This machine will threfh, it is faid, from twenty to thirty quarters of wheat in twelve hours in great perfection; from thirty to forty-five of barley in the fame time; and from forty to fifty quarters of oats. It threfhes every thing perfectly clean when the grain is in fheaves. But though it cleans the corn from chaff, as feen above, winnowing is required afterwards. It was feen with one feeder to threfh twenty-two large and long fheaves in three minutes, without any variation in the ordinary movement of the horfes. This machine was conftructed by Elliott of Hexham, in Northumberland, and coft about 200*l.*, without the expences of fitting up, &c.

It is ftated, in the Effex Agricultural Report, that Mr. Newman of Hornchurch has a threfhing-mill which was built by two young millwrights from Somerfetfhire, in which there are two new circumftances of improvement, one of which is a movement fo prepared, as that the perfon who feeds the mill, by putting his foot on a pedal can lift one of the fluted cylinders out of its work, fo that the wheat-ears having been advanced far enough to be threfhed, the ftraw may be drawn back again and be prevented from being broken; the other is a click, or iron, which admits the horfes to be ftopped fuddenly without ftopping the beaters; by which the connection is removed for a moment, fo that one operates without the other: this is of capital importance in working the machine. Reprefentations of thefe improvements are given in the above work.

Thefe machines have occafionally grinding-mills combined with them, and are in this way found very convenient and advantageous. The Hon. Newton Fellows, in Devonfhire, has been at very great expence, it is faid, in erecting a threfhing-mill connected with one for grinding, both of which are wrought by a never-failing ftream of water. The power of this mill or machine is faid to be calculated as equal to fixteen horfes. And together with its power and capability for threfhing, winnowing, and dreffing every kind of corn, the pair of ftones for grinding attached to it are about four feet in diameter, to which a bolting-machine or apparatus is added.

In working, this threfhing-machine is capable of difcharging about twenty-five bufhels of wheat, and nearly forty bufhels of barley or oats in the hour. The barn, or place where the machine is placed, being filled with the wheat or other corn; the manual affiftance for performing the bufinefs is diftributed through it in this manner: one man and two women for unbinding the fheaves of corn and feeding the rollers, which laft are grooved and divided into lengths of fix or eight inches: on the ftraw being difcharged from the machine, one perfon attends to fhake it well over a large open fcreen, whence it is toffed over to another perfon, who removes it out of the way. At and under each of the winnowing-machines, fieves are placed to receive the grain coming directly from the machine, which is then put into the hopper of the fan of the fecond winnowing-machine, from which it is again received into another fieve, and thence difcharged into the hopper for grinding, for the market, or for other purpofes: in paffing through this little fan, fuch a feparation takes place as completely to divide the head from the tail corn. A cylindrical pearl-barley machine or apparatus is alfo applied and ufed to cleanfe the wad of its fmut, and thus by taking off the downy end of the grain, a much finer fample of both wheat and flour is obtained. This is preferred to the brufh apparatus; for although that may cleanfe the body of the grain, it will not carry off the down from its end, which may reafonably be fuppofed to contain the germ of fmut, or to form the neft of other animalculæ equally injurious to fuch grain when ufed as feed on lands.

There is in this machine only one labouring man employed to five women, which is an advantage of great importance in many fituations. The introduction of fuch machinery as this is therefore of great benefit in bettering and improving the rural condition of the country.

But, befides machines of this fort being conftructed for performing the different operations of threfhing, winnowing, grinding, and bolting, they have fometimes contrivances for other purpofes, as an iron hopper axis for grinding apples; and a contrivance for fhelling clover feed, and the haddocks of wheat. Thefe two additions belong to a threfhing-machine of Mr. Vinns in the above diftrict; and fome others are occafionally met with in other places which are a little different in their nature, but unneceffary to be here defcribed.

In the general conftruction of thefe machines, they are commonly,

commonly, as has been feen, made of two defcriptions, large and fmall kinds; the former of which probably not only perform their work more expeditioufly, but in a more perfect manner, though their expence is an objection to them on fmall farms. They require very different ftrength of teams or other powers in working them, according to their fizes, the nature of their conftruction, and other circumftances.

It is ftated, that in fome large machines of this kind, the rollers take in about three hundred inches of grain in a minute. The medium length of the ftraw being eftimated at about thirty inches, and fuppofing half a fheaf to be introduced into the machine at a time, the whole fheaf will be equal to fixty inches, and the machine, when fupplied with a middling quantity of water, will threfh five fheaves in a minute. But in refpect to the performance of thefe mills, much muft depend on the attention with which they are fed, as a fmall neglect in this point will make a very confiderable difference in the quantity of work that is performed in a given time.

In regard to the expence of thefe machines, it muft depend upon the fize and power which they poffefs of performing work, the number of other operations which they perform at the fame time, and whether they be fixed or moveable. According to fome perfons well informed on the fubject, a fixed mill that requires the power of two or three horfes, will coft from fixty to a hundred guineas. This will threfh about fifteen quarters of wheat, and from that to twenty of barley, oats, peas or beans in the courfe of eight or nine hours.

It is noticed, that the only defect of machines worked by wind, upon their firft introduction, confifted in the rifk to which they were expofed, by ftopping them to take in the fails, which could fcarcely be done during a brifk gale: in that way it fometimes happened, that when the wind frefhened confiderably after the machine was fet a going, either the fails were torn to pieces, or the arms broken off. That defect, however, is now remedied by a late invention of Mr. Mickle, by which the whole fails can be taken in, or let out, in lefs than half a minute, merely by a perfon pulling a rope within the houfe; by this contrivance the fails are, with eafe and expedition, proportioned to any degree of wind, an uniform motion is produced, and all danger of ftraining or hurting the machine is avoided.

It is further obferved, that the number of hands required for working one of thefe machines, is from five to fix; but that this depends greatly on the conftruction of the machine, fome of them being fo contrived, that the work can be performed with much fewer hands.

It is, however, noticed in the Agricultural Survey of Norfolk, that a machine erected by Mr. Johnfon, at Lempfton, appears to be one of the beft, if not the very beft, of the larger kind that has yet been met with. The movements in it are uncommonly fmooth. It requires from fix to eight horfes, fix men, and one woman; it threfhes, without any queftion, much cleaner than the flail, and, without any doubt, cheaper. To bring it to its prefent perfection, as he was determined to carry his point, he never ftopped till it worked to his mind; and having completed it, the repairs fince have been quite trifling. The common complaint of their being always out of order is attributed to original errors or inattention in the conftruction of them. The arrangement is excellent, it is faid, in this machine, for difpofing of the chaff, colder, ftraw, and corn, at once, in their refpective places, without any confufion or after-removals; and it takes up a very fmall part of a barn. It was built by Mr. Wigful of Lynn.

Mr. Whiting, of Fring, has alfo a large threfhing-mill, built by Mr. Fordyce, an engineer from Scotland. It coft him 200*l.*: is worked by fix horfes; threfhes twenty-four coombs of wheat in the day, fifty-five of barley, and from fixty-three to eighty-four of oats. It has five beaters on the drum-wheel, and the fluted fegment of a cylinder which covers the drum in two parts, with an unfluted plate between them, which is raifed or funk by a fhort lever: this is a guard againft ftones getting in. In another circumftance alfo it is fingular; there is a long platform, with a rolling cloth bottom: the whole raifed or funk at pleafure, for delivering the corn, acrofs the floor fpace of the barn, from the goff in which the corn is ftacked, to the other end in which the mill is built; which faves much labour, and works to his fatisfaction.

The horfe-wheel is here upon a different conftruction from the common ones, working by a cogged-wheel of fmall diameter below, inftead of above the horfes; and the communicating fpindle under their path; but it is faid to be hard work.

And Mr. Coke, of Holkham, is ftated to have a very large machine, which coft about 600*l.* Befides threfhing, it grinds corn, works two chaff-cutters, and breaks oil-cake. It threfhes fixty-four coombs a day.

Mr. Reeves, of Heverland, has a threfhing-mill which is, the writer thinks, ftill nearer to perfection than any other he has feen; it was made by Afbey, works with two or three horfes, and coft a hundred guineas. He found it at work, threfhing oats; it does for barley as well as for any other grain, threfhing thirty-two coombs in a day of feven hours and a half; more of oats; forty of peas; and thirty of wheat: its day's work of wheat, threfhed the day before he faw it, was thirty-one coombs, which were ftanding facked in the barn. It varies confiderably in the beating-drum cylinder from the others he has feen, it being of a much larger diameter, and has eleven beaters.

At Brightwell-Grove, in Oxfordfhire, according to the Agricultural Report of that diftrict, there is a threfhing-machine, belonging to Mr. Lowndes, which was conftructed by Raftrick, and in which there is fome novelty of contrivance: it works by means of four horfes: the drum-wheel, in this cafe, is three feet and a half in diameter, makes two hundred and fixty revolutions in a minute, and, having fixteen beaters, it gives 4160 ftrokes in that time: there is a rake with four fets of teeth which takes the ftraw, and delivers it to a fecond drum-beating cylinder two feet in diameter. This drum is termed the dreffer, and turning in an oppofite direction to the motion of the ftraw, beats it down, and in its defcent ftrikes it againft a circular board, faced with bars fhod with iron, through the fpace of eighteen inches, by which the ftraw receives feveral additional ftrokes, which, it is conceived, have a great effect in diflodging that corn which has not been completely feparated in paffing the principal drum. This is the addition not ufual in thefe machines. Thefe are wrought four hours at a time, in which eight quarters of wheat are threfhed out. Every thing is threfhed perfectly clean; and the ftraw is not broken more than by the flail. Twelve quarters of barley are threfhed in four hours, and fixteen have been done in that length of time. The horfes, in this machine, are not attached in the draught, in the manner which refembles pufhing, by advancing with the lever before them, but in the common drawing method, with the lever behind them, in which way they are fuppofed by fome to do the work much better.

This machine was feen to threfh forty-three fheaves in ten minutes. It dreffes at the fame time; and there is a chaff-cutter,

cutter, as well as a corn grinding-mill with ftones, for farm ufe, attached, and wrought or not, at pleafure.

It is perhaps only in places fituated in the immediate vicinity of a colliery, and where, from the cheapnefs of fuel, they are capable of being worked at a very trifling expence, that fteam can be had recourfe to as the moving power of thefe machines. See STEAM, and STEAM-*Engine*.

With regard to fmall machines, it is faid in the Eaft Lothian Agricultural Report, that they have been introduced there, upon a reduced fcale, at a price fo low as 40*l.*: that thefe fmall machines, having little work to do, and that little being, in general, done flowly, anfwer the purpofe tolerably well; but though cheaper in the firft inftance, they are, in the end, more expenfive than larger ones, a certain degree of ftrength being abfolutely requifite to do the work perfectly. If the parts of the machine are below that degree of ftrength, the work is either ill done, or the machine is deftroyed, by being exerted above what it is able to bear.

The writer of the Effex Agricultural Survey too ftates, that in that diftrict at prefent many are made by Balls of Norfolk, the price fifty guineas, and do their work very clean and well for all forts of corn, but do not drefs. They have been applied to white clover, and have done it to the fatisfaction of the growers, by paffing it through twice or thrice. In one erected by Mr. Vaizey, which is worked by horfes, one man feeds, two fupply, a boy drives, and two men clear away the ftraw. He has threfhed fixty quarters of wheat with it in eighteen hours. It coft 52*l.* 10*s.*, and 10*l.* putting up; the fhed added about 20*l.*, two winnowing machines 15*l.* 15*s.*; in all, complete, about 100*l.* But in this a greater number of horfes are ufed than are noticed above. The owner has no fault to find with its performance, but is very well fatisfied with it. He has applied it to cobbing white clover with great fuccefs; by paffing it thrice through the mill, he got from three jags, feven bufhels of clean feed in four hours. And one built by Dickfon of Ipfwich, for Mr. Sanxter, goes with two or four horfes, and coft fifty guineas. It is fuppofed that it will threfh twenty quarters of wheat *per diem*. But it is now fifty-five guineas, put up and ready to work. Two horfes work it, without hard labour. The laft year's wheat, which was very badly threfhed at 7*s.* *per* quarter, was done by this machine perfectly well. Alfo at Little Wakering, Dr. Afplin has a machine which the writer faw working with one horfe, which moved with great eafe, driven by a little girl; one man and two boys work it, and it does three quarters of wheat in a day. The writer examined the ftraw for about a quarter of an hour, and did not find a fingle kernel in it. The price is fixty guineas. The conftruction in this machine varies from the others he has feen, in the wheels which communicate the motion. The doctor threfhes only wheat with it, though it will do for all forts of grain. He thinks it anfwers greatly, and is perfectly fatisfied with it. It was made by Turbot, Bankfide, Weftminfter, but they are now made by Jones, Clement's-Lane, Clare-market, London.

There are many other perfons who put up thefe machines at an equally reafonable rate, and fo as to work with much perfection.

Where machines of this fort coft about one hundred guineas, the annual expence in intereft of capital and repairs cannot be more than from 10*l.* to 12*l.* at moft, except in the expences of teams and the labour of the perfons employed in the execution of the bufinefs and work about them.

The expenfive machines which have rollers for rubbing out the grain inftead of beaters, are thought in general to perform the bufinefs in the moft perfect manner, though they require more power to work them.

It is, however, thought by fome to be utterly impoffible to build threfhing-machines which will do juftice to the owners for any fuch fum as 50*l.*, or thereabouts, as their durability and fuccefs depend materially on their firmnefs, ftrength, folidity, and other circumftances of the fame nature, which are by no means attainable for any fuch money. Yet many of thefe fmall machines of one or two horfe power, are faid to perform their work well, and at the rate of fix quarters of wheat, and the relative proportions of other forts of grain, in the courfe of the day. They are ftated to be made in feveral different diftricts, at the prices of from thirty to fifty guineas, fo as to threfh well at nearly the above rate, and to have, in fome inftances, other additions, fuch as chaff-cutters, &c. made to them. In particular cafes, they are thought not to break the wheat-ftraw fo much as the flail; and though wheat and beans are moftly well threfhed by them, barley is under the neceffity of being often twice paffed through fuch machines, as feen above. They do not drefs in general; but fometimes head feed clover in a pretty perfect manner, as noticed already.

Small threfhing-machines have likewife been conftructed fo as to be wrought by hand, in fome diftricts, both in the northern and fouthern parts of the kingdom, and been afferted by fome to perform their work in a clean and fatisfactory manner; but from their moftly wanting that degree of velocity, in being wrought in this manner, which is effential to good work of this kind, they have not yet become in any way general. Indeed, in fome diftricts in the fouth, the working of them by the hand not being found to fucceed well in actual practice, the ufual feeding rollers have been applied with the horfe-tackle, at the additional charge of about 20*l.*, which has enabled them, it is faid, to do the work properly, and in an eafy manner, even by the power of one horfe. Where the teeth of the iron wheels in fuch machines have been found too fine for the increafed force made ufe of in this way, vertical wooden wheels and pinions have been put in their place, which have contributed to the ftrength and preferved the fimplicity of the machinery.

Threfhing-machines have now been known, and in fome meafure employed, in the northern parts of this country for more than half a century, and are at prefent very general in thofe that are any way improved; but in the more fouthern diftricts, they have only been attended to, in any confiderable degree, for the fpace of the laft thirty or forty years, yet their ufe and application are faft becoming general among the more extenfive farmers whofe farms are of the arable kind. In fhort, it is not improbable but that in a little time the machine will be the moft prevalent method of threfhing out corn. And it has been fuggefted, that parifh machines of this nature, in centrical fituations, would perhaps not be lefs ufeful or convenient than parifh mills, while, at the fame time, they might be eafily fo regulated as to be rendered of great general benefit to the community, as well as advantageous in the way of private fpeculation to individuals. Something of this fort is faid to be already the cafe in fome diftricts of the North, and would, it is believed, be defirable in all, for the convenience and accommodation of the fmall farmer; as the fame conveyance that brought the corn to be threfhed, might take back the ftraw and grain, and in this way little wafte of labour or time be fuftained, while the faving would be confiderable and certain.

It may be noticed alfo, that in all cafes where threfhing-machines are made ufe of, they fhould be well fuited to the

 extent

extent of the farms, and be erected in fuch a manner as to be convenient for having the contents of the ftacks brought to them. In this view it has been fuggefted, in the Report on Agriculture for the Weft Riding of Yorkfhire, that the barns to which they are attached fhould extend into the yards in which the ftacks are contained; as in that way the labour and time will be confiderably leffened of fupplying them with corn in the ftraw for being threfhed. And it has been juftly remarked, by an intelligent promoter of agricultural improvements, that this machine has not been attended with one-half of the advantage which might have flowed from fo ufeful a difcovery, for want of combining the ufe of it with the various connected circumftances of the farm-yard. The bufinefs of ftacking corn, for inftance, muft, it is conceived, receive an entirely new arrangement in confequence of building a threfhing-mill or machine. By means of no other additional expence than that of an iron railway, and placing the ftacks on frames refting on block-wheels, two feet in diameter, a very confiderable annual expence in time and labour muft, it is fuppofed, be faved in carting ftacks to the barns, in lofs of corn, and in waiting for good weather, as well as in the faving of threfhing by flails, and all the attendant evils of pilfering and leaving corn in the ftraw. This is a material object, which it is thought cannot receive too much attention from both landlord and tenant. It is contended that there cannot be the fmalleft doubt of the propriety or profit of having one of thefe machines fixed in the principal farm-yard. But that where the farm is large, and ftacks confequently fcattered over various fields or parts of it, then it may be right to have a moveable one alfo; but fo many operations are wanting at home, that one fhould certainly be fixed. The circular form of the railway upon which the ftacks are brought to the mill or machine, is confidered neceffary in fuch cafes, as being the only one which permits a choice of any particular ftack to threfh, without waiting for all or many others being done before it can be got at; but a ftraight line leading to and paft the mill or machine is admiffible, except for this circumftance, though much inferior, in fome other points, to the circular form. In forming this plan, a fort of railway fhould be fo contrived as that a horfe or two may be fufficient to draw all common ftacks to the mill or machine. And it is directed that the wooden ftumps on which the frame refts fhould be tinned, or laid in the common manner with brafs latten, which is more durable than common tin, to keep out rats. Alfo, that as the power applied to the threfhing-mill in other ways is at hand, and applicable alfo to the above fort of work of drawing the ftacks, it may be ufed for the purpofe in many cafes.

Threshing-*Mill Barn* or *Building*, that fort of barn, fhed, or other building which is calculated for receiving, or which contains this kind of mill or machine.

In this intention, an upper floor, raifed eight, nine, or ten feet from the ground, in proportion to the height or fize of the animals, and the arrangement of the machinery which is to be employed, will be required, and which fhould reach from end to end of the barn or building, as a repofitory for the unthrefhed corn, which fhould be there lodged and depofited, at leifure times, from the ftack-yard, or other places, in order to be ready to feed the mill or machine with from this upper floor. The ground-floor fhould contain the large mill-wheel, and a horfe-path round it, all the lower parts of the machinery, a dreffing-room for the grain, and a wide open fpace for ftraw of different forts, which is there to be piled up, ready for the cattle-fheds, on each fide of this repofitory of fodder.

The expences of thefe prepared barns or buildings, will probably not only be much leffened, but wholly done away, in fome cafes, by the ufe of the threfhing ftack farm-yard, which has been defcribed in fpeaking of the mills or machines for this ufe, and much convenience and accommodation be thereby gained to the farmer in the difpatch of the bufinefs, &c.

On the whole, by thefe means the labouring teams and hands will be enabled to perform the work of threfhing at fuch wet, ftormy, and leifure periods as will render it the leaft troublefome and expenfive to the farmer. See Threshing-*Machine*.

THREX, among the Romans. See Thraces.

THRIFT, in *Botany*. See Statice.

THRIHING. See Trihing.

THRIMSA, in *Antiquity*, a filver coin, the value of which has occafioned a variety of conjectures. Lambard, who gave the firft eftimate of it, makes it a three-fhilling piece, in which opinion he is followed by fir Henry Spelman. Bifhop Nicholfon apprehends, that it was the name of their common coin, and that the thrimfa, fceata, and penny, were all of them the fame. Somner, from the import of the word, and the value given to the thrimfa in the Saxon laws, rates it at three-pence. Selden, Brady, and Hickes, are of opinion, that this coin was either the laft tremiffis of the Franks and Germans, and confequently four-pence, or the third part of the Saxon fhilling, *i. e.* three halfpence and one-third of a halfpenny in their money. Mr. Clarke adopts, and endeavours to eftablifh the opinion of Somner, who obferved, from the laws of Athelftan, that the price of a thane's life was, by the Angli, valued at 2000 thrimfas, which, by the Mercian eftimate, was 1200 fhillings; and if each of thefe fums denotes the fame value, which is probable, the thrimfa muft be to the fhilling as 2000 is to 1200, or three parts in five of a Saxon fhilling, *i. e.* three-pence.

The thrimfa was firft coined in the reigns before Athelftan, during their greater affluence in cafh, and defigned merely for the convenience of exchange, as the moft proper divifion that could be made in their money without a fraction, between the fhilling and the penny. But when the fhilling was reduced, it was of little ufe, and by degrees entirely laid afide.

Dr. Hickes obferves, that the method of computing by thrimfas was chiefly ufed in the more mercantile parts of this kingdom, among the Eaft and Weft and South Saxons, and poffibly coined only among them; for it appears that the inland provinces, the Mercians, reckoned generally by the fhilling. Clarke's Conn. of the Roman, Saxon, and Englifh Coins, p. 229, &c.

THRIN, in *Geography*, a river of Norfolk, which joins the Yare at Yarmouth.

THRINAX, in *Botany*, θριναξ, *a fan*, in allufion to the form of its leaves; a name beftowed by the younger Linnæus on the little Fan Palm of Jamaica, when he firft diftinguifhed this plant generically from *Corypha*, to which it had been referred by Browne. To that genus it is, as Swartz obferves, very clofely allied, differing chiefly in the want of a corolla.—Swartz Prodr. 57. Ind. Occ. v. 1. 613. t. 13. Schreb. Gen. 772. Willd. Sp. Pl. v. 2. 202. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 307.—Clafs and order, *Hexandria Monogynia*. Nat. Ord. *Palmæ*.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, minute, hemifpherical, with fix fmall, erect, marginal teeth. *Cor.* none. *Stam.* Filaments fix, erect, equal, thread-fhaped, about

about twice the length of the calyx, inserted at the base of the germen; anthers terminal, erect, linear, longer than the filaments, cloven at each end. *Pist.* Germen half immersed in the base of the calyx, ovate; style cylindrical, thickish, erect, the length of the filaments; stigma very large, funnel-shaped, oblique, of a single, dilated, ovate, rather tumid, lip, finely crenate at the margin, rarely accompanied by another lip. *Peric.* Drupa small, globular, naked, rather dry. *Seed.* Nut solitary, large, globose, brittle, of one cell, with a solitary kernel.

Eff. Ch. Calyx with six teeth. Corolla none. Stigma funnel-shaped, oblique. Drupa globular, with a single seed.

1. Th. *parviflora.* Small Jamaica Fan Palm; Palmetto Royal; or Palmetto Thatch. Willd. n. 1. Ait. n. 1.—Native of the sea-coast, and other barren dry situations, in Jamaica and Hispaniola. *Swartz.* The *stem* is from ten to twenty feet high, unarmed; tumid at the base. *Leaves* collected about the top, stalked, from one to two feet long, palmate, plaited like a fan; their segments lanceolate, ribbed and streaked, rigid, nearly equal. *Footstalks* longer than the leaves, roundish, somewhat compressed, smooth, flexible, unarmed. *General Sheath* compound. *Flower-stalk* terminal, solitary, nearly erect, two or three feet long, panicled, imbricated with *partial sheaths*, or *bracteas*; its *branches* alternate, subdivided, spreading; the ultimate ones opposite or ternate, crossing each other. *Flowers* stalked, opposite or ternate, small, perfect. *Anthers* yellow.—Brown says, Hist. of Jamaica, 191, this tree covers whole fields in many parts of that island, thriving better on the rocky hills, than on the low moist plains near the sea. The copious little berries serve as food for birds and wild beasts. The trunk, seldom more than four or five inches in diameter, ten or fourteen feet high, is called the *Thatch-pole*, and is much used for piles in wharfs and other buildings made in the sea; for it stands the water well, and is never corroded or touched by worms. The split footstalks make baskets, bow-strings, ropes, &c. being very strong and tough. The leaves are called *thatch*, and are used as such, for outhouses especially, being found to resist the weather for many years. Such coverings of buildings have only the inconvenience of harbouring rats or other vermin, which prevents their general use.

THRINCIA, so called by Roth, from θριγκος, *the battlement of a wall*, to which he compares the seed-crown of the marginal florets. The Italian name *Trinciatella*, used by Camerarius, *Hort. Med.* 173, for *Hyoseris radiata*, may, as Dr. Roth supposes, have a similar origin; but it comes directly from the Italian verb *trinciare*, to cut, alluding to the remarkable segments of the leaf in that plant.

This genus of *Thrincia* consists of two species, *Leontodon hirtum* of Linnæus, and *Hyoseris taraxacoides* of Villars, excluding the synonyms of the latter. We see no occasion to separate them from *Apargia* of Schreber and Willdenow, the *Hedypnois* of Hudson. Having, in the *Prodr. Fl. Græc.* v. 2. 142, adopted Hedypnois; and in p. 130 of the same volume, Apargia; we refer the reader to the former in its proper place, and shall here introduce the latter, with its full characters and synonyms.

Apargia, Απαργια, an ancient Greek name, with whose original meaning, or application, we are unacquainted. Dalechamp has applied it to something of the *Hieracium* kind; and Schreber, after Scopoli, to the genus now before us, with which we hope it will remain.—Schreb. Gen. 527. Willd. Sp. Pl. v. 3. 1547. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 445. Sm. Prodr. Fl. Græc. Sibth. v. 2. 130. Compend. Fl. Brit. ed. 2. 117. Marsch. a Bieberst. Caucas. v. 2. 247. (Hedypnois; Hudf. Fl. Angl. 340. Sm. Virea; Gærtn. t. 159.)—Class and order, *Syngenesia Polygamia-æqualis.* Nat. Ord. *Compositæ semiflosculosæ*, Linn. *Cichoraceæ*, Juss.

Gen. Ch. *Common Calyx* oblong, permanent, imbricated, of several linear, parallel, unequal, longitudinal, incumbent scales; those at the base very small. *Cor.* compound, imbricated, uniform; the florets numerous, all perfect, equal, monopetalous, ligulate, linear, abrupt, with five teeth. *Stam.* Filaments five, capillary, very short; anthers united into a cylindrical tube. *Pist.* Germen nearly obovate; style thread-shaped, the length of the stamens; stigmas two, recurved. *Peric.* none, except the permanent, straight calyx, at length reflexed. *Seeds* solitary, oblong, striated, crowned with sessile feathery down, somewhat chaffy in the lower part, and often unequal in the marginal florets; somewhat stalked in the central ones, frequently accompanied by shorter hairs or plumes. *Recept.* dotted, naked, or very slightly hairy.

Eff. Ch. Receptacle naked, dotted. Seed-down feathery, sessile, unequal. Calyx imbricated, with small scattered scales at the base.

This genus, though very natural and well defined, has the general habit of *Hedypnois*, or of *Hieracium*, agreeing with the latter in having some caulescent species, though in most the *flower-stalks* are radical and single-flowered. The *leaves* are variously toothed or sinuated, mostly hairy, rarely villous. *Flowers* of a full yellow. *Root*, except in our thirteenth species, perennial, tuberous. We adopt the English name of Hawk-bit from Petiver.

1. A. *aurantiaca.* Orange-coloured Hawk-bit. Willd. n. 1. "Waldst. et Kitaib. Hung."—"Stalk radical, single-flowered, naked; tumid and hairy in the upper part. Calyx hispid. Leaves lanceolate-oblong, slightly toothed."—Found on the lofty mountains of Hungary. *Leaves* three or four inches long, smooth. *Stalk* six inches high, smooth, except just below the flower. *Calyx* clothed with rigid blackish hairs. *Corolla* orange-coloured. *Seed-down* sessile, feathery. It differs from the next in having no scales on the *stalk*, which is more tumid in its upper part; very smooth *leaves*; and a different-coloured *flower*. *Willd.*

2. A. *alpina.* Alpine Hawk-bit. Host. Syn. 423. Willd. n. 2. (Leontodon alpinum; Jacq. Austr. t. 93. L. pyrenaicum; Gouan. Illustr. 55. t. 22. f. 1, 2. Hedypnois pyrenaica; Villars Dauph. v. 3. 78, from the author. Picris saxatilis; Allion. Pedem. v. 1. 211. t. 14. f. 4. Taraxacum foliis integris dentatis, calyce hispido, pappo plumoso; Hall. Helvet. ed. 1. 741.)—Stalk radical, solitary, single-flowered, scaly; slightly tumid, and somewhat hairy, at the top. Calyx hispid. Leaves lanceolate-oblong, slightly toothed, somewhat hairy.—Native of grassy pastures, on the Alps of Austria, Switzerland, Dauphiny, and Italy. Haller found it on mount St. Gothard, Schleicher on mount Fouly, and the late Mr. Davall on St. Bernard. Our synonym of Haller's first edition, misquoted by Willdenow, rests on the authority of Allioni. We do not find the plant in his subsequent publications. The *root* is tuberous, perennial, with long fibres. *Leaves* from three to eight, radical, stalked, erect, obtuse, two or three inches long; tapering at the base; distantly toothed about the middle or lower part: rough, with shaggy short hairs, particularly about their rib and *footstalk*; which latter is sometimes red or purple. *Flower-stalk* from three to ten inches high, slender, erect, bearing a few scattered linear scales, and one yellow *flower*, hardly so big as our common Dandelion, whose *calyx-scales* are narrow, black with shaggy hairs.

3. A.

3. A. *crocea*. Saffron-coloured Hawk-bit. Willd. n. 3. (Leontodon croceum; Haenke in Jacq. Coll. v. 2. 16.)—"Stalk radical, solitary, single-flowered, slightly scaly; tumid and hairy above. Calyx hispid. Leaves smooth, runcinate, with a triangular terminal lobe."—Gathered by Haenke on the alpine heights of Judenberg, in Upper Stiria, where it inhabits dry, open, barren pastures, but is elsewhere rarely to be seen. This is said by Willdenow to be like the preceding, but different in the above-described figure of its *leaves*, which are only sometimes hairy. *Flower* an inch and half, or two inches, in diameter, very handsome, and readily distinguished from all the surrounding species of its own tribe, by its colour, which is that of tincture of saffron.

4. A. *hastilis*. Shining Spear-leaved Hawk-bit. Host. Syn. 423. Willd. n. 4. Ait. n. 1. (Leontodon hastile; Linn. Sp. Pl. 1123. Jacq. Austr. t. 164. L. protheiforme B & C; Villars Dauph. v. 3. 87. Picris, n. 26; Hall. Helvet. v. 1. 12.)—Stalks radical, single-flowered, smooth as well as the calyx. Leaves obovato-lanceolate, smooth, with numerous slightly hooked teeth.—Native of the south of Europe; very abundant in Switzerland. The *leaves* are often a foot long, tapering at the base into purplish, flat, winged *footstalks*; their surface smooth, even, and somewhat glaucous; their margin cut into many deep, acute, triangular teeth, partly hooked backward. *Stalks* several, round, very smooth, glaucous, very rarely divided, twelve or eighteen inches high. *Flower* bright yellow, an inch and half wide, with scarcely any perceptible hairs on the *calyx*; drooping when in bud. Sometimes the *flower-stalks* bear a few linear distant scales.

5. A. *dubia*. Doubtful Hawk-bit. Willd. n. 5.—"Stalk single-flowered, radical, nearly naked; hairy, as well as the calyx, above. Leaves lanceolate, toothed at the base, slightly clothed with forked hairs."—Communicated to Willdenow by Hoppe, from the Saltzburg alps, under the above name, which seems to us but too well applied. We have not indeed seen a specimen of this plant. Willdenow describes it as intermediate between the last and *A. hispida*. The *stalks* are mostly furnished with one small scale, and are tumid under the *flower*, whose *calyx*, as well as the upper part of the stalk, are beset with short forked hairs. The *leaves* seem smooth at first sight, but bear scattered, white, forked hairs.

6. A. *tuberosa*. Knotty-rooted Hawk-bit. Willd. n. 6. Ait. n. 2. Sm. Fl. Græc. Sibth. t. 797, unpubl. (Leontodon tuberosum; Linn. Sp. Pl. 1123. Dens leonis bulbosus; Ger. Em. 290. Chondrilla altera Dioscoridis, &c.; Lob. Ic. 232.)—Stalks radical, single-flowered, naked, somewhat hairy. Calyx hairy. Leaves pinnatifid, runcinate, somewhat lyrate, rough with forked hairs. Root of many ovate tapering knobs.—Native of the south of Europe and the Levant; very common in the sandy meadows of Greece, Cyprus, and Zante. The modern Greeks name it ῥαδίκι, or *radish*; and it may be, as some old botanists have thought, the χονδρίλλη ἑτέρα of Dioscorides, but this is hard to determine. The perennial *root* is a cluster of sessile ovate knobs, above an inch long, tapering into radicles. *Leaves* numerous, spreading, dark green, obtuse, either simply runcinate, with a large terminal lobe, or deeply, sometimes interruptedly, pinnatifid, and bluntly toothed. *Flower-stalks* several, a span high, ascending, striated, more or less hairy; purple, like the *footstalks*, at their base. *Calyx* slender, with acute scales. *Flowers* above an inch wide, full yellow; red underneath.

7. A. *incana*. Hoary Hawk-bit. Scop. Carn. v. 2. 113. Willd. n. 7. Ait. n. 3. (Hieracium incanum; Jacq. Austr. t. 287. Linn. Sp. Pl. ed. 1. 799. H. sextum montanum; Clus. Hist. v. 2. 141. Ger. Em. 302. Leontodon hispidum β; Linn. Sp. Pl. ed. 2. 1124.)—Stalks radical, single-flowered, almost naked, hoary as well as the calyx. Leaves lanceolate, erect, very minutely and sparingly toothed, hoary with starry hairs.—Found on hills and mountains in Germany, Switzerland, Carniola and France. The *root* is long and woody, divided at the crown, where its bears several tufts of straight, upright, more or less acute, very hoary, *leaves*, tapering at the base, from three to five inches long, with a few little, marginal, glandular teeth. *Stalks* often solitary in each tuft, a foot high, swelling at the top. *Flowers* light yellow, an inch and a half broad. *Calyx-scales* narrow, acute. The uniformly entire *leaves*, though beset with a few glandular teeth, and the structure of most other parts, when minutely examined, render this plant sufficiently distinct from *A. hispida*, hereafter described, with which Linnæus subsequently confounded it as a variety.

8. A. *Taraxaci*. Dandelion-leaved Hawk-bit. Willd. n. 8. Ait. n. 4. Compend. Fl. Brit. n. 3. (Hedypnois Taraxaci; Villars Dauph. v. 3. 80. t. 26. Fl. Brit. 825. Engl. Bot. t. 1109. Hieracium Taraxaci; Linn. Sp. Pl. 1125. Retz. Obs. fasc. 4. 30. t. 2. Lightf. Scot. 435. Picris n. 27; Hall. Hist. v. 1. 12. P. Taraxaci; Allion. Ped. v. 1. 211. t. 31. f. 1.)—Stalks radical, mostly single-flowered; tumid and hairy at the top. Leaves smooth, with recurved teeth. Calyx hairy.—Native of watery pastures on the loftiest mountains of Lapland, Scotland, Wales, Switzerland, Savoy, and Dauphiny, flowering in July or August. *Root* abrupt, with long lateral simple fibres. *Herb* very variable in the breadth of its *leaves*, as well as the number, height and luxuriance of its *flower-stalks*. The former are either lanceolate, and almost linear, or spatulate and obovate, sharp or blunt, from two to four inches long, with shallow or very deep, always runcinate, teeth. The latter are ascending or erect, solitary or in pairs, sometimes, though rarely, divided, naked or furnished with a few linear scales, shaggy with black hairs at the top, as is likewise the broad and thick *calyx*. *Flowers* an inch broad, or more, of a full yellow, with brownish terminal teet. *Germen* surmounted with a taper neck, like a stalk, but as the seed swells, this appearance vanishes, and the feathery *down* is truly sessile. *Receptacle* naked. Willdenow justly remarks, that Gouan's synonym is misapplied to this species in the *Fl. Brit.* We have now quoted it more correctly under our second *A. alpina*, to which some of the slender varieties of the present bear a great resemblance. Solander, as well as Linnæus, thought this plant a mule between *Hieracium alpinum* and *Leontodon Taraxacum*, merely because its *flowers* resembled one, and its *leaves* the other. The generic character differs from both.

9. A. *autumnalis*. Autumnal Hawk-bit. Hoffm. Germ. for 1791. 274. Willd. n. 9. Ait. n. 5. Compend. Fl. Brit. n. 4. (Hedypnois autumnalis; Fl. Brit. n. 4. Engl. Bot. t. 830. Leontodon autumnale; Linn. Sp. Pl. 1123. Hieracium minus; Fuchs Hist. 320. H. minus, sive leporinum; Ger. Em. 296.)—Stalks radical, branched; their ultimate divisions scaly. Leaves lanceolate, toothed, or pinnatifid, smoothish.—Native of meadows and pastures throughout Europe, flowering in autumn; very common in Britain. The *root* is abrupt, with very long and copious fibres. *Leaves* numerous, variously and unequally pinnatifid, or merely toothed, rarely a little rough or shaggy, oblique, or somewhat serpentine, in their general form or position. *General stalks* one or more, a foot or two in height, spreading, curved and zigzag, alternately branched, not quite without pubescence, terminating in a few long scaly

partial

partial stalks, which are hollow, and each contains a peculiar tuft of very white cotton, remarked by the Rev. Mr. Holme. *Calyx*, and top of each *stalk*, a little downy. *Flowers* bright lemon-coloured, hardly an inch broad, often reddish on the outside. *Seeds* slender, all crowned with sessile feathery down. Sometimes the *flowers* are proliferous, like the Hen-and-chicken Daisy.

10. A. *crispa*. Curled Hawk-bit. Willd. n. 10. Ait. n. 6. (Leontodon crispum; Villars Dauph. v. 3. 84. t. 25. Hieracium alterum saxatile montanum; Column. Ecphr. 244. t. 243. H. parvum hirtum, caule aphyllo, crispum ubi siccatum; Bauh. Hist. v. 2. 1038.)—Stalks radical, almost naked, single-flowered, hairy as well as the calyx. Leaves with various divaricated teeth and segments, rough with dense three-forked hairs. Seeds with a rough elongated beak.—Native of rocks in Dauphiny, Switzerland, and Italy.—The *root* is said to be very long, thrusting itself deep into the scarcely visible clefts of large rocks, and sending forth many long, simple, lateral fibres. *Leaves* numerous, in dense spreading tufts, from two to four inches, Columna says more than six, in length, pinnatifid in a rather lyrate manner, some of their segments or teeth turned various ways, especially, as J. Bauhin observes, when dry; they are densely clothed, on both sides, with prominent hairs, whose peculiarly white tips have three or more spreading forks or points. *Flower-stalks* ascending, a span high, furrowed, bearing a few linear scales near the top. *Flower* full an inch broad. *Seeds* uniform, each terminating in a long, tapering, brown, minutely rough beak, which looks like a stalk to the dense feathery *down*. This species comes very near the following, but appears to be essentially distinguished by the beak of the *seeds*. Villars confounds its synonyms with those of *A. hirta*, which differs very materially in having a scaly short crown to its marginal *seeds*, as will hereafter be described.

11. A. *hispida*. Rough Hawk-bit. Willd. n. 11. Ait. n. 7. Compend. Fl. Brit. n. 1. (Hedypnois hispida; Fl. Brit. n. 1. Engl. Bot. t. 554. Leontodon hispidum; Linn. Sp. Pl. 1124. Curt. Lond. fasc. 5. t. 56. Fl. Dan. t. 862. Hieracium dentis leonis folio, hirsutum; Ger. Em. 303.)—Stalks radical, naked, single-flowered. Leaves with reversed teeth, rough. Florets hairy at their orifice; glandular at the tip. Seeds scarcely beaked.—Very common in meadows, pastures, and waste ground, throughout Europe, from Sweden to Greece, flowering in summer. The *root* is tapering, zigzag, long and slender. *Leaves* oblong, more or less deeply toothed, or in some measure pinnatifid, their teeth acute, pointing downwards; they are much less densely hairy than those of the last, their hairs generally simply forked only; but we are aware of the uncertainty of this character. *Stalks* several, upright, striated, clothed with similar hairs. *Flowers* drooping while in bud; afterwards erect, bright yellow, an inch and half broad. *Calyx* hairy; its outer scales lax and scattered. *Florets* with a tuft of long yellow erect hairs, at the top of their tube externally; their summit terminates in five teeth, at the back of each of which Mr. Sowerby first detected a small triangular cluster of brown glands. These two characters serve admirably to distinguish the present species from every other British one, but the first of them, if not the other, is found in *A. crispa*. The *seeds* however have not near so long a beak as in that species, and they differ from *A. hirta* in being all uniformly furnished with a feathery *crown*. It is curious to trace an assertion of the *seed-down* being stalked in this species, published by Willdenow, taken from Haller, on the authority of Reichard. On turning to Haller, n. 25, we find he trusted to Berkhey, who, in his *Flores Compositi*, t. 6. f. 10, has figured a *seed*, supposed to belong to the plant before us. On examination however its crown proves to consist of simple, not feathery, rays, and therefore it has nothing to do with any *Apargia*. We mention this circumstance, to shew the mischief of taking things for granted; not only in botanical criticism, but any other inquiry of the human mind.

12. A. *hirta*. Deficient Hawk-bit. Hoffm. Germ. for 1791. 274. Compend. Fl. Brit. n. 2. (Thrincia hirta; Roth. Catal. v. 1. 98. Willd. Sp. Pl. v. 3. 1554. Ait. Hort. Kew. v. 4. 447. Hedypnois hirta; Fl. Brit. n. 2. Engl. Bot. t. 555. Leontodon hirtum; Linn. Sp. Pl. 1123. Curt. Lond. fasc. 6. t. 59. Rhagadiolus n. 7; Hall. Hist. v. 1. 5, with some doubtful synonyms.)—Stalks radical, naked, single-flowered. Leaves toothed, rough. Calyx nearly smooth. Outer row of seeds destitute of down.—Native of gravelly heaths and waste ground throughout Europe. Dr. Sibthorp gathered it, along with our violets and primroses, in Arcadia. Mr. Curtis observes that this species seldom occurs on the same spot with the preceding, of which Mr. Hudson made it a variety. Other botanists have found great difficulty in distinguishing them under all their various appearances, whilst Haller, and more recently Roth and Willdenow, have separated them generically. Linnæus thought the simple hairs of the plant before us afforded a good mark; but this is fallacious. The herbage of both is nearly the same, or at least their varieties closely approach each other. The *flowers* of both droop in the bud, but those of *A. hirta* are the smallest; their *florets* orange beneath, destitute of hairs about the orifice, and of glands at the summit. The most essential difference of all is found in the *seeds* of the circumference, which have no feathery *down*, but instead thereof a crown of short jagged scales. The *root* is abrupt, or bitten off, not tapering.

13. A. *annua*. Annual Hawk-bit. (Thrincia hispida; Roth. Catal. v. 1. 99. Willd. Sp. Pl. v. 3. 1555. Hyoseris taraxacoides; Villars Dauph. v. 3. 166. t. 25, excluding the synonyms.)—Stalks radical, naked, single-flowered. Leaves lanceolate, toothed, rough with forked hairs. Calyx hoary and hispid. Outer row of seeds destitute of down: those of the disk beaked.—Native of Spain and France, in sandy ground. The annual fibrous *root* distinguishes this from all the other known species, and especially from the last, with which the short crown of its outer row of *seeds* agrees. The rest of the *seeds* however are elongated at the summit into a slender beak, which elevates the feathery *down*, as on a longish stalk, but is not really such. The rough and hoary *calyx*, and the brighter green of the *leaves*, are further differences. The name of *hispida* being preoccupied, see sp. 11, we are obliged to select a new one for the present species.

14. A. *Villarsii*. Villarsian Hawk-bit. Willd. n. 12. (Leontodon hirtum; Villars Dauph. 82. t. 25, excluding the synonyms.)—"Stalks radical, naked, single-flowered, nearly smooth as well as the calyx. Leaves deeply toothed, or pinnatifid, rough with simple awlshaped bristles."—Native of dry sunny rocks in Dauphiny. Willdenow, who had a dried specimen, says the *leaves* are hoary with copious white hairs. We have not seen the plant, nor dare we attempt any illustration of it; Villars having so confounded various synonyms under this and his *Leontodon protheiforme*, p. 87. t. 24, that, even with some of his specimens before us, the descriptions are not satisfactory.

15. A. *caucasica*. Caucasian Hawk-bit. Marsch. a Bieberst. Caucas. v. 2. 247.—"Stalk radical, single-flowered, smooth. Calyx hairy. Leaves runcinate, rough, sparingly clothed with simple depressed hairs."—Native of

 grassy

graſſy paſtures on the Caucaſian alps, flowering in Auguſt and September. *Root* perennial, abrupt. *Leaves* with triangular, nearly entire lobes pointing backward, beſprinkled on the upper ſide with decumbent hairs, ſo ſparingly that they ſeem altogether ſmooth. *Stalk* longer than the leaves, ſtriated, naked except a minute ſcale or two; a little tumid and downy under the *calyx*, which is blackiſh, though hiſpid with whitiſh hairs. *Flower* of a full yellow. *Seeds* ſmooth to the naked eye; their down ſeſſile, feathery. This plant has the habit and ſtature of *A. hiſpida*, n. 11, but differs in the want of hairs on the *ſtalk*, as well as in the form and poſition of the pubeſcence of the foliage.

16. A. *coronopifolia*. Bucks-horn-leaved Hawk-bit. Willd. n. 13. (Leontodon coronopifolium; Desfont. Atlant. v. 2. 229. t. 214.)—Stalks radical, ſingle-flowered, ſcaly, ſhorter than the leaves, hairy as well as the calyx. Leaves pinnatifid, with blunt lobes, rough with forked hairs.—Native of the ſandy deſerts of Barbary, near Caſsa. The whole plant is rough with branched hairs. *Leaves* three or four inches long, ſpreading on the ground, unequally, but rather regularly, pinnatifid. *Stalks* ſeveral, aſcending, an inch or two high. *Flowers* yellow, an inch broad.

17. A. *hiſpanica*. Spaniſh Hawk-bit. Willd. n. 14. Marſch. a Bieberſt. Caucaſ. v. 2. 248. (Leontodon hiſpidum; Cavan. Ic. v. 2. 39. t. 149, excluding the ſynonym.)—Stems leafy, moſtly ſingle-flowered, hairy as well as the calyx. Leaves oblong-lanceolate, toothed or pinnatifid, rough, with forked hairs.—Native of hilly ſituations in Spain, flowering the beginning of May. Frequent alſo in Tauria. This, as Willdenow remarks, differs as much as poſſible from *A. hiſpida*. The whole herb is even more rough or briſtly than that ſpecies. *Stems* ſix inches high, furniſhed with lanceolate ſcales, accompanied by ſome oblong, obtuſe, entire or toothed, *leaves*, an inch or inch and half long. The *radical leaves* are more numerous and longer, tapering at the baſe, gradually dilated upward, bluntly toothed, or in ſome degree pinnatifid. *Flowers* terminal, ſolitary, pale yellow, nearly an inch and half broad. *Calyx* with numerous long, narrow, very hairy ſcales. The hairs of the ſtem and other parts are white, ſometimes forked.

18. A. *aſpera*. Branching Rough Hawk-bit. "Waldſt. et Kitaib. Hung. v. 2. 114. t. 110." Willd. n. 15. Ait. n. 8. — Stem leafy, ſomewhat branched, hairy. Calyx ſmooth. Leaves lanceolate, runcinate, hairy, with forked briſtles.—Native of rocky woods in Hungary, near the baths of Hercules. Very nearly akin to the laſt, but the more branching *ſtem*, runcinate *leaves*, and ſmooth very cloſe-preſſed ſcales of the *calyx*, fringed at the edges only, not lax and hairy, appear ſufficient, as Willdenow thinks, to diſtinguiſh this ſpecies.

19. A. *ſtrigoſa*. Briſtly Hawk-bit. Marſch. a Bieberſt. Caucaſ. v. 2. 249. (Scorzonera aſperrima; Willd. Sp. Pl. v. 3. 1507. S. hiſpida; Forſk. Ægypt.-Arab. 215.)—"Stem leafy, hiſpid, bearing one or two flowers. Calyx hoary; the margin and keel of its ſcales fringed with briſtles. Leaves lanceolate, toothed, hiſpid, with forked hairs. Seeds rough."—Native of dry open places in Iberia, and the eaſtern part of Caucaſus, flowering in June. Forſkall found it at Eſtac, near Marſeilles. We have already deſcribed this under the article Scorzonera, n. 32. The able author of the *Flora Taurico-Caucaſica* ſays, "the *leaves* and *ſtems* are extremely hiſpid; the *calyx* only hoary, except the edges and keels of the ſcales. *Stems* bearing one or two *leaves*, and from one to three *flowers*, like *A. hiſpanica*. *Florets* pale yellow; the outermoſt purple beneath. *Seeds* brown, linear, tapering much at the top, as in the *Scorzoneræ*; they are rough with minute prominent points. *Down* feathery. The habit of this plant, and its affinity to *A. hiſpanica*, n. 17, and *incana*, n. 7, make it rather an *Apargia* than a *Scorzonera*." We have ſeen no ſpecimen. The regularly imbricated membranous-edged ſcales of the *calyx* in the latter, and the naked tips of its *ſeed-down*, are ſufficient indications of that genus, and if not found in the preſent plant, there can be no doubt upon the ſubject; but of this we are left in ignorance.

20. A. *variegata*. Party-coloured Hawk-bit. Willd. n. 16. (Hieracium variegatum; Lamarck Dict. v. 2. 362.)—Stem nearly leafleſs, ſomewhat branched, ſhaggy. Radical leaves oblong, ſtrongly toothed, hairy towards the edges. Calyx-ſcales ſpatulate, flat; downy at the baſe and margin.—Gathered by Commerſon at Monte Video. The *root* ſeems rather woody. *Stems* ſeveral, ſix inches high, each terminating in one large yellow or orange-coloured *flower*, and bearing ſeveral linear acute ſcales, with the rudiments of branches; but we find none of the pinnatifid ſtem-leaves mentioned in Lamarck. The numerous *radical leaves* are two inches long, tapering at the baſe, bluntiſh, with coarſe blunt unequal teeth, green, not hoary; ſhaggy with ſimple briſtly hairs about the margin and mid-rib on both ſides. The dilated, obtuſe, ſmooth ſcales of the *calyx* are more regularly and copiouſly imbricated than uſual in this genus, and are prettily variegated with white marginal cottony down. The *ſeed-down* is feathery, but of the *ſeeds* or *receptacle* we can ſee nothing.

21. A. *hieracioides*. Corymboſe Hawk-bit. Willd. n. 17.—"Stem branched at the top, hairy. Leaves oblong-lanceolate, hairy, toothed. Hairs forked."—Native of Galatia. Willdenow, who had a dried ſpecimen, deſcribes this plant as reſembling *Hieracium murorum*. The *ſtem* is erect. *Leaves* ſeſſile, an inch and a half long. *Flower-ſtalks* ſcaly and hairy. *Down* ſeſſile, feathery. *Receptacle* naked.

THRINIUM-Gild. See Trinium-*Gild*.

THRIO, Θρια, in *Antiquity*, a feſtival in honour of Apollo.

THRIPS, in *Natural Hiſtory*, a name uſed among the ancients to expreſs a ſort of worm hatched from the egg of a beetle: which, while in the worm-ſtate, eats its way into wood, and forms cells and cavities in it of various ſhapes, and in various directions, often reſembling the figures of letters or other things. See Enxylon.

The ancient Greeks are ſaid to have uſed ſmall pieces of the wood thus eroded in particular forms, as ſeals, before the engraving of theſe utenſils was invented; and indeed they muſt very well have ſerved this purpoſe, ſince it is ſcarcely poſſibly to conceive how one of theſe pieces of corroded wood ſhould be counterfeited, or the impreſſion imitated.

Lucian mentions his marking his olives with a ſignature of one of theſe pieces of wood greatly eroded, and uſes the word *thrips*, not as the name of the animal, but of the piece of wood eroded by it. Theophraſtus, Pliny, and Ariſtotle, alſo uſe the ſame expreſſion; and we find that the word thrips was as frequently uſed to ſignify the pieces of wood eroded, as the animal which eroded them.

Thrips, in the *Linnæan Syſtem of Zoology*, is a genus of the order of Hemiptera, the characters of which are, that the roſtrum is obſolete, being hidden within the mouth; the antennæ filiform, and as long as the thorax; the body ſlender, and of equal thickneſs; the abdomen reflexible, and often bent upwards; the four wings extended, incumbent, narrow,

row, and croffing one another at fome diftance from their bafe. The thrips has fix feet, and the tarfus of each foot has only two articulations. Gmelin enumerates the following eleven

Species.

Paradoxa. Brown, with abbreviated wings, and antennæ pectinate, fiffile and filiform. Found in China, but Gmelin doubts whether it be of this genus.

Physapus. With glaucous elytra or fhell-wings, and black body. Found frequently on flowers in Europe.

Minutissima. With glaucous elytra and body, and brown eyes. Found as the former.

Juniperina. With fnowy elytra and brown body. Found in the galls of the juniper.

Ulmi. Black, with fnowy ciliated wings, and acuminated anus. Found gregarious on the bark of the elm.

Urticæ. Yellow, with whitifh elytra. Found folitary on the leaves of the nettle, vine, and hazle.

Fasciata. With elytra banded with white and black, and brown body. Found on flowers in Europe.

Fusca. Blackifh, with glaucous elytra. Found in Denmark: the female probably fafciated?

Obscura. Yellowifh, with palifh elytra, and eyes and wings of the abdomen black. Found in Denmark.

Rufa. Red. Found on the fpikes of wheat; if it be not the larva of the minutiffima.

Variegata. Variegated. Found on flax.

The thrips is highly injurious and deftructive to many forts of fine fruited trees, but particularly fo to thofe of the grape or vine kind. The beft and moft effectual means of preventing its mifchievous effects, in fuch cafes, is probably that of frequent good wafhing of the trees with common water, by the engine or otherwife. It has lately been advifed that this fhould be done every evening, as, when performed in the heat of the fun, the vines are materially injured. Indeed all fuch trees fhould, it is fuppofed, be well wafhed every evening, until the berries begin to colour, whether infefted with infects or not, but efpecially in the former ftate; after which it is to be wholly difcontinued.

Where there is a neglect of wafhing the trees in this or fome other way, the thrips, for the moft part, makes its appearance. In fuch cafes, thefe infects may without much difficulty be deftroyed by the fumigation of tobacco and damp hay; the plants or trees being well wafhed after it by pure water.

The *white-bug* is another infect which is often very hurtful to peach-trees and vines in forcing-houfes; and the caufe of which is believed to be much owing to the trees not being daily properly wafhed in the above manner. Each of thefe forts of trees ftand in need of particular management in clearing them of this infect.

The *brown-bug* too occafionally makes its appearance on, and is hurtful to peach-trees in fuch fituations, efpecially when they are fhaded, or approach near the flues of the houfes. Proper wafhing of the trees, in thefe cafes, with lime-water, in the winter feafon; and fyringing them with it as foon as the leaves have fallen off, are often very effectual in removing fuch infects.

The *green-fly* is alfo very deftructive to peach-trees, efpecially when in the forcing ftate. Thefe are the moft effectually deftroyed by means of well wafhing the trees daily in a regular manner, after the work of forcing is begun. It is the common practice of moft gardeners to difcontinue fuch wafhings as foon as the flowers begin to make their appearance, but others have lately continued them with fuppofed advantage, and not found them to prevent the fruit from fetting. If any flies of this fort prefent themfelves, they may be kept under by proper watering or wafhing, as above, and by carefully picking off the firft buds on which they appear, which is found to prevent them from breeding, and to render the ufe of tobacco-fmoke unneceffary. Fumigations of this fubftance are, however, fometimes beneficial in thefe cafes in removing the vermin.

This and the *blue-fly* too are often very injurious to plum-trees, efpecially after they have been affected with the honey-dew. The manner of getting rid of them in fuch cafes, which has lately been recommended, is that of watering the trees in a plentiful manner two or three times a week, if the weather be dry; and during the continuance of the above fort of dew upon the trees, preparing the water with a little common falt and the fluid part of a good portion of broom that has been boiled. This mixture, it is faid, effectually kills the flies, while it does no injury to the trees, if care has been taken not to ufe too large a proportion of falt. This practice alfo tends to make the trees fhoot ftronger, and to hinder fuch infects from breeding.

There is another infect which has lately been found to be greatly injurious to apple and other fruit trees, but which is yet only little known to gardeners. It is the *Tortrix wœberana*, which may be feen well defcribed in the fecond volume of the "Tranfactions of the Horticultural Society of London." It is there ftated to be occafionally very hurtful to fuch trees, not only in the larva ftate, but others; and that its attacks are by no means confined to the difeafed parts of fuch trees. The infect in its perfect ftate is a fmall moth, which is very abundant in gardens and fruit grounds.

In what regards the means of removing and deftroying fuch infects when their attacks become injurious, the hints given below are thrown out. The firft and moft effential procefs evidently is, it is thought, to cut away the edges of the cankery parts where they are chiefly found, making the wound fmooth, and covering it with any compofition likely to prevent the moth from depofiting her *ova* or eggs there again. One precaution is neceffary, which is to put into boiling water, or to bury at a confiderable depth, the cut-out pieces of decayed bark containing the larvæ; which, if left near the tree, would foon crawl from their holes or other places, and remount it; thus defeating the labour of the horticulturalift, who often, from neglecting a flight additional trouble, lofes the benefit of more painful exertions. Where the larvæ are found to have infinuated themfelves generally into the rough bark of old trees, it would probably, it is thought, be advifable to fcrape off the whole of the lifelefs bark, and fuch portions of the alburnum as are injured, as fuggefted by Mr. Knight on another occafion; a procefs which, there can be no doubt, it is faid, would be advantageous to the tree in other refpects, as pointed out by the above writer. And where projecting faw-duft-like maffes fhew that the larva has attacked even fmooth-barked trees, the infertion of a blunt pricker into the hole would probably, in moft cafes, fuffice to deftroy it, and do lefs injury to the tree than fuffering it to attain its growth. But the mode which is moft to be recommended in this, as in the cafe of almoft all infects hurtful to fruit or other trees, is, it is faid, to deftroy the moths themfelves by collecting them from off the trees, or other places, during the fummer months, which might be done by children properly directed and provided with fuitable means for the purpofe, or in other ways. The deftruction of every female moth, before the depofition of its eggs, may, it is faid, be fairly calculated to prevent the exiftence exiſtence of ſome hundreds of larvæ; and thus, in any garden or fruit-ground not in the neighbourhood of others, where the ſame methods are neglected, the whole race might, it is ſuppoſed, be extirpated in a few years.

THRISSA, in *Ichthyology*, the name given by the Greeks and by the modern Latin writers to the fiſh which we call the ſhad, or the mother of the herrings.

THRIVING, in *Neat Cattle*, a term made uſe of by graziers and other ſtock-farmers to ſignify the property they have of doing well on the food they conſume, or of fattening kindly, in contradiſtinction to that of a ſtunted unthrifty growth, or bad ſort of feeding. It is moſtly known by the hides or coats of the beaſts having a mellowneſs of feel in handling them, with a fineneſs and ſleekneſs in their appearance. This depends, in a very great degree, upon the pile and growth of the coats, for the ſhorter and ſleeker they are, the more thriving the beaſts; as, on the contrary, in proportion to length and hardneſs, is the unthriſtineſs of the ſtock.

A coarſe, rough, thick hide is an indication too of hardneſs of fleſh in beaſts; while, on the contrary, fineneſs and cloſeneſs of grain in it, give the feel of fine texture in the hide.

Theſe circumſtances demand great attention in chooſing neat cattle for all purpoſes.

THRIVING *Drinks*, ſuch drinks as are prepared and given to neat cattle, or other beaſts, when in a low unthrifty ſtate. They are moſtly compoſed of the powders of different ſorts of aromatic ſeeds, ſuch as thoſe of aniſeeds, carraway ſeeds, and grains of paradiſe, in the proportion of about two ounces of each: which are mixed well together and put into a quart of warm ale, in which they are given to the beaſts; or of ſweet fennel ſeeds and cummin ſeeds, each two ounces, long pepper, ginger, turmeric, and elecampane, each one ounce, mixed together, to be given in the ſame way as above, to which ſometimes a little freſh butter and treacle or coarſe ſugar are added. Snake-root and gentian root, in powder, too, are ſometimes employed in ſuch drinks.

As the principal effect of ſuch drinks, for the moſt part, depends upon the eſſential oil the ſubſtances may contain, they will be ſomewhat preſerved and increaſed by giving them in the above manner.

The moſt proper management for the beaſts in theſe caſes, is to change their food as much as poſſible for the better, letting them have occaſional good maſhes of ſcalded bran, ground malt, or other ſuch ſubſtances, with a ſmall proportion of ground oats or barley meal put into them: warm water may alſo ſometimes be neceſſary.

By the uſe of drinks of this ſort, very reduced cows and other neat cattle may often be readily reſtored and brought into a thriving condition.

THRIXSPERMUM, in *Botany*, ſo called by Loureiro, from θριξ, *a hair*, and σπερμα, *ſeed*. We cannot ſay much for the conſtruction of this word, which ſhould have been *Trichoſpermum*, provided there be no dormant claim to that name; but it is not worth changing, till we are better aſſured of the genus.—Loureir. Cochinch. 519.—Claſs and order, *Monandria Monogynia*. Nat. Ord. *Orchideæ?*

Gen. Ch. *Common Calyx* catkin-like, linear, compreſſed, fleſhy, with alternate, acute, ſingle-flowered ſcales. Perianth none. *Cor.* Petals five, linear-awlſhaped, long, erect, nearly equal. Nectary attached to the receptacle, between the two lowermoſt petals, deeply divided into two lips; the inner one three-cleft, embraced by the petals, its lateral ſegments ſhort and blunt, the middle ſegment longeſt, conical, aſcending; outer one ovate, undivided, prominent beyond the petals. *Stam.* Filament ſolitary, thread-ſhaped, ſhort, attached to the piſtil; anther ovate, of two cells, with a lid. *Piſt.* Germen thread-ſhaped, ſtraight, bearing the flower; ſtyle thick, unequal, ſtanding on the baſe of the nectary; ſtigma ſimple. *Peric.* Capſule oblong, triangular, the angles acutely emarginate, of three valves and one cell. *Seeds* numerous, long, very ſlender, like hairs.

Eſſ. Ch. Petals five, linear, erect. Outer lip of the nectary ovate, prominent.

1. Th. *centipeda*. Nhánh goì rít of the Cochinchineſe. Found in Cochinchina, creeping upon the native trees. The *ſtem* is paraſitical, long, compreſſed, perennial, creeping by means of ſimple, very ſhort, lateral roots. *Leaves* linear-lanceolate, entire, ſmall, ſheathing, reflexed. *Flowers* pale yellow, with a reddiſh *nectary*, in ſtraight, lateral, catkin-like, two-ranked *ſpikes*.

We gueſs this to be allied to ſome of thoſe paraſitical *Orchideæ*, formerly referred to *Epidendrum* by Linnæus; and by Swartz chiefly to *Cymbidium*. The ſtructure of the whole tribe is ſo obſcure, that Loureiro may very well be excuſed if we cannot entirely unravel his deſcription.

THROANA, in *Ancient Geography*, a town of India, on the other ſide of the Ganges, which Ptolemy aſſigns to the people called Leſti, or pirates.—Alſo, a town of Serica, near the mountains in the vicinity of Aſmiræa. Ptolemy.

THROAT, the anterior part of an animal, between the head and the ſhoulders, in which is the gullet.

Phyſicians include, under the word throat, all that hollow, or cavity, which may be ſeen when the mouth is wide open.

It is ſometimes alſo called *iſthmus*, becauſe it is narrow, and bears ſome reſemblance to what is called by geographers *iſthmus*.

THROAT, *Sore*, in *Medicine*. See QUINZY.

THROAT, *Wounds of*, in *Surgery*. See WOUNDS.

THROAT, in *Architecture*, *Fortification*, &c. See GORGE and GULA.

THROAT, in *Ship-Building*, the inſide of knee-timber at the middle or turn of the arms. Alſo, the middle part of the floor-timbers; the inner part of the arms of an anchor, where they join the ſhank; and the inner ends of booms and gaffs, where they traverſe round the maſt.

The throat is oppoſed to peek, which implies the outer extremity of the ſaid gaff, or that part which extends the ſail behind. Hence the ropes employed to hoiſt up and lower a gaff, being applied to thoſe parts of it, are called the throat and peek haliards. Falconer.

THROAT-*Wort*, in *Botany*, the name of a perennial weed common in paſture grounds. The ſtalk is cornered and undivided. The flowers grow in bunches at the top of the ſtalk. They are erect, of a beautiful purple colour, and divided in the middle into five acute ſegments. It is a very pernicious weed when ſuffered to get a-head in ſuch lands, and not capable of being deſtroyed without conſiderable difficulty and trouble. See TRACHELIUM.

This plant yields, when wounded, a milky juice in great plenty, and this, if received into a ſhell or other ſmall veſſel, curdles immediately, and the whey runs from the thick part: this whey is of a brown colour, whereas that of the wild lettuce is of a fine purple, and dries into a cake that may be crumbled into a purple powder. The juice of the throat-wort ſmells ſour, and its curdled part, being dried, burns like reſin at the flame of a candle. Phil. Tranſ. N° 224.

THROATING, in *Agriculture*, the act of mowing beans againſt their bending, which is never done but in a thin crop. But in ſuch it is often neceſſary, in order to cut them with the moſt perfection and advantage. They ſhould

ſhould never be allowed to become too ripe when intended to be cut in this manner. The term is alſo occaſionally applied to ſome other purpoſes in huſbandry.

THROGGY, in *Geography*, a river of Monmouthſhire, which runs into the Severn, 4 miles S.W. of Chepſtow.

THROMBUS, from θρομβος, *coagulated blood*, a clot of blood. The term has alſo been applied to a tumour, formed of a collection of extravaſated blood under the integuments after bleeding. When ſuch an extravaſation, though of ſome extent, is not conſiderable, it is uſually called an *ecchymoſis*; which ſeé.

A thrombus ſometimes depends on the ſurgeon having totally divided the vein; but much more frequently on his not having made the opening in the veſſel properly correſpond to that in the ſkin. The patient's altering the poſture of his arm, while the blood is flowing into the baſin, will often cauſe an interruption to the eſcape of the fluid from the external orifice of the puncture; and, conſequently, it inſinuates itſelf into the cellular ſubſtance in the vicinity of the opening in the vein. In proportion as the blood iſſues from the veſſel, it becomes effuſed between the ſkin and faſcia in the interſtices of the cellular ſubſtance, and this, with more or leſs rapidity, and in a greater or leſſer quantity, according as the edges of the ſkin impede more or leſs the outward eſcape of the fluid. Sometimes, alſo, a thrombus forms after veneſection, when the uſual dreſſings, compreſs, and bandage, have been put over the puncture, and the patient imprudently makes uſe of the arm on which the operation has been done. This is more particularly liable to happen when a very large opening has been made in the vein.

The accident is not attended with any danger when the extravaſation is inconſiderable; for, in this circumſtance, the tumour generally admits of being eaſily reſolved by applying to it linen dipped in any diſcutient lotion. If the ſwelling ſhould be more extenſive, applying to it a compreſs wet with a ſolution of common ſea-ſalt, is deemed a very efficacious plan of promoting the abſorption of the extravaſated blood. Brandy, and a ſolution of the muriate of ammonia in vinegar, are likewiſe eligible applications.

It ſometimes happens, that a thrombus induces inflammation and ſuppuration of the edges of the puncture. The treatment is now like that of any little abſceſs: a common linſeed poultice may be applied, and any conſiderable accumulation of matter ſhould be prevented, by making an opening with a lancet in proper time. As ſoon as the inflammatory ſymptoms have ceaſed, diſcutients ſhould be reſorted to again, for the purpoſe of diſperſing the remaining clots of blood and ſurrounding induration. Cooper's Dict. of Practical Surgery.

THRONE, θρονος, a royal ſeat, or chair of ſtate, enriched with ornaments of architecture and ſculpture, made of ſome precious matter, raiſed one or more ſteps, and covered with a kind of canopy.

Such are the thrones in the rooms of audience of kings, and other ſovereigns.

THRONI, in *Ancient Geography*, a town of the iſle of Cyprus, upon the ſouthern coaſt, S.W. of Leucolla, and at ſome diſtance N.W. of the promontory of Pedalium. Near this town was a promontory of the ſame name, according to Ptolemy.

THRONION, or THRONIUM, a town belonging to the Locrians, ſituated, according to Strabo, 20 ſtadia from the ſea.

THRONIUM, a town of the Abantide, which was a diſtrict of Theſprotia, in Epirus, towards the Ceraunian mountains. On the return from the war of Troy, when the ſhips of the Greeks were diſperſed, the Locrians of Thronium, and the Abantes of Eubœa, were driven with eight veſſels towards the Ceraunian mountains. They eſtabliſhed themſelves in this place, and built a town, which they called Thronium, and they gave the country the name of the Abantide. They were afterwards expelled by the Apolloniates.

THROO, or THROUGH, in *Agriculture*, a term ſignifying a breadth, ſlip, or width of corn, which a ſet of reapers, &c. drive before them at once, whether it conſiſt of one or more lands or ridges. The mode of reaping by means of throos is very common in ſome of the northern counties of the kingdom, and ſuppoſed by ſome to greatly expedite the work.

THROPPLE, among country people, denotes the wind-pipe of a horſe.

THROSTLE, or *Song-Thruſh*, *Mavis*, or *Turdus muſicus* of Linnæus, in *Ornithology*, is called by authors the *turdus viſcivorus minor*, to diſtinguiſh it from the larger ſpecies, called in Engliſh the *miſſel-bird*, and uſually known among us by the ſimple name of *thruſh*. It is called *viſcivorus* by authors, from its reſemblance in colour to the other *viſcivorus*, not from its feeding on the miſletoe-berries, as that does.

It reſembles the miſſel-thruſh in colour, except that the inner coverts of the wings are yellow.

It feeds on worms, ſnails, and ſmall inſects, and remains with us the whole year. It builds with moſs and ſtubble, and lines the neſt with mud. On this it lays five or ſix eggs, which are of a blueiſh-green, variegated with a few black ſpots. It ſits on hedges and buſhes, and ſings very agreeably.

The throſtle is the fineſt of our ſinging-birds, not only for the ſweetneſs and variety of its notes, but for the long continuance of its harmony; as it obliges us with its ſong for nearly three parts of the year. See TURDUS.

THROSTLING, a diſeaſe of black cattle, proceeding from humours gathering under their throats; by which means their throats are ſo dangerouſly ſwelled, that they will be choaked, unleſs ſeaſonably relieved by bleeding.

THROUGH-STONE, in *Rural Economy*, a term which ſignifies a long ſtone which paſſes the whole breadth of the wall in making fences of that kind, and which binds them together in a more perfect manner than would otherwiſe have been the caſe. It is always of great importance to have plenty of throughs in fences of this nature, from almoſt the bottom part to near the top.

THROW, the provincial name of a turner's lathe. There is a great variety of theſe ſorts of tools in uſe for different purpoſes. See LATHE.

THROW *the Glove*. See GLOVE.

THROWED SILK. See SILK.

THROWSTER, one who prepares raw ſilk for the weaver, by cleanſing and twiſting it. See MILLING and SILK.

THRUM, in *Gardening*, among the cultivators of fine flowers, is a term applied to the thread-like internal buſhy parts of them, and which, in ſome ſorts of good flowers, ſuch, for inſtance, as the auricula and other ſimilar kinds, ſhould be of a bright colour, and the chives, or thready briſtles, of which it is compoſed, clear and ſhining with ſpangles, ſomewhat like gold-duſt; and they ſhould alſo be diſtinct from each other, leaning inwardly towards the pipe; as when they appear clotted together, or look battered or mis-ſhapen, the beauty of the flowers to which they belong is much impaired; which is not unfrequently occaſioned by the wild and other bees, which, when in ſearch of honey or food, are apt to greatly hurt ſuch parts of fine flowers.

flowers. The bees, in such cases, should be carefully taken by proper means, and be prevented as much as possible from collecting their food from such fine kinds of flowers.

THRUM-*Cap Island*, in *Geography*, a low woody island, of a circular form, and not much more than a mile in compass, in the South Pacific ocean, covered with verdure of many hues, but without inhabitants, discovered and so called by Cook in April 1769. S. lat. 18° 35′. W. long. 139° 48′.

THRUM-*Wort*, in *Agriculture*, a troublesome weed in some lands of the rather moist down kind, which is of the perennial sort.

THRUMMING, in *Rigging*, denotes interplacing short pieces of thrums, or rope-yarn, in a regular manner into matting, through intervals made by a fid, or large needle.

THRUSH, an affection of the inflammatory and suppurating kind in the feet of the horse, and some other animals. In the horse it is an inflammation taking place in that part of the foot termed the sensible frog, which is mostly occasioned from want of due cleanliness in it, especially in those of the team or working sort, from the heels being in a contracted state, or from shoeing upon erroneous and bad principles, but most commonly from the last of these causes. See SHOEING.

The disease may be known to be present in this, as well as in other animals, by a tenderness and uneasy feel being shewn on pressing the frog, or affected part, and its being accompanied with a discharge of matter of the purulent kind, as well as by other similar appearances.

The means of removing the complaint in the horse, when inflammation is chiefly present, consist first in taking away the shoe, and lowering the heels, in such a manner as that the frog or diseased part may come in contact with the ground or floor: after which the animal may be suffered to stand some days without shoes, the part being well washed two or three times a day with a common stable brush, and a solution of soft soap in rain-water, an application composed of white vitriol, Armenian bole, and alum, in fine powder, of each half an ounce, mixed up with common tar, in a sufficient proportion to make a sort of ointment, being then had recourse to as a dressing. This may be used spread upon lint, being applied between the cleft of the frog, or affected part, and renewed as often as there may be a necessity.

It is likewise advised by some, that all the diseased parts, in such cases, should be carefully removed by means of a drawing-knife, and that if the animal be not allowed to have rest, a bar-shoe must be had recourse to, until the disease becomes quite removed. It is thought, too, that three or four pints of blood may often be taken away with advantage in cases where there is much inflammation, and mashes with nitre be given in the evenings. Much benefit also may sometimes be found from the use of diuretic balls, and from the foot affected being fomented with warm water, in which a handful of common salt has been dissolved, just before the application of the above dressing. Great utility is occasionally derived, too, from the insertion of a seton or rowel in the chest, or other proper part, and letting it continue some time. See SHOE.

In cases where the complaint proceeds chiefly from contracted heels, some suppose the only certain and effectual mode of removing the affection is, perhaps, that of the use of the artificial, or patent frog, not long ago invented by Mr. Coleman, who has bestowed much attention on the feet of animals, especially of the horse. See FROG.

In other animals, where the hoofs, claws, or other parts of the feet are affected with inflammation, and collections or discharges of matter, in some measure of the thrush kind, or having some resemblance to it, the best means of relief are probably those of first trying the effects of discutient saturnine applications, and if these do not succeed, to have recourse to warm emollient fomentations or poultices, then cutting or paring the parts down so as to lay them well open, and let out any thing they may contain, dressing the openings with mild escharotics, as there may be occasion. In this way, very troublesome affections of this sort may often be speedily removed.

THRUSH, in *Medicine*. See APHTHÆ and INFANT.

THRUSH, in *Ornithology*, is the *turdus viscivorus* of Linnæus, and the largest of the genus. See TURDUS and MISSEL-*Bird*.

THRUSH, *Wind*. See RED-*Wing*.

THRUSHEL, in *Geography*, a river of England, in the county of Devon, which runs into the Tamer, opposite to Launceston.

THRUSK. See THIRSK.

THRUST, in *Fencing*, is an action of which there are three kinds. *To thrust in carte*, is to throw your hand as far as possible on the inside, with the point of your sword towards your adversary's breast: *to thrust seconde*, is to have your arm in a perfect opposition to your adversary's, holding your head inside: *to thrust tierce*, differs from carte only by the position of the hand, which must be reversed.

THRUSTING, or *Hand-pressing*, in *Dairying*, is a term applied to the practice of squeezing and forcing the liquid parts contained in the curd out of it by the hand, or other such means, after it has been properly reduced, and placed by a cloth in an upheaped or conical manner in the vat or hoop.

THRUSTING-*Screw*, in *Rural Economy*, a contrivance of the large screw kind, calculated for affording due pressure in the making of cheese with facility and convenience. These screws are perfectly simple, and capable of being made either of wood or iron; but the latter material is probably by much the best. They may be wrought in several different ways, but it is commonly done by means of a sort of lever applied in some manner or other, not unfrequently through a hole for the purpose in the head of the large screw. In some districts they have them fixed up to the under-sides of the floors above the pressing-rooms, and the power of them so managed as to be regulated at pleasure. By means of these thrusting-screws, it is evident that the pressure can be gradually increased, as there may be occasion, from the first application to the concluding hard or heavy pressure in finishing the work. This command of power is, of course, a circumstance of great utility and advantage in such business.

THRUSTINGS, a term applied in cheese-making, in some districts, to the *white* whey, or that which is the last pressed or forced out of the curd by the hand and other means, after it has been put into the cheese vat. In some instances in the process and practice of making butter of the whey kind, these thrustings are set by in earthen pans for the purpose, in order to acidulate, or *carve*, as it is called in some places, either by means of the warmth of the season, or of a room, for being churned, in the same way as in the common manner practised, in many places, for making butter from milk. See WHEY.

These thrustings, probably, form and constitute the best butter of the whey sort, though it is made from that fluid managed in other ways, as seen under the head just referred to above.

THRYALLIS, in *Botany*, an ancient Greek name for something of the Mullein kind, whose woolly leaves served to to make wicks for lamps. It is not eafy to conceive how Linnæus came to apply this name here, nor can we trace out any thing to account for his having done fo. We moft readily agree with De Theis, that the fhrub about to be defcribed has nothing in common with *Verbafcum* but its yellow flowers. (See Diofcorides, book 4. chap. 104.)—Linn. Gen. 213. Schreb. 289. Willd. Sp. Pl. v. 2. 570. Mart. Mill. Dict. v. 4. Juff. 251.—Clafs and order, *Decandria Monogynia*. Nat. Ord. *Tricoccæ*, Linn. *Acera*, Juff.

Gen. Ch. *Cal.* Perianth inferior, in five deep, lanceolate, erect, permanent fegments. *Cor.* Petals five, roundifh, fpreading. *Stam.* Filaments ten, awl-fhaped, longer than the calyx; anthers roundifh. *Pift.* Germen obtufe; ftyle thread-fhaped, the length of the ftamens; ftigma fimple. *Peric.* Capfule with three fides, and three angles, obtufe, feparable into three parts; its cells burfting at the external angle. *Seeds* folitary, very fmooth, obovate; obtufe at the bafe, with an incurved point.

1. Th. *brafilienfis*. Brafilian Thryallis. Linn. Sp. Pl. 554. Willd. n. 1. (Fruticefcens herba; Marcgr. Braf. 79. f. 3.)—Native of Brafil. A little *fhrub*, with round, jointed, reddifh branches. *Leaves* on reddifh footftalks, oppofite, ovate, entire, about an inch long; pale green above; whitifh beneath, with a flender mid-rib. *Stipulas* briftle-fhaped. *Clufters* terminal, folitary, from fix or feven inches to a foot long, with very flender partial *ftalks*, longer than the *flowers*, and very fhort fetaceous *bracteas*. *Flowers* fmall, elegant, yellow, bordered with red, with which colour alfo their yellow *ftamens* are fpeckled. *Fruit* three-lobed. Neither the plant nor its flower has any remarkable odour.—Linnæus appears to have examined a dry fpecimen of this plant, but it is wanting in his herbarium, as well as in every other that we have feen. His idea of its natural order is furely lefs correct than Juffieu's. Specimens without fruit are not unlikely to have been overlooked for fome nondefcript *Bannifteria* or *Malpighia*.

THRYANDA, in *Ancient Geography*, a town of Afia Minor, in Lycia. Steph. Byz.

THRYOCEPHALUM, in *Botany*, a genus of Forfter's, named from θρυον, *a fort of rufh*, and κεφαλη, *a head*, becaufe of the habit of the plant, and its little round head of flowers. This genus is the fame as Kyllingia. (See that article.) The only fpecies mentioned by Forfter, is there confidered by us as *K. monocephala*. Vahl, in his *Enum. Plant.* v. 2. 381, refers it to *K. triceps*, probably becaufe he faw a fpecimen with a compound head. This very circumftance ftrengthens his own fufpicion, that thefe two fuppofed fpecies of *Kyllingia* are not, in reality, diftinct. Our fpecimen from Forfter himfelf has a very flight indication of a fmall lateral head, by the fide of the principal one, nor can it be otherwife diftinguifhed from *K. monocephala*. In the ftructure or appearance of any other part, we cannot difcern the leaft difference between *monocephala* and *triceps*, in feparating which we confided more in thofe who have originally defcribed thefe plants, than it feems they deferved.

THRYOESSA, or Thryon, in *Ancient Geography*, called from the time of Strabo Epitalium, fituated on the left banks of the Alpheus, E. of Olympia.

THUAREA, in *Botany*, bears that name in honour of M. Aubert du Petit Thuars, a French botanift of the prefent day, who is cited for the genus itfelf in Perf. Syn. v. 1. 110.—Brown Prodr. Nov. Holl. v. 1. 197.—Clafs and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Eff. Ch. Calyx-glumes of one valve, two-flowered, fpiked, unilateral, on a dilated common ftalk; the lowermoft ones only partly perfect; the reft male only; the inner floret of the lowermoft glume male, its outer valve refembling the calyx. Nectary of two fcales at the bafe of the germen. Stigmas feathery. Seed wrapped in the corolla, and enfolded in the hardened, clofed, involute ftalk.

The *ftems* are creeping, very long, with erect, fhort, undivided, leafy branches. *Spike* folitary, terminal, fhort, for a long time half enclofed in a leaf-like fheath. The *common ftalk* is thick and coriaceous, not membranous, as M. du Petit Thuars terms it, he having, as Mr. Brown fuppofes, confounded that part with the fheath. *Flowers* feffile, in a fimple row, one or two of the loweft only being perfect, the remaining four, five, or fix, in the contracted portion of the fpike, males.

Mr. Brown obferves, that this genus of graffes is not very diftantly related to Panicum (fee that article); efpecially to *P. dimidiatum*, Retz. Obf. fafc. 6. 23; but in *Thuarea*, the *calyx-glumes* are, with refpect to the *ftalk*, inverted, and want an outer value. In ftructure this genus agrees, in many particulars, with Spinifex, (fee that article,) in which the fexes are indeed more feparated, and therefore a requifite abundance of males is provided. The figure and economy of the *common-ftalk*, or *rachis*, too is different; though that part is permanent in both genera, and affifts in both, though not in the fame manner, to difperfe the *feeds*.

The only fpecies of which we can give an account are the three following, though Mr. Brown mentions alfo a *T. farmentofa*.

T. *latifolia*. Br. n. 1.—"Perfect flowers two. Stems downy. Leaves lanceolate, filky on both fides."—Gathered by fir Jofeph Banks, in the tropical part of New Holland.

T. *media*. Br. n. 2.—"Perfect flowers folitary. Leaves linear-lanceolate; their under fide fmooth, as well as the ftem."—Found by Mr. Brown, in the tropical part of New Holland.

T. *involuta*. (Ifchæmum involutum; Forft. Prodr. 73. Willd. Sp. Pl. v. 4. 741.)—Perfect flowers folitary. Leaves lanceolate, nearly fmooth on both fides.—Gathered by Forfter in the Society Ifles, and fome other places within the tropics. The fpecimen given by him to the younger Linnæus is marked *Taheité*. The erect *ftems*, or *branches*, are but two or three inches high, fimple, ftriated, fmooth, each bearing at the bottom one lanceolate, acute, ftriated *leaf*, about its own length; fheathing at the bafe; becoming involute in drying. Sometimes there is another *leaf*, about half as long, with a fheath almoft an inch in length, near the middle of the branch. *Spike* fcarcely an inch long, terminal, of about four *flowers*, fpringing laterally from the hollow of a concave pointed leaf, rather fhorter than the reft. *Calyx* ribbed. *Corolla* fmooth. Feathery *ftigmas* very confpicuous in the lowermoft *flower*.

THUBUNA, Tubnab, in *Ancient Geography*, a town of Mauritania Sitifenfis, according to Ptolemy; fituated in the mountains, between two rivers, S.W. of Igilgili.

THUBURSICA, a town of Africa, in New Numidia. Ptol.

THUBUTIS, a town of Africa Propria, near Bullaria. Ptol.

THUCCA, or Tucca, *Dugga*, a town of the interior of Africa, mentioned by Ptolemy; fituated at the extremity of a fmall chain of hills about two miles S. of Tiburficumbure. On this fcite were found many maufoleums, and the portico of a temple ornamented with beautiful columns. Here was alfo an aqueduct.

THUCYDIDES, in *Biography*, a celebrated Greek hiftorian, was born in the 77th Olympiad, about 470 B.C.

The

The name of his father was Olorus, or Orolus, that of a Thracian prince, indicating a connection with Thrace, in which he feems to have poffeffed gold-mines, and to have had influence over its chiefs. He belonged to one of the principal families at Athens, and was related to that of Miltiades. His education was that which diftinguifhed Athenians of rank: Antiphon being his preceptor in rhetoric, and Anaxagoras in philofophy. When he heard Herodotus recite his hiftory at the Olympic feftival, he is faid to have fhed tears; and Herodotus obferving it, congratulated Olorus on his fon's difpofition. At the commencement of the Peloponnefian war he was at Athens, and fhared in the calamity of peftilence that then occurred; and in the eighth year of that war he had a command in Thrace, and was oppofed to the Spartan general Brafidas, who furprifed the town of Amphipolis, for the lofs of which Thucydides was punifhed by banifhment, though it does not appear that he could have prevented it. During the twenty years of his exile, he devoted himfelf to literary refearches and obfervations through different parts of Greece, and thus collected materials for the hiftory which he was projecting. He refided for a confiderable time in Thrace, but the place and time of his death are not afcertained. Dodwell conjectures that he paffed his 80th year, and died in Thrace. His hiftory comprehends the tranfactions of the firft twenty years of the Peloponnefian war, difpofed in eight books; more limited in its compafs than that of Herodotus, but not merely rivalling but furpaffing it in hiftorical merit, more efpecially if we admit what a modern writer fays of it, "that the firft page of Thucydides is the commencement of real hiftory." The diftinguifhing characteriftics of this hiftorian are diligence of refearch, and the felection of the beft authorities, and perfect impartiality. To thefe qualities we may add fagacity in inveftigating caufes and effects, and a philofophical fpirit in forming a difcriminating judgment of human affairs. His narration is occafionally very interefting, and indicates the writer of genius. His ftyle, which has undergone much criticifm, is of that kind which the ancients termed the auftere, aiming at force and brevity rather than harmony, elegance, or perfpicuity. Its concifenefs and frequent tranfpofitions render it frequently obfcure, nor is this defect compenfated by its energy and elevation. The moft valued editions of this work are Hudfon's, Oxon. 1696; Waffe and Ducker's, Amft. fol. 1731; and the Leipfic, 2 vols. 4to. 1790—1804. Voff. Hift. Græc. Gen. Biog.

THUDACA, in *Ancient Geography*, a town of Africa, in Mauritania Cæfariana, near Tingis. Ptol.

THUELATH, a maritime town of Africa, on the coaft of Libya, between Autolatæ and Thagana. Ptol.

THUEYE, in *Geography*, a town of France, in the department of the Ardeche; 18 miles W. of Privas.

THUJA, in *Botany*, θυιον, θυια, or θυα of the Greeks, the name of a tree, whofe very durable wood ferved, according to Theophraftus, to make images. Its root in particular, being curioufly twifted or veined, was ufed for the moft valuable ornamental works. This plant was probably the *Juniperus Oxycedrus*, very common throughout Greece and the Archipelago, of which Mr. Hawkins is of opinion that the moft ancient ftatues were made. It is the Small Cedar, κεδρος μικρα of Diofcorides, and ftill univerfally bears the name of κεδρος in modern Greek. Our prefent genus of *Thuja* has nothing in common with this claffical plant, except being an aromatic evergreen tree, of the fame natural order, with a very durable wood; but it is not a native of Greece or the Levant.—Linn. Gen. 500. Schreb. 651. Willd. Sp. Pl. v. 4. 508. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 321. Purfh 646. Juff. 413. Tourn. t. 358. Lamarck Illuftr. t. 787. Gærtn. t. 91.—Clafs and order, *Monoecia Monadelphia*. Nat. Ord. *Coniferæ*, Linn. Juff.

Gen. Ch. Male, *Cal.* Catkin ovate, compofed of a common ftalk, on which the flowers ftand oppofite, in three rows, each flower having for its bafe a nearly ovate, concave, obtufe fcale. *Cor.* none. *Stam.* Filaments in each flower four, but fcarcely vifible; anthers as many, attached to the bafe of the fcale above mentioned.

Female on the fame plant, *Cal.* Catkin nearly ovate, with oppofite flowers, and confifting of two-flowered, ovate, convex fcales, converging longitudinally. *Cor.* none. *Pift.* Germen minute; ftyle awl-fhaped; ftigma fimple. *Peric.* Cone ovate-oblong, obtufe, burfting lengthwife, into oblong imbricated, nearly equal, obtufe, externally convex fcales. *Seeds* folitary, oblong, each furrounded by a longitudinal membranous emarginate wing.

Eff. Ch. Male, Catkin with imbricated fcales. Corolla none. Anthers four.

Female, Catkin becoming an imbricated cone, with two-flowered fcales. Corolla none. Seed furrounded by a vertical membranous wing.

Obf. Linnæus indicates the clofe relationfhip of this genus to *Cupreffus*. They are neverthelefs diftinguifhed by the peltate fcales of the *cone* in the latter, and its angular, obtufe, fcarcely winged, *feeds*, or *nuts*.

1. Th. *occidentalis*. American Arbor-vitæ. Linn. Sp. Pl. 1421. Willd. n. 1. Ait. n. 1. Purfh n. 1. "Michaux Arb. For. v. 3. 29. t. 3." (Arbor vitæ; Cluf. Hift. v. 1. 36. Ger. Em. 1369.)—Young branches two-edged. Leaves imbricated in four rows, compreffed, ovate, fomewhat rhomboid, dotted. Inner fcales of the cone abrupt, tumid under the point.—Native of North America, from Canada to the mountains of Virginia and Carolina, bloffoming in May. It is rather fcarce in the fouthern ftates, and only found on the fteep banks of mountain torrents. The branches are extremely tough. *Purfh.* This tree was introduced into our gardens in Gerarde's time, or before, and is much efteemed for ornament and fhelter in fhrubberies, or for platted and clipped hedges in nurfery-gardens, in which laft ftate it is really very beautiful. By a ftrange miftake of Linnæus, this fpecies is handed down as a native of Siberia; becaufe Gmelin, *Fl. Sib.* v. 1. 182, mentions a *Thuja*, to which he mifapplies the fynonyms of the prefent, but which by his own account is different; for he fays it is "paler than the garden kind, and fmaller in all its parts." It was brought him by a travelling furgeon, from rocks near Pekin in China, and could be no other than the *Th. orientalis*, hereafter defcribed. *Th. occidentalis* is a perfectly evergreen *tree*, of humble growth, much branched, very different from moft others in the compreffed vertical afpect of its younger fhoots, and their clofely imbricated *leaves*, which are fmall, obtufe with a point, fmooth; thofe of two oppofite rows compreffed and keeled; the intermediate ones flat, with a glandular point, or cell of refin, at the back. The *flowers* appear in May, and are fmall, folitary, terminal; the males yellowifh, and moft abundant. *Cones* ripened the following year, drooping, each the fize of a filberd-kernel, confifting of about half a dozen lax, fmooth, coriaceous *fcales*. The fmell of the bruifed plant is fomething like Savine, aromatic, but not agreeable. The *wood* is not hard, but tough and extremely durable, on which laft account it is much efteemed in America for making pales and fences.

2. Th. *orientalis*. Chinefe Arbor-vitæ. Linn. Sp. Pl. 1422. Willd. n. 2. Ait. n. 2. Gærtn. f. 1. "Schkuhr Handb. v. 3. 285. t. 309. (Thuya; Gmel. Sib. v. 1. 182 Th. n. 3; Duhamel Arb. v. 2. 320. t. 90, the two lower figures.

figures. Very bad.)—Young branches two-edged. Leaves imbricated in four rows, compreffed, ovate, fomewhat rhomboid, with a central furrow. Inner fcales of the cone obtufe, with a recurved dorfal point.—Native of rocky fituations in China. *Gmelin.* On mountains in Japan. *Thunb. Jap.* 266. A hardy tree in our gardens, which appears to have been cultivated by Miller in 1752. It flowers at the fame time as the former, but though a much more handfome tree, is lefs common. The very copious and crowded young *branches* are more erect, more flender, and rather lefs compreffed than the former, and the *leaves* are furrowed, without any refinous dot. The differences between thefe two fpecies are accurately marked in our fpecific characters, adopted from Linnæus and Willdenow. The inner fcales of the *cone* in that before us are remarkably hooked. Gærtner obferves that the wing of its *feed* is hardly difcernible.

3. Th. *articulata.* Jointed Arbor-vitæ. Vahl. Symb. v. 2. 96. t. 48. Desfont. Atlant. v. 2. 353. t. 252. Willd. n. 3. (Th. aphylla; Linn. Sp. Pl. 1422, as to the fynonym of Shaw, and part of the character taken from thence, but not of Am. Acad. v. 4. 295; fee TAMARIX. Cypreffus fructu quadrivalvi, foliis equifeti inftar articulatis; Shaw Afric. n. 188. f. 188.)—Young branches jointed, rather compreffed, with four furrows. Leaves minute, concave, pointed, four at the top of each joint; glandular at the back. Cones quadrangular, of four hooked fcales.—Native of the mountains of Barbary, where it is not uncommon. A *tree* from fifteen to thirty feet high, with round *branches*, the younger ones repeatedly fubdivided, in a partly oppofite, partly alternate manner, moderately compreffed, compofed of a feries of linear, fmooth, brittle joints, from a quarter to half an inch long, and marked with four longitudinal furrows, which are continued to the interftices of the four minute fcale-like *leaves* crowning each of thefe joints. Willdenow, mifled by the analogy of other fpecies, and the figures of authors, fuppofes each *joint* to be an affemblage of *leaves*, from which error the faithful defcriptions of Vahl and Desfontaines might have guarded him. *Catkins* terminal, folitary; the males ovate-oblong, of many fcales; females roundifh, of much fewer. *Fruit* fomewhat depreffed, about the fize of a black currant, with four protuberant angles, and crowned with as many intermediate reflexed points. The *fcales* feparate at the angles, but are firmly united at their bafe. *Seeds* fmall, with a broad kidney-fhaped wing. The late celebrated Brouffonet obferved the refin called Gum Sandarache to be procured from this tree. Dale attributes it to the Common Juniper. Such being the hiftory of the fpecies before us, the *Th. aphylla* of Linnæus becomes a nonentity.

4. Th. *dolabrata.* Sculptured Arbor-vitæ. Linn. Suppl. 420. Willd. n. 4. Thunb. Jap. 266. (Quai, vulgò Fi no ki et Ibuki; Kæmpf. Am. 884.)—Young branches two-edged, jointed; convex on one fide; concave and white on the other; joints obovate. Leaves lateral, oppofite, keeled, compreffed.—Native of Japan. Thunberg obferved it in the countries of Oygawa and Fakonia, between Miaco and Jedo; and it was planted along the high road on the hill of Fakonia. He fpeaks of it as a *tree* of vaft height and dimenfions, the moft beautiful of all the evergreen tribe. The *branches* are alternate, repeatedly fubdivided, compreffed and clothed with imbricated *leaves*. At firft fight the young *branches* appear covered with four rows of *leaves*, but the analogy of the foregoing fpecies, even of the firft of all, leads us to believe the intermediate row, on each fide, is an obovate furrowed joint, infenfibly terminating in a fhort broad *leaf*, while the more obvious *leaves* are oppofite, laterally inferted into the bafe of the joint at each fide, and about the fame length; each of them ftrongly compreffed, with a thick keel, and incurved point. Their great peculiarity confifts in being all convex and green on the upper fide of the branch; concave and as if whitewafhed, like the furrows of the joints, on the under. This gives the plant an artificial, but moft elegant, appearance. The *flowers* we have not feen. Kæmpfer fays the *fruit* is warty, the fize of a pea.

5. Th. *cupreffoides.* African Arbor-vitæ. Linn. Mant. 125. Willd. n. 5. Ait. n. 3. Thunb. Prodr. 110. (Th. aphylla; Burm. Prodr. 27, excluding the reference to Shaw.)—Young branches but flightly compreffed. Leaves imbricated in four rows, even. Cones nearly globofe, of four acute warty fcales.—Native of the Cape of Good Hope, from whence Dr. Roxburgh introduced it to Kew Garden in 1799. The growth of the *tree* is tall and clofe, like that of the Cyprefs. *Leaves* clofely imbricated, not fpreading. *Fruit* of the fize and appearance of the Cyprefs, nearly globular, with four obfolete angles, feparating into four thick acute valves or fcales, tuberculated externally, keeled within. *Seeds* numerous, each terminated by a membranous obovate wing. Linnæus adds to this defcription, "*Ramuli minime articulati more Equifeti.*" If *minime* be not printed by miftake for *minimi*, we prefume this alludes to Shaw's fynonym, cited in the *Mantiffa* with many fcruples, and certainly not belonging to this but to *articulata*, our third fpecies.

THUJA, in *Gardening*, contains plants of the hardy, evergreen tree-kind, of which the fpecies cultivated are, the American arbor-vitæ (T. occidentalis); and the Chinefe arbor-vitæ (T. orientalis).

In the firft of thefe fpecies there are different varieties; as the American fweet-fcented, and the variegated-leaved.

Method of Culture.—Thefe plants may be increafed by feeds, layers, and cuttings. Good feeds fhould be obtained from the native fituations of the trees, and be fown foon after they are ripe, or as foon as they can be obtained, in autumn or fpring, in pots or boxes of light earth, covering them half an inch deep, placing the pots, &c. in a fheltered warm fituation, or under the fhelter of a frame in bad weather, efpecially when fown in autumn, that they may be protected from fevere frofts: they fometimes come up in the fpring, but are frequently apt to remain in the ground till the fecond year. When the plants are come up, the pots fhould be placed in an eaft border to have only the morning fun, but open to the free air, giving frequent but very moderate waterings all the fummer; and in winter removing the pots again to a fheltered place till fpring, when they may be pricked out in nurfery-rows; or, when they are fmall and weakly, continued in the pots another year, placing them in a fhady fituation during fummer, and in a fheltered place in winter; and in the fpring following planting them out in the nurfery, in rows a foot or two afunder, in order to acquire fize and ftrength for planting out where they are to remain.

The layers fhould be made from the young fhoots of one or two years growth, which may be laid down early in autumn, bending down the branches to the earth, and laying all the young wood in by flit or twift-laying, with the tops only appearing a little above ground; fhortening any that have much longer tops than the others: they moftly emit roots in the earth, and form proper plants by the autumn following; when, or rather in fpring after, they fhould be feparated from the ftools, and be planted in nurfery-rows, to remain two or three years, or till of a proper fize for the fhrubbery, &c.

The cuttings fhould be made from the ftrong young fhoots of the fame year's growth, which fhould be planted

in

in the autumn in a ſhady border, taking the opportunity of ſhowery weather, if poſſible, for the buſineſs; they ſhould be cut off with a ſmall part of the old wood, where practicable, and be planted in rows a foot aſunder, cloſing the earth well about them: they will be properly rooted in one year for planting out in wider nurſery-rows: they may alſo be planted in pots, and placed in a hot-bed, in order to have them more forward.

And they all may be planted out into the borders, &c. in the autumn or early ſpring months.

Theſe trees in their native ſituations grow to very conſiderable ſizes and magnitudes, but in this climate they are of much inferior growths, ſeldom riſing to any great height or thickneſs. They ſucceed beſt in the countries from which they are brought, in rather moiſt ſoils; but here they thrive perfectly in any tolerably good common kind, and in any ſituation. They have a beautiful form of growth, being much and finely branched from their very bottoms, and conſtantly cloſely adorned with leaves, which are of a very minute ſize, and arranged in a curiouſly compact imbricated manner, diſplaying a continual verdure and ornamental variety at all times of the year.

They are highly ornamental evergreens, proper for adorning the ſhrubbery and other parts, having a fine effect alſo when diſpoſed ſingly in borders, &c. and in open ſpaces of graſs; in all of which ſituations they ſhould be ſuffered to grow with their full branches, in their own natural way, except reducing with a knife any low ſtraggling or rambling branches occaſionally: this is all the culture they require afterwards.

They may alſo be employed as timber-trees, in the evergreen foreſt-tree plantations.

And thoſe in the pots, as the Chineſe arbor-vitæ, may be placed among other potted plants to adorn any particular compartment, and in aſſemblage with greenhouſe plants for variety.

THUILLIER, Vincent, in *Biography*, a learned Benedictine, was born at Coucy, in the dioceſe of Laon, in 1685; and entered into the congregation of St. Maur in 1703, where he was diſtinguiſhed for his talents. Having officiated as profeſſor of philoſophy and theology in the abbey of St. Germaine-des-Pres, he was made ſub-prior, and died in 1736. With his extenſive literature, he combined a lively imagination and a turn for ſatire, which involved him in ſeveral controverſies. He firſt oppoſed, and then warmly defended the bull "Unigenitus," on which ſubject he publiſhed two treatiſes. But he was more uſefully employed in a French tranſlation of Polybius, which appeared in 1721–28, in 6 vols. 4to. His verſion is elegant and faithful. Moreri.

THUIN, in *Geography*, a town of France, in the department of Jemappe, on the Sambre; 14 miles S.E. of Mons. N. lat. 50° 20′. E. long. 4° 21′.

THUIR, a town of France, in the department of the Eaſtern Pyrenées; 7 miles S.W. of Perpignan.

THULDEN, Theodore Van, in *Biography*, was one of the moſt diſtinguiſhed among the pupils of Rubens, whom he aſſiſted in forwarding the pictures of the Luxembourg gallery. He was born at Bois-le-Duc in 1607. He painted a conſiderable number of large works for the churches and public buildings of the principal towns and cities in Flanders; ſome of which have been honoured by being conſidered as from the hand of Rubens. Among the beſt of them are the Martyrdom of St. Sebaſtian, at Mechlin; the Martyrdom of St. Adrian, at Ghent; and the Aſſumption of the Virgin, formerly in the church of the Jeſuits, at Bruges. He was engaged at Paris, which he viſited in 1633, to paint a ſeries of pictures of the life of the patron ſaint of the Mathurins, St. John of Matha, which he afterwards etched and publiſhed in twenty-four plates. He is alſo the author of ſeveral other etchings from his own works and thoſe of others; particularly of 58 plates of the life of Ulyſſes, from pictures painted at Fontainebleau by Primaticcio, of moſt of which there is now no other remembrancer than his etchings. He died in 1676, at the age of 69.

THULE, or Thyle, in *Ancient Geography*, an iſland of the Northern ocean, deſcribed in a very vague manner by the ancients: but which ſome maintain to have been the Shetland iſles. Virgil (Georg. l. i. v. 30.) and Seneca (Medea, v. 379.) call this iſland "Ultima Thule." It is difficult to aſcertain its preciſe ſituation. Strabo aſcribes the ignorance and uncertainty that prevailed with regard to this iſland to its great diſtance, and charges Pytheas with having made many falſe reports concerning it. Ptolemy places the middle of this iſland in 63° of latitude, and ſays, that at the time of the equinoxes, the days were 24 hours, which could not have been true at the equinoxes, but muſt have referred to the ſolſtices; and, therefore, this iſland is ſuppoſed to have been in 66° 30′ lat. or under the polar circle. Stephanus Byzantinus ſays of this iſland, "Thula inſula magna in oceano ſub Huperboreas partes ubi Æſtivus dies ex viginti horis æqualibus conſtat, nox vero ex quatuor. Hybernæ vero dies é contrario." From this account it appears that the ancients deſcribed an iſland which was ſituated three degrees on this ſide of the polar circle; but its ſituation, if ſuch an iſland exiſted, ſtill remained very uncertain. As the ancients have not given us the dimenſions of this iſland, ſome authors have concluded that the appellation of Thule was given to Scandinavia, of which the ancients had a very imperfect knowledge. According to Procopius (l. iii. de Bell. Goth. c. 14.) a party of the Etulians, when vanquiſhed by the Lombards, ſought an abode towards the extremities of the earth. With this view they traverſed the country of the Sclavonians; and in their progreſs entered into the country of the Varnæ, and into Denmark, and at length arrived on the ocean, where they embarked, and then landed on the iſland of Thule. This iſland, he adds, is ten times larger than Great Britain, and is far remote from the northern coaſt, a great part of it being deſert. The habitable part was occupied by thirteen different claſſes of people, who had their reſpective kings. Towards the ſummer ſolſtice, the ſun appeared 40 days ſucceſſively above their horizon; ſix months afterwards, the inhabitants had 40 days of night, which they paſſed in a ſtate that was truly deplorable, as their commerce was totally interrupted. By the account of Procopius, it appears that the place to which he refers muſt have been beyond the polar circle, and of courſe beyond 63° lat., where Ptolemy placed the middle of Thule. Procopius ſays, that he often wiſhed to viſit this iſland, but was never able to accompliſh his object; but he profeſſes to have derived his information from perſons who had actually viſited the country, and he deſcribes its aſpect, and productions, and the manners of its inhabitants. His details correſpond to the accounts that have been given of the ancient ſtate of Lapland (which ſee); but this could not have been the Thule of the ancients. The deſcriptions tranſmitted to us from the ancients of their pretended iſle of Thule are ſo intermixed with fabulous and incredible relations, that ſome modern geographers have even doubted whether ſuch an iſland as they deſcribe ever exiſted; others have ſuppoſed that they refer to Scandinavia, or ſome country far diſtant to the north, of which they could have no certain and fatisfactory accounts; and others again have been of opinion, that no iflands to which modern voyagers have had accefs, correfpond more exactly to their reports than the ifles of Shetland, N. of Scotland. See Zetland *Iflands*.

Thule, in *Geography*, a town of Weftphalia, in the bifhopric of Paderborn; 6 miles W.S.W. of Paderborn.

Thule, a river of Wales, in the county of Glamorgan, which runs into the Lloghor, near its mouth.

Thule, *Southern*, a part of Sandwich Land, obferved by Capt. Cook in January 1775, in S. lat. 59° 13′ 30″ and W. long. 27° 45′, and fo called becaufe it is the moft fouthern land that has ever yet been difcovered. It exhibits a furface of vaft height, and is every where covered with fnow. Some thought that they faw land in the fpace between Thule and Cape Briftol: Cook thought it more than probable that thefe two lands are connected, and that this fpace is a deep bay, which he called Forfter's bay.

THUM, a town of Saxony, in the circle of Erzgebirg; 7 miles S. of Chemnitz. N. lat. 50° 37′. E. long. 12° 50′.—Alfo, a town of Bavaria, in the bifhopric of Bamberg; 3 miles S.S.W. of Forcheim.

THUMATA, in *Ancient Geography*, a town of the Arabs, placed by Pliny on the banks of the Tigris, at a confiderable diftance from the town of Petra.

THUMATHA, a town fituated in the interior of Arabia Felix, between Chabuata and Olaphia. Ptol.

THUMB, Pollex, in *Anatomy*, one of the members or parts of the hand. See Extremities.

Thumb-*Stall*, a ferrule made of iron, horn, or leather, with the edges turned up, to receive the thread in making fails. It is worn on the thumb to tighten the ftitches while fewing.

THUMELITHA, in *Ancient Geography*, a town of Africa, in Interior Libya, near the fource of the river Cinyphis. Ptol.

THUMEREVILLE, in *Geography*, a town of France, in the department of the Mofelle; 6 miles S.W. of Briey.

THUMERSTONE, in *Mineralogy; Axinite*, Haüy. This mineral was called Thumerftone by Werner, from Thum, in Saxony, the place where it was found; and Axinite by Haüy, from the flattened fharp edges of the cryftals refembling the edge of an axe. This is the firft character which ftrikes the eye when this mineral is prefented for infpection. It is moft commonly found cryftallized, but fometimes maffive or diffeminated. The form of the cryftals is a very compreffed oblique rhomboidal prifm. The primitive cryftal, according to Haüy, is a four-fided prifm, whofe bafes are parallelograms with very oblique angles: the larger angle being 101.32, and the fmaller 78.28. In the fecondary cryftals, the acute edges are generally truncated. It is cryftallized alfo in oblique four-fided tables. The form of the cryftals is fometimes very difficult to be determined; they not unfrequently interfect one another, forming a cellular aggregation. The external luftre is generally fplendent; internally it is gliftening or fhining, and is vitreous. It is tranfparent or tranflucent. The fracture is fine-grained and uneven; in the tranflucent varieties, it fometimes approaches to fplintery; and in the tranfparent varieties, to the fmall and imperfectly conchoidal. It fcratches glafs; is harder than felfpar, but not fo hard as quartz; it is fragile, and fufible by the blow-pipe into a greenifh-white glafs, but if laid on charcoal into a black glafs. The fpecific gravity is from 3.2 to 3.3. The colours of this mineral are moft commonly a clove-brown of various degrees of intenfity, inclining to violet and green. It is fometimes green and opaque: according to Brongniart, this is owing to a mixture of chlorite. It has been obferved, he remarks, that the cryftals which are coloured with this earth are the moft regular. The conftituent parts are given by Klaproth and Vauquelin as under.

	Klaproth.		Vauquelin.

Oxyd of manganefe	1.	5.25	4
Potafh - -		0.25	

This mineral occurs in Saxony, France, Switzerland, and Spain, and at mount Atlas, in Africa. It is found alfo maffive and cryftallized near St. Juft, in Cornwall, at the Botellock mine, affociated with common garnet, and in veins between Marazion and Penzance.

The moft beautiful variety is met with in a rock of ferpentine, near Balme d'Auris, in Dauphiny, in the department of the Ifère, where it generally occurs in well-defined cryftals, fometimes colonrlefs and tranfparent, but more frequently of a dull reddifh-violet colour, whence it obtained the name of violet fchorl of Dauphiny. The cryftals of thumerftone, which are not fymmetrical, become electric by heat: it is indeed a general law, that all minerals which poffefs the pyro-electric property, are defective in the fymmetry of the cryftals.

THUMLITZ, in *Geography*, a river of Saxony, which runs into the Mulda; 3 miles S. of Grima.

THUMMIM, in the *Scripture Learning*. See Urim and Thummim.

THUMNA, in *Ancient Geography*, the name of two towns fituated in the interior of Arabia Felix; one between Mochura and Aluare, and another between Mariama and Vodona. Ptol.

THUN, in *Geography*, a town of Switzerland, in the canton of Bern, at the diftance of about 12 miles from the town of Bern. It occupies the bottom and brow of a hill, and ftretches on both fides of the Aar. It contains 1200 inhabitants, enjoys confiderable immunities, has its own magiftrates and courts of juftice, in which the bailiff from Bern always prefides, and from whofe decifion an appeal always lies to the capital. The inhabitants employ themfelves in carding and fpinning filk for the manufactures of Bafle. Some of the burghers poffefs large herds of cattle. To the N.E., on an eminence, ftand the church, and the caftle, which is the refidence of the bailiff. N. lat. 46° 44′. E. long. 7° 31′.—Alfo, a lake of Switzerland, in the canton of Bern; about four leagues long, and one broad, and probably very deep: the borders are richly variegated, and prefent feveral fine points of view, much heightened by many rugged rocks rifing boldly from the margin of the water. The river Aar paffes through the lake of Brientz, and then enters that of Thun, from which it is again difcharged, paffing between two level promontories, prettily fprinkled with trees, on one of which ftands the caftle of Schadao; 15 miles S.S.E. of Bern.

THUNA, a town of Cachemire; 45 miles S. of Cachemire.

THUNBERGIA, in *Botany*, received that name firft from profeffor Retzius, and next in the *Supplementum Plantarum*, from the pen of the younger Linnæus, in honour of their mutual friend, fir Charles Peter Thunberg, knight of the order of Wafa, by whofe difcoveries that work was peculiarly enriched with new and curious fpecies, efpecially from the Cape of Good Hope. This illuftrious veteran ftill fits

fits in the professorial chair of Rudbeck and Linnæus at Upsal, after having essentially added to the general stock of knowledge by his Travels to Japan, his Floras of that country and of the Cape, and his very numerous academical dissertations. The liberal communications, and amiable character of professor Thunberg, have secured him no less personal esteem than his extensive application and knowledge. His constitution, though shaken by a terrible misfortune in his voyage, the accidental use of white lead in his food, which proved fatal to some of his mess-mates, has still carried him on to the advanced age of 73.—Retz. Act. Lund. v. 1. 163. Linn. Suppl. 46. Schreb. Gen. 426. Willd. Sp. Pl. v. 3. 388. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 65. Thunb. Nov. Gen. 21. Prodr. 106. Juss. 103. Lamarck Illustr. t. 549.—Class and order, *Didynamia Angiospermia.* Nat. Ord. *Personatæ*, Linn. *Acanthi*, Juss.

Gen. Ch. *Cal.* Perianth inferior, double, permanent: the outermost of two ovate, obtuse, ribbed, equal leaves, as long as the tube of the corolla: inner of one leaf, in many, about twelve, awl-shaped erect segments, not one-third so long as the former. *Cor.* of one petal, salver-shaped: tube gradually dilated upwards: limb in five deep, nearly equal, obovate, very abrupt segments, about half the length of the tube. *Stam.* Filaments four, awl-shaped, inserted into the tube, the two lower ones shortest, all included within the tube; anthers arrow-shaped. *Pist.* Germen superior, roundish; style thread-shaped, erect, hardly so long as the tube; stigma of two rounded flat lobes. *Peric.* Capsule globose with a beak, smooth, or two cells and two valves, bursting lengthwise: the beak linear, obtuse, compressed, furrowed; partition obovate, emarginate, perforated below the summit, membranous at the sides, permanent. *Seeds* two in each cell, kidney-shaped, rugged, convex on the outside, concave on the inner, with a longitudinal furrow.

Eff. Ch. Calyx double; the outer of two leaves; inner in many awl-shaped segments. Corolla salver-shaped, with five regular lobes. Capsule beaked, of two cells.

Obs. Linnæus remarks that this genus agrees in many points with *Barleria*. Thunberg takes the outer calyx-leaves for bracteas, but this is not countenanced by the altogether peculiar appearance of the inner calyx, by no means like an external perianth.

1. T. *capensis.* Diffuse Thunbergia. Linn. Suppl. 292. Willd. n. 1. Retz. Act. Lund. v. 1. 163, with a figure.—Leaves roundish-ovate, obtuse. Stem diffuse.—Native of the Cape of Good Hope. The *root* seems to be perennial. *Stems* a finger's length, diffuse, simple, leafy, square, hairy. *Leaves* opposite, on short hairy stalks, entire or somewhat toothed, hardly an inch long, strongly reticulated with veins: very rough with minute bristles above; hairy beneath. *Flowers* yellow, on simple, solitary, striated, erect, axillary, hairy *stalks*, twice the length of the leaves. *Outer calyx* very hairy; inner rigid, with almost pungent points. *Corolla* about an inch long, its segments somewhat rounded. *Capsule* rigid, about the same length.

2. T. *fragrans.* Twining Thunbergia. Roxb. Corom. v. 1. 47. t. 67. Willd. n. 2. Ait. n. 1. Andr. Repos. t. 123.—Leaves ovate-oblong, somewhat heart-shaped, acute. Stem twining.—Common in hedges, among bushes, on the banks of water-courses, about Samulcotah, flowering in the wet and cold seasons. Dr. Roxburgh never met with it any where else. He says the plant possesses a peculiar and agreeable fragrance, and the beauty of its *flowers*, though not fragrant, entitles it to a place in the flower-garden. No scent has been discovered in any part of this plant in our stoves, where it blossoms freely all summer long. The long and twining *stems* readily distinguish this species from the foregoing, as well as the elongated form of the *leaves*, which are occasionally angular, or toothed, near the base. The *flowers* are white, larger, and with a narrower tube than the *capensis*, their segments more abrupt or somewhat notched.

It appears by the Linnæan herbarium that the younger Linnæus had originally destined the name of *Solandra* for this genus.

Another *Thunbergia* was previously established by Dr. Montin, in the Stockholm Transactions for 1773, but the noble plant on which it was founded proved a GARDENIA. See that article.

THUNDER, a noise in the lowest region of the air, excited by a sudden explosion of electrical clouds; which, on this account, are called thunder-clouds.

Seneca, Rohault, and other authors, both ancient and modern, account for thunder by supposing two clouds impending over one another, the upper and rarer of which, becoming condensed by a fresh accession of air raised thither by warmth from the lower parts of the atmosphere, or driven upon it by the wind, immediately falls forcibly down upon the lower and denser cloud: by which fall the air interposed between the two being compressed, that next the extremities of the two clouds is squeezed out, and leaves room for the extremity of the upper cloud to close tight upon the under; thus a great quantity of air is enclosed, which, at length escaping through some winding irregular vent or passage, occasions that noise which we call thunder.

But this could only reach to the phenomena of thunder heard without lightning; and, therefore, recourse has been had to another solution. It has been said, that thunder is not occasioned by the falling of clouds, but by the kindling of sulphurous exhalations, in the same manner as the noise of aurum fulminans.

"There are sulphurous exhalations," says sir Isaac Newton, "always ascending into the air when the earth is dry; there they ferment with the nitrous acids, and sometimes taking fire, generate thunder, lightning, &c."

That, besides the vapours raised from water, &c. there are also exhalations carried off from sulphur, bitumen, volatile salts, &c. is past all doubt; the vast quantity of sulphurous and bituminous matter all over the surface of the earth, and the volatile salts of plants and animals, afford such an ample stock of them, that it is no wonder the air should be filled with such particles, raised higher or lower, according to their greater or less degree of subtlety and activity; and more copiously spread in this or that quarter, according to the direction of the winds.

Now, the effects of thunder are so like those of fired gunpowder, that Dr. Wallis thinks we need not scruple to ascribe them to the same cause; and the principal ingredients in gunpowder, we know, are nitre and sulphur; charcoal only serving to keep the parts separate, for their better kindling.

Hence, if we conceive in the air a convenient mixture of nitrous and sulphurous particles, from the sources above mentioned; and those, by any cause, to be set on fire, such explosion may well follow; and with such noise and light, the two phenomena of thunder, as in the firing of gunpowder; and being once kindled, it will run from place to place, this way or that, as the exhalations happen to lead it; much as is found in a train of gunpowder.

This explosion, if high in the air, and remote from us, will do no mischief; but if near us, may destroy trees, animals, &c. as gunpowder would do in the like circumstances.

This nearness, or distance, may be estimated by the interval

terval of time between the flaſh and the noiſe. Dr. Wallis obſerves, that, ordinarily, the difference between the two is about ſeven ſeconds, which, at the rate of 1142 feet in a ſecond of time, gives the diſtance about a mile and a half; but ſometimes it comes in a ſecond or two, which argues the exploſion very near us, and even among us. And in ſuch caſes, the doctor aſſures us, he has more than once foretold the miſchiefs that happened.

Upon the whole, that there is in lightning a ſulphurous vapour has been argued from the ſmell of ſulphur which attends it, and from the ſultry heat in the air which uſually precedes it; and that there is a nitrous vapour along with it, the ſame writer concludes hence, that we know of no other body ſo liable to a ſudden and violent exploſion. And as to the kindling of theſe materials, we know that a mixture of ſulphur and ſteel-filings, with a little water, will of itſelf break forth into actual flame. Nothing, therefore, is wanting to the exploſion but ſome chalybeate or vitriolic vapour; and, among the various effluvia from the earth, the doctor does not doubt but there muſt be ſome of that kind; but, in proof of what he leaves as a probability, the following facts have been alleged.

In hiſtory, we meet with inſtances of its raining iron in Italy, and iron-ſtones in Germany. Jul. Scaliger tells us, he had by him a piece of iron rained in Savoy. Cardan reports 1200 ſtones to have fallen from heaven, ſome of them weighing 30, ſome 40, and one 120 pounds, all very hard, and of the colour of iron.

The matter of fact is ſo well atteſted, that Dr. Liſter, in the Philoſophical Tranſactions, builds a whole theory of thunder and lightning on it; maintaining that they both owe their matter to the vapour or exhalation of the pyrites.

The noiſe of thunder, and the flame of lightning, are eaſily made by art. If a mixture of oil or ſpirit of vitriol be made with water, and ſome filings of ſteel added to it, there will immediately ariſe a thick ſmoke or vapour out of the mouth of the veſſel; and if a lighted candle be applied to this, it will take fire, and the flame immediately deſcend into the veſſel, and this will be burſt to pieces with a noiſe like that of a cannon.

This is ſo far analogous to thunder and lightning, that a great exploſion and fire are occaſioned by it; but in this they differ, that this matter when once fired is deſtroyed, and can give no more exploſions; whereas, in the heavens, one clap of thunder uſually follows another, and there is a continued ſucceſſion of them for a long time. M. Homberg explained this by the lightneſs of the air above us in compariſon of that here, which therefore would not ſuffer all the matter ſo kindled to be diſſipated at once, but kept it for ſeveral returns.

Ever ſince the year 1752, in which the identity of the matter of lightning, and of the electric fluid, has been aſcertained, philoſophers have generally agreed in conſidering thunder as a concuſſion produced in the air by an electrical exploſion. For the illuſtration and proof of this theory, ſee Lightning. See alſo Electricity.

We ſhall here obſerve, that Mr. Henry Eeles, in a letter written in 1751, and read before the Royal Society in 1752, conſiders the electrical fire as the cauſe of thunder, and endeavours to account for it on this hypotheſis; and he tells us, that he did not know of any perſon's having made the ſame conjecture. Phil. Tranſ. vol. xlvii. p. 524, &c.

That rattling in the noiſe of thunder, which makes it ſeem as if it paſſed through arches, or were broken variouſly, is probably owing to the ſound being excited among clouds hanging over one another, and the agitated air paſſing irregularly between them.

See this phenomenon particularly accounted for under Lightning.

Thunder-*Bolt*. If what we call lightning acts with extraordinary violence, and breaks or ſhatters any thing, it is called a thunderbolt, which the vulgar, to fit it for ſuch effects, ſuppoſe to be a hard body, and even a ſtone.

But that we need not to have recourſe to a hard ſolid body to account for the effects commonly attributed to the thunderbolt, will be evident to any one, who conſiders thoſe of the pulvis fulminans, and of gunpowder: but more eſpecially the aſtoniſhing powers of electricity, even when collected and employed by human art, and much more when directed and exerciſed in the courſe of nature.

When we conſider the known effects of electrical exploſions, and thoſe produced by lightning, we ſhall be at no loſs to account for the extraordinary operation vulgarly aſcribed to thunderbolts. As ſtones and bricks ſtruck by lightning are often found in a vitrified ſtate, we may reaſonably ſuppoſe, with ſignior Beccaria, that ſome ſtones in the earth, having been ſtruck in this manner, firſt gave occaſion to the vulgar opinion of the thunderbolt.

Places ſtruck with thunderbolts were held ſacred among the ancients. Nigidius has a curious treatiſe on the thunderbolt.

The ancient painters and poets have armed Jupiter with a ſort of flaming dart, called a thunderbolt. Thus, it is ſaid, he became maſter both of gods and men.

Theſe thunderbolts are forged for Jupiter, according to the poets, by the Cyclopes.

The thunderbolt, in antiquity, repreſented ſovereignty, and a power equal to the gods; on this account, Apelles painted Alexander, in the temple of Diana of Epheſus, holding a thunderbolt in his hand: and on medals, the thunderbolt is ſometimes found to accompany the emperor's heads, as that of Auguſtus.

Appian informs us, that the thunderbolt was the principal divinity of Seleucia; adding, that it was adored, even in his time, with various hymns and ceremonies.

Thunder-*Clouds*, in *Phyſiology*, are thoſe clouds which are in a ſtate fit for producing lightning and thunder. From ſignior Beccaria's exact and circumſtantial account of the external appearances of thunder-clouds, we ſhall extract the following particulars.

The firſt appearance of a thunder-ſtorm, (which generally happens when there is little or no wind), is one denſe cloud, or more, increaſing very faſt in ſize, and riſing into the higher regions of the air. The lower ſurface is black, and nearly level; but the upper finely arched, and well defined. Many of theſe clouds often ſeem piled upon one another, all arched in the ſame manner; but they keep continually uniting, ſwelling, and extending their arches.

At the time of the riſing of this cloud, the atmoſphere is generally full of a great number of ſeparate clouds, motionleſs, and of odd and whimſical ſhapes. All theſe, upon the appearance of the thunder-cloud, draw towards it, and become more uniform in their ſhapes as they approach, till, coming very near the thunder-cloud, their limbs mutually ſtretch towards one another; they immediately coaleſce, and together make one uniform maſs. Theſe he calls *adſcititious* clouds, from their coming in, to enlarge the ſize of the thunder-cloud.

But ſometimes the thunder-cloud will ſwell, and increaſe very faſt, without the conjunction of any adſcititious clouds; the vapours in the atmoſphere forming themſelves into clouds wherever it paſſes. Some of the adſcititious clouds appear like white fringes at the ſkirts of the thunder-cloud, or under the body of it, but they keep continually growing darker and darker, as they approach to unite with it.

When the thunder-cloud is grown to a great ſize, its lower ſurface is often ragged, particular parts being detached towards the earth, but ſtill connected with the reſt. Sometimes the lower ſurface ſwells into various large protuberances, bending uniformly toward the earth. And ſometimes one whole ſide of the cloud will have an inclination to the earth, and the extremity of it will nearly touch the earth. When the eye is under the thunder-cloud, after it is grown larger, and well formed, it is ſeen to ſink lower, and to darken prodigiouſly; at the ſame time that a number of ſmall adſcititious clouds (the origin of which can never be perceived) are ſeen in a rapid motion, driving about in very uncertain directions under it. While theſe clouds are agitated with the moſt rapid motions, the rain generally falls in the greateſt plenty, and if the agitation be exceedingly great, it commonly hails.

While the thunder-cloud is ſwelling, and extending its branches over a large tract of country, the lightning is ſeen to dart from one part of it to another, and often to illuminate its whole maſs. When the cloud has acquired a ſufficient extent, the lightning ſtrikes between the cloud, and the earth, in two oppoſite places, the path of the lightning lying through the whole body of the cloud and its branches. The longer this lightning continues, the rarer does the cloud grow, and the leſs dark is its appearance; till, at length, it breaks in different places, and ſhews a clear ſky. When the thunder-cloud is thus diſperſed, thoſe parts which occupy the upper regions of the atmoſphere are equally ſpread, and very thin; and thoſe that are underneath are black, but thin too; and they vaniſh gradually, without being driven away by any wind.

Theſe thunder-clouds were ſometimes in a poſitive as well as negative ſtate of electricity. The electricity continued longer of the ſame kind, in proportion as the thunder-cloud was ſimple and uniform in its direction; but when the lightning changed its place, there commonly happened a change in the electricity of the apparatus over which the clouds paſſed. It would change ſuddenly after a very violent flaſh of lightning, but the change would be gradual when the lightning was moderate, and the progreſs of the thunder-cloud ſlow. Beccar. Lettere dell' Elletriciſmo, p. 107; or Prieſtley's Hiſt. Electr. vol. i. p. 397, &c. See LIGHTNING.

THUNDER-*Houſe*, in *Electricity*, is an inſtrument invented by Dr. James Lind of Edinburgh, for illuſtrating the manner by which buildings receive damage from lightning, and to evince the utility of metallic conductors in preſerving them from it.

A (*Plate* XV. *Electricity*, *fig.* 2.) is a board about three quarters of an inch thick, and ſhaped like the gable-end of a houſe. This board is fixed perpendicularly upon the bottom board B, upon which the perpendicular glaſs pillar C D is alſo fixed in a hole about eight inches diſtant from the baſis of the board A. A ſquare hole I L M K, about a quarter of an inch deep, and nearly an inch wide, is made in the board A, and is filled with a ſquare piece of wood, nearly of the ſame dimenſions. It is nearly of the ſame dimenſions, becauſe it muſt go ſo eaſily into the hole, that it may drop off, by the leaſt ſhaking of the inſtrument. A wire, L K, is faſtened diagonally to this ſquare piece of wood. Another wire, I H, of the ſame thickneſs, having a braſs ball, H, ſcrewed on its pointed extremity, is faſtened upon the board A: ſo alſo is the wire M N, which is ſhaped in a ring at O. From the upper extremity of the glaſs pillar C D, a crooked wire proceeds, having a ſpring ſocket F, through which a double knobbed wire ſlips perpendicularly, the lower knob, G, of which falls juſt above the knob H. The glaſs pillar D C muſt not be made very faſt into the bottom board; but it muſt be fixed ſo that it may be pretty eaſily moved round its own axis, by which means the braſs ball G may be brought nearer or farther from the ball H, without touching the part E F G. Now when the ſquare piece of wood L M I K (which may repreſent the ſhutter of a window or the like) is fixed into the hole ſo that the wire L K ſtands in the dotted repreſentation I M, then the metallic communication from H to O is complete, and the inſtrument repreſents a houſe furniſhed with a proper metallic conductor; but if the ſquare piece of wood L M I K is fixed ſo that the wire L K ſtands in the direction L K, as repreſented in the figure, then the metallic conductor H O, from the top of the houſe to its bottom, is interrupted at I M, in which caſe the houſe is not properly ſecured.

Fix the piece of wood L M I K, ſo that its wire may be as repreſented in the figure, in which caſe the metallic conductor H O is diſcontinued. Let the ball G be fixed at about half an inch perpendicular diſtance from the ball H, then, by turning the glaſs pillar D C, remove the former ball from the latter; by a wire or chain connect the wire E F with the wire Q of the jar P, and let another wire or chain, faſtened to the hook O, touch the outſide coating of the jar. Connect the wire Q with the prime conductor, and charge the jar; then, by turning the glaſs pillar D C, let the ball G come gradually near the ball H, and when they are arrived ſufficiently near one another, you will obſerve, that the jar explodes, and the piece of wood L M I K is puſhed out of the hole to a conſiderable diſtance from the thunder-houſe. Now the ball G, in this experiment, repreſents an electrified cloud, which, when it is arrived ſufficiently near the top of the houſe A, the electricity ſtrikes it, and as this houſe is not ſecured with a proper conductor, the exploſion breaks part of it, *i. e.* knocks off the piece of wood I M.

Repeat the experiment with only this variation, *viz.* that this piece of wood I M is ſituated ſo that the wire L K may ſtand in the ſituation I M; in which caſe the conductor H O is not diſcontinued; and you will obſerve that the exploſion will have no effect upon the piece of wood L M, this remaining in the hole unmoved; which ſhews the uſefulneſs of the metallic conductor.

Farther, unſcrew the braſs ball H from the wire H I, ſo that this may remain pointed, and with this difference only in the apparatus repeat both of the above experiments, and you will find that the piece of wood I M is in neither caſe moved from its place, nor any exploſion will be heard, which not only demonſtrates the preference of conductors with pointed terminations to thoſe with blunted ones, but alſo ſhews that a houſe furniſhed with ſharp terminations, although not furniſhed with a regular conductor, is alſo ſufficiently guarded againſt the effects of lightning.

Mr. Henly, having connected a jar containing 509 ſquare inches of coated ſurface with his prime conductor, obſerved that if it was ſo charged as to raiſe the index of his electrometer to 60°, by bringing the ball on the wire of the thunder-houſe, to the diſtance of half an inch from that connected with the prime conductor, the jar would be diſcharged, and the piece in the thunder-houſe thrown out to a conſiderable diſtance. Uſing a pointed wire for a conductor to the thunder-houſe, inſtead of the knob, the charge being the ſame

ſame as before, the jar was diſcharged ſilently, though ſuddenly; and the piece was not thrown out of the thunder-houſe. In another experiment having made a double circuit to the thunder-houſe, the firſt by the knob, the ſecond by a ſharp-pointed wire, at one and one-fourth of an inch diſtance from each other, but of exactly the ſame height (as in *fig.* 3.) the charge being the ſame; although the knob was brought firſt under that connected with the prime conductor, which was raiſed half an inch above it, and followed by the point, yet no exploſion could fall upon the knob; the point drew off the whole charge ſilently, and the piece in the thunder-houſe remained unmoved. Phil. Tranſ. vol. lxiv. part i. p. 136. See POINTS, in *Electricity*.

THUNDER-*Stone*, in *Natural Hiſtory*, the ſame with that called by authors brontia.

THUNDER-*Storm*. See THUNDER-*Clouds*.

THUNDER *Bay*, in *Geography*, a bay in lake Huron, about nine miles long, and nearly as many broad. The Indians who reſide near, and all European travellers who have paſſed this bay, agree to call it by the preſent name, on account of the continual thunder they obſerve. N. lat. 44° 50′. W. long. 83° 30′.—Alſo, a bay on the N. part of lake Superior.

THUNDERING LEGION, *Legio Fulminans*, was a legion in the Roman army, conſiſting of Chriſtian ſoldiers, who in the expedition of the emperor Marcus Aurelius Antoninus againſt the Sarmatæ, Quadi, and Marcomanni, A.D. 174, are ſaid to have ſaved the whole army, then ready to periſh with thirſt, by procuring, with their prayers, a very plentiful ſhower on them; and at the ſame time a furious hail, mixed with lightning and thunderbolts, on the enemy, and thus he obtained a deciſive victory.

This is the account commonly given by eccleſiaſtical hiſtorians; and the whole ſtory is engraven in bas-relievos on the Antonine column. And hence aroſe the denomination *thunderers:* though ſome ſay, that the legion thoſe Chriſtians were of was called the *thundering legion* before.

This deliverance has been thought by many to have been miraculous, owing to the prayers of the Chriſtians who were in the Roman army; and it has been ſuppoſed, that the emperor wrote a letter to the ſenate on this occaſion, which was very favourable to the Chriſtians; others, however, have thought, that the Chriſtians, by a pious ſort of miſtake, attributed this unexpected and ſeaſonable ſhower, which ſaved the Roman army, to a miraculous interpoſition; and this opinion, ſays Moſheim, is indeed ſupported by the weightieſt reaſon as well as by the moſt reſpectable authorities; and the letter of Marcus Antoninus is allowed, even by the defenders of the miracle of the thundering legion, to have in it manifeſt tokens of ſpuriouſneſs, to be the work of a man unſkilful in Roman affairs, and who probably lived in the ſeventh century. Moſheim ſums up the arguments on this ſubject in the following manner: it is certain, he ſays, that the Roman army encloſed by the enemy, and reduced to the moſt deplorable and even deſperate condition by the thirſt under which they languiſhed in a parched deſart, was revived by a ſudden and unexpected rain. It is alſo certain, that both the Heathens and the Chriſtians looked upon this event as extraordinary and miraculous; the former attributing it to Jupiter, Mercury, or the power of magic; the latter to Chriſt, interpoſing, thus unexpectedly, in conſequence of their prayers. It is ſtill farther beyond all doubt, that a conſiderable number of Chriſtians ſerved, at this time, in the Roman army, and it is extremely probable, that in ſuch trying circumſtances of calamity and diſtreſs, they employed the merciful interpoſition and ſuccours of their God and Saviour. And as the Chriſtians of the time looked upon all extraordinary events as miracles, and aſcribed to their prayers all the uncommon and ſingular occurrences of an advantageous nature that happened to the Roman empire, it will not appear ſurpriſing, that upon the preſent occaſion they attributed the deliverance of Antoninus and his army to a miraculous interpoſition which they had obtained from above. But, on the other hand, it muſt be carefully obſerved, that it is an invariable maxim univerſally adopted by the wiſe and judicious, that no events are to be eſteemed miraculous, which may be rationally attributed to natural cauſes, and accounted for by a recourſe to the ordinary diſpenſations of providence; and as the unexpected ſhower, which reſtored the expiring force of the Romans, may be eaſily explained without riſing beyond the uſual and ordinary courſe of nature, the concluſion is manifeſt; nor can it be doubtful in what light we are to conſider that remarkable event. Eccl. Hiſt. vol. i. 8vo. edit.

Mr. Moyle and Mr. King had a curious and intereſting controverſy on the ſubject of the thundering legion. The learned Dr. Lardner has collected into one view every thing relating to it of importance, in his Collection of Jewiſh and Heathen Teſtimonies, vol. ii. ch. xv. ſect. iii. p. 221, &c.

THUNGEN, in *Geography*. See TIENGEN.

THUNOE, a ſmall iſland of Denmark, between the coaſt of Jutland, and the iſland of Samſoe. N. lat. 55° 58′. E. long. 10° 27′.

THUNUDROMUM, in *Ancient Geography*, a town, with the title of a Roman colony, in Africa, in New Numidia, according to Ptolemy. It is named Tynidrumenſe Oppidum by Pliny.

THUNUSDA, a town of Africa Propria, according to Ptolemy, denominated by Pliny Thunuſidenſe Oppidum.

THUPÆ, or THUPPÆ, a town of Africa, in the interior of Libya, upon the ſouthern banks of the Niger. Ptol.

THUPPA, a town of Africa, in the interior of Libya, upon the northern bank of the river Gira.

THUR, in *Geography*, a river of Switzerland, which riſes in the ſouth part of the county of Toggenburg, and runs into the Rhine, 7 miles S.S.W. of Schaffhauſen.

THURE, a town of France, in the department of the Vienne; 4 miles W. of Chatellerault.

THUREN, a river of France, which riſes in the department of the Upper Rhine, paſſes by Thann, &c. and joins the Ill at Enſiſheim.

THURGAU, a country of Switzerland, with the title of landgravate; bounded on the north by Swabia and the lake of Conſtance, on the eaſt by the lake of Conſtance, on the ſouth by the territories of St. Gall, and on the weſt by the cantons of Zurich and Schaffhauſen. It receives its name from the river Thur, and, in its moſt extenſive ſenſe, comprehends all the extent of country on both ſides of that river. Though ſomewhat mountainous towards the ſouth, yet it affords rich paſtures; and its other parts, as approaching nearer to levels, produce plenty of grain, with vegetables and fruits of all kinds, as alſo wine. The country is populous, and well cultivated, containing ſix towns, with ſeveral handſome burghs, a great number of ſeats, and upwards of 170 villages. About one-third of the inhabitants conſiſts of Roman Catholics, and in church affairs are ſubject to the biſhop of Conſtance. The other two-thirds, ever ſince the year 1543, have been Calviniſts. The Thurgau is a very ancient landgravate, which, on the extinction of the counts of Old or Hohen Frauenfelden, devolved to thoſe of Kiburg, and, on their failure, to the counts of Habſburg, with whom it came to the houſe of Auſtria, which continued poſſeſſed of it till 1460, in which year the Switzers, being at war with the archduke Sigiſmund, wreſted this country from him, which, by by the peace concluded at Conſtance in the following year, was confirmed to them. The cantons to which the territorial ſovereignty of this country belongs, are the eight old cantons of Zurich, Bern, Lucerne, Schweitz, Underwalden, Zug, and Glaris; but it was not till the peace of Arau, that the ſecond was admitted by the others as a co-ſovereign. Theſe eight every two years alternately appoint a landvogt over it, who reſides at Frauenfeld; and ſince the year 1449, the cantons of Friburg and Soleure have alſo obtained a ſeat in its criminal court.

THURGOLAND, a townſhip of Yorkſhire, in the Weſt Riding; 4 miles S.W. of Barneſley.

THURIA, in *Ancient Geography*, a town of Meſſenia, on the river Aris, S.W. of Alagonia. It had a temple dedicated to the goddeſs Aſtarte, a Syrian divinity, ſuppoſed to be the ſame with Venus.—Alſo, an iſland on the Ægean ſea, near Naxos, according to Plutarch.

THURIBULUM, among the Romans, a cenſer, or veſſel, in which incenſe was burnt at ſacrifices.

THURIFICATI, in *Church Hiſtory*, a deſignation given to thoſe who, to avoid the perſecution of the Roman emperors, offered frankincenſe to the heathen gods.

THURII Montes, in *Ancient Geography*, mountains of Italy, in Magna Græcia.

THURINGII, Thuringians, a people of Germany, ſuppoſed by ſome authors to have been a part of the Vandals. They have been ſcarcely known in hiſtory ſince the fall of the Roman empire. Towards the end of the fifth or commencement of the ſixth century, Thuringia had a king, or at leaſt a warlike chief.

THURINGIA, in *Geography*, a circle of Saxony, which forms the N. part of the landgravate of that name. The country is well watered, yields good paſturage, and abundance of corn, particularly wheat, which is excellent, as alſo fine timber-wood, ſafflower, aniſe, fennel, and wine; and has alſo a conſiderable breed of horſes, horned cattle, and ſheep. Of theſe natural productions of the country, a great part is exported. Thuringia contains in it 60 towns, 674 villages, and 300 noble eſtates. The modern Thuringia, which lies nearly between the Saale and the Werra, is but a part of the ancient Thuringia, a country formerly comprized under that name, extending itſelf much farther every way. In the ſixth century, the Franks and Saxons ſubjected the Thuringians to their dominions, whoſe country from that time forwards became divided into the North and South. North Thuringia, towards the N., extends itſelf beyond Harzwalde, quite to the river Elbe, and belonged to the Saxons. It was united with the duchy of Saxony, loſt its name, and was at length annexed to Eaſtphalia, or to the eaſtern part of the county of Saxony. South Thuringia belonged to the Franks, and comprized in it the modern Thuringia, together with a large ſhare of the modern Franconia, Heſſe, &c. Till the eleventh century, it ſtood under the emperors and kings, and beſides the counts, we find alſo ſome dukes mentioned, to whom the German kings entruſted the government of this country. Ever ſince the thirteenth century, the marggraves of Meiſſen, who afterwards became electors of Saxony, have been in poſſeſſion of the landgravate of Thuringia, which was at one time divided among ſeparate lines, but returned again by the extinction of the latter to that of Meiſſen. It has been ceded to Pruſſia by the king of Saxony.

THURIS, in *Ancient Geography*, a town ſituated in the interior of Arabia Felix. Ptol.

THURIUM, a town which ſucceeded the ancient *Sybaris*; which ſee.

THURLES, in *Geography*, a poſt-town of the county of Tipperary, Ireland, ſituate on the river Suire, which divides it nearly into two equal parts. There was formerly a caſtle belonging to the knights of St. John of Jeruſalem, and there are ſtill ſome ruins of a monaſtery. Thurles is 70 miles S.W. from Dublin.

THURLMERE, a lake of England, in the county of Cumberland, from whence a river runs to the Derwent; 3 miles S.E. of Keſwick.

THURLOE, John, in *Biography*, ſecretary of ſtate to the Protectorate, was the ſon of Thomas Thurloe, rector of Abbot's Roding, in Eſſex, where he was born in 1616. He was brought up to the law, and in 1644–5, by the intereſt of Oliver St. John, was appointed one of the ſecretaries to the parliamentary commiſſioners at the treaty of Uxbridge. Advancing through other offices, he went as ſecretary to lord chief juſtice St. John, and Mr. Strickland, in their embaſſy to the States-General. In 1652 he roſe to the office of ſecretary to the council of ſtate; and when Cromwell, in 1653, aſſumed the protectorate, he was nominated his ſecretary, on whom he repoſed peculiar confidence. In 1655 he was entruſted with the management of the poſt-office; and in 1656 he repreſented the iſle of Ely in parliament. On the death of Cromwell he ſigned the order for proclaiming Richard, and in the following parliament was returned member for the univerſity of Cambridge. He retained his office of ſecretary under Richard, and alſo under the parliament that depoſed him. On the reſtoration, he was accuſed of high treaſon and examined, but ſoon ſet at liberty. He then retired to his ſeat in Oxfordſhire, and viſited London, at his chambers in Lincoln's Inn, in term-time. Charles II. often invited him to take a part in his adminiſtration: but he declined it, alleging that perhaps he ſhould not be able to ſerve the king, as he had done the protector, in connection with men of different characters and principles; the protector, as he told his majeſty, was uſed "to ſeek out men for places, and not places for men." The abilities of Thurloe for public life were diſtinguiſhed, and his character in private life no leſs amiable. He died in Lincoln's Inn, where he was maſter of the bench, in 1667–8, and was interred in the chapel. His ſtate papers formed a valuable hiſtorical collection, and were publiſhed by Dr. Birch, in 7 vols. fol. 1742. Biog. Brit. Gen. Biog.

THURLOW, in *Geography*, a townſhip of Upper Canada.

Thurlow's *Iſland*, a narrow iſland in the Pacific ocean, near the coaſt of North America, about 24 miles in length from E. to W. N. lat. 50° 24′. E. long. 233° 35′.

THURMAN, a poſt-townſhip of the United States, in the ſtate of New York, and county of Waſhington, erected in 1792 from Queenſbury, and then compriſing a great extent of territory, which has been ſince ſubdivided into other towns. Thurman is bounded N. by Cheſter and Johnſburg, E. by Caldwell and Bolton, S. by Saratoga county, and W. by Montgomery county. The firſt ſettlements commenced about 1786, and in 1810 there were about 200 families, moſtly Scots, and the reſt from the eaſtern ſtates. It has one Preſbyterian and one Methodiſt meeting-houſe, and a pretty competent number of common ſchool-houſes and ſchools. The whole townſhip is well watered, and Crain's mountain in the W. part of it is rich in mineral treaſures. Much of this weſtern part is ſtill unſettled.

THURN, a town of the duchy of Stiria; 5 miles S. of Windiſch Gratz.

Thurn *Am Hardt*, a town of the duchy of Carniola; 2 miles S. of Gurckfeld.

THURNAU, a town of Germany, in the principality of Culmbach; 5 miles S.S.W. of Culmbach. N. lat. 50° 2′. E. long. 11° 26′.

THUR-

THURNEISSER, Leonard, in *Biography*, a man of great temporary celebrity in chemiſtry and the occult ſciences, was born at Baſle in the year 1530. Having imprudently, in 1547, when a boy, married a widow, who proved unfaithful; and having involved himſelf in debt, he found himſelf under a neceſſity of leaving both his wife and his native place. Accordingly, in 1548 he went to Straſburg, and from thence he proceeded to Conſtance, having, by diligent application to his trade of a goldſmith, amaſſed a conſiderable ſum of money. He employed himſelf in the conſtruction of mathematical inſtruments, and in a variety of metallurgic operations with ſuch reputation, that he was entruſted with the direction of the ſmelting works at Eberſwold in the Tyrol. During his abode at Conſtance, he married the daughter of a goldſmith by whom he had been employed, and in 1558 retired with her to Tarenz in the Upper Innthal, where he formed metallurgic eſtabliſhments on his own account, and conſtructed furnaces, together with a manufactory for the preparation of ſulphur. Here he was viſited by ſeveral perſons of eminence, and became known to the emperor Ferdinand; and patroniſed by the emperor's ſon, the archduke Ferdinand, he travelled, by his conſent, in 1560, to Scotland and the Orkney iſlands, and in 1561 to Portugal and Spain, and alſo to ſome parts of Africa and Aſia. On the ſummit of mount Sinai he received the order of St. Catharine; and in his way home he viſited Candia, Greece, Italy, and Hungary. When he arrived in the Tyrol, he found his eſtabliſhments in great confuſion; but he was enabled by the government of Inſpruck to revive and ſupport them. He was then deputed by the archduke to examine the mines in Hungary and Bohemia; but notwithſtanding this high patronage, he involved himſelf in debt, and by his pride and extravagance forfeited the favour of his patrons. In 1569 he obtained leave to viſit Lower Germany, for the purpoſe of making ſome obſervations in natural hiſtory, and of ſuperintending the printing of ſome of his works. During the leiſure afforded by ſome of his ſea-voyages, he had compoſed, in German verſe, a work intitled "Archidoxia," or an account of the influence which the planets have on the human body, and on all the employments of man; together with a ſecret introduction to alchemy. He had prepared alſo another work, called the "Quinteſſence," in which he pointed out the connection between medicine and alchemy, and gave inſtructions how to extract from all ſubſtances their quinteſſence or ſubtile parts. He pretended alſo to have made ſome other curious diſcoveries, which we cannot detail. At Munſter he publiſhed, in 1569, the firſt edition of his "Archidoxia," in 4to.; and his "Quinteſſence" was printed there, alſo in 4to., in 1570. Theſe works were afterwards enlarged and publiſhed in folio. Thurneiſſer, quarrelling with the biſhop, left Munſter and removed to Frankfort on the Oder, to print his "Piſon," or Deſcription of Rivers, by which, together with his calendar and book on plants, he acquired the greateſt ſhare of his reputation. Having cured the margravine of Brandenburg of a dangerous illneſs, the margrave appointed him his phyſician, and defrayed the expence of bringing his wife and family from Conſtance. In 1572 he publiſhed his work "On Urine," in which he aſſerts, that by examining the urine of Sigiſmond I. of Poland, he had diſcovered the nature of his diſeaſe, and predicted his death, with the day on which it would happen. Under the patronage of the margrave of Brandenburg he went on proſperouſly with his laboratory and printing-preſs; and indulged in the moſt expenſive and ſplendid mode of dreſs and living. His viſitors were numerous, and of the firſt rank; and among his correſpondents were the emperor Maximilian, and Elizabeth queen of England. He was conſulted not only in all kinds of diſeaſes, but on witchcraft, magic, and other ſuch matters. His printing-preſs was in high eſtimation. By printing, and the ſale of his MSS. and preſcriptions, he acquired great wealth. For the MSS. the elector, John Gruge, gave him 9000 dollars; and there was formerly in the king's library at Berlin, a MS. entitled "De Tranſmutatione Veneris in Solem," for which an annual penſion of 600 dollars was ſettled on him and his children. He was the firſt perſon who formed a collection of natural curioſities in the Marche of Brandenburg. He had alſo a garden filled with plants for the ſtudy of botany, and a menagerie, containing a collection of various animals from all parts of the world. In 1575 he loſt his ſecond wife, who arranged all his affairs with great prudence; and this was the era of his downfall. From opulence he was reduced to poverty. His reputation as a phyſician declined. Dr. Hoffman of Francfort, in his oration "De Barbarie Imminente," was formidable to his credit, and he contrived means to prevent its being printed till the year 1578. Thurneiſſer, fearing utterly to loſe his character, prepared for his departure from Berlin, and retired to Baſle, where, in 1580, he married a third wife. Withdrawing from domeſtic diſquiet into Italy, he is ſaid to have converted, in the preſence of the grand duke, Franceſco de Medici, one half of an iron nail into gold. This ſingular man died in 1595, or 1596, in a monaſtery at Cologne, after requeſting that his body might be interred cloſe to that of Albert the Great. A liſt of his works is given by Haller in his Bibliotheca. Gen. Biog.

THUROTZ, in *Geography*, a river of Hungary, which runs into the Waag, 12 miles N. of St. Martin. It gives name to a county.

THURROCK GRAYS, or Great Thurrock, a market-town in the hundred of Chafford, and county of Eſſex, England; is ſituated 22 miles S.S.W. from Chelmsford, and 24 miles E. by S. from London. It acquired the appellation of Grays from the noble family of that name, who poſſeſſed the manor for upwards of three centuries, from the year 1194, when it was granted to them by king Richard I. The town conſiſts principally of one irregular ſtreet, on the banks of a ſmall creek from the Thames, navigable for hoys and veſſels of ſmall burthen. A weekly market is held on Thurſdays, chiefly for the ſale of corn, and is much frequented: here is alſo an annual fair. The church is built in the form of a croſs, with a tower on the north ſide. By the return under the population act of the year 1811, this pariſh was ſtated to contain 214 houſes, and 1055 inhabitants.

In the adjacent pariſhes of Chadwell and Little Thurrock are various caverns, or holes, of unequal depths and dimenſions, formed in the chalk, which here conſtitutes the upper ſtratum: they appear to open from the top by a narrow circular paſſage, which near the bottom begins to ſpread, and communicates with ſubterranean apartments of different forms. Dr. Derham meaſured ſix of theſe caverns, and reports them to be of various depths, from fifty to eighty feet. The origin of theſe excavations is uncertain; the opinion of ſome modern writers, that they were the granaries of the Britons, ſeems by far the moſt rational ſuppoſition. They are alſo called Dane Holes, and traditionally reported to have been uſed as receptacles or hiding-places for plunder during the frequent incurſions of the Danes into this iſland.—Beauties of England and Wales, vol. v. Eſſex; by J. Britton and E. W. Brayley.

THURSDAY, the fifth day of the Chriſtians' week, but the ſixth of that of the Jews. See Thor and Week.

Thursday, *Holy*. See Holy.

Thursday, *Maunday*. See Maunday *Thurſday*.

THURSIO, in *Ichthyology*, a ſpecies of fiſh mentioned by Pliny, lib. ix. cap. 9. It is thought by ſome to be the *phocæna*, or porpeſs; and by others the ſturgeon.

THURSO, or Thorsay, in *Geography*, a market-town in the ſhire of Caithneſs, Scotland, is ſituated on the northern ſide of the coaſt, at the extremity of a ſpacious bay, on the eſtuary of the river Thurſo, at the diſtance of 279 miles N. from Edinburgh. The town is irregularly built. A new town, on a regular plan, has been lately commenced at Thurſo, in conſequence of which, the incloſed lands let for five guineas *per* acre *per annum*. Here is a fine bay or harbour, which is progreſſively much improved in convenience and ſecurity. Eight veſſels belong to the town, and are chiefly employed in conveying ſalmon to London. Although the cuſtoms of this port are very inconſiderable, yet the following officers are regularly ſtationed here; a collector, comptroller, land-ſurveyor, land-waiter, two eſtabliſhed tideſmen, and one extraordinary tideſman. Thurſo is a borough of barony, holding of ſir John Sinclair as immediate ſuperior. The charter of erection was granted by Charles I. in 1633, in favour of John Maſter, of Berriedale, by which it was entitled "to all the privileges, immunities, and juriſdictions, belonging to a free borough of barony in Scotland." It is governed by two baillies and twelve counſellors, who are appointed by the ſuperior, and hold their offices during his pleaſure. A well-ſupplied market is held on Fridays; and here are two annual fairs, one of which continues for ten days. The principal manufacture of the town is coarſe linen cloth: in the neighbourhood are a bleach-field and a tannery, both of which are proſperous. In the population return of the year 1811, the town and pariſh of Thurſo were eſtimated to contain 592 houſes, inhabited by 3462 perſons. The pariſh extends about three miles from the town in every direction, except to the north-weſt, where it is bounded by the ſea. The rocks that bound the coaſt exhibit various ſcenes of natural grandeur. The Clett is an inſulated rock about 160 yards long and 80 broad; it is elevated about 400 feet above the ſurface of the ſea; and during the ſpring ſeaſon, is frequented by innumerable flocks of ſea-fowls.

Thurſo Eaſt, anciently called Thurſo Caſtle, once the reſidence of the earls of Caithneſs, is now the ſeat of ſir John Sinclair, bart. a native of Thurſo; a gentleman whoſe exertions will ever be revered by men of ſcience for "The Statiſtical Account of Scotland." In the park are the ruins of a ſmall chapel, where earl Harold the younger was buried, and where a neat modern monument has been erected by the above-mentioned baronet.—Beauties of Scotland, vol. v. Carliſle's Topographical Dictionary of Scotland, vol. ii.

Thurso, a river of Caithneſs, which runs into the ſea, at the town of Thurſo.

THURUS, in *Natural Hiſtory*, the name of a creature deſcribed by Geſner, and ſome others, as a diſtinct ſpecies of wild bull; but the accounts of it ſeem either fabulous or miſtaken deſcriptions of the wild bull.

THURY, in *Geography*, a town of France, in the department of the Yonne; 10 miles S.E. of St. Fargeau.—Alſo, a town of France, in the department of the Oiſe; 7 miles S.E. of Creſpy.

THUS, a town of Perſia, in the province of Khoraſſan; 200 miles N.N.W. of Herat.

Thus, a river of Perſia, which riſes near Meſghid, in Khoraſſan, and runs into the Caſpian ſea, 40 miles N.W. of Zaweh.

Thus. See Frankincense.

Thus *Judæorum*, called alſo *caſcarilla* and *cortex eleutheriæ*, in the *Materia Medica*, is the bark probably of the ſhrub deſcribed by Cateſby, under the name of *ricinoides elæagni folio* or *ilathera*, the *croton caſcarilla* of Linnæus, which grows plentifully in moſt of the Bahama iſlands; thence it is brought to us in curled pieces, or rolled up into ſhort quills, about an inch wide; covered on the outſide with a rough whitiſh matter; and browniſh within; and exhibiting, when broken, a ſmooth cloſe blackiſh-brown ſurface. The bark, freed from the outer coat, has a light agreeable ſmell, and a moderately bitter taſte, accompanied with a conſiderable aromatic warmth. It is eaſily inflammable, and yields, whilſt burning, a fragrant ſmell, ſomewhat reſembling that of muſk. Stiſer was the firſt who employed this bark as a medicine in Europe; who relates that a tincture of it in alkalized vinous ſpirits, or in dulcified alkaline ſpirits, proved carminative and diuretic, and did ſervice in arthritic and ſcorbutic caſes. In 1694 and 1695, it was employed by Apinus in an epidemic fever of the intermittent kind. The gentlemen of the French Academy found this bark of excellent ſervice againſt an epidemic dyſentery in 1719, when the ipecacuanha proved ineffectual. At preſent it is of great eſteem among the Germans, as a warm ſtomachic and corroborant, in flatulent colics, internal hæmorrhages, dyſenteries, the diarrhœa of acute fevers, and, mixed with the Peruvian bark, in common intermittents.—Among us it has been lately received into practice; but its uſe, ſays Dr. Lewis, is not yet become ſo general as it well deſerves to be. Its virtues are partially extracted by water, and totally by rectified ſpirits. Lewis's Mat. Med.

Thus, in *Sea Language*, the order by which the pilot directs the helmſman to keep the ſhip in her preſent ſituation when ſailing with a ſcant wind, ſo that ſhe may not approach too near the direction of the wind, and thereby ſhiver her ſails, nor fall to leeward, and run farther out of her courſe. Falconer. See Steering.

THUSCUS Vicus, in *Ancient Geography*, the name of one of the ſeven mountains of Rome, called alſo Cœlius Mons.

THUTHOA, a river of the Peloponneſus, in Arcadia, which diſcharges itſelf into the Ladon.

THUYA, in *Botany*. See Thuja.

THWAITE, in *Ichthyology*. See Shad.

THWART, in a boat, the ſeat or bench of a boat on which the rowers ſit to manage the oars. Hence *thoughts*, (which ſee,) is uſed in the ſame ſenſe.

Thwart *the Hawſe*, in *Sea Language*. See Athwart.

Thwart *Ships*, acroſs the ſhips. See Athwart.

Thwart *the Way*, in *Geography*, a ſmall iſland in the Straits of Sunda. S. lat. 5° 55′. E. long. 105° 43′.—Alſo, a ſmall iſland in a bay on the coaſt of New Guinea. S. lat. 2° 15′. E. long. 136° 54′.

THWARTER, Trembling, or *Leaping-Ill*, a diſeaſe in ſheep, of the ſhaking, jumping, and convulſive kind. Theſe different terms, ſome of which were formerly particularly uſed in one part and another in another, eſpecially in the northern diſtricts of the kingdom, are now ſaid to be had recourſe to indifferently, and applied indiſcriminately to all diſeaſes which, on a dry ſoil, proceed from a weak and enfeebled ſtate of body and barren ſeaſons. Under this threefold name, ſome ſay they have ſeen ſheep ſuffering by diſeaſes, which at leaſt had much reſemblance to thoſe of ſeveral other ſorts, as the apoplectic, paralytic, rheumatic, &c.; and that even when an old ſheep falls down, and dies of weakneſs and exhauſtion, the manner of its death differing ſomewhat from that of the hog-ſheep, it is frequently aſcribed by ſhepherds to the thwarter or trembling-ill.

There is, on the whole, ſo much contrariety of opinion, and diverſity in the deſcriptions of the diſeaſe, its cauſes, and the means of cure, that the writer of a paper on ſome of the diſeaſes of ſheep, in the third volume of the "Tranſactions of the Highland Society of Scotland," has divided and conſidered it under two diſtinct ſpecies.

The *firſt* variety, it is ſaid, is much more rare than formerly, and is ſcarcely known in the Highlands of the above country. It appears moſtly in the ſpring and harveſt ſeaſons. It affects ſheep of all ages and kinds, but never when in good condition, exiſting chiefly on dry farms, which have a northern expoſure, and which are evidently overſtocked; but on theſe only when the ſpring is ſevere and dry, or when early April graſs has been cut down by froſts, and the ſheep can find no ſucculent food or any thing green. Its production is favoured by a long continuance of eaſterly winds; and in cold weather, ewes are ſometimes attacked by it, even after they are fleeced. In theſe circumſtances they become extremely emaciated, eſpecially when heavy with lamb in many of them, or giving ſuck; and when at this time they get an overſtretch in running or leaping, or even an haſty ſtart, or cruſh in the fold, numbers fall a prey to this diſorder.

The appearances are, that ſome ſheep, it is ſaid, will fall down and die in two or three minutes; others will loſe the power of one ſide, and lie ſprawling until they die of hunger; others again will lie ſhivering, and very ſick at times, until death alſo comes on; and ſome will go a long time quite lame, until they are likewiſe quite exhauſted. Others deſcribe it as of two kinds; in one, ſometimes ſeizing the whole ſyſtem, when there is a general trembling over the whole body, and in the other, ſometimes affecting the legs only, when the animal immediately falls down, and the ſhaking, which is uninterrupted, is confined to the legs. Some ſay that the animal gradually loſes the power of its legs and body, until it becomes quite weak, always lying at laſt upon one ſide. Thoſe ſheep which die of it in ſpring, are lean and uſeleſs; but the mutton of fat hog-ſheep carried off by it in the autumn is not uneatable. It is ſometimes extremely fatal. In one inſtance, out of a flock of forty ſcore, ſeventeen ſcore were, it is ſtated, loſt in one ſpring. It was formerly thought to be contagious, and although this can ſcarcely be the caſe, it is certainly moſt deſtructive when it firſt comes among a flock; and when ſheep are brought from a clean ground to one infected with it, great numbers of them are ſure of dying. Thoſe which ſurvive it one ſeaſon, are ſure to relapſe the next ſpring.

Udder-locking ſhould be entirely laid aſide, as in one inſtance, one-twentieth of a large parcel of ewes is ſaid to have died of the diſeaſe, in the courſe of a week after they had been udder-locked. See Udder-*Locking*.

It is alſo ſaid to be uſeful during the early ſpring months to provide them with ſufficient food and ſhelter; and to avoid overſtocking, if the early graſs has been blighted, to paſture them in a rich park or other ground, on water-meadow, or on moſs and early rye-graſs.

The *ſecond* variety of the diſeaſe is, it is remarked, chiefly confined, in the above part of the kingdom, to the flocks in the ſouth of it, more eſpecially about the banks of the river Tweed, and of thoſe which diſcharge themſelves into it. It is ſaid to be a complaint almoſt unknown to the farmers on the Pentland range, and to the north of the Forth. In thoſe places where it prevails, it is ſometimes peculiarly fatal, and a farmer often loſes more of the flock by it alone, than all the other diſeaſes put together.

The appearances when it firſt comes on, which is generally during the ſummer or harveſt months, are, that the animal turns ſomewhat ſtupid and neglects its food, dozes round, in ſome meaſure, as in the ſturdy, and frequently leaps up, as if to clear any buſh or dike before it; at times, it will eat voraciouſly, and again refuſe all ſuſtenance for a conſiderable time. It continues frequently leaping during the day, and the neck is often ſtiff, and turned on one ſide; convulſions take place in the limbs which cauſe the animal to fall down, make curious contortions, and at times run to a little diſtance; the body ſometimes partakes of theſe, when the ſheep becomes totally incapable of motion, and dies from want of food, which the jaws will not open to admit, being cloſely wedged together. In this ſtate, it is unable to follow the flock, and the wool claps to the body. It lies for a long time motionleſs, and at length dies. After lying motionleſs for a conſiderable time, in thoſe caſes where the diſeaſe is not ſo violent, and the ſpaſm of the jaw not ſo ſevere, it gradually relaxes, and the ſheep will eat the whole of the food within reach quite bare, although the power of the limbs is totally gone, leaving the earth quite red and naked all round them. If the ſhepherd be attentive, and lifts them from place to place, and the ſeaſon be pretty well advanced, they often ſlowly recover, and are again reſtored to the uſe of their limbs. When they lie in this inactive ſtate, if the weather be warm, maggots are very apt to breed in them; and if not attended to, ſoon deſtroy them.

The diſeaſe moſtly appears at the periods ſtated above, eſpecially during hot and ſultry weather, and ariſes either from the ſheep being put into violent motion by dogs, or overheated by the ſun; in which caſes, in a few hours afterwards, it makes its appearance by the ſtiff neck, or ſome of the other ſigns coming on. When the ſheep are expoſed to fatigue, it will take place, if the weather be warm, independent of violent motion. They are commonly the *fatteſt* of the flock that are cut off by it. It not unfrequently ariſes from the braxy, of which it is moſtly a favourable ſign. It is never ſevere, however, when it is the conſequence of that diſeaſe, and the ſtiff neck never accompanies it.

In regard to the means of cure in the *firſt* ſort, they are various. When the ſheep fall down ſuddenly, and are threatened with immediate death, bleeding, by cutting the tail, or opening a vein on the inſide of the fore-thigh, will ſometimes give inſtantaneous relief. In all the other caſes it is proper to take them home and feed them with ſtrengthening food; and if at this time they be attacked with a temporary ſcouring, they moſtly recover very faſt, and ſoon acquire their former vigour. It is ſaid that ſome few means of cure are occaſionally tried, but it is believed with little ſucceſs. Dipping in cold water is not unfrequently practiſed: whiſky and gunpowder are ſometimes poured down their throats; and balls of muſtard and other hot pungent medicines are often adminiſtered. Others recommend bringing them into the houſe, giving them a mixture of equal quantities of ſallad oil and ſpirits, with a little finely powdered ginger, and at the ſame time rubbing into the back a little black ſoap broken in warm water, and feeding them on hay, the produce of dry walks or other grounds.

The giving of the ſheep a decoction of the dewcup and healing leaf boiled in butter-milk, is ſaid to have been uniformly ſucceſsful in treating ſheep affected with this diſorder during the ſummer and autumn.

In the removal of the *ſecond* kind of the diſeaſe, as it ariſes from the brain being oppreſſed, by too much blood being ſent to it by the quickened circulation, the firſt thing to be attended to on its appearance is copious blood-letting, which

which will be more effectual if taken from the veins of the neck, or from a vein on the outside of the eye, mostly well known to shepherds. It may even be taken from the tail, or fore-leg; but opening of the veins of the head is generally considered as the most proper and beneficial in this species of the complaint. As there is too great a determination of blood to the head, it will be attended with advantage to make a determination to the bowels, by stimulating them by means of purgatives, such as those of common salts, one ounce or more: calomel, from ten grains to half a drachm; or, what is supposed more proper, as it also acts upon the kidneys and skin, a dose of half an ounce or more of nitre. These remedies are to be persevered in, until all marks of the disease disappear. But if the sheep be too far gone in the disorder, and has lost all motion, it should be killed for the sake of the carcase, which in this species of the disease is not affected, or at least but very slightly.

In the managing of the cure, much nice attention is necessary in both kinds of this disease.

THY, in *Geography*, a town of Prussia, in Pomerelia; 7 miles N. of Marienburg.

THYAMIA, in *Ancient Geography*, a town of the Peloponnesus, in Sicyonia. Xenophon.

THYAMIS, a town of Arachosia, founded by Semiramis.—Also, a promontory of Epirus, between Thesprotia and Cestrinia.

THYARIS, a river of Asia, in Phrygia Salutaris, which passed through the northern part of this province, and discharged itself into the Sangara.

THYATIRA, Akhisar, a town of Asia Minor, in Lydia. According to Steph. Byz. it was very ancient, and called Pelope, Pelopea, or Pelopia, and afterwards Semiramis. According to Pliny it was also denominated Evippa. It derived its name of Thyatira, from the Greek word signifying daughter, from Seleucus Nicanor, who received the news, as it is said, at this town of the birth of a daughter. From an inscription found in this city, it appears that Adrian had a temple in it; and medals have been found here that were struck in honour of Adrian. Strabo says that the town of Thyatira was considered by some authors as the last of the district of Mysia, and that it was a colony of Macedonians. After Scipio had defeated Antiochus near Magnesia of Sipyla, the town of Thyatira sent ambassadors to the Romans, to render them homage. Thyatira was taken by Aristonicus, in the year 130 B.C.; but this prince having been taken prisoner in the same year by the consul Perpenna, this town reverted to the dominion of the Romans. Thyatira was much distinguished by the benefactions of the emperor Caracalla; and it appears by a medal of this town, that under the reign of this prince it took the name of Neocorus. This place was one of the seven churches of Asia, mentioned in the book of Revelations; so that the Christian religion was introduced here by the apostles and their immediate disciples; but whether the church was founded by St. Paul or St. John, or by either of them, does not appear.

The inhabitants of Thyatira had a particular veneration for Diana. This appears from many inscriptions found in the town, on one of which this goddess bears the title of "Diana Montana." The town was situated at the southern foot of a chain of mountains, on the route from Pergamus to Sardis, and it was watered by a stream of the river Caicus. The town suffered much by an earthquake in the reign of Tiberius. See Akhisar.

THYIA, Θυια, in *Antiquity*, a festival in honour of Bacchus, celebrated by the Eleans.

THYITES Lapis, in the *Materia Medica of the Ancients*, the name of an indurated clay, approaching to the nature of a stone. It was found in Egypt, and used in distemperatures of the eyes.

This substance has been very much misunderstood by late writers, and by most of them supposed to be lost at this time; but this was wholly owing to their mistaking the class of bodies among which they were to look for it: some imagining it to have been a species of green marble; and others the turquoise-stone, that Dioscorides meant by this name. It is very plain, however, that it was no other than an indurated clay of the morochthus kind, and no more a stone than that substance, that being also frequently called *lapis morochthus*.

It is of a smooth, even, and regular texture, very heavy, of a shining surface, and of a pale green, without the admixture of any other colour. It does not at all adhere to the tongue, nor stain the fingers in handling; but drawn along a rough surface, leaves a slender white line. It melts slowly in the mouth, and is of a sharp, acrid, and disagreeable taste; and when rubbed down with water on a marble, it melts into a milky liquor of a pure white, not the least greenness being sensible in it. It is found at present in the great mine at Gosselar in Saxony, and seems to owe its colour to particles of copper, to which also it owes the virtues attributed to it by Dioscorides, acting as a weak kind of verdigris. Hill.

THYLACION, a word used by the ancient medical writers, to express the bag formed by the membranes of the fœtus at the orifice of the pudenda, before the birth.

THYLLA, Θυλλα, in *Antiquity*, a festival in honour of Venus.

THYMALLUS, in *Ichthyology*. See Grayling, and Salmo *Thymallus*.

THYMATERIUM, in *Ancient Geography*, a town of Africa, in Libya, two days' journey beyond the columns of Hercules, according to the Periplus of Hannon: it is the Thymateria of Steph. Byz.

THYMBRA, a town of Asia Minor, in the Troade, according to Steph. Byz. who says that it was founded by Dardanus, who gave it its name after that of his friend Thymbros. Apollo had a temple here under the appellation of Thymbrian. Strabo says that a stream called Tymbrius traversed its canton, and that this stream discharged itself into the Scamander, before the temple of Apollo. Servius says that Achilles was wounded here by Paris; and this circumstance gave occasion to the report that the wound was inflicted by Apollo.

Thymbra, or *Tymbra*, a mountain of Asia, in Phrygia.

Thymbra, in *Botany*, a name borrowed from Dioscorides, whose real θυμβρα, however, is a species of Satureia; see that article, n. 3. Linnæus therefore has adopted the above name for another Greek genus, nearly akin to the original plant.—Linn. Gen. 288. Schreb. 385. Willd. Sp. Pl. v. 3. 46. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 375. Sm. Prod. Fl. Græc. Sibth. v. 1. 398. Juss. 115. Lamarck Illustr. t. 512.—Class and order, *Didynamia Gymnospermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, nearly cylindrical, with a longitudinal hairy keel at each side, the orifice two-lipped; upper lip broadest, cut half way down into three equal converging segments; lower in two deep narrower segments. *Cor.* of one petal, ringent; tube nearly cylindrical; upper lip flat, erect, cloven, obtuse; lower in three, nearly equal, flat lobes. *Stam.* Filaments four, thread-shaped, approaching each other in pairs, two of them shorter than the rest; anthers of two divaricated lobes, under the upper lip of the corolla. *Pist.* Germen superior, four-cleft;

cleft; ftyle thread-fhaped, cloven a little way down; ftigmas two, acute. *Peric.* none, except the unaltered calyx. *Seeds* four.

Eff. Ch. Calyx nearly cylindrical, two-lipped, marked on each fide with a hairy prominent line. Style cloven.

1. Th. *fpicata.* Spike-flowered Thymbra. Linn. Sp. Pl. 795. Willd. n. 1. Ait. n. 1. Sm. Fl. Græc. Sibth. t. 546, unpublifhed. (Th. fpicata verior hifpanica; Barrel. Ic. t. 1230. Thymum majus longifolium, &c.; Pluk. Phyt. t. 116. f. 5.)—Flowers fpiked. Leaves lanceolate.—Native of the Levant, on dry hills. Dr. Sibthorp met with the plant in Crete, Afia Minor, and Greece, and conceived it to be the υσσωπος ορεινος, or Mountain Hyffop, of Diofcorides, which is extremely probable. The *ftem* is fhrubby, very bufhy, about a foot high, with numerous, upright, fimple, leafy, purplifh, quadrangular branches, whofe oppofite fides are often denfely downy, in an alternate manner between the different pairs of leaves, the pubefcence recurved. *Leaves* oppofite, feffile, crowded, fpreading, acute, entire, about an inch long, fmooth on each fide, befprinkled with refinous dots, and fringed at the margin with copious white hairs. They are accompanied by axillary tufts of fmaller and narrower leaves. *Flowers* of a fine reddifh purple, in folitary, terminal, denfe, leafy, whorled *fpikes*, from two to four inches long. *Calyx* reddifh, abounding in effential oil, fmooth and naked, without ribs, except the lateral line at each fide, which is fringed, as well as the teeth, with ftrong white hairs. *Bracteas* lanceolate, fringed, purplifh. Tube of the *corolla* twice the length of the calyx, fomewhat downy; lower lip deflexed, in three obtufe equal fegments, hairy about the throat. The whole herb has the warm pungent flavour of Thyme, and the afpect of Hyffop.

2. Th. *verticillata.* Whorl-flowered Thymbra. Linn. Sp. Pl. 796. Willd. n. 2. Ait. n. 2. (Hyffopus montana; Dalech. Hift. 934; not 394, as Willdenow, copying Linnæus's typographical error, has it.) — Flowers whorled. Leaves linear-lanceolate.—Native of the fouth of Europe. The *ftem* is fhrubby, but more flender than the laft, hairy in the fame manner, but more univerfally. *Leaves* much narrower, dotted and fringed in the fame manner. *Flowers* axillary, from top to bottom of each branch; thofe of the principal one fix in each whorl; thofe of the lateral branches only two. In ftructure, fize and colour they agree with the foregoing, only the *calyx* has fome appearance in the dried fpecimen of being more ribbed. Its lateral keels, as well as the teeth, are ftrongly fringed. Neverthelefs, the general hue and afpect of thefe two plants are fo much alike, that there feems great reafon for Linnæus's fufpicion of their being varieties of each other. At the back of the original fpecimen of this laft is the following fynonym. Tragoriganum creticum, majore craffiore afperiori folio; Profp. Alpin. Exot. 79. So confufed is this old author, that one can hardly tell which of his plates his loofe defcriptions refer to; but our plant certainly agrees better with his *Thymbra*, t. 80, than with his *Tragoriganum*, t. 78, though the above fynonym feems to indicate the latter.

3. Th. *ciliata.* Capitate-flowered Thymbra. Desfont. Atlant. v. 2. 10. t. 122. Willd. n. 3.—Flowers capitate. Leaves linear. Bracteas ovate.—Found by Desfontaines, on dry hills and uncultivated fpots, near Mafcar, in Algiers. A fmall bufhy *fhrub*, from eight to twelve inches high, agreeing much in habit with the two preceding fpecies; but the *leaves* are linear; while the *bracteas* are broader and more ovate, as well as the *fpikes* much fhorter, than in the *Th. fpicata.* The *leaves* are equally fringed in all. Nothing is faid, or expreffed in the figure, of any hairy lateral lines on the *calyx*, the moft important character of *Thymbra.* Having feen no fpecimen of this fpecies, we cannot judge with certainty refpecting its genus, nor whether it might not rather be referred to Satureia, fee that article; but we cannot fatisfactorily affent to the opinion of its learned difcoverer, that thefe genera are not fufficiently diftinct. The *calyx* in the natural order to which they belong affords, in many inftances, clear, though nice, generic differences. At the fame time we admit that Linnæus is incorrect in making a femibifid ftyle, by which muft be underftood a ftyle cloven half way down, one of the effential marks of a *Thymbra.*

Thymbra, in *Gardening*, furnifhes plants of the under fhrubby, exotic kind, among which the fpecies cultivated are the fpiked thymbra (T. fpicata); and the whorled thymbra (T. verticillata).

Method of Culture.—Thefe plants may be increafed by feeds, flips, and cuttings. The feeds fhould be fown in the early fpring in a warm border, and fheltered from bad weather by glaffes; or, which is better, in pots filled with light mould, and placed in a mild hot-bed: when the plants have attained fome growth, they fhould be fet out or removed into feparate pots.

The flips and cuttings fhould be planted out in the fpring and fummer, and when well rooted, removed where they are to grow: they alfo fometimes fucceed by bottom offsets, planted out as above.

They afford variety among other potted greenhoufe plants; and require the protection of fuch houfes during the winter feafon, in this climate, in almoft all fituations and places.

THYMBRÆUS Mons, in *Ancient Geography*, a mountain of Afia Minor, in the Troade; from which, according to Feftus, Apollo was denominated Thymbrian.

THYMBRIA, a place of Ionia, four ftadia E.S.E. of Myus. The cavern Charonium was near Tymbria, which was thought to be one of the mouths of Hell, becaufe from it iffued peftilential vapours.

THYMBRIUM, a town of Afia, in Phrygia, at the diftance of twelve parafangas from Cayftropedium. At this place was a fountain, called the fountain of Midas, king of Phrygia.

THYME, in *Botany.* See Thymus.

In the *Materia Medica*, the common garden thyme is a moderately warm pungent aromatic. To water it imparts by infufion its agreeable fmell, with a weak tafte and yellowifh or brown colour; in diftillation, it gives over an effential oil, in the quantity of about an ounce from thirty pounds of the herb in flower, of a gold yellow colour if diftilled by a gentle fire, of a deep brownifh-red if by a ftrong one, of a penetrating fmell like that of the thyme itfelf, but lefs grateful, and in tafte exceedingly hot and fiery: the remaining decoction, infpiffated, leaves a bitterifh, roughifh, fubfaline extract. The active matter, which by water is only partially diffolved, is by rectified fpirit diffolved completely, though the tincture difcovers lefs of the fmell of thyme than the watery infufion; and the fpirit brings over, in diftillation, a part of its flavour, leaving an extract of a weak fmell, and of a penetrating camphorated pungency. Murray has obferved, that this plant feems actually to contain a fpecies of camphor.

The virtues of thyme, according to Bergius, are refolvent, emmenagogue, diuretic, tonic, and ftomachic. As agreeing, fays Woodville, in common with the natural order of verticillatæ, its aromatic qualities may be found equally ufeful in fome of thofe complaints for which lavender, fage, rofemary, &c. are ufually employed.

The *ferpyllum*, or mother of thyme, is an elegant aromatic plant,

plant, fimilar to the preceding fpecies, but milder, and in flavour rather more grateful; its effential oil is both in fmaller quantity and lefs acrid, and its fpirituous extract comes greatly fhort of the penetrating warmth and pungency of that of the others, fo that it is lefs medicinal than the other fpecies. It is faid to afford an agreeable diftilled water, more durable, but lefs active and penetrating than peppermint. (Lewis.) This has been much extolled as a nervous fimple. An infufion of it has been faid to do wonders in tumours, lownefs of fpirits, and head-aches: and it has been much commended for the cure of the night-mare.

The *lemon-thyme*, which is a variety of the laft, is lefs pungent than the firft fort, but more fo than the fecond, and much more grateful than either. Diftilled with water, it yields a larger quantity than the other forts, of a yellowifh very fragrant oil of the lemon-flavour, containing nearly all the medicinal parts of the plant. It gives over alfo, with rectified fpirit, its finer odorous matter. Lewis.

Thyme, *Cat.* See Teucrium *Marum*.

Thyme, *Maftich.* See Thymus *Maftichina*.

THYMELÆA, in *Botany*, from θυμος, *thyme*, and ελαια, *an olive*, (the firft alluding to the leaf, and the latter to the fhape and oilinefs of the fruit,) is an ancient Greek name, found in Diofcorides, book 4. chap. 173. His θυμελαια, there defcribed, is thought to be the *Daphne Gnidium* of Linnæus; and muft be at leaft one of that natural order, and, probably, genus. Hence the name has been applied by many botanifts, amongft which were the Bauhins and Tournefort, to what Linnæus called Daphne; fee that article. This latter appellation was preferred by him and his fchool, becaufe a name compofed of another, already eftablifhed, is contrary to a very found law of the *Philofophia Botanica;* and in the prefent inftance the word is compounded of two other generic names, though one of them has been made Latin in *Olea*. The French however ftill hanker after *Thymelæa*, as appears by Juffieu's choofing it for the title of one of his Orders. See Thymelææ.

THYMELÆÆ, the twenty-fifth of Juffieu's Natural Orders, or the fecond of his fixth clafs, thus named from an ancient fynonym of the genus *Daphne*, which makes a principal figure herein. (See Daphne and Thymelæa.) This order is analogous to the *Veprecule* of Linnæus. For the detailed characters of Juffieu's fixth clafs, fee Lauri. The order of *Thymelææ* is defined as follows.

Calyx of one leaf, tubular, inferior. *Corolla* none; but in fome inftances there are petal-like fcales, originating from the mouth of the calyx, which have the appearance of a polypetalous corolla. *Stamens* definite, inferted into the calyx, and for the moft part double the number of its fegments, fome being oppofite, others alternate therewith. *Germen* fuperior, fimple; ftyle folitary; ftigma moftly undivided. *Seed* folitary, fuperior, either naked, or pulpy, or clothed with the calyx. *Embryo* deftitute of albumen; its radicle fuperior. *Stem* moftly fhrubby. *Leaves* generally alternate.

We may add to thefe characters of Juffieu the remarkable filky appearance of the inner bark, when a twig is broken. Mr. Brown, *Prodr. Nov. Holl.* v. 1. 358, obferves that the general number of *ftamens* is eight, fometimes four, rarely but two; in the latter cafes always oppofite to the fegments of the *calyx*, which are occafionally five, fometimes, not always, with ten *ftamens*. The fame writer informs us there is fometimes a flight portion of *albumen*. The *leaves* are entire, deftitute of *ftipulas*. *Flowers* capitate or fpiked, terminal or axillary, fometimes folitary.

The genera, as they ftand in Juffieu, are *Dirca; Lagetta*, Lamarck Illuftr. t. 289; *Canjera*, Juff. append. 448; *Daphne; Pafferina; Stellera; Struthiola; Lachnea; Dais; Gnidia; Nectandra* of Bergius, included under *Gnidia* by Linnæus; and *Quifqualis*. To thefe is to be added the great diandrous genus of *Pimelea*, of which Mr. Brown defines thirty-four New Holland fpecies.

The order under confideration is one of thofe which has moft excited the queftion of what is a *calyx?* and what a *corolla?* and is appealed to equally by thofe who maintain different theories on this intricate fubject. It feems to us that the *Thymelææ* combine both thofe parts in one, the coloured infide of their *calyx* having exactly the nature of a *corolla;* which is confirmed by the remark of Juffieu, that the tube of *Daphne Mezereum* is double, formed of two layers. The appendages, in the form of fcales, or glands, found in *Gnidia* and *Struthiola*, are more evidently *petals*, and would doubtlefs be univerfally taken for fuch, did not analogy and theory caft a doubt over the fubject. At any rate it is fafe to fay that *Daphne* has a coloured *calyx*, as well as moft of its allies; juft like *Polygonum*, in the generally colourlefs order of *Holeraceæ*, or *Atriplices*.

Thymelææ *Radix*, in the *Materia Medica*, the dried root of the *thymelæa foliis lini* of Tournefort and other authors.

It is a light root of different fizes, of a reddifh colour without, and greyifh within, woody, and full of fibres, and taftes fweet at firft, but is hot as fire when it has been held a little time in the mouth. It lofes however both this fiery tafte, and its acrid quality, in long keeping, and with them its virtues.

It is to be chofen new, well fed, and not worm-eaten. The fruit of this plant is the *granum cnidium* of the fhops. They are both of an acrid quality, and are not in ufe in the fhops at prefent.

THYMELE, in *Biography*, a celebrated female Grecian, who invented theatrical dances. It is fuppofed that the Greeks called their comedians *Thymelici* from her name.

Thymele, in the *Ancient Theatre*, a kind of pulpit, where the fingers, called *thymelici*, performed.

THYMELICI, among the Romans, were muficians, who fung in the interludes, or who danced and kept time with their geftures. The place where they performed was called thymele, whence Juvenal, vi. 66.

"Attendit thymele, thymele nunc ruftica difcat."

THYMIAMA, θυμιαμα, in *Antiquity*, an offering of incenfe to God.

Thymiama, in the *Materia Medica*, a name by which fome authors have called the *cafcarilla bark;* called by fome *cortex thuris*, or Indian bark. (See Thus *Judæorum*.) The *cortex thymiamatis* of the German fhops is a bark, in fmall brownifh-grey pieces, intermixed with bits of leaves, brought from Syria, Cilicia, &c. and fuppofed to be the produce of the liquid ftorax-tree. It has an agreeable balfamic fmell, approaching to that of liquid ftorax, and a fubacid bitterifh tafte accompanied with fome flight aftringency. Cartheufer and Hoffman report, that it affords an excellent fumigation for œdemas, rheumatifms, and catarrhs; and that the fpirituous tincture and extract, and the diftilled fpirit, are ufeful anodynes or antifpafmodics in convulfive coughs and other diforders. It is rarely met with in this country. Lewis.

THYMIAMATA, a kind of fumigations among the ancients, the ingredients of which were fo various, that it appears they always confulted utility as well as pleafure, in their compofition of them.

We find the gum ammoniacum of the ancients, which had the fmell of caftor, ufed in them: whence it is evident, that

that the ancients ufed falutiferous as well as fweet-fcented things in thefe fumigations. Galbanum has a worfe fmell than ammoniacum, and yet this alfo we find, together with the myrrh, and other gums, is made an ingredient in the oldeft prefcriptions of this kind.—And Pliny mentions the ammoniacum with the fchænanth, and other fweets, ufed for this purpofe.

THYMIATUM, in *Ancient Geography*, a country of Africa, in Libya, on the coaft of the Atlantic, according to the Periplus of Hannon.

THYMIC, in *Anatomy*, arteries, veins, &c. belonging to the *thymus;* fee that article.

THYMIUM, a wart or excrefcence on the fkin.

THYMNIAS, in *Ancient Geography*, a gulf placed by Pliny on the coaft of the Doride, a province of Afia Minor. Here was a promontory of the fame name.

THYMOXALME, in the *Materia Medica of the Ancients*, was a compofition ufed externally in the gout, and many diforders of the limbs, and was given inwardly in diftemperatures of the ftomach, a quarter of a pint for a dofe. It operated as a purge, and was prepared in the following manner: take two ounces of bruifed thyme, as much falt, a little meal, rue, and pennyroyal.—Thefe were to be put into a pot, and three pints of water and fourteen ounces of vinegar are to be poured upon them; after which they are to be covered with a coarfe cloth, and fet in the fun for fome time. Diofcorides, lib. v. cap. 24.

THYMUS, in *Anatomy*, a glandular body, occupying the upper and anterior part of the cheft, and neighbouring portion of the neck, very large in the fœtus, and diminifhed or nearly difappearing in the adult. The name is Greek, θυμος, which Pollux defines "caro fimilis tonfillæ, prope cordis caput;" p. 258. The gland confifts of two lobes, a right and left, which are elongated and conical, being broader below and narrow above: they are joined by cellular fubftance, which can eafily be deftroyed by diffection, in their inferior two-thirds, but above they are feparated by the intervention of the trachea. The thymus, indeed, may be defcribed as forming two elongated horns above, of which the right is fometimes longer than the left: it alfo forms two horns below; but they are fhorter, thicker, and more obtufe. The principal body of the gland occupies the cavity of the mediaftinum, or the interval between the right and left pleuræ, behind the upper part of the fternum. Here it is covered in front by that bone, on the fides by the pleuræ, and it refts behind on the front of the pericardium, of the aorta at its origin, and of the left fubclavian vein. The inferior cornua reach to about the middle of the pericardium; and fometimes nearly to the diaphragm: the fuperior run into the neck, on each fide of the trachea, between that tube and the carotid, and reach the thyroid gland, or nearly fo.

The thymus is large in the fœtus; nearly equal to the heart or one of the lungs. In a fœtus of fix months, this gland was to the kidney as 4 to 6. It not only does not increafe after birth, but it becomes lefs, contains lefs fluid, is harder, and is nearly loft in the furrounding fat. In the mature fœtus it weighed 160 and 180 grains; at twenty-eight years, 90 grains. In a calf it was 16 ounces; in a full-grown cow, 9 ounces.

In ftructure it refembles the conglomerate glands: that is, it is compofed of innumerable fmall portions, united by cellular fubftance. By maceration thefe may be feparated into fmaller and fmaller lobules. It is however fofter than the pancreas or falivary glands, and of a darker colour. When cut into, a copious whitifh fluid may be fqueezed out from all parts of its texture. If air be impelled into it, the whole is reduced into a fpongy kind of fubftance.

No excretory duct has been difcovered in the thymus; although anatomifts have fancied that they had difcovered paffages from it to the œfophagus, trachea, pericardium, &c.

It has feveral arteries and veins: the former principally from the thyroid and mammary. The veins join the left fubclavian, or the jugular, and the internal mammary.

The nerves, if it has any, are extremely fmall twigs from the phrenic. Its abforbing veffels, which no doubt exift, are not much known.

It is of confiderable fize, even in the adult, in fome animals, as the rat: the fame may be obferved of the Arctic bear. It is large in fetaceous animals.

We know nothing of its office, nor why it is fo large in the fœtus. There is not even a probable conjecture on the fubject.

Thymus, a warty excrefcence, efpecially about the anus or pudenda.

THYMUS, in *Botany*, *Thyme;* θύμος of the Greeks, whether fo called from θυμὸς, *courage*, in allufion to its cordial qualities; or from θυω, *to glow* or *burn;* or *to facrifice*, becaufe it may have been ufed in facrifick garlands; we muft leave to every one's opinion. The laft explanation appears the leaft fatisfactory.—Linn. Gen. 297. Schreb. 394. Willd. Sp. Pl. v. 3. 138. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 413. Sm. Fl. Brit. 639. Prodr. Fl. Græc. Sibth. v. 1. 419. Purfh 413. Juff. 115. Tourn. t. 93. Lamarck Illuftr. t. 512.—Clafs and order, *Didynamia Gymnofpermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, permanent, divided nearly half way down into two lips, the mouth clofed with converging hairs; upper lip broadeft, flat, erect, with three teeth; lower of two equal awl-fhaped fegments. *Cor.* of one petal, ringent; tube the length of the calyx, with a fmall throat; upper lip rather the fhorteft, flat, erect, emarginate, obtufe; lower longer and broader, fpreading, in three obtufe lobes, of which the middle one is the broadeft. *Stam.* Filaments four, incurved, two longer than the reft; anthers fmall, two-lobed. *Pift.* Germen fuperior, deeply four-cleft; ftyle thread-fhaped; ftigma divided, acute. *Peric.* none, the feeds being concealed in the calyx, whofe orifice is contracted and hairy. *Seeds* four, fmall, roundifh.

Eff. Ch. Calyx two-lipped, its mouth clofed with hair. Upper lip of the corolla flat, emarginate.

The trifling genera of old authors, made out of the prefent, though indicated by Linnæus, are not worth confidering. It is more defirable to define the limits of *Thymus* itfelf, which run very clofe upon thofe of Melissa; fee that article, at the end of which this fubject is difcuffed. The number of fpecies in Syft. Veg. ed. 14. are eleven; Willdenow has 22. We fhall find fome things among them to correct, and feveral new fpecies to add. The habit of the whole is more or lefs fhrubby, but their ftature humble, with fpreading or diffufe *branches*. *Root* woody, generally perennial. *Branches* fquare. *Leaves* oppofite, moftly entire. *Flowers* either whorled or capitate, purple or lilac, fometimes nearly white; never really blue, fcarlet or yellow. Whole plant abounding with pungent aromatic effential oil. This genus is almoft entirely European, and inhabits dry hilly fituations, in the warmer or more temperate climes.

1. Th. *Serpyllum.* Wild Thyme, or Mother of Thyme. Linn. Sp. Pl. 825. Willd. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 1514. Curt. Lond. fafc. 2. t. 47. Woodv. Med. Bot. t. 110. (Serpyllum; Rivin. Monop. Irr. t. 42. S. vulgare; Ger. Em. 570. Dod. Pempt. 277. Vaill. Parif. t. 32. f. 9, as well as the varieties 6, 7 and 8.)

β. Serβ. Serpyllum citratum; Ger. Em. 571. Rivin. Monop. Irr. t. 41. Lemon Thyme.

γ. Thymus lanuginofus; Willd. n. 2. (Th. Serpyllum δ; Linn. Sp. Pl. 825. Th. pannonicus; Allion. Pedem. v. 1. 20. Th. n. 236. Hall. Hift. v. 1. 103. Serpyllum montanum hirfutum; Rivin. Monop. Irr. t. 42.) Hoary Mother of Thyme.

Flowers capitate. Stems decumbent, creeping. Leaves flat, ovate, obtufe; fringed at the bafe.—Native of dry heaths and hillocks, as well as alpine paftures, throughout Europe, from Sweden to Greece, flowering all fummer long. Its entangled branches form an elaftic perennial turf, exhaling a warm aromatic odour when trodden upon, which varies in degree, and, in the well-known variety β, affumes the grateful flavour of lemon-peel. The hoary or woolly variety we believe to be no more fpecifically diftinct, notwithftanding Willdenow's remark, of its being unchanged by culture; for he does not mention having raifed it from feed. The *ftems* of *Th. Serpyllum* are wiry and flender, always wavy, never ftraight; their branches leafy and downy, afcending, each terminating in a little round head of numerous purple *flowers*, whofe palate is variegated with white and crimfon. *Leaves* dotted, ftrongly fringed at the bafe, as are their *footftalks* throughout. *Stipulas* none. Bees frequent the *flowers* in great numbers. Hairy fwellings, caufed by an infect, are common on the young fhoots. The *feeds* are rarely perfected.

2. Th. *lævigatus*. Smooth Arabian Thyme. Vahl. Symb. v. 2. 65. Willd. n. 3. (Th. Serpyllum; Forfk. Ægypt.-Arab. 107.)—"Flowers capitate. Stems procumbent. Leaves linear, obtufe, feffile; contracted at the bafe."—Found by Forfkall, on mount Chadra, in Arabia Felix. *Stems* fhrubby, thread-fhaped; fmooth in the lower part, villous above, grey, with jointed annulated *branches*. *Leaves* half as long as the nail, very fmooth, without ribs, dotted on both fides; fringed at the bafe. Head of *flowers* feffile, terminal, hemifpherical, furrounded with numerous larger leaves. *Calyx* marked with elevated hairy lines; its teeth awl-fhaped, fringed. *Corolla* rather hairy. *Vahl.*

3. Th. *montana*. Smooth Mountain Thyme. Waldft. et Kitaib. Hungar. v. 1. 72. t. 71. Willd. n. 13, excluding the reft of the fynonyms, which belong to our *Th. Serpyllum*, var. γ. Ait. n. 7.—Flowers in elongated heads. Stem erect, branched. Leaves ovate, obtufe, flat, fmooth and naked, entire.—Native of the Carpathian mountains. We received it from the Cambridge garden, in 1803. The *root* is perennial, with many long branching fibres. *Stem* a fpan high, bufhy; the angles downy, with fine recurved hairs. *Leaves* ftalked, broadly ovate, flightly revolute; very fmooth and even above; deftitute of fringe at the bafe. *Inflorefcence* like *Th. Serpyllum*, but rather more elongated, or fpiked, and the *flowers* fmaller, with a much lefs hairy, though not fmooth, *calyx*, the hairs of whofe orifice are fcarcely prominent at all, by no means fo confpicuous as in the *Serpyllum*.

4. Th. *nummularius*. Money-wort Thyme. Marfch. a Bieberft. Taur. v. 2. 58.—Flowers capitate. Stems decumbent, creeping, hairy. Leaves roundifh-ovate, flat, obtufe; fomewhat fringed at the bafe and midrib.—Native of mount Caucafus. We received wild fpecimens from Dr. Fifcher. This has a very different afpect from *Th. Serpyllum*, on account of its almoft orbicular *leaves*, and the hemifpherical leafy heads of *flowers*. Every part moreover is three or four times the fize of that common fpecies. The joints of the *ftem* are remarkably villous in their upper part, efpecially near the *flowers*. Sometimes, it is faid, the whole plant is denfely hairy.

5. Th. *Marfchallianus*. Bufhy Taurian Thyme. Willd. n. 8. Marfch. a Bieberft. Taur. v. 2. 59.—Flowers in elongated heads. Stem fhrubby; its flowering branches erect. Leaves linear-lanceolate, bluntifh, flat, fomewhat triple-ribbed; fringed at the bafe. Frequent in dry graffy hilly places, about mount Caucafus, flowering from May to Auguft. This feems by the defcription more akin to *Th. Serpyllum* than to *Th. Zygis*, for which latter it was taken by Pallas. The *ftem* is procumbent, fending up numerous fimple flowering-branches, fix inches high, downy in the upper part. *Leaves* eight lines long, one and a half broad, on very fhort ftalks. *Calyx* hairy, ftriated. It varies with *leaves* but half as broad.

6. Th. *vulgaris*. Common Garden Thyme. Linn. Sp. Pl. 825. Willd. n. 4. Ait. n. 2. Woodv. Med. Bot. t. 109. (Thymum durius; Ger. Em. 573.)—Stem fhrubby, much branched, erect. Leaves ovate, revolute. Whorls crowded into leafy fpikes.—Found on ftony hills in Spain, Portugal, the fouth of France, Greece, and the Archipelago. Common in gardens, flowering during fummer. The *ftem* is bufhy, woody and rigid. *Leaves* a quarter of an inch long, various in breadth, downy, of a greyifh hue, numerous, with little axillary tufts of fmaller ones. *Flowers* fmall, light purple, in hairy heads, or fhort fpikes, with two or three remote whorls beneath. *Calyx-teeth* ftrongly fringed. This has ufually a warm pungent flavour, like Winter Savory; but there is a fweet-fcented variety, called Frankincenfe-Thyme, differing in no other refpect from the common fort, which is commonly cultivated in Norfolk, and highly grateful to moft people. The θυμος of Diofcorides is not, as Bauhin fuppofed, this plant, but *Satureja capitata*.

7. Th. *lanceolatus*. Lanceolate Thyme. Desfont. Atlant. v. 2. 30. t. 128. Willd. n. 5. Prodr. Fl. Græc. n. 1396.—Stem fhrubby, erect. Leaves elliptic-lanceolate, obtufe, entire, downy, flat. Whorls crowded into a denfe fpike.—Found by profeffor Desfontaines, flowering in the early fpring, on mount Atlas, and by profeffor Sibthorp in hilly places in Greece. *Root* creeping, woody. *Stems* numerous, fimple or branched, about fix inches high, downy. *Leaves* near an inch long, and one-third as broad, rather crowded; veiny and dotted beneath. *Spikes* two inches long, interfperfed with lanceolate *bracteas*. *Calyx* downy. *Corolla* purple, glandular, about the fize of the laft.

8. Th. *numidicus*. Numidian Thyme. Desfont. Atlant. v. 2. 29. Willd. n. 6.—"Stem fomewhat fhrubby, erect. Leaves linear, fpreading, fmooth; ribbed beneath. Flowers capitate. Bracteas ovato-lanceolate, fringed. Calyx hairy."—Native of Barbary near La Calle. A little bufhy *fhrub*, four inches high, with flender upright branches, downy in the upper part. *Leaves* entire, with axillary tufts. *Flowers* in oblong heads. *Calyx* villous, ftriated. *Corolla* fmall, rofe-coloured. Allied to *Th. Zygis*, but the *leaves* are quite fmooth, not fringed; and the *bracteas* broader at the bafe. *Desfontaines*.

9. Th. *Zygis*. White Spanifh Thyme. Linn. Sp. Pl. 826. Mant. 413. Willd. n. 7. Ait. n. 3. Sm. Fl. Græc. Sibth. t. 574, unpublifhed. (Thymum angufto longioreque folio; Barrel. Ic. t. 777. Serpillum fylveftre, Zygis Diofcoridis; Cluf. Hift. v. 1. 358. S. creticum; Ger. Em. 571.)—Stem fhrubby, afcending. Leaves linear-lanceolate, obtufe, revolute; tapering and fringed at the bafe. Whorls crowded into leafy fpikes.—Native of Spain and the Levant. Dr. Sibthorp gathered it on hills about Athens and Conftantinople. Mr. Malcolm is faid in Hort. Kew. to have had the plant in his garden in 1771. Linnæus cultivated it at Upfal. The *root* is woody and perennial. *Stems* numerous, from four to fix inches long, leafy, round, finely downy,

downy, reddifh, flightly branched, fpreading on the ground before flowering, then afcending. *Leaves* three-quarters of an inch long, numerous, crowded, fpreading, very minutely and denfely downy, copioufly dotted; ribbed and rather paler beneath; tapering into a fhort, broad, downy *footftalk*, coarfely fringed like the bafe of the leaf itfelf. *Flowers* in leafy heads, often with an axillary whorl below. *Calyx* clothed with recurved hairs; all its teeth tapering and parallel, ftrongly fringed. *Corolla* white, with red dots on the palate. *Anthers* reddifh, prominent. Profeffor Sibthorp adopted the opinion of the old authors, that this might perhaps be the ερπυλλος ζυγις of Diofcorides. Its appellation in modern Greek is σμάρι, which, if we miftake not, means "the delight of bees."

10. Th. *Acinos*. Bafil Thyme. Linn. Sp. Pl. 826. Willd. n. 10. Fl. Brit. n. 2. Engl. Bot. t. 411. Curt. Lond. fafc. 1. t. 43. (Acinos; Rivin. Monop. Irr. t. 43. f. 2. Ocymum fylveftre; Ger. Em. 675.)—Flowers on fimple footftalks, about fix in a whorl. Stem herbaceous, afcending, branched. Leaves acute, ferrated. Calyx gibbous at the bafe. Native of dry gravelly or chalky paftures, fallow fields, &c. throughout Europe, nor rare in England, flowering from July to September. The *root* is annual, of a few flender fibres. *Stems* clothed with recurved hairs, reddifh, lax and fpreading, hardly a fpan long; their flowery ultimate branches erect. *Leaves* on fhort footftalks, fmall, ovate, varying to roundifh or oblong, but always acute, more or lefs deeply and copioufly ferrated, rarely quite entire, veiny, hairy; the upper ones tapering much at the bafe. *Flowers* light violet; their palate white, with dark purple fpots. *Stamens* fhort. *Calyx* deeply furrowed, hairy, fringed, fwelling underneath, as is the cafe, more or lefs, with all the fpecies to which this is allied. The herb is rather flightly aromatic, not pungently fo.

11. Th. *fuaveolens*. Penny-royal-fcented Thyme. Prodr. Fl. Græc. n. 1400. (Clinopodium minus anguftifolium, pulegii odore, romanum; Bocc. Muf. v. 1. 50—54. t. 45, A.)—Flowers whorled. Leaves lanceolate-elliptical, pointed, fomewhat ferrated, hairy. Stems fhrubby.—Native of Italy and Greece. The *ftem* is a foot high, bufhy; the branches leafy, rough, with recurved hairs. *Leaves* with their *ftalks* about an inch long, rigid, ribbed, briftly, often quite entire. *Flowers* fix or eight in a whorl, on fimple ftalks. *Calyx* like the laft, but longer and more flender. The whole plant fmells powerfully of Penny-royal, even after having been dried thirty years. On this fubject Boccone has treated us with a long difquifition, quite in the Italian ftyle, in which the facts are better than the philofophy, though fome of thofe want confirmation. He attributes the above fcent to particles of fulphur and bitumen communicated by the foil.

12. Th. *patavinus*. Marjoram-leaved Thyme. Jacq. Obf. fafc. 4. 7. t. 87. Willd. n. 11. Ait. n. 5. (Clinopodium perenne, pulegii odore, majoranæ folio, patavinum; Bocc. Muf. v. 1. 60. t. 45, B.)—Flowers whorled. Leaves ovate, with copious fhallow ferratures, flightly hairy. Stems fhrubby.—Native probably of the fouth of Europe, though no botanift who has defcribed this fpecies feems to have known it but from gardens. Hence even its name originated, which is therefore liable to great exception. Willdenow appears to have feen no fpecimen. The fpecific character taken by him from the firft edition of Hort. Kew. of "the inflated throat of the *corolla*, extending beyond the *calyx*," is not in the leaft degree peculiar. Neverthelefs, authentic fpecimens of the plant prove it diftinct from the foregoing and the following, in the broad-ovate, almoft heart-fhaped, figure of the rather flefhy *leaves*, their even furface, and numerous, minute, fhallow ferratures. They much refemble fome kinds of *Ocymum*, and like thofe are fometimes concave.

13. Th. *alpinus*. Alpine Thyme. Linn. Sp. Pl. 826. Willd. n. 12. Ait. n. 6. Jacq. Auftr. t. 97. (Clinopodium montanum; Bauh. Pin. 225. Bocc. Muf. v. 1. t. 45, C. C. auftriacum; Cluf. Pann. 622, 623. Hift. v. 1. 353. Ger. Em. 676.)—Flowers on fimple footftalks, about fix in a whorl. Stem herbaceous, afcending, branched at the bottom. Leaves ovate or roundifh, bluntifh, coarfely ferrated. Calyx gibbous at the bafe.—Native of the lofty mountains of Auftria, Switzerland, Italy, and Crete, as well as of the Bithynian Olympus. Nothing is more difficult than to define the difference between this and our *Th. Acinos*, except that the *alpinus* is in every part larger and more handfome, with a ftrong refinous fcent. The *root* is either biennial, or perennial, we are not certain which. The *leaves* are too entire in the cut of Clufius and Gerarde.

14. Th. *exiguus*. Small Cyprian Thyme. Sm. Prodr. Fl. Græc. Sibth. n. 1402. Fl. Græc. t. 575, unpublifhed.—Flowers very few in a whorl. Leaves rhomboid, pointed, oblique, nearly entire. Stems branched at the bafe. Tube of the corolla thread-fhaped.—Difcovered by Dr. Sibthorp in hilly fituations in the ifle of Cyprus. The *root* is annual, fimple, fibrous. *Stem* two or three inches high, erect, with fimple leafy hairy *branches* from the bottom. *Leaves* one-third of an inch long, fmoothifh, on long hairy ftalks. *Flowers* either two or four in each whorl, on thick ftalks. *Calyx* flender, furrowed, hairy. *Corolla* with a very flender white tube, enclofing the *ftamens*, and fhort, rounded, pale-purple fegments in the limb.

15. Th. *pulegioides*. Penny-royal-leaved Thyme. Linn. Sp. Pl. ed. 1. 592. Sm. Prodr. Fl. Græc. Sibth. n. 1397. (Cunila thymoides; Linn. Sp. Pl. ed. 2. 31. Willd. Sp. Pl. v. 1. 123. Acinos thymi folio annuus, floribus inexpanfis; Morif. fect. 11. t. 19. f. 6.)—Whorls many-flowered, crowded into long, denfe leafy fpikes. Leaves ovate, obtufe, entire. Stem herbaceous, branched, with four hairy angles.—Native of the fouth of France, and of hills in Greece.—*Root* fibrous, marked as annual by Linnæus, but the ftems have a fhrubby appearance. They are a fpan high, with oppofite branches, leafy, their angles denfely clothed with recurved hairs. *Leaves* ftalked, from a quarter to half an inch long, deflexed, dotted, fmooth, except a few occafional coarfe marginal hairs. *Flowers* on longifh, cylindrical, denfely downy ftalks, ten or twelve in each whorl. *Calyx* ftrongly furrowed, hairy, with a broad upper lip, and two long, narrow, fringed teeth in the lower one; the orifice denfely hairy. *Corolla* fmall; its limb feems to refemble the laft-defcribed. Sometimes the *ftem* is clothed with whorls of *flowers* almoft from the bottom to the top, and the upper *leaves* are larger than the lower. The odour of the plant is that of Thyme, not of Penny-royal.

16. Th. *graveolens*. Strong-fcented Greek Thyme. Sm. Prodr. Fl. Græc. Sibth. n. 1403. Fl. Græc. t. 576, unpublifhed.—Whorls barely fix-flowered. Leaves ovate, rhomboid, obtufe, revolute, fomewhat ferrated. Stems much branched, fhrubby.—Gathered on mount Parnaffus, by Dr. Sibthorp, who fufpected it might be the τραγοριγανος of Diofcorides, and from whofe manufcripts we have adopted the fpecific name. The ftrong, woody, branching *root* bears a tuft of numerous afcending, branched, leafy, reddifh, downy *ftems*, about fix inches high. *Leaves* dark green, paler beneath, fmooth, a quarter of an inch long, on *footftalks* of nearly their own length. *Flowers* on fimple ftalks, with a pair of fmall oval *bracteas* at the bafe of each ftalk, ufually

usually three or four in a whorl, sometimes five or six. *Calyx* with a shortish furrowed tube, very gibbous at the base beneath; its upper lip broad; lower of two awl-shaped fringed teeth; both tinged with red. *Corolla* of a purplish crimson, large and handsome, downy in the mouth, as well as at the back, which latter is the case with *Acinos*, *alpinus*, and all of the same tribe.

17. Th. *marginatus.* Thick-edged Thyme. Sm. in Dicks. Dr. Pl. n. 71. (Th. Piperella; Allion. Pedem. v. 1. 21. t. 37. f. 3, excluding the synonyms.) — Stalks many-flowered, lateral and terminal. Leaves ovate, nearly smooth, ribbed, entire, with a thick cartilaginous margin. Calyx-teeth nearly equal. Stems shrubby, ascending.—On the rocks of the maritime alps of Piedmont very abundantly. *Allioni.* Of more humble stature than the last, with many round, slender, downy, purplish, ascending *stems*, about a finger's length, branched at the base only. *Leaves* nearly sessile, inclining to heart-shaped, covered with resinous dots, sometimes slightly downy, remarkable for their thick, smooth, pale margin. *Flower-stalks* chiefly axillary, about as long as the leaves, somewhat corymbose, downy, bearing several small ovate *bracteas*, and three or four *flowers*. *Calyx* cylindrical, furrowed; all its segments awl-shaped, and not very unequal, none of them fringed. *Corolla* with a slender hairy tube, twice as long as the calyx, and a short rounded limb. The whole plant is warm and pungent, highly aromatic. It is very distinct from the following.

18. Th. *Piperella.* Pepper Thyme. Linn. Syst. Nat. ed. 12. v. 2. 400. Willd. n. 14, excluding the synonym of Allioni, and possibly those of Vahl and Forskall. (Marum hispanicum nigrum, flore purpureo, Piperella hisp; Barrel. Ic. t. 694. Bocc. Mus. 166. t. 117.) — Stalks many-flowered, lateral. Leaves ovate, somewhat heart-shaped, obtuse, entire, smooth, strongly ribbed, copiously dotted. Upper lip of the calyx very broad; lower fringed.—Native of Spain. The *root* is perennial. *Stems* apparently trailing, a span long, branched, bluntly quadrangular, finely downy. *Leaves* varying in size, but scarcely more than a quarter of an inch long at the most, thick, flat, without any cartilaginous edges, their ribs numerous, parallel and strong. *Footstalks* short, downy. *Flowers* in axillary, corymbose, downy, leafy tufts, with ovate *bracteas*. Upper lip of the *calyx* remarkably broad, and rather the longest, covered with resinous dots; lower strongly fringed. *Corolla* a little longer than the calyx, pale, dotted with resinous points. The odour of the plant is most like *Th. Serpyllum*. Vahl speaks of a border to the *leaves*, which induces a suspicion that he took our *marginatus* for *Piperella*.

19. Th. *Brownei.* Jamaica Thyme. Swartz. Prodr. 89. Ind. Occ. 1011. Willd. n. 15. (Th. n. 1; Browne Jam. 259.) — Stalks axillary, thread-shaped, single-flowered. Leaves orbicular-heart-shaped, crenate, smooth. Calyx-teeth ovato-lanceolate, nearly equal. Stem herbaceous, procumbent.—Native of moist grassy places, near rivulets, in Jamaica and Hispaniola, flowering all summer. The *root* is annual, fibrous. *Stems* a foot long, creeping, slender, quadrangular, smooth, often purple, with short leafy branches. *Leaves* about half an inch long, not unlike some of our annual *Veronicæ*, paler beneath, on slender stalks. *Flowers* purplish-white, small, on long, very slender, solitary stalks. *Calyx* cylindrical, smooth, strongly furrowed, with broad pointless teeth. Swartz says it has a very strong smell, like *Mentha arvensis*.

20. Th. *filiformis.* Minorca Thyme. Ait. n. 8. Willd. n. 16. — Stalks axillary, thread-shaped, single-flowered. Leaves heart-shaped, bluntly pointed, entire, with a thick cartilaginous margin. Stems thread-shaped, decumbent.—Native of the Balearic islands. Introduced into our greenhouses in 1770, by Mr. Malcolm. The *root* is perennial, woody. *Stems* from four to six inches long, trailing, purplish, slightly branched. *Leaves* stalked, agreeing with those of n. 17. in their tumid margin, but not half so large, and more pointed. *Flowers* very small. *Calyx* ovate, furrowed; its three upper teeth broadest and shortest; lower ones fringed.

21. Th. *incanus.* Hoary Calamint Thyme. Sm. Prodr. Fl. Græc. Sibth. n. 1405. Fl. Græc. t. 577, unpublished. (Calamintha orientalis annua, ocymi folio, flore minimo; Tour. Cor. 12, by the character.)—Whorls simply stalked, of about six flowers. Leaves roundish, entire, clothed with hoary down. Beard of the calyx concealed. Stems procumbent.—Common in the islands of the Archipelago, and about Athens. The *root* is woody, and but for Tournefort's synonym, we should judge it perennial. *Stems* herbaceous, numerous, diffuse, a foot long, with opposite leafy branches, clothed, like every part of the herbage, with fine, soft, grey pubescence. *Leaves* stalked, convex, ribbed, rounded and blunt, half an inch in diameter. *Flowers* scarcely projecting beyond the leaves, on simple hairy stalks. *Calyx* ovate, tumid, ribbed; with lips of equal length; the upper broad, abrupt, three-toothed: converging hairs of the throat concealed in the tube. Upper lip of the *corolla* pink, hairy; lower white; palate dotted with red.

22. Th. *grandiflorus.* Large-flowered Calamint Thyme. Sims in Curt. Mag. t. 997. (Th. carolinianus; Michaux Boreal-Amer. v. 2. 9. Calamintha grandiflora; Pursh 414.) —Whorls simply stalked, of about ten flowers. Leaves ovate, serrated, nearly smooth. Beard of the calyx concealed. Stems erect, shrubby.—On the banks of the river Savannah, in Georgia and Carolina, flowering in July and August. *Pursh.* Cultivated by John Walker, esq. at Southgate, about 1804. The *root* is perennial. *Stems* bushy, with opposite branches, a foot or more in height. *Leaves* stalked, deflexed, above an inch long, green, somewhat downy to the touch only. *Flowers* large, pale purple, with a vaulted upper lip, and a dotted palate. Upper lip of the *calyx* very broad.

23. Th. *Calamintha.* Common Calamint Thyme. Fl. Brit. n. 3. Engl. Bot. t. 1676. (Melissa Calamintha; Linn. Sp. Pl. 827. Willd. Sp. Pl. v. 3. 147. Calamintha; Rivin. Monop. Irr. t. 46. f. 2. Matth. Valgr. v. 2. 76. C. vulgaris officinarum; Ger. Em. 687.)—Whorls stalked, many-flowered, forked. Leaves hairy, with shallow serratures. Beard of the calyx concealed. Stem erect.—Native of dry banks, and the borders of fields, especially on a gravelly soil, in England and the more southern parts of Europe, flowering in July and August. The whole herb has a peculiarly sweet and grateful fragrance. The *root* is perennial. *Stem* twelve or eighteen inches high, hairy, with many opposite branches. *Leaves* broad, ovate, bluntish, on long stalks. *Flowers* copious, pale lilac, the whorls becoming leafless in the upper part of the branches. *Bracteas* bristle-shaped, fringed. *Calyx* ovate, furrowed, bristly; its broad upper lip deeply three-cleft; lower fringed.

24. Th. *Nepeta.* Lesser Calamint Thyme. Fl. Brit. n. 4. Engl. Bot. t. 1414. (Melissa Nepeta; Linn. Sp. Pl. 828. Willd. Sp. Pl. v. 3. 147. Curt. Lond. fasc. 6. t. 40. Calamintha odore pulegii; Ger. Em. 687. C. folio incano; Rivin. Monop. Irr. t. 47.)—Whorls stalked, many-flowered, forked, longer than the leaves. Leaves serrated. Beard of the calyx prominent. Stem erect.—Native of chalky banks, and the borders of fields, plentifully in England, and throughout the south of Europe; very common in Greece and the Archipelago, flowering in August.

August. The habit of this species is like the last, but with smaller *leaves*, more conspicuous longer-stalked *flowers*, and less upright *stems*. Its scent is different, and much stronger, resembling Penny-royal.

25. Th. *cephalotus*. Great-headed Portugal Thyme. Linn. Sp. Pl. 826. Willd. n. 17. Ait. n. 9. Vahl Symb. v. 3. 77. "Hoffm. et Link Lusit. v. 1. 127. t. 13." (Tragoriganum dictamni capite, hispanicum; Barrel. Ic. t. 788. Bocc. Mus. 50. t. 43.)—"Heads of flowers with loosely imbricated, large, coloured bracteas, destitute of dots. Leaves linear, entire.—Native of Spain and Portugal. A shrubby bushy plant, with purplish *stems*, and downy *branches*. *Leaves* fringed at the base. *Flowers* concealed by the large purplish *bracteas*, forming an ovate head. Upper lip of the *calyx* rather the largest; lower fringed. We have seen no specimen, either of this or the next.

26. Th. *striatus*. Striated Neapolitan Thyme. Vahl. Symb. v. 3. 78. Willd. n. 18.—"Heads of flowers with closely imbricated, ovate, striated, dotted bracteas. Leaves linear-lanceolate, serrated, dotted in the margin."—Found by Cyrillo, in the kingdom of Naples. The *stems* are shorter and more upright than the foregoing; not branched in their upper part. *Leaves* broader, erect; striated at the back. *Heads* smaller, with smaller green *bracteas*. *Vahl.*

27. Th. *villosus*. Hairy Thyme. Linn. Sp. Pl. 827. Willd. n. 19. Ait. n. 10. "Hoffm. et Link Lusit. v. 1. 128. t. 14." Sm. Fl. Græc. Sibth. t. 578, unpublished.—Heads of flowers with imbricated, fringed, lanceolate, ternate, keeled bracteas. Leaves lanceolate, hairy, acute. Stems trailing.—Native of Portugal, Cyprus, and the Archipelago. The strong woody *root* sends out numerous, decumbent, branched, shrubby *stems*, which compose ample tufts, taking root as they spread, with short, simple, ascending flowering branches. *Leaves* clustered, nearly awl-shaped, dark green, fringed with coarse white hairs. *Bracteas* and *calyx* tinged with a violet purple; the upper lip of the latter oval, with three sharp teeth. *Corolla* rose-coloured, with a slender hairy tube, twice the length of the calyx. *Stamens* prominent.

28. Th. *Mastichina*. Mastick Thyme. Linn. Sp. Pl. 827. Willd. n. 20. Ait. n. 11. (Marum; Rivin. Monop. Irr. t. 40. Ger. Em. 670.)—Whorls stalked, many-flowered, crowded into round heads. Leaves ovate, obtuse, entire. Calyx-teeth awl-shaped, taper-pointed, all fringed, nearly uniform.—Native of stony ground in Spain and Greece. Dr. Sibthorp gathered it on mount Hymettus, near Athens, so famous for honey. This plant has been treasured up in many a rustic garden, or cottage window, ever since the days of old Gerarde; but will scarcely bear our winters unprotected, for any length of time. It flowers throughout the latter part of summer. The figure of Rivinus is cited by mistake, in the usually accurate Hort. Kew. for *Teucrium Marum*. The *stem* of the present species is shrubby, twelve or eighteen inches high, erect and bushy, with many roundish, downy, leafy branches. *Leaves* numerous, stalked, about the size and shape of *Th. Serpyllum*, but thicker, finely downy, and not fringed at the base; most hoary beneath. *Flowers* white, small, conspicuous for the long slender teeth of the *calyx*, which are pectinated with abundance of long bristly hairs. The tube is closed with copious white hairs, nor can we see any foundation for Linnæus's doubts, whether this plant should be referred to *Thymus* or *Satureja*, except the calyx-teeth being nearly equal, which is the case, more or less, with some of the foregoing. The odour of *Th. Mastichina* is pleasantly aromatic, not very pungent.

29. Th. *Tragoriganum*. Goat's Thyme. Linn. Mant. 84. Willd. n. 21. Ait. n. 13. Turr. Farset. 11. (Tragoriganum majus; Alpin. Exot. 79. t. 78. T. secunda, altera species; Clus. Hist. v. 1. 355. T. cretense; Ger. Em. 668.)—"Stem somewhat shrubby, erect. Flowers whorled. Leaves hispid, pointed."—Native of hills in Crete; as well of Cyprus and Bœotia, according to Dr. Sibthorp's manuscripts, though his herbarium contains no specimen. Neither does that of Linnæus, whose specific character we are obliged to copy. He describes it as a sweet-scented plant, with hairy *stems*, a foot high; *leaves* rather rigid, pointed at each end. The *root* appears to be woody and perennial. Whorls numerous, dense, of many *flowers*.

For *Th. virginicus*, Willd. n. 22, see PYCNANTHEMUM, n. 5. The same author has a *Th. inodorus*, n. 9, adopted from Desfont. Atlant. v. 2. 30. t. 129. A specimen apparently answering to this, gathered by Thunberg at the Cape of Good Hope, is preserved in the Linnæan herbarium, with a note at the back adverting to the singularity of a plant of the *Didynamia Gymnospermia* having alternate leaves; and it is named *Satureja alternifolia*. We do not find that either Linnæus or Thunberg ever published this plant; possibly because of the uncertainty of its genus; or it may be among those which the latter has referred in his *Prodromus* to *Selago*, several of which we have no means of determining. Whether the plant of Desfontaines be the same or no, we dare not, without examination, consider it as a *Thymus*, though he describes the *calyx* as closed with hairs, which is certainly not the case with Thunberg's specimen.

THYMUS, in *Gardening*, contains plants of the low, aromatic, perennial kind; among which the species cultivated are, the wild thyme (T. serpillum); the garden thyme (T. vulgaris); the mastick thyme (T. mastichina); and the Virginian or savory thyme (T. virginicus).

In the first sort there are several varieties; as the broad-leaved, the narrow-leaved, the variegated-leaved, the silver-striped-leaved, the citron-scented or lemon thyme, and the great purple-flowered.

And in the common sort there are different varieties; as the broad-leaved, the narrow-leaved, and the variegated or striped-leaved thyme.

Method of Culture.—These plants may be easily raised from seed, by slipping the roots and branches, and by cuttings; but the seed method is seldom practised, except with the second sort, or garden thyme. The seed should be sown in the early spring on light, rich, dry ground, which should be properly dug over, and the surface be made moderately smooth with the spade. As the seed is small, it should not be sown too thick, or be covered too deep: the seed is best sown while the ground is fresh stirred, either broad-cast on the surface, raking it in lightly, or in flat shallow drills, earthed over thinly: the plants appear in two or three weeks. It is necessary to be careful to keep them well weeded, giving occasional light waterings in dry weather; and by June they will require thinning, especially if the plants are to grow stocky, and with bushy full heads; in which case they should be set out to six or eight inches distance; when those thinned out may be planted in another place, in rows six or eight inches asunder, giving water till fresh rooted, keeping the whole clean from weeds by occasional hoeing between them in dry days, which will also stir the surface of the earth, and much improve the growth of the plants: they will be in perfection for use in summer, or early in autumn.

Sometimes the market kitchen-gardeners raise large quantities in beds, for daily supply, leaving the whole thick:

when

when of proper [illegible] root and [illegible] together, from time to time, as wanted, and tie them in [illegible]

[illegible] quantity [illegible] for occasional [illegible]

[illegible] cultivated for kitchen [illegible] half a foot apart, [illegible] plants, [illegible] plants, each [illegible] proper [illegible] It may also often be [illegible] other compartments [illegible] the plants multiply exceedingly [illegible] furnishing the [illegible] increase. Some [illegible], however, [illegible] raised from seed in the above manner, as [illegible] a stronger aromatic quality than those [illegible]

When it is intended [illegible] particular varieties, [illegible] certainty, it can only be effected by slips and cuttings.

In respect to the offsets and slips, all the sorts multiply by [illegible] root and slips of the branches: the rooted [illegible] most expeditious method, as the old plants increase [illegible] many offset stems rising from the root, each furnished with fibres; and by taking up the old plants in the [illegible] &c. and slipping or dividing them into separate parts, not too small, with roots to each, and planting them in beds of good earth, in rows half a foot asunder, giving water directly, and repeating it occasionally in dry weather till they have taken root, and begin to shoot at top; they soon grow freely, and form good bushy plants in two or three months.

The strong slips of the branches without roots, succeed when planted any time in the early spring season in a shady border, in rows four or five inches distant, giving due waterings; and become good plants by autumn, when they may be planted out where they are to remain.

The cuttings of the young branches grow readily, the same as the slips, when planted at the same season in a shady place, and well watered.

The common thyme is in universal use as a pot-herb for various culinary purposes; it may also be employed in assemblage with other small plants, to embellish the fronts of flower-borders, shrubbery clumps, small and sloping banks, &c. placing the plants detached or singly, to form little bushy tufts, and in which the variegated sorts, and the silver thyme and lemon thyme particularly, form a very agreeable variety. The lemon thyme is also in much estimation for its peculiar odoriferous smell. Some of each of these sorts may also be potted, in order to be moved occasionally to any particular places as may be required, and under occasional shelter in severe weather, to preserve the plants more effectually in a lively state; likewise some of the mastick thyme. Spanish and Portugal thymes are also sometimes potted for the same purpose, and to place under the protection of a garden frame or green-house in winter, to continue them in a more fresh and lively growth; and sometimes some of the smaller thymes are [illegible] or planted for edgings to particular beds or borders for variety, such as the lemon thyme, silver-leaved and variegated sorts; also occasionally the common thyme; and all kept low, close and regular, by clipping them at the sides and top annually in the summer season.

All the several sorts and varieties possess an aromatic quality, which principally resides in the leaves, whence it is imparted and affords a fine agreeable fragrance. But the first three kinds are by much the most noted and valued in kitchen gardens, and more especially the common thyme, which is so very useful as a culinary herb.

In gathering this for use, in common gardens, it should in general only be cut or slipped as it is wanted, in small quantities at a time, and then not stumped off in too close a manner: but the mode pursued by market gardeners is quite different, as has been already seen.

THYNI, in *Ancient Geography*, a people of Thrace, according to Strabo. Among the Thraces of Asia. mentioned by Herodotus, we are to include the Bithynians and Thynians. These people were originally of Europe, and were driven from thence by the Teucrians and Mysians. They were also called Strymonians: and upon passing into Asia, they took the name of Bithynians. The Thynians were originally Thracians; inhabiting the environs of Salmydessus and Apollonia: and upon their removal to Asia, they occupied the sea-coast, and some part of the adjacent territory. These people had acquired the art of engraving precious stones: accordingly we find the following verse of Mecænas upon the death of Horace, preserved by Isidore in his Origines:

> "Nec percandida margarita quæro
> Nec quos Thynica lima perpolivit,
> Amellos, nec jaspios lapillos."

THYNIA, a country of Asia, in Bithynia. Pliny.

THYNIAS, an island of the Euxine sea, opposite to Bithynia, according to Pliny, but on the coast of Bithynia, according to Strabo.

THYNNIA, Θυννια, in *Antiquity*, a sacrifice offered to Neptune by the fishermen, after a plentiful draught.

The word comes from θυννος, *a tunny*, that being the sacrifice offered.

THYNNUS, in *Entomology*, a genus of the Hymenoptera order of insects: the characters of which are, that the mouth is horny; the mandible bent, with a short jaw, straight; the lip larger than the jaws, with the apex membranaceous; trifid; the intermediate fringes emarginate; the tongue very short or folded; the four palpi filiform and equal; the antennæ filiform. Gmelin enumerates three

Species.

Dentatus. With black abdomen; the second, third, and fourth segments marked with two white points. Found in New Holland.

Emarginatus. With black abdomen, the segments having a yellow interrupted band; the scutellum emarginate. Found in New Holland.

Integer. Black, with the segments of the abdomen villose-cinereous at the margin, and the anus entire. Found in New Holland.

Thynnus, in *Ichthyology*. See Tunny, and Scomber, of which it is species.

THYOS, Θυος, in *Antiquity*, an offering of fruits, leaves, or acorns, which were the only sacrifices at first in use.

THYRÆI, in *Ancient Geography*, a people of Italy, in Japygia, who inhabited the middle of the isthmus, between Tarentum and Brundusium, according to Strabo.

THYREA, a town of the Argolide, upon an eminence, in that part which adjoined Laconia, that is, on the western coast of the Argolic gulf. The country in which it was situated bore the name of Cynuria or Cynouria.—Also, a town of Greece, in the Phocide, where, according to Pausanias, Phocus, the son of Harmythion, placed a colony.—

Also,

Alfo, a place fituated on the coaft of the Peloponnefus. According to Herodotus, the inhabitants of Hermione gave it to thofe of Samos.

THYREUM, a fmall town of Arcadia, S. of Megalopolis. It was deferted in the time of Paufanias.

THYRIDES, a town of Laconia, S.E. of Meiffa. Near this place were the ruins of the town of Hippola, in the midft of which was feen, in the time of Paufanias, a chapel of Minerva Hippolaitis.—Alfo, the name of the fummit of Tænarus, in the Peloponnefus; 30 ftadia from the promontory Tænarum. Pliny gives the name of Thyrides to three iflands of the gulf Afinæus.

THYROID, in *Anatomy*, *thyroideus*, or more properly *thyreoideus*, from θυρεοειδης, compounded of θυρεος, *a fhield*, and ειδος, *form*; a name given to one of the cartilages of the larynx (fee LARYNX), to a gland fituated near that cartilage (fee LARYNX), and to the arteries and veins of the gland. See ARTERY and VEIN.

THYROID *Gland*, *Difeafed*. See BRONCHOCELE.

THYROID *Gland*, *Extirpation of*. It cannot be doubted that this operation is one of the moft difficult and dangerous in the practice of furgery; and it ought never to be undertaken, except under the moft urgent circumftances, and by operators of confummate fkill and judgment. Were a furgeon, fuperficially acquainted with anatomy, and little accuftomed to attempts of fo bold a kind, to undertake the operation of cutting away a difeafed thyroid gland, he would run the utmoft rifk of feeing the patient bleed to death under his hands.

The following is a memorable inftance of the fuccefsful performance of this operation. In the year 1784, J. Hyons, twenty years of age, experienced an acute pain at the middle and anterior part of the neck, in confequence of a violent extenfion of the head. This pain, which was only momentary, was followed by fome difficulty of motion. About three months afterwards, a fmall, hard, indolent tumour appeared on the right fide of the trachea. The fwelling was unattended with pain, or alteration in the colour of the integuments. The tumour feemed to be raifed by a pulfatory action, which tended to prove the exiftence of a large artery underneath, and, in fact, its bafe was fituated on the general courfe of the carotid artery. The patient feeling no inconvenience, neglected it until June 1788. At this time it was an inch in diameter. Its progrefs, which in the firft inftance was flow, now augmented with proportionable rapidity. Internal remedies and topical applications had no effect in preventing its increafe. A fluctuation in its centre was foon evident: an incifion was then made into this part, and a quantity of yellow ferofity difcharged. Three months after this operation, which was not of the leaft fervice, recourfe was had to cauftics, which were repeatedly applied without any advantage. On the 20th of March 1791, fhe prefented herfelf for admiffion at the Hôtel-Dieu. At this period the tumour was two inches in diameter, round, hard, and attached to the right and middle part of the trachea, and it pufhed outwards the fterno-maftoideus mufcle. Independently of its being fenfibly raifed by each pulfation of the arteries, it obeyed the motions of deglutition, and in a flight degree impeded the paffage of the folid aliment. The patient, [illegible]neftly defiring to get rid of fo inconvenient a deformit[illegible], [illegible]etermined to fubmit to its extirpation, which appeared her only refource. The danger, the length of time, and the pain neceffarily annexed to the operation, were not concealed from her. The operation, after a few days previous preparation, was performed in the amphitheatre by Default in the following manner: the patient being laid on her back, a little inclined on the left fide, with the head and neck more raifed than the reft of the body, the furgeon made a longitudinal incifion through the middle of the tumour, beginning one inch above, and finifhing one inch below, to allow room to finifh the operation with eafe: in the firft fection he cut down as far as the gland, dividing the integuments, the platyfma-myoides, and fome fibres of the fterno-hyoideii and fterno-thyroideii mufcles; an affiftant, with the view of fixing the tumour, drew towards the left the infide edge of the wound made by the incifion, whilft the furgeon detached it from the fterno-maftoideus mufcle. In diffecting the cellular fubftance which united the parts, two fmall arteries were divided, which were raifed by a pair of diffecting forceps and fecured by ligatures. The external furface of the tumour being thus difengaged, the internal part was detached in the fame way. The tumour was drawn outwards by means of a hook, that it might be feparated with more eafe from the anterior part and from the fide of the trachea. In the courfe of this diffection, the branches of the thyroid arteries were fucceffively tied, as faft as they were divided. The affiftant, to whom the hook was confided, directed the gland from within and forwards, whilft the furgeon finifhed the diffection outwards and from above downwards. This part of the operation was the moft minute and difficult: it was neceffary by means of a fponge continually to wipe away the blood, which neceffarily prevented the parts from being eafily diftinguifhed, and obliged the furgeon to divide but a little at a time, and previoufly to feel with his finger thofe parts he was about to incife. By this cautious diffection of parts, the fuperior and inferior thyroid arteries were laid bare, and afterwards fecured by ligature by means of a blunt crooked needle. They were afterwards tranfverfely divided, and the remaining part of the tumour detached from the trachea, to which it ftrongly adhered. The wound refulting from this operation was near three inches in depth: it was outwardly bounded by the fterno-maftoideus mufcle, and inwardly by the trachea and œfophagus; pofteriorly by the carotid artery, and by the nerves of the eighth pair, which were expofed at the bottom of the wound. After the wound was well wafhed with warm water, and cleared from the blood, it was filled with coarfe lint, powdered with colophony; fquare compreffes, fecured by a bandage moderately tight, formed the reft of the dreffing. The extirpated tumour was five inches in circumference; and on examination was found to differ in no particular from fchirrous glands, except that in the centre there was a cartilaginous nucleus. The patient fupported this long, difficult, and painful operation with uncommon firmnefs: fhe paffed the reft of the day without experiencing any other fymptom than a flight fhivering, generally confequent to large wounds. The following night fhe complained of a fenfe of heat in the neck, and fome difficulty in deglutition. The next day a little eafe was obtained by moiftening the dreffing with a decoction of marfhmallows. A weak drink of the herb dog's-tooth, acidulated with oxymel, was prefcribed. On the third day the fever was very moderate, but the difficulty in fwallowing had confiderably increafed at this period; the compreffes and the external lint were removed, and frefh applied. On the fourth, the fever ceafed, and deglutition became lefs painful. Suppuration now became eftablifhed. The next day all the lint was detached, and the whole of the dreffings renewed. The wound was in a good ftate: it was dreffed with foft lint and compreffes moiftened with an emollient decoction; a practice which was continued for the following days. No particular circumftance occurred during the cure. The wound followed the ordinary progrefs,

grefs, and was cicatrized at the end of a month. The patient left the hofpital, perfectly cured, the 34th day after the operation. See Default's Parifian Chirurgical Journal, vol. ii. p. 292—296.

To the preceding cafe, the editor of the above work has annexed the few following reflections.

The extirpation of the thyroid gland is an operation extremely difficult, and certainly highly dangerous, when performed by an operator but moderately exercifed in the practice of his profeffion. The number and fize of the arteries neceffary to divide, the proximity of the trachea, œfophagus, and carotid, near which the knife muft neceffarily pafs, are the principal dangers that the operator fhould avoid. Thefe are the circumftances which have deterred the majority of practitioners from performing it, particularly thofe who from long eftablifhed prejudice have been deterred from ufing ligatures in cafes of wounded arteries. Examples of this operation are very rare. The firft time that Gooch undertook to perform it, he was deterred from finifhing it by the hemorrhage, and his patient died on the eighth day. The fecond time he fucceeded better, but was incapable of fecuring the veffels, and fucceeded in ftopping the hemorrhage, which would otherwife have been mortal, by caufing the parts to be compreffed by the hand of an affiftant for the fpace of eight days. Gooch's Med. and Chir. Obf. p. 130. Bell's Syftem of Surgery, vol. v. p. 525. And La Bib. Chir. de Richter, l. 2. 4e partie, p. 128.

A. F. Vogel and Theden have practifed the fame operation with the moft complete fuccefs. All danger from the hemorrhage, or inconvenience arifing from the difcharge of blood, may be obviated by pinching up the fmall veffels, tying them as faft as they are divided, and by difcovering and tying the large veffels previous to their divifion; other parts that cannot be wounded without danger, are to be avoided by diffecting flowly and a little at a time, and feeling with the finger every part previous to its divifion with the biftoury.

THYRO-ARYTENOIDEUS, a mufcle of the larynx. See Larynx.

THYRO-EPIGLOTTICUS, a fuppofed mufcle of the larynx. See Larynx.

THYRO-HYOIDEUS, a mufcle paffing between the os hyoides and the thyroid cartilage. See Larynx.

THYRO-PHARYNGEUS, a portion of the inferior conftrictor of the pharynx. See Deglutition.

THYROIDEÆ *Glandulæ Mufculus*. See the defcription of the thyroid gland in the article Larynx.

THYRRÆUM Vinum, a fort of wine among the ancients, remarkable for its thicknefs and dark colour; it was fweet and lufcious, and not aftringent.

THYRREUS Lapis, in *Natural Hiftory*, the name of a foffil, which the writers of the middle ages have called *fyrus*.

It has many virtues afcribed to it; but all the accounts we have of its real properties are from Pliny, who obferves, that it fwam upon the water while whole; but when broken into fmall pieces, thefe funk to the bottom. It feems to have been a fort of bitumen of a fpongy ftructure.

THYRSINE, in *Botany*, probably from its denfe clufter-like appearance, a name given by Gleditfch to the Cytinus, (fee that article,) in a treatife publifhed in his Phyfic. Botan. Oecon. Abhandlungen, v. 1. 199. t. 2. He is cited in Schreb. Gen. 609, and Willd. Sp. Pl. v. 4. 589.

THYRSUS, Θυρσος, in *Antiquity*, the fceptre which the ancient poets put in the hands of Bacchus, and with which they furnifhed the Mænades in their Bacchanalia.

The thyrfus was originally a lance or fpear, wrapped up in vine leaves; with which Bacchus is faid to have armed himfelf and his foldiers in his Indian wars, to amufe and deceive the unpractifed Indians, and make them fufpect no hoftilities.

Hence it was afterwards borne in the feaft and facrifices of that god; and as the Satyrs, who were Bacchus's foldiers, were fuppofed to have fought with it, it became a cuftom to reprefent them therewith.

Thyrsus, *Oriftagni*, in *Ancient Geography*, a river of the ifle of Sardinia, which ran from N. to S. and difcharged itfelf towards the W. into the fea.

Thyrsus, in *Botany*, a Bunch, is a mode of inflorefcence, nearly allied to a *Racemus*, or Clufter, except in being compound, in which it agrees with a Panicle. Its form is more or lefs ovate, and the difpofition of the branches and fubdivifions is either oppofite or alternate; the ultimate one fometimes obfcurely umbellate. Examples are found in the Lilac, *Syringa vulgaris*, and a bunch of Grapes, *Vitis vinifera;* as well as in the herbaceous plants *Tuffilago hybrida* and *Petafites*. Hence it appears that a *Thyrfus* is nothing more than a denfe or clofe Panicle; and in the examples laft cited, this mode of inflorefcence actually becomes a loofe panicle, as the plant perfects feed. See Panicula and Inflorescence.

THYSANOTUS, θυσανωτος, *fringed*, a very defcriptive name of Mr. Brown's, which he complains of Mr. Salifbury for having knowingly fuppreffed.—Brown Prodr. Nov. Holl. v. 1. 282. (Chlamyfporum; Salif. Parad. 103.)—Clafs and order, *Hexandria Monogynia*. Nat. Ord. *Coronariæ*, Linn. *Afphodeli*, Juff.

Gen. Ch. *Cal.* none. *Cor.* inferior, of one petal, in fix deep, fpreading, permanent fegments; the three inner ones broadeft, fringed at the edges with jointed hairs; the three outermoft externally of the texture of a calyx. *Stam.* Filaments fix, awl-fhaped, fmooth, much fhorter than the calyx, inferted into its bafe; anthers linear, incumbent, attached by the finus at their bafe, a little unequal at the end, the three outer ones generally elongated and reclining. *Pift.* Germen fuperior, roundifh; ftyle thread-fhaped, declining, about the length of the ftamens; ftigma fimple. *Peric.* Capfule oval, of three cells and three valves, with a partition from the centre of each, enveloped in the withered corolla. *Seeds* two in each cell, one erect, the other pendulous, roundifh, fomewhat ftalked, inferted into a cup-fhaped white appendage; albumen denfe, flefhy.

Obf. A few fpecies have only three ftamens.

Eff. Ch. Corolla in fix deep fegments; the three innermoft broadeft, fringed; permanent. Stamens fmooth. Capfule fuperior, of three cells and three valves. Seeds in pairs, with cup-fhaped appendages.

A rather numerous genus of perennial herbaceous plants, natives of different parts of New Holland. The *root* is either fibrous, or confifts of cluftered flefhy bulbs. *Stem* generally branched and leafy. *Leaves* linear, narrow, often channelled, fometimes thread-fhaped, or fhortened. *Flowers* terminal, umbellate; rarely fcattered; their ftalks jointed in the middle. *Corolla* blue within; three, at leaft, of its fegments green at the back. *Anthers* purple; the outer ones fometimes whitifh, which in the triandrous fpecies are wanting. *Seeds* black. The permanent *corolla*, and fmooth *filaments*, principally diftinguifh this genus from Mr. Brown's *Arthropodium*, Prodr. Nov. Holl. v. 1. 276, by which it is related to the Linnæan *Anthericum*. The learned author whom we follow defines twenty-one fpecies, of which he feems doubtful whether any one has ever been introduced into the Englifh gardens, at leaft fo as to bear flowers; for he thinks the figure in Parad. Lond. was done from

from a dried ſpecimen. On this ſubject we have no particular information. Several drawings of this genus and its allies, made in New Holland, have paſſed under our inſpection, and diſplay a degree of elegance which renders the plants highly deſirable.

Of the twenty-one ſpecies, ſeventeen are hexandrous, four triandrous.

Sect. 1. *Stamens ſix.*

Th. *tuberoſus.* Tuberous Fringe-bloſſom. Br. n. 1.—"Bulbs faſciculated, ſtalked. Radical leaves channelled, lax, ſmooth, rather ſhorter than the round, ſmooth, panicled ſtem. Umbels of two or three flowers. Anthers unequal."—Gathered by Mr. Brown, near Port Jackſon, New South Wales.

Th. *junceus.* Ruſh-leaved Fringe-bloſſom. Br. n. 9. (Chlamyſporum juncifolium; Saliſ. Parad. t. 103.)—"Root fibrous. Stems branched, diffuſe, round, ſtriated; branches ſlightly angular. Radical leaves ſhort; thoſe of the ſtem ſtraight, ſlightly ſpreading. Umbels of few flowers. Anthers unequal."—Native likewiſe of Port Jackſon, from whence we have received ſpecimens by favour of Dr. White. The *ſtems* are about a foot long, diffuſe, according to Mr. Brown, ſmooth, ſlender, ruſhy, alternately branched.—*Flowers* about an inch in diameter, their inner ſegments obtuſe, delicately fringed. They are ſaid to be very tranſient.

Th. *dichotomus.* Forked Fringe-bloſſom. Br. n. 14. (Ornithogalum dichotomum; Labillard. Nov. Holl. v. 1. 83. t. 109.)—Root fibrous. Radical leaves hiſpid. Stem round, ſtriated, with numerous rather ſpreading branches; forked above. Flowers ſolitary. Anthers unequal.—Gathered in Lewin's land by M. Labillardiere, from whom we have a ſpecimen. The *ſtem* is 15 or 18 inches high, repeatedly divided from the bottom, ſo as to be almoſt corymboſe at the top, roughiſh to the touch, ſlightly leafy. *Radical leaves* numerous, about four inches long, erect, linear, obtuſe, entire, channelled, rough with ſhort, rigid, pale, prominent hairs; ſheathing at the baſe: thoſe of the ſtem ſolitary under each branch, ſhort, awl-ſhaped, ſtriated, claſping the ſtem with a dilated, membranous margin in the lower part. *Flowers* terminal, two or three to each branch, but it appears to us that the individual ones are ſolitary. Three inner ſegments purple on the inſide, with a fringe of the ſame colour; their outſide, like the whole of the outer ones, green. *Anthers* but ſlightly, if at all, unequal. Valves of the *capſule* beaked.

Sect. 2. *Stamens three.*

Th. *triandrus.* Triandrous Fringe-bloſſom. Br. n. 18. (Ornithogalum triandrum; Labill. Nov. Holl. v. 1. 84. t. 110.)—"Root fibrous. Leaves linear, fringed, the length of the ſmooth unbranched common flower-ſtalk. Umbel many-flowered. Lower joint of each partial ſtalk ſeveral times longer than the bracteas.—Gathered by Labillardiere, in Lewin's land. *Stalks* one or more, compreſſed, a ſpan high, as well as the numerous, all radical, *leaves.* *Umbel* of about nine *flowers;* its *ſtalks* jointed below the middle. *Stamens* but three, oppoſite to the three fringed ſegments of the *corolla*, which are purple on the inſide.

THYSANUS, from θυσανος, *a fringe*, becauſe of the fringed tunic of the ſeed.—Loureir. Cochinch. 284.—Claſs and order, *Decandria Tetragynia.* Nat. Ord. *Terebintaceæ*, Juſſ.?

Gen. Ch. *Cal.* Perianth inferior, of five coloured, permanent, lanceolate, concave, hairy, ſpreading leaves. *Cor.* bell-ſhaped, of five ſpreading oblong petals, the ſize of the calyx. *Stam.* Filaments ten, ſhort, reflexed; anthers roundiſh, erect, of two cells. *Piſt.* Germen ſuperior, quadrangular; ſtyles four, thread-ſhaped, inſerted laterally into the four angles of the germen; ſtigmas ſlightly cloven. *Peric.* Drupas four, oblong, gibbous, recurved at the point, with a woolly coat, burſting laterally. *Seeds.* Nuts ſolitary, oblong-ovate, ſmooth, naked at the top, enveloped in their lower part with a fleſhy, fringed, red tunic.

Eſſ. Ch. Petals five. Drupas four, gibbous. Nuts with a fringed tunic.

1. Th. *Palala.* Deei Khê of the Cochinchineſe.—Native of the woods of Cochinchina. A large, woody, nearly erect, branching *ſhrub*, without thorns. *Leaves* pinnate, of about ten pair of oblong, entire, ſmooth leaflets. *Stalks* axillary, many-flowered. *Calyx* red. *Corolla* white. Wing, or tunic, of the *nuts* red.

Such is the deſcription of Loureiro, who quotes, with a mark of doubt, *Palala ſecunda;* Rumph. Amboin. v. 2. 26. t. 6. But that is a *Myriſtica*, and has ſimple leaves. Yet hence the ſpecific name appears to be taken. He more juſtly indicates the affinity of his plant to *Sinaba;* Aubl. Guian. 400. t. 155, of which we propoſe to treat hereafter in its proper place, under Schreber's name of Zwingera.

We preſume Loureiro's *Thyſanus* to be very nearly related to Cnestis of Juſſieu and Willdenow; ſee that article. The number of germens may be very variable or uncertain. What the author terms a *drupa*, appears, from its burſting laterally, to be a true *follicle*, as is the ſeed-veſſel of *Cneſtis.* Whether the ſeed of the latter has any thing analogous to the fringed *tunic*, does not appear.

THYSDRUS, in *Ancient Geography*, a town of Africa Propria, and one of thoſe which, according to Ptolemy, lay to the S. of Adrumetum.

THYSIUS, (Thys,) Antony, in *Biography*, a philologiſt, was born at Leyden in 1603, and became profeſſor of eloquence and poetry in the univerſity of his native city, and public librarian. Beſides two or three works of his own, he was the editor of ſeveral editions of claſſics called "Variorum;" of which were "Valerius Paterculus," "Salluſt," "Valerius Maximus," "Seneca the Tragedian," "Lactantius," and "Aulus Gellius." He died in 1670.

THYSSAGETÆ, in *Ancient Geography*, a people who inhabited the territory near the Sarmatæ, where was the ſource of the river Tanais. Ammianus Marcellinus ſays that theſe people had their abode in large foreſts, and lived by the chace. Their wives and children they had, he ſays, in common. Herodotus ſays they were a numerous nation, and governed by their own laws. Hardouin, in his notes on Pliny, ſays that they inhabited the banks of the Tanais, towards that bend of the river, where it moſt nearly approaches the Wolga, and which is now the territory of Aſtrachan.

THYSSELINUM, in *Botany*, a name adopted by Lobel in his *Icones*, 711, for the *Selinum ſylveſtre* of Linnæus. Lobel cites Pliny, but the name in that author is *Thyſſelium.* The plant to which it belonged was "not unlike parſley, *Apium;* its *root* when chewed purged humours from the head." Rivinus, Pentap. Irr. t. 19 and 20, has the Linnæan *Selinum ſylveſtre* and *paluſtre* under the generic name of *Thyſſelinum*, as has Tournefort likewiſe, in his *Inſtitutiones*, 319. The latter diſtinguiſhes his genus from *Oreoſelinum* ſolely by its milky juice. As this juice is highly acrid, theſe authors ſhould ſeem to conſider the word as derived from θυω, *to burn*, and σελινον, *parſley.* Linnæus omitted the firſt ſyllable as, in his opinion, ſuperfluous,

fluous, and even Haller follows his example. See Selinum.

THYSSUS, in *Ancient Geography*, a town of Macedonia, on and about mount Athos. Pliny and Thucydides.

THYSTHUM, or Thytium, a town of Etolia. Suidas.

TIABA, a town of Asia Minor, in Caria. Strabo.

TIAGAR, a town in the interior of Arabia Felix, between [illegible] and Appa. Ptolemy.

Tiagar, in *Geography*, a town of Hindooftan, in the Carnatic; 5[illegible] miles W.S.W. of Pondicherry. N. lat. 11° 42′. E. long. 79° 12′.

TIAGNANUCO, a town of Peru, in the diocefe of La Paz. This is a town of great antiquity, and is faid to have received its name from one of the Incas. In it are fome ftatues, and a coloffal pyramid, with a variety of human figures cut out of ftone, which, though decayed by time, appear to have belonged to fome gigantic nation; 36 miles N.W. of La Paz.

TIAGURA, in *Ancient Geography*, a town of India, on this fide of the Ganges, and E. of the river Nomadus. Ptolemy.

TIANG-POTAO, in *Geography*, an ifland of Corea, about thirty miles in circumference, in the Hoang-hai. N. lat. 37° 2[illegible]′. E. long. 124° 52′.

TIANO. See Theano.

Tiano, a fmall ifland in the North fea, near the coaft of Lapland. N. lat. 68° 42′.

TIANTEGNIES, a town of France, in the department of Jemappe; 6 miles S.W. of Tournay.

TIANTONG, a town of Upper Siam, on the Mecon; 60 miles N.W. of Porfelouc.

TIAOYU-SU, a fmall ifland in the Chinefe fea, belonging to thofe called Lieou-kicou. N. lat. 25° 55′. E. long. 123° 37′.

TIARA, τιαρα, an ornament, or habit, with which the ancient Perfians covered their heads; and which the Armenians and kings of Pontus wear on medals: thefe laft, becaufe defcended from the Perfians.

Latin authors call it indifferently *tiara* and *cidaris*.

Strabo fays, the tiara was in form of a tower; and the fcholiaft on Ariftophanes's comedy, Ἀχαρνεῖς, act i. fcene 2. affirms that it was adorned with peacocks' feathers. Some moderns, however, fancy the fcholiaft is here fpeaking of the cafque which the ancient Perfians wore in war, rather than of the habit which they wore on the head in the city.

The kings of Perfia alone had the right of wearing the tiara ftraight and erect; the priefts and great lords wore it depreffed, or turned down on the fore-fide. Xenophon, in his Cyropædia, fays that the tiara was fometimes encompaffed with the diadem, at leaft in ceremonials; and had frequently the figure of a half-moon embroidered on it: others are of opinion, that the diadem was in figure of a moon; and that it was hence the *tiara* was called *lunata*. Laftly, others think that the tiara itfelf was made fometimes in form of a half-moon. From what we have faid, it appears that there were different forms of tiaras; and, in effect, Pafchalius, De Coronis, diftinguifhes no lefs than five different kinds. See Diadem.

The tiara was alfo an ornament belonging to the Jewifh priefts. Exod. xxviii. 40. xxxix. 26.

Tiara is alfo the name of the pope's triple crown; anciently called *regnum*.

The tiara and keys are the badges of the papal dignity; the tiara of his civil rank, and the keys of his jurifdiction: for as foon as the pope is dead, his arms are reprefented with the tiara alone, without the keys.

The ancient tiara of the popes was a round high cap. Boniface VIII. firft encompaffed it with a crown. Benedict XII. added a fecond crown; and John XXIII. a third.

TIARANTUS, in *Ancient Geography*, a river of Scythia, which ran into the Danube; now the *Alut*.

TIARE, a town of Afia Minor, in the Troade. Pliny.

TIARELLA, in *Botany*, the diminutive of τιαρα, a Perfian diadem, or ornament for the head. This name alludes to the form of the feed-veffel, and was contrived by Linnæus to preferve an analogy with Mitella, fee that article, to which the prefent genus is next akin.—Linn. Gen. 223. Schreb. 301. Willd. Sp. Pl. v. 2. 659. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 72. Purfh 659. Juff. 309. Lamarck Illuftr. t. 373.—Clafs and order, *Decandria Digynia*. Nat. Ord. *Succulentæ*, Linn. *Saxifragæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, ovate, acute, permanent fegments. *Cor.* Petals five, oblong, their claws inferted into the calyx. *Stam.* Filaments ten, capillary, longer than the corolla, inferted into the calyx; anthers incumbent, orbicular. *Pift.* Germen fuperior, cloven, terminating in two very fhort ftyles; ftigmas fimple. *Peric.* Capfule oblong, fomewhat compreffed, of one cell and two flattifh valves, one of them twice as long as the other. *Seeds* numerous, ovate, polifhed.

Eff. Ch. Calyx in five deep fegments. Petals five, undivided, inferted into the calyx. Capfule of one cell, with two unequal valves.

Obf. The undivided petals, and the inequality of length in the two valves of the capfule, diftinguifh this genus from *Mitella*.

1. T. *cordifolia*. Heart-leaved Tiarella. Linn. Sp. Pl. 580. Willd. n. 1. Ait. n. 1. Purfh n. 1. Lamarck as above. (Cortufa americana, flore fpicato, petalis integris; Herm. Parad. 129, without a figure.)—Leaves heart-fhaped, acutely lobed, with pointed teeth. Clufter fimple, ovate.—Native of the fhady woods of Canada, and the high mountains of New York and Pennfylvania, flowering in April and May. *Purfh.* It is hardy in our gardens, flowering at the fame feafon, but chiefly preferved in the more curious collections only. The *root* is tuberous, with many blackifh fibres, perennial. *Leaves* feveral, all radical, light green, hairy, elegantly lobed and veined, acute, about an inch and half in diameter, on erect, fimple, hairy *footftalks*, thrice as much in length. *Flower-ftalk* radical, moftly folitary, unbranched, hairy, taller than the leaves, bearing a fimple downy clufter, an inch long, of about twenty fmall, delicate, white *flowers*, which is fubfequently elongated as the *fruit* ripens. The *capfules* then become deflexed, two-lipped, ribbed, fmooth, and fhining. It is wonderful that every author fhould perfift in quoting, after Linnæus, the plate of Hermann's *Paradifus*, which is evidently *Heuchera americana*, and is mentioned under the name of *Cortufa americana*, *flore fquallidè purpureo*, in the text of the fame work, p. 131; where alfo this figure is referred to. The editor, having committed a double blunder, in the title of the plate and its reference, 130 inftead of 131, is in fome meafure refponfible for the miftake; which however the compound *panicle*, and clofed *calyx*, ought to have fooner corrected.

2. T. *Menziefii*. Slender-fpiked Tiarella. Purfh n. 2.—"Leaves ovate-heartfhaped, acute, toothed, with fhallow lobes; thofe of the ftem alternate, remote. Clufter threadfhaped, fomewhat fpiked. Calyx tubular."—Gathered by Mr. Menzies, on the north-weft coaft of America. Perennial. More than a foot high, with five or fix alternate *leaves* on the *ftem*. *Purfh.*

3. T. *trifoliata*. Three-leaved Tiarella. Linn. Sp. Pl. 580. Willd. n. 2. Purfh n. 3. (Mitella foliis ternatis; Linn. Am.

Am. Acad. v. 2. 351.)—Leaves ternate, lobed and toothed. Stem leafy. Cluster compound.—Gathered by Mr. Menzies on the north-west coast of America, where it is frequent in woods. Linnæus saw it only in the collection of plants from Kamschatka, submitted to his inspection by Demidoff, and described in the 2d volume of the *Amœnitates Academicæ*; for there is no specimen in his own herbarium. The *root* is tuberous, and somewhat creeping, perennial. *Stems* above a foot high, erect, simple, leafy, smooth and slender. *Leaves* all ternate, slightly hairy, paler beneath; the leaflets somewhat rhomboid, acute, more or less deeply lobed, and irregularly notched, an inch or an inch and half in length; the lateral ones often deeply divided; so that they much resemble some of the more delicate species of *Rubus*. The radical leaves have long slender *footstalks*; those on the stem short ones. *Cluster* many-flowered, from three to six inches long, alternately branched; the branches corymbose, each bearing from three to six or seven very small greenish-white *flowers*. The base of the *calyx* is concave, or slightly bell-shaped. *Capsule* half an inch long, each valve tipped with a permanent, elongated, capillary *style*.

4. T. *biternata*. Compound-leaved Tiarella. Venten. Malmaif. t. 54. Pursh n. 4.—Leaves twice ternate, lobed and toothed. Stem leafy. Panicle compound, divaricated; its branches somewhat spiked.—Found on the mountains of South Carolina, flowering in May. *Root* perennial. *Stem* a yard high. The appearance of the plant is justly compared by Ventenat to *Spiræa Aruncus*. The *leaves* consist of nine large ovate *leaflets*, slightly hairy, partly lobed, and all strongly toothed, or notched. *Flowers* very small, yellowish-white, almost sessile, disposed in numerous long *clusters*, forming a large, spreading, repeatedly branched *panicle*. The *petals* in Ventenat's figure are narrow, elliptic-lanceolate. Pursh says they are sometimes wanting. The appearance of the *capsule* in that figure is very different from the other species, and the valves are of equal length. This plant is said to have proved biennial in the garden of Malmaison; but it may still be perennial in its native country. We have seen no specimen, nor has this curious species, any more than the last, yet found its way into the English gardens.

TIARINI, Alessandro, in *Biography*, an historical painter, who was born at Bologna in 1577. He was first a disciple of Prospero Fontana, but on the death of that master, he received instructions from Bartolomio Cesi, from whom, being obliged to leave Bologna on account of a quarrel, he went to study under Passignano at Florence. After some time, about seven years, as the influence of the circumstance which had driven him from his native city subsided, he ventured to return there, and became a pupil of the Caracci; and he principally attached himself to Ludovico, more for the improvement of his style, than for practice.

He had, during his residence at Florence, acquired considerable fame, and painted several pictures for churches and convents in places within and round about that city. On his return to Bologna, his talents acquired him considerable employment there, and many of his principal works still adorn its public edifices. Ferdinand, duke of Mantua, invited him to take up his residence with him; sat to him for his portrait, as did all the princes of his family, and many of the nobles of his court.

The colouring adopted by Tiarini in his best time is clear and rich; his design tasteful and agreeable, though of a serious cast; and his expression just and natural: and there are not many artists who have have done more credit to the Bolognese school. He died in 1668, at the advanced age of 91.

TIARIULIA, in *Ancient Geography*, a town of Hispania Citerior, in the interior of the country of the Ilercaons. Ptol.

TIARP, in *Geography*, a town of Sweden, in Westmannland; 25 miles N. of Upsal.

TIASSE, in *Ancient Geography*, a river of the Peloponnesus, in Laconia, which ran between Sparta and Amycla. Pausanias.

TIASUM, a town of Dacia, in the vicinity of Nantidava and Zugma. Ptol.

TIAUSPA, a town of India, on this side of the Ganges, W. of this river and near it. Ptol.

TIB, in *Geography*, a town of Persia, in Chusistan, or Kuzistan; 60 miles N.W. of Shuster.

TIBAENS, a town of Portugal, in the province of Entre Duero e Minho; 4 miles W. of Braga.

TIBALDI, Pellegrino, in *Biography*, was born at Bologna in 1527. He was the pupil of Bagnacavallo, and copied with much attention the works of Vasari, in the refectory of S. Michele in Bosco. At the age of twenty he went to Rome, chiefly to study the works of Michael Angelo. The pictures he produced at Rome obtained for him the patronage of the cardinal Poggi, who employed him in ornamenting his Vigna, near the Porto del Popolo, with works in fresco, and then sent him back to Bologna, to assist in the completion of his palace there (now the Academical Institute), both as architect and painter; and in both characters it remains as the principal testimonial of his powers remaining in Italy. He also constructed and adorned a chapel for his patron in the church of S. Giacopo Maggiore. One of the paintings he executed there was the Preaching of St. John, and another, the Last Judgment; where, in the opinion of the Caracci, he almost equalled the majesty of Michael Angelo, and it was preferred by them to all the other works of Pellegrino, and served them and their scholars as a model of study.

From Bologna, the cardinal sent him to Loretto, to superintend the erection of a chapel in the church of La Madonna, which he also ornamented with stuccoes and paintings of the Nativity, the Presentation in the Temple, the Transfiguration, and the Decollation of St. John. From thence he went to Ancona, where he wrought in the churches of S. Agostino and Ciriaco; and in the great hall of the merchants he painted one of his most celebrated pictures, the subject of which is Hercules overthrowing monsters. He also superintended, as military architect, the fortifications of the place, about the year 1560; and two years afterwards visited Pavia, where he constructed the palace of the Sapienza; he then went to Milan, and there built the temple of S. Fidele, and before the year 1570 was elected architect of the cathedral.

Here he disencumbered the dome of numerous Gothic monuments, sepulchral urns and trophies, and embellished it in their stead with various chapels and a majestic choir. He soon after received a commission from Philip II. to prepare designs and plans for adorning the Escurial, both architectural and pictorial. He followed them to Spain himself in 1586. There he superintended the work for nine years, painting a great number of pictures, particularly some in fresco in the lower cloister, whence he expunged the unsuccessful productions of F. Zucchero. The subjects were from scripture, of the Purification; the Flight into Egypt; the Murder of the Innocents; Christ tempted in the Wilderness; the Election of the Apostles; the Resurrection of Lazarus; the Expulsion of the Money Changers from the Temple; and the Resurrection of our Saviour. Besides these, he painted during his residence in Spain several pictures ture, for other places, particularly for the great church at Madrid, where there are five pictures by him. But his moft renowned work, and which moft contributed to eftablifh his fame in Spain, was the cieling of the library of the Efcurial, where he appears to have rivalled the compofition of the fchool of Athens by Raphael; with beautiful groups of children and figures fupporting the cornices and feftoons in great varieties, and forefhortenings worthy of an imitator of the ftyle of Michael Angelo. For the extraordinary talents which he exhibited in thefe great works, Philip loaded him with riches and honours, and even gave him patents of nobility, creating him marquis of Valdelfa; a diftrict in which his father and his uncle had laboured in the humble capacity of mafons. He lived to an advanced age, but the exact year of his death is not known, though it is thought to have been about 1600.

Pellegrini Tibaldi is confidered, and with fufficient evidence from his works, as the greateft defigner of the Bolognefe and Lombard fchools. He approaches the line of Michael Angelo nearer than all the reft of his imitators; but as he had decidedly adopted the technic without always penetrating the moral principles of his model, the manner of the mafter frequently became the ftyle of the pupil; though it cannot be denied that he often united energy of attitude and grandeur of line, with fublimity of conception and dignity of motive. Of thefe he has given no where more fignal proofs than in the cielings and the compartments of the Academical Inftitute at Bologna. They reprefent various fcenes from the Odyffey; among them, Polypheme waking under the pangs of the fiery point, though painted with a fentiment of original expreffion, is evidently imitated from the newly created figure of Adam in the Siftina; but the fame Cyclops groping at the entrance of his cave to prevent the efcape of Ulyffes and his affociates, is in conception of the whole, and in the detail of the parts, an original invention; a form, than which Michael Angelo himfelf never conceived one of greater energy, with expreffion, attitude, and limbs more in unifon. With this may be placed that wonder of forefhortening, excentricity, and rotundity, the figure of Elpenor, on one of the architraves of the Salotto, reprefented in the moment when, yet dreaming, he leaves his hold, and is precipitated from the roof. The air of originality which this figure in every view prefents, and the elegance with which the imitator has reverfed the figure in the Laft Judgment of Michael Angelo, from which he borrowed the principal limbs of his own, place him on a level with the inventor.

It was, however, lefs for the powers exerted by Pellegrino, in the decorations of the Inftitute, than for the eclectic principle which they difcovered in his fubfequent works, that the Caracci gave him the epithet of *Michel Angelo riformato*, and commended

"Del Tibaldo il decoro e il fondamento."

The compofitions of the chapel Poggi, in St. Giacomo, where the imitation of Michael Angelo is blended with that of Raphael, Corregio, and D. da Volterra, contain the rudiments of their own fyftem.

Pellegrino Tibaldi is more known by his works in frefco than by his pictures in oil, which are extremely fcarce: one of the earlieft is the Nativity, already mentioned, in the Palace Borghefe, of which the cartoon ftill exifts in a private collection of drawings. It is painted in a fober unaffected tone, and confidered as the work of an artift jealous of his line, with great mellownefs of touch. The figures of this are confiderably lefs than the fize of life; but there are pictures of his to be met with of diminutive dimenfions, with all the finifh of miniatures, though rich in figures, touched with great fpirit and equal vivacity of colour: they are generally fet off by backgrounds drawn from his favourite branch of art, architecture. Fufeli's Pilkington.

TIBARANIA, or TIBARÆNIA, in *Ancient Geography*, a country of Afia, in Pontus, in the vicinity of Cappadocia, and adjoining the country of the Chalybes. Steph. Byz.

TIBERIA, a town of Thrace, founded by the emperor Tiberius, whence its name.

TIBERIACUM, a town of Italy, near Ravenna.—Alfo, a town of Lower Germany, upon the route from Colonia Trajana to Colonia Agrippina, between this latter place and Juliacum, according to the Itinerary of Antonine.

TIBERIADES WATER, the water of a hot fpring near Tiberiades in Egypt.

Dr. Perry, when on the fpot, tried fome experiments on this water, which give us a much better idea of its nature than we have from any other accounts of it. Half a drachm of oil of tartar being mixed with an ounce and half of the water, it becomes turbid and muddy; and after twelve hours, three parts of the whole appear like white wool, only leaving a fmall portion of clear water at the top. The white woolly matter dried, produced only a fmall quantity of yellow ochre.

Spirit of vitriol added to the water in the fame quantity, affords a large unctuous fediment of a white colour. A folution of fublimate being mixed in the fame quantity, it became turbid and yellowifh, and yielded an earthy fediment in fmall quantity; whence it feems evident, that it contains a fal murale. Saccharum faturni being added in the fame quantity, the water depofited a lateritious fediment in a fmall quantity. Mixt with fpirit of fal ammoniac, it turns to a blueifh-green turbid liquor, and finally yields a woolly fediment. Sugar of violets mixed with it, turned it to a yellow colour; and the fcrapings of galls mixed with it, turned it to a deep purple; and on fhaking, this became as black as ink.

It appears from thefe experiments, that the water contains a good deal of a grofs fixed vitriolic falt, fome alum, and a fal murale. It is too falt and naufeous for internal ufe; but it muft be of ufe as a bath in all cutaneous foulneffes, efpecially in fcorbutic and leprous cafes; for it will powerfully deterge, fcour, and cleanfe the excretory pores, and it may be, by its weight and ftimulus, reftore them to their natural ftate and tone, and reftore the true ftate of the vitiated folids in general. Phil. Tranf. N° 462. p. 52.

TIBERIANI CAMPI, in *Ancient Geography*, fields of Italy, in the vicinity of Rome, which took their name from the emperor Tiberius, who fixed them at 25 acres.

TIBERIAS, a town of Paleftine, the capital of Galilee, was fituated in a plain, near the lake of Gennefareth, which from this city was alfo called the lake or fea of Tiberias. This city is very famous, and often mentioned by Jewifh writers, becaufe, after the taking of Jerufalem, there was at Tiberias a fucceffion of Hebrew judges and doctors till the fourth century. It was a bifhop's fee in this century. Epiphanius fays that a Hebrew tranflation of St. John, and the Acts of the Apoftles, was kept in this city. It was diftant about 90 miles from Jerufalem. See TABARIA.

TIBERINA INSULA, the ifle of Tiber, fituated in the city of Rome; called by Suetonius the ifle of Æfculapius. Plutarch fays that this ifland was called at Rome the facred ifle and the ifle of two bridges, becaufe in confecrating to Mars a field which belonged to the Tarquins, they threw into the

the river the corn and alſo the trees which grew in this field. Theſe materials, united with the mud brought down by the river, formed an iſland, on which were built ſeveral temples and porticoes.

Tiberina *Regio*, a country of Aſia, in Cappadocia, where was a place named Ariarzus.

TIBERIOPOLIS, a town of Aſia, in Phrygia Major. Ptol.—Alſo, a town of Bulgaria, upon the coaſt of the Euxine ſea.

TIBERIS, or Tiber, a river of Italy, which had its ſource in the Apennines, towards a place called Tifernum Tibarinum. Its courſe was firſt towards the S. paſſing by Peruſia, as far as Tuder, where it turned towards the S.W. as far as the Volſinii. Having received the Clanis, it turned towards the S.E., received the Nar at Hortanum, and continued in this direction as far as a point that lies between Capena and Cures. Aſſuming a direction towards the S., it paſſed to Rome, and then proceeded towards the S.W. to the ſea before Oſtia, *i. e.* the mouths, of which it has many. This river was inconſiderable till it reached Hortanum; but afterwards it was augmented by the Nar, the Valinus, and the Anio, ſo that at Rome it was large and deep. The ancients, by way of enhancing its celebrity, repreſent it as receiving twenty other rivers; but under this general denomination they muſt comprehend ſeveral ſmall ſtreams. It was called by various names.

TIBERIUS Claudius Nero, in *Biography*, a Roman emperor, ſo called after his father, his mother's name being Livia Druſilla, was born in the year B.C. 42. He was at an early age ſo well inſtructed in Greek and Roman literature, as to be able, when nine years old, to pronounce a funeral oration for his father, which gained great applauſe. His temper was naturally reſerved and gloomy, and yet, with the advice of his mother Livia, who was married to Auguſtus, he conducted the uſual ſpectacles with a magnificence which gave ſatisfaction to the Roman people. His firſt appearance in a military character was as a tribune in the Cantabrian war; he next ſuſtained the office of commander-in-chief in placing Tigranes on the Armenian throne, and on his return was made prætor. He was afterwards ſent to join his brother Druſus, and gained a deciſive victory over the Rhetians and Vindelicians. He became conſul in the twenty-eighth year of his age, and thus rapidly advanced to the rank which, as the emperor's ſtep-ſon, he was likely to obtain, and his elevation was accelerated by the death of Agrippa, B.C. 22. Previouſly to his being admitted into a partnerſhip of the empire, Auguſtus obliged him to divorce his wife Viſpania, the daughter of Agrippa, and the object of his choice and affection, and to marry his own daughter Julia, of doubtful reputation.

The next object of his military career was the reduction of the Pannonians, in conſequence of which he was honoured with triumphal ornaments. From his ſucceſsful proſecution of the war in this part of the empire he was ſuddenly called to attend his brother Druſus in his laſt moments: and he afterwards accompanied his remains on foot in a funeral proceſſion to Italy. After his victories had been celebrated by an ovation, he was deputed to make peace in Germany, and being a ſecond time made conſul, B.C. 7, he triumphed on the day when he took poſſeſſion of his dignity. At the expiration of the year, Auguſtus conferred upon him the tribunitial power for five years. At this time Caius, one of the emperor's adoptive ſons, though under age, was raiſed to the pontificate, and introduced into the ſenate. Jealous of Caius as a rival, and diſguſted by the open gallantries of his wife Julia, he reſolved to aſk permiſſion to withdraw from public buſineſs, and to live in retirement at the iſland of Rhodes. Accordingly he ſailed for Rhodes. His wife's conduct became ſo notorious, that ſhe was baniſhed by her father to the iſle of Pandataria, and divorced from her huſband. Having obtained leave of the emperor, though reluctantly granted, to return from Rhodes to Rome, he lived privately till the death of the two Cæſars, Caius and Lucius, opened to him new proſpects. The emperor, whoſe declining age needed an aſſociate, adopted Tiberius A.D. 4, renewing his tribunitian power, and then placing him next to himſelf in the empire. Having brought the war againſt the Pannonians and Dalmatians, as much by policy as by force, to an honourable termination, he obtained a triumph, A.D. 9; and as a recompence of other ſervices, his tribunitian authority was prolonged: but the emperor terminating his life at Nola, Tiberius, without oppoſition, ſucceeded to the empire, in the fifty-fifth year of his age. Paſt experience had taught him the art of diſſimulation, and this art he practiſed during the progreſs of his reign. Although he was very jealous of his authority, he was moderate in the exerciſe of it, and always paid great deference to the ſenate, and reſpect to the conſuls. He was zealous in the adminiſtration of juſtice, and avoided oppreſſive impoſts even in the moſt diſtant provinces, for which he had the leſs occaſion, as he was not avaricious of money; a virtue which, as Tacitus ſays, he retained, when he had renounced all others. To which we may add, that he was munificent in his relief of public calamity and private diſtreſs. Theſe qualities, combined with his ſound ſenſe, rendered the earlier part of his reign as proſperous as perhaps any in the annals of the empire.

The popularity of Germanicus rendered Tiberius jealous, and vigilant of his conduct; and in order to reſtrain his authority, he employed Piſo, a man of ancient family and imperious ſpirit, as his ſubordinate agent for this purpoſe. Germanicus, however, died of a lingering diſeaſe, and Piſo was ſuſpected, if not accuſed, of having given him poiſon. Piſo was impeached in the ſenate for his conduct towards Germanicus. In the courſe of his trial, Tiberius acted with apparent impartiality; but the accuſed, deſpairing of an acquittal, put an end to his own life. Tiberius, in the ſeventh year of his reign, withdrew from Rome to Campania, in order to accuſtom Druſus, who was then conſul, to the exerciſe of the ſupreme power. Notwithſtanding ſeveral inſtances, in which he manifeſted a moderate exerciſe of power, a ſtern unfeeling tyranny was becoming the ſettled character of his reign, to which his growing confidence in the deteſtable Sejanus very much contributed. The death of Druſus, A.D. 23, occaſioned by poiſon, adminiſtered in conſequence of the ſeduction of his wife, was borne by his father Tiberius with a degree of ſelf-poſſeſſion, which was imputed to want of natural affection. After this event he appeared in the ſenate: and the two elder ſons of Germanicus were preſented to him. Taking them by the hand, and delivering a ſpeech which melted the whole aſſembly into tears, he recommended theſe orphans, who had loſt both their uncle and father, to the guardianſhip of the ſenate. Two years after the death of Druſus, Tiberius took an opportunity, which a propoſal for erecting a temple to him and his mother afforded him, of giving his ſentiments on that deification which diſgraced the reigns of the Roman emperors. Recognizing himſelf as a mere mortal, ſubject to all the infirmities of the human condition, and ſufficiently honoured in holding the firſt place among men, he was deſirous that poſterity ſhould know his ſentiments on the ſubject, and that he wiſhed for no other honours paid to his memory than to be thought to have worthily performed the duties of his ſtation. The whole ſpeech, replete with wiſdom and good fenfe, is reported by Tacitus. His defign of retiring from the capital, encouraged for felfifh purpofes by Sejanus, was put into execution A.D. 26. Accordingly he withdrew into the ifle of Capreæ, near the bay of Naples. Here he paffed his remaining years, immerfed in grofs and infamous debauchery, hating mankind, fcarcely known to exift but by his cruelties, and rendering himfelf, in direct oppofition to his own maxims, "let them hate, provided they efteem me," no lefs contemptible than odious. It ought to be mentioned, however, that in a conflagration which confumed a large quarter of Rome, he difplayed a very laudable and fpontaneous munificence. For an account of his connection with Sejanus, and of the effects and termination of that connection, we refer to the article SEJANUS. The latter part of Tiberius's reign was marked by fervility on one hand, and defpotic ferocity on the other; and it appears by one of his letters to the fenate, that he fuffered as much mifery from the anguifh of felf-reproach and tumult of mind as he inflicted: "What I fhall write to you, confcript fathers, or what I fhall not write, or why I fhould write at all at this time, may the gods and goddeffes plague me more than I feel daily that they are doing, if I can tell!" What mental torture it muft have been, fays Tacitus, that could have extorted fuch a confeffion. Some few occafional acts of wifdom and munificence brightened in a faint degree the black picture that was exhibited by his general conduct. Towards the clofe of life, and at an advanced age, the appointment of a fucceffor engaged his attention. He had two alternatives; the one was the nomination of Caius, his grandfon, the fon of Germanicus, who was his adopted fon; and the other, the appointment of Gemellus, the fon of Drufus, who was his fon by nature. The former was of mature age, being now twenty-five, and poffeffed of popular favour. The diffimulation of tbis afpirant to the empire had not eluded the penetration of Tiberius. See CALIGULA.

Tiberius, leaving Capreæ, frequently changed his abode, and at laft ftopped at a country-houfe, which had belonged to Lucullus, near the promontory of Mifenum. There, on March 16th, A.D. 37, he funk into a ftate, in which he appeared dead; upon which Caius, with indecorous precipitance, proceeded with a numerous efcort to feize poffeffion of the empire: but his revival threw them all into confufion. At this inftant Macro, the pretorian prefect, caufed him to be fuffocated with pillows. He died in the feventy-eighth year of his age, and twenty-third of his reign, univerfally execrated; and his predominant vices were fuch, that they have almoft effaced the records of his laudable qualities. Tacitus. Suetonius. Crevier.

TIBERIUS CONSTANTINE, emperor of the Eaft, was a Thracian by birth, and by office captain of the guards to Juftin II. By the recommendation of the emprefs Sophia, he was raifed to the rank of Cæfar A.D. 574, and in 578, when Juftin died, fucceeded to the imperial throne. Sophia, attached to his perfon, had flattered herfelf with the hope of his being her fecond hufband; but on his acceffion to the empire, it appeared that he had been previoufly married to Anaftafia, who was proclaimed Augufta. Sophia, thus difappointed, concurred in a confpiracy for raifing to the purple Juftinian, commander of the eaftern army; but the plot being difcovered, Sophia was punifhed by lofing the greateft part of her allowance. The government of Tiberius has been favourably reprefented. He was temperate, juft, and humane; economical in the difburfement of the revenue, yet liberal and beneficent, and ready to remit the dues of taxation to fufferers under public calamity. The principal events of his reign were two victories over the Perfians. Soon after the fecond victory, Tiberius fell into a difeafe, during which he declared Maurice, who had married his daughter Conftantia, and who had been nominated Cæfar, his fucceffor: and after a reign of four years, he clofed his life in 582, with the general regret of his fubjects. Anc. Un. Hift. Gibbon's Rom. Emp.

TIBESTI, in *Geography*, a town of Africa, on the route from Fezzan to Bornou, inhabited by the people called *Tibbo* (which fee); 150 miles S.E. of Mourzouk. The vales of Tibefti are fertile in corn, and pafturage for cattle, of which they have numerous herds; and they are particularly celebrated for their breed of camels, which are efteemed the beft in Africa. For this fertility they are indebted to the water of the innumerable fprings, that amply compenfate for the want of rain, which feldom, if ever, falls within the limits of Tibefti. Among the natives of Tibefti, different religions are profeffed; for fome of them are Mahometans, and others continue attached to their ancient fyftem of idolatry. From the plain, which lies to the W. of the defert of Tibefti, a part of the mountains of Tibefti take their rife. Thefe vaft hills, the range of which is very extenfive, are varioufly peopled: but fuch of them as are croffed on the route from Fezzan to the city of Bornou, are inhabited by a mixture of Muffulmen and idolaters, who employ themfelves in breeding camels and affes, and other cattle, particularly horfes of a fmall fize.

TIBET. See THIBET.

TIBI, a town of Arabia, in the country of Oman; 8 miles N. of Kalhat.

TIBIA, in *Anatomy*, the large bone of the leg. See EXTREMITIES.

TIBIA, *Fractures of the*. See FRACTURE.

TIBIA *Biceps*. See BICEPS.

TIBIA, in *Mufic*, was originally a flute, made of the fhank or fhin-bone of an animal; and when the art of boring flutes was difcovered, they were made of box-tree, laurel, brafs, filver, and even of gold. See FLUTE.

TIBIA *Articularis*. See BAGPIPE.

Dr. Burney (Hift. Muf. vol. i. p. 521.) apprehends that the union of this inftrument with the fyrinx fuggefted the firft idea of an organ.

TIBIÆ *Pares et Impares*, in the *Dramatic Mufic of the Ancients*. It has been long doubted, whether *pares* and *impares* meant double and fingle flutes, or equal and unequal in point of length and fize. But though in preferring either of thefe acceptations, fome fenfe and meaning is acquired, yet we fhould incline to the latter. For in none of the reprefentations in ancient painting or fculpture, which we have yet feen, does it appear that the tibicen, either at facrifices or in the theatre, plays on a fingle flute, though we as often fee double flutes of different lengths in his hands, as of the fame length; and as harmony, or mufic in different parts, does not appear to have been practifed by the ancients, the flutes of *equal* length may naturally be fuppofed to imply unifons; and *unequal*, fuch as are octaves to each other.

TIBIALIA, among the Romans, a kind of fwaths with which they ufed to cover their legs.

TIBIALIS, in *Anatomy*, a name applied to various organs fituated in the neighbourhood of the tibia. There is an anterior and a pofterior tibial artery, an anterior and pofterior tibial nerve (fee ARTERY and NERVE), and the two following mufcles.

TIBIALIS *Anticus*, jambier antérieur, tibio-fus-tarfien; an elongated mufcle, flattened at the fides, placed on the front of the leg, and extending from the upper end of the tibia to the firft cuneiform bone. It is covered in front by the

the aponeurofis of the leg, to which it adheres clofely at the upper part: the anterior furface of the mufcle forms the convexity on the outfide of the tibia, which is more confiderable in ftrong mufcular fubjects. The inner flat furface correfponds to the outer or concave furface of the tibia, and is attached to its upper half: the outer furface correfponds above to the extenfor longus digitorum pedis, below, to the extenfor longus pollicis pedis: the anterior tibial veffels and nerve being interpofed. The pofterior edge of the mufcle is attached to the upper three-fourths of the interoffeous ligament, then it lies on the front of the tibia, on the ankle joints, and on the upper and inner part of the tarfus. The upper extremity of the mufcle is fixed to the front of the external tuberofity of the tibia; thence it defcends parallel to the tibia, firft increafing in fize, then diminifhing again, and ending about the lower third of the leg in a thick and flat tendon, which defcends over the front of the tibia, and of the ankle, confined by the fuperior annular ligament of the tarfus. (See Fascia.) Having paffed this ligament, the tendon paffes forwards on the foot, then turns obliquely inwards, becoming a little broader, over the convexity of the firft cuneiform bone, and divides into two portions. The pofterior, which is the largeft, is fixed to the inner and front part of the bafis of that bone; the anterior and fmaller is attached to the pofterior extremity of the firft metatarfal bone.

The lower part of the tibialis anticus confifts of a ftrong tendon, which enters the fubftance of the mufcle, and expands into an aponeurofis reaching nearly to the upper end of the mufcle. The flefhy fibres arife from the fafcia of the leg, from the external furface of the tibia, from the interoffeous ligament, and from an aponeurotic feptum between it and the extenfor longus digitorum. They pafs obliquely to both furfaces of the tendon, like the barbs on the fhaft of a feather, and are continued much lower on its pofterior than on the anterior furface.

It bends the foot on the leg, and turns the point inwards: it elevates at the fame time the whole internal edge of the foot. It brings the leg forwards on the foot, and maintains it in that pofition.

Tibialis *Pofticus*, jambier poftérieur, tibio-fous-tarfien, is a long narrow mufcle, thicker above than below, placed at the back of the leg, under the calf, and extending from the upper part of the tibia and fibula to the os naviculare. It is covered behind by the foleus, by the flexor longus digitorum and pollicis pedis. In front it is attached to nearly the whole pofterior furface of the interoffeous ligament, and above, to the pofterior furface of the tibia. On the outfide it is fixed to the fibula. Its upper extremity is divided into two portions, an external and fmaller attached to the fibula, an internal larger to the tibia and interoffeous ligament; they are feparated by an interval, through which the anterior tibial artery paffes. The mufcle defcends parallel to the bones of the leg, and arcuated between them, becoming larger to its middle, from which it again diminifhes; towards the lower part of the leg it forms a ftrong tendon, which runs in a groove hollowed in the external malleolus, and furrounded by a fibrous fheath, which feparates it from the flexor longus digitorum. In this groove the tendon becomes broader: it paffes below the head of the aftragalus, fwelling into a hard and nearly bony fubftance, and is attached to the lower and inner part of the os naviculare, and to the bafis of the firft cuneiform bone. The inferior tendon afcends into the mufcle, expanding into an aponeurofis, in which the flefhy fibres are inferted obliquely on all fides from the fibula, the tibia, the interoffeous ligament, and the aponeurofis, which covers it from the flexor longus digitorum. It extends the foot on the leg, turning the fole and point a little inwards. It will carry the leg backwards on the foot, when that is fixed.

TIBICEN, in *Ancient Mufic*, a flute-player.

Tibicen, in *Ichthyology*, a fifh of the *trigla* kind, called by many authors *lyra*, or the *harp-fifh*; and in fome parts of England, the *piper*.

The head of this fifh runs out into two broad horns, which are ferrated, or befet with a fort of teeth, or fmall fpines, all along their edges, which is its principal diftinction from the hirundo or fwallow-fifh. Above the gill-fins it has on each fide a long and fharp fpine. The forehead is elevated into a fort of eye-brows over the eyes: and at the angles of thefe there are fmall and fhort fpines, which are long and crooked. The fide lines feel but very little rough to the touch, and the forehead between the eyes is not hollowed. The whole head is covered with a bony cruft, which runs into two horns or fpines behind. It has three fingers or filaments on each fide, from the roots of the gill-fins; and its jaws are rough like files, but have no diftinct teeth. The tail-fin, and the middle of the back, in this fifh, are red. It is caught in the Mediterranean, and in fome other feas. In our county of Cornwall it is not unfrequently caught about the fhores, and from the noife it makes, when taken out of the water, is called the *piper*. Ray and Willughby.

TIBIGENSE Oppidum, in *Ancient Geography*, a town of Africa Propria, according to Pliny; called Thigiba by Ptolemy.

TIBIGI, in *Geography*, one of the rivers of the Brazils, which flow into the Parana, rich in diamonds, as the few families that live in its vicinity have reafon to remember with gratitude. Weft of this river and of Corritiva, it is dangerous to land, fince in that direction are found the Anthropophagi, who were driven from thefe boundaries at a very recent period. The country to the N. abounds with wood.

TIBILIS, in *Ancient Geography*, a place of Africa, diftant 10 leagues S.W. from Hippo Regius, and 16 miles E. of Cirta; where are many ruins.

TIBISCA, a town of Lower Mœfia. Ptol.

TIBISCUM, one of the moft confiderable towns of Dacia. Ptol.

TIBISCUS, a river of Dacia, which ran into the Danube.

TIBISIS, a large river, which rofe in mount Hæmus, and purfuing a north courfe, difcharged itfelf into the Ifter.

TIBIUM, a mountain of Afia, in Phrygia.

TIBOELALE, in *Geography*, a town on the S. coaft of the ifland of Ceram. S. lat. 3° 19′. E. long. 128° 45′.

TIBOUCHINA, in *Botany*, an unexplained barbarous name, Aubl. Guian. 445. t. 177. Juff. 329. The fhrub which bears it is fufpected by Schreber to be a fpecies of Melastoma. (See that article.) We fee no reafon to queftion this, though Aublet defcribes the fruit as a dry capfule; for the known *Melaftomæ* differ greatly in the degree of pulp in their berries, efpecially according to the period at which they are examined.

TIBOULEN, in *Geography*, a fmall ifland in the Mediterranean, near the coaft of France. N. lat. 43° 15′. E. long. 6° 24′.

TIBOURBOU, in *Botany*, the Caribbean name of a fine tree of Guiana and Cayenne, called *Apeiba Tibourbou* in Aubl. Guian. 538. t. 213. See Aubletia and Sloanea.

TIBRACANA, in *Ancient Geography*, a town of Aſia, in the interior of Media. Ptol.

TIBULA, or TIBULÆ, a town ſituated on the northern coaſt of the iſland of Sardinia. Ptol. Iter. Anton.

TIBULLUS, ALBIUS, in *Biography*, a Roman poet of the Auguſtan age, of the equeſtrian rank, whoſe native place and time of birth are not aſcertained. His patrimony was much impaired, either by his own prodigality, or by the devaſtation of ſeveral wars; but yet he does not ſeem to have been diſtinguiſhed by any tokens of the liberality of Auguſtus and Mæcenas, the munificent patrons of literature at the period in which he lived; nor does he mention their names in any of his poems. M. Valerius Meſſala Corvinus, upon whom he compoſed a panegyric, was his particular friend and patron, whom he accompanied in his expeditions to Aſia; but he preferred peace and retirement in the ſociety of one of thoſe objects of his affection whom he has celebrated in his elegies. Horace, with whom he was intimate, has addreſſed to him an ode and an epiſtle, complimenting him as a candid judge of his writings, and deſcribing him as poſſeſſed of every worldly advantage. It has been inferred, from an epigram of Domitius Marſus, that he died about the ſame time with Virgil, B.C. 19, in the flower of his age. Ovid lamented his death in a beautiful elegy, repreſenting his mother and ſiſter as mourners at his funeral, and ſpeaking of him as a poet of the higheſt reputation.

The poems of Tibullus are elegies compriſed in three books, and a panegyric of Meſſala. His fame is founded on his elegies, which are deſcribed by one of his biographers as occupying, by the teſtimony of ancient and modern critics, the firſt claſs of ſuch compoſitions with regard to "the appropriate qualities of elegance, tenderneſs, and that beautiful ſimplicity, which is the character of real feeling." Their principal ſubjects are "love and rural life." With his deſcription of a paſſion which is illicit, he has blended "more touches of a pure, and what may be termed a conjugal affection, than almoſt any other Roman poet. His language is a true example of what the Latins call *terſe*, or neat and poliſhed. He is eaſy and natural, with ſcarcely any mixture of learned alluſion or figure." His works are uſually printed with thoſe of Catullus and Propertius; but of the ſeparate editions, the moſt eſteemed are thoſe of Brookhuſius, Amſt. 1708, 4to.; of Vulpius, Patav. 1749, 4to.; and of Heyne, Lipſ. 1755, 1777, 8vo. Gen. Biog.

TIBUR, TIVOLI, in *Ancient Geography*, a town of Italy, near the Anio, N.E. of Rome, in the country of the Sabines. Pliny refers its origin to the age which preceded the ſiege of Troy, and ſays that its founder was Tiburnus, one of the ſons of Amphiariis, aſſiſted by his two brothers, Catille and Corax. This Tiburnus was regarded after his death as a god; and was worſhipped in a wood conſecrated to him, and where a temple was erected to his honour. But Dionyſius Halicarnaſſenſis pretends that it was built by the Siculi, before this epocha. For its ſituation, and ſome other circumſtances attending it, we refer to the article TIVOLI.

Horace has deſcribed in a few lines the beauties which he admired in contemplating this ancient city, Od. 7. lib. i. "Nothing," ſays the poet, "ſtruck me ſo much as the houſe of the reſounding Albunea, the lofty caſcade of the Anio, the ſacred wood of Tiburnus, and the gardens irrigated by unintermitting ſupplies of water." The "domus Albuneæ reſonantis" of the poet was the ſolfatara or ſulphureous abyſs of the place, probably the crater of ſome ancient volcano, which perpetually diſcharged a kind of gas or mephitic vapour, that was thought to poſſeſs a ſanative quality, and to be a remedy for many diſorders. Many perſons reſorted hither for relief; and Suetonius informs us, that Auguſtus alſo came for the benefit of the baths which the place afforded. Theſe benefits were aſcribed to imaginary deities, who were thought to preſide over this privileged ſpot. Accordingly, a monument has been diſcovered, which indicated that Hygeia, the goddeſs of health, was worſhipped here. The vapour poſſeſſed alſo a kind of inſpiring quality, ſo that here was a temple of the Muſes; and alſo, beſides various other monuments, a temple in which was an oracle. Virgil informs us how this oracle was conſulted. The "præceps Anio" of Horace refers to the caſcade of this river. The gardens and vineyards have to this day retained their celebrity; the wine of this canton being held in high eſtimation.

Tibur was alſo famous for its temple of Hercules, which had its college of prieſts and curators; a beautiful portico, where, according to Suetonius, Auguſtus adminiſtered juſtice when he reſided here; and an excellent library of which Aulus Gellius ſpeaks in his "Noctes Atticæ." Tibur had alſo a temple of the Sibyl, much admired for its elegance. This place was alſo famous for other monuments, now in ruins. Towards the end of the Roman republic, the adjoining territory was ſelected for ſuperb buildings and houſes of various kinds, all diſtinguiſhed by their magnificence and beauty. Of theſe, the Tiburnus of Adrian was the moſt celebrated.

TIBURO, in *Ichthyology*, a fiſh very badly and falſely deſcribed by ſeveral authors, and proving, on a ſtrict inquiry, to be no other than the lamia or white ſhark.

The tiburo of Linnæus is a ſpecies of ſqualus, with a very broad and heart-ſhaped head, found in the American ſeas. Linnæus queries, whether it is not a variety of the *zygæna*, or hammer-headed ſhark.

TIBURON, in *Geography*, a town and bay on the S.W. coaſt of Hiſpaniola, near Cape Tiburon.—Alſo, a ſmall iſland in the Pacific ocean, diſcovered by Magellan in 1520. It is variouſly laid down in maps. S. lat. 9°, 13°, 14°, 15°, and 17°.

TIBURONES, or *Main Cape Reef*, two ſmall iſlands, ſurrounded with rocks, near the coaſt of Honduras. N. lat. 15° 10′. W. long. 82° 8′.

TICADEE, a town of Hindooſtan, in the circar of Ruttunpour; 15 miles N. of Dumdah.

TICAL, in *Commerce*, a weight for gold and ſilver, and alſo a money of account in certain parts of the Eaſt Indies, particularly at Pegu and Siam. At Pegu, the weight of ſilver, under this denomination, is divided into 16 toques or touch. Gold and ſilver are here weighed by the tical, and their fineneſs is expreſſed by the parts called touch. The tical weighs $4\frac{1}{2}$ pagodas, or $237\frac{1}{3}$ Engliſh grains. The commercial weights are the vis of 100 ticals or tuals, and the candy of 100 vis. From the above weight of the tical, the candy ſhould weigh $508\frac{1}{2}$ lbs.; nevertheleſs the Engliſh reckon it at 6 maunds 28 ſeers of the Bengal factory, or 500 lbs. avoirdupois.

At Siam, the accounts are kept in catties, tales, ticals or tuals, miams, fouangs, and cowries. The catty is = 20 tales, the tale = 4 ticals = 16 miams = 32 fouangs; and the fouang is = 800 cowries. The coins are gold ticals, which paſs for ten ſilver ticals; ſilver ticals, miams, fouangs, and ſompeias, the latter being the fourth part of a fouang. The ſilver tical weighs $225\frac{1}{2}$ Engliſh grains, and being from 11 oz. 4 dwt. to 11 oz. 12 dwt. fine, is worth from 29*d.* to 30*d.* ſterling; but theſe coins are often adulterated; 2 ticals paſs commonly for 1 Spaniſh dollar, and $2\frac{1}{2}$ ticals for 1 Dutch

1 Dutch ducatoon. The finenefs of gold and filver is expreffed by toques or touch, the weight being divided into 100 parts. The pecul, or weight for heavy goods, is = 50 catties, and the catty = 20 tales = 80 ticals. The Siam pecul weighs 129 lbs. avoirdupois, and the catty, 41 oz. 4½ dwt. avoirdupois.

TICANONA, Tacona, *Jeanona* or *Jeatona*, in *Ancient Geography*, a town of Egypt, between Cene and Oxyrynchon. Itin. Anton.

TICAO, in *Geography*, one of the Philippine iflands, about 25 miles long, and from 3 to 8 broad. N. lat. 12° 39′. E. long. 123° 34′.

TICENA, in *Ancient Geography*, a town of Africa Propria, S. of Carthage, between the rivers Bagradas and Triton. Ptol.

TICENGO, in *Geography*, a town of Italy, in the department of the Upper Po; 6 miles E. of Crema.

TICHASA, Te-Gewse, in *Ancient Geography*, a town of Africa Propria, S. of Carthage, between the rivers Bagradas and Triton, 12 leagues S.W. of Capfa: in which are fome veftiges of the Romans. Ptol.

TICHENBRAY, in *Geography*. See Tinchebray.

TICHFIELD, a village of England, in the county of Hants, fituated on a river which runs into the Southampton Water. Here Charles I. concealed himfelf, when he fled from Hampton-Court, in the year 1674, at a feat of the earl of Southampton. This feat had been an abbey, and is faid to be the place where the marriage of Henry VI. with Margaret of Anjou was folemnized; 8 miles N.W. of Gofport.—Alfo, a town of Jamaica, on the N. coaft; 22 miles N.E. of Kingfton. N. lat. 18° 12′. W. long. 76° 10′.

TICHIS, in *Ancient Geography*, a river which flowed from the Pyrenees, now *Tech*, in the department of the Eaftern Pyrenees.

TICHIUM, a town of Greece, in Etolia. Thucydides.

TICHOS, or Tichus, a fortrefs of Achaia, in the eaftern part to the S. of the promontory Araxum.

TICINDLO, or *Naviglio Grande*, in *Geography*, a canal made from the river Tefino to the city of Milan, by order of Francis I. king of France.

TICINUM, Pavia, in *Ancient Geography*, a town of Tranfpadane Gaul to the S.W. upon the river Ticinus, or near it. After the fecond Punic war, it attained the rank of municipal. Odoacer, king of the Heruli, deftroyed it, and it was rebuilt under the name of Papia, whence the name Pavia.

TICINUS, Tesin, a river of Tranfpadane Gaul, which commenced in the country of the Lepontii, traverfed the lake Verbanus, and difcharged itfelf into the Po, near Ticinum. It is celebrated for a battle of the fame name, between the Romans, conducted by Cornelius Scipio, the father of Scipio Africanus, and the Carthaginians, conducted by Hannibal, in the year of Rome 535, in which the Romans were defeated.

TICK, in *Natural Hiftory*, a nafty little animal of a livid colour, with a blunt and roundifh tail, elevated antennæ, a globofe-ovate form, and full of blood; which infefts cows, fwine, goats, fheep, and dogs. The tick or ricinus is, in the Linnæan fyftem, a fpecies of *acarus* in the *aptera* order of infects.

In order to deftroy and remove thefe noxious vermin, which fpread very rapidly in fheep, it has been recommended to feparate the wool, and to wafh the difeafed fpots two or three times, or oftener, if neceffary, with a liquid preparation, confifting of one ounce of cream of tartar, and a quarter of a pound of bay-falt, each finely powdered and fifted, and one ounce of corrofive fublimate, reduced into the fame ftate; the whole being well diffolved and mixed together in two quarts of foft water: or four pounds of foft foap, and two pounds of arfenic, may be fteeped and diffolved in thirty gallons of water, and the animals be immerfed in the infufion or folution, the heads of them being carefully kept above water, and the fheep being fheltered from rain for one or two days afterwards. The wool muft be clofely preffed, and the liquor that runs off be caught in a tub, or other veffel, for future ufe. The proportion above fpecified, is fufficient to bathe or wafh forty lambs, or the fame number of fmall fheep; and fometimes many more.

But the preparation which is in ufe at Holkham-Hall, in the county of Norfolk, for this purpofe, confifts of two pounds of tobacco, two pounds and a half of foft foap, and one pound of the white calx of mercury, well reduced into powder; the whole being boiled in eight gallons of water for an hour. This is a quantity fufficient for dreffing fixty fheep, being applied by parting the wool down the fhoulders and breaft, and twice on each of the fides of the fheep, then pouring it in very carefully fo as to prevent its being wafted. It is faid to be very effectual not only in deftroying the vermin, but in removing the fcabby fores that are produced.

It is ftated in a paper in the third volume of the "Tranfactions of the Highland Society of Scotland," that the tick, or *acarus reduvius*, is a diftinct fpecies or fort of vermin of this kind from that of the kid, or *hippobofca ovina*, the former of which haraffes the lambs and trembling fheep in the fpring feafon, while the latter molefts all forts and ages, but particularly hogs or young fheep, and chiefly fuch as are in a lean ftate. The former always adheres clofe to the bare fpots of the fhoulders, thighs, or ears, draining and drawing away the blood from them; and for the moft part drops off about midfummer: but the latter harbours in the wool, bites the fheep, and fucks their blood. Smearing with tar, it is faid, expels it from the fkin, and it foon afterwards drops from the wool. Tobacco-juice is fatal to it almoft inftantaneoufly, and mercurial ointment deftroys it. The former, or tick, is removed by the fame remedies as the kid, and it is wholly prevented by having the young fheep in good condition. This diftinction, in fome cafes, may be of confiderable ufe to the fheep-farmer in the deftruction and removal of fuch hurtful vermin.

Tick, in the *Manege*, a habit that fome horfes take of preffing their teeth againft the manger, or all along the halter or collar, as if they would bite it.

Tick-*Bean*, or *Ticks*, in *Agriculture*, a term commonly applied to the fmall bean employed in the feeding of horfes and other animals; of which there are feveral kinds, as the common ticks, the large flat ticks, the fmall or Effex ticks, and the French ticks. The firft is a fort which is fmall and very commonly cultivated, but moft generally by the farmers of Kent, where they are ufed for the fattening of hogs, and as food for horfes, efpecially thofe of the team kind. The fecond is a larger fort than the common, and ripens fomewhat more early. They are very productive in fome cafes; but from being larger in fize, they of courfe are lefs heavy, and confequently of rather lefs value the quarter or any other meafure. They are fometimes called May beans. The Effex ticks are a much fmaller fort than the common, and of a rounder fhape or form. They ripen a few days later, and are not fo productive, but are more valuable, as being heavier in proportion. The laft fort, or fmall French ticks, are a ftill lefs kind, being only about as large as a middling-fized pea, and nearly circular. They ripen later than

than any of the other forts, but are the moft valuable when dry, on account of their great weight.

Ticks are an important article of cultivation in moft places, where the land is fuited to their growth; and though they have been for a long time, and are at prefent, almoft wholly confined to the counties of Effex and Kent, they may be raifed in many other diftricts with equal fuccefs and advantage.

TICKARRY, in *Geography*, a town of Hindooftan, in Bahar; 15 miles N.W. of Gaya. N. lat. 24° 58′. E. long. 85°.

TICKELL, Thomas, in *Biography*, an Englifh poet, was the fon of a clergyman in Cumberland, and born at Bridekirk, near Carlifle, in the year 1686. He was admitted at Queen's college, Oxford, in 1701; and in 1707 he publifhed a poem, entitled "Oxford," and infcribed it to lord Lonfdale, expreffing his gratitude to that univerfity. In 1708 he took his degree of M.A., and two years after was elected a fellow of his college, under a difpenfation from the crown againft the ftatute which required him to be in orders. With a view of advancement by the exercife of his literary talents, he came to the metropolis, and ingratiated himfelf with Addifon by an elegant copy of verfes in praife of his opera of Rofamond. He contributed to the periodical publications of the "Spectator" and "Guardian," in the latter of which, all the papers on paftoral poetry, except one by Pope, are afcribed to him. During the negotiations which terminated in the peace of Utrecht, he publifhed a very popular poem, entitled "The Profpect of Peace," which was highly commended by Addifon, in return for which commendation he wrote his lines on the "Cato" of that author. On the acceffion of the Hanover family, to which he was attached, he prefented George I. on his arrival with a piece called "The Royal Progrefs;" and he ferved the caufe ftill more effectually by two fatirical poems on the Jacobite party, *viz.* "An Imitation of the Prophecy of Nereus," and "An Epiftle from a Lady in England to a Gentleman at Avignon." Tickell accompanied Addifon to Ireland, and was there initiated in public bufinefs with a view to future preferment. On occafion of Pope's publication of the firft volume of his tranflation of Homer's Iliad, Tickell publifhed a tranflation of the firft book of that poem, which was patronifed by Addifon, fo as to occafion an interruption of his friendfhip with Pope. When Addifon was made fecretary of ftate, Tickell was underfecretary, and continued in office under his fucceffor Craggs. On the death of Addifon, Tickell was entrufted with the charge of publifhing his works, to which he prefixed a valuable life of the author. In 1725 he was appointed to the lucrative poft of fecretary to the lords-juftices of Ireland, and retained it till his death, which happened at Bath in 1740. Tickell had been married and left a family.

Tickell is ranked by his biographers among Englifh poets of the fecond order; equalled by few of his contemporaries in eloquence of diction and harmony of verfification, and without lofty flights maintaining a decent elevation by a cultured ftyle, and by juft and ingenious thoughts. His funeral poem on Addifon is pronounced by Dr. Johnfon to be more fublime and elegant than any that is to be found in the whole compafs of Englifh literature. His "Ode to the Earl of Sunderland," and his "Colin and Lucy," are highly commended.

Richard Tickell, efq. a grandfon of this poet, who was a commiffioner of the ftamp-office, has been known to the literary world by his "Wreath of Fafhion," and efpecially by an effufion of political art and fatire, entitled "Anticipations of the Debates of the Houfe of Commons," 1778. He died at Hampton Court in 1793. Johnfon and Anderfon's Lives of the Poets. Gen. Biog.

TICKELY, in *Geography*, a town of Hindooftan, in the circar of Cicacole; 30 miles N.E. of Cicacole. N. lat. 18° 36′. E. long. 84° 34′.

TICKERA, a pafte which is prepared in Fezzan from dates and the meal of Indian corn, and which, whenever they travel, is in great requeft among the people of Fezzan.

TICKEREE, in *Geography*, a town of Hindooftan, in Oude; 48 miles N.E. of Manickpour.

TICKHILL, a market-town in the lower divifion of the wapentake of Strafford-and-Tickhill, in the Weft Riding of the county of York, England; is 4 miles W. from Bawtry, 7 miles S. from Doncafter, and 154 miles N. by W. from London. The houfes are placed in a valley, and cover a large fpace of ground. Some of them are of brick, and others of ftone: a few of them are refpectable, but the more numerous have only a mean appearance. A market is held on Fridays, but is nearly fallen into difufe. A fair is kept annually for horfes, horned cattle, and fheep. The population return of the year 1811, ftates that Tickhill contained 1508 inhabitants, who occupied 279 houfes. The objects moft worthy of attention are the church, and the remains of an ancient caftle. The former is a fpacious edifice, with a lofty and beautiful tower, and from its architecture feems to have been built in the reign of Henry III. The caftle, of which nothing now remains but the lofty mound on which the keep formerly ftood, with a ditch and part of the walls furrounding the fortrefs, is fituated on the fouth fide of the town. An ancient gateway, forming the entrance on the weftern fide, is the moft curious part of the ruins. Part of thefe, with modern repairs and additions, is the feat of the honourable Frederick Lumley. A great part of the ground within the walls is converted into gardens and fhrubberies. The fteep declivity of the mound is formed into winding walks, leading by a gentle afcent to the fummit.

The hiftory of Tickhill prior to the Norman conqueft is wholly unknown. It appears to have been one of the forty-nine manors given by the Conqueror to Roger de Bufli, who probably erected and refided in the caftle. It was afterwards fucceffively held by feveral noblemen, till Richard II. gave it to his uncle, John of Gaunt, duke of Lancafter, from whom it paffed to the crown by the fucceffion of Henry IV. In the year 1644 the caftle was regarded as a very ftrong fortrefs, and was garrifoned for Charles I.; but being furrendered to the parliament, an order was iffued that it fhould be difmantled and rendered untenable. The circular keep was in confequence demolifhed, but the foundations may ftill be traced by opening the ground. A royal free chapel or collegiate church was founded in the caftle by queen Eleanor, wife of Henry II. It was given by king John to the prebends of the cathedral church of Rouen in Normandy. It was afterwards granted to the prior and convent of Lenton, Nottinghamfhire; and in 1504 to the abbot and convent of St. Peter, Weftminfter. After the diffolution it was given by Edward VI. to Francis, earl of Shrewfbury.

About two miles and a half from Tickhill is Sandbeck, the feat of the earl of Scarborough. The manfion, built by the late earl, is a large and commodious edifice, feated in a fpacious park, which abounds with foreft trees; and is adorned with an extenfive lake. Near the weftern verge of the park, are the venerable and picturefque ruins of Roche abbey, which was founded in the year 1147, for monks of the Ciftercian order. Here is a famous quarry, from which the

the ſtone for building the abbey, and for many other public edifices, was obtained.

About five miles nearly S. from Tickhill is Walding Well, the ſeat of ſir Thomas White, bart. The houſe is a modern edifice, ſituated in a well-wooded park of conſiderable extent, and ſtands partly in Yorkſhire and partly in Nottinghamſhire; a ſmall rivulet, which runs under a part of the out-buildings, forming the boundary between the two counties. In the park was formerly a priory of nuns, called St. Mary in the Park, founded by Ralph de Cheurolcourt. This religious houſe appears to have ſtood within the limits of Nottinghamſhire.—Beauties of England and Wales, vol. xvi. Yorkſhire; by J. Bigland.

TICKING, or Tiching, in *Huſbandry*, denotes the act of ſetting up turfs in ſuch a manner as that they may be dried by the ſun, and fit for being burnt into aſhes on the land.

TICKLE Harbour, in *Geography*, a harbour on the E. coaſt of Newfoundland.

Tickle *me Quickly*, a bay on the coaſt of Darien, near the Samballas.

TICKLISH, in the *Manege*. A horſe is ſaid to be ticklish that is too tender upon the ſpur, and too ſenſible, that does not freely fly the ſpurs, but in ſome meaſure reſiſts them, throwing himſelf up when they come near and prick his ſkin. A ticklish horſe has ſomewhat of the ramingues, *i. e.* the kickers againſt the ſpurs; but with this difference, that the latter put back, leap, and kick, and yerk out behind, in diſobeying the ſpurs; whereas a ticklish horſe only reſiſts for ſome time, and afterwards obeys, and goes much better, through the fear of a vigorous ham, when he finds the horſeman ſtretch his leg, than he does upon being actually pricked.

TICKSAH, in *Geography*, a river of America, in the Miſſiſſippi territory, which riſes 10 miles N.E. of the forks of the Amite, and when it enters Weſt Florida, is a creek of trivial ſize; it then becomes gradually augmented by ſeveral creeks, and after a S. courſe of 50 miles, falls into lake Maurepas, 4 miles N.E. of the mouth of Amite. Three miles above its mouth the Tickſah receives from the E. the united ſtreams of the Notalbany and Pontchatoola, upon the latter of which ſtands Springfield, on the road from Madiſonville to Natchez. Springfield is one of the landing places of travellers, who paſs in ſchooners from New Orleans to Natchez. The above-mentioned Amite riſes within the Miſſiſſipi territory, about 20 miles N. of the town of Liberty, in Amite county. The two ſtreams that conſtitute the Amite, remain ſeparate in their courſe through the Miſſiſſipi territory, but unite immediately on entering Weſt Florida, and then it joins the Iberville, and falls after a whole courſe of 100 miles into the lake Maurepas. Below the junction of Amite and Iberville, the united ſtreams form a fine navigable river, admitting veſſels of ſix feet draught.

TICKSEED Sun-flower. See Coreopsis, and Sun-flower.

TICOLEA, in *Geography*, a town of Hindooſtan, in Bahar; 7 miles N. of Bettiah. N. lat. 26° 55′. E. long. 84° 38′.

TICOLOOSA, a town of the United States of America, in Tenneſſee; 38 miles S. of Knoxville.

TICONDEROGA, a townſhip of Eſſex county, in the ſtate of New York, erected in 1804. It is bounded N. by Crown Point, E. on lake Champlain, S. by Waſhington county, W. by Scroon, and includes the N. end of lake George. Mount Defiance is in the S. part of this townſhip. In 1810 it had about two hundred families, and thirty-five ſenatorial electors: ſeven ſaw-mills, three grain-mills, three forges, three carding-engines, and ſome other machines, and three ſchool-houſes. Here is alſo a broom machine, in which, by means of machinery moved with water, one man makes a hundred brooms a day. The inhabitants are moſtly farmers.

In this townſhip ſtands the fortreſs of Ticonderoga, now a heap of ruins. It was built by the French in 1756, on a point of land formed by the junction of lake George creek with lake Champlain, in N. lat. 43° 50′, and 34′ E. long. from New York. It was, both by nature and art, a place of great ſtrength. On three ſides it is ſurrounded by water, and about half the other ſide is occupied by a deep ſwamp, and the line of defence was completed by the French with the erection of a breaſt-work nine feet high, on the only aſſailable ground. In 1758, general Abercrombie with the Britiſh army unſucceſsfully aſſailed this fortreſs, and with the loſs, as it is ſaid, of 1941 men; but in July of the following year it was ſurrendered to general Amherſt. It was the firſt fortreſs carried by the arms of America, in their conteſt for independence; being taken by ſurpriſe by general Allen, May 10, 1775, and retained till July 1777, when it was evacuated at the approach of general Burgoyne with the Britiſh army. This fort is never likely to be rebuilt; for the ſituation is very inſecure, being commanded by the lofty hill called Mount Defiance. Mount Independence lies on the E. ſide of the lake, about two miles S.E. of the fort, between which two places there is a well-regulated ferry. The population of the townſhip, in 1810, conſiſted of 985 perſons.

TICOO, a town on the W. coaſt of Sumatra, near the Line. E. long. 99° 21′.

Ticoo *Iſlands*, a cluſter of ſmall iſlands near the W. coaſt of Sumatra. S. lat. 0° 6′. E. long. 99° 13′.

TICORANTE, a town of the iſland of Teneriffe.

TICOREA, in *Botany*, a name of Aublet's. See Ozophyllum.

TICOS, in *Geography*, a ſmall iſland in the Pacific ocean, near the E. coaſt of the iſland of Luçon. N. lat. 14° 10′. E. long. 124°.

TICOUL Hotun, a town of Corea; 450 miles E.N.E. of Peking.

TICOUR, a town of France, in the department of the Moſelle; 6 miles N.W. of Morhange.

TICSAN, a town of Peru, in the juriſdiction of Cuença.

TICUARIN, the name of the iſland of Goa, before the city was built.

TICUNAS, *Poiſon of*, is an active poiſon prepared by the native Indians, on the borders of the river of the Amazons, in three or four degrees of ſouth latitude, which, together with that of Lamas, Pevas, and Yameos, is extracted by fire from plants, called by the French lianes, and uſed in poiſoning their arrows. See an account of the nature and effects of theſe poiſons by M. Heriſſant, in Phil. Tranſ. vol. xlvii. art. 12. and by M. Fontana, in Phil. Tranſ. vol. lxx. part i. Append. art. 2.; and alſo Fontana ſur les Poiſons, &c. Florence, 4to. See alſo Poison.

TIDE, or Tidi, in *Geography*, a river of England, which paſſes by St. Germains, and runs into the Hamoaze below Saltaſh.

Tide, the ſame with time, or ſeaſon. The word is originally Saxon, *tid;* which ſignifies the ſame.

Tide, among *Miners*, denotes the ſpace of twelve hours.

Tide, *Shrove*. See Shrove.

Tide, *Twelfth*. See Twelfth.

Tide, *Whitfun.* See Whitsun-*Tide*.

TIDES, two periodical motions of the waters of the fea; called alfo the *flux* and *reflux*, or the *ebb* and *flow*.

When the motion of the water is againft the wind, it is called a *windward-tide:* when wind and tide go in the fame direction, *leeward-tide:* when it runs very ftrong, it is called a *tide-gate.*

To tide it over or up into any place, is to go in with the tide, either ebb or flood, as long as that lafts; then to ftay at anchor all the time of contrary tide; and thus to fet in again with the return of the next tide.

It is faid to *flow-tide* and *half-tide*, allowing fix hours to a tide, when the tide runs three hours in the offing longer than it does by the fhore; but, by *longer*, they do not mean its running more hours; but that, if it be high water a-fhore at twelve, it will not be fo in the offing till three. An hour and a half longer make tide and quarter-tide, three-fourths of an hour longer make tide and half-quarter tide, &c.

When the moon is in the firft and third quarter, *i. e.* when fhe is new and full, the tides are high and fwift, and are called *fpring-tides:* when fhe is in the fecond and laft quarter, the tides are lower and flower, and called *neap-tides.*

Tides, *Phenomena of the.* The fea is obferved to flow, for certain hours, from fouth towards north; in which motion, or flux, which lafts about fix hours, the fea gradually fwells: fo that, entering the mouths of rivers, it drives back the river-waters toward their heads, or fprings.

After a continual flux of fix hours, the fea feems to reft for about a quarter of an hour; after which it begins to ebb or retire back again from north to fouth, for fix hours more; in which time, the water finking, the rivers refume their natural courfe. Then, after a feeming paufe of a quarter of an hour, the fea again begins to flow, as before; and thus alternately.

Thus does the fea ebb twice a day, and flow as often; but not in the fame hours. The period of a flux and reflux is 12 hours $50\frac{1}{2}$ minutes; fo that the tides return later and later each day by $50\frac{1}{2}$ minutes, which is the excefs of a lunar day above a folar one, fince $28\frac{1}{2}$ lunar days are nearly equal $29\frac{1}{2}$ folar ones. So that the fea flows as often as the moon paffes the meridian, both the arc above, and that below the horizon; and ebbs as often as fhe paffes the horizon, both the eaftern and weftern point of it.

This farther agreement we obferve between the moon and the fea, that the tides, though conftant, are not equal; but are greateft, when the moon is in conjunction or oppofition to the fun, or at the time of new and full moon; and leaft, when in quadrature to it. This increafe and diminution conftitute the *fpring* and *neap* tides: the augmentation becomes alfo ftill more obfervable when the moon is in its perigee, or neareft the earth. The loweft as well as the higheft water is at the time of the fpring-tides: the neap-tides neither rife fo high nor fall fo low.

Laftly, thofe tides are the greateft, which happen in the new and full moon, and the time of the equinoxes, while the moon is in its perigee. Thefe tides are often ftill more increafed by the equinoctial winds, which are fometimes fo powerful as to produce a greater tide before or after the equinox than that which happens in the ufual courfe, at the time of the equinox itfelf.

Add, that the fame things are obferved throughout moft of the coafts of Europe; only that the tides are fo much the lefs, and happen the later, as the coafts are the more northerly.

Thefe phenomena of the tides are admirably accounted for, from the principle of gravitation. All we require to their folution is, that the earth and moon, and every particle of them, mutually gravitate towards each other: the reafonablenefs of which affumption, fee under the article Gravity.

Indeed the fagacious Kepler, long ago, conjectured this to be the caufe of the tides: "If," fays he, "the earth ceafed to attract its waters towards itfelf, all the water in the ocean would rife and flow into the moon: the fphere of the moon's attraction extends to our earth, and draws up the water." Thus thought Kepler, in his Introd. ad Theor. Mart. This furmife, for it was then no more, is now abundantly verified in the following theory, firft amply deduced by Dr. Halley from the Newtonian principles.

However, we may obferve with M. de la Lande (Aftronomie, vol. iv. Paris, 1781.) that feveral of the ancients, and among others, Pliny, Ptolemy, and Macrobius, were acquainted with the influence of the fun and moon upon the tides. And Pliny fays exprefsly, that the caufe of the ebb and flow is in the fun, which attracts the waters of the ocean; and adds, that the waters rife in proportion to the proximity of the moon to the earth.

Tides, *Theory of the.*—1. It is obvious, that if the earth were entirely fluid, and quiefcent, its particles, by their mutual gravity towards each other, would form themfelves into the figure of an exact fphere.

Suppofe, then, that fome power acts on all the particles of this earth with an equal force, and in parallel directions, the whole mafs will be moved by fuch a power, but its figure will fuffer no alteration by it; becaufe all the particles, being equally moved by this power in parallel lines, they will ftill keep the fame fituation with refpect to each other, and ftill form a fphere, whofe centre will have the fame motion as each particle. Upon this fuppofition, if the motion of the earth round the common centre of gravity of the earth and moon were deftroyed, and the earth were left to the influence of its gravitation toward the moon, the earth falling toward the moon would ftill retain its fpherical figure; all the parts being equally carried on, and retaining therefore the fame fituation with refpect to each other. But the effects of the moon's action, as well as the action itfelf, on different parts of the earth, are unequal, at all places within the angular diftance of $79\frac{1}{2}°$ from the line paffing through the attracting body, either in the nearer or in the remoter hemifphere: thofe parts, by the general law of gravity, being moft attracted which are neareft the moon, and thofe being leaft attracted which are fartheft from the moon; while the parts that are at a middle diftance, are attracted by a mean degree of force; befides, all the parts are not acted on in parallel lines, but in lines directed towards the centre of the moon; and on thefe accounts the fpherical figure of the earth muft fuffer fome change from the moon's action.

Suppofing the earth to fall towards the moon, and abftracting from the mutual gravitation of its parts towards each other, and alfo from their cohefion; it will eafily appear, that the parts neareft the moon would fall with the fwifteft motion, being moft attracted, and that they would leave the centre or greater bulk of the earth behind them in their fall, while the more remote parts would fall with the floweft motion, being lefs attracted than the reft, and be left a little behind the bulk of the earth, fo as to be found at a greater diftance from the centre of the earth than at the beginning of the motion. Whence it is manifeft, that the earth would foon lofe its fpherical figure, and form itfelf into an oblong elliptic fpheroid, whofe longeft diameter would point at the centre of the moon.

If the particles of the earth did not gravitate toward each other, but toward the moon only, the diſtances betwixt the parts of the earth that are ſuppoſed to be neareſt the moon, and the central parts, would continually increaſe, becauſe of their greater celerity in falling; and the diſtance betwixt the central parts, and the parts that are fartheſt from the moon, would increaſe continually at the ſame time; theſe being left behind by the central parts, which they would follow, but with a leſs velocity. Thus the figure of the earth would become more and more oblong, that diameter of it which pointed toward the moon continually increaſing.

But there is another reaſon why the earth would ſoon aſſume an oblong ſpheroidal form, if its parts were allowed to fall freely by their gravity towards the moon's centre; for the lateral parts of the earth, or thoſe which are at the diſtance of a quarter of a circle from the point which is directly below the moon, and the central parts deſcending with equal velocities toward the ſame point, *viz.* the centre of the moon, in approaching to it, would manifeſtly approach, at the ſame time, to each other; and their diſtance becoming leſs, the diameters of the earth paſſing through them would be diminiſhed, ſo that the diameters of the earth that point toward the moon would increaſe, and thoſe diameters of the earth that are perpendicular to the line joining the centres of the earth and moon, would decreaſe at the ſame time, and render the figure of the earth ſtill more oblong for this reaſon.

Let us now allow the parts of the earth to gravitate towards its centre; and, as this gravitation far exceeds the action of the moon, and much more exceeds the differences of her actions on different parts of the earth, the effect reſulting from the inequalities of theſe actions of the moon, will be only a ſmall diminution of the gravity of thoſe parts of the earth which it endeavoured in the former ſuppoſition to ſeparate from its centre, and a ſmall addition to the gravity of thoſe parts which it endeavoured to bring nearer to its centre; that is, thoſe parts of the earth which are neareſt to the moon, and thoſe which are fartheſt from her, will have their gravity toward the earth ſomewhat abated; whereas the lateral parts will have their gravity increaſed; ſo that if the earth be ſuppoſed fluid, the columns from the centre to the neareſt, and to the fartheſt parts muſt riſe, till, by their greater height, they be able to balance the other columns, whoſe gravity is either not ſo much diminiſhed, or is increaſed by the inequalities of the action of the moon. And thus the figure of the earth muſt ſtill be an oblong ſpheroid.

Let us now conſider the earth, inſtead of falling toward the moon by its gravity, as projected in any direction, ſo as to move round the centre of gravity of the earth and moon; it is manifeſt, that the gravity of each particle toward the moon will endeavour to bring it as far from the tangent, in any ſmall moment of time, as if the earth were allowed to fall freely toward the moon; in the ſame manner as any projectile, at our earth, falls from the line of projection as far as it would fall by its gravity in the perpendicular in the ſame time. Conſequently the parts of the earth neareſt to the moon will endeavour to fall fartheſt from the tangent, and thoſe fartheſt from the moon will endeavour to fall leaſt from the tangent, of all parts of the earth; and the figure of the earth, therefore, will be the ſame as if the earth fell freely toward the moon; that is, the earth will ſtill affect a ſpheroidal form, having its longeſt diameter directed toward the moon.

In order to underſtand this theory, it muſt be carefully conſidered, that it is not the action of the moon, but the inequalities in that action, that produce any variation from the ſpherical figure; and that if this action were the ſame in all the particles as in the central parts, and operating in the ſame direction, no ſuch change would enſue.

For the farther illuſtration of the preceding obſervations, we muſt perceive that the waters at Z (*Plate* I. *Geography*, *fig.* 10.) on the ſide of the earth A B C D E F G H, next to the moon M, are more attracted than the central parts of the earth, O, by the moon, and the central parts are more attracted by her than the waters on the oppoſite ſide of the earth at *n*; and therefore the diſtance between the earth's centre and the waters on its ſurface, under and oppoſite to the moon, will be increaſed. For let H, O, and D be three bodies, all equally attracted by the body M, and they will all move equally faſt toward it, their mutual diſtances from each other continuing the ſame. If the attraction of M is unequal, then that body which is moſt ſtrongly attracted will move faſteſt, and this will increaſe its diſtance from the other body. Conſequently, by the law of gravitation, M will attract H more ſtrongly than it does O, by which the diſtance between H and O will be increaſed; and a ſpectator in O will perceive H riſing higher toward Z. In like manner O, being more ſtrongly attracted than D, will move farther toward M than D does; and therefore the diſtance between O and D will be increaſed; and a ſpectator in O, not perceiving his own motion, will ſee D receding farther from him towards *n*; all effects and appearances being the ſame, whether D recedes from O, or O from D.

Suppoſe now there is a number of bodies, as A, B, C, D, E, F, G, H, placed round O, ſo as to form a flexible or fluid ring; then, as the whole is attracted toward M, the parts at H and D will have their diſtance from O increaſed; whilſt the parts at B and F, being nearly at the ſame diſtance from M as O is, will not recede from one another; but rather, by the oblique attraction of M, they will approach nearer to O. Hence the fluid ring will form itſelf into an ellipſe Z I B L *n* K F N Z, whoſe longer axis *n* O Z produced, will paſs through M, and its ſhorter axis, B O F, will terminate in B and F. Let the ring be filled with fluid particles, ſo as to form a ſphere round O; then, as the whole moves toward M, the fluid ſphere, being lengthened at Z and *n*, will aſſume an oblong or oval form. If M is the moon, O the earth's centre, A B C D E F G H the ſea covering the earth's ſurface, it is evident that, whilſt the earth by its gravity falls towards the moon, the water directly below her at H will ſwell, and gradually riſe toward her; and alſo the water at D will recede from the centre, (or, ſtrictly ſpeaking, the centre recedes from D,) and riſe on the oppoſite ſide of the earth; whilſt the water at B and F is depreſſed, and falls below the former level. Hence, as the earth turns round its axis from the moon to the moon again in about $24\frac{3}{4}$ hours, this oval of water muſt ſhift with it; and thus there will be two tides of flood and two of ebb in that time.

Some perſons have found a difficulty in conceiving how, agreeably to the principles above ſtated, the earth can fall towards the moon by the power of gravity, when the moon is full, or in oppoſition to the ſun; ſince the earth revolves about the ſun, and muſt continually fall towards it; and if the earth is conſtantly falling towards the moon, they muſt at laſt come together. In order to obviate this difficulty, it has been ſuggeſted, that it is not the centre of the earth that deſcribes the annual orbit round the ſun, but the common centre of gravity of the earth and moon, the diſtance of which from the earth's centre, dividing 240,000 miles, the moon's diſtance from the earth, by 40, the exceſs of the earth's weight above that of the moon, is 6000 miles; and that whilſt the earth is moving round the ſun, it alſo deſcribes a circle round that centre of gravity, going as many times round it in one revolution about the ſun as there are lunations or courſes of the moon round the ſun in a year; and therefore the earth is conſtantly falling towards the moon from a tangent to the circle which it deſcribes round the ſaid common centre of gravity. Let M (*fig.* 11.) be the moon, T W part of the moon's orbit, and C the centre of gravity of the earth and moon: whilſt the moon goes round her orbit, the centre of the earth deſcribes the circle *d g e* round C, to which circle *g a k* is a tangent; and, therefore, when the moon has gone from M a little beyond W, the earth has moved from *g* to *e*, and in that time has fallen towards the moon, from the tangent at *a* to *e*, and ſo on round the whole circle.

From the above reaſoning it appears, that the parts of the earth directly under the moon, or that have the moon in their zenith, and alſo thoſe in the nadir, or places diametrically oppoſite to each other, will have the flood, or high water at the ſame time.

Moreover, thoſe parts of the earth, where the moon appears in the horizon, or 90° diſtant from the zenith and nadir, will have the ebbs, or loweſt waters.

It is evident that, by the motion of the earth on its axis, the moſt elevated part of the water is carried beyond the moon in the direction of the rotation. The water continues to riſe after it has paſſed directly under the moon, though the immediate action of the moon there begins to decreaſe, and comes not to its greateſt elevation till it has got half a quadrant farther. It continues alſo to deſcend after it has paſſed at 90° diſtance from the point below the moon, though the force which the moon adds to its gravity begins to decreaſe there. For ſtill the action of the moon adds to its gravity, and makes it deſcend till it has got half a quadrant farther; the greateſt elevation, therefore, is not in the points which are in a line with the centres of the earth and moon, but about half a quadrant to the eaſt of theſe points in the direction of the motion of rotation. Thus in open ſeas, where the water flows freely, the moon, M, (*fig.* 10.) is generally paſt the north and ſouth meridian, as at *p*, when the high water is at Z and at *n*: the reaſon of which is plain, becauſe the moon acts with ſome force after ſhe has paſt the meridian, and thereby adds to the libratory or waving motion, which the water acquired when ſhe was in the meridian; and, therefore, the time of high water is not preciſely at the time of her coming to the meridian, but ſome time after.

Beſides, the tides anſwer not always to the ſame diſtance of the moon from the meridian at the ſame places; but are variouſly affected by the action of the ſun, which brings them on ſooner when the moon is in her firſt and third quarters, and keeps them back later when ſhe is in her ſecond and fourth; becauſe, in the former caſe, the tide raiſed by the ſun alone, would be earlier than the tide raiſed by the moon, and in the latter caſe later.

For the further illuſtration of the principle upon which lunar tides depend, we ſhall ſuppoſe, with Dr. Young, that the earth were wholly fluid, and the ſame part of its ſurface were always turned towards the moon; in which caſe, the pole of the ſpheroid being immediately under the moon, the lunar tide would remain ſtationary; the greateſt elevation being at the points neareſt to the moon and fartheſt from her, and the greateſt depreſſion in the circle equally diſtant from theſe points; the elevation, however, being twice as great as the depreſſion, on account of the ſmaller ſurface to which it is confined. The actual height of this elevation would probably be about 40 inches, and the depreſſion 20, making together a tide of five feet. If alſo the waters were capable of aſſuming inſtantly ſuch a form as the equilibrium would require, the ſummit of a ſpheroid equally elevated would ſtill be directed towards the moon, notwithſtanding the earth's rotation. This may be called the primitive tide of the ocean: but on account of the perpetual change of place which is required for the accommodation of the ſurface to a ſimilar poſition with reſpect to the moon, as the earth revolves, the form muſt be materially different from that of ſuch a ſpheroid of equilibrium. The force employed in producing this accommodation, may be eſtimated by conſidering the actual ſurface of the ſea as that of a wave moving on the ſpheroid of equilibrium, and producing in the water a ſufficient velocity to preſerve the actual form. We may deduce, ſays Dr. Young, from this mode of conſidering the ſubject, a theory of the tides which appears to be more ſimple and ſatisfactory than any which has yet been publiſhed: and by comparing the tides of narrower ſeas and lakes with the motions of pendulums ſuſpended on vibrating centres, we may extend the theory to all poſſible caſes.

If the centre of a pendulum be made to vibrate, the vibrations of the pendulum itſelf, when they have arrived at a ſtate of permanence, will be performed in the ſame time with thoſe of the centre; but the motion of the pendulum will be either in the ſame direction with that of the centre, or in a contrary direction, accordingly as the time of this forced vibration is longer or ſhorter than that of the natural vibration of the pendulum; and in the ſame manner it may be ſhewn that the tides, either of an open ocean or of a confined lake, may be either direct or inverted with reſpect to the primitive tide, which would be produced, if the waters always aſſumed the form of the ſpheroid of equilibrium, according to the depth of the ocean, and to the breadth as well as the depth of the lake. In the caſe of a direct tide, the time of the paſſage of the luminary over the meridian muſt coincide with that of high water, and in the caſe of an inverted tide with that of low water.

In order that the lunar tides of an open ocean may be direct, or ſynchronous, its depth muſt be greater than 13 miles, and for the ſolar tides than 14. The leſs the depth exceeded theſe limits, the greater the tides would be, and in all caſes they would be greater than the primitive tides. But in fact the height of the tides in the open ocean is always far ſhort of that which would be produced in this manner; it is therefore improbable that the tides are ever direct in the open ocean, and that the depth of the ſea is ſo great as 13 miles.

In order that the height of the inverted or remote lunar tides may be five feet, or equal to that of the primitive tides, the depth of the open ſea muſt be $6\frac{1}{2}$ miles; and if the height is only two feet, which is perhaps not far from the truth, the depth muſt be $3\frac{1}{2}$ miles.

The tides of a lake or narrow ſea differ materially from thoſe of the open ocean, ſince the height of the water ſcarcely undergoes any variation in the middle of the lake; it muſt always be high water at the eaſtern extremity when it is low water at the weſtern: and this muſt happen at the time when the places of high and low water, with reſpect to the primitive tides, are equally diſtant from the middle of the lake.

The tides may be direct in a lake 100 fathoms deep and leſs than 8° wide; but if it be much wider, they muſt be inverted. Suppoſing the depth a mile, they will be direct when the breadth is leſs than 25°; but if a ſea, like the Atlantic, were 50 or 60 degrees wide, it muſt be at leaſt four miles deep, in order that the time of high water might coincide with that of the moon's ſouthing.

Hitherto we have conſidered the motion of the water as free

free from all refiftance ; but where the tides are direct, they muft be retarded by the effect of a refiftance of any kind ; and where they are inverted, they muft be accelerated ; a fmall refiftance producing, in both cafes, a confiderable difference in the time of high water.

Where a confiderable tide is obferved in the middle of a limited portion of the fea, it muft be derived from the effect of the elevation or depreffion of the ocean in its neighbourhood ; and fuch derivative tides are probably combined in almoft all cafes with the ofcillations belonging to each particular branch of the fea.

Lunar tides, the rife and progrefs of which are fcientifically traced by Dr. Young, are fubject, independently of the influence of the fun, to a variety of modifications, fome of which we fhall fpecify in the fequel of this article.

2. We have hitherto taken notice only of the action of the moon in producing tides ; but it is manifeft that, for the fame reafons, the inequality of the fun's action on different parts of the earth would produce a like effect, and that this alone would caufe a like variation from the exact fpherical figure of a fluid earth. So that, in reality, there are two tides every natural day from the action of the fun, as there are in the lunar day from that of the moon, fubject to the fame laws ; and the lunar tide, as we have obferved, is fomewhat changed by the action of the fun, and the change varies every day on account of the inequality between the natural and the lunar day. Indeed, the effect of the fun in producing tides, becaufe of his immenfe diftance, muft be confiderably lefs than that of the moon, though the gravity toward the fun be much greater, the folar tide being, as Dr. Young ftates it, only about two-fifths of the lunar. For it is not the action of the fun or that of the moon, but the inequalities in the actions of each, which have any effect. The fun's diftance is fo great, that the diameter of the earth is as a point compared to it, and the difference between the action of the fun on the neareft, and that on the fartheft parts, becomes, on this account, vaftly lefs than it would be if the fun were as near as the moon.

However, the immenfe bulk of the fun makes the effect ftill fenfible, even at fo great a diftance ; and, therefore, though the action of the moon has the greateft fhare in producing the tides, the action of the fun adds fenfibly to it when they confpire together, as in the change and full of the moon, when they are nearly in the fame line with the centre of the earth, and therefore unite their forces. Thus, in conjunction, or when the fun and moon are on the fame fide of the earth, they both confpire to raife the water in the zenith, and confequently in the nadir ; and when they are in oppofition, that is, when the earth is between them, whilft one makes high water in the zenith and nadir, the other does the fame in the nadir and zenith. Confequently, in the fyzygies, or at new and full moon, the tides are the greateft, and are what we call the *fpring-tides*. Moreover, the action of the fun diminifhes the effect of the moon's action in the firft and laft quarters, becaufe the one raifes the water in that cafe where the other depreffes it ; and therefore, in the quadratures the tides are the leaft, and are called *neap-tides*.

As the lunar tide is much larger than the folar tide, the former muft always determine the time of high and low water, which, in the fpring and neap-tides, remains unaltered by the effect of the fun ; fo that in the neap-tides the actual time of low water is that of the folar high water ; but at the intermediate times, the lunar high water is more or lefs accelerated or retarded. The progrefs of this alteration may eafily be traced by means of a fimple conftruction. If we make a triangle, of which two of the fides are two feet and five feet in length, the external angle which they form being equal to twice the diftance of the luminaries, the third fide will fhew precifely the magnitude of the compound tide, and the halves of the two angles oppofite to the firft two fides the acceleration, or retardation, of the times of high water belonging to the feparate tides refpectively. Hence it appears that the greateft deviation of the joint tide from the lunar tide amounts to $11^{\circ}\ 48'$ in longitude, and the time correfponding to 47 minutes, fuppofing the proportion of the forces to remain always the fame ; but in fact the forces increafe in proportion as the cubes of the diftances of their refpective luminaries diminifh, as well as from other caufes ; and in order to determine their joint effects, the lengths of the fides of the triangle muft be varied accordingly. In fome ports, from a combination of circumftances in the channel, by which the tides reach them, or in the feas, in which they originate, the influence of the fun and moon may acquire a proportion fomewhat different from that which naturally belongs to them : thus at Breft, the influence of the moon appears to be three times as great as that of the fun ; when it is ufually only twice and a half as great.

Sir Ifaac Newton has calculated the effects of the fun and moon refpectively upon the tides from their attractive powers. The augmentation of the gravity of the lateral parts of the earth, produced by the action of the fun, is a fimilar effect to an augmentation, eftimated by him on another occafion, that is made to the gravity of the moon toward the earth by the fame action, when the moon is in the quarters ; only the addition made to the gravity of the lateral parts is about $60\frac{1}{2}$ times lefs, becaufe their diftance from the earth's centre is fo many times lefs than the diftance of the moon from it. The gravity of thofe parts of the earth that are directly beneath the fun, and of thofe oppofite to it, is diminifhed by a double quantity of what is added to the lateral parts ; and as the diminution of gravity of the one, and augmentation of gravity of the other, confpire together in raifing the water under the fun, and the parts oppofite to it, above its height in the lateral parts ; the whole force that produces this effect is to be confidered as triple of what is added to the gravity of the lateral parts ; and is thence found to be to the gravity of the particles as 1 to 12868200, and to the centrifugal force at the equator as 1 to 44527. The elevation of the waters by this force is confidered by Newton as an effect fimilar to the elevation of the equatorial parts above the polar parts of the earth, arifing from the centrifugal force at the equator ; and, being 44527 times lefs, is found to be 1 foot and $11\frac{1}{30}$ inches, Paris meafure. This is the elevation arifing from the action of the fun upon the water.

Mr. Maclaurin makes this elevation to be 1 foot $10\frac{8656}{10000}$ inches, of the fame meafure, which differs from the above eftimate by the $\frac{1}{6}$th part of an inch ; and the greateft elevation, when the fun is in the equinoctial, 1 foot $11\frac{1}{20}$ inches.

In order to find the force of the moon upon the water, Newton compares the fpring-tides, at the mouth of the river Avon, below Briftol, with the neap-tides there, and finds their proportion to be that of 9 to 5 ; whence, after feveral neceffary corrections, he concludes, that the force of the moon is to that of the fun, in raifing the waters of the ocean, as 4.4815 to 1 ; fo that the force of the moon is able, of itfelf, to produce an elevation of 8 feet and $7\frac{5}{22}$ inches, and the fun and moon together may produce an elevation of about $10\frac{1}{2}$ feet, in their mean diftances from the earth, and an elevation of about 12 feet, when the moon

... nearest the earth. The height to which the water is found to rise, upon coasts of the open and deep ocean, is agreeable enough to this computation.

Dr. Horsley estimates the force of the moon to that of the sun as 5.0469 to 1. Newton Princip. lib. iii. sect. iii. prop. 36, 37, apud Newt. Op. Ed. Horsley, vol. iii. p. 104. &c. and Maclaurin's Diss. de Causa Physica Fluxus & Refluxus Maris, apud Phil. Nat. Princ. Math. Comment. le Seur & Jacquier, tom. iii. p. 272.

3. It must be observed that the spring-tides do not happen precisely at new and full moon, nor the neap-tides at the quarters, but a day or two after, (at least two, and commonly three tides after,) because, as in other cases, so in this, the effect is not greatest or least when the immediate influence of the cause is greatest or least. As, *e. g.* the greatest heat is not on the solstitial day, when the immediate action of the sun is greatest, but some time after.

That this may be more clearly understood, let it be considered, that though the actions of the sun and moon were to cease this moment, yet the tides would continue to have their course for some time; for the water, where it is now highest, would subside, and flow down on the parts that are lower, till, by the motion of descent, being there accumulated to too great a height, it would necessarily return again to its first place, though in a less measure, being retarded by the resistance arising from the attraction of its parts. Thus it would for some time continue in an agitation like to that in which it is at present. The waves of the sea, that continue after a storm ceases, and every motion almost of a fluid, may illustrate this.

The resistance of fluids, in general, says Dr. Young, is as the square of the velocity, consequently it must be much greater for the lunar than for the solar tide, in proportion to the magnitude of the force; and the acceleration of the lunar tide produced by this cause must be greater than that of the solar: hence it may happen, that when the lunar tide occurs two or three hours after the transit of the moon, the solar tide may be three or four hours after that of the sun, so as to be about an hour later, at the times of conjunction and opposition, and the tides will be highest when the moon passes the meridian about an hour after the sun; while at the precise time of the new and full moon, the lunar tide will be retarded about a quarter of an hour by the effect of the solar tide.

4. The different distances of the moon from the earth produce a sensible variation in the tides. When the moon approaches the earth, her action on every part increases, and the differences of that action on which the tides depend, increase. For her action increases as the squares of the distances decrease; and though the differences of the distances themselves be equal, yet there is a greater disproportion betwixt the squares of less, than the squares of greater quantities; *e. g.* 3 exceeds 2, as much as 2 exceeds 1; but the square of 2 is quadruple of the square of 1, whilst the square of 3 (*viz.* 9) is little more than double the square of 2 (*viz.* 4).

Thus it appears, that by the moon's approach, her action on the nearest parts increases more quickly than her action on the remote parts; and the tides, therefore, increase in a higher proportion as the distances of the moon decrease. Sir Isaac Newton shews, that the tides increase in proportion as the cubes of the distances decrease, so that the moon, at half her present distance, would produce a tide eight times greater.

The moon describes an ellipse about the earth, and in her nearest distance produces a tide sensibly greater than at her greatest distance from the earth: and hence it is, that two great spring-tides never succeed each other immediately; for if the moon be at her nearest distance from the earth at the change, she must be at her greatest distance at the full, having, in the intervening time, finished half a revolution; and, therefore, the spring-tide then will be much less than the tide at the change was: and for the same reason, if a great spring-tide happens at the time of full moon, the tide at the ensuing change will be less.

5. The spring-tides are greatest about the time of the equinoxes, *i. e.* about the latter end of March and September, and least about the time of the solstices, *i. e.* toward the end of June and December; and the neap-tides are least at the equinoxes and greatest at the solstices; so that the difference betwixt the spring and the neap-tides is much less considerable at the solstitial than at the equinoctial seasons. In order to illustrate and evince the truth of this observation, it is manifest, that if either the sun or moon were in the pole, they could have no effect on the tides, for their action would raise all the water at the equator to the same height, and any place of the earth, in describing its parallel to the equator, would not meet, in its course, with any part of the water more elevated than another, so that there could be no tide in any place.

The effect of the sun or moon is greatest when in the equinoctial; for then the axis of the spheroidal figure, arising from their action, moves in the greatest circle, and the water is put into the greatest agitation; and hence it is that the spring-tides produced, when the sun and moon are both in the equinoctial, are the greatest of any, and the neap-tides are the least of any, about that time.

But the tides produced when the sun is in either of the tropics, and the moon in either of her quarters, are greater than those produced when the sun is in the equinoctial, and the moon in her quarters, because, in the first case, the moon is in the equinoctial, and in the latter case, the moon is in one of the tropics; and the tide depends more on the action of the moon than that of the sun, and is, therefore, greatest when the moon's action is greatest.

However, it is necessary to observe, 6. That, because the sun is nearer the earth in winter than in summer, *i. e.* in February and October than in March and September, the greatest spring-tides are after the autumnal, and before the vernal equinox.

7. Since the greatest of the two tides happening in every diurnal revolution of the moon, or lunar day, *i. e.* about $24^h\ 50^m$, is that in which the moon is nearest the zenith, or nadir; for this reason, while the sun is in the northern signs, the greater of the two diurnal tides in our climates, is that arising from the moon above the horizon: when the sun is in the southern signs, the greatest is that arising from the moon below the horizon.

In proof of this observation, let it be considered, that when the moon declines from the equator toward either pole, one of the greatest elevations of the water follows the moon, and describes nearly the parallel on the earth's surface which is under that which the moon, on account of the diurnal motion, seems to describe; and the opposite greatest elevation, being antipodal to that, must describe a parallel as far on the other side of the equator; so that while the one moves on the north side of the equator, the other moves on the south side of it, at the same distance. Now the greatest elevation which moves on the same side of the equator, with any place, will come nearer to it than the opposite elevation, which moves in a parallel on the other side of the equator; and, therefore, if a place is on the same side fide of the equator with the moon, the day-tide, or that which is produced while the moon is above the horizon of the place, will exceed the night-tide, or that which is produced while the moon is under the horizon of the place. It is the contrary if the moon is on one fide, and the place on the other fide of the equator; for then the elevation which is oppofite to the moon, moves on the fame fide of the equator with the place, and, therefore, will come nearer to it than the other elevation. The difference will be greateft when the fun and moon both defcribe the tropics; becaufe the two elevations in that cafe defcribe the oppofite tropics, which are the fartheft from each other of any two parallel circles they can defcribe. Thus it is found, by obfervation, that the evening tides in the fummer exceed the morning tides, and the morning tides in winter exceed the evening tides. The difference is found at Briftol to amount to fifteen inches, and at Plymouth to one foot. It would be ftill greater, but that a fluid always retains an impreffed motion for fome time; fo that the preceding tides affect always thofe that follow them. Upon the whole, while the moon has north declination, the greateft tides in the northern hemifphere are when fhe is above the horizon, and the reverfe while her declination is fouth.

To illuftrate this matter by figures; let N E S Q (*fig.* 12, 13, 14.) be the earth, N C S its axis, E Q the equator, T ♋ the tropic of Cancer, *t* ♑ the tropic of Capricorn, *a b* the arctic circle, *c d* the antarctic, N the north pole, S the fouth pole, M the moon, F and G the two eminences of water, whofe loweft parts are at *a* and *d* (*fig.* 12.), at N and S (*fig.* 13.), and at *b* and *c* (*fig.* 14.), always 90° from the higheft.

Now, when the moon is in her greateft north declination at M (*fig.* 12.), the higheft elevation, G, under her is on the tropic of Cancer, T ♋, and the oppofite elevation, F, on the tropic of Capricorn, *t* ♑; and thefe two elevations defcribe the tropics by the earth's diurnal rotation. All places in the northern hemifphere, E N Q, have the higheft tides when they come into the pofition *b* ♋ Q, under the moon; and the loweft tides when the earth's diurnal rotation carries them into the pofition *a* T E, on the fide oppofite to the moon: the reverfe happens at the fame time in the fouthern hemifphere E S Q, as is evident to fight. The axis of the tides *a* C *d* has now its poles *a* and *d* (being always 90° from the higheft elevations) in the arctic and antarctic circles; and, therefore, it is plain, that at thefe circles there is but one tide of flood, and one of ebb, in the lunar day. For when the point *a* revolves half round to *b* in twelve lunar hours, it has a tide of flood; but when it comes to the fame point *a* again in twelve hours more, it has the loweft ebb. In feven days afterward, the moon M (*fig.* 13.) comes to the equinoctial circle, and is over the equator E Q, when both elevations defcribe the equator; and in both hemifpheres, at equal diftances from the equator, the tides are equally high in both parts of the lunar day. All the phenomena being reverfed, when the moon has fouth declination, to what they were when her declination was north, require no farther defcription, *fig.* 14.

From what has been faid it appears, that as the tides are governed by the moon, they muft turn on the axis of the moon's orbit, which is inclined $23\frac{1}{2}$ degrees to the earth's axis at a mean ftate; and, therefore, the poles of the tides muft be fo many degrees from the poles of the earth, or in oppofite points of the polar circles, going round thefe circles in every lunar day. It is true that, according to *fig.* 14, when the moon is vertical to the equator E C Q, the poles of the tides feem to fall in with the poles of the world N and S; but when we confider that F G H is under the moon's orbit, it will appear that when the moon is over H, in the tropic of Capricorn, the north pole of the tides (which can be no more than 90° from under the moon) muft be at C in the arctic circle, not at P, the north pole of the earth; and as the moon afcends from H to G in her orbit, the north pole of the tides muft fhift from *c* to *a* in the arctic circle, and the fouth pole as much in the antarctic.

It is not to be doubted, but that the earth's quick rotation brings the poles of the tides nearer to the poles of the world than they would be if the earth were at reft, and the moon revolved about it only once a month; for, otherwife, the tides would be more unequal in their heights, and times of their returns, than we find they are. But how near the earth's rotation may bring the poles of its axis and thofe of the tides together, or how far the preceding tides may affect thofe which follow, fo as to make them keep up nearly to the fame heights, and times of ebbing and flowing, is a problem more fit to be folved by obfervation than by theory.

Thofe who have opportunity to make obfervations, and choofe to fatisfy themfelves whether the tides are really affected in the above manner by the different pofitions of the moon, efpecially as to the unequal times of their returns, may take this general rule for knowing when they ought to be fo affected. When the earth's axis inclines to the moon, the northern tides, if not retarded in their paffage through fhoals and channels, nor affected by the winds, ought to be greateft when the moon is above the horizon, leaft when fhe is below it; and quite the reverfe when the earth's axis declines from her; but in both cafes at equal intervals of time. When the earth's axis inclines fideways to the moon, both tides are equally high, but they happen at unequal intervals of time. In every lunation the earth's axis inclines once to the moon, once from her, and twice fideways to her, as it does to the fun every year; becaufe the moon goes round the ecliptic every month, and the fun but once in a year. In fummer, the earth's axis inclines towards the moon when new; and, therefore, the day-tides in the north ought to be higheft, and night-tides loweft about the change: at the full the reverfe. At the quarters they ought to be equally high, but unequal in their returns; becaufe the earth's axis then inclines fidewife to the moon. In winter the phenomena are the fame at full moon as in fummer at new. In autumn the earth's axis inclines fidewife to the moon when new and full; therefore the tides ought to be equally high and unequal in their returns at thefe times. At the firft quarter the tides of flood fhould be leaft when the moon is above the horizon, greateft when fhe is below it, and the reverfe at her third quarter. In fpring, the phenomena of the firft quarter anfwer to thofe of the third quarter in autumn, and *vice verfâ*. The nearer any time is to either of thefe feafons, the more the tides partake of the phenomena of thefe feafons; and in the middle between any two of them, the tides are at a mean ftate between thofe of both.

8. Such would the tides regularly be, if the earth were all over covered with fea very deep, fo that the water might follow the influence of the fun and moon; but, by reafon of the fhoalnefs of fome places, and the narrownefs of the ftreights in others, by which the tides are propagated, there arifes a great diverfity in the effect, not to be accounted for, without an exact knowledge of all the circumftances of the places; fuch as the pofition of the land, and the breadth and depth of the channels, direction of the winds, &c. For a very flow and unperceptible motion of the whole body of water,

water, where it is (for example) two miles deep, will fuffice to raife its furface ten or twelve feet in a tide's time; whereas, if the fame quantity of water were to be conveyed through a channel forty fathoms deep, it would require a very great ftream to effect it in fo large inlets as are the channel of England and the German ocean; whence the tide is found to fet ftrongeft in thofe places where the fea grows narroweft, the fame quantity of water being, in that cafe, to pafs through a fmaller paffage.

This is moft evident in the ftreights between Portland and Cape la Hogue in Normandy, where the tide runs like a fluice; and would be yet more between Dover and Calais, if the tide, coming round the ifland, did not check it.

This force, being once impreffed upon the water, continues to carry it above the level of the ordinary height of the ocean, particularly where the water meets a direct obftacle, as it does in St. Maloes; and where it enters into a long channel, which running far into the land, grows very ftraight at its extremity, as it does into the Severn fea at Chepftow, where the tide rifes to 40 feet, and Briftol, where its height is 30 feet. At Breft, the height of the tides is about 20 feet; at St. Maloes, 50; at Annapolis, in the bay of Fundy, as much fometimes as 100 feet. In the Mediterranean, the tides are generally inconfiderable; neverthelefs they are perceptible: at Naples, they fometimes rife to a foot; at Venice, to more than two feet; and in the Euripus, for a certain number of days in each lunation, they are very diftinctly obfervable from the currents which they occafion. In the Weft Indies, and alfo in the gulf of Mexico, the tides are lefs obfervable than in the neighbouring feas, perhaps on account of fome combinations derived from the variations of the depth of the rivers, and from the different channels by which they are propagated.

The fhoalnefs of the fea, and the intercurrent continents, are the reafons that in the open ocean the tides rife but to very fmall heights in proportion to what they do in wide-mouthed rivers, opening in the direction of the ftream of the tide; and that high-water is not at the time of the moon's appulfe to the meridian, but always fome hours after it, as it is obferved upon all the weftern coafts of Europe and Africa, from Ireland to the Cape of Good Hope; in all which a fouth-weft moon makes high water; and the fame is reported to hold in the weft of America.

So that tides happen to different places at all diftances of the moon from the meridian, and confequently at all hours of the lunar day.

It is to be confidered that, in order to allow the tides their full motion, the ocean, in which they are produced, ought to be extended from eaft to weft 90° at leaft. Becaufe the places, where the moon rifes moft, and moft depreffes the water, are at that diftance from each other. Hence it appears, that it is only in the great oceans that fuch tides can be produced, and why in the larger Pacific ocean they exceed thofe in the Atlantic ocean. Hence alfo it is obvious, why the tides are not fo great in the torrid zone, between Africa and America, where the ocean is narrower, as in the temperate zones on either fide; and we may hence alfo underftand, why the tides are fo fmall in iflands that are very far diftant from the fhores. It is manifeft, that, in the Atlantic ocean, the water cannot rife on one fhore but by defcending on the other; fo that, at the intermediate diftant iflands, it muft continue at a mean height betwixt its elevation on one and on the other fhore. But when tides pafs over fhoals, and through ftreights into bays of the fea, their motion becomes more various, and their height depends on many circumftances.

The tide entering the Atlantic appears, fays Dr. Young, to advance northwards at the rate of about 500 miles an hour, correfponding to a depth of about three miles, fo as to reach Sierra Leone at the eighth hour after the moon's fouthing; this part of Africa being not very remote from the meridian of the middle of the South Atlantic ocean, and having little fhare in the primitive tides of that ocean. The fouthern tide feems then to pafs by Cape Blanco and Cape Bojador, to arrive at Gibraltar at the thirteenth hour, and to unite its effects with thofe of other tides at various parts of the coafts of Europe.

We may therefore confider the Atlantic as a detached fea, about 3500 miles broad, and three miles deep; and a fea of thefe dimenfions is fufceptible of tides confiderably larger than thofe of the ocean, but how much larger we cannot determine without more accurate meafures. Thefe tides would happen on the European coafts, if there were no refiftance, a little lefs than five hours after the moon's fouthing, and on the coaft of America, a little more than feven hours after; but the refiftance oppofed to the motion of the fea may eafily accelerate the time of high-water in both cafes about two hours, fo that it may be a little before the third hour on the weftern coafts of Europe and of Africa, and before the fifth on the moft expofed parts of the eaftern coaft of America; and in the whole of the Atlantic, this tide may be combined more or lefs both with the general fouthern tide, and with the partial effects of local elevations or depreffions of the bottom of the fea, which may caufe irregularities of various kinds. The fouthern tide is, however, probably lefs confiderable than has fometimes been fuppofed, for, in the latitudes in which it muft originate, the extent of the elevation can only be half as great as at the equator; and the iflands of Kerguelen's land and South Georgia, in the latitudes of about 50° and 55°, have their tides delayed till the tenth and eleventh hours, apparently becaufe they received them principally from diftant parts of the ocean, which are nearer to the equator.

On the weftern coafts of Europe, from Ireland to Cadiz; on thofe of Africa, from Cape Coaft to the Cape of Good Hope; and on the coaft of America, from California to the ftreights of Magellan, as well as in the neighbouring iflands; it is ufually high-water at fome time between two and four hours after the moon's fouthing; on the eaftern coaft of South America, between four and fix; on that of North America, between feven and eleven; and on the eaftern coafts of Afia and New Holland, between four and eight. The Society Iflands are perhaps too near the middle of the Pacific ocean to partake of the effects of its primitive tide, and their tide, being fecondary, is probably for this reafon a few hours later. At the Almirantes, near the eaftern coaft of Africa, the tide is at the fixth hour; but there feem to be fome irregularities in the tides of the neighbouring iflands.

The progrefs of a tide may be very diftinctly traced from its fource in the ocean into the narrow and fhallow branches of the fea which conftitute our channels. Thus the tide is an hour or two later at the Scilly Iflands than in the Atlantic, at Plymouth three, at Cork, Briftol, and Weymouth four, at Caen and Havre fix, at Dublin and Brighthelmftone feven, at Boulogne and Liverpool eight, at Dover near nine, at the Nore eleven, and at London-bridge twelve and a half. Another portion appears to proceed round Ireland and Scotland into the North fea; it arrives from the Atlantic at Londonderry in about three hours, at the Orkneys in fix, at Aberdeen in eleven, at Leith in fourteen, at Loeftoffe in twenty, and at the Nore in about twenty-four, fo as to meet there the fubfequent tide coming from the fouth. From the time occupied by the tide in travelling from the mouth of the Englifh

Channel

Channel to Boulogne, at the rate of about fifty miles an hour, we may calculate that the mean depth of the channel is about twenty-eight fathoms, independently of the magnitude of the refiſtances of various kinds to be overcome, which require us to ſuppoſe the depth from thirty to forty fathoms. In the great river of Amazons, the effects of the tides are ſtill ſenſible at the ſtreights of Pauxis, 500 miles from the ſea, after an interval of ſeveral days ſpent in their paſſage up: for the ſlower progreſſive motion of the water no more impedes the progreſs of a wave againſt the ſtream, than the velocity of the wind prevents the tranſmiſſion of ſound in a contrary direction.

Dr. Young obſerves, that ſcarcely a ſingle inſtance occurs that favours the ſuppoſition of high water in the open ſea being within an hour of the moon's ſouthing, as it muſt be if the depth were very great; ſo that neither the height of the tide, nor the time of high-water, will allow us to ſuppoſe the ſea any where quite ſo deep as four miles.

The tide that is produced on the weſtern coaſts of Europe, in the Atlantic, correſponds to the ſituation of the moon already deſcribed. Thus it is high-water on the coaſts of Spain, Portugal, and the weſt of Ireland, about the third hour after the moon has paſſed the meridian; from thence it flows into the adjacent channels, as it finds the eaſieſt paſſage. One current from it, *e. g.* runs up by the ſouth of England, another comes in by the north of Scotland; they take a conſiderable time to move all this way, and it is high-water ſooner in the places to which they firſt come, and it begins to fall at thoſe places, while they are ſtill going on to others that are farther in their courſe. As they return, they are not able to raiſe the tide, becauſe the water runs faſter off than it returns, till, by a new tide propagated from the open ocean, the return of the current is ſtopped, and the water begins to riſe again. The tide, propagated by the moon in the German ocean, when ſhe is three hours paſt the meridian, takes about twelve hours to come from thence to London-bridge; ſo that when it is high-water there, a new tide is already come to its height in the ocean; and, in ſome intermediate place, it muſt be low water at the ſame time.

Conſequently, when the moon has north declination, and we ſhould expect the tide at London to be the greateſt when the moon is above the horizon, we find it is leaſt; and the contrary when ſhe has ſouth declination.

At ſeveral places it is high-water three hours before the moon comes to the meridian; but that tide which the moon puſhes, as it were, before her, is only the tide oppoſite to that which was raiſed by her when ſhe was nine hours paſt the oppoſite meridian.

It would be endleſs to recount all the particular ſolutions which are eaſy corollaries from this doctrine: as why the lakes and ſeas, ſuch as the Caſpian ſea and the Mediterranean ſea, the Black ſea and Baltic, have either ſmall or no very ſenſible tides: for lakes are generally ſo ſmall, that when the moon is vertical ſhe attracts every part of them alike, and therefore no part of the water can be raiſed higher than another: and having no communication with the ocean, it can neither increaſe nor diminiſh their water, in order to riſe and fall; and ſeas that communicate by ſuch narrow inlets, and are of ſo immenſe an extent, cannot, in a few hours time, receive and empty water enough to raiſe or ſink their ſurface any thing ſenſibly.

To demonſtrate the excellency of this doctrine, the example of the tides in the port of Batſha, in the kingdom of Tonquin, in the Eaſt Indies, 20° 50′ N. lat. which are ſo extraordinary and different from all others we have yet heard of, may ſuffice.

The day in which the moon paſſes the equinoctial, the water ſtagnates there without any motion; as the moon removes from the equinoctial, the water begins to riſe and fall once a day; and it is high-water at the ſetting of the moon, and low-water at her riſing. This daily tide increaſes for about ſeven or eight days, and then decreaſes for as many days by the ſame degrees, till this motion ceaſes, when the moon has returned to the equinoctial. When ſhe has paſſed the equinoctial, and declines toward the ſouth pole, the water riſes and falls again as before; but it is high-water now at the riſing, and low-water at the ſetting of the moon.

Sir Iſaac Newton, in order to account for this extraordinary tide, conſiders that there are two inlets to this port of Batſha, one from the Chineſe ocean, betwixt the continent and the Manillas, the other from the Indian ocean, betwixt the continent and Borneo. This leads him to propoſe, as a ſolution of this phenomenon, that a tide may arrive at Batſha, through one of theſe inlets, at the third hour of the moon, and another through the other inlet ſix hours after, at the ninth hour of the moon. For, while theſe tides are equal, the one flowing in as the other ebbs out, the water muſt ſtagnate; now they are equal when the moon is in the equinoctial; but as ſoon as the moon begins to decline on the ſame ſide of the equator with Batſha, it has been ſhewn that the diurnal tide muſt exceed the nocturnal, ſo that two greater and two leſſer tides muſt arrive at Batſha by turns. The difference of theſe will produce an agitation of the water, which will riſe to its greateſt height at the mean time betwixt the two greateſt tides, and fall loweſt at a mean time betwixt the two leaſt tides; ſo that it will be high-water about the ſixth hour at the ſetting of the moon, and low-water at her riſing. When the moon has got to the other ſide of the equinoctial, the nocturnal tide will exceed the diurnal; and, therefore, the high-water will be at the riſing, and low-water at the ſetting of the moon.

The ſame principles will ſerve to account for other extraordinary tides, which, we are told, are obſerved in places whoſe ſituation expoſes them to ſuch irregularities: and, as ſome think, for particular currents and winds. See Current and Winds.

When the time of high-water at any place is, in general, mentioned, it is to be underſtood on the days of the ſyzygies, or days of new and full moon; when the ſun and moon paſs the meridian of the place at the ſame time. Among pilots, it is cuſtomary to reckon the time of flood, or high-water, by the point of the compaſs the moon bears on, allowing three quarters of an hour for each point, at that time; thus, on the full and change days, in places where it is flood at noon, the tide is ſaid to flow N. and S., or at 12 o'clock; in other places, on the ſame days, where the moon bears 1, 2, 3, 4, or more points to the E. or W. of the meridian, when it is high-water, the tide is ſaid to flow on ſuch point; thus, if the moon bears S.E. at flood, it is ſaid to flow S.E. and N.W. or three hours before the meridian, that is, at 9 o'clock; if it bears S.W. it flows S.W. and N.E. or at three hours after the meridian; and in like manner for other points of the moon's bearing.

The times of high-water in any place fall about the ſame hours after a period of about fifteen days, or between one ſpring-tide and another; but during that period, the times of high-water fall each day later by about forty-eight minutes.

From the obſervations of many perſons there have been collected the times when it is high-water on the days of the new and full moon, on moſt of the ſea-coaſts of Europe, and many other places; which are uſually put in a table againſt the names of the places; a ſpecimen of which is ſubjoined.

A Table of the Times of High-Water on the Days of the New and Full Moon, on moſt of the Sea-Coaſts of Europe.

Youghall - - - -	Ireland - -	St. George's Channel -	4 30

The following times ſerve for coaſts of conſiderable extent, and nearly for the places on thoſe coaſts; *viz.* Finmark, or N.N.W. coaſt of Lapland, $1^h\ 30^m$; Jutland iſles, $0^h\ 0^m$; Frieſland coaſt, $7^h\ 30^m$; Zealand coaſt, $1^h\ 30^m$; Flanders coaſt, $0^h\ 0^m$; Picardy and Normandy coaſts, $10^h\ 30^m$; Biſcay, Gallician, and Portugal coaſts, $3^h\ 0^m$; Iriſh weſt coaſt, $3^h\ 0^m$; Iriſh ſouth coaſt, $5^h\ 15^m$; Africa weſt coaſt, $3^h\ 0^m$; America weſt coaſt, $3^h\ 0^m$; America eaſt coaſt, $4^h\ 30^m$.

The uſe of the preceding table is to find the time of high-water at any of the places contained in it: for this purpoſe, find the time of the moon's ſouthing on a given day (ſee MOON); and then add the time which the moon has paſſed the meridian on the full and change days, to make high-water at that place; and the ſum ſhews the time of high-water on the given day.

See on the ſubject of this article, Newton Princ. Math. lib. iii. prop. 24. and De Syſtem. Mundi, ſect. 38–54. Apud Opera Ed. Horſley, tom. iii. p. 25, &c. p. 203, &c. Maclaurin's Account of ſir I. Newton's Diſcoveries, book iv. ch 7. Ferguſon's Aſtron. ch. xvii. Robertſon's Navig. book vi. ſect. vii. viii. ix. Young's Lectures.

TIDE-*Dial*, the name of an inſtrument contrived by Mr. Ferguſon, for exhibiting and determining the ſtate of the tides. It is repreſented in *Plate* IV. *Dialling*, *fig.* 36. and the external parts of it conſiſt of 1. An eight-ſided box, on the top of which, at the corners, are ſhewn the phaſes of the moon at the octants, quarters, and full. Within theſe is a circle of 29½ equal parts, which are the days of the moon's age reckoned from the ſun at new moon, round to the ſun again. Within this circle is one of twenty-four hours, divided into their halves and quarters. 2. A moving elliptical plate, painted blue, to ſhew the riſing of the tides under and oppoſite to the moon, with the words *high-water*, *tide-falling*, *low-water*, *tide-riſing*, marked upon it. To one end of this plate is fixed the moon M by the wire W, which goes along with it. 3. Above this elliptical plate is a round one, with the points of the compaſs upon it, and alſo the names of above two hundred places in the large machine (but only thirty-two in the figure, to avoid confuſion) ſet over thoſe points on which the moon bears when ſhe raiſes the tides to the greateſt heights at theſe places, twice in every lunar day; and to the north and ſouth points of this plate are fixed two indices I and K, which ſhew the times of high-water, in the hour-circle, at all theſe places. 4. Below the elliptical plate are four ſmall plates, two of which project out from below its ends at new and full moon; and ſo, by lengthening the ellipſe, ſhew the ſpring-tides: the other two of theſe ſmall plates appear at low-water when the moon is in her quadratures, or at the ſides of the elliptic plate, to ſhew the neap-tides. When any two of theſe ſmall plates appear, the other two are hid; and when the moon is in her octants, they all diſappear. Within the box are a few wheels for performing theſe motions by the handle H. Turn the handle till the moon, M, comes to any given day of her age in the circle of 29½ equal parts, and the moon's wire W will interſect the time of her coming to the meridian on that day, in the hour-circle: the XII under the ſun being mid-day, and the oppoſite XII mid-night: then looking for the name of any given place on the round plate (which makes 29½ rotations, whilſt the moon M makes only one revolution from the ſun to the ſun again) turn the handle till that place comes to the word *high-water* under the moon, and the index which falls among the forenoon hours will ſhew the time of high-water at that place in the forenoon of the given day: then turn the plate half round, till the ſame place comes to the oppoſite high-water mark, and the index will ſhew the time of high-water in the afternoon at that place. And thus, as all the different places come ſucceſſively under and oppoſite to the moon, the indices ſhew the times of high-water at them in both parts of the day; and when the ſame places come to the low-water marks, the indices ſhew the times of low-water. For about three days before and after the times of new and full moon, the two ſmall plates come out a little way from below the high-water marks on the elliptical plate, to ſhew that the tides riſe ſtill higher about theſe times: about the quarters, the other two plates come out a little from under the low-

water

water marks toward the fun, and on the oppofite fide, fhewing that the tides of flood rife not then fo high, nor do the tides of ebb fall fo low, as at other times. For the defcription of the infide work of this machine, and the method of conftructing it, fee Ferguson's Aftron. p. 297.

Tide-*Gage*. See Gage.

Tide-*Gates* are the lower gates of a lock open to a tide-way: thefe are alfo placed at the mouths of drains.

Tide-*Mill*, in *Rural Economy* and *Agriculture*, an ufeful fort of mill, the moving power of which is formed by running a dam acrofs an inlet where tide-water comes in, fo as to leave a narrow paffage open for placing it in on one fide. It alfo fignifies a mill for raifing and clearing lands from tide-water in fen fituations, and where injury is done by the overflowing of the tides. See Watering *of Land*.

Tide-mills may moftly be formed without producing any obftruction or hindrance to agriculture.

Tide-*Waiters*, or *Tide-Men*, certain officers belonging to the cuftom-houfe, appointed to watch or attend on fhips coming from abroad, to fee that nothing be landed till the cuftoms be paid.

They are thus called, becaufe they go aboard the fhips at their arrival in the mouth of the Thames, and come up with the tide.

TIDENSDORF, in *Geography*, a town of Pruffia, in the province of Ermeland; 4 miles S. of Frauenburg.

TIDER, or Ner, a fmall ifland in the Atlantic, near the coaft of Africa. N. lat. 19° 30′.

TIDESWELL, a fmall market-town in the hundred of High Peak, and county of Derby, England; is fituated in a valley among bleak hills, 32 miles N.N.W. from the county-town, and 160 miles N.W. by N. from London. The town is reported to have received its name from an ebbing and flowing well, now hardly remembered, as it has long ceafed to flow. The church, which was erected in the fourteenth century, is a handfome edifice of the conventual form, with a neat tower at the weft end, terminated by eight pinnacles; thofe at the angles rifing from octagonal bafes, and being much higher than the intermediate ones. In the chancel is a fmall ftone commemorative of John Foljambe, who died in 1358, and is faid to have contributed much towards the building of the church. A raifed tomb perpetuates the name of Sampfon Meurill, who died in 1462, and who, in the courfe of two years, was engaged in eleven battles in France. Among other monuments of ancient date, is one to the memory of a native of this town, Robert Purfglove, prior of Gifburn priory, who obtained a penfion from Henry VIII. for his obfequious compliance with that monarch's wifhes, in not only furrendering his own houfe, but alfo acting as a commiffioner to procure the furrender of others. In queen Mary's reign he was appointed archdeacon of Nottingham, and fuffragan bifhop of Hull; but on the acceffion of Elizabeth, he was deprived of all his fpiritualities, and retired to Tidefwell, where, having founded a grammar-fchool, and an hofpital for twelve poor people, he died in 1579. By the population return of the year 1811, the inhabitants of this parifh are ftated to be 1219, who are chiefly fupported by the mining bufinefs; the number of houfes, which are moftly fcattered on the oppofite banks of a rivulet, was eftimated at 283. A weekly market is held on Wednefdays; and here are three annual fairs.

In the vicinity of Tidefwell is the fequeftered retreat of Monfal-Dale, peculiarly eminent for picturefque beauty. Near the head of the Dale, the rocks jut out on the fouth fide, like the immenfe towers of a ftrong fortrefs. Lower down, the crags foften into verdure, the dale expands, and the eye dwells enraptured on the rich profpect that prefents itfelf. The back-ground is formed by a fteep precipice, variegated by fhort herbage and brufhwood, with occafionally a ftarting rock breaking its continuity of furface. On the fummit of an eminence called the Great Finn, was a large barrow, about 160 feet in circumference, chiefly compofed of broken maffes of limeftone, to obtain which the barrow was deftroyed about the year 1795. Within this tumulus various fkeletons were difcovered, two of them of gigantic fize, with feveral urns, and other ancient memorials; among which were two arrow-heads of flint, whence the barrow is fuppofed to have been of very remote antiquity; for, as the learned author of "Nenia Britannica" obferves, "flint arrow-heads are evidences of a people not in the ufe of malleable metal; and it therefore implies, wherever thefe arms are found in barrows, they are inconteftibly the relics of a primitive barbarous people, and preceding the era of thofe barrows in which brafs or iron arms are found." It is worthy of note, that, excepting on the fide next the precipice, the fummit of the Great Finn is furrounded by a double ditch, with a vallum to each: the diftance between the banks is 160 yards.

Near the hamlet of Wormhill, in this parifh, is a romantic and deep glen or dale, where the river Wye flows beneath a ftupendous mafs of rock, called *Chee-Tor*. This mafs of freeftone rifes about 300 feet above the level of the river, and conftitutes a moft impofing and fingular feature. At a fmall hamlet called Tunfted, in the liberty of Wormhill, was born James Brindley, juftly famed for his fuccefsful efforts in planning and executing canals. See Brindley.—Beauties of England and Wales, vol. iii. Derbyfhire; by J. Britton and E. W. Brayley. Davies's Hiftorical and Defcriptive Account of Derbyfhire, 8vo. 1811.

TIDEWA, a town of Sweden, in Weft Gothland; 62 miles N.E. of Uddevalla.

TIDLA, a river of Sweden, which runs into the Wenner lake, near Marieftadt, in the province of Weft Gothland.

TIDON, a town on the eaft coaft of the ifland of Celebes, in the bay of Gunong Tellu. N. lat. 0° 3′. E. long. 120° 38′.

TIDOR, or Tidore, an ifland in the Eaft Indian fea, and one of thofe called Moluccas, fituated near the weft coaft of the ifland of Gilolo, between Ternate and Timor; about ten leagues in circumference, and fo called from its capital, though named Tadura, or Daco, by the natives. It abounds in fpices, efpecially cloves. The Dutch have feveral forts, but the ifland is governed by a king, who poffeffes likewife fome territory on the ifland of Gilolo; 15 miles S.E. of Ternate. N. lat. 0° 42′. E. long. 127° 19′.

TIDSI, a river of Morocco, which difcharges itfelf into the ocean a few miles S. of the Tegrewelt, or Cape Offam.

TIEBAS, a town of Spain, in the province of Navarre; 5 miles S.E. of Pamplona.

TIEDEMAN, Dieterich, in *Biography*, a philofophical writer, was born April 1748, at Bremervorde, in the duchy of Bremen, and educated in the fchool of his native place in the Greek and Latin languages, in which he made very confiderable proficiency. Devoting himfelf to the church, he removed to the fchool of Verden, and from thence to the Athenæum at Bremen, where he formed an intimate friendfhip with Meiners, afterwards profeffor at Gottingen.

Gottingen. In 1767 he fettled at Gottingen, and here he renounced the ftudy of theology, becaufe he difapproved the fyftem there taught, and applied to mathematics, claffical literature, and philofophy. In the winter of 1769 he fixed his refidence in Livonia, as tutor to a nobleman of that country; and whilft he was there, he publifhed at Riga, in 1772, his "Effay on the Origin of Language." After vifiting his native place in the following year, he went to Gottingen, and formed an acquaintance with the celebrated Heyne, who wrote a preface to his "Syftem of the Stoic Philofophy," and perfuaded him to publifh it. By the recommendation of this learned friend, he was appointed profeffor of ancient literature in the Caroline college at Caffel, of which office he took poffeffion in 1766. His intervals of leifure were employed in the ftudy of philofophy and its hiftory; and alfo in preparing for the prefs his "Inveftigation of Man," "The Firft Philofophers of Greece, &c." and his "Spirit of Speculative Philofophy." Upon the diffolution of the Caroline college in 1786, he occupied the chair of philofophy at Marpurg, and his lectures were very popular. He was an oppofer of Kant's philofophy: and he indulged himfelf in ridiculing the extravagant pretenfions or pious arrogance of the founders of fects. Although his conftitution was robuft, he was carried off by a fever and inflammation of the lungs, in May 1803, at the age of 55. As a literary character, he was intimately converfant with the literature of Greece and Rome, and with all the fyftems of ancient and modern philofophy, as well as the manners and cuftoms of ancient and modern times. His extenfive erudition appears in his "Argumenta Platonis," annexed to the edition of Plato, printed at Deux-Ponts; in his prize effay, entitled "Difputatio de Quæftione quæ fuerit magicarum artium origo," and in various other differtations. In philofophy he was in early life a dogmatift, and in the latter period of his life inclined to fcepticifm. His works, which, befides thofe already mentioned, were numerous, and relate chiefly to the hiftory of philofophy, and its different fyftems, afford ample evidence of his affiduity and labour. Monthly Magazine. Gen. Biog.

TIEFENSEE, in *Geography*, a town of Pruffia, on a lake of the fame name; 20 miles S. of Brandenburg.

TIEFF, a town of Pruffia, in the province of Bartenland; 7 miles S.E. of Angerburg.

TIEFFENAW, a town of Pruffian Pomerelia; 15 miles S. of Marienburg.

TIELLEN-HEAD, a cape of the county of Donegal, on the weft coaft of Ireland. N. lat. 54° 41'. W. long. 8° 40'.

TIEM, a town of Afia, in the kingdom of Laos, on the Mecom; 90 miles S.S.E. of Lantchan.

TIEN, or Lien, a city of China, of the fecond rank, in Quang-tong; 960 miles S. of Peking. N. lat. 24° 50'. E. long. 111° 49'.—Alfo, a town of Corea; 25 miles N.N.E. of King-ki-tao.—Alfo, a city of China, of the fecond rank, in Quang-fi, on the north fide of the Pofoi: 1120 miles S.S.W. of Peking. N. lat. 23° 46'. E. long. 106° 19'.

TIEN-CHAN, a town of Corea; 53 miles W.N.W. of Han-tcheou.

TIENEN. See Tirlemont.

TIENGEN, or Thiengen, or *Thungen*, a town of Germany, in the principality of Klettgau, on the Wutach, formerly, with its diftrict, conftituting a lordfhip; 29 miles E. of Balo. N. lat. 47° 42'. E. long. 8° 17'.

TIENHOVEN, a town of Holland, on the Leck; 6 miles S. of Schoonhoven.—Alfo, a town of Utrecht; 7 miles N. of Utrecht.

TIEN-SING, a great port of China, on the river Pei-ho. Its Chinefe name literally fignifies "heavenly fpot;" and in the time of Marco Paolo, when it is fuppofed to have been much larger than at prefent, it was called "Citta Celefte:" and it is faid to have a claim on this appellation from its fituation in a genial climate, fertile foil, dry air, and ferene fky. It is the general emporium for the northern provinces of China, and is built at the confluence of two rivers, from which it rifes in a gentle flope. The palace of the governor ftands on a projecting point, commanding a broad bafon, or expanfe of water, produced by the union of the rivers, and almoft covered with veffels of different fizes. Thefe two rivers are the Pei-ho and the Yun-leang-ho, or grain-bearing river, from the quantities of wheat conveyed upon it from the province of Shan-fee, and fent up by the Pei-ho to the neighbourhood of Peking. Over thefe rivers, where they unite, is a bridge of boats: and along the quays were fome temples and other handfome edifices, but the reft confifted chiefly of fhops for the retail of goods, and alfo warehoufes, together with yards, and magazines for maritime ftores. The houfes at Tien-fing are chiefly built of brick, of a leaden-blue colour. Few are red: the pooreft are pale brown. Many of the houfes are two ftories high.

TIEN-TCHA, or *New Gibraltar*, a mountain of Cochin-china, which forms the harbour of *Turon;* which fee.

TIENTONG, a town of Siam; 350 miles N.N.W. of Juthia.

TIEN-TSANG, a town of Thibet; 268 miles E.S.E. of Hami.

TIEPOLO, Giovanni Batista, in *Biography*, was one of the laft of the eminent Venetian painters. He was born at Venice in 1697, and was a fcholar of G. Lazzarini; but he afterwards ftudied the works of P. Veronefe. He poffeffed a quick invention, and great freedom of hand, and was admirably qualified for the execution of large frefco works upon ceilings, &c.; where great facility of handling, and richnefs of colouring, will often apologize for the want of higher qualities, particularly in allegoric or grotefque fubjects. Tiepolo was employed in many of the palaces in Italy, but moft honoured by the employment he received from the king of Spain, who engaged him to adorn his palace at Madrid. He died at Madrid in 1770, at the age of 73. He etched many of his own defigns with great neatnefs and tafte.

TIER, in *Sea Language*, the name of the feveral ranges of guns mounted on one fide of a fhip's deck; which, according as they are placed on the lower, middle, or upper decks, are called the lower, middle, or upper tier.

Tier *of the Cable*, denotes a range of the fakes or windings of the cable, which are laid within one another in an horizontal pofition, fo as that the laft becomes the innermoft.

Tier *Cable*, is the hollow fpace in the middle of a cable, when it is coiled.

Tier, in *Organ-Building*, is ufed to diftinguifh the different ranks or ranges of pipes (as a tier of guns in men of war) in the front of the inftrument, and even in the interior of the cafe, when the compound ftops have feveral ranks of pipes, as the fefquialter, furniture, and cornet.

TIERBY, in *Geography*, a town of Sweden, in the province of Halland; 6 miles S.E. of Helmftadt.

TIERCE', a town of France, in the department of the Mayne and Loire; 3 miles S. of Chateauneuf.

Tierce, or *Teirce*, in *Commerce*, a meafure of liquid things,

things, as wine, oil, &c. containing the third part of a pipe, or forty-two gallons. See Measure.

The tierce is alſo a weight by which proviſions are ſold in Ireland. The tierces, barrels, and firkins are not tared, but the pieces in each caſk muſt be of the following weight and number:

		lbs.				lbs.	
Beef. —	Navy	304	*per* tierce,	being	38 pieces of	8	each.
	India	336	ditto	-	42 -	8	
	Meſs	304	ditto	-	38 -	8	
	Ditto	200	*per* barrel	-	25 -	8	
	Ditto	100	*per* firkin	-	25 -	4	
Pork. —	India	318	*per* tierce	-	53 -	6	
	Navy	320	ditto	-	80 -	4	
	Army	208	*per* barrel	-	52 -	4	
	Meſs	200	ditto	-	50 -	4	
	Ditto	100	*per* firkin	-	25 -	4	

Tierce, in *Muſic*, a 3d. The higheſt ſtop in an organ, called the tierce, is a major 3d above the 15th, every ſound being a 17th above the diapaſon. See Third.

Tierce *de Picardie*, in *French Muſic*, and indeed all choral muſic of old maſters in a minor key, is terminated with a ſharp 3d, which the French now call *tierce de Picardie*, on account of the great number of cathedrals in that province, where it continues ſtill in uſe.

Padre Martini (Saggio di Contrap. parte prima, 23.) recommends the terminating minor movements with a ſharp 3d; a practice which Rouſſeau (Dict. de Muſ.) cenſures as Gothic, and a proof of bad taſte. If the firſt of theſe excellent writers wiſhed only to preſerve its uſe in the church, and the ſecond to baniſh it elſewhere, they were both right, however their opinions may ſeem to claſh. The learned author of the Saggio di Contrappunto, who was ſo perfectly acquainted with all the beauties and effects of choral muſic, is certainly more to be relied on in whatever concerns it, than the animated author of the Dictionnaire de Muſique; who, with the moſt refined taſte and exalted views with reſpect to dramatic compoſitions, had neither time nor opportunity ſufficiently to explore the myſteries of canto fermo, or to become a very profound contrapuntiſt. For our own part, though we never wiſh to hear a ſong or glee in a minor key, and with a ſharp 3d; yet there is ſomething ſo ſolemn and grateful in theſe terminations of eccleſiaſtical compoſitions, that we ſhould be very ſorry if the practice were not continued. And if we conſider the relation and compoſition of the ſeveral ſtops in an organ, we ſhall find, that as every ſingle key in the chorus of that inſtrument has a complete chord with a ſharp 3d to it, when we dwell on a chord with a flat 3d, while the tierce, cornet, ſeſquialter, and ſometimes the furniture, are ſounding the ſharp 3d, it affords an additional reaſon for the origin and continuance of the practice, beſides the peculiar properties of tonal modulation.

Tierce, in *Gaming*, a ſequence of three cards of the ſame colour.

Tierce, in *Fencing*. See Guard and Thrust.

Tierce *Order*. See Third *Order*.

Tierce *Point*. See Third *Point*.

TIERCED, Tierce, in *Heraldry*, denotes the ſhield to be divided by any of the partition lines, party, coupy, tranchy, or tailly, into three equal parts, of different colours or metals.

If the chief and baſe be of the ſame colour when divided by a feſſe, they blazon it by expreſſing the colour, and mentioning the feſſe; otherwiſe, they ſay, it is *tierce in feſſe*, and mention each of the colours, or *tierce in pale*, if ſo divided in pale.

TIERCEL, in *Falconry*, a name given to a male hawk, as being a third part leſs in ſize than the female.

TIERCELET. See Tassel.

TIERDILL, in *Geography*, a town of Hindooſtan, in Viſiapour; 20 miles W. of Galgala.

TIERPIED, a town of France, in the department of the Channel; 3 miles E. of Avranches.

TIERRA. See Terra.

Tierra *Bomba*, a ſmall iſland near the coaſt of South America, at the entrance of the harbour of Carthagena; where, in 1741, the Engliſh erected a battery.

TIERY, a town of Sweden, in the province of Upland; 30 miles N. of Upſal.

TIES, aboard a ſhip, are thoſe ropes by which the yards hang; and when the haliards are ſtrained to hoiſe the yards, theſe ties carry them up.

TIESSERBACH, in *Geography*, a river of Wurtemberg, which runs into the Neckar, near Nurtingen.

TIETAR, a river of Spain, which runs into the Tagus, near Talavan, in Eſtremadura.

TIE-TCHEOU, a town of Chineſe Tartary, in the country of Kokonor: 688 miles S.E. of Hami. N. lat. 33° 56′. E. long. 102° 54′.

TIETE, or Anhembi, a river of Braſil, which runs into the Parana.

TIFACOUM, a word uſed by ſome of the chemical writers to expreſs quickſilver.

TIFATA Mons, in *Ancient Geography*, a mountain of Italy, in Campania, near Capua. The table of Peutinger has placed here two temples, one deſignated by the words "Ad Dianam," the other by thoſe of "Jovis Tifationus."

Tifata, a town of Italy, in Latium. Pliny.

TIFATUM, a word uſed by ſome of the chemical writers to expreſs ſulphur.

TIFER, in *Geography*, a town of the duchy of Stiria; 3 miles S. of Cilley.

TIFERNUM, or Tifernus, in *Ancient Geography*, a river of Italy, in Samnium.

Tifernum *Metaurum*, a town of Italy, in Samnium. Livy.

Tifernum *Tiberinum*, or *Tifernum of the Tiber*, *Citta di Caſtello*, a town of Italy, in Umbria, to the N.W. towards the banks of the river Tiber. It was municipal.

TIFESELT, in *Geography*, a town of Fez; 12 miles N.E. of Sallee.

TIFFAUGES, a town of France, in the department of the Vendée; 9 miles E. of Montaigu.

TIFFE *de Mer*, in *Natural Hiſtory*, a name given by count Marſigli to a ſpecies of ſea-plant, as he ſuppoſes it to be, commonly but erroneouſly reckoned among the ſpunges, and called by authors a *branched ſpunge*. This author has called it by this name from its reſemblance to the heads of the *typha paluſtris*, or cat's tail, when ripe in the month of September.

The ſpunges muſt be of a lax and cavernous texture; but this ſubſtance is ſmooth and firm, and has no inequalities on its ſurface, excepting a few ſhort hairs, which give it a velvety look, when firſt taken out of the water. It is a very elegant and beautiful ſubſtance; it grows to two feet in height, and is very elegantly branched; it grows on rocks and ſtones, and, when firſt taken out of the ſea, is full of a viſcous water, as yellow as the yolk of an egg; but when this water is preſſed out, and the ſubſtance dries, it loſes its yellow, and becomes of a duſky-brown colour: it is very tough and firm while in the water, but when dry it uſually

uſually breaks of itſelf into little pieces, and may be crumbled to powder between the fingers. This is a very ſtrong proof, among others, of its not being of the nature of the ſpunge.

When viewed by the microſcope, the whole ſurface is found to be covered with extremely fine and ſlender hairs; and, among theſe, there is an infinity of little apertures, through which the ſea-water makes its way.

When a branch of it is cut tranſverſely, there are ſeen a number of long and fine canals, by means of which the water, received at theſe ſuperficial apertures, is conveyed to its whole ſubſtance. Marſig. Hiſt. de la Mer, p. 82.

Subſtances of this kind are now known to be of animal and not of vegetable origin. See Coral.

TIFFENETH, in *Geography*, a town of Pruſſia, in the province of Natangen; 10 miles S. of Brandenburg.

TIFFESCH, or Tifas, anciently *Theveſte*, a town of Algiers; 40 miles S. of Bona. N. lat. 36° 20′. E. long. 7° 40′.

TIFLISBERG, a mountain of Switzerland, between the cantons of Uri and Unterwalden.

TIGA, in *Ancient Geography*, a town of Africa, in Mauritania Cæſariana, near the coaſt of the Atlantic. Strabo.

Tiga, in *Geography*, a ſmall iſland in the Eaſt Indian ſea, near the north-weſt coaſt of the iſland of Borneo. N. lat. 6° 25′. E. long. 112° 14′.

TIGAON, an iſland in the Indian ſea, near the north-weſt coaſt of the iſland of Borneo. N. lat. 6° 10′. E. long. 128° 48′.

TIGARA, in *Ancient Geography*, a town of Africa, in the interior of Mauritania Cæſariana. Ptol.

TIGAREA, in *Botany*, a barbarous or arbitrary name, of which its publiſher Aublet has given no explanation.—Aubl. Guian. 917. Juſſ. 339. Lamarck Illuſtr. t. 826.—Schreber admitted the genus, under the name of *Rhinium*, in his Gen. 701, but in his *Addenda* to that work, 833, reduced it to Tetracera; ſee that article. Mr. Purſh, however, has reſtored the genus and the name, in his *Flora Americæ Septentrionalis*, 333, where he has, not without ſome doubt, referred hither a very curious new ſhrub, found in the meadows of the Rocky-mountains, and on the Columbia river, by the name of *T. tridentata*, t. 15. This has crowded, wedge-ſhaped, hoary, three-toothed *leaves*, and ſolitary, terminal, yellow *flowers*, the ſize of hawthorn-bloſſoms. That it is very diſtinct in genus from Aublet's *Tigarea* we have no doubt, being very nearly akin to the *Rubus japonicus* of Linnæus, *Corchorus japonicus* of Thunberg, as has lately been pointed out by M. De Candolle, in a paper read before the Linnæan Society. But it ſeems to us that the genus of neither of theſe ſhrubs can as yet be determined, for want of perfect fruit.

TIGAUDA, in *Ancient Geography*, a municipal town of Africa, in Mauritania Cæſariana, upon the route from Ruſucurrum to Cala, between Caſtellum Tingitanum and Oppidum Novum. Anton. Itin.

TIGE, in *Architecture*, a French term for the ſhaft or fuſt of a column, comprehended between the aſtragal and the capital.

TIGEGUACU, in *Ornithology*, the name of a ſmall Braſilian bird, of the ſize of a ſparrow, and with a ridged and triangular bill, in which it reſembles the mouche-rolle; its eyes are of a fine blue, and its legs and feet yellow; it is all over of a deep black, but that it has a large blood-red ſpot on the top of its head; its tail is ſhort and black.

TIGELLIUS, in *Biography*, a muſician, born in Sardinia, grandſon of Phamea, a muſician in great favour at Rome in the time of Julius Cæſar. Horace has handed him down to poſterity as a mercileſs ſpendthrift, and an egregious coxcomb.

> "Ambubajarum collegia Pharmacopolæ
> Mendici, Mimæ, Balatrones, hoc genus omne
> Mæſtum, ac ſolicitum eſt cantoris morte Tigelli:
> Quippe benignus erat."—Sat. lib. i. 2.

Tigellius was not only much in favour with Julius Cæſar, but afterwards with Cleopatra and Auguſtus: he was an able muſician, an ingenious buffoon, and ſubtle courtier. What Horace has ſaid of his caprice, has often been applied, and we fear will ever continue to be applied, to muſicians of a ſimilar diſpoſition.

> "Omnibus hoc vitium ut cantoribus, inter amicos
> Ut nunquam inducant animum cantare rogati;
> Injuſſi nunquam deſiſtant."—Sat. lib. i. 3.

TIGENHAGEN, in *Geography*, a town of Pruſſian Pomerelia; 12 miles N. of Marienburg.

TIGENWIT, a town of Africa, in Negroland; 45 miles N. of Arguin.

TIGER, a ſmall iſland in the Spaniſh Main, near the coaſt of Darien. N. lat. 8° 35′. W. long. 77° 30′.

Tiger, *Tigris*, in the Linnæan ſyſtem of *Zoology*, is a ſpecies of cat, or Felis *Tigris*; which ſee.

The tiger (formed of גיר, *ſagitta, a dart*, whence תגיר) has its name from its ſuppoſed ſwiftneſs. See the article Felis *Tigris*.

Tiger, *American*. See Felis *Onca*.

Tiger-*Cat*. See Felis *Capenſis*.

Tiger, *Hunting*, or *Leopard*. See Felis *Leopardus*.

Tiger, *Man*. See Mantegar.

Tiger-*Shell*, a name given to the red voluta, with large white ſpots.

In the Linnæan ſyſtem, the tiger-ſhell is a ſpecies of the cypræa. See Shells.

TIGGREE, in *Geography*, a town of Hindooſtan, in the circar of Sumbul; 17 miles S. of Nidjibabad.

TIGH, in our *Old Writers*, a cloſe or incloſure mentioned in ancient charters, and is ſtill uſed in Kent in the ſame ſenſe.

TIGHMAN's Island, in *Geography*, a ſmall iſland in the Cheſapeak. N. lat. 38° 48′. E. long. 76° 21′.

TIGHT, in *Sea Language*, expreſſes the quality by which a veſſel reſiſts the penetration of any fluid, whether compreſſing its ſurface, or contained within it. Hence a ſhip is ſaid to be tight, when her planks are ſo compact and ſolid, as to prevent the entrance of the water in which ſhe is immerſed; and a caſk is called tight, when the ſtaves are ſo cloſe, that none of the liquid contained in it can iſſue through or between them. In both ſenſes, tight is oppoſed to leaky. Falconer.

TIGILLUM, a word uſed by ſome chemiſts to expreſs the tile with which they cover the mouth of their crucibles; and, by others, for the crucible itſelf.

TIGILSKOI, in *Geography*, a town of Kamtſchatka; 80 miles W. of Ukinſkoi. N. lat. 57° 20′. E. long. 157° 44′.

TIGINE. See Bender.

TIGIS Herba, in *Ancient Geography*, a town of Africa, in the interior of Mauritania Cæſariana, near a river, and S. of Icoſium. In the Itin. of Anton. it is marked on the route from Ruſucurrum to Scaldæ.

TIGLIUM, in *Botany*. See Pinei *Nuclei*, &c.

TIGNALE, in *Geography*, a town of the iſland of Corſica; 30 miles S.E. of Corte.

TIGNARES, a town of Brafil, and chief place in the captainfhip of Rio Grande.

TIGNES, a town of France, in the department of Mont Blanc; 3 miles S.E. of St. Maurice.

TIGRA, in *Ancient Geography*, a town of Lower Mœfia, on the route from Viminiacum to Nicomedia, between Exantaprillis and Appiaria. Anton. Itin.

TIGRAH, in *Geography*, a town of Hindooftan, in Bahar; 40 miles E.S.E. of Hajypour. N. lat. 25° 28′. E. long. 86° 7′.

TIGRANA, in *Ancient Geography*, a town of Afia, in the interior of Media. Ptol.

TIGRANAAMA, a town of Afia, in the Greater Armenia, and one of thofe which were fituated to the E. of the fources of the Tigris. Ptol.

TIGRANES, *the Great*, in *Biography*, king of Armenia, after having been delivered by his father as a hoftage to the Parthians, was liberated and affumed the crown about the year B.C. 93. Having formed an alliance with Mithridates, king of Pontus, againft the Romans, he married Cleopatra, daughter of that prince; and, agreeably to the terms of his alliance, he reduced Cappadocia, and caufed Ariarathes, the fon of Mithridates, to occupy the throne inftead of Ariobarzanes, who was fupported by the Romans. Soon after this event, Tigranes was offered the crown of Syria, and accepted it B.C. 83; and when he had taken poffeffion of the kingdom, governed it for many years by a lieutenant. He then invaded Leffer Armenia, and completely ruined it in the courfe of one campaign. Having made various other conquefts, he founded the city of Tigranocerta, on the fpot in Armenia where he had received the crown. He afterwards joined Mithridates, his father-in-law, in a war againft the Romans; but when Mithridates, after having been defeated by Lucullus, took refuge in Armenia, he was coldly received by Tigranes, who granted him a caftle for his refidence, with a royal allowance. By a feries of fubfequent adventures, which proved fuccefsful, Tigranes was fo elated, that he affumed the title of king of kings, and exacted from all who approached him tokens of the moft humiliating reverence. A change however in his fituation was rapidly approaching; for Lucullus, the Roman general, having reduced the kingdom of Pontus, availed himfelf of a preconcerted circumftance for marching in a hoftile manner into Armenia, and laid fiege to Tigranocerta. Tigranes advanced to its relief; but meeting with Lucullus at the head of a fmall army, an engagement enfued, the refult of which was the pufillanimous flight of Tigranes, and the difperfion of his numerous army; and though he received confiderable fuccour from Mithridates, and levied frefh troops, he could not prevent the furrender of Tigranocerta to Lucullus; and this furrender was followed by a fignal defeat of the united forces of Mithridates and Tigranes; upon which the latter prince withdrew to the remoteft part of his dominions. When Pompey fucceeded Lucullus in the command of the Roman army, Mithridates and Tigranes, availing themfelves of an interval of inaction, recovered Armenia and a great part of Pontus; but their fuccefs was interrupted by the rebellion of the fon of Tigranes, who took up arms againft his father; but being defeated, he fought refuge in Parthia, and perfuaded Phraates, the fovereign of that country, to declare war againft the Armenians. Phraates, with a numerous army under his command, compelled Tigranes to withdraw to the mountains, and befieged his capital Artaxata. The younger Tigranes being left in command of the Parthian army, was defeated by his father, who raifed the fiege of Artaxata. Tigranes afterwards joined the Romans, and conducted Pompey into Armenia againft his father. Unable to refift this invafion, he determined to furrender himfelf to Pompey, and to confide in his generofity. Upon being introduced to the prefence of the Roman general, he took off his diadem, and proftrated himfelf at Pompey's feet. Pompey raifed him, and replaced the royal diadem; and in compromifing the difpute between the father and fon, reftored to the former the kingdom of Armenia, and the greateft part of Mefopotamia, but impofed upon him a fine of 6000 talents for making war upon the Roman people. He was alfo obliged to refign the crown of Syria, which he had held for eighteen years, and likewife the provinces of Cappadocia and Cilicia. From this time Tigranes was received as a friend and ally of the Roman people, and by maintaining their friendfhip, he was enabled to retain his dominions in peace to the end of his life, which terminated in the eighty-fifth year of his age. Anc. Un. Hift.

TIGRANOCERTA, Sered, in *Ancient Geography*, a town of Afia, in Greater Armenia, at fome diftance to the left of the Tigris, on the river Nicephorius, and N.W. of its mouth in the Tigris. This town was built by Tigranes, in the time of the Mithridatic war. According to Plutarch, it was large, handfome, populous, powerful, and rich. Tacitus reports that Tigranocerta was fituated on an eminence, nearly furrounded by the Nicephorius, and that it was well fortified and garrifoned.

TIGRE, in *Geography*, a fmall ifland in the Pacific ocean, at the entrance into Amapalla bay. N. lat. 13° 10′. W. long. 88° 44′.

Tigré, a province of Abyffinia, about 200 miles in length, and 120 in breadth. What in a fpecial manner makes the riches of Tigré, is, that it lies neareft the market, which is Arabia; and all the merchandize deftined to crofs the Red fea muft pafs through this province, fo that the governor has the choice of all commodities wherewith to make his market. The ftrongeft male, the moft beautiful female, the pureft gold, the largeft teeth of ivory, all muft pafs through his hand.

TIGRIDIA, in *Botany*, the *Flos Tigridis* of old authors, fo called from its beautifully fpotted corolla, refembling the fkin of a tiger, or rather of a leopard or lynx. This fine Mexican plant, being known to fyftematic botanifts from early engravings only, did not find a place in their arrangements, till Mutis fent a drawing of it to Linnæus, under the name of *Pavonia*, in honour of one of his ableft pupils, Pavon, as appears by his letters; and not, as fome have fuppofed, becaufe of any refemblance in the fpots of the flower to a peacock's tail. Being judged a *Ferraria*, it was referred to that genus in the *Supplementum;* but Juffieu, and after him Mr. Gawler, has reftored the genus of Mutis, under the above name, there being another Pavonia, which the reader may fee in its proper place.—Juff. Gen. 57. Gawler, (now Ker Bellenden,) in Sims and Kon. Ann. of Bot. v. 1. 246. Ait. Hort. Kew. v. 4. 137. (Ferraria; Lamarck Illuftr. t. 569.)—Clafs and order, *Monadelphia Triandria.* Nat. Ord. *Enfatæ*, Linn. Gawler. *Irides*, Juff.

Gen. Ch. *Common Sheath* two-edged, of two compreffed pointed valves; *partial* ones fmaller, two-ranked, alternate, fingle-flowered. Perianth none. *Cor.* fuperior, regular, of fix petals; the three outermoft ovate-oblong, acute, concave at the bafe; flightly contracted towards the middle: three innermoft much fmaller, oblong-fiddle-fhaped, pointed, convex, recurved, haftate at the bafe. *Stam.* Filaments three, firmly united into a triangular, abrupt, erect column, longer than the inner petals; anthers feffile at the top of the column,

column, erect, linear-oblong, acute, converging at the points, bursting externally. *Pist.* Germen oblong, abrupt, with three rounded angles; style thread-shaped, rather longer than the column of the stamens; stigmas three, slender, acute, deeply divided. *Peric.* Capsule oblong, bluntly triangular, abrupt and scarred at the top, of three cells and three valves, the partitions from the centre of each valve. *Seeds* numerous, nearly globose, ranged in a double row in each cell, somewhat angular from mutual pressure.

Eff. Ch. Common Sheath of two leaves. Calyx none. Petals six; the three inner ones smallest, fiddle-shaped, pointed. Stigmas linear, deeply cloven. Capsule of three cells, inferior.

1. T. *Pavonia.* Mexican Tiger-flower. Redout. Liliac. t. 5. Gawler n. 1. Ait. n. 1. (Ferraria pavonia; Linn. Suppl. 407. Willd. Sp. Pl. v. 3. 581. Cavan. Diss. 342. t. 189. f. 1. Andr. Repos. t. 178. F. Tigridia; Curt. Mag. t. 532. Ocoloxochitl, seu Flore Tigris; Hernand. Mex. 276. Tigridis flos; Dodon. Pempt. 693. Ger. Em. 122.)—Native of Mexico and Peru. Said to have been first introduced into the gardens of this country, about the year 1796, by Ellis Hodgson, esq. of Everton, near Liverpool, who liberally communicated it to the nurserymen about London, so that now few ornamental flowers are more easily obtainable. If treated as a greenhouse plant, like the Cape bulbs, the *Tigridia* flowers in spring, ripening abundance of seeds. If planted in the open ground in March or April, the more dry or sandy the soil the better, it will blossom in succession through the autumn, at the end of which the bulbs should be taken up, carefully dried, freed from their very succulent fibres, and preserved from frost till the following spring. Though each flower lasts but one day, as every plant bears several, a plentiful succession may readily be had. The *root* is an ovate bulb, which is eatable when roasted, tasting like a chesnut; from its base are sent down several long, perpendicular, tapering, very juicy, downy fibres. *Stem* two or three feet high, erect, round, leafy, somewhat branched. *Leaves* several, erect, sword-shaped, many-ribbed, plaited, smooth, a foot long. *Flower* inodorous, three or four inches broad, so splendidly variegated with scarlet, crimson, purple and yellow, that no description can do it justice. The ends of the larger *petals* are scarlet; their middle yellow; their base, like the whole surface of the smaller ones, richly spotted. *Stamens* and *pistil* red. It increases by bulbous offsets, as well as by seeds.

TIGRINI, Orazio, in *Biography*, a canon of Arezzo, who published at Venice, in 1588, a Musical Compendium; "Compendio della Musica," which he dedicated to Zarlino, from whom he received a letter of thanks for the laurel-crown with which he had bound his brows; which letter is prefixed to the work, with complimentary verses innumerable from other friends. This Compendium is not only well digested by the author, but rendered more clear and pleasant in the perusal, by the printer, who has made use of large Roman types, instead of Italic, in which most of the books that were published in Italy, before the present century, were printed. This author is the first, in our recollection, who has censured the impropriety and absurdity of composing music for the church upon the subject of old and vulgar ballad tunes. The cadences which he has given in three, four, five, and six parts, and which are good examples of ecclesiastical counterpoint, have been almost all used by Morley, without once mentioning Tigrini's name, either in the text or catalogue of authors whom he has cited. Zarlino, who had adopted the four new ecclesiastical tones proposed by Glareanus, was followed by Tigrini, with whom they seem to have stopped: as no more than the eight ancient tones appear afterwards to have been acknowledged by orthodox ecclesiastical composers; and Zarlino himself, in the last editions of his works, relinquished the idea of twelve modes: as no new harmony or modulation was furnished by the additional four to the contrapuntist, without violating the ancient rules of canto-fermo, which confine all its melody to the different species of octave. It appears from this Compendium, that *contrapunto alla mente*, or extemporary discant upon a plain-song, was still practised in the churches of Italy.

TIGRIS, in *Ancient* and *Modern Geography*, a large river of Asia, which has its source in the mountains of Greater Armenia, about 15 miles S. of the sources of the Euphrates, and pursues nearly a regular course S.E., until its junction with that river at Korna, 50 miles above Bassora. Formerly these rivers discharged themselves separately into the Persian gulf; but they now fall into the sea by a common canal, about 70 miles S. of Bassora. In the time of Pliny their separate beds might be seen. According to the same author, it was named "Deglito," from its source to mount Taurus, which it traversed; and from the place of its discharge on the other side of the mountain, to the sea or Persian gulf, it was called Tigris. This author says that it passed through the lake of Arethusa, without mixing its waters with those of the lake. Strabo and Arrian denominated the mouth of the Tigris "Pasitigris," and Pliny gives this name to that part of the river which separated into two arms, that, after enclosing an island, joined again, and fell into the same bed. Moses (Gen. ii. 14.) calls this river, as it has been supposed, Hiddekel. The cavern of mount Taurus, through which it is said to have passed, was called "Zoroanda;" and as a proof that it was the same river which entered the cavern and passed out of it, any substance thrown into the river on one side of the mountain was discharged by it on the other.

The ancient Persians called this river "Teer," *the arrow*, from the rapidity of its current; and it is now called "Degila," and "Shat-Bagdad," the river of Bagdad. The united rivers of the Tigris and Euphrates are denominated "*Shat-ul-Arab*;" which see.

The Tigris, though a far less noble stream than the Euphrates, is one of the most celebrated rivers in history; and many famous cities have, at different periods, decorated its banks; among which we may reckon, in ancient times, those of Nineveh, Seleucia, Ctesiphon; and in subsequent periods, those of Bagdad, Mosul, Diarbekir, &c.

This river is navigable for boats of twenty or thirty tons burthen as far as the mouth of the Odorneh, but no farther; and the commerce of Mosul is consequently carried on by rafts, supported by inflated sheep-skins. The rafts are floated down the river, and when arrived at Bagdad, the wood of which they are composed is sold without a loss, and the skins conveyed back to Mosul by camels. The Tigris is, on an average, between Bagdad and Korna, about 200 yards wide. The banks are steep, and, for the most part, overgrown with brush-wood, the haunt of lions and other wild beasts. The Tigris rises twice in the year; the first and great rise is in April, and is caused by the melting of the snows in the mountains of Armenia; and the other is in November, produced by the periodical rains. A boat, with a fair wind, will sometimes pass from Bagdad to Bassora in six days, but the common passage is from eight to ten.

The banks of the Tigris, from Tauka-Kesra to Korna, cannot boast of a single village, or even habitation, with the exception of Koot, a miserable place, containing 40 or 50 mud-huts. The city of Wasith, repeatedly mentioned in the Arabian histories, is no longer a place of any consequence; it stands on the banks of the Hye, or great canal. From Korna to the neighbourhood of Bassora, Bassara or Basra, Bafra, there is little or no cultivation; but from thence the country bordering on the banks of the river is covered with plantations of date-trees, which continue, without interruption, almoft to the mouth of the Shat-ul-Arab.

Tigris *Fons*, a fountain of Afia, in the mountains S. of Maxo ne, which formed a ftream that ran towards the S.E. and difcharged itfelf into the lake Arethufa.

Tigris, in *Geography*, a river of China, between Canton and the fea, fo called by Europeans.

Tigris, in *Zoology*. See Felis *Tigris*.

TIGUAZALPA, in *Geography*, a town of Mexico, in the province of Nicaragua, on a river which runs into Amapalla bay; 80 miles N. of Leon. N. lat. 13° 50′. W. long. 87° 36′.

TIGUILLACA, a town of Peru, in the diocefe of La Paz; 10 miles N. of Puno.

TIGURINI, in *Ancient Geography*, a people of Gaul, who eftablifhed themfelves in a canton of the Helvetians, and who joined the Cimbri when they made an attempt to pafs into Italy.

TIGURINUS Pagus, one of the four cantons which compofed the Helvetic confederacy; fuppofed to be Zurich.

TIGUTIA, a place of Italy, in Liguria, N.E. of Monilia.

TIGY, in *Geography*, a town of France, in the department of the Loiret; 12 miles S.E. of Orleans.

TIHAN, a town of Hungary; 20 miles S.W. of Stulweifenburg.

TIHOE, a bay on the S. coaft of the ifland of Bouro. S. lat. 3° 44′. E. long. 126° 27′.

TIHOL, in *Natural Hiftory*, a name given by the people of the Philippine iflands to a fpecies of crane very frequent among them, and remarkable for its fize, being taller than a man when it ftands erect, and holds up its neck. They call it alfo fometimes *tipul*.

TIIB, El, in *Geography*, a town of Perfia, in the province of Chufiftan, on the Ahuaz river; 70 miles N.W. of Toftar.

TIJEGUACU-PAROARA, in *Ornithology*, the name of a Brafilian bird, of the fize of a lark; it has a fhort and thick beak, brown above and whitifh below; its head, throat, fides, and the lower part of its neck, are of a fine yellow, variegated with red in the female, and all over of a perfect blood-red in the male; the upper part of the neck, and the whole back, are grey, with a mixture of brown; the wings are brown, tipped with white; the tail is of the fame colour; and the fides of the neck, the breaft, belly, and thighs, are white. Marggrave's Hift. Brafil.

TIJEPIRANGA, the name of a Brafilian bird of the fparrow kind. It is a little larger than the lark; its whole body, neck, and head, are of a very fine red or blood colour, and its wings and tail black.

There is another fpecies alfo of this bird, which is of the fize of a fparrow, and is of a blueifh-grey on the back, white on the belly, and of a fea-green on the wings; the legs of this are of a pale grey. Marggrave's Hift. Brafil.

TIJOLA, in *Geography*, a town of Spain, in the province of Grenada; 5 miles S.W. of Purchena.

TIJOUCA, a cultivated valley of the Brazils, in the vicinity of Rio de Janeiro, fituated, as it were, in the bottom of a funnel, being furrounded on all fides by mountains, excepting to the fouthward, where a fmall opening admits an arm of the fea. The valley is watered by a clear ftream, precipitated down a fteep and broad rock of granite, forming a magnificent cafcade. The foil requires little labour of cultivation: indigo, manioc, coffee, cacao or chocolate trees, fugar-canes, plantains, and orange and lime-trees growing promifcuoufly, and fome fpontaneoufly, in the fpace of twenty fquare yards. Coffee and indigo claim the chief attention. The temperature of the valley is very hot, on account of its confined fituation and the reflection of the mountains. Fahrenheit's thermometer in the fhade about four in the afternoon ftood at 88°. Staunton's Emb. to China, vol. i.

TIIZ, or Tiz, a town of Perfia, in the province of Mecran, at the mouth of the Kurene; 75 miles S. of Kidge. N. lat. 25° 25′. E. long. 60° 24′.

TIKAX, a town of Mexico, in Yucatan; 68 miles S. of Merida.

TIKE, the Zetland name for an otter, of which there are many to be found about that ifland. Phil. Tranf. N° 473. fect. 8.

Tike is alfo ufed for a fmall bullock or heifer, for a particular fort of worm, and in Scotland for a dog.

TIKIOB, in *Geography*, a town of Denmark, in the ifland of Zealand; 4 miles S.W. of Helfingoer.

TIKITHOCKTHOCK, a fettlement on the E. coaft of Labrador. N. lat. 56° 15′. W. long. 60° 5′.

TIKOO, a town of Bengal; 30 miles S.W. of Ramgur. N. lat. 23° 29′. W. long. 84° 55′.

TIKOTSCHIN, a town of the duchy of Warfaw; 24 miles N. of Bilefk.

TIL, a town of Perfia, in the province of Adirbeitzan; 60 miles N.W. of Tauris.

TILA Navi, one of the Lipari iflands; 6 miles S.S.W. of Stromboli.

TILAMUNGALUM, a town of Hindooftan, in Myfore; 5 miles S. of Ouffoor.

TILBORG, a town of Brabant, celebrated for its manufacture of cloth; 10 miles S. of Bois-le-Duc.

TILBURREAH, a town of Bengal; 30 miles N.N.E. of Doefa.

TILBURY, a townfhip of Upper Canada, near lake St. Clair.

Tilbury, *Weft*, a village and parifh in the hundred of Barftable, and county of Effex, England; is fituated 24 miles S. by W. from Chelmsford, and 27 E. by S. from London. It appears to have been an epifcopal feat of Cedda, bifhop of the Eaft Saxons, who in the 7th century propagated the Chriftian religion in this county, and built churches in feveral places, but "efpecially," as Bede reports, "in the city, which, in the language of the Saxons, is called Ythanceftre; and alfo in that which is named Tillaburgh (the firft of which places is on the banks of the river Pant, the other on the banks of the Thames), where gathering a flock of fervants of Chrift, he taught them to obferve the difcipline of a regular life, as far as thofe rude people were then capable." Ythanceftre is fuppofed to have ftood at the mouth of the river Pant, or Blackwater, but has been entirely engulphed by the fea. Tilbury is now only a fmall village, containing, as the return of the year 1811 ftates, 44 houfes and 117 inhabitants. A medicinal fpring was difcovered here in the year 1727, of great efficacy in cafes of hæmorrhage, fcurvy, and fome other diforders. (See Tilbury-*Water*.) The marfhes in this, and the contiguous parifhes, are chiefly rented by the grazing butchers of London, who generally ftock them with Lincolnfhire and Leicefterfhire wethers, which are fent hither about Michaelmas, and feed till Chriftmas, when they are conveyed to the metropolis for fale.

On the banks of the Thames, in this parifh, is Tilbury-Fort, originally built as a kind of block-houfe by Henry VIII., but enlarged into a regular fortification by Charles II., after the Dutch had failed up the river in the year

year 1667, and burnt three Engliſh men of war at Chatham. Various additions have been ſince made; and it is now ſtrongly garriſoned, and defended by a great number of guns. Some traces of the camp formed here to oppoſe the threatened invaſion of the Spaniſh armada, in the time of Elizabeth, are yet viſible.—Beauties of England and Wales, vol. v. Eſſex; by J. Britton and E. W. Brayley.

Tilbury-*Water*, in *Medicine*, is an acidulous or ſaline water, iſſuing from a ſpring ſituated near a farm-houſe at Weſt Tilbury, near Tilbury-Fort, in Eſſex. This water is of a ſtraw-colour, ſoft and ſmooth to the taſte, but leaving, after agitation in the mouth, a ſmall degree of roughneſs on the tongue; it throws up a ſcum variegated with ſeveral colours, which feels greaſy; and effervesces with ſpirit of vitriol; it mixes ſmooth with milk, but curdles with ſoap; when boiled, it turns milky, but is fined by a fourth part of mountain-wine, and by acids; it operates chiefly by urine, though it is ſomewhat purgative, and increaſes perſpiration. This water is eſteemed for removing glandular obſtructions, and hence is alſo recommended in ſcurvies and cutaneous diſeaſes; it is good in bloody fluxes, purgings, and the like: in diſorders of the ſtomach ariſing from acidity, in the gravel, fluor albus, and immoderate flux of the menſes. As a diuretic, it is beneficial in dropſical complaints. It gently warms the ſtomach, ſtrengthens the appetite, and promotes digeſtion. The uſual doſe is a quart a-day. This water is ſuppoſed to owe its virtue to a native alkaline ſalt, which may be obtained from it by evaporation, and to its fixed air, which, however, being very volatile, ſoon exhales when the water is heated or ſtands for ſome time expoſed. Elliot's Account of Mineral Waters, &c. p. 220.

TILCARA, in *Geography*, a town of South America, in the province of Tucuman; 32 miles N.N.W. of St. Salvador de Jugui.

TILDIZ Dagh, a mountain of Aſiatic Turkey; 10 miles S. of Tocat.

TILE. See Tyle.

Tiles, *Draining*, in *Agriculture*, ſuch as are made of particular forms and dimenſions, for the purpoſe of draining and taking away the water that ſtagnates in or upon land. They are ſaid to conſtitute a very neat and convenient, as well as cheap and beneficial material for this uſe in a great many caſes, eſpecially as they are exempt from the common duties on ordinary tiles and bricks. They have the advantage too of being capable of being laid with much facility and diſpatch, and of requiring leſs cutting than in the methods uſually had recourſe to in the common practice of freeing land from wetneſs. They are made and employed in ſome diſtricts, as Cheſhire, &c. with complete ſucceſs and much utility.

Tile-*Earth*, that ſort of earthy material of the ſtrong clayey kind which is uſed in the making of tiles. It is alſo a term in farming which is ſometimes employed to ſignify a ſtrong, ſtiff, ſtubborn ſort of land or ſoil that cannot be brought into cultivation, and be managed without very great labour, trouble, and expence, but which, when once reduced and got into order, is, in ſome caſes, very productive and laſting in its returns.

Vaſt ſtrength of men and teams is often requiſite in working ſuch lands as farms, as they cannot be effectually improved and got into a proper ſtate, except by the application and incorporation of large quantities of different proper rich earthy and other ſuitable ſubſtances.

The farmer ſhould always calculate well before engaging farms conſiſting greatly of this ſort of land or ſoil.

The general opinion among the moſt attentive and diligent farmers in the county of Eſſex is, that even the paſture lands upon the wet, cold, tile-earth bottoms, ſhould be kept under the plough two or three years in twenty, in order to render them in the moſt ſuitable and productive ſtate.

Tile, or *Tyle*, in *Aſſaying*, a ſmall flat piece of dried earth, uſed to cover the veſſels in which metals are in fuſion.

Theſe are made of a mixture of clay and ſand, or powder of flints, or broken crucibles, made into a paſte, and ſpread thin with a rolling-pin, on a table or flat ſtone. From theſe cakes or plates, pieces are to be cut with a knife, to the ſhape and ſize of the mouths of the veſſels to be cloſed. It is beſt then to pare away the borders of the under ſurface of the piece thus cut off, that this ſurface may immediately touch all the way the edge of the mouth of the veſſel, leaving a prominent rim, by which means the tile fits cloſe upon the veſſel, and is not ſo eaſily diſplaced by accidents, as a touch of the poker, or of the coals put on to mend the fire, as it otherwiſe would be. Finally, put on the middle of the outer ſurface a ſmall bit of the ſame matter, which ſerves as a kind of handle, by means of which it may be conveniently managed by the tongs, and eaſily taken off and put on again at pleaſure. Cramer, Art. Aſſ. p. 66.

TILENUS, Daniel, in *Biography*, a doctor and profeſſor of theology at Sedan, in France, was born in Sileſia, in 1563, and was the firſt foreigner who wrote againſt Arminius, though he afterwards changed his opinion and ſupported the doctrine of that theologian. He alſo took part in a violent controverſy with Du Moulin. A reconciliation was attempted between the diſputants, in which the elector palatine, the duke de Bouillac, and king James I. of England, interpoſed; and a national ſynod of the French churches was held for this purpoſe at Tonneins in 1614. The attempt to produce a pacification failed; and Tilenus was deprived of his profeſſorſhip in 1619 or 1620. He then removed to Paris, and afterwards maintained for five days, at Orleans, a diſputation with John Cameron on grace and free-will. In a letter addreſſed to the people of Scotland, he accuſed the Preſbyterians of introducing too many changes in the form of their religion, and praiſed the people of England for admiring epiſcopacy. King James I. cauſed this letter to be printed, and invited the author to England, with an offer of a penſion. Tilenus accepted the offer; but returning to France in order to arrange his affairs, an outcry was in the meanwhile raiſed againſt him in England, and he therefore determined to remain at Paris, where he died in 1633. He was the author of many works in Latin and French, which it is needleſs to recite. Gen. Biog.

TILGUN, in *Geography*, a town of Aſiatic Turkey, in Caramania; 36 miles E.N.E. of Akſhehr.

TILHARA, a town of Hindooſtan, in Rohilcund; 30 miles S.S.E. of Bereilly.

TILIA, in *Botany*, the Lime-tree, or Linden-tree, an ancient Latin name, whoſe origin may perhaps be found in the Greek πτελεα, *the Elm*; but on this ſubject nothing certain, nor indeed very plauſible, has been made out by etymologiſts.—Linn. Gen. 267. Schreb. 355. Willd. Sp. Pl. v. 2. 1161. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 299. Venten. in Sims and Kon. Ann. of Bot. v. 1. 207. Sm. Fl. Brit. 571. Prodr. Fl. Græc. Sibth. v. 1. 362. Purſh 362. Juſſ. 292. Tourn. t. 381. Lamarck Illuſtr. t. 467. Gærtn. t. 113.—Claſs and order, *Polyandria Monogynia*. Nat. Ord. *Columniferæ*, Linn. *Tiliaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, concave, coloured, deciduous ſegments, about as large as the corolla. *Cor.* Petals five, alternate with the calyx, oblong, obtuſe, crenate at the ſummit. Nectary a ſcale at the baſe of each petal, not univerſal. *Stam.* Filaments numerous,

merous, thread-ſhaped, the length of the corolla; anthers of two nearly orbicular divaricated lobes, burſting outwards. *Piſt.* Germen ſuperior, roundiſh; ſtyle thread-ſhaped, the length of the ſtamens; ſtigma obtuſe, with five angles. *Peric.* Capſule globoſe, angular, coriaceous or membranous, burſting tardily at the baſe, of five valves and five cells. *Seeds* ſolitary, roundiſh.

Obſ. Two or three of the cells are generally abortive and obliterated. The nectary ſeems confined to the American ſpecies.

Eſſ. Ch. Calyx in five deep ſegments, deciduous. Petals five. Capſule ſuperior, roundiſh, angular, of five cells, and five valves.

An important genus, of uſeful, as well as ornamental, hardy deciduous trees. The bark ſerves for cordage, and for thoſe very ſerviceable mats, manufactured in Ruſſia, ſo well known to our gardeners, and ſo uſeful for packing. The ſmooth, ſoft, white, cloſe-grained wood is eſteemed by carvers, and was preferred by the inimitable Gibbons, for thoſe feſtoons of flowers, fruit, dead game, &c. with which his free and expeditious hand adorned moſt of the great houſes in England. The leaves are ſometimes given to cattle in ſeaſons of ſcarcity in the North. The whole plant abounds with mucilage, and the ſap is reported to afford ſome ſugar. Nothing is more delicioufly fragrant than the flowers of the whole genus, which bees frequent in great numbers, as they yield plenty of honey.

Section 1. *Flowers without the ſcaly nectaries.* European ſpecies.

1. T. *europæa.* Common Smooth Lime-tree. Linn. Sp. Pl. 733. Willd. n. 1. Ait. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 610. Fl. Dan. t. 553. (T. platyphyllos; Scop. Carn. v. 1. 373? Venten. n. 2. T. vulgaris platyphyllos; Bauh. Hiſt. v. 1. p. 2. 133. Raii Syn. ed. 2. 316. T. fœmina; Ger. Em. 1483.)—Nectaries none. Capſule coriaceous. Leaves heart-ſhaped, undivided; ſmooth and ſomewhat glaucous beneath, with the branching of their veins woolly. Branches and footſtalks ſmooth.—Native of woods and the borders of meadows, or the ſlopes of hills, in various parts of Europe, from Sweden to Greece, flowering early in July. A tall upright *tree*, with ſmooth, ſpreading, round *branches*, green when tender, afterwards brown. *Leaves* alternate, on longiſh ſtalks, pointed, ſharply ſerrated, almoſt orbicular, about three inches in diameter, entire at the baſe, and their ſides rather unequal or oblique in that part: their upper ſurface of a full bright green, quite ſmooth: under paler, ſomewhat glaucous, with a yellowiſh prominent midrib, and ſeveral other ribs, either oppoſite from the central one, or radiating from the baſe, ſubdivided, connected by parallel tranſverſe veins, all ſmooth as well as the ſurface of the leaf, except at the baſe of each ſide-rib, where is a ſmall, depreſſed, axillary, fringe-like tuft of hairs. *Stipulas* none. *Flower-ſtalks* axillary, ſolitary, ſhorter than the leaves, ſmooth, ſlender, each bearing an irregular umbel or cyme of yellowiſh *flowers*, and very remarkable for a large, ſolitary, oblong, obtuſe, entire, veiny *bractea*, of a pale greeniſh hue, and ſmooth ſurface, united firmly to the ſtalk, and falling off with it. The *germen* is very woolly. *Capſule* obovate, or angular, eſpecially when it ripens more than one *ſeed*, which is not often the caſe. The *flowers* are delightfully fragrant, eſpecially at night. This is the kind of Lime moſt uſually planted for avenues, nor can any thing be more deſirable for that purpoſe. It appears to have taken place of our more ancient elms in king William's time, when alſo it was equally popular in France. The branches naturally feather down to the ground, but will bear clipping without injury. The *leaves* fall perhaps the firſt of all our native trees, eſpecially in the ſquares of London, where the Lime nevertheleſs bears the ſmoky atmoſphere tolerably well. Whether the *T. ulmifolia, ſemine hexagono* of Merrett, mentioned by Dillenius in his edition of Ray's *Synopſis*, 473, be a variety of this, with more perfect fruit, or of any other ſpecies, we have no means of determining.

2. T. *corallina.* Red-twigged Downy Lime-tree. (T. europæa β; Ait. Hort. Kew. ed. 1. v. 2. 229. ed. 2. n. 1. γ; Fl. Brit. n. 1. T. grandifolia; Ehrh. Arb. n. 8. T. foliis molliter hirſutis, viminibus rubris, fructu tetragono; Raii Syn. ed. 2. 316.)—Nectaries none. Capſule coriaceous. Leaves heart-ſhaped, undivided; downy beneath, with the branching of their veins woolly. Branches and footſtalks downy.—Native of various parts of Europe. Plentiful in Stoken-church woods, Oxfordſhire, where it was firſt noticed by Bobart, and where its ſhining red twigs are very conſpicuous. This character, however, is not invariable. We have the ſame ſpecies in Norfolk with brown twigs, and it ſeems to be often planted indifferently with the former. They have not yet been ſeparated as ſpecies, nor did Ehrhart, in publiſhing the preſent under the appellation of *grandifolia*, mean any thing further than to diſtinguiſh it, in common with the foregoing, from his *parvifolia*, hereafter deſcribed. We therefore prefer an older and leſs ambiguous name. Profeſſor Mertens, who has ſtudied theſe trees in Germany, obſerves that *corallina* flowers a fortnight earlier than *europæa.* As to their ſpecific difference, it appears chiefly to depend on the fine ſoft hairs, which clothe the backs of the *leaves*, and eſpecially cover their ribs, fringing their minuteſt veins in a delicate and regular manner. Theſe hairs are condenſed into little axillary tufts, at the origin of each principal vein. In the *infloreſcence* or *flowers* we perceive no material difference. The *capſule* has four or five angles. The famous old Lime in the church-yard of Zedlitz near Guttenberg, in Bohemia, which is ſaid to have borne hooded *leaves*, ſince a parcel of monks were hanged upon it, proves, by an authentic ſpecimen ſent us by profeſſor Jacquin, to be this ſpecies, not the foregoing.

3. T. *parvifolia.* Small-leaved Lime-tree. Ehrh. Arb. n. 36. Pl. Off. n. 125. Sm. Engl. Bot. t. 1705. Ait. n. 2. "Schkuhr Handb. v. 2. 72. t. 141." (T. microphylla; Venten. n. 1. Sav. Etruſc. v. 1. 152. T. europæa β; Fl. Brit. n. 1. T. ulmifolia; Scop. Carn. v. 1. 374. T. ſylveſtris; Trag. Hiſt. 1111. T. folio minore; Bauh. Hiſt. v. 1. p. 2. 137. Raii Syn. ed. 2. 316. T. bohemica, &c.; Till. Piſ. 165. t. 49. f. 3.)—Nectaries none. Capſule roundiſh, very thin. Leaves heart-ſhaped, ſharply ſerrated, ſomewhat lobed; ſmooth and glaucous beneath, with denſe, axillary or ſcattered, tufts of hair.—Native of Germany, Carniola, Switzerland, Italy, France, and England. Ray ſays it frequently occurs in Eſſex and Suſſex, as well as Lincolnſhire and elſewhere. It flowers a month later than even the firſt ſpecies, not being in full perfection before Auguſt. The *leaves* are but about half the ſize of either of the foregoing, their ſerratures ſharper, tufts of axillary hair larger, and often accompanied by large hairy blotches. *Footſtalks* ſlender, and often of a longer proportion, quite ſmooth. *Flowers* ſmaller, ſmelling like a Honeyſuckle. *Capſule* ſmall, roundiſh, ſcarcely angular, rarely perfecting more than one ſeed, its coat thin and tender compared with either of the former ſpecies, on which circumſtance M. Ventenat chiefly founded its diſtinctive character. We do not find that part ſo unlike them in firmneſs, as in thickneſs; but we have no doubt of the ſpecies being perfectly diſtinct. By planting this intermixed with the others about houſes, in avenues, &c. a longer

longer fucceffion of fragrance from their bloffoms might be obtained.

Sect. 2. *Flowers with fcaly nectaries.* American fpecies.

4. T. *americana.* Broad-leaved Lime-tree. Linn. Sp. Pl. 733. Willd. n. 2. Ait. n. 3. (T. glabra; Venten. n. 3. " Mem. de l'Inftit. v. 4. 9. t. 2." Purfh n. 1. T. canadenfis; Michaux Boreal.-Amer. v. 1. 306.)—Nectaries prefent. Leaves orbicular-heartfhaped, abrupt with a point, fharply ferrated; their veins minutely hairy beneath. Petals abrupt, crenate. Capfule ovate, fomewhat ribbed. In the woods of Canada and the northern United States, and on the mountains, as far as South Carolina, flowering in May and June. It is known by the name of Lime-tree or Line-tree, Bafs-wood, or Spoon-wood, and is both ufeful and ornamental. *Purfh.* Kalm firft made the plant known to Linnæus, and it was fuppofed by them to be the only American fpecies of *Tilia.* The *ftem* is faid to be eighty feet high. The *branches* are brown, fmooth. *Leaves* larger than any of our European fpecies, and of a more orbicular or rather elliptical form, abrupt rather than heart-fhaped at their bafe; of a fine green above, turning red in autumn; much paler beneath; finely veined and fmooth on both fides, except that all their veins are minutely hairy (not fringed like *T. corallina*) beneath, and even the fmaller ones, as well as the larger, are furnifhed with little axillary hairy tufts. *Flowers* corymbofe; their common ftalk about twice the length of the footftalks. *Petals,* according to Ventenat, abrupt, and toothed towards the end. We have not examined the flowers.

5. T. *laxiflora.* Panicled Lime-tree. Michaux Boreal.-Amer. v. 1. 306. Purfh n. 2.—" Leaves heart-fhaped, taper-pointed, fparingly toothed, membranous, fmooth. Panicles loofe. Petals emarginate, fhorter than the ftyle. Capfule globofe."—Near the fea-coaft, from Maryland to Georgia, flowering in May and June. A very diftinct fpecies, though generally confounded with the foregoing one. *Purfh.*

6. T. *pubefcens.* Hoary Lime-tree. Ait. n. 4. Willd. n. 3. Venten. n. 4. " Mem. de l'Inft. v. 4. 10. t. 3." Purfh n. 3.—Nectaries prefent. Leaves heart-fhaped, pointed, coarfely ferrated; abrupt and unequal at the bafe; downy beneath. Panicles forked, compound. Petals acute.—In clofe copfes, and on the banks of rivers, from Virginia to Georgia, flowering from May to July. *Purfh.* Its thinner-leaved variety was long ago brought from Louifiana to the Paris gardens, and Juffieu gave it the name of *multiflora,* which is very apt, but has never been publifhed till lately. Catefby is reported to have introduced this fpecies into England before the year 1726. If our memory does not deceive us, it is to be met with at Bulftrode, and in other old plantations, and the flowers are more highly fragrant than any others of the genus. Its growth is faid not to be fo lofty as that of *T. americana.* The *leaves* are fmaller, obliquely heart-fhaped, with very broad and pointed ferratures; their under fide extremely foft to the touch, but not white, though paler than the upper, and fomewhat hoary. There are fcarcely any axillary tufts of hair to the veins, except on the older denudated leaves. *Flower-ftalks* twice as long as the *footftalks,* branched at the top into a forked, fpreading, downy *panicle* of numerous *flowers.* The *petals* are rather pointed, as Ventenat defcribes them; and not emarginate, as in his and Purfh's fpecific definition. We readily concur with thefe authors, that the Louifiana tree, called *multiflora,* is a mere variety, and but a flight one. Our defcription of the *inflorefcence* and *flowers* is taken from this variety. It is hardly neceffary to mention that all thefe American Lime-trees bear the fame peculiar fort of *bractea* as thofe of Europe.

7. T. *alba.* White Lime-tree. Ait. n. 5. Willd. n. 4. " Waldft. et Kitaib. Hung. t. 3." Jacq. Hort. Schoenbr. v. 3. 18. t. 283. (T. rotundifolia; Venten. n. 5. " Mem. de l'Inft. v. 4. 12. t. 4.")—Nectaries prefent. Leaves deeply heart-fhaped, obfcurely lobed, fharply ferrated; downy and white beneath.—Native of woods in Hungary. *Willdenow.* Found by Bruguière and Olivier near Conftantinople. *Ventenat.* It was erroneoufly reported by our gardeners to come from America, as every new plant, at one period, was fuppofed to do. More recently, every novelty has been attributed to Botany Bay.—This is a hardy tree in England, but does not flourifh fo well as any of the preceding. The deep, and more even, heart-fhaped figure of the *leaves,* and their fnow-white under furface, readily characterize this fpecies. Its light-yellow, cymofe or panicled *flowers* are faid to have the fcent of a jonquill.

8. T. *heterophylla.* Various-leaved Lime-tree. Venten. n. 6. " Mem. de l'Inft. v. 4. 16. t. 5." Purfh n. 4. (T. alba; Sm. Inf. of Georgia, v. 1. 21. t. 11?)—" Leaves ovate, fharply ferrated; white and downy beneath; either heart-fhaped, or obliquely, or equally, abrupt, at the bafe. Capfule globofe, obfcurely ribbed."—On the banks of the Ohio and Miffiffippi, flowering in June. A very handfome and defirable ornamental tree. *Purfh.* Ventenat fays it is diftinguifhed from the laft by many characters. The young *branches,* and *buds,* are fmooth, of a purple colour inclining to black. *Leaves* delicately ferrated, pointed, with tufts of reddifh axillary hairs to the veins. *Flower-ftalks* almoft as long as the leaves, being thrice the length of *T. alba.* We have feen no fpecimen of this fpecies, but it has probably been introduced into the gardens by fome of our collectors from America. It is extremely likely to be the Warhew of Mr. Abbot, in our Infects of Georgia, t. 11.; which from the above-mentioned error of the gardeners refpecting *T. alba,* we fuppofed could be no other than that fpecies, now known not to grow in America. The Warhew is faid to be very like the European Lime-tree, except being always a low bufh or fhrub. Mr. Abbot's figure anfwers fo well to Ventenat's and Purfh's definitions, as to leave fcarcely a doubt on the fubject, except only that the latter fpeaks of *T. heterophylla* as an *ornamental tree.* It may attain a greater fize in one part of the country than in another.

We feel much regret in rejecting our late efteemed correfpondent M. Ventenat's fuppofed improvements in the nomenclature of the fpecies of *Tilia.* But befides their appearing to us uniformly for the worfe, as ufual in all fuch alterations that ever came in our way, we greatly prefer eftablifhed names; which though occafionally erroneous or ambiguous, have generally acquired affociations that compenfate for any defects.

Tilia, in *Gardening,* contains plants of the ornamental tree kind, among which the fpecies moftly cultivated are, the European lime-tree (T. europæa); the broad-leaved American lime-tree (T. americana); the pubefcent Carolina lime-tree (T. pubefcens); and the white lime-tree (T. alba).

The firft fort, though little ufed, is a handfome tree, having a fmooth taper ftraight trunk, and the branches forming a beautiful cone. The foliage alfo is fmooth and elegant: it grows to a very large fize, and affords good fhade: it makes a fine detached object in parks and open lawns, planted fingly: the branches are fo tough as feldom to be broken by the winds, and the flowers have a delightful fragrance: the wood is foft, but capable of being turned into light

light bowls and dishes, &c. There are several varieties of it, as the narrow-leaved, the broad-leaved, the elm-leaved, the red-twigged, the smooth small-leaved, the smooth large-leaved, the soft hairy-leaved, the wrinkled-leaved, and the striped-leaved.

Culture.—These trees may be increased by seeds, layers, and cuttings. The seed, when ripe in the autumn, should be beaten down, keeping the green-twigged and red-twigged sorts separate; and be sown soon after, or preserved dry and sound till spring; sowing it in a bed or border of common earth; previously digging the ground, and dividing it into four-feet wide beds; drawing the earth off the surface evenly, about an inch deep, into the alleys; then sowing the seeds thinly, touching them lightly down into the earth with the back of the spade, directly earthing them over to the above depth.

When they come up in the spring, the beds should be kept clean from weeds, giving moderate waterings in dry weather, to forward the plants in growth as much as possible, in order to be fit for planting out in nursery-rows by the autumn or spring following; though, if they have shot rather weakly, they should stand another year, then be planted out in rows two feet and a half asunder, by eighteen inches distance in the lines, to remain three or four years or more to acquire a proper size for the purposes intended, trimming off the large side-branches from the lower part of the stem occasionally, to encourage their aspiring more expeditiously at top, which should be suffered to remain entire: these trees, when raised from seed, generally assume a more handsome and expeditious growth than such as are raised from layers and cuttings. When they are from about five or six to eight or ten feet high, they are of proper size for final planting out; though, when designed as forest-trees for timber, it is advisable to plant them finally while they are young, as not more than from three or four to five or six feet high.

They are all raised readily by the layer method; and for this purpose proper stools must be prepared, and the young shoots of a year or two old are the proper parts for being laid down, which should be performed in autumn or winter, by slit-laying, shortening the tops of each layer within a little of the ground: they are mostly rooted by the autumn following, and fit to plant out in nursery-rows, being then managed as the seedlings.

When cuttings are employed, the strong young shoots of the year should be chosen in autumn or spring, and planted in a moist good soil; or any scarce sorts may be planted several together in pots, and plunged in a hot-bed, as they more readily strike root in that way.

These two last methods are the proper ones for raising the varieties with certainty.

These trees are of a quick handsome growth, and succeed in almost any soil and exposure. They are some of them employed for their fine appearance, others for the exquisitely sweet smell of their flowers, and most of them for the use of their wood. The plants of them are also occasionally made use of in forming hedges in particular situations, but they are not by any means well calculated for this purpose.

As timber trees, their wood is found highly valuable on account of its softness, lightness, and toughness, for the making of various sorts of household utensils, as bowls, basons, &c. as well as for different purposes in the business of carving, gilding, turning, spinning, &c.

All these trees afford ornament and variety among other deciduous trees in the shrubbery, plantations, &c.

TILIACEÆ, in *Botany*, a natural order of plants, the seventy-ninth in Jussieu's system, or the nineteenth of his thirteenth class, of which *Tilia*, the Lime-tree, is an example. See GERANIA for the full characters of this thirteenth class. Those of the order in question are thus given.

Calyx either of many leaves, or in many deep segments. *Petals* definite, distinct, (wanting in *Sloanea*,) alternate with the segments or leaves of the calyx, and for the most part agreeing with them in number. *Stamens* generally indefinite in number, and distinct. *Germen* simple. *Style* frequently solitary, rarely either multiplied, or wanting. *Stigma* either simple or divided. *Fruit* in some instances pulpy, in others capsular, mostly with several cells, having one or many seeds in each, the partitions from the centre of each valve. *Corculum* of the seed flat, surrounded by a fleshy albumen. *Stem* arboreous or shrubby; rarely herbaceous. *Leaves* alternate, simple, accompanied by stipulas.

Section 1. *Stamens definite in number, more or less combined in their lower part, or at the very base.* These are termed by Jussieu "doubtful *Tiliaceæ*." They consist of *Waltheria*, *Hermannia*, and *Mahernia*.

Sect. 2. *Stamens distinct, mostly indefinite. Fruit of many cells.* Genuine *Tiliaceæ*.

Antichorus; Corchorus; Heliocarpus; Triumfetta; Sparmannia; Sloanea; Apeiba of Aublet, which is *Aubletia* of Schreber; *Muntingia; Flacourtia* of L'Heritier; *Oncoba* of Forskall, Lamarck Illustr. t. 471; *Stuartia; Grewia;* and *Tilia.*

Sect. 3. *Stamens distinct, indefinite. Fruit of one cell.* Genera allied to *Tiliaceæ*.

Bixa; Laetia; and *Banara* of Aublet and Schreber.

The author hints that this order might possibly, with propriety, receive a reinforcement of several polypetalous polyandrous genera, at present not well understood, and therefore annexed to other orders, among subjects that remain in doubt. He names *Soramia* of Aublet (see MAPPIA); *Calinea* of the same (see DOLIOCARPUS); *Cleyera* of Thunberg (see TERNSTROEMIA); *Vallea* of Linnæus; *Dicera* of Forster (see ELÆOCARPUS); *Caraipa*, *Mahurea* (see BONNETIA), *Houmiria* (see MYRODENDRUM), *Vantanea* (see LEMNISCIA), all of Aublet; and *Trilix* of Linnæus. The reader will be able to form his own opinion on these matters, by turning to these articles in their proper places, many of the genera and their affinities having become better known since the publication of Jussieu's work.

The characters of his *Tiliaceæ* are hardly to be distinguished from those of his next order *Cisti*, the principal difference consisting in the straight *corculum*, and more copious *albumen*, of the former.

TILLABARUM, in *Ancient Geography*, a town of Africa Propria, upon the route from Tacapæ to the Greater Leptis, between Thebelamum and Adaugmagdum. Anton. Itin.

TILLÆA, in *Botany*, was dedicated by Micheli (followed by Linnæus) to the honour of his friend and fellow-labourer Michael Angelo Tilli, who published a splendid and rich catalogue of the garden of Pisa, of which he had the care, in 1723. He was a member of the Royal Society of London, as well as of the Botanical Society of Florence, and corresponded with the chief botanists of his time, in England, Holland, and elsewhere. He travelled to Constantinople and Tunis.—Linn. Gen. 68. Schreb. 93. Willd. Sp. Pl. v. 1. 720. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 282. Sm. Fl. Brit. 201. Mich. Nov. Gen. 22. t. 20. Juss. 307. Lamarck Illustr. t. 90. Gærtn. t. 112.—Class and order, *Tetrandria Tetragynia*. Nat. Ord. *Succulentæ*, Linn. *Sempervivæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, in four deep, flat, ovate, large segments. *Cor.* Petals four, ovate, acute, flat, rather fmaller than the calyx. *Stam.* Filaments four, fimple, fhorter than the corolla; anthers fmall, roundifh. *Pift.* Germens four; ftyle fimple; ftigmas obtufe. *Peric.* Capfules four, oblong, pointed, reflexed, the length of the calyx, burfting longitudinally along the upper edge into two valves, with one cell. *Seeds* two, or many more, in each cell, ovate.

Obf. *T. mufcofa* has the parts of fructification ufually in threes, not fours. Gærtner difcovered its flowers to be fometimes even five-cleft. He juftly remarks, that fuch differences of number are in this natural order of little importance, and that *Tillæa* differs from *Craffula* in nothing but the want of nectariferous fcales below the germens.

Eff. Ch. Calyx in three, four, or five fegments. Petals as many. Nectaries none. Capfules three, four, or five, burfting inwards. Seeds feveral in each capfule.

1. T. *aquatica.* Water Swedifh Tillæa. Linn. Sp. Pl. 186. Fl. Suec. 54. Willd. n. 1. Ehrh. Phytoph. n. 14. Schkuhr in Uft. Annal. fafc. 12. 6. t. 1.—Stem erect. Leaves linear, acute. Flowers nearly feffile.—Native of watery places in Lulean Lapland; as well as near Upfal, where water has ftagnated, in hilly fpots. *Linnæus.* A delicate, fmooth, annual plant, two or three inches high, fomewhat like *Montia fontana*, but much more flender, growing in denfe tufts, fimple or branched. *Leaves* oppofite, ftalked, narrow, acute, entire, a third of an inch long. *Flowers* either axillary and lateral, or in the forks of the ftem, folitary, fmall, white, on very fhort ftalks. The whole *herb* is fucculent and pellucid.

2. T. *proftrata.* Proftrate German Tillæa. Schkuhr in Uft. Annal. fafc. 12. 6. Willd. n. 2. (T. aquatica; Schkuhr in Uft. Annal. fafc. 2. 21. t. 3.)—Stem proftrate. Leaves lanceolate. Flowers on fhort ftalks.—Native of moift ground in Germany. Annual, differing from the foregoing in having many proftrate *ftems* from one *root*, broader *leaves*, which are nearly cylindrical, and rather longer *flower-ftalks*. *Seeds* eight in each *capfule*. *Schkuhr.*

3. T. *Vaillantii.* Stalked French Tillæa. Willd. n. 3. (Sedum minimum annuum, flore rofeo tetrapetalo; Vaill. Parif. 182. t. 10. f. 2.)—Stem erect, much branched. Leaves ovate, clafping the ftem, fhorter than the flower-ftalks.—Native of France. Obferved by Vaillant, in the foreft of Fontainebleau, where water has ftagnated in winter, flowering from May to Auguft. *Root* annual, of a few fmall tufted white fibres. *Stem* an inch or two high, repeatedly branched, fcarcely forked, purplifh. *Leaves* in pairs croffing each other, very thick, pointed, gibbous underneath, dark green, about two lines long. *Petals* four, rofe-coloured, with a dark-coloured mid-rib. *Seeds* numerous, black, very minute.—The broader thicker *leaves*, and the much longer *flower-ftalks*, render this very diftinct, as Willdenow obferves, from *T. aquatica*.

4. T. *peduncularis.* Long-ftalked Brazil Tillæa.—Stem erect. Leaves lanceolate, acute. Flower-ftalks often twice the length of the leaves. Capfules abrupt.—Gathered by Commerfon, in marfhy fpots that had been overflowed, at Monte Video. This grows in tufts, and has very much the habit of *T. aquatica*, for which poffibly it may have been taken. There appears neverthelefs much difference between them. The whole *herb*, in the prefent inftance is red, and the *flowers* rofe-coloured, growing on long *ftalks*, which, though indeed variable, are never lefs than half the length of the leaves, and often twice their length. The fhape of the *leaves* agrees with *aquatica*; but the *capfules* when expanded are more abrupt, and even inverfely heart-fhaped.

5. T. *mufcofa.* Moffy Tillæa. Linn. Sp. Pl. 186. Willd. n. 8. Fl. Brit. n. 1. Engl. Bot. t. 116. Rofe's Elem. append. 448. t. 2. f. 2. (T. mufcofa annua perfoliata, flore albo; Mich. Gen. 22. t. 20. Sempervivum omnium minimum repens mufcofum, polygoni facie; Bocc. Muf. 36. t. 22. Polygonum mufcofum minimum; Bocc. Sic. 56. t. 29.)

β. Craffula mufcofa; Linn. Sp. Pl. 405. Am. Acad. v. 6. 86. Willd. Sp. Pl. v. 1. 1557. Thunb. Prodr. 54. See Crassula, n. 40. (Ficoides africana annua minima mufcofa; Herm. Parad. 170.)

Stems procumbent, branched. Leaves obtufe. Flowers moftly three-cleft. Calyx and petals taper-pointed.—Native of fandy barren ground in the more temperate parts of Europe, flowering in fummer. Abundant on fandy heaths near Norwich, Bury, Brandon, &c. The variety β is brought from Africa, from Lima, and even from New South Wales. We can find no difference in the dried fpecimens, except their being larger than our's, with fomewhat of a glaucous hue, and the *flowers* partly ftalked, more numerous, and all, as far as can be examined, five-cleft and pentandrous, juft like Gærtner's plate of *T. mufcofa*. The Britifh fpecimens of the *mufcofa* are from one to two inches high, ftrongly tinged with a blood-red, afcending, branched, with a fibrous annual *root*. *Leaves* elliptical, thick, obtufe, fomewhat channelled above; clafping their ftem at their bafe. *Flowers* moftly three-cleft, feffile; their *petals* white, with a taper red point, lefs than the *calyx*. *Seeds* only two in each capfule.

We fcruple to retain in this genus four other fpecies admitted by Willdenow. The firft is *T. capenfis*, Linn. Suppl. 129. Willd. n. 4; evidently, as Thunberg calls it, a *Craffula*, by its purple triangular nectaries, though, on account of its four-cleft *flowers*, made a *Tillæa* by Linnæus and Willdenow.

T. perfoliata, Linn. Suppl. 129. Willd. n. 5; *T. umbellata*, Willd. n. 6; and *T. decumbens*, Willd. n. 7; all referred to *Craffula* by Thunberg, have none of them fallen under our infpection; but as Willdenow avows having been guided by number, we have no fcruple in removing them hence.

So alfo *Craffula mofchata*, Forft. Magell. 16; gathered by that author, as well as by Commerfon, Menzies, Banks, and Solander, at Staten land, is moft certainly a *Craffula*, becaufe of its nectaries; though, on account of its four-cleft *flowers*, it has been taken by fome great botanifts for a *Tillæa*.

TILLAGE, in *Agriculture*, the practice of tilling or cultivating land, efpecially of the arable kind, or the means of bringing it into a ftate of preparation for the growth of different forts of arable crops.

Of all the arts, fays Vattel, tillage, or agriculture, is the moft ufeful and neceffary. It is the nurfing-father of the ftate. It forms the fureft refource and the moft folid funds of riches and commerce, for people who enjoy a happy climate. This object, therefore, deferves the utmoft attention of government: and it ought carefully to avoid every thing capable of difcouraging the hufbandman, or of diverting him from the labours of agriculture. Thofe taxes, thofe exceffive and ill-proportioned impofitions, the burthen of which falls almoft entirely on the cultivators; and the vexations they fuffer from the commiffioners who levy them, take from the unhappy peafant the means of cultivating the earth, and depopulate the country. Spain is the moft fertile and the worft cultivated country in Europe. The church poffeffes too much land, and the undertakers of the royal magazines, who are authorized to purchafe, at a low price, all the corn they find in the poffeffion of a peafant, above what is neceffary for the fubfiftence of himfelf and his [illegible], ſo greatly diſcourage the huſbandman, that he ſows no more corn than is neceſſary for the ſupport of his own houſehold. Whence frequently ariſes the greateſt ſcarcity in a country capable of feeding its neighbours.

Another abuſe injurious to agriculture is, the contempt caſt upon the huſbandman. The inhabitants of cities, even the moſt ſervile artiſts, and the moſt lazy citizens, conſider him that cultivates the earth with a diſdainful eye; they humble and diſcourage him. They dare to deſpiſe a profeſſion that feeds the human race; the natural employment of man. A little inſignificant mechanic places far beneath him the beloved employment of the firſt conſuls and dictators of Rome. China has wiſely prevented this abuſe; agriculture is there held in honour, and to preſerve this happy manner of thinking, every year, on a ſolemn day, the emperor himſelf, followed by his whole court, ſets his hand to the plough, and ſows a ſmall piece of land. Hence China is the beſt cultivated country in the world: it nouriſhes an innumerable multitude of people, that at firſt appears to the traveller too great for the ſpace they poſſeſs. Beſides, the cultivation of the ſoil is an obligation impoſed by nature on mankind.

The moſt proper ſorts of ſoils for the purpoſes of tillage-cultivation, are all thoſe of the more dry and friable kinds, whether the depth of earth or mould, or what is often termed ſtaple in them, be only ſlight or conſiderable; as under different circumſtances theſe differences fit them for the production of different ſorts of crops, the methods of cultivation in which are fully explained under their different proper heads.

In this view, all the various denominations of light ſoils, ſuch, for inſtance, as gravels, ſands, light chalks, and thin loamy lands, are well adapted, in moſt caſes, to the purpoſes of tillage, from their being, in general, pretty well ſuited to the various ſorts of grain, as well as to the raiſing of ſuch green and root-crops as are neceſſary in the ſupport and management of different kinds of live-ſtock. The more deep, loamy, chalky, and gravelly ſorts of land, where they can be kept ſufficiently dry, and in a proper ſtate, during the winter ſeaſon, may likewiſe, in many caſes, be well employed in tillage-cultivation, and eſpecially when they do not produce and afford an abundant and uſeful ſort of herbage for the keeping of animals, or other uſes. All the lands of the ſward-kind, or in the ſtate of graſs, which are liable to be infeſted with the moſs-plant, or to become over-run with a moſſy covering, may, in common too, be managed under the tillage-ſyſtem with much advantage, and better than in ſuch a ſtate of graſs.

In ſome caſes, lands may be ſuited to convertible tillage, or alternately that of grain and graſs, with vaſt benefit to the farmer. It has been remarked on this ſort of tillage by a late writer, that land may in this way often be turned to better account by ploughing and tilling it eight or ten years, and then laying it down to graſs, in order to take up another part or portion, than by the common method, but eſpecially where the land is ſubject to ant-hills; as the paring and burning deſtroys all ſuch hills, and ſuch land is ſure to bring abundant crops of corn. And that there are very few ſituations that have dry land and ſoil fit for the plough, but what would bring more profit under tillage than by lying in the ſtate of old graſs; for when ſuch good land as this is well laid down to graſs, with plenty of good proper ſeeds, after a courſe of tillage, an acre of it will keep as much ſtock as four acres would which were produced in the natural way, and this is what makes its great value. Such tillage-land as this, it is ſaid, is worth more money than the fineſt graſs-land in the kingdom; as, on the fine marſhes ſo much boaſted of, the earlieſt of the ſummer-ſtock comes to market at the very time when all ſorts of vegetables are in plenty, ſuch as peas, beans, and many others, and when meat conſequently is ſure to fall in price; and great numbers of graſs-fed beaſts, or cattle and ſheep, come together. Beſides, the very beſt graſs-lands ſend only two ſheep in the two early months of April and May from an acre; but the beſt tillage-land will ſend ten from an acre, and have them ready any time in the winter, when meat is the deareſt. Thus, it is contended that ten acres of turnips will ſend one hundred ſheep in the deareſt time to the market, but that it will take fifty acres of the beſt land in graſs, to ſend the ſame number to the market.

It is therefore concluded that, in this way, the tillage-farmer ſends three hundred acres of corn to market, and as many fat ſheep beſides, acre for acre, as the beſt grazing-land; and that by ſtill other improved methods of management, as that of the culture of flax for the uſe of the ſeed in fattening live-ſtock, and ſome others of a ſimilar deſcription, the tillage-farmer may derive greater profit than by the turnip practice, from the large quantity of winter-fattened animals, and the vaſt ſupply of dung or manure which is thus raiſed and provided.

Although the neceſſity of good tillage in the preparation of land for cropping be now pretty well underſtood by the practical farmer, and has been inculcated occaſionally under different heads in the preſent work, it requires to be well explained in ſome of its proceſſes. It has indeed been obſerved in the Agricultural Survey of the County of Hereford, after noticing that the Romans were convinced of the good effects of this ſort of preparation, as Pliny has remarked the advantages of frequent ploughing and turning over the ſoil in Tuſcany; and that, in this country, Evelyn ſuggeſted its power of ſo altering a ſoil from its former nature, as to render the hardeſt and harſheſt as well as moſt uncivil clay obſequious to the huſbandman; that tillage alſo deſtroys weeds, and reduces the earth to ſmall particles, rendering it ſufficiently looſe and porous to admit of the eaſy growth and extenſion of the roots and fibres of the grain to be cultivated in or upon it. And that the ſpade is well adapted to theſe purpoſes, becauſe it moves the ground eight or ten inches deep, turns it upſide down, and covers the weeds with a quantity of earth, under which they rot, and contribute towards its fertilization and improvement; and that this mode is founded on the juſt idea or notion of the Flemings, that a farm ſhould reſemble a garden as nearly as poſſible. But that as the ſpade method is much too tedious and laborious, as well as too expenſive, to be practiſed on the larger ſcale of a farm, the plough is therefore ſubſtituted, as cheaper and more expeditious, but that, in general, it does not ſtir the earth ſo deeply, and often moves it in large bodies or maſſes, without ſufficiently breaking it into pieces. In order to remedy this inconvenience, the celebrated Mr. Tull, it is ſaid, recommended a plough of his own invention, which had four coulters inſtead of one, and thus divided the earth raiſed by the ſhares into ſeveral narrow ſlips; but the reſiſtance occaſioned by the additional coulters was found to require a greater ſtrength in horſes than the profits of the experiment and work would warrant. It was, however, afterwards aſcertained by a diſtinguiſhed foreigner, M. de Chateauvieux, that the breadth of the furrow ſhould be proportioned to the ſtiffneſs of the ſoil or land; and that thus the reſiſtance may be regulated on all kinds of land or ſoil. But the operation of repeated croſs-ploughing, and the uſe of other tools, as now generally practiſed, aided as they are by full expoſure

expoſure to froſt, rain, &c. ſo effectually break down the hardeſt ſoils, that other meaſures are, it is thought, rendered leſs neceſſary. Since the above was written, however, many uſeful inſtruments have been formed, by which tillage-cultivation is not only rendered more effective, but more eaſy and expeditious, as may be ſeen by the deſcriptions which have been given of them under their different proper heads. See DRAG, SCARIFIER, SCUFFLER, SPIKE-*Roller*, &c.

M. Duhamel has ſince too obſerved in his "Elements of Agriculture," that ſome believe it is more advantageous to increaſe the fertility of land by frequent ploughing and other means than by manure; becauſe, in general, only a certain quantity of manure can be procured; as twenty acres of land will, in common caſes, ſcarcely produce as much manure as is neceſſary for five; whereas the particles of the earth may be divided and ſubdivided almoſt to infinity. The aids, therefore, which are derived from manure, muſt, it is ſuppoſed, be limited, whilſt no bounds can be ſet to the benefits that may accrue from ploughing or breaking down and reducing the parts of the ſoil. This appears, the writer thinks, to be over-rating the advantages of breaking the ſoil down in other ways; but, it is certain, that when the particles of land or ſoil adhere ſo cloſely together as to impede the extenſion of the roots of plants, in ſearch of the food and nouriſhment they require, the plants themſelves cannot grow with proper vigour, or yield a proper produce. This is therefore to be corrected by frequent ploughings, &c. And that, laſtly, repeated ploughings and other ſuch means enable the land to receive and retain all the benefits to be derived from the floating vapours and dews of the atmoſphere, which falling on hard ground, where it cannot readily penetrate, is quickly exhaled by the next day's ſun and wind.

Notwithſtanding theſe remarks, it may, however, be noticed, that no tillage or breaking down of the parts of the ſoil, though ever ſo complete and effectual, can wholly ſupply the place of manure, although it may greatly contribute, in different inſtances, to aſſiſt its fertility.

Theſe are ſome of the more general and particular ways in which tillage becomes ſo eſſential and effectual in promoting the fertility and improvement of land; but there are a few others, the proceſſes of which may be ſeen under their proper heads.

In the tillage-cultivation for moſt ſorts of crops of the grain or corn kinds, as well as ſome others, it becomes eſſentially neceſſary that the ſoil ſhould be reduced to a very conſiderable degree of fineneſs, or what is frequently termed *tilth* by writers on huſbandry; as, where this is not the caſe, they can neither be ſo well provided with food or nouriſhment, nor be kept ſo perfectly and ſo ſufficiently clean and free from weedy matters. There are other reaſons too that require, at leaſt, the more ſuperficial parts of the ſoils to be in a fine condition of tillage for the receiving of ſuch crops, which are thoſe of the young tender roots of the new riſing plants being thereby rendered more capable of fixing themſelves perfectly in the mould which is produced, and of their drawing from it a more regular ſupply of food, in conſequence of the more equal diffuſion of moiſture and other ſubſtances through it, which muſt neceſſarily take place. Beſides, it is favourable in other ways, as by ſuch tillage the ſeed-corn is not only more capable of being perfectly but equally covered, in conſequence of which the vegetation and growth of the young plants of it are more equal and expeditious.

But beſides the ſtate and condition of the ſoil or land in regard to tilth, it ſhould be in a ſuitable ſituation in reſpect to dryneſs; as where there is too great a degree of moiſture in it, the tillage can neither be performed in a proper manner, nor the ſeed-corn be put in without the danger of ſuſtaining injury by becoming rotten before the vegetative proceſs takes place, as not unfrequently happens to pea and other garden crops, when put into the ſoil during the moiſt winter months: and where, on the contrary, the land is in too dry a ſtate, the tillage is improper to be effected, as cauſing too much exhalation, by which the ſeed-corn, when put in at ſuch periods, may be much injured by the want of that moiſture which is neceſſary for perfect vegetation. Under the laſt circumſtance too, it may be more liable to be deſtroyed by worms, grubs, and other inſects. On theſe accounts the arable farmer ſhould, of courſe, be equally attentive to the tillage preparation of the ſoil, and the condition in which it may be cropped to the greateſt advantage, and with the greateſt chance of ſucceſs.

The writer of the "Elements of Agricultural Chemiſtry" ſtates, that in all caſes of tillage, the ſeeds ſhould be put in ſo as to be fully expoſed to the influence of the air. And that one cauſe of the unproductiveneſs of cold clayey adheſive ſoils is, that the ſeed becomes coated with matter impermeable to air. All immediate tillage, for putting in crops, ſhould conſequently be performed as much as poſſible in ſuitably dry weather on ſuch ſorts of land.

In ſandy ſoils, he ſays, the earth is always ſufficiently penetrable by the atmoſphere; but in clayey ſoils there can ſcarcely be too great a mechanical diviſion of the parts in the proceſs of tillage.

In general, the beſt and moſt effectual method of breaking down and bringing land into the ſtate of proper tillage, is by the uſe of the plough and different other implements of the harrow kind, ſuch as thoſe which have been noticed above, ſuited to the intention of the cultivator, and the peculiar nature of the land or ſoil. The tillage with the plough ſhould conſtantly be performed according to the nature of the ſoil, and that of the crop which is to be ſown or ſet, and the operations which are afterwards to be executed upon it. But to whatever depth this may be proper to be done, it is of much conſequence to have it performed in an exact and effectual manner; as on this not unfrequently depends the difference between a good and bad crop, as well as that between the animals employed in the labour moving with eaſe and with difficulty. The repetitions in the tillage of this ſort muſt be conſtantly regulated by the quality and circumſtances of the land and the deſigns of the farmer, as ſome ſorts and caſes of land require much more tillage than others. This point is moſt decidedly evinced in the Agricultural Survey of the County of Glouceſter. On the Cotſwolds, it is the practice, the writer remarks, to ſow their crops on one ploughing, experience having proved that frequent ploughings or tillage on theſe light ſoils, weaken the ſtaple of the land, and are productive of injury.

On the ſtrong lands or ſoils of the county of Eſſex, the moſt intelligent and ſucceſsful practical farmers, it is ſaid, are thoſe who are the moſt careful in the repetition of tillage of the plough kind, to which they conſtantly attribute great powers and effects. The ſtrong heavy lands have it eight or more times in many caſes, even for barley or oats; and on thoſe which are leſs ſo, the general ſyſtem of tillage is moſtly four or five times for the different fallow crops. In this laſt intention, it is not unuſual to commence the firſt tillage ploughing towards November, continuing it nearly or quite to the end of March, after barley ſowing; and if at the firſt period of ſuch tillage the ridges be laid a little round, ſo as to be water-ſhot, and after that well water-furrowed, the tillage is greatly promoted. The land is moſtly first broken up into ridges of eight or twelve nine-inch furrows; then crossed, and the tillage given in different ways very often during the summer season, carefully turning up and exposing every time a different surface, as much as possible, to the sun and air: before harvest it is got up on four-furrow ridges, when, after that season is over, it has again immediately another tillage ploughing; and if the weather be suitable, it is done twice, leaving it upon the ridge for the ensuing winter: the later the last tillage furrow is given the better, in this district, for preventing the black grass-weed getting up; after which the whole is well water-furrowed for taking off any water that may be upon it: by these means the land is much earlier got upon in the spring season than could otherwise be done, and in consequence, when the tillage for barley is performed, such stiff tenacious lands break down into the finest tilth it is almost possible to conceive.

In executing the work of tillage on ridges for wheat, or any other sort of crop, great attention is here bestowed on turning the furrows well, drawing them straight, making them alike in size, and lapping them with such regularity on to each other, that the harrow tools cannot fail to lay hold of them all with facility; the shutting-up furrow more especially is drawn with perfect straightness, exactly turned, swept out with cleanness, and at the same time the space between the ridges not left in too wide a state.

But notwithstanding this great and frequent tillage, in some places they do not venture in the seed on the autumnal furrow, but give a spring plough tillage, though perhaps some other tool of the tillage kind might answer better in many cases, and be far more expeditious.

The most proper and suitable depths of tillage for different sorts of soils, have probably not yet been well ascertained; but such as have a good strong staple, require much more deep tillage than those of the light kind. Whether flat-work tillage, as practised in Norfolk, or that of feather-edged, as employed in Essex, has the advantage, is not properly decided, but probably each may have a superiority on different sorts of land: the great point of importance is that of allowing the covering of the seed well.

The plan of tillage given below has been advised in the Corrected Agricultural Survey of the County of Salop, for the lighter sorts of friable lands, on a farm of four hundred acres: first, the wheat stubble is to be harrowed by drawing the harrows one way, which lays the stubble; and by returning back along the same stroke, they draw the greater part of that which was gathered by the harrows; and a proper person following them with a fork, unloads them, and lays the stubble in heaps, to be disposed of as directed below.

This stubble ground has the tillage of ploughing from the middle of November to the end of the following month; about the beginning of March it has that of cross-ploughing given it, and when dry, well harrowed; and when the weather is suitable, much of the couch-grass is got out of it and burnt; but when not so, it is, in this way, checked in its growth during the seed-time, and the business is more easily performed; which is to be done in the month of May and the two succeeding ones, in which the fallow lands have the tillage of three ploughings and sufficient harrowings to prepare them for turnips, for which eight cubic yards of reduced dung, or seventy-two bushels of clod-lime, are laid upon the acre; which are ploughed in at the last tillage-furrow, though sooner, it is thought, would be better, if the dung be reduced enough by that time, or the land be so clean as not to require much harrowing. Turnip-seed, one pound to the acre, is then sown from the 7th of June to the 14th of the following month, the plant being twice hoed; the average produce is from 2*l.* to 2*l.* 15*s.*

As the same land becomes cleared of its crop of turnips, it has the tillage of ploughing and harrowing, preparatively for a crop of barley: and being again tilled, by being ploughed up in butts or lands five yards in width, from the latter end of March to the latter end of the following month, is sowed with three and a half statute bushels of barley, fourteen pounds of common red clover-seed, and one peck of fine rye-grass-seed to each acre: the average produce is about forty bushels, of the statute kind, of barley to the acre.

The young clover which is not eaten between December and May, in the part which is mowed, on an average produces about two waggon-loads, or a ton and a half to the acre. In the succeeding month of October, it is ploughed in the tillage of nine-inch furrows and six inches deep, and sowed with two and a half bushels of wheat: the produce about seventeen bushels the acre.

The turnip-crop is generally disposed of somewhat in this manner: first, by drawing home those under the hedges, at the beginning of November, and some of the largest over the rest of the field, taking all up where the horses and carts are to pass. When the tops and small roots are cut off, they carry them home, and place them in heaps of about twelve cart-loads each, in the form of the cone of a wheat-rick, covering them a foot thick with straw and thatch. These serve as a resource in time of frost and snow, for the beasts that are stall-fed, of which there are generally twenty yearly; and a man and boy, with one horse and cart, supply them; leaving ultimately in the fields as many turnips to be eaten off upon the land by sheep, as to ensure fertility enough for the crops of barley, &c. as the barley, being too rank, commonly spoils the young clover growing with it. Another advantage in this plan of tillage, which is obtained by stall-feeding with turnips, is the making a large quantity of straw into manure at home; which is the best use that can be made of it, as straw-food is not an improver of cattle-stock.

This method of tillage or cultivation for dry lands, is recommended to those who have been in the practice or custom of long tillages, and without the use of general turniping, to be continued for so long as two courses of tillage, that is, eight years; by which time their land will be clean, and more fit for what is conceived to be a more beneficial mode of husbandry, and which mode is now, it is said, pursued; namely, first turnips, managed and manured for as above; second, barley; third, pease, in rows one foot asunder, hand-hoed and weeded; fourth, barley, with ten pounds of common clover, four pounds of white Dutch clover-seed, two pounds of trefoil-seed, and one peck of fine rye-grass-seed, eight cubic yards of rotten dung, or seventy-two bushels of stone-lime laid upon the young clover in November; fifth year, mow or graze the land; the sixth, graze until October; and the seventh, give a plough tillage, and sow with wheat as before; the land mucked for turnips, and lime or compost of lime, and earth or mud, &c. laid on the young clover in the autumn. This is believed to be a more profitable course of tillage, after land has been got into order, than that which was previously practised, affording a greater change, and thereby obviating the failure both of turnips and clover, and occasioning more grass-land, which for many years has there exceeded the tillage in point of profit.

As an improvement of wheat-lands, or mixed soils upon clay, the mode of tillage directed below is advised to be practised.

The

The turf or other land being well ploughed or tilled, and laid dry before Chriſtmas, in the following month of April ſow the land with four and a half ſtatute buſhels of oats, plough and lay it dry in the autumn, and in the month of May and the two following ones, give it three good tillage ploughings and harrowings, with ſome rollings, &c. ſo as to reduce it well; being thus drawn up and laid dry, it may continue in that ſtate to the middle of September; though made both fine and clean, it ſometimes gets an adheſive and binding quality, and conſequently works lumpy, and therefore has the texture and quality which the farmer, by miſtake, is afraid of loſing by making his land clean. It is, however, it is ſaid, in the three above months, when the ſun is powerful, that land is to be cleaned by tillage: a ploughing in Auguſt is ſeldom of much worth.

If manured with lime, lay eighty buſhels upon the acre; if with dung, ten cubical yards to each acre, either ploughed under at the July tillage ploughing, or before. From the 20th of September to the 10th of the ſucceeding month, ſow wheat nine ſtatute pecks to the acre, after having ſoaked the ſame not more than eight hours in mild brine, and dried it with lime, to prevent the ſmut. The next autumn plough the corn ſtubble, and at the end of March plant beans or peaſe in rows one foot aſunder, hand-hoe and weed them. Plough in the autumn, and ſow oats in the ſpring, and lay down with ten pounds of red clover-ſeed, four pounds of white Dutch clover-ſeed, and one peck of rye-graſs-ſeed to each acre. Manure the land in ſeeds in the autumn, and let it lie in ſward two or three years, as it may be required. At the next breaking up, plant the land with beans, hand-hoe and weed them; the enſuing autumn ſow it with wheat, then with beans in rows, hand-hoe and weed that crop; then put in oats and lay down with ſeeds, as before. In lieu of one of the hoeing crops, if the land be not too wet, potatoes may be planted, which would be found very profitable to the wheat-land farmer; being very uſeful food for feeding or milking cows in the winter ſeaſon. The farmer ſhould fallow for the firſt crop in one tillage, and hoe the next, and ſo proceed alternately; the ſummer ſun to wheat-lands being certainly uſeful, and alſo the manuring with dung or lime in an alternate manner. Where marle is to be procured at convenient diſtances, nothing turns to more profit; upon open ſoils, with either clay or dry bottoms, marle laid upon the ſward in the autumn, and to lie one year, is commonly the beſt practice, eſpecially if the marle be not perfectly good. Lime is ſure to pay well the next tillage courſe.

On this mode of tillage it is, however, remarked, that good farmers, on light ſoils, will entertain the plan here preſcribed with ſome caution, and that their apprehenſions of a crop of couch will often outweigh their hopes of a crop of clover. That peaſe are precarious; one week's hot weather whilſt in blow is often fatal to the crop.

It is added too, on the authority of Mr. Harries, after noticing the inſufficiency of ſome fallow tillage lands, that there are many active farmers who begin the tillage on their fallows in January, and by repeated ploughings, harrowings, and rollings, bring them into very good order for wheat. Others graze the ſecond year's clover until about the middle of the ſummer, and ſometimes mow it at that time: if the ſoil be dry and the ſummer favourable, they bring it into very good tillage order by ſeed-time. It would, however, it is thought, be better tillage huſbandry to raiſe a crop of turnips on ſuch lands, after wheat or barley. If this was done, at leaſt in every courſe of tillage, a good crop of wheat would be grown upon clover lays, upon one tillage ploughing, at a light expence. It is frequently his cuſtom to break up his clover lays of the firſt or ſecond year, if they are tolerably clean, upon one ploughing, putting upon the plough a cutting tool or inſtrument, which is there termed a *ſay* or *ſlay*, that cuts or pares off the ſurface turf, and lays it in the bottom of the furrow. Lately, a clover lay was worked with this inſtrument upon the plough, and after the ſeed was harrowed in, ſcarcely any of the ſurface turfy matter came upon the ploughed ſurface, the field looking as well, and appearing as clean, as though it had been ſown upon fallow tillage.

Some, however, on hollow lands, do not approve of this ſkimming or paring tillage; as ſlicing the ſurface of ſuch ſoils they conſider much worſe than turning it over in the ordinary manner, and letting the ſurface vegetable matters be laid into the furrows in a ſort of diagonal poſition, though ſome of them ſhould even appear out in the ſeams. The notion is notwithſtanding probably erroneous, as ſuch ſurface produce is always, in ſome way or other, to be rotted and got rid of, as in every mode of tillage it is ploughed in or under, and the main point is how to get the moſt ſpeedily and completely quit of it, and to render it the moſt uſeful to the crop which is to be put in. Theſe are certainly the beſt and moſt fully accompliſhed by taking it wholly off by ſuch a cutting apparatus, and placing it at the bottoms of the furrows, which muſt alſo leſſen the hollowneſs of the land at the ſame time.

In the breaking-up tillage of old graſs-lands, it muſt be executed in a manner ſuitable to the nature, ſtate, and quality of the ſoil, whatever that may be, reducing and breaking the turfy ſward well and carefully down, and clearing it effectually from inſects and vermin of all ſorts by proper crops, ſuch as thoſe of the pea, bean, teaſel, and other ſimilar kinds, before the introduction of thoſe of the grain ſort. In this way, the lands will not only be the beſt wrought into a proper ſtate of tillage, but the corn-crops the moſt effectually ſecured from the danger of worms, grubs, and other noxious vermin.

It has been remarked by the writer of the Corrected Agricultural Survey of the County of Norfolk, that for the laſt four or five-and-thirty years that he has examined Weſt Norfolk with the eye of a farmer, the change in the tillage ſyſtem, which has taken place in that vaſt arable diſtrict, has not been great. At the early part of that period, the tillage courſe was, it is ſaid, firſt, turnips; ſecond, barley; third, graſſes for two, or, in a few caſes, three years; fourth, white corn: on the better ſoils, wheat; on others rye, &c. The only material change that has occurred, has been, it is thought, in the graſſes: the variation, which, it is believed, firſt took place from forty to fifty years ago, was ſhortening the duration from three years to two; in both caſes giving what may be called a ſort of baſtard fallow the laſt year, by means of a half-ploughing, ſoon after the middle of the ſummer. Above thirty years ago, the writer, it is ſaid, contended, both in print and in converſation, againſt it, but was held cheap for entertaining any doubts of the propriety of the practice. He has lived, however, it is obſerved, to ſee this change alſo in a great meaſure take place amongſt the beſt farmers, who now give only one ploughing for the winter corn, whether wheat or tares; or in the ſpring for peaſe. That it is an improvement cannot be queſtioned, it is thought. The argument for it, founded on the invention of the drill-roller, and on the introduction of the drill-plough, is good, it is ſaid, but not ſingular, as the practice of dibbling is likewiſe far more adapted to a whole than to a broken furrow; and for broad-caſt common ſowing, if we are able to cover the ſeed by harrowing on ſtiff ſoils, once ploughed, aſſuredly the ſame practice might be better followed on ſand. The other reafon for the former fyftem, fpear-grafs getting a-head in a layer, is quite inadmiffible, it is thought; as he muft entirely agree with Mr. Overman, a large tillage cultivator in that diftrict, that no weeds, the feeds of which are not carried by the wind, will be *found* in a layer, if they were not *bred* there.

It is contended likewife, that the variations which have taken place in the tillage crops put in upon layers, are neither great, nor are they peculiar to the above county; the principal one is that of taking peafe on the flag, and then the wheat, and others, an admirable fyftem, which, it is faid, has long been practifed by good farmers in Suffolk, and, it is believed, ftill earlier in Kent. That Mr. Purdis's mode of fubftituting tares holds on the fame principle. Confidering the very great ufe and value of white pea-ftraw, well got, as fheep food, which is no where better underftood than in Kent, it is thought there is no tillage hufbandry better adapted to a fheep-farm, than this of peafe or tares preceding the wheat crop.

But it is thought that a very great and important change has taken place in the application of tillage crops to fheep inftead of bullocks and cows. Formerly the farmers confumed much of their ftraw by cattle; now the beft of them have it all trod into manure. Sheep are the main grazing ftock, and no more cattle kept than for treading, not eating ftraw while feeding on oil-cake and other fuch food. This is, it is contended, a very important change, which has had confiderable effect, and which has depended not a little on the introduction of South Down fheep. Yet ftill, it is conceived, that the grand object in the whole tillage fyftem, is the fingular fteadinefs with which the farmers of Weft Norfolk have adhered to the well-grounded antipathy to the taking of two crops of white corn in fucceffion: this is talked of elfewhere, it is faid, but no where fo fteadily adhered to as in this diftrict. It is this maxim, it is faid, which has preferved the effect of their marle on thin-fkinned lands of the wheat kind in fuch a manner, that the diftrict continues highly productive, under an almoft regularly increafing rent for more than fixty years, or three leafes of twenty-one years each; and by means of which great tracts have been marled a fecond, and even a third time with much advantage. This tillage fyftem, it is fuppofed, has been that to which the title of Norfolk hufbandry has been long, and is now peculiarly appropriated; and by no means that of the management of the very rich diftrict of Eaft Norfolk, where the foil is naturally among the fineft in the kingdom, and confequently where the merit of the farmer muft be of an inferior ftamp; barley there, it is faid, very generally follows wheat; an incorrect tillage hufbandry, deferving no praife, but condemnation. The celebrity of the county in general was not heard of, it is faid, until the vaft improvements of heaths, waftes, fheep-walks, and warrens, by enclofure, and marling took place in confequence of the exertions of Mr. Allen, of Lyng-Houfe, lord Townfhend, and Mr. Morley, who were in the firft thirty years of the preceding century. They were happily, it is faid, imitated by many others; an excellent fyftem of tillage management introduced, and fuch improvements wrought, that eftates and lands which were heretofore too infignificant to be known, became objects of public attention in the capital. The fame of Norfolk, it is remarked, gradually expanded, and the hufbandry of the county was celebrated before Eaft Norfolk was heard of beyond the converfation of Norwich and Yarmouth. It is, however, afferted, that without a continuance of careful tillage management and perfevering exertions, Weft Norfolk would even again become the refidence of poverty and rabbits. But let the meadows be improved; irrigation be practifed wherever it is applicable; the remaining waftes cultivated; and this diftrict will, it is maintained, become a garden. Such are the utility and importance of good tillage and other fyftems in the cultivation and improvement of land.

In concluding, it may be ftated from the Corrected Agricultural Report of the County of Hereford, that the importance of the tillage farmer cannot be difputed; and yet that perhaps no branch of the art of hufbandry is clogged with fo many obftacles and impediments to its improvement and fuccefs. The advantages of the grazing fyftem over that of tillage-cultivation, hold out a great inducement to the farmer to convert his tillage land into pafture, the immediate effect of which muft be felt in the reduced quantity and increafed price of grain of every defcription. And unfortunately, this is not the only obftacle or hindrance to the tillage farmer; the tax on horfes ufed in agriculture operates alfo againft the proper tillage culture of the ground. It was probably fuppofed, it is faid, by the framers of this duty, that the number of horfes would thus be diminifhed, and that of oxen increafed; but it fhould be recollected that oxen, valuable as they fometimes are as *auxiliaries*, can never be made the *fubftitute* of horfes for tillage; their conftitution and habits will not admit of it; and the fhoe with which they are occafionally furnifhed, affords but an imperfect protection to the foot on hard lands or ftony roads. See TEAM.

No check, but every encouragement, fhould certainly be given to tillage, or the means of raifing and providing the bread-corn for the increafing population of the country. See SUPPLY *and Confumption*.

TILLAGE *Farm*, that fort of farm which is, for the moft part, cultivated under the arable or tillage fyftem, or that by means of the plough. See FARM.

TILLANDSIA, in *Botany*, was fo named by Linnæus, in memory of an early Swedifh botanift, Dr. Elias Til-lands, profeffor of phyfic at Abo, who died in 1692, aged 52, after having publifhed in 1683 an octavo alphabetical catalogue, in Latin and Swedifh, of the wild, as well as cultivated, plants of the neighbourhood of his refidence. This little volume was accompanied, or foon followed, by another, confifting of rude, but often expreffive, wooden cuts, of 158 plants, mentioned in the foregoing catalogue. It is a defect in thefe cuts that they are not always original; an inftance of which occurred to the writer of the prefent article, while preparing a critical differtation on fome Britifh fpecies of *Hieracium*, fee Tr. of Linn. Soc. v. 9. 232. The *Pilofella*, t. 14. of Tillands proving a copy of Tabernæmontanus, rendered his work of no authority in an important point; though fuch a defect was not previoufly known, even to his learned countryman the late Mr. Dryander; and the book funk immediately in his eftimation, except as a rarity.—A curious reafon for the name of *Tillandfia*, as applied to the genus of which we are about to fpeak, is given by Linnæus himfelf, in his *Prælectiones in Ordines Naturales Plantarum*, publifhed by Gifeke, p. 291. "*Tillandfiæ* cannot bear water, and therefore I have given this name to the genus, from a profeffor at Abo, who in his youth having an unpropitious paffage from Stockholm to that place, no fooner fet his foot on fhore, than he vowed never again to venture himfelf upon the fea. He changed his original name to Tillands, which means *on*, or *by*, *land;* and when he had fubfequently occafion to return to Sweden, he preferred a circuitous journey of 200 Swedifh miles through Lapland, to avoid going eight miles by fea." This circumftance is alfo alluded to in the Tour in Lapland, publifhed from the journal of Linnæus in 1811, v. 1. 43. One of the moft invidious cenfors censors of this great botanist has declared that he would "excuse a thousand of his faults for the sake of the above name alone."—Linn. Gen. 158. Schreb. 212. Willd. Sp. Pl. v. 2. 11. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 202. Pursh 217. Juss. 50. Lamarck Dict. v. 1. 616. v. 7. 666. Illustr. t. 224. (Caraguata; Plum. Gen. 10. t. 33. Renalmia; ibid. 37. t. 38.)—Class and order, *Hexandria Monogynia*. Nat. Ord. *Coronariæ*, Linn. *Bromeliæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, oblong, erect, permanent, in three oblong-lanceolate, pointed segments. *Cor.* of one petal, tubular; tube long, inflated; limb small, erect, in three obtuse segments. *Stam.* Filaments six, linear, inserted into the tube of the corolla, and of the same length; anthers acute, incumbent, in the throat of the tube. *Pist.* Germen superior, oblong, tapering at each end; style thread-shaped, the length of the stamens; stigma three-cleft, obtuse. *Peric.* Capsule elongated, bluntly triangular, pointed, scarcely separated into more than one cell, of three valves. *Seeds* several, cylindrical, each supported on a long stalk of aggregate fibres, becoming a feathery wing.

Eff. Ch. Calyx inferior, three-cleft, permanent. Corolla tubular, three-cleft. Capsule with three valves. Seeds on a feathery wing.

1. T. *utriculata*. Bottle Tillandsia. Linn. Sp. Pl. 409. Willd. n. 1. Ait. n. 1. (Viscum caryophylloides maximum, flore tripetalo pallidè luteo, semine filamentoso; Sloane Jam. v. 1. 188.)—Leaves linear, channelled, recurved; dilated and inflated at the base. Stem closely panicled.—Found on the branches of large trees in Jamaica, where it is known by the name of Wild Pine. Sloane observes that the long, tough, smooth fibres of the *root*, which is perennial, do not insinuate themselves into the bark or wood, to draw nourishment from thence, but merely grasp the branch, fixing themselves firmly to the bark for support. *Stem* solitary, round, smooth, leafy, three or four feet high. *Leaves* numerous, often a yard long, channelled, entire, tapering to a very slender point, recurved, striated; paler beneath, and clothed with extremely minute chaffy scales like powder; the radical ones greatly enlarged and tumid at the base, where they form a sort of oval hollow vessel, which holds a quantity of water, collected during the wet season, from the rain trickling down the channels of the leaves. In this it is said that small aquatic animals sometimes take refuge, while birds, and even men, are reported to have hence derived a welcome supply of drink. The water seems destined to support the plant during drought, when it could otherwise obtain nothing by its roots; but this slender stock is enough to preserve life, and indeed a considerable degree of luxuriance. The *flowers* are of a pale greenish-yellow, with purple *anthers*, and compose a close branched panicle. The long branching down which accompanies each *seed*, and is inserted into its base, carries it to a distance, and readily clings to the rough barks of trees, where the *seed* speedily vegetates. When the *stem* is wounded, a clear white mucilaginous gum exudes. *Sloane.*

2. T. *serrata*. Serrated Tillandsia. Linn. Sp. Pl. 409. Willd. n. 2. Ait. n. 2. (Caraguata clavata et spicata, foliis serratis; Plum. Ic. 63. t. 75. f. 1.)—Leaves flat, smooth, with strong spinous serratures; entire towards the base. Spike compound. Bracteas with spinous teeth.—Native of Jamaica. Brought to Kew, with the foregoing, by captain Bligh, in 1793. This is a large stout perennial plant, with the aspect of an *Aloe*, but not so succulent. The *leaves* are two or three feet long, and two inches broad, their upper part especially bordered with hooked spines; their under side curiously and minutely dotted between the numerous fine ribs. *Stem* and *compound spike* beset with broad, ovate, pointed *bracteas*, wh[illegible] spines are more direct and tooth-like; the under side ribbed and dotted in the manner of the leaves.

3. T. *lingulata*. Tongue-leaved Tillandsia. Linn. Sp. Pl. 409. Willd. n. 3. Ait. n. 3. Jacq. Amer. 92. t. 62. (Caraguata latifolia clavata; Plum. Ic. 63. t. 74. Viscum caryophylloides maximum, capitulis in summitate conglomeratis; Sloane Jam. v. 1. 189. t. 120.)—Leaves flat, somewhat tongue-shaped, smooth, entire, as well as the crowded bracteas.—Native of old trees in the vast forests of Martinico, as well as of Jamaica, where it is said to collect water, like the first species. In size it agrees with the second, but the entire *leaves*, and the close leafy head or spike of *flowers*, abundantly distinguish that before us. Jacquin says the *flowers* are yellow, inodorous, three inches long.

4. T. *tenuifolia*. Slender-leaved Tillandsia. Linn. Sp. Pl. 410. Willd. n. 4. Swartz Ind. Occ. v. 1. 591. (Renalmia spicâ multiplici, angustifolia, flore cæruleo; Plum. Ic. 234. t. 238. f. 2. Viscum caryophylloides minus, foliorum imis viridibus apicibus subrubicundis, flore tripetalo purpureo, semine filamentoso; Sloane Jam. v. 1. 190. t. 122. f. 1.)—Leaves linear-thread-shaped, channelled, erect, taper-pointed. Spikes alternate, imbricated. Flowers two-ranked.—Parasitical, like all the foregoing, on the branches of trees in the West Indies. The *stem* is a foot high, simple, entirely concealed by the broad sheaths of the *leaves* which clothe it. The radical *leaves* are very numerous, above a span long, very slender, resembling those of some long-leaved kinds of *Pinus*, but more tapering and channelled; moderately dilated, sheathing, downy and rusty, at the base. Those of the stem are much shorter, and almost setaceous, though their base is still broader. *Spikes* three or four, alternate, sessile, imperfectly two-ranked, lanceolate, an inch long, proceeding from broad sheathing *bracteas*. *Flowers* imbricated in two rows, blue. Linnæus quotes by mistake a synonym of Jacquin, belonging to the following.

5. T. *flexuosa*. Zigzag Tillandsia. Swartz Ind. Occ. 590. Willd. n. 5. Ait. n. 4. (T. tenuifolia; Jacq. Amer. 92. t. 63.)—Leaves linear-lanceolate, channelled, recurved. Spikes lax, zigzag. Flowers two-ranked, distant. —On trees near the sea in Jamaica, as well as near Carthagena in South America. Extremely unlike the last. The *leaves* are very broad and concave in their lower part, convoluted about the base of the stem, green, elegantly marked with broad, whitish, minutely scaly, transverse stripes; their points recurved in all directions. *Stem* twice as tall as the leaves, being two or three feet high, mostly subdivided in the upper part, invested with close red sheaths, and terminating in two or three long, lax, zigzag *spikes*, with triangular stalks. *Flowers* about an inch or more asunder. *Calyx* coloured, near an inch long. *Corolla* still longer, with reflexed segments, at first blue, then red, as we presume from Dr. Swartz's description and the analogy of *T. stricta* hereafter described. *Capsule* long, of three cells, the valves black and shining on the inside.

6. T. *setacea*. Setaceous Tillandsia. Swartz Ind. Occ. 593. Willd. n. 6.—Leaves linear-thread-shaped, recurved, nearly smooth. Spike simple, with two-ranked imbricated sheaths.—Found on trees in Jamaica. *Stem* a foot or more in height, round, nearly upright, clothed with alternate, broad, bristle-pointed sheaths. Radical *leaves* nearly equal in length to the stem, numerous, sheathing at the base, greyish, rigid, somewhat mealy as it were, with very minute scales.

fcales. *Spike* terminal, folitary, ovato-lanceolate. *Flowers* alternate. Moft like *T. tenuifolia*, n. 4, but differing in its recurved *leaves*, and fimple folitary *fpike*.

7. T. *paniculata*. Panicled Tillandfia. Linn. Sp. Pl. 410. Willd. n. 7. Lamarck v. 1. n. 6. (Renalmia ramofiffima, floribus variegatis et circinatis; Plum. Ic. 233. t. 237.)—Radical leaves very fhort, lanceolate. Stem panicled, twice compound. Spikes erect. Segments of the corolla linear, fpiral.—Native of South America. We know nothing of this fpecies but from Plumier, whofe figure reprefents numerous, crowded, erect, concave radical *leaves*, and a *ftem* alternately branched from the very bottom, with two-ranked reclining *branches*, laden with afcending *fpikes*. A copy, in our poffeffion, of his original drawing fhews the *flowers* to be four inches long.—We have no good authority for Browne's fynonym, cited by authors, nor does it, if correct, throw any light upon this very obfcure fpecies. Lamarck informs us, from Plumier's manufcripts, that the *ftem* is fometimes taller than a man; that the *calyx* is fpotted with green and purple; *corolla* of a violet blue, dotted with purple, its long narrow fegments becoming fpiral as they expand. This is the circumftance to which Plumier's definition alludes. His greatly reduced plate is not fufficiently exact to explain it, and Linnæus inaccurately copied *foliis* for *floribus*, in which Willdenow, of courfe, follows him without the leaft enquiry.

8. T. *fafciculata*. Fafciculated Tillandfia. Swartz Ind. Occ. 586. Willd. n. 8.—" Leaves lanceolate-awlfhaped, erect, ftraight. Spikes lateral, two-ranked, imbricated." —Found on trees in Jamaica, in thickets near the fea-fhore. *Stem* one or two feet high, leafy, fimple. Radical *leaves* broad, concave, and fheathing, at the bafe; lanceolate and tapering upward, very flightly recurved; downy externally; thofe of the ftem fhorter, fomewhat imbricated, ovate, with long awl-fhaped points. *Spikes* alternate, lateral and terminal, two-edged, an inch broad, with imbricated ovate *bracteas*, membranous at the margin. *Flowers* folitary. *Capfule* an inch long. *Swartz*. Lamarck's *T. clavata*, cited by Willdenow with a mark of doubt, belongs to *T. monoftachya*, n. 11, as evidently appears from Plumier's fynonym, the figure belonging to which thefe writers overlooked.

9. T. *nutans*. Nodding Tillandfia. Swartz Ind. Occ. 588. Willd. n. 9. Ait. n. 5.—" Leaves ovato-lanceolate, membranous. Stem nearly naked. Spikes fubdivided, drooping. Flowers feparate, ovate."—Native of branches of trees on hills in Jamaica. *Plant* from one to two feet high. *Leaves* all radical, tumid at the bafe, ftriated lengthwife, fmooth, much fhorter than the *ftem*, which is round, clothed with membranous ftriated fheathing fcales. *Spikes* alternate, rather diftant, drooping, with angular *ftalks*. *Flowers* diftinct, near each other, but not imbricated. *Corolla* white. *Capfule* roundifh-ovate. *Swartz*.

10. T. *polyftachya*. Many-fpiked Tillandfia. Linn. Sp. Pl. 410. Willd. n. 10. (Renalmia fpicâ multiplici, flore albo; Plum. Gen. 37; alfo as Linnæus fuppofed, R. alia, fpicâ multiplici, anguftifolia; ibid. 37. Vifcum caryophylloides anguftifolium, floribus cæruleis; Catefb. Carol. v. 2. 89. t. 89?)—" Stalk bearing imbricated lateral fpikes." —Native of South America. We can make out nothing further of this fpecies, nor how Linnæus came to a knowledge of it, there being no fpecimen in his herbarium. Swartz however appears to be acquainted with the plant; fee his remarks under n. 13. and 14.

11. T. *monoftachya*. Single-fpiked Tillandfia. Linn. Sp. Pl. 410. Willd. n. 11. (T. clavata; Lamarck Dict. v. 1. n. 4. Renalmia clavata, floribus niveis; Plum. Ic. 233. t. 238. f. 1. R. non ramofa fquamata, et floribus niveis; Plum. Gen. 37.)—Leaves radical, linear, channelled, recurved; broad and fheathing at the bafe. Stem fimple, clothed with imbricated fcales. Spike fimple. Bracteas ovate, concave.—Native of the Weft Indies. Plumier gathered it on old trees in Hifpaniola. The numerous radical *leaves* fpread widely in every direction, being about a foot long, and two inches broad, fo much recurved that their points touch the branch on which the plant is fixed. *Stem* from fifteen to eighteen inches high, erect, round, firm, quite fimple, as well as its fpike. *Bracteas* white, ftreaked or dotted with red. *Corolla* fnow-white; its limb in three deep ovate fegments.

12. T. *pruinofa*. Frofted Broad-leaved Tillandfia. Swartz Ind. Occ. 594. Willd. n. 12.—Leaves lanceolate, taper-pointed, recurved, clothed with fhaggy fcales. Spike fimple, with imbricated, pointlefs, downy bracteas.—Found on the arms and ftems of aged trees in Jamaica, as well as in Brafil. *Stem* a foot or more in height, fimple, leafy. *Radical leaves* a foot long, fpreading varioufly, near an inch broad at the bottom, but foon contracted into a long taper point, flat, denfely clothed all over with fhaggy, torn, peltate, fhining fcales, the marginal ones flat, inbricated, and much dilated; *ftem-leaves* much fhorter and narrower. *Spike* terminal, folitary, fimple, an inch long, ovate. *Bracteas* ovate, bluntifh, concave. *Corolla* blue, longer than the bracteas. *Capfule* oblong, triangular, fmooth.

13. T. *canefcens*. Hoary Tillandfia. Swartz Ind. Occ. 595. Willd. n. 13.—" Radical leaves linear, erect, hoary, as tall as the ftem. Spikes about three, terminal."—Native of Jamaica, on trees near the fea-fhore. Perennial, about a foot high, with fhort, fimple, curling, fibrous *roots*. *Stem* fimple, leafy. *Radical leaves* imbricated, linear, rigid, whitifh or hoary; with very broad, ovate, concave, tumid, membranous, fheathing bafes; *ftem-leaves* tapering, acute, with more lax fheaths. *Spikes* ufually three, crowded at the top of the ftem, feffile, ovate, acute, flattifh. *Bracteas* two-ranked, imbricated, ovato-lanceolate, fmooth. *Corolla* red, with long fegments. Nearly related to *T. polyftachya*, but that fpecies is taller, with recurved, zigzag, fmooth *leaves*, and numerous, fcattered, lanceolate *fpikes*. *Swartz*.

14. T. *anguftifolia*. Narrow and long-leaved Tillandfia. Swartz Ind. Occ. 596. Willd. n. 14.—" Leaves linear-lanceolate, nearly erect, fmooth, taller than the ftem. Spikes fomewhat cluftered."—Found on the trunks and branches of trees, in Jamaica and Hifpaniola. Perennial. *Stem* two feet high, nearly upright, fimple, leafy. *Leaves* all imbricated, broad and fheathing at the bafe, lanceolate, narrow towards the end, ftraight, ftriated; the fheaths of the radical ones broadeft, and rather inflated. *Spikes* numerous, fcattered, fomewhat cluftered, alternate, feparated by leafy fheaths, imperfectly imbricated, compreffed, lanceolate, many-flowered, an inch and half long. *Flowers* two-ranked. *Bracteas* imbricated, equitant, ovate, pointed, keeled, ftriated, fmooth. *Capfules* elongated, pointed, triangular, fmooth, extending beyond the *bracteas*. This likewife is cautioufly to be diftinguifhed from *T. polyftachya*, by having more upright *leaves*, longer than the *ftem*, and the *fpikes* feparated by leafy *fheaths*. *Swartz*. Nothing is mentioned refpecting the colour of the *flowers*.

15. T. *ftricta*. Frofted Stiff-leaved Tillandfia. Gawler in Curt. Mag. t. 1529. Ait. Epit. 375. Banks Ic. Ined. —Leaves chiefly radical, linear-lanceolate, channelled, recurved, minutely fcaly at the back. Stem fimple. Spike folitary. Bracteas ovate, concave, imbricated, glaucous, fmooth.—Found by Dr. Solander, on trees near Rio Janeiro, in Brafil. Said to have been introduced into the European ftoves,

ftoves, by lady Neale, about the year 1799. The *root* is fomewhat tuberous, with many tough fmooth fibres. *Stem* about fix inches high, furrounded, and almoft concealed, by the denfe tuft of very numerous radical *leaves*, which are fometimes all curved to one fide, five or fix inches long, pale green, frofted, as it were, with hoary fcaly pubefcence, thickeft towards the bafe. *Spike* three inches long, fimple, many-flowered, with beautiful large white *bracteas*, tinged and tipped with rofe-colour; the lower ones ending in leafy points. *Calyx* of the colour of the *bracteas*, but hardly fo long. *Corolla* with obtufe, emarginate, convolute fegments, at firft of a rich deep blue, but finally changing to a deep red. *Capfule* dark brown, an inch long. This is, no doubt, very different from *T. monoftachya*, though Linnæus's account of that fpecies may be, as juftly hinted in the Bot. Mag., incomplete. *T. ftricta* flowers in November. It is faid to live and bloffom when fufpended by a thread in a warm room. Few plants are more elegant or fingular.

16. T. *recurvata*. Recurved-leaved Tillandfia. Linn. Sp. Pl. 410. Willd. n. 15. Ait. n. 6. Purfh n. 1. Swartz Obf. 121. (Vifcum caryophylloides minus, foliis pruinæ inftar candicantibus, flore tripetalo purpureo, femine filamentofo; Sloane Jam. v. 1. 190. t. 121. f. 1.)—Leaves radical, awl-fhaped, fcaly, recurved. Stalks naked, two-flowered.—Native of the trunks of old rotten trees, in Jamaica and the Brafils, as well as in Florida and Georgia, growing in denfe tufts. The *ftems* are very fhort, clothed with crowded, fpreading, recurved, fheathing *leaves*, two or three inches long, downy with minute hoary fcales. *Stalks* terminal, folitary, four inches high, flender, round, naked and fmooth, each bearing at the top two upright *flowers*, enveloped in a pair of fheathing, furrowed, dotted *bracteas*. Segments of the *corolla* blue, obtufe, fcarcely extending beyond the *calyx*. *Anthers* yellow. *Capfule* an inch long, flender, brown and fhining, enveloped in the pale fegments of the permanent *calyx*, which are as long, and nearly as broad, as the valves.—Sloane fays it draws its nourifhment from rain water, falling into the cavity made by the leaves.

17. T. *ufneoides*. Long-mofs Tillandfia. Linn. Sp. Pl. 411. Willd. n. 16. Purfh n. 2. (Vifcum caryophylloides tenuiffimum, e ramulis arborum mufci in modum dependens, foliis pruinæ inftar candicantibus, flore tripetalo, femine filamentofo; Sloane Jam. v. 1. 191. t. 122. f. 2, 3. Cufcuta ramis arborum innafcens, &c.; Pluk. Phyt. t. 26. f. 5; alfo f. 6.)—Stem much branched, thread-fhaped, twifted, minutely fcaly, as well as the awl-fhaped channelled leaves.—Native of fhady woods from Virginia to Florida, as alfo of the Weft Indies and the Brafils, flowering in July. The long wiry contorted *ftems* creep over the ftems and branches of old trees, and even along a rope or hair line, if put in their way, the *roots* fcarcely fixing themfelves, or deriving any fuftenance, from either. The *flowers* are, according to Mr. Purfh, of a yellowifh-green. When the hoary fhaggy coat of the plant is feparated by beating or rubbing, the remains of the ftems look like a mafs of curling black horfe-hair, and ferve, like that, to ftuff mattreffes, &c. In this denudated ftate the ftems are reprefented, along with the perfect plant, by Sloane as well as Plukenet.

M. Poiret, in Lamarck Dict. v. 7. 666—673, has greatly enriched this genus, not only with all the fpecies publifhed by Dr. Swartz, and which we likewife have adopted, but alfo with ten befides, adopted from the *Flora Peruviana* of Ruiz and Pavon. That our work may not be incomplete, we fhall briefly mention thefe in the order in which M. Poiret has arranged them, trufting to him for the references, which we have not the means of confulting. He introduces them all, except the laft, between the *anguftifolia*, our n. 14, and *recurvata*, n. 16.

18. T. *tetrantha*. Four-flowered Tillandfia. Poiret n. 9. Fl. Peruv. v. 3. 39. t. 265.—Leaves radical, lanceolate, imbricated; recurved at the point. Stem erect. Stalks reflexed, four-flowered.—Grows on trees and rocks in the forefts of the Andes, flowering in July and Auguft. —*Root* of many fibres. *Leaves* radical, large, fpotted with red. *Stems* folitary, rather longer than the leaves, zigzag, clothed with oval, pointed, clofe, fcaly *bracteas*, of a purplifh rofe-colour; the upper ones fpreading almoft horizontally, each of the latter bearing an axillary *ftalk*, fupporting four, nearly feffile, *flowers*. *Calyx* yellow, coriaceous. *Corolla* violet.

19. T. *maculata*. Spotted-leaved Tillandfia. Poiret n. 10. Fl. Peruv. v. 3. 40. t. 267.—Leaves radical, lanceolate-fword-fhaped, fhining; revolute at the point. Panicle alternately branched. Spikes nearly fimple, many-flowered.—Native of rocks and trees, in the middle of the great forefts of the Andes, flowering from July to September. The *leaves* are channelled, polifhed on both fides, covered with red or purplifh fpots. Every part of the plant is often red. *Stems* three feet high, fimple, jointed, with an oval fcale, or *bractea*, at each joint. *Panicle* terminal, eighteen inches long, red, compofed of alternate, nearly fimple, *fpikes*, furnifhed with numerous, oval-lanceolate, pointed *bracteas*, reddifh as well as the *calyx*. *Corolla* violet, fmall.

20. T. *rubra*. Red Tillandfia. Poiret n. 11. Fl. Peruv. v. 3. 40. t. 266.—Leaves radical, fword-fhaped, fomewhat pointed. Panicle fimple, fpikes undivided.—Native of rocks in Peru, flowering in March and April. The *leaves* are about two feet long, fpreading or recurved; of a fhining green above; filvery white beneath. *Stems* folitary, erect, two or three feet high; clothed with fheathing fcales below; terminating in a ftraight reddifh *panicle*, compofed of many fimple, alternate, oblong, lanceolate, divaricating *fpikes*. *Bracteas* red, pointed, keeled, an inch in length. *Flowers* imbricated, feffile. *Calyx* yellowifh-red. *Corolla* fmall, violet, with reflexed fegments.

21. T. *parviflora*. Small-flowered Tillandfia. Poiret n. 12. Fl. Peruv. v. 3. 41. t. 269.—Leaves radical, awl-fhaped, greatly dilated at the bafe. Panicle fimple. Spikes from three to feven. Flowers two-ranked.—On rocks in the forefts of the Andes, flowering from Auguft to October. *Leaves* very numerous, from fix to nine inches long, channelled, fpreading, whitifh, clothed with a multitude of mealy fcales. *Stems* a foot high, flender, fimple, purplifh, with diftant, awl-fhaped, channelled, whitifh, fhort *ftem-leaves*, and oval whitifh *bracteas*. *Flowers* fmall, white, alternate, on zigzag partial ftalks. *Capfule* almoft eight times as long as the *calyx*.

22. T. *biflora*. Two-flowered Tillandfia. Poiret n. 13. Fl. Peruv. v. 3. 41. t. 268.—Leaves fword-fhaped, acute. Stem racemofe. Flowers in pairs.—Found on the Andes, flowering in Auguft and September. This fpecies is often proliferous. *Leaves* nearly equal, ftraight, fpreading, ftriated. *Stems* folitary, fimple, eighteen inches high, covered with lanceolate fcaly *fheaths*, or *ftem-leaves*, and terminating in a fimple *clufter*, fix inches long. *Flowers* on fhort ftalks, in alternate pairs, furnifhed with elongated, lanceolate, ftriated *bracteas*, recurved and pale green at their extremity. *Capfules* yellowifh, an inch long.

23. T. *purpurea*. Rofe-coloured Tillandfia. Poiret n. 14. Fl. Peruv. v. 3. 41. t. 270.—Leaves fword-fhaped, tapering, channelled, recurved, clothed with mealy fcales. Panicle of many fpikes. Flowers two-ranked.—Found on little

little hills about Lima, and in other sandy or stony situations in Peru, flowering in June and July. The perennial *root* throws out many prostrate trailing *shoots*. *Leaves* spreading, six to nine inches long, whitish. *Stem* solitary, a foot high, simple, clothed with long awl-shaped *sheaths*. *Panicle* rose-coloured, of from five to nine alternate *spikes*, with oval, concave, whitish *bracteas*. *Flowers* sessile, with rose-coloured *bracteas* and *calyx*. *Corolla* dark purple, with a white tube. *Capsule* [illegible]; deep purple within.

24. T. *heptantha*. Seven-flowered Tillandsia. Fl. Peruv. v. 3. 21. (T. heptandra; Poiret. n. 15.)—Leaves radical, sword-shaped, tapering, very acute. Spike solitary, simple, of about seven flowers.—Native of rocks and trees, among precipices, in Peru, flowering from June to August. *Leaves* whitish, and rather downy. *Stem* near a foot high, quite simple, scaly. *Flowers* sessile, in two ranks, with lanceolate violet-coloured *bracteas*. *Corolla* white, tipped with violet. We presume that M. Poiret has erred in his specific name.

25. T. *sessiliflora*. Sessile-flowered Tillandsia. Poiret n. 16. Fl. Peruv. v. 3. 42. t. 271.—Leaves radical, tongue-shaped, flat, obtuse. Spike solitary, simple.—Native of Peru, flowering in November and December. *Root* biennial. *Plant* smooth. *Leaves* eight or nine inches long, and an inch broad; the outer ones gradually smaller. *Stems* slender, a foot high, jointed, clothed with obtuse *sheaths*. *Spike* six inches in length. *Flowers* alternate, solitary, each with an oval, concave, acute *bractea*. *Corolla* of a violet purple on the inside.

26. T. *capillaris*. Capillary Tillandsia. Poiret n. 17. Fl. Peruv. v. 3. 42. t. 271. f. C.—Leaves linear-awlshaped. Stem forked. Stalks axillary, mostly single-flowered, capillary, smooth, thrice as long as the leaves.—On rocks, walls, and trees, in Peru, flowering in November and December. This species is said to be related in many respects to the *T. recurvata*, n. 16, but differs in having forked *stems*; more numerous and broader *leaves*, contracted at their base, and not recurved; capillary *flower-stalks*; and solitary *bracteas* to each *flower*. (We would observe that the last character is found in the *recurvata*.) The plant forms dense, leafy, whitish, tufts, the *leaves* being clothed with very minute mealy scales. *Stems* about six inches high, forked several times, furnished with two-ranked, crowded, imbricated, reflexed, linear-awlshaped *leaves*, striated at their base, and half clasping the stem. *Stalks* straight, bearing one or two *flowers*, with a solitary, ribbed, smooth *bractea*, and a leaf at their base. *Calyx* scariose, deep violet. *Corolla* white, hardly longer than the calyx. *Anthers* yellow. *Capsules* linear, twice the length of the calyx, dark violet within.

27. T. *virescens*. Greenish Tillandsia. Poiret n. 20. Fl. Peruv. v. 3. 43. t. 270. f. B.—Leaves linear-awlshaped. Stalks axillary, single-flowered, the length of the leaves, with a solitary convoluted bractea.—Native of rocks in Peru, flowering in December and January.—A small species, forming dense, proliferous, whitish, warty tufts. *Leaves* imbricated in two rows, reflexed at the point, striated at the base. *Flowers* pale yellow. *Capsule* green, twice the length of the calyx; internally dark-purple.

TILLANJONG, in *Geography*, one of the Nicobar islands, in the Indian sea. N. lat. 8° 40′. E. long. 94° 9′.

TILLE, La, a river of France, which runs into the Saône, about 3 miles below Auxonne.

Tillé, a town of France, in the department of the Oise; 3 miles N. of Beauvais.

TILLEE, a town of Bengal; 28 miles N.W. of Dacca.

TILLEMANS, Peter, in *Biography*, was born at Antwerp in 1684, and visited England in 1708, where he attracted attention by his excellent copies from the pictures of Bourgognone and Teniers, of whose works he preserved the freedom and spirit. He also painted landscapes with small figures, views of gentlemen's seats, sea-ports, &c. and met with very considerable employment. The duke of Devonshire favoured him, and for him he painted a picture of Chatsworth, which gained him considerable eclat. He died here in 1734.

TILLEMONT, Louis Sebastian le Nain de, a French ecclesiastical writer, was born at Paris in 1637; and in the school of the Port-Royal, into which he was admitted at the age of ten, he discovered promising talents and a pious disposition. From early life he devoted himself to the study of ecclesiastical antiquity, and made collections, principally relating to the first six centuries, with a view of composing a history of the church. Modest and diffident, as well as learned, he deferred taking priests' orders till his 40th year; and having done this, he declined all preferment, and retired first to Port-Royal-des-Champs, and then to Tillemont, near Vincennes, prosecuting his literary labours, and keeping in view his main object: he subjected himself at the same time to very rigid penitentiary discipline. His austerities and intense application debilitated his constitution to such a degree, that he died in 1698, at the age of 61 years.

The plan of his great work comprehended two parts, *viz.* the secular and the ecclesiastical history of the period of which he proposed to treat. Accordingly the first part, entitled "Memoires pour servir a l'Histoire Ecclesiastique des six premiers Siècles," was comprised in 16 vols. 4to. of which four volumes were published in his life-time, and twelve more after his death. The other part, entitled "L'Histoire des Empéreurs et des autres Princes qui ont regné durant les six premiers Siècles de l'Eglise," consists of 6 vols. 4to. the last being left in MS. and not published till 1738, finishing with the emperor Anastasius. Dupin, though he disapproves the method of Tillemont, observes, that great instruction may be derived from his history, especially with respect to critical and chronological matters. His style merits no commendation. Gibbon, who often quotes his History of the Emperors, and praises his scrupulous accuracy, finds frequent occasion to censure his bigotry, and remarks, that "he never dismisses a virtuous emperor without pronouncing his damnation." Moreri. Gen. Biog.

TILLENENSEE, in *Geography*, a lake of Prussia, 8 miles W. of Lick.

TILLER, or Tillar, in *Husbandry*, a little young tree, left to grow till it be fellable.

Tiller is also a term used by farmers to signify, that the produce of the grain branches out into several stalks; in which sense it denotes the same thing with the Latin word *fruticare*.

It has been suggested by the writer of the "Elements of Agricultural Chemistry," that in the tillering of corn, that is, the production of new stalks round the original plume, there is every reason to believe that oxygen must be absorbed; for the stalk at which the tillering takes place, always contains sugar, and the shoots arise from a part which is deprived of light. The drill-husbandry is therefore supposed to favour this process; as loose earth is thrown by the hoeing round the stalks; and they are preserved from light, and yet supplied with oxygen. The writer has counted from forty to one hundred and twenty stalks produced from a grain of wheat, in a moderately good crop of the drilled kind. And we are informed, it is said, by sir Kenelm Digby, in 1660, that there was in in the poſſeſſion of the fathers of the Chriſtian doctrine at Paris, a plant of barley, which they, at that time, kept by them as a curioſity, and which conſiſted of two hundred and forty-nine ſtalks ſpringing from one root, or grain; and in which they counted above eighteen thouſand grains, or ſeeds of barley.

It is noticed, too, that the great increaſe which takes place in the tranſplantation of wheat, depends upon the circumſtance, that each layer thrown out in tillering may be removed, and treated as a diſtinct plant.

The following ſtatement is given in the fifty-eighth volume of the Philoſophical Tranſactions, at p. 203: Mr. C. Miller of Cambridge ſowed ſome wheat on the 2d of June, 1766; and on the 8th of Auguſt, a plant was taken and ſeparated into eighteen parts, and replanted; theſe plants were again taken up, and divided in the months of September and October, and planted out ſeparately to ſtand the winter, which diviſion produced ſixty-ſeven plants. They were again taken up in March and April, and produced five hundred plants: the number of ears thus formed from one grain of wheat was twenty-one thouſand one hundred and nine, which gave three pecks and three-quarters of corn, that weighed 47lbs. 7 oz.; and that were eſtimated at five hundred and ſeventy-ſix thouſand eight hundred and forty grains.

There is a number of facts and caſes of the vaſt increaſe of grain crops by tillering, ſcattered through the writings on agriculture and huſbandry, which clearly ſhew the great utility and importance of it in the raiſing of ſuch crops.

Tiller *of a Ship*, a long piece of timber (which ſhould be ſtraight-grained and free from knots) fitted into the head of the rudder as a lever, to turn it from one ſide to the other, in order to ſteer the ſhip. This term, or *hich*, is uſed for the handle of a boat's rudder.

Tiller-*Rope*, a kind of tackle, communicating with the ſhip's ſide, and uſually compoſed of untarred rope-yarn for the purpoſe of traverſing more readily through the blocks or pullies: this tackle ſerves to guide and aſſiſt the operations of the tiller, and in all large veſſels is wound about a wheel, which acts upon it with the powers of a crane or windlaſs.

TILLERING, in *Agriculture*. See Tiller.

TILLEWALL, in *Geography*, a town of Pruſſia, in Oberland; 5 miles N.E. of Eylau.

TILLIE'RES, a town of France, in the department of the Eure; 6 miles N.E. of Verneuil.

TILLING, a town of Sweden, in the province of Upland; 23 miles S.E. of Upſal.

TILLIUM, or Tilium, in *Ancient Geography*, a town on the weſtern coaſt of the iſle of Sardinia, between the promontory Gorditanum and port Nymphæus. Ptol.

TILLONGCHOOL, or Katchal, in *Geography*, one of the Nicobar iſlands, of a triangular form, about 36 miles in circumference. N. lat. 7° 58′. E. long. 93° 50′.

TILLOT, Le, a town of France, in the department of the Voſges; 12 miles S.E. of Plombieres.

TILLOTSON, John, in *Biography*, a celebrated Engliſh prelate, deſcended from an ancient family in Cheſhire, was the ſon of Robert Tillotſon, a clothier at Sowerby, in the pariſh of Halifax, Yorkſhire, where he was born in the year 1630. Having been brought up in the principles of his father, who was a Calviniſtic puritan, and diſcovering an inclination to literature, he was entered in his 17th year a penſioner of Clare-Hall, Cambridge. In 1651 he was elected fellow of his college, and took pupils, to whoſe moral and religious inſtruction he was duly attentive. At this time, he was in his ſentiments Calviniſtic, heard ſuch preachers, and uſed extemporaneous prayer. His views of theology were enlarged ſoon after he left college in 1656, by the peruſal of Chillingworth's "Religion of Proteſtants." But retaining his attachment to the Preſbyterian form of church government, he was received into the family of Edmund Prideaux, attorney-general to the Protector, as chaplain and tutor to his ſon. He attended the Savoy conference in July 1661, and preached a ſermon (the firſt which he preached) at their morning exerciſe in Cripplegate, in the month of September. Under the Act of Uniformity in 1662, to which he ſubmitted, he became curate at Cheſhunt, in Hertfordſhire. In London he was much admired as a preacher, and was choſen miniſter by one of the pariſhes, but declined accepting the office, becauſe the vacancy had been occaſioned by the refuſal of Mr. Edm. Calamy to comply with the Bartholomew Act. From a rectory in Suffolk, to which he was preſented, he removed to the office of preacher to the ſociety at Lincoln's Inn. In 1664 he married the daughter of Dr. French, canon of Chriſtchurch, by a ſiſter of Oliver Cromwell; and in 1665 he was appointed lecturer to the pariſh of St. Laurence Jewry. His reputation as a preacher was very conſiderably increaſed at this time by his printed ſermon, "On the Wiſdom of being religious." His controverſy on popery commenced with the publication of his "Rule of Faith," in anſwer to a book written by a convert to the Romiſh church. The part he took in a ſcheme for comprehending diſſenters under the eſtabliſhment, evinced his reſpect for that deſcription of Chriſtians and Proteſtants. (See Comprehension.) In 1666 he took his degree of D.D., and in 1669 he was made a king's chaplain, and was preſented to a prebend of Canterbury. When king Charles, in 1672, iſſued a declaration for liberty of conſcience, with a view of favouring the Roman Catholics, the biſhops took the alarm, and recommended to the clergy to preach againſt popery. The king was diſpleaſed, and Tillotſon, at a meeting of the clergy convoked by the biſhop of London, ſuggeſted the following apology for their conduct: "That ſince his majeſty profeſſed the Proteſtant religion, it would be an unprecedented thing that he ſhould forbid his clergy to preach in defence of a faith which they believed, and which he declared to be his own." Soon after this he preached a ſermon at Whitehall on the hazard of ſalvation in the church of Rome; and yet, offenſive as this ſermon muſt have been, he was advanced, in 1672, to the deanery of Canterbury, which was followed, in 1673, by a preſentation to a prebend of St. Paul's. At this time he publiſhed Dr. Wilkins's "Principles of Natural Religion," with a recommendatory preface; and the author, who died in his houſe, committed to him the diſpoſal of his papers. A ſimilar truſt was repoſed in him by Dr. Barrow. His dread of popery induced him, in 1680, to preach before the king a ſermon, afterwards publiſhed by the royal command, and entitled "The Proteſtant Religion vindicated from the Charge of Singularity and Novelty." In this ſermon a paragraph was introduced which incurred the charge of intolerance. "I cannot think," ſays he, "till I be better informed, which I am always ready to be, that any pretence of conſcience warrants any man that is not extraordinarily commiſſioned, as the apoſtles and firſt preachers of the goſpel were, and cannot juſtify that commiſſion by miracles, as they did, to affront the eſtabliſhed religion of a nation, though it be falſe, and openly to draw men off from the profeſſion of it, in contempt of the magiſtrate and the law. All that perſons of a different religion can in ſuch a caſe reaſonably pretend to is, to enjoy the private liberty and exerciſe of their own conſcience and religion, for which they

they ought to be very thankful, and to forbear the open making of profelytes to their own religion, (though they be never fo fure that they are in the right,) till they have either an extraordinary commiffion from God to that purpofe, or the providence of God make way for it by the permiffion of the magiftrate." The king flept while the preacher delivered the fermon, but a nobleman at the clofe of it faid to him, "It is a pity your majefty was afleep, for we have had the rareft piece of Hobbifm that ever you heard in your life," to which Charles replied, "Oddsfifh, then he fhall print it," which was the caufe of the order. The paragraph was unworthy of Dr. Tillotfon, and gave very general offence, both to the eftablifhed clergy and Prefbyterians. Tillotfon was an ardent promoter of the Bill of Exclufion, nor would he concur in the addrefs of the London clergy to the king on his declaration that he could not confent to fuch a bill. In 1682 he took occafion to vindicate the character of Dr. Wilkins from the afperfion of Anthony Wood, by a preface to a volume of fermons, which he publifhed from the doctor's MSS. He was alfo the editor, in 1683, of Dr. Barrow's fermons, in 3 vols. fol. It has been regretted as an inconfiftency in the character of Tillotfon, that when in company with Burnet he attended lord Ruffel preparatory to his execution, they fhould urge this martyr to liberty to acknowledge the abfolute unlawfulnefs of refiftance, though they were foon after decided friends to the revolution. By a "Difcourfe againft Tranfubftantiation," and another "Againft Purgatory," he commenced a prolonged controverfy with the Papifts. In 1685 he avowed himfelf a warm advocate for affording charitable relief to the French refugees, on the repeal of the edict of Nantes; and in reply to Dr. Beveridge, the prebendary of Canterbury, who objected to reading a brief for this purpofe, as contrary to the rubric, he remonftrated, by faying, "Doctor, Doctor, charity is above rubrics." After the fettlement of the prince of Orange at St. James's, he was inftrumental in perfuading the princefs Anne, who confulted him, to acquiefce in giving up her claim to the crown during the life of William, in cafe of her fifter's dying before him. After the revolution, no obftacle remained to the full gratification of his defires of advancement, which, however, he profeffed to be very limited. In 1689 he was appointed clerk of the clofet to the king, and permitted to exchange the deanery of Canterbury for that of St. Paul's. During archbifhop Sancroft's fufpenfion for refufing to take the oaths to the new government, Dr. Tillotfon was appointed to exercife the archiepifcopal jurifdiction; and it was then determined that he fhould have poffeffion of the fee. His whole conduct at this time evinced his attachment to the principles of toleration and civil liberty; and he was active in his endeavours for promoting a comprehenfion, though they ultimately proved unfuccefsful. He alfo failed in introducing a new book of Homilies; and in a fermon preached before the queen, againft the abfolute eternity of hell torments, he excited the refentment and oppofition of the orthodox party. After fome reluctance on his part, he was confecrated to the archbifhopric of Canterbury in May 1691, and alfo in a little while fworn a member of the privy-council. From this time he became very obnoxious to the high-church zealots, who attacked him in a variety of ways. Among other charges againft him, one was his attachment to Socinian principles, which feems to have had no other foundation than his rational defence of Chriftianity, and his friendfhip and intercourfe with Locke, Limborch, and Le Clerc; and for repelling which, he caufed to be republifhed, in 1693, four of his fermons "On the Divinity and Incarnation of our Saviour."—"If this be Socinianifm, for a man to inquire into the grounds and reafons of the Chriftian religion, and to endeavour to give a rational account of it," fays he in one of his pofthumous fermons, alluding to this charge, and alfo to the character of Chillingworth, "I know no way but that all confiderate inquifitive men, that are above fancy and enthufiafm, muft be either Socinians or Atheifts." Dr. Jortin, in reference to this unfounded accufation, obferves, "Tillotfon had made fome conceffions concerning the Socinians, which never were, nor ever will be, forgiven him, and had broken an ancient and fundamental rule of theological controverfy: 'Allow not an adverfary to have either common fenfe, or common honefty.'" After an examination of bifhop Burnet's expofition of the thirty-nine articles, which he fent him in MS., he concludes his eulogy on the bifhop's prudence and ability with obferving, "The account given of Athanafius's creed feems to be nowife fatisfactory; I wifh we were well rid of it." The archbifhop's affiduity and zeal in the duties of his exalted ftation were highly exemplary and laudable; and yet they were not fufficient to filence the clamours of his enemies. At length the period of his ufefulnefs terminated, in confequence of a paralytic ftroke, which feized him, November 1694, in the chapel of Whitehall, and which, on the fifth day, proved fatal, in the 65th year of his age. His funeral, at the church of St. Laurence Jewry, was attended by many perfons of rank. He left a widow, but no children; and as he took no pains to accumulate property, his debts could not have been paid, if the king had not remitted his firftfruits; and the copy-right of his fermons was the only provifion which he left for his widow, to which a penfion, fettled upon her by the crown, was added.

"The temper and character of Dr. Tillotfon," fays one of his biographers, "were intitled to every encomium. He was humble, open, and fincere, of kind and tender affection, extremely bountiful in his charities, and forgiving of injuries, in which laft virtue he was feverely tried. His public principles bore the ftamp of his difpofition; they were philanthropical, tolerant, and liberal; and if he retained fome predilections for the fect in which he had been educated, the chief profeffional fault with which he has been charged, candour will make due allowance for the effect of early habit. In fome points he was, perhaps, too compliant, and was led into fome inconfiftencies; but the times were difficult, and his intentions feem to have been always pure. As a writer, he is principally remembered for his fermons, which have long maintained a place amongft the moft popular compofitions of that clafs in the Englifh language.. A folio volume, comprifing his "Rule of Faith," and fermons, was printed in his life-time; and after his death two more folio volumes of fermons were publifhed by his chaplain, Dr. Barker. Abroad, as well as at home, his works have been held in high eftimation. The character given of them by Le Clerc, in his "Bibliotheque Choifie," is as follows: "The archbifhop's merit was beyond any commendation he could give. It confifted in the union of extraordinary clearnefs of head, great penetration, an exquifite talent of reafoning, a profound knowledge of genuine theology, folid piety, a moft fingular perfpicuity, and unaffected elegance of ftyle; with every other quality that could be defired in a man of his order; and whereas compofitions of this kind are commonly mere rhetorical and popular declamation, better to be heard from the pulpit than read in print, his are for the moft part exact differtations, capable of bearing the teft of the moft rigorous examination." Addifon confidered the fermons of Tillotfon as a ftandard of purity of the Englifh language. Dryden acknowledges, that

that if he had any talent for Engliſh proſe, it was derived from frequent peruſal of Tillotſon's writings. Mr. Melmoth, however, in his "Fitzorbone's Letters," expreſſes a very different, and in our judgment a leſs juſt, or to ſay the leaſt of it, a leſs candid opinion. He ſpeaks of "his words as frequently ill choſen, and almoſt always ill placed; his periods as tedious and unharmonious; and his metaphors as generally mean, and often ridiculous." Notwithſtanding theſe reflections, Tillotſon's ſermons, though ſurpaſſed by the correctneſs and elegance of modern compoſitions in this department, and leſs peruſed than formerly, will not ceaſe to be regarded as a valuable part of Engliſh literature. Birch's Life of Archbiſhop Tillotſon. Biog. Brit. Gen. Biog.

TILLS, in *Agriculture*, a term ſignifying tares or vetches in many places, in both the northern and ſouthern parts of the kingdom.

TILLURAH, in *Geography*, a town of Bengal; 21 miles E.N.E. of Purneah.—Alſo, a town of Hindooſtan, in Bahar; 22 miles S. of Patna. N. lat. 25° 14'. E. long. 85° 22'.

TILLY, a town of Canada, on the St. Laurence; 10 miles S.W. of Quebec.—Alſo, a town of France, in the department of the Meuſe; 9 miles S. of Verdun.—Alſo, a town of France, in the department of the Eure; 7 miles S.E. of Grand Andelys.—Alſo, a town of France, in the department of the Sambre and Meuſe; 6 miles W. of Gemblours.

Tilly *la Campagne*, a town of France, in the department of the Calvados; 4 miles S.S.E. of Caen.

Tilly *Verolle*, a town of France, in the department of the Calvados; 9 miles W. of Caen.

Tilly *Land*, in *Agriculture*, that ſort which is, for the moſt part, conſtituted and compoſed of materials of the till kind.

Theſe kinds of land, in their original ſtates, are in general of a very barren and unproductive nature; but when they have been fully turned over by the plough or other means, well and effectually wrought and reduced by other proper tools, and their parts completely divided and expoſed to the alternate action of different agents, ſuch as thoſe of froſt and thaw, of drought, dews, and rain, with the many other improving effects of the atmoſphere which ſurrounds them; and withal ſtimulated, ſeparated in their parts, and enriched by calcareous and other ſuitable manures and ſubſtances, they become, in various inſtances, of a far leſs ſtrong and ſtubborn nature, and greatly more diſpoſed to the raiſing of good and plentiful crops upon them. They are commonly much ameliorated and improved at firſt by growing beans, tares, and rape in ſucceſſion with wheat and other ſuitable ſorts of grain, having the green crops ſo managed as to ſtand as cloſe, thick, and ſmothering as poſſible on the land. See Land and Soil.

TILMUS, τιλμος, a term uſed by ſome of the medical writers to expreſs the effect of a ſort of delirium, in which people pull the bed-cloaths, or pick out threads from the ſheets. This is uſually eſteemed a dangerous ſymptom.

TILNOR, in *Geography*, a town of Bengal; 60 miles N.N.W. of Midnapour.

TILO-GRAMMUM, Ougli, or *Ongli*, in *Ancient Geography*, a town of India, ſituated, according to Ptolemy, to the right of the moſt weſtern arm of the Ganges, about 23° lat.

TILOTAMA, a nymph celebrated for her beauty in the mythological and amatory poems of the Hindoos. She appears to have been one of that numerous claſs of females, who, under the name of Upſara, aroſe from the churned ocean, as deſcribed under our article Kurmavatara: a fable as prolific of poetical incident, and as often referred to, as any in the whole range of invention. The chief of theſe Upſaras, or water-nymphs, was Rhen ba, of whom ſome mention is made under her name in this work. They are deſcribed in numerous Hindoo poems with all the warmth and fancy that may be predicated of "youthful poets when they love;" and in terms too glowing for readers beyond the tropics. Under the name of another of theſe beauteous damſels, Menaka, we have ſaid ſomething of them. See alſo Upsara.

The name of the elegant nymph, the ſubject of this article, occurs in an inſcription on a copper-plate found in the Deccan, bearing date A.D. 1359. The inſcription is given in the 9th volume of the Aſiatic Reſearches, and records a grant for pious purpoſes. After much adulation of the mother of the royal donor, it is ſaid that "by the charms of her graceful gaiety ſhe obſcured Tilotama."

TILOUTTAH, in *Geography*, a town of Hindooſtan, in Bahar; 10 miles S.S.E. of Saſeram. N. lat. 24° 48'. E. long. 84° 15'.

TILOX, in *Ancient Geography*, a promontory on the northern coaſt of the iſland of Corſica, between the mouth of the river Valerius and Cæſiæ Littus.

TILPHOSSÆUM, a ſmall country of Greece, in Theſſaly.

TILSIT, in *Geography*, a town of Pruſſia, in the Lithuanian department, large, rich, and commercial. It obtained the privileges of a city in the year 1552, though the caſtle is ſaid to have been ſtanding ſo early as 1289. The river Memel, which runs along the N. ſide of the town, opens to it a very advantageous trade with Konigſberg, in corn, linſeed, butter, and other proviſions. Tilſit, properly ſo called, conſiſts of two long ſtreets, of a proportionate breadth, which are called the German-ſtreet and the High-ſtreet, contiguous to which are the ſuburbs called the "Liberty." The number of houſes in this city is about 600, and the inhabitants amount to 7000 ſouls. The eccleſiaſtical buildings are an evangelical or Lutheran German church, a Lithuanian church, and a Calviniſt or reformed church. Without the town is a Lutheran chapel, and about an Engliſh mile from it a Roman Catholic chapel. The flat country about Tilſit, which is about 16 miles in length, and as many in breadth, is one of the moſt fertile ſpots in the whole kingdom: the inhabitants of it breed great numbers of horned cattle, and furniſh not only Pruſſia, but likewiſe other provinces, with excellent butter and cheeſe; and the fiſheries in this place are alſo conſiderable. The horſes are large and ſtrong, but clumſy. Barley is almoſt the only grain ſown in theſe parts, which afford little or no wood. The marſh-land is, in ſpring, expoſed to inundations by the overflowing of the rivers, which often do great damage. In 1807, it was taken by the French; ſoon after which a peace was made between France, Ruſſia, and Pruſſia, called the "Peace of Tilſit; 50 miles N.E. of Konigſberg. N. lat. 55° 8'. E. long. 22° 8'.

TILT. See Tournament.

Tilt, in *Rural Economy*, a term ſignifying the arched or other covering of a cart, waggon, or other carriage.

The hoops for ſupporting the tilts in theſe caſes, may be faſtened upon the ſides of the carriage-frames, after being properly prepared and bent in a ſort of half-circular manner, in ſeveral different ways, but the faſtening by means of ſcrews is probably the beſt, where they are to remain fixed.

Tilt-*Boat*, a boat covered with a tilt, *i. e.* a cloth, or tarpawling, ſuſtained by bails or hoops over the ſtern, for the sheltering of paffengers. Such are fome of thofe which carry paffengers between London and Gravefend.

TILT-*Hammer*, is a large and heavy hammer, adapted to be put in rapid motion by the power of a water-wheel or fteam-engine.

The tilt-hammer is diftinguifhed from the lift-hammer, or forge-hammer, by the manner in which it is lifted up by the cogs of a wheel which is turned by the mill.

The forge-hammer is mounted on a centre of motion at the extremity of the haft or helve of the hammer oppofite to the head of the hammer, and the cogs of the wheel operate beneath the helve near the head, to lift or tofs up the hammer againft a ftrong wooden fpring called the rabbit, which is firmly fixed over the head of the hammer. This fpring reflects the hammer down upon the anvil with greater force and fmartnefs than the hammer would defcend by the action of gravity alone. A lift forge-hammer is defcribed under the article IRON. See *Plate* IV. *Iron Manufacture.*

The tilt-hammer is poifed on pivots or a centre of motion, which is about the middle of the length of the helve, or fometimes at two-thirds from the head. The cogs of the wheel are made to act on the tail of the helve beyond the centre of motion, and they prefs down the end of the tail, and thus caufe a correfpondent elevation of the head of the hammer. Sometimes the fpring is placed over the head of the hammer, the fame as a lift-hammer; but more commonly, the tail of the hammer is made to ftrike againft a fixed floor; and when the head of the hammer is thrown up fuddenly, the momentum given to it caufes the head to rife up after the tail ftrikes the floor, and thus bends the helve, which by its elafticity caufes the head of the hammer to defcend fmartly upon the anvil.

The *tilt-mills* in the neighbourhood of Sheffield are very fimple: they are worked by a fmall water-wheel, upon the axis of which is a wheel with a great number of cogs, fixed in its circumference. Thefe fucceffively deprefs the tail of the hammer, and raife its head: the hammer falls by its own weight, aided by the fpring of the helve, upon the hot metal. The fize of the water-wheel, and the number of cogs in the wheel, are adapted to produce from three hundred to four hundred ftrokes *per* minute.

This great number requires the water-wheel to move with a velocity which is inconfiftent with the beft mode of applying the fall of water, becaufe it is well known that water, as well as any other heavy body, can only defcend with a certain fpeed. If, therefore, the floats of the wheel are required to turn with a great rapidity, it is evident the proportion of work the wheel will perform, will be but fmall in proportion to the quantity of water expended. For this reafon, it is found to be a great improvement in tilt-mills to add cog-wheels which will give the hammers a fufficient velocity, while the water-wheel turns at fuch a rate as is found to produce the greateft power from a given quantity of water.

A capital mill of this kind is delineated in *Plate* VIII. *Iron Manufacture.* It was made at the Carron iron-works in Scotland, after defigns of the celebrated Mr. Smeaton. It is adapted for forging iron into bars, and has three tilt-hammers of different powers for different kinds of work. Thefe hammers are not made to ftrike fo quick as is ufual in the Sheffield mills for the tilting and drawing out fteel bars; but by giving a greater number of cogs to the wheels, the requifite rapidity may be obtained without increafing the fpeed of the water-wheel. A capital mill was built at Sheffield about fix years ago, which is on Mr. Smeaton's plan, except in the proportions of the wheels, and its performance is fuperior to any of the other tilt-mills.

A A, in the plan *fig.* 1. are the walls of the building; B B the great water-wheel, which is of the kind called a breaft-wheel. (See WATER-*Wheel.*) It is 18 feet diameter and 5 feet broad. The total defcent of the water which actuates it is 7 feet 2 inches, and it falls upon the float-boards rather below the centre of the wheel, being retained againft the floats by what is called the breafting, that is, a fweep or curved wall of mafonry, which is accurately adapted to the float-boards of the wheel, and as clofe to them as is poffible, to avoid touching.

The axis C of the water-wheel is carried through the wall A, and on the extreme end of it is a large iron wheel D, of 90 wooden teeth, 9 feet 6 inches diameter. This turns a pinion E of 30 teeth, and 3 feet 2 inches diameter. The pinion is fixed on one end of a caft-iron axis G G, which is made very large, for ftrength, and hollow within, like a pipe. The gudgeons *b* and G are fixed into it at each end, and upon thefe gudgeons it revolves. F F is a caft-iron fly-wheel, fixed on the axis clofe to the pinion; it is 12 feet diameter, and the rim 6 inches by 5. The weight is very confiderable, and gives it a momentum to regulate the motion of the whole mill, and equalize all irregularities which arife from the fucceffive actions of the mill to raife the three hammers, L, M, and N.

Each hammer has a feparate cog-wheel, K, I, and H, to give it motion, which is effected by the cogs of thefe wheels acting upon the tails of the hammers and preffing them down. This is explained by the elevation *fig.* 2. where *e* is the iron head of the hammer, *f* its centre of motion, and *d* the tail or extreme end, upon which the cogs of the wheel act, and which is plated with iron on the upper fide, to prevent it from wearing.

P is the anvil-block, which muft be placed on a very firm foundation, to refift the inceffant fhocks to which it is fubjected: the centre, *f*, or axis of the hammer, is fupported in a caft-iron frame, *g h*, called the hirft. When the cogs of the wheel ftrike the tail of the hammer fuddenly down, and raife the head, the lower fide of the tail of the hammer ftrikes upon a fupport *n*, which acts to ftop the afcent of the head of the hammer *e*, when it arrives at the defired height; but as the hammer is thrown up with a confiderable velocity as well as force, the effort of the head *e* to continue its motion, after the tail ftrikes the ftop *n*, acts to bend the helve L of the hammer, and the elafticity of the helve recoils the hammer down upon the anvil with a redoubled force and velocity to that which it would acquire from the action of gravity alone.

To obtain this action of recoil, the hirft *g h* muft be held down as firmly as poffible; and for this purpofe, four ftrong iron bolts are carried down from the four angles of the bottom plate *h*, and made faft to the folid bafis of ftone R R, upon which the whole refts: upon this bafis are placed four layers of timbers, *i*, *k*, *l*, *m*, which are laid one upon another, and the timbers of each layer are laid crofsways over the others. Each layer confifts of feveral pieces laid fide by fide, and they are flightly treenailed together, to form a platform. Each platform is rather lefs than that upon which it refts, fo as to form a pillar of folid timber; on the top of which the hirft-frame *g h* is placed, and firmly held down by the four bolts, which defcend through all the platforms, and have fecure faftenings in the folid mafonry beneath.

The ftop *n* is fupported by a fimilar pillar, but fmaller, and compofed of three layers: the upper piece *n*, which is feen croffways in *fig.* 2, is about three feet long, and the under fide is hollowed, fo that the piece bears only upon the two ends, leaving a vacancy beneath it, which occafions it to bend or ſpring every time the tail *d* of the hammer ſtrikes upon it, and this aids the recoiling action very much.

The axis on which the hammer moves is formed by a ring of caſt-iron, through which the helve of the hammer is put, and held faſt by wedging round it. The ring has a projecting trunnion on each ſide, ending in an obtuſe conical point, which is received in a ſocket firmly fixed in the hirſt-frame *g h* by ſcrews and wedges, one of which is ſeen at *r*. Theſe two ſockets are thus capable of adjuſtment, ſo as to make the hammer face fall flat upon the anvil. The three wheels K, I, H, are of different ſizes and numbers of cogs to produce that velocity in each hammer which is beſt adapted for the work it is to perform: thus, the wheel K for the great hammer has eight cogs, and therefore produces eight blows of the hammer for each revolution of the fly-wheel; the wheel I for the middle hammer has twelve cogs; and the wheel H for the ſmall hammer ſixteen; the latter will therefore make two ſtrokes for every one of the great hammer. In fixing the three wheels upon the great ſhaft G H, care is taken that they ſhall produce the blows of the different hammers in a regular ſucceſſion, and equalize as much as poſſible the force which the water-wheel muſt exert. The wheels are fixed upon the ſhaft by means of a wedging of hard wood, driven in all round; the wood, being capable of yielding a little to the ſhocks occaſioned by the cogs meeting the tails of the hammers, renders the concuſſions leſs violent.

The following are the principal dimenſions:

The head of the great hammer, P, weighs $3\frac{1}{4}$ cwt., and it is intended to make 150 blows *per* minute: it is lifted 17 inches from the anvil at every blow.

The middle hammer, M, is 2 cwt., and makes 225 blows *per* minute: it is lifted 14 inches each time.

The ſmall hammer, N, weighs $1\frac{1}{3}$ cwt., and makes 300 blows *per* minute: it is lifted only 12 inches.

To produce theſe velocities, the great axis G muſt make $18\frac{3}{4}$ turns *per* minute; and the cog-wheels E and D, being in the proportion of one to three, the water-wheel muſt make $6\frac{1}{4}$ revolutions *per* minute; the water-wheel being 18 feet diameter, its circumference will be $18 \times 3.1416 = 56.54$, or $56\frac{1}{2}$ feet: this multiplied by 6.25 is about 353 feet motion *per* minute, or divided by $60 = 5.9$ feet motion *per* ſecond for the circumference of the water-wheel.

The tilt-mills employed in the manufacture of ſteel, do not have the great hammer P, but the largeſt they uſe is about the ſize of that at M, and is adapted for welding faggots of ſteel to make ſhear ſteel: the other two hammers are about the ſize of N, and are made to work much quicker, *viz.* from 350 to 400 blows *per* minute. This is very eaſily accompliſhed by making the wheels E and F as 1 to 4, inſtead of 1 to 3, as ſhewn in the drawing.

TILTH, in *Agriculture*, a term uſed to ſignify the condition of the earth or ſoil after the land has been ploughed and broken down by the harrow or other tool of the ſame kind; or the ſtate and circumſtances of the ground in regard to tillage, or heart, as relating to manure. Thus we have a *good* and *bad* tilth, as well as land *in* and *out* of tilth, in works on agriculture.

TILTIL, in *Geography*, a town of Chili; 30 miles S.E. of Valparayſo.

TILTING *of Steel*, the proceſs by which bliſtered ſteel, or ſteel in the raw ſtate, is rendered ductile and fit for the purpoſes of various manufactures. Tilting conſiſts in hammering or forging the ſteel by a large hammer called a *tilt*. See TILT-*Hammer*.

Steel is formed by two proceſſes: one in which it is made at once from pig or crude iron in the finery, nearly in the ſame manner as making bar-iron: this is called natural ſteel. In the ſecond proceſs, malleable iron, in bars, is imbedded in charcoal or other carbonaceous matter, and expoſed to a conſiderable heat, till the carbon is thought to have penetrated ſufficiently into the iron to have changed it into ſteel. This is called converting the iron by cementation with charcoal; and the furnace in which the operation is performed is called a converting furnace.

The object of this proceſs of cementation, is to impregnate the iron with a certain quantity of carbon, to be derived from the charcoal: like many other ſimple operations, it requires great care and nicety to perform it properly, when put in practice on a large ſcale. The iron muſt be expoſed to the action of an intenſe heat in contact with carbon (but defended from the acceſs of oxygen), until the iron imbibes a portion of carbon and becomes ſteel.

The quantity of carbon which muſt be combined with iron to produce ſteel, admits of conſiderable latitude, and the qualities of the ſteel vary in the ſame proportion: with too little carbon, ſteel will be ſoft; and not ſufficiently hard when it has been ſuddenly cooled by plunging in water. It has a rough and ſomewhat fibrous fracture, and in general may be ſaid to poſſeſs many of the qualities of malleable iron. On the other hand, in proportion as the quantity of carbon is diminiſhed, an over-cemented ſteel, containing an exceſs of carbon, is brittle, eaſily fuſible, exceſſively hard after being ſuddenly cooled, and is liable to crack on the ſudden change of temperature from hot to cold. All theſe properties are an approach to crude iron.

The received opinion reſpecting ſteel and the beſt caſt-iron is, that they have the ſame conſtituent parts, but in different proportions; the former containing a ſmaller proportion of carbon than the latter. All the crude or caſt-iron of commerce contains oxygen in greater or leſs proportion, but the beſt ſteel is ſuppoſed to be nearly free from this. Mr. David Muſhet, whoſe great practical and theoretical knowledge entitles his opinion to the greateſt reſpect, ſuppoſes that the carbon contained in caſt-iron and in ſteel, exiſts in very different ſtates; and that ſteel is a combination of iron with pure carbon, ſimilar to the diamond, but that crude iron, is iron containing the oxyd of carbon, which is charcoal. This opinion he founded upon the reſult of a very numerous ſeries of experiments, many of which he communicated to the Philoſophical Magazine, vol. xiii. He found that a piece of Swediſh bar-iron, weighing 885 grains, introduced into a Stourbridge clay crucible, and half its weight (442 grains) of charcoal well prepared; a clay cover, fitting exactly, being placed on, and the whole expoſed to a moderate heat for half an hour; that the reſult was, a perfect button of ſuper-carbonated crude iron, weighing 928 grains, which therefore had gained $\frac{1}{20}$th on its original weight; while the charcoal, which remained in the crucible in an intenſely black ſtate, weighed 290 grains, having loſt 34.4 *per cent.* of its original weight.

In a ſecond experiment, made in a ſimilar manner, but with only a quarter of the charcoal, the iron gained $\frac{1}{19\frac{9}{10}}$ of its original weight, and the loſs in charcoal was 45 *per cent.*: the metal was richly carbonated. When one-ſixth of charcoal was uſed, the iron produced, reſembled the produce of No. 1. and 2. of the crude iron of commerce; its weight was increaſed $\frac{1}{20\frac{3}{4}}$; and 57 *per cent.* of the charcoal diſappeared in the proceſs.

With one-eighth of charcoal, the iron gained $\frac{1}{22\frac{4}{10}}$ of its original

original weight; and the weight of the charcoal which disappeared was $67\frac{1}{5}$ *per cent.* The metallic button was very highly carbonated, and apparently formed an entire mass of carburet.

One-ninth of charcoal produced a super-carbonated button of crude iron, rather inferior to the preceding in point of carbonization: its surface was smooth, and of a dull lead-colour, entirely free from the usual shining specks of carburet, which very rich crude iron contains upon its surface. It had gained equal to $\frac{1}{26}$th in weight by the fusion; and the loss in charcoal was 80 *per cent.*

When treated in the same manner with $\frac{1}{12}$th of its weight of charcoal, the iron gained weight equal to $\frac{1}{27}$ parts: and 83.5 *per cent.* of the charcoal disappeared in the process. The metallic button possessed an uniformly smooth surface, partially covered with carburet.

One-fifteenth part of charcoal, exposed with the iron to a heat sufficient to melt it, was all lost; the metal gained $\frac{1}{30}$th in weight, which was exactly half the weight of charcoal lost. The surface of the button was not carbonated, as the foregoing experiments: the colour was blueish-black, smooth in the centre, but a little oxydated towards the edges. The fracture was that of close dark-grey crude iron; the crystals much closer and more minute than in the preceding experiments. Its quality was such as manufacturers term No. 2. grey melting pig-iron.

When only $\frac{1}{20}$th part of charcoal was employed, none of which remained after the fusion, the iron gained $\frac{1}{33}$ parts in weight: a small portion of amber-coloured glass was found round the edges of the button. The fracture of the metal was smooth silvery-white, occasionally studded with carbonaceous specks in form of small grains: it exactly resembled mottled pig-iron.

With $\frac{1}{25}$th part of charcoal, the metal gained $\frac{1}{63}$ parts in weight, the whole of the charcoal disappearing. The upper surface of the button was smooth, but the under considerably pitted. The concaves were chequered with the rude crystallization peculiar to cast-iron. Its fracture was bright silvery-white, destitute of grain, and exhibiting a very perfect streaky crystallization slightly radiated: its resemblance was strikingly similar to that of highly-blown crude iron, prepared in the finery for making malleable iron.

A piece of Swedish iron was placed in $\frac{1}{30}$th its weight of charcoal: the fusion of the mixture produced a metallic button weighing $\frac{1}{127}$ parts more than the iron employed, which increase is not quite a quarter of the loss in charcoal, which wholly disappeared in the experiment. The upper surface of the button was smooth without configuration, but the under surface was uneven, and covered with minute but perfect crystallization: its fracture was blueish silvery-white, composed of flat dazzling crystals, proceeding in lines from a centre to the edges of the button. Here it was evident, that from the small proportion of carbon combined with the iron, it was found to assume the earliest stage of granulation approaching to the state of steel. The brilliant concretions observable in the surface of the button were too indistinct and flat for steel capable of bearing the hammer.

When the proportion of the charcoal was reduced to $\frac{1}{40}$th of the iron, its consequent increase was but $\frac{1}{500}$th part. The upper surface of the button was smooth, with a faint impression of a chequered crystallization: the under surface possessed some large pits similarly though more perfectly crystallized; the fracture was one shade of blue beyond the last experiment. A regular granulated surface, composed of flat oblong crystals, was observable, still too indistinct and too much on edge for workable steel.

With only $\frac{1}{50}$th of the weight of charcoal, the button was deficient $\frac{1}{354}$th part of its weight originally used, yet the whole of the charcoal was lost. The surfaces of this button were uniformly smooth; the fracture dense, and displaying a grain peculiar to highly saturated blistered steel. When put under the hammer with a low red heat, it withstood a few blows, but afterwards parted.

Charcoal $\frac{1}{90}$: the metallic button weighed $\frac{1}{31\frac{6}{10}}$ less than the iron employed. Its surface was wavy and crystallized: the under surface was rough, and contained one large pit accurately crystallized: the fracture was regularly granulated, small but distinct, and of a light blueish colour. The crystals, though distinct, were not so prominent as those of easy drawing cast-steel; it however hammered with the usual degree of caution necessary in the working of cast-steel. The bar of steel formed from the button was very proper for file-making, and other purposes requiring highly converted steel.

The proportion was reduced to $\frac{1}{100}$th part the weight of iron: the produce was $\frac{1}{22\frac{8}{10}}$ less than the original weight of iron. The surface of the button was smooth, without crystals: the under surface rough, and possessed of one large pit in the centre, faintly marked with the usual crystalline appearance. The fracture presented regular light-blue grains, distinct and more prominent than in the last experiment. One half of this button was drawn into a neat square bar, and proved excellent steel. One end of it, being loose and shaled, welded tolerably well, and hardened afterwards with a low heat. From its quality, it seemed adapted for manufacturing penknives, razors, &c. possessing neither the extremes of hardness nor softness.

Mr. Mushet continued this series of experiments till the proportion of charcoal became so small as $\frac{1}{200}$th part; and he gives the following conclusions, deduced from the results.

	Parts by Weight.
Iron semi-steelified is made with charcoal	$\frac{1}{150}$
Soft cast-steel, capable of welding, with -	$\frac{1}{120}$
Cast-steel for common purposes, with -	$\frac{1}{100}$
Cast-steel requiring more hardness, with -	$\frac{1}{90}$
Steel capable of standing a few blows but quite unfit for drawing, - - -	$\frac{1}{50}$
The first approach to a steely granulated fracture, is from - - -	$\frac{1}{30}$ to $\frac{1}{40}$
White cast-iron - - - - - -	$\frac{1}{25}$
Mottled crude iron - - - - -	$\frac{1}{20}$
Carbonated crude iron - - -	$\frac{1}{15}$
Super-carbonated crude iron - -	$\frac{1}{12}$, or

when any greater quantity is combined with it.

In the above experiments it will be seen, that when more than $\frac{1}{40}$th part of charcoal is employed, the weight of the produce is increased; but when less than $\frac{1}{40}$th part is used, a loss is experienced proportioned to the diminution of the carbon. The increase of weight in the iron is by no means equal to the loss in the charcoal, never exceeding the half thereof; but this is accounted for in other experiments made by Mr. Mushet, where charcoal was found to be transmitted through close crucibles in a high degree of heat.

The French chemists made a direct experiment to prove that the diamond is really carbon in a crystallized state. By inclosing a small diamond in a piece of malleable iron, and melting this in a close crucible, it was found to be converted into steel, and the diamond had disappeared.

The manufacture of *natural steel* is carried on in Germany, and Swedenborgius gives us the following account of the method used in Dalecarlia for making steel from cast-iron. The

The ore from which the crude iron to be converted into ſteel is obtained, is of a good kind; it is black, friable, and compoſed of many ſmall grains: it produces very tough iron. The converſion into ſteel is made upon a forge-hearth, ſomething ſmaller than that commonly uſed for converting caſt-iron into malleable iron: the ſides and bottom are made of caſt-iron; the tuire is placed with very little inclination on one of the ſide-plates; the breadth of the fire-place is fourteen inches, its length is greater; the lower part of the tuire is ſix inches and a half above the bottom: in the interior part of the fire-place, there is an oblong opening for the flowing of the ſuperfluous ſcoria.

The workmen firſt put ſcoria on the bottom, then charcoal and powder of charcoal, and upon theſe the caſt-iron, run or cut into ſmall pieces. They cover the iron with more charcoal, and excite the fire. When the pieces of iron are of a red white, and before they begin to melt, they ſtop the bellows, and carry the maſs under a large hammer, where they break it into pieces of three or four pounds each: the pieces are again brought to the hearth, and laid within reach of the workman, who plunges ſome of them into the fire and covers them with coal. The bellows are made to blow ſlowly till the iron is liquefied, when the fire is increaſed; and when the fuſion has been long enough continued, the ſcoria is allowed to flow out, and at that time the iron hardens. The workman adds more of the piece of crude iron, which he treats in the ſame manner, and ſo on a third and fourth time, till he obtains a maſs of ſteel of about a hundred pounds, which is generally done in about four hours. This maſs is carried to the hammer, where it is forged and cut into four pieces, which are further beat into ſquare bars four or five feet long. When the ſteel is thus forged, it is thrown into water, that it may be eaſily broken, for it is yet crude and coarſe-grained. The ſteel is then broken in pieces, and carried to another hearth, ſimilar to the former. Theſe pieces are laid regularly in the fire-place, firſt two parallel, upon which ſeven or eight others are placed acroſs; then a third row acroſs the ſecond in ſuch a manner, that there is a ſpace left between thoſe of the ſame row: the whole is then covered with charcoal, and the fire is excited. In about half or three quarters of an hour the pieces are made hot enough, and are then taken from the fire one by one, to the hammer, to be forged into little bars from half a foot to two feet long, and while hot, are thrown into water to be hardened. Of theſe pieces, ſixteen or twenty are put together, ſo as to make a bundle, which is heated and welded, and afterwards forged into bars four inches thick, which are then broken into pieces of convenient length for uſe.

Converting of Steel by Cementation with Charcoal.—The quality of ſteel is intimately connected with that of the iron from which it is converted, and the iron made in Sweden is eſteemed the beſt for the purpoſes of cementation. This proceſs is almoſt wholly in the hands of the Engliſh, who pay a higher price for the iron, and by that means ſecure nearly all the iron of Roſlagia, which is the beſt iron of Sweden.

The beſt marks of Swediſh iron are: that called the hoop L, which is denoted by a circle, with an L in the centre; thus, : the G L; thus, : the double bullets; thus, . The iron of theſe three marks bears nearly the ſame price, which is ſometimes as high as 40*l.* *per* ton. There are alſo the Swediſh marks; as P L, : the hoop S, : and the gridiron, ; which are worth a few pounds *per* ton leſs than the former; *viz.* from 34*l.* to 38*l.*, when the beſt marks are 40*l.*

The Ruſſian marks are, firſt, that called the C C N D: the mark is ſix Ruſſian letters, C H E H P B, worth about 37*l.* *per* ton, when the others are at 40*l.*: and the P S I, which is marked by the Ruſſian letters P S I, is ſo inferior, as to ſell for only 26*l.* or 27*l.*

It is to be lamented that, in the preſent ſtate of our iron manufacture, we are unable to produce malleable iron which is equally fit for converting into ſteel with the Ruſſian and Swediſh iron. The general opinion upon this deficiency is, that it ariſes from ſome ſuperiority in the foreign ores of iron, but more immediately from the circumſtance of their uſing charcoal of wood inſtead of the coke of pit-coal in ſmelting or reviving them; and ſome of our manufacturers do not heſitate to aſſert, that they can make iron with charcoal equal to the foreign in quality; but that in reſpect to price, the circumſtances of this country will not allow them to cope with thoſe countries, where the deſtruction of wood is in ſome meaſure conſidered as beneficial, by clearing the land for the operations of huſbandry.

The Swediſh and Ruſſian iron is imported into this country by iron merchants in immenſe quantities together, this trade being in the hands of a few individuals: by them it is retailed in ſmaller portions to the converters, whoſe furnaces are chiefly about Sheffield and at Newcaſtle, who, after cementation, diſpoſe of the greater part of it to the manufacturers of ſteel goods in the ſtate of bliſtered bars. Its value is eſtimated by the Swediſh or Ruſſian marks of iron, which ſtill remain upon the bars. The manufacturers ſend their bars to the tilt-mills, where they are made into common ſteel and ſhear or German ſteel, or they melt it to form caſt-ſteel.

The converſion of iron into ſteel is performed in a furnace, hence called a converting furnace. The external building is a large and tall cone, ſimilar to a glaſs-houſe, within which, one or two large crucibles, called pots, are placed, and ſurrounded by flues in a manner beſt calculated to communicate a conſtant and regular heat to every part of them. In theſe pots the iron bars are placed, being ſtratified in pulverized charcoal, and the pots are covered over with ſand to exclude the external air.

A more perfect idea of the converting furnace will be had by referring to *Plate* VII. *of Iron Manufacture*, which contains a horizontal plan and two vertical ſections of one of the furnaces uſed in the neighbourhood of Sheffield, with two pots for containing the iron. In all the figures, the ſame letters of reference denote the ſame parts. C C is the external cone, built of brick or ſtone work; its diameter at the baſe varies in different furnaces, according to the ſize of the pots it contains: its extreme height from the ground to its vertex ſhould not be leſs than forty or fifty feet to cauſe a proper draught. To create a ſufficient heat for the proceſs, the top of the cone uſually terminates with a cylindric chimney of ſome feet in height. The conical form of the external building is by no means eſſential; any form will operate in the ſame manner, if it is of a proper height: ſome are in practice built nearly in the ſhape of the ſmall end of an egg, with a round chimney upon the top. The lower part of the cone is built ſquare or octangular, as is the plan of *fig.* 3. The ſides are carried up until they meet the cone, giving the furnace the appearance of a cone cut to a ſquare or octangular priſm at its baſe, and exhibiting the parabola where every ſide interſects the cone.

The conical building contains within it a ſmaller furnace, called

called the vault, built of fire-brick or ftone, which will withftand the action of a moft intenfe heat, without cracking or vitrification. D D in the fection is the dome of the vault, and E E its upright fides, the fpace between which, and the wall of the external building, is filled up with rubbifh and fand. The vault, as is fhewn in the plan, is always four-fided, that it may contain the pots which receive the iron bars to be converted. A B reprefent the two pots, built of fire-ftone, each ten feet long, three feet deep, and two feet nine inches wide; the fpace between them is twelve inches wide; and directly beneath it is the fire-grate. The pots are fupported by a number of detached courfes of fire-brick, as fhewn at *e e* (*fig.* 1.) which leave fpaces between them, called flues, to conduct the flame under the pots: in the fame manner, the fides of the pots are fupported from the vertical walls of the vault, and from each other, by a few detached ftones, (*f*, *fig.* 1.) placed fo that they may intercept as little as poffible of the heat from the contents of the pots. The adjacent fides of the pots are fupported from one another by fmall piers of ftone-work, which are alfo perforated, as fhewn at *d* (*fig.* 2.) to give paffage to the flame. The bottoms of the pots are built of a double courfe of brick-work, about fix inches thick; the fides neareft together are built of a fingle courfe of ftone, about five inches in thicknefs; and the other parts of the pots are fingle courfes about three inches, the fides not requiring fo much ftrength, becaufe they have lefs heat and preffure to refift.

The vault has ten flues or fhort chimneys, F F, rifing from it; two on each fide, to carry off the fmoke into the great cone, fhewn in the plan 3, communicating with each fide, and two at each end.

In the front of the furnace, at H, an aperture is made through the external building, and another correfponding in the wall of the vault: thefe openings form the door, at which a man enters the vault to put in or take out the iron: but when the furnace is lighted, thefe doors are clofed by fire-bricks luted with fire-clay. Each pot has alfo fmall openings in its end, through which the ends of two or three of the bars are left projecting in fuch a manner, that by only removing one loofe brick from the external building, the bars can be drawn out without difturbing the procefs, to examine the progrefs of the converfion from time to time: thefe are called the tap-holes; they fhould be placed in the centre of the pots, that a fair and equable judgment may be formed from their refult of the reft of its contents.

a b, in the elevation, is the fire-grate, formed of bars laid over the afh-pit I, which muft have a free communication with the open air, that it may convey a current of frefh air to fupply the combuftion. The afh-pit fhould alfo have fteps down to it, that the attendant to the furnace may get down to examine by the light, whether the fire upon the whole length of the grate is equally fierce; and if any part appear dull, he ufes a long iron hook to thruft up between the bars and open a paffage for the air. The fire-place is open at both ends, and has no doors. The fire-grate is laid nearly on a level with the floor of the warehoufe, before the furnace, and the fireman always keeps a heap of coals piled up before the apertures at its ends, fo as to clofe the opening. This forms a very fimple and effective door; and when the furnace requires a frefh fupply of fuel, a portion of the heap of coals is fhoved in by a fort of hoe, and the heap renewed, to ftop any air from entering into the furnace, except that which has paffed upwards through the ignited fuel, and by that means contributed to the combuftion.

The fire-ftones that compofe all thofe parts of the furnace which are expofed to the action of the heat, are firft hewn nearly to fize, and finifhed by grinding two furfaces together, fo that they make very perfect and clofe joints: when laid together, they are cemented with well-tempered fire-clay, mixed up very thin with water. The fire-clay which anfwers beft for this purpofe, is that brought from Stourbridge, in Staffordfhire, and is the fame of which the celebrated Stourbridge crucibles are compofed; but very good fire-clay for the purpofe is procured from Birkin-lane, near Chefterfield. When the furnace has been once burnt, this clay becomes equally hard with the ftone, and is lefs liable to fly or vitrify in an intenfe heat, than any other known cement.

The procefs of charging the furnace with iron for converfion is conducted as follows. The bars of iron are firft cut to the length of the pot; and for this purpofe an anvil is placed at fuch a diftance from the wall of the building, that the diftance from the edge of a cold chiffel wedged into the eye of the anvil, to the wall, will be juft the length of the pots. One workman places the end of a bar againft the wall, and lays the other end acrofs the edge of the chiffel, whilft another with a fledge-hammer ftrikes upon the bar till it is cut half through; then it is turned the other fide upwards, and the end cut completely off. By this gauge the bars are all cut to one length, and a man enters through the door in the vault, to difpofe of them in the pots: he is provided with a bafket of fine pulverized charcoal, a fieve, and a fhovel. An iron plate is put into the furnace, and lays over the fpace between the two pots to form the floor, upon which the man ftands while at work. He commences his operations by fifting a layer of charcoal over the bottom of the pot, about half an inch thick, and he is careful in ufing the fieve to lay the charcoal of an even thicknefs in every part; but if it fhould not be carefully done, he levels it with the fhovel. The workman on the outfide now introduces the bars into the furnace through a hole, made by taking out a brick in the wall, juft over the end of one of the pots, and the workman within depofits them upon the ftratum of charcoal in the bottom of the pot, arranging them parallel to each other, and leaving an interval of about an inch between each bar. When the bottom of the pot is in this manner covered with iron bars, charcoal is again fifted upon them, and levelled with the fhovel, to fill up the intermediate fpaces between the bars, and to cover them about an inch thick: another layer of bars is then introduced into the furnace, placed upon the charcoal, and in its turn covered over with a ftratum of charcoal; and in this manner the pot is filled to within two inches of the top. A layer of the fand which is found in the bottom of grindftone troughs, is then fpread three or four inches thick upon the whole, to cover the pots up clofe, and prevent the accefs of the common air and flame. In placing the fucceffive layers of bars in the pot, it is proper that each fhould be laid over the fpace between two of the bars in the layer beneath, becaufe each bar will then be furrounded by a greater thicknefs of charcoal, than it would if they were laid directly over each other. Two or three of the bars fhould be left fomewhat longer than the reft, and their ends fhould project through the trial-holes in the ends of the pots, and fand rammed round them in the holes to keep out the air.

The pots being both filled and covered up with the fand and rammed down, the holes for introducing the bars are clofed by a brick or fire-ftone, and luted with fire-clay. The apertures through the outer wall oppofite the ends of the trial-holes are alfo ftopped and luted. The iron plate upon which the man ftood is now removed, and the doors in the vault clofed up by bricks fet with fire-clay; next, the opening in the external building is fhut up, and the furnace is charged ready for lighting.

The furnace is kindled by lighted wood placed on the fire-grate, then a few coals are thrown in, and when well lighted, the quantity is increafed; the heat thus generated rarefies the air contained in the vault and in the great cone; and

and being thus rendered of lefs fpecific gravity than the external air, it rifes up in the cone, and a frefh fupply rufhes in through the bars of the grate, to reftore the equilibrium. By going through the fire, this air parts with its oxygen, and excites the combuftion, and becoming heated, rifes up the chimney, and caufes a very ftrong draught of air to enter the fire.

At firft kindling, the fuel is fupplied in fmall quantities, that the heat in the furnace may be gradually increafed, and not endanger the cracking of the ftones: in a few hours time the quantity of fuel is increafed, fo as to produce the full heat, which is to be maintained as equally as poffible throughout the whole procefs. The fuel, which is pit-coal, is introduced at both ends of the grate, through fmall arches in the wall, which are in a line and on a level with the fire-grate, a quantity of coals being always left before the end of the arch to ftop it up, and prevent any air getting into the furnace, without paffing through the grate. Part of thefe coals is forced into the furnace, as before mentioned, when it requires a fupply of fuel, which is generally at intervals of about half an hour each. The fireman frequently examines the appearance of the under fide of the fire-grate, and judges from it the ftate of the fire: he improves it where neceffary, as before defcribed, by thrufting a hook up between the bars to make way for the air.

The flame arifing from the ignited fuel upon the grate partly proceeds upwards between the pots, and heats them by that means; it then ftrikes the roof of the vault, and is reverberated down upon the pots, and efcapes through the fix flues or chimnies in the vault. The draught alfo draws the flame from the grate under the pots, and round the outfide and ends. The principal object in this ftage of the procefs, is to maintain the fame degree of heat in every part of the pot, that every bar may be equally converted in the fame fpace of time. The roof of the vault muft be built of very good ftone (none being better than from Roches quarry, in Afhover), to withftand the great heat exerted upon it: it is cuftomary to build them very thin, and cover the outfide with a fmall thicknefs of dry fand to keep them tight, in cafe of a ftone cracking.

In this way the fire is kept up in as equable a manner as poffible, until the iron is fuppofed to have imbibed a fufficient portion of carbon from the charcoal to render it fit for its intended purpofe: in this circumftance, the manufacturer regulates his judgment by his experience of former proceffes. About the time that he fuppofes the converfion to be fufficiently advanced, one of the trial-bars is drawn out from the pot, and by comparing the fize of the blifters raifed upon its furface with another bar which is known to be fufficiently carbonated, an idea is formed of the ftate of the furnace, and accordingly the fire is, at the proper time, difcontinued, and the furnace is fuffered to cool. Some manufacturers proceed to make experiment of the trial-bar by hardening and tempering it, fo as to prove to a certainty the degree of its converfion, the blifters being found in fome degree fallacious; for their fize depends as much upon the degree of heat to which the bar has been expofed, as upon its carbonization, and fhew the rapidity with which the converfion has been carried on, rather than its actual ftate.

The time which the iron is required to be in the procefs of cementation depends upon a variety of concurring circumftances. 1. The degree of carbonization required to form a fteel of the proper quality; this varies with the ufe the fteel is to be applied to. 2. The heat it is fubjected to. 3. The nature of the iron employed in the procefs. The combinations of thefe circumftances are fo numerous, that nothing but long experience can determine the proper duration of the procefs.

In general terms it may be obferved, that a fhort period will produce a fteel very foft and tenacious, which, when properly treated, will poffefs elafticity as its moft ftriking property, and is therefore very proper for fprings, wire-drawing, and other purpofes requiring ductility, but without the hardnefs requifite for edge-tools. The period of cementation for fuch fteel varies in different manufactories, from four to fix days and nights.

Steel which requires more hardnefs, but at the fame time fufficient tenacity to refift fudden fhocks, fuch as the edge-tools for working wood are fubject to, muft be cemented a longer time. This, which is moftly tilted into fhear fteel, is cemented fix, feven, or eight days, according to the heat and the quality of iron employed. The fteel employed for fabricating tools for cutting metals and hard fubftances being but fmall in demand compared with the others, is not cemented a longer time, but is returned into the furnace at the next charge, along with a charge of iron, and cemented again with frefh charcoal: this is termed double converted fteel. But for fome few purpofes, fuch as the turning and boring of caft-iron, the fteel is converted three times: in this ftate it becomes fo hard and brittle as to be totally unfit for any purpofe requiring tenacity, or for any cutting edge which is lefs than an angle of 70 degrees, or it would be continually breaking.

The heat which is requifite for the procefs, muft be as great as to give the iron nearly a welding heat, but if carried farther, will endanger melting the bars when the procefs has proceeded fome time; an accident which has frequently occurred through the inattention of the fireman. It is obferved by manufacturers, that the carbonization proceeds quicker when the heat is greateft, and for this reafon the duration of the procefs varies in different furnaces, in fome meafure from their conftruction, in urging a greater heat, and this depends chiefly upon the height of the chimney, and the draught it occafions.

When the converfion is fuppofed to be complete, the furnace is fuffered to cool, until a man can conveniently enter the furnace, to take out the bars and remaining charcoal, and prepare the furnace for a new charge. The bars which are brought out are (from being covered with blifters upon the furface) termed bliftered fteel.

On examination of the fracture of a bliftered bar, it is found full of internal cracks, which are generally parallel to the flat fide of the bar: fome of them are larger than others, and extend the parts of the bar fufficiently to raife numerous protuberances or blifters upon its furface. Thefe cracks have every appearance of being opened by the expanfive force of fome gas generated in the iron during the procefs, but what the nature of this gas is, ftill remains to be inveftigated. It feems to arife from the body of the iron itfelf, by the crack being within the folid fubftance of the bar. The fracture of the bliftered fteel is exceedingly irregular, of a white colour, like frofted filver, and appears like an irregular cryftallization; but the facets exhibited are larger in proportion as the cementation has been longer continued, and from this reafon they are larger towards the furface of the bar than in its centre.

The furnace above defcribed is of that kind which is efteemed the beft for the procefs, and is moft generally employed in and about the neighbourhood of Sheffield in Yorkfhire, where the manufacture of fteel is carried on in a larger fcale than in any other part of England. The furnaces ufed at Newcaftle, which is another feat of this trade, are very fimilar.

The charge confifts of twelve tons, each pot containing fix tons of iron; and it is neceffary that all the bars converted at at one procefs be of the fame fize, or the fmaller ones would be thoroughly converted before the others had taken up a fufficient dofe of carbon. This large quantity of a fingle article is more than the trade of fome manufacturers will difpofe of, they therefore employ fmaller furnaces, which contain only eight tons, and fuch are generally conftructed but with one pot ten feet in length, three feet broad, and two feet deep: the fire-place is directly beneath the pot, twenty inches wide, and flues are carried round it on both fides and ends: the vault and chimney of fuch a furnace are the fame as the double pot. It is found by experience that the fmall furnaces confume fomewhat more fuel in proportion to the quantity of iron they convert, than the large ones, becaufe the heat loft in the beginning and end of the procefs, and that tranfmitted through the walls of the building, is the fame in both inftances.

Mr. Daniel Little of America, in 1785, recommended a new fubftance to be ufed in the cementation of fteel inftead of charcoal: it is the marine plant known by the name of rockweed, or rockware, and is found in great plenty on rocky fhores in America. It was to be prepared by firft mowing it from the rocks by the fcythe or fickle, and fpreading it out on dry land till the rains have wafhed off the greater part of the fea-falt; it was then to be dried and pulverized, and may be ufed as any other cement for making of fteel. He fays that he difcovered this property in an experiment where a fmall piece of iron was put into a crucible, and filled with the powdered plant as a cement: after it had been expofed to little more than a cherry heat for five or fix hours, it was converted into fteel.

All cemented fteel in its raw ftate, after it is taken from the converting furnace, is called bliftered fteel; becaufe the furfaces of the bars are covered with blifters, and on breaking a bar it is found to be full of cavities withinfide, which feem to have been opened by fome gas generated in the iron when in the procefs of cementation, and to have raifed the furface into blifters, which are hollow within. In this ftate the fteel is not fit for any purpofe, becaufe of thefe numerous cavities, and from the great difpofition it has to break with the moft irregular and rugged fracture imaginable. To render it found and tenacious, it muft be well hammered while at a moderate heat, which operation is termed *tilting the fteel*, becaufe it is done under the tilt-hammer, worked by machinery. There are many reafons why the hammering of fteel cannot be fufficiently performed by hand: the principal are, that the expence of labour would be too great to anfwer, and that a man could not ftrike hard and quick enough, to complete the operation at one heat of the fteel: if more than one heat is taken, the fteel will not receive fo much advantage from the hammering, becaufe when it is heated, its pores are opened; and if fuffered to cool without hammering, the grain of the fteel will be found confiderably coarfer; therefore, every time it is heated, the good effects of the previous hammering are in a great meafure loft. Tilt-hammers are worked by water-wheels or fteam-engines, according to the local fituation of the manufactory. (See a defcription in the article TILT-*Hammer*, *Plate* VIII. *Iron Manufacture.*) The fame axis is made to actuate three or four tilt-hammers placed fide by fide, and the hammers are not all of equal lengths, each one being fhorter than the next: by this arrangement, when they are all working together, the workman of one tilt does not incommode thofe employed at the other two. The anvils of the hammers are nearly on a level, or at moft only a few inches above the furface of the ground; and the workman fits in a pit or foffe, dug for the purpofe, in a direction perpendicular to the helve of the tilt, upon a feat which is fufpended from the roof of the building by two iron rods: by this means he can with the greateft eafe advance to or from the hammer, by juft touching the ground with his foot, and pufhing himfelf backwards or forwards as he fits in the fwing. The three feats are in parallel directions, but fufficiently diftant from each other, in confequence of the different lengths of the hammers, to allow the workmen to perform their bufinefs. At a convenient diftance from each tilt, is placed the forge for heating the fteel. The two forges for the fmall hammers are placed together under the fame dome, while the other forge is by itfelf near the great hammer. The bellows for the forges are worked by a fmall crank on the end of the gudgeon of the fhaft; they are placed over-head in the roof of the building, and a copper pipe conveys the air to the tue iron. The forges are like thofe ufed by fmiths, except that they have a fmall cover built of fire-brick over the hearth: the cover is fquare within, about eight inches wide, eight high, and eighteen inches or two feet long. It is open in front, to introduce the bars. The coals are placed on the hearth, as fmiths ufually do, and the brick cover acts, to reverberate the flame down upon the fteel, and give a very regular heat. Each workman at the tilt is attended by two boys, who heat the fteel at the forge, and convey it to the workman, that he may lofe no time: another boy attends each tilt to take away the finifhed rods and cut them to length, and then to ftraighten them.

The operations of the tilt are conducted in the following manner: Suppofe a piece of fteel has been heated by one of the boys, and brought to the man at the hammer, he places it upon the anvil, at a part neareft to the centre of the hammer, where its furface is reduced to a round edge, about an inch wide: the face of the hammer is made round, to correfpond with the anvil, and from its fimilarity to the edge of a fmith's hammer, may be called the pen of the hammer and anvil. The machine is always in rapid motion, and between every ftroke that the hammer makes, he moves the bar forwards on the anvil, that it may be ftruck by the edge of the hammer in a frefh place. If the bar is flat, as bliftered fteel ufually is, it is firft hammered in this manner upon its edge, to reduce it to a fquare, and at the fame time draw it out in length. When it has been hammered thus all its length, the furface becomes indented on both fides by the edges of the hammer, the anvil being bounded by waving lines. This firft operation is called *notching down*. The tilter then removes the bar beneath the flat face of the hammer, and the rod is flattened at every ftroke, and all the indentation removed; when he gradually recedes from the hammer, drawing the rod along, and flattening it all the way. When the end of the rod comes under the hammer, he turns the other face of the rod upwards, and advancing to the hammer, pufhes the rod forwards under it: in this manner he proceeds, flattening it on one fide or the other, until he brings it to the proper fize, which he tries by a gauge. The moment it is finifhed, the boy brings another piece of hot fteel, which he places under the hammer, and then the other boy takes away the finifhed rod from the tilter, who takes the frefh piece: in doing this, they are careful that the hot piece of fteel is placed under the hammer before the other is taken away, that the faces of the hammer and anvil may not ftrike together, when there would be danger of breaking them, as they are both made of caft-iron: the fecond piece is tilted in the fame manner as before, and when finifhed, is changed for another.

The perfection of tilting fteel, depends upon drawing out a rod perfectly ftraight to the fame fize in every part of its length. Many workmen, particularly at Sheffield, have acquired fuch fkill and dexterity in the management of the rod while under the tilt, that their work is as ftraight and even as as though it had been drawn through a ſteel-plate, in the ſame manner as wire, and all its angles perfectly ſquare: its ſurface is of a black poliſh, and as ſmooth as though it had been filed. All artiſts uſe the ſquare ſteel rods for making their tools; and the ſtraightneſs and regularity of the rods are ſuch, that a perſon who has not been an eye-witneſs of the operation, would ſcarcely believe it poſſible to produce ſuch accurate work from the blows of a hammer. The points to be attended to by a tilter are, that in notching down the bar to draw it out to length and ſize, he cauſes the blows to fall exactly at equal diſtances from each other, unleſs (which ſeldom happens) the bar ſhould have any part thicker than the reſt; the ſtrokes muſt then be a little nearer together in that place, to reduce it all to one ſize. Afterwards, to flatten the bar, he muſt be careful to place the bar truly flat upon the anvil, and hold it in the ſame place, whilſt he draws the bar under the hammer, and that he moves himſelf with a perfectly equable motion, that every part of the bar may be alike ſubjected to the action of the hammer: the ſurface will then be true, and free from undulations. Another circumſtance to be attended to is, when he turns the bar upon the anvil to hammer the adjacent ſides, that he makes them truly ſquare to the former ſides. Theſe things muſt all be done in ſo little time, that it requires long practice and experience to perform them well. Beginners are always apt, when they place their feet on the ground, to move themſelves too quick juſt at that time, which cauſes the bar to be thicker at that place.

The different methods of conducting the operation of tilting, give the ſteel different qualities, which are diſtinguiſhed into 1. Common ſteel; 2. Shear or Newcaſtle ſteel, alſo called German ſteel; and 3. Tilted caſt ſteel.

Common ſteel is made by tilting bars of bliſtered ſteel, and drawing them out into rods of any ſize. The bliſtered bars are of various ſizes, but in general about an inch and a half broad by half an inch thick. If theſe are to be drawn into rods half an inch ſquare, they are broken into convenient lengths to handle, and one end of each piece is heated to a good welding heat by the boy who attends the forge, who puts three or four in the fire together, and, according to their ſize, he learns by experience at what time he muſt put every one into the fire, that it may acquire the proper degree of heat by the time that the tilter ſhall have juſt finiſhed the other bars.

The tilter firſt begins by notching down the narrow edge of the bar, holding the other end of it in his hand, and notches down ſuch a length of it as experience teaches him will be ſufficient to form a rod of the length and ſize required. The notching on the edge of the bar rather increaſes its thickneſs, while it diminiſhes its breadth, and brings it nearly to the ſquare figure of a rod: he then flattens it, and begins again to notch it down upon the broad ſide; afterwards he again flattens it; then proceeds to notch it upon the edge, and afterwards to flatten it once or twice on both ſides, and the rod is finiſhed.

When a ſkilful tilter has been ſome hours at work upon rods of one ſize, he judges by ſight when the rod is of the proper ſize; but on firſt beginning, he tries it by a gauge, and flattens it repeatedly, if neceſſary, the boy bringing a piece of hot ſteel to place under the hammer while he is gauging, and which is drawn out in its turn. When the tilting is completely finiſhed, the ſteel rod is taken away by another boy, who, with a pair of ſhears, cuts off the rod from the bliſtered bar from which it was drawn out. He places the rod on a flat caſt-iron table, and ſets it truly ſtraight by a hammer, then ſtamps the bar with a mark of the quality of the ſteel, and it is finiſhed.

All theſe operations are performed in ſo ſhort a time, that the rod ſtill retains a red heat; but this will excite leſs ſurprize when it is conſidered that the hammer ſtrikes four hundred blows *per* minute, and falls with great weight, ſo that it ſoon completes the work, and it is very probable that the great percuſſion it exerts upon the ſteel in ſome meaſure preſerves the heat. It is well known that blackſmiths are in the conſtant habit of lighting a match to kindle their fire, by only hammering a ſmall piece of iron quickly, and turning it about under the hammer, and in a ſhort time it acquires ſufficient heat to inflame the ſulphur of the match. This heat moſt probably ariſes from the friction which the hammer cauſes amongſt the particles of the iron, by rubbing them violently againſt one another; and the ſmiths obſerve, that the iron will not become red-hot if it is always ſtruck upon the ſame ſide; but it muſt be turned round, that a new ſurface may be continually expoſed to the action of the hammer.

Shear ſteel is ſo called, becauſe the ſhears for dreſſing woollen cloth are made of it. It is alſo called Newcaſtle ſteel, becauſe formerly made there; and German ſteel, becauſe the natural ſteel in Germany is treated in the ſame way; it is likewiſe called *faggotted ſteel*. To make ſhear ſteel, the bars of bliſtered ſteel are broken into lengths of about eighteen inches; then four or more of theſe are laid together with one of double the length, and all four are tied together with pieces of ſmall ſteel: this is called a faggot, and is placed in the forge, to be heated to a good welding heat; it is then taken to the tilt, and notched down on both ſides, to weld all the bars together, and cloſe up the internal flaws. The workman holds the faggot by the end of the long bar as a handle: the operation of welding takes but a few ſeconds, and a ſmall rod is then drawn out from a piece of the end, in the ſame manner as drawing out common ſteel.

Caſt ſteel is prepared by melting fragments of bliſtered ſteel, and caſting them into an ingot. (See STEEL.) The ingot is then drawn out under the tilt into the required ſize, and the manner of doing this is the ſame as for common ſteel.

It is the cuſtom of the manufacturers of cutlery and ſteel goods to purchaſe ſteel from the converting furnaces in the ſtate of bliſtered bars, which they ſend to the tilt-mills to be drawn out to the ſize they require for their uſe: this is done at regular prices. In tilting ſteel, a trifling loſs is ſuſtained by the metal oxydating upon the ſurface, and throwing off black ſcales. The manufacturers are in the habit of allowing 4.6 to 8 lbs. *per* hundred weight for ſuch loſs: this latitude is given, becauſe in drawing the bars out into rods of a ſmall ſize, the waſte muſt neceſſarily be greater; the metal being much longer expoſed to oxydation, and the ſurface throwing off more ſcales.

TILUTHA, in *Ancient Geography*, an iſland of Aſia, in the Euphrates, about 33° 55′ lat.

TILWARAH, in *Geography*, a town of Hindooſtan, in Gurry Mundella; 5 miles S. of Gurrah.

TIM, a town of Ruſſia, in the government of Kurſk; 44 miles E. of Kurſk. N. lat. 51° 40′. E. long. 37° 34′.

TIMA, THIMA, *Taima*, *Alablao*, or *Al Ablak*, a town of Arabia, in the province of Nedsjed; 180 miles N.N.E. of Medina.

TIMACUM, in *Ancient Geography*, a town placed by Ptolemy in Upper Mœſia, at a diſtance from the Danube.

TIMÆA, a town of Aſia, in the interior of Bithynia. Ptol.

TIMÆUS, the *Locrian*, in *Biography*, was a philoſopher of the Italic ſchool, and flouriſhed in the time of Plato, who derived from him principally the doctrine of Pythagoras, and whoſe book, entitled "Timæus," was founded on his book "On the Nature of Things." Proclus preserved a small treatise of Timæus "On the Soul of the World," and it is prefixed to some editions of Plato's Timæus. In this treatise, chiefly Pythagorean, he differs from Pythagoras in the following particulars: *viz.* that, instead of one whole, or monad, he supposes two independent causes of nature, God and Mind, the source of intelligent nature, and Necessity or Matter, the original of bodies; and that he explains the cause of the formation of the world, from the *external* action of God upon matter, after the pattern or ideas existing in his own mind. Upon a comparison of this piece with Plato's Timæus, it will be found that the Athenian philosopher has obscured the simple doctrine of the Locrian with fancies drawn from his own imagination, or from the Egyptian schools.

In the time of Ptolemy Philadelphus there was a Sicilian, named Timæus, who was a celebrated historian; but none of his writings are extant. He died at the age of 96, B.C. 262. Brucker by Enfield, vol. i.

TIMAGENUS, in *Ancient Geography*, an island in the Arabic gulf. Ptol.

TIMANA, in *Geography*, a town of South America, in the province of Popayan; 80 miles E. of Popayan. N. lat. 2° 12'. E. long. 74° 46'.

TIMANTHES, in *Biography*, a famous Grecian painter, was, as it is said, a native of Cythnos, one of the islands called Cyclades, or of Sicyon, and flourished about the year B.C. 400. The mind of this artist is supposed to have surpassed his art, in the exercise of which he displayed great skill, so that in his performances, something was to be understood, which he did not express. As an instance of this, we are referred to his picture of Iphigenia about to be sacrificed, in which, having exhausted every variety of the expression of grief in the other spectators, he has thrown a veil over the face of her father, thus intimating that his anguish surpassed all external tokens. In his Sleeping Cyclops, exhibited in a small tablet, he has introduced Satyrs measuring his thumb with a thyrsus, in order to give an idea of the magnitude of the principal figure. At Samos he was a competitor with the famous Parrhasius in a piece, of which the subject was the judgment for the arms of Achilles, between Ajax and Ulysses; on this occasion the prize was awarded to Timanthes. In the temple of Peace at Rome a hero of admirable workmanship by the same artist was preserved. Pliny Nat. Hist.

TIMAR, a tract or portion of land, which the grand signior grants to a person on condition of serving him in war, on horseback.

Some define the timar a portion of land assigned to a spahi, or other person fit to serve on horseback, to enjoy, during life, for his subsistence.

Meninski describes it as a stipend or revenue, granted to old soldiers who have deserved well, in lands, and possessions of castles, towns, villages, fields, or in tithes, and other fruits and incomes; sometimes with the prefecture, jurisdiction, or signory of the said places.

The timar is a kind of fief granted for life. The whole Ottoman empire is divided into sangiackies, or banneries, under which all such as hold timars, who are called *timariots*, are bound to list themselves when summoned upon any expedition. Timars may be resigned as benefices among us, only obtaining the consent of the beglerbey, or governor of the province. Indeed, for timars of above 2000 aspers *per annum*, called *zaim*, the grand vizier alone grants dispensations.

TIMARIOTS, those who enjoy lands on the footing and tenure of timars. See TIMAR.

The timariots are obliged to serve in war, personally, with as many men and horses for service as their timar, by the estimate made of it, contains 2500 aspers, or about 6*l.* sterling; and to maintain them constantly mounted and armed after their manner, to be ready to march at all hours when commanded, and that on pain of death; nothing, not even sickness itself, being allowed to excuse them.

Besides this service, they likewise pay an acknowledgment of one-tenth of their revenue. If they have any children of age to bear arms, and fit for the service after their decease, or, in defect of this, if they have any relations that have the least interest, the timar is used to be continued to them on the same conditions, otherwise it is transferred to others.

If the revenue thus held of the grand signior exceed 15,000 aspers, or 36*l.* sterling, they who hold it are not called *timariots*, but *subassi*, or *zaims*: these always have the administration of justice in the place, under the sangiac of the province.

The timariots have different appointments, from 4000 or 5000 aspers, equal to about 12*l.* sterling, to 20,000 aspers: but unless their timar exceed 8000 aspers, they are never obliged to march, except when the grand signior goes to the army in person, on which occasion none are exempted.

The origin of the timariots is referred to the first sultans, who, being masters of the fiefs or lands of the empire, erected them into baronies or commanderies, to reward the services of their bravest soldiers; and especially to raise and keep on foot a number of troops without disbursing any money.

But it was Solyman II. that first established the order and discipline among these barons, or knights of the empire; and by his order it was, that the number of horsemen each should maintain was regulated.

This body has heretofore been not only exceedingly powerful, but great and illustrious throughout all the empire; but avarice, the ordinary fault of the Orientals, has occasioned their declension of late years.

The viceroys and governors of provinces manage their matters so at court, that timars, even out of their jurisdiction, are given to their domestics, or to such as will give them the most money for them.

There are two kinds of timariots, the one appointed by the Porte, the other by the viceroy of the country; but the revenues of both are less than those of the zaims, and their equipage and tents less in proportion.

Those who have their patents from the court, have from 5000 or 6000 aspers to 19,999 aspers *per annum;* if they have one asper more, they become zaims. Those who receive their patents from the viceroys, have from 3000 to 6000 aspers *per annum.*

This cavalry is better disciplined than that properly called the *spahis*, though the spahis be the neatest and briskest. These last only fight in platoons; whereas the zaims and timariots are divided into regiments, and commanded by colonels, under the direction of bashaws. The bashaw of Aleppo, when in the army, is colonel-general of this militia.

TIMARISTAN, in *Geography*, a town of Persia, in the province of Farsistan; 15 miles E. of Pasa.

TIMAVO, a river of Carniola, which runs into the gulf of Trieste, near Duino.

TIMAVUS, in *Ancient Geography*, a fountain, lake, river, and port of Venetia.

TIMBANG, in *Commerce*, a measure at Batavia for rice, pepper,

pepper, and other dry goods. It is reckoned at ten facks, or five pikuls: another meafure is called kulack, and weighs 7¼ cattis: 7 kulacks make one timbang, liquid meafure.

TIMBER, in *Geography*, a river of Pruffian Lithuania, which runs into the Nemouin; 4 miles N.E. of Wipe.—Alfo, a town of Pruffian Lithuania, 6 miles W. of Infterburg.

TIMBER, or *Timber-Trees*, in *Rural Economy*, that fort of wood produce which is ufeful and proper for the purpofes of building, the conftruction of tools, implements, carriages, &c.; or fuch large trees of different forts as have reached their full or fuitable ftates of growth, and are in fituations fit for being cut down for ufe. The various kinds of trees which are the moft ufeful and important in this intention, have been noticed and confidered in fpeaking of the nature of common and other plantations and planting; but they are chiefly the different forts of pines, the larch, the birch, the common afh, the mountain-afh, the beech, the fycamore, the elm, the oak, the horfe and common chefnuts, the alder, and the poplar. However, in general, the oak, the afh, the elm, the larch, and the Scotch pine, are by much the moft ufeful and valuable for all the different ufes of this nature.

We fhall here mention from Evelyn's Sylva, &c. fome of thofe kinds of timber that are moft ferviceable, and give a brief view of the ufes to which they are applied, referring to their feveral denominations and other collateral articles for a further detail.

1. *Oak*, the ufes of which need no enumeration; to endure all feafons and weathers, there is no wood like it: hence its ufe in pales, fhingles, pofts, rails, boards, &c. For water-works, it is fecond to none; and where it lies expofed both to air and water, there is none equal to it.

2. *Elm:* this, felled between November and February, is all fpine or heart, and no fap; and is of fingular ufe in places where it either is always wet, or always dry: its toughnefs likewife makes it of ufe to wheelwrights, millwrights, &c.; nor muft it be omitted, that its not being liable to break and fly in chips, makes it fit for dreffers and planks to chop on.

3. *Beech:* its chief ufe is in turnery, joinery, upholftery, and the like, as being of a clean, white, fine grain, not apt to bend nor flit: it has been fometimes, efpecially of late, ufed for building-timber, and if it lie conftantly wet, is judged to outlaft oak.

4. *Afh:* its ufe is almoft univerfal; it is good for building, or other occafions where it may lie dry: it ferves the carpenter, cooper, turner, ploughwright, wheelwright, gardener; as alfo it is ufed at fea for oars, handfpikes, &c.

5. *Fir*, commonly known by the name of *deal*, is of late much ufed in building, efpecially within doors, for ftairs, floors, wainfcot, and moft works of ornament.

6. *Walnut-tree:* this is of univerfal ufe, excepting for the outfides of buildings; none is better for the joiner's ufe, it being of a more curious brown colour than beech, and lefs fubject to worms.

7. *Chefnut-tree*, next to oak, is the timber moft fought for by joiners and carpenters. It is very lafting.

8. *Service-tree*, ufed in joinery, as being of a delicate grain, and fit for curiofities: it alfo yields beams of confiderable fize, proper for building.

9. *Poplar, abel:* this and *afpen*, differing very little from one another, are much ufed of late inftead of fir: they look as well, and are tougher and harder.

10. *Alder*, much ufed for fewers or pipes to convey water: when kept always wet, it grows hard like a ftone; but where fometimes wet, and fometimes dry, it rots prefently.

The ufes of timber are fo many, and fo great, that the procuring of a fufficient fupply of it extremely well deferves the care of every ftate; as it muft be a great difadvantage to it to be obliged to have recourfe to its neighbours, and purchafe, at a very confiderable and continually renewed expence, what might, by an eafy economy, be fufficiently fupplied at home.

This economy, however, muft be applied in time; for our natural indolence, our love to reap the advantages of every thing ourfelves, and our little care for pofterity, give great room to fear fucceeding ages will want wood, both for private and public exigencies. All our arts fhould be employed on this fubject, with two views, the one to preferve and cherifh our growing wood, the other to renew the trees which have been, and are continually cut down.

The quantity of acorns which the oak bears, has made many people fuppofe, that Nature has taken care for a renewal for us; and that of this vaft quantity of feed, which annually fall, there will be always an over-fufficient fupply of young trees, which will grow up in the place of the old ones: but experience proves, that this is by no means the cafe. The greater number of thefe fallen acorns is devoured by many different animals, for whofe nourifhment Nature has provided that abundance of them: and of thofe which efcape this fate, we are to confider how few can come to good, from the natural accidents they are unavoidably expofed to; they fall on a covered ground, where dead leaves, and decayed parts of branches of trees, ufually prevent their touching the earth, into which they are to fhoot; or, if they can fhoot here, it is merely from the furface, where they are, in their flow growth, liable, while very tender, to all the inclemencies of frofts; and add to this, that it is very difficult for fuch tender plants as the young feedlings of thefe to find room for growth or nourifhment among the every-way fpreading roots of other trees; and the continual fhade and want of free air, muft render them very weakly and irregular in their growth, even fuppofing them to get over all the other difficulties.

It is very certain, that timber-trees of oak are frequently met with among the underwood of forefts; but we fhall always find this to be the cafe, not in the clofe places, but in certain fpots, where there has been a vacancy or opening; and that ufually, where there are not, nor have at any time been, oaks in the neighbourhood of the fpot. The acorns that fall from the oaks ufually come to nothing from the before-mentioned accidents; and thefe trees which grow at diftances, are owing to the acorns brought thither by birds, and accidentally dropped there. This is an inftance familiarly verified, by obferving, that there are frequently little bufhes near woods, which, though of white-thorn or other trees, are ufually furrounded and ornamented with young oaks; the jays and the like granivorous birds are the authors of this crop; for bringing the acorns from the adjoining woods, to eat under thefe bufhes, they drop many by the way, which they do not trouble themfelves to look for on the ground, and which having here a freer ground to ftrike root into, and an open air to grow in, feldom fail of coming to good, unlefs deftroyed when young.

In order to the prefervation of our growing timber-trees, it would be a very ufeful law, that all who cut down any number of oaks, fhould alfo leave a number in good condition for after-cutting; and that no timber fhould be cut down, but at a proper age, in regard to the nature of the foil;

ſoil; ſince it is certain, that trees grow to their perfection at very different periods of time, in proportion to the depth of ſoil they have to grow in; and that as it is, on the one hand, not for the intereſt of the ſtate to ſuffer trees to be cut till at their perfection for ſize and ſoundneſs, ſo after they are arrived at their perfection, it is equally certain that they gradually decay.

The quality of the ſoil the tree ſtands in may be neceſſary to be obſerved to this purpoſe; but the quantity or depth of it is the great ſubject of enquiry; and a great number of obſervations has proved, that the proper ſeaſon for cutting oaks, in a ſoil of two feet and a half deep, is at fifty years old; thoſe which ſtand in a ſoil of three feet and a half deep, ſhould not be cut down before ſeventy years; and thoſe which ſtand in a ſoil of four feet and a half deep, or more than that, will increaſe in goodneſs and in ſize till they are a hundred years old; and obſervation has proved, that after theſe ſeveral periods, the trees begin to decay.

This ſeems the beſt rule to eſtabliſh, in regard to the common ſoils; but thoſe which grow in a lighter or more ſandy ſoil, may have their periods changed from theſe to forty, to ſixty, and to eighty years at the greateſt depth; and after theſe times it is always beſt to fell the wood meant for public ſervice, whether then wanted or not, ſince it is much better to keep it in public magazines, than to leave it to be daily decaying.

Heaths, and other uncultivated places, where there is no regular growth of wood, but where fern and uſeleſs plants alone ſeem to flouriſh, uſually afford alſo ſome ſtraggling trees of the oak. Theſe probably have had their origin from acorns dropped by birds; but they ſeldom grow tall or regular; ſince, not having been defended from the injuries of cattle, they are uſually browſed on, and ſtunted while young, and ſo become crooked and ſhort-trunked, or pollard-trees. Theſe, though not of ſuch value as the more regular oaks, yet deſerve care, both with reſpect to their preſervation and felling; ſince they afford a number of trees naturally bent, and formed for many parts of ſhip-building.

The little care uſually taken of theſe trees, though on this occaſion of great value, ſeems to threaten a general loſs of them; but as trees, thus naturally crooked and bent, are of value, it is a laudable attempt to try at the finding of a regular method of producing ſuch; and this is eaſily practicable, by following the ſame methods by which theſe wild ones become ſo. They wholly owe their figure to the cattle's biting off their tops while young, and afterwards biting off again the tops of the ſhoots from the firſt wound. In this manner, if a number of young trees, ſet apart for the experiment, have their tops cut off at two, four, ſix, eight, ten, and twelve feet from the ground, and four years afterwards the ſhoots from theſe ſtunted tops are again cut in the ſame manner, the trees will be found afterwards to grow up in all the irregularly crooked figures that can be conceived, and by this means a ſupply of naturally crooked wood may be raiſed for all the occaſions of ſhip-building, with infinitely greater eaſe, and more certainty, than by the method propoſed by ſome, of bending them down with weights tied to their tops while young. See *Growth of Crooked* TIMBER.

As to the ſupply of young wood in the place of what is cut down, there are ſome circumſtances which have not had the attention paid to them which they deſerve. The ſpring froſts, which come on at a time when the ſhoots, by which nature is to raiſe the ſupply for what is cut down, are juſt preparing to grow, are of prodigious injury, and do not leſs miſchief to theſe than to the young ſhoots of garden plants, though the diſtant hope of the ſucceſſion of the proprietor, and uſually alſo the diſtance of the place, and want of repeated obſervations, occaſion its not being perceived. This, however, may in a great meaſure be guarded againſt. Frequent experiments and repeated obſervations prove, that the miſchief done by theſe froſts affect in a much greater degree thoſe ſhoots which are expoſed to the ſouth, than thoſe which face the north: and that it is greatly more powerful againſt ſuch as are wholly expoſed to the wind, than againſt ſuch as are ſheltered. Theſe known circumſtances may give the hint to a method of ſaving, at leaſt, a great part of the wood to be felled from this deſtruction, to its renewal, by the making it a rule to begin cutting down on the north ſide; and, as the whole felling is a work of ſome years, the ſtanding wood of every ſeaſon will defend the young ſhoots of the newly-cut ſtumps the following ſpring, not only from the ſouth expoſure, but will ſhelter them alſo from the wind.

Many prudent managers have made fine eſtates of their coppice-woods, by regularly felling a certain portion every year, and providing for a renewal of the firſt cutting, againſt the felling of the laſt portion, by proportioning the time of growth to the quantity to be cut every year; and there is great intereſt to be made of a true knowledge of the growth of wood in this manner. Whoever obſerves the growth of young trees, will find that the ſecond year's growth is much more conſiderable than that of the firſt; the third year is more than that of the ſecond, and ſo on for many years; the yearly growths of young wood greatly increaſing every ſeaſon up to a certain time or age of the tree, after which the increaſe in bulk, by growth, becomes gradually leſs. The great advantage to be made of coppice-wood, would be by knowing this intereſting period, and ſeizing on it, always to cut down the trees juſt at that time when they arrived at the end of their quick growth, and ſo ſetting nature to work with new ſhoots, to employ the ſame on enriching again the owner. Regular obſervation and experiment alone can aſcertain this happy period; but any man who has much coppice-wood upon his eſtate, may aſſure himſelf of it, by cutting a given quantity every year, for ten years ſucceſſively, and then carefully reviewing the differences of the yearly produce. Memoirs Acad. Scienc. Ann. 1739.

On the buſineſs of raiſing and growing good timber, or trees of that ſort, Mr. Loudon has thrown out ſome intereſting, ingenious, and philoſophical hints and ſuggeſtions, as well as ſtated ſome ſtrong facts in confirmation of them, in his work on forming and improving country reſidences. It is conſidered as remarkable, that the matter has never particularly engaged the attention of thoſe who have been employed in deſcribing the methods of rearing trees. The effects of culture on other vegetables is ſo great, it is ſaid, as always to change their appearance, and not unfrequently to alter, in a conſiderable degree, their nature. The common culinary vegetables, and cultivated graſſes, aſſume ſo different an appearance in our fields and gardens from what they do in a ſtate of wild nature, that even a perſon accuſtomed to the nature of plants might eaſily be deceived in regard to the ſpecies or kind. The ſame general laws operate upon the whole kingdom of vegetables; and thence it is thought plain, that the effects of culture upon trees, though different in degree, muſt be analogous in their nature. It is true, it is ſaid, that as yet we are poſſeſſed of no great number of either experiments or obſervations, to enable us to determine with minute accuracy the preciſe extent of of thefe effects; but ftill a perfon practically converfant with the fubject, who fhall pay attention to what he may notice to be taking place in different parts of the country, and who poffeffes a fufficient knowledge of the vegetable kingdom and phyfiology to reafon from analogy, may, it is thought, deduce fuch general confequences, as will fuggeft important practical rules and regulations.

It may be proper, it is faid, to remark, that by culture is not meant merely the operations upon the foil, or on even the form of the particular tree; but every thing that tends to remove it from its natural ftate in order to accelerate vegetation. It is confidered too, that a tree is in a natural *ftate* whenever it has fprung up fortuitoufly, and propagates itfelf without aid from man: whether it be in crowded forefts, woody waftes, or in fcattered groups on hills or commons. Some trees and other vegetables may be faid to be naturalized to fituations which, but for art, they probably never would have grown upon. Thus, for inftance, mountain plants are fometimes found common in plains, and even meadows; and alpine trees which diffeminate themfelves in level and warmer parts of the country: but then the perfon who is converfant with fuch matters, by comparing the effects of thefe different fituations on the vegetable, always knows to felect as general nature that which perfects all the parts, and where the foil and fituation are beft fuited for the reproduction of the fpecies or fort, and the prolongation of individual life. Thefe rules are, it is faid, founded in nature. For example; no perfon, judging from them, could miftake a warm Englifh common as the natural foil and fituation of Scotch firs, though they not unfrequently diffeminate themfelves there. It is, indeed, well known to every one in the leaft converfant with the vegetable economy, that in all herbaceous vegetables, and even fhrubs of confiderable fize, the effect of removal to an improved foil, climate, and fituation, is to expand the parts of the whole vegetable: that the effect of removing or cutting off part of the vegetable above ground is to expand thofe parts which remain: that the effect of removing any of the parts under ground, or of removing the whole vegetable into a colder climate and lefs congenial foil and fituation, is to contract or confolidate the whole. This, were it neceffary, could, it is faid, be illuftrated in a thoufand inftances from the commoneft vegetables: but for the prefent purpofe, it is only neceffary to notice further, that this takes place more or lefs in a degree correfponding with the rapidity of the growth of the vegetable, and its duration. Thus, all the annual graffes are much farther removed from a ftate of nature by culture than the perennial ones. So are the annual garden vegetables, as cabbages, legumes, and fpinach, in oppofition to ftrawberries, afparagus, and many others. Quick growing trees or fhrubs, as willows, rafpberries, and fome others, are alfo much eafier removed from their natural ftate, than fuch as oaks, thorns, hollies, and heaths, which grow much flower. If thefe remarks and conclufions be juft and well-founded, which, it is fuppofed, none will deny, it muft follow that the fame general effects take place more or lefs on all trees; that when they are removed into a colder climate, or have part of their roots cut off, it will in fome degree contract the fibre of the wood, and render it a of more folid and hard texture; and that when they are removed into a warmer climate, have moft of their branches taken off, or are placed in a better *ftate*, it muft, by accelerating their growth, it is thought, tend to expand the fibre of the wood, and of courfe render the wood fofter and more liable to fuffer by the action of the common elements, when the tree is cut down and applied to ufe. That this does really take place, will, it is faid, be gathered from the detached facts ftated below, which have come to the writer's knowledge, and to which every practical unprejudiced perfon, who has vifited different parts of the kingdom, will, it is thought, be able to add many others from his particular obfervation, attention, and examination.

Firft, that every hedger and forefter knows, that furze and thorns, which have been cultivated in fields or hedges, are of a much fofter or wider grain, and are much eafier cut over with the hedge-bill, than fuch as fpring up from feed in a wild fcenery, and never undergo any fort of pruning or cutting in, nor any kind of culture in any way. They know too, that in a common to be cleared of furze or thorns, or in a hedge to be cut over, there are fome parts which require a much flighter ftroke of the hedge-bill than others; and that thofe parts eafieft to cut, are uniformly thofe where the plants have grown the quickeft:—gardeners experience the fame thing in pruning or cutting over fruit-trees or fhrubs. Thus the difference between the texture of the cultivated and the wild rafpberry is, it is faid, ftriking, though the ftem of the one is nearly double the thicknefs of that of the other. In all the other of thefe cafes, the ftems of both are fuppofed alike in diameter and cleannefs, or abfence of knots; though the fame thing would, it is thought, take place in a confiderable degree, even if the ftem of the cultivated or quick growing one were thicker than that of the other in the wild ftate. Suppofing that there were no other proofs, this, it is contended, clearly fhews that cultivation, or whatever tends to increafe the growth of a tree, tends likewife to expand the vegetable fibre. But there are other concurring proofs, it is faid, which demonftrate this, and at the fame time fhew, what few, it is fuppofed, will doubt, that when the vegetable fibre is expanded, or when the annual ringlets or circles of wood, produced by a tree, are foft and larger than the general annual increafe of fuch tree, the timber muft be lefs hard, and more permeable by air, water, heat, and other matters, and, of courfe, inferior for all the purpofes of timber.

Secondly, that it is well known that the common oak in Italy, where it grows fafter than in this country, is comparatively of fhort duration. And that the oak which grows on the mountains of the Highlands of Scotland is much harder and clofer than any produced in England, though on thefe mountains it feldom attains one-tenth part of the fize of Englifh trees. Every country carpenter in Scotland knows, it is faid, the extreme difference between the duration of Highland and Englifh oak for fpokes of wheels. Many hedge-carpenters in both parts of the country know the relative duration of tranfplanted or *plantation* oaks, that is, the young oaks which are thinned out from thriving plantations of this fort, and thofe from natural forefts, when employed as pofts for railing. From different obfervations which the writer has made in Monmouthfhire and Herefordfhire, the duration of the oak in thefe counties, it is thought, is much inferior to what it is in Cumberland and Yorkfhire: it is thought no exaggeration, when it is faid that the difference is as eight to ten. Some timber dealers are known by the writer, who, in purchafing it, pay attention to the difference of foil and fituation even in the fame woods. When they can find oak in expofed fituations and on deep clay foil, and afh on rocky fteeps, they always give them the preference in their purchafes as timber.

Thirdly; that a known fact is ftated by the writer which is faid to be of fuch importance, that it is trufted, if it does not fatisfy every unprejudiced perfon in refpect to the truth of the general principles which are wifhed to be here laid down and explained, it will at leaft arreft the attention of all thofe who are interefted in the quality as well as mere bulk

of

of timber: and this, it is thought, may lead to more extenſive obſervations, and perhaps more favourable concluſions relative to it.

The plantations of the timber kind which were made at Kinnaird caſtle in the years 1770—1790, are, it is ſaid, well known in the north of Scotland. They were chiefly of deciduous trees, among which were generally introduced larches for ſhelter. Theſe larches, in ſome places, grow with aſtoniſhing rapidity. On many ſlopes, where the ſurface-ſoil was good though not deep, and the ſub-ſoil a ſandy gravel, they advanced upwards of five feet a year for the firſt ſix or eight years after being put in. As they overtopped and crowded the deciduous trees, they were gradually felled; and as much had been ſaid about the durability of larch-wood, the firſt trees that were cut down were ſawn up, and applied to a purpoſe which was perhaps, it is thought, one of the beſt teſts of their durable properties. This purpoſe was the foot-paths of peach-houſes and vineries, where they were expoſed to alternate drought and moiſture, heat and cold, and where common deal and other kinds of wood had repeatedly failed. The larch deal of theſe trees was, it is ſtated, applied in the ſame way as the others, and in leſs than two years was completely rotten and deſtroyed!

It may, it is conceived, be alleged by ſome, that this could only hold true in regard to the *ſap*, or laſt formed wood: but the *heart*, or red central wood which was preſent, though it laſted longer, did not, it is affirmed, endure three years! The vaſt number of theſe trees annually taken down, were afterwards, it is ſaid, chiefly made uſe of as fuel; and though this wood had been aſſerted not to flame, or be conſumed without the aſſiſtance of other wood, it did not, in this caſe, flame violently, but it burned by itſelf without care or attention, and unaſſiſted from other timber-wood, producing numerous fires for labourer's uſes. In rendering it fit for this purpoſe too, the workmen found it extremely brittle, a tree a foot in diameter being often broken with the greateſt eaſe, by means of two or three blows given with the back of the hatchet. The tops and ſide-branches of them were likewiſe remarkably light and brittle, as are known to many perſons in that part of the country as well as this. See Timber, *Crooked Growth of.*

Theſe facts are ſaid to deſerve a very ſerious attention, and to lead to very important concluſions, in reſpect to the cultivation and growth of this tree as timber in this country. They are not ſolitary ones; for though, as yet, ſufficient time has not elapſed for a fair trial of this wood in different ſoils and ſituations, yet ſome have found it much leſs durable than others; and that an attentive, nice obſerver will, it is thought, perceive larch-trees in ſome rich warm ſituations in a decaying ſtate, and others growing ſo rapidly, or ſo much ſide-lopped or pruned, as to ſuggeſt doubts, whether their duration will be much longer than thoſe of the above caſtle.

And, fourthly, that in Scotland, the difference of durability between common fir-wood which has been of ſlow growth, and that which has been *forced*, as it is termed, either by ſhelter, advantageous ſoil, ſituation, or climate, or by lopping off the ſide-branches, is known to every carpenter in the more northern parts of it, eſpecially in the diſtricts of Perth, Stirling, and Argyle. There, it is ſaid, they diſtinguiſh the wood cut as timber in the native foreſts, from that obtained in plantations, by calling the former highland-fir, and the latter park-fir. The highland-fir is moſt eſteemed, on account of its greater durability, being frequently found undecayed in ancient buildings when other ſorts are entirely waſted. Theſe circumſtances are ſtrongly ſupported, it is thought, by Mr. Lambert, who, in ſpeaking of the genus *Pinus*, has ſaid, that "this ſtriking difference between the highland and park fir, is probably to be attributed to the mountainous and rocky ſituations in which the native timber is found, and where, the trees being of ſlower growth, the wood is conſequently of a harder texture." The ſame writer is of opinion too, it is ſaid, that few ſpecies of pines will endure more than forty years in the ſoils in which they are commonly ſet out or planted in England. Indeed, there are many proofs of this, it is thought, from Croom, Kew, and other places; though there are ſome excellent fir-trees at Langhangles, where the ſoil is deep and cold, that are much older than that period. The greater durability of the former ſort of fir-timber may be daily ſeen, it is ſaid, in the ſtill more northern diſtricts of Aberdeen, Bamff, and ſome others, during the removal of old farm-houſes and cottages; as wherever a piece of the highland-fir appears, it is always of a much deeper yellow than the park or low country fir. At Gogar, it is ſaid, ſome large fir-trees were taken down in 1795; they grew upon a deep cold loam; the wood was ſawn up, and was found of excellent quality as timber. About a mile from this, at Lenny Park, a dry bank is covered with fir-trees of greater age than thoſe of the former ſituation; ſome of them have been taken down at different periods before and ſince that time, and have uniformly been found of inferior quality as timber-wood. In 1804, too, a number of fir-trees were taken down from the rocky banks of the Almond, between Craigie Hall and Cramond Houſe; and they were found of excellent quality in their wood. While at Bevelaw, there are extenſive plantations of fir-trees, which have been often thinned; but the trees have grown ſo faſt, and been ſo much cut or pruned in the branches, that they never laſt long, it is ſaid, as paling. All theſe caſes have either come under the writer's own particular notice, or that of a relation of his, who is highly intereſted in the value of park-fir, and, of courſe, has paid a more than common attention to the matter. A great number of other inſtances might, it is ſaid, be here added, but it is unneceſſary: and the compariſon of the wood of the common crab, the father of the orchard, with that of the cultivated apple, is in ſupport of the ſame. Any perſon who will take the trouble to examine the fir-woods at Gordon Caſtle, and contraſt them with others in the county of Perth, and thoſe in England, will, it is thought, unqueſtionably come to theſe concluſions: that *ſlow growth* is eſſentially neceſſary to the *durability* of fir-timber; and that wherever the *accumulation* of wood has been *accelerated* by culture of the ſoil, improvement of the climate, or by cutting and pruning, it is *injured* in quality in proportion to the ratio in which theſe agents have been employed. It is not ſaid, that no branches ſhould ever be cut from fir-trees, but that it is certain that judgment muſt direct to cut off, *in general* only, ſuch as indicate that they are no longer of much uſe, which is eaſily diſcovered by marks of approaching decay.

Much of the above principles, reaſonings, and concluſions, is probably, in ſome meaſure, equally applicable to other ſorts of timber.

In the raiſing and growth of timber of the fir or Scots pine kind, it is found not well ſuited to very elevated ſituations, as the ſharpneſs and keenneſs of ſuch expoſures bring it too quickly into a ſtate of decay and death. The writer of an agricultural ſurvey of one of the more northern diſtricts of Scotland has remarked, that there is a kind of laminated clay, much diſpoſed to diſſolve with water, which is not favourable to the growth of this, or any of the pine tribe. It ſucceeds very well, it is ſaid, however, in moſt

moſt parts of the clay ground of that tract, if care be taken to prevent ſtagnant water. It does exceedingly well too on land covering the freeſtone rock; but that the beſt timber of this ſort is produced on hard dry gravelly ſoils. But that the Siberian pine, and ſome others of a ſimilar nature, have been introduced with very little ſucceſs. The ſhort intervals of mild weather which happen in the beginning of the ſpring, excite them to vegetate too early, and the next cold blaſt deſtroys the young buds. The New England pine thrives in a tolerable ſoil, until from twelve to twenty years of age, in proportion to the nature of the expoſure, after which it generally begins to decay. And that the ſpruce is likewiſe unfit to weather the ſtorm on the greateſt heights. It ſucceeds on the hard dry rock where the Scots pine dies, but frequently decays at the end of eighteen or twenty years, on ſtiff wet clay. Its moſt favourite ſoil for timber is that which is dry and gravelly. The ſilver fir thrives in clay ſoils, where the ſpruce fails; nor is it averſe either to the hard rock or gravelly ſoil, which probably affords the beſt timber; but it makes little or no progreſs on any ſoil that is very poor. It unfortunately too frequently ſuffers ſeverely from the froſty mildews of the ſpring, eſpecially in its youth, or more early ſtate of growth. However, the *larix* or larch is now found to be the moſt hardy alpine plant. In moiſt places, it makes greater progreſs than almoſt any other timber-tree, and there is ſcarcely any ſoil, that is not drowned with water, on which it will not ſucceed. It ſuffers moſt in too luxurious ſituations, where its ſoft ſhoots, unable to keep erect, bend away from the ſlighteſt gale, and its timber produce is probably the worſt. It is liable while young, in ſome ſituations, to be much injured or wholly deſtroyed by early ſpring froſts taking place after mild weather has brought on its vegetation, and is occaſionally ſeized with diſeaſe, and dies when placed on miry clay.

It is ſuggeſted that the birch is next to the larch in the progreſs of its growth, and equal to it in ability to ſtand the blaſt in alpine ſituations; and that it is ſuperior to it in the plain. But in whatever ſituation it is placed, it delights moſt in a light ſoil and dry bottom, probably producing in ſuch the beſt timber-wood. It, however, thrives in moiſt ſoils, with very moderate draining.

The aſh alſo, when it enjoys a ſufficient depth of good ſoil, is capable of braving the ſtorm, and puſhing up its head in the moſt expoſed ſituations; however, in a thin ſoil, covering a ſtiff argillaceous bottom, it can make no progreſs. It notwithſtanding thrives well in ſome marſhy ſoils, where the banks are ſteep, ſo that the water gets away without ſtagnating. On dry rocky ſteeps, the timber is probably the beſt. It forms perhaps the moſt important wood in the country as timber, being uſeful in all its ages and ſtates, and fit for moſt purpoſes.

The mountain-aſh is likewiſe a hardy native, which grows freely in almoſt all ſoils and expoſures; but its favourite ſituation ſeems to be in hanging banks, among woods and coppices, where the timber-wood is perhaps the beſt. This and the gean-tree, or wild cherry, raiſe and propagate themſelves much when left at liberty, by putting up or out ſuckers from their roots.

The beech is ſaid to come near to the aſh in capability of braving the ſtorm, and has much the advantage of it in thriving in poor or ſtiff ſoils; but there are ſome barren argillaceous bottoms too much even for the beech; and it is moſt ſucceſsful, and affords the beſt timber, in friable ſoils. Its ſhoots, while young, are ſoon affected by froſt, but the tree ſpeedily recovers.

The ſycamore and elm require a light ſoil, and a dry, open under-ſtratum: and when this is the caſe, the timber is the beſt, and the trees thrive in a ſituation pretty much expoſed. They form good timber too on ſome ſoils of a heavier nature.

In regard to the oak, it is leſs patient of the blaſt than moſt of the timber-trees of the foreſt. Being late in putting forth its leaves, it continues to grow till the ſeaſon is far advanced; and the immature wood of its late ſhoots, unable to reſiſt the piercing effects of the cold wind in expoſed ſituations, withers before the next ſpring; ſo that, like Penelope's web, the progreſs of one ſeaſon is undone in the following. The moſt favourable ſituations for the oak, as timber or otherwiſe, are therefore hollows or hanging ſlopes, where the ſharp cutting winds are broken by the neighbouring heights. In ſuch ſituations, if ſtagnant moiſture be avoided, it will thrive in the ſtiffeſt ſoils, and with its ſtrong roots penetrate the deepeſt bottoms, affording good timber. Though the growth of this tree be ſlow in infancy, when it is placed in a favourable ſituation, it will make a progreſs in the courſe of fifty years, little inferior to many other kinds, and at length arrive at a great ſize of timber. See theſe timber-trees.

It has been found that the horſe cheſnut-tree thrives well on the lower grounds, and deep ſoils only. The ſweet cheſnut, which quickly becomes a timber-tree in diſtricts more northern than this, does not ſucceed here. Its ſeaſons of growth are too early, or too late, for the climate. In its firſt, it bears ſome reſemblance to the Siberian pine, &c.; in its laſt, to the oak; its early growths being almoſt as early as the former, and its later being nearly as late as thoſe of the latter, and ſtill more ſoft and ſuſceptible of the cold. Hence its ſhoots are alternately put forth and deſtroyed, and it generally becomes a low, ſtunted, ſhrubby tree. But this, it is ſaid, does not ſeem to have always been the caſe. The fate of the common walnut, which may be conſidered almoſt as much a timber as a fruit-tree, is nearly the ſame with that of the ſweet cheſnut. It probably affords the beſt timber on dry friable ſoils of ſome depth.

The poplar and moſt of that tribe delight moſt in waterformed ſoils, but are commonly averſe to marſh, and, when happily ſituated, make quicker progreſs than almoſt any other ſorts of trees, producing much light uſeful timber. See CHESNUT, WALNUT, and POPLAR.

Management of Timber.—The rules and regulations for the management of fir and other timber-trees, which are given below, deſerve attention. Mr. Salmon, of Woburn, in Bedfordſhire, who is in favour of much lopping or cutting of the ſide-branches of fir-timber, remarks, in a late volume of the Tranſactions of the Society of Arts, &c. that conſidering the purpoſes that this ſort of timber is commonly applied to, it muſt occur that clearneſs of knots, ſtraightneſs, length, and equality of ſize of the trunk, conſtitute its perfection, and that, if deficient in all theſe, it is of no value but for the fire. Next to theſe conſiderations, and the proſpect of an improved knowledge of raiſing and cultivating this kind of timber-wood, it may, it is ſaid, be a fair queſtion, if our own country be not capable of producing this timber little or not at all inferior to foreign fir? In this country at preſent, fir appears, it is thought, not for any length of time to have been conſidered much otherwiſe than as ornamental. For this purpoſe they ſerve only for a certain time, which, when paſt, it has been their fate to be cut down long before having attained maturity. But from the great extent of ground now covered with this ſort of timber-tree, it is to be hoped, it is ſaid, that another century may obtain to Engliſh fir ſome of the character of the oak of the ſame country: towards ſuch an end, if attainable, every means should, it is said, be used, and towards which nothing appears more likely to succeed, than a well-grounded general practical mode of management, from the time of the trees being put out, to their greatest imaginable age of improvement. That a knowledge of such may by perseverance be gained, is not, it is said, much to be doubted, as from different specimens there appears great reason to conclude, that early and proper side-lopping the branches, and thinning out the young trees, will form a considerable feature in the plan and system to be adopted and pursued.

The subsequent plan and rules for the general management in these cases, are given as the partial result of practical experience, but of only a few years' observations.

In the raising of this sort of timber, from every authority and observation, there can be no doubt, it is thought, that all firs should be set out or planted thick or near together, as not more than four or five feet apart. That where firs of the same kind are put out together, there is less loss of plants, too, from one sort not overgrowing and destroying the others; consequently, that it appears adviseable that all the different sorts should be set out separately by themselves. If any admixture at all be admitted, the Scotch fir and larch may, perhaps, best succeed together; but this is not certain, and they will unquestionably be best separate on two accounts; first, because they are not so likely to injure each other; and, secondly, because the larch may be put into the soil best suited for it, and the Scotch fir the same. And that in raising any particular sort extensively, it may be right to have a few of the spruce sort, or others, on the out or exposed sides, to prevent mischief from sudden gusts or blasts of wind: but if the situation be not liable to such gusts, the spruce had better be omitted, being mechanical agents only, and, by excluding the sun and air, act against the operations of nature. However, in these hints, ornament is not, it is said, considered, but only timber: if the former be wanted, and profit also, then the spruce, the larch, the silver, and some other sorts, may be combined.

It is contended, that from some years' observations on cutting out and side-lopping the branches, and the effects thereof, it appears certain that fir-trees, whenever they arrive at a certain age, should be cut or lopped to a certain height; and that for regulating thereof, the simple rule given below is recommended: the cutting-in to commence when the trees are six years old, or when there is discernible five tier of boughs and the shoot; the three lower tier of boughs are then to be taken off. After the first lopping or cutting-in, the trees to be let alone for four or five years, and then, and at every succeeding four or five years, the cuttings-in to be repeated, till the stem of the tree be clear to forty feet high, after which, as to such side-lopping, it may be left to nature. The rule for the height of thinning and cutting-in, after the first time, to be half the extreme height of the tree, until they attain twenty years' growth, and after that time, half the height of the tree, and as many feet more as it is inches in diameter at four feet from the ground. This cutting-out and retrenching the branches of such trees is known, from repeated observations, it is said, not to be excessive; and that the rule is calculated to check the too tapering top, and for strengthening the slender bottom, by carrying the cutting and retrenching to a greater proportionate degree, in a ratio compounded of the height and bottom bulk; and by this rule, too, it may be observed, that the trees will be at top clothed with somewhat less than half their branches. The proper time for such cutting-in is, it is said, between September and April, and the tool to be employed in the business, the saw.

It is noticed, that orderly thinning the trees at certain periods, when for timber, is the next essential to that of cutting in and lopping their side-branches; and that for this purpose, observations have been made on the most orderly and thriving collections of this sort of trees, and the subsequent simple rule is laid down: keep the distance of the trees from each other equal to one-fifth of their height. In the application of this rule to this purpose, it is evident that each individual tree can never be made to comply, for the original distance (even if set out in the most regular order) will allow only for certain modifications, by taking out every other tree, and so on; but even if the obtaining such equal distance were practicable, experience would shew, it is thought, that another way should be preferred, of which the eye must be the judge, by taking out such trees as are least thriving, stand nearest to other good trees, &c. &c. at the same time keeping in view the rule laid down: the directions and rules for which, given below, may easily be proved, by measuring a chain square, or any quantity of the land, and counting the trees thereon; then, by trying the height of two or three trees in that quarter, and taking one-fifth of such for the distance, it would be readily seen how many trees for timber should be contained in the piece measured: or the practice may be more simply regulated, it is said, by taking the distance of eight or ten such trees added together, the average of which should be equal to a fifth of the height of the trees. In these rules and directions there is nothing impracticable or complicated, it is thought.

The writer states, too, that he has for years known the expence and produce of this side-trimming alone, and finds that in Bedfordshire the produce of it doubly repays the charge or cost; and that although some experimentalists may differ from him, or time may shew some reason for somewhat deviating from his rule, it is presumed all will agree that some simple plan is adviseable, instead of having timber collections and woods mismanaged, to the great loss of the community and their proprietors. If such a plan of proceeding, as is here proposed, be generally promulgated, if not perfect, it will most likely, it is thought, in time become so, and thereby have its advantage; and in order to promote this, these concluding remarks are given: in the common course of gardening, it is understood that cutting and trimming invigorate the tree; that taking off the side-branches makes the upright ones shoot the stronger; and by cutting out the dead and decayed wood, the tree is kept alive: some of this doctrine will, it is supposed, certainly apply to the tribe of firs; it will certainly, too, substitute clean timber-wood for knots: and of all this treatment, from their particular uses, they of all other trees stand in most need, and will be the most improved by it. And that should it be admitted that the like treatment would on the fir, as well as other trees, produce the like effect, it would lead to a well-grounded expectation that, as well as producing clearness from knots, straightness, and length, the same operation would advance the quality nearer to that of foreign fir; for it may be traced, that where trees are tall and clear of boughs or knots, the whole substance of the wood is better and of finer grain, and that it appears likely that such will always be the case; the reason of which may probably, it is thought, be inferred from the sap having farther to rise and descend, and having no boughs to divert or delay it, the circulation must be more free and rapid, most increase be left in the neighbourhood of the boughs at the top of the tree, and least on the sides at the lower part, consequently adding to the length of the head, and rendering more fine each annual increase to the body; thereby producing a close-grained, clean, long, and regular easy-

eaſy-tapering uſeful piece of timber, inſtead of a coarſe-grained, ſhort, ſudden-tapering trunk, with a quantity of boughs and knots.

The foregoing rules, directions, and obſervations, are meant, it is ſaid, to apply to fir-timber only, but to a certain extent they may be applied to other timber; though by no means in the ſame degree or age. But if had recourſe to as far as the firſt fourteen years of their growth, and then ſuch cutting and ſide-lopping be altogether omitted, and the thinning out very much increaſed, any collection of ſuch timber-trees would, it is thought, be rendered much more valuable than if left to nature.

The firſt of the above writers has, however, already ſtated, that the general effects of ſide-cutting or lopping the branches of fir, and probably ſome other timber-trees, are of a correſponding nature with that of culture; that is, to increaſe the quantity of timber produce. And that the particular manner in which it does this, is by directing the greater part of the ſap, which commonly ſpreads itſelf in the ſide-branches, into the main ſtem. This muſt, of courſe, neceſſarily enlarge that ſtem in a more than ordinary degree, by increaſing the annual layers or circles of wood.

Now if the tree happen to be in a worſe ſoil and climate than thoſe which are natural to it, this will, it is ſuppoſed, be of ſome advantage, as the extra increaſe of timber will ſtill be of a quality not inferior to what would take place in its natural ſtate; or, in other words, it will agree with that ſtate of quality and quantity of timber which the nature of the ſpecies, or ſort of tree, admits of being produced. But if the tree be in its natural ſtate, the annual increaſed produce of timber occaſioned by this cutting or lopping the ſide-branches, muſt neceſſarily injure its quality, in a degree correſponding with the increaſed quantity. And if the tree be in a better climate and ſoil than that which is natural to it, and at the ſame time the annual increaſe of wood be promoted by ſuch cutting means, it is evident, it is ſaid, that ſuch wood muſt be of a very indifferent quality from that produced in its natural ſtate.

Conſequently, although it might, in ſome degree, it is ſuppoſed, be ſhewn from vegetable anatomy, and the analogy of what takes place in herbaceous vegetables, it is preferred to deduce, from the facts ſtated above, this propoſition: that whatever *tends* to increaſe the wood in a *greater* degree than *what* is natural to the ſpecies or kind when in its natural ſtate, muſt *injure* the quality of timber. Cutting or lopping the ſide-branches tends to increaſe this in a conſiderable degree; and, therefore, it muſt, it is thought, be a pernicious practice, in ſo far as it is uſed in theſe caſes.

It has been ſhewn, it is ſaid, in a very ſtriking manner by Mr. Knight, that timber is produced, or rather that the alburnum, or ſap-wood, is rendered ligneous, by the motion of the tree during the deſcent of the true ſap. It is ſufficiently known, too, to all who have attended to the phyſiology of vegetables, and greatly confirmed by ſome experiments not long ago communicated to the Royal Society by the ſame writer, that the ſolid texture of the wood greatly depends upon the quantity of ſap, which muſt neceſſarily deſcend, and likewiſe on the ſlowneſs of its deſcent. Now both theſe requiſites are, it is contended, materially increaſed by ſide-ſhoots or branches, which retain a large quantity of ſap, and by their junction with the ſtem occaſion a contraction and twiſted direction of the veſſels, that obſtructs the progreſs of this juice. That this is true in fact, is well known to thoſe accuſtomed to make wine from maple or birch trees, as in this buſineſs it is found that thoſe trees which have the feweſt ſide-branches, bleed more freely than the others, but during a much ſhorter ſpace of time. Theſe hints, conſequently, afford additional evidence againſt the practice of cutting or lopping the ſide-branches of timber-trees, and eſpecially againſt that of uſing it for fir-trees, which, as the above writer juſtly remarks, it is ſaid, have larger veſſels than moſt others, and therefore, when in an improved ſoil and climate, ſide-branches for the above purpoſes are eſſentially neceſſary, if ſolid, reſinous, and durable timber be the object in view.

The following concluſions may, of courſe, it is thought, be drawn in reſpect to the management of timber-trees from the above facts and remarks. Firſt, that timber-trees ſhould be ſet out in ſoils, ſituations, and climates, as much as poſſible analogous to thoſe of their natural ſtate: and that it is chiefly in this ſtate, or where there are ſome defects in regard to them, that ſuch cutting or lopping and culture can be exerciſed with advantage. Secondly, that in proportion to the ſuperiority of the ſoil, &c. in which trees are put, over the natural ſoil of ſuch trees; in the ſame proportion lopping and cultivating the ſoil ought to be avoided, and thinning encouraged. Thirdly, that particular regard ſhould be had to the ſoil and ſituation, where either larches or any of the pine tribe are placed out to remain finally for produce as timber: for as the roots of theſe chiefly run along the ſurface, and as in them the great current of the ſap is principally confined to one channel, that is, the trunk, that tribe of trees is, of courſe, peculiarly liable to change when ſubjected to unnatural agency of theſe kinds. Fourthly, that the only way in which oak-timber of *ſafe* quality can be raiſed and provided for the navy of this country, is by incloſing, preſerving from cattle, and properly managing, thoſe royal foreſts where oak is the natural produce of the ſoil. The neglect of this advice, there is reaſon to fear, it is ſaid, may at ſome future day be regretted. For park-oak, as has been ſeen, is by no means unfrequently much inferior to that of the foreſt kind in durability. And that, laſtly, as the practice adviſed tends to render trees characteriſtical of their peculiar ſpecies or kind, it muſt conſequently be the moſt agreeable to ornament too, or the principles of natural taſte.

The neceſſity of conſidering, thus fully, this branch of the management of timber-trees is, becauſe the matter ſeems, it is ſaid, to have been almoſt entirely overlooked by practical men, who appear, in general, to think culture and lopping, or cutting-in, of no other utility than to increaſe the produce in the *quantity* of timber. Though they are not, however, to be diſcarded in many other views, yet if ſolid and *durable* timber be the object, they ought, it is thought, to be had recourſe to with caution, and in a diſcriminate manner. As a contrary plan of proceeding has been attempted to be enforced by ſome, as has been ſeen, it is thought neceſſary to arouſe the attention of the country to the raiſing and improved management of the important article of timber, eſpecially as the conſequences of that plan are ſuppoſed to be more dangerous, as they cannot eaſily diſcover themſelves until it be too late to apply a remedy.

In the management of timber-trees of the deciduous kinds, the lopping, cutting-in, and thinning, ſhould be practiſed, in ſome meaſure, on the ſame principles as the above, but according to the particular nature, circumſtances, and habits of growth of the different ſorts; being conſtantly executed in ſuch a manner, as to prevent any injury or inconvenience ariſing by the too extenſive growth of the lateral ſhoots or branches, theſe being too few in number for the proper retention of the ſap; and without the trees being left at too great a diſtance, and too naked and expoſed. The trees for timber too are always to be kept clear of all foul wood, and any branches to be removed, taken off in a clean, careful, up-

ward

ward direction, as where the parts are left in any way rugged or uneven, they are liable to catch and detain the wet and moisture, and conduct it to the hearts of the trees, by which they are not only greatly hurt in their growths, but often much spoiled as timber-wood. The thinning of the trees for timber should be performed at different suitable periods, so as to prevent too much crowding, and afford proper room for the full growth and increase of their wood, on the principles laid down above. See Pruning and Thinning.

Sir Humphrey Davy has remarked in a late work, that trees possessing the firmest and the least porous heart-wood, are the longest in duration. That, in general, the quantity of charcoal afforded by woods, offers a tolerably accurate indication of their durability: those most abundant in charcoal and earthy matter are most permanent; and those that contain the largest proportion of gaseous elements are the most destructible. That, amongst our own trees, the chesnut and the oak are pre-eminent as to durability; and the chesnut affords rather more carbonaceous matter than the oak. That, in old Gothic buildings, these woods have been sometimes mistaken one for the other; but they may be easily known by this circumstance, that the pores in the alburnum of the oak are much larger and more thickly set, and are easily distinguished: whilst the pores in the chesnut require glasses to be seen distinctly. That, in consequence of the slow decay of the heart-wood of the oak and the chesnut, these trees, under favourable circumstances, attain an age, it is said, which cannot be much short of a thousand years. The beech, the ash, and the sycamore, most likely, never live half so long.

It is noticed too, that the oak and chesnut decay much sooner in a moist situation than in a dry sandy soil; and that their timber is less firm. The sap-vessels, in such cases, are more expanded, though less nourishing matter is carried into them; and the general texture of the formations of wood necessarily less firm. Such wood, it is said, splits more easily, and is more liable to be affected by variations in the state of the atmosphere.

The same trees, in general, are likewise much longer lived in the northern than in the southern climates. The reason of which seems to be, it is thought, that all fermentation and decomposition are checked by cold; and that at very low temperatures, both animal and vegetable matters altogether resist putrefaction: and in the northern winter, not only vegetable life, but likewise vegetable decay must be at a stand.

The antiputrescent quality of cold climates is, it is said, fully illustrated in the instances of the rhinoceros and mammoth lately found in Siberia entire, beneath the frozen soil, in which they most probably have existed from the time of the deluge.

Trees that grow in situations much exposed to winds, have harder and firmer wood than such as are considerably sheltered. The dense sap is determined, by the agitation of the smaller branches, to the trunk and large branches; where the new alburnum formed is consequently thick and firm: such trees abound in the crooked limbs fitted for forming knee-timber, which is necessary for joining the decks and the sides of ships. The gales in elevated situations gradually act so as to give the tree the form best calculated to resist their effects. And the mountain oak rises robust and sturdy; fixed firmly in the soil, and able to oppose the full force of the tempest.

Different states of timber are chosen for different uses, but the above writer remarks, that ship-builders prefer for their purposes that kind of oak-timber afforded by trees that have had their bark stripped off in the spring, and which have been cut in the autumn or winter following. The reason of the superiority of this timber is, it is thought, that the concrete sap is expanded in the spring in the sprouting of the leaf; and the circulation being destroyed, it is not formed anew: and the wood, having its pores free from saccharine matter, is less liable to undergo fermentation from the action of moisture and air.

It must, however, be considered as very extraordinary, that in a country where the navy is a matter of such vast importance, and in districts where the oak, or other sorts of timber-wood useful for the same purpose, may be said to be almost the staple articles, no complete or satisfactory trials should have yet ever been made of the means of increasing the duration of such timber, which are mostly so readily practicable, and so very material in their consequences.

Felling of Timber.—The proper periods or times of cutting down, or making *falls* of timber, as they are often called, must evidently, in some measure, depend upon and be regulated by the nature and the differences in the circumstances of the growths of the same or different kinds of trees. But as in them, as well as other living matters, there seem to be three stages of growth; as that of their early rising, their middle mature state, and that of their decline or decay; they may serve as more satisfactory guides in the business. In the first, the growth is mostly soft and rapid; in the second, it becomes firm, strong, and perfect; and in the last, it begins to become weak and unsound. Mr. Loudon has considered the beginning of the middlemost of these stages as the most profitable period or season for felling of timber; as after that time, though the tree may appear sound and healthy, its annual increase is so little, that the cutting it down and replacing it may be more beneficial than letting it remain. The number of years that a tree may stand before it arrives at such a state, must, it is said, vary in different soils, situations, and exposures; but the period itself may readily and without difficulty be ascertained,—by the annual shoots, the state of the bark, and by taking the circumference of the tree at the same place for two or three successive seasons, and comparing the difference. In the view of profit from timber produce, it is of material consequence, it is said, to cut down such collections of trees at maturity, or in their vigour and perfection, which, some suppose, for the oak, where the soil is natural, is from about the age of fifty to sixty or seventy years' growth. Many trees will stand a half, others a whole century after they are full grown, appear quite healthy, and, at the same time, make little or no increase of timber. There are particular cases too, depending on the nature and state of the markets, in which it may even be more profitable to cut timber before it is arrived at a full growth than afterwards.

It may be difficult, it is thought, to say when timber, which is principally planted for ornament, should be cut down. A tree, when young and fresh, is beautiful; when middle-aged, it is more or less picturesque; when in old age, strikingly so, with a degree of grandeur; and its greatest height of picturesqueness and sublimity, is when decaying under the pressure of age. Hence it is conceived, that if ornament, or expression, which is a more appropriate term, were the sole object in view, trees need almost never be cut down. But most persons have a feeling of what is beautiful; and though all may be struck with grandeur or sublimity, few have so much enthusiasm as to sacrifice the profit of valuable timber, for the pleasure of enjoying either of those characters.

The time and manner of cutting *underwood* and *undergrowth* will be seen under these heads.

There are persons in this country, who, unquestionably from

from neglect and mifmanagement of their timber, are now, it is faid, lofing annually very handfome incomes. The lofs of price which generally follows the refufal of a good or high offer, the certain lofs of intereft, the decay of timber, and the injuries arifing from the incumbrance of full-grown trees, are irretrievable loffes, which thofe who have the care and management of timber fhould ftudioufly endeavour to avoid. But while the difadvantages of fuffering timber to ftand until it be overgrown are thus held out, it is far from proper or advifeable to propofe or favour the premature felling of it.

The feafon of the year for this work ufually commences about the end of April; becaufe the fap then rifes, which makes the bark *run* freely, as it is technically termed; that is, it *ftrips* off the trees freely; fo that where a quantity of timber for ordinary ufes is to be felled, the ftatute 1 Jac. I. c. 22. formerly required it to be done between the 1ft of April and the laft of June, for the advantage of tanning: but this act was repealed by 48 Geo. III.

However, the opinions and practices of authors are very different as to the beft feafon for felling timber: Vitruvius recommends an autumnal fall; others advife December and January: Cato was of opinion, that trees fhould have borne their fruit before felled; at leaft, that their fruit fhould be firft ripe; which coincides with the fentiments of Vitruvius.

In effect, though timber unbarked be moft obnoxious to worms, yet we find the wild oak, and many other kinds, if felled too late, when the fap begins to be full, to be very fubject to worms; whereas about mid-winter, it neither cafts, rifts, nor twines. If trees were felled at a more early feafon than April, it is faid that the timber would be better feafoned.

It is, indeed, the common opinion, that timber which is felled in winter, is ftronger, and more lafting, as being more firm and clofe, than that which is felled in fummer. But M. Leeuwenhoeck apprehends that there is no difference, except in the bark, and outermoft ring of the wood, which in the fummer are fofter, and more eafily pierced by the worm: wood confifting of hollow pipes, which, both in fummer and winter, are full of moifture, and do not fhrink in winter; and therefore the wood cannot be clofer at one time than another, for if otherwife, it would be full of cracks and clefts. The unexpected and fudden rotting of fome timber, he conceives to proceed from fome inward decay in the tree before it was felled: having obferved all trees to begin to decay at firft in the midft or heart of the tree. Phil. Tranf. N° 213. or Abr. vol. i. p. 592.

The ancients had a great regard to the age of the moon in the felling of their timber. If their rules avail aught, they are thefe: fell timber in the wane, or four days after new moon; fome fay, let it be the laft quarter. Pliny orders it to be in the very article of the change, which happening on the laft day of the winter folftice, the timber, fays he, will be immortal: Columella fays, from the twentieth to the twenty-eighth day: Cato, four days after the full: Vegetius, from the fifteenth to the twenty-fifth, for fhip-timber; but never in the increafe, trees then moft abounding with moifture, the only fource of putrefaction.

Some even have a regard to the temper and time of the day; the wind to be low, neither eaft nor weft, neither in froft, wet, nor dewy weather, and finally, never in the forenoon.

Laftly, fome regard is had to the fpecies: fir is beft felled when it begins to fpring, both as it then quits its coat beft, and as the wood, according to Theophraftus, is by that means rendered wonderfully durable in water. Elm, fays Mr. Worlidge, is to be felled between November and January, in which cafe it will be all heart, at leaft the fap will be very inconfiderable: this, he adds, is alfo the only good feafon for felling afh. Some authors add farther, that in felling timber, care fhould be taken, firft, only to cut it into the heart, and fo to let it ftand till dry; by which means the moifture is evacuated in drops, which would otherwife occafion putrefaction.

M. de Buffon obferves, as a circumftance which greatly increafes the ftrength and folidity of timber, that the trees intended to be felled for fervice, fhould firft be ftripped round of their bark, and fuffered to ftand and die upon the fpot before the cutting. The fappy part, or blea of the oak, becomes by this management as hard and firm as the heart, and the real ftrength and denfity of the wood has been proved by many experiments to be greatly increafed by it: nor is this practice detrimental to the proprietor, becaufe the remaining ftumps of thefe trees fend up their young fhoots as vigoroufly, as if they had been cut down in their natural condition. Mem. de l'Acad. Sc. Par. 1739.

When any tree is to be cut down for timber, the firft thing to be taken care of is a fkilful difbranching fuch limbs as may injure it in its fall. In felling the tree, it fhould always be cut as clofe to the ground as poffible, unlefs it is intended to be grubbed up; and this will be of advantage both to the timber and the wood; for timber is never fo much valued, if it be known to grow out of old ftocks.

There are feveral different modes made ufe of in felling or taking down timber, and they muft neceffarily be fomewhat various, according to the nature, extent, and kind, of which the collection may be, as well as in the methods of performing the work: thus, in groves of the deciduous timber kind, the trees are moftly beft felled by gradually taking or thinning them out as they arrive at maturity; which, where they are to be continued, fhould be cut over by the furface of the ground, and the ftools be each feparately well fenced in, that by defending them from cattle, new trees may be produced; but when not defigned to be continued, they may at once be rooted out. Groves of the fir or pine fort, or any fingle fir-tree of any kind, fhould at once be taken out by the roots. In woods, any timber-trees that may be cut down, fhould have their places as nearly as poffible fupplied by fapplings, or any other proper forts of young timber-trees. However, previous to the work of felling, the trees fhould be marked by a proper perfon; in performing which, in a *fall* of timber, regard is to be had to the relative ftate of ftanding in the trees. In clofe timber-woods, the whole or nearly the whole may be marked and taken down; as if fome which appear flourifhing be left ftanding, they will not only be liable and in danger of being hurt in taking the others down; but, in confequence of their fituation in regard to expofure being changed, will no longer continue to flourifh. As their atmofphere is not only thus altered, and rendered too cool, perhaps, for their acquired habit, by the removal of the adjoining trees; but they thereby get room to throw out fide-fhoots from their ftems; in confequence of which their tops die, and their growth is irrevocably ftinted. While, on the contrary, in open woods of the fame kind, thin hedge-rows, and other open fpaces, fuch timber-trees only as are ripe for the axe, or are fuitable for the intended purpofe, fhould be marked: the youthful growing trees being left to be benefited moft probably by an increafe of air and head room, in an atmofphere and expofure to which they are habituated and accuftomed. On eftates that are timbered, it is directed that they fhould be frequently gone over by proper perfons, who, let the price and demand for timber be what they may, fhould mark every tree which

wears

wears the appearance of decay. Where the demand is brifk and the price high, he fhould go two fteps further, and mark not only fuch as are full grown, but fuch alfo as are near perfection; for the intereft of the money, the difincumbrance of the approaching young timbers, and the comparative advantages of a good market, are not to be bartered for any increafe of timber which can reafonably be expected from trees in the laft ftage of their growth.

In the work of felling timber, three diftinct methods are practifed and had recourfe to in different cafes; as, firft, that of cutting the trees *above ground;* fevering them from their roots, by means of the axe or the faw; leaving what are termed *ftools*, to occupy the fpots where they ftood. Second, that of cutting them, *within* the ground, with the axe and mattock; but leaving the principal parts of the roots in the foil. And third, that of *grubbing* them up by the *roots*, by the ufe of the fpade and mattock; thus throwing them down with the butts and large roots adhering to the ftems. The preference to be given to one or other of the two firft modes of taking down timber-trees, refts, it is faid, chiefly on the nature of the future application of the land upon which they grow. If it be intended to remain in the ftate of woodland, the firft method, or the fecond, if too much of the main roots be not cut away, is the beft and moft eligible. But if the land is to be cleared for the purpofes of agriculture, where fufficient hands can be had for difpatching the bufinefs, the fecond is, by far, the beft. The laft is improper in moft cafes.

The writer of the rural economy of the midland diftricts ftates, that there the methods of *ftocking*, *axe-grubbing*, and *axe-falling* are practifed. That the firft is a kind of partial grubbing, in which the roots are cut through a foot or more from the ftem; and, again, a foot or more from the inner cutting; taking up a fhort length of the thickeft part of the roots, and digging a trench round the tree, wide enough to come at the downward roots. That the fecond, or axe-grubbing, is fomewhat fimilar to the mode of grub-felling defcribed below, except that the end of the butt is left larger in thefe places than in that cafe. And that the third, or axe-falling, is the common method of Yorkfhire, and other places, of cutting off above ground, with the axe; a method which is feldom practifed, except in fome few cafes where another crop of timber, or of coppice-wood, is defigned to be taken. Stocking is the prevailing mode;—the charge for taking down varying with the fize of the tree: for a tree of two feet in diameter, it is about a fhilling; and about four-pence more for cutting off the butt; the ftocking and butting being, for the moft part, let together. Other modes, too, are practifed in other diftricts in performing the bufinefs; as that of fawing the trees off in an horizontal manner clofe by the furface of the ground, by means of a long faw with one or both handles fixed on the upper fide, the trees being firft dipped in by the axe on the falling fide.

The method of falling timber practifed in the county of Norfolk, is faid, by the fame writer, to be uniform, and perhaps peculiar to the county. It is very aptly called grub-felling; the operation partaking both of grubbing and of felling with the axe, in the common way above ground; a method which is wafteful of timber. The woodman of this diftrict, therefore, fells below the furface of the ground, by cutting off the horizontal roots clofe to the ftem, which, inftead of fhortening, he, in effect, lengthens, by adding to it a conical point, cut out of the crown of the root; fo that by this way of proceeding, a greater length of timber is obtained, than by firft grubbing and afterwards cutting off the butt with a faw. Grub-felling is, it is thought, without doubt, the moft eligible way of taking down hedge-row timber; and this, it is fuppofed, accounts for its being the eftablifhed practice in the above county.

The difpofal of timber, which often takes place before it is cut down, is to be regulated by the *occafion* of it, as arifing from the *ftate* of the timber, or other caufes and circumftances. It is, however, feldom proper and beneficial to fell and cut it down before its moft profitable ftate of growth is reached; though this principle may fometimes be fet afide by particular circumftances, as the nature of a market; the value of the land it encumbers by its growth, being greater than its annual increafe; the intereft of the money it is worth, with that of the growth from the ftools, being greater than the increafe of the ftanding timber, &c. It is confequently rarely advantageous to fuffer timber to remain upon its roots, after it has attained its *full* growth; —as, in this cafe, the whole of the intereft is loft, it is faid, to the owner; while the ufe of one of the moft valuable articles of the produce of the country is loft to it and the whole community.

In fpeaking of oak-timber, the late bifhop of Landaff has given fome ufeful and interefting remarks in regard to the difpofal of it, in the introduction to the Agricultural Report of the State of the County of Weftmoreland. Where profit is confidered, it is faid every tree fhould be cut down and fold, when the annual increafe in value of the tree by its growth, is lefs than the annual intereft of the money it would fell for. This being admitted, it is only neceffary to inquire into the annual increafe in the value of oaks of different ages. After different ftatements, thirty-fix fhillings each are fixed upon as the price of trees that fhould be cut down and fold; as, if they be cut down before they arrive at that value, or if they be allowed to remain until they will fell for a much higher price, the proprietor of the foil or land on which they grow will be a lofer. It is noticed too, as being the general opinion, that it is more profitable to fell and fell oak-wood at fifty or fixty years' growth, than to let it ftand for navy timber to eighty or a hundred, owing to the low price that is now paid for oak-trees of large dimenfions, either by the Navy Board or the Eaft India Company. On this account, it is advifed making a much greater increafe of price than ordinary on timber of this fort of large fcantling, as in place of four or five pounds the load, if eight or nine were given for trees containing each one hundred cubic feet and upwards, every perfon in the kingdom, it is thought, would have a reafonable motive for letting his timber ftand until it became of a fize fit for the ufe of the navy; whereas, according to the prefent eftablifhed price, it is every one's intereft to cut down and fell their trees before they arrive at a proper fize to be ufeful as navy timber. This fuggefts, too, the neceffity of attending to the royal forefts in a more particular manner; and may be an additional inducement to the trying the cultivation and growth of the larch in them, and training it for fhip-timber. See Timber, *Crooked Growth of*.

There are feveral different modes of difpofing of timber according to the nature of it, the fituation, and the cuftoms of the diftricts to which it belongs; but the principal of them are, firft, thofe of felling the trees ftanding; either by *auction*, by receiving *written* propofals, or by *bargain* and *fale:* fecond, cutting the trees down, and felling them in the rough; by any of the above modes: third, converting the fallen trees; that is, cutting them up into wares to which they are beft adapted, or which are moft faleable in the particular fituation. On a large timbered eftate, the firft mode is, is, in common, the moſt adviſeable to be had recourſe to; in which caſe, an accurate *valuation* of the marked trees is to be made, before they are offered for ſale: and, in the caſe of oak timber-wood, it is moſtly proper, and always ſatiſfactory, to have ſeparate valuations of the timber and the bark.

In ſelling timber in the county of Norfolk, the prevailing practice is, according to the writer of the rural economy of that diſtrict, to fell it ſtanding, at ſo much a ton when fallen; meaſuring the timber down to ſix inches timber girt; the *topwood* and the *bark* (of oak) becoming the property of the purchaſer; who is uſually at the expence of taking it down. And it is cuſtomary there, too, for the purchaſer to diſpoſe of the bark (of oak), and ſometimes the topwood, by the ſame admeaſurement.

In the midland diſtricts, after diſpoſing of and cutting out the timber, the arms or boughs of the trees are cut up into poſts, rails, and cord-wood for charcoal; the *ſpray* being moſtly made up into faggots.

The relative value of different ſorts of timber may be ſaid to depend almoſt wholly upon local circumſtances, as thoſe of contiguity and facility of being taken to the places where they are the moſt largely made uſe of, or where only employed. Some ſorts are, however, every where valuable on account of either their general application, or their ſcarcity, ſuch as the oak, the aſh, the elm, the beech, and the ſtill more valuable larch, and others of the firſt deſcription: and of the latter, the common cheſnut, the yew, the box, and the holly. The light products of different kinds, afforded by ſome timber-trees, are alſo of great uſe and value in moſt places.

Hunter, in his "Evelyn's Sylva," has juſtly remarked, that every perſon who can meaſure timber, thinks himſelf qualified to value ſtanding trees; but that ſuch men are often deceived in their eſtimates. That it is the perfect knowledge of the application of the different ſhaped trees that enables a man to be correct in ſuch valuations. That a foot of wood may be of little importance to one trade, but of great value to another. This is the grand ſecret, it is thought, which enriches the purchaſers of ſtanding timber.

On the whole, the great and conſtant demand for timber, on account of the increaſing ſcarcity of it, ſhould induce the proprietors of lands which are proper and ſuitable for it, to attend as much as poſſible to the raiſing and providing of this great object of rural economy, and national as well as individual wealth.

Timber, *Hardening of.* See Hardening *of Timber*, and *Seaſoning of* Timber.

Timber, *Seaſoning of*, a term uſed to expreſs the preparing of timber after it is felled, for cutting and working up for uſe.

As ſoon as felled, it ſhould be laid up in ſome dry airy place, but out of the reach of too much wind or ſun, which, when in exceſs, will ſubject it to crack and fly. It is not to be ſet upright, but laid along, one tree upon another, only with ſome ſhort blocks between, to give it the better airing, and prevent its becoming mouldy, which will rot the ſurface, and produce muſhrooms on it. Some perſons daub the trees all over with cow-dung, which occaſions their drying equally, and prevents their cracking, as they are otherwiſe very apt to do.

Some recommend the burying of timber in the earth, as the beſt of all ways of ſeaſoning it; and others have found it a fine preſervative to bury their timber under the wheat in their granaries; but this cannot be made a general practice.

In Norway, they ſeaſon their *deal* planks, by laying them in ſalt-water for three or four days, when new ſawed, and then drying them in the ſun; this is found a great advantage to them; but neither this, nor any thing elſe, can prevent their ſhrinking. And it has been recommended to lay boards, planks, &c. in ſome pool or running ſtream for a few days, to extract the ſap from them, and afterwards to dry them in the ſun or air; by this means, it is ſaid, they will be preſerved from chopping, caſting, or cleaving: but againſt ſhrinking there is no remedy. Mr. Evelyn particularly recommends this method for fir. See Hardening *of Timber.*

The ſeaſoning of timber by fire is the beſt way of all, for piles and other pieces that are to ſtand under the earth, or water. The Venetians firſt found out this method, and the way by which they do it is this: they put the piece to be ſeaſoned into a ſtrong and violent flame; in this they continually turn it round by means of an engine, and take it out when it is every way covered with a black coaly cruſt; by this means the internal part of the wood is ſo hardened, that neither earth nor water can damage it for a long time afterwards. This method is practiſed in many places for ſeaſoning the poſts for paling of parks, &c. and has this to recommend it, that in the very oldeſt ruins we have ever been acquainted with, there have been diſcovered many times pieces of charcoal, all of which have been found uninjured, though buried in the earth for ever ſo many ages. This method of charring timber is practiſed in many parts of England, and has been much recommended, both as to economy and effect.

For this purpoſe, all that is neceſſary is to light a fire upon the ground, which ſhall be ſurrounded with a wall built with looſe bricks or ſtones, and then, when the pieces of timber are laid acroſs the walls, to turn them round carefully ſo as to preſent every part to the action of the fire in ſucceſſion; and when the whole ſurface, to the depth of three quarters of an inch or an inch, is converted to charcoal, they will be ſufficiently prepared. While burning, they ſhould have a temporary covering of boughs or other fuel to preſerve them from the action of the atmoſphere, which would be apt to convert part of the wood into aſhes. See Parkes's Eſſays, vol. ii. See alſo Charring *of Poſts.*

An ingenious friend of the editor objects to this practice. The opinion that *paint* is a preſervative of wood is almoſt univerſal. Neverthleſs, we ſhall ſhew it to be not only erroneous, but that in moſt caſes the uſe of paint accelerates the deſtruction of every ſpecies of wood to which it is applied.

The decay of wood is occaſioned by *internal*, not external moiſture, and this only when it becomes ſtagnant. As long as there is a free circulation, no decay takes place. Stop the circulation, and if there be any moiſture whatever in the wood, ſtagnation commences, putreſcence enſues, and the deſtruction will proceed with an activity in proportion to the quantity and cloſe confinement of the internal moiſture. When wood is thoroughly painted on every ſide, it is evident that the moiſture within it is completely *ſealed* up, and which neceſſarily becoming ſtagnant, the decompoſition and decay of the timber immediately commence. Hence it is clear, that painting of wood, as above ſtated, in every caſe, except only when it is entirely free from moiſture, or as it is called *thoroughly ſeaſoned*, muſt be as effectual a method as any that can be deviſed for accelerating its decay.

Wood that is painted only on one ſide, will, *ceteris paribus*, laſt as long again as that which is painted on both ſides. And that which is not painted at all will be moſt durable. Experiment will prove this to be the fact, whether the wood is expoſed to the weather or not.

It

It is ſeldom that we meet with either a ſcaffold-pole or a ſcaffold-board (ſuch as are uſed by builders) that is rotten, although they are of fir, and are alternately wet and dry, and deſcend from father to ſon for ſeveral generations. The reaſon is, *they are never painted.*

Examine any old building, and it will be found that no part of the wood or timber is in a ſound ſtate, excepting that which has eſcaped the painter's bruſh. The wainſcot, doors, windows, &c. will be found to be rotten, when the floors and ſtairs, although alternately wet and dry from periodical waſhing, are perfectly ſound, *becauſe* they have never been painted.

It is a common practice in London to cover the baſement floors with painted oil-cloth; and it is aſtoniſhing to ſee how ſoon, in theſe caſes, the floors are rotten, and which is called the dry rot, but which is never once ſuſpected to be the ſtoppage of circulation by the uſe of the oil-cloth. Were carpets ſubſtituted for the painted cloths, no ſuch effect would take place.

The dry rot in buildings, and particularly in the *navy*, is comparatively a modern diſeaſe, and has very much increaſed ſince the pernicious practice of painting has become ſo general. The ancient city of Cheſter, where ſo much timber was introduced into the outſides of the buildings, and which is now black with age, but never painted, is a ſtriking illuſtration of this theory. The ſame may be remarked of the villages at a diſtance from the metropolis, where the outſide wood-work of the buildings, ſuch as doors, windows, window-ſhutters, weather-boarding, &c. which have never been painted, are nevertheleſs ſound, and yet ſome of them ſo ancient as to defy all enquiry as to their age. How different this from the gentlemen's houſes near London or other great towns, where the gates, poſts, rails, and palliſadoes are kept conſtantly *well painted*, but are ſeldom found to laſt longer than ten or a dozen years at moſt!

Paint indeed conceals from the eye the deſtruction which it occaſions; and our readers will doubtleſs by this time begin to ſuſpect their former opinions of it to be erroneous. We ſhall therefore only mention two other inſtances, which came under our own obſervation, to ſhew that wood never ought to be painted, except for the purpoſe of ornament.

A few years ago, ſome old houſes were pulled down near the Monument in London. Several of the principal timbers were ſo ſcorched and burnt on the outſide, that an enquiry took place as to the cauſe of it; and it was clearly aſcertained, that the timbers in queſtion muſt have been preſerved from the ruins of the great fire of London in 1666, ſo that this wood muſt now be much more than 150 years old; yet the writer of this article lately ſaw that ſame fir-timber ſawed out into deals, and again uſed as new ſtuff, being to all appearance as ſound as ever. The only perceptible difference was in the colour, which was darker than deals generally are.

The other inſtance referred to is the late old Jewry chapel in London. When that building was taken down, the pews, which were of oak, and the ſeats, which were deal (but never had been painted) were found to be in ſo perfect a ſtate of ſoundneſs, that they were removed to the new building in Jewin-ſtreet, and where there is no doubt they will remain as long as the building itſelf, although thoſe ſaid deal ſeats are known to be conſiderably more than one hundred years old.

The moſt effectual method of preſerving timber from decay is to char it; but when the purpoſe to which it is to be applied will not admit of that operation, the next beſt method is to waſh it over with charcoal and water, ſimilar to white-waſhing. Either of theſe methods will certainly preſerve it from the dry rot, charcoal being the greateſt antiputreſcent known, and no moiſture within the influence of its action will become putrid or decompoſed, and we have already ſhewn that this muſt take place before wood will periſh. It may be further obſerved, that vegetation cannot take place where charcoal or charring is uſed, and the dry rot is always accompanied with that ſpecies of vegetation called *fungi*, and this fungus never occurs till decompoſition or decay has begun.

When boarded floors are to be laid upon or very near the ground, it ſhould be ſtrewed over with dry aſhes, and the joiſts and underſide of the boards either charred or payed over with charcoal-waſh, as before directed. The ſame ſhould be done with the ſide of the wainſcot next the walls.

As painting is indiſpenſable from the faſhion of the times, to doors, window-ſhutters, wainſcot, &c. it would be well to have them painted once over in the carpenter's ſhop when the ſtuff is perfectly dry, and finiſhed afterward in the building for which they are prepared.

If the beſt ſeaſoned ſtuff be put up *unpainted* in a new building, the quantity of moiſture it will imbibe from the brick-work, plaſter, &c. before it can be painted, will defeat all former care of well ſeaſoning.

As to ſaſhes, mahogany is unqueſtionably the cheapeſt article they can be made of; for deal, when painted only a few times, will have coſt more than the difference of price of that very ſuperior wood, both as to look and durability. Air that is ſtagnant is equally pernicious as ſtagnant moiſture. When it is in that ſtate, it ſoon becomes decompoſed, and the hydrogen gas fixing upon wood, ropes, paper, and other vegetable ſubſtances, quickly brings on their deſtruction. Ventilation, and the uſe of charcoal, are the beſt preventives.

The above hints will be ſufficient to guide the intelligent workman in all other caſes.

Though it does not properly belong to this article, it may not be amiſs to mention, that theſe obſervations are quite inapplicable to the preſervation of iron. Iron decays from the effect of *external* moiſture, and the action of the atmoſphere upon its ſurface, which produces oxydation, and which is the ſole cauſe of its decay. This is only to be prevented *by painting.*

Timber, *Preſerving of.* When boards, &c. are dried, ſeaſoned, and fixed in their places, care is to be taken to defend and preſerve them; to which the ſmearing of them with linſeed-oil, tar, or the like oleaginous matter, contributes very much.

The ancients adviſe the ſmoke-drying of all inſtruments made of wood, by hanging them up in the chimnies where wood-fires are uſed. The whole benefit ariſing from this ſeems to be, that the oil of the burnt wood enters, as it aſcends in the ſmoke, into the pores of that which is propoſed to be preſerved.

The Dutch preſerve their gates, portcullices, drawbridges, ſluices, &c. by coating them over with a mixture of pitch and tar, on which they ſtrew ſmall pieces of cockle and other ſhells, beaten almoſt to powder, and mixed with ſea-ſand, which encruſts and arms them wonderfully againſt all aſſaults of wind and weather.

Timber felled before the ſap is perfectly at reſt, is very ſubject to the worms; to prevent or cure which, Mr. Evelyn gives us the following ſecret, as moſt approved: Put common ſulphur into a cucurbit, with as much aquafortis

as

as will cover it three fingers deep; diſtil it to a dryneſs, and let it have two or three rectifications.

Lay the ſulphur remaining at bottom on a marble, or in a glaſs, and, with the oil it diſſolves into, anoint the timber.

This, he adds, not only infallibly prevents or cures the worminess, but preſerves all kinds of woods, and even many other things, as ropes, nets, and maſts, from putrefaction, either in air, water, or ſnow.

For ſuch as would go a ſhorter way to work, two or three anointings with linſeed-oil may do very well.

As to the chaps, or clefts, green timber is liable to after working, and which is a very great defect in many fine buildings, they are cloſed by anointing, ſuppling, and ſoaking it with the fat of beef-broth, twice or thrice repeated. — Some carpenters uſe greaſe and ſaw-duſt mingled for the ſame purpoſe. But the former method is excellent. Mortimer's Huſbandry, vol. ii. p. 104.

Timber, *Strength of.* See Strength *of Materials*, and Beam.

Timber, *Crooked*, *Growth of*, the means of raiſing and providing bent or twiſted timber of different ſorts for the purpoſe of ſhip-building and many other uſes. It has been noticed by Mr. Loudon, that the form of the larch timber-tree is unſuitable for ſome of the purpoſes of naval architecture; and that to render it more proper and ſuitable for ſuch uſes, cutting or pruning it has been adviſed by ſome; and, what is ſtill leſs practicable, ſhading it, by others: but that when its mode of growth is well conſidered, it will be found that neither of theſe methods would prove effectual. The former could not ſucceed, it is ſuppoſed, becauſe in the larch and fir-tribe one ſtem conſtantly takes the lead; and that in this ſtem alone is contained the timber. The latter, or ſhade, might, it is thought, produce a crooked enough ſtem; but that in regard to ſtrength, or timber produce, it would evidently be ſo deficient, as to be totally unfit for naval architecture. In conſequence of which, he has recommended the plan of bending the young trees as preferable to every other practice; and as this mode may, at ſome future period, perhaps be deemed of public importance, he has given a few remarks concerning the method that ſhould be adopted and employed in the buſineſs.

It is ſaid that, in the firſt place, ſuppoſing a timber plantation or wood to be planted in regular rows, fifteen feet apart, and the ſame diſtance in the row; and grown from fifteen to twenty years; in bending or rendering the trees crooked, begin with the firſt row, and let every other tree be bent down in different degrees, and tied to the intermediate ones which remain erect, or be faſtened to the ground. After the trees have had the growth of ſeven or eight years longer in that ſituation or poſition, they may be bent backwards, ſo as to have ſomewhat the form of the letter S, the tops or leading ſhoots riſing directly upwards again from the upper bends, and the bent trees be either tied to themſelves between the bent parts, to keep them in their proper bent poſitions, or to the trees on the ſides, or to any of the trees which ſurround them, as may be found to be moſt convenient and neceſſary. When the ropes have held the trees in theſe ſituations or poſitions for a few more years, they will have received, and retained, in ſome meaſure, the above crooked appearance; which is a form that will afford knee and other pieces, which are of great uſe in ſhip-building, and which always, it is ſaid, bear a higher price than any other form of even oak-timber. Some trees need, however, it is thought, only be bent gently on one ſide, and others a little more ſo. This variation in the inclination of the trees, with thoſe which ſhould be left erect, would, it is ſuppoſed, ſerve to produce and afford proper ſhelter for the whole timber plantations to which they might belong, according to the uſes or purpoſes for which they are intended, or to the form which is moſt in demand. This plan is certainly thought worthy of a trial; and there is no great reaſon to doubt its ſucceſs; for the practice of bending trees is not new; as it was adviſed by Evelyn, and practiſed by the Romans in Virgil's time.

It is probable, too, that ſome other ſorts of timber-trees may be grown in this way with advantage.

It is ſuggeſted, that in planting the larch for this, or any other purpoſe, a careful attention ſhould be had to the choice of a proper ſoil, as when the tree is in one which is not too rich, it reaches a large ſize, and ſoon arrives at maturity; and that it is obvious, that if the above method were adopted, the timber would be fit for building the largeſt ſhips fifty years after it was planted, and for building ſmaller veſſels much ſooner. And that there is abundant evidence, that it would grow to a ſufficient ſize for this uſe in all the mountainous parts of the iſland; moreover, that the experiments which have been made by Mr. Knight, on the ſap and wood of trees, as well as common obſervation, prove, that the circumſtance of bending, eſpecially in an open expoſure, would produce a much thicker trunk and a larger quantity of timber, in a given time, than a ſtraight tree. Theſe circumſtances, in connection with the valuable qualities of this tree as ſhip-timber, and the growing ſcarcity of that article in this country, lead the writer to ſuggeſt the propriety of devoting ſome extent of the national foreſts to the cultivation and raiſing of the larch as timber, either bent in different ways, or even allowed to take its natural form; as the firſt coſt of planting and fencing in, even for five hundred acres, would not exceed 1000*l.*, and the yearly expences afterwards would be but a mere trifle. The culture of the oak, and perhaps ſome other timber-trees, ſhould not, however, be neglected in the ſmalleſt degree: but when it is conſidered that this tree takes two or three hundred years to come to perfection, and the larch not above half a century, reflecting at the ſame time on the approaching ſcarcity of oak-timber fit for the navy, theſe hints and remarks may not, it is thought, be unworthy of the attention of the legiſlature, or from other quarters. See Timber and Tree.

The excellent properties of larch-timber, for the uſe of the navy, have been noticed by many, as thoſe of reſiſting different dangerous effects. Anderſon, in his Catalogue of Trees, aſſerts, it is ſaid, that it does not fly in ſplinters by the impulſe of a ball in an engagement; that no force of heat makes it flame; but that when thrown into a ſtrong fire it conſumes imperceptibly. How many accidents then, it is aſked, might be prevented by a greater uſe of this timber, if applied in ſhips? Many lives are loſt by the ſplinters of oak in naval warfare: all theſe would be ſaved to the ſtate by having the planks of war-ſhips made of it. Decks of the ſame materials would reſiſt fire, either accidental or deſigned; for although burning materials in time will force their way through a plank of larch, yet it never would ſpread to the adjoining plank. To be in a ſhip on fire at ſea, is certainly, it is ſaid, the moſt dreadful ſituation in which any perſon can be placed; every exertion, therefore, to prevent ſuch calamity, is the duty of all well-wiſhers of their country. Beſide theſe advantages ariſing from the uſe of the larch as timber, there is another of no ſmall importance to a warlike and commercial nation, the ſaving of expence in ſhip-building; as by experience it is found that it laſts longer than oak under water, and worms will not touch it. Sailors are ſaid indeed to put larch chips among their clothes; which are found by experience to prevent vermin,

vermin, mould, &c. Confequently, in place of renewing fhips of war every twenty or thirty years, their exiftence may, it is thought, be lengthened to thrice that time.

Many other interefting circumftances and facts in fupport of thefe ftatements may alfo be met with in Newton's Vitruvius, which we have not room to admit in this place.

Timber, *Age of the Growth of*, the limit to the growth and increafe of wood in trees of this fort. It has been remarked by a late writer, that from the old alburnum of fuch trees being gradually converted into heart-wood, and being continually preffed upon by the expanfive force of the new fibres, it becomes harder, denfer, and at length lofes altogether its vafcular ftructure; and in a certain time obeying the common laws of dead matter, decays, decompofes, and is converted into aeriform and carbonic elements; into thofe principles from which it was originally formed. The decay of the heart-wood would confequently feem to conftitute the great limit to the age and fize of timber or trees of that kind. This is more liable to take place in fome cafes than in others. The age of growth in timber-trees is, however, moftly afcertained by the rings or layers of which they are formed.

In regard to the age of the growth of the oak, the writer of the rural economy of the midland counties has remarked, that there has been lately a fall of timber in the woods there, including fome large timber-trees. That he counted the rings of one which was found at the butt: the number, as nearly as he could afcertain it, was two hundred. But thofe of the laft forty or fifty years' growth were fo thin, he could not count them with certainty; though with fufficient accuracy upon which to ground the calculations given below. The girt of this tree, in the girting place, was nine feet, the diameter of which was fomething more than thirty-four inches. And the eftimated growth, in this part, was thirty inches diameter during the firft hundred and fifty years, and four inches (two inches thick) in the laft fifty years. The length of the ftem was twenty-two feet. The contents of the whole were one hundred and ten feet of timber. Thofe of the firft hundred and fifty years' growth, eighty-five feet; leaving twenty-five feet for the growth of the laft fifty years. It is therefore obferved, that although the increafe of diameter had been comparatively fmall during the laft fifty years, the increafe of timber had been nearly as great as in the firft ftages.

But fuppofing, it is faid, that this tree had been taken down at one hundred and fifty years old, it would, at 2*s.* a foot, have produced 8*l.* 10*s.*, the intereft of which would have amounted, in the courfe of fifty years, to more than 20*l.*; befide the ufe of the land during that time: whereas the tree, at that rate, is now worth only 11*l.* Thefe calculations and inferences are not, however, it is faid, intended to excite a fpirit of felling timber prematurely, or at too early an age, a fpirit which is already too prevalent; but to endeavour to decide on the moft *proper* age of growth for its being cut down; it being an incontrovertible fact, that, in point of utility, public and private, the fault of fuffering timber to ftand to too great an age, is infinitely greater than that of cutting it down before it has attained its full growth or age. In the latter cafe, it is faid, there is no wafte; the intereft of money, and the fucceeding fhoots, or the ufe of the land, ftand againft the lofs of growth of timber. But, in the former, the principal, intereft, after-fhoot, and the ufe of the land, are all thrown away: fo that the community, as well as the proprietors, are lofers by the management. In the one cafe, cutting part before it be fit, may fave other trees which are more fully grown; but, in the other, the whole is loft. Leaving, it is faid, the prefervation and management of fhip-timber to thofe to whom it properly belongs, it does not follow that, becaufe it is wrong to fuffer timber to ftand to wafte, it is right to take it down before it be of a proper age, or fufficiently grown, for the purpofe of fhip-building. It is not over-grown, but ftout-growing timber which is fit for that ufe. Timber is feldom cut down prematurely, or at too early an age, but by the neceffitous; or by thofe who have only a temporary poffeffion in their refpective eftates. And what argument, it is afked, can prevail with this clafs of proprietors? Another clafs, and it is trufted by much the largeft, is compofed of thofe who, confidering their timber merely as a profitable part of their feveral eftates, take it down whenever it becomes *full*-grown, and a *fair* opportunity offers. And a third clafs of this fort of proprietors confifts of thofe who, through falfe pride, falfe fear, or falfe economy, fuffer their timber to ftand until it be *over*-grown: and if the writer have any other motive for making known the above minutes on the ages of timber-trees, than that of recording facts, it is the defire of placing in its proper light, the improvident management of this clafs of timber proprietors; and, at the fame time, to endeavour to form juft ideas of a fubject, which has not, hitherto, been brought before the public; but which is pre-eminently entitled to public notice and difcuffion.

It is additionally ftated, that this matter having been rendered, in a confiderable degree, familiar to the writer by many years' obfervation and practice, he may here fet down what appears to him the *proper* ages of growth for cutting down the four following fpecies or forts of timber.

1. Poplar, from thirty to fifty years old.
2. Elm, from fifty to a hundred.
3. Afh, from fifty to a hundred.
4. Oak, from one to two hundred.

But it is faid that it very much depends on fituation, and on the foil and fubfoil in which timber-trees are rooted. On dry abforbent foils, the oak and the elm, at leaft, are obferved to go off much fooner than in cooler more retentive fituations. And in a wood, on a dry loam, with a rocky fubfoil, the oak was found going faft to decay at two hundred years old; while in another, in a cooler fituation, it was found, but unprofitable, at that age; and in a third, perhaps a ftill cooler fpot, it was found, profitable, and wearing every appearance of being in a fit ftate of growth for being taken down at the age of a hundred and fifty years. Thefe three woods were thofe of Merevale, Bagot-park, and Statfold, in the midland diftricts of this country.

A full knowledge of the age of growth in timber-trees is a matter of great utility and advantage to the proprietors of wooded lands.

Timber, *Marking of*, the putting of fuch marks upon timber-trees, or large falls of timber, as may be neceffary to diftinguifh them in felling, and which are of a proper age and growth for being taken down. It is ufually performed by means of an inftrument of the compaffes kind, by which a circle, with a number, or fome other particular fort of mark, is formed on the tree. It is of great ufe and advantage in felling and difpofing of timber, to have this bufinefs executed in a careful and judicious manner. See Timber.

Timber, *Meafuring of*. See Mensuration and Sliding-*Rule*.

For finding the area of a board or plank, the rule is fimple and eafy; which is that of multiplying the length by the mean breadth. If the board is tapering, the breadths at the two ends fhould be added together, and half the fum will be the mean breadth. The method by the fliding-rule is too obvious to need being mentioned.

Timber-*Carriage*, that ſort of wheel-carriage which is contrived and conſtructed for the purpoſe of conveying heavy and other timber. Carriages for this uſe are formed in a ſtrong firm manner, but in different methods, according to circumſtances, and the nature of the timber to be drawn. They are ſometimes made with four wheels, but much more frequently only with two. They have occaſionally ſhafts too, but are more often conſtructed with a pole merely.

Theſe carriages, the writer of the rural economy of Norfolk remarks, are in that diſtrict, as in moſt other places, of two kinds; the four-wheeled ſort of carriage, provincially "*a drag*;" and the pair of wheels, provincially "*a gill*." The laſt is moſt in uſe. The conſtruction of the gill of this county is, it is ſaid, ſimilar to that of the timber-wheels of moſt other counties; namely, a pair of tall wheels, with a crooked axle-tree, ſurmounted by a block; to which axle is fixed a pair of ſhafts, or ſometimes a ſingle pole only. But it is noticed, that the method of uſing them there, is different from that which has been obſerved in other places; where the only uſe they are put to is to raiſe the butt-end of a large timber to be drawn a ſhort diſtance; the top-end being ſuffered to drag behind upon the ground, to the great injury of the turf, or the road upon which it is drawn.

In the above county, however, a large ſtick of timber, or perhaps three or four ſmaller ones, are, it is obſerved, entirely ſlung to the axle; ſo that, in drawing, no part of them whatever touches the ground; the top-end or part being generally drawn foremoſt, and the end towards the horſes always the heavieſt.

It is ſtated, that the method of taking up a piece of timber is this: the horſes being taken off, the wheels are run, by hand, aſtride the timber to be ſlung, until the axle is judged to be a few inches behind the balance-point: or, which is better, a chain is firſt put round the timber, and the wheels run up to it. It is difficult to aſcertain the exact place of fixing the chain by the eye; but nevertheleſs, a perſon accuſtomed to ſling timber in this manner, will, it is ſaid, come very near the truth. The chain hooked, and the axle brought into its proper ſituation, the ſhafts, or pole, are thrown back in the uſual manner; the chain carried over the block, brought round the pole, its ends made faſt, and the ſhafts or pole brought down again by the horſes; by which means the timber is lifted from the ground, and ſuſpended to the axle. If the required point of balance be not hit upon at the firſt trial, the ſhafts are ſuffered to riſe again, the chain is unhooked, and ſhifted to its proper ſituation: the ſhafts being then again pulled down, are bound by an iron trace, or ſmall chain, cloſe down to the timber; while another ſmall chain or trace is faſtened round the foremoſt end to hook the horſes to; the team drawing by the timber, and not by the pole or ſhafts.

It is ſuppoſed, that the utility of having a ſuper-balance of weight forward is two-fold: if the piece were ſlung in exact equilibrium, it would, upon the road, be in perpetual vibration; thereby rendering the pull unſteady, and extremely inconvenient to the horſes: whereas, by throwing the balance forward, the traces are commonly kept down conſtantly in their proper place, and the pull becomes uniform: if, however, too much weight were to be thrown forward, the draught of the horſes would not raiſe the point of the timber from the ground; the friction would, of courſe, increaſe the draught, and the road be at the ſame time hurt. It therefore follows, it is ſaid, that the proper weight to be thrown forward is ſuch as is enough to prevent a vibration, but not ſo much as to prevent the point from being raiſed from the road by the draught of the horſes upon level ground. And that the other advantage, by a ſuper-balance forward, is gained in going down a hill; in which caſe, the draught not being wanted, the point, of courſe, falls to the ground, and ſerves as a pall to regulate the motion of the carriage: if the ſuper-balance alone be not ſufficient to check the too great rapidity of the motion, the driver adds, it is ſaid, his own weight. Likewiſe, if, in aſcending a hill, the balance be loſt; he, in like manner, ſeats himſelf upon the fore-part of the load, thereby keeping it down to its proper level.

It is added, that this method of conveying timber may, it is poſſible, be in uſe in other diſtricts; but the writer has not ſeen it practiſed any where except in the above county: and that it is known to be an excellent, but not a common mode of practice.

It is of great utility and convenience for timber proprietors and dealers to be always provided with good carriages of this ſort.

Timber *Hedge-Row*, ſuch trees of this kind as are raiſed and grown in the lines and rows of the hedges. It has been long a diſputed point among the writers on agriculture, and which is not yet fully decided, whether it be admiſſible or not to have trees of this ſort in the directions of the hedge-rows: ſome ſtrongly contending for its utility, on the grounds of the ſhelter, ſhade, and timber afforded by the practice; while others as ſtrongly oppoſe it, on the ſcore of the injury which it does to the crops and the hedges underneath the trees, as well as the obſtruction which it affords in working the land, when in the tillage ſtate. However, in many ſituations and caſes, there can be no doubt of the advantage of having timber-trees of the hedge-row kind, when under proper and ſuitable management.

It has been well obſerved by an able writer on the means of improving the rural objects and practices of the country, that although a few trees growing in a hedge, when conſidered ſingly, may have little effect, and be of no great value or conſequence; yet that a number of hedge-rows, all properly interſperſed with timber-trees, will completely change the appearance of a hilly country or diſtrict, improve its climate, and yield a conſiderable quantity of timber to the owners of the lands. The conſideration of the matter muſt, of courſe, it is thought, be of great importance to the landed intereſt of ſome parts of the iſland, eſpecially thoſe in the more northern or mountainous diſtricts of the kingdom. What is neceſſary to be ſaid on this ſubject here, may conſequently be introduced under the heads of the *nature* of the *lands* where timber of the hedge-row kind may be raiſed and grown without *injury* to the farmer; and the *ſpecies* or ſort of trees which is moſt proper to be raiſed in ſuch caſes. In regard to the *intereſt* of the farmer, the lands which are the moſt evidently and ſuitably adapted for the growth of hedge-row timber-trees are all thoſe which are naked and much expoſed, and which are kept for the moſt part under paſturage; and in ſo far as the beauty of a country or diſtrict, the improvement of its climate, and the health of its inhabitants, are concerned, the hedge-rows of the riſing-grounds alone ſhould be occupied by trees, except a few in the vallies, by the ſides of public roads or rivers, to form fore-grounds to the reſt of the country or diſtrict; and a few near houſes or villages to group with them, and afford a richneſs to their appearance. In low rich vallies between mountains, which are kept in perpetual aration, the hedge-rows ſhould not be taken up by timber-trees of this ſort. But a country or diſtrict wholly level, as many of the counties and diſtricts in the ſouthern parts of the kingdom are, may ſometimes have the hedge-rows partially ſet with trees, without doing any great injury to the farmer;

farmer; while, if properly managed, it may vary the country, and improve its climate. In ſuch levels, the hedges ſhould, however, be kept very low, and the trees be trained erect with ſingle ſtems, and few lateral arms or boughs near the ſurface; or, as is done in ſome places, the width of an ordinary ridge may be left on each ſide of the hedge, to be kept in perpetual paſture, which prevents the corn from being ſo much injured by the trees, and is a great ornament to a farm. This laſt mode is, however, not without its diſadvantages, as it is liable to diſſeminate and fill the adjoining tillage-lands with the ſeeds of noxious and hurtful weeds. However, in caſes where the whole farm is to be kept in perpetual paſture, the trees may often be allowed to extend their branches, and the hedges may be kept high or low, at pleaſure. Moiſt or clayey ſoils ſhould never, when under perpetual aration, be ſet with hedge-row trees; and indeed, before they are put into ſuch rows any where, or in any caſe, a full conſideration and eſtimate ſhould, it is ſaid, be made of their effect on the annual rent of the land, on their intrinſic value, on the climate, and on the appearance of the country.

The writer of the Yorkſhire rural economy conſiders this an intereſting ſubject to the proprietors of incloſed eſtates. The old incloſed parts of that neighbourhood, when ſeen at ſome diſtance, have, it is ſaid, the appearance of woodlands; the incloſures being moſtly narrow, and full of hedge-row timber. The age, on a par, is about 50 years. In half a century more, the value of the timber of ſome parts of it, if ſuffered to ſtand, will probably be equal to the value of the land; a circumſtance, it is ſuppoſed, of no ſmall import to the owner. But the detriment to the occupier requires to be conſidered. In this county, it ſeems, it is ſaid, to be a general idea, founded perhaps on experience, that lofty hedge-rows are beneficial to graſs-land; increaſing its productiveneſs by their warmth, and giving ſhelter and ſhade to paſturing-ſtock. The roots even of the aſh are conſidered as inoffenſive to land in the ſtate of graſs; in which ſtate the grounds, thus loaded with hedges and timber-trees, are almoſt univerſally kept. Indeed it would be impoſſible, in their preſent ſtate, to occupy them as arable land. They are entire incloſures, every foot of the areas of which muſt neceſſarily be occupied by aſhen roots; nevertheleſs they give an ample ſupply of hay and paſturage; one to two tons of hay an acre: and, in many of them, three acres will afford ſufficient paſturage for two cows of the largeſt ſize. The rent from thirty to forty ſhillings an acre. Strong evidence this, it is ſaid, that the roots of the aſh are not very hurtful to graſs-land.

It is evident, however, it is thought, that the oak, when ſuffered to thruſt its low ſpreading head into the incloſure, is injurious to the herbage beneath it; that the leaves of the aſh are very detrimental to after-graſs; and that the hedges are annually receiving irreparable damage: no general plan of training up the trees with tall ſtems having, it is believed, in any inſtance, been adopted, ſo as to prevent, in any complete manner, ſuch effects.

On theſe accounts it is concluded, that the advantages accruing from the planting of timber-trees in the hedge-rows of incloſed common fields, of a ſoil and lying in a ſituation adapted to graſs, are far ſuperior to any diſadvantages ariſing therefrom, even where they have been ſuffered to grow in a ſtate of almoſt total neglect. And that land which has lain open, and which has been kept in a ſtate of aration during a ſucceſſion of ages, is equally productive of graſs and trees. That it is generally good management to let it lie in graſs for ſome length of time, after incloſure. Beſides, that in the above neighbourhood, it is evident to common obſervation, that trees flouriſh with unuſual vigour in newly-incloſed lands of arable fields; and that their injury to graſs-land is inconſiderable, when compared with the value of the timber which they produce. The low ſpreading heads of the oak, and the leaves of the aſh, appear to be the chief inconveniencies of theſe two ſorts of trees to graſs-land.

But as an alternacy of corn and graſs is, it is thought, generally eligible on lands which our anceſtors have made choice of for common fields; and as the roots of the aſh are not only obſtructions to the plough, but the general nature of the plants is, in a ſingular degree, inimical to corn; it is conſequently neceſſary to eradicate the aſh from the hedge-rows, before the land be again broken up for arable; or to preclude this tedious operation, in the firſt inſtance, by planting oak in its ſtead. It is conceived that the head of the oak may be raiſed to ſuch a height, as not to be injurious to graſs, nor to the hedge, while yet in a youthful ſtate, even though it were ſuffered to run up to its natural height.

The roots of the fir tribe of trees afford equal obſtruction to the plough; they are, of courſe, equally objectionable in the hedge-rows of arable fields.

It is ſuggeſted, in concluſion, that whenever the incloſures are broken up for corn, the hedges ſhould, in common good management, be headed down, and kept in a dwarfiſh ſtate; in which caſe, tall ſtemmed oaks would be a valuable ſource of timber, without being, in almoſt any degree, injurious either to the hedges, or to the corn growing under them. But the training of young oaks, and the general management of hedge-row timber, cannot, with any degree of prudence, be left to a mere occupier. When intended as nurſeries of timber, they ſhould, it is conceived, be under the immediate direction and management of a perſon proper for the purpoſe. See Pollard and Fence.

The writer of the Glouceſter Report on Agriculture, however, remarks, that the practice of planting timber-trees at all in hedges is liable to objections; for if the tree be left to take its natural growth, which is the beſt mode of raiſing it for good timber, the lower fence is ruined by its ſhade and drippings; or if they are cut up and ſhreded into naked poles, or pollarded for the ſake of the lop or fire-wood, the timber is injured, and the beauty of the tree deſtroyed. A better plan is, it is thought, to aſſign certain ſpots on eſtates for the purpoſe of raiſing timber-trees only. This would eventually be no waſte of land, becauſe the graſs or corn growing near the hedges, which are filled with timber or fruit-trees, is worth little or nothing. In the ſmall incloſures at the angles of a field, for inſtance, the trees might take their natural growth; and this would be more rapid, in conſequence of their being planted in clumps, and protected. If, however, the old mode of planting in hedge-rows ſhould be continued, the aſh may be the beſt for the purpoſe. The timber, in ſome reſpects, is ſuperior to elm, and, in various caſes, uſeful where that cannot be applied. In durability it almoſt rivals the oak, and its growth is improved by being kept to a ſingle ſtem, the only mode of treatment in which trees ſhould be admitted into hedge-rows at all, but which few other trees will bear. The oak and beech particularly, when ſo large as to become heart-wood, appear to be greatly hurt by the loſs of their ſide branches; the immediate effect of which is a retardation of growth: and it is ſaid, that the oak will not thrive for ten years after this operation; and of the elm, that it is injured, though apparently ſuffering leſs. It is, however, to be noticed, that the fineſt and ſoundeſt trees are thoſe which have been moſt left to their natural growth.

In

In what relates to the moſt proper ſorts of trees for putting in hedge-rows, in different caſes, it may be further noticed, that when the ſoil is good and deep, according to the firſt of the above writers, the oak and Scotch elm may be the moſt ſuitable; in ſtrong land, the aſh; in poor ſoils, the beech, ſycamore, and birch; in caſes of moiſt ſoils, as meadows and ſuch like places, the Lombardy poplar, which, beſides its timber produce, forms, when in rows, a cloſe, erect, narrow hedge, fifty or ſixty feet high, in a few years. Such hedges are, however, of no very great value, whether the trees be cut low, or allowed to riſe to their full height. The oak and the above ſort of elm proſper better, it is ſaid, in hedge-rows than in any other ſituations; their roots have a free range in the adjoining incloſures, while their tops ſhoot out vigorouſly on every ſide, thus often producing excellent ſhip-timber. More remarks of this nature may be met with in Kent's hints, and Marſhal's work on planting. The beech, it is thought, is peculiarly ſuited for thin ſoils and expoſed ſituations. When put out about ten or twelve feet aſunder, it affords excellent ſhelter, and, at the ſame time, a very conſiderable quantity of timber. The aſh and the ſycamore will riſe and grow erect on the moſt expoſed upland ſituations, or near the ſea. When put out in good ſoils, they ſhould generally be trained to one ſtem; in which ſtate, their timber produce is the moſt valuable and uſeful. The reſinous tribe and the evergreen ſorts of trees are, for the moſt part, improper for being ſet out in hedge-rows. In the different cyder diſtricts or counties in the ſouthern parts of the kingdom, fruit-trees are not unfrequently introduced into the hedge-rows; the practice of which might probably be advantageouſly had recourſe to in many other diſtricts and counties in the ſame part of the country, as well as in ſeveral more to the north. In many different ſituations they would be a valuable acquiſition, without doing any injury, or taking up the more uſeful part of the land.

In a great number of diſtricts and places where hedge-row timber exiſts, the ſituation is often improper, and the management wretchedly bad and negligent; in conſequence of which, it has frequently become an injury to the farmer, without yielding any advantage to the proprietor. Two more glaring inſtances of this cannot, it is thought, be given than in the tall naked elms, and pollarded oaks, which prevail in many places in the ſouthern parts of the iſland: the former, by improper lopping and cutting, are worth nothing; and the latter, by being cut over at the height of eight or ten feet, form ugly buſhy-headed trees, which do great injury and miſchief to the farmer, and yield nothing to the owner. In defence of ſuch practices, it has been ſaid, that fuel alone is the intended produce; but certainly it would be much the beſt method, in ſuch caſes, it is thought, to allot a ſpace or portion by itſelf for the purpoſe of raiſing fuel, and devote the hedge-rows to the more important uſes of producing timber. The fuel part of the land might be rented by the farmer, and the hedge-rows belong excluſively to the proprietor. Keeping each ſort of woody collection ſtrictly characteriſtic of its kind is, it is thought, as beneficial in the raiſing of trees, as the diviſion of labour is in political economy. There is a great number of ſituations and places in the more northern parts of the iſland, as well perhaps as in ſome others, where hedge-row timber might be cultivated to the advantage of both the landlord and tenant, and the great ornament of the country. Suppoſe, it is ſaid, an eſtate of two thouſand acres, divided into fields of ten acres each, and the hedge-rows planted with trees at fifteen feet apart; this would be above the rate of eight trees upon the acre, or ſixteen thouſand trees in the hedges only. At the end of thirty years, if well managed, they would be worth from twenty to forty ſhillings each; but ſay only thirty ſhillings each, this would be ſixteen thouſand pounds: a very conſiderable ſum, it is ſaid, for a proprietor of only two thouſand acres to receive every thirty years, above the annual rent of his eſtate.

Theſe hints and obſervations place the utility and importance of hedge-row planting, where it can be done with propriety, in a ſtriking point of view.

Timber-*Inſpector*, a term applied to a perſon who is appointed to inſpect and examine the ſtates of timber-woods, plantations, and foreſts in any diſtrict or place. It has been ſuggeſted by the writer of the corrected account of the ſtate of agriculture in the county of Devon, that, as it is evident that the timber in that county is waſting in a very alarming manner, (and the ſame is the caſe in many other timber-wooded diſtricts,) it is neceſſary that an ordinance ſhould be made, that in future no timber-tree ſhould be cut down, or legally expoſed for ſale, without having the mark of the timber-inſpector of the diſtrict affixed to it, and a certificate accompanying it. This ſort of officer ſhould, it is thought, be appointed and paid by government, and to whom annual returns ſhould be made of all matters and circumſtances appertaining to his duty, which ſhould alſo extend to the inſpection and examination of all young timber-plantations, &c.: where it ſhould be required that he ſhould not only ſee that a certain number of young trees is planted for every timber-tree that is cut down, but that the ſame young trees and plantations are well fenced in and protected. That on his obſerving ſuch timber woodland fences inſufficient for their ſafety, and their owners perſiſtingly unmindful of the report he has made, he ſhould be empowered to order and direct the neceſſary repairs to be done, and to be enabled to recover the amount of ſuch expence, by levying an immediate diſtreſs upon the moveables on the premiſes of the parties.

It would unqueſtionably be of great utility and advantage in increaſing the quantity, and improving the quality of timber, to have ſuch inſpectors in all timber-wooded diſtricts of every deſcription.

Timber-*Plantation*, that ſort which is made ſimply for the purpoſe of raiſing and producing timber. Several points and circumſtances are neceſſary to be attended to in the performance of this buſineſs, in order to render ſuch plantations the moſt expeditiouſly and abundantly productive, ſuch as the proper choice of ſoil, ſituation, and expoſure, as well as proper fencing in, thinning, training, and pruning, all of which are noticed and explained under their appropriate heads. See Plantation, Planting, Pruning, Thinning, Timber, &c.

Timber-*Repairs*, ſuch as are done by ſome ſort of timber, to be cut down on eſtates, &c. Rough timber is moſtly allowed for repairs to be done by tenants, and it is commonly the cuſtom of this country to permit the top-wood of the trees to be taken by them for their trouble and expences in various ways with ſuch timber. In ſome caſes, however, the contrary mode takes place, ſuch top-wood being charged to them at a moderate rate or price. And, in all caſes, it is thought by the writer of the work on "Landed Property," that the tenant ſhould be charged for the bark of oak-timber, which is now become ſcarce and of great value, he being allowed for peeling and for carriage to market, or other places.

It is adviſed that the neat value of the bark and the top-wood, where it is charged in theſe caſes of repairs, ſhould be made a fair eſtimate of when the timber is marked, and charged to tenants in a ſum certain. By this means they become,

come, it is thought, interested in the peeling and harvesting or securing of the bark: no waste is consequently incurred through their neglect, or any unfair dealings risked; nor is there any disputable account to be settled, on the rent-day, between them and the receivers.

In the view too of enabling the acting managers, in such cases, to *select*, in the best and readiest manner, *proper* trees for the several different sorts of repairs that may, from time to time, be required, — let, it is said, the woodmen, or those who have the immediate charge of the timber of estates, be directed to note down, in going their rounds, such trees as may be faulty, and are likely to go soon to decay, or which are stinted in their growth, or too much crowded, and, in general, such as are proper to be taken down for the different uses of estates: whether for erecting or repairing buildings, or for gates or other purposes: in order that they may be able to lead or direct, without loss of time, the acting managers and the carpenters or builders of estates, with the estimates, in their hands, of the quantity and quality of the timber which is requisite to the trees most proper for any given purpose: thus preserving the *crop* of *sale* timber from unnecessary spoil, by a less discriminate choice or method of proceeding.

Timber, *Stick of*, a term frequently applied to any large boled or stemmed tree of the timber kind: a fine, large, perfect timber-tree. See Timber and Tree.

Timber-*Trees*, the wood of timber, before it be felled, particularly that of oak, &c. See Trees.

For the raising, planting, transplanting, pruning, &c. of timber-trees, see Seminary, Nursery, Pruning, and Transplanting.

Timber-*Wood*, a term signifying that sort of wood which is employed or designed for the raising and growth of timber, in contradistinction to that of the under-wood or coppice kinds, or such as has little or no brush-wood or under-growths in it. There are but few cases in which it is not advantageous for timber-woods to be kept pretty clear and free from most sorts of under-growths, especially where they approach near the trees. See Wood.

Timber-*Wood* or *Tree*, *Register of*, the account which is necessary to be kept of the timber-wood or trees of that kind, which are growing upon the different parts of a timbered estate. The writer of a late work on "Landed Property," has advised that it should consist of all that is met with on the several divisions of an estate; setting forth the number of such trees in each of the different woods, groves, hedge-rows, and all other places, with the several species or kinds, the number which is affixed to each, and the admeasurement of each of them. Separate accounts, containing those trees of each particular division, being entered and kept; for the satisfaction and occasional use of the land-manager and the woodward. Such lists or registers are always of great utility and benefit to the proprietors of timber-wooded estates, as ascertaining their nature, state, and situation in many different respects.

Timber-*Lode*, in our *Old Writers*, a service by which tenants were to carry timber from the woods to the lord's house.

Timber, *Bearing of*. See Bearing.

Timber-*Work*, *Casing of*. See Casing.

Timber or *Timmer of Furs*, as ermines, martens, sables, and the like, denotes forty skins; of other skins, six score. Rust.

"Hæc civitas (sc. Cestriæ) nunc reddebat de firma 45 libras et tres timbrias pellium martenarum." LL. Edw. Conf.

Timbers *of Ermin*, in *Heraldry*, denote the ranks or rows of ermin in noblemen's coats.

Timber, in *Falconry*. *To timber*, is to nestle, or make a nest, as birds of prey do.

Timber, *Prick*, in *Botany*. See Spindle-*Tree*.

Timbers, in *Ship-Building*, the ribs of a ship, or the incurvated pieces of wood branching outward from the keel in a vertical direction, so as to give strength, figure, and solidity to the whole fabric.

One timber in a ship is composed of several pieces united into one frame, which accordingly is called by the artificers a frame of timbers. The timbers whose planes are perpendicular to the keel, are called *square-timbers*; and those which are placed obliquely on the keel, as at the extremities of a ship, are called *cant-timbers*. The foremost of those pieces on the ship's bow are called the *knuckle-timbers*; and the hindermost on the quarter, the *fashion-pieces*. See Ship-building.

Timber *and Room*, or *Room and Space*, is the distance betwixt the moulding edges of two adjoining timbers, which must always contain the breadth of two timbers; and sometimes two or three inches between them.

TIMBO, in *Geography*, a town of Africa, on the Grain Coast. N. lat. 5° 28′. W. long. 9° 20′.

TIMBRE, or Timmer, in *Heraldry*, denotes the crest of an armory, or whatever is placed atop of the escutcheon, to distinguish the degree of nobility, either ecclesiastical or secular.

Such as the papal tiara, cardinal's hat, the cross, mitre, coronet, mortier, and particularly the casques or helmets, which the ancients called more especially timbres, from their resembling a kind of bell without a clapper, which the French call timbre, or because they resounded like those timbres when struck. This is the opinion of Loiseau, who derives the word from the Latin, *tintinnabulum*.

TIMBREL, *Tabret*, or *Tambour de Basque*, in *Music*, is an instrument of very high antiquity; having been in use among the Hebrews, Greeks, and Romans. To the rim were hung bells or pieces of metal.

TIME is a portion or part of infinite duration. It is generally measured by motion, and chiefly by the motions of the heavenly bodies.

There is nothing perhaps of which the mind is less capable of forming a distinct idea than time, unconnected with the motions of sensible objects; and yet, on account of this connection, every one thinks it a subject with which he is familiarly acquainted, until an explanation is required.

The opinions of ancient philosophers on the subject are generally vague and contradictory. Pythagoras and Heraclitus maintained that time was a substance, but the Stoics considered it as unsubstantiated. Aristotle and the Peripaticians define time to be "a multitude of parts of motion, which pass and succeed each other in a continual flux, and have relations to each other, inasmuch as some are anterior and others posterior." Archytas defined it to be "a continued and indivisible flux of *nows* or instants."

The Epicureans considered "time as merely an object of the imagination, or an attribute given to things by the mind while contemplating them either as enduring or ceasing; as possessing a longer or shorter existence, as enjoying such existence, as having enjoyed it, or as being about to enjoy it."

Lucretius, the great poet and philosopher of this sect, defines time as follows:

"Tempus item per se non est, sed rebus ab ipsis
Consequitur sensus, transactum quid sit in ævo;
Tum, quæ res instet, quid porro deinde sequatur:
Nec per se quemquam tempus sentire fatendum est
Semotum ab rerum motu, placidâque quiete."

Lib. i. 460.

Thus

Thus tranflated by Creech:

"Time of itfelf is nothing, but from thought
Receives its rife, by labouring fancy wrought
From things confidered, whilft we think on fome
As prefent, fome as paft, or yet to come.
No thought can think on time, that's ftill confeft,
But thinks on things in motion or at reft."

The above opinion of Lucretius, though fanctioned by many of the ancients, and even by fome of the moderns, does not appear to have fatisfied philofophers in general. Cicero fays (1 de Invent.) "difficile eft tempus definere." Thus alfo St. Auftin (2 Confeff. 24.) obferves, "fi nemo ex me quærat quid fit tempus, fcio; fe quærenti explicare velim, nefcio."

Locke feems to have confidered time more profoundly than perhaps any other philofopher. The following are among his opinions on the fubject. Human Underft. vol. i. ch. 14.

"The anfwer of a great man to one who afked him what time was, 'fi non rogas intelligo,' (which amounts to this; the more I fet myfelf to think of it, the lefs I underftand it,) might perhaps perfuade one that time, which reveals all things, is not itfelf to be difcovered. Duration, time, and eternity, are, not without reafon, thought to have fomething very abftrufe in their nature.

"To underftand time and eternity aright, we ought with attention to confider what *idea* it is we have of *duration*, and how we came by it. 'Tis evident to one who will but obferve what paffes in his own mind, that there is a train of ideas which conftantly fucceed one another in his underftanding as long as he is awake. Reflection on thefe appearances of feveral ideas, one after another in our minds, is that which furnifhes us with the idea of *fucceffion;* and the diftance between the appearance of any two ideas in our minds, is that which we call *duration* (which fee). Having thus got the idea of duration, the next thing natural for the mind to do, is to get fome *meafure* of this common duration, whereby it might judge of its different lengths, and confider the diftinct order wherein feveral things exift: without which, a great part of our knowledge would be confufed, and a great part of hiftory rendered very ufelefs. This confideration of duration, as fet out by certain periods, and marked by certain meafures or epochs, is that, I think, which moft properly we call *time*."

Nearly according to the above our modern Encyclopædifts define time; *viz.* "a fucceffion of phenomena in the univerfe, or a mode of duration marked by certain periods and meafures, and principally by the motions or apparent revolutions of the fun." Others define time to be "the duration of a thing, the exiftence of which is not without beginning or end; which diftinguifhes time from eternity."

Time is diftinguifhed into *abfolute* and *relative*.

Abfolute time is confidered in itfelf, without any relation to bodies or their motions flowing uniformly. *Relative time* is the fenfible meafure of any portion of duration by means of motion. As the equal and uniform flux of time does not affect our fenfes; and as there is nothing in this flux that can make us know immediately time itfelf; we muft, of neceffity, have recourfe to fome motion, by which we can determine the quantity of time, by comparing parts of time with thofe of fpace that the moving body traverfes. Therefore, as we judge that times are equal, when they flow whilft a body which is in an uniform motion traverfes equal fpaces; fo likewife we judge that times are equal, when they flow whilft the fun, moon, and the other celeftial luminaries, complete their ordinary revolutions, which to our fenfes appear uniform. See Motion.

But as the flowing of time cannot be accelerated nor retarded; as all bodies move fometimes quicker and fometimes flower; and as there is perhaps no perfectly uniform motion in nature, except the earth's rotation on its axis, fome authors are of opinion that abfolute time cannot be concluded to be fomething really diftinct from motion: for fuppofing for a moment the earth and the other planets have been without motion ever fince the creation, does it thence follow that the courfe of time would have been ftopped or interrupted? Would not the duration of this ftate of reft have been equal to the time which has elapfed fince the creation?

As abfolute time is a quantity which flows in a uniform manner, and which is very fimple in its nature, mathematicians reprefent it to the imagination by the moft fimple fenfible magnitudes, particularly by right lines and by circles, with which abfolute time appears to have a great analogy in refpect of fucceffion, the fimilarity of parts, &c.

In fact, it is not abfolutely neceffary to meafure time by motion; for the conftant and periodical return of a thing which happens or manifefts itfelf by intervals equally diftant from each other, as, for inftance, the budding of a plant, &c. may do the fame thing. It is faid there are people in America who reckon years by the arrival and departure of birds.

Time is ufually reprefented by the uniform motion of a point that defcribes a right line. The point is the fucceffive ftate, prefent fucceffively at different places, and producing by its fluxion a continual fucceffion, to which we attach the idea of time. The uniform motion of an object alfo meafures time; for when this motion takes place, the moving body traverfes, for example, one foot in the fame time in which it has traverfed a firft foot; therefore, the duration of things that co-exift with the moving body whilft it traverfes one foot being taken as one, the duration of thofe that will co-exift with its motion whilft it will be traverfing two feet will be two, and fo on; fo that by this means time becomes commenfurable, fince we can affign the reafon of one duration to another duration that we had taken for unity. Thus, in clocks, the hand moves uniformly in a circle: the twelfth part of the circumference of this circle is unity, and time is meafured by this unity, by faying two hours, three hours, &c. So likewife one year is taken for one, becaufe the revolutions of the fun in the ecliptic are equal, or nearly fo, to our fenfes; and we make ufe of it to meafure other durations in relation with this unity. We know the attempts made by aftronomers to find a uniform motion, to enable them to meafure time exactly; and this is what has been beft done by means of pendulums. See Pendulum.

There is no meafure of time exactly correct. Every one has his own meafure of time in the quicknefs or flownefs with which his ideas fucceed each other; and from thefe different degrees of quicknefs in different perfons, or in the fame perfon at different times, arife thefe modes of fpeaking, *I have found the time very long*, or *very fhort;* for time appears long to us, when the ideas fucceed each other flowly in our mind, and *vice verfâ*. The meafures of time are arbitrary, and may vary among different people: the only one that is univerfal is the prefent inftant; and yet fome deny the exiftence of prefent time, as being conftantly on the wing; or, according to Horace, (Carmen XI.)

"Dum loquimur fugerit invida ætas."

Time is indeed an inexhauftible fubject for figurative and poetical allufions, and even for paradoxes. Thus, it is faid

to

to owe its own immaterial being to the creation of material order; to have all its portions meafured by the periodical motions of matter, and yet to be diftinct from, and independent of, thofe motions for its exiftence, though it could not exift until they exifted: alfo that it operates upon every thing, yet touches nothing. Many other contradictory properties might be mentioned, but fuch tend to darken rather than to elucidate the fubject. Some philofophers have gone even fo far as to deny the exiftence of time; for if there be no prefent, there cannot be any future, and the paft certainly has no exiftence.

We now come to confider the application of mathematics to time, as connected with aftronomical computations, where the fubject is accurately calculated, and rendered fubfervient to the important purpofes of meafuring fpace, by which the longitude is determined both in the heavens and on earth.

Aftronomical time is diftinguifhed into folar or apparent time, mean time, and fidereal time.

Apparent time, alfo called *true folar* and *aftronomical time*, is regulated by the apparent motions of the fun. *Mean* or *mean folar time*, alfo called *equated time*, is a mean or average of apparent time: and *fidereal time* is fhewn by the diurnal revolutions of the fixed ftars.

An *apparent day* is the interval between two fucceffive tranfits of the fun's centre over the fame meridian, which interval is fubject to continual variations, owing to the eccentricity of the earth's orbit, and the obliquity of the ecliptic to the equator. Thefe variations are computed in a table, for which fee EQUATION *of Time*.

A *mean day* is the interval that would be obferved between two fucceffive tranfits of the fun's centre over the fame meridian, if the earth's orbit were circular, and the fun always in the equinoctial. Thus the intervals or tranfits would be all equal, fuch as are fhewn by a clock that goes exactly 24 hours in a day, and $365^{d}\ 5^{h}\ 48^{m}\ 48^{s}$ in a year. A clock thus fet is faid to be adjufted to mean time.

A *fidereal day* is the interval between two fucceffive tranfits of a ftar over the fame meridian; which interval is uniform, becaufe all the fixed ftars make their revolutions in equal times, owing to the uniformity of the earth's diurnal rotation on its axis.

The fidereal day is fhorter than the mean folar day by $3^{m}\ 56^{s}.55$ fidereal time. This difference arifes from the fun's apparent annual motion from weft to eaft, which leaves the ftar as it were behind. Thus, if the fun and a ftar be obferved on any day to pafs the meridian at the fame inftant, the next day, when the ftar returns to the meridian, the fun will have advanced about a degree eafterly (his daily portion of the ecliptic): and, as the earth's diurnal rotation on its axis is from weft to eaft, the ftar will come to the meridian before the fun, infomuch that at the end of the year it will have gained a day on the fun, that is, it will have paffed the meridian 366 times, while the fun will have paffed it but 365 times. Now as the fun appears to perform his revolution of 360° in a year, fay, as $365^{d}\ 5^{h}\ 48^{m}\ 48^{s} : 360° :: 1^{d} : 59'\ 8''.3$, which is the fpace the fun would defcribe in a day, if all the days were of an equal length; and this fpace reduced to time, $= 3'\ 56''.55 =$ the excefs of a *mean* day above a *fidereal* day, in fidereal time, or $3'\ 55''.91$ in mean folar time.

It therefore appears that the earth defcribes about its axis an arc of $360°\ 59'\ 8''.3$ in a *mean folar* day, and an arc of 360° in a *fidereal* day; therefore, as $360°\ 59'\ 8'' : 360° :: 24^{h} : 23^{h}\ 56'\ 4''.09 =$ the length of a fidereal day in mean folar time, or the interval between two fucceffive tranfits of a ftar over the fame meridian.

Hence the following general rule for converting fidereal to mean time, and the contrary:

As $24^{h} : 23^{h}\ 56'\ 4''.09 ::$ any portion of fidereal time to its equivalent in mean time. And as $23^{h}\ 56'\ 4''.09 : 24^{h} ::$ any portion of mean time to its equivalent in fidereal time. Thus Tables I. and II. in our article CHRONOMETER are computed.

From what has been faid, it is evident that apparent and mean time are the fame, with refpect to the length of the hour, minute, and fecond of each, as well as of the year; but the hour, minute, and fecond of fidereal time are refpectively lefs in the above proportion. It is only the folar and mean days that differ, and this variation is marked by the times of commencement. Thus the apparent day always begins when the fun's centre is on the meridian; but the mean day commences fometimes fooner and fometimes later, as computed in the tables of the equation of time. See EQUATION *of Time*.

The *reduction of time*, that is, to turn apparent, mean, and fidereal time into each other, may be performed by the following theorems, taken from Kelly's Spherics, p. 208, ed. 4.

Let $A =$ apparent time.
$M =$ mean time.
$S =$ fidereal time.
$E =$ the equation of time at apparent noon.
$e =$ the daily difference of the equation of time.
$R =$ the fun's right afcenfion at apparent noon.
$r =$ the daily increafe of the fun's right afcenfion.
$N =$ the fun's mean right afcenfion at mean noon, *i. e.* the fidereal time at mean noon.
$m =$ the reduction of fidereal time at the rate of $3'\ 55''.91$ for 24 hours fidereal time.
$s =$ the reduction of mean to fidereal time, at the rate of $3'\ 56''.55$ for 24 hours mean time.
And let $\pm$ fignify that addition or fubtraction which is to be ufed according as the quantity under confideration is increafing or decreafing.
Alfo let $A' = M \pm E$, as applied in cafe 2.

Formulæ for the Reduction of Time.

Cafe.	Given.	Req^{d}.	Solution.
1	A	M	$M = A \pm E \pm \frac{A \times e}{24}$
2	M	A	$A = A' \pm \frac{A' \times e}{24 \pm e}$
3	M	S	$S = N + \overline{M + s}$
4	S	M	$M = \overline{S - N} - m$
5	A	S	$S = A + \frac{A \times r}{24} + R$
6	S	A	$A = S - R - \frac{\overline{S - R} \times r}{24 + r}$

The

The foregoing ſix caſes comprehend all the varieties that occur in the reduction of time; and for their numerical illuſtration, ſee our article CHRONOMETER.

For the application of time to the meaſurement of ſpace and motion, ſee LONGITUDE and LUNAR *Obſervations*.

TIME, *Civil*, is aſtronomical time accommodated to civil uſes, and formed and diſtinguiſhed into years, months, days, and hours, with their ſubdiviſions: the reckoning of the hours as civil to twelve twice over, is meant to mark the natural day.

TIME, in *Heathen Mythology*, was perſonified and deified. Saturn was uſually the ſymbol of it. Time was repreſented with wings, to mark the rapidity with which it paſſes, and with a ſcythe, to ſignify its ravages. It was divided into ſeveral parts; the century, the generation or ſpace of thirty years, the luſtrum, the year, the ſeaſons, the months, the days, and the hours; and each of theſe parts had its particular figure in men or women, according as their names were maſculine or feminine; their images were uſed in religious ceremonies.

TIME, in *Muſic*, is an affection of ſound, by which we denominate it *long* or *ſhort*, with regard to its continuance in the ſame degree of tune.

Time and tune are the great properties of ſound, on whoſe difference or proportions muſic depends: each has its ſeveral charms: where the time or duration of the notes is equal, the differences of tune alone are capable of entertaining us with endleſs pleaſure.

And of the power of time alone, *i. e.* of the pleaſures ariſing from the various meaſures of long and ſhort, ſwift and ſlow, we have an inſtance in the drum, which has no difference of notes, as to tune.

Time, in muſic, is conſidered either with reſpect to the abſolute duration of the notes, *i. e.* the duration conſidered in every note by itſelf, and meaſured by ſome external notion foreign to the muſic; in reſpect to which the compoſition is ſaid to be *quick* or *ſlow*: or it is conſidered with reſpect to the relative quantity or proportion of the notes compared with one another. See NOTE.

The ſigns or characters by which the time of notes is repreſented, are ſhewn under the article CHARACTERS, in *Muſic*, where the names, proportions, &c. are alſo expreſſed.

A ſemi-breve, for inſtance, is marked to be equal to two minims, a minim to two crotchets, a crotchet to two quavers, and ſo on, ſtill in a duplicate ratio, *i. e.* in the ratio of 2 : 1. Now where the notes reſpect each other thus, *i. e.* where they are in this ratio, the muſic is ſaid to be in *duple*, *i. e.* *double* or *common* time.

When the ſeveral notes are triple of each other, or in the ratio 3 : 1, that is, when the ſemi-breve is equal to three minims, the minim to three crotchets, &c. the muſic is ſaid to be in *triple* time.

To render this part as ſimple as poſſible, the proportions already ſtated among the notes are fixed and invariable: and to expreſs the proportion of 3 : 1, a point (.) is added to the right ſide of any note, which is deemed equivalent to half of it; and by this means a pointed ſemi-breve, O. becomes equal to three minims, and ſo of the reſt.

From hence ariſe ſeveral other ratios conſtituting new kinds of triple time; as 2 : 3 and 3 : 4, &c.; but theſe, Mr. Malcolm obſerves, are of no real ſervice, and are not perceived without a painful attention. For the proportions of the times of notes, to afford us pleaſure, muſt be ſuch as are not difficultly perceived; on which account the only ratios fit for muſic, beſide that of equality, are the double and triple.

TIME, *Common* or *Duple*, is of two ſpecies: the firſt, when every bar or meaſure is equal to a ſemi-breve, or its value in any combination of notes of a leſs quantity.

The ſecond, where every bar is equal to a minim, or its value in leſs notes. The movements of this kind of meaſure are various, but there are three common diſtinctions; the firſt *ſlow*, ſignified at the beginning by the mark C; the ſecond *briſk*, ſignified by ; the third *very quick*, ſignified by

But what that ſlow, briſk, and quick is, is very uncertain, and only to be learned by practice. The neareſt meaſure we know of, is to make a quaver the length of the pulſe of a good watch; then a crotchet will be equal to two pulſes, a minim to four, and the whole meaſure or ſemi-breve to eight. This may be reputed the meaſure of *briſk* time; as for the *ſlow*, it is as long again, and the quick is only half as long.

Some propoſe to meaſure it by imagining the bar as actually divided into four crotchets, in the firſt kind, and ſo make the whole as long as one may diſtinctly pronounce theſe four words, *one*, *two*, *three*, *four*, all of equal length: ſo that the firſt crotchet may be applied to *one*, the ſecond to *two*, &c. and for other notes proportionally: and this is made the briſk movement of *common* time.

The whole meaſure then of common time is equal to a ſemi-breve, or a minim; but theſe are variouſly ſubdivided into notes of leſs quantities.

Now to keep the time equal, we make uſe of a motion of the hand or foot, thus: knowing the true time of a crotchet, we ſhall ſuppoſe the meaſure or bar actually ſubdivided into four crotchets for the firſt ſpecies of common time; then the half meaſure will be two crotchets; therefore the hand or foot being up, if we put it down with the very beginning of the firſt note or crotchet, and then raiſe it with the third, and then down to begin the next meaſure; this is called *beating of time*.

By practice, they get a habit of making this motion very equal, and conſequently of dividing the meaſure or bar into equal parts, up and down; as alſo of taking all the notes in the juſt proportion, ſo as to begin and end them preciſely with the beating. In the meaſure of two crotchets, they beat down the firſt, and the ſecond up. Some call each half of the meaſure in common time, *a time*; and ſo they call this the mode or meaſure of *two times*, or the *dupla* meaſure.

Again, ſome mark the meaſure of two crotchets with a 2 or $\frac{2}{4}$, ſignifying it to be equal to two notes, of which four make a ſemi-breve; and ſome mark it $\frac{2}{8}$ for quavers. Malcolm's Muſic, p. 385, &c.

TIME, *for Triple*. See TRIPLE-*Time*.

TIME-*Table*. See CHARACTERS, FRANCO, and *Plate* I*.

TIME, in *Fencing*. There are three kinds of time; that of the ſword, that of the foot, and that of the whole body. All the times that are perceived out of their meaſure, are only to be conſidered as appeals, or feints, to deceive and amuſe the enemy. See FENCING.

TIME, in the *Manege*, is ſometimes taken for the motion of a horſe, that obſerves meaſure and juſtneſs in performing a manege; and ſometimes it ſignifies the interval between two of his motions. In the manege of a ſtep and a leap, the horſe makes by turns a corvet between two caprioles; and in that caſe the corvet is one time that prepares the horſe for the caprioles.

The

The times obſerved in making a ſtop are nothing but ſo many falcades.

Time alſo ſignifies the effect of one of the aids; thus, we ſay, a good horſeman diſpoſes his horſe for the effects of the heel, by beginning with one time of the legs, and never runs precipitately upon his times.

Time *of ſhewing Flowers*, in *Gardening*, among floriſts, the period or ſeaſon of exhibiting thoſe of the finer kinds, either on the ſummer ſtages for this purpoſe, or in other places. For ſome ſorts of flowers, as thoſe of the auricula and other ſimilar kinds, it is uſually from about the latter part of April until about the beginning of May, in ſituations near the metropolis, in which length of period or ſeaſon there are commonly about four ſuch ſhows at different ſuitable intervals of time.

In other ſorts of fine flowers, the ſhows are moſtly ſomewhat later, and do not laſt any great length of time, as for tulips, carnations, and ſome other ſimilar kinds; and there are ſtill a few others which laſt differently in regard to time, or a great part of the ſummer ſeaſon. See Summer-*Stage*.

TIMELFIOERD, in *Geography*, a bay of the North ſea, on the coaſt of Norway; 32 miles W. of Romſdal.

TIMEN-GUY, in *Rigging*, a rope faſtened at one end to the fore-ſhrouds, and nailed at the other end to the anchor-ſtock, on the bow, to prevent the fore-ſheet from entangling.

TIMENS, in *Geography*, a town of Norway, in the province of Chriſtianſand; 15 miles S. of Stavanger.

TIMERA, a town of Sweden, in the province of Medelpadia; 5 miles N. of Sundſwall.

TIMERY, a town of Hindooſtan, in the Carnatic; 6 miles S. of Arcot.

TIMERYCOTTA, a town and fortreſs of Hindooſtan, in Golconda; 54 miles S.E. of Hydrabad. N. lat. 15° 20′. E. long. 79° 26′.

TIMERYDURGAM, a town of Hindooſtan, in Baramaul; 21 miles N.N.W. of Darempoury.

TIMESQUIT, or Timasquit, a town of Africa, in the country of Darah; 80 miles W. of Tafilet.

TIMETHUS, in *Ancient Geography*, a river of Sicily, the mouth of which is placed by Ptolemy between Tyndarium and Agathyrium.

TIMICI, *Abat-el-Wed*, a place in Africa, S.E. of Arſinaria, on the banks of one of the rivers which formed the Carteimus; and in which are ruins.

TIMIRU, in *Geography*, a town of the iſland of Cuba; 20 miles W.S.W. of Villa del Principe.

TIMMER. See Timber and Timbre.

TIMMIA, in *Botany*, received that name from the celebrated Hedwig, in compliment to his correſpondent Mr. Joachim Chriſtian Timm, an apothecary and principal magiſtrate at Malchin, who publiſhed *Floræ Megapolitanæ Prodromus*, in 1788. This makes an octavo volume, containing the names, characters, places of growth, &c. of the native plants of Mecklenburg-Schwerin, diſpoſed according to the Linnæan ſyſtem, with the abolition of the 20th, 21ſt, 22d, and 23d claſſes, and a ſeparation of all the graſſes and graſs-like plants together, into a claſs by themſelves. The number of ſpecies is 1200, of which 501 belong to the *Cryptogamia*, the other claſſes being far from rich. Neither does the work contain any critical obſervations to compenſate for the inconvenience of the above changes.—Hedw. Crypt. v. 1. 83. Sp. Muſc. 176. Schreb. Gen. 761. Timm. Megapol. 234.—Claſs and order, *Cryptogamia Muſci*. Nat. Ord. *Muſci*.

Eſſ. Ch. Capſule ovate. Outer fringe of ſixteen pointed teeth: inner membranous, with jointed teeth combined at the top. Male flowers on the ſame plant, axillary, ſtalked, bud-ſhaped.

The known ſpecies are two only. *T. megapolitana*, Hedw. Crypt. v. 1. 83. t. 31, found near Malchin, growing in boggy ground among *Carices*, as well as in North America: and *T. auſtriaca*, Hedw. Sp. Muſc. 176. t. 42. f. 1—7, native of Schneeberg, a celebrated Auſtrian mountain. Both have the habit of Bryum, or Mnium; ſee thoſe articles. We cannot conſider *Timmia* as an admiſſible genus, being diſtinguiſhed from *Bryum* merely by the connexion of the points of the inner fringe, like Pohlia of Hedwig, which the reader will find in its proper place. Under the head of Fringe *of Moſſes* we have ſuggeſted the objections to founding genera on the differences of figure in the inner fringe, which are uncertain, variable, very difficult to obſerve, and lead to unnatural diſtinctions. Characters derived from the ſituation of the male flowers are ſubject to ſtill greater difficulties and objections.

TIMMISKAMAIN Lake, in *Geography*, a lake of North America, in Canada. This lake gives name to a tribe of Indians near it. N. lat. 47° 30′. W. long. 80° 40′.

TIMMS, a town of North Carolina; 15 miles S.S.E. of Fayetteville.

TIMOAN, an iſland in the Eaſt Indian ſea, inhabited by Malays: ſhips may obtain wood and water; the anchorage is good almoſt all round the iſland; but the inhabitants are ſurly and inſolent. N. lat. 2° 58′. E. long. 104° 25′.

TIMOCHARIS, in *Biography*, an aſtronomer of Alexandria, who flouriſhed in the third century B.C. He obſerved B.C. 294, on the 9th of March, four hours before midnight, a conjunction of the moon with the Spica Virginis, the ſtar being then, according to him, 8° W. from the equinoctial point.

TIMOK, in *Geography*, a river of Servia, which riſes in mount Hæmus, and runs into the Danube, 6 miles N. of Viddin.

TIMOLEON, in *Biography*, a diſtinguiſhed example of patriotiſm and attachment to liberty, was of noble parentage, and a native of Corinth. His diſcriminating character was exhibited at an early age in the reſcue of his brother Timophanes at a moment of danger, when he was thrown from his horſe in an engagement with the Argives, and ſurrounded by the enemy. Timoleon flew to his aid, covered him with his ſhield, and after receiving many wounds, liberated his brother. This ſame brother, being placed by the Corinthians for the ſafety of their city at the head of a ſtanding body of mercenaries, aſſumed the ſovereignty of the ſtate; but Timoleon, dreading the ſubverſion of the liberty of his country by the ambition of his own brother, remonſtrated againſt his proceedings; and, finding his own attempts for reſtraining him ineffectual, engaged two friends to concur with him in his efforts; but their united endeavours proving of no avail, Timoleon is ſaid to have ſtood by him weeping, with his face covered, while his aſſociates diſpatched the tyrant. Such is the account of Plutarch; but Diodorus ſays, that Timoleon killed his brother with his own hand. This act,

act, however, followed by the reproaches of his friends, and by the imprecations of his mother, was the occasion of poignant distress to Timoleon; so that he withdrew from all public affairs, and for some years wandered about in the most disconsolate state, in the most gloomy recesses of his grounds, without ever approaching the city. After a retirement of twenty years, the Syracusans applied to Corinth for succour in a season of calamity, occasioned by domestic tyrants, and by the hostile preparations of the Carthaginians. The Corinthians passed a vote for granting the assistance that was requested, and Timoleon, in preference to many others who were proposed, was appointed their general. Timoleon sailed for Sicily in the year B.C. 344, with a fleet of about ten sail, and arriving, by a stratagem, in the port of Tauromenium, disembarked his army, consisting of no more than one thousand men. Success and victory attended his arms; and having become master of Syracuse, he destroyed its citadel as a nest of tyrants, and caused to be erected in its place a hall of judicature; thus intimating, that the state was now to be governed by laws, and not by arms. He also colonized the city, which had been depopulated, by an importation of Greeks, and by inviting all the fugitives to return. Timoleon at the same time extended his attention to the other cities of Sicily, reducing those inhabitants who had usurped authority to the rank of private citizens, or sending them as exiles to Corinth. He prepared likewise to resist the Carthaginians, who were sending a powerful army against the island; and with a small force, but by extraordinary displays of valour and military skill, totally defeated them. He afterwards directed his attention to the internal state of Sicily, and by the measures which he adopted, settled its inhabitants in the unmolested possession of the advantages which they enjoyed in a fertile soil and propitious climate. The Sicilians acknowledged their obligations with gratitude and respect, and considered Timoleon as the common father of the nation. Having fixed his abode in Syracuse, he sent to Corinth for his wife and family, and lived as a private citizen, respected and esteemed for his virtues. Two demagogues, however, contrived to disturb his tranquillity, and brought charges against him, which he thought unworthy of refutation, and in reference to which he merely said, "he could not sufficiently express his gratitude to the gods for allowing him to see the time when the Syracusans enjoyed the liberty of speaking what they thought proper." Whilst Greece was involved in the calamities of a civil war, and in conflicts which terminated in the loss of public liberty, Timoleon was unmolested and tranquil, in a country which he had contributed to render happy. Fortunate in all his transactions after he left Corinth, he ascribed his successes to the goddess Fortune, and dedicated to her the house in which he resided. It has been observed, that in the system of the ancients, a regard to these nominal and fictitious deities did not exclude their belief of a superintending providence: and a particular instance occurs in the history of Timoleon which would lead him to imagine that his life and its incidents were under a providential care and direction. Soon after his arrival in Sicily, two strangers were hired to assassinate him: and whilst he was sacrificing in the temple of Adranum, where he then lived, these murderers mixed in the throng, and were preparing to execute their commission. At this instant a man gave one of them a blow on the head with his sword, which laid him at his feet, and then fled to the top of a rock. The other, supposing their design had been discovered, laid hold of the altar, and intreated Timoleon to spare his life, on condition of his revealing the whole plot. The first fugitive being brought down from the rock, asserted that he had committed no crime, because the man whom he had struck had murdered his father in the city of Leontium. Such an escape would naturally impress a mind less thoughtful than that of Timoleon.

At a late period Timoleon lost his sight, and this affliction he bore with perfect resignation: and it was alleviated to him by the assiduous attentions of the Syracusans. In his old age he was revered by the Syracusans as a father in the midst of his family: and at length terminated his life by a slight disease, in the year B.C. 335. His funeral obsequies were attended by a great number of people; and when the body was placed on the pile, a herald made the following proclamation: "The people of Syracuse inter Timoleon the Corinthian, the son of Timodemus, at the expence of two hundred minæ: they honour him, moreover, through all time, with annual games, to be celebrated with music, horse-racing, and wrestling: as the man who destroyed tyrants, subdued barbarians, repeopled great cities which lay desolate, and restored to the Sicilians their laws and privileges." A monument was afterwards erected to his memory in the market-place, which being surrounded with porticoes and other public buildings, was made a place of exercise for the youth, and named the "Timoleontéum." Plut. Vit. Timol. Anc. Un. Hist.

TIMON *the Phliasian*, a disciple of Pyrrho, flourished in the time of Ptolemy Philadelphus, and lived to the age of ninety years. At an early age he visited Megara, for the advantage of Stilpo's instructions in dialectics, and afterwards removed to Elea, where he became a hearer of Pyrrho. He first professed philosophy at Chalcedon, and afterwards at Athens, where he remained till his death. He took so little pains to invite disciples to his school, that it has been said of him, that as the Scythians shot flying, Timon gained pupils by running from them. This indifference to his profession was probably owing to his love of ease and indulgence; for he was fond of rural retirement, and so much addicted to wine, that he held a successful contest with several celebrated champions in drinking. This disposition probably led him to embrace the indolent doctrine of scepticism. He seems to have treated the opinions and disputes of the philosophers with contempt, for he wrote with sarcastic humour against the whole body. His poem, entitled "Silli," often quoted by the ancients, was a keen satire, abounding with bitter invectives against men and doctrines. The remaining fragments of this poem have been industriously collected by Henry Stephens, in his "Poesis Philosophica." The public succession of professors in the Pyrrhic school terminated with Timon. Brucker by Enfield.

TIMON, SAMUEL, a writer of history, was born at Tirnau, in Hungary, and died at Cassovia, in 1736, at the age of sixty-one years. In 1693 he entered among the Jesuits, and being of feeble constitution, declined the labours of the society, and devoted himself to literary occupation, particularly to the history of his own country, in reference to which he published several works. Nouv. Dict. Hist.

TIMONEER, TIMONIER, Fr., in *Sea Language*, the helmsman, or person who manages the helm to direct the ship's course.

TIMONITIS, in *Ancient Geography*, a country of Asia, in Paphlagonia, in the vicinity of Bithynia. Strabo and Ptolemy.

TIMONVILLE, in *Geography*, a town of France, in the department of the Moselle; 9 miles W. of Morhange.

TIMOORGOODA, a town of Hindoostan, in the circar of Cicacole; 10 miles S.W. of Cicacole.

TIMOPHEEVA, a town of Russia, in the government of Irkutsk, on the Ilim; 32 miles N.W. of Vercholensk.

TIMOR, an island in the East Indian sea, about 120 miles

miles in length, and 33 in breadth. The Portugueſe were the firſt Europeans who formed any kind of ſettlement on this iſland, who fled to it as a place of refuge from their enemies, the Dutch. But they were purſued by thoſe implacable enemies, and in the year 1613 driven from Cupan, or Coupang, a town ſituated at the weſt end of the iſland, where the Dutch have ever ſince poſſeſſed and garriſoned a fort which the Portugueſe had erected. The chief of the natives, or king of the iſland, is by the Dutch called *keyſer* (emperor). Some Portugueſe reſide in the north part of the iſland. The principal productions are ſanders or ſandal wood and wax, which the Dutch receive in exchange for coarſe linens or piece-goods; but on the whole, the profit ariſing from the commerce is little more than ſufficient to defray the expences, and the ſettlement in all probability is continued merely to keep out other nations. S. lat. 7° 16′ to 10° 24′. E. long. 124° to 126° 21′.

Timor *Laut*, or *Laoet*, ſignifying in the Malacca language *ſea*, an iſland in the Eaſt Indian ſea, about 60 miles in circumference. S. lat. 7° 25′. E. long. 132° 16′.

TIMOROSO, in the *Italian Muſic*, intimates that the ſong is to be played or ſung in ſuch a manner as to expreſs an awe or dread, either to ſhew reſpect, or to repreſent fear.

TIMOROUS, in the *Manege*. See Starting, Skittish, &c.

TIMOTEO da Urbino, in *Biography*, whoſe real name was T. della Vite, was born at Urbino in 1470. He received his education as an artiſt under F. Francia, at Bologna, but at the age of twenty-ſix returned to his native city, whence he ſoon after went to Rome to ſee his countryman, Raphael, and the great works in the Vatican which had recently acquired for him ſo much renown. Raphael employed him in painting the Sibyls in the church of La Pace, and was ſatisfied of his ability in the performance: ſo much ſo, that he allowed him to retain the Cartoons. After this he returned to Urbino, and there executed ſeveral great works for the cathedral and other public buildings. He improved his ſtyle, as it was natural he ſhould, under the tuition of his great maſter: and his latter productions exhibit much grace and vigour in their execution. His moſt eſteemed works are, the Conception, in the church of the Oſſervanti, at Urbino; and Chriſt appearing to Mary Magdalen, in S. Angeli, at Cagli. He died in 1524, aged fifty-four.

TIMOTHEUS, one of the moſt celebrated poet-muſicians of antiquity, was born at Miletus, an Ionian city of Caria, 246 B.C. He was contemporary with Philip of Macedon, and not only excelled in lyric and dithyrambic poetry, but in his performance upon the cithara. According to Pauſanias, he perfected that inſtrument by the addition of four new ſtrings to the ſeven which it had before; though Suidas ſays it had nine before, and that Timotheus only added two, the tenth and eleventh, to that number.

It ſeems neceſſary here to ſtate the ſeveral claims made in favour of different perſons who have been ſaid to have extended the limits of the Greek muſical ſcale.

Many ancient and reſpectable writers tell us, that before the time of Terpander, the Grecian lyre had only four ſtrings; and, if we may believe Suidas, it remained in this ſtate 856 years, from the time of Amphion, till Terpander added to it three new ſtrings, which extended the muſical ſcale to a heptachord, or ſeventh, and ſupplied the player with *two conjoint tetrachords*.

It was about 150 years after this period, that Pythagoras is ſaid to have added an eighth ſtring to the lyre, in order to complete the octave, which conſiſted of *two disjunct tetrachords*.

Theſe dates of the ſeveral additions to the ſcale, at ſuch diſtant periods, though perhaps not exact, may, however, if near the truth, ſhew the ſlow progreſs of human knowledge, and the contented ignorance of barbarous times. But if we wonder at the muſic of Greece remaining ſo many ages in this circumſcribed ſtate, it may be aſked, why that of China and Perſia is not better now, though the inhabitants of thoſe countries have long been civilized, and accuſtomed to luxuries and refinements.

Boethius gives a different hiſtory of the ſcale, and tells us that the ſyſtem did not long remain in ſuch narrow limits as a tetrachord. Chorœbus, the ſon of Athis, or Atys, king of Lydia, added a fifth ſtring, Hyagnis a ſixth, Terpander a ſeventh, and, at length, Lychaon of Samos, an eighth. But all theſe accounts are irreconcileable with Homer's Hymn to Mercury, where the chelys, or teſtudo, the invention of which he aſcribes to that god, is ſaid to have had ſeven ſtrings. There are many claimants among the muſicians of ancient Greece, to the ſtrings that were afterwards added to theſe, by which the ſcale, in the time of Ariſtoxenus, was extended to two octaves. Athenæus, more than once, ſpeaks of the *nine-ſtringed* inſtrument; and Ion of Chios, a tragic and lyric poet and philoſopher, who firſt recited his pieces in the 82d Olympiad, 452 B.C. mentions, in ſome verſes quoted by Euclid, the *ten-ſtringed* lyre; a proof that the third conjoint tetrachord was added to the ſcale in his time, which was about fifty years after Pythagoras is ſuppoſed to have conſtructed the octachord.

The different claimants among the Greeks to the ſame muſical diſcoveries, only prove that muſic was cultivated in different countries; and that the inhabitants of each country invented and improved their own inſtruments, ſome of which happening to reſemble thoſe of other parts of Greece, rendered it difficult for hiſtorians to avoid attributing the ſame invention to different perſons. Thus the ſingle flute was given to Minerva, and to Marſyas; the ſyrinx, or fiſtula, to Pan, and to Cybele; and the lyre, or cithara, to Mercury, Apollo, Amphion, Linus, and Orpheus. Indeed, the mere addition of a ſtring or two to an inſtrument without a neck, was ſo obvious and eaſy, that it is ſcarcely poſſible not to conceive many people to have done it at the ſame time.

With reſpect to the number of ſtrings on the lyre of Timotheus, the account of Pauſanias and Suidas is confirmed in the famous decree againſt him, for which ſee Senatusconsultum.

It appears from Suidas, that the poetical and muſical compoſitions of Timotheus were very numerous, and of various kinds. He attributes to him nineteen nomes, or canticles, in hexameters; thirty-ſix proems, or preludes; eighteen dithyrambics; twenty-one hymns; the poem in praiſe of Diana; one panegyric; three tragedies, the Perſians, Phinidas, and Laertes; to which muſt be added a fourth, mentioned by ſeveral ancient authors, called "Niobe," without forgetting the poem on "The Birth of Bacchus." Stephen of Byzantium makes him author of eighteen books of nomes, or airs, for the cithara, to eight thouſand verſes, and of a thouſand Προοιμια, or preludes, for the nomes of the flute.

A muſician ſo long eminent as Timotheus, muſt have excited great deſire in young ſtudents to become his pupils; but, according to Bartholinus, he uſed to exact a *double price* from all ſuch as had previouſly received inſtructions from any other maſter; ſaying, that he would rather inſtruct thoſe who *knew nothing*, for *half price*, than have the trouble of *unteaching*

unteaching ſuch as had already acquired bad habits, and an incorrect and vicious manner of playing.

Timotheus died in Macedonia, according to Suidas, at the age of ninety-ſeven; though the Marbles, much better authority, ſay at ninety; and Stephen of Byzantium fixes his death in the fourth year of the 105th Olympiad, two years before the birth of Alexander the Great; whence it appears that this Timotheus was not the famous player on the flute ſo much eſteemed by that prince, who was animated to ſuch a degree by his performance, as to ſeize his arms; and who employed him, as Athenæus informs us, together with the other great muſicians of his time, at his nuptials. However, by an inattention to dates, and by forgetting that of theſe two muſicians of the ſame name, the one was a Mileſian, and the other a Theban, they have been hitherto almoſt always confounded.

TIMOTHY, a favourite diſciple and companion of St. Paul, was the ſon of a Jeweſs by a Greek father, at Lyſtra in Iſauria. He was the confidential aſſociate and friend of St. Paul, and he addreſſed to him two epiſtles. (See Epistle.) According to the Roman martyrology, he was ſtoned to death at one of the feſtivals of Diana at Epheſus.

Timothy *Graſs*, in *Agriculture*, the common name of a graſs which is ſaid to be cultivated much in America. The ſeeds are ſaid to have been carried from the ſtate of Virginia, by Mr. Timothy Hanſon, to that of North Carolina, where it is much grown, and from which circumſtance it probably received its name. It is a ſort of graſs which thrives moſt in low, damp, marſhy grounds; in ſuch ſoils and ſituations, it will produce a fine turf in a ſhort time. It is very luxuriant, grows to a conſiderable height, and has, in ſome ſort, the appearance of wheat or rye, having a broad blade or leaf.

It may be noticed, that all ſorts of cattle are ſaid to be fond of it whilſt in the green growing ſtate, as well as in that of hay.

It is very productive, but coarſe, and flowers late. Almoſt all the agriculturaliſts and travellers of America concur in giving this graſs the higheſt commendations, as being the chief ſupport of cattle wherever meadows are found. And from the inquiries made by Mr. Strickland, at the requeſt of the Board of Agriculture, it appears to be extenſively cultivated in the middle and northern ſtates of the American union; he has frequently ſeen extraordinary crops of it growing as thickly as it could ſtand on the ground, three or four feet high, and in ſome inſtances as coarſe as wheat-ſtraw. In this ſtate it is cut before maturity; and as the hay in America is always well cured, however ſucculent it may be, at the time of cutting, horſes prefer it to every other kind of hay, and thrive better upon it.

No other graſſes approach it in produce; and it is ſtated to be particularly uſeful when mixed with red clover, in preventing it from falling too cloſe to the ground. And ſince his return, by cultivating it in his garden he has aſcertained it to be the ſame as the *cat's-tail* graſs; but he is doubtful whether, if it were cultivated in the field, and ſhould grow with American luxuriance, an Engliſh ſun would be able to cure it with American perfection. It has, however, been ſaid by Curtis, that it has no excellence that we are acquainted with, which the meadow fox-tail graſs does not poſſeſs in an equal degree. In the trials made by the Rev. Mr. Young of keeping it cloſely fed down by ſheep, upon a moiſt loam with a clayey marle bottom, the ſucceſs was ſufficiently encouraging to evince that it is deſerving of attention; eſpecially as its ſeeds may be eaſily procured in any quantity from America at the price of about one guinea the buſhel; which, he obſerves, is enough, in conjunction with that of other graſſes, for four or five acres of land. He thinks four pounds, the proportion for the acre as fixed by Rocque, who firſt introduced it into this country, are much too little; and is of opinion, that timothy is beſt adapted to moiſt loams, eſpecially thoſe of the peaty kinds.

It is ſaid to be common in the dairy paſtures of Cheſhire, by the writer of the Agricultural Report of that county, but that, although it has been ſtrongly recommended for cultivation, it ſeems by no means to merit the high character which was, at one time, given it. In moiſt lands or ſoils it grows tolerably well; but in all caſes and kinds of land, it is thought much inferior to the meadow fox-tail, and the ſmooth-ſtalked meadow-graſs. In a paper in the third volume of the "Tranſactions of the Highland Society of Scotland," the ſeed of this graſs is put down as uſeful in a mixture for one crop of hay, to be ſucceeded by paſture, in land of the clay kind. And that, in theſe circumſtances, late and coarſe as it is, it may be beneficial in ſuch ſort of land, as it is in ſome degree congenial to it.

The experiments, however, lately made at Woburn Abbey, under the direction of his grace the duke of Bedford, the reſults of which are detailed in an appendix to a late work on "Agricultural Chemiſtry," place its comparative merits in the ſtrongeſt and moſt certain point of view. It is there ſtated, that, at the time of flowering, from a clayey loam:

Produce *per* acre - - - - - -	653400	0	=	40837	8	0	
Weight when dry of produce of ſame ſpace - - -	310365	0	=	19397	13	0	
Weight loſt by produce of ſame ſpace in drying - -				21439	11	0	
Nutritive matter afforded by produce of ſame ſpace - -	58703	14	=	3668	15	14	
Latter-math, produce *per* acre - - - -	152460	0	=	9528	12	0	
Affords of nutritive matter - - - - -	4764	6	=	297	12	6	

Sixty-four drachms of the ſtraws, afford ſeven drachms of nutritive matter. The nutritive powers of the ſtraws ſimply, therefore, it is ſaid, exceed thoſe of the leaves, in proportion of 28 to 8; and the graſs at the time of flowering, to that at the time the ſeed is ripe, as 10 to 23; and the latter-math to the graſs of the flowering crop, as 8 to 10.

From the whole of theſe particulars, the comparative merits ments of this grafs will, it is fuppofed, appear to be very great; to which may be added the abundance of fine foliage which it affords early in the fpring; in which refpect it is inferior, it is faid, to the *fertile* meadow-grafs and *narrow-leaved* meadow-grafs only. The value of the ftraws at the time the feed is ripe, exceeds that of the grafs at the time of flowering, as 28 to 10; a circumftance which increafes its value, it is thought, above many others: for, by this property, its valuable early foliage may be cropped, to an advanced period of the feafon, without injury to the crop of hay, which, in other graffes that fend forth their flowering ftraws early in the feafon, would caufe a lofs of nearly one-half of the value of the crop, as is clearly fhewn in many inftances; and this property of the ftraws too, makes the plant peculiarly valuable for the purpofe of hay.

In the fmaller variety of this grafs, the produce *per* acre on the fame fort of land, at the time of ripening the feed; the weight when dry; the lofs of weight in drying; and the nutritive matter afforded, are all very confiderably lefs than in the above fort. In the latter-math produce on the fame fpace, the quantity is the fame as in that, but the nutritive matter afforded by it fomething lefs, as may be feen in the work referred to above.

In the bulbous-ftalked fpecies, the produce of the acre in the fame kind of land, at the time of flowering; the weight when dry; that loft by the produce of the fame fpace in drying; and the quantity of nutritive matter afforded by it, are all ftated in the fame work to be greatly lefs than in the firft kind. And that this grafs is inferior in many refpects to that of the firft fort. That it is fparingly found in meadows. And that from the number of bulbs which grow out of the ftraws, a greater proportion of nutritive matter might have been expected. This feems to prove, it is faid, that thefe bulbs, in this fort of grafs, do not form fo valuable a part of the plant as the joints, which are fo confpicuous in the firft fort, the nutritive powers of which exceed thofe of this bulbous-ftalked fort, as 8 to 28.

The qualities and ufeful properties of timothy grafs are thus well pointed out and determined. See PHLEUM and GRASS.

TIMOU, in *Geography*, a town of Thibet; 225 miles E.S.E. of Laffa.

TIMOUR, or TAMERLANE, in *Biography*, a famous Oriental conqueror, was born at the village of Sebzar, in the territory of Cafh, 40 miles S. of Samarcand, in the year 1336. At the time of his birth, the Khans of Cafhgar, with an army of Getæ or Kalmucks, invaded Tranfoxiana. In 1357, Timour, having lately loft his father, collected a number of followers with a view of delivering his country; but being deferted by them, he retreated to the defert, and his army was there farther diminifhed by an action with the Getæ. He then wandered with his wife and feven companions, and being arrefted, was kept two months in prifon. Upon his liberation he fwam over the rapid ftream of Oxus or Jihon, and for fome months led the life of a vagrant. In procefs of time, and on return to his native country, he was at the head of a confiderable force, which enabled him to expel the Getæ from Tranfoxiana. After a civil war between him and his brother-in-law, the Emir Houffein, who was defeated and put to death, Timour, at a general diet held in 1370, was feated on the throne of Zagatai, at the city of Balk, and invefted with the high title of Saheb Karan, or emperor of the Age; upon which he repaired to Samarcand, which became the feat of his empire. In confequence of this elevation, his ambition was directed to greater objects; and having reunited to Zagatai its former dependencies, Karizme and Kandahar, he fixed his views on the kingdoms of Iran or Perfia, which were then occupied by various ufurpers. Having reduced to fubmiffion Ibrahim, the prince of Sherwan, and fecured the conqueft of Fars or Perfia proper, by the defeat and death of Shah Manfour, its prince, and the extirpation of his male progeny, he advanced from Shiraz to the Perfian gulf, and exacted from the rich city of Ormuz an annual tribute. He then proceeded as a conqueror through the whole courfe of the Tigris and Euphrates from their fources to their mouths, entered Edeffa, and reduced the Chriftians in the mountains of Georgia. Retaliating upon the Getæ the invafion of his country, he paffed the Sihon, and fubdued the kingdom of Cafhgar. In his feveral expeditions he penetrated as far as 480 leagues to the N.E. of Samarcand, and his emirs croffed the Irtifch into Siberia, another fcene of his adventures and conquefts near Kipzak or Weftern Tartary. Having entertained at his court Toctamifh, a fugitive prince of that country, he fent him back with an army which eftablifhed him in the Mogul empire of the North. Toctamifh, however, after a reign of ten years, unmindful of his obligations to his benefactor, entered Perfia with a mighty army, paffed the Sihon, burnt the palaces of Timour, and reduced him to the neceffity of contending for his capital and empire. But his triumph was of no long duration; for Toctamifh was defeated, Kipzak was invaded, and Toctamifh was again encountered and routed. This purfuit led Timour to the tributary provinces of Ruffia, and a duke of the reigning family was made captive on the ruins of Yeletz, his capital. Timour then marched fouthwards, and having pillaged, reduced to afhes the commercial city of Azoph, and alfo thofe of Serai and Aftrachan. Under the influence of that ambition which was his ruling principle, he determined, in 1398, on the invafion of Hindooftan, and taking advantage of the rebellion againft the weak Sultan Mahmood, he led an army of 92 fquadrons, each of 1000 horfe, and found great difficulty in traverfing one of the fnowy ridges between the Jihon and the Indus. Having croffed the Indus at Attock, he entered the Panjab, and formed a junction with one of his grandfons, who had reduced Moultan. He then advanced towards Dehli, and having overthrown the army of Mahmood with its elephants, took poffeffion of the capital, which he defolated by pillage and maffacre. In this part of his march he manifefted his religious zeal, by deftroying infidels and idolaters without mercy, and having paffed the Ganges about 100 miles N.E. of Dehli, he flaughtered a great number of the Guebres, or fire-worfhippers. Whilft he was thus engaged, he received intelligence of the difturbances that had occurred on the confines of Georgia and Anatolia, of the revolt of the Chriftians, and of the ambitious projects of the Turkifh fultan Bajazet. Having iffued orders to his commanders, he haftened back to Samarcand; and after a fhort interval of repofe, he proclaimed a feven years' expedition to the weftern parts of Afia. In the year 1400 he began with the Georgian Chriftians, and foon reduced them to the alternative of tribute or the Koran, and to prifoners he allowed no other choice but death or abjuring their religion. Returning from this warfare, he gave audience to the ambaffadors of Bajazet, and after fome time fpent in mutual complaints and menaces, Timour laid fiege to Siwas or Sebafte, on the borders of Anatolia, which he took and deftroyed, burying alive with favage cruelty the Armenian garrifon of 4000 men. He then invaded Syria, and advanced towards Aleppo, from which iffued a numerous and well-appointed force to engage his army, the front of which was covered by a line of Indian elephants, carrying turrets filled with archers and

and Greek fire. This formidable hoft threw the Syrians into diforder, and they fled with precipitation into the city, whither the enemy accompanied them. Timour foon became mafter of this opulent capital. While the ftreets were ftreaming with blood and refounding with cries, the conqueror held a theological conference with the doctors of the law; protefting, towards the clofe of his harangue, that he was not a man of blood, that he was not the aggreffor in any of his wars, and that his enemies brought upon themfelves the calamities they fuffered: at the fame time his foldiers were piling up a certain tale of heads of the enemy, in conformity to his orders, which, according to his cuftom, were afterwards piled up in columns and pyramids. From Aleppo, Timour proceeded to Balbeck, which he took, and then advanced towards Damafcus. The fultan of Egypt had made great preparations for the defence of the city, and alfo for the affaffination of the invader; but the plot of ufing poifoned daggers was difcovered. The fultan pretended fubmiffion, and thus intended to put Timour off his guard; in the accomplifhment of this artifice, the camp of Timour was fuddenly attacked by the Syrian army, and thrown into diforder; but as foon as order was reftored, the Syrians were repulfed, and driven to the gates of Damafcus with great flaughter. The fultan in the mean while had returned to Egypt, and the city was left to make the beft poffible terms with the conqueror. During a truce, the foldiers broke into the city, maffacred a great part of the inhabitants, and made captives of the reft, carried off a great quantity of rich plunder, and the city was reduced to afhes. Bagdad was the next place of importance to which Timour directed his views. Here Timour attended in perfon, and ordered a blockade; after 40 days' defence on the part of the inhabitants, a ftorm was commanded; and the death of fome of the affailants was revenged by a maffacre which produced a pyramid of 90,000 heads. The city was completely razed, with the exception of mofques, hofpitals, and colleges. Timour's next object was the Ottoman empire. Having confulted the court-aftrologers, and obtained a favourable anfwer, he put himfelf at the head of an almoft innumerable force, and moved from the Araxes through Armenia and Anatolia, determining to carry the war to the heart of his rival's dominions. By his rapid advances, he invefted Angora before Bajazet was apprized of his movement. Upon receiving this intelligence, the Ottoman haftened to its relief with a very large army. An engagement enfued, and the conteft, which was very fanguinary, was at length decided by the defeat and capture of the Turkifh emperor. This battle was fought in July 1402. Bourfa, Nice, and Smyrna were fucceffively captured with the fame circumftances of cruelty that marked the progrefs of Timour's arms.

Timour's conquefts were extended from the Irtifch and Volga to the Perfian gulf, and from the Ganges to the Archipelago; and beyond thefe limits his name was a found of terror. Several princes purchafed his favour by tribute, or by extraordinary tokens of refpect. His want of fhipping prevented his entrance into Europe. From his various expeditions, Timour did not return to Samarcand until the fummer of 1404. In that capital, he difplayed his magnificence and power in difpenfing rewards and punifhments, attending to the complaints of his people, erecting palaces and temples, and giving audience to ambaffadors from Egypt, Arabia, India, Tartary, Ruffia, and Spain. Although he had profeffed fatisfaction with the extent of his empire, yet he indulged a project of ambition of very great magnitude, which was that of the conqueft of China. His preparations for this grand expedition were proportioned to its magnitude: 200,000 veteran foldiers were muftered, and they were furnifhed with means for conveying neceffaries over the defarts which feparate Samarcand from Pekin. The aged emperor mounted his horfe in the winter feafon, croffed the Sihon on the ice, and advanced to the diftance of 300 miles from his capital; but at the camp of Otrar he was feized with a fever, which fatigue, and the imprudent ufe of iced water, foon rendered mortal. He was not unapprized of his danger; and having fummoned round him his empreffes and principal emirs, he declared his grandfon Mehemet Jehan Ghir his univerfal heir and fucceffor, and exacted an oath of obedience to him. He thus expired April 1ft, 1405, in the 70th year of his age, and the 35th from his elevation to the throne of Zagatai. He left 53 defcendants, and his pofterity are to this day invefted with the title of the Mogul emperors, although the power and dominions have paffed into other hands.

His perfon and character are defcribed by one of his biographers in the following terms: "Timour was tall and corpulent, with a wide forehead and large head, a pleafing countenance, and fair complexion. He had broad fhoulders and ftrong limbs, but was maimed in one hand and lame of the right fide. His eyes were full of fire; his voice was loud and commanding; his conftitution hardy and vigorous; his underftanding found; and his mind firm and ftedfaft. In converfation he was grave and modeft, and he prided himfelf in an attachment to truth. He delighted in reading hiftory, and in difcuffing topics of fcience with the learned. His religion was fierce and fanatical, and he actually had, or affected to have, the fuperftitious reverence for omens, prophecies, faints, and aftrologers, which is general in the Eaft. He conducted his government alone, without favourites or minifters, and its fpirit was abfolute and uncontrouled rule. It was his boaft to have introduced fecurity and order throughout his wide dominions, and he challenged the praife of a benefactor to mankind; but no conquefts have been attended with greater deftruction of human lives, and greater defolation of flourifhing cities and diftricts, than his were; and his ambition prompted him to extend his authority beyond the poffible limits of a fingle government. He was not, however, a mere barbarian conqueror; but, if his inftitutions can be relied on as genuine, had enlarged ideas of the adminiftration of a great empire." The "Inftitutions of Timour" have been made known in Europe by two tranflations from a Perfian verfion: one in Englifh by major Davy and profeffor White, Oxford, 1783; and the other in French, by M. Langles, Paris, 1787. Mod. Univer. Hift. Gibbon's Rom. Emp. Gen. Biog.

TIMOURKENG, or *Fortrefs of Iron*, in *Geography*, a town of Thibet; 60 miles W.N.W. of Latac.

TIMPALU, a town on the W. coaft of the ifland of Celebes. N. lat. 0° 16′. E. long. 119° 44′.

TIMPANO, Ital., a kettle-drum. See TYMPANUM and TYMBALLES.

TIMPFE, or TYMPFE, in *Coinage*, an old filver coin of Poland. The *tympfe*, or *tympfen*, was reckoned at eighteen grofchen, and the florins were valued at thirty grofchen.

TIMURCOUGH, in *Geography*, a town of Thibet; 54 miles W.N.W. of Lahdach. N. lat. 35° 12′. E. long. 77° 12′.

TIMUS, in *Ancient Geography*, a town of Afia Minor, deftroyed by an earthquake.

TIMYRA, a town of Afia, in Ifauria.

TIN, *Stannum*, *Jupiter*, a whitifh metal, fofter, lefs elaftic, and lefs fonorous, than any other metal, excepting lead. In the Chaldee language, טין, *tin*, fignifies *flime*, *mud*, or *dirt*; and

and when the Phœnicians came into Cornwall, and ſaw this metal in its ancient ſlimy ſtate, they called it "the mud;" and hence, ſome have ſaid, the name *tin*, in Cornu-Britiſh *ſtean*, is derived. Some of the ancients called it *plumbum album*, white lead, probably to diſtinguiſh it from common lead; not knowing that it was radically another metal.

This metal, denominated κασσίτερος by the Greeks, and *ſtannum* by the Latins, ſeems to have been known from the moſt remote ages. It is mentioned by Moſes; ſee Numb. xxxi. chap. 22. It was tranſported to the Eaſt from Spain and Britain by the Phœnicians, with which nations they are ſaid to have carried on a lucrative commerce. Homer mentions it; and by Ariſtotle, the epithet Κελτικον, or *Celtic*, is applied to it, indicating plainly the country from which it was procured. See TIN-*Trade of Britain*.

TIN-*Stone*, in *Mineralogy*, is the moſt common ore of tin, and is nearly a pure oxyd of that metal. The colour is brown, which paſſes from a blackiſh-brown to black, and from a red-brown to yellowiſh and greeniſh-white. It occurs cryſtallized and amorphous, and in grains and rolled pieces, varying from the magnitude of a grain of ſand to that of an egg, or larger. The primitive form of the cryſtal is a flat octohedron: the angles are 112° 10′ and 67° 50′. The figure of the cryſtals is ſeldom perfect; ſometimes a rectangular priſm is interpoſed between the pyramids that form the octohedron. The edges and ſummits of the cryſtals are frequently bevelled or truncated, from which a great variety of ſecondary forms is derived. The cryſtals are alſo frequently united, forming compound cryſtals or macles: indeed, ſo numerous are the ſecondary cryſtals of tin, that more than one hundred and eighty forms of ſingle cryſtals have been obſerved, beſides the compound cryſtals, of which there is a conſiderable variety. The ſurface of the cryſtals is commonly ſmooth and ſplendent, but is ſometimes ſtreaked. The ſtructure is laminar, but the laminæ are rarely viſible. The fracture is uneven and imperfectly conchoidal, with a more or leſs ſhining and reſinous luſtre. When the laminar ſtructure is diſplayed, the luſtre is highly ſplendent. The cryſtals are ſemi-tranſparent or opaque, the darker colours being opaque, the lighter ſometimes nearly tranſparent; and the intermediate ſhades are only tranſlucent, or tranſlucent at the edges. The ſtreak is a greyiſh-white. Tin-ſtone is hard, ſcarcely yielding to the knife, and giving ſparks with ſteel. It is brittle and heavy. The ſpecific gravity varies from 6.759 to 6.970.

Before the blowpipe it decrepitates, and becomes paler; when finely pounded and mixed with borax, it is reducible on charcoal to the metallic ſtate.

Tin-ſtone contains the following conſtituent parts, according to Klaproth.

	From Alternon.	Schlackenwald.
Tin - -	77.50	75.
Oxygen -	21.50	24.50
Iron - -	0.25	0.50
Silex -	0.75	

Some analyſes of tin-ſtone give from two to three *per cent.* of alumine. The tin-ſtone of Cornwall, dreſſed in the common manner, is reckoned rich if it yield 65 *per cent.* of tin. Tin-ſtone may be diſtinguiſhed from *wolfram* by its ſuperior hardneſs, as it gives ſparks with ſteel; but wolfram yields eaſily to the knife. The powder of tin-ſtone is a greyiſh-white, that of wolfram a reddiſh-brown. It is diſtinguiſhed from *blende* by its ſuperior hardneſs, and its not emitting a ſulphurous odour when pounded. By its greater ſpecific gravity and luſtre, it may be diſtinguiſhed from *garnet*; and from *ſchorl*, by its colour, luſtre, form, and higher ſpecific gravity. This ore occurs in veins and beds, and diſſeminated in granite rocks. The veins interſect rocks of granite, gneiſs, mica-ſlate, and ſlate: tin-ſtone occurs alſo in alluvial ſoil in the diſtricts that contain tin-veins. See STREAM-*Tin*.

Wood-tin is a ſpecies of tin-ſtone, or oxyd of tin, found with ſream-tin in rolled pieces, which are wedge-ſhaped or reniform, and ſometimes globular. The ſtructure is divergingly fibrous, with concentric laminæ; and from the ſuppoſed reſemblance to the tranſverſe ſection of fine-grained wood, it received its name. The colour is commonly hair-brown or wood-brown, paſſing into yellowiſh-grey. The luſtre is glimmering or ſilky. It is opaque, hard, and brittle: the ſpecific gravity is 6.450. It is infuſible before the blowpipe, but is changed to a browniſh-red colour. When ſtrongly heated in a charcoal crucible, it yields about 75 *per cent.* of metallic tin. The conſtituent parts are, according to Vauquelin,

Oxyd of tin	-	91
Oxyd of iron	-	9

In Cornwall, this ore is almoſt always found with ſtream-tin, and never in veins: it is ſaid, however, to have been recently met with in cellular quartz, but in very minute pieces. It is one of the moſt common ores of tin in Mexico, and occurs in veins that traverſe a porphyritic trap, and alſo in alluvial depoſitions. In ſome wood-tin, there is a ſmall, black, ſmooth globule, from which, as from a centre, the fibres diverge: this has received the name of *bird's-eye tin*. Wood-tin, in its ſtructure and mode of formation, probably bears a near analogy to the kidney-ſhaped hematite iron-ore.

Bell-metal Ore, *Tin Pyrites*, or *Sulphuret of Tin*, is an extremely rare ore of this metal, being found only in Cornwall, at Huel rock, in a vein accompanied with ſulphuret of zinc and iron. Its colour is ſteel-grey, paſſing into yellowiſh-white: it has a metallic luſtre, and granular uneven fracture: it yields eaſily to the knife, and is brittle. The ſpecific gravity is 4.350. It fuſes into a black ſlag before the blowpipe, exhaling at the time a ſulphurous odour. It communicates a yellow or green colour to borax. The conſtituent parts differ in different ſpecimens; according to Klaproth, they are as under:

Tin - -	34	26.50
Copper - -	36	30.
Iron - -	3	12.
Sulphur -	25	30.50
Earthy matter	2	
	100	99

Klaproth obſerves, that the darker varieties of this ore are conſiderably poorer in tin than the lighter, but the proportion of iron increaſes.

Analyſis of the Ores of Tin.—The analyſes in the *dry way* were made by Klaproth in charcoal crucibles in the following manner, in which the reſults were always found to be conſtant. The ore was broken, and well cleaned from the matrix. One hundred grains were introduced into the cavity of a charcoal crucible, cloſing its orifice with a ſtopper of charcoal. The charcoal crucible was then fitted cloſe into one of baked clay, and placed upon the forge-hearth before the nozzle of the bellows. The contents in the charcoal crucible were reduced to the metallic ſtate by expoſing it to a ſtrong blaſt for half an hour. The button of metallic tin produced was a little blackiſh on the ſides, and

and its furface coated with a greenifh cruft. From one hundred grains of Bohemian tin-ftone, feventy-two grains and a half of tin were produced. Wood-tin and ftream-tin were treated in a fimilar manner. Brown tin-ftone, expofed to a porcelain fire in a clay crucible, formed a clear denfe glafs, greenifh-grey in the middle, but of a bright yellow on the fides and top. The interior of the veffel was glazed, of a milk-white, and overlaid with many fmall groups of needle-fhaped cryftals of a light-brown colour. The inner furface of the lid was lined with fimilar cryftals.

Analyfis of Tin-Stone in the humid way.—To Klaproth we are indebted for the difcovery of a fimple and effectual mode of analyfing tin-ftone in the humid way. Boil 100 grains of this ore, finely pounded, with a folution of 600 grains of cauftic potafh. Evaporate to drynefs, and then ignite the mafs moderately for half an hour. Add boiling water, which diffolves the principal part of the mafs, and the refidue muft again be ignited with fix times its weight of cauftic potafs, and diffolved in water, as before. Add this to the laft folution, and faturate the whole with muriatic acid, which will throw down an oxyd of tin. Let this be re-diffolved by an additional quantity of muriatic acid, and precipitated again by carbonate of foda; when lixiviated, and dried in a gentle heat, it acquires the form of bright-yellowifh tranfparent lumps. This precipitate muft be finely powdered, and once more diffolved in muriatic acid, affifted by a gentle heat. The infoluble part confifts of filex. Dilute the folution, which is colourlefs, with from two to three parts of water, and introduce a ftick of zinc, round which the tin will collect in a metallic ftate in the form of delicate dendritic laminæ. Scrape off the tin, wafh, dry, and fufe it under a cover of tallow in a capfule placed on charcoal. A button of fine metallic tin will remain at the bottom, the weight of which, deducted from that of the ore, indicates the proportion of oxygen.

Analyfis of Bell-metal Ore, or Tin Pyrites.—To two drachms of finely powdered ore, add one ounce of muriatic acid, and half an ounce of nitric acid: this will diffolve the greater portion of the metallic part without heat, but a gentle heat muft be applied to diffolve the whole. The fulphur will float on the furface of the folution, and muft be feparated by filtration. To the folution add carbonate of potafs, which produces a greenifh precipitate; let this be rediffolved in diluted muriatic acid, and introduce a cylinder of pure tin, the weight of which is to be previoufly afcertained. By this means the copper will be feparated in a metallic ftate. The cylinder of tin muft now be carefully weighed, and the quantity which it has loft muft be noted, and a cylinder of zinc muft be introduced into the foregoing folution: this will feparate all the tin, which muft be melted with tallow and weighed. Deduct the quantity of tin which was loft by the cylinder, and the remainder will be the quantity of tin from the ore, held in the folution.

The fulphur feparated by the firft filtration muft be ignited, and the unconfumed refidue, diffolved in nitro-muriatic acid, muft be added to the folution, in order to obtain the whole of the contents. The undiffolved part will be the filiceous matrix.

The copper may be brifkly digefted in nitric acid, which will leave behind a minute portion of oxyd of tin, and afcertain the precife quantity of pure copper contained in the ore.

The method of getting, preparing, &c. the tin in the Cornifh mines, much the beft and moft confiderable in the world, is given us in the Philofophical Tranfactions, Abr. vol. ii. p. 569, &c. and more diftinctly and fully in Pryce's Mineralogy.

The working of the tin-mines is very hard and difficult, not only by reafon of the great depth which the veins defcend to, even as low as fixty fathoms; but alfo becaufe the rocks, through which paffages are frequently cut, are extremely hard. Nor is the foft fhaking earth found in the tin-mines much lefs inconvenient to the workmen, both by reafon of the fetid, malignant vapours it exhales, and of the current of water often met with in them: thefe difadvantages often render it impracticable for the workmen to hold it above four hours together.

The exiftence of native tin has been always doubted, and till of late abfolutely denied by all mineralogifts, both ancient and modern: however, Mr. Borlafe, in his Natural Hiftory of Cornwall, p. 185, fuggefted, that its exiftence was far from being improbable; but he afterwards difcovered three fpecimens of this metal, native or pure, of which he prefented an account to the Royal Society. Mr. Mendes da Cofta made feveral experiments on one of thefe fpecimens, with a view of proving that it was really tin; from which he infers, that it is perfectly ductile and malleable; and being bent between the teeth, gives the fame crackling noife as tin always does: in an open fire it melts eafily, calcines on the furface, and fmokes; but forced in a ftronger fire with borax, it detonates with fmall phofphorefcent fparks, which is a property of pure tin; and it is only corroded to a white calx in fpirit of nitre, and oil of tartar *per deliquium* being added to the folution, none of it was precipitated: whence he concludes, that it was pure tin. Philof. Tranf. vol. lvi. art. 7. 39. Native tin is alfo faid to have been found in Saxony and Malacca.

The ores of tin may be generally claffed into fhoad or fhode, ftream, and bal or mine tin. The fhoad is disjunct, and fcattered to fome diftance from its parent lode, and is pebbly or fmoothly angular, of various fizes, from half an ounce to fome pounds weight. See Shoad.

Stream-tin ore is the fame as fhoad, but fmaller fized, &c. See Stream-*Tin* and Streaming.

Bal or mine tin-ore often rifes very rich; and inftances frequently occur, in which it has been difcovered in the richeft and pureft ftate imaginable. This kind of rich ore confifts of the blackeft grains or cryftals, and is ufually found at a moderate depth, or within the day-fide of forty fathoms.

When the tin-ore is raifed, or dug and drawn out of the mine, and laid by the fhaft, it is firft *fpalled*, as the procefs is termed, which confifts in breaking it into fmaller fragments, and feparating it from the worthlefs parts. When the beft parts are forted, they are divided into heaps by a hand-barrow, containing a fack and a half, or eighteen gallons. Each of thefe fhares, called *doles*, being turned over, equally levelled and mixed, is then divided with a fhovel into two equal parts; and after being bruifed by large fledges to the fize of a hazel-nut, is equally levelled and divided into four parts: the bruifing and divifions are repeated at pleafure, till the quantity defigned for fampling is well mixed, and made as fine as common fand. To make a rough guefs, or coarfe effay, the fampler takes a handful of it, and wafhes it on a fhovel, till the impure parts are carried off by the water, and the more folid and heavy particles, that are left behind, are bruifed with a fledge on the fhovel, till the whole affumes the appearance of mud. This is again wafhed, and by a peculiar motion the metallic particles are collected together on the fore-part of the fhovel. By repeating thefe bruifings, wafhings, and motions, it becomes clean black tin, fit for the fmelting-furnace. This is called a *van*, (probably from the French *avant*, *foremoft*,) as it is thrown upon the point of the fhovel by the dexterity of of the ſample trier. After the tin is thus cleaned, it is dried; and if there be as much black tin as will cover a ſhilling, or equal to the weight of a ſhilling, it is called a *ſhilling van*, which is not rich; but if the van will cover or equal the weight of a crown-piece, it is good tin-ſtuff, and called a *crown van*. The ſhilling van, the tinners ſay, will produce one hundred avoirdupois weight of block or white tin; and the crown van will yield five hundred weight of block tin, for every hundred ſacks in meaſure of the reſpective doles from which the ſample or van was taken, and ſo in proportion, to the richeſt tin-ſtuff, called *ſcove*, which is reckoned at the rate of ten thouſand of white tin-metal for every hundred ſacks. But a better judgment may be formed from the meaſure of a wine half-pint, than from a handful, which is indeed accounted a half pint. When the tin, thus meaſured, is reduced clean, and to a proper ſize, by uſing a large ſhovel, and taking off the ſized tin on another ſhovel, the van is dried in a ſhovel upon the fire, and then weighed by pennyweights and grains; and for every pennyweight and a half the van weighs, the produce will be one hundred weight of black tin for every hundred ſacks of tin-ſtuff; and for three pennyweights, two hundred weight, &c. in the ſame proportion; and if it be tin worth ten for twenty, or one for two, then the tin-ſtuff is valued at five hundred weight of block or white tin for every hundred ſacks: if it be worth twelve for twenty, the ſtuff is valued at ſix hundred weight of white tin a hundred; or if it be worth only eight for twenty, it is only valued at four hundred weight of white tin a hundred, &c. This *black* tin is rather of a liver colour, though called black in contradiſtinction from white tin, or the metal produced from this black ore: it is very heavy, and may in general be computed to hold one-half clean metal, and ſome of it will produce thirteen, or even fourteen parts in twenty; whence the mode of expreſſing ſo much white tin for twenty of black tin, *i. e.* eight for twenty, ten for twenty, twelve for twenty, &c. Thus, if the van of one hundred ſacks of tin-ſtuff weighs ſix pennyweights, being four hundred weight of black tin at twelve for twenty, the white tin or metal muſt be two hundred weight one quarter ſixteen pounds.

In this method of ſampling, the tinners form a near conjecture of the quantity of white tin which their doles of tin-ſtuff will produce at the ſmelting-houſe, when it is dreſſed, and brought into black tin. But if the black tin is combined with any bad mixture, as of mock-lead, copper, or mundic, after the van is bruiſed fine and waſhed, they lay the ſhovel over the fire, and burn the black tin, ſtirring it continually, till it has done ſmoaking: they then waſh it again on the ſhovel, and thus the heterogeneous matter, becoming light by being burnt, is carried off by the water: for when black tin is calcined or burnt, it ſtill retains its ſpecific gravity; but copper, lead, and other crude minerals, become much lighter by torrefaction, and are eaſily ſeparated from the tin by water. In the dreſſing and management of tin by ſtamping, &c. there are obtained two ſorts of black tin, *viz.* the crop and rough, or the crop and leavings of tin. The firſt is the prime tin: immediately ſeparable from the baſer parts by its ſuperior weight and richneſs. The latter is that which is carried off, and mixed with the lighter earthy parts, by being under ſize, and, therefore, more eaſily carried off by the water.

The tin-ſtuff, after this previous preparation and adjuſtment, is carried to the ſtamping-mill, in order to be dreſſed or pounded.

This operation of pounding in the ſtamping-mill is eſſential to the complete ſeparation of the ore from the matrix, through which it is diſſeminated. If full of ſlime, it is thrown into a pit, called a *buddle*, to waſh away the earthy matter, and render the ſtamping more free, without choaking the grates. The ore is ſhovelled into a kind of ſloping canal of timber, called the *paſs*, whence it ſlides by its own weight, and the aſſiſtance of a ſmall ſtream of water, into the box where the lifters work: the lifters are raiſed by a water-wheel, and are armed at the bottom with large maſſes of iron, weighing nearly two hundred weight each: theſe pound or ſtamp the ore ſufficiently to enable it to paſs through the holes of an iron grate fixed at one end of the box. To aſſiſt its pulverization, a rill of water keeps it conſtantly wet, and it is carried by a ſmall gutter into the fire-pit, where it makes its firſt depoſition; the lighter particles running forward with the water into the middle pit, then into a third, where what is called the *ſlime* ſettles. (See *Dreſſing of* Ores, and Buddle.) From theſe pits the ore is carried to the *keeve*, which is a large vat containing water; in which it is farther purified by an operation termed *packing*, and which conſiſts in beating the upper part of the contents with mallets for ſome minutes, by which the lighter particles are kept ſuſpended, whilſt the tin-ore, from its great ſpecific gravity, ſubſides. The waſte is ſkimmed and laid by, to be again buddled, under the name of the *ſkimpings*. The tin is ſifted through a copper-bottom ſieve into another keeve of water, by which the gravelly waſte ſtill remaining is ſeparated from the clean tin; and the tin that runs through the ſieve, if it requires no farther buddling, may be cleaned by repeatedly toſſing and packing it as before. If it be neceſſary to buddle it again after it is ſifted, let it be buddled and diſtributed in three parts, *viz.* the crop or pureſt, the creaſe or next in purity, and the hind-creaſe or tail, which is the moſt impure. The crop is to be cleanſed by toſſing, &c. and the creaſe muſt be buddled again, and out of this muſt be reſerved as much as may be cleanſed by toſſing and packing. The remainder muſt be cleanſed by an operation called *dilleughing*, from *dilleugh, to let go, or ſend away.* A dilleugher is a large fine hair-ſieve, which the dreſſer holds in a keeve one-third full of water, into which the tin is thrown by a ſhovelful at a time, and which is ſhook ſo as to put the tin into motion: one ſide of this dilleugher is dipped in water, and raiſed again in ſuch a manner, that the waſte may run over, which is laid aſide to mix with the ſkimpings, to make the ſamples of low value, called the *rough* (or *row*) tin. This uſually undergoes another operation, in which, by a rill of water paſſing over the buddle in which it is placed, it is farther cleanſed, and then dilleughed, ſo as to be fit to mix with the crop-tin.

Upon the ſame mechanical principle of ſeparation, the tinner is capable of eſtimating the value of a ſample of ore. For this purpoſe, the pounded tin-ore, or tin-ſtuff, as it is called, is placed on a ſhovel and waſhed under a ſtream, till the impure earthy parts are carried off by the water from its ſides, when, by a particular and dexterous motion, not eaſily deſcribed, all the metallic particles are collected together on the fore-part of the ſhovel: this operation is called *vanning*, which we have already deſcribed.

When the tin-ore is contaminated with the different pyritous ores of copper, arſenic, and iron, it is firſt roaſted in a burning-houſe, and then waſhed in water, by which means the tin, which is heavy, is eaſily ſeparated.

By this proceſs, as at preſent conducted in Cornwall, a conſiderable quantity of copper is loſt; for being converted into ſulphate of copper, which is ſoluble in water, it is loſt by waſhing: whereas, if the roaſted ore were ſuffered to remain in a cloſe pit for a few days, and the water drawn off

off into another pit, the copper might be feparated by iron in a metallic ftate.

The leavings of tin, confifting of the flime and tails, *i. e.* of tin-mud and tin-gravel, are dreffed by a particular kind of apparatus, for the conftruction and ufe of which, we muft refer to Pryce's Min. Corn. p. 226, &c.

Each ftamping-mill, which has conftant work and water, will employ one man and five boys; and one hundred facks are carried, ftamped, and dreffed, in the fpace of a few days, at the average rate of about four-pence *per* fack, or one guinea and a half *per* hundred.

When the tin-ore is dreffed, it is divided into as many fhares as there are lords and proprietors.

The next operation pertaining to tin-ore, or black tin, is that of *fmelting* it. The Phœnicians, who traded to Cornwall for tin in the earlier ages, probably conducted this procefs by digging a hole in the ground, and ftrewing the ore on a charcoal fire, which perhaps was excited by a bellows. But having no idea of confining the fire, and directing its force on the fubftance to be fmelted, they made no ufe of furnaces, either fimple or reverberatory. Charcoal was long ufed in the operation of fmelting, till at length neceffity fuggefted the introduction of pit-coal; and in the fecond year of queen Anne, a patent was granted for fmelting black tin with foffile coal in iron furnaces. The invention of reverberatory-furnaces built with brick, ftone, fand, lime, and clay, foon followed this difcovery; the form of which, being fimple, has admitted of little improvement to the prefent time. The charge for one of the tin fmelting-furnaces is from five to fix hundred weight of black tin, well mixed with a tenth or twelfth or eighth its weight of culm, which is a fpecies of coal from South Wales, that is very free from fulphur. The furnace is charged through a hole in its fide with a fhovel, and the tin levelled over the bottom with an iron rake or paddle. The apertures are then clofed, and the fire raifed to a very great ftrength, in which ftate it is left for four or five hours, when the door is taken off, and the whole charge well ftirred together. The ftate of the metal is examined, and more culm thrown in if neceffary; the furnace is again clofed, and the fire kept up till the end of about fix hours from its receiving the charge; when it is again examined, and if proper, it is then tapped, and the metal let out into a fixed bafon made of clay, and large enough to hold fomewhat more than the metal of the charge. The fcoria in the bottom of the furnace is raked out at the mouth into a fmall pit made for this purpofe, where it generally forms itfelf into a cake. When cold, it is carried to the ftamping-mill, in order to feparate the globules of melted tin diffeminated through the fcoria or flag. This, being broke by hammers to the fize of goofe-eggs, is put into the firft ftamping-mill, and paffed through fmall iron bars; by which means the *pillion* (for fo all tin recovered out of the flags is called) of the larger fize is taken out and prevented from wafte by too much ftamping. The refufe of this firft ftamping is put into other ftamping-mills of a fecond, third, or even fourth fize. Of the pillion, feparated from the fcoria, all the rough or grainy parts are confidered as metals, and refined accordingly, by being fmelted without any flux, and the produce of this fmelting refined, with the tin firft tapped.

The tin in the bafon, or float (as it is called), as foon as it comes down to a moderate heat, is laded out into the moulds, in flabs or pigs of about three-fourths of a hundred weight.

The method of fmelting in Saxony and Bohemia, does not differ greatly from that practifed in Cornwall. When the ore has been roafted it is wafhed upon tables, to feparate the oxyd of iron and the oxyd of copper, which are lighter than tin-ore. At Alt-Saint-John, the oxyd of tin is mixed with the black oxyd of iron: this is feparated by a powerful magnet, which is drawn over the table. That the powdered oxyd of tin may not be blown away by the blaft of the furnace, it is previoufly moiftened with water; but as the flame always carries away a part of the ore, a chamber is conftructed about the middle of the chimney, made of wood lined with clay, where the powdered ore that has been driven up by the flame is depofited.

The next procefs is that of *refining*. The furnace having, by the fide of the fmall float now defcribed, a larger one capable of holding twenty, or more blocks, is for this purpofe fuffered to cool to a certain degree, and then charged full with the flabs juft mentioned, the tap-hole being kept open, fo that as the tin melts in this moderate fire, it makes its exit through it into the float; where, while running out, it is frequently ftirred and toffed by a ladleful at a time held arm-high, letting it fall in a ftream into the mafs of metal, when the fcum which arifes is taken off. While the metal already put into the furnace is melting, more is added, fo as to be juft enough to fill the float with good tin: and this, after being toffed and fkimmed as before, and fuffered to cool to a proper temper, is carried in iron ladles to moulds holding generally fomewhat above three hundred weight (then denominated *block-tin*), where they are marked as the fmelters chufe with their houfe mark, which may be a pelican, plume of feathers, ftag, or horfe, by laying brafs or iron ftamps, in the face of the blocks while the tin is in a fluid ftate, and yet cool enough to fuftain the ftamping iron. The blocks are then ready to be weighed, numbered, and fent to the neareft coinage town to be coined. The privileged towns for coinage of tin, were anciently Lifkeard, Loftwithiel, Truro, and Helfton: but foon after the Reftoration, Penzance was added to the number; in which laft place there is every quarter more tin coined than in the towns of Lifkeard, Loftwithiel, and Helfton, for a whole year. When the tin is brought to be coined, the affay-mafter's deputy affays it by cutting off with a chiffel and hammer a piece of one of the lower corners of the block, about a pound weight, partly by cutting and partly by breaking, in order to prove the roughnefs and firmnefs of the metal. If it is a pure good tin, the face of the block is ftamped with the duchy feal, which ftamp is a permit for the owner to fell, and at the fame time an affurance that the tin fo marked has been examined and found merchantable. The ftamping of this impreffion by a hammer is *coining* the tin, and the man who does it is called the *hammer-man*. The duchy feal is argent, a lion rampant gules, crowned or, within a border garnifhed with bezants.

The droffy part remaining in the furnace is by an increafing fire wholly melted, which is then tapped into the fmall float, where the tin fubfiding, and the drofs rifing to the top, the latter is taken off, and the tin laded into fmall flabs, as at firft, to be again refined. The tin that remains in and about the fcoria and drofs of the laft tappings, &c. is recovered by repeated fmeltings, till at laft, being almoft entirely drained of that metal, they become what the workmen generally call *hard heads*, and efteemed of no farther value.

M. Groffe, in the Memoirs of the Academy of Sciences of Paris, has delivered a method he had invented of feparating tin from lead or filver. Having tried an experiment on the fcoriæ of metal, which contained with the tin a large quantity of filver, it feemed to him that one great ftep toward the feparation of the filver, was the haftening of the calcination of the tin, and with this view he tried a mixture

 of

of charcoal, faltpetre, and earth, which he put together into the coppel with the fcoriæ. It is eafy to fee that a detonation would happen from this, and this muft greatly add to the force of the fire, in acting upon the fcoriæ, while the ferruginous matter well known to be contained in the charcoal mixed itfelf with the tin, and muft greatly accelerate its calcination, divide its parts, and give the fire a new action over it. The confequence of this perfectly anfwered expectation, and recovered a large quantity of filver from the fcoriæ, in which the tin had before held it firmly imbodied; repeated experiments proved the truth of this obfervation, and it was found to be eafy by this means at any time to feparate filver from tin, or to purify filver without lofs, by means of lead in which tin has accidentally been imbodied.

The fcoriæ in which tin is mixed with filver, are compofed of tin half calcined, and run into an opaque vitrified fubftance, which forms a fort of net-work, in which the filver is confined in extremely fmall particles. If this is thrown into aqua fortis, the whole is diffolved: but then it requires a very ftrong fire to make the tin lofe its metallic form; finally, if the whole is finely powdered, and then put into this menftruum, the filver only is taken up or diffolved, the tin remaining untouched at the bottom of the veffel.

The fame gentleman found alfo a method of feparating tin from filver, by means of corrofive fublimate of mercury. To conceive the manner in which this feparation is effected, a piece of fine tin need only be caft into a folution of fublimate; in which cafe the acid of the fea-falt is feen to leave the mercury in order to fix upon the tin.

And, according to the fame principle, if fublimate corrofive be added to a mixture of tin and filver, the fame effect is produced, the acid affixes itfelf to the tin, and makes with it a butyrum joviale or butter of tin, the mercury becomes diffipated in the mean time by the action of the fire, and the filver remains pure and alone; but in this experiment, if too much corrofive fublimate be added, there is danger of lofing fome of the filver; fince the abundant acid will prey upon and carry off a part of that metal, making a fort of luna cornea which diffipates itfelf in the air, or if the operation be performed in a clofe veffel, a butyrum lunare.

Gold may alfo be purified from tin in this manner, and in this there is no rifk of lofs, fince the acid which takes up the tin has not the leaft power over that metal: in all thefe proceffes, however, the operator muft avoid the fumes iffuing from the crucible, for they are very dangerous.

Thefe methods of feparating of tin from filver are very certain and infallible, but they are too expenfive to be employed in common, and in larger works.

The feparating of tin from lead to be employed in the refining of filver is a matter of great importance; and this may be done in the following manner: melt the lead, and when in fufion throw into it a quantity of filings of iron, then increafe the fire to a confiderable degree, and the furface of the metal will be covered with a fort of fcum, which is no other than the iron and tin. At this time there fhould be a little alkali falt thrown in, and by this means the fcoriæ readily feparate themfelves, and the pure lead remains in form of a regulus at the bottom. The fame method may be ufed to feparate tin from filver in the larger way, but it will be neceffary for this purpofe to add fome lead, fince otherwife the fufion will be very flow and difficult, and the tin will calcine without feparating from the filver. This is a very eafy and very cheap method, and will obviate moft of the mifchiefs which happen to the refiners, of which they would have much lefs frequent reafon to complain, if they nicely examined the lead they were to employ. But if gold or filver be mixed with tin, the fhorteft method in fmall quantities is to calcine the whole very brifkly, and in order to complete the vitrification and feparation of the tin, to caft in a little glafs of lead, which will immediately join itfelf with it and carry it off from the mafs.

It may feem fingular that iron being one of the hardeft of the metals to melt, and tin being of all the eafieft, they fhould fo readily and eafily unite in thefe experiments; but this feems to be the refult of one of thofe natural and unexpected alliances which accident frequently difcovers to us in bodies. There is one conjecture, however, that may be worthy a place in this refearch, which is, that all tin-ore contains a quantity of arfenic; and it is well known that iron very readily mixes with arfenic, and is employed to feparate the arfenic from other ores, and a regulus may be formed of arfenic and iron. It is eafy to fuppofe that tin is, in its metalline form, not wholly divefted of the arfenic it contained when in the ore; and if this be allowed, it is no wonder that the two metals are eafily brought together by the mediation of that principle. Memoirs Acad. Scienc. Par. 1737.

Mr. Cramer gives the practical rules of feparating filver from tin, thus: Divide one centner of tin into two equal parts; put each of thefe into a feparate teft, and add to each fixteen centners of granulated lead, and one of copper; put the whole under the muffle, and make a very ftrong fire; the tin will be calcined immediately, and will fwim upon the lead. Then diminifh the fire a little, till the afhes of the tin that fwim upon the furface do no longer fparkle: when you fee this, add with a ladle two centners of glafs of lead to each teft, in fuch a manner that it may be fpread wide over the whole furface of the rejected calx; the calx will then change its form of powder into that of glafs; then increafe the fire to its higheft degree, ftir up the whole with an iron rod made warm; and when the fcorification is perfected, pour out the glafs into a mould; the fcoriæ being feparated, put both the regulufes into two coppels well heated; and into a third put fixteen centners of lead, and one of the fame copper ufed in the procefs: examine all thefe beads after the coppelling is over; if the two firft weigh exactly alike, it is a proof the procefs has been well performed; and fubtracting the weight of the bead, feparated from the third pan, from the joint weight of the other two, the remainder is the weight of the pure filver contained in the quantity of tin which was examined. Cramer's Art of Affaying, p. 228.

Tin is found in Europe, Afia, and America, but has not hitherto been difcovered in the continent of Africa. This metal is much lefs generally diffeminated than gold, filver, iron, copper, or lead; but where it occurs, it is moft frequently in large quantities. In Afia it is found on the coaft of Sumatra, and in Siam and Pegu. It is principally imported into our Indian poffeffions from Queda, Junkfeilon, Tavai in Lower Siam, and the ifland of Banca. The tin-mines of Banca are faid to be of great extent; and Mr. Ellmore informs us, that no lefs than from forty to fixty thoufand peculs of tin are furnifhed by thefe mines annually. Tin is faid alfo to be found at a place five days' journey from Nankin in China. The Indian tin was known to the ancients. Diodorus Siculus mentions it among the productions of India. Tin-ftone is found in Mexico in the ftate of ftream-tin, and is procured from alluvial depofitions by wafhing. It is alfo faid to occur in Chili.

Tin-ore occurs in Saxony and Bohemia in beds, and diffeminated in granite rocks; it is found alfo in veins in rocks of granite, gneifs, and mica-flate. Alluvial depofitions of tin are alfo met with in thefe diftricts. The mines fometimes confift of a mafs of ore formed by the junction of a multitude of of ſmall veins which paſs through the rocks in different directions. Theſe veins alſo contain topazes. Brongniart Traité Elementaire.

Tin is found near Monterey, in the province of Gallicia in Spain, in veins which traverſe granite and mica-ſlate. This ore has recently been diſcovered in ſmall quantities in grains and cryſtals, in a rock of granite at Puy les Vignes, in the vicinity of St. Leonhard, in the deparment of Haute-Vienne in France. It occurs in veins with wolfram, arſenical pyrites, and martial arſeniate of copper.

The moſt conſiderable repoſitory of tin-ore in Europe is that of Cornwall. The greateſt part of the tin conſumed in Europe is procured from thence; and Camden even ſuppoſes this abundance of tin in Cornwall and Devonſhire, to have given the original denomination *Britain* to the whole kingdom. In the Syriac language, *varatanac*, or *baratanac*, ſignifies *land of tin;* from which Bochart derives the name *Britain*. It occurs in Cornwall, both in veins and alluvial depoſitions, in various parts of the county. Alluvial depoſitions of this ore are alſo met with on Dart-moor, in Devonſhire. The veins which contain tin interſect both granite and ſlate rocks; the latter are provincially called *killas*. Theſe veins vary in width, and ſometimes contain large maſſes of the ore. One block was raiſed from the mine called Polberrow, in St. Agnes, which weighed more than twelve hundred pounds, and produced more than half that weight of pure metal. Tin-ſtone generally occupies the upper part of veins, and is ſucceeded by copper-ore; but there are inſtances of tin occurring at the depth of two hundred fathoms. Different modifications of the forms of the cryſtals are peculiar to certain veins. Cryſtals of tin-ſtone are alſo diſſeminated in ſome of the granite rocks in the vicinity of veins: the cryſtals appear to occupy the place of mica. Where the tin-ſtone is diſſeminated in ſlate, it is generally in ſmall ſtrings or minute veins. See Mine and Veins.

The workmen diſtinguiſh ſeveral kinds of tin; as *moor-tin*, which is the beſt ſort, a fool of which weighs eighty pounds; and *mine-tin*, which is the next, the fool of it weighing about fifty-two or fifty pounds. The tin got from the ſoft, gravelly earth, they call *pryan-tin*, to diſtinguiſh it from that obtained from the ſtones, which is better by almoſt half. See Stream-*Tin Ore*.

Grain-tin denotes the ore of tin that is ſometimes dug very rich in the form of grains or pebbles, or elſe in larger pieces, compoſed of many ſuch diſtinct grains, united in one maſs, always of a black or dark roſin colour, pointed like diamonds. Grain-tin is alſo uſed to ſignify the pureſt and fineſt block or white tin, ſmelted with charcoal in the blaſt or blowing-houſe furnace, which never had any brood or foreign mixture in the mine: whereas the mine-tin is uſually corrupted with ſome portion of mundic, or other mineral, and is always ſmelted with a bituminous fire, which communicates a harſh ſulphurous quality to the metal. Grain-tin is peculiarly produced from ſtream-work, and is worth ſeveral ſhillings *per* hundred more than mine-tin. See Streaming.

See on this article Macquer's Chem. Dict. art. *Tin;* and Pryce's Mineralogia Cornubienſis, fol. 1778.

There is a curioſity in the Corniſh mines, which is this: that in digging at the depth of forty or fifty fathoms, they frequently meet with large timber, ſtill entire.

Childrey, in his Natural Hiſtory, goes back as far as the deluge to place them there; but, without having recourſe to ſo great antiquity, they who believe that the mines, when exhauſted of their ore, or mineral matter, renew and fill again in courſe of time, will ſoon ſolve the difficulty, by ſuppoſing that, in the firſt working of theſe mines, theſe timbers had been let down to ſerve as props and pillars.

But there are other people who will think this renewal of the mines itſelf a difficulty as great as the former. However, what the former author adds, *viz.* that in ſome places in the mines they likewiſe find pick-axes, &c. with wooden ſhafts, as alſo braſs nails, and that even a medal of Domitian has been found in one, ſeems to countenance the opinion.

For the uſe of tin in the compoſition of pewter, ſee Pewter.

Tin-*Trade of Britain*. That tin was procured from Britain in a very early age, appears probable from the concurrent teſtimony of the moſt ancient hiſtorians. The Phœnicians are ſaid by Strabo to have paſſed the pillars of Hercules, now the ſtraits of Gibraltar, about twelve hundred years before Chriſt. At what preciſe period they diſcovered the Caſſiterides, or Tin iſlands, is unknown, nor is their exact ſituation determined; but it is generally believed that the Scilly iſlands, and the weſtern part of Britain, were the places from whence theſe early navigators procured the tin which they exported to other countries. The Phœnicians were extremely anxious to conceal from the reſt of the world the true ſituation of the Caſſiterides. Herodotus, who wrote about four hundred and fifty years before Chriſt, could not learn where theſe iſlands were ſituated; but he ſuppoſed that tin, like amber, was brought from the remoteſt parts of Europe. Strabo relates, that the captain of a Phœnician veſſel returning from Britain ſeeing himſelf purſued by a Roman galley, choſe rather to run his veſſel among the rocks, that the Romans might experience the like fate, than be the means of diſcovering ſo valuable a commerce to the enemies of his country. The captain having eſcaped from the wreck, claimed from his country compenſation for the loſs of his veſſel and the cargo; and it is ſaid he was paid from the public treaſury the amount of his claims. By theſe precautions, the Phœnicians are ſaid to have enjoyed a profitable trade to theſe iſlands for about three hundred years. The ſecret was at length diſcovered, and the Greeks, Gauls, and Romans, came in ſucceſſively for a ſhare of this trade. The Phocean Greeks eſtabliſhed a colony at Marſeilles five hundred and forty years before Chriſt; and after the deſtruction of Carthage, carried on this commerce: they endeavoured to conceal from the Romans their knowledge of the Britiſh iſles; for on being queſtioned by Scipio reſpecting the ſituation and extent of thoſe iſles from whence the tin was brought, they declared that they were entirely unknown to them. The Phœnicians, in their voyage to Britain, are ſaid to have ſailed from Cadiz to the harbour of the Artabici, near Cape Finiſterre, from whence, after four days' ſail, they arrived in Britain. Strabo relates, that Publius Lucius Craſſus having made fruitleſs attempts to diſcover whence the tin was brought, at length ſucceeded, and arrived in Britain. It is uncertain when this Craſſus lived, and even who he was, there being two of this name; the father, who was proconſul of Spain, and the ſon, who had a command under Cæſar in Gaul.

Diodorus Siculus, who wrote during the time of Auguſtus, appears, from the quotation which we ſhall ſubſequently give, to have been well acquainted with the tin-trade of Britain at that period. There cannot be a doubt, that from the conqueſt of Britain by the Romans, to the decline of their empire in the Weſt, they enjoyed the undiſturbed poſſeſſion of the Britiſh tin-trade.

What the ancient method was of preparing tin for the furnace we cannot learn, ſays Dr. Borlaſe. Polybius the hiſtorian is ſaid to have deſcribed it; and that work is commended recorded by Strabo, but now loſt. The ſhort deſcription of the tin-trade given by Diodorus Siculus deſerves particular attention. "Theſe men (the tinners) manufacture the tin by working the grounds which produce it with much ſkill. For though the land is rocky, it has ſoft veins running through it, in which the tinners find the treaſure, which they extract, melt, and purify. Then ſhaping it by moulds into a cubical figure, they carry it off to a certain iſland lying near the Britiſh ſhore, which they call Ictis; for at the receſs of the ſea between the iſland and the main land, the paſſage being dry, the tinners embrace the opportunity, and carry the tin over in carts to the Ictis or Port; for it muſt be obſerved, that the iſlands which lie between the continent and Britain have this peculiarity, that when the tide is full they are real iſlands, but when the ſea retires they are ſo many *peninſulæ*. From this iſland the merchants bring the tin of the natives, and export it into Gaul; and finally through Gaul, by a journey of about thirty days, to the mouth of the Rhone:" lib. 4. Poſidonius, as quoted by Strabo, ſays the port to which tin was brought in the ſouth of France was Marſeilles.

To what uſes the nations of antiquity applied all the tin which they obtained with ſo much labour from Britain, is not preciſely known. The Phœnicians were celebrated for their ſkill in the art of dyeing; and the Tyrian purple, which was either a bright crimſon or a ſcarlet, was held in the higheſt eſtimation; hence it has been conjectured, with much probability, that the Phœnicians were acquainted with the uſe of the ſolution of tin in the preparation of that colour. In the modern art of dyeing ſcarlet or crimſon, the ſolution of tin in the nitro-muriatic acid is eſſentially neceſſary to communicate thoſe colours to woollen cloths or ſtuffs, a practice which is probably derived from the ancient manufactures of the Eaſt.

The mirrors of the civilized nations of antiquity were made of a compoſition of copper and tin. The moſt ancient account that we have of theſe mirrors is that in Exodus, chap. xxxviii. 8. "And he made the laver of braſs (a mixture of copper and tin), and the foot of braſs of the mirrors of the women." The Jewiſh women probably received theſe mirrors from the Egyptians when they left the country; for it was the cuſtom of the Egyptians to carry a mirror in their left hand, when they went to their temples. Cyril de Ado.

Pliny ſays that the beſt ſpecula were anciently made at Brunduſium of copper and tin. The metallic mixture of tin and copper, for rendering the latter metal white, is mentioned by Ariſtotle. (De Mirab.) This compoſition is ſtill in uſe for the ſpecula of reflecting teleſcopes. (See SPECULUM.) The ancients alſo made uſe of an alloy of tin with copper and lead for pot-metal. In the time of Pliny, pot-metal, *ollaria temperatura*, was made of two pounds of lead, and an equal quantity of tin, mixed with one hundred pounds of copper. From the ſame writer we learn, that the bronze of which the Romans made their ſtatues, and the plates on which they engraved their inſcriptions, was compoſed of one hundred pounds of copper, mixed with twelve pounds and a half of an alloy made of equal parts of lead and tin. He informs us alſo that tin, *plumbum album*, was employed in coating or tinning copper veſſels, to render them more wholeſome; and it appears that the Romans not only uſed pure tin, but the ſame mixture of tin and lead which ſome of our workmen uſe at this time in tinning of veſſels. A mixture of equal parts of tin and lead they called *argentarium*; a mixture of two parts of lead and one of tin they called *tertiarium*; and with two parts of tin and one of lead, they tinned whatever veſſels they thought fit. (Watſon's Chemical Eſſays, vol. iv.) In the manufacture of arms, the ancients uſed an alloy of tin with copper, their braſs being a compoſition of theſe metals; but by what method they were enabled to communicate to it the neceſſary degree of hardneſs is unknown.

What was the relative value of tin, compared with that of gold and ſilver, as eſtimated by the Phœnicians, the Greeks, or the Romans, is uncertain.

The proceſs of extracting tin from its ores was probably very imperfect, and remained ſo in this country to the time of Elizabeth, when Carew informs us that ſir Francis Godolphin introduced great improvements in the tin-works.

The reverberatory-furnace appears, from Dr. Borlaſe, to have been introduced into Cornwall about the beginning of the laſt century; and about the ſame time the introduction of pit-coal became general, the wood of the country having been nearly exhauſted. Sir Bevil Granville had previouſly made many experiments for melting tin with pit-coal, but without ſucceſs, when the ore was ſmelted at the blowing-houſes by large bellows worked by a water-wheel.

Whether the Phœnicians or the Greeks intereſted themſelves in the management of the tin-mines, or whether they were ſimply merchants purchaſing and exporting the tin, is uncertain. It appears, however, by the paſſage quoted from Diodorus Siculus, that the veins of tin-ore were worked as mines; though it has been, and is ſtill generally believed, that ſtream-tin was the only ore worked by the ancients. From the teſtimony of Strabo, Pliny, and others, the Romans not only traded to Britain for tin, but improved the art of mining in Cornwall. The Romans being the conquerors, and the Britiſh under them having probably little or no property, they were the working miners, but under what regulations is uncertain. The Saxons did not obtain poſſeſſion of Cornwall till the reign of Athelſtan, and neither they nor the Danes appear to have directed their attention to the mines. After the Norman conqueſt, the working of mines is ſaid to have yielded great profit. In the time of king John, however, the right of working tin being as yet, ſays Borlaſe, wholly in the king, as earl of Cornwall, the property of the miners was precarious and unſettled, and all the tin that was raiſed was engroſſed and managed by the Jews. The *tin-farm* of Cornwall at this time amounted to no more than one hundred marks, according to which valuation, the biſhop of Exeter received then, and ſtill receives from the duke of Cornwall, the annual ſum of 6*l.* 13*s.* 4*d.*, ſo low were the tin profits then in Cornwall; whereas in Devonſhire, the tin was then farmed at 100*l.* yearly. King John, ſenſible of the languiſhing ſtate of the mines, granted the county of Cornwall ſome privileges, and is ſaid to have alſo granted a charter to the tinners.

In the time of Henry III. the tin-mines of Spain, which had been worked by the Moors, were ſtopped, and Cornwall had all the trade of Europe for tin. In the eighteenth year of Edward I., the Jews being baniſhed the kingdom, the mines were again neglected for want of proper encouragement to labour, and ſecurity to enjoy and diſpoſe of the products. In conſequence of a petition from ſome Corniſh gentlemen to Edmund, earl of Cornwall, a charter was obtained with more explicit grants of privileges of keeping courts of judicature, and managing and deciding ſtannary cauſes. About this time, ſays Borlaſe, it appears that the rights of bounding or dividing tin grounds into ſeparate portions, for encouraging the ſearch for tin, were more regularly adjuſted, and various laws introduced for the protection of the miner.

In

In the thirty-third year of Edward I. the above charter ſeems to have been confirmed, and the tinners of Cornwall were made a diſtinct body from thoſe of Devonſhire, before which time the tinners of both counties were accuſtomed to meet on Hingſton-Hill every ſeventh or eighth year, to concert the common intereſt of both parties. Two coinages of tin yearly were alſo granted by this charter, and the tinners had the liberty of ſelling their own tin, unleſs the king inſiſted on buying it himſelf. Other laws and regulations for the encouragement and protection of the miners, were paſſed in the reigns of Edward III., Henry VII., and Elizabeth. The mines having been much neglected during the reign of Mary, Elizabeth invited German miners into the country, and great encouragement was given to mining operations in Cornwall, and various parts of England. The quantity of tin procured annually in the ſucceeding reigns of James I. and Charles, amounted to ſixteen hundred tons. During, and for ſome time after the civil wars, the tin-trade declined, but revived again in the reign of George I., and has ſince been increaſing. For an account of the annual products of the tin-mines of Cornwall and Devonſhire, ſee the article MINE.

All the tranſactions connected with the tin-mines are under the controul of the ſtannary laws: courts are held every ſix months, and they decide by juries of ſix perſons, with a progreſſive appeal to the lord warden and lords of the duke of Cornwall's council. By whatever method or accident a vein is diſcovered, permiſſion of the proprietor muſt be obtained before any operations can be commenced, except in the caſe of ſuch tin-mines as are anciently embounded according to the proviſion of the ſtannary laws. (See STANNARY COURTS.) The owner of the ſoil is technically called the *lord*, whoſe ſhare (which is called his *diſh*) is generally one-ſixth or one-eighth of the ore. The duke of Cornwall receives a duty of four ſhillings *per* hundred weight of tin, which is taken when the tin is aſſayed and licenſed: this proceſs is called the *coinage*, from the French word *coin*, a corner. A corner is chipped off each block at the office, and if it be found ſufficiently pure, the blocks are ſtamped with the arms of the duke. The annual revenue of the tin is about 10,000*l.*; the average annual amount being about 3200 tons, and the value about 120*l.* *per* ton. The mode of aſſay is obviouſly rude and imperfect; and we have heard that foreigners have recently complained that the Britiſh tin was not ſo pure as that obtained from the Eaſt. But whatever be the purity of Britiſh tin, there can be no doubt that it is greatly adulterated on the continent. It is ſaid that every tin-founder in Holland has Engliſh ſtamps, and be the quality of the tin what it may, the inſcription makes it paſs for Engliſh. The metal with which Britiſh tin is adulterated on the continent is lead, which being five times cheaper, and when mixed in ſmall quantities not eaſily detected, the temptation for ſuch fraud is great. It is not true, as aſſerted by ſome foreign writers of reſpectability, that Britiſh tin is purpoſely alloyed with certain portions of copper and lead before it is exported from Cornwall. The ores of tin, in the tin-mines of Cornwall, are ſo intimately aſſociated with portions of copper-ore, lead-ore, arſenical pyrites, and other metals, of which a ſmall mixture will remain in the block-tin, and can only be ſeparated by ſubſequent refining, that any conſiderable portion of alloy may be detected by the increaſe of ſpecific gravity. Grain-tin, which is the pureſt tin of commerce, is ſmelted from the fineſt ore by a charcoal fire: the common block-tin is ſmelted with pit-coal or culm, as before ſtated. Grain-tin is uſed for various purpoſes in the arts, where tin of the pureſt quality is required.

Long as the tin-mines of Cornwall have been worked, they ſtill continue to ſupply in abundance this uſeful metal; but from the greater extent of the preſent works, and from the circumſtance of tin always occupying the upper part of the vein, we may infer that the tin-mines of that county will be exhauſted at no very diſtant period. At preſent, the principal part of the tin is obtained from the weſtern extremity of the county; but when the tin-mines in that diſtrict are worked out, we may conſider the tin-trade of Cornwall as nearly extinct. The granitic range of Dartmoor, in Devonſhire, has been leſs explored than Cornwall; but there is reaſon to believe that the metallic repoſitories of tin and copper which it contains will furniſh an ample field for the induſtry of future adventurers, and a failure in the ſupply from Cornwall would greatly enhance the price of this metal, and give increaſed ſpirit to mining ſpeculations.

TIN, in *Chemiſtry* and the *Arts*. The colour of tin is white, like that of ſilver: it has a ſenſible taſte, and when rubbed, emits a peculiar ſmell: its hardneſs is greater than that of lead, and leſs than that of zinc: its ſpecific gravity is ſtated by Briſſon to be 7.291, and it is ſaid to become a little greater by hammering: it is very malleable, and may be beaten into very thin leaves. *Tin-foil*, as it is termed, is uſually about $\frac{1}{1000}$th of an inch in thickneſs; but this is by no means the utmoſt degree of thinneſs which it will bear. Its ductility and tenacity are rather low: a tin wire, $\frac{1}{12.5}$th of an inch in diameter, is ſtated by Muſchenbroeck (as quoted by Dr. Thomſon) to be capable of ſupporting a weight of 31 lbs. only, without breaking. Tin may be eaſily bent, and when bent, produces a peculiar crackling noiſe: it fuſes at about 442° of Fahrenheit's ſcale, but will bear a moſt intenſe heat before it is volatilized. On being expoſed to the atmoſphere, its ſurface becomes ſlightly tarniſhed, but it undergoes no other change. When kept under cold water it undergoes no change; but red-hot tin, expoſed to the vapour of water, decompoſes it, an oxyd of tin is formed, and hydrogen gas is evolved. Expoſed to the action of the air in a melted ſtate, it quickly becomes covered with a greyiſh powder, or oxyd; and if the heat is very violent, it is ſtated to take fire, and to burn with a pale white light.

Tin unites with oxygen in two proportions, as has been lately proved by Gay Luſſac, in oppoſition to Berzelius, who concluded from his experiments that there were three oxyds of tin. (See Annal. de Chimie et Phyſ. vol. i. p. 40.) The firſt oxyd, or protoxyd, of tin, conſiſts of about

Tin	-	-	100.
Oxygen	-	-	13.6

The ſecond, or peroxyd, of about

Tin	-	-	100.
Oxygen	-	-	27.2

This gives the weight of the atom 7.352. Dr. Thomſon is inclined to conſider it as 7.375; but it perhaps will be found hereafter either 7.25 or 7.5. The firſt of theſe oxyds may be formed by diſſolving tin in muriatic acid, either by means of heat, or by adding occaſionally a little nitric acid: when diſſolved, add to it a ſolution of potaſh; a white precipitate falls, which is partly taken up again; but the remainder, on ſtanding, aſſumes a dark grey colour, and even a metallic luſtre; and on being heated to whiteneſs, is pure protoxyd of tin. The peroxyd may be formed by boiling

boiling the protoxyd in dilute nitric acid, drying by evaporation, and heating to rednefs.

Tin forms likewife two combinations with chlorine. When tin is burnt in chlorine, a very volatile clear liquor is formed, a non-conductor of electricity, and which, when mixed with a little water, becomes a folid cryftalline fubftance, a true muriate of tin, containing the peroxyd of tin. This compound has been called the *fmoking liquor of Libavius*, from its difcoverer, who formed it by diftilling together amalgam of tin and corrofive fublimate. According to the experiments of Dr. John Davy, it confifts of two atoms or proportions of chlorine united to one of tin; or of about

Tin	- -	100.
Chlorine	- -	121.82

Prochloride of tin, firft defcribed by Dr. J. Davy, is a grey, femi-tranfparent, cryftalline folid, and may be formed by heating together amalgam of tin and calomel. According to the fame chemift, it confifts of one atom or proportion of chlorine united to one of tin; or of about

Tin	- -	100.
Chlorine	- -	60.72

Tin combines readily with fulphur and phofphorus, but not with hydrogen, azote, carbon, or boron.

There are two fulphurets of tin; the firft may be formed by fufing tin and fulphur together: it is of a blueifh colour, and lamellated ftructure; and from the experiments of Dr. J. Davy, confifts of one proportion of tin united to one of fulphur. The other fulphuret of tin is made by heating together the peroxyd of tin and fulphur. It is of a beautiful gold colour, and appears in fine flakes. It was formerly called *aurum mufivum*, and various complicated proceffes given for forming it. Pelletier and Prouft inveftigated its nature, and concluded it to be a compound of oxyd of tin and fulphur; but Dr. Davy has fhewn that this is not the cafe, and that it confifts merely of one proportion of metallic tin united to one proportion of fulphur.

The phofphuret of tin may be formed by heating the two fubftances together. Only one phofphuret is known: it has a metallic appearance, and is fo foft that it may be cut with a knife. When gently heated in the air, the phofphorus takes fire. According to the experiments of fir H. Davy, it contains about 17 *per cent.* of phofphorus, and confifts therefore of one atom or proportion of phofphorus united to one of tin.

Tin combines with moft of the metals, and fome of its alloys are much employed.

Its alloys with the metals of the fixed alkalies fpeedily tarnifh in the air, and effervefce in water.

It readily unites with gold by fufion, and was formerly fuppofed to have the property of rendering this metal brittle; but this has been more recently denied. An alloy of 11 gold and 1 of tin, was found by Mr. Hatchett to have a pale whitifh colour, brittle when thick, but when cut thin, capable of being bent eafily. Its fracture was fine-grained, and of an earthy appearance. Mr. Alchorne found, that gold alloyed with no more than $\frac{1}{24}$th of tin, retains its ductility fufficiently to be rolled and ftamped in the ufual manner. But Mr. Tillet fhewed, that when heated to rednefs, the tin melts, and the alloy falls to pieces.

Its alloys with platina, according to Dr. Lewis, are brittle and dark-coloured, when the two metals are in equal proportions. The alloys of tin and filver are very hard and brittle. The alloys, or rather amalgams, of tin and mercury differ in hardnefs, according to the proportions in which the two metals are mixed: three parts of mercury and one of tin form an amalgam which cryftallizes in cubes, or, according to Sage, in the form of brilliant fquare plates, thin towards the edges. Tin readily combines with copper, and forms alloys exceedingly ufeful for a variety of purpofes, as will be briefly noticed when we fpeak of the ufes of this metal. Tin does not readily combine with iron, but their union may be effected by fufing them together in clofe veffels: it combines with zinc by fufion, and the alloy is harder than zinc, and ftronger than tin: with lead it readily unites in all proportions, and the lead by the addition becomes confiderably harder.

The oxyds of tin are capable of combining with the alkalies, and of forming with them peculiar compounds.

Salts of Tin.—Tin is oxydated and diffolved by many of the acids, and forms falts, differing in their nature according to the degree of oxydizement of the metal.

Nitrates of Tin.—Concentrated nitric acid (fpecific gravity 1.48) poured on tin, exerts but little action upon it; but if a little water be added, a violent action is exerted, and peroxyd of tin is formed, which feparates in the form of a white powder, this oxyd being apparently incapable of combining with nitric acid: in this cafe, both the acid and the water are decompofed, and nitrate of ammonia is formed; but if the acid be diluted, and care be taken to moderate its action upon the metal, the water only is chiefly decompofed, and the protoxyd of tin is formed, which combining with the nitric acid, forms a folution of a yellow colour, which is a real nitrate of tin. Still, however, a little nitrate of ammonia is formed, and the nitrate of tin itfelf is not permanent, the metal continuing to pafs to the ftate of peroxyd, and gradually feparating. The fame change is produced by heating the folution, a precipitate being depofited, which, however, is partly fubnitrate of tin.

Muriates of Tin.—We have already fpoken of the chlorides, or compounds of tin with chlorine. Now if water be added to thefe chlorides, they are converted into muriates of tin. The muriate of tin, in which the metal is in the ftate of protoxyd, may be formed, however, by diffolving tin in about four times its weight of muriatic acid: hydrogen efcapes, and the folution has a brownifh-yellow colour, and yields, on evaporation, fmall needle-fhaped cryftals, foluble in water, and fomewhat deliquefcent. Water poured upon it in fmall quantity decompofes it, and converts it into a fubmuriate, which is precipitated, and a fuper-muriate, which remains in folution. A fimilar effect is produced by the alkalies, when not added in excefs. This muriate of tin, formed of the protoxyd, has a great tendency to combine with oxygen, and to pafs into the ftate of muriates with the peroxyd, and this property enables it to exert many curious efforts upon other metallic falts. Thus, for example, the red oxyd of mercury, the black oxyd of manganefe, the white oxyd of antimony, the oxyds of zinc and filver, are deprived of their oxygen by this falt, and reduced to the metallic ftate. The muriate of tin with the peroxyd of the metal may be formed as before mentioned. It is capable of cryftallizing, and poffeffes properties quite different from thofe of the muriate above defcribed. It is much ufed by dyers, who generally form it by diffolving tin in nitro-muriatic acid.

Sulphate of Tin.—Sulphuric acid, when cold, has little action on tin, but affifted by a moderate heat, it attracts oxygen from it; fulphurous acid gas is evolved, and a fulphate of tin is formed, which yields, when evaporated, fmall needle-formed cryftals. It is probable there are two fulphates

fulphates of tin, though their properties do not appear hitherto to have been diftinctly defined.

The *phofphate*, *fluate*, and *borate of tin* may be formed by double decompofition, by adding folutions of their alkaline falts to a folution of muriate of tin. They are all infoluble compounds, and have been but imperfectly examined. No *carbonate of tin* appears to exift.

The other falts of tin are unimportant, and but little known. The *acetate* has been moft inveftigated: it may be formed by boiling tin in acetic acid. The folution has a whitifh colour, and yields cryftals by evaporation. There appears, however, to be another *acetate*, (formed probably with the peroxyd of the metal,) that does not cryftallize, but is capable of exifting only, on evaporation, in the form of a gummy mafs.

Ufes of Tin and its Compounds.—Tin and its compounds are extenfively ufed in the arts. We fhall here briefly point out fome of the more important operations in which they are concerned, referring our readers for further particulars to the different articles themfelves. An amalgam of tin and mercury forms the metallic coat of glafs mirrors. For the method of performing this operation, fee the article SILVERING *of Mirrors*.

The compounds of tin with copper are very important. Of this alloy *cannons* are made, alfo *bell-metal*, *bronze*, and the *mirrors* or *fpecula of telefcopes*. For thefe different purpofes, the two metals are mixed in different proportions, which are pointed out more particularly under their refpective articles.

Veffels of copper, efpecially for culinary purpofes, are ufually covered with a thin coating of tin, to prevent the copper from oxydating. (See the article TINNING.) Thin iron plates covered with this metal, form what is known by the name of *tin-plate*; which fee.

The oxyd of tin, mixed with that of lead, forms *putty*, which is much ufed in polifhing metals. See PUTTY and SPECULUM.

Tin alloyed with lead forms *folder*; which fee.

Of the falts of tin, a folution of the *muriate*, or *dyers' liquor*, as it is termed, is ufed as a mordant in dyeing fcarlet. ee the articles DYEING, MORDANT, and RED.

The folution of tin in aqua regia, added to the tinctures of cochineal, of gum-lac, and of fome other red tinctures, heightens the colour of thefe, and changes it from a crimfon or purple to a vivid reddifh-yellow, or fire-coloured fcarlet. The new fcarlet, or Bow dye, is obtained in this manner; and it is faid, that our moft beautiful and lafting-coloured fine cloths owe their fuperlative excellence to the retentivenefs given by our fine grain-tin; infomuch, that the Englifh fuperfine broad-cloths, dyed in grain by the help of this ingredient, are become famous in all markets of the known world.

Mr. Pryce apprehends, that the purple dye of the Tyrians owed its reputation wholly, or in part, to the ufe of our tin in the compofition of their dye-ftuff, as the tin-trade was folely under their own direction.

This colour, however, fucceeds only with wool and other animal matters. Attempts have been made, but without fuccefs, to give this colour to thread, to cotton, and even to filk, though this latter fubftance has many properties of animal matters. The folution of tin made with marine acid alone, or with vitriolic acid, does only give to red tinctures a crimfon colour, as alum does. Vegetable acids, as vinegar and cream of tartar, are alfo capable of diffolving tin.

Tin or its compounds are not ufed in medicine. They do not appear to be of a poifonous nature; but the muriate of tin, taken into the ftomach in confiderable quantity, fpeedily induces death, apparently merely from its corrofive qualities. It was formerly recommended for its anthelmintic virtues; but it is poffible, fays Dr. Lewis, that thefe may proceed not fo much from the pure metal, as from a certain fubftance of a different or arfenical nature, of which the pureft forts of tin are found to participate.

The principal preparations of tin are as follow:

TIN, *Butter of*, is a name given by fome chemifts to a combination of tin with the concentrated marine acid of corrofive fublimate. It is procured by reducing thefe fubftances into fmall parts, and mixing them together: this mixture will, by degrees, be moiftened by attracting the humidity of the air. The decompofition of the corrofive fublimate by the tin is more fpeedily effected by diftillation.

TIN, *Calx of*, is the metal reduced into powder, either by means of fire, or by being diffolved in an acid menftruum, and precipitated with an alkali.

TIN, *Cerufs of*. See *Spanifh* WHITE.

TIN, *Diaphoretic of*. See ANTIHECTICUM *Poterii*.

TIN, *Flowers of*, are a kind of white cofmetic, or paint for the complexion, drawn from tin with fal ammoniac, by means of fublimation.

TIN, *Gold-coloured preparation of*, is made by adding fix ounces of mercury to twelve of melted tin, pulverizing the cold mafs, mixing with it feven ounces of flowers of fulphur and fix of fal ammoniac, and fubliming in a matrafs.

This preparation is called *aurum mofaicum*, and as a medicine is little regarded, though formerly much efteemed againft hyfterical and hypochondriacal complaints, malignant fevers, and venereal diforders. Upon experiment, it appears to be little more than calx of tin.

TIN, *Salt of*, *Sal Jovis*, is prepared from twelve ounces of calx of tin, and four of aqua regia, diluted with twenty-four of water: after digeftion for two days, the veffel is to be fhaken, the more ponderous part of the calx fuffered to fettle, the turbid liquor poured off, and evaporated almoft to drynefs, and the mafs farther exficcated on brown paper: to the remaining calx half the quantity of frefh menftruum is to be added, and the procefs repeated. Dr. Lewis's experience has not enabled him to pronounce on the virtues of this falt, which is in tafte very fharp and corrofive: he thinks it needlefs to calcine the metal, as tin uncalcined diffolves much more eafily and plentifully, and the folution is in both cafes the fame. According to Hoffmann, the folution of tin is a ftrong purgative. Lewis's Mat. Med.

TIN is alfo a word ufed by fome of the chemical writers to exprefs fulphur.

TIN-*Coping*, in *Rural Economy*, a fort of covering of this kind of metallic fubftance in the fheet form, which is not unfrequently employed on the upper parts of the frames, ftands, or ftaddles of corn-ftacks, for the purpofe of preventing deftructive vermin from entering or getting into them. It is a cheap, ready, convenient, and ufeful material in this intention, in many cafes, which the arable farmer fhould not be inattentive to in his ftack-yard.

TIN-*Floors*, a contrivance ufed by our hufbandmen who propagate hops, to dry them after the gathering. See OOST.

It is thus done: Let a fquare brick room be built, with a door on one fide, and a long fire-place of a foot wide in the middle, reaching almoft acrofs it; let holes be made at the fides of this fire-place, to let out the heat into the room; and at the height of five feet above this, let a floor be made of laths of an inch thick, laid lattice-wife. Let this be covered with great plates of double tin, taking care that the joinings of the tin be well foldered, and lie upon the laths, nor over the interftices, which may be about four inches wide. Let a row of boards be fitted round the edge of this

this floor, to keep the hops from falling off; then lay on a covering of hops of a foot thick, and make a fmall fire of charcoal in the mouth of the fire-place, and the hops will dry very quickly and very regularly. They may be continually ftirred about while drying, and, when dry, a part of the boarded edge of the kiln may be taken down, and the dried parcel thruft out, and a frefh parcel laid on in their place. A very fmall quantity of fuel is fufficient in this way, and any fuel will do, for the fmoke never comes at the hops. There is a very great improvement ftill upon this method of drying hops, ufed by fome people: this is the making of a wooden cover, of the fize of the tin-floor; this is covered with plates of tin nailed on, and is fufpended over the kiln in fuch a manner, that it may be let down at pleafure, when the lower parts of the hops are dry. This is to be let down within ten inches of their furface, and there it acts as a reverberatory, and drives back the heat on the upper ones, fo that they are dried as foon as the lower ones. Thus all the trouble of turning is faved, and the hops are much better dried than in any other way. Mortimer's Hufbandry, p. 186. See VENTILATOR.

TIN-*Foil*. See FOIL, FOLIATING, and LOOKING-GLASS.

TIN-*Hatch*, in *Mining*, a term ufed by the people of Cornwall, to exprefs the opening into a tin-mine. They alfo call it *tin-fhaft*.

They make feveral openings in the fides of the hills where they expect veins of ore to be. All thefe, except that which opens on the head of the mine, are called *effay-hatches;* but that which does fo, is made their entrance afterwards, and changes its name to that of the tin-hatch. See HATCHES and SHAFT.

TIN-*Hoop for Cheefe*, in *Rural Economy*, a light thin hoop conftructed of this fort of fheet metallic fubftance, that is fometimes employed in cheefe-making, for holding and keeping the curd together while it is breaking and being crumbled down into the filling-vat, in order to prevent the trouble of raifing and holding up the corners of the cloth which is made ufe of in the bufinefs. It is ufually about nine inches in breadth, and formed fo as exactly to fit the top part of the cheefe-vat on which it refts when ufed. Thefe hoops are fometimes made of other materials, as wood, &c. and are ufeful in faving time and trouble.

TIN-*Ore*, called *tin-ftuff* by the miners in Cornwall. See TIN-*Stone*.

M. Gellert directs, that ores of tin fhould be affayed in the following manner: Mix a quintal of tin-ore, wafhed, pulverized, and twice roafted, with half a quintal of calcined borax, and half a quintal of pulverized pitch; thefe are to be put into a crucible, moiftened with charcoal-duft and water, and the crucible placed in an air-furnace: after the pitch is burnt, give a violent fire during a quarter of an hour, and then withdraw the crucible. If the ore be not very well wafhed from the earthy matter, as it ought to be, a larger quantity of borax is requifite, with fome powdered glafs, by which the too quick fufion of the borax is retarded, and the precipitation of the earthy matter is prevented. If the ore contains iron, to the above mixture may be added fome alkaline falt. See MOOR-*Stone*.

The method of affaying tin-ore, fays Mr. Pryce, is very eafy; for in its form and fize of black tin (which is the ore dreffed by ftamping, feveral wafhings, and calcination, if mineralized with vitriolic, arfenical, or fulphureous pyrites) great part of the work is done, and little more remains than fufion, which is accomplifhed by a red heat in the following procefs: Take four or five ounces of black tin as emptied from the facks, mix it well with about one-fifth part of its weight of powdered culm; put the mixture in a black-lead crucible, on the wind furnace, and, in about twenty minutes, the metal will be found precipitated to the bottom of the crucible, the culm and fcoria floating on the tin. On the furface of this matter there will be globules of tin; and therefore the mixture fhould be ftirred with an iron rod, to make them fall into the tin at the bottom. Clofe the furnace, and let the whole remain in fufion from three to five minutes. Keep in readinefs an iron or brafs mortar, and an ingot-mould about fix inches long; pour the tin into the ingot, and empty the culm and fcoria into the mortar, fcraping off what remains in and about the crucible with a fharp iron. As foon as cold, put them into another mortar, and pulverize them gently, fo as to feparate the fcoria from the largeft of the globules of tin. Select the larger globules, and pulverize the remainder a fecond time; then put this ftuff, twice powdered, on a fhovel, and paffing it often through water, in the fame manner as the lighter parts are wafhed from ores in vanning, and the fmaller globules will remain on the fhovel; and thefe, with the larger (both together being generally called *pillion-tin*), being added to, and weighed with the ingot, fhew the produce in metal of the four or five ounces affayed. See Macquer's Chem. Dict.; and Pryce's Min. Corn. p. 269.

TIN-*Plates*, an article of manufacture very common among us, and vulgarly called *tin*. It is iron plated over with tin. The French call it *fer blanc*, white iron, as we fometimes do in England. It was once known under a diftinct name, *lattin*, under which article the procefs of manufacturing it is defcribed.

The procefs ufed for this purpofe near Caermarthen, in South Wales, which is defcribed by Mr. Donovan, in his "Defcriptive Excurfions through South Wales in 1805," is as follows:

The iron-ore employed in this manufactory is the common kind of the country, intermixed with a large portion of the fine hæmatite from Ulverftone, in Lancafhire, which gives a very fine metal. This too is fmelted with charcoal inftead of coke, to produce a metal of the greateft purity and extenfibility, and clofenefs of texture, which qualities are particularly required in this manufacture. The reduced ore is fmelted in the ufual manner, and caft into pigs, which are then wrought by the hammer into long flat bars, that are afterwards cut into pieces of about ten inches in length. Thefe are then wrought into plates by being heated red-hot, and paffed through a flatting-mill, which confifts of two large cylinders of fteel, cafe-hardened and fecured in a frame of iron. Thefe are placed contiguous to each other, but with a certain interval of fpace, and revolve in a contrary direction, fo that when one end of the bar is thruft in the fpace between the cylinders, the whole is drawn through and proportionably extended and flattened in the paffage. The diftance between the cylinders, which of courfe determines the thicknefs of the plate, is maintained and regulated by fcrews which can be altered at pleafure. When the bar is thus made into a plate of twice the thicknefs of the ordinary plates, it is heated red-hot, cut in two by a pair of fhears, and one piece folded exactly over the other, and both repaffed repeatedly through the cylinders till the folded plate has extended to the fame length and breadth as the plate was before cutting. It is then clipped round the edges, and the two plates torn afunder (which requires fome little force) after which they are each finifhed by paffing through a finer rolling-prefs, fo as to take away every creafe or inequality in the plate, and thofe that are too rough to pafs through this finer prefs are thrown afide.

The plates are then fteeped in a very weak acid liquor, and when taken out are fcoured thoroughly with bran, fo as to to be quite bright and poliſhed to enable the tin to adhere. The tin is melted in deep rectangular crucibles, and kept fluid by a moderate charcoal fire beneath. To prevent its calcination, a quantity of greaſe prepared from linſeed-oil and ſuet is conſtantly kept floating on the ſurface of the tin, and renewed as it evaporates off, which gives an exceſſively nauſeous ſtench. The plate is then taken up by one corner by a pair of pincers, and dipped vertically into the tin, and when withdrawn is found beautifully white and reſplendent with the coating of this metal that adheres to it. This dipping is repeated three times for what is called *ſingle tin-plate*, and ſix times for the *double plate*. The plates are then only cleanſed and ſorted, and are fit for uſe.

We ſhall here add, with regard to the hiſtory of this manufacture, that in the year 1681, tin-plates were made in England by one Andrew Yarranton, who was ſent to Bohemia to learn the manner of making them. But the manufacture was diſcontinued by his employers, and afterwards ſo much diſregarded, as to be reckoned among the projects called bubbles of the year 1720; however, it was revived, and brought to ſuch perfection about the year 1740, that very little of it was imported from foreign parts; our own plates being of a finer gloſs, or coat, than that made beyond ſea, the latter being hammered, and ours being drawn under a rolling-mill. And. Hiſt. Com. vol. ii. p. 175, 361.

The two principal wholeſale houſes for this manufacture in London, are thoſe of Jones and Taylor in Tottenham-Court Road, and Howard and Co., in Old-ſtreet Road.

TINA, a name given by the old medical writers to a bath made of a ſtrong decoction of many carminative ingredients to be uſed in the colic.

Tina, in *Geography*. See Knin.

TINAGOB, a town on the W. coaſt of the iſland of Samar. N. lat. 12° 5′. E. long. 124° 30′.

TINALMO, a town on the S. coaſt of the iſland of Luçon. N. lat. 13° 38′. E. long. 122° 42′.

TINAMASAKI, a town of Japan, on the S. coaſt of the iſland of Niphon. N. lat. 34° 12′. E. long. 136° 55′.

TINAPA, a town of Mexico, in the province of New Biſcay; 120 miles N.W. of Duranga.

TINARA, a town of Nubia, on the Nile; 200 miles S.S.W. of Syene.

TINCA, the *Tench*, in *Ichthyology*. See Cyprinus *Tinca*, and Tench.

Tinca *Marina*, the *ſea-tench*, a name given by ſome authors to the common *turdus*, called in Engliſh the *wraſſe*, and *phycis*.

TINCAL, is a name given to borax in the crude ſtate in which it is brought from India, and before it is refined. It conſiſts of ſmall cryſtals of a yellowiſh colour, and it has a greaſy or unctuous touch. See Borax.

According to M. Cadet, it contains a larger quantity of the peculiar vitreſcible earth of borax than the refined ſalt commonly ſold does. See Baurac.

TINCAUSARIS, in *Ancient Geography*, a place of Africa, in Cyrenaica, on the route from Carthage to Alexandria, between Boreum and Atticis. Anton. Itin.

TINCHEBRAY, in *Geography*, a town of France, in the department of the Orne; 10 miles N. of Domfront.

TINCO, a town of Spain, in the province of Aſturias; 20 miles N.W. of Oviedo.

TINCONTIUM, or Tinconcium, in *Ancient Geography*, a town of Lyonneſe Gaul, between Avarican and Deccida. Anton. Itin.

TINCTOR, John, in *Biography*, born at Nivelle, in Brabant, and flouriſhed about the year 1474. He was a great muſician, long in the ſervice of Ferdinand of Aragon, king of Naples and Sicily, who reigned from 1458 to 1504, and ſtyles himſelf his arch-deacon, chaplain, and cantor. Beſides ſeveral muſical tracts by this early writer on counterpoint, he was author of the firſt muſical dictionary. All written muſic in counterpoint during the fifteenth century was compoſed for voices, at leaſt we have never ſeen any other; and being intended for the church, was ſet to Latin words: ſo that the firſt terms uſed in the art, were likewiſe in that language; and theſe were ſo numerous in Tinctor's time, that he collected them, under the title of "Terminorum Muſicæ Diffinitorium," and printed them at Naples. This was doubtleſs not only the firſt muſical dictionary that was ever compiled, but the firſt book that was printed on the ſubject of muſic in general. The work is ſo ſcarce, that we have never been able to find it, except in his majeſty's ineſtimable library. In this "Diffinitorium," we firſt met with the preciſe definition of the four principal parts in vocal counterpoint: *cantus*, *altus*, *tenor*, and *baſe*; which ſee under their ſeveral heads.

Tinctor, in one of his tracts, gives to the Engliſh the invention of counterpoint. See Dunstable.

Walther ſeems never to have heard of Tinctor's "Diffinitorium;" but he gives the title of his three tracts: "De Arte Contrapuncti;" "De Tonis;" and "De Origine Muſicæ;" from Geſner's Bibl. Univ.

TINCTORUM Rubia. See Madder.

TINCTURE, Tinctura, in *Pharmacy* and *Chemiſtry*, a ſeparation of the finer and more volatile parts of a mixed body, made by means of a proper menſtruum diſſolving the ſame.

Tincture is more particularly uſed for an extract of part of the ſubſtance of a body, eſpecially its flavour and colour, which are hereby communicated to the menſtruum.

Tinctures, in the *Materia Medica*, are ſpirituous ſolutions of ſuch of the proximate principles of vegetables and animals, as are ſoluble in pure alcohol or in proof-ſpirit; and they are ſaid to have been invented about the end of the thirteenth century, by a profeſſor of medicine at Montpelier, called Arnold de Villa Nova. From vegetable matter ſubmitted to its action, alcohol takes up ſugar, reſin, extractive, tannin, cinchonin, camphor, volatile oils, ſeveral acids, and the narcotic principle; proof-ſpirit alſo takes up the whole of theſe partially, and is beſides the proper menſtruum for gum-reſins; ſo that alcohol, either in a concentrated or diluted form, is capable of ſeparating the greater part of the active principles of vegetables from the ligneous inert fibres. The tinctures obtained from animal ſubſtances are very few in number, and the principles taken up by the ſpirit are analogous to thoſe enumerated above, belonging to the vegetable kingdom.

Pure alcohol is required in very few inſtances only for the formation of tinctures, proof-ſpirit being adequate for almoſt every purpoſe. The dilution of the ſpirit, however, muſt be varied according to the known principles of the ſubſtances to be ſubmitted to its action: when reſin predominates, it muſt neceſſarily be more concentrated; when gum-reſin or extractive is the moſt abundant conſtituent, proof-ſpirit then muſt be employed. In conſequence of the great affinity of water for alcohol, the addition of it to alcoholic tinctures ſeparates the reſin, camphor, and volatile oils they contain; but water is generally miſcible with tinctures made with proof-ſpirit, without producing any decompoſition. Tinctures are not liable to ſuffer ſpontaneous decompoſition, as is the caſe with infuſions and decoctions; and, independently of the loſs which takes place from the evaporation of the ſpirit and the volatile oils, if the bottles containing tinctures be cloſely corked, they may

be

be kept for an indefinite length of time, and their virtues remain unimpaired.

Tinctures are prepared by macerating the ingredients in the ſpirit in a temperature not exceeding 80°, at which degree, by allowing the menſtruum to remain on the ingredients for a ſufficient length of time, all the principles that can prove uſeful in the tincture are extracted, and the ſolvent ſaturated. The ingredients muſt be dried and reduced to a coarſe powder, and the maceration made in cloſe veſſels, and aſſiſted by frequent agitation. When completely made, tinctures ſhould not be allowed to remain upon the ingredients, but be filtered through bibulous paper, and kept in this ſtate in well-corked bottles.

The chief uſe of this claſs of preparations is to cauſe infuſions and decoctions to which they are added, to ſit lighter upon the ſtomach, or to unite with them ſome active principle, which the water is incapable of extracting. Thomſon's London Diſpenſatory.

A great variety of tinctures may be given to common water, and many remarkable things occur in their changes on the addition of common menſtruums. Take a large ſpoonful of the ſyrup of pomegranate-flowers, mix it with five ſpoonfuls of water; the mixture will be of a very lively and brilliant red: for a violet colour, take the ſame quantity of ſyrup of violets and the ſame of water. When theſe tinctures are thus prepared, have at hand a phial, in which is a ſmall portion of oil of tartar, which will only look like water remaining after the waſhing of the phial. Pour the red or the violet tincture into this phial, and it immediately becomes a fine graſs-green. Diſſolve the quantity of a walnut of crude ſal ammoniac in a glaſs of water, pour all out except three or four drops at the bottom, and pour into this glaſs the fine red liquor, and it immediately becomes black as ink. In order to change the purple liquor red, only have a ſmall quantity of ſpirit of vitriol in the bottom of a phial, and pour into this the violet water; it immediately on this becomes of a florid red.

Steep Braſil wood in common water, or in white wine, twenty hours; the liquor will then look of the colour of red wine: pour this into a glaſs waſhed with vinegar, and it becomes of a fine yellow, like ſack. If this experiment be made with white wine, the wood and the vinegar make ſo little alteration in it, that it may be drank afterwards, and the whole proceſs ſeems a way of turning red port into ſack. Into this liquor, when yellow, put a few drops of a tincture of benjamin made in ſpirit of wine, and it immediately loſes its yellow colour and becomes white. Beat ſome galls to fine powder, and rub the powder on a towel; then put into a baſon of water, in which any perſon is going to waſh their hands and face, a ſmall piece of common green vitriol, or copperas: after the perſon has waſhed, let them have this towel to wipe on, and the hands and face will be as black as if waſhed with the common writing-ink; the copperas in the water and the galls on the towel making real ink where they mix. This does no laſting injury to the ſkin, but will come off again upon waſhing with ſoap. Phil. Tranſ. N° 238, p. 88.

We ſhall here enumerate and deſcribe the principal tinctures that occur in the materia medica.

Tincture *of Acetate of Iron* is prepared, according to the Dub. Phar. by adding together two ounces of acetate of kali and one ounce of ſulphate of iron in a ſtone-ware mortar, till they unite in a ſoft maſs, and when dried by a moderate heat, triturating it with two pints of rectified ſpirit of wine; and then digeſting it for ſeven days in a phial, cloſely corked, and frequently agitated, and then pouring the clear tincture from the fæces.

Tincture *of Acetate of Iron with Alcohol*, is prepared by rubbing together ſulphate of iron and acetate of alkali, of each an ounce, and proceeding as in the former article, triturating with two pints of alcohol; and digeſting for twenty-four hours. Theſe tinctures have a peculiar odour, a reddiſh-brown colour, and a warm ſtyptic taſte; and poſſeſs the ſame medical properties as the other preparations of iron. The doſe of either may be from ♏ x to f℥j, given in water or any other ſuitable vehicle.

Tincture *of Acetate of Zinc* of the Dub. Ph., is obtained by rubbing ſulphate of zinc and acetate of kali, of each an ounce, and adding one pint of rectified ſpirit of wine, and then macerating for a week with occaſional agitation, and filtering through paper. This tincture is aſtringent, but requires to be diluted with water, before it is uſed either as a collyrium or an injection. It may be beneficially employed as an internal remedy in dyſpepſia and other debilities of the ſtomach.

Tincture *of Aloes* of the Lond. Ph., is prepared by macerating of extract of ſpiked aloes powdered, half an ounce; of extract of liquorice, an ounce and a half; of water, a pint; and of rectified ſpirit, four fluid-ounces, in a ſand-bath until the extracts are diſſolved, and then ſtraining.

The *tincture of aloes* of the Dub. Ph. is obtained by digeſting for ſeven days, half an ounce of ſocotorine aloes powdered, an ounce and a half of extract of liquorice diſſolved in eight ounces of boiling water, and eight fluid-ounces of proof-ſpirit, and then ſtraining.

The *tincture of ſocotorine aloes* of the Edinb. Ph. is formed by digeſting for ſeven days, with a gentle heat, in a cloſe veſſel, often ſhaken, half an ounce of ſocotorine aloes in powder, an ounce and a half of extract of liquorice, four ounces of alcohol, and a pound of water; and pouring off the clear tincture. Its doſe is from f℥ſs to f℥jſs.

Tincture, ethereal, of aloes of the Edinb. Ph., is prepared by digeſting an ounce and a half of myrrh with a pound of ſulphuric ether with alcohol, for four days, in a cloſed bottle, and then adding one ounce of Engliſh ſaffron cut, and one and a half of ſocotorine aloes in powder; digeſting again for four days, and pouring off the tincture. This is a warm ſtomachic purgative, and is given with advantage in dyſpeptic affections, jaundice, gout, chloroſis, and other caſes in which aloetics are proper; in doſes of fℨj or fℨij as a ſtomachic, and in larger doſes as a briſk purge.

Tincture, compound, of aloes of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (ſeven days Dub.), of extract of ſpiked aloes powdered, and ſaffron, of each three ounces, in two pints of tincture of myrrh; and ſtraining.

Tincture of aloes and myrrh of the Edinb. Ph., is prepared by mixing a pound and a half of alcohol with half a pound of water, and then adding two ounces of myrrh in powder; digeſting for four days; and, laſtly, adding of ſocotorine aloes in powder an ounce and a half, and an ounce of Engliſh ſaffron cut; digeſting again for three days, and pouring off the clear tincture. This tincture may be adminiſtered in the ſame caſes and doſes as the former; and it is occaſionally uſed as a local ſtimulant to foul ulcers.

The *tincture of aloes*, formerly called *tinctura ſacra*, and *hiera picra*, was ordered to be made by digeſting five ounces of the powder, called *hiera picra*, or a powder formed of eight parts of aloes and two of canella alba, in five pints of mountain wine; or an ounce of aloes, with one drachm of the leſſer cardamom ſeeds, and the ſame quantity of ginger, in two pounds of the ſame wine. Lewis.

Dr. Buchan directs this tincture to be made by infuſing an ounce of ſocotorine aloes in powder, and two drachms of Virginia ſnake-root, and as much ginger, in a pint of mountain

mountain wine and half a pint of brandy, for a week, frequently ſhaking the bottle, and ſtraining off the tincture. This, he ſays, is a ſafe and uſeful purge for perſons of a languid and phlegmatic habit; but it is thought to have better effect when taken in ſmall doſes as a laxative. The doſe, as a purge, is from one to two ounces.

Tincture *of Ambergris*. See Ambergris.

Tincture *of Ammoniated Iron*. See Iron.

Tincture *of Anguſtura Bark*. See Angustura.

Tincture *of Antimony* uſed to be thus made: Take ſalt of tartar, a pound; antimony, half a pound; rectified ſpirit of wine, a quart; reduce the antimony to powder, and mix it with the ſalt by fuſion over a ſtrong fire. When it is cold powder it, and pour on the ſpirit of wine; digeſt them together in a ſand-heat, and then filtre off the clear tincture for uſe. The ſalt of tartar yields a tincture as well as antimony. It is a diaphoretic and attenuant. See Antimony.

This tincture, on an empty ſtomach, is ſaid to have ſometimes proved emetic.

Tinctura *Antiphthiſica*. See Tinctura *Saturnina*.

Tincture, *Aromatic*, may be prepared by infuſing two ounces of Jamaica pepper in two pints of brandy, without heat, for a few days, and then ſtraining off the tincture. This will anſwer all the intentions of the more coſtly preparations of this kind.

Tincture *of Aſſafœtida*. See Assafœtida.

Tinctura *Aurantii*, *Tincture of Orange-peel*, is obtained in the Lond. and Dub. Ph., by macerating three ounces of freſh orange-peel in two pints of proof-ſpirit for fourteen days (three days Dub.), and filtering. This is an uſeful adjunct to infuſions and decoctions in dyſpepſia, communicating to them an agreeable flavour, and not decompoſable by water.

Tincture *of Bark*. See Angustura and Tincture *of Cinchona*.

Tincture *of Benzoin*, *Compound*, of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (ſeven days Dub.), three ounces of benzoin, two ounces of ſtorax balſam ſtrained, one ounce of balſam of Tolu, and half an ounce of ſpiked aloes, in two pints of rectified ſpirit, and filtering.

The *compound tincture of benzoin* of the Edinb. Ph., or *Traumatic balſam*, is obtained by digeſting for ſeven days, three ounces of benzoin in powder, two ounces of balſam of Peru, half an ounce of hepatic aloes in powder, in two pints of alcohol, and filtering through paper. This tincture is a ſtimulating expectorant, and ſometimes preſcribed in chronic catarrh and old aſthmatic caſes; but chiefly uſed as an external application to wounds and languid ulcers. Its doſe is from f℥ſs to f℥ij, or more. See Benzoin.

Tincture *of Calumba* of the Lond. Ph., is had by macerating for fourteen days of calumba (or Columbo) root ſliced, two ounces and a half, in two pints of proof-ſpirit, and filtering.

The Edinb. *tincture of calumba* is obtained by digeſting for ſeven days, two ounces of calumba root in powder, in two pounds of proof-ſpirit, and filtering through paper. This is an uſeful addition to ſtomachic infuſions and decoctions. See Columbo.

Tincture *of Camphor*, *Compound*, is ordered by the Lond. Ph. to be prepared by macerating for fourteen days, of camphor two ſcruples, of hard opium powdered and acid of benzoin, of each one drachm, in two pints of proof-ſpirit, and filtering.

The *camphorated tincture of opium*, or "paregoric elixir," is obtained by digeſting for ten days, of hard purified opium in powder, and benzoic acid, of each a drachm, of camphor two ſcruples, of eſſential oil of aniſeed a drachm, in two pints of proof-ſpirit, and filtering. This is an uſeful anodyne in chronic aſthma, hooping-cough, and catarrh after the inflammatory ſymptoms have abated, and contributes to allay the frequent cough. The doſe is from fʒj to fʒij occaſionally, uſing after it the inhaler, and fʒiij in caſes where quiet, rather than ſleep, is required. See Camphor.

Tincture *of Capſicum* of the Lond. Ph., is obtained by macerating for fourteen days, an ounce of capſicum berries in two pints of proof-ſpirit, and filtering. The doſe in tympanitis, cynanche maligna, the low ſtage of typhus, and ſuch caſes, is from fʒſs to fʒj; and a mixture of fʒvj with half a pint of water will anſwer all the purpoſes of the capſicum gargle. See Capsicum.

Tincture *of Cardamoms* of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (ſeven days Dub.) three ounces of cardamom ſeeds huſked and bruiſed, in two pints of proof-ſpirit, and filtering.

The *tincture of cardamoms*, or "tinctura amomi repentis," of the Edinb. Ph. is had by digeſting for ſeven days, four ounces of leſſer cardamom ſeeds bruiſed, in two pounds and a half of proof-ſpirit, and filtering through paper.

The *compound tincture of cardamoms* of the Lond. and Dub. Ph. is prepared by macerating for fourteen days, cardamom ſeeds (huſked Dub.), carraway ſeeds and cochineal, of each, in powder, two drachms, cinnamon bark bruiſed half an ounce, ſtoned raiſins four ounces, in two pints of proof-ſpirit, and filtering. Theſe are agreeable additions to ſtomachic infuſions.

Tincture *of Caſcarilla*. See Cascarilla.

Tincture *of Caſſia*. See Cassia.

Tincture *of Caſtor* of the Lond. and Dub. Ph., is formed by macerating for ſeven days, of caſtor powdered two ounces, in two pints of rectified ſpirit (proof-ſpirit Dub.) and filtering. The Edinb. Ph. directs an ounce and a half of Ruſſian caſtor powdered to be macerated for ſeven days in one pound of alcohol, and then filtered. The doſe is from ♏xx to fʒij. See Castor.

The *compound tincture of caſtor* of the Edinb. Ph. is obtained by digeſting for ſeven days, one ounce of Ruſſian caſtor powdered, half an ounce of aſſafœtida, in a pound of ammoniated alcohol, and filtering through paper. This is advantageouſly given in hyſteria, cramp of the ſtomach, and flatulent colic, to the extent of fʒij for a doſe.

Tincture *of Catechu* of the Lond. and Dub. Ph., is prepared by macerating for fourteen (ſeven Dub.) days, three ounces of extract of catechu, and two ounces of cinnamon bark bruiſed, in two pints of proof-ſpirit, and filtering.

The *tincture of catechu*, formerly *Japonic tincture* of Edinb. Ph., is prepared by digeſting for ſeven days, three ounces of extract of catechu in powder, two ounces of cinnamon bark bruiſed, in two pounds and a half of proof-ſpirit, and filtering through paper. This tincture is a ſolution of tannin, extractive matter, and the oil of cinnamon. The doſe, in caſes where aſtringents are required, is from fʒj to fʒiij, taken in water or wine, or cretaceous mixture.

Tincture *of Cinchona* of the Lond. Ph., is obtained by macerating for fourteen days, ſeven ounces of lance-leaved cinchona bark in powder, in two pints of proof-ſpirit, and filtering.

The *tincture of cinchona* of the Edinb. and Dub. Ph. is had by digeſting for ſeven days, four ounces of cinchona bark in powder, in two pounds and a half (two pints Dub.) of proof-ſpirit, and filtering through paper. The doſe is from fʒj to fʒiv.

For the *compound tincture of cinchona*, ſee Snake-root.

This is the ſame as the celebrated tincture of Huxham, who

who gave it in intermittents and low nervous fevers, in diluted wine or other proper vehicle, with 10 or 15 drops of elixir of vitriol (aromatic fulphuric acid, Edinb.) in dofes of from f℥j to f℥iij, or more in intermittents. See Cinchona.

Tincture *of Cinnamon* of the Lond. and Dub. Ph., is obtained by macerating for fourteen days (feven days Dub.) three ounces of cinnamon bark bruifed (three ounces and a half Dub.) in two pints of proof-fpirit, and filtering. The dofe, as a fit adjunct to the chalk mixture and aftringent infufions, is from f℥j to f℥iij.

The *compound tincture of cinnamon* of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (feven days Dub.) fix drachms of cinnamon bark bruifed, three drachms of cardamom feeds bruifed, long-pepper powdered and ginger, of each two drachms, in two pints of proof-fpirit, and filtering.

The *compound tincture of cinnamon* of Edinb. is formed by digefting for feven days, cinnamon bark bruifed, leffer cardamom feeds bruifed, of each one ounce, long-pepper in powder two drachms, in two pounds and a half of proof-fpirit, and filtering through paper. This is beneficially ufed in flatulencies, atonic gout, languors, and debility, in dofes of f℥j or f℥ij properly diluted.

Tinctura *Croci*, or *Tincture of Saffron* of the Edinb. and Dub. Ph., is prepared by digefting for feven days, one ounce of Englifh faffron cut in fhreds in fifteen ounces (a pint Dub.) of proof-fpirit, and filtering through paper. See Crocus and Saffron.

Tincture *of Fox-glove* (Digitalis) of the Lond. Ph., is obtained by macerating of fox-glove leaves dried (rejecting the large ones) and reduced to a coarfe powder, two ounces, in a pint of proof-fpirit, and filtering. The Dub. Ph. directs two ounces of fox-glove leaves (the larger ones rejected) dried and coarfely powdered, in a pint of proof-fpirit, and then to filter.

The *tincture of fox-glove* of Edinb. Ph. is had by digefting for feven days, one ounce of fox-glove leaves dried, in eight ounces of proof-fpirit, and filtering through paper. The dofe of this tincture fhould be ♏ at firft, and gradually increafed.

Tincture *of Galbanum* of the Dub. Ph., is formed by digefting for feven days, two ounces of galbanum cut into fmall pieces, in two pints of proof-fpirit, and then filtering. Ufed as tincture of affafœtida, but lefs naufeous and lefs powerful.

Tincture *of Galls* (Dub.) is prepared by macerating for feven days, four ounces of galls in powder, in two pints of proof-fpirit, and then filtering. The dofe, as an aftringent, is from f℥j to f℥iij.

Tincture *of Gentian*, *Compound*, (Lond. and Dub.) is obtained by macerating for fourteen days (feven days Dub.) two ounces of gentian root cut, one ounce of orange-peel dried, half an ounce of cardamom feeds bruifed, in two pints of proof-fpirit, and filtering.

The *compound tincture of gentian*, commonly called "ftomachic tincture," of Edinb. Ph., is prepared by digefting for feven days, two ounces of gentian root fliced and bruifed, one ounce of orange-peel dried and bruifed, half an ounce of canella alba bruifed, half a drachm of cochineal in powder, in two pints and a half of proof-fpirit, and filtering through paper. This is an elegant ftomachic bitter and cordial, but in dyfpepfia the infufion is preferable. See Gentian.

Tincture *of Gold*. See Aurum *Potabile*, and *Chemical Hiftory of* Gold.

Tincture *of Guaiac* of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (feven days Dub.) half a pound of guaiac powdered (four ounces Dub.), in two pints of proof-fpirit, and filtering.

The *tincture of guaiac* of the Edinb. Ph., is formed by digefting for feven days, one pound of guaiac powdered, in two pounds and a half of alcohol, and filtering through paper. Adminiftered in the form of a draught, it muft be triturated with yolk of egg or mucilage, that it may combine with water. The dofe is from f℥j to f℥iij, in any convenient vehicle.

The *ammoniated tincture of guaiacum* of the Lond. and Dub. Ph., is obtained by macerating for fourteen days (feven days Edinb. and Dub.), four ounces of guaiac in powder, in two pints of compound fpirit of ammonia, and filtering. The dofe is from f℥j to f℥ij, triturated with any mucous or vifcid matter. See Guaiacum.

Tincture *of Black Hellebore* of the Lond. Ph., is obtained by macerating for fourteen days, four ounces of the root of black hellebore fliced, in two pints of proof-fpirit, and filtering.

The *tincture of black hellebore* of the Edinb. and Dub. Ph., is prepared by digefting for feven days, four ounces of black hellebore root bruifed (powdered Dub.), half a drachm (two fcruples Dub.) of cochineal in powder, in two pounds and a half (two pints Dub.) of proof-fpirit, and filtering through paper. This tincture was regarded by Dr. Mead as a powerful emmenagogue, and is ftill ordered in uterine obftructions, and in fome cutaneous affections. The dofe is from ♏xxx to f℥j, in any appropriate vehicle. See Hellebore.

Tincture *of White Hellebore*. See Tinctura *Veratri Albi*.

Tincture *of Henbane* of the Lond. Ph., is formed by macerating for fourteen days, four ounces of the dried leaves of henbane in two pints of proof-fpirit, and filtering. The Dub. Ph. directs to digeft for feven days, two ounces and a quarter of dried leaves of black henbane, in coarfe powder, in a pint of proof-fpirit, and then ftraining.

The *tincture of black henbane* of the Edinb. Ph. is had by digefting for feven days, one ounce of the dried leaves of black henbane in eight ounces of proof-fpirit, and filtering through paper. In a dofe of f℥j, it feldom fails of procuring fleep and quiet, and does not affect the head or produce coftivenefs. In cafes of diarrhœa, a few drops of tincture of opium fhould be added to counteract its tendency to pafs off by the bowels.

Tincture *of Hops* of the Lond. Ph., is formed by macerating for fourteen days, five ounces of hops in two pints of proof-fpirit, and ftraining. This has been recommended as a fubftitute for tincture of opium in gout and rheumatifm. The dofe is from f℥fs to f℥ij, or more. See Hops.

Tincture *of Jalap* of the Lond. Ph., is made by macerating for fourteen days, two ounces of jalap root powdered, in two pints of proof-fpirit, and filtering. The Dub. Ph. orders five ounces of jalap root in coarfe powder, to be digefted for feven days in two pints of proof-fpirit, and then filtered.

The *tincture of jalap* of the Edinb. Ph. is formed by digefting for feven days, three ounces of jalap root in powder, in fifteen ounces of proof-fpirit, and then filtering. See Jalap.

Tincture, *Japonic*. See Tincture *of Catechu*.

Tincture *of Kino* is obtained by macerating for fourteen days, three ounces of kino in powder, in two pints of proof-fpirit, and filtering through paper. In the Edinb. and Dub. Ph. two ounces of kino (three ounces Dub.) are digefted for two days in a pint and a half of proof-fpirit, and filtered through paper. The dofe is from f℥j to f℥ij.

Tincture *of Lacca*. See Lac.

Tinctura

Tinctura *Lyttæ*, or *Tincture of Bliftering Fly.* See Lyttæ.

Tinctura *Martis cum Spiritu Salis*, a medicine thus prepared: Take filings of iron, half a pound; Glauber's fpirit of fea-falt, three pounds; digeft all together without heat, as long as the fpirit will work upon the filings; then, after the fæces have fubfided, pour off the clear liquor, evaporating it to one pound, and adding of rectified fpirit of wine three pints.

Some combine the acid and inflammable fpirits firft, and digeft three ounces of iron-filings in a quart of the dulcified compound. A few drops of this tincture are a fufficient dofe.

This tincture is good in all the cafes in which the fal martis is fo.

Tincture *of Martial Flowers.* See Iron.

Tincture *of Metals*, called *Lily of Paracelfus*, may be prepared by melting together in a crucible two parts of martial regulus of antimony, one part of fine tin, and one part of pure copper. The alloy thus compounded is to be powdered, when cold, and mixed with thrice its weight of purified nitre. The mixture is to be thrown, at different times, into a red-hot crucible, where it detonates, and is expofed to a violent fire, till the metals be perfectly reduced to calces. The matter is to be taken from the crucible, while red-hot, and immediately thrown into a heated iron mortar, where it is quickly powdered. The powder, while hot, is to be put into a matrafs, and upon it fome rectified fpirit of wine is to be poured to a height equal to the breadth of four fingers. The digeftion is continued during fome days, or till the fpirit of wine has acquired a very deep yellowifh-red colour. The fpirit is to be decanted and kept in a bottle.

This tincture, although no part of the metals, reduced by calcination almoft to the ftate of pure earths, can be diffolved by the fpirit of urine, has a fpirituous, faponaceous, acrid, and alkaline character, and has been fuccefsfully ufed, when the fibres and veffels require to be excited and animated, as in apoplexies, palfies, and dropfies. It is alfo capable of accelerating the motion of the blood, and of increafing certain fecretions and excretions, particularly fweat and urine. The dofe is from fix or twelve drops to forty, or even more, and muft be adminiftered in fome proper cordial. Macquer's Dict. Chem.

Tincture *of Muriate of Iron.* See Iron.

Tincture *of Mufk* of the Dub. Ph., is obtained by digefting for feven days, two drachms of mufk in powder, in a pint of rectified fpirit, and then ftraining.

Tincture of mufk is directed, in the Edinb. Ph. of 1783, to be made by diffolving two drachms of mufk, in a pound of rectified fpirit.

Tincture *of Myrrh* of the Lond. Ph., is prepared by macerating for fourteen days, three ounces of myrrh bruifed, in twenty-two fluid-ounces of rectified fpirit, and a pint and a half of water, and filtering. The Edinb. Ph. directs three ounces of myrrh in powder to be digefted for feven days, in twenty ounces of alcohol and ten ounces of water, and filtered through paper. The Dub. Ph. orders three ounces of myrrh bruifed to be digefted for feven days, in a pint and a half of proof-fpirit and half a pint of rectified fpirit, and then ftrained. This tincture is tonic and deobftruent; it is ufed now generally in gargles, combined with infufions of rofes and acids; or applied to foul ulcers and exfoliating bones, or diluted with water, as a wafh for the mouth when the gums are fpongy. The dofe is from f℥fs to f℥j.

Tincture *of Opium* of the Lond. Ph., is formed by macerating for fourteen days, two ounces and a half of hard opium powdered, in two pints of proof-fpirit, and ftraining.

The *tincture of opium* of Edinb. Ph. or *Thebaic tincture*, or *liquid laudanum*, is obtained by macerating for feven days, two ounces of opium in two pounds of proof-fpirit, and filtering through paper.

Tincture of opium, or *Thebaic tincture* of Dub. Ph. is prepared by digefting for feven days, ten drachms of purified hard opium in coarfe powder, in a pint of proof-fpirit, then ftraining. The ufual dofe is from ♏x to ♏xl. In colica pictonum, f℥j, given before purges, facilitates their action, and renders the relief more fpeedy; and in tetanus, f℥vfs have been advantageoufly given in divided dofes, in twenty-fix hours. The tincture externally applied allays local pain, and affifts in relaxing the fpafm in lock-jaw and fimilar affections.

The *ammoniated tincture of opium* of the Edinb. Ph. is formed by digefting for feven days, in a clofe phial, three drachms of benzoic acid, and the fame quantity of Englifh faffron, cut in fhreds, two drachms of opium, half a drachm of volatile oil of anifeed, in fixteen ounces of ammoniated alcohol, and filtering through paper. This tincture is ufed in hooping-coughs and fpafmodic afthma. Each f℥j contains gr. j of opium. See Opium.

Tincture *of Quaffia* of the Dub. Ph., is obtained by digefting for feven days, an ounce of chips of quaffia wood in two pints of proof-fpirit.

Tincture *of Rhubarb.* See Rhubarb.

Tincture *of Saffron.* See Tinctura *Croci.*

Tincture *of Sena.* See Sena.

Tincture *of Salt of Tartar*, is made by pouring fome rectified fpirits of wine, to a height equal to the breadth of three or four fingers, into a heated matrafs, that contains fome hot falt of tartar, which has been previoufly fufed in a crucible and powdered. The matrafs is to be clofed, and the digeftion continued for feveral days with a gentle heat, or till the fpirit of wine has acquired a fine reddifh-yellow colour.

This is effentially the fame as tincture of metals, their medicinal qualities being the fame.

Tinctura *Saturnina*, the lead tincture, a name given in the late London Difpenfatory to the tincture before called *tinctura antiphthifica*, becaufe it was ufed to check the immoderate fweats in hectic complaints.

It is made of fugar of lead and green vitriol, of each two ounces, and of rectified fpirit a quart. The falts are feparately to be reduced to powder, and then put into the fpirit, then the whole is to ftand fome days without heat to extract the tincture, and afterwards filtered through paper.

Many perfons have found great perplexity in making this tincture, it having at firft begun to fhew a good colour, but afterwards loft it: this accident is owing to the heat ufually employed in making the tincture.

This tincture is a powerful ftyptic, and is often ufed with good fuccefs in hectic fevers, fpitting of blood, heat of the kidnies, fimple gonorrhœas, fluor albus, and tabes dorfalis.

It was firft recommended by Etmuller; who, from its effect, gave it the name of *tinctura antiphthifica*, which our College of Phyficians changed to that of *tinctura faturnina.* The Edinb. Ph. directed it to be made of three ounces of the fugar and two of the vitriol, to a quart of fpirit, and in the beft of the foreign ones. Mr. Boyle recommends it, and our moft eminent phyficians formerly ufed it, notwithftanding that fome authors confider it as a dangerous medicine, on account of its principal ingredient, the *faccharum faturni*, which fome call a flow poifon. Whether it be fo or not when given in fubftance, it is certain that there is a great difference between a corrofive falt fo given, and a tincture made of the fame, in fpirit of wine, and given in fmall dofes, as Dr. Mead obferves; who adds, that in flow hectic fevers attended with a loofenefs, profufe fweats, and a colliquation of the humours, he reckons two or three drachms, given at different times, in cooling liquors, every twenty-four hours, to be a convenient dofe. But the ufual dofe was from fifteen to thirty drops in Briftol water, or fome temperate or cool julep.

Concerning the danger of faturnine preparations, when applied to the purpofes of internal medicine, fee fir George Baker's Farther Obfervations on the Poifon of Lead, in Med. Tranf. vol. ii. p. 446, &c. See alfo Colica *Damnoniorum*, Lead, Saccharum *Saturni*, and Vinegar *of Lead*.

Tincture *of Snake-root*. See Snake-root.

Tincture *of Soot*. See Soot.

Tincture *of Squills*. See Squills.

Tincture *of Spanifh Flies*, or *Tinctura Cantharides*. See Tinctura *Lyttæ*.

Tinctura *Styptica*, a form of medicine made with very little trouble and apparatus, and ferving to fupply the place of that elaborate preparation the tincture of Helvetius: it is prefcribed in the late Lond. Ph., and is to be made by mixing a drachm of calcined green vitriol with a quart of French brandy tinctured by the cafk: this is to be fhook together, that the brandy may turn black, and then ftrained off for ufe.

Tincture *of Sulphur*. See Sulphur.

Tinctura *Thebaica*. See Tincture *of Opium*.

Tincture *of the Balfam of Tolu* of the Edinb. Ph., is made by digefting an ounce and a half of the balfam in a pound of alcohol in a gentle heat, till the balfam is diffolved, and filtering through paper.

This tincture poffeffes all the virtues of the balfam; and in coughs, and other complaints of the breaft, a tea-fpoonful or two of it may be taken in a bit of loaf-fugar.

But it is chiefly ufed for making the fyrup. An ounce of the tincture, properly mixed with two pounds of fimple fyrup, will make what is commonly called the *balfamic fyrup*. See Syrup.

Tincture *of Valerian* of the Lond. and Dub. Ph., is prepared by macerating for fourteen days (feven days Dub.) four ounces of valerian root in powder, in two pints of proof-fpirit.

The *ammoniated tincture of valerian* of the Lond. Ph. is obtained by macerating for fourteen days, four ounces of valerian root in two pints of aromatic fpirit of ammonia, and filtering. The Dub. Ph. directs two ounces of valerian root in powder to be digefted for feven days in a pint of fpirit of ammonia. It is beneficially employed in hyfteria and other nervous affections, in dofes of f ʒi, or f ʒij, given in milk, or fome other bland fluid.

Tinctura *Veratri Albi*, *Tincture of White Hellebore*, of the Edinb. Ph., is made by digefting for feven days, eight ounces of white hellebore-root bruifed, in a pound and a half of proof-fpirit, and filtering through paper. This tincture is employed to excite vomiting in maniacal and apoplectic cafes, and as an alterative in cutaneous eruptions. It is given in dofes of ♏v to ♏x; but its effects are fometimes very violent. Thomfon's Difpenfatory.

Tinctura *Zingiberis*, or *Tincture of Ginger*, of the Lond. and Dub. Ph., is formed by macerating for fourteen days (feven days Dub.) two ounces of ginger-root fliced, in two pints of proof-fpirit, and filtering. This is ufeful as a ftimulant and carminative, in atonic gout when it attacks the ftomach, in flatulent colic, and as a corrector of griping purgatives.

Tincture is alfo applied by the *Heralds* to the colours ufed in efcutcheons, or coats of arms; under which, with them, are likewife included the two metals, *or* and *argent*, becaufe often reprefented by yellow and white. See Colour.

Tincture comprehends *colours* and *furs*.

The writers on heraldry have had great difputes, which of thefe colours or tinctures are the moft honourable. All agree in giving the pre-eminence to the metals gold and filver, that is, to the yellow and white colours: as to the others, fome efteem them more noble as they approach more to light, that is, to whitenefs. Upton, on this account, ranges them thus: azure or blue, gules or red, purpure or purple, vert or green, fable or black: others wholly diffent from this, and prefer thofe colours moft which can be feen at the greateft diftance; with thefe, fable or black is the moft honourable or firft colour; and they allege the imperial black eagle, placed in a white field, as an inftance of this. Leigh prefers the red to the blue, as the red has fome alliance to gold, and the blue to filver; the fable is generally preferred to green and purple, by thofe who give the red and blue the firft places: it is in this efteem on account of its ftrong appearance; and green is preferred to purple, becaufe the latter is but of very late ufe in heraldry, and is called a new colour.

All the precedence given to tinctures muft however be confidered with this fpecial provifo, that there is no particular reafon for bearing them otherwife in the arms of kingdoms and families. In all coats of arms there fhould be two colours or tinctures; and it is the general rule that the field fhould be of a nobler colour than the figures placed upon it: thus in the arms of Scotland the field is yellow, and the lion placed upon it red; and if the field confifts of two different colours parted by fefs or by pale, then the nobleft colour muft always be in the beft place, as on the upper part, or on the right hand of the fheld; but all thefe rules are to be underftood with this limitation, that there are no other fpecial reafons in the family for the contrary. Nefbit's Heraldry, p. 19.

The two metals, or and argent, and the four colours, black, red, blue, and green, (fee Colour,) are the feveral tinctures, fays Edmondfon, of which the fields and all charges of arms ought in ftrictnefs to be made; excepting, however, fuch charges as are to be borne in their own proper or natural colour; which bearings, not having in blazon any particular technical or fixed terms, are all comprehended under the word *proper*. As to the tinctures *purpure*, *tawny*, and *fanguine*, thefe, being mixtures, are now feldom, if ever, ufed, either for fields or charges, though they are ranked among thofe, which, as fome whimfical heralds fay, have myftical fignifications, and reprefent the *moral*, *political*, and *military* virtues of thofe who originally bore their arms fo coloured or tinctured. Some heralds, fays the above-named writer, have blazoned the armorial colours in different terms, according to the rank and dignity of the perfon whofe arms they are defcribing. Accordingly, the arms of gentlemen, efquires, knights, and baronets, are to be blazoned by tinctures; thofe of nobles by precious ftones; and thofe of fovereign princes, kings, and emperors, by planets: but this mode of blazoning would, he thinks, introduce into the fcience of heraldry great abfurdity and confufion, and render blazons in fome cafes very ridiculous.

TINCULEN, or Tinzulen, in *Geography*, a town of Africa, in the country of Darah; 120 miles S.W. of Tafilet.

TINDAL, Matthew, LL.D. in *Biography*, a reputed deiſt, was the ſon of a clergyman, and born at Beer-Ferres, in Devonſhire, about the year 1657. From Lincoln college, Oxford, into which he was admitted in 1672, he was removed to Exeter college; and having graduated B.A., he was elected fellow of All-Souls college, and became LL.D. in 1685. About this time, the reign of James II., he was beſet by ſome of the popiſh emiſſaries, who were then active and induſtrious in making proſelytes, and converted to popery; but, upon farther examination, he returned to the church of England in 1687. To the revolution he was ardently attached; and having been admitted an advocate, he often ſat as judge in the court of delegates, and had a penſion from the crown of 200*l. per annum*. Tindal was both a political and theological writer, and under the latter deſcription he publiſhed "A Letter to the Clergy of both Univerſities," on the ſubject of the Trinity and the Athanaſian creed, with a view to ſome alterations in the Liturgy, which were ſubjects of diſcuſſion. But the treatiſe that attracted principal notice appeared in 1706, and was entitled "The Rights of the Chriſtian Church aſſerted againſt the Romiſh and all other Prieſts who claim an independent Power over it; with a Preface, concerning the Government of the Church of England, as by Law eſtabliſhed." This publication rouſed the animadverſions of the high-church clergy, and the venders of it were legally indicted. The favourable notice taken of this work by Le Clerc, in his "Bibliotheque Choiſée," gave great offence to the lower houſe of convocation; and this learned body circulated a declaration, implicating the foreign critic, and others of ſimilar ſentiments, which Le Clerc himſelf, and many other perſons, thought to be unjuſt and illiberal. Tindal alſo publiſhed a defence of his work, the ſecond edition of which, in two parts, was ordered by a vote of the houſe of commons, to be burnt in the ſame fire with Sacheverel's ſermons, in the year 1710. Some time after, the lower houſe of convocation, Atterbury being prolocutor, on a repreſentation of the ſtate of religion in the kingdom, animadverted on the dangerous conſequences of the doctrine of neceſſity. To which Tindal replied, by aſſerting the truth and uſefulneſs of that doctrine. Of the ſubjects and tendency of his political writings, it is now needleſs to give any account. It will be ſufficient to obſerve that he was an advocate for the Hanoverian ſucceſſion, and for the Whig miniſtry of that period. Hitherto Tindal had made no direct attack againſt religion; but in 1730 he no longer diſguiſed his ſentiments, which were announced to the public in a treatiſe entitled "Chriſtianity as old as the Creation, or the Goſpel a Republication of the Religion of Nature." He diſclaims, indeed, in words, oppoſition to the divine authority of the Chriſtian religion, and denominates himſelf and his friends "Chriſtian Deiſts;" but in reality it was his evident and avowed purpoſe to ſhew, that there neither has been, nor can be, any external revelation diſtinct from what he terms "the internal revelatiou of the law of nature in the hearts of all mankind." Tindal was attacked by Dr. Waterland, who treated him with a degree of contempt which called forth the animadverſions of Dr. Middleton. The author, though declining in health, wrote in his own defence, but concretions of the gall-bladder, with which he had been long afflicted, terminated his life in the year 1733. His remains were interred in Clerkenwell church, agreeably to his own deſire, near thoſe of Dr. Burnet, biſhop of Saliſbury. A ſecond volume of his "Chriſtianity as old as the Creation" was left in MS.; but the publication of it was prevented by Dr. Gibſon, biſhop of London. His firſt work had given occaſion to ſo many unanſwerable defences of Chriſtianity, that the learned biſhop was unneceſſarily alarmed, when he prevented further diſcuſſion of this intereſting ſubject.

Tindal, Nicholas, the nephew of the former, was educated at Exeter college, Oxford, and had different preferments in the church. He died in 1774, at a very advanced age, at Greenwich Hoſpital, of which he was chaplain. Among his literary undertakings, the moſt conſiderable was a tranſlation of Rapin's Hiſtory of England, with a continuation. Biog. Brit.

TINDALE. See Tyndale.

TINDEL, in *Geography*, a town of Africa, in the country of Zenhaga, on the ſea-coaſt; 18 miles S.S.E. of Cape Mirik.

TINDERCOTTA, a town of Hindooſtan, in the Carnatic; 15 miles E. of Tiagar.

TINDERO, a town of Sweden, in the province of Medelpadia; 12 miles N.E. of Sundſwall.

TINE, in *Agriculture*, a term applied to a tooth or ſpike, which is ſet or placed in any kind of tool or implement, but eſpecially thoſe of the harrow, drag, and other ſimilar kinds. Tines for this uſe ſhould, for the moſt part, be a little curved or racked forward towards the points, as laying hold of the ground better, and in a more perfect manner. Sometimes tines are neceſſary to be ſteeled a little in the points and front edges, in order to prevent the wear of them, and render them more effective in tearing, cutting up, and dividing the land.

Tine, or *Tyne*, in *Geography*, a river of England, which riſes in two ſtreams, one called the North Tyne, which riſes on the borders of Scotland, in the north-weſt part of the county of Northumberland; the other, which is called the South Tyne, riſes about ſeven miles S. from Aldſtone, in Cumberland: both theſe ſtreams unite near Hexham, from whence the united ſtream proceeds to Newcaſtle, and from thence to the German ſea, at Tinemouth.

TINEA, a river of France, which riſes in the Alps, and runs into the Var, about 12 miles N. of Nice.

Tinea, in *Medicine*. See Porrigo.

Tinea, in *Natural Hiſtory*. See Moth, &c.

TINEH, in *Geography*, a town of Egypt, ſituated between the ſouth extremity of lake Menzaleh and the Mediterranean, near the ancient Peluſium, and on a canal formerly called the *Peluſian* or *Bubaſtic* mouth of the Nile; through which Alexander paſſed with his fleet from Gaza: this canal is now choaked up with mud; 80 miles N.N.E. of Cairo. N. lat. 30° 48′. E. long. 38° 45′.—Alſo, a town of Africa, in Tripoli, on a river which runs into the gulf of Sidra. N. lat. 30° 5′. E. long. 19° 12′.

TINEHALY, a poſt-town of the county of Wicklow, Ireland; 41 miles S. by W. from Dublin.

TINEMAN, in our *Old Writers*, a petty officer in the foreſt, who had the nocturnal care of vert and veniſon, and other employments in the foreſt.

TINEMAR, in *Geography*, a town of Ceylon; 10 miles S.W. of Trinkamaly.

TINEMOUTH. See Tynemouth.

TINET, Tinettum, in our *Old Writers*, is uſed for bruſh-wood and thorns to make and repair hedges. In Herefordſhire, *to tine* a gap in a hedge, is to fill it up with thorns, that cattle may not paſs through it.

TINETO, in *Geography*, a ſmall iſland near the coaſt of Genoa, at the entrance of the gulf of Spezza. See Tino.

TINEVELLY, or Palamcotta, a city of Hindooſtan, and capital of a province of the ſame name, in the Carnatic;

natic; 74 miles S.S.W. of Madura. N. lat. 8° 42′. E. long. 77° 46′.

TINEVELLY, a province of Hindooftan, bounded on the N. by Madura, on the E. and S. by the gulf of Manara, and on the W. by Travancore, from which it is feparated by the Ghauts. The coaft of this ftate is called the Fifhing Coaft, and has long been celebrated for its pearls. It was formerly in poffeffion of the Portuguefe. The fifheries are carried on by the natives, but the Dutch claim the fovereignty, and fend two or three frigates to protect the boats, which fometimes amount to hundreds. The revenues of the country belong to the nabob of Arcot.

TINEWALD, the parliament or annual convention of the people of the Ifle of Man, of which this account is given: the governor and officers of that ifland do ufually fummon the twenty-four keys, being the chief commons of it, once every year, *viz.* upon Midfummer-day, at St. John's chapel, to the court kept there, called the tinewald-court; where, upon a hill near the faid chapel, the inhabitants of the ifland ftand round about the plain adjoining; and here the laws and ordinances, agreed upon in the chapel of St. John, are publifhed and declared unto them. At this folemnity the lord of the ifland fits in a chair of ftate, with a royal canopy over his head, and a fword held before him, attended by the feveral degrees of the people, who fit on each fide of him, &c.

TING, in *Geography*, a city of China, of the fecond rank, in Pe-tche-li, near the river Tam; 107 miles S.S.W. of Peking. N. lat. 38° 32′. E. long. 114° 39′.

TINGAM, a town of Hindooftan, in the circar of Aurungabad; 20 miles E.S.E. of Aurungabad.

TINGAMOLLY, a town of Hindooftan, in the circar of Ruttunpour; 6 miles W. of Kyragur.

TINGANO, a river of Malacca, which runs into the Chinefe fea, N. lat. 5° 27′. E. long. 103° 9′.

TINGAU, or TINCH, a town of Bavaria, late belonging to the abbey of Kempten; 7 miles N.E. of Kempten.

TING-CHAN, a town of the kingdom of Corea; 30 miles S.E. of Haimen.

TINGENTERA, ALGECIRAZ, in *Ancient Geography*, a town of Spain, in Bœtica, towards the S.W. It appears to have been the fame town with that called by Antonine "Portus Albus," and "Julia Traducta." It was the native place of Pomponius Mela.

TING-FAN, in *Geography*, a city of China, of the fecond rank, in Koei-tcheou; 992 miles S.S.W. of Peking. N. lat. 26° 5′. E. long. 106° 4′.

TING-HAI, a city and walled town of Chufan, on the coaft of China, fituated within a mile from the large open village or fuburb, built along the fhore. The way from the one to the other lies over a plain, interfected with rivulets and canals in various directions, and cultivated like a garden. The city walls are thirty feet high; and along thefe, at the diftance of every hundred yards, are fquare ftone towers. In the parapets are embrafures, and the holes in the merlons for archery, without cannon. The gate is double, and within it a guard-houfe, where military men were ftationed, and the bows and arrows, pikes and matchlocks, were arranged in an orderly manner. Of the towns of Europe, Ting-hai moft refembled Venice, on a fmaller fcale. The bridges are fteep, and afcended by fteps, like the Rialto; the ftreets are like alleys, or narrow paffages, and paved with fquare flat ftones. The houfes are low, and moftly of one ftory. Attention to ornament was chiefly beftowed on the roofs of the houfes; on the ridges of which were uncouth figures of animals, and other decorations in ftone and in iron. The town was full of fhops, containing, chiefly, articles of clothing, food, and furniture, difplayed to full advantage. Even coffins were exhibited to view in a variety of colours. The fmaller quadrupeds, including dogs, intended for food, as well as poultry, were expofed alive for fale, as were fifh in tubs of water, and eels in fand. The number of places where tin-leaf, and fticks of odoriferous wood were fold, for burning in their temples, indicated no flight degree of fuperftitious difpofition in the people. Loofe garments and trowfers were worn by both fexes; but the men had hats of ftraw, or cane, which covered the head, the hair, except one long lock, being cut fhort or fhaved; while the women had theirs entire, and plaited and coiled, in a becoming manner, into a knot upon the crown of the head. Activity and labour univerfally prevailed. None afked alms, and none fhunned labour. Staunton's Embaffy to China, vol. i.

TINGI, a clufter of fmall iflands in the Chinefe fea, near the eaft coaft of Malacca. N. lat. 2° 23′. E. long. 104° 21′.

TINGIA, a town of Peru, in the audience of Lima; 15 miles S.E. of Iça.

TINGIS, TANGIER, a town of Africa, fituated upon a ftrait between the promontory, the coafts, and the mouth of the river Valon, according to Ptolemy, who furnamed it Cæfarea. Mela fays that it was a very ancient city, founded by the giant Antæus. It gave name to Mauritania *Tingitana*, of which it was the capital. Pliny fays that it took the name of Julia Traducta, when the emperor Claudius fent thither a colony. Plutarch, in *Sertorio*, calls it Tingena, and fays that a fon of Tinga by Hercules, called Sophax, founded it, and gave it the name after that of his mother.

TIN-GLASS, a name frequently given to the femi-metal bifmuth.

TING-NGAN, in *Geography*, a town of China, of the third rank, in Quang-tong, on the river of Limou; 17 miles S. of Kiong-tcheou, in the ifland of Hai-nan.

TINGO, or TENNA, a river of Italy, which runs into the Adriatic, 3 miles N. of Fermo.

TINGORAN, a fmall ifland in the Chinefe fea, near the coaft of Malacca. N. lat. 4° 8′. E. long. 103° 33′.

TINGORCALLY, a town of Hindooftan, in Bengal; 40 miles W.S.W. of Calcutta. N. lat. 22° 9′. E. long. 87° 53′.

TINGRACALLY, a town of Bengal; 16 miles E. of Mahmudpour.

TINGRECOTTA, a town of Hindooftan, in Baramaul; 18 miles S.E. of Darampoury.

TINGRI, a town of Thibet. Here the Nepaulefe were defeated by the troops of China in 1792; 22 miles S.W. of Zuenga.

TING-TCHEOU, a city of China, of the firft rank, in Fo-kien; 870 miles S. of Peking. N. lat. 25° 48′. E. long. 116° 4′.

TINGUIRICA, a river of Chili, which runs into the Rahel; 40 miles from its mouth.

TINGUZGALPA, a town of Mexico, in the province of Nicaragua; 80 miles N.W. of Leon.

TINGWALL, a town of the ifland of Shetland; 4 miles W.N.W. of Lerwick.

TINGWALLA, an ifland of Sweden, in the north part of the Wenner lake, on which the town of Carlftadt is built.

TINIA, or TENEAS, in *Ancient Geography*, a river of Italy, in Umbria, which, according to Silius Italicus, ran into the Tiber.

TINIAN,

TINIAN, in *Geography*, one of the Ladrone iflands, in the North Pacific ocean, about 42 miles in circumference, firft difcovered by the crew of a Manilla fhip, which was caft away here in the year 1638. The author of Anfon's Voyage gives a pleafing defcription of this ifland, as found by the crew of the Centurion, in the year 1742. Commodore Byron, who vifited it in the year 1765, and anchored on the fouth-weft end of the ifland, in the fame place where the Centurion lay, inftead of delightful lawns, found the trees and underwood fo thick, that in endeavouring to force a paffage through, they were entangled and cut as if with whip-cord. After they had cleared the well, which they imagined was the fame at which lord Anfon filled his cafks, commodore Byron found the water brackifh, and full of worms. He fays, "the road alfo where the fhips lay was a dangerous fituation at this feafon (Auguft 1ft), for the bottom is a hard fand, and large coral rocks; and the anchor having no hold in the fand, is in perpetual danger of being cut to pieces by the coral; to prevent which as much as poffible, I rounded the cables, and buoyed them up with empty water-cafks. Another precaution alfo was taught me by experience, for at firft I moored, but finding the cables much damaged, I refolved to be fingle for the future, that by veering away, or heaving in, as we fhould have more or lefs wind, we might always keep them from being flack, and confequently from rubbing, and this expedient fucceeded to my wifh. At the full and change of the moon, a prodigious fwell tumbles in here, fo that I never faw fhips at anchor roll fo much as our's did while we lay here; and it once drove in from the weftward with fuch violence, and broke fo high upon the reef, that I was obliged to put to fea for a week; for if our cable had parted in the night, and the wind had been upon the fhore, which fometimes happens for two or three days together, the fhip muft inevitably have been loft upon the rocks. I foon found that the ifland produced limes, four oranges, cocoa-nuts, bread-fruit, guavas, and paupaus in abundance; but we found no water-melons, fcurvy-grafs, or forrel. Notwithftanding the fatigue and diftrefs that we had endured, and the various climates we had paffed through, neither of the fhips had yet loft a fingle man fince their failing from England, but while we lay here two died of fevers, a difeafe with which many were feized, though we all recovered very faft from the fcurvy. I am indeed of opinion that this is one of the moft unhealthy fpots in the world, at leaft during the feafon in which we were here. The rains were violent, and almoft inceffant; and the heat fo great as to endanger fuffocation: befides the inconvenience which we fuffered from the weather, we were inceffantly tormented by the flies in the day, and by the mufquitos in the night. The ifland alfo fwarms with centipedes and fcorpions, and a large black ant, fcarcely inferior to either in the malignity of its bite. Befides thefe, here were venomous infects without numbers, altogether unknown to us, by which many of us fuffered fo feverely, that we were afraid to lie down in our beds: nor were thofe on board in a much better fituation than thofe on fhore, for great numbers of thefe creatures being carried into the fhip with the wood, they took poffeffion of every birth, and left the poor feamen no place of reft either below or upon the deck. Our principal refource for frefh meat was the wild hog, with which the ifland abounds. Thefe creatures are very fierce, and fome of them fo large, that a carcafe frequently weighed 200 pounds. Mr. Gore, one of our mates, at laft difcovered a pleafant fpot on the north-weft part of the ifland, where cattle were in great plenty, and whence they might be brought to the tents by fea. We were now upon the whole pretty well fupplied with provifions, efpecially as we baked frefh bread every day for the fick; and the fatigue of our people being lefs, there were fewer ill with the fever; but feveral of them were fo difordered by eating a very fine-looking fifh which we caught here, that their recovery was for a long time doubtful." The author of lord Anfon's voyage fays, that the people on board the Centurion thought it prudent to abftain from fifh, as the few which they caught at their firft arrival furfeited thofe who eat of them. Befides the fruit that has been mentioned already, this ifland produces cotton and indigo in abundance, and would certainly be of great value if it were fituated in the Weft Indies. The furgeon of the Tamar enclofed a large fpot of ground here, and made a very pretty garden, but he did not ftay long enough to derive any advantage from it. Captain Wallis touched upon this ifland in 1767; and obtained beef, pork, poultry, papaw apples, bread-fruit, limes, oranges, and every refrefhment mentioned in the account of lord Anfon's voyage. The fick began to recover as foon as they went on fhore; but flefh meat would not keep fweet for fcarcely one day. N. lat. 14° 55′. W. long. 214° 7′.

TINICUM, a townfhip of Pennfylvania, in the county of Bucks, containing 1017 inhabitants; 20 miles N. of Philadelphia.—Alfo, a townfhip of Pennfylvania, in the county of Delaware, containing 249 inhabitants.

TINIETZ, a town of Auftrian Poland; 4 miles W. of Cracow.

TINIMA, a town of the ifland of Cuba; 22 miles W.N.W. of Bayamo.

TINING, in *Agriculture*. See TINE. See alfo TILLAGE.

TININGBURG, in *Geography*, a town of Hungary; 16 miles N. of Prefburg.

TINISSI, a town of Bohemia, in the circle of Koniggingratz; 10 miles S.E. of Konigingratz.

TINIT, a town of Africa, in Zanhaga, on the coaft; 25 miles S.S.E. of Cape Mirik.

TINJULEEN, a town of Africa, in the country of Darah; 105 miles S.E. of Morocco. N. lat. 29° 30′. W. long. 5° 30′.

TINKER'S ISLAND, one of the Elizabeth's Iflands, near the coaft of America.

TINKLING or TINGLING *of the Ear*. See TINNITUS.

TINMOUTH, in *Geography*, a poft-town of the ftate of Vermont, in the county of Rutland, containing 1001 inhabitants; 8 miles S. of Rutland.—Alfo, a town of Nova Scotia, on the eaft coaft, formerly called *Pictou*.

TINNA, or TINA, in *Ancient Geography*, a river of the ifle of Albion, between the gulfs Taua and Boderia, according to Ptolemy, fuppofed to be the river Eden, in Fife. —Alfo, a fmall river of Italy, in Picenum.

TINNE′, in *Geography*, a town of Africa, in Mafina, on the north fide of the Niger; 130 miles W.S.W. of Tombuctoo.

TINNING, the covering or lining any thing with melted tin, or with tin reduced to a very thin leaf.

Looking-glaffes are foliated or tinned with thin leaves of beaten tin, applied and faftened to them by means of quickfilver. See LOOKING-GLASS.

Kitchen utenfils are tinned with melted tin; and locks, bitts, fpurs, &c. with leaf-tin, by the help of fire.

For the method of tinning iron-plates, fee LATTIN and TIN-*Plates*.

Copper and brafs are covered over with tin by the help of fal ammoniac, the acid of which cleans the furface of the metals

metals to be tinned, and the oily matter contained in it furnifhes the phlogifton (according to the old fyftem) that is neceffary in this operation. The copper, or brafs, being made hot enough to melt tin laid upon it, is ftrewed over with fal ammoniac, and the melted tin rubbed about the plate. The fal ammoniac takes up the drofs of the tin, and leaves the tin to flow freely upon the metal. As the furface of copper is continually altered by the mere action of the air, the workmen, before the tinning of any veffel, fcrape its furface with a fteel inftrument till it be clean and bright; then they place the veffel upon kindled coals, and heat it to a certain degree: as foon as it is hot, in fome proceffes of tinning, they rub it with pitch, and apply the melted tin, which they fpread upon the furface of the copper by means of hards. For this purpofe pure tin is feldom ufed; but, in general, two parts of tin are alloyed with one part of lead.

The pitch ufed in this latter mode of tinning is quite neceffary, becaufe the degree of heat given to the copper is fufficient to calcine its furface in fome degree: and this alteration, however flight, would prevent the perfect adhefion of the tin, unlefs by means of the pitch the phlogifton was reftored to it at the very inftant of the application of the tin. The pitch alfo prevents the flight calcination which would happen on the furface of the tin, or revives the fmall particles of calx which are formed during the operation. In either way, or in the method of tinning iron plates, the fuccefs of the operation depends on the facility with which tin unites with thefe metals, which incorporates with them, diffolves in fome meafure their furface, and forms a kind of alloy, at leaft when the tinning is well performed; and moreover, on the cleannefs of the furfaces, both of the melted tin, and of the copper or iron to which it is applied; for the metals cannot perfectly unite unlefs they are in a metallic ftate, and free even from their own earth or calx.

It has been alleged that copper veffels, fo pernicious in themfelves, are not perfectly preferved from ruft or verdigris by tinning; and, befides, tin itfelf is combined with arfenic, and lead is alfo ufed in tinning. M. Malouin has, therefore, propofed in his Memoirs on Zinc (Mem. de l'Acad. Sc. 1742.) to fubftitute that femi-metal in place of lead and tin, for the tinning of iron and copper veffels; the greater hardnefs of the zinc, it is thought, would render it lefs liable to be worn, and the dangerous effects of lead and tin would be avoided. Macquer's Dict. Chem. Engl. edit.

The plumbers, on fome occafions, tin or whiten their fheets of lead: in order to which they have a tinning furnace, filled with live coal, at the two fides of which two men are placed, who hold up the fheets over the fire to heat: and the tin-leaves being laid over them, as faft as the fheets grow hot, and the tin melts, they fpread it, and make it take by rubbing it with tow and refin.

TINNITUS Aurium. A very common difeafe in the fenfe of hearing, is when certain founds, like thofe of a drum, a bell, the falling of water, &c. are heard, when no fuch noifes actually exift, or can be heard by other perfons. This affection is called *tinnitus aurium*, of which various kinds have been obferved. For the moft part, it is a very flight tranfient diforder; but fometimes it is moft obftinate, long continued, and troublefome. It fometimes arifes from the flighteft caufe, fuch as any thing partially ftopping up the meatus auditorius, or Euftachian tube itfelf, fo that the free paffage of air into the cavity of the tympanum is interrupted. A kind of tinnitus is heard by the moft healthy when they yawn.

A much more frequent and troublefome fpecies of tinnitus accompanies many difeafes both of the febrile and nervous kind. This is faid to be occafioned partly by the increafed impetus of the blood towards the head, with an increafe of fenfibility in the nervous fyftem itfelf, fo that the very beatings of the arteries are heard; and partly by the augmented irritability and fpafmodic motions of the little mufcles within the organ of hearing. In fevers, the throbbing of the carotid arteries at the fides of the fella turcica has produced exceffive annoyance in particular individuals, efpecially when they were in the recumbent pofture; and the celebrated Haller informs us, that when he was afflicted with fever, he fuffered much from the beating fenfation caufed in his ears, as he fuppofed, from the pulfation of the carotids in the neighbourhood of thofe organs.

According to writers, tinnitus aurium fometimes arifes from a vehement affection of the mind; fometimes from a diforder in the ftomach; fometimes from rheumatifm extending its effects to the ears and head; or from a catarrh, producing a temporary obftruction in the Euftachian tube. In the foregoing examples, the cure of the affection of the ear depends upon the removal of the other diforders, of which it is merely an effect.

In certain cafes, tinnitus aurium occurs as a feparate independent diforder, and may be the caufe of long-continued, diftreffing fuffering. The exiftence of unreal founds in the organ of hearing generally prevents the patient from hearing diftinctly other fonorous impreffions, and, of courfe, more or lefs deafnefs is a common attendant of the complaint.

The writer of this article lately had a patient, who is attacked five or fix times every year with tinnitus aurium, which caufes for feveral days the moft annoying fenfations in the ears, and a confiderable degree of deafnefs. The diforder is always accompanied with fevere pain in the branches of the nerve coming out of the infra-orbitary foramen, head-ache, indigeftion, and many fymptoms of the nervous and bilious kind.

In this cafe, relief is obtained by fomenting the affected ear with a decoction of poppies, and wafhing out the meatus auditorius with a fyringe and warm water. However, thefe means are always affifted with a few dofes of calomel and rhubarb, without which, in all probability, the local applications would not entirely anfwer.

We have alfo had other cafes, in which a ftrong folution of opium in water, camphorated oil, blifters, &c. were the remedies employed.

The tinnitus aurium, produced by fevers, fometimes does not fubfide at their termination, but lafts, either in a continued or periodical form, during life. Two fuch inftances are now within our own recollection; and every man of experience muft have witneffed the fame thing.

TINNUNCULUS, in *Ornithology*, the name of one of the long-winged hawks, called by Linnæus FALCO *tinnunculus*; which fee.

It is about the fize of a common pigeon. Its bill is fhort, crooked, and very fharp, and covered with yellow fkin at the top; near this the bill is white, elfewhere it is blue; its tongue is bifid; its mouth very wide, and its palate blue; its head is large and flatted, and is of an afh-colour, with longitudinal ftreaks of black; its back and wings are brown, variegated with black fpots; its rump is grey, with fome tranfverfe black fpots; and its breaft and belly of a pale ruft-colour, with a few longitudinal ftreaks of black; its tail is long and pointed, its tip of a pale ferruginous hue, with a broad tranfverfe ftreak of black over it; and the reft of the tail is a mixed grey and brown, with black fpots and ftreaks; its legs and feet are of a fine yellow.

The tinnunculus, or keftrel, breeds in the hollows of trees, in the holes of high rocks, towers, and ruinated buildings:

buildings: it lays four eggs, which are white, variegated with a number of red spots; its food is field-mice, small birds, and insects.

This is the hawk which we so frequently observe in the air fixed in one place, and as it were fanning with its wings, at which time it is watching for its prey. It flings up the indigested fur and feathers in form of a round ball. Ray and Pennant.

TINO, in *Geography*, a small island near the coast of Genoa, at the entrance of the gulf of Spezza; 8 miles S. of Spezza. N. lat. 44° 3′. E. long. 9° 40′. See TINETO.

TINO. See TENOS.

The form of this island is oval, about 60 miles in circumference. It is mountainous, but its rich plains are decked by the opulence of industry. Its fruits are excellent and its wine good; but the most abundant of its productions is silk, which is manufactured by the females, who are highly commended for the beauty of their persons and the elegance of their dress. The inhabitants are active and industrious, most of whom are of the Greek church, though it is the see of a Roman Catholic bishop. It is reckoned one of the most agreeable islands of Greece, but has no good harbour. The small town of San Nicolo is built on the ruins of the ancient Tenos. Its capital bears the name of the island. N. lat. 37° 36′. E. long. 25° 7′.

TINPHADUM, or TIMPHADUM, in *Ancient Geography*, a place of Africa, in Numidia, upon the route from Theveste to Sitifis, between Theveste and Vegesela. Ant. Itin.

TINSEDA, in *Geography*, a town of Africa, in the country of Darah. N. lat. 27° 30′. W. long. 5° 46′.

TINTA, a town of Peru, in the bishopric of Cusco, and jurisdiction of Canas y Canches, sometimes also called Tinta; 60 miles S. of Cusco.

TINTENIAC, a town of France, in the department of the Ille and Vilaine; 9 miles S.S.E. of Dinan.

TINTINNABULUM, among the *Ancients*. See BELL.

TINTO, in *Geography*, a river of Spain, in the province of Seville, which owes its name to its waters being tinged of a yellow colour. It is also of a petrifying quality; and it is said that it destroys all verdure, and that no fish can live in it. Its nature, however, is changed by the confluence of other rivulets; for when it passes by Niebla, it is not different from other rivers: and it falls into the Atlantic, six leagues lower down, at the town of Huelva, where it is two leagues broad, and admits the passage of large vessels as high as San Juan del Puerto, three leagues above Huelva.

TINTON, a town of the state of New Jersey, near the sea; 12 miles E. of Freehold, in the county of Monmouth.

TINTOQUE, a town of Mexico, in the province of Xalisco; 45 miles S.S.W. of Compostella.

TINTORETTO, IL, in *Biography*, the cognomen of a celebrated Venetian painter, whose real name was Giacopo Robusti. He was born at Venice in 1512, the son of a dyer; from whence he acquired the name of Il Tintoretto. His natural disposition towards the art of drawing manifested itself very early, and his father had the wisdom to indulge it; and seeing it likely to lead to something decisive, caused him to be instructed in painting, and finally placed him as a pupil with Titian, then in the prime enjoyment of his reputation and power. It is a painful thing to relate, and a severe lesson to the pride of the most able, that where so much ability, so much honour and wealth abode, the mean and degrading passion of jealousy should have found encouragement. Titian, the great, the honoured Titian, that man who possessed a mind capable of grasping almost all the art of painting required, who was richly and highly honoured, courted, and employed, is said (and the truth of the story rests upon too sound authority) to have seen with the corroding pangs of jealousy the early essays of his pupil Tintoretto, and to have permitted it to operate so strongly upon him, that he excluded the dreaded object from his house, about ten days after his admission.

But the aspiring talents of the young painter were not to be damped by so mean a measure, though even in the powerful hands of Titian. To him dismission from the eye of a master was emancipation. He dared to think for himself, and boldly aimed at selection in art, and an union unthought of till then; and as Lanzi says, generously aspired at the honour of being the founder of a school and style of his own, by combining the form of the great Florentine, M. Angelo, with the colour of his former master. To maintain a due excitation to the performance of so bold an undertaking, he wrote upon the wall of his study, "Il disegno di Michel Angelo e il colorito di Tiziano;" and with all the ardour of an intrepid mind, endeavoured to perfect the task he had assigned himself, by copying whatever pictures of Titian he could procure during the day, and drawing by night from casts taken from the works of M. Angelo, together with many others he procured from ancient basso-relievos and statues. It is doubtless to his studies by night and the lamp, that he acquired that perfect mastery of chiaro-scuro, those decided masses of light and shade, which distinguish his works, both in their groups and single figures. Add to these labours, that he modelled in wax and clay, and clothed his figures studiously, arranging them in different lights, and sometimes hanging them from the ceiling, to acquire, by drawing from them in that position, the knowledge of the *sotto in su*, then much in use for the adornment of ceilings, and in the houses of the grandees. By these deep studies, and a perfect knowledge of anatomy, he was enabled to exert the exuberant and glowing fancy with which nature had blessed him, in the freest and boldest manner; and had he always applied his powers with equal intenseness, with a careful discrimination of what was due to his own honour, there can be no doubt but that he would have left a name unrivalled in art. This for some time he attended to, and some of his best works lack only character and expression to place them in the highest rank. The large picture which lately adorned the walls of the Louvre, but is now returned to its original station, the Scuola di S. Marco at Venice, is a work of this class, which he painted when only 36 years old; and another is the Crucifixion, in the Scuola di S. Rocco. The former is known by the name of Il Servo, and represents the miracle of St. Mark descending, and breaking the bonds of a slave condemned to death by Turks. Grand but not correct in its style of design, astonishing the mind by the intrepid boldness of its colour and execution, it displays more complete mastery of the materials of art than is to be found in the works of any other painter. If there be any fault in this astonishing performance, it is that the subject is lost in the splendour of the execution, the spirit in the matter in which it is embodied. The same cannot be said of the Crucifixion above mentioned, in which the louring deep and ominous tone preserved through the whole, produces the most perfect unity, gives strength of expression to the picture, and overwhelms the spectator with terror. All seems to be hushed in silence round the central figure of the Saviour suspended on the cross, with his fainting mother, and a group of male and female mourners at his feet; and though many are the improprieties of costume and of action, yet all vanish in the power which compresses them to a single point, and we do not detect them till we recover from the first impression. Unhappily for his fame, he was not always so careful in his labours;

labours; and the impetuofity of his mind, or perhaps the feelings of his employers, who were numerous, did not allow him fufficient time to do juftice to himfelf; and he permitted many pictures to leave his eafel, poffeffing only the freedom of colour and execution which peculiarly belonged to his pencil.

Tintoretto was fo certain of his execution, that he is faid by Sandrart to have frequently wrought without a previous fketch, or any preparatory outline, finifhing as he went on, and adapting his labours to the price he was to receive; not fufficiently confidering that his works would outlive their author, and deprive him of a large portion of the fame fo juftly due to his power, when efficiently exercifed. It was, therefore, truly obferved by An. Caracci, that in fome of his works, Tintoretto was not inferior to Titian, while in others he fell below himfelf.

One remarkable inftance of his intrepidity and impetuofity of genius, and promptnefs of execution, is related by Vafari, *viz.*: The confraternity of S. Rocco at Venice had determined to decorate their church with a picture of the apotheofis of their patron faint, and, defirous of having the choice of good defigns, commiffioned fome of the moft eminent artifts to make compofitions for their felection. Paulo Veronefe, A. Schiavone, Salviati, Zucchero, and Tintoretto, were the competitors. On the day appointed for their decifion, the good fathers were aftonifhed to find a finifhed picture by Tintoretto placed in the appointed fituation; and when they remonftrated upon fo extraordinary a proceeding, as they had only required a defign from him, he told them that was his way of making defigns, and that if they hefitated to pay him for his trouble, they were welcome to the picture, which was allowed to keep poffeffion of its honours. His compeers rendered due juftice to fo extraordinary an exertion, and denominated him *Il furiofo Tintoretto.*

To do juftice to the power of Tintoretto, he muft be contemplated on the grand theatre of his pictorial exiftence, *viz.* at Venice, where alone his grander works are to be found; and there the public buildings are filled with them, in the higher and lower degrees of excellence. In ftyle, the grandeur which he borrowed of Michael Angelo was rather mufcular enlargement of line, and that not always correct, than felect or characteriftic; and it is not often that he rifes above common nature; moftly fo in his female characters, though they are often too flender for truth of action, and too affected for grace. His touch is delightfully free, with a full impafto of colour, and his chiarofcuro of the richeft and moft brilliant kind. He lived to the great age of 82, and died at Venice in 1594.

Tintoretto left a daughter named Marietta Robufti, who was born at Venice in 1560, and whom he inftructed in the art of painting, principally in portraiture, in which fhe acquired confiderable practice and reputation; painting many of the principal perfonages in her native city. She had the honour to be invited to the courts of the emperor Maximilian and of Philip king of Spain; but her father would not be prevailed upon to part with her. She died foon after him, in 1590. He left alfo a fon, Domenico Robufti, who practifed the art with confiderable fuccefs, though not with the fire of invention or execution which characterife his father's productions. He was born at Venice alfo, in 1562. His principal works are in the Sala di Configlio and the Scuola di San Marco at Venice. Portraiture was, however, his principal occupation, and moft fuited to his genius; and he had the honour of being eminently patronized. He died in 1637.

TINURTIUM, Tournus, in *Ancient Geography*, a town of Gaul, on the route from Lugdunum to Gefforiacum. Anton. Itin.

TINUS, in *Botany*, a name in Pliny, book 15, chap 30, for what he fays is fometimes termed a fort of wild laurel, and is diftinguifhed by the blue colour of its berries. This defcription is univerfally agreed to apply to our Laurus-tinus, *Viburnum Tinus* of Linnæus; a plant likewife indicated by Ovid's

Et bicolor myrtus, et baccis cærula tinus.

Linnæus has transferred this name to a Weft Indian fhrub, fuppofed by him to conftitute a new genus, having fome refemblance to the above fhrub.—Linn. Gen. 200. Schreb. 270. Juff. 264 and 451.—Clafs and order, *Enneandria Monogynia.*

The characters of this however were difcovered by Swartz to be founded in error, the plant being a genuine fpecies of Clethra; fee that article, n. 5.

The origin of the word *Tinus* has been fought by Vaillant in the Greek τινος, *fmall*, or *dwarf*, as meaning a fmaller or more humble kind of laurel; but this is fcarcely correct, nor does the derivation by any means fatisfy us.

TINZ, in *Geography*, a town of Silefia, in the principality of Brieg; 22 miles W. of Brieg.

TINZULIN. See Tinjuleen.

TIO, a town of South America, in the province of Cordova; 70 miles E. of Cordova.

TIOGA, a county of New York, erected from Montgomery county in 1791, and from the E. part of this county. The county of Brome was erected in 1806. Tioga is bounded N. by a fmall angle of Steuben county, and by Seneca and Cayuga counties, E. by Brome county, S. by the ftate of Pennfylvania, and W. by Steuben county. Its form is nearly that of a fquare, 26 by 34 miles; its area 571,306 acres: between 42° and 42° 25′ N. lat., and 2° 14′ and 3° W. long. from New York. Its towns are Condor, Caroline, Catharinas, Cayuta, Chemung, Denby, Elmira, Owego, and Spencer its capital. Its eaftern part is traverfed by the Sufquehanna; and the Tioga, the principal W. branch of that river, waters the S.W. part. The furface is confiderably broken and hilly. It is rapidly increafing in population, and contains a large proportion of good farming land. Rafts, arks, and fmall boats defcend the waters of this county, and find the principal market at Baltimore, in Maryland. Tioga fends one member to the houfe of affembly.

Tioga, a large townfhip in the S.W. corner of Brome county, 13 miles W. of Chenango Point; bounded N. by Berkfhire, E. by Union, S. by the ftate of Pennfylvania, and W. by Tioga county; about 15 miles long from N. to S., and 7 broad, having the Sufquehanna running W. acrofs its centre. The foil is various, and the furface uneven. It yields various kinds of trees, grain, and pafture. Fruit in general fucceeds well, and apples are no where better. This town has been fettled fince about 1790.—Alfo, a river of New York, which runs into the Sufquehanna at Tioga Point, N. lat. 41° 56′. W. long. 76° 33′.

TIOLO, a town of Italy, in the Valteline; 10 miles S.W. of Bormio.

TION, a river of France, which runs from the lake of Annecy to the Siers.

TIOOKEA, one of King George's iflands, in the South Pacific ocean, difcovered by commodore Byron. It is a low ifland, with a large lake in the centre. Captain Cook fent to examine a creek, which he fuppofed communicated with the lake. They found the creek fifty fathoms wide at the entrance, and thirty deep; farther in thirty wide and twelve deep; the bottom every where rocky, and the fides bounded with coral rocks: dogs feemed to be in great plenty, but no fruit

fruit was feen but cocoa-nuts. The inhabitants of this ifland, and perhaps of all the low ones, are of a much darker colour than thofe of the higher iflands, and feem to be of a more favage difpofition. This may be owing to their fituation, nature not having beftowed her favours on thefe low iflands with that profufion fhe had done to fome of the others. The inhabitants are chiefly beholden to the fea for their fubfiftence; confequently are much expofed to the fun and weather, and by that means become more dark in colour, and more hardy and robuft, for there is no doubt of their being of the fame nation. Captain Cook's people obferved that they were ftout well-made men, and had marked on their bodies the figure of a fifh, a very good emblem of their profeffion. S. lat. 14° 27′. W. long. 144° 56′.

TIORA, in *Ancient Geography*, a town of Italy, in the country of the Sabines, on the route from Reate to Lifta, between Vatia and Lifta.

TIORN, in *Geography*, an ifland in the North fea, near the weft coaft of Sweden, about 25 miles in circumference, containing three parifhes, and abounding in excellent paftures. N. lat. 58°. E. long. 11° 29′.

TIORNEBIERG, a fmall ifland in the Baltic, near the fouth coaft of Laland. N. lat. 54° 42′. E. long. 11° 18′.

TIORNEHOLM, a fmall ifland in the Baltic, near the fouth coaft of Laland. N. lat. 54° 39′. E. long. 11° 37′.

TIOS, Tieum, or *Tion*, in *Ancient Geography*, a town of Afia, in Paphlagonia, which lay, according to Ptolemy, on the coaft of the Euxine fea, between Pfyllium and the mouth of the river Parthenius.

TIOUGHNIOGA, in *Geography*, a river of New York, which runs into the Chenango, N. lat. 41° 56′. W. long. 76° 53′.

TIPARA, a town of Hindooftan, in Oude; 10 miles S.E. of Gooracpour.

TIPARENUS Insula, now *Specia*, in *Ancient Geography*, the ifle of Tiparena, fituated in the Argolic gulf, feparated by a fmall canal from the continent, which eftablifhed a communication between the gulfs Hermione and Argolic.

TIPASA, Tipsa, a town of Africa, in Mauritania Cæfariana, according to Ptolemy and the Itin. Anton. having the title of colony, and fituated on the route from Carthage to Tingis, between Cæfarea Colonia and Cafæ Caluenti. It ftill preferves its ancient port, and has fome remains of ancient walls.

TIPE, or Type, in *Rural Economy*, a trap or device of the wooden box, or excavated earth kind, for catching or taking rabbits, &c. Thefe tipes or traps are fet or formed in a particular track at the time the rabbits have departed from the warrens, or parts of them, in fearch of food, all the other holes or ways of return being ftopped up. Dogs are then employed in forcing the rabbits to return, when they are taken in the tipes or traps. The tipes are formed of different numbers and fizes, according to the nature and extent of the warren.

TIPER, or Tipra, in *Geography*, a country of Afia, annexed to Bengal, bounded on the N. by Silhet, on the E. by Ava, on the S. by Chittigong, and on the W. by Dacca, about 100 miles long, and 50 broad: the inhabitants are faid to be moft fubject to goitres or wens in the throat, a difeafe generally attributed to the water drank. Comillah feems the chief town. A town of the fame name is laid down in fome maps, as fituated on the river. N. lat. 24° 20′. E. long. 110°.

TIPHA, in *Ancient Geography*, a fmall town of Greece, in Bœotia, fituated on the gulf of Corinth, in which was a temple of Hercules, whofe feaft was annually celebrated. Paufanias.

TIPHCA Princeps, one of the Hebrew accents, fometimes ferving for a comma, and marked under a letter thus (ʻ).

TIPHIA, in *Entomology*, a genus of the Hymenoptera order of infects, in the Gmelinian fyftem of Linnæus; the characters of which are, that the mouth has a membranaceous roundifh jaw, a mandible arched, and acute, a fhort tridentated lip, and no tongue; the feelers are four, filiform, unequal, ftretched out in the middle of the lip; and the antennæ unfiliform and arched. This genus includes the following

Species.

Vespiformis. Black, with a ferruginous abdomen, black at the bafe, and cyaneous wings. The fphex vefpiformis of Fabricius. Found in Malabar.

Crassicornis. Black, the abdomen with three bands, the legs ferruginous, and the wings cyaneous. Found in Spain.

Nigra. Black, without fpots. An European infect.

Femorata. Black, with the four hinder thighs angulated and red. Found in England.

Histrionica. Black, thorax maculated, abdomen with five yellow bands, the two foremoft interrupted. Found in China.

Quinquecincta. Black, thorax fpotted, abdomen with five yellow bands, the fecond interrupted. Found in England.

Variegata. Thorax black, varied with yellow, abdomen yellow. A Siberian infect.

Ciliata. Black, the fegments of the abdomen yellow, with ciliated margin. Found in Spain.

Hæmorrhoidalis. Black, the abdomen with five yellow fpots on each fide, the toes and legs red. Found in South America.

Ephippium. Black, the thorax with a red dorfal fpot. Found in South America.

Radula. Hairs black, thorax reddifh before, the fecond and third fegments of the abdomen yellow. Found in New Holland.

Dorsata. Black, the fecond and third fegments of the abdomen yellow. A Coromandel infect.

Ruficornis. Ferruginous fpotted with black, yellow abdomen, and four black bands. Found in Tranquebar.

Tricincta. Black, the abdomen with three yellow bands, the anus and legs ferruginous. Found in South America.

Collaris. Black, the thorax on the fore-part cinereous villous, behind retufe, with cinereous wings. Found in Malabar.

Morio. Black, with brown wings, pofterior thighs banded with cinereous. Found in Spain.

Pedestris. Apterous, black variegated with yellow, thorax compreffed. Found in New Holland.

TIPHLE, in *Ichthyology*, a name by which fome authors exprefs the acus, or tobacco-pipe fifh.

TIPICA, in *Geography*, a town of Peru; 30 miles E. of Lipes.

TIPING, a town of Corea; 25 miles S.E. of King-ki-tao.

TIPIOCA, or Tapioca, a name given by fome authors to a fort of cream or flour made from the yucca or manihot-root, by maceration of it in water, after expreffing the juice.

TIPOR, in *Geography*, a town on the weft coaft of Celebes. S. lat. 2° 5′. E. long. 119° 22′.

TIPPACANOE Creek, a river of North America, which

which runs into the Wabafh, N. lat. 40° 18′. W. long. 86° 56′.

TIPPAL, a river of England, in Northumberland, which runs into the Tyne, near Haltwhiftle.

TIPPERARY, a county in the province of Munfter, Ireland, extending in a very irregular form between the King's and Queen's counties on the north, the latter county and that of Kilkenny on the eaft, the counties of Waterford and Cork on the fouth, and thofe of Limerick, Clare, and Galway on the weft. From the two latter counties, the river Shannon forms a natural boundary; as the river Suir does from Waterford for about 15 miles on the fouth. The length from north to fouth is 52 Irifh (or $73\frac{1}{2}$ Englifh) miles, and its breadth 31 Irifh (or $39\frac{1}{2}$ Englifh) miles. It contains 554,950 acres, or 867 fquare Irifh miles, equal to 882,398 acres, or 1420 fquare Englifh miles, including bogs, mountain, and wafte. There are twelve baronies, two of which, Upper and Lower Ormond, gave the title of duke, as they now do that of earl, to the family of Boteler, or Butler, fo diftinguifhed in Irifh hiftory. The population of Ireland not having yet been fatisfactorily afcertained, little can be faid on the fubject. Dr. Beaufort ftated the number of houfes in 1792, at 30,705; and from the means of information he had, and his ufual accuracy, there can be little doubt of his correctnefs: but from the great increafe of tillage fince that time, the number of houfes muft have increafed, though Tipperary has had more caufes to retard this increafe than any other county in Ireland: 30,703 houfes, at an average of $5\frac{1}{2}$ fouls *per* houfe, would be about 169,000; but if, according to Mr. Bufhe's opinion, as given in the Tranfactions of the Irifh Academy, we take $6\frac{1}{2}$ as the average, it would exceed 190,000, a very fmall population for fuch an extent of ground. The number of parifhes is 187, which, when Dr. Beaufort wrote, were comprifed in 63 benefices, and had only 46 churches. A number of churches have however been fince built, as well as feveral glebe-houfes, and fome benefices have been divided; to which the exertions of the prefent archbifhop of Cafhel (Brodrick) have greatly contributed. Unions of parifhes which were formed, when from the ftate of the country the income of a parifh was very fmall, and the number of inhabitants very few, are now as unneceffary as they are injurious. The archbifhopric of Cafhel, and bifhopric of Emly, which are united, contain 116 parifhes, Waterford 32, and Killaloe 41. Tipperary returns four members to the imperial parliament, two knights of the fhire, and two for the boroughs of Clonmell and Cafhel. This reduction was lefs than in moft other counties, as Tipperary had only three boroughs before the Union, of which Featherd was disfranchifed. Though the towns reprefented are confiderable ones, efpecially Clonmell, yet the boroughs are both what are called *clofe* ones, the proprietors in fact exercifing an undifputed right of chufing the member. The lands of Tipperary have been always ranked amongft the moft productive in Ireland, and one tract in particular, including the neighbourhoods of Tipperary and Cafhel, has been called the *Golden vale*, on account of its extraordinary fertility. It has however been always a great grazing country; and as this fyftem drives the peafantry into barren mountains, or forces them to crowd into towns and villages, that they may procure a precarious and wretched fubfiftence, they too commonly become turbulent, violent, and difcontented. Whether this be the caufe or not, fuch is certainly the character of the peafantry of this county, who have been engaged in every difturbance, and who are now groaning under an infurrection act, attended with enormous expence, which the ufual parliamentary opponents of government could not object to, and which, though there is an apparent calm, it would be yet unfafe to repeal. The increafe of tillage would operate favourably, but the exemption of grazing land from every kind of tithe, operates as an encouragement to it, which the prefent ftate of the market for grain is not likely to counteract. Whilft, however, Tipperary contains a confiderable portion of very fertile land, it has alfo extenfive tracts of bog and mountain. Of the former, the moft extenfive is a tract lying in the north-eaft of the county, between the towns of Rofcrea, Templemore, Urlingford, Littleton, and New Birmingham, and forming a part of the Great Bog of Allen. This was furveyed by Mr. Ather, of Caftle-comer, under the directions of the commiffioners for enquiring into the nature, extent, &c. of the bogs of Ireland; and from his report it would appear, that about 36,000 acres, moftly in this county, might be eafily reclaimed, and at a moderate expence, on account of the favourable fituation for draining, and the abundance of limeftone gravel, of which the diftrict is principally compofed, and which is the beft material for reclaiming them. To the fouth of this range of bog, and fituated between the fmall town of Killenaule and the county of Kilkenny, is the coal diftrict. It refembles what has been called the Leinfter coal diftrict in the very able geological and mining report lately given of that diftrict by Richard Griffith, efq. mining engineer to the Dublin Society. It feems indeed to be only a continuation of that diftrict, and is feparated from it by a fecondary limeftone country. The fpecies of coal is the carbonaceous or ftone-coal, better known by the name of Kilkenny coal. To the fouth of this, and in the fouth-eaftern angle of the county, is Sliebh-na-man mountain. On the borders of the county of Waterford, over the town of Cloghen, are the Knockmele-down mountains, which occupy a confiderable fpace in both counties. Nearly parallel to thefe, and north of them, are the lofty Galtees, extending from the borders of Cork and Limerick to the town of Cahier. Between thefe and the town of Tipperary is the lower range, called Sliebh-na-muck; but the greateft extent of mountain croffes the county from fouth-weft to north-eaft, running from the county of Limerick to the Queen's county, and completely feparating the two Ormonds from the reft of the county. The high hills adjoining Limerick are called the Keepe mountains, from the higheft of them, which is a remarkable object to the traveller and the adjoining country. The hills near the fmall town of Silvermines, have been marked in fome maps as the Silvermines mountains; others have been called the Devil's Bit; and adjoining the Queen's county, they take the name of the Sliebh-bloom mountains. In this diftrict, lead and copper mines have been wrought with various fuccefs; and fome parts of it afford fine mill-ftones. The river Suir rifes in the north of the county, near Rofcrea, and flows from north to fouth, when it takes an eaftern direction, and becomes the boundary between it and Waterford. This and its tributary ftreams afford an abundant fupply of water; and turn a very great number of boulting-mills. The weftern divifion of the county has the Shannon for its boundary, and is well watered by the ftreams which flow to it from the range of mountains above mentioned. Clonmell, on the Suir, and at the fouthern extremity of the county, is the fhire-town, and though very inconveniently fituated for the affizes, has an excellent gaol, court-houfe, &c. It is a place of confiderable trade, and one of the principal inland towns of Ireland. Cafhel, Rofcrea, Nenegh, Tipperary, Carrick, and fome others mentioned in their proper places, are of refpectable fize, but none of them diftinguifhed for trade or manufactures, unlefs we except the manufacture of ratteens at Carrick. Tipperary was, previous to the arrival of the Engliſh, a part of the kingdom of Munſter; ſometimes ſeparated as an independent ſovereignty under the kings or princes of Caſhel. The name Ormond is a corruption of Oir Momond, *i. e.* Eaſt Munſter, and was ſo called in oppoſition to Deſmond, South Munſter, and Thomond, North Munſter. After the Engliſh ſettlement, the O'Briens were confined to Thomond, the Fitzgeralds eſtabliſhed themſelves in Deſmond, and the Butlers became the poſſeſſors of Ormond and Kilkenny, acknowledging indeed the ſovereignty of England, but maintaining ſuch authority as rendered it only nominal. The counties of Kilkenny and Tipperary were palatinates; and it was not till the attainder of the duke of Ormond, in 1716, that this diſtinct juriſdiction was aboliſhed. As the inhabitants of Tipperary were actively engaged againſt the Proteſtants in 1641 and the ſucceeding years, great forfeitures took place on Cromwell's ſucceſs, and many of the preſent landholders are deſcendants from his officers. Tipperary abounds with ruins. The number of old caſtles is very great, ſome of them boldly ſituated, and forming very ſtriking objects to the traveller: ſuch as the caſtle of Ardfinnan, built by king John, and that of Cabier, on an iſland in the Suir. The chief eccleſiaſtical ruins are thoſe of Holycroſs, Monaincha, and Caſhel, which all deſerve to be viſited by the curious. No ſtatiſtical account has been publiſhed of the county of Tipperary, and there appear to be very ſcanty materials for its hiſtory.

Tipperary, a market and poſt-town in the county of the ſame name, 87 miles S.W. from Dublin, and about 20 miles N.W. from Clonmell, on the road to Limerick. Its name is ſaid to be in Iriſh Tiobrad-arain, ſignifying the *well* of the territory called *Arain*. The town is not large, and appears to be in a ruinous condition, though it was formerly of ſufficient importance to give its name to the county. The adjoining county is very rich, and there are ſome fine ſeats, eſpecially Thomaſtown, the ſplendid ſeat of the earl of Llandaff, deſcended from the Mr. Matthew whom Swift viſited; and Damers-Court, a ſeat of the earl of Dorcheſter. In the neighbourhood are the ruins of Emly, the church of which was once the metropolitan church of Munſter, and which ſtill gives name to a biſhopric, united to the archiepiſcopal ſee of Caſhel.

TIPRA. See Tipera.

TIPREE, a dry meaſure at Bombay; where the candy contains 8 parahs, the parah 16 adowlies, 64 ſeers, or 128 tiprees. Rice is ſold by the batty meaſure, in which the morah is = 4 candies, or 25 parahs, the parah 20 adowlies, 150 ſeers, or 300 tiprees. A candy is ≐ 25 Wincheſter buſhels nearly.

TIPSA, in *Geography*, a town of Algiers, in the province of Conſtantina, on the borders of Tunis, near the banks of the Melagge, anciently called *Tipaſa;* at preſent a frontier city and garriſon of the Algerines. This place, which enjoys a fine ſituation, with ſome mountains at a ſmall diſtance, ſtill preſerves the principal gate, ſeveral fragments of old walls, and other marks of the rank and figure it formerly obtained amongſt the cities of Numidia; 85 miles S.E. of Conſtantina. N. lat. 35° 27′. E. long. 8°.

TIPSTAVES, officers appointed by the marſhal of the king's bench, to attend the judges with a rod or ſtaff tipped with ſilver, and take charge of ſuch perſons as are either committed, or turned over at the judge's chambers.

The denomination is alſo ſometimes given to thoſe more frequently called *boſtons;* who are the wardens of the Fleet's officers, attending the king's court with a painted ſtaff, for the taking into cuſtody ſuch priſoners as are committed by the court; and to attend ſuch priſoners as go at large by licence.

TIPUL, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands, to a ſpecies of crane common there, and ſo tall, that when it ſtands erect, it can look over a man's head. See Dongon.

TIPULA, in *Entomology*, a genus of the Diptera order of inſects, the characters of which are, that the mouth has a very ſhort proboſcis, membranaceous, canaliculated on the back, receiving a briſtle; the hauſtellum ſhort, without a vagina; the feelers two, incurved, equal, filiform, longer than the head: the antennæ are moſtly filiform.

The ſmaller ſpecies of this genus ſo much reſemble gnats, that the generality of authors, not excepting even Goedart and Swammerdam, have confounded the two genera, and deſcribed theſe among the gnats.

The long form of the body, the poſition of the wings, and the length and poſition of the legs, are the circumſtances that make the reſemblance between the gnats and tipulæ; but the ſtructure and organs of the head are alone a very ſufficient diſtinction.

As the tipulæ differ from the gnats in the figure of the mouth, and in being without a trunk, they differ as much from the other flies of that character, by their reſembling the gnat in the ſhape of their body. They differ alſo in the conformation of the mouth, and its ſeveral parts and organs. The opening of the mouth is a ſlit extending itſelf from the fore part of the head toward the hinder part, and its lips cannot be called upper and lower; but they are lateral ones. When the body of the creature is preſſed, this mouth opens, and ſhews what ſeem to be a ſecond pair of lips within. Theſe are more firmly cloſed than the others, and reſemble only certain duplications of the fleſh. The exterior lips are cartilaginous, and are furniſhed with ſhort hairs; the interior are perfectly ſmooth, and of a fleſhy texture. The head of the tipula is of a long and ſlender figure; the lips are articulated at the extremity of this head, and on each ſide there ſtands, on the upper part, a ſort of beard, which, when minutely examined, is found to be articulated in the manner of the antennæ of inſects. Theſe two beards, in their uſual poſition, are placed cloſe together, and bent forwards over the head; their office ſeems to be the covering of the aperture of the mouth. Theſe ſeem conſtantly to be found in all ſpecies of the tipulæ, and placed exactly in the ſame manner.

The largeſt ſpecies of tipulæ are uſually found in our meadows, and theſe are in no danger of being confounded with the gnat kind, their ſize alone being a ſufficient obvious diſtinction. Theſe are often found of nearly an inch in length from head to tail; but their bodies are very ſlender, and are compoſed of only nine rings. The male tipula is eaſily diſtinguiſhed, at ſight, from the female; it is much ſhorter in the body, and is thicker at the tail than any where elſe; this tail alſo uſually turns upwards, whereas that of the female is placed in the ſame line with the body, and is ſlender, and compoſed of ſeveral ſcaly parts, proceeding from the laſt ring of the body. Theſe creatures are found in our meadows through the whole ſummer; but the end of September and beginning of October is the time when they are moſt of all plentiful.

The legs of theſe creatures are greatly diſproportioned to the body, according to the common rules of nature, eſpecially the hinder pair, which are in the larger ſpecies uſually three times the length of the body.

This large ſpecies is a creature of no great beauty; its body is of a browniſh colour, and its corcelet is ſo elevated, that the creature ſeems hump-backed; the head is ſmall, and the

the neck very ſhort, the reticulated eyes are ſo large, that they cover almoſt the whole ſurface of the head; theſe are of a greeniſh colour, with a caſt of purple, when viewed in ſome lights. Reaumur ſuppoſes that two very lucid ſpecks, on the anterior part of the breaſt, are eyes, though placed in ſo very ſingular a manner; the wings of this creature are long, but very narrow, and ſeem ſcarcely well proportioned to the ſize of the animal; they are tranſparent, but have a ſlight caſt of brown; and their ribs, when viewed by the microſcope, appear beſet with ſcales, or feathers, in the manner of thoſe of the gnat kind. Some ſpecies of the tipulæ have them alſo fringed with theſe ſcales at the edges; there are no ailerons, or petty wings, at the origin of theſe, but in the place of them there are two very fine balancers or mallets; theſe have long pedicles, and roundiſh or oval heads; the ſtigmata of the corcelet are four; one pair is placed immediately underneath theſe balancers, and the other immediately below the firſt pair of legs; the firſt pair is very long, the others ſmall, and thoſe on the rings of the body, if there be any, are too ſmall for our ſight, even with good glaſſes. Each ring of the body is compoſed of two half cylinders, which are joined into one, by means of a membrane, which gives them room to diſtend or cloſe up at the creature's pleaſure. The large tipulæ all carry two antennæ, or horns, upon their heads; but theſe are of no remarkable ſtructure, they are only compoſed of a great number of joints, each covered with a fine downy hairineſs; and at the joining of each to the next, there is a tuft of longer and more ſtiff hairs. This is the deſcription of the common large tipulæ which we find in the meadows, and in almoſt all its parts is applicable to the generality of the larger ſpecies of theſe inſects.

The ſmaller kinds are very numerous, and of great variety. Theſe are frequent in all places, and at all ſeaſons of the year; the ſpring ſhews us immenſe clouds of them, and even the coldeſt winter's day ſhews a great number of them in the ſun-ſhine about noon. Theſe creatures fly much better than the larger tipulæ; they ſeem indeed to be almoſt continually upon the wing, and their manner of flight is very ſingular; they are continually mounting and deſcending again, and that without quitting the direction of the line in which they go forward; this they will often do for many hours together. In tracing theſe flies from their origin, they are all found to be produced from worms which have no legs, and have a regular ſcaly head. Thoſe from which the larger tipulæ are produced live under ground; they are moſt fond of marſhy places, but any ground will do that is not often diſturbed. They uſually are found at about an inch under the ſurface, and are ſo plentiful in ſome places as greatly to injure the herbage.

Theſe creatures do not find it neceſſary to their living, that plants ſhould be upon the ſurface of the earth in which they live. There is frequently found in the hollows of the ſtumps of old trees, a ſort of earth which ſeldom produces any vegetables; yet the female flies of this ſpecies well know that their young will find a proper ſubſiſtence there; and there are uſually found great numbers of them in all theſe places. The hollow elms and willows, ſo common in our hedges, and by ditch ſides, afford innumerable proofs of this: but it muſt be obſerved, that they are only found in ſuch earth of this kind as is continually ſomewhat moiſt.

M. Reaumur mentions a very ſingular ſpecies of large tipulæ, which was produced with him from one of the worms found in the earth of an old elm; this was of the larger kind, and had ſome beautiful ſpots on the wings. It had alſo a very elegant tufted antenna; whereas, in the common large tipulæ, theſe are plain and ſimply granulated ones, as well in the males as females. Reaumur's Hiſt. Inſ. vol. ix. p. 7, &c.

The numerous ſpecies are diſtributed, by Gmelin, into ſeveral claſſes, as follow:

* *With patent Wings.*

Pectinicornis. With pectinated antennæ; the wings with a black ſpot; the thorax yellowiſh. Found in moiſt places in Europe.

Rivosa. With hyaline wings; rivules brown, with a ſnowy ſpot. Frequent in Europe.

Sinuata. With white wings, ſinuated margin and ſpots brown; cinereous body, and ferruginous feet. Found in the north of Europe.

Quadrimaculata. With wings brown-veiny, margin and four ſpots brown; abdomen above yellowiſh. There is a variety denominated *calmarienſis*. Found in the meadows of Europe.

Crocata. With wings having a brown ſpot; abdomen black, yellow bands. Frequent in the north of Europe.

Oleracea. With hyaline wings; the margin of the rib brown. Found in Europe at the roots of pot-herbs, grain, &c. &c.

Hortorum. With hyaline wings; ſcattered obſolete ſpots. Found among the pot-herb plants of Europe.

Tricolor. With whitiſh wings; the exterior margin and bifid apex brown. Found in North America.

Triangularis. With wings dimidiate-brown, and white triangular ſpot. Found in Scotland.

Variegata. Black; baſe and ſides of the abdomen red, ſpotted with yellow. Found in the gardens of Europe.

Contaminata. Black, with white wings; two bands, and a point black. Found in moiſt places of Europe.

Lunata. With aſh-coloured wings, and white marginal lunule. Found in the meadows of Europe.

Turcica. With veiny wings; white marginal lunule; cinereous body, and abdomen with a black dorſal line.

Pratensis. With variegated thorax; brown abdomen; ſides ſpotted with yellow; front tawny. Found in the meadows of Europe, deſtroying the roots of graſſes.

Dorsalis. Yellowiſh; brown back; hyaline wings; marginal ſpot black. Found in Germany and Italy.

Plumbea. Brown-cinereous, with white wings; rib and nerves black. An Italian inſect.

Terrestris. With hyaline wings; brown marginal point; back of the abdomen cinereous. Found in Europe. See Crane-*Fly*.

Cornicina. With hyaline wings, marginal point brown: abdomen yellow; three lines brown. Found in Europe at the roots of plants.

Nigra. With brown wings, and black body. Found among the plants of Europe.

Albimana. Black, with teſtaceous thighs, and hinder tarſi white.

Costalis. Sordidly yellow; with antennæ twice longer than the body; hyaline wings, and browniſh coſta. Found in Van Diemen's Land.

Clavipes. Brown; with tarſi annulated with white in the middle; ovated, incraſſated. Found in North America.

Atrata. With glaucous wings; marginal point and body black; firſt ſegment of the abdomen and feet red. An European inſect.

Bimaculata. With hyaline wings; two brown ſpots; the middle of the abdomen ſpotted ferruginous; plumoſe antennæ; as the former.

Annulata.

ANNULATA. With wings variegated with brown; thighs with white rings; as the former.

OCELLARIS. With whitiſh wings, very numerous, blackiſh, ocellar ſpots. North of Europe.

CINEREA. With whitiſh wings, three brown ſpots, cinereous unſpotted body. A Norwegian inſect.

FASCIATA. With whitiſh wings, four brown flexuoſe bands; abdomen and feet yellowiſh. Found in the marſhes of Sweden.

MELANOCEPHALA. Teſtaceous; head and dorſal line of the thorax black; wings hyaline; three brown ſtreaks. A Cayenne inſect.

SEXPUNCTATA. With white wings; three marginal brown points; thorax compreſſed, yellow; dorſal line black. Found in Italy.

FLAVIPES. Brown, with obſcure wings ſpotted cinereous, and three brown coſtal ſpots; feet yellowiſh; joints brown.

TRIPUNCTATA. With hyaline wings; three marginal points brown; yellow body. Found in Italy.

FLAVESCENS. With unſpotted wings; yellow body; brown back. Found in the fields of Europe.

ENSIFORMIS. With lanceolate ſerrulate antennæ; wings, veins, and ſpot black. Found in Sweden.

REGELATIONIS. With hyaline gloſſy wings; cinereous brown body. Found frequently in Europe.

PILIPES. Cinereous; with ſtriated browniſh wings; foremoſt legs hairy

MORIO. Black; with white wings; marginal point brown; pallid feet.

REPLICATA. With hyaline wings; margin ſlender, recurved; body brown; ſimple antennæ. Found in the waters of the north of Europe.

MONOPTERA. Black; with feet and feelers pallid. North of Europe.

ARUNDINETI. Whitiſh; villoſe antennæ; black eyes. Found among the reeds of Europe.

BARBICORNIS. Black; with plumoſe antennæ; ſimple at the apex. Found occaſionally in Europe.

GIGANTEA. With wings brown, hyaline, waved longitudinally in the middle. Found in the gardens of Auſtria and France.

VENOSA. With hyaline wings; veins brown, and brown margin. In Upper Auſtria.

PLICATA. Cinereous; with hyaline wings; brown veins; external margin and middle line interwoven in ſmall folds. Upper Auſtria.

PUNCTATA. With hyaline wings, pointed with black; exterior margin ſpotted with black. As the former.

PHRAGONITIDIS. Yellow; with black head, hyaline wings, and three black points. Found among the reeds in Auſtria.

LINEATA. Yellow; pointed with three lines on the thorax, and four on the abdomen. Auſtria and Carniola.

OCREATA. Black; with hyaline wings, ſpotted and pointed with black; the band before the hinder tarſi white. Upper Auſtria.

BIFASCIATA. Yellow; with hyaline wings, ſubfaſciated with brown. Upper Auſtria.

DEPRESSA. With cinereous thorax; abdomen yellow, depreſſed; wings yellowiſh-brown; four marginal ſpots brown. An European inſect.

DISCOLOR. Cinereous; abdomen on both ſides yellowiſh; wings with brown and white ſpot. As the former.

PECTINATA. Black; with antennæ ſemi-pectinated; glaucous wings; marginal point and apex large; thighs and legs red; apices black. As before.

VERSICOLOR. Yellow; thorax yellow, ſpotted with black; abdomen and back, beneath and ſides, cinereous; wings, veins, and ſpot brown. As before.

MACULOSA. Black; bill, legs, and apex of abdomen yellowiſh; wings with ſcattered brown ſpots. As before.

LUTEA. Pale yellow; with yellowiſh wings. As before.

FUSCIPES. Black; with two yellowiſh bands on the abdomen; white wings, ſpotted with black; yellowiſh legs, joints, and ſoles; with the toes brown. As before.

QUADRIFASCIATA. Cinereous-yellowiſh; with grey wings; four yellowiſh bands, and margin of coſta pointed; with yellow legs; black joints. As before.

OCTOPUNCTATA. With white wings; eight black points; black abdomen; thorax and legs paliſh. Found at Paris.

PARISIENSIS. Green; with hyaline wings; brown band; the two bands of the abdomen and anus black. As before.

SECALIS. Cinereous; with ciliated wings; eyes, antennæ annulated with white; the apex of the abdomen and feet black. Found in fields of rye. Gmelin queries whether the two laſt ſpecies belong to this tribe of inſects.

* *With incumbent Wings:* "Culiciform."

PLUMOSA. With greeniſh thorax; white wings; brown point; and plumoſe antennæ. In the marſhes of Europe.

LITTORALIS. Greeniſh; with unſpotted wings; and fore-legs very long. In the maritime parts of Europe.

CINCTA. Livid; with wings and three marginal ſpots black; the abdomen black, annulated with white. Found in Sweden.

MOTITATRIX. With fore-legs very large and motatory; with white ring. Frequent in Europe, yellow-green.

PILICORNIS. Blackiſh; fore-legs as before; thorax lineated; white wings unſpotted.

FASCICULATA. Black; fore-legs as before; ſides of the abdomen ſpotted with ferruginous. Found in Germany.

TENDENS. Ferruginous; with white unſpotted wings; fore-legs very long and pale. In marſhes of Denmark.

VIBRATORIA. Fore-legs very large, motatory; white at the apex. Found in marſhes of Europe.

VARIA. Brown; fore-legs elongated; abdomen yellowiſh; wings varied with white and black.

TREMULA. Fore-legs very long, motatory; black, with white wings. In the marſhes of Sweden.

FLEXILIS. Fore-legs motatory, all pallid; wings with duſkyiſh band. In the watery places of Europe.

MONILIS. With white legs, nine black rings; wings varied with white and cinereous. In the gardens of Europe.

ZONATA. Pallid; with wings, two bands, and three points brown; thighs with brown angle. Found in Orford.

VIRENS. Green; with unſpotted wings; brown ſoles. A Swediſh inſect.

VIRIDULA. Green; with antennæ verticillate, hairy; pallid legs. North of Europe.

GENICULATA. Beneath yellowiſh; lines of the thorax and back of the abdomen black, with white immaculate wings.

PALLIPES. Smooth-brown; with hyaline unſpotted wings, and paliſh legs.

MACROCEPHALA. Greeniſh; with eyes and back of the thorax black. In the marſhes and moiſt ſhores of Europe.

PUSILLA. Green; with three black ſpots on the hinder part

part of the thorax; antennæ of the male plumoſe. In the lakes of Europe.

Marci. Black, ſmooth; with blackiſh wings; fore-thighs furrowed inwards. In the dunghills and putreſcent ſoil of Europe: probably a variety of hortulana?

Thomæ. Black, ſmooth; with black wings; ſides of the abdomen marked with a ſaffron line. At Upſal.

Chrysanthemi. Black, ſmooth; the abdomen red at the baſe; the antennæ incraſſated, piloſe. On the chryſanthemus coronarius of Spain.

Ferruginata. Black, ſmooth; brown wings; abdomen brown-ferruginous. South of Europe.

Johannis. Black, ſmooth; white wings; black point; ſhort antennæ; black legs. In ſhady parts of Europe.

Pomonæ. Black, ſmooth; hyaline wings; black point; ferruginous thighs. In the plains of England and Norway.

Ruficollis. Black, ſmooth; red thorax. At the Cape of Good Hope.

Brevicornis. Black, ſmooth; with wings blackiſh at the margin; abdomen brown; fore-ſhanks ſpinoſe. In the ſhady gardens of Europe.

Putris. Brown; the baſe of the wings cinereous. In the teeming ſoil at the commencement of ſpring.

Febrilis. Black, oblong, hairy; with blackiſh wings. An European inſect in cloſe places.

Insularis. Black, hairy; with ferruginous legs, hinder elongated.

Forcipata. With cylindric black abdomen; wings brown-hyaline; anus appendiculated. An Engliſh inſect.

Vernans. Cinereous; thorax black-lineated; white wings ſpotted with brown. In meadows of Denmark.

Florilega. Black, ſilken. On the apple-flowers of Europe, which it deſtroys.

Hortulana. With hyaline wings; exterior margin black. In the flowers of aſparagus and apple.

Phalænoides. With wings deflexed, cinereous, ovate-lanceolated, ciliated. In the walls of dunghills and mixens of Europe.

Hirta. Hairy; with wings deflexed, ovate-ciliated, teſſellated with white and black. In Lapland.

Persicariæ. Black; with wings incumbent, ſubciliated; under the leaves of the peach-tree.

Notata. Black; with white wings; with a white ſpot in front of the ſides of the abdomen. In Europe.

Juniperina. Cinereous; with white wings; margin villous; found in the juniper.

Culiciformis. Cinereous, with pallid legs; wings marked with two blackiſh ſpots. At Upſal.

Incarnata. Incarnated; with moderate antennæ. At Upſal.

Palustris. Pallid; black head; reddiſh abdomen. In marſhes of Europe.

Longicornis. With antennæ longer than the incarnated body. In moiſt places of Europe.

Rufipes. Black; with red legs; wings black in the middle; yellowiſh at the baſe. North of Europe.

Stictica. Black; ſegments of the abdomen white at the apex; wings with a brown point. In Germany.

Pallida. Pallid, piloſe; legs punctated with black. In Germany.

Hafniensis. Brown; lateral line of the thorax and legs whitiſh, unſpotted.

Flabellicornis. Pallid; abdomen annulated with black; wings ſpotted. Germany.

Bipunctata. Brown; wings cinereous; marginal point white. Found in Europe.

Sericea. Black; back black; ſides of the thorax bare; balancers yellow. In Sweden.

Minutissima. Yellow; eyes concurring in the vertex black. In the ditches of Sweden and Auſtria.

Pulicaris. Black; ſides of the thorax, ſcutellum, and abdomen yellow. In the ditches of Europe.

Pennicornis. With antennæ bipectinate; black body; halteres, or balancers, white. In the flowers of ariſtolochia clematis.

Scathopse. Black; antennæ moniliform; with wings incumbent hyaline. In the privies of Auſtria.

Buxi. Yellow; head and thorax black; wings brown incumbent. In the box-tree of Europe.

Berberina. With wings incumbent, fuliginous; ſpotted white at the baſe and margin. In the excreſcences of the barbery.

Lutescens. Yellowiſh; three brown ſpots on the back; antennæ plumoſe. Found in Europe.

Trifasciata. Ferruginous; with three bands on the wings. In Europe.

Multicolor. Yellowiſh body; greeniſh abdomen; white wings with a brown band. As before.

Alba. Grey; with white wings and abdomen; the apex of the latter brown. As before.

Carbonaria. Black; legs ferruginous; wings hyaline. As before.

Plumicornis. Brown; antennæ browniſh-plumoſe; legs yellowiſh. As before.

Dichroa. Black; legs ferruginous. As before.

Leucoptera. Brown; apex of abdomen and legs pale yellowiſh; wings white. As before.

Moschifera. Wings cinereous; thorax and abdomen yellow. Found in Chili.

TIPULA Wasp. See Wasp *Tipula*.

TIQUADRA, in *Ancient Geography*, one of the ſmall iſlands ſituated near the Balearic iſlands, near the town of Palma.

TIQUINA, in *Geography*, a town of Peru, in the dioceſe of La Paz; 55 miles N.N.W. of La Paz.

TIR, a town of Perſia, in the province of Khoraſſan; 40 miles N. of Herat.—Alſo, a town of Perſia, in the province of Farſiſtan; 50 miles N.E. of Schiras.

TIRABOSCHI, Girolamo, *Abate*, in *Biography*, author of the beſt hiſtory of Italian literature which that country, fertile in men of learning, taſte, and talents, has produced. He was born at Bergamo in 1731, and is ſtyled *Cavaliere* by his biographer, and the laſt editor of his Hiſtory, in a life prefixed to the index of the ſecond edition, publiſhed at Modena in 1794. He had his education in the Jeſuits' college from fifteen till the abolition of the order. He was profeſſor of eloquence in the univerſity of Brera at Milan till the year 1770, when he was appointed præfect of the Eſte library at Modena, by the intereſt of count Firmian. He firſt diſtinguiſhed himſelf, after this appointment, by a new edition of the Italian and Latin Vocabulary of Mandoſio; which work was almoſt wholly new written by him, and corrected and augmented with the moſt refined purity of the two languages; and the Latin and Italian orations which he delivered publicly at Milan, two of which were printed, and eſtabliſhed his reputation for eloquence.

He diſtinguiſhed himſelf during the firſt years of his præfectorſhip of the duke of Modena's library, by drawing up a new catalogue of the manuſcripts, books, medals, gems, and rarities of that celebrated library, and compiled the firſt volume of his Hiſtory of Italian Literature, publiſhed in 1771, which manifeſted ſuch taſte and ſolid learning

learning as aftonifhed his readers; but the public in general was ftill more aftonifhed at his finifhing the whole work in eleven years, confifting of thirteen large volumes in 4to.; a work which, by its immenfe erudition, profound critical difcuffions, and judgment in every kind of literature, acquired him the praife of the whole republic of letters.

Befides this great work, he produced during the fame period the life of St. Olympia; a letter on the comparative excellence of Italian and Spanifh literature; the life of Fulvio Tefto; the two firft volumes of the Biblioteca Modenefe; and all the articles which he furnifhed to the twenty-three firft volumes of the Giornale di Modena, a kind of review and hiftory of new books and difcoveries in arts and fciences within the year.

He was knighted by the duke of Modena, though a regular ecclefiaftic, and ennobled by his fellow-citizens at Bergamo. To enable him to proceed in his great work with more convenience, his patron augmented his appointment, and gave him an affiftant in the library.

His correfpondence with the learned throughout Europe muft have occupied much of his time: as at his deceafe, among his papers were found materials for twenty-eight volumes of original letters addreffed to him as author of the Literary Hiftory of Italy, and editor of the Giornale di Modena. In his numerous minor productions, as well as in thofe of greater volume and importance, he difcovers himfelf to have been gifted with a quick penetration, and poffeffed of great facility in writing, as well as a clear conception of the works of others, which to have acquired, muft have been ftudied with conftant application.

This admirable writer died at the age of fixty-two, of a bloody flux, in 1794.

From this celebrated work, we expected to acquire new and authentic information concerning the rife and progrefs of mufic previous to the feventeenth century, in a country which has taught every other part of Europe all the refinements of the art, a country in which we fought in vain, by travelling, converfation, and the perufal of all the books written by the natives which we could procure on the fubject, to trace the origin of Italian melody. Dull and pedantic elementary books we procured in abundance; but fcarcely any that we could read with pleafure, previous to the eftablifhment of the opera at the beginning of the feventeenth century. Quadrio's heavy volumes are filled without tafte, felection, or folicitude concerning the authenticity of facts. Padre Martini, unfortunately for modern mufical hiftory, did not live to finifh his plan; having advanced no farther than the ancient mufic of the Greeks.

Tirabofchi is copious on all other parts of literature, arts, and fciences. It is only on mufic, and mufical writers, our peculiar refearch, that we have ever found him unfatisfactory: we never confulted him on any other fubject unprofitably. The little he tells us of Pythagoras, Ariftoxenus, the Etrufcans, and Guido, we had often previoufly read in innumerable books in various languages.

He fpeaks of the Lyric poetry of the Greeks and Romans; but that of the Italians has not furnifhed an article. We did hope to be informed what kind of melodies were fet to the fongs of Dante, Petrarca, and Boccaccio. We could not reafonably expect fpecimens of this melody in notation, any more than prints of pictures and buildings that are mentioned in his work; but when a capital work of Raphael, Michael Angelo, or Palladio is mentioned, we are generally told where it is to be feen, or at leaft where it *has* been feen. Had Tirabofchi told his readers where the original melodies to the fongs of the old Italian poets were to be found, it would have been a great fatisfaction to thofe who confult books for ufeful and folid information, or feek in them for any thing but mere amufement.

Of the laft century he fays nothing, as his plan went no farther than the end of the feventeenth century. And, indeed, of that period, his information is very fcanty; neither Cariffimi nor Stradella, the two beft compofers which Italy had then produced; nor among contemporary theorifts, or writers on harmonics, is any notice taken of Lemme Roffi, or Daniel Bartoli, authors of two books, which in a general hiftory of literature ought to have been mentioned. See BARTOLI, and ROSSI.

TIRACHEA, in *Ancient Geography*, a town of Judea, in the Decapolis, on the coaft of the fea of Galilee.

TIRADE, in *French Mufic*, formerly implied what the Greeks meant by *αγωγω*, *agogo*, *ductus*, the filling up a wide interval by the intermediate diatonic notes. (See GREEK *Mufic*.) But, at prefent, *tirade* feems nearly equivalent to *volata* in Italian; a divifion, a flight.

TIRAGHT, in *Geography*, an ifland in the Atlantic, near the W. coaft of Ireland; 8 miles S.W. of Dunmore-Head.

TIRAMANGALUM, a town of Hindooftan, in Madura; 10 miles S.W. of Madura.

TIRAMANY-MUTOO, a river of Hindooftan, which runs into the Cauvery; 8 miles N. of Carroor.

TIRAN. See TYRAN.

TIRANADUM, or TIRINADUM, in *Ancient Geography*, a town of Africa, in Mauritania Cæfariana, on the route from Carthage to Cæfarea, between Rapidum and Caput-Cillanum. Anton. Itin.

TIRANDURG, in *Geography*, a town of Hindooftan, in Myfore; 12 miles S.S.E. of Ouffoor.

TIRANO, a town of Italy, in the department of the Lano, late belonging to the Grifons, the capital of the Upper Terzero, and refidence of a governor called Podefta, on the Adda, which divides it into two parts, connected by a ftone bridge of a fingle arch: formerly furrounded with walls by Ludovico Sforza, as a defence againft the Grifons, who deftroyed the fortifications when they gained poffeffion of the Valteline. The chief trade is in wine and filk, which is not confiderable. The wine is fent into the country of the Grifons, to Bormio, and into the territories of Venice; the filk, which is drawn from this diftrict of the Valteline, is not of the beft quality, nor very abundant; part is forwarded to Venice, and the remainder, through Chiavenna, to Germany. About half a mile from the town, on the other fide of the Adda, is the church of the Madonna, or Virgin, much vifited by Catholic pilgrims; the modern building annexed to what remains of the old edifice is in an elegant ftyle of architecture, and the era of it is 1533, the ancient part having been erected in 1206. In the area before the church is held the fair of Tirano, remarkable for the number of cattle brought hither for fale; they are fed upon the higheft Alps, where they continue until the fnow begins to fall, and are chiefly fent from hence into Italy. The fair is in October, and lafts three days, during which time the authority of the podefta is fufpended, and the governor of the Valteline has abfolute jurifdiction over the town and the diftrict; 24 miles E.N.E. of Morbegno.

TIRANY, a town of Hindooftan, in the Carnatic; 3 miles N. of Ootatore.

TIRATA, in old *Italian Mufic*, implied a regular afcent or defcent of notes of the fame kind; but, at prefent, the term has a more extenfive acceptation than its original import, *drawn out*: as when a fubject is well treated, productive

ductive of beautiful paſſages, made the moſt of by a compoſer; it is then ſaid to be *ben tirato*.

TIRBIA, in *Geography*, a town of Spain, in Catalonia; 16 miles N.W. of Urgel.

TIRE, or, as the ſeamen pronounce it, *tier of guns*. See Tier.

TIREBOLI, in *Geography*, a river of Turkiſh Armenia, which runs into the Black ſea at Tireboli.—Alſo, a town of Turkiſh Armenia, on the Black ſea, at the mouth of a river of the ſame name; 20 miles N.E. of Kereſour.

TIREH, a town of Aſiatic Turkey, in Natolia, ſituated on the Meinder; the inhabitants are chiefly Turks: 32 miles S.S.E. of Smyrna. N. lat. 38° 8′. E. long. 27° 40′.

TIRES *of Wheels*, in *Rural Economy*, the ſtraps, ſlips, bands, or hoops of iron which are put round them for the purpoſe of guarding and protecting them againſt the effects of the roads, as well as ſecuring and keeping them tight in their different parts. The moſt advantageous and beneficial form of tire for wheels of different kinds and breadths in different points of view, have probably not yet been well aſcertained. It is obvious, however, that it ſhould be ſuch as may have the leaſt poſſible tendency to penetrate and deſtroy the ſurfaces on which the wheels act and move. It would appear, that almoſt all of thoſe who have written on this ſubject, have gone upon a wrong or falſe principle; nearly all having directed that the exterior ſurface, when more bands than one are uſed, as in the caſe of broad-wheeled waggons, ſhould be unequal; in ſuch a manner as that the centre band may receive the whole of the preſſure, when the road is even and compoſed of hard materials; the other bands being only in readineſs to ſuſtain their portions of the burthen, when, either from unevenneſs or the want of firmneſs in it, they may be brought into contact with it.

It is well known, however, to every one, that it is the nature of a wedge to work its way, when forcibly applied to a cleft or opening; and that the extent of its penetration will depend on the ſharpneſs or acuteneſs of its wedge-form, and the power by which it is impelled. Admitting this to be the fact, it is plain that every wheel, the tire of which acts in the ſmalleſt degree as a wedge, muſt enter a looſe ſoil, ſurface, or road, more or leſs, in proportion as its edge or projection is more or leſs acute and protruding, or the contrary.

A rolling cylinder is not eaſily capable of penetrating below the ſurface, for this reaſon, that it preſents no *one protruding* point; but where a rolling body ſwells out in a projecting manner in the middle, it will unqueſtionably act or work deeper in that part where it is the moſt prominent, than in any other, as it is a ſort of obtuſe wedge. And ſuch muſt be the caſe in every wheel of which the tire is not cylindrical; as when its protruding part gets in, the whole body ſoon finds its way.

A broad flat tire is not, however, without its inconvenience; as, whether the road be good or bad, it preſents the ſame ſurface, and, of courſe, is as much reſiſted in its front, while on a hard ſurface, as while on one into which it ſinks. Conſequently, the cylindrical tire can never draw light and free, though it will not by any means penetrate deeply into any tolerably ſound ſurface.

Flat tires are probably, however, the beſt of any for narrow wheels.

In conſequence of the above, it has been propoſed by ſome, that every wheel ſhould be furniſhed with a *concave* or hollow tire which is cylindrical; but, that after leaving two rims, of proportionate breadth, at the edges, the whole intermediate ſpace ſhould be ſcooped out, or otherwiſe hollowed. By this means, on hard roads, the wheel would ride on the two rims only: while on ſoft roads, the whole would bear up the burthen. All ſuch wheels, the tires of which have even the ſmalleſt tendency to a wedge-like form, invariably, it is ſaid, throw the ſoil or earth from them; ſqueezing it out at the ſides, and burying themſelves, not only in the furrows they make, but under the very mud which they force from out of them: while, on the contrary, the concave tire, it is ſuppoſed, keeps in the ſoft ſoil, unleſs, indeed, it be in an abſolutely ſloppy ſtate, and forces it, by compreſſion, to bear up the weight or burthen. It is obſerved, that let two wheels be tried on a meadow which is not very firm in its ſurface, the cylindrical tired wheel will, aſſuredly, act better than that with a receding or convex edged ſort of tire; but that the concave tired wheel could not, it is believed, fail to diſplay its ſuperiority in ſeveral of the moſt deſirable points and reſpects.

Let it be ſuppoſed that the tire of a waggon-wheel is nine inches in breadth, and cylindrical: at the two edges leave a band of one inch in breadth, or more; then groove out the intermediate ſpace, to an inch and a half in depth in the centre, rounding it in gradually. Such a tired wheel would, it is ſaid, on a hard road, preſent only two inches of bearing; while the reſiſtance would gradually increaſe in proportion as the incumbent weight, and the ſoftneſs of the ſurface over which it may be proceeding, ſhould bring the whole to bear in an equal manner. The ſoft ſoil could not eſcape ſo eaſily, at leaſt, it is conceived, from under a concave tire, as thoſe of the oppoſite kind, conſequently it could not add to the exterior impediments of wheels.

It muſt neverthleſs be admitted, it is ſaid, that the concave tire is liable to ſome diſadvantage; for inſtance, it will at times clog, and, poſſibly, not only choke its own groove, but even accumulate conſiderably more; which will adhere to the clay and other matters with which the groove may be filled. In this way, it would, in fact, it is thought, become, in a certain meaſure, cylindrical. But that if it did no more than fill its groove on heavy ſoils, it would not prove ſo highly objectionable; for, on ſuch, the whole breadth of the tire *ought* to preſs the ſoil or ſurface.

The remedy ſuggeſted for the above inconvenience, in ſuch caſes, is that of a ſuitable fixed ſcraper, which has no difficulty in it, at leaſt, for carriages on one pair of wheels, or for the hind wheels of waggons. Such a ſcraper, and the mode of fixing it in ſuch caſes, may be ſeen deſcribed in ſpeaking of ſcrapers for different kinds of implements, tools, &c.

Theſe hints and ſuggeſtions may be uſeful in leading to farther improvements on the tires of wheels, which is a matter of great importance in different points of view, and which, as has been ſeen, has yet been thought but little upon in a proper manner. See Wheel.

TIREYMEG Lake, in *Geography*, a lake of North America. N. lat. 61° 52′. W. long. 107°.

TIRGUBIS, or Tigubi, in *Ancient Geography*, a town of Aſia, in Meſopotamia, on the banks of the river Chaboras, according to the Theodoſian table and Ptolemy; ſituated N.W. of Reſaina.

TIRGUL, in *Geography*, a town of European Turkey, in Moldavia; 62 miles W. of Jaſſy.

TIRGULFORMOSA, a town of European Turkey, in Moldavia; 20 miles W. of Jaſſy.

TIRING,

TIRING, in *Falconry*, is the giving a hawk the leg or pinion of a fowl to pluck at. Dict. Rust.

TIRIPANGADA, in *Ancient Geography*, a town of India, on this side of the Ganges. Ptol.

TIRIPIN, in *Geography*, a sea-port of South America, in the province of Cumana.

TIRISTA, in *Ancient Geography*, a town of Lower Mysia, near the Danube, between Trimanium and Durustorum, Ptol.

TIRISTRIA, or Tetrisia, a promontory of Lower Mysia, on the Euxine sea, between Dionysopolis and Odessus. Ptol.

TIRKA, in *Geography*, a town of Africa, in the kingdom of Ghana, on the north side of the Niger; 120 miles E. of Ghana. N. lat. 15° 20′. E. long. 14° 30′.

TIRLEMONT, a town of France, in the department of the Dyle, called by the people of the country *Tienen*; on the Geete. It was anciently one of the principal cities of Brabant, and made a fourth quarter in the assembly of the States; but that precedence was afterwards removed to Bois-le-Duc. It certainly has been a very flourishing and populous city, and many vestiges of its grandeur are yet visible; but it has suffered much by war, and other calamities; 9 miles S.E. of Louvaine.

TIRMAKUL, a fort of Hindoostan, near Gooty, taken by the British in 1801.

TIRMANIZ, a mountain extending from Bukovina to Transylvania.

TIRNA, a river of Hungary, which runs into the Danube, a few miles below Presburg.

TIRNAU, a town of Hungary, containing nine churches, and as many convents. This town was built in the thirteenth century; 20 miles E.N.E. of Presburg. N. lat. 48° 24′. E. long. 17° 44′.

TIROAN. See Taron.

TIROCOOR, a town of Hindoostan, in Golconda; 8 miles S. of Calloor.

TIRRETO, a town of Naples, in Calabria Ultra; 15 miles E.S.E. of Reggio.

TIRROUP-MEW, a town of the Birman empire: the meaning of the word is the *Chinese city*, and the appellation was derived from a victory obtained over the Chinese some centuries ago, when they invaded Birmah; 35 miles N.E. of Paghan.

TIRSÆ, in *Ancient Geography*, a town of Macedonia, in Mygdonia.

TIRSCHENRIED, in *Geography*, a town of Bavaria; 28 miles N.N.E. of Amberg.

TIRSCHNITZ, a town of Bohemia, in the circle of Kaurzim; 4 miles N.W. of Kosteletz.

TIRSIO, in *Ichthyology*, a name given by Gaza and some other authors to the phocæna of Willughby and others, the *porpesse* or *marsum*. Pliny, Bellonius, and many others call it *tursio*.

TIRSRUM, in *Geography*, a town of Sweden, in East Gothland; 25 miles S. of Linkioping.

TIRUA, a small island in the Pacific ocean, near the coast of Chili. N. lat. 38° 30′.

TIRUAN, a town of Hindoostan, in Bundelcund; 20 miles N.E. of Callinger.

TIRUMBORE, a town of Hindoostan, in Madura; 7 miles N.E. of Madura.

TIRUN, or Tedong, a name given to tribes who live chiefly on the N.E. coast of Borneo, and are reckoned a savage and piratical race, addicted to eating the flesh of their enemies. Their language is peculiar. It is probable, however, that they are only a tribe of Idan, who are imagined to be only a race of Haraforas or Alfoërs, as they are termed by the Dutch, who seem to be the most original race of all the eastern islands, excepting perhaps the Papuas. The Idan are sometimes termed Marut; they are certainly the original inhabitants of Borneo, and resemble the Haraforas equally in stature, agility, colour, and manners. The Haraforas are indigenous in almost all the eastern isles, and are sometimes found on the same island with the Papuas or oriental negroes. They are often lighter in colour than the Mahometan races, and generally excel them in strength and activity. They are universally rude and unlettered, and where they have not been reduced to the state of slaves of the soil, their manners have a general resemblance. In their manners, the most singular feature is the necessity imposed on every person, of some time in his life embruing his hands in human blood; and, in general, among all their tribes, as well as the Idan, no person is permitted to marry, till he can shew the skull of a man whom he has slaughtered. They eat the flesh of their enemies, like the Battas, and drink out of their skulls; and the ornaments of their houses are human skulls and teeth, which are consequently in great request among them, as formerly in Sumatra, the ancient inhabitants of which are said to have originally had no other money than the skulls of their enemies. The Haraforas are found in all the Moluccas, in Celebes, the Philippines, and Magindano, where they are termed Subano or Manubo; and the ferocious race mentioned by Marsden, who live inland from Samanka in Sumatra, and are accustomed to atone their own faults by offering the heads of strangers to the chiefs of their villages, are probably of the same description. As. Ref. vol. x.

TIRUVELORE, a town of Hindoostan, in the Carnatic; 30 miles E. of Tanjore.

TIR-Y, or Tyrie, one of the islands of the Hebrides, situated in the district of Mull, and shire of Argyle, Scotland, is about 11 miles in length, and $2\frac{1}{2}$ miles in breadth. Its coast is mostly rocky, and intersected with many beautiful sandy bays, some of them a mile broad. About one-half of the surface is arable, interspersed with small rocks and rising grounds, none of which are above 250 feet above the sea-level; but the surface in general is so even, that the waves are often seen from the one shore rising apparently several feet above the level of the other. In the centre of the island is a large plain, which contains about 1200 Scotch acres, and is elevated about six feet only above high-water mark: consequently, in stormy weather the sea often meets across this plain, and is productive of bad consequences. The inhabitants have endeavoured to avert this evil by building a defence of stone and earth on the one side, while the sea, on the other, has raised a considerable barrier of bowlder stones; yet neither has been sufficient to resist the waves of the Atlantic. Here are several lakes, covering in all about 600 acres: in one of these is a small island, on which are the ruins of an ancient castle, on the scite whereof a neat house has been erected for the residence of the factor of the duke of Argyle, who is proprietor of the whole island. The fisheries employ a number of hands, as well as the manufacture of kelp, of which about 245 tons are annually made. The hill of Cean-Mharra, the western point of the island, is remarkable for a great number of large natural caves, frequented by innumerable flocks of sea-fowls. Here are the remains of many Danish forts, and also of several old chapels, at some of which burying-grounds and crosses are still visible. In the time of St. Columba, this appears to have been part of the patrimony of of that church. Here is a parochial ſchool, and alſo one eſtabliſhed by the Society for Promoting Chriſtian Knowledge, both of which are well attended. The population of the pariſh (which comprehends the iſlands of Coll, Gunna, and Tir-y) was, in the year 1811, eſtimated at 3186. There is a regular ferry from Tir-y to Coll, three miles diſtant, which is often dangerous, owing to a heavy ſwell from the Atlantic, and a rapid current over rocks and ſhifting ſands. The two iſlands appear to have been formerly united: the iſle of Gunna, which lies in the ſound, being apparently part of the intermediate land which has eſcaped deſtruction.—Beauties of Scotland, vol. v. Carliſle's Topographical Dictionary of Scotland, vol. ii.

TIRYNS, in *Ancient Geography*, a town of the Argolide, N. of Midea, ſituated in an encloſure of the mountains; called anciently Halicis, or the town of fiſhermen, from its having been the abode of the Hermionean fiſhermen. In the time of Pauſanias it was in ruins.

TISÆUS, or Tisæum, a very lofty mountain of Theſſaly.

TISALPHATA, a town of Meſopotamia, ſituated W. of the Tigris, on one of the ſmall rivers which diſcharged themſelves into the Mygdonius.

TISBURY, in *Geography*, a ſmall fiſhing town on the N. coaſt of Martha's Vineyard, belonging to the ſtate of Maſſachuſetts.

TISCHNOWITZ, a town of Moravia, in the circle of Brunn; 13 miles N.W. of Brunn.

TISDRA, Tusdro, or *Thyſdrus*, in *Ancient Geography*, a town of Africa, ſix leagues S.W. of Sarſura and five leagues S.W. of Achola. It has many ancient relics of altars, inſcriptions, columns, and fragments of marble ſtatues; and alſo the remains of an amphitheatre.

TISEBARICA, a country of Ethiopia, according to Arrian, which commenced near the port of Berenice, and extended along the Red ſea, as far as the country of the Moſchophagi.

TISHEET, in *Geography*, a town of Africa, with a ſalt-mine; 150 miles N. of Benown. N. lat. 17° 20'. W. long. 26° 50'.

TISHOLTZ, a town of Hungary; 10 miles E.N.E. of Libeten.

TISIDIUM, in *Ancient Geography*, a town of Africa, the command of which, according to Salluſt, was given by Metellus to Jugurtha.

TISIPHONE, in *Mythology*, one of the three Furies. She is repreſented by the poets with vipers, ſometimes as looſe ſerpents, intermixed with her hair, and ſometimes as ſerpents growing from her head inſtead of hair. As ſhe is one of the chief of all the infernal executioners, her robe is deſcribed either as dropping with freſh blood, or ſtiff with human gore: this robe is faſtened round her with a ſerpent inſtead of a girdle; and ſhe has ſometimes vipers twiſted round her arms inſtead of bracelets. They ſometimes give her a torch in her hand wet with blood; ſometimes a torch in one hand and a ſerpent in the other; and ſometimes ſerpents in both. Statius, Theb. i. v. 91. v. 111. v. 113. Theb. vii. v. 467. Ovid. Met. iv. v. 483. v. 490. v. 495. v. 510.

TISMANA, in *Geography*, a town of Walachia, at the ſource of a river of the ſame name; 18 miles W. of Tergoſyl.—Alſo, a river of Walachia, which runs into the Syl, 15 miles S. of Tergoſyl.

TISQUIUU Lake, a lake of North America. N. lat. 56° 10'. W. long. 95° 45'.

TISRI, or Tizri, in *Chronology*, the firſt Hebrew month of the civil year, and the ſeventh of the eccleſiaſtical or ſacred year.

The Hebrews call it *raſh-haſhanna*, that is, the beginning of the year. It anſwered to part of our September and October. On the firſt day of this month was kept the feaſt of trumpets, becauſe the beginning of the year was then proclaimed by ſound of trumpets. On this day they refrained from all ſorts of ſervile buſineſs, and offered in ſacrifice a calf, a ram, and ſeven lambs. Levit. xxiii. 24. Numb. xxix. 1.

The tenth day of this month was the great day of expiation, and on the fifteenth the feaſt of Tabernacles began, which laſted till the twenty-ſecond day incluſively. See Scenopegia.

TISSA, in *Ancient Geography*, a ſmall town of Sicily, at the northern foot of Ætna, near the river Onobala. Ptol.

TISSANAH, in *Geography*, a town of Hindooſtan, in the circar of Sumbul; 16 miles S.W. of Sumbul.

TISSIA, a town of Bengal; 35 miles S.E. of Palamow.

TISSUE, Cellular, in *Anatomy*, the cellular ſubſtance. It is an expreſſion borrowed from the *tiſſu cellulaire* of the French, who alſo often call it *tiſſu muqueux*. See Cellular *Subſtance*.

TISTE, in *Geography*, a poſt-town of Germany, in the county of Verden; 20 miles N.E. of Rotenburg.

TISURUS, Tozer, in *Ancient Geography*, a town of Africa Propria, S. of Adrametum, and 4 leagues S.W. of Tichaſa. It has ſome Roman remains.

TIT, in *Geography*, a town of Morocco, near the Atlantic ocean; 8 miles S.W. of Mazagan.

Tit, in *Rural Economy*, a term provincially applied to a ſmall ſtiff horſe, or ſort of poney, and ſometimes to other horſes, as a handſome or ugly tit, &c.

TITALBARY, in *Geography*, a town of Bengal; 20 miles N.N.W. of Goragot.

TITALEEA, a town of Bengal; 6 miles E. of Moorſhedabad.

TITALLYA, a town of Bengal; 50 miles N. of Dinagepour.

TITAN. See Levant.

TITANA, in *Ancient Geography*, a town of Sicyonia, E. of the river Sitas, and W. of the river Aſopus; ſituated on a mountain, and regarded as a fortified town. Here was a temple of Eſculapius, and a ſtatue of this god; and alſo a ſtatue of Hygeia. In the temple of Eſculapius were nouriſhed ſacred ſerpents.—Alſo, a ſmall country of Sicyonia. — Alſo, a river of Aſia, which had its ſource in mount Zagrus, and flowed into the river Sillas.

TITANIA, τιτανια, in *Antiquity*, a feſtival in memory of the Titans.

TITANIDÆ, or Artemidæ, the ſeven daughters of Chronus, ſon of Uranus, by Aſtarte.

TITANIS, in *Ancient Geography*, a port on the weſtern coaſt of Corſica, between the mouth of the river Ticarius and the town of Fiſera. Ptol.

TITANIUM, in *Mineralogy*, a metal originally diſcovered by Mr. Gregor of Cornwall, in the grains of a black mineral found in the bed of a rivulet in the valley of Menaian, in that county. It occurs alſo in different ſtates of oxydation or intermixture in various parts of the world; and, according to the recent obſervations of M. Cordier, is a conſtituent part of moſt volcanic rocks. The oxyd of titanium is reduced by expoſure to an intenſe heat, being previouſly moiſtened with oil and ſurrounded by powdered charcoal.

charcoal. A blackifh bliftered fubftance is obtained, which has a reddifh colour in fome points. According to Lampadius, its colour refembles that of copper, but is deeper, and the luftre is confiderable. It is brittle, but when in thin plates, its elafticity is confiderable.

When titanium is boiled with nitric acid, no remarkable effect enfues, but the bright fpots difappear, and are fucceeded by a white compound. Nitro-muriatic acid forms alfo a white powder, which remains fufpended in it. Sulphuric acid exhibits a fimilar appearance, fulphurous acid is difengaged, and the titanium is partly changed to a white oxyd, and partly diffolved. Muriatic acid diffolves titanium, but not its oxyd.

The folution of titanium gives a white precipitate with alkaline carbonates, a grafs-green mixed with brown with pruffiate of potafh, and a dirty dark green with the hydrofulphurets. Infufion of galls precipitates a reddifh-brown fubftance, which, if the folution be concentrated, has the appearance of blood. A rod of tin immerfed in the folution imparts to the liquid round it a fine red colour, and a rod of zinc a deep blue.

Titanium tarnifhes by expofure to the air, and is oxydized when heated in contact with it. It can exift in three ftates of oxydation; the firft is blue or purple, the fecond red, and the third white. The white oxyd is the only one the compofition of which is accurately known. It has been fhewn by Vauquelin and Hecht to confift of eighty parts of red oxyd, and eleven of oxygen. Titanium has not yet been combined with fulphur, but has been combined by Mr. Chenevix with phofphorus.

The only alloy of any confequence which it forms is with iron; it is of a grey colour, interfperfed with brilliant particles, and is quite infufible. The above are the principal properties of this metal which have yet been difcovered: it has not hitherto been applied to any ufeful purpofe in the arts.

The ores of titanium have been divided into fix fpecies by mineralogifts; *viz.* menachanite, iferine, nigrine, fphene, rutile, and octahedrite.

Menachanite is fo called from the valley of Menaian, in Cornwall, where it was originally found. It occurs alfo on the fhores of the ifland of Providence, and in the vicinity of Richmond, in the United States of America; and alfo at Botany Bay, in New South Wales. It is found in fmall angular grains, which are of a greyifh or iron-black colour, and have a rough glimmering furface. From its appearance it has been confounded with iron-fand, but its magnetic attraction is much weaker: it is lefs hard, and may be diftinguifhed by its fracture, and particularly by the luftre, which approaches to femi-metallic. The fracture is imperfectly foliated: the fragments are angular and fharp-edged, and it is perfectly opaque. It yields to the knife, retaining its colour in the ftreak. It is opaque and brittle. The fpecific gravity, according to Gregor, is 4.427; but as given by Lampadius, is 4.270. Menachanite is infufible by the blowpipe without addition, but tinges borax of a greenifh-brown colour. Its conftituent parts, according to Klaproth, are

Cornwall.

Oxyd of iron	- -	51.00
Oxyd of titanium	-	45.25
Oxyd of manganefe	-	0.25

Botany Bay.

According to Chenevix:

Oxyd of iron	- -	49
Oxyd of titanium	- -	40
Silex	- - - -	11
		100

Iferine is fo called from having been originally found near the fource of the river Ifer, in Silefia: it is diffeminated in granitic fand, with iron-fand. It occurs alfo with fimilar fand in the bed of the river Don, in Aberdeenfhire. It is fufpected by profeffor Jamefon to be affociated with trap-rocks; and from the obfervations of M. Cordier, that it is found as a conftituent part of lava, this opinion is rendered the more probable. Iferine is of a brownifh iron-black colour. It is found in fmall grains and rolled pieces, with a rough and glimmering furface. The internal luftre is femi-metallic. Its fracture is conchoidal, which diftinguifhes it from menachanite, to which it bears a near refemblance. The fpecific gravity is 4.5. Before the blowpipe it melts into a blackifh-brown coloured glafs, which is flightly attracted by the magnet. The mineral acids have no fenfible effect on it, but the acid of fugar extracts a portion of the titanium. According to Dr. Thompfon, its conftituent parts are

Oxyd of titanium	- -	48
Oxyd of iron	- -	48
Oxyd of uranium	- -	4
		100

Nigrine; Titane oxydé ferrifére of Haüy, is fo called on account of its colour, which inclines to a velvet-black. It occurs, like the preceding fpecies, in angular grains and in rolled pieces. The external luftre is gliftening, that of the fracture fhining: the ftructure is imperfectly foliated. It is opaque, and harder than menachanite. Nigrine is brittle, and gives a yellowifh ftreak. The fpecific gravity varies from 3.700 to 4.740. It is not attracted by the magnet, and is infufible by the blowpipe, but with the addition of borax melts to a tranfparent hyacinth red globule. The acid of fugar extracts the titanium from this ore. It is found in alluvial ground in Tranfylvania, Bavaria, and the ifland of Ceylon: it occurs alfo in the granite of the Uralian mountains.

The conftituent parts of nigrine are given as under:

Tranfylvania.

Octahedrite; Schorl bleu, Romé de Lifle; *Titane anatafe,* Haüy. This ore of titanium is fo called from its conftant occurrence in cryftallized forms, which are varieties of the octahedron.

octahedron. The cryftals are fmall; the furface is tranfverfely ftriated, and has a femi-metallic luftre: the internal luftre is alfo fplendent. The ftructure is foliated. This mineral is more or lefs femi-tranfparent; it fcratches glafs, and is brittle. The fpecific gravity, according to Haüy, is 3.8571. The colour of octahedrite is indigo-blue, paffing through many fhades to brown. It is infufible by the blowpipe, but with borax it forms a reddifh-brown coloured glafs. At the extremity of the flame, the brown colour changes to blue, and becomes opaque; by the continued action of the blowpipe, the brown colour reappears, and may be again chauged by variation of temperature. This mineral is rare: it occurs in veins with felfpar, axinite, rock-cryftal, and chlorite, in the primitive rocks of Dauphiny, and in drufy cavities in limeftone, at Hadeland, in Norway.

Sphene and Rutile.—Thefe ores of titanium have been already defcribed. (See SPHENE and RUTILE.) In addition to thofe articles we may ftate, that common fphene has been difcovered in fmall cryftals in the fienite of the mountains in Galloway, and on the fouth fide of Loch-Nefs; in the granite of Bennevis and Aberdeen; and alfo in other parts of Scotland. Rutile has alfo been difcovered in the granite of Cairngorum, and near to Beddgelert, in Carnarvonfhire.

TITANOS, a word ufed by fome authors to exprefs lime; by others for the calx of burnt gypfum or plafter of Paris, and by others a lixivium of quicklime.

TITANS, TITANES, Τιτᾶνες, in the *Ancient Mythology*, the fons of Uranus or Cœlus, and Vefta, or Titæa, or Terra, *i. e.* of Heaven and Earth, according to Hefiod and Apollodorus; or, which comes to the fame thing, of Æther and Tellus, according to Hyginus. They are faid to have derived their name from their mother, and hence the moft ancient fabulous hiftories have made them pafs for fons of the Earth. Apollodorus reckons fix Titans; Oceanus, Cœlus, Hyperion, Crius, Iapetus, and Saturn or Cronus: Hyginus alfo reckons fix, *viz.* Briareus, Gyges, Sterope, Atlas, Hyperion, and Cottus; but he feems to include the hundred-handed giants in the number, which Apollodorus, and the generality of mythologifts, diftinguifh from the Titans.

The tradition is, that Cœlus, by the fame wife Vefta, had Briareus, Gyges, and Cottus, the hundred-handed giants, and had chained them up in Tartarus: Vefta, the earth, their mother, refenting this treatment, raifed the Titans againft their father, her hufband: all, excepting Oceanus, made war upon him and dethroned him, fetting up Saturn in his place.

Saturn, it feems, proved no more favourable to them than his father; but continued the giants in their prifon. Upon this, Jupiter revolted againft Saturn; ferving him as he had done Cœlus; and refcued the three giants; who afterwards proved of great fervice to him in the war which the Titans waged againft him.

This war lafted ten years: but at length the Titans were vanquifhed; Jupiter remained in peaceable poffeffion of heaven; and the Titans were buried under huge mountains thrown on their heads.

Hyginus gives another origin of the Titans: he derives them from Titan, Saturn's eldeft brother, by Cœlus and Vefta; who, though prefumptive heir of heaven, yet finding his father and mother more inclined for Saturn than for him, furrendered to him his right of fucceffion, on condition he fhould not bring up any male child, that the empire of heaven might revert to his own iffue the Titans.

But Jupiter, Neptune, and Pluto, having been afterwards faved by the artifice of Ops, Titan, and his fons the Titans, made war on Saturn, who had difpoffeffed his father Uranus of the throne, and acquired an extenfive empire, vanquifhed and imprifoned him; thus he continued in the power of his enemies, till Jupiter, who had been conveyed by his mother Rhea for fafety to the ifle of Crete, being grown up, left Crete, made war on the Titans, and delivered his father.

Having re-eftablifhed him on the throne, he returned to the place of his retreat. Saturn afterwards reigned for fome time in tranquillity; but upon confulting an oracle, he received information that he would be expofed to danger from the youngeft of his fons. Accordingly he recurred to all poffible means for getting aid of Jupiter. Having fought him in Crete, he was betrayed and conftrained to make a hafty retreat into the Peloponnefus. Thither Jupiter purfued him, and obliged him to take fanctuary in Italy, under the protection of Janus.

The Titans, thus difperfed through feveral countries of Greece, being jealous of the power of this new conqueror, as they had been of his father's, levied troops againft Saturn, and gave him battle; but being defeated, they retired into the interior parts of Spain, whither Saturn followed them. Jupiter fought them out in their retreat, and beat them for the laft time near Tarteffus, and with this battle terminated the war, which had lafted ten years. Saturn made his efcape into Sicily, and there, as it is faid, died from grief. With this laft victory, and the death of Saturn, commenced the reign of Jupiter. During the war of the Titans, Atlas feized on thofe provinces of Africa which were remote from the centre of the empire. Pluto was fettled governor of the weftern parts of the empire of the Titans, of the Gauls, and Spain, which government, after the death of Pluto, was given to Mercury, who is faid to have become the great divinity of the Celtæ; and Jupiter referved to himfelf the whole Eaft, that is, Greece, the Ifles, and that part of Afia whence his anceftors came. For the explication of the fable that reprefents the Titans as thruft down to Tartarus by Saturn, fee TARTARUS.

The moft judicious among our mythologifts, fuch as Gerard Voffius, Marfham, Bochart, and father Thomaffin, are of opinion that the partition of the world among the fons of Noah, Shem, Ham, and Japhet, was the original of the tradition of the fame partition among Jupiter, Neptune, and Pluto; and hence they have been led to form comparifons between the three fabulous princes, and the three fons of the patriarch. Accordingly the learned Pezron contends that the divifion which was made of this vaft empire, came in aftertimes to be taken for the partition of the world: that Afia remaining in the hands of Jupiter, the moft potent of the three brothers, made him be looked upon as the god of Olympus, a celebrated mountain where he had his refidence, and which was afterwards taken for heaven itfelf: that the fea and iflands which fell to Neptune, occafioned their giving him the title of god of the fea: and that Spain, the extremity of the then known world, thought to be a very low country in refpect of Afia, and famous for its excellent mines of gold and filver, falling to Pluto, occafioned him to be taken for the god of the infernal regions. However this be, the empire of the Titans, according to the ancients, was very extenfive. Thefe princes were poffeffed of Phrygia, Thrace, a part of Greece, the ifland of Crete, and feveral other provinces, to the inmoft receffes of Spain. To thefe Sanchoniathon feems to join Syria; and Diodorus adds a part of Africa and the kingdoms of Mauritania.

F. Pezron, in his Antiquity of the Celtæ, makes that people to be the fame with the Titans; and their princes the fame with the giants in Scripture. According to him, the

the Titans were the defcendants of Gomer, the fon of Japhet. He adds, that the word Titan is perfect Celtic, and derives it from *tit, earth*, and *den* or *ten, man:* and hence it was the Greeks alfo called them very properly γηγενεις, *q. d. terriginæ, earth-born.*

Banier obferves, that although moft of the ancients have confounded the giants (fee *Rebel* GIANTS) with the Titans, they ought to be diftinguifhed. The latter, he fays, were of an illuftrious family, and extended their empire over one part of the world; the others were fo many banditti difperfed over Theffaly, who occafioned great trouble to the Titans. Hefiod diftinguifhes them from one another, and ftates that the giants were not born till long after the overthrow of the Titans, and after the wars which thefe carried on againft the others. The occafion of confounding them feems to have been, that both the giants and the Titans made war upon the gods; with this difference, that the Titans, though of the fame race, had often feparate interefts; fome taking part with Saturn, and others of them with Jupiter: whereas the giants were a gang of robbers, who had a defign equally upon all the Titans. Both giants and Titans were reprefented as fons of Heaven and Earth, and hence they have been confounded, for want of confidering, what Apollodorus fays, that Earth brought forth the giants only becaufe fhe was incenfed againft Jupiter for keeping the Titans fhut up in Tartarus. Thus the Titans were born long before the giants.

The Titans, according to the learned Mr. Bryant, were thofe Cuthites, or fons of Chus, called *giants*, who were employed in building the tower of Babel, and who were afterwards difperfed. See DISPERSION *of Mankind.*

He fuppofes that they were denominated from their religion and place of worfhip, *Titæa*, which is reprefented as the mother of thefe people, being compounded of *Tit-aia*, and fignifying literally *a breaft of earth*, analogous to τιτθος αιας of the Greeks, and therefore expreffing the figure as well as the materials of the ancient altars, which confifted of a conical hill of earth, in the fhape of a woman's breaft. Thefe altars were alfo called *Tit-an* and *Tit-anis*, from the great fountain of light, ftyled *An* and *Anis*. Hence many places were called *Titanis* and *Titana*, where the worfhip of the fun prevailed; for *Anes* and *Hanes* fignified the *fountain of light* or *fire*. Titana was fometimes expreffed Tithana, and by the Ionians Tithena; and Tithena was faid to be the nurfe of the Titans. But Titæa their mother, and Tithena their nurfe, were all of the fame nature, *viz.* altars raifed of foil. Hefiod, in his account of the difperfion of the Titans, and of the feuds which preceded (Theogon. ver. 676, &c.), fays that the Deity at laft interpofed, and put the Titans to flight, and condemned them to refide in Tartarus at the extremities of the earth; but Mr. Bryant obferves, that he has confounded the hiftory by fuppofing the giants and Titans to have been different perfons. The fons of Chus, he fays, were the aggreffors in thofe acts of rebellion defcribed by the poets as the war of the giants, who were alfo reprefented under the character of the Titanians. The fictions of the poets with regard to the banifhment of the Titans after their war againft heaven, took their rife from this true hiftory. A large body of Titanians, after the difperfion, fettled in Mauritania, upon the Atlantic ocean, which is the region ftyled Tartarus, and reprefented as the realms of night, becaufe it was fituated in refpect to Greece towards the regions of the fetting fun. The term ζοφος, by which it was expreffed, fignified both the weft and darknefs; as did alfo Ereb, ערב, whence Erebus, which was alfo another name for Tartarus, to which the poets condemned the Titans and giants. The firft war of the Titans, according to this ingenious writer, confifted in acts of apoftacy and rebellion againft heaven: and this refers to that part of the hiftory of the fons of Chus, which reprefents them as building a mighty city in the region, which they had ufurped, and erecting a lofty tower, to prevent their being fcattered abroad: but there was another war in which they were engaged with men, which happened in confequence of the difperfion. This was no other than the war mentioned by Mofes, which was carried on by four kings of the family of Shem, againft the fons of Ham and Chus, to avenge themfelves of thefe enemies by whom they had been greatly aggrieved. See Bryant's Analyfis of Ancient Mythology, vol. iii. p. 48, &c. p. 71, &c.

The word Titan is alfo ufed by the poets for the fun; in which cafe it is likewife Celtic, though from another root, being formed from *ti, houfe* or *habitation*, and *tan, fire.*

Hefychius obferves, that Titan is likewife ufed for fodomite. He adds, that it is alfo one of the names of antichrift; in which fenfe it muft be written *Teitan*, in Greek, to contain the numeral letters of 666, which in the Apocalypfe, xiii. 18. is the number of the beaft.

TITANUS, in *Ancient Geography*, a town of Afia Minor, on the coaft of the Æolide, on the banks of a river of the fame name.

TITARESSUS, a town of Afia, in Leffer Armenia, in the country named Melitane. Ptol.

TITARESUS, or TITARESSUS, a river of Theffaly, mentioned by Homer, which had its fource in mount Titarus.

TITATY, in *Geography*, a town of Bengal; 55 miles N. of Dinagepour.

TITCHFIELD, a fmall market-town in the hundred of the fame name, in the Portfdown divifion of the county of Hants, England; is fituated near the Titchfield river, 3 miles W. from Fareham, and 78 miles S.W. from London. It is inhabited by many refpectable families. The church, which is the only object of particular notice, is a fpacious edifice, of the workmanfhip of different ages: the N. fide is faid to have been built by William of Wykeham; but the S. fide is more ancient. In the S. chancel is an interefting monument to the memory of fir Thomas Wriothefley, firft earl of Southampton, Jane his lady, and Henry their fon, the fecond earl; all of whom are reprefented by effigies on the tomb. Four annual fairs are held in Titchfield; and a weekly market on Saturdays. The population of the parifh, under the act of 1811, was returned as 3227, the number of houfes at 553.

At a fhort diftance from the town, on the N., are the ruins of Titchfield Houfe, the ancient feat of the Wriothefleys. It was erected, by the firft earl of Southampton, on the fcite, and with the materials of an abbey, founded for Premonftratenfian canons, by bifhop Peter de Rupibus, in the year 1231. The annual revenues of this eftablifhment, at the period of the diffolution, amounted, according to Dugdale, to 246*l.* 16*s.* 1*d.*; but according to Speed, to 280*l.* 19*s.* 4½*d.* Its poffeffions were then granted by Henry VIII. to his favourite fecretary, Wriothefley, who built here, Leland reports, "a righte ftatelie houfe embattled, and having a goodlie gate, and a conducte caftelid in the middle of the court of it, in the very fame place wher the late monafterie ftoode." This building is now in a very dilapidated ftate: the entrance gateway is the principal part left ftanding; fixteen rooms having been recently pulled down for the fake of the materials. The eftate is the property of John Delmé, efq. of Cam's Hall. In Titchfield Houfe, Charles I. was concealed after his efcape from Hampton Court in 1647, and previous to his refigning himfelf to colonel Hammond,

who conducted him to the Isle of Wight.—Beauties of England and Wales, vol. vi. Hampshire; by J. Britton and E. W. Brayley.

TITCHVIN, a town of Russia, in the government of Novgorod, on the river Sias; 84 miles N.N.E. of Novgorod. N. lat. 59° 52'. E. long. 33° 14'.

TITE. See TICHT.

TITEA, in *Mythology*, the wife of Uranus or Cœlus, by whom he is said to have had eighteen children, each of which had his own name, though they were generally designated by the appellation of *Titans*; which see. This princess, after her death, received divine honours, and she was called after her name.

TITERUD, in *Geography*, a town of Norway, in the province of Aggerhuus; 38 miles N. of Christiana.

TITHENIDIA, τιθηνίδια, in *Antiquity*, a Spartan festival, so called from τιθηναι, *nurses*, who at this time carried the male infants committed to their charge to the temple of Diana Corythallia. For the ceremonies observed on this occasion, see Potter, Archæol. Græc. lib. ii. cap. 20. tom. i. p. 432, seq.

TITHES, TYTHES, *Tenths*, *Decimæ*, or *Dixmes*, the tenth part of the increase, yearly arising and renewing from the profits of lands, the stock upon lands, and the personal industry of the inhabitants; allotted to the clergy for their maintenance.

Tithes essentially differ from *offerings*, *oblations*, and *obventions*, which are the customary payments for communicants at Easter, for marriages, christenings, churching of women, burials, and such like. See OBLATIONS.

Tithes, with regard to their several kinds or natures, are *personal*, *predial*, and *mixt*.

TITHES, *Personal*, are those due or accruing from the profits of labour, art, trade, navigation, and industry of men; and of these, only the tenth part of the clear gains and profits is due; after charges deducted.

TITHES, *Predial*, are those which arise merely and immediately from the ground; as grain of all sorts, hay, wood, fruits, herbs; for a piece of land or ground, being called in Latin *prædium* (whether it be arable, meadow, or pasture), the fruit or produce of it is called *predial*.

TITHES, *Mixt*, are those which arise not immediately from the ground, but from things immediately nourished by the ground, as from beasts, and other animals fed with the fruits of the earth; as colts, calves, lambs, chickens, milk, cheese, eggs.

Tithes, with regard to their value, are divided into *great* and *small*.

TITHES, *Great*, are those of corn, hay, and wood.

TITHES, *Small*, are the *predial* tithes of other kinds, together with those that are called *mixt* and *personal*. It is said, that this division may be altered by custom, which will make wood a small tithe in the endowment of the vicar; by quantity, which will convert a small tithe into great, if the parish is generally cultivated with it; and by change of place, which makes the same things, *e. g.* hops in gardens, small tithes, in fields great tithes. But it has been admitted, that the quantity of land within any parish, that is cultivated for a particular produce, cannot change the nature of the tithe: and, according to this opinion, the law is now settled, that the tithes are to be denominated *great* or *small*, according to the nature and quality of them, and not according to the quantity.

It has been said by lord Coke and many others, that before the council of Lateran in the year 1180, a man might have given his tithes to what church or monastery he pleased; but this is denied by Dr. Prideaux. It is now certain, that tithes of common right do belong to that church, within the precincts of whose parish they arise; and this regulation, corresponding with the ancient law of the land, was enjoined by a decretal epistle of Innocent III. to the archbishop of Canterbury, in the year 1200. (2 Inst. 641. 2 Blackst. Com. 27.) But though one person may prescribe to have tithes within the parish of another; this is what is called a "portion of tithes." (Gibs. 663.) Tithes extra-parochial, or within the compass of no certain parish, belong to the crown, and may be granted to whom the king will. 1 Roll's Abr. 657. 2 Inst. 647.

It is a general rule, that of common right tithes are to be paid for every thing that yields an annual increase; but this rule admits of exceptions, *e. g.* tithe is due from saffron, though gathered but once in three years; and on wood that is felled or lopped, called *sylva cædua*, though it is not renewed every year: and on the other hand, tithes shall be paid for the produce of seeds, as of clover, sown on the same ground, though renewed oftener than once a year. No tithes shall be paid of common right for any thing that is of the substance of the earth, or which is not of annual increase, as stone, lime, coal, tin, lead, and such like; nor for creatures that are *feræ naturæ*, or of a wild nature, as deer, hawks, fish, &c. whose increase so as to profit the owner is not annual, but casual; unless tithes in either of these cases are payable by custom. Degge, p. 2. c. 8. 1 Inst. 651. 664.

Lands, and their occupiers, may be exempted or discharged from the payment of tithes, either in part or totally, by a real composition, or by custom and prescription.

A *real* composition is when an agreement is made between the owner of the lands, and the parson or vicar, with the consent of the ordinary or patron, that such lands shall for the future be discharged from payment of tithes, by reason of some land, or other real recompence given to the parson, in lieu and satisfaction thereof. But these compositions are now restrained by the disabling statute 13 Eliz. cap. 10. See COMPOSITION.

A parson may bind himself by *deed* to accept of a composition for tithes during life, or incumbency of a particular living. It is also very common to agree by *parol* for an annual composition for tithes, which binds the parties to it till sufficient notice given of dissent from the agreement, but what is sufficient notice to determine such an agreement, has never been decided in terms. See LEASES *by Statute*.

A discharge by custom or prescription is, where time out of mind such persons, or such lands, have been either partially or totally discharged from the payment of tithes. The difference between *custom* and *prescription* is this: *Custom* is that which gives right to a province, county, hundred, city, or town, and is common to all within the respective limits; in pleading of which it is alleged, that in such a county or the like, there is, and time out of memory hath been, such a custom used and approved therein. *Prescription* is that which gives a right to some particular house, farm, or other thing; in pleading of which it is alleged, that all they whose estate is had in such land, have time out of mind paid so much yearly, or the like, in full satisfaction of all tithes arising on those lands. (Gibson, 674.) And there is this difference between a prescriptive and customary modus, that the former is annexed to the lands which it covers, whereas the latter exists in action of law, independent of the lands by force of the custom of the district. In a prescriptive modus, therefore, the lands must be definite, and not liable to shift. And therefore a bill to establish a modus for every ancient farm, but not setting out the abuttals of each, was dismissed, difmiffed, although it was ftated that the whole parifh confifted of ancient farms. (See Custom and Prescription.) This cuftom, or prefcription, is either *de modo decimandi*, (fee Modus *Decimandi*,) or *de non decimando*. No modus can be eftablifhed at this day, but by act of parliament. A modus founded upon good confiderations may be in various ways difcharged, and tithes become due in kind: as,

1. Where land is converted to other ufes: fo, when the prefcription is for hay and grafs, fpecially, in fo many acres of land; if the land is converted into a hop-garden or tillage, the prefcription is gone.

2. By the alteration or deftruction of the thing for which the money was paid: as where two fulling-mills were under the fame roof, and turned into a corn-mill; where alfo there was one pair of ftones in a mill, and another pair was added; and where the water-courfe was altered by the owner, and the mill was pulled down and re-edified upon it; in all thefe cafes, it was adjudged that the modus was gone. But where a man was feifed of eight acres of meadow and one of pafture, for the tithes whereof he had paid time out of mind 5*s*. 4*d*. and afterwards the owner built a corn-mill upon the fame; it was adjudged that he fhould pay no tithes for the corn-mill, becaufe the land was difcharged by the modus. 2 Inft. 490.

3. By non-payment of the confideration, or payment of tithes in kind, for fo long a time as to deftroy the poffibility of making proof that fuch cuftom or prefcription was: but an interruption for fome fhort time only, will not difcharge it; efpecially if made by the leffee, to the prejudice of the leffor. Watf. c. 47.

The rule is, that the modus is to be fued for in the ecclefiaftical court, as well as the very tithe; and if it be allowed between the parties, they fhall proceed there; but if the cuftom be denied, it muft be tried at the common law: and if it be found for the cuftom, then a confultation muft go; otherwife the prohibition ftandeth. The like is affirmed, in cafe a jury upon an iffue joined in a prohibition upon a modus decimandi, find a different modus; fince a modus is found, they fhall not have confultation. 2 Inft. 490.

The principal reafon why the courts of common law prohibit the fpiritual court from trying of modufes, is, that whereas every modus is lefs than the real value, the rule of the canon law is, that lefs than the real value fhall not be taken, and that a cuftom to the contrary is void; and that the ecclefiaftical and temporal laws differ in the times of limitation, forty years or under making a good cuftom by the ecclefiaftical laws, whereas by the temporal laws it muft be beyond the time of memory. Gibf. 691.

But the fpiritual courts have commonly allowed and do allow pleas of modus decimandi; and the averment in the prohibition is not that they do take cognizance, but that the plea hath been offered and refufed; which fuppofeth, that if the plea be admitted, the prohibition ought not to go. And accordingly it hath been affirmed by Doderidge and others, that the fpiritual court may as well try the modus, as the right of tithes, and that a prohibition is not to be granted, till the fpiritual court either refufe to admit the plea, or proceed to try it by methods different from the rules of the temporal law, as to the time of limitation, or number of witneffes, or the like. And where lord Coke contended for the contrary doctrine, it was declared by Kelynge and Twifden, that in cafe one libel for a modus decimandi, if the fpiritual court allow the plea, they may try it. Gibf. 691.

But, notwithftanding, it feemeth now to be clearly fettled, that if a modus decimandi be fued for in the ecclefiaftical court, a prohibition lies to ftop the trial of it, if the modus be denied; and the reafon is not upon the account that the fpiritual court wants jurifdiction, but in regard of the notion the temporal law hath of cuftom, different from the fpiritual: and feeing that every modus is due by cuftom, it is the common law only that can determine, what time and ufage with us fhall be fufficient to create fuch cuftom, that is, time beyond all memory to the contrary. Whereas by the fpiritual law, fometimes ten years, fometimes twenty, they will adjudge fufficient to create a cuftom. And prohibitions in fuch cafes are granted, not becaufe the fpiritual court hath not jurifdiction of the matter, but in refpect of the trial which is to be by the temporal law only; and if upon the trial it be found for the modus, the proceedings fhall go on in the fpiritual court; if againft the modus, the prohibition fhall ftand. Watf. c. 56.

If in the trial of a modus, the defendant permits the fpiritual court to proceed to fentence, he is then too late to come for a prohibition; becaufe it is only for defect of trial, and not for defect of jurifdiction: but a man is never too late for a prohibition, where it is for defect of jurifdiction. Bunb. 17. 10 Eaft's Rep. 349.

A bill in equity, in the nature of a bill of peace, will alfo lie to eftablifh a modus, where a fuit has been inftituted for tithes in kind; but a bill to eftablifh a modus or cuftomary payment in lieu of tithes, cannot be fupported, where there has been no attempt to enforce the payment of tithes in kind. 4 Gwill. 1596.

The following modufes have been eftablifhed as good, by decifions in the courts of law: One penny for ancient gardens and orchards. (Bunb. 79.) Seventeen-pence for every cow having a calf, for the tithe of the milk and calf; eleven-pence for the tithe of the milk of a milk cow, milked without a calf; for every heifer, the firft year fhe has a calf, thirteen-pence for the milk and calf—thefe payable at Michaelmas. Eight-pence for every hogfhead of cyder, made of apples grown in the parifh; for hoard apples, one penny; for fire-wood fpent on the farm, one hearth penny; for fruit, herbs, roots, and other garden ftuff, a garden penny; for a colt, one penny;—thefe payable at Eafter. (Bunb. 57.) Eight-pence for a cow, four-pence for an heifer; three fhillings and four-pence, payable at Eafter, for every fcore of fheep fhorn out of the parifh, and fo proportionably for a lefs number than twenty, or for a lefs time than a year, for their wool and lambs. (Bunb. 171.) Two-pence an hogfhead for cyder. (Roll. Abr. 649.) The non-refident occupiers of land in B. and W. to pay on Good Friday, or as foon after as demanded, four-pence an acre for the tithe of hay, and the herbage of pafture lands not ploughed or fown; but, if refident, to pay tithes in kind. (2 P. Wms. 565.) Four-pence an acre for high land, and three-pence an acre for low land. (Ibid.) Twelve-pence for an acre of low meadow, and eight-pence for an acre of high meadow, for tithe of hay. (1 Bro. P. C. 214.) One penny for hay for an ancient meffuage, with the demefne lands thereunto belonging, containing 60 acres, &c. One pound fix fhillings and eight-pence for an ancient tenement, containing 625 acres, for hay, fmall tithes, and Eafter offerings. (Bunb. 161.) Nine cart-loads of logwood, delivered to the rector by the lord of the manor, for himfelf and tenants, in lieu of all tithes. (Bunb. 279.) So of fix pounds *per annum*. (Cro. Eliz. 559.) A halfpenny for each calf, in lieu of calves, payable on Wednefday before Eafter. A fmoak penny for fire-wood. An halfpenny, payable on Shear-day, for the wool of each fheep dying between Candlemas and Shear-day. Four-pence a month, payable on Shear-day, for the tithe wool of every hundred fheep fhorn in the parifh, which were brought in after the 2d day of February.

Three

Three eggs for every cock and hen, duck and drake, payable on Wednesday before Easter, in lieu of tithe eggs, and chickens and ducks hatched in the parish. (Bunb. 307.) Thirty eggs for all tithes of eggs. (1 Roll's Abr. 648. 651. 2 Salk. 656.) The tenth cheese made from the 1st of May until the last of August, in discharge of the tithe of milk. (Cro. Eliz. 609.) An halfpenny for the wool of sheep sold after shearing, and before Michaelmas. (Moore, 911.) One penny *per* head for sheep brought into the parish after Candlemas, and clipt in the parish, in lieu of tithe of wool; three-pence *per* head for sheep in the parish before Candlemas, and carried out before shearing time, though the wool tithe is not then actually due. (1 Anst. 341.) It is a good modus for an innkeeper, that in consideration that he and all, &c. have paid tithe hay and grain growing upon the land belonging to the said inn, and have paid tithe for all their own cattle feeding upon the land, that they have been time, &c. discharged of the tithes of the horses of their guests agisted in the said land, when they travel by the said inn; for some have said that this was but a personal tithe, and others have said that no tithes should be paid for such *agistment* by the common law, without any modus. 9 Vin. Ab. 13.

The things that are titheable are, for the most part, as follow: corn is a predial great tithe, and titheable according to the custom of the place, commonly by the tenth shock, cock, or sheaf. Beans and pease, expended in the house, are subject to no tithes; but if they are gathered to be sold, or to feed hogs, they are titheable, and are in their nature great tithes. Hay is a predial great tithe, and is to be tithed in swathes or cocks, according to the custom of the place. Clover, rape, and woad, are small tithes; heath, furze, and broom are also titheable: but no tithe shall be paid of fern. (2 Inst. 652.) The tithe *agistment* is a small tithe, and due of common right. Wood is a predial tithe, but whether great or small, hath been questioned between the parsons and the vicars; but it has been resolved, that if a vicar be only endowed with the small tithes, and has always had tithe-wood, in such case it shall be accounted a small tithe, otherwise it is to be accounted among the great tithes. Timber fit for building of houses and ships, and comprehending oak, elm, and ash, are exempted from tithes, by 45 Edw. III. c. 3; but timber-trees, cut and corded for fuel, have been adjudged to pay tithes, as well as under-wood; however, no tithe shall be paid for the roots of trees, for wood cut for husbandry or fuel, for hurdles of sheep, for hop-poles, and for making of bricks, and also fruit-trees. When the wood is titheable, it is set out while standing by the tenth acre, pole, or perch; or, when cut down, by the tenth faggot or billet. Of under-woods sold standing, the tithe shall be paid, not by the seller, but by the buyer. The tithe of flax and hemp is a small tithe, and by statute this is charged at 5*s. per* acre. (11 & 12 Will. c. 16.) The tithe of madder is also a small tithe, and charged at 5*s. per* acre, by 31 Geo. II. c. 12. The tithe of hops is predial, and reckoned among small tithes; it is not to be paid till after they are picked, and before they are dried, every tenth measure. Out of gardens is paid tithe of all garden herbs and plants, which are small tithes, and may be demanded in kind: potatoes and turnips are also small tithes, as are likewise tobacco and saffron. However, in lieu of the tithes of gardens, a certain consideration in money is paid, either by custom, or by agreement with the parson. Fruits of trees, as apples, pears, plums, cherries, and the like, are predial tithes, to be paid in kind when they are gathered, unless there is some modus, or rate-tithe, paid in lieu of them. The tenth calf is due to the parson of common right; and if there are seven, he shall have one; if under seven, a halfpenny, or what custom shall direct, for each calf. But in most places, at this day, the custom hath obtained, that if there are five, the parson shall have the value of half a calf, lamb, or other such like; if there are six, he shall have one entire; and shall receive or pay out respectively a proportionable sum for each number under five, or above six. Colts and pigs are titheable in the same manner as calves; and the time of payment of these tithes is when they are so old that they may be weaned. Wool and lamb are generally reckoned mixt small tithes. Milk is a mixt tithe: where tithe-milk is paid in kind, no tithe-cheese is due; and where tithe-cheese is paid in kind, no tithe-milk is due. The tithe of milk is to be paid, not by the tenth part of every meal, but by every tenth meal entire. Deer and conies, being *feræ naturæ*, are not titheable of common right, but by special custom. Of fowls, which are domestic, as geese, hens, and ducks, tithes are to be paid, either by paying the tenth egg, or the tenth of their young, according to custom. It hath been adjudged, that the paying of thirty eggs in Lent, is a good modus for all tithes of eggs. Bees are free of tithes, but the wax and honey are chargeable at the rate of the tenth measure of honey, and the tenth weight of wax. By the books of common law it appears, that some tithe or other is due for a mill. Fish in ponds and private fisheries, and in common rivers, are titheable only by custom. Fish taken in the sea are chargeable by custom as a personal tithe. Personal tithes are regulated by stat. 2 & 3 Edw. VI. c. 13; but personal tithes are now scarcely any where paid in England, unless for mills or fish caught in the sea, and then payable where the party hears divine service, and receives the sacrament.

The manner or form of setting out or payment of tithes, is for the most part governed by the custom of the place. The parson, vicar, impropriator, or farmer, cannot come himself, and set forth his tithes, without the licence and consent of the owner; for if of his own head he shall tithe the corn or hay of any land-holder within his parish, and carry it away, he is a trespasser, and an action will lie against him for it. But every person is bound of common right, to cut down, and set out the tithes of his own lands. And that it may be done faithfully and without fraud, the laws of the church entitle the parson to have notice given him; but by the declaration of the common law, such notice is not necessary. Yet neverthelefs, the common law declareth a custom of tithing without view to be an absurd custom: and by the statute of 2 & 3 Ed. VI. c. 13. it is enacted, that at all times whensoever, and as often as any predial tithes shall be due at the tithing of the same, it shall be lawful to every party to whom any of the said tithes ought to be paid, or his deputy or servant, to view and see their said tithes to be justly and truly set forth and severed from the nine parts.

The care of the tithes, as to waste or spoiling, after severance, rests upon the parson, and not upon the owner of the land. For it seemeth that the parson is at his peril to take notice of the tithes being set out; and so it hath been declared, that although the parishioner ought *de jure* to reap the corn, yet he is not bound to guard the tithes of the parson. Gibs. 689.

But after the tithes are set forth, he may of common right come himself, or his servants, and spread abroad, dry and stack his corn, hay, or the like, in any convenient place or places upon the ground where the same grew, till it be sufficiently weathered and fit to be carried into the barn. But he must not take a longer time for the doing thereof, than what is convenient and necessary; and what shall be deemed a convenient and necessary time, the law doth not nor can define; for the quantity of the corn or hay, and the weather,

ther, in this cafe are to be confidered; and what fhall in this and all other cafes of like nature be faid to be a reafonable and convenient time, is to be determined by the jury, if the point come in iffue triable by a jury; but if it come to be determined upon a demurrer, or other matter of law, the judges of the court where the caufe depends are to refolve the fame. Deg. p. 2. c. 14. Str. 245.

And it fhall be lawful quietly to take and carry the fame away. And if any perfon carry away his corn or hay, or his other predial tithes, before the tithe thereof be fet forth; or willingly withdraw his tithes of the fame, or of fuch other things whereof predial tithes ought to be paid; and if any perfon do ftop or let the parfon, vicar, proprietor, owner, or other their deputies or farmers, to view, take, and carry away their tithes, as is above faid; he fhall forfeit double value, with cofts; to be recovered in the ecclefiaftical court. 2 & 3 Ed. VI. c. 13.

And he may carry his tithes from the ground where they grew, either by the common way, or any fuch way as the owner of the land ufeth to carry away his nine parts. But if there are more ways than one, and the queftion is, which is the right way, this is cognizable in the temporal court. Deg. p. 2. c. 14.

It feems, that if tithes fet forth remain too long upon the land, the owner of the foil may take them damage feafant; but then, if he be fued for them, in order to juftify, he muft fet forth how long they had remained before he took them; and when they fhall be faid to remain too long is triable by the jury. Watf. c. 54.

Or an action upon the cafe will lie againft the parfon for his negligence in this behalf: but no action in fuch cafe will lie, unlefs the parifhioner hath duly fet forth his tithes, and hath alfo given notice to the parfon, that they are fo fet forth. Deg. p. 2. c. 14. L. Raym. 187.

But the occupier of the ground cannot put in his cattle and deftroy the corn or other tithe: for that is to make himfelf a judge, what fhall be deemed a convenient time for taking it away: but the court and jury, upon an action brought, are to determine of the reafonablenefs of the time, and of the recompence to be made for the injury fuftained. L. Raym. 189.

Tithes are recoverable in the fpiritual court by the canon law, and by divers ftatutes, as the ftatute of *circumfpecte agatis*, 13 Edw. I. ft. 4; the ftatute of *articuli cleri*, 9 Edw. II. ft. 1. c. 1. 18 Edw. III. ft. 3. c. 7. 1 Rich II. c. 13, 14. 27 Hen. VIII. cap. 20. 32 Hen. VIII. c. 7. 2 & 3 Edw. VI. c. 13. 7 & 8 Will. III. c. 6. 34. 1 Geo. ft. 2. c. 6. 27 Geo. II. c. 20.

Tithes in London are fubject to particular regulations. By a decree made in 1545, according to the ftatute 37 Hen. VIII. c. 12. it is ordered, that the citizens and inhabitants of London and its liberties, fhall yearly pay their tithes to the parfons, vicars, and curates, after the rate of 16½*d*. for every 10*s*. annual rent, and 2*s*. 9*d*. for every 20*s*. rent, and fo above the rent of 20*s*. by the year, afcending from 10*s*. to 10*s*., according to the faid rate. The wife, children, fervants, or others of their family, taking the rites of the church at Eafter, fhall pay 2*d*. for their four offering days yearly, &c. Notwithftanding the fettlement of this decree, divers prefcriptions for the payment of leffer rates than the parfons might require by it (as to pay 10*s*. for the tithe of a houfe, although its rent was 40*l*. a year, or more) have been gained and allowed. But by 22 & 23 Ch. II. c. 15. after the fire of London, annual certain tithes, or fums of money in lieu of tithes, for fifty-one churches, were appointed to be raifed by affeffments, in the manner prefcribed by the faid act. For the ftipends of the minifters of the fifty new churches, provifion is made by the feveral acts of parliament relating to them, to be raifed from the duties on coals. There are alfo particular ftatutes for particular churches, in London and in other places.

Original and Hiftory of Tithes.—The cuftom of giving or paying tithe is very ancient; in Gen. xiv. 20. Abraham gives Melchifedech the tenth of all the fpoils he had taken from the four kings he had defeated: in Gen. xxviii. 22. Jacob makes a vow at Bethel, to give the tenth of all the riches he fhall gather in that fojourn, to God.

But thefe tithes were free and voluntary, and, befides, differed in divers other refpects from what was afterwards called tithe: what Melchifedech received, was only the tenth of the fpoils, not of Abraham's poffeffions; and this once, not annually; and befide, not as maintenance, which Melchifedech wanted not, but as homage: add, that this was only from one prieft to another; for Abraham had not only a prieft in his loins, but was a prieft himfelf. And as to Jacob, who was alfo a prieft, what he did was the effect of a vow, voluntarily taken, to offer the tenth of all he fhould poffefs; not to any other prieft, but to God himfelf upon an altar.

Tithe was firft legally enjoined by Mofes, Lev. xxvii. 30. Numb. xviii. 21. Deut. xiv. 22. That legiflator obliged the Ifraelites to the payment of feveral kinds of tithes: as,

1. The *firft tithe* מעשר הראשון, which was a tithe of all the fruits given to the Levites: this was not taken till after the oblation called תרומה *terumah*, which was a tenth part allotted to the priefts, had been made.

2. The *fecond tithe* was a tenth part of the nine remaining, after payment of the firft tithe. This tithe was fet apart in each family, and the mafter of the family was obliged to carry it to Jerufalem, and to ufe it there; or, in cafe he could not, he was to redeem it, or convert it into money: in which cafe he was to add a fifth to it, and carry the money to Jerufalem.

3. The *tithe of the tithe*, was the tenth part of all the tithes that had been given to the Levites by the people: for the Levites, after they had got all their tithes of the people, divided the whole into ten parts; and in their turn gave a tithe to the priefts.

4. The *tithe of the third year* was another kind of tithe, not much different from the fecond tithe, excepting that it was lefs troublefome; becaufe they did not carry it to Jerufalem either in kind, or in money, but kept it by them, to be fpent by the Levites, the ftrangers, the fatherlefs, and the widows of the place, Deut. xiv. 28, 29. This was alfo called the *tithe of the poor*, and the *third tithe*; and thefe third years when it was paid, were called the *tithe-years*. Several learned Jews and Chriftians, however, conceived that this was not a diftinct tithe, but the fame as the fecond; fo that, as Mr. Mede apprehends, what was wont in other years to be fpent in feafting, was every third year fpent upon the poor. All thefe tithes are calculated to amount to above one-fixth of the revenue of each perfon.

Thefe matters are all farther explained in the Talmud, in which are two books on tithes; alfo in the book of benedictions, ברכין, in the commentaries of Bartenora, Maimonides, R. Schelomoh Jarrhi, in Scaliger, Amama, Selden, Frifchmuth, Quenfted, Varenius, Hottinger, Sigonius, Cunæus, Godwyn, Leidecker, &c.

Under the new law, tithes are not eftablifhed by Jefus Chrift, or Chriftian difpenfation, as they were under the old law by the miniftry of Mofes; the Chriftian priefts, and the minifters of the altar of the new covenant, lived at firft wholly upon the alms and oblations of the devout.

In after-times, the laity gave a certain proportion of their revenues

revenues to the clergy, but voluntarily, and not out of any conſtraint or obligation: the firſt inſtances we have of this, are in the fourth and fifth centuries.

This gift was called tithe, not that it was really a tenth part of their income, or near ſo much; but only in imitation of the tithes of the old law.

In the following age, the prelates in their councils, in concert with the princes, made an expreſs law to the purpoſe; and obliged the laity to give a full tenth part of their revenues, their fruits, &c. to the eccleſiaſtics.

This the church enjoyed without diſturbance for two or three centuries; but in the eighth century the laity got hold of part of theſe tithes, either by their own authority, or by grants and donations of the princes; and appropriated them to their own uſes.

Some time afterwards they reſtored them, or applied them to the founding of monaſteries or chapters, and the church conſented, at leaſt tacitly, to this reſtitution. In 1179, the third council of Lateran, held under Alexander III. commanded the laymen to reſtore all the tithes they yet held to the church.

In 1215, the fourth council of Lateran, held under Innocent III., moderated the matter a little; and, without ſaying any thing of the tithes which the laity already poſſeſſed, forbad them to appropriate or take any more for the future.

We may obſerve, that, upon the firſt introduction of tithes, though every man was obliged to pay tithes in general, yet he might give them to what prieſts he pleaſed, which were called *arbitrary conſecrations of tithes:* or he might pay them into the hands of the biſhop, who diſtributed among his dioceſan clergy the revenues of the church, which were then in common. But when dioceſes were divided into pariſhes, the tithes of each pariſh were allotted to its own particular miniſter; firſt by common conſent, or the appointments of lords of the manors, and afterwards by the written law of the land. However, arbitrary conſecrations of tithes took place again afterwards, and became in general uſe with us till the time of king John. This was probably owing to the intrigues of the regular clergy, or monks of the Benedictine and other rules, and will account for the number and riches of the monaſteries and religious houſes which were founded in thoſe days, and which were frequently endowed with tithes. But in proceſs of years, the income of the laborious pariſh-prieſts being ſcandalouſly reduced by theſe arbitrary conſecrations of tithes, it was remedied by pope Innocent III. about the year 1200, in a decretal epiſtle, ſent to the archbiſhop of Canterbury, and dated from the palace of Lateran, which enjoined the payment of tithes to the parſons of the reſpective pariſhes, where every man inhabited, agreeably to what was afterwards directed by the ſame pope in other countries. This epiſtle, being reaſonable and juſt, and correſpondent to the ancient law, was allowed of, and became *lex terræ*. This put an effectual ſtop to all the arbitrary conſecrations of tithes; except ſome footſteps which ſtill continue in thoſe *portions of tithes*, which the parſon of one pariſh hath, though rarely, a right to claim in another: for it is now univerſally held that tithes are due, of common right, to the parſon of the pariſh, unleſs there be a ſpecial exemption. This parſon of the pariſh may be either the actual incumbent, or elſe the appropriator of the benefice: appropriations being a method of endowing monaſteries, which ſeems to have been deviſed by the regular clergy, by way of ſubſtitution to arbitrary conſecrations of tithes.

Fa. Paolo, in his "Treatiſe of Beneficiary Matters," is of opinion, that the cuſtom of paying tithes, under the new law, began in France; and affirms, that there are no inſtances of it before the eighth and ninth centuries: but he muſt be miſtaken; for in the ſecond council of Matiſcona, held in 585, it is ſaid expreſsly, that the Chriſtians had a long time kept inviolate that law of God, by which tithe of all their fruits was enjoined to be given to the holy places, &c.

In effect, Origen (Hom. xi. on Numb.) thinks, that the old laws of Moſes, touching the firſt-fruits and tithes, both of cattle and of the fruits of the earth, are not abrogated by the goſpel; but ought to be obſerved on their ancient footing.

The 5th canon of the council of Matiſcona orders tithe to be paid to the miniſters of the church according to the law of God, and the immemorial cuſtom of the Chriſtians, for the uſe of the poor, and the redemption of captives, and that upon penalty of excommunication: which is the firſt penalty we find impoſed on ſuch as would not pay tithe. On which grounds it is that many among the modern clergy hold their tithes to be *jure divino*.

Others, on the contrary, plead, that the recompence to be given church miniſters, is differently ordained by God, according to the differences he has put between his two great diſpenſations, the law and the goſpel: under the law he gave them tithes; under the goſpel, having left all things in his church to charity, and Chriſtian freedom, he has given them only what ſhall be given them freely, and in charity. That the law of tithes is in force under the goſpel, all the Proteſtant divines, except ſome among the Engliſh, deny; for though hire to the labourer be of moral and perpetual right, yet that ſpecial kind of hire, the tenth, can be of no right or neceſſity, but to the ſpecial labour for which God ordained it; that ſpecial labour was the Levitical and ceremonial ſervice of the tabernacle, (Numb. xviii. 21. 31.) which was aboliſhed: the right, therefore, of the ſpecial hire muſt be aboliſhed too.

That tithes were ceremonial, is evident from their not being given to the Levites till they had been firſt offered as an heave-offering to the Lord, ver. 24. 28.

He, then, who by the law brings tithes into the goſpel, brings in likewiſe a ſacrifice, and an altar; without which, tithes, by the law, were unſanctified and polluted, ver. 32. And, therefore, they were never thought of in the firſt Chriſtian times, till ceremonial altars and oblations had been brought back.

The Jews themſelves, ever ſince their temple was deſtroyed, though they have rabbies, and teachers of the law, yet pay no tithes, as having no proper Levites to whom, nor any altar upon which to hallow them; which argues that the Jews themſelves never looked on tithes as moral, but merely ceremonial. Add, that tithes were not allowed to the prieſts and Levites merely for their labour in the tabernacle; but in conſideration of this likewiſe, that they were not allowed to have any other part or inheritance in the land (ver. 20. 24.), and, by that means, for a tenth, loſt a twelfth.

Beſides, it has been urged, that the prieſts and Levites were properly the officers and miniſters of ſtate under God as king of Iſrael; and the Iſraelites paying through their hands one-tenth to him, was agreeable to the cuſtom of almoſt all nations to pay one-tenth to their king. Tithes, therefore, are to be conſidered as an appendage to the theocracy, and it has been ſaid, that it will be extremely difficult to prove, that Chriſtian miniſters have a divine right to demand them, from this circumſtance of a conſtitution peculiar to the Jewiſh nation. As to the original of tithes, judge Blackſtone obſerves, that he will not put the

the title of the clergy to them upon any divine right; though fuch a right certainly commenced, and, as he apprehends, as certainly ceafed, with the Jewifh theocracy; yet an honourable and competent maintenance for the minifters of the gofpel is, undoubtedly, *jure divino*; whatever the particular mode of that maintenance may be. Accordingly, all municipal laws have provided a liberal and decent maintenance for their national priefts or clergy: ours, in particular, have eftablifhed this of tithes, probably in imitation of the Jewifh law; and, perhaps, confidering the degenerate ftate of the world in general, it may be more beneficial to the Englifh clergy to found their title on the law of the land, than upon any divine right whatfoever, unacknowledged and unfupported by temporal fanctions. But, however beneficial this appointment may be to the clergy, it has been complained of as impolitic in a variety of refpects, and peculiarly burdenfome to the ftate.

Mr. Smith obferves (Nature and Caufes of the Wealth of Nations, vol. iii.), that tithes, as well as other fimilar taxes on the produce of the land, are in reality taxes upon the rent, and, under the appearance of equality, are very unequal taxes; a certain portion of the produce being in different fituations, equivalent to a very different portion of the rent. In fome very rich lands the produce is fo great, that the one-half of it is fully fufficient to replace to the farmer his capital employed in cultivation, together with the ordinary profits of farming-ftock in the neighbourhood. The other half, or, what comes to the fame thing, the value of the other half, he could afford to pay as rent to the landlord, if there was no tithe. But if a tenth of the produce is taken from him in the way of tithe, he muft require an abatement of the fifth part of his rent, otherwife he cannot get back his capital with the ordinary profit. In this cafe the rent of the landlord, inftead of amounting to a half, or five-tenths of the whole produce, will amount only to four-tenths of it. In poorer lands, on the contrary, the produce is fometimes fo fmall, and the expence of cultivation fo great, that it requires four-fifths of the whole produce to replace to the farmer his capital with the ordinary profit. In this cafe, though there was no tithe, the rent of the landlord could amount to no more than one-fifth or two-tenths of the whole produce. But if the farmer pays one-tenth of the produce in the way of tithe, he muft require an equal abatement of the rent of the landlord, which will thus be reduced to one-tenth only of the whole produce. Upon the rent of rich lands, the tithe may fometimes be a tax of no more than one-fifth part, or four fhillings in the pound; whereas, upon that of poorer lands, it may fometimes be a tax of one-half, or of ten fhillings in the pound.

It is a great difcouragement to the improvement of land, that a tenth part of the clear produce, without any deduction for the advanced expence of raifing that produce, fhould be alienated from the cultivator of the land to any other perfon whatever. The improvements of the landlord and the cultivation of the farmer are both checked by this unequal tax upon the rent. The one cannot venture to make the moft important, which are generally the moft expenfive improvements; nor the other to raife the moft valuable, which are generally too the moft expenfive crops; when the church, which lays out no part of the expence, is to fhare fo very largely in the profit. When, inftead either of a certain portion of the produce of land, or of the price of a certain portion, a certain fum of money is to be paid in full compenfation for all tax or tithe; the tax becomes, in this cafe, exactly of the fame nature with the land-tax of England. It neither rifes nor falls with the rent of the land. It neither encourages nor difcourages improvement. The tithe in the greater part of thofe parifhes which pay what is called a modus in lieu of all other tithes, is a tax of this kind. Some have propofed, as a better method for raifing a revenue for the clergy, to lay an equivalent tax upon all eftates, cultivated or not cultivated. It is well known, and has often been lamented, even by the clergy themfelves, that this method of raifing a revenue for their fubfiftence, is a continual fource of difpute between the clergy and their parifhioners, and contributes to obftruct the ufefulnefs of their miniftry. In Holland, and fome other Proteftant countries, the civil magiftrates have adopted what fome have thought a better plan, by allowing their minifters a fixed ftipend, paid out of the public funds.

In effect, for the firft three hundred years after Chrift, no mention is made in all ecclefiaftical hiftory of any fuch thing as tithes; though, in that time, altars and oblations had been recalled, and the church had miferably judaized in many other things. The churchmen confeffedly lived all that time on free-will offerings: nor could the defect of paying tithes be owing to this, that there were wanting civil magiftrates to enjoin it; fince Chriftians, having lands, might have given out of them what they pleafed; and the firft Chriftian emperors, who did all things by advice of the bifhops, fupplied what was wanting to the clergy, not out of tithes, which were never propofed, but out of their own imperial revenues.

The firft authority produced, fetting afide the Apoftolical Conftitutions, which few of the patrons of the tithes will infift on, is a provincial fynod at Cullen in 356, where tithes are voted to be God's rent: but before that time, divers other abufes and complaints had got ground, as altars, candles at noon, &c. And thus one complaint begat another; as it is certain that tithes fuppofe altars.

It is not eafy to afcertain the time when tithes were firft introduced into this country. About the year 794, Offa, king of the Mercians, made a law, by which he gave to the church the tithes of all his kingdom, in order, as it is faid, to atone for the death of Ethelbert, king of the Eaft Angles, whom, in the preceding year, he had caufed to be bafely murdered. But that they were paid in England before this time, by way of offering, according to the ancient ufage and decrees of the church, appears from the canons of Egbert, archbifhop of York, about the year 750, and from an epiftle of Boniface, archbifhop of Mentz, written about the fame time to Cuthbert, archbifhop of Canterbury, and from the 17th canon of the general council held for the whole kingdom at Chalchuth, in the year 787. But the law of Offa firft gave the church a civil right to them in this land by way of property and inheritance, and enabled the clergy to recover them as their legal due, by the coercion of the civil power. However, this eftablifhment of Offa reached no farther than to the kingdom of Mercia, over which he reigned; until Ethelwulph, about fixty years after, enlarged it for the whole realm of England. See Revenue.

Judge Blackftone fays, that poffibly tithes in this country were contemporary with the planting of Chriftianity among the Saxons, by Auguftine, the monk, about the end of the fixth century. But the firft mention of them, which he has met with in any written Englifh law, is in a conftitutional decree, made in a fynod held (as he fays) A. D. 786, in which the payment of tithes in general is ftrongly enjoined. This canon or decree, which did not at firft bind the laity, was effectually confirmed by two kingdoms of the heptarchy, in their parlia-

parliamentary conventions of eftates, refpectively confifting of the kings of Mercia and Northumberland, the bifhops, dukes, fenators, and people. This was a few years later than the time when Charlemagne eftablifhed the payment of them in France, A.D. 778, and made the famous divifion of them into four parts; one to maintain the edifice of the church, the fecond to fupport the poor, the third the bifhop, and the fourth the parochial clergy.

The next authentic mention of them is in the Fœdus Edwardi et Guthruni, or the laws agreed upon between king Guthrun, the Dane, and Alfred and his fon Edward the Elder, fucceffive kings of England, about the year 900. This treaty may be found at large in the Anglo-Saxon laws, and it not only enjoins the payment of tithes, but adds a penalty upon non-obfervance; which law is feconded by the laws of Athelftan, cap. i. about the year 930. This, he fays, is as much as can be certainly traced out, with regard to their legal original. Blackft. Com. b. ii. c. iii. fect 2. Burn's Eccl. Law, vol. iii. article *Tithes.*

The cuftom of paying tithes, or of offering a tenth of what a man enjoys, or of what he reaps from it, has not only been practifed under the old and the new law, but we alfo find fomething like it among the heathens.

Xenophon, in the fifth book of the expedition of Cyrus, gives us an infcription upon a column, near the temple of Diana, by which the people were warned to offer the tenth part of their revenues every year to that goddefs.

The Babylonians and Egyptians gave their kings a tenth of their revenues: fee Ariftotle in his Oeconomics, lib. ii. Diodorus Siculus, lib. v. and Strabo, lib. xv.

Afterwards the Romans exacted of the Sicilians a tenth of the corn they reaped; and Appian tells us, that thofe who broke up, or tilled any new grounds, were obliged to carry a tenth of their produce to the treafury.

The Romans offered a tenth of all they took from their enemies to the gods; whence the name of Jupiter Prædator: the Gauls, in like manner, gave a tenth to their god Mars, as we learn in the Commentaries of Cæfar.—And Feftus, de Verb. Signif. affures us, that the ancients ufed to give tithe of every thing to their gods: "Decima quæque veteres diis fuis offerebant."

Authors have been ftrangely perplexed to find the original of a cuftom eftablifhed among fo many people of different manners and religions to give a tenth to their kings, their gods, or their minifters of religion. Grotius takes it to arife hence, that the number ten is the moft known, and the moft common among all nations; by reafon of the number of fingers, which is ten. On this account he thinks it is, that the commandments of God were reduced to ten, for people to retain them with greater eafe; that the philofophers eftablifhed ten categories, &c.

Tithes, *Extra-parochial*, denote tithes which are not within the compafs of any diftinct parifh. By the canon law, thefe were to be difpofed of at the difcretion of the bifhop; but by the law of England, all extra-parochial tithes, as in feveral forefts, belong to the king, and may be granted to whom he pleafes. Accordingly they have been adjudged to him, not only by feveral refolutions of law, but alfo in parliament 18th Edw. I. But extra-parochial waftes and marfh lands, when improved and drained, are by 17th Geo. II. c. 37, to be affeffed to all parochial rates in the parifh next adjoining.

Tithes, *impropriated and appropriated*, called alfo *infeodated tithes*, are thofe alienated to fome temporal or ecclefiaftical lord, united to their fee, and poffeffed as fecular goods. See Appropriation and Impropriation.

By the council of Lateran, held under Alexander III. in 1179, the alienation or infeodation of tithes is prohibited for the future: whence all infeodations made fince that time are generally held, by the canonifts, illegal.

Some attribute the original of thefe impropriated tithes to Charles Martel; and hold him damned for firft giving the revenues of benefices to fecular nobles. But Baronius will have this to be a fable, and refers their origin to the wars in the Holy Land; which is alfo the opinion of Pafquier.

The tribute, it feems, which the Romans impofed on all the provinces of their empire, was a tenth part of all the fruits: hence feveral authors obferve, that the Franks, having conquered the Gauls, and finding the impofition eftablifhed, they kept it on foot, and gave thofe tithes in fee to their foldiers; and this, fay they, was the origin of infeoffed or impropriated or appropriated tithes. But the truth is, they are not fo ancient; nor do we find any mention of them before the reign of Hugh Capet; even the very council of Clermont, held in 1097, as hot as it was in the intereft of the church, does not fay one word of them; which yet would undoubtedly have made loud complaints of fuch an ufurpation, had it been then known.

Tithes, *Portion of*, denotes tithes which the parfon of one parifh hath a right to claim in the parifh of another. Thefe portions, which might probably, at leaft in part, have been owing to the lord of a manor's eftate, extending into diftricts which are now apportioned into diftinct parifhes, are in law fo diftinct from the rectory, that if one who has them purchafes the rectory, the portion is not extinct, but remaineth grantable. The cognizance of thefe belongs, like that of other tithes, to the ecclefiaftical court.

Tithes, *as Obftructions to Agriculture*, the impediments and hindrances which they throw in the way of the progrefs and improvement of the land and its cultivation and amendment. It has been faid to be the inftruction of natural as well as revealed religion, that a portion of our property is due for the maintenance and fupport of the worfhip of God, and that "thofe who ferve at the altar, fhould live by the altar;" but that whether a fpecial proportion of one-tenth of our yearly income from land is due to the clergy by divine and unalterable right, is a point which has been warmly agitated, and much controverted. Under the Jewifh government, it is well known that tithes were directed to be paid by divine appointment. And it has been ftated by bifhop Butler, that under the Mofaic difpenfation, God himfelf affigned to the priefts and Levites, tithes and other poffeffions, and that in thefe poffeffions they had a divine right; a property quite fuperior to all human laws, ecclefiaftical as well as civil. But that every donation to the Chriftian church is that of a human donation, and no more; and therefore cannot give a divine right, but fuch a right only as muft be fubject, in common with all other property, to the regulation of human laws. How far the claim to tithes on the principle of divine right remains ftill eftablifhed in Catholic countries, is not well known; but this fort of claim to tithes has long fince ceafed in this country. And it is remarked by a late writer, that the conduct of Henry VIII. of England, and of Charles I. of Scotland, furnifhes indubitable proofs of their holding a different opinion; as thofe kings, on the abolition of popery, in place of transferring the tithes from the Roman Catholic clergy to their fucceffors in office, affumed the right of granting the greateft part of them to the nobility and great laymen of the time; and in the latter kingdom in particular, with the burden only of reafonable ftipends to the Proteftant clergy. And further, that the grants of

tithes

tithes made by thefe kings and their fucceffors having been either directly and indirectly ratified by parliament, are now to all intents and purpofes the property of the fucceffors of thefe original grantees.

The hiftorian Gibbon has ftated that tithes appear to have been common in all ages. That the firft Chriftian emperor, Conftantine the Great, was very liberal to the church; and in the year 321, publifhed an edict, granting his fubjects full liberty to bequeath any extent of property they chofe to the clergy. But that this, in place of proving that a tenth of the produce was payable to the clergy in the early ages of Chriftianity, fhews, it is thought, the direct contrary;—that the clergy, inftead of having any legal right to tithes, were fupported by charitable or gratuitous donations, and not by affeffments made either under divine or human laws. The period or time, however, when the payment of tithes was eftablifhed by law, is noticed by Montefquieu, in his Spirit of Laws, who ftates that no one queftions but the clergy opened the bible before the time of Charlemagne, and preached the gifts and offerings of the Leviticus. But that he dares fay, before that prince's reign, though the tithes might have been preached up, they were never eftablifhed. And the above hiftorian not only fixes this period, but the reafon of it too, in the manner below: the fynod of Frankfort, held under Charlemagne in the year 794, furnifhed, it is faid, a cogent motive to pay the tithes. A capitulary (ftatute) was made in it, wherein it is faid, that in the laft famine the ears of corn were found to contain no feed, the infernal fpirits having devoured it all; and that thofe fpirits had been heard to reproach the people with not having paid tithes; in confequence of which it was ordained, that all thofe who were feifed of church-lands fhould pay the tithes; and the next confequence was, the obligation extended to all.

The writer of a late agricultural report has ftated, that in this country, tithes, or a tenth of the produce of the fruits of the earth, as well as of cattle, have been fo long eftablifhed, that without afferting their divine right, it may be maintained, that every eftate in the kingdom was once fubject to them, and that every exoneration has arifen either from encroachment, from royal grant on the diffolution of the abbeys, or from impolitic conceffion, by accepting a fpecific fum of money in lieu of them, which, as it does not vary with the times, has left the clergy in many parifhes and diftricts of the kingdom without any adequate provifion. All modufes and compofitions real, are, it is faid, of this nature; but that, as many of thefe are fixed and irrevocable, it muft be left to the difcretion of the patrons, or the interference of the legiflature, to rectify the evils which they have produced, and to fulfil the fcripture maxim, that "the labourer is worthy of his hire."

And that when it is confidered, that the title by which a tenth of the produce of agriculture is appropriated to the church, is far more ancient and better afcertained than that to the other nine parts, it will appear furprifing that the dues of the clergy fhould in general be paid with reluctance, and that lay proprietors, on the contrary, fhould find little difficulty, either in obtaining a fair rent for their lands, or a reafonable compofition for their tithes. Yet the fact is indifputable, it is faid, that incumbents, however moderate in their demands, can feldom advance the compofition for their tithes in any proportion to their value, without expofing themfelves to obloquy and oppofition; or if they take their tithes up, are frequently fubject to expences and inconveniences, befides producing an unfavourable effect on agricultural improvement, to encourage which ought to be no lefs the object of private than of public policy.

That the farmer, when he takes a bargain of the farm kind, which is fubject to tithes, will undoubtedly eftimate the proportion he is to pay to the incumbent, not according to what may have been demanded twenty or thirty years ago, but what it is actually worth at the prefent moment; and that if, by the lenity or forbearance of the rector or vicar of his parifh, he may pay lefs, he ought to confider it as a facrifice that often can be ill afforded, and as laying him under an obligation which he fhould endeavour to return by every means in his power. Were this the cafe, that harmony which the good of religion, and the intereft of the parties require, would, it is thought, be preferved inviolate; and that none but the extortionate incumbent would be the object of deferved enmity and reproach. The writer too has feen many good effects refulting from the proprietors of titheable land becoming perfonally refponfible to the clergyman, and letting their eftates, efpecially when there are no leafes, tithe-free. The advantage is mutual; and it prevents mifunderftandings as well as an oppofition of interefts, which frequently arife, when the tenant and the incumbent are left to themfelves.

That, upon the whole, the rights of the clergy are exacted with extreme moderation, fmall as many of their livings are, in moft parts of this portion of the country. That no very great part of their tithes is taken in kind, in many places; yet that notwithftanding, complaints exift of the hardfhip of tithes from the farmer, and of the unpleafant fituation in which the incumbent is fometimes placed, by trying to raife his humble benefice to two-thirds, or even one-half of its real worth. Hence, it is conceived, there muft be fomething radically wrong in a fyftem, which excites prejudices in the moft liberal and enlightened minds, and which equally militates againft the interefts of religion and thofe of agriculture.

Having thus briefly ftated the nature of the origin of tithes, and the difficulties which attend them, as they refpect the clergyman and farmer, it may be proper and neceffary to inquire to what ufes they were applied, after a legal right to demand them had been obtained, and how far the clergy of the prefent day follow out in practice the principle on which they were originally made payable. It has been remarked by the writer of the work on Modern Agriculture, that in regard to the queftion, whether the tithes in this part of this country be now appropriated to the ufes for which they were at firft paid, whether voluntarily or by compulfion? it will be neceffary to go back to the firft introduction of the tithing fyftem into the country. Bede ftates, it is faid, that about the year 597, Gregory the Great, then pope, fent a monk of the name of Auftin into England, to propagate the gofpel, and to introduce a fyftem of church-government among the people. Auftin having fucceeded to the utmoft of his wifhes, and having received a grant of land from the then king of Kent, befides donations from private individuals, for the fupport of himfelf and the priefts whom he had brought along with him, found it neceffary to apply to the pope for directions in regard to the manner in which thefe royal and private donations fhould be applied. Gregory folved the monk's queftion, by replying, that it was the cuftom of the church to divide fuch voluntary gifts as Chriftians were pleafed to beftow in four parts: to give one to the bifhop, another to the inferior clergy, a third to the poor, and to fet afide the fourth for erecting and upholding churches or places of worfhip. And in confirmation of this, it may be noticed, that Blackftone has remarked, that at the firft eftablifhment of parochial clergy, the tithes of the parifh were diftributed in a fourfold divifion; one for the ufe of the bifhop, another

 for

for maintaining the fabric of the church, a third for the poor, and the fourth to provide for the incumbent: but that when the fees of the bifhops became otherwife amply endowed, the bifhops were prohibited from demanding their ufual fhare of thefe tithes, and the divifion was in three parts only. In confidering the ftate of tithes in the fourteenth century, he likewife takes notice of an act of Richard II. enjoining the bifhops to allocate a proper fum out of the tithes of each diocefe, for the fuftenance of poor parifhioners; remarking, in addition, that it feems the people were frequently fufferers by withholding of thofe alms, for which, among other purpofes, the payment of tithes was originally impofed.

The firft of the above two writers obferves farther, that at what period the fuperior clergy of England firft poffeffed themfelves of the tithes, in defiance of the original deftination, and of many ftatutes made to enforce an application of them to the ufes for which they were firft made payable, it is unneceffary to inquire. It will not be denied, however, it is thought, by the keeneft ftickler for the prerogatives of the church, that in place of one-third of them being applied for the ufe of the officiating clergy, one-third for the fupport of the poor, and the remaining third for the repairs of the churches, which, when the bifhops had acquired land in mortmain, or free alms, fufficient to fupport their dignity, was the deftination originally intended; the tithes payable in England are now very differently, although not, it is faid, fo legally, appropriated. Thofe people, fays the writer, who are moft difpofed to cry out "the church is in danger," when the real or fuppofed rights of the clergy are invaded by the flighteft attempts to alienate the tithes, ought to reflect that the third of all the tithes in England, whether in poffeffion of the church or of the laity, ought to be allowed for the fupport of the poor; that another third ought to be expended in the repairs of the churches, the expence of which is now defrayed, in almoft every inftance, by an affeffment on the parifhioners; and that the laft third ought to fall to the officiating clergymen, many of whom are the moft miferable of the fons of men.

But it is not by any means, it is faid, intended to cenfure the prefent members of the church of England for alienations of rights that took place centuries ago; far lefs to infinuate that that refpectable body have not an unqueftionable right to the value of fuch a proportion of the produce of the foil, as will enable them to fill the ftations in which they are placed with dignity and honour. The object which is here aimed at, is the giving a fuccinct account of the particulars and circumftances in which the payment of tithes in kind operates againft the introduction of improvements in agriculture, and the advancement of religion; and by fhewing the manner in which the alteration in the tithing fyftem was effected in Scotland, to endeavour to point out a way in which the future payment of tithes in England may be arranged, fo as to meet the purpofes, and moft effectually promote the interefts of agriculture, without in the fmalleft degree infringing on the rights of the individuals concerned in paying or receiving them.

There are many different ways in which the payment of tithes in kind operates unfavourably to the general advancement and profperity of the hufbandry of this country. According to the writer of the Effays on rural affairs, it is univerfally confidered as a grievance; there being, it is faid, fcarcely an agricultural furvey of a county, in which it is not ftated as an evil that ought to be removed. And this the author thinks no wonder, as the drawing of tithes in kind, when it is examined with attention, will be found to operate directly, in the ftricteft fenfe of the word, as a tax on induftry; and to be, at the fame time, more vexatious in the mode of collecting than perhaps any tax that has ever been adopted, or had recourfe to, on any occafion.

It is conceived to be a meafure that has an injurious and unfavourable effect on four different defcriptions of fociety, as the farmer, the landholder, the clergyman or impropriator of the tithe, and the public.

As to the firft, or the farmer, he is more or lefs affected, according to the differences of the nature, circumftances, and fituation of the land which he may hold. The intelligent writer on Modern Agriculture, noticed above, confiders it unfortunate, though certainly the cafe, that the payment of tithes in kind operates more againft the fpirited improver than againft the flovenly and indolent; and that tithes, as the law now ftands, cannot be confidered fo much the tenth of the natural produce of the foil, as a tenth of the capital employed by the farmer in its cultivation and improvement. For inftance, if a farmer pays his ploughman ten pounds a year of wages, his labourer ten-pence a day for his labour, or the landlord a hundred pounds of rent, he muft confider himfelf as advancing one-tenth part of thefe fums for the purpofe of promoting the intereft of the tithe-owner, who not only receives annually a fum equivalent to the tenth part of this capital, but that tenth improved to the higheft degree which the unremitting exertion of the tenant is able to effect. Mr. Locke, it is continued, in his Treatife on Civil Government, remarks, that it is labour which puts the greateft part of the value upon land, without which it would fcarcely be worth any thing. That it is to that we owe the greateft part of all its ufeful products; for all that the produce of an acre of wheat is more worth than the produce of an acre of as good land which lies wafte, is the effect of labour. Hence, it is thought, the farmer furnifhes a fund to purchafe the neceffary labour, whereby an acre of land is rendered fo productive as to afford fix, or eight, or ten fhillings yearly of clear revenue to the tithe-owner, which, but for the application of that labour, would have remained unproductive for ever, in fo far at leaft as he was concerned. So much is this the cafe, it is faid, that if a farmer expends one hundred pounds on the purchafe of manure, the improvement and cultivation of his farm, and the payment of the rent; and if the value of the crop, when fold, amounts to one hundred and ten pounds, he is actually a lofer to the extent of five pounds, or what may be the intereft of one hundred pounds for a year. He indeed gets his capital of one hundred pounds returned, but the tithe-owner draws the ten pounds, or rather more, or, which is the fame thing, the value; fo that the farmer has employed his capital to enable the tithe-owner to draw a dividend of 10 *per cent.* on that capital; whereas had he lent it on mortgage, or placed it in the funds, he would have benefited himfelf and his family to the extent of the intereft or the dividend which he, in either of thefe cafes, would have himfelf received. So much, it is faid, for the abfurdity of attempting to improve lands under fuch circumftances. The able writer of the above named Effays likewife, after ftating different ways in which tithes operate againft the tillage or corn-farmer, ftrongly remarks, that in this country, befides commons and waftes, much very fine land is allowed to remain in grafs in a very unproductive ftate, which, with a very little or moderate degree of induftry and outlay of money upon it, might be made to yield abundant crops of corn: and the reafon affigned for this difgraceful ftate of management and want of production, which is fo called, becaufe, were it altered, even the grafs-land might be eafily made twice as productive

tive as it is by a judicious ufe of the plough, is, that the tithe of corn-land is fo very heavy, as deters the farmer from having recourfe to the plough: whereas in Scotland, where the corn-tithe is never drawn in kind, immenfe tracts of country, which thirty years ago were covered with heath, and totally unproductive even of grafs itfelf, are now converted into fertile fields that yield abundant crops of corn and grafs; and which, if the tithe-laws had there exifted, muft, in all probability, have continued unproductive until the end of time. This is a contraft that is very ftriking to every one, it is faid, who travels through thefe parts of that country; and that it brings forward a practical fact, which ought, it is thought, to outweigh a million of fpeculative arguments.

The intelligent author of the Prefent State of Hufbandry in Great Britain ftates, that another grievance to which farmers are fubjected, in the payment of tithes in kind, arifes from the harfh and oppreffive manner in which the payments are fometimes exacted. The nature and extent of this grievance may, it is faid, be learned by a perufal of the extract which is given below, from the fame writer's Agricultural Report of the County of Northampton; where it is ftated, that it has happened, (though, to the credit of the tithe-owners be it faid, the inftances are very few or rare,) where, when the tithes have been let for the purpofe of oppreffion, the tithing-man has been known to exert that authority with which he was invefted; that he has not only taken the tenth fhock of corn, and the tenth cole of hay, but alfo the tenth lamb, pig, hen, egg, &c.; nay, has even gone into the garden, and taken not only the tenth part of the fruit, but likewife the tenth of the produce of the kitchen-garden. Under fuch circumftances as thefe, it may be afked, who is the farmer that would not feel himfelf aggrieved? From this it muft appear, it is thought, obvious, that whether the farmer's intereft or happinefs be confidered, it muft be equally his defire that fome arrangement fhould be effected, whereby the payment of tithes in kind fhould for ever be abolifhed; for, as the writer of the Agricultural Report of the County of Buckingham very juftly, it is faid, obferves, it may be laid down as a propofition, that whatever profit arifes to the cultivator of the foil, by the force of fuperior ingenuity and induftry, fhould be held facred by the church and government. If it be otherwife, it difcourages the improvement of the foil; and thereby the church prevents the future increafe of her tithes, and the government the future increafe of its taxes.

It has been ably contended by the writer of the Effays on rural fubjects, already noticed, that though the tithe-laws are hurtful to the farmer, they are perhaps ftill more fo to the proprietor or land-holder. Whatever checks, it is faid, the induftry of the farmer, muft, in a direct manner, diminifh the income of the landlord; and as the energy of a farmer, when once excited, is well known to augment in proportion to the advances he has made, whatever checks that energy in the bud, occafions in time a diminution of income to the proprietor, much greater than can be eafily conceived. And that, as it is fuppofed the proportion of rent which can be afforded for arable land, increafes with the productivenefs of that land in a much higher degree than in the ratio of the quantum of the crop; whatever tends to render land permanently more productive than before, if no deduction be made from it, tends, at the fame time, to augment the income of the proprietor in a ftill higher degree than that of its produce. But as it is obvious that the tithe operates as a dead bar to the commencement of improvements in agriculture upon any foil of no great degree of fertility, fo as to prevent the beginning of that motion, from the acceleration of which alone the proprietor can hope to derive confiderable increafe of rent; in all cafes his rent is diminifhed in a much higher ratio than one-tenth, as it might feem to do by thofe who take only a flight view of the matter. It is added, that fhould the proprietor of poor lands, feeing the impoffibility of the tenant's improving them, attempt to render thefe more permanently fertile by the outlay of ftock upon them, that he never expected to draw back; but would content himfelf with a reafonable return of intereft on the capital in the name of rent, he would not find the cafe much altered. He fets out, it may be fuppofed, with this principle, that if he can fecure a permanent rent, equal to 5 *per cent.* on the money expended upon them, he will be very well fatisfied with it. Let us fay, then, that twelve bufhels of grain were the neat expence of culture, &c. which, on an average of all forts of corn, was valued at 4*s.* the bufhel; and that he had expended 20*l.* the acre, the intereft of which, at 5 *per cent.*, is 20*s.* or in other words, five bufhels. But that before he can draw this rent free of tithe, the average produce muft be, at leaft, eighteen bufhels, out of which muft be taken one bufhel and nine-tenths, fo that inftead of five, his rent will be reduced to 3 *per cent.* nearly; while the tithe-owner will be entitled to draw nearly 2 *per cent.* for ever, on the capital which the improver had thus expended. It is almoft needlefs to add, it is faid, that under fuch circumftances it is vain to look for a general fpirit of agriculture, either among proprietors or tenants, to both of which defcriptions of perfons the operation of the tithe-laws are, it is contended, highly oppreffive.

And another inftance is ftated of very material importance, in which tithe becomes fingularly pernicious and prejudicial to proprietors of land. The importance of keeping and preferving the whole produce of the ground upon the farm where it was raifed, for the purpofe of making manure, feems, it is faid, to be very generally underftood; as a claufe to that effect is univerfally found inferted in the leafes in every county of England, wherever leafes are granted at all. What punifhment, it is afked, would the proprietors of thefe lands deem adequate to the crime of felling off the whole produce of the farm every tenth year? Yet great as this crime would be, it would not be adequate, in point of damage to them, to the right of drawing tithe in kind from their arable lands; becaufe the farmer who fold the produce would, at leaft, become poffeffed of money to replace, in fome degree, by means of extraneous manures, the lofs he had incurred by the abftraction of the home-dung. Thofe who are entitled to draw the tithe in kind are, in fact, by this means, vefted with a power of enriching themfelves, or their own private property, if they be fo inclined, at the expence of every other proprietor around them. In this point of view, therefore, tithes are fingularly pernicious to proprietors of land. This is unqueftionably an objection to the drawing of tithes in kind that can probably never be well got over by any of thofe who are fo favourable to the prefent tithing fyftem. It ftrikes at the very vitals of all our improvements in hufbandry and rural bufinefs.

Befides, the writer of the work on modern hufbandry confiders that infomuch as the fpirit of improvement is depreffed and checked, the land-holder muft be injured; and that as there are no regulations or laws exifting in this country which have fuch a tendency to impede the introduction of new or improved modes of hufbandry as thofe of exacting the payment of tithes in kind, there are, of courfe, none that operate fo decidedly againft the landed intereft of the kingdom. If, it is faid, the farmer be reftrained from inclofing, draining, purchafing manure, in fhort, from cultivating

tivating and improving his land to the higheft degree, who will deny that the intereft of the owner is affected? And that this is the cafe in a variety of inftances, from the operation of the tithe-laws, is admitted by every one who is perfectly acquainted with the prefent ftate of agriculture in this country.

In refpect to the impropriators of tithes, it may be noticed that, if the interefts of religion and the clergy be confidered, it will be found that the fyftem of taking the tithes in kind is equally productive of bad confequences. It will be difcovered to difturb the harmony of fociety, and to be often the means of creating fuch difputes and divifions between the clergyman and his parifhioners, as renders the religious inftructions of the former of little avail. Among the many inftances which might be mentioned of the teafing and vexatious circumftances of this nature that occur to infringe the harmony which ought to fubfift between the clergyman and his parifhioners, that which is given below, from the Agricultural Report of the County of Hants, may be fufficient. In this cafe the clergyman and the farmer were at variance; and the farmer, determined to be even with the clergyman, gave him notice that he was going to draw a field of turnips on a certain day. The clergyman accordingly fent his team and fervant at the time appointed, when the farmer drew ten turnips, and defired the other to take one of them; faying he fhould not draw any more that day, but would let him know when he did. This fully fhews the vexatioufnefs of the practice of tithing in this manner.

Further, that in a political point of view it is alfo injurious, as tending to loofen that chain of intercourfe and connection which, it is conceived, is of fo much importance to keep united. The intereft of the clergy would likewife be greatly promoted, were they to receive an equitable compenfation for their tithes, in place of drawing them in kind, or of making annual arrangements with the farmers.

But it is the lay proprietors, it is faid, that are the moft blameable in refpect to the rigorous manner in which the tithes are collected. It is faid that clergymen, who act up to the character in which they ftand in the fcale of fociety, (and the moft violent declaimer againft them will not pretend that a very great majority of that refpectable body do not fo act,) very generally facrifice fo great a portion of their juft demands for the fake of peace and quiet, that, if the expence of collecting be added, there is fcarcely any compofition that can be propofed which it would not be for their intereft to accept. Some inftances there no doubt are, where the clergyman, being of a turbulent, avaricious difpofition, lays hold of every advantage, and collects his tithes to the value of the uttermoft farthing: but it ought to be remembered, that a clergyman who does fo, nay, that a clergyman who fubmits to the drudgery of collecting tithes in kind, muft lofe, in the opinion of the parifhioners, a great fhare of that refpectablility of character, which it is his indifpenfable duty to fupport and keep up.

And in relation to the public, the effect which this injudicious regulation has, is equally prejudicial and mifchievous. It comes in, according to the author of Modern Agriculture, for its fhare of the lofs arifing from the effect which the tithe-laws have on the hufbandry of the country, as, by their operation, the quantity of corn that might be cultivated, did not fuch laws exift, is diminifhed to an immenfe degree, and other branches of the art of farming are greatly impeded. Befides, they check induftry, by depreffing the farmer's fpirit, and by preventing the circulation of money that would be expended in improvements, and in the purchafe of the manufactures of the country. Were no fuch laws in force, the proprietors and farmers, in confequence of the fuccefs of the improvements which in that event would be undertaken, would be enabled to purchafe more of the manufactures of the country, pay a greater fhare of the taxes for the fupport of the ftate, and after all, live in a greater ftate of eafe and comfort, than under the exifting circumftances they are able to do. In fhort, it is confidered that the abolition of thefe laws is the only meafure that can be adopted with any probability of fuccefs, at leaft the firft one that ought to be attended to, with a view of again bringing the corn-trade to turn once more in favour of this country. When all thefe various circumftances are conjoined; and when it is further confidered that, except in Spain and Portugal, there is fcarcely a civilized nation in the world where this fyftem of church-flavery is allowed to exift; and that even in Ruffia tithes are abolifhed; it may be reafonably hoped that the period is not far diftant when England will be relieved by legal and conftitutional means, and in confequence of arrangements made on liberal principles, from this almoft Egyptian bondage.

It further likewife appears, from the accounts given by different writers on the fubject of tithes, that they were paid in the latter end and ages of the Romifh church with great reluctance; and even in this country during the reign of Henry VIII. Therefore it is faid, that if, when improvements in agriculture were in their infancy, and at a period too when men's minds were held in flavifh fervitude by the clergy, the payment of tithes in kind could hardly be enforced, can it be fuppofed wonderful, that in thefe enlightened days it fhould be confidered as a grievance? At a period when the principles of religion and of real genuine liberty are better afcertained, and more generally known, than in any former age, it is not furprifing that laws compelling the payment of tithes in kind, laws which originated in edicts iffued by bigotted kings under the influence of defigning priefts, fhould now be found inimical to the beft interefts of the country, and to the happinefs of fo many thoufands. That this is the cafe, every inhabitant of this ifland has ample opportunities of fatisfying himfelf by a perufal of the agricultural reports of the different counties of England and Wales, which have been lately publifhed. And that as thefe reports, after having been circulated among the proprietors of land and farmers for their correction and amendment, ftill contain, in their republication, the fame or fimilar complaints in refpect to the hardfhips which the farmers are fubjected to, and the injury which agriculture fuftains, by the continuance of the payment of tithes in kind, fuch complaints may juftly be deemed the voice of the people proclaimed in a conftitutional way; and as fuch, merit the moft ferious and fpeedy attention of the legiflature and of the clergy.

A few of the injurious effects of the practice of paying tithes in kind have been noticed above, and many more of the hardfhips proceeding from it are recorded in the different agricultural county furveys and other works which have been only flightly touched upon in what has been already faid upon the fubject. And the neceffity of fomething effectual being done, in order to the removal of fo inconvenient and oppreffive a regulation, has been ftrongly fhewn in the writings of the various advocates of the improvements of Britifh hufbandry and farming, as well as by many other able and intelligent writers on matters connected with them, but which, for want of room, cannot be confidered here.

As, therefore, fome reform in the mode of paying tithes in this country muft be admitted to be indifpenfably neceffary,

fary,

fary, it is to be wifhed that the legiflature, efpecially at the prefent time, would devote that attention and confideration to the fubject which its importance and neceffity demand, and the clergy come forward with fuch reafonable propofitions for the adjuftment of the bufinefs as may be fuitable, as by fuch means the matter might, and no doubt would, be foon eafily fettled to the fatisfaction of all the parties concerned.

In the view of affording a proper knowledge of the moft fuitable means of effecting fo important an alteration, the author of the "Prefent State of Hufbandry" in this ifland, gives the following clear account of the beneficial arrangement which took place in refpect to tithes in Scotland, and of the circumftances which led to it. It is ftated, on the authority of Erfkine's "Inftitutes of the Law of Scotland," that the payment of tithes in kind was continued for many ages in that kingdom; and that, owing to the precarioufnefs of the climate, it was attended with more grievous hardfhips than could have taken place in the fouthern part of the ifland. Every Scotch proprietor or farmer, who prefumed, after reaping their corns, to carry off any part of them from the field, until the perfon having right to the tithe had drawn his fhare, were, from the firft eftablifhment of this right, fubject to fevere penalties. The tithe-owner, on the contrary, either from indolence, a defire to opprefs, or with a view of compelling the proprietor or farmer to purchafe his tithes annually at a high price, frequently delayed drawing his fhare until a great part of the crop or produce was rotten. Notwithftanding feveral ftatutes were enacted with a view of checking the oppreffive difpofition which fo often evinced itfelf in the conduct of the clergy in this refpect, yet thefe grievances continued to exift, more or lefs, until the year 1633: when a decree-arbitral, paffed by Charles I. in 1629, for arranging and determining a mode, to be afterwards adopted, for the payment of tithes, was ratified by parliament.

That during the ftruggle for the eftablifhment of this or that form of church-government, great alterations had taken place, both in regard to thofe having right to the tithes, and to the manner in which they were exacted. On the Reformation, the benefices of the church fell to the crown, and were, at different periods, gifted for fervices, or other confiderations; fuch as for fupporting univerfities, hofpitals, &c.; and the perfons obtaining them were denominated lords of erection, and fometimes called by other names. They likewife got, or affumed, the right of nominating officiating clergy on all vacancies. Thefe alienations were, by act of parliament, 1587, put a ftop to; and fuch tithes as had not been previoufly difpofed of, remained with the crown unalienably. The tithes, which were then annexed to the crown, may be valued and leafed by the proprietor of the lands, but cannot be purchafed. The officers of the crown are in ufe to grant leafes of this defcription of tithes for nineteen years, and which are renewed as matters of courfe on paying a reafonable fum on fuch renewal. The fum demanded is regulated by the yearly value of the tithes; fo that a capital equal to between five and fix years' amount of the tithes, laid out at the commencement of the leafe, and improved by compound intereft, is fufficient to produce fuch a fum at the expiry as will obtain renewals to perpetuity.

Some of the clergy remained, it is faid, in poffeffion of their benefices after the Reformation; and the vacancies that happened in fuch benefices were filled up by thofe who affumed the right of prefentation. An act of parliament was foon afterwards paffed, whereby the patrons were deprived of the right of patronage: but in compenfation for this fuppofed hardfhip, it was enacted, that the right of all tithes, fo poffeffed by the clergy, fhould be vefted in thofe who had exercifed the right of patronage. Patrons having acquired tithes in this way, are compelled by law to fell them at nine years' purchafe of the yearly value of the tithes.

The fyftem of tithes and tithing having, however, got into great confufion, in confequence of the various alterations that took place in the government of the church of Scotland, thofe interefted found it neceffary to fubmit their feveral rights and claims to the determination and final award of Charles I., who, on the 2d of September, 1629, pronounced two decrees-arbitral, or judgments, which laid the foundation of that arrangement refpecting tithes, and the payment of the eftablifhed clergy in Scotland, which has been productive of fo many good confequences.

The moft important article in thefe two decrees-arbitral, is that which directs the valuation and fale of tithes; after which, the land-holder is entitled to the whole crop upon payment to the proprietor of the tithes of a yearly rent, or to purchafe them at an eafy rate, fubject to a reafonable provifion to the clergy. The words of this famous decree are, it is faid, that "the rule of all tithes, where they are valued jointly with the ftock, fhall be a fifth part of the conftant yearly rent that is paid for the lands." Another material circumftance in the valuation of tithes in Scotland is, that the rents of mills, thofe arifing from recent improvements, and fome others of lefs importance, are deducted from the grofs amount.

By thefe decrees, which were ratified in parliament in 1633, the proprietors of land not having right to the tithes, were not only found entitled to fue the titular in an action at law to afcertain their value, but, unlefs vefted in the crown, to obtain a purchafe of them on eftablifhed terms, as mentioned above. Thus, ever fince 1633, every landholder in Scotland has had it in his power to acquire right to his own tithes, either by purchafe, or leafe, fo that they fhould be no longer payable in kind. Neverthelefs, thofe who neglect to fue for a valuation may ftill be fubjected to all the inconveniencies of the former law; as under fuch circumftances, thofe having right to the tithes may draw them in the manner commonly practifed in England. The remedy is, however, fo eafy, that he muft be a fool indeed who would fubject himfelf or his tenants to fuch a flavifh fervitude, while he has it in his power, by a fimple application to the fupreme court of the country, to abolifh it for ever.

Some inftances are, however, recollected, where proprietors in the north of Scotland, having a right to the tithes, and being unwilling to forego all the power of haraffing their tenants, which attached itfelf to the ancient feudal barons, ftill continued to draw the tithes for fome time. But they at laft became afhamed of fuch conduct; and there is not now, it is faid, one inftance where tithes are paid in kind, or where the tenants have any concern, either directly or indirectly, with or in the payment of tithes on the north fide of the Tweed. How then, it may be afked, are the Scotch clergy provided for? The anfwer is, it is faid, eafy; the ftipends provided by law for the maintenance of the Scotch clergy are ftill payable out of the tithes. The judges of the court of feffions, who act as commiffioners for the arrangement of tithes, have a right to modify reafonable ftipends to the parochial clergy. And accordingly, in all fuch cafes, where the clergyman can fhew that the parifh is a place of more than ordinary refort, that the cure is burdenfome, or that the neceffaries of life give a high price in that part of the country, or that the

fcanty

fcanty allowance of ftipend in that parifh bears too fmall a proportion to the weight of the charge, provided there are free and unappropriated tithes in the parifh, the commiffioners, on the application of the clergyman, grant an additional ftipend, either in money, but more generally, where practicable, in grain, as being lefs fluctuating in value than money. But that owing to the free tithe in the parifh having been previoufly affigned to the clergyman, fome inftances do occur, where the commiffioners have it not in their power to augment his ftipend, although it be too fmall for the decent maintenance of a numerous family. In all fuch cafes it would, it is thought, be highly proper to apply part of the bifhop's tithes, fuch as are now payable to the crown, to the purpofe of rendering the fituation of thefe clergymen, who are fo unfortunately fituated, more decent and refpectable.

In order to the introduction of a fuitable arrangement in regard to tithes in this part of the country, it is remarked, that the queftion has been for fome time paft very popular, and much agitated; and that many difficulties have been ftarted, apparently for the purpofe of rendering it more perplexed and complicated than it is in reality. Holding it as a facred and inviolable principle, that tithes, as now payable in England, were formerly appropriated for particular purpofes, and that although in many inftances alienations were made at different periods; yet that as thefe are exprefsly or virtually confirmed by thofe laws which protect national and individual property; therefore tithes, as now payable in the fouthern part of the ifland, are payable in conformity to the laws of the country. This being granted, no man who has a regard for juftice, who venerates the conftitution, or who would not wifh to fee the rights of property invaded, but muft be fatisfied, that if the prefent mode of paying tithes is abolifhed, the clergy and the lay-proprietors of tithes are, in law, juftice, and equity, entitled to an equivalent. What that equivalent ought to be, and in what manner afcertained, becomes the queftion. It is obferved, that it is not by appeals to quarter-feffions, nor by fpecial acts of parliament for this or that particular diocefe or parifh, that this great national queftion can be determined with propriety: it is only by a fubmiffion of all rights and claims of both parties to the determination of fome one refpectable individual, that the matter can be amicably or equitably decided. And it is thought, that the moft proper individual to be made choice of is the fovereign, or perfon holding the government of the country.

The clergy, it is faid, need not be afraid to appeal to fuch an arbiter, as in the courfe of a great length of time there has been no inftance of any degree of infringement of or upon their rights. The land-holders and lay tithe-owners may keep their minds at eafe, as though the moft facred regard for religion has been evinced, yet it has been divefted of fuperftition or bigotry. If, it is continued, Charles I. during the anarchy of church-government that prevailed in his time, found no difficulty in paffing a decree in a fimilar cafe, which, having received the fanction of parliament as a matter of courfe, laid the foundation for a juft and equitable arrangement of the tithes, the bufinefs may unqueftionably be accomplifhed with much lefs difficulty at the prefent period. The probable confequences of fuch a fubmiffion would, it is thought, be, that the arbiter would no doubt appoint commiffioners to examine and afcertain the yearly value of all the landed property in England, the produce of which is fubject to the payment of tithes. Were the yearly value of the lands afcertained by a corn-rent in place of one in money, and which, it is fuppofed, might be eafily done by taking the average price of corn for the feven or ten years or more laft paft, with the exception, however, of 1795, and fome other fcarce and dear years, the clergy could fuftain no lofs, nor would after valuations in confequence of the depreciation in the value of money, be rendered neceffary.

This being done, a fifth, a fixth, or any other given proportion of the free rent, after the payment of parliamentary taxes affecting land, would be declared due to the tithe-owner in lieu of the payment of tithes in kind. One claufe of the decree would probably, it is thought, be, to compel every lay-owner of tithes to fell his right to the land-holder, at a fair and equitable, but regulated price; and another would moft likely be, declaring the clergy entitled for ever to a fifth or fixth, or fome other determinate proportion of the prefent real free rent of all titheable lands, to which they may have right, and fubjecting the proprietors to the regular payment thereof. Thus at once would, it is faid, a load which has for many ages preffed down the fpirit of the Englifh farmers, be removed, and that while all ranks and degrees muft applaud the equity and the propriety of the arrangement, a fpirit for agricultural improvements would evince itfelf fuperior, it is thought, to any of which the records of this country make mention.

It is fuppofed that this mode is the lefs exceptionable, as it is almoft fimilar to that adopted when acts of parliament are paffed for enclofing particular parifhes. At the firft meeting of the commiffioners named in fuch acts, they direct, that all having intereft may deliver in their claims, and the rights or grounds on which they claim, againft a certain day. Thofe being afterwards examined by the commiffioners, who are neither more nor lefs than arbiters appointed by the legiflature, their decifion conftitutes the law in regard to the right by which the individual proprietors hold the lands, which by the arbiter's award is affigned to them. In place, therefore, of multiplying acts of parliament refpecting the adjuftment of tithes *ad infinitum*, one only, and that a very fhort one, feems neceffary, authorizing the governing perfon to arbitrate between the owners of the tithes and the land-holders; and whofe award, like that of the commiffioners appointed under acts of parliament for enclofures, fhould be final, and have the effect of law. Having thus laid down the general principle, it will not be expected that any attempt will be made to combat the little difficulties that may be ftarted againft the practicability of carrying the meafures founded thereon into effect. Thefe the wifdom of the arbitrator will be fully fufficient to obviate and direct. One thing is certain, it is fuppofed, namely, that a decree-arbitral or judgment, pronounced by fuch high authority, and founded on thefe principles, would give univerfal fatisfaction to every party concerned.

On a matter which is fo very interefting and important to the Englifh land-holder and farmer, it will be neceffary and ufeful to bring to the inquirer's notice and attention a few of the different other modes and plans which have been fuggefted at different times by different writers for effecting the bufinefs and adjuftment of the matter of tithes.

The intelligent writer of the Effays ou rural affairs has fuppofed, that the tithes of or in England and Wales fhould be converted, fo as to make a payment in money be univerfally received in lieu of the payments in kind that are at prefent exigeable; but under fuch modifications as to prevent the poffibility of thofe who are entitled to draw the tithes from fuffering by the depreciation in the value of money, which we have feen for a long time paft has been going on in a regular progreffion; and which may be expected to continue; or may, perhaps, as at this time in a neighbouring country, be funk almoft to nothing by fome political fhock

that

that cannot at prefent be forefeen. With thefe views, might not, it is afked, a law be obtained, authorizing the valuation of tithes, in every cafe where either of the parties interefted in it fhould fo incline? This might be done, it is faid, by a fummons raifed againft all the parties concerned, either before the fheriff of the county where the property lay, or before any other judge that fhould be thought more proper for executing the office; who, after hearing the parties, fhould proceed to make a legal inqueft to obtain a clear proof what had been the amount of the tithes, actually paid and drawn, for five, ten, fifteen, or twenty years laft paft, as fhould be judged the moft proper, out of the feveral lands in queftion; fpecifying diftinctly the quantity of each denomination of grain, or other titheable produce. But as it may eafily be forefeen, that it would be a matter of great difficulty, in many cafes, to get at thefe facts with precifion, might it not be put in the power of the judge, if the parties could not agree as to that particular, to appoint two or more perfons of good character in the neighbourhood, to gather up the tithes in kind themfelves, fairly and honeftly, for five years next to come, without favour to any perfon; the amount to be delivered to the perfons having a right to receive them, after the quantities had been refpectively afcertained, fo as to admit of the collectors making up an account of the whole, upon oath, to be delivered to the judge; who, from that account fo made up, fhould caufe an average to be ftruck of the quantities of each particular article; which average quantities, after deducting a juft proportion for the expence of collecting, and taxes affecting the tithe, fhould be declared by him to be the legal tithe exigeable from the land in queftion in all time to come? But as there is room to fufpect that the money prices of corn, wool, &c. of different denominations, may rife to be much higher in fome future period than it was at that time; inftead of then afcertaining the price of thefe articles, let it be declared, that the quantities of grain and other articles refulting from the averages refpectively, are payable out of the refpective lands, leaving the average prices of fuch grain, &c. to be fettled and afcertained each year, as is fpecified below; declaring that the money which fhall arife from the average prices thus afcertained, fhould be in lieu of the whole tithe that could be exacted each year; the time of payment too to be fpecified. And, in order to prevent all difputes as to the average prices of thefe articles in time to come, let the fheriff of each county be authorized and required to make an inqueft at a certain period each year of what has been the actual ready money felling price of corn of the preceding year's crop, from the time the crops were reaped till this time, and of wool, as well as of all other titheable articles for the former year, by examining witneffes before a jury to be appointed for that purpofe, which prices, after being thus afcertained, fhould be publifhed and declared to be thofe by which the quantity of tithe-corn of each particular defcription, and other titheable articles, contained in any degree of valuation, fhould be payable for the crop of the preceding year. Thus, it is faid, would the tithe-owner be entitled to receive payment of his tithes, without any extraordinary expence or trouble, or unjuft deduction or difpute whatever: the farmer would be allowed to carry on his operations uncramped by thofe galling reftraints which the tithe-laws at prefent perpetually throw in his way: the proprietor would be at liberty to apply fuch part of his capital as he might incline, towards promoting agricultural improvements, with a reafonable profpect of being benefited by his exertion: and the public would become poffeffed of a quantity of furplus produce of land, which it can have no profpect of ever otherwife enjoying, which would be the means of diffufing a perpetual plenty through every corner of the land.

Mr. Pitt too, in his account of the agriculture of a midland diftrict, fuggefts, that the mode or fcheme to be adopted as the outline of an exchange of tithes, fhould be for land, in the manner directed below, as land will always bear a value proportionate to that of its produce, and that even the price or value of labour is meafured by the fame ftandard. This is, that an act of parliament fhould appoint, in every diocefe, an equal number of the moft refpectable clergy and country gentlemen commiffioners and truftees, with a power of nominating furveyors, to value all the tithes belonging either to the clergy or laity within the diocefe; and that this act fhould be let give an option to the land-owners of purchafing their refpective tithes, at the valuation fixed on them by fuch commiffioners and furveyors; the money arifing from fuch redemption being invefted in the funds, or other more proper fecurities, until a fuitable opportunity fhould offer of laying it out in the purchafe of land; and that, where the land-owners fhould refufe to purchafe fuch tithes, the commiffioners fhould have the power of mortgaging them, or of taking up money on their fecurity, to be invefted in the fame way with that arifing from the tithes actually fold; or after a given time, the truftees might be impowered to fet apart an allotment of the land of thofe owners who refufe to purchafe, and which, if conveniently fituated for the former tithe-owner, might be fo applied, otherwife fold; and the money arifing from fuch fale invefted as before, until it could be laid out in the purchafe of land. The execution of fome fuch plan or mode as this, would, it is fuppofed, be attended with infinitely lefs trouble and expence than now incurred by the annual valuation of tithes; as, fhould fuch a regulation be once effected, the bufinefs would be fettled for ever: while under the prefent fyftem, the furveyor or valuer's bufinefs is never done, but continued from year to year; and, if it fhould remain, will be from generation to generation. An equivalent in land muft certainly, it is thought, be a more folid property than tithes. Land too may be improved in any degree by good management and induftry: tithes fluctuate or fink in value at the will of the cultivator. Some fuch commutation as this may, it is thought, be readily and eafily effected, and that all parties would be pleafed with the alteration.

The concluding remarks and fuggeftions on this greatly interefting matter, are the refult of the inveftigations and enquiries of two clergymen, who have been lately engaged in drawing up accounts of the ftate of the agriculture of two large counties of the kingdom; thofe of Hereford and Berks. The former ftates, that of the various modes propofed to effect the defirable object of a general commutation of tithes, that of a corn-rent feems to have met lefs objection than moft others which have been yet propofed; ftill, however, nothing has been ferioufly attempted, and the matter remains open to further difcuffion. It has not, perhaps, it is faid, occurred to every one, that tithes, in their prefent form, have a direct and powerful tendency towards increafing the prices of wheat and of every other grain, by creating obftacles to its culture, and thus diminifhing the quantity which would otherwife be grown. But that the fingle fact, that an acre of land under the culture of wheat, is liable to a deduction on account of tithes, in nearly a ten-fold proportion to that of an acre of land grazed by cattle or fheep, is furely fufficient evidence that tithes muft operate unfavourably to the culture of grain, and confequently to its abundance and cheapnefs. How defirable then is, it is faid, fuch a commutation as would render this payment equally heavy on every acre of land, according to its value, whether it it be applied to the culture of grain, or to the production of animal food. Under this impreffion it is here propofed, that in lieu of tithe, a tax be impofed, on the principle of an equal land-tax, upon every eftate, according to its value, for the fupport of the clergy. The wifdom of parliament would, it is fuppofed, eafily determine how many fhillings in every pound of rent would be equal to the revenues to which the clergy have a claim, and that the meafure would be greatly facilitated by the inveftigations occafioned by the income or property act lately in force. The tenant might be made liable in the firft inftance to the payment of the duty propofed as a fubftitute for the tithe, but in cafe of his defalcation, the landlord might be made ultimately refponfible.

In this mode of arrangement, the clergy, it is fuppofed, would receive what is their due, a full equivalent for tithes in its prefent ftate; the fecurity would ftill attach to the foil itfelf, and their revenues would ftill increafe with the increafe of the value of land and its produce. Encouragement would thus be afforded to increafe the culture of grain; the induftrious farmer would not have to contribute more than is juft proportion; the tithe-owners too would obtain the fair value of their property; the clergy of the church of England would acquire that degree of refpect and efteem to which few will deny that they are, in the aggregate, entitled; and, above all, they would be enabled to fulfil the valuable purpofe of their inftitution: while at prefent, the clergyman who demands but the fair value of his property, becomes hated, and often infulted; and, to ufe the ftrong language of fome, his "integrity becomes fufpected; his every action is feen through a falfe medium; and the paftor is loft in the collector of tithes!" If it fhould be objected, that under this or any other mode of commutation, the farmer would not eventually be benefited, becaufe the landlord would then receive what is now paid to the tithe-owner; and that the farmer has no juft ground of complaint, as he engaged his farm fubject to the deduction or payment of tithes: let it be underftood that the intereft of the community at large, not of any one branch of it, is here contended for.

The writer maintains, that the great object of a commutation of tithes, beyond a religious view of it, is the relief of the corn-field, and not the farmer. Perhaps, it is faid, if the fubject be well confidered, the farmer would gain lefs in a commutation than any one clafs of fociety. Tithes, in their prefent form, may check his improvements, may contract his fyftem of farming and his capital, may harafs his mind, and lead to perfonal animofities and expenfive litigations; but probably his mere payments in lieu of tithe would, on the whole, be as heavy under any commutation, as thofe to which he is now liable. The public, it is faid, muft give that price for grain, at which it will anfwer the farmer to raife it; and that fuppofing it poffible that the farmers throughout the ifland were to engage in a combination, to convert fo much of their prefent tillage into pafture, as would leave only half the ufual number of acres under corn, the inevitable confequence would be, that grain would fell at an enormous price, and the farmer would receive that increafed price, at a time when his expences were diminifhed in the proportion of his tillage. Thus the confumer, which is the public, and not the farmer, would fuffer; and if a tax, fuch as tithes, added to the increafed price of timber, iron-work, and labour, fhould induce the farmer gradually but materially to contract his tillage, there could be no hope that grain would be fold during any confiderable period at a moderate price; nor could there be an adequate fupply for the wants of the country, without the aid of large importations, which are always precarious, and fometimes impoffible: and as animal food invariably rifes in value with the increafed value of grain, the farmer might thus be enriched at the expence of every other branch of the community. The plan or mode here propofed for a commutation would, it is prefumed, counteract or prevent thefe ferious evils; encouragement would be given to an extended culture of grain; and a new motive to induftry and exertion would be found in the confideration, that the moft indolent farmer muft contribute an equal fum with the moft active and fuccefsful cultivator.

The latter of thefe clergymen thinks, that in regard to tithes in fecular hands, though the church may fuffer in the amount of its income, it derives a confiderable degree of fecurity for what it ftill poffeffes, from this very circumftance; and confequently only touches on the fubject fo far as to propofe that they fhould be commuted for land, according to their value. To this no reafonable objection is feen, or any infuperable difficulty, if a legiflative plan were once chalked out for its accomplifhment. But as for tithes in the hands of the clergy, whether great or fmall, it is fuppofed they might be beneficially commuted, by firft taking their fair valuation by two competent fworn commiffioners, one of whom fhould be named by the incumbent, and thus fixing a fum to be paid according to the combined prices of *corn*, *meat*, as mutton and beef, and *malt*, to be taken on the average of the feven preceding years, and to vary with the times every fubfequent feven years. And in order to prevent any thing perfonal between the incumbent and his parifhioners, except in the duties of his vocation, the overfeers and churchwardens to be made the refponfible agents in collecting and paying the fum to be raifed, with certain provifoes and fecurities againft mifapplication and lofs. A corn-rent alone is, it is faid, found to be an inadequate mode of commutation; but that taking the three great articles of life in every family, *bread*, *meat*, and *malt*, the clergyman would be fecure from injury, and the farmer, paying only in proportion to the value of his produce, would have no reafon to complain. It is to be obferved, however, that it is wifhed for the laws to act uniformly for the benefit and fecurity of the parochial minifter, without fubjecting him to the neceffity of coming forward in a perfonal and partial light. By thefe means, what he might lofe in the influence of fear, would, it is thought, be amply compenfated for on the principle of love; without which he can feldom be happy himfelf, or difcharge the duties of his facred office with effect and fatisfaction.

Where lands have been exonerated from tithes by an act of parliament, and an allotment made in land in lieu of them, even where an adequate value has been given, which in no inftance that has fallen under the writer's notice is, it is faid, really the cafe, it is throwing too much land into mortmain, it is fubjecting the incumbent to all the cares and incumbrances of landed property, and driving him to the neceffity of becoming a farmer, for which he is often ill qualified, or of letting lands, according to the exifting laws, on fuch conditions, that improvement muft be checked, and induftry languifh.

In order, however, to obviate fome of the evils refulting from a practice that has already, it is faid, become too general, it is propofed, that after having referved a fufficient glebe, which in every inftance fhould be done, with a due regard to the value of the living, the incumbent fhould be allowed to leafe the remainder, at the full value, with the confent of the patron and the bifhop, on a running leafe, determinable every three or feven years, at the option of either of the two principal contracting parties. A new incumbent

cumbent would thus, it is fuppofed, without waiting too long, have an opportunity of improving his property, if he thought it capable of being fo; and the tenant, having a fair profpect of occupying the land under any change, would feel himfelf equally fafe in making improvements, as if he rented of a layman. All dilapidations and repairs on the farm, however, fhould fall on the tenant; who ought not only to be bound in proper covenants, but be obliged to give due fecurity for their performance, as well as the payment of the rent.

Or, to land belonging to the clergy, the *corn*, *meat*, and *malt* rents might, it is faid, be applied as well as to tithes with leafes for twenty-one years certain, which would probably be the moft eligible mode, as it would give uniformity to the plan of clerical provifion, and would always afford an income according to the times.

Upon the whole confideration of the fubject, there cannot be any doubt but that great advantage and improvement would arife to agriculture, from fome meafure of this nature being had recourfe to and carried into execution; and though the farmer might not perhaps, on the whole, experience any great diminution in the quantity of money which he would have to pay, he would be wholly freed from the anxiety, trouble, and vexation, which conftantly attend the taking of tithes in kind, and at the fame time, which is much more important and material, be left at full liberty to exert his utmoft endeavours to promote all kinds of improvements, which the nature of his farm may with propriety admit. And in this way, and by fuch means, the art of agriculture would be carried forward to fuch a ftate of improvement and perfection as cannot be eafily conceived. Befides, fuch a meafure might have a confiderable effect in promoting the inclofure and cultivation of much land ftill in the difgraceful fituation of wafte, all which are defirable objects on various accounts in the prefent ftate of the country.

TITHE-*Rate*. See RATE-*Tithe*.

TITHES, *Subtraction of*. See SUBTRACTION.

TITHING, DECENNA, or *Decury*, a number or company of ten men, with their families, knit together in a kind of fociety, and all bound to the king, for the peaceable behaviour of each other.

Anciently no man was fuffered to abide in England above forty days, unlefs he were enrolled in fome tithing.—One of the principal inhabitants of the tithing is annually appointed to prefide over the reft, being called the *tithing-man*, the head-borough, and in fome countries the borfholder, or borough's elder, being fuppofed the difcreeteft man in the borough, town, or tithing. The diftribution of England into tithings and hundreds is owing to king Alfred. See DECINERS, FRANK-*Pledge*, and FRIBURGH.

TITHONIA, in *Botany*, was fo named by profeffor Desfontaines, in allufion to the glowing light-orange tint of its flowers, which the French call *couleur aurore*. The fabled favourite of Aurora, Tithonus, is therefore here meant to be commemorated. The allufion would have been ftill more happy, had the flower been one of the everlafting kind.—Desfont. Ann. du Muf. v. 1. 49. Willd. Sp. Pl. v. 3. 2246. Juff. 189. Lamarck Illuftr. t. 708. Poiret in Lam. Dict. v. 7. 690.—Clafs and order, *Syngenefia Polygamia-fruftranea*. Nat. Ord. *Compofitæ oppofitifoliæ*, Linn. *Corymbiferæ*, Juff.

Gen. Ch. *Common Calyx* cylindrical, of a double row of ovate-oblong, acute, flat, nearly equal, erect fcales. *Cor.* compound, radiated. Florets of the difk numerous, all perfect, level-topped, tubular; limb five-toothed; tube inflated near the bafe. Thofe of the radius female but abortive, about twelve; limb elliptic-lanceolate, acute, entire, horizontal, flat. *Stam.* in the difk only, Filaments five, capillary, fhorter than the tube; anthers united into a cylinder of the fame length. *Pift.* in the difk, Germen oblong, flender; ftyle thread-fhaped, the length of the partial corolla; ftigmas two, recurved, obtufe; in the radius, germen very fmall; ftyle fcarcely any. *Peric.* none, except the unchanged calyx. *Seeds* in the florets of the difk only, folitary, ovate, fmooth; their crown of five fhort, acute, erect, membranous fcales. *Recept.* convex, chaffy, its fcales concave, acute, rather taller than the feeds.

Eff. Ch. Receptacle chaffy, convex. Seed-crown of five chaffy fcales. Calyx cylindrical; its fcales equal, converging, in two rows. Florets of the difk inflated at the bafe; thofe of the radius elliptic-lanceolate.

1. T. *tagetiflora*. Marigold Tithonia. Desfont. as above, t. 4. Willd. n. 1.—Native of Vera Cruz. *Root* annual. *Stem* erect, alternately branched, leafy, a foot high. *Leaves* alternate, on long ftalks, downy, crenate, reticulated with veins, triple-ribbed; the lower ones deeply three-lobed; upper undivided, ovate, or fomewhat heart-fhaped, acute. *Flowers* on long folitary ftalks, at the end of each branch, orange-coloured, about the fize of a French marigold.

TITHOREA, in *Ancient Geography*, a town of Greece, in the Phocide, on mount Parnaffus, 80 ftadia from Delphi. This place was famous for its facred grove dedicated to Minerva, a temple with the ftatue of this goddefs, and the tomb of Antiopê and Phocus. The temple of Efculapius Archagetes was fituated 70 ftadia from Tithorea. The inclofure which contained the chapel of Ifis was 40 ftadia farther diftant than the temple of Efculapius.

TITHRASUS, a town of Africa, in Libya, bordered by a river of the fame name.

TITHRONIUM, a town of Greece, in the Phocide, in which was a grove facred to Apollo, with fome altars and a temple, but without a ftatue. This town was fituated 15 ftadia from Amphicea and 20 from Drymea, near the river Cephiffus. Paufanias.

TITHYMALOIDES, in *Botany*, fo called from its affinity to *Tithymalus*, the *Euphorbia* of modern botanifts, differs from that indeed merely in having the calyx gibbous on one fide at the bafe.—Tourn. Inft. 654.—Two or three Weft Indian fpecies of *Euphorbia* come under this defcription.

TITHYMALUS, τιθυμαλος of Diofcorides, fuppofed to be derived from τιτθος, *the breaft*, in allufion to the milkinefs of the plant. Tourn. t. 18. See EUPHORBIA.

TITI, SANTI DI, in *Biography*, was born at Citta S. Sepolcro, in the Florentine ftate, in 1538. He firft acquired a knowledge of painting under the tuition of A. Bronzino, and afterwards of Bandinelli, but owes the greater part of his fame to his ftudies at Rome, where he long refided, and from whence, as Lanzi obferves, he carried back to his native country a graceful and fcientific ftyle of art, not fupported by much ideal beauty, but chiefly characterized by the truth and frefhnefs of nature; and in expreffion he had few fuperiors in any fchool, none in his own. He adorned his pictures with pieces of architecture, which fcience he in a meafure profeffed, and by its means gave great relief to his figures, and increafed the dignity and beauty of his compofitions. His principal works are, the Supper at Emmaus, painted for the church of St. Croce, at Florence; the Refurrection of Lazarus, in the Duomo di Volterra; and the Defcent of the Holy Spirit, painted for a convent at Citta di Caftello. He died at Florence in 1603, aged 65, leaving a fon, *Tiberio Titi*, born at Florence in 1578, who followed the fame art with his father, but not with equal fuccefs. In general he painted ſmall portraits very ſkilfully, and made drawings in black-lead; of which there is a large collection in the Florentine gallery, made originally for the cardinal Leopold de Medici. He died in 1637.

TITIAN, the name by which we are acquainted with that great maſter, who is univerſally regarded as the head of the Venetian ſchool of painting, Tiziano Vecelli da Cadore. This juſtly diſtinguiſhed artiſt was born of noble parents at the caſtle of Cadore, in Friuli, in 1480, according to Vaſari and Sandrart; though Ridolfi, and others after him, place the date of his birth three years earlier, in 1477: but as Giorgione was confeſſedly older than he, and was born in 1478, we have preferred the authority of the former, as moſt likely to be correct. The education he received, firſt from Sebaſtiano Zuccati of Trevigi, and afterwards from Giovanni Bellini at Venice, rendered him a diligent and ſubtle obſerver of nature. His early works exhibit the greateſt correctneſs of imitation, but in a laboured and minute ſtyle, with a finiſh ſo highly wrought, that when, at a maturer age, he painted a picture for Ferrara of the tribute-money, in competition with Albert Durer, he excelled in nicety of pencilling that maſter of minuteneſs; with this difference, that his finiſh did not, like the German's, obtrude itſelf, and impede the general effect, but obtained grandeur by diſtance. This picture, to which he made no companion, as he ſoon after changed his ſtyle, now adorns the gallery of Dreſden, and remains a proof of the ſenſe this great artiſt entertained of the falſity of that taſte, which ſeeks for gratification in mere finiſh, and which he deſerted for the adoption of a ſtyle conveying general character inſtead of identity. It was from the better taſte of his fellow pupil, Giorgione, that Titian imbibed a more exalted view of art, and was induced to quit the meaner and more confined ſtyle with which he commenced his practice; and ſome portraits which he painted about this time are ſcarcely to be diſtinguiſhed from thoſe of Giorgione himſelf. But he ſeems to have found it not exactly to his mind, and ſoon diſcovered a variety of ſtyle more congenial to his own feelings; leſs ſoftened, and perhaps leſs grand, but more agreeable; a ſtyle which delights the ſpectator leſs by novelty of effect, than by the exactneſs of truth. His firſt work in this ſtyle, which is entirely his own, and may be denominated Tizianeſque, is the archangel Raphael leading Tobiah, painted in his thirtieth year for the ſacriſty of S. Marciale; and ſoon after he painted the Preſentation of the Virgin, at the Carita; one of the richeſt and moſt numerous of his compoſitions remaining.

When only eighteen years of age, he had painted a portrait of the head of the Barbarigo family, which excited univerſal admiration; and he was ſoon afterwards employed, in concert, or rather in rivalry, with Giorgione, to paint one of the fronts of the Fondaco de Tedeſchi, when unhappily the jealouſy already ſubſiſting between theſe great artiſts was ſtrengthened by the ſuperior encomiums beſtowed upon Titian. On the death of Giorgione in 1511, Titian ſucceeded him in ſeveral important commiſſions, and continuing to increaſe in renown, was invited to the court of Alfonſo, duke of Ferrara, for whom he painted the celebrated picture of Bacchus and Ariadne, now in England. Here he became acquainted with the poet Arioſto, whoſe portrait he painted, and in return was celebrated by him in his Orlando Furioſo.

About 1523, Titian produced the work which, above all others, elevates him in the ſcale of merit among painters; *viz.* the celebrated picture of the Death of St. Peter the Martyr, for the church of S. Giovanni and S. Paolo at Venice, which has by almoſt all artiſts and connoiſſeurs been conſidered his chef-d'œuvre in hiſtory. This extraordinary picture was one of the firſt objects of French ſpoliation at Venice. It was painted originally on wood, but was transferred to canvas in France, in conſequence of its having been much bliſtered from the wood by the effect of ſea-water in its voyage to Marſeilles; and it is now returned to its original ſtation in a more agreeable, if not more perfect condition, than when it was firſt removed. The excellence of this picture procured him, according to Vaſari, a commiſſion from the ſenate to paint the battle of Cadore between the Venetians and the Imperialiſts, or the rout of Giaradadda, in which the action proceeded during a tremendous ſtorm of rain. This grand work was deſtroyed by fire, but the compoſition is preſerved to us by the print engraved by Fontana. Beſides theſe, he painted ſeveral other public works, which, together with the friendly aſſiſtance of Pietro Aretino, whoſe pen delighted to dwell upon the powers of this great artiſt's pencil, ſpread his fame in every direction, and he was honoured with a ſuperabundance of employment. In 1530, when Charles V. came to Bologna to be crowned by pope Clement VII. Titian was ſent for by the cardinal Hippolito de Medici to paint the portrait of the monarch, which he did on horſeback and in armour; which ſo pleaſed Charles, that he gave the painter 1000 crowns of gold, and declared he would never be painted by any body elſe. When Titian returned to Venice, he found Pordenone much employed and ſupported by ſeveral of the principal perſons; but his great ſuperiority ſoon became too manifeſt to be reſiſted, and he was more than ever employed, both publicly and in private.

In 1541 the emperor returned to Bologna, to hold a conference with the pope, and was again painted by Titian, as was alſo the cardinal Hippolito de Medici in a Hungarian dreſs. He alſo painted his friend P. Aretino, who about this time introduced him to Fred. Gonzaga, duke of Mantua, whom he painted, and alſo, for him, a ſeries of the twelve Cæſars for a ſaloon in the palace; underneath each of which, Julio Romano afterwards painted a ſubject from each of their hiſtories.

Titian had ſoon after the honour of painting pope Paul III., when he viſited Ferrara in 1543, and was invited by that pontiff to Rome; but he excuſed himſelf at that time on account of an engagement with the duke of Urbino, whoſe portrait he painted with ſo much fire and truth, that Aretino honoured it with a ſonnet, comparing it with that of Alexander by Apelles. He painted alſo ſeveral other pictures for the ſame duke of Urbino (Franceſco Maria), and when he had completed his engagement there, accepted another invitation to Rome, ſent by the pope, through the medium of cardinal Bembo.

He arrived there in 1546, according to Vaſari, who was already known to Titian, having ſeen him at Venice, and was on this occaſion honoured by the cardinal's appointing him Cicerone to this great painter; to conduct him through the city, and to ſhew him its beauties. Nothing could be more flattering than his reception by the pope, who immediately upon his arrival aſſigned him apartments in the Palazzo Belvidere, and employed him in painting his portrait at whole length, and thoſe of the cardinal and the duke Ottavia, which gave univerſal ſatisfaction; but an Ecce Homo, which he painted as a preſent to the pope, was not eſteemed by the Roman artiſts, whoſe minds were accuſtomed to the works of Raphael and M. Angelo. The latter is ſaid to have remarked to Vaſari, after ſeeing Titian at work on his Danäe, that it was a great pity the Venetian painters applied themſelves ſo little to deſign, and had not a better mode of ſtudy, ftudy, being fo perfectly fkilful in colour and imitation. Adding, " if this man were as much aided by art in defign as he is by nature, and moft particularly fo in giving juft refemblance of natural objects, he would be perfect; as he has a noble fpirit, and a beautiful and lively manner."

He did not remain long in Rome, but on his return to Venice vifited Florence, where he beheld with delight the great works of art with which it is adorned, and vifited the grand duke Cofmo, who declined his offer to paint his portrait, perhaps, as Vafari obferves, that he might not give umbrage to the ingenious artifts of his own city and dominions.

Immediately upon his arrival at Florence, he received an invitation from his patron, Charles V., to vifit Spain, and accordingly went to Madrid, where he arrived in 1550. He remained there three years, during which time he painted a great number of portraits and hiftorical pictures. For the portrait which he painted of the emperor, he received 1000 crowns of gold, and was created a knight of the order of St. Jago, and a count palatine of the empire, with a ftipend from the treafury of Naples of 200 crowns annually; and to this, Philip II. added afterwards 200 more, befides paying him munificently for each of his productions. When Charles had devoted his life to the aufterities of a convent, he commiffioned him to paint a large picture of the Trinity, accompanied by the Holy Virgin, and furrounded by faints and angels, in which the emperor, and the emprefs his wife, were reprefented elevated to the heavens, and in the act of adoration. There is a fketch of it in England, and a print has been engraven from the picture, by which it appears to have been a very grand work.

Though Titian had returned to his native place before Philip II. came into poffeffion of the throne, and was as much engaged as he could be, yet that monarch, when he had built the Efcurial, and conceived the idea of enriching it with the moft fplendid materials, reforted to his father's favourite painter to affift him in perfecting it; and though it does not appear that Titian returned to Spain, yet he muft have employed his pencil very affiduoufly in its fervice from the very great number of his pictures which are to be found there, many of them among his very fineft productions. Several of thefe have been withdrawn by the fcruples of bigotry from public view; and among them his picture of a fleeping Venus, which was prefented by Philip IV. to our Charles I., when prince of Wales, on his vifit to Spain, and which after his death was purchafed by the Spanifh ambaffador, then refident here.

Titian was invited by Henry VIII. to England, but his numerous engagements on the continent prevented him from coming. He painted, however, two pictures for Henry, which now adorn Cleveland Houfe (the marquis of Stafford's). Their fubjects are the Bath of Diana, with the unfortunate intrufion of Acteon, and the Difcovery of the crime of Califta, and both are exquifite performances, and in tolerably good prefervation. They continued in the royal collection till it was difperfed on the death of Charles I., and found their way into the gallery of the duke of Orleans; and on the purchafe of the Italian part of that collection being effected by the duke of Bridgewater, the earl of Carlifle, and lord Gower, thefe pictures fell to the lot of the former of thefe noblemen.

This great painter is one of the happy few, for whom nature and circumftances have combined in fortunate conjunction. " For him," as Vafari juftly obferves, " health and fortune laboured, and he received of heaven only happinefs and bleffings." By him the higheft among men, the moft learned, and the moft beautiful, were proud to have their portraits tranfmitted to pofterity. He was handfome in perfon and graceful in manners, and lived in a ftyle worthy of one fo honoured and beloved. Thefe bleffings he was permitted to enjoy through a very uncommon portion of human exiftence, which was at length interrupted by the plague in his 96th year. He appears to have been able to purfue his delightful art to a very advanced period, for Vafari found him painting in 1566, when he vifited him at Venice, and fpeaks of it with pleafure; and though it may well be imagined that the latter productions of his pencil exhibit the ftrong hand of time, yet they are free and mafterly in every thing in which a perfect knowledge of the principles of the art are concerned, and weak only in the execution.

Had Giorgione lived but to one-half of the lengthened years of his great rival, Titian might not perhaps have ftood fo completely at the head of the Venetian fchool of painting, as from his numerous excellent productions he now does. That noble work, the death of S. Pietro Martire, alone fully entitles him to this diftinction and honour: perhaps no other production of the pencil is fo perfect in the combination of every requifite quality of a fine painting; compofition, defign, action, expreffion, chiaro-fcuro, and colour. The choice of the fcene, and the accompaniments, are every way adapted to affift in creating alarm and difmay; the tone of evening or twilight fpread over the whole, and contrafted to the brilliant ray of heavenly light from above, aids the impreffion; and the execution is in every part correfpondent to the grandeur of form felected. This picture he painted, as we have faid, in the prime of his life, when he was about forty-three; and he continued long after to work in the fame ftyle, which is of his own creation, and totally different from both his former laboured one, and his latter loofe and vague manner. In this picture, every part is wrought to an exact character of reprefentation, though without minutenefs, or in any degree trefpaffing upon the heroic nature of the tragic fubject; and there is no introduction of heterogeneous matter, as is too frequently to be found in his hiftoric productions. Here he appears to have caught a glimpfe of the grandeur of Michael Angelo's ftyle, and to have employed it more effectually than in any other of his works, except perhaps in the figures on the ceiling of the Salute at Venice, and the martyrdom of St. Laurence in the Jefuits'. In general, his felection of form is but little improved upon his model; his male figures being too flefhy for character or action, and his females too full for elegance.

The mind of Titian appears to have been of a fedate and rather ferious character. There is, as fir Jofhua Reynolds has obferved, " a fenatorial dignity about him," which diftinguifhes him from his compeers of the Venetian fchool. All his compofitions are arranged with gravity; even the gay and fometimes licentious fubjects which he now and then amufed himfelf with, are conducted with fuch a fcale of chiaro-fcuro and colour, as gives an air of morality to their effect, which impofes upon the fpectator a tone of fobriety, and induces him to difcard thofe loofe thoughts which the gay luxuriance of the ftyle of Rubens, treating the fame compofitions, would inevitably excite.

Colouring appears to have been the grand foundation of the fuccefs of Titian. He knew better than any other painter the juft power of each colour of his pallette; and by this knowledge, produced a fpecies of chiaro-fcuro independent of light and fhade, and perfectly diftinct from that of Corregio and Lionardo da Vinci, and more immediately imitative of the general effects of nature. Mafter of the

 means

means of imitating the moſt ſubtle combinations of colour in viſible objects, and fully comprehending the degrees of purity or of tone with which colours might be employed individually or collectively, to aſſiſt in projecting or withdrawing the various parts of a picture, he never fails to gratify the eye with a full and true relief, correſpondent with the nature of the ſubject. In this quality he was as much ideal, as the Greeks and Florentines were in form; for though the harmony and richneſs which he produced are to be found occaſionally in nature, it is neither her every day attire, nor is it to be comprehended by ſuperficial obſervers. There is a ſcience of exceeding import to painting in the arrangements of colours, by which a ſkilful artiſt will create attraction or diſguſt, as it pleaſes him. Change the poſition of the colours of that moſt beautiful of nature's works, the rainbow; let the blue and the green occupy the centre, and the red and yellow the edges of it; and judge how far it will decreaſe in its power of attraction. Of this ſcience, Titian was the firſt great poſſeſſor; and as he poſſeſſed the knowledge of the value of colours, ſo alſo did he that of the nature of ſhade; that colour (to the painter at leaſt, though it be the abſence of it to the philoſopher) which deſtroys all colours, and renders all alike obſcure; and which is the moſt difficult of attainment in all that relates to the art of colouring. The tone of ſhade that Titian employed, whatever be the ſubſtance which produced it, was uſed by no other ſo ſucceſsfully, except Tintoretto. It ſeems, in its union with the local colours of objects, to have produced the half teints without further labour; or at leaſt to have laid ſuch a foundation, as to have made that of the ſubſequent tinting very trifling; and doubtleſs this mode of proceeding rendered him able to produce ſuch an infinity of works as appear to have iſſued from his pencil. His errors flowed naturally, from the eaſe with which he produced the beauties of his ſtyle; and as the mind was filled with gratification by the delightful harmony and richneſs of colour his works preſented, ſo it ſought the leſs for the qualities of expreſſion, and appropriate dreſs and action in the figures; and would not condemn too rudely the frequent admiſſion of heterogeneous matter.

To the accuſations of exhibiting defects like theſe, the works of Titian are far leſs juſtly ſubject than thoſe of his imitators and ſucceſſors in the Venetian ſchool of painting; none of whom poſſeſſed the taſte and judgment of this great maſter, though many were eminently ſkilful in their reſpective departments.

TITIANO, Girolamo Dante, called *Il.* According to Ridolfi, he was brought up in the ſchool of Titian, and was employed by that maſter to aſſiſt him in ſeveral of his works. By frequently painting in conjunction with him, and ſometimes copying his works, ſome of his pictures, retouched by Titian, have paſſed for originals by that maſter. He ſometimes painted from his own deſigns, and his picture in the church of St. Giovanni at Venice, repreſenting S. S. Coſmo and Damiano, is worthy of the ſchool in which he was educated. Bryan's Dict.

TITICACA, or Chucuito, in *Geography*, a lake of South America, in the viceroyalty of Buenos Ayres, dioceſe of La Paz, and juriſdiction of Chucuito, the figure of which is oval, inclining nearly from N.W. to S.E., its circumference being about 80 leagues, and depth near the ſhore from four to ſix fathoms, and towards the middle forty or fifty, without any ſhoals. Ten or twelve large rivers, beſide a great number of ſmaller ſtreams, diſcharge themſelves into it. The water, though neither bitter nor brackiſh, is ſomewhat turbid, and its taſte is ſo nauſeous that it cannot be drank. It abounds with fiſh of two very different kinds; one large and palatable, called by the Indians Suchis, and the other ſmall, inſipid and bony, long ſince called by the Spaniards Boyas. It has alſo a great number of geeſe, and other wild fowl, and the ſhores are covered with flags and ruſhes, the materials of which the bridges are made. The weſtern borders of this lake are called Chucuito, and thoſe on the E. are denominated Omaſcuyo. It contains ſeveral iſlands, from one to another of which the Indians paſs on their balſas, a kind of rafts, ſupported by inflated ſkins. One of theſe iſlands is very large, and was anciently one mountain, ſince levelled by order of the Incas: this gave to the lake its own name of Titicaca, which, in the Indian language, ſignifies a mountain of lead. In this iſland the firſt Inca, Mancho-Capac, the illuſtrious founder of the empire of Peru, invented his political fable, that the ſun, his father, had placed him, together with his ſiſter and conſort Mama Oello Huaco, there, enjoining them to draw the neighbouring people from the ignorance, rudeneſs, and barbarity in which they lived, and humanize them by cuſtoms, laws, and religious rites dictated by himſelf; and in return for the benefits reſulting from this artful ſtratagem, the iſland has, by all the Indians, been conſidered as ſacred; and the Incas, determining to erect on it a temple to the ſun, cauſed it to be levelled, that the ſituation might be more delightful and commodious.

This was one of the moſt ſplendid temples in the whole empire. Beſides the plates of gold and ſilver with which its walls were magnificently adorned, it contained an immenſe collection of riches, all the inhabitants of provinces which depended on the empire, being under an indiſpenſible obligation of viſiting it once a year, and offering ſome gift. Accordingly, they always brought in proportion to their zeal or ability, gold, ſilver, or jewels. This immenſe maſs of riches, the Indians, on ſeeing the rapacious violence of the Spaniards, are thought to have thrown into the lake; as it is certainly known they did with regard to a great part of thoſe at Cuſco, among which was the famous golden chain made by order of the Inca Huayna-Capac, to celebrate the feſtival of giving name to his eldeſt ſon. But theſe valuable effects were thrown into another lake, ſix leagues S. of Cuſco, in the valley of Orcos: and though numbers of Spaniards, animated with the flattering hopes of ſuch immenſe treaſures, made frequent attempts to recover them, the great depth of the water, and the bottom being covered with ſlime and mud, rendered all their endeavours abortive. For notwithſtanding the circuit is not above half a league, yet the depth of water is in moſt places not leſs than twenty-three or twenty-four fathoms.

Towards the S. part of the lake Titicaca, the banks approach each other, ſo as to form a kind of bay, which terminates in a river called El Deſaguadero, or the drain, and afterwards forms the lake of Paria, which has no viſible outlet; but the many whirl-pools ſufficiently indicate that the water iſſues by a ſubterraneous paſſage. Over the river Deſaguadero is ſtill remaining the bridge of ruſhes, invented by Capac Yupanqui, the fifth Inca, for tranſporting his army to the other ſide, in order to conquer the provinces of Collaſuyo. S. lat. 16° 10′. W. long. 69° 56′.

TITILLARES Venæ, a name given by ſome authors to the iliac veins.

TITILLATION, Titillatio, the act of tickling, *i. e.* exciting a ſort of pleaſurable idea, by a gentle application of ſome ſoft body, upon a nervous part; and which uſually tends to produce laughter.

TITILLICUM, a word uſed by ſome anatomical writers for the arm-pit.

TITIN Ara, in *Geography*, a mountain of Ruſſia, in the

the government of Upha. N. lat. 52° 25'. E. long. 61° 14'.

TITIOPOLIS, in *Ancient Geography*, a town of Asia, in Isauria, or the second Cilicia, one of the twenty-three towns, which, according to the Notitia of Hierocles, were under the metropolis of Seleucia; named Titopolis by William of Tyre.

TITISNESS, in *Geography*, a small island near the coast of Lapland, at the entrance of a bay called Titsfiord. N. lat. 67° 36'.

TITIUM FLAVUM, in *Ancient Geography*, a river of Illyria, which discharged itself into the sea at Scardona, and served as a boundary between Liburnia and Dalmatia. Pliny. It is named Titus by Ptolemy.

TITIZIGHE, in *Geography*, a seaport town of the principality of Guriel, with a good harbour, on the Black sea. This place is also called Pghino; 10 miles S. of Puti.

TITLARK, in *Ornithology*. See ALAUDA *Pratensis*.

TITLE, TITULUS, an inscription put over any thing, to make it known.

The word is more particularly used for the inscription in the first page of a book, expressing the subject of it, the author's name, &c.

What tortures abundance of authors, is to find specious titles for their books: a title should be simple, and yet clear: these are the two genuine characters of this kind of composition. Assuming titles are prepossession against the authors.

TITLE, *Titulus*, in the *Civil* and *Canon Law*, denotes a chapter or division of a book.

A title is subdivided into paragraphs, &c.—Each of the fifty books of the Digest consists of a number of titles; some of more, others of less.

TITLE is also an appellation of dignity, distinction, or pre-eminence, given to persons possessed of the same.

The titles of order or dignity, Loyseau observes, should always come immediately after the name, and before the titles of office.

The king of Spain has a whole page of titles, to express the several kingdoms and signories of which he is master. The king of England takes the title of *king of Great Britain and Ireland:* the king of France, the title of *king of France and Navarre:* the king of Sweden intitles himself *king of the Swedes and Goths:* the king of Denmark, *king of Denmark and Norway:* the king of Sardinia, among his titles, takes that of *king of Cyprus and Jerusalem:* the duke of Lorrain, the title of *king of Jerusalem, Sicily*, &c.

The cardinals take titles from the names of some churches in Rome: as of St. Cecilia, St. Sabina, &c. and they are called cardinals of the title of *St. Cecilia*, &c.

The emperor can confer the title of prince, or count of the empire; but the right of suffrage in assemblies of the empire depends on the consent of the estates.

The Romans gave the titles of Africanus, Asiaticus, Macedonicus, Numidicus, Creticus, Parthicus, Dacicus, &c. in memory of the victories obtained over the people of those countries. The king of Spain, after the like manner, gives honourable titles to his cities, in recompence for their services, or their fidelity.

TITLE expresses also a certain quality ascribed by way of respect to certain princes, &c.

The pope has the title of *holiness;* a cardinal prince of the blood, that of *royal highness*, or *most serene highness*, according to his nearness to the throne; other cardinal princes, *most eminent highness;* an archbishop, *grace* and *most reverend;* a bishop, *right reverend;* abbots, priests, religious, &c. *reverend.*

As to secular powers, to the emperor is given the title of *imperial majesty;* to king, *majesty;* to the king of France, *most christian majesty;* to the king of Spain, *catholic majesty;* to the king of England, that of *defender of the faith;* to the Turks, *grand signor* and *highness;* to the prince of Wales, *royal highness;* to the dauphin of France, *serene highness;* to electors, *electoral highness;* to the grand duke, *most serene highness;* to the other princes of Italy and Germany, *highness;* to the doge of Venice, *most serene prince;* to the republic or senate of Venice, *signory;* to the grand-master of Malta, *eminence;* to nuncios, and to ambassadors of crowned heads, *excellency.*

The emperor of China, among his titles, takes that of *tiensu*, son of heaven. The Orientals, it is observed, are exceedingly fond of titles: the simple governor of Schiras, for instance, after a pompous enumeration of qualities, lordships, &c. adds the titles of *flower of courtesy, nutmeg of consolation*, and *rose of delight.*

TITLE, in *Law*, denotes a right which a person has to the possession of any thing.

A title to lands is thus defined by sir Edward Coke: *titulus est justa causa possidendi id quod nostrum est*, or it is the means by which the owner of lands hath the just possession of his property. There are several stages or degrees requisite to form a complete title to lands and tenements. The lowest and most imperfect degree of title consists in the mere naked possession, or actual occupation of the estate, without any apparent right, or any shadow or pretence of right, to hold and continue such possession. See DISSEISIN.

The next step to a good and perfect title is the right of possession, which may reside in one man, while the actual possession is either in himself or another. The third circumstance attending a title is the mere right of property, the *jus proprietatis*, without either possession or even the right of possession. It is possible that one man may have the possession, another the right of possession, and a third the right of property. But in the union of these three qualifications consists a complete title to lands, tenements, and hereditaments. For it is an ancient maxim of the law, that no title is completely good, unless the right of possession be joined with the right of property; which right is then denominated a double right, *jus duplicatum*, or *droit droit.* And when to this double right the actual possession is also united, when there is, according to the expression of Fleta, *juris et seisinæ conjunctio*, then, and then only, is the title completely legal.

The statute 32 Hen. VIII. c. 9, hath provided, that no one shall sell or purchase any presented right or title to land, unless the vendor hath received the profits thereof for one whole year before such grant, or hath been in actual possession of the land, or the reversion or remainder; on pain that both the purchaser and vendor shall each forfeit the value of such land to the king and the prosecutor.

A title to things personal may be acquired or lost by occupancy, by prerogative, by forfeiture, by custom, by succession, by marriage, by judgment, by gift, by contract, by bankruptcy, by testimony, and by administration. Blackst. Com. b. ii. See POSSESSION and PROPERTY.

Title is also an authentic instrument, by which a man can prove and make appear his right.

There must be at least colourable title to come into possession of a benefice, otherwise the person is deemed an intruder. For prescription with title, see PRESCRIPTION.

TITLE, in the *Canon Law*, is that by virtue of which a beneficiary holds a benefice: such is the collation of an ordinary, or a provision in the court of Rome, founded on a resignation, permutation, or other legal cause. The title of of a benefice, or beneficiary, is either a true or a colourable one. A *true* or *valid* title is that which gives a right to the benefice: such is that received from a collator who has a right to confer the benefice on a person capable of it, the usual solemnities being observed. See COLLATION, &c.

Colourable title is a seeming one; *i. e.* such an one as appears valid, and is not. Such would that be founded on the collation of a bishop, in case the benefice in question were not in his collation.

By the canons, a colourable title, though false, produces two very considerable effects. 1. That, after peaceable possession for three years, the incumbent may defend himself by the rule *de triennali possessione*, against such as would dispute the benefice with him. 2. That in case he be prosecuted within three years, and obliged to surrender the benefice, he shall not be obliged to restore the produce of it, during the time he possessed it.

TITLE is also used, in several ancient synods and councils, for the church to which a priest was ordained, and where he was constantly to reside.

"Nullus in presbyterum, nullus in diaconum, nisi ad certum titulum ordinetur." Concil. Londin. ann. 1125.

There are many reasons why a church might be called *titulus*, title: the most probable Cowel takes to be this, that in ancient days the name of the saint to whom the church was dedicated was engraved on the porch, as a token that the saint had a title to that church: whence the church itself became afterwards to be called *titulus*.

TITLES, or *Titular Churches*, M. Fleury observes, were formerly the denomination of a particular kind of churches at Rome.

In the sixth and seventh centuries, there were four sorts of churches in that metropolis; *viz. patriarchal*, *titular*, *diaconal*, and *oratorial*. The *tituli*, *titular*, were, as it were, parishes, each assigned to a cardinal-priest, with a certain district or quarter depending on them, and a font for the administration of baptism in case of necessity.

TITLE, *Clerical* or *Sacerdotal*, denotes a yearly revenue or income of the value of fifty crowns, which the candidates for priesthood were anciently obliged to have of their own, that they might be assured of a subsistence.

By the ancient discipline there were no clerks made, but in proportion as they were wanted for the service of the church, which is still observed with regard to bishops; none being consecrated, but to fill some vacant see.

But for priests, and other clerks, they began to make vague ordinations in the East as early as in the fifth century: this occasioned the council of Chalcedon to declare all vague and absolute ordinations null.

Accordingly the discipline was pretty well observed till towards the end of the eleventh century; but then it began to relax, and the number of priests was exceedingly increased; either because the people became desirous of the privileges of the clericate, or because the bishops sought to extend their jurisdiction.

One of the great inconveniences of these vague ordinations was poverty, which frequently reduced the priests to sordid occupations, and even to a shameful begging. To remedy this, the council of Lateran laid it on the bishops to provide for the subsistence of such as they should ordain without title, till such time as they had got a place in the church that would afford them a settled maintenance.

There was also another expedient found out to elude the canon of the council of Chalcedon; and it was appointed, that a priest might be ordained on the title of his patrimony; that is, it was not necessary he had any certain place in the church, provided he had a patrimony sufficient for a creditable subsistence.

The council of Trent retrieved the ancient discipline in this respect, forbidding all ordination, where the candidate was not in peaceable possession of a benefice sufficient to subsist him; and allowing nobody to be ordained on patrimony or pension, unless where the bishop declares it to be expedient for the good of the church: so that the benefice is the rule, and the patrimony the exception. See ORDINATION.

But this rule is not regarded, even in some Catholic countries, particularly France, where the patrimonial title is the most frequent; and the title is even fixed to a very moderate sum.

As to religious, the profession they make in a monastery serves them for a title, in regard no convent is obliged to maintain them: and as to mendicants, they are maintained upon the *title of poverty*.

Those of the house and society of the Sorbonne are also ordained without any patrimonial title, and on the sole title of poverty; it being supposed a doctor of the Sorbonne can never want a benefice.

TITLE *for Orders*. See DEACON, ORDINATION, and PRIEST.

TITLIS, in *Geography*, a mountain of Switzerland, in the canton of Uri, the most elevated in those parts, and scarcely inferior to the Schreekhorn and Jungfrauhorn: it was for a long time considered as inaccessible. The summit of this mountain is called Nollen, and commands a very picturesque scene of mountains and vallies; 11 miles S.S.W. of Altorff.

TITMEG, a lake of North America. N. lat. 62° 15'. W. long. 99°.

TITMOUSE, in *Ornithology*. See PARUS.

TITOLO, in *Geography*, a town of Naples, in the province of Basilicata; 6 miles S.W. of Potenza.

TITONEUS, in *Ancient Geography*, a mountain situated on the confines of Thrace and Macedonia.

TITOVO, in *Geography*, a town of Russia, in the government of Kaluga; 40 miles E.S.E. of Kaluga.

TITSCHEIN, NEW, or *Nowi Giezi*, a town of Moravia, in the circle of Prerau, well built and defended by walls; 24 miles E.N.E. of Prerau. N. lat. 49° 32'. E. long. 18° 10'.

TITSCHEIN, *Alt*, a town of Moravia; 2 miles S.W. of New Titschein.

TITSCHIN, a town of Moravia, in the circle of Olmutz; 16 miles S. of Olmutz.—Also, a town of Moravia, in the circle of Prerau; 8 miles S.W. of Freyberg.

TITTERIE, a southern province of Algiers, which extends from the river Masaffran, on the W., to the river Booberak, on the E.: northward it is bounded by the Mediterranean, and southward by Sahara; about 60 miles long and 40 broad.

TITTERIE *Gewle*, a lake of Algiers, situated near mountains; 60 miles S. of Algiers.

TITTERIE *Dosh*, or *Hadjar Titterie*, a ridge of precipices in Algiers: on the summit is a large plain, with only one narrow road leading up to it, where a tribe of Arabs keep their granaries; 50 miles S. of Algiers.

TITTING, or DIETTING, a town of Bavaria, in the bishopric of Aichstatt; 5 miles N. of Aichstatt.

TITTIUS, in *Botany*, a name given by Rumphius, Amboyn. v. 3. t. 19, and t. 20, to two very different kinds of trees, the latter of which is supposed by Jussieu to be a CORNUTIA. See that article.

TITTMANING, or DITTMANING, in *Geography*, a town

town of the archbiſhopric of Salzburg, on the Salza. In the year 1310, a peſtilential diſeaſe made ſuch ravages in this town, that 1300 perſons died between the 11th of November and the 2d of February following. In the year 1571, almoſt the whole town was burned down by lightning; 20 miles N.N.W. of Salzburg. N. lat. 48° 1′. E. long. 12° 44′.

TITTUA, in *Ancient Geography*, a town of India, on this ſide of the Ganges, which belonged to the Carœans. Ptol.

TITUBATION, in *Aſtronomy*. See TREPIDATION.

TITUL, in *Geography*, a town of Hungary, on the Theyſſe. This town has often been taken and retaken by the Imperialiſts and Turks; 24 miles E.S.E. of Peter Warden.

TITULAR, or TITULARY, denotes a perſon inveſted with a title, in virtue of which he holds an office or benefice, whether he performs the functions of it or not. In this ſenſe the term is uſed in oppoſition to ſurvivor, and to a perſon only acting by procuration, or commiſſion. An officer is always reputed titular till he hath reſigned his office, and the reſignation hath been admitted.

TITULAR is alſo ſometimes applied adjectively to a perſon who has the title and right of an office or dignity, but without having poſſeſſion, or diſcharging the function of it.

It is ſometimes alſo uſed abuſively for a perſon who aſſumes and pretends a title to a thing, without either a right to it, or a poſſeſſion of it.

TITULAR *Churches*. See TITLES.

TITULARS *of Tithes*, a term ſometimes applied to perſons who had the poſſeſſion of tithes under the crown in Scotland. They had alſo other names or titles applied to them in ſome caſes. See TITHES.

TITULCIA, in *Ancient Geography*, a town of Hiſpania Citerior, between Mantua to the N.E. and Toletum to the S.W.; marked in Anton. Itin. on the route from Saragoſſa to Emerita.

TITUS, in *Scripture Biography*, a diſciple and companion of the apoſtle Paul, who attended him in many peregrinations to Jeruſalem, Epheſus, and Crete, and who was deputed by him on ſeveral important ſervices. For an account of the epiſtle addreſſed to him by St. Paul, ſee EPISTLE.

TITUS VESPASIANUS, in *Biography*, a Roman emperor, was the eldeſt ſon of Veſpaſian, and born A.D. 40. In the courſe of his education at the court of Nero, he made a great proficiency in the ſtudy of eloquence and poetry. In his military ſervice he firſt ranked as tribune in Germany, and afterwards in Britain; and by his valour and ſkill, as well as by the graces of his perſon and manners, obtained great applauſe. On his return to Rome, he acquired reputation in the forum as a ſucceſsful pleader. His firſt wife was the daughter of a Roman knight, and after her death he married a lady of illuſtrious deſcent, whom he divorced after ſhe had borne him one daughter. Having diſtinguiſhed himſelf as quæſtor, he ſerved as lieutenant under his father in the war of Judea, during which he gained renown, not only by his military enterpriſes, but by the mildneſs and generoſity of his temper; and though he did not abſtain from the indulgences of youthful propenſities, he did not neglect ſerious occupations. When Veſpaſian, after the death of Otho, was deliberating about aſſuming the purple, he acted as mediator in the confederacy between him and Marianus, the governor of Syria; and when Veſpaſian marched to Italy, Titus was entruſted with the proſecution of the war in Judæa. When his father took poſſeſſion of the imperial authority, he declared Titus his colleague in the conſulate, A.D. 70. In that year Jeruſalem was taken after a calamitous ſiege, and the deſtruction of the temple, which Titus wiſhed to have preſerved. After the reduction of Jeruſalem, he went to Alexandria, and took part in the ſuperſtitious conſecration of the ox Apis; and after having given audience to the ambaſſadors of the king of Parthia, he haſtened to Rome with a view of counteracting ſome unfavourable rumours, and was honoured with a magnificent triumph. Veſpaſian admitted him to a participation of the empire, and they continued to co-operate in the exerciſe of the imperial power, and lived together in amicable intercourſe. Suetonius, however, intimates that Titus's conduct was in a variety of reſpects very far from being irreproachable, either in private life or in his public character. During the war in Judæa, he had indulged a violent paſſion for Berenice, daughter of Agrippa I. king of the Jews, and widow of Herod, king of Chalcis; and as ſhe followed him to Rome, he gave offence to the people by his attachment to a foreign queen of doubtful reputation; and, as Suetonius ſays, ſuſpicions were entertained that Titus would eventually prove a ſecond Nero.

Upon the death of Veſpaſian, A.D. 79, Titus immediately ſucceeded him; and by his conduct towards his rival Domitian, and to thoſe who adhered to his intereſt, he gained the affection of the people, and eſtabliſhed a character, which has cauſed him to be recorded under the glorious title of "The Delight of the Human Race." Although his reign was ſhort, it was diſtinguiſhed by a ſeries of beneficent actions; not always, perhaps, equally liberal in the principle from which they originated. This courſe of beneficence was commenced by a confirmation of all the grants and donations made by his predeceſſors. And he thus eſtabliſhed a precedent, which governed the conduct of his ſucceſſors. Upon aſſuming the office of chief pontiff, he avowed it to be a ſolemn engagement not to ſhed the blood of a citizen, and to this reſolution he adhered in a conſpiracy againſt himſelf. In the caſe of one of the two patricians implicated in this crime, he calmed the anxiety of his mother by deputing a ſpecial meſſenger to aſſure her that her ſon's life was in no danger. Beſides, he abrogated the law of high-treaſon with reſpect to all convictions for words or writings againſt the perſon or dignity of the emperor.

It was one of his maxims, "that no one ought to depart diſcontented from the perſon of his prince;" and on this he founded his practice of giving hopes to petitioners when he thought it neceſſary to refuſe their requeſts. If we connect this maxim with his well-known exclamation at the cloſe of a day on which he had conferred no benefit, "My friends I have loſt a day," we cannot forbear ſuſpecting that the benefits to which he referred were rather acts of private bounty to courtiers or importunate ſuitors, than the performance of public duties. Many inſtances occur of his love of popularity, and of the exceſs in which he indulged it. The public calamities that happened during his reign gave occaſion for the exerciſe and diſplay of his compaſſion and bounty; ſuch were the great eruption of mount Veſuvius, which deſtroyed Herculaneum, Pompeii, and other towns: and the conflagration of Rome, which was followed by a fatal epidemic diſorder. His general conduct entitled him to the affection of his ſubjects; nor does he ſeem to have deſerved reproach for any act of injuſtice or oppreſſion. Whilſt he was on a journey to the country of the Sabines, he was ſeized with a fever, which terminated fatally, on the 13th of September, A.D. 81, in the 41ſt year of his age, and after a reign of two years and leſs than three months. Apprehending his diſſolution, he lamented his early and premature doom; and yet, though his death was deplored at Rome as a general calamity, it was perhaps, conſidering the flexibility of his diſpoſition, and his inclination to profuſe expen-

expenditure, favourable to his own reputation and to the public profperity and happinefs. Suetonius. Anc. Un. Hift. Crevier's Rom. Emp.

TITWALLA, in *Geography*, a town of Hindooftan, in Baglana; 28 miles E. of Baffeen.

TITYRUS Mons, in *Ancient Geography*, a mountain in the weftern part of the ifle of Crete, in the country named Cydonia, according to Strabo. On this mountain was a temple named Dictynnæum Templum. In fome copies of Strabo, this mountain and temple are placed in the town of Cydonia.

TITZ, in *Geography*, a town of France, in the department of the Roer; 4 miles N.N.E. of Juliers.

TITZLA, a town of Afiatic Turkey, in Caramania, on a falt lake; 60 miles S.W. of Kirfhehr.

TIVA, a town of the Arabian Irak; 130 miles W. of Bafforah.

TIVER, in *Rural Economy*, the provincial name of a fubftance of the colouring ochre kind, ufed for marking fheep in fome places.

TIVERING, a term applied to the act or operation of marking fheep and lambs in different ways, with the material of the tiver kind, in fome diftricts and places, for particular ufes and purpofes. Thus, it is a practice with fome correct fheep-farmers to have their fheep tivered fo as to afcertain different points in their management with great exactnefs. The bows or breafts of the rams are tivered every two or three days in the tupping or riding feafon, and the ewes which are put to them, the firft week, marked with one ftroke of tiver, thofe of the fecond week, with two ftrokes, and fo on. The tivering of fheep is alfo ufeful on many other occafions for marking and diftinguifhing the objects and views of the fheep-farmer. The practice of it is very common in the Romney-marfh fyftem of fheep-grazing. See Sheep.

TIVERTON, in *Geography*, anciently called *Twyford-town*, a borough and market-town in the hundred of the fame name, and county of Devon, England; is fituated on the flope of a hill between the rivers Exe and Loman, 14 miles N. by E. from Exeter, and 163 miles W. by S. from London. In the time of Alfred it was only a village, but had twelve tithings belonging to it, and was governed by a portreve. Henry I. granted the manor and lordfhip to Richard Rivers, afterwards earl of Devon, by whom a caftle was erected here about the year 1106, which continued to be the baronial refidence for a confiderable number of years. The attractions of the caftle occafioned a great increafe in the buildings and population of Tiverton; and by the favour of the lords, it was invefted with the privilege of a market as early as the year 1200. About fifty years afterwards, the ftream of water, now called the Town-Leat, was conducted from the diftance of five miles to fupply the inhabitants; and a piece of wafte land, called Elmore Common, was given for the benefit of the poorer claffes, either for pafturage or for cultivation. Thefe advantages continued to attract new fettlers; but the moft rapid augmentation of the town took place on the final eftablifhment of the woollen manufacture about the year 1500. Towards the clofe of Elizabeth's reign, Tiverton was the principal place in the county for the manufacture of woollen goods; particularly kerfeys, which ftill continue to be the chief article made here. About this period, the profperity of the town received a temporary check: in 1591 it was vifited by the plague, to which 550 perfons fell victims; numbers fled for fafety; and the inhabitants were fo thinned, that the growing of grafs in the ftreets is particularly recorded. Scarcely had the town recovered, when it was nearly deftroyed by fire, April 3, 1598, when more than four hundred houfes were confumed, and thirty-three perfons perifhed in the flames: the value of the property deftroyed was eftimated at 150,000*l.* In about a dozen years from that time, Tiverton was again efteemed a town of great importance, and called the chief market-town of the Weft. Many rich clothiers and merchants lived in it, and 8000 people were conftantly employed in its woollen manufactures. The buildings were increafing in number and refpectability, and Tiverton would have probably become one of the greateft manufacturing towns in the kingdom, but for a fecond conflagration, which deftroyed nearly all the property of the inhabitants, and wholly blafted their flourifhing expectation. In this fire, which happened Auguft 5, 1612, fix hundred houfes were deftroyed, with goods and merchandize to the amount of 200,000*l.*; and the inhabitants of every defcription were reduced to the greateft diftrefs. The poor manufacturers were diftributed in different towns, by which means the advantages of the clothing trade that had hitherto been exclufively enjoyed by Tiverton, were extended to other parts of the county. In the year 1615, Tiverton received its firft charter of incorporation from king James; and its government was vefted in a mayor, twelve capital burgeffes, and twelve affiftant burgeffes. The right of returning two members to parliament was alfo granted to the fame perfons. This charter continued in force till 1723, when it was forfeited by neglect, and a new one, exactly fimilar, was granted by George I. In 1731, a third deftructive fire occurred, which again nearly laid wafte the town. During the 17th century, the trade and population progreffively increafed: but in the following century, rapidly declined: a favourable alteration has recently taken place, and the general trade of the town is now on a refpectable bafis. By the parliamentary return of the year 1811, the number of houfes is ftated to be 1303, the inhabitants 6732. A weekly market is held on Tuefdays, and two fairs annually. The fpot of ground on which Tiverton is built, partakes of a triangular form, from the courfe of the rivers by which it is bounded. Its greateft length is nearly one mile; its breadth exactly three quarters. The four principal ftreets form a quandrangle, inclofing an area of gardens, in the centre of which is a bowling-green. Moft of the houfes are of red brick, or of ftone, and are generally covered with blue flate. Thofe on the outfkirts of the town, and at the ends of the ftreets, which efcaped the fire of 1731, are of earth or cobb, covered with thatch. The principal buildings are the caftle, the church, and the free grammar-fchool. The caftle, from the prefent remains, appears to have been nearly of a quadrangular form, inclofing an area of about an acre, and furrounded by ftrong walls, from twenty to twenty-five feet in height. At the angles were embattled towers, about thirty-five feet high. This fortrefs was fecured from attack on the W. fide by a fteep declivity of about fixty feet, on the edge of which a lofty wall was built. Two wide and deep moats, filled with water from the Town-Leat, defended the whole of the N. and S. walls to each fide of the caufeway leading to the gate on the E. This caftle has been frequently expofed to fieges: during the reign of Stephen, and in the conteft between the houfes of York and Lancafter, it was feveral times fubject to the affaults of the contending parties; and in the civil war of Charles I. being garrifoned for the king, it was befieged and taken by the parliamentary forces. From this period the caftle has been failing to decay; and feveral of the ancient buildings have been converted into the offices of a farm. Great part of the S. and W. walls, with parts of the towers at the angles, are ftill ftanding. The moat at the S. fide is converted into a good kitchen garden;

garden; that on the N. ſide is filled up, and made part of a court-yard. The church is ſituated on an eminence, at a ſhort diſtance from the caſtle; and though the work of different ages, is more regular than might have been expected. The S. ſide is ornamented with much curious ſculpture. The tower is a plain ſtone ſtructure, ornamented with battlements and pinnacles: the height is 116 feet. The interior of the church is ſpacious, and its chancel is ſeparated from the body of the church by a ſcreen, ornamented with elegant tracery. The church being too ſmall for the reception of the inhabitants of the town, a chapel of eaſe was erected about the year 1733; and here are alſo ſeveral meeting-houſes for diſſenters of various denominations. A free grammar-ſchool was erected about the year 1604, purſuant to the will of Peter Blundell, a native, and eminent clothier of this town; who, from a very low origin, by a long life of ſucceſsful induſtry acquired an ample fortune; and bequeathed 40,000*l.* to various charitable purpoſes. In this ſchool he provided for the inſtruction of 150 boys: with maintenance for three ſcholars in each of the univerſities of Oxford and Cambridge, to be choſen out of his ſchool. Here are alſo a charity-ſchool, a free Engliſh ſchool, ſeveral alms-houſes, and other endowments for the benefit of the poor inhabitants. The other public buildings are: the town-houſe, a ſpacious edifice, appropriated to the meetings of the corporation, grand juries, and other public bodies; the market-houſe, a large quadrangular fabric, for the ſtanding and ſale of corn; and the hoſpital or poor-houſe, an extenſive ſtructure, erected in 1704, and containing various workſhops for the employment of thoſe whom indigence or misfortune may oblige to have recourſe to it. The pariſh of Tiverton is upwards of nine miles in length, and about eight miles in breadth.

At a ſhort diſtance to the ſouth of Tiverton is Colliprieſt Houſe, formerly the ſeat of the Blundell family, but now the property of Thomas Winſlow, eſq. who recently rebuilt and enlarged the manſion. It ſtands on the ſide of an eminence near the river Exe, having a ſloping lawn in front, and a hanging wood behind.—Hiſtorical Memoirs of the Town and Pariſh of Tiverton, &c.; by Martin Dunsford, Exeter, 4to. 1790. Beauties of England and Wales, vol. iv. Devonſhire; by J. Britton and E. W. Brayley, 1803.

Tiverton, a town of Rhode iſland, in the county of Newport, containing 2837 inhabitants, ſituated on the Taunton river; 15 miles S.E. of Providence.

TIUHOLM, a ſmall iſland of Denmark, in the Cattegat; 4 miles N.N.E. of Fladſtrand.

TIVIÇA, a town of Spain, in Catalonia; 15 miles N.N.E. of Tortoſa.

TIVIOT, a river of Scotland, which riſes about 12 miles S.W. from Hawick, and runs into the Tweed, at Kelſoe. The valley which it waters is called *Tiviotdale.*

TIUKI-KARAGAN, a cape on the E. ſide of the Caſpian ſea; 156 miles S.E. of Aſtrachan. N. lat. 44° 20′. E. long. 50° 14′.

TIULIT, a town of Africa, in the kingdom of Fez; 12 miles S.W. of Fez.

TIUMEN, a town of Ruſſia, in the government of Toboſk, at the union of the Piſchma and the Tura. This town is not built parallel to the river Tura, but at right angles with it; and the little river Piſchma runs through the town, and falls into the Tura at the extremity of it. Over the river is a bridge of eighty-three fathoms in length; and a little below it ſtands a fort, built with ſtone, in which is a church of the ſame materials. Without this fortification, and towards the lower bank of the Tura, are ſix wooden churches, a convent of nuns, with a church, and 500 dwelling-houſes. At the lower end of the town is an oſtrog. Beyond the Tumenka lies the Yamſkaia ſloboda, or ſuburb, conſiſting of 250 houſes, inhabited by people of all ranks and profeſſions; and at the extremity of this ſuburb ſtands a monaſtery: it has likewiſe three churches, built with ſtone. Another ſuburb lies oppoſite to Tiumen, on the N. ſide of the Tura, which is inhabited by Ruſſians, Mahometan Tartars, and Bucharians; 112 miles W.S.W. of Toboſk. N. lat. 57°. E. long. 65° 14′.

TIVOLI, anciently called *Tibur*, a town of the Popedom, in the Campagna di Roma, ſituated on a rocky mountain, planted with olive-trees, which are ſaid to yield the beſt oil in Italy; the ſee of a biſhop held immediately under the pope. The town itſelf is mean, and contains a great number of forges. The cathedral is built on the ruins of a temple of Hercules. In the market-place are two images of Oriental granite, repreſenting Iſis, the Egyptian deity. The principal beauty of this place ariſes from the river Teverone, which falling headlong about fifty feet down the rock, forms a noble caſcade, and ſeveral leſſer ones, called Le Caſcadelle. The latter are extremely picturesque; as is alſo a deep ravine in the hill, called La Grotta di Nettuno, into which the great caſcade falls. To enrich the view, here are ſome remains of ancient buildings, as the villa of Mæcenas, and particularly the little round temple of the Sibyl, as it is commonly called, but rather of Veſta; one of the moſt elegant remains of the Grecian architecture. The naturaliſt will here take pleaſure in obſerving the continual formation of new Tiburtine ſtone from the depoſit of water deſcending from the calcareous Apennines; 15 miles E.N.E. of Rome. N. lat. 41° 58′. E. long. 12° 46′.

TIURANEN, a ſmall iſland on the E. ſide of the gulf of Bothnia. N. lat. 65° 38′. E. long. 24° 46′.

TIUTERS, an iſland of Ruſſia, in the gulf of Finland; 80 miles E.N.E. of Revel. N. lat. 59° 40′. E. long. 27° 14′.

TIVY, a river of South Wales, which riſes about 5 miles N. from Tregaron, and runs into the ſea about 5 miles below Cardigan.

TIXIER, John, (Lat. *Raviſius Textor*), in *Biography*, a perſon of literary character in France, was lord of Raviſy in the Nivernois, and educated in the college of Navarre at Paris, where he taught the belles-lettres, and whence iſſued many of his publications for the uſe of his ſtudents. In 1500 he was appointed rector of the univerſity of Paris, and he died, as ſome ſay in the hoſpital, in 1522. His works are, "A Collection of Latin Letters," "Dialogues," "Poems," "Epigrams," "Orations," &c. in Latin, written in good ſtyle; "Officina, ſeu potius Naturæ Hiſtoria, &c." ſeveral times reprinted; "De Memorabilibus et claris Mulieribus, aliquot diverſorum Scriptorum Opera," to which he has annexed the life of Joan of France, written by himſelf. Moreri.

TIZ, in *Geography*. See Tiiz.

TIZRI, in *Chronology*. See Tisri.

TIZZANO, in *Geography*, a town of the duchy of Parma; 13 miles S. of Parma.

TIZZONAIOS, in the *Glaſs Art*, are two apertures, one on each ſide of the working-furnace, by which a ſervitor night and day puts on coals to maintain the fire.

TLACOOZELOTL, in *Zoology*. See Ocelot.

TLAM, or Slam, in the *Alum-Works*, a word uſed by the workmen to expreſs a ſort of mud or foulneſs which does great hurt to the alum, rendering it foul and coarſe. The ſlam is a muddy ſubſtance ſettling to the bottom of the

the veſſels; but in the boiling of the liquor it gives a reddiſh colour, and diſorders the whole works when in any great quantity. They always paſs their liquor over four parcels of the alum-rock, and the laſt, if not carefully calcined, generally gives it this diſadvantageous mixture. Phil. Tranſ. N° 142.

TLANHQUACHUL, in *Ornithology*, the name of a Braſilian bird, very much approaching to the nature of the European platea, or ſpoonbill.

It is a very voracious bird, and feeds on live fiſh, but will not take or meddle with dead ones, and is all over of a beautiful red. It has a black ring round the upper part of its neck, and is common about the ſhores of the ſea and rivers.

TLAQUACUM, in *Zoology*, the name given by the Spaniards, and ſome others, to a very remarkable animal in America, commonly known among us by the name of the poſſum or opoſſum.

TLAQUATZIN, a name by which the natives in ſome parts of America call the opoſſum.

Tlaquatzin *Spinoſum*, the name by which Hernandez has called the cuanda, a ſort of Braſilian porcupine.

TLASCALA, in *Geography*, a province of North America, in the government of Mexico; bounded on the N. by Guaſteca, on the E. by the gulf of Mexico and the province of Guaxaca, on the S. by the Pacific ocean, and on the W. by the province of Mexico Proper; about 320 miles in length, and from 40 to 120 in breadth. The climate, ſoil, and produce, are much the ſame with thoſe of Mexico Proper. On the W. ſide there is a chain of mountains for the ſpace of eighteen leagues, very well cultivated; and on the N. is alſo a great ridge of mountains, covered with perpetual ſnow, the neighbourhood of which expoſes it to horrid tempeſts, hurricanes, and frequent inundations, whereby houſes, even on the top of eminences, are ſometimes endangered. Yet this is allowed to be the moſt populous country of all America: and this is partly aſcribed to its having been originally an ally to Cortez, in the conqueſt of Mexico, who obtained a grant of it from the emperor Charles VI. alſo king of Spain, by which it is ſtill exempt from any ſervice or duty whatſoever to that crown, only paying the king of Spain a handful of maize for each head, as an acknowledgment; which inconſiderable parcels were ſaid, upwards of fifty years ago, to make up 13,000 buſhels; for it produces ſo much of the Indian corn, that hence it had the name of Tlaſcala, that is, the Land of Bread. By this means the towns and villages ſwarm with Indians. This province was anciently a monarchy, till civil wars ariſing among the inhabitants, they formed themſelves into an ariſtocracy of many princes, in order to get rid of one. They divided their towns into different diſtricts; each of them nominated one of their chiefs to reſide in the court of Tlaſcala, where they formed a ſenate, whoſe reſolutions were a law to the whole. Under this form of government they maintained themſelves a long while againſt the kings of Mexico, and continued in it till the reception of the Spaniards under Cortez.

Tlascala, a town of North America, and anciently the capital of a province to which it gives name, ſituated on a river, which runs into the Pacific ocean. When the Spaniards firſt arrived here, it is ſaid to have contained 300,000 inhabitants: and Acoſta affirms, that it had a market-place large enough to hold 30,000 buyers and ſellers; that in the ſhambles were ſeldom leſs than 1500 ſheep, 4000 oxen, and 2000 hogs. But matters were ſo much altered, that Gemelli, who was here in 1698, ſays it was then become an ordinary village, with a pariſh-church, in which hangs up a picture of the ſhip which brought Cortez to La Vera Cruz. The inhabitants formerly offered up human ſacrifices, and when the Spaniards firſt arrived here, we are told by Diaz del Caſtillo, that they found wooden cages, in which priſoners were confined to be fatted for victims; 20 miles N. of Puebla de los Angelos. N. lat. 19° 45′. W. long. 98° 30′.

TLAYOTIC, in *Natural Hiſtory*. See Colic-*Stone*.

TLEMSAM, or Telemsen, in *Geography*. See Tremecen.

TLETSCH, a town of Ruſſia, in the government of Tobolſk, on the Irtiſch; 72 miles E.S.E. of Tobolſk.

TLEUQUECHOLTOTOTL, in *Ornithology*, the Mexican name of a bird of the wood-pecker kind, deſcribed by Nieremberg under the name of the *avis ſalutiferus*; the feathers of a red creſt it carries on its head being ſuppoſed a remedy for head-aches.

TLOS, in *Ancient Geography*, a town of Aſia Minor, in Lycia, at the paſs of a mountain, on the ſide of Cybara, according to Strabo. It is placed by Ptolemy in the number of the interior towns of Lycia, in the vicinity of mount Cragas.—Alſo, a town of Aſia, in Piſidia.

TLUMACZOW, in *Geography*, a town of Moravia, in the circle of Hradiſch; 15 miles N. of Hradiſch.

TMAIE′, a town of Egypt; 12 miles S.E. of anſora.

TMARUS, in *Ancient Geography*, a mountain of Epirus, in Theſprotia, at the foot of which was a temple. Strabo. It was alſo called Tamarus and Tomarus.

TMATARACAN, or Tamatercan, literally denoting the "ſwarm of beetles," called in Theodoſius's Itinerary "Tamatarce," a name anciently given to the city of Taman, over the ſuburbs of which extend all the ruins of the ancient city of Phanogoria. The diſtance acroſs the Boſphorus from Tmataracan to Kertchy, *i. e.* from Phanogoria to Panticapæum, is found to correſpond with the actual diſtance from Taman to Kertchy. Among other antiquities of Taman, one of the moſt remarkable is the Naumachia, or amphitheatre for naval combats, not leſs than 1000 paces in diameter, with its whole area paved. The ſubterraneous conduits for conveying water ſtill remain, but are applied to other uſes. The materials of the ruined buildings do not exiſt in the iſle of Taman, but muſt have been brought from the Crimea, from Greece, or in later ages, by the Genoeſe from Italy. The diſtance from Taman to Yenikele, on the oppoſite ſhore, is about 12 miles. Clarke's Travels, vol. ii.

TMESCHEDE, or Muschede, a town of Germany, in the county of Arenſberg, on the left ſide of the Roer; 3 miles N.W. of Arenſberg.

TMESIPTERIS, in *Botany*, an uncouth, however learned, name, compoſed of τμησις, *a notch*, or *inciſion*, and πτερις, *a fern*, becauſe the capſules are ſeated in the notches of the frond.—Bernhardi in Schrad. Journ. for 1800, 131. t. 2. f. 5. Willd. Sp. Pl. v. 5. 56. Swartz Fil. 187. Labill. Nov. Holl. v. 2. 105. t. 252. This fern is referred by Mr. Brown to Psilotum. (See that article.) We ought there to have noticed Mr. Brown's remark, that the plant of Forſter differs from Labillardiere's, in not having abrupt *leaves*, and that it was found in New Zeeland, not in the iſle of Tanna. Willdenow has juſtly obſerved the difference between Bernhardi's figure, and that of Labillardiere. Mr. Brown ſays both theſe ſpecies are paraſitical, on the ſtems of arboreſcent ferns.

TMESIS, τμησις, formed from τεμνω, *I cut*, in *Grammar*, a figure by which a compound word is ſeparated into two parts, and one or more words interpoſed between them.

Thus,

Thus, when Terence ſays, " quæ meo cunque animo libitum eſt facere," there is a tmeſis ; the word *quæcunque* being divided by the interpoſition of *meo*.

Lucretius abounds in tmeſes ; as " ſæpe ſalutantum tactu præterque meantum ;" or " diſſidio potis eſt ſcjungi, ſeque gregari ;" and " diſpectis diſque gregatis."

TMOLUS Mons, in *Ancient Geography*, a mountain of Aſia Minor, in Lydia. Strabo ſays that the town of Sardis was commanded by the Tmolus, a rich mountain, on the ſummit of which the Perſians had erected a turret, from which might be ſeen all the adjacent fields, which were watered by the Cnyſtrus. According to Homer it obtained, from its extraordinary elevation, the name of Ventoſe, or windy. From Pliny we learn that the Pactolus, Chryſorrhoas, and the fountain Tarne, had their ſources in this mountain, and that it produced excellent wine, highly commended by Pliny and Vitruvius. The ſummit is repreſented as always covered with ſnow. It was ſometimes denominated Timolis, as by Ovid,

" Deſernere ſibi Nymphæ ? . . . Timoli."

According to the mythologiſts, it was in this mountain that Apollo puniſhed Midas, king of Phrygia, by giving him aſſes' ears.

Tmolus, a town of Aſia Minor, in Lydia, on mount Tmolus. According to Tacitus, Tmolus was one of the twelve towns overthrown by an earthquake, in the fifth year of the reign of Tiberius, A.D. 117, and it was rebuilt by this prince.

TMORUS, the name of one of the ſummits of the Ceraunian mountains, in Epirus.

TMULGA, in *Geography*, a town of Algiers ; 10 miles E. of Sinaab.

TNYSSUS, in *Ancient Geography*, a town of Aſia Minor, in Caria.

TOA, in *Geography*, a river of the iſland of Porto Rico, which runs into the harbour of Porto Rico.

TOAD, *Rubeta*, *Rana Bufo* of Linnæus, in *Zoology*, a creature ſufficiently known. See Rana.

The toad has been generally conſidered as a poiſonous animal, but Mr. Pennant apprehends without ſufficient reaſon. They have been taken up in the naked hand without the leaſt injury, and quacks have even eaten them, and drank their juices without damage. Beſides, they are common food to many animals, as buzzards, owls, Norfolk plovers, ducks, and ſnakes ; of late, indeed, live toads have been applied to cancers, with a view of curing them : facts have been alleged in proof of their efficacy for this purpoſe. The mode of applying them has been to put the animal into a linen bag, and to hold its head, preſſing out of the bag, to the part, which it has ſoon laid hold of and ſucked with greedineſs till it dropped off dead. The creature has ſwelled and appeared to be in great pain ; often ſweats much and turns pale ; and ſometimes diſgorges, recovers, and becomes lively again. For other particulars, we muſt refer to Mr. Pennant's appendix *ubi infra*. The time when toads propagate is early in the ſpring ; at which ſeaſon the females are ſeen crawling about oppreſſed by the males, who continue on them for ſome hours, and adhere ſo faſt as to tear the ſkin from the part to which they ſtick. They impregnate the ſpawn as it is drawn out in long ſtrings, like a necklace. And the female is aſſiſted by the male, in diſcharging the ſpawn, who with his hinder feet pulls out the eggs, whilſt his fore-feet embraces her breaſt. The eggs are included each in a membranous coat that is very firm, in which is contained the embryo, and theſe eggs, faſtened to one another by a ſhort but ſtrong cord, form a kind of chaplet, the beads of which are diſtant from each other about half their length. The male, by drawing this cord with his paw, performs the functions of a midwife, and acquits himſelf in it, it is ſaid, with a dexterity which could not be expected from ſo lumpiſh an animal. Pennant's Brit. Zool. vol. iii. p. 14. p. 385, &c.

The toad of Surinam, or *rana pipa* of Linnæus, has long been an object of attention to the curious, on account of its enormous bulk and ugly form. Dr. Fermin, in his " Traité des Maladies les plus fréquentes à Surinam," &c. publiſhed at Maeſtricht in 1764, has given ſome remarks on its mode of generation. Having put three males and a female into an open veſſel of water, he obſerved that one of them had ſeveral ſpots on its back, which were eggs, each containing an embryo. At the end of three weeks, the animal ſeemed much agitated, and one of the cells on his back burſting open, a young one crept out of it. In five days no leſs than thirty-five of theſe cells opened in the ſame manner and produced as many animals. On the back of one of theſe which was diſſected, there were no leſs than one hundred and twenty of theſe cells, each of which he conſiders as a real matrix, in which its eggs are lodged and fecundated ; and, indeed, in one of them he diſcovered an embryo completely formed, enveloped in a kind of placenta, accompanied by two thin tranſparent membranes, ſeemingly analogous to the chorion and amnios in other animals. For other ſpecies of toad, ſee Rana.

Toad-*Fiſh*, *Rana piſcatrix*, in *Ichthyology*. See Lophius *Piſcatrix*, and Sea-*Devil*.

Toad-*Flax*, in *Botany*. Antirrhinum.

Toad-*Stone*, in *Mineralogy*, a variety of trap-rock. (See Trap.) The toad-ſtone of Derbyſhire is generally a dark-brown baſaltic amygdaloid, compoſed of an intimate intermixture of baſalt and green earth, and containing oblong cavities, principally filled with calcareous ſpar. It ſometimes aſſumes the form and texture of a compact baſalt, and is alſo found in a decompoſing ſoft ſtate, approaching to clay. In compoſition and appearance it bears a ſtrong reſemblance to ſome volcanic rocks ; and there are certain peculiarities in the geological poſition of this rock, which have excited conſiderable attention. Mr. Whitehurſt, in his Theory of the Earth, has given a particular account of the Derbyſhire toad-ſtone ; and has ſtated the number of beds, and the thickneſs of each, with that of the mountain lime-ſtone, with which it alternates, as under :

Firſt lime-ſtone	-	50 yards.
Firſt toad-ſtone	-	16
Second lime-ſtone	-	50
Second toad-ſtone	-	46
Third lime-ſtone	-	60
Third toad-ſtone	-	22
Fourth lime-ſtone	-	not cut through.

It appears, however, that the thickneſs and extent of the toad-ſtone beds are by no means ſo regular as thoſe of the other ſtrata, in the ſame diſtrict.

In ſome ſituations, one or more of the beds will become very thin, or be entirely wanting ; in other ſituations, a ſingle bed will be found of vaſt thickneſs : and maſſes of this ſubſtance, which cannot be referred to any of the three beds, will be found interpoſed in the lime-ſtone ſtrata. In ſome inſtances, particularly near Aſhover, nodules of lime-ſtone may be ſeen imbedded in toad-ſtone. Farey's Derbyſhire Report, vol. i. p. 276.

The moſt remarkable phenomenon which the beds of toad-ſtone preſent in Derbyſhire, is the complete ſeparation of the metallic veins which they generally occaſion. The mountain lime-

lime-ſtone of that diſtrict is interſected by numerous perpendicular metallic veins, which riſe from the loweſt lime-ſtone to the uppermoſt; but on ſinking through the vein in the firſt lime-ſtone, down to the firſt toad-ſtone, the vein will entirely diſappear, but on perforating through the toad-ſtone, it will be found again in the ſecond lime-ſtone; and the ſame appearances will be preſented on piercing through the ſecond and third beds of lime-ſtone, and the ſecond and third beds of toad-ſtone. See *Plate* IV. *Geology*, *fig.* 1. where 1, 2, 3, 4, repreſent the four beds of lime-ſtone; *b*, *b*, *b*, the three beds of toad-ſtone; and *v*, *v*, *v*, *v*, the metallic vein paſſing through the different lime-ſtone beds, but completely cut off or ſeparated by the intervening beds of toad-ſtone. To account for this interruption of the vein at *v*, *v*, *v*, Mr. Whitehurſt ſuppoſes that the toad-ſtone, in a ſtate of igneous fuſion, has burſt through the lower ſtrata, and has forced itſelf between the ſtrata of lime-ſtone by a lateral motion. Were this the caſe, we muſt admit that the toad-ſtone had riſen through fiſſures or dikes, ſimilar to what exiſt in many of the northern parts of Britain, and are called whin-dikes. The whin-ſtone, or baſalt, bearing a cloſe reſemblance to toad-ſtone, and the ſtrata in the peak of Derbyſhire being much fractured, we ſhould feel little difficulty in admitting the probability of Mr. Whitehurſt's theory, did it apply to the different phenomena which theſe beds of toad-ſtone preſent. According to this theory, the beds of toad-ſtone muſt have been interpoſed ſubſequently to the formation of the metallic veins. There are, however, inſtances, in which very large veins extend from the lime-ſtone to ſome depth in the toad-ſtone, and terminate in ſmall ſtrings of ore; in other inſtances, though the ore is not continued through the toad-ſtone, a ſmall vein filled with ſpar may be traced from No. 1. the firſt lime-ſtone, through *b*, to No. 2. the ſecond lime-ſtone. Such inſtances prove, in the moſt deciſive manner, that the formation of the veins was poſterior to that of the toad-ſtone. Hence we are led to ſeek for ſome other cauſe which may explain the abſence of metallic ores in the beds of toad-ſtone. This ſubject will be conſidered when we treat of metallic veins. See Trap, and Veins, *Mineral* and *Metallic*.

From the experiments of Dr. Withering on this ſtone with different acids, alkalies, and by fuſion, it appears that one hundred parts of it conſiſt of 63½ parts of ſiliceous earth, 16 of calciform iron, 7½ of calcareous earth, and 14⅔ of earth of alum. The aggregate of theſe ingredients is found to weigh 1⅔ parts more than the original maſs, which is aſcribed to the ſubſtance capable of uniting with fixable air, not having been fully ſaturated with it, as they would be after their precipitation by the earth of alum. (Phil. Tranſ. vol. lxxii. part ii. p. 353.) This ſubſtance differs little from baſaltes: it is ſofter, contains a ſmaller proportion of iron, and a larger of ſilex.

TOAGAMALLY, in *Geography*, a town of Hindooſtan, in the Carnatic; 17 miles W.S.W. of Tritchinopoly.

TOAIREH, a town of Egypt, on the coaſt of the Red ſea, where the water is ſalt; 3 miles N. of Kolzum.

TOALDO, Joseph, in *Biography*, a diſtinguiſhed philoſopher, was born in 1719 at a ſmall village near Maroſtica, in the valley of Vicenza, at the foot of the Alps, and ſent, in the year 1733, to the ſeminary of Padua, where he ſtudied Latin, rhetoric, philoſophy, theology, and particularly mathematics. In this ſeminary he afterwards became a teacher of grammar, rhetoric, philoſophy, and mathematics. His firſt literary work was a new edition of the writings of Galileo, to which he added ſeveral fragments never before publiſhed, with a preface and notes. For his ſervices to the above-mentioned ſeminary he was recompenſed with the benefice of Montegalda, which he enjoyed for 14 years, and which he exchanged for another more convenient, after his appointment by the ſenate of Venice, in 1762, to the profeſſorſhip of aſtronomy and meteorology in the univerſity of Padua. Here he conſtructed an obſervatory, begun in 1767 and completed in 1774. In 1769 he publiſhed at Padua a ſhort view of plane and ſpherical trigonometry, entitled "Tavole Trigonometriche, &c." which was reprinted and uſed in many of the Italian ſeminaries. He next publiſhed a treatiſe on the influence of the heavenly bodies on the weather and atmoſphere, containing the reſult of a long ſeries of meteorological obſervations. This work, printed at Padua in 1770, 4to., was tranſlated into different languages, and ſo well received, that he was admitted into various learned ſocieties. About the ſame time he preſented to the public eſſays in favour of electrical conductors, which cauſed them to be erected in the Venetian territories; alſo a chronological view of uncommon changes in the weather, with tables of the ſtate of the barometer, and the flux and reflux of the ſea. His meteorological journal was begun in 1773, and continued till his death. His celebrity was augmented in 1774 by an anſwer to a prize queſtion, propoſed by the academical ſociety of Montpelier, on meteorology applied to agriculture; and after this time he laboured inceſſantly in diffuſing meteorological ſcience. In 1777 he tranſlated Lalande's Aſtronomical Tables, and his "Abrégé de l'Aſtronomie;" and ſome time after, his "Aſtronomie des Dames;" erecting alſo in his obſervatory a marble buſt of that eminent aſtronomer. From this time he almoſt reſtricted his attention to aſtronomy and meteorology, endeavouring to confirm his hypotheſis of the influence of the moon on the different changes of the weather. He alſo publiſhed an hiſtorical view of the ſervices rendered by the Venetian ſchools to aſtronomy, geography, and navigation. In 1783 he obtained, in conjunction with his nephew Chiminello, who was his aſſiſtant in the obſervatory, the prize offered for the beſt treatiſe on the conſtruction of a comparative hygrometer; and in 1784 he publiſhed a ſmall work on the longitude, which was well received. He proceeded regularly with his journal till the year 1787, when a ſmall work in two ſheets was printed at Venice; and in the following year his Tables of Vitality appeared at Venice and Padua. Of his travels in 1780 and in 1788, in the courſe of which he examined the place where Hannibal croſſed the Alps, the reſult was inſerted in his diſſertation on the ſubject, printed in the fourth volume of the Tranſactions of the Academy of Padua. But our limits will not allow us to give even the titles of the numerous eſſays and papers which he publiſhed on various ſubjects, relating principally to meteorology. The journals of the period in which he lived contain many curious pieces contributed by this induſtrious inquirer into the operations and phenomena of nature. Beſides his publications, he left in MS. ſeveral papers, and particularly obſervations on the travels of Marco Polo, and on the real epoch of the Chineſe wall. The termination of Toaldo's life was accelerated by the chagrin which he felt, in conſequence of a fruitleſs attempt to ſerve a young man who had been deprived of his office. This irritation affected his health, ſo that in November, 1797, he was attacked by a nervous affection, which in a few days proved fatal, in the 79th year of his age.

"Toaldo," ſays his biographer, "was of ſmall ſtature; but, in general, had an engaging appearance that inſpired confidence

confidence and refpect. His deportment was eafy, and in his converfation, which was lively, he difplayed great knowledge, and an extenfive acquaintance with various branches of fcience. Simple in his manners, open and fincere, he indulged only the milder paffions; and feemed to have no other ambition than that of being ufeful. He was fteady in his friendfhip; always ready to do good offices in the moft difinterefted manner, and indulgent towards every one around him. To the talents of a literary man, he added the virtues of the citizen; and therefore was univerfally efteemed, but particularly by thofe who enjoyed his more intimate acquaintance." Phil. Mag.

TOALOOR, in *Geography*, a town of Hindooftan, in Baramaul; 3 miles S.E. of Wombinellore.

TOAMENSING, a townfhip of Pennfylvania; 50 miles N. of Philadelphia.—Alfo, a townfhip of Pennfylvania; 15 miles N. of Philadelphia.

TOANA, in *Ancient Geography*, a town of India, on this fide of the Ganges, eaft of this river, among the people called Nanichæ. Ptol.

TOANI, a people of Arabia Felix, in the environs of the ftrait of the Arabic gulf. Pliny.

TOB, or Tubia, a country on the other fide of Jordan, in the northern part of the tribe of Manaffeh. It was the country into which Jephtha retired, as we read in the book of Judges.

TOBA, in *Geography*, a fmall ifland in the Eaft Indian fea, near the weft coaft of Aroo. S. lat. 5° 8'. E. long. 135° 9'.

TOBACCO, Nicotiana, in *Botany*. See Nicotiana.

Tobacco, *Culture and Preparation of*. See Nicotiana.

Tobacco, *Hiftory of*. Tobacco was not known in Europe till after the difcovery of America by the Spaniards, and firft imported about the year 1560, as fome fay by fir Francis Drake.

The Americans of the continent call it *petun*, thofe of the iflands *yoli*. The Spaniards, who gave it the name *tobacco*, took it from Tabaco, a province of Yucatan, where they firft found it, and firft learned its ufe; or, as fome fay, it derived its name from the ifland of Tabago, or Tobago.

The French, at its firft introduction among them, gave it various names; as *Nicotiana*, or the *ambaffador's herb*, from John Nicot, then ambaffador of Francis II. in Portugal; who brought fome of it with him from Lifbon, and prefented it to a grand prior of the houfe of Lorrain, and to queen Catherine de Medicis; whence it was alfo called *queen's herb*, and *grand prior's herb*. They alfo gave it other names, which are now all reduced to the original name of *tobaco*, or *tobacco*, from *Tabaco*, given it by Hernandez de Toledo, who firft fent it into Spain and Portugal.

It appears from Lobel, that this plant was cultivated in Britain before the year 1570; and the introduction of the practice of fmoking it in England has been commonly afcribed to fir Walter Raleigh, about the year 1584. The cultivation of it is now common in various parts of the globe; and though prohibited by the laws of this country, the manufacture of it forms no inconfiderable branch of commerce.

Tobacco might be cultivated with advantage through the greater part of Europe; but almoft in every part of Europe it has become a principal fubject of taxation; and it has been fuppofed, that it would be more difficult to collect a tax from every farm where this plant might happen to be cultivated, than to levy one upon its importation at the cuftom-houfe. The cultivation of tobacco has been, upon this account, moft abfurdly, (fays Mr. Smith, Wealth of Nations,) prohibited through the greater part of Europe, which neceffarily gives a fort of monopoly to the countries where it is allowed; and as Virginia and Maryland produce the greateft quantity of it, they fhare largely, though not without fome competitors, in the advantage of this monopoly: the cultivation of it, however, is faid to be lefs profitable than that of fugar. At the time when the author publifhed his work above cited, about ninety-fix thoufand hogfheads of tobacco were annually purchafed in Virginia and Maryland, with a part of the furplus produce of Britifh induftry; but the demand of Great Britain does not require, perhaps, more than fourteen thoufand. If the remaining eighty-two thoufand, therefore, could not be fent abroad and exchanged for fomething more in demand at home, the importation of them muft ceafe immediately, and with it the productive labour of all thofe inhabitants of Great Britain, who are at prefent employed in preparing the goods with which thefe eighty-two thoufand hogfheads are annually purchafed. Thofe goods, which are part of the produce of the land and labour of Great Britain, having no market at home, and being deprived of that which they had abroad, muft ceafe to be produced. The moft round-about foreign trade of confumption, therefore, may, upon fome occafions, be as neceffary for fupporting the productive labour of the country, and the value of its annual produce, as the moft direct. In order to facilitate the great exportation which was neceffary, for getting rid of that which remained after the home confumption, the whole duties were drawn back, provided the exportation took place within three years.

The principal kinds of tobacco imported into England are, as we have already obferved, the Maryland, called Oroonoko, and the Virginia-tobacco. The former is not fo agreeable to the Britifh tafte as the fweet-fcented tobacco of the latter country; but the northern nations of Europe are faid to like it better.

Befides the tobacco of the Weft Indies, there are confiderable quantities cultivated in the Levant, the coafts of Greece, and the Archipelago, the ifland of Malta, and Italy. The marks of good twift tobacco are a fine fhining cut, an agreeable fmell, and that it has been well kept.

In the ifland of Ceylon, there are two kinds of tobacco cultivated for profit. They call both kinds *dunkol*, which fignifies a leaf, the ufe of which is to be fmoked. The one kind they call *hingele dunkol* or *fingele dunkol*, for they make no difference between the letter S and H in their pronunciation; the other they call *dunkol kappada; kappada* fignifies gelding, and is a word of Portuguefe origin. This *kappada* tobacco is much ftronger and more intoxicating than the other; but both kinds are the produce of the fame plant; only the fingle tobacco has very little care taken of it, being, after the fowing, in a manner left to itfelf; while the other has great pains beftowed upon it during the whole time of its growth, and till it is fit for ufe.

Some of the Ceylonefe chew this ftrong tobacco with their betel; and fome, who fmoke it alone, ufe no pipe, but, taking a long leaf of it, they roll it up into a long form, and cover it with the leaf of the wattukan-tree; they then light one end of it, and fmoke by the other, till the whole is confumed. Phil. Tranf. N° 278, p. 1143.

Although in Ruffia tobacco is not confidered as one of the general neceffaries of the lower claffes of the people, the practice of fmoking having been held as a fin to the end of the 17th century; neverthelefs the confumption of it is by no means fmall, and of courfe the importation always much overbalances the exports. In 1793, the former at St. Peterfburg

Peterſburg alone amounted to upwards of 47,000 rubles; and the latter, from all parts of the empire, barely to 20,000: however, the conſumption muſt have increaſed, as the exportation in 1768 is ſtated by Guldenſtædt at 21,000, and the whole of the importation at 108,000 rubles. The culture has been profitably carried on, ſince the year 1763, in various diſtricts of the empire. Moſt of it is obtained in the Malo-Ruſſian governments, where the cultivation was firſt encouraged; but it has been much cultivated in other regions, *e. g.* about the Volga and the Samara, and particularly by the Coſſacks on the Orenburg and Siberian lines. The greater part of the Ruſſian tobacco is derived from American, and ſome Turkiſh and Perſian ſeed. In the generality of the ſouthern governments, theſe plantations admit of being greatly multiplied. The different ſorts of tobacco and ſnuffs prepared from it, which are now in uſe, are to be attributed to the difference of the climate and ſoil in which it grows, and the peculiar mode of managing and manufacturing the plant, rather than to any eſſential difference in its qualities.

Tobacco, in the *Materia Medica*, *&c.* This is a well-known drug of a narcotic quality, which it diſcovers in all perſons, even in ſmall quantity, when firſt applied to them; and when uſed in large quantities, its effects have ſometimes been more violent, ſo as to have proved a mortal poiſon. Beſides its narcotic qualities, it poſſeſſes alſo a ſtrongly ſtimulant power, perhaps, as Dr. Cullen obſerves, with reſpect to the whole ſyſtem, but eſpecially with reſpect to the ſtomach and inteſtines; ſo as readily, even in no great doſes, to prove emetic and purgative.

The leaves of tobacco have a ſtrong diſagreeable ſmell, and a very acrid burning taſte: diſtilled in a retort, without addition, they yield an acrid, empyreumatic, poiſonous oil. They give out their acrid, matter both to water and ſpirit, but moſt perfectly to the latter: the aqueous infuſions are of a yellow or brown colour, the ſpirituous of a deep green. The ſeveral ſorts of tobacco imported from abroad are ſtronger in taſte than that of our own growth, and the extracts made from them much more fiery, but in leſs quantity.

Tobacco has been employed, in ordinary uſe, by ſnuffing, ſmoking, and chewing; and theſe practices have been common for more than 200 years to all Europe, and they have more or leſs prevailed in other parts of the globe. Like other narcotics, the uſe of it may be introduced by degrees; and its peculiar effects may hardly at all be manifeſted; but beyond certain limits, violent effects have been ſometimes produced on thoſe who have been accuſtomed to the uſe of it. The power of habit is often unequal, even among thoſe who have been addicted to this practice. Dr. Cullen mentions a lady, who had been for more than twenty years accuſtomed to take ſnuff at all times of the day; but ſhe found at length that indulging much in the uſe of ſnuff before dinner took away her appetite; and in proceſs of time, that a ſingle pinch, taken any time before dinner, palled her appetite for that meal. But when ſhe abſtained from the uſe of it, her appetite returned; and after dinner, for the reſt of the day, ſhe took ſnuff freely without inconvenience. When ſnuff, that is, tobacco in powder, is firſt applied to the noſe, it proves a ſtimulus, and excites ſneezing; but by repetition, that effect entirely ceaſes.

Snuff, when firſt employed, if it be not taken in ſmall quantity, and if it be not thrown out immediately by ſneezing, occaſions ſome giddineſs and confuſion of head: but theſe effects do not occur when perſons are habituated to the uſe of it. But ſuch perſons, if it be taken beyond the uſual quantity, experience the ſame conſequences; and the effect is manifeſt, not only on the ſenſorium, but on other parts of the ſyſtem, particularly the ſtomach, occaſioning a loſs of appetite, and other ſymptoms of a weakened tone in that organ. Dr. Cullen ſays, that he has obſerved ſeveral inſtances of perſons who take ſnuff to exceſs, ſuffering from it by a loſs of memory, by a fatuity, and by other ſymptoms of the weakened or ſenile ſtate of the nervous ſyſtem, induced before the uſual period. He has alſo found ſymptoms of dyſpepſia, and pains of the ſtomach, occurring every day, in conſequence of exceſs in the practice of taking ſnuff. Theſe ſymptoms have ſubſided, when the uſe of ſnuff has been diſcontinued. A ſpecial effect of ſnuffing, he ſays, is its exciting a conſiderable diſcharge of mucus from the noſe; and there have been ſeveral inſtances of head-aches, tooth-aches, and ophthalmias thus relieved: and when this diſcharge of mucus is conſiderable, the ceaſing or ſuppreſſion of it, by abſtaining from ſnuff, is apt to occaſion thoſe diſorders which it had formerly relieved. Another effect of taking ſnuff is this, that as a part of the ſnuff is often carried back into the fauces, ſo a part of this is carried down into the ſtomach, and then more certainly produces the above-mentioned dyſpeptic ſymptoms.

Smoking, when firſt practiſed, ſhews very ſtrongly the narcotic, vomiting, and even purging powers of tobacco, and it is very often uſeful as an anodyne; but by repetition theſe effects diſappear, or only ſhew themſelves when the quantity ſmoked is beyond what habit had before admitted of; and even in perſons much accuſtomed to it, it may be carried ſo far as to prove a mortal poiſon. From much ſmoking, all the ſame effects may ariſe which we ſaid might ariſe from the exceſs in ſnuffing.

With reſpect to the evacuation of mucus which is produced by ſnuffing, there are analogous effects produced by ſmoking, which commonly ſtimulate the mucous follicles of the mouth and fauces, and particularly the excretories of the ſalivary glands. By the evacuation from both ſources, with the concurrence of the narcotic power, the tooth-ache is often greatly relieved by it; but we have not found the ſmoking relieve head-aches and ophthalmias ſo much as ſnuffing often does. Sometimes ſmoking dries the mouth and fauces, and occaſions a demand for drink; but, as commonly the ſtimulus it applies to the mucous follicles and ſalivary glands draws forth their liquids, it occaſions on the other hand a frequent ſpitting.

So far as this is of the proper ſaliva, it occaſions a waſte of that liquid ſo neceſſary in the buſineſs of digeſtion; and both by this waſte, and by the narcotic power at the ſame time applied, the tone of the ſtomach is often weakened, and every kind of dyſpeptic ſymptoms is produced. Though in ſmoking a great part of the ſmoke is again blown out of the mouth, ſtill a part of it muſt neceſſarily paſs into the lungs, and its narcotic power applied there often relieves ſpaſmodic aſthma; and by its ſtimulant power it there alſo ſometimes promotes expectoration, and proves uſeful in the catarrhal or pituitous difficulty of breathing.

Smoking has been frequently mentioned as a means of guarding men againſt contagion. In the caſe of the plague, the teſtimony of Diemerbroek is very ſtrong; but Rivinus and others give us many facts which contradict this; and Chenot gives a remarkable inſtance of its inutility. We cannot indeed ſuppoſe that tobacco contains an antidote of any contagion, or that in general it has any antiſeptic power; and therefore we cannot allow that it has any ſpecial uſe in this caſe: but it is very probable that this and other narcotics, by diminiſhing ſenſibility, may render men leſs liable to contagion; and by rendering the mind leſs active and anxious, it may alſo render men leſs liable to fear, which has

has ſo often the power of exciting the activity of the contagion. The antiloimic powers of tobacco are therefore on the ſame footing with thoſe of wine, brandy, and opium.

The third mode of uſing tobacco is that of chewing it, when it ſhews its narcotic qualities as ſtrongly as in any other way of applying it; though the nauſeous taſte of it commonly prevents its being carried far in the firſt practice. When the practice, however, is continued, as it is very difficult to avoid ſome part of it diſſolved in the ſaliva from going down into the ſtomach, ſo this, with the nauſea excited by the taſte, makes vomiting more readily occaſioned by this than the other modes of applying it. They are the ſtrong, and even diſagreeable impreſſions repeated, that give the moſt durable and tenacious habits; and therefore the chewing of tobacco is apt to become one of theſe: and it is therefore in this way that it is ready to be carried to the greateſt exceſs, and to ſhew all the effects of the frequent and large uſe of narcotics. As it commonly produces a conſiderable evacuation from the mouth and fauces, ſo it is the moſt powerful in relieving the rheumatic affection of tooth-ache. This practice is alſo the occaſion of the greateſt waſte of ſaliva; and the effects of this in weakening digeſtion, and perhaps from thence eſpecially, its noted effect of producing emaciation, may appear.

The effects already recited of the different modes of employing tobacco depend eſpecially upon its narcotic power, and certain circumſtances accidentally attending its application to the noſe and mouth: but as we have obſerved before, that beſide its narcotic, it poſſeſſes alſo a ſtimulant power, particularly with reſpect to the alimentary canal: by this it is frequently employed as a medicine for exciting either vomiting or purging, which it does as it happens to be more immediately applied to the ſtomach or to the inteſtines.

An infuſion of from half a drachm to a drachm of the dried leaves, or of theſe as they are commonly prepared for chewing, for an hour or two, in four ounces of boiling water, affords an emetic which has been employed by ſome practitioners, but more commonly by the vulgar only. As it has no peculiar qualities as an emetic, and its operation is commonly attended with ſevere ſickneſs, it has not been, nor is it likely ever to come into common practice with phyſicians.

By long boiling in water, its deleterious power is ſaid to be abated, and at length deſtroyed: an extract made by long coction, is recommended by Stahl and other German phyſicians, as the moſt effectual and ſafe aperient, detergent, expectorant, diuretic, &c.; but the medicine muſt neceſſarily be precarious in ſtrength, and has never come into uſe among us. Lewis Mat. Med.

It is more commonly employed as a purgative in glyſters; and, as generally very effectual, it is employed in all caſes of more obſtinate coſtiveneſs; and its powers have been celebrated by many authors. Dr. Cullen has known it to be in frequent uſe with ſome practitioners: and he adds, it is indeed a very effectual medicine, but attended with this inconvenience, that when the doſe happens to be in any exceſs, it occaſions ſevere ſickneſs at the ſtomach, and it has been known to frequently occaſion vomiting.

A ſtrong decoction of tobacco, with proper carminatives and cathartics, given glyſter-wiſe, ſometimes proves of good effect in what is uſually called the ſtone colic, and alſo in the iliac paſſion.

It is well known, that in caſes of obſtinate coſtiveneſs, in ileus and incarcerated hernia, the ſmoke of burning tobacco has been thrown into the anus with great advantage. The ſmoke operates here by the ſame qualities that are in the infuſions of it above-mentioned: but as the ſmoke reaches much farther into the inteſtines than injections can commonly do, it is thereby applied to a larger ſurface, and may therefore be a more powerful medicine than the infuſions. In ſeveral inſtances, however, ſays Dr. Cullen, I have been diſappointed of its effects, and have been obliged to have recourſe to other means.

Bates and Fuller give ſome receipts, in which tobacco is an ingredient, with mighty encomiums, in aſthmatic caſes.

Hoffman obſerves, that horſes have been often relieved by this remedy, but in human ſubjects it has been rarely tried; and ſays he has known ſome of the common people, who laboured under excruciating pains of the inteſtines, freed in an inſtant from all pain by ſwallowing the ſmoke. Both the decoction and the ſmoke have not unfrequently been injected in caſes of incarcerated herniæ, and often with ſucceſs. The ſmoke thus applied is recommended as one of the principal means for the revival of perſons apparently dead from drowning or other ſudden cauſes; but ſome ſuſpect the narcotic power of tobacco as unfavourable in theſe caſes.

The infuſion of tobacco, when it is carried into the blood-veſſels, has ſometimes ſhewn its ſtimulant powers exerted in the kidneys; and very lately we have had it recommended to us as a powerful diuretic of great ſervice in dropſy. Upon the faith of theſe recommendations we have now employed this remedy in various caſes of dropſy, but with very little ſucceſs. From the ſmall doſes that are proper to begin with, we have hardly obſerved any diuretic effects; and though from larger doſes they have in ſome meaſure appeared, we have ſeldom found them conſiderable: and when, to obtain theſe in a greater degree, we have gone on increaſing the doſes, we have been conſtantly reſtrained by the ſevere ſickneſs at ſtomach, and even vomiting, which they occaſioned: ſo that we have not yet learned the adminiſtration of this remedy, ſo as to render it a certain or convenient remedy in any caſes of dropſy.

Tobacco is ſometimes employed externally in unguents and lotions, for cleanſing foul ulcers, deſtroying cutaneous inſects, and other like purpoſes: it appears to be deſtructive to almoſt all kinds of inſects, to thoſe produced on vegetables as well as on animals. Lewis.

A ſtrong decoction of the ſtalks, with ſharp-pointed dock, and alum, is ſaid to be of good ſervice, uſed externally, in cutaneous diſtempers, eſpecially the itch: ſome boil them for that purpoſe in urine. The ſame decoction is ſaid to be infallible in curing the mange in dogs.

Tobacco beat into a maſh with vinegar or brandy, and laid on the ſtomach, has ſometimes good effects in removing hard tumours of the hypochondria. We have the hiſtory of two cures made by ſuch applications in the Med. Eſſ. Edinb. vol. ii. p. 41.

The juice of this plant is ſaid to be good againſt ulcers and mortifications. Boyle's Works, Abr. vol. i. p. 56.

Some caution, however, Dr. Lewis obſerves, is requiſite even in the external uſes of tobacco, particularly in ſolutions of continuity: there are inſtances of its being thus tranſmitted into the blood, ſo as to produces violent effects.

A drop or two of the chemical oil of tobacco being put on the tongue of a cat, produces violent convulſions, and death itſelf in the ſpace of a minute; yet the ſame oil uſed in lint, and applied to the teeth, has been found of ſervice in the tooth-ache; though it muſt be to thoſe that have been uſed to the taking of tobacco, otherwiſe great ſickneſs, retching, vomiting, &c. happen; and even in no caſe is the internal uſe of it warranted by ordinary practice. See experiments on the effects of oil of tobacco on pigeons, by M. Fontana, in which he found vomiting to be a conſtant effect of this poiſon, as he calls it, and the loſs of motion in in the part to which it is applied an occafional or accidental effect, in Phil. Tranf. vol. lxx. part i. append. p. 38, or Fontana fur les Poifons, &c. Florence, quarto.

In cafes of obftinate ulcers, the infufion has been employed as a lotion with advantage; but the many inftances of its being abforbed, and thus proving a violent poifon, diffuade from the practice; efpecially as there are other medicines of greater efficacy, that may be ufed more fafely. Bergius recommends it to be employed as a fomentation in the paraphymofis.

Sim. Paulli, phyfician to the king of Denmark, in an exprefs treatife on tobacco, obferves, that the merchants frequently lay it in bog-houfes, to the end that, becoming impregnated with the volatile falt of the excrements, it may be rendered the brifker, more fetid, and ftronger.

Amurath IV. emperor of the Turks, the grand duke of Mufcovy, and the emperor of Perfia, have prohibited the ufe of tobacco in their ftates. Our king James I. wrote a treatife exprefsly againft it, entitled "A Counterblaft to Tobacco." By a bull of pope Urban VIII. fuch are excommunicated as take tobacco in churches.

Tobacco, *Laws and Regulations concerning.*—Tobacco is not to be planted in England, on forfeiture of 40*s.* for every rod of ground thus planted; but this fhall not extend to hinder the planting of tobacco in phyfic gardens, in quantities not exceeding half a pole of ground, and alfo on forfeiture of 10*l.* for every rod. (15 Car. II. c. 7. 12 Car. II. c. 34.) And juftices of peace have power to iffue warrants to conftables, to fearch after and examine whether any tobacco be fown or planted, and to deftroy the fame, which they are to do under penalties, &c. 22 & 23 Car. II. c. 26. 5 Geo. c. 11.

The act of 29 Geo. III. c. 68. regulating the importation, exportation, and manufacture of tobacco and fnuff, and alfo that of 30 Geo. III. c. 40. made to explain and amend the former, are fo extended, and comprehend fo great a variety of particular regulations, as not to admit of minute recital in this place. The former repeals a confiderable number of preceding ftatutes. By 49 Geo. III. c. 68. and c. 69. all duties under the refpective departments of Cuftoms and Excife are repealed, and other duties are granted in lieu of them. Tobacco and fnuff are alfo fubject to annual duties by the act for continuing the duties on penfions, offices, &c.; and certain drawbacks are allowed upon the exportation of them: which duties are to be under the management of the commiffioners of the cuftoms and excife. 43 Geo. III. c. 68. and c. 69.

No tobacco fhall be imported but from America, on pain of forfeiture, with the veffel and its contents; except from Spain, Portugal, and Ireland, from which it may be imported under certain regulations. (29 Geo. III. c. 68.) But tobacco of the territories of Ruffia or Turkey may be imported from thence in Britifh-built fhips, and warehoufed, and may be exported or entered for home confumption, on payment of the like duties as tobacco of the United States of America; and on its being manufactured in Great Britain and exported fhall be entitled to the drawbacks. (43 Geo. III. c. 68.) By 45 Geo. III. c. 57. tobacco, the production of the Weft Indies or the continent of America, belonging to any foreign European ftate, may be imported into certain ports fpecified in the act, and exported to any port of the united kingdom, fubject to the regulations of the act; and fuch tobacco fhall pay the fame duties as that which is the growth of the Britifh Weft Indies, or of the United States of America. By 49 Geo. III. c. 25. unmanufactured tobacco may be imported from any place in Britifh veffels navigated according to law, or in foreign fhips navigated in any manner whatever belonging to any ftates in amity with Great Britain; and fuch tobacco fhall be liable to the fame regulations as tobacco from the Britifh plantations.

But no tobacco or fnuff fhall be imported in any veffel of lefs burthen than 120 tons; nor any tobacco-ftalks, tobacco-ftalk flour, or fnuff-work, in any veffel whatever; nor any tobacco or fnuff in cafks lefs than 450lbs. on the like penalty; except loofe tobacco for the crew, not exceeding 5lbs. for each perfon; nor fhall the veffel be forfeited, if proof be made from the fmallnefs of the quantity that fuch tobacco or fnuff was on board without the knowledge of the owner or mafter. 29 Geo. III. c. 68.

And no tobacco or fnuff fhall be imported except at London, Briftol, Liverpool, Lancafter, Cowes, Falmouth, Whitehaven, and Hull (and by 31 Geo. III. c. 47. Newcaftle-upon-Tyne); on the like forfeiture.

			£	s.	d.
Every manufacturer of tobacco or fnuff fhall take out a licence from the officers of excife, for which he fhall pay, if the quantity of tobacco and fnuff-work, weighed by him for manufacture within the year, ending the 10th of October previous to his taking out fuch licence, did not exceed	-	20,000 lbs.	2	0	0
If above 20,000 and not exceeding		30,000	3	0	0
30,000	-	40,000	4	0	0
40,000	-	50,000	5	0	0
50,000	-	60,000	6	0	0
60,000	-	70,000	7	0	0
70,000	-	80,000	8	0	0
80,000	-	90,000	9	0	0
90,000	-	100,000	10	0	0
100,000	-	120,000	12	0	0
120,000	-	150,000	15	0	0
150,000	-	-	20	0	0
Every perfon who fhall firft become a manufacturer of tobacco or fnuff, fhall pay for every fuch licence 2*l.*, and within ten days after the 10th of October next after taking out fuch licence, fuch further additional fum, as with the faid 2*l.* fhall amount to the duty herein before directed to be paid, according to the quantity of tobacco and fnuff-work weighed for manufacture within the preceding year	-	-	2	0	0

and a furcharge.

And every dealer in tobacco and fnuff fhall take out a licence in like manner, for which he fhall pay, within the liberties of the chief office in London, 5*s.*, elfewhere 2*s.* 6*d.* 43 Geo. III. c. 69. Sched. (A.)

But perfons licenfed as manufacturers, who fhall not fell tobacco in a lefs quantity than four pounds, nor fnuff in two pounds, need not be licenfed as dealers. 29 Geo. III. c. 68.

Every perfon who fhall manufacture or deal in tobacco or fnuff without taking out fuch licence; or fhall not renew the fame ten days at leaft before the end of the year, fhall forfeit, if a manufacturer, 200*l.*, and if a dealer, 50*l.*

But no perfon fhall be liable to the faid penalty of 50*l.* for felling unmanufactured tobacco or fnuff, whilft remaining in the king's warehoufe.

But perfons in partnerfhip need not take out more than one licence for one houfe.

Every perfon who fhall manufacture tobacco, tobacco-ftalks, or returns of tobacco, or flatten any tobacco-ftalks, or or cut the ſame into Spaniſh, ſhall be deemed a manufacturer of tobacco. And every perſon who ſhall grind or manufacture any tobacco-ſtalk flour, ſnuff-work or ſnuff, ſhall be deemed a manufacturer of ſnuff. And every perſon who ſhall ſell any tobacco, tobacco-ſtalks, or returns of tobacco, or ſtalks flattened or cut into Spaniſh, ſhall be deemed a dealer in tobacco. And every perſon who ſhall ſell any tobacco-ſtalk flour, ſnuff-work or ſnuff, ſhall be deemed a dealer in ſnuff, within the meaning of this act.

Every manufacturer and dealer ſhall make entry in writing of his houſe or place intended to be made uſe of for manufacturing, keeping, or ſelling tobacco or ſnuff, three days before he ſhall begin, on pain of forfeiting 200*l.*, and alſo the tobacco and ſnuff there found, together with the caſks and package, which may be ſeized by the officers of the cuſtoms or exciſe.

Every manufacturer, within the limits of the head office, muſt be an occupier of a tenement of 10*l.* a-year, and pay to the pariſh rates; elſewhere, he muſt pay to the church and poor.

Every ſuch manufacturer ſhall, three days before he begins, make entry in writing at the exciſe-office of all mills, preſſes, engines, rollers, ſtoves, mullers, or ſpinning-wheels, intended to be uſed by him about the manufacturing of tobacco or ſnuff; on pain of forfeiting 50*l.* for every ſuch utenſil not entered.

Every ſuch manufacturer and dealer ſhall cauſe to be put up in large legible characters over his door, or on ſome conſpicuous part of ſuch houſe or place, the words *Manufacturer of, and Dealer in Tobacco and Snuff*, or *Tobacco* or *Snuff*, or *Manufacturer of*, or *Dealer in Tobacco and Snuff*, or *Tobacco* or *Snuff* (as the caſe may be); on the penalty of 50*l.*

If any perſon, who has not made ſuch entry as aforeſaid, ſhall put up the ſaid words, he ſhall forfeit 100*l.*

And by 30 Geo. III. c. 40. no perſon ſhall ſet up or begin any manufactory of tobacco or ſnuff within five miles of the ſea-coaſt, except in the ports and places aforeſaid, where tobacco may be imported, or places within three miles thereof; or in cities, or the ſuburbs thereof, and market-towns; and no entry thereof ſhall be of any avail. But the ſame ſhall not extend to places duly entered before the 5th of July, 1789.

But tobacco and ſnuff may be manufactured by any unlicenſed Spaniſh cutter or ſnuff-miller at any entered mill, on account of any licenſed manufacturer, provided the ſame be legally permitted from ſuch manufacturer, and for the ſole purpoſe of manufacturing or grinding. 29 Geo. III. c. 68.

Every manufacturer ſhall give notice in writing to the officers (if in London ſix, in cities and market-towns twelve, and elſewhere twenty-four hours), before he ſhall begin to ſtrip, ſpin, or preſs any tobacco for cutting; or make any tobacco into carrots, or flatten any ſtalks for Spaniſh; and ſhall expreſs therein the weight of each article, and the time he intends to begin: and the officer ſhall attend accordingly, and he ſhall begin within one hour of the time ſo mentioned, and ſhall proceed without delay; and ſhall afterwards deliver a declaration in writing to ſuch officer, of the quantity intended to be uſed for each ſort of tobacco; on the penalty of 20*l.* and ſuch notice being void. 30 Geo. III. c. 40.

Provided, that if ſuch tobacco ſhall afterwards appear to be unfit for the purpoſe ſpecified in ſuch declaration, it may be applied to any other purpoſe, on giving 48 hours' notice to the officer of the ſort it is intended for. 29 Geo. III. c. 68.

Such manufacturer, as ſoon as the manufacturing is finiſhed, ſhall deliver to the officer a declaration of the weight of the different ſorts of tobacco ſo manufactured, and the number of the rolls or carrots made, and the weight thereof, and of the tobacco-ſtalks and returns ariſing from the operation; and ſhall keep each ſort ſeparate for twenty-four hours, or until an account be taken; on the penalty of 50*l.*

If any manufacturer ſhall make, or have in his poſſeſſion, any roll or carrot tobacco for exportation, which ſhall have any tobacco-ſtalks therein, the ſame ſhall be forfeited, and may be ſeized, and he ſhall alſo forfeit 50*l.*

Every perſon who ſhall cut any walnut-tree, or other leaves, herbs, or plants, in imitation of tobacco (not being tobacco-leaves or plants); or ſhall colour the ſame ſo as to reſemble tobacco; or ſhall mix any ſuch leaves, herbs, or plants with tobacco; or ſhall ſell, or expoſe to ſale, or have in his poſſeſſion any ſuch leaves, herbs, or plants ſo cut, coloured, or mixed, ſhall forfeit the ſame with the caſks and package, which may be ſeized; and alſo 200*l.*

Provided, that nothing herein ſhall extend to prohibit any ſuch manufacturer from dyeing tobacco, or for having ſuch dye in his poſſeſſion for that purpoſe. 30 Geo. III. c. 40.

Every manufacturer of ſnuff ſhall provide proper moveable caſks for preparing, laying down, or putting into bins ſnuff-work and tobacco-ſtalks for flour; and ſhall place them ſo as that the officer may conveniently examine and weigh the ſame at all times; and ſhall mark every ſuch caſk with a progreſſive number, and the tare and weight thereof; and ſhall not lay down any ſnuff-work in any caſk not ſo marked; nor put the ſame in any bin; on the penalty of 50*l.* 29 Geo. III. c. 68.

Such manufacturer of ſnuff ſhall, before he begins to liquor, or cut any tobacco or ſtalks, &c. or to lay down any ſnuff-work, give like notice as aforeſaid to the officer, and ſhall in ſuch notice declare the weights thereof reſpectively, and the number of each particular caſk or bin in which the ſame is intended to be laid down; and ſuch officer ſhall attend accordingly; and ſuch perſon ſhall begin within one hour of the time ſo mentioned, and ſhall without delay proceed therein, until the whole is weighed; and ſhall then deliver an account in writing of the quantity intended for each ſort of ſnuff or flour; and when put into caſks, he ſhall give a like notice, and in the preſence of the officer ſhall affix to each caſk a ticket ſpecifying the number of ſuch caſk, and the weight of the ſnuff-work, &c. therein, and the time when laid down, and what ſort of ſnuff it is intended for; which ticket ſhall be ſigned both by ſuch manufacturer or his ſervant and the officer; and when the ſame is intended to be taken out to be ground, like notice ſhall be given, and the ſame ſhall be weighed out in the preſence of the officer. And no ſuch manufacturer ſhall mix ſnuff-work or tobacco-ſtalks for flour of one making with another; on pain of forfeiting for every offence aforeſaid 50*l.*

Provided always, that if ſuch ſnuff-work ſhall afterwards appear to be unfit for the purpoſes ſpecified in ſuch declaration, or be intended to be manufactured contrary thereto, notice thereof in writing ſhall be given to the officer within forty-eight hours after the delivery of ſuch declaration, and a freſh declaration ſhall be given, ſpecifying the ſort it is intended for, and ſuch manufacturer ſhall proceed therein in manner as aforeſaid. 30 Geo. III. c. 40.

Scotch ſnuff and tobacco-ſtalk flour may be manufactured into brown Scotch ſnuff, and tobacco-ſtalk flour into rappee ſnuff, ſubject to the regulations aforeſaid. And on taking

 ſtock,

ftock, certain credits fhall be allowed, as fet forth in the act; and if on taking fuch ftock any excefs be found, the fame fhall be forfeited, and may be feized. 30 Geo. III. c. 40.

And to fnuff-work in operation, tobacco, tobacco-ftalks, or flour, or returns of tobacco, may be added, on giving to the officer, previous to fuch increafe being made a like notice, and conforming to the regulations fpecified in the act.

The whole of any parcel of fnuff-work in cure, may be mixed with the whole of any other parcel in cure, although laid down at different times, if the fame be mixed in the prefence of an officer, to whom notice is to be given as aforefaid.

If any manufacturer has occafion to fupply his cuftomers with manufactured tobacco or fnuff from any parcel in operation, before the whole is finifhed, he may, in the prefence of an officer, take for the purpofe aforefaid any manufactured tobacco or fnuff not lefs than 200lbs. But if taken without conforming to the regulations fpecified in the act, he fhall forfeit 50*l.*

And every manufacturer fhall diligently manufacture fuch fnuff-work, and ftalks for flour, when taken out of fuch cafk, according to the notice given; and when the fame is finifhed, he fhall deliver to the officer a declaration in writing of the weight of each fort fo made, and fhall keep the fame feparate for twenty-four hours, or until the officer fhall have taken an account thereof; on the penalty of 50*l.* 29 Geo. III. c. 68.

Every manufacturer may have a ftore-room for keeping dried Scotch fnuff, but the fame fhall have but one door or opening, which fhall be locked up, fealed, and fecured by the officer; wherein may be depofited Scotch fnuff returned directly from the mill for fix months, without being taken as part of his ftock. And when the fame is intended to be taken out of fuch room, notice fhall be given to the officer, who fhall attend and open fuch room, and fuch fnuff fhall be taken out in his prefence; and fhall be kept feparate one making from another; on the penalty of 50*l.* And if any fuch manufacturer fhall open fuch ftore-room, except in the prefence of an officer, he fhall forfeit 200*l.*

Every perfon, who fhall cut any walnut, hop, fycamore, or other leaves, or any other herbs, plants, or materials (not being tobacco-leaves or plants); or fhall colour or cure any fuch, to make the fame refemble tobacco; or fhall fell the fame, mixed or unmixed, for tobacco;——fhall forfeit 5*s.* a pound, half to the king (charges of the profecution firft deducted), and half with full cofts to him who fhall fue. 1 Geo. I. ft. 2. c. 46.

Every perfon who fhall make, mix, or colour any fnuff with ochre, umber, or other colouring, except water tinged with Venetian red only; or fhall mix with fnuff any fuftic or yellow ebony, touchwood, or other wood, or any dirt, fand, or fmall tobacco fifted from tobacco,—fhall forfeit the fame, and 3*l.* for every pound weight, half to the king, and half to him that fhall fue. 1 Geo. I. ft. 2. c. 46. 5 Geo. I. c. 11.

And all fuch leaves and other materials, and all engines, utenfils, and tools for working the fame, may be fearched for and feized, by warrant of three commiffioners of the treafury or of the cuftoms. 1 Geo. I. ft. 2. c. 46.

If any perfon fhall mix any fuftic, or other wood, or any leaves, herbs, or plants (other than tobacco), or any earth, clay, or tobacco-fand, with any fnuff-work or fnuff; or fhall colour the fame with any fort of colouring (water tinged with colour only excepted); he fhall forfeit 200*l.* And if any manufacturer or dealer in fnuff fhall fell, or expofe to fale, or have in his entered premifes, any fuftic, yellow ebony, touchwood, logwood, red or Guinea wood, Braziletto or Jamaica wood, Nicaragua wood, or Saunders wood; or any walnut-tree, hop, or fycamore-leaves; or fhall have in his poffeffion any of the aforefaid articles; or any other wood, leaves, herbs, plants, earth, clay, or tobacco-fand, mixed with any fnuff-work or fnuff; or fuch fnuff-work or fnuff-coloured (except as aforefaid); he fhall forfeit 50*l.*, and the fame fhall be forfeited, and may be feized. 29 Geo. III. c. 68.

Any manufacturer of Britifh rappee, Scotch or brown Scotch fnuff completely finifhed, and of which an account has been taken by the officer, may liquor the fame, before mixing with fnuff of a different making, fo as it exceed not the legal credit. And if fuch manufacturer fhall intend to liquor fnuff, for which the legal credit has not been received, he fhall give notice thereof to the officer. But no fnuff fhall be liquored in lefs parcels than 200lbs., nor in more than four different parcels of one making. 30 Geo. III. c. 40.

Snuff, for which fuch allowance fhall have been made, fhall be kept feparate from all other fnuff, and fhall be fhewn to the officer on demand; on the penalty of 20*l.*

Every manufacturer and dealer, who fhall mix Spanifh with fhort cut tobacco, or any tobacco-ftalk flour with fnuff, or fnuff of different forts the one with the other, fhall every day enter in a book or paper, the quantity fold, fent out, or confumed of two pounds or upwards, and the grofs weight thereof, and the time when mixed; on pain of forfeiting 50*l.* 29 Geo. III. c. 68.

When any officer fhall difcover that the manufacturing of tobacco or fnuff is carried on in any unentered place, and that any perfon knowingly affifts, or is any ways concerned in carrying on the fame, every fuch perfon fhall forfeit 30*l.* over and above all penalties and forfeitures that the proprietor thereof fhall be liable to; and fuch officer or his affiftant, may ftop and arreft fuch perfon, and convey him before a juftice, who, on his confeffion, or the oath of one witnefs, may convict fuch perfon fo difcovered, who fhall immediately pay the faid penalty to fuch officer or perfon who brought him; and if not fo paid, fuch juftice fhall commit him to the houfe of correction to hard labour for fix months from the day of conviction, or until the faid penalty be paid. And for a fecond offence, he fhall forfeit 60*l.*, which, if not paid in manner aforefaid, he fhall be committed in like manner for one year, or until fuch penalty be paid.

The officers of excife (between five in the morning and eleven in the evening without a conftable, and between eleven in the evening and five in the morning with a conftable) may enter into any houfe or place belonging to or made ufe of by any manufacturer or dealer, and take an account of the ftock found therein; and fhall give credit (as particularly fet forth in the act). And if at any time any excefs in ftock fhall be found, of which no notice has been given to the officer, unlefs received by permit, the fame fhall be deemed and taken to be brought in without permit.

Every manufacturer and dealer fhall keep fufficient fcales and weights for the ufe of the officers, on the penalty of 100*l.* And if any fuch perfon fhall, in weighing, ufe any art or device to prevent fuch officer from taking a true weight of fuch tobacco, &c. he fhall forfeit 200*l.* together with fuch fcales and weights, which may be feized.

And every fuch manufacturer and dealer fhall with a fufficient number of his fervants affift fuch officer in taking fuch account of ftock, on pain of forfeiting 50*l.*

But

But no officer ſhall weigh any tobacco, tobacco-ſtalks, or ſnuff-work, whilſt actually in the operation of manufacture; except ſnuff-work intended to be ſent out or received by permit.

And unmanufactured tobacco, tobacco in the ſtate of operation, and manufactured tobacco, ſhall be kept ſeparate from each other; on the penalty of 50*l*.

The officers ſhall be permitted to take ſamples of tobacco or ſnuff, &c. in the poſſeſſion of any manufacturer or dealer, paying for the ſame (if demanded) the value or uſual price; on the penalty of 100*l*. upon refuſal.

Every manufacturer and dealer ſhall, in a book or paper, to be furniſhed by the officers, keep an account of all tobacco, &c. and ſnuffs which he ſhall have ſold, ſent out, or conſumed the preceding day, in quantities of 4lbs. or upwards, of tobacco, &c. and 2lbs. or upwards of ſnuffs; and alſo another book or paper in like manner, if under 4lbs. of tobacco, &c. or 2lbs. of ſnuffs. But no ſuch perſon ſhall have more than one ſuch book or paper of each ſort at the ſame time, which is to be returned to the officer, if in London, or any city or market-town every ſix weeks, elſewhere every ſix months, or when the ſame is filled up or demanded; and ſhall be verified on oath. And ſuch books and papers ſhall lie open for the inſpection of the officer, and ſhall be made up at his requeſt; on the penalty of 100*l*. for every offence.

If any officer ſhall diſcover any increaſe in ſtock not legally accounted for, the ſame ſhall be deemed and taken to be made by a commodity, for which no duty has been paid, and privately brought in without permit; and ſuch increaſe ſhall be forfeited, and may be ſeized; and the perſon, in whoſe ſtock ſuch increaſe ſhall be found, ſhall alſo forfeit 20*l*.

But Scotch ſnuff, in the cuſtody of a manufacturer or dealer, not having gained more than 5lbs. in the 100lbs. by the moiſture of the air, ſhall be deemed a fair commodity, and ſuch perſon ſhall have credit for the ſame in his ſtock, and may remove the ſame by permit. And ſuch ſnuff ſhall be kept ſeparate from all other ſnuff, and ſhewn to the officer upon demand; on the penalty of 20*l*.

If any manufacturer ſhall remove any tobacco or ſnuff out of his entered houſe or place, before the ſame has been weighed, and taken an account of by the officer, or ſhall hide or conceal the ſame from the view of ſuch officer; he ſhall forfeit 50*l*.

And no tobacco (except returns) of 4lbs. and upwards, nor ſnuff of 2lbs. and upwards, nor any tobacco-ſtalks, Spaniſh returns of tobacco, tobacco-ſtalks for flour, ſnuff-work, or tobacco-ſtalk flour, exceeding 200lbs. ſhall be removed by land or water without a permit, on pain of forfeiting the ſame, with the caſks and package, and alſo the horſes, cattle, boats, barges, and carriages uſed in conveying the ſame, which may be ſeized.

Such officer on requeſt ſhall grant permits, wherein ſhall be limited the time for ſuch removal; and if the goods permitted ſhall not be delivered within the time ſo limited, the ſame ſhall be deemed and taken to be removed without permit.

But no permit ſhall be granted or be valid for the removal of any ſnuff-work from one part of the kingdom to another except from the entered premiſes of a manufacturer of ſnuff, where the ſame was laid down to the mill for the purpoſe of grinding; on forfeiture thereof, together with the horſes, cattle, boats, barges, and carriages, which may be ſeized. 30 Geo. III. c. 40.

And no ſuch permit ſhall be granted or be valid, unleſs the requeſt note from ſuch manufacturer or dealer contain the particulars ſpecified in the act, and ſuch permit to correſpond with the requeſt note; and if for removing unmanufactured tobacco (other than ſamples), except the ſame be in the original package, and be removed according to the regulations ſpecified in the act: and all tobacco, &c. removed contrary thereto ſhall be forfeited, together with the caſks and package, and the horſes, cattle, boats, barges, and carriages uſed in the removal thereof, which may be ſeized. 29 Geo. III. c. 68.

Provided always, that permits may be granted for the removal of any unmanufactured tobacco, in any quantity not leſs than 200lbs. in any package whatſoever, from the entered premiſes of any manufacturer to any mill to be manufactured, and back to ſuch entered premiſes. 30 Geo. III. c. 40.

And every manufacturer of tobacco or ſnuff may manufacture their tobacco, tobacco-ſtalks, ſnuff-work, and returns of tobacco, at any entered mill, and may remove the ſame by permit to and from ſuch mill.

Provided, that nothing herein ſhall extend to prevent any manufacturer from ſtoving or finiſhing tobacco, or drying ſnuff-work at any mill, provided the officer be allowed to weigh and take an account thereof. 29 Geo. III. c. 68.

Where any permit ſhall be granted for the removal of any tobacco or ſnuff, &c. and the ſame ſhall not be removed agreeable thereto, ſuch permit ſhall be returned before the expiration of the time limited for ſuch removal; on forfeiture of treble the value of ſuch goods. And where ſuch permit ſhall not be ſo returned as aforeſaid, and on taking ſtock a decreaſe does not appear to anſwer the contents of ſuch permit, a like quantity ſhall be forfeited, and may be ſeized.

No manufacturer, unleſs licenſed as a dealer, ſhall have a permit for, or ſhall ſell or ſend out, any manufactured tobacco, Spaniſh, or returns of tobacco, in a leſs quantity than 4lbs., nor ſnuff than 2lbs.; on the penalty of 20*l*.

No tobacco, &c. or ſnuff, &c. ſhall be brought into any houſe or place of a manufacturer or dealer without a permit, and alſo notice thereof ſhall be given to the officer; on pain of forfeiting the ſame, together with the caſks and package, which may be ſeized, and ſuch manufacturer or dealer ſhall alſo forfeit treble the value thereof.

No tobacco or ſnuff, &c. ſhall be removed from any place without the limits of the bills of mortality or exciſe-office in London, to any place within thoſe limits; nor from any place without the limits of the ports herein before enumerated to any place within, or within two miles of thoſe limits; on forfeiture thereof, with the caſks and package, and alſo the veſſels, horſes, cattle, and carriages employed in removing the ſame, which may be ſeized. But the ſame ſhall not extend to the legal removal of the ſeveral articles ſpecified in the act.

By 30 Geo. III. c. 40. tobacco-ſtalks ſtripped from the leaf may be removed, by permit, from any entered premiſes out of the limits of the bills of mortality, to any place within thoſe limits, ſubject to the regulations in the aforeſaid act, and this act ſpecified.

Any manufacturer or dealer, who hath received into his ſtock, by permit, any tobacco or ſnuff, may return the ſame within forty-eight hours to the perſon from whom he received it under certain regulations. But if found returned, or returning without permit, or ſhall not be the ſame identical tobacco or ſnuff which had been received, without any alteration; the ſame ſhall be forfeited, with the caſks and package, which may be ſeized, and the perſon who ſhall return the ſame ſhall alſo forfeit 50*l*. 29 Geo. III. c. 68.

If any tobacco of 4lbs. or upwards, or fnuff of 2lbs. or upwards, or any tobacco-ftalks, &c. fhall be found removing, unlefs between feven in the morning and five in the evening from 29th Sept. to 25th March, and between five in the morning and feven in the evening from 25th March to 29th Sept. (except by a common carrier or veffel which ufually goes out of thefe hours,) the fame fhall be forfeited, with the cafks and package, and the horfes, carriages, and veffels made ufe of in conveying the fame, which may be feized, whether the fame be accompanied with a permit or not.

If any perfon whatfoever without a permit, or hawkers with one, fhall offer any tobacco, &c. to fale, he fhall forfeit the fame, together with the package, and alfo 20*l*. And the perfon to whom it fhall be fo offered to fale, may feize the fame, and carry it to the next warehoufe belonging to the cuftoms or excife, and fhall bring the perfon fo offering it to fale before a juftice, who fhall commit him to prifon, that he may be profecuted for fuch penalty; and the perfon fo feizing the fame fhall be entitled to the fame rewards as the officers of the cuftoms or excife; and in cafe fuch perfon fhall defire it, the commiffioners may caufe threepence for every pound of tobacco, &c. fo feized to be paid to him, till the fame can be difpofed of, upon a certificate under the hand and feal of fuch juftice, of fuch offender being committed to prifon; and after fale, the money fo advanced fhall be replaced out of the produce of fuch fale.

If any perfon fhall counterfeit or forge any permit, he fhall forfeit 500*l*.

If any perfon fhall affault, refift, oppofe, moleft, obftruct, or hinder any officer in the due execution of this or any other act; or fhall refcue any goods which have been feized; or any veffel, horfes, cattle, or carriages, which have been forfeited, and for which no particular penalty is provided; he fhall forfeit 200*l*.

If any perfon fhall give or offer any bribe, recompence, or reward to any officer to prevent him doing his duty, whether the fame be accepted or not, he fhall forfeit 500*l*.

No tobacco, fnuff, &c. fhall be landed, without firft making entry thereof with the officers of the cuftoms, on forfeiture thereof, with the cafks and package.

If any officer of excife fhall have caufe to fufpect that any tobacco, &c. or fnuff, which fhall have been imported contrary to this act, or forfeited by this or any other act, is depofited, lodged, hid, or concealed, if within London or Weftminfter, or the limits of the chief office, upon oath made before two commiffioners, elfewhere upon oath made before one juftice fetting forth the ground of his fufpicion, fuch commiffioners or juftice may, by warrant, authorife fuch officer by day or night, but if in the night, in the prefence of a conftable, to enter into fuch fufpected place, and to feize and carry away all fuch tobacco, &c. or fnuff which fhall be there found, together with the cafks and package containing the fame. And if any perfon fhall obftruct or hinder any fuch officer fo authorifed, or perfon affifting him in the execution of fuch warrant, he fhall forfeit 100*l*.

Tobacco and fnuff, taken as prize, are fubjected to the regulations of this act, by 43 Geo. III. c. 134.

No manufacturer or dealer in tobacco or fnuff, or perfon anywife interefted or concerned therein, fhall act as a magiftrate in the execution of any act relating to tobacco or fnuff; and all acts done by fuch perfon fhall be utterly null and void.

If any tobacco-ftalks or ftems ftript from the leaf fhall be imported, the fame fhall be forfeited and burned, and the officer feizing the fame fhall be allowed one penny a pound; and every perfon, who fhall be affifting or otherwife concerned in unfhipping the fame, or to whofe hands they fhall knowingly come after unfhipping, fhall forfeit treble value, together with the veffels, bags, cafks, or other things, wherein the fame are contained, and the horfes, cattle, carts, and other carriages, made ufe of in removing the fame; half to the king, and half to fuch officer of the cuftoms, who fhall feize, inform, or fue for the fame. 12 Geo. c. 28. 5 Geo. III. c. 43. 8 Geo. c. 18.

All feizures of veffels or boats of 15 tons or under, and of horfes or other cattle and carriages, by virtue of any act relating to the cuftoms, may be profecuted, heard, and determined, before two juftices refiding near where the feizure was made. 8 Geo. III. c. 18. 5 Geo. III. c. 43. 29 Geo. III. c. 68.

And all penalties and forfeitures in the excife may be fued for, levied, and mitigated as by the laws of excife, or in the courts at Weftminfter, half to the king, and half to him who fhall fue (unlefs otherwife particularly directed). 29 Geo. III. c. 68. 30 Geo. III. c. 40. 43 Geo. III. c. 69.

Tobacco-ftalks or ftems, ftripped from the leaf, that are imported, fhall be forfeited and burnt, and the officer feizing the fame fhall be allowed 1*d*. a pound; and perfons affifting in unfhipping them, &c. fhall forfeit treble value, with the veffels, horfes, &c. which may be profecuted and determined before two juftices near the place where the feizure was made. (12 Geo. c. 28. 5 Geo. III. c. 43. 8 Geo. c. 18.) By 24 Geo. II. c. 41. and 26 Geo. II. c. 13. no tobacco or ftalks exceeding 24lbs. weight, nor any fnuff exceeding 10lbs. fhall be conveyed by land, without proper certificates, under penalty of forfeiture, together with horfes and carriages, and commitment of the carrier to the county-gaol for one month by one juftice. The feizure of horfes and carriages may be determined by two juftices near the place where the feizure was made.

Tobacco, *Englifh*, *Nicotiana minor*, or *Nicotiana ruftica* of Linnæus, is a fpecies of tobacco, which was originally a native of America, but now propagates itfelf plentifully in England and other parts of Europe. The flowers are of an herbaceous yellow colour, appearing in July, and are fucceeded by roundifh capfules filled with fmall feeds, which ripen in autumn. The leaves are faid by fome to be of the fame quality with thofe of henbane; but by others, to be fimilar to the preceding, but weaker. They have been fometimes fubftituted in our markets, inftead of the true tobacco; but are eafily diftinguifhed by their fmallnefs and oval fhape, and by being furnifhed with pedicles. Lewis.

Tobacco, *Kanafter*. See Kanaster.

Tobacco-*Water*, among *Sheep-Farmers*, a liquor prepared by infufing or boiling tobacco in water. A very ufeful mode of preparing it is, by boiling one pound of tobacco in two gallons of ftrong falt brine, adding, after the liquid has become cool, about three ounces of the oil of turpentine. It is fometimes, too, the practice to diffolve fifteen or twenty grains, or more, of fublimate or muriated quickfilver in the turpentine, before it is added to the liquor or mixture. A fmall proportion of corrofive fublimate, diffolved in fpirits of wine, is alfo a fafe and neat mode of incorporating it with the tobacco-water or liquid.

Tobacco-water, or liquor, is likewife occafionally mixed with other fubftances; as two pints of it have fometimes three ounces of fulphur mixed in them, being put on a fire until they boil together. The liquor is ufed in a cold ftate.

The South Down ſheep-farmers have a decoction of tobacco, wildvine-root, and ſulphur, which is boiled in brine for a quarter of an hour, and then ſtrained off for uſe.

Tobacco-water, or liquor, is kept ready prepared for the uſe of farmers in many places where ſheep are largely kept, but it is probably the beſt way for them to provide their own.

This water, or liquor, is a powerfully efficacious remedy in various caſes of the ſcab kind in ſheep, and probably in other animals. It is uſually applied by ſhedding or dividing the wool by the fingers and thumbs, and pouring a little of the liquid in along it. It may be uſed every night, as there may be occaſion. Such diſeaſes are readily removed by it in moſt caſes, and eſpecially in long-woolled ſheep, in which they often take place.

In gardening, the ſimple water, or liquor, which is prepared by infuſing or boiling tobacco in ſoft water, without any admixture, or having any ſuch ſubſtances as above diſſolved in it, is often found beneficial in deſtroying and removing inſects of different kinds on fruit-trees and fruit-ſhrubs, by having it repeatedly ſprinkled over them by means of a watering-pot, or dew-ſyringe, or in any other way. Many ſorts of theſe trees and ſhrubs in hot-houſes, and other places, are treated in this manner with great effect and advantage in clearing them of ſuch vermin.

Tobacco *Key*, in *Geography*, a ſmall iſland in the bay of Honduras, near the coaſt of Yucatan. N. lat. 16° 45′. W. long. 88° 35′.

Tobacco-*Pipe*. See *Tobacco* Pipe.

Tobacco-*Pipe Clay*. See Cimolite.

Tobacco-*Pipe Fiſh*, in *Ichthyology*, the Engliſh name of the *Acus*, or the Syngnathus *Acus* of Linnæus; which ſee.

TOBACTLI, in *Ornithology*, a name which Nieremberg ſays is often given to the American bird more commonly called *hoactli*.

TOBAGO, in *Geography*, one of the Caribbee iſlands, in the Weſt Indies, about 30 miles in length from ſouth-eaſt to north-weſt, and about nine in breadth. This iſland was firſt diſcovered by Columbus, in the year 1498; but though projects were formed for ſettling it, particularly by William, earl of Pembroke, who obtained a grant of it in the year 1628, and alſo of Barbuda and St. Bernard, they proved ineffectual. About the year 1632, ſome Zealanders, having fitted out a ſmall ſquadron for trading to thoſe iſlands, made ſuch a favourable report of this in particular, upon their return home, that the company of merchants to which they belonged undertook to ſettle it, and gave it the name of *New Walcheren*, from one of the iſlands in Zealand. The new colony, in a ſhort time, increaſed to about 200, who, finding themſelves peſtered by the viſits of the Caribbean Indians, began to erect a fort for their preſervation. The Indians had recourſe to the Spaniards, who readily granted them aſſiſtance. They ſent a force upon the iſland which demoliſhed the riſing fort, and exterminated the new colony. It was probably from ſome Dutch merchants who travelled to Courland, that James, duke of that country, conceived the deſign of ſettling Tobago. Being a prince of an active diſpoſition, and finding there was room for ſuch a ſettlement, he ſent over a colony of his own ſubjects, who ſettled upon what has ſince been called *Great Courland Bay*, and erected a ſmall regular fort, with a town, in the neighbourhood; and the duke's title was farther confirmed by a grant from Charles II. king of England, but diſputed by the Dutch. Upon the extinction of the Kettler family, dukes of Courland, in the perſon of Ferdinand, ſon of duke James, the fief of the iſland of Tobago reverted to the crown of England in 1737. By the treaty of Aix-la-Chapelle in 1748, St. Vincent, Dominica, St. Lucia, and Tobago, were declared neutral, and thoſe who remained of the ancient proprietors were left in unmoleſted poſſeſſion. By the 9th article of the peace of Paris, ſigned on the 10th of February, 1763, the three iſlands of Dominica, St. Vincent, and Tobago, were aſſigned to Great Britain, and St. Lucia to France; the Charaibes not being mentioned in the whole tranſactions, as if no ſuch people exiſted. The climate of Tobago is far more temperate than could be expected in an iſland that is but 11 degrees 16 minutes north from the equator; for the heat is allayed by the ſea-breezes. Tobago has another favourable circumſtance to recommend it, by its lying out of the track of thoſe hurricanes that prove ſo fatal to the other Weſt India iſlands. The ſurface of the iſland is unequal and agreeably diverſified; but no part of it is rugged or impaſſable, though its north-weſt extremity is mountainous. Its ſoil is of different kinds, but in general the mould is rich and black, and proper for producing, in the greateſt plenty, whatever is raiſed in other parts of the Weſt Indies. The abundance of ſprings upon the iſland contributes to its healthfulneſs, and its bays and creeks are ſo diſpoſed as to be very commodious for all kinds of ſhipping. Its ſituation, however, requires fortifications to render the iſland ſecure againſt the viſits of ſavages and enemies. Beſides its producing the different kinds of wood that are to be found in the other Weſt India iſlands, the Dutch affirm, that both the true nutmeg-tree and the cinnamon-tree, with that which produces the real gum copal, grows upon the iſland, but this aſſertion wants confirmation. Mr. Blome, who, in 1687, wrote "The preſent State of our American Iſlands," ſays that the ſoil of Tobago produces Indian corn, Guinea corn, peaſe, beans, French beans, figs, pine-apples, pomegranates, oranges, lemons, limes, plantains, bananas, grapes, guavas, tamarinds, prickly pears, papaws, and a variety of other fruits, which are not to be found in Europe. The cocoa-tree grows here to ſuch perfection, that the Indians call it God's tree, as producing both meat, drink, and clothing. Muſk-melons, water-melons, gourds, cucumbers, and pompions, are raiſed to perfection: neither is there any want of potatoes, yams, carrots, turnips, parſnips, onions, and manioc. Wild hogs abounded ſo much in Tobago, that the people killed at leaſt twenty thouſand of them every year without their being ſenſibly diminiſhed. Here are likewiſe found peccaros, reſembling ſwine, armadilloes, guanoes, Indian rabbits, and badgers. Horſes, cows, aſſes, ſheep, deer, goats, and rabbits, were probably introduced by the Dutch, and have multiplied exceedingly. The ſea is ſtored with excellent fiſh, particularly turtle of every kind, and mullets of a moſt delicious taſte, with other kinds unknown in England. In ſhort, the commodities which the country doth, or may produce, are cocoa-nut, ſugar, tobacco, indigo, ginger, ſarſaparilla, ſempervivum, bees'-wax, venelloes, natural balſam, balm, ſilk-graſs, green tar, ſoap-earth, with many curious ſhells, ſtones, marcaſites, and minerals. In 1781, the iſland was ſurrendered to the French on favourable terms. In 1793, it was again taken by the French, and ſoon after retaken by the Britiſh. N. lat. 11° 16′. W. long. 60° 30′.

Tobago, *Little*, a ſmall iſland near the eaſt coaſt of Tobago, about two miles long, and one broad.

TOBAK, a town of European Turkey, in Beſſarabia, on lake Jalpug. In 1789, the Ruſſians were defeated by the Turks, near this town; 34 miles N.N.W. of Iſmail.

TOBAN, a town of the iſland of Cuba; 16 miles N.E. of Trinidada.

TOBAR,

TOBAR, a town of Spain, in Old Caftile; 18 miles from Burgos.

TOBATA, in *Ancient Geography*, a town of Afia, in the interior of Paphlagonia.

TOBATI, in *Geography*, a town of Paraguay; 50 miles N.E. of Affumption.

TOBED NIGAURLEDEGH, a river of New Brunfwick, which runs into the St. John, N. lat. 46° 50'. W. long. 67° 36'.

TOBIANUS, in *Ichthyology*, a name given by Schoneveldt and others to the ammodytes, or fand-eel.

TOBIRA, or TOBERA, in *Botany*, a Japanefe fhrub, figured and defcribed by Kæmpfer; fee PITTOSPORUM, n. 2. See alfo EUONYMUS, where its ill-agreement with the latter genus is noticed.

TOBIS, in *Ichthyology*, a name given by the Swedes to the ammodytes, or fand-eel.

TOBITSCHAU, or TOWACZOW, in *Geography*, a town of Moravia, in the circle of Olmutz; 10 miles S. of Olmutz. N. lat. 49° 23'. E. long. 17° 14'.

TOBIUS, in *Ancient Geography*, a river of the ifle of Albion, the mouth of which is placed by Ptolemy on the weftern coaft, between the promontory Octapitorum and that of Ratoftathybius.

TOBLER BACH, in *Geography*, a river of Wurtemberg, which runs into the Glatt, 2 miles N.W. of Sultz.

TOBLPAD, a town of the duchy of Stiria; 8 miles S.W. of Gratz.

TOBOL, a river of Ruffia, which rifes in N. lat. 52° 30', and long. 81°, in the country of the Kirghiftzi, in the chain of mountains that parts it from the government of Upha. It pours itfelf into the Irtyfh or Irtifch at Tobolfk, after running a courfe of about 500 verfts, in which it receives the following rivers; *viz.* the Ui, the Ifet, the Tura, and the Tavda, all which fall into it on the left. Of thefe, the Tura is the largeft; it rifes near Verkhoturia, in the Ural mountains, and glides into the Tobol, in lat. 57° 30', after having taken up the rivers Salda, Tagil, Pyfhma, Nitza, &c. into which laft-mentioned, the Neiva, the Ætfh, and the Irbit flow. By this acceffion of waters, the Tura becomes a confiderable river, not much inferior to the Tobol itfelf. The Ifet is likewife a river of fome confequence, rifing out of a lake two verfts from Ekatarineburg; and after having taken up feveral rivers, as the Sifert, the Sinava, the Tfetfha, and the Miæs, falls into the Tobol, in N. lat. 57°. The Tobol has moftly low fhores; and in the fpring feafon frequently fhade its waters far around.

TOBOLOVO, an oftrog of Ruffia, in the government of Tobolfk, on the Enifei. N. lat. 69° 40'. E. long. 86° 42'.

TOBOLSK, a city of Ruffia, and capital of a government, at the confluence of the Irtifch and Tobol. It is the fee of an archbifhop, and was heretofore the capital of all Siberia. This city is divided into the Upper and Lower Towns. The Upper Town ftands very high, on the eaft fide of the Irtifch; and the Lower Town lies on a plain, between the hill on which the former is built, and the river. Both towns taken together are of a very large circumference; but the houfes being moftly built with wood, it was nearly confumed by fire about the year 1786, and afterwards rebuilt chiefly of ftone. It contains about 15,000 inhabitants. In the Upper Town, which is properly called the city, ftands the fort, which was built with ftone, by governor Gagarin. In the fort are the governor's court, as it is called, the governor's houfe, the archbifhop's palace, the exchange, and two of the principal churches, which are all ftone buildings. The Upper Town, which ftands on the eaft fide of the fort, and is inclofed within an earthen rampart, affords nothing remarkable, but a market for provifions and all kinds of fmall ware, three wooden churches, and a convent. The Lower Town contains a market-place for all kinds of provifions, on which feveral fhops are built. The Upper Town is out of the reach of inundations from the river, by its high fituation, which, however, is attended with this inconveniency, that the inhabitants are under a neceffity of going down the hill for water. Befides, large maffes of earth fall from the fide of a hill, on which the town ftands, towards the river, almoft every year, which obliges the inhabitants to pull down and rebuild the houfes that ftand near the declivity. The Lower Town, indeed, has water at hand, but is expofed to inundations when the river overflows its banks; but fuch floods do not happen every year. The town is very populous, and almoft the fourth part of its inhabitants is compofed of Tartars, who are partly defcended from thofe that were fettled there before the conqueft of Siberia, and partly from the Bucharians. Thefe Tartars, in general, behave very quietly, and carry on fome commerce; but practife no mechanic trades. They are very fober, and averfe from intemperance, and all kinds of riotous living. The reft of the inhabitants are Ruffians, whofe anceftors were banifhed hither for their crimes, or fuch as are exiles themfelves. As every thing is fold here fo exceeding cheap, that a common man may live very well at Tobolfk at ten rubles a year; indolence and floth prevail to fuch a degree, that it is a hard matter to get the leaft utenfil, &c. made, though the town abounds with artificers, who want neither tools nor materials to carry on their refpective trades. The commerce is in a flourifhing condition in this city: and the traffic which the Bucharian and Kalmuck merchants carry on in Indian goods, with which they fupply all Siberia, and part of Ruffia, is very confiderable. All the Chinefe caravans are obliged to pafs through this town; and all the furs furnifhed by Siberia are brought into a warehoufe in this city, and from hence are forwarded to the Siberian chancery at Mofcow. Several of the Swedifh officers, who were taken prifoners at the battle of Pultawa, and fent to Tobolfk, fet up fchools here, in the year 1713, for teaching the children of Swedes, Ruffians, Coffacks, Tartars, &c. the German, Latin, and French languages, with geography, geometry, and drawing. Many of them alfo took in boarders. Thefe fchools acquired great reputation; fo that children were fent hither for education, from a confiderable diftance, and the exemplary behaviour of thefe military pedagogues was attended with uncommon fuccefs. However, when the peace of Nyftadt was concluded, the Swedifh officers returned into their own country, and then thefe beneficial feminaries of learning dropped of courfe. Some time after a German fchool was founded here, under the aufpices of the emprefs; 1000 miles E. of Mofcow. N. lat. 57°. E. long. 68° 14'.

TOBOLSKIAN TARTARS, derive their appellation from the river Tobol, on which they dwell; and they are the defcendants of the inhabitants of Ifker or Sibir, their ancient capital, which being reduced to a heap of ruins after Yormak's conqueft, they abandoned; and inftead of it the Ruffians afterwards built Tobolfk. Thefe are diftinct from the Tartar inhabitants of Tobolfk, who are a barbarian colony. Their number amounts to upwards of 4000 males.

TOBOLSKOI, a government of Ruffia, extending from N. lat. 55° to 78°. E. long. 59° to 108°, including a confiderable part of Siberia. Tobolfk is the capital.

TOBORON, a town of Thibet; 53 miles N. of Tourfan Hotun.

TOBOSO, El, a town of Spain, in New Caftile; 37 miles S. of Huete.

TOBRONA, a town of the ifland of Cuba; 148 miles S.W. of Havannah.

TOBRUS, in *Ancient Geography*, a town of Africa Propria, in the number of thofe fituated between the river Bagradus and the town of Thabraca. Ptolemy.

TOBULLA, in *Geography*, a town of Africa, on the E. coaft of Tunis; 8 miles N.W. of Medea.

TOBY, a town of Sweden, in Eaft Bothnia, near the Gulf; 20 miles N. of Chriftianfand.

Toby's *Creek*, a river of Pennfylvania, which runs into the Allegany, N. lat. 41° 8′. W. long. 79° 40′.

TOCA, a central town of New Granada, E. of Bogota, the capital.

TOCAIGH, a bay on the W. coaft of the ifland of Owhyhee: the depth of water was 25 fathoms; the bottom a ftiff clay, and good holding ground, incommoded by a patch of rocky bottom, which was found to fhoal fuddenly, and the depth to decreafe to 7, 4, and 3 fathoms, about the fourth of a mile to the fouth-weftward of the anchoring-place; and confequently to be a very great inconvenience to the roadftead, which at beft, in the opinion of captain Vancouver, is but a very indifferent one, being entirely expofed to the north-weft winds, and the weftern oceanic fwell, which beats with great violence in the reefs that encompafs the fhores. Thefe reefs ftretch out a mile or upwards, leaving between them and the land a narrow channel, that affords comfortable and commodious landing for fmall boats and canoes; but the landing is at too great a diftance from the place of anchorage to allow of profecuting any debarkation from the fhip. N. lat. 20° 3′. E. long. 204° 4′.

TOCAIMA, a central town of New Granada, in the immediate proximity of Bogota, the capital, and W. of it: founded in 1544, at fome diftance from the river Poti, called Bogota, not far from its confluence with the river Magdalena. Its fituation is bad, expofed to great heats, and numerous venomous creatures, and even deftitute of water. But the diftrict is very fertile in cacao, tobacco, fugar, maize, yucas, plantains, potatoes, &c. and the fifh are abundant in the rivers of Bogota and Fufagafuga, though there be many alligators. The inhabitants, about 700, are moftly poor. Here are mines of excellent copper, though not worked.

TOCANTIN's River, a river of South America, formed by the union of a number of fmall rivers in Brafil, which rife about the 18th or 19th degrees of fouth latitude, and between the 50th and 51ft degrees of weft longitude. Its courfe is due north to the 2d degree of fouth latitude, when it joins the Guanapu, about 120 miles from the fea, and takes the name of Para, from a city fo called.

TOCAT, or Tokat, a city of Afiatic Turkey, in the pachalic of Sivas, anciently a city of Pontus, called *Berifa*. It is fituated on the river Tofanlu, in the corner of a valley, and almoft furrounded with mountains, which afford quarries of marble, and well fupplied with water from innumerable fprings. On the top of a lofty rocky mountain, on the W. fide of the town, are the remains of an old caftle. The ftreets are well paved, but frequently built on uneven ground. The houfes are tiled, and moftly built with wood. It is the refidence of a cadi, a waiwode, and an aga, commanding a thoufand janizaries, and fome fpahis. The inhabitants are computed to be 60,000, confifting of 20,000 Turkifh families, 4000 Armenians, and about 400 families of Greeks. The Armenians have feven churches, the Greeks only one. The Armenians make an excellent wine, refembling claret in flavour, but ftronger. Fruits are abundant in this town, and the grape-vines are excellent. It is the fee of a metropolitan, dependent on the archbifhop of Niefara, or Neocæfarea, an ancient city, almoft ruined, about two days' journey from Tocat. Here are fome manufactures of filk and yellow Turkey leather; but the chief trade is in copper veffels, kettles, candlefticks, &c. which are fent to Conftantinople, Egypt, &c. Tocat may be confidered as the centre of trade of Afia Minor. The copper is obtained from the mines of Gumifcana, at the diftance of three days' journey from Trebifond, and from thofe of Caftan Boal, yet richer, and fituated ten days' journey from Tokat, on the W., towards Angora. The caravans from Diarbek arrive in eighteen days, from Sinob in fix, from Burfa in twenty, from Smyrna in twenty-feven, and proportionally lefs on horfeback, or on mules; 40 miles N.W. of Sivas. N. lat. 39° 35′. E. long. 36° 30′.

TOCAYO. See Tocuyo.

TOCCATA, Ital. from *toccare, to touch:* to prelude, to touch an inftrument, to play a fhort movement extempore, previous to the performance of a regular piece.

TOCCATINA, a fhort prelude, or trial of an inftrument.

TOCCAVIENSIS Bolus, *Bole of Tokay*, in the *Materia Medica*, a fine medicinal earth, dug about Tokay in Tranfylvania, and efteemed a powerful aftringent. Kentman calls it the *bolus Pannonica vera;* and Crato, *bolus Hungarica*.

This laft author efteemed it fuperior even to the bole armenic of Galen, and had a great opinion of it in malignant fevers. It is a fine and pure earth, and very heavy, moderately compact in its texture, but not very hard; and in colour of a confiderably deep and ftrong yellow. It is naturally of a fmooth furface, and does not ftain the fingers in handling. It ferments violently with acid menftrua, and does not become red in burning. Hill. See Bole.

TOCHEN, in *Geography*, a town of Germany, in the principality of Anhalt Zerbft; 5 miles W. of Zerbft.

TOCHU, a town of Africa, in the kingdom of Quoja.

TOCKAY, in *Zoology*, the name of a fpecies of Indian lizard, diftinguifhed from the other kinds, by being fpotted all over.

TOCKSDORF, in *Geography*, a town of Pruffia, in the province of Bartenland; 6 miles N.W. of Raftenburg.

TOCMIA, in *Ancient Geography*, a town of Arcadia, in the fouthern part to the N.W. of Megalopolis, and E. of the Alpheus. It ftood upon an eminence; but it was in ruins in the time of Paufanias.

TOCMOL, in *Natural Hiftory*, a name given by fome to the common turtle.

TOCOCA, in *Botany*, a Caribbean name, ufed by Aublet.—Guian. 437. t. 174. Juff. 330. See Melastoma.

TOCOLOSIDA, in *Ancient Geography*, a town of Africa, in Mauritania Tingitana. Ptolemy. The Itinerary marks it 48 miles from Tingis, and three miles from Volubilis.

TOCORARY, or Tukorari, in *Geography*, a town of Africa, in the country of Ante; 10 miles E. of Infuma.

TOCORT. See Tuggurt.

TOCOSANNA, in *Ancient Geography*, a river of India, on the other fide of the Ganges. Ptolemy places its mouth in the Ganges.

TOCOYENA, in *Botany*, an unexplained name.—Aubl. Guian. 131. t. 50. Juff. 201. Lamarck Illuftr. t. 163.

See

See Gardenia, of which this is probably a fpecies. The author calls his only fpecies *T. longiflora*, and his defcription contains the following particulars.

The *ftem* is three feet high, erect, fimple, leafy, fcarcely fhrubby. *Leaves* oppofite, erect, pliant, fifteen inches long, lanceolate, entire, fmooth, tapering at each end, on fmooth *footftalks*, about an inch and half in length, attached to a pair of triangular, acute, combined, intrafoliaceous *ftipulas*. *Flowers* about fourteen in a terminal head, in oppofite feffile pairs, each flower accompanied by two fmall fcaly *bracteas*. *Calyx* fuperior, bell-fhaped, in five fmall fegments, meafuring with the *germen* not more than four lines. *Corolla* with a yellowifh cylindrical tube, as thick as a goofe-quill, and nine or ten inches long, dilated at the throat, and terminating in a white bell-fhaped limb, with five ovate, equal, fpreading fegments. *Anthers* nearly feffile, between the fegments of the corolla, oblong, incumbent. *Germen* oval, inferior. *Style* capillary, the length of the tube, tumid and hairy for an inch below the top. *Stigma* of two large, compreffed, oval lips, included within the throat of the corolla. *Berry* oval, an inch long, crowned with the calyx, of two cells, with numerous roundifh *feeds*, imbedded in vifcid pulp. The *flowers* have a very fweet fmell. Aublet met with feveral plants of this fpecies in the wood of Aroura in Guiana, flowering in Auguft.—All the leaves were perforated or gnawed by infects. His dried fpecimen of the flower is as black as ink. If *mannia* of Thunberg and Salifbury be diftinct from *Gardenia*, the prefent plant fhould feem to belong to the former.

TOCRUM, in *Geography*, a town of Bengal; 8 miles S. of Koonda.

TOCRUR, a town of Africa, and capital of a kingdom, in Nigritia, on the north fide of the Niger, W. of Cafhna; 270 miles E.N.E. of Tombuctoo. N. lat. 16° 32′. E. long. 6° 5′.

TOCSON Hotun, a town of Thibet; 20 miles W.S.W. of Tourfan. N. lat. 43° 26′. E. long. 89° 14′.

TOCUYO, a city of South America, in the government of Venezuela, fituated in a valley formed by two mountains. Its divifion and conftruction are very regular: the ftreets are on a line, and fufficiently wide. It has a well-built parifh church, on which depends a chapel of eafe. The Francifcans have one monaftery, and the Dominicans another. It is governed by a common-council. The climate is rather cold than hot; and though the fky is often overcaft, the air is wholefome. The inhabitants are graziers, agriculturifts, artifans, and traders. The wheat of its vicinity is reckoned the beft in the province, and furnifhes fufficient for the confumption of many towns of the interior. They export from 8000 to 10,000 quintals of flour. From the wool of their fheep they fabricate coverlids, and other cloths, which they carry as far as Maracaibo and Carthagena. They have alfo tanneries and taweries, and, like the inhabitants of Carora, work up as many as they can of the raw materials, and fell the reft. Another article of commerce, very lucrative to the citizens of Tocuyo, is falt, which they bring from the falt-ponds of Coro. In this city are reckoned 10,200 perfons, who are reproached with the crime of fuicide. Tocuyo is 90 leagues diftant S.W. of Caraccas, and 20 leagues N. of Truxillo. N. lat. 9° 35′. Long. W. of Paris 72° 40′.—Alfo, a river of Venezuela, which difcharges itfelf into the fea, 25 leagues E. of the Gaigues, which runs 16 leagues W. of Coro. The fource of Tocuyo is about 15 leagues S. of Carora, upwards of 60 leagues from the fea. It is navigable as far as Banagua, a village fituated on its banks, at the diftance of 40 leagues from its mouth. Its vicinity furnifhes abundance of timber of the largeft fize, and fit for every kind of building. Depons, vol. i. and ii.

TOD *of Wool* is mentioned in the ftatute 12 Car. II. c. 32. as a weight containing twenty-eight pounds, or two ftone. See Weight.

Some will have the word derived from the French, *toilet*, a wrapper, within which, by ufage, two ftone of wool are folded.

A laft of wool contains 12 facks, a fack 2 weighs, 13 tods, 26 ftone, 52 cloves, or 364 pounds.

Tod-*Head*, in *Geography*, a cape on the eaft coaft of Scotland, in the county of Kincardine; 5 miles S. of Stonehaven. N. lat. 56° 51′. W. long. 2° 11′.

TODDALIA, in *Botany*, Juff. 371. Poiret in Lam. Dict. v. 7. 693, a barbarous name made out of the Kaka-toddali of Rheede, Hort. Mal. v. 5. 81. t. 41. (See Scopolia.)—Todda, with fome addition, is the appellation of other Indian plants, as Todda-pana of *Cycas circinalis*, and Todda-vaddi of *Oxalis fenfitiva*. We humbly hope that the worthy M. Poiret, who is fo highly difpleafed at our wifhing to retain a *Scopolia*, will approve of our having fo much laboured to eftablifh a Poiretia. See that article.

TODDA-PANA, the name by which many authors call the *palma farinifera*, or fago-tree.

TODDINGTON, or Tuddington, in *Geography*, an ancient market-town in the hundred of Manfhead, and county of Bedford, England; is fituated five miles N. by W. from Dunftable, and 39 miles N.W. by N. from London. A market was originally held here on Thurfdays, by a grant from king Henry III. in 1218; but this was changed to Saturday, by a charter of Edward II. in 1316, which was confirmed by Richard II. in 1385. In 1681, the market was fo confiderable, that fixteen butchers rented ftalls in the market-place. It gradually declined, and of late years has been wholly difcontinued. The market-houfe was pulled down in 1799, and the materials fold. It is probable, that it had been before difcontinued, and afterwards revived, as Leland does not include Toddington in the lift of the market-towns in Bedfordfhire. A fair was granted by the charters of 1218 and 1316: five are now held in the year. The population return of the year 1811, ftates the parifh to contain 259 houfes, and 1143 inhabitants. The manor of Toddington was given by William the Conqueror to Ernulfus de Hefdin, anceftor of the earls of Perch. On the death of the laft earl, in 1216, it devolved to the earl of Pembroke, and from him to Paulinus Peyvre, fteward of the houfehold to Henry III. From the Peyvre family, the manor defcended to fir Thomas Cheney, K. G. whofe fon, Henry, was knighted by queen Elizabeth in 1563, fhe being then on a vifit to him at Toddington. In 1572, fhe created him lord Cheney. Lord Cheney built a noble manfion at Toddington, of which nothing now remains but the kitchen, which is remarkably fpacious. Toddington church is a handfome ftructure; the frieze, on the outfide, is decorated with grotefque figures of animals. The fouth tranfept contains fome ancient monuments of the Peyvres, and alfo thofe of the Cheneys. The north tranfept was the burial-place of the Wentworths, and contains two monuments to lady Maria, and lady Henrietta Wentworth, on each of which 2000*l*. were expended. Both tranfepts are in a fhameful ftate of dilapidation. In the year 1443, an hofpital was founded at Toddington, by fir John Broughton, for three poor men, and a mafter or chaplain, who was to pray for the fouls of the Peyvre family. There are now no traces of the hofpital: the ftones were ufed in building the market-houfe. Lyfons's Magna Britannia, vol. i. Bedfordfhire, 1806.

TODDIPOODY, a town of Hindooftan, in the circar of Rajamundry; 18 miles E.S.E. of Rajamundry.

TODDY, or Toddi, is a juice drawn from various kinds of palms, by cutting off the branch intended by nature to produce fruit, and receiving from the wounded branch the fap which was defigned for the nourifhment of the future crop. But as toddy, although fweetifh when firft drawn, is in a ftate of fermentation in the courfe of 24 hours, acquiring an intoxicating quality, and thus becomes four and harfh, it could not have been the palm-wine of the ancients; which muft have kept for fome time, as it was carried on the rivers during voyages of many days, and even appears to have been ftored up. Toddy is ufed with molaffes, rice, and other ingredients, in the diftillation of *Arrack;* which fee. The toddy of the date-tree is faid to be of an inferior quality to that from fome other kinds of palms. The palm-wine was made in Babylonia, where palms abounded, of the fruit of the palm-tree. This was fweet to the tafte, but apt to give the head-ache. The palm, as Herodotus informs us (Clio, c. 193.) produced to the inhabitants of Babylonia, bread, wine, and honey. The wine muft have been very plentiful, for he fays that the boats which defcended the Tigris from Armenia, fome of which were very large, were loaded with palm-wine as the principal article of their commerce. We derive fimilar information from Xenophon, who fpeaks of the floats that paffed the Euphrates at Carmanda, and the Tigris at Cænæ. We learn, from the travels of M. Burckhardt in Nuba (Nubia) in 1813, that the practice of making wine as an article of commerce is difcontinued in Mefopotamia and Babylonia, where the date-trees abounded, and where the profufion of fruit rendered wine fo plentiful, becaufe in modern times the want of a proper diftribution of water for irrigation, has left only a fmall proportion of date-trees; and hence it is probable, that none of the fruit can be fpared from the neceffary demand for food. Kæmpfer is filent on the fubject of palm-wine; and this circumftance fatisfactorily proves the difcontinuance of the practice of making it in thofe countries. M. Burckhardt tells us, that in all the larger villages of Nubia, the ufe of palm-wine is very common; and at Derr, the reputed capital of the country, a great quantity of fpirit is confumed. The wine, he fays, does not tafte amifs; but it is too rich and too thick to be drank with pleafure. When the date-fruit has acquired its full maturity, it is thrown into large earthen boilers, and left to boil without interruption for two or three days. It is then ftrained, and the clear juice put into earthen jars, well clofed and buried in the ground, where it ferments. It is left ten or twelve days under ground; at the expiration of which time it is fit to drink. It keeps for twelve months, and then turns four. The aqua-vitæ made from dates is of a very good quality, and keeps well for years. People of the upper claffes at Derr are every evening intoxicated either with date-wine or fpirits, of which great quantities are confumed. They are fold openly. From Siout, fouthward, through Upper Egypt, date-fpirits are made and publicly fold; the pacha receiving a tax upon it from the inn-keepers: they alfo make a kind of jelly or honey from the dates, which ferves for a fweetmeat.

Toddy-*Tree.* See Mammee-*Tree.*

TODEA, in *Botany*, a fuppofed genus of ferns, dedicated by Willdenow to the memory of the Rev. Henry Julius Tode, a clergyman of Mecklenburg, who died in 1797, aged 64. He is diftinguifhed among cryptogamic botanifts, as the author of an accurate and practical work, in quarto, with numerous plates, entitled *Fungi Mecklenburgenfes Selecti*, publifhed at Lunenberg, in 1790, to which the reader will find frequent references in our feveral articles relating to the order of *Fungi.* This genus, however, is funk in Osmunda; fee that article, n. 3.

TODENDORP, in *Geography*, a town of the duchy of Holftein; 6 miles N.E. of Hamburgh.

TODI, Maria Francisca, in *Biography*, born in Portugal in 1748, arrived in England in 1777, with Jermoli, as firft woman in the comic opera. She muft have improved extremely after fhe left this country, where fhe remained only one feafon, and was little noticed; her voice being feeble, and feldom perfectly in tune. But fhe afterwards became the moft captivating finger for tafte and expreffion in cantabile airs, in France and Germany (according to report), that ever appeared in Europe. She was taught by Perez.

Todi, in *Geography*, a town of the Popedom, in the duchy of Spoleto, near the Tiber, the fee of a bifhop, immediately under the pope. It contains feveral churches and convents; 18 miles W. of Spoleto. N. lat. 42° 47′. E. long. 12° 18′.

TODIALOOR, a town of Hindooftan, in the country of Coimbetore; 5 miles N. of Coimbetore.

TODIVESTI, a town of Moldavia; 6 miles N.E. of Saczava.

TODOROVA, a town of Croatia; 18 miles W.N.W. of Novi.

TODOS Santos. See All-*Saints*.

TODS, a town of the ftate of Virginia; 9 miles E.N.E. of Hanover.

TODTENVOGEL, in *Ornithology*, a name by which Gefner and fome other authors have called that fpecies of œnanthe, known in England by the name of the *ftone-chatter, ftone-fmich*, or *moor-titling.*

TODTIBERG, in *Geography*, a mountain of Switzerland, and reckoned one of the higheft in the country, in the road from Difentis to the Grifons.

TODUCÆ, in *Ancient Geography*, a people of Africa, in Mauritania Cæfarienfis, towards the fource of the river Ampfaga.

TODUS, Tody, in *Ornithology*, a genus of the order Picæ, the characters of which are, that the bill is awl-fhaped, fomewhat depreffed, obtufe, ftraight, and at its bafe befet with briftles; the noftrils are ovate and fmall; the feet are formed for walking; and the outer toe is connected at the bafe to the middle one.

Species.

Viridis. Green, with a red breaft: the green tody. Found in the warmer parts of America, and the neighbouring iflands.

Cinereus. Afh-coloured, with the under part yellow: the *Tie-tie* of Buffon; the grey and yellow fly-catcher of Edwards. Found in open places of Surinam and Guiana.

Fuscus. Ferruginous, under part olive-coloured, fpotted with white; the tail ferruginous, and wings croffed with a blackifh bar. Found in South America, lefs than the green.

Cæruleus. Blueifh, with white throat; temples, throat, and abdomen orange. Found in America, of the fize of the green.

Varius. Varied with blue, black and green; the bill, head, throat, neck, feet, nails, and tail black; the margin of the tail, and the coverts of the wings, green. Found in India.

Leucocephalus. Black, the head fubcriftated; throat and upper part of the neck white: white-headed tody of Latham. Found in America.

Brachyurus. Black, the vertex, neck, back, and ſhort tail black: the ſhort-tailed tody of Latham. Found in America.

Plumbeus. Above lead-coloured hoary, beneath milky; the crown, wing-feathers, and tail black: plumbeous tody of Latham. Found in Surinam.

Obscurus. Above brown and black, underneath very ſordid white, with pale throat: the duſky tody of Pennant and Latham. Found in Rhode iſland.

Regius. Black and brown; the breaſt whitiſh, ſtriated tranſverſely with blackiſh; the throat and eye-brows white; the abdomen, rump, and tail red; the creſt ferruginous at the apex, tipped with black: king tody of Latham. Found in Cayenne.

Paradiseus. Creſted head black; body white; tail wedge-formed; the intermediate tail-feathers very long: pied bird of paradiſe of Edwards, and paradiſe fly-catcher of Latham. It has the following varieties; *viz.* the tody with wings and tail pale-red; the tody underneath white, the breaſt from cæruleſcent to cinereous; and the Braſilian creſted tody. Found in Africa and the iſland of Madagaſcar.

Ferrugineus. Ferruginous-black, underneath ferruginous; wing-feathers marked with a brown bar; cheeks ſpotted with black and white: the ferruginous-bellied tody of Latham. Found in Cayenne.

Novus, or Gularis. Brown, underneath white; throat white, and breaſt ſpotted with brown, above yellow: white-chinned tody of Latham.

Platyrhynchos, or Rostratus. Brown-yellowiſh, beneath yellow, throat whitiſh; vertex lead-coloured, with a white ſpot upon it; wings and tail brown; bill very broad: the broad-billed tody of Latham.

Macrorhynchos, or Nasutus. Black, bill very broad; chin, ſides of the cheeks, abdomen, vent and rump red: the great-billed tody of Latham.

Rubecula. Cinereous, with orange throat and breaſt, and white abdomen: the red-breaſted tody of Latham. Native of New Holland.

Xanthogaster, or Flavigaster. Brown-cinereous, ſix inches long; beneath luteous, with pale bill: the yellow-bellied tody of Latham. Native of New Holland.

Cristatus. Creſt crimſon; body brown, ſpotted with white. Found in Guinea.

TOEBAN, in *Geography*, a town on the N. coaſt of the iſland of Java.

TOELCHUS *de Apie*, a diſtrict of South America, in the country of Patagonia.

Toelchus *de la Caballo*, a diſtrict of South America, in the country of Patagonia.

TOE-LING Hotun, a town of Chineſe Tartary; 375 miles E.N.E. of Peking. N. lat. 42° 22′. E. long. 123° 29′.

TOENDE, in *Commerce*, a corn meaſure in Denmark, equal to 8 ſcheffels or ſkiepers, or 32 foertels or fierdingers, and 12 toendes = a laſt: 100 toendes of Copenhagen, anſwer to about $49\frac{1}{2}$ Engliſh quarters. A laſt of Spaniſh ſalt, or of coals, contains 18 toendes, and the toende = 8 ſkiepers or 176 pots, which contain $5\frac{1}{2}$ Daniſh cubic feet; but Norway ſalt is ſold by weight, and the toende muſt weigh 250 lbs. Daniſh weight, or 275 lbs. avoirdupois. A laſt of French ſalt, or of lime, contains 12 toendes, corn meaſure; a laſt of oil, butter, and other fat ſubſtances, is 12 toendes, beer meaſure; and a toende of beer muſt hold $4\frac{1}{4}$ Daniſh cubic feet, or 136 pots. By a tonne or toende of hard corn is meant as much land as can be ſown with 1 toende of rye, 1 of barley, and 2 of oats. What is called a toende of ſaatland or arable land is the fourth part of the above, and contains $563\frac{1}{7}$ Daniſh ſquare ruthes, or 220 Engliſh ſquare perches. Thus the toende of hard corn is = $5\frac{1}{2}$ Engliſh acres. A Daniſh ſquare foot contains about 153 Engliſh ſquare inches; or 16 Daniſh ſquare feet = 17 Engliſh ſquare feet nearly.

TOENII, in *Ancient Geography*, a people of Germany, in the vicinity of a lake, which was common to them, the Rhætians, and Vindelicians. Ptol.

TOENJOLOKER, in *Geography*, a ſmall iſland in the Eaſt Indian ſea. S. lat. 5° 30′. E. long. 132° 32′.

TOES, by anatomiſts called *digiti pedis*, are the extreme diviſions of the feet, anſwering to the fingers of the hand, and reſembling them in figure, and make the third part of the foot. See Extremities.

Toes, *Adheſions of the.* It is a frequent thing to meet with new-born infants with their fingers or toes cohering or growing together, either by a ſtrict adheſion of the fleſh, or elſe by ſome looſe productions of the ſkin, as in the feet of ducks and geeſe; and a diſorder of the ſame kind is alſo ſometimes found in adults, from accidents; as when the fingers or toes have been neglected, after an excoriation of them by burns or wounds. In both theſe caſes the ſurgeon's aſſiſtance is neceſſary, partly to remove the deformity, and partly to reſtore the proper uſe of the fingers.

Theſe adheſions, according to the nature of the diſorder, are to be ſeparated by cutting out the intermediate ſkin, or elſe barely by dividing them from each other with a pair of ſciſſors. When this is done, to prevent their coheſions again, each finger muſt be inveſted ſeparately with a ſpiral bandage about an inch broad, dipped in lime-water and ſpirit of wine.

Sometimes the fingers, inſtead of adhering to each other, grow to the palm of the hand, from wounds or burns, ſo that they cannot be by any means extended, or drawn back to open the hand. The method of relieving this diſorder is firſt very carefully to ſeparate the fingers from the adheſions of the palm, without injuring their tendons, then dreſs them with a vulnerary balſam, and ſcraped lint, and extend them on a ferula or thick paſte-board; and let them remain in this extended poſture, ſeparately to be dreſſed till they are perfectly healed; but at every dreſſing they muſt be gently moved, to prevent a rigidity or ſtiffneſs of the joints. Heiſter.

Toe, in the *Manege*, is the ſtay of the hoof upon the forepart of the foot comprehended between the quarters.

We commonly ſay the toe before, and the heel behind, in French *pince devant et talon derriere;* implying, that in horſes, the toe of the fore-feet is ſtronger than the toe of the hind-feet: and, on the other hand, that the heels behind are ſtronger than thoſe before; and accordingly, in ſhoeing we drive higheſt in the toes of the fore-feet, and in the heels of the hind-feet.

A horſe that does not reſt his hind-feet all equally upon the ſhoe, but raiſes his heels, and goes upon the toes of his hind-feet, is called in French *rampin.*

Toe-*Head*, in *Geography*, a cape of the county of Cork, Ireland, not far from the Stags of Caſtlehaven. N. lat. 51° 27′. W. long. 9° 9′.—Alſo, a cape of Scotland, on the S.W. coaſt of the iſland of Lewis, in that part called Harris; 42 miles S.W. of Stornaway. N. lat. 57° 50′. W. long. 7° 5′.

Toe-*Shell*, in *Conchology*. See Pollicipes.

Toe-*Stick*, in *Agriculture*, the ſtick or bar which confines that part of ſmall carts in its place, that contains the load, but which, on being ſlipped out, lets that or a part of it be diſcharged. It has been obſerved in the Corrected Agricultural Report of the County of Norfolk, that Mr. Overman,

Overman, of Burnham, in that diſtrict, has made an improvement in his carts of this kind: inſtead of the toe-ſtick drawing out to let the back or framed part of the cart tilt up, and deliver the load or part of it, this contrivance turns in the centre on a pivot, and the hooks which confine it at the ends, are each in a poſition the reverſe of the other, by means of which it is expeditiouſly effected.

TOESA, in *Commerce*, a long meaſure in Spain; the toeſa or braza is 2 varas, or 6 feet, that is, $66\frac{3}{4}$ Engliſh inches; a paſo or pace, is 5 feet; an eſtadal, 12 feet, or 4 varas; and a cuerda, $8\frac{1}{2}$ varas.

TOESCHI, Alessandro, in *Biography*, the head of a celebrated muſical family from Romania, ſettled at Munich, who in 1756 was appointed concert-maſter to the elector of Bavaria's eccleſiaſtical band.

Toeschi, Charles Joseph, after being director of the chamber-muſic of the court of Bavaria, in 1756 was appointed firſt violin in the famous band of the elector palatine at Manheim. He was ſeven years concert-maſter, and engaged in other honourable profeſſional employments about the court of Manheim till 1786. In 1766 he publiſhed at Paris ſix ſymphonies; violin quartets; and flute concertos. About the ſame time, ſix violin duets, and other works at Amſterdam. His ſtyle is full of fire, new effects, and in ſlow movements, grace and elegance. He was a diſciple of the great Stamitz, and died at Manheim in 1788, in the 60th year of his age, leaving behind him an excellent private character.

Toeschi, John, concert-maſter at Manheim, and an admirable performer on the violin. He was one of the principal ornaments of the famous court-band in 1756.

Toeschi, Susannah, a ſinger of great merit in the ſervice of the court at Munich, brought up under Holtzbauer, the maeſtro di capella to the elector palatine.

TOESOBIUS, in *Ancient Geography*, a river of the iſle of Albion, which had its mouth, according to Ptolemy, on the weſtern coaſt, between the gulf Sereia and the promontory Ganganorum: probably the river Conway.

TOE-YAH-YAH, in *Geography*, a bay of Owhyhee, one of the Sandwich iſlands, extending along the whole coaſt from the weſternmoſt point, to the northern extremity of the iſland, and bounded to the N. by two very conſpicuous hills. Towards the bottom of the bay there is foul, corally ground, extending upward of a mile from the ſhore, without which the ſoundings are regular, with good anchorage, in twenty fathoms. Cook's Third Voyage, vol. iii.

TOFIELDIA, in *Botany*, was ſo called by the late Mr. Hudſon, after his correſpondent Mr. Tofield, who reſided in the neighbourhood of Doncaſter, and to whom Britiſh botaniſts are indebted for the diſcovery of *Vicia bithynica*, the original ſpecimens of which are preſerved in his herbarium, now belonging to William Younge, M.D. F.L.S. of Sheffield, Yorkſhire.—Hudſ. Angl. ed. 2. 157. Sm. Fl. Brit. 397. Dryandr. in Ait. Hort. Kew. v. 2. 324. Purſh 246. Kunth Nov. Gen. et Sp. Pl. v. 1. 267. (Anthericum; Linn. Gen. Pl. ed. 1. 106, but not of the ſubſequent editions. Narthecium; Ger. Gallopr. 142. Juſſ. 47. Michaux Boreal.-Amer. v. 1. 209. Lamarck Illuſtr. t. 268.)—Claſs and order, *Hexandria Trigynia*. Nat. Ord. *Tripetaloideæ*, Linn. *Junci*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, membranous, three-cleft, ſmall, permanent. *Cor.* Petals ſix, oblong, concave, equal, ſpreading, permanent, many times longer than the calyx. *Stam.* Filaments ſix, oppoſite to the petals, awl-ſhaped, ſimple, ſmooth, about the length of the corolla; anthers incumbent, roundiſh-heartſhaped. *Piſt.* Germens three, ſuperior, converging, pointed, terminating in as many ſhort, diſtant, vertical ſtyles; ſtigmas capitate. *Peric.* Capſules three, connected at the baſe, gibbous, keeled, membranous, of one cell and two valves, burſting chiefly at the inner edge. *Seeds* numerous, elliptic-oblong, angular, inſerted into the inner margin of each valve.

Eſſ. Ch. Calyx three-cleft. Petals ſix, equal. Styles vertical, ſhort. Capſules three, ſuperior, combined at the baſe. Seeds numerous. Anthers roundiſh.

The ſmall membranous permanent calyx, more or leſs diſtantly ſeparated from the other parts of the flower by an elongation of the baſe of the latter, is the very peculiar character of *Tofieldia*. By this it is diſtinguiſhed from Helonias, Narthecium and Anthericum, with all which it has been confounded; ſee thoſe articles. *Helonias* moreover has a ſimple germen and capſule, with very few ſeeds. *Narthecium* and *Anthericum* have each a ſimple ſtyle; the former hairy filaments, and tunicated ſeeds; the latter angular ſeeds.

Five of the ſix ſpecies, now known to compoſe the genus before us, have been confounded together as one. We ſhall give their characters, and moſt eſſential ſynonyms. The whole hiſtory of the miſtakes which have embroiled the ſynonyms and characters, both generic and ſpecific, of *Tofieldia*, have lately been detailed, more at length than ſuits our purpoſe here, in a paper communicated to the Linnæan Society by the writer of the preſent article.

The ſpecies are all perennial and herbaceous, with ſimple *ſtems*, ſpiked, or generally cluſtered, *flowers*, ſword-ſhaped, equitant, moſtly radical, *leaves*, the habit of the whole very nearly according with *Narthecium*. The *ſeeds*, in ſome inſtances, betray an affinity to that genus, in a little membranous appendage at each extremity, as may be ſeen in our *T. alpina*.

1. T. *paluſtris*. Scottiſh Aſphodel, or Marſh Tofieldia. Hudſ. n. 1. Fl. Brit. n. 1. Ait. n. 1. Engl. Bot. t. 536. (T. puſilla; Purſh n. 1. Anthericum calyculatum; Linn. Sp. Pl. 447. Fl. Lapp. ed. 2. 106. t. 10. f. 3. Fl. Dan. t. 36. Lightf. Scot. 181. t. 8. f. 2. Helonias borealis; Willd. Sp. Pl. v. 2. 274.)—Head of flowers ovate. Stem ſmooth, thread-ſhaped, leafleſs. Petals obovate, obtuſe Germens roundiſh.—Native of bogs, and the margins of rivulets, on the mountains of Lapland, Scotland, Durham, and North America, flowering about July. A little ſmooth plant, of a deep green, with a ſlender ſolitary *ſtem*, from four to ſix inches high, naked, except an occaſional ſmall leaf at the baſe. The radical *leaves* are two inches long, erect, forming ſeveral tufts. *Flowers* ſmall, pale green, in a ſolitary ovate-oblong denſe head, ſcarcely more than half an inch in length, often much leſs. There are hardly any diſcernible *bracteas*, the *calyx* being cloſe to the main ſtalk, and divided down to the baſe, into three ſmall, acute, membranous ſegments. The reſt of the *flower* is elevated on a ſhort ſtalk within the calyx, which, as the fruit advances, becomes very conſpicuous. The *capſules* are obovate, each about the ſize of muſtard-ſeed, crowded together into a globular form, minutely pointed, and crowned by the ſtyles.

Michaux and Purſh, miſtaking what we ſhall next deſcribe, for the true Linnæan *Anthericum calyculatum*, juſtly conſidered this as a new ſpecies. A little examination, of the *Flora Lapponica* in particular, would have prevented this error, though all writers upon European plants have hitherto confounded the two ſpecies in queſtion.

2. T. *alpina*. Alpine Tofieldia. Sm. MSS. n. 2. (T. paluſtris; Redout. Liliac. t. 256. Narthecium iridifolium; Villars Dauph. v. 2. 225. N. calyculatum; Allion. Pedem.

v. 2.

v. 2. 165. Poiret in Lamarck Dict. v. 4. 431, the fynonyms confufed. Phalangium alpinum paluftre, iridis folio; Tourn. Inft. 368. Segu. Veron. v. 2. 61. t. 14, copied in Lamarck's t. 268. Pfeudo-afphodelus fecundus; Cluf. Hift. v. 1. 198. Afphodelus Lancaftriæ verus; Ger. Em. 96.) —Clufter cylindrical. Bracteas nearly equal in length to the flower-ftalks. Stem fmooth, bearing two leaves. Petals obovate. Germens oblong.—Very common in moift graffy paftures, or the margins of rivulets, on the Alps of Auftria, Switzerland, Italy, Savoy and Dauphiny, flowering in Auguft. We know not of its having ever been obferved in Britain, notwithftanding the name in Gerarde's herbal, which is mifapplied to the figure of this plant, and properly belongs to *Narthecium offifragum*, exhibited in the preceding page of the fame book. Linnæus knew the prefent fpecies by its fynonyms only, cited, with marks of well-founded doubt, in his *Fl. Lapp.* He was led by Dillenius to efteem it a mere variety of the foregoing, an opinion generally adopted ever fince, but certainly for want of due enquiry. The *alpina* is not only twice the fize of *paluftris*, with a thicker more woody *root*, but the *ftem* always bears two diftant *leaves*. The *flowers* form a *clufter*, not a head or fpike, from one to two inches long, often interrupted, with a concave *bractea* at the bafe of each *ftalk*, about its own length. *Calyx* clofe to the reft of the flower, rather flightly three-cleft. *Petals* more yellowifh. *Capfules* oblong, combined almoft all the way up, thrice as large as in *paluftris*. As the *fruit* advances, the partial ftalks become ftill more evident than in the flower.

3. T. *ftenopetala*. Narrow-petalled Tofieldia. Sm. MSS. —Clufter cylindrical. Bracteas overtopping the calyx. Stem fmooth, bearing two leaves. Petals lanceolate, acute. —Native of North America, where it was gathered by Kalm, whofe fpecimens were referred by Linnæus to his *Anthericum calyculatum*. They more agree with our *T. alpina*, in fize and habit, having two or three *leaves* on the *ftem*. The *clufter* is denfe and obtufe, an inch and a half long. *Bracteas* very different from that fpecies, being lanceolate, and always as long as the *partial ftalk* and *calyx* taken together; fometimes much longer. *Calyx* broad and fhallow, unequally notched. *Petals* greenifh-white, lanceolate, narrow and acute, not obovate. *Anthers* pointed. *Germens* tapering into ftyles twice the length of the foregoing. No doubt can exift of this being a moft diftinct fpecies. We find no indications of it in the works of Michaux or Purfh, nor is its precife place of growth known.

4. T. *cernua*. Drooping-flowered Tofieldia. Sm. MSS. (Anthericum n. 39; Gmel. Sibir. v. 1. 73. t. 18. f. 2.)— Clufter cylindrical. Flowers drooping. Bracteas very fhort. Flower-ftalks fmooth, the length of the corolla. Stem leaflefs.—Found by Gmelin in mountainous woods in Siberia, flowering late in July. This is a fpecies fo evidently diftinct from all the foregoing, that we cannot account for their having been confounded; except by fuppofing that Linnæus, not having fpecimens of each in fruit as well as in flower, too haftily confidered the various appearances before him, as caufed by different ftages of growth. The drooping *flowers*, and quite pendulous *fruit*, of the prefent plant are remarkable at firft fight; and the former are expreffed in Gmelin's figure. Thefe characters are too decided, in both our fpecimens, to be attributed to any accident in drying. The whole plant indeed is larger than any of the former three, with more creeping *roots*. *Stem* a foot high, or more, quite leaflefs, except at the very bottom, glaucous in the upper part. *Leaves* near three inches long, narrow, with a fmall oblique point, fuch as may be feen in fome of the leaves of moft of the fpecies, except *ftenopetala*, whofe foliage is peculiar for its long ftraight, taper points. *Clufter* erect, fmooth, two inches long while in flower, near four when in feed, rather lax, many-flowered, fcarcely interrupted. *Flower-ftalks* fpreading, flender, fcattered, about an eighth of an inch long, and ftill longer when the fruit is full-grown, having a little ovate *bractea* at the bafe of each, about a quarter the length of the ftalk. *Flowers* white, about twice the fize of *Convallaria bifolia*. *Calyx* with three fhallow lobes. *Petals* obovate, obtufe, flightly pointed, concave, the length of the flower-ftalks, and keeping pace with them in their fubfequent elongation. *Stamens* fhorter than the corolla, with yellow, heart-fhaped, pointlefs *anthers*. *Germens* ovato-lanceolate, with longifh *ftyles*. *Capfules* fhorter than the permanent corolla, obovate, membranous, but brittle, combined nearly all the way up, fo as to form a turbinate three-lobed fruit, crowned with the three fpreading *ftyles* and capitate *ftigmas*. *Seeds* minute, prifmatic.—Gmelin's fuppofed variety, taken from Steller, having a leafy *ftem*, is probably another fpecies. *T. cernua* is a very pretty plant, and we may hope that, in fome of the frequent importations from Siberia, it may be introduced into the gardens of England.

5. T. *pubens*. Downy American Tofieldia. Dryandr. in Ait. Hort. Kew. n. 2. (T. pubefcens; Purfh n. 2. Narthecium pubens; Michaux Bor.-Amer. v. 1. 209. Anthericum filamentis lævibus, perianthio trifido; Linn. Hort. Cliff. 140. Gron. Virg. ed. 1. 39. Afphodelus minor albus; Pluk. Mant. 29. Phyt. t. 342. f. 3.)—Clufter cylindrical, interrupted. Flower-ftalks aggregate, rough, the length of the corolla.—Found in the moift meadows, and moffy boggy woods, of Virginia and Carolina, flowering in July, according to Clayton and Purfh. This is moft like the laft in ftature and habit, but the roughnefs of the *flower-ftalks* and their *main ftalk*, effentially diftinguifhes it. The former grow three or four together, as if rather whorled than fcattered. The *flowers* are white, with yellow *anthers*, and appear to be always erect.

6. T. *glutinofa*. Vifcid Yellow Tofieldia. Purfh n. 3. (Narthecium glutinofum; Michaux Bor.-Amer. v. 1. 210.) —Clufter ovate, denfe. Flower-ftalks glutinous, rough, the length of the corolla. Anthers prominent, orbicular. —Gathered by Mr. Menzies on the weft coaft of North America. Michaux fays his plant is found from Quebec to lake Miftaffins. There is no room to fuppofe the latter different from our's, though the *Narthecium glutinofum* of Mr. Gawler, Curt. Mag. t. 1505, is very decidedly fo, being a real and evident *Narthecium*, not, like Michaux's, a *Tofieldia*. Purfh calls it *N. americanum*, p. 227, which name, though not one of the beft, we would fubftitute for *glutinofum* in our article NARTHECIUM, the plant not being glutinous. All reference to Michaux and his obfervations in that place are to be erafed. The plant is, according to Purfh, a native of boggy fields and woods, on the pine-barrens, as they are termed, of New Jerfey, flowering in June and July.

Our *Tofieldia glutinofa* has a tuberous horizontal *root*, with long fimple fibres. *Stem* a foot high, angular, roughifh all over with fhort glandular hairs, efpecially for two inches from the fummit. *Leaves* few, almoft entirely radical, four or five inches long, narrow, ribbed, fmooth, except a little roughnefs towards the point. *Clufter* about an inch in length, of twelve or fourteen pale-yellow *flowers*, on hairy vifcid ftalks, about a quarter of an inch long, fometimes in pairs, having at the bafe one or two acute *bracteas*, one-third that length. Lobes of the *calyx* fhallow. *Petals* obovate, rather fhorter than the ftamens. *Anthers* purplifh,

nearly

nearly orbicular, pointlefs. *Germens* ovate-oblong, tapering into longifh *ftyles*, with fmall *ftigmas*. The habit and hue of the plant are very fimilar to the European *Narthecium offifragum* as well as to the *N. americanum* above-mentioned.

7. T. *frigida*. Wintry Tofieldia. Kunth Nov. Gen. et Sp. Pl. v. 1. 267.—Clufter lax, partly fcattered. Flower-ftalks fmooth, twice the length of the bracteas. Petals rather acute. Stem fmooth, with three diftant ovate leaves towards the top.—Native of lofty fummits of the Andes, in the kingdom of Quito, between Loxa and the village of Ona, where it was found, by the celebrated travellers Von Humboldt and Bonpland, flowering in December. Having feen no fpecimen of this, we can only extract its characters from the defcription of our able friend Mr. Kunth, who unluckily was not acquainted with the technical differences of the other fpecies, fo that his fpecific character anfwers nearly equally well to any one of the genus. The *root* is perennial, perpendicular, branched. *Stem* about a foot high, round, fmooth, bearing in its upper part three ovate, acute, fmooth, diftant *leaves*, called by Mr. Kunth *bracteas*. *Radical leaves* two-ranked, fword-fhaped, ribbed, fmooth, rigid, three or four inches long. *Clufter* (erroneoufly termed *fpica*) folitary, erect, two inches long. *Flowers* on folitary partial ftalks, which are fmooth, round, two lines in length, with an ovate acute *bractea*, half as long, at the bafe of each. *Calyx* in three deep, ovate, acute fegments, one-fourth as long as the oblong, fharpifh, ftriated, whitifh *petals*. *Stamens* fhorter than the corolla, fmooth, with oblong upright *anthers*. *Germens* combined. The prefent fpecies may perhaps be neareft akin to our *T. ftenopetala*, differing effentially in having fhorter *bracteas*, to fay nothing of other diftinctions, which the reader will detect by the above defcription.—The author fpeaks of *Tofieldia* as monogynous, taking the *ftyles* for *ftigmas*, and not adverting, as it appears, to the partial feparation of either the *germens* or *capfules*. Hence we muft conclude that this feparation is here lefs remarkable than in the other fpecies, which brings the plant in queftion nearer to *Helonias*, the *calyx* being its only, though all-fufficient, diftinction.

TOFSALA, in *Geography*, a town of Sweden, in the government of Abo, on an ifland; 20 miles W.N.W. of Abo.

TOFT, TOFTUM, or *Tofta*, in our *Law-Books*, a parcel of land, or a place where a meffuage hath ftood, but is decayed, or cafually burnt, and not re-edified.

TOFT alfo fignifies a grove of trees.

TOFTA, in *Geography*, a fmall ifland in the Baltic, E. of the ifland of Aland. N. lat. 60° 13′. E. long. 20° 7′.

TOFTS, KATHARINE, in *Biography*, an Englifh finger of great renown on our ftage at the beginning of the laft century. In 1703, fhe fung at a fubfcription concert in Lincoln's-Inn theatre, feveral Italian and Englifh fongs. This lady was the conftant rival of Margarita de l'Epine.

In 1704, fhe fung at the fubfcription mufic in Drury-lane playhoufe; and foon after, fignora Margarita fung for the firft time at the fame theatre. At her fecond appearance, there was a difturbance while fhe was finging, which, from the natural, and, it is to be feared, not uncommon effects of rival malice, was fufpected to have been created by the emiffaries of Mrs. Tofts; an idea the more difficult to eradicate, as the principal agent had happened to live with that lady as a fervant. But as the law of retaliation is frequently practifed on the like occafions by the injured party, it was thought neceffary, a few days after, to infert a paragraph and letter in the Daily Courant, February 8, 1704, in vindication of Mrs. Tofts.

She was the principal finger in Clayton's Arfinoe, in 1705, the firft opera attempted in our country and language on the Italian model. See CLAYTON.

Mrs. Tofts was likewife the heroine of the famous opera of Camilla, of Addifon's Rofamond, fet by Clayton, and Thomyris, adjufted to Italian mufic, and wholly to Englifh words, till the arrival of Valentini, in 1707, the firft male foprano finger that ever appeared on our ftage; when Camilla and Thomyris were performed, half in Englifh and half in Italian. And even after the arrival of the celebrated Nicolini, when a new opera, entitled Pyrrhus and Demetrius, was brought on the ftage in 1708, in which almoft all the characters were filled up by Italians, Mrs. Tofts continued to perform her part in Englifh, as did Ramondon and Cook; but the public feemed perfectly fatisfied with the motley performance, which had a run of eighteen nights; and the confufion of tongues, concerning which Mr. Addifon is fo pleafant in the Spectator, feems to have been tolerated with perfect good humour by the public, which, in mufic as well as words, feemed to care much lefs about *what* was fung, than *how* it was fung.

After the year 1709, when the whole opera, poetry, mufical compofition and performers were Italian, Mrs. Tofts, who feems to have endeared herfelf to an Englifh audience by her voice, figure, and performance, more than any preceding finger of our country, retired.

Colley Cibber, though he does not fpeak of mufic *en connoiffeur*, and, as an Englifh actor and patentee of a theatre, was an enemy to Italian operas and Italian fingers upon a principle of felf-defence, probably gives us the general and genuine opinion of his acquaintance concerning Mrs. Tofts, who, he fays, had her firft mufical inftructions in her own country, "before the Italian tafte had fo highly prevailed, and was then not an adept: whatever defect the fafhionably fkilful might find in her manner, fhe had, in the general fenfe of her hearers, charms that few of the moft learned fingers ever arrive at. The beauty of her fine proportioned figure, and exquifitely fweet filver-tone of voice, with peculiar rapid fwiftnefs of her throat, were perfections not to be imitated by art or labour."

This performer had fongs given to her in all ftyles; her compafs, however, did not furpafs the common limits of a foprano, or treble voice. With refpect to her execution, of which we are ftill enabled to judge by the printed copies of her fongs, it chiefly confifted in fuch paffages as are comprifed in the fhake, as indeed did that of moft other fingers at this time.

Mrs. Tofts quitted the ftage in 1709. The talents of this finger and of Margarita de l'Epine gave rife to the firft mufical factions which we hear of in this country. According to Hughes, author of the Siege of Damafcus, their abilities were difputed by the firft people in the kingdom.

"Mufic has learn'd the difcords of the ftate,
And concerts jar with Whig and Tory hate.
Here Somerfet and Devonfhire attend
The Britifh Tofts, and ev'ry note commend;
To native merit juft, and pleas'd to fee
We've Roman arts, from Roman bondage free.
There fam'd l'Epine does equal fkill employ,
While lift'ning peers crowd to th' ecftatic joy:
Bedford to hear her fong his dice forfakes,
And Nottingham is raptur'd when fhe fhakes;
Lull'd ftatefmen melt away their drowfy cares
Of England's fafety, in Italian airs."

Although it is publicly infinuated in the Tatler, for Thurfday, May 26, 1709, that Mrs. Tofts was infane, it feems doubtful whether we are to take this account literally, or whether

whether sir Richard Steele had not recourse to invention, or at least exaggeration, in order to throw a ridicule on opera quarrels in general, and on her particular disputes at that time with the Margarita or other female singers. See Tatler, N° 20.

After quitting the stage, by which she is said to have acquired a considerable fortune, she married Mr. Joseph Smith, who was afterwards appointed consul at Venice, where he resided till the time of his death, about the year 1770. He was a great collector of books and pictures, and a patron of the arts in general.

TOGA, in *Ancient Geography*, a town of Asia, in Greater Armenia. Ptol.

Toga, in *Antiquity*, a wide woollen gown, or mantle, without sleeves, used among the Romans, both by men and women.

In process of time, none wore the toga but lewd women: whence that of Horace, *in matrona, ancilla, peccesve togata*. Lib. i. sat. ii. ver. 63.

The toga was of divers colours, and admitted of various ornaments: there was that called *toga domestica*, worn within doors; *toga forensis*, worn abroad; *toga militaris*, used by soldiers, tucked up after the Gabinian fashion; and *toga picta*, or *triumphalis*, wherein the victorious triumphed: this was embroidered with palms: that without any ornaments was called *toga pura*.

The *toga picta*, &c. was an ancient habit of the Etruscans, and not brought to Rome till after Tarquinius Priscus had subdued the twelve states of that nation.

The toga was sometimes worn open, and called *aperta;* sometimes girt or tucked up, called *præcincta;* and this cincture or girding, again, according to Sigonius, was of three kinds; *laxior*, or the loose kind, where the tail trailed on the ground; *adstrictior*, the close kind, wherein it did not reach so low as the feet; and *Gabinia*, where one of the skirts or lappets was girt round the body.

Sigonius distinguishes the several togæ, or Roman gowns, into *pura*, *candida*, *pulla*, *picta*, *prætexta*, *trabea*, and *paludamentum*. See Prætexta, Paludamentum, &c.

The *toga pura* was also called *virilis*. Kennet's Rom. Ant. part ii. c. 8.

Toga is sometimes used metaphorically for peace. See Trope.

Togæ, *Jus*, or privilege of the toga, was the same with the privilege of a Roman citizen, *i. e.* the right of wearing a Roman habit, and of taking, as they explain it, fire and water through the Roman empire.

TOGAWADY, in *Geography*, a town of Hindoostan, in Baramaul; 7 miles S. of Sankerydurgam.

TOGDA, or Todga, a town and district of Africa, in the country of Sugulmessa; 50 miles W. of Sugulmessa.

TOGEBAUT, a town of Persia, in the province of Irac; 81 miles N. of Ispahan.

TOGETHER, in *Sea Language*, the order given to the men in the exercises of heaving, rowing, twisting, &c. to act all in concert, or at the same instant.

TOGGEL, in a *Ship*, a small wooden pin, about five or six inches long, and usually tapering from the middle toward the extremities. It is used to fix transversely in the lower part of a tackle, in which it serves as a hook whereby to attach the tackle to a strop, slings, or any body in which the effort of the tackle is to be employed.

There are also toggels of another kind, employed to fasten the top-gallant sheets to the span, which is knotted round the cap at the top-mast-head. Falconer See Beckets.

TOGGENBURG, in *Geography*, a county of Switzerland, dependent on the abbey of St. Gal, bounded on the N. by the territory of St. Gal, on the E. by the canton of Appenzell, on the S. by the county of Sargans and the territory of Caster, and on the W. by the canton of Zurich. In its natural quality it resembles Appenzell and the other cantons, and, being full of fertile Alps, abounds in numerous breeds of cattle. Till the year 1436, this county had its own counts; the last of whom carried his indulgence to his vassals so far, as to grant them such privileges as nearly amounted to a state of absolute freedom: accordingly, on his demise in the above year, they entered into a close alliance with the cantons of Schweitz and Glaris, which alliance was confirmed in 1440. Afterwards, the county descended to the barons of Raron; but, in 1468, they sold it to Ulrich VIII. abbot of St. Gal, who, in 1469, entered into a perpetual league with the cantons of Schweitz and Glaris, and likewise gave his sanction to the former compact between the inhabitants of the county and the said cantons. In the beginning of the eighteenth century, the Toggenburgers, resenting the illegal and oppressive exactions of abbot Leodegarius, applied for assistance to their allies, who readily granted it; and, in 1707, Zurich and Bern also declared, that they would maintain the county of Toggenburg in the secure enjoyment of its rights and liberties, against all illicit violence whatsoever. On this the people began to assert their rights, and, in 1707, in a solemn landesgemeine, held at Watweil, renewed their federal oath, and erected three councils, named the great, lesser, and privy, which are composed of an equal number of members of both sects. The intestine commotions here continued however to increase, till, in 1712, they broke out into open war, in which Zurich and Bern sided with the county, and Schweitz and Glaris with the abbot. In 1718, at Baden, in the Argau, an accommodation, confirming the liberties of the county, was brought about between the new abbot and the cantons of Bern and Zurich. Pursuant to this peace, the abbot and prince of St. Gal both is, and bears the title of, natural sovereign, and territorial lord of the county of Toggenburg; and the people are to take the accustomed oath to him, and to pay him suitable services, but without any violation of their rights and liberties.

TOGLUPOUR, a town of Hindoostan, in the subah of Delhi; 15 miles W.N.W. of Panniput.

TOGOMI, a town of Japan, in the island of Niphon; 80 miles N.W. of Meaco.

TOGOSOHATCHEE Creek, a branch of the Oakmulgee river, in the state of Georgia.

TOGRIN, Cape, a cape at the mouth of the river Sierra Leone.

TOGULA, among the Romans, a narrow kind of toga, used by the poorer sort of people.

TOHBA, a denomination given to a class of priests in Thibet. Youth intended for the monastery of Teshoo-Loomboo, are, upon their first being admitted, at the age of eight or nine years, into the establishment, called "Tuppa," and they are then occupied in receiving the instructions suited to their age, and the duties for which they are designed. At fifteen they are usually admitted into the order of Tohba, the first step in their religious class, and after due examination, they are advanced from the order of Tohba to that of Gylong, between the age of twenty-one and twenty-four. See Gylong.

TOHOTCHIE Hotun, in *Geography*, a town of Chinese Tartary, in the country of Hami; 30 miles N.W. of Hamil Hotun.

TOJIE, a town of Hindoostan, in Candeish; 10 miles N. of Hurdah.

TOIKO, a town of Japan, in the ifland of Niphon; 80 miles E.S.E. of Jedo. N. lat. 36° 5′. E. long. 140° 40′.

TOILES, fnares or nets fet by hunters for catching of wild beafts; as deer, &c.

TOILET, a fine covering, of linen, filk, or tapeftry, fpread over the table in a bed-chamber, or dreffing-room, to undrefs and drefs upon.

The dreffing-boxes, in which are kept the paints, pomatums, effences, patches, &c. the pin-cufhion, powder-box, brufhes, &c. are efteemed parts of the equipage of a lady's toilet.

That of the men confifts of comb-cafe, brufhes, &c.

To make a vifit to one at his toilet, is to come to entertain him while he is dreffing or undreffing.

Sattin, lace, velvet, brocade, point de France, &c. are now ordinarily ufed for toilets: anciently they were made much plainer: whence the name, which is formed from the French, *toilette*, a diminutive of *toile*, any thin ftuff.

TOISE, or Fathom, a long meafure in France, containing 6 feet, the foot being 12 inches, the inch 12 lines, fubdivided into 12 points: 76 French feet are equal to 81 Englifh feet, or, more accurately, 4000 French feet equal 4263 Englifh feet.

TOISON *d'Or*, a term, in *Heraldry*, for a golden fleece, which is fometimes borne in a coat of arms.

TOISSEY, in *Geography*, a town of France, in the department of the Ain, near the Chalaregne and Saône, which unite about half a mile from the town; 18 miles W. of Bourg-en-Breffe.

TOJUCA, a river of Brafil, which runs into the Atlantic, S. lat. 27° 44′.

TOKA, a town of Hindooftan, in the circar of Aurungabad; 33 miles S.W. of Aurungabad.

TOKAI, a river of Bucharia, which runs into the Gihon, near Hefdr-afp.

TOKARESTAN, a diftrict of Grand Bucharia, fituated to the eaftward of Balk.

TOKAY, a town or rather village of Hungary, fituated at the foot, and to the E. of a high hill, clofe by the conflux of the river Bodrug with the Theis or Tibifcus. The inhabitants are chiefly either Hungarians of the Proteftant religion, or Greeks, who came originally from Turkey, but have been long fettled here, for the purpofe of carrying on the wine-trade. The hills on which the vine grows lie all to the W. of the river Bodrug, and beginning clofe by the town of Tokay, extend weftward and northward from thence, and occupy a fpace of perhaps ten Englifh miles fquare; but they are interrupted and interfperfed with many extenfive plains, and feveral villages. Near fome of thefe, particularly Tabia and Tarczal, the wine is better than that which is produced on the hill of Tokay; but it all goes under the fame name; 98 miles N.W. of Colofvar. N. lat. 48° 10′. E. long. 10° 57′.

Tokay-*Wine*, derives its name from the town or village of Hungary, where it is produced. (See the preceding article.) The vineyards extend beyond the forty-eighth degree of northern latitude; the foil where the vines grow is a yellow clayifh earth, extremely deep, and interfperfed with large loofe lime-ftones: the expofures moft inclining to the fouth, the fteepeft declivities, and the higheft parts of thefe, produce the beft wine. This wine, fo far from its being found in fo fmall a quantity as never to be genuine, unlefs when given in prefents by the court of Vienna, is a common defert wine in all the great families at Vienna and in Hungary, and is very generally drank in Poland and Ruffia: nor is the Tokay wine altogether the property of the crown, but many of the German and Hungarian nobility, as well as gentlemen, and even peafants, have vineyards at Tokay. The grapes are all white, and the vintage commonly begins about the 28th of October, fometimes as late as the 11th of November. There are four forts of wine made from the fame grapes, diftinguifhed at Tokay by the names of effence, aufpruch, mafslafch, and the common wine.—The effence is made by picking out the half-dried and fhrivelled grapes, and putting them into a perforated veffel, where they remain as long as any juice runs off by the mere preffure of their own weight. This is put into fmall cafks. The aufpruch is made by pouring the expreffed juice of the grapes from which the former had been picked on thofe that yielded the effence, and treading them with the feet. The liquor thus obtained ftands for a day or two to ferment, and then is poured into fmall cafks, which are kept in the air for about a month, and afterwards put into the cellars. The fame procefs is again repeated by the addition of more juice to the grapes which have already undergone the two former preffures, and they are now wrung with the hands; and thus is had the mafslafch. The fourth kind is made by taking all the grapes together at firft, and fubmitting them to the greateft preffure: this is chiefly prepared by the peafants. The effence is thick, and very fweet and lufcious; it is chiefly ufed to mix with the other kinds. The aufpruch is the wine commonly exported, and which is known in foreign countries by the name of Tokay. The goodnefs of it is determined by the following rules. The colour fhould neither be reddifh nor very pale, but a light filver: in trying it, the palate and tip of the tongue fhould be wetted without fwallowing it, and if it manifeft any acrimony to the tongue, it is not good; but the tafte ought to be foft and mild: when poured out, it fhould form globules in the glafs, and have an oily appearance: when genuine, the ftrongeft is always of the beft quality: when fwallowed, it fhould have an earthy aftringent tafte in the mouth, which is called the tafte of the root. All Tokay wine has an aromatic tafte, which diftinguifhes it from every other fpecies of wine. It keeps to any age, and improves by time; but is never good till about three years old. It is the beft way to tranfport it in cafks; for when it is on the feas, it ferments three times every feafon, and thus refines itfelf. When in bottles, there muft be an empty fpace left between the wine and the cork, otherwife it would burft the bottle. A little oil is put upon the furface, and a piece of bladder tied over the cork. The bottles are always laid on their fides in fand. Phil. Tranf. vol. lxiii. part ii. p. 292, &c.

TOKE, in *Geography*, a town of Bengal; 35 miles N.N.E. of Dacca.

TOKEN-BESSEYS, a clufter of fmall iflands in the Eaft Indian fea. S. lat. 6°. E. long. 123° 36′.

TOKENS, in *Peftilential Cafes*, thofe livid fpots which appear in the feveral ftages of the difeafe, and are certain forerunners of death. They generally appear only under the moft defperate circumftances, and when the patient would otherwife be declared dying; but Hodges gives us inftances where they appeared before any other fymptoms of the difeafe, and came out without any pain or trouble; yet even in thefe cafes the perfon always died. Thefe tokens are the mark by which the fearchers conclude of the caufe of the death of the perfon, and are the rule for ordering the houfe to be fhut up, to prevent the fpreading of the difeafe. But the nurfes, and other crafty people, have a way of difguifing the fymptom after death, by covering the body with wet and cold fheets. Thefe ftrike in the fpots, fo that the perfon may be thought to have died by fome other difeafe.

Tokens, *Falfe*, in *Law*. See False.

Tokens, in *Coinage*, coins in the reign of queen Elizabeth, ftruck ſtruck in the cities of Briſtol, Oxford, and Worceſter, and alſo by about 3000 tradeſmen and others; upon returning which to the iſſuer, he gave current coin, or value, for them, as deſired. In the ſucceeding reign, on the 19th of May, 1613, king James's royal farthing tokens commenced by proclamation. Theſe were not forced upon the people as farthings or eſtabliſhed coin, but merely as pledges or tokens, for which government was obliged to give other coin if required. Their legend was the king's common titles running upon each ſide. Theſe pieces were not favourably received, but continued in a kind of reluctant circulation through the whole of this reign, and the beginning of the ſucceeding. In 1635, Charles I. ſtruck thoſe with the roſe inſtead of the harp. But the vaſt number of counterfeits, and the king's death in 1648, put an utter ſtop to their currency; and the tokens of towns and tradeſmen again took their run, increaſing prodigiouſly till the year 1672, when farthings properly ſo called were firſt publiſhed by government. Theſe town-pieces and tradeſmen's tokens, together with thoſe of the time of queen Elizabeth, are collected by ſome antiquaries with great avidity. Similar tokens, ſays Pinkerton, are to this day current in Scotland, both of copper and tin, principally uſed by the bakers and grocers; farthings not being very common in that country.

In 1804, the bank of Ireland bought in a large quantity of depreciated ſilver coin; and, as a ſubſtitute, iſſued Spaniſh dollars, newly ſtamped, at 6*s*. Iriſh, and alſo fractions of the dollar, which had been minted for the occaſion at the Tower of London, conſiſting of five-penny, ten-penny, and thirty-penny pieces Iriſh, being exactly $\frac{1}{13}$, $\frac{2}{13}$, and $\frac{6}{13}$ of the dollar. All theſe coins are called Bank tokens, the Bank having engaged to receive them again at the iſſued price, and they have been declared a legal tender in the payment of taxes: their intrinſic value may be known from that of the dollar. In 1809, a new ſilver coinage was minted at the Tower of London for the colonies of Eſſequibo and Demerary, conſiſting of pieces of 3, 2, 1, $\frac{1}{2}$, and $\frac{1}{2}$ guilders: the larger piece weighs 15 dwt., and is 1 oz. 6 dwt. worſe than Engliſh ſtandard. Its value therefore is 3*s*. 5*d*. ſterling, or, computing it as the dollar is now rated in the Weſt Indies (*i. e.* at 4*s*. 8*d*.), its value is 3*s*. $8\frac{1}{4}$*d*. and the ſmaller pieces in proportion. They are marked on the reverſe "Colonies of Eſſequibo and Demerary Token," and the king's is on the obverſe. The exchange with London ſhould be about 12 guilders for 1*l*. ſterling, but varies conſiderably above this, even to 20 guilders, and upwards. Kelly's Cambiſt.

TOKIS, in *Geography*, a town of Japan, in the iſland of Niphon; 40 miles N.N.E. of Meaco.—Alſo, a town of Japan, in the province of Ximo; 15 miles N.N.W. of Nangaſaki.

TOKI-TAO, a ſmall iſland near the coaſt of China. N. lat. 38° 7′. E. long. 120° 39′.

TOKORARI. See Tocorary.

TOKTABA, a town of Bootan; 50 miles N. of Beyhar.

TOL, in *Law*, a term ſignifying to defeat, or take away. From the Latin, *tollere*, which ſignifies the ſame.

Thus, *to tol the entry*, is to take away the right of entry.

Tol *Peden Penwith*, in *Geography*, a cape on the S. coaſt of the weſtern extremity of Cornwall; 3 miles S.E. of Land's End. N. lat. 50° 4′. W. long. 5° 36′.

TOLA, in *Commerce*, a weight for gold and ſilver at Bombay, Surat, and other places in India: at Bombay, the tola contains 40 valls, 100 gonze or Bombay grains, or 600 chowes. The tola is equal in weight to the ſilver rupee; 24 tolas make 1 ſeer, and 32 tolas 13 valls = 1 lb. troy. At Surat, the tola contains 32 valls or 96 ruttees: $82\frac{1}{2}$ valls make 1 oz. troy, and therefore 31 tolas 1 lb. troy nearly.

TOLABO, Cape, in *Geography*, a cape on the E. coaſt of Celebes. S. lat. 0° 45′. E. long. 122° 50′.

TOLAGO Bay, a bay on the N.E. coaſt of the northern iſland of New Zealand, in the South Pacific ocean, diſcovered by captain Cook in the year 1769. It is moderately large, and has from ſeven to thirteen fathom, with a clean ſandy bottom and good anchorage, and is ſheltered from all winds except the north-eaſt. On the ſouth point lies a ſmall but high iſland, ſo near the main as not to be diſtinguiſhed from it. Cloſe to the north end of the iſland, at the entrance into the bay, are two high rocks; one of which is round, like a corn-ſtack, but the other is long, and perforated in ſeveral places, ſo that the openings appear like the arches of a bridge. Within theſe rocks is a cove, convenient for wood and water. Off the north point of the bay is a pretty high rocky iſland; and about a mile without it, are ſome rocks and breakers. The tide flows at the full and change of the moon, about ſix o'clock, and riſes and falls perpendicularly from five to ſix feet. Captain Cook ſaw no four-footed animals, nor the appearance of any, either tame or wild, except dogs and rats, and theſe were very ſcarce: the people eat the dogs, as at Otaheite, and adorn their garments with the ſkins. He climbed many of the hills, hoping to get a view of the country, but could ſee nothing from the top except higher hills, in a boundleſs ſucceſſion. The ridges of theſe hills produce little beſides fern; but the ſides are moſt luxuriantly clothed with wood and verdure of various kinds, with little plantations intermixed. In the woods he found trees of above twenty different ſorts, and carried ſpecimens of each on board; but there was nobody to whom they were not altogether unknown. The tree cut for firing was ſomewhat like the maple, and yielded a whitiſh gum. Another ſort was found of it, of a deep yellow, which might be uſeful in dyeing. One cabbage-tree was met with, and cut down for the cabbages. The country abounds with plants, and the woods with birds in an endleſs variety, exquiſitely beautiful, and of which none of them had the leaſt knowledge. The ſoil of both the hills and vallies is light and ſandy, and very fit for the production of all kinds of roots; though none were ſeen except ſweet potatoes and yams. S. lat. 38° 22′. W. long. 181° 15′.

TOLAND, John, in *Biography*, a writer on ſubjects of political and religious controverſy, was born in the year 1669, in Ireland, near Londonderry; and his parents, of a good family, were Roman Catholics. Educated in the principles of his family, he renounced them before he attained the age of ſixteen years, and became a zealous oppoſer of popery. Accordingly he completed his education in Scotland, and having ſpent three years in the univerſity of Glaſgow, removed to Edinburgh, where he graduated M. A. in 1690. From Edinburgh he removed to London, and became acquainted with ſome reſpectable diſſenters, who enabled him to purſue his ſtudies for two years more at Leyden. On his return to London, he viſited Oxford, and here he collected materials for the execution of ſome literary projects: one of which was a diſſertation in order to prove that the common narrative of the death of Regulus was a fable. In 1696 he publiſhed at London his "Chriſtianity not myſterious; or a Treatiſe ſhewing that there is nothing in the Goſpel contrary to Reaſon, or above it; and that no Chriſtian Doctrine can be properly called a Myſtery." This publication cauſed an alarm, and not without reaſon, among

among Chriſtians of all denominations, by whom it was regarded as an attempt to overthrow revealed religion. At home and abroad it excited attention, and the advocates of Chriſtianity concurred in the defence of their religion againſt what they conceived to be an attack upon it. The magiſtrates, alſo, intruded into this controverſy, and procured a preſentment by the grand jury of Middleſex. The author withdrew from the ſtorm which ſeemed to be gathering into his own country; but the obnoxious character of his book had excited prejudices againſt him. Toland, as we learn from the correſpondence between Mr. Molyneux and Mr. Locke on the ſubject, does not ſeem to have acted with that moderation and prudence which might reaſonably have been expected in his circumſtances. His manner of defending and propagating his opinions gave juſt offence even to thoſe who entertained ſome degree of reſpect for his talents and learning; and was condemned by thoſe who were avowed advocates of rational liberty and enemies to every kind of perſecution. From another quarter he experienced a ſeverity of treatment, which his own miſconduct had provoked, but which, in this more enlightened and liberal period, none, we preſume, will undertake to juſtify. In a reply to Toland's book, by Mr. Peter Brown, ſenior fellow of Trinity college, the civil magiſtrate was called upon to interfere; accordingly the grand jury of Dublin made a preſentment of the book: the parliament of Ireland voted it to be burnt by the common hangman, and iſſued an order that the author ſhould be taken into cuſtody by the ſerjeant at arms, and proſecuted by the attorney-general. Toland, univerſally ſhunned by his acquaintance, and reduced to pecuniary diſtreſs, left the country, and returned to England. While ſome diſapproved the violence of this proceeding, others juſtified it; and Dr. South, in particular, highly commends the Iriſh parliament for having, "to their immortal honour, preſently ſent him (Toland) packing, and, without the help of a faggot, ſoon made the kingdom too hot to hold him." On the ſpirit which dictated this language we make no comment. Toland, upon his arrival in London, publiſhed an account of his treatment in Ireland, and renouncing communion with the Diſſenters, declared himſelf a latitudinarian, or one who would comply with the religious worſhip of any claſs of Proteſtants, whoſe differences were not, in his eſtimation, of ſufficient importance to juſtify diſturbing the peace of a nation. He then directed his attention to other topics; and in 1698 he publiſhed a pamphlet, intitled "The Militia reformed," in which he propoſed to ſubſtitute that ſpecies of armament to a ſtanding army. In the ſame year he wrote a "Life of Milton," to be prefixed to an edition of his proſe works, and which was alſo printed ſeparately. In this preface he oppoſed the notion then prevalent, that the "Icon Baſilike" was written by Charles I.; and from the conſideration of this impoſture, as he pronounced it to be, he digreſſed to the conſideration of the ſpurious works that had been aſcribed to Chriſt and his apoſtles. Againſt a hoſt of political and religious adverſaries, he defended himſelf in a treatiſe intitled "Amyntor;" in which he gave a complete hiſtory of the "Icon Baſilike," and alſo a catalogue of ſuch primitive writers, who were judged by him to be ſpurious. As he was ſuppoſed in the diſcuſſion of this latter topic to impugn the authenticity of the received canon of Scripture, he drew forth replies from ſome of the ableſt advocates of Chriſtianity, and particularly Mr. (afterwards the highly celebrated Dr.) Samuel Clarke.

In 1699, Toland was engaged by the duke of Newcaſtle to publiſh "Memoirs of Denzil Lord Holles;" and in the following year by Mr. Robert Harley, afterwards earl of Oxford, then a Whig, to give a new edition of Harrington's "Oceana." When the Act of Succeſſion was paſſed, on occaſion of the death of the duke of Glouceſter in 1701, he publiſhed "Anglia Libera," being an explanation and eulogy of this act; and he accompanied the earl of Macclesfield, who was deputed to carry it to Hanover, and had the honour of preſenting his book to the electreſs Sophia, and of kiſſing her hand on the occaſion. At Berlin, which he viſited, he held a diſpute, before the queen of Pruſſia, with the learned Beauſobre, on the authority of the books of the New Teſtament; an account of which was ſent by the latter to the "Bibliotheque Germanique." Upon his return to England in 1704, he publiſhed "Letters to Serena," (meaning the queen of Pruſſia,) on the origin and force of prejudices; the hiſtory of the ſoul's immortality among the heathens; the origin of idolatry; and remarks on Spinoza's philoſophy. Theſe letters were animadverted upon by Wotton, and by the author of the Divine Legation. In 1708 he publiſhed at the Hague two Latin diſſertations, entitled "Adeiſidæmon, ſive Titus Livius a Superſtitione vindicatus," and "Origines Judaicæ, ſive Strabonis de Moyſe et Religione Judaica Hiſtoria breviter illuſtrata." In 1718 he publiſhed "Nazarenus; or Jewiſh, Gentile, or Mahometan Chriſtianity," &c. in which he endeavours to ſhew that the Jewiſh converts were to obſerve their own law throughout all generations, &c. Two years afterwards appeared a Latin tract, entitled "Pantheiſticon: ſive Formula celebrandæ Sodalitatis Socraticæ, &c.:" a work which has ſubjected its author to the charge of atheiſm, and in conſequence of which he was unjuſtly accuſed by Dr. Hare with having compoſed a profane prayer to Bacchus in his character of Pantheiſt. In the ſame year he publiſhed his "Tetradymus," on the pillar of cloud and fire that guided the Iſraelites; on the exoteric and eſoteric philoſophy of the ancients; on Hypatia, the female philoſopher; and a defence of his Nazarenus againſt Dr. Mangey. To this work he annexed an account of his conduct and ſentiments, ſolemnly profeſſing his preference of the Chriſtian religion, pure and unmixed, to all others.

Toland's health was now declining, and being in low circumſtances, lord Moleſworth aſſured him that he ſhould never want, while he himſelf lived. However, his diſeaſe baffled all remedies, and his life cloſed on the 11th of March, 1722, in the 53d year of his age. He manifeſted a conſiderable degree of reſolution and patience during the progreſs of his illneſs: replying to one who aſked him if he wanted any thing, "I want nothing but death;" and after taking a calm leave of his friends, ſaying to them that "he was going to ſleep." In an epitaph which he prepared for himſelf, he expreſſes that confidence and ſelf-applauſe which belonged to his character. He cloſes with theſe words: "Spiritus cum æthereo patre, a quo prodiit olim, conjungitur; corpus item; naturæ cedens, in materno gremio reponitur. Ipſe vero æternum eſt reſurrecturus, at idem futurus Tolandus nunquam." His poſthumous works were publiſhed in 2 vols. 8vo. in 1726, and again in 1747, with an account of his life and writings, by Des Maizeaux. Biog. Brit.

TOLANORE, in *Geography*, a town of Hindooſtan, in the Carnatic; 5 miles N. of Volconda.

TOLASTRA REGIO, in *Ancient Geography*, a country of Aſia, in Galatia. Ptolemy.

TOLBIACUM, a town of Gallia Belgica, according to Tacitus; ſituated on the route from Trevari to Colonia Agrippina.

TOL-BOOTH, or TOLL-BOOTH, a place in a city, where goods are weighed, to aſcertain the duties or import on them.

TOLCESTER, Tolcestrum, in our *Old Writers*, an old excife, or duty paid by the tenants of fome manors to the lords, for liberty to brew and fell ale.

TOLCKSDORF, in *Geography*, a town of Pruffia, in Ermeland; 12 miles S.E. of Frauenburg.

TOLEDO, in *Biography*. See Alva.

Toledo, in *Geography*, a city of Spain, in New Caftile, on the Tagus, the fee of an archbifhop, and an univerfity, founded in the year 1475. The origin of Toledo is uncertain; it is only known to have been a Roman colony, and made the depofitory of the treafures fent to Rome. From the Romans it paffed under the dominion of the Goths; Leovigild refided there and embellifhed the city, which became more confiderable under his fucceffors. The Moors took Toledo in 714, and reigned there till 1085, when it was taken from them by Alphonfo VI., who ftyled himfelf emperor of Toledo, whence it took, and has preferved, the title of royal and imperial. Toledo, as is well known, was formerly famous for the exquifite temper of the fword-blades made there; and the genuine ones that ftill remain are fold at an exorbitant price. It is faid that the fecret of hardening them has been again recovered; and experiments have been made with blades lately fabricated there which feem to juftify this affertion. When one of thefe has undergone the operation of tempering, if it be in the leaft notched, by ftriking with it feveral violent blows on an iron head-piece, it is rejected: almoft all that are made here, it is faid, will ftand this proof. Two centuries ago, Toledo contained more than 200,000 inhabitants, but now fcarcely 30,000. When a houfe falls to decay, it is never rebuilt; and in 20 years more, this city will be little elfe than a heap of ruins. Toledo is built upon rocks, and commanded by eminences which feem to prefent the image of fterility; yet, in the midft of thefe precipices, the traveller finds, to his furprife, feveral fertile and charming fituations, impenetrable to the burning rays of the fun. Thefe places are called *Cigarrales*. Several councils have been held at Toledo, particularly one in 633, in which it was declared unlawful and unchriftian to force people to believe, feeing it is God only who hardens, and fhews mercy to whom he will; but by another council in a few years after, they highly commended their monarch for perfecuting the Jews. In 681 it was decreed, that the archbifhop of Toledo fhould have power to create bifhops throughout Spain in the king's abfence, and confirm thofe made by the king. In 1355, it was feized by Henry and Frederick, the baftards, brothers of king Peter, who robbed all the Jews, and murdered about 1000 of them; 32 miles S.S.W. of Madrid. N. lat. 39° 56′. W. long. 4° 18′.

TOLEN, a town of Norway; 22 miles W. of Berga.—Alfo, an ifland belonging to the ftate of Zealand, in the eaft branch of the Scheldt, feparated from the main land of Brabant by a canal, about ten miles in length, and four in breadth. It contains two towns, Tolen and St. Martyn's Dyck, and feveral villages. Tolen, the capital, from whence the ifland itfelf is named, is a handfome town, and ranks as fourth in the affembly. The name of it is derived from the toll which was formerly paid here by order of the counts of Zealand. It is fortified with feven baftions, and the ftates have caufed a fort, called Suckenburg, to be built on the other fide of the river, fo that it is now one of the ftrongeft frontier towns of the ftate of Zealand. The ftadt-houfe is an old building, which makes a good fhow. The arfenal is fituated at the entrance of the fmall harbour; there is alfo a magazine for powder. The church is built in the figure of a crofs, and is an extraordinary piece of architecture; 4 miles N.W. of Berg-op-Zoom. N. lat. 51° 36′. E. long. 3° 58′.

TOLENTINO, a town of the Popedom, in the marquifate of Ancona, on the Chiento, the fee of a bifhop, united to Macerata. It is only remarkable for being the depofitory of the body of St. Nicholas, where the arm, by bleeding afrefh, prognofticates when any fignal calamity is to befall Italy; 18 miles W. of Fermo. N. lat. 43° 10′. E. long. 13° 18′.

TOLENTINUM, in *Ancient Geography*, a town of Italy, in Picenum, S.W. of Ricina.

TOLENUS, a river of Italy, in the country of the Marfi.

TOLERATION, in *Religion*, a term which has engaged much attention in the difputes among Proteftants.

M. Bafnage, and fome others, diftinguifh *civil* toleration from *ecclefiaftical*. The latter allows of different, and even oppofite fentiments in the church; and the firft permits them in civil fociety.

By civil toleration, is meant impunity and fafety in the ftate for every fect which does not maintain any doctrine inconfiftent with the peace and welfare of the ftate. This *civil* or *political* toleration, implies a right of enjoying the benefit of the laws, and of all the privileges of the fociety, without any regard to difference of religion.

Ecclefiaftical toleration is an allowance of certain opinions, which, not being fundamentals, do not hinder thofe who profefs them from being efteemed members of the church. But as to the quality and number of thefe fundamental points, they never could, nor in all probability ever will be agreed upon.

In order to difcover the genuine principles of toleration, it is neceffary to confider that, antecedently to the formation of civil focieties, mankind poffefs certain rights, independent of all human grant, not derived from any compact, and which are therefore to be acknowledged as the rights of human nature. A right to judge for themfelves in points of religion is one of thefe rights; which, whilft it authorizes every individual to claim the exercife of this privilege to himfelf, obliges him to allow it in the fame extent to all about him, and eftablifhes one uniform regulation for his behaviour toward others, and their behaviour toward him: *e.g.* no apprehenfions of the truth and certainty of any perfon's religious fentiments can juftify him in attempting to impofe them on his neighbour; for the fame right of judgment which any *one* can claim, belongs, on the fame principle, equally to *all*, and ought to be equally facred and inviolable in all; and no reafon can be alleged by him for taking the religious liberty of others from them, but what will, at the fame time, equally deftroy his own title to it. The injuftice of fimilar encroachments upon *him* from *others* follows from the fame principle, and with the fame evidence.

Whether the claim of fuch a liberty of judgment in religion for ourfelves is weakened by men's entering into civil fociety, is the next object of confideration.

The great end of government is to protect the fubjects of it from the injuries to which they were expofed in a ftate of nature; and as all injuries imply rights of which they are violations, and the care taken to guard againft the violation of thefe rights is an acknowledgment of the reality and importance of them; it evidently follows, that when they enter into fociety, if the primary and leading view of government be to prevent or reftrain thofe injuries, to which men were expofed for want of its protection, they carry thefe rights with them; that they continue to retain them; and that, inftead of fuppofing themfelves to be deprived of them, the very defign with which they put themfelves under the authority of government is to fecure them the more firmly. With this view they entruft the prefervation of them to common guardians, by whofe intervention, it is prefumed, they will be more vigoroufly afferted and more effectually protected, than it is poffible they fhould be in a ftate where there is no common umpire to check the evils of oppreffion on the one hand, and reftrain the no lefs formidable evils of immoderate refentment on the other.

If we confider what are the rights which men give up to government, when they enter into civil focieties, they will be found to be, not thofe which may moft properly be ftyled the primary rights of human nature; not the right which every man has to live undifturbed, to enjoy the advantages which he juftly poffeffes, and to be left to his freedom in all things not injurious to his fellow-creatures; but the confequential, though equally real and certain right which, where men are not fubject to government, every perfon has to take the affertion of all his rights into his own hands, and correct the infringers of them by the inflicting of fuch pains, or the ufe of fuch other methods of deterring the authors of the wrong, as reafon fhall warrant for his future fecurity: and, fpeaking precifely, even thefe rights are not abfolutely extinguifhed and utterly loft, but fufpended by fuch limitations as the order and well-being of fociety require, and fo long as the fuccours of government fhall be effectual. The primary rights of liberty, fafety, and protection from oppreffion, ftill fubfift in their full vigour. To fuppofe them abandoned, renounced, and annihilated, or that government can have any right to deftroy them, is afcribing to it a right to defeat the end for which it is eftablifhed, and betray the truft repofed in it. It is, indeed, totally inverting the principle upon which the power of rulers ftands, and by which the acts of it ought to be guided.

Man was not made for government, but government for man; and the great object, to which all the operations of it fhould be directed, is to guard, as much as poffible, the equal, impartial eafe and freedom of all the fubjects of it. To this purpofe judge Blackftone obferves, that the principal aim of fociety is to protect individuals in the enjoyment of thofe abfolute rights, which were vefted in them by the immutable law of nature, but which could not be preferved in peace without that mutual affiftance and intercourfe, which are gained by the inftitution of friendly and civil communities: fo that the primary end of human laws is to maintain and regulate thefe abfolute rights of individuals. See Government and *Civil* Liberty.

Now of all the rights inherent in human nature, that of thinking for ourfelves, and following the conviction of our own judgments in relation to the object of our faith, worfhip, and religious obedience, is the moft facred, inconteftible, and in every view of it, intitled to the moft careful protection. The prefervation of thefe is one of the chief, perhaps the firft end for which civil focieties are inftituted, and the rulers of them invefted with power: and therefore, in all governments, the rights of confcience fhould have a principal place affigned them in the care of thofe, to whom the protection of their fellow-creatures is committed. If the fecuring of equal, impartial liberty, in all thofe inftances of it in which it is not injurious to others, be fo much the object of every equitable, wife, and well-conftituted fyftem of laws, that all needlefs encroachments upon it are deviations from the fpirit which ought to be diffufed through all laws, and impair the benefit which they ought to confirm, can it be fuppofed that the rights of confcience ought not to be guarded from violation? Rights of this kind are the laft which men can ever be imagined to give up to be modelled at the pleafure of others; nor (as it is argued) is there any one principle connected with their fubmiffion to governors in other refpects, that can require or juftify fuch a furrender. Does it follow that, becaufe the magiftrate is entrufted with authority to decide difputes between us and our fellow-citizens concerning property, he is to determine points which lie only between God and our own confciences? Becaufe it is allowed to be his office to guard the peace of his fubjects, and to inflict punifhments for this purpofe on thofe who unjuftly difturb it; is it to be taken for granted, that he is to dictate to them what rule of faith they fhall adopt, and in what manner they are to worfhip the Deity; when it is allowed on all hands, that of thefe things the will of God is the only rule, and that no worfhip can be acceptable to him, but what is accompanied with the fincere conviction of him who offers it? Befides, it is argued, that fuch is the nature of this right, and it fo ftands upon a foundation peculiar to itfelf, and is diftinguifhed from every other right, that it *cannot* be given up. Property may be refigned, transferred, or fubmitted to the regulation of others; a man may relinquifh his eafe, and fubject himfelf to inconveniences, and be not only innocent but laudable; nay, he may facrifice life itfelf, and merit the higheft applaufe; but his confcience he cannot refign.

To "prove all things, and hold faft that which is good," is not only a privilege but a duty; an obligation laid upon him by the very nature of religion and virtue, and from which he cannot difcharge himfelf without departing from the principles of both. It muft always remain entire to him; nor, while the principles of the moft reafonable liberty are allowed to fubfift in their due extent, can any attempt be confiftently made to take it from him.

From thefe principles it has been inferred, that toleration, fo far from being a matter of mere grace or favour, which government has a right to withhold, grant, abridge, or refume at pleafure, is the acknowledgment and confirmation of a right: not one of thofe adventitious rights, which are fubfequent to the eftablifhment of civil focieties, and arife out of the peculiar forms and conftitution of it; but of thofe higher rights which belong to men as fuch, and which ought to be preferved under all ftates and governments whatever, as effectually, univerfally, and impartially as any other right. With regard to the extent of toleration, it is urged, that if liberty of confcience be a right effential to human nature, all penalties in cafes merely of a religious nature muft be an infringement of a right, and a degree of oppreffion, though inflicted by a law. Farther, the inquiry concerning the perfons entitled to toleration does not depend on the fuppofed truth or error of the fentiments which men may adopt, but upon the common right, which all men have, to be led in thefe points by the light of their own minds, and to enjoy all the fecurities and benefits of fociety, while they fulfil the obligations of it. All who can give good fecurity to the government under which they live, and to the community to which they belong, for the performance of the duties of good fubjects and good citizens, have an undoubted claim to it, and cannot with any juft reafon be deprived of it. It is not error, but injury to the ftate, or the individuals who are under the care of it, which juftifies the animadverfion of the magiftrate; and all to whom this cannot be juftly imputed, are the objects of his protection.

Archdeacon Paley diftinguifhes two kinds of toleration: the one *partial*, which is the allowing to diffenters the unmolefted profeffion and exercife of their religion, but with an exclufion from offices of truft and emolument in the ftate; and the other *complete*, which is the admiffion of them, without diftinction, to all the civil privileges and capacities of other citizens. The juftice and expediency of toleration in general is founded by this ingenious writer primarily in its conducivenefs to truth, and in the fuperior value of truth to that of any other quality which a religion can poffefs. Befides this principal argument for toleration, there are other auxiliary confiderations that are important. The reftriction of the fubject to the religion of the ftate is a needlefs violation of natural liberty, and in an inftance with regard to which conftraint is always grievous. Perfecution produces no fincere conviction, nor any real change of opinion; on the contrary, it vitiates the public morals, by driving men to prevarication, and commonly ends in a general though fecret infidelity, by impofing, under the name of revealed religion, fyftems of doctrine, which man cannot believe, and dare not examine: finally, it difgraces the character, and wounds the reputation of Chriftianity itfelf, by making it the author of oppreffion, cruelty, and bloodfhed. Our author includes under the idea of religious toleration the toleration of all books of ferious argumentation, without deeming it any infringement of religious liberty to reftrain the circulation of ridicule, invective, and mockery upon religious fubjects.

Concerning the admiffion of diffenters from the eftablifhed religion to offices and employments in the public fervice, which is neceffary to render toleration *complete*, doubts, fays Dr. Paley, have been entertained with fome appearance of reafon. In vindication of thefe doubts, he refers to thofe who hold religious opinions that are utterly incompatible with the neceffary functions of civil government; enthufiafts, who maintain that all diftinction of property is abolifhed by Chriftianity, and that the gofpel enjoins upon its followers a community of goods; and to Quakers or Friends, who believe it to be contrary to Chriftianity to take up arms. He allows, however, that with the fingle exception of refufing to bear arms, the various fects of Chriftians which actually prevail in the world hold no tenet which incapacitates men for the fervice of the ftate. It has indeed been afferted, that difcordancy of religions, even fuppofing each religion to be free from any errors that affect the fafety or the conduct of government, is enough to render men unfit to act together in public ftations. But upon what argument, or upon what experience, is this affertion founded? "I perceive no reafon," fays this liberal writer, "why men of different religious perfuafions may not fit upon the fame bench, deliberate in the fame council, or fight in the fame ranks, as well as men of various or oppofite opinions upon any controverted topic of natural philofophy, hiftory, or ethics." For a further account of this author's fentiments on toleration and collateral fubjects, fee RELIGION, SUBSCRIPTION, and TEST-*Act*.

To the term *toleration*, though it has been adopted by Mr. Locke and feveral writers of the firft diftinction, others have objected; alleging that, as words have a confiderable influence on opinions, this term appears to be injurious to that religious liberty, which it is defigned to import. It implies a *right* to impofe articles of faith, and modes of worfhip; that nonconformity is a crime; and that the *fufferance* (toleration) of it is a matter of favour or lenity. But the nonconformift in every country, whether he be a Chriftian at Conftantinople, a Proteftant at Rome, an Epifcopalian in Scotland, or a Prefbyterian in England, and, we may add, a Catholic in any part of Great Britain, if his rational principles be confonant to his practice, will regard this claim of *right* as ufurpation; and will urge, that it has been neither conferred by Jefus Chrift, nor delegated by the people. Our Saviour exprefsly declares, "My kingdom is not of this world;" and his religion was perfecuted and oppreffed, during the period of its greateft purity and perfection, and when the minifters of it had gifts and powers which are now unknown. The people could not delegate fuch a right to any man or body of men; for the human mind is fo mutable, that no individual can fix a ftandard of his own faith, much lefs can he commiffion another to eftablifh one for him and his pofterity; and this power would be in no hands fo dangerous as in thofe of the ftatefman or prieft, who has the folly and prefumption to think himfelf qualified to exercife it. The ufe of this term was introduced at a time, when very imperfect notions of religious liberty, and very erroneous ideas of the authority of the civil magiftrate in the province of religion, prevailed. In its literal acceptation, it is without doubt objectionable, and incompatible with juft views of religious liberty. What human being, however exalted his rank or extenfive his influence, can prefume to *tolerate* or *fuffer* a fellow-creature to worfhip God according to the dictates of his own confcience, and in that way, or according to thofe rites and forms, which he apprehends the object of his worfhip has prefcribed; or, in other words, to *tolerate* God in receiving that worfhip; for to this extreme the argument may be extended. All difabilities and penalties incurred by not worfhipping God, and performing other acts of religion, according to any merely human ritual, are in fact prohibitions againft man's rendering and God's receiving the homage of the underftanding and the heart. Toleration, it has been faid, fuppofes on the part of thofe who exercife it an authority, to which they have no juft claim; and on the part of thofe who are the objects of it, a certain degree of criminality and culpability, which the perfons that exercife the right of toleration condefcend to excufe and allow. Such are the ideas which fome modern writers have entertained on this fubject; and accordingly they have wifhed for a difufe of the term, as it is founded in, and leads to, error. Liberty, whether it be complete, or partial, is a term well underftood; and the ufe of it is lefs liable to objection than that of toleration.—See on this fubject, Fownes's Inquiry into the Principles of Toleration, &c. 8vo. 1772. Locke's Letters concerning Toleration, in his Works, vol. ii. p. 231, &c. Hoadley's Rights of Subjects, paffim. Paley's Philofophy, vol. ii. c. 10. Percival's Effay on Truth, p. 90.

To the account above given of the general principles of toleration, it will be proper to add a few words concerning the ftate of toleration in our own country. With regard to the Proteftant-diffenters in general, fee DISSENTERS, NONCONFORMISTS, and QUAKERS. See alfo CONVENTICLE, CORPORATION-*Act*, SHERIFF, and TEST.

As for diffenting teachers, or minifters in particular, they were prohibited by 17 Car. II. cap. 2. from coming within five miles of a city, town-corporate, or borough, unlefs only in paffing upon the road, or unlefs required by legal procefs, without taking an oath of allegiance therein mentioned, on pain of 40*l.*, and of commitment by two juftices, on oath of the offence, for fix months. And by 22 Car. II. cap. 1. preaching in any meeting or conventicle, in other manner than according to the practice of the church of England, incurred a forfeiture of 20*l.* for the firft offence, and for every other offence 40*l.* Moreover, by 13 & 14 Car. II. cap. 4. no perfon fhall prefume to confecrate and adminifter the facrament before he be ordained prieft, according to the form of the church of England, on pain of 100*l.* But now by 1 W. cap. 18. commonly called the Act of Toleration, which, by 19 Geo. III. cap. 44. is declared to be a public act, they are exempted from the penalties of thofe ftatutes, upon taking the oaths of allegiance and fupremacy, and fubfcribing the declaration againft popery; and alfo, by 1 W. cap. 18. fubfcribing the articles of religion mentioned in the ftat. 13 Eliz. cap. 12. (which only concern the confeffion of the Chriftian faith and the doctrine of the facraments) with an exprefs exception of thofe relating to the government and powers of the church,

church, and to infant baptiſm; or if they ſcruple ſubſcribing the articles, upon making and ſubſcribing the declaration preſcribed by ſtat. 19 Geo. III. cap. 44. profeſſing themſelves to be Chriſtians and Proteſtants, and that they believe the Scriptures of the Old and New Teſtament, as commonly received among Proteſtant churches, to contain the revealed will of God, and that they receive the ſame as the rule of their doctrine and practice; for the regiſter of which they ſhall pay *6d.* to the officer of the court and no more, and *6d.* for a certificate thereof ſigned by ſuch officer. A farther enlargement of the Toleration Act, in favour of thoſe who impugn the doctrine of the Trinity, was made by 53 Geo. III. c. 160.

Any preacher or teacher, duly qualified, ſhall be allowed to officiate in any congregation, although the ſame be not in the county where he was ſo qualified, provided that the place of meeting hath been duly certified and regiſtered, and ſuch teacher or preacher ſhall, if required, produce a certificate of his having ſo qualified himſelf, and before any juſtice of ſuch county where he officiates, make and ſubſcribe ſuch declaration, and take ſuch oaths as aforeſaid, if required. (10 Ann. cap. 2.) And every ſuch teacher, having taken the oaths, and ſubſcribed as above, ſhall from thenceforth be exempted from ſerving in the militia, or on any jury, or from being appointed to bear the office of churchwarden, overſeer of the poor, or any other parochial or ward office, or other office in any hundred, city, town, pariſh, diviſion, or wapentake. For the ſtate of diſſenting ſchool-maſters, ſee SCHOOL-*Maſter*.

In conſequence of the Toleration Act, non-conformity is no longer a crime in the eye of the law, and the penalties to which it was obnoxious are not only ſuſpended, but abſolutely annulled with regard to thoſe diſſenters who are qualified as the act directs. See Furneaux's Letters to Judge Blackſtone, letter i. See DISSENTERS.

For an account of the laws relating to Papiſts or Catholics, ſee PAPISTS. We ſhall here ſtate the toleration granted to Catholics by the 31 Geo. III. c. 32. By this act it ſhall be lawful for perſons profeſſing the Roman Catholic religion, to appear in any of the courts at Weſtminſter, or at the general quarter ſeſſions for the county, city, or place where he ſhall reſide, and there in open court, between the hours of nine in the morning and two in the afternoon, take, make, and ſubſcribe the following declaration and oath: *viz.*

"I A. B. do hereby declare, that I do profeſs the Roman Catholic religion.

I A. B. do ſincerely promiſe and ſwear, that I will be faithful and bear true allegiance to his majeſty king George the Third, and him will defend to the utmoſt of my power, againſt all conſpiracies and attempts whatſoever, that ſhall be made againſt his perſon, crown, or dignity; and I will do my utmoſt endeavour to diſcloſe and make known to his majeſty, his heirs and ſucceſſors, all treaſons and traitorous conſpiracies which may be formed againſt him or them: and I do faithfully promiſe to maintain, ſupport, and defend, to the utmoſt of my power, the ſucceſſion of the crown; which ſucceſſion, by an act intitled, *An Act for the further limitation of the crown and better ſecurity of the rights and liberties of the ſubject*, is and ſtands limited to the princeſs Sophia, electreſs and ducheſs dowager of Hanover, and the heirs of her body, being Proteſtants, hereby utterly renouncing and abjuring any obedience or allegiance unto any other perſon claiming or pretending a right to the crown of theſe realms. And I do ſwear, that I do reject and deteſt, as an unchriſtian and impious poſition, that it is lawful to murder or deſtroy any perſon or perſons whatſoever, for or under pretence of their being heretics or infidels; and alſo that unchriſtian and impious principle, that faith is not to be kept with heretics or infidels. And I do further declare that it is not an article of my faith, and that I do renounce, reject, and abjure the opinion, that princes excommunicated by the pope and council, or any authority of the ſee of Rome, or by any authority whatſoever, may be depoſed or murdered by their ſubjects, or any perſon whatſoever. And I do promiſe that I will not hold, maintain, or abet any ſuch opinion, or any other opinion contrary to what is expreſſed in this declaration. And I do declare, that I do not believe that the pope of Rome, or any other foreign prince, prelate, ſtate, or potentate, hath or ought to have any temporal or civil juriſdiction, power, ſuperiority, or pre-eminence, directly or indirectly, within this realm. And I do ſolemnly, in the preſence of God, profeſs, teſtify, and declare, that I do make this declaration, and every part thereof, in the plain and ordinary ſenſe of the words of this oath, without any evaſion, equivocation, or mental reſervation whatever; and without any diſpenſation already granted by the pope, or any authority of the ſee of Rome, or any perſon whatever; and without thinking that I am or can be acquitted before God or man, or abſolved of this declaration, or any part thereof, although the pope or any other perſon or authority whatſoever ſhall diſpenſe with or annul the ſame, or declare that it was null or void."

Which ſaid declaration and oath ſhall be ſubſcribed by ſuch perſon with his name at full length, if he can write, and if not, with his mark, and his name ſhall be written by the officer, adding his title, addition, and place of abode, which ſhall there remain of record: and ſuch officer ſhall make, ſubſcribe, and deliver a certificate of ſuch declaration and oath having been duly made and taken, if demanded, for which he ſhall have *2s.*; which certificate ſhall be competent evidence, unleſs falſified.

And ſuch officer ſhall yearly, on or before the 25th of December, tranſmit to the privy council liſts of the perſons, with their titles, additions, and places of abode, who ſhall have made and ſubſcribed ſuch declaration and oath in the preceding year.

And no Roman Catholic, who ſhall have taken and ſubſcribed the ſaid oath as aforeſaid, ſhall be convicted upon any of the acts following; *viz.* 1 Eliz. c. 2. 23 Eliz. c. 1. 29 Eliz. c. 6. 35 Eliz. c. 2. 1 Jac. I. c. 4. 3 Jac. I. c. 4. 3 Jac. I. c. 5. and 7 Jac. I. c. 6. or any other ſtatute or law of this realm; or in any eccleſiaſtical court, for not reſorting to church, or having ſervants who ſhall not reſort to church, or other place of common prayer.

And by 43 Geo. III. c. 30. Roman Catholics taking and ſubſcribing the declaration and oath contained in the 31 Geo. III. c. 32. ſhall be entitled to all the benefits of the 18 Geo. III. c. 60. to every purpoſe as if they had taken the oath thereby preſcribed.

And whereas, by 23 Eliz. c. 2. 27 Eliz. c. 2. 35 Eliz. c. 2. 2 Jac. I. c. 4. 3 Jac. I. c. 5. 3 Car. I. c. 2. 25 Car. II. c. 2. Papiſts are made ſubject to ſeveral puniſhments, penalties, and diſabilities, it is enacted that no perſon who ſhall take and ſubſcribe the ſaid oath in manner aforeſaid ſhall be proſecuted or convicted for being a Papiſt, or reputed Papiſt, or for profeſſing or being educated in the Popiſh religion, or for hearing or ſaying maſs, or for being a prieſt or deacon, or entering or belonging to any eccleſiaſtical order or community of the church of Rome, or for being preſent at or performing or obſerving any rite, ceremony, practice, or obſervance of the popiſh religion, or maintaining or aſſiſting others therein.

Provided always, that no place of congregation or aſſembly for religious worſhip ſhall be allowed, until the place of of ſuch meeting ſhall be certified to the ſeſſions of the county or place in which the ſame ſhall be held, and be there recorded; and the clerk of the peace ſhall give a certificate thereof, if demanded, for which he ſhall have *6d.* And no miniſter or other perſon ſhall officiate in any ſuch place of meeting until his name and deſcription as a prieſt or miniſter ſhall have been recorded at the ſeſſions, for which ſhall be paid *6d.* and a certificate thereof ſhall be granted, if demanded, for which ſhall be paid *2s.* And no prieſt or miniſter who ſhall officiate in any ſuch meeting not ſo recorded as aforeſaid ſhall be deemed to be within the benefit of this act for any purpoſe whatſoever.

Provided, that if any ſuch place of aſſembly ſhall have the doors locked, barred, or bolted, during the time of meeting, all perſons who ſhall come to or be at ſuch meeting ſhall receive no benefit from this act, notwithſtanding his having taken ſuch oath as aforeſaid, but ſhall be liable to the ſame pains and penalties, as if this act had not been made.

If any Roman Catholic ſhall hereafter be appointed high or petty conſtable, churchwarden, overſeer of the poor, or any other parochial or ward office, and ſhall ſcruple to take upon him any of the ſaid offices, he may execute the ſame by a ſufficient deputy, to be approved of in like manner as other perſons.

Every miniſter of any Roman Catholic congregation who ſhall take and ſubſcribe the ſaid oath in manner aforeſaid, ſhall be exempt from ſerving on juries, and from the office of church-warden, overſeer, or other parochial or ward office, or other office in any hundred of any ſhire, city, town, pariſh, diviſion, or wapentake.

But all laws made for frequenting divine ſervice ſhall continue in force, unleſs where perſons ſhall come to ſome religious worſhip permitted by this act, or an act of 1 W. & M. for exempting Diſſenters.

And if any perſon ſhall wilfully and on purpoſe maliciouſly and contemptuouſly come into any congregation or aſſembly of religious worſhip permitted by this act, and diſturb the ſame; or miſuſe any prieſt, miniſter, preacher, or teacher therein, he ſhall, on proof by two witneſſes, before one juſtice, find two ſureties of the peace to be bound by recognizance in *50l.* and in default thereof, ſhall be committed to priſon till the next ſeſſions, and on conviction of ſuch offence at the ſeſſions, ſhall forfeit *20l.* to the king.

Provided, that no benefit herein contained ſhall extend to any Roman Catholic eccleſiaſtic permitted by this act, who ſhall officiate in any congregation, or aſſembly hereby permitted, with a ſteeple and bell, or at any funeral in any church or church-yard; or who ſhall exerciſe any of the rites or ceremonies of his religion; or wear the habits of his order, ſave within ſome place of congregation, or aſſembly for religious worſhip permitted by this act; or in any private houſe where there ſhall not be more than five perſons aſſembled beſides thoſe of the houſehold; or who ſhall not previouſly to his ſo exerciſing his function have taken the oath of allegiance, abjuration, and declaration hereby appointed, in manner aforeſaid.

But nothing herein ſhall exempt any Roman Catholic from paying tithes or other parochial duties, or any other duties to the church or miniſter; or to repeal any part of 26 Geo. II. c. 33. "for preventing clandeſtine marriages," or any parts of any ſtatutes concerning marriages; or to give any eaſe or benefit to any perſon who ſhall, by preaching, teaching, or writing, deny or gainſay the oath and declaration aforeſaid, or the doctrines therein contained, or any of them; or to repeal or affect any law concerning the right ſucceſſion to or limitation of the crown.

And no Roman Catholic, who ſhall take and ſubſcribe the ſaid oath of allegiance, abjuration, and declaration, as aforeſaid, ſhall be proſecuted for teaching youth as a tutor or ſchool-maſter; but he ſhall not hold any maſterſhip of any college, or ſchool of royal foundation, or of any other endowed college or ſchool for the education of youth; nor ſhall keep a ſchool in either of the univerſities; nor ſhall receive into his ſchool for education the children of any Proteſtant father; nor ſhall teach any ſchool until his name ſhall be entered at the ſeſſions in manner aforeſaid, as a Roman Catholic ſchoolmaſter: and no perſon offending in the premiſes ſhall receive any benefit from this act.

Provided alſo, that nothing herein ſhall make it lawful to found, endow, or eſtabliſh any religious order or ſociety of perſons bound by monaſtic or religious vows; or any ſchool, academy, or college by any Roman Catholic; and that all uſes, truſts, and diſpoſitions, whether of real or perſonal property, before deemed to be unlawful, ſhall continue to be ſo deemed.

No perſon ſhall be ſummoned to take the oath required by 1 W. & M. ſeſſ. 1. c. 8. or the declaration required by 25 Geo. II. c. 2. Nor ſhall the 1 W. & M. ſeſſ. 1. c. 9. for removing Papiſts from London and Weſtminſter, extend to Roman Catholics who ſhall have taken and ſubſcribed the oath, &c. herein appointed.

No peer who ſhall have taken and ſubſcribed the ſaid oath, &c. in manner aforeſaid, ſhall be liable to be proſecuted under 30 Car. II. ſt. 2.

And the 1 Geo. I. ſeſſ. 2. c. 55. and 3 Geo. III. c. 18. requiring Papiſts to regiſter their names and real eſtates are repealed; and all deeds and wills of Papiſts ſhall, after the 24th of June 1791, be good as if the ſaid acts had never been made.

And whereas by 7 & 8 Will. c. 4. and 1 Geo. I. ſt. 2. c. 13. every perſon acting as a counſellor at law, barriſter, attorney, ſolicitor, clerk, or notary, not having taken the oaths and declaration therein preſcribed, ſhould be liable to certain penalties, it is enacted that theſe oaths and declarations ſhall be no longer required; but the oath and declaration herein appointed ſhall be taken in lieu thereof, in manner aforeſaid.
