeship or a seat in congress: whereas he will find himself as much a fifth-rate lawyer here as in Boston. The truth is, there is as fair a proportion of talent in Illinois, as in any other State in the Union in proportion to its population. There are, it is true, but a very few minds of the highest order—men who are marked as the leaders of our republic, or stars of the first magnitude in the literary galaxy of America—but there is an unusual amount of very respectable, clever talent; there are a large number of men whose literary and classical acquirements fit them for every office, and would make them ornaments of any society in North America. Nor are they to be found alone in our larger towns; they are very liberally strewn over all the soil of this great and growing State. In traveling through the country, one will meet with a well thumbed and select library in the log cabin, and listen to discourse on any topic in that rude home which would give spirit and life to an assemblage in a Boston drawing-room. Already there is a sufficient amount of literary talent in Illinois to fill with ability and success any chair of professorship in any educational institution, or any office of trust in the gift of the people. But all this talent is not available. Much of it is withdrawn from active life, and is to be met but in the seclusion of agricultural life. Yet there is enough for any present exigency, and as the field of action enlarges itself, the whole ground will be covered by immigration, or the annual graduations from their own literary institutions.

Indeed, a man of respectable talents, coming from the east or south, finds here many and powerful competitors, and will have to work his way to favor or wealth in his profession, much as he

would elsewhere. It is true there is less competition because there is a wider field, the facilities are multiplied and multiplying, instead of being nearly exhausted, as is the case in the east. A young man of enterprise and a small capital, whether in law, medicine, engineering, surveying, or in the mercantile business, stands a much fairer chance to succeed in either here than any where east or south, because not only is his field larger and competition less, but new sources of wealth and power are developed every day, and more and more. But the same talent, tact and industry are requisite here as elsewhere. The difference is, he must succeed here, elsewhere he may.

Let no young man intending to pursue either of the above professions, set his face westward with the false impression that a small modicum of talent or education and a careless devotion to his business, will secure him either a competence or honor. He will suffer sad disappointment. On the other hand let no young man hesitate an instant, who has a fair share of talent and tact, and whose patience will enable him to endure, and disposition to prosecute, the labors necessary to success. He can but succeed—fame and wealth, with a fair proportion of enjoyment, are here in store for all such, provided all this be accompanied with an integrity of purpose which no temptation can seduce, and perseverance which no disappointment can overcome. I intend to devote a larger space to mechanics and farmers with hints to emigrants in general, in which will be found some interesting matter respecting labor, produce, prices, travelling, settling, etc. etc.

TRUE CHARITY.—One of the most beautiful instances of the considerate kindness of true charity with which we are acquainted, is that of the benevolent Dr Wilson of England. He once discovered a clergyman at Bath, who, as he was informed, was sick and poor, and at the same time oppressed with the care of maintaining a numerous family. In the evening he gave a friend fifty pounds, requesting he would deliver it in the most delicate manner, and as from an unknown person. The friend replied, "I will wait upon him early in the morning." "You will oblige me, sir, by calling directly." Think of what importance a good night's rest may be to that poor man."—*Christian Register.*

A Stockholm journal announces that M. Orgesson, a Swede, possessing extensive domains near Helsingfors, in Finland, has discovered a means of rendering peat as compact and hard as coal, so that it lights with great facility, burns without crackling, throws out a clear bright flame, and gives as much, if not more, heat than coal. The peat when prepared loses one-fifth of its weight, and three-eighths of its bulk, but gains the advantage of having the whole of its aqueous parts extracted.

Linsed Oil Meal. Teel Seed Oil Meal.

For sale by G. & H. STEARNS, who have removed to No 5 Merchants Row. 1m
March 27. -

PEAR TREES FOR SALE.

At the Pomological Garden, Salem, Mass., a good collection of Standard Pear Trees, all of which have been proved. They comprise the choicest of the old and new varieties.

Also—Scions of Fruit Trees.

Scions of a great variety of Apples, Pears, Plums, and Cherries, from bearing Trees, for sale by the subscriber.
April 3. ROBERT MANNING.

BUCK THORNS.

For sale at the New England Farmer Office by
April 3. JOSEPH BRECK & CO.

FRUIT AND ORNAMENTAL TREES, MULBERRY TREES, &c.**Nursery of William Kenrick.**

The Catalogue of Fruit and Ornamental Trees for 1839 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and Peachs now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeysuckles, Peonies, Dahlias and other Herbaceous Flowering Plants.
10,000 Cockspur or Newcastle Thorns.
10,000 Buckthorns.

Morus Mutilicaulis, and other Mulberries; the trees grown here and here, at prices fair, and varying with the size, and the quantity which may be desired.

Fruit and all other trees, when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston.

January 30, 1839.

PEAR, PLUM, & GRAPE VINES, &c.

1000 Pear Trees of the most approved kinds;
1000 Plum Trees, of the most approved kinds and extra size—many of them have borne the past season;
500 Quince Trees;
3000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hamburg, Sweetwater, Pond's seedling;
30,000 Giant Asparagus Roots;
5000 Wilmot's Early Rhubarb or Pie Plant, lately introduced.

Also—a good assortment of Gooseberries, Roses, &c. of different kinds;

All orders left at this office, or with the subscriber at Cambridge-port, or in Mr Lynch's baggage wagon box, at Gould & Howe's, No. 3 Panel Hall, will meet with immediate attention. SAMUEL POND.
March 27. Cambridge-port, Mass.

HO! FOR ILLINOIS.

To a first rate man, well acquainted with trade, who can command a ready capital of from \$2,000 to \$5,000, who is desirous of locating himself in one of the most beautiful and healthy situations on Rock River, in Illinois, where he can join a New England Colony, and engage in Mercantile and Agricultural pursuits, with a rare prospect of success, a first rate opening offers itself, and may be heard of by addressing a line (post paid) through the City Post Office, to
X. Y. Z.

N. B. An exchange of Western property, for real estate in New England, a good stock may be effected.
March 27. 3w

MAN AND BOY.

Wanted a man who is acquainted with vegetable and fruit gardening; he must be of good moral character, active, constantly industrious, and a temperance man—he is wanted for the season, and perhaps he can secure a permanent situation.

Also—A good boy, he must be willing to give his whole time and attention, and he will be thoroughly instructed in the business—he must produce good recommendations—none other need apply.
March 20.

FARM FOR SALE OR TO LET.

The subscriber offers for sale or to let, a farm situated on Charles River, in the north part of Newton, and near the Newton Chemical Works. It contains fifty acres or upwards of good land, and has on it a good house and other buildings. Its pleasant situation on the bank of the river renders it a desirable place for a country seat, or its vicinity to the Waltham Factories an excellent location for a market or vegetable farm. Forty acres can be added to the above, if desired.
March 13. 4w+8 SETH BEMIS, Watertown.

FARM FOR SALE.

For sale a valuable farm, situated in Newton, half a mile from the Upper Falls Village and ten miles from Boston. The farm comprises about 100 acres of land, one third of which is covered with a thrifty growth of wood and fencing timber. It has a good well of water, besides a never failing brook which passes through the farm. The buildings are of ample size, and in good repair. A lot of about ten acres of the land near the buildings, is on a level plain of superior quality for the growth of the mulberry tree. For particulars inquire of Miss Ann Bent, 214 Washington Street, or of E. P. Woodward, near the premises. if

LETTERS FROM S. L. DANA, M. D., ON ASHES, LIME, &c.

LETTER I.

Lowell, February 16, 1839.

DEAR SIR,—You have asked me how the action of ashes, leached, or unleached, whether of wood, peat, or coal, is to be explained on my views of vegetation. The best answer I can give you, is to state what is the composition of ashes, and to glance at my views. By the last, I presume you refer to statements in Prof. Hitchcock's late report. I have there said that fertility depends on salts and *geine*. Without the last there is no healthy vegetation. The great body of the soil, in which salts and *geine* act, is only the comminuted remains of rocks, usually called primitive. We have termed this "granitic sand." We have thus three great, natural divisions of the ingredients of soil: 1st. *Geine*, 2d. Salts, 3d. Granitic Sand. Strictly speaking, we have two classes only, *geine* and salts, for the granitic sand is a mass of salts; a mass, in which siliceous acts as an acid, and alkalies, lime, magnesia, alumine, metallic oxides as bases, a mass of *silicates*. I prefer this term to granitic sand and I shall hereafter use it. Let us now glance at these three divisions.

1. *Geine*.—To my remarks, already published by Professor Hitchcock, I now add, that *geine* enters vegetables simply as *geine*, or as an alkaline, earthy, or metallic *geine*, dissolved either in water or in alkali. The organic and inorganic acids and salts of the plant, decompose these varied forms. The elements of *geine*, its oxygen, hydrogen, and carbon, play their usual part in vegetable economy. Acetic, and probably some of the other vegetable acids, do not precipitate the alkaline solution of *geine*. In this case, it may still circulate in fluid form in plants. The earthy and alkaline bases of the *geines* form the bases of the various salts which plants afford.

2. *Salts*.—This class includes, first, compounds of *geine*; second, alkaline salts, potash, soda, ammonia, and all their combinations, known by the names of carbonates, sulphates, nitrates, muriates, &c., as common salts, soap's *spent leys*, consisting chiefly of muriate of potash mixed with a peculiar organic compound called glycine, saltpetre, ashes leached or fresh, urine, containing abundant phosphates and ammoniacal salts, soot; containing both ammonia and *geine*; third, lime in all its forms, marl, shells, chalk, marble, air-slacked lime, plaster, bones.

3. *Silicates*.—To have a distinct idea of this division of soil, let us tabulate the composition of argillite, and of the several simple minerals, whose aggregate composes primitive rocks. Though analyses, imperfect as they are, have not yet discovered phosphoric acid in all these aggregates, yet I doubt not, that accurate investigation will detect its presence in all granitic sand. Phosphate of lime is by no means an uncommon mineral in primitive rocks, and chlorides are widely diffused.

Table of the constituents of the elements of silicated soils or granitic sand.

One hundred parts of	Potash and Soda.	Silex	Alumine	Lime	Magnesia	Oxide of Iron.	Oxide of Magnesia.
Argillite, Quartz,	5 to 7	48	23	4	1.06		
Mica,	8 to 9	47	34	6	1	1 to 2	1 to 2
Pelspar,	13 to 14	66	19	4		1	$\frac{1}{2}$
Hornblende, (including Trap Rocks.)		42	12	11	2 to 3	30	$\frac{1}{2}$

Argillite contains notable portions of carbon. The source of this not only in this, but in other primitive rocks, I shall show elsewhere, is the *geine* and *geates*, held in solution in the water, from which these sedimentary rocks were deposited.

Sulphuretted iron is abundant in primitive rocks. Its decomposition produces with the silicates, sulphates of alkalies, earths, and oxides. Keeping in view the remark on phosphates and muriates, and we have then, at a glance, the inorganic elements of all plants.

Burning reduces these constituents to two classes, ashes and volatile salts. The last are found in soot. The ashes are formed of salts and silicates. These vary in quantity and quality, not only in different plants, but, as is well known, in different parts of the same plant. Let us take oak, beech, basswood, birch, as the types of the composition of hard wood ashes, yellow pine,—(*pinus abies*)—as the type of soft wood ashes; and wheat straw as the type of the ashes of the grasses.

The average quantity of ashes from 100 parts of dry oak, beech, birch, &c., is 2.57. Ashes are divided, by the simple process of leeching, into two parts, soluble and insoluble in water. 100 parts of hard wood ashes thus afford—soluble, 13.57; insoluble, 86.43.

100 parts of the soluble contain :

Carbonic acid,	22.70
Sulphuric acid,	6.43
Muriatic acid,	1.82
Silex,	.95
Potash and soda,	67.96
	99.86

100 parts of the insoluble contain :

Carbonic acid,	35.80
Phosphoric acid,	3.40
Silex	4.25
Oxide iron,	.52
Oxide Manganese,	2.15
Magnesia,	3.55
Lime,	35.80

Pine,—(*pinus abies*.)—100 parts dry wood afford only .0083 of ashes; of which 100 parts afford, soluble, 50; insoluble, 50.

100 parts of the soluble contain :

Carbonic acid,	13.50
Sulphuric acid,	6.90
Silex,	2.
Potash and soda,	69.70

Water, 7.90

100.

100 parts of the insoluble contain :

Carbonic acid,	21.50
Phosphoric acid,	1.80
Silex,	13.
Magnesia,	8.70
Oxide iron,	22.30
Oxide manganese,	5.50
Lime,	27.20

100.

Wheat straw.—100 parts yield .044 of ashes; 100 parts of which afford, soluble, 19; insoluble, 81.

100 parts of the soluble contain :

Sulphuric acid,	0.2
Muriatic acid,	13.
Silex,	35.6
Potash and soda,	50.

100 parts of the insoluble contain :

Phosphoric acid,	1.20
Silex,	75.
Oxide iron,	2.50
Lime,	5.80
Charcoal,	15.30

Peat ashes abounds in carbonate, sulphate, and especially phosphate of lime. I have always traced free alkali in peat ashes; but alkali exists in it, rather as silicate, as in leached ashes. Anthracite coal ashes contain a carbonate of lime, alumina, and oxide of iron. It is good, so far as these abound.

The above are calculated on the analysis of Berthier, who has detected soda in the ashes of all plants. The elements are stated singly; because we have thus at one view, the amount of each, and, as I shall show, it is the base chiefly which acts. The agricultural value of ashes may be determined by reference to these tables. In what state these elements may be combined in plants, we can only determine theoretically. Thus, the phosphoric acid, by its affinities, would be united in the hard woods as above, with the lime and iron,—forming in each 100 parts of the insoluble portion of ashes, phosphate lime, 5.40; phosphate iron, 1.86.

Of the various substances which chemistry detects in the ashes, few probably exist in the living plant, in that state of combination, in which we find them in ashes. Burning decomposes and recomposes them anew. We are by no means to conclude, because we find various salts in plants, that they existed as such in the soil. Of the soluble alkaline salts, probably none exist in the soil. They are products of vegetation educed from the composition of silicates and salts.

The composition of the insoluble part of ashes gives us nearly the constituents of leached ashes. If the soapboilers' process was as perfect as that which the chemist employs—still his leached ashes

would show more lime, than the above tables, because he always employs a portion of lime to make his lye caustic. This is a variable portion; whatever it is, it adds so much to the value of the leached ashes. Besides the soap-maker always leaves a portion of alkali, which is combined with the silice. Exposure to air decomposes this, and then the alkali can be extracted by water. This is one great source of the active power of leached ashes. The course of this wonderful power, not only in fresh and in leached ashes, but in some degree in all salts, is to be found in the action of the bases on geine and on silicates.

There is one great, simple principle running through all the classes of soils. It is this, that in all salts and silicates the action of the base is ever the same in vegetation. The base of the silicates and salts acts always in one uniform mode. Peculiarities of action depend on the acid constituent of the salt. Lime, for instance, acts ever the same, whether it is used as carbonate, sulphate, or phosphate, marl, plaster, or bone-dust. The salt is decomposed by the living plant. The various acids combine with the alkalies, as they are eliminated, from the decomposition of the silicates, and the lime, liberated, acts ever as lime. It acts in its caustic state, as a converter of insoluble into soluble geine. If this does not exist in the soil, all the lime in the world would not cause plants to grow. The base of the lime-salts acts primarily on geine, either solving the soluble or converting the insoluble. The same is true of alumine, iron, and the bases of all salts. The same general rule applies to all alkaline, earthy or metallic salts and to silicates.

The order in which the farmer may apply salts is the following. Carbonate, phosphite, and sulphate of lime, carbonates, nitrates, muriates, and sulphates of alkalies. No salts, excepting carbonates, can be used in large quantities. The reason is at once explained by the principle of unity of action of the bases. The acid of the salts, eliminated, decomposes the geates, rendering the soluble insoluble, the acid combines with any free base, produced from the decomposition of the silicates, and thus prevents that forming soluble geine. Having saturated the bases, any excess acts then as free acid, poisoning the vegetable, as oil vitriol, or muriatic acid would animals. In carbonates, the acid forms part of the food of plants. The alkaline geates are so very soluble, that when alkalies, as ashes for instance, are freely used, we lose a part, by its draining away, or in wet soils becoming too dilute. But a small dose produces all the beneficial effects of a large dose of lime. We have in ashes, not only the alkali to solve geates, but a very large portion of carbonate and phosphate of lime. Experiments are wanting to prove the relative value of lime and ashes. I should not deem it extravagant to say, that a bushel of ashes is equal to a cask of lime. The alkalies and their salts act more powerfully than any other substance, in solving and converting geine. Lime in all its forms, ranks next. These produce always decided beneficial effects. The alkalies never fail. Ashes show their effect at once, due to the alkaline part, while their carbonate of lime produces more permanent effect. Lime, from peculiar states of the soil, may not show any immediate good result, but ultimately, this result is sure to follow. Permanent barrenness never is produced by the free use of carbonates. It surely follows the free use of all other salts, yet in small doses, they all and ever act beneficially, whenever their bases, combined with carbonic acid, would be beneficial.

But how do the elements of soil act? As I have stated in the report of Professor Hitchcock, by forming galvanic batteries with the roots of living plants. The most active element in the pile is the root. The soil, like the rocks from which it is derived, is slowly acted on by atmospheric agents. The effect of this action annually is imperceptible.

A single plant in one season will effect a greater amount of decomposition of a given portion of soil, than that produced by all the atmospheric agents in many years. The galvanic agency of plants is not confined to the soil, in immediate contact with their roots. It extends from these, in every direction, to undetermined distances. Hence there is a transfer, as is usual in galvanic decompositions, of substances quite remote from the plant. The whole plant contributes to this galvanic agency. It never exists in full force, perhaps not at all, till the plant has pushed above ground—acted on by air and light.

The soil, as we have explained, consists almost wholly of silicates, though it has been proved, that carbonic acid slowly decomposes these, and an argument, for the mutual action of the elements of silicates, derived from their admitted electrical states, yet the amount of this action is never measurable in one season. Being silicates, they have no tendency to act on each other. We can only excite this action by introducing new elements, salts, which in this sense only, can be said to be excitants or stimulants. The silicates are the flour, the salts the yeast. The galvanic agency is excited by the salts, but above all, over all, and controlling all, this action of soils is the living plant. The influence of the last unfolds the mystery of the often-repeated experiment of growing plants in pure water. Granting the water to have been chemically pure, the galvanic agency of the vegetable would decompose the containing vessel. The most barren sand would be made fertile by living plants. Sand containing no appreciable quantity of geine, may yet from its origin from sedimentary rocks, contain carbon. Water it, and grow in it plants. Let these perish. They return to the acid, not only organic matter, the source of geine for a new crop, but various salts, of whose previous existence in the same it required the most delicate chemistry to detect traces. The living plant is a consummate analyst. This is the process nature employs. Mr Keely, acting on this principle, and following out and assisting the natural mode, has opened the whole soul of rising crops. The memorable experiment of the Haverhill rye-field, ought to be engraved on the thresholds and lintels of every farm-house in the country.* It teaches us that salts, so important in agriculture, are within the reach of every farmer. Every farmer has a lime-quarry on his own land. He ought also to have constantly burning a lime-kiln. The farmer has on his own grounds, lime sufficient for all wants. Let all brushwood, unfit for the kitchen, be burned for the ashes. But let the soil to be saved. It is too valuable to be lost in air. Look at its composition as stated by Bracannot.

GEINE	30.70
Extractive matter and nitrogen	20.
Carbonate of lime and traces of magnesia	14.66
Acetate of lime	5.65
Sulphate of lime	5.
Phosphate of lime and iron	1.50
Acetate of potash	4.10

*See Appendix E. page 113, First Report of Agriculture of Massachusetts.

Muriate of potash	.36
Acetate of Ammonia	.20
Acetate of Magnesia	.53
Silice	.95
Carbon	3.85
Water	12.50
	100.

I have nearly finished the analysis of Adams' soil. I will send it to you next week, together with the composition of the substance used by Webster, in Dracut.

With great respect,

I am very truly yours,

SAMUEL L. DANA.

Rev. H. COLMAN, Boston.

(For the New England Farmer.)

REPORT OF THE COMMITTEE ON INVENTIONS, &c.

The committee regret that the claims for premiums under this offer were so few. There were only three applicants. One for an improvement in the construction of the plough—one for a supposed improvement in the construction of a bee-hive, and one for a machine for dropping and covering corn in planting, and also for a machine for sowing the lighter grains with more evenness and equality than can be done by the hand in sowing broad cast.

The ingenuity and calculation of Americans, has, in almost all departments of active life, except the farmer's, been a balance for the advantage of Europeans, in their regulated and very low price of manual labor; but in farming, from the axe to the plough, until a few years, no improvement was attempted; all were contented with the depth and smoothness of cutting with their old instruments, and the contest in skill was more in manual dexterity and power, than in improvement of the instruments used. Of late, the attention of the practical and philosophical, has been called to observe and suggest alterations in the usual implements of husbandry, that labor might be saved, and, by increased facility in the operation, time might be saved, and "time is money." Our agricultural hall has many machines, purchased or presented by those who have an interest in the objects of the society; most of them are complicated and cumbersome, expensive, and only adapted to lands long cultivated and offering little obstruction from rocks or roots.

The implements for which premiums are not claimed, are entitled to much credit for their simplicity and economy, the ease with which they may be used, and the facility with which they may be repaired when necessary.

The improvement already made in the construction of the plough, and the study of the principles on which it should be made, justifies the conclusion, that it is better economy for the farmer to keep three ploughs, adapted to specific purposes, than two of the same construction, differing only in size, as has heretofore been most common.

The sward plough of Mr Prouty, to whom the offered premium of twenty dollars is awarded, appears to have been the result of continued attention and minute observation, with practical skill as a farmer in the use of the plough, as well as mathematical calculation in the principles of its construction, as will appear by the letter of Mr Prouty, recommended to be published. In the Yankee Farmer of the 28th April, 1838, there is a communication headed "Ploughing and Ploughs, by E. P.,

Lexington," giving a very particular description of this plough, which was highly gratifying to your committee.

It has long been the wish of our farmers who are in the practice of raising vegetables for consumption by their stock, to procure a good sub-soil plough, loosening the ground between the rows of vegetables to a greater depth than can be done by the common plough. As the society have offered the liberal premium of thirty dollars for the introduction of an approved one, there can be no doubt that the ingenuity of our mechanics will soon furnish them such an one.

To the gentleman who communicated a specification and drawing of his patent for a bee-hive, the committee are obliged, for his labor and desire of usefulness, but they award no premium, first, because they are of opinion that the principles and improvements for which his patent was procured, were familiar and in use by those who had the management of bees, and also, because it has not been usual to award a premium, (unless with some stipulations) for any improvement or invention restricted in its use by a patent right.

The machines offered by Mr Buckminster, at the time of the exhibition, to the committee, were incomplete, and those who exhibited them, stated improvements which were suggested by the inventor. The Committee, therefore, although gratified by the perfect simplicity, economy, and apparent adaptation of these machines to their respective purposes, and also having certificates of the success of the corn and seed planter, did not award a premium to implements not yet completed—when finished and used, they may be the proper subjects for premium as well as commendation.

Several valuable implements were sent by Joseph Breck & Co., from the New England Agricultural Warehouse and Seed store, for exhibition only; viz: Willis' improved mill for grinding the sugar beet, and also apples; Willis' Rotary Vegetable Cutter; Boynton's Rotary Cylinder Straw Cutter; Willis' Improved Straw Cutter; Willis' Improved Double Wheel Seed Sower; Willis' Improved Double Corn Sheller; Shaler's Improved Corn Sheller, and also, Howard's Improved Cast Iron Plough. The committee were much pleased with these machines, and recommend this establishment to the patronage of the public.

From the seed store of Messrs Ellis & Bosson, several valuable articles were sent, for exhibition only; viz.: a green-sward plough, a side-hill or swivel plough; a Cultivator; Partridge's Hay and Manure forks; a seed sower; a vegetable cutter, and a corn sheller. The committee thought well of these articles, and would also recommend to the patronage of the public, this new establishment.

Could we persuade our farmers to bestow the same skill and economy to obtain the greatest product, upon the soundest principles, with the least labor and the least waste, that is bestowed by our manufacturers in their works; could we persuade them to bestow the same attention to the operations of the principles of chemistry, and to hold the same faith in those principles in selecting both manure and seed for their adaptation to the soil in which they are to be used, which is given to them in their application to materials, by our manufacturers, the result would be truly astonishing.

All which is respectfully submitted.

E. HERSHEY DERBY.

The Legislature adjourned on Wednesday, after a session of one hundred days.

[Circular.]

MANURES.

The attention of the public has recently been directed to the use of *Urate* and *Poudrette*. It has long been known in France, as the most efficacious of all manures, and the few experiments made the last year, (1835) in the use of the *Poudrette*, in and around the city of New-York, has awakened the attention of farmers and gardeners. The royal academy of agriculture, in England, have caused experiments to be made of the respective power of the different manures, and upon the trials so made, it appears beyond a doubt, the superiority of manure, made from sinks and privies over any other productive agent for agricultural purposes.

DIRECTIONS.—The following directions are given by Peter Barthelemy, (who was one of the first discoverers, in France, of the present system of preparing the articles), how and in what manner it should be applied, and who recently has introduced its manufacture in the city of New-York.

Urate is the product of the liquid part, and *Poudrette* of the substantial part of sinks, or privies, both of them reduced by different process, to a dry and inodorous substance, and used as the best of all manures known to the agriculturists or horticulturists; being an animal manure of the richest and purest kinds, and the most powerful of any application that can be made to the earth.

URATE.—The *Urate* may be used in its dry state by spreading it on the land, as you would lime or ashes, or after having been dissolved in water, may be used through a watering pot, or by a cask on cart wheels, in the same manner as the streets in the city of New-York are watered in summer.

For all kinds of small grains, such as wheat, rye, oats, barley, flax, and others of a like kind, it may be sowed dry, upon the soil in the proportion of 12 to 18 bushels per acre, according to the quality of the land.

For corn and potatoes, and such like, it is best to mix the *Urate* in an equal quantity of dry soil, and put in the hill about a gill, or handful, sprinkled round the seed corn and potatoes, as is usually done with ashes.

For beets, turnips, or other vegetables, sowed or planted in drill, the *Urate* is to be prepared in like manner and sowed in the drill.

For grape vines, fruit trees, forest trees, flowering trees, flowers; also for garden vegetables, such as cauliflower, cabbage, melons, cucumbers, and the like, *Urate* is dissolved in water, in the proportion of one pound to a gallon of water, and poured on the subject; one application is sufficient; and for articles not herein enumerated, it may be sowed dry on the surface of the ground.

Where the land retains water during the winter, *Urate* must be used only in the spring, in order that its salts may not be absorbed in too large a quantity of water.

Where the land is dry, or does not retain water, during the winter, *Urate* may be used in the autumn; if, however, the sowing takes place shortly before the hard frosts, it is better to use *Urate* only in the beginning of spring.

As a general rule, more *Urate* is required upon the same quantity and quality of land in autumn, than in the spring; if used in the spring, it is better to apply the *Urate* in a damp day, or immediately after a heavy rain, if it cannot be applied shortly before the rain.

There is great advantage in soaking corn or other grain for one hour only, in a strong solution of

Urate, before planting or sowing it; the corn or grain will start sooner, be stronger, and less liable to attack by worms or birds.

POUDRETTE is to be used in the same manner as *Urate*, with the following exceptions, namely; the quantity must vary from 18 to 35 bushels per acre, according to the quality of the land; less than 18 bushels to the acre may not be very satisfactory, and more than 35 is useless.

Poudrette is never dissolved in water before being used, as is *Urate*, but in other respects it is used in its dry state, or by mixing it with dry soil in hills or drills, or sown in broad cast, as lime or ashes.

The difference of the season between spring and autumn, and the state of the atmosphere, are to be considered, before using either *Urate* or *Poudrette*; damp weather is always to be preferred. Neither of them contain any seed of weeds of any description; an application of *Urate* or *Poudrette* once in every three years is sufficient.

Urate and *Poudrette* may be sent to any part of the country in barrels or bags; barrels to be preferred, when it is liable to get wet. Orders may be given, post paid, directed to "The New York *Urate* and *Poudrette* Company," box No. 1211, post office, New-York.

The *Urate* and *Poudrette* made by this company, is not confined to distribution among its stockholders only, and therefore farmers and gardeners may expect a supply in the order in which their application is made, without any condition of becoming a stockholder or advancing any more money than may be sufficient to purchase what they need.

The public should be on their guard in relation to the use of the *Poudrette*, as it is feared it may be brought into disrepute by other manufacturers of the article, where quantity rather than quality, is considered most desirable.

It may be that on trial of *Urate* and *Poudrette*, a different application may be found more desirable; in such case it is hoped the experimenter will make known to the public his discovery.

(To be continued.)

CURE FOR POISONED SHEEP.—Bruise well the green twigs of white ash, boil them one hour in water enough to cover them when pressed down with a stone or some other weight. Two spoons full of the decoction thus made, if administered within twentyfour hours after the sheep has eaten the poison, will generally effect a cure within one or two hours. If administered at a later period will generally effect a cure but not so soon.

MR COLMAN.—Sir—The above is so certain a cure for sheep poisoned with laurel, that it ought to be generally known. The season is now approaching when sheep are most exposed, and a publication in the Farmer, at this time, of the above recipe, would probably confer a public benefit.

Worcester, Feb. 26, 1839.

R. NEWMAN.

We are happy to insert the above as unquestionable; and in many cases the recipe will prove of great advantage.

H. C.

PERSISTENCE.—A man of sagacity and penetration, upon meeting with a few difficulties, does not drop his pursuits, but if he cannot succeed in one way he tries another. We are not acquainted with the strength of our own minds till we exercise them, nor do we know to what length our abilities will carry us until we put them to the test.

N. E. FARMER.

The following remarks from the New-York Journal of Commerce, are so sensible, so well-timed, and so much to the purpose, that we insert them with much pleasure, and invite the attention of our readers.

N. Y. AGRICULTURAL CONVENTION.—A late number of "The Cultivator" contains the proceedings of a State Agricultural Convention, held at Albany in February last; and also the proceedings of the State Agricultural Society, held in the same city about the same time. As we consider agriculture the handmaid and support of commerce,—the most natural, the most healthful, and one of the most useful employments of man,—more favorable to good morals and substantial happiness than any other, and deserving to be considered at least as honorable as any other,—we offer no apology for introducing these proceedings to the notice of our readers. And in so doing we cannot help remarking, that the host of hangers-on for places as book-keepers, clerks, &c. who through our large cities, would consult their own interests infinitely better, (many of them at least,) by going back into the country, and addressing themselves assiduously to the plough, the hoe, and the spade. In this way they might be sure of a competence, and almost sure of more than a competence. But in preference to this, they loiter about the city, month after month, and some of them year after year, in search of employment, and wonder why they cannot find it! The reason is obvious. The business they seek is overdone; and the reason of that is, the rush from the country of thousands and thousands who ought to have turned their hands to agriculture. Book-keepers and clerks, with a few exceptions, are miserably paid, receiving scarcely enough, if they have a small family, to make the two ends of the year meet,—and yet, because a few have blundered into fortunes through that door, every body else must try their luck too! Let a man in this city advertise for a farmer, and he may have difficulty in finding one,—but let him advertise for a book-keeper, and he will be overrun with applicants from morning till night. It is painful to behold the disappointment of so many worthy young men who are only seeking an honest livelihood; but they are most to be pitied because they have not sagacity enough to perceive that they are on the wrong scent; pursuing what but a small proportion of them can obtain, and which, if they could obtain it, is by no means as desirable as the state of independent competence which is everywhere within the reach of the industrious farmer. What adds to their distress while waiting so long for employment, is the expense of living; and this is occasioned in a considerable degree by the high price of provisions; and this again by the fact, that instead of being producers, as they would have been if they had remained in the country, they have become consumers. Let the thousands and thousands who have turned aside from the pursuits of agriculture to make their fortunes in a day, and most of whom, as they have grasped the object of their pursuit, have grasped only a shadow,—let them harden their hands with the plough and the hoe, and the scythe and the pitch-fork; and our word for it, they will no longer complain of the dearness of provisions. The false delicacy, wherever it exists, which makes a man feel as if agricultural pursuits were beneath him, shows, if it shows anything, that he is beneath them.

(From the Natchez Courier)

TRAVELLING AS IT WAS AND AS IT IS.

MR. BLACK: Dear Sir.—The following brief summary of a recent journey from New-York to New-Orleans, contrasted with one made in 1800, will perhaps be interesting to some of your readers, and serve to illustrate the modern improvement in travelling. Yours, J.

IN 1800.

"April 3d. Left New-York in ferry boat for Jersey city. Took two-horse coach and got to Philadelphia the fourth day at 4 p. m. Left Philadelphia next morning in a one-horse chaise, with the mail bag behind, for Lancaster, where we arrived the third day. At Lancaster bought a horse, and after nine days' journey through the forests, reached Pittsburg. Here with some others, I bought for eighteen dollars, a flat boat, in which we took our departure for New-Orleans, floating with the current. After divers adventures and escapes from great peril by land and water, we reached Natchez the fifty-seventh day after leaving Pittsburg, and New-Orleans city in thirteen days thereafter, having been from New-York on the journey, eighty-four days, which our friends in New-Orleans did say was an expeditious voyage. My own personal cost on the way was, in sum total, £27 lls. 4 1-4d."

IN 1839.

Left New-York Monday, January 21st, at 6 a. m. in railroad cars at Jersey city. Arrived at Philadelphia at ten minutes past 12.

Time, 6 h. 10 m.—Cost \$4.

At 2 left Philadelphia in cars for Baltimore. Arrived at 8 p. m.

Time, 6 h.—Cost, \$4.

Left Baltimore next afternoon at 4, in mail chariot for Wheeling. Arrived at Wheeling 5 minutes before 12, Saturday noon.

Time, 43 h. 50 m.—Cost, \$23.

Left Wheeling next morning in accommodation stage for Cincinnati. Arrived at Cincinnati in 59 1-2 hours.

Time, 59 h. 30 m.—Cost, \$24 50.

Left Cincinnati at 10 next morning, in the mail boat Pike, and at 10 at night reached Louisville.

Time, 12 h.—Cost \$4.

Left Louisville next morning at 11, in steamer Diana, and reached Natchez the sixth day.

Time, 149 h.—Cost, \$35.

Left Natchez same day, and reached New-Orleans the next evening.

Time, 30 h.—Cost, \$10.

Incidental expenses at Philadelphia, Baltimore, Cincinnati, and Louisville, \$10.

Total, 306 hours 30 minutes.—Cost, \$114 50.

Thus making 12 days, 18 hours, and 30 minutes the time of travel between New-York and New-Orleans.

Difference between 1839 and 1800, in time, about 71 days.

Ditto in expense, about \$25 in favor of 1839.

N. B.—This last journey was made in the winter season.—In the summer months it can be performed for \$80, and in less time. The above includes every item, both of expense, of "feed and fare." Yours, VIATOR.

[This is a document well worth preserving. Formerly, and within the memory of many persons now living, a journey to New-York and back, was an affair of three weeks. Then, a man about to undertake this great affair, it is often said, made his

will, put up a note at church for his safe return, and took a regular leave of his wife, children and acquaintance. Now, he leaves Boston at 3 o'clock, p. m., gets to New-York the next morning, before the Knickerbockers are knocking about—has 12 hours for business, and is in Boston the next morning, as soon as his coffee is clear, and perhaps before his wife is ready to turn it out. The passengers in that excellent steamer, the John W. Richmond, reach Boston in little more than twelve hours after leaving the great city of Manhattan; and all this too "without being broken of one's rest at night." Some of our married friends may be tempted to try it, with a view to being spared the usual lecture and getting a comfortable night's rest.]

EXTRAORDINARY PERFORMANCE.—A locomotive, built by M. W. Baldwin, Esq. of Philadelphia, drew a train of 45 cars freighted with 150 tons of nails and hoop iron and 28 men, and including cars and engines, making a gross weight of 223 tons, from Reading to Bridgeport, at an average speed of 12 1-2 miles per hour. The quantity of wood consumed was 1 3-8ths cords, which, allowing 2,000 pounds to the cord, is 2,600 lbs. or 11 lbs. 10 oz. per ton for the 40 miles, or 4 2-3 oz. per ton per mile.—Pittsburg Advocate.

[This is an astonishing performance. How much farther we are to go is beyond conjecture. We have not yet got to the feather which broke the camel's back.]

The largest Multicaulis story yet, is told by the Bridgeton New-Jersey Chronicle. A gentleman in Georgia, some five or six years since, obtained and planted a mulberry tree in his garden, when it had stood untouched till the past winter, when it attracted the attention of some one in the trade, who offered the owner three cents a bud for the top of it. The bargain was struck, and on cutting off the branches and counting the buds, they amounted to twelve hundred and fifty dollars, there being 41,661 buds on the tree.

[The above is certainly well entitled to the designation which it everywhere receives, of very remarkable. Yet after all it is not so remarkable as the high prices, which are constantly given for a plant which is propagated with so much facility and in such abundance.]

A PLEASANT COUNTRY.—A western editor describing the great advantages which are peculiar to the Maumee river country, says—

"A stranger passing through Toledo the other day, inquired his way to Monroe, Michigan. He was told to take the road that appeared plainest and the most travelled. He did so, and in the course of a few minutes, found himself in the burying ground! He did not stay there very long, but was soon seen running through the country, as if the rider of the pale horse was at his heels."

[Again, he states on "good authority," that that portion of the country which lies on the south side of the river will produce more rattlesnakes to the acre, than any piece of land of its size in America. This must be a glorious country to remove to!]

The N. Y. Journal of Commerce proves by a mass of statistical facts, copied from an English publication, that the danger of loss of life on an average railroad trip, is only as about one to four millions.

[For the N. E. Farmer.]

TO RAISE EARLY PEAS.

Mr Knight, the President of the London Horticultural Society, has described his method of raising early peas, which is as follows:—On March 1st, the ground being previously prepared, part of the seed was sown as usual, in drills, where the plants were to remain; at the same time, other peas of the same early kind, were sown in circles within the circumference of pots, ten inches in diameter. These pots were filled with a compost made of equal parts of thin turf, to which much lifeless verbage was attached, and unfermented horse-dung without litter, and a quantity of ashes of burnt reeds, containing a considerable portion of burnt mould, equivalent in bulk to about one-twelfth of the other materials. Equal parts of fresh soil, with unfermented horse-dung with litter, and a small quantity of quick lime or wood ashes, would probably operate as powerfully as the compost above described. The whole was reduced to fragments, and well intermixed. The pots were filled with it to within an inch of their tops. On the surface of his compost the peas were planted, and covered with common mould. The pots remained in the hothouse till the plants were an inch high; they were then removed into the open air, but were protected during the nights.

In the last week in March, the plants were taken from the pots and planted in rows in the ground; nearly the whole of the compost adhered firmly to their roots, and their growth was not checked by the transplanting. They were placed contiguous to those previously sown, and a small quantity of the compost was added and then the soil closed round their roots. Sticks, &c. were provided in proper time. On April 29th, the plants sown in the pots were 15 inches high, while their neighbors, which had been originally sown in the soil, were only 4 inches. These plants produced their fruit 12 days earlier than the others, and gave a more rapid succession of crops.

Mr Knight attributes this partly to the heat of the unfermented manure; it having been often observed, he says, that snow does not lie so long on ground manured the previous season with fresh unfermented horse-dung, as on ground not manured, showing that the manure retains or produces a considerable degree of heat, though it may not be sensible to the touch of a warm-blooded animal; partly to the stimulant nature of the compost, and partly to the favorable state of the soil in which they were placed, as peas never thrive in strong soils, particularly when it has been pressed down and soddened by rain.

RUSSIAN FORESTS.—A modern traveller states that a vast portion of the soil in the northern provinces of Russia, is uncultivated—the land being covered with almost interminable forests. The boundless extent of wood with which Russia is covered, may be inferred from the condition of one government alone, in which, of 50,000,000 acres, its whole extent, 47,000,000 consist exclusively of forests. According to an estimate made in 1809, which referred only to the North of Russia, these forests appear to contain no less than 8,192,295 pine trees, fit to be masts, each being, at least, 30 inches in diameter. The accuracy of this estimate has since been amply confirmed by actual survey, in the course of which it has been ascertained, that in the three northern governments of Vologda, Archangel, and Olmetz, there are 216,000,000 acres of pine and fir.

AGRICULTURAL STATISTICS.—While the total number of families in Great Britain has increased, between 1811 and 1831, from 2,544,215 to 3,114,174, or at the rate of 34 per cent., the number of families employed in agriculture has increased only from 895,998 to 961,134, or at the rate of 7 1-2 per cent. From a table designed to show the progress of agriculture in England during each of the years between 1760 and 1769, when the average number of inhabitants of England and Wales was 6,850,000 souls, the quantity of wheat produced was more than sufficient for the home use, by 1,384,561 qrs. The committee of the House of Commons which sat in 1813, stated in their report that, through the improvements in cultivation, the produce had been increased one-fourth during the then preceding 10 years. The revenue drawn in the shape of rent has been doubled since 1790. In Essex, farms could be pointed out which were let just before the war of the French revolution at less than 10s. per acre, and which rose rapidly during the progress of that contest, until, in 1812, the rent paid for them was 45s. to 50s. per acre. This advance has not, it is true, been maintained since the return of peace; in 1818, the rent was reduced to 35s. and at this time is only 20s. an acre, which is still more than double that paid in 1790. In Berkshire and Wiltshire there are farms which, in 1790, were let at 14s. per acre, and which, in 1810, produced a rent of 70s., being a five-fold advance. These farms were let in 1820 at 50s., and at this time pay 30s. per acre, being 114 per cent. advance upon the rent paid in 1790. The extent of land brought into cultivation under inclosure acts, from the beginning of the reign of George III. to the end of 1834, is computed at 6,840,540 acres. A statement made out in May, 1827, gives the territorial surface of Great Britain, Ireland, and the adjacent islands, at 46,522,970 cultivated acres, 15,000,000 uncultivated, 15,873,463 unprofitable, being a gross surface of 77,301,434 acres.

FROZEN GROUND.—It has long been supposed that the sub-soil in districts lying in or near the frigid zones, was permanently frozen; but scientific men have hitherto paid little attention to that subject. Professor Baer, of St. Petersburg, has, however, communicated some information to the Geographical Society at London, which appears to have awakened attention to the subject. A well was not long since sunk at Yatusk, in Siberia, to the depth of three hundred and eighty-two feet in the frozen ground! The inquiry is to be prosecuted farther in Siberia, and measures are about being taken by the London Geographical Society, to collect information of the officers of the Hudson's Bay Company, as to the extent of the layer of frozen ground in North America, the thickness it attains in different parallels of latitude, and how much it disappears at the end of summer. Sir John Franklin mentions, that at York factory, in lat 57°, the summer thaw penetrated only to the depth of three feet; and on the shores of the Great Bear lake, it reached only to the depth of twenty-two inches.

HOW TO RELIEVE CHOKED CATTLE.—It will be recollected by the constant readers of the Telegraph, that some months since, John Conant, of this village, published an article in the Telegraph, addressed to farmers, making known a method for relieving cattle choked with potatoes or other substances. The object of this paragraph is, to call

attention to the subject again, and to add my own testimony in favor of the remedy. A few mornings since, one of my cows was choked with a potato. Living but a short distance from my friend Conant, the author of the article alluded to, I sent for his assistance, as I had never witnessed the operation. He came with a quantity of gunpowder, took about as much as would be necessary to charge a common fowling-piece two or three times, inclosed it in paper, somewhat after the manner of preparing a cartridge, and while I held the cow's head up, he, with his hand, thrust the preparation down her throat, as far as convenient. I held her head up a moment, until she had broken and swallowed the charge, which soon produced heaving; but the first trial did not succeed. After waiting a few minutes, we repeated the process, which succeeded admirably, and the poor, distressed animal was relieved at once. She raised the potato, chewed and swallowed it. Let whoever has occasion, try the experiment.—*Vermont Telegraph.*

AGRICULTURAL STATISTICS.—During the prevalence of the wild speculations which swept like a pestilence over New England, the industry of Maine was diverted from the cultivation of the earth to engage in the creation of paper wealth by the transfer of lands. For the wise purpose of restoring to agriculture those who had abandoned its honest and healthful pursuits, the legislature of that State offered a bounty for the production of wheat. The soil was suited to the nourishment of this grain, and the climate, although not remarkably favorable, was not unpropitious for the harvest. At a later period, a bounty was proposed for corn. The success of this policy is proved by the result. The following table exhibits the quantity of wheat and corn for which the bounties have been claimed from the treasury during the past year, expressed in bushels:—

	Wheat.	Corn.
York	80,856	403,614
Cumberland	52,273	271,406
Lincoln	45,301	126,498
Hancock	24,164	1,777
Washington	42,921	212
Kennebec	126,933	366,765
Oxford	126,386	245,914
Somerset	195,454	89,276
Penobscot	153,464	21,151
Waldo	122,554	54,135
Franklin	104,312	45,717
Piscataquis	83,229	4,538
	1,107,849	1,630,996

The bounty paid for wheat was \$87,342; for corn, \$66,628; in the aggregate, \$153,970.

During the last year, the quantity of wheat raised in Massachusetts was 97,192 bushels. There were 3,683 claimants of the bounty, amounting to \$9,422. From 85 towns no returns were received, and the payments were distributed to 221 out of the 306 towns.—*National Egis.*

When the farming interest is depressed, every other interest suffers in proportion; and it is just as necessary to keep that interest in a sound, healthy and flourishing condition, as it is to keep open and free the springs of existence itself. One of the best means of effecting this desirable object, is to make farming popular, and not to associate it with the idea of unpaid or involuntary work of the hands.—*Daily Times.*

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, APRIL 17, 1839.

AGRICULTURAL MEETING.

We continue our reports of the tenth meeting, in which in addition to the discussion respecting the use of fruit as food for stock, of which we gave a sketch in the last Farmer, the general subject of transplanting and engrafting fruit trees came up. We do not perceive anything original or novel in any of the methods detailed by the different gentlemen; but they are valuable as being the results of the actual experience and careful observation of persons, who have been successfully and for years engaged in the business, and familiar with all its operations. They will be presented in a miscellaneous and desultory form as they were elicited in the course of the inquiry and discussion.

Mr Stone, of Watertown, has been in the habit for years, of raising, transplanting and engrafting the trees upon his farm; his orchards are very extensive, and his fruit abundant, as must appear indeed from a statement made in the last paper; that he has made from 100 to 150 barrels of cider in a year; and that he has given sometimes from a 1000 to 1200 bushels of apples in a year to his stock, which consisted merely of apples that were not saleable in the market.

In transplanting trees, he says, he very rarely fails to make them live and flourish. He thinks it important to make the hole for the reception of the tree large; even if the tree be small he would have it three feet in diameter, so as to give an opportunity for the roots to be expanded freely; he fills it up after setting out the tree, with loam or soil suited to the tree; and he chooses to set them out if possible immediately after taking them from the nursery bed. He approves of setting trees by the side of a wall; and he prefers a deep and moist soil. A clayey soil he considers as unfavorable.

In grafting he chooses to select and cut his scions early in April, and places them the cut ends in the earth, covering them with some protection from the wet and sun. He is opposed to very early grafting, preferring the time just before the opening of the blossoms. He prefers a warm and mild day for engrafting; and he uses as a composition to apply to the cut limb a mixture of three parts of rosin, three parts bees-wax, and one of tallow. Clay and manure mixed form an equally good application, excepting the greater trouble of preparing and applying it.

He has no more difficulty in engrafting cherry than apple trees. The secret of grafting a cherry tree with success is in putting the scion in. The outer bark is to be divided with a knife; the tree is then to be split and the scion put in; but the scion of a cherry tree must not be *shoved* or forced down. It is not so with an apple scion. He has engrafted old trees with success. Any tree, which is healthy, may be grafted with advantage. To an inquiry made of him, he replies that he knows nothing of engrafting a barren tree. In engrafting old trees he chooses to get out on the extreme branches and place his scions, where the limbs are not more than three inches in diameter. He would not engraft the whole tree in the same season. He commonly puts in twice as many scions as he wishes to have remain; and uses the limbs which appear most favorable. The trees which are engrafted are more healthy than those not engrafted. (We write from our notes, but we suppose that Mr Stone designed to convey the idea that a tree, not in very flourishing condition, would become improved

in health by engrafting.) He would prefer engrafting a sucker to a limb.

He has made many experiments in the removal of trees. He has removed forest trees with success; and has transplanted pines in June and August with safety. He has likewise with success removed an oak and an apple tree in summer. In this case, however, the roots were preserved with great care, and placed as far as possible in their original and natural position. He transplanted with success many of the evergreens at Mount Auburn. We understood him to say that in this case the distance of removal was not great.

For the prevention of the ravages of the canker worms he is accustomed to tar his trees. But he has another preventive against their depredations and that of other insects and worms, which certainly speaks well for his taste and his humanity. He never suffers a bird or a squirrel to be shot or molested on his place. He treats the despised toad likewise with great respect and kindness, and gives them the free range of all his pleasure grounds. He sells no cherries, but plants them purposely for the birds, considering the advantage he derives from them in destroying grubs and worms as vastly more than a compensation for the little pittance which they ask for. (Now this is noble. Little matters are as fair a test of character as great. All things have an equal right to live. A man who would kill a robin out of pure wantonness, would be very likely to kill a child, under the same circumstances, if he were not afraid of the law. A man, who would wantonly trample down an ant hill and crush the thousands of its industrious and happy population at a single stamp of his foot, would, under auspicious circumstances, make a second Nero or Caligula. The rookeries in England are guarded with extreme care; and we recollect some time since seeing a curious and probable calculation of the advantages, which the farmer derived from the labors of these birds, which vastly preponderated over any injuries which they occasioned to his crops.)

Mr Stone further stated that in his cultivation or engrafting or transplanting he paid no attention to the moon (there were in truth no signs of lunacy about any of his remarks or operations) or to the aspect of the tree in its former position. He had sometimes practised engrafting under ground, but did not do it where it could be advantageously done in another way.

Mr Brown of Pembroke, Plymouth Co. often engrafs in the roots and with success. To protect a scion he is accustomed to twist a piece of strong paper round the limb where the scion was inserted in the shape of a tunnel, and fill it with earth or sand. This method he much approves on upright limbs and prefers it to clay, which is apt to crack in a dry season, or to become very hard and chafe the tree. On horizontal limbs the application of this paper and loose sand or earth was not easy; yet it was practicable.

Mr Fowler of Danvers has been in the practice of transplanting forest trees. Evergreens which he has transplanted in August have succeeded better than those which he has transplanted in the spring. He has received evergreens which were taken up in Penobscot, Me., in July, and set them out in August with success. Mr Fowler has used a mixture of sand with his clay for engrafting with great advantage.

Mr Nichols of Danvers went very fully into the subject of engrafting, and brought some specimens to exhibit to the meeting the different modes of operating by cleft-grafting, by whip-grafting, &c. We shall report his remarks very briefly, as he has kindly promised to give us his views on the subject in full in writing.

He rests particular stress upon the scions fitting into the bark. Cherry trees should be engrafted under the

bark; and must be carefully covered with cement. Trees in the nursery should be engrafted the next year after being planted. Scions sometimes need a support, which is easily given to them by fastening a splinter to the body of the tree. Mr Nichols, (thank Heaven! the peace party is on the increase) is likewise a great friend to the birds; and lest the scion should be broken by it birds lighting upon it, not an unusual accident, I would tie a limb by its side, to furnish them a resting place. He is careful to cut his scions before the buds swell; and to insert them when the sap flows freely.

He does not like a cement of wax so well as of clay he frequently uses clay with hair intermixed; and chooses to put it on with the hand. He has never used clay and sand, which Mr Fowler speaks of having used to advantage.

Mr Fowler, we understood him to say, had never succeeded in grafting the cherry by cleft-grafting. Cleft-grafting is more tender at first, but may be protected by care.

Mr Stone spoke again of engrafting plum trees, which he does with success. He has no difficulty in budding in August. A large tree should be engrafted; a small tree should be budded. The Mazzard cherry is the best stock for budding or engrafting. He buds the peach likewise with success in August. In engrafting upon the wild cherry and the thorn bush, the scions have done well for two or three years, but afterwards not well. He is of opinion that the plum tree should be much trimmed, and says it will bear pruning like the willow.

Some conversation was had upon the insect by which the plum tree is often infested, and, unless a preventive is employed, destroyed by them. The Rev. Mr Perr of Bradford, seems to have found a perfect security against their attacks and diffusion, which will be four detailed in the first report of the agricultural survey and from this authority may be considered decisive.

Mr Gates, of Worcester, spoke of having successful use in grafting, a composition made up of one part rosin, one part of bees-wax, and one of lard; and never experienced any inconvenience from its melting. Mr Stone has tried the same, but has suffered from the inconvenience alluded to.

The above report is, we are aware, a very imperfect sketch of the conversation and discussion of the evening. It embodies, however, some of the principal matters connected with this subject; and being the suggestions and opinions of men practically versed in the subject, we have no doubt they will be fully valued. We do not expect to find in these miscellaneous hints, a complete system either of arboriculture or agriculture. We will gather the stones where we find them, and lay them up in store, so that we can erect the building where we have got the materials together and find the leisure. Much good must come from striking out these sparks from the flint. We mean to apply the steel until presently we light a match and kindle a fire, which we hope will do some little towards lighting up and warming the good old state of Massachusetts. H. C.

NOTE.—We had intended to have given the remaining Premium Farm Reports in this number. It shall be done shortly. Most of them require transcribing for the spectacles of our compositor, and this requires time a commodity which has of late been very scarce with us and not to be had in the market for love or money. H. C.

NOTICE.

The Seeds recently sent the Massachusetts Horticultural Society, by Herr J. Rinz, Jun. of Frankfurt on the Maine, Germany, a Corresponding Member of the Society, will be distributed on Saturday next, at 11 o'clock. April 17.

BRIGHTON MARKET.—MONDAY, April 15, 1859.
Reported for the New England Farmer.

At Market, 230 Beef Cattle, 70 Stores, 8 Pairs Working Oxen, 12 Cows and Calves, 525 Sheep, and 1950 wine. About 300 Sheep and a few Swine unsold.

Prices.—Beef Cattle.—We quote to correspond with last week, First quality, \$5 75 a \$9 00 Second quality, \$5 00 a \$8 50. Third quality, \$6 75 a \$7 75.
Stores.—A very few sales only were effected.

Working Oxen.—We noticed the sale of two yoke at 108 and \$115.

Cows and Calves.—\$32, \$38, \$42, \$55 and \$58.

Sheep.—Several small lots at \$9 50, \$6 62 and \$6 75.

Swine.—One lot at 8, one at 8 1-2. Several at 8 3-8 and 9 3-8, and at 8 1-2 and 9 1-2; and one lot at 9 and 10, large barrows at 9; at retail from 9 to 11.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending April 14.

Sunday,	14	32	31	N. E.

STRAWBERRIES.

Gentlemen wishing to cultivate this delicious fruit are respectfully informed, that the subscriber has succeeded after a number of years of exertion in bringing the strawberry nearly to perfection.

He has for sale at his garden in Brighton, Mass. the following six varieties of the Plants. They are of superior stock and quality, and in the finest condition for immediate transplanting.

He will offer in addition his *Seedling Methuen*, a very valuable kind, a fine bearer, fruit juicy and very large, fruit measuring four inches was gathered the last season.

Methuen Castle—Fruit from these plants has been exhibited at the Horticultural Society's Rooms, measuring five and a half inches in circumference.

Bath Scarlet—Fruit large, full bearer, and beautiful scarlet.

Royal Scarlet—Fruit long, oval shaped and juicy.

Heath—Fruit smaller, but very numerous.

English Wood—Fruit well known.

Monthly—Fruit is gathered from these vines from June to October, and in good quantity and fine quality.

Orders left at the Garden in Brighton, or directed to him at Boston or Brighton, at J. Breck & Co.'s Seed Store, will be promptly attended to.

JAMES L. L. F. WARREN.

BRIGHTON, Mass., April 17, 1859.

DILLINGHAM POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store connected with the New England Farmer Office, a few barrels of Dillingham Potatoes. These are well known as a most excellent eating and very prolific kind. Also, a few *Blue Horn* Potatoes, a very fine kind; the celebrated *Rohau* Potato; Early Whites, and Eastern Potatoes of various kinds.

April 17. JOSEPH BRECK & CO.

CORN SHELLERS.

Just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, a supply of Currier's Patent Corn Shellers; a very convenient and cheap article. A right to using said machines in counties or towns may be obtained by applying as above.

April 17. JOSEPH BRECK & CO.

FOR SALE.

The subscriber offers for sale his estate in Harvard, County of Worcester, the well known *Bromfield Place*; an excellent dairy farm, well wooded, the house spacious, fitted for two distinct families; the situation among the most pleasant to be found, especially for a private or high school. Bordering a part of the farm is a beautiful sheet of water, containing two islands belonging to the farm. Inquire of the subscriber at South Natick. J. H. T. BLANCHARD.
4w

A BULL WANTED.

Wanted a young Bull, of the short horned Durham breed, old enough to be used the present season. Apply to April 10. JOSEPH BRECK & CO.

GRAPE VINES.

- 150 Sweet Water Grape Vines.
- 200 Isabella, " "
- 150 Catawba, " "
- 100 Black Hamburg Grape Vines.
- 1000 Asparagus Roots.
- 100 Early Wilmot Rhubarb Roots.
- 200 Common " "

Also—Strawberry Plants of the following choice kinds: Methuen Castle, Bath Scarlet, Hauthous, English Wood, Monthly, &c. Raspberries, Franconia White and Red. Gooseberries—Currants—Flowering Shrubs and Plants of all kinds supplied at short notice, by

JOSEPH BRECK & CO.
51 and 52 North Market Street.

Just received at the New England Farmer Office, the Second Report on the Agriculture of Massachusetts, by Henry Colman, Commissioner for the Agricultural Survey of the State. For sale by JOSEPH BRECK & CO.
April 10. 51 and 52 North Market St.

NOTICE.

The subscribers, publishers of the *Indiana Farmer*, at Indianapolis, have in connection a Book and Seed Store and a field of eight acres adjoining for a seed garden; but wishing to devote their time and attention more exclusively to the interests of their paper and the printing business, they offer for sale their Garden and Book and Seed department, and to rent the store they occupy, favorably situated in the business part of the town.

A person acquainted with the seed and horticultural business would find this a desirable location for a permanent establishment, not exceeded by any in the west. For further information inquire of the publishers of the *New England Farmer*, or of the subscribers by letter.
April 10. OSBORN & WILLETS.

WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing his seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurzel, Turnips, Carrots, Beets, Parsnips, Onions, Corn, &c. It is highly recommended by a great number of persons who have used it the present season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO.
April 3.

EARLY AND LATE PEAS.

For sale at the N. E. Agricultural Warehouse and Seed Store, a choice assortment of Early Peas, consisting of—Cedo Nulli, extra fine and early.
Early Warwick, do. do. Knights' Tall Marrow, do. do. Knights' Dwarf do. do.
Early Washington, do. do. Fall Sugar, do. do.
Russel's Early Dwarf, do. do. Dwarf Sugar, eatable pods, do. do.
Bishop's do. do. Full Late Marrow Fats, do. do.
Early English Frame, do. do. Dwarf do do.
Early Golden Hotspur, do. do. Blue Imperial, do. do.
Blue Prussian, do. do. Woodford's Tall Marrow, do. do.

In addition to our usual stock of Peas, we have recently received a few varieties of very superior Peas from England, viz: Marquis of Hastings, extra fine Marrow, Early White Warwick, early fine and cedo Nulli, very early, Waterloo Blue, fine large blue, Groom's Improved Blue, White Scimitar.

All of which are remarkably fine, and are considered as some of the most desirable varieties cultivated here or in England.

MISCELLANEOUS.

EXTRACTS FROM CHEEVER'S LETTER.

NO. 1. FROM TURKEY.

From Ghemlik to Broosa was our last post, of six hours, which would make a day of sixteen hours on horse-back; at least four too much, had it been the first day of a longer journey. Leaving the town on the north side of the bay, the road, much better than the paths we had hitherto travelled, winds directly up the declivities on the other side, affording a noble view of the gulf, the verdant plain, the rising mountain, and the town resting at its base. It was an extensive and beautiful landscape, and we parted from it with reluctance, when we reached the last and highest point from which we could command it. Here we encountered an energetic shower, and rode on for a season in expectation of a thorough drenching; but the clouds grew lighter, and though the sun did not shine, we had rain only in short intervals. The road lies along a romantic and lovely country, and the aspect of all nature led us naturally to speak of the manner in which God is visible in his works, and of the feelings with which we ought to regard such lovely scenery. "My father made them all." A full realization of the thoughts which Cowper has so beautifully expressed, is too rare in our individual experience in the contemplation of nature. Take any portion of the landscape, as it lies along our path, and minutely examined, how wonderfully does it exhibit the glory of the Creator. This simple patch of shrubbery we are now passing—what a combination of lovely form and color, festooned and diversified, in such pleasing wildness of natural shapes and masses, with such attractive shades of foliage, and such delicate beauty of the blossoms!

"We are apt to get angry with the world, and call it hard names—a dark world, a gloomy world, a wretched world—when in reality it is a bright world, a lovely world, the world as God has made it."

"But this world of nature how beautiful! every thing is full of beauty—every thing seems but an exhibition of the attribute of beauty in the divine mind. How many are the objects of which their loveliness alone constitutes their value. Ask for what purpose they were made, and you cannot tell; their extreme beauty is their only utility, and that is utility enough. Let us not think that we are the only beholders of the loveliness of our mortal habitation; or that, if man were not, "*this earth would want spectators*—God would praise."

"Millions of spiritual beings walk the earth Unseen, both when we sleep and when we wake."

And how many flowers in the forest, invisible to mortal eye, may be raising their petals and spreading their blossoms to the admiration of higher order of intelligences! The world is not always regarded by such stupid eyes as ours. Many a clump of daisies, which the shoe of the heedless peasant only treads upon, may have suggested a new thought of love and praise in the bosom of a passing angel.

In our way this afternoon, we passed along some very singular formations of rock, looking so much like an artificial wall of huge dimensions rising up the mountain side, that we could with difficulty resist the deception. The common people think they are the work of the Genesee. The whole of this region would afford an interesting field for the geologist. About an hour and a half from Ghemlik our path had brought us to a high and commanding

point among the mountains, and the view we were leaving behind was exceedingly grand; a vast expanse of hills and valleys, and blue ridges in the distance, with a portion of the gulf of Moudania visible like a lake embosomed among the mountains. But our admiration was greatly increased, when, at a higher point of view, the splendid ranges of Olympus, covered with snow, flashed suddenly up before us, with the distant view of the city of Broosa, lying at the foot of the mountain, while behind us still lay a vast extent of country, with the gulf of Moudania and another blue mountain range beyond. On the side we had left, the sun was setting at the edge of a dark thunder-cloud, amidst wild and savage masses, but on that towards which we were now to descend, his golden light was pouring, and the evening effect upon the snowy ridges of Olympus, was indescribably glorious. We very soon lost sight of the whole landscape in the falling darkness, and about two hours from Broosa, were glad to arrive at a solitary *derbend*, situated in a lonely valley, which reminded me of the way up towards the Notch of the White mountains. Here we found a guard of soldiers; the sentinel at the door respectfully grounded his arms at our entrance, and we were glad of the relief to our fatigue, afforded by a few moments' change of position, with a cup of coffee, and the certainty of the last pipe on the way to Broosa. Our last two hours were lengthened into almost four, and we traversed the indistinguishable path through the darkness in single file, sometimes wading through sheets of water so broad that it seemed like a lake, and sometimes following the portion of stone pavement thrown up for the road as if in the midst of a deluge.

The approach to Broosa is through a vast and beautifully cultivated plain of mulberries, and by day, the whole city, magnificently rising at the base of mount Olympus, is visible long before the traveller arrives at its walls; by night, its dancing lights were for a great while distinguishable before us, glimmering as if we were just upon them, till indeed we were quite tired of the deception. Meantime it rained at intervals, and our guide, not knowing his way clearly through the city, had to coast its walls a long distance through the gardens that surround it, till we should get to that quarter where we wished to stop. Amidst all this, the nightingales were singing, accompanied with the fitful lamp of the glow-worm; the lovely music of the one, in such a rainy night amidst the foliage, and the cheerful light of the other, in such thick darkness, composing an instructive moral for the mind, and both reminding one of that sweet fable of Cowper, the employment of school-room hours:

"A nightingale, that all day long
Had cheered the tillage with its song,
Nor yet at even-tide suspended,
Nor yet when even-tide was eided,
Began to feel, as well he might,
The keen demands of appetite."

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells.
Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention.

March 27.

NAHUM WARD.

WINSHIP'S BRIGITON NURSERIES,
AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c.

Orders addressed to Messrs WINSHIP Brighton, Mass., will be promptly executed and forwarded to any part of this or other countries.
April 10.

FRUIT AND ORNAMENTAL TREES, MULBERRIES &c.

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1839 now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and of Teaches now ready is particularly large. Also Ornamental Trees, Shrubs, Roses, Honeysuckles, Pæonies Dahlias and other Herbaceous Flowering Plants.
10,000 Cockspur or Newcastle Thorns.

10,000 Bachelors.
Morus Multicaulis, and other Mulberries: the trees grow fine and fine, at prices fair, and varying with the size, and the quantity which may be desired.

Fruit and all other trees, when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston.
January 30, 1839.

FRUIT TREES, &c.

Pears, Plums, Raspberries, Roses, &c.

The subscribers have recently received, per the Switzer land from Harve, a large assortment of the choicest varieties of Pear and Plum Trees, from one of the best Nurseries in France, together with a small collection of superb French Roses, all in excellent order for transplanting, which the offer for sale at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street. The Pear and Plums are from 6 to 7 feet high, and will be sold at \$1 0 each.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

PUBLISHED BY JOSEPH BRECK & CO., NO. 22 NORTH MARKET STREET, (AGRICULTURAL WAREHOUSE.)

VOL. XVII.]

BOSTON, WEDNESDAY EVENING, APRIL 24, 1839.

[NO. 43.

N. E. FARMER.

The subjoined address was delivered at the Show of the Berkshire Agricultural Society, in 1836, by LEWIS W. BISHOP, Esq., of Lenox. A copy was requested by the society, but the request was declined, from a reluctance to tax the funds of the society. There are few ways in which a portion of them could be better used. We feel ourselves particularly indebted to the kindness of the author, for permitting us, by our request, to enrich our columns with it. It will be read with great pleasure.

GENTLEMEN OF THE SOCIETY:—The seasons have dispensed their blessings: the fruits, to which showers of spring gave life, and summer's warmth gave substance, autumnal suns have ripened. The buds of the present year are closed: the fruit germs for the next are wrapped in winter clothing: the forest leaves are sending back again the vital fluids to the roots: soon will the chilling night-dews impel the patient ox to seek his stall, and wintry winds, revisiting the highlands, drive down to their folds the warm-clad flocks. In this, the evening of the year, their labors over, and nature, all around them, falling to repose, 'tis rational, 'tis wise, for the cultivators of the earth, to come in on the fields around, lay aside the instruments and habiliments of husbandry, and conclude the year by appropriate festivities. With us, in Berkshire, this is an occasion of high and animating interest,—an occasion, which annually brings to this, the queen of her villages, and convenes within these sacred walls, the active, the intelligent and the renowned of her population. Why does the interest, felt in our society, in this anniversary, grow stronger and stronger, and extend itself farther and farther, each successive year? Is it because it gives relaxation from toil,—a season of recreation—a social pastime? For other objects was this association formed; for higher and nobler purposes have its influences been excited. Its relations, and their vital importance to the prominent pursuits and occupations of this county, convene us, not merely to extend the greeting hand, regale upon the rich lands of our hosts, and disperse; but to commune freely and fully, upon the varied interests of agriculture and its kindred occupations,—to cast back to determine what has been, and forward to ascertain what can be done, to advance them.

The other occupations of life know and acknowledge no such state as quiescence. Their march is onward. Intellectual activity is the element of their success, and they move forward with the rapidity of thought. Every new principle—every new combination of matter, and every new application of its laws, is seized and husbanded by the mechanic. "He makes the air his servant, and the waters his workmen." By accelerated movement, he has given to days the value of years and reduced degrees to minutes. He has shot beyond the limits set by the boldest anticipations, and He only, who has limited the powers of the human intellect at conception, and prescribed all the possible forms and appliances of matter, can determine what the future may unfold.

Will the agriculturist consent to fold his arms in stationary attitude, while all around him are hurrying on to the attainment of greater excellence and higher eminence? Will he be patient to have his occupation regarded as a mere trade, requiring nothing but muscular strength and manual dexterity, while the other departments of business, less useful and less intimately blended with social well-being, are acquiring all the respectability which art, and all the dignity which science can impart to them? If it do not move on abreast with them, the fault is entirely his own. If it be true, that science has done less for agriculture than for other occupations, it is also true that there is nothing for which it can do more; indeed, there is nothing for which it can do so much, for nothing else requires learning so various. Is it of less moment that the husbandman should understand the composition of his soils, than that the clothier should know that of his dyes? Is it of more practical importance that the leather manufacturer should know the properties and action of heat, than that he who cultivates the earth, should know its power and influence upon vegetation? If, after years of minute and accurate observation, and by the collection of facts innumerable, and leading truths illustrated in practice, and confirmed by experience, important and interesting relations are disclosed between the vital air and animal organization, enabling the learned physician to detect and obviate the causes of disease, who will venture to predict, that relations, if not equally important, quite as curious, may not be discovered between the same fluid and vegetable organization, which, by the aid of facts and experience, will enable the scientific husbandman to detect and obviate the causes of the failure of anticipated harvests? The discovery that caustic lime-stone would absorb and retain the noxious exhalations of putrefaction, was justly accounted an important achievement by physical science—a signal victory over the subtle agents of death. The relations of the discovered truth to human health and life, were quickly discerned and applied. But discovery did not stop here. It has been as clearly disclosed, that the noxious substance exhaled, is the chief aliment of plants, and though destructive to animal, sustains vegetable vitality, and that, in combination with lime, it can be long preserved, conveniently used, and parts, except as required for the purposes of vegetation, with few, if any, of its fertilizing properties. Why may not the double application of this single truth, double the benefits of its discovery to mankind? Were the effects of the laws of vitality, which govern the functions of plants, as closely watched and as accurately recorded by the farmer, as those which govern animal functions are by the physician, a new character and a new impulse might be given to agriculture, and the toils of labor be regarded as the recreations of learning.

Until the recent companionship of chemistry with agriculture, it was hardly considered as having anything to do with uniform physical laws, or if it were, the general ignorance of those laws precluded the

possibility of a practical conformity to their operations. The influence of heat, moisture, and the atmosphere, upon vegetation, was more or less known, but their nature and modes of action were subjects of superstitious conjecture; and the thermometer, barometer, and other cheap and simple contrivances by which their changes may be foretold, and which have shorn the moon of half its glory, were unknown. There are certain natural phenomena, the study of which is of conceded importance. Those connected with climate are most obviously such. To climate, all the processes of husbandry, whether tillage or grazing, must be adjusted, and its influence extends not only to the kind of plants and animals to be reared, but to the mode of rearing. A few plants and but few, are universal. Of those belonging to agriculture, may be enumerated most of the annual pasture and hay grasses, and of the cereal grasses, wheat, rye and barley. The pea, bean, turnip, potato and perennial pasture grasses, will not thrive either in very high or low temperature; cotton and rice can be grown in warm countries only, and the oat in temperate regions. Some animals are universal, as the swine and horse; others are limited in their range, as the sheep when domesticated. It will, to be sure, live in Lapland or Congo, but in either country deteriorates, and loses its useful qualities. In very high latitudes, it requires a protection, the expenses of which are widely disproportionate to its value; and in low, its soft, fine clothing is converted to a loose coarse garment of hair. No one can be found so foolhardy as to attempt to raise the fruits of the tropics in open sky, at fifty degrees above the equator, or to substitute the reindeer for the camel upon the sands of Africa, or the camel for the reindeer among the snowdrifts of Siberia. It would be a defiance of the operations of well-known, unyielding natural laws,—an act of stupid folly; and little else than such, is the attempt to transfer any of the vegetable species from its own to unwelcome localities. Efforts at acclimation have, with very few exceptions, been unavailing. The effects of climate have destroyed the favorite exotics, long before they could adapt themselves to the circumstances of their new situation.

By climate, as connected with agriculture, something more is intended than those alternations of temperature, occasioned by the seasons in the different geographical parallels of latitude: there are local, which modify, strengthen or counteract the influences of these general causes, and which merit the special notice of the practical husbandman, who, when he may, would make nature his auxiliary. Little can be inferred of the climate of any section within the temperate parallels, by the mere knowledge of its distance from the tropic. While the English farmer in Northumberland, is busily preparing his well dried field for the barley crop, the farmer of Berkshire, 500 miles below him, may be riding on snowdrifts over the fences which enclose his stalk-grounds. Within our own local limits, we notice the effects of local climate. The ploughman, while, in early spring, subverting the

warm, alluvial sward of the intervale of the Hoosic, sees on either hand, the hill-sides covered with a patch-work of grass and snow, and gives, with philosophical accuracy, his judgment, that no spot can there be found for a profitable corn field.

The physical circumstances, which principally affect vegetable growth, are temperature and light, moisture and soil. Soil may be improved in a thousand ways. The influences of moisture may be modified materially, by draining and irrigation. Where found in excess, it can be reduced by open or covered trenches,—where deficient, supplied by dykes and subterraneous conductors. In the north of Europe, and in this country, large tracts have been reclaimed from marsh and moor, by drainage, and swamps of sedge converted to luxuriant meadow grounds; and by irrigation, in the south of Europe and Asia, entire districts have been transformed from silicious barrens, into garden closes, and rich fields of perennial herbage. Over temperature and light, however, human agencies have little control. The winds from Hudson's bay and Labrador, charged with sleet and frost, will sweep over our corn-fields in spite of us, and spread over the fruit trees a mantle of icy crystals. The winter, asked or unasked, will make himself our guest from October till May, consuming our own and the stores of our flocks,—nor can we, do what we may, prolong the annual visit of the sun, till, by his light and heat, he mature for us a crop of rice and cotton. These are, however, no reasonable causes of dissatisfaction. If there be other suns of longer continuance, and other winters of shorter stay than our own, those who enjoy them, have less of energy and more of lassitude—more of the wearisome indolence of leisure, and less of the gay activity of industry, than we. We cannot rear the animals nor raise the vegetables of every climate: such is not the ordination of heaven here or anywhere:—it is enough, that a greater variety of those which are useful, can nowhere else be propagated than here. The dwellers upon the prairies of the west, may point us to their wheat-fields of a hundred or a thousand level acres; we in turn, can bid them listen to the beatings of the flocks from Saxony, upon our mountains, answered from our valleys by the lowings of our herds from Devonshire and Durham. Climate and soil have made theirs the business of tillage—ours, the business of grazing husbandry. The assertion that grazing must be the business of the Berkshire farmer, should perhaps be qualified. In some favored localities, most of the plants of the temperate regions can be successfully and profitably cultivated; but these, compared with the moist and elevated districts, where their cultivation would be expensive and uncertain, are limited. It may, therefore, be safely affirmed, that grazing is and must continue to be, our leading agricultural occupation. But even to the profitable pursuit of this, it is said, that our interminable winters are opposed,—that they require large supplies of food, and leave a brief space only in which to grow, prepare and store them. True it is, that we are hurried from the plough and hoe to haying and the summer harvest, and thence without recess, to the autumn crops, which are scarcely matured and gathered, before the north pours down again the desolations of winter. But it should not be forgotten that there are benefits resulting from this state of things. Were our winter period abridged, or its severity very considerably mitigated, the effects would be witnessed ultimately, if not presently, in the deteriorated staple, and diminished quantity of our wool, for it is

an established physical law, with few exceptions, that the fitness and quantity of the natural clothing of animals, are adjusted to the frugidity of the climate in which they live. Besides, it is well ascertained, that animal plants in general, attain a greater size and a higher degree of perfection when the winters are long, and the summers warm and light, for the reason, that the alternate action of heat and cold, rain and ice, meliorates and softens the ground, and prepares it the better for their nourishment. Could not the objections to climate, suggested, be obviated, in a measure, at least, by substituting for some of the crops at present raised, others better suited to it, and requiring at the same time, less labor and expense, and affording a greater amount by the acre, of nutritious matter? It is thought by those whose experience should enable them to form a correct opinion upon the subject, that were the esculent roots substituted partially, at least, for maize and other grain, a much greater quantity of food might be obtained by the same labor and expense. To this topic let our thoughts for a few moments be directed.

It is well known with what fondness we regard, and with what care and perseverance we cultivate, that native of American ground, Indian corn. It is with great reluctance and diffidence, that anything is said in disparagement of this king of plants. Its excellence justifies the highest commendations. Like every other member of the cereal family, however, it has its appropriate nourishment, soil and seasons. It cannot be made to flourish every where and in all seasons, as the past season has most clearly demonstrated. In most of our towns, he is unwise who looks to his corn-crib solely, for the means of replenishing his pork and beef barrels, or to help out his deficient hay-mows. There are vegetables, valuable as food, and of great productiveness, to which all the varieties of our soil are adapted, and of which a May snow storm, or a September frost, cannot deprive us. To these the whole turnip tribe belongs—a class of esculents, which, in the country of our ancestors, has for more than half a century, been highly appreciated; but which, till lately, has obtained with us but little favor. The published accounts in foreign journals, of the turnip culture, induced several intelligent farmers here to make a series of experiments, the results of which have answered, in every respect, all which could be anticipated. But many American husbandmen, slow to accredit the authority of the books, and slower still to admit in practice anything bearing the semblance of innovation upon ancestral maxims or usages, have remained unimpressed by these results. Its advantages to English agriculture have been immense. No single species of vegetables has wrought more good. The introduction of the improved turnip culture into the husbandry of Great Britain, says Mr Brown, "occasioned one of those revolutions in rural art, which are constantly occurring; and though the revolution came on with slow and gradual steps, yet it is now completely and thoroughly established. Before the introduction of this root, it was a difficult task to support live stock through the winter and spring months; and as for feeding and preparing it for market, during these inclement seasons, the practice was hardly thought of, and rarely attempted. Since its introduction, abundance of food has been provided for man and beast, and soils before sterile and useless, have been cultivated with profit and facility, and turned to the uses for which they were physically calculated."

It is made certain, by repeated trials, that the several varieties of this root are at home in our climate. It was long ago told by Pliny, that it delighted in "an air temperately cool, and preferred elevated table lands, rich with decayed leaves, to the fertile plains along the margin of the great sea." It is of rapid growth, and resists, uninjured, the early frosts, which destroy a great majority of the annuals. With proper care in cultivation, it rarely disappoints the hopes of the husbandman. That both alone, and when mixed with other esculents it is very nutritious food for domestic animals, long experience has clearly determined. For sheep it is invaluable. A German or English shepherd, could not be persuaded to dispense with it. When mingled or alternated with dry food, as cut hay and straw, its succulence corrects effectually, their feverish, obstructing tendencies, and by its laxative action, heals or prevents many of the disorders which so frequently depopulate the sheep-fold. A member of our society, whose flock is one of the largest, and best, and most carefully tended in the county, raised several hundred bushels of the Swedish variety the last season, which he fed out intermixed with his dry fodder. He states that "100 bushels of rutabaga are equivalent to 1 ton of hay; that he raised 800 bushels upon an acre; that it is food which sheep and cattle require during our long winters, to prevent diseases contracted by being kept entirely on dry hay and grain. He fed last winter, 2000 bushels of roots of various kinds; commenced with 1003 sheep, 20 head of cattle, and 2 horses, and all, except 7 sheep, left in better condition than they entered the fold." He has now growing 5 acres of rutabaga—a practical evidence of his conviction of its utility. There are several varieties of turnip, differing in amount of nutriment they yield, the periods during which they retain, unimpaired, their valuable qualities, and in the modes necessary to their perfect cultivation. The choice sorts, however, are limited to what are commonly called the English globe, and Swedish or rutabaga, as early or late supplies are wanted. The globe, the more prolific of the two, rarely remains good after the winter months, and is used for early feeding. Upon this, the graziers of England and Germany fatten their cattle and sheep for the fall market. The Swedish variety has excited the greatest attention with us. It is grown with ease, and cultivated at moderate expense. If the opinion of those conversant with it, is entitled to regard, it is indeed an article of the greatest importance; affording green food of the choicest quality—highly relished by every kind of stock, and of incalculable advantage in a late season. Its vigorous resistance to the inclemencies of the weather, when growing, and its obstinate retention of succulence, after vegetation commences in the spring, entitle it indisputably to rank as a sure crop, and as the farmer's latest spring food. Of its productiveness, accounts bordering upon the incredible, yet within the strict lines of truth, have been given; accounts, which would stagger belief, were there any ascertained limits to the productive powers of a soil of the right constitution, under good management. Our purposes do not require a repetition of extravagant statements. A farmer in the eastern part of our State, who has written and done much for the good of our cause, reported to the committee of the Massachusetts Agricultural Society on agricultural experiments, a crop of 903 bushels to the acre of 50 lbs. to the bushel—the standard weight of the society; making 50,568 lbs., or a fraction more

than 25 tons. By the analysis of Sir H. Davy, found in his agricultural chemistry, the nutritive matters afforded by 1000 parts of this root is 64; that afforded by a 1000 of Timothy or herds grass, 33. This analysis, if made the rule by which to determine relative values, would make the crop of 25 tons of rutabaga equivalent to 46 tons of hay. The solutions of the laboratory, however, though curious, cannot be regarded as the best means of discovering the absolute value of alimentary substances. It is not enough to separate and measure their constituents, since certain combinations of them may be more nutritive than others. Experiments made at the stalls and in the yard, will disclose the truth, and if the animals there grow and fatten faster and better upon one article of food than another, the relative value will be readily and accurately estimated. As long ago as 1823, Col. Wilson, of Deerfield, raised of this root 1100 bu. the acre. We need not go beyond the limits of our own jurisdiction, for instances of its great productiveness. On our hills, and on lands which those who examine the books only for its favorite soil, would pronounce unfriendly to its growth, it has been raised for successive years at the estimated rate of 800 bushels to the acre, and been used not simply as a substitute for hay, but for fattening for the market, all kinds of farm stock. It is obvious that much too little thought and labor, are bestowed upon the cultivation, not of this only, but of the other roots. The carrot, beet, potato, mangel-wurtzel, have all a just claim to the regards of the grazing husbandman. Can the earth be more profitably used than it was by Mr Ware, of Salem, whose crop of carrots weighed at the hay-scales, at the rate of 44,576 lbs. by the acre, measuring 923 bushels? or than it was by Mr Lathrop, and has been by a thousand other men, who have raised 700 bushels of potatoes upon an acre? It would seem that the oat crop, as abundantly productive as it is, and by no means to be neglected, has less claim to the regards of the cultivator, whose eye is intent upon the profit of his labors. It may be said that these are the results of high cultivation; this is not strictly true, and the results themselves prove it. High cultivation should be encouraged, for the sooner we learn the immense productive powers of a perfectly cultivated acre, so much the better. Much is attributable undoubtedly, to skilful management, in instances of uncommon success, but quite as much to the kindly influences of climate, and those peculiarities and characteristics of soil, required for the full and free development of the special qualities and properties of the plant. Objections are often started to the expenses incident to the root culture. It is said that much labor is required, more than is demanded for the successful culture of grain and grass, and that we have less of labor than of other capital. These are no startling objections to a Yankee population—a population expert and inquisitive, whose strength lies, not like Sampson's, in locks which may be shorn, nor in those giant arms, which fable tells us were employed in piling Ossa upon Pelion, to scale the heavens; but in that reposeless, studious perseverance, which withdraws not from its purpose till satisfied that no agents for its accomplishment can be found in earth or air. The objection applies no more strongly to this than to other agricultural operations. Labor-saving utensils are already contrived and provided for it: if defective or faulty, ingenious experience will correct and perfect them. The drill-barrow and cultivator, or horse-

hoe, where the drill system is adopted, (and no other should be,) will perform the work of many hands, pursuing the ordinary modes, and will enable the farmer to raise a field of Swedes or globes, mangel-wurtzel or sugar beets, as easily as a field of potatoes of the same compass. It should not be a matter of complaint, that mechanical labor-saving improvements have done less for agricultural than manufacturing pursuits. The novel combination of the mechanic powers have, and probably can, he made to have, comparatively, little application to the business of husbandry. We may, perchance, plough, but we shall never reap or mow, by steam. It is well that it is so. No matter if facilities be not furnished, which will diminish the number necessarily engaged in the untempting, healthful, joyful pursuits of agriculture. With the plough and the sickle, the hoe and the pruning-hook, the domestic happiness and moral purity of a people such as we are, are intimately associated. He is a fortunate husbandman whose intelligence has revealed to him the pure, peaceful, peerless joys of his occupation,—who reads as from a holy book, dropped down from heaven, the manifestations of love and kindness, standing out in high relief on everthing around him,—who hearkens to the lessons of wisdom and notes the intimations of duty, which the dumb even of his charge impart; whose ox teaches him the despised virtue of submission, and rebukes his complainings; whose noble horse illustrates the excellence of docility, and speaks to him of the careful gratitude due to laborious fidelity;—the dam of whose fold, bereft of her lamb to fill out the dishes of luxury, in accents of distress which human speech cannot articulate, tells him of the excessive tenderness of maternal love, and of the wickedness of that heart which would increase a mother's anxious cares. No one holds intercourse with nature so pleasant, so instructive, as the farmer. It is with organized, living, breathing things, that his pursuits associate him. These are, or should be, his study: they have enough of novelty to amuse, enough of wonder to excite, to broad and deep inquiry. He may admit, but he should not envy the scientific mechanic, when he sees inert matter subjected to his creating mind and forming hand, and made actively obedient to his will,—when he beholds him borrowing of the wild cascade its motion, and reining and curbing the impetuous torrent as with a bridle.

(To be concluded next week.)

PREMIUM FARM REPORTS.

We publish next the report of Wm. Buckminster, Esq., of Framingham. Mr Buckminster received a premium of fifty dollars from the Massachusetts Society. He was honored likewise, with a premium on his farm this year, of fifteen dollars, from the Middlesex Agricultural Society. He received likewise, a premium of fifty dollars the last year from the Massachusetts Society. This is carrying a large swarth.

To the Trustees of the Massachusetts Agricultural Society.

GENTLEMEN:—I have made as correct a statement as possible, of the proceeds of my farm this season, and of my method of cultivation.

1. My answer to your first inquiry is—my farm consists of one hundred and fifty acres, exclusive of wood land.

2. It has a variety of soil. Its general character is a light loam, rather inclining to sand than

clay,—some gravel in different parts; some of the low meadows have a peat bottom; no clay.

3. I have always found that by mixing soils of different qualities, I made a more permanent improvement than by putting on manure of any kind. I put light sandy loam on to wet and heavy loam; peat is useful to both. The greatest objection is the expense of carting. When the mixture can be effected by the plough, as it often can, the sub-soil often differing in quality from the surface soil, it is done at a very cheap rate.

4. Mine is a stock farm and I till but little I have in tillage this year, seven acres, including nursery. On a lot intended for corn or potatoes; put about 20 loads or 5 cords of manure to the acre generally.

5. I use both long and compost manure.

6. I never put manure in the hills. It is one of the worst modes of practice. It jeopardizes the crop the present year, and operates unequally on the succeeding. It is an invitation to worms, and lessens the labor of the crows. It gives you more stalks than corn—more vines than potatoes—and more labor is required than in spreading it. I plough in the coarse manure and harrow in the fine.

7. I plough the green sward just before planting—first having spread on long manure; never suffer the manure to dry after spreading. Put a handful of ashes on the hill of corn; a spoonful of plaster on potatoes.

8. I mow, this year, about 45 acres of upland, including interval that can be ploughed; and we judge that we have cut 40 tons of merchantable hay on the same.

9. I irrigate none but low meadows—think the practice of watering high land injures the quality of the hay.

10. By making dais across the brook, I flow most of my meadows occasionally, and improve the grass both in quantity and quality. No matter how wet these meadows are kept, if the water is not suffered to stagnate and heat. These low meadows are spoiled for meadows, by ditching. If we drain them we must introduce the English grasses.

11. I mow 25 acres of coarse meadow grass, very suitable for young stock, worth half the price of English.

12. I have reclaimed much low peat land, within a dozen years, and continue the practice. I began by paring and burning the surface. This mode has some advantages. In a dry summer, an acre may be prepared for the seed at an expense of 20 dollars. The ashes furnish an abundance of manure for two or three years, and I have thus obtained one and a half tons of hay to the acre without other manure. But as many seasons prove wet, and stop our whole progress for the year, I have abandoned this mode, and prefer to cart on loam or sand, or gravel, in preference. When banks of this kind are near the margin of the meadow, a man with one yoke of oxen will cover over one acre in six days—\$12. Ten loads of compost must then be hauled on—\$10. This is the lowest estimate. A few years ago, I sold about four acres of such land at \$200 per acre. Before it underwent this process, the same land never yielded a dollar per acre. I have reclaimed one acre of low land, which is not a peat bottom, at very little cost. When I purchased it, twelve years ago, it had never borne any crop. It was too wet to grow bushes. I drained it, and have gathered ten good crops from it in succession without any manure. Two of these were corn—one, potatoes; the other crops

were grass, and we have often cut two of these in a season. Last summer I sold the standing grass on this acre, for two tons, without weighing,—the purchaser paid, within a fraction, twenty dollars for it. Since that, in August, we cut one load for a horse, of rown, on the same, and now the cattle are taking from it a third crop. The soil is a black light mould, three to four feet deep—so light and puffy that we were obliged to carry on 20 loads of loam from the roadside, before the seed would vegetate. Since that, we have applied three or four loads of leechd ashes to the surface. This acre has been kept thus productive, by merely ploughing in the rown, or second crop once in three or four years, and sowing grass-seed on the furrow in September. Thus I kill the sour grasses without going through the unprofitable process of planting and sowing wet lands.

In reclaiming meadows that are tolerably even on the surface, I first drain them—then cart on loam, &c., enough to cover up the grasses completely, *not having mowed the grass*—this long grass helps to fill up the cavities, and much less loam is required to cover it. We lose the grass, but it is soon turned to manure, and we are not so likely to hear from it again as if we had cut it close. It is my rule to convert one or two acres annually into English. By the time the coarse grass makes its second appearance, the sward below becomes so rotten that a common plough will turn it up.

13. I planted but one acre of corn this season; expect from it 60 bushels: spread on the manure and ploughed it in—put ashes in the hills. I now plant my rows one-fifth of a rod apart, and the hills two feet distant in the rows. I can thus obtain more corn, and as I have a machine for planting it, the labor of planting seven thousand hills in an acre rather than four thousand, is not increased. With this machine I can plant an acre completely in one hour and mark it out. Without it, I was twenty hours in doing the same labor.

14. I plant less than an acre of potatoes this season—consider them an exhausting crop on light loams, and can always obtain better grass after corn than after them. I spread on the manure and plough it in—hull them a little at the first hoeing, but not afterwards—use the cultivator for these and for corn—do not hill up the corn except with the mould thrown up by the cultivator. This instrument performs nearly the whole labor of tilling corn, when that is planted perfectly straight, as the machine does it. Our potatoes are unusually small. Mine will not yield 75 bushels to the acre, and I see many fields that were manured in the hill yielding much less. I plant the long red and the Chango—some blue noses.

15. I have now growing one acre and a half of rutabaga and half an acre of English turnips, planted to give to cattle—expect to gather 800 bushels from one acre;—can raise four bushels of these at less expense than one of potatoes. I planted one acre with eighteen thousand hills, in fifty-five minutes, with a new machine drawn by one horse. It marked out and planted, most perfectly, two rows at a time. I had no help but a boy to ride the horse. Here was forty-eight hours work performed in one, and only one pound and a quarter of seed used.

16. I have raised this season 200 bushels winter rye, sown last fall on newly cleared land;—seed was harrowed in—ground not ploughed—one bushel of seed to the acre. This was raised from less than ten acres. Have raised one acre and a half

of good spring wheat—not yet threshed—estimate 30 bushels. Last year the crop was Indian corn. In the spring the ground was first harrowed thoroughly and the cultivator was run over the corn stubs—then the ground was nicely ploughed, once only, for I did not wish, after burying up all the rubbish, to uncover it again. We covered the wheat with an iron tooth harrow—then sowed the grass-seed and covered with a bush.

I have a newly invented machine that sows grain and all kinds of grass-seed very even. It is a box placed on a pair of small wheels, and the harrow is hitched to the hind side of it, so that the team sows the grain or the grass-seed very nicely, and harrows it in at one operation. This may be seen at David Prouty & Co.'s store, Boston.

We sowed one and a half bushels to the acre of the tea wheat—first having washed thoroughly and limed it with two or three quarts to the bushel—slacked lime:—after the wheat was up, fifteen bushels of wood ashes were spread on an acre. These gave the wheat a fine start and kept the surface moist through the summer, and kept all the grass alive, that was sown in spring, through the drought of August. The soil is a gravelly loam. A bushel of slacked lime was sown on one part of the field, but we could not perceive that the kernel was better here than elsewhere.

17. In addition to this seeding with grass, I have sowed grass-seed, viz.: clover, honey-suckle, herds grass and red top, on my ten acres of rye, for pasturage. The clover and Dutch honey-suckle were not sown till last spring—some of it on the snow—it promises well. In September last, I ploughed about an acre of low interval, that had never been ploughed, and rolled it down close, then sowed grass-seed. It lay too low to be planted, and therefore it was never ploughed, and it has never yielded the value of one-fourth of a ton of good hay to the acre. I put on eight loads of manure, mixed with as many more of sandy loam. If this does as well as the adjoining acre, which was seeded in the same way last year, I shall now two tons from it. I have also seeded down about an acre of common meadow land, first draining it and then carting on loam on to the standing grass, and completely covering it up—ten loads of compost was then applied and the seed sown. Between thirteen and fourteen acres have been thus seeded this season. By planting but little of corn or potatoes, I have manure for my grass lands, so that by merely turning them over in September and covering up a green crop, I am enabled to keep all the mowing land in good order, turning it over as fast as it becomes bound out; and every time I turn it, whether I apply manure or not, I make the land richer, because I take no grain from it, but help it to a green dressing under the sod. I raise grain in sufficient quantity for my family and hogs, but cannot afford to raise grain for the market.

18. To increase the manure and to preserve it, I put the best soil I can procure from the roadside into the hog-pen and into the cow-yards, and under the sheds and the barns where the cattle lie. Soil is thrown into the hog-stye twice a week—also under the privy, which is set high; by this means, all disagreeable effluvia from these places is neutralized, and a large quantity of manure saved from evaporation. Still, my cheapest mode of making manure is, to turn the sod with a plough when it has a coat of grass on it—if it has none, give it a coat of buckwheat, which will grow on very poor land. I sometimes turn in two crops

of buckwheat in a season. When this is well done it is equal to 20 loads of stable dung to the acre.

19. I keep one yoke of oxen, two horses four cows, and young cattle enough to consume my coarse hay. I have wintered 40 head, and sold four hundred dollars worth of hay the same season. I usually keep from 35 to 40 head through the year. I have three barns, and each has a cella under the whole area. One is 70 feet by 40—one is 40 by 30, and the other is 33 feet square. The young cattle go loose under these barns and sheds attached to them, all winter, and are much more comfortable than when tied up by the head. They can always choose a dry place to lie in, and they eat coarse hay better when loose. They are watered in the yards and are never suffered to roam in winter. Not one pint of the liquid manure is lost, for it is absorbed in the loam and in the refuse hay. My cows also lie loose under a barn by themselves. They lie much cleaner through the winter than in stalls; their bags are clean, and their milk is as sweet in winter as in summer. One-half the labor of tending is thus saved, and the cattle winter better.

20. I purchase most of my cattle from the Vermont droves—a mixed breed.

21. When I raise calves, I suffer them to suck the first part of the milk for three months, and milk the last part for butter; they are then not so likely to be pod-bellied as when taken immediately from the cow.

22. Mine is not a dairy farm. Most of my pasturage is too distant to drive cows. We make our own butter.

The profits of my farm arise principally from the sale of cattle and hay. We reckon the value of the milk from four cows, at \$35 each—\$140.

23. I wintered 4 breeding sows, and raised from them 28 pigs—sold most of them at eight weeks old.

24. I keep them in summer on the refuse of the dairy—give them very little grain—had the breed originally from New-York,—cannot afford to raise or to buy much grain for pork; rutabaga roots are cheaper than potatoes to feed them with.

25. The best article to be thrown into the hog-pen to increase and to preserve the manure, is loam. We should not throw them peat muck; they will not fatten so well, and they become very filthy in rooting it over. Straw and refuse hay is better to be put under cattle than hogs. Hogs mix up manure very industriously, and turn it many times. They prepare it for immediate effect in the field; but it is much overrated: it looks richer than it is; it has been stirred so much, it is ripe for immediate action; but it lasts not so long as manure from neat cattle or from horses; its strength is gone the first season. Horse manure, if kept from heating too much, is more lasting and more valuable.

26. My mode of farming requires very little labor: one man can perform the whole, except the haying. I hired this summer, one man for seven months, at \$16 per month; one-sixth of this time he had lost, taking one day each week to himself. For three weeks in hay time, I hired on the average, three additional hands—nine weeks. My son, a lad of eighteen, has assisted two-thirds of his time, and I have done but little on the farm myself, except in hay time, about one month, when I labored half the time.

In hay time I gave one dollar a day on the average. One steady man and a boy twelve years old, would do my work for the seven months after April

first, except the haying. In winter I hire none, and have but little to do to tend my stock.

27. I have five hundred apple trees, and most of them are grafted.

28. I have forty pear trees, thirty-five peach trees, twenty bearing English cherry trees, three black mulberry trees, three plum trees, five quince trees, and two Siberians.

29. Borers have not troubled us much: canker worms are not plenty this year. To kill them, dig about the trees, or plough, or turn in hogs in the fall and sow corn about the roots.

30. We use no ardent spirits. Cider and water sweetened with molasses, is our strongest drink.

Principal amount of produce this year:
Hay for sale, 25 tons \$400
Have sold 10 beef cattle for 367
Have still to turn this fall, 8 more, valued at \$240; but I deduct therefrom the original cost of the cattle, \$116; this leaves to be added 134

And I keep the stock good in number.
Sixty bushels corn \$60; 200 do. rye \$250, 310
Three acres buckwheat, 43 bushels, at \$1 43
1000 bushels rutabaga for stock, not counted.
30 bushels wheat at 10s. 6d. 53
70 bushels potatoes 28
Sold hogs and pigs to the amount of \$81 1-2 81
Two on hand to keep stock good.
145 bbls. good merchantable apples at 7s. 169
30 bbls. cider at 7s. 6d. 37
Cash for cattle taken in to pasture 25
Produce of 4 cows at \$35 each 140
For trees sold from the nursery 48

\$1,835
Deduct half value of potatoes that will be given to stock or hogs 14
\$1,821

This is as accurate a statement as I can make. I cannot say it is perfect,—it is nearly so.
WM. BUCKMINSTER.

[For the N. E. Farmer.]

RED OAK SHINGLES.

MR EDITOR—I think it a duty of every one to make known to the public, all experiments that are likely to be useful to the community.

In 1830, I built me a house, and covered one roof with shingles made of what we call red oak. The shingles I split and shaved myself: they are quite as easily made of oak as chestnut; they split more freely and shave as easily. The shingles have been on the roof nine years, and from present appearance, they will last longer than a coat of the best of pine shingles. They are as free from warping and twisting as pine; the wood is much harder and does not wear so fast. Good pine shingle timber is scarce in this part of the country, and there is in many places, large quantities of oak; therefore, from nine years experience, I think I can safely recommend it to the public.

Any person having a desire to see the proof of the experiment, will please call at my house and examine for themselves, in the north east part of Sturbridge.

GARDINER WATKINS.

A new sloop of war called the Decatur, of 16 guns, was launched at Brooklyn, N. Y., last week.

MULTIPLYING SWARMS OF BEES.—All who have read the Georgics of Virgil, will recollect the story which the old poet relates, of manufacturing swarms of bees by beating a heifer to death, and leaving her carcase to breed bees. This mode will do much better in poetic theory than in sober practice. By studying nature, and following or applying the laws which are unfolded to us by careful research, many things can be accomplished which were before considered among the impossibilities. This is proved by the researches of Mr Weeks, of Salisbury, Vermont, into the natural history of bees. He has become so familiar with their manners and customs, that he thinks nothing of taking a few spare ones from any hive, shutting them up by themselves, and after compelling them to raise to themselves a queen, sets them to raising up a swarm of their own. At first we were a little inclined to doubt this; but after reading his treatise, which is full of practical instruction in the business, and having some correspondence with him, we have come to the conclusion that it must be so.

The following extract from a letter received from him, dated March 25th, will be interesting to our readers. "I am indebted to a gentleman who had travelled in Italy, for my first thoughts of compelling bees to make queens. I devised means instantly to try the experiment, and succeeded. I tried again and again, and in various ways and under various circumstances, and never failed in a single instance.

I have had them robbed, but never until after the young queen had made her escape from the cell where she was raised. That the birth of the queen is hastened so that she hatches several days sooner than her sisters, (Larvæ) there can be no doubt. The fact is obvious to every close observer. Now whether it is the difference in food, or change of position, from a horizontal to a perpendicular one, which changes her nature to a queen, is more than I can tell. But one thing is certain: their nature must be changed, if changed at all, before they have obtained their entire growth, for all chrysalises, with which I have any knowledge, become perfect—entire—before they reach this period of their existence. If I am not mistaken, all naturalists agree to the following fact, which is this: 'The peculiar jog which constitutes a male or female in the insect tribe, is produced while in the larvæ state; not by design, however, in many, as in the honey bee tribe.' * * * * *

In regard to the multiplication of swarms, he observes: "That bees may be increased to any extent without swarming, there is not a doubt. Compelling the bees to make extra queens, is the foundation of the whole business. And this may be done in any country favorable to the raising of bees.

The most northern latitudes are not as favorable to increase colonies of bees without swarming, as in a more mild climate, and where the seasons are longer. I have tried this experiment several times, and have not yet failed. I have divided them, and received a swarm from one of the divisions the same season. I have transferred and divided in the same season with perfect success, and thus far I have not failed in a single trial, when the experiment was made in accordance with the rules set forth in my manual. Bees may be increased to any extent without swarming, where the seasons are favorable to that object. In this latitude the seasons are too short to make very rapid advances.

Artificial heat is not as favorable to the breed-

ing of bees, nor to their health and lives, as natural heat. I have set them to breeding in January, but I found that the heat produced by the fire, though moderate, in the course of two weeks caused death in many of the old bees, and a chill destroyed the larvæ, and I was compelled to relinquish the winter enterprise, as unprofitable business. I am inclined to think that a room may be so constructed and so warmed by heated air, that swarms may be forwarded in the spring to great advantage."

We trust that Mr Weeks will pardon the liberty we have taken, in publishing so much of a private letter; but the information is so novel and interesting, that we deemed it a duty to lay it before our readers.—Maine Farmer.

AGRICULTURAL STATISTICS.—The following statistics of the county of Susquehanna, are from an official report made to the Legislature of Pennsylvania, for 1838:

No. of farms	2768	Acres of turnips	73
Acres of wheat	5439	" Buckwheat	3546
" Rye	1624	" Flax	195
" Corn	3330	" Rotabaga	32
" Oats	8404	" Peas	230
" Meadow	34792	" Beans	83
" Potatoes	2367		

		Aggregate val.	
No of maple trees tapped	97,961	\$23,502	64
Wheal No. of horses	3,998	195,925	00
Oxen	2,919	99,425	00
Cows	8,187	164,305	00
Sheep	51,600	84,101	00
Swine	9,033	12,800	00
Neat cattle of all ages	22,746	454,920	00
Lbs. of butter sold	257,325	14,519	00
" cheese sold	58,550	3,659	94

The average size of farms, 105 acres. Of barley 178 acres were raised in the county. Corn averaged 33 bushels per acre. Potatoes 170 bushels per acre. The county has a surplus of oats, corn and potatoes. 193,783 lbs. of maple sugar were made, averaging 3 lbs. to a tree. The best crop of rutabaga on record in the United States, was raised in Chocornton township, averaging on 3 acres more than 1200 bushels per acre. 342 tons of plaster were sown. Dr. Rose, of Silver Lake, has a large number of merino sheep, and sold 18,000 lbs. of wool, at 44 cents per pound.

EMBALMING.—A fluid has been discovered, in London, says the Nantucket Inquirer, whereby the bodies of dead animals may be preserved for a great length of time, in all the perfection of which nature, deprived of vitality, is susceptible. Several specimens of large birds, preserved by this process, were recently exhibited before a medical society in London, which excited great admiration. The body of a man was also submitted to inspection several months after death—the flesh of which retained its natural softness and elasticity, and exhaled no disagreeable effluvia. The discovery is thought to promise much advantage to the cause of anatomical science.

MORE GOLD MINES.—A rich mine of ore has been discovered at Lemmen's mine, fifteen miles from Charlotte, N. C. It is computed that a bushel of the best ore is worth five thousand dollars, and the poorest one hundred dollars. Several new mines have been opened in that region with great prospects of success.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, APRIL 24, 1839.

We give with pleasure to our readers, the subjoined agreeable letter, because we know it will give them pleasure to read it. We had prepared the usual editorial dish, but this is a much more agreeable and spicy viand than anything we could serve up; besides, it is not designed to keep; and now is the time to place it on the table. There are some observations of much practical utility at the close. H. C.

MR. COLMAN: The past winter in Berkshire, has been one of peculiar clemency. The first dawns of spring have been of kindred character. March, to be sure, came in with some roughness, but none of the lion-fierceness for which it is usually characterized. It went out with all the meekness of a lamb, distinguishable for nothing save its warm sunny days, with occasional soft showers. April, for the first nine days, was very warm and dry. On the fourth, the mercury rose, at 2 o'clock, p. m., to 90°; fifth, same hour, 80°. The 12th was very rainy, with N. E. wind; 14th, wind N. W.; snow; ground quite white. Vegetation has come forward with sufficient rapidity. The *Tussilago* (colts-foot) is in bloom the 3d; *Dicra Palustris* (moose or leather wood) 6th; *Taxus Canadensis* (dwarf yew), the 7th; *Ulmus fulva* (slippery elm), the 8th; *Ulmus Americana* (common elm), the 9th; *Acer Rubrum* (red flowering maple) the 10th. But there is, of course, a check put upon these things, which we hope for a few days at least, in fear of worse consequences will remain. The season has evidently been too forward to hold out, and a little snow now, is much less annoying than in May.

The late rain has much revived grass and winter grain, which, considering the freezing and thawing to which it has been exposed, now looks unusually well; of the latter, however, there is but a small quantity on the ground in our vicinity.

Ploughing for spring crops is considerably advanced; but little seed, however, has yet been committed to the earth. Prudence has rather delayed sowing, in anticipation of cold storms and checking frosts. It is well to delay these things in a clayey soil like ours, until about the usual time, notwithstanding warm suns, and gentle winds and rains, may advise to the contrary; for the heavy rains will descend, and their effects are to consolidate the earth, however well it may have been prepared, so that the young and tender plant will find it difficult to push its tender blade through the surface, and crowd itself forward to maturity and harvest.

Maugre the veto which the winds and storms have put upon the movements of the plough and harrow, there are still many things of kindred importance, still on hand, to invite the attention of the enterprising farmer, such as removing stone from his meadows, clearing up his old waste places, and, if he has taste in matters of rural improvement, transplanting a few trees, to "grow with his growth and strengthen with his strength"; to furnish himself and friends with beautiful shades from the valtriness of a vertical summer sun; to stand as beautiful monuments of his labor and skill, when his labors are ended, and enrich posterity with many an ennobling thought of his regard for their comfort, when ordinary men of his own times shall be forgotten.

Since our fathers have not only cleared fields and planted trees, that we may eat the fruit of them, and dug pools of water, that we may drink thereof; in short, done so many things which have passed to our express

comfort, we think it not only rational, but duteous of us, who have entered into their labors, and are enjoying the richer part of the reward thereof, to testify our gratitude by planting for the benefit of others. Let us then now, when a favorable season for the operation is passing away—a season which has come some days earlier, so promising to be somewhat longer, as if to invite us to the pleasant and profitable employment, by our example invite all around us to devote a few hours, days if possible, to planting out trees. We ourselves, shall surely find ample compensation for our toil, not only in the opening bud, when future springs shall come to people the forest with new verdure and the earth with flowers, curious to behold—not only in summer, when the ample leaf woos the dying zephyr back to life and quickens it to a breeze, but when autumn spreads its russet hues over the scenery, or when winter comes, with storms and tempests clad, to shake the leafless bough, and hasten the reign of terror in its career—then, then they break the fury of the winds, and reduce the rigors of frowning climate.

Why the culture of trees around our dwellings and by the way-side is not more attended to than it is at present, we cannot imagine. They surely regulate the atmosphere which surrounds them, and by their wonderful organic properties, inhale many of its qualities, which though salutary to them, would be highly deleterious to ourselves, beside ornamenting the grounds which sustain them. We have actually known unhealthy localities rendered free from all pernicious qualities by the influence. But were health not promoted by them, how does a dwelling look, standing "in unblushing nakedness," with no tree to shield it from the heat of summer or protect it from winds of winter? Like a world without a soul; and we very often are tempted to doubt, when passing such habitations, whether their denizens possess the immortal principle which alone constitutes the nobility of man. They surely cannot possess it in the nobleness of social and refined excellence.

But with those who do occasionally "confer a benefit on posterity, by planting out a tree," there are some defects in "modus operandi" which may properly be cured. We refer to cutting off the tops—a species of inhuman butchery, which cannot be too severely reprobated. The main shoot should always remain entire; if destroyed, the effect will be bad. The branches may all be taken off without detriment, as they will replace themselves; but when the stalk or upright shoot is amputated, a side branch usually takes its place, and from it the head of the tree is formed, not however in a firm and durable manner, for it derives its support from a sickly fountain, and in premature age is frequently prostrated by the winds, leaving the stump which sustained it, in lonely widowhood.

Another error is, in taking up less root than the necessities of the tree require; we cannot be too particular in this part of our operation, nor obtain too much for the convenience of the plant. Grouting, or smearing the roots in soft mud, is very beneficial in planting trees, and is easily performed. We have practised it in removing trees at all times, in all seasons, with entire success.

Yours, truly, W. B.
Mount Osceola, April 15, 1839.

THE SEASON.

The season was never more beautiful and promising; and for any person who desires any better weather or any better climate than we have been blessed with since last November, our only prayer is, that he may find one as soon as possible. For ourselves, we ask for nothing better. The springs were at one time quite low; and

with some persons, a slight inconvenience was felt in regard to water; but a most copious rain, of several days, coming in exactly the gentle mode we could desire, at the time most needed, and in the quantity suited to our wants, has stilled all complaint, and presents claims upon our gratitude, which every one must feel who has a heart to feel anything. The grass is well set. The winter grain is looking well. The agricultural operations are everywhere going on without impediment, and with due diligence. We advise, always, to ear planting of corn. There is no danger of getting it in too early, if the ground is prepared for it. We have found with scarcely an exception, in the experience of more than thirty years, that the early planted, in strength to resist drought, in abundance of produce, and in security from early frosts, has always had the advantage over late planted.

Potatoes, for early use, should be planted early, of course. If designed for a winter crop, the time of planting should depend on the kind planted. The La Plata, or long red potatoes, require as much time as you can give them. The Chenango, if designed for winter use, need not be planted early, as the season of their maturing is comparatively short; and in general, it is desirable that potatoes should be taken from the ground as soon as the plant is ripe, and the vines dead. For Ruta Baga, some persons advise late planting. Our opinion is in favor of getting them in by the last of May, or the first week in June. Carrots for winter use, need not be sown until the first of June. We advise that the seed be sown in the wet sand before sowing. It is otherwise a long time in coming up, and the weeds are apt to get the start of it; and to render the cultivation of it vexatious and difficult. For Mangel Wurtzel and all the beet tribe, we advise the last week in May. Planted earlier, they are very apt to be eaten off by an insect or worm. Planted late, they are not secure against his depredations; but the chance of security is greater. Parsnips cannot be planted too early. It is greatly to be desired that this as a field crop, should receive much more attention than hitherto it has done. In the islands of Jersey and Guernsey, they are raised abundantly as food for stock, and deemed a most valuable crop. We have tried them for milk cows and fattening stock, with great advantage. They are subject to few casualties. The seed is of trifling cost. They may be left in the ground until the spring with impunity from the frosts; and then taken out at a season when such feed for cattle is greatly needed. Farmers now, however, have no time to read a long homily; we therefore stop. Heaven is scattering its blessings about us in unintended profusion. Our only duty is, to work with industry and skill; to use with temperance; to bestow with liberality; and to enjoy with pious gratitude. "Paul may plant, and Apollos water, but God giveth the increase." H. C.

RHODE ISLAND.

Dr. C. T. Jackson, of Boston, the learned geological surveyor of Maine, has been appointed by the Legislature of Rhode Island, to make a geological and agricultural survey of the State. The appointment is, in every respect, eligible. We are glad to see our little sister holding her head as high as the rest of the graces in the circle. H. C.

Massachusetts Horticultural Society.

VEGETABLES.

The first specimens of Cucumbers presented at the rooms of the Society, this season, were from the garden of Samuel S. Lewis, Esq., of Brinley place, Roxbury. The specimens were fine, and do great credit to his gardener, Mr Henry Reed.

For the Committee.

JAMES L. L. F. WARREN,
Chairman.

April 6th.

BRIGHTON MARKET.—MONDAY, April 22, 1839.

Reported for the New England Farmer.
At Market, 205 Beef Cattle, 20 Yoke Working Oxen, 0 Cows and Calves, 250 Sheep, and 690 Swine. About 200 Swine were reported last week.

Prices.—Beef Cattle.—Last week's prices were fully sustained. More than the usual number were sold at the highest quotations. We quote First quality, \$8 75 \$9 00 Second quality, \$8 00 a \$8 50. Third quality, \$6 75 a \$7 75.

Working Oxen—We noticed the following sales, all of which were purchased for work. \$105, \$115, \$125, \$130, and \$150.

Cows and Calves.—Sales were effected at the following prices; \$30, \$32, \$40, \$50; and two at \$115; two at \$60 each, and one at \$75.

Sheep.—We did not obtain the price of lots.

Swine.—A lot of old hogs, part sows, at 7 1-2; a lot of barrows at 8, and a lot at 9; a lot of shots at 8 and 9, and a lot one third barrows at 8 1-2, and several lots small shots at 9 and 10. A treil from 8 to 11. A few small Berkshire shots at 12 1-2 and 13.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending April 21.

MULBERRY TREES, &C.

WILLIAM PRINCE & SON still have the following Trees for sale.

35,000 genuine Morus Multicaulis trees, from 1 to 6 feet high, which will be sold either trimmed or untrimmed, or in cuttings. The wood of these trees is perfectly mature, and they have been well preserved from all injury.

42,000 genuine Alpine trees, of a very superior character, at least equal to any in the Union.

10,000 of the splendid Morus Expansa, 5 to 9 feet high, and much branched—remarkable for its great excellence in every respect. This is the only large parcel of this tree existing in this country.

75,000 Canton, Brussa, Morus Elata, Rose of Lombardy, Roman, Pyramide Oriental, White Italia and other kinds; all of which will be sold at prices deemed moderate.

Also, a large assortment of the silk worm's eggs, of the most choice and valuable kinds.

Ample directions for the culture and successful propagation of all kinds of mulberry trees, will be given to every purchaser.

Flushing, near New-York.

April 17, 1839.

GRASS SEED.

Just received at the New England Agricultural Warehouse and Seed Store—A few casks of prime Eastern Clover Seed, and a fresh lot of Herds Grass Seed.

ap 24 **JOSEPH BRECK & CO.**

MORUS MULICAULIS.

A few thousand trees of the genuine Morus Multicaulis; also a few thousand cuttings of the same may be had on immediate application to the subscriber.

WILLIAM KENRICK,
Nonantum Hill, Newton.

HERBACEOUS PLANTS.

A great variety of Herbaceous Plants, of beautiful and hardy varieties, can be furnished by the subscribers from their gardens at Brighton at short notice. From 25 cents to \$1 00 per plant.

JOSEPH BRECK & CO.

FOR SALE.

The subscriber offers for sale his estate in Harvard, County of Worcester, the well known Bromfield Place; an excellent dairy farm, well wooded, the house spacious, fitted for two distinct families; the situation among the most pleasant to be found, especially for a private or high school. Bordering a part of the farm is a beautiful sheet of water, containing two islands belonging to the farm. Inquire of the subscriber at South Natick.

J. H. T. BLANCHARD.
April 17. 4w

STRAWBERRIES.

Gentlemen wishing to cultivate this delicious fruit are respectfully informed, that the subscriber has succeeded after a number of years of exertion in bringing the strawberry nearly to perfection.

He has for sale at his garden in Brighton, Mass. the following six varieties of the Plants. They are of superior stock and quality, and in the finest condition for immediate transplanting.

He will offer in addition his *Seedling Methren*, a very valuable kind, a free bearer, fruit juicy and very large, fruit measuring four inches was gathered the last season.

Methren Castle—Fruit from these plants have been exhibited at the Horticultural Society's Rooms, measuring five and a half inches in circumference.

Bath Scarlet—Fruit large, full bearer, and beautiful scarlet.

Royal Scarlet—Fruit long, oval shaped and juicy.

Hudson's—Fruit smaller but very numerous.

English Wood—Fruit well known.

Monthly—Fruit is gathered from these vines from June to October, and in good quantity and fine quality.

Orders left at the Garden in Brighton, or directed to him at Boston or Brighton, at J. Breck & Co.'s Seed Store, will be promptly attended to.

JAMES L. F. WARREN.
Brighton, Mass., April 17, 1839. eopis6w

DILLINGHAM POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store connected with the New England Farmer Office, a few barrels of Dillingham Potatoes. These are well known as a most excellent eating and very prolific kind. Also, a few Crown Horn Potatoes, a very fine kind, the celebrated Roban Potato; Early Whites, and Eastern Potatoes of various kinds.

April 17. **JOSEPH BRECK & CO.**

CORN SHELLERS.

Just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, a supply of Currier's Patent Corn Shellers; a very convenient and cheap article. A right to using said machines in counties or towns may be obtained by applying as above.

April 17. **JOSEPH BRECK & CO.**

WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at one quarter the expense of the common way of sowing his seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds: say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions, Corn, &c. It is highly recommended by a great number of persons who have used it the present season.

For sale at the N. E. Agricultural Warehouse and Seed Store by **JOSEPH BRECK & CO.**
April 3.

EARLY AND LATE PEAS.

For sale at the N. E. Agricultural Warehouse and Seed Store, a choice assortment of Early Peas, consisting of—

- Cedo Nulli, extra fine and Early Charlton.
- Knights' Tall Marrow,
- Knights' Dwarf do.
- Early Washington, Dwarf Sugar, extra fine pods,
- Russel's Early Dwarf, Fall Late Marrow Fat, do.
- Early English France, Dwarf do do.
- Early Golden Hotspur, Blue Imperial,
- Blue Prussian, Woodford's Tall Marrow.

In addition to our usual stock of Peas, we have recently received a few varieties of very superior Peas from England, viz:

- Marquis of Hastings, extra fine Marrow,
- Early White Warwick, early and fine,
- Cedo Nulli, very early,
- Waterloo Blue, fine large blue,
- Groom's Improved Blue, White Scimitar.

All of which are remarkably fine, and are considered as some of the most desirable varieties cultivated here or in England.

JOSEPH BRECK & CO.
March 27.

Just received at the New England Farmer Office, the Second Report on the Agriculture of Massachusetts, by Henry Colman, Commissioner for the Agricultural Survey of the State. For sale by **JOSEPH BRECK & CO.**
April 10. 51 and 52 North Market St.

A few Hives of Bees at the New England Farmer Office, March 20. **JOSEPH BRECK & CO.**

MISCELLANEOUS.

THE OLD MAID'S FIRST OFFER.

I must tell you the heart-rending story—I have long wished to do so, and the time is at length arrived. (Here her voice dropped into a confidential whisper.) Poor dear Major Ogilvie, who is now dead and gone—heigh ho!—had been long showing me marked attention;—in fact, paying his addresses, though he never made his declarations; when one morning, after having sung me a song of Farinelli's—the music I believe was Gluck's;—ah! you should have heard the Major, he was such a sweet singer. Well, the doctor had gone out to buy a new invented fish sauce,—poor dear man! he *d. es* like to have his fish well dressed—and I remember he took Franchette, my little beauty of a spaniel, with him, so that the Major and I were all alone in the breakfast parlor, when looking beseechingly in my face, he suddenly went down on one knee before me—ah! there was gallantry in those days!—and taking my hand, which he tenderly pressed, made a passionate avowal of his love. I felt myself blushing crimson, when, at this agitating moment, just as I was going to utter a palpitating confession of my partiality, my eyes began to twinkle, I felt a tingling in my nose, my mouth opened in spite of myself, and I sneezed like an explosion of gunpowder, right in his upturned and imploring face! Now, do tell me lady Susan, you know how *tremendously* I always sneeze, did you *ever*—of all the awkward occurrences!

The Major started, as well he might, but recovered himself—so did I—he gazed at me tenderly and expectantly, and I was just about to relieve him from his suspense, when I sneezed with a second and louder explosion, that seemed to shatter the very nose from my face.

This was a confusion to me and the Major; but still holding my imprisoned hand, and looking downwards, to avoid the shower bath that I was unintentionally scattering round me, he swore that he never would rise from his knees till I had pronounced his doom. I uttered a heartfelt sigh, and the soft avowal was just trembling on the tip of my tongue, when, I felt something on the tip of my nose! Lady Susan—lady Susan—it was beginning to bleed!—*did you ever!*—of all the distressing moments!

I struggled to withdraw my hand, that I might get my handkerchief, an action which the Major attributed to coyness, and therefore did but hold it more firmly. In the contest, after frightfully spotting my tabinet silk gown, three very large drops of blood fell upon the Major's wrist! He started up—I closed my eyes and sunk in a chair, overwhelmed with confusion. Supposing I had fainted, the Major hastily seized a large tumbler of water and threw it in my face. At such an unexpected sousing, I screamed with surprise and terror. The Marschal powder which I wore—I was always famous for my powder—mingling with the water and blood, converted my face into a hideous spectacle; when, just at that moment, the door flew open, and Franchette, thinking her mistress was killed, flew at the poor dear Major, and bit a large mouthful out of his left leg, while the good, horror-stricken doctor suffered the bottle of newly invented fish sauce to fall from his hand and be smashed to pieces on the floor! Now dearest lady Susan! consider what must have been my feelings!—*did you ever!*—such a scene!

Among the exports of the principality of Coburg we find enumerated "sausages and livers of geese."

The influence of words is incalculable. Men will do that, when it is called by a gentle name, from which they would often shrink if it were correctly and strongly characterized. With this truth in view, it is humbly submitted whether there is not a better term for the act of appropriating funds entrusted to one's charge, than the sarcenet phrase of "defalcation?" Pistol calls it "to convey," but the ancient is not authority in philological or moral matters; and, besides, he had a purpose to serve in smoothing the rough edges of the title of his favorable professional pursuit. Let defalcation be called stealing, and let it be punished as stealing, and it will not occur quite so frequently. It is known that fine words are useless in one branch of culinary operations; but in other respects they may be so used as to cause the superficial to regard crime with a lenient eye, and they have long enabled the vicious to flourish without losing caste.—*Pennsylvanian*.

The above is not only right humorous, but there is a sagacious propriety in its recommendations. It is too common now a-days to dress up every crime, of every hue, from the red dye of murder to the blue tint of some intemperate brawl, in the garniture of soft and dainty words. A desperate bowie-knife encounter, resulting in the death of two or three bravos, is called "a fatal affray," or "an improper occurrence," and so on to the end of the chapter of terms and titles. It is high time to speak no longer of foul doings, in high places or low, in phrases of satin; call things by their right names—give to the defaulter his cognomen of thief, and let the stain consonant to the name be affixed to the wearer. Let this system be adopted, and in no rank or degree of life in our country could sin so plate itself with gold, as to become invulnerable to the shafts and bolts of public opinion.—*Philadelphia Gazette*.

The following is an extract from the unpublished papers of JAMES MADISON. May the sentiment which it embodies, be deeply impressed on the heart of every American citizen:—

"Advice to my Country.—As this advice, if it ever see the light, will not do it till I am no more, it may be considered as issuing from the tomb, where truth alone can be respected, and the happiness of man alone consulted. It will be entitled, therefore, to whatever weight can be derived from good intentions, and from the experience of one who has served his country in various stations through a period of forty years—who espoused in his youth, and adhered through life, to the cause of liberty, and who has borne a part in most of the great transactions which will constitute epochs of its destiny.

The advice nearest to my heart and deepest in my convictions is, that the UNION OF THE STATES be cherished and perpetuated. Let the avowed enemy to it be regarded as Pandora with her box opened, and the disguised ones the serpent creeping with his deadly wiles into paradise."

Of all the knaves, there is the greatest hope for a cobbler, for he he ever so idle, yet when he does anything, he is always mending.

A merry fellow said the ale-house was the only place to thrive in, for he had known many a score made there.

Of the children in the Prussian dominions, between the ages of 7 and 14, it is calculated that 14-15ths are educated in the public schools.

WINSHIP'S BRIGTON NURSERIES,
AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c.

Orders addressed to Messrs WINSHIP, Brighton, Mass., will be promptly executed, and forwarded to any part of this or other countries.

April 10.

FRUIT AND ORNAMENTAL TREES, MULBERRIES, &c.

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1839 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and of Feaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeysuckles, Pæonies, Dahlias and other Herbaceous Flowering Plants.

10,000 Cocksput or Newcastle Thorns.
10,000 Buckthorns.
10,000 Malicinals, and other Mulberries; the trees genuine and fine, at prices fair and varying with the size, and the quantity which may be desired.

Fruit and all other trees, when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.

WILLIAM KENRICK.

Nonant Hill, Newton, near Boston.

January 20, 1839.

PEAR, PLUM, GRAPE VINES, &c.

1000 Pear Trees of the most approved kinds;
1000 Plum Trees, of the most approved kinds and extra size—many of them have borne the past season;
500 Quince Trees;
3000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hamburg, Sweet water, Pond's Seedling;
30,000 Giant Asparagus Roots;
5000 Wilmot's Early Khabarb or Pie Plant, lately introduced;

Also—a good assortment of Gooseberries, Roses, &c. of different kinds;

All orders left at this office, or with the subscriber at Cambridge-port, or in Mr Lynch's baggage wagon box, at Gould & Howe's, No. 8 Faneuil Hall, will meet with immediate attention.

SAUEL POND,

Cambridge-port, Mass.

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells.
Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention.

March 27.

NATHAN WARD.

GRAPE VINES.

150 Sweet Water Grape Vines.
200 Isabella, " "
150 Catawba, " "
100 Black Hamburg Grape Vines.
1000 Asparagus Roots.
100 Early Wilmot Rhubarb Roots.
200 Common

Also—Strawberry Plants of the following choice kinds: Methuen Castle, Bath Scarlet, Hautbois, English Wood, Monthly, &c. Raspberries, Franconia White and Red. Gooseberries—Currants—Flowering Shrubs and Plants of all kinds supplied at short notice, by

ADDRESS,

Delivered at the Show of the Berkshire Agricultural Society, in 1836, by Henry W. Bishop, Esq., of Lenox.

(Concluded.)

There is another topic to which I beg leave briefly to allude, as well because of its connexion with the agricultural, as with other prominent and permanent pursuits of this county. This is its geological and mineralogical character and features. The partialities to their own county, of some of her most enlightened citizens, may have led to the adoption of an erroneous opinion;—if they have not, there is no field of the same extent, which contains more than Berkshire, to animate and reward the researches of him who studies the structure of the earth, and of him, who classifies its minerals and treats of their properties. The relations of these branches of the science of nature, to the cultivation of the earth, are most apparent. The earths which form the basis of the richest soils, are but the ruins of rocks, detached from mountain masses, and reduced to minute particles, by the powerful or long continued action of natural causes. The earths, therefore, must partake of the character of the rocks upon which they repose, or from which they have been brought. The soils overlaying granite, materially differ from those covering limestone, and both essentially vary from those which repose upon slate. To determine the character of alluvion, which may have been brought from various formations, an analysis of a portion of the mass, may be required. Now, nothing can be more important, and perhaps nothing so important is less understood, than the nature, properties and agencies, chemical and mechanical, of the earths, in the processes of vegetation. Although they constitute, in very minute proportions, only the proper food of plants, yet, as the reservoirs of that food, and as its conductors to the organs which take it up, they are deserving study and examination. Fertilizing substances are almost inert and useless, unless the earths, with which they are mixed, be of the right character and constitution. The earths without putrescent matter, are barren; and neither of them, in a simple state, with ever so much putrescent matter, could be made permanently fertile.

Who but a novice in these matters, would seriously set himself about creating a permanently good soil, out of slate alone, converted to clay,—or of pulverized quartz, or of lime or chalk, reduced to powder, with ever so much of barn-yard scrapings, or butchers' offal, to mix with either? With all mingled in proper proportions, he might, with no small prospect of success, thus busy himself. A very few experiments, accompanied with attentive observation, would teach him that the adhesiveness of clay must be subdued by the application of sand; and the looseness of sand corrected by the tenacity of clay; and that a little lime, to neutralize the acids, and catch and retain the fertilizing particles

passing off in the process of decomposition, could be well employed. And more, were he to extend his inquiries a step further, he might learn that plants which have no feet to walk about for food, no hands to put it to the mouth, and no teeth to masticate it, must have water to dissolve and convey it to them, and that too at convenient times, and without prolonged intermission. He would likewise learn, that the hardness of the particles of sand, and their loose arrangement, make it incapable of absorbing and retaining moisture,—that the adhesiveness of clay does not permit water freely to penetrate it, and that each in these respects, corrects the defects of the other,—and to do so perfectly, must meet with it in determinate proportions. It is an acknowledged natural truth, that vegetables will not grow in a soil, where the elements necessary to compose them are wanting,—and that they will be imperfect, where the earths are not congenial to their nature. The farmer can, it is true, settle by trial the question, whether certain plants, suited to the climate, will thrive upon his lands. Plants are undoubtedly the most certain indicators of the nature of soil and its value, for while no practical cultivator would engage with land of which he knew nothing, except the results of a chemical analysis, yet every gardener or farmer who knew the sort of plants it produced, would at once be able to decide as to its value for cultivation. Nothing should be permitted to supersede such tests, for probably no adequate substitutes could be found,—yet as their auxiliaries, economical geology might well be employed. Is it not desirable to determine the capabilities, and measure the resources of this county,—to ascertain what materials it can furnish for the arts and occupations of life,—to disclose to its citizens, if it may be, new sources of wealth, and fresh fountains of pleasure,—to multiply motives to harmony and kindness, by creating new relations in business, and increasing the sense of mutual dependence, and the necessity of mutual aid? If this be desirable, should there not be a geological survey made of it,—minute and thorough—under the auspices of this society, by means provided by the enlightened and liberal, if our own be inadequate,—a survey, which shall embrace not only its soils, but its minerals, and fossils. The plan is of easy execution. It is not a scheme of a merely speculative projector: it proceeded from an enlightened, sober source, and has been suggested to him who addresses you, as worthy a place in the paper which he reads. It commends itself to your attention. Were our resources upon the surface only, it might be otherwise. They are below it,—rich, immense, invaluable. Our meadow lands repose upon beds of iron, sufficient to meet the demands of all the improvements among us, in progress and in prospect. Our mountain pastures are the overlayings of primitive lime rocks, worthy the chisel of Praxiteles. From our shops the finest ornamental marble of the country has been taken. The cities have hewn from our quarries the corinthian columns for their proudest edifices. At the east and west of us, this

valuable material is not, and probably may not be found, in the quantity and of the quality which will justify the expenses incident to the raising and preparing it for the markets. There is little danger of rivalry except among ourselves. Exhaustless masses have already been uncovered,—still further and more thorough examinations should be made, till all is known that can be learned. A survey, under the supervision of some individual of practical science, would hasten and facilitate these examinations,—would ascertain the best localities of this material—its texture—its admixture of foreign ingredients—its several varieties, and their respective value and fitness for different economical and ornamental purposes, public and private. Duty to ourselves and our children, requires us to unlock these store-houses.

This matter, like everything else which gives impetus to industry and skill—like the manufacturing establishments, with which the margins of our streams are dotted, has close alliance with the interest of agriculture. Well has it been reported by one of the most distinguished geologists of this, or any country, "that the inhabitants of Berkshire cannot but regard their inexhaustible deposits of marble as a rich treasure to themselves, and an invaluable legacy to their posterity."

We think too little of the aid and facilities which science has provided,—of the relief from toil, and the rational pleasures, which it has given to every kind of rural employment. It has alleviated labor, by giving it the right direction and application. It has elevated thought and character. The pleasures of agriculture are felt and highly appreciated, because they are the pleasures of intellect. Learning has given them new charms. Upon the fields are men of learning, pursuing the study of nature, with the utensils of husbandry for their philosophical apparatus. Theory and practice begin to harmonize. While it is admitted on the one hand, that theory, based upon speculation, without fact, is not science, it is on the other conceded, that, after all, science is little else than perfected practice. The prejudices and superstitious fears which for ages embarrassed the operations of agriculture, and checked its advances, are fast giving place to the practical deductions of truth. Facilities for practice are drawn largely from those sober places, where men of learning sit. Mind, and mind only, can give confidence to energy and direction to activity. The intrepidity of the fearless sailor, riding upon tumultuous waters, springs not from confidence in his own physical strength, but from the means which learning has provided, of conducting his bark to its appointed haven, "and to the orbits of the stars above him, he looks for the landmarks of the deep."

Gentlemen of the Society: The field upon which we labor is of peculiar features. We have fertile intervals, but they are of narrow breadth. The rising sun, up midway the sky, throws clear across them the shadows of our Alpine elevations. We have a rude scenery and a rigorous climate. A few favored spots only are exempt from the harsh

astueries of a high northern position. Nature has left much for industry and the rural arts to do, to render us prosperous and happy as an agricultural people. We have neither the propitious suns nor the luxuriant soils of the far off west, to which our young men are flocking for fame and wealth and careless leisure. But we have what are a thousand times more valuable than these—a vigorous, enlightened population—schools of virtue and institutions of wisdom. Who, I ask, that regards life and health as he should, would willingly exchange the pure air of our hills for the atmosphere of western prairies, laden with miasma and charged with fevers? Heaven is universally and impartially kind. He has placed us among rugged mountains, but these very elevations break, as it approaches, the violence of the tornado, and in times of fearful drought, arrest the cloud which sweeps across the arid plains, condense its vapors, and pour them down upon the thirsty fields.

In every clime—in every age, the men of the mountains have evinced the strongest love of liberty and country. The records of the world show theirs to have been the loftiest achievements of patriotism. Conquests have repeatedly changed the population of the plains of Italy—but to whose harps before the Swiss, did the Alps respond? The lowlands of England were successively overrun by Roman, Saxon, Dane, and Norman warriors—but during all, the Celtic language only was heard among the Cornish rocks. To use another's thoughts and language—"Snowdon asked Ben Nevis, and Ben Nevis Snowdon, concerning the affections of its people—each to the other said, "I have known my people for a thousand years, and each year of the thousand they have loved me the more." In the bosom of the mountaineer, the love of life is not stronger than the love of home:

"Dear is that hill which lifts him to the storms,
And dear that shed to which his soul conforms;
And as a child when a searing soul molest,
Clings close and closer to its mother's breast:
So the loud tempest and the whirlwind's roar,
But bind him to his native mountains more."

WHEAT CROP.

The subjoined account of a wheat crop was laid before the Massachusetts Agricultural Society. The crop would have received the premium of thirty dollars, but for a failure to send certificates of the measurement of the land—a matter made indispensable by the requisitions of the Society. Mr Cooper was seasonably written to, when the omission was discovered, but as no answer has ever been received, it is presumed the letter miscarried. There can be no doubt of the correctness of Mr Cooper's statements. His farming, within doors and without, is of a high character; and we sincerely regret this accidental omission. H. C.

Sheffield, Oct. 29, 1838.

To BENJ. GUILD, Esq.—Sir: The following statement I make, with the concurrence of the man whose signature is annexed, and who assisted me to harvest, thresh, and measure the wheat which grew upon one acre of my farm, and was sown in the autumn of 1837, and which has already been entered for the premium.

1. The land upon which I sowed one acre of wheat in the autumn of 1837, was green sward, which I turned over, harrowed, and sowed, without further preparation. It was upland, and the soil consists of clay mixed with loam. It was dry early in the spring of 1838.

2. The land produced herds grass and clover, and I used it the preceding year for pasturage, and put no other manure upon it that year than two hundred weight of plaater.

3. I have put upon it the same quantity of plaster in the spring of this year that I did last, but no other manure.

4. I used one and three-fourths bushels of seed upon the acre in sowing.

5. I sowed it about the middle of September, 1837. It did not require weeding. I harvested it on the twentieth day of July, 1838, and by actual measurement ascertained that I had obtained from the acre thirty-five and four-fifths bushels.

The production of it cost me nine dollars, the seed that I sowed included.

Respectfully yours, &c.

JOHN L. COOPER.
LEVI O. MASON.

CROP OF VEGETABLES FOR STOCK.

NEWBURY, Nov. 29, 1838.

To the Trustees of the Massachusetts Agricultural Society.

GENTLEMEN—The hope of obtaining your premium which you offer for the largest amount of vegetables raised and consumed, &c., has had a great inducement for me to make you the following statement. I have raised and have consumed or shall consume, the following quantities, viz.: between five and six hundred bushels of the common flat turnip; two hundred do. of sugar beet; fifty do. of carrots; forty do. of small potatoes; about one quarter of one acre of cabbages. My stock consists of thirteen head of horned cattle and two swine. My farm contains ten acres of tillage land, seventy-five or eighty do. of marsh, woodland, rocky pasture, orcharding, &c. The value of the same to the consumer, must be somewhat relative; say one bushel of potatoes worth three pounds of beef, or one-third the quantity of Indian corn, sugar beets or carrots, half the value of potatoes; turnips one-third the value of potatoes. The cost of cultivation for several years together, I think will be about as follows: potatoes, twenty-five cents a bushel; beets, twelve and a half do.; turnips, four cents. The latter, which we consider a second crop, may to the farmer be the most profitable.

Respectfully yours,

TRISTRAM LITTLE.

N. B.—I raised I think, about four tons of pumpkins in addition to the above, which were consumed on the place.

STATEMENT OF A PREMIUM RUTA BAGA CROP.

Raised in Uxbridge, Worcester county, Massachusetts.

To BENJ. GUILD, Esq.—Sir: I have sent you, herewith a statement of the produce of one acre of land, sown with ruta baga. I present it as a competitor for the premium.

Yours, very respectfully,

J. F. SOUTHWICK.

STATEMENT.

1. The condition of the land in the spring of 1838, good: planted with potatoes: left it in good condition.

2. The product, 300 bushels of potatoes. Since I commenced farming in 1834, I have ploughed deep, and spread my manure after first ploughing;

generally ploughing twice. Planted in drills 3 1/2 by 1 foot apart; hoed them twice. Quality of manure, made by hogs from loam and litter.

3. The quantity of manure used the present season, 10 loads of winter manure, made under my barn.

4. I raised the seed—did not weigh it: should think it took 1 1/2 pounds. I put the seed in so thick as to leave no vacancies.

5. I got my manure out the first of May; spread it and ploughed it in deep; sowed three bushels of buckwheat and barley about the 12th of May: or the 15th of June rolled and ploughed the same in with Nourse's side hill plough. When it had got to be large, levelled the same with rakes. On the 17th of June, sowed the seed with a drill barrow, 2 1/2 feet apart; hoed them twice; thinned them within about one foot as near as possible, the first time hoeing. I give every fifteenth bushel for harvesting. The amount of the product, by actual measurement, was 825 bushels. Allowing 56 lbs. to a bushel, they weighed probably more than is required.

Expenses of Cultivation.

10 loads of manure at \$3 per cord	\$30
1st time ploughing	2
3 bushels of buckwheat and barley	3
Sowing and harrowing the same	1
Rolling, ploughing and levelling	4
Cost of seed and sowing	2
4 days work thinning and hoeing	4
Harvesting 825 bushels at 1 1/3	11
	\$57
1 acre land worth \$100—interest	6
	\$63

Ruta baga at 20 cents per bushel worth \$165—leaving a net gain of \$102 from one acre.

The foregoing statement is correct and true, according to our best knowledge and belief—the land upon which the ruta baga was raised being the same piece measured by Baruch Southwick, according to his certificate, which is herewith annexed.

J. F. SOUTHWICK,
DAVID SEVY.

I certify that I have this day measured for Jonathan F. Southwick, a certain piece of land as the same was staked out by him, and found the same to contain just one acre.

BARUCH A. SOUTHWICK.

December 4, 1838.

EARLY PEAS.—If you desire early peas, reader, let us advise you not to plant the little hotspur variety. Of this you may, perhaps, obtain a mess a few days earlier than of the early Washington variety, but it is but a "mess"—one, or at the farthest, two stunted gatherings, and there is all the reward you get for your labor and pains. Better raise what is worth gathering whilst you are about it, even if you have to suffer the mortification of having your neighbor boast of eating green peas five or six days earlier than you. The early Washingtons are nearly as early as the hotspurs, and when they are ready for gathering, there is something of them; the pods are larger, and the peas in them are more luscious. Besides, they will continue to bear for two or three weeks before the vines die.—*Maine Cultivator.*

A bill providing for a geological survey of South Carolina, has passed the legislature of that State.

MASSACHUSETTS AGRICULTURAL SOCIETY FARM REPORTS.

The subjoined is the account of Caleb Wetherbee, of Marlboro, County of Middlesex, of his farm; for which the Society awarded a premium of one hundred dollars. Marlboro is one of the best farming towns in the State, and Mr. Wetherbee is one of the best farmers in Marlboro.

MY DEAR SIR,—I herewith subjoin for you the answers I received from Mr. Wetherbee when I was at his farm in September last. I thought Mr. Allen's examination would be minute, without any reference to my accidental visit, but as Mr. Wetherbee relied upon his answers to me and Mr. Allen also, I send them to you.

Respectfully and very truly, yours,
BENJ. GUILD.

HON. P. C. BROOKS.

1. The farm consists of one hundred and eighty acres, besides one hundred and twenty acres of wood.

2. The soil is a rocky black loam.

3. The modes of improvement adopted, consist in a rotation of crops, ditching and manuring.

4. I have fifteen acres under cultivation; nine being in corn, and six in potatoes.

5. Twenty loads of manure are usually applied to an acre; ten fresh manure, ten compost.

6. The green manure is spread, the compost is out in the hills.

7. My method of cultivation is, to break up sward land in the Autumn—in the Spring manure, harrow and plant potatoes. If corn were planted first, it would be destroyed by the worms; after one year of potatoes, corn is planted for one, and sometimes two years, and the succeeding Spring the land is laid down to grass with grain.

8. About twenty-five acres are mowed, and I get about sixty tons, or nearly two and a half tons to the acre.

9 & 10. I am not in the practice of irrigating my land.

11. I mow twenty acres of low meadow, and obtain less than a ton to an acre. Five acres of this land yielded about seven tons of excellent stock hay, of the fowl meadow grass. A piece of less than five acres of similar land, produced a quality not so good, but about the same yield.

12. I ditch my land, throw in stone where very wet, and cart on gravelly soil from upland. The success is very satisfactory. [This land was in fact the most productive of his grass lands.]

13. I have nine acres in corn. I plough and spread manure as in the 5th and 6th answers, and cross plough the ground. The crop is not yet harvested. I conjecture it will yield 50 bushels to the acre. Five acres of it were in Canada corn, planted in order to ripen early. This is the first time of trial with this seed.

14. I have six acres in potatoes, planted in hills. I manured as in 5th and 6th answers. They are hoed twice only. They will probably yield 300 bushels to the acre. The kinds are the blue, round red, and Cumberland.

15. Other vegetables are raised only for family use.

16. I have six acres in barley, laid down with grass seed, for mowing. I sow two and a half bushels of barley to the acre. Of grass seed, 3 pecks of herds grass, 1 peck of red top, and 5 or 6 lbs. of clover. No manure is applied, excepting

in the preceding seasons. I have no wheat sown. I have twelve acres in rye, with grass seed, harrowed over upon burnt ground, for pasture. The wood has been recently cut off.

17. I have laid down the present season, six acres with barley as above, for mowing; twelve acres with the rye, for pasture.

18. My manure is thus prepared. One hundred and fifty loads of loam and soil are carted annually into the barn yard and pig-stye adjoining; that in the barn yard is ploughed every fortnight; about thirty of the loads only are put in the pig-stye, and it is often filled up with meadow mud, vegetables, loads of brush, wash of the dairy, &c. &c. In this way a large amount is accumulated.

19. I keep five yoke of oxen. Two are fattened annually, and their places supplied from the droves from the country. I keep twenty-five cows of native breed. I do not raise any calves. I buy heifers in the Autumn, to come in in the Spring. It is cheaper to buy than to raise my stock. I keep two horses for the farm work. I have no sheep. I have four barns. The average width is thirty feet. The whole length one hundred and eighty-nine feet. I have a cellar under only one of them. It is 31 feet long by 11 in width, and used for a vegetable cellar. I have no cover for the manure.

20. My cows are of native stock.

21. The amount of butter made this year is not yet determined; but the nett proceeds

for 1835 were \$736 66 at 22 cts. a lb.

36 827 32 24 " "

37 601 50 24 " "

The year '37 I had three cows less, and Mrs. Wetherbee's ill health made the product of the dairy less than before. These three years the farm was managed at the halves, in consequence of Mrs. W's ill health. I make no cheese but for home use. It is difficult to procure female labor. I have a very good milk cellar, and the wash of the dairy is very important for the hogs, and the hogs for manure.

23. I have sixteen hogs, bought of the New York drovers.

24. They are fed with vegetables, weeds, dairy wash, until September, then they have meal, potatoes and pumpkins; and this year I am making an experiment with apples.

25. From my hog-styes I usually obtain seventy five loads of manure a year.

26. The labor employed on the farm consists of one man by the year at \$170. One man eight months at \$20 a month. Extra labor in haying and other occasions, on walls &c., is equal to six months. [This is supposed to be exclusive of his family labor. The amount of this is not known.]

27. I have never counted my apple trees. I suppose there are from 500 to 800 over the farm. I usually put up about one hundred barrels of apples, and make three hundred barrels of cider. Most of my trees are grafted. All the small trees are engrafted. In the two last years I have set about three thousand and scions.

28. I raise a few pears, peaches, cherries and plums.

29. I have not been troubled with the canker worms. I find the borers troublesome, and not easily destroyed.

To BENJ. GUILD, Esq., Secretary of the Massachusetts Agricultural Society.

SIR,—The quantity of butter made from the 1st of April to the 1st of December from twenty five cows, four of which were dried the first of Sep-

tember for the purpose of being fatted, amounted to 2551 lbs. As to the weight of pork, I have fatted sixteen hogs, twelve of which are killed. The twelve which I have killed weighed in the market 4808 lbs. The remaining four I shall kill in about two weeks. They will not vary much from 1600 lbs. I have tried the effects of apples and pumpkins boiled together for about three months; and am fully satisfied that good pork can be made with them, with the addition of a small quantity of meal. I can truly state that I have never made so great a weight of pork with so small a quantity of meal; and am fully of the opinion that apples are valuable to feed hogs and cattle with, if properly applied. The quantity of corn which I have raised this year, as nearly as I can ascertain without actual measurement, is 375 bushels—of potatoes about 900 bushels—rye 193 bushels—barley 133 bushels—and fifty cart loads of pumpkins.

In respect to labor, in addition to the regular help, I think that I have hired to the amount of one man for five or six months. I have done a large amount of work aside from the ordinary farm work, such as getting in and harvesting the crops. I have carted on to my low meadow lands about 300 loads of gravel and loam. I have made from 200 to 300 rods of ditches in the same meadows; besides building a number of pieces of stone wall. All of which is respectfully submitted.

(Signed) CALEB WETHERBEE.

MARLBORO, Nov. 28, 1835.

At an argument for the culture of Beet Sugar in Michigan, the Committee of the Legislature computed the consumption of foreign sugar in that State at near half a million of pounds, or \$50,000.

The approaching season bids fair to be very productive in fruit. The past winter has been so mild that the trees are already giving evidences of their returning vigor. The greatest danger is to be apprehended from their too rapid advancement; in which case a late frost would be nearly fatal.—*N. Y. Sun.*

The New Orleans Picayune says the times are harder than they were ever before known in that city,—that the stores are full of all kinds of goods, but nobody to buy them. The world will learn, by and by, that overtrading is not so good as producing.—*Boston Times.*

Ex-President Adams has accepted the invitation of the New York Historical Society to pronounce before it an address on the approaching fiftieth anniversary of the inauguration of Washington as first President of the United States.

A bill passed by the Mississippi Legislature, relieves all the revolutionary soldiers in that State from taxation, and allows them a pension of \$100 per annum.

Imprisonment for debt in Michigan, was abolished, immediately, totally, and forever, by the legislature of that State on the 15th ult.

The mulberry fever has got as far as Ohio—the legislature of which State has passed a bill to encourage the culture of silk.

Extremes.—On the 14th of March, snow fell to the depth of a foot in Indiana;—on the 20th, the mercury was at 75, in the shade.

PAWTUXET CATTLE SHOW,

Exhibition of Manufactures, Ploughing Match, and Public Sale of Animals and Manufactures, at Pawtuxet, R. I., on Wednesday, October 9th, 1839.

The Standing Committee of the Rhode Island Society for the encouragement of Domestic Industry, offer the following premiums:

For Grain, Vegetable Crops, and Agricultural Experiments.

- To the person who shall raise the greatest quantity of wheat on two acres of land—mode and expense of culture being stated \$10
- To the person who shall raise the next greatest quantity, same condition 5
- Next greatest do. 3
- To the person who shall raise the greatest quantity of rye on two acres, not less than thirty bushels per acre, same condition 5
- Next greatest quantity on two acres, same condition 3
- To the person who shall cultivate Indian corn at the least expense per bushel, taking into the estimate the quantity of manure used, and how used, and the cost of the labor of cultivation, giving the product per acre 20
- To the next most successful experiment for raising Indian corn, same condition 15
- To the person who shall raise or introduce into the State, potatoes of a quality superior to any heretofore raised or introduced 5
- For the cultivation of root crops at the least expense per bushel, the cost to be estimated on the same plan as for Indian corn 10
- For the most satisfactory statement of the comparative cost of keeping stock on roots and hay, or on dry fodder alone 10
- For the most approved statement of the comparative profit of fattening sheep or swine upon the produce of a farm, the lean sheep to be valued after shearing 10
- For the best specimen of beet sugar, stating the process of making and the cost per pound 10
- For reclaiming bogs, requiring a statement of the process and expense, with the increased value of the land 10
- For under draining land with covered stone drains, so that the plough may pass over them without injury, stating the cost per rod after the stones are delivered 5
- For spreading clay or marsh mud on light soil at the rate of 160 loads to the acre, stating the distance carted, the cost of the same and the effect produced on succeeding crops 5
- For the best statement on turning in green crops and manure on a tract of land not less than ten acres 10
- For plantations and nurseries of white ash trees raised from the seed 5
- For plantations of yellow locust trees, set either in cleared land or on land from which the native growth of timber has recently been taken, the number set on each acre, at equal distance, not to be less than 20, and no premium to be allowed if set near cultivated land 10
- To the person who shall introduce any grass not before cultivated in this State, and prove by actual experiment, tested by satisfactory evidence, its superiority to any other grass now cultivated 10

To the person who shall, by actual experiment, prove the best season and mode of laying down land to grass, whether spring, summer or fall seeding be preferable, and whether with or without grain on different soils 8

To the person who shall take up in the season, on his own farm, the greatest quantity of good honey, and shall at the same time exhibit superior skill in the management of bees

For Stock.

- For the best full-blooded hull, not under two, or over four years of age, to be kept in the State one year after the fair, and to be used in the State the present season \$100
- [Competitors for this premium can obtain further information, by calling on the treasurer or secretary of the society.]
- For the next best bull 20
- For the next best do. 10
- For the best bull calf, full blood 25
- For the next best do. 15
- For the best native bull calf 8
- For the next best 6
- For the next best 4
- For the best cow, full blood 20
- For the next best cows, not less than three in number 20
- For the next best, not less than two in number 10
- For the next best, one in number 5
- For the best cows, kept in the country, not less than three in number, which shall have yielded the greatest quantity of milk in any thirty days previous to the 25th of September—a certificate thereof, duly sworn to, will be required, and the cows must be exhibited at the fair 12
- For the best cows, not exceeding two in number, same conditions 8
- For the best cow, same conditions 5
- For the best two years old heifer, having had a calf, same conditions 6
- For the next best, do. do. 4
- For the best heifer yearling 4
- For the next best 2
- For the best pair of working cattle, to have been owned in this State at least 3 months, not exceeding six years old 6
- For the next best 4
- For the next best 2
- For the best pair three years old steers 6
- For the next best 4
- For the next best 2
- For the best pair two years old steers 4
- For the next best 5
- For the next best 3
- For the best boar, to be kept in this State, until the 1st of April, 1840 10
- For the next best do. do. 8
- For the next do. 8
- For the best pigs, not less than two in number and not less than four nor more than eight months old, to have been raised in the State 8
- For the next best 6
- For the best South Down ram 10
- [The premiums for the bulls and boars will be paid when evidence is produced that they have been kept in the State the time required.]
- For each yoke of oxen exhibited at the fair, (which shall appear in a team of 50 or more

yoke and to which no premium for any peculiar excellence is awarded) if driven less than five miles 25 cts

For each yoke, five and over 50 do.

For each yoke, ten and over 75 do.

For each yoke, twenty and over \$1

Butter and Cheese.

For the best cheese, all from the same dairy, not less in quantity than one hundred pounds \$8

For the next do. not of the same dairy 6

For the next do. do. 4

For the best butter, not less than forty pounds 15

Next best do. do. 12

Next best do. do. 10

Next best do. do. 7

Next best do. do. 6

Next best do. do. 5

Next best do. do. 2

[The butter to be exhibited in butter-tubs with covers, and without ornament or any mark whatever; method of making to be given.]

Household Manufactures.

For the best piece of carpeting, 4-4 wide, and not less than fifteen yards \$6

Next best do. 4

Next best do. 3

For the best lot of woollen knit hose, at least three pair 2

For the best flax or hemp knit hose 2

For the best cotton do. 2

For the best worsted do. 2

For the best silk do. 3

For the best piece of woollen flannel, 7-8 wide, thirty yards at least 5

Next do. 3

[All to have been manufactured in this State, within the last two years, and a certificate thereof required.]

Shop Manufactures.

For the best dozen scythes 3

For the best dozen axes 3

For the best dozen hoes 3

For the best cast steel shovels 3

For the best dozen rakes 3

For any newly invented agricultural implements, superior to any designed for the same uses, a reward, (not exceeding twenty dollars in all) according to the importance of the invention 20

To the female who shall in the six months immediately preceding the first Monday of October next, weave on three looms, the greatest quantity of cloth, the width, fineness and picks taken into consideration 25

Next quantity greatest 10

[Certificates, with samples of the cloth woven, certified by the overseer of the room and agent of the mill, will be required.]

Ploughing Match.—(No Drivers allowed.)

First plough \$9	Fifth plough \$5
Second do. 8	Sixth do. 4
Third do. 7	Seventh do. 3
Fourth do. 6	Eighth do. 2

The depth to be ploughed will not be less than five inches, and the breadth of the furrow not more than ten inches.

The strictest regulations will be adopted, to insure the proper management of the cattle. They will not be permitted to be driven faster than their natural pace; and these premiums will be adjudged

for the best work with the least expense of labor. It must be understood, that in all cases, whether there be any competition or not, it is at the discretion of the committees to withhold a premium, if, in their opinion, the object so offered is not deserving of it.

Any attempts to obtain premiums by unfair practices, will be punished by a forfeiture of the premium, should it have been awarded before a discovery, and will also preclude the offender from being permitted to apply for premiums in future. Premiums to be demanded within six months after they are awarded.

JAMES RHODES, *President.*

WM. W. HOPKIN, *Secretary.*

MASSACHUSETTS AGRICULTURAL SOCIETY.—PREMIUM FARMS.

We publish below, William Pomroy's answer to the questions of the Massachusetts Agricultural Society the last year. Mr Pomroy was honored with a premium of seventyfive dollars. Mr Pomroy's farm is in Northfield, Franklin Co; and we have no hesitation in saying that in its condition and management, is among the very best in the State.

H. C.

1. The farm consists of 90 acres exclusive of wood land.

2. The soil is a loam bordering on sand.

My methods of improvement are as follows.

3. I have practised for a number of years past, sowing from six to eight lbs. of southern clover seed per acre, whenever I have sowed wheat, rye, or oats, in order to plough it in after the crop of grain is taken off. I have postponed turning in the clover and stubble as late as convenient, that the clover may be dead before ploughed in, as my experience tells me if I plough in a perfectly green crop of clover, it will leave the land cold and heavy. I never sow grass seed without grain, nor grain without grass seed. By this method, my land is growing better every year.

4. I have tilled this season 23 1-2 acres, and apply about ten loads of manure to the acre, with corn.

5. My manure is applied in compost.

6. I sometimes put the manure into the hill or spread it after ploughing, and harrow it in. I prefer the latter mode.

7. My method of managing green sward is as follows: to plough late in the fall, and harrow well in the spring, and plant without manure, excepting about one bushel of gypsum, two bushels of dry ashes, and three bushels of leached ashes to the acre, which is put in the hill with the corn.

8. My mowing land consists of 14 acres in my home lot, and 7 1-2 acres in the meadow. This meadow is not flowed. The 7 1-2 acres in the meadow produced this season 15 tons; 5 acres in my home lot produced 20 tons; the remaining 9 acres 25 tons—total on 21 1-2 acres, 60 tons.

9. I employ no irrigation, my land not being favorably situated for that. I manure my home lot every other year from my barn-yard, applying from 10 to 15 loads per acre.

10. I cut no hay but the best of English hay.

11. I have no low land or peat bog on my farm.

12. In Indian corn this season I have 8 acres and 26 rods; 3 1-2 acres of which in my home lot ploughed once, (as it will be understood I never plough but once for a crop,) about the middle of

April, and manured with barn yard manure carted out in the fall ten loads to the acre—put in the hill and planted some during the last days of April with common eight-rowed corn. I usually pick the corn and carry it off; then cut the stalks at the bottom, and bind the bundles with straw and cart them into the barn on the same day. I never top my stalks. This piece produced 67 bushels to the acre; also 2 1-2 tons of fodder. The above corn was hoed three times. I used a harrow the first time and a cultivator afterwards. Four acres and 106 rods of corn in the meadow, being the remainder of the above mentioned 8 26-100 acres, was thus managed. It was green sward, and ploughed in November. It was turned over perfectly smooth and harrowed well in the spring. I put about one gill of gypsum and ashes (principally leached) in the hill. I planted it about three feet apart; finished 4th of May, with eight-rowed corn of good sized ears but rather short, said to have been brought from Canada the year before. This was hoed and harvested as above mentioned, and produced 75 1-4 bushels to the acre—75 lbs. of ears to the bushel. We weighed 75 lbs. of ears at two different times, and shelled it, which produced one bushel and two quarts each time.

Neither this piece nor any other part of my meadow has had any manure for 7 or 8 years last past. I have practised this method of raising corn on green sward 4 or 5 years, with about the same result, compared with other pieces, with different management. I think the gypsum and ashes of but little use, excepting to keep off the worms. I have not put anything in the hill three years out of the five.

I lay down a piece of land to grass with 12 qts. of herds grass to the acre, every year, in order to mow, that I may have a piece to plough for corn every year. I sow it with wheat or rye, say from the 10th to the 20th of September, and mow it from one to three years successively, as the case may be. I never plant my land which is not manured, except on green sward.

13. I plant no potatoes excepting in my garden. I can get one bushel of corn on the same ground that would be required to produce two bushels of potatoes on my farm.

14. I have practised raising cattle in years past, but think it not profitable for me, as I am now situated.

15. I have cultivated this season 2 1-2 acres of winter wheat. Last fall the land was ploughed once, harrowed and bushed. I sowed one bushel and three pecks to the acre. My wheat has for the last three years, been badly winter killed. I have cultivated this season two acres of Italian spring wheat and three-fourths of an acre of a common kind. I sowed two bushels to an acre. It was a fair crop. The Italian was best. I always soak my seed in lime-water or brine, and roll it in gypsum or ashes. I have cultivated five acres of rye, and sowed one bushel of seed to the acre; and five acres in oats: I sowed 3 1-2 bushels of oats to the acre.

16. I have laid down to grass this season, five acres; sowed on the 15th September, with 12 qts. herds grass with grain.

17. I have no other means of making manure but in my barn-yard.

18. I stall-feed from 25 to 30 oxen usually through the winter. I pasture from 10 to 14 in summer. I keep 2 or 3 cows and 2 horses through the year.

19. My barn is 70 feet long, 42 feet wide, 16 feet

posts; I have also, 220 feet of sheds, 15 feet wide' 14 feet posts. The under story is used for carriages, farming tools, granary, stabling, and the remainder for sheds for cattle. The upper part is filled with hay and corn fodder.

20. My cows are of native stock.

21. I raise no calves.

22. I make no butter excepting for my family use. I have kept no account of the quantity made.

23. I fat three hogs weighing together when dressed about 1100 lbs. I do not know what breed they are of.

24. We give the swine our slops and what milk and bran we have. They are fattened on some kind of grain provender.

25. I obtain no manure from my hog-pen, as my hogs run in my barn-yard, excepting when fattening.

26. I employ only one man constantly. Laborers have obtained here this season, from 11 to \$14 per month. I have paid \$13; but as I am about leaving town, I found it necessary to procure one that is capable of keeping my accounts, making purchases and sales, as the farm may require. I have obtained such an one, who I am at this time paying \$300 per year and board. I have kept an account of every day's work done on my farm from the time of fitting my grounds and sowing my seeds last fall, to the time of finishing my corn harvest this fall, and charged to each piece at the time it was done, calculating one pair of oxen the same as a man, and a horse half as much.

14 acres mowing in home-lot	65 days.
7 1-2 " in meadow	21 "
4 " 106 rods of corn in meadow	86 3-4
3 1-2 " in home-lot	72 1-4
5 " oats	35 1-2
2 1-2 " winter wheat in meadow	15 1-4
2 3-4 " spring " " "	15 3-4
5 " winter rye	19

331

27. I have about 35 apple trees, all of grafted fruit.

28. I have a few pear, plum, and cherry trees.

29. My trees have not suffered, as I know, from canker worms or borers.

30. I have used no spirituous liquors nor wine on my farm nor in my house, for thirteen years last past.

WILLIAM POMROY.

Northfield, Oct., 1838.

COLDEST CLIMATES.—The earth has no spot on its surface, either habitable or otherwise, which is so cold as Yakutsk, a paltry yet principal town of eastern Siberia, where a few wooden houses are intermixed with numerous huts, plastered over with cow-dung, and windowed with ice. In this dreary and remote region, the earth is always frozen, the summer's thaw never reaching below three feet from the surface, the subterranean ice having a computed depth of 300 yards. In January the thermometer has been known to sink 18 degrees below the bitterest cold experienced by Ross during his last expedition; and yet the inhabitants, favored by a warm though short summer, reap both wheat and barley, and cultivate successfully potatoes and various other hardy vegetables.

The Northampton Courier says that hawkers and pedlers are carrying about all sorts of bushes and twigs for mulberry trees. So look out.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MAY 1, 1839.

ELEVENTH AGRICULTURAL MEETING AT THE STATE HOUSE.

CULTIVATION AND DEPTH OF PLOUGHING.

We have already given a short sketch of the conversation and discussion at the tenth agricultural meeting at the State House. Our reports must of necessity be very brief, and consequently imperfect. We shall claim then from the candid every just allowance.

The subject of general discussion was Cultivation, and several gentlemen took a part in the conversation. The Chairman for the evening, the Rev. Mr Abbott of Westford, had tried what he denominated trench ploughing, by which we understood him to mean, going a second time in the same furrow; the depth reached was about a foot; he applied ten or fifteen loads of manure to the land; the soil was a strong clayey loam. He felt convinced that the crop of wheat on this land was much benefited by this mode of cultivation.

He had been accustomed to plough to the depth of eight inches for corn. He had manured this land copiously with a dressing of compost consisting of peat mud and barn manure; having applied one hundred loads of this mixture to four acres of land. He planted the Phinney corn as it is denominated, a kind well known in the vicinity of Boston, and obtained a large yield. The experiment was not conducted so as to enable him to ascertain with precision the advantages from this mode of cultivation; but he was satisfied it was very considerable.

Dr Stearns, of Sudbury, was of opinion that the depth of ploughing should be regulated by the nature of the soil. He thinks no method has been as yet fully tested. There is a good deal of plain-land in his town. A farmer in his neighborhood never ploughed more than four inches, and his cultivation was successful. Another farmer ploughed deeper and he was equally successful. (The inference was plain that much depended on the character of the soil, and much likewise upon the amount of manure which, in such cases, a farmer has it in his power to apply to the amelioration of his soil.)

Mr Thaxter, of Martha's Vineyard, remarked that no farmer would undertake to prescribe beforehand the depth of ploughing until the nature of the soil and subsoil were fully understood. Land which has been heaped up is always improved. (This brings it to the air, the light, and the heat, the action of which is always powerful and ameliorating upon the soil.) If the soil be shallow and rest upon a gravelly substratum the ploughing should not be deep. If the subsoil be clay, the ploughing should be deep. When one piece of land is ploughed to the depth of two inches and another to that of four inches, there can be no question, which would prove most productive. Shallow ploughing is not adapted to effect any permanent improvement of the land.

Mr Choate, of Essex, spoke of the inconvenience and evil he suffered from the quack grass, (*tritium repens*) sometimes called the wheat-grass, and known by various local names in different parts of the country, but known everywhere and under all names as a great pest, though it found one friend in this case strangely disposed to defend it. Mr Choate considered it no disadvantage in mowing lands, but a great evil in cultivation. He wished to know what was the best method of destroying it.

Dr Stearns, of Sudbury agreed in opinion of the difficulty of getting rid of it; and deemed it best not to cul-

tivate the land in which it prevailed. Such land could not be cultivated to advantage. A judicious neighbor of his was accustomed to till such land never oftener than once in five years.

Mr Nichols, of Danvers, stated that he was well acquainted with this grass; but he did not seem to pride himself much upon the acquaintance. He was of opinion that the best method was to starve it to death. (This was rather an ungracious way of treating one's acquaintance.) A farmer of his acquaintance was accustomed to turn out land to pasture which was much infested with it. This would destroy it. It would not flourish without manure; and it was advisable to let it run out. (The inmates of the house quit, when there is nothing put upon the table.)

The Chairman agreed with Mr Nichols in the expediency of this mode of treatment. He had turned out to pasture a field in which it abounded; and was satisfied with this process.

The discussion then reverted again to the subject of ploughing. Mr Bruce, of Grafton, questioned the expediency of ploughing deeply in new lands. He deemed five inches sufficient. He had never succeeded in obtaining good crops when he had ploughed new lands deeply. (By new lands we understood him to mean lands that had been recently cleared of their wood and never before cultivated.) He had a neighbor whose lands had been in his opinion materially injured by deep ploughing. The bad effects had been apparent for the last fifteen years.

Dr Stebbins, of Swanzey, was strongly in favor of deep ploughing. The virgin earth, which was turned up, soon became productive. The substratum of many low grounds was of a marly character; which might be brought to the surface with great advantage.

Dr Stearns expressed a strong desire that this matter of the depth of ploughing should be made the subject of exact experiment. The gravel from the bottom of a well, after having been exposed on the surface for a year or two produced clover freely. Deep ploughing was likely to bring to the surface any lime which was in the soil, where its chemical influences would be felt and diffused. He deemed it important to deepen the mould as much as possible, and this could only be effected by deep ploughing.

Mr Thaxter, in a light sandy soil, ploughed to the depth of eight inches. He manured it with ashes, and obtained the first year a crop of turnips of 450 bushels to the acre. Next year he planted the land with corn in rows four feet apart, and in hills three feet apart. The kind of manure was not stated but the crop was good. This was succeeded by wheat; of which he gets a yield of never less than eighteen bushels; and has obtained thirty bushels to the acre.

Mr Bruce after the first crop then proceeds to deepen his cultivation, until he reaches the average depth of five inches.

Mr Danforth, of Pittsfield, mentioned the case of a German farmer, whose success from deep cultivation had been very great. (He did not mention the name of this farmer but we presume he referred to Van Vought, of whose cultivation we design at a future time to give a full account.) He had taken a farm in a low condition; and had gone on improving it until he cultivated, by what he called trench ploughing, to the depth of fourteen inches, by which means he had fully doubled his crops.

Much other discussion occurred but we are unable more fully to report it. We have given above the opinions of practical men, familiar with the operations of husbandry, and observing of actual results. We

agree with Dr Stearns that experiments are wanted with a view of more fully testing results.

(To be continued.)

SILK CULTURE IN VERMONT.

The subjoined letter is from an excellent, active, and highly intelligent friend of agriculture in Vermont, Henry Stevens, Esq. of Barnet. Barnet is one of the best farming towns in New England. The dairy farmers in Barnet are quick scented; and have been down repeatedly after the premiums of the Massachusetts Agricultural Society for butter and cheese; and have, by just right, carried them off in triumph. We wish them as many more such successes as they will deserve; and we can have no objection to their deserving as many as are to be obtained.

We hope our friend Stevens will not be offended at the liberty we take in publishing this letter. The account possesses much interest. The skins of silk enclosed are of the most even and beautiful description; and shall have a conspicuous place in our collection. We have often heard of the fair Vermontese and now begin to believe all the fairy stories we have been told of them. We do not know any Massachusetts girls, who would do half as well; but we hope this beautiful example of the Green Mountaineers will stimulate a generous and active competition.

Travellers in search of agricultural improvements or of the most picturesque scenery, can no where find higher gratification than in an excursion up to the headwaters of the Connecticut. This would carry them through Barnet, which is near the junction of Wells river with the beautiful Connecticut. The ride, for hundreds of miles, presents an uninterrupted succession of interesting objects, and as enchanting scenery as ever the eye rested upon. The placid current of the river, as it often presents itself in long reaches, the deep embankment, the precipitous bluff on the river side, bristled with firs, and as the traveller winds his narrow passage between it and the river, threatening to stop his passage, the level, wide-spreading and verdant alluvions and prairie grounds, the cultivated fields, the dense and variegated forests, the rich pastures sprinkled over with flocks rioting in the profusion of nature's beneficence, and occasional glimpses of the highest mountains in the remote horizon, combining every variety of magnificence and sublimity of form, their snow clad summits piercing through a thick drapery of clouds, hanging in graceful folds and festoons around them, make it the region of the perfect poetry of landscape and rural beauty and splendor.

H. C.

Barnet, Vt., April 24, 1839.

DEAR SIR,— * * * I send you, to be deposited in your agricultural museum, two skins of sewing silk manufactured by my daughter Sophia in 1836; also two skins of colored silk manufactured by Miss Elveta Skinner the same year. I believe these samples are of the first manufactured in this part of Vermont. In the fall of 1834, I procured from Mansfield, Conn., a few eggs; in the spring of 1835 the eggs hatched. I had thousands of worms. I tried to feed them on the leaves of the common mulberry in our woods; but were in the course of a few days all died but seven. I had of the white mulberry leaves sufficient to sustain them. Five of the seven worms produced excellent cocoons; from these I had eggs enough in the spring of 1836.

My white mulberries having grown, furnished a supply for about 200 worms; and from these my daughter, then nine years of age, with a little help from Mrs Stevens, manufactured thirteen skins. The silk was reeled on a common hand reel, and twisted on the common woollen wheel. Miss Skinner manufactured hers after the same manner. Miss S. last year had about sixteen pounds of cocoons, most of which she has manufactured into sewing silk. Many of the tops of our white mulberry trees have been injured by the hard winters, but the roots send forth a plenty of sprouts every spring.

Miss Skinner a few days since sold 1000 of the Alpine two years old trees for \$100; she has several hundred now standing. I examined them yesterday. They wintered well, and are very nice. If you have any farmer's daughters in Massachusetts, that never saw a silk-worm, that will begin to manufacture better sewing silk than the enclosed, I should be glad to have them send you a sample. If you wish to ornament your agricultural museum, it must be done with the handwork of the females.

Your friend,

HENRY STEVENS.

BRIGHTON MARKET.—MONDAY, April 20, 1839.

Reported for the New England Farmer.

At Market, 148 Beef Cattle, 8 Pairs Working Oxen, 32 Cows and Calves, 115 Sheep, and 1075 Swine.

Prices.—Beef Cattle.—We advance our quotations to correspond with sales. First quality, \$9 00 a \$9 25. Second quality, \$8 25 a \$8 75. Third quality, \$7 00 a \$7 75.

Working Oxen.—No sales noticed.

Cows and Calves.—Sales were not so quick as usual. We notice the following, \$30, \$32, \$38, \$47, \$64, and one very fine, \$100.

Sheep.—About one half only were sold, price not made public.

Steers.—Sales quick. Selected lots of old barrows at 8 1-2, sows 7. Lots to peddle at 8 1-2 a 9 for sows and 9 1-2 a 10 for barrows. At retail from 8 to 11 according to size and quality.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass., in a shaded Northerly exposure, week ending April 25.

MULBERRY TREES, & C.

WILLIAM PRINCE & SON still have the following Trees for sale.

35,000 genuine Morus Multicaulis trees, from 1 to 6 feet high, which will be sold either trimmed or untrimmed, or in cuttings. The wood of these trees is perfectly mature, and they have been well preserved from all injury.

42,000 genuine Alpine trees, of a very superior character, at least equal to any in the Union.

10,000 of the splendid Morus Expansa, 5 to 9 feet high, and much branched—remarkable for its great excellence in every respect. This is the only large parcel of this tree existing in this country.

75,000 Canton, Brussa, Morus Elata, Rose of Lombardy, Roman, Pyramidalis, Oriental, White Italian and other kinds; all of which will be sold at prices deemed moderate.

Also, a large assortment of the silk worm's eggs, of the most choice and valuable kinds.

Ample directions for the culture and successful propagation of all kinds of mulberry trees, will be given to every purchaser.

Flushing, near New York.
April 17, 1839.

GRASS SEED.

Just received at the New England Agricultural Warehouse and Seed Store—A few casks of prime Eastern Clover Seed, and a fresh lot of Herds Grass Seed.

ap 24 JOSEPH BRECK & CO.

MORUS MULTICAULIS.

A few thousand trees of the genuine Morus Multicaulis; also a few thousand cuttings of the same may be had on immediate application to the subscriber.

WILLIAM KENRICK,

Nonantum Hill, Newton.

HERBACEOUS PLANTS.

A great variety of Herbaceous Plants, of beautiful and hardy varieties, can be furnished by the subscribers from their gardens at Brighton at short notice. From 25 cents to \$1 00 per plant.

JOSEPH BRECK & CO.
April 24.

FOR SALE.

The subscriber offers for sale his estate in Harvard, County of Worcester, the well known Bromfield Place; an excellent dairy farm, well wooded, the house spacious, fitted for two distinct families; the situation among the most pleasant to be found, especially for a private or high school. Bordering a part of the farm is a beautiful sheet of water, containing two islands belonging to the farm. Inquire of the subscriber at South Notick.

J. H. T. BLANCHARD.
April 17.

PEAR TREES FOR SALE.

At the Pomological Garden, Salem, Mass., a good collection of Standard Pear Trees, all of which have been proved. They comprise the choicest of the old and new varieties.

Scions of a great variety of Apples, Pears, Plums, and Cherries, from bearing Trees, for sale by the subscriber.

April 3. ROBERT MANNING.

STRAWBERRIES.

Gentlemen wishing to cultivate this delicious fruit are respectfully informed, that the subscriber has succeeded after a number of years of exertion in bringing the strawberry nearly to perfection.

He has for sale at his garden in Brighton, Mass. the following six varieties of the Plants. They are of superior stock and quality, and in the finest condition for immediate transplanting.

He will offer in addition his *Seedling Melburn*, a very valuable kind, a free bearer, fruit juicy and very large, fruit measuring four inches was gathered the last season.

Melburn Castle—Fruit from these Plants have been exhibited at the Horticultural Society's Rooms, measuring five and a half inches in circumference.

Bath Scarlet—Fruit large, full bearer, and beautiful scarlet.

Royal Scarlet—Fruit long, oval shaped and juicy.

Hartley—Fruit smaller but very numerous.

English Wood—Fruit well known.

Monthly—Fruit is gathered from these vines from June to October, and in good quantity and fine quality.

Orders left at the Garden in Brighton, or directed to him at Boston or Brighton, at J. Breck & Co.'s Seed Store, will be promptly attended to.

JAMES L. L. F. WARREN.
Brighton, Mass., April 17, 1839. episcow

DILLINGHAM POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store connected with the New England Farmer Office, a few barrels of Dillingham Potatoes. These are well known as a most excellent eating and very prolific kind. Also, a few Cobs or Horn Potatoes, a very fine kind; the celebrated Rohan Potato; Early Whites, and Eastern Potatoes of various kinds.

April 17. JOSEPH BRECK & CO.

CORN SHELLERS.

Just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, a supply of Currier's Patent Corn Shellers; a very convenient and cheap article. A right to using said machines in counties or towns may be obtained by applying as above.

April 17. JOSEPH BRECK & CO.

WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing his seeds, and have it done in a much better manner. It opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds: say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions, Corn, &c. It is highly recommended by a great number of persons who have used it the present season. For sale at the N. E. Agricultural Warehouse and Seed Store by

JOSEPH BRECK & CO.
April 3.

MORUS MULTICAULIS.

For sale, at the Garden of Fromont, near Paris, France, 150,000 of the Morus Multicaulis. These Mulberry Trees are 2, 3 and 4 feet in height and of the first growth, deliverable either at Paris or at London, in the course of the Autumn of 1839. Orders for the above must be addressed to the Director of the Garden of Fromont at Ris, Seine et Oise, France, or to J. H. Mey, of South Carolina, at Paris, to the care of J. C. Darillier & Co. Paris, with an order on a Banker, at Paris, for the amount which will be immediately attended to, and the plants put up in the best order.

The Garden of Fromont, has also, large quantities of the Mulberry Morati and other new kinds, as well as the newest varieties of Camellias, Rhododendrons, Magnolias, Azaleas, Rose Trees, Dahlias, Chrysanthemums, &c. &c.

Immediate application should be made for the Mulberry Trees.

For further particulars, apply to James Ailger & Co., Charleston, South Carolina; C. W. Karthous & Co., Baltimore; John Bohlen, Philadelphia, and C. C. Meien & Co., New York.

Paris, France, January 1, 1839.

A new milk goat, of a superior breed, producing milk like cream; well calculated for the invalid, or for a vessel for a long voyage. Inquire at this office.

March 12.

Just received at the New England Farmer Office, the Second Report on the Agriculture of Massachusetts, by Henry Colman, Commissioner for the Agricultural Survey of the State. For sale by

JOSEPH BRECK & CO.
April 10. 51 and 52 North Market St.

MISCELLANEOUS.

BLESSINGS OF POVERTY IN YOUTH.—An English being asked what contributed most to the bar, replied, "Some succeed by great talent, some by high connexions, some by a miracle, but the majority by commencing without a shilling." The same remark holds true of almost any calling or profession. A traveller who starts on a journey with a heavy load, or too much baggage, is much less likely to get on with comfort to himself and success in his enterprise, than he who forbears to encumber himself.

Poverty is a sharpener of the wits and an incentive to exertion. No man who has the requisites for success—and every man is fit for something—is apt to let his talents lie in a napkin, if the exercise of them is necessary to his pecuniary support and comfort. If, however, he commences with property sufficient to defer the business of life—to slight the duties which he should perform in the community; the chance is, that when the hour of necessity arrives, he will find himself unfitted by slothful habits and neglected opportunities. The occurrence of these consequences may be recalled to any reader's mind by a recollection of the history of the rich men and the poor men among his acquaintance. Many a poor lad is enabled, by the changes and chances of fortune, to befriend in his need the man who was his rich school-mate.

There are many rich people in the world who have themselves no idea what they are good for—and whose friends have never thoroughly found them out—we mean the rich by inheritance. Maria Edgeworth, whose works were very popular fourteen or fifteen years ago, and ought to be more widely read now, has an excellent story among her other excellent works, entitled "Ennui." The reader of fiction, if he is not already familiar with it may hunt for it. With that and the other novelties of the same writer, time may be both pleasantly and profitably employed. Meanwhile, as the incidents are apposite to our argument, we will briefly relate them from the recollections of a perusal fourteen years ago.

The subject of the sketch, the victim of ennui, is a rich Irish resident landholder, whose time hangs awfully heavy on his hands. Having no inducement or incentive to occupation, he is a mere blank in creation, and his restless existence is a positive burthen to himself. He is accounted by his acquaintance a negatively good, harmless, useless, individual, who might shuffle off his mortal coil, and the world suffer no loss by it. So he vegetated for a number of years, in possession of his property, until he accidentally discovered that the estate of which he was in possession—not enjoyment—was not his own. The foster-mother of the real heir had changed infants with the owner of the estate, and given him her child instead of his own. Conscience would not permit him to remain in possession of property acquired by his mother's fraud, and he lost no time in putting the real owner in possession, and launching forth himself, at middle age, into the world, penniless. The dross of wealth removed, the man shone out. Industry, talent and application, gave him wealth and character, and by the time the real heir had exhausted his suddenly acquired property, and killed himself in revelling in the enjoyment of uncultivated taste, and low dissipation, our victim of ennui was ready to re-purchase and enjoy the estate which he had so magnanimously surrendered.

To his second possession he brought an acquaintance with himself, and with his own powers. He had acquired habits of employment, and knew how to devote his time with usefulness to his fellows, and occupation and happiness to himself. Ennui was a word no longer in his vocabulary. He had learned "the uses of the world;" and to him they no longer seemed "weary, stale, flat, and unprofitable." It is those only who do not understand the world, and mix in it with a clear conscience, that it does seem so little worth caring about. The guilty may be sick of it, for its events remind them continually of their own bad passages. The weary of pleasure—the sated with enjoyment, may cry out that "all is vanity," and the ascetic may affect to regard the world which God made and pronounced good, not good enough for them. But the true christian and philanthropist—the observer of men, of manners, and of nature, will always deem existence a boon worth thanking heaven for. But we are wandering from the subject.

The experience of the suddenly enriched peasant, in the tale to which we have referred, shows the danger of wealth coming to the possessor by surprise. Riches are not wealth unless they are earned dollar by dollar. The eastern sage was right, who preferred that riches should come drop by drop, rather than that the golden stream should be quick and violent. There are men about town—we meet them daily in the streets—who have been rich, and now are poor, in purse, in mind, in character. An unexpectedly fortunate turn to a speculation, a bequest of property from the dead, or perchance a lucky venture in a lottery, has made them wealthy beyond their former conceptions, and almost beyond their desires. Money thus acquired by accident, is seldom, except by accident, retained; and as the purse runs out, the man runs out with it. Of course, in this connexion, we do not intend to allude to those whom the chances of trade have rendered unfortunate. Honestly losing their means, they do not lose themselves with their property—but may be, like the hero of Miss Edgeworth's story, better men for being poorer.

The desire to obtain property, is honest and laudable. Honestly and laudably followed, it brings an improvement of the man with the acquisition of every dollar. The passion for acquisition, is another trait of character altogether, and degenerates to avarice. The desire, followed in moderation, makes great men of our little men—the passion, indulged to excess, belittles our great ones. —*New York Despatch.*

SPANISH ETIQUETTE.—The etiquette of the Spanish court was the most severe in Europe. One of their kings even fell a victim to it. Philip III. being newly recovered from a dangerous malady, was sitting near a chimney, in which was so large a fire of wood that he was almost stifled. Etiquette did not permit him to rise, nor a common domestic to enter. At length the marquis de Polar, chamberlain, came in, but etiquette forbade his interference, and he the duke of Usseda, master of the household, was sent for. He was gone out; and the heat increased, while the king bore it patiently, rather than violate his dignity. But his blood was so heated, that next morning an erysipelas of the head appeared, and a relapse of the fever soon carried him off.

The general government has bestowed upon Michigan 969,757 acres of land for school purposes.

WINSHIP'S BRIGHTON NURSERIES,

AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c.

Orders addressed to Messrs WINSHIP, Brighton, Mass., will be promptly executed, and forwarded to any part of this or other countries. April 10.

FRUIT AND ORNAMENTAL TREES, MULBERRIES &c.

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1839 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and of Teaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeyuckles, Paeonies, Dahlias and other Herbaceous Flowering Plants.

10,000 Cockspar or Newcastle Thorns.

ANNUAL ADDRESS

Before the Kentucky State Agricultural Society—delivered at the Capitol in Frankfort, January 14, 1839, on the dignity of the profession of agriculture, and the propriety of legislation for its improvement. By Col. C. S. Todd, of Shelby.

GENTLEMEN OF THE STATE AGRICULTURAL SOCIETY: In compliance with the invitation of our worthy President, I appear before you this evening, in behalf of the great interest which sustains every other interest in the community; and relying upon your indulgent feelings towards a cultivator of the soil, entreat you to forget, in the magnitude of the subject, any deficiencies of the advocate.

In entering upon the duty assigned to me, I feel a consciousness of the difficulties which beset my path, arising as well from my own inadequacy to the task, as from the nature of the subject, which is generally considered not to be susceptible of those illustrations and attractions, rendered so interesting in this age of improvement, by the exertions of cultivated intellect applied to the departments of law, physic, moral and political economy. All that I can hope then to effect, will be to lead able minds to reap laurels in a field in which, as a pioneer, I shall be content if the public mind be directed to the subject.

As the advancement of the cause of agriculture is the exclusive object contemplated in the formation of this society and of the annual meeting on this day, I propose upon this occasion, to examine this subject in two of its most interesting aspects—first, to present to my brother farmers some of the considerations which should lead them to form and act upon, a more exalted estimate of the dignity of their profession; and then, to offer some suggestions, which, it is hoped, may have a tendency to stimulate the legislative councils to that encouragement of the cultivation of the soil, which an enlightened forecast deems to be so intimately connected with the public welfare.

In the first place, as to the dignity which belongs to the pursuits of agriculture. The illustrious Franklin, whose eulogy was conveyed in such felicitous language by the eloquent Mirabeau—"Eripuit celo fulmen sceptrumque tyrannis;" the sage, whose fame shed lustre on the age in which he lived, and who sustained towards his country the envied attitude of mechanic, patriot, statesman and philosopher, has pronounced "agriculture to be the most honorable of all employments, being the most independent. The farmer," says he, "has no need of popular favor, nor of the favor of the great; the success of his crops depending only on the blessing of God upon his honest industry." The occupation of the farmer is not only honorable, as being the first pursuit of man, and as having engaged the attention of the most virtuous and illustrious men in every age, but it is the most honorable for the precise reason stated by Franklin—it is the most independent. The other pursuits of men, in all their diversified forms, depend, in a greater or less de-

gree upon the success of those who exert their energies in other avocations—the merchant depends upon the farmer and manufacturer—the mechanic upon the farmer and merchant, and the professional man upon all of them; but Franklin, as well as the experience of ages proclaims, that the farmer is independent of all save "the blessing of God upon his honest industry."

Washington, the father of his country, has declared that "he knew of no pursuit in which more real and important services can be rendered to any country than by improving its agriculture." Socrates, one of the most eminent of the ancient philosophers, says, "agriculture seems to possess an incontestable right to the title of parent and nurse of all other professions;" and the celebrated Vattel, of modern times, whose treatise on the Law of Nations is regarded as the standard of international duty amongst the most enlightened states of the present day, says, "of all the arts, tillage or agriculture is doubtless the most useful and necessary; it is the nursing father of a state; the cultivation of the earth causes it to produce an infinite increase; it forms the surest resource and the most solid fund of rich commerce for the people who enjoy a happy climate."

Agriculture was the first avocation of man, Adam being directed to "dress and keep" the garden of Eden. This was his duty in the days of primeval innocence; and after the fall, he was required to earn his bread by the "sweat of his brow." The first valuable improvements in husbandry were made by Noah, who, though a preacher of righteousness, was called a man of the ground, because of his advancement in agriculture and his invention for subduing and fertilizing the soil. The divine command to the Jews, "break up your fallow ground and sow not among thorns," is applicable to all the nations who live by the cultivation of the soil; and I indulge the hope that there is not a christian farmer in our land, who, while he recognises the spiritual beauty of the passage which has immediate reference to the cultivation of the heart, does not feel its literal force in calling upon him to adopt all practicable means of improving the soil committed to his care. And here it may not be impertinent to remark, that if the mass of my brother farmers would "indeed break up their fallow ground and sow not among thorns," as well in relation to their husbandry as to the cultivation of their minds, we should not be placed, as a profession, in the rear of other less worthy pursuits.

The descendants of Abraham in Palestine, the Chaldeans, the Egyptians, the ancient Persians, the Phœnicians, the Athenians, and the Romans, including those in the highest offices in each of those nations, manifested the highest regard to the pursuits of agriculture. Hesiod and Xenophon of the Greeks, and Cato, Varro, Virgil, Pliny and Columella, of the Romans, published treatises on the subject—and the greatest improvement was made in agriculture during those periods of the ancient nations, when their institutions approached more nearly to the republican character. Xenophon, one of their

historians, remarked that "agriculture is the nursing mother of the arts, for, where it succeeds prosperously, there the arts thrive; but where the earth necessarily lies uncultivated, there the arts are extinct." In the best days of the Roman republic, he was entitled to the highest praise who "best cultivated his spot of ground," and such should be now the tone of public sentiment. Montesquieu has observed that "countries are not cultivated in proportion to their fertility, but to their liberty;" and the conductor of the New York "Cultivator," who unites in himself, more eminently than any other citizen of the republic, the rare qualities of scientific knowledge and practical experience with a polished pen, lays it down as almost a maxim, that "the mental and moral condition of an agricultural district is in the ratio of its improvement in husbandry."

There is a moral beauty in the sentiment of Franklin, which maintains that the farmer is independent of all, save "the blessing of God upon his honest industry." Those who plough the land, as well as those who plough the sea, are under peculiar obligations to recognise a special and superintending Providence. The farmer has the promise of seed-time and harvest; the seasons, the rain, the warmth of the sun, the growth of the soil, and all the operations of nature, admonish him of the exertions of an omnipotent energy. In the country he seems to stand in the midst of the grand theatre of God's power, and seeing that the succession of heat and moisture constitutes the sources of production, he is led to feel in the action of the sun and the descent of dew and rain, his obligations to reverence that unsearchable sovereign without whose permission not a "sparrow falls to the ground," nor a blade of grass springs up. The sailor, too, looks through the elements to the great first cause, and the man at sea must be insensible to all the high and holy motives of gratitude, who does not feel his own impotency, not less than a reverential awe of that Supreme Power whom the winds and waves obey.

Ancient and modern poets* have dignified the cultivation of the soil by the majesty and melody of their immortal songs. Virgil, the great Roman, has left an imperishable monument of his devotion to the cause of agriculture; and strange as it may seem to some of our modern farmers, some of whom affect not to need any instruction in the science upon whose successful application they depend for support, Virgil gives in his Georgics much of what constitutes the present mode of ameliorating the soil. An interesting extract which may be found in Book I. line 79-80, speaks of the Roman practice of saturating the parched soil with rich animal manure, of scattering sordid ashes upon the exhausted lands, and of giving rest to their fields by a rotation of crops; to which if we add the later process of renovating through the introduction of the grasses and the application of marl, we shall have the present improved mode of farming as practised in our own country. Milton, the Homer of modern times, (both of them blind to nature, though touch-

ingly alive to moral beauty) occupied his master mind in delineating the paradise which Adam was directed to "dress and keep;" and Thompson has presented aftertimes with a surpassingly beautiful scene in his Autumn, where he introduces among the gleaners of the harvest,

"The lovely young Lavinia, who once had friends,
And to time smiled deceitful on her birth."

A sentiment as descriptive of the benevolence which belonged to the period of harvest as it is illustrative of the career of thousands upon whom the sunshine of prosperity in early life has only dawned to render the gloom of adversity more conspicuous in their declining days.

Ancient and modern patriots have been devoted to the cultivation of the soil. Cincinnati, Dentatus and Regulus, La Fayette, Washington, and our own Shelby, are illustrious examples of this interesting fact. They repaired from the plough to the defence of their country, and from the defence of their country returned to the plough; and although they were renowned warriors, we must suppose there was a redeeming spirit in the nature of their vocations as cultivators of the soil, which caused their love of country to be superior to all selfish considerations. Considered in this aspect, their fame will live undimmed in the records of time, whilst the memory of the Cæsars and Alexanders, the Bonapartes and Irtubides will rot, like "the memory of the wicked." Of Cesar, nothing is left but his accomplished commentaries and his unhallowed ambition. Of Alexander, who shed tears because he had no more worlds to conquer, no monument remains but the city of Alexandria, in Egypt, once the pride of the world in its unrivalled library, and when it commanded the commerce of the Mediterranean sea and the Arabian gulf, but now only a scene of magnificent ruin, since the discovery in the 13th century, of a new route to the East Indies by the Cape of Good Hope. In a few years posterity will only speak with approbation of Bonaparte as having left a valuable code of laws for France, and as having established agricultural societies and professorships, and the National Garden; whilst the frequent and inexplicable revolutions in former Spanish America will only serve to proclaim the succession of military tyrants, countenanced alone in countries where the system of religion prescribes the rights of conscience as well as the lights of knowledge.

The most distinguished individuals in our country, including nearly all of our Presidents, have delighted in the pursuits of agriculture. Washington, whose career presents the brightest example of true glory recorded in ancient or modern history, was impatient to retreat from the toils of war and the cares of State, to betake himself to the pure and unalloyed joys of rural life. Jefferson, whose fame is identified with the independence of his country, rejoiced in the opportunity of mingling the avocations of the farm with the sweets of polite literature. Madison, whose monument is found in the matchless constitution he contributed to form and which he administered in peace and in war, was always anxious to retire to the mellow pursuits of agriculture, as the most congenial in their influence upon the profound and classic efforts of his unrivalled pen. Monroe, who fought in both wars for the maintenance of his country's independence, and whose career is signalized by association with the purchase of Louisiana and Florida; the heroic Jackson, whose fame will live as long as the waters of the father of rivers roll on to the ocean; our own

eloquent Clay the great unsurpassed of modern statesmen, and our own veteran Harrison, whose patriotic policy founded and whose skillful valor defended the vast North-West—these all have manifested a deep solicitude for the interests of the great cause which we have this day convened to promote.

To descend to our own history as the first republic in the wilderness of the great west, we have many noble examples of our most distinguished citizens devoting themselves to the pursuits of agriculture. At an early period, Shelby, Nicholas and Breckenridge were conspicuous in their efforts to advance this great object. The first, renowned in the war of the revolution, and in the early as well as the after history of the State; the two latter, his equal in vigorous intellect and patriotic devotion, whilst they were scarcely excelled in the whole Union in their enlightened advocacy of the principles of constitutional law. In our own day we find the whole community in its civil, political and religious character, coming up to mingle its tears with ours over the graves of the lamented Garrard and Green, who, after signalizing their valor in the North-West, considered it their proudest claim to distinction in devoting their strong minds and patriotic hearts to the great cause of agriculture. And passing from our own country and our own age, we may refer to the fact which is exhibited in bold relief in the history of every nation claiming to be civilized, that men of every profession, in all ages, have contemplated at some period of their career, to retire to the repose to be found only in the pleasures of rural life. The statesman, the civilian, the philosopher, the physician, the merchant, the handicraft tradesman, the county court pettifogger, the village constable and the heartless usurer, all fix in their minds some future day in which they hope to realize what their imaginations have depicted of the joys of retirement in the country.

As a further illustration of the value which highly gifted men have attached to the pursuits of agriculture, I venture to introduce an extract from the essays of Dr Johnson, who stands at the head of British literature. It is allowed that "vocations and employments of vast dignity are of the most apparent use; that the meanest artisan or manufacturer contributes more to the accommodation of life, than the profound scholar and argumentative theorist; and that the public would suffer less present inconvenience from the banishment of philosophers than from the extinction of any common trade."

"Some have been so forcibly struck with this observation that they have, in the first warmth of their discovery, thought it reasonable to alter the common distribution of dignity, and venture to condemn mankind of universal ingratitude; and what labor can be more useful than that which procures to families and communities those necessities which supply the wants of nature, or those conveniences by which ease, security and elegance are conferred."

"This is one of the innumerable theories which the first attempt to reduce them into practice certainly destroys. If we estimate dignity by immediate usefulness, agriculture is undoubtedly the first and noblest science; yet we see the plough driven, the clod broken, the manure spread, the seeds scattered and the harvest reaped, by men, whom those that feed upon their industry, will never be persuaded to admit into the same rank with heroes or sages; and who, after all their confessions which truth may extort in favor of their occupation, must

be content to fill up the lowest class in the commonwealth, to form the base of the pyramid of subordination and lie buried in obscurity themselves, while they support all that is splendid, conspicuous or exalted."

Peerless woman, in all her high and holy influences, has contributed to give dignity to the pursuits of agriculture. Throughout the succession of time in all civilized nations, she has been man's solace in every condition of life, and to no class of men more eminently than to the cultivators of the soil. It is in the domestic circle of the farmer, that woman shines in all her glory, guiding the distaff or leading lisping infancy in prayer. But it is not to the farmer alone, that she is the richest of all temporal blessings—her hand is ever open as day to melting charity, her approbation gives rapture to the statesman and the philosopher—her love animates the warrior on the field of battle—her heart is often an altar dedicated to the service of the living God, and her bosom is as the balm of Gilead to the wounded spirit in the hour of trouble.

But if the testimony of men of science and of patriots in all ages fails to recommend the pursuits of agriculture to our favorable consideration, there is intrinsic merit in the profession itself to command our unqualified regard. It is the nursery of patriotism, of wealth and of strength to the state. All writers on political economy speak of the farmer as the "productive class" and all others as the "unproductive classes;" and whilst he is creating materials, nearly all other occupations are employed on pre-existing materials. If these views of the general value of the agricultural interest be acknowledged, how much more impressive will they be regarded in reference to our own state where the products of the soil enter so pre-eminently into the sources of her prosperity. We are in a latitude so peculiarly blessed as to unite the growths which belong to a Northern and a Southern climate. The tobacco of the south is found by the side of the hemp of the north, and the grass of the north grows luxuriantly by the side of the corn which flourished best in the south. This happy concurrence of climate meets upon a soil of unparalleled fertility and of irrepressible energy: presenting just the undulations in surface which protects it alike from baking or of washing in the cultivation. The corn and grass of this rich region contribute, in the character of provisions and live stock, mainly to the supply of the cotton planter of the south, who, in his turn, supplies the raw material to the manufacturer of the north, who, in his turn, with the merchant and the seaman taking it to market, is fed chiefly by the products of our soil: so that in the circuitous operations of labor and of commerce, Kentucky with the other states of the west, feeds all the operatives of the north and of the south. How dignified then should be the pursuit, and how controlling the interest which effects these high objects. But with a soil and climate so inviting, we do not realize from our lands half the product which is found in the northern states, where the cold soil and rock surface is made to yield to the influence of the scientific labor; and without a prospect of improvement in the character of our husbandry, we are in danger of being exposed to the remarks of Solomon in regard to the slovenly farmer. "I went by the field of the slothful, and lo it was all grown over with thorns, and nettles covered the face thereof, and stone wall was broken down." May we not, however, hope that a better day is dawning upon us in all that relates to the means by which the

physical as well as intellectual resources of our country may be developed, and that in view of all the considerations which have been addressed to the pride of the farmer, he may be led to aim at a standard better calculated to elevate him in public regard?

In contemplating the causes which in our own country have led to the low estimate heretofore placed upon the pursuits of agriculture, we cannot fail to ascribe the principal agency to the disrepute in which manual labor is held by those who have been educated for the so called learned professions. Even the merchant considers himself as occupying a higher grade in society, although he is but the *teamster* who is employed in transporting and exchanging the surplus products of the farmer, who creates the raw material, and in bartering the articles of the mechanic and manufacturer who exerts his labor in preparing the raw material for the market. The standard of the farming character suffers injury from the common opinion which attaches to his profession, the want of any intellectual culture or any refinement in manners; and although we may deplore and condemn this unworthy prejudice towards the employment which is intrinsically the most respectable, we have reason to confess that too large a portion of those engaged in the cultivation of the soil seem by their conduct to attach little importance to these requisites of character. If as a profession we do not occupy in the community, the attitude of intelligent farmers and accomplished citizens, we have to ascribe the result, in a great degree, to our neglect of the means which would elevate us in society. We have, heretofore, discarded all connexion between science and art as applied to agriculture, and by the neglect of general education, have allowed other professions to assume and to occupy the position to which we are entitled. We have disregarded, even, the proper measures for training our sons to the exercise of their most exalted privileges as citizens; and to the apathy and ignorance of farmers, in reference to the fundamental principals of public policy, we may trace most of the political disorders in the state. It is often said when a young man is supposed to be too dull for what are called the learned professions, that he is *then fit for the plough*. Be it our high aim to establish the converse of this proposition; and were the standard of intelligence among farmers as elevated as their employment is honorable, the day may not be distant when the youth who should be found to want the intelligence and energy necessary to make him a successful farmer, will then be pronounced fit only for seeking his fortunes in some one of the "unproductive"—less dignified—learned professions. With this high object constantly in view, and by the adoption of the means which will be adverted to in the further discussion of the subject, the cultivator of the soil may hope to resume the proud attitude which the nature of his profession as well as the approbation of ages has assigned to him.

In attempting to examine the subject with a view to legislative encouragement, I find myself surrounded by a multitude of imposing facts in our own history and in that of other nations in relation to this great interest, all calculated to deepen conviction as to the necessity of arousing the apathy of farmers, of vindicating the dignity of their profession, and of guiding public sentiment to an appreciation of the fundamental cause of national prosperity.

(Concluded next week.)

REPORT ON RECLAIMED MEADOWS.

We have the pleasure of presenting to our readers from the "Transactions of the Essex Agricultural Society for 1838" the report of the committee on reclaimed meadows; in which will be found interesting accounts of some spirited improvements. Of Mr Brown's extraordinary improvement, a partial account was given in the First Report of the Agriculture of Massachusetts. The completion of the experiment shows a result in the highest degree creditable to his industry and indefatigable perseverance.

H. C.

In submitting their report for the current year, the committee have great pleasure in remarking that they have reason to believe that there is an increasing attention paid to these improvements.

The number and length of the statements that have been furnished to the committee, and which are annexed, seem to render it proper that they should abstain from a report any more detailed than is absolutely necessary.

They have viewed the premises described in the several statements, and have examined with attention the claims made for the improvements.

They award the first premium of twenty dollars to Timothy H. Brown, of Saugus, and the second of ten dollars, to William Osborn, jr. of Salem, for his land in Saugus.

For the Committee,

N. W. HAZEN.
N. W. Hazen, Amos Sheldon, Asa }
T. Newhall, Daniel Putnam, } Committee.

TIMOTHY H. BROWN'S STATEMENT.

To the Committee on the Improvement of Wet Meadow and Swamp Lands:

GENTLEMEN—The improvement that I submit to your examination, has been made upon between five and six acres of swamp land, situate in the town of Saugus. The mud or soil varies from two to twelve feet in depth. Two years ago, it was so thickly covered with briars and bushes, that a dog would have found difficulty in passing through it. These bushes I mowed and burnt on the ground. There were so many stumps and logs that it was impossible to plough; so I commenced cutting the surface into squares about fifteen inches each way, and then with forked hoes made very strong, pulled off the sods, and cleared out the stumps and logs. Then using the same hoes, cleared out all the small roots, levelled the surface, and placed back the sods the other side up. This part of the work I did in strips of about one rod in width. In August, 1837, I commenced this. In 1836 I mowed the bushes and dug one ditch. The stumps and logs I took out without the help of oxen. Some of the stumps I should judge had nearly half a cord of wood in them. There were a considerable number of trees that had blown down, and the meadow had formed over them. Many of them were perfectly sound, and some measured sixty feet in length. The stumps were very numerous. I found three tier deep, and under the bottom lay a pine log, that had some time or other been on fire. After going over the surface and clearing in the manner I have described, I found the expense to have been, at a fair estimate for the labor, \$504.

In the winter I hauled off the wood and piled it up for coaling. The largest of the small roots I selected for my own fire; the smallest I burnt upon the ground. I commenced harrowing with an iron tooth barrow, as soon as the frost began to

come out of the ground. The sods being fastened over by the frost, and the harrow passing over the upper side, they mouldered away as fast as the frost would admit; and when the harrow had got to the depth of the sods, they were worked up pretty fine, the frost below making a bridge for the team to pass on. About the first of last May, I began planting with potatoes, without any manure. I cut the seed very fine, and planted the parts near together. I merely marked the hills with a hoe, then a man followed after with the seed, and then another man to cover it. So I made speedy work in planting. I calculated to have the seed when covered, one inch from the surface. I use sixty-nine bushels of seed, that is, about fourteen bushels to an acre. I should not have seeded so light, had I not felt an uncertainty about obtaining a crop, without the use of manure. There was but one man among those I consulted, who gave me any encouragement. Many said I should lose my labor. To their astonishment I harvested 927 bushels of excellent potatoes. The expense incident to planting, hoeing, harvesting, &c., including the seed, I estimate at \$117. The land is now in a state that I can plough it at pleasure. On a small piece of the land I planted corn, and it ripened well. On a small piece I sowed wheat, but it came to no perfection, either in the straw or grain.

The wood was converted into charcoal. In 1837 I coaled 1301 bushels, which sold in the market for \$166 40. In 1838 I coaled 4200 bushels, which sold on the hearth for \$333 33, and I ascertained from the purchaser that it sold in Boston market for \$630. I sold wood to the amount of \$50, and I estimate that which I used for my own fire worth \$50 more. I have on hand one hundred cart-loads of the bottom of the coal pits, which I value at \$75, having had some knowledge of its virtue as a manure. The account may be thus stated:

Proceeds of coal in 1837	\$166 40
do, do, in 1838	333 33
Value of crop of potatoes at 50 cts. a bu.	463 50
Value of ashes for manure, &c.	75 00
Value of wood sold	50 00
Value of wood used	50 00
Increased value of the land, it being now worth \$125 an acre, and originally thought to be worth only \$12 an acre	565 00
	<hr/>
	\$1702 23

Labor, &c.

Leveling and clearing the land, &c.	\$504 00
Carting the wood and roots	35 00
Harrowing, &c.	12 00
Planting, hoeing, harvesting, &c.	117 00
Coaling in 1837	40 00
Coaling in 1838	100 00
	<hr/>
	\$808 00

Balance in favor of the experiment \$894 23.

I have about two acres more of similar land, that I am managing in the same way. It requires much hard labor, but it yields a fair reward.

Yours with respect,

TIMOTHY H. BROWN.

Saugus, Dec. 7, 1838.

WILLIAM OSBORN, JR.'S STATEMENT.

The subscriber presents the following statement to the Committee on Reclaimed Meadows: The piece of meadow land reclaimed and culti-

vated by the subscriber, lies in Saugus, and contains 4 acres very wet, and peaty bottom, and admitted of running a pole in some places, 10 feet without reaching hard bottom; covered with a large quantity of pine stumps, and a young growth of maples, alders, dogwood, &c.

In the first place I commenced removing the sods and roots from about one-fourth of an acre, and burning the same, but finding the land would not be made sufficiently dry by this process, I turned the sods over the whole piece in the fall (1837), and let them remain for the action of the frost until spring (1838), then had them chopped with large grub hoes, fine enough for planting potatoes, &c. The process of turning over the sods and getting out stumps were both done at the same time: after doing this, I run a ditch around the piece, and four ditches across it, 3 feet deep and 4 feet wide, with an outlet sufficient to drain the land at all times last season, to 15 inches below the surface.

I annex a rough sketch of the different lots, which I will describe:

Lot No. 1.—Containing one-fourth of an acre, nearest the upland, was cleared in the fall and spring by chopping and clearing the small roots, and made in a good condition for cabbages; manured with compost of loam and manure, and a small portion of unleached ashes put in each hill. Crop, fifty dozen large cabbages.

Lot No. 2.—One-fourth of an acre, pared and burned; sods not fully burned collected into heaps and mixed with stable manure, lime, and salt; in spring, chopped fine and spread in drills: planted with ruta бага. Crop, 100 to 150 bushels—mixed with others and I cannot give the exact number.

Lots No. 3 and 4.—Sods turned and mud-wheeled on from the ditches and spread; raked in rye and grass seed. Crop, 5 1-2 bushels of rye, and 18 to 20 cwt of hay, without manure.

Lots No. 5 and 6.—Potatoes, squashes, pumpkins, &c., with coarse barn and stable manure.

Lot No. 7.—Corn, potatoes and squashes.

The amount of manure used on the whole piece, about 6 cords; 2 casks of lime, 1 bushel of salt.

Estimate worth of Crops, and Expenses.

CROPS.	
327 bushels of potatoes at 60 cts. per bu.	\$196 20
51-2 do rye, at \$1 25	6 87
81-2 do. corn, " 1 00	8 50
100 do. ruta бага, at 30 cts. " "	30 00
18 to 20 cwt. hay,	12 00
40 doz. cabbages at 50 cts. per doz.	25 00
2000 lbs. squashes,	20 00
Value of fuel taken off, at least	25 00
	<hr/>
	\$392 57

EXPENSES.

Cost of land	\$25 00
Labor, per contract	86 50
94 days by help on farm	70 50
Seed potatoes	15 00
Rye and grass seed	1 17
Six cords of manure	30 00
Two casks of lime	2 00
22 days labor, gathering crops	16 50
	<hr/>
	\$246 67

Net profit, \$76 90.

The present value of the land I leave for the judgment of the Committee.

WM. OSBORN, Jr.

December, 1838.

ASA T. NEWHALL'S STATEMENT.

To the Committee of the Essex Agricultural Society on Wet Meadow and Swamp Lands:

GENTLEMEN—The piece of meadow land which I offered for your inspection the past season, and which you have been pleased to view, is a part of a lot containing about ten acres, that twelve years since was a sunken quag-mire, from 2 to 12 feet in depth, producing nothing except bushes, dogwood, lilies, and in some places, coarse water grass; this piece, a part of which was very low and wet, contains 1 acre and 61 poles; in the latter part of the summer of 1836, I covered three-fourths of an acre with sand and gravel from 3 to 6 inches in depth, manured with 100 bushels of leached ashes and 4 cartloads of the scrapings of the barn-yards, sowed with rye and grass seed the last of October; the rye sprang up from one to two inches in height before the ground froze, but was, as I believe, owing to the lateness of sowing, principally pulled up and destroyed by the frost; a few patches of the rye which survived the winter were harvested, after which it yielded more than 2 tons of hay, which sold at 20 dollars per ton. In 1836 the first crop weighed 41 24-100 hundred. In the summer of 1837 I prepared the remaining part of this piece; manured with 75 bushels of ashes and 3 loads of scrapings, sowed with rye and grass seed the fore part of September, but owing to the extreme drought, there were several patches where the seed did not vegetate. The crop of rye which grew on about half an acre, produced 14 1-2 bushels, weighing as soon as thrashed 64, and after having been spread to dry for 5 weeks, 62 pounds per bushel.

The grass on the stubble at the time of reaping, as also on the first named piece, promised fair for a sound crop, but finding the grasshoppers becoming very numerous, I fed with neat cattle.

Believing that farmers generally have strong doubts as to the utility of cultivating rye on meadow lands, has been the principal inducement to offer this experiment.

In 1831 I prepared and sowed 2 acres and 53 poles of this meadow with grass seed, and might have conveniently sowed the whole with rye, if I could have had any confidence of success; but after consulting with the most experienced farmers in the vicinity, and getting no encouragement, I concluded to try one-eighth of an acre only, on which I sowed four quarts of seed, which yielded five bushels and three pecks of grain of superior quality.

Very respectfully, your ob't serv't,

ASA T. NEWHALL.

Lynnfield, Dec. 1st, 1838.

RICHARD PHILLIPS JR.'S STATEMENT.

To the Committee on the improvement of Wet Meadow and Swamp Land:

GENTLEMEN—My piece of land, which is entered for premium, contains one acre and an eighth. I came into possession of this land early in June last. It was then in its wild state, thickly covered with small maples, dogwood, black alders and other bushes. On the 25th of June the mud and water were three feet in depth on this land. I then cut a small ditch on the southerly side of it and drained off the water. In August it was so dry as to permit the cutting of the bushes, which laid a number of days, and then fire passed over them. After this, there remained large hassocks and roots, which I cut and dug up by hand, and let them remain a few days, then piled them up and set fire to them, and burnt, as good judges said, nearly three hun-

dred cords of hassocks, roots, and bush. Twenty cords of these now remain on the edge of the land, which I intend to burn. I cut a ditch on the western side of this piece, and cross ditches on it about three rods apart, which have drained it sufficiently dry. About the 25th of this month, I spread the earth that came out of the ditch, on the land, on the top of which I spread the ashes, which were made from the burning of the hassock, etc. Then I sowed upon it 3 pecks of herds grass seed, and half a bushel of red top, with a very little clover seed. On this piece of land I have spent 48 1-2 days work, which cost about \$48 50. This piece of land has been brought to, without the help of oxen, horses, or plough. It was accomplished altogether with the sweat of the brow.

Yours respectfully,

RICHARD PHILLIPS, Jr.

Topsfield, Sept. 27, 1838.

(From the Gazette and Mercury)

Good Luck.—Much having been said and written in disparagement of fine wooled sheep as *nurses*, the writer wishes to state a fact respecting his own flock. Probably for fitness, they are not excelled by any flock in the country.

He has taken especial pains to procure sheep of superior quality, as respects body, and also fineness of wool. And he has found his efforts amply repaid by his success in wool growing, for a number of years past. Out of a flock of two hundred eighty-five, he has not lost a single sheep since taken to the barn last Autumn. He has also raised one hundred and forty lambs the present season without losing a single lamb out of his flock; and all have been owned by the sheep. He has not fed out six quarts of cow's milk to them, and yet they are all in a thriving condition. He has not given them over half a bushel of grain of any kind, since they were taken in, in the fall. Since the first of April, they have been fed with ruta бага, this is all the feeding they have had, except hay.

Perhaps a flock of the far famed Bakewell sheep consisting of 255, with but a single half bushel of grain for the whole flock, would not beat this. If there is such a flock I should like to hear of it.

ABEL WILLIAMS.

Ashfield, April 22, 1839.

We understand the farmers in this state are making great efforts this spring to put seed enough into the ground to give crops, if the season be propitious, ample for home consumption, and thus keep the hundreds of thousands of dollars at home, which are now annually sent into other states for bread stuffs. There will be more corn planted this year in this country, than has been planted in any one year for the last fifteen years. In this village every little patch of ground is to be improved for the growth of something or other useful in a family. The valley of the Merrimack will this year begin to look like a garden, and all the face of the country round about, is to be dressed up in good style. Speed the plough, and let the farmer prosper, and all will prosper except lawyers and sheriffs, for plenty will be in the land, and then their vocations lessen to profit.—*Concord (N. H.) Courier*.

HOR CULTURE.—It appears that the American crop varies from one to three millions a year while in England it reaches to forty or fifty. There seems no good reason why we should raise so little.

NEW YORK AGRICULTURAL CONVENTION.

The following resolutions were passed at the New York Agricultural Convention, holden in Albany in February last. They are of general interest and importance. The proceedings in detail, would be too voluminous for the space we have to devote to them.

Resolved, That this convention respectfully request the legislature of this state to pass an act making it the duty of the assessors in each city and town in this State annually to ascertain the whole amount of the produce of said city and town, including agricultural, mechanical, and manufactures of every description—designating each separately, in proper tables, so that the specific produce of said city or town may be seen by the items respectively; and in order to obtain particularity and uniformity, the Secretary of State be required to make blank tables or forms, such as he may deem proper and necessary, to ascertain the entire produce of the State of every description; that such blanks may be furnished to the clerks of each city and town, in order that they may be distributed to such officers whose duty it is to obtain such information; that said officer be required to make due return thereof in such manner as shall be designated by the Legislature, and that the Secretary of State may make due report of all such information so acquired, to the legislature annually, in the month of January.

Resolved, That in the opinion of this convention, the culture of silk is an object well worthy of legislative encouragement by the offering of bounties for a limited number of years, for its production.

Resolved, That this convention regard the culture of the sugar beet, with a view to the production of sugar, as a branch of agriculture, which may be prosecuted to the very great advancement of the prosperity of the State, and recommend it as well entitled to legislative encouragement by the offer of liberal bounties.

Resolved, That this convention regard it of very great importance that a brief treatise, containing plain directions for the growing of the mulberry and the management of silk worms, should be prepared and distributed to each of the common schools in this State.

Resolved, That the introduction into all the common schools of this State, of a short practical treatise containing plain, simple directions for growing the sugar beet, and extracting the sugar therefrom, according to the latest and best process, would, in the opinion of this convention, greatly contribute to the general introduction of this new branch of national industry, which promises so greatly to increase the prosperity and promote the welfare of the people of this State.

Resolved, That this convention cordially concur in the recommendation of his Excellency the Governor, in his annual message to the present legislature, that publications upon agriculture, horticulture and rural economy, ought to constitute a part of every common school library.

Resolved, That this Convention respectfully and earnestly recommend, that the legislature make provision for procuring and distributing the above named publications, and that the expense thereof be defrayed out of the fund appropriated for common school libraries.

Resolved, That in the opinion of this Convention, agriculture has not hitherto received, from the people's representatives, that stimulus to improvement

which sound policy would justify, and which equal justice and the best interest of the state demand.

Resolved, That the products of our soil may be vastly increased, our revenue augmented, the wealth and comfort of every class of our citizens promoted, and the character and prospects of our state elevated—by a judicious and liberal appropriation of public moneys, to enlighten, to stimulate and to reward, that numerous portion of our fellow citizens who are employed in the business of agriculture.

Resolved, That an annual appropriation of twenty thousand dollars of public moneys ought to be made, for a term of years, to encourage improvements in agriculture; and that in the opinion of this Convention it will return an annual interest to the treasury, and compound interest to the state.

Resolved, That the general principles of the bill to encourage agriculture, reported at the last session of the legislature, by the committee on agriculture, meet the views of this Convention, and that we respectfully request that those principles be adopted by the Legislature now in session.

Resolved, That the American Institute richly deserves the fostering care and liberal patronage of the Legislature, as an institution which has already done much good to the state, and which is eminently calculated to promote great and rapid improvement in the mechanic and manufacturing arts, and materially to aid in the improvement of agriculture.

Resolved, That the establishment of common school libraries will form an important era in our history, and is eminently calculated to advance us in the march of useful knowledge, to multiply our domestic and social comforts, and to elevate our character—provided that judicious selections of books are made for such libraries—adapted to the capacities and understandings of those whom they are designed to benefit, to the wants and improvement of the various branches of productive industry, and to the promotion of industrious and moral habits in the rising generation;—and that in this view of the subject, the appointment of a competent board to prepare, or cause to be prepared, a selection of books for common school libraries, by the Legislature, at least so far as the public moneys are to be applied to this object, is called for by the highest consideration of public usefulness.

Whereas, the growing of wheat is a business of great importance, not only to the agricultural but also to the mercantile, manufacturing, commercial and financial interests of this state:—*And whereas*, the eastern and northern portions of the state have, for some years past, been visited by the ravages of insects which have destroyed the crops therein, and reduced the farming interests thereof to dependence on their western neighbors for their supplies of flour:—*And whereas*, this Convention view with alarm, the rapid spread of this evil towards the fine wheat districts of the west:—

Therefore, in hopes to stop the progress of this scourge in our land, this Convention do most earnestly and confidently call upon and request the legislature now in session, to authorize the governor or some other suitable person or persons, to offer a reward to any person or persons who shall discover and make public any remedy for preventing or counteracting the effects of these insects. Such bounty to be paid out of the treasury of this state.

And whereas, also a knowledge of the character and habits of these insects may lead to the discov-

ery of a course of husbandry which may avoid the deleterious effects of the labors of these insects,

Therefore, this Convention do also request that the Governor may be further authorized and required to offer a reward for the best treatise on the habits, character and nature of these insects. Such treatise to be submitted to and determined by a board for that purpose to be appointed.

THE MONTAGUE COAL.—The mineral supposed to be coal, which was discovered in Montague last autumn, does not sustain the hopes which it excited. Specimens were sent to Professor Hitchcock, who submitted them to chemical analysis. The result will be found in the following extract from a letter from him, in answer to one addressed to him, containing some inquiries relative to the subject.

Amherst, April 13th, 1839.

Dear Sir,—I have received from at least two gentlemen, specimens of the lately discovered coal in Montague, and have subjected some of it to analysis. After pulverizing it and heating it nearly to redness to drive off water, I subjected 100 grains to the heat of a powerful furnace, for 2-12 hours, in a platinum bowl; and it lost only 6.7 grains. The residue was common sand.—Surely, a substance containing 93.3 per cent. sand, cannot be of any value for fuel. Yet I have been told that this substance would burn; and hence I have thought it possible that I may not have received the best specimens. Yet the gentlemen from whom I received them would not be apt to be mistaken. They have strongly the appearance of coal, yet are nothing but shale; which contains a little carbon. This rock usually accompanies coal; yet it often occurs, especially in the valley of the Connecticut, where there is no coal. I have noticed the spot where this supposed coal is dug; but have not been there since it was discovered. I should think that the question might be settled by boring a few feet. I indulge some hope that a large body of coal may be found in this valley: but I confess my expectations are not sanguine. Small pieces of the best bituminous coal that I ever saw, have been dug out of the rocks in South Hadley, and in West Springfield.—*Greenfield Mercury.*

ASHES.—When wood is burned in a position that excludes the air, the product is coal; if combustion is performed in the open air, the produce is ashes. Ashes by being leached, or having warm water passed through them, are deprived of the alkali they contain, and this obtained in the shape of potash or soda, by evaporation. Different wood, and plants, vary much in the quantity of ashes and alkali they produce; the fir, beech and poplar, ranking the lowest, and the box, willow, elm, wormwood and fumitory, the highest. The leached ashes of several kinds of grain, were found by Ruckert, to be constituted as follows:

	Silica.	Lime.	Alumina.
Ashes of Wheat,	48	37	15
“ Oats,	68	26	6
“ Barley,	69	16	15
“ Rye,	63	21	16
“ Potatoes,	4	66	30
“ Red Clover,	37	33	30

Leached ashes are found to be an excellent manure, applied to soils that are light, or such as are inclining to be sour; the alkali correcting the acid with which such soils, as the vegetation proves, abound. In some instances, crops of grain, roots and grass, have been nearly doubled by their use; and no skillful agriculturist permits their waste.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MAY 8, 1839.

ELEVENTH AGRICULTURAL MEETING AT
THE STATE HOUSE.CULTIVATION AND DEPTH OF PLOUGHING.
(Concluded.)

The depth of ploughing which is to be advised, must depend upon many circumstances, which necessarily vary much, and will be found very differently combined in different situations.

The food of vegetables is to be found, so far as it depends on the soil, in the decayed organic matter, which is there deposited; and which forms with various intermixtures the mould. The earths or salts existing in the soil, or forming its substratum act only as condiments or stimulants or preparers of this vegetable matter that it may be in a condition to be taken up by the roots of the plants. They themselves furnish but in a very slight and inconsiderable degree the materials out of which the plants are formed. The simple earths themselves have no nutritive properties. In a single state, as in pure sand or pure clay for example, they have no action whatever, and are incapable of producing or sustaining vegetable growth. In combination, mixed with manures, the remains of decayed organic substances, either vegetable or animal, and exposed to the action of air, moisture, light, and heat, they become active and the seed germinates, and the plants grow, and the fruits are matured in them. Cold, inert, gravelly earth, brought, as one gentleman observed, from the bottom of a well, became fertile and produced clover. It imbibed undoubtedly some principles of fertility from the air. Vegetable matter in the form of dust is continually floating about, and much of it would light and be retained on such a heap. Then after vegetation had once commenced in such a situation, the natural decay of the plants would itself serve to enrich the soil, and furnish food for future plants. The more vegetable matter in the soil the richer the soil. The exuberantly rich western soils in the great valley of the Mississippi are the deep deposits of decayed vegetable matter, the vast accumulations of past centuries. In pure vegetable matter, if such could be found, in unmixed manures either of animal or vegetable origin, vegetation becomes plethoric and diseased. The intermixture of it therefore with salts and earths is essential to put it in the best condition for vegetable nutriment. The electrical or galvanic operation of such intermixtures and combinations is supposed to constitute an important office or instrumentality in promoting vegetable growth.

Another point which seems settled is, that the activity and usefulness of manures are increased in proportion as they are kept near the surface, and as they, with the earths with which they are combined, are brought in contact with solar and atmospheric influences. Placed directly upon the surface much of their usefulness is lost by evaporation. We cannot do in this case exactly as we would; some of the manure will be necessarily exposed; some will be of necessity placed too deep; but though the expression may not be strictly grammatical, we think we shall be best understood, when we say that manures should be covered but not buried.

Another matter to be considered in the case is the nature of the plant which you propose to cultivate. The cereal grains gather their principal nourishment from near the surface. Long tap-rooted vegetables, such as the carrot and parsnip and so likewise the whole

family of the clovers go down deep for their sustenance, and require both for the extension of their roots and the expansion of their substance, a deep loose, friable bed. All these matters are to be considered, when you wish to know how deeply you should plough.

Do not plough so deep as to bring only the cold sub-soil to the surface, and bury the vegetable mould beyond the reach of the active influences of the sun and air. Do not bring any more of the gravelly and cold sub-soil to the surface than you have the means of enriching with manures. Cultivate your tap-rooted vegetables only on soils that have been already deeply cultivated and enriched; or where you have such a depth of soil that they can stretch themselves out at their pleasure, without the danger of starvation. Then again, be trying continually to deepen your soil by ploughing a little deeper and a little deeper every year. What cannot be done by a single blow, may be effected by gradual approaches. We are perfectly convinced, that for wheat in our old soils, deep ploughing is indispensable. Wheat seems to require, what Dr Stebbins calls, a virgin earth. Whether, as some persons suppose, the particular elements or ingredients in the soil necessary to the growth of wheat, have, by cultivation, become exhausted; or whether according to the profound conjectures and experiments of De Candolle, the excrementitious deposits of the plant have poisoned the soil for its successive and repeated cultivation, no one is as yet prepared to decide; but experiments, repeated and decisive experiments, have determined that where a fresh soil is turned up and properly managed, the wheat crop among us has never been known to fail.

The greatest improvements, however, are to be confidently looked for from the introduction of the sub-soil plough. On this subject, we beg leave to refer the farmers to the first report of the Agricultural Survey. This instrument keeps the vegetable mould at the surface, while it breaks and opens the sub-soil for the extension of the roots of the plants and the reception of the filterings of the enriching manures from above. We hope that it will soon be brought into common use among us. Many farmers in England said, some time since, that its use had actually doubled their crops; and the recent accounts speak in the highest terms of its continued and increased approval among them.

This subject of ploughing, the great operation in husbandry, deserves much more than this passing glance, and we design, hereafter, to give to it a much more extended notice. What we now offer, are mere hints, for other minds to work up. "Speed the plough."

H. C.

TWELFTH AGRICULTURAL MEETING.

It was our intention to have given a full report of the twelfth and last agricultural meeting, holden at the State House in April, but our notes in this case are too imperfect to make one out to our satisfaction and to do justice to the gentlemen who took part in the discussion. The subject *primo pally* discussed was the application of manures. Dr. Kepp went pretty largely into the subject of the use of lime and ashes, and the formation of compost. He was kind enough to promise us a full report of his remarks, which were highly instructive and interesting. The note, for fear of its being out-laved, we have already had renewed, that it therefore stands pretty well; but if not paid at maturity, we assure our friend, the Dr, that it will "be lodged for collection."

The meeting broke up with an expression of strong satisfaction on the part of those present, in these repeated interviews and interchanges of sympathies, information, and experiences, and of a strong conviction of their utility. From various indications, we feel strongly con-

firmed in the cheering persuasion, that the cause of agricultural science and improvement is daily making advances, and claiming that attention from the community to which it is entitled by its eminent importance.

H. C.

SECOND REPORT OF THE AGRICULTURE OF
MASSACHUSETTS

As some omissions and misarrangements have been ascertained, we hope it will be deemed excusable in taking this method to say to our agricultural correspondents out of the State, that this document was duly transmitted by mail to the

Southern Agriculturist, at Charleston, S. C.
Franklin Farmer, Frankfort, Kentucky.
Indiana Farmer, Indianapolis, Ind.
Ohio Farmer, Columbus, Ohio.
Farmer's Register, Petersburg, Vir.
Baltimore Farmer & Gardener, Baltimore, Md.
Am. Silk Society's Journal, do.
Farmer's Cabinet, Philadelphia, Penn.
Silk Grower, do.
Cultivator, Albany, N. Y.
Genesee Farmer, Rochester, N. Y.
New York Farmer, New York city.
Rural Library, do.
Silk Culturist, Hartford, Ct.
Monthly Visitor, Concord, N. H.
Yankee Farmer, Portland, Me.
Maine Farmer, Wintrop, Me.

If these copies have failed to reach their destination, and the slightest intimation should be given of a wish to receive the Report, it shall be forwarded with much pleasure; not from any conceit of its value, but as a token of the author's respect for his co-laborers of the agricultural fraternity, and his desire to keep the chain of correspondence between them bright and strong.

H. C.

May 6, 1839.

DENNIS' SILK MANUAL.

We have received from the author, a copy of Dennis' Silk Manual, containing complete directions for cultivating and manufacturing silk, to profit, from the raising of the tree and worm to the perfection of the article for sale, with a full account of his newly invented reel. We had designed to have given the figure of this reel in our present number, but of necessity omit it. The book is written in a full, detailed, and practical style—showing the results of personal practice and observation, and deserves patronage. It has another merit—that of containing four times as much information on the subject as some books for which four times the price is asked. It is sold at 25 cts. a copy. Silk Directories and Manuals seem to be coming up as if they had been sown broadcast in a nursery bed.

Massachusetts Horticultural Society.

EXHIBITION OF FLOWERS.

Saturday, May 4, 1839.

By Thomas Lee, Esq., Brookline, a fine specimen of *Rosa* var. *bonquet*. On this stem of 54 roses, about 40 have expanded. This is the third flowering from a bud put into a Noisette, planted in the green house last June. Also, fine specimens of the following plants, viz.: *Clarkes*, *Alba* and *Pulchella*; *Collinsia* bicolor; *Calceolaria pallida*; *Senecio*, double purple; *Centaurea lutea*; *Phlox Drummondii*; *Verbena melindris*, g. flora; *Yellow Tea*; *Hymenaeal* do.; *Bolwiller*; *Double McCarty*; *Black Birch*; *Mespilus Arborea*; double *Cery*. By Mr David Haggerston, from the garden of J. P. Cushing, Esq., Watertown: *Cumbretum purpureum* (fine); *Greville Rose*; *Magnolia Thompsoniana*.

For the Committee.

S. WALKER, Chairman.

BRIGHTON MARKET.—MONDAY, May 6, 1839.

Reported for the New England Farmer.

At Market, 235 Beef Cattle, 14 Pairs Working Oxen, 5 Cows and Calves, 100 Sheep, and 400 Swine.

Prices.—Beef Cattle.—We quote to correspond with 1 week, viz: First quality, \$9 00 a \$9 50 Second quality, \$8 25 a \$8 75. Third quality, \$7 00 a \$7 75 **Working Oxen**—We noticed the following sales; 70, \$78, \$85, \$100 and \$140.

Cows and Calves.—Sales were effected at the following prices, viz: \$31, \$36, \$42 50, \$55, and \$65.

Sheep.—We did not bring the prices.

Swine.—Sales were not very readily made. Several were sold to peddle at 8 a 8 1-2 for sows and 9 a 1-2 for barrows. Several small lots of large barrows 8 and 8 1-4. At retail from 8 to 11 according to size of quality.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors the New England Farmer, Brighton, Mass. in a shaded outhouse, week ending May 5.

SWEET POTATOES.

Carolina Potato Slips for planting.

The following are brief directions for their management. In three or four inches deep in a hot bed; when these are six inches above the ground, part them off from the potato which it suffered to remain, will produce more sprouts a successive planting; transplant them into a rich, light soil, in rows four feet apart. Keep clear of weeds until the legs begin to cover the ground, after which they will grow dry. For sale at the New England Seed Store, 31 1/2 Market Street JOSEPH BRECK & CO. Day 8.

DOUBLE DAHLIA ROOTS.

For sale at the New England Agricultural Warehouse and Seed Store, a superb collection of Double Dahlias, consisting of all the improved varieties. Also, Double Carnations of many fine varieties. JOSEPH BRECK & CO. Day 6.

MULBERRY TREES & C.

VILLIAM PRINCE & SON still have the following for sale. 5,000 genuine Morus Multicaulis trees, from 1 to 6 feet high, which will be sold either trimmed or untrimmed, and in lots. The wood of these trees is perfectly mature, and they have been well preserved from all injury. 2,000 genuine plum trees, of a very superior character, especially equal to any in the Union. 6,000 of the splendid Morus Expansa, 5 to 9 feet high, much branched—remarkable for its great excellence in every respect. This is the only large parcel of this tree existing in this country. 5,000 Canton, Brussa, Morus Elata, Rose of Lombardy, 2,000 Pyramidalis, Oriental, White Italian and other kinds, of which will be sold at prices deemed moderate. Also, a large assortment of the silk worm's eggs, of the best choice and valuable kinds. Simple directions for the culture and successful propagation of all kinds of mulberry trees, will be given to every purchaser. For sale at the Agricultural Warehouse and Seed Store, near New-York. April 17, 1839.

FOR SALE.

The subscriber offers for sale his estate in Harvard, County of Worcester, the well known Bromfield Place; an excellent dairy farm, well wooded, the house spacious, fitted for distinct families; the situation among the most pleasant in the county, especially for a private or high school. Bordering a part of the farm is a beautiful sheet of water, containing two islands belonging to the farm. Inquire of the subscriber at South Natick. J. W. T. BLANCHARD. April 17.

MORUS MULTICAULIS.

A few thousand trees of the genuine Morus Multicaulis; so a few thousand cuttings of the same may be had on immediate application to the subscriber. WILLIAM KENRICK, Nonantum Hill, Newton. April 24.

HERBACEOUS PLANTS.

A great variety of Herbaceous Plants, of beautiful and hardy varieties, can be furnished by the subscribers from their gardens at Brighton at short notice. From 25 cents to \$1 00 per plant. JOSEPH BRECK & CO. April 24.

PEAR TREES FOR SALE.

At the Pomological Garden, Salem, Mass., a good collection of Standard Pear Trees, all of which have been proved. They comprise the choicest of the old and new varieties. Also—Scions of Apples, Pears, Plums, and Cherries, from bearing Trees, for sale by the subscriber. April 3. ROBERT MANNING.

DILLINGHAM POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store connected with the New England Farmer Office, a few barrels of Dillingham Potatoes. These are well known as a most excellent eating and very prolific kind. Also, a few Cow Horn Potatoes, a very fine kind; the celebrated Rohan Potato; Early Whites, and Eastern Potatoes of various kinds. JOSEPH BRECK & CO. April 17.

CORN SHELLERS.

Just received at the New England Agricultural Warehouse and Seed Store, Nos 51 and 52 North Market Street, a supply of Currier's Patent Corn Shellers; a very convenient and cheap article. A right to using said machines in counties or towns may be obtained by applying as above. April 17. JOSEPH BRECK & CO.

WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they were apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can sow one half of an acre, and do the work at less than one quarter the expense of the common way of sowing his seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangol Wurzel, Turnips, Carrots, Beets, Parsnips, Onions, Corn, &c. It is highly recommended by a great number of persons who have used it the present season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO. April 3.

MORUS MULTICAULIS.

For sale, at the Garden of Fromont, near Paris, France, 150,000 of the Morus Multicaulis. These Mulberry Trees are 2, 3 and 4 feet in height and of the first growth, deliverable either at Paris or Bordeaux, in the course of the Autumn of 1839. Orders for the above must be addressed to the Director of the Garden of Fromont at Ris, Seine et Oise, France, or to J. H. Mey, of South Carolina, at Paris, to the care of J. C. Darilier & Co. Paris, with an order on a Banker at Paris, for the amount which will be immediately attended to, and the plants put in the best order. The Garden of Fromont, has also, large quantities of the Mulberry Morati and other new kinds, as well as the newest varieties of Camellias, Rhododendrons, Magnolias, Azaleas, Rose Trees, Dahlias, Chrysanthemums, &c. &c. Immediate application should be made for the Mulberry Trees. For further particulars, apply to James Ailger & Co., Charleston, South Carolina; C. W. Karthous & Co., Baltimore; John Bohlen, Philadelphia, and C. C. Meien & Co., New York. Paris, France, January 1, 1839. A new milk goat, of a superior breed, producing milk like cream; well calculated for the invalid, or for a vessel for a long voyage. Inquire at this office. March 13.

GRASS SEED.

Just received at the New England Agricultural Warehouse and Seed Store—A few casks of prime Eastern Clover Seed, and a fresh lot of Herds Grass Seed. JOSEPH BRECK & CO. April 24.

Just received at the New England Farmer Office, the Second Report on the Agriculture of Massachusetts, by Henry Coleman, Commissioner for the Agricultural Survey of the State. For sale by JOSEPH BRECK & CO. April 10. 51 and 52 North Market St.

PLUM AND PEAR STOCKS.

A few hundred Pear and Plum Stocks, for sale by SAMUEL POND, Cambridgeport. May 8.

MISCELLANEOUS.

The subjoined extracts are from letters written by a lady of New York, now travelling in the East. They are from the New York American, and we think are full of interest, and will be welcome to the readers of the last page of the Farmer:

"Turn now to the East. The broad plain which lies between us and the river, was once covered with palaces and streets of the greatest city of antiquity. Where are they now? You see the waving corn spread like a sea before us. Where beautiful fountains once threw their spray high in air, to toy with the many-hued Iris, are now only to be seen the muddy rivulets of irrigation, trailing their serpentine forms through the luxuriant vegetation, like huge boas in the jungles of India.

The surface of the ground over which we are now coursing, without the least obstacle to obstruct our path, is thirty feet above the pavements of Thebes, caused by the annual overflowing of the Nile for ages since the ancient mounds which excluded it from the populous city, were broken down, and the waters left to complete the work of desolation and oblivion.

We can never hope that the curious antiquarian, or the interested speculator, will ever attempt to lay bare any part of the immense area of a city which lies so deeply buried. Although the superincumbent mass of earth is as light and as easily removed as the ashes which cover the streets and houses of Pompeii, yet it is by no means certain, and perhaps scarcely probable, that anything of the least value has been suffered to remain on the site of this ruined city. But were it possible to denude a portion of it without too much expense, much might be learned of the form and style of private edifices, from their foundations and overturned walls. It is my opinion, however, that the private dwellings were of wood, or some equally frail texture, like those in India and China are represented to be, and that the great architectural energies and science of the nation were directed to their religious temples. To this they were of course instigated and stimulated by the crafty and powerful hierarchy who ruled them at times with a rod of iron, and at others, led them by the "cords of love." Why are we halting here, to muse and speculate upon what may or may not be underneath these grain fields? Spr on to the river!

You perceive that as we approach its banks, there is a gradual rise in the plain. You cannot perceive it by the ordinary means of observation, for it is too gradual and imperceptible; but take notice of those rills of Nile water coming with considerable velocity directly towards us and at right angles with the river. They proceed from small reservoirs on the river bank, which are kept overflowing all day long by the peasants, who raise it from the river in various curious though simple ways, which you will soon behold.

I perceive that Ali has our skiff ready to convey us across the stream, and if he has obeyed orders, has horses prepared for us on the opposite bank. Do you see that black speck, just above the water, near the farther shore? It is a *crocodile*, watching us; and the moment we embark, you will see him draw under water one eye, which is the only thing he keeps above the surface.

On yonder sand-bank is another huge Leviathan, at full length, sunning himself. He too, will slide off, the moment he perceives us. I have frequently seen a dozen at a time, quite near to us, as we

suddenly rounded a turn in the river, and came unexpectedly upon, and caught them napping. Some of them were twenty feet in length. The gentlemen frequently shot at them, but the ball glanced off from their coat of mail, as if they had been projected against a cuirass of Milan steel.

The current, you see, is not rapid, as the waters are now getting quite low. Although the water appears so dark and thick, yet when taken up in a glass it is quite transparent, and deposits very little extraneous matter—much less, probably, than at the time of the great flood, when the rush of waters brings down the rich alluvion of the overflowing lakes of South-western Africa.

I have purposely kept your attention fixed upon the water, in order to manage a surprise for you. Look up, and behold the towering walls of Luxor above your head, with its aspiring obelisk, ready in anger to dart at the sun, for not having annihilated at a stroke, the barbarous Gaul, who so lately robbed it of its mate.*

We are now arrived at the water-steps of the temple, by which devotees used to ascend to worship at the shrine within.

The river front is not as imposing as the opposite one which faces the north. Before we land, I will call your attention to the sudden turn in the river at this point, by which it runs nearly parallel with the south facade of the temple. We will ascend the steps and make a *detour*, in order to get a front view of the great north entrance of Luxor, where it is to be seen to the best advantage.

If we had time at this moment, I would make a morning call, and introduce you to an English lady, who, with her husband, arrived here yesterday overland from India, and one at present living in yonder tent, delightfully pitched under the shade of some palm trees. But they will be our guests at dinner this evening, when you shall see them. So *adions*, to our work.

Step now from behind that mud-hut, and behold the sublime entrance to a sublimer temple. That pyramid is 200 feet wide at its apparent base. (The real base is 30 feet below the present level of the soil.) On one side is the widowed obelisk, mourning for its lost companion. May the Briton have more good taste than the Gaul, and leave it here, under its own bright skies, where the sun, of which it is a type, never for a day withdraws from it the light of his countenance. Fancy it now standing among the dripping and moss-covered trees of James' Park, and after two years smoking, coated with an inch of coal soot! It would then be under the ban of Typhoon with a vengeance! That row of enormous heads and shoulders, which you see twenty feet above the soil, belong to many huge statues of red granite buried 30 feet in the earth. We will pass through the prepylon only in order to see a succession of courts very similar to those of the Memnonium, a temple in very little better preservation than the latter, and much less perfect than that of Medinet Abon.

(To be continued.)

*The French, by permission of the Pasha, have taken one of these beautiful obelisks to Paris, where I saw it lying on the quay. The other is destined to enjoy the fogs of London.

SAYLE'S GARDEN ENGINE.

For sale at the New England Agricultural Warehouse, Nos. 51 and 52 North Market Street, Sayle's Garden Engines. This Engine is a splendid article, and will throw a constant stream of water to the distance of 50 or 60 feet, with great force, and in case of fire would be a good substitute for a fire engine. It is the most perfect article for the purpose ever introduced.

JOSEPH BRECK & CO.

April 3.

WINSHIP'S BRIGHTON NURSERIES,
AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbariums, Perennials, Green House Plants, &c.
Orders addressed to Messrs WINSHIP, Brighton, Mass., will be promptly executed, and forwarded to any part of this or other countries.
April 10.

FRUIT AND ORNAMENTAL TREES, MULBERRIES, &c.

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1839 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and of Teaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeyuckles, Peonies, Dahlias and other Herbaceous Flowering Plants.

10,000 Cuckspur or Newcastle Thorns.
10,000 Buckthorns.

Moss Mullicaulis, and other Mulberries; the trees genuine and fine, at prices fair, and varying with the size, and the quantity, which may be desired.

Fruit and all other trees when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston.

January 30, 1839.

PEAR, PLUM, GRAPE VINES, &c.

1000 Pear Trees of the most approved kinds;
1000 Plum Trees, of the most approved kinds and extra size—many of them have borne the past season;
500 Quince Trees;

300 Isabella and Catawba Grape Vines, from 6 to 15 feet high and in their bearing home fruit—Black Hamburgh, Sweetwater, Pond's seedling;

30,000 Giant Asparagus Roots;
5000 Wilmot's Early Rhubarb or Pie Plant, lately introduced;

Also—a good assortment of Gooseberries, Roses, &c. of different kinds;

All orders left at this office, or with the subscriber at Cambridgeport, or in Mr. Lynn's baggage wagon box, at Cambridge & Howe's, No. 3 Panel Hall, will meet with immediate attention.

SAUEL POND,

Cambridgeport, Mass.

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel, put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, Ground Oyster Shells.

Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention.

March 27.

NAHUM WARD.

GRAPE VINES.

150 Sweet Water Grape Vines.
200 Isabella, " "
150 Catawba, " "
100 Black Hamburgh Grape Vines.
1000 Asparagus Roots.
100 Early Wilmot Rhubarb Roots.
200 Cornwall " "

Also—Strawberry Plants of the following choice kinds: Methven Castle, Bath Scarlet, Haultois, English Wood, Monthly, &c. Raspberries, Franconia White and Red. Gooseberries—Currants—Flowering Shrubs and Plants of all kinds supplied at short notice, by

N. E. FARMER.

ANNUAL ADDRESS

Before the Kentucky State Agricultural Society—delivered at the Capitol in Frankfort, January 14, 1839, on the dignity of the profession of agriculture, and the propriety of legislation for its improvement. By Col. C. S. Todd, of Shelby.

(Concluded.)

Agriculture constitutes the business of severals of every civilized community, and is the ultimate source of all national power and wealth, commerce and manufactures being only subordinate results of this main spring. If it be conceded that it is the duty of the legislator to consult the good of the greatest possible number in the community, the transcendent claims of this class will not be questioned; and taking for granted that the condition of our agriculture admits of improvement, and that such improvement will lead to the receipt of greater revenue, there will be no difficulty in obtaining an assent to the proposition that the state is bound to elevate the standard of good farming. This high object has been effected in some of our sister states and in some portions of Europe, by the endowment of agricultural societies and of agricultural professorships in colleges, to induce experiments and impart scientific knowledge in all the branches of farming. These measures have been adopted with the happiest results—those who originated them having concurred in the opinion of Sir John Herschel, the great astronomer, that “the arts cannot be perfected till their whole processes are laid open: they are the application of knowledge to a practical end;—if this knowledge be experience, reasoned upon and brought under general principles, it is *scientific art*.”

The advances made in agriculture by the Romans, so beautifully illustrated by their poets and orators, shared the fate of other improvements that were buried in the dark ages, and it was not until after the revival of letters that the present system of farming commenced in Flanders about 800 years ago; and although the soil was originally a barren white sand, it now yields twice as much as the lands in England. The practicability of *creating* soil is shown in the history of Flemish husbandry. They seem to want nothing but a space to work on, whatever was the quantity or the quality of the soil, they made it productive. It is their maxim, that “without manure there is no corn—without cattle there is no manure—and without grain crops or roots, cattle cannot be kept.” The productiveness of their lands proceeded from six causes—small farms, manure, rotation of crops, clover and roots, cutting the forage and grinding the grain—and the farmers giving their personal attention to their farms: no lumbering, no fishing, no speculation, no hankering after office. If the personal digression be pardonable, I will refer in connexion with this subject, to an incident which occurred in my own history when entering upon the cultivation of the soil. In conversing with an experienced far-

mer, I was led to enquire as to the best mode of making corn. He told me that I must *keep my work horses fat*. I did not then perceive the comprehensive character of his counsel, but have long since realized that it implies every thing connected with good cultivation, although neither he nor I then knew that Cato, one of the most illustrious of the Romans, 2000 years ago, had announced that “the true secret of farming consists in *feeding well*.”

The great Fellenburg first introduced into Prussia under the auspices of the sagacious Frederic, the agricultural schools, which “connected the science with the practice of agriculture—which made gentlemen farmers, and farmers gentlemen—combining intellectual with physical power, and literature with labor.” Frederic expended a million annually for these purposes, and said he considered it as *manure spread upon the ground*. In Paris a society has been formed which communicates with more than 200 local societies in France, receiving annually \$100,000 from the public treasury. Agricultural colleges have been established at St. Petersburg and Moscow, in Prussia, Bavaria, Hungary, Wurtemberg, Ireland, France, and in Scotland, who effected her late astonishing improvements by her skilful agriculturists reducing their practice to writing, thus establishing agriculture as a science. Fellenburg has a school in Switzerland with pupils from Switzerland, Germany, France, Spain, Portugal, North and South America. The Highland society in Scotland has appropriated 500 sovereigns as a premium for the first successful application of steam power to the cultivation of the soil, and premiums for other objects to the amount of \$15,000. The agricultural condition both of England and Scotland, has been advanced to its present prosperity by the lights of science applied to the cultivation of the soils. The tour of Sir Arthur Young, to the continent in 1788-9, for the purpose of looking into the countries there under the best system of farming, produced the first decided advances in England to her present agricultural maturity and the perfection to which the art has been brought in Scotland, is ascribed chiefly to the endowment of an agricultural Board, through the influence and exertions of Sir John Sinclair.

Agricultural societies are not now to be regarded as experiments: they are the peculiar privileges of modern times. Before they were formed, in New England and New York, 10 bushels of rye, 20 of corn, 200 of potatoes and one ton of hay, was the average crop. Since premiums were offered, claims have been presented for having raised from 40 to 50 bushels of rye, from 115 to 122 of corn, from 400 to 500 of potatoes and from 3 to 4 tons of hay. Massachusetts gives a bounty equal to the cost of manufacturing upon the growth of silk, and upon manufacturing beets into sugar. After experiencing the benefit of a former appropriation she has voted to continue it. Maine, Vermont, Connecticut, New Jersey and Pennsylvania have also granted a bounty upon the growth of silk. Will these examples and these results be lost upon us? Will not the State as well as our farmers profit by

the experience acquired in other States of the value derived from legislative encouragement, and ought not an agricultural survey to follow the geological reconnaissance now in progress, which will develop the intimate relation between the minerals that the earth covers and the true method of cultivating its surface?

An improved state of husbandry in Kentucky, and the system of improved roads and navigation, will act with reciprocal benefit upon each other; the roads and rivers will enhance the price of agricultural products by the greater facilities afforded in conveying them to market and thus increase the revenue from tolls; while the increase in the products of the soil will not only add to the tolls but will furnish an increased revenue, both from the value of the increased products and the increased value of the lands. For the want of any accurate statistical tables shewing the agricultural product of the whole State, it is impossible even to approximate to a correct estimate, but it is palpably evident that 10 per cent. upon the amount would yield a large revenue, and will any sensible farmer doubt that our modes of cultivation may not be improved so as to add 20 or 50 per cent. to the wealth of the State? And if, according to Pliny, Egypt with only 6000 square miles, at one time contained a population of 20,000,000 by reason of the immense fertility superinduced by the government leading canals from the Nile, what may not be the future destiny of Kentucky, with more than six times the territory, when her resources shall be developed and invigorated by the same beneficent policy? Of the value of canals, or slack water navigation, which is more beneficial, upon the agricultural interests of a country, a striking illustration is given by Count Chaptal, a Peer of France, distinguished for his attainments in agricultural chemistry and his experience as a practical farmer, who, “traversing a barren part of Flanders, accompanying Napoleon, the latter expressed his surprise at a meeting of the council of the department, that so great a tract of land remained uncultivated in so industrious a nation. The answer was, “If your Majesty will order a canal to be made through this district, we pledge ourselves that in five years it will all be converted into fertile fields.” The canal was ordered to be made without delay, and in less time than they promised, “not an unproductive spot remained.” This was effected by means of the easy transportation upon the canal, of the manure from the rich districts.

The chief magistrate, alluding in his last annual message to the deep interest which the State ought to cherish in the cause of internal improvement, uses the emphatic language that “Kentucky cannot stand still.” A noble sentiment! worthy indeed of a patriot, and which may be illustrated by reference to many proud periods in the history of the State. The soldiers of the revolution, who were the pioneers in planting the standard of liberty, law and civilization on this once “dark and bloody ground,” rescuing it from the savage and from the forest, “did not stand still.” In the second war for

independence waged in defence of commercial interests and of sailor's rights, of which she was not personally the victim, Kentucky "did not stand still;" her valor and her patriotism having signalized every field of blood from the shores of the lakes to the banks of the Mississippi. "Kentucky did not stand still" in the cause of human freedom, whether she supposed that standard was unfurled among the children of the sun in the south, or on the classic shores of Greece; and now in this age of improvement, she stands ready to take her place among her enlightened sisters of the confederacy, by entering upon a noble career in reference to the high interest which the Governor elucidates with so much ability. But may we not hope that if the day has not already dawned, it is rapidly approaching, when she "will not stand still" in efforts to advance the great cause of agriculture? All the motives which may be supposed to have influence in causing her march to be "onward" in relation to the cause of internal improvements, apply with equal force to the encouragement of her agricultural interests; for if the appropriation of seven millions of dollars to the construction of paved rail roads and slack water navigation, be justly predicated on the assumption that it will increase the wealth and consequently the revenue of the State, there can be no conceivable reason why an improved condition of agriculture, superinduced by the application of science to art, shall not demand of the legislative councils some display of the public bounty. The selfish as well as the more elevated motives which ought to prompt the farmer to adopt such methods and to seek such information as science imparts to the cultivation of the soil, whereby an increased profit may attend his labors, address themselves with undiminished force to the legislative councils; for if, as in the case of Scotland and the New England States, the endowment of agricultural societies and professors, and the authorizing of agricultural surveys, should lead to a fourfold increase in the productions of the soil, the bounty granted by the State would be more than repaid in an increased revenue. But this subject is too transcendent in its beneficial influences, to be estimated merely by the dollars it would yield to the treasury of the State or of individuals. An improved condition of agriculture carries with it a train of blessings which money cannot purchase, in an increased intelligence and a higher toned morality in the mass of the people. In proportion as science shall shed its rays upon the path of the farmer; and in proportion as "mind, the grand source of intellectual pleasure, the master power which abridges labor," shall be exerted on the pursuits of agriculture, the character and dignity of the profession will be advanced, the sources of national strength will be developed, and the indications of moral improvement will be visible in the public countenance. If it be contended that the plans which are in progress for the improvement of the soil partake of the character of experiments, and that therefore the legislature should pause in granting aid, we may derive an instructive lesson from the history of the growth of cotton and of sugar. Fifty years ago it was not known that cotton would grow in the United States, but the experiment received the fostering care of government, and from only 200,000 pounds being exported in 1791, more than four hundred millions are exported at the present time. Then, its production was limited to one State—now, it is the staple of seven, regulating by its price nearly every other production, and

supplying, in addition to our own great and increasing demand, two-thirds of all that is used in foreign climes. Indeed, the culture and manufacture of cotton have now become the support of more than ten millions of the human race in Europe and America, and of more than fifty millions in Asia and Africa. A more recent experiment in Maine and Massachusetts, has served to exhibit the value of legislative encouragement in aid of agricultural effort. Maine granted a bounty to the growth of wheat of \$150,000, and a large bounty was given by Massachusetts upon the same article, at a period when her consumption of imported flour amounted to \$7,000,000. It is now ascertained that both these States will be able to export flour—the policy having originated from the supposed fact that their inhospitable soil and climate would not produce grain; but intelligent, scientific agriculturists, men whom the ignorant stigmatize as "book farmers," acted upon a different opinion, and its truth has been demonstrated in the fact that wheat has been successfully grown in Maine, further north than Massachusetts, thus presenting another instance of the soundness of the maxim that experiment is the mother of improvement and improvement is the true source of wealth.

I cannot exaggerate to myself the importance which a free people should attach to agricultural periodicals and to agricultural education. All the valuable improvements in husbandry have been the result of scientific effort and of the wide spread dissemination of the opinion which the writings of the most eminent Romans inculcated, that the cultivation of the soil and of elegant letters were not incompatible pursuits. By the application of the physical sciences, the wonderful creation of modern times, agriculture has become not merely a mechanical employment, but a science founded upon the process of induction from ascertained facts, and if a medical institute be entitled to legislative regard, the claims to a bounty for an agricultural education are equally imposing, science being alike beneficial to both—the one to preserve and prolong life, the other to nourish it and multiply its comforts. The public mind should be excited to the tone which prevailed in ancient Sparta, of regarding the children of the republic as the property of the republic, as the materials of our temple of freedom, erected upon the principle of teaching the hands to work and the mind to think. In reference to this vital interest, the late De Witt Clinton indulged in a prophecy in his last message to the legislature of New York, which the experience of the schools in Prussia and other German states has since fulfilled. He said, that "by a proper system of education and correct modes of teaching, our children might become familiar with the physical sciences, botany, mineralogy, the various classes of animals, chemistry, natural philosophy, astronomy, the fundamental principles of agriculture and political economy, and much of history and biography."

The endowment of agricultural schools and the circulation of agricultural journals is rendered the more necessary from a consideration of the peculiar habits and modes of thinking prevalent among our farmers. As a class of people they have little intercourse with each other; they do not preserve the result of their experiments in books, like mechanics and manufacturers; they have rarely held conventions to concentrate into a focus the lights of the day, to be thence imparted through the press to the remotest ends of the republic; they entertain an unworthy prejudice towards the attainments of

book farming; they profess to be too old to seek or to receive information upon the great business of their lives, and therefore we must look to the means which shall enlighten the rising generation for any hope of future high attainments in agricultural knowledge. In designating the source of these unpropitious notions among our farmers, we shall perceive at once the pernicious influence of their reluctance to read agricultural journals; and as if they had designed to set at naught all the maxims of common prudence, we find them encouraging and sustaining nearly one thousand political papers, whilst not more than twenty papers devoted to agriculture are supported by a class whose numbers and importance are in the inverse ratio of their distinctive journals. The farmer is content to meet his neighbor at the court yard, at the muster, at the election, and occasionally at the fireside in the winter, to converse about his farm and its products, and sometimes about the reason of different modes of cultivation, but he will reject a newspaper devoted to agriculture, which conveys to him the concentrated experience of all the intelligent and practical farmers who have lived in every country and in every age, and cannot be persuaded to realize that in perusing the pages of the N. Y. Cultivator, the Genesee Farmer, the Farmer's Cabinet, of Penn., the Farmer's Register of Va., the Buckeye Ploughboy, of O., and the Maine Farmer, the N. E. Farmer, the Farmer and Gardener of Balt., and the Franklin Farmer, he is conversing at his leisure with those in every age who have made farming both a science and a business. In view then of these facts, who can estimate the vast amount of every species of improvement in cultivation, the results of individual exertion for ages, that has been lost for the want of convenient methods of communication; or who would now attempt to calculate the addition that has been made to our stock of agricultural knowledge and wealth by the publications which are now diffusing their light all over the country?

As an evidence of the deep necessity for the adoption of some stimulating measures in relation to our agricultural condition, we have only to advert to the crop which is annually produced in Kentucky, not exceeding upon an average 35 bushels of corn, 12 of small grain, 500 lbs. of hemp and one ton of hay to the acre; and whilst the Atlantic States present the humiliating spectacle of importing hay and oats from Scotland, eggs from France, potatoes from Ireland and Germany, and bread stuffs from every country in Europe, Kentucky imports clover and timothy seed from Wheeling and Ohio, and seed Irish potatoes from Pittsburg. How few among us understand the amount which an acre perfectly cultivated, will produce. How few understand the secret of producing the greatest result without deterioration to the soil; the object being not merely to obtain the greatest crops for a few years, but the largest annual returns compatible with the increasing value of the soil. And how few now realize the startling fact that a farmer from Flanders would support his family by the cultivation of the fence corners now in weeds upon any of the large farms in Kentucky.

These reflections, gentlemen, are submitted to you in the hope that we may all begin to learn something of our duty, and I shall be more than compensated if they shall have the auspicious effect of leading my brother farmers to think, and the legislative authority to act in relation to the great interest upon the prosperity of which every other de-

ends; for the sentiment of Dean Swift is not less true now than when first published, "that whoever could make two ears of corn or two blades of grass to grow upon a spot of ground where only one grew before, would deserve better of mankind and do more essential service to his country, than the whole race of politicians together."

Allow me then, in conclusion, to appeal to your pride of character, to your patriotic feelings and to your patriotic energies, by addressing to you the language once applied to our profession by that ripe scholar and able financier, who has since won golden opinions for himself as President of the Bank of the United States: "In this nation, agriculture is probably destined to attain its highest honors. The pure and splendid institutions of this people have embodied the brightest dreams of those high spirits who, in other times and in other lands, have lamented or struggled against oppression; they have realized the fine conceptions which speculative men have imagined, which wise men have planned, or brave men vainly perished in attempting to establish." * * "The American farmer is the exclusive, absolute, uncontrolled proprietor of the soil. His tenure is not from government. The government derives its power from him. There is above him nothing but God and the laws; no hereditary authority usurping the distinctions of personal genius; no established church spreading its dark shadow between him and heaven. But his character assumes a loftier interest by its influence over the public liberty. It may not be foretold to what dangers this country is destined, when its swelling population, its expanding territory, its daily complicating interests, shall awaken the latent passions of men, and reveal the vulnerable points of our institutions. But whenever these perils come, its most steadfast security, its unfailing reliance, will be on that column of landed proprietors—the men of the soil and of the country, standing aloof from the passions which agitate denser communities, well educated, brave, and independent—the friends of the government without soliciting its favors, the advocates of the people without descending to flatter their passions; these men, rooted like their own forests, may yet interpose between the factions of the country, to heal, to defend and to save."

ODESSA WHEAT.—Six thousand miles from New York, in the interior of the eastern continent, and in the heart of the most despotic government on earth, is a city containing sixty thousand inhabitants, sprung up where but forty years since only a few fishermen's huts existed, and at the wharves of which now, two hundred vessels are sometimes seen at a time, exchanging the various products of the east and the west. That city is Odessa; and the wheat shipped from this place in large quantities to the countries of the Mediterranean, Portugal, Spain, Great Britain, and to the shame of American agriculture be it said, to this country also, is known by the name of Odessa wheat. The whole immense extent of Southern Russia, including the Crimea, is a vast plain, rich in soil, and wherever cultivated, producing as does the same range of country in Poland, and the north of Germany, the most luxuriant crops. It is divided off into immense seignories, or as it would be called at the south, plantations, cultivated by white slaves, of whom some of the proprietors own from twenty thousand to one hundred thousand; and these men clothed in undressed sheep skin, and performing all their operations in the most primitive, barbarous manner, are still able

to send wheat to this country, and it is said at a handsome profit. To England the trade in Black Sea or Odessa wheat, is an object of consequence; and now when in consequence of the partial failure of the crop, the ports are thrown open for the importation of grain, the supply from this source promises not to be the least abundant in meeting the wants of a half famished population.

PLAIN DIET.—This is what children ought on every account, to be accustomed to from the very first. It is vastly more for their present health and comfort, than those little nice things with which fond parents are so apt to vitiate their appetites; and it will save them a great deal of mortification in after life. If you make it a point to give them the best of every thing, to pamper them with rich cakes and sweetmeats, and sugar plums, if you allow them to say with a scowl, "I don't like this, and I can't eat that," and then go away and make them a little toast or kill a chicken for their dainty palates, depend upon it you are doing them a great injury; not only on the score of denying them a full muscle and a rosy cheek, but of forming one of the most inconvenient habits that they can carry along with them into after life. Better far to put them upon water gruel or brown bread, till their appetite comes, and they can be satisfied with such food as others eat at the same table. If you accustom your children to "eat what is set before them, asking no questions," they will always find something, among whatever class of people they may afterwards be thrown, upon which they can make a comfortable meal; whereas, if you allow them to comf and find fault at your own table, when they come to leave you, they will not half the time find anything they can eat, and thus you will prepare them to go chafing along through life, the veriest slaves, almost, in the world.—*Yankee Farmer.*

The following letter from a highly intelligent friend, who has returned from this country to England to take possession of a farm, has so much good humor and piquancy about it, and in the operation of the English game laws, presents such a striking contrast with the condition of things in our own country, that, though an entirely private letter, we take the liberty of publishing it, because we know it will be read with much interest by our country friends.

H. C.

“Near Lincoln, 12th month.

Here I am, up to the ears in farming projects, and I like the pursuit vastly well, only I would rather farm where game laws and tithes are not quite so much in vogue. My estate is a ragged one, and I shall have much to do to put a decent face upon it. But this does not disturb me, for I like the planning of improvements. I intend to go over each farm with a gang of men, repairing and building, hedging and ditching, jevelling and draining, and when all this is done, I hope I shall see old Salem, where my heart only finds its home. Were it not for the hope of recruiting the wasted health of my family, I would not be long here; pecuniary considerations should not keep me. They do not—for, of a truth, my property is only yielding 2-3-4 per cent. at most. We have been too long from old England. Had we always lived here, our situation would be enviable, for we have really much to make us happy. Thou knowest that living in England on one's own acres, is a condition not to be grinned at. We are something like the

English who go to the East Indies. They place all their hopes of happiness upon the period of their return, and expect supreme felicity in spending their last days in England; they come back strangers by long absence, and hurry back to the East as fast as they can.

I wish thou wast here: we have partridges in abundance, and I know where to go for a hare at any time. But thou knowest the color of my cloth; I have done with guns; and acting with some little sternness of principle, I will not allow other people to use them on my property. If thou wast here, I would relax a little in thy favor; for I take thee to be a most humane sort of a gunner. The passion for field sports is as rife among the English people as ever it was; and if it were merely a wholesome exercise, and not connected with cruelty to animals, I should not have much to say. I almost envy the fine looking fellows I sometimes meet, rushing on horseback to the rendezvous, with faces flaming with ruddy health and almost eclipsing the scarlet of their jackets. And the age too at which they will follow the hounds, astonishes me. It is not so much the foible of the young as of elder men. Men with heads white as silver, or with no hair at all, like the bald-pated knight in the fable book, are far more commonly seen than those of youthful appearance. What an outrage upon common decency are the game laws of this country! I despise them from the very bottom of my heart. Why, I can't shoot a hare upon my own property if I were inclined to, without paying that little slut up there somewhere about *Linnæus*, something like twenty dollars a year. Is it not monstrous? If I were king absolute for only one two hours, I would sweep the whole code of game laws from the statute book with the besom of destruction. The entire thing seems just contrived for the very special purpose of setting the rich and the poor at loggerheads. Two or three keepers and two or three poachers have been killed already this season. I have told my tenants what I should do upon finding miss pussy eating my turnips, and nobody nigh—*knock her over*—they may do as they please. When the laws are vicious, obedience is scarcely a virtue. Perhaps I might be willing to take back a little of this doctrine; but it does gall me to think that a rich man may come on to my land with a license in his pocket, and kill my game, and the worst that I can make of it is simple trespass. But if a poor man come on without a license, it is felony. This is not right. The common sense of every man tells him that wild animals are not, in fact, any man's property. And the most ignorant know full well that game laws are not founded on principles of natural justice. Thanks to the schoolmaster, they cannot last long: they will all go together—the game laws and the old—. I wont hurt thy feelings by even a distant hint against the venerable establishment thou lovest so well.

Altogether absorbed in the improvement of my estate, I know nothing of politics. However, I know this: the Tories can never govern this country for long. The whigs have the rabble and the radicals, like Blanch and Tray at their heels, and if the Tories should gain the ascendancy, they have only to set on the dogs. The Tories cannot do this if they would, nor would they do it if they could."

A new article of marketing.—*Morus Multicaulis* leaves were selling in the Philadelphia market last week, at five for a cent!

MASSACHUSETTS AGRICULTURAL SOCIETY.—PREMIUM FARM REPORT.

The subjoined is from Joshua R. Lawton, of Great Barrington, Berkshire county. Mr Lawton was honored last year with a premium or gratuity of seventy-five dollars, and this year with one of fifty dollars; so that he may be considered a highly fortunate competitor. We are satisfied that he is a deserving one, and know that his farming is intelligent, enterprising, skilful, and profitable. U. C.

To the Trustees of the Massachusetts Agricultural Society for 1838.

GENTLEMEN—I herewith make answer to the questions put to the applicants to your society for premiums on the best cultivated farms.

Answer to question 1. My farm consists of 173 acres, exclusive of wood land.

2. The soil is generally loam, including about 40 acres of sandy loam and 25 acres inclining to a clay loam.

3. In the improvement of my tillageable lands, I consider the best method generally, to put my straw in pens about on the lands I till, and scatter it out to my cattle and sheep; I use it also, to stack and fodder out in comfortable weather, a part of my hay. I am accustomed to sow one bushel of plaster to the acre annually. I never feed my lands very closely in summer; I turn them up with the plough once in four or five years, varying the time with circumstances—generally taking from two to three crops before laying them down. I never suffer them to be laid down, however, until the turf and soil is thoroughly subdued and pulverized. The crops are alternated in spring and winter productions. I manure the third crop with from 10 to 12 loads of fine manure to the acre, spread upon the land and well incorporated with the soil, giving them a heavy stock of timothy and clover seed. When the grass seed is well up, I sow upon each acre one bushel of plaster.

I have not been able from the want of manure, to put more than ten loads to the acre with the third crop, and that upon the lightest soils. I think it very important on my soils, which are inclined to clay, that a heavy coat of foliage be suffered to remain on them through the winter, as it in a good degree, prevents the effects of frost upon the grass roots and affords nourishment to the crop of the succeeding year. This is best for all lands.

4. I this year till 56 acres, including my spring and last fall's sowing. On lands that I plant to corn or potatoes, I put from 12 to 15 loads of manure to the acre. On that sown with ruta baga, from 20 to 30 loads as the land varies in quality.

5. My manures are applied mostly in compost, though much is applied in a long or green state.

6. I generally spread and plough in my manures on lands destined for corn or potatoes. I never suffer my manures to be spread any faster than they can be turned under with the plough, as they will lose much of their strength by drying.

7. I plough my green sward in the spring, after the ground is well settled and thoroughly dry; say the last days in April and the first in May, from four to five inches in depth. If there is a deep soil I plough five inches; if shallow, four inches. At the next ploughing, when in stubble, I then plough the four inch soils five inches, which serves to deepen the soil if the husbandry is good and the lands are manured. At the first time ploughing of green sward, I lay the furrows at an angle of from 30 to 40 degrees, thinking this better than to lay them flat.

8. I mow 55 acres of upland, averaging one and a half tons to the acre. The yield is not always uniform—sometimes more, sometimes it falls short, though not often. This year the crop averaged this yield.

9. I have not practised irrigation.

10. I sometimes spread fine manure on lands where bad grasses prevail, and coarse manures on lands which are moist.

I fodder out straw and hay to my sheep and cattle on my mowing land as much as I can. I make a pen where I wish to manure a piece of mowing land, and put in a few hundreds of hay from stack or barn; I then draw a lot of straw and place it mostly on one side of the hay in the pen. This preserves the hay. They can be foddered out together. When this spot is manured, I move to another place. This can be done with convenience in comfortable weather, and is better for the sheep and cattle and for the land. I sow annually one bushel of plaster to the acre in the month of April or May.

11. I have from five to six acres of mowing not suitable for ploughing. The most of this I have drained and under drained, so that it is dry and produces timothy, red top and clover, mostly giving me from one to two tons to the acre.

12. I have no bog or foul meadow lands.

13. I have planted 12 acres of corn this season. After ploughing as described in answer 7, before planting, I harrow twice lengthwise of the furrows and then harrow diagonally until the sod is thoroughly pulverized, taking care not to break up the turf—then furrow or mark with a drag three feet apart each way or at right angles.

This season I planted the Dutton corn and prepared my seed by soaking it 12 hours in weak solution of saltpetre in water and rolling it in plaster. I manured my ground (or the most of it) with compost; this I draw out in winter and put in long heaps on the ground. The remainder was long or green manure, which I drew before ploughing and dropped in small heaps for spreading, at the rate of about 12 or 15 loads to the acre. I never suffer my manure to be spread faster than it is turned under with the plough. My corn has yielded me this year 50 bushels to the acre.

14. I this season planted four acres of potatoes. I prepared my land the same as for corn; see answer 13; with the exception of putting from 15 to 20 loads of manure to the acre. I furrowed my lands 2 1-2 by 3 feet at right angles, with a light plough. I cultivated the land by ploughing and hoeing twice before the setting of the potatoes—taking care not to plough up to or disturb the hills, as this produces great injury to the roots. The average yield this year was 175 bushels to the acre, but little more than half a crop. The kinds were Ladies' baking potatoes, round pink eye and flesh color.

15. I sowed two acres of ruta baga. The produce was 750 bushels to the acre, which will be given to my cattle, hogs and sheep.

16. I sowed last fall ten acres of winter rye; this spring twenty acres of spring wheat, five acres of oats, and three acres of oats and peas. For my winter and spring grains I plough my grounds twice and sow the seed on the furrow; harrowing the same twice each way, or until the soil becomes perfectly smooth and mellow: I sow one and a quarter bushels of rye if sowed early; if late, one and a half bushels per acre: two bushels of spring wheat, two and a half bushels of oats, and two

bushels of peas and one bushel of oats mixed per acre. I sowed 16 acres of spring wheat of the Italian variety, on my sandy loam soils. I placed my seed in a tub where the water ran in and out of the tub, and washed from it all the impurities, including light grains, oats, &c., after which I rolled it in lime slacked in a dry state, making as much adhere to the kernel as the moisture would take up. I sowed about four acres of the common spring wheat without liming, which was not as good. A small part of one lot that was sowed with the Italian one that was limed as above, I sowed without lime. The difference in the product was very perceptible in the field. That which was limed produced the most. I have sowed this fall 14 acres of winter wheat of the red chaff and white flint sort, and 10 acres of rye. These lands were stubble lands that I have sowed this fall.

17. I have laid down twenty-five acres for grass the present season. I have sowed my grass seed on my winter grain the last of April, and on that portion of land sowed with spring grain, my seed was sowed with the grain. I sow six quarts of timothy to the acre with four quarts of clover.

18. My manures in addition to that made in my barn yards by the litter of my stock, are made by gathering turf and vegetable matter and putting it into my yards, and particularly into my pig styes—constantly putting in straw and vegetable matter as often as it is well broken and mixed.

19. I have four oxen, six milch cows, seven young cattle and four horses. I winter generally 350 and summer 450 or more sheep; (the summer addition consists of my lambs.) I would here say that I hire a pasture for which I pay \$70, where I keep a part of my sheep in summer.

I have one barn 29 feet wide by 84 feet long, 15 feet posts; 30 feet of the lower part of this is used for shelter and making manure; also, attached to this barn is a cow house 24 feet wide and 50 feet long, with a loft above for storing hay and grain, and in this shed I collect and house my manures and compost. I am building also one other barn, 35 feet wide by 45 feet in length. Under this barn I am making a cellar, which is almost accomplished. I shall have the barn over it in the month of November next. The cellar will be 8 1-2 feet deep.

20. My cows are of the native breed, part of them crossed with the Durham stock.

21. My calves are nursed from the cows, four days after which they are fed with milk until they are eight or ten weeks old, when they are put into good pasture.

22. I have made 403 lbs. of butter since the 19th of April last, and 1783 lbs. of cheese—all new milk.

23. The last season I kept fifty swine, and made 6,880 lbs. of pork. I killed it the latter part of January last. I have now on hand forty-eight swine; twenty-six of these I wintered. The prospect now is that my quantity of pork will be fully equal to that of the last year. My swine are of the grass breed.

24. The twenty-six swine kept through the winter have been kept to pasture through the summer months.

I fatten my swine on oats, peas and corn meal, with potatoes and ruta bagas thoroughly steamed.

25. I make from my hog styes seventy-five loads of manure. For the materials of which it is made, see answer 18.

26. I employ one man by the year, but from his loss of time his average labor will not exceed eight

months at \$10 per month; that is \$80. I also employ one man by the day at four shillings per diem. He has and will labor six months for me this season, which amounts to \$104. I have three sons whose labor is equal to two men at \$12 per month—\$168. My own health not being good, I have not been able to labor during the season. Making in the aggregate an amount for labor of \$352. Of this amount a part of the labor has been bestowed on improvements on my farm—making fences, walls, &c., say an amount equal to one hand four months, which at \$12 per month amounts to \$48—which deducted, leaves a balance for labor of \$304.

27. I have about 100 apple trees on my farm, a few of which are grafted fruit; and also a small number of peach, pear and cherry trees.

29. I have not suffered from borers or canker worms.

30. I suffer no ardent spirits to be used about my premises nor furnish any to my laborers.

Gentlemen, I have answered the questions proposed agreeably to my understanding of them: if they afford that information which they were designed to obtain, I shall be much gratified.

JOSHUA R. LAWTON.

Great Barrington, Oct. 24th, 1835.

N. S. BENNETT'S STATEMENT.

Nathaniel S. Bennett of Framingham, received a premium of fifty dollars from the Society. His replies to their interrogatories are as follows.

1. My farm consists of ninetytwo acres, exclusive of wood land.

2. The soil is various; and combines in different proportions, sand, gravel, clay, loam, and peat.

3. The methods of improving my land are by draining and top-dressing the peat; tilling and manuring the loam; making manure with the sand; and roads with the gravel.

4. By rotation I keep under tillage eighty acres; and apply twentyfive loads of manure per acre.

5. In applying my manure, the long and green manure is kept long and green (until applied to the soil) by being mixed with sand or loam as it is removed from behind the cattle*; and the compost manure, such as is made in the cow and hog yards in summer, is applied as a top dressing on mowing land, or for covering corn in the hills.

6. My mode of applying my manure is as follows. My green manure is spread and covered in the soil, sometimes by ploughing and sometimes by harrowing. My land generally presents a rough surface when ploughed the last time for corn; and I prefer harrowing in the manure to ploughing it under. I use compost manure on the same field, sufficient to cover the corn in the hills.

7. My mode of managing green sward is as follows. I plough green sward in August, (on my farm, and I believe everywhere else, ploughing in August is a sovereign remedy for the corn, or cut wort) cross plough in April, apply twentyfive

* Mr. Bennett's method is to keep a large quantity of earth, sand or loam, in his cow house behind his stock, with which the manure is mixed daily; and the urine is absorbed. In this way it is kept in a measure from freezing; and as we understand the above statement, from fermentation. The stable or tie-up is wide, and the manure is kept under cover from sun and rain. We think, however, that a barul cellar would be a great improvement upon this method.

† The Committee of the Society disapprove fall ploughing, and prefer spring ploughing for the very reason that Mr. Bennett prefers ploughing in the fall. We know another farmer who says he ploughs early in the fall, that there may be grass enough start between the furrow slices to feed the

loads of manure and harrow the land; mark it out for corn or potatoes one way, cover the corn in the hills with compost from the cow and hog yards, plough and hoe the corn three times without making any unnecessary hills; split the hills in the spring, harrow the same way I intend to plough, plough clean, harrow, sow with wheat and harrow, sow timothy and clover seed, and two bushels of plaster per acre, and bush it down; and level the borders and the ground around the trees, with the hoe.

8. In the course of my rotation, I mow seventy acres of my farm, of upland; thirtythree acres this year. The average yield of hay is twentyfive hundred pounds per acre.

9. I have practised irrigation, but receiving no benefit from it, abandoned it; the water brought on was considered too pure to produce any benefit.

10. I manure my low mowing land at the rate of twentyfive loads of compost per acre.

11. I mow eighteen acres of low land not suitable for the plough, and obtain fifteen tons prime stock hay, and five tons of good English.

12. My method of reclaiming low and bog lands, is by draining and ditching with plough and scraper; the sods being carried to the bogs and cattle yard for manure; the mud, gravel and sand ploughed and scraped on the meadow, in order to level it. I then manure the land, and sow red top and timothy seed in August or first of September; then harrow it with two pair oxen and a heavy and sharp harrow; level again with the hoe, and then rake &c. so as to leave the surface smooth. I have managed to mow two and sometimes three tons per acre, on land thus improved.

13. I have planted with corn eight acres the present year. For the preparation of the ground, kind, quantity, and the manner of applying manure, see No. 7. I prefer planting corn in a dry state; the crows may be kept away by surrounding the field with a white line. The quantity of corn obtained in the above land is three hundred bushels.

14. I had two acres in potatoes the present year. I prepare the ground for potatoes as I do for corn; in lieu of compost I put a spoonful of plaster in the hills when I plant them. I plant the Nova Scotia blues. The average yield this year is only one hundred bushels per acre.‡

15. I raised this year five bushels dried beans; some pumpkins and turnips with my corn and potatoes, squashes, beans, peas, beets, and other garden vegetables, in the kitchen garden; quantity not ascertained.

16. I sowed one and a half acre with spring

ent-worm with that he may not attack the corn. This may be a solution of the disagreement between the parties in the case. A most respectable farmer in the interior makes oats his first crop on green sward; and in this way he says entirely escapes the worm, while when corn was the first crop in the rotation, gave him great trouble.

Mr. Bennett's cross ploughing in the spring is no doubt a work of supererogation; and if he goes so deep as to disturb and break or invert the inverted sward, is decidedly inexpedient and had. His answer in this case is not so full and explicit as could be desired. We cannot in this matter refer him to higher authority than to the author of the report of the Society, whose successful practice demonstrates the soundness and excellence of his cultural principles of cultivation—principles which he has fully explained to the public.

‡ That water fully charged with purest matter or enriching soil would be far more efficacious than pure spring water is obvious enough; but that pure spring water would be wholly useless we cannot admit without farther light. The purest water is in itself a powerful agent in vegetation; and we should have been glad to have had some more particulars in regard to Mr. Bennett's experiments in irrigation.

§ The yield of potatoes is very small, but the drought every where was severe, and materially affected their crops.

H. C.

wheat. For preparation of ground see No. 7. In laying land down to grass, I sow two bushels wheat, ten quarts timothy and ten pounds clover seed per acre. My seed was the white and red bearded wheat. The soil is loamy; the wheat was immersed in brine, and coated with plaster; no lime was used.

18. My means for making manure are from my cattle and hogs. My manner of saving it, is by preparing sand, loam, mud, straw, &c., and placing it behind my cattle, and in my yards, in order to absorb the liquid parts; and to prevent washing, evaporation, and as much as possible, freezing.

19. My stock consists of four oxen, six cows, five young cattle, and one horse. My barn is 80 feet long by 36 feet wide. I have no cellar under it. My stable manure is kept under cover until 20 or 25 loads are made, when it is carted to the field where it is to be used, put in one heap and covered.

20. My cows are of the native breed.

21. My calves intended to be raised are allowed to suck half the milk of a cow each morning and evening for five weeks, when they are turned to pasture and weaned.

22. I have made 400 lbs. of butter the last season; sold and used the remainder of the milk; have made no cheese.

23. I keep five swine, and shall make twelve hundred pounds pork. My swine are of a mixed breed.

24. My swine are kept through the summer on skimmed milk and whatever else would have been cast away. They are fattened on boiled apples and potatoes mixed, and a small quantity of corn meal added while the potatoes and apples are hot.

25. I make forty loads of manure from the hogs-pens. My manure is made by furnishing the hogs with sand, mud, loam, &c., to which is added the wash from the sink.

26. I employ one man and two boys. I paid \$216 for labor the past year.

27. I have nine hundred apple trees; eight hundred acre grafted, and one hundred natural fruit.

28. I have one hundred and twelve cherry, peach, and pear trees.

29. I have had no canker worms. I had a few borers in peach trees, and destroyed them with a pointed knife. I prevent their attacks by plastering the lower part of the trunk and upper part of the roots, with mortar such as is used for plastering a house. It is applied in the month of August.

30. No ardent spirits are used on my place.

SORE THROAT.—Mr Editor: I saw in your paper some time since, a recommendation of the daily use of cold water, applied to the neck as a security against sore throat. My own experience concurs with yours on this point. I was many years subject to this ailment, and was advised to try this remedy by one who had proved it. I did so, and have had no return of the complaint. As the season has come when there is considerable exposure, from the contrast between the temperature of the day and evening, it may be well to remind your readers of this method of protecting themselves. Below I give you the testimony of Sir Walter Scott, on the same point, which I transcribe from one of his letters published in Lockhart's life:

"When I was a little subject to sore throats I cured myself of that tendency by sponging my throat, breast and shoulders, every morning with the coldest water I could get."—*Bost. Merc. Jour.*

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MAY 15, 1839.

We take much pleasure in laying before our readers the subjoined remarks of Dr N. C. KEEPE, at one of our agricultural meetings, which we had before promised and which we will be read with interest.

MANURES.

REV. MR COLMAN—Sir: I send you the following as the substance of my remarks at the last agricultural meeting.

After alluding to the statements we had received on former evenings, of the great advantage of ditching and draining wet land; the improvements in the mode of exterminating the wild grasses, preparatory to planting such as we wish to cultivate, we came naturally to the enquiry, what nourishment do the cultivated plants require?

Plants are organized, living bodies; they must have a home in the soil; they must have water and air; but beyond all this, if they could speak, we should hear the cry from many a field, "Give us food." Manure is far from being a simple substance. The most obvious division of its parts is into vegetable, animal, and saline.

The vegetable part of manure furnishes the substantial pabulum, or food for the plant; and also tends very much to preserve a due proportion of moisture in the soil. The saline parts act mostly as stimulants, and must be used in compost, or on soils containing vegetable matter. The severe drought of the last summer has demonstrated the value of vegetable compost in retaining moisture in the soil.

Squashes, sugar beets, and potatoes planted on sandy soil, manured with compost made of peat and lime, moistened with the wash from the barn-yard, survived the drought and yielded a respectable crop; while others planted on similar soil, manured with the best stable manure, died.

Lime neutralizes the *ulmic acid* which renders decayed vegetable matter partially or wholly unfit for manure, and forms a new compound—*ulmate of lime*. By the addition of one-sixth of animal manure, we get a new product, the *ulmate of ammonia*. These are, probably, the most valuable salts in any manure.

The analyses which have been made, indicate an almost universal deficiency of vegetable matter in our soil. Science teaches us that by the aid of lime, or any of the alkalies sufficient to neutralize the *ulmic acid*, we may use with perfect success in supplying this deficiency, peat, swamp mud, muck &c., which, if used alone, would be found to be inert or injurious.

The compost, sweetened by lime from the comparatively insoluble nature of the salts it contains, must be more durable than a similar compost where wood ashes are used instead of lime, because some of the salts produced by neutralizing *ulmic acid* with potashes are very soluble in water, and although beyond all question good, may, and probably will, for this very reason, be found by experiment to be too soon exhausted to be used on a large scale with economy.

All salts that dissolve readily in water, will soon escape from the soil; a few of them are volatile and may rise in vapor; but the major part of them, more particularly in compost manure, are not volatile, but are more or less soluble in water. Just so far as they are dissolved by water they are capable of being carried down by the rains, until they get beyond the reach of the rootlets of the plants.

Every farmer needs a laboratory appropriated to the manufacture of manure for his own uses. It should be covered from the weather, and be near the barn-yard. A cistern large enough to contain all the wash of the yard should be near at hand. There is hardly an article of waste about the barn or house which does not properly belong to the compost heap. The contents of the wash-tub, refuse brine, the remains of all vegetable or animal matter, too poor to be otherwise used, should be used; night soil is very valuable. In short, every thing sweet or sour, fat or alkaline—the soot from the chimney, even fine charcoal, if to be used on a white soil, may be added with advantage.

The raw materials may be put down in layers, as for example, a layer of peat, then lime, or whatever alkali is used put upon it, then a layer of animal manure next, and so on. (It is more convenient to moisten the lime before using it, just enough to make it fall to a fine powder.)

Those who have had experience, inform us that the ingredients must be thrown on lightly and not trodden down. The pile being completed, the fermentation may be regulated by pumping more or less of the liquid manure from the cistern on to it. All the salts contained in the wash of the yard will combine with the mass, acting upon it according to the laws of chemical affinity, and in turn being acted upon in like manner.

The loss of manure by evaporation, I apprehend, is occasioned by manure being exposed while fermentation is going on; then the gases are let loose and readily fly off, but by having present four or five times its quantity of the decayed vegetable matter, (so abundant in our peat bogs,) we have an absorbent, which most effectually prevents the escape of ammonia. This is the *volatile salt*, and if we cannot get vegetable matter, we should take the soil for an absorbent.

We need more light on this subject. It is an immensely important practical question, which must be tested by experience, which of the alkalies or alkaline earths shall we use to make the best, most durable, and profitable compost. Also, how much by weight or measure of lime, (weighed or measured before slaking,) is necessary to neutralize a cord of peat? how much caustic or fresh made wood ashes? how much leached ashes? how much potashes? how much soda are required? But we know enough to begin. Let us attend to this branch of manufacture! Every man can, at a moderate expense, build his own laboratory. The raw materials can, in most cases, be obtained at small expense.

Our necessities call loudly for the establishment of these domestic manufactories. An adequate supply of manure cannot now be purchased at any price. By these establishments we can improve the quality and diminish the price of the article, and increase the quantity at least five hundred per cent. the first year.

N. C. K.

As the New England Farmer circulates largely in Rhode Island, and has always received a most liberal patronage from its society for the promotion of agriculture and manufactures, we deem it a matter of duty as it is a pleasure, to lay before the public the subjoined circular. We shall present the particular inquiries addressed to the farmers by the agricultural surveyor, on another occasion.

H. C.

CIRCULAR TO THE CITIZENS OF RHODE ISLAND.

The committee, acting under a resolve of the legislature of Rhode Island, have engaged Dr Charles T. Jackson, of Boston, to make an agricultural and geological survey of this State. He will commence his work the first of May next.

To enable him to complete an agricultural survey, by which the scattered experience of individuals may be concentrated in his report, which will be printed for public use, much will depend on the information which he is enabled to procure from the farmers of Rhode Island in relation to their crops, their respective modes of culture, their stock, variety and comparative value, and their various experiments in the use of lime, ashes, plaster, ground bones, clay, marl, salt, peat, rock and sea weeds, composts, fish, and any other mineral, vegetable or animal manures, they may have used in the treatment of soils.

To aid the farmer in making out his returns, the committee have subjoined blank forms, which the farmers will please to fill up with as much care and exactness as possible, and report them to the Surveyor or at Providence, or communicate them to him personally when he comes into their vicinity. They will please to add such remarks as they may deem useful, though they may not be suggested by the forms distributed by the committee.

Specimens of minerals, rocks or soils collected and marked with the name of the proprietor, and of the town where found, will be highly desirable for the purpose of forming a State Cabinet of the productions of Rhode Island. These specimens will be analyzed by the Surveyor, so far as he is able, for your information, and stated in his report to the Legislature.

It is requested that these specimens of minerals, rocks and soils, may be so marked, and labels attached to them by means of paste, that they cannot be misplaced. Boxes containing such specimens, may be directed to the Surveyor, to the care of Owen Mason, Esq., Providence, and their contents will be carefully examined.

The Surveyor will first take a rapid outline view of the State, by performing a journey around its borders, and then will proceed to visit and survey more methodically and minutely its various sections; in his journeyings and sojournings the committee trust that he will meet with those aids and facilities, which may enable him the better to accomplish a work so beneficial to all, and with that hospitality which is characteristic of the yeomanry of Rhode Island.

General Committee.

April 25, 1839.

MORUS MULTICAULIS.—We have received from Mr Edward P. Little, of Marshfield, 29 Morus Multicaulis trees of last year's growth, 6 to 7 feet high and 1 to 1 1/2 inch in diameter at the butt, with numerous lateral branches. The trees are in excellent order and filled with vigorous buds to the extremities of the branches. We have never seen trees of this description so finely kept. We understand they were planted in boxes and placed in the cellar during the winter.

J. B.

PRATT'S SPINNING AND REELING MACHINE.

We have received a beautiful sample of sewing silk manufactured by Mr. J. Pratt, of Sherburne, Mass., who is likewise the inventor of a beautiful spinning and reeling machine. We are not prepared to decide on its comparative merits, but it is well deserving of the examination of the curious and ingenious. It may be found at the office of the Yankee Farmer, in North Market Street.

H. C.

BRIGHTON MARKET.—MONDAY, May 13, 1839.

Reported for the New England Farmer.

At Market, 175 Beef Cattle, 25 Pairs Working Oxen, 60 Cows and Calves, 270 Sheep, and 500 Swine.

Prices.—Beef Cattle.—Last week's prices were fully sustained and sales readily made. We quote First quality, \$9 25 a \$9 50. Second quality, \$8 50 a \$9 00. Third quality, \$7 50 a \$8 00.

Working Oxen.—The following sales were noticed; \$75, \$80, \$92, \$105, \$110 and \$135.

Cows and Calves.—Dull, and sales limited considering the number at market. We quote the following: \$30, \$37 50, \$40, \$45, \$52 20, \$60, and \$62.

Sheep.—We noticed the sale of one lot at \$5 50, and another lot of 170 at \$6 50.

Swine.—Selected lots to peddle 8 3-4 a 9 3-4, a lot of 9 3-4 to 10 barrows. A lot of large hogs at 8; a lot large and nearly all sows at 6 1-2. At retail 9 to 11.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending May 12.

TULIPS, RANUNCULUSES, PINKS AND VIOLAS.

S. WALKER, of Roxbury, offers for sale in beds, or of such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland, France and England, to which yearly additions have and will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superb Tulips will do well to make a selection for themselves when the bulbs are in bloom, (about the 1st of June.) The prices will conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices, in the country where the bulbs were raised, and cheaper than the like quality can be imported.

Tulips in beds of from 30 to 100 rows, containing from 10 to 7000 bulbs, or by the dozen, 100 or 1000.

Viola grandiflora—Pansy, or Heartsease. Upwards of 2000 superb varieties will be exhibited and offered for sale when the Tulips are in bloom.

Ranunculus—fine mixtures, at from \$2 to \$5 per 100. *Pinks*—fine named varieties, from 25 cents to \$1 each.

For particulars apply to **S. WALKER, or to JOSEPH BRECK & CO.**

DILLINGHAM POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store connected with the New England Farmer Office, 1 few barrels of Dillingham Potatoes. These are well known to be a most excellent eating and very prolific kind. Also, a few Cow Horn Potatoes, a very fine kind; the celebrated Rohan Potato; Early Whites, and Eastern Potatoes of various kinds.

JOSEPH BRECK & CO.

FOR SALE.

The subscriber offers for sale his estate in Harvard, County of Worcester, the well known Bromfield Place; an excellent dairy farm, well wooded, the house spacious, fitted for two distinct families; the situation among the most pleasant to be found, especially for a private or high school. Bordering a part of the farm is a beautiful sheet of water, containing two islands belonging to the farm. Inquire of the subscriber at South Natick.

J. H. T. BLANCHARD.

4w

MORUS MULTICAULIS.

A few thousand trees of the genuine *Morus Multicaulis*; so a few thousand cuttings of the same may be had on immediate application to the subscriber.

WILLIAM KENRICK,

Nonantum Hill, Newton.

CORN SHELLERS.

Just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, a supply of Currier's Patent Corn Shellers; a very convenient and cheap article. A right to using said machines in counties or towns may be obtained by applying as above.

JOSEPH BRECK & CO.

WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it can not possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing his seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangrel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions, Corn, &c. It is highly recommended by a great number of persons who have used it the present season. For sale at the N. E. Agricultural Warehouse and Seed Store by **JOSEPH BRECK & CO.** April 3.

SAYLE'S GARDEN ENGINE.

For sale at the New England Agricultural Warehouse Nos. 51 and 52 North Market Street, Sayle's Garden Engines This Engine is a splendid article, and will throw a constant stream of water to the distance of 50 or 60 feet, with great force, and in case of fire would be a good saluine for a fire engine. It is the most perfect article for the purpose ever introduced. **JOSEPH BRECK & CO.**

STRAWBERRIES.

Gentlemen wishing to cultivate this delicious fruit are respectfully informed, that the subscriber has succeeded after a number of years of exertion in bringing the strawberry nearly to perfection. He has for sale at his garden in Brighton, Mass. the following six varieties of the Plants. They are of superior stock and quality, and in the finest condition for immediate transplanting.

He will offer in addition his *Seedling Methven*, a very valuable kind, a free bearer, fruit juicy and very large, fruit measuring four inches, was gathered the last season.

Methven Castle—Fruit from these plants have been exhibited at the Horticultural Society's Rooms, measuring five and a half inches in circumference.

Bath Scarlet—Fruit large, full bearer, and beautiful scarlet.

Royal Scarlet—Fruit long, oval shaped and juicy. *Hautbois*—Fruit smaller but very numerous. *English Wood*—Fruit well known.

Monthly—Fruit is gathered from these vines from June to October, and in good quantity and fine quality.

Orders left at the Garden in Brighton, or directed to him at Boston or Brighton, at **J. Breck & Co.'s Seed Store**, will be promptly attended to. **JAMES L. F. WARREN.**

Brighton, Mass., April 17, 1839. eopis6w

DOUBLE DAHLIA ROOTS.

For sale at the New England Agricultural Warehouse and Seed Store, a superb collection of Double Dahlias, consisting of all the improved varieties.

Also, Double Carnations of many fine varieties. **JOSEPH BRECK & Co.** May 6.

MISCELLANEOUS.

LETTERS FROM THE EAST.

BY A LADY OF NEW YORK.

(Continued.)

The first court is one hundred and sixty feet broad by three hundred feet long, surrounded with a portico of double columns. Beyond is a forest of columns, twelve feet in diameter by forty high, each surmounted by a beautiful capital, resembling the sacred Lotus flower. The first interior department of the temple is one hundred and forty feet by one hundred and sixty. To this succeed several other equally magnificent halls, all adorned with clusters of highly ornamented columns, which support the heavy stone roof. But the whole is encumbered with the mud huts of the present Egyptian peasants, whose filth is scarcely a less profanation of these splendid ruins, than were formerly the unholy rites herein practised by a civilized people. The whole length of the temple and its advanced courts, which were once roofed in, is eight hundred feet!

From the top of the Propylon is a superb view. First, you have the whole field of ruins at one glance; then to the south, a long reach of river prospect; to the west, the temples of *old Thebes*; to the east, the broad plain to the Arabian mountains; and to the north, the eye rests on the sublime wonders of Karnac, two miles distant.

If the ascent to the top of this gateway was difficult, you will find the descent much more so, for the earthquake has not spared this pile more than any of the rest. The staircase is out of joint in so many places, that wide chasms are to be leaped, and one false step would be instant death.

We are now clear of the vile parasite mud huts, which cling so closely to the noble pile of ruins, and are once more in the open champaign country.

From the point where we now are, the river slightly inclines to the west of north, while the road to Karnac diverges as much to the east of north, by which, the temples there are more than a mile from the river.

Here, near the river bank, the present surface of the soil is over thirty feet above its ancient level, while at Karnac the accumulation has not been so great.

Below where we are now riding, there is a double row of colossal sphinxes, lining the ancient avenue which connected Karnac with Luxor. This avenue is two miles long. We shall soon see indications of these sphinxes; and further on, the avenue has been entirely excavated, and is found to be sixtythree feet wide, and the sphinxes twelve feet apart, so that there is (above and below ground,) two thousand of these colossi! What a magnificent perspective this must have been, and how gloriously terminated at either end. The excavations on either side of us, are where the curious have sought and found the continuation of the chain of sphinxes. The high mounds are where probably chapels and altars have stood on both sides the sacred way. We are now arrived at the excavated part of the avenue. You see the sphinxes are of soft sandstone, and not of the red granite of Syene; for even the Herculean labors of the ancient Egyptians could scarcely have accomplished such a task.

These sphinxes are formed of the lion's body and ram's head, with the figure of some divinity as large as life, standing between each paw of the couchant beast.

That continuous mound which you see stretch-

ing away to the east and west, is the ancient wall of sun-dried bricks which formed the sacred enclosure in the midst of which stand the awful ruins of Karnac's holy fane. We must here dismount, for it would be profanation in us to approach these mysterious ruins otherwise than on foot.

The grand propylon before us is the southern entrance to the great court of Karnac. You have now to enjoy the greatest treat the world can afford in the way of ruins. If you enter that gate as I did, such will be your surprise that you will be riveted to the spot without the power of advancing any farther for an hour. As I am your *cicerone*, you must be guided not only by my advice, but you must obey my commands. It is my intention to transport you suddenly into the *centre* of the great area of ruin, in order that you may at once attain the only point of view where the *whole* may be seen to advantage. There, without stirring from the spot, you may, by simply turning round to every side, behold all the wonders of this most extraordinary locality. Therefore I will draw your shawl over your eyes, while I conduct you thither; but be prepared for a surprise when you shall be unhooded, and string your nerves to their utmost degree of tension. You need not fear that any of those tottering walls would reach you should they fall, for such is the immense diameter of the court, that should another earthquake occur while you are there, no harm could happen to you, should every one of the immense fabrics be overthrown at once.

There, be seated on the capital of this overthrown column. I will now remove the veil from your eyes, and leave you for half an hour to your own reflections. None can tolerate the least intrusion at such a moment of intense excitement, when the wrapt soul is absorbed in contemplating the most sublime conceptions and wonderful executions of that creature whom God made after his own image.

I leave you with this caution: Divest your mind of all association with the vulgar name of Karnac, and of the heathen uses to which these temples were put. Elevate the mind to the point where an enlightened, though partially corrupt priesthood caused these vast piles to rise in honor of the great creator of the universe, so far as he was then known to them, under the type of *Jupiter Ammon*. These are greater and more glorious temples than were ever dedicated directly to the true and only God, since the creation of this world.

* * * Ha! has not thy fit of abstraction left thee yet? Thy eyes are still

"With a fine frenzy rolling,"

and thou hast drunk in sublimity enough from this overflowing fountain, to supply the poetical springs of thy soul for an age to come. Would that the inspiration were now manifest in sound for our especial benefit. One bold burst of enthusiastic sentiment at this moment, were worth a whole quarto of cauntering hexameters from the closet. Thy muse is silent: try then a little invocation. Begin

"Descend ye nine," &c.

'Thou'rt not in the vein, I perceive. Come down then to humble prose, and scan by architectural rule, that which thy poetical measure cannot at present compass.—*To be continued.*

HERBACEOUS PLANTS.

A great variety of Herbaceous Plants, of beautiful and hardy varieties, can be furnished by the subscribers from their gardens at Brighton at short notice. From 25 cents to \$1 00 per plant. JOSEPH BRECK & CO. April 21.

WINSHIP'S BRIGHTON NURSERIES,
AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c.

Orders addressed to Messrs WINSHIP Brighton, Mass. will be promptly executed, and forwarded to any part of this or other countries, April 10.

FRUIT AND ORNAMENTAL TREES, MULBERRIES.

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1839 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries, Currants, Strawberries, Grape Vines, &c. The stock of Cherries and of Peaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeysuckles, Fæonies, Dahlias and other Herbaceous Flowering Plants.

10,000 Cockspur or Newcastle Thorns.

10,000 Buckthorns.

Morus Mullicaulis, and other Mulberries; the trees genuine and fine, at prices fair, and varying with the size, and the quantity which may be desired.

Fruit and all other trees, when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston.

January 30, 1839.

PEAR, PLUM, GRAPE VINES, &c.

1000 Pear Trees of the most approved kinds; 1000 Plum Trees, of the most approved kinds and extra size—many of them have borne the past season;

500 Quince Trees;

3000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hamburg, Sweetwater, Pons's seedling;

30,000 Giant Asparagus Roots;

5000 Wilmot's Early Rhubarb or Pie Plant, lately introduced;

Also—a good assortment of Gooseberries, Roses, &c. of different kinds;

All orders left at this office, or with the subscriber at Cambridge-port, or in Mr Lynch's baggage wagon box, at Gould & Howe's, No. 3 Faneuil Hall, will meet with immediate attention.

SAUEL POND, Cambridge-port, Mass.

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells. Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention.

NAHUM WARD.

GRAPE VINES.

150 Sweet Water Grape Vines.
200 Isabella, " "
150 Catawba, " "
100 Black Hamburg Grape Vines.
1000 Asparagus Roots:
100 Early Wilmot Rhubarb Roots.
200 Common " "

Also—Strawberry Plants of the following choice kinds: Methven Castle, Isth Scarlet, Haultbois, English Wood, Monthly, &c. Raspberries, Franconia White and Red. Gooseberries—Currants—Flowering Shrubs and Plants of all kinds supplied at short notice by

JOSEPH BRECK & CO.
51 and 52 North Market Street.

AGRICULTURAL.

From 'Transactions of the Essex Agricultural Society, 1839.'

ESSEX AGRICULTURE.

Addressed to the Farmers of Essex County, Mass.
BY HENRY COLMAN.

The agriculture of Essex county is in a comparatively improved condition; yet in productiveness and extent of cultivation, it is far from being what it should be. Commerce is a great interest in Essex. Manufactures are a great interest. The fisheries are spiritedly and extensively pursued. The exportation of granite is a very large business. But the agriculture of Essex receives little of that enthusiastic and energetic devotion and pursuit, with which these other pursuits are regarded and conducted. The improvements made are on a small scale. Little capital is risked in agricultural enterprises and experiments. The agricultural productions of the county are perhaps scarcely a tenth of what they might be profitably made. Where now a hundred bushels of corn are raised, five hundred might be raised. Where two hundred bushels of potatoes are grown, two thousand should be; and other products in proportion. The agriculture of Essex is capable of being made a great interest, and when we take into view the fluctuations and capricious changes to which manufacturing and commercial pursuits are subject, and some of which changes have been experienced in great severity within even a short time past, there are certainly strong reasons why it should receive much more attention than is now given to it. There is indeed every reason why it should be placed at least upon a level with the other great interests to which we have referred. We believe, likewise, in respect to pecuniary profit, when all the risks are considered, capital judiciously used and invested in agriculture, will be found as profitable an investment in the long run, in the course, for example, of twenty years, as, with the exception of some extraordinary and accidental instances of success, in any other business whatever.

The profits from commerce and manufactures are more immediate; and coming directly in a pecuniary form, seem to be more positive and substantial. But the advantages are only in appearance. The risks are great. Shipwrecks, bankruptcies, disappointments and insolvencies are innumerable. We shall not speak of the moral dangers of trade, which, in what are called periods of success and extraordinary prosperity, are always multiplied to a vast extent. We shall say nothing of the risk of life in maritime pursuits, though the number of widows and fatherless children in Marblehead, Salem, Gloucester, and Newburyport, on this subject, suggest instructive lessons. We shall say nothing of the evils to health which arise out of many manufacturing pursuits, especially those of a sedentary nature, and necessarily carried on in confined rooms and under a high artificial temperature. Without any invidious, or what might be deemed question-

able comparisons, with any other branches of business, it is enough to say that agriculture in Essex county may be pursued to great advantage. There is certainly much excellent soil in the county already in the condition to be cultivated; in Lynn, in Marblehead, in Beverly, in Danvers, in Ipswich, in Andover, Bradford, Haverhill, West Newbury, Newbury, and other towns. There are very extensive tracts of peat meadow and land capable of being reclaimed and rendered highly productive.— There are extensive tracts of salt marsh, which require only to be drained and dyked to be placed in a course of most profitable improvement. No county in the commonwealth is more favorably situated in regard to quick and certain markets. In most cases too, manures or the materials for manure, are in great profusion. The large towns in the county furnish vast quantities of the most valuable manures in their stables, streets, slaughter houses, and the various collections of filth and refuse inevitable wherever a numerous population is congregated. From its extent of sea-coast likewise, and extensive fisheries, a vast amount of sea-wreck and fish offal, among the most efficacious and valuable of all manures, are constantly furnished. Muscle-bed likewise, dock mud, the remains of shell-fish and the fish themselves, the Munhaden, which are found in vast schools upon our shores in the spring, furnish abundant means of fertility to large portions of the county on the sea-board, and are capable of being transported some distance into the interior with advantage and profit. These circumstances, added to the general intelligence of the county and the universal prevalence of good morals, are strong reasons why the agriculture of the county should be encouraged, and may with advantage be rendered a great and commanding interest.

Experience however, gives us little reason to expect that these general considerations will have the influence to which they are entitled. All we can hope for in the case is that we may draw attention more strongly to the agricultural resources and improvements of the county; and ascertain, if any, what alterations can be advantageously made in its present management.

I have heretofore urged repeatedly and strongly the cultivation of esculent vegetables, with a view to their consumption on the farm, and I feel daily stronger and stronger convictions of the propriety of such advice. The carrot crop, of which more than seven hundred bushels have been repeatedly raised in the county to an acre, may be deemed a profitable crop at four hundred bushels; and for the feed of any stock, horses, milch cows, sheep or swine, in the opinion of many experienced farmers, may be regarded as equivalent to at least half that amount in hay or grain. But let us suppose that even this is an overestimate, and that four pounds of carrots are equivalent to one of hay, or corn, or oats. Four hundred bushels of carrots are certainly not an extravagant crop—at fifty pounds to a bushel they would give twenty thousand pounds to an acre; that, allowing four for one, would be equal to a yield of two and a half tons of hay, of one hundred

bushels of corn, at fifty pounds to the bushel; and of one hundred and fiftyone bushels of oats at thirty-three pounds to the bushel. Now under proper management, the expense and labor in the cultivation of carrots are not very much more than in the cultivation of an acre of corn. We have certainly much underrated its value in comparison with hay, and so far from reckoning it as four to one, it might be fully estimated as four to two of hay.— Four hundred bushels of carrots might then be estimated as equal to five tons of hay. Under any aspect it is obvious how much would be gained by extending the root cultivation. What is said of carrots will apply with proportional force to ruta baga, to the sugar beet, the blood beet, the parsnip and the potato. Now a farmer in Essex who raises yearly a thousand bushels of carrots or almost any other vegetable esculent to be given out to his stock, or indeed anything like this, it would be difficult to find. In this respect then, one of the most important steps in the improvement of the agriculture of Essex remains to be taken. The effect which such cultivation would at once have upon the butter dairy, the stove, and the stall, would be highly favorable; and not less favorable would be its effects upon the manure heap as the great means of keeping up and increasing the fertility of the farm. The root culture, requiring as it does, deep, rich and clean cultivation, is among the very best preparations for wheat and other grains. From this remark we except potatoes, the cultivation of which is more slowly than that of any crop raised among us. Why do not farmers see this? It is matter of experiment and of demonstration. We do not despair of conviction ultimately, though we have little hope of living to witness it. If individual farmers are not willing to undertake it, the experiment could at least be tried to advantage in some of the pauper establishments, where light labor abounds, and under the management of a skillful and industrious overseer. In such places experiments might be made to test the comparative expense of such crops, and ascertain their exact value as feed for stock. They could be made in such places to advantage, and the results would be likely to prove of very great utility.

At present, the great object of the county appears to be the raising of hay; and this hay to be sold away from the farm. I cannot satisfy myself that this is the best husbandry which could be chosen. The best husbandry, in all cases, is undoubtedly that which brings most profit without injury to the place; and not only without injury but with an evident improvement of the condition and productiveness of the farm under the husbandry pursued.— Some of the farmers in the neighborhood of Marblehead and various other places on the sea-shore, are able to keep their farms in high condition, by the abundance of sea-manure, which they obtain without difficulty and at no cost, but the labor of collecting and carting. But this applies to a comparatively small number of farms. Others, who live in the immediate vicinity of large towns, are able to purchase manure; but this is always done at a heavy

expense of money, and time and labor. A very large portion of the hay which is sent to market from Essex county, is purchased by jobbers, who take it from the farmer and convey it with their own teams to market; but return no manure to the farm. Let us now look at this operation. The average price of hay in market in Salem, Lowell, or Boston, for the last twenty years, has not exceeded eighteen dollars per ton. Let us take the case of a farmer, who goes to market with his hay and purchases manure for a return load. He will not keep up the fertility of his land generally, without obtaining one cord of manure in place of each ton of hay which he sells. We will suppose a farmer in the vicinity of Salem, for example, carrying a ton and a half of hay to Salem. We will suppose the hay in market brings at eighteen dollars per ton of two thousand pounds, twentyseven dollars. Now what are the abatements to be made from this? Two men must be occupied nearly half a day in loading the hay for market. This with the waste incidental to loading the hay and uncovering the mow, cannot be estimated at less than one dollar. He must then with his team of one horse and two yoke of oxen, or two yoke of oxen, be absent a day. This can hardly be estimated at less than three dollars, including incidental expenses. He cannot purchase a cord of manure to compensate his losses for the hay under a sum less than four or five dollars. Here there is an amount of eight or nine dollars to be deducted from the amount received for the hay. Now is there no mode by which his hay can be used on his farm at a value equal to what is here realized, and all the vexation and toil of marketing be saved? Or if he is a farmer in Newbury, Rowley, or other towns similarly situated, he must allow to the wagoner who either purchases the hay on his own account or sells it on commission, a sum varying from five to seven dollars per ton, as commission on the sale. In this case too, it is to be remembered that he gets no return of manure. I cannot think this a very good operation.

The hay in Essex county does not give an average yield, over one and a quarter ton per acre; and where land is kept long in grass, the average is not beyond a ton. There are, indeed, much better crops than these, but we are speaking of a general yield. Hay should come in as a regular crop in rotation; and there are some lands, redeemed peat meadows, for example, which are not suited to cultivation, and where, unquestionably, hay is the preferable crop; and the fertility of the land is to be maintained by top dressing. There is no general proposition to which exceptions may not be made. But what I wish my brother farmers of Essex particularly to consider is, whether hay is the best crop which they can cultivate; and whether the selling of hay is so eligible or unobjectionable a process as it is generally esteemed to be.

Hay is always worth ten dollars a ton, to be fed on the farm. Here the labor and expense of marketing are avoided, and the manure is secured on the farm. Farmers in Essex may get, in many cases, horses from the capital, to be wintered for one dollar and twentyfive cents or one dollar and fifty cents per week, and in this case their hay is worth ten dollars per ton. Hay is worth ten dollars per ton to be given to fattening wethers, or to sheep for the raising of early lambs for market. Essex is not a grazing county, and the fences throughout the county are not at all adapted to the keeping of sheep. But wethers may be purchased to advan-

tage in the autumn and sent to market in the spring; and ewes might be purchased in the fall, with arrangements so made that they should bring their lambs in February; and with liberal keeping, both ewes and lambs might be sent to market in the spring. The lambs being sent early, would bring a high price.

The fattening of wethers for the market might be done to great advantage in Essex, on account of the demand within the county and the proximity to Brighton. I say this from personal and repeated experiments. This is done to great advantage a hundred miles in the interior, where hay is worth ten dollars per ton, oil meal is twentyfive dollars per ton, potatoes twentyfive cents per bushel, and Indian corn one dollar per bushel. Farmers within my knowledge buy all their corn for this very object, and do it to advantage. These would be good and remunerating prices in Essex, especially where the produce is consumed on the farm. The average net profit upon sheep well purchased, well fed and well sold, may be set down as from one to two dollars per head. I have seldom known any loss sustained. I have often known a much greater gain than this. Within my knowledge, a farmer one hundred miles in the interior, purchased the last autumn, fifty wether sheep for fattening, of the best description, large, thrifty, well-conditioned. When driven into his yard in November, they cost him three dollars and seventyfive cents per head. About the first of January he sold twenty of the number in Brighton for six dollars and twentyfive cents per head, out of which, probably, thirtythree or fifty cents commission to the drover were to be deducted; if fifty cents, this gave an advance of two dollars per head for about five weeks keeping, at, probably, for I have often made it the subject of exact account, twentyfive cents per week, leaving a net gain of seventyfive cents per head. He kept the remaining thirty until the second week in March, and then received for them twelve dollars twentyfive cents per head in his yard. We will suppose them to have been kept sixteen weeks at twentyfive cents per week; this would bring the cost to seven dollars and seventyfive cents per head, and leave in this case a net profit of four dollars and fifty cents per head. This is an unusual gain; but with proper skill and management they always do well. If an Essex farmer can get by any such process ten or twelve dollars for his hay consumed at his barn, it is much better than for him to sell it in the market in Lowell, Boston or Salem, for eighteen dollars, with all the vexation and toil of marketing, and all the expense of buying and carting manure. A fattening sheep, of a good size, will require from two to three pounds of hay per day, one pint of corn per day, take the whole time together, and one pint of potatoes or other esculent vegetables. This is liberal feeding; and every farmer can make his own calculations. This business, in order to be successful, like every other business, requires skill and care. The sheep ought to be in good condition when put up to fatten. It is an old proverb that a sheep is never fat but once. It is utterly hopeless to attempt to fatten a poor or an unhealthy sheep. They belong to the crows, and the sooner they have them the better. The Saxony sheep are too small to be profitable for fattening. The half blood merinos are an excellent variety. They are in general thrifty, and the deficiency in size is compensated by the superior value of the fleece. Our own native sheep are often of the right kind. When crossed with the Dishley

or Bakewell, the stock is usually excellent for this purpose. I can but hope that presently the South Downs will be introduced and diffused among us, which seem to me, for these objects, to combine more good properties, by far, than any race yet known among us.—Then the feeding of the sheep requires great care.—It must be done with regularity. They must be treated kindly. They must not be abused. They should have plenty of room, and never more than fifty in one enclosure. They should be at liberty to choose a shelter or the open air; and they should have plenty of good litter often renewed; and then the manure which they will make will be abundant, and of a powerful and enriching quality.

In answer to all this, for there is no end to the excuses of indolence, and when she can't get out at the door she will always contrive to crawl through the key-hole, it will be said that if all the farmers in Essex should go to fattening sheep, the business would be overdone. Now there is no probability, even if the profits were as clear as the sun shining at noon day, of all the farmers in Essex, or even a considerable part of them undertaking any such thing. Farmers, and they are as intelligent in Essex county as anywhere, are a proverbially slow and faithless race. Demonstration must come down upon them like a triphammer in a foundry, before you can convince them of anything extraordinary that has been done out of sight of the smoke of their own chimneys. An enterprising, intelligent, quick, industrious man, whose perceptions are as rapid as the lightning's flash, and who comes to his safe and certain conclusions by a sort of instinct, just as the tree is riven or the rock is broken by the bolt, without knowing precisely how or where the blow was given, these are the minds for whom we write, and from whom, and from whom only, any improvements are to be expected. Such men, moving with an intellectual and muscular elasticity and energy such as keep the world alive, will be up and dressed and their day's work half accomplished before a large part of mankind will have buttoned their waistcoats or pulled their shoes up at the heel, and before many will have decided whether or not to get up at all. Now there are few such men, but few or many, to such my suggestions are addressed, and all I desire is, that they should value them for what they are worth.

There is no danger, under any circumstances, of the business being overdone. The demand will keep pace with the supply. Hitherto it has greatly outrun the supply. Mutton was never more in demand in Boston than it has been the past winter. The operation requires no expensive outlays or fixtures. It is liable to as few accidents as any business of the kind which can be pursued; and from ignorance, want of skill, mistakes of judgment, neglect, want of perseverance, and other obvious causes, there will be always failures and disappointments enough to give those who pursue it skillfully, liberally and properly, a fair chance of success.

Here are two modes then, by which the farmer in Essex county may dispose of his hay on his farm to advantage and with a reasonable profit. He may do it likewise with equal advantage by a winter dairy, and at present prices, by raising young stock.

(To be continued.)

The Genesee Farmer says that wheat never looked more promising at this season of the year than it does at present. This cheering prospect has caused the price of wheat to decline a little.

From 'Transactions of the Essex Agricultural Society, 1838.'

EXPERIMENTS ON MANURES, &c.

The Committee report: That they consider the subject of the making and application of manures, one of the greatest importance to the agricultural interest. Manure and labor are to the farmer what capital and credit are to the merchant. With them well applied, the one will add barn to barn, the other store house to store house, till there shall be no room to contain their several wealth; without them, they must soon suspend operations, and their farms and their ships pass into the hands of more skilful and industrious owners.

Many farmers think they cannot afford to purchase manure, and the price *does* seem disproportioned to the immediate profits; but no farmer will say that he cannot afford to make the most of what he has, and to apply it to the best advantage. Many take an honest pride in being able to say, I have raised so many hundred bushels of corn, or so many tons of hay; now to be able to say I have made five hundred loads of manure, is just as much a matter of boasting, for manure will make corn, and hay, and other valuable products, if it be only judiciously applied. Put in the seed and the manure and the grateful soil will make you a liberal return. It is held to be true by experienced farmers, that he who doubles the expense of labor and manure, will increase his profits and products in nearly a four fold proportion. In other words, the man who spends half his time upon his farm, and skins over one hundred acres of land and gleans from it fifty bushels of corn and twenty tons of hay, if he should devote his whole energies to his farm and improve his means of making manure, might raise nearly two hundred bushels of corn and eighty tons of hay.

Some have, in their natural situation and proximity to the sea-board, greater facilities for making and obtaining manure, but every substance of animal and vegetable matter can be mixed with the soil in such a manner as to increase the fertility of the earth; and even the different soils may be mingled so as to produce the same effect.

The quantity of manure a farmer uses, is a pretty fair criterion by which to judge his character. In Plymouth county, where a premium is awarded to the man who makes the greatest number of loads, a most worthy and truly respectable farmer, the last year, reached the very enviable eminence of seven hundred and ninety-eight loads; the lowest competitor claimed for three hundred and fifty loads, and his must be allowed to be an *improving* character. William Clark, jr., of Northampton, in his statement to the Hampshire, Franklin, and Hampden Agricultural Society, represents that he keeps an average stock of eight swine, three horses, and eight oxen and cows; from this stock, with the skilful use of all of his advantages, which are not superior to those of many of our farmers, he made from June 1837 to June 1838, nine hundred and twenty loads, an honorable monument to his intelligence and industry, which compensates in utility and solid value for what it may want in taste and splendor. Mr Clark used for compost, three hundred loads of sods and soil and two hundred and forty-seven loads of swamp muck. His yards were supplied with corn stalks and refuse hay during the winter, and brakes and weeds in the summer, and cleared out twice during the year. It might be supposed that manure so made could possess but little of the quickening and strengthening princi-

ples, but those who have visited his farm and seen his fields burdened with their heavy crops, are satisfied that Mr Clarke knows how to make manure and to apply it, and that his fields acknowledge their obligation and pay their due return. Mr Clarke, from such manure, has raised more than one thousand bushels of corn in a year.

The committee award to Daniel Putnam, of Danvers, for the satisfactory experiment and the full and explicit statement made by him, a premium of twenty dollars.

They recommend that Mr Putnam's statement and the letter addressed by Joseph How, Esq., of Methuen, to the committee, be published.

For the Committee,

DANIEL P. KING.

Topsfield, Dec. 25, 1838.

DANIEL PUTNAM'S STATEMENT.

To the Committee of the Essex Agricultural Society on Experiments on Manures:

GENTLEMEN—The following account of experiments in the use of unleached wood ashes as manure, is submitted, that you may make any use of it which in your judgment will render it serviceable to the farmers of the county. In the latter part of August, 1837, I broke up about one acre of low land (too low and wet to till with ease,) which had become so much bound out that it yielded not more than 14 or 15 cwt. of hay, and that little was of poor quality. After ploughing, I rolled this land, and then dressed it with 40 bushels of wood ashes, mixed with wash (mostly sand) from the road-side, making probably about one and a half cord; sowed half a peck of herds grass and 3 pecks red-top seed, then harrowed thoroughly and rolled. The seed took well. In 1838, I obtained from this piece of land 35 or 40 cwt. of very good hay, mostly herds grass.

In November, 1834, I broke up a field, dressing it with about 4 cords of manure to the acre; on a part turning it under the sod, and the remainder putting it on the furrow. In 1835, planted with corn; the crop large: in 1836, without mowing the sod, sowed oats and hay seed. Obtained 40 bushels of oats to the acre. The hay seed took well, but in the following winter was killed by ice forming and remaining long upon the field. In 1837, obtained not more than 15 cwt. of clover to the acre. Thought I must take this field in hand again. In April, 1838, ploughed an acre and a half of it, rolled, dressed with 40 bushels of wood ashes, un-mixed with any other material, to the acre; sowed oats and hay seed. The oats had a fine growth and the hay seed came up well, but (for I think it best to tell the whole,) the rust which visited my neighbors' oats was not kept out of my field by the ashes; I mowed for fodder before the crop had ripened; there was growth enough for 40 bushels to the acre. The young grass too, did not find in the ashes a matchless sanative, for its sickness, (in the scorching weeks of August,) which a draught of pure water would have cured, proved mortal.

Shall I tell you too, what virtue there is in bones? From Mr Ward, of Roxbury, I obtained last spring, 20 bushels ground bone, (cost at Roxbury, 35 cents per bushel,) sold one bushel to a neighbor; mixed the remaining 19 bushels with about one cord of soil taken from the side of the roads in the fields where the mixture was to be used. Some of it was used in 10 or 12 days after it had been mixed, and some remained in heap 5 or 6 weeks. About the

10th of May, when planting corn where 4 cords of manure to the acre had, the previous autumn, been turned under the sod, and where I was putting 4 cords to the acre in the hill, I selected four rows through the centre of the piece, in which I put the bone mixture, at the rate of 50 bushels bone to the acre; no other manure in the hill. The corn here looked as well through the season as on the remainder of the piece, and ripened a little earlier. At the time of harvesting, 104 hills on bone yielded 184 lbs. of corn on the cob. The same number of hills in the adjacent rows on manure, yielded 188 3/4 lbs. That on the bone was the driest at the time of weighing.

The first week in May, I planted a piece of corn, where I put 3 1/2 cords of manure upon the furrow, and 4 cords in the hill, to the acre. Through the centre I left four rows until about the 10th of May, when I planted them with bone, as in the other piece. Here, from 66 hills on bone, I obtained 90 lbs.; from 66 on manure, 96 lbs. Here too, the corn on the bone ripened earlier, and of course weighed less. May 21st, when planting potatoes where 4 cords of manure to the acre had been turned under the sod the previous autumn, and where I was putting 5 cords to the acre in the hill, two rows were planted on bone, 50 bushels to the acre.— This ground was furrowed only one way, and the hills on the bone happened to be put nearer to each other than those on the manure. When dug, equal quantities of ground were taken; of bone 14 hills; of manure 12 hills; the bone yielded 55 lbs.; the manure 52.—Between the 15th and 20th of May, I sowed sugar beet, in drills, 3 feet apart. In some used barn manure, 6 cords to the acre; in others muscle bed or sea-marl, 5 cords; in others bone, 50 bushels. Three drills of each kind, about three rods long, yielded as follows, viz: from barn manure, 247 lbs.; muscle bed, 355 lbs.; bone, 337 1/2.

At the same season I sowed carrots on barn manure, muscle bed, and bone. Barn manure, 6 cords to the acre; muscle bed, 4; bone, 50 bushels.— Some of the bone and the other manures were spread broad-cast, and a part of the bone was put in the drill; rows 14 inches apart. Two rows of each kind, three rods long, yielded as follows: barn manure, 75 lbs.; bone in drill, 105 lbs.; bone spread, 82 lbs.; muscle bed, 88 1/2 lbs.

I sowed with ruta бага, June 1st, 10 drills, 3 feet apart and 15 rods long; 5 drills on barn manure, part of it fresh from the barn cellar and part partially decomposed, 9 cords to the acre. The other 5 on bone, 50 bushels to the acre. Those on the bone were less eaten by the fly than the others, though the others were not very badly injured. A strip 17 feet in length across the drills, where 5 had bone and 5 manure partially decomposed, yielded bone, 248 lbs.; manure, 228 lbs.

Another strip, 16 1/2 feet long, where there was bone and fresh manure, gave—bone, 212 lbs.; manure, 227 lbs.—About the 10th of June, I sowed ruta бага on reclaimed meadow land; drills 3 feet apart; manure, 9 cords to the acre; bone, 50 bushels. Soon after the plants came up, those on the barn manure were nearly all destroyed by the fly; it was necessary to sow a second time. Those on the bone were but very little injured. Four drills 2 rods long, on bone, yielded 486 1/2 lbs.; four on manure, 439 lbs.

DANIEL PUTNAM.

North Danvers, Dec. 5, 1838.

(To be continued.)

PREMIUM FARM REPORTS.

The subjoined is the statement of the farming of William Wells, of Shelburne, Franklin co., Mass. Few farms are in better condition or show a better result than that of Mr Wells. His establishment is, in many respects, a model of good husbandry—of order, neatness, industry, temperance, hospitality and the grateful enjoyment of the blessings of a kind Providence. Mr Wells received a gratuity of fifty dollars.

H. C.

To the Trustees of the Massachusetts Agricultural Society for 1838.

1. My farm consists of 285 acres, exclusive of wood land.
2. The soil consists partly of light loam, and partly of stiff loam.
3. The drier part which I mow and till is improved by a rotation of crops, beginning with corn or potatoes the first season; the next season the land is in wheat, oats, or barley. It is then stocked well with grass seed, and then mowed until it wants ploughing and manuring again. It generally remains in grass from four to six years. Occasionally I sow plaster on the stiff loam. The moist part which is not suitable for tillage I mow, manuring it once in three or four years. I am careful at all times to have a suitable proportion of pasturing.
4. I usually till from 12 to 15 acres. I put on from eight to ten loads of manure where I manure in the hill, and from twenty to twentyfive where it is spread.
5. My manure is generally applied in its green state when spread, but well rotted when put into the hill.
6. I never plough in manure where I plant corn or potatoes, but spread it after ploughing the land; giving it a light harrowing, as I wish to leave it as near the surface as possible, unless dropped into the hill.
7. Green sward I generally turn over in the month of April; then cart on manure, say 20 or 24 loads per acre, before planting—spread it and give it light harrowing. Many times in addition, I give it a light manuring in the hill. When I hoe it I use a cultivator, taking care not to disturb the sods.
8. I mow 36 acres of upland. The average crop of hay exceeds two tons per acre.
9. I irrigate six acres through the warm season, excepting when cutting the hay. The effect is a greater increase in the crop, and of a superior quality of hay.
10. The irrigated land needs no manure except what is carried by the water. My mowing which is too moist for tillage, requires manure once in three or four years. I apply about 20 or 25 loads to the acre of common yard manure.
11. I mow eight or nine acres of low land; the hay is nearly all English hay, averaging not far from two tons per acre.
12. Bog or peat lands I have none.
13. I planted five acres of corn this season; one acre and a half is planted on land after a crop of oats. The stubble was turned under in August and ploughed again in the spring. Before planting, about ten loads of good rotten yard manure per acre were put into the hill. It produced 86 bushels of corn. Another piece of green sward, containing one acre and twentyfive rods, was turned over in April. Before planting I carted on 25 loads of green yard manure, spread it, and harrowed it in lightly. Then I put about nine loads of well rotted manure per acre into the hill. It pro-

duced 116 bushels of corn, averaging 100 bushels and 10 quarts per acre. Another piece of worn land about the same size, prepared in the same manner, produced 84 bushels of corn. Another piece containing a few rods over an acre of pasture land, which had never been manured, was cultivated in this manner. I turned it over a little before planting and harrowed it lightly, and about ten loads of green stable manure per acre were put into the hill. The produce was sixtyseven bushels. My whole crop of corn averages 70 bushels and 6 qts. per acre. My corn was planted in hills three feet apart each way; four stalks were allowed to stand in a hill. The seed was shelled from the ear and planted without any preparation. The corn was hoed three times. I made use of a cultivator in hoeing each time.

14. I planted two and one-quarter acres of potatoes on green sward turned over in the month of May. Ten loads of green manure per acre were put into the hill. More than one and a quarter acre was planted with a dark purple potato, known in this section by the name of the Mohawk potato. Owing to the unfavorable season for potatoes, the crop was light. The yield was only 250 bushels. I had one other piece, about four-fifths of an acre, prepared in the same manner, with the addition of one-third of a gill of plaster to the hill, dropped upon the manure after dropping the potatoes. The potatoes planted are of the pale red kind, common throughout the State. The yield was 250 bushels. Through the centre of this piece there were two rows planted without the application of plaster. The effect was, the two rows without plaster did not produce only half as much as the adjoining rows. The soil where they were planted is a stiff loam. Plaster has but little if any effect in producing a crop on my light loam. My potatoes are all hoed twice.

15. I raise no other vegetables except in the garden for family use.

16. I sowed four and a half acres of winter rye: three and three-quarter acres of spring wheat; five acres of oats and three and a half acres of peas and oats. For the rye stubble land I ploughed once. The quantity of rye sowed was three pecks per acre and harrowed in. The wheat was sowed after a crop of corn or potatoes; I ploughed once; sowed about two bushels per acre. I sowed half a bushel of Italian wheat. The rest of the seed was straw-bearded Leghorn wheat, without any use of lime. A part was sowed on light loam, a part on stiff loam. The crop was equally good on both. My oats were sowed on stock land ploughed once; the oats sowed and harrowed in; two bushels of seed were sowed per acre.

17. I have laid down two acres to grass this season. The seed was sowed with wheat the latter part of April. I put on twelve quarts of timothy and red-top to the acre.

18. My manure is principally made by cattle in the yard, occasionally carting in muck or common earth.

19. I keep this year fourteen head of oxen, eight cows and heifers that brought calves last spring; young stock, twentythree head; three horses, two colts and eight sheep.

20. I have one barn one hundred and ten feet long by thirty feet wide. I have one other barn fortyfive feet long by thirty feet wide, and an open cellar under the whole for covering manure. At the large barn there is no manure covered excepting what is under some large sheds.

21. I have three cows and one heifer, all native breed; I have four heifers half blood, of short horn Durham breed.

22. I take my calves from the cow at three days old, and learn them to drink milk; keep them on new milk four weeks, and then it may be skimmed if half a gill of rye or oilmeal be added to two qts. of milk. I wean them at twelve weeks old.

23. I raised this season five calves; made free use of milk in my family; made 700 lbs. of butter and 500 lbs. of new milk cheese.

24. I have fourteen hogs of the small Byfield breed. Quantity of pork fattened this season, 3600 pounds.

25. I keep my hogs in a pasture in the summer months and give them milk and whey, and the wash from the house. I commence fattening my hogs by boiling potatoes and apples mixed together; about one-third apples. After they are well boiled, a little meal, about ten or twelve quarts to a barrel, is applied. I mix it well and let it cool. I finish fattening my hogs by giving clear provender four or five weeks previous to killing.

26. As my hogs are taken from the pasture to the pen to fatten, I make no manure excepting what is made in the pen while fattening, which is about ten or twelve loads.

27. I have three hands in the winter, four in the summer, with some extra help in the haying season. I pay from ten to twelve dollars per month by the year; from eighteen to twenty dollars per month in the season of haying and harvesting.

28. I have about two hundred apple trees, mostly young and just beginning to bear; selected by taking sprouts from the roots of trees producing the best of fruit, or by engrafting. I have about eighty other fruit trees, consisting of peaches, pears, quinces, plums and cherries.

29. My fruit trees have never been attacked by canker worms nor borers.

30. I keep no distilled spirits in my house for myself or laborers.

WILLIAM WELLS.

The following is the account of the farm of William Salisbury, of Groton, Middlesex county, Mass., a town distinguished for its general excellent cultivation, and especially for its admirable success in the redemption of peat bogs, now rendered some of the richest and most productive lands in the State. Mr Salisbury, as we infer from his statement, is one of those striking examples of successful perseverance against difficulties, and with little other means than courage, diligence, and frugality, with which New England abounds, and the moral fruits of which upon the heart and character, are as valuable as those which are brought out of the soil.

H. C.

To the Trustees of the Massachusetts Agricultural Society.

1. My farm consists of 130 acres, exclusive of wood land.
2. The soil consists of clay, loam, and peat.
3. I till the present year about 17 acres. I do not apply manure to land the same year that I sow.
4. I apply my manure in as green a state as I can.
5. & 6. I spread my long manure on grass for corn, and turn it under from three to four inches. I have this year also put meadow mud that had been in the hog-yard through the winter, into the hill on some part of my corn this year; but intend for the

future to spread the muck on the top and harrow it in, as I do not approve of making so much of a hill as we must where the manure is put into the hill on sward land.

7. I mowed this year about thirty-five acres of upland. My hired man said he thought my grass would average one and a half ton to the acre. The upland I think, would not average that, but some of the meadow would nearly double that. I shall estimate my hay at seventy-five tons.

8. I have but just begun to irrigate, but am preparing by means of dams, to flow a considerable part of my poor meadow land. When I have flowed in the spring and fall and kept the water confined till the sediment that washed from the road was settled, it has brought in a better quality of grass and increased the quantity very much.

9. I have not manured land that I irrigated; not making so much manure as I want to apply to ground that I plant, and not being able to buy, I have not applied much clear manure. As a top dressing to my grass, I have put on in different places a load of fresh horse manure and litter on to my meadow land, and the land has always produced good grass after such application. I plough the soil at the sides of the road, and sometimes mix a little manure with it, and spread it on my meadow land about twenty loads to the acre, and sow six or eight quarts of grass seed to the acre, and take a pair of horses that will walk quick with a sharp harrow, and harrow the land when the frost is out about an inch or two; and I have in that way improved some of my meadow land very much.

10. I mow about twenty acres not suitable for the plough. Some of the hay is of a good quality, and the rest is a mixture of wild grass, buck horn and polypod.

11. My low peat lands that I have reclaimed, where there have been bushes or small trees, I have taken them out by the roots, which is done comparatively easy, and where there have been hassocks I have taken them off with a bogging hoc and have carted or sledged my loam that I had piled up the summer before upon the meadow when it was frozen hard, and spread from twenty to thirty loads to the acre; and in the spring when there was a light snow, I have sowed my seeds, and when the frost has got out of the top of the meadow, I have harrowed it thoroughly, and in that way have obtained pretty good grass. I think it bad policy to carry gravel on our meadow land. Perhaps a better way to reclaim our meadows that are too soft to plough in summer, is to go on in the spring when the frost is out about four inches, with a plough ground sharp, and plough and plant to potatoes one or two years, until the wild grass is killed out, and stock it down; in that case we should have good hay the first crop.

12. I planted three acres to corn this year; I carted my green manure, say twenty loads to the acre, and left it in small heaps on my grass land a day or two before I wanted to plant, and spread no faster than we ploughed. After ploughing, I rolled it down with a light roller, then harrowed it lengthwise, then furrowed it; and on two acres I put about twelve loads per acre of meadow mud that was thrown into the hog-yard in the fall and spring. One acre I did not manure in the hill but put ashes about the corn after it came up.

The kind of seed I brought from latitude 45, nine years since; and it is from ten to twenty rows; I planted the seed without soaking. Two acres of the land were considerably shaded with apple and

other trees. I had about forty baskets to the acre.

13. I planted about four acres of potatoes this year. About two acres that I planted on the meadow I ploughed as soon as the frost was out three or four inches deep. On one acre I put loam in the hill with a little lime mixed with it; and on the other I put long manure. The potatoes which I have dug grew to a good size, but were but few in the hill. What I have dug did not yield more than seventy-five or eighty bushels to the acre. My upland potatoes are not at this time all dug. I planted lady-fingers, blues, orange, and long reds.

14. I planted about half an acre to ruta baga, mangel wurtzel and cabbages, and expect to feed them to my cows.

15. I sowed last fall one and a half acre to winter wheat. This spring I sowed two acres to spring wheat. I usually apply lime on the seed, and also on the land. I put on about two bushels of seed to the acre. Both pieces were blasted; so that the crop did not equal the seed sown. The spring wheat sowed was the tea wheat.

16. I have laid down to grass this year about nine acres. After my grain was pretty well harrowed in, I sowed from eight to ten quarts of herds grass seed; when I intended to pasture I added a pound one and a half lb. of white clover, and went over the ground with a light harrow.

17. In addition to the manure from my stables I fetch meadow mud and loam, and put it under my stables, into my hog-yard, and under my back house; sometimes I mix lime with loam or meadow mud.

18. I kept through last winter one yoke of large oxen, one yoke three years old, one yoke of steers two years old, six heifer calves, which have since taken bull; and six cows and two horses.

19. I have one barn 82 by 30 ft.; one 52 by 30; one 40 by 28; and one built for sheep, 60 by 20; the lower part of which barn I am converting into a stable for my cows, and intend to stable them over night in summer and winter, and keep the manure under cover.

My cows are a mixed breed of native, English and French.

20. I am in the habit of letting my calves that I raise, have new milk for a week or two, then give them skimmed milk with a little meal; but this year most of the calves that I raised or killed came very late, and the season was so warm that milk would sour before the cream would rise; I have therefore given my calves new milk. I have raised this year seven calves. I have but six cows and two of them did not calve till the middle of June.

21. I have had twelve persons in the family, and we drink milk and water instead of cider or spirit. The calves took at least the milk of two cows till about the first of September. We have therefore made but a little more butter and cheese than the family will want—say 420 lbs. of four meal cheese and 230 lbs. of butter.

22. I killed three hogs which weighed nearly 900 lbs. My swine are a mixture of Byfield and Bedford or some other down county breed. The sire came from Mr Phinney, of Lexington.

23. I have put a board fence round about two and a half acres of the most compact part of my orchard and let my hogs run there until about the 20th of August, and give them the wash of the house. After that time I shut them all up and feed them with common apples and pumpkins and wash. When my apples are all gathered, I turn those which I intend to keep over into the orchard

again; feed those that I intend to kill with apples and pumpkins raw as long as they last, then feed with pudding made of corn ground in the ear and barley mixed with it, occasionally giving them a little small corn till within about a month before I intend to kill, then give them pudding made of corn and barley without the cob.

24. I take from my hog-yard from thirty to forty cart loads of manure, made principally of meadow mud and turf.

25. I have a son 19 years of age who goes to school at least one-third of the year, probably more; a grandson 16 last August, who goes to school all the time the town school is kept; I myself am not able to do hard work and do not pretend to mow. I hired a foreigner 4 months at \$10 per mo. \$40 00
Another man the month of July—paid 20 00
2 other hands 5 days each at 5s. per day 8 33
10 days work 1 man planting and hoeing at 4s. 6 67

\$75 00

26. I have about 300 apple trees probably, more than one-half of which are grafted.

27. I have about 50 pear, peach, plum and cherry trees.

28. My trees have never been attacked by the canker worm.

29. I do not allow the use of ardent spirits as a drink on my farm.

In conclusion I would state that when I came on to the farm nine years since, everything that had been raised had been taken away from it, and the pastures were overrun with alder brakes; and the fences were very much out of repair. Some of the low meadows had not been cut for several years; nearly all of the meadow-land was very much covered with hassocks, with no manure on the premises, and not being able to buy, with a numerous family, and so many obstacles in the way, I found it rather hard to get along. For three of the first years it cost me fifty dollars per year for hay to get my stock through; and one year I paid \$25 for pasture, and for several years more or less. In 1837 I pastured four cows beside my own stock, and sold \$500 worth of hay.

All which is respectfully submitted.

WILLIAM SALISBURY.

Groton, Oct. 18th, 1838.

Good Profits.—The New York Journal of Commerce states that a person last year received a small invoice of the *Morus Multicaulis* seed from Canton, which cost them about four dollars per lb. It was afterwards resold several times, at a constantly increased price; and a small parcel is said to have been sold at one hundred dollars the pound. The price has since abated a little, and the present market rate may be quoted at about eighty dollars per pound.

Cure for the sting of a Wasp or Bee.—A Liverpool paper states that a person last year received a small invoice of the *Morus Multicaulis* seed from Canton, which cost them about four dollars per lb. It was afterwards resold several times, at a constantly increased price; and a small parcel is said to have been sold at one hundred dollars the pound. The price has since abated a little, and the present market rate may be quoted at about eighty dollars per pound.

Cure for the sting of a Wasp or Bee.—A Liverpool paper states that a person last year received a small invoice of the *Morus Multicaulis* seed from Canton, which cost them about four dollars per lb. It was afterwards resold several times, at a constantly increased price; and a small parcel is said to have been sold at one hundred dollars the pound. The price has since abated a little, and the present market rate may be quoted at about eighty dollars per pound.

Another Fever.—A new species of cotton seed is now selling in Alabama at fifty cents a kernel!

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MAY 22, 1839.

HIGH PRICES OF PROVISIONS AND "GOOD BUSINESS TIMES."

Great complaints are now made in all parts of the country respecting the exorbitant price of provisions.—Beef, for example, in New York, is stated to be at 28 cents per pound, and in Cincinnati butter has been sold at 75 cents a pound, and potatoes at \$1.25 cents per bushel.

Another curious fact, that within the last two and three years, we have had large importations of the necessities of life—butter, cheese, wheat, rye, barley, oats, and even hay from Europe; and which have, it is believed, commanded remunerating, in many cases, large profits.

The prices of agricultural products are, however, not in great disproportion to other matters. Labor of every description was never higher. Mechanical labor is extraordinarily high, carpenters demanding more than two dollars, masons three dollars per day; seamen's wages are enormous; fifteen, twenty, twenty-five dollars per month demanded; and house-rents exorbitant. The expenses of living are, in most respects, advanced beyond all precedents, and absolutely discouraging to those who have to provide for their families, and those who would be glad to have families to provide for.

What is the account to be given of all this? This is a great question in political economy. We shall not attempt to go to the bottom of it; but shall suggest some causes which may have assisted in the result.

There were some accidental circumstances which have operated in the case, which are temporary in their nature and must soon pass away. There are others of an abiding character, for which we see no immediate remedy. Within a short period we had two years of scarcity in respect to our great products, wheat and Indian corn; and to hay likewise. In these cases comparatively little pork was raised, and lard, and the beef cattle were turned off and killed in a lean condition. These operations created actual deficiencies, which could not be supplied at once. Cattle for stall-feeding were never remembered to have been so scarce as they were the last season; and many farmers who had the hay and provender on hand, refused to buy cattle for stall-feeding, on the almost certain presumption, that when compelled to purchase at so dear a rate, no returns which they were likely to realize when their animals would be ready to go to market, would meet the expenses of stall-feeding on hay and grain at current prices.

Then again, the last year, owing to the universal drought, the potato crop, on which much dependence is always placed for feeding swine and cattle as well as the human family, was everywhere a short crop. These causes however, are transient in their nature. Farmers are now everywhere going largely into the raising of meat stock, and existing deficiencies will be soon supplied; and as to other crops we may at least hope for ample returns the coming season.

But there are other causes of the present high prices of agricultural produce more deeply seated and of a more permanent character.

The population, by natural growth and by foreign accessions, increases among us in a rapid ratio. These are to be fed. The style of living generally, has, within five years, become much more luxurious than formerly, and the consumption of meats of every kind has greatly increased. Where one dish satisfied us, two and three are now considered indispensable. This is certainly the case in cities.

Next the immense increase of the class of consumers and decrease of the class of producers. Look at the innumerable hordes of individuals employed on public works, railroads and canals, on buildings and improvements, in manufactures and trades, all of whom are withdrawn from the labors and yet are to be supported by the products of agriculture. Observe too the infinite number of young persons from the country, who are employed in our cities in various trades, in shop keeping, and as house-servants. This class is daily increasing, and we cannot but regard with feelings that we hardly dare to express, the crowds of young men, who might establish themselves as independent freeholders in the country, who are willing to barter the pleasures and privileges of rural life, of open fields and many em-

ployments, to become the mere sellers of tape and needles, ruffles, essences, and paste jewelry in our cities, or engage in the degrading services of cleaning brasses and washing dishes, with the noble privilege of living in basement-story kitchens.

But one great and prolific source, as we honestly believe, of high prices, deficient labor, the luxury, waste and servility which prevail among us, is in the multiplication of banks beyond the business wants of the community, the extension of paper money, and the abuses of the credit system. Our honest conviction is that the enormous increase of bank capital, beyond all reasonable limits, is destined to prove to the country in its various influences, a source of immense evil. The calamities from which we have just escaped, are to be directly traced to this as their great origin; and as matters are now going on, we have only to look forward to another explosion, as disastrous as that from which we have so recently recovered—for come it must. Its arrival in the natural course of things, is as certain as the descent of water upon an inclined plane or the passing of the sun over the meridian. The creation of immense amounts of purely artificial and fictitious capital, produces a dangerous delusion with individuals and on the public mind. If its effect were merely to increase the facilities and stimulate the powers of production, it would so far be degree and in an indirect form. This money is loaned to what are called men of business—a class of men, who as far as they are money brokers, the mere exchangers of commercial products without any increase of their value, or speculators in stocks and lands, add little or nothing to the wealth of the community. The increase in the nominal value of real estate, is of no advantage to the community, unless it is based upon some positive improvement or increased productiveness of the soil. If a piece of land is sold today at five dollars an acre and next week it is valued at ten dollars an acre, without any change whatever in its condition, how is the community in any respect benefited or its wealth increased? But on the other hand, the obtaining of land for agricultural purposes, for production, and the actual creation of wealth, is by this enhanced price, rendered the more difficult to the man whose labor is his only capital, the man of other arts in the community the most to be embarrassed. His value as a producer, the abundance of money itself. The facilities of procuring credit and money induce recklessness; lead to all kinds of speculation; create a distaste for labor; encourage the most luxurious expenditures; relax the bonds of moral principle; and convert the community into a population of gamblers. It is the true secret of the enormous frauds with which our community has been convulsed within the last two years, and of the prevalence of the gross and immoral principle, that a neglect to pay one's debts to a corporation or a fraud upon a corporation, is a delinquent matter from one committed upon an individual. In fine, it is the moving cause and prolific source of speculation,—speculation, a matter pregnant with evils and from which no more good has accrued or can ever accrue to the community than from any other form of lottery gambling.

These are to a certain and considerable extent, the causes of the high prices of living; and under this system they must continue until we have another periodical explosion. There is no cure or preventive. There is no moral soundness enough in the community to afford any hope of amendment or of change, until another fit of *vetrum tremens* brings us up, as the sailors say, "all standing;" rubs out old scores, and then leaves us to start again in a new course of unbridled profligacy, vulgarly called prosperity. H. C.

AGRICULTURAL INTELLIGENCE.

We learn from an authentic source that the Board of Trustees of the Massachusetts Agricultural Society have resolved to appropriate to the Berkshire and Worcester Agricultural Societies the current year, \$200 each, to be used as the local societies may suggest, with the approbation of the Trustees of the Massachusetts Society. What these subjects of premium shall be, is not as yet fully determined; but as soon as known we shall lay them before the farmers. A committee of the Massachusetts Society will attend at each of the shows. It is agreed, likewise, we believe, to offer a premium of fifty dollars for the best treatise on the mulberry tree, with a reference particularly to the climate of New England. Our mulberry tree and silk culture friends are in a fair way of anticipating the wishes of the Society without the

stimulus of a premium, since there have been no less than eight treatises on this very subject within the last six months; and several more are in embryo. Whitcomb, Kenrick, Cobb, Dennis, Perry, Roberts, Homer, and one or two others, (the names of whom we do not at this moment remember,) have all given their views and experiences on the subject, and have actually come upon us in such a battalion as to drive us from our first intention of giving a distinct notice of each. Then we have Force's book on Silk cultivation, the Journal of the American Silk Society, Bydenburgh's Silk Worm, Cheney's Silk Grower, Hartford's Silk Culturist, Duponceau's Treatise, submitted to Congress, and published by their order; and the Report of their committee on this subject, of which Mr Adama was chairman, and articles and essays without number, which are appearing in rapid succession in the Farmer's Register, in Virginia, Southern Agriculturist, in South Carolina, Cultivator, at Albany, Yankee Farmer and New England Farmer, at Boston, Northampton Courier, at Northampton, a paper which has distinguished itself for the most valuable information on this subject, and many judicious and valuable articles on other agricultural subjects, to say nothing of a host of others. The people, therefore, are not likely to suffer for lack of knowledge. The only thing now to be apprehended in this great Yankee nation, is that making silk books will take the place of raising silk trees; as raising silk trees has actually taken the place of raising silk worms; and there is, in truth, but little more prospect the current year of making silk in the country, than there was when the first *Morms Multicaulis* was imported.

We learn also, that the liberal sum offered in premiums for farms the last year, will be offered again the present year. These premiums have already done a great service; and now that many farmers whom we thought nothing would rouse, and who seemed likely to sleep on in the lethargy until they sunk into their last nap, have actually opened their eyes and turned over, and asked what time 't might be, we have the strongest hopes that the competition for these prizes of honor will be much more general and spirited than ever before, and that those who have waked up will actually get up, and enter upon the race with a determination to succeed. A deliberate and inflexible determination is, in all cases, the great element of success.

We do not know at all the conditions on which these premiums are to be offered, and probably before this all is fully settled; but while nothing is further from our wish than to dictate in the case, we may express the hope, which we do with all respect, that the premiums will be offered in less sums than the last year, so that they may be more numerous; and especially that provision will be made for a competition in specific branches of husbandry, as dairy husbandry, wool husbandry, arable farming, market gardening, grazing or stall-feeding, and general husbandry, which may combine the whole. We shall announce the prospectus as soon as it is received. H. C.

THE MASSACHUSETTS HORTICULTURAL SOCIETY.—Saturday, May 4th, 1839.—The President in the chair. The chairman of the committee on the Courtes legacy, upon being questioned, communicated the state of affairs at present, whereupon considerable discussion took place.

Mr Walker, of Roxbury, proposed the Rev. Joseph Tyso, of Wallingford, England, as an honorary member—and upon the ballot he was unanimously chosen.

The same member proposed Carey Tyso, Esq., of Wallingford, England, as a corresponding member—and he was upon the ballot unanimously chosen.

Then adjourned to this day week. E. WESTON, Jr., Rec'd Sec'y.

MAY 19th—EXHIBITED

A very fine specimen of the double flowering Cherry, from the estate of Madame James Perkins, Pearl street, Boston; from the Messrs Winslip, Brighton, a splendid Bouquet; native, cultivated plants from the Rev. John Lewis Russell, of Salem, viz.: Trillium grandiflorum; *Claytonia spatulata*; *Thalictrum dioicum*; *Uvaria sessiflora*; *Convallaria stellata*; *Pulmonaria Virginica*; *Phlox stolonifera*; *Phlox mvea*.

NOTICE.—The premiums for *Geraniums*, viz. for the best display, twelve best varieties in pots, \$10; for the second best display, \$5; for the best seedling, \$3. *Tulips*—for the best twelve varieties, \$10; for the second best twelve varieties, \$5, will be awarded on Saturday next 25th inst. For the Committee of Flowers.

S. WALKER, Chairman.

Boston, May 19th, 1839.

BRIGHTON MARKET.—MONDAY, May 20, 1839.

Reported for the New England Farmer.

At Market, 215 Beef Cattle, 40 Pairs Working Oxen, 45 Cows and Calves, 120 Sheep, and 320 Swine.

PRICES.—Beef Cattle.—Former prices were not sustained, and we reduce our quotations to correspond First quality, \$9 00 a \$9 25. Second quality, \$8 25 a \$8 75. Third quality, \$7 50 a \$8 00.

Working Oxen.—We noticed the following sales, viz. \$70, \$82, \$95, \$110, \$125, \$130, and \$140. About 60 head were purchased by gentlemen from Worcester County, at prices varying from 60 to \$75 each.

Cows and Calves.—We quote sales at \$35, \$33, \$40, \$48, \$55, \$57, and \$62.

Sheep.—A few (sheared) and ordinary were sold at about \$2 50 each. A lot no sheared at \$4 25.

Steine.—Prices remain without much change from the two last weeks. Lots to peddle 8 1-2 a 9 for sows, 9 1-2 a 10 for barrows. At retail from 9 to 11.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending May 19.

BRUSSA MULBERRY.

A fresh lot of genuine Brussa Mulberry Seed just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street. This species of Mulberry flourishes best in high and even poor lands, and is more likely to endure the rigors of our severe winters and not so subject to the effect of the frost, as trees brought from more southern latitudes, or warmer climes.

The leaves of the Morus alba of Brussa, are said to contain a much greater quantity of saccharine matter, than any other of the white species, and moreover, the leaf is much larger than those of Italy and Spain; it is also a hardy tree, susceptible of being raised in climates, where the frosts are severe.

At the annual fair of the American Institute, at New York, in October last, specimens of the leaves of the Brussa tree, of different years' growth, were exhibited, and excited universal approbation, and the Institute awarded a silver medal for the introduction of this invaluable tree, observing in the report of the committee, "that these with every new and useful plant, calculated to withstand the rigors of our climate, are worthy of attention, and those introducing them into our country, deserve to be placed on the catalogue of our country's benefactors."

May 22.

EXHIBITION OF TULIPS AND VIOLAS.

The third Exhibition of Tulips will commence on FRIDAY, the 17th inst., at the Garden of S. Walker, (opposite the residence of Madam Eustis) Roxbury, and continue for a few days.

Since the last Exhibition, great improvements have been made in the arrangements. The bed, the present season, will contain upwards of 1000 Flowers, all of them rare and very beautiful; among them will be found fourteen varieties that obtained the Queen of England's Plate, and the London Horticultural Society's Cup Prizes, at Hampton, in May, 1838.

In addition to the Tulips, upwards of 2000 Viola Grandiflora will be in bloom.

Tickets may be had at the Bookstores of C. C. Little & Co., W. D. Faxon, and Gould, Kendall & Lincoln; and at the Garden Gate.

Single admission 25 cts. Season Tickets 50 cts.

May 22.

FOR SALE.

A very superior Berkshire Boar and Sow, twentytwo months old, very large of their age. Apply to

JOSEPH BRECK & CO.

ANNUALS IN POTS.

J. L. F. WARREN has for sale, at his garden in Brighton, a great variety of Annuals, started in pots and ready for transplanting.

Sheet Lead and Lead Pipe.

Sheet Lead and Lead Pipe all sizes, constantly for sale at No. 1 City Wharf, by **ABBOT FEARING & CO.** May 22.

FOR SALE.

5000 Cabbage Plants, in fine order. Apply to DANIEL HINDS, at Mr Stearns's, near the colleges at Cambridge. May 22.

WILLIS'S LATEST IMPROVED SEED SOWER

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing his seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who have used it the present season. For sale at the N. E. Agricultural Warehouse and Seed Store by **JOSEPH BRECK & CO.** April 3.

DILLINGHAM POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store connected with the New England Farmer Office, a few barrels of Dillingham Potatoes. These are well known as a most excellent eating and very prolific kind. Also, a few Cow Horn Potatoes, a very fine kind; the celebrated Rohan Potato; Early Whites, and Eastern Potatoes of various kinds. **JOSEPH BRECK & CO.** April 17.

FOR SALE.

The subscriber offers for sale his estate in Harvard, County of Worcester, the well known Bromfield Place; an excellent dairy farm, well wooded, the house spacious, fitted for two distinct families; the situation among the most pleasant to be found, especially for a private or high school. Bordering a part of the farm is a beautiful water, containing two islands belonging to the farm. Inquire of the subscriber at South Natick. **J. H. T. BLANCHARD.** April 17.

MORUS MULTICAULIS.

A few thousand trees of the genuine Morus Multicaulis; so a few thousand cuttings of the same may be had on immediate application to the subscriber.

WILLIAM KENRICK,

April 24. Nonantum Hill, Newton.

CORN SHELLERS.

Just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, a supply of Currier's Patent Corn Shellers; a very convenient and cheap article. A right to using said machines in counties or towns may be obtained by applying as above.

April 17. **JOSEPH BRECK & CO.**

DOUBLE DAHLIA ROOTS.

For sale at the New England Agricultural Warehouse and Seed Store, a superb collection of Double Dahlias, consisting of all the improved varieties.

Also, Double Carnations of many fine varieties. **JOSEPH BRECK & Co.** May 6.

MISCELLANEOUS.

LETTERS FROM THE EAST.

BY A LADY OF NEW YORK.

(Continued.)

Turn first to the south. The most striking object which arrests our attention on the left is a propylon, tottering as if on the verge of annihilation, very similar in appearance to that of the Memnonium, though vastly more imposing and gigantic.—That artificial cavity midway to the top, is part of the interior gallery and staircase leading to the summit, as usual in all these edifices. Near the lower part of the same are large apartments, probably used by the guards and keepers of the gates. This is one of a triple range of propylæ; the two others you see a short distance to the south, are much less shaken by the earthquake. The elevated gateways through each are lined with enormous slabs of highly polished red granite. In front of each propylon, and on each side of the gateway, are immense colossal statues in granite and stone, from thirty to forty feet in height, though now half buried in rubbish. Obelisks *always* were in advance of all propylæ; and wherever these are found wanting, as in this case, we must seek them among the ruins of more modern Alexandria, in the stadium of Constantinople, at Byzantium, in the piazzas of Rome, and the avenues of Paris. It is easy to account for these three magnificent entrances, one succeeding the other, at this particular point. The avenue which they guarded led from a temple some distance away from Karnac, and which must have been particularly holy, directly to the first and most ancient part of the city of temples behind us. The smaller propylon on our right, and through which we entered from the avenue of sphinxes, leading from Luxor, is doubtless a subsequent erection, made to communicate with the more modern part of the great temple of Karnac.

To the west, we see over the wall which connects the latter propylon with the western front of the temple. The view is only bounded by the Lybian mountains some miles distant. We can just discern the Memnonium and Medinet above, at their base, and a small strip of river which cuts the plain, and now sunk deep below its banks.

Turn now towards the north. On our left is the great propylon *par excellence*, and the most magnificent one in all Egypt. We shall see it to more advantage when we walk through it to the interior of the temples. The tall insulated columns behind it are in the first great court of the temple, which was covered with a roof which these columns supported, the same as in the case of Luxor. By far the grandest and most perfect feature on this site is the great hall of columns, directly in front of us.

You have contemplated the exterior grandeur of this vast pile, and as we are to pass through it we will leave it for the present. Perhaps you do not remark one very peculiar, and to me singularly impressive feature, about all we have been contemplating. Everything we have yet seen, from the smallest propylon to the vast, magnificent, and truly astonishing monument before us, the hall of columns, are but entrances and antechambers to something more vast, more magnificent, more holy, and more ancient. Where is that something? you ask. Gone! When the vengeance of an offended God swept over the devoted land of the heathen gentile, the proud fane of Iheban Ammon was struck down to the dust, and lies buried under yonder heap of rubbish. These proud trappings, the gifts of long

lines of Pharaohs, are left standing, as mementos to all future times, of the splendor, magnificence and magnitude of the principal fane, and to point out the spot where it lies entombed. Its epitaph is engraved on these mighty tombstones which surround this grave of heathen Egypt. Why is it that the solid walls of the great Egyptian Pantheon were shaken down to their very foundations, while those tall columns were permitted to stand erect, and to this day support the superincumbent weight of roof? You perceive that the hall of columns, by its peculiar construction, was always as light inside as the day without; but the interior of the temple itself was of course, as all others were, perfectly dark, and in which deeds of darkness, and all sorts of abominations, were practised, as part of the religious creed and daily observance of this nation of base idolaters. Hence it was that the avenging hand of the outraged majesty of heaven was particularly directed towards this great mother of Egyptian iniquity. She has been laid in the dust, while many of her children in other places, have been passed over, partly in contempt, and partly, perhaps, with a view to perpetuate the record of abomination so deeply engraven on all their walls.

Let us now take a rapid view of the interior, ere the setting sun shall leave it in obscurity. We will pass out at the gate where we entered, and walk round to the western and principal front.—You perceive that another avenue of sphinxes mark the great avenue towards the Nile. Every approach to this temple had a similar avenue, similarly ornamented. This greatest of all the great propylæ of Egypt, measures four hundred feet long, forty feet thick, and proportionally high. When surmounted with its tall masts, ornamented with banners, pennants, and oriflames, its effect must have been very imposing on those who approached it from the Nile. It is comparatively of modern construction when compared with the other sacred edifices behind it. It is in an unfinished state and not adorned with sculptures. Its ascertained age is now 3000 years. We will cross the first great court, which is three hundred feet square, with small temples on the side. Through a smaller propylon is a gate-way, over twenty feet wide and sixty feet high, at one time guarded by brazen doors. A noble entrance truly, to the noblest hall ever built by man! The perspective of the vast central colonnade is seen to better advantage from this entrance, than when we shall have passed it; for there the senses are overpowered by the forest of gigantic columns on every side. I can compare those great centre columns to no other familiar object than tall light-houses or shot-towers, such as we have at home. Of course, such immense masses could not be monolithic, but are composed of huge blocks, piled one on the other by the aid of some powerful engine.

But it is time to enter; for see, the almost horizontal rays of the setting sun, are producing lights and shadows in this mysterious hall, which give a much finer effect than the vertical meridian beams can possibly do.

(To be continued.)

The Legislature of Pennsylvania invites the consideration of that of New York to an effort to connect the canals of the two States, at a point that will enable the one State to exchange her coal for the salt and plaster of the other.—Old Connecticut will next wish to cut a canal for the better exchange of her nutmegs and other "notions," for the "tar, tumeric and turpentine" of North Carolina.—*Boston Times.*

WINSHIP'S BRIGHTON NURSERIES,
AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c.

Orders addressed to Messrs WINSHIP, Brighton, Mass., will be promptly executed, and forwarded to any part of this or other countries. April 10.

FRUIT AND ORNAMENTAL TREES, MULBERRIES, &c.

Nursery of William Kenrick.

The Catalogue of Fruit and Ornamental Trees for 1839 is now ready, and will be sent to all who apply. It comprises a most extensive selection of the superior varieties of Pears, Apples, Plums, Quinces, Gooseberries, Raspberries (Currants, Strawberries, Grape Vines, &c. The stock of Cherries and of Teaches now ready is particularly large. Also, Ornamental Trees, Shrubs, Roses, Honeyuckles, Pæonies, Dahlias and other Herbaceous Flowering Plants.

10,000 Cockspur or Newcastle Thorns.
10,000 Buckthorns.
Morus Multicaulis, and other Mulberries; the trees genuine and fine, at prices fair, and varying with the size, and the quantity which may be desired.

Fruit and all other trees, when so ordered, will be securely packed for safe transportation to distant places, and orders promptly executed, on application to the subscriber.

WILLIAM KENRICK,
Nonantum Hill, Newton, near Boston.
January 30, 1839.

PEAR, PLUM, GRAPE VINES, &c.

1000 Pear Trees of the most approved kinds;
1000 Plum Trees of the most approved kinds and extra size—many of them have borne the past season;
500 Quince Trees;
3000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hamburg, Sweetwater, Pond's Seedling;
30,000 Giant Asparagus Rots;
5000 Wilmot's Early Rhubarb or Pie Plant, lately introduced.

Also—a good assortment of Gooseberries, Roses, &c. of different kinds;

All orders left at this office, or with the subscriber at Cambridgeport, or in Mr Lynch's baggage wagon box, at Gould & Howe's, No. 8 Faneuil Hall, will meet with immediate attention.
SAMUEL POND,
March 27. Cambridge-*patri*, Mass.

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells.

Orders left at the Bone Mill near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention.

March 27.

NAIUM WARD.

GRAPE VINES.

150 Sweet Water Grape Vines.
200 Isabella, " "
150 Catawba, " "
100 Black Hamburg Grape Vines.

AGRICULTURAL.

From 'Transactions of the Essex Agricultural Society, 1838.'

ESSEX AGRICULTURE.

Addressed to the Farmers of Essex County, Mass.

BY HENRY COLMAN.

(Concluded.)

On former occasions I have strongly urged upon the Essex farmers the subject of a winter dairy. If well managed, a room with a proper temperature secured, and an abundance of succulent food prepared for the stock, I believe it would be attended with less trouble than in summer; and the best of new made sweet butter in the winter, where the cows are bountifully fed upon good hay and carrots, would command a very high price in Boston market. I know one farmer who keeps a winter dairy in the vicinity of Boston, and who for several years has contracted for his butter deliverable new once a week at fortyfive cents a pound; and the firkin butter presented for premium at the shows of the Massachusetts Agricultural Society in December, has much of it been sold for several years at from thirtythree to fifty cents per pound. These are certainly as encouraging prices as any reasonable man can ask.

This, however, brings me to speak of other crops intimately connected with agricultural improvement, and the cultivation of which such operations would require. Indian corn, at fifty bushels to the acre, is a much more valuable crop than hay. The fodder upon an acre of corn yielding fifty bushels of grain, is, when well cured, fully equal for any kind of neat stock, to one ton of English hay; and one ton is as much as is obtained by many farmers from their land.

Carrots we have already spoken of. Ruta baga, though an exhausting, is an excellent and profitable crop. So also are the sugar beet and the common blood beet. The mangel wurtzel and the common flat turnip are inferior to the other vegetables. The yellow Aberdeen turnip is of almost equal value with the ruta baga, and will keep sound nearly as long. As soon as the farmers in Essex will go largely into this kind of cultivation, their products will be increased; their manure heaps will be increased; their lands will be put in the best condition for wheat and barley; and I think we might venture to anticipate that their crops and improvements will be quadrupled.

The fattening of pork might be pursued by the Essex farmer with great advantage. The prices of every description of agricultural produce are high, and so they bid fair to remain. While pork remains at ten cents per pound, the piggery, if well managed, would yield ample profits.

The cultivation of fruit, apples in particular, cannot be too strongly urged upon the Essex farmers. We can give no better advice to them than was given by the old Scotchman to "Jock, to be always sticking in a tree, for it would be growing while he was sleeping." The ascertainment of the great value of apples for fattening swine, for fattening

beef cattle, and for the increase of milk and the improvement of dairy produce, may be pronounced an important modern agricultural discovery. Many intelligent farmers rate them at equal value with potatoes, the small expense at which a permanent and abundant supply of them can be obtained, commend a cultivation of them as extensive as possible.

Fruit should be cultivated, likewise, much more than it is, for the market. Several farmers in the vicinity of Boston, sell, of the single article of apples only, from five hundred to twelve hundred dollars worth per year. Some in Essex county within my knowledge, are accustomed to sell annually to more than the amount of a thousand dollars. Here too the demand outruns the supply. Large quantities of apples are imported annually from the south and from the east into Salem and Boston. The production of them costs comparatively but little. Seven years, under good management, will give you a bearing orchard. A respectable citizen and a capital farmer in your own county some years since, at the age of seventy, planted an orchard, and has lived several years to enjoy the fruits of the trees of his own planting. The climate and soil of Essex are well adapted to the raising of the best of apples and pears. The farm should be fully stocked with these trees. The sides of the fields by the road should be lined with them. Many vacant places could probably be found, in which trees might be set with advantage, where now nothing of any value is obtained. Thousands and thousands might be set out in your pasture grounds without injury to them; indeed in many cases with decided benefit. Apple trees do not impoverish the land; and the shade is of service to your cattle. They will at first require protection, but this is a small affair; and after they come in bearing, the cattle will get the windfalls; but this will do them no hurt. A farmer in Watertown publicly stated, not long since, that he had been accustomed to give to his stock, swine, milch cows, and fattening cattle, from ten to twelve hundred bushels of apples a year, with most decided advantage. In his case they were given uncooked; and he pronounced them of equal value with potatoes. What a resource farmers have here put within their reach? Ten or twelve bushels of apples to a tree of tolerable size and age, is not a large yield. How few farms are there where room cannot be found for the planting of a hundred or even two hundred trees. When once well-planted, protected and trained, little care is required to keep them in order and productive. But I shall probably be told that the bover will pierce them; the canker worm will blast them; the cattle will browse them; they will require to be pruned yearly; the earth around them must be kept loosened; the frost will often come before we can gather the apples; we have no place to store them after they are gathered; yes! and indolence may conjure up a hundred other objections as discouraging and frightful as these; but that which depends upon our own carefulness, our own carefulness should provide against. The chances

of success altogether outweigh the risks of failure. What appears to be chance and accident, (matters which in truth have very little concern in human affairs,) is designed and suited to stimulate human foresight and prudence; and there can be no doubt that it would be an evil and a calamity if things in this world were more certain to man's providence and command than in truth they now are. Prudence and industry are the great elements of success; and in general, success in matters pertaining to them are about as certain to prudence and industry, as the harvest to the seed we sow.

There is another matter to which I wish to call the attention of the Essex farmers, and the farmers throughout the commonwealth; and that is, the cultivation of the sugar maple. It is a tree of quick growth and makes excellent fuel. It is easily propagated, and there are many localities in Essex, where, undoubtedly, it would flourish. It is a healthy tree, having no bad influences; and is not a great exhauster of the soil. It is one of our most beautiful trees for shade or ornament. But I recommend its cultivation for the purpose of making sugar. Many farmers in Essex will say, if they should attempt it, they never could expect to reap the fruits of their labor. That may be so; but shall we do nothing for posterity? Have we no ambition to transmit to those who shall come after us, the legacy received from our fathers, enlarged and improved? A maple tree of thirty years old may be calculated upon to yield sap enough for four pounds of sugar. I have known one tree to yield twentyseven pounds of sugar in a season. I have known another tree to yield forty pounds. These, however, are rare instances. The amount of four pounds is a fair average. Several towns in the commonwealth from their own maple trees obtain an ample supply of sugar and molasses for domestic use. One town within my knowledge made the last year twenty thousand pounds of sugar—two others thirty thousand pounds each! One town was supposed to have made nearly seven thousand pounds; but this last amount is not so well authenticated as the former, of which indeed, there is no doubt. Some farmers within my knowledge are accustomed to make three hundred lbs. each; some five hundred pounds; some one thousand pounds; some one thousand five hundred pounds in a season. In many of these cases, the trees from which these products are obtained, are only between thirty and forty years old. They can be tapped, if done judiciously, for years and years without injury. Under improved modes of manufacture, the sugar is capable of being made a very good article; and when refined, of being as handsome a sugar as is to be found in the market. Now, whatever may be the results of the beet sugar cultivation in this country, in the ultimate success of which indeed I have perfect confidence, this ought not to interfere with or prevent our planting the maple for the object mentioned. We may, therefore, with the greatest advantages to ornament, comfort, and interest, line our roads with it; scatter it over our pastures; and cultivate it in

various locations, without prejudicing any other cultivation or crop.

But I must bring this long communication to an end. Yet I have only glanced at topics which I should have been happy to have discussed at large; and I have neglected several which I wished to have brought before the farmers of Essex. I trust I shall have other opportunities. I would not by any means be supposed to dictate to men, whose agricultural intelligence, and skill, and experience, I well understand and respect, and by which I have been often instructed. But I felt myself honored by the invitation of the intelligent and devoted Secretary of the Society, to whom the agricultural community are largely indebted, to add something to your annual pamphlet; and I am most happy in any form of friendship or union in a common cause, to associate my name with the farmers of Essex. Connected to this improved county by ties of kindred, friendship, and long residence and intercourse, I am most anxious to keep the chain bright and strong.

In offering these suggestions to the farmers, I do it with a high appreciation of the agricultural capacities of the county. At present, however, I have not strong hopes of seeing these capacities even half developed. Opportunities and promises of quicker gain in her enterprising commerce, and her active and industrious manufactures, present themselves so frequently and flatteringly, that agriculture is likely to continue to be carried on with little labor and little capital. Under such circumstances, agriculture can no more flourish than commerce and manufactures can flourish with little labor and little capital. As her population is multiplied, the demands of the great market-towns in her vicinity increased, and the facilities of intercommunication among her own people and with the neighboring towns extended, this great interest must, and will be much more regarded than it now is; and will secure its proper place in the consideration and attention of its inhabitants. By an extended, skilful, and liberal cultivation, it will then be found that in the capacities and productiveness of much of her soil, as well as her commercial and manufacturing advantages, her intellectual and moral improvements, the county of Essex has been signally blessed by Divine Providence.

HENRY COLMAN.

April, 1839.

From 'Transactions of the Essex Agricultural Society, 1839.'

EXPERIMENTS ON MANURE, &c.

(Concluded.)

MR. HOW'S LETTER.

Methuen, Dec. 5, 1838.

DEAR SIR—In compliance with your request, I suggest a few ideas on a subject of no small importance; for success in farming depends principally on the quantity of manure that is made. And, in fact, a locomotive may as well be propelled without steam, as a person have good success in farming without manure. There are various ways by which manure may be increased. Cellars under barns for the reception of manure are highly important, as its value is much increased by being preserved from drenching rains and drying winds. Also, the quantity may be much increased by hauling muck or soil, or throwing in hay, straw, or some other materials to receive and suck up the urine, as this is supposed to be worth nearly as much as the droppings. A suitable plan for a cow yard is of no small importance. It should be much

hollowing in the middle; the sides so elevated as to prevent the water from running in, consequently there will be but little to run out, to wash out the manure. A large quantity of manure may be made in such a yard, by hauling in muck, soil, or some other material, and ploughing or pitching it over occasionally. But it is said, we have no meadow from whence to get muck; there are no scrapings in the road to be collected; therefore we have nothing to make compost of. But I would say, if they have nothing else, take the soil from the field, and with a little additional manure, the field may again be restored to its former fertility. Another object of some importance is to have the manure applied in the best manner. I have, until recently, been of the opinion that it is best to be applied in a green state, and have the fermentation take place in the ground; but of late I have had a different opinion, although I have tried no experiment that is satisfactory in my own mind. I would suggest the idea of recommending a premium to be offered for the best experiment on the application of manure, that it may be ascertained which is the most profitable, to apply manure in a green state or to make a compost of it by mixing other materials, taking into the account all the additional expense of labor.

Another thing is, to keep the hogs at work. By keeping a good supply of hogs, and accommodating them with materials to work with, they will add much to a farmer's stock of manure.

Some farmers are averse to the credit system; to supply their hogs with materials to work with; to fill their cow yards and barn cellars with muck, &c., and to give one, two, or three year's credit is too much. This is one important reason why so little improvement is made in farming. I believe there are the materials on almost every farm, and means within the reach of almost every farmer, to enrich his farm to almost any extent.

Suppose a person to make a certain additional quantity of manure; consequently in the same proportion the products of his farm will be increased; from which, by spending on the farm, will again increase the manure, and so on, until his farm may be enriched without limit. Finally, I believe that if all the farmers would pay the attention to making manure and enriching their farms that their interest requires, the western fever would be less prevalent among us, and our young men, instead of leaving the farms of their sires and engaging in speculation, or emigrating to the far west, would cultivate the land of their fathers and learn from experience that they may be amply repaid for all their toil, and that the cultivation of the earth is second to no other employment.

Yours, with sincere respect,

JOSEPH HOW.

[For the New England Farmer.]

Wool Growers, look out!—Manufacturers have already begun to cry down the price of wool. You have your remedy: keep the wool on hand until they offer fairly. Old wool is not so plenty but that the new will be in demand, and the merchant does not say that "cloths are declining." Again we say, *look out!* W. B.

To make Copying Ink.—Add to common ink a sufficient quantity of sugar to make it glutinous when dry; then put a piece of damp, thin, unsized paper on it, and press it with a warm smoothing iron, which will copy the writing.—*Yankee Farmer.*

[For the N. E. Farmer.]

EVERGREENS—THEIR CULTIVATION.

MR COLMAN—However to the contrary the taste of others may be, we are enthusiastic in admiration of evergreens. No matter how humble their growth—if they develop themselves in the moss which adheres to the craggy rock—the humble vine, that creeps upon the earth, hardly daring to look upward in the short space of its existence, or in the waving pine or dark hemlock, frowning at angry storms from the mountain's height, while centuries pass away; they are all objects on which our eyes can gaze with a pleasure and admiration which other portions of vegetable nature cannot afford.

The symmetrical maple, the spreading elm, with its trunk fasciated with tiny branches, the beautiful hickory, and tulip-tree aspiring towards the clouds with blossoms lovely as the rainbow, truly may vie with them, when the bud first expands before the early breathings of spring, and the rich leaf matures under the ripening sun of summer; but, like *sun mer friends*, or those who go with us while all goes well, their goodness withers away at the approach of autumn's storms, and in winter, they leave us nought remaining of what in summer, we admired, but the bareness of desolated beauty.

Evergreens are like "the friend that is born for adversity." Whether the sun pours the vertical and intense rays of summer, or casts the sidelong glances of winter upon the earth, they always present a gladsome and cheering prospect. In spring their new foliage is of a more lively green; in summer many of them exhibit the gayest flowers; in autumn they alone remain unchanged, saving that their foliage assumes a deeper hue, as if to shroud itself in mourning that the beauty and glory of the year has departed. When winter, monarch of the year, assumes its reign, the winds may moan through their dense-leaved groves, as if to peal the requier of nature, but there is music, solemn and sweet chanting in its pipings;—the snow may descend and lodge upon their branches, but it is only to veil beauty with the mantle of purity. While the stand as memorials of a past, whose "glory is departed" with its own short days, they also give assurance of a future, when nature shall awake from her dormancy at the touch of spring. Who does not admire them, and why do we not indulge a more familiar acquaintance with them by cultivation?

Anticipated difficulties in the culture of evergreens, is, probably, a great reason why they receive no mere attention. This is imaginary rather than real. For ourselves, we have no more objection to undertake the removal of a fir or a pine, in expectation of its future success, than of a maple or anything else. There are simple rules to be applied to transplanting all trees and shrubs, which rules, like those adapted to other things, must vary according to circumstances. Trees should, as nearly as may be, be always removed to a soil and locality similar to that from which they are taken. This cannot often be done in setting out the variety that is desirable around dwellings and in parks. But when removed to different soils, it is preferable to move from wet to dry than otherwise, for in the case the vessels may contract so as to adapt themselves to their emergencies; but when a tree is removed to a wet soil, a surfeiting of liquid is the consequence: disease, whose presence is indicated by paleness of the leaf, and death are the effect. How strikingly analogous are the effects of excess

ive drinking in the vegetable and animal world, in both, a small lack of food is more beneficial to health and long life, than a superabundance of it.

In transplanting evergreens, the first attention is to be paid to the time for the removal. We prefer the season when they are shooting most vigorously, and if the new shoot has started two or three inches, with us it is no objection. They are taken up with such care to preserve the roots, and if the earth comes with them it is well; if not, *grouding* or rolling them in earth and water of the consistency of a pudding, should be resorted to. If removed in a day when the sun shines, the root should be protected from its rays. In transplanting, the pit should be amply large, and when the roots are fairly covered with fine earth, a pailful of water should be poured into each pit and the remainder of the earth thrown in. The first year they should be frequently watered, if the season is dry. We know an individual who set out a number in 1838, and who watered them every day. The consequence was, his trees all lived and grew well the season they were removed. These trees were brought from a cold and wet, to a dry soil, so that last year they had less water than usual, and this year none by artificial means.

Another error we have seen in transplanting evergreens is, in getting those too large. Being unwilling to wait for a tree to grow, we set out those of too great a size, only to see them die. Man cannot change his climate or occupation in after life without evil, often fatal consequences to his health; and while his habits (if good) are formed to his circumstances when young, and they must not be broken in upon,—so with trees: their circumstances are adapted to their cases, and if one changes, the other must, and the earlier this change is effected the easier it is got over. An evergreen, set when small by a larger one, will reach it in size in a few, very few years, and will soon pass by it and keep ahead.

Pruning evergreens is more fatal the first year than when performed on deciduous trees, so much so that we prefer letting them entirely alone. If pruned, however, something should be applied to prevent the exudation of the gum or resin: grafting wax is very good for this purpose.

Evergreens which grow in the shade of other trees should have a similar locality again. Some of them cannot endure the hot rays of the sun or the twisting of the winds. Such are the *Kalmias*, as beautiful flowering shrubs as the world affords. Now for two weeks is the time for transplanting them. W. B.

Mount Osceola, May 15, 1839.

STATE OF THE SEASON 1839.

We feel ourselves much indebted to Mr Lowell for the subjoined notices of the season. He has for several years favored the public in this way, and his reports and comparisons are always looked for with great interest. There is not an individual in the country to whom the agricultural and horticultural community are more largely indebted than to this gentleman: and we know that no one can enjoy more than himself in seeing everywhere seconded and urged forward the powerful impulse given to agricultural improvement by his intelligence, practical skill, and public spirit years since, in connexion with other distinguished and patriotic individuals, several of whom are still in the field and at the plough. We venture to say that there never was a cause in which a good mind however highly

gifted, can look back upon its devoted and successful labors with purer satisfaction and pleasure than in that of general agricultural improvement. We do not mean, of course, the mere productiveness of agricultural labor in a pecuniary view; but the promotion of the general intelligence, comfort, independence, and good morals of the agricultural community—the multiplication and diffusion of the simple and healthful luxuries of rural life, and the security and increase of the rewards of labor, directed where Divine Providence first designed it should be directed, and where it may always be incontestably applied, in compelling the earth to bring forth her inexhaustible treasures. H. C.

Roxbury, May 21, 1839.

TO THE EDITOR OF THE N. E. FARMER.—At your request, I send you a comparison of the present season, as to its temperature and present prospects, with several others. It is well known that the past winter was a mild one, and very little injury was done to the fruit trees. The tenderest of them, the peach, did not lose a bud, and the blossom of that fruit was never greater. The present season is a remarkable example of the variability of our climate, and that it can never be safely affirmed that one of our springs is early or late until it is past. On the first of May the season was 14 days earlier than that of the preceding one; yet since that time we have had seven severe frosts, six of them in eight days in succession. I have been asked whether the frosts have injured the fruit? I answer, that from my experience frosts in the spring seldom hurt the fruits, even the tenderest; never, I believe, unless severe enough to discolor the young foliage. No—the great enemy to fruits is cold, long-continued rains, or north-east storms, while the blossoms are expanded, checking the ascent of sap while the fruit is setting, or just after it is set. This is the cause of the falling of the young apples, pears, cherries and peaches, sometimes after they arrive to the size of chestnuts.

I will now compare the present year with five very early seasons and five very late ones within the last thirty years.

In 1839—Cherries and peaches opened	May 3,
Rocky Mountain currant	May 3,
Plums in full flower	May 4,
Pears opening	May 6,
Apples opening	May 12,
Apples in fullest flower and other fruit, out of flower	May 21.

In five of the earliest years, take the cherry and apple as samples.

In 1822—Cherries in flower	May 1,
Apples in flower	May 12,
Some apples	May 9,
In 1824—Cherries began to open their flowers	May 1,
Apples began to open their blossoms	May 11.

In 1825—one of the earliest of all seasons:	
Cherries began to open	April 25,
Apples open their blossoms	May 8.

In 1827—Cherries began to flower	April 25,
Apples do.	May 12.

In 1828—Early cherries opening	May 1,
Apples opening	May 10.

In five of the late seasons:	
In 1813—Cherries began to blow	May 10,
Apples begin to blow	May 23.

In 1815—Cherries opening	May 10,
Apples in fullest flower	May 27.

In 1816—Cherries opening	May 6,
Apples opening	May 18.

In 1829—Cherries opening	May 9,
Apples opening	May 15.

Thus it is proved that the present season must be classed with the early ones, and in other more important respects it is certainly to be deemed one of the most propitious ones. Copious, seasonable, and not destructive rains have put out of all danger the grass crops and early grain, and brought forward every species of market vegetables with a strength and luxuriousness of growth almost unexampled.

I am, dear sir, your humble serv't,

JOHN LOWELL.

Upon a more accurate examination of the peach trees, I find that the *growing* buds do not correspond with the blossoms—that the foliage is bad, owing probably to overbearing the last year. I was apprehensive of such an effect last year, as the trees were overloaded with fruit. J. L.

REPORTS OF FARMS

Entered with the Massachusetts Agricultural Society for premium, but upon which no premium was bestowed.

There are of this class four claims, which we shall number A, B, C, D, and publish in succession. We shall not give the names or places of residence of the claimants; not because their farming is not highly creditable to them, for that it is, in every case, as we know from personal inspection; but because few persons are willing to have their names published in a list of rejected claimants. We know them indeed to be among the very best farmers in the state. In respect to neatness, industry, improvement, skill, good management, and success, they are all prominent examples. Whoever compares their statements with those of the successful claimants, will perceive how extremely difficult it was for a committee, who had seen none of the farms, and were anxious to do strict and impartial justice, to come to a decision entirely satisfactory either to themselves or the parties interested. The community should feel themselves highly indebted to gentlemen, willing from the most disinterested and public motives to undertake the unpleasant task of discrimination, where the competitors are all respectable and so nearly equal. H. C.

The Products of (A) farm, for the year 1838—in reply to the questions of the Massachusetts Agricultural Society.

1. My farm consists of 133 acres.
2. The soil consists of hard-pan or clay, gravel and loam.
3. In respect to the management of my lands, I prefer a medium depth in ploughing and without a coultter. I practise a rotation of crops on the same land in almost every case. I turn over my green sward in the spring, say from 20th of April to 10th of May; plant with corn or potatoes; the next year with oats, and sow with clover and herds grass, though frequently I continue the cultivation until the third year, and sow my oat stubble with winter wheat or rye and then seed as above.
4. I have planted the past season seven acres with corn, put in the 17th of May. The field was green sward, turned over about the first of May coarse manure was applied to a part of it before;

ploughing; a finer kind after ploughing on the other part and thoroughly dragged in; planted with the eight-rowed yellow corn in hills about 3 ft. apart; hoed twice; topped the stalks about the 1st of Sept. Of coarse manure there were applied 12 loads to the acre, (of 30 bu. each) and of the fine kind which was dragged in, about 9 loads of the same size.—The produce of the above was 44 bushels to the acre; no manure was put in the hills.

I planted the past season one acre of potatoes the 20th of May, part of which was manured in the hill, and the other part plaster was put in the hill. The product was 320 bushels, but not much difference was observable between those manured in the hill or where plaster was put in; though I think the result depends considerably on the season. They were of the kind called pink-eyed & black potatoes.

5. I generally manage my green sward as above with corn and potatoes, though occasionally I turn over a piece about the first of July, cross plough in September and sow with wheat or rye as soon as the 20th.

6. I mowed the past season 30 acres, all upland; 21 acres of which is natural meadow, too wet for the plough; the remainder of plough land averaged 1 3-4 tons to each acre—in all, 52 1-2 tons. The quality consists of the kinds natural to our climate: clover, herbs grass, red top and other fine grasses.

7. As to irrigation, I have a small stream of water which runs most of the season, that I turn upon my meadow, which irrigates about 1 1-2 acres, the effects of which are very beneficial.

8. I do not manure the land upon which the water flows, though I manure occasionally my other natural meadows with my finest manure, which is applied about the 1st of April; the present year it was applied the 3d of April: also, immediately after haying, I apply such manure as I have about my barn to my grass lands.

9. I reclaim low lands by ditching with an open drain and manure put upon the same, in which I have good success, increasing the quantity from two to three fold.

10. My crop of ruta baga failed from the drought the present season. I planted one-third of an acre. I afterwards sowed the same with the field turnip, which produced 45 bushels. I shall feed them to my horned cattle.

11. I have sowed 15 acres of oats after corn. They were sowed from the 1st to the 10th of May; the corn hills were split and then dragged and cross ploughed once; 2 1-2 bushels of seed were sown to the acre—produce, 33 1-2 bushels to each acre on an average. One acre of spring wheat of our common kind, was sowed after potatoes, ploughed twice this spring without manure; the land was plastered as soon as the wheat appeared out of the ground. Two bushels of seed were sowed to the acre. The seed was soaked in strong brine one week and rolled in lime. The product was 20 bu. 4 qts. The winter grain harvested this year was 3 3-4 acres; 3-4 acre was in wheat, the rest was in rye. Product, rye, 55 bu.; wheat, 15 bu. 12 qts. This was oat and rye stubble ploughed once and manure applied to the surface and dragged in, about 8 loads to the acre. The wheat was of the red ball kind; it was soaked in brine and rolled in lime; 1 1-2 bu. of seed to the piece; the seed of rye was 1 1-4 bu. to the acre. The soil was of the kind called loam.

12. I have laid down to grass the present year about eleven acres. I sowed my seed at various times on my winter grain; on the 20th of April the

rest was sowed with spring grain and was dragged once; afterwards it was dragged twice more. I calculate to apply six quarts of seed to the acre of clover and herds grass; of each an equal quantity.

13. I use my straw for litter for my stables and barn-yard. I collect leaves and the turfs from my ditches and other places occasionally, for the litter of my hog-pens.

14. I have kept, the last year, three pair of oxen, five cows, ten young cattle, three horses and fifty sheep and lambs. My barn is 40 by 50 feet: it has no cellar: it contains two large cow-houses. A good part of my manure is under cover. I have generally kept about one-quarter more stock than I have the present year.

15. My cows are mostly of the native breed.

16. My manner of raising calves is as follows: I take those that come during the month of March, from the cow at one day old; feed them with new milk about two weeks, then feed them until about the 15th of May with skimmed milk, and then turn them off to pasture.

17. I have made 650 lbs. of butter and 558 lbs. of cheese (all new milk) since 1st of April.

18. I have kept 19 swine, a mixture of the Moco, Berkshire and grass-fed breed. I have made, the present season about 2250 lbs. of pork. I feed my hogs during the summer on the slops from the house. They run in the pasture and occasionally have a few potatoes. I fatten them upon apples, potatoes, pumpkins, and corn. I get from 15 to 20 loads manure from my hog-pen or yard, and 150 loads from my barn and sheds.

19. I employ on my farm one man constantly, and my son, 14 years old, works during the summer. I hired 23 days work during haying and har vesting; also 20 days work at other times during the season. I pay my man by the year \$150. I pay occasional laborers one dollar per day during haying and harvesting, and 75 cents at other times, with board.

20. I have about 90 apple trees, mostly of natural fruit, though I have a young orchard coming on, principally of grafted fruit.

21. I have about 12 fruit trees (other than apples), consisting of a variety of cherries and plums. They have ever been healthy.

22. I occasionally furnish some spirits to my men during haying and harvesting, in very small quantities.

23. I have 71 acres in pasturage this year; have kept three horses at 42 cts. each; three pair oxen at 83 cts. a pair; five cows at 25 cts.; four 3 yr. olds at 20 cts.; two 2 yr. olds at 17 cts.; four calves at 5 cts. and 50 sheep at 1 1-2 ct. This would amount to \$7 09 per week—from 20th of May to 20th of November, 6 months or 24 weeks, would amount to \$184 34.

24. My seed corn I put into warm water the same morning I plant it and roll it in plaster, when I take it out during the day, and apply to my corn as soon as it comes up, plaster and ashes—1-2 bu. plaster and about 2 bu. ashes mixed to the acre.

25. I used 2 3-4 tons of plaster the present season, worth ground \$9 per ton. Sowed some on my natural meadow 27th of April; the remainder on my other grass and plough lands, such as oats, wheat and rye occasionally, according to the weather, up to the 10th of May, excepting the oats, on which I sowed plaster until about the first of June. I sow about one bushel and a peck to the acre.

I have on hand two pair of fat oxen, which will weigh 50 cwt.; two pair of steers, 31 cwt.—enu-

merated in the number of cattle above; but the value of the beef not included in my estimate of products.

I make the whole product of the farm this year, not including the beef on hand, \$1881 17.

FARM REPORT B.

To Benjamin Guild, Esq., Secretary of the Massachusetts Agricultural Society:

SIR—The subscriber having made application to the Massachusetts Agricultural Society for the premium for the best farm, submits the following return in conformity to the questions contained in the premium list, published by order of the trustees of the Society.

Questions numbered and answers made in the same order as found upon the premium list:

1. My farm consists of 200 acres.

2. Eighty acres consists of a mixture of clay and loam; 40 acres of sand and loam; the remainder is of black loam with clay bottom.

3. I consider the best method of improving my lands to use two hundred weight of plaster upon the clay and loam, as also upon the sand and loam to the acre; and fifteen cart-loads of manure upon the black loam with clay bottom. The plaster and manure to be applied annually; the manure in a compost state, generally. If the condition of the land require it, I put the same quantity of manure upon the clay and loam and sand and loam lands in preparing it for corn or wheat. These lands I seed, pasture, or mow for the term of four years successively. I plough, plant, or sow them afterwards for the same term.

4. I till 50 acres. All my land is susceptible of tillage excepting 18 acres, which are too wet for that purpose. When I use manure I put 15 cart-loads upon the acre.

5. I apply my manure in a compost state.

6. I spread and harrow in manure which is put upon ploughed land.

7. In cultivating green sward, I turn it over early for corn, harrow it, and plant thereon. I prepare it in the same manner for wheat or rye.

8. I mow twelve acres of upland. It produces two tons of hay to the acre.

9. I practise no irrigation.

10. I manure all the land I mow. I put fifteen cart-loads upon the acre once in three or four years, in a compost state, of common barn-yard manure.

11. I mow 18 acres of low land not suitable for the plough. The quality is herds grass and red-top. It produces one and a half tons per acre.

12. I have no bog or peat lands upon my farm.

13. I have this year twenty acres in corn. I turned over the green sward, dragged it, and planted the seed dry. I used no manure this season. I have 120 bushels of ears of corn to the acre this year, but my corn will not average more than 75 bushels per acre.

14. I have only one and a half acres in potatoes this season. I turned over green sward, put fifteen cart-loads of manure to the acre, and harrowed it in; planted in hills and hoed them once only. I have two hundred bushels to the acre. The kind is English whites.

15. I have only one-half of an acre of common English turnips. They yield at the rate of two hundred bushels to the acre, and I shall feed them to my milch cows.

16. I have 13 1-2 acres of winter grain and 14 acres of spring grain. For winter grain I turned over green sward, harrowed and sowed it. I sow-

ed my summer grain upon land where I had corn last year, without other preparation than ploughing. I sowed three and a half acres of wheat, and used one bushel and three pecks of seed to the acre. One and a half acre was sown with the common white-bearded wheat, and two acres with the white bald wheat. The soil was a mixture of clay and sand. I used no lime.

17. I have laid down to grass 14 acres, in May last. I used eight quarts of seed to the acre, one-half timothy and the other clover, with a grain crop.

18. I have between 40 and 50 head of cattle and three horses, which together with fodder and the straw produced from my farm, furnish my manure. I put it in heaps in the spring, excepting what I use of the compost for corn, &c.

19. My stock consists of four oxen, eighteen cows, twenty young cattle, three horses, and fifty sheep. I have two barns, one 40 by 50 feet, the other 30 by 40 feet in size. I have one stable under ground, 30 by 40 feet, and one shed and stable 20 by 40 feet in size. My manure is not covered.

20. My cows are of native breed.

21. In raising my calves I feed them upon new milk until they are two weeks old, then upon skimmed milk and whey, until they are three months old, when I turn them out to pasture.

22. I have made this year 1500 lbs. of butter, and 4000 lbs. of cheese, all of new milk.

23. I have twenty-five swine of the Byfield and Berkshire breed crossed, and make forty-five hundred weight of pork.

24. I feed my pigs upon whey and pasture the hogs which I have wintered. I give them the wind-fall apples and afterwards fatten them upon corn.

25. My hog-pens give me fifteen cart-loads of manure yearly, which is made of corn and straw.

26. I have two sons; one aged 15 and the other 17 years of age. I have also a colored boy, 18 years of age, bound to me until he is 21 years of age, who, together with myself, do all the labor upon my farm.

27. I have 150 apple trees—30 of them are grafted—the remainder natural fruit.

28. I have 100 other fruit trees, peaches, &c.

29. My fruit trees have never been attacked by canker-worms or otherwise.

30. I do not allow the use of ardent spirits in the cultivation of my farm.

Respectfully submitted,

Your ob't servant.

Oct. 29, 1838.

N. B.—I stated to Mr Allen, the agent, who inspected my farm, the quantity of grain I raised during the past year. I did not include, however, 40 bushels of white beans, which I raised among my corn.

FARM REPORT C.

The following answers are made by the subscriber to the questions given in the printed premium list for 1838. To the first question he answers—

1. His farm comprises 170 acres.

2. The soil consists of gravel and loam.

3. My method of management is to put the land in grass as soon as I get a good bottom and then keep it up by manure. After pasturing one year, I break up. The meadows (i. e. the mowing lands) are better to remain, without coming under the plough.

4. I have about 75 acres in pasture and tillage. Generally I use about 25 cart-loads of manure to the acre.

5. My manure from the stables is applied in the spring—the long manure lies until fall, when it is spread on the meadows.

6. I put the manure in the hill when I plant.

7. For winter crops I plough twice (follow my land) and harrow. For corn and potatoes I plough once in the spring and use the harrow and roller liberally.

8. Most of my mowing is upland, producing say for 65 acres one ton and a half an acre.

9. I irrigate about four acres. I let in the water about the first of May and keep it on until about the first of July. It produces about double the ordinary crop.

10. A part of the irrigated land and all the upland meadow is manured by long manure, at the rate say, of 25 loads to the acre.

11. Of low land not suitable for the plough, I have about 7 or 8 acres. The kind of hay is English and clover of good quality when manure is used; and the quantity, about 1 1-2 ton per acre.

12. I improve my low lands by thorough ditching and manuring, and my success has been good.

13. I have this year 2 1-2 acres in corn. The land used was in stubble; bore oats the 3 years previous; rye 4 years since, and oats 5 years. I ploughed, harrowed, and furrowed both ways and dropped the manure in the hill. The seed used was the Dutton corn, rolled in plaster. The quantity of manure, about 10 loads to the acre. The produce, about 30 bushels sound corn. I gave it three dressings with the hoe.

14. In potatoes I have 2 1-2 acres, same kind of land, and treated in the same way, excepting being hoed twice only. My crop is poor this year; about 150 bu. to the acre. The kinds raised are Orange, and English white. I planted 1 1-2 acre of green sward ploughed once, dragged; without manure; hoed twice; the produce about 200 bu. to the acre. Same kind of seed.

15. I planted or sowed 2 acres to ruta baga. It was stubble land; ploughed three times; manured with stable (ox) manure; about 20 loads to the acre, dropped in furrows, upon which the seed was sowed with Merchant's drill-barrow; being very dry, the crop is not good—say 300 bu. to the acre. I shall feed them to fattening cattle and working cattle in the spring. From experience, I think potatoes a better crop for cattle.

16. I sowed 25 acres of oats; ploughed once; part was a clover ley, including 7 acres. This was the fifth crop of oats; part was potato land; harrowed twice; sowed about 2 1-2 bushels to the acre. It was a light crop this year, from drought. I used plaster and no manure. I sowed 3 acres to spring wheat; ploughed once and then ploughed in the seed, 2 bu. per acre; 4 bu. tea wheat and 2 bu. German wheat; rolled the seed in lime and sowed on the crop about 1 bu. per acre of lime. Soil is loam and gravel—crop pretty good—not yet threshed. I have about 20 acres of winter rye; part on a clover ley; ploughed but once; the remainder ploughed twice (followed); harrowed twice; sowed about 5 pecks to the acre—dry. I shall plaster it in the spring. I raised 300 bu. buckwheat on about 14 acres; ploughed the land twice and harrowed.

17. I stocked down about 18 acres this season with oats, about the last of April. For pasture I use 3 qts. of clover; for mowing 1 qt. of clover and 5 of herds grass.

18. I have no means of making manure excepting from stables and hog-pen.

19. My stock is variable. I sold 30 tons of hay last year and fed out the remainder. Generally winter 7 or 8 yoke of oxen—keep about 3 yoke for the farm; about 5 or 6 cows; about 15 head of young cattle; 2 horses; 44 sheep; sell the lambs. I have 2 barns—one 30 by 40 ft.; one 28 by 71 ft. No cellar; part of the manure is under cover and part in the yards.

20. My cows are of the native breed.

21. I let some of the calves which are intended to be raised, run with the cows, and some are raised by hand. I feed them with milk in summer, and potatoes and apples in winter, daily.

22. Make butter and cheese only for family use.

23. I keep 7 hogs; have now 4. I put up last year 2100 lbs. of pork; I hope to make 1500 lbs. this year. The breed is believed to be Byfield.

24. In summer I feed my hogs with bran and slops from the house and let them run in clover. I fatten them on apples and provender of oats and buck-wheat ground together, but not cooked.

25. I get about 10 loads of manure from the hog sty. I litter the pens with straw.

26. I keep about 4 laborers, excepting in laying, when I have more. For my regular hands I pay one \$18 and one \$14 per month. I pay \$1 a day for laying and board the men.

27. I have about 200 apple trees, part natural and part grafted fruit—principally the latter; they are mostly young trees.

28. I have some pears, peaches and cherries, say 75 trees.

29. I have never suffered from canker worms. For borers I put ashes about the roots.

30. I use no cider nor beer; possibly one gallon of spirits in a year.

I believe the foregoing to be fair answers, as near the fact as I can state.

Rotation of Crops.

I state the following facts:—In 1833 I took six acres of clover ley, limestone soil, broke up and planted with corn and manured in the hill. In '34 I put on a crop of oats, ploughed once and harrowed twice; the produce was about 40 bu. per acre. In '35, ploughed twice and sowed to oats; produce about 50 bu. per acre. In '36, ploughed twice and sowed to oats; produce about 30 bushels per acre. These were sowed too late. In '37, ploughed once and sowed to oats; produce about 30 bushels per acre. A fine bed of white clover covered the land. In '38, ploughed once and sowed oats; produce about 30 bushels per acre; much white clover appeared. I sowed clover seed in '38, and stocked down the land. This year has been a very bad season for oats, but the crop has been a full average of other lands. I have applied from 1 to 1 1-2 bushel of plaster every year. I am decidedly of opinion that the land has improved under this course of cultivation. I plough deep.

November 1, 1838.

Negroes in Alabama bring at auction, on an average, about eight hundred dollars a head, while good lands, by the same mode of sale, bring seldom more than one dollar per acre. It costs more to stock a farm than to purchase it, by at least a hundred to one. Such a fact as this indicates a no very healthy state of things so far as the farming interest is concerned.—*Boston Times*.

The papers from every section of the country, report a remarkably promising appearance of the coming crops. So may it continue.—16.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MAY 29, 1839.

IMPROVEMENT.

Improvement! We are disposed to think that this is the best word in the language, because it signifies the best thing in this world. It combines most of hope.—Wherever things are stationary, hope expires; but where there are progress and advancement, hope is continually fed and stimulated; and as we ascend, the prospect widens. It brings more happiness with it than anything else in life. The human heart knows no sensation more pleasurable and more satisfying than the consciousness of advancement. To be growing better, and to perceive the capacity of growing better continually unfolding itself and becoming more and more enlarged, inspires a high sentiment of the dignity and value of our existence; calls out and urges to their utmost speed, all the faculties of our minds; and gratifies the best affections of our nature. It is in this matter, likewise, that man acquires a sentiment, if we may be allowed the expression, of the infinity of his nature. The brute creation soon reach the end of their line. The birds have built their nests in the same form and sung the same song ever since the race was created. In the same species, invention, if it may be called invention, reaches to a certain point and then stops; and in this respect, unless in a case of disease or unnatural impotence, invention is the same in all of the same family, and no one goes beyond another. They gain no advantages from experience, and they learn nothing from each other. How different is the case with man; how infinitely does the human intellect transcend the brute instinct. To the mind of man, to its inventions, its conceptions, its desires, its attempts, its aspirations, what limit has been found or can be conceived? Even here there is an ocean of knowledge spread out before it, boundless, fathomless. But beyond this world, there is a universe for its exploration, and an eternity to labor in. These considerations proclaim the infinity of the human being.

Wherever this spirit of improvement is discoverable, and puts forth in any, even the most humble form, its beautiful manifestations, it imparts the highest pleasure to the benevolent heart. The improvement of the human mind, so that it may soar higher, know more, acquire faster, retain longer, is a delightful process in the experience and the contemplation. The improvement of the character, the moral nature, so as to exalt the standard of duty, give to the individual a more complete self-possession, render vice odious, and attach us to duty and virtue as the business and purpose of life, extend the usefulness of man, and render him the benefactor and the ornament of the creation, this we all acknowledge to be the highest good and happiness of his being. The improvement of his outward condition, his animal subsistence, his personal accommodations, his physical condition, his external comforts, his sensible pleasures, so as to render his food more abundant, more palatable, more healthful, more nutritious, his repose more peaceful, his labor less toilsome, the earnings of his industry more secure; so as to render his residence more beautiful, more tasteful, more attractive, and to multiply the sources and means of innocent gratification—all this is adapted to impart a rich and unalloyed pleasure to a contemplative and benevolent mind. When these improvements go on rapidly and their impulse quickens as they advance; when we see them, like the rising spring-tide upon our broken and indented shores, gradually widening themselves out, breaking over temporary in-

pediments, pressing into every creek and opening, filling every ditch and cavity, and at length spreading themselves out in a broken and mirrored surface over wide plains, and leaving, wherever the waters come, rich deposits to quicken and supply the latent but active vegetation; there is a charm in the prospect, in the good attained, and the returns anticipated, which refreshes, delights, and elevates the mind—teaches the value of our being, and makes us thankful to God that we are alive. "I pity the man," says Tristram Shandy, "that can travel from Dan to Bathsheba and cry that it is all a desert." Indeed he is to be pitied for his heartlessness, selfishness, and inhumanity.

We have been led into these reflections in looking at the condition of our own community, and in strolling through the highways and the byways, upon the hills and in the valleys, in the gardens and over the fields in the vicinity of Boston, within the last fortnight of this charming and delicious month of May. It would be thought out of place by the fastidious, if we went into any discussion of the intellectual and moral condition of our community in this journal; and therefore we abstain. Yet we cannot but think that the improvement of man's physical condition has a direct influence upon the improvement of his intellectual and moral nature. In proportion as the comforts and luxuries of life are diffused and equalized, they become less the objects of envy, covetousness, and plunder. Where fruit abounds it is seldom stolen. So, likewise, in proportion as man's outward condition is improved, so he attends to the cleanliness of his person, the neatness of his dress, the elegance and tastefulness of his residence, and multiplies about him objects of refined taste and beauty, his self-respect is strengthened, his value of character elevated, his sentiment of honor quickened. These are among the great securities of virtue and powerful excitements of virtuous ambition. The improved perceptions of outward beauty, the beauty of natural objects, are direct aids and quickeners of our moral perceptions, and refiners and improvers of our moral tastes.

But in respect to the external condition of things among us and around us, the actual advances and improvements made within the last thirty years are absolutely amazing. Within that period and within a circuit of twenty miles round the capital, thousands and thousands of acres which seemed too barren ever to be rendered productive, or too rocky ever to admit the plough, or too wet ever to be redeemed, have been brought into a condition of fertility and are covered with a luxuriant vegetation. Where here and there was an elegant mansion, belonging to some individual of princely wealth, whose privileged situation presented an insular aspect and seemed placed altogether beyond the reach of the many, there are now hundreds and hundreds of elegant cottages and villas, belonging honestly to individuals who earn their daily bread by their daily labor; blessed at the same time with sufficient liberality to adorn their residences with beautiful embellishments; and with improved taste to enjoy many of the most refined luxuries of rural life. Thirty years ago, the cultivation of fine fruit was limited to a few; refuse apples, fit hardly for cider; pucker-mouth pears, which set the children as well as the fathers' teeth on edge; field strawberries, with their stems and leaves and half-formed fruit upon them; wild grapes, about of the hardness of green peas and flavor of crab-apples; currants, blackberries and wild cherries, whose acid made your eyes sparkle with tears when you broke their skin, constituted some of the principal luxuries of the market. Now, green houses and conservatories and forcing beds in the country are getting to be an almost indispensable appendage to every handsome residence; and the richest fruits,

peaches, nectarines, pears, and grapes, which are capable of being reared in our climate, are spread about in the vicinity of the capital and fast finding their way far into the interior in the richest profusion. Add to this the cultivation of flowers, which is extending itself with the most extraordinary profusion. Not many years since, a few wild roses, pinks, princess-feather, sweet-williams, lady's delight, tulips, lilacs and marigolds, constituted the whole parterre; and even these were looked upon as rare luxuries; and if the children at school could find a dandelion or lilac or a white daisy to stick in their bonnet, it was deemed no common acquisition. Now, everywhere, certainly in this vicinity, the most common houses show the most beautiful green-house plants at their windows; their daphnes japonicas, geraniums and lilies; their front yards bloom through the season with a succession of the most splendid flowering shrubs, and their door-ways and piazzas are trellised with woodbine and montly roses, and breathe the delicious odors of the sweetbriar and the honeysuckle.

All these things mark a progress in refinement and innocent luxury, in every respect auspicious to comfort, general improvement and humanity; and fill to overflowing the bosom, susceptible of grateful influences, with thankfulness to that Gracious Being, who has made this creation so beautiful, and given man so much to enjoy; and who when he had finished the creation and saw his glorious work blooming in vernal glory and splendor, pronounced it "all good." II. C.

OBITUARY.

Died in Hallowell, Me., Charles Vaughan, Esq., aged 80. The State of Maine has never lost a more worthy citizen. Agriculture has seldom had a more enlightened and devoted friend. Mr Vaughan, in company with other members of his family, who had been the pupils of the distinguished Dr Priestley, came to this country more than forty years since; and Charles Vaughan, in company with his eminent brother, Benj. Vaughan, L. L. D. and M. P., settled at Hallowell, Me. There, by their superior education and intelligence, simplicity of manners, unimpeachable integrity, soundness of judgment, disinterestedness, active usefulness and public spirit, they conciliated universal esteem and reverence, and rendered themselves most eminently the benefactors of the community. They were both deeply interested in the improvement of the agriculture of the State, and in the advancement of education and all useful arts. The agricultural community are largely indebted to them for the introduction of valuable seeds and plants, much improved live stock, and the diffusion of agricultural information. Mr Charles Vaughan has been a frequent correspondent of the New England Farmer from its commencement; and it is but a few days before his death that we received interesting letters from him, making inquiries, communicating intelligence, and proposing plans of agricultural operation for himself and the public benefit. It is an enviable privilege to be thus permitted to "live while we live." The beneficent influences of the labors and characters of such men, are widely diffused; and continue to extend themselves long after their departure. Their memories will be cherished by the wise and virtuous with an intense and never-ceasing affection and respect. II. C.

Massachusetts Horticultural Society.

SATURDAY, MAY 25, 1839.

This was the day assigned to award the Society's prizes for the best specimens of Geraniums and Tulips.—Messrs. Sweetser and Donald were appointed judges on geraniums, and Messrs. Donald and Meller on tulips; who reported as follows:

"Geraniums: first prize to Mr Meller; second prize to Messrs Hovey.

Signed,
J. SWEETSER,
JOHN DONALD."

"Tulips: first prize (there was no competition) to Mr S. Walker; the second prize to Mr S. Walker, he having the next best twelve varieties.

Signed,
JOHN DONALD,
WM. MELLER."

MISCELLANEOUS.

LETTERS FROM THE EAST.

BY A LADY OF NEW YORK.

(Concluded.)

The next finest point of view is in the centre of this great hall. Every way you turn, you perceive here is a fine perspective. To the west, through the gate-ways, the distant mountains of Lybia bound the view. Through the opposite entrance to the hall, the eye rests on the sad ruins of the ancient temple. On every side is a forest of massy columns, the largest of which are twelve feet in diameter—the whole number about 150.

The architecture of this hall differs from anything I have seen in Egypt. In all the other temples, I have observed that the columns which support the roof, are of equal size and height, consequently the roof is level throughout with the side-walls of the building. Here, you perceive, it is entirely otherwise. The two rows of gigantic columns which run through the centre of the hall, are nearly 70 feet high, while the nine rows on each side are only 40 feet high. The platform or roof which the centre colonnade supports, is consequently about 30 feet higher than the roofs on each side of it. Short columns, which stand on the low roofs reach up to the level of the higher roof and support its extremities. Between these short columns are immense stone window frames, through which light and air were admitted to this vast area.

When I first saw this peculiar construction, I was forcibly struck with its perfect resemblance to the Gothic cathedral-style of building, in which the *nave* is always nearly twice as high as the *aistles*, with windows above the roofs of the latter. There can be no doubt, in my mind, that the Saracens took their idea from this very hall, and on which the Gothic builders (who employed Saracenic architects in Sicily and Spain,) improved, by reducing the diameters of the columns, and supporting from their summits the aspiring arches. This hall, no doubt, served for a promenade for the priests, sheltered from the scorching rays of a tropical sun by the heavy stone roof. The cool breezes entering by the ample north windows above; while to the south, curtains or awnings keep out the sun. I doubt if these windows were ever glazed; for as it is never cold nor over rains here, there was no necessity for such protection. The whole interior appears once to have been stuccoed and highly ornamented.

Observe yon tall column, which presents the most extraordinary feature that I have ever beheld among ruins, in any part of the world. It is broken off near the ground, and leans over, supported by its neighbor, at an angle of at least thirty degrees from the perpendicular. This, in a shaft of *one single stone*, would be nothing remarkable, for hundreds are seen everywhere in a similar position in every important ruin. But this column being composed of numerous blocks in layers one above the other, with no cement or central pins to bind them together, the great mystery is that the centre does not give way, and the whole mass fall to the ground, being only supported at each end.

The other day we pulled out from between two stones a wooden cramp, or anchor, which had been used to keep the joints together. It has the saw marks upon it, showing that the use of that instrument was known four thousand years ago, at least.

Some have endeavored to deduce proof from the employment of wooden cramps in buildings, in sup-

port of the very silly and unscientific theory that iron was unknown to the ancient Egyptians. It has always been the received opinion of every philosophical mind, that without the knowledge of this all-important gift of an all-wise creator, nations could not have been civilized. Besides, I have somewhere read of a civilized people being deprived of it, relapsing into barbarism. The Egyptian architect knew too well the value of this material to employ it wastefully; for the soft sand-stone from which we took the wooden cramp, was of a weaker texture than the wood, and gave way before it when force was used to separate them. Finally, will these visionary theorists inform us how the hard granite and Seyerite was separated from the mountain rock, worked into huge obelisks and columns, elaborately carved, without the best of steel made from iron?

The sun is setting—let us hurry through with a few more of the important features of this place, before we are driven from it by the night.

Passing out of the east entrance of the hall, we enter upon the most appalling field of desolation that the world presents.

Hold! we can proceed no farther unless we conclude to bivouac here for the night. We will from this elevation take a rapid glance over the sad remains of the principal temple and courts of Karnak, and endeavor to imagine what they were

"Three thousand years ago,
When the Memnonium was in all its glory,
And time had not begun to overthrow
Those temples, palaces, and piles stupendous,
Of which the very ruins are tremendous."

Around us are tall obelisks still erect, while others are prostrate and broken. In the mass of confusion before you to the east, can easily be traced the foundations of the great temple which once covered the sanctuary built of granite, yet perfect. Beyond, are the remains of two other large temples connected with the principal one. Their corridors are supported by colossal caryatides instead of columns. And finally, the propylon seen at the end of the perspective, terminates this series of temples and palaces, which in length between the grand western propylon and the one at the eastern extremity, is a quarter of a mile of continuous buildings, which it would require a week to examine even in a very superficial manner. I have not permitted you to glance at the sculptures innumerable which cover the storied walls and columns, both inside and out; for months would not suffice to follow up the histories thereof engraved in characters which will last to the end of time.

The last trembling ray of the setting sun is just tipping with gold the highest projections of the ruins. As to the chaos below, "shadows, clouds, and darkness rest upon it."

Take now your last farewell look upon this awful "wreck of matter," and tremble at the mighty earthquake which produced it,

"And shook the pyramids with fear and wonder,
When the gigantic Memnon fell asunder."

Something New.—A steam ferry boat which plies on the Alton (Illinois) ferry, having more power in her engine than is required, the proprietors have attached a pair of burr mill-stones to her, with which, the Telegraph says, while crossing the ferry and running off steam, she is enabled to grind about one hundred bushels of fine meal per day.—*American Sentinel.*

Strawberries are selling in the New-York market at two dollars per quart.

THE EVERGREEN.

There is a plant whose hardy form
Unshrinking meets the wintry storm,
And lives beneath the drifting snow;
It seeks no mild farouian air,
But ever fresh and ever fair,
Its green, unfolding branches grow.

I've mark'd it on the mountain wild,
Where once I rovd a careless child;
And with its leaves adorn'd my hair;
And still, to aid the wreath I twine,
For friendship's pure and holy shrine,
The evergreen shall flourish there.

My friend, this little plant shall be
An emblem of my love for thee;
It cannot boast a rich perfume—
It bears no bright, attractive flower,
To grace awhile the summer bower,
But truly claims its constant bloom.

Bayside, 1839.

Spring and Poetry.—The editor of the Cincinnati News has had his imagination exalted by the poetic influences of spring, and thus pours out the tide of song:

"And now the merry ploughboy
Whistles his morning song
Along the dale and through the vale
'Tis echoed loud and long;
The farmer's docks are roving free,
And on the budding shrubbery
His spouse's
Cowses
Browses:
And the martins have returned and found
A welcome to our houses;
And the little niggers run around
Dressed of their trousers!"

Tulips, Ranunculuses, Anemones, Auriculas, Carnations, Picotees, Pinks and Germaniums

H. GROOM, of Walworth, near London, England, by appointment Florist to Her Majesty Queen Victoria, begs respectfully to call the attention of his friends and the admirers of flowers in America generally, to his extensive collection of the above flowers, which from his having been very successful in their cultivation this season he can offer at very moderate prices. He would particularly recommend to those persons about commencing the growth of the Tulip (which in England is becoming very fashionable) the under collections in beds, as it is by far the cheapest mode of purchasing them.

Tulips arranged in beds with their names.

First Class.

A bed of 30 rows containing 210 bulbs including several of the newest varieties, - - - - - £15
A bed of 45 rows, - - - - - £21
A bed of 60 rows, - - - - - 25 guineas

Second Class.

A bed of 30 rows including many fine sorts, - - £10
A bed of 45 rows do - - - - £14
A bed of 60 rows do - - - - £17 10s

Tulips not arranged.

100 Superfine sorts with their names from - £7 7s to £13
Superfine mixtures, from - - - - 7s 6d to 21s

Ranunculuses.

100 Superfine sorts, with their names from £3 3s to £5
Superfine mixtures, from - - - - 5s to 21s per 100

Anemones.

100 Superfine sorts with their names, - - £3 10s
Superfine double mixtures from 10s 6d to 21s per 100

Auriculas.

25 Superfine sorts with their names, - - £3 13s 6d
Catalogues with the prices of the other articles may be had on application.

ON MULBERRY TREES.

The Committee on the Cultivation of Mulberry Trees, Silk, &c. respectfully report: That applications for premiums have been made by Miss B. G. Phillips and sisters, and Joseph S. Holt, of Andover, or plantations of mulberry trees, and by Gardner & Perry, of Bradford, for a nursery of the same, or a description of which we refer to the statements made by the claimants, which the committee believe are fully sustained by the appearance of the trees, and recommend the following awards:

1. To the Misses Phillips, for their orchard of one acre, containing five hundred trees, the first premium of \$25 00.

2. To Mr Joseph S. Holt, for his plantation of a little less than a half acre, containing fifteen hundred trees, the second premium, \$20 00.

3. To Mr Perry, for his nursery adapted to the growth of silk, \$20 00.

The committee in submitting their report, think proper to observe, that though these were the only applications made, yet they should not have left it their duty to recommend the awards, had they not thought them justly merited on account of its flourishing state of the trees and the apparent skillful management bestowed upon them.

GARDNER B. PERRY,
JOHN W. GROSVENOR,
EDWARD S. DAVIS,
ASA A. ABBOT,
ABEL NICHOLS,

Committee.

MISSES PHILLIPS' STATEMENT.

To the Committee of the Essex Agricultural Society on the Cultivation of Mulberry Trees:

GENTLEMEN—The land on which our orchard stands, has for some years past, been lying at grass; was ploughed up in the fall of 1837. Soil a gravelly mould, rather inclined to moisture. The trees were procured of Rev. G. B. Perry, of different ages, from six to ten years, and in height, from five to twelve or thirteen feet, possessing fine roots, and were very flourishing—five hundred in number, which were set out in May. They stand in rows, sixteen feet apart, and generally four feet from each other in the rows, and occupy one acre. They are the kind known as the Italian. The estimated value of the trees at the time of transplanting was one hundred dollars; they have grown well this season and now appear in a healthy condition.—The land was well manured, and the spaces between the rows have been cultivated with beans and winter squashes, of which there were good crops. The surface of the land is level. Expense of planting the trees, about twelve or thirteen dollars.

Andover, Dec. 20, 1838.

MR. HOLT'S STATEMENT.

To the Committee of the Essex Co. Agricultural Society on the Cultivation of the Mulberry Tree.

GENTLEMEN—I offer for premium a growth of the White Mulberry tree, of about 1500 plants. The following is the method adopted in their cultivation:

The seed was sown in the spring of 1833. The plants for the first season were rather small; and although they were covered in autumn with straw and coarse manure, they were killed to the ground by the severe frosts of the following winter. The second season they grew to the height of about 2 feet. In 1835 they were removed from the bed to a gravelly knoll, in a field exposed to bleak winds, and planted in hedge-rows, 8 feet asunder, and the trees one foot apart in the rows. The ground has since been improved in raising potatoes and beans alternately; very little manure having been used, and that in the hills of the growing crop. My object has been to raise the trees by a slow, healthy, and substantial growth; and I have thus far succeeded in preserving them, while many who have urged their trees forward too rapidly, have been sadly disappointed in having them destroyed by our severe winters.

I will merely add, that if applied for, a part of the trees will be disposed of at a reasonable price, as I have a larger number than I need for my own use.

Respectfully,

JOSEPH S. HOLT.

Andover, Oct. 1, 1838.

MR PERRY'S STATEMENT.

To the Committee of the Essex Agricultural Society on the Cultivation of the Mulberry Tree:

The nursery which I submit to the committee for examination and award, is the produce of two and a quarter pounds of seed, sown in 1836, one pound Italian and the remainder of the kind sold as the Chinese. The seed came up tolerably well, but owing to the unfavorable season, many of the plants died during the summer, and those that lived grew but very little, many hardly putting forth more than four or five leaves, and in the winter, though protected with pine boughs (probably the best protection they could have,) a considerable portion, full one-half, perished. In the year 1837 they proved more flourishing, and were less injured by the succeeding winter. This year they have had a vigorous and healthful growth, exhibiting a full and swelling crown, and strong and properly inclined branches. They stand in wide rows, with a space between the rows of five or six feet, well adapted to feeding worms, where it is thought best to suffer the trees to stand in nurseries—a method, however, which my own experience would not justify me in recommending. I have not taken pains to ascertain with much accuracy the number of trees; they probably amount to five or six thousand. The land is a gravelly loam, rather inclined to be dry; had been cultivated the two previous years with corn

and potatoes, pretty well manured. The soil has not, I think, proved as favorable to them as that of some pieces which I have before devoted to a similar use. The reason, so far as I have been able to discover it is, that it contains a large portion of clay. It is not easy to state the expense with much accuracy, so much of the labor being performed at what farmers call *odd jobs*; but of one thing I have become fully convinced, that in common with many others, I have in former estimates set the sum too low. The seed cost about sixteen dollars, and the expense of labor, &c. amounted to from fifty to seventy-five dollars, and I should not be surprised, could a full account be presented, to find it a still larger sum.

A part of the trees in this nursery, together with some thousands of others from five to eleven years old, in flourishing condition, are for sale.

General Remarks on the Cultivation of Mulberry Trees.

In compliance with a wish expressed by several gentlemen, I will subjoin to the report on mulberry trees a few observations, for the justice of which the committee are not to be held responsible, as owing to the time, it has not been practicable to submit them to their approval, though most of the statements which will be made were subjects of conversation with members of the committee, and I do not recollect but there was a perfect agreement of opinion in respect to them.

The raising of mulberry trees in this county for the purpose of producing silk in modern times, was commenced by Mr Enoch Boynton, of Newbury, who in 1822 planted some cuttings. His nursery thus commenced, was increased by trees raised from seed, engraftings and cuttings, to more than 42,000 in 1832. Upon the produce of them he fed many worms, produced considerable silk, for specimens of which he received more than one gratuity from this Society. A few years after the last date, his farm passed into other hands, and the nursery was either dug up or suffered to run out, so that very few if any trees now remain. In 1829, and the years following, the writer of this and a few others, commenced nurseries. The seed sowed generally came up well, and the young trees grew thriftily, and the prospect of producing food for worms to any desired amount, was altogether encouraging. A deep and spreading interest began to be awakened upon the subject. Many persons in different parts of the county set out plantations, in size from a few hundred to as many thousand. Worms were raised in a great many families, from a few dozens by way of experiment, to many thousands for profit; reports of many of these experiments were made, useful and interesting accounts of which may be found in the printed transactions of the Society. Among other communications was an essay from the pen of Andrew Nichols, M. D., which deserves particular notice.—This article contains more just observations and practical wisdom than are found in any other work of the same extent on the subject that has fallen

under my observation, and it did much to recommend the silk business to the favorable consideration of the community. Many of the first efforts to produce silk yielded a good profit, and every circumstance seemed to justify the expectation that the business, if followed with energy, would generally secure a competence and not infrequently lead to wealth. Just at this time of the most encouraging promise, came the cold winter of 1831, whose destructive influence, not only upon the mulberry, but upon most fruit and other trees, especially of a tender nature, was too general and great to be soon forgotten. From that time, attention to the silk business has been gradually falling off, till the last one or two years, while the number of trees in the county has greatly diminished. Many flourishing nurseries have been suffered to run out; plantations have been cut down or otherwise destroyed; and the impression has become somewhat prevalent that the climate, soil, or other undiscovered causes, are unfavorable to the growth of the mulberry tree, and therefore that the silk business cannot be advantageously pursued in this county.

What is proposed in the subsequent remarks, is to enumerate some of the causes which it is believed have united with the cold of '31 and of some of the winters since, in producing the injury which the mulberry trees have sustained, and thus deeply affecting that kind of property and working a great change in the public mind in respect to the prospect of the silk business among us.

In enumerating these causes, I shall not consult any particular order, but present them as they occur to my mind.

1. The first I will mention is, that a great number of the trees have been the offspring of unsound and disordered seed. There are many ways in which seed as small as those of the mulberry may be essentially damaged, so that, though not entirely devoid of the power of vegetation, yet so as to cause them to produce an imperfect and sickly plant. In the year 1831, the writer of this sowed four ounces of seed, apparently good. A considerable portion of it vegetated, and yet the plants proved so feeble and sickly that nearly the whole were pulled up and thrown away the first and second year, while very few of those that were saved made trees of a vigorous growth. And I have seen other nurseries dwindling away, according to my best convictions, principally, from the same cause.

Defect in the seed cannot be certainly detected by sight alone, and in fact will often remain undetected till exhibited in the plants the first, second, and sometimes the third year; but whenever or however late, it is believed the best economy would be consulted by destroying the trees and beginning again. A vigorous and healthful tree will occupy but little more space than a sickly one, while it will yield many fold more food, and this food secure a more healthy race of worms, and these in their turn yield a much larger and more valuable produce of silk; while the trees will be much less likely to be injured by cold or any other disastrous cause.

2. Many trees have, upon transplanting, failed, because taken from a nursery so much more highly manured and cultivated than the land to which they are removed. Most trees suffer from this cause, but it is believed that the mulberry has been a special sufferer, particularly because the opinion has prevailed somewhat generally, that the poorest soil just as good, if not better for them, than that of a better quality. But let us ask ourselves in so-

ber sense, what it is reasonable to expect must be the fate of a young and tender nursing taken from a rich and highly cultivated garden, sheltered from the wind, furnished as it will be under such circumstances, with small root, and planted out without much skill, in some of the most barren of our fields, devoid of all protection from the wind? yet such is literally the history of no inconsiderable part of the plantations which have had an existence in this county. Could not the end have been as well known before as it is at the present time, when no trace of their existence remains?

3. Another reason of the failure of the tree is to be found in the fact that they have been planted in soils unsuitable to their vigorous growth. Like most other vegetable productions they may live in a great variety of soils, but to live and grow, and produce a rich foliage, they require a loose, warm, sandy or slaty soil, tolerably deep, and with a porous subsoil; for if its roots have standing water about them for any time, they will soon mould and gradually decay, to the essential injury of the vigor if not to the destruction of the life of the tree.

4. A fourth cause of injury is, the trees have often stood too thick in the nursery; this prevents their putting forth a sufficiently full foliage. A tree cannot thrive well without a good proportion of leaves, which must have opportunity to develop themselves, nor will the tree be healthful unless the leaves by exposure, enjoy air, motion, and sun. But I will not enlarge here, as this subject will come up under some of the following particulars.

5. We proceed to a fifth reason, which has probably operated more extensively than any other cause which we shall give. This is the too close picking of the leaves. Very few persons at the commencement of the business of raising worms have an adequate idea how many they are likely to have hatched from what seems a very small quantity of eggs. The result often is, that they find themselves overstocked with worms. They very commonly overrate the production of their trees for the first few years. They are obliged, therefore, to strip their trees very closely or let their worms, after they are a half or two-thirds grown, die. This they are unwilling to do, though it would be altogether the best policy. The injurious effects of close cropping, no one acquainted with the physiology of vegetation can doubt. In 1834, the writer of this, though having as many worms as could be well supplied from his nursery, being desirous to accommodate some friends in and out of town who were overstocked, permitted a considerable part of his nursery to be closely picked; the result was, as he fully anticipated, the absolute loss of many hundred trees, and the no inconsiderable injury to many more. Most of the nurseries and plantations of those friends which had been first stripped shared the same fate, several were almost entirely destroyed, and others, if not quite killed, have not yet fully recovered. Under a former head I mentioned that leaves are essential to the vigorous and healthful growth of trees. It is equally important that a portion of them at least should develop themselves fully and remain on the tree till they fall naturally from the branches; and though it may be departing a little from the subject, I will take this occasion to observe that it is almost equally essential to the health and life of trees, that portions at least of the *fruit*, should remain till full maturity. I am fully persuaded that most of the injury which fruit trees have been supposed to suffer from the cold of our climate, would never have been realiz-

ed, had it not been for the premature destruction of the leaves from various causes, and the too early gathering of the fruit.

6. There has been a disease which has prevailed pretty generally among the mulberry trees, exhibiting itself upon the leaf, and which for want of better knowledge, I shall call the *rust*. By this name, I apprehend it will be readily recognized by most who have had any concern in their cultivation. This disease has made its appearance about the first of July, and continued to what is called the second flow of sap, when it has generally begun to disappear, or in other words, has not seized upon leaves which made their appearance after that time. Whatever may be the nature or the cause of this malady, one of its effects is similar to close cropping. By destroying the leaf, it prevents a full and perfect elaboration of the sap. Suitable food is not produced for the strength and growth of the tree, which in consequence becomes weak and sickly, if it does not actually die. Whether this disease, as I have called it, is produced by insects or is an actual malady in the plant may be known to others; I am not able to determine confidently in respect to it. It has certainly proved a very serious obstacle in the way of producing silk, making its appearance just about the time when there is the greatest call for food by the worm. Information on the cause and the remedy would be of essential service to the community, and would be very gratefully received by the writer of this.

7. The trees have suffered somewhat extensively from the *web worms*, (I use a term which I suppose will be generally understood.) These usually make their appearance and begin their work about the middle of August; perhaps some years a little later. How, with the webs of these worms spread over whole trees and sometimes covering large portions of nurseries, the opinion could have attained currency that there was no worm or insect which would touch the mulberry, is not easy to say, and yet this very summer, a statement to this amount has found a place in several of the most popular journals. Great injury has certainly been done by these worms. They destroy the foliage, and thus rob the tree of proper nourishment, even when they work upon trees whose leaves have not been picked; but if they take those which have been disrobbed of a large part of their foliage for the purpose of feeding the worm, as is frequently the case, the only wonder is that a single tree should survive. The tree is thus deprived both of the earlier and later growth of leaves; no sap can therefore be perfectly elaborated, no suitable nourishment is provided either for the growth or life of the tree; how can it then escape?

I may be allowed to make an observation, relative to the injury which our *fruit trees* suffer from the same cause, though produced mostly by worms differing in some particulars from those which appear upon the mulberry. Most persons seem to be aware of the damage done to trees by the caterpillar, which makes its appearance in the early part of the season, and many take some pains to destroy them; while it is apprehended that comparatively few think much of the ravages produced by the *web* and other worms which destroy the foliage in the latter part of summer and beginning of autumn, and make very little effort to ward against it, when the truth is, that the actual and permanent damage done by the latter is equal and probably much greater than that by the former. Keep your trees

clear of insects in the autumn if you wish matured fruit the next year.

8. The mulberry tree has to some extent shared with the pear tree in what is called the *fire blight*. This disease has not, to my knowledge, prevailed very extensively, yet it has had its agency among other causes in diminishing the expectations of gain from this branch of business. Its ravages were more general, so far as I had opportunity of knowing, in 1837, than in any year before or since. The insect which causes this blight seems to be enlarging his field of operation, and there are reasons to fear if some effectual remedy be not discovered, that other trees will suffer from its operations as extensively as the pear tree has in years past.

It is believed that the above causes, with some others which would be mentioned were it not for the great length to which this article has extended, should be regarded as concurring with the cold of a few of the past winters in producing a state of unfruitfulness among a great portion of the mulberry plantations, and the actual destruction of not a few of them.

The question which then naturally presents itself, is, whether under such circumstances there are sufficient encouragements still remaining to justify further efforts to continue and increase the means of silk culture in the county, or had the patronage of the society be better turned to some other source? In coming to a rational determination on this point, it will be necessary to look over the causes of failure and see how many of them may with proper effort and skill be remedied; and then to enquire whether those which are beyond human power essentially to modify, are more numerous than are usually met with in most employments of life. Upon such a survey, I apprehend, it will appear that with the exception of the climate, all the hindrances to success in this business are as capable of being removed by effort, prudently and perseveringly put forth, as those which present themselves in most other occupations in which men engage, and which by resolute effort they either remove, modify, or avoid. Nearly all of them are the very same which are met with in all attempts to cultivate the better fruits, and yet men do not despair in respect to them, nor are their efforts unattended with encouraging success. In regard to the climate even, it should not be forgotten that trees in past times have lived long and become large, and yielded a rich supply of foliage from year to year, and we certainly have no sufficient reason to think that such an essential change has taken place in this particular as to justify the inference that they may not thrive again. And beside this, it is a fact, that during these last years of discouragement, there are no inconsiderable number of trees in different parts of the county, which have remained flourishing and have already attained a considerable size; while it is a generally admitted fact by those who have given themselves opportunity to observe, that there is manifest a general improvement in the appearance of the trees recently, especially during the last year, where any attention has been paid to their culture.

We certainly do not find, therefore, in the causes above enumerated, sufficient reasons to abandon the enterprise, and will therefore subjoin a few reasons which we think should have considerable influence to induce a continuance in the effort to sustain and increase the business in this county.

1. Among these we present the fact that there are large tracts of land in this county well adapted to the growth of the mulberry, much of which is now yielding but little produce of any kind, and will not, unless it is put under a different culture than that now bestowed upon it. If these tracts were planted over with the mulberry, they would soon begin to yield some profit; the land would at the same time be improved, and the trees when grown would afford a great amount of good timber and fuel; and I will add, by forming obstructions to the course of the winds, would in no inconsiderable degree soften our climate, and thus make the whole county a more pleasant and healthy place to dwell in.

2. There are many persons, especially aged females and children, whose time and strength in many places can now be turned to very little profit, who might labor in this employment to advantage, and thus contribute much to their own support.

3. It might be made the means of giving employment to the inmates of the public alms-houses, penitentiaries, &c., and thus put them in the way of meeting in whole or part the expenses of their maintenance, and so relieve the community from a part of the taxes to which they are now subject. If there are any waste lands suitable for the mulberry connected with such establishments, it would be good economy for the towns or county to cover them over with young trees; they would pay good interest even as an article of fuel.

4. It would multiply the productive employments of the county, which is always a subject of good policy to every community, for so the danger of suffering from the temporary suspension or failure of any one of them is comparatively diminished and all classes of citizens become less dependent upon the will of others, and the whole community more independent of other nations.

5. It would call into exercise the inventive powers of man, and thus improve and widen its sphere of operation.

6. It opens another page in the physical operations of the Creator, affords deep evidence of the wisdom, power, and providence of God, and by communicating a wider knowledge of his works, gives a better knowledge of Himself; a result which will not be thought of small consideration by a moral and religious community, who feel that there are other interests to secure beside the accumulation of worldly wealth.

Taking all these circumstances together, and weighing them as carefully as we can, we feel ourselves justified in coming to the conclusion, that though somewhat moderated in the expectation that the silk business would give unusual gain, that still there are good reasons to suppose it may be found sufficiently profitable to justify individuals in undertaking it, and that the public advantages are likely to be such as to entitle it to the favorable notice and patronage of the county society.

(From the same.)

ON CULTIVATION OF CROPS.

The Committee of the Essex Agricultural Society on wheat, rye, oats, and barley, have attended to the subject committed to them, and Report: That they recommend that the accompanying statements be published, and that the first premium of ten dollars be awarded to Moses French, of Salisbury, for his crop of barley. For the committee,

ERASTUS WARE.

Topsfield, Dec. 25, 1838.

MOSES FRENCH'S STATEMENT.

To the Committee on the Cultivation of Crops:

GENTLEMEN—I submit the following statement of a crop of barley that I raised the past season. The land on which it grew is a clayey loam. In 1827 the sward was turned. The lot was planted with corn and potatoes, principally with corn. A shovel full of manure was put to each hill, and the crop was fair for the season. I cut the corn at the ground the 25th of September, bound it in bundles, and dried it in the field. The fodder was the best I ever had. Last spring I spread two loads of compost manure on the lot. On the part where the potatoes grew, it being the poorest, I spade one load of night soil, ploughed it all very shallow, so as to turn up the sod, harrowed it well, and sowed two bushels of the two rowed barley, and then rolled it. It came up and grew finely, until the heads began to show themselves. While it was green and tender, it was beaten down by a shower and wind, and much of it never rose again, especially where the night soil was spread.

The lot contained one acre and twelve rods, and yielded 39 1-4 bushels of sound grain.

The straw is very bright, and worth to me more than salt hay.

I prefer two the rowed barley as being the largest kernel and best to yield.

MOSES FRENCH.

East Salisbury, September 27, 1838.

TRISTRAM LITTLE'S STATEMENT.

To the Committee on Cultivation of Crops:

GENTLEMEN—The field containing one acre, upon which my experiment in raising barley the past season was made, was a dark clay loam of an equal quality; the year before was planted with potatoes. Sometime about the last of April the land was ploughed and harrowed, sowed with one bushel and three pecks of clean barley. After that there was spread on one half the land three loads of pond mud, two of which was mixed with two bushels of lime, the other with ten bushels of leached ashes. The other part was dressed with about the same quantity of dirt which was hauled out from under a woodhouse. There was a small strip left between the dressing without any manure, on which the growth was quite inferior to the other parts. At the time of sowing, my intention was to keep the parts separate. Before the grain was ripe the rain and wind had beat all the dressed part down, and so badly tangled that it had to be cut altogether, so that the exact quantity of each part could not be ascertained. There were 38 bushels as it run from the mill. I think if the measure had been streeked, there would have been forty bushels.

Respectfully yours,

TRISTRAM LITTLE.

Newbury, Nov. 28, 1838.

Finances of a New England State.—Connecticut owes nobody, and has \$21,000 in her coffers, besides a school fund of \$2,000,000, yielding an annual revenue of \$104,000. The State paupers cost \$1,700 a year for their maintenance, but the State Prison earns a nett sum of \$3000 or over.

The scrip issued by Massachusetts, in aid of her railroads, commands a higher price on the London Stock Exchange than any other foreign securities. *Boston paper.*

FARM ACCOUNT.

We invite the attention of our readers to the subjoined account of some Rhode Island farming. It will speak for itself, and needs no commendation beyond what it is sure to receive from every intelligent observer. The condition of the place when it fell under the husbandry of this enterprising cultivator was unpromising enough. The hand of industry directed by skill, has entirely changed its aspect.—We do not know what we can present to our readers more useful than such statements as these. Attention will be particularly called to Mr Anthony's opinion and use of ashes; his cultivation of millet, and his value of ruta baga. Whether he has discovered a preventive against the injury to milk from the taste of turnips, is deserving of farther inquiry. We have, no doubt, however, that sugar beet and we know that the common blood beet would be a better feed for his milch cows than the ruta baga, and raised with equal ease. We should feel ourselves greatly obliged if other farmers in and out of the State would furnish us other accounts of a like exactness. They would render a substantial benefit to the agricultural community.

H. C.

North Providence, 5 mo. 19, 1839.

RESPECTED FRIEND HENRY COLMAN: Premising that my mode of farming has been of too ordinary a character for its details to afford much of interest or instruction, I will now endeavor to furnish the statements requested. The farm on which I reside has been under my management for thirteen years, most of the time for the owner, but recently as tenant. It contains 150 acres: of this 50 is wood land, and (not pretending to perfect accuracy in the division,) 30 pasture—leaving 70, which has been subjected to tillage: 12 of this is a bog, of peaty character, 18 inches in depth over a hard pan of sand, in which there sometimes occurs a minute portion of clay. There are, perhaps, 15 acres of what may be termed loamy soil. The remainder, with the exception of a brook margin of about an acre of moist and more adhesive character, is very sandy with a gravelly or sandy subsoil.

In 1826, the farm was in very poor condition. There were probably not more than six acres that would have defrayed the expense of cultivation for one year only. The crops of that year were 5 tons of hay, 2 of oats, 3 of bog hay, hardly worth the cost of procuring, 200 bushels of potatoes, 200 of turnips, some fruit, and a supply of garden vegetables for the family.

Prior to the period above alluded to the sandy portion of the farm had been occasionally planted with corn; the crops on an average yielding about eight bushels to the acre. It afforded nothing for the scythe, and was of so little value for grazing, that a neighbor rented so much of it as a cow pasture, the first year of my management for \$15, as the last season produced more than 60 tons of millet, clover, and other hay, besides including what is now one-half the value of my present pasture.

Previous to 1829, farming had been with us but a secondary object, but by having ashed such grounds as were seeded, the quantity of hay had been considerably increased, and at this period, the cows were advanced to 15 for the purpose of benefiting the farm as well as for furnishing milk for market. The number was subsequently increased to 20, which with a pair of oxen and a horse have been the average stock of the farm for several

years, and has been as may be supposed an important agent in its improvement. But of such as has been effected in the condition of the sandy and most sterile part of it, ashes has been the basis. These have been two or three times applied at the rate of about 200 bushels an acre, at intervals of three years, if the grass seed took well, otherwise oftener, previous to a dressing of stable manure. The crops obtained in the process being millet, and the small or southern clover. Timothy and red-top have sometimes been added, and though coming later to maturity than the clover, always to advantage. The hay has been better for the practice, and a firmer sward turned over at the next ploughing. The millet and grass seeds are mixed together and sown on a surface previously levelled by the roller, and spread over with ashes. The millet crop may be stated at 1 1-2 ton—more of clover, with some diminution the second year. The field has sometimes remained in clover two years after the ashing, which has immediately preceded manuring. In other cases (and it has probably been the better practice,) a dressing of about 30 loads of stable manure, 27 cubic feet to the load, has been turned under, and the field planted with corn the second year.

Thus treated, this kind of land will grow oats or barley, but generally not heavy crops of either.—Those to which it is best adapted are corn, millet, and clover. When afterwards ploughed, which has generally been in three or four years, some hard crop has been the first of the rotation. Manure is always applied for the benefit of this crop, and is always turned under—the sod rolled down and not disturbed by the after culture.—Of the different methods pursued in reclaiming the bog, paring and burning was the cheapest and most effectual. "The lazy bed" way of the Irish would not soon have accomplished the object, and what my fancy suggested as an improvement on that method, grew more bushes than potatoes. This was, to plant until the sward should be rotted by the excavations of ditches previously spread over it for that purpose. Of the 12 acres now stocked to grass, about 4 only have had any manure excepting the ashes produced by burning the surface. Thorough drainage appears indispensable to a reduction of the crude materials of which this kind of land is composed, and without a breaking down of its fibre it can afford but little nourishment for plants. Occasional ploughing and manuring will also doubtless be necessary to sustain it in good condition, and when there is an excess of water to prevent a recurrence of its original wildness.—The pasture rarely affords sufficient feed for my cows. They however run out in days during summer and a part of autumn, but are always stabled at night. Clover, the suckers of corn, and when these are gone, the tops, sometimes millet, and the tops of the French turnip or ruta baga furnish a succession of green crops which supply the deficiency in the pasture feed. In addition to this they have also, two quarts of Indian meal each per day. The quantity is increased on the failure of green food, with the addition of pumpkins or other vegetables. But during winter, or till such time as they are sold to the butcher, they are liberally supplied with Indian meal and shorts, and when it can be procured, faxseed oil meal mixed together with some cut hay ten or twelve hours before feeding, and given in the form of swill. In summer the meal is fed dry. The cows are milked till sold, which is generally in the spring. As they are turned off their places are supplied as fast as

is necessary to keep up a uniform quantity of milk, by such as have recently calved, or as reference is often had to beef in the purchase by those that have been sometime in milk. A few of the best are occasionally allowed to bring calves, but generally the stock is entirely changed. This practice has had the merit of convenience, but is nevertheless of doubtful utility, for it is difficult to procure new milch cows in winter or spring that have been properly kept. Farmers in general provide only dry provender for their stock in winter, and a cow coming in under circumstances involved by such keeping will not ordinarily give more than two-thirds the quantity of milk that might be obtained from her if in suitable condition at the time of calving. Liberal feeding afterwards will fatten the animal but generally not occasion large secretions of milk.

When not at pasture the cows are kept most of the time in the barn, and stand on a tight floor that descends from the manger to the sill, over which it projects a few inches and conducts the urine into a paved trench outside the barn through an aperture of about five inches in width between the side and the boarding of the barn, extending the whole length of the cattle floor. Through this vacancy, which is closed when necessary by shutters inside, the manure is also shoveled into the trench, and excepting in cold weather, almost daily sufficiently covered with bog mud or loam to absorb the urine and to protect the manure from the influence of the sun and atmosphere. As often as these trenches are filled in the ploughing season, the manure is taken to the field and turned under, most of it for hard crops, but occasionally for millet and for feeding. That which has been made late in autumn has sometimes been ploughed in on land designed for planting the ensuing season. In winter it is put in heaps on land to be ploughed in the spring, and when sufficiently thawed for the purpose, is also turned under. Thus managed, it does not ferment before it is placed beneath the sod or mixed with the soil.

My management hitherto has been very defective in regard to the root culture, having never raised an adequate supply for my stock. Of the different kinds which I have grown for the purpose, I am inclined with some hesitation, to a preference for the French turnip or ruta baga. The former is by some supposed to be an inferior variety; but between the smooth kind and the Swede I know no difference either in produce or quality. The unpleasant flavor which they impart to the milk of cows that are fed with them I believe never occur if ten or twelve hours elapse between the time of feeding and milking. I have pursued this method for years without any complaint of "turnip milk," to avoid which I had at one time abandoned the feeding.

I consider millet almost an indispensable crop for light and sterile soils. When grown of suitable fineness, a circumstance which depends on the quantity of seed sown, it is equal to English hay a provender, and better than most grasses for soiling. Grass seed, however, should not be sown with it except on inferior soils. For such ten or twenty quarts of seed to the acre is sufficient. Ricquards require twice the quantity, which would inevitably destroy the young grass plants. Beside its value there is a consideration in its culture of great importance to the farmer—it does not interfere with his other "seed time and harvest." The time of sowing is from the twentieth of the first

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JUNE 5, 1839.

IMPROVEMENT.

In our last paper we said something of improvement—agricultural improvement. We design to add a few remarks. The subject should be kept constantly before the mind. No farmer ought to be satisfied with merely "getting along." There is another cast phrase, which we adopt in this case, which will express a second rule and a principal rule of duty; that is, he should "go ahead." It is not enough for him to get from his place a mere subsistence; but he should make that place continually better. He should be continually seeking to render his farm more productive, more convenient, more easy to be cultivated, and in every respect more valuable. We would have him pay some attention to appearances. Almost every one thinks it necessary to take great pains to please the taste. Why should not as much pains be taken to please the eye? We are of opinion that the pleasures of the eye are of a much higher class than those of the taste. The pleasures of the taste cannot be cultivated greatly without danger to the morals. They are in their nature exclusively selfish; and create a disposition fastidious and constantly growing more difficult to be pleased. It is not so with the pleasures of the eye. These are open to all. Here there is no monopoly; and much of our enjoyment arises from the fact that these pleasures though in our possession, are enjoyed equally by others without detracting from any of their advantages to ourselves.

An attention to appearances, neat arrangements, the removal from our premises of everything that is offensive, the addition of various ornaments and embellishments, all tend to strengthen our attachments to home, our domestic affections, and to increase our self respect and in this way directly contributes to refinement of manners and to good morals.

Let improvements then go on. In the first place render your farm as productive as you can. Secondly, render it as convenient as you can. Thirdly, render it as neat and beautiful as you can.

It would seem altogether probable that interest would induce every farmer to render his farm as productive as possible. Yet this is very far from being the case. Of course we should not advise a farmer to cultivate that which will never compensate him for his labor and expenditures. But where the production would afford an ample equivalent, we regret to be compelled to express our conviction that not one farm in two hundred is rendered as productive as it might be, and fully pay for the labor and expense, which it would require to make it so. How many farms in the State, consisting of one hundred acres have twenty five under cultivation. Most of them have not half that amount. How many farmers in the State produce annually a thousand bushels of corn? As far as our observation goes, we do not believe there is one in Essex, Middlesex, Worcester, or any of the south-western counties. Possibly there may be two or three in the county of Berkshire. In Franklin county, in Hampshire and Hampden there may be half a dozen all included. But there are in the State hundreds and hundreds of farms on which this might be done to the greatest advantage. In the wheat bill of the last year, a premium of one hundred dollars was offered to every farmer who should produce four hundred bushels of wheat. The premium was not claimed. The season it is true, was unfavorable; but had it been ever so fa-

vorable, we have heard of only two farmers in the state, who by any possibility could have obtained it; who had sowed anything like the quantity of land that would have produced this amount, had the yield been even at sixty bushels per acre.

How many farmers in the State produce annually two thousand bushels of potatoes? We do not believe there are twenty. In this matter we may be in error, yet we came to this conclusion from no limited observation.—Certainly there are very few farmers possessed of one hundred or even fifty acres of land who might not cultivate to advantage their six or eight acres of potatoes. Few crops at three hundred bushels to an acre, pay better than they do. The cultivation of them, however, is in many parts of the country very poor; and the average yield perhaps does not exceed one hundred and fifty bushels.

How many farmers in the State with their hundred acres produce two or three hundred bushels of other vegetables for their stock; of carrots, of ruta bags, of beets, of parsnips? They must be very few. Here and there may be one, who provokes the ridicule of his neighbors by his singularity, or alarms them by his enterprise.

If the farmers will look next at the condition of their farms, and remark how many acres lie absolutely waste, and how many not half improved; how many saturated and spoiled by water which might be drained; how many in pasture, which might be brought under cultivation; how many in wood which might be cleared; how many laying open, which might be enclosed; it is not difficult to see how far short of what it might be, production falls.

Here the agricultural improvement should begin—in constant, intelligent, skillful, persevering attempts to render the soil more productive; to get more out of the earth; to press her to her utmost capacity. We have not even approached that point. We are very far in the rear of it. As we increase her products, the more ample our means are rendered her further increase. Under judicious husbandry, production increases the power of production. The more we get the more we can get, and the more means we have of keeping up and increasing the fertility of the soil. How honestly such wealth is gained, every one must feel. The saying of the shrewd Swift is often quoted; that "the man who causes two blades of grass to grow where but one grew before, is to be esteemed a public benefactor." This is a small increase; and we hope no farmer whom we address will ever be satisfied without making the increase at least ten fold.

We have much more to say on this subject, but at present we forbear. H. C.

THE PROSPECTS OF THE SEASON.

The weather the last few days has been rather cold, but without any frost. We have had frequent rains, which have come in gentle succession, with occasional gleams of sunshine; but the temperature for the time of year has been lower than it was in April.

There is a fine promise of fruit of every description, though much has fallen off, owing as we suppose to the cold weather. Corn is every where coming up well. Winter and spring grain look uncommonly well. Grass is every where well set and very forward. The markets are very high and so are likely to continue. Canker worms have not as yet showed themselves in any great numbers; and of caterpillars there are hardly enough for the birds. Nothing at present is scarce but the complaints of the farmers. But they never fail;

and we shall have an abundant crop of them without doubt before the summer ends. Look out for them, as the almanac maker says of a storm, running the direction from the top to the bottom of the page, "about these days." H. C.

ELECTION WEEK.

The capital has been thronged the past week with visitors from the country, attending the anniversaries of many religious and benevolent associations. They are fully attended by clergymen and women, with a pretty liberal sprinkling of the laity. We have literally become a nation of orators, and speaking in public has got to be so common a gift, that it is rather difficult to find a man who does not in this way try to set the world to rights. The women too, have taken to speaking in public, and show off in grand style—at this, some portion of the men take fire. These poor souls think it enough to be favored with their private admonitions, without a continuation of the same edifying strains in public. We say let those both men and women speak, who have anything to say. We wish we could silence some, who have nothing to say; yet insist upon speaking the whole time. As to the women, we hardly know who is to be done with them. In England the ladies of the Queen's bed chamber, the maids of honor, have actually prevented the accession of the Tory ministry and beat the Hero of Waterloo. We are getting into a bad way and what is to be done with these women we do not see. We wonder what they were made for. They have produced a vast deal of trouble in the world ever since our great grandmother took such a bad counsel in the garden of Eden. H.

NOTE.

The Editor of the Courier gives it as his opinion that the high prices of provisions are in part owing to the appropriation of large tracts of land and a great amount of labor to the cultivation of the *Morus Mautis*. This cause certainly comes under the head of speculation; and undoubtedly has had its influence. But it has as yet scarcely begun to be felt. The prices and the inordinate speculations in Multicauligan last year. Before that, the cultivation was comparatively limited, as the plants were a drug in the market. The extraordinary prices since obtained have led to the devotion of a great extent of land to cultivation, and very large investments of capital. It will undoubtedly interfere with the production of grain and meat. It would seem impossible, however in the nature of things, that the extravagance of speculation on this subject should continue longer than the present season. The market will be overstocked with purchasers will not continue to pay such prices as an article, which may be propagated as easily as a plant.

Our belief in the success of the cultivation amounts to a strong confidence. Yet all it is matter of experiment, which time only can establish. The great difficulty will be found not in the price of labor, but in the absolute impossibility of procuring it at any price. There are not hands enough. Overemployments occupy vast numbers, who cannot transfer themselves from one employment to another and there are multitudes, poor enough indeed, who will not work—and who would faint with horror at the sight of a silk worm, though they have not the difficulties in wearing the products of his labor. H. C.

MISCELLANEOUS.

MRS. JUDSON.

A British officer, Major Calder Campbell, describing an "adventure in Ava," in the year 1826, gives a beautiful and affecting description of Mrs Judson, the wife of the celebrated missionary in the East Indies. Major Campbell, then a lieutenant, when descending the Irawaddi river, in a canoe manned by Burmans, was attacked in the night while asleep, by his faithless boatmen, and severely wounded and robbed. When waiting on the beach with much anxiety and distress for the passage of some friendly bark, a row-boat was seen approaching. Signals of distress were made, and a skiff sent to his assistance. The following is the language of the writer:—

"We were taken on board. My eyes first rested on the thin attenuated form of a lady—a white lady! the first white woman I had seen for more than a year! she was standing on the little deck of the row boat, leaning on the arm of a sickly looking gentleman, with an intellectual cast of countenance—in whom I at once recognised the husband or the brother.

His dress and bearing pointed him out as a missionary. I have said that I had not beheld a white female for many days; and now the soothing accents of female words fell upon my ears, like a household hymn of my youth. My wound was tenderly dressed, my head bound up, and I was laid upon a sofa bed. With what a thankful heart did I breathe forth a blessing on those kind Samaritans! with what delight did I drink in the mild, gentle sounds of that sweet woman's voice, as she pressed me to recruit my strength with some of that beverage which cheers but not inebriates! She was seated in a large sort of swinging chair, of American construction, in which her slight, emaciated, but graceful form, appeared almost ethereal. Yet with much of heaven, there were still the breathings of earthly feelings about her, for at her feet rested a babe, a little, wan baby, on which her eyes often turned with all a mother's love; and gazing frequently upon her delicate features, with a fond yet fearful glance, was that meek missionary, her husband! Her face was pale, very pale; with that expression of deep and serious thought which speaks of the strong and vigorous mind within the frail and perishing body; her brown hair was braided over a placid and holy brow,—but her hands—those small, lily hands, were quite beautiful; beautiful they were, and very wan; for ah! they told of disease—of death—death in all its transparent grace—when the sickly blood shines through the clear skin, even as the bright poison lights up the Venetian glass which is about to shatter! That lady was Mrs Judson, whose long captivity and severe hardships amongst the Burmese, have since been detailed in her published journals.

I remained two days with them; two delightful days they were to me. Mrs Judson's powers of conversation were of the first order, and the many affecting anecdotes that she gave us of their long and cruel bondage—their struggles in the cause of religion—and their adventures during a long residence at the court of Ava, gained a heightened interest from the beautiful energetic simplicity of her language, as well as from the certainty I felt that so fragile a flower, as she in very truth was, had but a brief season to linger on earth! Why is it

that we grieve to think of the approaching death of the young, the virtuous, the ready? Alas! it is selfishness of human nature that would keep to itself the purest and sweetest gifts of heaven, to encounter the blasts and the blights of a world where we see them, rather than that they should be transported to a happier region, WHERE WE SEE THEM NOT!

When I left the kind Judson's I did so with regret.—When I looked my last on her mild worn countenance, as she issued some instructions to my new set of boatmen, I felt my eyes fill with prophetic tears. They were not perceived; we parted, and we never met again; nor is it likely that of the wounded subaltern was ever again thought of by those who had succoured him. Mrs Judson, and her child, died soon after the cessation of hostilities."

SEMINOLE ANECDOTE.—The intrepid bravery and tender affections of one of these Indians are strikingly verified in the following anecdote. Having taken refuge for some time in the city of San Augustine, and got the name of Peter, he moved his residence to St. Anastasia's Island, which makes the harbor of the city, employed as a hunter by Mr Fish, an English gentleman, who owned that Island, and who gave it celebrity by the culture of the sweet orange. Peter being absent, a party of his enemies crossed the river, surprised his habitation, and murdered his wife and two children. On his return he did not hesitate a moment on the course to pursue; he fastened up his house containing the dead, repaired to Mr Fish's dwelling, near by, to borrow a gun that Mr Fish had made with a large bore, expressly for shooting ducks in large flocks. In this Peter put an uncommon load of buck shot, and getting into his canoe, proceeded up the river all alone, about six miles, to a creek on the main, as though instinct had pointed to him the way they went. He ascended the creek, when a distant smoke, curling above the forest, apprised him of an Indian camp.

He landed, and, taking his course through the woods of a hostile country, discovered four Indians sitting on a log, side by side, and a fifth near by employed in cooking; he circled round so as to bring the four in range, crept up close, fired, threw down his gun and rushed up with his tomahawk. The report, the fall of four Indians, and Peter's presence, armed with such a weapon, were so sudden and impressive, that the one who was cooking neither attempted defence nor fight, but became an easy prey to vengeance. By this time he found that one of the fallen was but wounded, and was endeavoring to reach his arms; but Peter had the advantage in being already armed. On searching, he found the scalps of his wife and children stretched out to dry, which he brought off, with several articles of property they had stolen, some of their arms, and the scalps of the five Indians he had killed, the greatest of all trophies, in his conception; returned home and buried his wife and children the same evening, and literally pined to death over their grave. This anecdote I had from Mr Fish, who pointed out to me poor Peter's grave. —*St. Augustine Herald.*

CONSOLATION.—"Father," said a sporting youth to his revered parent, "they say trout will bite now." "Well, well," was the consoling reply, "mind your work, then, and you'll be sure they won't bite you."

NATURE.

FROM LINTAEN ABBEY.

For I have learned

To look on nature, not as in the hour
Of thoughtless youth, but hearing oftentimes
The still, sad music of humanity,
Nor harsh nor grating, though of ample power
To chasten and subdue. And I have felt
A presence that disturbs me with the joy
Of elevated thoughts; a sense sublime
Of something far more deeply interfused,
Whose dwelling is the light of setting suns,
And the round ocean and the living air,
And the blue sky, and in the mind of man:
A motion and a spirit, that impels
All things through all objects of all thought,
And rolls through all things. Therefore, am I still
A lover of the meadows and the woods,
And mountains; and of all that we behold
From this green earth; of all the mighty world
Of eye and ear, both what they half create,
And what perceive; well pleased to recognise
In nature and the language of the sense,
The anchor of my purest thoughts, the nurse,
The guide, the guardian of my heart, and soul
Of all my mortal being.

Wordsworth.

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground hoses form the most powerful stimulant, that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 25 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells.
Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention.

March 27.

NAHUM WARD.

FOR NEW YORK.

Cabin Fare \$3 00—Deck Fare \$1 50.

The Steamer JOHN W. RICHMOND, Capt. Wm. H. Townsend, will leave Providence on MONDAYS and THURSDAYS, at 4 o'clock, P. M.

Passengers Cars to meet the boat will leave Boston at half past 2 o'clock, P. M.

Mondays and Thursdays, will be her regular days of leaving Providence, until further notice.

For further information, apply to S. Q. COCKRAN, 30 Congress Street, Boston.

N. B. Freight taken at 6 cents per cubic foot.
June 5.

BRUSSA MULBERRY.

A fresh lot of genuine Brussa Mulberry Seed just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street. This species of Mulberry flourishes best in high and even poor lands, and is more likely to endure the rigors of our severe winters and not so subject to the effect of the frost, as trees brought from more southern latitudes, or warmer climates.

The leaves of the Morus alba of Brussa, are said to contain a much greater quantity of saccharine matter, than any other of the white species, and moreover, the leaf is much larger than those of Italy and Spain; it is also a hardy tree, susceptible of being raised in climates, where the frosts are severe.

At the annual fair of the American Institute, at New York, in October last, specimens of the leaves of the Brussa tree, of different years' growth, were exhibited, and excited universal admiration, and the Institute awarded a silver medal; for the introduction of this invaluable tree, observing in the report of the committee, "that these with every new and useful plant, calculated to withstand the rigors of our climate, are worthy of attention, and those introducing them into our country, deserve to be placed on the catalogue of our country's benefactors."

May 22.

THE NEW ENGLAND FARMER.

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

BOSTON, WEDNESDAY EVENING, JUNE 12, 1839.

[NO. 49.

N. E. FARMER.

We do not know how we can render a better service to our readers than by the publication of the subjoined remarks made by Mr Binns, Secretary of the Lancaster Agricultural Society, (Eng.) at their meeting in October last. They seem to us to be of the highest degree sound, intelligent, and practical; and disclosing sources and means of productive increase in the enrichment of his lands, without the reach of every enterprising farmer. They are in the main as applicable to the greater part of New England as of Old England husbandry. The various topics treated deserve to be much enlarged upon; and we shall hereafter revert to them.

H. C.

“Mr Binns having been called upon by the fairman, read the following excellent paper on the subject appointed for discussion, viz.: “In what manner the manure upon a farm can be most profitably augmented, and how best applied?”

The first question for this day's discussion, how the manure upon a farm could be most profitably augmented, is one of the greatest importance to the farmer, and of still greater importance to landowners and to the public at large; for although the farmers who first adopt those improvements which profitably increase the produce, reap advantage over their more prejudiced or inanimate neighbors, yet the public as consumers, eventually receive the whole benefit in greater abundance, cheapness, and superior quality of the productions of the earth. The increased production which, under certain circumstances, may have a tendency to reduce the price to the farmer, is compensated by the greater disposable produce. This enables him to pay the same rent as when he received a higher price, because, although an increased produce requires more labor, yet as the expense of living would be reduced, so would be the rate of labor. Seeing then, the vast advantages which must flow from increased production, and seeing how deficient most farmers are of this valuable auxiliary, the question arises, how can this be best accomplished? It will be readily admitted that the manure forms an essential ingredient in the food of plants; therefore we find that this ingredient can be profitably augmented to an almost inconceivable extent, those advantages will follow.

I consider it most desirable that agriculturists should possess a knowledge of vegetable physiology, of chemistry, and other sciences connected with the cultivation of the earth, but it is not necessary on the present occasion to discuss this branch of the subject. I intend to produce facts and arguments which will be perfectly plain, and I hope convincing, without being indebted to the aids of chemistry as a science; my plan is, therefore, as far as possible, to be confined to the present day, who unfortunately are not much acquainted with science. The subject under discussion, considered in the abstract, I admit is not of a very pleasing nature to ears refined, but let them consider to what

they are indebted for the delicacies they enjoy, for the beauties of the green-house and the garden, the delicious fruit, and more delicious perfume wafted by the gentle gales of summer: on the other hand, I hope agriculturists will pardon me, when I recommend a little more refinement and cleanliness with regard to their yards and cattle. This would be quite compatible with their success, and would contribute materially to their comfort. How many farm-yards do we pass where the manure is most disgustingly accumulated about the premises, to the annoyance of every passer by, wasting its value by absorption and exposure to the sun and wind. The most superficial observer must have remarked the great waste and want of economy that is everywhere seen in the management of manure; the whole liquid of a farm-yard is not unfrequently allowed to escape into a ditch, to be carried away by the next stream.

The great and principal source of extravagance and waste of manure is to be found in allowing it to be dropt by the cattle in the field, where, instead of a benefit, it becomes a nuisance.

Having thus shown how much of the little manure produced is wasted, to the great loss of the cultivator of the soil, it would seem bordering on absurdity to attempt to point out the means by which he might increase this valuable commodity. If he neglects to take care of the little, what could he do with the increased quantity? However, in the hope that there are those who may see the advantage of having a bountiful supply always at command, I will proceed to state my views as to the manner in which the manure upon a farm can be most profitably augmented, and afterwards how it may be best applied.

If clover, vetches, rape, and other green crops were cultivated in sufficient quantity for the cattle, and given in sheds or yards during the summer, treble the number would be supported on the same ground.

In the present practice, the manure in summer is all wasted; but according to the proposed plan it would all be saved, and not only be saved, but made the most of; it must therefore be evident that an immensely increasing fund, year by year, would be the consequence. It must be admitted that on this plan more labor is required, but the additional number of cattle kept would far more than amply repay this, independent of the greater quantity of grain that will be raised on the same space of ground from the greater productiveness of the soil. If the system should become general, the tendency would be to reduce the price of provision, and consequently of the money price of labor.

The system is simple in its nature and beneficial in its effect, for the very means by which the manure is produced affords profit; this is very different to the extravagant expenditure of money in the purchase of manure, in occupying horses in drawing it several miles, which ought to be cultivating the farm. This is, in my opinion, the only rational and judicious mode of keeping cattle, setting aside even the increase of manure, for it is well

known that many plants when mown produce three times as much as when pastured. This may be accounted for in two ways; it has been ascertained that plants derive a considerable portion of their nourishment from the atmosphere, through the medium of their leaves, and the more freely the plant is allowed to grow, the more nourishment it receives from that source. The more vigorous and leafy the plant, the deeper will the roots penetrate below the ordinary depth at which the following grain crops derive their nourishment. It is also a curious fact that a better crop of grain is produced the following year, without any manure, upon the ground which has grown clover, and been twice mown, than if the same had been pastured, though the manure during the whole season had been dropt upon the pasture.

In addition to these advantages, the cattle are healthier and sooner get fat. My firm opinion is that the agriculture of this country will always be in a degraded state till this plan of keeping cattle is generally adopted. I confess I am not very sanguine as to its speedy adoption: at the same time I am firmly of opinion that it will become general ere long, followed by astonishment that the present barbarous practice of keeping half-starved cattle, picking up a scanty subsistence with incessant labor day and night, exposed to the scorching summer's sun and to the night's cold, galloping to elude tormenting flies, then plunging in a state of perspiration into the water—that these sudden changes producing various diseases, has even been thought of, much less practised.

In the experiment that I made in stall feeding some years ago, for which I obtained premiums from the Lancaster and Garstang societies, when the cattle generally were affected with sore udder, red water, lameness, and mine were all perfectly free. I recollect the ridicule to which I was exposed some twentyfive years ago, when I introduced the improved short horn cattle and Leicester sheep into the district, and on looking at the change which has since taken place, I find ground for hope and encouragement as to the improved method of keeping them.

This plan of augmenting the manure upon a farm is no theoretical speculation, as some may suppose, but it is practised in Germany, Belgium, Holland, Switzerland, and many other places, with the greatest success. Without particularizing the system as practised in each country, it will be sufficient shortly to state that the cows are all stalled, and the success of the farmer is estimated by the number of cows he can support; the proportion is generally one cow to two or three acres, on a small arable farm.

The floors of the cow-houses are boarded, having a gutter behind 15 inches deep and 10 inches wide; this communicates with several cisterns or tanks, which are made of masonry, well cemented. The cisterns should not be disturbed during fermentation, which lasts four weeks. Their dimensions should be calculated according to the number of the animals, so that each may be filled in a week. In

the evening the keeper lets in a proper quantity of water to the gutter, and in the morning carefully mixes with it the manure that had fallen from the cattle, so as to form the whole into an equal and flowing liquid. During the day the boards are frequently swept, and water let into the gutter and emptied when necessary. Mr Hague, the engineer on the Morecambe Bay embankment, related to me some further particulars respecting the method practised in Holland. He informed me that when the cows were turned out for an hour each day, they were covered with a sheet or jacket. This is necessary on account of the dense fogs that frequently prevail in Holland, which would be detrimental to the cows, on being turned out, as they are carried and brushed with so much care, that they would be liable to take cold without such precaution. The jacket is also used occasionally as a protection from flies. Mr Hague observed that the fogs were sometimes so dense that nothing could be seen but their heads moving above it.—Cleanliness is carried to such an extent that while the cows are out, the boards they lie upon are scoured, as Mr Hague expressed it, as clean as a kitchen table. One plan which the trench behind seems to render necessary, gives to the animals a grotesque appearance; all the cows' tails being tied by ropes to weights round pulleys fixed at the top of the cow-house, in the same manner as it was usual in the nicking of horses' tails.

To elucidate this more fully, I present the meeting with a sketch of the cow-house and the inmates, with their tails in a proper position.

I am aware that the British farmer would consider all this as unnecessary labor, that would not pay; the Dutch think differently. I am not called upon to state an opinion how much of this care and cleanliness is profitable; before I do so I should like to test their practice with my own observation on the spot. It presents however, a striking contrast to our slovenly and shamefully dirty system of accommodation for cattle, and well may the Dutch butter be in estimation.

The Dutch management of the dairy is deserving of imitation, but to enter upon it would be travelling out of the present question. I have stated that the average number of cows kept on a mixed farm was one for two or three acres, but it has been sufficiently proved that an acre of ground devoted to this purpose will supply food for three cows; Cobbett asserts that an acre will supply four.

Trusting now that I have satisfactorily explained how manure may be profitably augmented, that a farmer would have no occasion to spend his money in purchasing manure, because he will have a abundance at home, I will now proceed to consider its preservation and application. Much, of course, depends upon the soil and situation. In a liquid state it is more immediately available to the use of the plant, and a smaller quantity is more efficacious. Liquid manure is calculated to be most beneficial upon light soils that require frequent applications of several doses. This system of stall-feeding and preparing the manure in England, where labor bears a high price, may be objected to on account of the expense; but the increased produce would far more than repay the additional labor. It is successfully practised in countries where the price of labor bears the same relative proportion to the price of produce as in England. If the account of labor will not perfectly balance, something at all events may be set down on the creditor side; on this plan the cattle will not require much hay, therefore the la-

bor in providing this expensive food would be saved, as vetches and green clover, turnips, &c. supply them early and late in the season, in place of hay, or other dry food; and every body knows the expense of meadows. Fencing also, a very troublesome operation, would be saved. The treading of the land, and injury to young grasses, the loss from trespass, illness from causes before mentioned, the labor of taking the cows to and fro to milk—the balance of the account altogether, I conceive, would be very much in favor of the plan proposed.

It is in my opinion consistent with the soundest principles of rural economy, and there is nothing mysterious in it. It is simple and intelligible, no nostrum belongs to it, no uncertainty: it has been tried and found to succeed. Its effects are certain, therefore may be safely, and ought to be earnestly recommended. The cattle by consuming the produce tend in a great ratio to re-produce—the more cattle the more corn.

A fine field would open for this system and for the exertions of the Lancaster Society, on the enclosure of Morecambe Bay, the deposit in which consists of the ingredients of a future most fertile soil, having 20 per cent. of carbonate of lime in its composition, with a large proportion of silice; the most profitable soils are composed principally of silice, viz., as much as 80 or 90 per cent. Vegetable matter is alone wanting to make it superior to most soils in the kingdom; this matter would be produced in the manner before stated. I have seen the finest clover, tares, turnips, and cabbages grow in comparatively barren sand. With the help of vegetable matter, what a field would be opened to the philanthropist,—70 thousand acres of land capable of the greatest fertility, cultivated at the least possible expense, with the advantage of a climate level with the sea; the benefits would be boundless. It would be worse than madness, as regards the public, it would be idiocy, to neglect the means which a kind providence has put within our reach to extend the bounds of utility and benefit to our fellow creatures. Another means of increasing manure is by more attention to irrigation. In many situations a stream might be brought through a farm-yard and the manure conveyed in a liquid state to the grass land with trifling labor.

Manure may also be much augmented by an increased care in collecting vegetable matters and forming composts to deposit in the farm-yard, and by covering the manure heaps so as to absorb the effluvia and juices.

(To be continued.)

PROPER MANAGEMENT OF FARM-YARD MANURE.

By Mr John Pearson, Gardener and Planter to W. D. Child, Esq., Kinet, near Bewdley, Worcester-shire.

As it is the fashion of the day to decry long established rules and customs before new systems are perfectly modelled, I may safely declare that it is almost impossible to conceive a more improper receptacle for manure to retain its essential properties than the generality of farm-yards. Let any reflecting man look into one of these folding yards during a heavy rain in winter, and he will soon observe the drip from all the roofs of the houses collected in a deep pool among the manure. The manure thus lies macerating for several months; but the farmers say that the manure water runs on to the meadow; yet I can assure them that grass roots take up liquid manure but slowly, and the

quick succession of heavy rain at that season of the year does not permit the retention of one-fiftieth part of what the dung has been deprived of. But the next deprivation of essential matter that that manure generally undergoes is worse than this, which is by throwing it up into heaps to rot, but to burn would be a more proper expression. Manure getting both washed and burned, it is not surprising that it is deprived of three-fifths of its original properties. I well recollect, when a lad, of being employed to drag down one of those rotting heaps at the risk of burning my feet, as well as receiving a lasting injury to my luohar vertebra. Several years ago I was finding fault with an experienced agriculturist for throwing his manure too thick together, when his answer was, that he always gave his men an extra jug of cider to throw it as high as the barn if they could. I asked, don't you find the middle of the heap as white as your shirt? Yes, said he, but I never could tell how it was; and added, that it was so dry sometimes that the wind blew it out of the carts. I advised him to save his extra jug of cider, and lay up the manure only from two to three feet in thickness, and not allow a foot to be set on it; but I must not anticipate my remarks. I think I have made out a sufficient case of condemnation against the present system of managing farm-yard manure; and any farmer that will condescend to try the following plan but once, will assuredly abandon his old practice. The plan is simply this: let all superabundant water be kept from the manure during the time it lies in the fold-yard. This is easily accomplished by having the barns, sheds, &c. provided with spouts to convey the water into drains or into tanks for use. The fold-yards thus rendered comparatively dry, the small quantity of manure water that would drain from the dung would easily be contained in poreless tanks, and applied to the meadow at a time when the grasses were growing, and the ground dry, both of which would take up the manure before the rains came to wash it into the brooks. When the manure is put into rotting heaps, never allow them to be more than from two to three feet in thickness, according to the goodness. What is a safe guide in this process is, to have a few sticks stuck into the heaps, and as soon as they feel warm to the hand, let the manure be turned and laid a little thinner; and should they get hot a second time, turn the manure again.—This, in most cases, will be found sufficient, provided the dung and straw have been well mixed during the process of turning; and, in the course of a month or five weeks, the manure will be sufficiently rotten for every agricultural purpose, and retain nearly if not all its original properties; and what is also of consequence to the farmer, it does not take quite so much labor as the old plan of throwing it as high as the barn.—*London Farmer's Magazine.*

LIQUID MANURE.

This species of manure is so valuable and so universally neglected, that a few observations, independent of what has been previously said, may tend to call the attention of agriculturists to an article of immense importance, which at present seems either entirely to have escaped their observation, or to have been deemed beneath their notice.

It should be always kept in view, that beyond the increase of size and weight which takes place in a living animal, the quantity of food supplied will pass from the animal in some form or other,

either in secretions, such as milk, urine, &c., or in excretions from the bowels. Beyond, therefore, what is expended in adding to the weight of the animal fed, the manure, either in a solid or liquid form, should be equal to the quality of food supplied. The solid manure or dung is the refuse of the food taken in by the animal after it has undergone the digestive process in the stomach, its nutritive particles being extracted, and taken into the animal system to supply the waste constantly going on, as well as to add to the weight or size of the animal. The urine again is the refuse of matter which has been absolute particles of the animal, and may, therefore be strictly considered animal matter: it contains within itself a far greater proportion of the fertilizing qualities that constitute the essential principle of manure, than what is contained in the same quantity of excrementitious matter or dung; but the fertilizing properties of urine are very trifling in the green or fresh state to what they are in the same liquid when it has undergone a thorough fermentation, and been thereby reduced to a high state of putridity. Whilst undergoing this process, it may be made available as a menstruum to convert vegetable or animal matter into the richest manure. The quantity of urine made by a moderate sized horned beast, when full grown, in the course of 24 hours, will be found something about 32 pounds, as has been before observed; but generally speaking the quantity if the beast be well fed with good food, will be much greater; even, however, according to that estimate, the quantity as well as the quality is of the greatest importance, and has a claim to the best attention of every one concerned in agriculture, or in the keeping of any kind of live stock.

The estimate generally made is, that one-third only of the food taken in by a neat animal is parted with as excrementitious matter or solid dung; two-thirds therefore, according to that estimate, must pass through the animal in a fluid form. Whatever food is taken in, before it can be made available for animal sustenance, must be converted into a fluid; for in a fluid state only can anything be made available to renovate those parts of the animal system which in the performance of their functions, are undergoing constant waste, as well to supply those demands which the various secretions constantly going on, are without interruption making upon the system. The following experiments detailed in the 1st vol. of *British Husbandry*, p. 255, are pertinent to the subject.

"On the 28th March, 1833, an experiment was made with a large sized Yorkshire cow, which was fed during four and twenty hours with the following provender:

81 lbs. brewer's grains,
30 lbs. raw potatoes,
15 lbs. meadow hay.

The food thus amounted to 126 lbs. She drank two pails full of water, and the urine was allowed to run off; but she had no straw or litter of any kind, and the weight of the solid dung which was carefully swept up, amounted to 45 lbs.

Another experiment was made with the same cow a week afterwards, but with a change of food, which was continued during some days, on the last of which she consumed within the 24 hours, the following quantity:

170 lbs. raw potatoes,
28 lbs. of hay.

As in the former experiment no litter was allow-

ed, and the urine was let off, but the solid dung amounted to 73 lbs.

Although not incidental to the subject in question, it may, however, be worthy of remark, that although the cow was in perfect health, yet on this latter food her milk actually fell off at the rate of very nearly two quarts a day.

These experiments, though to a certain extent valuable, as showing the quantity of excrementitious matter in relation to the food consumed, are yet far from being satisfactory, as the exact quantity of water drank, is not set forth with precision in one case, and not at all in the other. The individual in making the experiments did not seem to consider that the drink to a certain extent, was as necessary to sustentation as the other food, and ought decidedly before such experiments would have been satisfactory, to have been set forth with precision. However, as they are, the quantity of solid dung in proportion to the food consumed is pretty clearly shown, when the fluid taken by the animal has been brought into account, to be under-estimated when put down as one to two.—*Roberts' Hints on Agricultural Economy.*

AGRICULTURE IN CANADA.

Notice has already been made in this paper of "The Canadian Quarterly Agricultural and Industrial Magazine" for August. If we again revert to this magazine, its importance is a sufficient excuse. It cannot but be a matter of regret that this work is not only not well supported, but that the proprietor and editor, who has done great service to this province by his former works on agriculture, has not received sufficient patronage to pay the expense of publishing. No farmer should be without this Magazine, and to every person residing in this country, it will be of more or less benefit. We have room to-day but for the following extracts on "The Importance of Agriculture, &c."—*Montreal Herald.*

"The profession of agriculture is more favorable to the entire development of the human faculties, to the unfolding and perfecting of this physical, this intellectual, this moral and immortal being which God has given us, than any other employment. It imparts vigor to the body and the mind, leaving the soul free from feverish excitements, to imbibe as it were with its growth the lessons which nature teaches; in fine, it is capable of ministering the most successfully of all arts and of all occupations to wealth, to intelligence, and to virtue.

The profession of agriculture is justly entitled to stand in the highest grade of dignity in every country, and more particularly in British America, agriculture must be the basis of all the industrial interests in these provinces. It is the only producer of the material of wealth—all others are but employed in working some change upon this material, in transforming and shaping it to the conveniences of civilized life. Enumerate these arts that are practised here and elsewhere—the hatter, the clothier, the manufacturer of woollens and of cottons, of iron, of leather in all its varieties, the tailor, the cordwainer, the miller, the paper maker, the printer even, could not carry on the purposes of their respective callings a single day, were the materials which they derive from agriculture to be entirely withdrawn; while agriculture rude, indeed, but still agriculture in some sort, could subsist with little aid from these or any arts. It is dependent, indeed, on other arts for its successful prosecution,

but not for its very existence. Commerce is but an interchange of the produce of agriculture, wrought it may be, into ten thousand forms, but still owing their original existence, and deriving their seminal principle from the soil."

We insert with great pleasure the subjoined communication received from the East Indies from a highly valued friend, formerly an active and enterprising merchant of Boston, and who is himself the mover in the enterprise here detailed. It has not much to do with New England agriculture, yet the intelligent reader will gather important hints from it; and it shows in so strong a light the value of enterprise directed by skill and intelligence, that it cannot fail to be instructive as well as interesting.

H. C.

To the Editor of the Singapore Free Press:

SIR—In compliance with the desire expressed by you for some information as to the result of the attempt made by me to grow sugar canes, and to manufacture the same into sugar, I have the pleasure to send you the following statement.

Soon after the series of remarks which I addressed to you in the first numbers of the Free Press, and which I trust contributed to remove the erroneous opinion then entertained of the agricultural capabilities of this island, I undertook, notwithstanding what was said and written about the soundness of those remarks, to bring into cultivation a piece of low clayey ground covered over with water during the whole year—for it was overgrown with a dense jungle and quite impervious to the sun's rays. To remove this stagnant body of water, it was necessary to cut outlets to a bend of the river Kalang on which the estate is situated at some distance below, which, owing to the numerous roots in the ground, proved to be a tedious and expensive operation. The laborers too, very reluctantly persevered in the work because of the annoyance of leeches, and but few could be had who would venture their limbs to be lacerated by them. At last, when the water was got rid of and the mud hardened sufficiently to allow a footing to the coolies, the under brush and the forest soon fell under the axe, and with the help of the backwoodman's faithful ally—fire—a clearing was made. But fire could not reach the embedded roots, and the first attempts at grubbing were truly disheartening, for it often happened that when all above ground had been destroyed by fire, a few days of dry sunshine would cause the surface of the soil to settle, and bring within reach of the hoe or of the spade, logs of immense size, many of which had probably for centuries been there buried; and as they were in that state where it was impossible to burn them, the only resort was to cut them up, and it not unfrequently gave rise to an obstinate contest between the well-tempered American axe, wielded by a nervous Chinese arm, and the stubborn antediluvian. But that which was then so disheartening is no longer so, for the laborers now make nothing of such obstacles—as a matter of course they cut them up, and when taken out, pile and burn them.

When some twenty acres had been dressed, it was planted with Pernambuco cotton; and although at first the young plants gave favorable indications, disappointment soon followed, for they were attacked by a red worm and withered; and those which were not destroyed gave too few pods to make it worth the while to continue the cultivation. Mean-

while the process of clearing went on and plantations of sugar canes took the place of cotton. The few attempts at the cultivation of the canes by the Chinese exhibited such fine specimens, as to leave but little doubt of its doing well under European management. These are principally of two species, viz, the purple or red and the yellow, which later is identically the same as the Otaheite—the juice of which was found afterwards of the density of 8 1-2 of the Saccharometer and easily clarified by the addition of the least quantity of lime water; whilst it was hardly possible to affect a separation of the mucilage and fecula in the juice of the red canes by the agency of any quantity of lime and heat. The plantations were made of the yellow canes, and only a limited quantity was grown, and for eating only, it was not without very considerable difficulty that enough of plants could be obtained, and the most part of these, under different circumstances, would have been rejected as they would only sell the worst. But as it was, they were gladly bought even at the extravagant price of one dollar per hundred. Poor as they were, they were made still more useless by a habit not unfrequently practised by the Chinese laborers, of selecting the best for eating, and contenting themselves to plant what remained of the piece. It was under these unfavorable circumstances that the first twenty acres were planted in the beginning of 1836. In the following year, a selection of the product of these canes served to extend the plantations forty acres more. About this time the old mode of planting, that is by inserting the plant in ridges of ground thrown up for the purpose, was abandoned for the improved manner of depositing two plants, about a foot long, side by side into holes eighteen inches in length, six in width, and twelve in depth, and covered over with a thin layer of dried grass or leaves to shelter them from the sun. To this change, and to the careful selection of good plants, is owing the marked difference observable in the new from the old plantations, and the far greater abundance and better quality of sugar which these yield.

Having thus far proceeded it became necessary to procure the implements for manipulation; and as the settlement offers no resources whatever in machinery, or even mechanics acquainted with what is technically called plantation work, it was necessary to send to Calcutta for a set of iron boilers, and to set about making a water-wheel and a wooden crushing mill, in the mean time. The wheel was made on the tub principle from an American patent, and the mill on the ordinary horizontal plan, both of which under the efficient superintendence of the manager, on the property, were completed, notwithstanding the difficulties and obstacles to overcome. In order to obtain a supply of water for the mill, a canal twenty feet wide and nearly a mile long, was cut into a small stream which falls into the Kalang and which in ordinary times affords a sufficient power. This canal, and another one previously made in conjunction with the owner of an adjoining property to prevent the overflowing of the Kalang during heavy rains, occasioned great delay and expense. These were not the only cuts, for the flatness of the grounds throughout made it necessary that it should be intersected at short distances by deep drains to carry off the rain.

The term of twenty year leases offered by the East India Company, not admitting of their tenants laying out money in the erection of expensive and permanent buildings, a boiling and a curing house

of wood, and some other cheap sheds were put up to answer present purposes, and will probably last out this limited period, when, should the estate revert to the Company, or go into other hands, the loss will be but trifling. The boiling house was arranged after the latest improvements in the West Indies, only that instead of a range of five, there are but three boilers of wrought iron. The plantations of canes not exceeding sixty acres, that number of coppers was deemed sufficient for the present, more particularly as the liquor is made to pass through a filter composed of a thick blanket, a stratum of six inches of coarse river sand and a cotton cloth of a thick texture, which retain all the fecula and mucilage, and sends the liquor into the teach quite limpid. In the curing house, clay moulds and crystallizers made of wood are used to drain and to clay in. It required sometime to get the Chinese potters in the way of making them of a suitable size and form, and clay of a good kind is to be had close at hand on the property.

In January of the present year, everything being in a state of readiness to commence the crop, the greatest difficulty of all—the want of experienced sugar-makers capable of directing the operations of this manufacture were of the utmost importance. But as on the island, I was the only person who had the least knowledge of the business, and that not practically, having only been an occasional looker on during repeated visits on sugar estates in the West Indies, it became necessary to put that little knowledge in practice, and moreover to form a whole set of raw hands and initiate them in the business of tempering, skimming, boiling to proof, potting, draining, and finally claying. It was thought preferable to encounter this arduous task rather than to undertake to bring Chinese sugar makers to our mode of working—for so wedded are they to their own manners and modes of doing things that it is almost a hopeless attempt to introduce a new system among them. The result has confirmed this opinion, for in one week's boiling, the Klings [natives of the Coromandel coast] who were taken from the field, were as expert mill-feeders and boilers as if they had been long experienced in this business, and with this additional advantage over the Chinese, that they work cheerfully, in and out of regular hours, in times of emergency.

Having overcome all these difficulties it is satisfactory to say that the soil and climate have proved as favorable as had been anticipated for the cultivation of the cane; wherever they have been attended to properly the stools have averaged ten canes of good size and length, and which have been fit for cutting in one year from the time of planting. Like all other *planted* canes in new lands, the quantity of molasses compared to that of sugar has been large. But the sugar itself, although made in iron pans of the old form and over a naked fire, is of a strong and large grain easily whitened by clay. Therefore so far every expectation has been realized in this new agricultural undertaking, and if in compliance to your wishes I give publicity to a private enterprise, it is with the view of assisting others who may contemplate such works hereafter, and perhaps to fix an epoch in the history of this island, destined without doubt to be as renowned for agriculture as it is now for commerce, whenever those who hold in their hands its destinies shall concede to it land regulations which shall encourage and not discourage European settlers.

AGRICOLA.

Singapore, 30th May, 1838.

We publish the subjoined from the British Farmer's Magazine for April, as deserving attention. We shall draw largely upon other parts of the essay. The fact that irrigation proved so highly beneficial where copious top-dressing of barn manure availed nothing, will arrest attention. The cause assigned, that the ground had become poisoned and unfitted for the growth of plants then upon it by the accumulated excretions of the plants, is a plausible one; and accords with De Candolle's theory of vegetation, which certainly has much to sustain it.

H. C.

IRRIGATION.

The most ancient, as well as the most extensively employed system of liquid manuring, is that by the use of river water, the weakest of liquid fertilizers. This was one of the early agricultural improvements, suggested by nature herself, in language too plain to be misunderstood by the most indolent farmer: the grass of the banks of every river, every mountain stream within the reach of the winter-flood waters, told the farmer too plainly of the advantages of an occasional watering with river water, for him to be ignorant of the boon which was thus offered for his service; and, in consequence, meadow watering or irrigation, has from time immemorial, been employed in Italy, in Switzerland, in Germany, and in China; it is extensively adopted in many parts of Britain, and is much better understood than it was formerly, although many erroneous ideas are still entertained with regard to its mode of operation, and the nature of the water best adapted to various soils.

Sir Humphrey Davy was of opinion, that one great advantage of a winter irrigation of meadow land is derived from its covering the grass, and protecting it from the injurious influence of severe cold; and he thus explains his opinion: "water is of a greater specific gravity at 42° than at 32°, the freezing point; and hence, in a meadow irrigated in winter, the water immediately in contact with the grass, is rarely below 40—a degree of temperature not at all prejudicial to the living organs of plants. In 1804, in the month of March, I examined the temperature in a water meadow near Hungerford, in Berkshire, by a very delicate thermometer. The temperature of the air at seven in the morning was 29°; the water was frozen above the grass. The temperature of the soil below the water, in which the roots of the grass were fixed, was 43°. In general those waters which breed the best fish are the best fitted for watering meadows; but most of the benefits of irrigation may be derived from any kind of water."

Such was the opinion of Davy as to the sheltering powers of water. His remarks were always cautiously made, and it is to be lamented that his agricultural opportunities for observation were so few. He appears, however, never to have steadily investigated the chemical composition of river water, with regard to its uses in irrigation, and, in consequence, knew little of the value of some of its impurities to vegetation. Thus, if the river water contains sulphate of lime (gypsum), which it undoubtedly does, if the water is hard, it must certainly, under ordinary circumstances, be on this account alone highly fertilizing to grass; for, calculating that one part of sulphate of lime is contained in every two thousand parts of water, and that every square yard of dry meadow land absorbs only eight gallons of the flood water, then it will be found that, by every flooding, more than one hun-

dred weight and a half per acre of gypsum is diffused through the soil in the water, a quantity equal to that generally adopted by those who spread gypsum on their clover, lucern, and sainfoin grasses, as a manure, either in its pure state or in peat ashes. And if we apply the same mode of calculation to the organic matters, ever more or less contained in flood waters; and, if we allow only twenty-five parts of animal and vegetable remains to exist in a thousand parts of river water, then we shall find, taking the same data, that every soaking with such water will add to the meadow nearly two tons per acre of animal and vegetable matters, which, allowing in the case of water meadows, five floodings per annum, are equal to a yearly application of ten tons; and I am confident that the quantity of foreign substances present in river water generally exceeds the quantity I have allowed for in these calculations.

I have found it impossible to give from analysis the amount of these foreign substances present in river water with any tolerable accuracy, since the proportion not only varies at different seasons of the year, but a considerable portion of these merely mechanically suspended matters subsides when the specimen water is suffered to rest, so that the chemical analysis is merely that of those portions in chemical combination. To give an instance—Thames water has been analysed by Dr Bostock. He found that the water, after having thus by resting deposited its mud, &c., contained in every ten thousand parts—

Organic matter	7 parts.
Carbonate of lime (chalk)	53 do.
Sulphate of lime (gypsum)	15 do.
Muriate of soda (common salt)	
and muriate of magnesia	2 do.
The water of the Clyde, analysed by Dr Thomson, contained in 10,000 parts—	
Common salt	0.369 parts.
Muriate of magnesia	0.305 do.
Sulphate of soda (glauber salt)	0.114 do.
Carbonate of lime (chalk)	0.394 do.
Silica (flint)	0.118 do.

The water of lakes and ponds is usually still more surcharged with foreign substances than river water; it is, in consequence, still better adapted for irrigation; and from the use of such waters, especially if a constant or winter stream of water passes through them, I have seen very great fertilizing effects produced; and in some instances in the valley of the Kennett, near Hungerford. I have seen the most luxuriant crops of grass produced by the use of such waters, when common farm-yard manure had been tried as a top-dressing without the slightest good result.

Such are some of the probable causes of the fertilizing influence of river water; it is likely that there are others with which we are totally unacquainted, and perhaps the removal of the excretory matters of plants from the soil, by the flooding waters which have been shown by M. Macaire to be so noxious to the plant which deposits them, may be one chief advantage of irrigation: water may truly in this sense be said to sweeten the soil. In every research in which vegetation is concerned, it is especially necessary to examine with care and patience, and amid the many difficulties with which the investigation is surrounded to avoid as much as possible substituting mere words as an explanation of facts, an error into which the cultivator is sure to fall if he is content with the usual modes of explaining these phenomena, and believes what is commonly asserted, that irrigation merely *cools* the land.

From 'Transactions of the Essex Agricultural Society, 1838.'

ON IRRIGATION.

The Committee on Irrigation regret that no claims have been entered the present season for the Society's very liberal premiums. There are many pieces of land in the county which are susceptible of great improvement by irrigation. Nature, in giving us a country abounding in hills and valleys, seems to invite the lords of the soil to conduct on to it the running streams to flood it, and leave their rich deposits. A good farmer, not content with the crops which his unaided labor procures, gladly impresses even the elements and makes them subservient to his purposes. He commits no sacrifice, for to *improve* is to enjoy and to obey, and nature lends her willing assistance. It is known that in many instances, crops of hay have been doubled in quantity by occasional flooding, and the feed in many pastures has been greatly increased by a small expense of well applied labor. It is hoped that our farmers will give more attention to this subject, and that they will not be backward in making known the result of their experience. The Society will be most happy in being made the organ of their communication, and will cheerfully pay generous premiums to the conductors of well managed and successful experiments.

For the Committee,

DANIEL P. KING.

THE VALLEY OF THE OHIO.

We publish this morning some interesting remarks upon the country drained by the Ohio and its tributaries, from the Baltimore American. The editor computes it at about 140,000 square miles, which exceeds, by several thousand square miles the area of Great Britain and Ireland, and is but little less than that of France. The present population of Great Britain and Ireland is 24,000,000; that of France say 32,000,000. In the valley of the Ohio there is less unproductive land than in either of the others and with proper cultivation it is capable of supporting in comfort and plenty, more than twenty millions of population.

Rival cities are contending for the commerce of this great valley—a commerce already immensely valuable, although only in its infancy. There is however, no need of jealousy in the matter; there will soon be abundance for all, and there need be no hesitation about opening every practicable avenue between the Atlantic cities and the noble river that flows for a thousand miles through this great valley.

But the valley of the Ohio forms but a comparatively small part of that great central basin which would not be half populated were all the crowded millions of Great Britain and France added to its present inhabitants. All that is required of art is to reach Pittsburg—nature has done the rest. Come here and read our steamboat bills—"For Peoria"—"For Galena"—"For Red River"—and remember when you are here that you are scarcely beyond the Atlantic slope—just on the verge of that ultramontane world that it makes a man dizzy to think about. Yet here you are met by magnificent vessels ready to bear you—not across the ocean, nor along the coast—but to the deepest interior of a great continent, or almost across it if you choose. There need not, then, there ought not, to be any hesitation or delay on the part of the States in which the mountain barriers exist between the Atlantic coast and this central valley, in opening ev-

ery possible avenue of intercommunication and commerce. They need only do the work—the vast resources of the west will soon pay for it.—*Pittsburg Advocate.*

WESTERN LAND SALES.

MILWAUKIE, W. T., April 19th, 1839.

To the Editor of the *Albany Argus*:

You are perhaps already aware that at the public land sales held at this place in the months of February and March last, the largest sale of government land was made, or one of the largest, ever known in the United States at one time.

The tract offered comprised all that part of the Milwaukee Land District, not previously brought into market at Green Bay, except a portion reserved under an act of Congress for the construction of a canal from this place to Rock River, and undoubtedly contains some of the best lands in the Territory.

The sales commenced upon the range of towns bordering upon Rock River, and were continued from day to day progressively east, through the different ranges for four weeks, and until they reached Lake Michigan. All the lands contained in the President's proclamation were offered for sale, and were either purchased or will be subject to private entry at the opening of the land office for that purpose, which it is supposed will take place in May or June.

The daily receipts of the sale varied from fifteen to forty thousand dollars; and the total receipts amount to a little short of half a million of dollars. To which the receipts from pre-emptions under the act of 1838 being added, makes the whole sum but little short of \$600,000.

Of the receipts of the sales, about \$90,000 was in specie, \$115,000 in treasury notes, and the remainder in bills of a denomination of \$20 and upwards.

It is worthy of remark that the whole of the land purchased, was taken by actual settlers, and for the purpose of cultivation, at the minimum price, ten shillings per acre, and the quantity by each 160 acres, (a quarter section,) and but rarely exceeded that amount.

Not an acre, as I can find, has been bought on speculation, but for improvement and cultivation.

Singular Operation upon a Horse.—Mr Eland, of Womersley, farmer, had a horse, which, on being taken up from grass, exhibited symptoms of broken wind, and gradually grew worse until about the 16th of March, when it evidently appeared that he would die of suffocation. Mr Nicholson, farrier, examined the horse and found an indentation of the windpipe, and that its circular form was lost. He then performed the operation of tracheotomy in the following manner: The integument and muscles covering the windpipe were divided and dissected back to the length of five inches, when it was found that the rings of the trachea were actually broken, and a false membrane extended over the broken portion, so that an aperture existed for the horse to breathe through sufficient only to allow a small probe to be passed down. The whole of the broken rings were then dissected, cut, and a semicircular tube was introduced, which remained in several days, and the external parts were brought together and healed.

The horse is fifteen years old, is now perfectly healthy and in daily work.—*Dorset (Eng.) paper.*

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JUNE 12, 1839.

THE NEW ENGLAND GAZETTEER, containing descriptions of all the States, counties, and towns in New England, also descriptions of the principal mountains, rivers, lakes, capes, bays, harbors, islands, and fashionable resorts within that territory, alphabetically arranged. By John Hayward, author of the *Columbian Traveller*, *Religious Creeds*, &c. &c. Boston, 1839.

This is a very convenient book of reference, and contains a great amount of useful information. To one of her maids of honor, soliciting the loan of a book to read, Queen Elizabeth presented a dictionary. The lady returned it in due time to the queen, saying that she had read it through with great interest and pleasure. We can lay no claims to the intense spirit of inquiry, which distinguished this maid of honor, and have not read this *Gazetteer* through; but we have examined it sufficiently to say that it abounds in useful facts of a geographical and statistical character; that its accounts are accurate, and, as far as we have examined, to be relied upon.—The information is presented in a condensed and perspicuous form, and the book, for the amount of matter it contains, is furnished at a very reasonable expense. It is to be followed by a register full of other local facts of general interest, which it was impossible to comprise in this volume. We wish the author a success commensurate with his industry and research.

With the exception of the New Hampshire granite ledge, the cuts in the volume would disfigure a school-primer; and the irrelevant matter introduced under some of the notices, such as "Deacon Marvin's Courtship" and "The Fortunate Stageman," &c. &c. are in very bad taste; and ought to give place to appropriate and useful matter.

H. C.

TO CORRESPONDENTS.

To our Westboro' friend "T" we feel under particular obligations. The matter for this week's *Farmer* was "made up" before we received his communication; and it shall have a place in our next. Such accounts confer a substantial benefaction on the agricultural community; and do honor to their author by the exactness of his arrangements and details. We wish that the example of himself and our respected friend Anthony, of North Providence, might provoke a spirited imitation among other of our friends.

We have received from J. Holbrook, Esq. his written communication; but the *Cleveland Herald*, to which he refers us for the printed details of his plans for improvement, has not reached us. We beg him to send another. The subject of his communication is of the highest importance—the education of the farmers; and we shall most heartily cheer on his plans for this object. He must be considered as the founder of lyceums and popular lectures throughout the country; and by this distinguished benefaction few men have stronger claims upon public respect and gratitude.

We thank "C. S." for his communication until we can take a more particular notice of it. His grain needs a little winnowing, but it is "pretty clean after all," and will make very good bread. We shall serve it up presently. We sympathize cordially in his views in regard to the distaste for agricultural labor prevalent with many; and the corrupting influences of fashion, luxury, indolence and avarice; but it is difficult to devise or apply a remedy.

We are sorry he should deem any apology necessary

for his style of writing. This diffidence often deters men from communicating to the public facts within their own knowledge or experience, which would be of great service. This distrust of their own powers is misplaced. We do not expect farmers to be accomplished writers; and in case of any false grammar or wrong spelling, we should certainly correct it as well as we know how before we printed it; but it is a fact which must be admitted, and which is constantly occurring under our own observation, that plain, intelligent, practical men, though without the advantages of a liberal education, generally express themselves with much more perspicuity, simplicity and directness, than men who are writers by profession, and whose lives have been devoted to books; who are very apt to acquire a verbose and involved style. Gen. Washington and Dr. Franklin among innumerable other self-educated and practical men, are examples of a clearness, directness, and force of style scarcely surpassed in the language. Few men have any difficulty in communicating their thoughts or knowledge in conversation. Let a man then undertake to write as he talks, and he will soon acquire a fluency of writing; and a little correction will give his writing exactness and force. Most practical men refuse to communicate their experience because, they say, they have nothing new or worth communicating. If we must not write unless we have something new to communicate, writing must soon cease. The common results of common operations drawn out with exactness and in detail, are what we want; and though many things from long familiarity have ceased to be new to those accustomed to them, they are not the less adapted to be useful, and combine the precise information most wanted by others, who are ignorant and inexperienced.

H. C.

SPANISH OXEN—WORKING COWS.

A gentleman temporarily resident in the Havana, who is a very competent judge, states that the oxen in that country are of a superior character. They draw entirely by the horns, and are, properly speaking, not driven but led by a boy, who precedes them, holding a rope fastened to a ring, which is passed through the cartilage of the nose; and they are trained to walk with as much speed as horses.

Every one who has seen an ox trot or run, must be satisfied that they were never formed for racers. Yet undoubtedly they might be trained, and with advantage, to move much faster than at their ordinary gait among us, which is proverbially slow. It is worth considering whether the habits of thought and action among a rural population bear any correspondence to the habits of the domestic animals with whom they associate; and whether the habits of people accustomed to the quick movement of horses in working and riding, are not more active, spirited, and enterprising than of a people accustomed only to the slow movements of oxen, who as they are often trained and driven, do little more than creep.

It would seem to be time to get over the absurd prejudice which prevails among us, against working cows. On small farms especially, where the expense of keeping an ox team is always heavy, it would be a great gain to use them in this way. In many parts of Europe they are so used, and certainly may be so used with as much propriety as we use mares; who, with the exception of certain seasons, are as useful as horses—indeed more active and spirited, and quite as enduring. In respect to cows, all that would be required would be extraordinary care and kindness when far advanced with calf, and entire release from work for a short time before and after calving. The extraordinary feed which we could then afford to give them, would enable us to

get almost as much milk from them as we now get.—We wish some intelligent and respectable farmer would make a fair experiment in this matter. But with existing prejudices, which we know it would be very difficult to overcome, a man would almost as soon be seen driving a team of women in harness as a team of cows. We must beg pardon for the homely analogy or for even so much as hinting the possibility of, not to say the want of gallantry in the thought of driving women in or out of harness. It may sometimes be possible to lead them after the Havana fashion, with a silken cord. We propose to hazard no advice on the subject however.

H. C.

PUMPKIN SUGAR.—It is stated on good authority that an important revolution is about occurring in France in regard to the manufacture of sugar; and that a large capitalist is about erecting an extensive establishment for the manufacture of sugar from pumpkins, experiments having shown conclusively that it may be obtained from this vegetable in abundance, and of a superior quality.

H. C.

CUBA.—A correspondent of a Baltimore paper writing from Havana, states that the island of Cuba, which has heretofore found ready demand for its sugar in the Russian market, has been superseded in the trade by the native cultivators of Russia.

The manufacture of beet sugar has increased to such an extent in the southern and central provinces of the Russian empire, that instead of one hundred thousand boxes of white sugar which were annually shipped from Cuba to St. Petersburg, forty thousand boxes now supply the demand.

The canker worm is making great ravages among the fruit trees in some parts of this and other States. In some instances whole orchards have been desolated.

Massachusetts Horticultural Society.

EXHIBITION OF FLOWERS.

Saturday, June 8th, 1839.

Splendid Bouquets were exhibited from the gardens of Messrs Winslip, Howe, Hovey, and Walker. *Native Plants* by Ezra West, a, jr., Esq. and Francis Parker; *Arethusa bulbosa*, *Kalmia angustifolia*, *Sarracenia purpurea*, *Iris versicolor*, *Robus trivialis*, *Nuphar advena*, *Hypoxis erecta*, *Eriophorum angustifolium*, *Geum rivale*, *Trifolium pratense*, *Vaccinium resinosum*, *Lathyrus Paliustris*, *Potentilla asnerina*. The report of the judges on the *Viola grandiflora* is herewith submitted.

For the Committee,

S. WALKER, Chairman.

"The exhibition of *Violas* for premium, was held to-day (June 8) at the Society's room. S. Walker, Esq. was the only competitor. The number of specimens was large and flowers beautiful.

The committee award to Sam'l Walker, Esq. the 1st and 2d premium for best display of *Violas*; and they also award to him the premium for the best seedling *Viola grandiflora*.

JAMES L. L. F. WARREN,
E. M. RICHARDS."

June 8, 1839.

Fruits exhibited at the hall of the Society, Saturday, June 8, 1839—*Strawberries*; a box of large strawberries of the variety called Royal Scarlet, from James L. L. F. Warren, Brighton.

For the Committee,

E. M. RICHARDS.

Vegetables—Mr G. W. Stearns, of Cambridge, exhibited fine specimens of the long green Cucumber—fruit very large. Specimens of the long Southgate Cucumber were also exhibited by James L. L. F. Warren, of Brighton.

For the Committee,

JAMES L. L. F. WARREN.

BRIGHTON MARKET.—Monday, June 10, 1831.

Reported for the New England Farmer.
At Market, 205 Beef Cattle (including 100 unsold last week), 20 Pairs Working Oxen, 45 Cows and Calves, 200 Sheep, and 47 Swine including small pigs. 60 Beef Cattle remain unsold.

Prices.—Beef Cattle.—Prices have advanced about 50 cents per hundred since last week on the best qualities, and we advance our quotations to correspond.—First quality, \$9 25 a \$9 50 Second quality, \$8 50 a \$9 00. Third quality, \$7 50 a \$8 00.

Working Oxen.—We quote the following sales, viz. \$100, \$120, \$130, \$137 and \$145.

Cows and Calves.—We quote sales at, \$30, \$33, \$42, \$47, \$55, and \$65.

Sheep.—One lot was sold at \$1 25, and one lot at \$5 00 not shear'd.

Swine.—A lot of large hogs were sold at 8 for sows and 9 for barrows. A small lot only was sold to peddle at 12 1-2 a 9 1-2, at retail from 8 1-2 to 11; small pigs 12 1-2 a 13.

THERMOMETRICAL.

Reported for the New England Farmer.
Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending June 9.

June, 1839.	5 A.M.	12 M.	7 P.M.	Wind.	
Monday,	3	46	70	54	N. W.
Tuesday,	4	45	63	56	S. E.
Wednesday,	5	51	50	43	N. E.
Thursday,	6	45	60	60	S.
Friday,	7	51	73	66	N.
Saturday,	8	54	83	65	S. W.
Sunday,	9	62	83	65	S. W.

BEES WANTED.

One or two first rate Hives of Bees wanted immediately. They must be warranted free from the moth. Apply at the New England Farmer Office, 52 North Market Street. June 12

DURHAM SHORT HORN BULL.

For sale, a very fine Durham Short Horned Bull, three years old. For further particulars inquire at the New England and Agricultural Warehouse. Boston, June 12, 1839

BOAR FOR SALE.

For sale a Boar 3 parts Berkshire, 1 part Mackay, one year old, raised by Elias Pinney, Esq. of Lexington. Apply to JOSEPH BRECK & CO. New England Farmer Office. June 5. 3t SIMON H. BARRETT, Malden.

DOUBLE DAHLIA ROOTS.

For sale at the New England Agricultural Warehouse and Seed Store, a superb collection of Double Dahlias, consisting of all the improved varieties of many fine varieties. Also, Double Carnations of many fine varieties. JOSEPH BRECK & Co. May 6.

NEW BOOKS.

A Treatise on the Cultivation of the Dahlia and Cactus. By E. Sayers.
Also, Birds and Flowers and other Country Things. By Mary Howitt.
Dennis' Silk Manual.
American Fruit Garden Companion.
An Essay on the Practicability of Cultivating the Honey Bee in Maritime Towns and Cities as a Source of Domestic Economy and Profit. By J. V. C. Smith, M. D. for sale by June 12 JOSEPH BRECK & CO.

TO GARDENERS AND FARMERS.

The subscriber has constantly for sale at his Garden, in Brighton, the best varieties of the following plants:
Early and Late Cauliflowers,
Purple and White Broc coli,
Cabbage of every kind,
Celery, Peppers, Tomato and Lettuce,
Martynia, Okra, &c. &c.
Also—Cucumber, Melon and Squash Plants, in pots, ready for transplanting. J. L. L. F. WARREN.
Brighton, June 5.

Sheet Lead and Lead Pipe.

Sheet Lead and Lead Pipe all sizes. Constantly for sale at No. 1 City Wharf, by A. FEARING & CO. May 22. 8w

FOR SALE.

A very superior Berkshire Boar and Sow, twentytwo months old, very large of their age. Apply to JOSEPH BRECK & CO. May 18. ept

SAYLE'S GARDEN ENGINE.

For sale at the New England Agricultural Warehouse Nos. 51 and 52 North Market Street, Sayle's Garden Engines. This Engine is a splendid article, and will throw a constant stream of water to the distance of 50 or 60 feet, with great force, and in case of fire would be a good substitute for a fire engine. It is the most perfect article for the purpose ever introduced. JOSEPH BRECK & CO.

TULIPS, RANUNCULUSES, PINKS AND VIOLAS.

S. WALKER of Roxbury offers for sale in beds, or of such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland, France and England, to which yearly additions have and will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superior Tulips will do well to make a selection for themselves when the bulbs are in bloom, (about the 1st of June.) The prices will conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices, in the country where the bulbs were raised, and cheaper than the like quality can be imported.

Tulips in beds of from 30 to 100 rows, containing from 210 to 700 bulbs, or by the dozen, 100 or 1000.

Viola grandiflora—Pansy, or Heartsease. Upwards of 2000 superb varieties will be exhibited and offered for sale when the Tulips are in bloom.

Ranunculuses—fine mixtures, at from \$2 to \$5 per 100.

Pinks—fine named varieties, from 25 cents to \$1 each.

For particulars apply to S. WALKER, or to JOSEPH BRECK & CO. eow

Tulips, Ranunculuses, Anemones, Auriculacs, Carnations, Picotees, Pinks and Geraniums

H. GROOM, of Walworth, near London, England, by appointment Florist to Her Majesty Queen Victoria, begs respectfully to call the attention of his friends and the admirers of flowers in America generally, to his extensive collection of the above flowers, which from his having been very successful in their cultivation this season he can offer at very moderate prices. He would particularly recommend to those persons about commencing the growth of the Tulip (which in England is becoming very fashionable) the under collections in beds, as it is by far the cheapest mode of purchasing them.

Tulips arranged in beds with their names.

First Class.

A bed of 30 rows containing 210 bulbs including several of the newest varieties, - - - - - £15

A bed of 45 rows, - - - - - £21

A bed of 60 rows, - - - - - 25 guineas

Second Class.

A bed of 30 rows including many fine sorts, - - - £10

A bed of 45 rows do - - - £14

A bed of 60 rows do - - - £17 10s

Tulips not arranged. £7 7s to £13

100 Superfine sorts with their names from - - - £13

Superfine mixtures, from - - - 7s 6d to 21s

Ranunculuses.

100 Superfine sorts, with their names from £3 3s to £5 5s

Superfine mixtures, from - - - 5s to 21s per 100

Anemones.

100 Superfine sorts with their names, - - - £3 10s

Superfine double mixtures from 10s 6d to 21s per 100

Auriculacs.

25 Superfine sorts with their names, - - - £3 13s 6d

Catalogues with the prices of the other articles may be had on application.

Orders received by JOSEPH BRECK & CO.

Nov. 1. eow.

CORN SHELLERS.

Just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, a supply of Carrier's Patent Corn Shellers; a very convenient and cheap article. A right to using said machines in counties or towns may be obtained by applying as above. JOSEPH BRECK & CO. April 17.

WHOLESALE PRICES CURRENT.

ANNUALS IN POTS.

J. L. L. F. WARREN has for sale, at his garden in Brighton, a great variety of Annuals, started in pots and ready for transplanting.

MISCELLANEOUS.

We give below some extracts from the letter of a valued friend who removed not long since from this country to England, which give some graphic sketches of American beggars in that country, and the condition of things in that country, which will be read with pleasure from its sprightliness and humor.

II. C.

"This is a strange out-of-the-way old-fashioned place: I know no more of the doings of the world when I am at home, than if I were out of it. I give myself wholly to my new profession: my daily talk is of corn and cattle—long fleeces and fat sheep—crops, cropping, manures and farm machinery. I sit almost at the feet of the laboring birds to gather the valuable knowledge they possess. What arrogance to call such men ignorant! Why, my dear friend, I would almost give my cars to know as much as some of these miscalled 'ignorant peasantry.' These humble men are many of them well stored with that productive knowledge, without which we should all be savages, and this fair world a wilderness. Tell me, friend, how much 'belles lettres' will it take to fill a man's belly? That's a poser: I know thee can't tell. Then don't call those men ignorant that can tell how to produce forty bushels of corn [wheat] to the acre. But come—this smells rather strong of the new shop.

Among the novelties of this place may be remarked the incredible number of American beggars—American beggars! methinks I hear thee say. Yea, friend—American beggars. They verily swarm at times, in this far off, long-forgotten nook of the world. How they find the place passes my comprehension. But so it is. I have seen more beggars professing to be Americans, in the few weeks I have been here, than all I saw put together during the two and twenty years I have lived in the United States. Almost every week till lately, have some of these gentry paid me a visit. I suppose I have seen the whole gang, and they will just stay away till I have forgotten their faces, and then round they will come again. They are all of one character—shipwrecked American sailors forsooth! and they tell such fair tales of Boston and Salem and all down east, that in spite of my better convictions, they are sure to wriggle something out of me;—and the rogues pay me such fine compliments. "Sir," said one of them, "we heard of you twelve miles off, and that you were an American, or had lived many years in America, and we have walked all these miles without breaking our fast to see you." Could any appeal be more irresistible? If I say, why don't you apply to the consul? they have a ready answer—they were only cast away the day before, or the ship they belonged to was owned in Halifax or Quebec, or some other fiction. The truth is, not one in a hundred of these fellows ever saw salt water. But such is the emigration from England to the United States, that there is scarcely a family that has not some relative there. The inhabitants of all rural districts imagine strange romantic things about a shipwrecked sailor; hence it becomes one of the best characters to assume; and now these fellows contrive to pull two strings upon the sympathies of the kind-hearted and credulous country people—first as shipwrecked sailors; but best of all, as shipwrecked American sailors; and they very well know how to give the hint—"God bless you—I hope none of your kin may never know want," is a common salutation; and if the

old lady addressed happen to have a son in America, as like enough she has, away flies her heart after the wanderer, and her hand involuntarily into her pocket, while the beggar proceeds—"Hope you will take pity upon us, poor American sailors, shipwrecked last week on the coast of Norfolk—all hands perished but us two—hope no son of yours may ever want a morsel of bread." By this time, the power of association has conjured up the much-loved kindred in the far off wilds of America, evading charity for aught that is known, at American hands. The heart of the good old lady is verily melted and the rogues make a fine haul.

Mendicancy has certainly diminished in this country during the last twenty years; but still there is much of it. In truth, there ought not to be any; the ample provision of the poor laws, and the munificent charities of the English people, meet all possible cases.—It is curious to observe what shifts the rogues adopt. Every now and then a forlorn man or woman, with bag in hand, enquires if we want to buy any corks. If I say no, the cork-seller instantly begins to beg, and it would be just the same if I bought of them. Three or four dozen corks are a light load, and it makes them traders, and thus they avoid the law against vagrants, having some visible mode of living.—Last winter while two men were thrashing for me in my barn, a great sturdy fellow came up with a basket of matches on his arm—"Hallo old chap!" said one of the thrashers, "come take this flail and I'll take that basket—let's change trades." The fellow leered under his old slouch hat, and in right good earnest replied, "I'd sooner go and hang myself."

On the course of some of the canals in Yorkshire, there are long tunnels cut through the limestone rock. When canal boats arrive at one of these, the boatmen never work their own boats through, but always hire men for the purpose.—These men, at their work, lie flat on their backs, on the cargo or deck of the boat, and striking their feet against the roof of the tunnel, urge the boat forward; hence they are called purchase men. Among these was one long John Bell, a notorious fellow, who stood six feet four without his shoes. He made an excellent purchase-man, but it does not appear that he was made for anything else.—During the long frost of last winter, the canals were all frozen up, and of course, the purchase-men were out of employment. Some took to one trade and some to another; but honest John Bell could think of nothing that he could do, unless it was to set up for a deaf and dumb man! And as necessity has no law, or in other words, as long John began to grow hungry, out he starts in his chosen profession. One of the first places at which he stopped was in the village of Harthill, at the house of one person Alderson, a most exemplary clergyman, steward to the late duke of Leeds, and the amiable almoner of many of his charities. The clergyman was roused from his study by a servant who reported that there was a strange man making strange signs at the kitchen door. And sure enough, there was Johnny Bell performing the first acts of his pantomime—cutting all sorts of imaginable "shines"—awkward enough to be sure, but all of them tolerably significant of an empty stomach. The keen eye of the parson instantly detected some "gillery," but he kept his own counsel, called for a table spoon, and mounting a chair, made signs for long John to drop his under jaw, and for some time pretended to amuse himself by an anatomical examination of the animal's tongue, turning it over

and over as a cook would turn a flounder in a frying pan. At last he expressed himself entirely satisfied—ordered the cook to give the man a good dinner, and to be sure to set a jug of the best ale before him; and then like a gentleman, retired, leaving the dumb man to enjoy his viands and victory. By the time, however, that long John had pretty well lined his long jacket, down again came the clergyman and began to give various directions to his servants. The instant these were given, he turns to our hero, and in a tone of the most silvery blandness says, "And how long, my poor man, have you been deaf and dumb?" "About three years, sir," replied John, with the most drawing simplicity imaginable; altogether thrown off his guard by the mildness of the clergyman's behavior and the sedative effects of the beef and ale. Parson Alderson, like all the best church of England clergymen that ever I knew or heard of, was a bit of a wag, and the success of his own stratagem so well pleased him, that he merely admonished the scoundrel, and gave him half a crown to carry him out of soundings."

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground is long the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells.
Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention.

March 27.

NAHUM WARD.

FOR NEW YORK.

Cabin Fare \$3 00—Deck Fare \$1 50.

The Steamer JOHN W. RICHMOND, Capt. Wm. H. Townsend, will leave Providence on MONDAYS and THURSDAYS, at 4 o'clock, P. M.

☞ Cars to meet the boat will leave Boston at half past 2 o'clock, P. M.

Mondays and Thursdays, will be her regular days of leaving Providence, until further notice.

For further information, apply to S. Q. COCKRAN, 30 Congress Street, Boston.

N. B. Freight taken at 6 cents per cubic foot.
June 5.

BRUSSA MULBERRY.

A fresh lot of genuine Brussa Mulberry Seed just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street. This species of Mulberry flourishes best in high and even poor lands, and is more likely to endure the rigors of our winter weather and not so subject to the effect of the frost, as trees brought from more southern latitudes, or warmer climates.

The leaves of the *Morus alba* of Brussa, are said to contain a much greater quantity of saccharine matter, than any other of the white species, and moreover, the leaf is much larger than those of Italy and Spain; it is also a hardy tree, susceptible of being raised in climates, where the frosts are severe.

At the annual fair of the American Institute, at New York, in October last, specimens of the leaves of the Brussa tree, of different years' growth, were exhibited, and excited universal approbation, and the Institute awarded a silver medal for the introduction of this invaluable tree, observing in the report of the committee, "that these, with every new and useful plant, calculated to withstand the rigors of our climate, are worthy of attention, and those introducing them into our country, deserve to be placed on the catalogue of our country's benefactors."

May 22.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within six days from the time of subscribing are entitled to a deduction of 50 cents.

AGRICULTURAL.

REMARKS OF MR BINNS

At a Meeting of the Lancaster (Eng.) Agricultural Society.

(Concluded.)

I now proceed to consider the best means of applying manure to the soil. Many may think that in this there can be no difficulty. It would contribute very much to cleanliness, to the health and neatness of farm premises, if manure could be disposed of as soon as produced. In the Dutch mode for instance, it is lost sight of immediately; all its cleanliness about the cow-houses. Whether the manure be solid or liquid, the sooner it is deposited in the ground after it has undergone a slight fermentation the better; if the ground were in that clean state which drilling and proper weeding would ensure, the manure might be deposited in the drills and covered up in the autumn, ready for planting potatoes or sowing turnips in the following spring; this would allow the vegetation of annual weeds, and their destruction by the harrow when the potatoes and turnips were sown. The ground by being ridged up, and having the manure in it, would become mellowed by the winter's frost; and the most favorable time for sowing might be taken advantage of in the spring. The ground would thus retain all the juices and virtue of the manure. Sir H. Davy remarks: "The fermentation and putrefaction of organized substances in the free atmosphere are noxious processes; beneath the surface of the ground they are salutary operations." When this plan cannot be adopted, the manure ought to be carted in winter, out of the yards to heaps in the fields, on which it is intended to be used, and there covered with soil, peat earth, and other substances, and turned over about a week before it is to be applied in spring.

For the turnip crop the use of liquid manure is of great advantage, for if the growth of this plant be checked when young, its success is greatly endangered, and though it may escape the dangers of the fly, it never after grows freely; for clover after mowing, and also for cabbages it is an excellent forcer. For meadow land, I believe manure is best applied immediately on the hay being taken off, for at this period the grass grows rapidly, and soon protects the manure from the sun; the ground not being saturated with moisture absorbs the juices, and less of its goodness is washed away than when applied in winter or spring. But in saying this I do not wish it to be understood that I approve of permanent meadows in general—I would have no meadows except in situations unsuitable for ploughing.

In manuring pasture land the liquid state is preferable. In wet pastures an excellent practice prevails, (but not to the extent it ought to do) that is, to waterfurrow, and mix up the furrows that are thrown out with lime or manure, and then spread the mixture on the surface; this accomplishes two valuable objects at once.

Having now explained the means by which the manure upon a farm may be profitably augmented, and given my views as to its application, I will only detain you a short time by a few remarks upon the effect of these improvements upon the farmer, the landlord, and the public.

The farmer by having an increased supply of manure, and consequently an increased produce upon the same land, would in the first instance be most benefited, and the most enterprising, skilful, and industrious, will always reap the greatest benefit. Let him imitate the Dutch, who are a happy people, fond of home, who delight in the neatness, comfort, and cleanliness of their houses, and are not only skilful agriculturists, but excel in horticulture. As the increasing population will require more food yearly, it is probable there would be a demand at present prices for the increased supply, that these improvements would furnish; the landlord would therefore also be benefited with an increased rent: if prices should be reduced by an increased supply fully equal to the demand, he would in that case also reap advantage, the expense of living being reduced and rents remaining the same.

But to the public the most important advantages would result in the reduced price from the increase of the necessities of life. The natural effect of this would be a reduction in the price of labor, without curtailing the comfort of the laborer; and more profit to the manufacturer, with an extension of our commerce and manufactures. I am aware that the price of labor is not always governed by the price of provisions, because labor, like other commodities, must depend upon supply and demand, but this would be the tendency; at all events the price of provisions fixes the minimum price of labor.

If this state of things should happily be realized, all bickering about the corn laws would cease; the agriculturist and manufacturer would then cordially shake hands and unite their efforts for the general good, and the latter would perceive that his interest was deeply connected with agriculture. I am of opinion that the volumes that are written about the corn laws, are all no better than waste paper, and if I may presume to question the wisdom of discussions in parliament on the subject, I should say it was misapplied. The agriculturists may be aptly likened to the wagner calling upon Jupiter, when they have the power and the means of putting their own shoulder to the wheel. If the agriculture of the country were improved to one fifth of the extent it is capable of, the corn laws would be a dead letter, and wonder would be excited that they ever existed amongst an enlightened and industrious people, and our agriculturists would look back with shame upon their cupidity for their dependence upon foreign nations for a supply of food, when the soil and climate of Great Britain offer such facilities for producing food, exceeding beyond any conceivable bounds, the present miserable amount. If the plan proposed should be adopted, the British farmer could raise grain, cattle, horses, and sheep, butter and cheese, as cheaply as these articles could be imported by foreigners, and as to the ar-

gument used of their not buying our goods, unless we take their corn, it is not worth a moment's consideration, as they will be glad to buy manufactures from those that will sell them the cheapest, and in proof of this, we have imported no corn lately, but our export of manufactures was never greater.

Our manufacturers are able, from their superior machinery and skill, to export goods to those countries where provisions and the money price of labor are much lower than in England; and if farmers would bestow sufficient care in the selection of their breed of horses, cattle, and sheep, there would be an increasing demand for them nearly the world over; these would be his superior machinery, and grain would be an auxiliary. We might then say, "these are our instruments of magic."

I was informed by Mr Wetherell, the celebrated breeder of cattle, yesterday, that several gentlemen from France were lately over in Durham for the purpose of buying great numbers of cattle, even at the present high prices, but if the breeders and farmers generally would pay proper attention to the breeding of stock, those cattle which now sell at 50*l.* and 100*l.*, might be afforded at 20*l.* and 30*l.* Why should agriculture remain dormant when all the arts are making rapid strides; it is the most useful and honorable of all. The senators and rulers of old gloried in it, and were considered the most honorable and useful of men, and I know no reason why the cultivators of the soil who administer so materially to our existence and our pleasure, should not take their place in intellectual society, except that they have not the opportunities for education and information that other classes in towns enjoy, their insulated position is unfavorable in this respect. It may perhaps be considered that I am wandering from the question before the meeting, and I have been expecting to hear that awful word "question," (*a laugh*), and I should not have ventured so far, if I did not think that the remarks I am now making had some connexion with the subject more immediately before the meeting. The want of education, particularly that portion embracing science in connection with agricultural subjects, is one great and lamentable cause of the retardation of important improvements and marks the disparity between the farmer and the manufacturer. Those who have the courage and disposition to try experiments, are seldom practical men—on the contrary are generally deficient in scientific knowledge, therefore, between them, experiments that would succeed and be profitable, from a want of practical knowledge and due economy, fail and do injury instead of the good that was intended. This peculiar difficulty under which the farmer labors, makes these meetings the more necessary, and may be a sufficient answer to those who ask why agriculture wants so much bolstering up by meetings and premiums when the manufacturers don't require it? But is there no society of arts under the peculiar care of the government, where rewards are bestowed on mechanical inventions? Notwithstanding the advantages enjoyed by these classes, laws are made for the education of the manufactur-

ing population, but agriculture may take its chance. However, she is blessed with advantages, and attended with the choicest pleasures; the rural life is a life of health, invigorating both to the mind and body. But let the practical agriculturists or their children be educated, then we should see agriculture make rapid strides. It is a subject well worthy the attention of the landowners, and if I might venture to recommend a plan I should say, establish, I do not mean agricultural schools, as generally understood, but schools for general education; let the children of farmers be also taught the elements of mechanics, chemistry, the nature of manures, plants, and vegetation. Some plan ought to be adopted for promoting this desirable object; to enter upon it now would occupy too much time; I wish merely to call the attention of the landlords and influential individuals to the subject.

**CATTLE SHOW AT BRIDGEWATER,
ON WEDNESDAY, OCT. 16, 1839.**

List of Premiums proposed by the Plymouth County Agricultural Society.

IMPROVEMENTS AND MANURE.

- To the person who shall cultivate the greatest number of Chinese mulberry trees, either from seed or cuttings, which shall be in the most flourishing condition the first day of September, 1839 \$8
- For the next greatest number 4
- To every person in the county who shall build before September, 1839, one hundred rods of good stone wall 9
- For every additional hundred rods 12
- And in the same proportion for fractional parts of a hundred rods after two hundred have been built.
- To the person who shall collect the greatest quantity of any kind of material (excepting manure from stock) which in the opinion of the committee shall more than pay the cost of collecting and spreading on his farm between the first day of September last, and the first day of September next, not less than 400 loads, 40 cubic feet considered a load 20
- A second premium for the same object, not less than 300 loads 15
- A third not less than 250 loads 12
- A fourth " " " 200 " 10

The committee are authorized to distribute eight vols. N. E. Farmer and eight vols. Yankee Farmer. N. B.—Claims to be made on or before the first day of September, 1839, to Morrill Allen, Pembroke. Claimants to entitle themselves to the above offered premiums, must make a particular statement in writing, of their several operations.

PRODUCE.

- For the greatest quantity of wheat, raised on not less than one acre of land, nor less than twenty bushels \$12
- For the next greatest quantity do do 8
- For do do do do do do 4
- For the best crop of Indian corn raised on one acre, not less than 60 bushels, (75 lbs. in the ear considered a bushel,) not to be harvested before the 15th of October, 1839 12
- Next best crop 8
- Next best do 5
- To the person who shall make the most satisfactory experiment to determine the comparative utility of cutting the stalks or top-

- ping Indian corn, or cutting and shocking, or letting the stalks remain until the corn is harvested, experiment to be made on not less than half an acre of land 8
- For the greatest quantity of buckwheat, not less than 35 bushels to an acre 8
- For the next greatest quantity not less than 25 bushels to an acre 4
- For the best crop of potatoes on not less than one acre of land, and not less than 400 bushels to the acre 8
- For the next best do. not less than 300 bushels, (56 lbs to be considered a bushel of every kind of root except onions.) 7
- For the best crop of oats on not less than two acres, and not less than 50 bushels to the acre 7
- For the next best on one acre 4
- For the greatest number of bushels of rye raised on an acre, and not less than 30 bushels 6
- For the next best do. 5
- For the greatest quantity of white beans raised on an acre, not less than 15 bushels 6
- For the next do. do. not less than 6 bushels on half an acre, 4
- For the greatest quantity of carrots raised on not less than one acre of land, and not less than 300 bushels 8
- For the next greatest quantity on half an acre 4
- For the greatest quantity of onions, on not less than a quarter of an acre of land, and not less than 75 bushels 5
- For the greatest quantity of sugar beets, raised on not less than 6 square rods of ground 4
- If the sugar should be extracted from the beets and a satisfactory account of the processes given, the premium will be trebled.
- For the greatest quantity of common turnips on an acre, not less than 300 bushels 5
- For the best crop of ruta бага or any other sort of eastern turnips, not less than 400 bushels to the acre 5
- Committee authorized to distribute 8 vols. N. E. Farmer, and 8 of Yankee Farmer, as additions to the above offered premiums, or as gratuities to unsuccessful claimants, according to their judgment of merit.
- P. S.—It will be required of claimants of the above premiums to state in writing the condition of the land at the time the course of cultivation for the approaching season may commence, and the several operations in that cultivation, and the amount of produce must be attested by the owner and one laborer.
- A certificate of the measurement of the land by some respectable surveyor will be required. Claims to be made on or before October 16, 1839, but the evidence of the amount of crops need not be produced until the 10th of November next. Communications to be made to Anthony Collamore, of Pembroke, Chairman of the committee on Produce.

STOCK.

- For the best fat ox \$6
- Next best do 5
- Next best do 4
- For the best milch cow 8
- Next best do 5
- Next best do 3
- For the best heifer, not less than one nor more than three years old 4
- For the second best do do 2
- For the best bull not less than 18 months old 8

- For the second best do do 6
- For the best bull calf, not less than 5 months old, nor more than 12 4
- For the second best do do 3
- For the best heifer calf, do do 3
- For the second best do do 2
- Committee authorized to distribute 4 vols. N. E. Farmer, and 4 of Yankee Farmer.
- Cattle not to be removed from the pens before 1 o'clock, P. M. Claimants for premiums on stock are required to exhibit to the committee evidence of the mode of rearing and treating animals offered for premium.
- Animals must have been kept in the county 6 months to entitle them to premiums.
- Claims for stock of every sort and entries for the ploughing match to be made on or before October 12, 1839, to Abram Washburn, 2d, Bridgewater.

PLOUGHING MATCH.

- The Ploughing Match will commence at 9 o'clock, A. M. on the day of exhibition.
- 1st premium \$8
- 2d do 6
- 3d do 4
- 4th do 3
- 5th do 2
- The work will be performed with one yoke of oxen.
- Committee authorized to distribute 3 vols. N. E. Farmer, and 3 of Yankee Farmer.

WORKING OXEN AND STEERS.

- For the best yoke of working oxen \$7
- For the second best do do 5
- For the best do raised and trained in the county 8
- For the best yoke of steers, not less than two nor more than four years old 5
- For the second best do 3
- Committee authorized to distribute 2 vols. N. E. Farmer, and 2 of Yankee Farmer.

ARTICLES OF THE DAIRY.

- For the best butter, not less than 50 lbs. \$4
- Next best do not less than 25 lbs. 2
- Next best do do 1
- For the best cheese not less than 200 lbs. 5
- Next best do not less than 100 lbs. 3
- Next best do do 2
- Committee authorized to distribute 2 vols. N. E. Farmer, and 2 of Yankee Farmer.

FRUITS AND VEGETABLES.

The committee on Fruits and Vegetables are authorized to distribute 20 dollars, for extraordinary fruits and vegetables that may be deposited in the hall for exhibition.

MANUFACTURES.

The committee on Cloths and the most useful articles of household manufacture, are authorized to award in premiums, according to their judgment of the comparative excellence and utility of the articles presented \$75

BONNETS AND FANCY ARTICLES.

The committee on articles of Usefulness and Fancy, are authorized to award \$50

INVENTIONS.

The committee are authorized to distribute for inventions and improvements in the structure of implements of agriculture, &c. as rewards of ingenuity \$20

Committee authorized to distribute 2 vols. N. E. Farmer, and 2 of Yankee Farmer.

COCOONS AND SILK.

To the person who shall raise and exhibit the largest quantity of cocoons	\$4
For the next greatest quantity	3
For do do	2
For every ounce of wrought silk raised and worked in the county, ten cents.	

P. S.—Cloths, fancy articles, products of the dairy, cocoons and silks articles of invention, fruits, vegetables, &c. must be deposited in the town house before 9 o'clock, A. M. on the day of exhibition.

Articles manufactured out of the county, not admissible.

PREMIUMS CLAIMABLE IN FUTURE YEARS.

To the person who shall on the first day of September, 1840, have the largest quantity of land in the best state of preparation for English mowing, which is now fresh meadow or swamp land	\$25
Second premium for the same object	15
Third do do do	10

Claimants for the above premiums must make entries with Morrill Allen, Chairman of the committee on improvements, on or before the first day of June, 1839, that the committee may have opportunity to view the land before operation upon it commences.

For the most extensive forest of any sort of trees suitable for timber, raised from the seed, not less than 1000 trees to the acre, which shall be in the most flourishing condition and more than five years old in September, 1845

	\$50
Second premium for the same object	30
Third do do do	20

Premiums not demanded within one year will be considered as generously given to promote the objects of the Society.

On all premiums above five dollars awarded to gentlemen not members of the Society, the Treasurer is directed to make a deduction of 25 per cent. to increase the funds.

The Trustees will not consider themselves obliged by the terms of the above offers, to give a premium in any case, when it shall be evident there has been no competition, nor more than ordinary exertion.

All entries for premiums may be made by letters post paid. Letters not post paid, will not be considered.

By order of the Trustees.

ISAAC ALDEN.

Bridgewater, January, 1839.

The subjoined essay contains information and matter for reflection to our farmers, of the very highest importance. We urge upon them to give it more than one careful reading. We may be thought importunate in urging so strongly the subject of liquid manure upon the farmers, but we should not be true to our convictions of its importance if we failed to do it. The farmers in the interior are constantly complaining of the want of manure; and yet they take no measures whatever to supply the deficiency by saving their liquid manure. The farmers in the vicinity of the capital and the large towns pay three, four, five, six, and we have known to be paid even seven dollars per cord for manure, and then transport it several miles, and yet the subject of liquid manure is hardly thought of. Two or three things may be considered as well established, and they are of the highest moment. The liquid manure of an animal is of

equal value as the solid manure, if the whole of each could be preserved and applied. Next, human urine is among the most efficacious of all manures; next, plants absorb nothing which is not in a fluid state; and manures applied in a fluid state were more active, immediate, and powerful than when applied in any other form. II. C.

ON MANURES—THEIR USE AND COMPOSITION.

BY CUTHBERT WILLIAM JOHNSON, ESQ.

Liquid Manure.

It is only in modern days that the idea of applying fertilizing matters to the soil, in a fluid state, has been seriously entertained by the cultivators of the soil. This great modern improvement has been one of the results of applying the researches of philosophy to the processes of the farmer—the fruit of carefully conducted experiments first suggested by the sagacious observations of the chemist.

It could not, however, have escaped the notice of the very earliest cultivators of the soil, that the drainage of the farm-yard, as it dispersed itself over the land, produced a most luxuriant crop of grass; that the ground on which a dunghill had rested was ever distinguished for the rankness of its vegetable products, and that those grass lands which were periodically flooded by the upland waters, were the most valuable of meadows,—all Egypt in its adoration of the Nile, testified to the same great truth: still amid all these self-apparent facts, ages elapsed before any correct conclusions were formed as to the cause of the fertilizing power of these liquid manures.

It was held to be the result of water, and water only, for no regard was had to the earthy, saline, or organic substances with which it was impregnated, and the fertility produced by a dunghill was sagely attributed, not to the fluid matters drained from it, but from the dunghill *warming the land*; and so far did they carry their arguments, that some of the Greek philosophers were fully convinced that water, and pure water only, was the sole food of plants, an error which centuries afterwards M. Van Helmont, a celebrated Dutch philosopher nearly succeeded in perpetuating by some curious though deceptive experiments upon a willow tree, which he nourished for a lengthened period solely by rain water, which water, thus collected in the ordinary way, always contains earthy and other substances, in minute proportions it is true, yet quite sufficient to furnish an ample supply for the willow, as M. Bergman afterwards very clearly proved, and every attempt to raise plants from pure water has invariably failed. An oak raised from an acorn in pure water, makes less and less progress every year, and those persons who cultivate hyacinths and other bulbous roots in water, are well aware that without these bulbs are placed in the earth every other year, they actually refuse to blow, and at last cease even to vegetate. It is clearly proved, therefore, that it is not pure water alone which constitutes the chief fertilizing ingredient in liquid manures, as was formerly supposed. Liquid manure, however, like all other fertilizers, must be applied with discretion, and in accordance with the habits of the crop, thus the proportion of flood water, in which the rice plant or the grasses of the meadow grow luxuriantly, would be destructive to barley or wheat, an excess of any kind indeed of manure is naturally pernicious to all plants.

Almost all the earthy, saline, or alkaline substan-

ces found in vegetables are soluble in water—thus lime, gypsum, and even silica, apparently totally insoluble substances, and very common vegetable ingredients, are all in very small proportions found in water, and there is little doubt but that all these substances are absorbed by plants in the fluid state, for every attempt of Sir Humphrey Davy to make plants absorb the fine impalpable powder of charcoal, obtained by washing gunpowder, entirely failed. It has been shown also by various well-contrived experiments that the roots of plants have the power of separating the various substances dissolved together in water in a very curious manner.—Davy caused the roots of some plants of mint to be analysed, which had grown both in pure water and in sugar and water. One hundred and twenty grains of the roots of the mint which had grown in common water, yielded three grains and a half of a deep olive extract of a sweetish and astringent taste; one hundred and twenty grains of the roots which had grown in the sugar and water, afforded five grains of pale, greenish, sweetish extract, not so astringent as the other. This, therefore, is another instance of the power possessed by plants of absorbing many manures in an unaltered state. Many experiments with saline manures support this position, thus in those of the late Mr George Sinclair.

1450 grains of wheat chaff, grown on an unsalted soil, yielded of common salt	2 3-4 grains.
1450 do. from a soil salted with 44 bushels of salt per acre	4 do.
1450 do. seeds, from soils unsalted	1-6 do.
1450 do. from soil treated with 44 bushels of salt per acre	1-4 do.

In this case the quantity of common salt absorbed by the plant evidently increased with the increase of the supply. The preference, too, which plants show for different salts is very remarkable, as first shown in some very curious experiments by M. Saussure. In these trials various salts were dissolved together in water, and plants of *polygomon persecaria*, and *bidens canabina*, with their roots, were placed in the solution, the same weight of each salt was dissolved, and the solution contained 100th of its weight of each salt, and in stating the result every salt is supposed to consist of 100 parts.

	Proportion absorbed by the plant.
1.—Sulphate of soda (glauber salt)	117
Muriate of soda (common salt)	22.
2.—Sulphate of soda	12.
Muriate of potash	17.
3.—Sulphate of soda	6.
Muriate of soda	10.
Acetate of lime	0.
4.—Gum	26.
Sugar	36.

Other plants showed similar results in the varying quantity of the salts which they absorbed.—Such were the Scotch fir, the mentha piperita, peppermint, &c., as long as they were furnished with their roots; but if these were cut off, or removed in any way, the plants then absorbed the solutions indiscriminately.

It is from plants always absorbing their food in a fluid state that liquid manures are so valuable as fertilizers; for in the dissolution of the excrements of animals in water, as practised so advantageously in foreign countries, the dung is merely rendered

more easily soluble by the plant, and better diffused in the land. No new compound is formed by the mixture; the action of the dung mixed with four or five times its weight of water is apparently much less energetic; and yet this plan is decidedly advantageous, successfully produces the most luxuriant crops, is an old practice on the continent, is gaining ground in England, and the more it is understood the oftener will it be adopted.

Liquid manure is called by the farmers of Switzerland *gulle*, in France it is called *licier*; they obtain it by collecting the drainage of their stalls and stables into underground reservoirs or pits, where it is allowed to ferment until it attains a slimy or mucous state. The mode adopted by the cultivators of Zurich is thus described in the *Bulletin de la Soc. de Geneve*:—

“The floor on which the cattle are stalled is formed of boards, with an inclination of four inches from the head to the hinder part of the animal, whose excrements fall into the gutter behind, in the manner usual in English cow-houses; the depth of the gutter is fifteen inches, its width ten inches; it should be so formed as to be capable of receiving at pleasure water from a reservoir placed near to it; it communicates with five pits by holes, which are opened for the passage of the slime or closed as occasion requires. The pits or reservoirs of manure are covered over with a floor of boarding, placed a little below that on which the animals stand; this covering is important as facilitating fermentation. The pits or reservoirs are made in masonry, well cemented, and should be bottomed in clay, well beaten to avoid waste. They should be five in number, in order that the liquid may not be disturbed during the fermentation which usually lasts four weeks. Their dimensions should be calculated according to the number of the animals held by the stable, so that each may be filled in a week; but whether full or not, the pit must be closed at the week's end, in order to maintain the regularity of the system of emptying: the reservoirs are emptied by means of portable pumps.

In the evening, the keeper of the stables lets a proper quantity of water into the gutter, and returning to the stable in the morning, he carefully mixes with the water the excrement which has fallen into it, breaking up the more compact parts, so as to form of the whole an equal and flowing liquid. During the day, whenever he comes into the stable, he sweeps whatever excrement may be found under the cattle into the trench, which may be emptied as often as the liquid it contains is found to be of the proper thickness; the best proportion of the mixture is three-fourths of water and one-fourth of excrement, if the cattle be fed on corn, but if in a course of fattening, one-fifth of excrement to four-fifths of water will be sufficient.”

This mode of fattening cattle, says Mr Loudon, is in general use in Holland and in the Netherlands, and we have seen it practised in France, at Trappe and Grignon, near Versailles, at Roville, near Nancy, at Ebensberg and Schleipsheim, near Munich, and at Hohenheim and Weill, near Stuttgart.

With regard to the quantity of liquid manure to be applied per acre, and the best mode of applying it, much must depend upon the circumstances under which the cultivator is placed, and the richness of the liquid: if the impurities dissolved or mechanically suspended in the water are only equal to one part in ten, then twenty to thirty tons per acre of the liquid will be found to be amply suffi-

cient to produce the most excellent results; if the fluid mass is richer, then less will suffice.

For gardens and small plots of ground the liquid may be readily and evenly distributed over the beds by means of a watering pot or garden engine; for fields it must be carried in water carts, and distributed either by being let into a transverse trough, pierced with holes in the manner of the carts employed for street waterings, or the Flemish plan may be adopted, of taking it into the fields in water carts open at the top, (furnished with slight movable covers,) and then distributing it out of the carts very evenly by means of a scoop.

I would suggest to the cultivator, in case he intends to employ either the watering pot or any other plan by which it will have to pass through small holes, the advantage of straining the liquid before he pumps it into the vessel, either through coarse sand or a basket; the pieces of straw and other coarsely divided matters thus separated by the strainer, he will find to add very slightly indeed to the fertilising powers of the liquid, and yet they will materially hinder the even distribution of the manure.

If it shall occur to the farmer that the quantity of solid manure thus conveyed to the soil will not in reality exceed two or three tons per acre, and that this is in appearance a very small allowance, I would then remind him that the quantity thus conveyed consists of the soluble or richest portion of the manure, and is, in fact, the extract without any of the straw or other inert residuum usually carried on to the soil. I have elsewhere endeavored to show that a flooding with river water so productive of fertility in the water meadows, does not convey on to the land more than two tons per acre of animal and vegetable substances, and in the very successful experiments of the late Lord Somerville with whale blubber, not more than a ton and a half per acre mixed with earth was employed.—The Essex farmers find three-quarters of a ton of strats amply sufficient, and two hundred weight per acre of gypsum is the ordinary allowance; it is a mistaken conclusion, therefore, which is often entertained by farmers, that manure must be added to a soil in large quantities to produce a desired result.

Liquid manure is easily and with excellent results applied to grass land; it is perhaps the most cleanly dressing that pastures can receive; I should advise, however, that wet or showery weather be chosen for the time of watering, that the manure may be more readily and completely absorbed by the soil. In some experiments with the liquid collected from a cow-house, ten tons per acre have been found amply sufficient by Mr Hammond, on some meadows near to Lewes, in Sussex.

The land on which the manure was sprinkled by means of a water cart has twice the quantity of grass than that not so fertilized; it is free from weeds which have been evidently choked with the grass, while the herbage of the other portion is poor and short, and very foul.

One great constituent of all the drainage matters of dunghills consists of urine, and this substance enters into the composition of almost all the artificially prepared liquid manures; and there is perhaps no fertilizer more powerful in its effects.—“All urine,” said Sir Humphrey Davy, “contains the essential elements of vegetables in a state of solution; during the putrefaction of urine the greatest part of the soluble animal matter that it contains is destroyed; it consequently should be used as

fresh as possible; but if not mixed with solid matter it should be diluted with water, as when pure it contains too large a quantity of animal matter to form a proper fluid nourishment for absorption by the roots of plants.”

Urine has been analysed by M. Berzelius, and its constituents were found to be as follows:

Water	933.00
Nephrin (a peculiar animal matter)	30.10
Sulphate of potash	3.71
Sulphate of soda	3.16
Phosphate of soda	2.94
Muriate of soda (common salt)	4.44
Phosphate of ammonia	1.65
Muriate of ammonia	1.50
Lactic acid	
Lactate of ammonia	} 17.14
Animal matter mixed with nephrin	
Earthy phosphates (earth of bones) and fluuate of lime	1.00
Uric acid	1.00
Mucus	0.32
Silica	0.03

1000.00

This analysis amply bears out the observation of Davy, that urine contains the essential elements of vegetables; and hence the magic effects which it produces when spread upon the earth: it contains many constituents which are a direct food of plants, and by the decomposition of others furnishes a supply in another form, containing all the ammoniacal salts of the dunghill, the phosphate of lime of bones, and abundance of easily decomposable animal matters.

The urine of the cow has been analysed by Mr Brande: he found it composed of—

Water	65
Phosphate of lime	3
Muriate of potash	} 15
Muriate of ammonia	
Sulphate of potash	6
Carbonate of potash	} 4
Carbonate of ammonia	
Urea	4
Loss	3
	100

The urine of the horse has been examined by M. M. Fourcroy and Vaquelin, and found to be composed of the following substances:

Carbonate of lime	.011
Carbonate of soda	.009
Benzoate of soda	.024
Muriate of potash	.009
Urea	.007
Water and mucilage	.940

The most extensive experiments with urine as a fertilizer, with which I am acquainted, were those made by Mr Harley, in the neighborhood of Glasgow, which he thus describes: “Early in the season, part of the proprietor's farm and some small fields contiguous to the cow-house, were sown with barley and grass seeds; these were watered with cow urine, by means of an engine on the principle of a fire-engine. There were also used for that purpose hand-barrows with broad wheels, upon which barrels were placed filled with urine. Under the barrels were placed conductors, about eight feet long, perforated with small holes. These barrows were easily wheeled along the rich soft ground, which would have been destroyed by horses and

carts. The urine was carted to the field in large casks, from which it was carried in stands resting on spoked, to the engine and barrows. The grass of the fields thus irrigated was cut five or six times a year, and though not very long in the blade, yet there was always a great weight of produce—indeed it was so rich and thick that it would have rotted unless cut often. The first cutting generally commenced about the middle of April, and was continued once a month. The grass was cut during the day when the weather was wet or moist, but when it was dry, it was cut late at night or early in the morning, and the land irrigated immediately after the grass was cut. Sir John Sinclair visited one of these fields which had been cut sixteen times in three years."

"Both urine and soap suds," continues Mr Harley, "were applied to the watering of fruit trees.—During the winter and the early part of the spring, every tree was washed from the top to the root, which cleansed the bark, promoted a luxuriant growth, and made the trees bear well. There were about five acres of Garnet Hill, near Glasgow, planted with strawberries of assorted kinds, the ground was prepared as stated above, (dug, ploughed, and some rubbish added), and the strawberries were planted in rows which were trenched between every fall or winter. The field was divided into sections across the hill, and at the top or head of each of these sections there was a small trench made. The cow urine was carted along the top of the field, and by turning the stop-cock the urine ran into the trench at the top of the highest section; a small opening was made between every row of the strawberries to admit the urine which saturated the first section, the remainder then went into the second trench, &c. to the bottom.

"The highest sections were the poorest, but from their being more richly saturated with the liquid, they soon became as fertile as the lowest. The mode of irrigating was then changed, viz.; a small cut was made from the top to the bottom of the field, and the urine made to run down that cut and fill each respective trench, allowing a larger quantity to the sections that stood most in need of it. This mode produced abundant crops of strawberries, very rich in quality, and, having a southern aspect, of most delicious flavor."

"The urine," continues Mr Harley, "destroyed worms and almost every kind of vermin;" and it was proved that when thrown by means of a garden engine over fruit trees, that the urine was a complete destruction to the predatory insects with which they were infested, and that when applied to grass plots, it was equally pernicious to earth worms, entirely preventing the earth-casts with which they are wont to annoy the gardener.

(To be continued.)

Boston Courier.

The price of flour has fallen rapidly. Howard street sells in Baltimore at \$5 75.

[For the New England Farmer.]

How often do we hear it said that "Massachusetts farmers cannot get a living"—but a few days since I heard a farmer remark that "no one could expect by farming to receive more than four per cent. for their capital invested." These things have been so frequently reiterated that our young men feel that they are under the necessity of seeking other employments or remove to the west, where it is represented that labor receives a greater return. I am aware that much may be done to increase the income of the farmer, and trust that light is dawning and that a new impulse has been given, which ere long will convince our young men that agriculture in Massachusetts is not only honorable but profitable. It has appeared to me strange that farmers generally neglect to keep correct accounts in reference to their farms; probably owing to this many have been deceived; their farms not having the credit for all they produce.—In your paper of last week, Mr Anthony has given an account from which something may be learned. It has been my practice to keep an exact account, charging everything and giving credit for everything belonging to the farm. In order that I may be corrected if in an error, I shall suppose a case, and give you the account as I keep my own.

Suppose my family consist of ten children, and one of the number, by sickness or some other calamity, is a constant bill of expense, and suppose my neighbor is not blessed with children, and we have farms nearly alike and managed nearly in the same way—our expenses will not be the same, and unless a proper account is kept, I may be led to complain of the unprofitable business of farming. The following account is on the supposition that I am "clear of the world" and my all is in my farm and stock. I estimate my stock and tools, &c., at prices they would command, being careful not to deceive myself on this point—considering that for my own use they are worth more than estimated at; also intending to improve my farm and make it more valuable.

1838, April 1.	Farm Dr.	
Cost of farm		\$3000
Manure on hand		150
Stock		400
Produce		200
Tools		250
Dairy utensils		50

		\$4050
Purchased during the year stock and tools		200
Sundry expenses		42
Paid for labor		40
Board		17
Labor of self and two sons including board		575
Labor in dairy		75
Paid taxes		15
Insurance		5
Interest on \$4050		243

		\$5262
Balance profit		400

		\$5662
	Cr.	
By hay and grain sold		\$196
Butter, cheese, veal and milk		394
Pork and beef		450

Wood for family above what was used for dairy, &c.	45
Grain, butter, milk, &c. &c. for family	195
Rent of house and use of horse	75
1839—March 31—On hand	400
Produce	350
Manure	250
Tools	262
Dairy utensils	45
Farm	3000

	\$5662

And now let us suppose my farm sold and the account closed, and the result as above. I have to support my family—

Received for board	\$17
Labor and do	650
Interest	243
Profit	400

\$1310

Now my expenses, arising from a numerous family, sickness, the education of a son, &c. may have been \$1600, if so, should it be said that farming is not profitable? It appears that I am paid for my labor and receive more than 15 per cent. interest for the capital employed.

I have made this statement, believing that farmers often are deceived, and that a multitude of farmers in Massachusetts can show a better result than is exhibited by this account. T.

Westboro', June, 1839.

Wool.—The season for sheep-shearing has passed, and we learn that there has been quite a large clip, and that the growers generally, are convinced that they will not be able to obtain the extravagant prices which a few months since it was expected would be realized. In consequence of some advance in prices of woollen goods last autumn, there was manifested by the manufacturers a strong disposition to lay in heavy supplies of wool, and an undue demand for the article was created, thereby causing a large advance in prices, which was far from being warranted, even if the highest prices for goods which were anticipated, had been realized. But instead of any permanent improvement in wool, to any great extent, the advance which had taken place was not maintained, and prices receded to nearly the lowest point which they had been during the preceding years. The consequence has been, that manufacturers generally, have not been doing a profitable, nor in many cases, a saving business, and will not, for any length of time, continue their operations under such unfavorable state of things. Already several establishments have stopped a portion of their machinery, and others will do so unless the prices of wool shall justify their going on. Some manufacturers have sold their woollen machinery at a great loss, and are preparing to work cotton. We have information from the western part of Pennsylvania, that the growers are selling their wool at an advance of about five cents per pound on the lowest prices realized last year. The wool grown in that region is the best produced in the country. The quantity is very large, and is likely to be in market quite early this season. Prices range there from 35 to 50c. Some very choice flecks command from 50 to 55 c. In New York sales are making at from 33 to 50 c. and in Vermont from 30 to 50c. No new wool has yet been brought to the principal markets, and as prices cannot be fixed until sales have been effected there, we omit quotations for the present. The supply of pulled Wool is limited, and asles continue to be made without any material change, as regards prices. Of coarse Foreign Wool there is not a large supply, but sufficient to meet the present demand, and prices are firm.—*Courier.*

Dreadful. Mr S. C. Johnson, of Raleigh, N. C. accidentally killed his wife on the 18th ult. by discharging his gun into the garden, not knowing that Mrs J. was there.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JUNE 19, 1839.

LETTER FROM J. HOLBROOK.

Berca, May 21, 1839.

REV. MR COLMAN—

Dear Sir,—I send you a copy of the Cleveland Herald, containing six essays on the "Education of Farmers," which to some extent, at least, will meet your views on the subject. The importance of the subject I am sure you will appreciate, and I think approve of the measures to promote it, which are the two principal points in the case.

I have been strongly impressed with the policy of referring farmers to themselves, the means within and around them, for intellectual and moral culture, from a large intercourse among the farmers in Pennsylvania, where I have recently spent two or three years. That measure has led the German farmers, who, you know, have been opposed to a college, and even a book education, to enter heartily and successfully upon *educating themselves*. It is exceedingly common to find among this class of our citizens, large "FAMILY CABINETS," embracing a great variety of minerals, plants, insects, &c. In some sections almost every family has such a collection, and in connexion with them they have numerous Lyceums, one of which started the "PRACTICAL FARMER," of Mechanicsburg. The members have also entered very systematically into experimental agriculture, by selecting a large list of experiments to be tried, and dividing them and allotting them to the particular charge of respective individuals.

It is not my wish or intention to speak to the disparagement of colleges or any other class of institutions, or of the individuals educated at them. I only wish to have farmers understand and appreciate their own facilities for acquiring knowledge, with the amount and kind they already possess. If I am not mistaken, knowing how to hoe a hill of corn, harness a horse, feed a pig, or make a cheese is knowledge, and *useful knowledge*, no less than an acquaintance with the inflections of a Greek verb.

I am also convinced from large experience, that a farm is one of the best establishments for promoting solid science. I have attended three courses of lectures by Professor Silliman, and was much with him in his laboratory, but I found the farm which I cultivated for many years, the best laboratory of the two—certainly for many of the fundamental principles of chemical science.

The plan for supplying our schools with teachers will probably meet your approbation, particularly as it is intended for farming communities or country towns, and not for cities or large villages. The plan meets almost entire approbation in Pennsylvania, where it has been fully and extensively discussed, and, to some extent, put in practice.

The plan of "*Circuit Schools*" you will probably be disposed, as I am sure you will be able, to advance. A prominent object of our establishment, the "LYCEUM VILLAGE" and Seminary, is to qualify teachers to take charge of such schools, also to act as agents or missionaries for the cause of education, of a more natural, practical and elevated character, than is generally procured in our schools, or even colleges. The applicants are very numerous, many more than we can accommodate at present, though by another year we hope to have our accommodations much enlarged. We have 1350 acres of land, ample water power, both on a creek and river, inexhaustible stone quarries, for grindstones, much the best I have ever seen, far superior to the Nova Scotia stones; two saw mills at work most of the time, cutting lumber for our village, and some measures in progress for the manufactory of apparatus, with the intention of reducing the price to one half or one third of its present cost, and of a superior quality, for practical illustrations, in chemistry, natural philosophy, mechanics, hydraulics, arithmetic, geometry, astronomy, &c. to any now to be procured.

The plan of "*Scientific Exchanges*" referred to in the essays is already widely extended, both in this and other countries. Specimens, numerous specimens, both of nature and art, have been sent from schools in various places, especially in Philadelphia and New York, to every part of the world. Measures are now in progress

to send specimens to every member of Congress and to every legislature in the Union, during their next sessions. Many have already been sent to the members of Congress and with the happiest results; they have also been sent or exhibited at several legislatures, where they have made very brief but very effective speeches in favor of rational practical education.

Mr Tucker, of the Genesee Farmer, is deeply interested in these plans, and desirous of presenting them to his numerous readers in a tangible practicable form.—If the same should be done by all or most of thirty-two agricultural journals in our country, a system of measures might probably be put in operation, which would greatly promote and greatly elevate the character, both of education and of farming interests.

Rev. H. O. Sheldon, Post Master of this place, is a warm and efficient friend of rational improvement of every kind; and is a successful agent of the "Genesee Farmer," many of which he distributes from his office. If you should deem it expedient to present this subject under any form in your paper, he, no less than myself, would esteem it a favor to have a copy containing the notice sent to him. He might possibly circulate a few copies to subscribers here of the New England Farmer. He has procured, at least, one subscriber for the Monthly Visitor, of Concord, N. H., and has introduced various publications of a useful character to the citizens.

I have extended this communication much beyond my intention when I took my pen, and will add the very respectful regards of

Your Friend,
J. HOLBROOK.

Remarks on Mr Holbrook's Letter—Condition of Pennsylvania—Practical Education.

We insert with much pleasure Mr Holbrook's letter; and shall wait impatiently the arrival of the Cleveland Herald, for a fuller explanation of his views on a subject of the highest moment, Practical and Popular Education. We shall not now go at large into this matter, as we have an article on the subject in preparation for another occasion; and do not wish to anticipate it.

We are glad to hear from him in Pennsylvania; and should have expected from the agricultural population of that state all the encouragement which his plans for practical improvement have met with. We have often heard with incredulity and some mixture of indignation, the German population of Pennsylvania spoken of in disdain as a set of ignorant, semi-savage boors, who despise everything like education and have no desire for knowledge; but when we have passed through different sections of that magnificent state, and witnessed their noble agricultural establishments and improvements, which are not surpassed and scarcely rivalled in any part of our country, their substantial houses, their noble barns, their spring houses, their fields waving with the most luxuriant and richest harvests, which the earth can yield, and which can be brought out only at the call of eminent skill and industry; when we have seen their splendid teams of horses, and the excellence of their equipments, the abundance of their markets and the immense amounts of their agricultural products; when we consider the unrivalled excellence of their butter and beef, and mutton and poultry, and their early and liberal introduction of the best breeds of sheep and neat cattle, and their persevering and expensive attempts to improve their stock; when further we observe their extraordinary public improvements in turnpikes, bridges, railroads and canals in which Pennsylvania has completely distanced all her sister states, by her munificent investments of capital and by the admirable manner in which her public works have been executed, then we have been disposed to ask, where is the evidence of all this ignorance and stupidity, this aversion to improvement with which the population of Pennsylvania is incessantly reproached? This assumption of superiority on the part of some persons, who, where the German farmers have been ready to spend a dollar, they have been re-

luctant to expend even a cent for public improvement is exquisitely ridiculous, to apply no harsher term.

It was our good fortune three or four years since, travelling through Pennsylvania, to fall in with a large body of Pennsylvanian gentlemen, who were proceeding together to some public business-meeting at Harrisburg and with whom we passed a day and a night in the canal boat. They were Pennsylvania farmers and manufacturers; and men of better manners or better information are seldom met with. A population composed of such men, or of men of the character indicated their private and public improvements, we cannot doubt will be ready to second with their personal influence and their money, any feasible, practical, and substantial schemes for the general welfare.

We cannot agree with Mr Holbrook in speaking disparagingly of scientific lectures in chemistry, as though he does in his letter. He is among the last men from whom we should expect it, and perhaps we must understand him. We admit that what a man acquires from his own personal investigations and experiments affects his mind with a deeper impression than that which he merely listens or of which he is a passive spectator. He may find in the earth the best laboratory for the application of the principles of chemistry and the ascertainment of many valuable chemical truths. I how can there be a doubt that his attendance upon lectures and experiments of an intelligent philosopher whose life has been devoted to inquiries and experiments in natural science, with all the advantages which an extensive and improved apparatus could afford, will be in the highest degree beneficial; and, in fact, the very best preparation he could have for the discovery and application of scientific and practical truths in our agricultural operations? What Mr Holbrook learned in Professor Silliman's laboratory, has undoubtedly given to him increased interest, pleasure, and success in farming; and has been the great stimulus and the successful guide to his public-spirited exertions to remedy knowledge every where accessible to the people; and create a strong taste and passion among them for natural science.

Of the comparative value of what is called a classical education we do not like to trust ourselves to speak this time, because we have not room to say what would; and we should be sorry to throw out opinion which would be deemed heretical, without giving reasons for those opinions at large. We have opinion on the subject of education and reasons for those opinions; and, if life is spared, those who will take trouble to read what we have to say, shall hear from us fully. In the mean time we have only to suggest that though all knowledge is useful, it seems a ridiculous waste of time to begin our studies where all who were before us began, instead of beginning where they left off and so taking advantage of their experience; that the devotion of the best years of life and of the faculties of the mind in their brightest vigor to the study of a dead language, which contains nothing useful but what may be obtained in a thousandth part of the time through the medium of a translation, and merely for the sake of the pleasure of understanding the accurate inflections of Greek tenses and declensions and of enjoying the euphony of a Greek dialect, is a waste of treasure and a piece of ridiculous coxcombry of which men of sense should see the criminality and the folly. We will also our conviction that our colleges and universities are actually behind the age; that many of our academies and boarding-schools mistake the true ends of education and furnish that only which is superficial and a poor equivalent for the time and money expended; that our theological schools are most of them the mere nurseries

monkery and fanaticism; and that there are now more and better educated men among the self-taught practical men of our community than among those who have received the parchment diplomas of our public institutions. They speak as well; they often write better. They know more of history, more of art, and more of human nature. They know more of natural philosophy, of moral philosophy, and of political philosophy;—more of law and more of government; less of metaphysical theology, but more of the religion of reason and common sense, which is the only true Christianity; less of the quibbles and scholastic technicalities of forensic practice, but more of the great principles of common law, equal justice, and the inalienable rights of humanity; and above all they have learnt the greatest of all arts, the only certain foundation of all real improvement, the art of using and applying their own physical, mental, and moral energies in a spirit of self reliance, and of personal judgment and independence. H. C.

Massachusetts Horticultural Society.

EXHIBITION OF FLOWERS.

Saturday, June 15th, 1839.

Native Flowers.—By Wm Oakes, Esq. of Ipswich, viz.—*apricinus*, flowers pure white; ditto, flowers flesh colored; ditto, flowers blue; *Senecio chloratus*, cultivated; *ovallaria borealis*, ditto.; *Eriophorum alpinum*. Also several specimens by Mr John Hovey of Roxbury. **Geraniums.**—Thirtyfour varieties from S. Sweetser, Esq. Cambridgeport. Some of the specimens were very good. **Roses.**—By S. R. Johnson, Esq. of Charlestown, viz.—*Lucia*, *Roses—Agrippina*, *D'Arcole*, *La Marque*, *Noisette*, *Andrieux*; *Out door Roses—Noisette*, *Parma*, *Duroc*, *Yellow arizon*, *Red and Yellow Austrian*. A fine specimen of *Chionanthus virginica*, or *White ring Tree* from the Messrs Winship. There was also a fine display of cut flowers from the gardens of Hon. John Lowell of Roxbury, Thomas Lee, Esq. Brookline, and from Messrs Merrill, Winship, Hovey, and Masson. John Towne, Esq. of Boston, presented several very fine green-house plants. Particulars hereafter. For the Committee. S. WALKER, Chairman.

Vegetables.—G. W. Stearns, Esq., of Cambridge, exhibited Cucumbers—large and very fine. Mr Rufus Howe, of Dorchester, Green Peas and early Virginia Strawberries—both fine specimens. For the Vegetable Committee. JAMES L. L. F. WARREN, Chairman.

NOTICE.—The Massachusetts Horticultural Society will read their premiums, on Saturday next, 22d inst. for the best display of *Roses* \$10; for the best twentyfour hardy varieties \$5 00; for the best twelve hardy varieties \$3; for the best twelve Chinese and other tender varieties \$5. Also their premiums for the best display of *Pinks* \$5; for the best six varieties \$3; for the best seedling \$3. Per order. S. WALKER, Chairman.

*. * The Rooms of the Society, 23 Tremont Row, are open every Saturday morning from 11 to 1 o'clock for public inspection. June 19

LARGE PIG.—We are informed that Mr Cotton Graves, of Sunderland, raised and latted a pig, which when slaughtered at the age of twelve months, weighed 400 lbs. We should call this a clever sized animal, for a young one.

BRIGHTON MARKET.—MONDAY, June 17, 1839.

Reported for the New England Farmer. At Market, 140 Beef Cattle (including 40 unsold last week), 20 Pairs Working Oxen, 18 Cows and Calves, and 770 Swine. Several hundred swine unsold. **PRICES.—Beef Cattle.**—We again advance our quotations to conform to sales. A few of a very prime quality were sold at \$10. We quote First quality, \$9 50 a \$9 75. Second quality, \$9 00 a \$9 25. Third quality, \$7 50 a \$8 50.

Working Oxen.—A few pairs were sold but we cannot quote prices.

Cows and Calves.—Sales, \$35, \$42, \$50, and \$65. **Sheep.**—None at Market except a few lambs. Prices not made public.

Swine.—“Dull,” and prices reduced with the exception of a few of the *Berkshire bred*. A lot of large barrows, selected and very fine, at 8 7-8, and a lot at 8 1-2. A lot of sows to peddle at 7, and a lot of small pigs at 9. At retail from 7 1-2 to 11. We noticed the sale of one Berkshire weighing about 160 at \$50.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending June 16.

SCYTHES AND RAKES.

The subscribers have received their usual supply of Scythes, Rakes, &c. among which are
100 doz. Hall's Rakes, superior.
100 " Wilder and Eddy's, do.
200 " Common, do.
25 " English Cast Steel Grass Scythes.
100 " " " Cradle " "
100 " " " Border " "
200 " Round Scythe Stones and Rifles.
100 " Square " " "
300 " Patent Scythe Snaths, superior.
June 19. JOSEPH BRECK & CO.

MULBERRY FOLIAGE.

Quantities of Mulberry Leaves for feeding Silk Worms, may be had by application, personally or by mail to WINSHIP'S Establishment, or to JOSEPH BRECK & CO. 52 North Market Street, Boston. Brighton, June 17.

SAYLE'S GARDEN ENGINE.

For sale at the New England Agricultural Warehouse Nos. 51 and 52 North Market Street, Sayle's Garden Engines This Engine is a splendid article, and will throw a constant stream of water to the distance of 50 or 60 feet, with great force, and in case of fire would be a good substitute for a fire engine. It is the most perfect article for the purpose ever introduced. JOSEPH BRECK & CO.

BEES WANTED.

One or two first rate Hives of Bees wanted immediately. They must be warranted free from the moth. Apply at the New England Farmer Office, 52 North Market Street. June 12

DURHAM SHORT HORN BULL.

For sale, a very fine Durham Short Horned Bull, three years old. For further particulars inquire at the New England Agricultural Warehouse. Boston, June 12, 1839

BOAR FOR SALE.

For sale a Boar 3 parts Berkshire, 1 part Mackay, one year old, raised by Elias Phinney, Esq., of Lexington. Apply to JOSEPH BRECK & CO., New England Farmer Office. June 5. 21 SIMON H. BARRETT, Malden.

DOUBLE DAHLIA ROOTS.

For sale at the New England Agricultural Warehouse and Seed Store, a superb collection of Double Dahlias, consisting of all the improved varieties. Also, Double Carnations of many fine varieties. JOSEPH BRECK & CO. May 6.

Sheet Lead and Lead Pipe.

Sheet Lead and Lead Pipe all sizes, constantly for sale at No. 1 City Wharf, by A. PEARING & CO. May 22. Sw.

CORN SHELLERS.

Just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, a supply of Currier's Patent Corn Shellers; a very convenient and cheap article. A right to us to say such machines in counties or towns may be obtained by applying as above. April 17. JOSEPH BRECK & CO.

NEW BOOKS.

A Treatise on the Cultivation of the Dahlia and Cactus. By E. Sawyer.
Also, Birds and Flowers and other Country Things. By Mary Hewitt.
Dennis's Silk Manual.
American Flower Garden Companion.
American Fruit Garden Companion, and
An Essay on the Practicability of Cultivating the Honey Bee in Maritime Towns and Cities as a Source of Domestic Economy and Profit. By J. V. C. Smith, M. D., for sale by June 12 JOSEPH BRECK & CO.

MISCELLANEOUS.

[From the Pictou Mechanic and Farmer.]

THE ALBION MINES AT PICTOU, AND THE COAL TRADE.

From the parlor window an advantageous view of the Mines may be enjoyed. From here may be seen half a dozen large chimnies, issuing columns of dark smoke. These are connected with the steam engines of foundry and coal works. One of the chimnies, used for the purpose of ventilation, is over 140 feet in height, and is a handsome structure. The pits are eight in number, one of them over 60 fathoms deep; and one of the engines is 70 horse power.

To the left, and in the rear of the inn, are the miner's houses. Their number is astonishing, and is probably not less than 250, over 100 of which were erected last year, and have a neat and pleasing appearance. In returning from the inn, nearly opposite to the office stands a small high-pressure engine of 10 or 12 horse power—the only one at the works. Farther on, in rear of the store, stands another engine of 28 horse power. These two engines are attached to the first set of pits—into one of which we descended, and enjoyed a ride for near half a mile on a subterranean railroad.

Passing along further you come to the stables, which, though a shabby set of buildings, contain the finest and largest stud of horses in the province; and in the lower regions there are upwards of 50 nire of equal beauty and strength. These horses have been selected from all parts of the Province, and many of them are the descendants of the Sampson horse. They are certainly fine animals, and their round and glossy appearance do great credit to their keepers. Farther on, stands the carpenters' shops and lumber yard, enclosed by a neat board fence. To your left, crossing the old railroad, are the new range of pits sunk during the last year. Four of the newly opened pits are for drawing coal, and the other two for the purpose of ventilating the works. The deepest of the two latter (450 feet) is called the engine pit, where the pumps and machinery for drawing the water from the mines are erected. The two winding engines, 25 horse power each, made at the "Albion Foundry," are erected; the pumping engine, 70 horse power, is erected, and the pumps are being put in will be completed about the first of June. The house containing this engine is a handsome stone building. We are informed that when completed, this new work will employ about 150 colliers, in addition to the immense number now employed on the premises. There are now from 5000 to 6000 chaldrons of coal raised per month.

To your right, on the opposite side of the road, are the coke and coal-tar ovens. A little farther onward, stands enclosed the foundry and its appendages, under the management of Mr H. W. Davis. This is also a large brick building, containing a steam engine of 20 horse power, and ample moulding, pattern and finishing rooms, &c. There is also a saw mill propelled by steam power, in constant operation on the premises. Three of the engines now in operation at Mines, were constructed at this foundry, the beam of one of which is over 30 feet long, and of 5 tons weight. Castings of every description can be supplied at the foundry, and the fact that the engines constructed there appear equal if not superior to others connected with the

works, add no little to the confidence that may be placed in Mr Davis, as an experienced engineer.

Before leaving the mines, the traveller must visit a spot on the river, a little above the store, where fire may be seen burning on the surface of the water—caused by carburetted hydrogen gas arising from the bed of the river—passing through the water, and escaping in bubbles on its surface. On applying a lighted candle or a piece of paper to the gas, it will ignite, and continue burning for weeks. Over it may frequently be seen a pot boiling on the water, the river frequently on fire, while some of the finny tribe may frequently be seen gliding through the water below the flames. Persons in the vicinity avail themselves of this burning gas, in heating water for washing.

Proceeding down the railroad about 2 1-2 miles, and about 1-4 of a mile below the bridge at New Glasgow, stand the shipping wharves, shoots, &c. Here the old railroad terminates—here the coal brought down from the mines in wagons of one chaldron each (one horse bringing four or five) are loaded into lighters, or vessels not exceeding eight feet draft of water. It was the intention of the company to have removed some banks in the river, so as to bring up twenty feet of water to this place; but we are sorry to say that after constructing a dredging boat, mud lighters, &c. they abandoned this part of their plan, in consequence of opposition experienced, we are informed, from persons in New Glasgow, who we certainly think have defeated their own interest. Here are constantly in employ two steamboats of 30 horse power each, engaged principally in towing coal lighters and vessels with their freight up and down the river—and in one of which a passage down the river may be obtained for a trifle. About two miles further down, on the opposite side of the river, may be seen the ship yard of the establishment. Here are slips for hauling up the steamboats and lighters; where during the winter, there were three steamboats and thirty lighters of various sizes, some of carrying 40 chaldrons of coal, all placed side by side and far from ice and water. As you proceed down the river, the attention is attracted by the excavations, embankments, bridges, &c. of the new locomotive railroad.

About three miles down from the shipyard, is South Pictou, where may be seen the largest bridge and range of wharves in Nova Scotia. The wharves are situated on the bank of the channel, and are 600 feet in length. On these are the conveniences for loading vessels engaged in the coal trade, embracing a steam engine of 18 horse power, called a "transfer engine." It was erected last autumn, and adds materially to the previous facilities in shipping. The coal is placed in boxes containing two chaldrons each; the engine raises the box with its contents and places it over the vessel's hatchway, when a trap-door in its bottom is opened and the whole speedily transferred into the ship's hold. Sixty chaldrons can thus be transferred with safety and ease in an hour's time. Here the new railroad is to terminate, being about six miles in length, and connected with the wharves by a bridge 1600 feet in length, built on piles and raised about 20 feet above high water mark. It is in a very forward state, and probably will be completed in three months. During the last summer, from 25 to 35 sail of American vessels might frequently be seen here at a time. Over 300 sail of vessels of various descriptions were loaded here last year; and if we are not mis-

informed that number will be doubled this season. There are three locomotive engines on their way from England for the railroad, which, when they arrive with those already at the works, will amount to the number of *twelve steam engines*, to be in operation during the course of the summer.

It is an undeniable principle, that the best encouragement that can be given to agriculture and industry is to increase the consumption of the produce of one, and extend the demand for the other. Applying this to the mines under review, it will be found that nothing contributes so directly to enrich this section of the province. Property in their vicinity has increased in value in many places over 100 per cent.; and we are informed that a farm—poor land, too—which a few years since could have been purchased for £250 or £300, will not now be parted with for £700. Still there are persons who say that the mines are of no advantage in the hands of this company. We believe it not. Where could the capital be found on this side the Atlantic here invested? or if procured who would invest it?

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, Ground Oyster Shells.

Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention.

March 27.

NAHUM WARD.

FOR NEW YORK.

Cabin Fare \$3 00—Deck Fare \$1 50.

The Steamer JOHN W. RICHMOND, Capt. Wm. H. Townsend, will leave Provincetown on MONDAYS and THURSDAYS, at 4 o'clock, P. M.

Express Cars to meet the boat will leave Boston at half past 2 o'clock, P. M.

Mondays and Thursdays, will be her regular days of leaving Provincetown, until further notice.

For further information, apply to S. Q. COCKRAN, 30 Congress Street, Boston.

N. B. Freight taken at 6 cents per cubic foot.

June 5.

BRUSSA MULBERRY.

A fresh lot of genuine Brussa Mulberry Seed just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street. This species of Mulberry flourishes best in high and even poor lands, and is more likely to endure the rigors of our severe winters and not so subject to the effect of the frost, as trees brought from more southern latitudes, or warmer climates.

The leaves of the Morus alba of Brussa, are said to contain a much greater quantity of saccharine matter, than any other of the white species, and moreover, the leaf is much larger than those of Italy and Spain; it is also a hardy tree, susceptible of being raised in climates, where the frosts are severe.

At the annual fair of the American Institute at New York, in October last, specimens of the leaves of the Brussa tree, of different years' growth, were exhibited, and excited universal approbation, and the Institute awarded a silver medal for the introduction of this invaluable tree, observing in the report of the committee, "that these with every new and useful plant, calculated to withstand the rigors of our climate, are worthy of attention, and those introducing them into our country, deserve to be placed on the catalogue of our country's benefactors."

May 22.

THE NEW ENGLAND FARMER.

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

AGRICULTURAL.

ON MANURES—THEIR USES AND APPLICATION.

BY WILLIAM CUTBERT JOHNSON, ESQ.

(Concluded.)

These experiments are entirely confirmed by those which were instituted some time since by the authority of some of the German governments, who were anxious to ascertain the truth of the reported value of liquid manures in bringing poor land into cultivation. "This very question," says Dr Granville, "having been submitted a few years since to the consideration of the late Professor Hembstadt, of Berlin, by the Saxon and Prussian authorities, who were desirous to apply the city drains and cess-pools to the recovery of barren and sandy lands, in the environs of Berlin and Dresden, that eminent agriculturist undertook, in conjunction with other learned men and practical farmers, a series of experiments, which were carried on for a great length of time, and were varied in every possible way, in order to avoid all sources of fallacy. The result of these experiments Hembstadt afterwards published, and they led to extensive agricultural operations, all of which proved successful. Professor Schubler, the writer of the most esteemed and certainly the most able treatise on Agronomy, or the best mode of knowing and treating every species of land, repeated and added to the experiments of Hembstadt, from which he obtained similar results; these he published in a tabular form, which has since passed into the hands of all the large practical farmers in Germany, and have formed the basis of instruction on manuring in the hands of the professors of agriculture, whom many of the continental governments have with infinite advantage established. From that table, concludes Dr Granville, the following facts may be collected:

If a given quantity of land sown, and without any manure yields three times the seed employed, then the same quantity of land will produce—

Five times the quantity sown when manured with old herbage, putrid grass, or leaves, garden stuff, &c.

Seven times when manured with cow dung.

Nine times with pigeon's dung.

Ten times with horse dung.

Twelve times with human urine.

Twelve times with goat's dung.

Twelve times with sheep's dung.

Fourteen times with human manure, or bullock's blood.

It has been clearly shown by many very accurately conducted experiments, that the quantity of nourishment or solid matters absorbed by the roots of plants, is in proportion to the impurity of the water with which they are moistened; thus M. Sausure caused some beans to grow under three different circumstances—the first were placed in distilled water, the second in sand, and watered with rain water, the third were placed in garden mould. The plants produced under these circum-

stances were actually analyzed, and were found to yield the following proportions of ashes:

1. Those fed by distilled water	3.9
2. Those fed by rain water	7.5
3. Those grown in soil	12.0

And although all attempts to make plants flourish in the pure earths have failed entirely, when they have been watered with pure water, yet a very different result has been experienced when an impure solution or liquid manure has been employed—thus M. Giobert having formed a soil of the four earths, silica, alumina, lime, and magnesia, in the most fertile proportion, in vain essayed to make plants flourish in it when watered with pure water only; but every difficulty was removed when he moistened these earths with the water from a dung-hill, for they then grew most luxuriantly; and M. Lampadius still further demonstrated the chemical power of this drainage, for he formed in his garden compartments of a single earth—pure lime, pure alumina, and pure silica, and planted in each different vegetables, watering them with the dung-hill drainage, and he found that they all flourished equally well. The soluble matters of a soil in fact constitute its most fertilizing portion, and if by any means the richest mould is deprived of these, as by repeated washings in cold or boiling water, the residuum or remaining solid matter is rendered nearly sterile, a fact first shown by M. Sausure, and since confirmed by a variety of experiments of my own; and that these truths may be still more forcibly elucidated, I will here add the observations upon the forcing properties of liquid manure, by the late T. A. Knight, Esq., of Downton, whose loss science has lately had to deplore, and from whom I gratefully acknowledge to have received, on many occasions, important advice, and the most zealous, the most cheerfully afforded information: to his memory the gardener must breathe the brightest of his flowers, and the vegetable physiologist dedicate his works.

"I have shown, in a former communication," said the late President of the Horticultural Society, "that a seedling plum stock, growing in a small pot, attained the height of nine feet seven inches in a single season, which is, I believe, a much greater height than any seedling tree of that species was ever seen to attain in the open soil. But the quantity of earth which a small pot contains soon becomes exhausted relatively to one kind of plant, though it may be still fertile relatively to others, and the size of the pot cannot be changed sufficiently often to remedy this loss of fertility; and if it were ever so frequently changed, the mass of mould which each successive omission of roots would enclose must remain the same. Manure, therefore, can probably be most beneficially given in a purely liquid state, and the quantity which trees growing in pots have thus taken under my care without any injury, and with the greatest good effect, has much exceeded every expectation I had formed.

"I have for some years appropriated a forcing

house at Downton to the purpose of experiment solely upon fruit trees, which, as I have frequent occasion to change, the subjects on which I have to operate are confined in pots. These at first were supplied with water, in which about one-tenth by measure of the dung of pigeons or domestic poultry, had been infused, and the quantity of these substances (generally the latter) was increased from one-tenth to one-fourth. The water, after standing forty-eight hours, acquired a color considerably deeper than that of porter, and in this state it was drawn off clear, and employed to feed trees of the vine, the mulberry, the peach, and other plants; a second quantity of water was then applied, and afterwards used in the same manner when the manure was changed, and the same process repeated.

"The vine and the mulberry being very gross feeders, were not likely to be soon injured by this treatment; but I expected the peach tree, which is often greatly injured by an excess of manure in a solid state, to give early indications of being overfed. Contrary, however, to my expectations, the peach tree maintained at the end of two years the most healthy and luxuriant appearance imaginable, and produced fruit in the last season in greater perfection than I had ever previously been able to obtain it. Some seedling plants had then acquired, at 18 months old, (though the whole of their roots had been confined to half a square foot of mould) more than eleven feet in height, with numerous branches, and have afforded a most abundant and gorgeous bloom in the present spring, which has set remarkably well, and those trees which had been most abundantly supplied with manure have displayed the greatest degree of health and luxuriance. A single orange tree was subjected to the same mode of treatment, and grew with equal comparative vigor, and appeared to be as much benefited by abundant food as even the vine and the mulberry tree."

There are many accidentally-made experiments which entirely support those of Mr Knight. The immense growth of grapes by the great Hampton court vine has been supposed to be mainly owing to its roots having penetrated to an adjoining sewer, and those of the nearly equally celebrated vine at Valentines, in Essex, are known to reach an adjoining stagnant pool.

In saving and in preparing liquid manure, tanks will be found exceedingly useful by the cultivator. I find by a paper with which I was favored from Eastbourne a short time since, that they have been constructed in that neighborhood of flint, stones, and mortar with great economy and success. "At the Eastbourne workhouse, for 14 parishes, a tank has been made 23 feet deep by 11 wide, of the roughest materials, being only flint stones, and though they require more mortar than if they had been regularly shaped, yet only 90 bushels of lime were allowed, including two coats of plaster; and the workmanship is executed like field work, at ten shillings per 100 square feet, the only essential being that no clay (which worms in time bore

through) be used, and that the lime or Parker's cement be good.

It seems, too, that they have in that neighborhood turned even the drainings from the public roads to an useful account. "Upwards of twenty laborers' gardens have been watered by the rain which formerly injured the public road, and was therefore turned into a sink well, the water from which was used in planting potatoes in 1835, and occasioned good crops when sets not so watered entirely failed."

Sewer Drainage.

Considerable attention has recently been paid to the national value of the drainage matters of all great cities now generally wasted in the adjoining rivers; and this has been chiefly owing to the exertions of the Thames Improvement Company; and although from want of being properly supported, little has been yet effected towards redeeming this loss, yet the farmers of England have had, through the society's exertions, some facts of a very important nature laid before them. It has been shown that through the sewers of every town, an immense mass of urine and other excrements are annually lost to the soil, and that to such a sensible extent does this mass of drainage improve for the purposes of irrigation the water of a river, that the farmers have clearly ascertained that its value is increased very perceptibly as a fertilizer after it has passed even a small country town. I instance the waters of the Itchen as employed both above and below the city of Winchester. And whenever it has been found practicable to secure the sewer drainage in its unmixed state, it has been found, when employed in irrigation, to produce the most luxuriant crops of grass—and in no place has this been carried to so great an extent, as in the neighborhood of Edinburgh, which city, from its elevated position, affords unusual facilities for the conveyance of the sewer waters over the adjoining lands.

There are, says Mr Thomas Oliver, not less than three hundred imperial acres to which it is regularly applied, and with great advantage. Such ground is usually kept in grass, and yields from three to six cuttings in the season, which let to dairymen and others at rents varying according to circumstances from twelve to twenty-four pounds per acre. By this sewer water, says Mr Stephens, about 200 acres of grass land (1834) for the most part laid into catch-work meadow, are irrigated, whereof 130 belong to W. H. Miller, Esq., of Craigtintny, and the remainder to the Earls of Haddington and Moray, and other proprietors. The meadows belonging to these noblemen, and part of the Craigtintny meadows, or what are called the Old Meadows, contain about fifty acres, and have been irrigated for nearly a century. They are by far the most valuable on account of the long and continued accumulation of the rich sediment left by the water; indeed, the water is so very rich that the tenants of the meadows lying nearest to the town have found it advisable to carry the common sewer water through deep ponds, in which the water deposits part of the superfluous manure before it runs over the ground. Although the formation of these meadows is irregular, and the management very imperfect, the effects of the water are astonishing; they produce crops of grass not to be equalled, being cut from four to six times a year, and the grass given green to milch cows.

The grass is let every year by public sale, in small patches of a quarter of an acre and upwards,

and generally brings yearly from twenty-four to thirty pounds per acre. In 1826, part of the Earl of Moray's meadow fetched fifty-seven pounds per acre.

About forty acres of the Craigtintny lands were formed into catch-work meadows before the year 1800, which comprises what is called Fillsieside Bank Old Meadows, and is generally let at a rent of from twenty to thirty pounds per acre. In the spring of 1821, thirty acres of waste land called the Fregate Whins, and ten acres of poor sandy soil, were levelled and formed into irrigated meadow, at an expense of one thousand pounds. The pasturage of the Fregate Whins was let previously to this improvement for forty pounds per annum, and the ten acres for sixty pounds. They now bring from fifteen to twenty pounds an acre per annum, and may be much improved. This, adds Mr Stephens, is one of the most beneficial agricultural improvements ever undertaken, for the whole of the Fregate Whins is composed of nothing but sand, deposited from time to time by the action of the waves of the sea.

Never was one thousand pounds more happily spent in agriculture. It not only required a common sewer to bring about this great change, but a resolution in the proprietor to launch out his capital in an experiment on a soil of such a nature.—One hundred and ten of Mr Miller's meadows in 1827, gave a clear profit of two thousand and ten pounds. The yearly expense of keeping these meadows in repair is from ten to fifteen shillings per acre, which is more than double the expense of keeping water meadows in repair in general, for the watering of them is not only through the winter season, but the water is put on them for one or two days together, immediately after every cutting of the grass throughout the whole of the season."

It is to be lamented that so little has been hitherto done in England towards imitating the example of our Scotch brethren in saving the drainage matters of our large cities, a question of no mean importance in even a national point of view, and yet how few persons are even aware of its amount, or of the value of the fertilizing riches of the soil hourly pouring into the sea.

By carefully conducted experiments, and very accurate gauging, it has been ascertained that the principal London sewers convey daily into the Thames 115,608 tons of mixed drainage, consisting on an average composition of one part of solid or mechanically suspended matters, and twenty-five parts absolutely fluid. But if we only allow one part in thirty of this immense mass to be composed of solid substances, then we have the large quantity of more than 3,800 tons of solid manure daily wasted in the river from London alone! What might not the farmers of England effect if this mass of fertilizing matter was preserved at a reasonable rate for their use? Fifteen tons of this solid manure—nay, ten tons would render in some degree fertile an acre of the poorest cultivated, or even common or heath land. But allow, for the sake of accuracy, that twenty tons were required, even then 3800 tons—20 gives a daily allowance of manure sufficient for 180 acres of land; and if we give 300 days on which this manure was collected, that would afford an annual supply for fifty-four thousand acres! Can I put this in a stronger light? Is it not lamentable that the fertilizing matter for such a breadth of land should be annually lost to the country? And in this calculation I allow nothing

for the absolutely fluid portion of the drainage—I am now speaking of its mechanically diffused matters; added to which the farmer will readily allow that when once these 54,000 acres are fertilized and rendered productive, that some time elapses before even the most naturally barren soils require again replenishing with any other manure than that which their own crops supply by the assistance of the live stock of the farm; so that in fact, in each and every year 54,000 acres of land might be recovered from the waste and brought into cultivation by the solid manure of the London drainage alone.

These facts, these conclusions, are not confined to London; for, unfortunately, the drains of all the English towns are pouring the agricultural riches of the land into the ocean through a thousand pores, and it is only by the exertions of its unrivalled merchants, as I have elsewhere endeavored to show, that by their enormous imports of animal and vegetable matters, the land has not, by being gradually drained of its organic matters, been rendered sensibly less productive than in former periods, if not nearly sterile. The quantity of food lost to the country by this waste of manure is very great; for, only allowing one crop of wheat to be raised on these 54,000 acres, and taking three-quarters per acre as the average produce, this gives 162,000 of wheat per annum—a quantity sufficient to find bread for 162,000 persons; and although I confine this statement to the produce of one crop only, yet every cultivator is aware that under the four-shift system four crops are usually obtained by once manuring the soil, viz.: 1 turnips, 2 oats, 3 barley, 4 wheat.

In those situations, therefore, where the farmer has access to sewer water, he will have little need of preparing liquid manure artificially, for which Evelyn, in his treatise upon earth, more than two centuries since, gives some very good directions. Thus, when speaking of sheep's dung, p. 123, he observes of it, "profitable on cold grounds, and to impregnate liquors of choice use in the garden," and p. 160, he gives the following directions for making "*Muck water*, cried up for doing wonders in the field—throw off the shortest and best manure into your cistern exceedingly comminute and broken, which you may do with an iron rake, or like instrument, till the liquor becomes very thick; cast on this the dung of fowls, conies, sheep, &c, frequently stirring it; to this add the soil of horses and cows, grains, lees of wine, ale, beer, and any sort of beverage, broths, brine, fatty and greasy stuff of the kitchen; then cast in a quantity of melting chalk, of which there is a sort very unctuous, also blood, urine, &c, mixed with the water, and with this sprinkle your ground at seasonable times; and when you have almost exhausted the cistern of the liquid, then mingle the residue with the grosser compost of your stable and cow-house. The taking up of the water out of the cistern you may much facilitate, by sinking a tub or vessel near the corner of the cistern, and piercing it with holes at the bottom and sides, by which means you may take it out so clean as to make use of it through a great syringe or watering engine."

There is yet, continues Evelyn, a shorter process, namely, the watering with fishmongers' wash impregnated with the sweepings of ships and vessels trading with salt, adding to it the blood of the slaughter-house. He then proceeds to give various recipes for making other liquid manures; in which he strongly recommends the use of nitre as

one of the ingredients for "the barrenest land, or water fruit trees for prodigious effects," and concludes Evelyn, "where there is good water there is commonly good earth. Never give much water at one time; if the water is from hungry fountains, expose it first to the warm sun for better concoction, infusing sheep's, pigeons' or neats' dung to give it body; but though the spring water be so bad, slow running river water is often very good, and pond water excellent." This system of artificial liquid manuring is well known in China.—The first care of the Chinese farmers, says Sir George Staunton, is to construct large cisterns, free from absorption, to contain, beside this manure, (night soil) and soil of every kind, all sorts of vegetables, as leaves or roots, or stems of plants; with all these they mix as much animal water as can be collected, or common water to dilute the whole; and in this state generally in the act of putrid fermentation, they apply it to the ploughed or broken earth,—and by a similar process the Flemish farmers also prepare liquid manure, and in several parts of Germany the same plan is generally adopted. Even soot and water have been advantageously mixed together, and foras, according to Mr Robertson, an excellent liquid manure. Asparagus, peas, and a variety of other vegetables, says this intelligent horticulturist, I have manured with this mixture with as much effect, as if I had used solid dung, but to plants in pots, particularly pines, I have found it admirably adapted; when watered with it they assume a deep healthy green, and grow strong and luxuriant

A DURHAM COW.—The Philadelphia U. S. Gazette gives the following account of the milking of a short-horned Durham cow during the week commencing the 27th of May:

	Morning.		Evening.	
	Quarts.	Pints.	Quarts.	Pints.
Monday	13	0	12	0
Tuesday	12	1	13	1
Wednesday	13	0	14	0
Thursday	13	0	15	0
Friday	15	0	14	0
Saturday	14	0	15	0
Sunday	15	1-2	15	0-1-2
	93	2-1-2	99	1-1-2
			93	2-1-2

Total yield for the week commencing 27th of May and ending 2d of June, inclusive—7 days 104 quarts,

Being within a fraction of 28 quarts per day, and from which were made 14 3-4 lbs. of butter of the finest quality.

The weather was cold, chilly, and wet, and it was supposed that the quality was less than is usually made under favorable circumstances by the same animal. Our friends in the farming interest will see the necessity of improving the breed of cattle as much as possible. This cow will cost but little more to keep in the best manner, than an ordinary, poor, thriftless creature, that will neither give much milk nor that which is good.—*Boston Daily Times.*

STILL BETTER. A good Cow.—It gives us pleasures to record the successful efforts of gentlemen to increase the means of comfort to us, who are cramped in cities; and certainly, the augmenting of milk and butter is one of those exertions

which must minister to such comforts. We give the following as the good doings of "Dairy Maid," the property of our neighbor James Gowan, of Mt. Airy, Germantown.

Dairy Maid's yield of milk for one week, from Wednesday, 5th June, to Tuesday, the 11th, inclusive.

	Morning.		Noon.		Evening.		Quarts.
	Qts.	Qts.	Qts.	Qts.	Qts.	Qts.	
Wednesday	12	6	7	1-2	7	1-2	25 1-2
Thursday	12	7	7	1-2	7	1-2	26 1-2
Friday	12 1-4	7 1-2	7	1-2	7	1-2	27 1-4
Saturday	13	7 3-4	8	1-2	8	1-2	29 1-1
Sunday	13	7 1-2	8	1-2	8	1-2	29
Monday	13	8 1-1	8	1-2	8	1-2	29 1-4
Tuesday	14	8 1-2	9	1-2	9	1-2	31 1-2
	Total						198 1-2

Being an average of more than 28 quarts per day. Butter not yet ascertained. The coming week's milk, which is expected to be greater, from improved feed will be reported. The feed of the past week was pasture, with a basket of grass morning and evening, cut from head land of a grain field, except on the evenings of the last three days, when a handful of chopt oats and corn, with shorts from lay-mow, was added.

The above yield is perhaps unprecedented by any young cow in this country under the circumstances, being in the fourth month from calving, and the calf having been with her till within a few days of trial. The milking at noon was adopted on account of the cow having been brought from the field to her calf, daily, at that time.

Dairy Maid is a beautiful roan, of the improved short horn Durham stock, bred by Mr Whitaker, of Yorkshire—imported last fall, and in point and proportions is said to have no superior. Her pedigree, which may be found in the third volume of the "Herd Book," is inferior to no cow on record.—*U. S. Gazette.*

Vegetation.—Nothing can be more singular than the unaccountable manner in which plants spring up on certain occasions. Thus after the great fire in London in 1666, the whole surface of the devastated city was in a short time covered with a luxuriant crop of the *Sisymbrium irio*, in such profusion that it was calculated that the whole of the rest of Europe did not contain so many specimens of this plant. Again, wherever a salt spring breaks out at a distance from the sea, its vicinity immediately abounds with salt plants, although none grew there before. When lakes are drained a new kind of vegetation springs up. Thus when the Danish Island of Zealand was drained, Vilny observed *Carex cyperoides* springing up, although that species is naturally not a native of Denmark, but a native of the north of Germany.—*British Farm. Mag.*

Effects of thorough Draining.—A correspondent informs us, that when walking lately over the estate of Glen Caradale, belonging to Mr Campbell, of Auchinbreck, he was shown a piece of land on the home farm carrying its first crop after being reclaimed. It was formerly not worth a shilling an acre, wet and weedy, but having been drained last year, it this season carried a most excellent crop of oats, a few stalks of which, pulled at random from the field, measured each six foot nine inches in length, and an inch and a quarter in circumference above the first joint; the produce of one seed being upwards of 200 grains of well-filled, heavy corn.—*Scottish Guardian.*

Massachusetts Horticultural Society.

Saturday, June 22d, 1839.

EXHIBITION OF FLOWERS.

The display of *Roses* and *Pinks* was very splendid. The report of the Committee to award the prizes is here with submitted. The specimen of *hardy Roses* by Augustus Aspinwall, Esq. were of the first order; had Mr Aspinwall selected specimens from his collection, and contended for all the prizes, there would not have been any successful competitor. The *China Roses* by Mr Samuel R. Johnson exceeded in beauty and size any former specimens exhibited at our rooms. Other specimens of *Roses* were presented by Messrs Rufus Howe, John Hovey and S. Walker.

Pinks, by Messrs Wm Meller, Johnson and Walker. *Bouquets*, by Messrs John Hovey, C. M. Hovey, Winslip, Kenrick, Howe, Meller and Walker.

The specimens from the garden of the Hon. John Lowell, came to hand in fine order and were much admired, viz. *Clematis Sebeldii*, *Hibiscus*, *Jatropha pandurifolia*, *Arum discolor*, *Cactus speciosissimus*, *C. Jenkinsonii*, *C. splendendum* epiphyllum.

Native Plants, by E. Weston Jr. Esq. and F. Parker; *Liriodendron tulipifera*, *Ligustrum vulgare*, *Viburnum dentatum*, *Cucubulus Behen*, *Rosa rubiginosa*, *R. micrantha*, *Cistus Canadensis*, *Apargia autumnalis*, *Azalea viscosa*, *Solanum dulcamara*, *Kalmia latifolia*, *Antirrhinum Canadense*, *Cynoglossum officinale*, *Achillea millefolium*, *Erysimum officinale*, *Potentilla Norvegica*, *Prunella*.

Native Plants, by William Oakes, Esq.; *Hudsonia tomentosa*, *Arenaria Peplodes*, *Glaux maritima*, *Lathyrus maritimus*, *Oxalis violacea*, ditto cultivated, *Iris versicolor* and *Virginica*, *Ranunculus sceleratus*, *Splachnum ampullaceum*, *Orobanchia uniflora*.

There were also some fine specimens of *Native Plants* by Thomas Lee, Esq. and C. Hovey of Lowell.

For the Committee.

S. WALKER, Chairman.

We, the undersigned, award the premiums offered by the Massachusetts Horticultural Society, as follows:

Roses.—The premium of \$10 for the best display of flowers to Augustus Aspinwall, Esq.

The premium of \$5 for the best twentyfour hardy varieties, to S. R. Johnson.

The premium of \$3 for the best twelve hardy varieties, to Rufus Howe.

The premium of \$5 for the best twelve Chinese and other tender varieties, to S. R. Johnson.

Pinks.—The premium of \$5 for the best display to Samuel Walker.

The premium for the best ten varieties of \$3 to Samuel Walker.

The premium of \$3 for the best seedling to William Meller.

JOSEPH BRECK.

J. E. TESCHEMACHER.

Boston, June 22d, 1839.

EXHIBITION OF FRUIT.

Strawberries.—Very fine specimens were presented by Messrs Hovey of Cambridgeport and James L. F. Warren, Esq. of Brighton. The seedlings of Messrs Hovey, marked No 1 and 2 were very large, high colored and beautiful to the eye. We shall speak of their flavor when we have a chance to taste them. Mr Warren also presented some very superior specimens of Warren's Seedling, Methven Castle, and the 'Montly.'

For the Committee.

S. WALKER.

BIRDS ON FARMS.

The value of birds in districts settled as thickly as the county of Philadelphia, is appreciated by but few individuals. The beauty of their plumage delights the eye; their song cheers the husbandman in his toil, and gives a charm to the country which no resident can too highly appreciate. The joyous twitter of the swallow and the martin, the song of the blue bird in the spring, the delightful wild notes of the partridge, the lark, the plover, the robin, the thrush, the mocking-bird and the sparrow, awaken an interest in those companions of the farmer, which should impel him to prompt and energetic exertions for their preservation. And let me ask, was there ever a time when these interesting creatures demanded protection more than at the present period? In this county our farms are overrun by parties of worthless boys, and more worthless men, who employ their time in destroying whatever comes in their way. They break our fences, alarm and very often injure our cattle; jeopardize the lives and limbs of our people, and the teams with which they are at work, and many of them do not hesitate to plunder us of our poultry when an opportunity offers. They tread down our crops and injure and annoy us in various ways, and all for the ostensible purpose of destroying the few birds which yet remain with us, which are not worth to them the cost of the powder and shot used in their destruction. When our horses are alarmed and become unmanageable in consequence of their firing, they very often refuse to abstain from what they denominate their sport; and my people have been compelled to quit their work for fear of some serious accident, and still they would persevere.—Let us no longer submit to such annoyances and injury, but assert our rights boldly and fearlessly. There is a law which applies to this county, which, if put in force, is abundantly sufficient to afford our birds protection, and to rid us of this intolerable nuisance. The value of birds to a farmer, few are able to estimate. To say nothing of the songs of those warblers, to which I always listen with delight, their value in the destruction of bugs, flies, worms, and noxious insects, is incalculable. The swallow, the martin and many others, busily employ themselves in destroying mosquitoes, flies, and other tenants of the air, which annoy us with their sting, or injure us in other respects.

The robin, woodpecker, sapsucker, and various other birds, protect our orchards, destroy the worms and insects that there do us mischief, and in their absence there is no little labor required to protect and save the trees which their industry alone would relieve us from. Besides, they do their work better than we can. The presence of a worm in a young tree is only indicated to us by the borings thrown from the orifice made by its entrance, and in removing them with a knife serious injury is done to the tree. The bird, on the contrary, eats the egg, destroys the worm when young, or if he has avoided his vigilance and got under the bark, nature has endowed the two last mentioned with a strong bill with which to strike through the bark, and long and rough tongues with which to drag the lurking villain from his hiding place, and that too with the least possible injury to the tree. Where is the farmer who has not seen his apple trees perforated along the whole length of their trunk by these industrious laborers; and who has not seen such trees distinguished for their health and fruitfulness?

I can recollect when there were large orchards

of healthy trees in parts of this county where it is now almost a folly to attempt to rear an apple tree. Those orchards that are near clumps of wood, may still exist here, but where there is no such harbor for birds designed for their preservation, it is in vain to attempt to rear a tree and preserve it against the destructive ravages of the insects that feed upon it.

The partridge, the plover and lark, too, feed upon insects and labor diligently to promote the interests of the farmer in destroying his enemies.—What gives a man more pleasure than when walking over his grounds, he is welcomed by the shrill whistle of the partridge, who, grown familiar with his friend and daily companion, cheers him in his toil and delights him when at leisure?

These birds I have often seen so tame that they would scarcely leave my path, and I remember a covey that during one winter, would frequently come to my gravel walk to receive the feed that was placed there for them. They amounted to about twenty, and I set a high value upon them; but there came upon my farm, during my absence, two gunners with their dogs, and destroyed them all. I assure you I felt the loss of those birds more than I would that of the best horse in my stable.

For myself, I feel in regard to my birds as the ancients did of their household goods; nor can I control a feeling of indignation and a sense of injury, when I see my neighbors or strangers wantonly destroying them upon my premises. There are many depredators in our wheat fields that are destroyed by the partridge, for it is on these he feeds. The lark and the plover do their work in our grass lands. The sparrow, blue-bird, wren and other small birds, labor diligently in our gardens, orchards and pleasure grounds, and they should be welcomed as agreeable visitors by all who reside in the country.

Boxes for their accommodation should be nailed to the trees, and by carefully avoiding to alarm them, and other kind means, they could be domesticated among us. They will otherwise take to the woods and by-places, and we shall be deprived of the pleasure of listening to their cheering songs, and lose the advantages of their incessant labors.

Farmers, think of this. Let us not be unkind to our neighbors, nor deny them reasonable privileges, but do not continue to refrain from expressing a sense of injury at their depredations, and of making known to all the high value we set upon our birds.—*Farmers' Cabinet.*

MOWING.

They who have not been in their youth accustomed to do this work, are seldom found to be able to do it with ease or expedition. But when the art is once learnt, it will not be lost.

As this is one of the most laborious parts of the husbandman's calling, and the more fatiguing, as it must be performed in the hottest season of the year, every precaution ought to be used which tends to lighten the labor. To this it will conduce not a little, for the mower to rise very early, and be at his work before the rising of the sun. He may easily perform half the usual day's work before nine in the morning. His work will not only be made easier by the coolness of the morning air, but also by the dew on the grass, which is cut the more easily for being wet. By this means he may lie still and rest himself during all the hottest of the

day, while others who begun late are sweating themselves extensively and hurting their health, probably, by taking down large draughts of cold drink to slake their raging thirst. The other half of his work may be performed after three or four o'clock, and at night he will find himself more free from fatigue.

If the mower would husband his strength to advantage, he should take care to have his scythe and all the apparatus for mowing in the best order. His scythe ought to be adapted to the surface on which he mows. If the surface be level and free from obstacles, the scythe may be long and almost straight, and he will perform his work with less labor and greater expedition. But if the surface be uneven, cradley, or chequered with stones, or stumps of trees, his scythe must be short and crooked. Otherwise he will be obliged to leave much of the grass uncut, or use more labor in cutting it. A long and straight scythe will only cut off the tops of the grass in hollows.

A mower should not have a snead that is too slender, for this will keep the scythe in a continual tremor, and do much to hinder its cutting. He must see that it keeps perfectly fast on the snead; for the least degree of looseness will oblige him to use more violence at every stroke. Many worry themselves needlessly by not attending to this circumstance.

Mowing with a company ought to be avoided by those who are not very strong, or who are little used to the business, or who have not their tools in the best order. Young lads who are ambitious to be thought good mowers, often find themselves much hurt by mowing in company.

Mowers should not follow too closely after each other, for this has been the occasion of fatal wounds. And when the dangerous tool is carried from place to place, it should be bound up with a rope of grass, or otherwise carefully secured.—*Ibid.*

Steam Plough.—Among the new inventions in France is one which is much talked of among speculators and manufacturers. It is a steam plough of very peculiar construction, with which it is said four miles of ground can be excavated with an engine of only eight horse power, to the depth of a foot and the breadth of two feet, in a single hour. The projector of the canal from Orleans to Nantes, which, under ordinary circumstances, would require at least five years for its construction, pretends that in one year the whole would be completed by the use of this machine, and that the saving in mere interest of capital would amount to forty thousand pounds sterling. A friend of mine, who is one of the best engineers in Europe, tells me that he has seen the instrument, and that with some ameliorations he believes it would accomplish all that has been stated. The earth as it is turned up is thrown into a sort of sail, which throws it to a distance of sixty feet.—*Latter Corr. Gardener's Gazette.*

What can be more curious than the circumstance that when the potato is propagated by cuttings, these cuttings will produce roots of the same quality; but when it is propagated by seed, scarcely two roots resemble each other. This is the case generally of trees and plants. A cutting of the golden pippin will produce a golden pippin; a seed of the same tree will produce a crab. If it were not for this law of nature against us, we might perpetuate all fruits.—*Farmer's Magazine.*

[For the New England Farmer.]

Ma COLMAN.—The remark is common, though none too much so to render its truth palatable, that every individual in the community possesses and exercises an influence over the minds and actions of some portion of the population among whom he dwells. Some may truly be limited in their operations, to a narrow sphere, and oftentimes, it is well for the world that it is so, for were their peculiar notions made an article of public creed, sad and fatal would be the consequences; as for instance, if the in temperate man or the votary of vice, in any of his hideous forms, could induce all others to be like them, the earth must become not only the abode of mortals, wrecked of every noble principle, but her luxuriant and beautiful surface, would soon be, like "the field of the slothful, all grown over to thorns and thistles." And, fortunately, there are those in every community who exercise a general influence, inasmuch, that the habits and general character of the people are formed in fashion as their own. The individuals who compose this class are more generally the intelligent and the good—those who have *motives* for their action, and whose motives can be sustained by the fitness of things. At the head of this class may probably be ranked the clergy, or teachers of various religious denominations, for it is to them that the world looks for those noble and precious examples, which are to make them better and happier here, as well as for an exposition of the holy precepts, an obedience to which will conduct us to the purer scenes which await us hereafter.

It has always been a matter of much wonder and frequent astonishment to us, that this class of men, who may be supposed to hold more familiar converse with their Maker, since their vocation naturally leads them to the more perfect investigation of his character, are so indifferent with regard to his handy-work. Many of them, as our observation verifies, regard "the things which are seen, and which declare his eternal power and god-head" with cold indifference if not positive contempt.

Where is the propriety of these things? If the Creator is our father and our friend, what moral right have we to pass by any portion of his works with apathy? They are evidently created with a view adapted to our comfort, and arranged in order calculated to gratify our taste. They possess hidden qualities, as if to invite our research, and while we investigate, wonder and admire, we cannot but imagine ourselves happier and better for the exercises to which we are subjected.

The clergyman who has during the last year taken an alle among us, happily possesses a fine taste in the matters, and the effect of it has already appeared around his domicile, by the appearance of plant shrubs and trees, which his own hands have planted and his own care has nurtured. His gardens enriched and adorned with plats of strawberry, hberry, &c., while the grape is distending itself along the alley. The border is ornamented with gooseberry and neatly pruned currant, while his court-yard has become the repository of various flowering shrubs, whose early

and latter blossoms give a balmy fragrance not only to his own quiet territory, but also to that of his neighbor, and of the traveller who journeys by his gate; and trees whose graceful form and beautiful foliage will ere long attract the admiring attention of the passer-by that way, and furnish a fanciful orchestra for nature's songsters.

Always ready to encourage a taste for rural improvement, particularly when it develops itself in the bosom of such men, who are or should be lights of the world in the things that are, as well as those which are to come, we made an arrangement with our friend to go with him to the mountains, at a proper season to get fir trees for the embellishment of his own sweet premises.

"May day" is an affair of less note here than in the region of country from whence he came, or in bustling cities, for every one, in these parts "pursues the even tenor of his way" on this as on other days. We, however, as the morning was cloudy, an omen of good, in such enterprises, set apart the day for our mountain excursion. The region through which we passed, was far less interesting in an agricultural than in a philosophical view; for in the former, our eyes were not greeted by many smooth meadows, or the prospect of rich pastures or waving grain fields. The fences were quite out of trim, and in many cases the place of their slumbering ruins hastening to decay, was defined by hedges of brambles and alders. The orchards presented a ludicrous appearance of scrubby trunks and matted tops clothed with moss, all arguing that the reign of temperance if not yet begun, would soon be complete, so far as cider was concerned, and that no rich juicy apples would be gathered there to satisfy the gusto of those who have the privilege of living on the richer bounties of the earth, if by patient and persevering industry they will earn them. The highway was a counterpart to all the other ways of men that we saw around us, for in many places it was rough as the hedges, that bounded it. On reaching a stream, one of the beauties of this region, we found the bridge minus, and on looking for a place to go forward, saw the necessity of turning into a meadow in May, and crossing on a poor apology of an affair, which had been thrown up or rather down for the present, to answer the traveller on his way, at the great danger of his own life and that of his beast. Wherever we find an enterprising people we are in most cases sure of good roads; and wherever a thorough moral culture is pursued, every other species of useful culture is consequential.

We found on enquiry, that in the region most obnoxious to our taste, that the people had become "wiser than their teachers are," and were therefore walking through their pilgrimage "in the light of their own eyes, after the desire of their own hearts."

Our ascent up the mountain lasted for three miles, in many places very steep and difficult, but over a road quite as smooth as those in the valley we had just left. In fact, everything in this region of clouds gave as much appearance of thrift as was to be found, with exceptions, in the land of mud which we had just left.

So far as relates to our getting trees, suffice it to say, we found a plenty, loaded our wagon in haste, and sped our way homeward, through fear night and the bears would give us an unfriendly greeting in this land of rocks and rivulets, of bristling firs and moss, which spreads its carpet without restraint.

It was with unusual satisfaction, that from the hill top, we again looked over our beautiful valley, dotted here and there with farm establishments, each with its meadow, just spreading its new carpet to enrich the landscape; and its grove to give beauty and variety to the sweet scenery of summer. The contrast between where we were going and where we had been was sufficient to awaken a feeling of satisfaction with the lot which had been appointed us, and to awaken a spirit of ambition, to prompt us forward in making our *pleasant places beautiful*. Of our trees, suffice it to say, they were duly located in places other than those, where strangers alone will be their admirers, and they are now all in a flourishing condition, apparently grateful for our kindness in removing them to their new abode.

The effect of this enterprise was a happy one. Our clergyman had been and got firs, and others would go. But the influence of that day's labor, is not begun. Future years will feel it and future ages will enjoy the benefits of it. It will be felt in a degree through time.

Clergymen, men of taste and influence every where, will you "go and do likewise?" The world will be improved, morally and physically improved if you will. "Home, sweet home," is the place where man's happiest hours must be spent, and where his virtues should shine the brightest, and in order to make happiness more complete, and virtue more pure, it should be adorned with all which can soften and subdue the rough asperities of our nature. Home! thou sacred place, where our days like a taper, are to waste away where future generations are to break forth in the first dawns of thought, where the principles which are to actuate them in all after years, are to spring up and grow, where associations of the kindest character are to intermingle and twine around our hearts, what shouldst thou be but a paradise, a miniature of the Eden which is lost, and a type of the Eden which is to be found. W. B.

Mount Oseola, June 15, 1839.

Eastern Railroad.—The Salem papers say that the Railroad is progressing with great rapidity. About three-fifths of the line from Salem to Ipswich is said to be completed. They have got through more than half and much the worst half of the great ledge in Beverly, and nearly finished the abutment on that side of North River. It is expected that the road will be open on that part of the route, about the first of October.

The British Queen.—This steamer must be a magnificent affair. A writer from Glasgow says: "You will be highly gratified with her arrangements throughout. Her funnel was lying on deck, and I took a promenade of sixty feet through, hat on and all, standing."

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JUNE 26, 1839.

[For the New England Farmer.]

MR COLMAN—Dear Sir: You will see by various evidences (which are certainly plain enough to myself at least) that I am not much accustomed to writing and composition, especially for the press; and I shall therefore make but a few remarks, which have a heavy hearing upon my mind, leaving the subject to such remarks as your pen and heart may suggest.

I have for years been in the habit of reading more or less the New England Farmer, and have often regretted that there is so little matter in it of use to the small, poor, middle-interest farmer, and to those who can get but little land, and are obliged to devote every inch of it as it were, and every moment of his time to the production of the real and substantial articles of consumption; and that there is so much about flowers, tulips, geraniums, &c. &c.; and so much about this and that great farm, managed by the rich and opulent, all of which is beyond the reach and calculated to discourage the great mass, and of all others the most important class, the most valuable, I might say the invaluable and indispensable class of the tillers of the soil. What a heaven this earth would become if this employment were desired and sought after as are those employments usually pronounced fashionable and genteel. It appears to me that the greatest good that any one could render his country or the world would be to ascertain the smallest amount of land absolutely necessary to support a family of say from five to ten persons; and establish the position that it is as much as any person ought to be allowed to possess; and that it is the duty of every one who has the good of his fellow creatures at heart, to do all in his power to turn the flood and host of the devotees to fashion, folly and extravagance back to the fountain and source of life from which they have so grossly departed, and formed for themselves plans and habits of life which are no other than avenues to sin, distress, misery and death.

There was a time when some, if not most, of our New England farmers raised all they wanted to eat, drink, and wear; the mothers, wives, and daughters spun, wove, and made up all the clothing which their fathers, sons and brothers required, while they labored in the field. When this state of things existed, they were as independent as any human condition can be made; had enough and to spare; were healthy, hearty and happy, and comparatively speaking, were giants.—But how are times changed since their day. There is not, probably, a farmer now living in New England upon this plan. Every farmer's son and daughter are in pursuit of some genteel mode of living. After consuming the farm in the expenses of a fashionable, flashy, fanciful education, they leave the honorable profession of their fathers to become doctors, lawyers, merchants, or ministers, or something of the kind, and desert the country to flood the cities and waste life in fashion, amusement, extravagance, idleness and dissipation.—What are the consequences of such a course? Why it is generally admitted that about nine out of ten are, in respect to property and independence, and too often in respect to health and morals, broken down or lost, while of those that remain in the country, the temperate and industrious tillers of the soil, very few fail to reach an old age of independence and comfort.

It appears to me that it is in the power of the conduc-

tors of such journals as the New England Farmer, and devoted like that to the exclusive purpose of promoting, elevating and rewarding industry, economy, and good management, to change this state of things to some extent. Having this impression, I would enquire whether if good and able men would give their attention to this state of things, something might not be done to prevent or remedy the evils consequent upon this general forsaking of the soil on the part of the great mass; and the popular and extravagant system of farming adopted by the few farmers in this vicinity, under whose influence and patronage the New England Farmer seems to be.

C. S.

We give place to the above communication as the fair and true expression of feelings which crowd and burden many good and reflecting minds among us. We should be glad to remark upon them at large; for it will be seen that if so we chose to do, our unknown correspondent has given us a text to preach upon for every day for a month to come; but we must restrict our comments within a narrow circle.

We do not agree with him in his suggestion that the accounts of large farms which have been given in the N. E. Farmer, have been without practical use to farmers on a smaller scale. On the contrary, we believe that there has not been a single statement of farming, among those presented to the Massachusetts Agricultural Society for premiums, of which we have published fourteen in succession, which is not full of matter bearing as directly upon the pursuits of the smallest farmer as upon those of the farmers who operate upon the largest scale. From the farmer who tells us particularly by what method he raises ten acres of corn, we certainly can learn, as well as from any one, how we can cultivate a single acre; from the mode in which he reclaims his peat bog, so that instead of producing a worthless kind of herbage it shall be made to yield three hundred bushels of potatoes or three tons of the best of hay to an acre, we can certainly learn as well as from any other example, how we can redeem and render productive our one or even our half acre. When he speaks, likewise, of the extravagant farming in the vicinity of the capital, we should be glad if his notions had been a little more definite. If he intends by it that a farmer whose means are limited and small, who has a growing family to maintain by his labor, and who perhaps at the same time is in debt, who should build an expensive house, fill it with elegant and luxurious furniture, devote much time to forming gravel walks, excavating fish ponds, and building expensive and faced stone walls, would deserve to be reproached for his extravagance and improvidence, more than that, for his injustice to his family and his creditors, we agree with him entirely; although for men of ample fortune these improvements and embellishments are highly commendable, and a most useful and public-spirited application of their superfluous wealth. But if he means to censure the farmer who seeks to render every inch of his land productive, to apply all the manure which he can purchase and apply to advantage to its improvement, to reclaim all the unproductive parts of his farm and render them productive at an expense which their increased yield will amply and speedily remunerate, and indeed to borrow capital for the purpose of agricultural improvements, where the security which he gives for it is such as every honest man would wish to give and to receive; and where, in all human probability, the improvement proposed will in a reasonable time give him the power of fully repaying the loan, so far in our opinion from reproaching such a man for extravagance, we do most heartily commend him for his industry and enterprise. We wish the agricultural

community abounded with such men, and then we should be able to show our young people the strongest inducements to devote themselves to agricultural labor, instead of throwing themselves away upon the idleness and frivolities and dissipations of the city. Capital is as essential to successful farming as to successful commerce or successful manufacturing. We recollect the remark made to us many years ago by a most judicious and experienced farmer in the vicinity of Boston, that "he had always remarked that those farmers who purchased the most manure, always obtained the best crops and the most money." We are familiar, likewise, with several instances, where, for example, peat bog, which yielded no herbage worth the mowing, has by a reasonable expense been converted into productive fields, which pay a clear profit of from eighteen to twenty dollars an acre, or more than the interest of three hundred dollars. The advice is often given to farmers to cultivate a little land and cultivate it well. Our advice is to cultivate a good deal of land and cultivate it well. If you design to farm for profit and advantage, then go to the extent of your ability, provided the returns will pay for your investments and labor. Beyond that it would be folly to go. But we should be very unwilling to charge the class of farmers whom we have described with extravagance; and more than that we are disposed to regard them as the very best examples for the instruction of the small farmer—whereas the Do-little family are but a poor pattern for any body.

But then in another matter we cordially concur with our correspondent. In his wish that it might be demonstrated, as far as it can be done, what is the smallest extent of land on which the substantial supplies of a family consisting of five to ten persons can be obtained. He will perceive at once, however, what a variety of circumstances and qualifications are involved in the calculation; as for example, What is the quality and condition of the land? What is the amount of labor to be expended on it? What are the sources or means of manure? What are the crops which it is proposed to raise? How are the family willing to live? Is it proposed to live exclusively upon the produce by its actual consumption, or to raise such crops as by sale may yield the means of purchasing the necessaries of life? Then again, what is indicated in the notion of family supplies? A farm may be made to produce all that is necessary to the comfortable support of life. It may furnish all the food and all the clothing which are indispensable to the end. But these matters constitute a small part of what fashion and habit have rendered desirable, and converted into articles of the first necessity. "Man wants but life here below" as far as the support and even comfort of life is concerned. But this assertion is anything but true when applied to the style of living prevalent throughout the community. In passing down through Washington street in Boston, or Broadway in New York, we have often amused ourselves in considering how few of all the infinite multitude of articles exposed for sale in the shops are indispensable and essential to the comfortable support of life. But we are entering upon wide subject, from which it is necessary that we should now refrain. It is often observed that the actual productive power of a single acre has never been ascertained. It would be gratifying to see even an approximation to the maximum product.

We design hereafter to revert to the letter of our correspondent for the purpose of touching upon other interesting matters which it suggests. In the meantime, we commend it as a subject for reflection to our readers.

H. C.

The Reports of the Horticultural Society for Saturday last will be found on another page of this paper.

BRIGHTON MARKET.—MONDAY, June 24, 1839.

Reported for the New England Farmer.

At Market, 175 Beef Cattle, 12 Working Oxen, 15 Cows and Calves, 560 Sheep and Lambs, 350 Swine, 160 Swine were reported last week.

Prices.—Beef Cattle.—Last week's prices were not sustained and we reduce our quotations. First quality, \$9 25 a \$9 50. Second quality, \$8 75 a \$9 00. Third quality, \$7 50 a \$8 50.

Cows and Calves.—We noticed sales at \$30, \$36, \$38, \$45, and \$55.

Sheep and Lambs.—Lots were taken at \$3 75, \$3 88, \$3 94, and \$4 00.

Swine.—"Dull." A lot of old hogs, selected, mostly barrows, at 8, and a lot nearly all sows at 7. A lot of small pigs at about 8. At retail from 7 1-2 to 11.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass., in a shaded Northerly exposure, week ending June 23.

JUNE, 1839.	5 A.M.	12 M.	7 P.M.	Wind.

GARDENER WANTED.

A Gardener will be wanted by the subscriber on the 21st of July next. He must bring good recommendations for his sobriety, industry and skill. A married man would be preferred. Wages \$400, payable quarterly, and no perquisites or privileges. The place must be kept in as high order as it is now in, or the contract is to void.

JOHN LOWELL.

Bromley Vale, Roxbury, June 26. 31

TULIPS, RANUNCULUSES, PINKS AND VIOLAS.

S. WALKER, of Roxbury, offers for sale in beds, or of such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland, France and England, to which yearly additions have and will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superb Tulips will do well to make a selection for themselves when the bulbs are in bloom, (about the 1st of June.) The prices will conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices, in the country where the bulbs were raised, and cheaper than the like quality can be imported.

Tulips in beds of from 30 to 100 rows, containing from 210 to 700 bulbs, will be by the dozen, 100 or 1000.

Viola grandiflora—Pansy, or Heartsease. Upwards of 2000 superb varieties will be exhibited and offered for sale when the Tulips are in bloom.

Ranunculuses—fine mixtures, at from \$2 to \$5 per 100.

Pinks—fine named varieties, from 25 cents to \$1 each. For particulars apply to S. WALKER, or to JOSEPH BRECK & CO. eow

SCYTHES AND RAKES.

The subscribers have received their usual supply of Scythes, Rakes, &c. among which are

- 100 doz. Hall's Rakes, superior.
 - 100 " Wilder and Eddy's, do.
 - 200 " Common, do.
 - 25 " English Cast Steel Grass Scythes.
 - 10 " " " Cradle "
 - 10 " " " Border "
 - 200 " Round Scythe Stones and Rifles.
 - 100 " Square " " "
 - 300 " Patent Scythe Snaths, superior.
- June 19. JOSEPH BRECK & CO.

MULBERRY FOLIAGE.

Quantities of Mulberry Leaves for feeding Silk Worms, may be had by application, personally or by mail to WINSHIP'S Establishment, or to JOSEPH BRECK & CO. 52 North Market Street, Boston. Brighton, June 17.

ANNUALS IN POTS.

J. L. L. F. WARREN is for sale, at his garden in Brighton, a great variety of Annuals, started in pots and ready for transplanting.

Tulips, Ranunculuses, Anemones, Auriculas, Carnations, Picotees, Pinks and Geraniums

H. GROOM, of Walworth, near London, England, by appointment Florist to Her Majesty Queen Victoria, begs respectfully to call the attention of his friends and the admirers of flowers in America generally, to his extensive collection of the above flowers, which from his having been very successful in their cultivation this season he can offer at very moderate prices. He would particularly recommend to those persons about commencing the growth of the Tulip (which in England is becoming very fashionable) the under root-lets in beds, as it is by far the cheapest mode of purchasing them.

Tulips arranged in beds with their names.
First Class.
A bed of 30 rows containing 210 bulbs including several of the newest varieties, - - - - - £15
A bed of 45 rows, - - - - - £21
A bed of 60 rows, - - - - - 25 guineas
Second Class.
A bed of 30 rows including many fine sorts, - - - £10
A bed of 45 rows do - - - - - £14
A bed of 60 rows do - - - - - £17 10s

Tulips not arranged.
100 Superfine sorts with their names from £7 7s to £13
Superfine mixtures, from - - - - - 7s 6d to 21s
Ranunculuses.
100 Superfine sorts, with their names from £3 2s to £5 5s
Superfine mixtures, from - - - - - 5s to 21s per 100
Anemones.
100 Superfine sorts with their names, - - - £3 10s
Superfine double mixtures from 10s 6d to 21s per 100
Auriculas.
25 Superfine sorts with their names, - - - £3 13s 6d
Catalogues with the prices of the other articles may be had on application.
Orders received by JOSEPH BRECK & CO. Nov. 1. eow.

BRUSSA MULBERRY.

A fresh lot of genuine Brussa Mulberry Seed just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street This species of Mulberry flourishes best in high and even poor lands, and is more likely to endure the rigors of our severe winters and not so subject to the effect of the frost, as trees brought from more southern latitudes, or warmer climates. The leaves of the Morus alba of Brussa, are said to contain a much greater quantity of saccharine matter, than any other of the white species, and moreover, the leaf is much larger than those of Italy and Spain; it is also a hardy tree, susceptible of being raised in climates, where the frosts are severe.

At the annual fair of the American Institute, at New York, in October last, specimens of the leaves of the Brussa tree, of different years' growth, were exhibited, and excited universal approbation, and the Institute awarded a silver medal for the introduction of this invaluable tree, observing in the report of the committee, "that these with every new and useful plant, calculated to withstand the rigors of our climate, are worthy of attention, and those introducing them into our country, deserve to be placed on the catalogue of our country's benefactors."

May 22.

CORN SHELLERS.

Just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, a supply of Currier's Patent Corn Shellers, a very convenient and cheap article. A right to using said machines in counties or towns may be obtained by applying as above.

April 17. JOSEPH BRECK & CO.

NEW BOOKS.

A Treatise on the Cultivation of the Dahlia and Cactus. By E. Sayers.
Also, Birds and Flowers and other Country Things. By Mary Howitt.

Dennis's Silk Manual.
American Flower Garden Companion.
American Fruit Garden Companion, and
An Essay on the Practicability of Cultivating the Honey Bee in Maritime Towns and Cities as a Source of Domestic Economy and Profit. By J. V. C. Smith, M. D., for sale by June 12 JOSEPH BRECK & CO.

BEES WANTED.

One or two first rate Hives of BEES wanted immediately. They must be warranted free from the moth. Apply at the New England Farmer Office, 52 North Market Street. June 12

DURHAM SHORT HORN BULL.

For sale, a very fine Durham Short Horned Bull, three years old. For further particulars inquire at the New England Agricultural Warehouse. Boston, June 12, 1839

MISCELLANEOUS.

[From the Edinburgh Philosophical Journal.]

ON THE PROBABLE DURATION OF HUMAN LIFE.

Dr Caspar, of Berlin, in his valuable work entitled "Der wahrscheinliche Lebensdur des Menschen," &c., 1835, after having examined the current opinions as to the average duration of human life, and as to the most satisfactory method of ascertaining such a result, announces his own doctrine in the following proposition: *the proportion of births to the population in any place expresses almost exactly the medium or average duration of life there.*

For example, suppose that this proportion is in the ratio of 1 to 25, then the average life of the inhabitants of the place will be found to be 35 years.

If this rule be correct, it must follow that the duration of life increased and diminished in a population according as their fecundity is greater or less; so that man, if not as an individual, at least as a member of the mass, may be said to have it in his power to lengthen or abridge his life.

This, if true, is indeed a proposition of great importance in political economy.

To prove that the mortality is in a direct ratio with the fecundity of any population, and consequently, that government seeing that the force of states consists not so much in the mere number as in the strength, fecundity, and longevity of their inhabitants, ought not to favor or encourage an over abundant population, the author has collected together a vast number of facts, and for this purpose has drawn up tables of the mortality, not only in Prussia, but also in Britain, France, and Belgium.

From these researches he comes to the conclusion that everywhere the mortality is directly proportional to the fecundity of the population.

This doctrine, if confirmed by future inquiries, may, to a certain extent, reconcile the opinions of Malthus and his opponents, as it shows us that nature herself tends to remedy the evil of a redundant population.

Dr Caspar gives a valuable table of the mortality in Berlin for twelve years, from 1817 to 1829, which comprises nearly 70,000 deaths in nearly 2,000,000 inhabitants.

The following are a few interesting data which are derivable from his researches.

The longevity of the female, is greater than that of the male sex.

The age of puberty carries off 8 per cent. more of the female than of the male sex.

The proportion of deaths of women in labor is 1 in 108.

It has been an erroneous, although hitherto a very prevalent notion, that the climacteric age of a woman has a marked influence in increasing the mortality of the female sex.

This opinion has been shown to be incorrect by several statistical writers, and the researches of Dr Caspar confirm the accuracy of their statements. On the whole, therefore, we may assert that the longevity of the female is greater than that of the male sex.

It is also worthy of notice that of stillborn infants there are more of the male than of the female sex.

Dr Caspar proceeds to show that the medium or average duration of life has increased considerably in most European cities of late years. In London this increase is great, for it would seem that, with-

in the last century, probably life has increased by twenty years.

At Geneva again, in the 16th century one-half of the infants born there died, we are told, before their fifth year; whereas, in the present day, it would appear that this half reaches nearly 43 years of age. A similar remark may be made as to the increased length of life at Berlin.

Dr Caspar treats pretty fully on the influence of pursuits and occupations on the duration of human life; and from his inquiries it appears that clergymen are on the whole, the longest, and medical men are the shortest lived. The different classes may be arranged, in respect to longevity, as follows:

	Medium	Longevity.
Clergymen	65	years.
Merchants	62	do.
Clerks	61	do.
Farmers	61	do.
Military men	59	do.
Lawyers	58	do.
Artists	57	do.
Medical men	56	do.

Another important agent or influence on the probable duration of life, is *marriage*. It is proved by the researches of our author that the marriage state is favorable to longevity, and especially in reference to the male sex.

The influence of poverty and destitution in shortening the medium duration of life is well known. Dr Caspar gives some tables of mortality which prove the sad contrast in this respect between the poor and the affluent. From these it would seem that the medium age of the nobility in Germany may be stated at about 50 years, whereas that of the paupers is as low as 32 years.

The last chapter of the work treats of the influence of the fecundity of a population upon its mortality. Dr Caspar shows by a vast number of documents, that "the mortality in any population is always in exact ratio to its fecundity," or in other words, "the more prolific the people is, the greater, usually, is the mortality among them."

He alludes to the difference, in this respect, in the different districts in England; and maintains that wherever the number of births is highest, there the mortality is greatest at the same time.

The same result is derivable from statistical investigations in Belgium, France, and other countries.

Dr Caspar concludes his work by embodying the general principles of his researches in the following conclusions:

1. The proportion of births to the actual stationary population of any place expresses, or is relative to, the medium duration of life in that population.
2. The female sex enjoys, at every period of life, except at puberty, at which epoch the mortality is rather greater among young females, a greater longevity than the male sex.
3. Pregnancy and labor occasion indeed a considerable loss of life; but this loss disappears or is lost in the general mass.
4. The so-called climacteric periods of life do not seem to have any influence on the longevity of either sex.
5. The medium duration of life at the present time, is in Russia about 21 years, in Prussia 29, in Switzerland 34, in France 36, in Belgium 36, and in England 38 years.
6. The medium duration of life has in recent times, increased very greatly in most cities in Europe.

7. In reference to the influence of professions or occupations on life, it seems that ecclesiastics are, on the whole, the longest, and medical men are the shortest lived; military men are nearly between the two extremes, but yet proportionally, they, more frequently than others, reach very advanced years.

8. The mortality is very generally greater in manufacturing than in agricultural districts.

9. Marriage is decidedly favorable to longevity.

10. The mortality among the poor is always greater than among the wealthier classes.

11. The mortality in a population appears to be always proportionate to its fecundity,—as the number of births increase so does the number of deaths at the same time.

Better days coming.—The Worcester *Egis* says that some of the newspapers scold badly about the want of accommodation for passengers, under certain circumstances, on the Providence Railroad, and adds, that whenever the Norwich railroad shall be opened, all these inconveniences will undoubtedly cease. The competition between the different routes to New York, will secure to the public the most easy and expeditious communication, and probably no man will have reason to complain of delay or want of civility when the different ways are open for his choice.

SAYLE'S GARDEN ENGINE.

For sale at the New England Agricultural Warehouse Nos. 51 and 52 North Market Street, Sayle's Garden Engines This Engine is a splendid article, and will throw a constant stream of water to the distance of 50 or 60 feet, with great force, and in case of fire would be a good substitute for a fire engine. It is the most perfect article for the purpose ever introduced.

THE EDUCATION OF FARMERS.

MR EDITOR—It has often been a matter of surprise to me, that in this age of improvement and progress, the education of our agricultural community should be so entirely neglected; the more so, when we consider how large and important a body our farmers constitute, forming, we believe, about four-sevenths of our whole population in this State, and producing nearly seven-tenths of all the exports of the Union. For the professions, from twenty to twentyfour years of constant study from youth to manhood, are considered requisite to prepare a young man to enter even upon the threshold of either; and for the trades, either mechanical or mercantile, the first fourteen years of life are spent in an elementary education, while the subsequent seven are devoted to acquiring the rudiments of the pursuit selected. The farmer, on the contrary, conceives that, after his sons can hold a whip or pull a weed, one-quarter of the year is quite sufficient to devote to the development of their minds, while the other three-quarters are consumed in the most drudging minutiae of agriculture. And this at a period of life when impressions are most easily and lastingly made, and when, if they imbibe any notions at all of the culture of the soil, it must be those of their fathers; and if these are tainted with ignorance or prejudice, the rising generation must be cursed with the same obstacles that were stumbling blocks to the preceding.

We often hear it said that *practical experience* will correct erroneous opinions formed in youth, and supply the want of agricultural information, which has not yet been acquired. And is this a fitting preparation of a young man for any pursuit, much more for one that requires the immediate and constant application of fixed and correct principles? Is it wise, is it just to the young farmer himself, first to expose him to the inculcation of the errors of an unimproved system of agriculture, and then throw him, with a half-formed mind, upon his own energies to suffer the consequences of his mistakes and correct them if he can? Do we find that this practical experience remedies the deficiencies of early education, and makes our farmers what they might and should be? Is not the adherence of our farming population, (and we appeal to their sober judgment when we put the question,) to old and erroneous practices in culture, almost proverbial? Judging from our own observation, limited to be sure as it has been, their love of the systems of their fathers right or wrong has given birth to a prejudice against, and a hostility to the improvements of the day that it seems almost impossible to overcome. This is the constant cry of those engaged in the regeneration of our agriculture. They cannot persuade the farmer to adopt modes of culture that every principle of science and all experience warrant, because, forsooth, preceding generations have followed different ones.

The reason why our agriculture is so far in the rear of all other pursuits, seems to be of a two-fold nature; first, because our farmers are but half educated when young; and, moreover, because they will not be induced by the ten thousand motives held out to them to eradicate mistaken opinions and prejudices engendered in youth, and which are at constant war with their best interests. They will not educate themselves. Scientific principles are ridiculed by them under the name of *book farming*, and the many substantial improvements and useful discoveries offered to them by the public-spirited, are sneered at as being theoretical and visionary. As a body, and I appeal to your own extensive observation, sir, for corroboration of the statement which I make without the slightest disrespect to the farming interest, our agriculturists know but little of the fundamental principles that govern the culture of the soil, and their information and skill are limited to the manual and more general operations of farming. And is this as it should be? Can the husbandman hope to reap the heaviest and most profitable crops while ignorant of vegetable physiology—the organization and habits of plants? Can he expect to obtain the most perfect animals, while he disregards the laws of breeding, and the comparative value and properties of different races? He will be successful just in proportion as he renders science and discoveries, which are the result of skillful observation, subservient to his pursuits; for just in that proportion does he compel nature to aid and complete his operations.

We most exceedingly regret that there should exist this settled antipathy among farmers to instruction, that is conveyed to them through the pages of a book, or the columns of a paper. They are among the most ready and powerful means for the improvement of agriculture, containing the practical results of the study and experience of some of the most distinguished and learned of the present and by-gone times. The principles they inculcate and the discoveries they reveal are based upon the incontrovertible laws of science, and require but careful attention united with enterprise and skill to be rendered available. And when these aids to the improvement of the soil and the mind are urged upon the farmer, we are met with the reply of *book farming, theory, speculation*. He sees the mechanic, the manufacturer, the professional man, deriving their most substantial assistance from books and papers relating to their pursuits, and yet those relating to his own are surrounded with phantoms of expensive experiments and futile theories. There is neither reason or wisdom in such a course. He is not required to try every new animal, vegetable or implement, or to enter haphazard into any or every system of culture that shall be brought forward; but to adopt only such as are warranted by well tried experiment, and are adapted to his means and situation. He is to distinguish between experimental and scientific farming; the former of which comes within the province of the fickle-minded and curious, and serves to gratify a love of novelty, or a desire to obtain solid good from repeated trials; while the latter is the

culture of the soil on those principles of natural science which are in constant daily operation about us, and the skillful application of which makes the successful farmer.

It is to a knowledge of these principles that we would direct the attention of our farmers. This constitutes an extensive branch of the education we would urge upon them, and we honestly believe they never will be preeminently successful until they have acquired it. They are called upon by every motive of public and private interest, and if such an argument will be entitled to any weight among them, by a due regard to the dignity and character of their profession, to throw off the absurd prejudice they entertain against the suggestions of scientific and observing men—against changing their systems of culture. In order that there may be a general and thorough-going improvement in our husbandry, our husbandmen of the present day must commence educating themselves with reference to their pursuits. It must be a matter of self-education, and they cannot turn in any direction without finding ample means for it. They have it brought home to their very doors in the shape of agricultural books and periodicals, and the assistance of agricultural societies. They have only to unite with these their well known intelligence and a proper degree of spirit to make themselves what they are not now—*scientific farmers*.

H. V.

Greenfield, June 19, 1839.

INOCULATION OR BUDDING.

The propagation of fruit may be effected by planting the seeds, by grafting, and by budding. The uncertainty whether the fruit from the trees grown will be like those of the parent prevents much reliance for choice fruit on the first method, and seeds are usually only sown to furnish stocks upon which to engraft or bud. On several accounts grafting is generally preferred to budding; but instances frequently occur in which it is desirable to propagate choice fruit when grafting cannot be practised. This in the summer season grafting is impracticable; but then budding comes to our aid, and enables us to secure the advantages of grafting with little comparative risk. A bud may be considered an embryo plant, of the same species as the parent tree, possessing distinctly developed parts, and individual vitality, and of course when removed to a congenial place, capable of continued growth and a reproduction of its species. In this transference of the bud from one place of growth to another, it is necessary that the plant into which the transfer is made, should be of the same genus of plants, and even the same species will usually be found most congenial. All the varieties of the apple and pear may be budded together; and the apricot, nectarine, and peach may be treated in the same manner. The plum and the peach are sometimes budded on each other; but the cherries are usually confined to stocks of the same kind of tree.

The time of budding is partly depending on the tree itself and partly on the vigor of its circulation.

July and August are the usual months for budding, but the cherry frequently succeeds in June, and the nectarine, &c. as late as September. The greater part of the failures that occur in budding arise from its being attempted at an improper time, when the bark does not separate freely, or when the new wood for the year is so far formed that new unions are not readily made. A sure indication of the tree being in a suitable state for budding is the bark peeling freely; this showing that the cambium or new wood is at that stage of formation which best secures the union and consequent life of the bud. To ensure success it is requisite that the bud should be mature; that the bark of the stock separate freely; and that the operation be performed in such a manner, that the introduced bud come in perfect contact with the stock.

The common practice in budding is to separate the bud in such a way that the longer portion is below the bud; consequently in making the incision in the bark, the bud is crowded downwards from the cross slit of the stock. As it is well known, however, that the elaborated juices that form the cambium or new wood, proceed from the leaves downwards, it was suggested that the cross cut made in the bark at the upper end of the perpendicular incision must have a tendency to cut off the downward flow of sap, and thus retard if not entirely prevent in many cases the desired union of the bud and stock. To remedy this it has been proposed by some French and English fruit growers to make the cross cut at the lower end of the incision, and then having the bark to which the bud is attached, longest above the bud, crowd it in the incision upwards, instead of downwards as in the usual mode. This by some is considered a decided improvement, but though its philosophy may be plausible, its superiority in effect to the former mode, can only be tested by experience.

Every farmer should set apart a few rods of ground for nursery purposes, in which a supply of young trees, such as apples, peaches, plums, cherries, &c. may be kept, and these when of a suitable age, say two or three years, should be grafted or inoculated with the choicest varieties, and then they can be transplanted or otherwise disposed of at pleasure. Many kinds of fruit trees are so short lived, particularly in our climate, that unless some efforts are made to ensure a supply, and renew them as they fail by age or other causes, we must for the greater part of the time be destitute of some of the most desirable fruits. We may mention for the convenience of those who in moving or travelling from one part of the country to another, would be glad to secure a supply of buds of some favorite fruit for propagation; that if the twigs on which good buds are found are cut, (and the longer the better) and immediately deprived of their leaves by cutting the leaf stem with a pair of scissors or a sharp knife, and then wrapped to wet moss or even wet cloths, they may be preserved for many days in a fresh and healthy state, so as scarcely to fail of growing where skillfully inserted.—*Genesee Far.*

A writer in the Farmer's Cabinet says that in setting out ruta baga, &c. he ploughs a furrow; then lays the plants in at the required distance, the tops resting upon the furrow slice. He then runs the plough along again, so that the furrow shall cover the root. He then follows with the hoe and relieves those which are covered too much, or cover those which may not have earth enough about them.

[For the New England Farmer.]

Ma COLMAN.—Our complaints of the weather and of the seasons are so common, that an observer might very reasonably infer, that they constituted a part of our daily exercises. The sage remark that we never saw such a season before—one of so much rain, so much dry; so much cold, or so much heat,—very naturally conveys the idea that we have stood, our whole lives, at the post of observation, with weather-gage in hand, seeking out and noting all events of meteorological character, as varying wind, falling storm, or tranquil sunshine have brought them to view.

Yet if we will actually be close in our observations, as every one should be, we shall find, after all, that some past year, and that not very far gone by, that the general features of the season were in kind and character similar to those of the one we are now passing, though in many of its qualities it may have been considerably different, variations of character always being attendant on different circumstances, and sometimes on very small changes of them.

As the success of the cultivator of the earth depends in a great measure on the seasons, or, perhaps more properly, on his adapting his operations to the circumstances of the season than to seasons themselves, it would be wise and prudent in him carefully to note, as their various circumstances change, the causes of such changes, if any definable ones there are, and the effect attending them; thus in future years enabling himself, or his successor, to vary their operations to meet these vicissitudes.

The current year, since winter wept itself away, has varied much from the last, though it has much similarity to some long gone by. In the early part of April we had a few days of high summer heat, and the month for the most part was very pleasant, and so warm that many supposed that a season was dawning unfavorable to the growth of wheat, and that corn would produce abundantly. But alas! how deceitful are appearances. How often does that which promises most, prove most abortive in its fulfillment! "As man flatters most" when treason is lurking in his bosom, so the sun shines brightly when the storm is gathering, and the skies are tranquil when the tornado is maturing in embryo.

Our May was the contrast of April. Cold and frost, those allied brethren, were frequent visitors until the middle of the month. Still the air was pure, and the earth in good condition to receive to its bosom the hopeful rudiments of a future harvest. Corn planting was done some ten days earlier than in former seasons. It came up well, stands well, but the cold and storms have given it a sickly appearance. When a warm day comes, as a few such days do come, it improves them as a thorough man will a favorable day in an unfavorable harvest, and the advancement it makes is such as to assure us that it would grow if it could. How important, then, since it is for us "that seed time and harvest" come at their appointed seasons, that we aid the struggling plant in pushing forward to maturity. We are fully aware that we cannot cause the germ to spring up, nor the swelling grain to ripen, yet we can become the helpmeets of "nature's God," who makes them grow, and by our kindness to our life-sustaining mother, may enable her to push them forth more luxuriantly and to hasten the time of their full and perfect harvest. How sublime is the idea, how cheering the thought that in making the earth produce more abundantly by our cares and

our labors, we are not only the initiators but the humble agents of him who causes the "herb and the tender grass to appear"—"who sendeth the sunshine and the rain"—"who clothes the tempest with its fury and who stays the angry winds"—"who sustains the falling sparrow and guides unnumbered worlds in their mighty careers."

About the middle of May a stormy season commenced, with a cool temperature for youthful vegetation, when it was just decorating the earth with spring's gay flowers. Such times are apt to depress the spirits of the husbandman, especially when spring has so long been inviting him to his labors. But the farmer here, among "the bleak hills of Berkshire," must not be discouraged by unpropitious circumstances. The seasons may be unfavorable, but persevering skill will, in a great measure, overcome their peculiarities—the storm and the sunshine may not be so agreeably blended as we might wish, but they set the "bow on the cloud, that harvest shall not fail." If the husbandman does his duty, "nature and nature's God" will pretty surely sustain his efforts.

Crops in general are promising. Wheat has been sown this spring in greater quantity than for many past years. This is as it should be. It is a deplorable sight, and one which ought never to offend the eye of sensibility, to see farmers buying their bread. This has been very much the case, however, in past years, and by the horrid practice of stocking lands with sheep to the exclusion of ploughing and stocking with grass seed, many of our best farms have depreciated in value. This, like all down-hill roads, is an easier way of getting along, but it cannot terminate the journey at home. We rejoice to see this foolish practice in a process of abandonment, and we are sure that if once given up, it will never be resumed. There can be no doubt but that every farm can be made to produce its own grain without any diminution of grass even in our imperfect system of farming, and at the same time furnish a richer and healthier herbage for the herds and flocks. So then by ploughing and seeding we gain two important points. First, raise our own grain, whereby we secure it to ourselves and save many dollars in our State, county and town—even in our own pockets annually; and second, our ground is kept in a more healthful condition, whereby it produces more and a better article. But there is another consideration which should induce us to venerate and use the plough and hoe. It furnishes a virtuous and profitable employment to the long-legged boys, who can never be easy without business, and who, unless employed in killing weeds might make themselves free in killing birds or fish, whose claim on life is as good as theirs, and whose time is often far more profitably spent. Consider it, ye who delight in torture, and instead of patrolling the woods with your guns to shoot down your friends, or in following the meandering stream with your fishing rod to decoy its lawful inhabitants to death, "just for sport," and "to kill time," occupy the leisure of spring and autumn in planting trees around your dwellings, by which you will invite nature's sweet songsters from the distant grove to domiciliate themselves with you, and inspire you at your morning and evening meal with loud and unaffected "hymns of lofty cheer" to him "who makes the outgoing of the morning and the evening to rejoice."

Wheat uniformly looks well. But little winter wheat is sown in the region of our roundabouts, but as we know not yet what we shall do we can-

not but think, and we hope it is not a foolish imagination of our heart, that it will eventually be raised in considerable quantity in our goodly Gotham. The principal obstacle seems to be its liability to heave out by the frost, and we are of opinion that if in stocking our land we will weave in liberal quantities of plaster and clover seed, the product of the last to be ploughed in when it has attained its full growth, that our land will eventually become more porous, so that the superfluous moisture will pass off, that this evil will be reduced at least.

Oats are not as much sown as usual; they look very well, as also do potatoes. Corn will give a good harvest if we have a plenty of warm weather. It grows as fast as possible. Grass looks according to circumstances. Where plaster has been sown on favorable lands, this spring, it looks very well. It was much injured by the dry weather early in May.

Yours truly,
Mount Oscola, June, 1839.

W. B.

[From the Farmers' Cabinet.]

FAT MUTTON—ROOTS.

It is to be regretted that so little attention is paid to the proper sheltering of cattle in this country. One would naturally suppose that the interests of owners would point out a proper course; and that once systematized, and the advantages of strictly attending to the comfort and convenience of our cattle made manifest, even to the most sceptical, that whole neighborhoods would adopt the system, and that, in a reasonable length of time, it would very extensively, if not universally prevail. It is lamentable to say that this is *not* the case. For some reason or other, which I have not as yet been able to ascertain, improvements make but slow advances among our farmers. It may be, that they consider improvements as innovations in those customs which have "grown with their growth." Some, with the evidence before their eyes, evidence which they cannot possibly resist or gainsay, refuse to profit by the experience of others. I have several cases in point, one of which I will note. For a number of years I have been in the habit of attending the Philadelphia market, principally with mutton, and as I always personally superintend my sheep and other animals on the farm, and saw that they were regularly and sufficiently fed, I generally brought meat which I was not ashamed of, and which by its good quality recommended itself to purchasers, inasmuch that I had no difficulty in securing a regular set of good customers, who cheerfully paid a fair price for a good article. Some of my neighbors attended the same market—but as I generally sold out first, they thought I was "uncommonly lucky." Four years since I obtained a quantity of the seed of the French sugar beet, and put in an acre by way of experiment, not in the way of making sugar, but the making of fat. This first trial fixed me. My cows, sheep, and hogs were very fond of them, during the long and severe winter which followed. They all kept in good heart and condition; what surprised me most was the rapid manner in which my sheep fed on the sugar beet, took on fat; and when carried to market the saddles excited particular attention, from their very superior appearance. But it was not in appearance only; the meat was of much better quality, more juicy, and exceedingly tender. The inquiry was, "why, sir, on what do you fatten your sheep?" And when I replied on the sugar beet, hay, and a

small portion of corn, it would generally call forth an exclamation of surprise. Ever since I have been a grower of the sugar beet, the meat I take to market is always in demand, and brings several cents more per pound than that fattened in the old way; and yet, strange to say, some of my neighbors, although I have urged them, will not plant the beet for their stock. I have been benefited to the extent of several hundred dollars by the introduction of this root—the effects are visible—my neighbors know it—and yet they stand lookers on, halting between two opinions. But light is breaking in upon us, and of one thing you may be assured, that is that the time is not far distant *when every extensive stock feeder will be an extensive root grower.*

To the delinquents, and there are many in my vicinity, I would say, "rouse ye from your lethargy and although for the present season you have lost the advantage of planting the sugar beet and the mangel wurtzel, yet you may in some measure atone for your past neglect, by putting in immediately a sufficient quantity of ruta бага. You have time enough for this, but none to lose. The ruta бага is an excellent root—plant it liberally—cultivate it thoroughly—and you will find your account in it in more ways than one, if you are spared until the ensuing winter. Depend upon it, there is nothing better for cattle than roots, properly prepared. I put in some of almost all kinds; and I find carrots answer well for a change. But with no the sugar beet is superior to all others. My way of feeding is simple. When the cattle are housed they are kept constantly furnished with good hay, have roots three times a day, with an occasional change to corn or cut feed. I find great benefit from currying my cows—indeed, it seems to me as necessary to curry a cow as a horse—and if any one will make the experiment as I did on two oxen, it will remove every doubt. They were both put up at the same time—fed precisely alike—and the treatment throughout was similar in every respect, except in the use of the curry comb, and the ox on which it was used was in *reality*, as well as in appearance, six per cent. better than his fellow. The cause of this must be apparent to every reflecting mind.

N. I.

Delaware county, May 18th, 1839.

Massachusetts Horticultural Society.

Saturday, June 29th, 1839.

Our tables were again decorated with some of Flora's choicest gifts. Among them we particularly noticed some pot plants from John Towne, Esq., viz: *Orchis ventricosa superba*; *do. Rubens* and *Roella ciliata*; and the fine collection of Roses by S. R. Johnson, Esq., of Charlestown.

Dahlias, by Henry Sheafe, Esq.; Mr Mason, from his garden, East Boston, and from the garden of Mr James L. L. F. Warren, Brighton.

Bouquets, from Messrs William Kenrick, Mason, John Hovey, Winship, and Walker.

Pinks, by Samuel Walker, of Roxbury,

Native plants, by William Oakes, Esq., *Orchis grandiflora*, *Viburnum lantanoides*, *pyrifolium* and *acerifolium*, *Acer Pennsylvanicum*, *Corallorhiza multiflora*, *Pyrola chlorantha*, *Hottonia inflata*, *Lunaea borealis*.

Native plants, by E. Weston, Jr. Esq., and F. Parker, *Cymbidium pulchellum*, *Kalmia latifolia*, *Arctostaphylos ophioglossoides*, *Vaccinium macrocarpon*, *Hypericum perforatum*, *Andromeda polifolia*, *Lysi-*

machia quadrifolia, *Lysimachia thrysifolia*, *Crotalaria sagittalis*, *Arenaria peploides*, *Hud sonia tomentosa*, *Cnicus horridulus*, *Verbascum thapsus*, *Azalea viscosa*, *Salsola salsa*, *Mitchella repens*, *Lathyrus maripinus*.

For the Committer,
S. WALKER, *Chairman.*

BOTANIC GARDEN AND CONSERVATORY.

We have been very much gratified with the exhibition of Roses at the Conservatory of the Botanic Garden, for which prizes have been adjudged, amounting to 75 dollars. We have for some time intended to notice this establishment, and think this affords a fit opportunity. If the increase of grog shops and places of licentious resort debase the morals of a people, it would seem reasonable to suppose that places where beauty, order, neatness and taste prevail, are open to the easy access of persons of both sexes, the morals must be in an equal degree elevated, and consequently the taste becomes gradually more refined. We believe from the report of travellers in Europe that this view is not theoretical, but is completely proved by the crowds of orderly persons who frequent such establishments there, and whose countenances and demeanor exhibit the quiet pleasure they enjoy. For this, and many other obvious reasons, we trust that the inhabitants of this city, will, by their assistance and countenance, cheer onward the gentlemen who are directing this good work, so that it may proceed towards completion and permanent stability. We think the progress made, has been full as great as could possibly be expected, for the time occupied in converting this waste into a garden: in a few weeks we believe the public may expect admission, and a walk round the whole area be completed.—The terrace on the edge of the water will form a delightful evening promenade, when the sun is setting behind the beautiful hills of Brookline; and the borders are filled with as many flowers as the season permits: thus both sides will offer various but agreeable objects to the eye. We think it a happy idea to have put an open fence in front, that the public at large may enjoy as much as possible, the gaudy borders. Indeed, we feel persuaded that the trustees are desirous of exercising their powers in the most liberal and judicious way possible, keeping only in view the necessity of raising sufficient funds to maintain beauty, order and neatness in the establishment, at the least possible expense.

There are many schemes of public utility which may also be engrained on this at a future period, any discussion on which, would be premature at present.

We understand the trustees have offered premiums to the amount of fifty dollars, for cut flowers to decorate the conservatory on the 4th of July, and hope this evidence of their wish to encourage the trade as well as the taste, will be duly appreciated, and meet with the return and support it well merits.

At some future time we intend to give a more particular description of this garden and conservatory as we believe they will be objects of great interest, not only to the city, but also to the country at large, and that one of the first enquiries by visitors from the country, will be for these places.

J. B.

GRUB WORM.

A procrustinating farmer saves the lives of millions of grubs.

It seems to be a law of nature, that population should keep pace with the means of subsistence, and this law appears to be faithfully maintained throughout the animal kingdom, even down to the lowest grade of insects and worms. The grub worm, which is so destructive to Indian corn in the early stages of its growth, was much less numerous and injurious previous to the introduction of red clover. At that period, corn was generally planted where there had not been a sufficient quantity of tender, succulent food for it to subsist upon in any considerable numbers, and consequently its propagation and support was so precarious, that its increase was so slow as not to be observable. But when clover was generally cultivated, and by the most skillful arrangement of the rotation of crops, Indian corn succeeded it when the clover began to run out, the increase of the grub worm keeping pace with the means of subsistence, (for it feeds with avidity on the green, succulent stalks of clover,) propagated to a most alarming extent; and the sod being ploughed down in the spring for corn, and the pasture of the worms being by that means destroyed when the young corn began to vegetate and show itself above ground, the worms following out the law of self-preservation, and from no mischievous propensity, commenced feeding upon it more ravenously, and for some years it was almost doubted whether its culture would not have to be abandoned in some neighborhoods.

During this state of suspense, some observing, reflecting person, who no doubt had taken the trouble to examine into the character, habits and instincts of the grub, discovered that early in autumn it sought retreat some inches below the surface of the earth, and there prepared itself a domicile where it might repose in safety from storms and tempests till the vernal season arrived and with it its accustomed food.

It was very rationally suggested, that if the sod was ploughed down late in the fall, and the habitations of the enemy turned topsy-turvy, that the walls might be broken in pieces by the winter frosts, and that the inhabitants being turned out of doors would perish, and the young corn be preserved from its greatest enemy. This was at first suggested as a theory; it was soon put to the test of practice; and every farmer knows the benefit that resulted from it. The grub soon became a much less formidable enemy; every one knew how to vanquish it, provided a pretty severe winter came to his aid. But farmers sometimes have treacherous memoriae as well as other folks, and the enemy having been supposed to have been completely routed, there was a strong propensity felt to resume old habits, and postpone ploughing corn ground till spring again, in accordance with ancient custom; this has often been done, and generally with the same result; the enemy not being entirely exterminated, increases his forces and proceeds again to the work of destruction.

A few years since, from winter setting in early, or some other cause, very little corn ground was ploughed in the autumn; the following spring the corn suffered severely from the depredations of the grub; but where portions of a field had been turned down in the fall, it furnished the usual protection: this was observable in numerous instances. The succeeding autumn, many farmers having a very short allowance of corn, and smarting under the infliction, went to turning up the ground in

good earnest, and overturned the quarters of the enemy without compunction. The consequence was a general exemption from injury; it was pretty well followed out for a year or two afterwards, but last fall many began to relax and to forget the things that they had suffered, and much corn ground was permitted to remain undisturbed till this spring, and those thus circumstanced are now going on in the old track, that did very well before clover was brought into general cultivation and the sod ploughed down for corn.

Now let us observe and see if the laws of nature have been reversed to accommodate those who neglect fall ploughing.—*Farmers' Cabinet.*

FEEDING MILCH COWS.

Natural grass is the first and best of all food for cows; and where this can be obtained in sufficient quantities nothing further can be desired. Sweet and nutritious, grass gives a richness and flavor to milk attainable from no other source; and which milk produced from grains, distiller's wash, or roots, can never equal. Of the grasses, lucerne is considered the best, and the clovers the next; and as lucerne cannot with propriety be considered one of our cultivated grasses, perhaps we have nothing in this country that excels white clover for imparting a peculiar richness and even fragrance to milk. The grasses are best for the cow, when fed green; but the best method of feeding the grass to the animal has been matter of some dispute. The common method of turning the cow into the field at once, occasions the least trouble perhaps, but it is also the most wasteful; and where economy is to be consulted, some other method of feeding may be found preferable. Curwen found by experience that three acres of good grass, cut and fed to the cows, supplied 30 milch cows with 23 lbs. each, during 200 days. Their other food was hay, of which they consumed little, and their health was excellent, and their milk superior. Mr Curwen observes, "that to have supplied a similar number of cows with a like quantity for the same period, would, in the usual way of management, have required 75 acres of land for its production. And to have grazed such a number of cows at liberty, that length of time, must, it is obvious, have taken a very considerable number of acres."

If such is the saving that may be made by substituting labor for land in feeding cows, we think the subject well worthy the attention of dairymen and milkmen, especially in the vicinity of our cities. If by employing the labor of one man through the summer months in carrying the grass to the cows instead of allowing them to gather or trample it down for themselves, twenty cows could be kept on land that now supports only ten, we think there can be no question as to the profit. Only the best and sweetest grasses can be used for carrying; but where meadows of this kind exist, and by proper attention to draining, manuring, and seeding, all may be made such, the quantity of grass that may be taken from them by successive cuttings is great. Because our meadows, the grass standing till nearly ripe before mowing, does not spring up at once, it by no means follows that when cut green, while the circulation is active and the roots vigorous that such would not be the case. Indeed the rapidity with which the grasses spring up in our rich pastures after being fed down by cattle, is sufficient proof of what nature is able to accomplish, when her efforts are not checked but aided by the skill of the husbandman.—*Genesee Farmer.*

Eggs.—Almost every body loves good fresh eggs, and with or without glasses or silver spoons, can contrive to eat them; whether boiled or fried, raw or roasted, made into custard with sugar and spices, or swallowed gently with a bordering of old Port, they agree with the palate and the stomach, and neatly laid out with fair slices of bacon, they form a repast within the reach of all and to be despised by none. But though most farmers keep fowls and raise their own eggs, there are many who have not yet learned the difference there is in the richness and flavor of eggs produced by fat and well-fed hens, and those from birds that have been half starved through our winters. There will be some difference in the size, but far more in the quality. The yolk of one will be large, fine colored, and of good consistence, and the albumen or white, clear and pure; while the contents of the other will be watery and meagre, as though there was not vitality or substance enough in the parent fowl to properly carry out and complete the work that nature had sketched. In order to have good eggs, the hens should be well fed, and also provided during the months they are unable to come at the ground, with a box of earth containing abundance of fine gravel, (if of limestone, so much the better,) that they may be able to grind and prepare for digestion the food they receive. Fowls form no small item in the profits of the small farmer, and few creatures better repay the care and attention they receive. Of eggs, those of the domestic hen are decidedly the best; but those of both ducks and geese may be used for some of the purposes of domestic cookery. Eggs can be kept any length of time, if the air, is perfectly excluded, and the place of deposit kept at a low temperature.—*Genesee Farmer.*

Fruit Trees protected from Spring Frosts.—In France a practice has long been successfully adopted, by which tender trees are secured from the effects of frost in the same manner that a house is secured from lightning—by means of a conductor. In these days of science, every farmer as well as every gardener, may, by a recourse to his barometer and his thermometer, and by the meteorological experience incident to his calling, detect a probable change in the weather, and a consequent increase or decrease of temperature. When, therefore, he apprehends a frosty night, or by way of precaution to secure against blight his tenderest and most valuable trees, let him entwine among the branches of each tree in full bloom, and from the top to the bottom, a thick hempen rope, the lower extremity of which must be immersed in a vessel of water. In the morning the surface of the water will be covered with a cake of ice, though water placed in a vessel by its side would not have been frozen; and the blossoms will be found uninjured. This is a very simple and has proved in France a very conclusive experiment, which may be adopted in England with great advantage. It would probably be difficult to apply it as here described in large orchards, although the same conductor, and the same water, might serve for several trees situated close to each other. But modifications might doubtless be found by the ingenious agriculturist, which would admit of its being used in orchards, on the most extensive scale, and without much expense.—*British Farmer's Mag.*

The Great steam ship British Queen is expected at New York about the 15th of July.

FARMERS' WORK FOR JULY, ON THE
FARM.

CORN.

Let your corn be kept constantly free from weeds, and the earth so stirred about the plants as to be always in a state not only to admit their free and unrestricted growth, but to attract and absorb whatever dews may fall, or moisture existing in the atmosphere. However good soils may be, however congenial to the growth of this particular grain, exact and cleanly cultivation is indispensably necessary to its successful culture—you may rest assured that it is just as essential as manure itself. In the working of the corn we are not the advocate of that plan which would raise a mound or hill around the plants—on the contrary, we believe that they will grow faster and yield more, where no hill whatever is raised. Nor are we the advocate of frequent ploughings; we believe that more than two ploughings should never be given to the corn crop—that one at the proper time is enough—and that whether one or two, they should be at the incipient period of the growth of the plant. All ploughings, after the lateral roots have pushed out to any considerable distance, serve only to cut and lacerate those roots, and deprive the stalk and its fruit of its wonted supplies of nourishment, and not unfrequently that much dreaded *firing*, as the planters term it, which so despoils the crop of its rightful fruitfulness. After the corn has reached two feet in height, the cultivator, harrow and hoe, should alone be used. By the judicious use of these implements, all the good to be effected by proper culture may be secured, without hazarding the fruitfulness of the crop by cutting off the sources of feeding, and thereby diminishing the chances of abundant production.

POTATOES.

Though it is *late* to put in your fall crop, by proper preparation of the soil, manuring and other treatment, a saving crop may yet be realized; those who have their potatoes already up, must keep them clean, and the earth in that condition which offers no impediment to the healthful vegetation—taking care at all times to keep a small *Jurroo*, flat at the top, around the vines, to act in the two fold capacity of a recipient of rain and moisture, and to afford room wherein the bulbs may grow without difficulty.

THE HARVEST.

Already, farther south, this interesting labor has been begun, and we trust and believe under auspices the most promising. With us, in ten days, or two or three weeks, wheat, rye, and oats will be ready for a similar operation, and it may not be amiss to remind the farmer, that should *rust* or *blight* fall upon the *stems* of either wheat or rye—and from the present state of the weather there is danger to be apprehended—both grains should be cut, though the kernels may still be in milk; for no possible nourishment can be expected to be drawn from the stalks of grain after their juices have been indurated by such agency.

This too is the month for the cutting and curing of hay, and upon this subject we propose to have a word. It is this—the sooner the grass is put into cocks the better, as it is less exposed to the injurious effects of the vicissitudes of weather in that form than when in swarth, and cures into hay to much greater advantage, retaining a much larger amount of nutritive matter than when dried in the old way. In storing it, the judicious farmer will not fail to

sprinkle a small portion of salt over each layer of hay, because in so doing, he will greatly add to its quality, and render it the more grateful to his stock.

TURNIPS.

Those who desire large crops of turnips, with a view of feeding stock, should put them in as early after the 15th of this month as possible. The sowing of those intended for the table may be delayed a week or two—indeed any time during the month will answer; but we admonish all against delaying sowing their seed until, as the old custom would have it, the 20th of August. Every prudent man should allow himself time to meet all contingencies that may occur.

BUCKWHEAT.

This grain may be put in any time between the first and the tenth of the month, with a certainty of its maturing; but the sooner the labor is performed the better—and surely no one who likes to see his family enjoying a good winter's breakfast—surely no husband or father, whose happiness is identified with that of his wife and children, will omit to secure a full supply of the material of those delectable cakes, which give so exquisite a zest to the breakfast table. But we will have a word as to the straw; for while it is our first object to secure comfort to the domestic circle of the homestead, it is our desire not to forget the inmates of the barn-yard. Therefore, let us admonish you to get your grain out early—as early as possible after your buckwheat is harvested, and carefully put away your *straw* to be fed to your milk cows as hay. As we have said before, we will here repeat it—it is just as valuable as so much timothy or clover for them. Custom, hitherto, with most farmers, has consigned it to the dung-heap or cow-yard, as a thing only fit to be trampled under feet; but enlightened economy would allot it a much higher destiny. When cured with care, and kept from the weather, it makes as good and wholesome provender, as ever went into the manger of cattle.

MILLET.

Up to the 15th of this month, this grain may be sown. In six weeks from the day of its being put into the earth, if sown on good, warm, light soil, it will be fit for cutting for hay. As a *cleanser* of grounds intended for *timothy*, there is nothing superior to it. As soon as the millet is off, the stubble should be well harrowed, the timothy seed sown, a light harrow passed over it, and then the ground should be rolled.

CABBAGES.

Those who would desire to keep their cows well to their milk through the winter, should put in at least one or two acres of this productive vegetable—in good ground they will yield 40 tons to the acre, and we need not say, that that quantity of green food in mid-winter would be most acceptable to your milk cows, and tend greatly to increase the quantity of milk and butter yielded by them.—*Farmers' Cabinet*.

THE GREAT AMERICAN OX.—This beautiful animal, which was exhibited at several places before its owner transported it across the Atlantic to convince John Bull of the fallacy of his belief that men and animals in America are a diminutive race, attracts great admiration in England. A Liverpool paper thus alludes to it:—

If Earl Spencer does not look to his laurels brother Jonathan will ere long pluck them from

his brow. We certainly had no idea that his Lordship had such powerful competitors, as the ox now exhibiting at Egyptian Hall proves he inconceivably has in the United States. The proprietor has given it the name of Brother Jonathan, and describes it as the wonder of the creation, weighing 4000 pounds, or 500 stone; measuring in length about twelve feet; in height, over the shoulders, five feet eleven inches; and in girth ten feet nine inches. It is six years old, of a beautiful dapple bay color, and was bred by the Honorable Isaac Hubbard, in New Hampshire. The animal is in excellent condition, but not overloaded with fat like those monsters exhibited at the Smithfield cattle shows in December; of a breed somewhat between the Durham and the Devon, and in every point beautifully proportioned. According to the opinion of breeders it might be fed to weigh fully a thousand pounds more. Those fond of exhibitions of this sort will be highly gratified by a visit to Brother Jonathan.

The "Honorable Isaac Hubbard," we presume, is only a natural blunder of the English editor—a personage comprehended, probably through ignorance, of the Hon. Isaac Hull and Mr Hubbard (if that was the gentleman's name) who bred the animal for exhibition.—*Boston Courier*.

SOILING MILCH COWS.

The Zorrites, a religious sect of Germans, on the Muskingum river in Ohio, keep their milk cows constantly in the stall and feed them with offal of the milk, hay, roots, &c., and they are said to yield an extraordinary quantity of milk—some twenty quarts a day through the year. They also pay particular attention to their cleanliness. Their stalls are thoroughly washed daily, and the water used for this purpose, is carefully collected in reservoirs, and applied, in the form of liquid manure, to their hot houses and gardens.

In a late communication to the British Board of Agriculture, it is stated that thirty cows, one bull, four calves, and five horses, were fed through the summer from fifteen acres of clover, sown the preceding year. The labor of two men and two women was sufficient to tend them, and the nett produce of the season, in butter, from June to October, was £19 10s., nearly \$90 from each cow.—*Silk Culturist*.

FRYING PORK.—Take one fresh egg, beat it, add half a gill of sweet milk, and a sufficient quantity of flour to make a batter, freshen and fry the pork as usual: then dip the pieces in the batter, which will of course adhere, replace them in the fat, and after a little more frying, a light and delicate cake will enclose the meat, and thus constitute a dish for a middling sized family, which will tempt the palate of the most fastidious. Try it ladies.

TO DRIVE BUGS FROM VINES.—The ravages of the yellow striped bugs on cucumbers and melons may be effectually prevented by sifting charcoal dust over the plants. If repeated two or three times, the plants will be entirely free from annoyance. There is in charcoal some property so obnoxious to these troublesome insects that they fly from it the instant it is applied.—*Indiana Aurora*.

The President of the United States has left the seat of government on a visit to his native State.

Accounts from Great Britain represent the crops as highly favorable.

NEW ENGLAND FARMER,
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JULY 3, 1839.

CLOSE OF THE SEVENTEENTH VOLUME.

The present number brings to a close the 17th volume of the N. E. Farmer. We shall commence the 18th volume with four additional pages, which will be added monthly, or oftener, if our many able correspondents will continue to favor us with their interesting communications.

We shall exert ourselves to make the paper increasingly useful and interesting; with the able assistance of the Rev. Henry Colman, who will continue to favor us with his weekly communications while on his agricultural survey—we trust we shall be able to do it. Since the decease of the lamented Fessenden, we have had two agricultural papers spring up by our side, and one in a neighboring State, which at first thought would lead one to suppose that the number of the supporters of the N. E. Farmer would be diminished and its prospects darkened; but such is not the fact. We rejoice to state, that with all the competition that exists, we are continually adding to our subscription list, and our old friends remain firm to this pioneer in agricultural publications. As we shall incur additional expense in the enlargement of our paper, we trust our readers will be prompt in remitting what is due, and those who choose to pay in advance for the next volume, may be assured that it will be received with thankfulness. A great majority of our patrons have been prompt in their payment for the N. E. Farmer from year to year, as our books testify. We feel very much obliged to them for this testimony of the value and worth of the paper, and hope they may live to read its pages from week to week for many years to come.

We ought to say a word to delinquent subscribers, especially to those who have let their accounts run for years; but we should hardly be able to keep cool were we to refresh our minds by turning to their accounts and sum up the thousands of dollars that have been our due for years.

We take this opportunity to make known our grateful feelings to those who have during the past year, furnished the columns of the N. E. Farmer with original communications. We think in comparing the present volume with those preceding it, that in none will be found a greater amount of practical, sound, and interesting original articles. Our desire is, that they may not be weary in well-doing, and remember that they are conferring a great benefit upon the agricultural community at large by their labors. We wish that all who are engaged in agriculture were more ready to communicate the result of their experience to their fellow men through the columns of an agricultural paper than what they generally are.

With the new volume we anticipate a large accession of subscribers, and we would call upon all who now read our paper to make an effort to effect this by persuading their neighbors to take the N. E. Farmer.

We promised some farther reply to the remarks of our correspondent C. S. In his letter given in the last New England Farmer, he says, "There was a time when some, if not most, of our New England farmers raised all they wanted to eat, drink, and wear; and their mothers and wives and daughters spun, wove, and made up the clothes for the fathers and sons, while the latter were in the field. When this state of things existed they were independent; had enough and to spare, and

were healthy hearty, and happy; and comparatively speaking, were giants; but how changed." In a degree we sympathize in the lamentations of our correspondent over the changes in public manners and habits to which he refers, and think them much to be regretted; but our hopes of anything like a return to the simplicity and wholeness of ancient manners are indeed very small. So long as men insist upon setting up a false standard of prosperity and every good in life is to be measured by its actual return or worth in dollars and cents, all calculations will be made in conformity, and everything be devoted to this idol. We have nearly reached this point. With the great mass, a man's standing in the community is wholly determined by his money; and if a new edition of the Catechism should be called for and be left to the revision of three-fourths of the community, to the question "What did God make mankind for?" they would never think of any other answer than, for accumulation and speculation, to get all he can and keep all he gets. This being the case, time, talents, health, comfort, hospitality, peace of mind, independence, self respect, honor, integrity, moral and religious improvement, are all sacrificed to this object. We despair of any amendment unless divine Providence should visit us with some signal calamity. To preach against it, as Dr Franklin said in another case, like spitting against the wind, which is only spitting in one's own face; and to attempt to alter it is very much like a man's wading into a river and holding out his hands to stop its current.

As a matter of pleasant discussion we have no objection to entering upon the subject. Opinions always should be free. Men may tie our hands but they cannot control our judgments; and there is a pleasure which most men experience in thinking differently from other people—in the conceit, consequently, of their own superior wisdom.

The question is often proposed whether a farmer should endeavor to supply from his own farm, as far as it can be made to do it, all the wants of his family: what they eat, drink, and wear. Then the question is at once extended, and it is asked whether New England should endeavor to supply all her own wants of a nature which her soil can be made to supply. To a certain extent the principles which apply in the one case are equally applicable in the other. But we shall confine ourselves to the case of a family in reply to the suggestions of our correspondent, and yet without the least hope of changing any one's opinions or purposes; and as to the other case, we shall for the present leave that as matter of inference. The simple question proposed is, whether a farmer should seek to supply from his own farm the wants of his family as far as the farm can be made to do it? Heretical as the opinion may seem in these days of tariff, restriction and division of labor, we answer emphatically in the affirmative. But then there are qualifications in the case, which every reasonable man will admit; and it would be preposterous not to avail ourselves of the advantages which the present state of the arts and the altered and changed condition of society present. It would be absurd for us to attempt the culture of articles or products to which our soil or climate are wholly unsuited, though in some extraordinary cases and circumstances we might succeed in ripening them. Coffee, tea, cotton, rice, are with our present habits, necessities of life, for which we must be dependent upon our neighbors or upon other countries, if we insist upon having them. A true economist will deny that these are the necessities of life, and will either reject them entirely or find substitutes, which habit will render equally palatable or useful, and which must be less doubtful in regard to their influence

upon health. For coffee he may substitute the prepared beet, a most delicious beverage; for tea, the sweet balm of the garden, more fragrant than the finest Pouchong or Pecco; for rice, let him go to the Indian hominy or the oatmeal groats; and for cotton, he may use linen, the product of his own flax, and which in its durability, comfort, and superior cleanliness, fully compensates for its higher cost. His maple trees, and presently his locust fields, will supply his sugar and molasses; his currant bushes and his grape vines will furnish glass of wholesome wine for himself and his friends; and as to alcoholic drinks in any of their forms, that, thank God, which was once deemed an indispensable article of use and hospitality, has now ceased to have a place even among the imaginary wants of a rational man. With respect to cotton cloth, improved machinery has rendered its manufacture so cheap, that it would be vain to bring our domestic manual labor in competition with it; but with respect to coffee, tea, and rice, we should lose nothing by renouncing them; and the farm might easily be made to furnish substitutes altogether preferable, when use had rendered them familiar. If we must have them, however, superfluities as they are, the farmer should be sure to raise a surplus product to purchase them. But he should not indulge himself in them unless he has produced beyond the necessities of his family, that for which he can purchase them.

A second rule of domestic economy is, not to cultivate articles which the farmer cannot cultivate but at a loss. For example, if even taking into view the improved condition of his land, the necessary expense of purchasing manure and hiring labor will not be met by the market value of the crops raised, but he must be farming continually at a loss, most certainly we should advise him at once to renounce his farming and not to throw away both his labor and his money. Under such circumstances, unless he has ample funds to expend as matter of amusement or recreation, we advise him to give up cultivation and escape the mortification and vexation of embarrassment and bankruptcy.

In the next place, for the sake of doing every thing within himself, we would not advise the farmer to attempt to do things which it is obvious he can undertake or accomplish only at a great loss of time and trouble. It would be absurd for him to attempt the construction of his own plough, the building of his own cart, or the shoeing of his own horse. These trades require skill, which can be the result of experience and long practice only; and preparations and fixtures which it would be expensive and inconvenient for every farmer to furnish for himself. At the same time, every farmer should be supplied with a good set of tools for common purposes of the farm; and if he has a good constructiveness, he will be often able to save himself many a heavy expense in repairing his implements and buildings, and in the making of many conveniences for which he must otherwise apply to a tradesman or mechanic. It would be absurd likewise for him to refuse to avail himself of any improved machinery which would save labor and toil, as for example, to thresh his grain by a flail, when it can be done much more expeditiously by a machine, unless the expense and trouble of managing such machinery and keeping it in repair is more than equivalent for the greater trouble of another mode.

There are other circumstances which should be taken into consideration in order to reply to the question whether a farmer should seek to live within himself and seek to supply his own and the wants of his family from the resources of his own farm. It would in general be much for his interest, for his independence, and for the improvement of his farm that he should do it. The question with him should be, not what method will

actually bring him the most money; but whether he can apply his labor in this way on his own farm to advantage and obtain in what it furnishes a reasonable compensation. If he sets out with a determination to do this, to produce with some tilling exceptions, every thing that is needed in his family, and to have nothing excepting what the farm will yield, if he is at the same time blessed with a family of children, it will lead to such a course of industry, enterprise, and economy as cannot fail to secure independence, comfort, health, and prosperity. The improvement of his family and of the improvement of the farm will be continually going on together; and such habits will be formed as are in truth, an estate to himself and the highest benefaction he can confer upon his children. H. C.

AGRICULTURE AND THE CLERGY.

Note. On account of our absence from the city we had not the pleasure of seeing the beautiful letter of W. B., inserted in the last Farmer, until after its publication, or we should have at once acknowledged it. Such a pen as he holds, should not be idle; and we beg him to let us hear from him often. What the clergy could do and ought to do for agriculture and horticulture is a topic which deserves no little attention. If half the time many of them now spend in their studies they would spend in their gardens or fields, they would have better health, more mental vigor, and do more intellectual labor. If instead of preaching theological dogmas and mysteries, which narrow the mind and abstract men from the proper business of life, and too often curdle all the milk of kindness which a man has in his heart, they would occasionally give them a discourse upon natural science, good husbandry, and the art of getting a living for themselves and their families by honest industry, and show them the Divine Providence as it operates everywhere around them, in the seasons, the sunshine, and rain, in the flowers and fruits, they would be more likely to keep their congregations awake and save their morals, and make them good christians. If instead of wasting their time in useless gossip in public places and on all sorts of meetings for the promotion of religion, by voting, and talking, and planning missions in the moon, they would try to promote religion in their own neighborhood, by eminent examples of good husbandry in productive cultivation, in providing food for man and beast, in improved lands, beautiful gardens, door-yards ornamented with flowers, and the raising of fine fruits, besides the satisfaction of setting themselves an example of the duty which they strongly urge upon their parishioners, that of supporting the ministry, they would do not a little towards advancing the comforts and improving the manners of their people, which is at least the chief object towards making them religious. It is hoped that we shall presently emerge from the darkness of fanaticism, superstition and nonsense, and get at least into the twilight of common sense. We shall then find out that man's proper business is to perform well the duties of the station where God has placed him; that it is the ordinance of his Creator that he should get his living by the sweat of his brow; and that doing what of good we can on earth, is the best way of securing what of good may be laid up for us in heaven. H. C.

BRIGHTON MARKET.—MONDAY, July 1, 1839.

Reported for the New England Farmer.

At Market, 170 Beef Cattle, 12 Pairs Working Oxen, 25 Cows and Calves, 2400 Sheep, and 700 Swine. 175 Swine have been before reported. 250 swine unsold.
Prices.—Beef Cattle.—Prices have further declined and we again reduce our quotations. First quality, \$9 00, a \$9 25. Second quality, \$8 50 a \$8 75. Third quality, \$7 25 a \$8 25.
Cows and Calves.—Sales "dull." A very few effected. We notice the following: \$35, \$38, \$40, and \$72.
Sheep.—Lots of sheep and lambs were taken at \$2 50, \$3 00, \$3 50. Wethers \$1 25, and \$1 75.
Swine.—The market appears to be completely supplied and prices are very materially reduced. Lots to peddle, of very fine shoats, were taken at 6 1-2 for sows, and 7 1-2 for barrows. A lot also at 7 1-2, half barrows. A lot of old hogs at 7, half sows, and a lot at 7 1-2. A lot ordinary sows at 6. At retail from 7 1-2 to 9.

Hall's Rakes, superior. 100 " Wilder and Eddy's, do. 200 " Common, do. 25 " English Cast Steel Grass Scythes. 10 " " " Cradle " " " " Border " " " Round Scythe Stones and Rifles. 100 " Square " " " Patent Scythe Snaths, superior. June 19. JOSEPH BRECK & CO.

TULIPS, RANUNCULUSES, PINKS AND VIOLAS.

S. WALKER, of Roxbury, offers for sale in beds, or of such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland, France and England, and which yearly additions have a d will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superb Tulips will do well to make a selection for themselves when the bulbs are in bloom, (about the 1st of June.) The prices will conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices, in the country where the bulbs were raised, and cheaper than the like quality can be imported. Tulips in beds of from 30 to 100 rows, containing from 210 to 700 bulbs, or by the dozen, 100 or 1000. Viola grandiflora—Pansy, or Heartsease. Upwards of 2000 superb varieties will be exhibited and offered for sale when the Tulips are in bloom. Ranunculuses—five mixtures, at from \$2 to \$5 per 100. Pinks—fine named varieties, from 25 cents to \$1 each. For particulars apply to S. WALKER, or to JOSEPH BRECK & CO. eow

FINE CALF FOR SALE.

A fine young heifer calf, from J. P. Cushing's celebrated bull. Enquire of JOSEPH BRECK & CO.

MISCELLANEOUS.

THE POCKET FARRIER.

Try before you buy.—If you meet with a horse you like, and are desirous of buying him, do not fall in love with him before you ride him, for though he may be handsome he may start or stumble.

To discover a stumbler.—If you buy of one who knows you, it is not unreasonable to desire to ride for an hour. If refused, you may suspect he has some faults; if not, mount him at the door of the stable where he stands; let him neither feel your spurs, nor see your whip; mount him easily, and when seated, go gently off with a loose rein, which will make him careless; and if he is a stumbler, he will discover himself presently, especially if the road in which you ride him be anything rough.

The best horse indeed may stumble (a young one of spirit, if not properly broken in, will frequently; and yet if he moves nimbly upon the bit dividing his legs true, he may become a very good saddle horse); the best horse, I say, may stumble; but if he springs out, when he stumbles, as if he feared your whip or spur, depend upon it he is an old offender. A horse should never be struck for stumbling, or starting; the provocation, I confess, is great, but the fear of correction makes him worse.

In the purchase of a horse, examine four things—his teeth, his eyes, his legs, and his wind.

To know his age.—Every treatise on farriery has instructed us to know a horse's age by the marks in his mouth; but no one in five hundred (a dealer excepted) can retain it in mind.

Every horse has six teeth before in each jaw, until he is two years and a half old, they are all smooth and uniform in their upper surface.

At two years and a half old he sheds the two middle teeth, (by the young teeth's rising and forcing the old ones out,) which at three years old are replaced by two hollow ones.

When he is about three years and a half old, he sheds two others, one on each side the two middle ones, which at four years old are replaced by two others, which are also hollow.

The sharp single teeth in horses, begin to appear in the lower jaw when the horse is about three and a half, or four years old, they are full grown, pointed, and concave in the inside.

When he is four years and a half old, he sheds the two corner teeth, which at five are replaced also with two hollow ones, grooved on the inside, which groove marks the age precisely.

At six years of age this groove begins to fill up, and disappear; so do the hollows of the rest of the teeth, which continue till near seven and a half or eight years old, when all the teeth become uniformly flat and smooth.

Crafty jockeys will sometimes burn holes in the teeth to make them appear young, which they call bishoping; but a discerning eye will soon discover the cheat.

Eyes.—If a horse's eyes are lively and clear, and you can see to the bottom, and the image of your face be reflected from thence, and, not from the surface of the eye, they are good, but if muddy, cloudy, or coal black, they are bad.

Legs.—If his knees are not broken, nor standing and trembling forward (which is called knuckling), his legs may be good; but if he stops short, and digs his toes in the ground, it is a sign he will knuckle. In short, if the hoof be pretty flat and not curled, you need not fear founder.

Wind.—If his flanks beat even and slow, his wind may be good, but if they heave double and irregular, or if, (while he stands in the stable) he blows at the nostrils, as if he had just been galloping, they are signs of a broken wind. Deceitful dealers have a draught which they sometimes give to make a horse breathe regularly in the stable; the surest way therefore to judge of his wind, is to give him a good brushing gallop, and it is ten to one, if his wind be broken, or touched, that he will cough and wheeze very much, and no medicine can prevent him doing so.

Cure for broken wind.—A broken wind may be cured, if the following be applied on the discovery of it: A quart of a pound of common tartar, and the like quantity of honey; beat them well together, then dissolve them in a quart of new milk; let the horse fast two hours before you give the drench; walk him an hour after, and let him fast two hours; give this drench every second day with warm meat and drink.

A Draught Horse.—A horse with thick shoulders and a broad chest laden with flesh, hanging too forward, and heavily projecting over his knees and feet, is fitter for a collar than a saddle.

A Saddle Horse.—A horse with thin shoulders and a flat chest, whose fore feet stand boldly forward and even, his neck rising semicircularly from the points of those thin shoulders to his head, may justly be said to have a light fore-hand, and be fitter for a saddle than a collar. As most horses in the hands of farmers are drawn while they are young, which notwithstanding their make, occasions them to move heavily; if you desire a nimble footed horse, choose one that has never drawn.

In buying a horse, inquire into four other things viz:—biting, kicking, stopping, and starting.

A horse may be sound, though guilty of all four, which you can hardly discover by barely looking at him; so I refer you to his keeper.

When you are buying it is common for the owner to say in praise of his horse, that he has neither splint, spavin, nor windgall.

That you may not be imposed upon, those three are thus described:

The splint.—The splint is a fixed callous excrescence or hard knot, growing upon the flat of the in or outside (and sometimes both) of the shankbone; a little under and not far from the knee, and may be seen and felt.

To take it off shave the part, and beat it with a stick, prick it with a nail in a flat stick, clap on a blistering plaster as strong as you can make it, let it lie on three days; then take it off, and rub the place with half a drachm of the oil of origanum, and as much oil of vitriol, mixed; if the first does not do, rub it a second time with the oils; if you find any remains of the splint, apply a second blistering plaster for twentyfour hours; walk him moderately to prevent any swelling or excrescence from settling.

Most young horses have splints, more or less, and they will occasion lameness while they are coming upon the bone; but after they are grown to the firmness of bones, they do not lame a horse, nor is such a horse worse for use, though he may not look so well to the eye.

The spavin.—The spavin is of the same nature, and appears, in like manner, on the instep bone behind, not far below the hough. To take it off, beat the bone with a bleeding-stick, and rub it; then anoint it with the oil of origanum, tie a wet cloth

about it, add with a hot brick applied to it, soak in the oil, till it be dry.

Windgall.—Windgalls are several little swellings just above the fetlock joints of all the four legs; they seem, when felt, to be full of wind or jelly, but they never lame a horse; the splint and spavin always do. They all three proceed from one and the same cause, which is hard riding, travelling too far in one day, or carrying too great a weight when young.

SAYLE'S GARDEN ENGINE

For sale at the New England Agricultural Warehouse Nos. 51 and 52 North Market Street, Sayle's Garden Engines This Engine is a splendid article, and will throw a constant stream of water to the distance of 50 or 60 feet, with great force, and in case of fire would be a good substitute for a fire engine. It is the most perfect article for the purpose ever introduced. JOSEPH BRECK & CO.

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells. Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention. NATHAN WARD.

TO GARDENERS AND FARMERS.

The subscriber has constantly for sale at his Garden, in Brighton, the best varieties of the following plants:

- Early and Late Cauliflowers,
 - Purple and White Broc ooli,
 - Cabbage of every kind,
 - Celery, Peppers, Tomato and Lettuce,
 - Maryina, Okra, &c. &c.
- Also—Cucumber, Melon and Squash Plants, in pots, ready for plant-planting. J. L. L. F. WARREN.
Brighton, June 5.
