1819.

CYCLOPÆDIA:

OR, A NEW

UNIVERSAL DICTIONARY

OF

ARTS and SCIENCES.

X X

X, A double conſonant, and the twenty-ſecond letter in the Engliſh alphabet; which, however, begins no Engliſh word.

The *x* of the Latins, and ξ of the Greeks, are compounded of *c s*, and κ σ; whence, to this day, the letter *x* in the Engliſh and French has the ſame ſound with *c s*, or *k s*. Thus we pronounce *Alexander* exactly as if written *Alecſander* or *Alekſander*.

The Italians have no *x* at all in their language, but both ſpeak and write *Aleſſandro*. The Spaniards pronounce the *x* like our *c* before *a*; viz. *Alexandro*, as if it were *Alecandro*. The Portugueſe pronounce it like *ſh*.

In foreign words, uſed in Engliſh, we ſometimes ſoften the *x* into a double *s*; as *Bruſſels*, for *Bruxelles*, &c.

The letter is not known in the Hebrew, or other oriental languages; but in lieu of it, they write the two ſimple letters of which it is compounded. And the like do the modern Germans.

Peter Diaconus relates, that the letter X was introduced into the Roman alphabet in the time of Auguſtus; and that, before his reign, the Romans ſupplied the want of it by the letters C and S. But Mr. Aſtle obſerves, that this is a miſtake; the letter X being found in the Duilean pillar, inſcribed in the year of Rome 494, and 259 before Chriſt. Origin and Progreſs of Writing, p. 78.

X is alſo a numeral letter, and ſignifies ten; as repreſenting two V's placed one at top of the other. See V.

X *Supra denos numero tibi dat retinendos.*

When laid flat, thus ⋈, it ſignifies a thouſand; and when a daſh is added over it, $\overline{\text{X}}$, it ſignifies ten thouſand. I before X denotes the ſubtraction, and after X the addition of unit: thus, IX = 9, and XI = 11. X before L or C denotes the ſubtraction of 10 from 50, or 100: thus, XL = 40, and XC = 90.

X on the French coins denotes thoſe ſtruck at Amiens.

We often meet with the Greek letters X and P joined in this manner ☧ on ancient medals. The firſt we find are on ſome large braſs coins of the Ptolemies, kings of Egypt, where it was placed on a civil account.

Some writers have taken it for a date, and others for the initial letters of a proper name; but as no reaſons are aſſigned for either of thoſe conjectures, Mr. Ward rather ſuppoſes it an abbreviation of the word XPHMA, *money*, impreſſed on thoſe pieces, to denote their currency as money; which might be thought proper, as they have not the heads of kings ſtamped upon them, like their ſilver and gold coins; but always that of a Jupiter on the front, and an eagle perched on a thunderbolt on the reverſe.

This character was afterwards applied to a very different purpoſe by Conſtantine the Great, who made uſe of it to denote XPICTOC, both in his coins and military enſigns; in which he was followed not only by ſome ſucceeding emperors, but alſo by private perſons, who out of devotion put it on their lamps and other utenſils.

It afterwards came to be uſed merely as a critical note, to point out remarkable paſſages in manuſcripts; and then it ſtood for the initials of XPHCIMON, *uſeful;* as we learn from Iſidore, Orig. lib. i. cap. 20. See Phil. Tranſ. N° 474. ſect. 1.

X, with a P, or Greek R, in the middle of it, is alſo the monogram of the name of CHRIST, which conſtantly occurs in the catacombs or burial-places of the ancient Chriſtians, and which was the chief ornament of the Labarum or military ſtandard of Conſtantine, and the ſucceeding emperors. See LABARUM.

XABEA, in *Geography*, a fea-port of Spain, in the province of Valencia, near the coaft of the Mediterranean; 38 miles N.N.E. of Alicant.

XABORECTORA, in *Ancient Geography*, a name given by P. Mela to Aborras, a river of Mefopotamia.

XACA, in *Geography*. See JACA.

XACRE, a cape on the fouth-eaft coaft of the ifland of Candia; 18 miles S.E. of Settia.

XAGUA BAY, a large bay on the fouth coaft of the ifland of Cuba. This is one of the beft ports in the Weft Indies, and is 15 miles in circumference, furrounded with mountains, which break off the force of the winds. N. lat. 22° 10′. W. long. 81° 20′.

XAINTES, SANTOS, or *All-Saints' Iflands*, as having been difcovered on that holiday by the Spaniards; three fmall iflands in the Weft Indies, fituated to the fouth-eaft of Guadaloupe. The moft wefterly of them is called Terra de Bas, or the Low ifland, and the moft eafterly, Terra de Haut, or the High ifland. The third, which lies exactly in the middle between the other two, feems to be nothing more than a large barren rock, but is of ufe in affifting to form a very good harbour. The ifland of Terra de Bas is about nine miles in circumference, but the other is larger. Thefe iflands have conftantly a frefh breeze, let the wind blow from what quarter it may: and on the Terra de Bas is a neat wooden church, with two very convenient creeks both for anchorage and landing. They are about fix miles diftant from Gaudaloupe, and 15 from Mariegalante. N. lat. 15° 56′. W. long. 61° 32′.

XALAPA, a confiderable town of Mexico, or New Spain, in the fertile province of Tlafcala, formerly famous for the fair held on the arrival of the ftated fleets from Europe; and fince the declared freedom of commerce, a confiderable mart for European commodities. It is fituated on the fouthern fkirts of a mountain, in a beautiful climate, the foil being partly clay and partly ftony, while pure waters iffue from a white fand, and fertilize the country. The population confifts of 243 Spanifh families, 182 Meftizos, and 361 Indians. When north winds prevail at Vera Cruz, it always rains at Xalapa; but the climate is efteemed very healthy. The purging powder of the country is made of the root of a plant, to which the town gives the name of Jalap; 30 miles E. of Puebla de los Angelos. N. lat. 19° 50′. W. long. 98° 26′.

XALISCO, a province of Mexico, in the audience of Guadalajara. It is wafhed by the South Pacific ocean on the fouth and weft; bounded on the eaft by Guadalajara Proper and Mechoacan; and feparated from Chiametlan on the north, by a narrow ftrip of land belonging to Guadalajara, and running out into the fea. It is not above fifty leagues in extent either way. It abounds with Indian wheat and filver mines, but has very few cattle of any fort. From this province is brought the oil of the infernal fig-tree, as the Spaniards call it, much ufed in medicine.

XALISCO, a town of Mexico, which gives name to a province; 9 miles N.W. of Compoftella Nueva. N. lat. 21° 25′. W. long. 106° 26′.

XALON, a river of Spain, which rifes in a mountain near Medina Celi, and runs into the Ebro, about fix miles above Saragoffa.

XAMACA, a river of America, which runs into the gulf of Mexico, 13 miles from Vera Cruz.

XAMBRINA, a town of Spain, in the province of Leon; 2 miles S.E. of Tordefillas.

XAMDELLILAH, an Arabian term, ufed as a grace or thankfgiving after meat.

The greateft men of that nation will often call in the meaneft, even the beggars, to eat with them; who, as foon as they have done, always rife and pronounce this word, which fignifies, God be praifed. Pococke's Egypt, p. 183.

XAMI, a name given by fome of the old writers to the *ceration* of the Greeks, or carob-tree. See CHARNUB.

XAN, in *Geography*, a river of the principality of Georgia, which runs into the Kur, 6 miles E. of Gory.

XANGA, a river of Africa, in the kingdom of Mongallo, which runs into the Indian fea, oppofite to the ifland of the fame name.—Alfo, one of the Querimba iflands in the Indian fea, near the coaft of Africa. S. lat. 10° 45′.

XANILA, a town of Fezzan, in the road to Egypt; 140 miles E.N.E. of Mourzouk.

XANQUE, or GUYAPO, a river of Mexico, which runs into the Spanifh Maine, 30 miles W. of Cape Camaron.

XANTEN, or SANTEN, a town of France, in the department of the Roer, near the Rhine; 7 miles N.E. of Gueldres.

XANTHE, in *Botany*, fo called from ξανθος, *yellow*, in allufion to its yellow juice.—Schreb. Gen. 710. Willd. Sp. Pl. v. 4. 877. Mart. Mill. Dict. v. 4. (Quapoya; Aubl. Guian. 897. Juff. 256. Lamarck Dict. v. 6. 21. Illuftr. t. 831.)—Clafs and order, *Dioecia Monadelphia*. Nat. Ord. *Guttiferæ*, Juff.

Gen. Ch. Male, *Cal.* Perianth of one leaf, in five or fix fmall, deep, imbricated, roundifh, concave, acute fegments, with a pair of minute oppofite fcales at the bafe. *Cor.* Petals five, roundifh, fpreading, larger than the calyx. *Stam.* Filament one, columnar, erect; anthers five, two-lobed, forming a peltate concave difk, full of gluten, their under fide burfting, and difcharging the pollen.

Female, *Cal.* like that of the male, permanent, inferior. *Cor.* as in the male. *Stam.* Filament none; anthers five, prifmatic, erect, imperfect. *Pift.* Germen fuperior, roundifh, with five furrows; ftyle none; ftigmas five, roundifh, thick, emarginate, feated on the germen. *Peric.* Capfule fmall, globofe or oval, with five furrows, five cells, and five valves, burfting at the furrows, their membranous partitions adhering to the central column. *Seeds* numerous, oblong, imbedded in the pulp, inferted in a double row upon the five-angled columnar receptacle.

Obf. It appears that one-fifth is frequently added to the parts of fructification, in the male as well as female flowers.

Eff. Ch. Male, Calyx in five deep fegments. Petals five. Filament columnar. Anthers five, two-lobed, forming a peltate difk.

Female, Calyx and Corolla like the male. Stigmas five, feffile. Capfule of five cells, with many pulpy feeds.

1. X. *fcandens.* Twining Xanthe. Willd. n. 1. (Quapoya fcandens; Aubl. Guian. 898. t. 343.)—Leaves obovate, flefhy. Capfule globofe.—Native of the forefts of Guiana, flowering in November. The *ftem* is fhrubby, with knotty branches, twining round neighbouring trees. *Leaves* oppofite, on fhort ftalks, fimple, entire, thick, and fmooth, three or four inches long, with a thick mid-rib, and a fhort blunt point, but no branching veins. *Panicles* at the ends of the drooping branches, compound, three-forked, fmooth. *Flowers* fmall, yellow; their partial ftalks longer than the calyx. *Petals* flefhy. *Capfule* about the fize of a black currant, flefhy, crowned with the black *ftigmas* all meeting in a point. *Seeds* red. Every part of the plant, when wounded, difcharges a tranfparent, white, vifcid, refinous juice. The Indians call this fpecies *Quapoy.* See QUAPOYA.

2. X. *par-*

2. X. *parviflora.* Small-flowered Xanthe. Willd. n. 2. (Quapoya Pana-panari; Aubl. Guian. 900. t. 344.)—Leaves elliptic-oblong. Flowers nearly sessile. Capsule elliptical. —Native of the same country. Differs from the preceding in having thinner *leaves;* smaller *flowers,* with shorter partial stalks; and an oblong, thicker, yellowish *fruit.* The *bark* and *leaves,* if cut or broken, discharge a yellow glutinous juice, which, when dried, resembles Gamboge, and is, like that substance, soluble in water. *Aublet.*

XANTHICA, Ξανθικα, in *Antiquity*, a Macedonian festival, so called because it was observed in the month Xanthus, at which time the whole royal family with the army was purified. See LUSTRATION.

XANTHIUM, in *Botany*, most unquestionably the ξανθιον of Dioscorides, book 4. chap. 138, as appears by his very apt description, owes its name to the use made of unripe fruit by the Greeks, to dye the hair yellow. Our common English species, *X. strumarium*, is evidently the identical plant of Dioscorides, and its specific name alludes to a reputed virtue of curing tumours.—Linn. Gen. 487. Schreb. 635. Willd. Sp. Pl. v. 4. 373. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 1017. Prodr. Fl. Græc. Sibth. v. 2. 234. Ait. Hort. Kew. v. 5. 268. Pursh 581. Juss. 191. Tourn. t. 252. Lamarck Illustr. t. 765. Gærtn. t. 164.—Class and order, *Monoecia Pentandria.* Nat. Ord. *Compositæ nucamentaceæ*, Linn. *Corymbiferæ anomalæ*, Juss.

Gen. Ch. Male flowers compound. *Common Calyx* of many imbricated, slender, equal scales, as long as the numerous florets. *Cor.* compound, uniform, equal, hemispherical, consisting of numerous, tubular, funnel-shaped, monopetalous, upright, five-cleft florets. *Stam.* Filaments in each floret five, united into a cylinder; anthers erect, parallel, distinct. *Common Receptacle* small, with chaffy scales between the florets.

Female flowers below the male, on the same plant, doubled. *Cal.* Involucrum two-flowered, of two opposite, acutely three-lobed leaves, (their middle lobe longest,) beset with hooked prickles, and closely enfolding, as well as united to, the germen, except the lobes, which are free. *Cor.* none. *Pist.* Germen oval, hispid; styles two pair, capillary; stigmas simple. *Peric.* Drupa dry, ovate-oblong, cloven at the point, clothed all over with hooked prickles. *Seed.* Nut of two cells.

Ess. Ch. Male, Common Calyx imbricated. Florets of one petal, funnel-shaped, five-cleft. Receptacle chaffy.

Female, Calyx two-leaved, two-flowered. Corolla none. Drupa dry, muricated, cloven. Nut of two cells.

Obs. Linnæus remarks, that the fruit of *Xanthium* could scarcely have been well understood, without a previous knowledge of that of *Ambrosia.* These genera in fact belong to that ambiguous tribe, whose habit, qualities, and in part the structure of their male flowers, all associate them with the compound or syngenesious order; while the disunion of their flowers, and the general nature of their female flowers, and fruit, necessarily refer them to the *Diclines*, or in the artificial system of Linnæus, the class *Monoecia.*

1. X. *Strumarium.* Common Burweed, or Small Burdock. Linn. Sp. Pl. 1400. Willd. n. 1. Ait. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 2544. Fl. Dan. t. 970. Bigelow Bost. 221. (Xanthium; Fuch's Hist. 579. Camer. Epit. 926. X. seu Lappa minor; Matth. Valgr. v. 2. 545. Bardana minor; Ger. Em. 809.)—Stem without thorns. Leaves heart-shaped; three-ribbed at the base.—Native of dung-hills, and rich moist ground, in various countries of Europe, as well as North America, flowering towards autumn. In this island it is of very rare occurrence, though occasionally met with about London, and in the west. Dr. Sibthorp noticed the plant in many parts of Greece, where the soil is rich and rather wet, and found it called, by the modern Greeks, κολλητζίδα; a name alluding to its bur-like property, rather than to the quality on which its ancient appellation is founded. The *root* is annual. *Herb* branched, rough, dark green, rather fœtid, of a coarse rank habit, with furrowed, rather hairy, *branches.* *Leaves* alternate, stalked, heart-shaped, acutely lobed, and toothed or serrated; their two lateral ribs marginal, for a small space, at the base, as in the great Burdock, *Arctium Lappa,* and a few other plants. *Male flowers* globular, green, few together, in axillary or terminal *clusters,* about the upper part of the branches; *female* in axillary sessile tufts. *Fruit* elliptical, double-pointed, hard, near an inch long, beset with firm, prominent, awl-shaped, hooked prickles, which attach themselves to the coats of animals, and thus serve to disperse the *seeds.*

2. X. *orientale.* Oriental Burweed. Linn. Sp. Pl. 1400. Willd. n. 2. Ait. n. 2? Linn. Fil. Dec. 33. t. 17. "Schkuhr Handb. v. 3. 239. t. 291."—Stem without thorns. Leaves ovate, slightly three-lobed, somewhat triple-ribbed; wedge-shaped at the base.—Native of Ceylon, Japan, and China, from which last country it was imported, according to the younger Linnæus, with other seeds for the Upsal garden, in 1761. Sir Hans Sloane is recorded by Ray as having introduced this *Xanthium* into England in 1685; but their plant seems to have been a slight variety of the first, figured by Morison, sect. 15. t. 2. f. 2, found in America, and not answering to the distinctive characters of the present species, though Morison, and others who speak of this variety, are cited by Linnæus and Willdenow. The true *X. orientale* is an annual herb, of a more slender habit than the *Strumarium,* and more harsh, though less hairy. Their essential differences are indicated in our specific characters. The most remarkable seems to be the taper base of the *leaves,* in the present species, and the union of their three ribs, at a greater or less distance, above the insertion of the *footstalk.* The *fruit* is twice as large as the foregoing, with peculiarly strongly hooked thorns.

3. X. *echinatum.* Compound-thorned Burweed. "Murray in Comm. Goett. for 1784, with a figure." Willd. n. 3.—"Stem without thorns. Fruit oval; its prickles hooked, crowded, compound at the base." Annual.—Its native country unknown. *Willdenow.* We have not seen either a specimen or figure.

4. X. *spinosum.* Spinous Burweed. Linn. Sp. Pl. 1400. Willd. n. 4. Ait. n. 3. (X. spinosum, atriplicis folio; Moris. sect. 15. t. 2. f. 3. X. lusitanicum spinosum; Herm. Parad. 246, with a figure. Volkam. Norib. 404, with a figure. X. lusitanicum, laciniatum, validissimis aculeis munitum; Magnol. Hort. 208. t. 20.)—Stipulas thorny, three-cleft. Leaves lanceolate, three-lobed; hoary beneath.—Native of the south of France, as well as of Italy, Spain, and Portugal. It might be raised here as a tender annual, and planted out in a border, were there sufficient beauty in its copious, long, flame-coloured thorns, to entitle it to a place in the flower-garden. The *leaves* are not inelegant. Their upper surface is of a fine green, nearly smooth; the lower downy and white. The *thorns* are in fact *stipulas,* an inch long, very sharp, standing in pairs at the base of each *footstalk,* separating just above their origin into three spreading needle-like points. *Flowers* small and inconsiderable. *Fruit* oval, covered with copious,

copious, ſmall, hooked prickles. The wild plant makes a conſpicuous appearance in winter, on banks about Montpellier.

For *X. fruticoſum*, Linn. Suppl. 418, ſee FRANSERIA.

XANTHIUM, in *Agriculture*, a term under which the leſſer burdock is ſometimes known by writers, and which is found to be a very troubleſome weed. See WEED.

XANTHOCHYMUS, in *Botany*, received that name, either from Dr. Roxburgh or Mr. Dryander, in alluſion to the remarkable yellow juice of its fruit; the word being compounded of ξανθος, *yellow*, and χυμος, *juice*.—Roxb. Coromand. v. 2. 51. Ait. Hort. Kew. v. 4. 420.—Claſs and order, *Polyadelphia Polyandria*. Nat. Ord. *Guttiferæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of five roundiſh, unequal, obtuſe, flattiſh, ſpreading, ſlightly imbricated, permanent leaves. *Cor.* Petals five, orbicular, nearly ſeſſile, oppoſite to the calyx-leaves, and twice as long. Nectary of five broad, ſhort, abrupt, porous glands, oppoſite to the petals, alternate with the ſtamens, inſerted into the receptacle under the germen. *Stam.* Filaments twenty, united into five oblong, linear, flat bodies, alternate with the nectaries, and above twice as long; anthers ſtalked, roundiſh, of two lobes and two cells. *Piſt.* Germen ſuperior, globoſe; ſtyle ſcarcely any; ſtigmas five, ſpreading horizontally, obtuſe, deciduous. *Peric.* Berry globoſe, ſucculent, with five ovate *ſeeds*, immerſed in the pulp, ſome of which are generally abortive.

Eſſ. Ch. Calyx of five leaves. Petals five. Nectaries five, abrupt. Stamens united into five ſets, alternate with the nectaries. Berry with from one to five ſeeds.

1. X. *pictorius*. Painter's Golden-apple. Roxb. Coromand. v. 2. 51. t. 196. Ait. n. 1.—Native of moiſt valleys, among the Circar mountains of Hindooſtan, flowering in the hot ſeaſon, and ripening fruit in November, December, and January. A large *tree*, whoſe tall trunk is covered with dark rough bark, and whoſe numerous, ſmooth, rather angular *branches* form an ample evergreen head. *Leaves* oppoſite, ſtalked, about a foot long and two or three inches broad, elliptic-oblong, acute, entire, coriaceous, ſmooth, and ſhining, with a ſtrong mid-rib, and many tranſverſe, parallel, fine, interbranching veins. *Footſtalks* an inch in length, angular, channelled, corrugated. *Stipulas* none. *Flowers* an inch in diameter, five or ſix together, in ſtalked umbels, each umbel oppoſite to a leaf, or ſituated nearly where a laſt-year's leaf has been. *Partial ſtalks* ſimple, ſmooth, near two inches long. *Petals* white. *Stamens* and *Piſtil* green. *Nectaries* and *Anthers* yellow. *Fruit* globular, drooping, ſomewhat pointed, orange-coloured, ſmooth, two inches or more in diameter. *Seeds* about the ſize and ſhape of almonds.

"The ripe apples," ſays Dr. Roxburgh, "are eaten by the natives. They are very inviting to the eye, and in taſte little inferior to many of our apples in England. I have no doubt, if meliorated by culture, they would prove a delicious fruit." The green, but full-grown, fruit yields a large quantity of a gum, very like *Gummi Guttæ*, Gamboge. The beſt way to obtain it is by cutting the apples acroſs, and to ſcrape off the juice, as it rapidly iſſues. When recent, it is of the conſiſtence of very rich cream, bright yellow, conſiderably acrid, and ſomewhat nauſeous to the taſte. In a few days it hardens, and becomes leſs acrid. It makes a pretty good water-colour, either by itſelf, as a yellow, or mixed with other colours, to form green, &c. It has no particular ſmell when burnt. A milky juice exudes from the bark of this tree when wounded, which ſoon thickens, and in thickening aſſumes a yellow tint. It has no ſmell, and, when firſt taken into the mouth, little taſte; but after a while, a ſenſe of dryneſs and acrimony extends a little way down the throat. This juice, like that obtained from the fruit, is imperfectly ſoluble in ſpirits. *Roxburgh.*

The tree above deſcribed is no very remote relation of the Mangoſteen, the moſt delicious fruit of India; ſo that Dr. Roxburgh's advice of improving it by culture may be well worthy the attention of horticulturiſts, if any be found in that part of the world where ſuch experiments are practicable. The moſt obvious would be to obtain pollen of the Mangoſteen, which, like that of many other plants, would probably bear carriage, and to impregnate with it ſome flowers of the *Xanthochymus*, whoſe progeny might thence perhaps be much altered.

XANTHON, a name given by ſome of the ancients to a ſpecies of marble of a yellowiſh-green colour, much uſed in ornamenting the inner parts of houſes; and from its equal hardneſs with the Tænarian marble, and the equal high poliſh it was capable of, ſuppoſed by the workmen to be of the ſame ſpecies.

The word *xanthon* is of very dubious meaning, but is ſuppoſed as the name of this marble to have expreſſed a green colour, as this was otherwiſe called *marmor herboſum*. See TÆNARIUM and HERBOSUM *Marmor*.

XANTHORRHIZA, in *Botany*, received its name from the late M. L'Heritier; ξανθος, *yellow*, and ῥιζα, *a root*, alluding to the colour of that part. We follow Marſhall, Schreber, and Martyn, in correcting the original orthography.—Schreb. Gen. 727. Mart. Mill. Dict. v. 4. Lamarck Illuſtr. t. 854. (Zanthorhiza; L'Herit. Stirp. Nov. 79. Willd. Sp. Pl. v. 1. 1568. Ait. Hort. Kew. v. 2. 199. Purſh 212. Juſſ. 234. De Cand. Syſt. v. 1. 386. Poiret in Lamarck Dict. v. 8. 838.)—Claſs and order, *Pentandria Polygynia*. (Polygamia Monoecia; *Schreb.*) Nat. Ord. *Multiſiliquæ*, Linn. *Ranunculaceæ*, Juſſ. De Candolle.

Gen. Ch. *Cal.* none; unleſs, with the French botaniſts, we take the corolla for ſuch. *Cor.* Petals five, ovate, acute, ſpreading, deciduous. Nectaries five, abrupt, two-lobed, ſpreading, inſerted into the receptacle, alternate with the petals, and about half as long. *Stam.* Filaments five to ten, awl-ſhaped, very ſhort; anthers roundiſh. *Piſt.* Germens ſeveral, ſeven to eleven, ſuperior, oblong; ſtyles awl-ſhaped, incurved; ſtigmas acute. *Peric.* Capſules as many, inflated, ovate-oblong, bluntiſh and compreſſed at the top, where they burſt, terminated obliquely by the ſtyles, each of one cell and two valves. *Seeds* ſolitary, oblong, compreſſed, ſmall, pendulous from the top of the capſule.

Obſ. Many of the flowers want either the ſtamens or piſtils.

Eſſ. Ch. Calyx none. Petals five. Nectaries five, abrupt, ſtalked. Capſules five, or more. Seeds ſolitary, pendulous.

1. X. *apiifolia*. Parſley-leaved Yellow-root. (Zanthorhiza apiifolia; L'Herit. Stirp. Nov. 79. t. 38. Willd. n. 1. Ait. n. 1. De Cand. n. 1. Purſh n. 1.)—Native of ſhady banks of rivers, from Virginia to Georgia, flowering in May. *Purſh.* Mr. Aiton ſays it was introduced, about the year 1766, by John Buſh, eſq. into the Engliſh gardens, where it is hardy, flowering in the early ſpring. Here it flowered unnoticed, or at leaſt undeſcribed, till M. L'Heritier publiſhed his magnificent and learned work. The *ſtem* is ſhrubby, buſhy, about a yard high, each branch crowned with a tuft of dark green, ſmooth, ſhining, long-ſtalked, pinnated *leaves*, whoſe *leaflets*, an inch or an inch and half long, are acute, rhomboid-lanceolate, ſharply and unequally ſerrated in their fore-part. *Flowers* in long panicled *cluſters*, from the ſame

ſame bud as the leaves, of a dark copper-coloured purple, like *Veratrum nigrum*, and though not gay or brilliant, not inelegant, when contraſted with the foliage. The *root* and *ſtem* are internally of a bright lemon-colour. The affinity of this plant to *Cimicifuga*, *Actæa*, *Helleborus*, &c. would lead us to ſuſpect, though there is no remarkable fetor, that its properties might be active, and accordingly it ſeems that the American phyſicians have employed it ſucceſsfully in practice, as a tonic or ſtimulant. Probably its qualities may not be diſſimilar from thoſe of *Helleborus trifolius* of Linnæus; *Coptis trifolia*, Saliſb. Tr. of Linn. Soc. v. 8. 305. Purſh 390. Bigelow Am. Med. Bot. v. 1. 60. t. 5; the root of which the laſt-mentioned writer informs us is purely and intenſely bitter, ſtrengthening the ſtomach and other viſcera, and promoting digeſtion. It makes a yellow tincture, like that of Gentian in flavour and medical virtues.

XANTHORRHŒA, from ξανθος, *yellow*, and ῥεω, *to flow*, a name given by the writer of this to the Yellow Gum plant of New Holland, which conſtitutes a moſt diſtinct and peculiar genus. Of this Mr. Brown has made us acquainted with ſeven ſpecies. — Sm. Tr. of Linn. Soc. v. 4. 219. Brown Prodr. Nov. Holl. v. 1. 287. Ait. Hort. Kew. v. 2. 271.—Claſs and order, *Hexandria Monogynia*. Nat. Ord. *Aſphodeli*, Juſſ. *Aſphodeleæ*, Brown.

Gen. Ch. *Cal.* none, unleſs the corolla be taken for ſuch. *Cor.* inferior, of one petal, in ſix deep, nearly equal, oblong, permanent ſegments; the three inner ones concave, converging at the baſe. *Stam.* Filaments ſix, inſerted into the lower part of the corolla, linear, flat, ſmooth, and naked, longer than the ſegments; anthers verſatile. *Piſt.* Germen ſuperior, ovate, with the rudiments of many ſeeds in each cell; ſtyle cylindrical, with three furrows; ſtigma ſimple. *Peric.* Capſule projecting beyond the cloſed permanent corolla, ovate, with three blunt angles, woody, almoſt horny, poliſhed, acute, of three cells, and three valves, the partitions from the middle of each valve. *Seeds* one or two in each cell, bordered, compreſſed, with a hard black ſhell; the ſcar at the baſe, naked; embryo tranſverſe; albumen ſoft and fleſhy.

Eſſ. Ch. Corolla inferior, in ſix deep ſegments, permanent. Filaments flat, linear, naked. Capſule triangular, poliſhed. Seeds one or two, compreſſed, bordered.

Mr. Brown, from whoſe examination, of the living plants, we have improved our generic deſcription above, remarks, that the ſpecies of this genus have a peculiar habit, ſo ſtriking, that where they abound, they give a ſingular character to the face of the country. The body of the *root* is ſometimes elevated into a thick, ſcarred, black *ſtem*, often divided or branched, and ſeveral feet in height, exuding a fragrant yellow reſin: in other inſtances it is very ſhort, ſcarcely riſing above the ſurface of the ground. *Leaves* very numerous, crowded, narrow, graſſy, of great length, linear, ſomewhat triangular, or two-edged, ſpreading every way; recurved at the extremity; dilated, and half-ſheathing, at the baſe; rigid and elaſtic when dry. *Flower-ſtalk* terminal, quite ſimple, round, often many feet in length, ſmooth, firm, hard, and durable. *Spike* terminal, ſolitary, cylindrical, denſe, many-flowered, reſembling a catkin, ſometimes equal in length to the ſtalk itſelf. *Flowers* ſeſſile, cloſely crowded, ſmall, white, each accompanied by numerous, imbricated *bracteas*, tapering at the baſe into a claw, the innermoſt gradually ſmalleſt. *Capſules* of a ſhining cheſnut, partly black.

"The ſtructure of the *ſeeds* agrees with *Borya*, Labill. Nov. Holl. t. 107. Brown Prodr. v. 1. 286; nor are theſe two genera very diſſimilar in foliage or infloreſcence. They are placed at the end of the *Aſphodeleæ*, becauſe of their fleſhy *albumens*, and the black cruſtaceous ſkin of their *ſeeds*." *Brown.*

1. X. *arborea.* Arboreous Yellow-gum. Br. n. 1.—"Stem arboreſcent. Leaves two-edged; triangular beyond the middle; ſtriated in front. Stalk ſcarcely the length of the very long ſpike. Bracteas and corolla beardleſs." — Native of the country near Port Jackſon, New South Wales. Each diviſion of the thick *ſtem* is crowned with a large tuft of innumerable long, ſlender, drooping *leaves*, in the centre of which the *flower-ſtalks* ſtand ſolitary. See n. 3.

2. X. *auſtralis.* Southern Yellow-gum. Br. n. 2.—"Stem arboreſcent. Leaves compreſſed longitudinally. Stalk ſhorter than the elongated ſpike. Bracteas ſubtending the tufts of flowers elongated."—Native of the iſland of Van Diemen, where it was gathered by Mr. Brown. We have ſeen no ſpecimen.

3. X. *Haſtile.* Spear Yellow-gum. Br. n. 3. Ait. n. 1. (Yellow reſin-tree; White's Voyage, 235. t. at p. 249.)—Stem very ſhort. Leaves compreſſed longitudinally. Stalk many times longer than the eighteen-inch ſpike. Bracteas, and outer ſegments of the corolla, downy at the point.—Native of New South Wales, from whence we received ſpecimens in 1790, by favour of Dr. John White. It is ſaid to have been ſent, in 1803, to Kew garden, by Philip Gidley King, eſq. A green-houſe plant, flowering in April and May. In the deſcription given by Dr. White, at the place above quoted, he evidently confounds this ſpecies and the *X. arborea;* for he ſays "it is about the ſize of an Engliſh Walnut-tree. The *trunk* grows pretty ſtraight for about fourteen or ſixteen feet, after which it branches out into long ſpiral *leaves*, which hang down on all ſides, and reſemble thoſe of the larger kinds of graſs, or ſedge. From the centre of the head of leaves ariſes a ſingle *footſtalk*, eighteen or twenty feet in height, perfectly ſtraight and erect, terminating in a *ſpike* of a ſpiral form. This large *ſtalk* is uſed by the natives for making ſpears and fiſh-gigs, being pointed with the teeth of fiſh, or other animals." The firſt part of this deſcription appears to belong to the *arborea;* the latter, regarding the *infloreſcence*, to the *Haſtile;* which might eaſily, perhaps, except by a ſcrutinizing botaniſt, be ſuppoſed different ſtages of growth, or varieties, of the ſame plant. Such a miſtake may be more eaſily accounted for than that of the great Linnæus, in combining nearly the whole genus of *Aloe* into one ſpecies. The Yellow Reſin is produced by the preſent, and ſome other, ſpecies of this genus, by ſpontaneous exudation from the trunk; promoted ſometimes, as we judge from the appearance of certain ſpecimens, by fires kindled by the ſavage natives of the country. The juice, fluid at firſt, ſoon hardens in the ſun, into a concrete brittle form, of a dull orange colour. Burnt on hot coals, it emits a fragrant ſmoke, ſmelling like a mixture of balſam of Tolu and Benzoin, approaching in ſome degree to Storax. This reſin is perfectly ſoluble in ſpirit of wine, but not in water, nor even in eſſential oil of turpentine, unleſs digeſted in a ſtrong heat. The varniſh which it makes with either is weak, and of little uſe. Dr. White found this Yellow Gum a good pectoral medicine, in many caſes. If burnt in a room, the ſcent, though pleaſant to ſome people, ſoon proves oppreſſive, and the ſmoke irritating to the lungs. Olive gum, uſed by the Italians, is preferable for fumigation.

4. X. *media.* Intermediate Yellow-gum. Br. n. 4.—"Stem rather ſhort. Leaves (longitudinally?) compreſſed. Stalk very long, many times exceeding the eighteen-inch ſpike. Bracteas and corolla beardleſs."—Obſerved by

Mr. Brown near Port Jackson. He is not quite confident of its being a distinct species from the last.

5. X. *minor*. Lesser Yellow-gum. Br. n. 5.—"Stem none. Leaves triangular; flat in front; rather concave beyond the middle. Stalk many times longer than the spike. Bracteas scarcely longer than the tufts of flowers, all, like the corolla, beardless."—Gathered by Mr. Brown, in New South Wales. The *spike* of this species measures from five to eight inches. *Brown*.

6. X. *bracteata*. Long-bracteated Yellow-gum. Br. n. 6.—"Stem none. Leaves triangular; below the middle somewhat elevated in front; beyond it rather concave. Stalk many times longer than the spike. Bracteas subtending the tufts twice or thrice the length of the flowers, lanceolate and divaricated, all, like the corolla, beardless."—From the same country. The *spike* is only from three to six inches in length. *Brown*.

7. X. *Pumilio*. Dwarf Yellow-gum. Br. n. 7.—"Stem none. Leaves below the middle flattish, with a slightly elevated ridge on both sides; beyond it triangular and channelled. Stalk many times longer than the ovate spike. Bracteas nearly equal, beardless as well as the corolla."—Gathered by Mr. Brown, in the tropical part of New Holland. The *flower-stalk* itself is, in this species, only a foot high. *Brown*.

XANTHOXYLUM, received its name from governor Cadwallader Colden, because of the yellow hue of the wood, to which ξανθος, *yellow*, and ξυλον, *wood*, alludes. We make no scruple to follow the example of professor Martyn, in restoring the proper orthography; nor is it requisite to burthen our readers with a perpetual indication of the original blunder, under every species, though that blunder has the sanction of Linnæus, and perhaps of all the authors, except Martyn, that we may have to quote. They generally write the word *Zanthoxylum*, or *Zanthoxylon*.—Linn. Gen. 519. Schreb. 684. Willd. Sp. Pl. v. 4. 753. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 382. Pursh 209. Swartz Ind. Occ. 570. Juss. 374. Lamarck Dict. v. 2. 38. Illustr. t. 811. Gærtn. t. 68. (Fagara; Duham. Arb. v. 1. 229. t. 97. Swartz Prodr. 33.)—Class and order, *Dioecia Pentandria*. Nat. Ord. "*Hederaceæ*," Linn. rather his *Dumosæ*. *Terebintaceis affine*, Juss.

Gen. Ch. corrected. Male, *Cal.* Perianth very small, in three or five deep, concave, rather acute segments. *Cor.* Petals three or five, oval, erect, concave, thrice the length of the calyx. *Stam.* Filaments three or five, awl-shaped, erect, longer than the petals; anthers roundish, two-lobed, furrowed.

Female, *Cal.* like the male, inferior, permanent. *Cor.* like the male, deciduous. *Pist.* Germens from two to five, roundish, each terminating in an awl-shaped style, longer than the petals; stigmas obtuse. *Peric.* Capsules from one to five, stalked, each of one cell, and two coriaceous valves, bursting at the inner margin. *Seeds* solitary, roundish, polished, pendulous from an upright bristle-shaped stalk.

Eff. Ch. Male, Calyx in three or five small deep segments. Petals three or five.

Female, Calyx like the male, inferior, permanent. Petals three or five. Capsules from one to five, of two valves, and one cell. Seeds solitary, pendulous.

Obs. This genus is distinguished from FAGARA, (see that article,) by having separated *flowers*, either three-cleft, or five-cleft, and pendulous *seeds*. Botanists appear to have mistaken its real character, taking the *corolla* for a *calyx*. To this error Linnæus and Duhamel led the way, and Jussieu, Willdenow, and others, have followed them. Yet Linnæus in his *Gen. Pl.* subjoins to his generic description a more correct statement, altogether superseding the former; and Willdenow admits species from Swartz, whose *petals* by their presence contradict his essential character. We have not seen living specimens of *Xanthoxylum*, but the descriptions of Browne and Swartz leave little doubt of the correctness of the above characters. We are much tempted to unite the two genera in question, but as they really have not been sufficiently investigated, and Gærtner seems to have discovered a distinctive mark of *Xanthoxylum*, in the stalked pendulous *seeds*, we leave them for future inquiry. The whole genus is shrubby or arboreous, with alternate, pinnate, sometimes only ternate, entire, or somewhat crenate *leaves*, and clustered, or panicled, *flowers*. The *stem* is, in most instances, armed with prickles, that are sometimes very formidable. The *wood* is hard, and serviceable for many purposes.

Sect. 1. *Stem without prickles*.

1. X. *ternatum*. Three-leaved Yellow-wood. Swartz Ind. Occ. 570. Willd. n. 1. (Fagara trifoliata; Swartz Prodr. 33.)—Prickles none. Leaves ternate, obovate, slightly emarginate, shining; dotted beneath.—Received by sir Joseph Banks from the island of Dominica. A *shrub*, six feet high, with roundish, subdivided *branches*, angular when young. *Leaves* on smooth, spreading, channelled *footstalks*. *Leaflets* on small partial stalks, entire, rigid, veiny; contracted at the base; paler beneath, and minutely dotted with black. *Clusters* axillary, compound. *Flowers* small, whitish. *Germens* three, contiguous, like one three-lobed germen. *Stigmas* three, sessile. *Capsules* three, each of two hemispherical valves, with two internal, membranous, whitish valves. *Seeds* solitary, roundish, polished. *Swartz*.

2. X. *emarginatum*. Emarginate Yellow-wood. Swartz Ind. Occ. 572. Willd. n. 2. Ait. n. 1. (Fagara emarginata; Swartz Prodr. 33. Lauro affinis, terebinthi folio alato, ligno odorato candido, flore albo; Sloane Jam. v. 2. 24. t. 168. f. 4.)—Prickles none. Leaves pinnate, ovate, emarginate, veiny. Flowers triandrous.—Native of mountains in the interior parts of Jamaica, where it is vulgarly called *Lignum rorum*, a corruption of *Lignum Rhodium*, the smell of every part of the shrub resembling the latter when rubbed, or held near the fire. The *stem* is woody, branched, round. *Leaflets* about three pair, rarely with an odd one, above an inch long, veiny, rather coriaceous, and shining. *Clusters* terminal, somewhat compound, erect. *Flowers* minute, whitish. *Calyx* in five deep, ovate, acute, permanent segments. *Petals* only three, ovate, concave, spreading, twice the size of the calyx. *Stamens* three, very short. *Germen* three-lobed, with three sessile *stigmas*. *Capsule* seldom more than one perfected, with two internal, as well as external, valves, and one orbicular, black, shining *seed*. *Swartz*.

3. X. *acuminatum*. Pointed-leaved Yellow-wood. Swartz Ind. Occ. 575. Willd. n. 3. (Fagara acuminata; Swartz Prodr. 33.)—Prickles none. Leaves pinnate, elliptical, pointed, coriaceous. Flowers triandrous.—Native of mountainous parts of Jamaica. A *shrub*, with round spreading *branches*. *Leaflets* three or four pair, laurel-like, shining. *Cymes* terminal, subdivided in a forked manner. *Flowers* crowded, small, white. *Calyx* of three minute ovate leaves. *Petals* three, obtuse, concave, one line and a half long. *Stamens* three, shorter than the *corolla*. *Fruit* globose, the size of a pepper-corn, only one *capsule*, out of three, coming to perfection.

Sect. 2. *Stem prickly*.

4. X. *punctatum*. Dotted Yellow-wood. Willd. n. 4.

"West

"Weſt St. Croix 236."—Stem prickly. Leaves ternate, or pinnate, oblong, finely crenate; dotted beneath.—Native of the iſland of Santa Cruz. *Willdenow*.

5. X. *ſpinoſum*. Prickly Triandrous Yellow-wood. Swartz Ind. Occ. 574. Willd. n. 5. (Fagara ſpinoſa; Swartz Prodr. 33.)—Stem prickly. Leaves pinnate, with many pair of ſeſſile, ovate, pointed leaflets; prickly beneath, as well as the branches. Flowers triandrous.—Native of dry mountainous ſituations in Jamaica. A *ſhrub*, about ſix feet high, with a round, branching, upright ſtem. *Spines* (rather we preſume *prickles*) ſcattered, prominent, needle-like, as long as the finger-nail; thoſe of the main ſtem ſtronger, and thicker at the baſe. *Leaves* a foot long, with a compreſſed *footſtalk*, round and prickly at its baſe, and, if we underſtand right, furniſhed with a pair of prickles before each pair of *leaflets*, which are nearly ſeſſile, eight or ten pair in all, ovate, with a ſhort emarginate point, veiny, rigid, ſmooth, and ſhining, very minutely crenate at the edges, their mid-rib occaſionally prickly. *Cymes* terminal, with minute, white, crowded *flowers*. *Calyx* with three ovate acute ſegments. *Petals* three, ovate, larger than the calyx. *Filaments* ſcarcely any. *Anthers* ovate, converging. *Germen* in three diſtinct lobes. *Stigmas* three, ſeſſile, obtuſe. *Fruit* not obſerved. *Swartz*.

We have been more full in our deſcriptions of Dr. Swartz's four ſpecies, that the reader may compare their characters with *Fagara*. Nothing is ſaid of their *flowers* being ſeparated, or dioecious.

6. X. *Clava Herculis*. Great Prickly Yellow-wood. Linn. Sp. Pl. 1455, excluding the ſynonym of Duhamel. Amœn. Acad. v. 3. 16. Willd. n. 6. Ait. n. 2. Swartz Obſ. 375. (X. ſpinoſum, lentiſci longioribus foliis, euonymi fructu capſulari; Cateſb. Carolin. v. 1. t. 26, according to Linnæus. X. aculeatum, fraxini ſinuoſis et punctatis foliis; Pluk. Phyt. t. 239. f. 4.)—Stem with broad angular prickles. Leaflets ovate, pointed, crenate; nearly equal at the baſe: common footſtalk prickly. Flowers terminal, panicled.—Native of woods in the Weſt Indies and Carolina, flowering in March and April. It is marked by Mr. Aiton as a green-houſe plant, cultivated ever ſince Miller's time, flowering in April and May. The *trunk* is woody, often, according to Swartz, 30 or 40 feet high, armed with very powerful *prickles*, which are thick at their baſe, angular and ſharp at the point. *Leaves* a foot long, pinnate, as in all the following ſpecies; their common *footſtalks* armed with ſcattered ſtraight prickles, one-third of an inch long: *leaflets* about ſeven pair, on ſhort partial ſtalks, unequally divided by their ſmooth mid-rib, and ſomewhat falcate, an inch and a half or two inches long, bordered with ſhallow unequal notches, ſmooth and rather ſhining. *Cluſters* terminal, compound. *Flowers* polygamous, there being ſome united ones, though not perfecting ſeed, on one tree, and others entirely female, on another. The *former* have a minute five-toothed *calyx*. *Petals* five, thrice as long, ovate, erect, or a little incurved. *Filaments* five, twice the length of the petals, and inſerted between them. *Anthers* oblong, cloven at the baſe. *Germen* roundiſh, abortive, with five awl-ſhaped erect *ſtyles*, and ſimple *ſtigmas*. The *female flowers* have a five-toothed *calyx*; five concave *petals*; no *ſtamens*. *Germens* five, united into a roundiſh body. *Styles* none. *Stigma* peltate, ſlightly convex, a little elevated, with five furrows. *Capſules* five, combined, or one of five lobes, each lobe having two valves, and containing a roundiſh, black, ſhining *ſeed*. Our deſcription of the fructification is taken from Dr. Swartz. The *leaves* bear but a ſlight reſemblance to the Maſtick-tree, or any other ſpecies of *Piſtacia*, being decidedly crenate.

7. X. *aromaticum*. Aromatic Yellow-wood. Willd. n. 7. (Euonymo adfinis aromatica, ſive Xanthoxylon ſpinoſum, fraxinellæ foliis cheuſanicum; Pluk. Amalth. 78. t. 393. f. 2.)—Stem with oppoſite prickles. Leaflets ovato-lanceolate, ſerrated; unequal at the baſe: common footſtalk prickly. Panicles terminal.—Native of Chuſan. "A *ſhrub* with ſtraight prickles. *Leaflets* two, three, or four pair, pointed, one inch and a half long, marked with pellucid dots; rounded near the baſe, at the upper edge; contracted at the lower. *Common footſtalk* beſet with ſtrong, nearly oppoſite, prickles." *Willdenow*, from a dried ſpecimen, without *flowers*. Plukenet ſays, "the fruit is a ſingle, round, rough, or warty *capſule*, taſting ſtrongly of camphor, lined with a white, ſmooth, inſipid membrane, containing a black poliſhed *ſeed*, with a hollow whitiſh ſcar, in which lies the thread connecting the ſeed with its capſule." This very accurate deſcription determines the genus. He adds, that the Chineſe uſe this fruit inſtead of pepper.

8. X. *rhoifolium*. Stomach-leaved Yellow-wood. Lamarck n. 2. Willd. n. 8. (Euonymo affinis aromatica, ſive Xanthoxylum ſpinoſiſſimum, fraxini anguſtiore folio punctatum; Pluk. Amalth. 76. t. 392. f. 1.)—Stem prickly. Leaflets lanceolate, finely ſerrated; nearly equal at the baſe: common footſtalk downy and prickly. Panicles axillary.—Brought from the iſlands of Chuſan, like the preceding. The *leaves* are a foot long. *Leaflets* nine to eleven pair, with an odd one, each three inches in length, pointed, dotted; ſlightly downy beneath. *Footſtalk* ſometimes without prickles. *Willdenow*. Plukenet's figure repreſents the *panicle* much like the preceding, but lateral. The *capſules* ſeem to be one, two, or three from each *flower*.

9. X. *juglandifolium*. Walnut-leaved Yellow-wood. Willd. n. 9. (X. americanum, ſive Herculis arbor aculeata major, juglandis foliis alternis parùm ſinuoſis; Pluk. Phyt. t. 239. f. 6?)—Stem prickly. Leaflets oblong, pointed, obſcurely ſerrated; unequal at the baſe: common footſtalk ſomewhat prickly. Panicles terminal.—Native of Hiſpaniola and Nevis. *Leaves* pinnate, with an odd one; *leaflets* alternate, coriaceous, two or three inches long, marked with diſtant, ſcarcely viſible, pellucid dots; their edges entire to the naked eye, but under a magnifier appearing furniſhed with cloſe diſtant ſerratures; contracted near the baſe, at the upper edge; rounded at the lower, rather downy beneath. *Common footſtalk* beſet with a few ſhort ſcattered prickles. *Panicles* terminal, much branched, denſe, downy. *Capſules* four or five, rather downy, pointed. *Seeds* black.

10. X. *rigidum*. Rigid Yellow-wood. Willd. n. 10.—"Stem prickly. Leaflets elliptical, entire, emarginate, pointed; their veins hairy beneath; mid-ribs and footſtalks prickly."—Native of South America. *Humboldt and Bonpland*. *Leaflets* four pair, coriaceous, on very ſhort ſtalks; the upper ones largeſt, two inches long; lower but half an inch; their baſe rather unequal; ſometimes having a ſhort, obtuſe, crenate point; their upper ſide poliſhed, reticulated with veins; under paler, with one long, reddiſh, awl-ſhaped prickle on the mid-rib of each, of which there are ſeveral on the common ſtalk. *Flowers* not ſeen. *Willdenow*.

11. X. *hermaphroditum*. Cayenne Yellow-wood. Willd. n. 11. (Fagara pentandra; Aubl. Guian. v. 1. 78. t. 30.)—Stem prickly. Leaflets elliptic-oblong, pointed, entire; nearly equal at the baſe: common footſtalk without prickles. Panicles terminal, repeatedly compound. Flowers united.

united.—Gathered by Aublet, in the forests of Cayenne, flowering in May, and bearing fruit in August. A *tree*, whose *trunk* is 40 or 50 feet high, and two feet and a half in diameter, with a prickly bark. The *wood* is white, hard, and compact. *Leaflets* about five pair, nearly sessile, smooth; the largest six inches long, and an inch and a half broad. *Panicles* large and much branched, composed of numerous, small, white *flowers*, having *stamens* and *pistils* in the same individual. *Capsules* three, four, or five from each flower, reddish, each containing a black, shining, oily *seed*. These *capsules* have a pungent aromatic flavour, and the Creoles call them negro's pepper.

12. X. *fraxineum*. Ash-leaved Yellow-wood, or Common Tooth-ache Tree. Willd. n. 12. Arb. 413. Ait. n. 2. Pursh n. 1. (X. Clava Herculis β; Linn. Sp. Pl. 1455. X. ramiflorum; Michaux Boreal.-Amer. v. 2. 235. Fagara fraxini folio; Duham. Arb. v. 1. 229. t. 97.)—Stem prickly. Leaflets ovate, very minutely serrated; equal at the base. Umbels axillary.—Native of shady woods, near rivers, from Canada to Virginia and Kentucky, flowering in April and May. A tincture of the bark and capsules is recommended in rheumatism and the tooth-ache, whence its English name. *Pursh*. A large deciduous shrub, whose *branches* are armed with sharp, conical, compressed, brown prickles, very broad at the base. *Leaflets* four or five pair, with an odd one, an inch and a half long, on short partial stalks; contracted at each end; more or less distinctly crenate, or bluntly serrated; smooth above; soft and downy beneath. Their common *footstalk* is described without prickles; but in our specimens it is always furnished with some, and occasionally with very numerous ones. The *flowers* are small, yellowish-green, in little dense *umbels*, just above the scars of last year's footstalks, accompanied by a tuft of downy young leaves. The mode of inflorescence abundantly distinguishes this species from all the rest. It is hardy in our gardens, flowering in March and April, before the leaves appear. The bark is used in America, as a powerful sudorific and diuretic, whence its use, as above-mentioned, in rheumatic disorders. This is the species most popularly taken for *X. Clava Herculis*, as appears by the herbarium of Jacquin, purchased formerly by sir Joseph Banks, and even by that of Linnæus. The two species, nevertheless, are widely different.

13. X. *tricarpum*. Three-grained Yellow-wood. Michaux Boreal.-Amer. v. 2. 235. Pursh n. 2. Ait. n. 4.—Stem prickly. Leaflets stalked, oblong-oval, pointed, very smooth, finely serrated; oblique at the base: common footstalk prickly. Capsules three, sessile.—In the woods of Carolina and Florida, flowering in July. *Michaux*, *Pursh*. Introduced into the English gardens in 1806, by Mr. John Lyon. A hardy shrub. *Aiton*.

14. X. *heterophyllum*. Various-leaved Yellow-wood. (Macqueria Commersoni; Juss. 374, under Xanthoxylum.)—Young branches prickly; their leaves with very numerous serrated leaflets, on prickly common stalks: old ones unarmed, their leaves of seven entire leaflets, on unarmed common stalks. Panicles axillary. Capsules solitary.—Gathered in the isle of Bourbon, by Commerson, some of whose specimens are in our possession. Nothing can be more paradoxical than the appearance of this shrub. We must rely on its discoverer for the accuracy of his specimens, as the two branches, so very different in appearance, are not connected together; though we cannot doubt their generical identity. The young *branch* is slender, covered with innumerable, sharp, ascending prickles, of various sizes, a line long at most. *Leaves* alternate: *common footstalk* of each five or six inches long, round, straight, channelled, beset with numerous prickles, like those of the branch, but smaller: *leaflets* from 40 to 60, or more, opposite or alternate, ovate, bluntish, smooth, crenate or bluntly serrated, one quarter or one-third of an inch in length, of a fine green, paler beneath, marked with pellucid dots; their mid-ribs bearing one or two prickles at the back. The older or flowering *branches* are stout, rugged, unarmed, leafy at their extremities only. *Leaves* alternate, rather crowded, altogether destitute of prickles, each consisting of three pair of obovate, bluntly pointed, entire, coriaceous, veiny, smooth *leaflets*, with an odd one; the lowermost smallest: *common footstalk* channelled, smooth. *Panicles* compound, rather shorter than the leaves; their stalks unarmed, compressed, and angular. *Capsules* only one, perfected in each flower, brown, the size of a pepper-corn, rugged, full of pellucid dots lodging a pungent aromatic camphorated oil, and very bitter. *Seed* black, polished, with a bivalve elastic *tunic*, or lining of the capsule.

For *X. trifoliatum*, Linn., see PANAX *Aculeatum*.

XANTHURUS INDICUS, in *Ichthyology*, the name of a fish called by the Dutch *geel-staardt*.

It is of the size and shape of the bream; its jaws are armed with straight and very sharp teeth, which stand almost straight out; its back is yellow, and its tail very strongly tinged with that colour; its belly is of a blueish-white; its head brown, and its fins of a fine red. It is caught with hooks among the rocks on the shores of the East Indies, and is a very wholesome and well-tasted fish. Ray.

XANTHUS, in the *Natural History of the Ancients*, the name of an iron-ore of the hæmatites or blood-stone kind, and usually accounted a species of it, and called by others *Elatites*.

It was of a pale yellowish-white, or the colour of the French pale yellow ochre, used by our painters; but like all other ferruginous bodies it became red by burning.

Theophrastus gives us expressly the etymology of the name, observing that it was called so from its colour; the Dorians calling a yellowish-white ξανθος, *xanthus*.

XANTHUS, in *Ancient Geography*, a famous river of Asia Minor, in the Troade. According to Pliny, it had its source in mount Ida, and discharged itself at the port of the Achæans into the Hellespont, after having joined the Simois.—Also, a river of Asia Minor, in Lycia, which had its source in mount Taurus, and watered the towns of Xanthus and Patara, and ran into the Mediterranean, near the last of these places. This river was anciently called Sirbes, according to Strabo, and he says that the temple of Latona was situated ten stadia above its mouth, and sixty stadia farther was the town of Xanthus.

XANTHUS, or *Xanthopolis*, a town of Asia Minor, and the largest in Lycia. It was situated seventy stadia from the mouth of the river on its bank. Pliny reckons fifteen miles from this town to the mouth of the river. Under Appian, the inhabitants of Xanthus were such enthusiasts for liberty, that when it was taken by Brutus they burnt it, and preferred death to submission to the conqueror. He adds, that the same circumstance occurred with regard to Harpalus, general of Cyrus the Great, and Alexander the Great. It subsisted in the time of Strabo.—Also, a town of the isle of Lesbos.

XANTIPPE, in *Biography*. See SOCRATES.

XANTON, in *Geography*, a town of France, in the department of the Vendée; 5 miles E. of Fontenay-le-Comte.

XANXUS, in *Natural Hiſtory*, a name given by ſome authors to a large ſpecies of ſea-ſhell, ſomewhat like that with which the Tritons of old were painted. It is found in great abundance near Ceylon, and is uſed there in medicine as an alkali and abſorbent in the ſame caſes in which we give the teſtaceous powders.

XAPARACO, in *Geography*, a town of Mexico, in the province of Mechoacan; 85 miles W.N.W. of Mechoacan.

XARAMA, a river of Spain, which runs into the Tagus, a little below Aranjuez.

XARAYES, or ZARAYOS, *Laguna de Los*, a ſuppoſed lake of Braſil, formed by the river Paraguay; about 108 miles in length, and 21 in breadth. This is merely an inundation of the river, and exploded as a lake. S. lat. 17° 45′.

XATHOS, in *Ichthyology*, a name given by Appian to the fiſh called by the generality of authors the *erythrinus*, or *rubellio*.

XATIVA, now ST. FELIPE, in *Geography*. See ST. *Felipe*.

XAVIER, a town of Spain, in Navarre, the native place of the celebrated miſſionary of that name; 3 miles E. of Sangueſa.

XAVIER. See SABI.

XAVIER *Gogo*, a town of Africa, in the country of Whidah; 12 miles N.N.E. of Sabi.

XAVIER, *Saint*. See SAINT *Xavier*.

XAVIER *Zante*, a town of Africa, in the country of Whidah; 14 miles N.W. of Sabi.

XAUXA, a town of Peru, in the biſhopric of Guamanga, containing two churches; 90 miles E. of Lima. S. lat. 12°. W. long. 75° 30′. See JAUJA.

XAUXA, a river of South America, which riſes in the Andes, about 75 miles N. from Atun Xauxa, and uniting with the Apurimac, forms the Ucayale.

XAUXAVA, a town of Morocco, on a river, and at the foot of a mountain, both of the ſame name; 15 miles N. of Morocco.

XEBEC, in *Sea Language*, a ſmall three-maſted veſſel, navigated in the Mediterranean ſea, and on the coaſts of Spain, Portugal, and Barbary. The fore and main maſts are called block-maſts, being ſhort, and formed ſquare at the head, to receive ſheaves, to reeve the jeers, &c. The mizen-maſt is fitted with a top-maſt, &c. ſimilar to a ſmall Engliſh ſhip, and which has been lately added, to keep them better to the wind. The xebecs have no bowſprit, but a ſort of boomkin, woulded and confined to the prow, nearly horizontal (ſee GALLEY), to the outer end of which lead the bow-lines. The fore-maſt rakes much forward, has no ſtay, and the ſhrouds ſet up, ſimilar to the runners in Engliſh cutters or ſloops, to toggles fixed in the ſides. Theſe ſhrouds are eaſily ſhifted when the veſſels go about. The main-maſt is nearly upright, and rigs as the fore-maſt. Each maſt carries a latteen-ſail, the largeſt ſide of which is bent to a yard that hoiſts by a purrel round the maſt, at about one-third its length; the yards are worked at the lower end by bow-lines, and the ſail extended by a ſheet at the clue. The upper lee-yard-arm is worked by a brace, and the ſtrain ſupported by vargs nearer the maſt. The mizen-maſt carries a latteen-ſail, ſimilar to the main and fore maſt. Veſſels with latteen-ſails will lie one point nearer the wind than a ſquare-rigged veſſel. Xebecs, particularly in France, have been rigged ſimilar to polacres; but they never ſail ſo well as they did in their primitive ſituation.

The xebec, generally equipped as a corſair, is conſtructed with a narrow floor, to be more ſwift in purſuit of the enemy; and of a great breadth, to enable her to carry a great force of ſail for this purpoſe, without danger of overturning. As theſe veſſels are uſually very low built, their decks are formed with a great convexity from the middle of their breadth toward the ſides, in order to carry off the water, which falls aboard, more readily by their ſcuppers. But as this extreme convexity would render it difficult to walk thereon at ſea, particularly when the veſſel rocks by the agitation of the waves, there is a platform of grating along the deck from the ſides of the veſſel toward the middle, on which the crew may walk dry-footed, whilſt the water is conveyed through the grating to the ſcuppers.

When a xebec is equipped for war, ſhe is occaſionally navigated in three different methods, according to the force or direction of the wind. Thus, when the wind is fair, and nearly aſtern, it is uſual to extend ſquare ſails upon the main-maſt, and frequently upon the fore-maſt; and as thoſe ſails are rarely uſed in a ſcant wind, they are of an extraordinary breadth. When the wind is unfavourable to the courſe, and yet continues moderate, the ſquare yard and ſails are removed from the maſts, and laid by, in order to make way for the large latteen yards and ſails, which ſoon after aſſume their place; but if the foul wind increaſes to a ſtorm, theſe latter are alſo lowered down and diſplaced, and ſmall latteen yards, with proportional ſails, are extended on all the maſts. The xebecs, which are generally armed as veſſels of war by the Algerines, mount from ſixteen to twenty-four cannon, and carry from three hundred to four hundred and fifty men, two-thirds of whom are generally ſoldiers. Falconer.

XEBEROS, in *Geography*, a town of South America, in the audience of Quito; 40 miles S.W. of La Laguna.

XEJUI, a river of Paraguay, which runs into the Paraguay.

XEKIAS, in *Biography*, a name given by the Chineſe and Japaneſe to an Eaſtern philoſopher of mythological origin and character, called alſo Buddas among the Indians, Somonacodom in Siam, and after his death Föe or Fotoki, who faſcinated the whole northern and eaſtern region of Aſia, as well as part of the ſouthern, with his pantheiſtic doctrine. It is probable, as ſome have ſaid, that he lived about 600 years before Chriſt; and having firſt appeared in the ſouthern part of India, on the borders of the Indian ocean, diſſeminated his philoſophy by means of his diſciples to all India. It is ſaid that he ſpent twelve years in ſolitude, when he was inſtructed by the Tolopoin, called by the ancients "hylobii," *i. e.* ſylvan hermits; and that in his 30th year he devoted himſelf to contemplation, and attained to the intuitive knowledge of the firſt principles of all things, from which he took the name of Föe, which ſignifies, "ſomething more than human." His myſtical philoſophy was delivered to his innumerable diſciples under the veil of allegory. The Japaneſe add, that in his contemplations, during which his body remained unmoved, and his ſenſes unaffected by any external object, he received divine revelations, which he communicated to his diſciples.

Buddas, or Xekias, in his eſoteric doctrine, taught the difference between good and evil; the immortality of the ſouls of men and brutes; different degrees of rewards and puniſhments in a future world; and the final advancement of the wicked, after various migrations, to the habitations of the bleſſed. Amidas, who, according to the Chineſe, is Xekias himſelf, preſides in theſe habitations, and is the mediator, through whoſe interceſſion bad men obtain a mitigation of their puniſhment. Theſe dogmas are contained in an ancient book, called Kio, which all the Indians beyond the Ganges, who follow the doctrine of Xekias,

 receive

receive as ſacred, and which is illuſtrated by innumerable commentaries.

The doctrine which Xekias delivered towards the cloſe of his life to his eſoteric diſciples was very different. Vacuum, or void, was, according to his inſtruction, the principle and end of all things, ſimple, infinite, eternal, but deſtitute of power, intelligence, or any other ſimilar attribute; and that to be like this principle, by extinguiſhing all paſſion and affection, and remaining abſorbed in the moſt profound contemplation, without any exerciſe of the reaſoning faculty, is the perfection of happineſs. The firſt principle in this ſyſtem cannot be pure nihility, which admits of no properties; probably, it is Firſt Matter, without variable qualities, whence all things are ſuppoſed to ariſe, which is not to be perceived by the ſenſes, but contemplated as the latent divinity, infinitely diſtant from the nature of viſible things, yet the origin of all ſubſtances. The emanations from this fountain became, in the popular theology, objects of the groſſeſt ſuperſtition and idolatry.

The doctrine of Föe, or Xekias, was embraced by innumerable diſciples. Among theſe, one of his moſt eminent ſucceſſors was Tamo, a Chineſe, who was ſo entirely devoted to contemplative enthuſiaſm, that he ſpent nine whole years in profound meditation, and was on this account deified.

According to the Bramins, Xekias had neither father nor mother; and as no Indian city claims the honour of his birth, he was probably a foreigner, who migrated to the ſouthern part of India from ſome neighbouring maritime country, perhaps from Lybia; whither he came with ſome Egyptian colony, and who had been inſtructed in the Egyptian myſteries. It is not improbable, that at the time when Cambyſes conquered Egypt, and diſperſed almoſt the whole nation, this impoſtor might have paſſed over into India, and propagating his doctrine among an ignorant and ſuperſtitious people, became an object of univerſal veneration. Brucker's Philoſ. by Enfield, vol. ii. Appendix. See Boodh, Brachmans, China, Japan, &c.

XEL, in the *Materia Medica of the Ancients*, a name given to the fruit *ſel*.

XELSA, in *Geography*, a town of Spain, anciently a Roman colony, called Julia Celſa.

XELVA. See Chelva.

XENDAY, a town of Japan, in the iſland of Niphon; 115 miles N.N.E. of Jedo. N. lat. 39°. E. long. 141° 52′.

XENEXTON, a word uſed by Paracelſus, to expreſs a ſort of amulet to be worn about the neck, to preſerve people from infection in the plague.

XENIA, Ξενια, q. d. *gifts*, in ſome *Ancient Cuſtoms*, were gifts, or preſents, made to the governors of provinces, by the inhabitants thereof.

The word occurs pretty frequently in charters of privileges; where *quietos eſſe à xeniis* denotes an exemption from making ſuch preſents to kings and queens, upon their travelling through ſuch precincts.

Xenia, in *Geography*, a townſhip of Ohio, in the county of Greene, with 1429 inhabitants.

XENIL, a river of Spain, which riſes in Grenada, and runs into the Guadalquivir, about three miles below Ecija.

XENINEPHIDEI, a word uſed to expreſs a ſort of imaginary ſpirits, mentioned by the adepts, as delighting to diſcover the occult qualities of bodies to men.

XENISMI, Ξενισμοι, in *Antiquity*, ſacrifices offered at the Athenian feſtival Anaceia.

XENOCRATES, in *Biography*, a famous Grecian philoſopher, was born at Chalcedon, in the firſt year of the 96th Olympiad (B.C. 396), and attached himſelf at firſt to Æſchines, but afterwards became a follower of Plato, and ſucceeded Speuſippus in the chair of the old academy (B.C. 339). His temper was gloomy, his aſpect ſevere, and his manners were little tinctured with urbanity. Plato took pains to correct theſe obliquities of his diſpoſition and character; and as he highly reſpected his maſter, he probably improved by his inſtruction, ſo that he was reckoned as one of his moſt eſteemed diſciples. Xenocrates was held in ſuch eſtimation among the Athenians for his virtues, and eſpecially his integrity, as well as his wiſdom, that in a public trial his ſimple aſſeveration was accepted inſtead of an oath, which was uſually required; and that even Philip of Macedon found it impoſſible to corrupt him. Dreading his influence, and the temptation of a bribe, he declined all private intercourſe with the Macedonian ſovereign, and was honoured by him with this teſtimony; that of all perſons who had come to him on embaſſies from foreign ſtates, Xenocrates was the only one whoſe friendſhip he was not able to purchaſe. On occaſion of being employed as an ambaſſador to the court of Antipater, for the redemption of ſeveral Athenian captives, he waved the honour of accepting the invitation of this prince to ſit down with him at ſupper, in the words of Ulyſſes to Circe, cited from Homer's Odyſſ. (l. x. v. 383); thus tranſlated,—

> "What man, whoſe boſom burns with gen'rous worth,
> His friends enthrall'd, and baniſh'd from his ſight,
> Would taſte a ſelfiſh, ſolitary joy?"

The patriotic ſpirit expreſſed in this appropriate paſſage gratified Antipater ſo much, that he immediately releaſed the priſoners. As another example of his moderation, it is alleged, that when Alexander, wiſhing to mortify Ariſtotle, on account of ſome accidental pique, ſent Xenocrates a magnificent preſent of 50 talents; he accepted only 30 minæ, returning the reſidue to the donor with this meſſage; that the whole ſum was more than he ſhould have been able to ſpend during his whole life. In this inſtance, he alſo manifeſted a ſuperiority to that kind of jealouſy and revenge which might have actuated meaner minds, when it is conſidered that Ariſtotle had inſtituted a ſchool in the Lyceum, in oppoſition to the academy over which Xenocrates preſided. In the uſe of food he was ſingularly abſtemious; his chaſtity was invincible by the ſeducing arts of Phryne, a celebrated Athenian courteſan; and his humanity was teſtified by the ſhelter which he afforded to a ſparrow that was purſued by a hawk, and fled into his boſom, where he allowed it to remain till its enemy was out of ſight, alleging that he would never betray a ſuppliant. In the employment of his time, he allotted a certain portion of each day to its proper buſineſs, one of which he devoted to ſilent meditation. His high ſenſe of the importance and utility of mathematical ſtudies was ſufficiently evinced by his refuſing to admit into his academy a young man who was ignorant of geometry and aſtronomy, becauſe he was deſtitute of the handles of philoſophy. Upon the whole, Xenocrates was eminent, both for his purity of morals, and his acquaintance with ſcience; and he ſupported the reputation of the Platonic ſchool by his lectures, his writings, and his conduct. His life was prolonged to the third year of the 116th Olympiad (B.C. 314), or the 82d year of his age, when he accidentally fell in the dark into a reſervoir of water.

His philoſophic tenets were Platonic; but in his lectures he adopted the language of the Pythagoreans. In his ſyſtem, unity and diverſity were principles in nature, or gods; the former being the father, and the latter the mother of the univerſe.

universe. The heavens he represented as divine, and the stars as celestial gods; and besides these divinities, he taught that there are terrestrial demons, of a middle order between the gods and men, partaking of the nature both of mind and body, and, like human beings, capable of passions, and liable to diversity of character. He probably conceived with Plato, that the superior divinities were ideas, or intelligible forms, proceeding immediately from the Supreme Deity, and the inferior gods, or demons, to be derived from the soul of the world, and, like that principle, compounded of a simple and a divisible substance, or of that which always remains the same, and that which is liable to change. Diogen. Laert. Plut. de Virt. Mor. De If. et Ofir. De Anim. Gent. Cicero de Nat. Deor. Brucker's Hist. Phil. by Enfield, vol. i.

XENODOCHUS, formed of ξενος, *stranger*, and δεχομαι, *I receive*, an ecclesiastical officer of the Greek church, the same with the hospitaler, or a person who takes care of the reception and entertainment of strangers.

St. Isidore, a priest and solitary, surnamed *Xenodochus*, lived in the fourth century. He was thus called, because entrusted with that office in the church of Alexandria.

XENOPAROCHUS, formed of ξενος, *stranger*, and παροχος, of παρεχω, *I furnish*, among the *Romans*, an officer who provided ambassadors with all kinds of necessaries, at the public expence.

XENOPHANES, in *Biography*, the founder of the Eleatic sect, was born at Colophon, about the 56th Olympiad (B.C. 556); and having left his country, took refuge in Sicily, where he gained a subsistence by reciting, in the court of Hiero, elegiac and iambic verses, which he had written against the theogonies of Hesiod and Homer. From Sicily he removed to Magna Græcia, where he became a celebrated preceptor in the Pythagorean school, without adhering strictly to the doctrines of Epimenides, Thales, and Pythagoras. His life was prolonged to the advanced age of 100 years, that is, till the 81st Olympiad (B.C. 456), during 70 years of which he occupied the Pythagorean chair of philosophy. In Enfield's Philosophy of Brucker we have the following summary of the doctrine of Xenophanes:— In metaphysics, he taught, that if ever there had been a time when nothing existed, nothing could ever have existed. That whatever is, always has been from eternity, without deriving its existence from any prior principle; that nature is one and without limit; that what is one is similar in all its parts, else it would be many; that the one infinite, eternal, and homogeneous universe, is immutable and incapable of change; that God is one incorporeal eternal being, and, like the universe, spherical in form; that he is of the same nature with the universe, comprehending all things within himself; is intelligent, and pervades all things; but bears no resemblance to human nature either in body or mind.

In physics, he taught, that there are innumerable worlds; that there is in nature no real production, decay, or change; that there are four elements, and that the earth is the basis of all things; that the stars arise from vapours, which are extinguished by day, and ignited by night; that the sun consists of fiery particles collected by humid exhalations, and daily renewed; that the course of the sun is rectilinear, and only appears curvilinear from its great distance; that there are as many suns as there are different climates of the earth; that the moon is an inhabited world; that the earth, as appears from marine shells, which are found at the tops of mountains, and in caverns far from the sea, was once a general mass of waters; and that it will at length return into the same state, and pass through an endless series of similar revolutions.

The doctrine of Xenophanes concerning nature is so obscurely expressed by those who have transmitted an imperfect account of it, that it has been misunderstood and misrepresented. Some have confounded it with the atheistical system of Spinoza; by others it has been accommodated to the ancient doctrine of emanation; and others have maintained its similarity to the Pythagorean and Stoical notions of the soul of the world. The truth seems to have been, according to Brucker's statement, that he held the universe to be one in nature and substance; distinguishing in his conception between the matter of which all things consist, and that latent divine force, which he considered not as a distinct substance, but an attribute, and yet necessarily inherent in the universe, and the cause of all its perfection. This view of his notion is consistent with the language he used, and with the account of his doctrine, preserved by Sextus Empiricus, that God is of the same nature with the universe; τὸν Θεὸν συμφυῆ τοῖς πᾶσι. When he asserted that there is no motion in nature, it is probable that he understood the term motion metaphysically, meaning merely that there is no such thing in nature as passing from nonentity to entity, or the reverse. Accordingly, the ancients more generally applied the term motion to a change of nature than to change of place. Brucker is of opinion that the notion ascribed to Xenophanes concerning the nature and origin of the celestial bodies, as meteors daily renewed, must have been founded on a misconception and misrepresentation of his opinion on the subject. See ELEATIC *Philosophy*.

XENOPHILES, an able Greek musician, who professed the philosophy of Pythagoras, and who lived at Athens, where he arrived at the great age of 105. It is Lucian who gives this account of his extraordinary longevity from Aristoxenus.

XENOPHON, the son of Gryllus, an Athenian, was distinguished as a philosopher, commander, and historian. His engaging appearance whilst he was a youth induced Socrates to admit him into the number of his disciples. Under his tuition he made rapid progress in that kind of wisdom for which his master was so eminent, and which qualified him for all the offices of public and private life. Having accompanied Socrates in the Peloponnesian war, and manifested his valour in defence of his country, he afterwards entered into the army of Cyrus as a volunteer; but his enterprise against his brother proving unfortunate, Xenophon, after the death of Cyrus, advised his fellow-soldiers to attempt a retreat into their own country rather than to surrender themselves to the victor. His advice was regarded, and he was chosen as their commander. In the exercise of this duty he acquired by his prudence and firmness a high degree of honour; and the memorable adventure is related by himself in his "Retreat of the Ten Thousand." Having joined Agesilaus, king of Sparta, after his return into Greece, and fought with him against the Thebans in the celebrated battle of Chæronea, he displeased the Athenians by this alliance; and he was publicly accused for his former engagement in the service of Cyrus, and condemned to exile. Thus ignominiously treated, the Spartans took him under their protection, and provided for him a comfortable retreat at Scilluns, in Elis. In this asylum he enjoyed the pleasures of domestic life with his wife and two children for several years, and availed himself of the leisure that was thus afforded him by writing those historical works which have rendered his name immortal. On occasion of a war between the Spartans and Eleans, he was obliged to abandon this agreeable retreat, and to join his son, who was settled at Lepreus. From hence he afterwards removed with his whole family to Corinth, where, in the second year of the

105th Olympiad (B.C. 359), his life terminated, at the age of about 90. As a philosopher, he was an ornament to the Socratic school by his integrity, piety, and moderation; and in his whole military conduct, he was distinguished by an admirable union of wisdom and valour. As a writer, he has presented to succeeding ages a model of purity, simplicity, and harmony of language, expressing sentiments truly Socratic. By his wife Phitesia he had two sons, Gryllus and Diodorus; the former of whom ended his life with military glory in the battle of Mantinea. The news of his son's death was communicated to him whilst he was offering sacrifice; and upon receiving it, he took the crown from his head, uttering with a sigh these memorable words, "I knew that my son was mortal:" but when he heard that he had fought bravely, and died with honour, he again put on the crown, and finished the sacrifice. As an historian, he may be considered in his "Hellenics" as the continuator of Thucydides, and as having brought down the affairs of Greece to the battle of Mantinea. His "Cyropædia," or "Institution of Cyrus," is generally regarded as a work of fiction rather than of real history, exhibiting, under the name of the elder Cyrus, the picture of a perfect prince, according to his own conception of the character. His "Anabasis" (or Ascent) is an account of that memorable expedition of the younger Cyrus, in which he himself appears so conspicuous. This work appeared under the name of Themistogenes of Syracuse, to whom Xenophon himself ascribes it; nevertheless it has been universally ascribed to Xenophon: but if this be the case, it must have been written from memory, long after the events, which are differently related by Diodorus. Among his political works we may enumerate his accounts of "The Republic and Laws of Sparta;" "Of the Republic of Athens and its Revenues;" his "Praise of Agesilaus;" and his "Hiero, or Dialogue on Tyranny." Of a miscellaneous class, he wrote a treatise on "Oeconomics;" "On Hunting;" and "On the Office of Master of the Horse." The character of Xenophon, pourtrayed in his writings, seems to have exemplified virtue and humanity, kind and generous feelings, and a considerable degree of piety blended with superstition. In his Anabasis he exhibits a singular degree of credulity and regard to celestial warnings, which, in his view of them, governed his conduct, and were miraculously verified by the event. For his preference of the Spartan to the Athenian government and manners, derogating from his patriotism, the only apology is his banishment. His style has been always admired for its purity, simplicity, and clearness; and his works are reckoned amongst the most popular of the Greek classics, and have passed, collectively and separately, through several editions. Laertius. Ælian. Hist. Var. Fabr. Bib. Græc. vol. ii. Brucker's Philos. by Enfield, vol. i.

XENOXUA, in *Geography*, a town of European Turkey, in Macedonia; 36 miles S.E. of Akrida.

XEQUETEPEQUE, a town of Peru, in the government of Truxillo, on the Pasca Mayo; 55 miles N. of Truxillo.

XERANTHEMUM, in *Botany*, from ξηρος, *dry*, and ανθος, *a flower*, a name well adapted to express the dry and durable nature of the flowers of the present genus, one of the tribe popularly denominated Everlasting Flowers.—Linn. Gen. 420. Schreb. 551, excluding *Xeranthemoides* of Dillenius. Willd. Sp. Pl. v. 3. 1901. Mart. Mill. Dict. v. 4, the first section only. Sm. Prodr. Fl. Græc. Sibth. v. 2. 172. Ait. Hort. Kew. v. 5. 20. Tourn. t. 284. Juss. 179, excluding *Eliehrysum* of Tournefort. Lamarck Illustr. t. 692. f. 1. Gærtn. t. 165.—Class and order, *Syngenesia Polygamia-superflua*. Nat. Ord. *Compositæ nucamentaceæ*, Linn. *Corymbiferæ*, Juss.

Gen. Ch. *Common Calyx* imbricated; scales numerous, elliptic-lanceolate, scariose, permanent, the inner ones much longer than the disk, coloured, forming a radiant crown to the whole compound flower. *Cor.* compound, somewhat unequal; florets of the disk very numerous, all perfect, tubular, funnel-shaped, much shorter than the calyx, in five equal spreading segments; those of the circumference fewer, female, tubular, somewhat two-lipped, with five unequal segments. *Stam.* (in the perfect florets) Filaments five, capillary, very short; anthers forming a cylinder rather longer than the corolla. *Pist.* (in the same florets) Germen short; style thread-shaped, longer than the stamens; stigma cloven: in the female florets, *Stam.* none. *Pist.* Germen and style as in the perfect florets; stigma simple, club-shaped. *Peric.* none, except the calyx scarcely at all altered, except being closed. *Seed* in both kinds of florets alike, oblong; down a row of taper-pointed narrow scales. *Recept.* flattish, clothed with linear acute scales, rather longer than the florets.

Eff. Ch. Receptacle scaly. Down of taper-pointed scales. Calyx imbricated, its inner scales forming a coloured spreading radius.

Obs. Gærtner has long ago observed, what indeed no one could overlook, that the essential character of this genus, as given by Linnæus, answers to his first species only, *X. annuum*. This stands in the *Syst. Veg.* making a section by itself, characterized by a chaffy receptacle; whereas the other sections, "with a naked receptacle," receive all the numerous species besides, and directly contradict the generic character, "*receptaculum paleaceum.*" Gærtner, Jussieu, and Willdenow, have properly corrected this oversight, as we have shewn under ELICHRYSUM. The true *Xeranthemum*, therefore, would be left with a solitary species, sufficiently well marked indeed to be so distinguished, as far as the Linnæan species go. But our great master is proved to have confounded several together, under his *X. annuum*. Willdenow distinguishes three species, two of which we cannot separate, but we shall subjoin a fourth. They were all known to Tournefort, who indeed divides them still further, mistaking double or white flowered varieties as species. The *root* of the whole genus is annual. *Herb* erect, rigid, alternately branched, clothed with fine, white, close, cottony down, easily rubbed off. *Leaves* alternate, sessile, lanceolate, acute, undivided, entire; tapering at the base. *Flowers* solitary, on long, terminal, slightly scaly, stalks. Outer scales of the *calyx* roundish, membranous and shining, at least at the edges; inner oblong, spreading while in flower, purple or brownish, occasionally white, very brilliant and ornamental.

1. X. *annuum*. Purple Xeranthemum, or Everlasting Flower. Linn. Sp. Pl. 1201. Willd. n. 1. Ait. n. 1. Prodr. Fl. Græc. n. 2045. Jacq. Austr. t. 388. Mill. Illustr. t. 67. Mill. Ic. t. 279. (X. flore simplici, purpureo, majore; Tourn. Inst. 499, with perhaps the five following of that author. X. incanum non fœtens, flore majore; Moris. sect. 6. t. 12. f. 2. Ptarmica austriaca; Clus. Hist. v. 2. 11. Ger. Em. 607. πταρμικη of Dioscorides, according to Dr. Sibthorp.)

β. Linn. Sp. Pl. 1201. (X. inapertum; Willd. n. 2. Ait. n. 2; excluding the synonym of Morison. X. capitulis inapertis; Hall. Enum. 709. t. 23. X. n. 122; Hall. Hist. v. 1. 52. Ptarmica Imperati; Ger. Em. 606, no figure. Jacea oleæ folio, minore flore; Bauh. Pin. 272.)

Outer calyx-scales roundish-elliptical, awned, smooth at the

the keel; inner lanceolate, spreading. Crown of the seed lanceolate, shorter than the calyx.—Native of dry hilly ground in Austria, Hungary, France, Italy, and Greece; β is found in Switzerland, Spain, and Germany. This species is a hardy annual, common in our gardens, ever since the time of Gerarde and Lobel, flowering in July and August. The first variety, and especially the semidouble kind, figured by Philip Miller in his *Icones*, is preferred for cultivation. The flowers with their stalks, dried quickly, preserve their shining purple colour very long, and make part of the winter decorations of a chimney-piece; but for this purpose, the back of every coloured scale of the calyx should be drawn, while fresh, over the edge of a blunt knife, to keep the flower open after it is dried. The *stem* is erect, branching, bearing linear-lanceolate, white, cottony *leaves*, and numerous *flowers*, an inch or more in diameter. The outer *calyx-scales* are membranous and shining, pale, quite smooth, each with a red or brownish mid-rib, most conspicuous upwards, and terminating in a small awn-like point.

In the variety β the *flowers* are of a smaller diameter, and the *calyx* spreads less; but we do not find that its outer scales are more acute, though somewhat variable in that respect; the inner are less strikingly purple, and turn browner as they fade. This variety we have from the Valais, as the undoubted plant of Haller, sent by the late Mr. Davall. Both kinds have a pleasant aromatic scent, different from the strong odour of the following.

2. X. *cylindraceum*. Cylindrical Xeranthemum. Sm. Prodr. Fl. Græc. n. 2046. (X. orientale, flore minimo, calyce cylindraceo; Tourn. Cor. 38. X. oleæ folio capitulis simplicibus, incanum, fœtens, flore purpurascente minore; Moris. v. 3. 43. sect. 6. t. 12. f. 1.) — Outer calyx-scales elliptical, pointless, woolly at the keel; inner lanceolate, erect.—Native of Germany and Asia Minor. Gathered by Dr. Sibthorp on the Bithynian Olympus, or in its neighbourhood. Seeds of this species were given to Mr. Davall by professor Lachenal at Basle, for the common *X. annuum*, as figured by Haller; but on seeing the real plant of that author, above described, from the country of the Valais, he allowed them to be distinct. Mr. Davall first detected the true specific difference, in the woolly scales of the *calyx*, which, moreover, want the red mid-rib of the preceding species. Morison indeed describes this mid-rib, which proves that he confounded *X. annuum β*, as many other people have done, with our *cylindraceum;* for Mr. Davall observed the strong disagreeable smell in his specimens, by which Morison characterizes the plant before us.

3. X. *orientale*. Oriental Xeranthemum. Willd. n. 3. Ait. n. 3. (X. annuum γ; Linn. Sp. Pl. 1201. X. orientale, fructu maximo; Tourn. Cor. 38. X. oleæ folio, capitulis compactis; Moris. v. 3. 44. sect. 6. t. 12. f. 4. Jacea oleæ folio, capitulis compactis; Bauh. Pin. 272. J. incana, folio oleæ; Dalech. Hist. 1193. Lob. Ic. 545. f. 1.)—Outer calyx-scales roundish, membranous; inner ovate, pointed, erect. Crown of the seed ovate, awned, longer than the calyx.—Native of Armenia and Syria. The *leaves* of this species appear to be broader and more elliptical than either of the foregoing. But its most striking difference is visible in the ovate scales, forming the crown of the *seeds*, each of them ending in a long point, far overtopping the upright radiant scales of the *calyx*. We have never seen a specimen, but the figures above cited render the plant sufficiently intelligible. Willdenow describes the *flowers* the size of *X. annuum*, or larger. Surely Lamarck's t. 692. f. 2. cannot be intended for this plant! We know nothing answerable to that figure.

Xeranthemum, in *Gardening*, contains plants of the herbaceous, flowering, annual kinds, in which the species cultivated are, the annual xeranthemum, or common eternal flower (X. annuum); the reflexed-leaved eternal flower (X. retortum); the golden eternal flower (X. speciosissimum); the silvery eternal flower (X. sesamoides); the proliferous eternal flower (X. proliferum); the leafy-flowered eternal flower (X. vestitum); and the imbricated eternal flower (X. imbricatum). As to the species of Xeranthemum, see the preceding article.

The first is an herbaceous flowering plant, of which there are varieties with large white flowers, with double white flowers, with double purple flowers, and with double violet-coloured flowers.

Method of Culture.—In the first sort and varieties, the culture is readily effected by sowing the seeds in pots of light fresh mould, in the autumn or spring, or at other seasons for a succession, plunging them in a moderate hot-bed, to bring forward the plants. In the spring they may also be sown in patches where they are to remain, or in beds to be afterwards removed. When the plants have a few inches growth, they should be pricked out in rows a foot apart on beds, or into the borders, clumps, or other places where they are to grow. They should afterwards be kept clean from weeds, and have occasional waterings immediately after pricking out, and afterwards in dry weather.

The other sorts are raised by planting cuttings of the young shoots in the summer, in pots filled with light mould, giving them a little water and shade; or, which is better, plunging them into a hot-bed, and covering them with hand-glasses. When they are become firmly established in the autumn, they should be carefully removed into separate pots, being replaced in the hot-bed till re-rooted, after which they should have the management of other shrubby green-house plants.

The first sort produces a fine effect in the borders, clumps, &c. while growing, as well as in pots when the flowers are taken off; and the other sorts afford variety in green-house collections, among other potted plants of the same kind.

XERASIA, in *Medicine*, the name of a disease, a species of alopecia, in which the hair falls off through a dryness of the part, and want of due nourishment.

Xerasia, in *Animals*, denotes a certain kind of diseased state, which consists in a dryness of the hairs, caused by the want of due and sufficient nourishment and support, from which they decay and fall off. It is met with in such animals as have been starved, and kept and fed in a stinted manner only on poor sorts of food. It is to be removed by a better and more full kind of fodder, and other sorts of keep, and by being turned into a good salt-marsh pasture. See Surfeit.

XEREQUARO, in *Geography*, a town of Mexico, in the province of Mechoacan; 45 miles N.E. of Mechoacan.

XERES, a town of South America, in Paraguay, now in ruins. S. lat. 20° 5′.

Xeres *de Badajos*, or *Xeres de los Caballeros*, a town of Spain, in Estremadura; 72 miles N.N.W. of Seville. N. lat. 38° 17′. W. long. 6° 52′.

Xeres *de la Frontera*, a town of Spain, in the province of Seville, on the Guadalete; near which a battle was fought between the Moors and Goths, in the year 712, in which Roderick, the last king of the Goths, lost his life. The environs are celebrated for that excellent wine corruptly called sherry. The best and richest sort of sherry is called "pagarette," from the Spanish word *pago*, a district, and particularly applied to this vintage. In one aranzado (an acre of vineyard) they plant 1800 vines at regular distances.

tances. It is reckoned a good year if it gives three butts *per* acre, middling if two, and bad if but one: ſome years, however, it yields four or five. The number of inhabitants is eſtimated at 40,000, of whom one-twentieth, Mr. Swinburne ſays, are religious; 15 miles N.N.E. of Cadiz. N. lat. 36° 41′. W. long. 6° 15′.

XERES *de la Frontera*, a town of Mexico, in the province of Zacatecas, with a garriſon of Spaniards to protect the mines; 25 miles S. of Zacatecas.

XERES *de Guadiana*, a town of Spain, in the province of Seville, near the frontiers of Portugal; 74 miles W. of Seville.

XERES *Nueva*, a town of South America, in the province of Venezuela.

XERES. See CHULUTECA.

XERIÇA, a town of Spain, in the province of Valencia; 7 miles N.W. of Segorbe.

XERIFF, in *Commerce*, a money of account in Morocco, which is divided into eight paels.

XERITO, in *Geography*, a ſmall river of Spain, which runs into the Alagon.

XEROCHLOA, in *Botany*, from ξηρος, *dry*, and χλοα, *a graſs*.—Brown Prodr. Nov. Holl. v. 1. 196.—Claſs and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Eſſ. Ch. Calyx two-flowered, of two unequal valves, parallel to the hollow of the receptacle, and half ſunk therein; the outer valve ſmalleſt. Corolla of both flowers longer than the calyx, of two valves, awl-ſhaped, membranous, awnleſs. Stamens in the outermoſt flower. Styles in the inner one, combined at the baſe. Nectary none. Seed encloſed in the inner, paper-like, valve of the corolla.

This genus conſiſts of perennial, ruſhy, dry, ſmooth graſſes. *Leaves* awl-ſhaped, ſtraight and ſtiff, with a very ſhort *ſtipula*. *Stem* terminated by alternate ſheaths, each containing from two to four ſhort *ſpikelets*, of few *flowers*. *Xerochloa* is akin to *Apluda*, whoſe character requires correction. *Brown*.

1. X. *imberbis*. Beardleſs Xerochloa. Br. n. 1.—Spikelets awl-ſhaped, ſlightly curved. Inner valve of the male flowers ſmooth.—Gathered by Mr. Brown, in the tropical part of New Holland.

2. X. *barbata*. Bearded Xerochloa. Br. n. 2.—Spikelets lanceolate, ſtraight. Inner valve of the male flowers bearded.—Native of the ſame country. *Brown*.

XERODES, in *Animals*, a term which is applied, and which ſerves to expreſs any ſort of tumour that is attended with the property of exſiccation or dryneſs. See TUMOUR.

XEROMYRON, formed of ξηρος, *dry*, and μυρον, *ointment*, a word uſed by the ancients to expreſs what they do at other times call in expreſs words a dry ointment. It was a compoſition of warm aromatic drugs, or of other things fit for external uſe, but without the fatty ingredients, by which they were uſually reduced into the form of ointments.

XEROPHAGY, Ξηροφαγια, formed of ξηρος, *dry*, and φαγω, *I eat*, among the *Ancients*, the feeding only on dry victuals, which was the practice of the athletæ.

In the firſt ages of the church, ſome, not contented with ſimple faſting, added the xerophagy thereto; abſtaining not only from fleſh and wine, but alſo from all freſh, ſucculent, and vinous fruits. And ſome even brought themſelves to bare bread and water.

Tertullian, in his book De Abſtinentia, cap. 9. ſpeaks of the xerophagia as a thing commendable in time of perſecution.

XEROPHTHALMIA, Ξεροφθαλμια, compounded of ξηρος, *dry*, and οφθαλμος, *eye*, a kind of ophthalmia, in which the eyes itch, and are red, but without ſwelling or watering.

XEROPHYLLUM, in *Botany*, from ξηρος, *dry*, and φυλλον, *a leaf*, a genus founded by Michaux upon *Helonias aſphodeloides* of Linnæus.—Michaux Boreal.-Amer. v. 1. 210. Willd. Enum. 402.—We confeſs ourſelves unable to make out any ſufficient reaſon for this meaſure, either in the author's deſcription, or in the plant itſelf. Mr. Purſh probably was equally puzzled; for he has not even cited the *Xerophyllum* of Michaux, as a ſynonym under the above *Helonias*. It ſeems the baſes of the *ſtamens* are dilated in the *aſphodeloides*, more than in other ſpecies of HELONIAS. See that article.

XEROPHYTA, ſo named by Juſſieu, from ξηρος, *dry*, and φυτον, *a plant*, alluding to the arid habit of this little ſhrub.—Juſſ. Gen. 50. Willd. Sp. Pl. v. 2. 15. Lamarck Illuſtr. t. 225.—Claſs and order, *Hexandria Monogynia*. Nat. Ord. *Bromeliæ*, Juſſ.

Gen. Ch. *Cal.* none. *Cor.* of one petal, ſuperior: limb in ſix deep ovate-oblong, acute, permanent ſegments; the three outer ones narroweſt, ſpinous-pointed, ſtouteſt, externally glandular. *Stam.* Filaments ſix, inſerted into the lower part of each ſegment, thread-ſhaped, very ſhort, equal; anthers erect, linear, half as long as the corolla. *Piſt.* Germen inferior, turbinate; ſtyle one, ſhort; ſtigma tumid, oblong, undivided. *Peric.* Capſule oval, rough, crowned with the faded corolla, with three cells, and many *ſeeds*.

Eſſ. Ch. Corolla in ſix deep ſegments, permanent; three outermoſt narroweſt, ſpinous-pointed. Stamens inſerted into the baſe of each ſegment. Stigma club-ſhaped. Capſule inferior, of three cells, with many ſeeds.

1. X. *pinifolia*. Fir-leaved Xerophyta. Willd. n. 1.—Gathered by Commerſon, in Madagaſcar. A hard rigid ſhrub, whoſe *ſtem* is round, alternately branched; the wood formed of parallel tubes, as in the generality of the monocotyledonous tribe: *branches* quarter of an inch in diameter, thickly clothed with the imbricated, deeply furrowed, permanent ſheaths of the laſt year's foliage, each crowned with the reflexed baſe of a leaf, by which the whole branch aſſumes a ſingular ſcaly appearance. *Leaves* alternate, two inches, or more, in length, linear, rigid, channelled, ſtriated, with thick entire edges, and a pungent ſpinous point; their baſe ſheathing, fibrous, and ſomewhat woolly. *Flowers* terminal, one or two at the end of each branch, on ſimple ſtalks, an inch long, rough, like the *germen*, with minute prominent glands, of which ſome traces are alſo found on the backs of the three outward ſegments of the *corolla*. The colour, of the inner ſegments at leaſt, appears reddiſh. Each *flower* is about half the ſize of a ſnowdrop. Nothing is known of the ripe *fruit*, in which perhaps ſome better marks, than have hitherto been given, may be found, to diſtinguiſh the eſſential characters of this genus from thoſe of HYPOXIS. See that article.

XEROPKIN, in *Commerce*, a ſilver coin of Goa, in the Eaſt Indies, which is worth 3*s.* 1½*d.* ſterling, nearly.

XEROTES, in *Botany*, ξηροτης, *dryneſs*, a name choſen by Mr. Brown to expreſs the arid ruſhy habit of this genus, in preference to *Lomandra*, by which it is deſignated in the work of M. Labillardiere. This latter appellation, formed of λωμα, *a border*, or rather *fringe*, and ανηρ, *a male*, is deſigned to indicate the occaſionally bordered anthers. It might perhaps have been allowed to remain, as well as many other names which are liable to ſome exception, though the anthers are not properly fringed. — Brown Prodr. Nov. Holl. v. 1. 259. (Lomandra; Labill. Nov. Holl. v. 1. 92.) — Claſs and order, *Dioecia Hexandria*. Nat.

Nat. Ord. *Tripetaloideæ*, Linn. *Junci*, Juss. *Junceæ*, Brown.

Gen. Ch. Male, *Cal.* Perianth of six regular, ovate, coloured leaves; the three innermost, or perhaps all the six, connected at the base. *Cor.* none, unless the calyx be so called. *Stam.* Filaments six, very short, inserted into the base of each leaf of the calyx; anthers orbicular, peltate. Some rudiments of a *pistil.*

Female, *Cal.* Perianth of six separate, permanent leaves. *Cor.* none. *Stam.* imperfect. *Pist.* Germen superior, ovate, with three furrows; styles three, short, combined at the base; stigmas obtuse. *Peric.* Capsule cartilaginous, coated, of three cells and three valves, with partitions from the centre of each valve. *Seeds* solitary, peltate.

Eff. Ch. Male, Calyx of six leaves; three innermost combined at the base. Corolla none. Anthers peltate.

Female, Calyx of six separate, permanent leaves. Styles three. Capsule superior, coated, of three cells; valves with central partitions. Seeds peltate, solitary.

This New Holland genus consists of perennial herbs, of a dry rigid texture, and a peculiar aspect, resembling the *Junci* and *Calamariæ*. *Root* fibrous. *Stem* none, or generally very short; sometimes divided, and clothed with sheathing foliage. *Leaves* grassy, linear, either flat or channelled, rarely thread-shaped; their base dilated, membranous, half sheathing; their extremity sometimes toothed. *Flowers* terminating the *stem*, or radical *stalk*, either panicled, racemose, spiked, or capitate. Inner leaves of the *calyx* often different from the outer in texture or size. When the *flowers* are sessile, they are invested with imbricated membranous *bracteas;* the male ones are sometimes stalked, without *bracteas*. Bark of the *capsule* at length separating, and occasionally a little pulpy. In some species, the skin of the *seed* adheres so loosely, as to resemble a distinct tunic. The *embryo* is longitudinal, straight, in the bottom of a cartilaginous *albumen*. *Xerotes* is allied in many points to the Palmæ. See that article. *Brown.*

Sect. 1. *Female flowers in solitary heads. Leaves entire at the extremity.*

1. X. *flexifolia.* Spiral-leaved Xerotes. Br. n. 1. (Dracæna obliqua; Thunb. Dracæn. 6. t. 1. f. 2.)—Stem somewhat branched. Leaves shorter than the branches, two-ranked, twisted; their edges rough with minute teeth; their points withering, acute. Male spikes interrupted, somewhat branched longer than the leaves. — Native of New South Wales, from whence specimens were sent us by Dr. White. The *stem* is about a foot high; woody at the base; more or less branched above, clothed with numerous, narrow, smooth, striated *leaves*, an inch or an inch and a half long, spreading in two directions; their sheathing bases imbricated, and bordered with a long, thin, torn, stipulaceous membrane at each side. *Male flowers* small, whitish, in long, mostly branched, rigid-stalked *spikes* or *clusters*, separated into little whorl-like tufts, accompanied by brown scaly *bracteas*. *Female flowers* rather larger, in round solitary heads, terminating short leafy branches in the forks of the stem.

2. X. *mucronata.* Pointed Xerotes. Br. n. 2.—"Stem somewhat branched. Leaves shorter than the branches, but longer than the male spikes, two-ranked, straight, or slightly twisted; their points withering, acute; their margins roughish, with very minute teeth; dilated and entire at the base."—Gathered by Mr. Brown, near Port Jackson, New South Wales, as well as the foregoing.

3. X. *collina.* Hill Xerotes. Br. n. 3.—"Leaves taller than the stem, narrow and straight; rough with marginal teeth; withering and very acute at the point; dilated and jagged at the base. Head of female flowers sessile."—Found by Mr. Brown, on the southern coast of New Holland.

4. X. *glauca.* Glaucous Xerotes. Br. n. 4. —"Leaves taller than the stem, narrow and straight; withering and bluntish at the point; rough with marginal teeth; dilated and jagged at the base. Tufts of flowers in the male spikes sessile."—Gathered on the south coast of New Holland by Mr. Brown.

5. X. *leucocephala.* White-headed Xerotes. Br. n. 5. —"Male, as well as female, flowers capitate. Receptacle woolly. Leaves narrow, smooth-edged, longer than the perfectly simple stalk, bearing one or two heads of flowers. Stem short."—Gathered by Mr. Brown, in the tropical part of New Holland.

Sect. 2. *Female flowers racemose or spiked: male ones racemose or panicled; partial stalks scattered; flowers drooping.*

6. X. *panciflora.* Few-flowered Xerotes. Br. n. 6.—"Flowers few in the male cluster, in distant whorls. Leaves very narrow, acute and smooth; dilated and entire at the base; shorter than the divided stem."—Found by Mr. Brown, near Port Jackson, New South Wales.

7. X. *filiformis.* Thread-shaped Xerotes. Br. n. 7. (Dracæna filiformis; Thunb. Drac. 4. t. 1. f. 1.)—Leaves thread-shaped, semicylindrical, elongated; flattened in front; rough-edged; finely striated at the back; round at the point. Male cluster scarcely branched. Stem short.—Gathered near Port Jackson, New South Wales, by Dr. White, and Mr. Brown. The *root* is woody. *Stem* scarcely any. *Leaves* several, a span or more in length, erect, rigid, very slender; flattened and whitish in front, with a green, striated, central furrow; convex at the back. We do not find that the point is always, as Mr. Brown says, round or cylindrical. *Clusters* much shorter than the leaves, branched in our specimens, as in Thunberg's figure, erect, lax, with rough stalks. *Flowers* scattered, or in pairs, drooping, whitish, small; the outer segments of the *calyx* smaller, and more membranous than the inner. *Bracteas* awl-shaped, acute, at the base of the *partial stalks*. Mr. Brown notices three varieties: α, male perianth nearly globular, twice the length of the partial stalk: β, male perianth nearly globular; partial stalk longer than that part, or the bracteas: γ, male perianth turbinate; partial stalk shorter than it, or the bracteas. The *leaves* seem variable in breadth and flatness.

8. X. *tenuifolia.* Fine-leaved Xerotes. Br. n. 8. —"Leaves thread-shaped, elongated; channelled in front; deeply striated at the back. Male clusters somewhat divided, their branches alternate. Stem short." — Observed by Mr. Brown, on the southern coast of New Holland.

9. X. *gracilis.* Slender Xerotes. Br. n. 9.—"Leaves very long and narrow, channelled; striated beneath; flat and entire at the point. Male panicles lax, alternately branched; partial stalks solitary. Stem short."—Found by Mr. Brown at Port Jackson.

10. X. *denticulata.* Small-toothed Xerotes. Br. n. 10. —"Leaves elongated, thread-shaped, compressed, channelled, with two or three terminal teeth. Male clusters simple or divided. Stem short."—Gathered by Mr. Brown at Port Jackson. We have some specimens which answer to this description, in the teeth of their *leaves*, but they seem nearly akin to *X. filiformis* to be separated from that species, and they exactly accord with Thunberg's *fig.* 1, drawn from a dried specimen. We are not, however, certain of their being Mr. Brown's *denticulata*.

11. X. *laxa.* Loose-flowered Xerotes. Br. n. 11.—"Leaves elongated, linear, flat, entire at the point. Male panicles

panicles loose, with whorled branches, and distant clusters; partial stalks solitary, shorter than the nearly globular perianth, but longer than their minute bractea."—Gathered by Mr. Brown, in the same country with the two last.

Sect. 3. *Flowers either spiked or panicled, their branches and tufts opposite or whorled. Male perianths sessile, imbricated with bracteas. Capsule smooth. Leaves toothed at the end.*

12. X. *rigida.* Rigid Xerotes. Br. n. 12. Ait. Epit. 376. (Lomandra rigida; Labill. Nov. Holl. v. 1. 93. t. 120.)—Stem very short. Stalks and spikes much shorter than the foliage. Leaves two-ranked, cartilaginous; convex beneath; abrupt, with two marginal teeth, at the end; smooth at the edges; dilated and entire at the base.—Gathered by Mr. Brown in the southern part of New Holland. M. Labillardiere found it in Van Lewin's land. *Root* woody. *Leaves* a span in length, full a quarter of an inch in breadth, spreading in two directions, thick, rigid, smooth; greatly dilated, and bordered with a membrane, at the base; singularly abrupt, and three-pointed, at the end. *Common flower-stalk* terminal, thick, sharply two-edged, sometimes triangular, smooth. Tufts of *flowers* one above another, not numerous, forming an interrupted, branched, upright spike; each tuft accompanied by several unequal, lanceolate, acute *bracteas.* Three alternate *stamens*, according to Labillardiere, are longer than the rest, and bear cloven, not bordered, *anthers.*

13. X. *montana.* Mountain Xerotes. Br. n. 13.—"Stem none. Leaves elongated, linear, flat, membranous, smooth-edged; their sharp point with two very short lateral teeth. Female spike undivided, many times shorter than its stalk."—Found by Mr. Brown, near Port Jackson.

14. X. *fluviatilis.* River Xerotes. Br. n. 14.—"Stem none. Leaves elongated, narrow, channelled, smooth-edged, two or three toothed, with an acute sinus, at the extremity. Female spikes simple or divided. Bracteas rather rigid, twice as long as the tufts of flowers."—Gathered by Mr. Brown in the same country, but, as appears by the name, in the vicinity of rivers.

15. X. *longifolia.* Long-leaved Xerotes. Br. n. 15. Ait. Epit. 376.—Stem none. Leaves elongated, linear, coriaceous, erect; irregularly toothed at the point; rough-edged. Panicles lanceolate, rather dense, with opposite branches. Flower-stalk flattish. Anthers uniform.—Gathered near Port Jackson, by Mr. Brown; at the Cape of Van Diemen, by M. Labillardiere. The *leaves* are a foot and a half long, somewhat striated; dilated at the base, and bordered in that part with a membrane, which at length separates, and becomes torn. *Stalk* from nine to twelve inches high, two-edged. *Flowers* more numerous and crowded than in *X. rigida*, n. 12, with long taper-pointed *bracteas. Capsule* ovate, acute, thrice as long as the calyx, chesnut-coloured; pale yellow at the base; its coat separating in irregular fragments.

16. X. *Hystrix.* Porcupine Xerotes. Br. n. 16.—Stem none. Leaves elongated, linear, lax, smooth-edged; somewhat toothed at the extremity. Stalk rather convex on both sides. Male panicles repeatedly compound, with whorled branches. Bracteas leafy, rigid, spinous-pointed.—Sent from the neighbourhood of Port Jackson, among the first botanical communications from thence, by Dr. White. It has also been gathered there by Mr. Brown. We have seen the living plant in some garden near London, possibly at Kew, and were much struck with the delightful fragrance of its copious panicles of male flowers, resembling the scent of *Crassula coccinea*, *Mesembryanthemum noctiflorum*, or a Bergamot Pear. Yet it does not occur in *Hort. Kew.* The *leaves* are a foot and a half or two feet long, spreading. *Flower-stalks* of the male plant numerous, erect, two-edged, though convex at each side, from one to one and a half feet high, somewhat zigzag occasionally, each bearing a flattish *panicle*, from six to fourteen inches long, composed of numerous triangular *branches*, from four to eight in a whorl, beset with numerous tufts, or whorls, of sessile *flowers*, accompanied by several chaffy, inner *bracteas*, and subtended by about three long, spreading, external ones, with needle-like points. The *flowers*, and whole *panicle*, are of a delicate straw-colour, with a tinge of brown about the *calyx* or *anthers*. We have not seen the female plant. This species well deserves a place in the green-house, for the singularity of its appearance, as well as for its fine smell.

17. X. *arenaria.* Sand Xerotes. Br. n. 17.—"Stem none. Leaves elongated, linear, smooth-edged, jagged and toothed at the end. Male panicle simple, with opposite branches. Tufts of flowers globose. Bracteas awl-shaped, reflexed. Flowers obtuse."—Discovered in the tropical part of New Holland, by Mr. Brown.

Sect. 4. *Male panicle whorled. Flowers stalked, in drooping tufts. Capsule rugged. Leaves entire at the point.*

18. X. *distans.* Distant-flowered Xerotes. Br. n. 18.—"Stem none. Leaves very long, channelled, very rough at the edges. Male panicle with undivided branches, and distant tufts of flowers. Partial stalks shorter than the calyx."—Native of the tropical part of New Holland. The male *panicles* are a foot long; *calyx* about a line and a half. *Brown.*

19. X. *media.* Intermediate Xerotes. Br. n. 19.—"Stem none. Leaves very long, channelled, smooth-edged. Branches of the male panicle undivided. Flowers five or six in each tuft; their partial stalks scarcely so long as the very short calyx. Female spike divided in the lower part, each branch bearing one head of flowers."—From the same country as the last. *Calyx* only one-third of a line in length; male *panicle* six inches. *Brown.*

20. X. *decomposita.* Compound Xerotes. Br. n. 20.—"Stem none. Leaves very long, channelled, smooth-edged. Male panicle repeatedly compound. Tufts of few flowers. Partial stalks hardly so long as the calyx."—Found also in the tropical part of New Holland. Male *panicles* a foot long. *Brown.*

21. X. *multiflora.* Many-flowered Xerotes. Br. n. 21.—"Stem none. Leaves very long, channelled; smooth at the back and edges. Male panicle with undivided branches, each bearing from one to three many-flowered tufts. Partial stalks longer than the calyx."—Found by Mr. Brown in the same country as the four preceding species.

22. X. *æmula.* Rough-long-leaved Xerotes. Br. n. 22.—"Stem none. Leaves very long, channelled, erect; rough at the back and edges. Male panicle with undivided branches, each bearing from one to three many-flowered tufts. Partial stalks longer than the calyx."—Found by Mr. Brown, in the country near Port Jackson, New South Wales. The roughness of the *leaves* seems chiefly to distinguish this species from the last. We have seen no specimens of either.

23. X. *Banksii.* Banksian Xerotes. Br. n. 23.—"Caulescent. Leaves two-ranked, flat, rough-edged. Female panicle dense, about the length of its two-edged stalk; branches quadrangular, very short."—Gathered by sir Joseph Banks, in the tropical part of New Holland, where it was not found by Mr. Brown.

Sect. 5. *Flowers of each sex in a cylindrical catkin-like spike.*

24. X.

24. X. *hastilis.* Spear-stalked Xerotes.—" Stem none. Spike very long. Stalk round. Leaves elongated."—Gathered by Mr. Brown, on the southern coast of New Holland. The habit of this species appears, by the above characters, to differ widely from the rest of its genus, rather approaching a Xanthorrhœa. See that article.

XEROTRIBIA, formed of ξηρος, *dry*, and τριβω, *I rub*, a term used by authors to express a dry friction, a rubbing of some affected part with the hand or otherwise, to recall the warmth and circulation.

XERTE, in *Geography*, a river of Spain, which passes by Placentia, and runs into the Alagon.

XERTIGNY, a town of France, in the department of the Vosges; 7 miles E. of Epinal.

XERUMENHA, or Jerumenha, or *Gerumenha*, a town of Portugal, in Alentejo; 10 miles S. of Elvas. N. lat. 38° 35′. W. long. 6° 58′.

XERXENA, in *Ancient Geography*, a country of Asia, on the confines of Lesser Armenia, of which it makes a part. Strabo.

XERXES, in *Biography*, was the son of Darius I. by Atossa, the daughter of Cyrus; and on the death of his father, succeeded to the crown of Persia, in the year 485 B.C. Having in the second year of his reign subdued the revolted Egyptians, and committed them to the government of his brother Achæmenes, he determined to renew the invasion of Greece, in which Darius had been disappointed; and for the success of his expedition, he formed an alliance with the Carthaginians, on condition of their making an attack on the Greek colonies in Italy and Sicily, so that they might not have it in their power to assist the mother-country. His preparations were immense, and occupied several of the first years of his reign. Having provided a large navy, he formed a project of cutting a canal through mount Athos, of sufficient breadth to admit two galleys a-breast; and to this undertaking, which some have regarded as a fiction, he devoted three years. He also constructed a bridge of boats across the Hellespont, in order to convey his army from Asia to Europe; and as the first bridge which had been laid was demolished by a storm, he not only manifested his childish rage by ordering 300 lashes to be inflicted on the sea, and a pair of fetters to be thrown into it, but his tyrannical and cruel disposition by beheading those to whom the conduct of the work had been committed. The number of sea and land forces which he employed in this expedition is said to have amounted to two millions and a half, to which we may add as many more attendants. When he ascended a high tower at Abydos, and took a view of the immense number that covered the sea and surrounding plain, his pride and triumph are said to have given way to tears, when the reflection occurred, that the brevity of human life was such as not to allow one of this countless host to survive the lapse of 100 years. Without detailing the events of this disastrous expedition, which are the proper subjects of history, we shall merely mention that it terminated in the defeat of Xerxes's navy at Salamis, and the subsequent overthrow and dispersion of Mardonius's army of 300,000 men; and specify some traits of the disposition and character of this ambitious despot. For his ignominious treatment of Leonidas, we refer to his article. Upon his taking possession of Athens, he wreaked his vengeance on the buildings and the temples, and dispatched a special messenger to his uncle Artabanus, to inform him of this inglorious triumph. Having erected a throne on a lofty mountain, in order to view the expected victory at Salamis, the event produced such consternation, that he suddenly left Mardonius and the army, and hastened to the Hellespont, where finding his bridge shattered by storms, but still haunted with terror, he intrusted himself in a fishing-boat, and hastened to Sardes; but when Mardonius was defeated, and all his hopes of conquering Greece were frustrated, he quitted Sardes, after having given orders for the demolition of all the temples in the Greek cities of Asia, and proceeded with all possible expedition to the Persian frontier. The other traces of his disgraceful expedition were the records of the cruelties and debaucheries exercised by himself and his family. So much at length did Xerxes become the object of contempt and hatred, that a conspiracy was formed among his own guards, which terminated in his murder during sleep, in the 21st year after his accession, B.C. 465. Herodotus. Diodorus. Anc. Un. Hist.

XESTA, Ξεστες, an Attic measure of capacity, answering to the Roman sextary.

XESTES, an ancient Greek liquid measure, which is = 2 cotyli. See Measure.

XIAMETLA, in *Geography*, a town of Mexico, in the province of Xalisco; 30 miles S.E. of Purification.

XIASSI, a town of the duchy of Warsaw; 20 miles S.S.E. of Posen.

XIBACA, a town of Japan, in the island of Niphon; 120 miles S.W. of Meaco.

XICOCO, called also *Sikoko*, and *Sikokf*, an island of Japan, about 90 miles in length, and about half as many in breadth, divided into several provinces, situated near the south-west extremity of Niphon, from which it is separated by a strait, full of small islands, and to the north-east of Ximo. It has several convenient harbours, and many towns within the country. N. lat. 33° 30′. E. long. 132°.

XICONA. See Xixona.

XILCA. See Chilca.

XILOA. See Quiloa.

XILOCA, a river of Spain, which rises in the south part of Aragon, about 7 miles N.E. of Albaracin, and at Calataiud changes its name to Xalon.

XILOTEPEC, a town of Mexico, in the province of Guasteca; 90 miles S.S.W. of Panuco.

XILVAN, a town of the principality of Georgia; 20 miles N. of Gory.

XIMABARA, a town of Japan, on the south coast of the island of Ximo, on a gulf to which it gives name; 33 miles E. of Nangasaki. N. lat. 32° 45′. E. long. 132° 7′.

XIMAGUINO, a town of Japan, in the island of Xicoco; 10 miles S. of Awa. N. lat. 33° 50′. E. long. 130° 30′.

XIMENA, a town of Spain, in the province of Seville. Near this town Crassus is said to have concealed himself in a cave, till Marius and Cinna were overthrown by Sylla; 24 miles E. of Medina Sidonia.

XIMENES, Francis, *Cardinal*, in *Biography*, was born in 1437, in Old Castile, and educated at Alcala and Salamanca. Renouncing preferments which he obtained in his youth, he assumed the habit of St. Francis, in a monastery of the Observantines, one of the most rigid orders of monks in the Romish church. Distinguished by his austerities and devotional practices, he became confessor to queen Isabella; and still retaining his customary modes of living, he so far engaged her respect and attachment, that he was nominated by her to the archbishopric of Toledo, the richest benefice in Europe next to the papal see; but his real or affected reluctance to accept this high preferment could be overcome only by the authority of the pope. In this elevated station he maintained his strict adherence to the rigours of the order to which he belonged, and so far from relaxing in in his feverities, he indulged them to the extreme of felf-mortification and penance. Having thus acquired a complete maftery over his own paffions, and poffeffing political talents in a very high degree, he was thought peculiarly fitted to exercife dominion over others; and accordingly Ferdinand and Ifabella entrufted him with a principal fhare in the adminiftration. When a ftrong party was formed among the Caftilians to deprive Ferdinand of the authority as regent, devolved upon him by the will of the queen, he was deferted by every perfon of diftinction except Ximenes and two nobles; and after he had refigned it to the archduke Philip, he again acquired it upon Philip's death in 1506, by the influence of Ximenes. In 1507 Ximenes was created a cardinal by pope Julius II.; and in the following year he undertook the conqueft of Oran, and of other places on the coaft of Barbary, with an armament, the expence of which he offered to defray out of his own revenues, and he fucceeded in this enterprife. Such was Ferdinand's confidence in the abilities and integrity of the cardinal, that when he was dying in 1516, he appointed him regent of Caftile until the arrival of his grandfon Charles. Although he was then in his 79th year, he took an active part in fecuring the throne to Charles, though in his own judgment he difapproved the king's conduct, who in his affumption of power contended the declared opinion of the Cortes. With no lefs firmnefs and inflexibility, he profecuted a plan for extending the royal authority, which the nobility had very much circumfcribed. The meafures which he adopted for this purpofe excited violent oppofition, but he perfifted, and ultimately fucceeded. During his adminiftration he was alfo engaged in two foreign wars; one for the prefervation of the kingdom of Navarre, in which he was fuccefsful, and another againft Horuc Barbaroffa, who advanced himfelf from the condition of a corfair to the fovereignty of Algiers and Tunis, in which the Spaniards were totally defeated. When Charles was prevailed upon by Ximenes to vifit Spain, the cardinal took a journey towards the coaft to meet his majefty; but being difabled to proceed by the attack of a diforder, fuppofed to be the effect of poifon, he requefted an interview with the king; but Charles having conceived prejudices againft him, returned a cold anfwer, with permiffion for his retirement to his diocefe, that he might finifh his days in tranquillity. In a few hours after the receipt of this letter, he expired November 1517, at the age of 80 years.

Ximenes was held in high eftimation by his fuperftitious countrymen, under a delufive idea that he poffeffed the gift of prophecy, and a power of working miracles. But his more unequivocal claims to their refpect were founded on his extraordinary talents and learning, his liberal patronage of literature, and the munificence of his public charities, to which he devoted the immenfe revenues of his archbifhopric. At Alcala he built the magnificent college of St. Ildefonfo, endowed with forty-fix profefforfhips, and conducted under excellent regulations. Here he printed the Complutenfian Polyglott, (fee POLYGLOTT,) the Mozarabic liturgy, and the theological works of Toftatus. Here he alfo eftablifhed a fplendid monaftery for the education of indigent females of quality, which ferved as a model for that of St. Cyr, under Lewis IV. The granaries which he constructed remained without decay for centuries; and upon the whole he was juftified in declaring on his death-bed, that to the beft of his knowledge he had not mifapplied a crown of his revenue. Robinfon's Charles V. vol. ii.

XIMENES, in *Geography*, a town of Spain, in the province of Leon; 10 miles S. of Aftorga.

XIMENESIA, in *Botany*, Cavan. Ic. v. 2. 60. Ait. Hort. Kew. v. 5. 85, a genus which can by no means be feparated from PALLASIA. (See that article, n. 3.) Nothing can be more trifling as a generic, or even fpecific diftinction, than the difference between the fyngenefious orders of *Polygamia-fuperflua*, and *P. fruftranea*, of the Linnæan fyftem, provided the form of the *florets* be alike. The *piftil*, of which rudiments are found in feveral genera of the latter, may occafionally become perfect, as it does now and then in *Helianthus*, and this overfets the diftinction.

XIMENIA, owes its name to Plumier, who confecrates this genus to the memory of the Rev. Father Francis Ximenes, a Spanifh monk, one of the twelve Francifcan friars who firft preached Chriftianity to the Mexicans. Being well fkilled in the language of the country, he collected a great ftore of information concerning the properties and medical ufes of the plants and animals of New Spain, and efpecially of Mexico; whence he compofed a work, printed in four books, at Mexico, in 1615, which is quoted with approbation by De Laet, in many parts of his own publication. It is fome confolation to find any of thefe apoftles turning their minds to the ftudy of their Maker's works; as we cannot fuppofe fuch to have been contaminated with that infernal fpirit, which renders the whole hiftory of the Spaniards in America a foul reproach to humanity, and to Chriftianity itfelf, fo proftituted or fo mifunderftood!—Plum. Nov. Gen. 6. t. 21. Linn. Gen. 190. Schreb. 255. Willd. Sp. Pl. v. 2. 338. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 352. Juff. 259. Lamarck Illuftr. t. 297. Poiret in Lam. Dict. v. 8. 804.—Clafs and order, *Octandria Monogynia*. Nat. Ord. *Aurantia*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, very fmall, in four pointed, permanent fegments. *Cor.* Petals four, oblong; hairy internally; their lower half erect, forming a tube; their upper part revolute. *Stam.* Filaments eight, erect, fhort; anthers erect, longer than the filaments. *Pift.* Germen fuperior, oblong; ftyle thread-fhaped, the length of the ftamens; ftigma obtufe. *Peric.* Drupa nearly ovate. *Seed.* Nut folitary, roundifh.

Eff. Ch. Calyx four-cleft. Petals four; hairy internally; revolute at the upper part. Drupa fuperior. Nut folitary.

Obf. Plumier's figure reprefents but three *petals*. Linnæus has left a note, that his correfpondent Allamand found but feven *ftamens*. Swartz and Jacquin defcribe eight.

1. X. *americana*. Thorny Ximenia. Linn. Sp. Pl. 497. Hort. Cliff. 483. Willd. n. 1. Ait. n. 1. Swartz Obf. 149. (X. multiflora; Jacq. Amer. 106. t. 177. f. 31. X. aculeata, flore villofo, fructu luteo; Plum. Ic. 260. t. 261. f. 1. Heymaffoli fpinofa; Aubl. Guian. 324. t. 125? and H. inermis; *ibid.* 325?)—Branches fpinous. Leaves oblong. Stalks many-flowered.—Native of the neighbourhood of Carthagena, as well as of Hifpaniola, flowering in September and October, and ripening fruit in December. *Jacquin.* Of the rocky fhores of Hifpaniola, flowering in July. *Swartz.* We believe Linnæus never faw any fpecimen of this, except in Cliffort's herbarium. That before us was given to the younger Linnæus by fir Jofeph Banks. Though Miller might have the plant at Chelfea in 1759, it would now probably be vainly fought for in any collection. The *ftem* is either fhrubby or arboreous. Young *branches* fpinous, round, ftriated. *Leaves* two or three together, in alternate tufts, from buds of many years' duration, ftalked, elliptic-oblong, obtufe with a minute point, rarely emarginate, entire, fingle-ribbed, fmooth on both fides, about two inches long. *Footftalks* quarter of an inch

inch long, smooth. *Thorns* lateral, erect, longer than the footstalks, awl-shaped, stout, but sparingly produced. *Flower-stalks* axillary, or rather from the same bud as the leaves, not half their length, deflexed, round, divided into from three to five smooth, single-flowered partial stalks. *Calyx* spreading quadrangular. *Petals* four, whitish, shaggy from the base almost to the apex, on the inside; smooth externally. *Fruit* the size of a small apple, yellow when ripe. Jacquin says the pulp is sweetish, eaten by children and negroes, and that the smell of the *flowers* is extremely sweet, as well as powerful, something like burnt frankincense. Aublet compares them to cloves. His figure, if it belongs to the same plant as our's, is very faulty; but we rather presume it must be a species nearly akin, whose *flowers* are really axillary, and, like the *fruit*, only one-third the size of the Linnæan plant; their *petals* finely downy, not shaggy, all over their inner surface. Still, without seeing a specimen, we dare not describe it as distinct.

2. X. *elliptica*. Elliptical Ximenia. Forst. Prodr. 27. Willd. n. 2.—"Thorns none. Leaves elliptic-lanceolate. Stalks many-flowered."—Found by Forster in New Caledonia. This is known only by the above characters, which are not so discriminative as could be wished, the *thorns* being variable in the original species, and in the plant of Aublet.

3. X. *inermis*. Jamaica Ximenia. Linn. Sp. Pl. 497. Willd. n. 3. (Amyris? arborescens, foliis ovatis glabris, vetustioribus confectis; petiolis submarginatis; floribus solitariis; Browne Jam. 209.)—"Thorns none. Leaves ovate. Stalks single-flowered." — Native of Jamaica. Browne describes it as a bushy *tree*, not above eight or nine feet high; its *trunk* about four and a half inches in diameter. *Leaves* oval, not above an inch long, standing very thick upon the smaller branches. *Petals* hairy on the inside towards the base. *Drupa* ovate-oblong.

M. Poiret describes, in Lamarck's Dictionary, a plant by the name of *X. ferox*, n. 3, which we can scarcely refer to this genus; the *flowers* being five-cleft; *petals* linear, smooth on both sides; and *stamens* prominent. This is a spinous *shrub*, found in Hispaniola, with nearly orbicular, coriaceous *leaves*, above an inch long, and either solitary or umbellate axillary *flowers*. The *thorns* are three or four inches long, very sharp, sometimes leafy.

Jussieu speaks of a *X. ægyptiaca*, as described in the *Species Plantarum* of Linnæus, though omitted subsequently in his *Systema*. We are unable to discover this, and Jussieu, like Caspar Bauhin, unhappily omits to cite pages. We do, however, find in Linnæus's copy of Plumier's *Genera Plantarum*, which once belonged to the French botanist Isnard, a note of the latter under *Ximenia*, that "the *Agihalid* of Alpinus, *Pl. Ægypt.* 38, appears to belong to this genus." The rude wooden cut does indeed countenance such an opinion, especially the *flowers;* but the author compares the *fruit* to that of *Sambucus Ebulus*, describing it moreover as bitterish and astringent. Now *Sambucus* has nothing in common with *Ximenia*. The plant of Alpinus, which was brought from Ethiopia, may be a thorny *Lycium*, but we cannot refer it to any known species.

XIMO, or Kiusiu, in *Geography*, an island of Japan, and second in size and eminence, situated to the S.W. of Niphon, from which it is divided by a narrow channel. Its circumference is supposed to be upwards of 300 miles, exclusive of the bays and creeks. It has considerable numbers of cities and towns, with some good harbours. N. lat. 32° 40′ to 34°. E. long. 130° 50′ to 133° 30′.

XIMONOSEQUI, a sea-port town of Japan, on the S.W. coast of Niphon, with a good harbour, capable of containing 300 vessels. It is a place of trade, and surrounded with walls. N. lat. 33° 56′. E. long. 132° 20′.

XINGU, a river of South America, which rises somewhere near S. lat. 17°, and is first called "Paranatinga;" it afterwards takes a northerly course of about 900 miles, and runs into the Amazons river, 20 miles E. of Paru, in the government of Para.

XIPHIAS, Ξιφιας, the name of the *sword-fish;* which see. This fish is cut in pieces by the Sicilians, and salted. The process was anciently performed particularly at the town of Thurii, in the bay of Tarentum, and hence the fish was called "Tomus Thurianus." (Plin. l. 32. c. 11.) Besides the Xiphias Gladius, described under the article Sword-*Fish*, Dr. Shaw has enumerated some other species, such as the following:—

Platypterus, or sword-fish with extremely broad back-fin, and very long sharp-pointed thoracic appendages; the *Guebecu* of Marcgrave, and *Scomber gladius* of Black. This species, in the appearance of the long and sharp-pointed process of the upper jaw, is nearly allied to the common sword-fish, but in other respects materially differs from it. It is found twenty feet in length, and sometimes much longer. Its general colour is a silvery blueish-white, except on the back, head, tail, and fins, which in the living animal are of a deep blue. The strength of this fish is such, that it pierced the bottom of an East Indian ship with such force as completely to imbed its snout almost to its base; and if it had not been killed by the violence of the effort, but had been able to withdraw its snout, the ship must have been leaky, and thus have foundered. This power of transfixing vessels is mentioned by Pliny. This fish is found not only in the Brasilian and East Indian seas, but also in the Northern ocean; and it is said to be a great enemy to whales, with which it has frequent combats. Dr. Black says, that when this species does not exceed four feet in length, it is considered as an eatable fish; but when it exceeds that length, it is too coarse.

Makaira, the blackish sword-fish with snout of middling length, and two bony tubercles on each side of the tail. This is a species lately discovered, and described by Cepede under the title of "Makaira." This fish was cast on the isle of Rhé, near Rochelle in France. Its length was 330 French centimetres, and its weight 365 kilogrammes; its colour was blackish. It was eaten by many of the inhabitants of Rochelle, and found to be tolerable food, though somewhat dry; the flesh was white. The "round-snouted sword-fish" is also described by Cepede, from the sword or snout preserved, with the fore-part of the head, in the Paris Museum. Shaw's Zoology, vol. iv. part i.

Xiphias is also used to express a fiery meteor, in form of a sword. See Acontias.

Xiphias, in *Astronomy*. See Dorado.

XIPHIDIUM, in *Botany*, from ξιφος, *a sword*, alluding to the sword-shaped leaves. The name occurs in Pliny, and was adopted by Loefling for the present genus, which Linnæus, in publishing Loefling's papers, sunk in Ixia (see that article); but subsequent writers have restored it, the *germen* being superior, and the *corolla* of six separate *petals*. —Schreb. Gen. 37. Willd. Sp. Pl. v. 1. 248. Vahl Enum. v. 2. 162. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 107. Aubl. Guian. 33. Swartz Ind. Occ. 79. t. 2. Juss. 59. Lamarck Illustr. t. 36.—Class and order, *Triandria Monogynia*. Nat. Ord. *Ensatæ*, Linn. *Iridibus affine*, Juss. *Hæmodoraceæ*, Brown?

Gen. Ch. *Cal.* none. *Cor.* inferior, of six petals, regular, permanent; the three outer ones largest. *Stam.*

Filaments

Filaments three, linear, oppofite to the three inner petals; anthers ovate. *Pift.* Germen fuperior, globofe; ftyle thread-fhaped; ftigma fimple. *Peric.* Capfule at firft flefhy, then dry, roundifh, with three furrows, and three cells. *Seeds* numerous, roundifh, pointed, inferted into a flefhy, central, nearly globular, receptacle.

Eff. Ch. Corolla regular, of fix petals. Capfule fuperior, of three cells, with many feeds.

Obf. The regularity of the *flower* readily diftinguifhes this genus from Wachendorfia. See that article.

1. X. *floribundum.* Many-flowered Xiphidium. Swartz Prodr. 17. Ind. Occ. 80. Vahl n. 1. (X. albidum; Lamarck Illuftr. v. 1. 131. X. album; Willd. n. 1. Ixia; Linn. in Loefl. It. 179.)

β. X. cæruleum; Aubl. Guian. 33. t. 11. Willd. n. 2. Ait. n. 1.—Native of South America, as well as of Tobago and St. Kitt's. Mr. Maffon is recorded by Dr. Swartz as having gathered the white-flowered kind, α, at the foot of fome hills, near Sandy Point, in the laft-mentioned ifland: β was found in Guiana, by Aublet. We have a fpecimen of the latter from Miller's herbarium, gathered in fome part of South America. The *root* is perennial, fomewhat creeping, jointed. *Stem* a foot or more in height, round, fimple, as thick as the little finger; leafy in the lower part; more or lefs minutely hairy. *Leaves* numerous, alternate, feffile, fomewhat fheathing, fword-fhaped, pointed, entire, or minutely ferrated, ftriated with numerous longitudinal ribs. *Clufter* compound, terminal, erect, of many fpreading, fimply racemofe, branches, more or lefs hairy, with a very minute *bractea* under each partial flower-ftalk. *Flowers* not half an inch in diameter. Three outer *petals* green, and often downy at the back; white or blue in front, as the three inner ones are on both fides.

Swartz and Vahl have united the two fuppofed fpecies of other authors. The latter afferts the blue-flowered variety to be fometimes entirely fmooth in its *leaves* as well as *flowers*.

XIPHILINUS, John, in *Biography*, was born at Trebizond, in the 11th century, and having paffed the earlier period of his life in a monaftery on mount Olympus, was advanced to the patriarchate of Conftantinople, which office he held till his death in 1075. Befides a fermon printed in the Bibliotheca Patrum, he is reputed by fome to be the author of an "Abridgment of the Hiftory of Dion Caffius," in Greek, written faithfully, which was printed at Paris in 1592, fol.

XIPHION, or Xiphium, in *Botany*, ξιφιον of Diofcorides, fo called from the fword-fhaped leaves, appears evidently, by the account of that ancient writer, to be *Gladiolus communis*, Linn. Sp. Pl. 52, our Common Cornflag. *Xiphium* neverthelefs is retained by Linnæus as the fpecific name of a common, but very elegant and fragrant bulbous *Iris*, with blue and yellow flowers. To this it feems he was led by Tournefort, who applies the name of *Xiphion* to the whole tribe of bulbous-rooted fpecies of *Iris*, of which he makes a feparate genus, characterized by the root. This is rather unfortunate, as the Linnæan *Iris Xiphium* has rather awl-fhaped than fword-like *leaves*.

XIPHOIDES, Ξιφοειδες, in *Anatomy*, a cartilage placed at the bottom of the *fternum*, called alfo *enfiformis*.

It is about an inch long, and fhaped like the point of a fword. Whence its appellation, from ξιφος, *fword*, and ειδος, *figure*.

XIPHONIÆ Promontorium, in *Ancient Geography*, a promontory of Sicily, near port Xiphonius.

XIPHOS, Ξιφος, among the Athenians, a capital punifhment, by beheading with the fword.

XIPIXAPA, in *Geography*, a town of South America, in the audience of Quito; 80 miles N.W. of Guayaquil.

XIQUACAN, a town of Mexico, in the province of Mechoacan; 50 miles S.E. of Zacatula. N. lat. 18° 4'. W. long. 102° 34'.

XIQUENA, a town of Spain, in the province of Murcia; 15 miles W.N.W. of Lorca.

XIQUITO, a town of Japan, in the ifland of Ximo; 16 miles S. of Naka. N. lat. 32° 20'. E. long. 133° 13'.

XIR, a word ufed by the chemifts to exprefs mercury.

XISINUM, a word ufed by fome of the chemical writers to exprefs vinegar.

XIVERT, in *Geography*, a town of Spain, in Valencia; 7 miles N.W. of Segorbe.

XIVRY le Franc, a town of France, in the department of the Mofelle; 9 miles S. of Longwy.

XIXONA, a town of Spain, in Valencia. In the neighbourhood of this town a great number of perfons are employed annually to collect the drug called Kermes, and a fmall diftrict, called *de la Grana*, produces fome years to the value of 30,000 dollars; 13 miles N. of Alicant. N. lat. 38° 32'. W. long. 0° 42'.

XIZABRAS, mountains of South America, in the province of Venezuela.

XOANA, in *Ancient Geography*, a town of India, on this fide of the Ganges.

XOCHIOCOTZO, in *Botany*, a name ufed by fome authors for the tree which produces the liquid amber, and is called the fweet gum by the inhabitants of the Weft Indies.

XOCHITENACATL, in *Ornithology*, a name given by fome to the toucan, or American great-beaked magpye.

Xochitenacatl *Alia*, the name of a bird defcribed by Nieremberg, of the nature of the toucan, or Brafilian magpye.

It is of the fize of a pigeon; its beak is large and thick, and is black and pointed; its wings and tail are variegated with black and white; it has a large black mark reaching from its back to the breaft; the anterior part of the wings is yellow, the reft of its body of a pale colour, and the legs and feet brown. It always is found among the fweet-flowering trees, and is not uncommon in many parts of South America. Ray.

XOCOTLAN, or Xocutlan, in *Geography*, a town of Mexico, in the province of Xalifco; 15 miles S.W. of Purification.

XOCOXOCHITL, the Indian name of the cloveberry-tree, or the *caffia caryophyllata*, the bark of which is ufed in medicine.

XODRACE, in *Ancient Geography*, a town of India, on this fide of the Ganges. Ptolemy.

XOES, an ifland of the Mediterranean, on the coaft of Egypt, near the mouth of the Nile, called "Xebenniticum;" and alfo a town of the fame name. Steph. Byz.

XOIS, a town of Egypt, in the Nome, denominated Xoites Nomos. Ptolemy.

XOLA, in *Geography*. See Sooloo.

XOLO. See Gilolo.

XOMOTL, in *Ornithology*, the name of an American bird, of which the Indians are very fond, making a part of their garments of its feathers.

Nieremberg has given a fhort account of it. It is a webfooted fowl; its back and the upper part of its wings are black, and its breaft is brown. When it is angry, it raifes up the feathers of its head in form of a creft. Ray.

XORULLO,

XORULLO, or JORULLO, *Volcano of*, in *Geography*, a basaltic cone of New Spain, which appeared above ground on the 15th of September 1759, and which is at this day 249 fathoms or 1494 feet above the furrounding plain. It is fituated in the province of Mechoacan, at the diftance of eight leagues from Pafquaro the capital, towards the S.W.; the volcano of Colima being in the fame direction, but at a greater diftance. A delicious and fertile vale, eight leagues in length from N. to S., and three in breadth, was called Xorullo by the Indians, a word in their language fignifying *paradife;* but upon the eruption of the volcano, this valley affumed an infernal afpect, blackened with perpetual fmoke, covered with deformed rocks and afhes, the trees confumed, the earth full of deep breaks and openings, and now forming a hill of confiderable height, crowned with a volcano. A rivulet which fertilized the valley is now fo hot as to burn men and animals who attempt to pafs it, which is peculiarly inconvenient, as it is in the direct road to the copper-mines in this quarter. Before this cataftrophe, there were conftantly heard horrible fubterraneous noifes, and earthquakes were felt, which excited confternation in the inhabitants.

XOXOUHQUITICPATLI, an American name of a ftone of the jafper kind, and of a beautiful green, but ufually pale, and fometimes with a mixture of grey, and variegated in feveral places with fpots of a deeper green.

It is found among the feveral kinds of *lapis nephriticus*, with which that country abounds, and moft of which the Indians celebrate for their virtues againft difeafes; they are not, however, acquainted with any medicinal virtues of this fpecies.

XV. VIR, *Quindecimvir*. See QUINDECIMVIR.

Authors, and efpecially antiquaries, make ufe of fuch abbreviations, which they borrow from medals, and other monuments of antiquity, where thofe names are fo expreffed.

XUAREZIA, in *Botany*, according to De Theis, is a genus dedicated, in the *Flora Peruviana*, p. 20, to Gafpar Xuarez, a Spanifh botanift, who has devoted himfelf to the ftudy of the plants of Italy.

XUCAHA, or XUCAAHI, the name of a plant much famed for its virtues among the ancient Arabians, but unknown at this time.

XUCAR, in *Geography*, a river of Spain, which rifes in New Caftile, and runs into the Mediterranean, 20 miles S. of Valencia.

XUCHES, or ZUCHIS, in *Ancient Geography*, a town of Africa, in Libya. Steph. Byz.

XULI, in *Geography*, a town of Peru, in the diocefe of La Paz, near the weft coaft of lake Titicaca, chiefly inhabited by Indians, and governed by Indian magiftrates; 100 miles N.N.W. of La Paz. S. lat. 16° 25′. W. long. 70° 6′.

XULI, a fmall ifland in the Pacific ocean, near the coaft of Peru. S. lat. 16° 50′.

XULLA, or XULLOE, an ifland in the Eaft Indian fea, about 42 miles long, and from 10 to 15 broad. The Englifh fome years fince formed a fettlement in this ifland, but from the badnefs of the foil, and fome other circumftances, they were induced to abandon it, and remove to Balambangan, on the coaft of Borneo. S. lat. 1° 53′. E. long. 125°.

XULLABELLA, an ifland in the Eaft Indian fea, about 25 miles long, and 6 broad. S. lat. 2° 15′. E. long. 126° 12′.

XULLAMANGOLA, an ifland in the Eaft Indian fea, about 30 miles long, and 10 broad. S. lat. 1° 54′. E. long. 125° 42′.

XUN, a city of China, of the fecond rank, in Se-tchuen; 150 miles S.W. of Pao-king. N. lat. 30° 18′. E. long. 103° 20′.

XUNDALE, a town of South America, in the province of Popayan; 8 miles S.W. of Sante Fe de Antioquia.

XUQUI. See JUGUI.

XUTHIA, in *Ancient Geography*, a country of Sicily. Diod. Sic. It is reprefented as a town by Steph. Byz.

XUXUY, in *Geography*, a town of La Plata, which chiefly trades in cattle, fold to the miners of Potofi, and brought in confiderable number to the great fair of Salta; but now in a declining ftate. See JUJUY.

XYLAGIUM, a name given by fome authors to the lignum fanctum, or guaiacum.

XYLANDER, WILLIAM, in *Biography*, whofe family name was *Holtzmann*, was born in indigent circumftances at Augfburg, in 1532, and enabled by public liberality to ftudy at Tubingen and Bafil, in the latter of which places he took the degree of M.A. in 1556. In 1558 he was invited to undertake the Greek profefforfhip at Heidelberg; where, with all the difadvantages of penury, he purfued his literary labours, and acquired an amplitude of erudition, which comprehended the learned languages, hiftory, poetry, mufic, philofophy, and phyfics. The works by which he is chiefly known are Latin tranflations, (with notes,) of Dion Caffius, Plutarch, Strabo, and Cedrenus. His life was prematurely terminated in confequence of hard ftudy, in 1576, at the age of 44 years. Moreri.

XYLARIA, in *Botany*, from ξυλον, *wood*, a name given by fome cryptogamic botanifts to the firft fection of the genus SPHÆRIA in Perfoon. (See that article.) The idea appears to have been fuggefted by the old name of *Hypoxylon*, belonging to one of the fpecies. But it may alfo apply to the woody and durable texture of that and fome others of the fame fection.

XYLENOPOLIS, the *Town of the Woods*, in *Ancient Geography*, a town of India, at one of the mouths of the river Indus, according to Pliny, who reports that it was built by Alexander. M. D'Anville thinks that this town is the fame with Hyala. It fubfifted in the time of Pliny.

XYLINA, IXIL, a town of Afia, in the Colchide, and country of the Lazii. It was fituated on the right bank of the Acinafis, near its mouth in the Euxine fea, north of Chordyla.

XYLINE, a town of Cappadocia, in Cappadocian Pontus. Ptol.

XYLINES, a people of Africa, in Libya interior, E. of the Agangines, from the foot of mount Arvalle, as far as mount Arangas. Ptol.

XYLO-ALOE, compounded of ξυλον, *wood*, αλον, *aloes*, in *Medicine*, the lignum aloes; called alfo *agallochum*. See ALOE, and CALAMBAC.

XYLO-BALSAMUM, ξυλοβαλσαμον, compounded of ξυλον, *wood*, and βαλσαμον, *balfam*, a name which naturalifts, &c. give to the wood of the tree, which yields that precious gum known to the Latins by the name of *opobalfamum*, and, among us, by the name of *balfam*, or *balm of Gilead*.

We have branches of this tree brought from Cairo. They are very ftraight, brittle, unequal, and full of knots; their bark is reddifh without, and greenifh within. The wood is whitifh, and full of pith; and, when broken,

broken, yields an agreeable ſmell, reſembling that of the balſam.

The *xylo-balſamum* is reputed good to ſtrengthen the brain and ſtomach, and to expel poiſon.

XYLOCARACTA, or XYLOCRACTE, in the *Materia Medica*, a name by which ſome authors have called the carob, or ſiliqua dulcis, the ſweet pipe-tree.

This was called by ſome of the Greek writers *xyloceraton*, the tree bearing pods, and from a corruption of this name the other has been formed.

XYLOCARPASUM, in *Natural Hiſtory*, a name given by ſome authors to a poiſonous kind of wood.

It was the wood of that tree whoſe gum was called *carpaſum* and *opocarpaſum*.

XYLOCARPUS, in *Botany*, from ξυλον, *wood*, and καρπος, *fruit*, alluding to the woody texture of the ſeed-veſſel.—"Koenig in Naturf. v. 20. 2." Schreb. Gen. 253. Willd. Sp. Pl. v. 2. 329. Mart. Mill. Dict. v. 4. Poiret in Lamarck Dict. v. 8. 806.—Claſs and order, *Octandria Monogynia*. Nat. Ord. *Tribilatæ*, Linn. *Meliæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, club-ſhaped, coriaceous, ſomewhat coloured, with four roundiſh teeth. *Cor.* Petals four, ovate-oblong, rather coriaceous, widely ſpreading, twice the length of the calyx. Nectary erect, ovate, inflated, ſomewhat fleſhy, with eight marginal ſegments. *Stam.* Filaments no other than the eight ſegments of the nectary, linear, obtuſe, emarginate, ſhorter than the petals; anthers eight, attached to the inner ſide of the filaments, and of the ſame length, linear-oblong, abrupt. *Piſt.* Germen ſuperior, ovate, ſmooth, ſlightly rugged at the baſe; ſtyle very ſhort and thick; ſtigma abrupt, broad, bordered, its margin furrowed, its diſk furrowed croſſwiſe, and perforated. *Peric.* Drupa large, globoſe, dry, with a thick coat; externally ſmooth, marked with four or five furrows; internally woody and fibrous. *Seeds.* Nuts eight, ten, or more, angular, unequal, irregular; their outer ſkin ſoft, and rather ſilky; inner woody and fibrous; kernel in ſome degree woody, brittle, with a prominent embryo.

Eſſ. Ch. Calyx oblong, with four teeth. Petals four. Nectary inflated, with eight teeth bearing the anthers. Drupa ſuperior, dry, woody, with four or five furrows. Nuts numerous, angular, irregular.

1. X. *Granatum.* Indian Wooden-pomegranate. Koenig as above. Willd. n. 1. (Granatum littoreum; Rumph. Amboyn. v. 3. 92. t. 61. *Cadul gaha* of the natives of Ceylon. *Candalanga* in the Tamul language.)—Native of muddy thickets on the ſea-ſhores of Amboyna, Ceylon, and other parts of the Eaſt Indies, among *Rhizophora* trees, flowering in November, and bearing fruit in January and February. A *tree* varying greatly in ſize, ſometimes little more than a ſhrub; its wood elegantly veined, but ſo twiſted and knotty, that no large handſome pieces can be procured. The *trunk* is erect, with a hard, deeply cracked bark; the *head* denſe, roundiſh, or oblong. Larger *branches* ſcattered; ſmaller generally oppoſite, numerous, clothed with a greyiſh bark. *Leaves* oppoſite, ſtalked, ſpreading, oblong, obovate, or elliptical, acute, entire, rather larger than thoſe of an apple-tree; dark-green, ſmooth and ſhining on the upper ſide; veiny beneath, with a prominent midrib. *Footſtalks* ſhort, roundiſh, ſpreading, a little curved, rugged, of a cheſnut-brown. *Cluſters* ſcattered or axillary, ſtalked, rather ſpreading, ſhorter than the leaves; their ſubdiviſions oppoſite, or three-forked, with round, ſmooth, red, tough, naked ſtalks; the ultimate ones ſhorter than the *flowers*, which are ſmall, yellowiſh, or dirty white. Their *nectary* ſomewhat reſembles a Lily of the Valley, but theſe flowers have no ſmell. The *fruit* is larger than a pomegranate, ſometimes the ſize of a child's head of three years old, and contains from eight or ten to twenty angular unequal nuts, bigger than cheſnuts, which do not appear to be uſed as food. There is a very remarkable diſproportion between the magnitude of the *flowers* and *fruit*. Rumphius, from whom, as well as from Koenig, we take our deſcription, hints that the *flowers* are perhaps dioecious. It is certain that moſt of thoſe, ſo numerous in each cluſter, muſt be abortive, or there would not be room to perfect the *fruit*.

XYLOCASIA. See CASSIA.

XYLOCOCCUM, in the *Materia Medica*, a name given by ſome of the later Greek writers to the carob-tree, or ſiliqua dulcis.

XYLOCOLLA, a word uſed by ſome of the ancient writers to expreſs what was more uſually called *taurocolla*, glue made of the ears and genitals of a bull.

XYLOCOPIA, Ξυλοκοπια, among the Greeks, a puniſhment with a cudgel. See FUSTIGATION.

XYLODON, in *Botany*, from ξυλον, *wood*, and οδον, *a tooth*, an appellation given by Perſoon to the third ſection of his genus SISTOTREMA, Syn. Fung. 550. (See that article.) The *lamellæ* of that genus, (which is intermediate, as he juſtly ſays, between *Boletus* and *Hydnum*, though, in our opinion, moſt akin to the latter,) are of a firm, woody, and durable nature, and divided into many compreſſed irregular teeth.

XYLOGLYCON, a name given to the carob, or ſiliqua dulcis, by ſome of the old Greek writers.

The word expreſſes a ſweet or ſweet-fruited tree.

XYLOIDES, or HYLOIDES, a term uſed by many of the ancient writers to diſtinguiſh thoſe plants which had woody ſtalks, though they never grew up to any conſiderable ſize; ſuch as the garden-thyme, marjoram, and the like.

XYLOMA, ſo called from the firm or woody ſubſtance of the whole fungus, and the jagged or radiating margin of one of the moſt common ſpecies, *X. acerinum;* the word being apparently compoſed of ξυλον, *wood*, and λωμα, *a fringe*, or *border*.—Perſ. Syn. Fung. 103. Obſ. Mycol. v. 2. 100. —Claſs and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi Angiocarpi*.

Eſſ. Ch. Flat, nearly orbicular. Receptacle various, hard, ſomewhat fleſhy internally; either remaining cloſed, or burſting unequally.

Sect. 1. *Compound. Several receptacles combined. Rather large.*

1. X. *ſalicinum.* Sallow-leaf Xyloma. Perſ. n. 1. "Diſp. Meth. 5. t. 2. f. 4."—Thick, tuberculated; internally cartilaginous, and white at the baſe.—Frequent on the leaves of *Salix caprea*. This, according to Perſoon, is generally cloſed, but he has found it in the ſpring, as delineated in the work quoted, breaking, in the upper part, into ſeveral portions, like the ſhell of a tortoiſe, from whoſe interſtices the fine powdery *ſeeds* flew off like ſmoke. The breadth of the whole fungus is about half an inch; its colour black.

2. X. *andromedæ.* Marſh-roſemary Xyloma. Perſ. n. 2. —"Oblong, thickiſh, with rib-like elevations, poliſhed."—Found in ſummer on the leaves of *Andromeda polifolia*, which hence appear as if pitch had been dropped upon them. Sometimes each fungus is as long as the whole leaf; ſometimes only half as long. Its thickneſs is conſiderable with regard to the ſize. The lower *ſtratum* is white and firm, as in the foregoing.

3. X. *acerinum.* Maple Xyloma. Perſ. n. 3. (Sphæria maculiformis; Ehrh. Crypt. n. 219. Beitr. v. 7. 101.)—Dilated, ſomewhat orbicular, thin, flat, black, ſlightly corrugated towards the centre.—Frequent on the leaves of

Acer

Acer platanoides, and *A. campeſtre*, in the autumn. It conſiſts of numerous, black, opaque, inſeparable patches, ſcattered over the upper ſide of the leaf, each about a quarter or one-third of an inch in diameter; the margin ſometimes variouſly and elegantly notched, or fringed, and always circumſcribed by a very ſtriking yellow, or tawny, diſcoloration of the leaf. Perſoon ſays he has obſerved the ſurface of this ſpecies, though uſually almoſt even and uniform, cracking into waved bordered fiſſures. We can ſee ſomething of this in a ſpecimen from profeſſor Schrader.

4. X. *punctatum*. Sycamore Xyloma. Perſ. n. 4. Obſ. Mycol. v. 2. 100. — Dilated, thin, imperfectly orbicular, ſomewhat convex, black. Receptacles unequal, aggregate, parallel, oblong, blunt, ſuperficial.—Frequent on the fading or fallen leaves of *Acer Pſeudoplatanus*, which are rarely without this paraſite in autumn and winter. The patches are from half an inch to an inch wide, cloſely united with the leaf, ſlightly convex above, and rather concave at the under ſide, which is ſomewhat blackened by them, eſpecially at the circumference of each. The wrinkles, or *receptacles*, are ſhaped like the clefts of an OPEGRAPHA (ſee that article); but much more ſhallow, as well as more uniform in colour.

5. X. *ſtellare*. Starry Xyloma. Perſ. n. 5. Obſ. Mycol. v. 2. 100.—" Thin, pitchy; the margin fringed with radiating fibres."—Found by Perſoon, on the leaves of *Phyteuma ſpicatum*, though rarely. About half an inch broad, more or leſs, of a handſome appearance, with an uniform ſmooth diſk, very black; the marginal fringe either black, or greyiſh. No diſtinct *receptacles* have yet been noticed.

6. X.? *rubrum*. Red Xyloma. Perſ. n. 6. Obſ. Mycol. v. 2. 101.—" Aggregate, orbicular, ſomewhat confluent, red."—Generally found in autumn on the leaves of *Prunus domeſtica*, rarely on *P. ſpinoſa*. At firſt ſight the red colour of this ſpecies, all the others being black, cauſes it to be taken for an *Œcidium*, or *Uredo*; but on examination the internal ſubſtance proves to be ſolid, uniform, ſcarcely containing diſtinct *receptacles*, or *ſeed-veſſels*; its genus, however, is reckoned by Mr. Perſoon as very doubtful. The patches are each from two to four lines broad, rather thick, with darker-coloured ſuperficial dots, viſible only with a microſcope. *Perſoon.*

Sect. 2. *Simple. Receptacles ſolitary, ſcattered; generally rounded, like a Peziza: or dot-like. Smaller.*

7. X. *pezizoides*. Cup-like Xyloma. Perſ. n. 7. (Peziza comitialis; Sowerb. Fung. t. 118. P. viridis; Bolt. Fung. t. 109. f. 1.)—Rather crowded, orbicular, black; opening at length, with an upright, ſomewhat crenate, border, and a pale olive or greeniſh diſk.—Found on fallen leaves of oak in December; more rarely, and in leſs perfection, on thoſe of beech. The ſpecimens are pretty uniform in ſize, larger than muſtard-ſeed, cloſely attached to the ſurface of the leaf; the border of each ſometimes pale, ſometimes black, unleſs Sowerby and Bolton deſcribe two different ſpecies.

8. X. *ſphærioides*. Dot-like Xyloma. Perſ. n. 8.—" Scattered, dot-like, ſoftiſh, with an open diſk, and a collapſed inflexed border."—On the leaves of *Salix caprea*. This at a diſtance reſembles *Sphæria punctiformis*; but under a magnifier it looks like ſome *Peziza*, with a criſped margin. The outſide is black; the diſk, rarely all diſplayed, is paler.

9. X. *hyſterioides*. Oblong Xyloma. Perſ. n. 9. " Ic. et Deſcr. Fung. t. 10. f. 3, 4."—" Elliptical, ſhining, ranged nearly parallel."—On the fallen leaves of Hawthorn, in the ſpring. Each plant is one-third of a line long, ovate, or elliptical, of a ſhining black; ſolid within. A longitudinal line ſeems to mark the place where it finally burſts.

10. X. *ſalignum*. Willow Xyloma. Perſ. n. 10. (" Sphæria ſaligna; Ehrh. Crypt. n. 299.")—" Aggregate and rather crowded, orbicular, thin, with a ſomewhat convex diſk."—On the leaves of *Salix caprea*, occupying nearly their whole ſurface. Each individual is from one-third to one-half a line broad.

11. X. *populinum*. Aſpen Xyloma. Perſ. n. 11.—" Aggregate, flattened, variouſly ſhaped, ſmooth, opaque, black." —Found on the old leaves of *Populus tremula*, in the ſpring. About a line broad; the diſk here and there greyiſh.

12. X. *concentricum*. Concentric Xyloma. Perſ. n. 12. Obſ. Mycol. v. 2. 101.—" Simple. Receptacles ſmall, orbicular, depreſſed, ſomewhat conical, concentrical, of a ſooty grey."—On half-decayed leaves of *Populus tremula*, forming circular patches, near an inch broad. *Receptacles* like ſmall ſcattered dots, at firſt black, afterwards ſooty or greyiſh, burſting finally at the ſummit.

13. X. *fagineum*. Beech Xyloma. Perſ. n. 13. " Diſp. Meth. Fung. 52."—" Minute, crowded, of a ſhining black, orbicular, plaited, a little depreſſed."—Found on the under ſide of fallen and dried leaves of Beech, in the form of crowded black dots.

14. X. *alneum*. Alder Xyloma. Perſ. n. 14.—" Minute, ſcattered, roundiſh, plaited." — This ſpecies is met with in ſummer, upon Alder-leaves, while they are ſtill green. It conſiſts of a few black diſtant dots.

Theſe minute productions are neceſſarily very obſcure in their characters and economy. The preſent genus is marked by its internal ſolidity, of a corky or woody ſubſtance, having nothing of a gelatinous nature, nor are there any diſtinct round capſular receptacles, as in SPHÆRIA. See that article.

XYLOMELUM, ſo called by the writer of this, from ξυλον, *wood*, and μηλον, *an apple*, in alluſion to the hardneſs and form of the fruit, which procured it, when firſt diſcovered, the appellation of the wooden pear.—Sm. Tr. of Linn. Soc. v. 4. 214. Mart. Mill. Dict. v. 4. Brown Prodr. Nov. Holl. v. 1. 387. Tr. of Linn. Soc. v. 10. 189. Ait. Hort. Kew. v. 1. 212.—Claſs and order, *Tetrandria Monogynia*. Nat. Ord. *Proteaceæ*, Juſſ. Brown.

Gen. Ch. *Cal.* none. *Cor.* Petals four, regular, equal, linear; externally hairy; a little dilated and concave at the tip; revolute ſoon after expanſion. Nectary four glands at the baſe of the germen. *Stam.* Filaments four, very ſhort, inſerted rather above the middle of each petal, and becoming prominent by its recurvation; anthers linear, inflexed, of two lateral parallel lobes, with a membranous edge; imperfect in ſome of the flowers. *Piſt.* Germen ſuperior, roundiſh; ſtyle erect, rigid, the length of the petals, deciduous; ſtigma vertical, club-ſhaped, obtuſe, often ſmall and abortive. *Peric.* Follicle woody, very thick, ovate, of one excentric ſmall cell, and burſting into two divaricated half valves, at the point. *Seeds* two, roundiſh, compreſſed, each with a terminal, oblong, rather oblique, membranous wing, as long as the follicle.

Eſſ. Ch. Petals four, bearing the petals above the middle, regular, revolute. Nectariferous glands four. Stigma club-ſhaped. Style deciduous. Follicle woody, of one excentric cell, with two winged ſeeds.

1. X. *pyriforme*. Wooden-pear. Brown n. 1. (Bankſia pyriformis; Gærtn. v. 1. 220. t. 47. f. 1. Lamarck Illuſtr. v. 1. 242. t. 54. f. 4. White's Voyage 224. t. 21. Hakea pyriformis; Cavan. Ic. v. 6. 25. t. 536.)—Gathered on the eaſtern coaſt of New Holland, near Port Jackſon, by the firſt ſettlers in that colony. We received ſpecimens from Dr. White,

Dr. White, in 1789 and 1793. Mr. Brown fays it grows on ftony hilly ground. This, the only known fpecies, is a tree, with oppofite branches; downy and rufty when young. *Leaves* oppofite, ftalked, five inches long, lanceolate, acute at each end, entire, rather coriaceous, fmooth, with one rib, and many prominent reticulated veins; pale and yellowifh beneath; clothed, when they firft come out, with denfe, deciduous, rufty down: thofe of young plants, according to Mr. Brown, are toothed. *Footftalks* flattifh, an inch long, fmooth. *Stipulas* none. *Spikes* axillary, oppofite, catkin-like, cylindrical, denfe, much fhorter than the leaves, many-flowered, fhaggy with rufty down. *Flowers* feffile, hardly an inch long, in pairs, each pair accompanied with one fmall downy *bractea*; all of them abortive, except the lowermoft, fo that from fpecimens feen in fruit only, the flowers were judged to be folitary. The *fruit* is ovate, or inverfely pear-fhaped, very hard, even, downy, two or three inches in length. *Seeds* and their wings brown. Mr. Brown remarks, that the greater part of the *flowers*, having a fmall *ftigma*, and no *germen*, are neceffarily abortive. Many of the *anthers* too have, as above-mentioned, an imperfect appearance; but having never feen living flowers, we cannot tell whether this be an original defect, or merely owing to their having long ago performed their office. It is poffible that the rufty hue of the flowers and young leaves, fo rich and beautiful in our fpecimens, may partly, if not altogether, be owing to drying. This plant, though procured for Kew garden, by fir Jofeph Banks, in 1789, appears never yet to have bloffomed there.

XYLON, is fo well defcribed by Pliny, book 19. chap. 1, as to leave no doubt of its being our Cotton. (See Gossypium.) He fays it ferved to make the choiceft garments of the Egyptian priefts. Dr. J. R. Forfter, the famous botanift and circumnavigator, publifhed in 1776 a moft learned little volume, to prove Cotton the true *Byffus* of the ancients. See alfo Matth. Valgr. v. 1. 376.

Xylon, Ξυλον, among the Athenians, a punifhment inflicted, by putting the offender into the ftocks.

XYLOPHYLLA, in *Botany*, very expreffively named by Linnæus, after Rumphius, from ξυλον, *wood*, and φυλλον, *a leaf*, in allufion to the hardnefs and rigidity of its foliage, which indeed ferves the purpofe of both leaves and flower-ftalks.—Linn. Mant. 147. Schreb. Gen. 200. Willd. Sp. Pl. v. 1. 1500. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 336. Juff. 387. Poiret in Lamarck Dict. v. 8. 812. Lamarck Illuftr. t. 855. Gærtn. t. 108. (Phyllanthus; Browne Jam. 188.)—Clafs and order, *Monoecia Monadelphia*. (Pentandria Trigynia; *Browne, Linn. Schreb. Willd.*) Nat. Ord. *Tricoccæ*, Linn. *Euphorbiæ*, Juff.

Gen. Ch. Male, *Cal.* Perianth in fix deep regular fegments; the three innermoft largeft. *Cor.* Petals none, unlefs the calyx, or its inner fegments, be taken for fuch. Nectary of fix globular glands. *Stam.* Filaments united into a very fhort column; anthers three or fix, roundifh; two-lobed.

Female, on the fame plant, and in the fame fituation, as the male. *Cal.* and Nectary as in the male. *Pift.* Germen fuperior, feffile, roundifh; ftyles three, fhort, fpreading; ftigmas three-cleft. *Peric.* Capfule roundifh, with three furrows, three cells, and fix elaftic valves. *Seeds* two in each cell, roundifh.

Eff. Ch. Male, Calyx in fix deep fegments; three of them interior. Petals none. Nectary of fix globofe glands.

Female, Calyx and Nectary like the male. Styles three. Stigmas three-cleft. Capfule of three cells, with fix elaftic valves. Seeds two in each cell.

Obf. Dr. Sims, in Curt. Mag. 1021, has juftly indicated this genus as too near Phyllanthus (fee that article); where the *feeds* are erroneoufly faid to be folitary. Whether the difference between their *nectaries* be permanent, we have not feen enough to determine. At any rate, thefe two genera muft ftand next to each other, in the Linnæan artificial fyftem, as well as in every natural one.

1. X.? *longifolia*. Long-leaved Sea-fide Laurel. Linn. Mant. 221. Willd. n. 1. Swartz Obf. 112. (Xylophyllos ceramica; Rumph. Amboyn. v. 7. 19. t. 12.)—Leaves linear, alternately toothed. Flowers folitary at each tooth.—Found only on the lofty, ftony, cold mountains of the ifland of Ceram. The *trunk* is fhrubby, fcarcely fo thick as a man's arm, dividing above it into many round *branches*, as thick as the finger. Thefe end in numerous, alternate, drooping, long, linear, acute *leaves*, or perhaps winged branches, with blunt alternate teeth, ufually an inch diftant from each other. The *flowers* are folitary, nearly feffile, at each notch. Of their ftructure nothing is known; nor of the *fruit*, except what Rumphius relates, and this, as Dr. Swartz obferves, does not agree with the genus before us, Linnæus having merely adopted this remarkable plant as a *Xylophylla*, on account of its habit, which is ftriking enough. Rumphius fays, "the *calyx* refembles a fmall clove, and is red, bearing a roundifh-oblong *fruit*, refembling a Bay-berry, or the *Abrus* of Alpinus, (and Linnæus,) green, hard, with a fmall point. When opened, a fmall *nucleus* is found, refembling a grain of rice, fixed on the ftalk, and tafting fweet, like a Filberd, being enclofed in a white fkin." It is very unlikely that the kernel of any fpecies of this genus fhould be eatable.

2. X. *latifolia*. Broad-leaved Sea-fide Laurel. Linn. Mant. 221, excluding the fynonym. Willd. n. 2. Ait. n. 1. Swartz Obf. 113. Curt. Mag. t. 1021. (Genefiphylla afplenifolia; L'Herit. Sert. Angl. t. 39. Phyllanthus n. 1. Browne Jam. 188. Hemionitidi affinis, americana epiphyllanthos, &c.; Pluk. Phyt. t. 36. f. 7.)—Leaves rhomboid, crenate; notches crowded, each bearing one or more ftalked flowers.—Native of lime-ftone rocks, near the fea-fide, in the Weft Indies. Mr. Waller is recorded in Hort. Kew. as having firft fent this elegant and fingular fhrub to his friends in England, in 1783. If we miftake not, the marquis of Rockingham, who died in 1782, received it from Mr. Waller fome time before; the original having been long one of the dowager marchionefs's fineft plants. It flowers in a ftove copioufly in Auguft and September. The *ftem* is four or five feet high, with a round bufhy head. *Leaves* a foot long, alternate, ftalked, alternately pinnate; *leaflets* twelve or more, nearly feffile, one and a half or two inches long, ovate-rhomboid, acute, hard and rigid, erect, ftriated, fmooth; entire towards the bafe. *Flowers* copious, fmall, green, on fimple crimfon ftalks; thofe of the female flowers much the longeft. Both *ftamens* and *piftil* fometimes occur in the fame flower, according to Dr. Swartz.

3. X. *Arbufcula*. Lanceolate-leaved Sea-fide Laurel. Swartz Prodr. 28. Willd. n. 3. (Phyllanthus fpeciofa; Jacq. Coll. v. 2. 360. Ic. Rar. t. 616. Swartz Ind. Occ. 1107. Schneev. Ic. t. 30?)—Leaves pinnate, lanceolate, pointed, crenate; notches crowded, each bearing one or more ftalked flowers.—Native of the floping fides of lofty mountains, in the fouth part of Jamaica. *Swartz.* We can difcern no real fpecific difference between this and the laft. The *leaves* indeed are narrower, more elongated and lefs falcate, but thofe characters vary. Dr. Swartz

lays

lays a ftrefs on the *flowers* being polygamous in *latifolia*, monoecious in *Arbufcula;* but nothing is more variable than this circumftance. It is difficult to fay which of the two Schneevoght's figure reprefents.

4. X. *falcata.* Sickle-leaved Sea-fide Laurel. Swartz Prodr. 28. Willd. n. 4. Ait. n. 2. Andr. Repof. t. 331. (Phyllanthus Epiphyllanthus; Linn. Sp. Pl. 1392. Ph. americana planta, flores e fingulis foliorum crenis proferens; Comm. Hort. v. 1. 199. t. 102.)—Leaves fcattered, linear-lanceolate, fomewhat falcate, diftantly toothed. Flowers nearly feffile, many together at each tooth.—Native of the Bahama iflands. Cultivated for above 120 years paft in the ftoves of England and Holland, flowering in July and Auguft. The *ftem* is five or fix feet high, fhrubby, with round *branches*. *Leaves* not pinnate, with a flat ftalk, as in the two laft, but fcattered irregularly over the branches, each proceeding from a fcaly bud, fimple, five or fix inches long, one-third of an inch wide, rigid, ftriated, tapering at each end; entire towards the bafe; alternately toothed in the upper part, the teeth an inch or more afunder. *Flowers* crimfon, on fhort ftalks, fome male and fome female in each tuft; the latter feweft.

5. X. *anguftifolia.* Narrow-leaved Sea-fide Laurel. Swartz Prodr. 28. Willd. n. 5. Ait. n. 3. (X. elongata; Jacq. Hort. Schœnbr. v. 3. 53. t. 348. Poiret n. 7. Phyllanthus n. 2; Browne Jam. 188. Ph. americana, anguftiori et longiori folio, ramofa, caulefcens; Pluk. Phyt. t. 247. f. 4. Ph. anguftifolia; Swartz Ind. Occ. 1111.)—Leaves pinnate, linear-lanceolate, rather diftantly toothed, fcarcely curved. Flowers on fhort ftalks, polygamous, one or more from each tooth.—Native of ftony rocky fituations, in the weftern part of Jamaica. *Swartz.* Cultivated in the Englifh ftoves before 1789, flowering in July and Auguft. *Aiton.* This agrees with our fecond and third fpecies, in having feveral alternate *leaflets*, on a flat or channelled, bordered *common ftalk;* but fcarcely half fo many on each ftalk as in thofe; and of a longer narrower form, not copioufly crenate, but fparingly and rather diftantly toothed, more in the manner of *X. falcata.* The *ftem* is only two feet high. The *flowers* are lefs copious than in the laft-mentioned fpecies, and, according to Dr. Swartz, there are fome perfect, intermixed with the male and female ones. Their colour is red; the male ones paleft. (Jacquin's figure expreffes the contrary.) Plukenet's engraving, fuch as it is, manifeftly agrees with this fpecies, and with no other. Linnæus, no doubt, confounded this, and, at one time, the *latifolia* alfo, with the *falcata.* Browne's fynonyms are fettled by his own fpecies, though unmarked.

6. X. *linearis.* Linear Sea-fide Laurel. (X. anguftifolia β; Swartz Prodr. 28. Willd. n. 5. Phyllanthus linearis; Swartz Ind. Occ. 1113.)—"Leaves pinnate, linear, tapering, pliant, crenate; their common ftalk bordered. Flowers feveral from each notch."—Native of fhady ftony banks of rivers, in the weftern part of Jamaica. *Swartz.* The ftem is fcarcely a foot high, erect, with round branches. Common *footftalks* four or five inches long, fcattered, compreffed, (rather depreffed,) bordered. *Leaves* linear, rather broadeft in the middle; tapering at the bafe; ending in a very long acute point, ftriated, paler beneath, two inches long, of a thinner fubftance than the foregoing fpecies, which circumftance, added to its humbler ftature, and different colour, has induced Dr. Swartz to confider it as diftinct. The *flowers* are white, monoecious, from three to fix at each notch of the leaves, on capillary ftalks, four lines in length.

7. X. *montana.* Mountain Sea-fide Laurel. Swartz Prodr. 28. Willd. n. 6. (Phyllanthus montana; Swartz Ind. Occ. 1117.)—Leaves fomewhat two-ranked, elliptic-lanceolate, coriaceous, deeply crenate. Flowers nearly feffile, many from each notch. Branches round; two-edged at the extremity.—Found on lime-ftone rocks, in the weftern part of Jamaica. A *fhrub*, fix feet high, much and irregularly branched; the *branches* often forked, round, nearly erect, with annular fcars; ultimate ones permanent, glaucous-afhcoloured, compreffed and two-edged at the fummit. *Leaves* alternate, imperfectly two-ranked, nearly feffile, either blunt or acute, obliquely ftriated, rigid, brownifh-green, fmooth, with deep many-flowered notches. *Flowers* monoecious; the males eight or ten, pale red; females folitary among the males, deep purple. Clearly diftinguifhable from all the fpecies which it otherwife refembles, by the permanency, and woody texture, of the ultimate branches. *Swartz.*

8. X. *ramiflora.* Siberian Sea-fide Laurel. Ait. Hort. Kew. ed. 1. v. 1. 376. ed. 2. n. 4. Willd. n. 7. (Pharnaceum? fuffruticofum; Pallas It. v. 3. 716. t. E. f. 2.)—Leaves elliptical, ftalked. Flowers axillary.—Native of the defarts of Siberia, from whence it was procured for the Englifh gardens, in 1783, by the late Mr. Bell. It is a hardy fhrub, flowering in July and Auguft. Pallas, who never faw the plant alive, merely gueffed at its genus. By his figure, its habit is altogether that of a *Phyllanthus.* The *ftem* is bufhy, with many ftraight, wand-like, leafy branches, each a fpan long. *Leaves* fcattered, thin, hardly an inch in length, blunt, crenate, or fomewhat wavy. *Flowers* fix or eight together, making a little axillary tuft, accompanied by minute red *ftipulas*, or *bracteas.* Segments of the *calyx* five, concave, white, with a coloured margin. *Anthers* five, thick, obtufe, furrowed at the outfide. *Germen* in the fame flower, as we prefume from Pallas's defcription, very fmall. *Styles* three, thread-fhaped, fimple, the length of the *ftamens.* The genus of this fpecies is, at beft, very doubtful, as Willdenow has already remarked.

Phyllanthus and *Xylophylla* are fo totally different in habit, and the latter is, in this refpect, fo very peculiar, that a clear character between them is much to be defired. The true *Xylophyllæ* are all of Weft Indian origin. The tropical *Phyllanthi* are natives of the Eaft Indies; a few hardy fpecies grow in North America.

Xylophylla, in *Gardening*, contains plants of the tender exotic kind for the ftove, in which the fpecies cultivated are, the long-leaved love flower (X. longifolia), the broad-leaved love flower (X. latifolia), and the falcated love flower (X. falcata).

The firft is a branching angular plant, but the fecond has round branches; and the laft is woody in the ftems and branches.

Method of Culture.—Thefe plants are increafed by fowing the feeds in pots in the early fpring, and plunging them in a hot-bed: when the plants are come up two or three inches in growth, they fhould be pricked out in feparate pots, replunging them in the bark-bed: they may afterwards be managed as other ftove-plants of a fimilar growth.

They are alfo, fome of them, capable of being raifed by off-fets, flips, and cuttings, affifted by a hot-bed in the fame manner.

They require the conftant protection of the ftove in winter, but in the hot fummer months may be fet out in their pots in a fheltered fituation, being taken in on the approach of cold nights.

They afford variety, and are curious in ftove collections among other plants of fimilar growths.

XYLOPIA, in *Botany*, altered by Linnæus from *Xylopicrum* of Browne, a name which the latter took from Plukenet, whose *Xylopicron*, formed from ξυλον and πικρος, alludes to the bitternefs of the wood. M. De Candolle, in following Linnæus, obferves, that this abbreviation entirely deftroys the fenfe. It certainly does to thofe who do not trace out the fource of the word. If the original had been conftructed in the moft unexceptionable manner, we might have hazarded its reftoration; but *Xylopia* is now too firmly eftablifhed to be lightly difturbed, and in found nothing can be better.—Linn. Gen. 469. Schreb. 375. Willd. Sp. Pl. v. 2. 1270. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 336. Juff. 284. De Cand. Syft. v. 1. 499. Poiret in Lamarck Dict. v. 8. 810. Lamarck Illuftr. t. 495. Gærtn. t. 69. (Xylopicron; Pluk. Almagr. 395. Xylopicrum; Browne Jam. 250.)—Clafs and order, *Polyandria Polygynia.* (Gynandria Polyandria, *Linn.*) Nat. Ord. *Coadunatæ*, Linn. *Anonæ*, Juff. *Anonaceæ*, De Candolle.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in from three to five deep, broad, ovate, coriaceous, rather acute, permanent fegments. *Cor.* Petals fix, feffile, linear-lanceolate, coriaceous, much longer than the calyx; the three outermoft largeft. *Stam.* Filaments none; anthers numerous, oblong, quadrangular, abrupt, parallel, crowded, feated on the tumid, nearly globofe, receptacle, in feveral rows. *Pift.* Germens feveral, on fhort ftalks, compreffed; ftyles tapering, crowded together; ftigmas fimple. *Peric.* Capfules feveral, ftalked, coriaceous, compreffed, bluntly angular, of one cell and two valves, burfting at the top. *Seeds* one or two, obovate, polifhed, tunicated at the bafe.

Eff. Ch. Calyx lobed, coriaceous. Petals fix; the three outermoft largeft. Capfules ftalked, angular, compreffed, of two valves. Seeds one or two, tunicated.

The plants compofing this genus are trees or fhrubs, with oblong or lanceolate (entire) *leaves*, and axillary, bracteated, fimple or divided *flower-ftalks*. The *wood* is bitter; *bark* and *fruit* aromatic. *De Candolle*, who defcribes eight fpecies, of which the firft is ftill the leaft underftood.

Linnæus, by a mifapprehenfion of the true character of his own clafs of GYNANDRIA, (fee that article,) has placed this genus far afunder from *Anona*, *Uvaria*, &c., to which it is clofely allied, both in natural and artificial diftinctions. Few genera have hitherto been lefs underftood.

1. X. *muricata.* Rough-fruited Bitter-wood. Linn. Sp. Pl. 1367. Willd. n. 1. De Cand. n. 1. Ait. n. 1. (X. frutefcens; Gærtn. v. 1. 339. t. 69, excluding the fynonym of Aublet. Xylopicrum n. 1; Browne Jam. 250. t. 5. f. 2.)—Leaves ovato-lanceolate, pointed; clothed with clofe-preffed hairs beneath. Branches zigzag, nearly fmooth. Stalks with feveral flowers. Fruit muricated.—Found by Dr. Patrick Browne, at the foot of the mountains, in Sixteen-mile walk, Jamaica. His fpecimen, drawn in the plate above-cited, is in our hands, but ftripped of the leaves. This deficiency is fupplied by another very large and perfect one, gathered in Jamaica, by Mr. Maffon. The latter M. De Candolle unfortunately did not fee, when the writer of this was favoured with too fhort a vifit from this learned and amiable man. It is become neceffary to correct fome errors in the defcription, whofe fource is unknown to us. The leaves are certainly not "bearded at the point," nor do we perceive in what fenfe they are termed "ftrigofe beneath." Thefe are Willdenow's expreffions, adopted by De Candolle. Sir Jofeph Banks fent a living plant of this fpecies to Kew garden, in 1793; but if it furvives, it has not yet flowered. This is a fmall *tree*, fifteen or twenty feet high, with alternate, round *branches*, zigzag when young, quite fmooth, except towards the very extremity, which is flightly filky. *Leaves* alternate, on fhort thick ftalks, fpreading, rather ovate than lanceolate, with a blunt or emarginate, fmooth point; their length two inches, or a little more; their margin entire, flightly revolute; their upper furface fmooth and fhining, reticulated with veins; under paler, more opaque, clothed with fine, fcattered, clofe, filky hairs, after a while deciduous: mid-rib ftout, rough with minute tubercles at the back. *Flower-ftalks* copious, axillary, folitary, fhort, knotty, bearing from two to five *flowers*. *Calyx* three-lobed, fcarcely downy. *Petals* half an inch long, denfely filky on both fides; the three innermoft very narrow, triangular-awlfhaped. *Capfules*, by Gærtner's account, which in the main agrees with that of Linnæus, nearly ovate, but angular and compreffed, fometimes as many as fifteen, coriaceous, covered with little points, of one cell and two valves, containing one or two oval *feeds*, each with a cup-like tunic at the bottom. Browne made no remarks on the bark or wood of this tree. We perceive little bitternefs in either, though fome aromatic flavour in the bark. This fpecies being the type of its genus, we have thought a full defcription requifite.

2. X. *frutefcens.* Shrubby Silky Bitter-wood. Aubl. Guian. 602. t. 242, excluding the fynonyms of Linnæus and Browne. Willd. n. 2. De Cand. n. 2. "Dunal Monogr. 120." Lamarck t. 495, copied from Aublet, excluding the fruit, which is Gærtner's figure of the foregoing. Poiret n. 2. (X. fetofa; Poiret n. 4, according to De Candolle. Embira feu Pindaiba; Pif. Braf. 71. Ibira; Marcgr. Braf. 99.)—Leaves lanceolate, pointed; glaucous and filky beneath. Branches filky. Stalks with few flowers. Capfules fmooth.—Found by Marcgraf in Brafil, flowering in February; by Aublet in Cayenne and Guiana, bearing flowers and fruit in Auguft. M. De Candolle has examined a fpecimen, and we, having feen none, are obliged to rely on him and the other authors here cited for the fpecific diftinctions between this and the firft fpecies. The fmoothnefs of the *fruit*, the filkinefs of the *branches*, and narrownefs of the *leaves*, appear fufficient to afcertain the prefent plant. Marcgraf fays the bark affords a tough kind of cordage. The *fruit*, equal in fize to hazel-nuts, is aromatic and acrid, ferving, when powdered, inftead of pepper.

3. X. *falicifolia.* Willow-leaved Bitter-wood. "Humb. and Bonpl. unpublifhed. Dunal Monogr. 121. t. 17." De Cand. n. 3.—"Leaves oblong, with a bluntifh point; filky beneath. Stalks fhort, fingle-flowered? with fmall bracteas."—Found by the celebrated travellers baron Humboldt and M. Bonpland, near Efpinal, in South America. A *tree* with blackifh *branches*, marked with white dots. *Leaves* narrow, an inch and a half or two inches long, three or four lines broad, on fhort ftalks, fingle-ribbed, without veins; fmooth and green above; villous beneath, with clofe-preffed, filky hairs, of a rufous grey. *Capfules* from five to feven, gibbous, flightly pointed, not burfting. *Seeds* one or two. *De Cand.*

4. X. *liguftrifolia.* Privet-leaved Bitter-wood. "Dunal Monogr. 121. t. 18." De Cand. n. 4.—"Leaves oblong, rather acute, fmooth on both fides. Stalks fhort, with few flowers, and fmall bracteas."—Gathered by Humboldt and Bonpland, at Buga, in South America. The *branches* are round, blackifh, rugged, rough with whitifh points. *Leaves* an inch and a half long, four lines broad, on very fhort ftalks, fingle-ribbed, veinlefs; fomewhat fhining above; paler beneath; the young ones filky at the under fide. *Stalks* axillary, with three or four flowers, and roundifh con-

cave *bracteas*. *Calyx* ſmall, three-cleft. Three outer *petals* longeſt, ſpreading at the points. *Capſules* corrugated, not burſting. *Seeds* one or two. *Dunal*. *De Cand.*

5. X. *glabra*. Smooth Bitter-wood. Linn. Sp. Pl. 1367. Willd. n. 3. De Cand. n. 4. " Dunal Monogr. 121. t. 19." Lunan Hort. Jam. 97. (Xylopicrum n. 2; Browne Jam. 251. Xylopicron arbor, barbadenſibus *Bitter-wood;* Pluk. Phyt. t. 238. f. 4.)—Leaves ovate-oblong, pointed, quite ſmooth on both ſides. Stalks ſingle-flowered, ſolitary or in pairs. Fruit ſmooth.—Brought from Barbadoes by Mr. James Reede, who was ſent to the Weſt Indies by the earl of Portland, to procure plants for the royal garden at Hampton-Court. *Plukenet*. This ſpecies, therefore, may have been alive in England. Dr. Patrick Browne met with it in the mountains, at the back of Bull-bay, in Jamaica, where it grew to a conſiderable ſize, being fifty or ſixty feet high. He never ſaw the flowers in perfection. " The wood, bark, and berries," ſays this author, " have an agreeable bitter taſte, not unlike that of the orange-ſeed; and would probably prove excellent medicines. Wild pigeons feed much upon the berries, and owe their delicate bitteriſh flavour to this food. I have eaten many of the berries juſt off the tree, and found them agreeable to the palate, and grateful to the ſtomach. The bark and wood are agreeably bitter while freſh, but that delicacy diminiſhes greatly after they are dried. The wood is eaſily wrought, and good timber, but muſt not be expoſed to the weather." *Browne*. Mr. Lunan, in his *Hortus Jamaicenſis*, adds nothing to this account, but carefully diſtinguiſhes this Bitter-wood from QUASSIA, (ſee that article,) with which ſome perſons have confounded it. M. De Candolle obſerves, that the *branches* of *X. glabra* are round, ſmooth, ſcarcely dotted; and that even the young *leaves* are ſmooth on both ſides: the full-grown ones are two inches long, and one broad, obtuſe with a point. *Calyx* ſmooth, with three very obtuſe lobes. Unexpanded *petals* oblong, clothed externally with cloſe-preſſed pubeſcence, their length four lines. Plukenet repreſents the *flower-ſtalks* ſolitary, oppoſite to each leaf.

6. X. *nitida*. Shining-leaved Bitter-wood. " Dunal Monogr. 122. t. 20." De Cand. n. 6.—" Leaves oblong-lanceolate, ſmooth; poliſhed on the upper ſide. Stalks branched, many-flowered. Calyx nearly entire."—Found by Joſeph Martin, on the Oyac mountains of Cayenne, ſloping down to the ſea. A *tree* of a middling ſize, with ſtraight, round, rugged, not hairy or downy, *branches*. *Leaves* ſomewhat elliptical, two or three inches long, and nine or ten lines broad; green, ſmooth, and very ſhining above; veiny, pale, and rather ſilky, with minute cloſe hairs beneath; the margin a little revolute. *Cluſters* ſmall, corymboſe, of four or five *flowers*, whoſe ſtalks are embraced by little roundiſh *bracteas*. *Calyx* coriaceous, brown, pitcher-ſhaped, ſcarcely divided. Bud of the *petals* oblong, triangular, acute. *Fruit* unknown. *De Cand.*

7. X. *acuminata*. Long-pointed Bitter-wood. " Dunal Monogr. 122. t. 16." De Cand. n. 7.—" Leaves oblong-elliptical, very long-pointed, perfectly ſmooth. Capſules on long ſtalks, ſingle-valved, with two ſeeds."—Native of Cayenne. *Branches* round, rugged, ſmooth. *Leaves* on very ſhort footſtalks, four to ſix inches long, two inches wide, remarkably pointed, revolute, rather coriaceous; a little ſhining above. *Flowers* unknown. *Capſules* ovate, nine or ten lines in length, pointed, each tapering down into a long ſtalk, imperfectly bivalve, ſmooth and even. *Seeds* obovate, black, fœtid, convex at the outſide, flat at the inner. *De Cand.*

8. X. *prinoides*. Winter-berry Bitter-wood. " Dunal Monogr. 122. t. 15." De Cand. n. 8.—" Leaves oblong-lanceolate, ſmooth, membranous, pointed; bluntiſh at the extremity. Flowers ſolitary. Capſules with two valves." —Native of Cayenne. *Branches* wand-like, ſlightly rugged. *Leaves* on ſhort ſtalks, ſmooth on both ſides, three or four inches, (the author, by miſtake as we preſume, ſays three or four lines,) in length, and from twelve to fifteen lines broad; ſhining above; rather glaucous beneath. *Stalks* ſingle-flowered, axillary, very ſhort, each bearing an extremely minute *bractea*. *Calyx* deeply three-cleft. *Petals* ovate, acute, ſcarcely two lines long, being the ſmalleſt of this genus, or perhaps natural order. *Capſules* ſtalked, imperfectly bivalve. *Seeds* two, flat at the inner ſide, convex at the outer. *De Candolle*.

XYLOPICRUM. See XYLOPIA *ſupra*.

XYLOPOLIS, in *Ancient Geography*, a town of Macedonia, in Mygdonia. Ptolemy.

XYLOSMA, in *Botany*, from ξυλον, *wood*, and οσμη, *a ſmell*, a name given by Dr. George Forſter to the *Myroxylon* of his father; the latter appellation having been appropriated by Linnæus to a different genus. (See MYROXYLON.)—Forſt. Prodr. 72. Schreb. Gen. 703. Willd. Sp. Pl. v. 4. 834. Mart. Mill. Dict. v. 4. Poiret in Lamarck Dict. v. 8. 817. Lamarck Illuſtr. t. 827. (Myroxylon; Forſt. Gen. t. 63. Juſſ. 444. Lamarck Dict. v. 4. 192.)—Claſs and order, *Dioecia Polyandria*. Nat. Ord. *uncertain*. Juſſ.

Gen. Ch. Male, *Cal.* Perianth in four or five deep, roundiſh, minute, ſpreading ſegments. *Cor.* Petals none. Nectary minute, annular, finely crenate, ſurrounding the ſtamens. *Stam.* Filaments numerous (20—50), capillary, twice the length of the calyx; anthers roundiſh, ſmall.

Female, on a diſtinct tree, *Cal.* as in the male. *Cor.* Petals none. Nectary as in the male, ſurrounding the germen. *Piſt.* Germen ſuperior, roundiſh-ovate; ſtyle very ſhort, cylindrical; ſtigma obtuſe, flat, obſcurely three-cleft. *Peric.* Berry? dry, oblong, imperfectly divided into two cells by a partition from the bottom. *Seeds* two in each, triangular, convex at the back, flat at the ſides.

Eſſ. Ch. Male, Calyx in four or five deep ſegments. Petals none. Nectary annular, crenate. Stamens from twenty to fifty.

Female, Calyx and Nectary as in the male. Style very ſhort. Stigma ſlightly three-cleft. Berry dry, of two incomplete cells. Seeds two to each cell.

1. X. *ſuaveolens*. Serrated Sweet-wood. Forſt. Prodr. n. 380. Willd. n. 1. (Myroxylon ſuaveolens; Forſt. Gen. 63. n. 1.)—Leaves ovate, ſerrated.—Native of the Society iſlands of the South ſeas. The inhabitants employ this wood, to give a fragrant ſcent to cocoa-nut oil, for anointing their hair. We know not whether this be the precious Red Sanders Wood of the South ſea iſlands, for a ſpecimen of which we are indebted to ſir Joſeph Banks, whoſe ſcent reſembles that of the Eaſt Indian wood of the ſame name. The tree which produced it was, as long as poſſible, kept from the knowledge of our European voyagers.

2. X. *orbiculatum*. Entire-leaved Sweet-wood. Forſt. Prodr. n. 381. Willd. n. 2. (Myroxylon orbiculatum; Forſt. Gen. 63. n. 2.)—Leaves roundiſh, entire.—Native of Savage iſland. We have never ſeen a ſpecimen of either ſpecies.

XYLOSTEON, a name by which ſome authors have called the ſmall red-berried double-fruited *chamæceraſus*.

XYLOSTEUM, Dod. Pempt. 411. Tourn. 609. t. 379. Juſſ. 212. Purſh 161. (Chamæceraſus; Tourn. ibid.), a word formed of ξυλον, *wood*, and οστεον, *bone*, being ſynonymous with a Swiſs name for the ſame ſhrubs, which

alludes

alludes to the hardnefs of their wood, and perhaps to its tubular form, filled with pith, as a bone is with marrow. The authors who retain this genus fplit the Lonicera of Linnæus, (fee that article,) into feveral, without neceffity or utility, offering, in our opinion at leaft, great violence to nature.

XYLOSTROMA, fo called from ξυλον, *wood*, and στρωμα, *a ftratum*, or *layer*, becaufe this fungus forms indeterminate expanfions, like cloth or leather, in the infide of the trunks or branches of trees.—Tode Fung. Mecklenb. v. 1. 36.—Clafs and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi angiocarpi?*

Eff. Ch. Expanded, coriaceous, two-fided, fhapelefs, concealed; furface fmooth and even. Seminal globules very minute, attached to internal fibres.

1. X. *giganteum*. Oak Leather. Tode as above, t. 6. f. 51. Sowerb. Fung. t. 358. (Racodium Xyloftroma; Perf. Syn. Fung. 702. Fungus coriaceus quercinus hæmatodes; Raii Syn. 25. "F. ampliffimus; Scop. Pl. Subterr. 116. t. 44." Byffus candida β; Lightf. Scot. 1004.)—This fingular production is found in the centre of the trunks of growing oaks, fpreading in the form of a piece of cloth or leather, with numerous ramifications, through fome of the largeft trees. But whether it is, like the *Boletus lachrymans*, or Dry Rot, in wrought timber, the caufe of their decay, or its confequence, we have not fufficient information to decide. Tode's obfervations countenance the former opinion. He fays the wood of the trees, occupied by this fungus, becomes rotten and perfectly dry. Its fmooth furfaces are owing to the fmoothnefs of the fiffures, through which it fpreads in a tender ftate, and its branching indeterminate figure arifes from the irregularity and fubdivifion of thofe fiffures. The infide is fpongy, or partly hollow, occupied with branching fibres, bearing numerous little ovate *capfules*, or *receptacles*, whofe apex appeared to Mr. Sowerby to have an opaque lid. The whole fungus is very durable, remaining unchanged for many years. Its hue is generally an uniform buff or pale tan colour; but Perfoon notices a whitifh variety, more compact than the ufual kind; and a faffron-coloured one, found by Schrader. We cannot well reduce the *Xyloftroma* to any other genus of this natural order. The *Racodium*, Perf. Syn. 701, defined as "expanded and foft, refembling cloth in its denfely interwoven fibres," feems to us but a vague affemblage; the firft fpecies being *Byffus nigra*, which fome make a *Lichen*, others a *Conferva;* the fecond a *Mucor*.

XYLOSTROTON, formed of ξυλον, *wood*, and στρωτος, *laid*, among the *Ancients*, an appellation given to Mofaic or chequered work.

XYLUS, in *Ancient Geography*, a town of Afia Minor, in Caria. Steph. Byz.

XYMETHUS, a town of Africa, in the interior of Cyrenaica. Ptol.

XYMPATHESIS, a word ufed by fome of the old medical writers for fympathy.

XYNERESIS, formed of ξυν, or συν, *together*, and αιρεω, *I feize*, a word ufed by Hippocrates, and others of the ancients, to exprefs a firm cohefion or connection of any two things. Some ufe it to exprefs that firm fhutting together, or clenching of the teeth, which happens in convulfions.

XYNIA, in *Ancient Geography*, a borough of Theffaly, on the confines of Perrhœbia, near a lake of the fame name. Livy.

XYNOECIA, formed of ξυν, or συν, *with*, and οικεω, *I inhabit*, a feaft among the ancient Athenians, inftituted on occafion of Thefeus's uniting all the petty communities of Attica into one commonwealth; the affemblies of which were to be held at Athens, in the Prytaneum.

XYPHOID, in *Anatomy*, a name given to the cartilage, which forms the inferior extremity of the fternum. See the defcription of the *fternum*, in the article Lungs.

XYRIS, in *Botany*, an ancient name, of unknown derivation, ξυρις, or rather ξειρις of the Greeks, fuppofed to belong to our *Iris fœtidiffima*, transferred by Gronovius to the prefent genus, as one of nearly fimilar habit and characters. They are not, however, of the fame natural order.—Linn. Gen. 29. Schreb. 39. Willd. Sp. Pl. v. 1. 254. Vahl Enum. v. 2. 204. Mart. Mill. Dict. v. 4. Brown Prodr. Nov. Holl. v. 1. 255. Purfh 33. Juff. 44. Kunth Nov. Gen. et Sp. v. 1. 255. Poiret in Lamarck Dict. v. 8. 818. Lamarck Illuftr. t. 36. Gærtn. t. 15.—Clafs and order, *Triandria Monogynia*. Nat. Ord. *Enfatæ*, Linn. (rather *Tripetaloideæ*.) *Junci*, Juff. *Reftiaceæ*, Brown, Kunth.

Gen. Ch. (corrected from Brown and Gærtner), *Cal.* Perianth inferior, of three concave chaffy leaves; the outermoft hooded, deciduous; the two lateral ones keeled, compreffed, curved, acute, converging, permanent. *Cor.* Petals three, large, fpreading, flat, crenate; with narrow claws, as long as the calyx. Nectaries three, feathery, alternate with the petals; fufpected by Brown and Kunth to be barren ftamens. *Stam.* Filaments three, inferted into the claws of the petals, much fhorter than the limb, thread-fhaped, erect; anthers oblong, incumbent. *Pift.* Germen fuperior, obovate, three-lobed; ftyle one, thread-fhaped, rather longer than the claws of the petals, three-cleft at the fummit; ftigmas obtufe, entire, or jagged. *Peric.* Capfule roundifh, of one cell and three valves, with three more or lefs prominent receptacles, running down the middle of each valve. *Seeds* numerous, minute, roundifh or elliptical, acute.

Eff. Ch. Calyx of three unequal leaves; the two lateral ones permanent. Petals three, equal. Nectaries three, feathery. Capfule fuperior, of three valves, with central receptacles. Seeds numerous.

A genus of perennial herbs, with fibrous *roots*. *Leaves* radical, numerous, fword-fhaped, or thread-fhaped; dilated, equitant, and membranous at the bafe. *Flower-ftalk* perfectly fimple, wrapped in a fheath at the bottom. *Head* terminal, folitary, its fcales membranous, fingle-flowered, clofely imbricated; the outer ones fometimes empty, and unlike the reft. *Anthers* pofterior. *Brown*. *Flowers* almoft invariably yellow.

Linnæus was acquainted with but one fpecies, *X. indica*. Several others have been determined by various authors, infomuch that Willdenow defines four, and Vahl ten in all. Mr. Brown has fifteen from New Holland alone, and there is a new one from South America. The author juft mentioned divides this genus into two fections. Thofe fpecies which belong to the firft fection have a capfule of one cell, whofe receptacles are feparate at the bafe; of thefe there are thirteen found in New Holland. The fecond fection is characterized by a capfule incompletely divided into three cells, the receptacles being combined in their lower part. Of this there are two New Holland fpecies. It is utterly impoffible for us to follow this arrangement, few people having feen half the fpecies in any ftate, much lefs their ripe capfules. We are poffeffed of ten, which appear to be diftinct, and which can be referred, with tolerable certainty in general, to as many defcribed fpecies. For the remainder we fhall cite our authorities.

1. X. *indica*. Eaft Indian Xyris. Linn. Sp. Pl. 62, excluding the fynonyms of Gronovius, Morifon, and Pifo. Linn.

Linn. Zeyl. 14. Willd. n. 1. Vahl n. 1. (Gladiolus indicus, flore tripetalo; Rudb. Elyf. v. 2. 17. f. 8. Gladiolo lacuftri accedens malabarica, e capitulo botryoide florifera; Pluk. Almag. 170. t. 416. f. 4. Kotsjilettipullu; Rheede Hort. Malab. v. 9. t. 71. Ranmotha; Herm. Zeyl. 41.)—Stalk furrowed, with many angles. Head ovate.—Native of the Eaft Indies, and perhaps of Sierra Leone. The *leaves* are defcribed by Vahl as fometimes a foot long, equalling the flower-ftalks, lax, acute, almoft the breadth of the nail; but he never faw any fo broad as in Rheede's figure. The *flower-ftalks* are feveral, rather more flender than a pigeon's quill, furnifhed with fix or eight furrows, and twifted in the lower part. *Head* rather fmaller than a Hazel-nut, with roundifh fcales. Our fpecimens, gathered by the late Mr. Smeathman at Sierra Leone, have no *leaves*, but the *ftalk* and *head* anfwer exactly to the above defcription. The *fcales* are from twenty-five to thirty in each head, rounded, or nearly orbicular, convex, clofely imbricated, obtufe, brown, but little polifhed, divided lengthwife into three nearly equal fpaces, or regions, (as is the cafe in moft of the fpecies that we have feen); the middle region here is flightly hoary or downy, the fide-ones fmooth. The *flowers* are paft. The *head* in thefe fpecimens is nearly globofe; not oblong, as in Gærtner's figure, marked *X. indica*. A few of the loweft fcales are flatter and rather fmaller than the reft, apparently always barren, or unaccompanied by flowers. Whatever Mr. Purfh's *X. indica* may be, it cannot belong to this fpecies. He defcribes the *leaves* very long and graffy, twifted as well as the *ftalks*.

2. X. *pubefcens*. Downy-fheathed Xyris. Poiret n. 2. —"Stalk ftriated, almoft cylindrical, enveloped in a downy fheath. Leaves greatly elongated."—Received by profeffor Desfontaines, from the Weft Indies. Nearly related to *X. indica*, but differing in feveral characters peculiar to itfelf. The *roots* are long, as thick as the finger, with foft, rather flefhy, nearly fimple, fibres, as thick as a raven's quill; and producing from the crown a great number of foft, flaccid, alternate, fomewhat imbricated, very fmooth *leaves*, a foot or foot and a half long, half an inch wide, entire, pointed; dilated at the bafe. *Stalks* ftraight, rather flender, twifted at the lower part, where they are each embraced by a cylindrical, ftriated, downy *fheath*, three or four inches long, terminating in a little fhort acute leaf. *Head* of *flowers* oval, obtufe, the fize of a large pea, formed of numerous, imbricated, very clofe, unequal, whitifh fcales; the outer ones a little dilated, oval, nearly flat, fcarcely pointed; the inner narrower, obtufe, rather concave. *Poiret*. See our *X. anceps*, which has alfo a very long leafy-pointed *fheath*, but it is quite fmooth.

3. X. *macrocephala*. Great-headed Xyris. Vahl n. 2.— "Stalk with one acute angle. Head and fcales ovate; the latter grey at the back."—Native of Cayenne. Defcribed from the herbarium of profeffor Desfontaines. The *leaves* are eighteen inches long; as broad as the nail, or broader. *Stalks* taller than the foliage; round in the lower part; fomewhat two-edged further up, with one convex and one acute fide. *Head* when in fruit twice as big as a Hazel-nut, ovate, with obtufe *fcales*. This differs from the reft in the breadth of its *leaves*, and the fize of the *head*. *Vahl*.

4. X. *platycaulis*. Broad-ftalked Xyris. Poiret n. 4.— Stalk compreffed, dilated, ftriated, fmooth; twifted below; with a lax, cloven, abrupt fheath at the bafe. Heads globofe, abrupt at the fummit.—Gathered by Commerfon in Madagafcar. *Leaves* wanting in the fpecimens. *Stalks* a foot high; two or three lines broad. *Sheath* at leaft three inches long, fmooth, ftriated, rather lax, cloven lengthwife, obliquely truncated at the fummit. *Head* hardly fo big as a pea, flattifh at the top, with broad, obtufe, concave, fhining, chefnut-coloured fcales, the outer ones keeled towards their point. *Poiret*. We have enlarged the author's fpecific character from his own defcription, in order the better to contraft this fpecies with the two following, with which it appears to agree in the flatnefs of the *ftalk*.

5. X. *anceps*. Small-headed Two-edged Xyris. Lamarck Illuftr. v. 1. 132. Vahl n. 3.—"Stalk two-edged, fmooth. Head nearly globofe."—Native of Madagafcar, and Malabar; perhaps alfo of Guiana. *Leaves* rather rigid, narrow, but one-third or one-fourth the height of the *ftalks*, which are feveral, a foot or more in height, twifted, fmooth, by no means ftriated. *Head* fcarcely fo large as a pea, with roundifh, convex, hardly emarginate, fcales. *Petals* yellow, finely toothed. *Vahl*. A Guiana fpecimen, communicated by Mr. Rudge, remarkable for the fmallnefs of its *head* in proportion to the herbage, anfwers precifely in every point to Vahl's defcription. Aquatic, or marfh-plants, fuch as the fpecies of this genus, are known to grow, more than any others, in widely diftant and diffimilar parts of the world. We have fufpected this Guiana fpecimen might be Poiret's *X. pubefcens* n. 2; but the fheath at the bafe of the ftalk is not pubefcent.

6. X. *complanata*. Flat-ftalked Xyris. Brown n. 1.— "Stalk compreffed flat, dilated, nearly ftraight; cartilaginous and rough at the edges, four times as long as the fword-fhaped, ftraight, bordered, roughifh leaves. Spike oblong or cylindrical. Scales orbicular, tumid."—Gathered by Mr. Brown, in the tropical part of New Holland. The *ftalk* is a line and a half broad. We have feen no fpecimen.

7. X. *fcabra*. Rough Xyris. Br. n. 2.—"Stalk two-edged, twifted, with rather acute and rough angles. Leaves linear, roughifh. Head ovate or oblong."—From the fame country. The *ftalk* is hardly a line in breadth. *Brown*.

8. X. *lævis*. Smooth Xyris. Br. n. 3.—"Stalk two-edged, fmooth, as well as the narrow linear leaves. Head nearly ovate. Scales imbricated every way. Keels of the calyx-leaves fringed."—Gathered by Mr. Brown near Port Jackfon, as well as in the tropical part of New Holland. The *ftalks* are from fifteen to eighteen inches high.

9. X. *americana*. Blue American Xyris. Aubl. Guian. 40. t. 14, very bad. Vahl n. 4. Symb. v. 3. 8. Willd. n. 3. Poiret n. 6. (Jupicai; Pif. Braf. 238.)—Stalk two-edged in the upper part. Head ovate-oblong. Scales polifhed, emarginate, with a fmall callous intermediate point. —Native of moift paftures in Brafil, flowering in the rainy feafon, according to Pifo, whofe fynonym was verified by Vahl, from an infpection of Marcgraav's herbarium. Aublet found the fame in wet meadows near the river Macouria, in Guiana, flowering in December; but his figure is made up, as Vahl obferves, with the leaves of an *Eriocaulon;* the fcales of the *head*, and the *flowers*, being moreover very ill drawn. We have never met with a fpecimen anfwering to this fpecies. Vahl fays the *leaves* are graffy, narrow, and acute, half the length of the *ftalk*, which is a foot or more in height; round in the lower part, with two prominent lines running down it; compreffed in the upper part, and a little dilated under the *head*. The latter is obtufe, rather bigger than a pea. *Scales* oblong, concave, cloven at the point, with a brownifh, rather callous point in the notch. *Vahl*. The *corolla* is faid to be blue, of which we know no other inftance in this genus.

10. X. *caroliniana*. Carolina Xyris. Walt. Carol. 69. Vahl n. 5. Poiret n. 7. Purfh n. 2. (X. Jupicai; Michaux Boreal.-Amer. v. 1. 23, according to Vahl.)— —"Stalk two-edged. Head ovate, acute."—Native of Carolina.

Carolina. *Vahl.* Found in low graffy fields, on a fandy foil, from New Jerfey to Florida. Perennial, flowering from June to Auguft. *Heads* fmall. *Flowers* yellow. It is extremely variable. *Purfh.* Vahl thought this fpecies diftinct from the laft, in having more rigid *leaves*, and larger *heads*, which are acute, inftead of being remarkably obtufe. The *flowers* moreover are yellow, not blue. The *leaves* vary in length. The heads in Lamarck's fpecimens are longer than thofe of Richard's. *Vahl.* We have not feen this fpecies, but it feems that more than one may poffibly here be confounded.

11. X. *torta.* Twifted-leaved Xyris. (X. indica; Purfh n. 1, excluding the fynonyms.)—Leaves linear, fpirally twifted, as well as the ftalk, which is two-edged below, quadrangular at the upper part. Head globofe. Scales polifhed, rounded, fomewhat emarginate, pointlefs, with a fmall filky difk.—Gathered in North America by Kalm. Linnæus confounded his fpecimens with *X. indica*, which he knew but imperfectly. They appear, however, to anfwer exactly to the *indica* of Purfh, who very properly gives an original fpecific character, inftead of copying what did not agree with the plant before him. He found it in overflowed meadows, and fmall ponds, from Pennfylvania to Virginia; perennial, bearing yellow *flowers* in June and July. He calls the *leaves* "*longiffimè graminea.*" In our fpecimens they are from one to ten inches long, a line broad, acute, many-ribbed, roughifh at the edges, perfectly graffy; the outermoft degenerating into broad, fhort, chefnut-coloured, pointed, imbricated fcales. *Stalks* folitary, about two feet high; nearly round, though two-edged and ftriated, at the bottom, as well as very much twifted, even more than the leaves; the upper part is lefs fo, more evidently two-edged; and towards the top there are four, not always equal, angles. *Head* the fize of a large white currant, obtufe, of a fhining chefnut-colour. *Scales* almoft orbicular, convex; dilated and thin at the edges; marked at the back, juft below the notch, with a pale, greenifh, filky fpot. Two or three of the lowermoft of all are fmaller, flatter, a little keeled.

12. X. *pufilla.* Dwarf Broad-leaved Xyris. Brown n. 4.—Stalk two-edged, fmooth, like the fhort, fword-fhaped, two-ranked, equitant leaves. Head orbicular, compreffed, of a few fhining, fomewhat keeled and pointed, fcales.—Gathered by Mr. Brown, in the tropical part of New Holland. Our fpecimens, in the herbarium of the younger Linnæus, were probably given to him when in England, by fir Jofeph Banks and Dr. Solander. The *ftalks* are from two to fix inches high, pale green, a little zigzag and twifted, fomewhat quadrangular; fheathed at the bafe with one or two *leaves*, which, like thofe that grow from the root, are about an inch long, and two or three lines broad, flightly incurved at the point, of a pale rather fhining green, with feveral ribs, and a finely dotted, or reticulated, furface in the dry ftate. *Head* the fize of a pea. *Scales* orbicular, convex, of a fhining chefnut-brown, pale at the edges: the two lowermoft equal, without *flowers*, in an early ftate covering the whole head, and furnifhed with a ftrong, green, pointed keel.

13. X. *denticulata.* Tooth-leaved Xyris. Br. n. 5.—Stalk roundifh, fmooth. Leaves fhort, linear-awlfhaped; rough with minute marginal teeth. Head globofe. Scales orbicular, fhining, keeled at the fummit.—Gathered in the tropical part of New Holland, by fir Jofeph Banks and Dr. Solander, who gave fpecimens to the younger Linnæus. This is about the fize of the laft, or rather taller. The *root* confifts of very fmall fibres. *Leaves* from one to two inches long, not a line broad, their fine reticulations feeming to form the little teeth, at the margin and keel. *Stalk* flender, ftriated or angular towards the top. *Head* twice the fize of the laft, of more numerous, bright-chefnut *fcales*, with thin, pale, often jagged margins, and a little green fhort keel, or point, not extending beyond the fcale. The two lowermoft *fcales* are barren, as in the preceding, and in a young ftate enclofe the whole head.

14. X. *paludofa.* Bog Xyris. Brown n. 6.—"Stalk roundifh, fmooth; angular at the top. Leaves fomewhat tubular; that of the ftalk longer than the fheath. Head nearly globular. Scales orbicular, fhining, imbricated every way."—Found in the tropical part of New Holland, by fir Jofeph Banks and Dr. Solander. We have feen no fpecimen, nor did Mr. Brown himfelf meet with this or the laft fpecies, any more than with the *pauciflora* hereafter defcribed.

15. X. *capenfis.* Cape Xyris. Thunb. Prodr. 12. Fl. Cap. v. 1. 310. Willd. n. 4. Vahl n. 6.—Stalk folitary, thread-fhaped, ftriated. Leaves linear, very fhort. Head ovate, acute. Scales ovate, obtufe, fmooth.—Native of hills near Verkeerde valley, at the Cape of Good Hope, flowering in December. *Stalk* a foot high, or more, flender, fmooth, very finely ftriated. *Leaves* few, radical, fmooth, many times fhorter than the ftalk. *Flowers* yellow. *Stigmas* three, tumid, revolute, whitifh. *Thunberg.*

16. X. *brevifolia.* Short-leaved American Xyris. Michaux Boreal.-Amer. v. 1. 23. Vahl n. 7. Purfh n. 3.—"Stalk thread-fhaped. Leaves awl-fhaped, compreffed. Head globofe. Scales oblong; the outermoft narroweft, keeled."—Native of low boggy meadows, in Lower Carolina and Georgia; perennial, flowering in July. The fmalleft American fpecies. *Flowers* yellow. *Purfh. Leaves* narrow, an inch and a half long. *Stalk* a fpan high, round and flender. *Head* the fize of a black pepper-corn. *Scales* broadifh-oblong. *Vahl.*

17. X. *pauciflora.* Few-flowered Xyris. Willd. n. 2. Phytogr. 2. t. 1. f. 1. Vahl n. 8. Br. n. 7.—Stalk quadrangular. Leaves linear; rough with minute marginal teeth. Head nearly globular. Scales fhining, orbicular; fpreading at the point, with a fhort triangular keel.—Gathered by Koenig and Rottler in the Eaft Indies; and by fir Jofeph Banks, in the tropical part of New Holland. The *root* is a fmall denfe tuft of pale fibres. *Stalk* from one to fix or eight inches high, erect, ftraight, flender, ftriated, roughifh. *Leaves* feveral, erect, fometimes nearly as tall as the ftalk, graffy, very narrow, taper-pointed, ftriated, roughifh, efpecially at the edges, where they are minutely toothed, or crenate, as in *X. denticulata*, n. 13. *Head* the fize of a large pea. *Scales* chefnut-coloured, with a membranous, dilated, fhining margin of a golden yellow, and each tipped with a green, triangular, projecting keel, or point, originating from the brown difk, but not extending beyond the membranous margin, with which it is incorporated. The prominence of this point, giving the head a fquarrofe afpect, is well expreffed in Willdenow's, otherwife miferable, figure. The two lowermoft *fcales* are barren, and clofely preffed to the next. *Corolla* yellow.

18. X. *bracteata.* Bracteated Xyris. Br. n. 8.—Stalk triangular. Leaves linear; their margins, and bafe of the keel, rough. Head roundifh. Scales with a hoary difk, and brown membranous margin; the lower ones oblong, empty, with a linear difk.—Sent from Port Jackfon, New South Wales, by Dr. White, in 1792. Mr. Brown found it in the fame country, and we borrow from him the above characters of the *leaves*, wanting in our fpecimens. The *ftalk* is a foot and a half high, flender and rufhy, bluntly triangular, even, fmooth to the touch, though Mr. Brown remarks that its moft acute angle is roughifh. *Head* rather

ovate

ovate than perfectly globose, one-third of an inch in length. *Scales* elliptical, abrupt, or partly emarginate; their disk elliptic-oblong, convex, not keeled, of a hoary or glaucous hue, finely dotted, not downy; their margin, at each side, about half as broad, membranous, of a shining brown, paler outwards. Three, four, or more, *scales*, at the bottom of each head, are destitute of flowers, shorter, much narrower, abrupt, oblong, not elliptical, with a peculiarly narrow disk, and have the appearance of *bracteas*. *Corolla* rather large, yellow, turning white in decay.

19. X. *juncea*. Rushy Xyris. Brown n. 9.—" Stalk roundish, slightly compressed, rather zigzag, smooth as well as the awl-shaped leaves. Head globose. Scales ovate, undivided, imbricated every way; their disk of the same colour as the margin. Stigmas many-cleft."—Gathered by Mr. Brown, in the neighbourhood of Port Jackson, New South Wales. The *stalk* is only eight or ten inches high. We have no specimens answering to the above characters.

20. X. *gracilis*. Slender Xyris. Brown n. 10?—Stalk thread-shaped, smooth, scarcely twisted. Leaves linear, straight, rough-edged. Head oval, of few flowers. Scales imbricated every way; their disk hoary; margin blackish. Stigmas undivided.—Sent from Port Jackson, in 1792, by Dr. White. Mr. Brown mentions only the south part of New Holland, and Van Diemen's island, as the native country of this species, and yet we cannot refer our specimens to any other mentioned by him. Our plant is about half the size of *X. bracteata*, with fewer and paler *flowers*. *Head* small, elliptical, or obovate. *Scales* with a broad, hoary, or glaucous, disk, like that of the *bracteata;* but their membranous margin is of a darker brown, and, at the upper part of each scale, quite black, as if burnt. Several of the lowermost scales are smaller, linear-oblong, and of a more uniform brown. The *stigmas* are long, and undivided. *Stalk* somewhat compressed, seldom above a foot high; Mr. Brown says a foot and half.

21. X. *filiformis*. Thread-shaped Xyris. Lamarck Illustr. 132. Vahl n. 9. Poiret n. 9.—Stalk thread-shaped, compressed. Leaves linear-awlshaped, compressed, two-ranked. Head and scales elliptical; disk and margin uniform, with slight traces of a keel.—Gathered by the late Mr. Smeathman, as well as by Dr. Adam Afzelius, in marshy sandy ground at Sierra Leone. The *root* is small and fibrous. *Leaves* four or five, seldom more, equitant, erect, linear-swordshaped, compressed, very narrow, tapering, but rather obtuse at the point; their surface minutely speckled, and more or less evidently reticulated, or dotted; their length, in our specimens, from one to two inches; Vahl says scarcely half an inch. *Stalk* solitary, six or eight inches high, very slender. *Head* the size of hemp-seed, but more oblong, acute at each end, of a copper-brown, not very shining; the two lowest scales empty, rather palest, most oblong, and strongly keeled; the rest elliptical, bluntly pointed, very smooth and even, without any limited disk, but sometimes marked with beautiful concentric veins; their keel scarcely discernible, except in the form of a short pale elevation, near the apex, but not projecting into a point. *Corolla* yellow, small.

22. X. *flexifolia*. Wavy-leaved Xyris. Br. n. 11.—" Stalk thread-shaped, twisted, smooth, as well as the zigzag, slender, slightly compressed, leaves. Head oval, with few flowers. Stigmas undivided."—Found by Mr. Brown, on the southern coast of New Holland. *Stalk* from six to twelve inches high.

23. X. *teretifolia*. Cylindrical-leaved Xyris. Br. n. 12. —" Stalk, as well as the leaves, round, straight, and roughish. Head ovate, many-flowered. Scales imbricated every way, torn into many segments."—From the same country. *Stalk* eighteen inches high. *Brown*.

24. X. *lacera*. Jagged-headed Xyris. Br. n. 13.—" Stalk round, smooth. Head nearly globular, many-flowered. Scales imbricated every way, torn into many segments."—Discovered by Mr. Brown, on the south coast of New Holland. We have seen no specimens of this, or the two species immediately preceding.

25. X. *subulata*. Awl-leaved Peruvian Xyris. " Fl. Peruv. v. 1. 46. t. 71. f. *b*." Vahl n. 10. Kunth n. 1.—" Stalk thread-shaped; roughish at the top. Leaves linear-awlshaped; their sheaths woolly at the margin. Head oblong, about three-flowered."—Native of marshy, cool, highly elevated, mountainous situations, in Peru, flowering in September. *Root* perennial. *Plants* growing together in patches. *Leaves* about an inch long; villous at the base. *Stalk* slender, about eight inches high. *Flowers* yellow, two or three only in each head. *Vahl.*

26. X. *vivipara*. Viviparous Xyris. Kunth n. 2.—" Stalk somewhat compressed; roughish at the top. Leaves linear-swordshaped; their sheaths fringed. Head globular; at length leafy and viviparous."—Gathered by Humboldt and Bonpland on the banks of the river Oroonoko, between the mouths of Ventuario and Guaviares, flowering in May. *Root* fibrous, perennial. *Leaves* all radical, two-ranked, from two to four inches long, erect, bluntish, sheathing, smooth, except a little roughness at the back; their *sheaths* keeled, striated, fringed, roughish also at the back. *Stalks* about a foot high, smooth, except some roughish points towards the summit; enveloped at the base with a striated, keeled, bluntish, smooth, rough-backed *sheath*, an inch and a half long. *Head* globose, rather abrupt, the size of a pepper-corn. *Scales* roundish-ovate, bluntish, brownish, coriaceous, smooth, rather transparent at the margin. After flowering, the head throws out from its centre a leafy crown, which becomes a young plant. *Kunth.*

We are not told whether this leafy tuft originates in the vegetation of one or two of the seeds; or in the *germen* being supplanted in the flower by a bud; or, which is the least likely, in a proliferous elongation of the *stalk*, independent of the parts of fructification altogether.

27. X. *operculata*. Imbricated Xyris. Labill. Nov. Holl. v. 1. 14. t. 10. Brown n. 14. Poiret n. 13. Curt. Mag. t. 1158.—Capsule partly three-celled. Stalk round. Leaves thread-shaped. Head obovate. Scales beardless, imbricated in five rows, with numerous empty ones, gradually smaller, at the base.—Sent from Port Jackson, New South Wales, by Dr. White, in 1792. Mr. Brown also observed it there; and Labillardiere in Van Diemen's island. Neither the figure of the last-mentioned author, nor that in the Botanical Magazine, by any means represents the remarkable character of the five-ranked scales of the *head*, and the numerous, gradually diminishing ones, destitute of flowers, at its base; so that, but for Mr. Brown's authority, we should have supposed our Port Jackson plant to be essentially and widely different. Dr. White's specimens are without *leaves*. The *stalk* is about eighteen inches high, round, or slightly angular, quite smooth. *Head* obovate, full half an inch long, with five rows of very numerous obovate *scales*, whose broad convex disk is of a bronze-like hue; the margin brown and narrow, more or less jagged, with a deciduous tooth-like fringe. *Flowers* large, bright yellow. *Stigmas* obtuse.

28. X. *lanata*. Woolly Xyris. Br. n. 15.—" Stalk round, smooth. Leaves linear, narrow. Head nearly globose. Scales woolly at the extremity, imbricated in five rows, with several empty ones, gradually smaller at the base."—Gathered by Mr. Brown, on the southern coast of New Holland.

The above great accession of new species throws much light

light on this hitherto little-known, and ill-defcribed, genus of plants. Could they all be compared together, even in a dried ftate, we have no doubt that their fpecific characters, and the principles on which they are founded, would derive confiderable improvement; and that *Xyris*, whofe generic marks are fo well eftablifhed, would afford a beautiful difplay of clear and precife fpecific difcrimination. Whether the *leaves* of any of the fpecies be really toothed, in a living ftate, we have confiderable doubt. Their *foliage* partakes greatly of the cellular texture, fo remarkable in the neighbouring genus *Eriocaulon;* with which alfo they clofely accord in *inflorefcence*, and general habit. Mr. Brown, in his *Prodromus*, has elucidated both thefe genera, as far as concerns their numerous New Holland fpecies, with infinitely more fuccefs than any other botanift; the one genus having previoufly been fcarcely better underftood than the other.

XYSMALOBIUM, from ξυσμα, *a ftrip*, or *narrow fhred*, and λοβο-, *a pod*, alluding to the fhreddy coat of the feed-veffel, which is very peculiar.—Brown Tranf. of the Wernerian Soc. v. 1. 38. Afclep. 27. Ait. Hort. Kew. v. 2. 79.—Clafs and order, *Pentandria Digynia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Juff. *Afclepiadeæ*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, lanceolate, acute, permanent fegments. *Cor.* of one petal, in five deep, ovate, fpreading, rather oblique fegments. Crown of the ftamens in a fingle row of ten deep fegments; five of them flefhy, roundifh, oppofite to the anthers, fimple at the inner fide; five intermediate ones fmaller. *Stam.* Filaments fcarcely any; anthers five, each tipped with an ovate bluntifh membrane; maffes of pollen ten, compreffed, fmooth, pendulous, with rather broad connecting proceffes. *Pift.* Germens two, ovate, pointed; ftyles very fhort; common ftigma pointlefs. *Peric.* Follicles two, inflated, clothed all over with numerous, long, flender, tapering, hairy, filamentous proceffes. *Seeds* numerous, imbricated, crowned with filky down.

Eff. Ch. Maffes of pollen ten, fmooth, pendulous. Crown fimple, in ten deep fegments, the intermediate ones minute. Corolla fpreading. Follicles fhaggy.

A genus of upright fhrubs, with oppofite, fometimes alternate, *leaves*. *Umbels* lateral, either axillary, or between the *footftalks*. *Flowers* rather large; the limb of the *corolla* fometimes bearded. Only two fpecies are at prefent known, both natives of fouthern Africa.

1. X. *undulatum*. Waved-leaved Xyfmalobium. Dryand. in Ait. n. 1. (Afclepias undulata; Linn. Sp. Pl. 312. Willd. Sp. Pl. v. 1. 1262. See Asclepias, n. 1. Apocynum africanum, lapathi folio; Comm. Rar. 16. t. 16.)—Leaves undulated, naked. Corolla bearded.—Native of the Cape of Good Hope. Sent to Kew garden, in 1783, by Mr. John Græfer. This is a green-houfe plant, flowering in July. Mr. Aiton marks it as a *fhrub;* but Commelin fays the thick, white, perennial *root* fends up every year, in the early fpring, two or three thick, round, green, leafy *ftems*. All authors fpeak of the *leaves* as oppofite; but in our Linnæan fpecimen, gathered at the Cape by Thunberg, they are alternate, feffile, three or four inches long, ovato-lanceolate, gradually tapering to a bluntifh point, with a thick mid-rib, and numerous interbranching veins; nearly fmooth on both fides; undulated and roughifh at the margin. *Umbels* axillary, ftalked, much fhorter than the leaves, with hairy ftalks, and linear hairy *bracteas*. *Flowers* green, their fegments denfely bearded at the extremity, with white fhaggy hairs. *Follicles* covered with fpreading hairy filaments, an inch long. Every part of the plant, when wounded, difcharges a copious milky fluid.

2. X. *grandiflorum*. Large-flowered Xyfmalobium. (Afclepias grandiflora; Linn. Suppl. 170. Thunb. Prodr. 47. Willd. Sp. Pl. v. 1. 1264. See Asclepias, n. 26.)—Leaves ftalked, hairy. Corolla fmooth.—Gathered by Thunberg, at the Cape of Good Hope, but as yet a ftranger to our gardens, nor does the Linnæan collection contain a fpecimen. The *ftem* is faid to be fimple, erect, and hairy. *Flowers* large, axillary, ftalked; but, as far as we can gather, the umbel is not elevated on a common ftalk, as in the foregoing. *Corolla* fpeckled like *Fritillaria Meleagris*, and of a fimilar colour.

XYSTARCHA, in *Antiquity*, the mafter or director of the xyftus.

In the Greek gymnafium, the xyftarcha was the fecond officer: the firft was the gymnafiarch. The xyftarcha was his lieutenant, and prefided over the two xyfti, and all exercifes of the athletæ therein.

XYSTICI, among the *Ancients*, a defignation given to the athletæ, becaufe they performed their exercifes in the xyftus.

XYSTIS, in *Ancient Geography*, a town of Afia Minor, in Caria. Steph. Byz.

XYSTRIS, in *Botany*, Schreb. Gen. 138. Poiret in Lamarck Dict. v. 8. 822, is one of thofe genera of profeffor Schreber's, to which we have adverted under Wheelera, (fee that article,) as being unintelligible to all but thofe who may have accefs to the learned author's herbarium, or to fome record in his manufcripts. The name is Greek, ξυστρις, *a curry-comb*, or *fcraper*.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Epacrideæ* of Brown?

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, lanceolate, acute, fpreading, hifpid, permanent fegments, each contracted at the bafe. *Cor.* of one petal: tube very fhort; limb in five deep, ovate, obtufe, veiny, fpreading fegments. *Stam.* Filaments five, briftle-fhaped, erect, fpreading at the fummit, fhorter than the corolla, inferted into the middle of its tube; anthers oblong, erect. *Pift.* Germen fuperior, globofe, pointed; ftyles two, capillary, erect, combined in the lower part; ftigmas obtufe. *Peric.* Drupa globofe, furrounded at the bafe by fhort, proftrate hairs, inferted into the middle of the calyx. *Seed.* Nut globofe, furrowed, of ten cells; kernels oblong.

Whether this genus be founded on fome New Holland fpecimen of the natural order of *Epacrideæ*, and whether the rigid or prickly habit of the plant fuggefted the name, can only be matter of vague conjecture. We acknowledge that the divifion of the *ftyle*, and the hifpid fegments of the *calyx*, militate greatly againft our ideas of the fuppofed natural order. In total darknefs, however, any glimmering of light is welcome, and we will therefore hazard another conjecture, not altogether inconfiftent with the former. As Schreber places *Xyftris* immediately after the *Jacquinia* of Linnæus, can it poffibly have been founded on *Jacquinia rufcifolia*, of whofe fructification no botanift, as yet, has given any fufficient account? There feems an affociation of ideas between the habit of *Rufcus*, and the name of *Xyftris;* and the globofe pointed figure of the *fruit*, as copied from Plumier in *Dill. Hort. Elth.* t. 123, anfwers to part of the above defcription, though the permanent *calyx* is drawn obtufe, and not apparently hifpid.

XYSTUS, Ξυστος, formed of ξυειν, *to polifh*, or *rub*, in the *Ancient Architecture*, among the Greeks, was a long fpacious portico, either open, or covered over; in which the athletæ, and others, practifed wreftling and running.

The xyftus made a neceffary part of a gymnafium. The athletæ, who practifed in it, were thence called *xyftici*.

Xystus, among the Romans, was an alley, or double row of trees, meeting arbor-wife at top, and forming a fhade to walk under.

Y.

Y, The twenty-third letter in the Engliſh alphabet, borrowed, originally, from the Greek υ.

It is occaſionally both vowel and conſonant. As a vowel ſome authors have judged it unneceſſary in our language, becauſe its ſound is preciſely the ſame with that of the *i*. Accordingly, it is but little uſed, except in words borrowed from the Greek, to denote their origin, by repreſenting the Greek υψιλον.

The vowel *y*, however, has a place even in ſome words purely Engliſh; and that both in the middle of them, as in *dying*, *frying*, &c. and at the end, as in *lay*, &c.

Some aſcribe the uſe of the *y*, in pure Engliſh and French words, and thoſe that have no *y* in Latin or Greek, to this; that anciently each of thoſe words was written with a double *ii*; which having ſomething aukward in it, the *y* was ſubſtituted in their place.

Others ſay, that thoſe words being anciently written, as well as pronounced, with a double *ii*, as they ſtill are in the Walloon, as *paiing*, *paiiſan*, &c. to avoid their being miſtaken for an *u* with two dots over it, they made the ſecond *i* longer than the firſt, and ſo formed the *y* without deſigning it. Some give a particular reaſon why words ending in *i* came to be written with *y*; *viz*. that the copyiſts found the tail of the *y* very commodious, in adorning the margins and bottoms of pages.

Y was much uſed by the Saxons; whence it is found for *i* in the old Engliſh writers.

When the *y* follows a conſonant, and at the end of words, it is a vowel, and has the ſound of *i*; and when it precedes a vowel, or diphthong, and at the beginning of words, it is a conſonant.

Some have thought that *y* is in all caſes a vowel; but Dr. Johnſon obſerves of *y*, as of *w*, that it follows a vowel without any hiatus, as *roſy youth*.

The Romans uſed the *y* for the vowel *u*, which they had no character for, diſtinct from the *v* conſonant; their way being to pronounce the common *u*, as we do the diphthong *ou*; and the Greek υψιλον, as the Engliſh and French *u*.

Peter Diaconus obſerves, that Auguſtus firſt took the letters *y* and *z* from the Greeks, which were not uſed by the Romans before his time; *s s* being written for *z*, and *i* for *y*. But Mr. Jackſon ſhews, that the *y* was uſed before the time of Auguſtus, though probably (ſays Aſtle, Orig. and Progr. of Writing, p. 78.) it was not much older.

In our own and ſome other modern tongues, authors begin to diſpenſe more and more with the preciſe orthography, which requires all words that have an upſilon, in the Greek, to be written with a *y*. And with reaſon; ſince our Greek *y* has loſt the ſound it had, in the language from which we borrow it. But it is certainly ridiculous to uſe it, as many do, in words which indeed have a Greek origin, but have no *u* in the Greek, as in *eclipſe*: yet ſome affect to do this.

Y is alſo a numeral letter, ſignifying 150, or, according to Baronius, 159; as in the verſe,—

"Y dat centenos et quinquaginta novenos."

When a daſh was added at top, $\bar{Y}$, it ſignified 150 thouſand.

Pythagoras uſed the Y as a ſymbol of human life; the foot repreſenting infancy, and the forked top the two paths of vice and virtue, one or the other of which people are to enter upon, after attaining to the age of diſcretion.

Y, on the French coins, denotes thoſe ſtruck at Bourges.

Y, in *Geography*, a city of China, of the ſecond rank, in Chan-tong; 317 miles S.S.E. of Peking. N. lat. 35° 10′. E. long. 118° 19′.

Y, a city of China, of the ſecond rank, in Pe-tche-li; 55 miles S.W. of Peking. N. lat. 39° 25′. E. long. 115° 14′.

Y, or Ey, a river, or broad piece of water, which paſſes by Amſterdam, exhibiting the appearance of a creek of the ſea rather than of a river.

YA, a city of China, of the ſecond rank, in Se-tchuen, on the borders of Thibet; 840 miles S.W. of Peking. N. lat. 30° 9′. E. long. 102° 39′.

YABAQUE, one of the Bahama iſlands, ſituated in N. lat. 23° 30′.

YABARGULSKAIA, a town of Ruſſia, in the government of Tobolſk, on the Irtiſch; 120 miles E. of Tobolſk.

YABAY, a town of Burmah; 50 miles S.W. of Ava.

YABTONOI, a ridge of the Altaian chain in Aſiatic Ruſſia, bending in a northerly direction to the vicinity of Ochotſk. The name denotes the mountains of Apples.

YACHT. See Ship, and *Plate* XIII. *Ship-Building*.

YACHTA, in *Geography*, a fort of Ruſſia, in the government of Irkutſk, on the borders of China; 48 miles S.S.W. of Selenginſk.

YACINTE, St. See St. *Yacinte*.

YACONG Tala, a number of ſmall lakes in Thibet, ſituated near each other. N. lat. 30° 50′. E. long. 78° 39′.

YADAVA, in *Hindoo Mythology*, a name of the Hindoo Kriſhna. It is ſaid to indicate his being of the family or tribe of Yadu.

YADI, in *Geography*, a river of Ruſſia, which runs into the Obſkaia gulf, N. lat. 68° 25′. E. long. 72° 38′.—Alſo, a river of Ruſſia, which runs into the Obſkaia gulf, N. lat. 67° 25′. E. long. 72° 18′.

YADKIN, a river of North Carolina, which riſes in the Allegany

Allegany mountains, and after a courſe of about 100 miles, changes its name to Pedee, in North Carolina; 9 miles S.W. of Salem.

YADRIN, a town of Ruſſia, in the government of Kazan; 122 miles W. of Kazan. N. lat. 55° 34′. E. long. 45° 44′.

YAEGONMEW, a town of Pegu; 58 miles S. of Prone.

YAFA. See JAFFA.

YAGARCHOCA, a lake of South America, in the juriſdiction of St. Miguel de Ibarra. It is famous for having been the ſepulchre of the inhabitants of Otabalo: upon this place being taken by Huana Capac, the 12th ynca, he, inſtead of ſhewing any clemency to them on account of their magnanimity, being exaſperated at the noble reſiſtance which they made againſt his army, ordered them all to be beheaded, both thoſe who had quietly ſurrendered, as well as thoſe taken in arms, and their bodies to be thrown into the lake: ſo that from the waters of the lake being tinged of a bloody colour, it acquired its preſent name, which ſignifies "a lake of blood."

YAGATH, in *Mythology*, a deity adored by the ancient Arabian idolaters, under the figure of a lion.

YAGO, ST. in *Geography*. See ST. *Tago*.

YAGUACHE, or ST. JACINTO DE YAGUACHE, a town of Peru, and principal place of a lieutenancy, in the province of Guayaquil; 25 miles N.E. of Guayaquil.

YAGUAHS, a town of the iſland of Cuba; 22 miles S. of Bayamo.

YAGUARIPE, a river of Braſil, which runs into the Atlantic, S. lat. 13° 12′.

YAGUARON, a town of South America, in the province of Paraguay; 10 miles S.E. of Aſſumption.

YAGUEPIRI, a river of Braſil, which runs into the Negro, 50 miles above Fort Rio Negro.

YAH, in *Hindoo Mythology*, a name of Pavana, the Hindoo god or regent of the wind; another of whoſe names is Vayu. See PAVANA and VAYU.

YAHANGA, in *Geography*, a ſmall iſland in the ſea of Japan. N. lat. 43° 8′. E. long. 131° 45′.

YAHEBIRI, a river of South America, which runs into the Parana, S. lat. 24° 20′.

YAIK, a conſiderable ſtream of Aſiatic Ruſſia, which flows into the Caſpian. The name has been recently changed for that of Ural, on account of a daring inſurrection of the tribes bordering on the Yaik.

YAITCHNEI, a ſmall iſland of Ruſſia, in the Penzinſkoi ſea. N. lat. 60° 30′. E. long. 160° 50′.

YAIVA, a river of Ruſſia, which runs into the Kama, 16 miles S. of Solikamſk, in the government of Perm.

YAK, in *Zoology*, the *bos grunniens* of the Linnæan ſyſtem, or ox with cylindric horns curving outwards, very long pendant hair, and extremely villous horſe-like tail, the grunting ox of Pennant, and yak of Tartary, has been lately particularly deſcribed by Turner, in his "Embaſſy to Tibet." He calls it the buſhy-tailed bull of Tibet; and in Hindooſtan it is denominated ſoora goy. It is about the height of an Engliſh bull, which it reſembles in the general figure of the body, head, and legs. He could diſcover no difference between them, except that the yak is wholly covered with a thick coat of long hair. The head is rather ſhort; the horns tapering from the root upwards, and terminating in ſharp points; arched inwards, and bending towards each other, but a little turned backwards near the extremities; the ears ſmall; the forehead prominent; the eyes full and large; the noſe ſmall and convex; the noſtrils ſmall; the neck ſhort and curved; the withers are high and arched; the rump low; over the ſhoulders riſes a thick muſcle, like the protuberance peculiar to the cattle of Hindooſtan, covered with a profuſion of ſoft hair; the tail compoſed of a prodigious quantity of long, flowing, gloſſy hair; the ſhoulders, rump, and upper part of the body, clothed with a ſort of thick ſoft wool, the inferior parts having ſtraight pendant hair that deſcends below the knee, and ſometimes trailing on the ground; from the cheſt, between the legs, iſſues a large pointed tuft of ſtraight hair, ſomewhat longer than the reſt; the legs very ſhort. In all other reſpects, this animal reſembles the ordinary bull. Theſe cattle appear of a large bulk; they have a downcaſt heavy look, and are, as they appear to be, ſullen and ſuſpicious, and very impatient at the near approach of ſtrangers. Their lowing is not loud, but a kind of ſcarcely audible grunting noiſe. They are paſtured in the coldeſt parts of Tibet, on the ſhort herbage peculiar to the tops of mountains and bleak plains. Their favourite haunt is the chain of mountains that is ſituated between the latitudes 27° and 28°, which divides Tibet from Bootan, and whoſe ſummits are commonly covered with ſnow. They are a valuable property to the tribes of itinerant Tartars, called Duckba, who live in tents, and tend them from place to place; they at the ſame time afford their herdſmen an eaſy mode of conveyance, a good covering, and wholeſome ſubſiſtence. They are never employed in agriculture, but are very uſeful as beaſts of burthen; for they are ſtrong, ſure-footed, and carry a great weight. Tents and ropes are manufactured of their hair, and caps and jackets are made of their ſkins. Their tails are much eſteemed; and under the denomination of *chowries*, they are univerſally uſed for driving away winged inſects, flies, and muſquitoes, and are employed as ornamental furniture upon horſes and elephants They ſupply an abundant quantity of rich milk and excellent butter, which may be kept in ſkins or bladders through the year, and to the utmoſt verge of Tartary furniſhes a very material article of commercial produce. The orientals highly value a large kind of bezoar that is ſometimes found in this animal's ſtomach. The yak is ſaid to vary in colour, as well as in the length and form of the horns. Thoſe with white tails are moſt eſteemed; and ſometimes their horns are as white as ivory.

In India no man of faſhion ever goes out or ſits in form at home without two "chowrabadars," or bruſhers, attending him, each furniſhed with one of theſe tails, mounted on ſilver or ivory handles, to bruſh away the flies. The Chineſe dye them of a beautiful red, and wear them as tufts to their ſummer bonnets.

Elian, according to Pennant, is the only ancient writer who takes notice of this ſingular ſpecies.

YAK, in *Geography*, a name given by the Oſtiaks to the *Oby*; which ſee.

YAKE DSAKE, a lake of Thibet, about 12 leagues in circumference. N. lat. 34° 40′. E. long. 90° 24′.

YAKSAI. See AKSHAI.

YAKSHA, in *Hindoo Mythology*, a race of malignant beings of hideous form, into whom the ſouls of bad men are ſaid to migrate; particularly the ſouls of ſuch as in this life are addicted to ſordid and baſe paſſions, or abſorbed too much in worldly proſperity. In the plural, they are termed Yakſhaſa; and are aſſigned as ſlaves or ſervants to Kuvera, the Plutus of the Hindoo Pantheon. Another race of beings, of a like deſcription, is called *Rakſha*. (See that article.) Rakſhni and Yakſhni are the feminines of theſe races of demons. Theſe names, and ſome note of their characters

characters and attributes, occur in the articles KUVERA, RAVENA, and SITANTA.

YAKSHNI-DEVI, a name and an inferior manifestation of the Hindoo goddess Parvati. It means goddess of malignant beings; one race of whom are in the masculine termed *Yaksha*, which article, and others thence referred to, the reader desirous of information concerning them may consult.

YAKSIMVAR, in *Geography*, a town of Russia, in the government of Viborg, on the north-west coast of lake Ladoga; 8 miles S. of Serdopol.

YAKUTSK, a town of Russia, in the government of Irkutsk, on the Lena, which is here about two leagues in width; but it is greatly impeded with ice, and navigable only by a few small boats, chiefly employed in supplying the town with provisions. This town is the capital of a province, to which it gives name: it contains between 500 and 600 houses, mostly of wood, with some stone churches, and is defended by a wooden fort. The best sables are found near this town and Nershinsk; 960 miles N.E. of Irkutsk. N. lat. 62° 5'. E. long. 129° 14'.

YAKUTSK, *the Province*. The Yakutes, or, as they denominate themselves, *Socho*, or natives of this province, are robust, and in general large; they resemble the Tartars in the cast of their features, and there is said also to be a great similarity in the idioms of these two people. Their ancient homestead extended from the Sayane mountains as far as the Angara and the Lena. Persecuted by the Buræts and Mongoles, they removed down the Lena to their present rude and inclement districts, where they are found in the government of Irkutsk on both sides of that river quite to the Frozen ocean. In the year 1620 they submitted to the Russian conquerors, and at the middle of the last century they numbered upwards of 40,000 bows; but since that time they are considerably increased. Their dress is simple, and nearly the same all the year round; the only difference is, that in winter it is made of skins; over their chemise they commonly wear a large striped waistcoat with sleeves; their breeches do not extend below the middle of the thigh, but their long boots, called *sarri*, reach above the knee. In hot weather they wear nothing but the breeches. Polygamy forms a part of the political code of this people; obliged to make frequent journies, a Yakute has a wife in every place where he stops, but he never assembles them together. Notwithstanding this licence, they are jealous to excess, and the sworn enemies of any one who shall dare to violate the rights of hospitality. When summer commences, they leave their winter habitations, and with their families and a small number of horses, make their harvests of fodder for consumption during the frost season. They repair to a considerable distance from their yourt, and to the most fertile cantons. In their absence, the horses are left to the care of the servants, and the neighbouring pastures serve for the maintenance of all their herds. Chamans, or sorcerers, are regarded as interpreters of the gods; they grant their mediation to the stupid Yakute, who implores it with trembling, but always pays for it. In the idolatry of the Yakutes, we find all the absurdities and superstitious practices of the ancient Kamtschadales, Koriaks, Tchutchis, and other inhabitants of these countries. The funerals are attended with a kind of pomp more or less magnificent, in proportion to the rank and wealth of the defunct. If a prince, he is arrayed in his finest habits, and most splendid arms. The body, placed in a coffin, is carried by the family to the tomb; deep groans announce the solemn procession; his favourite horse, and another the best in his stud, both richly caparisoned, and led by a valet, or near relation, walk by the side of the corpse. When arrived at the burying-place, they are tied to two stakes, fixed near the grave, and while the master is interred, their throats are cut over the corpse. This bloody libation is the homage paid to his attachment to these animals, who are supposed to follow him into the other world, where it is imagined that he will again be able to enjoy them. They are then flayed; the head and hide, in one entire piece, are fixed horizontally upon the branches of trees at a small distance from the grave; and such is the memorial that is erected. A fire is then kindled, and the last proof of friendship for the deceased consists in roasting and eating upon the spot these favoured animals: the feast being concluded the company disperses. The same ceremonial is observed for a woman, except that instead of a horse, they sacrifice her favourite cow. Their houses, like the yourts of the wandering Koriaks, are circular, spacious, and constructed with poles, fewer in number, but ranged in the same manner, and kept asunder by a sort of hoops at the top, the whole covered with the bark of the birch-tree, formed into pieces eighteen inches wide, placed in a downward direction. These pieces are edged with a kind of ribband, made of bark, and shaped into festoons, and the inside of the yourt is ornamented in the same manner. The taste of the ornaments is governed by the caprice of the proprietor, and there is in them a sort of wildness that is sufficiently amusing. The same decoration is annexed to the chairs and beds of the heads of families. The domestics lie upon the ground on mats or skins, and the fire is lighted in the middle of the house. See YUHAGHIRS.

YALE, a town of the island of Ceylon; 56 miles S.S.E. of Candi. N. lat. 6° 52'. E. long. 81° 20'.—Also, a river of Ceylon, which runs into the sea, on the S.E. side of the island, N. lat. 6° 23'. E. long. 81° 41'.

YALE *College*. See COLLEGE.

YALEPUL, in *Geography*, a town of Ceylon, at the mouth of the Yale; 30 miles S. of Yale.—Also, a town of the island of Ceylon, near the E. coast; 96 miles S.E. of Candi.

YALLAH'S BAY, a bay of the island of Jamaica, on the S. coast, situated to the E. of Yallah's Point.

YALLAH'S *Point*, a cape on the S. coast of Jamaica; 12 miles S.E. of Kingston. N. lat. 17° 53'. W. long. 76° 21'.

YALLAH'S *River*, a river of Jamaica, which runs into the sea, a little to the east of Yallah's Point.

YALMAL, a cape on the E. coast of Russia, in the Karskoe sea. N. lat. 72°. E. long. 68° 24'.

YALME, a river of Devonshire, which runs into the English Channel, 7 miles S.E. of Plymouth.

YALOFFS, YALLOFFS, *Jalofs*, or *Jalloffs*, an active, powerful, and warlike race of negroes, and esteemed the most handsome of those people, who inhabit a great part of that tract of Africa which lies between the Mandingo states, on the river Gambia to the S., and the Senegal to the N. and E. See JALLOFFS.

The Yaloffs differ from the Mandingoes, (see MANDING,) not only in language, but likewise in complexion and features. Their noses are not so much depressed, nor the lips so protuberant, as among the generality of Africans; and although their skin is of the deepest black, they are considered by the white traders as the most sightly negroes in this part of the continent. They are divided into several independent states or kingdoms; which are frequently at war either with their neighbours, or with one another. In

 their

their manners, superstitions, and government, however, they have a greater resemblance to the Mandingoes than to any other nation; but excel them in the manufacture of cotton cloth, spinning the wool to a finer thread, weaving it in a broader loom, and dyeing it of a better colour. Their language is said to be copious and significant, and is often learnt by Europeans trading to Senegal. Their numerals are as follow:

One - - -	Ween
Two - - -	Yar
Three - - -	Yat
Four - - -	Yanet
Five - - -	Judom
Six - - -	Judom Ween
Seven - - -	Judom Yar
Eight - - -	Judom Yat
Nine - - -	Judom Yanet
Ten - - -	Fook
Eleven - - -	Fookang Ween, &c.

Park's Travels, vol. i.

In connection with this brief account of the Yaloffs, we cannot forbear mentioning an anecdote that redounds very much to the honour of Damel, their king. On occasion of a war between Damel and Abdulkader, king of Foota Torra, a country to the W. of Bondon, the latter inflamed with zeal for propagating his religion, sent an ambassador to Damel, accompanied by two of the principal Bashreens, who carried each a knife, fixed on the top of a long pole. When they obtained admission into the presence of Damel, they announced the object of their embassy in the following singular manner:—"With this knife," said the ambassador, "Abdulkader will condescend to shave the head of Damel, if Damel will embrace the Mahometan faith; and with this other knife, Abdulkader will cut the throat of Damel, if Damel refuses to embrace it—take your choice." Damel coolly replied, that he had no choice to make; he neither chose to have his head shaved, nor his throat cut: and with this answer the ambassador was civilly dismissed.

Abdulkader with a powerful army invaded Damel's country. The inhabitants of the towns and villages filled up their wells, destroyed their provisions, carried off their effects, and abandoned their dwellings as he approached. Thus he was led on from place to place, until he had advanced three days' journey into the country of the Yaloffs. Several of his men had died with fatigue and hunger by the way. This led him to direct his march to a watering-place in the woods, where his men, having allayed their thirst, lay down, overcome with fatigue, to sleep among the bushes. In this situation, they were attacked by Damel before day-break, and completely routed. Many were killed, and a greater number taken prisoners. Among the latter was Abdulkader himself, who was led, as a miserable captive, into the presence of Damel. The behaviour of Damel on this occasion is celebrated, in terms and sounds of the highest approbation, by the singing men. When his royal prisoner was brought before him in irons, and thrown upon the ground, the magnanimous Damel, instead of setting his foot upon his neck, and stabbing him with his spear, according to the custom in such cases, addressed him in the following manner:—"Abdulkader, answer me this question. If the chance of war had placed me in your situation, and you in mine, how would you have treated me?" "I would have thrust my spear into your heart," returned Abdulkader with great firmness; "and I know that a similar fate awaits me." "Not so," said Damel; "my spear is indeed red with the blood of your subjects killed in battle, and I could now give it a deeper stain by dipping it in your own: but this would not build up my towns, nor bring to life the thousands who fell in the woods. I will not therefore kill you in cold blood; but I will retain you as my slave, until I perceive that your presence in your own kingdom will be no longer dangerous to your neighbours; and then I will consider of the proper way of disposing of you." Abdulkader was accordingly retained, and worked as a slave for three months; at the end of which period, Damel listened to the solicitations of the inhabitants of Foota Torra, and restored to them their king.

YALOVA, a town of Natolia, on the sea of Marmora, once the residence of Dioclesian; 30 miles N. of Brusa.

YALUTOROVSK, a town of Russia, in the government of Tobolsk, on the river Tobol; 108 miles S.W. of Tobolsk. N. lat. 56° 8'. E. long. 66° 32'.

YAM, in *Botany*, a large fleshy root, eatable when boiled or roasted, of which there are several species, all natives of tropical climates, and highly useful to voyagers, as they will, like potatoes, keep for a considerable time without spoiling. See DIOSCOREA.

YAM, in *Geography*. See JAMEZ.

YAMA, in *Hindoo Mythology*, is the god of the infernal regions, corresponding with the Pluto of western heathens. Yama is a very important deity: his name is of perpetual recurrence in the sacrificial ceremonies of the Hindoos; oblations and invocations to him forming a portion of many of those ceremonies. The Hindoos, as is explained under our article MARUT, have assigned regents or guardian deities to each of the cardinal and intermediate points of the world. Yama is regent of the south, or lower world, in which the Hindoos place the infernal regions; this corresponding with the Grecian Pluto or Minos. Under our article MENU, the great law-giver of that name is supposed to have been the same person as the Minos of antiquity. Yama has many names; and in his character and functions is found related to many important personages of sacred and profane history. Among his names are, *Dherma-raja*, or king of justice; *Pitripeti*, lord of the Pitris, or patriarchs (see PITRIS); and *Mritu*, meaning death; a name also of *Kala*, or *Siva*. (See those articles.) *Susan-yama*, and *Vaivaswata-yama*, are others of his names, derived, it is said, the first from a term denoting comeliness or beauty, the other from his solar origin; Yama being of the race of the sun, of which some explanation will be found under our article SURYAVANSA. He is also named *Sradha-deva*, or lord of the obsequies, in honour of deceased ancestors, of which a copious account is given under SRADHA. As well as the Seventh Menu, Yama bears likewise the name of *Satyavrata*. He is also named *Adhumbara*; this name is said to be derived from a species of wood, by the attrition of which fire is produced, wherewith to light the pile on which funeral obsequies are performed to Yama. Every thing connected with the important element of fire is peculiarly mystical with the Hindoos. Touching the sacrificial and other fires, the reader will find many particulars under our articles PAVAKA, SAGNIKA, SAMI, and others thence referred to. *Anheka* is another name of Yama; it means *death*, or the *destroyer*: thus the compound *Kal-anheka-yama* is Yama, the destroyer of Kal or Time, a personification of great boldness and extent. *Kal* is also a name of Yama. (See KAL.) Yama has other compound names, meaning the slayer of all beings, king of deities, reducer of all things to ashes, the dark-blue deity, of wolf-like

like belly, the variegated being, the wonderful inflictor of pains, &c.

His abode is in the infernal city of Yamapur, whither the Hindoos believe that a departed soul immediately repairs; and receiving a just sentence, ascends to Swerga, the first heaven, or descends to Nareka, the snaky hell; or is returned to earth, according to its merits or demerits, where it assumes the form of some animal, unless its offences had been such as deserved condemnation to a vegetable or even to a mineral prison. This extensive theory of transmigration is of a very poetical tendency, affording great scope for the imagination, which the mystical and enthusiastic turn of Hindoo metaphysicians or theologians has amply indulged in.

Mr. Wilford believes Yama to be the same with Serapis; deriving the latter from a Sanskrit term, implying thirst of blood. In the Puranas, Yama is described as attended by two dogs, named Serbura and Syama; the first name signifies *varied*, and it has other appellations meaning *stained* or *spotted*. When we add that it was also called *Tri-siras*, or the three-headed, little doubt can be entertained of its being the same with the Cerberus of the Greeks. *Syama* means *black*. See SERBURA, SYAMA, and TRI-SIRAS.

As Dherma Raja, or the king of justice, Yama is described in the Puranas as having two countenances. "One, called his divine countenance, is mild and benevolent; and those only see it who abound in virtue. In this form, he is called an emanation of Vishnu. He is attended by a servant named Karmala, who conducts the righteous on self-moving cars into the presence of their judge. His other countenance or form is more especially named Yama. He is then depicted with large teeth and a monstrous body, and is thus seen only by the wicked. His attendant is named Kashmala, who drags the wicked with ropes round their necks over rugged paths; and at the command of Yama some are beaten, some cut to pieces, some devoured by monsters, and thrown headlong into hell. He is unmerciful, hard is his heart, and every one trembles at his sight."

Yama is the name of a celebrated legislator, whose enactments are still venerated by the Hindoos. For his profound knowledge and justice, he is said to have been made the judge of departed spirits.

In the seeming contradictions of mythologists, Yama is found to be identified, or nearly so, with both *Siva* and *Vishnu*, (see those articles,) as well as with Menu, Kala, and others. This may be reconciled, as in the mythology of Greece, by recollecting that almost all the deities melt into one. Proserpine or Hecate is given to Pluto as a help-mate, being but another form of Diana. Thus Yama has a form of Parvati assigned him, under the name and character of Pataladevi, or goddess of the infernal regions. (See PATALADEVI.) In heaven Diana is Luna, and Parvati is Swardevi, or queen of heaven. On earth they are distinguished by the names of Diana and Bhudevi, the latter meaning goddess of the earth. These similarities or coincidences could be carried to a great extent.

Some of the ceremonies still in use as propitiating Yama, or his consort *Sakti*, (which see,) have been found by sir W. Jones and others, as strikingly resembling those of the Eleusinean goddess; and there can be no doubt but the investigation of the mythological fables of the Hindoos has thrown great light, and may throw still greater, on many obscure and unintelligible passages of our ancient poets of Europe.

We do not find any direct representation of Yama, or any minute description of his person and attributes, in the mythological works before the public; nor many particulars of his family. We have already noticed him as the offspring of the sun; this he shares in common with several other of the heroic personages of the Hindoos. Yama is indeed one of the many names of Surya, or the sun. The river Yamuna, or Jumna, or rather perhaps the damsel who was poetically metamorphosed into that interesting stream, is fabled as the twin sister of Yama. She is poetically called the "blue daughter of the sun." Days are especially set apart for certain ceremonies to their honour. On one, Yamuna is said to have entertained her brother; and the remembrance of it is preserved in an existing usage of Hindoo young ladies feasting and making their brothers presents on its anniversary. In the Rig-veda (see VEDA), a dialogue is given, in which Yama endeavours to seduce his beauteous sister: but his base offers are rejected by her with virtuous expostulation. In some accounts, a divinity named Swadha is described as the goddess of funeral obsequies; and as such we should expect to find her closely allied to Yama, but know little of the relationship. We have noticed her under the article SWADHA. Several other of our articles contain some particulars of Yama. See KASYA, KRITANTA, SRADHADEVA, TAPAS, and VAIVASWAT.

YAMAMAK, in *Geography*. See JAMAMA.

YAMANCHALINSKOI, a town of Russia, in the government of Caucasus, on the Ural; 20 miles N. of Guriev.

YAMASCA, a river of Canada, which runs into the St. Laurence, N. lat. 46°. W. long. 72° 45′.

YAMASCO, a town of Canada, at the conflux of the Yamasca with the St. Laurence.

YAMBLAK, one of the *Aleutian islands*; which see.

YAMBO. See JAMBO.

YAMBURG, a town of Russia, in the government of Petersburg, on the Luga. The cloth manufactory at this place was instituted by Catharine II., presently after her accession to the throne: it contains 36 looms, and employs 600 persons. The cloths are sold at St. Petersburg at a low price; 20 miles E. of Narva. N. lat. 59° 15′. E. long. 28° 40′.

YAMEOS, a town of South America, in the audience of Quito, on the river Amazons; 36 miles W.S.W. of St. Joachim de Omaguai.

YAMIMKA, a river of Russia, which rises in the government of Tobolsk, and runs into the Irtisch, 14 miles S.S.W. of Kozlovo.

YAMINA, a town of Africa, in the kingdom of Bambarra, near the Niger. This town, according to Mr. Park, was large, covering the same extent of ground as Sansanding; but having been invaded and plundered a few years since by the king of Kaarta, it was, when he was there, half in ruins. N. lat. 13° 46′. W. long. 3° 50′.

YAMON BAY, a bay on the north coast of the island of Luçon. N. lat. 14° 21′. E. long. 122° 37′.

YAMSCHEVSKAIA, a fort of Russia, in the government of Kolivan, on the Irtisch. N. lat. 51° 55′. E. long. 77° 50′.

YAMSKAIA, a gulf of Russia, in the Penzinskoi sea, between Cape Piliatchin and the continent. N. lat. 60° 20′. E. long. 154° 14′.

YAMSKOI, a town of Russia, near the gulf of Yamskaia; 2500 miles E. of Tobolsk. N. lat. 60° 12′. E. long. 153° 34′.

YAMUMINTI, in *Hindoo Mythology*, the name of one of of the wives of the amorous Hindoo deity Krifhna. Her name feldom occurs.

YAMUNA, in *Geography*, a river of India, which takes its rife, as is fuppofed, in the great range of mountains called Himalaya. Its fource has not been accurately explored, but it probably is not more remote than that of the Ganges, which rifes in the fouthern part of that range. The Yamuna flows through the province of Srinagara, or Serinagur, in a foutherly courfe, nearly parallel with the Ganges, approaching its fifter ftream to within forty miles, at the village of Garudavara (Gurudwar), in N. lat. 30° 22′; it is then of nearly equal width. The Yamuna enters Hindooftan Proper, in the province of Delhi, varying its diftance from eighty to fifty miles from the Ganges. The country between them is called Dooab, a word meaning two waters, or watered by two rivers. It is a very fertile diftrict. The rivers approximate and join at Allahabad, an important fortrefs and military ftation under the Bengal government, when the Yamuna, little inferior in magnitude, has its name and waters abforbed in the more celebrated ftream. Its length, of courfe under its own name, is eftimated at about nine hundred miles.

For many miles of its courfe, the Yamuna, or Jumna, as it is more properly called, was confidered a boundary to the Britifh territories, dividing them from the poffeffions of the Mahrattas. But from its fhallownefs, being fordable in many places in the dry feafon, it was not an important military barrier; and for the fame reafon is of lefs confequence for the operations of commerce.

The confluence of any two rivers is viewed with holy refpect by Hindoos,—of thefe two grand ftreams more particularly. To heighten the myfticifm, (any *ternary* connection being ftill more deeply venerated,) it is feigned that a third river, the Sarafwaty, joins the other two by a fubterranean communication at Allahabad. Frequent allufion is made to this occult union by mythological poets, who teach that thefe three rivers are terrene manifeftations of the three great goddeffes, Parvati, Lakfhmi, and Sarafwati; the Sakti, as they are called, or active energies of their refpective lords, Siva, Vifhnu, and Brahma, who compofe the Hindoo triad of divinity. Of thefe perfonages fufficient will be found in the articles given under their feveral names in this work. The fable of the "three plaited locks," as this fuppofed union of thefe rivers is poetically called, often occurs in the writings of the Hindoos: it is noticed in our articles JUNCTIONS, TRIVENI, and ZENNAR. Under SUICIDE, an account is given of the fuppofed pronenefs of the Hindoos to this crime. At the confluence now under our notice, it not only lofes its fin, but affumes a meritorious form. Of this, fee more under SUTTEE.

The river goddefs Yamuna is made by mythologifts to be the fame with Lakfhmi, confort of Vifhnu, and twin fifter of Yama, the judge of departed fpirits, and ruler of the infernal regions. Of thefe perfonages fufficient occurs under their refpective names.

YAMUTHA, one of the Aleutian iflands. N. lat. 53° 40′. E. long. 180° 29′.

YAMYA KONDA, a town of Africa, in the kingdom of Yani.

YAMYAMA KUNDA, a town of Africa, in the kingdom of Tomani.

YANA, a river of Ruffia, which rifes in a lake, fituated in lat. 63° 40′, long. 131° 14′, and running due north, being fupplied by many fmall ftreams, empties itfelf in the Frozen fea, N. lat. 71° 25′. E. long. 131° 16′. At its difcharge it forms five confiderable rivers, which iffue in a capacious bay.

YANAM, a town of Hindooftan, in the circar of Rajamundry; 28 miles S.E. of Rajamundry.

YANATONG, a town of Burmah; 40 miles S. of Mellone.

YANAUCA, a fmall ifland at the mouth of the river of the Amazons; 10 miles N. of Caviana.

YANDABOO, a town of Birmah, on the Irawaddy, remarkable for its manufacture of earthenware; 70 miles W.S.W. of Ava.

YANDINSKOI, a town of Ruffia, in the government of Irkutfk, on the Angara; 160 miles N.N.W. of Irkutfk. N. lat. 54° 30′. E. long. 103° 20′.

YANFONG, a town of Corea; 40 miles E.S.E. of Ou-tchuen.

YANG, a town of Corea; 13 miles E. of King-ki-tao.

YANGBONRAW, a town of Pegu; 60 miles S. of Lundfey.

YANG-CONG, a river of China, which runs into the Kincha river, near Lo-choui-tong.

YANG-HO, a river of China, which joins the San-camho, N. lat. 40° 23′. E. long. 112° 49′.

YANG-KIN, a town of the kingdom of Corea; 15 miles S.E. of King-ki-tao.

YANG-LI, a city of China, of the fecond rank; 1157 miles S.S.W. of Peking. N. lat. 22° 54′. E. long. 106° 35′.

YANG-TCHEN, a town of Corea, in Tchufin; 150 miles S.S.W. of King-ki-tao. N. lat. 35° 19′. E. long. 125° 14′.

YANG-TCHEOU, a city of China, of the firft rank, in Kiang-nan, fituated on the bank of the royal canal, which extends from the Ta-kiang northwards to the river Hoang-ho, or the Yellow river: it carries on a great trade in all manner of Chinefe works, and is rendered extremely populous, chiefly by the fale and diftribution of the falt that is made on the fea-coafts of this jurifdiction and parts adjoining, and which is afterwards carried along fmall canals made for this purpofe, which end in communication with the great canal; 485 miles S.S.E. of Peking. N. lat. 32° 26′. E. long. 118° 54′.

YANG-TCHUEN, a town of Corea; 35 miles W.S.W. of King-ki-tao.

YANG-TE′, a town of Corea; 84 miles E. of Hantcheou.

YANG-TSE-KIANG, a river of Afia, which rifes in the mountains of Thibet, and after croffing the empire of China, from eaft to weft, empties itfelf into the fea, 120 miles E. from Nan-king. This river changes its name almoft in every province through which it paffes. See KINCHA.

The Yang-tfe-kiang may be confidered as equalling, if not exceeding in fize, the YELLOW *River* (which fee). The fources of both thefe rivers are in the fame range of mountains, and they approach one another in one part within a few miles. The Yang-tfe-kiang, according to Mr. Barrow's ftatement, confifts of two diftinct branches, which feparating from each other about eighty miles, flow in a parallel direction to the fouthward for the fpace of 70 miles, and then unite between the 26th and 27th degrees of N. latitude, juft at the boundaries of the two provinces of Yunnan and Sechuen. Then ftriking off to the N.E. directly through the latter of thefe provinces, collecting the waters of the numerous rivers that defcend towards it from that and another province called Quee-choo, it continues in this direction about 600 miles, and then enters the province of Hoo-quang, in the

31ſt degree of N. latitude. Through this province it takes a ſerpentine courſe, and receives the waters of ſeveral lakes, with which this part of the country abounds. Leaving Hoo-quang, it paſſes between the province of Ho-nan and Kiang-ſee, and with a little inclination from the E. towards the N., its copious ſtream glides ſmoothly through the province of Kiang-nan, and is diſembogued into the ſea, which bounds China to the E. in the 32d degree of N. latitude. The diſtance from thence to Hoo-quang is about 800 miles, which makes the whole length of the river about 2200 miles. The current, where the yachts of lord Macartney's embaſſy paſſed it, did not exceed in the ſtrongeſt part two miles; but it was much deeper than the Yellow river. There theſe two great Chineſe rivers, taking their ſources in the ſame mountains, paſſing almoſt cloſe to each other in a particular ſpot, ſeparating afterwards from each other to the diſtance of 15 degrees of latitude, finally diſcharge themſelves into the ſame ſea, within two degrees of each other; comprehending within their graſp a tract of land of above 1000 miles in length, which they contribute greatly to fertilize and enrich, though by extraordinary accidents occaſioning unuſual torrents, they may do injury in particular inſtances. This tract includes the principal portion of the Chineſe empire in ancient times; and lies in that part of the temperate zone, which in Europe, as well as in Aſia, has been the ſcene where the moſt celebrated characters have exiſted, and the moſt brilliant actions been performed, which hiſtory has tranſmitted to poſterity. When the gentlemen of the embaſſy had croſſed the Yang-tſe-kiang, they found that, inſtead of a flat country, lakes, and ſwamps, the ground roſe gradually from the margin of the river, enriched with various kinds and tints of culture, interſperſed with trees, temples, and pagodas. In the river were iſlands ſkirted with ſhrubbery, and rocks riſing abruptly from the ſurface of the water. The waves rolled like thoſe at ſea, and porpoiſes are ſaid to be ſometimes ſeen leaping amongſt them: ſeveral junks were lying at anchor. In the middle of the river is the iſland called "Chin-ſhan," (which ſee.) The ground to the ſouthward of the river gradually roſe to ſuch a height, that it was found neceſſary to cut down the earth in ſome parts to the depth of near 80 feet, in order to find a level for the paſſage of the canal. The land in this neighbourhood is chiefly cultivated with that particular ſpecies or variety of the cotton-ſhrub that produces the cloth uſually called Nankeens in Europe. The down enveloping the ſeed, or cotton-wool, is whole in the common plant; but in that growing in the province of Kiang-nan, of which the city of Nan-kin is the capital, the down is of the ſame yellow tinge which it preſerves when ſpun and woven into cloth. The colour, as well as the ſuperior quality of this ſubſtance in Kiang-nan, was ſuppoſed to be owing to the particular nature of the ſoil; and it is aſſerted, that the ſeeds of the Nankeen cotton degenerate in both particulars when tranſplanted to another province, however little different in its climate. Lord Macartney's Embaſſy, vol. ii.

YANG-TSI, a town of Corea; 30 miles S. of King-ki-tao.

YANI, a kingdom of Africa, ſituated to the eaſt of Burſali, and divided into Upper and Lower, on the north ſide of the river Gambia. See PISANIA.

YANIMAREW, a town of Africa, in the Lower Yani.

YANIMAZCU, a town of Africa, in the kingdom of Yani. N. lat. 13° 40'. W. long. 14° 1'.

YANKEON, a mountain of Thibet; 30 miles N. of Zuenga.

YANKJA, a town of Aſſyria, near the Tigris, and not far from Bagdad. This place and alſo Doueſlla are ſmall ſtraggling towns, every houſe being ſurrounded by a ſeparate mud-wall.

YANTAC, a town of Thibet; 28 miles S.W. of Harachar.

YAN-TCHIN, or VAN-TCHIN, a city of China, of the ſecond rank, in Quang-ſi; 1177 miles S.S.W. of Peking. N. lat. 23° 1'. E. long. 106° 51'.

YAN-TINCOU, a town of Thibet; 75 miles E.N.E. of Pa.

YANTRA, a word denoting a myſtical figure among the Hindoos; alſo a mathematical inſtrument uſed in any ſcience or art of an occult nature. An inſtrument uſed in aſtronomical obſervations, called Golayantra, or the ſpheric yantra, is deſcribed in the ninth volume of the Aſiatic Reſearches, art. 6, as ſimilar to our armillary ſphere. The article now referred to by Mr. Colebrooke, preſident of the Aſiatic Society of Calcutta, is very curious and important. The Hindoos, being ſo prone to myſticiſm, can fancy various wiſhes in occult figures and practices. Figures ſimilar to the magic ſquares, abracadabra, &c. of weſtern wizards, are ſtill uſed and venerated by the knaves and fools of Aſia; theſe are generally called yantra: as are peculiar figures or hieroglyphics, appropriated to certain Hindoo deities, whoſe followers or ſectaries mark their foreheads therewith, and deem them of a ſanctifying tendency. The nature of theſe various yantras, with ſuitable inſtructions and warnings as to their formation, uſes, and purpoſes, are taught in a Sanſkrit book, entitled "Agamaſaſtra, or Occult Science." It may be noticed in paſſing, that the word Agama, meaning in the Sanſkrit tongue hidden, myſterious, ſecret, &c. ſeems to have had in various languages and regions a ſimilar meaning, as to which it may ſuffice to refer to our articles OGHAM, O'M, and SHASTAH.

Combined with and related to the yantra, are certain imprecations, incantations, charms, philtres, &c. called Mantra and Tantra, which occur frequently in Hindoo writings, and of which ſome notice is taken in this work under thoſe words.

YAO, in *Geography*, a city of China, of the ſecond rank, in Chen-ſi; 485 miles S.W. of Peking. N. lat. 35° 54'. E. long. 108° 31'.

YAO-NGAN, or YAO-GAN, a city of China, of the firſt rank, in Yun-nan. The territory of this city is conſiderable, although it contains but two cities, one of the ſecond order, and the other of the third. It is intermixed with mountains, which are covered with fine foreſts and fruitful valleys, and produces abundance of muſk: near the city there is a well of ſalt water, from which they make very white ſalt; 1175 miles S.W. of Peking. N. lat. 25° 33'. E. long. 101°.

YAO-TCHEOU, a town of Chineſe Tartary; 380 miles E.N.E. of Peking. N. lat. 40° 43'. E. long. 122° 14'.

YAO-TCHEOU, or YAO-CHOO-FOO, a city of China, of the firſt rank, in Kiang-ſi, ſituated on the S.E. bank of the lake Po-yang. It has ſeven towns of the third rank in its juriſdiction. In this town is a large manufacture of porcelain, from whence, as well as from King-te-ching, it is ſent to Nem-chang-foo; 670 miles S. of Peking. N. lat. 29°. E. long. 116° 14'.

YAP, among the *Hindoos*, is a ſilent meditation on the names, attributes, and powers of the Deity. Great merit is aſcribed to this ſpecies of devotion, which is otherwiſe, though we apprehend leſs correctly, ſpelled *jap;* under which article we find we have ſufficiently deſcribed it, although reference has occaſionally been made to this article;

ticle; which is therefore thus given, chiefly to point to the more lengthened defcription.

YAP *Ifland*, in *Geography*, one of the group called *Carolines*; which fee. In this ifland, a kind of crocodile is the object of their worfhip. Here are alfo a number of magicians, who impofe upon the credulity of the inhabitants, by leading them to believe, that they have communication with the evil fpirit; and by this impofition, they commit with impunity all forts of crimes. They procure maladies and even death to thofe whom it is their intereft to deftroy.

YAPANDAIN, a town of the empire of Birmah, on the Irawaddy; 40 miles W. of Ava.

YAPIZLAGA, or LLANOS DE MANSO, a province of South America, in the vice-royalty of Buenos Ayres, of great extent, fituated to the fouth of the Vermejo river. This country was formerly called Llanos de Manfo, or the Plains of Manfo, from a captain of that name, who in 1556 undertook to build a town: but when he thought himfelf in perfect fecurity, he, with all his attendants, was murdered by the Indians; of whom there are feveral nations. The country is but little known.

YAPOC, a river of Surinam, which runs into the Atlantic, near Cape Orange.

YAPON, in *Botany*, a fpecies of *ilex*. See HOLLY.

YARACUI, in *Geography*, a river of Venezuela, which runs into the Spanifh Maine, N. lat. 10° 28′. W. long. 68° 40′.

YARANSK, a town of Ruffia, in the government of Viatka; 72 miles S.W. of Viatka. N. lat. 55° 36′. E. long. 48° 34′.

YARAY, a town of Africa, in the kingdom of Kayor; 80 miles S.E. of Amboul.

YARBA, a town of Africa, and capital of a country, called Yarra; 430 miles S.W. of Tombuctoo.

YARD, *Virga*, a long meafure, ufed in England and Spain; chiefly to meafure cloth, fluffs, &c.

The Englifh yard contains three feet. It was firft fettled by Henry I. from the length of his own arm. See MEASURE.

The Englifh yard is juft feven-ninths of the Paris ell; fo that nine yards make feven ells. To reduce ells, therefore, into yards, fay, If feven ells give nine yards, how many yards will the given number of ells give?

Yards are converted into ells Flemifh, by adding a third part; into ells Englifh, by fubtracting a fifth part; or multiplying by 8, and cafting off the right-hand figure. Ells Englifh are converted into yards, by adding a fourth. To turn ells Flemifh into yards, fubtract one quarter.

The Spanifh vara, or yard, chiefly ufed at Seville, is, in fome places, called *barra*. It contains feven twenty-fourths of the Paris ell; fo that feventeen ells make twenty-four Spanifh yards.

YARD, in *Anatomy*, the penis, or virile member; ferving for the evacuating of the urine and feed.

It is alfo the common name for the penis in moft animals.

YARD *of Land*, *Virgata Terræ*, or *Virga Terræ*, is a certain quantity of land, but that various, according to the place. At Wimbledon, in Surrey, it is only 15 acres; but in moft other counties it contains 20, in fome 24, in fome 30, and in others 40 or 45 acres.

"Virgata terræ continet 24 acras; et 4 virgatæ conftituunt unam hidam, et quinque hidæ conftituunt feodum militare." MS. Abbat. Malmef. See CARRUCATE, HIDE, and KNIGHT'*s Fee*.

YARD, in *Agriculture*. See FARM-*Yard*.

YARD-*Manure*. See FARM-*Yard*, COMPOST, DUNG, MANURE, and MANURING.

In order to prevent the vegetation of weeds in this manure, the manure is turned up in the yard in rows when it is about two feet in depth, leaving proper room between each row to put the frefh dung from the ftables, cowhoufes, and hog-fties. After the manure thus thrown up has got a fair heat, it is again turned over, which moftly deftroys or prevents the weeds from growing, when the manure is ready for being taken out upon the land.

The ufes and powers of the long and fhort yard dungy manure are very different in different ftates of it.

The opinions and practice of the farmers in the county of Norfolk, in regard to the ufe of long or fhort dung or yard manure, are much divided. Comparative trials are wanting to fully afcertain this important point.

It is, however, a prevailing idea in the above county, that long dung is beft for ftrong land, and fhort for light foils; but that the general practice is that of fpreading fhort in all cafes.

In Effex, too, it is now the practice of many enlightened farmers to make ufe of long dung or yard manure with great advantage; though what may be faid to be the general cuftom of the diftrict is to clamp and employ that which is in the fhort ftate. Some farmers there, however, do not like to fee their yard-manure too long in the heaps, as there is lofs in turning it. In the practice of dunging for wheat, it was there obferved, on long and extenfive experience, that it fhould be *long frefh* dung, as the fuperiority of fuch dung to that which the farmers fo generally prefer, fuch as has been moved and turned over until quite rotten, was, one load of it, worth fix of that of a year old and rotten, as with fuch dung a crop of wheat is always certain.

In Oxfordfhire, and many other counties, the fame is the cafe with many farmers, though the common practice is to mine and turn yard-manure until it is reduced into the fhort ftate, and then to apply it to the land.

On this very interefting point of management, the writer of a late work on Agricultural Chemiftry has fuggefted, that a flight incipient fermentation is undoubtedly of ufe in the heaps of this fort of manure, as by means of it a difpofition is brought on in the woody fibre to decay and diffolve, when it is carried to the land, or ploughed into the foil; and that this fort of fibre is always in great excefs in the refufe of the farm, efpecially that of the yards: but that too great a degree of fermentation is very prejudicial to fuch mixed yard-manure, when in the heaps; and that it is better that there fhould be no fermentation at all before the manure is ufed, than that it fhould be carried too far, the excefs of fermentation tending to deftroy and diffipate the moft ufeful part of the manure.

During the violent fermentation which is neceffary for reducing farm-yard manure to the ftate in which it is termed *fhort muck* or *dung*, not only a large quantity of fluid, but likewife of gafeous material is loft; infomuch that the dung or manure is reduced one-half, two-thirds, or more of its weight; and that the principal claftic matter difengaged is carbonic acid with fome ammonia; both of which, if retained by the moifture in the foil, would be capable of becoming an ufeful food or nourifhment of plants.

Befides the diffipation of gafeous matter when fermentation is pufhed to the extreme, as in the cafe of fhort dung, there is another difadvantage attending it in the lofs of *heat*, which, if excited in the foil, is ufeful in promoting the germination of the feed, and in affifting the plant in the firft ftage of its growth, when it is moft feeble and moft liable to difeafe: and the fermentation of the manure in the foil muft be particularly favourable to the wheat-crop, in preferving a genial temperature beneath the furface late in the autumn and during winter. Moreover, it is a general principle in chemiftry, that in all cafes of decompofition, fubftances combine much more readily at the moment or time of their difengagement, than after they have been perfectly formed: and in fermentation beneath the foil the fluid matter produced is applied inftantly, even while it is warm, to the organs of the plant, and confequently is more likely to be efficient, than in fhort dung or manure that has gone through the procefs; and of which all the principles have entered into new combinations.

The writings of fcientific cultivators allege many arguments and facts which favour the application of yard-dung in a frefh or long ftate; and it is fuppofed, that perhaps there is no fubject of inveftigation in which there is fuch an union of theoretical and practical evidence and proof.

The main objection againft the ufe of flightly fermented or long yard-dung or manure is, that weeds rife more luxuriantly and in greater numbers where it is had recourfe to: but though feeds thus carried out will certainly fprout, it is but feldom that this can be the cafe to any extent; and if the land be not clean of weeds, any kind of manure, long or fhort, fermented or unfermented, will caufe their rapid growth.

The application of yard-dung, or manure in the long ftate, is highly advantageous with regard to the quantity or extent of the improvement which may be produced, as nearly four loads of it are moftly required to form one of the fhort kind.

There is another queftion connected with this fubject, which is not of lefs intereft or importance to the farmer to have decided, which is that of the fuperior advantage of confuming the ftraw of the farm by animals, or of having it littered and trodden into dung or manure in the yards. Many of the moft enlightened farmers in the firft of the above counties, the writer of the account of the agriculture of it fays, are againft the former of thefe practices, though a large part of them is in the cuftom of it: and they have frequently, too, recourfe to the method of buying oil-cake, even often at a lofs, in order that their ftraw may be trodden into dung or manure by fattening beafts, which is an excellent management of the yard kind.

Yard-*Fallen*, a term ufed among our farriers to exprefs a malady to which horfes are fometimes fubject, which is the hanging down of the penis from its fheath between the legs, the creature not being able to draw it up again. This is caufed by weaknefs of the peculiar mufcles which fhould act in the drawing up; and proceeds fometimes from a violent flip or ftrain, fometimes from a blow on the back, and fometimes from extreme wearinefs in long journeys.

The method of curing this is, firft to wafh it with oil of rofes, after this with warm white wine, and finally, to anoint it with a mixture of oil of rofes and honey; it is then to be returned into its place, and kept from falling down again by a little canvas bolfter. It is to be thus dreffed once in twenty-four hours, till the cure is perfected.

There are fome other diftemperatures to which this part is fubject in a horfe, as the being foul at the end, fo that the creature voids his urine in the fheath; in this cafe, the method of cure is to draw out the penis, and cleanfe the end of it from any foulnefs that may be found there; then it is to be wafhed with butter and white wine vinegar melted together: fometimes there is a difcharge of yellow ftinking matter from the penis; this is peculiar to ftone-horfes, and principally affects them after the time of their covering of mares.

This running is attended with a fwelling of the penis, and with a pain in voiding the urine; the creature alfo finds a difficulty in drawing up the penis into the fheath.

The method of cure is, to diffolve in a pint of white wine an ounce of roach-alum by boiling; and four or five times a day this is to be ufed, injecting it up into the yard with a fyringe, blood-warm. This will prove a certain cure.

Yard-*Foul*, the filthy, furred ftate of the yard and fheath in animals of the horfe kind, which fometimes produces difeafe.

It is removed by well wafhing and cleaning the parts, by the free ufe of foft-foap and water.

Yard, *Mattering of*, a difeafe in the yards of horfes, produced by different caufes, in which matter is formed. It is removed by the ufe of cooling wafhes, and keeping the parts clean and perfectly free from dirt and naftinefs.

Yard, *Sheep*. See Sheep-*Yard* and Standing *Fold*.

Yard, *Stable*. See Stable.

Yard, *Stack*. See Farm-*Yard*, Stack, and Stack-*Yard*.

Yard, *Straw*. See Straw-*Yard*.

Yards, in a *Ship*, are long cylindrical pieces of fir-timber, fufpended to the mafts of fhips, &c. to extend the fails to the wind.

All yards are either fquare or latteen; the former are fufpended athwart the mafts by the flings, at right angles, and the latter at one-third their length, obliquely.

The proportional lengths of yards are as follow, particularly in the royal navy:—Main-yard, eight-ninths the length of the main-maft; fore-yard, feven-eighths of the main-yard; mizen-yard, fix-fevenths of the main-yard; main-topfail-yard, five-fevenths of the main-yard; fore-topfail-yard, feven-eighths of the main-topfail-yard; mizen-topfail-yard, two-thirds of the main-topfail-yard; topgallant-yards to 74-gun fhips, two-thirds all under three-fifths of their topfail-yards; royal-yards, half of the topfail-yards; crofs-jack-yard and fpritfail-yard, the fame as the fore-topfail-yard; fpritfail-topfail-yard and driver-yard, the fame as the fore-topgallant-yard; and the ftudding-fail-yards, four-fevenths of their booms.

Proportion of diameters of main and fore yards at the flings is one-quarter of an inch to every foot in their length; mizen-yard, two-thirds the diameter of the main-yard; topfail-yards, five-eighths of an inch to every yard in the length; topgallant-yards, three-fifths of an inch to every yard in the length; royal-yards, half the diameter of the topfail-yards; fpritfail-yard and crofs-jack-yard, the fame diameter as the fore-topfail-yard; fpritfail-topfail-yard and driver-yard, the fame diameter as the fore-topgallant-yard; and the ftudding-fail-yards, one inch diameter to every five feet in the length.

The fquare yards are of a cylindrical furface the greater part of their length. They taper from the middle, which are called the *flings*, towards the extremities, which are termed the *yard-arms;* and the diftance between the flings and the yard-arms on each fide is divided into quarters, which are diftinguifhed into the firft, fecond, and third quarters, and yard-arms, which are regularly tapered by the following proportions. The firft quarter, or that next the flings or middle, thirty thirty-ones of the given diameter; the fecond quarter, feven-eighths; the third quarter, feven-tenths; and the arms or ends, three-fevenths. From a middle line ftruck on the tree or fpar the yard is to be made from, half of the feveral dimenfions above is to be fet ſet off, and the yard then ſawn to its ſiding; it is then canted, and a middle line ſtruck on one of thoſe ſides, and the middle and the quarters ſquared up thereon from the middle line on the firſt ſide, and the ſame diameters ſet off as before, then lined and ſawn ſquare to the upper ſide; it is then ſawn eight-ſquare the whole length.

The main and fore yards (*fig.* 17. *Rigging, Plate* II.) are then trimmed ſixteen-ſquare, and rounded from one quarter on each ſide the ſlings to the outer ends, except on the aft-ſide, which muſt remain eight-ſquare two-quarters on each ſide the middle. The whole is then planed fair and ſmooth.

In merchant ſhips they have a ſheave-hole in their arms for the topſail-ſheets, and are left ſquare the length of the ſheave-hole; but this method weakens the lower yards.

Topſail-yards (*fig.* 18. *Rigging, Plate* II.) being trimmed ſixteen-ſquare, are rounded and planed from the firſt quarter on each ſide the middle to their outer ends, and a ſheave-hole cut from their upper ſide, its length within each outer end for the reef-tackles. In ſome merchant ſhips a hole is cut within the cleats for the top-gallant-ſheets, but is better avoided, as it weakens the yard-arms.

Topgallant-yards (*fig.* 19. *Rigging, Plate* II.), royal-yards, croſs-jack-yards, mizen-yards, ſprit and ſprit-topſail-yards, ſtudding-ſail and driver yards, are trimmed eight-ſquare, ſixteen-ſquare, and then rounded and planed fair and ſmooth from end to end throughout the length.

Battening of Yards.—Main and fore yards, main, fore, and mizen topſail-yards, have oak battens nailed on their ſquares nearly the ſame length and breadth, one inch to three-quarters of an inch thick; their ends rounded and ſnaped, and the edges chamfered. The fore-ſide has no battens.

Cleating of Yards.—The ſling-cleats, *a a*, (*fig.* 17. *Rigging, Plate* II.) nailed on the fore-ſide of the main and fore yards, are once and a quarter the given diameter of the yard in length, with a ſhoulder one-third its length; the breadth one-fourth the length; the thickneſs two-thirds the breadth, made of elm, and nailed once the given diameter on each ſide the ſlings.

Stop-cleats, *b*, (*fig.* 17. *Rigging, Plate* II.) are made of oak, and nailed within the arms, on the fore-ſide and aft-ſide of the lower yards, one inch and a half to every yard in their length. Their length half the given diameter of the yard; the breadth one-fourth its length; and its thickneſs two-thirds its breadth. Yards for merchant ſhips have their cleats ſometimes raiſed from the ſolid.

Topſail-yards have ſtop-cleats, nailed on the fore-ſide of the yard, once the given diameter on each ſide of the ſlings. Thoſe within the arms, on the fore and after ſides of the main and fore topſail-yards, three inches to every yard in the length; and mizen topſail-yards, two inches and a quarter.

Topgallant-yards the ſame as topſail-yards.

Royal-yard-cleats are once the diameter on each ſide the middle aſunder, and twice their length within at the arms.

Croſs-jack-yards have ſtop-cleats, nailed on the fore-ſide of the yard, half the diameter on each ſide of the ſlings; thoſe at the arms, one inch and a half within their outer ends to every yard in length, and nailed on the fore and after ſides.

Mizen-yards have ſtop-cleats nailed once the diameter aſunder on the ſtarboard-ſide, and once and a half the given diameter below the middle of the yard: thoſe at the peek or outer end, once the diameter within.

Sprit and ſprit-topſail-yards have ſtop-cleats nailed on their under ſides; the ſpritſail-yard once the diameter on each ſide the ſlings; the ſprit-topſail-yard half the diameter one each ſide: thoſe at the arms one inch and a half within their outer ends to every yard in the length; and they nail on the fore and after ſides contrary to thoſe at the ſlings.

Studding-ſail and driver yards have ſtop-cleats, nailed once the given diameter aſunder, at one-third the length of the yard from the inner end; thoſe at the arms twice their length within.

Boat-yard-cleats are once the given diameter aſunder at the ſlings; ſome in the middle, others one-third from the end, ſuch as lugs, latteen, and ſettees, and the length of the cleat within at the arms.

Yards are fitted at their outer ends for rigging out ſtudding-ſails. Main and fore yards have four boom-irons; one on each of their outer ends, *c*, (*fig.* 17. *Rigging, Plate* II.) the others at one-third the length of the boom within, *d*. The outer boom-iron is compoſed of a ring, a neck, and ſtraps.

The ring, through which the boom ſlides, is of the ſame diameter in the clear as its topmaſt-ſtudding-ſail boom; breadth three-eighths the diameter, and from five-eighths to three-quarters of an inch thick. In one ſide a lignum vitæ roller is fitted, one-third in length the diameter of the boom-ring. The neck is ſquare, and connects the ring to the ſtraps; each neck one inch longer than the diameter of the ring, and one-fourth its length in ſize.

The ſtraps are made one inch and a quarter in length to every three feet of the yard; their breadth once and a half the breadth of the ring; thickneſs at the inner part, three-eighths of an inch: they increaſe in ſubſtance towards the neck, and are made to the ſhape of and let in their thickneſs into the yard-arm. They are bolted, and have two hoops made to the ſize of the yard-arm, one cloſe to the end, and the other near the neck.

Inner boom-irons are made after the ſame proportion as the outer ones, but differ in ſhape. The ſtraps are made to compaſs the yard at one-third the length of the topmaſt-ſtudding-ſail boom within the end, and the ring is ſeparated from the ſtrap by a collar; the upper part of the ring opens with a hinge on one ſide, and the heel of the boom is claſped therein.

Boom-irons fix on the yards thus: the rings are parallel with the axis of the yard, in a ſtraight direction, with a line ſtruck upon the yard, in the middle of the ſquare, between the upper and fore ſide.

Boom-irons, on the yard-arms of ſhips in the merchant ſervice, differ much in ſhape. The ring the boom ſlides through is connected by a collar to a ſquare hoop, that lets on and nails to the yard-arms, they being left ſquare; and ſometimes a round hoop to the ſize of the yard-arms. Others have a ſtraight neck, projecting from ſtraps, with a ſhoulder in the middle of the neck, and the part without left ſquare. The boom-ring has a ſhank on the under part, with a mortiſe that fits the neck, and there faſtened by a ſcrew-nut, or a ſpring-forelock, that goes on the neck next the ring.

Topſail-yards, main and fore, commonly have boom-irons at their outer ends, like the lower yards in merchant ſhips. In the navy they are moſtly fitted with a boom-ring, and a ſprig-eye-bolt driven in the middle of their ends, parallel to its axis; and an iron hoop let in its thickneſs and breadth, and nailed, to prevent ſplitting the yard-arm. Yards that have no inner boom-irons have ſaddles for the heel of the boom.

Topgallant-yards, main and fore, mizen-yards, ſprit and ſprit-topſail-yards, have their arms fitted with a ferrule-hoop and ſprig-eye-bolts, as the topſail-yards.

Mizen-

Mizen-topsail and topgallant yards have hoops like the former let on their outer ends, but no eye-bolts.

Driver-yards have a ſheave-hole cut through their outer end, and a hoop and eye-bolt.

The main and fore yards of large ſhips are ſometimes made of two trees; they have each tree lined, long enough to ſcarf four feet beyond the firſt quarter, next the middle, or ſlings, which is in all five-eighths the length of the yard, adding four feet. The ſcarfs line ſtraight, from each quarter next the middle to one-fourth the ſubſtance at the quarter next the butt, and three-fourths at the quarter next the middle, and haunches to about three inches at the butt. Each tree is then ſawn as before directed, and completed thus: the ſcarf and haunches are trimmed ſtraight, and out of winding on the inſide, and a line ſtruck along the middle, and a chain-coak ſet off, each about two feet four inches long, and one-third the diameter broad; and the butts ſquared acroſs and down the ſides. The coaks are raiſed one inch and a quarter at the butt, and ſunk to the ſame on the other ſide of the middle, towards the arm; the other half is then canted thereon, ſet ſtraight and out of winding, and fayed as the *maſts*, (which ſee, and the *Plate* of *Maſts*,) and bolted together fore and aft through the middle, in the butt of every coak; the heads are to be driven from the thinneſt part of the ſcarf, and clenched on a ring, and the haunches nailed.

The yard is then completed as before directed, and the ſcarfs caulked their length and hooped; one hoop over the butt of each ſcarf, one in the middle of each haunch, and one over every bolt: then a fiſh of fir, two inches thick, and the ſame length and breadth as the ſquare on the aft-ſide, is fayed and nailed cloſe over all the hoops.

Another method of ſcarfing yards together made of two trees, which is the ſtrongeſt, and takes leſs trees than the former, is by providing two trees that will hold the diameter beyond the *fiſhes*, and ſcarf together ſimilar to the former. Then the deficiency of the diameter towards the middle is made good by long fiſhes of fir, from four to ſix inches thick, as the ſize of the yard may require, extending two feet in length at each end beyond the long ſquare on the aft-ſide, and each of ſufficient breadth to form the eight-ſquare on the outſide. The inner ſurfaces of the fiſhes are coaked and fayed cloſe upon the yard, the coak extending near the whole length. The yard is then finiſhed as before directed, and hooped and bolted, as in the *Plate* of *Maſt-making*.

Yard-*Arm* is that half of the yard which is on either ſide the maſt, when it lies athwart the ſhip. See the preceding article.

Yards alſo denote places belonging to the navy, where the ſhips of war, &c. are laid up in harbour. See Dock-*Yards*.

YARDLEY, in *Geography*, a village of Worceſterſhire, which, according to the population return of the year 1811, contained 1918 inhabitants, including 121 families employed in manufactures, and 453 houſes; 7 miles S.E. of Birmingham.

YARE, a river of England, in the county of Norfolk, which riſes about five miles N. from New Buckenham, paſſes by the city of Norwich, and runs into the German ocean near Yarmouth.

Yare. See Segovia *Nueva*.

Yare, among *Sailors*, implies as much as, nimble, ready, quick, expeditious. Hence, *to be yare at the helm*, as ſome ſay, ſignifies to ſet a freſh man at the helm.

YARECA, in *Geography*. See Jareca.

YAREE, a town of Burmah; 40 miles S.W. of Ava.

YARENSK, a town of Ruſſia, in the province of Uſtiug, on the Vitchegda; 92 miles N.E. of Uſtiug. N. lat. 62°. E. long. 47° 50′.

YARI, a town of Braſil, in the government of Para; 60 miles N.E. of Paru.

YARIN, a word uſed by ſome of the chemical writers to expreſs the flos æris.

YARKAN, Yarkand, *Irken*, or *Yarkien*, in *Geography*, a town of Caſhgar, or Little Bucharia, where the grand khan of the Eluth Tartars chiefly reſides. The town is large, and well built of bricks dried in the ſun. The environs are fertile, and the palace of the khan large, but not handſome. In 1400 this town was taken and plundered by Timur Bec; 90 miles S.E. of Caſhgar. N. lat. 38° 13′. E. long. 78° 49′.

Yarkan, or *Yarkand*, ſuggeſted to be the Oechardes of Ptolemy, a river of Aſia, which paſſes by the town of Yarkan, and after a conſiderable courſe runs into lake Lop; 100 miles S. of Tourfan.

YARM, or Yarum, a market-town in the W. diviſion of the liberty of Langbaurgh, in the North Riding of the county of York, England, is ſituated on the banks of the river Tees, 4 miles S. by W. from Stockton, 44 N.N.W. from York, and 237 in the ſame direction from London. In 1811 the houſes in the town and pariſh were 361, and the inhabitants 1431. Here is a neat modern church. A market is held on Thurſday, and fairs on Thurſday before the 5th of April, Holy Thurſday, 2d of Auguſt, and 20th of October. At Yarm was an hoſpital, founded before 1185; alſo a houſe of Black friars, founded about 1271, by the family of Brus or Bruce, both of which were ſuppreſſed by Henry VIII. Over the river Tees at this place is a handſome ſtone bridge, communicating with the county of Durham. The town, formerly more conſiderable than at preſent, ſtill carries on a good trade by water, particularly in corn and lead for the London market. In 1761 the town ſuffered ſeverely by an inundation of the river Tees.—Beauties of England and Wales, Yorkſhire, by J. Bigland, 8vo. Lond. 1812.

YARMOUTH, Great, an important ſea-port, borough, and market-town, in the hundred of Eaſt Flegg, and county of Norfolk, England, is ſituated on the E. coaſt of England, near the mouth of the river Yare, whence it has its name, 22 miles E. from Norwich, and 124 N.E. from London. The number of houſes in the pariſh, according to the returns of 1811, was 3594, and the inhabitants were 17,977. A market is held here on Saturday, and a fair in Eaſter week. The town, which ſends two members to parliament, was incorporated by James I. It is governed by a mayor, recorder, 7 aldermen, 36 common-council-men, a town-clerk, and other inferior officers. In former times, Yarmouth was a member of the Cinque Ports, and by ancient cuſtom appointed bailiffs, who, in conjunction with the magiſtrates of the town, hold a court there during the herring-fair. The corporation poſſeſs alſo the privileges of courts of admiralty and of record. Yarmouth is ſingularly ſituated on a long, narrow, ſandy peninſula, having on the E. the German ocean, and on the W. the river Yare, which, after pointing N.E. towards the ſea, ſuddenly bends round to the S. parallel to the ſhore, and opens into the ſea, two miles below the town. The coaſt near Yarmouth and ſouthward to Loweſtoft is the moſt eaſterly part of Great Britain, Yarmouth church lying in E. long. 1° 45′ from Greenwich.

The firſt mention of this town is in Domeſday-book, which renders it probable, that it had its beginning in the early part of the Anglo-Saxon dynaſty. When the ſand-bank, on which it ſtands, and which, thrown up by the ſea, impeded,

impeded, or at leaſt diverted, the courſe of the Yare, was ſufficiently conſolidated, habitations were formed on it by the fiſhermen who reſorted to the coaſt. By the influx of foreigners for the purchaſe and ſale of fiſh the town increaſed, ſo as to become the moſt conſiderable port on the eaſt coaſt of England. To provide for its ſecurity, Henry III. granted to the inhabitants permiſſion to incloſe the town with a moat and walls; works which, however, do not appear to have been commenced until 1285, the thirteenth year of his ſucceſſor, Edward I. But when war with France broke out in 1545, an additional rampart was thrown up towards the ſea, and further extended in 1587. In the following year, to guard againſt the Spaniſh invaſion, outworks were conſtructed, the ſouth mount was raiſed and planted with cannon, and a boom was laid acroſs the entrance of the harbour. Coeval with the firſt fortification of Yarmouth was probably the caſtle, in the centre of the town. It ſerved for ſome years as a priſon; but in 1621 the whole was demoliſhed. In 1642 the inhabitants of Yarmouth declared for the parliament; but it was only after the independents had gained an aſcendancy in the ſtate that a garriſon was admitted here. During the American war, forts and batteries were conſtructed, and barracks for a conſiderable body of troops were erected for the defence of the place. Indebted for its original exiſtence, and ſubſequent increaſe to the fiſhery, Yarmouth very early poſſeſſed a very numerous ſhipping. In the ſummer of 1310, when Edward II. ordered the ſeveral ports of England to ſend ſhips to Dublin, to convey troops over to Scotland, Yarmouth furniſhed ſix, while even Briſtol and Glouceſter, although ſo conveniently ſituated for that object, furniſhed only two between them. To form a fleet to be employed in the ſiege of Calais, in 1346, under Edward III., Yarmouth ſent out forty-three veſſels, carrying 1095 mariners; a number of men far exceeding thoſe furniſhed by any other port in the kingdom; for London itſelf was called on for only twenty-five veſſels, containing 662 mariners.

In 1797, when men for the navy were required in proportion to the tonnage of each port, Yarmouth was the ninth in order; but according to the Cuſtom-houſe books of 1800 it had advanced to be the eighth, the ſhips of the port being 375, the tonnage 32,957, navigated by 2442 men, while Briſtol poſſeſſed 186 ſhips, carrying 26,193 tons and 1674 men. Yarmouth was early diſtinguiſhed, and ſtill remains unrivalled, for the herring-fiſhery. About 1220 the abbot of St. Alban's purchaſed a large houſe in Yarmouth, "in order to lay up fiſh, eſpecially herrings, which were bought in by his agents at the proper ſeaſon, for the uſe of his abbey." Prior to 1238, the people of the oppoſite coaſt of Europe were in the habit of reſorting to Yarmouth for a ſupply of herrings. Theſe and other recorded facts ſhew that the method of preſerving that fiſh, probably by ſalt, muſt have been known in England more than 200 years before the pretended invention of Beukels in Flanders, from whom *pickling* is ſaid to have had its name. (See HERRING-*Fiſhery*.) The herrings uſually appear on the eaſt coaſt of England about September, when the grand fiſhing ſeaſon commences. The boats fitted out for the fiſhery are decked, and average from forty to fifty tons burthen, with a crew of eleven or twelve men to each. The veſſels, with ſome tons of ſalt on board, proceed from four to twelve leagues out to ſea. Each boat is provided with eighty or a hundred nets, twenty-one yards in length, and eight and a half in depth; all of which, faſtened to a long rope, are let down into the ſea at duſk, and drawn up at day-light. When ſalted, the fiſh are hung up in lofty buildings, and expoſed, with ſmall intermiſſions, for about a month, to the ſmoke of a wood fire, and thus become red-herrings. Two centuries ago the fiſhery was alſo carried on in ſummer; but in the preſent times no herrings are found on the coaſt in that ſeaſon. In the interval of the fiſhery, the boats are employed in catching mackarel and cod. Yarmouth trades very largely in the export of corn and malt, and in the woollen ſtuffs of Norwich. Timber, iron, and hemp, are imported from the Baltic, and ſhip-building is carried on at this place to a conſiderable extent.

The formation and the maintenance of the harbour of Yarmouth have required great exertion, ingenuity, and expence; for the preſent is the ſeventh recorded to have been made, and its yearly charge amounts to about 2000*l*., which ſum is defrayed by duties exacted from goods brought in. The new works were executed by Joas Johnſon, a Dutchman, who had been invited from Holland for the purpoſe. The principal or north pier is in length 265 yards, and the ſouth pier, which is better conſtructed, 340 yards: the extent of the harbour between theſe piers is 1111 yards; and the depth of water, in all ſtates of the tide, being now about twenty-four feet, inſtead of three feet, as was the caſe before the erection of the piers, veſſels can always lie afloat at their moorings. The well-known Yarmouth roads are formed by ranges of ſand-banks, lying out parallel to and at no great diſtance from the ſhore. The channels between the banks, ſome of which are dry at low water, and between them and the ſhore, are in general narrow, but deep enough for ſhips of any ſize. The roads conſequently afford moſt deſirable ſhelter in ſtormy weather, on a tract of coaſt projecting a great way into the German ocean, and peculiarly deſtitute of acceſſible harbours. But the concourſe of ſhipping in this ſtation has, on various occaſions, produced dreadful diſaſters, the veſſels being frequently driven from their anchors, and wrecked on the banks or on the ſhore.

The town of Yarmouth is in form an oblong quadrangle, conſiſting of four principal ſtreets, croſſed at right angles by 156 lanes, called rows, ſo confined in breadth, that for the conveyance of goods through them, the inhabitants have adopted narrow carts, mounted upon low wheels, and drawn by one horſe, the driver ſtanding in the front of the cart. The town is incloſed by a wall on the north, eaſt, and ſouth ſides, in length 2240 yards, which, with the weſt ſide along the river, 2030 yards, make the circuit two miles and 750 yards. Although ſo populous a town, Yarmouth forms but one pariſh, and, until a century ago, had but one church, that of St. Nicholas, which was erected by Herbert Loſinga, biſhop of Norwich, in 1123; but it was greatly enlarged in 1250. It conſiſts of a nave, two aiſles, and a tranſept, and had lately a ſpire 136 feet high, a diſtinguiſhed ſea-mark in the midſt of a long tract of low and dangerous coaſt; but in 1803 it was taken down. The other public buildings of Yarmouth are, the town-hall, a handſome building, with a Tuſcan portico, ſituated near the centre of the quay; the council-room, which alſo ſerves for aſſemblies; the fiſherman's hoſpital, a quadrangle, containing twenty rooms on a floor, each intended for an old fiſherman and his wife; the hoſpital-ſchool for maintaining and clothing thirty boys and twenty girls, at the expence of the corporation; and the charity-ſchool for ſeventy boys and thirty girls, who are clothed and educated. The quay of Yarmouth is juſtly the boaſt of the town, and is one of the fineſt and the moſt extenſive in Europe. Its length from the ſouth gate to the bridge is 1014 yards, beyond which it reaches 1016 yards farther, making its whole extent a mile and 270 yards. In many places the breadth is 150 yards, and the ſouthern part is decorated with a range of handfome buildings. By means of a bridge acrofs the Yare a communication is maintained with the county of Suffolk, which ftretches up the weft bank of the river. As a fafhionable watering-place, Yarmouth is well provided with every accommodation, and confequently much frequented. On the beach a bathing-houfe was erected in 1759, commanding a fine view of the roads and fhipping; and in 1778 a neat theatre was opened. Oppofite to Yarmouth, and for about two miles north and fouth of the town, the coaft is nearly a level common, elevated only from two to three yards above high-water mark. From the edge of the common down to the water is a gentle flope of fine fand, intermixed with loofe pebbles called fhingles; and as the tides rife but about fix feet, the fpace brought under water is only a few yards. From high-water mark to the turf of the common the fands abound with marine plants, fome of them rare and curious, of which an account is given by Mr. Dawfon Turner in the Hiftorical Guide to Great Yarmouth, 12mo. 1806.— Beauties of England and Wales, Norfolk, by J. Britton, F.S.A. 8vo. Lond. 1809.

YARMOUTH, *South*, a fea-port, borough, and market-town, in the S.W. half hundred of Weft Medina liberty, in the Ifle of Wight, and county of Southampton, or Hampfhire, England, is fituated at the entrance of the little river Yare, on the N.W. coaft of the ifland, 10 miles W. from Newport, and 97 S.W. from London. The town, which is governed by a mayor, twelve burgeffes, a fteward, a town-clerk, &c. was incorporated by James I., and fends two members to parliament. In 1811 the houfes in the borough and parifh were 88, and the inhabitants 427. A market is held here on Saturday, and two fairs annually. Yarmouth is built on a bank floping to the fea, and feems to have been formerly much larger than it is at prefent. The church is fituated in the middle of the town. The market-houfe has over it the town-hall. Here was a caftle, built by Henry VIII. on the fcite of an ancient church, which had been deftroyed by the French. This fortrefs is defended by fome pieces of cannon, and a fmall garrifon. Between Yarmouth and Lymington a packet fails daily.—Beauties of England and Wales, Hampfhire, by J. Britton and E.W. Brayley, 8vo. Lond. 1808.

YARMOUTH, a fea-port town of Maffachufetts, in Barnftaple bay; 50 miles S.E. of Bofton. N. lat. 41° 42′. W. long. 70° 10′.

YARMOUTH, a town on the weft coaft of Nova Scotia; 35 miles W. of Shelburn.

YARMOUTH, *North*, a town of America, in the diftrict of Maine, and county of Cumberland, with 3295 inhabitants; 9 miles N.E. of Portland. N. lat. 43° 45′. W. long. 70° 8′.

YARMUC, or YARUN, a town of Paleftine, in the diftrict of Saphet, on a river of the fame name, which runs into the lake of Tiberias, chiefly inhabited by Chriftians; 24 miles S.E. of Saphet.

YARMUC, a river of Syria, anciently called *Marfyas*, which runs into the Orontes, near Apamea. In 636 a battle was fought on the banks of the river, between the Chriftians and the Saracens, in which the former were defeated.

YARN, denotes fpun wool. See WOOL, and WOOLLEN *Manufacture*.

YARN, *Marking*. See MARKING.

YARN, in *Rope-Making*, is fpun from hemp, and is called twenty-five, twenty, and eighteen thread yarn, which differs only in the finenefs; the twenty-five being finer than the twenty, &c. It is thus diftinguifhed, becaufe either twenty-five, twenty, or eighteen threads a hook, make a rope of three inches in circumference, and fo in proportion.

YARN, *Spun*, on board a *Ship*. See SPUN.

YARNALLS, in *Geography*, a town of Pennfylvania; 20 miles E. of Sunbury.

YAROVOI, a town of Ruffia, in the government of Tobolfk, on the Irtifch; 52 miles N. of Tobolfk.

YARRA. See JARRA.

YARRINGLES, or YARRINGLE-*Blades*, a kind of reel, or inftrument, with which hanks of yarn are wound on to clues, or balls.

YARROW, in *Botany*. (See ACHILLEA.) Perhaps this old Englifh name originated in the Spanifh *Yerba*, or *Yerva*, an herb; our Common *Achillea Millefolium* having been formerly called, in that language, *Milhoyas Yerva*, or Thoufand-leaved Herb, a tranflation of its Latin appellation.

The leaves and flowers of the common yarrow, or *achillea millefolium* of Linnæus, which is in flower on our ditch-banks, and in dry paftures, the greateft part of the fummer, are greatly recommended by fome of the German phyficians, as mild corroborants, vulneraries, and antifpafmodics, in diarrhœas, hemorrhages, hypochondriacal, and other diforders. They promife, fays Dr. Lewis, by their fenfible qualities, to be of no inconfiderable activity. They have an agreeable, though weak, aromatic fmell, and a bitterifh, roughifh, fomewhat pungent tafte. The leaves, having the greateft bitterifhnefs and aufterity, are chiefly directed for medicinal ufe; the flowers have the ftrongeft and moft fubtile fmell, are remarkably acrid, and promife to be of the greateft efficacy, if the plant has any fuch efficacy, as an anodyne or antifpafmodic. The virtue of both leaves and flowers is extracted by watery and fpirituous menftrua; the aftringency moft perfectly by the former; their aromatic warmth and pungency by the latter; and both of them equally by a mixture of the two. The flowers, diftilled with water, yield a penetrating effential oil, poffeffing the flavour of the milfoil in perfection; in confiftence fomewhat thick and tenacious; in colour very variable, from a greenifh-yellow to a deep green and blueifh-green, and fine blue, which differences depend in a great meafure on the foil in which the plant is produced; the flowers gathered from moift frefh grounds yielding generally a blue oil, and thofe collected from dry commons a green one, with a greater or lefs admixture of yellow. The extract obtained by infpiffating the yellowifh tincture made in rectified fpirit, is more agreeable in fmell than the flowers, of a moderately warm penetrating tafte, fomewhat like that of camphor, but much milder, accompanied with a flight bitterifhnefs and fubaftringency. The *achillea ptarmica* of Linnæus, called *fneezewort*, or *baftard pellitory*, is perennial, grows wild on heaths, and in moift fhady grounds, and is found in flower from June to the end of fummer. The roots of this plant have a hot biting tafte, approaching to that of pellitory of Spain, with which they nearly agree in their pharmaceutic properties, and for which they have been fometimes fubftituted in the fhops. They are by fome recommended internally as a warm ftimulant and attenuant; but their principal ufe is as a mafticatory and fternutatory. Lewis.

YARROW, in *Agriculture*, a plant of the herbage kind, which is common but ufeful in the pafture-field in many cafes. It has long ago been noticed, by the writer of the "Effays on Rural Affairs," as valuable for cultivation in grafs-lands in different forts of foil. It fucceeds on moift loams, but is moft proper for dry burning gravels, fands,

and

and chalks. It is ſaid to poſſeſs the ſingular quality or property of reſiſting drought on the moſt arid ſoils; ſo that if a green ſpot appears in a burnt-up cloſe-fed paſture ground, it may almoſt with certainty be concluded to be covered with this plant. In paſtures there is not any ſort of plant which is eaten down more cloſely than this, by every kind of browſing domeſtic animal. It has been remarked with ſurpriſe, that ſpots of rich dry land, which were almoſt wholly filled with theſe plants, were eaten down barer than even white clover. It is a ſtrong-rooted perennial plant, which has many fine leaves, of a highly aromatic ſmell, and which is conſidered as not only very acceptable, but uncommonly healthy, or even medicinal, both to ſheep and black cattle.

It is found in the beſt bullock paſtures and grounds, where it is ſaid to be highly grateful to every ſort of live-ſtock of the cattle kind, and particularly ſo to ſheep, which bite it as faſt as it grows or riſes: ſo that on tolerably well-ſtocked paſtures or grounds it is rarely ſuffered to come into flower. The ſeeds of it are, therefore, to be obtained from ſome rich dry ſpot which is well ſtored with the plant; and if the ſoil be well ſupplied with good mouldy compoſt, it has been found that the yarrow may be made into a rough hay, from which it is eaſy to obtain ſeeds, which are of a peculiar winged form and appearance. It flowers late in the ſummer, and the ſeeds may be gathered about the month of October.

It is a plant that has not been obſerved in abundance in boggy or wet lands; but which, for dry rich ſoils, deſerves the preference to moſt others for the purpoſe of being depaſtured. It is a plant that on the whole ſeems to merit the attention of the ſtock-farmer, at leaſt in a much greater degree than he has yet beſtowed upon it.

YARROW, *Water*. See *Water* VIOLET.

YARROW, in *Geography*, a river of Scotland, which riſes in a mountain called *Yarrow Cleugh*, in the county of Selkirk, forms two lochs, St. Mary's and Lows, in its courſe, and runs into the Tweed, about two miles below Selkirk.

YARUM. See YARM.

YARUQUI, a plain twelve miles north-eaſt from the city of Quito. This ſpot was pitched upon as the baſe of the whole operations for meaſuring the length of an arc of the meridian, by Ulloa, &c. Near it is a village of the ſame name.

YARWHELP, or YARWIP, an Engliſh name uſed in ſome places for the *ægocephalus* of authors. See GODWIT.

YASASCHNA, in *Geography*, a town of Ruſſia, in the government of Irkutſk, on the Kitoi; 68 miles N.W. of Irkutſk.

YASASCHNAIA, a river of Ruſſia, which runs into the Kolima, at Verchnei Kovimſkoi.

YASCHAMBOU, a town of Perſia, in the province of Adirbeitzan; 198 miles S.W. of Tauris.

YASSA, in *Modern Hiſtory*, the name given among the Tartars to a body of laws, aſcribed to the famous conqueror Gengis-Kan, which are ſtill obſerved among the Tartars of Crimea, and other parts of Aſia. M. de la Croix has given, in his life of Gengis-Kan, an extract of thoſe laws, compriſing twenty-one articles: the firſt of which inculcates the belief of one God, the Creator of heaven and earth, and to whom belong the abſolute diſpoſal and dominion of events.

YASUDA, in *Hindoo Mythology*, the name of the foſter-mother of the Hindoo Kriſhna: it is ſaid to mean the *giver of honour*.

YASUDERA, the name of the wife of Budha, or Boodh, or deity of the Hindoos, and of other people. See BOODH.

YATA, in *Geography*, a town on the ſouth coaſt of the iſland of Catanduanes. N. lat. 13° 52′. E. long. 124° 29′.

YATCHEVERAM, a town of Hindooſtan, in the Carnatic; 25 miles S.W. of Nellore.

YA-TCHI, a town of Corea; 25 miles S.W. of Outcheou.

YA-TCHING, a town of China, in Fo-kien; 15 miles N.E. of Fou-nhing.

YATE'S RIVER, a river of Africa, which runs into the Atlantic, N. lat. 8° 8′. W. long. 12° 15′.

YATHKIED, a lake of North America. N. lat. 63° 10′. W. long. 98°.

YATI, the prieſthood of the extenſive ſect of Jaina, in India. (See JAINA.) A yati is ſometimes ſaid to be more properly an aſcetic, for it doth not appear that he performs any religious rite. It is his duty to read and expound to his diſciples the ſcriptures of the Jaina ſyſtem. See under SECTS *of Hindoos* for a general notice of the Jainas.

The yatis are devoted to religion from their infancy; for with the Jainas the prieſthood is not hereditary, as with the orthodox Hindoos. A yati never marries, but ſometimes purchaſes a child, adopts it, and inſtructs it in religious duties. Parents ſometimes vow or promiſe their firſt-born to the deity, in the hope of obtaining the bleſſing of fecundity in their family. They ſerve their noviciate with their guru, or preceptor, and perform for him many domeſtic offices. After a proper period, when arrived at a ſufficient age and progreſs in their ſtudies, they are admitted as yatis. The ceremony on this occaſion is ſimple. The noviciate is carried out of the town with muſic and rejoicing in proceſſion, followed by a crowd of Sravakas, as the laity of the Jainas are called. (See SRAVAKA.) He is taken beneath a tree with milky juice. The pipala, or Indian fig, is uſually preferred. A circle is formed on the ground, within which none but yatis are admitted. The hair, or lock, of the noviciate is pulled out by the root at five pulls; and camphor, muſk, ſandal, ſaffron, and ſugar, are applied to the ſcalp: he is then ſtripped, and placed, with joined palms, the poſture of reſpect and ſupplication, before his guru, who pronounces a mantra (ſee MANTRA) in his ear, and inveſts him with the dreſs of a yati, which conſiſts of a cloth of three cubits for his loins, another of five cubits for his head, a coarſe country blanket, called *kamly*, for his bed, a water-pot, a plate for his victuals, a cloth to tie them up in, a long ſtick to defend him, but not to injure others, and laſtly, a broom of cotton-threads to ſweep the ground where he ſits or lies, to avert the deſtruction of any inſect. The Jainas are the ſect that ſo eſpecially avoid ſhedding blood or deſtroying life; a tenet that leads them to ridiculous exceſſes, as will be ſeen under our article JAINA, in which ſeveral particulars of the yati are alſo given.

YATREB, in *Geography*, the real name of Medina, in Arabia. It is called *Medina*, or the city, by way of eminence.

YATTENDON, a village of England, in the county of Berks. Here Alfred overthrew the Danes in 876; 4 miles S.E. of Eaſt Ilſley.

YATTONG, a town of Burmah; 15 miles W.N.W. of Ava.

YATTONUR, a town of the iſland of Ceylon; 10 miles S.W. of Candy.

YAUACA, a town of Peru, in the diocefe of Lima, on the coaft; 20 miles S.S.E. of Nafca. S. lat. 15°.

YAUGAR, a town of Burmah, on the right bank of the Irawaddy, oppofite to Raynangong.

YAUGOS, a town of Peru, in the diocefe of Lima; 80 miles S.E. of Lima. S. lat. 12° 40′. W. long. 75° 46′.

YAVI, a town of Peru, in the diocefe of La Plata; 85 miles E.S.E. of Lipes.

YAW, in *Sea Language*, denotes the movement by which a fhip deviates from the line of her courfe towards the right or left in fteering. See STEADY.

YAWL, a fmall light fhip's boat, rowed with four to fix oars, ufed to convey the officers to and from the fhip.

YAWNING, OSCITATIO, an involuntary opening of the mouth, generally indicating a troublefome wearinefs, or an inclination to fleep. See LUNGS.

YAWS, in *Medicine*, a fevere cutaneous difeafe, which is indigenous in Africa, and has been thence conveyed to the Weft Indies and America; fo called from the refemblance of its eruptions to a rafpberry, the word *yaw* in fome African dialect being the name of that fruit. Nofologifts have denominated it *Frambœfia*, from the French *Framboife*, which has the fame fignification.

The nature of this difeafe has been imperfectly inveftigated by European practitioners; and as it is perhaps never feen in England, a brief account of it will be here fufficient.

It is not eafy to difcover the precife character of this eruption, from the varying language of authors. An anonymous writer, who gave the firft explicit account of the difeafe, (fee Edinb. Med. Effays, vol. v. part 2. art. 76.) fays, they are at firft "level or fmooth with the fkin," but foon "become protuberant *like pimples*." Dr. Hillary, who has copied much from this writer, defcribes them as "*pimples*," though fmooth and level with the fkin, but foon becoming "protuberant *puftules*." (On the Dif. of Barbadoes, p. 339.) And Dr. Winterbottom, who has given on the whole the moft perfpicuous defcription of the difeafe, calls them "*puftules*," from their firft appearance. Again, as to the contents of thefe eruptions, the anonymous author and Dr. Hillary fay, that *no pus* nor any quantity of ichor is found in them, but fpeak of a little *ichor* as drying upon the furface; while Dr. Winterbottom fays, they are "filled with an opaque whitifh fluid," and when they burft, "a thick vifcid matter is difcharged." There is alfo fome difference of opinion among the writers on this difeafe refpecting the precurfory fymptoms, the earlier authors afferting, that the general health is not impaired during the firft ftages; but others, efpecially Dr. Winterbottom and Dr. Dancer, affirm, that a *febricular* ufually precedes it. On the whole, however, the following appears to be the moft correct account of the malady, which is to be collected from the various defcriptions which have been publifhed.

The eruption of the yaws fometimes commences without any precurfory fymptoms of ill health; but it is generally preceded by a flight febrile ftate, with languor, debility, and pains of the joints, refembling thofe of rheumatifm. After feveral days, minute protuberances appear on various parts of the fkin, at firft fmaller than the head of a pin, but gradually enlarging, in fome cafes to the diameter of a fixpence, and in others even to a greater extent: they are moft numerous, and of the largeft fize, in the face, groins, axilla, and about the anus and pudenda. But the crop is not completed at once; new eruptions appear in different places, while fome of the earlier ones dry off. When the cuticle is broken, a foul cruft is formed on the furface, from under which, on the larger protuberances, red fungous excrefcences often fpring up, which attain different magnitudes, from that of a fmall rafpberry to that of a large mulberry, which fruit they fomewhat refemble from their granulated furfaces. When the eruption is moft copious, thefe tubercles are of the fmalleft fize; and when fewer, they are largeft. Their duration and progrefs are various in different conftitutions, and at different periods of life. Children fuffer lefs feverely than adults, and are more fpeedily freed from the difeafe. In them, according to Dr. Winterbottom, the duration of the yaws is from fix to nine months; while in adults it is feldom cured in lefs than a year, and fometimes continues during two or three. The fungous tubercles attain their acme, according to the anonymous writer already quoted, more rapidly in the well-fed negroes than in thofe who are ill-fed and thin; and they likewife acquire a larger fize in the former than in the latter. They are not poffeffed of much fenfibility, and are not the feat of any pain, except when they appear upon the foles of the feet, where they are confined and compreffed by the hard and thickened cuticle: in that fituation they render the act of walking extremely painful, or altogether impracticable. They never fuppurate kindly Dr. Winterbottom fays, but gradually difcharge a fordid glutinous fluid, which forms an ugly feat round the edges of the excrefcence, and covers the upper part of it, when much elevated, with white floughs. When they appear on any part of the body covered with hair, this gradually changes in its colour from black to white, independently of the white incruftation from the difcharge. They leave no depreffion of the fkin.

The period during which the eruption is in progrefs varies from a few weeks to feveral months. "When no more puftules are thrown out," Dr. Winterbottom obferves, "and when thofe already upon the fkin no longer increafe in fize, the difeafe is fuppofed to have reached its acme. About this time it happens, on fome part of the body or other, that one of the puftules becomes much larger than the reft, equalling or furpaffing the fize of a half-crown piece: it affumes the appearance of an ulcer, and inftead of being elevated above the fkin like others, it is confiderably depreffed; the furface is foul and floughy, and pours out an ill-conditioned ichor, which fpreads very much, by corroding the furrounding found fkin: this is what is called the *mafter* or *mother yaw*." When arrived at its acme, however, the eruption continues a confiderable time without undergoing much alteration, often without very materially injuring the functions, and it feldom proves dangerous, except from the mifchievous interference of ill-directed art.

The yaws is propagated folely by the contagion of the matter difcharged from the eruption, when it is applied to the wounded or broken fkin of another perfon, who has not previoufly undergone the difeafe. For, like the febrile eruptions, the yaws affects the fame perfon only once during life; but, unlike them, it is not propagated by effluvia. The complaint is fometimes inoculated by flies, in thofe hot countries, when the fkin both of the difeafed and the healthy remains uncovered. Hence, Dr. Bancroft fays, "none ever receive it whofe fkins are whole; for which reafon the whites are rarely infected; but the backs of the negroes being often raw by whipping, and fuffered to remain naked, they fcarce ever efcape it." (Nat. Hift. of Guiana, p. 385. See alfo Winterbottom, p. 141—3.) In Africa it is ufually undergone during childhood. The period which elapfes between the reception of the contagion and the commencement of the difeafe is no where mentioned; but in the cafe of a Dane, whom Dr. Adams faw at Madeira, the patient had been abfent ten months from

from the Weſt Indies before he felt any indiſpoſition. See Memoirs of the Med. Soc. of London.

With reſpect to the treatment of yaws, nothing very ſatisfactory is to be collected from the writings of the practitioners to whom we are indebted for the hiſtory of the diſeaſe. "The native Africans," according to Dr. Winterbottom, "never attempt to cure it until it has nearly reached its height, when the fungi have acquired their full ſize, and no more puſtules appear." And the practitioners in the Weſt Indies ſoon learned by experience, that active evacuations retard the natural progreſs of the diſeaſe; and that mercurials, although they ſuſpended it, and cleared the ſkin of the eruption, yet left the patient ſtill ſuſceptible of, or rather ſtill impregnated with, the virus, which ſpeedily evinced its preſence by a re-appearance of the ſymptoms more ſevere and tedious than before. In truth, the diſeaſe, it would ſeem, like the puſtular and exanthematous fevers of our own climate, will only leave the conſtitution after it has completed the various ſtages of its courſe, and removed the ſuſceptibility of the individual to future infection; and no medicine yet diſcovered has had any influence in ſuperſeding this action, or in accelerating its progreſs. Unleſs, therefore, any urgent ſymptoms ſhould require alleviation, (which ſeldom, if ever, happens) it is adviſeable to diſpenſe with the adminiſtration of medicine, and to be content with reſtricting the patient to a moderate and temperate regimen, during the firſt ſtage of the malady. When the eruptions begin to dry, or as ſoon as they ceaſe to multiply and enlarge, the diſeaſe appears to require the ſame management as other ſlow and ſuperficial ulcerations, accompanied with a cachectic ſtate of the ſyſtem; *viz.* a light but nutritious diet, a dry and wholeſome air, warm clothing, moderate exerciſe, and a courſe of tonic medicine, eſpecially of ſarſaparilla, or cinchona, with the mineral acids, or with antimonials and ſmall doſes of mercury, according to the circumſtances of the individual habit. The effects of mercury, however, exhibited ſo as to excite ſalivation, as the early practitioners recommend, ſeem to be of a very queſtionable nature, eſpecially when it is unaccompanied by the vegetable decoctions; and it is certain that patients have, in ſome caſes, ſoon recovered under the uſe of the latter, when the mercurials were omitted. The mercurial treatment, indeed, is often followed by a train of haraſſing ſymptoms, called by the negroes the *bone-ache.* "The unhappy ſufferer is tormented with deep-ſeated pains in the bones, eſpecially round the joints, which are occaſionally aggravated to a violent degree: the perioſteum becomes thickened, inflamed, and painful, and nodes are formed on the bones. When theſe ſymptoms have continued for ſome time, the bones are affected with caries, and even become ſoft and loſe their form." The native Africans employ decoctions of the bark of two or three trees, which are generally purgative, as well as tonic, and likewiſe waſh the ſores with them, after carefully removing the cruſts.

The *maſter-yaw* ſometimes remains large and troubleſome after the reſt of the eruption has altogether diſappeared. It requires to be treated with gentle eſcharotics, and ſoon aſſumes a healing appearance under theſe applications. Stronger cauſtics are requiſite after the cure of the *crab-yaws*, or tedious excreſcences, which occur on the ſoles of the feet.

We may add, that the anonymous writer in the Edinb. Med. Eſſays, and after him Dr. Hillary and others, have deemed the yaws to be the Hebrew leproſy, deſcribed by Moſes. (Leviticus, chap. xiii.) In ſome reſpects, and eſpecially in the appearance of what is called "raw fleſh" in the leprous ſpots, together with *whiteneſs of the hair*, the deſcription of the leproſy of the Jews is applicable to the yaws. But the leproſy is deſcribed by the great legiſlator as beginning in ſeveral ways, or appearing under ſeveral varieties of form, in only one of which this riſing of "raw fleſh" is mentioned; and the two circumſtances, which all theſe varieties exhibited in common, were a depreſſion of the ſkin and whiteneſs of the hair. Now this change in the colour of the hair is common to the yaws and to the leuce; and it is conjoined in the latter with cutaneous depreſſion. It ſeems pretty obvious indeed, that the term leproſy was uſed in the Scriptures to denote ſeveral diſeaſes of the ſkin, againſt which the law of excluſion was enforced, and others to which it did not apply. An inſtance of the latter occurs in Gehazi, whom we find ſtill in the employment of Eliſha, and even converſing with the king, after the leproſy had been inflicted upon him, "and his ſeed for ever." (2 Kings, chap. v. vi. and viii. v. 4.) See Dr. Bateman's Practical Synopſis of Cutan. Diſeaſes; and the Works above quoted.

YAXARTES, or YAKSARTES, the *Syr-Daria*, in *Geography*, a river of Ruſſia, that falls into the Aral.

YAXLEY, a ſmall market-town in the hundred of Norman-Croſs, and county of Huntingdon, England, is ſituated 2 miles N.E. from Stilton, and 73 miles N. by W. from London. It has of late increaſed in importance from its contiguity to the barracks at Norman-Croſs. The market was for a long time diſcontinued, but has been recently revived, and is now held on Tueſdays. It was originally granted to the abbots of Thorney, one of whom, named De Yalkeſley, who died in 1294, was native of this town. Here is alſo an annual fair. The church is a handſome fabric, and particularly remarkable for its lofty and well-proportioned ſpire, which is ſeen at a conſiderable diſtance on all ſides. The population of the pariſh, in the enumeration of the year 1811, was returned at 1391, occupying 171 houſes.

YAYACATLAN, a town of Mexico, in the province of Tlaſcala; 10 miles E.S.E. of Puebla de los Angelos.

YAYAUHQUITOTOTL, in *Ornithology*, the name of an Indian bird deſcribed by Nieremberg, remarkable for having two feathers of its tail much longer than the reſt, and naked for a great way, but the end ornamented with black and blue hairs. The bird is of the ſize of the ſtarling, and is beautifully variegated with green, blue, yellow, and grey.

Mr. Ray is of opinion, that this is the bird deſcribed by Marcgrave under the name *guiaira-guainambi.*

YAYNANGHEOUM, or EARTH OIL CREEK, in *Geography*, a town of Burmah, on the Irawaddy, which receives its name from ſome wells of petroleum, in its neighbourhood. It is chiefly inhabited by potters; 15 miles S. of Pegongmew.

YAYYOS, or YANVOS, a town of Peru, and capital of a juriſdiction, in the archbiſhopric of Lima, which begins about 48 miles ſouth-eaſt from Lima, and extends about 75 miles in length along the Andes. It abounds in fruit, maize, wheat, barley, &c. and the paſtures feed a great number of cattle for the markets of Lima; 80 miles S.S.E. of Lima.

YAZAMATES, a people who inhabited Kuban, after the Sarmates were for the moſt part given to Europe, five years before Alexander.

YAZOO, a river of the ſtate of Georgia, which runs into the Miſſiſſippi, N. lat. 32° 38′. W. long. 91° 10′.

YAZOO, *Little*, a river of Weſt Florida, which runs into the Miſſiſſippi, N. lat. 32° 13′. W. long. 91° 10′.

YAZVA,

YAZVA, a river of Ruſſia, which runs into the Viſchera, 8 miles E. of Gerdin, in the government of Perm.

YBAGUE, a town of South America, in the kingdom of New Grenada.

YBAICABAL. See NERVIO.

YCA. See ICA.

YCAYALE. See UCAYALE.

YCHAN, a town of Corea; 13 miles S. of Hetſin.

Y-CHI, a town of China, of the third rank, in Chan-ſi; 12 miles N.N.E. of Kiai.

YCONOMIUS. See OECONOMUS.

YDALA, in *Geography*, a town of Sweden, in Blekingen; 10 miles S.S.E. of Kongſback.

YDRIA. See HYDRIA.

YDRINUS, or HYDRINUS, a name given by ſome to the *ophites*, or ſerpent-ſtone.

YDRUS, in *Ancient Geography*, a mountain of Hiſpania. Jerome.

YE, or WYE, in *Geography*, a river of Holland, which paſſes by Amſterdam, and runs into the Zuyder See, about 6 miles below.

YEA WATER, a river of Scotland, which runs into the Nith, 2 miles E. of Lochmaben.

YEADON, a townſhip of Yorkſhire, in the Weſt Riding, with 1695 inhabitants, including 476 employed in trade and manufactures; 3 miles S. of Ottley.

YEALME, a river of England, in the county of Devon, which runs into the Engliſh Channel, 1 mile N.N.W. of Stoke Point.

YEANGLAW, a town of Birmah; 7 miles S. of Pegongmew.

YEANING, among *Sheep-Farmers*, a term uſed to ſignify the act of bringing forth the young in animals of the ſheep kind. It is ſaid that in the polled breeds of ſheep the lambs are yeaned with the greateſt eaſe and facility, and in the large-horned breeds with the greateſt difficulty and inconvenience. See SHEEP.

YEANING-*Time*, the ſeaſon of yeaning in ſheep, which is different in different breeds of them, but probably the moſt early in the Dorſetſhire breed, as they may be managed ſo as to lamb at a very early period. In general, however, the management is ſuch, that the lambs are yeaned or brought forth from towards the latter end of February to the beginning of the following month, and later in ſome caſes and ſituations. When yeaned too early there is often great loſs, on account of the inclemency of the ſeaſon, unleſs the ewes have been kept very well for ſome time before it takes place. Conſequently, in all ſuch caſes, they ſhould, for ſome weeks at leaſt before the yeaning time, be plentifully ſupplied with proper food, ſo that the health and ſtrength of them and that of their young may be promoted and preſerved againſt this period. Proper ſheltered ſituations, yards, and ſpots of ground, ſhould alſo be provided for this purpoſe, by which the lives of numbers may be ſaved. See SHEEP.

In all bad caſes of yeaning, the ewes ſhould be well ſupported by good oatmeal gruel and cordial drinks.

YEANLING, a term applied to the young of the ſheep kind when newly yeaned. See LAMB.

YEAR, ANNUS, in the full extent of the word, is a ſyſtem or cycle of ſeveral months; uſually twelve.

Others define year, in the general, a period, or ſpace of time, meaſured by the revolution of ſome celeſtial body in its orbit.

Thus, the time in which the fixed ſtars make a revolution is called the great year. And the times in which Jupiter, Saturn, the ſun, moon, &c. finiſh their revolutions, and return to the ſame point of the zodiac, are reſpectively called the years of Jupiter and Saturn; and the ſolar and the lunar years.

As there is no luminary whoſe changes and revolutions are ſo frequent and remarkable as thoſe of the moon, ſome have thought that all nations at firſt meaſured and divided time according to the various aſpects of this planet. Accordingly the Egyptian year originally conſiſted of a ſingle lunation; afterwards it included two or three months, and was defined by the ſtated returns of the ſeaſons. It has been alſo ſuppoſed, that ſeveral ages muſt have elapſed before the idea of adjuſting the length of the year to the courſe of the ſun became general, though repeated obſervations were made on his motion in the ecliptic. The Indians, the Chaldæans, and Egyptians, who in a very early period applied their attention to aſtronomy, at length found, by comparing the motions of the ſun and moon together, that one revolution of the former was equal to about 12 of the latter; and hence was formed a year of 12 lunations, in every one of which were reckoned 30 days: and hence alſo, it is ſaid, aroſe the diviſion of the ecliptic into 360 equal parts or degrees.

Year, properly, and by way of eminence ſo called, is the ſolar year; or the ſpace of time in which the ſun moves through the twelve ſigns of the ecliptic.

This, by the obſervations of Caſſini, Bianchini, and de la Hire, contains 365 days, 5 hours, and 49 minutes; which is the quantity of the year aſſumed by the authors of the Gregorian calendar.

But in the civil or popular account, this year only contains 365 days; except every fourth, which contains 366.

The viciſſitude of ſeaſons ſeem to have given occaſion to the firſt inſtitution of the year. Man, naturally curious to know the cauſe of that diverſity, ſoon found it was the proximity and diſtance of the ſun; and, upon this, gave the name year to the ſpace of time in which that luminary, performing his whole courſe, returned to the ſame point of his orbit.

And hence, as it was on account of the ſeaſons, in a great meaſure, that the year was inſtituted, their chief regard and attention were, that the ſame parts of the year ſhould always correſpond to the ſame ſeaſons; *i. e.* that the beginning of the year ſhould always be when the ſun was in the ſame point of his orbit; and that they ſhould keep pace, come round, and end together.

This, different nations aimed to attain by different ways; making the year to commence from different points of the zodiac, and even making the time of his progreſs different. So that ſome of their years were much more perfect than others, but none of them quite juſt; *i. e.* none of them whoſe parts did not ſhift, with regard to the parts of the ſun's courſe.

We may naturally ſuppoſe that the commencement of the year would be determined by the date of ſome conſiderable event, ſuch as the creation of the world, the univerſal deluge, a conjunction of planets, the incarnation of our Saviour, &c.; and of courſe it has been referred to different points in the ecliptic. The Chaldæan and Egyptian years were dated from the autumnal equinox. The eccleſiaſtical year of the Jews began in the ſpring; but in civil affairs they retained the epoch of the Egyptian year. The ancient Chineſe reckoned from the new moon, neareſt to the middle of Aquarius; but according to ſome recent accounts, the beginning of their year was transferred (B. C. 1740) to the new moon neareſt to the winter ſolſtice. This likewiſe is the date of the Japaneſe year. Diemſchid, or or Gemfchid, king of Perfia, obferved on the day of his public entry into Perfepolis, that the fun entered into Aries; and in commemoration of this fortunate event and coincidence, he ordained the beginning of the year to be removed from the autumnal to the vernal equinox. This epoch was denominated Neuruz, *viz*. New-day, and is ftill celebrated with great pomp and feftivity.

The ancient Swedifh year commenced at the winter folftice, or rather at the time of the fun's appearance in the horizon, after an abfence of about 40 days. The feaft of this epoch was folemnized on the 20th day after the folftice. Some of the Grecian ftates computed from the vernal, fome from the autumnal equinox, and others from the fummer tropic. The year of Romulus commenced in March, and that of Numa in January. The Turks and Arabs date the year from the 16th of July; and the American Indians reckon from the firft appearance of the new moon of the vernal equinox. The church of Rome has fixed new-year's day on the Sunday that correfponds with the full moon of the fame feafon. The Venetians, Florentines, and Pifans in Italy, and the inhabitants of Treves in Germany, begin the year at the vernal equinox. The ancient clergy reckon from the 25th of March; and this method was obferved in Britain until the introduction of the New Style, A.D. 1752, after which our year commenced on the firft day of January. See EPOCHA and CHRONOLOGY.

They were the Egyptians, if we may credit Herodotus, that firft formed the year, which was luni-folar, making it to contain 360 days, which they fubdivided into 12 months.

This year was corrected by the Thebans, who added to it five intercalary days. The Medes and Perfians, who were anciently a part of the Affyrian empire, adopted the old Chaldæan year of 360 days, which they afterwards reformed.

Some miffionaries report, that the luni-folar year was corrected in China; the year of the Indians contained 360 days, and was divided into 24 months. But befides this form of the year, the Indians ufed another, for aftronomical purpofes, confifting of 365 d. 15 h. 31′ 15″; which Indian days and hours are equal to 365 d. 6 h. 12′ 30″, according to our mode of computation. Or, as this year is fidereal, if you fubtract 21′ 35″ on account of the motion of the ftars in longitude, the Indian tropical year will be 365 d. 5 h. 50′ 55″. The Mexicans received the luni-folar year from the Indians or Chinefe, and divided it into 18 months of 20 days; adding five days to the laft month, and dating the year from March. That the ancient Grecian year was luni-folar, is evident from many teftimonies of Hippocrates, Plato, and Pliny. The Latin year, before Numa's correction of it, confifted of 360 days, 304 of which were divided into 10 months; and to thefe were added two private months, not named in the calendar. Plut. in Vit. Numa. Serv. et Virgil Georg. l. i. v. 43.

It has been faid that Mercurius Trifmegiftus added five days to the Egyptian year of 360 days. And, on this footing, Thales is faid to have inftituted the year among the Greeks; though that form of the year did not hold throughout all Greece. Add, that the Jewifh, Syrian, Roman, Perfian, Ethiopic, Arabic, &c. years were all different.

In effect, confidering the imperfect ftate of aftronomy in thofe ages, it is no wonder different people fhould difagree in the computation of the fun's courfe. We are even affured by Diod. Siculus (lib. i.), Plutarch in Numa, and Pliny (lib. vii. cap. 48.), that the Egyptian year itfelf was at firft very different from that now reprefented.

The imperfection of the luni-folar year became more and more apparent as the arts and fciences improved; but the neceffary correction depended upon a competent knowledge of the folar year. Every nation, by degrees, invented or adopted the method of intercalating a few days at certain intervals. The author of the difcovery is not certainly known: the Egyptians have claimed the merit of it; and the Theban priefts have attributed it to Hermes or Thoth. It appears that they were acquainted with the year of 365 days in a very remote period. (Herodot. l. iv. c. 4. Strabo Geog. l. xvii. Syncull. Chron. p. 121.) The length of the folar year was reprefented in a golden circle fixed upon the tomb of Ofymandes; and this circle was 365 cubits in circumference, having on each cubit a day of the year infcribed, together with the heliacal rifings or fettings of the ftars. This Ofymandes is faid to have flourifhed either in the 13th or 11th century before the Chriftian era. For perpetuating the memory of this correction, though inaccurate, the firft month of the year was diftinguifhed by the title Thoth, or Sothis, which was the Egyptian appellation of the dog-ftar, the heliacal rifing of which announced the inundation of the Nile. Hence, it is faid, originated the fable, invented of the priefts of Thebes, that Mercury, or Thoth, regulated the civil year by extending it, as we have already obferved, to 365 days; and, in return, the firft month was called by his name. See *Egyptian* YEAR, and CANICULAR *Year*.

The method of correcting the civil year, by the addition of five epagomenæ, was communicated by the Chaldæans and Egyptians to other nations; but it has not been afcertained at what epoch the folar year was obferved to be almoft 6 hours longer than the civil year of 365 days. The priefts of Thebes claimed the merit of the difcovery (Diod. Sicul. l. i. p. 59. Strabo Geog. l. xvii.); but Herodotus takes no notice of it; nor Thales, who, on his return from Egypt, taught the Greeks to form a folar year of 365 days without any intercalation. Plato and Eudexus are faid to have obtained it, as a fecret, from the Egyptians, about 80 years after Herodotus, and to have carried it into Greece; which fhews that the knowledge of this form of the year was then recent, and confined to a few of the learned, while the old form was ftill retained, and the Egyptians ufed no intercalation until the corrected Julian year was received at Alexandria by the order of Auguftus; and even at this time the Greeks and Romans, who refided in Egypt, alone obeyed the imperial mandate. The fuperftitious nations refufed to admit any addition to a form of the year which had been fo long eftablifhed among them.

The reformed year of the Chinefe confifted of 365 d. 5 h. 20′, which were divided into 24 months, each of thefe equal parts including 15 d. 5 h. $14\frac{7}{12}$′. (Du Halde. Hyde. Relig. Vet. Perf.) The quantity of the Indian year was fomewhat different from that of the Chinefe: the lunar year contained 364 d. 22 gurris, 1 pull; and the folar year 365 d. 15 gurris, 30 pulls, $22\frac{1}{2}$ puts; 60 puts = 1 pull, 60 pulls = 1 gurri, and 60 gurris = 1 day: fo that their folar or rather fidereal year confifted of 365 d. 6 h. 12′ 7″. This mode of computation is ufed by the Bramins, by the Moguls, and by other Mahometans in India.

YEAR, *Solar*, is the interval of time in which the fun finifhes his courfe through the zodiac; or in which he returns to the fame point of it from whence he had departed.

This, according to our account, is 365 days, 5 hours, 49 minutes; though fome aftronomers make it a few feconds, and fome a whole minute lefs; as Kepler, for inftance, who makes it 365 days, 5 hours, 48 minutes, 57 feconds, 39 thirds. Ricciolus, and Tycho Brahe, 365 days, 5 hours, 48 minutes.

The

The solar year is either *astronomical* or *civil*.

YEAR, *Solar Astronomical*, is that determined precisely by the observations of astronomy; and is of two kinds, *tropical* and *sidereal* or *astral*.

YEAR, *Tropical* or *Natural*, is the time which the sun employs in passing through the zodiac, or from one equinox, or one tropic, to the same again; which, as before observed, is 365 days, 5 hours, 49 minutes; or, more accurately, 365 d. 5 h. 48′ 48″. This is the only proper or natural year, because it always keeps the same seasons to the same months.

In order to find the tropical year, observe the meridian altitude, a, of the sun on the day nearest to the equinox; then the next year take its meridian altitude on two following days, one when its altitude, m, is less than a, and the next when its altitude, n, is greater than a, then $n - m$ is the increase of the sun's declination in 24 hours; also, when the declination has increased by the quantity $a - m$ from the time when the meridian altitude, m, was observed, the declination will then become a; and as we may consider the increase of declination to be uniform for a day, we have $n - m : a - m$ :: 24 hours, the interval from the time when the sun was on the meridian on the first of the two days, till the sun has the same declination a, as at the observation the year before; and this time, added to the time when the sun's altitude m was observed, gives the time when the sun's place in the ecliptic had the same situation in respect to the equinoctial points, which it had at the time of the observation the preceding year; and the interval of these times is the length of a tropical year.

If, instead of repeating the second observation the next year, there be an interval of several years, and you divide the interval between the times when the declination was found to be the same, by the number of years, you will get the tropical year more exactly.

YEAR, *Sidereal* or *Astral*, is the space of time in which the sun, going from any fixed star, returns to the same. This consists of 365 days, 6 hours, 6 minutes, 11,5 seconds.

To find the length of a sidereal year. On any day when the sun is at Z on the meridian (*Plate* XXI. *fig.* 12.), take the difference, Z m, between the sun's right ascension when it passes the meridian, and that of a fixed star, S; and when the sun returns to the same part of the heavens the next year, compare its right ascension with that of the same star for two days, one when their difference, $b\,m$, of right ascensions is less, and the other when the difference, $f\,m$, is greater than the difference, Z m, before observed; then $b\,f$ is the increase of the sun's right ascension in the time, t; and as the increase of right ascension may be considered as uniform for a small time, we have $b\,f : b\,Z :: t$: the time, T, in which the right ascension is increased from b to Z; this time, T, therefore, added to the time of the observed right ascension at b, gives the time when the sun is at the same distance, Z m, in right ascension from the star, which it was when observed at Z the year before; the interval of these times is therefore the length of the sidereal year. The best time for these observations is about March 25, June 20, September 17, December 20, the sun's motion in right ascension being then uniform. Instead of observing the difference of the right ascensions, you may observe that of their longitudes.

If, instead of repeating the second observations the year after, there be an interval of several years, and you divide the observed interval of time when the difference of their right ascensions was found to be equal, by the number of years, you will have the length of a sidereal year more exactly.

The precession being given (see PRECESSION), and also the length of a tropical year, the length of a sidereal year may be found by this proportion; $360° - 50'',25 : 360°$ :: 365 d. 5 h. 48′ 48″ : 365 d. 6 h. 9′ $11\frac{1}{2}''$ the length of the sidereal year.

YEAR, *Anomalistical*, is the time that elapses from the sun's leaving its apogee till it returns to it: and as the progressive motion of the apogee in a year is $11'',75$, the anomalistical year must be longer than the sidereal year, by the time which the sun takes in moving over $11'',75$ of longitude at its apogee; but when the sun is in its apogee, its motion in longitude is 58′ 13″ in 24 hours: hence $58'\ 13'' : 11'',75$ :: 24 hours : $4'\ 50\frac{2}{3}''$, which added to 365 d. 6 h. 9′ $11\frac{1}{2}''$, gives 365 d. 6 h. 14′ $2\frac{1}{6}''$, the length of the anomalistical year. M. de la Lande determined this motion of the apogee from the observations of M. de la Hire, and those of Dr. Maskelyne. Cassini made it the same. This year is sometimes used by astronomers. See ANOMALISTICAL *Year*.

YEAR, *Civil*, is that form of year which each nation has contrived for the computation of time: or the *civil* is the tropical year, considered as only consisting of a certain number of whole days; the odd hours and minutes being set aside, to render the computation of time in the common occasions of life more easy.

Hence, as the tropical year is 365 days, 5 hours, 48 minutes, 48 seconds, the civil year is 365 days. And hence, also, as it is necessary to keep pace with the heavens, it is required that every fourth year should consist of 366 days.

Hence, lastly, the civil year is either *common* or *bissextile*.

YEAR, *the Common Civil*, is that consisting of 365 days. This, therefore, has seven months of 31 days each, four of 30 days, and one of 28 days; according to the well-known canon:

Thirty days hath September,
April, June, and November.
February twenty-eight alone,
And all the rest have thirty-one.

YEAR, *Bissextile*, or *Leap*, is that consisting of 366 days; or it has one day extraordinary; which day is called the *intercalary*, or *bissextile day*.

This intercalary, or additional day to every fourth year, was first appointed by Julius Cæsar; who, to make the civil year keep pace with the tropical ones, contrived that the six hours which the former wanted of being equal to the latter, should, in four years, make a whole day, and be added before the twenty-fourth, or to the twenty-third of February, which was their sixth of the calends of March. Hence, as in that year, they reckon this day twice over, or add *bis sexto calendas*, the year itself came to be called *bis sextus*, and *Bissextile*; which see.

The intercalary day, however, among us, is not introduced by telling the twenty-third of February twice over, but by adding a day after the twenty-eighth of February; which month, in that year, contains twenty-nine days. See LEAP-*Year*.

A farther reformation in this year was made by pope Gregory. See *Gregorian* YEAR, and CALENDAR.

YEAR, *Lunar*, is a system of twelve lunar months. See LUNAR.

Hence, from the two kinds of synodical lunar months, there arise two kinds of lunar years; the one *astronomical*, the other *civil*.

Year, *Lunar Aſtronomical*, conſiſts of twelve lunar ſynodical months; and therefore contains 354 days, 8 hours, 48 minutes, 36 ſeconds; and is, therefore, 10 days, 21 hours, 0 minute, 12 ſeconds, ſhorter than the ſolar year. This is the foundation of the *Epact;* which ſee.

Year, *Lunar Civil*, is either *common* or *emboliſmic*.

Year, *the Common Lunar*, conſiſts of twelve lunar civil months; and therefore contains 354 days.

Year, *the Emboliſmic* or *Intercalary*, conſiſts of thirteen lunar civil months; and therefore contains 384 days. See Embolismic.

Thus far we have conſidered years and months, with a view to the principles of aſtronomy, on which the diviſion is founded. By this, the various forms of civil years that have anciently obtained, or ſtill do obtain in divers nations, are to be examined.

Year, *Ancient Roman*, or *Latin*, was the lunar year, which, as firſt ſettled by Romulus, only conſiſted of ten months; *viz.* 1. March, containing 31 days. 2. April, 30. 3. May, 31. 4. June, 30. 5. Quintilis, 31. 6. Sextilis, 30. 7. September, 30. 8. October, 31. 9. November, 30. 10. December, 30. In all 304 days, which came ſhort of the true lunar year by 50 days; and of the ſolar, by 61 days. Hence, the beginning of Romulus's year was vague, and unfixed to any preciſe ſeaſon; to remove which inconvenience, that prince ordered ſo many days to be added yearly as would make the ſtate of the heavens correſpond to the firſt month, without incorporating theſe additional days, or calling them by the name of any month. Cenſorinus, Varro, and other Roman authors, agree, that the ancient Latin year was divided into 10 months, which appears from a paſſage in Plutarch, that two intercalary months were added to every year; which two months were not inſerted in the calendar. Romulus retained the former names and number of the months; but adapted their quantity nearly to the courſe of the ſun, aſſigning, as we have ſtated, ſix of them 30 days, and to the remaining four 31 days each, and he transferred the beginning of the year from April to March: December was the 10th month, as its name implies; after which the two intercalary months were inſerted, but no names were affixed to them till the ſucceeding reign.

Numa Pompilius corrected the irregular conſtitution of Romulus's year, and compoſed two new months, January and February, of the days that were uſed to be added to the former year. Thus, Numa's year conſiſted of twelve months; *viz.* 1. January, containing 29 days. 2. February, 28. 3. March, 31. 4. April, 29. 5. May, 31. 6. June, 29. 7. Quintilis, 31. 8. Sextilis, 29. 9. September, 29. 10. October, 31. 11. November, 29. 12. December, 29. In all 355 days, which exceeds the quantity of a lunar civil year by one day; and that of a lunar aſtronomical year by 15 hours, 11 minutes, 24 ſeconds, but comes ſhort of the common ſolar year by ten days; ſo that its beginning alſo was vague and unfixed.

Numa, however, deſiring to have it fixed to the winter ſolſtice, ordered 22 days to be intercalated in February every ſecond year, 23 every fourth, 22 every ſixth, and 23 every eighth year, making in all 90 days.

But this rule failing to keep matters even, recourſe was had to a new way of intercalating; and, inſtead of twenty-three days every eighth year, only fifteen were added; and the care of the whole was committed to the pontifex maximus, who neglecting the truſt, let things run to the utmoſt confuſion. And thus the Roman year ſtood till Julius Cæſar made a reformation. See Calendar.

For the manner of reckoning the days of the Roman months, ſee Calends, Nones, and Ides.

Year, *Julian*, is a ſolar year, containing, commonly, 365 days; though every fourth year, called biſſextile, it contains 366.

The months, &c. of the Julian year ſtand thus: 1. January, 31 days. 2. February, 28. 3. March, 31. 4. April, 30. 5. May, 31. 6. June, 30. 7. July, 31. 8. Auguſt, 31. 9. September, 30. 10. October, 31. 11. November, 30. 12. December, 31. But every biſſextile year, a day is added after the 28th of February; which month then contains 29 days.

The aſtronomical quantity, therefore, of the Julian year is 365 days, 6 hours; which exceeds the true ſolar year by ſomewhat more than eleven minutes; which exceſs, in 131 years, amounts to a whole day. So that the times of the equinoxes go backward, and fall earlier by one day in about 131 or 130 years. And thus the Roman year ſtood, till the reformation made in it by pope Gregory.

For this form of the year, we are indebted to Julius Cæſar; who, in the contrivance of it, was aſſiſted by Soſigenes, a famous mathematician, called over from Egypt for this very purpoſe; who, to ſupply the defect of ſixty-ſeven days, which had been loſt through the fault of the pontifices, and to fix the beginning of the year to the winter ſolſtice, made that year to conſiſt of 15 months, or 445 days; which, for that reaſon, is uſed to be called *annus confuſionis*, the *year of confuſion*. See *Julian* Calendar.

Year, *Gregorian*, is the Julian year corrected by this rule; that whereas, on the common footing, every ſecular or hundredth year is biſſextile; on the new footing, three of them are common years, and only the fourth is biſſextile.

The error of eleven minutes in the Julian year, little as it was, yet, by being repeated over and over, at length became conſiderable; and from the time when Cæſar made his correction, was grown into thirteen days, by which means the equinoxes were greatly diſturbed. In the year 1582, the equinoxes were fallen ten days, and the full moons four days, more backwards than they were in the time of the Nicene council; *i. e.* the equinox, which in the year 325, when that council was held, fell on the twenty-firſt of March, was in 1582 thrown back to the tenth, and the full moon was removed from the fifth to the firſt of April. To remedy this irregularity, which was ſtill increaſing, pope Gregory XIII., in the year juſt mentioned, called together the chief aſtronomers of his time, and concerted this correction; and, to reſtore the equinoxes to their place, threw out the ten days that had been got from the time of the council of Nice, and which had ſhifted the fifth of October to the fifteenth. He exchanged the lunar cycle for that of the epacts; and in order to reſtore the ſpring equinox to the Nicene ſtandard, ſubtracted ten days out of the month of October, in that year (1582), making the fourth to be the fifteenth; and by this means, the vernal equinox has been reſtored to the twenty-firſt of March. Moreover, it was endeavoured, by the omiſſion of three intercalary days in four hundred years, to make the civil year keep pace with the ſolar for time to come. See Calendar.

In the year 1700, the error of ten days was grown to eleven; upon which the Proteſtant ſtates of Germany, to prevent farther confuſion, accepted the Gregorian correction. See *Reformed* Calendar, and Style.

Yet is even the Gregorian year far from being perfect; for we have ſhewn, that in four centuries the Julian year gains three days, one hour, twenty minutes; but it is only the three days that are kept out in the Gregorian year; ſo that

that there is ftill an excefs of one hour, twenty minutes, in four centuries, which, in feventy-two centuries, amount to a whole day.

The Gregorian year is now ufed in moft countries in Europe. From the difference between this and the Julian year arifes the diftinction of the old or Julian, and new or *Gregorian Style;* which fee.

YEAR, *Egyptian*, called alfo the *year of Nabonaffar*, on account of the *epocha of Nabonaffar*, is the folar year of 365 days, divided into twelve months, of thirty days each, befides five intercalary days, added at the end.

The names, &c. of the months are as follow: 1. Thoth. 2. Paophi. 3. Athyr. 4. Chojac. 5. Tybi. 6. Mecheir. 7. Phamenoth. 8. Pharmuthi. 9. Pachon. 10. Pauni. 11. Epiphi. 12. Mefori; befide the ἡμεραι επαγομεναι.

Hence, as the Egyptian year in every four years lofes a whole day of the Julian year, becaufe it neglects the fix hours, which make a leap-day once in four years, its beginning, in the fpace of 1460 years, runs through every part of the Julian year; which fpace elapfed, they meet again; and, therefore, it is juftly called the *erratic year*. And becaufe it returns to the fame day of the Julian year after 1460 Julian years, this circle is called the Sothic period. See CANICULAR *Year*.

This year is ufed by Ptolemy, in his Almageft; fo that the knowledge of it is of great ufe in aftronomy, for comparing the ancient obfervations with the modern.

This defultory form was applied by the Egyptians to civil ufes, till Antony and Cleopatra were defeated; and the mathematicians and aftronomers ufed it till the time of Ptolemy.

The ancient Egyptians, we are told by Diodorus Siculus (lib. i.), Plutarch (in the Life of Numa), and Pliny (lib. vii. c. 48.), meafured their years by the courfe of the moon. At firft, they were only one month, then three, then four, like that of the Arcadians; and then fix, like that of the people of Acarnania. Thofe authors add, that it is on this account they reckon fuch a vaft number of years from the beginning of the world; and that, in the hiftory of their kings, we meet with fome who lived 1000 or 1200 years.

But Herodotus is filent on this point: he only fays, that the Egyptian year confifted of twelve months, as we have above reprefented it. Befides, we learn from Scripture, that from the times of the flood, the year was compofed of twelve months; Cham, confequently, and his fon Mifraim, the founder of the Egyptian monarchy, muft have had that cuftom; and it is no way probable his defcendants fhould alter it. Add, that Plutarch fpeaks of it with great uncertainty, and as no more than a report; and Diod. Siculus, as only a conjecture of authors whom he does not name; and who, in all probability, might have framed this hypothefis to reconcile the Egyptian chronology to that of fome other nations.

F. Kircher, however, maintains, that befides the folar year, there were fome of the nomes or cantons of Egypt which ufed a lunar one; and that in the remoteft ages there were fome who took a revolution of the moon, that is, a month for a year; and others, who finding the year too fhort, made it two months, others three, and others four, &c. (Oedip. Egypt. tom. ii. p. 252.) A late author obferves, that Varro has affirmed of all nations, what we have here quoted of the Egyptians; and adds, that Lactantius takes him to tafk on that fubject. We do not know in what places of Varro, or Lactantius, he has feen this: all we can fay is, that Lactantius (Divin. Inft. lib. iii. c. 13.), where he gives Varro's opinion, only reprefents him as fpeaking of the Egyptians. However, St. Auguftine (De Civit. Dei, lib. xv. c. 14.) fhews, that the years of the patriarchs mentioned in Scripture are like ours, and not one of ours equal to ten of theirs, as, it appears, had been the opinion of fome people.

Upon the Egyptians being fubdued by the Romans, they received the Julian year, though with fome alteration; for they ftill retained their ancient months, with the five ἡμεραι επαγομεναι, and, every fourth year, intercalated another day between the 28th and 29th of Auguft. Add, that the beginning of their year, or the firft day of the month Thoth, anfwered to the 29th of Auguft of the Julian year, or to the 30th if it happened to be leap-year.

This year, thus reformed, and called the fixed Egyptian year, was called the *annus Actiacus*, as being inftituted foon after the battle of Actium.

YEAR, *Ancient Greek*, was lunar, confifting of 12 months, which, at firft, had 30 days a-piece, then alternately 30 and 29 days, computed from the firft appearance of the new moon; with the addition of an embolifmic month of 30 days, every 3d, 5th, 8th, 11th, 14th, 16th, and 19th years of a cycle of 19 years; in order to keep the new and full moons to the fame terms or feafons of the year. With this correction, though erroneous, it fubfifted until the time of Herodotus and Hippocrates. Solon attempted the reformation of the calendar by the introduction of the complete and defective months; *i. e.* months of 30 and of 29 days; for two lunations made 59 days, nearly. Thus amended the year became lunar, and was adopted at Athens; but in other ftates of Greece the ancient form was retained.

Their year commenced with the new moon, the full moon of which comes next after the fummer folftice. The order, &c. of their months was thus: 1. Ἑκατομβαιων, containing 29 days. 2. Μηταγειτνιων, 30. 3. Βοηδρομιων, 29. 4. Μαιμακτηριων, 30. 5. Πυανεψιων, 29. 6. Ποσειδεων, 30. 7. Γαμηλιων, 29. 8. Ανθεστηριων, 30. 9. Ελαφηβολιων, 30. 10. Μουνυχιων, 30. 11. Θαργηλιων, 29. 12. Σκιροφοριων, 30.

The Macedonians had other names for their months; fo had the Syro-Macedonians, Smyrnæans, Tyrians; fo alfo the Cyprians, Paphians; and fo the Bithynians, &c.

YEAR, *Ancient Macedonian*, is a lunar year, only differing from the Attic, in the names and order of the months; the firft Macedonian month agreeing with the Attic Mæmacterion: as the Macedonian year commenced not at the fummer folftice, but at the autumnal equinox. The months ftand thus: 1. Διος, 30 days. 2. Απελλαιος, 29. 3. Αυδυναιος, 30. 4. Περιτιος, 29. 5. Δυστρος, 30. 6. Ξανθικος, 29. 7. Αρτεμισιος, 30. 8. Δαισιος, 29. 9. Πανεμος, 30. 10. Λωος. 11. Γορπιαιος, 30. 12. Ὑπερβερεταιος.

YEAR, *Modern Macedonian*, is a folar year, whofe beginning is fixed for the firft of January of the Julian year, with which it perfectly agrees.

This year was particularly called the *Attic year;* and the intercalary month, after Pofideon, was called Ποσειδεων β, or *latter Pofideon.*

YEAR, *Ancient Jewifh*, is a lunar year, confifting, commonly, of eleven months, which alternately contain 30 and 29 days.

It was made to agree with the folar year, either by the adding of 11, and fometimes 12 days, at the end of the year, or by an embolifmic month.

Tradition reports, that Abraham preferved in his family, and tranfmitted to pofterity, the Chaldæan form of the year, which originally confifted of 360 days (compare Dan. vii. 25. xii. 7. with Rev. xii. to xiv. xi. 2, 3.), and remained without any correction until the date of the Nabonaffarean era. If any intercalation was ufed by the Jews, Mofes

Moses appears to have been unacquainted with it. After the Babylonish captivity, they adopted the solar year. When they were subjected to the Syro-Macedonian yoke (B.C. 312), they were compelled to admit the lunar year into their calendar. To adjust this year to the course of the sun, they added, at certain periods, a month to Adar, and called it Ve-Adar. They composed also a cycle of 19 years; in seven of which they inserted the intercalary month, *viz.* in the 3d, 6th, 8th, 11th, 14th, 17th, and 19th. The design of this correction was, to bring the 15th day of Nisan to the equinoctial point, and to regulate the courses of the seasons, and of the feasts, in such a manner, as that the corn might be ripe at the passover, as the law required.

The names and quantities of the months stand thus: 1. Nisan, or Abib, containing 30 days. 2. Jiar, or Zius, 29. 3. Siban, or Siwan, 30. 4. Thamuz, or Tamuz, 29. 5. Ab, 30. 6. Elul, 29. 7. Tisri, or Ethanim, 30. 8. Marchesvan, or Bul, 29. 9. Cisleu, 30. 10. Tebeth, 29. 11. Sabat, or Schebeth, 30. 12. Adar, in the embolismic year, 30. Adar, in the common year, was but 29.

Note.—In the defective year, Cisleu was only 29 days; and in the redundant year, Marchesvan was 30.

Year, *Modern Jewish*, is likewise lunar, consisting, in common years, of 12 months, but of 13 in embolismic years; which in a cycle of 19 years are, the 3d, 6th, 8th, 11th, 14th, 17th, and 19th. Its beginning is fixed to the new moon next after the autumnal equinox.

The names, &c. of the months are, 1. Tisri, containing 30 days. 2. Marchesvan, 29. 3. Cisleu, 30. 4. Tebeth, 29. 5. Schebeth, 30. 6. Adar, 29. 7. Veadar, in the embolismic year, 30. 8. Nisan, 30. 9. Iiar, 29. 10. Sivan, 30. 11. Thamuz, 29. 12. Ab, 30. 13. Elul, 29.

Year, *Syrian*, is a solar year, having its beginning fixed to the beginning of October, in the Julian year; from which it only differs in the names of the months, the quantities being the same, as follows:

1. Tishrin, answering to our October, and containing 31 days. 2. Latter Tishrin, containing, like our November, 30. 3. Canun, 31. 4. Latter Canun, 31. 5. Shabat, 28, or 29 in a leap-year. 6. Adar, 31. 7. Nisan, 30. 8. Aiyar, 31. 9. Haziram, 30. 10. Tamuz, 31. 11. Ab, 31. 12. Elul, 30.

Year, *Olympic*, was of a singular form, the first month commenced at the new moon, that the full moon might fall on the 15th day. Four years of 360 days contain 1440 days; 48 lunations are equal to 1417 days, 11 hours, 14 minutes; a 49th lunation added to the 4th year makes 1447 days, nearly. By this adjustment, the new moon would have happened on the 8th instead of the 1st of the month. To correct this error, two days were added to the last month of every year, the 4th excepted, when one day was added. By these means, the olympic year, which consisted of 362 or 361 days, must have varied 14 days from the course of the sun in the space of an olympiad; and, at the end of 50 years, the games would have been transferred to the winter solstice; but for preventing this deviation, a month was intercalated at certain intervals. Notwithstanding this, a considerable error still remained. The olympic games were regulated by the Cycle *of Clostratus*; which see. See also Olympiad and Epocha.

Year, *Persian*, is a solar year, of 365 days, consisting of 12 months of 30 days each, with five intercalary days added at the end.

The months are as follow: 1. Afrudia meh. 2. Ardihascht meh. 3. Cardi meh. 4. Thir meh. 5. Merded meh. 6. Schabarir meh. 7. Mehar meh. 8. Aben meh. 9. Adar meh. 10. Di meh. 11. Behen meh. 12. Asirer meh.

This year is called the *yezdegerdic* year, to distinguish it from the fixed solar year, called the *gelalean* year, which the Persians began to use in the year 1079, and which was formed by an intercalation made six or seven times in four years, and then once every fifth year.

The yezdegerdic year, it may be observed, is the same with Nabonassar's year, differing from it only in the names of the months, and the commencement of the epocha; for whereas the Nabonassarean began on February 26, this began on June 16. As to the gelalean year, it is absolutely the best and justest of all the civil years yet invented, as being found, by calculation, to keep the solstices and equinoxes precisely to the same days, and answering very accurately to the solar motions; which no other civil year does, not even the Gregorian, for want of so commodious an intercalation. See *Persian* Calendar.

Year, *Arabic*, *Mahometan*, and *Turkish*, called also the year of the *hegira*, (which see,) is a lunar year, equal to 354 days, 8 hours, and 48 minutes, and consisting of 12 months, which contain alternately 30 and 29 days.

Though sometimes it contains 13 months; the names, &c. of which are as follow: 1. Muharram, containing 30 days. 2. Saphar, 29. 3. Rabia, 30. 4. Latter Rabia, 29. 5. Jomada, 30. 6. Latter Jomada, 29. 7. Rajab, 30. 8. Shaaban, 29. 9. Ramadan, 30. 10. Shawal, 29. 11. Dulkaadah, 30. 12. Dulheggia, 29; and in the embolismic year, 30. An intercalary day is added every 2d, 5th, 7th, 10th, 13th, 15th, 18th, 21st, 24th, 26th, 29th, in a cycle of 29 years.

The months commence not from the real new moon, but from its first appearance after conjunction.

Year, *Ethiopic*, is a solar year, perfectly agreeing with the Actiac, except in this, that the names of the month are different. It commences with the Egyptian year, on the 29th of August of the Julian year.

Its months are, 1. Mascaram. 2. Tykympt. 3. Hydar. 4. Tyshas. 5. Tyr. 6. Jacatil. 7. Magabit. 8. Mijazia. 9. Ginbat. 10. Syne. 11. Hamel. 12. Hahase. Intercalary days 5.

Year, *Holy*. See Holy.

Year, *Platonic*, or *Great*. See Platonic.

Year *of the Hegira*. See Hegira, and *Arabic* Year.

Year's *Day*, *New*, or the day on which the year commences, has always been very different in different nations; and yet in all has been held in great veneration.

Among the Romans, the first and last day of the year were

were confecrated to Janus; on which account it was that they reprefented him with two faces.

To them we owe the ceremony of wifhing *an happy new year*, which appears to be very ancient. Before the firft day was fpent they not only vifited and complimented each other, but alfo prefented ftrenæ, and offered vows to the gods for the prefervation of each other.

Lucian reprefents it as a practice of a very ancient ftanding, even in his time, and refers it to Numa.

Ovid intimates the fame ceremony in the beginning of his Fafti:

> " Poftera lux oritur, linguifque animifque favete:
> Nunc dicenda bono funt bona verba die."

And Pliny more exprefsly, lib. xxviii. cap. 1. " Primum anni incipientis diem lætis precationibus invicem fauftum ominantur."

In Ruffia at the new year is annually held a feaft of the dead, called Raditzli Sabol, on occafion of which every body vifits the grave of his relations, lays fome victuals upon it, and then hears mafs, in payment for which the priefts get the victuals. In our own country, the ufhering in of the new year, or " New Year's tide," with rejoicings, prefents, and good wifhes, was a cuftom obferved, during the 16th century, with great regularity and parade, and was as cordially celebrated in the court of the prince as in the cottage of the peafant. On the firft day of the new year, prefents, called new year's gifts, were given and received with the mutual expreffion of good wifhes, and particularly that of a " happy new year." The compliment was fometimes paid at each other's doors in the form of a fong; but more generally, efpecially in the north of England and in Scotland, the houfe was entered very early in the morning by fome young men and maidens felected for the purpofe, who prefented the fpiced bowl, and hailed you with the gratulations of the feafon. In the reign of queen Elizabeth, the chief officers of ftate, and feveral of the queen's houfehold fervants, gave new year's gifts to her majefty, confifting, in general, either of a fum of money, or jewels, trinkets, wearing-apparel, &c. The largeft fum given by any of the temporal lords was 20*l*.; but the archbifhop of Canterbury gave 40*l*., the archbifhop of York 30*l*., and the other fpiritual lords 20*l*. and 10*l*. Many of the temporal lords and great officers, and moft of the peereffes, gave rich gowns, petticoats, fmocks, kirtles, filk ftockings, cyprus garters, fweet-bags, doublets, mantles, fome embroidered with pearls, garnets, &c., looking-glaffes, fans, bracelets, cafkets ftudded with precious ftones, jewels ornamented with fparks of diamonds in various devices, and other coftly trinkets. Thefe prefents alfo confifted of books, and appropriate gifts from phyficians, apothecaries, &c. The queen, though fhe made returns in plate and other articles, took fufficient care that the balance fhould be in her own favour. In the country, however, with the exception of the extenfive houfeholds of the nobility, this interchange was conducted on the pure bafis of reciprocal kindnefs and good will, and without any view of fecuring patronage or fupport; it was, indeed, frequently the channel through which charity delighted to exercife her holy influence, and though originating in the heathen world, became fanctified by the Chriftian virtues.

We fhall here add, that the rejoicings on new year's tide were fucceeded by the obfervance of the " Twelfth-day," called, from the idea that the Eaftern magi, who are faid to have vifited our Saviour on that day, were kings, the " Feaft of the Three Kings." The " Twelfth-cake," diftributed on that occafion, was almoft always accompanied by the *waffail bowl*; which fee. Drake's Shakfpeare, vol. i.

YEAR, *Civil*, or *Legal*, in England, formerly commenced on the day of the Annunciation; *i. e.* on the 25th day of March: though the hiftorical year began on the day of the Circumcifion; *i. e.* the firft of January, on which day the German and Italian year alfo begins.

Stowe obferves, that William the Conqueror having been crowned on the firft of January, that henceforth became the firft of the year for hiftorians, &c. though, in all civil affairs, they retained the ancient manner of accounting, which began the 25th of March.

The part of the year between thefe two terms was ufually expreffed both ways, as 1748-9, or 174$\frac{8}{9}$. But by the act for altering the ftyle, the civil year now commences with January 1. See *New* STYLE.

Since the Conqueror, the king's patents, charters, proclamations, &c. are ufually dated by the year of the king's reign.

The church, as to her folemn fervice, begins the year on the firft Sunday in Advent, which is always that next St. Andrew's day, or the 30th of November.

The Jews, as moft other nations of the Eaft, had a civil year, which commenced with the new moon in September; and an ecclefiaftical year, which commenced from the new moon in March.

The month Tifri, which began about the time of the autumnal equinox, was the firft month of the Jewifh year, till it was changed at the time of the coming up of the children of Ifrael out of Egypt. For that happening in the month of Abib, afterwards called Nifan, this month was for this reafon reckoned the firft month of the year in all ecclefiaftical matters. Before this period, Tifri was reckoned the commencement of the year, becaufe it was thought that the world was created and firft began at the time of the autumnal equinox. And for this reafon, the Jews do ftill in their era of the creation of the world, as well as in their era of contracts, compute the beginning of the year from the firft of Tifri, and all their bills and bonds, and all other civil acts and contracts, are ftill dated among them according to the fame computation; and from this month alfo they began all their jubilees and fabbatical years. And therefore, although their ecclefiaftical year began from Nifan, and all their feftivals were computed from it, yet their civil year was ftill reckoned from Tifri, and the firft day of that month was their new year's day; and for the more folemn celebration of it, the feaft of trumpets feems to have been appointed.

The French year, during the reigns of the Merovingian race, began on the day on which the troops were reviewed; which was the firft day of March. Under the Carlovingians it began on Chriftmas-day; and under the Capetians, on Eafter-day; which, therefore, varied between the 22d of March and the 25th of April. The ecclefiaftical year in France begins on the firft Sunday in Advent. But for the civil, Charles IX. appointed, in 1564, that for the future it fhould commence on the 1ft of January.

For an account of the change that took place in the year of France, fee *French* or *Republican* CALENDAR. The French calendar was of no long duration. It was abolifhed in the courfe of thirteen years; and the Gregorian was reftored, and ordered to be ufed in all dates after the 1ft of January, 1806.

The Mahometans begin their year the minute in which the fun enters Aries. The Perfians in the month anfwering to our June. The Chinefe, and moft of the Indians, begin it with the firft moon in March. The Brachmans begin it with the new moon in April, on which day they hold a feaft called *famwat faradi pauduga*, q. d. *feaft of New-year's day*. The Mexicans, according to D'Acofta, begin the year on our

our 23d of February, when the leaves begin to grow green: their year confifts of eighteen months, having twenty days each, which make three hundred and fixty days; the remaining five days are fpent in mirth, and no bufinefs is fuffered to be done, nor even any fervice at the temples. Alvarez relates much the fame of the Abyffinians; who begin their year on the 26th of Auguft, and have five idle days at the end, which they call *pagomen*. At Rome there are two ways of computing the year; the one beginning at the Nativity of our Lord: this the notaries ufe, dating *a Nativitate*. The other on the 25th of March, on occafion of the Incarnation; and it is by this the bulls are dated, *anno Incarnationis*. The Greeks begin their year of the world from the firft of September. See YEAR *fupra*.

Years are alfo diftinguifhed with regard to the epochas whence they are numbered: thus, *years of our Lord*, are thofe reckoned from the birth of Jefus Chrift. *Years of the world*, are thofe elapfed fince the Creation. *Years of Rome, of the Hegira, of Nabonaffar*, &c. See the difference between thefe years, under the article EPOCHA.

YEAR is alfo a word ufed by fome of the chemical writers to exprefs any product of their operations, which may ferve as a medicine, whether internally or externally.

YEAR *and Day*, in *Law*, &c. is a time that determines a right in many cafes, and is in fome an ufucaption, and in others a prefcription.

Thus, in the cafe of an eftray, if the owner, proclamation being made, challenge it not within a year and day, it is forfeit. In like manner is the year and day given in cafes of appeal, of defcent, of entry or claim, of non-claim upon a fine, or writ of right, of the death of a man fore bruifed, or wounded, of protections, effoins in refpect of the king's fervice, of a wreck, and on many other occafions.

YEAR, *Day, and Wafte, Annus, Dies, et Vaftum*, is a part of the king's prerogative, by which he challenges the profits of the lands and tenements of perfons attainted for petit treafon, or felony, for the fpace of a year and a day, whofoever is lord of the manor to which they belong.

Formerly the king had only a liberty of committing wafte on the lands of felons, by pulling down their houfes, extirpating their gardens, ploughing their meadows, and cutting down their woods. But this tending greatly to the prejudice of the public, it was agreed in the reign of Henry I. that the king fhould have the profits of the land for one year and a day in lieu of the deftruction he was otherwife at liberty to commit: and, therefore, Magna Charta provides, that the king fhall only hold fuch lands for a year and a day, and then reftore them to the lord of the fee; without any mention made of wafte. But the ftatute 17 Edward II. *de prærogativa regis*, feems to fuppofe, that the king fhall have his year, day, and wafte, and not the year and day inftead of wafte; which fir Edward Coke, and the author of the Mirror, before him, very juftly look upon as an encroachment, though a very ancient one, of the royal prerogative.

This year, day, and wafte, are now ufually compounded for; but otherwife they regularly belong to the crown: and, after their expiration, the land would naturally have defcended to the heir (as in gavel-kind tenure it ftill does), did not its feodal quality intercept fuch defcent, and give it by way of efcheat to the lord. Black. Com. book iv.

YEAR-*Books*, in *Law*. See REPORTS.

YEARS, *Eftate for*, in *Law*, is a contract for the poffeffion of lands or tenements for fome determinate period: and it happens when a man letteth them to another for the term of a certain number of years, agreed upon between the leffor and the leffee, and the leffee enters thereon.

If the leafe be but for half a year, or a quarter, or any lefs time, this leffee is reputed as a leffee or tenant for years, and is fo ftyled in fome legal proceedings; a year being the fhorteft term which the law in this cafe takes notice of. An eftate of this kind, even for a thoufand years, is only a chattel, and reckoned part of the perfonal eftate; and, therefore, a leafe for years may be made to commence *in futuro*, though a leafe for life cannot.

With regard to emblements, or profits of land fowed by tenant for years, there is this difference between him and tenant for life: that where the term of tenant for years depends upon a certainty, as if he holds from Midfummer for ten years, and in the laft year fows a crop of corn, and if it is not ripe and cut before Midfummer, the end of his term, the landlord fhall have it; for the tenant knew the expiration of his term, and therefore it was his own folly to fow what he never could reap the profits of. But where the leafe for years depends upon an uncertainty; as, upon the death of the leffor, being himfelf only tenant for life, or being a hufband feifed in right of his wife; or if the term of years be determinable upon a life or lives: in all thefe cafes, the eftate for years not being certainly to expire at a time foreknown, but merely by the act of God, the tenant or his executors fhall have the emblements in the fame manner as a tenant for life, or his executors fhall be intitled to it. But not fo, if it determine by the act of the party himfelf; as if tenant for years does any thing that amounts to a forfeiture; in which cafe the emblements fhall go to the leffor, and not to the leffee, who hath determined his eftate by his own default. Blackft. Com. vol. ii.

YEARLINGS, in *Rural Economy*, a term applied to young neat cattle of the heifer kind in the fecond year. It is obferved in the Gloucefterfhire Report on Agriculture, that until within thefe few years, it was there efteemed a bad practice to let them be put fo early to the bull, but that now it is even thought that this method improves them as milkers; and that from the increafed value of ftock, it is advantageous to anticipate a year, as a heifer in calf, at two years old, will be worth nearly as much as it would be if kept three. See LIVE-*Stock*.

YEARN, in *Hunting*, fignifies to bark, as beagles properly do, at their prey.

YEARNING, in *Rural Economy*, a term applied to runnet, ufed for curdling milk in fome places. See DAIRYING and RUNNET.

YEAST, YEST, or *Barm*, the foam or flower of beer, or other liquor in fermentation.

The yeaft of beer is ufed for a leaven or ferment in the making of bread: as ferving to fwell or puff it up very confiderably in a little time, and to make it much lighter, fofter, and more delicate. But when there is too much of it, it renders the bread bitter.

The ufe of yeaft in bread is but of late ftanding among us: it is not above a century fince the avarice of the bakers firft introduced it; and then it was only done by ftealth. Though Pliny witneffes it to have been ufed by the ancient Gauls.

The faculty of medicine of Paris, by a decree of the 24th of March, 1688, folemnly maintained it noxious to the health of the people; yet even that cenfure could not prevent its progrefs.

Common ale-yeaft may be kept frefh and fit for ufe feveral months by the following method: Put a quantity of it into a clofe canvas bag, and gently fqueeze out the moifture in a fcrew-prefs, till the remaining matter be as firm and ftiff as clay.

In this ftate it may be clofe packed up in a tight cafk, for ſecuring it from the air; and will keep freſh, ſound, and fit for uſe for a long time.

This is a ſecret that might be of great uſe to the brewers and diſtillers here, who, though they employ very large quantities of yeaſt, ſeem to know no method of preſerving it, or raiſing nurſeries of it; for want of which they ſuſtain a very conſiderable loſs; whereas the brewers in Flanders make a very great advantage of ſupplying the malt-diſtillers of Holland with yeaſt, which is rendered laſting, and fit for carriage, by this eaſy expedient. Shaw's Lectures.

Mr. Henry has repeatedly prepared an artificial yeaſt, by impregnating flour and water with fixed air, with which he has made very good bread, without the aſſiſtance of any other ferment: and he propoſes this method of procuring freſh fermented bread at ſea.

The proceſs is as follows: Boil flour and water together to the conſiſtence of treacle; when the mixture is become cold, fill a ſmall caſk with it. This caſk is to be filled up in the manner repreſented in *Plate* XV. *fig.* 7. *Pneumatics*, and deſcribed under PYRMONT *Water*, for the impregnation of water with fixed air; and the proceſs is to be conducted in a ſimilar way, except that the caſk is to be agitated as often as the mixture riſes to about two-thirds of the capacity of the funnel *k*; and after each agitation, which ſhould continue during ſeveral minutes, the unabſorbed air is to be let out, by withdrawing the plug from the orifice *m*, till that part of the mixture which remained in the funnel has returned into the caſk. The orifice at *i* ſhould alſo be larger than is neceſſary in the other operations, on account of the ſuperior viſcidity of the mixture. When, after repeated agitation, the mixture which has aſcended into the funnel does not ſubſide into the caſk, it may be ſuppoſed incapable of abſorbing more air.

Pour the mixture, thus ſaturated, into one or more large bottles, or narrow-mouthed jars; cover it over looſely with paper, and upon that lay a ſlate or board with a weight to keep it ſteady. Place the veſſel in a ſituation where the thermometer will ſtand from 70° to 80°, and ſtir up the mixture two or three times in twenty-four hours. In about two days, ſuch a degree of fermentation will have taken place, as to give the mixture the appearance of yeaſt.

With the yeaſt in this ſtate, and before it has acquired a thoroughly vinous ſmell, mix the quantity of flour intended for bread, in the proportion of ſix pounds of flour to a quart of the yeaſt, and a ſufficient portion of warm water. Knead them well together in a proper veſſel, and covering it with a cloth, let the dough ſtand for twelve hours, or till it appears to be ſufficiently fermented, in the above-mentioned degree of warmth. It is then to be formed into loaves and baked.

Mr. Henry adds, that perhaps the yeaſt would be more perfect, if a decoction of malt were uſed inſtead of ſimple water.

When the operation is finiſhed, the caſk, in order to prevent its contracting a diſagreeable taint, ſhould be well waſhed. Henry's Account of a Method of preſerving Water at Sea, &c. p. 26, 1781.

YEAST, *Chemical Properties of.* The nature of yeaſt has been briefly diſcuſſed under the head of FERMENTATION. Since that article was written, however, ſome additional experiments have been publiſhed on the ſubject, which deſerve to be noticed here.

The active and eſſential principle of yeaſt, as obſerved under the article *Fermentation* above alluded to, appears to be a ſpecies of *gluten*. When yeaſt is kept for ſome time in cylindrical glaſs veſſels, a white ſubſtance, not unlike curd, ſeparates and ſwims upon the ſurface. If this ſubſtance be removed, the yeaſt loſes the property of exciting fermentation. This ſubſtance poſſeſſes many of the properties of gluten, though it differs from it in others. Its colour is much whiter. It has not the ſame elaſticity, and its particles do not adhere with the ſame force. It diſſolves more readily in acids. Dr. Thomſon conſiders this as the real fermentative principle, and thinks it may be conſidered as gluten ſomewhat altered, and rendered much more capable of decompoſition. He thinks alſo that it exiſted in the raw grain originally, but underwent conſiderable modifications by the malting proceſs, and perhaps others during the fermentation of the beer from which it ſeparated.

The ſame diſtinguiſhed chemiſt ſtates, in ſupport of this opinion, the experiments of Fabroni and Thenard. Fabroni, by heating the juice of grapes, and paſſing it through a filtre, ſeparated an adheſive matter, which poſſeſſed the properties of gluten, and deprived of which the juice refuſed to ferment, though it fermented as well as uſual when this principle was again added. Thenard likewiſe found in the juices of all the fruits he examined a ſubſtance ſimilar to that deſcribed by Fabroni, and which, according to him, is abſolutely the ſame with pure yeaſt. This ſubſtance is inſipid, does not change vegetable blues, is inſoluble in water, loſes three-fourths of its weight when dried, and is decompoſed like animal ſubſtances. When eight parts of it were diſtilled, they left 2.83 of charcoal, and yielded 1.61 of water, 1.81 of oil, and a quantity of ammonia, which, when ſaturated with muriatic acid, formed 1.46 of muriate of ammonia. The gas obtained weighed 0.33, and conſiſted of one-fifth of carbonic acid, and four-fifths of carburetted hydrogen, requiring $1\frac{1}{2}$ times its bulk of oxygen to conſume it. Nitric acid, even when much diluted, converts it into a ſpecies of tallow. With potaſh it forms a ſoap, while ammonia is diſengaged. When mixed with ſugar and a ſufficient quantity of water, fermentation takes place, carbonic acid is diſengaged, and a vinous liquor formed. By this action, the ferment loſes the whole of its azote, and becomes incapable of exciting fermentation when mixed with a new portion of ſugar. In farther corroboration ſtill of this opinion, Dr. Thomſon adduces an experiment of Kirchhoff, which he thinks throws conſiderable light on the nature of yeaſt. Barley-meal contains both gluten and ſtarch. Pure ſtarch infuſed in hot water is not converted into ſugar; nor does gluten become ſaccharine matter when heated in the ſame manner. But if a mixture of pure dried pulverized wheat-gluten and potatoe-ſtarch be infuſed in hot water, the ſtarch is converted into ſugar. During the proceſs an acid is ſaid to be evolved. The gluten is little changed in appearance or quantity, and may moſt of it be ſeparated by filtration. What is ſingular, however, it is incapable of inducing the ſame change upon ſtarch a ſecond time.

The following are the conſtituents of yeaſt, according to Weſtrumb, as quoted by Dr. Thomſon. From 15.360 parts he obtained,

Potaſh	13
Carbonic acid	15
Acetic acid	10
Malic acid	45
Lime	69
Alcohol	240
Extractive	120
Mucilage	240
Saccharine matter	315
Gluten	480
Water	13.595
	15.142

Besides some traces of phosphoric acid and silica. But it is evident, as Dr. Thomson observes, that all these ingredients are not essential, and he considers the gluten only as deserving that appellation.

Some of the French chemists have considered the principle of fermentation to reside in an imperfect species of sugar, which they have denominated the *sweet principle*, and which they state to exist in combination with real sugar in all fruits containing that principle. This *sweet principle* they suppose to differ from pure sugar, in being incapable of crystallizing. A familiar example of it we have in *treacle* or *molasses*, which, according to them, is the *sweet principle* of the sugar-cane. This doctrine, however, has not met with many adherents; for, as Dr. Macculloch observes, although chemistry has not hitherto discovered the means of separating the sugar from the *sweet principle*, the results of fermentation leave no doubt that the latter consists of sugar combined with the vegetable extractive matter, or gluten, as it is denominated by most chemists. Thus molasses consists of a certain portion of *real sugar*, in such a state of combination with a variety of substances, and the fermentative principle among the rest, that it cannot be made to crystallize or be otherwise obtained in a separate state. This is demonstrated by the well-known fact, that molasses may be made to undergo the fermentative process, and to yield alcohol, in precisely the same manner as a simple mixture of sugar and yeast. The sweet principle of molasses, therefore, must be in fact nothing else than sugar, unless we suppose two different substances capable, by the same means, of producing the same result, which is totally unprecedented in chemistry, besides being in itself extremely improbable.

Upon the whole then, in the present state of our knowledge, we are obliged to conclude that the essential principle of yeast, or the real fermentative principle, is either identical with gluten, or closely allied to it. Of its real nature, however, and *modus operandi*, we are totally ignorant, and shall probably long remain so.

The yeast of beer is that most generally employed, and is of the utmost importance in the manufacture of bread, and of fermented liquors from malt. If carefully dried and preserved from moisture, it retains its properties for a long time, and it is a pity this practice is not more generally resorted to, as fluid yeast in warm weather soon becomes acescent and putrid, and not only loses its properties, but imparts a most disagreeable flavour to the bread, &c. with which it is mixed. Yeast may be readily dried by first separating its watery parts as much as possible, and afterwards exposing it in shallow vessels to the air, or to a gentle heat in a stove. In this way, it may be obtained in thin laminæ, and requires only to be preserved in close vessels in a dry place, when it will be always ready for use, by diffusing it in a little warm water. A popular method of preserving yeast is by drying it upon bunches of twigs. See Bread, Brewing, Fermentation, and Wine.

Yeast, *Medicinal Properties of*. Yeast has been highly extolled as an antiseptic remedy in diseases, when a putrid diathesis was supposed to prevail; as in low typhus fevers, gangrene, &c. A good method of exhibiting it is, to mix one or two table-spoonfuls of it with a quart of infusion of malt or mild porter, and to take a wine-glassful of this mixture frequently. Many practitioners also have spoken highly of the good effects of a fomenting poultice composed partly of yeast, when applied to foul and gangrenous ulcers. The good effects of this remedy, if in reality it possesses any, may probably be attributed to the carbonic acid gas generated by its agency. See Fever.

YEATS, Mrs., in *Biography*, the celebrated tragic actress, who, in conjunction with Mrs. Brooke, the novelist, a lady of considerable literary merit, undertook, in 1773, at all risks, the conduct and government of the opera, and all its dependencies; an enterprise for which they were but sparingly qualified. In the first place, Mrs. Yeats, though possessed of strong natural parts, and an inherent spirit of government, knew no language but English, was ignorant and indifferent about music, dancing, painting, machinery, and decorations. She and her husband had saved a considerable sum by their salaries and benefits at our national theatres, and in hopes of accumulation previous to retirement, they quitted employments for which they were extremely well fitted, and in which their success was certain, to govern a most froward family by deputation, at the extreme hazard of being ruined.

Mrs. Brooke, who had resided some time at Quebec, after its conquest, with her husband, the Rev. Dr. Brooke, chaplain to the army in that colony, indeed knew French, had a good taste in books, and wrote in a good style; but was ignorant of music, and totally unacquainted with all opera concerns. Yet it was during this female regency, that the best composers, the greatest singers, and the most capital and renowned dancers, were engaged: for during nine years, from 1773 to 1782, we had Sacchini, Truetta, and Anfossi, to compose; Pacchierotti, Ansani, and the Gabrielli, to sing; and Madlle. Heynel, the Vestris, and Le Picq, to dance.

Mrs. Yeats did not enrich herself by her opera sovereignty; but she had the address to escape ruin. And Mrs. Brooke, who risked no property, lost no reputation by imprudence, or the want of talents in the persons she engaged.

YECATY, in *Geography*, a town of Hindoostan, in Mysore; 20 miles N. of Seringapatam.

YECORA, a town of New Mexico, in the province of Hiaqui; 50 miles E. of Riochico.

YEDACOTTA, a town of Hindoostan, in Mysore; 15 miles N. of Dindigul.

YEDAPADY, a town of Hindoostan, in the Carnatic; 8 miles N. of Sankeridurgam.

YEDAPILLY, a town of Hindoostan, in Mysore; 2 miles N.W. of Vencatighery.

YEDDIMUNGALUM, a town of Hindoostan, in the Carnatic; 18 miles E. of Tanjore.

YEDKAST. See Jezdkast.

YEGUE Hotun, a town of Chinese Tartary; 418 miles E.N.E. of Peking. N. lat. 43°. E. long. 124° 19'.

YEHENAGUR, a town of Hindoostan, in Lahore; 15 miles N.N.E. of Jallindar.

YEHUNGSCHAUL, a town of Hindoostan, in Lahore; 40 miles W.N.W. of Lahore.

YELASURAM, a town of Hindoostan, in Palnaud; 20 miles W.S.W. of Timerycotta.

YELCHORE, a town of Hindoostan, in the circle of Guntoor; 3 miles N.E. of Innaconda.

YELCOUR, a town of Hindoostan, in the Carnatic; 15 miles N. of Chittoor.

YELDOOR, a town of Hindoostan, in Mysore; 12 miles N.E. of Colar.

YELFOLA, a town of Spain, in Galicia; 18 miles N. of Santiago.

YELION, a word used by some of the barbarous writers to express glass.

YELL Island, in *Geography*, one of the Shetland islands, 20 miles long, and about 7 broad, but intersected by a number of bays, by the inhabitants called Voes, which afford good harbours. The principal part of the arable land is confined to the neighbourhood of the coast; the inland parts are mountainous,

tainous, and covered with peat mofs: there is but little heath, but abundance of a rough fort of grafs called *lubbo*, which grows naturally, and affords tolerable pafture for fheep, horfes, and black cattle. Though the crops raifed are not fufficient for above eight months' confumption, yet the inhabitants, by the advantage of having plenty of fuel, and catching immenfe quantities of fmall fifh, live comfortably, and as well as the generality of the peafants of Scotland. N. lat. 60° 56'. W. long. 1° 20'.

YELLAGOOD, a town of Hindooftan, in Golconda; 45 miles S.E. of Canoul.

YELLAMOODY, a town of Hindooftan, in the province of Madura; 25 miles W. of Madura.

YELLANG, a town of Burmah; 14 miles S. of Mellone.

YELLOOR, a town of Hindooftan, in Baramaul; 6 miles N.N.W. of Namcul.

YELLOW, a bright colour, reflecting the moft light of any after white. See COLOUR.

The word is formed from the Italian *giallo*, or the German *geel*, which fignifies the fame; or from the Latin *galbanus*, *bright*, *gay*.

There are divers yellow fubftances that become white, upon wetting and drying them again feveral times in the fun: fuch as wax, linen cloth, &c. (See BLEACHING.) And the fame bodies, if they be already white, and continue a long time in the air without being wetted, turn yellow.

Paper and ivory, applied near the fire, become fucceffively yellow, red, and black. Silk, when turned yellow, is whitened again with the fumes of fulphur.

YELLOW, in *Dyeing*, is one of the five fimple and mother colours. See COLOUR.

The only materials ufed by the calico-printers for the production of fine yellows are the quercitron-bark (fee QUERCUS), and the *Weld*, or *Refeda Luteola*, which fee. In order to obtain calicoes of the fineft yellow or more delicate lemon colour, it is neceffary to dry the pieces in the open air, as the ftove would not fail to injure fuch colours; ftove-drying having a tendency to change a yellow into an orange. In the operation of dunging the mordants for thefe pale yellows, care fhould be taken that it be not done at a higher temperature than 96° or 100°, as fuch a high temperature would impair their beauty. But befides, by dunging at this low temperature, the dyeing may be completed at about 110°, which will give a much livelier colour than if a higher temperature had been employed. For all the different fhades of reds and yellows, the mordant employed by calico-printers is the acetate of alumine; which is prepared by a mixture of the fulphate of alumine with acetate of lead, both in a ftate of folution; fo that, on the theory of double decompofition, fulphate of lead is formed, which precipitates while the acetate of alumine remains in folution. Of late this article has been prepared from the pyroligneous acid, by means of lime and alum, in the following manner:—The pyroligneous acid is firft paffed through a ftill, to diveft it of a portion of the tar which is always diffolved in it: it is then faturated with lime or whiting; and the acetate of lime thus formed is decompofed by a heated folution of fulphate of alumine. The refult of this double decompofition is fulphate of lime, which precipitates, and acetate of alumine, which is drawn from the fediment of the calcareous fulphate, and preferved for ufe. Mr. Parkes cautions the manufacturer againft the ufe of lime in the procefs for making acetate of alumine; and he fays that the true mode of making it, though more expenfive, is that recommended by Berthollet, which confifts in decompofing fulphate of alumine by means of faccharum faturni, or acetate of lead. Mr. Parkes mentions a method of producing yellows on calico, which, though not often practifed, has neverthelefs a very good effect. The procefs is as follows:—A ftrong decoction of bark, thickened with gum tragacanth, is to be mixed with a portion of very pure muriate of tin; and this, when printed with the ufual management, will produce a colour of great brightnefs and durability. This mode poffeffes one very important advantage; *viz.* that if it fhould be neceffary to pad a piece in diluted acetate of alumine to obtain a pale lemon ground, the yellow figures previoufly done by the above procefs will not give out any part of their colour to the fecond mordant; whereas, whenever a ftrong yellow has been produced in the common way, the pattern is very apt to fpread, and to become irregular, and often to ftain the ground, when the piece comes a fecond time into the acetate of alumine. Parkes's Eff. vol. ii.

Turmeric likewife gives a good yellow, though not the beft.

Woollen cloth, impregnated with a folution of alum and tartar, acquires on being boiled with the watery decoction, an elegant, but not very durable orange-yellow or gold-coloured dye. It is rarely made ufe of by the dyers, on account of its price, and the perifhablenefs of its colour.

There is alfo an Indian wood that gives a yellow colour bordering on gold. This wood, called *fuftick*, is a fpecies of mulberry-tree, of a deep fulphur-yellow colour, which it readily gives out both to water and fpirit. The watery decoction dyes prepared woollen of a very durable orange-yellow: the colour is imbibed by the cloth in a moderate warmth, without boiling.

The *fuftet* or *fuftel* of the French is a yellow wood or root, very different from our fuftick: it gives a fine orange dye to woollen, but the colour is extremely perifhable in the air. This is called *cotinus coriaria*, or *Venice fumach*.

The leaves of many kinds of herbs and trees give a yellow dye to wool or woollen cloth that has been previoufly boiled with a folution of alum and tartar. There is, indeed, no colour for which we have fuch plenty of materials as for yellow.

Mr. Hellot obferves, in his Art de Teindre, that all leaves, barks, and roots, which on being chewed difcover a flight aftringency, as the leaves of the almond, peach, and pear trees, afh-bark (efpecially that taken off after the firft rifing of the fap in fpring), the roots of wild patience, &c. (fee LEAF), yield durable yellows, more or lefs beautiful, according to the length of time that the boiling is continued, and the proportions of alum and tartar in the preparatory liquor: that a large quantity of alum makes thefe yellows approach to the elegant yellow of weld; that if the tartar is made to prevail, it inclines them to an orange; and that if the roots, barks, or leaves, be too long boiled, the yellow proves tarnifhed, and acquires fhades of brown. Neumann's Chemical Works, by Lewis, p. 384. 434.

The Chinefe are famous for their yellows in dyeing, which never change with wafhing. They make this dye of the flowers of the acacia, in a manner in which we might ufe feveral of our productions to a great advantage.

It is thus: they gather the flowers before they are perfectly ripe, and dry them in an earthen veffel over a gentle heat, till they crifp up in the manner of tea-leaves: they then add to them the ripe feeds of the fame tree in different proportions; and then boiling them in river water with alum, they give the yellow in any degree that they pleafe.

They have three kinds of yellow, which they diftinguifh by the names of *Ngo-hoang*, *king-hoang*, and *hoang* alone.

The firft of thefe is the brighteft yellow: to dye five or fix ſix ells of ſilk of this colour, they uſe a pound of the flowers of the acacia, about two ounces of the ſeeds, and four ounces of alum.

The *king-hoang* is a ſomewhat deeper yellow: to dye this, they uſe the ſame ingredients in the ſame proportion as in the former caſe; and when the ſilk is dry from the dipping in this, they give it a ſecond dipping in a ſlight tincture of Braſil wood: this brings it to the fine ſtrong yellow we ſee.

The *hoang*, or pale yellow, is made of the ſame ingredients as the firſt, only inſtead of four ounces of alum they put in but three ounces: river water is found to be greatly preferable to any other for the extracting of theſe colours; but even in that there is great difference, ſome doing the buſineſs much better than others.

The Chineſe are ſo expert in judging on this occaſion, that they can tell by the taſte of water whether it will or will not do; and if it taſte faint they know it is faulty; but they dip the pieces twice into it inſtead of once, and the colour ſucceeds well.

The flowers of the acacia, when they have been prepared by roaſting in this manner, may be kept all the year round, and employed in dyeing as occaſion requires, only there is to be longer boiling for the dried flowers than the freſh ones; and it is always found that the freſh flowers give the brighteſt colour. Obſ. ſur les Coutum. de l'Aſie, p. 254.

Greens are uſually made of yellow and blue mixed. With yellow, madder red, and goat's-hair prepared with madder, are made the golden yellow, Aurora, panſy, nacarate, Iſabella, and chamois colour, which are all caſts or ſhades of yellow.

Mr. Peter Woulfe has given the following receipt for making the yellow dye:—Take half an ounce of powdered indigo, and mix it in a high glaſs veſſel, with two ounces of ſtrong ſpirit of nitre, which ſhould be previouſly diluted with eight ounces of water, for preventing the indigo's being ſet on fire by the ſpirit; becauſe two ounces and a half of ſtrong ſpirit of nitre will ſet fire to half an ounce of indigo: let the mixture ſtand for a week, and then digeſt it in a ſand-heat for an hour or more, and add four ounces more of water to it; filtre the ſolution, which will be of a fine yellow colour. If the indigo be digeſted twenty-four hours after the ſpirit of nitre is poured upon it, it will froth and boil over; but after ſtanding about a week, it has not that property.

One part of the ſolution of indigo in the acid of nitre, mixed with four or five parts of water, will dye ſilk or cloth of the paleſt yellow colour, or of any ſhade to the deepeſt, and that by letting them boil more or leſs in the colour. The addition of alum is uſeful, as it makes the colour more laſting: according as the ſolution boils away, more water muſt be added. None of the colour in the operation ſeparates from the water, but what adheres to the ſilk or cloth; and conſequently this colour goes far in dyeing.

Cochineal, Dutch litmus, orchil, cudbear, and many other colouring ſubſtances treated in this manner, will all dye ſilk and wool of a yellow colour.

The indigo which remains undiſſolved in making Saxon blue, and collected by filtration, if digeſted with ſpirit of nitre, dyes ſilk and wool of all ſhades of brown, inclining to a yellow.

Cloth and ſilk may be dyed green with indigo; but they muſt firſt be boiled in the yellow dye, and then in the blue. Phil. Tranſ. vol. lxi. part i. p. 129, &c. See DYEING.

Painters and enamellers make their yellow of maſſicot, or, as ſome write it, maſticot, which is ceruſſe raiſed to a yellow colour by the fire; or with yellow ochre. Limners and illuminers make it with ſaffron, French berries, oreanette, &c.

Mr. Boyle tells us a moſt beautiful yellow may be procured by taking good quickſilver, and three or four times its weight of oil of vitriol, drawing off, in a glaſs retort, the ſaline menſtruum from the metalline liquor, till there remains a dry ſnow-white calx at the bottom: on pouring a large quantity of fair water on this, the colour changes to an excellent light yellow.

He ſays he fears this colour is too coſtly to be uſed by painters, and he does not know how it would agree with every pigment, eſpecially oil colours. Works abr. vol. ii. p. 91. See VITRIOL.

Branton obſerves, that it was anciently the cuſtom to paint a man's door yellow, and ſtrew his houſe with ſalt, to declare him a traitor to his king.

YELLOW *and other Colouring Matters of Flowers*, in *Rural Economy*, the different colouring matters thus produced. The nature of the colouring matters of flowers has not yet been much examined into. Such colouring matters are in general very tranſient, eſpecially thoſe of the blue and red kinds. The yellow colouring matters of this ſort are ſaid to be the moſt permanent. It is noticed by a late writer, that the carthamus contains a red and a yellow colouring matter; that the yellow is eaſily diſſolved by water; that from the red, rouge is prepared by a proceſs which is kept ſecret; that the colours of moſt flowers are changed by alkalies to green, and by acids to red; that an imitation of the colouring matter may be made by digeſting ſolutions of gall-nuts with chalk; a green fluid is produced, which becomes red by the action of an acid; and that has its green colour reſtored by means of alkalies.

YELLOW *Copper*, in *Mineralogy*, copper pyrites. See COPPER *Ores*.

YELLOW *Earth*, a ſoft yellow mineral ſubſtance, found at Wehraw, in Upper Luſatia, aſſociated with clay and argillaceous iron-ſtone: it is ſometimes uſed as a yellow pigment. The characters given of this ſubſtance do not ſeem to entitle it to be regarded as a different ſpecies from ſome of the ochreous clays which occur in the coal-ſtrata in England. It is claſſed by profeſſor Jameſon with the lithomarge family, and is thus deſcribed by him. Its colour is ochre-yellow, of different degrees of intenſity; it occurs maſſive; it is dull in the croſs fracture, but glimmering in the principal fracture. In the large, the fracture inclines to ſlaty; in the ſmall, the fracture is earthy. The fragments are tubular, or indeterminately angular. It becomes ſhining in the ſtreak; it is opaque and very ſoft, paſſing into friable; it ſoils the fingers ſlightly, and adheres to the tongue; its feel is rather greaſy; it is rather light, but the ſpecific gravity is not given. Before the blow-pipe, yellow earth is converted into a black and ſhining enamel. We have no analyſis of this earth.

YELLOW *Tellurium Ore*, an ore of tellurium, hitherto found only at Nagyag, in Tranſylvania. See TELLURIUM.

YELLOW *Cow-Wheat*, in *Agriculture*. See WEED.

YELLOW *Dead Nettle*. See WEED.

YELLOW *Devil's Bit*. See WEED.

YELLOW or *French Berries*. See AVIGNON, and LYCIUM.

YELLOW *Fever*, an epidemic diſeaſe of frequent occurrence in America and the Weſt Indies. See FEVER, *Yellow*.

Veſſels arriving in Great Britain or Ireland, or the iſlands of Guernſey, Jerſey, Alderney, Sark, or Man, from places where the yellow fever is known to exiſt, or where it is deemed likely to break out, are ſubjected by various laws and orders of his majeſty in council to the reſtraint of quarantine; the ſame as ſhips arriving from countries ſubjected to to the *Plague*, for the details of which, fee that article in the *Addenda*.

YELLOW-*Hammer*, in *Ornithology*, the name of a very common Englifh bird, called by authors *emberiza lutea;* and by Linnæus *emberiza citrinella;* and by fome *hortulanus;* by others *luteus;* and by others *chloreus*.

The bill is of a dufky hue; the crown of the head is of a pleafant pale yellow; in fome almoft plain, in others fpotted with brown; the hind-part of the neck is tinged with green; the chin and throat are yellow; the breaft is marked with an orange-red; the belly yellow; the leffer coverts of the wings are green; the others dufky, edged with ruft colour; the back of the fame colours; the rump of a rufty red; the quill-feathers dufky, edged on their exterior fides with yellowifh-green; the tail is a little forked; the middle feathers are brown; the two middlemoft edged on both fides with green, the others on their exterior fides only; the interior fides of the two outmoft feathers are marked obliquely near their ends with white.

This fpecies makes a large flat neft on the ground, near a bufh or hedge, of mofs, dried roots, and horfe-hair: it lays fix eggs, of a white colour, with dark purple veins; and in winter frequents our farm-yards with other fmall birds. Pennant.

There is befide this another kind, which is much fmaller, and of a browner colour on the back; this is called by fome authors *zivolo*.

YELLOW *Hawkweed*, in *Agriculture*. See WEED.

YELLOW *Jaundice*, in *Medicine*. See JAUNDICE.

YELLOW, *King's*, is a pure orpiment, or arfenic coloured with fulphur, ufed for painting in oil and varnifh; of an extreme bright colour, and when good a true yellow: when ufed alone, it will ftand well; but mixed with white lead, and feveral other pigments, its colour flies or changes. It is fometimes mixed with blue pigments, to form a green colour. This pigment may be prepared by mixing fulphur and arfenic by fublimation: taking of arfenic powdered, and flowers of fulphur, in the proportion of twenty parts of the firft to one of the fecond, and putting them into a fublimer, and fubliming them in a fand-heat by means of a furnace particularly adapted to the purpofe. When the operation is completed, the king's yellow will be found in the upper part of the glafs, which muft be feparated with care from any foul parts adhering to it in the glafs, and levigated into an uniform powder. It may be alfo obtained from common orpiment by fubliming it in the fame manner. This pigment may be rendered warmer, or more inclined to orange, by increafing the proportion of the fulphur, and *vice versâ*. Handmaid to the Arts, vol. i. p. 17.

YELLOW *Ladies' Bed Straw*. See WEED.

YELLOW *Meat*, in *Rural Economy*, that which is much tinged with a yellow colour. It is faid to be a peculiar property in fome forts of animals, of both the fheep and cattle kinds, to afford meat which has a yellow caft or appearance.

It is fuggefted that this defect muft be hereditary, as no pafture or particular food can either produce or remove it, as fheep which have been tried in the manner here defcribed and found yellow have been fent to the Thames marfhes, kept there a year, and when flaughtered have proved as yellow as gold. It may probably depend upon fome phyfiological principle, which mere examination after death has not yet fhewn. Thefe remarks are equally applicable to beef as mutton, and are the refult of information on the fubject derived from a well-experienced Smithfield falefman.

YELLOW, *Naples*. See GIALLOLINO.

YELLOW *Oat-Grafs*, in *Agriculture*, a fort of grafs which thrives well in meadows and paftures, as well as upon hills where the foil is of a calcareous nature, flowering in the middle of fummer. It is a rather coarfe grafs, which, though tolerably fweet, is thought by many to be much inferior to the meadow and fefcue graffes; and which Withering has afferted not to be relifhed by cattle; but which Swayne thinks one of the beft graffes of this kind for the ufe of the farmer.

The proportional value which the grafs, at the time the feed is ripe, bears to that at the time of flowering, is as 9 to 15.

The proportional value which the grafs of the latter-math bears to that at the time of flowering, is as 5 to 15; and to that at the time the feed is ripe, as 5 to 9.

It is remarked, that this fpecies of grafs is pretty generally cultivated in many diftricts and parts of this country; and that it would appear from the above details to be a valuable grafs, though inferior to many others. See AVENA *Flavefcens*, GRASS, and GRASS-*Land*.

YELLOW *Ochre*. See OCHRE.

YELLOW *Rattle*. See WEED.

YELLOW *Scour* or *Milk*, a difeafe in lambs, which takes place while they are young, and in which they appear quite dull and fpiritlefs; their ears inftead of being upright lie flat and afunder on their heads; they are very lank in the fides and bellies, and their breathing is very fhort and unequal. Thefe appearances are fucceeded by a purging of a yellowifh milky coloured matter, which, in fome cafes, has come on before the difeafe is noticed; but at other times, the lambs die without having had any or only a flight difcharge of excrement. The body or carcafe appears well fed; the excrement in the inteftines, which laft are fometimes in fome degree fwelled, refembles in colour that paffed at the anus, while the ftomach is particularly full of coagulated milk.

It is a difeafe which never appears or fhews itfelf in hard feafons, but only when the weather is warm, growing, and genial, and there is great plenty of new grafs. In general it does not affect them after they are three weeks old. It is moftly afcribed to their fucking more milk than they can digeft; and it is even faid, that they not unfrequently fuck until their ftomachs burft.

The lambs being young, and of little value, remedies to prevent or remove the difeafe are feldom tried; but thofe of the aromatic cretaceous kind, with a little opium, may often be ufed with much advantage in preventing and curing the complaint.

YELLOW *Vetchling*, in *Agriculture*, a plant of the tare kind, that may be cultivated by the farmer in many cafes with profit. The writer of the Effays on Rural Affairs ftates, that it grows with great luxuriance on ftiff clayey foils; that it continues annually, for any length of time, to afford a great weight of produce, which is of the very beft quality; that it is equally fit for pafture herbage or for hay, and that it may be applied to one or other of thefe purpofes at any period as convenient; that it has likewife this advantage, that as it continues to grow with equal ftrength in the end as in the beginning of the fummer feafon, it may admit of being paftured upon in the early fpring, when neceffary, without endangering the lofs of the hay-crop, which cannot be the cafe with any other plant ufually cultivated, except clover, which is unfit both for early pafture and for hay; and that it is ftill more valuable, as growing to the greateft perfection on fuch foils as are wholly unfit for producing fain-foin, the only fort of plant yet cultivated in the

the field, which seems to have qualities approaching to those of this plant.

The principal objection to its cultivation is the difficulty of procuring the seeds of it in plenty, which may probably be obviated by proper management. It is, however, an abiding plant, and one which increases fast by its running roots, and which may readily be propagated in this way in the field. See LATHYRUS *Pratensis*.

YELLOW-*Berry Wash*, is a solution of the gum of the French berries in water; and may be prepared by boiling a pound of the berries in a gallon of water with half an ounce of alum, in a pewter vessel, and filtering the fluid; and by evaporating the fluid in the boiler till the colour appears to be of the requisite degree of strength.

This is used as a washing colour in water-painting: it will stand extremely well, and being more diluted, or laid on thicker, will, in consequence of its transparency, give a variety of shades.

YELLOW *Wash of Saffron*. See *Tincture of* SAFFRON.

YELLOW *Wash of Turmeric*. See TURMERIC.

YELLOW *Breeches Creek*, in *Geography*, a river of Pennsylvania, which runs into the Susquehanna, N. lat. 40° 13'. W. long. 76° 52'.

YELLOW *Creek*, a township of Ohio, in the county of Columbiana, with 491 inhabitants.—Also, a river of America, which runs into the Ohio, N. lat. 40° 34'. W. long. 80° 44'.

YELLOW *River*, a small river of Ireland, in the King's county, which joins the river Boyne.

YELLOW *River*. (See HOANG.) Mr. Barrow, supposing, without the possibility of exaggeration, that the breadth of the Yellow river, where Macartney's embassy passed it, about 70 miles from the sea, was only three-fourths of a mile, the mean depth five feet, and the velocity of its course four miles an hour, concludes, from these data, that the river discharges into the Yellow sea, in every hour, a volume of water equal to 418,176,000 solid feet, or 2,563,000,000 gallons of water, or 1100 times as much as appears to be furnished by the Ganges. By another computation, he estimates the quantity of mud wafted into the sea by this river in every hour to be equal to 2,000,000 solid feet, or 48,000,000 in every day, or 17,520,000,000 in every year. Supposing the mean depth of the Yellow sea to be 20 fathoms, or 120 feet, the quantity of earth brought down by the Yellow river would, if accumulated together, be sufficient to fill up, even to the surface of the sea, an island one mile square in 70 days. By extending the calculation, a curious inquirer may find in what space of time the Yellow sea itself might be filled up by the successive depositions from the Yellow river alone; for supposing that sea to extend northward from that river, and to include the gulfs of Pe-che-lee and Leao-tong, the number of square miles on the surface of this extent would be about 125,000, which, multiplied by the number (70) of days necessary for consolidating one mile square, would make 8,750,000 days, or 24,000 years.

The velocity of the Yellow river at the place where the embassy crossed it was so great, as to require, agreeably to the superstitious notions of the Chinese crews, a sacrifice to the spirit of the river, in order to ensure a safe passage over it. With this view, the master presented a cock, and having wrung off his head, which he threw into the sea, consecrated the vessel with the blood spouting from the body, by sprinkling it upon the deck, the masts, the anchor, and the doors of the apartments, and stuck upon them a few of the feathers of the bird. Various kinds of provisions were then ranged across the deck; and when the captain had made three profound inclinations of the body with his hands uplifted, he muttered a few words, as if of solicitation to the Deity. The loo, or brazen drum, was in the mean time beaten forcibly; lighted matches were held towards heaven; papers, covered with tin or silver-leaf, were burnt; and crackers fired off in great abundance by the crew. The captain afterwards made libations to the river, by emptying into it from the vessel's prow the several cups of liquids which he had provided, and concluded with throwing in also that which held the salt. All the ceremonies being finished, and the bowls of meat removed, the people feasted on it; and afterwards launched with confidence the yacht into the current. As soon as she had reached the opposite shore, the captain returned thanks to heaven, with three inclinations of the body. Sacrifices are also offered to obtain a fair wind, and to avert any impending danger.

Besides these offerings, great exertions were necessary to overcome the violence of the Yellow river, and to transport large yachts in safety to the opposite shore. Embassy to China, vol. ii.

YELLOW *Sea*, an extensive but shallow inland sea between Corea and China, hardly any where exceeding forty-five fathoms in depth, and often not more than twenty; with a bottom of clay or mud: the alluvion, without doubt, of the rivers that are poured into it from the mountains and plains of China. See LEAO-TONG.

YELLOWS, in *Animals*, is a disease which is incident to horses, neat-cattle, and sheep, in which there is a yellow jaundice-like appearance, especially in the eyes.

It is a disease that takes place in horses in all states of them, but which in those of the young kind is often unaccompanied with fever, or any sort of irritation.

It shews itself by a particular yellowness in the eyes and the inside of the mouth, with a considerable degree of constipation of the bowels in some cases.

The complaint is frequently much relieved by the use of a ball composed of one ounce of aloes in powder, with one drachm of calomel, and half an ounce of Castile soap, made up with a sufficient quantity of treacle; and the second morning afterwards giving one constituted of half an ounce each of nitre, resin, and Castile soap, made up with honey; and if the yellowness should continue in the eyes and mouth, repeating the latter after an interval of four days.

Some, however, advise to have first recourse to bleeding, clysters, and purges; in the last of which intentions the composition directed below may be found useful: One ounce and a half of Indian rhubarb, two drachms of saffron, and six drachms of soccotrine aloes, formed into a ball with syrup of buckthorn. But if the rhubarb should be thought too expensive, it may be omitted, and the same quantity of cream of tartar, and half an ounce of Castile soap, with four drachms more of aloes, be added. This may be repeated two or three times, giving intermediately the remedies directed below: Half an ounce of Æthiops' mineral, and one ounce of Castile soap, formed into a ball, and one of them given every day, washing it down with a pint of the following decoction: Madder and turmeric-root, each four ounces; burdock-root sliced, half a pound; monk's rhubarb, four ounces; and liquorice sliced, two ounces; boiled in one gallon of forge-water to three quarts; the liquor then strained off, and sweetened with honey.

In this disease, balls of Castile soap and turmeric alone are likewise often had recourse to, even to the quantity of three or four ounces or more in the day; and not unfrequently succeed in recent cases.

By means of this sort, the disease for the most part abates

abates in the courſe of a week or ten days, which may be known by the alteration in the eyes and mouth of the horſe; but the remedies are to be continued until the yellowneſs is wholly removed. Should, however, the diſeaſe prove obſtinate, and not give way to ſuch modes of treatment, it will be neceſſary to have recourſe to more powerful remedies, ſuch as thoſe of the mercurial purging kind, repeated two or three times at proper intervals, and then to give the balls compoſed of the ſubſtances directed below: Two ounces of ſalt of tartar, four ounces of cinnabar or antimony, three ounces of filings of ſteel, and ſoap half a pound, formed with honey into balls the ſize of a pullet's egg, giving one night and morning in a pint of the above decoction drink.

On the recovery of the horſe, ſome adviſe two or three mild purges; and if he be ſtrong and fat, to put in a rowel.

He ſhould have maſhes and warm water frequently, and be exerciſed daily, and warmly covered with cloths.

In order to prevent a relapſe, the firſt purging-ball may ſometimes be uſed with great advantage; and a powder formed of the following ingredients be mixed, with the feeds of corn every night for a fortnight: Æthiops' mineral, nitre, and aniſeeds, each half an ounce, mixed together.

Salt-maſhes, too, have often been found very uſeful in the cure of this diſorder, and when taken in time rarely fail in reſtoring the animal.

The yellows in neat-cattle is a common diſeaſe, ariſing from obſtruction in the gall-ducts, and conſiſts in a diffuſion of the obſtructed bile through the whole body of the animal. It is firſt diſtinguiſhed in the white of the eyes, which has a particular yellow appearance; and as it increaſes, the whole of the ſkin becomes tinged with the ſame yellow colour: but the ears, tail, eyes, and mouth, are the parts in which it is the moſt conſpicuous. The animals are affected with great weakneſs and debility in every ſtage of the diſeaſe, and there is a liſtleſſneſs, with indiſpoſition to move, and a want of appetite for their food. When in the paſtures, they moſtly wander about by the ſides of the hedges, or other fences, in a lonely manner. Milch cows are particularly ſubject to the diſeaſe in the ſpring and at the fall of the year; though they are not exempt from having it at all other ſeaſons. The moſt unfavourable ſtate of the diſeaſe is when it proceeds from an induration of ſome part of the liver, as there is then but little hope of the diſeaſe being permanently removed. As the changing ſtate of the weather has often a great effect in retarding or haſtening the removal of the diſeaſe, care ſhould be taken to houſe the animals in all unfavourable ſeaſons.

On the firſt appearance of the diſeaſe, it may often be removed by the compoſition directed below: Salt of tartar, Caſtile ſoap, and grains of Paradiſe, each one ounce; turmeric-root, and coriander-ſeeds, in powder, each two ounces; the whole being made into a drink, by pouring three pints of hot ale upon the ingredients in a proper cloſe veſſel, firſt ſlicing the ſoap in a thin manner, and covering them well up until they become about new milk warm, when two ounces of honey or treacle may be added, and the whole given as a drink. It muſt be repeated at the diſtance of every day or two, for two or three times, or as there may be occaſion.

Where the beaſt is ſtrong, a little blood may ſometimes be taken away with advantage; but it ſhould not be turned out into the paſture the ſame day.

When the diſeaſe does not give way to theſe remedies, it may be neceſſary to have recourſe to a ſtrong purge or two. After which a drink compoſed as below may be given: Salt of tartar, one ounce; Caſtile ſoap ſliced, two ounces; well rubbed down with an ounce of balſam of copaiva, and then two ounces each of valerian-root, ginger-root, and Peruvian bark in powder added, and the whole given in ale or gruel as above, repeating it every other day.

It is neceſſary to keep the bodies of the animals well open through the whole of the diſeaſe; in which intention a drink compoſed as below may often be uſeful: Barbadoes aloes, in powder, one ounce; caſtor-oil, four ounces; ſyrup of buckthorn, two ounces; mixed and given in a quart of oatmeal-gruel when about new milk warm, and repeated until the proper effect be produced, uſing the firſt ſaponaceous drink at the ſame time.

When this complaint is removed, the general health of the animals may ſoon be reſtored by the proper uſe of cordial ſtrengthening drinks, formed of the different aromatic pectoral ſeeds in the powdered ſtate.

The yellows is not a very common diſeaſe among ſheep, and conſequently has not been very accurately deſcribed; but probably confounded with many other affections to which they are ſubject. It is ſuppoſed by ſome to be in general confined to the South-Down and new Leiceſter breeds, which, from their more tender conſtitutions, are more liable to complaints.

The appearances of the diſeaſe are a yellowneſs over the whole body, but particularly diſtinguiſhable in the white of the eye. The wool, too, has a little of the tinge, and is ſlightly hard. The paſſages of the belly are of a whitiſh colour, and the urine is found to tinge any thing immerſed in it of a yellow hue. Sometimes there is a degree of fullneſs and hardneſs in the right-ſide, about the ſeat of the liver. The cauſes are any thing which has a tendency to obſtruct the gall-ducts, but they are by no means evident; their effect, however, ſeems generally to harden the liver, and invariably to impede the paſſage of the bile from it into the bowels. In ſome caſes, ſmall ſtones, formed in the gall-bladder, produce it; and at other times, it is cauſed, as in the rot, by the ſwelling of the glands impeding the flow of the bile in the ducts, in which caſe it is moſtly incurable.

The removal of the diſeaſe is to be attempted by the uſe of ſtrong purgatives, and ſuch remedies as act ſtrongly on the ſtomach. A ſtrong ſolution of purging ſalts will partly tend to produce this effect; and ten grains of ipecacuanha, given every three hours in a little warmed ſtrong beer, is ſaid to be attended with the moſt beneficial effects, when continued for five or ſix days together, and a doſe of purging ſalts given after it, ſo as to clear the bowels. Calomel and ſoap may likewiſe be often given with great benefit, as well as ſome of the above ſaponaceous remedies.

YEMANA, or Jemama, in *Geography*, a country and city of Arabia, which M. D'Anville, probably miſled by ſome map and uncertain accounts, places on a river called Aftan, and which he repreſents as a ſtream in Neged, though Niebuhr mentions it merely as a wali or brook, which runs after rains. D'Anville ſays, that Jemama is in Al Kardjé, which is the grand province of Kerjé of Niebuhr, on the E. of Hedjaz and Yemen; and in this province, according to the Daniſh geographer, is the city of Amamé or Imamé, renowned for the prophet Moſeilama, whom the hiſtorian Gibbon aſcribes to Yemana, and which town is in the diſtrict of Surſa. But this cannot correſpond with D'Anville's Jemama, which is in the province of Ared, bounded only by that of Lahſa on the E. Niebuhr alſo informs us, that Aijana, a town of Ared, is remarkable for the new prophet Wahhab; and therefore Gibbon ſeems to have erred by ſuppoſing it to be the ſame with Yemama, the latter being probably a town of Kerjé, not far to the E. of Hedjaz. After all, the province and city of Jemama are

are probably mere fictions, which ſhould be excluded from the maps, together with the river of Aſtan, which, if it exiſted, would certainly be followed by the caravans from Lahſa to Mecca, while they ſeem to prefer a ſandy deſert. Pinkerton's Geography.

YEMBA. See Emba.

YEMELLA, a town of Hindooſtan, in Golconda; 24 miles E.N.E. of Rachore.

YEMEN, a province of Arabia, comprehending the fineſt and moſt fertile part of Arabia, repreſenting, as Gibbon has obſerved, the Arabia Felix of antiquity, ſurrounded by the Red ſea, or Arabic gulf, and by the province of Hadramaut, Nedsjed, and Hedsjas. Yemen is naturally divided into two parts, differing greatly in ſoil and climate: that bordering on the Red ſea is a dry and ſandy plain, nearly two days' journey in breadth, and is ſcorched by the moſt torrid heats; the other, extending immediately beyond this, is a high-lying country, full of precipitous yet fertile hills, and enjoying a much more temperate air. Yemen is, like the reſt of Arabia, parcelled out among a number of different ſovereigns in unequal portions. Some of them are princes of conſiderable power; but many are petty ſchiecks, who are, however, perfectly independent: the moſt conſiderable of theſe princes is the imam, who reſides at Sana. There are ſeveral other independent ſtates, as Aden, Kaukeban, Kobail or Haſchid-u-Bekil, Abu-Ariſch, a large diſtrict between Abu-Ariſch and Hedsjas, inhabited by free Bedouins; Khaulan, Sahan, comprehending the principality of Saade; Nedsjeran, Kachtan, Nehhm, Eaſt Khauſan, Dsjof or Mareb, Jafa, and ſeveral others. The ſame intermixture of fertile and barren territory, and the ſame productions, appear every where through the whole province: the imam, however, ſeems to be maſter of the richeſt, the moſt agreeable, and the moſt intereſting part of this tract of country. It would not be eaſy to explain diſtinctly the extents and limits of this ſovereign's territories, as they are ſo interſected by the domains of a number of petty princes. The general diviſion of Yemen into Tehama the Lowlands, and Djebal the Highlands, obtains in the imam's dominion as well as elſewhere. Upon this grand diviſion depends the ſubdiviſion of the kingdom of Sana into thirty governments or counties. Tehama contains ſix of theſe governments, and the Highland country twenty-four: the ſmall governments are not all alike populous or remarkable. There are in the territory of the imam many ſchiecks diſperſed among the mountains, who acknowledge not his authority, and are but in a very ſlight degree dependent upon him. From the expulſion of the Turks in the year 1630, the reign of the imams began; their great anceſtor Khaſſem Abu Mahomed was the chief author of that revolution. The throne of Yemen is hereditary; if generally approved of by the ſubjects, the eldeſt legitimate ſon of an imam is his rightful ſucceſſor. But in the deſpotic governments of the Eaſt, indeed, no order can be cloſely obſerved, becauſe there are no fundamental laws. The imam is an abſolute prince, and the more ſo by uniting in his own perſon ſupreme authority, both ſpiritual and temporal, over his ſubjects. His juriſdiction in eccleſiaſtical matters, however, extends not over the dominions of other ſovereigns of the ſame ſect: theſe ſtates have each a mufti, or cadi, for its ſpiritual uſe. Although the imam be abſolute, he is checked in the exerciſe of his authority by the ſupreme tribunal of Sana, of which he is only preſident: this tribunal, conſiſting of a certain number of cadis, poſſeſſes the ſole power of life and death. The imam may not order any of his ſubjects for execution, but ſuch as have been condemned in conſequence of a criminal proſecution before this court. The cadis are generally eſteemed to be perſons of incorruptible integrity, of blameleſs lives, and devoted to the faithful diſcharge of their duties: they are not changed here ſo often as in Turkey, but hold their offices uſually for life. Every petty diſtrict in the dominions of the imam has its governor: if not a prince, or one of the higher nobility, this governor is called wali and dola, or ſometimes emir, when he happens to be a perſon of low birth. In every little town, a ſub-dola, with a ſmall garriſon, conſiſting ſometimes of five or ſix ſoldiers, reſides to maintain order. The chief of a large village is a ſchieck; he of a ſmall one a hakin. Every city in which a dola reſides has alſo a cadi, dependent on the chief cadi of Sana; the cadi is ſole judge in civil and eccleſiaſtical affairs, nor may the dola interfere to contradict his ſentences, or render them inefficacious. The cadis in the provinces, no leſs than in the capital, are in high reputation for wiſdom and integrity. The revenue of the imam is fluctuating and precarious; Niebuhr ſtates it at about 500,000 crowns a month. This revenue ariſes from a land and poll tax, and from duties payable upon articles of merchandize. The military force conſiſts ordinarily of 4000 infantry and 1000 cavalry. Theſe armies uſe no artillery, nor do the Arabs know how to manage cannon. As the imam has no dread of enemies or corſairs upon the Arabic gulf, he has no occaſion for a naval force; and his ſubjects are therefore generally unſkilled in navigation. The fiſhermen venture far to ſea in ſmall canoes ſcarcely furniſhed with oars. The manufactures of a people of ſo little induſtry cannot but be very trifling: no ſabres are manufactured in Yemen, nor any edged weapon, except a kind of crooked knives, called *jembea*. The making of match fire-locks has been attempted here within theſe few years: it ſucceeds but indifferently. It is only of late that glaſs works have been eſtabliſhed at Mocha; ſome coarſe cloth is manufactured here, but not ſo much as is required for the uſe of the country: broad cloths are neither made nor worn here. The Engliſh brought ſome goods of this ſort to Mocha, but were obliged to carry them back to India unſold. A country which affords ſo few articles for ſale cannot have a great trade. Coffee is almoſt the ſole article exported from Yemen; a valuable commodity, in exchange for which many of thoſe things which this country needs from abroad may well be obtained. All the commerce of Yemen is carried on by Mocha, except only that ſome ſmall quantities of coffee are exported by Loheia and Hodeida. Agriculture ſeems to be farther advanced in Yemen than in the other parts of the Eaſt. Wheat, in the beſt cultivated diſtricts, is ſaid to yield an increaſe of fifty-fold; durra, in the Highlands, 140; and in the Tehama from 200 to 400: and the inhabitants of Tehama reap three ſucceſſive crops from the ſame field in the ſame year. In many parts of Yemen, whole fields are cultivated like a garden, and watered in the rainy ſeaſon by canals from the hills. The inhabitants of the plain are obliged to encompaſs their fields with dykes, that the water may remain for ſome time upon the ſurface of the ground. In the upper parts of Yemen, the inhabitants collect the water neceſſary for their fields in dams formed at the foot of the hills. In ſome diſtricts of Yemen, maize and durra are planted with the hand. The huſbandry of Tull and Du Hamel, ſays Niebuhr, although novel in Europe, is very old in Arabia. In order to guard their fields from depredation of birds and other deſtructive animals, the peaſants watch them by turns. In the Highlands, he who watches ſeats himſelf on a tree; in the Tehama, on a ſort of ſcaffold, with a roof raiſed over it. Niebuhr's Travels.

YEN, a river of China, which runs into the Hoang, 17 miles S.E. of Yen-tchang.

YEN-CHIN-TCHING, a town of China, in Chantong; 45 miles E.S.E. of Tci-nan.

YENDON, a river of England, in the county of Stafford, which runs into the Churnet.

YENGHI Iman, a town of Curdiftan; 70 miles S.E. of Kerkuk.

YENGI, a town of Corea; 25 miles N.E. of Kang.

YENISSEI, or Yenissey, or *Eniffei*, a river of Ruffia, which the Tartars and Mongoles, who inhabit the fuperior regions of it, above the Tungufka, call Kem, and the Oftiaks, Gub or Khefes, fignifying the Great river, and which is at firft compofed of two rivers, the Kamfara and the Veikem, originating in the Chinefe Soongaria, or Bucharia, and forming a conjunction in N. lat. 51° 30′, and E. long. 111°. About the mouth of the Bom-Kemtfhyug it enters on Ruffian ground, and hence firft takes the name of Yeniffey. After various windings it turns northward, and in N. lat. 70′, and E. long. 103° 30′, forms a bay containing feveral iflands; and at laft, in 3° 30′ of length, falls into the Frozen ocean. In autumn, when its water is at the loweft, its breadth, *e. gr.* at the town of Yeniffeifk, is about 570 fathom, whereas in the fpring it is 795 fathom and upwards. The coafts of the Frozen ocean, between the mouths of the Yeniffey and Oby, are called the Yuratzkoi fhore. The more confiderable ftreams taken up by the Yeniffey are the following: on the right, the Ufs, the Tuban, the Kan, and the three Tungufkis, *i. e.* the Upper, the Middle, or Podkammenaia, and the Lower Tungufka; on the left, the Abakan, the Yelovi, and the Turukhan. In its fuperior regions, the Yeniffey flows over a very ftony bed; and its fhores, particularly the eaftern, are moftly befet with lofty mountains and rocks. Its courfe is in general very rapid, though near its mouth it flows fo gently, that the current is hardly perceptible. In the neighbourhood of Turukanfk and elfewhere it forms fome confiderable iflands; and between the cities of Yeniffeifk and Krafnoyarfk feveral cataracts are to be feen. The Yeniffey is navigable from its mouth as far as Abakan, and affords abundance of the beft fifh. Near this river, as well as in fome other fteppes of Ruffia, are ftone-tombs, which reprefent in rude fculpture human faces, camels, horfemen with lances, and other objects. Between this river and the Oby, or Ob, is a vaft fpace extending from the north of Tomfk to the Arctic ocean, which is regarded as a fteppe, being a prodigious level with no appearance of a mountain, and fcarcely of a hill. The fame term is applied to the wider fpace between the Yeniffey and the Lena, between the Arctic ocean in the N., and the river Tungufka, or Angara, in lat. 65°; and to the parts beyond the Lena as far as the river Kolyma or Covima. Tooke's Ruff. vol. i.

YENISSEISK, or Enisseisk, a fmall town of Ruffia, in the government of Tobolfk, fituated on the above defcribed river, the forges of which yield a confiderable tax to the Ruffian revenue. Its jurifdiction is extenfive, and it pays annually a tribute in fkins to the crown of Ruffia; 400 miles E.N.E. of Kolivan. N. lat. 58° 16′. E. long. 91° 50′.

YENITE, in *Mineralogy*, *Lievrite*, Werner, a mineral found in the ifland of Corfica, which from the great quantity of iron that it contains might properly be claffed with the ores of iron. It is arranged by profeffor Jamefon with the chryfolite family, but it differs greatly in the proportions of its conftituent parts from all the other fpecies which he has claffed with this family. The appearance of this mineral refembles hornblende, or rather black epidote: it occurs both cryftallized and maffive. The form of the cryftals is that of a rhomboidal prifm, the alternate angles of which meafure about 113 and 67 degrees: the prifms are terminated by low four-fided pyramids, the faces of which are fet on the lateral planes of the prifm. It is alfo cryftallized in rectangular prifms, bevelled on the extremities, and the bevelling planes fet on the obtufe edges. Thefe figures are alfo varioufly modified by the edges or angles being bevelled. The cryftals are fometimes very minute or acicular, and fometimes half an inch in thicknefs; they are frequently aggregated in diverging radii, and fometimes imbedded. The prifms are ftriated longitudinally. The ftructure is imperfectly lamellar, with joints parallel to the fides, and to the fhort diagonal of the rhomboidal prifm. The fracture of yenite is uneven, and imperfectly conchoidal, with a luftre between vitreous and refinous. The colour is black paffing into brown; it does not change its colour in the ftreak. The hardnefs of yenite is about equal to that of common felfpar; it is eafily frangible. The fpecific gravity of yenite varies from 3.825 to 4.061.

It is fufible with eafe by the blow-pipe into a black glafs, which has a metallic afpect, and is attracted by the magnet, but does not poffefs polarity; it diffolves with borax with a flight ebullition. It is acted upon by the mineral acids, but does not gelatinize with them. When expofed to heat it becomes magnetic. Its colour is changed by heat from black into dark reddifh-brown, and it lofes about two *per cent.* of its weight.

The conftituent parts of yenite are,

Silex	from	28 to 30
Alumine		1
Lime		12 - 14
Oxyd of iron with manganefe		51 - 58

Yenite decompofes gradually on expofure to the air, and is reduced to a yellowifh-brown ochre. According to Brongniart, yenite occurs in difperfed cryftals and groups, and in compact kidney-fhaped maffes, in a thick bed of a greenifh fubftance nearly refembling yenite, but which has not been accurately examined. It is accompanied with epidote, quartz, and arfenical pyrites. This bed at Rio la Marino, in Corfica, covers a rock of primitive marble mixed with talc. At the Cap de Calamite, it is accompanied with magnetic iron-ftone, garnets, and quartz.

YEN-KING, in *Geography*, a city of China, of the fecond rank, in Pe-tche-li; 52 miles N.N.W. of Peking. N. lat. 40° 30′. E. long. 125° 30′.

YENLADE, or Stray, a channel between the Thames and Medway, which feparates the ifland of Graine from the coaft of Kent. It was formerly the ufual paffage for veffels to and from London.

YENNE, a town of France, in the department of Mont Blanc, near the Rhône, fuppofed to be the ancient Epanna, where Sigifmund, king of Burgundy, affembled a council at the end of the fifth century; 14 miles N.W. of Chambery.

YEN-NGAN, a city of China, of the firft rank, in Chen-fi, on the river Yen; 390 miles S.W. of Peking. N. lat. 36° 44′. E. long. 108° 49′.

YEN-PING, a city of China, of the firft rank, in Fo-kien; 820 miles S. of Peking. N. lat. 26° 40′. E. long. 117° 54′.

YEN-TCHEOU, a city of China, of the firft rank, in Tche-kiang. Near this town are mines of copper, and trees that yield varnifh, which give a value to the cabinet-work fo much efteemed in Europe; when this varnifh is once dry, it never melts again, and will bear boiling water. The

The paper manufacture of this place is in equal esteem, and for which they have a great demand. Six towns of the third order are under its jurisdiction; 650 miles S.S.E. of Peking. N. lat. 29° 38′. E. long. 119° 14′.—Also, a city of China, of the first rank, in Chan-tong. The territory depending upon this capital is inclosed between two considerable rivers, which abound with fish, and make the soil very fruitful. The country is very well cultivated, the mountains are covered with woods, and the air is mild and temperate. There are twenty-seven towns within the jurisdiction of this capital; four of the second order, and twenty-three of the third; 267 miles S. of Peking. N. lat. 35° 44′. E. long. 116° 36′.

YENTCHERU, a town of Hindoostan, in the circar of Cuddapa; 20 miles N.N.E. of Combam.

YEN-TCHING, a town of China, in Chan-tong, where a peculiar species of glass is manufactured, of so delicate a nature, that it will not endure the inclemency of the air; 45 miles S.E. of Tci-nan.

YEO. See Yeovil.

YEOMAN, the first or highest degree among the plebeians of England; next in order to the gentry.

The yeomen are properly the freeholders, who have land of their own; so called from the Saxon *gemane*, or *geman*, *common*.

The word *yongman* is used for yeoman in the statute 33 Hen. VIII., and in old deeds it is sometimes also written *jeman*, which, in the German, signifies *any-body*.

According to sir Thomas Smith, a yeoman is a free-born Englishman, who can lay out of his own free land in yearly revenue to the sum of forty shillings sterling.

The yeomanry of England are capable of holding lands of their own to a good value; are adjudged capable of certain offices, as constables, churchwardens, jurymen; and are also to vote in elections to parliament, and to serve in the army, and to do any other act where the law requires one that is *probus et legalis homo*.

The yeomen were famous, in ancient times, for military valour, being particularly expert at the management of the bow; whence the infantry was composed chiefly of them.

They frequently constituted the body-guard of our kings; and in process of time gave rise to the institution of *yeomen of the guard*.

In many cases, the law conceives a better opinion of the yeomanry that occupy lands, than of tradesmen, artificers, &c.

By a statute, 2 Hen. IV., it is enacted, that no yeoman shall take or wear a livery of any lord, upon pain of imprisonment, and a fine at the king's pleasure.

Yeoman is also a title of office in the king's household, of a middle place or rank between a gentleman and a groom. Such are the yeoman of the buttery; yeoman of the scullery; yeoman of the wine-cellar, ewry, wood-yard, &c. There are also the yeoman of the mouth, yeoman of the kitchen, yeomen-porters, &c.

Yeoman, in *Sea Language*, an officer under the boatswain or gunner of a ship of war, usually charged with the stowage, account, and distribution of their respective stores.

Yeomen-*Warders*. See Warders *of the Tower*.

Yeomen *of the Guard*, properly called *yeomen of the guard of the king's body*, were anciently a body of men of the best rank under gentry, and of larger stature than ordinary; every one being required to be six feet high.

Their number has varied in almost every reign, and formerly consisted of a certain number in ordinary, and an indefinite number extraordinary; and in case of a vacancy in the former, it was supplied out of the latter number. In the reign of king Edward VI. this corps was very numerous. In the reign of queen Elizabeth, the yeomen attending her in her different progresses were occasionally mounted. In the reign of queen Anne, the arms of half this band were arquebuses, which are said by Chamberlain to have been disused ever since the reign of king William; the other half had partisans, and those of both classes had swords. They had their wages and diet allowed them; so that in a MS. of the expences of the royal establishment for the year 1727, the charges of the table of the yeomen of the guard were 273*l.* 15*s.* But their diet has been discontinued since that reign. Their duty was to wait upon the queen in her standing-houses; forty by day, and twenty by night. At St. James's, they waited in the first room above stairs, called the guard-chamber. It is also their duty to attend the sovereign abroad by land or water.

At present there are but one hundred yeomen in constant duty, at 39*l.* 11*s.* 3*d.* *per annum* each; eight of whom are called ushers, who have 10*l.* *per annum* each more than the other yeomen; six are called yeomen hangers, and two, yeomen bed-goers, who have the same pay as the ushers; and seventy more not on duty; and as one of the hundred dies, his place is supplied out of the seventy.

The officers are, a captain, who has 1000*l.* *per annum;* a lieutenant, at 500*l.* *per annum;* an ensign, at 300*l.*; and four exons, at 150*l.* *per annum* each; and a clerk of the checque at the same salary.

Their origin is traced to the year 1485, when king Henry VII. ascending the throne, immediately after his coronation, instituted a guard of fifty archers to attend him and his successors. They were probably then, as they are now, called the *yeomen of the guard*.

It is observed, that this is the first instance of any established or permanent military guard in England: its kings, till that time, except in times of war and insurrection, contenting themselves with the guard of their proper domestics and retinue. And. Hist. Com. vol. i. p. 302.

Most of the writers, however, against standing armies commence that establishment with the serjeants at arms, who were first instituted by king Richard I. Their dress is that which was worn in the reign of king Henry VIII., and which on many occasions was put on by that king: it consists of a scarlet coat reaching down to the knees, guarded with garter blue velvet, and with badges of the rose and crown on their breasts and backs; their breeches also are scarlet, guarded with blue velvet; their caps are of black velvet, with broad round crowns, adorned with ribbands of the royal colours, *viz.* red, white, and blue.

The officers and yeomen are at the disposal of the captain; but the captain is at the appointment of the king.

Yeoman *of the Salt Stores*. See Acatery.

YEOMANRY Cavalry, a denomination given to those troops of horse which were levied in the late war among the gentlemen and yeomen of the country, upon the same principle with the volunteer companies. The yeomanry cavalry were to be allowed pay when called out on actual service, and each corps was liable to be put upon duty within its district: all contingent expences, properly and unavoidably incurred, were to be reimbursed after an investigation at the war-office. One serjeant and a trumpeter *per* troop were to have constant pay, with the same allowances as serjeants and trumpeters of regular cavalry. Some accoutrements were to be furnished by the ordnance, or an equivalent

equivalent in money to be given in lieu of them, and 14*s.* 2*d.* *per* man for holfters.

YEOVIL, in *Geography*, a large and populous market-town in the hundred of Stone, county of Somerfet, England, is fituated on the confines of the county, at the diftance of 9 miles S.S.E. from Somerton, and 122 miles W.S.W. from London. It derives its name from the river Yeo, which rifes near Sherborne, and paffes this place under a ftone bridge of three arches, feparating the counties of Somerfet and Dorfet. The town of Yeovil confifts of upwards of twenty ftreets and lanes; many of the former are of confiderable width: the houfes in general are refpectable, and many of them are built of ftone. Part of the town is called the Borough, and is governed by a portreve and eleven burgeffes, out of whom the portreve is annually chofen. Here is a fpacious market-houfe, feventy feet in length, and twenty in breadth, fupported by ftone pillars, in the centre of which are the remains of an ancient crofs. A confiderable market is held on Fridays for corn, cattle, pigs, butter, cheefe, and flax: here are alfo two annual fairs. The woollen trade was formerly extenfive here, but has decreafed: the chief bufinefs of the town is the manufacture of leather gloves. In the return of the year 1811, the population of this parifh was eftimated at 4118; the number of houfes at 459. The church, a large ancient ftructure, confifts of a nave, chancel, two aifles, and tranfept: the length of the whole is 146 feet; the breadth 50. At the weft end is a plain tower, ninety feet high, with a ftone baluftrade at the top. Diffenters have feveral meeting-houfes in the town. Here is an alms-houfe, founded in the year 1476, by the Rev. Mr. Woburne, minor canon of St. Paul's, London, and by him endowed with confiderable landed property for the maintenance of a mafter, two wardens, and twelve poor perfons of either fex. He alfo built a chapel for the ufe of his poor, and ordained divine fervice to be performed in it every day.—Collinfon's Hiftory of Somerfetfhire, vol. iii. Beauties of England and Wales, vol. xiii. Somerfetfhire.

YEOUNGBENZAH, a town of Birmah, on the Irawaddy; 36 miles N.N.W. of Rangoon. N. lat. 17° 30′.

YEOU-TUN-OUEI, a town of Chinefe Tartary. N. lat. 41° 8′. E. long. 121° 9′.

YEOU-YU, one of the fmall iflands in the Chinefe Archipelago; 62 miles S.W. of Macao.

YEOWAH, a town of Birmah; 15 miles S. of Pegongmew.

YEPES, a town of Spain, in New Caftile; 17 miles E. of Toledo.

YERAPATTA, a town of Hindooftan, in Myfore; 8 miles S. of Dalmacherry.

YERCO, a town of Thibet; 90 miles S.E. of Laffa.

YERE, a river of France, in the department of the Lower Seine, which runs into the Englifh Channel, at Eu.

YERGHIEN. See YARKAN.

YERK, in *Horfes*, a term fignifying to ftrike out backwards. A horfe is faid to yerk, or ftrike with the hind legs, when he flings and kicks with his whole hind quarters, ftriking out the two hinder legs near together, and even to their full extent. Horfes of this fort are very dangerous, and fhould be parted with as foon as poffible, whether they are of the farm or the faddle kind.

YERKIE, in *Geography*, a town of Ruffia, on an ifland at the mouth of the Volga, where veffels take their departure for the Cafpian fea. Here fhips formerly entered and cleared, but the ifland is now almoft overflowed, and the trade of the place much decayed fince 1747; 60 miles S. of Aftrachan.

YERMA. See JERMAH.

YERMUK. See YARMUC.

YERTNAGOODAM, a town of Hindooftan, in the circar of Rajamundry; 17 miles S.W. of Rajamundry.

YERVA-MORA, in *Botany*. See BOSEA.

YERVILLE, in *Geography*, a town of France, in the department of the Lower Seine; 12 miles N.N.E. of Caudebec.

YESCOKING CREEK, a river of North Carolina, which runs into Pamlico found, N. lat. 35° 29′. W. long. 76° 14′.

YESD. See YEZD.

YESD, a town of Perfia, in the province of Lariftan; 40 miles N. of Lar.

YESDECAST. See JEZDKAST.

YESID, a town of Perfia, in the province of Chufiftan, or Kuziftan; 18 miles N. of Toftar.

YEST. See YEAST.

YETCHERADAW, in *Geography*, a town of Hindooftan, in Myfore; 9 miles E. of Rydroog.

YETEOPAUK, a town of Hindooftan, in the circar of Cicacole; 15 miles S.W. of Coffimcotta.

YETHAN, a river of Scotland, which runs into the German fea, 10 miles N. of Aberdeen.

YETHOLM, or ZET-HAM, a market-town in the diftrict of Kelfo, and fhire of Roxburgh, Scotland, is fituated nine miles S.E. from Kelfo, on the fmall river Bowmont, which divides it into two parts, refpectively named Town Yetholm and Kirk Yetholm. A weekly market is held on Wednefdays; and two fairs annually. Many tinkers and gypfies refide in this town. The parifh extends about four miles in length, and two in breadth; and is bounded on the eaft and fouth by the Englifh border. The furface is hilly, but the hills are covered with verdure, and paftured by a very confiderable number of fheep. In the population return of the year 1811, this parifh is ftated to contain 213 houfes, and 1138 inhabitants. King Robert III. granted the barony of Yetholm in the fourteenth century to Archibald Mac Dougal, whofe defcendant ftill enjoys it.—Carlifle's Topographical Dictionary of Scotland, 1813.

YETTUS, in *Natural Hiftory*, a name given by the writers of the middle ages to a fpecies of marble of a deep red, which was ufed by fome as a touch-ftone.

YEU, in *Geography*, a fmall and infignificant ifle, fituated on the W. coaft of France.

YEVA CHARRUM, in *Natural Hiftory*, a name given by the people of the Eaft Indies to a kind of litharge, which is very common in that part of the world, and is faid to be made partly from lead and partly from zinc.

It is lefs heavy than our yellow litharge, and of a paler colour. It is ufed as a cauftic in all the occafions of furgery there.

YEVERING, in *Geography*, a village of England, in the county of Northumberland, where the Scots were defeated in 1415, by fir Robert Humphrevil and the earl of Weftmoreland. Near it is a mountain called Yevering Bell, belonging to thofe called Cheviot; 6 miles W.N.W. of Wooller.

YEULA, a town of Hindooftan, in Baglana; 5 miles E. of Bahbelgong.

YEVRE LE CHATEAU, a town of France, in the department of the Loiret; 6 miles S.E. of Pithiviers.

YEW, or EUGH, in *Botany*. (See TAXUS.) De Theis traces thefe Englifh words, whofe antiquity cannot be doubted,

doubted, to the Celtic *If* or *Iw*, green, alluding to the evergreen foliage of this tree. The French have retained *If* unaltered to the prefent day.

Yew, as fome fay, may be derived from the Greek ἰπτω, *to hurt;* and probably becaufe before the invention of guns our anceftors made their bows of this wood: they therefore took care to plant the trees in the church-yards, where they might be often feen and preferved by the people.

Yew is alfo a term ufed by the falt-workers of Lymington, and fome other parts of England, to exprefs the firft rifing of a fcum upon the brine in boiling.

In the places where they ufe this term, they add no clarifying mixtures to the brine, for it ferments in the ciſterns, and all its foulnefs finks to the bottom in form of a thin mud; they admit only the clear liquor into the pan, and boil this brifkly till it yews, that is, till a thin fkin of falt appears upon its furface; they then damp the fire, and carefully fkim off this film, and clear only the fcratch or calcareous earth, which feparates to the bottom.

They do not collect this into fcratch-pans, as at many of the other works, but they rake it up to one fide of the pan, and take it out; they there add a piece of butter, and continue the fire moderately ftrong till the falt is granulated. They keep a brifker fire on this occafion at Lymington than in moft of the other works; fo that they will work three pans in twenty-four hours. See Salt.

Yew-*Tree*, in *Agriculture* and *Rural Economy*, a well-known evergreen tree, the timber of which is much efteemed for different ufes and purpofes in hufbandry, and where toughnefs, elafticity, and durability, are required.

Trees of this fort may be eafily propagated, in moft cafes, by fowing their berries when divefted of the pulp in autumn, as foon as they are ripe, upon a bed of frefh undunged foil, either over the whole or in drills, covering them over about half an inch thick with the fame earth: but the latter is the better mode. In the fpring, the bed muft be carefully cleared from weeds, and if the feafon prove dry, it will be proper to refrefh it with water now and then, which will promote the growth of the feeds; many of which will come up the fame fpring, but others will remain in the ground until autumn or fpring following; but when the feeds are preferved above ground till fpring before they are fown, the plants never come up till the year after, fo that by fowing the feeds as foon as they are ripe there is often a whole year faved.

The plants, when they come up, fhould be kept conftantly well cleared from weeds, which, if permitted to grow amongft them, would caufe their bottoms to be naked, and frequently deftroy the plants when they continue long undifturbed.

In this bed, the plants may remain two years; after which, in autumn, there fhould be a fpot of frefh undunged foil prepared, into which they fhould be removed about the beginning of October, planting them in beds about four or five feet wide, in rows about a foot afunder, and fix inches diftant from each other in the rows, obferving to lay a little litter or mulch upon the furface of the ground about their roots, as alfo to water them in dry weather until they have taken root; after which they will require no farther care, but to keep them clear from weeds in fummer, and to train them according to the purpofe for which they are defigned, —for timber in a ftraight manner.

In thefe beds they may remain two or three years, according as they have grown, when they fhould again be removed into a nurfery, placing them in rows at three feet diftance, and the plants eighteen inches afunder in the rows, obferving to do it in the autumn, as before directed, and continue to trim them in the fummer for what they are intended; after they have continued three or four years in this nurfery, they may be tranfplanted where they are to remain, always obferving to remove them in autumn where the ground is very dry; but on cold moift land it is better in the fpring.

Thefe trees are very flow in growing, but there are many very large trees upon fome barren cold foils.

It is obferved in the Gloucefterfhire Report on Agriculture, that the yew-tree fhould not be fuffered to grow in or near cow-paftures. The leaves are poifonous to horned cattle and horfes, though the berries are efteemed inoffenfive. In January 1805, in confequence of fome fences being broken down by a violent wind during the night, a number of cows belonging to a farmer in Sandhurft entered an inclofed fhrubbery, where there were many yew-trees growing, and continued in it till the morning. Soon after they were driven out, all of them were feized more or lefs with a kind of madnefs, or fuch acute pains as made them run about in a very furious manner, fometimes leaping to a confiderable height, then beating their heads againft whatever oppofed them, and at laft falling inftantly dead. Oils of different forts were poured down their throats, as there was an opportunity of fecuring them, which feemed to produce a good effect on fome; but notwithftanding every effort, nine out of thirty died in a few hours after they were difcovered. On their being opened, it appeared that the whole quantity they had eaten, put together, would not have filled a peck.

An opinion prevails, that the leaves are not poifonous in the fummer: this, however, is probably erroneous, at leaft it is not confirmed fufficiently by fact to juftify the farmer in fubjecting his cattle to the experiment. If cattle come within reach of the yew-tree at that time of the year, they may perhaps reject it altogether, giving the preference to other green food, more palatable, and in plenty around them.

Thefe trees fhould therefore in all cafes be carefully kept out of the hedge-rows and all other parts of fields, where cattle are fuffered to feed and pafture.

YEYEAPOUR, in *Geography*, a town of Hindooftan, in Lahore; 16 miles S. of Nagorcote.

YEZD, or Yesd, a large and populous city of Perfia, fituated in a fandy defert, contiguous to a high range of mountains running nearly E. and W. This is the grand mart between Hindooftan, Bucharia, and Perfia, and is, therefore, a place of confiderable trade. The bazaar is well fupplied, and the city contains 20,000 houfes; befides thofe of the Guebres, or worfhippers of fire, which are eftimated at 4000. The Guebres were an induftrious people, but are greatly oppreffed, being taxed at twenty piaftres a-head, in addition to the various other exactions of the Perfian government. Many opulent Hindoos formerly refided here; but the late governor, wifhing to enrich himfelf by plundering their property, they all fled in one night towards Candahar, where they have fince eftablifhed themfelves. The prefent khan has, in vain, endeavoured to recall them, and there are now only nine Hindoos in Yezd. The city imports the greateft part of its corn from the neighbourhood of Ifpahan. Cattle are alfo fcarce, and an afs will fometimes fell as high as fifty tomauns. The manufacture of filk ftuffs is fuperior to any in Perfia; and the numuds or thick felts of Tuft, a fmall village, diftant eight miles, are equally famous. The fort of Yezd has but a mean appearance; and the town is deftitute of a wall. That

That territory which lies between Yezd and Ifpahan is the moft arid part of Irak. The foil is poor, light, and fandy; and here is a general fcarcity of wood and water: the climate alfo is hot, though not unhealthy. The fmall towns of Ardiftan, Nain, Aujdah, Mynboot, and Sezdabad, are badly built, and contain from 100 to 200 houfes each. M'Kinneir's Perfia.

YEZDEGERDIC YEAR, in *Chronology*. See PERSIAN *Year*.

YEZDICAN, in *Geography*, a river of the Perfian empire, in the province of Azerbijan, which has its fource about 60 miles to the E. of the lake of Van, and which, purfuing a N.E. courfe, paffes under the walls of Yezdican and Kurs, and meets the Araxes a little to the N. of Nuchfhivan.

YEZEDI, the name of a Perfian fect, of which feveral tribes inhabit the mountains of Sinjar, about eight or ten miles from Nifibis. They are numerous in the vicinity of Mofu1, and are faid to worfhip, or rather deprecate, the devil, entertaining an idea that he poffeffes an unlimited power over mankind. They even diflike to hear the name of the evil fpirit mentioned in their prefence. They are the defcendants of thofe Arabs who followed the banners of Yezid, and fought againft Houffein, in the battle of Kerbela; and fcheik Ade, the founder of the fect, is interred near Mofu1. They adore one Supreme Being as the creator and benefactor of the human race, drink wine and other ftrong liquors, and circumcife like the Mahometans. The Yezedi are hated by the Turks, to whom they are mortal enemies, and who have never been able to fubdue them. They lie in ambufh behind the rifing grounds which fkirt the road between Mofu1 and Merdin; and as travellers are obliged to pafs a lonely wild, twenty furlongs in length, they are liable, if not numeroufly attended, to be murdered by thefe mifcreants. Sinjar affords abundance of pafturage, and alfo yields a fufficient quantity of grain for the confumption of its favage inhabitants. M'Kinneir's Perfia.

YFFINIAC, a town of France, in the department of the North Coafts; 6 miles S.E. of St. Brieuc.

YGEA, a town of Spain, in Old Caftile; 12 miles S. of Calahorra.

YGGEDE, or UGGADE, in *Ancient Geography*, a place of Gallia Lyonnenfis. Anton. Itin.

YGIN, in *Geography*, a town of Corea; 28 miles S.S.W. of Haimen.

YGROMETER. See HYGROMETER.

YGUALADA, in *Geography*, a town of Spain, in Catalonia; 28 miles N.W. of Barcelona.

YGUISAN, a fmall ifland among the Philippines, near the north coaft of Panay. N. lat. 11° 35′. E. long. 122° 32′.

Y-HO, a river of China, which rifes in Chan-tong, and runs into the Hoang, near Sou-tcheou, in the province of Kiang-nan.

YIAN-CHAN, a town of Corea; 28 miles E. of Hetfin, or Etfin.

YICHKENISH, one of the fmaller Weftern iflands of Scotland; 1 mile N. of Benbecula.

YIELD or *Slack the Hand*, in the *Manege*. See SLACK.

YIELDING *and Paying*, a law phrafe, formed by corruption from the Saxon *geldan*, or *gildan*, *to pay*. Hence, in Domefday, *gildare* is frequently ufed for *folvere*, *reddere*; the Saxon *g* being eafily converted into a *y*. See GELD, and GILD.

YIETI, in *Geography*, a town of South America, in the province of Paraguay; 120 miles S.E. of Affumption.

YIN, a word ufed by fome of the chemical writers to exprefs verdigrife.

YISSER, in *Geography*, a river of Algiers, anciently called Serbetis, which runs into the fea at Jinnett.

YKINA, a town of Sweden, in the province of Finland; 45 miles N. of Biorneborg.

YLANE, a town of Sweden, in the government of Abo; 27 miles N. of Abo.

YLAY. See ILA.

YLIGAN, a town on the north coaft of Mindanao.

YLIKANNUS, a town of Sweden, in the government of Wafa; 24 miles E.N.E. of Gamla Karleby.

Y-LIN, a city of China, of the fecond rank, in Houquang; 617 miles S.S.W. of Peking. N. lat. 30° 52′. E. long. 110° 44′.

YLISTARO, a town of Sweden, in the government of Wafa; 24 miles E.N.E. of Wafa.

YLIVIESKA, a town of Sweden, in the government of Ulea; 38 miles S. of Ulea.

YLO, or ILO, a fea-port town of Peru, in the diocefe of Arequipa, fituated near the mouth of a frefh-water river of the fame name, which is dry from the beginning of October to January; 25 miles W. of Moquegna. S. lat. 17° 38′.

YLST. See ILST.

YLUM OE, a fmall ifland of Denmark, in the Little Belt. N. lat. 55° 8′. E. long. 10° 7′.

YLWISKA, a town of Sweden, in Eaft Bothnia; 28 miles S. of Braheftad.

YNATILAN, a town on the weft coaft of the ifland of Sibu. N. lat. 10° 21′. E. long. 123° 22′.

YNCA, YNCAN, or INCA, an appellation anciently given to the kings of Peru, and the princes of their blood; the word fignifying literally, *lord*, *king*, *emperor*, and *royal blood*.

The king himfelf was particularly called *capac ynca*, *i. e.* great lord; his wife, *pallas*; and the princes fimply *yncas*. Thefe yncas, before the arrival of the Spaniards, were exceeding powerful. Their people revered them to excefs, as believing them to be fons of the fun, and never to have committed any fault. If any perfon offended the royal majefty in the fmalleft matter, the city he belonged to was totally demolifhed.

When they travelled, whatever chamber they lay in on the road was walled up as foon as they departed, that nobody might ever enter in after them. The like was done to the room in which the king died; in which, likewife, all the gold, filver, and precious furniture, were always immured, and a new apartment was built for his fucceffor.

His beloved wives, domeftics, &c. likewife facrificed themfelves, and were buried alive in the fame tomb along with him. See the Hiftory of the Yncas, by Garcilaffo de la Vefia. See alfo INCA.

YNG, or YN, in *Geography*, a city of China, of the fecond rank, in Chan-fi. N. lat. 39° 40′. E. long. 112° 49′.

YNIESTA, a town of Spain, in New Caftile; 20 miles S.E. of Alarcon.

Y-NING, a town of Corea; 33 miles E.N.E. of Tfintcheou.

YN-PING, a town of Corea; 38 miles S.W. of Koangtcheou.

YN-TCHENG, a town of Corea; 25 miles E. of Outchuen.

YN-YUEI, a city of China, of the fecond rank, in Yun-nan; 1300 miles S.W. of Peking. N. lat. 25° 58′. E. long. 98° 24′.

YOAK, in *Agriculture*. See YOKE, and YOKING.

YOAK, *Jugum*, in *Antiquity*. The Romans made the enemies they fubdued pafs under the yoke, which they called *fub jugum mittere;* that is, they made them pafs under a fort of *furcæ patibulares*, or *gallows*, confifting of a pike, or other weapon, laid acrofs two others planted upright in the ground. This done they treated them with humanity enough, and fent them home again. See FURCA.

The fame meafure was fometimes dealt them by their enemies upon the fame occafion. Thus Cæfar (lib. ii.) obferves, that the conful L. Caffius had been killed by the Swifs, and his army defeated, and made to pafs under the yoke.

YOAK *of Land, jugata terræ*, in our *Ancient Cuftoms*, was the fpace which a yoke of oxen, that is, two oxen, may plough in one day. See HIDE, YARD-*Land*, &c.

YO-CHIN, in *Geography*, a town of Corea; 10 miles N.E. of Han-tcheou.

YOCKLET. See JOCKLET.

YOCOM CREEK, in *Geography*, a river of Virginia, which runs into the Potomack, N. lat. 38° 6′. W. long. 76° 36′.

YOCOTE, a town of Hindooftan, in Dowlatabad; 27 miles S.S.W. of Mahur.

YOGESWARA, in *Hindoo Mythology*, a name of the Hindoo god *Siva;* which fee. It means lord of ages, or of time; yug, or yog, being vaft periods of time into which Hindoo chronologifts arrange the paft. The addition of Ifwara, the powerful, a name of Siva, feems to give a fatisfactory derivation. (See ISWARA.) For an account of thofe periods, fee JOGUES. Some have derived the name of Yogefwara from lord of Yogis, fuppofing the fect of fanctified beggars fo defignated as being more immediately under the protection of Siva; but this is in fact nearly the fame thing, for yog fignifies *union* or *junction*, and thefe periods of time re-unite all things in the Deity; and the Yogi by intenfe contemplation effects a fimilar union. But this metaphyfical dogma cannot be explained here. See KALPA, YOGI, and YUG.

YOGI, a defcription of wandering faints, much refpected by many of the natives of India, though by others they are ftrongly fufpected to partake more of the impoftor than the enthufiaft. There are many defcriptions of thefe itinerants among the Hindoos; and we are not aware that the diftinctions between them have been accurately pointed out. The appellation Yogi means a devout man, devoted to fpiritual things, efpecially to the contemplation of the attributes of the Deity. It is derived from yog or yug, which, among very many fignifications, means primarily *union* or *junction*, and is applied in this fenfe to one who by intenfe meditation is united to the divine nature; a myfticifm eafily underftood by the initiated and enthufiaftic Hindoos, though not recognizable by others. There is a difference, we believe, between the Yogi and Saniaffy, but we cannot exactly fay in what it confifts. In the latter part of the article SECTS *of Hindoos*, fome particulars of thefe two will be found. Perhaps the Yogi may be the defignation of the Vaifhnava, and Saniaffy of the Saiva fect. (See SAIVA, VAISHNAVA, and YOGESWARA.) Both profefs poverty, purity, and aufterities. When the latter are carried to any extent, the zealot is honoured with the title of Tapafwi, of whatever fect he be. Of fuch, and their aufterities, fee under TAPAS. We fometimes read of female anchorets denominated Yogni; but they are, we believe, merely enthufiaftic females, who become afcetics and not the wives of the fanctified males. Among the oriental manufcripts prefented to the Royal Society by fir W. Jones, is one entitled "Hatha Pradipaca, or Inftructions for the Performance of the religious Difcipline called Yoga."

In the Gita, Krifhna defcribes the Yogi as being "more exalted than the Tapafwi, the zealot who haraffes himfelf in performing penances: he is refpected above the learned in fcience, and fuperior to thofe attached to moral works." This paffage is quoted in the latter part of our article SECTS *of Hindoos*, but being erroneoufly pointed is fcarcely intelligible. This article being thence referred to, we take the opportunity of correcting another error or two in it:—In the fecond column, the name of the Mahratta Brahman general, Purferam Bhow, is twice fpelled Bhon; in the fifth column, the name of Vopadeva, the author of the Sri Bhagavata, is fpelled Vapadeva; in the next column, line 21 from the bottom, a comma is wanted after Krifhna. Having referred above to the article TAPAS, we will here correct an error in that alfo:—In fecond column, line 11, for inflexions read inflictions.

YOHOGANY, in *Geography*. See YOUGHIOGENY.

YOIDES, in *Anatomy*, the bone of the tongue, commonly called hyoides. See HYOIDES.

YOINGT, or JOINGT, in *Geography*, a town of France, in the department of the Rhône and Loire; 7 miles E. of Roanne.

YOITSBACH, a river of Silefia, which runs into the Queis, near Friedberg.

YOKE, in *Agriculture*, a frame of wood hollowed out and lined for receiving the neck part of the ox or other cattle in working. Yokes are conftructed in different manners, as fingle and double, in order to be ufed differently. They are fixed with bows over the necks of the oxen or other cattle when in ufe; by which means, in the latter fort, the two animals are coupled together, and attached to the plough or other vehicle. See YOKING.

YOKE, in *Sea Language*, a name formerly given to the tiller, when communicating with two blocks or fheaves affixed to the inner end of the tiller. It is now applied to a fmall board or bar which fits on the upper end of a boat's rudder at right angles, and having two fmall cords extending from its oppofite extremities to the ftern-fheets of the boat, by which fhe is fteered as with a tiller.

YOKED LEAF, in *Botany*, *folium conjugatum*, or *binatum*. See LEAF.

YO-KEOU, in *Geography*, a town of Corea; 38 miles S. of Haimen.

YOKING, in *Agriculture*, the practice of putting the animals into the yoke or other fort of team.

In the bufinefs of yoking or harneffing oxen for the purpofe of draught, different methods have been followed by different farmers. And the modes of harneffing and yoking oxen are even different in different counties, and diftricts of the fame county. The moft common practice in the fouthern parts of this kingdom, is that of working them in harnefs in the manner of horfes; while in the northern counties, the yoke and bows are ftill much employed. On the continent, as in France, Portugal, &c. the head is the part to which the draught is chiefly attached.

In the firft cafe, the fhoulder is made the principal point of draught; but in the fecond method, the neck and fhoulder conjointly have the weight of the draught; and in the laft mode, the principle of draught is, in one cafe the head, and in the other the joint power of the neck and bafe of the horn, which lord Somerville has confidered a purchafe as great perhaps as can be given to the animal.

It is "effected by a long leathern ftrap, wrapped round the

the base or bottom of the horns, and again fastened to the yoke." It has been observed by a writer in the ninth volume of the Agricultural Magazine, that with respect to the second method which has been noticed above, the "usual form of the yoke is a frame of wood fitted over the necks of the oxen, by which they are coupled, and harnessed to the plough. It consists of several parts, as the yoke properly so called, which is a thick piece of wood, lying over the neck; the bow, which compasses the neck about; the stitchings and wreathings, which hold the bow fast in the yoke, and the yoke-ring and ox-chain," which is supposed "a method which is evidently founded on a total mistake in the anatomy of the ox."

And that in the first we have "imitated the gear used with the horse, without considering that the strength and agility of the ox are placed by nature in a different situation. The neck of the ox is a tower of strength; if the soil resist, he projects this part of his form with that prodigious muscular force with which nature has provided him for his own defence; but without attending to her operations, we impose a load of timber on his withers, we lacerate his flesh, and press him down to the earth."

The third or French mode of yoking is thus described in the words of Mr. Hughes. "The labourer passes a piece of wood, of about one-sixth of the weight of the English yoke, across the forehead of his cattle, having previously neatly hollowed out the extremities of it to fit the mould of the head, and lined those hollows with a piece of woolly sheep-skin, to answer the purpose of a soft pad or cushion. This light and easy yoke he braces to the horns with a small thong of leather, attaches the beam of his plough to the middle part of it, and the animal is completely equipped for his labour."

It has been observed by lord Somerville, in his System of the Board of Agriculture, that oxen, "whether worked in harness, or in the yoke and bow, as in England, by the joint power of the yoke and horn, as in Portugal, or by the head, as in France, they cannot fail to benefit their employer. As, however, the yoke and bow have prevailed for a considerable length of time, it is probable that the practice may still prevail, in which case the Portuguese mode of draught will apply with the utmost ease and success to our yoke and bow, so as gradually and imperceptibly to cheat oxen into its use. This in itself is an obvious advantage, because it gives two points of draught instead of one, and thereby relieving each admits of a lighter yoke, which in this country has ever been far too heavy and oppressive; and if hereafter the French method should be preferred, for which there are not wanting advocates, it is the best preparatory step to its introduction. It would be almost superfluous to remark that the strong points of an ox are in his head and neck. It is ordained by nature, that where the strength of an animal lies, there he will resort for defence; the horse to his heels, the man to his arms, and the ox to his head; and in cases of the greatest exertion, the beast ever puts his nose close to the ground."

In objection to the harnessing of oxen, it has been observed in the paper noticed above, that "the article of gear is an oppressive annual charge, from the perishable nature of the commodity employed. The tackle there recommended for twelve oxen would not amount to six-and-thirty shillings, whereas the leathern harness for the same number of animals, according to the new method, would cost six-and-thirty pounds, and the annual expence of repairs would exceed thrice the original cost of the former." And that "by the French mode of yoking, at least one-third more of the power of the animal is obtained. In the common way, the shoulder being bruised by the unyielding bow, no vigour is exerted, excepting what is imparted by the goad; and the sinews of the neck are not brought into employment: hence the sublime and gigantic force with which he is endowed is not rendered subservient in the important duties he has to perform for the supply of human subsistence. The cattle proceed in the French team bold and erect: no pain oppresses them, and they chew the cud cheerfully as they pace along the furrow. On the contrary, in this country the painful pressure obstructs the progress of the animals, they lean against each other, scarcely capable of supporting their own weight, and the fine intelligent eye which nature has given them to express the generosity of their temper is clouded with anxiety." That "the trial of this method has at least two recommendations; it may be made at very little expence, and under the fair expectation of success." See TEAM.

The methods of yoking cattle in ploughs are also different in different places; but the only circumstance worthy of being considered is, whether the cattle should be yoked in pairs, or in a line before each other. It may, therefore, be useful to consider the advantages and disadvantages attending each mode, and to compare them.

The most common way of yoking cattle in ploughs is in pairs. There are some disadvantages attending this way that are obvious. In ploughing the furrows betwixt ridges, the land-cattle go upon the ploughed land, and tread it down with their feet: this, especially if the land be wet, poaches and hurts it very much. And there is another disadvantage which is very obvious. When there is but as much of the ridge unploughed as to allow the land-cattle to go upon it with difficulty, they are frequently either going into the opposite furrow, and thereby giving the plough too much land, or, which is worse, they are jostling the furrow-cattle upon the ploughed land.

In order to remove the inconveniences which attend the ploughing with cattle yoked in pairs, some yoke them in a line before each other. It is obvious, that cattle yoked in this manner, going always in the furrow, neither tread upon the ploughed land nor jostle one another. In these respects, the yoking the cattle in a line before each other seems to have the advantage. It is to be observed, however, that this method is not quite free from inconveniences. When examined, it may, perhaps, be found attended with as great inconvenience as the other. Where cattle are yoked in a line, they go all in the furrow. This makes it necessary to give the plough more land than ordinary, either by the sock or the muzzle; for if this be not done, the head and sock being in the same direction with the beam, and the cattle yoked to the middle of it, the plough will directly follow the cattle without taking any thing off from the land. Now it is inconvenient to be obliged to give the plough land either by the sock or muzzle; for when the sock is turned out of the plane of the beam, it makes the plough heavy to draw; and when the muzzle puts the draught too much to one side of the beam, it prevents the plough from going upright. The yoking of the cattle in pairs is attended with none of these inconveniences; for in this case, the quantity of land which the plough has naturally, when right made, is sufficient to make it take off a proper furrow.

There is another inconvenience that attends yoking cattle in a line, arising from the nature of the animals, which is, that as they like their ease, they are disposed to throw the burden upon their fellows. This they have a better opportunity of doing when yoked in a line before each other than when yoked in pairs. When yoked in a line,

line, each pulls by the traces of the one behind him; and therefore, though it may be known when the foremoſt neglects his work, by the ſlackening of his traces, it cannot be known when any of the reſt neglect their work; for though one of them does this, yet by the pulling of the one before him his traces may be fully ſtretched. But this is eaſily diſcovered when the cattle are yoked in pairs; for then every one of them has a ſeparate draught.

There is ſtill another inconvenience that attends the common way of yoking cattle in a line before each other. When the fore cattle are all yoked to the traces of the hindmoſt, it is obvious, that as the beam to which the draught is fixed is much lower than his ſhoulders, by which the reſt pull, ſuch a weight muſt be laid upon his back or ſhoulder, as muſt render him incapable of giving any aſſiſtance. Beſides, as the whole force is applied in the direction of the traces of the hindmoſt, it cannot have ſuch influence on the plough, as when a part of it is in a direction more horizontal. When a body is to be moved forward in any direction, the nearer that the direction of the force applied approaches to the direction of the body, it acts with greater influence; and, therefore, as the plough moves horizontally, and as the direction of the united draught of a plough with the cattle yoked two abreaſt is more horizontal than the direction of the draught in a plough with cattle yoked in a line, the ſame force applied will have greater influence.

When theſe two different ways of yoking cattle in ploughs are thus conſidered and compared together, it is difficult to determine which ought to be preferred. Each of the two ſeems preferable to the other in a certain ſituation. When the land is ſtiff, and the labour ſevere, the yoking the cattle in pairs ſeems preferable, as it is certainly the ſtrongeſt draught; and when the land is wet, and in danger of being much hurt by the treading of the cattle, the yoking them in a line before each other ſeems preferable; as thereby they are confined to the bottom of the furrow, which is the firmeſt part of the land, and prevented from doing harm.

In wet lands and ſeaſons, as long teams anſwer beſt, for the moſt part, collars and trace-chains become of conſiderable utility in moſt caſes in yoking of cattle; and in whichever way neat cattle are geared for work, they ſhould conſtantly have bridles or bit-halters, with blinders, as by ſuch means they are rendered docile, tractable, and eaſy to manage in the buſineſs of team labour. Much information on this ſubject may be ſeen in the Corrected Report on Agriculture for the County of Suſſex.

YOKULS, in *Geography*, the higheſt mountains in Iceland, perpetually clothed with ſnow. Of theſe, Snæfial, hanging over the ſea on the S.W. part of the iſland, is ſaid to be the higheſt, its height being computed at 6860 feet. The mountains are ſaid to be chiefly ſand-ſtone, pudding-ſtone, with petroſilex, ſteatite, and argillaceous ſchiſtus.

YOLK, or YELK, in *Natural Hiſtory*, the yellow part in the middle of an egg. See EGG.

The chicken is formed out of and nouriſhed by the white alone, till it be grown to ſome bulk: after which the yolk ſerves it for nouriſhment; which it likewiſe does, in part, after it is hatched. For a good part of the yolk remains after excluſion; being received into the chicken's belly: and being there reſerved, as in a ſtore-houſe, is by the ductus inteſtinalis, as by a funnel, conveyed into the guts, and ſerves inſtead of milk. Willughby's Ornithol. lib. i. cap. 3.

This was even known to Pliny:—"Ipſum animal ex albo liquore ovi corporatur: cibus ejus in luteo eſt." Lib. x. cap. 53.

YOLK, in *Rural Economy*, the peculiar munctuous ſecretion which exudes through the ſkins of ſheep, and which by intermingling with the pile of the wool renders it ſoft, pliable, and in proper condition. It has ſomewhat the ſame effect on it which oil has upon a thong of leather, when kept in and perfectly ſaturated with it. The diſpoſition to the production of this ſubſtance in ſheep is favourable to the valuable properties of the wool, and ſhould be attended to by the ſheep-farmer in fixing and regulating his ſtock. It is noticed by a late writer on Agricultural Chemiſtry, that wool often waſhed in calcareous water becomes rough and more brittle than uſual, as the carbonate of lime has the power of diſſolving or decompoſing the yolk of it, which is an animal ſoap that naturally defends it; that the fineſt wool, ſuch as that of the Spaniſh and Saxon ſheep, is moſt abundant in yolk; that M. Vauquelin has analyſed ſeveral different ſpecies of yolk, and has found the principal part of all of them a ſoap, with a baſis of potaſſa, that is, a compound of oily matter and potaſſa, with a little oily ſubſtance in exceſs; and that he has likewiſe found in them a notable quantity of acetate of potaſſa, and minute quantities of carbonate of potaſſa and muriate of potaſſa, and a peculiar odorous animal matter.

The ſame chemical writer has ſtated, that he found ſome ſpecimens of wool loſe as much as forty-five *per cent.* in being deprived of their yolk; and that the ſmalleſt loſs in his trials was thirty-five *per cent.*

It is ſuggeſted in the above work, that the yolk is the moſt uſeful to the wool on the back of the ſheep in cold and wet ſeaſons; and that probably the application of a little ſoap of potaſſa, with exceſs of greaſe, to the ſheep brought from warmer climates in our winter, that is, increaſing their yolk artificially, might be uſeful in caſes where the fineneſs of the wool is of great importance. A mixture of this ſort is more conformable to nature, it is thought, than that ingeniouſly adopted by the late Mr. Bakewell; but that at the time his labours began, the chemical nature of the yolk of wool was not known. See WOOL, WASHING *Sheep*, &c.

YOLK *of the Seed*, *Vitellus*, in *Botany* and *Vegetable Phyſiology*, a part firſt deſcribed by Gærtner, and thus named by him, from its ſuppoſed analogy with the yolk of an egg. This analogy, and even the exiſtence of the part in queſtion, have been diſputed, as Mr. Brown hints, in *Prodr. Nov. Holl.* v. 1. 306, by M. Correa de Serra, and by the writer of the preſent article. We have never at any time communicated on this ſubject with our learned and ſagacious friend, now the Portugueſe miniſter at New York; ſo that we are ignorant how far his objections extend, or on what they are founded. Nor does Mr. Brown know more of this matter, than a ſimple record of M. Correa's opinion, in De Candolle's Flore Françaiſe, v. 1. 157. This coincidence, however, from ſuch a quarter, gives us great confidence in our own opinion, which was firſt offered to the public in *Introd. to Botany*, chap. 19, publiſhed in 1807. On a more attentive and full conſideration of the queſtion, the ſame ſentiments were more explicitly detailed and defended in a paper read before the Linnæan Soc. Nov. 3, 1807, and printed in that Society's Tranſactions, v. 9. 204.

Gærtner ſtates the *Vitellus*, or Yolk of the Seed, to be "diſtinct from the *Cotyledons*, as well as from the *Albumen*, and for the moſt part ſituated between the latter and the *Embryo*." (See SEED, where a reference is made to VITELLUS, under which head the ſubſtance of the preſent article wa was designed to have been inserted.) Gærtner considers the part of which we are about to treat, as "of all the internal parts of a seed the most singular, and by far the most unfrequent." Its importance therefore cannot be very considerable. The principal diagnostics of the *Vitellus*, according to this eminent carpologist, are the following: 1st, "It is most closely connected with the *Embryo*, so as not to be separable therefrom, without injury to its own substance. 2dly, Notwithstanding this intimate connection, it never rises out of the integuments of the seed, as the *Cotyledons* usually do, in germination, so as to become a seminal leaf; but, rather like the *Albumen*, its whole substance is destroyed by the seedling plant, and converted into its own nourishment. And 3dly, If the *Albumen* be likewise present, the *Vitellus* is always situated betwixt that and the *Embryo*, in such a manner, however, that it may be separated from the *Albumen* with great ease, and without injury." For these reasons, Gærtner considers the organ in question as "allied on the one hand to the *Albumen*, on the other to the *Cotyledons*," but truly distinct in nature from both.

We presume to dissent from this decision of the great writer, whose words have just been quoted, for the following reasons: 1st, The *Vitellus* is certainly not more closely connected with the *Embryo* than the greater number of *Cotyledons* are, as any person may find by examining seeds in the first stage of their germination, and as the faithful delineations of Gærtner himself every where shew. 2dly, That the *Vitellus* never rises out of the ground, is a circumstance likewise common to many *Cotyledons*, allowed by Gærtner to be such, as in various leguminous plants, as well as in *Æsculus*, *Cyamus*, *Tropæolum*, and many others. The difference between *Cotyledons* which grow up into seminal leaves, and those which remain and decay under ground, is of so little importance as to the classification of plants, that the most natural order of *Papilionaceæ*, or *Leguminosæ*, contains decided instances of both; *Lupinus* and *Vicia* affording examples of the former mode of growth, *Lathyrus* of the latter. And 3dly, The situation of the *Vitellus*, between the *Albumen*, if the latter be present as a separate organ, and the *Embryo*, is only a necessary consequence of the more intimate connection between the *Vitellus* and the *Embryo*, than either of them has with any other part, except that of the *Cotyledons* and *Embryo*, which is as strict as can possibly be. Hence we cannot consider the *Vitellus* of Gærtner to differ from the subterraneous *Cotyledons* abovementioned. We presume their offices must be exactly similar, to perform the necessary functions relative to air or oxygen, till the leaves come forth, and assume those functions in greater perfection, with the co-operation of light. This appears to us more satisfactory than the hypothesis of Gærtner, that the organ of which we are treating affords nourishment to the *Embryo*; because this is abundantly supplied by the copious *Albumen* of a multitude of seeds, whose *Vitellus* is very inconsiderable, such as grasses; and it is recurring to two causes to explain what is evidently accounted for by one alone. If the vegetation of corn be observed, the *Vitellus* will be found to dwindle away, with scarcely any change in its very inconsiderable bulk, when the first leaves are unfolded, exactly as happens to the subterraneous *Cotyledons* of *Lathyrus odoratus*, &c. The same thing very often takes place as speedily in *Cotyledons* which rise out of the ground. Some which are more permanent, as in cruciform and umbelliferous plants, being only more of the nature of leaves. In grasses, the scale taken by Gærtner for a *Vitellus* is mostly so thin and unsubstantial, as not possibly to contain any material portion of nourishment; ample supplies of which are furnished by the plentiful *Albumen* of those plants. But its expanded figure is very well calculated, like that of the leaves, for functions analogous to vegetable respiration; and it has the evident aspect of a subterraneous leaf, quickly rendered superfluous by the production of real leaves, and withering away, as the first of those leaves themselves do, when more vigorous ones come forth. It is remarkable, that the pretended *Vitellus* appears not to be necessary to all plants furnished with this distinct kind of *Albumen*, as *Palmæ* and *Orchideæ* have it not; while, on the other hand, no instance presents itself of a supposed *Vitellus*, and a real *Cotyledon*, or *Cotyledons*, in the same plant. Gærtner takes the *Plumula* for *Cotyledons* in *Rhizophora* (see his t. 45.), as well as in some of the *Scitamineæ*; for we cannot conceive the tubular part, embracing the Embryo, in *Amomum*, (see Gært. t. 12, which he erroneously calls *Zingiber*,) to be any thing but a *Cotyledon*, notwithstanding the opinion of our learned friend Mr. Brown, who, like Gærtner, terms it a *Vitellus*. The name would be of little importance, if the supposed use of it did not convey, as we presume to think, an erroneous idea; in attributing to these seeds two distinct and separate sources of nourishment. That two such distinct parts exist in this natural order, and perhaps, as Mr. Brown observes, in *Nymphæa* and *Nuphar* likewise, we are ready to admit; and we are therefore more satisfied to attribute to each a separate and appropriate office. We have had no opportunity of observing the germination of *Amomum*, or any true scitamineous plant; but as far as we have been able to judge, it appears that the *Albumen* of every seed, when separate from the other parts, is always totally absorbed, or removed, leaving its skin empty; whereas a *Cotyledon* withers and shrinks in its whole substance, like a decaying leaf. If the albuminous matter, necessary for the temporary nourishment of perhaps every seed, in one form or other, be lodged in the substance of the *Cotyledons*, as in *Zamia*, the leguminous and cucurbitaceous tribes, and many others, such parts shrink the more, but do not lose any one particular portion of their substance, so as to have only a skin left behind. Perhaps a confusion of ideas has arisen, from the first consideration of this subject, in consequence of the term monocotyledonous as contrasted with dicotyledonous. The first had an evident reference to the *Albumen*, in corn, palms, &c.; and when Gærtner had emancipated himself from this error, he seems to have transferred the idea to the *Embryo*, which he calls *monocotyledonous*, as if he meant by that word to express its own simple form. Prepossessed with this idea, when a separate organ manifested itself, as in the *Scitamineæ*, he thought a new appellation requisite. Mr. Brown objects to the term *Cotyledon* in this case, because he says there is no point of union between the part in question and the *Embryo*. If such be the case, which we cannot understand, it would be not at all less difficult to conceive how this part could, as a *Vitellus*, supply the *Embryo* with nourishment, than it would be to imagine how it could perform any services towards that organ with respect to air, in its capacity of a *Cotyledon*.

It seems to us, that by considering the *Vitellus* of Gærtner as a *Cotyledon*, all ambiguity respecting the anatomy or component parts of any seed is removed. When the *Cotyledons* are two or more, the albuminous matter is either lodged in their substance, or forms a separate part. In the latter case, it has no more connection with the *Embryo* than is absolutely necessary, being in fact not an organic part, but a mere reservoir of food or nourishment, immediately undergoing a chemical change, after which its whole substance is speedily absorbed. Such is the economy of corn and palms; even the large *Albumen* of the cocoa-nut soon disappearing,

appearing, for the evolution and ſuſtenance of the little *Embryo*, lodged in a cavity of its baſe; while the *Cotyledon* of the not very diſtant genus *Zamia* ſhrinks indeed conſiderably, from loſing the albuminous part of its ſubſtance, but does not diſappear; becauſe the remaining part deſtined to perform the eſſential office of a *Cotyledon*, reſpecting air, merely decays when its purpoſe is anſwered, and ſloughs off, like any other dead portion of the vegetable body.

We have already (ſee GERMINATION) adverted to theſe two different ſituations of the albuminous matter. That ſubſtance muſt be preſent, in ſome ſhape or other, for the nouriſhment of the young *Embryo*, at the firſt period of its evolution, when ſo great an alteration of bulk takes place, till it can ſupply itſelf from the earth. The idea of this nutritious ſubſtance, whether of an oily, mucilaginous, or farinaceous nature, being always, when not a diſtinct body, lodged in the *Cotyledons*, throws additional light on the nature and phyſiology of theſe laſt-mentioned parts, and in a very beautiful manner confirms their analogy with leaves. The ſap of plants (ſee CIRCULATION *of the Sap*) being carried into the leaves, and there acted upon by air, light, heat, and moiſture, is returned in the form of various ſecretions, into the different parts of the vegetable body. Under the influence of light, the upper ſurface of their leaves abſorbs carbonic acid gas, and the under gives out pure oxygen. But in the dark, leaves abſorb oxygen. So the *Cotyledons* of ſeeds, in their dark ſubterraneous ſituation, being moreover often guarded expreſsly from light by a brown or even black ſkin, abſorb oxygen, which, as we have ſaid in the article above cited, is known to be neceſſary to germination. They are already ſtored with albuminous matter, abounding with the carbonic principle. This, by the action of oxygen, becomes ſaccharine and milky, fit to be tranſmitted, through the returning veſſels, which the *Cotyledons*, in common with *Leaves*, poſſeſs, into the ſtem of the *Embryo;* all theſe important parts having already begun to ſwell, from the abſorption of moiſture, and the ſtimulant effects of heat. Hence we ſee why light proves hurtful to incipient germination, and why carbonic acid gas may be given out by ſeeds during that proceſs. It is evident that the proper functions of *Cotyledons* are beſt performed under ground, and that when they riſe into the air and light, it is not till after their primary deſtination is fulfilled, and then only becauſe, being fundamentally of the nature of leaves, they are moſtly capable of aſſuming the functions of thoſe organs, with reſpect to light. *Cotyledons* of ſeeds are ſubterraneous leaves, juſt like the ſcales of a bulbous root. Both are ſtored with albuminous or nutritious matter, and when acted upon by oxygen perform under ground thoſe functions, which leaves perform in the open air, with the aſſiſtance of light. It is worthy of notice that the *Cotyledons* are ſo placed, in all ſeeds, that the oxygen gas muſt be imbibed by their under ſurface only, that very ſame part which, in leaves, gives out this kind of gas during the day, and probably abſorbs it at night. "It would," as we have elſewhere obſerved, Tr. of Linn. Soc. v. 9. 213, "have evinced a ſtrange contrariety in the conſtitutions of two organs otherwiſe ſo analogous, the *Leaves* and *Cotyledons*, if the *upper* ſurface of the latter, while in the unexpanded ſeed, had been preſented to receive the oxygen gas."

By taking the *Vitellus* of Gærtner for a *Cotyledon*, we throw no new difficulties in the way of the claſſification of plants by this organ. Its form is always, as far as we know, ſimple and undivided, ſo that the plants in which it occurs remain only the more ſteadily fixed in their place of *Monocotyledones*, as oppoſed to the *Dicotyledones;* witneſs *Gramina*, *Scitamineæ*, &c. thus indeed acquiring a right to ſuch an appellation, which they could otherwiſe ſcarcely claim, having, according to Gærtner's principle, no *Cotyledon* at all.

YOLOTOU, or YULDUZ, or *Cyalis*, or *Chialiſh*, in *Geography*, called by the Turks Keraſher, or the Black City, a town of Little Bucharia, ſituated in a country abounding with ſprings and fine meadows; 85 miles N.N.W. of Hami.

YOM-NIM-KIEN HOTUN, a town of Chineſe Tartary, on the E. coaſt of the gulf of Leao-tong; 263 miles E. of Peking. N. lat. 40°. E. long. 121° 34′.

YOM-TA-HOTUN, a town of Corea; 648 miles E.N.E. of Peking. N. lat. 42° 55′. E. long. 129° 37′.

YON, a river of France, in the department of the Vendée, which paſſes by La Roche ſur Yon.

YONGHELAHE, a river of the iſland of Madagaſcar, which runs into the ſea on the weſt ſide of the iſland, S. lat. 23° 30′. E. long. 47° 4′.

YONG-LI, a town of Corea; 30 miles S.E. of Koangtcheou.

YONG-NGAN, a city of China, of the ſecond rank, in Quang-ſi; 1027 miles S.S.W. of Peking. N. lat. 24°. E. long. 110°.

YONG-NGAO, a ſmall iſland near the coaſt of China, in Quang-tong; 20 miles S.S.E. of Macao.

YONG-NING, a city of China, of the firſt rank, in Yun-nan, on the borders of Thibet. A little to the E. of this town is a lake; 1095 miles S.W. of Peking. N. lat. 27° 50′. E. long. 100° 24′.—Alſo, a city of China, of the ſecond rank, in Quang-ſi; 977 miles S.S.W. of Peking. N. lat. 25° 6′. E. long. 109° 14′.

YONG-NING, or *Yung-ning*, a city of China, of the ſecond rank, in Koei-tcheou; 1027 miles S.S.W. of Peking. N. lat. 25° 55′. E. long. 104° 57′.

YONG-PE, a city of China, of the firſt rank, in Yunnan; 1150 miles S.W. of Peking. N. lat. 26° 42′. E. long. 100° 34′.

YONG-PING, a city of China, of the firſt rank, in Pe-tche-li, on a river which runs into the gulf of Leao-tong. This city is advantageouſly ſituated, but its juriſdiction is not very extenſive; it contains but one city of the ſecond order, and five of the third. It is environed by the ſea, by rivers, and by mountains, covered for the moſt part with fine trees: this makes the country leſs fertile, but the neighbouring bay ſupplies its want with great plenty of all the neceſſaries of life. Not far from this city ſtands a fort named *Chun-hai*, which is the key of the province of Leaotong. This fort is near the beginning of the great wall, which is built, for a league together, in a boggy marſh, from the bulwark in the ſea; 115 miles E. of Peking. N. lat. 39° 55′. E. long. 118° 34′.

YONG-SIN, a town of Corea; 113 miles E. of Hantcheou.

YONG-TCHANG, or YUNG-TCHANG, a city of China, of the firſt rank, in Yun-nan. This city is large and populous, and is built in the midſt of high mountains, on the borders of the province, in the neighbourhood of a ſavage people, whoſe genius and manners the inhabitants of this country partake of. The country produces gold, honey, wax, amber, and a vaſt quantity of fine ſilk. It has within its diſtricts one town of the ſecond order, and two of the third; 270 miles S.W. of Peking. N. lat. 25° 6′. E. long. 99°.

YONG-TCHEOU, a city of China, of the firſt rank, in Hou-quang; 882 miles S.S.W. of Peking. N. lat. 26° 10′. E. long. 111° 15′.

YONG-TONG, a town of Corea; 40 miles E. of Het-fin.

YONI, in *Metaphyfics*, the name of a myfterious fymbol among the Hindoos; which, although contemplated with refpect and awe by that fuperftitious race, is yet of fuch a nature as not to be difcuffed without difficulty in the living language of a country which has happily fhaken off the trammels of priestcraft; and views with pity, mixed with juft abhorrence, the idolatrous propenfities of thofe ftill retained in mental bondage; accompanied, as we find they were, among many ancient people, by the indecencies of impure rites, fcarcely yet difufed, even in Europe, and exifting in almoft undiminifhed groffnefs in the ftill unenlighted regions of Afia.

The reader is fuppofed to be more or lefs aware of the nature of the orgia incident to the worfhip of fuch deities as Pan, Priapus, Bacchus, Venus, &c. We do not here inquire particularly into the origin of fuch rites. In their earlier ftages, they were probably an innocent ebullition of gratitude for the experienced bounties of nature. In the lapfe of time, a concourfe of people of both fexes, warmed by exercife and beneficent feelings, at a genial feafon moft likely of the year, found, as is ever the cafe, their unreftrained devotion fublimed into enthufiafm; and hurried by fuch feelings beyond the fcope of unaffifted reafon, gave themfelves up to the extravagances of myfticifm, and in the end to exceffes which not only Chriftians, but the decent of every fect and country muft unite in reprobating. Thefe Bacchic phrenzies were accordingly fuppreffed or mitigated as to their oftenfible ufages and tangible abominations. Nature, in the phrafeology of certain fects, was no longer propitiated through the indulgence of feelings of her own prompting, excited farther by the prefence of unequivocal exhibitions. She, ftill perfonified, was more decently reprefented by certain fymbols fubftituted for the earlier types. The cunning prieft no longer daring to exhibit their obfcenities in fhamelefs nudity, permitted only a portion of indecency to remain in the hands and eyes of their deluded votaries, and concealed their origin and meaning in the various myfteries and hieroglyphics denominated Bacchic, Eleufinian, Phallus, Linga, Yoni, Cone, &c. &c. Some notice of thefe things, and of the ordinary courfe and confequences, will be found under the appropriate articles of our work; alfo in MYSTERY, MYSTICS, and others thence referred to.

By fuch people Nature was contemplated chiefly under her attribute or property of fecundity; and fymbols of generative allufion were thofe under which her prolific potencies were exhibited. Thofe prone, like the Hindoos, to refolve almoft every thing into fexual allegory, of courfe fancied the male and female pudenda omni-archetypal. Thefe, in the early days of fuch perverted devotion, were probably pourtrayed in India, as elfewhere, without referve; but were, in moft cafes, foon corrected into the comparative decency of the hieroglyphics; and the deluded people were cajoled by mummery and myftery, that became lefs and lefs underftood, and therefore, perhaps, the more reverenced. We have faid in moft cafes; for in Egypt and Greece the groffnefs of Phallifm is known only in the remains of antiquity; in India it doubtlefs exifts, but divefted of obtrufive or confpicuous indelicacy; and too true it is that among Chriftians was the primeval infamy of the fymbol and ufage moft tenacioufly retained. We can but juft allude to the difcovery of this curious though lamentable fact, by fir William Hamilton, in the neighbourhood of Naples. His communication, with ample commentary and illuftration, has been printed, but very properly not publifhed; concealed, though not fuppreffed; and we therefore make no direct reference to the fufficiently inftructive, though too difgraceful volume, in which this difgufting worfhip is proved to exift in Chriftian Europe, and is traced almoft all the world over.

Among the Egyptians, Greeks, and Romans, the Phallus and the Cone feem to have been the earlieft of the groffer and corrected emblems; the latter contained both the Linga and Yoni, nature active and paffive; and fimilar, familiar, or recondite meanings and allufions were thus readily revived in the minds of the vulgar and the initiated, fuitable to the efoteric or ifoteric nature of their capacities and feelings. Thefe fooleries, to give them no harfher name, thus found to have exifted among the people juft mentioned, and others, have, with great appearance of reafon, been fuppofitively derived from the ftill more ancient ufages of India. Much might be faid in fupport of this, were it worth while; and thus far the inquiry will probably be repaid, that it may bring to light many ftrange coincidences. If fuch writers as Colebrooke, Wilford, Faber, and others, who bend their minds to the developement and elucidation of Eaftern literature and myfteries, continue for a while in the fame line of refearch, we anticipate a confirmation of the furmifes long entertained, that nearly all the learning, fcience, and art, as well as the religion of Egypt and Greece, originated in India, or at leaft with the Brahmans; however much they may have been improved or embellifhed by the hands through which they reached us.

India then, or the country of the Brahmans, wherever that was, being in our judgment the region where the fuperftitious practices now under our confideration originated, we may expect to find its early hiftory teeming with allufions to it. This is indeed the cafe; though fuch allufions are not, perhaps, found in its *earlieft* works on theology. But as no people have changed fo little as the Brahmans and their flock by the innovations of ftrangers, or the lapfe of time, (for frequent fubjugations by conquefts feem to affect them but little, and perfecutions ferve only to confirm their prejudices,) we may expect to find their religious inftitutions and practices more in accordance with thofe of their early days than the ufages of other people who have not difdained to become wifer by the operation of reafon and philofophy; and who have been taught to look on the follies of their anceftors with the pity they deferve. In India, we thus find certain hieroglyphics ftill receiving the external adoration fo little their due. There we find the infidious Brahman ftill teaching his ignorant fuppliant to fall down and worfhip the Linga and Yoni; fymbols, in whatever fhape exhibited to the public eye, no doubt fitter for the brothel than the temple. The former of thefe is the attribute of Siva, the Maha-deva, or great divinity prefiding over reproduction, or regeneration in the abftract; and the other of his confort Devi, or Parvati, the Magna-Mater, the Bona Dea of the Eaft.

In preceding articles, we have neceffarily touched on the character and attributes of the two juft mentioned grand divinities of the Hindoos; and refer our readers to PARVATI and SIVA for our remarks thereon, and to LINGA for a brief notice of the Phallic worfhip of India. In this article, we propofe to difcufs that ftill offered to the Juno, the Venus, the Ifis, the many-named all-abforbing goddefs of the Hindoos, whofe emblem is the Yoni.

Writers on this fubject generally, perhaps unavoidably, commix their fpeculations on the Linga and Yoni. Crude nature is perſonified, and called Prakriti; ſhe is declared to be nature, or the earth, the womb of nature; ſhe is thence any thing conceiving or containing, or the power or ſakti of ſuch faculties. In its firſt ſtate that *power* was rather a tendency, an aptitude, and laid dormant until excited by the *bija*, or vivifying principle, the *aura* of nature perſonified in Siva, who in this character is called Paruſha, or the primeval male. Here we find nature paſſive and active: the power or aptitude of nature is ſymbolized by the Yoni; the vivifying principle by the Linga. Prakriti is found to be one of the names and forms of Parvati, as Paruſha is of Siva. Under theſe names we have taken ſome notice of their character; but it is not eaſy, in the ſhort articles to which, in theſe matters, we muſt reſtrict ourſelves, to explain fully, were we able, the nature and alluſions of theſe abſtract perſonifications.

The faculty or power of containing, of which the Yoni is the type, is alſo called Argha by Hindoo myſtics. The name is given to a cup or diſh, or *veſſel*, in which fruits and flowers are offered in oblation. Theſe veſſels, they ſay, ought always to be *boat-ſhaped;* and ſo they frequently are, but ſometimes round, oval, or ſquare; moſtly, however, circular. All this is myſterious and profound. The rim of the Argha is more eſpecially the Yoni, while the contents of the veſſel repreſent the Linga, which is ſometimes more unequivocally figured by an image of Siva ſtanding erect in the centre of the Argha. Hence one of his names is Arghanatha, or lord of the boat-ſhaped veſſel. We may ſtop a moment here to remark how readily Bryant, Faber, and the race of Noetics, would have recognized the ark, in the arga or arka, or ark, as it may without much licence be written, of the Hindoos. We do not heſitate to hint our belief that many of the fables connected with Colchis, Juno, Io, Ionia, Jonah, &c. are traceable upwards to Hindoo words: many alſo connected with the names of places or perſons, beginning with Col or Kal, or containing its root, that are ſcattered in unmeaning profuſion through the geography and early biography of Europe. But this is not the place to enlarge on this ſubject.

The Argha, as a type of the *power of conception*, excited and vivified by the Linga or Phallus, Mr. Wilford (Aſ. Reſ. vol. iii.) ſuppoſes to be one and the ſame with the ſhip Argo, which, according to Orpheus (Argon. v. lxvi.), was built by Juno and Pallas, or, according to Apollonius (b. ii.), by Pallas and Argus, at the inſtance of Juno. The word Yoni, as it is uſually pronounced, nearly reſembles the name of the principal Etruſcan goddeſs; and the Sanſkrit phraſe Arghanatha Iſwara ſeems accurately rendered by Plutarch (on Iſis and Oſiris), when he aſſerts that Oſiris was commander of the Argo. That the Sanſkrit words *p'hala*, meaning fruit, and *p'hulla*, a flower, had ever the ſenſe of *phallus*, is not affirmed; but as theſe are the chief oblations in the Argha, and are confeſſed to be a repreſentation of the Linga, their ſounds may eaſily have been ſo transferred. We have ſeen, too, that Mahadeva himſelf, the prototype of the Linga, is ſometimes placed erect in the Argha: this is to complete a myſtical triunion of powers; for Viſhnu, the principle of humidity and of conſervation, is ſymbolized by a convexity or emboſſment in the centre of the Argha, over which the image of Mahadeva, or the p'hala and p'hulla, as repreſenting the Linga or Phallus, are placed. The idea that the Sanſkrit p'hala or p'hulla may in ſenſe as well as ſound be cognate with and the ſource of the Greek phallus, derives ſtrength from the fact that Mahadeva, in his character correſponding with that of Jupiter Marina, or Neptune, bears, like his Roman kinſman, a trident, called Triſula, and ſometimes Triphala, denoting trifurcation and trifloreſcence. Jupiter Triphylius is thus identified with the three-eyed Siva, who in this form is named Trilokan and Triſula.

That the Sanſkrit language is very widely ſpread, and is traceable in various dialects, we have the authority of Mr. Colebrooke for believing. In the names of places, we are inclined to think its extenſion is proved as much as in any point: and we do not deem the idea very extravagant (ſays our correſpondent) that derives the name of Trafalgar, the ſcene of the laſt grand triumph of the Britiſh Neptune, from the mythological language of our fellow-ſubjects of India.

To return to the Yoni or Argha, we have ſeen that the veſſel under the latter denomination is boat-ſhaped, and a type of the world. In the general Deluge, the generative powers of nature, male and female, reduced to their ſimpleſt elements, the Linga and Yoni, aſſumed this ſhape for the preſervation of mankind. Brahma, the creative power, is repreſented to have been aſleep at the bottom of the abyſs. This alludes, we ſuppoſe, to the deſtruction of mankind; man being repreſented in the abſtract by Brahma. The Yoni becoming boat-ſhaped, the Linga was the maſt, and protected by Viſhnu rode upon the waters. This, though ſufficiently groſs, is doubtleſs an arkite allegory. Every thing hollow or concave having the property of containing, remind myſtics of their type the Argha or Yoni, as aſpiring objects do of the Linga. Enthuſiaſts ſee theſe two principles; that is, they ſay, nature paſſive and active, dormant and revivified, every where and in every thing,—the earth, the ſea, a boat, a well, a pond, the hollow of the hand, clefts in rocks, excavations, caves, commiſſures of branches, &c. partake of relationſhip with the one,—mountains, eſpecially if inſulated and conical, pyramids, cones of any ſort, fire, a maſt, a tree, eſpecially if denuded of branches, obeliſks, &c.—all theſe connect themſelves with ideas of Mahadeva and the Linga. The earth is typified by a boat; the Argha of the Hindoos, and the Cimbium of the Egyptians. Oſiris is repreſented in a boat carried by men: in India, Mahadeva erect in the Argha refers to the ſame allegory. All over India, the Argha, and Linga of ſtone inſerted in it, is found an object of worſhip. It is ſtrewed with flowers, and water is poured on the Linga, and conveyed off by the rim or Yoni; the foſſa navicularis or myſtical boat of Iſis.

Caves we have noticed as types of the Yoni, from their property of hollowneſs or containing, and alſo from the ſhape of their mouth. It will be recollected, that the moſt ancient oracle and place of worſhip at Delphos was that of the earth in a cave, which was called Delphi; an obſolete Greek word, ſynonymous, according to Mr. Wilford (Aſ. Reſ. vol. vi.), with Yoni in Sanſkrit. Similar ſuperſtitions have prevailed farther weſtward. Perforations and clefts in ſtones and rocks were called Cunni Diaboli by early Chriſtians, who uſually beſtowed the appellation of devils on the deities of the heathens. One of the wonders of the peak in Derbyſhire retains an appellation ſtill coarſer: but Mr. Wilford thinks improperly; for this wonderful cave, or one he ſays very like it, particularly noticed in the Puranas, is declared to be the ſacred Yoni. The cleft called Guhyaſthan, in Nepal, anſwers fully and literally to the coarſe appellation of its relative in Derbyſhire, (Guhya, or Podex,) and is devoutly worſhipped by numerous pilgrims from all parts of India. Perforated rocks or ſtones, as well as the mouths of caves, are myſtically contemplated in India. A regeneration is effected by paſſing through them; or, if the hole be too ſmall, a hand or a foot thruſt through, with a ſufficient faith, will nearly anſwer the ſame purpoſe.

It

It is difficult to difcufs fuch fubjects as thefe without feeling a certain degree of contempt, pity, and wonder, at the fooleries of creatures called rational. But when we recollect that many millions, hundreds of millions probably, of our fellow mortals are, or have been, thus mifled, and have been fimilarly mifled in all parts of the world, the origin and fpread of fuch ufages become a fubject not unworthy the inquiry of the philofopher: as connected probably with the hiftory of ftupendous events in facred hiftory, it claims alfo the attention of the theologian; and the total difufe of all fuch irrational fuperftition among ourfelves is a matter of gratulation to us as reformed Chriftians. We are difpofed, however, to view it in all cafes as an invention and engine of priestcraft, and not much more to be charged on the religion of the Hindoos and others, than the mummeries practifed at Loretto, Naples, and elfewhere, are juftly chargeable on Chriftianity.

Connected with the fymbols and rites of the Yoni, we had prepared to offer fome remarks fhewing the fpread of fimilar fuperftitions almoft all over Europe, as well as in other regions. And, indeed, although their origin and allufion are now wholly forgotten, curious obfervers may difcern in ftill exifting ufages occafional relics of this fpecies of devotion even in England. It is inexpedient, however, to indulge in this extended view.

Adoration of ftones is found fimilarly fpread through the fuperftitious ages of all nations. The Hindoos retain it with undiminifhed bigotry; and will affirm, and indeed go nigh to prove, that fuch objects, from the facred monolithic fubject of the Kaaba at Mecca, or the obelifks of Egypt, to the trilithic temple at Stonehenge, with many intermediate, are no other than their Linga, under various forms and denominations. The Bætilia of antiquity are nearly related to it. Under BÆTYLOS, CROMLECHE, KISTVAEN, STONEHENGE, and other articles of this work thence referred to, the reader may, if defirous, fee the extent of fpeculation to which the fuperftition connected with *Lithifm*, if fuch a term may be allowed, has given rife.

Clefts in rocks, rent by the hand of nature, may therefore be fuppofed to be profoundly venerated by fuch enthufiafts as are Hindoo myftics. One of the moft celebrated in India, as far as we have heard, is at the promontory on the ifland of Bombay, called by the Englifh Malabar point. The promontory itfelf, thrufting its apex into the fea, which there forms a fandya, or junction, (fee JUNCTIONS,) is *Lingaic*. It ufed to be much reforted to, and its fin-expelling potency much relied on, before its purity and privacy were polluted and interrupted by the prefence of ftrangers, and the increafing population of the ifland. The unequalled denfity of its prefent population, and the extending prevalence of foreign manners, have leffened the fanctity of this fpot, now the conftant refort and abode of perfons who look on the local fuperftitions with an eye too rational or curious—or fevere fhall we fay?—to encourage their continuance. Like the Lithic Linga temple of its neighbouring ifland of Elephanta, as the Englifh call it, the Yoni of Malabar point will foon ceafe to be reforted to. Its fine temple is levelled to the rock whence it arofe, and fome of its fpoils adorn the Mufeum at the India Houfe. The neighbourhood of Bombay was in former times a grand affemblage of Hindoo temples. The great beauty and falubrity of the fituation, the forms of the hills and iflands, and other real and fanciful advantages, combined to give it high charms to the tafteful and cunning Brahman. An ifland rifing conically is, we have feen, itfelf a Linga, its fhores a Yoni, the ocean an Argha. The demoralizing effect of this perverted philofophy on the mind of the fimple Hindoo might be exemplified by a citation from our great dramatic poet, flightly altered:

" —— And this their life, exempt from public haunt,
Found Lingas in ftones, Arghas in running brooks,
Yonis in rocks, and gods in every thing."

Paffing through fuch clefts as we have juft noticed with a piacular or expiatory view is, or rather has been, of extenfive prevalence. We could fhew it to have exifted in many parts of Europe. Relics of it ftill exift in England. And indeed fuch is the recent rage of theological innovation, and the amazing increafe of credulity, that a zealous fectarian need not defpair of feeing thefe, or ufages equally ridiculous, revived among us. But it would not fuit the crafty Brahmans to allow rich delinquents fo eafy an expiation as the paffage through a cleft or Yoni of rock. In certain cafes of defilement, it is required that an image of pure gold be made of the female power of nature, either in the form of a woman or of a cow: in this ftatue, the perfon to be regenerated is enclofed, and is protruded through the ufual channel. As this evidently muft be enormoufly expenfive, it is of courfe rarely reforted to. An inftance is given in the Hindoo Pantheon, p. 398. of a recent cafe where a Yoni of gold was the medium of regeneration to two Brahmans, who had fuffered pollution by coming to England. The defilement of a natural birth is done away by the protrufion of the perfon or head through a facred thread called *Zennar*. (See that article.) This regeneration is effential to Brahmanical purity, and is alfo required of the two next tribes. The individuals thereafter are denominated *twice-born*. The fourth tribe is not allowed to be thus purified, and is therefore confidered as bafe and unclean. See SECTS *of Hindoos*.

Enough has been faid under this article to fhew the myfterious bearing of its title. It is a fubject which, connected with the Linga, meets the obferver or inquirer directly or allufively, though not oftenfibly, or very often in an offenfive form, at every ftep he takes in the inveftigation of Hindoo literature or antiquities. Refpecting the non-offenfivenefs of their appearances, we refer to our article LINGA; of which indeed this may be confidered as a continuation. The fubject is inexhauftible, but to us not inviting, though it muft have been fo to others. It might not be exaggeration, if it appear fo, to fay, that more fpeculation exifts hereon in the languages of India than would fill a volume equal to our whole Cyclopædia! Reference to earlier articles defcriptive of the Yoni and its attributes and allufions enables us to abridge this, which is, however, even combined with what is faid in thofe articles, ftill and neceffarily incomplete. See KAMALAYONI, LILESWARA, LOTOS, MERU, PATRA, RADHA, SAIVA, SAMI, SAMI-DEVI, and SECTS *of Hindoos*. From the article SAMI reference is made to this, and we take this occafion to correct an error in the former: in col. 2, line 24 from bottom, for *fiction* read *friction*.

Individuals, chiefly of the fect called Sakta, meaning worfhippers of the Sakti, or female energy of Mahadeva, the deity of reproduction, propitiate the goddefs under the form of the Yoni, the myftical matrix of nature. Of this, fee under SAKTA and SAKTI. Such individuals have the fectarial appellation of Yonija. In what they differ from the Sakti, if they differ at all, we are not informed. Thefe fects may be fuppofed to comprife but few perfons; but this is a point on which information is obtained with difficulty. Refpectable individuals, if there be any fuch belonging to it, are afhamed to avow being Saktas; and from perfons of a different fort information is not to be relied on.

Writings,

Writings, too, on thefe fubjects, are very obfcure; their endlefs Scholia equally fo, and can be critically underftood by very few Europeans, even with the affiftance of a learned native, who, afhamed probably of what he is defired to explain, will, with almoft laudable delicacy or deceit, glofs over the half-revealed obfcenities of his brethren.

The common tendency in the nature of the adoration of the Linga and of the Yoni might, one would think, have united their worfhippers in a community of object and view. But fuch are the anomalies and perverfities of the human mind, that it appears to be an hiftorical fact, that the Lingajas and Yonijas have actually not only difputed and quarrelled refpecting the comparative merits of their refpective hieroglyphics, or, in other terms, the paramount potentiality of the archetype; but that bloody wars have arifen between them on the queftion, which, as far as now appears, feems really to have been one of phyfiology: the only inftance, probably, in which fuch a queftion hath ever operated as a caufe of holy war, manifold as thofe caufes unhappily have been. The Yonijas infifted, it feems, on a fuperior influence in the *female* over the *male* nature in the production of a perfect offspring. The confequent difputes and warfare the Hindoo writers have, as ufual, recited in extravagant allegories, which we fhould call obfcene, but which they confider as awfully facred.

"This diverfity of opinion," fays Wilford, "feems to have occafioned the general war which is often mentioned in the Puranas (fee PURANA), and was celebrated by the poets of the Weft as the bafis of the Grecian mythology: I mean that between the gods led by Jupiter, and the giants, *or fons of the earth*, or, in other words, between the followers of Ifwara (fee ISWARA) and the Yonijas, or men produced, as they afferted, by Prithu, a form of Vifhnu (fee PRITHU and VISHNU); for Nonnus (Dionyf. b. xxxiv. v. 241.) exprefsly declares, that the war in queftion arofe between the partifans of Jupiter and thofe who acknowledged no other deities than water and earth. According to both Nonnus and the Hindoo mythologifts, it began in India, whence it was fpread over the whole globe, and all mankind appear to have borne a part in it.

"Thefe religious and phyfiological contefts were difguifed in Egypt and India under a veil of the wildeft allegories and emblems. On the banks of the Nile, Ofiris was torn in pieces; and on thofe of the Ganges, the limbs of his confort Ifi, or Sati, (fee OSIRIS, ISIS, ISI, and SATI,) were fcattered over the world, giving names to the places where they fell, and where they are ftill fuperftitioufly worfhipped. In Sanfkrit books, we find the Grecian ftory concerning the wanderings of Bacchus; for Ifwara, having been mutilated through the imprecation of fome offended Munis, (fee MUNI and SAMI-DEVI,) rambled over the whole earth, bewailing his misfortune; while Ifi wandered alfo through the world finging mournful ditties in a ftate of diftraction. There is a legend in another book, of which the figurative meaning is more obvious. When Sati, after the clofe of her exiftence as the daughter of Dakfha, fprang again to life in the character of Parvati, or mountain-born, (fee MERA and MENA,) fhe was re-united in marriage to Mahadeva. This divine pair had once a difpute on the comparative influence of fexes in producing animated beings, and each refolved, by mutual agreement, to create apart a new race of men. The race produced by Mahadeva was very numerous, and devoted themfelves exclufively to the worfhip of the male deity; but their intellects were dull, their bodies feeble, and their complexions of different hues. Parvati had at the fame time created a multitude of human beings, who adored the female power only. Thefe were well-fhaped, with fweet afpects, and fine complexions. A furious conteft enfued between thefe Lingancitas and Yonijas: the former ftood their ground pretty well at firft, but were in the end defeated, and fhamefully routed in the battle, through the potency of the facred Yoni. Mahadeva enraged was about to deftroy them by the fire of his eye: but Parvati interpofed; and to appeafe him, made ufe of the fame artifice that Baubo did to put Ceres into good humour, and fhewed him the prototype of the Lotos. Mahadeva fmiled, and relented on condition that the Yonijas fhould inftantly leave the country.

"It is evident that this ftrange tale was invented to eftablifh the opinion of the Yonijancitas, or votaries of Parvati or the Yoni, that the good fhape, ftrength, and courage of animals depend on the fuperior influence of the female parent, whofe powers are only excited and put into action by the male *aura*. But the Lingancitas maintain an oppofite doctrine. There is alfo a fect of Hindoos, by far the moft numerous of any, who, attempting to reconcile the two fyftems, tells us, in their allegorical ftyle, that Parvati and Mahadeva found their concurrence effential to the perfection of their offspring; and that Vifhnu, at the requeft of the goddefs, effected a reconciliation between them: hence the *navel* of Vifhnu, by which they mean the *os tincæ*, is worfhipped as one and the fame with the facred Yoni." Wilford, in Af. Ref. vol. iii.

YONIJA, the name of a fect of Hindoos, who worfhip the hieroglyphic of Parvati, called *Yoni*; which fee.

YONKERS, in *Geography*, a poft-townfhip of the ftate of New York, in Weft Chefter county, on the E. bank of the Hudfon, above New York ifland, 20 miles N. of New York, extending near eight miles along the Hudfon, and having a medial breadth of near three miles. The furface is broken, but the lands are cultivated and productive. In 1810 the whole population confifted of 1365 perfons, with 93 electors, and 204 taxable inhabitants.

YONNE, a river of France, which rifes about four miles S. from Château-Chinon, in the department of the Nyevre, paffes by or near to Monceaux, Clamecy, Coulanges, Cravant, Auxerre, Joigny, Villeneuve, Sens, Pont fur Yonne, &c. and joins the Seine at Montereau.

YONNE, one of the nine departments of the central region of France, formerly *Yonne*, E. of Loiret, in N. lat. 47° 50′, about 70 miles long, and from 30 to 40 broad, containing 7740 kiliometres, or 373 fquare leagues, and 333,278 inhabitants; bounded on the N.E. by the department of the Aube, and on the S.E. by the department of the Côte d'Or, on the S. by that of the Nyevre, on the W. by that of the Loiret, and on the N.W. by that of the Seine and Marne. The river Yonne, from which it receives its name, croffes it from S.E. to N.W. It is formed of the Auxerrois, formerly reckoned a part of Burgundy. Its capital is Auxerre. It is divided into five circles, or diftricts, 34 cantons, and 484 communes. The circles are, Sens, comprehending 57,285 inhabitants; Joigny, 81,933; Auxerre, 103,882; Tonnerre, 47,394; and Avallon, 42,784. According to Haffenfratz, its extent in French leagues is 29 in length, and 25 in breadth: its circles are 7, its cantons 69, and its population confifts of 364,969 perfons. In the 11th year of the French era, the total of its contributions was 3,093,023 fr.; and its expences, adminiftration, judiciary, and for public inftruction, were 297,935 fr. 66 cents. The foil is various; it has fome dry and indifferently fertile tracts, diverfified with little hills; the weftern part is of a clayey foil, covered with woods and pools:

pools: the cantons to the S. and E. are planted with vineyards; and the northern district is tolerably cultivated. The department, in general, is fertile, producing grain in abundance, with wine, fruits, and excellent pastures.

YOOL ISLANDS, a cluster of small islands in the Pacific ocean, so called by captain Forrest, in the year 1774. In 1788 they were by Mr. Meers called Tattee islands.

YOO-MIOU, a large town of the Birman empire, situated on a small river, which enters the Irawaddy at a place called Yoo-wa. An extensive tract of country is inhabited by a people called Yoo, who are said to be exceedingly ugly, having protuberant bellies, and white teeth. These Yoos are subjects of the Birman state, and observe the same religious worship. They speak the language of Tavay, which is merely a provincial dialect of the Birman tongue. Symes's Embassy to Ava, vol. ii.

YOPA, a town of Mexico, in the province of Culiacan; 100 miles E.N.E. of Culiacan.

YOPAS, LAS, or *Yopez*, a river of Mexico, which rises in Tlascala, and runs into the Pacific ocean, N. lat. 17° 10′.

YO-PING, a town of Corea; 33 miles S.W. of King-ki-tao.—Also, a town of Corea; 28 miles S.S.E. of Tsin.

YORK, the *Eboracum* of the Romans, is the capital of the great county to which it gives name, the see of an archbishop, who is primate and metropolitan of England, and the second city in rank in the kingdom. It is of unquestionable antiquity, and eminently distinguished in English history by the important political, ecclesiastical, and military transactions which have occurred within its walls, or with which it has been in other ways intimately connected. Seated in the midst of a vast plain, by the side of a river which was navigable for the largest ships of ancient times, and too remote from the open sea to be immediately exposed to predatory invasion, York must have early attracted the attention and become the favourite abode of the chiefs of the northern states, and of their successful invaders from foreign lands. Eboracum was accordingly selected by Roman emperors and commanders as a principal residence during their protracted contests with the ungovernable inhabitants of the northern parts of Britain. The metropolis of a shire unparalleled in the kingdom for extent, population, and productions, York is placed at the point of junction, although independent of them all, of the three ridings or districts into which the shire is subdivided. The cathedral is situated in N. lat. 53° 58′, and in W. long. from Greenwich 1° 7′. The city is distant, by the shortest roads, from London, N. by W. 198 miles; from Edinburgh, S.S.E. 201 miles; from Durham, S. by E. 67 miles; from Hull, W.N.W. 38 miles; and from Liverpool, E.N.E. 100 miles. The nearest point of the sea-coast on the E. is at Bridlington bay, distant 33 miles, and on the W. at Lancaster 90 miles. The position of the city is central, with respect to both the limits of the county, and the great body of the population, industry, and commerce, by which it is distinguished. The ancient station of Eboracum was confined between the river Ouse on the W. and the collateral stream, the Foss, on the E., which falls into the Ouse at the southern extremity of the old city. In later times, however, the limits were extended considerably on the opposite sides of both rivers. Such a position, defended on three sides by rivers and marshes, and accessible by an enemy on the N. side alone, although in the midst of a plain, but consequently overlooked by no neighbouring eminence, would, even in the modern art of war, be susceptible of powerful defence: in ancient times it might have been rendered nearly impregnable. In constructing the walls, and laying down the streets, on ground previously occupied by their camps, it was the practice of the Romans to preserve as much as possible the form and distribution of the prior intrenchment. Of this practice frequent instances are found in Britain, as well as in Gaul, and other parts of the continent. The same, notwithstanding the many changes to which the city has been subjected, may still be traced in York, where evident remains of Roman architecture are yet preserved, and where monuments of antiquity of various classes have often been discovered.

In its present state, the plan of York forms an irregular pentagon, extending from S. to N. about 1340 yards, and from W. to E. about 1360 yards: the area within the walls is therefore about 300 acres. It is divided into four wards, which take their names from the four gates. Bootham-gate-ward, in the N.W., contains three parishes; Micklegate-ward, on the W. side of the Ouse, contains six parishes; Monk-ward, in the N.E., five parishes; and Walmgate-ward, on the S.E., seven parishes. But the close of the cathedral is not included in any ward. Some of these parishes extend beyond the walls; and the two churches of St. Lawrence and St. Maurice, situated on the outside of the city, are still commonly reckoned to belong to it. The number of churches, exclusive of the cathedral, is therefore twenty-three. In former times they amounted to forty-five. Although no regular plan can now be traced in the distribution of the streets, yet some of them are of respectable appearance, having of late years been much improved by widening and paving; and new and handsome buildings, public and private, have been erected. The river Foss, long a piece of stagnated water, has again been rendered navigable, and now materially contributes to the ornament of the city as well as to the health of the inhabitants.

York, still inhabited by many genteel families, maintains its importance in no inconsiderable degree; but in point of population and wealth, it has been far excelled by many manufacturing and trading towns in the county, of comparatively modern foundation. According to the reports of the population of the kingdom in 1811, the inhabitants of York were then only 18,217, and the houses 2743.

Civil History.—York, under its romanized name, *Eboracum*, early appears in British history. In the year 208, the emperor Severus, with his sons Caracalla and Geta, visited Britain; and returning from an expedition against the northern insurgents in the following year, Severus resided at Eboracum, while his troops were employed in constructing across the isthmus, between the mouths of the Eden and the Tyne, the great wall of defence still known by his name. In this enterprise, he followed the example and completed the fortification of his predecessor Hadrian, which had been formed in the year 121. While Severus's great work was in progress, the emperor died at York in 210; and his successor Caracalla, more intent on the destruction of his envied brother Geta than on the enlargement or the preservation of the Roman dominion in Britain, soon afterwards returned to the continent. During his residence in York, Severus struck money, on which he styled himself *Britannicus;* and also issued a decree respecting the recovery of slaves, which decree is still preserved in the Roman code, dated at Eboracum, on the 3d of the nones of May, in the consulate of Faustinus and Rufus, corresponding to the year A.D. 209.

Turning his arms against the Caledonians, and other Britons, who struggled for freedom in the north, Constantius fixed his head-quarters in York, and there ended his life in 306. York was also the scene of the inauguration of his son fon and fucceffor Conftantine, who, learning in Afia the indifpofition of his father, haftened to York, where he arrived in time to receive his laft inftructions; and was there proclaimed emperor by the army.

Among the towns fpecified in the geography of Ptolemy, the Itinerary of Antoninus, and the much later work of Richard of Cirencefter, Eboracum is ranked firft as a colony, and afterwards as a municipal town. As a colony, or fettlement of veteran troops, the inhabitants were citizens of Rome, and governed by the laws of the ftate. When advanced to the higheft ftation, that of municipium, the inhabitants retaining the privileges of Roman citizens were no longer under thofe particular laws, but invefted with the power of felf-government, under magiftrates of their own appointment. Befides Eboracum, Britain contained but one other municipal town, Verulamium. In the lift of Roman troops ftationed in York, the fixth legion, called the victorious, appears to have been there for three fucceffive centuries, down to 446, when the Romans finally renounced all dominion in Britain. The Britifh name of York is loft; but although foftened into Eboracum by the Romans, and by their colonies, who copied from them, traces of the original may ftill be perceived in the Kair-Ebrauc of Nennius and Henry of Huntingdon, and in the Cair-Effroc, or Efroc, of the Welfh. In Britifh compound appellations of places, the defcriptive part precedes the proper name: in the language of the Saxons a contrary mode prevailed. Hence Cair-Effroc was by them converted into Efroc-wyc, and Yevor-wyc, from which the prefent name of York feems to be derived.

York was the capital of Deira, one of the diftricts into which the Provincia Maxima of the Romans, or the county of Northumberland, was divided; and there, in the beginning of the feventh century, refided Edwyn, who re-united thofe kingdoms, and acquired the principal afcendency over Saxon-England. To this prince are afcribed the conftruction of the caftle, and the foundation of the city of Edinburgh (Edwyn's burgh), now the capital of Scotland. He alfo founded a cathedral in York; but in 633 he fell in the defence of his dominions, againft the combined attack of the Saxons of Mercia and the Britons of Wales. Under Ofwald, who came to the crown in the following year, Northumberland was again united into one kingdom; and afterwards governed by the celebrated Egbert, who, in 827, out of the Saxon heptarchy, formed the great kingdom of England. After a long feries of difafters from Danifh invafion, and the internal diforders of the kingdom, York was expofed to utter deftruction from the memorable expedition of Harold Hardrad, king of Norway. On the death of Harold of England, an unfuccefsful attempt was made by the people of York to place Edgar Atheling on the throne. For this ftep, William of Normandy befieged the city in 1070, which, after many months, was compelled by famine to furrender. The conqueror inflicted the moft horrible vengeance on the inhabitants, the furrounding country was laid wafte, and caftles were erected within the walls, to keep the conquered citizens in fubjection. With the exception of the contefts between the metropolitans of York and Canterbury, little is recorded of the former city until 1137, when the cathedral church, thirty-nine parifh-churches, and the greater part of the houfes, were accidentally burnt down. About 1160, one of the firft parliaments of England was held there by Henry II.; and in the reign of his fucceffor, Richard I., in 1190, occurred the horrible maffacre of the Jews, which was perpetrated and accompanied with circumftances of peculiar atrocity. In 1299, the courts of juftice were removed from London to York by Edward I. during his expeditions againft Scotland. In his reign this city was claffed among the fea-ports of England, and required to furnifh one fhip for his ufe. In the fanguinary contefts between the houfes of York and Lancafter, the former city naturally efpoufed the caufe of the white rofe; and in 1483, Richard III. was a fecond time crowned in the cathedral. The year 1509 was diftinguifhed by the eftablifhment of a printing-prefs in the minfter-yard of York, near the place where the royal preffes were afterwards erected in 1642, while king Charles refided in the city. Nothing of moment relative to York is afterwards recorded until the 31ft year of Henry VIII., when commiffioners were appointed there to conduct the fuppreffion of the northern monafteries. Adhering to the royal caufe, the city was, in 1644, befieged by the parliamentary forces under fir Thomas Fairfax. But on the approach of prince Rupert, the fiege was raifed; and on the 2d of July, the important battle of Marfton-moor, about five miles off, was fought, in which the royal party was completely defeated. Returning to the fiege, Fairfax, at the end of fix weeks, obtained poffeffion of the city, on moft honourable terms for the garrifon and inhabitants. Notwithftanding the zeal for the royal caufe manifefted by the citizens of York, their charter was fuppreffed by Charles II., and never reftored. A new charter, however, confirming all the former rights of the city, was granted by his fucceffor James II. in 1685. Down to the 30th of July, 1688, the inhabitants of York continued to exprefs the moft determined attachment to James; and on that day, the mayor, aldermen, and commons, congratulated him, in the moft energetic terms, on the birth of a young prince.

Civil Government.—The government of York is vefted in a mayor, who, like the mayors of London and Dublin, and the provoft of Edinburgh, is authorized by the act of Richard II. to affume the title of lord; a recorder, two city-council, twelve aldermen, two fheriffs, feventy-two common-council-men, and fix chamberlains. What is ftyled the privy-council, or the upper houfe, confifts of the lord-mayor, aldermen, and fheriffs, together with thofe citizens who have paffed the office of fheriff. This body, whatever may be its number, is ufually called the twenty-four. The mayor, whofe office ceafes on the 3d of February, is chofen annually from thofe aldermen who have not borne that office twice, nor within the fix preceding years; and during his mayoralty takes precedence of all perfons within his jurifdiction. York was early diftinguifhed among the cities of England: in the Domefday-book it appears to be exempted from the payment of geld, except when the fame is paid by London and Winchefter, and from paying reliefs. In 1396 king Richard appointed two fheriffs, inftead of three bailiffs, for the government of the city, which was then conftituted a county within itfelf. The earlieft charters of York now preferved are, one granted in 1199, and another by Henry III., who died in 1272: but both recite preceding charters of Richard I., Henry I., and Henry II. Reprefentatives in parliament for the city of York appear in the fummons and returns of the 23d of Edward I. For the parliament called to affemble at Shrewfbury, on the 30th of September 1283, which was but the 11th year of Edward, two reprefentatives were fummoned from a number of cities and towns, among which York ftands the fourth in order; thofe before it being London, Winchefter, and Newcaftle-upon-Tyne. Under the jurifdiction of the lord-mayor, aldermen, and fheriffs, befides the city, is a confiderable diftrict on the W. of the river Oufe, called the Ainftey, in ancient writings, Ancitty; but its origin and import are now unknown. This tract was once a hundred or wapentake of the Weft Riding of Yorkfhire; but in the 27th year

year of Henry VI. it was annexed to the jurifdiction of the magiftrates of York, and has ever fince been comprehended in the county of the city of York. The whole diftrict was anciently a foreft, but laid open in the reigns of Richard I. and John: it contains 22 parifhes fubdivided into a number of townfhips; the inhabitants of the whole amounting, in 1811, to 8205 perfons. In all parliamentary affeffments the city is called on for three-fifths of the amount, and the Ainftey for two-fifths. Doubts having long been entertained whether the inhabitants of this diftrict could vote for the reprefentatives of Yorkfhire in parliament, a decifion was obtained in the houfe of commons in 1735, declaring, "that the perfons whofe freeholds lie within that part of the county of the city of York, which is commonly called the Ainftey, have a right to vote for knights of the fhire for the county of York."

Ecclefiaftical Hiftory.—The earlieft notice refpecting the recognifed eftablifhment of Chriftianity in Eboracum, or York, exifts in the lift of bifhops, or paftors, who compofed the fynod or council of Arelate, now Arles, in the fouth of France, about A.D. 314. The bifhops who then appeared on the part of the Britifh church were, Eborius de civitate Eboræcenfi, Reftitutus de civitate Londinenfi, and Adelfius de civitate Colonia Londinenfium. By the retreat of the Romans in the middle of the 5th century, and the fubfequent overwhelming invafions of the Saxons, Chriftianity was almoft entirely fuppreffed in the northern parts of the kingdom. At laft, about 628, Edwin, king of Northumbria, having married Ethelburga, the fifter of Ebald, the converted king of Kent, was, by her perfuafion, aided by Paulinus, who attended her to York, induced alfo to embrace the Chriftian religion. Paulinus was confequently publicly appointed bifhop, or, as fome fay, archbifhop of the renovated church of York. The appointment was confirmed, and the new prelate formally invefted with the enfigns of his office, by pope Honorius. In former times, jealoufies and contefts occafionally took place between the metropolitans of York and Canterbury; to appeafe which it was often neceffary to appeal to the pope. Under the archbifhop of York are placed the bifhops of Durham, Chefter, Carlifle, and the Ifle of Mann; and he is ftyled in general primate and metropolitan of England: but the archbifhop of Canterbury affumes the fame titles over *all* England. At the coronation the latter crowns the king; but the queen has that ceremony performed on her by the archbifhop of York. By the removal of the feat of government to the fouthern parts of the kingdom, and particularly after the Norman Conqueft, the prelates of Canterbury and Winchefter, fituated near the throne, foon acquired an afcendancy over their brothers of York in political favour and power. Among the latter, however, were many men of eminence in the hiftory of the church and of the ftate. Wilfrid, appointed in 669, founded the celebrated monaftery of Ripon. Egbert, the brother of Eadbert, king of Northumberland, was the patron of Alcuin, the enlightened fecretary of Charlemagne. In 930 Wulftan was deprived for aiding Anloff, the Danifh king of Northumberland, againft Edred of England. Aldred, who fucceeded in 1060, was the laft prelate of the Saxon race; for dying in 1070, he was fucceeded by Thomas, a Norman. Gerard, appointed in 1100, as well as his predeceffor, refufed obedience to the fee of Canterbury; but pontifical authority compelled him to fubmit. Obedience was again denied by Thurftan, who had been appointed in 1114; but at laft he retired to a monaftery. In 1153 fucceeded William, afterwards canonized. Roger, fufpected of being privy to the death of Becket, was acquitted on his oath of purgation. In 1190 the fee was filled by Geoffrey Plantagenet, fon of Henry II. and the Fair Rofamond. His fucceffor, Walter de Grey, is faid to have tranfmitted a prodigious fum to Rome for his inftallation: but for this apparent fimony he atoned by purchafing the manor of Thorpe for the country-refidence of the archbifhops of York, and by contributing materially to the erection of the cathedral. While the fee was occupied by John Thorefby, appointed in 1352, in order to remove the contentions between the two archprelates, pope Innocent VI. eftablifhed the diftinction before-mentioned in the metropolitan dignity. Richard Scroope, who fucceeded to the fee in 1398, was, in 1405, beheaded for the active part he took in oppofition to Henry IV. after the murder of Richard II., who, on various occafions, had fhewn a particular favour for York. The fifty-fecond prelate, appointed in 1464, was George Neville, brother of the famous earl of Warwick, and diftinguifhed by the misfortunes of his latter years, no lefs than by the unbounded magnificence of his inftallation. Chriftopher Bainbridge, appointed in 1508, and ambaffador to Rome, was created a cardinal; but was foon after poifoned by an Italian prieft, his fteward. His fucceffor, in 1514, was the celebrated cardinal Wolfey. By the exertions of archbifhop Heath, appointed in 1555, the fee recovered a great part of the revenues it now enjoys, which had been alienated by the arbitrary and avaricious meafures of Henry VIII. As a Roman Catholic, he was deprived of his dignities by Elizabeth, who, however, refpected his merits, and allowed him to retire to his eftate at Cobham. In 1641 the fee was filled by John Williams, who, after warmly efpoufing the royal caufe, openly joined the parliament. After him the fee remained vacant for ten years until 1660, when, on the reftoration of Charles II., it was conferred on archbifhop Frewen. Archbifhop Dolben, who fucceeded Richard Sterne, was an enfign in the army in his youth, and bled in the royal caufe at Marfton-moor: he died in 1688. The laft prelate was Dr. Markham, who had been head-mafter of Weftminfter-fchool, and preceptor to the prince of Wales. Dying in 1808, he was fucceeded by the prefent archbifhop, the honourable Edward Vernon.

Antiquities.—That Eboracum poffeffed temples, palaces, theatres, and the other public edifices with which the politic Romans were in the habit of adorning the principal, and even in fome cafes the minor cities within their dominions, cannot be doubted; but all fuch ftructures have long difappeared. The moft remarkable monument of Roman occupation now to be feen is what is called the multangular tower, being a polygon forming the N.W. angle of the Roman wall, near the N.E. bank of the Oufe. The lower part of this tower is faced with rows of regularly fquared ftones, feparated at broad intervals by layers of flat bricks. The upper part of the tower, pierced with loop-holes, is of much later date. Various Roman infcriptions have been and continue to be difcovered in York: fome are mentioned by Camden, who was the firft to record them. In digging for a cellar, in the beginning of the laft century, in what is called the manor, or the ruins of St. Mary's abbey, on the outfide of Bootham-bar, was found a fmall buft in bronze. In the environs of the city, particularly on the London road, which follows the courfe of the ancient Roman way, fepulchral urns of various kinds have been difcovered. Coins, feals, fibulæ, and many other relics of Roman antiquity, are abundantly found within and around the city. The coins bear the names of all the emperors, from Auguftus to Gratian. In 1807 a fmall vault of Roman conftruction was difcovered, four feet below the furface, on the outfide of Micklegate-bar, containing a ftone coffin, with a human fkeleton entire, a lacrymatory, &c. In 1813 two large ftone

ftone coffins were found without Bootham-bar; and are now preferved in the cathedral. In 1814 was laid open a beautiful teffellated pavement, within Micklegate-bar, but without the Roman town; but unfortunately a part of it only was preferved: this was the firft ever found in York. The walls of the city, which probably fucceeded to the Roman fortifications, and which are now in rapid and difgraceful decay, ftill retain fufficient evidences of their ancient ftrength and importance. When they were erected is now unknown; but their conftruction on the Roman foundations is generally afcribed to Edward I., about 1280: in the time of Henry VIII. they were in complete repair. The oldeft part of the prefent walls appears to be that adjoining to Walmgate-bar, at the S.E. corner of the city, on the road to Hull, where the remains of the Red tower are ftill vifible. During the laft fiege of York, in the civil wars, by fir Thomas Fairfax, in 1644, thefe walls were fo fhattered as to require three years to repair them: but fince that period they have been fhamefully neglected by thofe whofe duty it is to preferve them.

York is diftinguifhed among the cities of England for its ancient gates, or bars, as they are termed. Of thefe, Micklegate-bar, on the S.W. fide of the prefent city, under which is the road from London, is the moft remarkable. It confifts of a lofty fquare embattled tower, with loop-holes, &c. and guarded by an adorned work, with baftion-turrets, &c. Bootham-bar, at the N. entrance of the city, not far from the Roman tower, is almoft wholly conftructed of materials formerly employed in Roman buildings. Monk-bar, on the N.E., and the Walmgate-bar on the S.E., feem to be of equal date, and were probably erected by Edward III. The whole circuit of the ancient walls is nearly two miles and three-quarters.

Caftle: Clifford's Tower.—Nearly at the junction of the Oufe and the Fofs, on an eminence, is the fcite of the ancient caftle, acceffible only from the city on the N., and ftrengthened on the other fides by the Fofs, carried round it in a deep moat. Prior to the Norman Conqueft, York poffeffed a caftle, by fome fuppofed to have ftood on the W. fide of the Oufe. It is, however, much more probable, that the principal fortrefs occupied the pofition here defcribed, on which William of Normandy erected his caftle, which was reftored by Richard III. Ceafing to be regarded as a place of ftrength, it was converted into the prifon for the county of York: but becoming ruinous, the whole was, in 1701, taken down, and the prefent grand ftructures, ftill retaining, although very incongruoufly, the original name, were erected. Within the inclofure of the ancient caftle on the N.W. is a high mount, furrounded by a deep ditch, rifing 90 feet above the river Oufe, and 30 above the fcite of the caftle. On the fummit ftands Clifford's tower, confifting of four fegments of circles joined together, and fo called, it is faid, from the firft governor, after its erection by William the Conqueror, to whofe caftle it ferved as the keep. In the time of Henry VIII. this tower was in a ruinous ftate: but on the commencement of the diforders in the reign of Charles I., it was repaired and fortified by the earl of Cumberland, who mounted fome pieces of artillery on the platform. In the year 1684, the powder-magazine within the tower exploded, and the building was reduced to its external walls, as now exifting. Correfponding to Clifford's tower, on the W. fide of the Oufe, is another mount, called the Old Baile, or *Vetus Ballium;* alfo the fcite of an ancient fortrefs.

Public Buildings.—At the head of the public edifices of York is neceffarily placed the venerable minfter, or cathedral, which, confidered in its totality, is unparalleled in England. The earlieft erection of a *ftone* edifice for the fervice of the Chriftian religion in York is always afcribed to Edwin, king of the Northumbrians. This church was founded about A.D. 628; but it was completed by bifhop Wilfrid, after 669, who covered the roof with lead, and filled the windows with glafs. This laft invaluable fubftance muft have been imported from the continent; for it was not till 674 that glafs-makers were firft introduced into England by Benedict Bifcop, to glaze the windows of his new monaftery at Bifhop-Wearmouth. That the cathedral of York fuffered with the other parts of the city by the ravages of the Danes in 867 is moft probable: but it is not noticed until 1069, when it was deftroyed, with a great part of the city, in a conflagration occafioned by the Norman garrifon, when attacked by the united Danes and Northumbrians. To punifh the refractory people of the city and vicinity, William of Normandy expelled the ecclefiaftics, and feized the revenues of the fee: but thefe were foon reftored, and his chaplain and treafurer, Thomas, a Norman, was promoted to the archbifhopric. By this prelate the cathedral was rebuilt in a magnificent ftyle; but in 1137 it was again deftroyed by fire, together with the abbey of St. Mary, and 39 parifh-churches. Having for a number of years lain in ruins, archbifhop Roger, the ftrenuous opponent of Becket of Canterbury, began in 1171 to rebuild the choir with its crypt, which he lived to finifh. In 1227, his fucceffor, Walter de Grey, erected the tranfept, with the exception of the N. part, which was the work of John le Romaine, the treafurer, who alfo raifed a central fteeple in 1260. In 1291, the fon of the preceding being advanced to the fee, commenced the nave, which, together with the two noble weftern towers, was completed by archbifhop William le Melton. In 1361, the prefent beautiful choir was commenced by archbifhop Thorefby, who contributed largely to defray the charges of the work. More money having been collected than was required, the furplus was, in 1370, employed to conftruct the prefent noble central tower, in the place of one erected by John le Romaine. Thus, in the courfe of 150 years, the cathedral of York was brought into a form nearly as it now appears. It is a grand and interefting edifice; and confifts of a nave with fide aifles, a large and lofty tranfept with aifles, a choir with aifles, and a large fpace eaft of the choir, called the lady-chapel, with aifles. Beneath the altar is a crypt; on the fouth fide are three apartments called veftries and treafury; and at the end of the north tranfept is a fine chapter-houfe, with a correfponding veftibule. The weft end is adorned by two elegantly ornamented towers, whilft another, of larger dimenfions, rifes at the centre of the tranfept. All thefe parts of the church are on a large and magnificent fcale; and though not in an uniform ftyle, yet the nave and choir are of correfponding height and width, and very fimilar in their windows, columns, and other members. The W. front is more richly adorned than any other part of the edifice. Its two towers diminifh in dimenfions as they afcend, and have been ornamented with feveral ftatues, of which now only very few remain. Each tower is furmounted by eight pinnacles; and in the fouth tower is a fet of celebrated bells. In the front are three entrances; that in the centre is divided into two by a pillar. The entire length of the cathedral is above 524 feet; that of the nave, from the weft end to the fcreen at the entrance of the choir, is 250 feet; the length of the choir to the altar-fcreen 150 feet; and that of the lady-chapel, at the eaft end, 65 feet. The tranfept is in length 222 feet. The breadth of the nave, with its fide aifles, is 103 feet; that of the nave itfelf being 63. In the centre of the nave the height to the roof is is 91½ feet; in the tranfept 103 feet; and in the choir 101 feet. The elevation of the central tower or lantern is 213 feet; that of the towers at the W. end 196 feet. The great windows which occupy the principal part of the W. and E. ends of the church are particularly beautiful. The great E. window, efpecially, is of uncommon dimenfions and richnefs. It was executed about 1405, at the expence of the dean and chapter; and the glafs painted, &c. by John Thornton, of Coventry, glazier, who engaged to finifh it in three years, and for which he was paid four fhillings *per* week. Spacious, lofty, and light, the interior of this cathedral has a moft impofing effect. For although the choir be feparated from the body of the building by a fcreen furmounted by the organ, ftill from the W. end the eye ranges over all, quite to the great terminating window in the E. The nave confifts of a double range of eight lofty pointed arches, fupported by flender cluftered columns. A fimilar arrangement prevails in the choir; but the tranfept is of a different age, ftyle, and character, to all the other parts of the church.

Great labour has been beftowed in the carving of the ftalls of the choir, which are of oak. The fcreen behind the altar is ftone, divided into eight pointed arches, the upper parts of which are perforated and glazed. At the entrance of the choir is a very elaborate fcreen of tabernacle work, perhaps of the time of Henry VI. It is covered with niches, canopies, pediments, pinnacles, &c. and contains ftatues of fifteen Englifh monarchs; *i. e.* eight on one fide of the entrance, and feven on the other fide. The whole has been of late years fuitably repaired. The central tower, or lantern, as it is ufually called, is fupported by four lofty arches refting on ftrong maffive cluftered piers.

Among the monuments of prelates and other eminent perfons preferved within the cathedral of York, is diftinguifhed that of archbifhop Walter Grey in the fouth tranfept. It exhibits his effigy in his pontificals, covered by a magnificent canopy, fupported by flender pillars. The whole was enclofed with a handfome railing by the late Dr. Markham. But the moft elegant of all is the monument of archbifhop Bowet, appointed in 1423, of great height, and in the moft florid ftyle of the pointed architecture. A full-length ftatue, with emblems and an infcription, commemorates the late fir George Saville. Attached to the fouth fide of the choir is a range of low buildings, ftyled the veftries; in one of which are preferved fundry emblems of the ancient metropolitan dignity of York cathedral. Among thefe is a famous antique horn, as it is termed, although formed out of an elephant's tooth, by the poffeffion of which the church holds lands of great value, faid to have been granted by Ulphus, a Saxon prince of Deira. In the fame place is preferved the filver paftoral ftaff, prefented by Catharine of Portugal, dowager of Charles II.; to her confeffor, who had been appointed popifh archbifhop by James II. in 1687. Adjoining to the S.W. angle of the tranfept was a fmall building, formerly ufed as a library. A library for the ufe of the ecclefiaftics of the cathedral is believed to have been founded by Egbert the archbifhop in 740, and his fucceffor Albert; but the whole was confumed by fire in 1069. By this misfortune no fmall lofs was fuftained by the lovers of learning; for according to certain writings of Alcuin, the fecretary of Charlemagne, many valuable claffic and other works were contained in it. To fupply in fome meafure its place, another library was collected by archbifhop Thomas, the Norman; but that alfo was deftroyed by the flames in 1137. From this period, the cathedral is not known to have been furnifhed with many books until the private collection, confifting of upwards of 3000 volumes, of archbifhop Matthew, was beftowed on it by his relict in the beginning of the 17th century. By various fubfequent bequefts, prefents, and purchafes, a large collection of valuable books and manufcripts has been formed, and placed in what was formerly the chapel of the archiepifcopal palace, on the north fide of the cathedral. This building has been lately repaired in a ftyle fuitable to that of the church, and commodioufly adapted to its prefent deftination. Connected by a fhort paffage or veftibule with the N.E. angle of the tranfept of the cathedral is the chapter-houfe, an octagon room, 63 feet in diameter, and nearly 68 in height. This building differs from many others of the fame kind, in having no central pillar to fupport the roof: but the preffure of the arched roof upon the walls is effectually counteracted by buttreffes at each external angle. From the fimilarity of the ftyle of building with that of the nave of the cathedral, founded in 1291, the chapter-houfe is fuppofed to have been erected about that time. The buildings belonging to the cathedral were formerly feparated from the city by walls; and fome remains of the gates of communication may ftill be difcovered. Of thofe buildings, the principal was the archiepifcopal palace, fituated on the north of the church. It was erected by the firft Norman prelate appointed in 1070; but after a lapfe of about 500 years, the great hall was taken down by the Proteftant archbifhop Young, for the fake, it is faid, of the lead on the roof. Since that time other parts of the palace have been leafed out. In former times to the fee of York belonged various places of refidence; but now that of Bifhopthorpe alone is occupied. This is agreeably fituated on the fide of the river Oufe, about three miles fouth-weft from the city. It was purchafed and appropriated to the fee by archbifhop Walter de Grey, in the early part of the 13th century; fince whofe time it has undergone many important alterations and improvements. The principal front and the veftibule are in the pointed ftyle of architecture, and in the interior are feveral fpacious and elegant apartments, befides the chapel and library. In the minfter-yard ftill remains the refidence of the dean of the cathedral, a fpacious and convenient edifice of refpectable appearance.

Of the parifh-churches in York, that of St. Margaret in the fouth-eaft quarter of the city is remarkable for the porch attached to it, but which is of much higher antiquity than any other part of the edifice. It was removed from the church of St. Nicholas, formerly fituated without Walmgate-bar, but ruined during the fiege of York in 1644. The arch of the porch is femicircular, and exhibits alternately the figns of the zodiac and the emblems of the months. The churches of St. Denys and St. Lawrence have alfo an appearance of confiderable antiquity. Next to the cathedral, the church of St. Michael-le-Belfrey is the largeft and the moft regular in the city, fupported by light pillars and pointed arches. The prefent building was erected on the removal of the former in 1535. The church of All Saints, on the pavement, is diftinguifhed by its open octangular turret, erected on a fquare tower, in which, according to tradition, a large lamp was fufpended in the night, to guide travellers over the broad foreft of Galtres, which extended on the north and eaft of the city. York contains places of meeting for various claffes of diffenters from the eftablifhed church; that for the Society of Friends, lately erected, is large and commodious. A handfome chapel for the ufe of the Roman Catholics was built in 1782.

Of the numerous religious eftablifhments formerly exifting in and near York many veftiges ftill remain. Of thefe,

 the

the principal was St. Mary's abbey, fituated on the bank of the river Oufe, on the outfide of the city wall. The foundation of the monaftery is of uncertain date; but the church, of which fome confiderable ruins ftill remain, was rebuilt in 1270. Having fallen to decay after the general fuppreffion of religious houfes, Henry VIII. ordered a palace to be erected out of the ruins, for the refidence of the lord-prefident of the north of England, to be defignated the 'king's manor.' This was enlarged by James I. Previoufly to the Revolution it became an object of popular outrage: but fome years afterwards the king's Mint was eftablifhed in it, and much gold and filver, diftinguifhed by the initial letter Y, was ftruck there for William III. The fcite of the abbey and the manor have long been leafed from the crown by lord Grantham and his predeceffors. Connected with the religious fyftem of former times, it may be noticed, that adjoining to the walls of York, immediately without Micklegate-bar on the London road, is an eftablifhment called the Nunnery. The building was originally acquired in 1686, as a place of education and living for young ladies of Roman Catholic families. The eftablifhment at prefent confifts of the fuperior and twenty affiftants, who wear the drefs and conform to the regulations of nuns in Catholic countries, with twelve lay-fifters, and a chaplain. From fixty to feventy boarders are ufually accommodated in the inftitution.

The Guild-hall and the Manfion-houfe are fituated near the river Oufe, in the north-weft quarter of the city. The hall, built in 1446, is a noble room, ninety-fix feet long, forty-five broad, and twenty-nine feet fix inches high. In it are held the law-courts and the courts of municipal juftice. The Manfion-houfe was erected in 1725, and contains every neceffary accommodation for the lord-mayor. In the fame quarter of the city are the affembly-rooms, the theatre, the fubfcription library, the principal hotels, &c. As a fortrefs, York caftle has long ceafed to be of importance: it is now occupied by feveral ftructures. That on the W. fide of the area is the county-hall, rebuilt in 1777, in which the affizes are held, and other county bufinefs is tranfacted. The centre building is the prifon for debtors and criminals: the third building on the E. contains the record-office, and various apartments neceffary for the tranfaction of the bufinefs of the county. Of all thefe buildings it is but juftice to fay, that in their conftruction external elegance and tafte have been properly combined with a due attention to their feveral deftinations. The arrangement and management of the prifons have been frequently the fubject of commendation. The new city-gaol, an extenfive ftone ftructure near the Old Baile, on the weft fide of the river Oufe, and the houfe of correction, are alfo deferving of attention.

The charitable eftablifhments for the poor and the fick in York are very numerous, and well conducted. Among thefe, the county-hofpital and the city-difpenfary are highly commendable. Schools for the education of youth of both fexes are not wanting in York. In 1647 a petition was prefented to the crown from the inhabitants of the city and the county, and from other parts of the north, for the eftablifhment of an univerfity in York: but the unfettled ftate of the affairs of the kingdom then prevented due confideration of the requeft; nor has it fince been renewed; although, for various important reafons, York feems peculiarly adapted for a place of literary and fcientific retirement and ftudy. A feminary or college for the education of minifters and lay-gentlemen among Proteftant diffenters, which formerly fubfifted at Manchefter under the fucceffive care of the Rev. Dr. Barnes and Mr. Walker, and was liberally fupported by voluntary fubfcription, was on the death of the latter profeffor removed to York, where it is conducted with great reputation by the Rev. Meffrs. Wellbeloved, Kenrick, and Turner.

Bridge.—Communication between the original city of York, and the fuburb ftyled Micklegate-bar on the fouth-weft fide of the river Oufe, is maintained by a handfome ftone bridge, which has lately been erected from the defigns and under the direction of Peter Atkinfon, efq. of York. In 1154 the bridge was wood: but in 1268 it was probably of ftone; for then was founded on it St. William's chapel, in atonement for the death of feveral perfons on the fpot in a fray with the people of the town. In 1564 a flood following an intenfe froft fwept away two arches of the bridge, with the houfes built on them.

On the fouth-eaft fide of York, going out by Walmgate-bar, near the village of Heflington, is an eftablifhment for the reception and relief of perfons difordered in mind; which has, for fome time, been the fubject of general approbation. This was called the Retreat, founded by the refpectable Society of Friends, and originally intended for members of their clafs alone. The firft idea of this admirable inftitution was fuggefted in 1791, by the unfortunate death of one of their fociety, at a common receptacle for the infane. In 1794 land was purchafed, and the building commenced, on a commanding eminence. The general arrangement, management, and fyftem of treatment of the unfortunate patients, have been imitated, as the moft perfect of their kind, in various parts of the kingdom and America. See an "Account of the Retreat," 8vo.—Eboracum, or Hiftory and Antiquities of York, by Francis Drake, F.R.S. folio, 1736. Defcription and Hiftory of the City and Cathedral of York, 12mo. 3d ed. 1790. Defcription of York, 12mo. 1816. A Guide to the Cathedral of York, 12mo. 1815, is a rational and judicious vade mecum.

YORK, *Cuftom of.* See RATIONABILI *parte bonorum.*

YORK, in *Geography*, a county of the United States, in the diftrict of Maine, containing 23 towns, and 41,877 inhabitants.

YORK, a diftrict of South Carolina, containing 10,032 inhabitants, including 3164 flaves.

YORK, a county of Pennfylvania, fouth-weft of Sufquehanna. It contains 22 townfhips, and 31,958 inhabitants.

YORK *Borough*, a town of Pennfylvania, in York county, containing 2847 inhabitants.

YORK, a townfhip of Pennfylvania, in York county, containing 1649 inhabitants.

YORK, a county of Virginia, with 5187 inhabitants, including 2931 flaves.

YORK, a town of United America, in the diftrict of Maine, and county of York, containing 3046 inhabitants; 50 miles N.N.E. of Bofton. N. lat. 43° 7′. W. long. 70° 40′.

YORK, a townfhip of Ohio, in the county of Belmont, containing 1349 inhabitants.

YORK, the capital of Upper Canada, fituated on the lake Ontario. It is likely to become a city of great importance, as it poffeffes great facilities for commerce and navigation. It lies in about 43° 35′ N. lat., within an excellent harbour of the fame name, made by a long peninfula, which embraces a bafon of water fufficiently large for containing a confiderable fleet. Veffels may ride fafely at its entrance during the winter. On the extremity of the peninfula, which is called Gibraltar Point, are erected commodious block-houfes and ftores commanding the entrance into the harbour. On the main land oppofite poſite to the Point is the garriſon, ſituated on a point made by the harbour and a ſmall rivulet, which being improved by ſluices, affords an eaſy acceſs for boats to go up to the ſtores. The barracks being built upon a knoll are well ſituated for health, and command a delightful proſpect of the lake to the weſt, and the harbour to the eaſt. The government-houſe has a ſtriking appearance from the lake, and is well calculated for the reſidence of a governor. Its ſituation is commanding, about two miles above the garriſon, being the head of the harbour. The town is increaſing; the ſociety of the place is reſpectable. The public buildings are deſigned for the legiſlative council, houſe of aſſembly, and courts of law. The gaol is in a healthy ſituation. The town is furniſhed with every convenience, and the market is well ſupplied with good beef, mutton, veniſon, fiſh, &c. The wheat ſupply is from Montreal: the land around York is in general ſandy; but bears good crops of every deſcription. The plan of the town is one mile and a half in length: the ſtreets are tolerably uniform; and the river Don empties itſelf into the harbour, a little above the town, running through a marſh, which, when drained, will afford excellent meadows. The country round this place is capable of great improvement, and renders it fit for a ſeat of government. See Boulton's Sketch of Upper Canada, ch. viii.

YORK, a river of Virginia, formed by the union of the North Anna and South Anna, which runs into the Cheſapeak, near its mouth.—Alſo, a river of America, in the diſtrict of Maine, which runs into the ſea, a little below York.

YORK *Bay*, a bay on the ſouth-weſt coaſt of the iſland of St. Vincent; 2 miles N.W. of Kingſtown bay.—Alſo, a bay formed by the union of the Eaſt and Hudſon's rivers below New York. It communicates with the ſea by a channel, called the Narrows.

YORK *Fort*, a fortreſs at the mouth of Nelſon's river, in Hudſon's bay. N. lat. 57° 2′. W. long. 92° 46′.

YORK *Iſland*, a ſmall iſland, near the eaſt coaſt of the iſland of Antigua; about half a mile N.N.E. of Frier's Head.—Alſo, one of the Gallapagos iſlands, in the Pacific ocean.

YORK *Iſlands*, three ſmall iſlands, in the South Pacific ocean, near York Cape, on the north coaſt of New Holland.

YORK *Minſter*, a lofty promontory on the coaſt of Terra del Fuego, ſo called by captain Cook in 1774. It forms the north-weſt point of entrance into Chriſtmas ſound. S. lat. 55° 26′. W. long. 70° 25′.

YORK *Point*, a cape in the ſtraits of Magellan. N. lat. 53° 39′. W. long. 73° 32′.

YORK *River*, a river of America, in the province of Maine, which runs into the Atlantic, N. lat. 43° 7′. W. long. 70° 40′.

YORK *Road*, a road for ſhips in the ſtraits of Magellan, near the coaſt of Patagonia. The only danger of ſailing into the bay, that is formed by two points in this road, ariſes from a reef that runs off to about a cable's length from the weſtern point, which once known may be eaſily avoided. To anchor in this bay, it is ſafeſt to bring York Point E.S.E.; Bachelor's river N. by W. half W.; the weſt point of the bay or reef N.W. half W.; and St. Jerom's ſound W.N.W. at the diſtance of half a mile from the ſhore. There is good watering about a mile up Bachelor's river, and good wooding all round the bay, where the landing alſo is, in all parts, very good. There is plenty of celery, cranberries, muſcles, and limpets, many wild-fowl, and ſome fiſh, but not enough to ſupply a ſhip's company with a freſh meal. S. lat. 53° 39′. W. long. 73° 52′.

YORK, *New*, one of the United States of America, ſituated, according to the ſtatement of Meliſh, between 40° 33′ and 45° N. lat., and 3° 43′ E. and 2° 43′ W. long. from Waſhington; extending from N. to S. 198 miles, and from E. to W. 256; and comprehending an area of 46,000 ſquare miles, or 28,440,000 acres. This ſtate is bounded on the N. by lake Ontario and Canada; on the S. by Pennſylvania, New Jerſey, and the Atlantic ocean; on the E. by Vermont, Maſſachuſetts, and Connecticut; and on the W. by Upper Canada, lake Erie, Pennſylvania, and New Jerſey. This territory, according to Spafford's "Gazetteer of New York," compriſes an area of 46,085½ ſquare miles, equal to 29,494,720 acres; but this computation includes all the inland rivers and lakes, one half of lake Champlain, and the St. Lawrence; excluding only all the waters below New York iſland, and that part of the lakes Ontario and Erie which belong to this ſtate. This ſtatement gives 20.8 perſons to a ſquare mile. New York is at preſent divided into 45 counties, and 452 townſhips, including four incorporated cities; *viz.* New York, Albany, Hudſon, and Schenectady, as exhibited in the following

Topographical Table.

* Laid out ſince the cenſus was taken.

Putnam county was erected in June 1812, from the S. end of Ducheſs county, and is formed of the towns of Philips or Philipſtown, Carmel, Frederick, Patterſon, and South-Eaſt. Courts are held in the Baptiſt meeting-houſe in the town of Carmel, and this county ſends one member to the houſe of aſſembly. The towns are, Carmel the chief, including, in 1810, 2020 inhabitants, the electors being 153; Frederick, with 1811 inhabitants, and 98 electors; Patterſon, with a population of 1446, and 110 electors; Philips, with 3129 perſons, and 165 electors; and South-Eaſt, in which the population is 1887, and the number of electors 161.

Warren county was erected from the N.W. extremity of Waſhington, March 12, 1813. It compriſes the towns of Bolton, Caldwell, Cheſter, Hague, Johnſburgh, Luzerne, Queenſbury, and Thurman, the laſt of which is divided into two towns, called Athol and Warrenburgh. The chief town is Caldwell, with a population of 560 perſons, and 60 electors; Athol has 443 inhabitants, and its electors are 20; Bolton has 726, and 30 electors; Cheſter 937, and 120 electors; Hague 398, and 21 electors; Johnſburgh 651, and 82 electors; Luzerne 1015, and 85 electors; Queenſbury 1948, and 197 electors; and Warrenburgh 887, with 41 electors.

The face of this ſtate exhibits a great variety. To the S.E. its ſurface is agreeably uneven; in the middle, mountainous; to the N.W. undulating; flat towards the lakes; and hilly towards the ſouthern extremity.

Of the *mountains* in this ſtate, the chain called Katſkill, or Catſkill, is the largeſt and moſt extenſive, and this preſents a bifurcation of the Apallachian ridge, which at the Highlands occupy a tract of about 16 miles in width, lying obliquely acroſs the Hudſon, and penetrated by that river. Theſe ridges preſerving their general direction ſtretch acroſs Ducheſs county, the eaſtern parts of Columbia and Renſſelaer counties, and exhibit ſome lofty ſummits. The Tauconick mountains are lofty and very rugged, and Hooſack and Williamſtown are mountains which deſerve the appellation. But the Catſberg or Catſkill mountains preſent ſome ſummits that are higher than any others of the Apallachian chain, if we except the White-hills in New Hampſhire. At the Highlands, the ſummit of Butter-hill is 1432 feet above the level of the river; that called the Crow's-neſt 1330; Bell-hill 1391. About 60 miles N., the Round-top is elevated 3655 feet above the level of the river; the High-peak 3487. Theſe ſummits are in Windham, Greene county, about 20 miles W. of Hudſon, and in full view from that city. A turnpike-road which croſſes this range of mountains near thoſe ſummits, winds up till it reaches the aſtoniſhing altitude of 2274 feet. Upon this ſpot the view is inexpreſſibly grand. The general altitude of the Catſkill mountains may be eſtimated at about 2000 to 3000 feet acroſs Greene county. From Greene they paſs into Schoharie county with ridges leſs rugged; and towards the ſouthern part, their continuity is leſs diſtinctly defined. Until after forming the falls of the Mohawk, this range traverſes Herkimer county, forming a rugged tract, and diminiſhing in altitude till they croſs the St. Lawrence into Canada, at the Thouſand iſlands. Theſe mountains have obtained from the early Dutch inhabitants the name of Helderberg, or clear mountain, preſenting, inſtead of lofty ſummits of granitic and ſchiſtic mountains, an elevated plain of conſiderable and very uniform altitudes. Around lake George, and to the W. of lake Champlain, we find the Peruvian mountains, which furniſh the northern ſources of the Hudſon, and form the height of land that ſeparates the waters of the Hudſon and St. Lawrence. The higheſt of theſe is probably that called White-face, which commands a view of Montreal, at the diſtance of near 80 miles. The altitude of this ſummit is little ſhort of 3000 feet from the level of lake Champlain. Theſe mountains obtained the name of Peru from the French inhabitants, in alluſion to their ſuppoſed mineral treaſures. With ſome few exceptions, the whole country S. of the Highlands is underlaid by rocks of granite, with ſuperſtrata of other rocks, which appear in the elevated tracts. There are ſome tracts of lime-ſtone and ſome of ſand-ſtone, but theſe are ſo inconſiderable in extent as to furniſh no objection againſt denominating this the granitic region. Some ranges of hills on the W. of the Hudſon, compoſed of ſand-ſtone, are underlaid by granite; and the Catſkill mountains are a maſs of ſand-ſtone, ſimilar to the Alleghany mountains in Pennſylvania, intermixed with lime; the Helderberg, with ſome particles of ſand-ſtone, occaſionally interſperſed. N. and E. of the Highlands the rocks are chiefly ſchiſtic that form the ſubſtratum, while calcareous ridges of great extent occupy the ſurface. The hills on the eaſtern border of Columbia and Renſſellaer counties are formed chiefly of fragile ſchiſtus, intermixed with quartz, and occaſional ſuperſtrata of lime-ſtone. On the eaſtern declivities of theſe hills limeſtone predominates, forming the marble quarries of Stockbridge, Laneſborough, &c. in Maſſachuſetts. The northweſtern continuation of the Catſberg or Catſkill preſents a kind of calcareous granite, in which the abſence of the felſpar is ſupplied by primitive lime-ſtone. The Peruvian mountains are principally granitic, though ridges of limeſtone, ſlate, flint, and ſand-ſtone, appear in conglomerate maſſes, and theſe are moſt abundant in mineral treaſures. The whole level county of the ſmall weſtern lakes is calcareous. The Tauconick hills that border the ſouth-eaſtern part of Columbia county are granitic.

The *rivers* of this ſtate are numerous and extenſive; and ſo are its *lakes* and *creeks*. The Hudſon and the Mohawk are the moſt conſiderable rivers, to which we may add the Sacandaga, a branch of the Hudſon and Scroon rivers, connected with Scroon and Brant lakes. The creeks of the Hudſon and Mohawk are numerous. The Suſquehanna riſes in this ſtate; and its weſtern branch, the Tioga, is a river of ſome note, and claims diſtinction from ſeveral creeks belonging to the former river. The Delaware, which receives ſeveral rivers and creeks, forms a part of the weſtern boundary of New York; and the Alleghany, a principal branch of the Ohio, has its origin in this ſtate, and its creeks, large and ſmall, are too numerous for our recital. The Chatauqua lake diſcharges itſelf into Connewongo creek. The Cataraugus and Buffalo creeks run into lake Erie; Tonewanda and Ellicott's creeks into Niagara river, forming a part of the weſtern boundary of the ſtate. Lake Ontario, half of which is in this ſtate, receives the Geneſee, the Oſwego, and Black rivers, which convey into this lake the

the waters of feveral other rivers and creeks. The St. Lawrence wafhes more than 100 miles of the north-weftern boundary, and it receives a number of rivers and creeks. Half of lake Champlain alfo belongs to this ftate, and it is fupplied by feveral ftreams. Eaft river alfo belongs to this ftate.

The *climate* and *feafons* muft in fuch an extent of country be very various, fo that it is difficult to accommodate any general obfervation to the whole ftate. In the eaftern territory, or wholly S. of the Highlands, where the prevailing winds are foutherly through the warm feafons, the weather is very variable; and the changes of temperature, governed by the winds, frequent and fudden. In the northern part of the ftate, the weather is lefs variable; but the winters are long and fevere, with a clear and fettled fky. This region, extending from the fouthern extremity of lake George, and weftward to near lake Ontario and the St. Lawrence, may be diftinguifhed as the region of the "northern climate." That of the "weftern climate" comprifes the great weftern territory of this ftate, extending from the Catfberg or Catfkill mountains to the great lake. Here fouth-wefterly winds prevail in a confiderable proportion throughout the year. A gentle current of air, that may be traced from the gulf of Mexico, and reaching to a diftance of more than 1000 miles, prevails almoft conftantly from the S.W.; and northerly and eafterly winds are almoft wholly unknown. In this diftrict, the average temperatures are about three degrees higher than in fimilar latitudes in the eaftern climate. Such is the general character of the weftern climate of the United States, and the diftinction is faid to terminate, or nearly fo, with the region about lake Ontario. The weftern climate of this ftate is therefore warmer than the eaftern by about 3° of Fahrenheit; and this is attributed to the greater prevalence of warmer currents of air from the S.W. In the region about Albany, the rigours of winter commence about the 20th of December, and end with February, or about the 10th of March, when the ice ufually breaks up in the Hudfon. From the middle of March to the end of April, the weather is very variable; the changes of temperature great and fudden, though it be generally rainy, with long-continued ftorms of eafterly winds. May is alfo a variable month; June affumes a fummer character; in July, foutherly winds are diminifhed, and drought prevails; Auguft is more fhowery, and more uniformly temperate, than any month of the year, and affording health and plenty. The former part of September refembles Auguft, and terminating with mild and pleafant weather. October is an agreeable month; early frofts occur about the 26th of September, though corn ripens till the middle of October; and from the 15th to the 25th of this month the foliage of the foreft-trees is deftroyed, and early falls of fnow commence about this time. December is ufually cold and fhowery, and ftorms from the N. and E. are frequent, and of long continuance. It is obferved, that a general modification of temperature, favourable to agricultural interefts, has occurred within the laft 10 or 15 years.

This ftate affords facilities for *inland navigation* fuperior to any other, combining both the objects and the means of intercourfe. The connections of the rivers Hudfon, Mohawk, Ofwego, Delaware, Ohio, Sufquehanna, Alleghany, Miffiffippi, and St. Lawrence, by creeks and ftreams, and canals with the lakes Oneida, Erie, George, Champlain, Ontario, &c. are peculiarly favourable to internal navigation and commerce. The canal at Rome, which connects the waters of the Mohawk and lake Ontario, and which was completed in 1797, deferves particular mention; and it fhould be noticed to the honour of this ftate, that the weftern inland lock navigation company is formed for the direct purpofe of improving the navigation of the weftern waters; and that the project of a great weftern canal for connecting lake Erie and the Hudfon by a boat navigation is a very important object.

The ftate of New York has few *bays*, exclufively of thofe of Long ifland, which are very numerous. It has many iflands, among which Naffau, or Long ifland, claims the firft place, as it affords more than 100 miles of fea-coaft, many excellent harbours, and many advantages for commerce. Its bays are both numerous and large, and it has immediately dependent upon it many fubordinate iflands. The iflands in the bay of New York, as well as that upon which New York itfelf is fituated, and Staten ifland, and thofe belonging to the Hudfon, Mohawk, Niagara, and St. Lawrence rivers, to lake Ontario, Champlain, George, &c. might be enumerated if our limits would allow. In this connection we might alfo mention a variety of bridges that ferve to facilitate communication and intercourfe between the various parts of this ftate.

The *foil* and *agriculture* of New York deferve our particular attention. The foil is of various characters in different parts of the ftate. In fome diftricts it is deep and warm, and well adapted to grain or grafs; in other parts it is of a loofer texture, and is found in various proportions by the admixture of vegetable remains; forming a thick vegetable mould, with a fmall proportion of earth, and called by the farmers in that country "black muck." This is foon exhaufted, and as it refts on a fubftratum, called "hard-pan" by the farmers, that is cold and ftony, it is incapable of being reftored or reclaimed by any manure or art of hufbandry. The weft end of Long ifland is rich, fertile, and highly cultivated; but the eaftern part has a large proportion of fandy barren plains. Below the Highlands, the foil is principally dry and warm, having a gravelly or fandy fubftratum, or granitic rock. North of the Highlands to the Mohawk, the foil is dry and warm, being either a gravelly or fandy loam in general; and both thofe which we have mentioned are ftated to be a medium foil. But on the eaftern border of the ftate, the rocks are principally fchiftic, and a fchiftic gravel forms moft of the foil, which is warm and productive, though not deep. The alluvial flats of Columbia and fome part of Renffelaer counties are very extenfive and rich; and the valleys, prefenting a warm gravelly foil, are alfo extenfive, and furnifh much good medium foil. Weft of Albany are extenfive fandy plains, interfperfed with marfhes, and rather cold and wet till we approach the Helderberg hills. This plain is generally underlaid by clay; but the Helderberg hills are calcareous, and prefent a better foil, though broken and much diverfified.

The agricultural products of this divifion of the whole territory of the ftate confifts of all the various productions of this country. The weft part of Long ifland, and the counties of Weft Chefter and Duchefs, are well cultivated. The latter is one of the beft farming counties in the ftate. The introduction of gypfum as a manure has marked a new era in the agriculture and rural economy of this region. The weft fide of the Hudfon is confiderably behind the eaftern. The fouthern part of Wafhington county has a warm gravelly medium foil, and abundant crops. Saratoga has much good but more wafte land. Its general character is more fandy; and, like that of Albany, refts on clay. Around lake Champlain there is a large extent of clayey foil, extending to the hills that fkirt the Peru mountains. With the exception of the alluvial flats, which are extenfive and rich, the foil of the country of the Mohawk may be generally

generally denominated a ſtiff loam, till we go weſt of the Catſkill hills at the Little Falls. Here it aſſumes a new character. The ſoil of the mountainous tract of the weſtern region is much diverſified: the hills are rocky; the valleys deep and narrow, or ſpacious and rich. This tract furniſhes conſiderable black muck, or deep vegetable mould, in the valleys. A very large proportion of the ſoil of this country may be denominated a rich mould, variouſly intermixed with earth of different kinds; and much of the ſoil is well adapted for grain and graſs. No part of the ſtate is more rapidly advancing in agricultural improvements than this weſtern region. The ſoil of the level country eaſt of lake Ontario, and along the St. Lawrence, is a warm ſandy loam, with a large proportion of the firſt rate of medium for agriculture.

The rotation of crops lately introduced into this country marks a new era in its agriculture. We ſhall cloſe this detail with remarking, that the exertions of the agricultural ſociety of this ſtate have been very beneficial, though its publications need more general circulation.

The *botanical productions* of this ſtate are numerous and various. Its foreſt-trees are luxuriant. The region of the weſtern climate is principally wooded with deciduous trees, and of the loftieſt growth. Thoſe of the eaſtern or Atlantic climate are generally deciduous, but leſs lofty. The moſt common foreſt-trees are, oak, maple, beech, walnut, butternut, cheſnut, birch, tilia or baſs-wood, poplar, cherry, ſycamore or button-wood, aſh, elm, ſaſſafras, hornbeam, ſumach, elder, pine, ſpruce, larch, fir, hemlock, cedar, and in ſome parts, locuſt laurel, mulberry, black-walnut, cucumber-tree, crab-apple, and common thorn, of many varieties. The ſtate of New York is eſſentially agricultural. Wheat is the firſt object of the farmers; and they alſo cultivate rye, maize, oats, flax, hemp, peas, beans, &c. and moſt of the domeſtic graſſes are cultivated with ſucceſs. Fruits are abundant and various; ſuch as apples, affording cyder of the beſt quality, peaches, pears, plums, cherries, &c. The garden-fruits are as various as thoſe of any ſtate in the Union.

The *domeſtic zoology* of the ſtate preſents the horſe, the cow kind, the merino and other kinds of ſheep, which furniſh good wool, and ſwine. The wild animals, not to mention the mammoth, the mooſe, and the biſon, now extinct in this ſtate, are, the deer, bear, wolf, and fox; and more rarely, the otter, the wolverene, the wild-cat, racoon, martin, the weaſel, hare and rabbit, ſquirrel and mouſe, &c. The lakes and rivers ſupply abundance of fiſh, ſuch as the ſalmon-trout, trout, ſturgeon, chad, herring, pike, and many others. The oyſters are in high repute. The number of birds ſtationary and migrating is very great. Serpents are found in ſmall numbers, and the rattle-ſnake does not frequently occur; other ſnakes are numerous. It is needleſs to mention the inſects, of which the number and variety are conſiderable.

The *mineralogy* comprehends iron-ore, ſalt, gypſum, limeſtone, marble, ſlate, native brimſtone, coal, ores of lead, copper, zinc, tin, aſbeſtos, mill-ſtones, marle and peat, clays, alum, ſwine-ſtone, &c. Calcareous petrifactions are very common in the calcareous regions. Siliceous ſand for the manufacture of glaſs, plumbago, a variety of ochres, mica, iſinglaſs, magneſian ſtones, amianthus, black flints for muſkets, molybdena, iron and copper pyrites, emery, magnetic ores of iron, ores of zinc, ores containing ſilver and antimony, and rock cryſtals, are ſeverally found in various parts of this ſtate. Its mineral waters are held in high eſtimation.

The *conſtitution* of this ſtate was adopted by a convention of delegates April 20, 1777, and reviſed in 1801; and its character is republican. The conſtitution of the United States was acceded to in this ſtate in 1788. The ſupreme executive power is veſted in a governor and lieutenant-governor, elected every three years by free-holders poſſeſſing a clear eſtate of 250 dollars; as are the ſenators alſo. The ſupreme legiſlative powers are veſted in a ſenate and houſe of aſſembly, which meet at leaſt once in each year. The ſenators are elected for four years; the members, or repreſentatives, as they are called, who compoſe the houſe of aſſembly, are elected annually. The number of ſenators is limited to thirty-two; that of members is not to exceed 150. For the convenience of electing ſenators, the ſtate is divided into four great diſtricts: the ſouthern, which elects five ſenators, and comprehends ſix counties; the middle, eight; the eaſtern, nine; and the weſtern, twenty-two. The general election is held annually. A cenſus of the electors is taken every ſeven years, and the repreſentation apportioned according to the numbers in the reſpective counties, increaſing the number of repreſentatives each year by the addition of two, until they amount to 150. The ſenators are divided into four claſſes, elected at different periods, ſo that ſome new ſenators are choſen annually. The governor is commander-in-chief of the militia, and admiral of the navy, of this ſtate: he has power to convene the legiſlature; to grant pardons and reprieves for crimes, except treaſon and murder; and can ſuſpend the execution of ſentences in thoſe caſes till the ſitting of the legiſlature, which alone has a right to pardon. A council of reviſion conſiſts of the governor, the chancellor, the judges of the ſupreme court, or any two of them, whoſe duty it is to reviſe all bills about to be paſſed into laws; and if they object in writing to a bill, a re-conſideration takes place, and the ſame muſt be amended or approved by two-thirds of both houſes before it can then become a law: and this is the negative of the executive power. If the council neglect to return a bill, in ten days it becomes a law, unleſs the legiſlature has previouſly adjourned. A council of appointment conſiſts of the governor, and a ſenator from each of the four great diſtricts, choſen annually by the legiſlature. In this council, the governor preſides, with only a caſting vote. The right to nominate is veſted concurrently in the governor and the other members of the council. The liſt of officers annually appointed by this council is enormous, and conſiſts of moſt of the ſubordinate officers of the ſtate.

The chancellor holds courts of equity, and appoints the officers of his court. The ſupreme court is a court of law. It conſiſts of a chief-juſtice and four aſſociate judges. County courts conſiſt of a firſt judge and a number of aſſociate juſtices. Circuit courts are held in the reſpective counties by a judge or juſtice of the ſupreme court, and the judge and juſtices of the county. Juſtices of the peace have cognizance of trials for the recovery of debts to the value of twenty-five dollars; and in New York to the value of fifty dollars. The right of habeas corpus is preſerved, and the trial by jury.

The great officers of ſtate are, the governor, lieutenant-governor, a ſecretary of ſtate, comptroller, treaſurer, ſurveyor-general, attorney-general, council of appointment, commiſſioners of the land-office, the regents of the univerſity, &c. for the department of ſtate.

Judiciary officers of ſtate, a chancellor, five judges of the ſupreme court, and a judge of probates.

For the general convenience and the better adminiſtration of juſtice, the whole territory of this ſtate is ſubdivided into counties, and theſe into towns.

From the report of the comptroller to the legiſlature of this ſtate in 1811, the productive funds of this ſtate, inveſted vefted in ftock of banks, United States ftock, &c. fecurities on lands, &c. &c. amounted to 4,191,803 dollars 25 cents, producing an annual revenue of 278,489 doll. 96 cents. To this amount of funds fhould be added the fchool fund, amounting to 483,326 doll. 29 cents, producing an annual income of 36,427 doll. 64 cents. The ftate alfo owns about 1,000,000 acres of land, which, valued at two dollars *per acre*, amount to 6,675,129 doll. 54 cents. The expences of government for the year 1811 amounted to 268,366 doll. 22 cents. This eftimate draws an excefs of revenue amounting to 10,123 doll. 74 cents, and including the balance in the treafury, Feb. 16, 1811, of ready funds, to the amount of 34,129 doll. 86 cents.

The *militia* of this ftate confifts of every able-bodied male inhabitant between eighteen and forty-five years of age; and the laws have made an honourable exception in favour of thofe whofe religious opinions are averfe to war. Agreeably to the annual return of the adjutant-general for 1809, the enrolled infantry amounted to 95,324; the artillery, 3102; the cavalry, 3642; giving a total of 102,068.

The conftitution provides for the free exercife of religion in this ftate in the following terms: "And whereas we are required by the benevolent principles of rational liberty not only to expel civil tyranny, but alfo to guard againft that fpiritual oppreffion and intolerance, wherewith the bigotry and ambition of weak and wicked priefts and princes have fcourged mankind: This convention doth further, in the name and by the authority of the good people of this ftate, ordain, determine, and declare, that the free exercife and enjoyment of religious profeffion and worfhip, without difcrimination or preference, fhall for ever hereafter be allowed within this ftate to all mankind. Provided, that the liberty of confcience hereby granted fhall not be fo conftrued as to excufe acts of licentioufnefs, or juftify practices inconfiftent with the peace or fafety of this ftate. That no minifter of the gofpel, or prieft of any denomination, fhall ever hold any civil or military office or place within this ftate." In April, 1804, a law was paffed authorizing all religious denominations to appoint truftees, for the purpofe of fuperintending the temporal concerns of their refpective congregations. And thefe truftees become a body corporate by that general act, capable of all legal tranfactions in behalf of the congregation.

All denominations, therefore, are left at liberty to fupport their own miniftry, and maintain the order of their worfhip, in fuch way as is moft agreeable; and every congregation may defignate from three to nine of its members as truftees, who are, with little trouble, invefted with corporate powers in behalf of the whole, and authorized to hold eftates producing an annual revenue of 3000 dollars. This free toleration has not produced more fects in this than in other ftates lefs tolerant of religious opinions. There are many fects however; and in the enumeration of thofe, no regard is paid to comparative numbers. There are, Englifh Prefbyterians, Dutch Reformed, Congregationalifts, Epifcopalians, Quakers, Baptifts, Methodifts, German Lutherans, Moravians, Roman Catholics, Shakers, Jews, and a few of the Univerfal Friends, or the followers of Jemima Wilkinfon, Scotch Cameronians, Anabaptifts; and Chriftian charity would include fome Indians, befide thofe who profefs Chriftianity. But it is worthy of remark, that many of the above fectarian diftinctions exift merely in name, while their tenets differ lefs, perhaps, than thofe of the fame religious fociety, in the individual opinions.

The *manners* and *cuftoms* of this ftate have undergone a confiderable variation during the period that has elapfed from its firft fettlement to the prefent day. Among thofe who planted the colony of New York, and who for many years afterwards fettled in it, a large proportion confifted of Dutch families, who migrated hither from the Dutch Netherlands, and transferred to the focieties which they eftablifhed here, the rural economy of the population of the Netherlands, of Holland, and of the banks of the Rhine. Soon after their arrival, various parts of this ftate prefented buildings refembling thofe of their native country, and habits of neatnefs, order, induftry, and frugality, which they had practifed from their youth. After the conqueft of the Englifh in 1664, multitudes flocked hither from various nations of Europe, and produced a confiderable change in the original and difcriminating character and cuftoms of this colony. In 1685 it had a numerous acceffion of French Proteftants. In 1710 it was augmented by about one hundred families of poor Palatines from Germany; fixty or feventy of which fettled Germantown on the eaft bank of the Hudfon, and fome at Efopus, now Kingfton. Other early German emigrants fettled on the Mohawk, in Orange county, on Long ifland, and in many other parts where their defcendants are now found. The early Englifh fettled principally at New York and in Long ifland. The French, at New Rochelle, in Weft Chefter county, and on Staten ifland. The Scotch fixed themfelves, during the more early periods, about Albany, and in Wafhington county. Maffachufetts fupplied alfo the eaft part of Long ifland with inhabitants, whofe pofterity form a large fhare of the prefent population. But the Dutch were the original proprietors and firft colonifts, and therefore their poffeffions were the greateft and the moft valuable: nor did they, or the Germans, next to them in number and importance, altogether abandon their difcriminating manners and habits. The Revolution, however, produced a material change in this ftate, and the change, though effected by fanguinary conflicts, was not unfavourable to its general character. The profperity that fucceeded the peace widely diffufed a fpirit of enterprife and of emigration; and was followed by a furprifing increafe of population and wealth. Hence arofe thofe various traits of national character, and thofe diverfified habits, manners, and cuftoms, which have diftinguifhed this ftate. It is obferved, that the new character imparted by the influx of emigrants is beneficial to the ftate; more efpecially as the New England people have introduced their improved agriculture, their fpirit of enterprife, their ingenuity in the arts, and their focial habits. In this ftate, it is faid, there are about 100,000 freeholders; and freehold eftates are known to produce for their proprietors from 30,000 down to 50 dollars *per annum;* and this fact is alleged as forming a peculiar feature of the civil habits, manners, and cuftoms of the population of this ftate.

The Englifh *language* is chiefly prevalent in this ftate; though the Dutch and German are in ufe among people of Dutch and German defcent: but thefe and other dialects are declining, in confequence of the intercourfe and influence of a large majority of thofe who fpeak Englifh. Some few inftances, however, occur, in which public worfhip is performed in the Dutch, German, and Welfh dialects.

The tafte for *literature* and *fcience* is gradually increafing, and is promoted by a variety of publications; and by the progreffive improvement of fchool education, for which a liberal fund is provided, which has been already mentioned. We are informed by the writer of communications, of which we avail ourfelves in the compilation of this article, that there are about a hundred printing eftablifhments in this ftate, and fixty-nine gazettes, befides a very confiderable number of other public journals, which contribute to diffufe various kinds of knowledge. The advancement of literature is promoted by an an institution established in 1787, intitled "Regents of the University of the State of New York;" being a society of twenty-one gentlemen, possessing adequate powers derived from the legislature for superintending colleges, academies, and schools. The university of New York is acquiring distinction, and the Columbia college claims high reputation. See COLLEGE.

In this state there are fifteen banking companies, with a very considerable sum of capital stock, which is said to have amounted in 1811 to 12,380,000 dollars; and 11 incorporated assurance companies. The manufactures of this state, consisting of woollen, linen, and cotton cloths, leather, paper, hats, iron, &c. are in an improving condition, and are said to have amounted, in 1811, to 30,000,000 dollars, of which 12,000,000 were produced by household industry and enterprise. If we judge of the *commerce* of this state by the returns of 1810, it must appear to be very considerable. The domestic exports of that year amounted to 10,928.573 dollars, and the foreign to 6,313,757, making a total of 17,242,330 dollars; and it is said that the port of New York yields about one-fourth of the revenue of the United States, arising from commerce. The exports, exclusive of articles from foreign countries, consist principally of beef, tallow, pork, hams, lard, wheat, maize, rye, butter, cheese, pot and pearl ashes, flax-seed, peas, beans, horses, cattle, lumber, flour and meal, bread and biscuit. The foreign exports are composed of important articles. Wheat, which is the national staple, is exported annually to a very great amount; and about 6,000,000 of bushels on an average, after deducting the supplies for the country, are sent to market from the surplus product of this state. The average annual payments into the treasury of the United States, for duties on imports, tonnage, &c. exceed 4,000,000 of dollars from the district of New York.

The Societies for promoting Agriculture and the Arts in this state are numerous. It has also several *Medical Societies;* an *Historical Society;* and also an *Academy of Arts* lately established at New York. *Bible* and *Missionary Societies* are instituted in New York, Albany, and some other counties; and the *Charitable* and *Humane Societies* abound. In the city of New York alone there are about forty benevolent institutions; and there are societies of the same kind, as well as those of a literary nature, in Albany, Hudson, Schenectady, Troy, Poughkeepsie, Kingston, Newburgh, Utica, and most of the large towns.

The *State-Prison*, or *Penitentiary*, is about two miles from the city-hall, in the city of New York, on the E. bank of the Hudson: it was built in 1796-7, and together with its buildings and courts comprises four acres of ground. The immediate government of the prison is committed to seven inspectors. The convicts are all dressed in uniform, the sexes kept separate, and all are comfortably clothed and fed. Great care is taken of their morals, in the benevolent hope of a reformation.

The *Natural Curiosities* of this state comprehend the cataracts or falls of Niagara, of the Mohawk, of the Hudson, of West Canada creek, of Black river, Seneca river, Genesee river, and some others of less note. It is probable, that the southern and western parts of this state were occupied by a considerable proportion of Indians at a remote period. So long ago as the year 1535, the country about the lake Onondaga was considered as a favourite situation by the wandering tribes: but their condition was not much known till about the year 1635. At that time, the Iroquoise, or Five Nations, occupied the countries from lake Erie to Ontario, the St. Lawrence, around lake Champlain, and the whole of that watered by the Hudson down to the Highlands, were very numerous and warlike. Such was their ascendancy, that the Indians of the lower country of the Hudson, on the Connecticut, the Delaware, and Susquehanna rivers, were in a kind of subjection to them. Onondaga was the principal settlement, and the seat of Indian power. Their combination consisted of Onondagas, Oneidas, Mohawks, Cayugas, and Senecas; and it was then so powerful as to be able to send several thousand warriors on distant expeditions. The first Christian colonists, availing themselves of Indian wars, which they promoted, taught the Indians to despise and abhor those for their hypocrisy and perfidy whom they had first considered as beings of a superior order; and thus originated the implacable enmities which not only continued but increased when the French and British became rival nations. About the year 1690, the English erected a strong fort at Onondaga; and in 1696, the French sent a considerable force against the Indian settlement, and succeeded in destroying it. From this time, colonies of each of these nations were planted there at different periods. But we forbear, to pursue their history, and to trace the sanguinary conflicts that served mutually to irritate and incense Indians and professed Christians. At this time, the principal settlements of the Indians are at Oneida and Onondaga, on the Genesee and Alleghany rivers, Buffalo creek, and Tuscarora, besides other places which we have not room to enumerate in detail. But we must hasten to finish this sketch of the New York state by a brief abstract of its *history*.

Soon after the discovery of America, towards the commencement of the 16th century, the present state of New York was possessed by the Iroquoise, and Canada by the Algonquins, two rival nations of Indians. About the year 1608, the French planted colonies in Canada, which they had laid claim to from having first sailed up the St. Lawrence as far as the present Montreal. In 1609 Champlain, the founder, discovered lakes Champlain and George, when he defeated a small party of the Iroquoise. In 1608 Hudson, an Englishman, discovered the East and North rivers, ascending up the latter as far as the present Albany; and soon after he sold his right to the Dutch. In 1614 the States General of Holland erected a fort at Albany, and granted an exclusive trade on Hudson river to the Dutch West India company; and in 1629, Wouter van Twiller, the first governor, arrived, and took the command of New Netherland, as it was then called. The English, who still laid claim to this country, objected to the sale of Hudson; and in 1663-4, the English king granted the whole to his brother James, duke of York and Albany, afterwards James II. A small armament subdued the colony for England, which then took the name of New York, as did the city also. In 1673 New York was conquered by the Dutch, but restored in 1673-4. The duke's grant was confirmed, and the colony assigned to the English by treaty; and this right they held till the Revolution. From the surrender of the province in 1664 to 1683, the duke of York possessed full sovereignty. He appointed the governor and the council, who made rules and orders that were acknowledged as laws. These were called the duke's laws; they were collected and arranged about 1674, and a copy of them is deposited among the records of the state. Those, it is said, which were made in 1683, and after the duke's accession to the throne of England, when the people were admitted to a participation of the legislative power, are defaced or lost. No regard is now paid to any laws made here antecedently to 1691, when the first legislative assembly was organized. New York was then divided into nine counties, and the house consisted of seventeen delegates. The second legislative assembly was convened in 1708. We shall not minutely trace the ſeries of events that occurred in this ſtate before the year 1776, when, on July 4, the thirteen united colonies were declared independent. This was followed in 1777 by the formation and adoption of the ſtate conſtitution, by a convention of delegates, which was reviſed in 1801. In 1783, New York was evacuated by the Britiſh, and general Waſhington made his public entry Nov. 25. In 1787 the preſent conſtitution of the United States was propoſed by the convention, and acceded to by this ſtate in 1788, by a majority of 30 to 25 votes. General Waſhington was elected preſident of the United States, and Congreſs met at New York for the firſt time under the new federal conſtitution, March 4, 1789. In 1797 Albany was made the capital of the ſtate. In 1801 the legiſlature divided the ſtate into thirty counties, and theſe into towns. An academy of the fine arts was founded in New York. In 1807 a ſteamboat was eſtabliſhed on the Hudſon for paſſengers, between New York and Albany; and in 1811 their number was 5. In 1809-10, the capitol was built at Albany, at an expence of 115,000 dollars, and was firſt uſed by the legiſlature in the ſeſſion of 1809-10.

York, *New*, a county in the American ſtate of the ſame name, compriſes the iſland of Manhattan, or York iſland, on the E. ſide, and near the mouth of Hudſon river. It is about $14\frac{1}{2}$ miles long from N. to S., and in breadth varying from half a mile to two miles: its area is about $21\frac{3}{4}$ ſquare miles, or 13,920 acres. It is ſituated between 40° 42′, and 40° 52′ N. lat., and 0′ and 8′ E. long. from the city of New York. It is bounded on the N. and E. by Haarlem and Eaſt rivers, S. and W. by the Hudſon, or by York bay, and the ſtate of New Jerſey. The limits of the county, town, and city of New York are the ſame; and the only legal ſubdiviſions are the wards, ten in number. The juriſdiction of the city and county of New York extends to low-water mark on the oppoſite ſhores of the waters that ſurround this county. The agriculture of New York county is highly reſpectable, and its horticulture is in the firſt ſtyle of the country. The whole population of the county probably exceeds 100,000; by the cenſus of 1810, it amounted to 96,373. This county ſends 11 members to the houſe of aſſembly.

York, *New*, a city of America, the capital of a county of the ſame name, is ſituated on the E. bank, at the confluence of Hudſon and Eaſt rivers, at the ſouth end of New York iſland. N. lat. 40° 42′ 40″. W. long. from Greenwich 74° 0′ 45″. The compact part of this city extends along the Hudſon about two miles, and along Eaſt river, from the S.W. angle of the battery, near four miles: its circuit is about $7\frac{1}{2}$ miles. The ſtreets of the ancient part are irregular; but the northern part has been recently laid out to greater advantage. Many of the ſtreets are ſpacious, running in right lines, and interſected by others at right angles. The ſurface has at preſent a gentle aſcent from the Hudſon and Eaſt rivers, and commands a fine view on the right and left of the town, the above-named rivers, and their crowds of ſhipping. The principal ſtreets are, Broadway, opening to the N.E., and extending through the whole length of the city, Greenwich-ſtreet, Pearl-ſtreet, &c. &c. The uſual tides at New York are about ſix feet, and the depth of water is ſufficient for the largeſt ſhips; and the harbour, which is ſafe and good, is capacious enough for the largeſt fleets, and very rarely obſtructed by ice. The houſes of this city are well built of brick, and its public buildings are numerous and elegant. The firſt of theſe that deſerves mention is the city-hall, in which are held the courts for the city and county of New York. This building ſtands on elevated ground, and its ſtructure is ornamental to the city. The whole number of the churches, or houſes for Chriſtian worſhip, is 37, beſides a Jewiſh ſynagogue. Of theſe, eight are Preſbyterian, eight Epiſcopal, four Dutch Reformed, three Scots Preſbyterian, three Methodiſt, two for Friends or Quakers, two Baptiſt, two German Lutheran, one French Proteſtant, one Moravian, one Roman Catholic, two African. The New York hoſpital is an extenſive eſtabliſhment; the cuſtom-houſe adjoins the battery at the S.W. angle of the city; the gaol and bridewell are oppoſite to the Park, and the alms-houſe is on the ſame ſquare with the gaol, bridewell, and city-hall. The college is about midway between the Park and the river Hudſon; and St. John's church, reckoned the moſt elegant in the city, is in Hudſon-ſquare, farther north. The ſtate-priſon is two miles N. of the battery, on the bank of the Hudſon. Here are alſo a library and theatre, ſix market-houſes, and many other buildings that might, if ſpace were allowable, be enumerated. There are eight banking-companies in this city; and their houſes and offices, together with thoſe of the inſurance, manufacturing, and other companies, and thoſe of various ſocieties, add to the number of edifices that adorn the metropolis. The population, which by the cenſus of 1810 was eſtimated at 96,373, is ſuppoſed to amount to more than 100,000. The city and harbour of New York have been lately fortified againſt naval aſſaults at a very great expence: but we ſhould be tedious in minutely deſcribing the works which have been conſtructed for this purpoſe. The number of charitable eſtabliſhments, and of ſchools for education in this city, is very great, and does honour to the diſpoſition and liberality of its inhabitants. The markets, which are kept every day, are well ſupplied with the productions both of land and water. The public walks and amuſements in the vicinity of this city afford attraction to its ſtated inhabitants, and to thoſe who occaſionally reſort hither. The theatre, reading-rooms, public-gardens, park, and walks on the battery, afford amuſement, and contribute to activity and health.

The city of New York is governed by a mayor, recorder, aldermen, and aſſiſtants, who conſtitute the common council. Each ward chooſes an alderman and aſſiſtant. The mayor, deputy-mayor, recorder, and aldermen, are ex-officio juſtices of the peace, and juſtices of oyer and terminer; and the mayor, aldermen, and commonalty, are authorized to hold a court of record or of common pleas; and this is called the mayor's court, and deemed of great importance. For the manufactures, commerce, literary inſtitutions, &c. &c. of the city of New York, we refer to the account already given of the ſtate of *New* York. Meliſh. Morſe. Spafford's Gazetteer of New York, 1813.

York, *New*, a poſt-town of Virginia; 167 miles S.W. of Waſhington.

York *Town*, or York, a townſhip of Weſt Cheſter county, in the ſtate of New York, 45 miles N. of New York, bounded N. by Ducheſs county, E. by Somers and Newcaſtle, S. by Newcaſtle, W. by Cortlandt; in length N. and S. 10 miles, and nearly 4 miles wide. The general ſurface is hilly, but productive, and well diſtributed into arable, paſture, and meadow lands. In 1810, here were 269 taxable inhabitants, 142 electors, and in all 1924 inhabitants.

York *Town*, a town of the ſtate of Virginia, capital of the county of York, on the right bank of York river, about 10 miles from its mouth, containing about 800 inhabitants. In the year 1781, the Britiſh army under lord Cornwallis ſurrendered themſelves priſoners of war to the united forces of America and France near this town, and was the occaſion of a peace which followed ſoon after. A marble

 column,

column, with a fuitable infcription and trophies, was ordered by Congrefs to be erected on the fpot in commemoration of the event; 8 miles E. of Williamfburgh.

YORKSHIRE, a county in the northern part of England, which, for extent, for its number of inhabitants, and for its natural and artificial productions, is by far the moft confiderable in the kingdom. In its general form the county is an irregular quadrangle; the longeft diagonal extends from N.W. to S.E. about 130 miles, and the fhorteft from S.W. to N.E. about 90 miles. The area of the county comprehends about 5,960 fquare miles, or above 3,814,000 ftatute acres. Yorkfhire, taken at its extreme points, is fituated between the parallels of 53° 18′, and 54° 40′ N. latitude, and between 2° 40′ of W. and 0° 10′ of E. longitude from Greenwich. On the N., the E., and part of the S. fides, it is diftinctly defined by rivers and by the fea. On the N. it is feparated in its whole extent, from the county of Durham, by the river Tees. From the mouth of this river to the entrance of the Humber, the whole E. fide is wafhed by the German ocean. By the eftuary of the Humber and the river Trent, it is divided from Lincolnfhire on the S. The limits between Yorkfhire, and the counties of Nottingham, Derby, and Chefter on the S., and thofe feparating it from Lancafhire and Weftmoreland on the W., are merely conventional, being indicated by no natural feature of the country; the latter, however, in general, coincide with the mountainous range which diftinguifhes the northern from the fouthern provinces of England. At a very early period of the Saxon dominion, the great county of York was fubdivided into three diftricts, ftill recognifed, and ftill under the corrupted name of ridings. Thefe are termed north, eaft, and weft, in reference to their relative pofitions with refpect to each other, and to the capital city of the county. The North Riding is fubdivided into 12 wapentakes, the Eaft into 7, and the Weft into 11 wapentakes; the whole county thus containing 30 wapentakes and 563 parifhes. The wapentake, a divifion adopted in certain northern counties of England, correfponds generally to the cantred or hundred of the fouthern provinces. The whole county comprehends one archiepifcopal city, York, and 59 market-towns, of which 13 are parliamentary boroughs. Of thofe laft in the North Riding are 5, *viz.* Malton, Northallerton, Richmond, Scarborough, and Thirfk; the Eaft Riding contains three boroughs, Beverley, Heydon, and Hull; in the Weft Riding the five boroughs are, Aldborough, Boroughbridge, Knarefborough, Pontefract, and Ripon. Yorkfhire fends thirty members to parliament; *viz.* two for the county, two for the city, and two for each of the boroughs juft named. According to the official reports made in 1811, the number of houfes and inhabitants in the county was the following:—In the North Riding 33,567 houfes, and 152,445 inhabitants; in the Eaft Riding (York city included), 31,420 houfes, and 167,353 inhabitants; and in the Weft Riding, 129,575 houfes, and 653,315 inhabitants. From this ftatement, Yorkfhire, at that period, contained altogether 194,562 houfes, and 973,113 inhabitants, or on an average 163 perfons for each fquare ftatute mile.

General Appearance, Soil, and Climate.—Yorkfhire is an extenfive and interefting county: in its geographical features, and geological characteriftics, it prefents important themes for inquiry and difquifition. Its ancient hiftory, and the numerous antiquities with which it abounds, afford other and not lefs interefting topics for inveftigation and comment. The manufactures, commerce, and trade of the county; its mineral productions, and agricultural practices, are alfo entitled to the moft careful and critical developement of the topographer. It is, however, to be regretted, that neither of thefe fubjects has hitherto been fatisfactorily elucidated by a local hiftorian: whence we fhall be neceffitated to refort to and cautioufly analyfe feveral detached and imperfect works, to render a fhort topographical account of this widely-extended county in any degree ufeful to the general reader. In the fequel thefe works will be referred to.

Yorkfhire prefents a great variety of furface: mountains, hills, vales, moors, fens, rocks, coaft, and rivers, are its component parts; but thefe are greatly diverfified. The North Riding confifts principally of two hilly regions, feparated by a comparatively low tract, which opens on the S. into the fpacious plain or vale of York. The hilly parts are commonly termed, from their pofition and their nature, the E. and the W. moorlands. Thofe on the E. bounded by the valley of the river Tees on the N., and by the fea on the N.E., occupy a fpace of 30 miles from W. to E. by about half as much from N. to S. They confift in general of bleak heath, interfperfed with loofe blocks of ftone, or with peat-mofs and bog. The whole is deftitute of wood, excepting in a few interfecting dales or valleys, where cultivation is practicable. Of thefe dales a few are of moderate extent, particularly Efkdale and Bilfdale, in the eaftern parts toward the fea. The weftern extremity of thefe moorlands, in the diftrict of Hamilton, produces heath intermingled with large quantities of coarfe grafs. Between the N. edge of the moorlands and the river Tees is the fertile diftrict of Cleveland. Several productive valleys interfect the W. moorlands, of which Wenfleydale is the moft confiderable. Watered by the river Ure, the bottom of the valley furnifhes rich grazing grounds, bordered on each fide by floping inclofed fields, which reach up the hills for more than a mile from the river. In the Eaft Riding the face of the country, although varied, is lefs boldly characterized than that in the N. It is divided in the middle into two extenfive plains, by the Wolds, a range of hills ftretching N. and S. Towards the fea the coaft of this Riding is in general low when compared with that of the North Riding; but in feveral places it rifes to cliffs of confiderable height, as at and in the vicinity of Flamborough-head. The S.E. part of this Riding confifts chiefly of a tract of fen and marfh, about 20 miles in length, and four in breadth, which fpreads from the fea to the Humber. This part of the Riding, forming the wapentake of Holdernefs, runs out to the S.E. and S., and terminates its courfe at the Spurn, a well-known point on the N. fhore of the Humber. A fucceffion of eafy rifings forms the eaftern afcent of the range of the Wolds; but on other fides they are fteep; and the whole have an agreeable and peculiar appearance. Confidered with refpect to extent and population, to manufactures and trade, the Weft Riding is by far the moft important divifion of Yorkfhire. Its furface is very irregular, varying from the low marfhy tracts in the E. to the rocky mountainous country in the W. The level marfhes are the continuation of thofe already mentioned in the Eaft Riding, and extend weftward nearly to the great N. road through Doncafter. Still farther weftward lies the middle divifion of the Weft Riding, gradually and beautifully fwelling into hills, and extending to Sheffield, Bradford, and Ottley. Beyond thefe towns, the country becomes rugged and mountainous, and is compofed chiefly of black moors, which terminate in the lofty range of hills bordering on Lancafhire. Thefe hilly and mountainous tracts are not, however, without many beautiful and romantic valleys, among which are thofe watered by the rivers Aire, Nid, and Wharf. Several of the fmaller dales are well-

well-wooded and inclofed, and have numerous villages interfperfed.

The foil of Yorkfhire is not lefs variegated than the furface. In the E. moorlands of the North Riding, wherever the ground is covered with ling or heath, the upper foil is invariably black moor or peat: but the fubfoil is various, and confifts of clay, free-ftone, and hardened fand. In that part of the moors called Hamilton, the foil confifts generally of fine loam on lime-ftone rock. In the interfecting dales, black moory earth, fand, and grit-rock, more or lefs, prevail; but the vale of Cleveland, along the river Tees, is compofed chiefly of ftrong tenacious clay. Lime-ftone, or a calcareous rock, is the general bafis of the W. moorlands; and the beneficial effects of this fubfoil are evident in the grafs and other ufeful productions with which the furface is generally covered. In the extenfive tract of plain ftyled the Vale of York, which occupies the interior parts of the county, and comprehends portions of all the three Ridings, confiderable changes of foil are found. In the N. part towards the river Tees, a rich gravelly loam prevails. The flopes of the high grounds on the E. and W. are in fome places cold, and abound in fprings; but in the greateft part the foil is ftrong and fertile. Of the Eaft Riding, the moft ftriking feature is the range of hills called the Wolds, compofed of chalk; but the furface is in general a light free loam, interfperfed with chalky gravel, often very fhallow. The great plain between the Wolds, the fea, and the lower part of the Humber, contains many extenfive tracts of fertile cultivable land, efpecially in the N. and E. quarters; but the fouthern diftricts, towards the river, are covered with marfhes and fens, fufceptible, where draining can be practifed, of material improvement. In the continuation of thofe fens, fituated on the W. of the Wolds, called the Levels, the foil is either clay or fand, with moorifh tracts interfperfed; but on the banks of the Darwent and the Oufe ftrong clay and loam prevail. In the extenfive Weft Riding foils of every kind are to be found, from deep ftrong clay and rich loam to the pooreft peat-earth. Clay and loam, but mingled with fome fand and moor, prevail in the E. diftrict of this Riding, while the middle divifion confifts chiefly of loam on a lime-ftone bafe. Similar foils extend through the W. parts, but are frequently interrupted by tracts of moor of different kinds.

In a country of fuch extent, and of fuch variety of foil, elevation, and expofure, as Yorkfhire, an accordant variety of climate, with regard to temperature, humidity, and falubrity, muft naturally be experienced. The E. moorlands, advancing high and bold into the German ocean, are neceffarily expofed to the cold, moift, and impetuous winds from the N. and E. The climate there, however, is rather difagreeable than unhealthy; for the high grounds are frequently involved in fogs and vapours from the fea. Among the W. moorlands the climate is ftill more fevere; but its effects on the productions of the furface are powerfully counteracted by the calcareous rock of which thofe mountainous tracts confift. By their diftance from the fea, combined with their much greater elevation, the fnow remains on them confiderably longer than on the E. moorlands. But the greateft obftacle to agricultural labours in the W. parts of the county is the almoft inceffant rain which falls among the mountains.. On them are accumulated and condenfed the vapours collected by the oppofite winds, which prevail on the contrary fides of the ifland. By the humidity thus produced, no attempt to raife corn-crops among thofe high lands can fucceed. In the intermediate plains and gently-fwelling tracts of the centre of the county, the climate is, on the contrary, in general mild and temperate, in proportion to the remotenefs from the mountainous quarters. The low grounds on the banks of the Darwent, are, however, fo moift, although warm, as to be much better adapted to pafturage than to corn-land. What is faid of the climate of the W. parts of the North Riding is equally applicable to the correfponding portion of the W.; for there the climate is alfo rainy, cold, and ftormy. At Sheffield, although on the S. border of the county, the quantity of rain which falls in a year is about 33 inches. It is, indeed, found by experience, that the lofty tracts which feparate Yorkfhire from Lancafhire and Chefhire are fully as fubject to fog, rain, and ftorms, as any other portion of England. But notwithftanding thefe circumftances, the air is pure and healthy. The middle and lefs-elevated tracts of the Weft Riding are equally healthy, milder, and lefs humid; holding a defirable medium between the tempeftuous blafts of the mountains in the W., and the dull fogs and damps which ufually befet the low marfhy country in the E. On the oppofite fides of the Wolds, in the Eaft Riding, a different temperature is experienced; for by thofe hills the W. divifion is in general fheltered from the cold damp winds from the fea and the entrance of the Humber, which prevail over the E. divifion. On the Wolds themfelves the air is fharp, and the fnow remains for a confiderable time on the ground. But the mildnefs of the climate in the W. Levels is abundantly compenfated, in regard to falubrity, by the vapours of the marfhes.

Mountains.—The E. moorlands of the North Riding form a peculiar feature in the county; for they are wholly detached by their pofition, and by their fubftance, from the mountains in the W. Some points of the E. moorlands rife nearly 900 feet above the level of the fea; but the moft remarkable fummit of the whole is Rofebury Topping. This fingular hill, fituated midway between Stokefley and Guifborough, towards the N.W. edge of the moors, fhoots up in a conical form, to the height of 1488 feet above the fea. By its detached pofition and fuperior elevation, it commands, in all directions, a profpect at once extenfive and interefting. The hill feems to reft on a bafis of alum-rock, interfperfed with iron-ftone; and its pinnacled fummit indicates to the furrounding country the approaching changes in the weather; for when the fummit is involved in clouds, rains feldom fail to defcend on the neighbouring low grounds. It is, however, on the W. borders of the county, that the moft elevated mountains are found. Thefe are a portion of the chain, which, commencing in the S. in Staffordfhire, extend northward, with increafing elevation, through Derbyfhire, Lancafhire, Weftmoreland, Cumberland, and Northumberland, into Scotland. In that portion of this range which belongs to Yorkfhire are feveral fummits of very confiderable elevation above the fea. Of thefe, the moft remarkable are, Pennigant, which rifes, according to barometrical meafurement, to the height of 3930 feet; Ingleborough, 3987 feet; and Whernfide, 4052 feet. The laft mountain is the higheft in England; for Crofsfell on the borders of Cumberland is in height only 3839 feet; Skiddaw, 3530; and Snowden, the higheft in Wales, 3568. Bennevis, a detached mountain in the N. of Scotland, and the moft elevated in Britain, rifes to the height of 4387 feet. Pennigant, fituated about 7 miles N. from Settle, is fteep and towering. Ingleborough confifts of a bafis of lime-ftone, but towards the fummit the grit-rock appears. The E. and S. fides of this mountain are very fteep, and of difficult accefs, on account of a deep morafs at the bottom; but the W. and N. fides, particularly the former, may be afcended

afcended with eafe. Continually receiving vapours from the Irifh fea on the W., Ingleborough is feldom free from clouds, and the whole mountain abounds with fprings: whence it is covered with verdure, and fheep graze on the moft elevated parts. In the vicinity appear Pennigant, diftant 6 miles to the E., and Whernfide 5 miles to the N. On the N.W. are the mountains of Weftmoreland, and on the W. fpreads out the low land of Lancafhire, bounded at the diftance of 24 miles by the Irifh fea, of which a great portion may, in clear weather, be defcried. In the midft of a circle of hills rifes Whernfide, on which account, although more elevated, the views from it are not equally interefting with thofe from Ingleborough. Near the fummit are feveral fmall lakes or pools, there called tarns, one of which is about 180 yards in length by nearly an equal breadth. In the Eaft Riding, the only hills of note are the Wolds, which exhibit themfelves to advantage, in rifing out of the low country around them; but at no point are they fuppofed to exceed 600 feet in height.

Rivers.—Along the whole length of the North Riding, from W. to E., the county is bounded by the river Tees. Rifing in the mountains of Weftmoreland and Cumberland, it purfues a very indirect courfe into the German ocean below Stockton, where it fpreads out into an eftuary three miles in breadth. The river Tees is navigable for fhips of confiderable burthen up to Stockton; but the channel is ferpentine and intricate, and the current is rapid. Commodious anchorage is, however, found at the entrance, in winds from the W. and S. A few inconfiderable ftreams from the W. moorlands fall into the river Tees; but the great body of the waters of Yorkfhire take their courfe in the oppofite direction, and unite with the Humber. Of thefe rivers, the moft northern is the Swale, which, rifing in the W. moorlands, enlivens the romantic Swale dale, and, after vifiting Richmond, bends S.E. until it reaches Boroughbridge, where it unites with the Ure. The latter river, proceeding from the fame moors, paffes near to Ripon, and in fome part of its courfe feparates the North and Weft Ridings. Having received the Swale, about fix miles below Boroughbridge, the Ure takes the name of Oufe, from an infignificant rivulet which joins it on the W. fide. Under this laft appellation the combined ftream, ftill farther augmented by the waters of the Nid, traverfes the city of York, where it becomes the limit between the Weft and the Eaft Ridings; and being navigable for large barges up to that city, it receives on its W. fide the rivers Wharf and Aire: at laft, after a very wandering courfe to the fouthward, in conjunction with the Trent, it difappears in the eftuary of the Humber. The Aire, already mentioned, a very confiderable ftream, iffuing from the mountains of Craven, facilitates by its waters the important manufactorial commerce of Leeds. Receiving on the W. fide the current of the Calder, which performs the fame fervice to Wakefield, the joint ftream conveys an important acceffion to the Oufe. Still farther to the S. the Don purfues its courfe from the W. mountains to Sheffield, where it bends to the N.E. by Rotheram and Doncafter, to its influx into the Aire. Before it be loft in the Humber, the Oufe receives on the E. the Darwent, which, having its fources in the E. moorlands, flows in general S.W. by Malton, acrofs the weftern parts of the E. diftrict. Two fmall ftreams ftill deferve notice in Yorkfhire, not fo much for their length of courfe, or volume of water, as for their great utility in forming the principal ports of the county. In the E. moorlands of the North Riding rifes the Efke, which after watering Efkdale opens into the German ocean through the harbour of Whitby. The river Hull traverfes the Eaft Riding from N. to S. paffing near to Beverley, and, at its influx into the Humber, forms the fecure though not capacious harbour of Kingfton, which, from the river, is generally alfo called Hull.

Canals of Yorkfhire. See CANAL.

Coafts and Harbours.—The fea-coaft of Yorkfhire, though very extenfive, affords but very few harbours of any importance. The mouth of the river Tees, as already ftated, is frequented as a place of anchorage in winds from the fouth and the weft. Veffels alfo often refort to other fpots on the coaft when the wind blows off the land, fuch as to Robinhood's bay to the fouthward of Whitby, to Filey bay on the north-weft, and Bridlington bay on the fouth-weft of Flamborough-head.

The principal harbour on this coaft is that of Whitby. (See WHITBY.) Scarborough bay is ferviceable in wefterly winds; and the pier, a noble ftone ftructure, furnifhes eafy accefs and fafe protection for fhips of confiderable burthen; for at fpring-tides, the depth of water at the entrance is from twenty to twenty-four feet: for want of a back-ftream, however, the harbour is in danger of being filled with fand. The entrance of the Humber affords to fhipping lefs protection than from its locality might be expected; for the fhores on both fides of Yorkfhire on the N.E. and of Lincolnfhire on the S.W. are low, and the channel is much incumbered with fand-banks and fhallows. Notwithftanding thefe difadvantages on its north bank, juft at the point where the eftuary turns its direction from E. to S.E., is fituated the much-frequented and important harbour of Kingfton-upon-Hull. The natural accommodation of the river has proved very infufficient for the increafed fhipping belonging and trading to the port, which ranks as the fifth in the kingdom. Docks of great capacity have therefore been excavated, in which veffels lie afloat or dry, as may be required. From this port, the produce of the great manufacturing diftricts in the interior of the country are exported to foreign parts; and there foreign commodities are transferred to fmaller veffels, to be in their turn diftributed over the interior of the kingdom. The moft remarkable projection of the coaft of Yorkfhire is the bold and lofty promontory, called Flamborough-head. The cliffs rife perpendicularly over the fea to the hight of 100 and 150 yards. They are compofed of a mouldering lime-ftone rock, of uncommon whitenefs; and at the bottom are pierced by a number of caverns, fome of them entering a great way into the rock. A new light-houfe is placed about 400 yards weft from the extremity of the promontory. About fouth by eaft eleven leagues from Flamborough-head is another point of great confequence to mariners. This is the Spurn-point, which, running out fouthwards, low and narrow, forms the north limit of the mouth of the Humber. The light-houfe is fituated in N. lat. 53° 41′, and E. long. 0° 17′.

Agriculture.—From what has been already noticed refpecting the mountainous and the marfhy tracts comprehended within the capacious limits of Yorkfhire, agricultural improvements in them muft be comparatively very limited. In other diftricts, however, particularly in the fpacious plains forming the central parts of the county, every fpecies of amelioration of the foil which the induftry of the inhabitants, availing themfelves of the natural means within their command, could apply, has been generally brought into action. The farms are of very unequal extent and rental, conformably to the nature of the foil and to the fituation of the farmer with refpect to a market. It is remarkable, that in the North Riding leafes are unufual; but although the hufbandman labours on fo precarious tious a possession, changes of occupants of farms are by no means common. In the vale of York one-third of the land is computed to be in tillage, and two-thirds in grass; but in Cleveland, along the south bank of the river Tees, the country is equally divided between corn and pasture. In the environs of Thirsk, where the dairy is the chief object of pursuit, fully three-quarters of the land are devoted to it. In the valleys or dales which intersect the east moorlands, about one-fifth of the surface is in tillage; but in those of the west, a much smaller quantity is usually ploughed: those parts although inclosed are therefore generally in pasture. In few districts of England have improvements in agriculture been more generally or skilfully introduced than of late years in the East Riding. The farms are commonly large, and vary in annual rent from two or three hundred pounds to a thousand; but in the marshy tracts, called the levels, they are mostly small. By drainage there, and in the flat country, in the vicinity of Hull, large tracts, formerly flooded, now produce plentiful crops of corn; the value of the land being thus increased to ten times its former worth. In the hilly range of the Wolds, barley and oats have in many places been superseded by wheat. In the West Riding the farms are generally small, but in the environs of the manufacturing towns a great portion of the ground is occupied by the inhabitants for the use of their families. To the eastward of Leeds, Wakefield, and Rotheram, the greatest part of the Riding is corn-land; but this tract contains no small proportion of common fields. The soil, however, is good, and improvement may be easily introduced. In addition to grain of all sorts, flax is cultivated in the marshlands to considerable extent; and in the environs of York mustard is now a valuable article of cultivation; though it is still considered as the produce of Durham. The horses of Yorkshire, and in particular those of the North Riding, have long and universally been famed. Cleveland furnishes an excellent breed for the coach and the plough; the northern parts of the vale of York others for the coach and saddle; and many of both kinds are bred in the southern parts and the marshes. The East Riding also rears horses of peculiar value. A smaller but hardy and useful kind is bred in the dales of the east moorlands: many of an equally serviceable description are also produced in the moorlands on the west. The horned cattle of Yorkshire are of various kinds, adapted to the nature of their pastures, and to the uses for which they are employed. The north parts of the vale of York and the district of Cleveland produce the Tees-water breed, which is ranked among the largest in the kingdom. In the plains where cattle are chiefly kept for the purposes of the dairy, the milk, and not the form or strength of the race, is the main object of attention with the farmer. The sheep in the various parts of the county are also extremely different in their nature and properties. In the North Riding, the stock has of late years been considerably improved by the intermixture of the Northumberland and other breeds. The sheep of the west moorlands are small; but the wool is tolerably fine: those of the east moorlands are still smaller, but with a very coarse wool. Many of the old sheep-walks on the Wolds, in the East Riding, are now broken up, and converted into corn-land. In the West Riding, by the introduction of the Leicestershire breed, the sheep have in many places been highly improved. Those bred on the west moors and hills of this Riding, when brought down early to pasture in the low grounds, become very valuable for food.

In many parts of Yorkshire, great amelioration of the soil has been produced by hollow-draining; irrigation, paring, and burning the surface, have also been advantageously adopted. In certain tracts, bones bruised in a mill are usefully employed in composts for manure. Considering its great extent, the North Riding of Yorkshire contains but a small proportion of woodlands; the whole having been estimated at about 25,000 acres, of which the vale of York, with its boundary hills to the north, contains about 11,000. Large full-grown timber is accordingly very scarce, excepting on the estates of the earl of Carlisle, C. S. Duncombe, esq. and some other land proprietors. But the oak-timber of this Riding, produced on hard rocky ground, if not of great size, is solid and durable; and hence the valuable qualities of the shipping built at Whitby and Scarborough. The planting of the Wolds in the East Riding has been successfully began by several proprietors. In the West Riding, the quantity of oak and ash is very considerable; and both are much used for ship-building, and for the various demands of the manufacturers: much is also consumed in the coal and other mines. In the vicinity of Sheffield, the duke of Norfolk possesses above 1500 acres of woodland. According to a calculation made in 1799, the waste lands in this Riding amounted to upwards of 400,000 acres, of which one-third seemed to be proper only for planting. No great progress in that operation has, however, yet been made.

Manufactures.—The manufactured productions of Yorkshire, especially of the West Riding, are of the very first importance to the county and to the kingdom, as well as to the multitudes to whom they furnish employment and wealth. The principal inducement for the establishment of those great works in the interior of the country was the plentiful supply of water and fuel for giving motion to machinery, and for the various other operations of the several branches of industry. Leeds, situated on the north bank of the river Aire, has long been celebrated as the centre of the manufacture of woollen cloth; and it is still the great mart for that staple article of the commerce of Yorkshire. (See Leeds, and Woollen *Manufacture.*) The white cloth is chiefly made at and about Dewsbury, among the hills which separate the valleys of the Aire and Calder, and in the vicinity of Wakefield. The mixed cloth is principally made in the villages comprehended in the parish of Leeds to the westward of the town; in the vale of Calder west from Wakefield; and also in the environs of Dewsbury. In the year 1806, the number of yards of broad cloth manufactured in the West Riding of Yorkshire is stated at 10,079,256, and of narrow cloth at 6,193,317. But in 1810 the broad cloth was only 9,826,048 yards, and the narrow cloth had increased to 6,951,762 yards. In 1811, however, the quantity of both sorts of cloth had sensibly diminished; for the yards of broad cloth were only 8,671,042, and those of narrow cloth 6,180,181; one of the many effects produced on the industry, and consequently on the well-being of the county and of the kingdom at large, by the hostilities in which Britain was then deeply involved on both sides of the Atlantic. The cutlery and plated goods of Sheffield are in all their branches carried to a perfection and an extent of which it is not easy to furnish a satisfactory account. The cutlery, consisting of edge-tools of every description, files, anvils, saws, &c. is not confined to that town, but manufactured in all the neighbouring villages. The plated goods, consisting of tea-urns, coffee-pots, tankards, candle-sticks, and many other articles of household use, are all prepared within the town. In it are also several founderies for iron, brass, and white metal.

Minerals, &c.—Excepting the alum on the borders of the east moorlands, and the lead of the vicinity of Richmond towards

wards the oppofite quarter, the North Riding of Yorkfhire furnifhes but few mineral fubftances of peculiar value. Copper of good quality, it is true, was wrought about the middle of the laft century near Middleton-Tyas; but the works have for fome time been difcontinued. Copper was alfo difcovered about twenty years ago at Richmond. In the vale of the river Swale, twelve miles above that town, are feveral very profitable lead-mines. The iron-ftone of the eaft moorlands has not hitherto been applied to any ufeful purpofe. It appears, however, from ancient records, that as early as the beginning of the thirteenth century, iron was wrought and forged in Rofedale. Ayton, a few miles S.W. from Scarborough, is the only place where forges are now eftablifhed, and thofe are but inconfiderable. The great alum works are principally fituated on the fea-coaft on both fides of Whitby, and in the vicinity of Guifborough. See WHITBY and ALUM.

Various parts of the North Riding produce coal, particularly in the plain between Eafingwold and Thirfk; and in the weft moors, the coal hitherto difcovered feems adapted only to the burning of lime: the north part of the Riding is confequently furnifhed with that mineral from the adjoining county of Durham. Good free-ftone for building appears in many parts of the Riding: a few miles weft from Whitby is a quarry from which have been drawn the blocks employed in conftructing the new piers of that town. Limeftone, and a fpecies of marble not inferior to the Derbyfhire, are found in different places; and loofe blocks of red granite are feen on the furface in certain parts of the weft moorlands.

In the Eaft Riding, the chalk of the Wolds is the only mineral fubftance of importance hitherto difcovered or brought into ufe; but the mineral productions of the Weft Riding are of peculiar value; for it contains lime, coal, iron, and lead, in great abundance. None of them, however, are found in the low level tracts in the eaft divifion of the Riding. The lime-ftone extends all to the weftward of a line running northward from Doncafter to Tadcafter. The tracts fituated between the rivers Aire at Leeds and Calder at Wakefield are the principal feats of the coal-mines, which abound likewife in the neighbourhood of Bradford, Barnfley, and Sheffield. Near Bradford alfo there are very confiderable iron-mines. Lead is principally extracted from the mines of Graffington, the property of the duke of Devonfhire.

Yorkfhire contains feveral mineral waters of great virtue and celebrity. The chalybeate and fulphureous fprings of Harrowgate have long been in high repute. See HARROWGATE.

Scarborough, on the fea-coaft of the Eaft Riding, has long been celebrated for its mineral fprings, which iffue from the foot of a lofty cliff on the fhore, a little way to the fouthward of the town. See SCARBOROUGH.

Ancient Hiftory, Remains, &c. — The great county of York was but a part of the territory of the Britifh tribe, called in Roman hiftory the Brigantes: they are not however mentioned by Cæfar. It appears that they were firft overpowered by Cerealis, in the reign of Vefpafian, in the year 71 of the Chriftian era. In 78, the Roman arms were carried beyond the river Tay in Scotland, where Agricola encountered the Caledonians, under Galgacus: but, contrary to the ufual practice of the Romans, after a fignal victory over the natives, as it is reprefented by Tacitus, his fon-in-law and profeffed panegyrift, the Roman commander, retreated into the fouthern part of the country previoufly fubdued. Having eftablifhed a chain of pofts acrofs the narrow ifthmus, between the firths of Forth and Clyde, Agricola was in the year 85 recalled by Domitian. From that period, until the arrival of the emperor Adrian himfelf in Britain in 120, little is known of the tranfactions in the northern parts of the ifland. That Adrian fhould deem it neceffary to repair in perfon to fo remote a portion of the empire, which then comprehended the richeft provinces of the world, is however a proof that the Britons, although overpowered, were by no means reduced to patient fubjection. Renouncing, therefore, a great part of the country included within the chain of forts of Agricola, Adrian conftructed an earthen rampart acrofs the ifland, between the mouths of the rivers Tyne and Edon. While thefe operations were in progrefs, the emperor fixed his refidence in Eboracum, or York; but fcarcely had he returned to the continent when the northern Britons, breaking through the fecond rampart thrown up againft them, joined with the Brigantes in an endeavour to regain their independence. To reprefs thofe attempts, Lollius Urbicus was fent into Britain, who, repelling the natives beyond the Roman bounds, conftructed a wall and towers on the line between the Forth and the Clyde, firft fortified by Agricola. From this event, which happened about 140 until 183, Britain feemed to be tranquil: but then, while the empire was fubject to the monfter Commodus by the exertions of the natives, and the difcontented fpirit of the legions themfelves, the power of the Romans in Britain was reduced to a very precarious fituation. Pertinax, who had ferved in the ifland, and who, by his military talents, was fully qualified to reftore the difcipline and fpirit of former times, was foon cut off by the licentious and diforderly Prætorian guards of Rome; and in 196, Septimius Severus became fole mafter of the empire. The Caledonians ftill continuing their efforts to rid themfelves of the Roman yoke, Severus, although thus far advanced in life, and very unfit for the fervice of the field, found it neceffary to repair to Britain. (See YORK.) In 207 he arrived at Eboracum, in the full determination to quell the reftlefs fpirit of the natives. After an expedition into the northern parts of the ifland, in which the lofs of the Romans is admitted by their own hiftorians to have been prodigious, he fixed his head-quarters in Eboracum; and commanded the rampart thrown up by Adrian between the Edon and the Tyne, to be powerfully ftrengthened, as Urbicus had done on the northern rampart with a continued wall and forts of ftone. Taking advantage of his abfence from the frontiers, the Caledonians again had recourfe to arms: but in 211, while Severus was preparing in Eboracum to repel their affaults, he died, and his fons and fucceffors Caracalla and Geta foon afterwards returned to Rome. Whatever might have been the inclinations of the Brigantes, however gladly they would have combined with their countrymen of the north, yet by the prefence of the imperial court, officers, and troops, every effort on their part muft have been inftantly difcovered and repreffed. Under Caraufius, Britain enjoyed fome femblance of independence; but his affaffination in the midft of his fpirited projects enabled Conftantius to fubject Britain again to the Roman arms. Dying in Eboracum in 307, Conftantius was fucceeded in the weftern portion of the empire by his fon Conftantine, who was prefent at his death, and was immediately proclaimed emperor by the legions. For many years, the Brigantes with the other fouthern provinces of Britain feem to have been fubmiffive to their mafters; but in 364, the northern nations renewed their incurfions, while the oppofite part of the ifland was haraffed by the predatory de-

fcents

fcents of the Saxons. Tranquillity was at laft reftored by Theodofius, whofe fon of the fame name obtained the purple, and after a fhort reign died in 393. Diffenfion within and affault from without were now faft haftening on the overthrow of the mighty empire of Rome; and in the middle of the fifth century of our era, the Romans finally relinquifhed all poffeffion, power, and authority in Britain. Of their long protracted refidence in Yorkfhire, many unqueftionable evidences are found in the capital, and in other parts of the county. The roads eftablifhed by that extraordinary people may yet be traced, traverfing the county in various directions. The whole fyftem of the Roman policy and difcipline was certainly directed to the perfection of their military power.

One great line of probably Roman road, which traverfes the county of York from S. to N., is now called the Watling-ftreet, (a name apparently Saxon,) which was opened from the Rutupian port, in the neighbourhood of Sandwich, in Kent, in various directions, all the way to the wall of Severus. Entering Yorkfhire near Bawtry, it has been traced by Doncafter, (Danum, or the ftation on the river Don,) over Scawfby and Pigburn Leas, to Barnfdale, through Pontefract to Caftleford, fuppofed to be the pofition of the ancient Legiolium, a little below the junction of the rivers Aire and Calder. From this point, the road was conducted by Calcaria, now Tadcafter, to Eboracum, or York. From this city it probably followed the N.E. fide of the river Oufe, croffing it near to Ifurium, now Aldborough, below Boroughbridge, and thence by Leeming-lane to Catterick-bridge, adjoining to which veftiges of Cataractorium are to be feen; there turning more to the northward, it paffed over the Tees at Pierfe-bridge into the county of Durham. Another military road is fuppofed to have been laid out from Mancunium, now Manchefter, in a N.E. direction, by Wakefield, to join the former line between Doncafter and York. North-eaftwardly from York a road feems to have been formed by or near Malton, terminating on the fea-coaft at Dunfley bay, the Dunus bay of Ptolemy. This road is ftill called Wade's caufeway, from the Saxon chief Wada, as Camden thinks, who refided on the coaft in a caftle, perhaps originally erected by the Romans. A branch of this road is fuppofed to have led to Scarborough, when the fheltered beach furnifhed a convenient place for Roman fhipping. The ftraight courfe of an ancient road may be traced, although over the high grounds of the Wolds pointing from York towards Bridlington bay, correfponding probably to the Sinus Gabrantovicorum of the Romans; a branch has alfo been obferved tending towards Hunmonby and Filey bay. Another line may alfo be followed in a direction to Patrington (Practorium) and the Spurn-point, which feems to correfpond with the Ocellum Promontorium of Ptolemy. From Lincoln (Lindum colonia) a Roman road may be traced running N. to the S. bank of the Humber near Wintringham, where are ftill feen veftiges of the ftation, ad Abum. On the N. bank, Brugh indicates the pofition of another ancient ftation, from which a branch of road probably communicated with York. This, however, is not the courfe indicated in the itineraries, which point out a much more convenient courfe from Lincoln to York, acrofs the river Trent at Littleborough, the ancient Segelocum.

The veftiges of Roman works and occupation diftributed over various parts of Yorkfhire are by far too numerous to be mentioned in this place: it muft therefore be fufficient to point out two, Cataractorium and Ifurium. About five miles below Richmond in Swaledale is the prefent village of Catterick, fo named from the Cataractorium of the Romans, of which the veftiges are vifible on the S. bank of the river, a little lower down the valley. Ifurium exhibits the moft remarkable proofs of Roman habitation. Sixteen miles above York, and nearly one mile below Boroughbridge, on the S. bank of the river Ure, is Aldborough, fo called in allufion to the old town, to which it has fucceeded, named by the Romans Ifurium.

Caftles.—Of thefe many ftill remain in Yorkfhire, although in feveral cafes they are either nearly demolifhed, or by later alterations, bear but little refemblance to their original form and ftructure: in fome, indeed, the name alone is preferved. Of York caftle, the keep, or Clifford's tower, is almoft all that is to be feen above the furface of the ground. Scarborough caftle is fituated on a projecting precipitous cliff, 300 feet above the fea, and cut off by a deep natural hollow from the high ground behind it. Richmond has long been diftinguifhed by its extenfive caftle, which was erected foon after the Norman Conqueft by Alan, a kinfman of William the Conqueror, on receiving the vaft poffeffions of the Saxon, Edwin, earl of Chefter. Crake or Creyke caftle, although belonging to the county of Durham, is fituated only twelve miles N. from York, is of great antiquity; for fo early as in 685, it was beftowed on St. Cuthbert by Egfrid, king of Northumberland. Six miles W. from Doncafter, are the caftle and village of Conifburgh, or more properly Coningfburgh. The caftle, one of the moft interefting edifices of the kind in the N. of England, a building of great extent and ftrength, is commanded by the high ground on which the village is placed. The area of the caftle is in circuit about 700 feet, encompaffed by a very deep ditch, now filled with trees. Of Knarefburgh caftle, once a fortrefs of importance, but few remains are now to be feen. It is believed to have been erected by Serlo de Burgh, who received the manor as a reward for his fervices at the Conqueft. Pontefract caftle, the fcene of many tranfactions of note in Englifh hiftory, in particular of the murder of Richard II., is built on a lofty rock. Sheffield caftle, formerly of great ftrength from its fituation, between and at the meeting of the rivers Don and Sheaf, was levelled to the ground by the parliament in the civil wars. The ancient caftle of Skipton, in the W. part of the county, is ftill in a habitable ftate. It now belongs to the earl of Thanet; but was formerly the refidence of the powerful family of Clifford, of which Henry, the fourteenth lord, was, in 1525, created earl of Cumberland. Near the E. bank of the Darwent, S.E. from York, are the remains of the magnificent caftle of Wrefsle, fuppofed to have been erected by Percy, earl of Worcefter, in the reign of Richard II., towards the end of the 14th century. Originally the caftle formed a quadrangle, having a tower at each corner, and a fifth over the entrance. Wrefsle was one of the places of refidence of the great earls of Northumberland, where they lived in a ftyle of fplendour and magnificence, formed on the model and with the ftate of the royal houfehold. Notwithftanding the zeal evinced by the earl of Northumberland in the caufe of the parliament, the caftle was, in 1650, difmantled. Three fides of the quadrangle were demolifhed, and an accidental fire in 1796 completed its deftruction. The fcite belongs to the earl of Egremont.

Seats.—To defcribe the number of admirable ftructures of modern times, with which the county of York is adorned, would require a volume. In this place merely to notice fome of the moft eminent feats is all that can be attempted. About 13 miles N.N.E. from York is fituated Caftle-Howard, the princely manfion of the earl of Carlifle, of the illuftrious houfe of Howard. On the fcite of the ancient caftle of Hinderfkelf the prefent building was erected, about a century ago, by fir John Vanbrugh, the celebrated architect

architect of Blenheim. Castle-Howard, in its general arrangement and appearance, bears an evident resemblance to that superb structure, and indicates the genius of that distinguished artist. In extent of front it exceeds Blenheim, and in exterior display of magnificence it is, perhaps, superior. The interior, spacious and lofty, is enriched with a very valuable assemblage of paintings by masters of the greatest celebrity; and the collection of antique statues, busts, &c. is peculiarly interesting. The surrounding park and grounds are distributed and ornamented in a way suitable to the grandeur of the structure they inclose. Duncombe-park, the seat of Charles Slingsby Duncombe, esq., 22 miles N. from York, also erected by Vanbrugh, is splendid in itself, and splendidly adorned with paintings of the most eminent artists. Harewood-house, the residence of the earl of Harewood, six miles N. from Leeds, is a magnificent structure, commenced in 1760, in which are combined grandeur of design and ornament, with convenience and accommodation of arrangement. One of the greatest ornaments, not of Yorkshire only, but of the kingdom, is Wentworth-house, once the habitation of the distinguished patriot Charles marquis of Rockingham, from whom it descended to his nephew and heir the present earl Fitzwilliam. It is situated in a spacious park, four miles N.W. from Rotheram, and seven N.N.E. from Sheffield. The mansion extends in front about 600 feet, forming altogether a structure of uncommon magnificence. Nor is the interior deficient in appropriate arrangement and splendour. In approaching the house, the attention of the visitor is arrested by a noble mausoleum, raised in 1788, by the present earl, to the memory of his uncle, the marquis. This monument is placed on an eminence, and is in itself 90 feet in height, divided into three parts. The square Doric basement supports a similar structure of the Ionic order, with open arches on the sides exhibiting a sarcophagus; the whole surmounted by a cupola. Within the basement story is a chamber containing a statue of the marquis, by Nollekens. Around the walls are busts of eight of his principal political friends, C. J. Fox, sir G. Saville, &c. Wentworth-house, erected by the earl of Strafford in 1730, but now the seat of Henry Vernon, esq., is a noble fabric. Towards the southern border of the county, midway between Doncaster and Worksop, is Sandbeck, the superb mansion of the earl of Scarborough, erected nearly fifty years ago.

Ecclesiastical State.—A very important change in the condition of the ecclesiastical establishments in Yorkshire, and over England in general, was introduced by William I. Prior to the Conquest the Saxon prelates, with their archdeacons and other delegates, sat in the courts with the earls and sheriffs for the administration of justice; receiving with the lay-judges a share of the fines imposed on offenders. According to the original charter, however, still preserved among the records of the cathedral of Lincoln, the Conqueror declared, that no bishop or archdeacon should, in future, hold ecclesiastical pleas in the hundred-court, nor suffer any cause of a spiritual nature to come under the cognizance of secular persons. Whoever, therefore, offended against the canons of the church was to be tried by a tribunal, to be appointed by the bishop of each diocese. It was also strictly enjoined on all sheriffs, royal officers, or other lay persons, not to encroach on the episcopal jurisdiction. These regulations were afterwards confirmed, in a general council of the nation, by the bishops, abbots, and all the principal nobility; but those nobles and prelates were then almost all Normans or other foreigners. To this artful separation of the ecclesiastical from the civil jurisprudence, the jealousies, contrarieties, contests, and open ruptures, by which the kingdom was, on various occasions, brought almost to its ruin, must be ascribed. In addition to the dissensions occasioned in this way, the dispute respecting the superiority of the see of Canterbury over that of York was conducted with peculiar animosity, between the Norman prelates of both. In 1070, Thomas, a canon of Bayeux in Normandy, appointed to York, repaired to Canterbury for consecration from the hands of archbishop Lanfranc, who had been previously installed; but refusing to swear obedience to the see of Canterbury, the consecration did not take place. The famous Gregory VII. making it now a rule to confer the pall on no prelate who did not appear in person before him, the two contending English archbishops were required to present themselves in the court of Rome, where the dispute was referred for decision to a synod of the clergy of England. By this council, assembled at Windsor in 1072, a sentence amounting to a compromise was pronounced. The rights claimed by Canterbury were confirmed; but Lanfranc dispensed with the oath of obedience from Thomas of York. In his profession of obedience, however, Thomas acknowledged that the archbishops of York and their suffragans were bound to obey the mandate of the primate of Canterbury, when required to attend him in council, wherever it should be held. On the appointment to York of Thurstan, chaplain and secretary of Henry I. in 1115, the dispute was again revived; but in 1121, Thurstan, who had obtained favour at Rome, was permitted by Henry, whom his pertinacity had irritated, to return to York. It does not, however, appear that he ever made any satisfaction for his resistance to the claims of Canterbury; or that a profession of obedience to that see was ever made by any of his successors. From this time, therefore, York maintained its independency, and, a few years afterwards, had certain suffragan bishops placed under its authority. Roger of York, in 1162, procured a bull from Rome, granting him the privilege of crowning the kings of England, possessed by some of his predecessors, and of having his cross carried erect before him throughout the whole kingdom. But in 1165, in the reign of Henry II., the latter privilege was by pope Alexander III. restricted to Roger's peculiar province. Opposing claims were nevertheless advanced on both sides, until Edward III. by influence and management procured from Rome a confirmation of the arrangement he had accomplished between the contending prelates. Then was introduced the casuistical and silly distinction, still preserved, in the titles of the two metropolitans, by which the archbishop of York is styled primate of England, and his brother of Canterbury primate of all England.

The county of York is wholly and immediately under the superintendence of the archbishop, whose suffragans are the bishops of Carlisle, Chester, Durham, and the Isle of Man. The latter, styled bishop of Sodor (the southern isles of Scotland) and Man, presiding over a diocese not formerly pertaining to England, has no seat in the house of peers. Under the archbishop, ecclesiastical affairs are conducted by archdeacons; an office first introduced into the diocese, as it is said, by Thomas the Norman, appointed in 1070.

Fertile and extensive as is the county of York, the number of religious houses erected within its bounds, in former times, was prodigious. "These were in all," according to Burton, (Monasticon Eboracense,) "106; *viz.* abbeys 14, priories 44, alien priories 7, cells 13, and houses of friars of various orders 28." Of those establishments the ruins of many houses still exist; some of them exhibiting very picturesque and attractive monuments of ancient devotion and liberality. St. Mary's abbey adjoining to York gives sufficient indications

tions

tions of its original grandeur. The abbots of St. Mary's and of Selby, both of the Benedictine order, were alone entitled to wear the mitre on the N. side of Trent. But for an account of these abbeys, and that of Whitby, the reader is referred to the description of the several towns in which they are situated. Of some others, erected in detached situations, a few may be here noticed. About three miles S.W. from Ripon are the magnificent and picturesque ruins of Fountain's abbey, of the Cistercian order, founded in 1132; and so named, not from any abundance of springs of water at the place, but from the village of Fontaines in Burgundy, where St. Bernard, the great patron of the order, was born. But the structure, of which the remains are so great an ornament to the country, was commenced in 1204. Built in the most elegant style of the ancient pointed architecture, the tower and the walls of the church still remain; the roof only being ruined. The length of the church was 351 feet, and that of the transept 186. The great tower, singularly situated at the N. end of the transept, is in height 166 feet. The whole edifice may be considered as one of the finest specimens of the simple but majestic style of the time of Henry III. and his successor Edward I. The abbey now forms a peculiar ornament to the celebrated grounds of Studley-Royal. On the N. bank of the river Aire, three miles to the westward of Leeds, are the remains of Kirkstal abbey, founded in 1147, by a colony of Cistercian monks from Fountain's abbey. The venerable remains of the Cistercian abbey of Rieval, or Rievaulx, are situated in a valley, about three miles northwards from Duncombe-park, from which they appear with peculiar advantage. Of the very ancient monastery of Ripon no part now exists. The collegiate church, or minster, still an interesting edifice, was partly rebuilt in the middle of the 14th century. Roche abbey, situated near lord Scarborough's seat of Sandbeck, in a deep narrow vale, is now reduced to a few arches, and a portion of the nave.

YORKSHIRE *Cows*, in *Rural Economy*, a term sometimes applied to a large short-horned breed of these cattle, which afford much milk, but which is not of the most rich kind, and which are much produced on the fine pastures in that district. See COW and LIVE-*Stock*.

YORKSHIRE *White*, in *Agriculture*, a perennial grass that thrives well in most situations, and which grows very generally on all soils, except those that are of the most barren and dry qualities. It flowers in the middle of the summer, and is well calculated for sheep, as it answers uncommonly well when closely fed down. It is said not to be much relished by neat cattle, and considered injurious to horses, which, in some cases, are supposed to become affected with a profuse discharge of urine and general weakness in consequence of the use of it. But should any hay, made from this grass, be accidentally given to these animals, and produce these effects, an immediate change of the fodder will prevent any further bad consequences. Its foliage is rather soft and woolly.

The proportional value which the grass at the time the seed is ripe bears to that at the time of flowering, is as 11 to 12.

It is an useful sort of grass in many cases of laying land down to pasture and other such purposes. See HOLCUS *Lanatus*.

YO-SANPOO, in *Geography*. See SANPOO.

YO-TCHEOU, a city of China, of the first rank, in the province of Hou-quang, situated on the Yang-tse river, and on the Tong-ting lake. This lake, which resembles a sea, is remarkable for the greatness of its circuit, which is more than 210 miles; for the quantity of its water, especially in certain seasons, in which the two great rivers of the provinces swelled with rains, discharge themselves into it, passing out on the other side sensibly diminished; and for its astonishing quantity of fine fish which are caught therein. The great number of barks and merchandizes which are brought thither render it one of the richest cities in the empire; its districts contain one town of the second order, and seven of the third; some on the east side of the lake, and others on the west. The country round is every where extremely fruitful, and full of different kinds of orange and lemon trees; 675 miles S. of Peking. N. lat. 29° 23′. E. long. 112° 35′.

YOUB, EL, a town of Algiers; 50 miles S.W. of Tremecen.

YOUGH GLADES, a post-town of Maryland; 173 miles N.W. of Washington.

YOUGHAL, a sea-port, borough, and post-town of the county of Cork, Ireland, situated at the mouth of the river Blackwater, in the eastern part of the county. Youghal is an ancient corporation, and sends a member to the united parliament. It is one of the towns belonging to the duke of Devonshire, as heir of the eldest branch of the Boyle family. It has a considerable corn trade, and is much frequented for bathing. There is a collegiate church, the wardenship of which is united to the see of Cloyne. Youghal is 115 miles S.W. from Dublin, and 25 E. from Cork.

YOUHIOGENY, a river of America, which rises in the north part of Virginia, and runs into the Alleghany, at Pittsburgh.

YOVIS, a town of Africa, in the county of Whidah; 9 miles E.N.E. of Sabi.

YOULE, a river of Madagascar, which runs into the sea on the west coast, S. lat. 20° 20′. E. long. 44° 40′.

YOUNG, EDWARD, in *Biography*, a celebrated poet and clergyman of the established church, was born at his father's living of Upham, in Hampshire, in 1684, and removed from Winchester school to New college, in the university of Oxford in 1703, and afterwards to Corpus Christi college. In 1708 he obtained a law-fellowship at All Souls by the patronage of archbishop Tenison, and at this time poetry was the chief object of his pursuit. His first performance in this department was "An Epistle to Lord Lansdown," one of the twelve peers created at the same time in 1712; and this was followed in the next year by his "Last Day," to which he prefixed a dedication to queen Anne, extolling the peace of Utrecht. From this circumstance he was regarded as a court-writer with a fixed stipend, under which character Swift alludes to him in his "Rhapsody on Poetry:"

"Where Y—— must torture his invention
To flatter knaves, or lose his pension."

 His

His next production was "The Force of Religion, or Vanquished Love," founded on the story of lady Jane Gray; and in 1714 he inscribed a poem on the death of the queen and the accession of George I. to Addison, who was then secretary to the lords justices. In 1719 he became tutor to the eldest son of the earl of Exeter; but soon abandoning that connection by the solicitations of the duke of Wharton, he graduated doctor of civil laws in this year, and wrote his tragedy of "Busiris, King of Egypt," which was dedicated to the duke of Newcastle, and favourably received; and in the same year he dedicated in a very complimentary strain to lord chancellor Parker, his poetical "Paraphrase on Part of the Book of Job." In the year 1721 his tragedy, "The Revenge," was exhibited with great applause, and dedicated to the duke of Wharton, whom he avows as his peculiar patron, and from whom he received some pecuniary favours. His satires, entitled "The Love of Fame, or the Universal Passion," were separately published, from 1725 to 1728, and as they became popular, he derived from them considerable profit. In 1726 he addressed his poem, entitled "The Instalment," to sir Robert Walpole, on his receiving the honour of the Garter; and he availed himself, on the accession of king George II., of his recommending an attention to the navy, to compose two odes, one inscribed "To the King, Pater Patriæ," introducing another under the title of "Ocean." Having attained his 44th year, he took orders, and in 1728 was nominated one of the royal chaplains; and this change of his views and pursuits induced him to withdraw from the stage his tragedy of "The Brothers," which was under rehearsal. His next publications were adapted to his new profession; and among these were his "True Estimate of Human Life," exhibiting the dark side of the picture; and a sermon preached before the house of commons on the 30th of January, entitled "An Apology for Princes, or the Reverence due to Government;" a subject not unappropriate to his situation as royal chaplain. In 1730, Dr. Young was presented by his college to the rectory of Welwyn, in Hertfordshire; and in the following year he married lady Elizabeth Lee, widow of colonel Lee, and daughter of the earl of Lichfield. Before this time he had resumed his poetical pen, and written "Imperium Pelagi, a Naval Lyric;" "Two Epistles to Mr. Pope, concerning the Authors of the Age;" and "The Sea-Piece," in two odes, dedicated to Voltaire. By his wife, who died in 1741, he had one son; and this circumstance, together with some other domestic losses that occurred about the same period, increased that melancholy and depression of mind to which he was constitutionally inclined. When he married lady Lee, she had a son, and also two daughters, the eldest of whom, denominated by him Narcissa, falling into a decline, went to the south of France, and died at Lyons in 1736. Her husband, Mr. Temple, supposed to be the poet's Philander, died in 1740; and his own lady died in 1741. If he referred to these events in the annexed lines, he must have taken a chronological licence hardly allowable even to a poet:

"Insatiate archer! could not one suffice?
Thy shaft flew *thrice*, and *thrice* my peace was slain;
And *thrice*, ere *thrice* yon moon had filled her horn."

It is certain that he began to write his "Night Thoughts" in the year 1741; and the occasion, as he declares, was real, and not fictitious. The seventh of these poems is dated in 1744, and the interval must have been occupied in the composition of them. Notwithstanding the sublime strains in which the author expresses his pious feeling, he is not regardless of the patronage of distinguished persons, for to such he inscribes them. On this work Dr. Young bestowed much attention and labour, and he valued it as the chief of his productions. Among his other works, we may mention a poem written as an expression of his loyalty in 1745, and entitled "Some Thoughts occasioned by the present Juncture, inscribed to the Duke of Newcastle;" "The Centaur not fabulous, in Six Letters to a Friend, on the Life in Vogue," an overcharged picture of the existing manners; and "A Sermon preached before their Majesties," with a dedication to the king, 1758. Dr. Young, notwithstanding his genius and piety, and his solicitude to obtain preferment, seems to have been disregarded; and though archbishop Secker expresses his surprise that he had been overlooked by persons in power, he declines any interference in his favour. It should be recollected, however, that the attention which he paid to Frederick, prince of Wales, during his variance with his father, was not forgotten; nor indeed would his junction of the poetical and clerical character be any recommendation to George II. But the reason of his name's being struck out of the list of court-chaplains on the accession of his present majesty is not known; it is the more unaccountable, as he was soon after appointed clerk of the closet to the princess dowager of Wales.

In his retreat at Welwyn he maintained a respectable and dignified character; and though the cast of his mind seems to have been gloomy, he was an agreeable and lively companion. The close of his life, however, was rather disconsolate than cheerful. The conduct of his only son, supposed to be the Lorenzo of the Night Thoughts, who is said to have been a rake and free-thinker, afforded him renewed opportunities for reproof and sarcasm, and must have been the occasion of poignant grief; though Mr. H. Croft vindicates his character, alleging that he was only eight years old when his father began that poem. But others have asserted that he was alarmed and grieved on his account; and that, notwithstanding the favourable change which took place in his sentiments and character, his father would not admit him to any interview in his latter years: and even on his death-bed he refused to see him, though he assured him of his forgiveness, and made him his heir. Towards the close of his life, he surrendered himself to the influence of a housekeeper, and from some mismanagement in his concerns, and a growing disposition to avarice, he became irritable in temper and depressed in spirits. His last production was a poem, entitled "Resignation," printed in 1762, which indicated the decline of his mental powers. His life was prolonged to the year 1765, and he then died in his 84th year. He was interred in the church of Welwyn, and his son erected a monument near the remains of both his parents.

Dr. Young is known principally, if not wholly, as a poet; and his compositions in this department are distributed into satires, tragedies, and night thoughts. His satires are founded on the questionable principle, that the love of fame is the universal passion of mankind; and as he did not excel in judgment, they are exercises of wit and invention rather than grave exposures of vice and folly. As a dramatic writer, he is charged with not understanding or not adhering to nature, and with indulging his imagination and feeling, and running into exaggeration of character and bombast of expression. The only tragedy that has kept possession of the stage is his "Revenge," the Zanga of which is said to have no competitor for theatric effect

effect among the perſonages of modern tragedies. His "Night Thoughts" are deemed original in deſign and execution. Whatever were the cauſes that produced them, they are adapted to excite devout feeling, and to produce moral effect, though they are juſtly complained of as in ſome places unintelligible, and as affording too much ſcope for criticiſm. To many readers, the theology on which they are founded and which they expreſs is too awful and ſevere, and not ſo well calculated to ſooth and pacify the human mind under trouble as the gentler and more conſolatory dictates of Chriſtianity. They are ſometimes tedious and prolix. They will never be neglected as long as taſte and ſuſceptibility of virtuous and religious impreſſions remain. The lyric attempts of Dr. Young are ſaid to have been ſingularly unfortunate. From the edition of his works publiſhed in his life-time in 4 vols. 8vo., he himſelf excluded ſeveral compoſitions which he thought of inferior merit. Biog. Brit. Croft's Life of Young in Johnſon's Engliſh Poets. Gen. Biog.

Young, Patrick, (*Patricius Junius*, Lat.), an eminent ſcholar, was born in 1584, at the ſeat of his father, ſir Peter Young, who had been co-tutor with Buchanan to James VI. of Scotland, at Seaton in Lothian. Educated in the univerſity of St. Andrew's, and accompanying his father in the ſuite of king James, he was employed for ſome time as librarian and ſecretary, by Dr. Lloyd, biſhop of Cheſter. In 1605 he aſſumed the degree of M.A. which he had before taken at St. Andrew's, and entering into orders, became chaplain at All Souls' college. During his reſidence at Oxford he occupied himſelf in the ſtudy of eccleſiaſtical hiſtory and antiquities, and alſo the Greek language; and upon his removal to London, he obtained a penſion of 50*l*. a year, and was occaſionally employed by the king and perſons in power in writing Latin letters. His patron was Montagu, biſhop of Bath and Wells, who procured for him the appointment of librarian to the king. In 1617 he was introduced at Paris, by the recommendation of Camden, to the learned men of that city; and upon his return, he aſſiſted Thomas Rhead in making a Latin verſion of the works of king James. In 1620 he married, and afterwards was advanced to ſeveral preferments in the church; and ſucceeded Rhead in 1624 as Latin ſecretary. Unknown by any publication, he was nevertheleſs honoured as a perſon of diſtinguiſhed literature, who rendered acceptable and uſeful ſervices to learned men. In this way, he was the coadjutor of Selden in the examination of the Arundelian marbles; and when they were publiſhed by this celebrated antiquary, he dedicated the work to Young. He was alſo employed in collating the Alexandrian MS. of the Bible with other copies; and as the reſult of his labours, he communicated many various readings to Grotius, Uſher, and other perſons. It was his intention to have edited a fac-ſimile of this MS., but his deſign was never executed. He publiſhed, however, in 1633, from this MS. the "Epiſtles of Clemens Romanus," and he propoſed editing the curious MSS. from the king's library; but the civil wars, and the ſeizure of the royal library, prevented the accompliſhment of his purpoſe. During the troubles of this period, he ſought an aſylum with a ſon-in-law, at Bromfield in Eſſex, where he died in 1652.

Young is ſaid to have indulged to exceſs a diſpoſition to oblige, which led him to lend valuable MSS. belonging to the royal library to foreigners and others; and he has been charged with betraying his truſt, by not returning MSS. which he removed to his own houſe in contemplation of the pillage of the library, and theſe were ſold among his other effects. To obviate this imputation, it has been alleged that he purchaſed for himſelf many MSS. from Greeks who viſited this country. Smith's Vit. Erudit. Viror. Gen. Biog.

Young is a name borne by many perſons connected with and remarkable in ſome way or other for uſeful talents in the arts. Charles Young, organiſt of Catharine-cree church, near the Tower, father of three daughters, who were all public ſingers: Cœcilia, the eldeſt, was an élève of Geminiani, ſpoke Italian well, ſung in many of Handel's later operas, and was afterwards married to Dr. Arne; the ſecond Miſs Young, Iſabella, was married to the ingenious and excellent compoſer Mr. Lampe, who ſet the Dragon of Wantley; and the third Miſs Young, Eſter, afterwards Mrs. Johes, ſung on the ſtage at Covent-Garden theatre to the time of their deaths. Charles, the father of theſe ladies, was, we believe, the ſon of Anthony Young, a muſician and muſic-ſeller in St. Paul's church-yard, commonly called Tony Young, who has been ſaid by ſome of the family to have ſet "God ſave great George our King." But at the time of the rebellion of 1745, when this air was revived, which Dr. Arne's mother aſſured us was written and ſet for king James II., when the prince of Orange was hovering over the coaſt previous to the Revolution; no claim was then made by the deſcendants of Anthony Young, or of any other compoſer of this air, which no one durſt ſing or own after the abdication of king James, without incurring the penalty of treaſon to king William; ſo that the ſong or hymn lay dormant, and the author concealed for near ſixty years, before it was applied to king George II.

There is a quibbling glee in the firſt volume of Purcell's catches on two perſons of the name of Young, father and ſon, who lived in St. Paul's church-yard; the one was an inſtrument-maker, and the other an excellent performer on the violin:

"You ſcrapers that want a good fiddle well ſtrung,
You muſt go to the man that is old while he's Young,
But if this ſame fiddle you fain would play bold,
You muſt go to his ſon, who'll be Young when he's old.
There's old Young and young Young, both men of renown,
Old ſells, and young plays, the beſt fiddle in town;
Young and old live together, and may they live long,
Young to play an old fiddle, old to ſell a new ſong."

Another Young, of the ſame family, the proprietor of a muſic-ſhop in St. Paul's church-yard till the middle of the laſt century, had a relation, an excellent performer on the violin, known by the name of *Chin*-Young, from the length of that feature, who led at almoſt all the concerts within Temple-bar, particularly at the Blue-coat ſchool chapel, Chriſt's hoſpital, on a Sunday evening, where there uſed to be a performance of ſacred muſic.

Miſs Young, afterwards the hon. Mrs. Scot, and her ſiſter Mrs. Bartleman, both public ſingers, ſeem to have been the laſt remains of the muſical family of Young.

Young. See Generation, Conception, Gestation, Embryo, Fœtus, Delivery, Child, &c.

In the army, that regiment, or officer, is ſaid to be the *younger*, *junior*, which was laſt raiſed, or whoſe commiſſion is of lateſt date, whatever be the age of the man, or however long he may have ſerved in other capacities.

Young *Frederick's Iſland*, in *Geography*, a ſmall iſland among Queen Charlotte's iſlands, in Port Ingraham.

Young *Nick's Head*, a cape on the eaſt coaſt of New Zealand, ſo called from Nicholas Young, a boy on board the

the Endeavour, who difcovered it in 1769. It forms the fouth-weft point of Poverty bay.

Young *Point*, a cape on the eaft coaft of St. Vincent. N. lat. 13° 12′. W. long. 61° 9′.

Young's *Ifland*, a fmall ifland near the fouth coaft of the ifland of St. Vincent; 2 miles S.E. of Kingfton bay.

YOUNGE, Nicholas, in *Mufical Hiftory*, an Italian merchant, the editor of "Mufica Tranfalpina," 1588; Madrigales of four, five, and fixe parts, chofen out of divers excellent Authours; with the firft and fecond part of La Virginella, made by Maifter Bird upon two Stanzas of Ariofto, and brought to fpeak Englifh with the reft. The editor having opportunities of obtaining from his correfpondents the neweft and beft compofitions from the continent, had them frequently performed at his houfe, for the entertainment of his mufical friends.

The fecond collection of the fame kind was publifhed by the fame editor in 1597; in which, among others, there are three madrigals by Crou, three by Luca Marenzio, and fix by the elder Ferrabofco. Thefe two collections being felected from the works of Paleftrina, Luca Marenzio, and other celebrated mafters on the continent, feem to have given birth to that paffion for madrigals which became fo prevalent among us afterwards, and which the compofers of our own country endeavoured with fuch zeal to gratify.

If allowance be made for the wretched ftate of lyric poetry in England at the time the madrigals publifhed in Younge's two collections were tranflated, which was long before the publication of the fonnets of Spenfer or Shakfpeare, the undertaking feems to have been tolerably executed. Indeed, fometimes with fuch care and felicity as to transfufe the expreffion of the original words into that of the verfion. The Italians themfelves, at this time, had but little melody or rhyme in their mufic; but their poetry having been long cultivated, and brought to a much greater degree of perfection than ours could then boaft, it indicated to the mufical compofer traits of melody, more airy and marked, perhaps, than we could derive from the profody or phrafeology of our own language. The tranflator of thefe madrigals, whoever he was, for the editor does not tell us, feems in general to have imitated the original Italian meafure and ftructure of verfe, as well as ideas; and though they abound with *concetti*, to which not only Italian poets, but thofe of all the reft of Europe were then fo much addicted, the general tafte of the times was indulged in poetry as well as mufic, and metre and melody were at once furnifhed with new models.

However, the perpetual double rhymes in Italian madrigals and fonnets have fo much diftreffed our tranflator to fupply them in Englifh, that, as the prefervation of the original mufic obliged him to render his verfion *totidem fyllabis*, his embarraffments on this account are fometimes truly ridiculous. It feems as if the conftant double rhymes in Italian poetry, which throw the accent on the penultima, inftead of the final fyllable, of a verfe, gave a peculiar caft to the melody in which it is clothed, and rendered it fpecifically different from that of Englifh fongs, in which but few double rhymes occur. The conftant and regular mixture of mafculine and feminine rhymes in French poetry may likewife have had a latent effect on the vocal melody of France, different from that of the other two neighbouring nations. But, after mentioning thefe fufpicions, we fhall leave the further inveftigation of fo fubtle a fubject to philofophers, not only poffeffed of the neceffary knowledge, but an equal zeal for the cultivation of philology, poetry, and mufic. No. 7, in Younge's fecond publication of Italian madrigals Englifhed, in which the old Saxon termination of the prefent tenfe of the indicative mood of our verbs is conveniently preferved, was doubtlefs not thought the worft, as it is applied to feveral compofitions in the collection.

"In vayne he feeks for beauty that excelleth,
That hath not fene hir eyes where love fejorneth,
How fweetly here and there the fame fhe turneth.

He knows not how love heateth, and he quelleth,
That knows not how fhe fighes, and fweet beguileth,
And how fhe fweetly fpeakes, and fweetly fmileth."

Thefe madrigals were celebrated, nearly forty years after their publication, by Peacham, who has pointed out the peculiar excellence of feveral, particularly thofe of Luca Marenzio, which, he fays, "are fongs the mufes themfelves might not have been afhamed to have compofed;" and of thofe by Alfonfo Ferrabofco, the father, he fays, "they cannot be bettered for fweetnefs of ayre and depth of judgment." Upon the ditty (words) of one of thefe, "I faw my Ladie weeping," (he fays) Mafter Byrd and Alfonfo, in a friendly emulation, exercifed their invention." The words of the Nightingale, and Fayre Sufanna, were fo much admired, that they feem to have been fet by all the beft compofers of the times. A few lines of each will perhaps convey to the reader an adequate idea of the poetical beauty of thefe favourite fongs.

The Nightingale.

"But my poore hart with forrowes over-fwelling,
Through bondage vyle, binding my freedom fhort,
No pleafure takes in thefe his fports excelling,
Nor of his fong receiveth no comfort."

Fayre Sufanna.

"To them fhe fayd, if I, by craft procur'd,
Do yeld to you my body to abufe it,
I lofe my foule; and if I fhall refufe it,
You will me judge to death reproachfully.
But better it is in innocence to chufe it,
Then by my fault t'offend my God on hye."

Indeed, in more than twenty fets, publifhed between the years 1588 and 1624, during a period of near forty years, including almoft four hundred and fifty madrigals and fongs in parts, it would be difficult to find any one of which the words can be perufed with pleafure. The fonnets of Spenfer and Shakfpeare, many of which are worthy of their authors, were indeed not publifhed till about the end of the fixteenth century; but afterwards, it is wonderful, that, except one by Shakfpeare, none of them were fet by our beft mufical compofers of their time.

YOUNGOULE, in *Geography*, a fea-port town, on the weft coaft of the ifland of Madagafcar. S. lat. 23° 30′. E. long. 47° 4′.

YOUNGSTOWN, a townfhip of the ftate of Ohio, in the county of Trumbull, with 773 inhabitants; 66 miles N. of Pittfburgh.

YOUTH,

YOUTH, *Adolefcence*. See AGE and ADOLESCENCE.

The renovation of youth has been much fought after by chemical adepts; and many of them pretended to various fecrets for this purpofe: but unluckily the death of the pretenders proved a fufficient refutation of their doctrine. Paracelfus talks of the mighty things he could do with his *ens primum;* and even Mr. Boyle tells us fome ftrange things about the *ens primum* of balm. (Boyle's Works abr. vol. i. p. 75.) But Mr. Boyle gives thefe wonderful ftories on the credit of a French chemift, and not on his own.

YOUTH, *Juventus*, or *Juventas*, in the *Pagan Theology*, a goddefs worfhipped among the Romans, who, together with the gods Mars and Terminus, kept her place in the Capitol along with Jupiter, when the other deities were turned out: whence the Romans drew a lucky omen for the durablenefs of their empire. Mem. Acad. Infcrip. vol. i. p. 71. feq.

This ftate of life was, by the ancients, compared to autumn. In which fenfe, Horace fpeaking of one approaching to puberty, fays,

" ——— Jam tibi lividos
Diftinguet autumnus racemos,
Purpureo varius colore."

The moderns, on the contrary, when they fpeak of one in the autumn of his age, mean one that is upon the decline; and choofe rather to ufe the comparifon of the fpring, to denote youth.

YOWRY, in *Geography*, a fmall ifland in the Eaft Indian fea, near the north coaft of New Guinea, on which a nutmeg-tree was found growing by captain Forreft. S. lat. 15′. E. long. 130° 45′.

YPAWA, a river of Bohemia, which runs into the Elbe, near its fource.

YPERLEE, a river of France, which rifes near Ypres, and runs into the canal of Nieuport.

YPOLOTE, a town on the E. coaft of the ifland of Paraguay. N. lat. 8° 46′. E. long. 118° 21′.

YPRES, or IPRES, a city of France, in the department of the Lys, fituated on the river Yperlee, from whence it takes its name. Before the year 800, it was only a château, which was facked and ruined by the Normans. Baldwin III. comte of Flanders, repaired the château, and built a town about the year 960, which was afterwards enlarged by Thierry, comte of Flanders, and Ferrand, the fon of Sanchez, king of Portugal. In the year 1325, the inhabitants revolted with moft part of the neighbouring towns againft Louis de Nevers, comte of Flanders, and pulled down the old wall to build a new one, in which they inclofed the fauxbourgs, which had become fo extremely populous, from weavers and other tradefpeople, that in the year 1242, the number of perfons amounted to 200,000. In the 14th century, the inhabitants of Ypres, for the moft part weavers, were exceedingly troublefome to their neighbours, being unwilling that any people fhould carry on trade befides themfelves. In the year 1383, the rebels of Ghent, affifted by the Englifh, under the command of the bifhop of Norwich, befieged this town with great vigour for fix weeks, but were compelled to retire; and the Englifh being obliged to quit Flanders, Philip the Hardy, duke of Burgundy, having become mafter by a marriage with the heirefs of the late comte Louis, enlarged it, and furrounded it with walls. It was erected into a bifhopric under the archbifhop of Malines, by pope Paul IV. in the year 1559. The town-houfe is a very large building, forming a fquare, and is faid to have been built by the Englifh, 600 feet in front; it has a very handfome tower, in which were kept their public archives from the year 1342. Befides the cathedral, it has feveral other churches, and fome religious houfes. The inhabitants carried on formerly a great trade in woollen cloth, but by the feverity of the duke of Alva, the principal manufacturers were driven to England, from which time that branch of trade declined. At this time they carry on a confiderable manufacture of linen of excellent fabric; 4 miles N.W. of Lifle. N. lat. 50° 48′. E. long. 2° 53′.

YPSILOIDES, ὑψιλοειδής, in *Anatomy*, the third genuine future of the cranium; thus called from its refembling a Greek *y*, or upfilon.

Some alfo call it λαμβδοειδής, *lambdoides*.

There is alfo a bone at the root of the tongue, called *ypfiloides*, and *hyoides*. See HYOIDES.

YQUETAYA, in *Natural Hiftory*, a plant growing in Brafil, long ufed as a medicine in that country; and lately difcovered to the Europeans by a French furgeon.

It has been fince found in France; where, being cultivated and examined by Marchant, it appears to be no other than the common water-betony, or fcrophularia aquatica.

It has this remarkable property, that it takes away from fena all its ill tafte and fmell; which property of correcting the infufion of fena was before wholly unknown.

To ufe this plant, it muft be dried ten or twelve days in the fhade, and afterwards expofed to the fun, till quite dry.

YRAME, in *Geography*, a town of Arabia, in the province of Yemen; 100 miles N.N.E of Aden.

YRIARTE, *Don* JOHN DE, in *Biography*, was born in the Ifle of Teneriffe in 1702, and having completed his education at Paris and Rouen, fettled at Madrid; where he occupied feveral literary offices, and particularly that of librarian to the king. His life terminated, to the regret of thofe who knew his worth, in 1771. Among his learned works, the principal are, "Palæographia Græca," 4to.; "Mifcellaneous Pieces in Spanifh, with Latin Poems," 2 vols. 4to.; "A Catalogue of Greek MSS. in the Royal Library;" and "A Catalogue of Arabic MSS. in the Efcurial," 2 vols. fol. Nouv. Dict. Hift.

YROUER, in *Geography*, a town of France, in the department of the Yonne; 5 miles S. of Tonnerre.

YRSEE ABBEY, a princely abbey of Germany, in the circle of Swabia, founded in the year 1182. The territory includes the village of Yrfee, and feven others. In 1802, this abbey was given among the indemnities to the elector of Bavaria; 3 miles N.W. of Kaufbeuren.

YRVILLAC, a town of France, in the department of the Finifterre: 3 miles S. of Landerneau.

YRUN, a town of Spain, in Guipufcoa; 2 miles S of Fontarabia.

YRVON, a river of Wales, in the county of Brecknock, which runs into the Wye, at Builth.

YS, in *Ichthyology*, a name given by Athenæus, and fome other of the Greek writers, to the fifh called *mus* and *fus* by others. It is the caprifcus of later writers. See GOAT-*Fifh*.

YSAMBRA, a word ufed by fome as a name for hellebore, and by others to exprefs a fpecies of poifon prepared in Spain, of which hellebore is an ingredient.

YSARD, in *Zoology*, a name given to the chamois.

YSCHE, in *Geography*, a river of France, which runs into the Dyle, 6 miles S. of Louvain.

YSENDYCK, or ISENDYCK, a town and fortrefs of Flanders, fituated on the fide or arm of the Scheldt, called the

the Blie: it was built near a town called Gafterneffe, fwallowed up by an inundation of the fea fome centuries ago, whofe inhabitants came to eftablifh themfelves at this place. The Dutch made themfelves mafters of it in the year 1604, and fince that time it has been ftrongly fortified, which is much affifted by its fituation, being furrounded by moraffes, which they can lay under water at pleafure; 8 miles E. of Sluys. N. lat. 51° 21'. E. long. 3° 28'.

YSIPORTAM, in *Ancient Geography*, a place of Afia, in Armenia, which had a Roman garrifon.

YSNI, in *Geography*. See Isny.

YSOPUS, a term ufed by fome to exprefs the chemical art of feparation.

YSPAR, a name by which fome of the chemical writers call iron.

YSSANDON, Jean, in *Mufical Biography*, born at Leffart, in the Compté de Foix, wrote "A Treatife on Practical Mufic, divided in Two Parts." This book is become very fcarce, and deferves to be reprinted. It was firft printed by Ballard in 1582. Laborde.

YSSEL, in *Geography*. See Issel.

YSSENGEAUX. See Issengeaux.

YSTAD, or Ydstad, a fea-port town of Sweden, on the fouth coaft of the province of Schonen, from whence a packet fails to Stralfund. It was formerly well fortified, and contained two churches. The harbour is neither large nor fafe; 26 miles S.E. of Lund. N. lat. 55° 22'. E. long. 13° 44'.

YSTLA, a town of North America, in the province of Mexico.

YSTWITH. See Istwith.

Y-TCHANG, a town of Corea; 35 miles W.N.W. of Kang-tcheou.

Y-TCHUUN, a town of Corea; 15 miles S.S.W. of Ou-tcheou.—Alfo, a town of Corea; 55 miles N. of King-ki-tao.

YTHAN, a river of Scotland, a few miles N. of the Don, that joins the fea, about two miles from Aberdeen, which falls into the German ocean. The Ythan is a ftream formerly celebrated for its pearl fifheries, of which fome relics are now found.

YTHER, a river of Wales, which runs into the Wye, 3 miles N. of Builth.

YTTERON, a fmall ifland in the gulf of Bothnia. N. lat. 63° 4'.

YTTRA Bergon, a fmall ifland on the W. fide of the gulf of Bothnia. N. lat. 61° 48'. E. long. 17° 13'.

YTTRIA, or Ittria, in *Chemiftry*, is a peculiar elementary fubftance ufually confidered as an earth.

Yttria has been hitherto met with in a peculiar mineral named Gadolinite, fo named from profeffor Gadolin, who firft analyfed it, and in Yttro-tantalite, both minerals found only in Sweden. See thofe articles.

Yttria has the appearance of a fine white powder, without tafte or fmell. It does not affect vegetable blues. Its fpecific gravity is confiderably higher than that of the other earths, being no lefs, according to Ekeberg, than 4.842.

Yttria is infoluble in water, yet, like alumina, it is capable, according to Klaproth, of combining with nearly one-third of its weight of that fluid when precipitated from a ftate of folution by the muriatic acid.

In folutions of the pure alkalies it is likewife infoluble; but in the carbonate of ammonia, and indeed in all the alkaline carbonates, it diffolves readily. It combines with acids, and forms with them falts, which, as far as they are known, are defcribed below.

Yttria is not affected by light, and probably does not combine with oxygen. According to the experiments of Klaproth, it does not combine readily with fulphur.

Sir Humphrey Davy found, that when potaffium was paffed through red hot yttria, it was converted into potafh, while grey metallic particles were perceived mixed with the alkali, which were confidered to be the metallic bafis of the earth or *yttrium*. Nothing further, however, is known refpecting this metallic bafis.

The *Salts of Yttria* are but little known. The following only have been examined.

Nitrate of Yttria.—This falt was firft formed by Ekeberg, and has been more lately examined by Vauquelin. It may be prepared by diffolving yttria in nitric acid. The folution has a fweet aftringent tafte, and can fcarcely be made to cryftallize. Expofed to the air, it deliquefces. When fulphuric acid is poured into the folution, cryftals of fulphate of yttria are inftantly precipitated.

Carbonate of Yttria.—This falt may be formed by precipitating yttria from its folution in acids by means of an alkaline carbonate. It is white taftelefs infoluble powder, compofed, according to Klaproth, of

Carbonic acid -	18
Yttria - -	55
Water - -	27
	100

According to Vauquelin, however, it lofes only 32 *per cent.* when calcined.

Phofphate of Yttria.—Vauquelin formed this falt by mixing a folution of the phofphate of foda with the fulphate, nitrate, or muriate of yttria. The phofphate of yttria precipitated in the form of gelatinous flakes.

Sulphate of Yttria.—Sulphuric acid diffolves yttria readily. As the folution proceeds, the fulphate cryftallizes in fmall brilliant grains. Ekeberg ftates thefe cryftals to be flat fix-fided prifms, terminated by four-fided fummits. Dr. Thomfon obtained thefe in the form of long flender rhomboidal prifms. Their colour is amethyft-red: their fpecific gravity 2.791. They are foluble in about 30 parts of water at 60°. A red heat partly decompofes them. Oxalic acid, pruffiate of potafh, and infufion of nutgalls, occafion a precipitate in the aqueous folution of this falt. It is decompofed by the phofphate of foda. The fulphate of Glucina is readily diftinguifhed from this falt by its being colourlefs, lighter, and more foluble in water. According to Berzelius, the fulphate of yttria is compofed of

Sulphuric acid -	50.0
Yttria - -	50.0
	100.0

Arfeniate of Yttria.—When yttria is diffolved in arfenic acid, and the folution boiled, arfeniate of yttria precipitates in the form of a white powder. Arfeniate of potafh alfo precipitates yttria from acids.

Chromate of Yttria.—Chromic acid diffolves yttria cold in confiderable quantity, and with effervefcence. The folution has an aftringent and pungent tafte, and, like moft of the chromates, has an orange-red colour, paffing into yellow. The folution is quite neutral. When evaporated, it forms minute prifmatic and cubic cryftals. It is very foluble in water.

Acetate of Yttria.—Yttria diffolves readily in acetic acid, and the folution on evaporation yields cryftals of the acetate of yttria, the form of which is ufually that of thick fix-fided plates,

plates, obliquely truncated. Their colour is amethyst-red, and they are not altered by exposure to the air.

Succinate of Yttria.—Yttria is not precipitated from its solution in acids by the succinates, unless the two salts be concentrated, in which case small cubic crystals fall, which are the succinate of yttria.

Oxalate of Yttria.—When oxalic acid, or the oxalate of ammonia, is dropped into a solution of yttria in an acid, a white insoluble powder falls, which is the oxalate of yttria. According to Vauquelin, this salt is composed of

Oxalic acid	57.5
Yttria	42.5
	100

Tartrate of Yttria.—Yttria is precipitated from its solution in acids by the tartrate of potash, but the precipitate is dissolved by the addition of water.

Dr. Thomson infers, from the analyses above-mentioned, and more especially from the analysis of the sulphate and carbonate by Berzelius and Vauquelin, that the combining weight or weight of the atom of yttria is 50, oxygen by 10, and consequently that it is composed of

Yttrium	80
Oxygen	20
	100

and the weight of the atom of yttrium will be 40.

With respect to the salts of yttria in general, it may be said, that many of them are little soluble; that they are capable of being precipitated from acids by the phosphate of soda, the carbonate of soda, the oxalate of ammonia, the tartrate of potash, and the prussiate of potash; and lastly, that the sulphate of yttria may be distinguished from the sulphate of lime by its greater solubility, and by its sweet taste.

YTTRIUM, the metallic basis of yttria. See YTTRIA *supra.*

YTTRO-TANTALITE, in *Mineralogy*, *Tantale yttrifire*, Brongniart, an ore of tantalum, combined with the newly-discovered earth called yttria, and found at Ytterby, near Roslagen, in Sweden. The colour of yttro-tantalite is a dark iron-black; when pulverized it is greyish: it occurs in nodules, about the size of a hazel-nut, and also crystallized in oblique six-sided and four-sided prisms. It occurs also in granular distinct concretions. Its fracture is compact or finely granular, and it has a shining metallic lustre. Yttro-tantalite scratches glass, but yields with difficulty to the knife. The specific gravity of this mineral is 5.13. It decrepitates with the blow-pipe, but at length melts into a greenish-yellow slag. According to Vauquelin, the constituent parts are,

Oxyd of tantalum	45
Oxyd of iron and yttria	55
	100

Yttro-tantalite is nearly allied to gadolinite, the other mineral in which yttria is found, and occurs with it at Ytterby, in a bed of flesh-red felspar in gneiss.

YTZAIMPATLI, in the *Materia Medica*, a name given by some to the cevadilla, or *hordeum causticum*, the *caustic Indian barley*.

YU, in *Geography*, a city of China, of the second rank, in Pe-tche-li; 87 miles W. of Peking. N. lat. 39° 52′. E. long. 114° 14′.—Also, a city of China, of the second rank, in Ho-nan; 442 miles S.S.W. of Peking. N. lat. 33° 22′. E. long. 112° 38′.—Also, a city of China, of the second rank, in Ho-nan; 377 miles S.S.W. of Peking. N. lat. 34° 16′. E. long. 113° 14′.—Also, a river of China, which rises in Ho-nan, 12 miles N. of Pi-yang, and joins the Hoai, 20 miles E.S.E. of Sin-tsai.—Also, a river of China, which rises about 26 miles W. from Ngan-fou, in Kiang-si, and runs into the Kan-kiang, 7 miles N.N.E. of Lin-kiang.

YUCATAN, a province of Mexico: it is a peninsula, surrounded on the W. and N. by the gulf of Mexico, between the bay of Campeachy on the S.W., and that of Honduras on the S.E., having the little province of Tabasco on the S.W., and that of Vera Paz, in the audience of Guatimala on the S., where it is joined on the continent by an isthmus not 120 miles broad. The climate is pretty warm in summer, which begins about April, and ends in September. It rarely rains here during the winter season, though the weather is tolerably cool, except in January and February, which are almost as hot as in the middle of summer. It is, however, very healthy, especially a large mountainous tract, extending from Salamanca on the W., to the eastern boundary, and where the natives live to a great age. The south side of this ridge is ill-peopled, and worse cultivated, for want of water; but the north part is very populous, being rendered pleasant by gentle breezes, though the sun is very hot. The days and nights are nearly equal all the year. The soil when properly cultivated produces great quantities of corn, cotton, and indigo. All sorts of cattle, wild-beasts, honey, wax, and fowls, are here in great plenty; and on the coasts are found large pieces of amber; but as no mines were ever discovered in this country, the Spaniards are not fond of making settlements here, so that it abounds mostly with Indians, subject to the Spaniards, who employ them in making salt, in the bay of Campeachy. This peninsula has very few rivers, but wells without number, and considerable lakes; and wheresoever they dig up the land, abundance of shells are found, which with the lowness of the country, and shallowness of the sea about it, has induced many to think that the greatest part of it was once under water. The capital of Yucatan is Campeachy, in the bay of which, and of Honduras, the former lying on the west, and the latter on the east side of this province, the English cut their logwood.

YUCCA, in *Botany*, is the *Yucca*, *Yuca*, or *Jucca*, of the original inhabitants of America. Gerarde appears first to have published this name in England. Caspar Bauhin follows him. Linnæus, *Phil. Bot.* 164, lays to the charge of Tournefort the introduction of *Yucca*, as a scientific generic appellation, but we do not find it in his work. Dillenius however adopts it in his *Nova Genera*, and *Hortus Elthamensis*, and Linnæus rather overlooks than approves of the barbarism.—Linn. Gen. 170. Schreb. 226. Willd. Sp. Pl. v. 2. 183. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 291. Pursh 227. Juss. 49. Poiret in Lamarck Dict. v. 8. 824. Lamarck Illustr. t. 243. Gærtn. t. 85. (Yuca; Dill. Nov. Gen. 111. t. 5. Ponted. Anthol. 294. t. 6. f. N, O. Cordyline; Van Royen Lugd.-Bat. 22.)—Class and order, *Hexandria Monogynia*. Nat. Ord. *Coronariæ*, Linn. *Lilia*, or perhaps *Bromeliæ*, Juss.

Gen. Ch. *Cal.* none. *Cor.* bell-shaped, in six deep, ovate, very large, equal, moderately spreading segments, connected by their claws. Nectaries none. *Stam.* Filaments six, inserted into the base of the corolla, very short, swelling upwards, reflexed; anthers minute, roundish. *Pist.*

Germen superior, oblong, bluntly triangular, with six furrows, rather longer than the stamens; style none; stigma obtuse, with three furrows, its lobes cloven, the centre pervious. *Peric.* Berry oblong, bluntly hexagonal, fleshy, perforated at the summit, of six cells; three of the partitions thicker than the three intermediate ones. *Seeds* very numerous, in a single row, separated from each other by transverse membranes, roundish-obovate, flat, depressed, attached, by their pointed base, to the inner angle of the cell.

Eff. Ch. Corolla inferior, bell-shaped, its segments without nectaries. Stamens club-shaped. Style none. Berry hexagonal, of six cells. Seeds numerous, flat.

Obs. We have, like Schreber, adopted Gærtner's idea of the fruit, which Linnæus does not appear to have seen in perfection, and which Dillenius confesses himself to have judged of from the unenlarged *germen* only. Analogy might well lead these authors to presume it a *capsule*, which, from the structure of the *germen*, might be judged to consist of three cells. This idea was moreover supported by an account which Ray had somehow obtained from the East Indies; where indeed no *Yucca* grows wild, and therefore this account cannot implicitly be trusted. Gærtner received, from professor Hermann of Strasburg, the ripe fruit of *Yucca draconis;* and this being the only authentic instance of the seed-vessel of any one of the genus passing under the investigation of a critical botanist, we must rely on it as affording the only certain type of the genus in this particular. Jussieu appears to have followed Linnæus; but the discovery of the true nature of the fruit, rather favours his opinion above-mentioned, of the affinity of *Yucca* to his *Bromeliæ*. This is a handsome perennial genus, more or less caulescent, with numerous, long, simple, rigid or coriaceous, pungent *leaves;* and copious, panicled, white, liliaceous, very elegant though generally inodorous *flowers*. Some of the species are tolerably hardy in our gardens, but they do not very readily or constantly blossom.

1. Y. *gloriosa*. Common Adam's-needle. Linn. Sp. Pl. 456. Willd. n. 1. Ait. n. 1. Pursh n. 4. Curt. Mag. t. 1260. Andr. Repos. t. 473. (Y. sive Jucca, peruana; Ger. Em. 1543. Yuca indica, foliis aloes, flore albo; Barrel. Ic. t. 1194.)—Caulescent. Leaves lanceolate, straight, furrowed; their edges smooth and entire.—Native of Peru and North America. On the sea shore of Carolina, flowering in July and August; the whole plant about ten feet high. *Flowers* white. *Pursh.* The *stem* in our gardens is seldom two feet in height, somewhat branched, thick, tough, crowned at the summit of each branch, if divided, with a profusion of crowded *leaves*, spreading in every direction, each a foot and a half or two feet long, tapering to a hard spinous point; contracted in the lower part, but dilated at the very base, where they half clasp the stem: their upper surface is of a fine green, smooth, furrowed longitudinally, especially towards the end; the under paler, and more even; the edges quite even and smooth. *Panicle* terminal, compound, erect, composed of perhaps an hundred drooping *flowers*, not much inferior in size and beauty to those of the White Water-Lily, but more cream-coloured, tinged at the base and points with crimson, destitute of scent. Partial *stalks* about an inch long, round, smooth, with a pair of membranous *bracteas* at the base. *Stigma* in three distinct, spreading, cloven lobes. We cannot but think, notwithstanding Mr. Ker's opinion, that Andrews's figure belongs to this species, and not to *aloifolia*. This is evinced by the furrows and margin of the *leaves*, as well as by the structure of the *stigma;* though we must allow the whole representation to be less happy and characteristic than that in the Magazine.

2. Y. *recurvifolia*. Drooping-leaved Adam's-needle. Salisb. Parad. t. 31. Pursh n. 3.—Caulescent. Leaves linear-lanceolate, furrowed, recurved and drooping; their edges at length somewhat filamentous.—Native of the sandy shores of Georgia, where it was found by M. Leconte, flowering in July and August. The *flowers* are of a greenish-yellow, with a tinge of purple. *Stem* about three feet high. *Pursh.* This species is recorded in the *Paradisus Londinensis*, as having flowered, in the late Mr. Swainson's garden at Twickenham, in 1805; yet it is not admitted by Mr. Dryander, or Mr. Aiton, into the *Hortus Kewensis*, or its *Epitome*. The *flowers* are said by Mr. Salisbury to have a strong smell, mixed with something like a citron flavour. The three inner segments of the *corolla* are a little the broadest. *Stigma* most like the last. The edges of the *leaves* split off in a few disjointed filaments, in the manner of *Y. filamentosa*, though far less remarkably. We have seen no specimen. Mr. Pursh having observed this, as well as the *gloriosa*, in a living state, in North America, chiefly induces us to admit it into our list of species; garden plants being always less to be trusted in any doubtful question.

3. Y. *aloifolia*. Aloe-leaved Adam's-needle. Linn. Sp. Pl. 457. Willd. n. 2. Ait. n. 2. Pursh n. 5. Curt. Mag. t. 1700. (Y. arborescens, foliis rigidioribus rectis serratis; Dill. Elth. 435. t. 323.)—Caulescent. Leaves linear-lanceolate, even, straight; their edges bordered with fine callous notches.—Native of South America, according to most authors; of the coast of Carolina and Florida, flowering in August. *Pursh.* It was introduced, more than a hundred years ago, into the English and Dutch gardens, and is generally treated as a green-house shrub, though said to succeed and flower better, in mild seasons, in the open ground. The *stem* is generally simple, and rises to the height of fifteen to eighteen feet, even in our conservatories, being for the most part naked, round, three or four inches in diameter, marked with scars where leaves have been. The upper part, for the space of a foot or more, is thickly beset with *leaves*, spreading in every direction, the lower ones pointing downwards, the upper ones nearly upwards, a few in the middle only being horizontal. The *leaves* are all straight, narrower and stiffer than in *Y. gloriosa*, and distinguished by their crenate edges, as well as even surface. The *panicle* also is more dense and cylindrical, from two to three feet high. *Flowers* white, externally tinged with purple. *Stigma* abrupt, of three shorter, less dilated and spreading, lobes. Mr. Ker truly remarks, in the Botanical Magazine, that this species will thrive for many years with very little earth, in pots not more than a foot deep. Its flowering is a rare occurrence, and after that event, the head decays at the top, throwing out lateral shoots, and the plant becomes branched; but its elegant simplicity is destroyed, and we believe no more flowers, at least in our gardens, are ever produced.

4. Y. *draconis*. Drooping-leaved Adam's-needle. Linn. Sp. Pl. 457. Willd. n. 3. Ait. n. 3. (Y. draconis folio, serrato reflexo; Dill. Elth. 437. t. 324. Tacori; Clus. Exot. 48.)—Caulescent. Leaves linear-lanceolate, even, reflexed, crenate. Segments of the corolla spreading, somewhat recurved.—Native of South Carolina, according to Mr. Aiton, who marks this species as a hardy shrub, flowering in October and November. We have never seen an authentic specimen of the *flowers*, but in the very admirable plate, communicated to Dillenius by his friend Sprekelson of Hamburgh, and published in the Hort. Elth. as above, the *corolla* is represented with more lanceolate, flat, spreading,

ing, and in fome meafure reflexed, fegments, than in any of the foregoing. The *leaves* are defcribed longer, narrower, and thinner than in the laft fpecies, reflexed, being bent downwards, and pendulous, from about the middle, or rather nearer the bafe; they are moreover fhining, of a deeper green, lefs concave, and with longer more flender terminal fpines. They are an inch broad, and above two feet long. Dillenius fays the marginal notches are rather finer than in the laft. The Linnæan fpecific definition implies the reverfe. Commelin's plate in his *Præludia Botanica*, t. 16, exhibits very large and diftant fpinous teeth, at the edges of the *leaves*, fuch as we have never feen, even in young plants. We have therefore refrained from citing this author under the prefent fpecies, as well as his t. 14. of the fame work, and Plukenet's t. 256. f. 4. under the laft; becaufe, though they may be right, fuch figures afford no information or inftruction. Clufius fays the Indians ufe the fibres of the leaves of the fpecies of which we are treating, obtained by maceration and beating, as a fine kind of thread, like flax or filk; and they alfo make ftrong cordage of the fame, for tying the rafters of their huts together. Such qualities merit further inquiry.

5. Y. *filamentofa*. Thready Adam's-needle. Linn. Sp. Pl. 457. Willd. n. 4. Ait. n. 4. Purfh n. 1. Curt. Mag. t. 900. (Y. foliis lanceolatis, acuminatis, integerrimis, margine filamentofis; Trew's Ehret 9. t. 37. Yuca, five Jucca, vera, foliis filamentofis; Morif. fect. 4. t. 23. f. 2.)—Stem none. Leaves lanceolate, entire, coarfely filamentous at the edges.—On the fhores of Virginia and Carolina, and in the weftern parts of the fame countries, flowering in July and Auguft. *Purfh.* A hardy perennial in our gardens, flowering, though not very conftantly, in autumn. The *leaves* are numerous, a foot long, fpreading in the form of a rofe from the crown of the root; their points fpinous, but fhort; their furfaces both ftriated, a little glaucous, rough to the touch with minute harfh prickles; their edges befet with long recurved threads. *Flower-ftalk* folitary, erect, from four to five feet high, round, fmooth, leaflefs, bearing feveral fcattered, oblong, membranous, reddifh-brown *bracteas*, fuch as alfo accompany the partial ftalks. *Panicle* compound, lax and fpreading, of numerous large and handfome, pendulous, cream-coloured, bell-fhaped *flowers*, reprefented of much too yellow a hue in the Botanical Magazine. Their fegments are taper-pointed. *Filaments* rough, or glandular, with very fmall *anthers*. *Stigma* with fpreading, fomewhat recurved and cloven, lobes, like *Y. gloriofa*.

6. Y. *anguftifolia*. Narrow-leaved Dwarf Adam's-needle. Purfh n. 2.—Stem none. Leaves linear, elongated, rigid, fparingly filamentous at the edges. Fruit obovato-cylindrical.—Gathered by Mr. Nuttall, on the banks of the Miffouri, flowering in July and Auguft. Perennial. *Leaves* very narrow. *Stalk* from two to three feet high. *Fruit* large. *Purfh.* This appears not yet to have been brought to England.

The name of *Yucca* may be found applied, by the older botanifts, to feveral plants which have no botanical affinity to the prefent genus; fuch as Morifon's fect. 4. t. 23. f. 3, where the *leaves* are digitate; and *Jatropha Manihot* of Linnæus. (See JATROPHA.) Such plants agree in the efculent quality of their flefhy *roots*, which when grated and wafhed, yield a farinaceous fubftance, of which the natives of America and the Weft Indies appear to have made a kind of bread, long before our European corn was introduced among them.

YUCCA, in *Gardening*, contains plants of the fucculent, evergreen, fhrubby, hardy, and tender kinds, in which the fpecies cultivated are, the common Adam's-needle (Y. gloriofa), the thready Virginian yucca (Y. filamentofa), the aloe-leaved yucca (Y. aloifolia), and the dragon-tree-leaved yucca (Y. draconis).

Thefe are all fucculent evergreen fhrubby plants, fome of them having a flefhy nature and great regularity of growth.

Method of Culture.—Thefe plants are all capable of being raifed by offsets or fuckers, from the roots and heads of the old plants, as well as by feed.

The offsets and fuckers may be taken off any time in the fpring or fummer feafons, being laid in fome dry place for a few days, till the wounded part caufed by the feparation from the plant is dried and healed over; when they may be planted out feparately in pots of light fandy compoft, and be placed in a fhady fituation till they have taken root in a perfect manner. When affifted by a hot-bed, they often fucceed better.

The feed obtained from abroad fhould be fown in the fpring in pots of light earth, plunging them in a hot-bed, in which the plants foon come up; and when they are two or three inches high, they fhould be pricked out feparately in fmall pots of light fandy mould, replunging them in the hot-bed to forward their growth, affifting them with moderate waterings and frefh air daily, and hardening them by degrees to the full air, fo as to be fet out in June to remain till October, when they fhould be removed into the green-houfe for the winter.

Some plants of all the forts fhould conftantly be preferved in pots.

They are all very ornamental; the two firft after they have been hardened, in the dry borders, where the foil is light, and where the fituation is warm and fheltered; and the others in green-houfe collections, among other potted plants.

YUE, in *Geography*, a city of China, of the fecond rank, in Yun-nan; 1105 miles S.S.W. of Peking. N. lat. 25° 22'. E. long. 103° 22'.

YUEN, a river of China, which runs into the lake Tong-ting, 17 miles E. of Tchang-te.—Alfo, a city of China, of the fecond rank, in Hou-quang; 850 miles S.S.W. of Peking. N. lat. 27° 23'. E. long. 109°.

YUEN-KIANG, a city of China, of the firft rank, in Yun-nan, on the Ho-ti river; 1250 miles S.W. of Peking. N. lat. 23° 37'. E. long. 101° 44'.

YUEN-TCHEOU, a city of China, of the firft rank, in Kiang-fi; 750 miles S. of Peking. N. lat. 27° 50'. E. long. 114°.

YUEN-YANG, a city of China, of the firft rank, in Hou-quang, on the river Han; 517 miles S.S.W. of Peking. N. lat. 32° 50'. E. long. 110° 29'.

YVERDUN, or IFFERTEN, a town of Switzerland, in the Vaudois, and capital of a bailiwick, in the canton of Berne, fituated on the lake of Neufchâtel, otherwife called the lake of Yverdun, at the mouth of the river Orb, which divides into two branches, forming a good port, and an ifland, on which the town is fituated. The two fauxbourgs communicate with the town by bridges. It is ancient, and in the Theodofian table called "Caftrum Ebredunenfe," and "Ebrodunenfe," by which it is underftood to have been a place of ftrength. The Romans maintained here a *præfectus barcariorum*, and there yet exifts a fociety of boatmen, of ancient ftanding, and numerous, who have a particular police, privileges, and laws of navigation. From the Romans it paffed to the kings of Burgundy, and afterwards to the dukes of Zahringen. In the year 1259, it was taken by Peter of Savoy, who reduced it by famine, and it continued in in that family till the year 1536. In this year, the troops of Berne, when they had reduced the reſt of the Vaudois, laid ſiege to this town, and after a few days, became maſters, ſince which Yverdun has been ſubject to Berne. The police is adminiſtered by a great and little council, compoſed of thirty-ſix members, the preſident of whom has the title of *banneret*. It has a large and ſtrong caſtle, flanked with four towers, built in the 12th century, by Conrad, duke of Zahringen: other public buildings are, a college for the inſtruction of youth, an hoſpital, divers magazines, &c. and in the town-houſe is a library, formed not long ſince by contribution. The environs were formerly a moraſs, which has been drained, and is now become good and fertile land. Near the town is a ſulphureous medicinal ſpring, and in the year 1730, a building, for the purpoſe of bathing, was erected by the magiſtrates. In the middle of the laſt century, a company was formed, for the purpoſe of making a navigable canal from the lake of Yverdun to the lake of Geneva, but it was never finiſhed. The bailiwick is one of the moſt conſiderable in the canton of Berne, containing about 25 pariſhes and 20 lordſhips, and is about 15 miles in length. The fertility is moderate: the wine is not of the beſt quality; 34 miles S.W. of Berne. N. lat. 46° 48′. E. long. 6° 14′.

YVES, or Ivo, in *Biography*, biſhop of Chartres, was born in the 11th century, of a noble family, in the territory of Beauvais, and ſtudied theology under Lanfranc, prior of Bec. Being made abbot of St. Quentin, he opened a theological ſchool, which became famous; and having ſuperintended this inſtitution for fourteen or fifteen years, and maintained a regularity among thoſe who attended it conformable to the ancient canons, he was juſtly regarded as one of the chief founders of the order of canons-regular. Upon the death of Geoffrey, biſhop of Chartres, he was choſen as his ſucceſſor, and the election was confirmed by Urban II. in 1091. The diſcipline he maintained in his ſee was exemplary, and in the duties of it he was employed for 25 years, his epiſcopate and his life terminating in 1116. Beſides ſermons, a brief chronicle of the kings of France, and two collections of eccleſiaſtical decrees, he has left 287 epiſtles, from which may be learned the manners of the times in which he lived. Of theſe we have a ſummary by Dupin. A collection of his works was printed at Paris in 1647. His name is highly reſpected in the church of Rome, and pope Pius V. iſſued a bull in 1570, empowering the canons-regular of Latran to celebrate an anniverſary for "the bleſſed Yves." Dupin. Moreri.

YVETOT, in *Geography*, a town of France, in the department of the Lower Seine. This was once a place of conſequence, and the capital of a kingdom; 18 miles N.W. of Rouen.

YUFTS, or *Ruſſia Leather*, as it is called in England, are the chief products of the tanneries in Ruſſia; and the principal places in which they are prepared, next to Moſcow and Peterſburg, are, Arſamas, Koſtroma, Yaroſlaf, Pſcove, Kazan, Vologda, Niſhney-Novgorod, Vladimir, Ekatarinenburg, &c. Mr. Tooke has deſcribed the proceſs by which they are prepared:—The raw ox-hides are firſt laid in running water, or in large tan-pits full of water dug in the earth for that purpoſe, to ſoak for a whole week; but in ſummer not ſo long. During this time they are daily taken out of the water, and ſcraped at a ſcraping-bench, or wooden horſe. Having now been duly ſteeped, they are put into a ley, thus prepared: In other vats, likewiſe dug in the ground, and under cover, they mix two parts of good aſhes with one part of unſlacked lime, in boiling water, and ſink the wet hides in this ley on a grating, which being ſuſpended by cords, can be raiſed or let down at pleaſure. In this vat the hides are laid again for about a week, though in warm weather leſs, in cold perhaps even longer. The ſign that they have lain long enough in the ley, is, that the hair can without difficulty be rubbed off with the hand, ſo that none remains. If the hides, after the expiration of a week, are not in that condition, freſh aſhes are put into the ley, and the ſkin ſunk in it. But if at length the hair be ſufficiently looſe, the hides are entirely taken out of the ley, and all the hair ſcraped off on a ſtretching-block, by means of blunt iron ſcrapers with two handles. The hair is waſhed clean, and ſold for domeſtic uſes. The hides, thoroughly cleanſed from hair, are ſuſpended in vats of clean water on a running ſtream, where they remain three days, diligently turning them to and fro, in order to purge them from the aſhes and ley; afterwards they are hung up, and left to drain. The hides muſt now be ſcraped on the fleſh ſide. To this end they employ either the aforeſaid ſcraping-iron, or others ſharper in various degrees. After this treatment, the hides are trampled. But calves-hides have another ſort of preparation, which the yuft-tanners, in the interior towns of the empire, who moſtly practiſe it, call rakſcha. This preparation is performed with the white excrement of dogs dried, which is diſſolved in boiling water, and to a hundred hides about four vedros full of excrement is the rule. If here the right proportion with the water be not found, the hides corrupt in this ſlime, the object whereof ſeems to be the complete freeing of the ſkin from the ſalts that adhere to it from the ley. The hides are left to lie twice twenty-four hours. With this is ſtirred a ſour gruel of oatmeal with warm water, and to three oſmics, or eighths of a chetverik, three or four vedros of dregs of the common quas, which the people make of meal and a ſmall portion of malt, put in the thin gruel, that it may quickly ſour with the hides. To ten hides, the tanners uſually reckon forty pounds of meal.

After the hides have ſoured, which is done in large vats, they are laid in other vats, and well ſteeped for two or three days in a ſtrong tan-juice, ſok, thoroughly boiled from good bark. When this is done they are brought ſtraight to the tan. In the tan-pits, in which often ſome hundreds of hides are lying, is poured half water and half tan, or water boiled with tan, and a grating is hung in with cords, having one hide after the other ſpread upon it, thick ſtrewed with good fine-pounded tan, and the grating conſtantly let deeper into the pit, till it be nearly full; yet ſo that the tan-liquor is always above the hides, which are then again ſprinkled over with tan. In this tan the hides continue to lie a week; thoſe of full-grown animals longer. On being taken out, they are waſhed and trampled on, which two workmen in a ſummer's day can perform with three hundred hides. The next day they are laid, in the manner above-deſcribed, in freſh tan. Thus they generally get four times ſucceſſively freſh tan, and are every time rinſed clean. In the laſt tan they lie three weeks, or longer, are then finally waſhed, hung up, and, when they have tolerably drained, delivered to thoſe workmen whoſe buſineſs it is, in particular workſhops, to dye, dreſs, and wax the yufts, and to deliver the goods finiſhed. It is to be obſerved, that the Ruſſian yuft-tanners ſeldom uſe oak-tan, and never willingly. The choiceſt and beſt tan is that of the tſchernotal, as they call it, or the black willow; and alſo the young bark peeled off from other ſhrubby willows, which are collected by the boors, dried in bundles, and brought in cart-loads to market. To ten hides, the tanners compute one and a half fathom of theſe bundles of willow-bark,

bark, as they are laid one upon another for fale, through all the tans. It muft not, however, be imagined that the excellence of the Ruffian yufts depends on this; for in Siberia, where are no oaks, and but few willows of any fize, they tan yufts with only birch-bark, which are not much worfe than the Ruffian. The bark is made fmall by either ordinary tan-mills, turned by horfes or by water; or the tanner himfelf, in many towns where there are no mills, caufes it, at unneceffary expence and labour, to be pounded in wooden mortars, or excavated blocks, with peftles, almoft like thofe in the tan-mills, by day-labourers.

The dyeing of the yufts is performed in two ways, and of two colours. The commoneft and moft natural cuftom of giving the colour to the hides is, by fewing them together in pairs, the hair fide inwards, while they are yet moift, round the edges, with rufhes or ftripes of bark, thus forming them into a bag or fack; into this fack the colour is put, the fack well fhook, and the fuperfluous dye let to run out, whereupon the fkins are dried. From this method of dyeing them, it feems to proceed that the yufts are called and taken by pairs. The other procefs, whereby much trouble, time, and colour are faved, and the edges of the fkin entirely preferved, is the following: Each fkin is hung upon a horfe over a long trough, fo that the hair fide, which muft be ftained, appears outwards, pouring the dye upon it out of the dye-kettle, till the whole fkin is dyed. The two colours given to the yufts are red and black. The red dye is thus prepared: Pound brafil-wood (fandal) in the pounding-mill, or with hand-peftles, as fine as the tan, and boil it in kettles. Previous to the dyeing, fteep the fkins in alum-water. It is calculated, that to each fmall yuft-fkin a half, and to a large one a whole pound of logwood is put. But the latter are moftly coloured black. To a hundred yufts to be dyed red, four pounds of alum is fufficient. For dyeing black the brafil-wood is likewife ufed; but in the red dye, to a hundred fkins three pounds of good iron vitriol is diffolved. After the firft tincture the fkins are dried, and afterwards on tables done over again with the fame dye and rolled up, that they may thoroughly imbibe the dye. For heightening the colour this tincture is fometimes thrice repeated. When the fkins are now tolerably dried, by hanging, that the colour may not fade, with the flefh fide outwards, the yufts, ftill fomewhat moift, are fmeared over on tables that have ledges. There was a time when it was commanded by authority to ufe nothing but dolphin and feal-blubber for fmearing them; but by that the yufts are harfher, and have not that yuft fmell, which foreigners prize fo much, unlefs the birch-tar, deggot, prepared in Ruffia, at leaft be mixed with it. At prefent this birch-tar alone is ufed for fmearing. This done, the fkins are cleanfed from any impurities that may remain, and are fent to the dreffing-houfe, where fkilful workmen fcrape them firft with fcraping-irons, having two handles, with the edge crofs-wife on a ftretching-bench, that a foft thin leather remains with a clear gloffy furface, free from all impurities. Other workmen then take the clean-fcraped yufts on large clean tables, fprinkle them on the flefh fide with a gentle fhower of frefh water from their mouths, and lay them flightly rolled up to moiften. This done, the fkins are taken feparately one after another, folded together, and worked and calendered in all directions, to make them foft and pliant. They are then curried with a kind of wooden curry-comb, with fharp irons fixed in leathers, like a card for carding wool, the fkin being folded with the hair fide outwards, by which the whole furface of the yufts acquire the crofs-ftrokes or trellis-like marks they are always feen to have. Some work the fkins with the hands firft dry, not fprinkling them till they are mangled with the card. Laftly, thofe fkins which are too harfh and ftiff to the feeling, are more or lefs fprinkled with linfeed-oil, and thus are ready for the merchant.

In this connection we fhall introduce from the fame author an account of the Ruffian method of preparing and dyeing their faffian, maroquin, or Morocco leather, which are dyed at Aftrachan of three colours, red, yellow, and black. The treatment of the red faffians, which are the moft famous, is ufually as follows:—The raw hides are firft laid in large vats, and have river water poured upon them, in which they are left to foak for three or four times twenty-four hours. They are then taken out, the water is drained and fqueezed from each fkin, and are fcraped one by one on the ftretching-bank with fcraping-irons, uraki, quite gently on the flefh fide, in order to take away the groffer impurities, but principally for opening the fkin, and to qualify it for the enfuing operation.

They now proceed to make the hair fall clean off, chiefly by the application of lime. To a hundred hides is ftirred in about half a bufhel of unflaked lime in vats with river water, and the hides are laid in fo as that the lime may as much as poffible be equally diftributed over all of them. The Aftrachan Tartars let the hides lie in this lime-pit frequently three weeks; but it is well known, that their faffians are fo harfh and liable to crack, and even fcorched by it, that they are fit for nothing, and can only impofe upon an inexperienced purchafer. They then take out fkins, wafh them, and carefully fcrape off the hair, now become loofe, with wooden fcrapers. It often happens, that the hair is not perfectly loofened by the firft lime-ley, but that many tender ftubbles and fmall hairs are left remaining. In this cafe, the hides muft be put into frefh lime-ley, and be left perhaps two weeks in it; the hair then comes off, and the hair fide of the fkin gets a green and very white appearance, but the fubftance is then alfo very foft, and the faffians, by this corrofion of the lime, are very little durable in comparifon of other kinds of leather.

The method now for taking the lime again out of the hides, is the fecond treatment with dog-excrement, or white gentian, which is carefully collected for this purpofe. This excrement, which is indifpenfably neceffary, is pounded, put into a narrow not very large vat, warm water poured upon it, the mafs thoroughly ftirred, and the cleanfed hides are put with it into another vat, fo as that the diffolved album grecum is fpread and infinuated over and between every fkin. In thefe ingredients, the fkins muft lie only twenty-four hours, or if the quantity of album grecum prove not rich, fomewhat longer. The proportion here to be obferved cannot be accurately afcertained; for the faffian-makers are guided generally by eye-meafure, and obferve only that the water be very thick and turbid, and confequently acrid enough. The hides come out of this corrofive much fofter and thinner than they were, and are now freed from the force of the lime; but no time muft be loft in endeavouring to extract the corrofive likewife, that the hide may not be even more ruined by it than by the lime. They are generally very careful that the hides lie not too long in this corrofive, which they judge of by their eye from the pliancy and fupplenefs of them. As foon as the fkins are lifted out, the unclean moifture is carefully and forcibly preffed out, and they are laid without lofs of time in a vat, wherein wheat-bran is ftirred to a tolerably thick gruel with warm water; in this they lie again about thrice twenty-four hours, whereby all the former defects are completely remedied, and the fubftance of the

fkin

ſkin is ſofter and mellow. All theſe particulars are in ſome meaſure of no other ſervice than to bring off the hair thoroughly clean from the ſkin.

Now follows the proper preparation of the ſkins taken out of the wheat-bran. This is done chiefly by honey. To eighty hides they take about twenty-five pounds of raw honey, boil it in a kettle, pour as much water to it as is neceſſary for giving it a due conſiſtence, and ſtir it for a pretty long time boiling on the fire. They then let the kettle cool, till they can but juſt bear the hand in it, and then pour the ſtill hot honey-water on the hides lying ſingly in little trays, by ladle-fulls, till they have thoroughly imbibed the honey-water. When all the ſkins are duly drenched, they are thrown into a dry vat all together, laying at top a board with weights upon it, and covering the whole vat with felt, carpets, or furs, that the vapour during the fermentation may not eſcape; and in this manner, the ſkins muſt ferment once more thrice twenty-four hours. By this means they acquire the grain. From the honey-vat they are rinſed clean in luke-warm water, wrung as dry as poſſible, and ſteeped immediately in a moderately ſtrong pickle or brine made of common ſalt, in which they muſt be left five or ſix days. This time being elapſed, the ſkins are taken out of the pickle, and hung upon clean poles, that the brine may drain out, as it would be thought injurious to ſqueeze it out with the hands. This done, the ſkins have received their whole preparation, and may now be dyed red, but not yellow; becauſe for the yellow ſaffians, as was ſaid before, the preparation is of another kind.

For giving the red ſaffians the colour, nothing is uſed but cochineal, or, as the Tartars call it, kirmifs, and that in the following method: Firſt, they boil a quantity of the herb ſalſola ericoides, by the Tartars called tſchagan, plentifully growing on the arid Aſtrachan ſalt-ſteppes. To about four Ruſſian vedros of water is put of this dried herb ſomewhat leſs than a pound, and it is ſet to boil for a whole hour, whereby the water acquires a dark greeniſh colour, but betrays no acrimony to the taſte. The ſaffian-maker only takes care that the water be not too deeply tinctured, and that when dropped on the thumb-nail ſhews only a ſcarce perceptible green; and in caſe it have adopted too many particles of the colour, it is drawn off, and freſh water put, in which the herb muſt boil again, till the decoction has received the due degree of ſaturation. The herb is then with a ſcoop taken clean out of the kettle, and then the previouſly nicely powdered cochineal thrown into a kettle of four Ruſſian vedros to about half a pound, well ſtirred, and freſh fire added, in which great attention muſt be paid, that the red ſcum, which ariſes from boiling, does not boil over, therefore conſtantly ſome is taken and again poured in, in order by this refrigeration to prevent the over-boiling, and to allay the foam. After boiling for about an hour and a half, the water has obtained a ſtrong tincture; but as much of it is boiled away, the kettle is filled up again with the remaining decoction of the herb tſchagan, and the thus attenuated colour boiled afreſh, till it is ſeen that the cochineal is perfectly diſſolved, and the colour become thoroughly bright. Upon this, to the whole kettle is put about two lote of pounded and burnt alum into the dye, with which it is to boil about a quarter of an hour, and then the fire is taken from under the kettle, leaving only ſome hot embers, that the dye may retain as much heat as the hand can but juſt bear. This done, the ſkins prepared for dyeing are taken in hand, the dye poured by ladles into trays, one ſkin folded together after another, with the hair ſide outwards, and then are worked in their portion of dye ſo long, till they have uniformly abſorbed all the dyeing particles, and only ſomewhat of a pale moiſture remains. The leathers being thus for the firſt time ſtained are quickly ſqueezed out, hung up ſingly acroſs poles, and when they are all done, they are directly taken for the ſecond time, and imbued in the ſame manner with dye, and this treatment is repeated for the third and the fourth time; ſo that each ſkin gets four ladles of the dye. From the fourth dye the ſkins are no more preſſed out, but hung up entirely wet, to be ventilated, upon poles.

After the dye, the ſkins are once more curried with the leaves of the tan-tree, which the Armenians call belgè. The cruſhed or pounded dry leaves, which the Aſtrachan ſaffian-makers get from the Terek, are ſtirred in broad troughs to a thick gruel with river water, and the coloured ſkins laid in it, between each of them, leaving a ſufficiency of the leaf-ooze; the tanner then goes barefoot into the troughs upon the ſkins lying on one another. In this tan, or quas, as the workmen call it, the ſaffians lie eight days and nights, adding freſh tan every other day; ſo that four tans are neceſſary.

Here it muſt be obſerved, that ſome Armenians who prepare ſaffians, for enhancing the quality of the red colour of their ſaffians, to half a pound of cochineal add two lote, or rather more of ſorrel, (or lutor, or loter, as they call it,) in the dye-kettle, but it is uſually omitted in Aſtrachan, on account of its high price; for which reaſon the Aſtrachan ſaffians are excelled by the Turkiſh in beauty of colour. Secondly, it is to be known, that inſtead of the leaves of the tan-tree, bruiſed nut-galls are held to be ſtill more ſerviceable for giving the ſaffians the tan. By this means, the colour is ſo durable as never to paſs away but with the leather; whereas the ſaffians prepared with the tan-tree begin ſoon to be diſcoloured. But the nut-galls are likewiſe too dear in Aſtrachan to be cuſtomarily uſed by the ſaffian-makers. The Kazan Tartars colour their ſaffians with red wood, and tan them with the ſhrub uva urſi, but it makes the worſt ſaffians of all, as they preſently fade.

When the ſaffians are lifted out of the tan, ſtill the laſt work remains. They are firſt left ſome time in the air to dry, they are afterwards ſcraped on the ſtretch-bank with ſharp ſcrapers on the fleſh ſide, quite ſmooth and clean, then waſhed in running water, each ſkin duly ſtretched with pegs all round the edges, and thus left till they are dry.

The ſkins muſt now be ſmoothed on the hair ſide with a wooden inſtrument for that purpoſe; and laſtly, they are laid on a thick felt, where, with an iron heckle that has blunt points, thoſe little pittings, which the ſaffians are generally ſeen to have, are impreſſed on the ſame ſide. And thus they are ready for ſale, without being ſmeared with linſeed-oil, as is mentioned in Gmelin's travels, which would infallibly ſpoil them.

The yellow ſaffians are little made in Aſtrachan, as the demand for them is much leſs, and there are but few ſaffian-makers who know much of the matter. The dye which they make uſe of for this purpoſe is of the berries of a ſort of rhamnus (perhaps lycioides), which are brought from Perſia under the name of uloſcharr, and uſually bought for ſix to nine rubles the pood. The Kazan Tartars colour their ordinary yellow ſaffians with the flowers of the yellow camomile, which they gather under the name ſare tſchetſchiak, *i. e.* yellow-flower.

In preparing the yellow ſaffians, they obſerve in Aſtrachan the following difference of treatment: 1. They make no uſe whatever of honey in the preparation. 2. They never

never at all put the hides into the falt brine. 3. Inftead of the honey-preparation and the pickling, they lay the hides before the dyeing, in the foregoing manner, in the tan of the leaves of the kitzliar tan-tree, leaving them in it eight days. 4. For preparing the dye, they have no need of the herb tfchagan, but the berries alone are boiled in clear water, of which to four Ruffian vedros of water about ten pounds are requifite, and heighten the colour afterwards with three lotes of alum to every pound of berries. The dyeing is performed in the fame manner as has been related with the red, and after the dyeing there is no need to lay the faffians in the tan, as having before received it. Nothing more is neceffary than to fcrape them clean, to work them thoroughly, to polifh and to ornament them. The yellow faffians ufually are fold at one ruble twenty kopeeks; but the red at fomewhat more, on account of the dearnefs of the dye, generally one ruble eighty kopeeks.

YUG, or Yog, the more correct mode of writing the word *jogue*, by which the Hindoos diftinguifh the poetical or mythological ages of the world. We have noticed thefe wild fpeculations under the more popular word *jogues;* to which, to Gentoos, Kalki, Kalpa, and Yogeswara, we refer thofe defirous of farther information hereon.

YUGASIRI, in *Hindoo Mythology*, is the name of the wife of *Vairava*, an incarnation of *Siva*. See thofe articles.

YUHAGHIRS, in *Geography*, a Ruffian tribe, which occupies the northernmoft parts of the territory of the Yakutes, bordering on the Frozen ocean, from the Yama to the Kolyma. They were known to the Ruffian conquerors as early as the Yakutes; but on account of their wild and impaffable deferts, could not be brought into entire fubjection until the year 1639. They had never feen a horfe, though that fpecies of animals was found among the Yakutes; and therefore they appear to have been for a long time confined to their cold, fenny, and mountainous diftricts. The whole people, at the revifion before the laft, fays Mr. Tooke, paid taxes only for about 1000 heads; but it was fo eafy for them in their deferts to evade the payment, that their entire population may be computed at a much higher number. See Yakutsk.

YVIAS, a town of France, in the department of the North coafts; 4 miles E.N.E. of Pontrieu.

YVICA. See Ivica.

YUKANLOOT, a town of Candahar; 10 miles E.N.E. of Suffa.

YULDUZ. See Yolotou.

YUMA, or Yumba, or *Long Ifland*, one of the Bahama iflands: about 50 miles in length, of very unequal breadth. N. lat. 23° 20′. W. long. 74° 50′.

Yuma, in *Mythology*. See Tscheremisses.

YUMAR, the name of the object of worfhip among the Votiaks; fimilar probably to Yuma, Yummel, and Yummala, among other tribes of the ancient Finns.

YUMBA Bay, in *Geography*, a bay on the E. coaft of the ifland of Hifpaniola, S. of Cape Spada.

YUMETOS, a clufter of fmall iflands, among the Bahama iflands, about 20 miles S.W. from Yuma.

YUMFONG, a fmall ifland, near the coaft of China, about three miles from the ifland of Tfeng-ming. N. lat. 31° 42′. E. long. 121° 17′.

YUMMALA, in *Mythology*, an idol deity of the Finns, who had a rich temple in Permia, or Biermia, fuppofed to have extended from the White fea to the mountains of Ural. This temple was decorated with a profufion of gold and jewels. See Permians.

YUMMEL, an appellation by which the Lieflanders and Efthonians worfhipped the true God; in fubordination to whom they only admitted inferior deities as beneficent and malicious fpirits.

YUN, in *Geography*, a city of China, of the fecond rank, in Yun-nan; 1262 miles S.W. of Peking. N. lat. 24° 32′. E. long. 99° 35′.

Yun, or *Tong-pe*, a city of China, of the firft rank, in Yun-nan; 1135 miles S.W. of Peking. N. lat. 26° 44′. E. long. 100° 34′.

YUNA, a river of Hifpaniola, which runs into the Somana bay.

YUNCHA, a town of South America, in the province of Tucuman; 60 miles S. of St. Jago del Eftero.

YUNG-KANG, a city of China, of the fecond rank, in Quang-fi; 1140 miles S.S.W. of Peking. N. lat. 22° 56′. E. long. 107° 26′.

YUNG-NGAN-POU, a fortrefs of China, in Chen-fi, on the borders of Tartary; 110 miles N. of Ling-tao.

YUNG-NING, a city of China, of the fecond rank, in Chan-fi; 300 miles S.W. of Peking. N. lat. 37° 35′. E. long. 110° 39′.

YUNGUS, or Vungus Vicus, in *Ancient Geography*, a place of Gaul, on the route from Reims to Treves. Anton. Itin.

YUN-HING, in *Geography*, a city of China, of the firft rank, in Ho-nan. The country within its diftrict is very large, and is partly flat, and partly mountainous, efpecially to the north and fouth; it is watered by feveral rivers, which render the foil very fruitful. There are two towns of the fecond rank, and twelve of the third under its jurifdiction; 430 miles S. of Peking. N. lat. 33°. E. long. 113° 52′.

YUN-LEAN-HO, a canal of China, formed of the river Pay-ho, or rather the river itfelf made navigable from Hiam-ho to Tien-tfin, in the province of Pe-tche-li, for the purpofe of conveying corn towards Tong-tcheou and Peking. The name in the Chinefe language is faid to mean corn bearing.

YUN-NAN, a province of China, bounded on the N. by Se-tchuen and Thibet, on the E. by Quang-fi and Koeitcheou, on the S. by Laos, and on the W. by Ava and Pegu; about 300 miles in length, and 250 in breadth. This province is reckoned one of the moft fertile and opulent in China. Its inhabitants are brave, robuft, affable, and fond of the fciences, which they cultivate with fuccefs: its rivers, gold, copper, and tin-mines; its amber, rubies, fapphires, agates, pearls, precious ftones, marble, mufk, filk, elephants, horfes, gums, medicinal plants, and linen, have procured it a reputation which renders it refpectable to the Chinefe. Its commerce is immenfe, as well as its riches, which are faid to be inexhauftible. This province contains 21 cities of the firft clafs, and 55 of the fecond and third. Sir George Staunton eftimates the population at eight millions.

Yun-nan, a city of China, of the firft rank, and capital of Yun-nan, fituated at the north extremity of a lake. It was formerly celebrated for its extent, and the beauty of its public edifices. Here were feen magnificent buildings, vaft gardens, tombs, triumphal arches, and elegant fquares; but the Tartars, in their different invafions, deftroyed all thefe monuments; and the city at prefent contains nothing remarkable: it is, however, the refidence of the governor of the province. It comprehends in its diftrict four towns of the fecond clafs, and feven of the third; 1152 miles S.S.W. of Peking. N. lat. 25° 6′. E. long. 102° 28′.

YUNTAI, an ifland near the coaft of China, in the

Eastern sea, 30 miles in circumference; about two miles and a half from the continent. N. lat. 34° 35′. E. long. 119° 19′.

YVOY. See CARIGNAN.

YUPURA, a river of Peru, which branches off from the Caqueta, about N. lat. 1°, and after an easterly course of about 500 miles, runs into the river of the Amazons by many mouths, 100 miles W. of Fort Rio Negro. S. lat. 4°.

YURATZKOI, the denomination of the shore that lay between the rivers Yenissey and Oby.

YURCUP. See URCUP.

YURE L'EVEQUE, a town of France, in the department of the Sarte, on the Huise; 3 miles E. of Le Mans.

YURIEF, a name given by the Russians to Dorpat, built by order of Yaroslaf in the year 1030.

YURIMAGUAS, a town of South America, in the audience of Quito, on the Guallaga; 60 miles S. of La Laguna.

YURNA, a small island on the coast of Brasil, at the mouth of the river Amazons, near the equinoctial line. W. long. 50° 40′.

YVRY, a town of France, in the department of the Eure; 11 miles N. of Dreux.

YUSDROME, in *Commerce*, a weight of Turkey, the oke being the 44th part of the cantaro, quintal, or kintal, containing four yusdromes, or chequees, or 400 druns; the chequee of cotton yarn being = 11½ ounces avoirdupois; the chequee of goat's wool = 5 lbs. 10 oz. avoirdupois; and the chequee of opium = 27 oz. 10 dr. avoirdupois.

YUTHIA, in *Geography*, the capital city of Siam, situated on an island formed by the river Meinam. See SIAM.

YUTI, a town of Paraguay, on a river of the same name, which runs into the Paraguay, 115 miles S.E. of Assumption.

YU-YANG, a town of Corea; 15 miles S. of Kang.

YXIR, a word used by some of the old chemists to express any thing good in medicine.

YZQUAUHTLI, in *Ornithology*, the Indian name for a bird described by Nieremberg, and called the crested eagle.

YZQUIEPATL, in *Zoology*, the name of an American animal of the weasel kind, with a short slender nose; short ears and legs; black body, full of hair; long tail, of a black and white colour; its length from nose to tail is about eighteen inches. It inhabits Mexico, and perhaps other parts of America. It lives in the caves and in the hollows of rocks, where it breeds, and brings up its offspring. It feeds on worms, beetles, and other insects, and small animals: when pursued, it breaks wind backward with an insupportable stench. See CONEPATL.

Professor Kalm was one night in danger of being suffocated by one that was pursued into a house where he slept; and it affected the cattle so that they bellowed through pain.

Another, which was killed by a maid-servant in a cellar, so affected her with its stench, that she lay ill for several days; and all the provisions in the place were tainted to such a degree, that the owner was obliged to throw them away.

Nevertheless, the flesh is reckoned good meat, and not unlike that of a pig; but it must be skinned as soon as killed, and the bladder taken carefully out. Pennant.

Z.

Z, The last letter in the alphabet, and one of the double consonants, both among the Latins and Greeks.

Its pronunciation is much more soft and obtuse than that of the *x*; which makes Quintilian call it *jucundissima*, and *dulcissima*. Nevertheless, the sound was not always the same as it is now; which is but, as it were, half that of an *s*: or, that, expressed by its name *izzard* or *s hard*, of an *s* uttered with closer compression of the palate by the tongue, as *freeze*, *froze*.

It had something originally in it of the *d*; but only what sounded very smoothly: thus, *Mezentius* was pronounced as if it had been *Medsentius*, &c.

The Z had also an affinity with the *g*: thus Capella, "z à Græcis venit, licet etiam ipsi primo *g* Græca utebantur."

Z begins no word originally English; although it is found in the Saxon alphabets, set down by grammarians, it is read in no word originally Teutonic. Johnson.

Z was also a numeral letter, signifying two thousand; according to the verse:

"Ultima Z tenens, finem bis mille tenebit."

When a dash was added at the top, $\bar{Z}$, it signified two thousand times a thousand.

This letter formerly stood as a mark for several sorts of weights. Sometimes it signified an ounce and a half, and very frequently it stood for half an ounce: sometimes for the

the eighth part of an ounce, that is, a drachm Troy-weight; and it has in earlier times been used to express the third part of an ounce, or eight scruples.

On French coins, Z denotes those struck at Grenoble.

ZZ, these letters were used by some of the ancient physicians to express myrrh. At present they are often used to signify *zinziber*, or *ginger*.

ZAAB, or Zeb, in *Geography*, a district of Africa, in the country of Sahara, belonging to the Algerines. It was anciently a part of the Mauritania Sitifensis, and is a narrow tract of land lying immediately under the Atlas. N. lat. between 34° 30′ and 35°.

ZAARA. See Sahara.

Zaara, a word used by the *Arabian physicians*, to express the *vigilia morbosa*, or continual watchings of persons in many illnesses.

ZAARAM, in *Ancient Geography*, a town of Arabia Felix, which, according to Ptolemy, was the residence of the king of the Cinædocolpites.

ZAARON, in *Geography*, a mountain of Africa, on the western side of the plain of Fez, in sight of Mequinez, on which is a village consecrated to Mahometan devotion. It contains the sanctuary of Sidi Edris, who came from Medina at the end of the 8th century, introduced Mahometanism, and was the first sovereign of his race in this part of Africa. This sanctuary is an asylum for malefactors, and never violated by the emperor of Morocco.

ZAB, a town of the Arabian Irak, on the Euphrates; 65 miles W.S.W. of Bagdad.

Zab, *Great*, the Zabatus of Xenophon, and Lycus of Ptolemy, a river of the Lower Kurdistan, in the pachalic of Bagdad, which rises in the same range of hills, and contiguous to those of the Diala, mentioned in history by the names of Delos and Arba; this latter river, increased by several streams, continues its course to the south, and enters the Tigris, about 5 miles above Tauke Kesra. During the summer it is fordable at Bakooba, 9 leagues from Bagdad, on the road to Kermanshaw, and is near 150 yards wide, at the place where a bridge of boats is thrown across it, for the convenience of travellers, just before it approaches the Tigris. The Great Zab at first pursues a northerly course, when meeting with a small stream, which comes from the district of Alhak, it proceeds to the westward, unites with the Hakiar, or river of Julamerick, and then flowing in a S.W. direction, forms a junction with the Hazir su (anciently Bumadus), and disembogues into the Tigris at Toprukala, 14 fursungs (or about 42 miles) below Mosul. Between Mosul and Erbille, this river can only be forded in the summer, and when low, it is so deep and so rapid that it is difficult of passage. The 10,000 Greeks commenced their retreat by crossing this river in the face of the Persian army. Xenophon reckons it 400 feet wide; but when the Greeks passed it, it must have been fordable.

Zab, *Little*, the *Zabus Minor* and *Caprus* of the Macedonians, a river of Kurdistan, formed by the junction of a great number of little brooks, which originate in the hilly country to the E. of Khoi Sindjack. At Altun Kupri, 68 fursungs from Bagdad, on the route to Mosul, it joins the Altun su, or golden water, and terminates in the Tigris, opposite to the large and rich city of Cœne, or the present village of Senn, 30 miles below Haditha. This river is narrow, winds very deep, and very rapid. That part of the Lower Kurdistan that lies N. of the Little Zab, has in every age been a rich and productive province; and still continues to supply Bagdad, Mosul, and the other cities, with corn, cattle, cheese, butter, dried fruits, and almost every other kind of provision. Another river, the Odorneh, supposed by some authors to be the *Phuskus* of Xenophon, is also formed by the junction of many streams, which arise in the hills between Kerkuk, the largest town in the Lower Kurdistan, (N. lat. 35° 29′,) and *Solymania* (which see). *Kerkook* or *Kerkuk*, (which see,) entitled *Demetrius* by Strabo, and *Corcura* by Ptolemy, lies in the direct road from Bagdad to Mosul, 59 fursungs from the former, and 41 from the latter, on a commanding eminence, but with narrow and filthy streets and mean houses. The population is estimated at 18,000 souls, Turks, Armenians, Nestorians, and Kurds; but this estimate is supposed to exceed the truth by 5000. It is defended by a mud wall, has 2 gates, 7 mosques, 14 coffee-houses, one hummum, one caravansera, one Armenian church, and 12 pieces of useless artillery. The suburbs contain 5 mosques, 9 small caravanseras, 13 coffee-houses, 3 convents, and 3 catholic churches. Around the town the country is hilly, and on the N. side a low range of barren and rocky mountains separates the district of Kerkook from the fine plain of Altun Kupri. At a small distance there is a number of naphtha pits, which supply the neighbouring country with the naphtha, which in a liquid state is raised in leathern buckets, and deposited in earthen jars. The river Odornah, after pursuing a S.W. course, falls into the Tigris, 20 fursungs above Bagdad. Its bed is about 60 yards broad, and its springs contain a large body of water. Kinneir's Persia.

ZABA, or Sabana *Emporium*, (*Batu-Saber*,) in *Ancient Geography*, a considerable place, and one of the principal trading towns of India, in the peninsula beyond the Ganges; marked in the map of D'Anville, a little W. of the S.E. point of this peninsula.

ZABACHA, in *Geography*. See Azof.

ZABADÆANS, in *Ancient Geography*, Arabs who lived to the east of the mountains of Galaad. In the 1st book of the Maccabees we learn that Jonathan marched against them, and defeated them.

ZABATRA, in *Geography*, a town of Asiatic Turkey, in the government of Marasch; 48 miles N.E. of Marasch.

ZABDA, a large and pleasant town of Syria, situated among the mountains, and chiefly, if not solely, inhabited by Christians, which furnishes 700 men fit for war. The town is divided into five districts, each having its separate scheick, who pays tribute to the emir of the Druses: they complain of oppression; and the state of the place and the adjacent country shew that their complaints are not unfounded. The town is sheltered by mountains, but the locusts are very destructive. Tobacco is one of the chief articles of cultivation. A rivulet, rolling from the rocks, turns the mills, and waters the ground. The air is salubrious, unmolested with excessive heat. Near it is a long structure, apparently part of an aqueduct, called "the tomb of Noah." It extends about 60 feet, being the stature of Noah, according to oriental tradition. The pilgrims who formerly came to worship in an adjacent mosque were very numerous; and the religious revenue is said to amount to 300 purses annually. Browne's Travels.

ZABDICENA, in *Ancient Geography*, a country of Asia, and one of those called by Ammianus Marcellinus Transtigritanes, because they lay beyond the Tigris, with respect to Persia. It was extended along the Tigris.

ZABECES, a people of Africa, in Libya, neighbours of the Marges and Zygantes, according to Herodotus.

ZABELTITZ, in *Geography*, a town of Saxony, in the margravate of Meissen; 4 miles N. of Grossen Hayn.

ZABER, a river of Wurtemberg, which runs into the Neckar, near Lauffen.

ZABERN, Conrard de, in *Biography*, born in Germany about 1450, was a very learned man, and much respected for his morals. He wrote two treatises on music; the first of which is entitled "De Monochordo," and the second "De Modo bene Cantandi." He was much beloved by the emperor Frederic III.

Zebern, in *Geography*. See Bergzabern.

ZABI, or Zaba, in *Ancient Geography*, a place of Africa, in Mauritania Sitifensis, on the route from Carthage to Cæsarea, between Aræ and Macri. Anton. Itin.

ZABII, or Zabians. See Sabæans and Sabaism.

ZABIN, in *Geography*, a town of Lithuania; 30 miles N.E. of Minsk.

ZABIRNA, in *Ancient Geography*, a river of Asia, in Mesopotamia, which discharges itself into the Tigris.

ZABLOTOW, in *Geography*. See Sablotow.

ZABLOWICZE, a town of Lithuania; 86 miles E.S.E. of Pinsk.

ZABOLA, a town of Transylvania; 10 miles N. of Cronstadt.

ZABORE, a town of Russia, in the government of Irkutsk; 36 miles S.S.W. of Kirensk.

ZABRZEH. See Hohenstadt.

ZABULISTAN. See Sablestan.

ZABULON. See Zebulun.

Zabulon, *Tribe of*, in *Ancient Geography*, was bounded on the N. by the tribes of Asher and Naphtali, on the S. by the torrent of Kishon, on the E. by the sea of Galilee, and on the W. by the ocean. Almost all the towns of this tribe were on the plain of Galilee.

Zabulon, a town of Judea, situated on the plain of Galilee, in the tribe of the same name, according to Joshua and the book of Judges. Josephus says, that Cestius, though he admired its beauty, took, pillaged, and burnt it. It was situated S.E. of Ptolemais.

ZABUR, a country of Asia, in Babylonia, in which was the town of Seleucia.

ZABUS, Zabatus, or *Zerbis*, (*Great Zab* or *Zarb*,) a river, which is the same with the Lycus, flowed from a source towards the 36th degree of latitude, and directed its course first to the N.W., then to the W., afterwards to the S.W., and finally to the S., discharging itself into the Tigris, about lat. 35° 45′. Xenophon says, that this river, at its entrance into the Tigris, appeared to the Greeks comparable to the Tigris itself. See Zab.

Zabus *Minor*, or *Caprus*, (*Lesser Zab*, or *Altun-Sou*,) a river of Asia, which had its source E. of Arbelles, and ran towards the S.W., discharging itself into the Tigris, over against Cœne, below or S.S.E. of the greater Zabus. See Zab.

ZACA, in *Geography*, a town of Egypt; 17 miles N.E. of El Arish.

ZACANTHA, in *Ancient Geography*, a town of Hispania, in Iberia, said by Steph. Byz. to have been taken by Hannibal, and to have been called Zacynthus or Saguntum.

ZACAPA, in *Geography*, a town of Mexico, in the province of Vera Paz; 42 miles S. of Vera Paz.

ZACAPULA, a town of Mexico, in the province of Chiapa; 130 miles S.E. of Chiapa dos Espagnols.

ZACATECAS, a province of Mexico, bounded on the north by New Biscay, on the east by Guasteca, on the south by the provinces of Mechoacan, Guadalajara, and Chiametlan, and on the west by Chiametlan and Culiacan. It is well inhabited, and abounds with large villages. Part of it lies in the temperate and part in the torrid zone: it is about 100 leagues in length, and 45 in breadth. The western part of it is an arid tract, and would not be inhabited were it not for the mines, which were formerly reckoned the richest in America; but the eastern part abounds with corn, and fruits of various kinds, and its forests are full of deer.

Zacatecas, the capital of the fore-mentioned district, the importance of which has declined with the mines. It formerly contained about 12,000 families of Spaniards and mixed breeds, though consisting chiefly of one street, in a deep passage between high rocks, crowned with cottages. Luis de Potosi on the S.E. is said by Alcedo to contain only 1600 families of Spaniards, Mulattoes, and Indians, though it has six magnificient churches. The ridge of St. Peter, five leagues from the city, contained rich mines of gold and silver; but they are now in part exhausted, and the fuel has become scarce. The opulence of this city has in course declined, and the chief trade is in goat-skins and tanned leather.

Zacatecas. See St. Louis *de Zacatecas*.

ZACATLAN, a town of Mexico, in the province of Tlascala; 30 miles N. of Puebla de los Angelos.

ZACATULA, or Sacatula, a town of Mexico, in the province of Mechoacan, on a river of the same names, near the Pacific ocean; 95 miles S. of Mechoacan. N. lat. 18° 35′. W. long. 103°.

Zacatula, a small but fertile province in the dominion of Mexico.—Also, a river of Mexico, which runs into the Pacific ocean, near the town of Zacatula.

ZACCARIA. See Tevo.

ZACCHIA, Paolo, in *Biography*, an eminent physician, was born at Rome in 1585, and in the progress of life was distinguished by his learning, and by his skill in music, painting, poetry, and eloquence, as well as in the more appropriate sciences relating to his own profession. He was physician to pope Innocent X., and celebrated among his contemporaries by various publications; of which the principal is intitled "Questiones Medico-legales, in quibus omnes materiæ medicæ quæ ad legales facultates videntur pertinere, proponuntur, pertractantur, resolvuntur;" a work which has been often reprinted. He was also the author, in Italian, of two esteemed works, "Del Vitto Quadragesimale," 1637, the subject of which is the regimen of diet in Lent; and "De' Mali Ipocondriachi," 1639, a diffuse treatise on hypochondriacal affections. He died in 1659, aged 75. Haller. Eloy. Gen. Biog.

ZACCONI, P. Lodovico, of Pesaro, author of an ample treatise of music, entitled "Prattica di Musica," the first part of which was printed at Venice, 1592, and the second in 1596; a publication in which the author not only proposes to give instructions for the regular composition, but the accurate performance of every species of music. The idea is splendid; but the world has been so frequently deceived by the titles of books, that authors are obliged to abate in their promises, in proportion as the expectations of the public are diminished. If arts and sciences could be acquired by the dead letter of silent instruction, every one who could read, in Italy, might, during the times under consideration, have been a musician. But though no ingenious occupation was perhaps ever yet completely taught by books, without a master, or by a master, without books, yet they are excellent helps to each other. It is hardly possible for a didactic work to satisfy all the doubts that arise in an inquiring mind during solitary meditation; particularly in the first stages of a student's journey through the rugged roads of science. But when he has made some progress, if he should be separated from his guide, the way becomes daily so much more straight and smooth, that by the

the help of these kinds of charts, he will be enabled to advance with tolerable speed and facility by himself.

Zacconi's work, though sometimes dry and tedious, contains much useful and practical knowledge. And as he is almost the only Italian writer on the subject of music who has not bewildered himself in inquiries concerning the systems of the ancient Greeks, or the philosophy of sound, he has had the more leisure for analysing the art, and facilitating the student's progress. This author regarded Okenheim, Josquin, Isaac, Brumel, Mouton, and Senfelio, as ancients compared with Willaert, Morales, Cipriano, Zarlino, and Palestrina; and these last, ancient with respect to himself and cotemporaries; and says (lib. i. cap. x.), that as the ancient Greeks and Romans produced their musical effects by mere melody, united with poetry, and Josquin and other early contrapuntists, by notes of different lengths, harmonized and worked into perpetual fugue; so the more modern, though the rules of harmony are the same, by a different disposition of concords, inversions, and other contrivances, produce a greater variety of effects.

He likewise observes (cap. xxiii.), that "every age has vainly thought its music brought to as great a degree of perfection as was possible; but it was always found that the next age continues to change, and still to think the same. Okenheim, the master of Josquin, and even in the days of Josquin, John Mouton, his scholar, had the same ideas of their own improvements; yet, since their time, music has not stood still, but made great advances towards perfection, being more light and pleasing."

The change in musical *modes* has continued to our own time, and will doubtless continue to the end of *all* time; for melody, being a child of fancy and imagination, will submit to no theory or laws of reason and philosophy; and therefore, like love, will always continue in childhood.

Zacconi's chief labour and merit in the third book have been the explanation of the moods, and correction of errors in the notation of old composers, to which his work will serve as a useful collection of errata. In Book I. he dwells much on the superiority of the singing and singers of his own time, over all that preceded them; and has a long chapter upon the manner of gracing and embellishing a melody, where he tells us, "Che stile si tenghi nel far di *gorgia;* dell' uso de i moderni *passagi*, come si *fiorischino* le cantilene;" and speaks of *acconciature*, as the modern Italians do of *rissioramenti*, or graces. The divisions, however, into which he breaks passages, in order to *embellish* them, if adopted by an opera-singer of the present times, would be like a modern fine lady appearing at court in the furbelows and flounces of queen Elizabeth, or a fine gentleman in the peruke of sir Cloudesley Shovel.

ZACHAN, or SOCHAN, in *Geography*, a town of Hinder Pomerania; 14 miles E. of Stargard. N. lat. 52° 13′. E. long. 15° 28′.

ZACHAREVSKAIA, a fort of Russia, in the government of Ekaterinoslav, on the Konskija; 28 miles W. of Mariupol.

ZACHARIÆ, JUSTUS FREDERICK WILLIAM, in *Biography*, was born at Frankenhausen in Thuringia, in 1726; and during the course of his elementary education at his native place, he distinguished himself by various poetical pieces. In 1743 he went to Leipsic to study jurisprudence, but directing his chief attention to the belles lettres, he produced his mock-heroic poem, entitled "Renommisten," which Eichorn, in his History of Literature, says, was the commencement of heroi-comic poetry among the Germans. In the following year, he was admitted as an associate by the young men who contributed to the work published under the title of "Amusements of Reason and Wit." From Leipsic, where he remained about three years, he removed to Gottingen, where, attracting the notice of professor Klaproth, he was recommended by him to be a member of the German society. In 1748 he was appointed tutor at the Caroline college at Brunswick, and in 1761 he became professor of poetry in that institution; to which, in the succeeding year, were annexed the offices of inspector of the typographic and bookselling establishment belonging to the Orphan House, and director of the Brunswick Intelligencer. From 1768 to 1774, he was editor of the New Brunswick Gazette; in 1775 he was appointed to the diaconate of St. Syriac, at Brunswick; and he died in the month of June, 1777, in the 51st year of his age. His biographer states, that "he possessed a very fertile and vivid imagination, with a fine taste, improved by observation and acquaintance with the world. As a poet, he composed with uncommon facility, and tried his talents in almost every species, but was the most successful in the descriptive and heroi-comic. His burlesque poems were distinguished from every thing of the kind that had before appeared in Germany." A collection of Zachariæ's poetical works was published at Brunswick in 1763—1765, 9 vols. 8vo. Gen. Biog.

ZACHARIAH, or ZECHARIAH, one of the minor prophets, who commenced the exercise of his gift in the 8th month of the 2d year of Darius, the son of Hystaspes; and on account of the precision and clearness of his predictions, he has been intitled "the sun among the minor prophets." The most remarkable of his prophecies are those that relate to the advent of the Messiah, and to the destruction of Jerusalem. Dupin.

ZACHARIAS, *Pope*, a native of Greece, succeeded Gregory III. in 741; at a time when the Roman territory was threatened with an invasion by Luitprand, king of the Lombards, and when the sons of Charles Martel were too much engaged by domestic broils to undertake its defence. The pope, therefore, tried how far he might avail himself of the authority of religion in averting the storm; and by a solemn embassy and personal visit, he not only obtained peace, but induced Luitprand to restore to the Roman see four cities which he had taken from it. He also interposed, in 743, with Luitprand on behalf of the exarch of Ravenna, and prevailed with him to desist from an invasion of the exarchate, and to grant peace, as well as to give back the fortress of Cesena to the exarch; and in the same year he held a council at Rome to settle some matters of discipline, particularly such as related to the clergy. During the pontificate of Zacharias in the year 746, Carloman, the eldest son of Charles Martel, who had surrendered his dominions to his brother Pepin, went to Rome, and assumed the monastic habit, with which he was solemnly invested by the pope. Rachis, the successor of Luitprand, who, upon his accession to the throne in 747, was peaceable disposed towards the pope and the Romans, took up arms against them; but his hostile purposes were averted by the remonstrances of Zacharias, and those of some of his principal clergy and nobility, who visited his camp, in order to obtain peace; nor were they successful merely in this object; but the result of their interview was Rachis's resignation of his crown, the assumption of the monastic habit conferred upon him by the pope, and retirement to the monastery of Monte Casino, where Carloman resided. In 752 Pepin applied to the pope for permission to seize the crown of France, and to set aside Childeric III.; the pope consented, and Childeric was provided for in a monastery. Zacharias, having displayed talents in the exercise of his office, which gave

him

him rank among the greateſt of the popes, and having eſtabliſhed an eſtimable character by his liberality to the poor, and by his munificence in public works, died in 752, in the 11th year of his pontificate. Some of his decrees and epiſtles, and alſo his tranſlation of the dialogues of St. Gregory from Latin into Greek, are extant. Bower.

ZACHAROVA, in *Geography*, a fort of Ruſſia, in the government of Irkutſk; 32 miles N.N.E of Kirenſk.

ZACHAU, a town of Brandenburg, in the Middle Mark; 10 miles E. of Brandenburg.

ZACHAW, Frederic Wilhelm, in *Biography*, an able múſician and organiſt at Halle, in Saxony, was born at Leipſic in 1665. He had the honour and good fortune to have Handel for his ſcholar. He is ſtill celebrated by the Germans as a maſter, who had eſtabliſhed an admirable ſchool of muſic at Halle, and as one who was deeply ſkilled in all the arcana of compoſition and performance.

ZACHEO, or Desechio, in *Geography*, a ſmall iſland in the Weſt Indies, between Hiſpaniola and Porto Rico; about 27 miles N.E. of Mona.

ZACHTLEVEN, Cornelius, in *Biography*, was born at Rotterdam in 1606, and became an admirable painter of ſcenes of humour, imitating the ſtyle of Bronwer; but in ſubjects of a more ſober deſcription, which he alſo painted, ſuch as farm-houſes, kitchens, and the recreations of villagers, &c. he choſe the more light and agreeable ſtyle of Teniers for his model; and in that ſtyle attempted to embody the ſame deſcription of perſons and compoſitions. In neither, however, of his imitations did he attain an equal degree of ſpirit or of truth with his prototypes. His works are well compoſed, and the touch with which they are executed is bold and free; they are not often met with, but are thought deſerving of a place in the beſt collections.

Zachtleven, Herman, was the younger brother of Cornelius, and was born at Rotterdam in 1609. He is ſaid to have been the pupil of Van Goyen, but did not follow the ſtyle of that maſter. His principal occupation appears to have been in painting views of the banks of the Rhine and the Meuſe. Theſe he executed in a very neat manner, but with a mean and common-place ſtyle of ſelection and imitation. The tones and hues of his pictures are generally cold, but freſh; and as he appears to have had great knowledge of aërial perſpective, his diſtances are well preſerved; and the forms drawn with great care and minuteneſs. He never left Flanders, though it has been aſſerted that he went to Italy. His drawings are numerous, and are carefully preſerved in the beſt collections. He died in 1685, aged 76. Both he and his brother Cornelius employed the etching-needle, and left ſeveral neatly executed plates, from deſigns of their own.

ZACINTHA, in *Botany*, whether ſo called by Matthiolus, the author of the name, becauſe this plant was originally found in the iſle of Zante, or for what other reaſon, does not appear.—Matth. Valgr. v. 1. 457. t. 460. Schreb. Gen. 534. Willd. Sp. Pl. v. 3. 1624. Ait. Hort. Kew. v. 4. 468. Sm. Prodr. Fl. Græc. Sibth. v. 2. 145. Tourn. t. 269. Poiret in Lamarck v. 8. 831. Gærtn. t. 157.—Claſs and order, *Syngeneſia Polygamia-æqualis*. Nat. Ord. *Compoſitæ-ſemifloſculoſæ*, Linn. *Cichoraceæ*, Juſſ.

Gen. Ch. *Common Calyx* double: the *outermoſt* ſhort, erect, of ſeveral lanceolate leaves, membranous at the edges; *innermoſt* larger, ſimple, furrowed, of eight permanent, linear, acute, converging leaves; at length ſwelling and very prominent at the baſe. *Cor.* compound, imbricated, uniform: florets equal, perfect, of one petal, ligulate, linear, abrupt, with five teeth. *Stam.* Filaments five, capillary, very ſhort; anthers united into a cylindrical tube. *Piſt.* Germen ovate-oblong; ſtyle thread-ſhaped, the length of the ſtamens; ſtigmas two, reflexed. *Peric.* none, except the interior calyx, which becomes woody, cloſed, depreſſed, with a point, having eight rounded protuberant angles, each ſcale enfolding one of the marginal ſeeds. *Seeds* ſolitary to each floret; the *marginal* ones ovate-oblong, incurved, compreſſed at the ſides, gibbous at the back, tapering below, ſtriated; longitudinally channelled, and villous, in front; *central* ones oblong, ſlightly incurved, quadrangular, compreſſed at the back, ſtriated, ſmooth. Down ſeſſile, ſomewhat feathery. *Recept.* naked.

Eſſ. Ch. Receptacle naked. Seeds of the circumference incurved; of the centre ſtraight. Down very ſhort, finely feathery. Outer calyx membranous; inner with eight protuberances.

1. Z. *verrucoſa*. Warty Zacintha. Gærtn. v. 2. 358. Willd. n. 1. Ait. n. 1. Sm. Fl. Græc. Sibth. t. 820, unpubliſhed. (Lapſana Zacintha; Linn. Sp. Pl. 1141. Cichorium verrucatum, Zacintha; Cluſ. Hiſt. v. 2. 144. C. verrucarium; Ger. Em. 289.)—Native of Italy, Crete, Lemnos, and Zante, as well as of mount Athos. *Sibthorp.* The *root* of this, the only known ſpecies, is annual. *Stems* ſomewhat leafy, round, ſmooth, branched and forked, ſpreading, from a ſpan to eighteen inches high. *Leaves* runcinate, ſmooth; the radical ones largeſt and moſt numerous. *Flowers* yellow, ſmall. The ſwelling part of the *calyx*, after flowering, aſſumes a purple colour. See Lapsana and Rhagadiolus.

ZACO, in *Geography*, a territory which probably belonged to the province of Adiabene, and was generally comprehended between the Tigris and the Caprus, or Little Zab. The ridges or mountains of Zaco are a part of the Kurdiſtan region, on which was the road along the Tigris, between Moſul and Jezirah. Theſe ridges were lofty, ſteep, and rocky, and the path rugged and difficult of aſcent. It was part of the road of the 10,000 Greeks in their retreat. The preſent town of Zaco ſtands near the northern part of the ridge, denominated from it; and it is the moſt conſiderable place that occurs between Moſul and Jezirah; and is ſurrounded by a fertile diſtrict, which produces a great variety of excellent fruits. Zaco ſtands in an iſland of the river Kurnib, which deſcends from the Kurdiſtan or Carduchian mountains, and falls into the Tigris, a few miles below the town.

ZACONDA, a town of Africa, in the country of Ante, where the Dutch built a fort. It was a conſiderable town at one time, till in a war between the people of Ante and Adom, it was burnt down by the latter; ſince which it has never been thoroughly repaired.

ZACUTO, or Zacutus Lusitanus, in *Biography*, a phyſician, was born at Liſbon in 1575, and educated at Salamanca and Coimbra. In his 20th year he took the degree of doctor, and ſettling in his native city, practiſed with reputation for thirty years. As he was a deſcendant of Jewiſh parents, his dread of the Inquiſition, after the edict of Philip IV. againſt the Jews was iſſued in 1625, induced him to retire to Holland, where he openly profeſſed the religion of his family, and maintained a character highly reſpectable, both in his profeſſion as a phyſician, and in his moral conduct. He died at Amſterdam in the year 1642; and left behind him a collection of works, amounting to 2 vols. fol. The principal of his works are, "De Medicorum Principum Hiſtoria," lib. vi. in which he approves himſelf a ſtrenuous advocate of Galen and the Greek phyſicians; "Praxis Hiſtoriarum Morborum," lib. v.; and "Praxis Medica admiranda," lib. iii. In all his works he blends acuteneſs of obſervation with a certain degree of

ſuperſtitious

ſuperſtitious credulity; but they are nevertheleſs conſulted and quoted. Haller. Eloy.

ZACYNTHUS, in *Ancient Geography*, an iſland of the Ionian ſea, W. of that part of the Peloponneſus on which is the Sinus Chelonitis. It is now called *Zante*. Strabo makes its compaſs 160 ſtadia. It had many forts, and was very fertile. In this iſle was a town of the ſame name, ſituated in the eaſtern part, with a citadel. According to Dionyſius of Halicarnaſſus, it derived its name from Zacynthus, ſon of Dardanus, who, accompanied by a number of Phrygians, ſettled here. According to Thucydides, the firſt Greeks known in this iſland were Achæans, who came hither from Achaia. It paſſed under the dominion of Philip, king of Macedon, who ſurrendered it to Amynander, king of the Athamanes, who confided the government of it to Philip of Megalopolis, by whom it was transferred to Hierocles of Sicily. After the defeat of Antiochus at Thermopylæ, Hierocles ſold it to the Achæans. Livy ſays, that the town and citadel were aſſaulted and captured by Levinus; and Pauſanias informs us that it was called Pſophis. According to Scylax it had one port; and Pliny ſays that it was very fertile, and that its port was named Hyrie; but P. Mela diſtinguiſhes Hyrie from Zacynthus.

ZACYNTHUS, a town of Africa, in Libya. Steph. Byz.

ZACYNTHUS, an epithet uſed by the ancients to a liquid bitumen, from the iſland Zante.

ZAD, in *Geography*, a name given to the Niger of Africa, in Bornou, which is deſcribed in Horneman's Journal as flowing eaſtwards. Its breadth was given to him for one mile, and he was told that it flowed towards the Egyptian Nile, through the land of the heathens. The courſe here given is directly towards the Congo; and it is ſaid, that Zad is the name of the Congo at its mouth, and it is the name of the Congo for at leaſt 650 miles inland.

ZADADRUS, in *Ancient Geography*, a river of India, on this ſide of the Ganges; which received the waters of the Hypaſis and Adris, according to Ptolemy.

ZADAN, in *Geography*, a town on the weſt coaſt of the iſland of Celebes. S. lat. 2° 55′. E. long. 119° 9′.

ZADAON, a river of Portugal, which runs into the Atlantic, near Setuval.

ZADELSDORF, a town of Saxony, in the circle of Neuſtadt; 3 miles S.S.E. of Auma.

ZADONZK, a town of Ruſſia, in the government of Voronez, on the Don; 92 miles N. of Voronez. N. lat. 53° 4′. E. long. 39° 14′.

ZADRACARTA, in *Ancient Geography*, a very large town of Aſia, the capital of Hyrcania, according to Arrian.

ZADRAMA, a town of Arabia Felix, the capital of the Cinædocolpites. Steph. Byz.

ZADRAN, in *Geography*. See HATVANY.

ZADRIS, in *Ancient Geography*, a town of Aſia, in the interior of the Colchide. Ptol.

ZADURA, in the *Materia Medica* of the ancients, a name given to a foreign root, which was round and ſmooth, and of the colour of ginger.

It was at that time imported from the Indies, and greatly eſteemed in peſtilential caſes.

ZÆA, or ZEA, in *Ancient Geography*, a very ancient town of Greece, in Bœotia. Steph. Byz.

ZÆTIA, or ZETIA, a town of Arcadia, N. of Megalopolis. It had two temples, one of Ceres, another of Diana.

ZÆZAR, in *Geography*, a town of Spain, in the province of Murcia; 22 miles N.W. of Murcia.

ZAFANIN, a town of Fez, near the coaſt of the Mediterranean; 35 miles S.E. of Melilla.

ZAFARANBOLI, a town of Natolia; 28 miles S. of Amaſieh.

ZAFFABEN, a word uſed by ſome of the chemical writers to expreſs putty.

ZAFFE IBRAHIM, in *Geography*, a town on the eaſt coaſt of Madagaſcar. S. lat. 17°.

ZAFFER, ZAFFRE, or SAFFRE, in *Chemiſtry*, is the reſiduum of cobalt, after the ſulphur, arſenic, and other volatile matters of this mineral have been expelled by calcination: ſo that it is a kind of calx or oxyd of cobalt, mixed with a portion of ſiliceous matter, of a grey or reddiſh colour; in which ſtate it is imported from Saxony. It is uſed to produce a very fine blue colour, when it is melted with fuſible and vitrifiable matters.

The blue colour produced by the vitrification of zaffer proceeds from the earth or calx of a ſemi-metallic ſubſtance contained in cobalt, called by chemiſts *regulus of cobalt*. This is proved by melting zaffer with a reducing flux, like any other roaſted ore, by which means the regulus will be obtained. The ſcoria in this fuſion has alſo a blue colour, proceeding from a portion of the calx of the regulus that is not reduced, but is vitrified together with the ſcoria. The calx, therefore, or metallic earth of the regulus of cobalt, is the ſole cauſe of the blue colour produced by zaffer.

But as this is contained in cobalt in various quantities, ſome zaffers produce more blue than others. The heterogeneous fixed matters contained in cobalts contribute, according to their quantity, not only to the greater or leſs intenſity of the blue colour, but alſo to its luſtre and beauty; and, therefore, thoſe who manufacture zaffer from cobalt make frequent eſſays of the roaſted ore, by mixing it with vitreous matters, in order to diſcover the intenſity and beauty of the blue colour.

Good cobalt calcined would form too deep a blue, and almoſt a black glaſs, if it were not previouſly mixed with a certain quantity of vitreous frit. In the manufacture of zaffer, therefore, the calx of cobalt, the ſtrength of which has been determined by previous eſſays, is mixed with ſuch a quantity of ſand, or of powdered flints and quartz, that with the addition of ſome ſaline flux, a deep blue glaſs may be formed. See COBALT.

The zaffer that is commonly ſold, and which comes from Saxony, is a mixture of oxyd of cobalt with ſome vitrifiable earth: it is of a grey colour, and ſome zaffers are clearer than others, according to the intenſity of the colour which they are capable of producing.

Zaffer is employed in the manufacture of pottery and of porcelain, for painting the ſurface of the pieces of ware, upon which it is applied, together with ſome ſaline flux, previouſly to the baking or glazing, that the ſame fire may vitrify this colouring material.

The blue of zaffer is the moſt ſolid and fixed of all the colours that can be employed in vitrification; it ſuffers no change from the moſt violent fire. It is ſucceſsfully employed to give ſhades of blue to enamels, and to the cryſtal glaſſes made in imitation of ſome opaque and tranſparent precious ſtones, as the lapis lazuli, the turquois, the ſapphire, and others of this kind.

To prepare zaffer for uſe in the glaſs-trade, put it in groſs pieces into earthen pans, and let it ſtand half a day in the furnace; then put it into an iron ladle to be heated red-hot in the furnace; take it out while thus hot, and ſprinkle it with ſtrong vinegar: and when cold, grind it on a porphyry to an impalpable powder, then throw this into water

water in glazed earthen pans; and when it has been well ſtirred about, let it ſettle and pour off the water: repeat this waſhing often, and the foulneſs of the zaffer will be thus wholly ſeparated. Dry the powder, and keep it for uſe.

ZAFFRAM, a word uſed often by authors to expreſs ſaffron, but ſometimes as the name of other things of a yellow colour; thus ochre was called by this name.

ZAFFRAMEN, a word uſed by ſome medical writers to expreſs ſaffron.

ZAFRA, in *Geography*, a town of Aſiatic Turkey, in the government of Maraſch; 15 miles S.W. of Tarſus.—Alſo, a town of Aſiatic Turkey, in the government of Trebiſond, on the Black ſea; 50 miles N.W. of Trebiſond.—Alſo, a town of Spain, in Eſtremadura; 22 miles E. of Xeres de los Caballeros.

ZAFRANIA, in *Colours*, a term uſed by the Greeks to expreſs the yellow of ſaffron. The barbarous writers of the after-ages tranſlated it into the Latin *crocietas*, or ſaffron colour.

The later Greek writers only uſe it, and they have taken it literally from the Arabians, Avicenna, and Serapio. This was a term uſed by them to expreſs the colour of the fine bole-armenic of Galen, which they tell us ſtained paper to a fine and beautiful gold colour.

ZAGA, in *Botany*, Poiret in Lamarck Dict. v. 8. 831. (Zaga Pohon, or *Corallaria latifolia*, Rumph. Amboin. v. 3. 175. t. 110.)—This is one of thoſe trees, whoſe hard red ſeeds are uſed for ornament, in the form of necklaces, bracelets, &c. by the natives of tropical climes, and even by the inhabitants of the moſt poliſhed countries of Europe, as faſhion, from time to time, is pleaſed, in her capricious wiſdom, to ordain. Such are the beautiful red and black ſeeds of *Abrus precatorius*, of which there is a pearly white variety, of rare occurrence. Such alſo are thoſe much larger ſeeds, of the ſame combination of colours, produced by the Weſt Indian genus ORMOSIA. (See that article.) The *Zaga* of Rumphius and Poiret is evidently a papilionaceous plant, with pinnate *leaves*, compoſed of about three pair of elliptic-oblong, entire, ſtalked, rather large leaflets, with an odd one. *Flowers* in panicled terminal cluſters. *Legumes* elliptic-oblong, pointed, hard and ſmooth, each containing one, rarely two, hard, ſhining, round *ſeeds*, all over of the colour of red coral, larger than thoſe of *Adenanthera pavonia*, being as broad as the fore-finger nail, and deſtitute of the defined circumſcribed area, for which the ſeeds of the *Adenanthera* are remarkable.

ZAGALA, in *Geography*, a town of Spain, in Eſtremadura; 25 miles S. of Alcantara.

ZAGAN, a town of the principality of Georgia, in the province of Kaket; 3 miles N. of Teflis.—Alſo, a town of Perſia, in the province of Irak; 12 miles S.W. of Hamadan.

ZAGARA, a mountain of Greece, in Livadia, anciently called Helicon.

ZAGATHAI, a name given from the ſecond ſon of Zingis to Great *Bucharia;* which ſee.

ZAGATIS, in *Ancient Geography*, a river of Aſia, in the Colchide, according to Arrian, who fixes its mouth between Athenæ and Anchiane Regia.

ZAGAWA, in *Geography*, a city of Africa, in Bornou, on a river which runs into the ſame lake, where the Niger is by ſome ſuppoſed to be loſt. N. lat. 19° 10′. E. long. 25° 50′.

ZAGGOS, a mountain of Africa, in which are ſome mines of ſalt; 100 miles S. of Algiers.

ZAGHARA, a town of Africa, in Bornou.

ZAGI. See ZEGI.

ZAGILLONITIS, in *Ancient Geography*, a country of Aſia, in Cappadocia. Strabo.

ZAGING, in *Geography*, a town of Auſtria; 3 miles N. of St. Polten.

ZAGIRA, in *Ancient Geography*, a town of Aſia, in Paphlagonia, at a ſmall diſtance from the ſea. Ptol.

ZAGLIA, in *Geography*, a town of the iſland of Corſica; 8 miles S.E. of Calvi.

ZAGORA, a town of European Turkey, in Romania, on a lake which communicates with the Black ſea; 12 miles S.W. of Burgas.

ZAGORA, in *Ancient Geography*, a town of Aſia, in Paphlagonia, on the coaſt of the Euxine ſea, between Caruſa and the mouth of the river Halys, according to the Periplus of Arrian.

ZAGOROLO, in *Geography*, a town of the Popedom, in the Campagna di Roma; 3 miles W. of Paleſtrina.

ZAGOROW, a town of the duchy of Warſaw; 20 miles S. of Kaliſch.

ZAGRAB. See AGRAM.

ZAGROS, MOUNT, a mountain of Perſia, in the province of Irak, along the brink of which extends the diſtrict of Kurrend, from the vicinity of Holwan to the village of Goour. It is covered with foreſts of oak, and inhabited by an extraordinary race of men, among whom ſubſiſt cuſtoms ſimilar to thoſe of the Kadmuſia in Syria, deſcribed by Volney. It is ſaid that in their nocturnal feſtivals, the garments of the fair ſex, at the expiration of a certain period, are thrown into a heap, and jumbled together. The lights are then extinguiſhed, and the clothes being regularly diſtributed among the men, the candles are relighted; and it is ſettled by the rules of the ſociety, that the lady muſt patiently ſubmit to the embraces of the perſon who has become poſſeſſed of her dreſs, whether father, ſon, huſband, or brother. The lights are then once more extinguiſhed, and all of this licentious tribe paſs the remainder of the night in the indulgence of the moſt promiſcuous luſt.

ZAGRUS, or ZAGRIUS MONS, in *Ancient Geography*, a mountain of Aſia, in Media. It made a part of mount Taurus, commencing in Armenia, and extending as far as the Chalonitide, between Media and Adiabene. Pliny. It is reckoned by Ptolemy one of the moſt conſiderable countries in Media. According to Strabo, it was this chain of mountains which touched the Niphates, and ſeparated Media from Babylonia.

ZAGU, in the *Materia Medica*, the name given by ſome authors to the ſago-tree, the *todda pauna*, or *palma fructi pruniforme*.

ZAGUANANAS, in *Geography*, a river of conſiderable length in New Mexico, which flows from the ſame ſources with the Rio Bravo, and joins the *Colorado;* which ſee.

ZAGYTIS, in *Ancient Geography*, a country of Africa, in Libya. Steph. Byz.

ZAHARA, in *Geography*, a town of Spain, in the province of Seville. In 1407, this town was taken from the Moors; about two years after the Moors retook the town, but not being able to reduce the citadel abandoned it. In 1481, it was ſurpriſed by the Moors, in a dark ſtormy night; moſt of the inhabitants were put to the ſword, and the reſt ſent ſlaves to Grenada; 36 miles S.E. of Seville. N. lat. 36° 50′. W. long. 5° 33′.

ZAHARA. See SAHARA.

ZAHIA, a word uſed by the Arabian phyſicians to expreſs a ſort of dyſentery, in which there was a very large

large discharge of blood from the rectum, attended with an evident sensation of abrasion, or pain in the bowels.

ZAHNA, in *Geography*, a town of Saxony; 8 miles N.E. of Wittenberg. N. lat. 51° 56′. E. long. 12° 54′.

ZAHRADKA, a town of Bohemia, in the circle of Czaslau; 17 miles S.S.W. of Czaslau.

ZAHRINGEN, an ancient citadel in the Brisgau, which gave the title of duke to a noble family that became extinct in the 13th century; 1 mile N. of Friburg.

ZAIBAC, one of the many names by which the ancient chemists have called mercury.

ZAIDIR, a name by which some of the chemical writers have called verdigrise, or the rust of copper; and others, the metal itself; and some brass.

ZAIM and TIMAR, lordships granted under those names in the Ottoman empire for life, as military rewards and encouragements. Those who possess a zaim, or timar, are honoured with the title of aga; they are bound to a military personal service, and obliged to bring with them to war one or more *gébélis*, horsemen or foot-soldiers, armed and equipped according to the revenue and extent of the lordship. The timar differs in no respect from the zaim, except that it is of less value, and that the aga who possesses it does not arm as many horsemen and foot-soldiers as the other. The number of zaims in Turkey in Europe is 914, and that of the timars is 8356. Nearly the same number is reckoned in Asia, which furnishes, with the *gébélis*, a militia of upwards of 60,000 men, better disciplined, and more inured to war than the spahis and the janizaries. This militia for a long time constituted the principal force of the Ottoman empire: to this principally the first sultans were indebted for the astonishing success of their arms, and the rapid progress which they made in a little time in Asia, in Europe, and even in Africa.

On the death of a zaimat, or a timariot, the sultan is to draw a year's revenue from the lordship, and nevertheless, give it up again to the son of an aga, a spahis, or any other military man, especially to him who, by a brilliant action, has distinguished himself in battle, who has first mounted to the assault, penetrated into the enemy's intrenchments, killed a great number of infidels, or contributed to put them to the rout. But since the sultans prefer to the fatigues of war and the dangers of battle the tranquillity of their seraglio, and the pleasures of their harems; and more especially since avarice and a love of gain have caused to be put up to auction the places intended for the recompence of valour and merit, the lordships are become the patrimony of the rich and of intriguers. Thus the best institutions degenerate; thus the Mussulman, formerly intrepid and valiant, becomes merely a vile plunderer, or a ferocious assassin; and the Ottoman armies, so formidable to their enemies, are become an object of contempt or pity, and this vast empire would no longer exist, if some European power were not interested in its support.

ZAIN, in *Horses*, a term used by the French to signify a horse of a dark colour, neither grey nor white, and without any white spot or mark upon him in any part. See HORSE.

ZAINAH, in *Geography*, a town of Algiers, in the province of Constantina; supposed, from some considerable ruins, to have been Zama, an ancient and royal city of Numidia; 25 miles S.E. of Seteef.

ZAINE, or *Wadel Berber*, a river of Africa, which runs into the Mediterranean, N. lat. 36° 54′. E. long. 9° 16′.

ZAIRA KAKONGO, an island in the Atlantic, at the mouth of the river Zaire.

ZAIRAGIA, or ZAIRAGIAH, a kind of divination in use among the Arabs; performed by means of divers wheels, or circles, placed concentric to one another, and noted with several letters, which are brought to answer to each other, by moving the circles according to certain rules.

This is also called *zariah*, because the circles of this machine, which are called *mutazariat*, *laflak*, &c. are intended to correspond to the orbs of the planets, and the atmospheres of the several elements.

ZAIRE, or SAIRE, in *Geography*, a river of Africa, which rises in the country of Matamba, about S. lat. 10°, and takes a northerly course to lat. 3°, in the kingdom of Congo; after which it takes a south-westerly direction, and runs into the Atlantic, S. lat. 6°. E. long. 12° 20′.

It has been an important question, with regard to which geographers have entertained various opinions, what are the course and termination of the Niger. The ingenious geographer, Mr. Rennell, on comparing the various accounts of the progress of the Niger beyond Houssa, declared his opinion to be, that its waters had no communication, either with the river Nile, as was thought, or with the sea, as others imagined; but that they were spread out into a great lake in Wangara or Ghana, and evaporated by the heat of the sun. (See NIGER.) Mr. Park, the late African traveller, directed his particular attention to this subject, and was induced to conclude that the Congo would be found to be the termination of the Niger from the following considerations: 1. The total ignorance of all the inhabitants of North Africa respecting the termination of that river. If the Niger ended any where in North Africa, it is not easy to account for this total ignorance, and for their so generally describing it as running to the Nile; and in fact, to a country with which they had not any acquaintance. A second consideration has been already suggested under the article ZAD. A third is deduced from the general supposition that the river of Dar-Kulla, mentioned by Mr. Browne in his "Travels," was the Niger, or at least that it communicated with that river; and this, it is said, would be exactly the course which the Niger ought to take in order to join the Congo. 4. The quantity of water discharged into the Atlantic by the Congo cannot be accounted for on any other principle, but that it is the termination of the Niger. If the Congo derived its waters entirely from the S. side of the mountains, which are supposed to form the belt of Africa, one would naturally suppose, that when the rains were confined to the N. side of the mountains, the Congo, like the other rivers of Africa, would be much diminished in size; and that its waters would become pure. On the contrary, the waters of the Congo are at all seasons thick and muddy. The breadth of the river, when at its lowest, is one mile, its depth is fifty fathoms, and its velocity six miles *per* hour. 5. The annual floods of the Congo commence before any rains have fallen south of the equator, and agree correctly with the floods of the Niger, calculating the water to have flowed from Bambarra at the rate of three miles *per* hour. Mr. Park, during his residence in Scotland, became acquainted with a Mr. George Maxwell, formerly an African trader, who was well acquainted with the whole western coast of Africa, more especially S. of the equator, and had published a chart of the river Congo. Mr. M. had been led by a variety of circumstances to conjecture that the source of the Congo lay considerably inland, and far to the north; and from a perusal of Mr. Park's travels

he

he concluded, that the Congo and the Niger were one and the fame ftream. Mr. Maxwell's reafoning confirmed Mr. Park in his opinion; and in this opinion he perfevered to the end of his life.

Since the difcoveries of Mr. Park, it is very generally allowed that the courfe of the Niger is from weft to eaft; and his opinion with regard to its termination in the Congo, or, as it is fometimes called, the Zaire, has received a confiderable degree of confirmation from the account of the Congo given by Mr. Maxwell. "Before ever the Niger came to be the topic of converfation," fays Mr. M., "it ftruck me, that the Congo drew its fource far to the northward, from the floods commencing long before any rains take place S. of the equator; fince it begins to fwell perceptibly about the latter end of October, and no heavy rains fet in before December, and about the end of January, the river muft be fuppofed to be at its higheft. At no time, however, can the rains to the fouthward of the line be compared with thofe in the Bight of Guinea, where fhips are obliged to have a houfe erected over them during thefe months."—"If the Niger has a fenfible outlet, I have no doubt of its proving the Congo, knowing all the rivers between Cape Palmas and Cape Lopas to be inadequate to the purpofe; nor need the immenfe courfe of fuch a river furprife us, when we know that the river St. Lawrence, contemptible in fize compared with the Congo, encompaffes the whole of North America, iffuing through a chain of lakes. But inftead of feven or eight lakes, the Congo may be fuppofed to pafs through feventeen or eighteen; which will folve any difficulty as to the floods of the Niger not immediately affecting the Congo." He adds, the river Congo, compared with other rivers, muft rank as the third or fourth in magnitude. Confidering the force of the current it produces in the fea, carrying out floating iflands fixty or feventy leagues from the coaft, the Amazon or Plata only can cope with it. At the diftance of 600 miles from its mouth, the Congo traders report that it is as large at the place from which they came, and that it went by the name Enzaddi, as it does among all the nations upon the coaft. If the fhallow water oppofite to Suenda fhould be thought to detract from the affumed fize of the Congo, it fhould be confidered, that the river there is fpread out ten miles in width, the middle channel of which has never been accurately founded. "It has long been my opinion, that Leyland's or Molyneux ifland at Embomma, (a fettlement on the banks of the Congo, diftant thirty leagues from its mouth,) either of which might be rendered as impregnable as Gibraltar, at a very fmall expence, could be a choice ftation for eftablifhing an extenfive commerce with the interior of Africa. Indeed, if the idea of the Congo being the outlet of the Niger prove fo upon trial, we may confider it is an opening defigned by Providence for exploring thofe vaft regions, and civilizing the rude inhabitants." The Congo appears from other teftimonies to be a river of the firft clafs, and larger, probably, than the Nile. The waters of the Congo, it is faid, may be diftinguifhed at fea more than thirty leagues from the coaft; and the water is frefh at the diftance of thirty miles. If thefe accounts are thought to be exaggerations, it is a general opinion among navigators that this river has a wonderful fize and force. All accounts concur in reprefenting that the ftream of the Congo is of a more uniform height, and fubject to much lefs variation from the dry and rainy feafons, than any tropical river which is known; and that on a comparifon with fuch rivers, it may be confidered to be in "a perpetual ftate of flood." The average rifing of the Ganges in the rainy feafon is ftated by major Rennell to be thirty-one feet, being almoft the fame with that of the Nile; whereas, the difference between the higheft point of the Congo about February, and the loweft, in September, is only about nine feet; and the river, at the latter period, has all the appearance to a ftranger of being in full flood. It is this remarkable peculiarity which diftinguifhes the Congo from other great rivers of a fimilar defcription, and which leads to important conclufions with regard to its origin and caufe. "In fupport then of the hypothefis which identifies the Congo with the Niger, the following arguments deduced from the preceding facts and obfervations may be alleged: 1. The great magnitude of the Congo. 2. The probability that this river is derived from very remote fources, perhaps confiderably north of the equator. 3. The fact, that there exifts a great river N. of the equator (the Niger), of which the termination is unknown, and which may, perhaps, form a principal branch of the Congo.

"Such being the evidence in favour of the hypothefis refpecting the Congo, the objections muft be admitted to be weighty and formidable: the principal of thefe are, 1. That it fuppofes the courfe of the Niger to be through the vaft chain of the mountains (anciently *Montes Lunæ*), the great central belt of Africa."—"It is difficult to underftand how the Niger could penetrate this barrier, and form a paffage fouthwards. 2. The courfe of the Niger, eftimated from its fource in the mountains of Senegal, (fuppofing it to be the fame river with the Congo, and to flow by Wangara and Cafhna, through the centre of Africa into the Atlantic,) would be confiderably more than 4000 miles. But the courfe of the Amazon, the greateft river in the old or new world, is only about 3500 miles; and although the exiftence of a river confiderably greater than any yet known may be within the limits of phyfical poffibility, yet fo improbable a fuppofition ought not to be adopted upon flight or conjectural reafoning, or upon any thing much fhort of diftinct and pofitive proof."

The editor of Mr. Park's Travels, &c. in 2 vols. 8vo. 1816, which we are now citing, very laudably expreffes a hope, "that this diftinguifhed river, which hitherto has been only known as one of the greateft marts of the Slave Trade, may at length be rendered conducive to objects of civilization and fcience; and that fome ufe will now be made of this great inlet into Africa, for the purpofe of exploring a part of that continent which as yet is entirely unknown; or, at leaft, of obtaining more complete and authentic information relative to the Congo itfelf, which muft unqueftionably be confidered as a very curious and interefting fubject of inquiry."

Another opinion with regard to the termination of the Niger has been advanced by M. Reichard, a German geographer, and publifhed in the "Ephemerides Geographiques," at Weimar, in Auguft 1808. This opinion is, that the Niger, after reaching Wangara, takes a direction towards the fouth, and being joined by other rivers from that part of Africa, makes a great turn from thence towards the fouth-weft, and purfues its courfe till it approaches the north-eaftern extremity of the gulf of Guinea, where it divides, and difcharges itfelf by different channels into the Atlantic; after having formed a great Delta, of which the Rio del Rey conftitutes the eaftern, and the Rio Formofa, or Benin river, the weftern branch. This hypothefis, though it diminifhes the diftance which the Niger has to flow in its courfe to the Atlantic, does not remove the objection arifing from the Niger's being conceived to penetrate the Kong mountains. But we muft not purfue this fubject any farther. For the lengths of the courfe of the moft noted rivers, fee RIVER.

ZAKA. See SCHAREDSJE.

ZAKEPH GADHOL, *Rex Pauperrimus*, one of the Hebrew accents, fometimes denoting no kind of paufe, and marked over a letter thus (ב֕).

ZAKEPH *Katon Rex*. one of the Hebrew accents, conftituting either a *comma* or femicolon, and marked over a letter thus (ב֔).

ZAKERZEZIN, in *Geography*, a town of Kurdiftan; 26 miles N.N.W. of Van.

ZAKIEH, a town of the Arabian Irak, on the Tigris; 10 miles N. of Korna.

ZAKLIKOW, a town of Auftrian Poland, in Galicia; 40 miles S. of Lublin.

ZAKROCZYN, or SAKROTSCHIM, a town of the duchy of Warfaw, on the Narew. In 1794 the confederate Poles were defeated here by the Ruffians; 40 miles N.W. of Warfaw.

ZAL ALEKSANDROVSKOI, a bay of the Cafpian fea; 260 miles S.S.E. of Aftrachan. N. lat. 43°. E. long. 51° 14′.

ZALA, in *Botany*, fo called by Loureiro, Cochinch. 405, from ζαλη, *a tempeft*, or *agitation of the fea*, becaufe the plant floats, and is driven about, at the mercy of the winds and waves. This is no other than the PISTIA of Linnæus (fee that article); where the generic characters, as corrected by Schreber, come fufficiently near to thofe of Loureiro, to leave no doubt in the mind of the reader, allowance being made for the peculiarities of ftructure in fo fingular a flower.

ZALA, in *Ancient Geography*, a town fituated in the vicinity of Amafæa, which was a town of the Peloponnefus, in Achaia Propria.

ZALA, in *Geography*. See WADAN.

ZALACA, in *Ancient Geography*, a town of Afia, in the interior of Media. Ptol.

ZALACUS, a town of Africa, in Mauritania Cæfariana. Ptol.

ZALACUS *Mons*, (*Van-nafh-reefe*,) mountains of Mauritania, at fome diftance from and to the S. of the river Chinalaph. Ptol.

ZALAMEA, a town of Spain, in the province of Seville; 38 miles W.N.W. of Seville.

ZALAMEA *de la Serena*, a town of Spain, in the province of Eftremadura. This town was anciently called Ilipa, and many veftiges remain of its former fplendour; 27 miles N.E. of Llerena.

ZALANTZ, a town of Hungary; 10 miles S.E. of Cafchau.

ZALAPA, in *Ancient Geography*, a town of Africa Propria, S. of Adrumetum. Ptol.

ZALESCE, in *Geography*, a town of Auftrian Poland, in Galicia; 32 miles S. of Lemberg.

ZALEUCUS, in *Biography*, a philofopher and legiflator of Greece, and founder of the Locrian ftate, flourifhed in the 7th century B.C. He was of obfcure birth, and lived in fervitude as a fhepherd; but his extraordinary abilities and merit attracted notice even in his humble ftation, and advanced him to the government. His laws were deemed fevere, but being adapted to the circumftances and manners of the Locrians, their conftitution was for feveral ages highly celebrated. His difcipline was rigorous, fo that he prohibited the ufe of wine, otherwife than as a medicine; and he ordained, that adulterers fhould be punifhed with the lofs of their eyes. When his fon had incurred this penalty, he blended paternal lenity with a pretence of maintaining the authority of the laws, by ordering his fon to be deprived of one eye, and by fubmitting to the lofs of one of his own eyes. In order to fecure the permanent ftability of his fyftem of legiflation, he required that a perfon who propofed a change in any one of them fhould come before the affembly with a cord about his neck, that he might be inftantly ftrangled, if upon examination the old law were preferred. Valer. Max. Diod. Sic. Laert. Brucker by Enfield.

ZALGIN, in *Geography*, a town of the ifland of Cuba; 47 miles N. of St. Jago.

ZALIKARA, the moft confiderable city of Mingrelia, fituated on the right bank of the Hippus, which rifes in the higheft mountain of the Soane, not far from the fource of the Phafis, flows through Letfghuani, divides Mingrelia from Iberia, and enters the Phafis near the Tredia: an open place, at the confluence of the Hippus and Phafis, well peopled by different nations, particularly Jews.

ZALISCUS, in *Ancient Geography*, a river of Afia, in Galatia. The mouth of this river in the Euxine fea lay between Cyptafia and Galorum.

ZALISSA, a town of Afiatic Iberia. Ptol.

ZALLANT, in *Geography*. See SALLAND.

ZALSSING, a town of Auftria; 5 miles N.W. of Aggfpach.

ZALUZIANSKIA, in *Botany*, fo named by Necker, in "Act. Palat. v. 3. phyf. 303," according to Willd. Sp. Pl. v. 5. 538, is no other than MARSILEA *quadrifolia*, which the reader will find in vol. xxii. The above name is defigned, as we prefume, to commemorate a Polifh botanift, author of *Methodi Herbariæ*, publifhed at Prague, anno 1592, in 4to., and at Frankfort in 1604. This work is fpoken of by Haller, *Bibl. Bot.* v. 1. 387, as a tranfpofition of the arrangement of Dodonæus, without any improvement or additional information.

ZAM, in *Geography*, a town of Grand Bucharia; 85 miles N.W. of Balk.

ZAMA, a town of Peru, in the diocefe of Arequipa; 30 miles N. of Arica.

ZAMA, in *Ancient Geography*, a town of Africa Propria, 5 journeys from Carthage. This town, to which ancient authors give the title of royal and a fortrefs, is famous in the wars of Jugurtha and Juba, and more efpecially on account of a battle between the Carthaginians under Hannibal and the Romans, commanded by Scipio, in the year 551 of the Republic. At the time when this town was in a flourifhing ftate, it was affigned to Numidia. Cornelius Nepos fays, that it was 300 miles from Adrumetum. Appian fays 3000 ftadia. It was fituated on a plain, and owed its ftrength to its fortifications more than to its fituation. Hirtius fays, that it was the ordinary refidence of king Juba, where he had his wives, children, and treafures. Pliny fays, that it became a Roman colony.

ZAMA, a town of Cappadocia, in the prefecture of Chamane.—Alfo, a town of Afia, in Mefopotamia. Ptol.

ZAMAMIZON, a town of Africa Propria, between the town of Tabraca and the river Bagradas. Ptol.

ZAMBOSE, or CUMANA, in *Geography*, a river of Africa, which rifes in the interior parts of Mocaranga, and runs into the Indian fea at feveral mouths: the principal of which takes the name of Luabo. S. lat. 19°. E. long. 37°.

ZAMBOZIN, a town of Congo; 24 miles S.S.W. of St. Salvador.

ZAMBRANO, JUAN LUIS, in *Biography*, a Spanifh painter, was born at Cordova in 1599. He was a difciple of Paolo de Cefpedes, and was a fuccefsful follower of the ftyle of that mafter. His principal works are in the cathedral at Cordova, and in the church of the convent of Los Martyros, where he painted two altar-pieces, reprefenting the ftoning of St. Stephen, and the martyrdom of St. Acifclo and St. Victoria. In the colegio di Santa Catalina is a fine picture by him of a guardian angel, and a St. Chriftopher, which Palomino defcribes as defigned in the great ftyle of M. Angelo. He paffed the latter part of his life at Seville, where he painted feveral altar-pieces for the church of St. Bafil, and died in that city in 1639, at the age of 40.

ZAMBROKRI, in *Geography*, a town of Hungary; 14 miles S.W. of Rofenberg.

ZAMBROW, a town of the duchy of Warfaw; 80 miles N.E. of Warfaw.

ZAMECH, a name given by fome writers to the lapis lazuli.

ZAMETUS, in *Ancient Geography*, a mountain of Arabia Felix. Ptol.

ZAMFARA, or ZANFARA, in *Geography*, a town of Africa, and capital of a kingdom of the fame name; 170 miles E.N.E. of Wangara. N. lat. 18° 20′. E. long. 16° 15′.

ZAMIA, in *Botany*, from ζημια, *damage*, or *lofs*. This name, which firft occurs, as the appellation of a genus, in the Gen. Pl. ed. 6. of Linnæus, is taken from Pliny, who ufes it for fuch cones of the fir as "fplit while they are upon the tree," and, as he fays, "require to be taken off, that they may not injure the reft." This fhould feem to apply to the male catkins, however falfe the phyfiology of Pliny, and the practice founded upon it, may be. Our *Zamia* anfwers to his, merely in the cone-like form of its fructification, which, being male on one plant, and female on another, exhibits in the former the appearance of lofs, or fterility, like the male catkins of the fir.—Linn. Gen. 574. Suppl. 68. Schreb. Gen. 778. Willd. Sp. Pl. v. 4. 845. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 410. Brown Prodr. Nov. Holl. v. 1. 348. Purfh 648. Juff. 16. Poiret in Lamarck Dict. v. 8. 831. Lamarck Illuftr. t. 892. Gærtn. t. 3.—Clafs and order, *Dioecia Polyandria*. Nat. Ord. *Filices*, Linn. Juff. *Cycadeæ*, Perfoon, Brown.

Gen. Ch. Male, *Cal.* Catkin ovate, teffellated-fcales horizontal, obtufe, thickened towards the end, permanent. *Cor.* none. *Stam.* Filaments none; anthers numerous, feffile, crowded on the under fide of each fcale, efpecially towards the extremity, elliptical, fmooth, of two valves and one cell, fplitting lengthwife.

Female, *Cal.* Catkin ovate, teffellated: fcales horizontal, obtufe, more or lefs peltate, permanent. *Cor.* none. *Pift.* Germens two, oval, feffile, horizontal, inflexed, on the under fide of each fcale, near the extremity; ftyle very fhort, fomewhat conical; ftigma obtufe, undivided, pervious. *Peric.* Drupa roundifh, fomewhat angular, of one cell. *Nut* hard, roundifh or elliptical, of one cell.

Eff. Ch. Male, Catkin teffellated. Scales abrupt. Anthers oval, feffile at the under fide of each fcale. Female, Catkin teffellated. Scales peltate. Drupas two, at the under fide of each fcale.

Obf. Mr. Brown, to whom we are obliged for the remark of the ftyle being finally pervious, records an idea of the late Mr. Dryander, that the American *Zamiæ*, which conftitute the original genus, having more perfectly peltate fcales to the male *catkin*, and the *anthers* affembled in two diftinct maffes might poffibly form a diftinct genus from the Cape and New Holland fpecies; more efpecially as in thefe American plants, the *leaflets* are each manifeftly articulated with a projection from the main rib of the leaf; whereas in the others they are either very obfcurely jointed, or perfectly decurrent. We conceive, however, that they all together compofe a very diftinct genus, which cannot, without violence to nature, be divided. It is neareft akin to *Cycas*, but differs effentially in the female part of the fructification being a *catkin*, whofe fcales bear two *germens* underneath; inftead of an affemblage of *fronds*, or leafy *receptacles*, bearing an indeterminate number upon their margins. The *herbage* is perennial, generally without a *ftem*. *Leaves* abruptly pinnate, fingularly hard, rigid, and often fpinous; rarely lobed. *Catkins* radical, ftalked.

It being extremely difficult to obtain and to compare good fpecimens of the different fpecies, as well as to detect and define their effential characters, authors have not very clearly defcribed them. Jacquin has publifhed magnificent figures of feveral; but their moft fatisfactory marks require to be fought at an earlier period of their growth, and in more minute parts, than he has generally exhibited.

1. Z. *cycadifolia*. Sago-palm-leaved Zamia. Jacq. Fragm. 27. t. 25, 26. Willd. n. 1.—Leaflets very numerous, two-ranked, linear, entire, with fimple fpinous points; common ftalk femicylindrical, channelled, downy. Catkin of the fruit elongated, fomewhat cylindrical.—Native of the Cape of Good Hope. Cultivated in the Imperial gardens at Schoenbrun, but not mentioned by Mr. Aiton as known to our Englifh collectors. The thick globular fcaly head of the *root*, near a foot in diameter, bears numerous fpreading pectinate *leaves*, very much refembling, at firft fight, thofe of *Cycas revoluta*. The *ftalk* of each is, in its naked part, two feet long, as thick as a fwan's quill, all over downy, as is alfo its leafy portion, and the young leaflets themfelves. The full-grown *leaflets* are from 50 to 80, rigid, parallel, acute, pungent, each about three inches long; the lowermoft gradually fhorteft, and rather more diftant. The ripe *fruit*, brought from the Cape, is ovate-oblong, about fifteen inches in length, and five in diameter, brown, each *fcale* bearing two ovate, angular, orange-coloured *drupas*, about an inch long, their points directed towards the bafe of the fcale. *Nut* not much fmaller, ovate, angular.

2. Z. *pungens*. Needle Zamia. Linn. fil. MSS. Ait. Hort. Kew. ed. 1. v. 3. 478. ed. 2. n. 1. Willd. n. 2. Poiret n. 3. (Palma fobolifera ægyptia, foliis lævioribus, fructu nigro; Till. Pif. 129. t. 45.)—Leaflets awl-fhaped, fpreading, ftraight, rigid, pointed, entire; their outer margin rounded at the bafe; common ftalk nearly cylindrical, unarmed.—Native of the Cape of Good Hope, from whence it was brought by Mr. Maffon, to Kew garden, in 1775, but has not yet flowered. The *leaflets* are very thick and coriaceous, much fewer than in the preceding fpecies, moftly oppofite, four or five inches long, and one broad; their under furface fomewhat ftriated; the upper fmooth and fhining; margin quite entire; point fimple, fpinous, ftout and rigid.

3. Z. *tridentata*. Three-toothed Zamia. Willd. n. 3.—Leaflets linear, obfcurely furrowed, fmooth, with three fpinous teeth at the end; common ftalk femicylindrical, channelled.—Suppofed to be a native of the Cape of Good Hope. The *leaflets* are fourteen to fixteen pair, linear, tapering at each end, with two lanceolate, pointed, terminal teeth, and a third fituated a little lower at the outer edge. *Common ftalk* fmooth. *Willdenow*. No other author appears to know this fpecies. We have fpecimens in the herbarium of the younger Linnæus, without name, indication of their native country, or any traces of fructification, which anfwer

anfwer to the above characters; except the *leaflets* being more numerous, fometimes with a fimple fpinous point only, on the fame ftalk with others that have two or three, very rarely four; and in one inftance the leafy part of the common *footftalk* is fhaggy with foft hairs. Each *leaflet* is two, or two and a half inches long, thick-edged and flightly revolute, entire, except the above-mentioned points; fmooth on both fides; furrowed beneath; tapering at the bafe, and fomewhat decurrent at its infertion. See n. 15.

4. Z. *anguftifolia*. Narrow-leaved Zamia. Jacq. Coll. v. 3. 263. Ic. Rar. t. 636. Willd. n. 4. Poiret n. 6.—Leaves linear, elongated, entire, obtufe, with two terminal callous points; common ftalk femicylindrical. Fruit ovate, pointed.—Native of the Bahama iflands; cultivated at Schoenbrun, where it was raifed from feed, and bore flowers and fruit, the catkins being about eight months in going through their different ftages. The *root* is fcarcely bigger than a large radifh; its ovate crown enveloped in a few pointed, very broad, fcales. *Leaves* about a yard high, with flender ftalks and *leaflets;* the latter drooping, a fpan long, and two lines broad. *Catkins* three inches long, on ftalks about the fame length; the male ones moft flender, and nearly cylindrical. *Fruit* three inches long, of a thick ovate, or elliptical figure, with a blunt point. *Drupas* concealed, red.

5. Z. *tenuis*. Slender Zamia. Willd. n. 5.—"Leaflets linear, obtufe, fomewhat revolute; tapering at the bafe; with one or two obfolete teeth near the extremity; common ftalk triangular, fmooth."—Native of the Bahama iflands. Willdenow faw a living male plant. *Leaflets* about fourteen pair; the upper ones furnifhed, near the point, with one or two very inconfpicuous teeth. An intermediate fpecies between the laft and the following; agreeing nearly with Z. *anguftifolia* in the form of its *leaflets*, but they are broader, and their *ftalk* is triangular: the *leaflets* are narrower than thofe of the following, neither are they minutely ferrated towards the point; but the *ftalks* are fimilar. *Willdenow.*

6. Z. *media*. Intermediate Zamia. Jacq. Hort. Schoenbr. v. 3. 77. t. 397, 398. Willd. n. 6. Poiret n. 7.—Leaflets linear-lanceolate, obtufe, flat; obfcurely ferrated towards the point; common ftalk triangular, fmooth.—Native of the Weft Indies; cultivated at Schoenbrun. The crown of the *root* is as big as the fift. *Leaves* two feet long, befides their naked *ftalk*, which is half as much. *Leaflets* from fourteen to twenty pair; five inches long, and one-third or half an inch broad, flat, for the moft part entire, except a few fhallow diftant ferratures towards the extremity, which is bluntifh, and without any fpinous termination. *Female catkins* on fhort thick ftalks, ovate, with a blunt point. *Fruit* oval, brown, rough, three inches long. *Jacquin.* That author confiders the prefent fpecies as allied, on the one hand, to his *anguftifolia* (fee n. 4.), and on the other to *integrifolia*, n. 8. Still we cannot queftion its being fpecifically diftinct from both.

7. Z. *debilis*. Lax-leaved Zamia. Linn. fil. MSS. Ait. Hort. Kew. ed. 1. v. 3. 478. ed. 2. n. 2. Willd. n. 7. (Palma prunifera humilis non fpinofa, infulæ Hifpaniolæ, fructui jujubino fimilis, officulo triangulo; Commel. Hort. v. 1. 111. t. 58.)—Leaflets lanceolate, acute, pointlefs, ferrated towards the point; common ftalk triangular, fmooth.—Native of the Weft Indies, from whence it is faid to have been imported, in 1777, by the late Meffrs. Kennedy and Lee. It flowers in the ftove, in July and Auguft. The *leaflets* are five or fix pair, half an inch broad; though only two and a half or three inches long, and are diftinguifhed from all the foregoing by their confpicuous ferratures, all indeed near the end, the greater part of the leaflet being entire: the upper fide is fmooth and fhining; under furrowed or ftriated. Commelin originally raifed this fpecies from feed in the Amfterdam garden, and was informed that the *fruit* was reddifh, growing partly underground.

8. Z. *integrifolia*. Dwarf Zamia. Linn. fil. MSS. Ait. Hort. Kew. ed. 1. v. 3. 478. ed. 2. n. 3. Willd. n. 8. Purfh n. 1. Poiret n. 5. excluding the reference to Commelin. Jacq. Coll. v. 3. 261. Ic. Rar. t. 635. Lamarck t. 892, copied from Jacquin. (Z. pumila; Linn. Sp. Pl. 1659, excluding all the fynonyms.)—Leaflets fmooth, ftriated, lanceolate; rounded, obtufe, and finely ferrated at the end; tapering at the bafe. Common ftalk fmooth, fomewhat quadrangular.—Native of Eaft Florida, from whence it was introduced into the Englifh ftoves, by the celebrated John Ellis, efq. in 1768. Jacquin fays it grows alfo in Hifpaniola. The crown of the *root* is fometimes as thick as a man's arm, dividing below into feveral ftout branches and fibres. *Leaves* ufually about eighteen inches long; fometimes twice as much. *Leaflets* from ten to twenty pair, oppofite or alternate, each two and a half or three inches long, varying in breadth from one-quarter to three-fourths of an inch, entire, rather fhining, ftrongly ftriated on both fides, with many parallel ribs; the extremity rounded and pointlefs, with a greater or lefs number of flight tooth-like ferratures in proportion to its width. *Catkins* on fhort ftalks, ovate, clothed with dark brown pubefcence; the male ones about two inches long. *Fruit* three inches long, elliptical, pointed, downy; its *fcales* finally widely feparating, each of them peltate and angular, fupported by a rather flender angular ftalk, above an inch in length, and remaining long after the fruit is fallen. Each *drupa* is elliptical, about half an inch, or more, in length, with a fmall quantity of fweet orange-coloured pulp, and a large, rather pointed, nut. The *leaflets* are too ftrongly ferrated in Lamarck's plate; and rather broader and more luxuriant than ufual in Jacquin's, otherwife admirable, reprefentation. The male *catkins* are very frequently produced; the female ones we know only from dried fpecimens, and the works of Jacquin.

9. Z. *muricata*. Prickly-ftalked Zamia. Willd. n. 9.—"Leaflets oblong, pointed, fmooth, ftriated; ferrated from the middle to the extremity; common ftalk fpinous."—Gathered by Humboldt and Bonpland, in South America, near Porto Cabello. *Leaflets* about four pair, fix inches long; tapering at the bafe; ftriated and ribbed on both fides; fharply ferrated in their upper half. *Footftalk* channelled, armed with very fhort, blunt, fcattered fpines. *Willdenow.*

10. Z. *furfuracea*. Broad Rufty-leaved Zamia. Linn. fil. MSS. Ait. Hort. Kew. ed. 1. v. 3. 477. ed. 2. n. 4. Willd. n. 10. Poiret n. 2. (Palma americana, foliis polygonati brevioribus, levitèr ferratis, et nonnihil fpinofis, trunco craffo; Pluk. Phyt. t. 103. f. 2. and t. 309. f. 5. P. americana, craffis rigidifque foliis; Herm. Parad. 210. t. 210. Palmifolia fructu clavato polypyreno; Trew Ehret, 5. t. 26.)—Leaflets elliptic-oblong, pointlefs; copioufly ferrated from the middle to the extremity; ftriated and hairy beneath; common ftalk fpinous.—Native of the Weft Indies. Plukenet faw it in the royal gardens at Hampton-Court in king William's time. It is ftill preferved in our ftoves, flowering towards autumn. The crown of the *root* is often a foot in diameter. *Leaves* from one to two feet long, exclufive of their prickly ftalks. *Leaflets* ufually eight or nine pair, three or four inches long, and one or one and a quarter broad, very rigid and coriaceous; fhining, and roughifh to the touch, on the upper fide; more

furrowed,

furrowed, and clothed with ſhaggy, chaffy pubeſcence, which gives them a ruſty or tawny hue, underneath. Their ſerratures, or teeth, are numerous, obtuſe, very irregular. *Catkins* ovate, hoary and downy, about three inches long, on *ſtalks* about the ſame length. Hermann ſays this plant produces a white inſipid gum.

11. Z. *ſpiralis*. Spiral Zamia. Saliſb. Prodr. 401. Willd. n. 11. Ait. n. 5. Brown n. 1.—Leaflets numerous, linear, very ſmooth, ſomewhat curved, with a few ſpinous teeth at the extremity. Catkins ſmooth, with pointed ſcales; thoſe of the male ones wedge-ſhaped. –Native of New South Wales, from whence ſeeds were ſent, in 1791, by Dr. John White, to the writer of this, and plants were raiſed from them in the following year, by the late Mr. Fairbairn, in Chelſea garden, being the firſt introduction of this ſpecies into Europe. The whole cone, filled with theſe nuts, was about half as large as a man's head; the nuts themſelves about the ſize of ſmall cheſnuts. They were ſaid to be eaten roaſted by the natives of New South Wales, but on being tried by our Engliſh ſettlers, occaſioned ſickneſs. Their flavour is certainly inferior to a cheſnut, and even to the nuts of *Cycas revoluta*, ripened in the biſhop of Wincheſter's ſtove at Farnham caſtle. The plants ſoon grew to a conſiderable ſize, and according to Mr. Aiton, this ſpecies flowers in the ſtove, in July and Auguſt. The *leaves* are very ſmooth, of a fine green, a yard or more in length, ſpreading, each compoſed of from thirty to forty pair of long narrow *leaflets*, tipped with from three to five ſpinous teeth. *Footſtalks* ſaid to be ſomewhat ſpiral. The *catkins* are ſtalked, cylindrical, about five inches long, and two in diameter, ſquarroſe, ſmooth, not downy nor hairy: *ſcales* of the *male ones* obovate-wedge-ſhaped, an inch long, with a ſhort, broad, ſharp, aſcending, poliſhed point; their upper ſide ſmooth and naked; under nearly covered with an uninterrupted heart-ſhaped aſſemblage of crowded, oval *anthers*, the ſize of poppy-ſeed: *ſcales* of the *female catkins* ſtalked, gibbous, two-edged and depreſſed, larger than the male ones, each tipped with an erect, ſword-ſhaped, pungent, ſmooth point, an inch long, and, as the fruit ripens, extended to three inches, the gibbous fleſhy part of the ſcale being then alſo much enlarged. *Germens* two, ovate, ſeſſile, cloſe together, at the inner edge of this fleſhy part of the ſcale, and directed horizontally inward. *Drupas* roundiſh, gibbous, an inch or inch and a half in diameter, orange-coloured, with a rather thin pulp, at leaſt in the dried ſtate, and a large, ovate, hard *nut*, not burſting, whoſe kernel, after keeping twenty-five years, is horny, ſemitranſparent, and as hard as the ſhell. Mr. Brown ſuſpects there may be two ſpecies confounded under Z. *ſpiralis*; one found in the neighbourhood of Port Jackſon, to which our deſcription and ſynonyms entirely belong, and which is from two to four feet high; the other, often ten feet in height, noticed by Mr. Brown on the ſouthern coaſt of New Holland, and which we have never ſeen. Mr. Brown remarks, that in both, the *catkins*, uſually ſolitary, ſometimes grow two together.

12. Z. *longifolia*. Tall-leaved Zamia. Jacq. Fragm. 28. t. 29. Willd. n. 12. Poiret n. 10.—Leaflets numerous, elliptic-lanceolate, pointleſs, entire, clothed with ſhaggy down. Scales of the male catkins wedge-ſhaped, with abrupt quadrangular points.—Native of ſouthern Africa, above a hundred miles from the Cape of Good Hope. Cultivated at Schoenbrun. The crown of the *root* is ſcaly, a foot in diameter, ſmooth. *Leaves* ſlightly ſpreading, from five to ſeven feet high; their *ſtalks* quadrangular, without ſpines; *leaflets* from forty to fifty or ſixty pair, two-ranked, three or four inches long and one broad, coriaceous; ſtriated beneath; clothed on both ſides, as well as the leafy part of their common ſtalk, with a cobweb-like down, eaſily rubbed off; the lower ones only ſomewhat pointed. This ſpecies has not flowered in Europe; but the male *catkin*, brought from Africa, and repreſented in Jacquin's magnificent plate, is elliptic-oblong, near two feet in length, and five inches in diameter, brown, ſmooth, compoſed of innumerable wedge-ſhaped *ſcales*, covered underneath with *anthers*, and each tipped with a quadrangular, or pyramidal, abrupt, prominent point, without any of the ſpinous termination ſeen in the laſt.

13. Z. *lanuginoſa*. Woolly-ſcaled Zamia. Jacq. Fragm. 28. t. 30, 31. Willd. n. 13. Poiret n. 9. —Leaflets lanceolate, ſmooth, ſpinous-pointed, with a few unilateral ſpinous teeth. Radical ſcales woolly.—Native of ſouthern Africa, from whence a ſingle plant was brought long ago to the Imperial ſtove at Schoenbrun. After twelve years' culture, it had made but ſlow progreſs, and ſhewed no ſigns of fructification. The *root* conſiſts of numerous, very thick, tap-ſhaped radicles; its crown being as large as a man's head, and covered with imbricated, deltoid, pointed ſcales, two or three inches broad, all clothed with ſoft, denſe, hoary wool. *Leaves* a yard high, or more, dark green, very ſmooth and ſhining, with unarmed quadrangular *ſtalks*, and from twenty-five to thirty pair of linear-lanceolate *leaflets*, each four inches long, with a ſhort ſpinous point; their margins all entire, except being often furniſhed with one, two, or three broad, ſpinous, tooth-like lobes, always at the lower edge of each leaflet, by which this ſpecies is at firſt ſight readily diſtinguiſhed. Profeſſor Willdenow ſuſpected it might not be diſtinct from Z. *cycadis* (ſee our 15th ſpecies); but we ſee no reaſon to concur in that opinion.

14. Z. *horrida*. Grey Thorny Zamia. Jacq. Fragm. 27. t. 27, 28. Willd. n. 14. Ait. n. 6. Poiret n. 8.—Leaflets lanceolate, glaucous, acute, ſpinous-pointed, with a few unilateral, lanceolate, ſpinous teeth. Radical ſcales ſmooth. —Native of ſouthern Africa, a hundred miles above the Cape of Good Hope. Cultivated at Schoenbrun, and introduced into the Engliſh green-houſes, in 1800, by John Liptrap, eſq., who poſſeſſed, for ſeveral years, a ſplendid collection of exotics at Mile-end; but it does not ſeem to have bloſſomed either here or in Germany. The ſcaly crown of the *root* is as large as the preceding, but the ſcales are not woolly. The *leaves* and their ſtalks are all over finely glaucous, which diſtinguiſhes the plant from the reſt of its genus. The *leaflets*, as well as their lateral ſpinous lobes, are longer, and more pointed, than in Z. *lanuginoſa*; the points and baſes green, as the whole ſurface becomes when rubbed. A ripe female *cone*, brought from its native country, is fifteen inches long and eight thick, brown, teſſellated, and warty, but not ſpinous. *Drupas* orange-coloured, oval, each with a thick, elongated, obtuſe point, in the place of the *ſtyle*. *Nut* oval, ſomewhat triangular. This ſpecies is, as Willdenow obſerves, very nearly related, in ſize and general habit, to the laſt, but differs in its ſmooth crown of the *root*, and glaucous colour of the *herbage*.

15. Z. *cycadis*. Bread-tree Zamia. Linn. Suppl. 443. Ait. n. 7. Poiret n. 4. (Cycas caffra; Thunb. Nov. Act. Upſal. v. 2. 284. t. 5.)—Leaflets lanceolate, ſpinous-pointed, ſmooth, entire; tapering at the baſe. Scales of the catkins abrupt, obtuſe, pointleſs.—Native of the north-eaſt part of ſouthern Africa, far above the Cape of Good Hope, from whence living plants were ſent to Kew, by Mr. Maſſon, in 1775. This is the ſpecies figured by Gærtner. It grows on the ſides of hills, in dry open ſpots, eſpecially where the ground has been cleared by burning, and flowers in Auguſt, or the following months. The crown of the *root* is round and large, imbricated with ſcales, and, according to Linnæus,

Linnæus, downy; with age, the plant acquires, like the palm tribe, a thick ſcaly *ſtem*, as tall as a man. The *leaves* are from a ſpan to two feet long, of rather numerous and crowded *leaflets*, each two or two and a half inches in length, and one-quarter or one-third of an inch in breadth; ſmooth and even above; ſtriated beneath; the younger ones, or rather thoſe of young plants, tipped with a ſharp tooth or two, beſides the terminal ſpine. *Common ſtalks* ſmooth. *Catkins* ſtalked, ovate: the *male* a ſpan long; its *ſcales* ſomewhat triangular, very obtuſe, rugged, ſmooth; flat on the upper ſide; keeled underneath, and covered with *anthers* the ſize of millet-ſeed: *female catkin* larger than the male, near a foot long, green and ſmooth; its *ſcales* ſtalked, with a quadrangular, peltate, thick termination, lodging a pair of ovate angular *drupas*, with a red pulp. *Nut* of each the ſize of an acorn, not very hard, with a white ſolid kernel. Thunberg ſays, the older plants, which have acquired a *ſtem*, are broken off, or cut down, by the Caffres and Hottentots; and the pith, which is of conſiderable thickneſs, being tied up in the ſkin of a ſheep or calf, previouſly well rubbed with greaſe, is buried in the ground. After remaining there a month, or longer, it is taken up in a putrefying ſtate, and being bruiſed between two ſtones, and moiſtened with water, forms a ſort of paſte, which is made into little round cakes, about an inch in thickneſs. Theſe are baked in wood-aſhes, and are eſteemed a great luxury; though, as the author obſerves, not very tempting to people of more refined habits, eſpecially if they happen to have witneſſed the whole proceſs of preparation.

We are not without a ſuſpicion that Willdenow's *Z. tridentata* (ſee n. 3.) may be this very ſpecies. This is more probable, at leaſt, than his own conjecture, of Jacquin's *lanuginoſa*, n. 13, being *Z. cycadis*.

Authors, even the moſt intelligent, uſe the term *frond*, inſtead of *leaf*, in their deſcriptions of this genus, becauſe Linnæus conſidered *Zamia* as either a Palm, or a Fern. But its fructification is by no means cryptogamic, or obſcure; nor do the leaves bear the flowers of either ſex. There is a curious coincidence of ſtructure and appearance between its *anthers*, and the ſuppoſed *capſules* of ſome of the ſpiked or racemoſe *Filices*, eſpecially of *Botrychium* (the *Oſmunda lunaria*, &c. of Linnæus); indeed the likeneſs is ſo great, that we can ſcarcely perſuade ourſelves that the two parts in queſtion are not deſtined to anſwer the ſame purpoſe.

Zamia, in *Gardening*, compriſes ſome low plants of the tender palm kind, among which the ſpecies chiefly cultivated in this climate are, the dwarf pinnated palm (Z. pumila), the thorny dwarf palm (Z. ſpinoſa), and the entire leaved palm (Z. integrifolia).

The firſt is the fineſt ſort, but the other two are occaſionally preſerved in ſome ſtove collections among other plants of the ſame claſs.

Method of Culture.—They may be raiſed from ſeeds, and by other means, in pots plunged in the bark-beds of hot-houſes and ſtoves, where they muſt conſtantly be kept in light rich earth or mould, having the management of other exotics of ſimilar kinds.

They afford variety in all ſuch collections of tender plants.

ZAMIANSK, in *Geography*, a fort of Ruſſia, on the Volga; 20 miles N.W. of Aſtrachan.

ZAMIN, a town of Grand Bucharia; 50 miles N.E. of Samarcand.—Alſo, a river of Aſia, which riſes about 70 miles S. of Kogend, and after a N.W. courſe of about 150 miles, loſes itſelf in the earth.

ZAMIRÆ, in *Ancient Geography*, a people of India that were Anthropophagi, near mount Mœcander. Ptol.

ZAMOLXIS, in *Biography*, a celebrated perſon among the Scythians, was, as ſome have ſuppoſed, a ſlave of Pythagoras, who, having attended him into Egypt, obtained his freedom, and taught his maſter's doctrine among the Getæ. It has been alſo ſaid, that in order to enforce the belief of the immortality of the ſoul, he dug a ſubterraneous apartment, and concealed himſelf in it for three years; but re-appearing as one riſen from the dead, he there eſtabliſhed his authority as a teacher. But Herodotus, who relates this fabulous ſtory, as a common tradition, gives it no credit, but expreſsly ſays, that ſo far from being a Pythagorean, he flouriſhed at a much earlier period than Pythagoras. The general teſtimony of the ancients furniſhes reaſon for concluding, that Zamolxis was a Thracian, who, at a very remote period, taught the Scythians the doctrine of the immortality of the ſoul, and that after his death, they enrolled his name among the divinities, with whom they aſſured themſelves they ſhould aſſociate in the inviſible world. Herodotus relates, that at certain feſtivals, they choſe ſeveral perſons by lot, who were to be deputed as meſſengers to Zamolxis; and that they put them to death, by throwing them up into the air, and catching them, as they fell, upon the points of their ſpears; and this ſtory is thought to be the more credible, becauſe it is well known, that the practice of offering human ſacrifices prevailed among the Scythians and the Thracians. Herodotus. Brucker by Enfield, vol. i.

ZAMORA, in *Geography*, a town of Spain, in the province of Leon, on the Duero; the ſee of a biſhop, ſuffragan of Compoſtella. In the year 967, this town was taken by the Moors and deſtroyed; but afterwards rebuilt and fortified. It is now a frontier town againſt Portugal, and place of arms. The ſtreets are narrow, and the general appearance of the town is gloomy; 120 miles N.W. of Madrid. N. lat. 41° 50′. W. long. 6°.—Alſo, a town of Algiers, founded in honour of a Mahometan ſaint. Here is a ſmall garriſon; 28 miles W. of Seteef.—Alſo, a town of Mexico, in the province of Guadalajara; 80 miles N.W. of Mechoacan. N. lat. 20° 54′. W. long. 103° 40′.—Alſo, a town of South America, in the audience of Quito, on a river of the Amazons. In the neighbourhood are ſome gold-mines; 200 miles S. of Quito. S. lat. 4°. W. long. 78° 46′.

ZAMOSCIE, or Samostzic, a town and fortreſs of Auſtrian Poland, in Galicia, built by the famous great chancellor, John Zamoyſki. It has a ſtately cathedral, and ſeveral other churches, a decayed univerſity, a charitable foundation called Mons Pietatis, and ſeveral valuable privileges; but the fortifications are now in a bad condition. The proprietor of this town, &c. ſtiled himſelf prince Zamoſcic. It now belongs to Auſtria; 60 miles N.W. of Lemberg. N. lat. 50° 31′. E. long. 23° 15′.

ZAMPALA, a river of Mexico, which riſes in the province of Tlaſcala, and runs into the gulf of Mexico, N. lat. 19° 40′.

Zampala, *Chempoalla*, or *Zempoala*, a city of Mexico. When Cortez landed in the year 1519, the chief or lord of this place, who was tributary to Montezuma, offered his ſervice to the Spaniards. It was at that time a large city and exceedingly populous, the loweſt account reckoning the inhabitants at 20,000 or 30,000. It was the capital of a country called Totonacapan, now the N.E. part of the province of Tlaſcala; 90 miles E. of Puebla de los Angelos. N. lat. 20° 10′. W. long. 97° 50′.

ZAMPERINI, Anna, in *Biography*, of Venice, arrived in England in 1767, as a buffa ſinger, a *parte eguale*, with the

the Guadagni, fifter to the great finger and actor Guadagni, who had been here in early youth.

The Zamperini was a very pretty woman, coquetifh, and an affected finger. Her firft appearance on our ftage was in La buona figliaola Maritata of Piccini, of which the mufic was fo difficult to perform, and not eafy to hear, that it was never fufficiently repeated for the public to be familiarly acquainted with it. They were glad, therefore, as well as the performers, to return to La buona figliaola, for their own relief from a too ferious attention.

The fifter of Guadagni, an elegant finger, and graceful actrefs, the original performer of the part of Cocchina in Italy, being fuperfeded in that part by the Zamperini, occafioned a great rupture between Guadagni juft arrived here in 1769 for the fecond time, and the honourable patentee and imprifario of the opera ; which generated faction and a party fpirit that deftroyed the comfort of the opera, ferious and comic, at a time when the public, in a ftate of tranquillity, would have been more delighted than at any other period.

We never heard the Zamperini fing ferious mufic, but are told by M. Laborde (Effai fur la Muf.), that "having a natural talent for mufic, and great fpirit and fire in her action, though her excellence of performance was principally manifefted in comic operas, yet fhe fung equally well in the ferious. After performing with great applaufe in London, Lifbon, and Italy, fhe quitted the ftage, and was well married."

ZAMPIERI, Domenico, called *Domenichino* in the Hiftory of Painting, was born at Bologna, in 1581, and placed when very young under the tuition of Denis Calvert ; but being ill treated by him, he prevailed upon his father to permit him to enter the fchool of the Carracci, at the time when Guido and Albano were both ftudents there. He foon diftinguifhed himfelf, but more by his care and affiduity than by brilliancy of talent. He here attached himfelf to Albano, and, when he left the Carracci, they travelled together to Parma, Modena, and Reggio, to ftudy the works of Corregio and Parmeggiano, and foon afterwards they both went to Rome. In that city his firft patron was cardinal Agucchi, who employed him in his palace, and commiffioned him to paint three pictures for the church of S. Onofria, of fubjects from the life of S. Jerome. His former mafter, An. Carracci, alfo employed him for fome time to affift in his great work at the Farnefe gallery ; and he painted from his own defigns, in the loggia in the garden, the Death of Adonis, when Venus fprings from her car to affift her unfortunate lover.

As the health of A. Carracci became rapidly impaired, and he was neceffitated to refufe many commiffions offered to him, he recommended them to his fcholars ; and had the fatisfaction of feeing Guido and Domenichino employed by the cardinal Borghes to paint the frefcoes in S. Gregorio, which have fubfequently become fo celebrated, and of which the Flagellation of S. Andrea by the latter is fo juftly admired. The cardinal Farnefe alfo employed him to paint fome frefcoes in the chapel of the abbey at Grotto Ferrata ; among them is that picture of the Cure of the Demoniac Youth, which has been compared with and by many preferred to the one of Raphael in the Transfiguration. Another cardinal, Aldrobrandini, availed himfelf of the eftablifhed renown of Domenichino, and engaged him to paint in frefco ten pictures of the hiftory of Apollo, in his villa at Frafcati, which added greatly to his reputation. Soon afterwards he completed the work which more than any other has ferved to immortalize his name, his well-known picture of the Communion of S. Jerome, painted for the principal altar of the church of S. Girolamo della Carità. This fine production ranks with the beft of any age. It is faid with great femblance of truth, that the arrangement of its compofition was borrowed of Agoftino Carracci, who painted the fame fubject for the Certofi at Bologna. But if Domenichino did borrow the thought, he has amply made amends by the mode in which he has adorned it. It received its due meed of applaufe at the time, and was ranked as the work next in value to the Transfiguration by Raphael ; but while the merit of its author thus excited the admiration of the public and moft of the artifts of Rome, it elicited in the minds of feveral, and among them of Lanfranco, the bitterift fpirit of envy and malignity, which was actively exerted againft him. He was reviled as a plagiarift, and the execution of his pictures condemned as heavy and ungraceful ; and in fpite of their powerful effect, the influence of his adverfaries fo far prevailed, that for a time he failed of commiffions, and had ferious thoughts of changing his profeffion for that of fculpture. The celerity and freedom with which Lanfranco invented and painted, and all thofe machinifts who applauded the means of art above the end, were oppofed to the flow and uncertain power of invention poffeffed by Domenichino. But upon this fubject Lanzi juftly obferves, that if Domenichino had had the good fortune which he merited, he would, like the Carracci in Bologna, have foon triumphed over his adverfaries, admitting that he was an imitator, but not a fervile one, and that if his works were more flow in their birth than thofe of his enemies, they merited a much longer exiftence. "The public," he adds, "is juft in its judgment, but before its tribunal a good caufe is not fufficient of itfelf unlefs able pleaders give it credit. Domenichino timid and folitary, mafter of little, had not then fufficient means to protect himfelf againft the torrent which overwhelmed him, and report feemed to verify the remark of the cardinal Agrecchi, that his worth would not be duly appreciated till after his death. Impartial pofterity does him juftice, and there is now no gallery which is regarded as complete without fome fpecimen of his talents."

The virulence of thefe perfecutions difgufted and difturbed Domenichino fo much, that he returned to Bologna, and there he tranquilly paffed fome years in the delightful practice of his art. Among the moft renowned of his productions about this period are his pictures of the Martyrdom of S. Agnes, for the church of that faint, and the Madonna della Rofario, both large works, and of fufficient merit to attract the infipidity of the French, and for a while they adorned the walls of the Louvre ; but they are now returned to their original deftinations. When malice and envy had exhaufted themfelves, and fame added frefh laurels to the brow of Domenichino, he was invited back to Rome by pope Gregory XV., who appointed him his principal painter, and architect to the pontifical palace. The cardinal Montotto engaged him to paint the vault of S. Andrea della Valle, where he reprefented the four Evangelifts with Angels ; and in the chapel of cardinal Bandini, in the church of S. Sylveftro, in the Quirinal, he painted four pictures, which rank amongft his beft : the fubjects are, Efther before Ahafuerus, Judith with the Head of Holofernes, David playing and finging before the Ark, and Solomon and his Mother Bathfheba feated on a Throne. The former are certainly of a very high clafs of art, and though lacking the fimplicity and grandeur of M. Angelo or Raffaelle, yet they are full of rich and fine forms, particularly thofe of the angels, &c. which accompany the figures. The latter are not of fo elevated a ftyle, but are more familiar, and wrought with fine colour : they are engraved by Jacomo Frey.

Frey. About the fame time he painted four of the Cardinal Virtues in the angles of S. Carlo Catenari, which have been preferved to us by the graver of G. Andran.

Domenichino not only excelled in hiftorical painting, in works both great and fmall, but he has alfo left us many landfcapes of extraordinary excellence in point of tone; feldom can fo much be faid of their compofitions. They are generally felect in fcenery, of a grave and dignified character, and are executed with boldnefs and freedom, and enriched with figures. A very fine one may be feen in the collection of the marquis of Stafford. He is univerfally efteemed as the beft among the difciples of the Carracci, and Nicolo Pouffin is faid to have preferred him before them: but that favour, if we except the Communion of S. Jerome, his works will fcarcely be found to fupport. M. Fufeli has remarked, that "expreffion which had languifhed after the death of Raphael feemed to revive in Domenichino; but his fenfibility was not fupported by equal comprehenfion, elevation of mind, or dignity of motive." His forms are by no means fo pure or graceful, or his actions fo natural and unconftrained, as thofe of that divine painter. His invention does not appear to have been vivid, but his ftudy was unremitting, and with all his defects he well deferved the title of a great painter, and certainly has not fince been equalled. He died in 1641, aged 60.

ZAMPOGNA, in the *Italian Mufic*, is ufed to denote any inftrument that founds like a flute; and particularly a bagpipe, being an affemblage of divers pipes of different fizes. It is alfo taken for a common flute.

ZAMRECOTTA, in *Geography*, a town of Bootan; 34 miles S.E. of Damfong.

ZAMZEVRIZI, a town of the principality of Georgia, in the province of Carduel; 15 miles S.W. of Gori.

ZANA, a river of Peru, which runs into the Pacific ocean, S. lat. 7°.

ZANAATHA, in *Ancient Geography*, a town in the interior of Arabia Petræa. Ptol.

ZANCHI, Basilio, in *Biography*, an elegant Latin poet, was born at Bergamo in 1501, and purfued his ftudies under Giovita Rapicio with fo much ardour, that at the age of feventeen he made a collection of Latin poetical epithets, which was afterwards publifhed. Before he had attained the age of twenty he vifited Rome, and was much noticed by the poets of that city. According to the practice which then prevailed he changed his baptifmal name Pietro into L. Petreius; but afterwards, returning to Bergamo, and entering, in 1524, among the canons-regular of Lateran, he affumed that of Bafil; devoting his attention to facred literature, and publifhing fome works on the fcriptures. In the progrefs of his life he frequently changed his refidence; and was every where refpected, on account of his learning and talents, by the principal fcholars of the age. Under the fevere decree of pope Paul IV. iffued in 1558, which commanded, under the threatened penalty of the prifon or galleys, all the religious to return to the cloifters to which they belonged, Zanchi was imprifoned, and fell a facrifice to the rigour of confinement. One of his biographers fays, that he had few equals in the fweetnefs, and fewer in the elegance of his poetry; fpecimens of which occur in his eight books of poems, one of which bears the title of "De Horto Sophiæ," and defcribes the moft remarkable facts and doctrines of the Catholic religion. Some of his poems are inferted in the "Deliciæ," and the "Carmina Poetarum Italorum." He alfo publifhed a kind of Lexicon, entitled "Latinorum Verborum ex variis auctoribus Epitome." Moreri. Gen. Biog.

Zanchi, Girolamo, an Italian Proteftant, was born in 1516 at Alzano, in the territory of Bergamo, and entered among the canons-regular of Lateran at the age of fifteen, in which connection he remained for ten years. But Peter Martyr having communicated to him, and others of his fraternity, the opinions of the reformers, he departed with him from Italy in 1530, and went to Geneva. From Geneva he removed to Strafburg upon an invitation to fupply a vacancy in the profefforfhip of facred literature, which he accepted in 1553, and which he occupied for about eleven years. Having figned the Augfburg confeffion, with fome reftrictions, he was aggregated to the chapter of St. Thomas, in Strafburg. Although his difpofition was moderate and conciliatory, he was engaged in fome difputes with the zealous Lutherans, who determined to procure his expulfion. With this view, they acquired his fignature of a formulary, to which he affented in the following terms: "Hanc doctrinæ formulam ut piam agnofco, ita etiam recipio." The ambiguity of this declaration was not fatisfactory to his adverfaries, and he was therefore induced to refign, and to accept an invitation to a church in Chiavenna. The articles with regard to which he was fufpected by the Lutherans were predeftination, the perfeverance of the faints, the euchariſt, ubiquity, images, antichrift, and the end of the world. Having refided at Chiavenna from the year 1563 to 1568, he removed to the theological chair at Heidelberg, when he took the degree of doctor. When Frederick III., who was a zealous Lutheran, fucceeded the elector palatine, and removed the Heidelberg profeffors, Zanchi declining offered fettlements at Leyden and Antwerp, took a place in count John Cafimir's college at Newftadt. Upon the reftoration of the expelled profeffors, Zanchi, on account of his age, was declared "emeritus;" and having loft his fight, died at Heidelberg in 1590.

Highly efteemed among Proteftants in general on account of his learning and invincible attachment to their principles, John Sturmius affirmed of him, "that he fhould not be at all anxious for the caufe of reformed religion, if Zanchius alone were to difpute in the council of Trent againft all the fathers prefent." Bayle.

ZANCLE, in *Ancient Geography*, a town of Sicily, on the ftrait which feparates this ifland from Italy. According to Herodotus, the Meffenians, driven from the Peloponnefus by the Lacedæmonians, tranfplanted themfelves into Sicily, took poffeffion of Zancle, and gave it the name of Meffana, whence Meffina.

ZANDENDORF, in *Geography*, a town of Germany, in the margravate of Anfpach; 2 miles S.W. of Cadolzburg.

ZANDHOP, a town of Pruffia, in Ermeland; 16 miles S.E. of Heilfberg.

ZANE, a town of Virginia; 9 miles S.S.E. of Winchefter.—Alfo, a townfhip of Champaign county, in the diftrict of Ohio, with 645 inhabitants.

ZANES, in *Ancient Geography*, a town of Upper Mœfia, fortified by Juftinian, fo as to render it one of the ftrongeft bulwarks of the empire.

ZANESVILLE, in *Geography*, a townfhip of the ftate of Ohio, in the county of Mufkingum, on the Scioto, with 2154 inhabitants.

ZANETTI, Antonio, in *Biography*, of Venice, maeftro di capella to the duke of Modena, the latter end of the 17th and beginning of the 18th century, for whom, and for the theatres in Venice, he produced fix or feven operas that were much efteemed in thofe days.

Zanetti, Francisco, was born in the year 1740, maeftro di capella in the cathedral at Perugia in 1770. He had previoufly paffed fome time in London, where fome elegant and eafy fonatas of his compofition were publifhed by by Bremner. He loſt his place in the church at Perugia, by having appeared on the Alberti ſtage at Rome, as a ſinger in an opera of his own compoſition, and that, merely to ſupply the place of the principal tenor, who had run away, and to prevent the piece from being ſtopped: he however married afterwards a pretty woman, who ſung well, and indemnified him for the loſs of his place.

Since his marriage he has compoſed ſeveral ſucceſsful operas, in which ſignora Zanetti has performed the principal female part, particularly one at Milan in 1785, in which ſhe was much applauded, as well as her huſband's muſic. He has compoſed much natural and pleaſing muſic for inſtruments; as ſix violin trios, ſix quintets for three violins, and two violoncellos, &c.

ZANFARA, in *Geography*. See ZAMFARA.

ZANGARISA, a town of Naples, in Calabria Ultra; 6 miles N.E. of St. Severina.

ZANGESAIR, or SANGUSEER, a ſea-port of Hindooſtan, in Concan, with a good harbour, but not much frequented; 15 miles S. of Severndroog. N. lat. 17° 38′. E. long. 72° 54′.

ZANGUEBAR, a name given to a large territory of Africa, bordering on the Eaſtern ſea, including many kingdoms; the name is ſaid to import "the coaſt of the negroes," all the inhabitants being blacks, with curled woolly hair; extending from two degrees north to the twenty-firſt degree of ſouth latitude. The principal kingdoms on the coaſt have been ſeparately ſpoken of and deſcribed. Of the country in general little is known; the whole tract is repreſented as barren and unhealthy, the lands lying low, and interſected with rivers, lakes, thick woods, foreſts, and marſhy grounds. The fruits of it are very unwholeſome, their rivers, for the moſt part, covered or choked up with weeds, buſhes, and thickets; all which ſo ſtagnate the air, and corrupt the products of the earth, and render the inhabitants ſo ſickly and indolent, that they receive little or no benefit from its produce. The Bedouin Arabs are the only people who make advantage of it by breeding multitudes of cattle, and living moſtly upon their fleſh and milk; whilſt the negroes, or Zanges, content themſelves with feeding upon wild beaſts and fowl, which ſwarm all over thoſe parts. To ſupply the want of corn, pulſe, roots, and other wholeſome food, of which they are deſtitute, the Divine Providence hath interſperſed that whole country with mines of gold, eaſily got, by the help of which they can purchaſe all the neceſſaries and conveniences of life from other parts: but this is the very circumſtance that makes them ſo extremely jealous of letting ſtrangers penetrate into the inland; more eſpecially ſince the Portugueſe have made themſelves maſters of ſuch a number of places along this coaſt. They are in their nature fierce and ſtout, ignorant and brutiſh, without religion, eſpecially the negroes; upon which laſt account they have the name of Caffers. As for the Bedouins, they have ſome kind of religion, or rather obſerve a variety of ſuperſtitious rites, but are no leſs ignorant and uncivilized than the Caffers; yet they chiefly herd among themſelves, and live at a great diſtance from the coaſts, and by the ſides of lakes and rivers, for the convenience of paſture for their numerous herds. They go all naked, both Caffers and Arabs, excepting that they wrap a piece of cotton cloth round their middle, which deſcends a little below the knee; but thoſe who live along the coaſts are ſomewhat more civilized, affect a little more finery in their dreſs, and inſtead of cotton cloth cover themſelves with the ſkins of wild beaſts, more or leſs rich, according to their rank, with the tails of animals trailing behind on the ground; they likewiſe adorn their necks, arms, and legs, with a variety of beads, bugles, and other trinkets, of amber, jett, glaſs, and other materials, which they purchaſe from the merchants with their gold, furs, ivory, and other commodities. There are among theſe coaſters a great number of Mahometans, but a much greater number ſtill among the iſlanders along the coaſt; they being for the moſt part deſcended from thoſe Arabs who were baniſhed out of their country. The countries are, Melinda, Mongala, Jubo, Moſambique, and ſome others.

ZANHAGA, or ZANZAGA, or *Zenhaga*, a province of Africa, in the country of Sahara, bordering on the Atlantic.

ZANIA, in *Ancient Geography*, a town of Aſia, in the interior of Media. Ptol.

ZANNA, the name of a medicinal earth, deſcribed by Oribaſius: he ſays it is found in Armenia, in that part which borders on Cappadocia; and that it is very drying, and of a pale colour, and eaſily diſunited by water, falling into a fine powder like lime.

It is called by the natives *zarina*, and the mountain from which it is taken is near the city Baganona. It is of a drying and aſtringent nature.

ZANNICHELLI, JOHN JEROME, in *Biography*, a phyſician and naturaliſt, was born at Modena in 1662, and ſettling in the medical department at Venice, he publiſhed a work on the preparation of chemical medicines, entitled "Promptuarium Remediorum chymicorum." In 1702 he was created, by a patent of the duke of Parma, doctor of medicine, ſurgery, and chemiſtry. He afterwards formed a muſeum of natural hiſtory, and made many journies in order to collect foſſils and other ſubjects for this repoſitory. Some of his excurſions were undertaken by public authority, as he was nominated by the chamber of health, phyſician-naturaliſt to all the ſtates of Venice. He died in 1729. During his life-time he publiſhed ſeveral tracts relating to botany and lithology; and after his death his ſon John James edited from his MSS. "Opuſcula Botanica Poſthuma," 1730, and "Iſtoria della Piante che naſcono nel lidi intorno à Venizia," 1735, being a deſcription, with figures, of the plants on the Venetian ſhores. Haller. Eloy.

ZANNICHELLIA, in *Botany*, was ſo named by Micheli, in compliment to John Jerome Zannichelli, an eminent apothecary at Venice, who ſpared no expence or labour, even at an advanced age, in the ſtudy of botany, on account of which he undertook ſeveral hazardous and difficult journies. He was particularly devoted to the obſervation of marine productions, as well animal as vegetable. In purſuit of theſe he was Micheli's companion and guide, among the iſlands and ſhores of the Adriatic; and has wrote an account of the plants there to be found; which, with the hiſtory of ſome of his mountain tours, were printed after his deceaſe. Zannichelli publiſhed a pamphlet on the medical qualities of *Ruſcus*, as well as various chemical and geological works. He died in 1729, aged 67. His ſon, John Jacob Zannichelli, wrote on the properties of the horſe-cheſnut, as well as an account of his own and his father's muſeum. — Mich. Nov. Gen. 70. t. 34. Linn. Gen. 476. Schreb. 616. Willd. Sp. Pl. v. 4. 181. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 229. Sm. Fl. Brit. 955. Prodr. Fl. Græc. Sibth. v. 2. 225. Purſh 4. Juſſ. 19. Poiret in Lamarck Dict. v. 8. 836. Lamarck Illuſtr. t. 741. Gærtn. t. 19. (Graminifolia; Dill. Gen. 168.)—Claſs and order, *Monoecia Monandria*. Nat. Ord. *Inundatæ*, Linn. *Naiades*, Juſſ.

Gen.

Gen. Ch. Male, *Cal.* none. *Cor.* none. *Stam.* Filament one, ſimple, elongated, erect; anther ovate-oblong, erect.

Female, cloſe to the male. *Cal.* Perianth of one leaf, inferior, hollow, ſwelling, oblique, with two or three teeth. *Cor.* none. *Piſt.* Germens from four to eight, ſtalked, oblong, converging; ſtyles as many, ſimple, rather ſpreading; ſtigmas ovate, peltate, flat, ſpreading outwards. *Peric.* none. *Seeds* as many as the germens, naked, ſtalked, oblong, compreſſed, a little incurved, beaked with the permanent ſtyles, tuberculated at the back, with a ſimple coriaceous coat.

Obſ. Schreber ſpeaks of ſome ſolitary, diſperſed, male flowers, furniſhed with a ſingle-leaved calyx, whoſe orifice is oblique, acute at the poſterior part, and entire. He follows Gærtner in conſidering the coat of each ſeed as a capſule; but the latter allows there is ſcarcely any internal coat, or integument, to the kernel, and the outer one is deſtitute of valves; ſo that although the ſtyle be permanent, we rather follow Linnæus than other authors; and we conceive that if the exiſtence of a naked ſeed be admitted in any inſtance, it muſt be in the preſent; there being only a ſimple covering to the embryo, which is indiſpenſable.

Eſſ. Ch. Male, Calyx none. Corolla none. Filament elongated, erect. Anther oblong.

Female, Calyx of one leaf. Corolla none. Germens four, or more. Stigmas peltate. Seeds ſtalked, naked.

1. Z. *paluſtris.* Marſh Horned-Pondweed. Linn. Sp. Pl. 1375. Willd. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 1844. Purſh n. 1. Mill. Illuſtr. t. 77. Fl. Dan. t. 67. (Z. paluſtris major, foliis gramineis acutis, flore cum apice quadricapſulari, embryonis clypeolis integris, et vaſculo non barbato, capſulis ſeminum ad coſtam dentatis; Mich. n. 1. t. 34. f. 1. Potamogeito ſimilis, graminifolia, ramoſa, ad genicula polyceratos; Pluk. Phyt. t. 102. f. 7.)—Anther of four cells. Stigmas entire.—Native of ponds, ditches, and rivulets, in Italy, as well as other parts of Europe, from Sweden to Conſtantinople, flowering in ſummer. It is found alſo in Virginia, near the ſweet ſprings, according to Clayton and Purſh. The *root* is annual. *Stem* ſlender, floating, branched, round, leafy, and ſmooth, with the habit of a *Potamogeton*. *Leaves* linear, graſſy, ſeſſile, narrow, acute, and entire, two or three inches long. *Bractea* membranous, tubular, axillary, including a pair of green *flowers*, one male, the other female. *Anther* tawny. *Seeds* blackiſh when ripe, rugged or toothed at the back.

2. Z. *dentata.* Toothed Horned-Pondweed. Willd. n. 2. Poiret n. 2. (Z. paluſtris minor, foliis gramineis acutiſſimis, flore minimo cum apice bicapſulari, embryonis clypeolis circumcrenatis, et vaſculo barbato, capſulis ſeminum ad coſtam aſperis; Mich. n. 2. t. 34. f. 2.)—Anther of two cells. Stigmas toothed.—Found in the neighbourhood of Florence, with the foregoing, as well as in mountain pools in the adjacent country. Rather ſmaller than the firſt ſpecies, with ſhorter *leaves;* but moſt eſſentially different in having only two cells to the *anther*, and remarkably toothed *ſtigmas*. The *ſeeds* alſo are tuberculated all over, not merely toothed at the back, or keel.

Loureiro has a *Z. tuberoſa*, Fl. Cochinch. 543, to which he attributes "ovate-oblong ſingle-ſeeded *berries*." It grows in the waters of Cochinchina, and has tuberous perennial *roots*, radical, ſword-ſhaped *leaves*, ſpiked *flowers*, the *calyx* of the female in ſix deep ſegments. We agree with M. Poiret that it would be too hazardous to admit this ſpecies without examination. Loureiro had probably never ſeen a real *Zannichellia*.

ZANOE, in *Ancient Geography*, a town of Paleſtine, in the mountains of the tribe of Judea.—Alſo, a town of Paleſtine, in the plain of the tribe of Judea. Joſhua.

ZANONA, in *Geography*, a ſmall iſland in the Mediterranean; 2 miles N.E. of Ponza.

ZANONIA, in *Botany*, bears that name in memory of an Italian botanical writer of the 17th century, James Zanoni, ſuperintendant of the public garden at Bologna. He publiſhed in 1675 a folio volume, in Italian, entitled *Iſtoria Botanica*, with 80 plates, of new or rare plants, accompanied by deſcriptions. Monti gave an enlarged edition of this work, in Latin, in 1742. Zanoni died in 1682, aged 67. Plumier, who ſpeaks of him as a learned and critical inveſtigator of the plants of the ancients, publiſhed a *Zanonia*, in his Nov. Gen. 38. t. 38, which Linnæus has reduced to COMMELINA (ſee that article, ſp. 12.); and which ſome botaniſts reckon a *Tradeſcantia*.—Linn. Gen. 523. Schreb. 690. Willd. Sp. Pl. v. 4. 769. Mart. Mill. Dict. v. 4. Juſſ. 397. Poiret in Lamarck Dict. v. 8. 837. Lamarck Illuſtr. t. 816.—Claſs and order, *Dioecia Pentandria*. Nat. Ord. *Cucurbitaceæ*, Linn. Juſſ.

Gen. Ch. Male, *Cal.* Perianth of three ovate ſpreading leaves, ſhorter than the corolla. *Cor.* of one petal, in five deep, ſpreading, pointed, inflexed, equal ſegments. *Stam.* Filaments five, ſpreading, the length of the calyx; anthers ſimple.

Female, on a ſeparate plant, *Cal.* Perianth as in the male; ſeated on the germen, deciduous. *Cor.* as in the male. *Piſt.* Germen oblong-clubſhaped, inferior; ſtyles three, ſpreading, conical, reflexed, permanent; ſtigmas divided, criſped. *Peric.* Berry large, elongated, abrupt; tapering at the baſe; encompaſſed near the top with a criſped future, of three cells. *Seeds* two in each cell, rounded-oblong, flat, in the centre of a lanceolate ſcale, or wing.

Eſſ. Ch. Male, Calyx of three leaves. Corolla in five deep ſegments.

Female, Calyx ſuperior, of three leaves. Corolla in five deep ſegments. Styles three. Berry of three cells, with a lid. Seeds winged, two in each cell.

1. Z. *indica.* Climbing Indian Cucumber. Linn. Sp. Pl. 1457. Willd. n. 1. Poiret n. 1. ("Penar-valli; Rheede Hort. Mal. v. 8. t. 49, male; t. 47, 48, female.")—Native of Malabar and Ceylon. A ſtranger in the gardens of Europe, nor do we recollect having ever ſeen a ſpecimen, Linnæus having, in this inſtance, confided entirely in the *Hortus Malabaricus*, which was very rarely his cuſtom. The herbaceous branching *ſtem* appears to climb by means of ſimple, ſpiral, axillary *tendrils*. *Leaves* alternate, ſtalked, ovate-oblong, acute, entire, ſmooth. *Flowers* in lax drooping *cluſters*, which in the male appear to be ſomewhat compound. *Fruit* oblong, abrupt, obſcurely triangular, with the flavour of a cucumber according to Rheede. There can be little doubt of this genus belonging to the gourd tribe, whether it anſwers to all the characters which authors have been pleaſed to apply to that tribe or not. The opening of the *fruit* betrays ſome analogy to *Momordica operculata*.

ZANORI, in *Geography*, a town of Mexico, in the province of Culiacan; 80 miles N. of Culiacan. N. lat. 25° 40′. W. long. 108° 10′.

ZANOTTI, FRANCIS MARIA, in *Biography*, a mathematician and philoſopher, was born at Bologna in 1692, began his education among the Jeſuits, and purſued a courſe of natural philoſophy at the place of his nativity. Declining the proſecution of juriſprudence, to which he directed his firſt attention, he devoted himſelf to the ſtudy of philoſophy, laying the foundation in an acquaintance with mathematics, and commencing with the works of Deſcartes and

and Malebranche. But being defirous of ftudying the works of Ariftotle and Plato in the original language, he applied with diligence to acquire a knowledge of the Greek, fo that he became able not only to read but to write it. Thus furnifhed, he obtained leave to give lectures in philofophy; in the courfe of which he inftituted a comparifon between the fyftem of Defcartes and that of Newton, avowing a decided preference to the latter; more particularly as it refpects optics and aftronomy. It was by his advice, and under his direction, that Algarotti undertook to compofe a popular treatife on light and colours. Declining to go to Padua for the purpofe of giving lectures, he was appointed librarian to the Inftitute at his native place, and afterwards fecretary, in which office he drew up in Latin an account of the tranfactions of the academy, with a hiftory of its inftitutions, which he continued till the year 1766. This work was rendered peculiarly pleafing and inftructive by the clearnefs of his arrangement, and the excellence of his ftyle; in both which refpects he feems to have formed himfelf on the model of Fontenelle. To thefe tranfactions he was himfelf a contributor; communicating a method of fquaring different fpaces of the hyperbola, and feveral important difcoveries with regard to the circle, fphere, and circumfcribing figures. Of thefe difcoveries he tranfmitted an account to the Academy of Sciences at Montpellier, of which, as well as of the Royal Society of London, he had been elected a member. He alfo difcovered a method of feparating indeterminate quantities, detected feveral errors in philofophy, and profecuted a variety of experiments; on thefe and other fubjects he delivered papers to the Bologna Inftitute, which were publifhed in his commentaries. Several of his papers on the central forces were alfo inferted in the Tranfactions of the Academy. His theorem on the means of determining the velocity of a body drawn or repelled from its centre, in any point of its orbit, were held in high eftimation by Paul Frifius, who availed himfelf of it in the compofition of his work on univerfal gravity. On the fubject of the "Vis viva," which in his time engaged particular attention, he wrote three dialogues in Italian, diftinguifhed for perfpicuity and elegance. In thefe he adopted the opinion of Defcartes in oppofition to that of Leibnitz, who conceived that this force was not to be eftimated from the velocity, as he afferted, but from the fquare of the velocity. The properties of numbers likewife engaged his peculiar attention; and he fhewed, that if any multiple of the number 9 be taken, the fum of the figures forming that multiple will be alfo a multiple of 9. In his fpeculations on moral philofophy, he defended the Peripatetics againft Maupertuis; and his adverfary Anfaldi, in his "Vindiciæ Maupertufianæ," accufed him of depreciating the Catholic religion, as he afcribed too great influence to the Stoic philofophy in alleviating the misfortunes of human life. This controverfy gave occafion to many publications. Zanotti was a poet as well as a mathematician and philofopher, and wrote verfes both in the Tufcan and Latin languages; aiming, in imitation of the moft celebrated poets of Italy, to blend the fuavity of Petrarch with the energy and vigour of Dante. Many of his Italian poems were publifhed by Euftatio Manfredi; and fome of his Latin elegies were edited by J. Antonio Vulpi; who fays of them, that Catullus himfelf would not have been afhamed to acknowledge them. Both his Italian and Latin poems were afterwards publifhed feparately, firft at Florence, and laftly at Bologna; and in this edition are contained imitations of Tibullus, Ovid, and Virgil, as well as of Catullus. After the death of Beccaria, Zanotti, whofe modefty was no lefs confpicuous than his talents and acquirements, accepted the office of prefident of the Inftitute, which he deemed peculiarly honourable, as it was a token of efteem conferred upon him by his countrymen. Among the learned men with whom he maintained intercourfes of friendfhip or correfpondence were the famous anatomift Morgagni, Voltaire, and pope Benedict XIV. He died in the month of January 1777. For an account of his works, which, befides thofe to which we have already referred, were numerous, we refer to "Fabroni Vitæ Italorum Doctrina excellentium;" and for an abftract of their titles, and time and place of publication, to Gen. Biog.

Zanotti, Giovanni Pietro, was born at Paris, though of Italian parentage, in 1674. He was fent young to Bologna, and became a pupil of Lorenzo Paffinelli. Under that mafter he acquired an agreeable tone of colouring, a mellow pencil, and an intelligent acquaintance with the principle of the chiaro ofcuro. He painted feveral altar-pieces for the churches at Bologna, of which the moft efteemed are, the Incredulity of St. Thomas, in the church of S. Tommafo del Mercato; the Refurrection, in S. Pietro; the Nativity, in La Purita; and a large picture in the palazzo publico, reprefenting the ambaffadors from Rome fwearing fidelity to the Bolognefe. He refided great part of his life at Cortona, where he alfo diftinguifhed himfelf by feveral pictures painted for the churches, particularly Chrift appearing to the Magdalen, Chrift bearing his Crofs, and the Murder of the Innocents.

Zanotti was a laborious and intelligent writer on art. Of his numerous publications the moft confiderable is his "Storia dell' Academia Clementina di Bologna," publifhed in two vols. 4to. in 1739. He died in 1765, aged 91. Bryant's Dict.

Zanotti, L'Abate Giancalisto, of Bologna, a difciple of Padre Martini, was born in 1770, of whofe compofition at the annual performance of the mufical ftudents, who were members of the celebrated Philharmonic Society in Bologna, founded in 1666, we heard a *dixit*, in which there were all the marks of an original and cultivated genius. The movements and even paffages were well contrafted; and to make ufe of the language of painters, there were difcernible in it not only light and fhade, but even mezzo tints. He proceeded from one thing to another by fuch eafy and infenfible gradations, that it feemed wholly the work of nature, though conducted with the greateft art. The accompaniments were judicious, the ritornels always expreffed fomething, the melody was new and full of tafte, and the whole was put together with great judgment, and even learning. We have very feldom been more pleafed or completely fatisfied than by this production; and yet the vocal parts were but indifferently executed, for there were then no great fingers at Bologna. We expected to have heard of future works by this moft promifing young compofer, who was one of the maeftri di capella in the church of San Petronio; but as that has not happened, we fear he did not long furvive this performance.

ZANOW, in *Geography*, a town of Pomerania; 6 miles E.N.E. of Cofslin.

ZANTE, an ifland in the Mediterranean, near the coaft of the Morea, about 12 miles in length, and fix in breadth, chiefly inhabited by Greeks, till lately under the Venetians, who appointed a governor, called proveditor, and two counfellors. The Greeks have 40 churches, befides convents, and a bifhop; the Roman Catholics have three convents and a bifhop. By the treaty of Campo Formio, Zante was given to France; but in 1799 it was taken by the united fleets of Ruffia and Turkey, and in the year 1800 connected with other neighbouring iflands, to form a republic of the Seven iflands, named the Ionian, which are to pay a tribute to the

the Porte, and guaranteed both by the Turks and Russians. Corfu, Cephalonia, and some others lately in the possession of Venice, were of this number. The island produces excellent wine, and that species of grapes called currants, olives, figs, melons, peaches, and other choice fruits: towards the coasts, the island is in general mountainous, but level in the interior parts. It is much subject to earthquakes. N. lat. 37° 40′. E. long. 21° 4′.

ZANTE, a town and capital of the island of Zante, situated on the N.E. side, with a harbour safe and commodious for vessels of any size. The town stretches between the harbour and the foot of a mountain about a mile in length, but narrow; the streets are not paved, and the houses in general low. On a mountain above the town is a citadel, which commands the harbour, and contains a little city within its walls. It is to be ascended with difficulty, is strong, and well supplied with stores, and furnished with a garrison. This is the residence of the governor and officers. Zante is the see of a Greek and Latin bishop. There are several churches, and the Jews have a synagogue; 21 miles S.S.W. from the town of Chiarenza in the Morea. N. lat. 37° 50′. E. long. 21° 8′.

ZANTHENES, in *Natural History*, a name given by the ancients to a fossile substance found in Media. Pliny quotes Democritus for saying, that if rubbed in palm wine and saffron, it became soft as wax, and yielded a very sweet smell.

ZANTHER, in *Geography*, a town of Pomerelia; 10 miles S. of Marienburg.

ZANTHORRHIZA, in *Botany*, L'Herit. Stirp. Nov. t. 38. See XANTHORRHIZA.

ZANTHOXYLUM, Linn. Gen. 519. See XANTHOXYLUM.

ZANTHOXYLUM, in *Gardening*, contains plants of the hardy and tender exotic shrubby kinds, in which the species cultivated are, the Canada tooth-ache-tree, or Hercules's club (Z. clava Herculis), and the Chinese tooth-ache-tree (Z. trifoliatum).

The first is a plant of the tree kind, of which there is a variety; the ash-leaved tooth-ache-tree, with oval-oblong folioles, and prickly mid-ribs.

And the last is a woody branching plant.

Method of Culture.—These plants may be increased by seeds and layers. The seeds should be sown in the spring, either in an east border, or in pots placed in the morning sun all the summer, being sheltered in a frame in winter; and in the spring following removed to the full air till October, giving proper waterings all the summer; and towards winter be placed again under shelter from frost till March, when the young plants may be potted separately; and thus continued for a year or two, being sheltered in the winter, when they may be transplanted into the shrubbery, where they are to remain.

The layers of the young wood may be laid down in autumn or early spring, and when they have stricken root be taken off and managed as the seedlings.

They also succeed by cuttings in spring or summer, planted in pots, assisted by a hot-bed, in which they soon strike, when they should be inured to the full air; and the young plants will be fit for planting out in the autumn, or the spring following.

The first is a very ornamental plant in the borders and other dry parts of shrubberies, and the latter among potted plants in the green-house collections.

ZANTOCH, in *Geography*, a town of the New Mark of Brandenburg; 8 miles E. of Landsberg.

ZANZALUS, in *Biography*. See BARADÆUS.

ZANZIBAR, or ZANGIBAR, in *Geography*, an island of Africa, in the Indian sea, near the coast of Zanguebar, governed by a king, who is tributary to the Portuguese. S. lat. 6°. E. long. 41° 15′.

ZANZOUR, a town of Africa, in the country of Tripoli; 15 miles W.N.W. of Tripoli.

ZAOIE, a town of Egypt, on the left bank of the Nile; 13 miles N. of Benisuef.

ZA-OSTROG, a town of Morlachia, near the coast; 15 miles S.E. of Macarska.

ZAOZERSKOI, a town of Russia, in the government of Novgorod, on the Sula; 28 miles W. of Tcherepovetz.

ZAPATA, or SAPATA, a kind of feast, or ceremony, held in Italy, in the courts of certain princes, on St. Nicholas's day, in which people hide presents in the shoes or slippers of those they would do honour to; in such manner, as to surprise them on the morrow, when they come to dress.

The word is originally Spanish, *capato*; and signifies a shoe, or slipper.

It is done in imitation of the practice of St. Nicholas; who used, in the night-time, to throw purses of money in at the windows, for portions to poor virgins in their marriage.

F. Menestrier has described these zapatas, their origin, and different usages, in his Treatise des Ballets Anciens et Moderns.

ZAPATERO, in *Geography*, a small island of Mexico, in lake Nicaragua, near the west coast; 30 miles S.E. of Grenada.

ZAPATILLA LAGOON, a bay on the east coast of Yucatan. N. lat. 18° 52′. W. long. 89° 32′.

ZAPETRA, in *Ancient Geography*, a town of Asia, in the mountains of Comagene, upon a small river, which discharged itself into the Euphrates, S. of that town.

ZAPFENDORF, in *Geography*, a town of Bavaria, in the bishopric of Bamberg; 9 miles N. of Bamberg.

ZAPHOR, a name given by some writers to *Zaffer*; which see.

ZAPOROGIAN COSSACKS, in *Geography*. See COSSACKS.

ZAPOTITLAN, a town of Mexico, in the province of Tlascala; 62 miles S.E. of Puebla de los Angelos.

ZAPOTLAN, a town of Mexico, in the province of Mechoacan; 25 miles N. of Colima. N. lat. 20° 10′. W. long. 104° 36′.

ZAPPANIA, in *Botany*, was so named by Scopoli, in honour of Paul Anthony Zappa, an Italian botanist, to whom the public garden at Pavia was indebted for many valuable communications. The French, not always exact in orthography, will have it *Zapania*, and they have misled our more accurate countryman Mr. Brown, who follows Jussieu and Lamarck in adopting this genus, in his Prodr. Nov. Holl. v. 1. 514. Scopoli published it in his Deliciæ Floræ et Faunæ Insubricæ, v. 1. 34. t. 15. The species, on which he founds the genus, and which he erroneously suspected might be the *Lantana involucrata* of Linnæus, is the *Verbena globiflora* of L'Heritier. (See VERBENA, n. 3.) We do not find it necessary or expedient to retain *Zappania* as a distinct genus.

ZAPUNTELLO, in *Geography*, a town of the island of Melada, which sometimes gives name to the island.

ZAQUALPAN, a town of Mechoacan, in the province of Mechoacan; 6 miles S. of Zacatulà.

ZARA, a city and sea-port of Dalmatia, see of an archbishop, situated in a district, called "The County of Zara," which was purchased of the king of Naples, in the year

1409, by the Venetians, in whofe hands it afterwards continued. Zara is furrounded on all fides by the fea, except that it has a communication eaftward with the continent, by means of a draw-bridge, commanded by a fort. It is reckoned one of the beft fortifications in Dalmatia, and deemed almoft impregnable. The citadel is divided from the town by a very deep ditch, hewn out of a rock. The harbour, which lies to the north, is capacious, fafe, and well guarded. The rain is carefully preferved in cifterns, to fupply the want of frefh water. In the caftle refides the governor or proveditor of Dalmatia, whofe office is only triennial. It now belongs to the kingdom of Italy; 28 miles N.W. of Scardona. N. lat. 44° 22′. E. long. 15° 38′.

Zara *Vecchia*, *Old Zara*, or *Biograd*, or *Alba Maritima*, a town of Dalmatia, now little better than a village. In the time of the Romans it was a place of confiderable figure, and received a new fet of inhabitants by a numerous colony of that people. In the middle ages it was called *Belgrad*, or *Alba Maris*, and more anciently *Blandona*. According to fome it was ruined by Attila; but we know with more certainty that it was deftroyed in the war between the Venetians and the Hungarians, by the doge Ordelafo Falieri. Some banditti afterwards mixing with the inhabitants that remained, the republic, to check their exceffes, ordered a general maffacre of the robbers, in which the ancient inhabitants were not fpared. Here was alfo a bifhop's fee, which, on the demolition of the town, was removed to Scardona; at prefent its inhabitants confift only of a few peafants; 18 miles S.E. of Zara.

Zara. See Scharedsje.

Zara, in *Ancient Geography*, a town of the Moabites, taken by Alexander Jannæus.—Alfo, a town of Afia, towards Armenia, upon the route from Arabiffum to Satala, between Eumeæ and Dagolaffum. Anton. Itin.

ZARAISK, in *Geography*, a town of Ruffia, in the government of Riazan, on the Ofer; 24 miles S.W. of Riazan. N. lat. 54° 30′. E. long. 38° 24′.

ZARAMA, in *Ancient Geography*, a town of Afia, in the interior of Media. Ptolemy.

ZARANDA, a name anciently given to the Euphrates.

ZARANG, the *Zarange* of Ptolemy, in *Geography*, a populous city of Perfia, in the province of Segeftan or Seiftan, fituated pleafantly on the banks of the Hearmund. This was the cuftomary refidence of Jacob Ben Lath, the conqueror of the caliph of Bagdad, and ftood a long fiege againft Timur, by whom it was at laft taken. Zarang is fuppofed to be the fame with the prefent Doofhak, the old name having been loft in the revolutions to which this province has been fubject for more than a century, and to which its prefent defolated ftate may, in a great meafure, be attributed. For a further account of it, fee Segestan.

ZARANIS, in *Ancient Geography*, a town of Afia, in the interior of Media. Ptolemy.

ZARATE, Augustine de, in *Biography*, a Spanifh hiftorian, was fent by Charles V. in 1543 to South America, as comptroller-general in Peru and Terra Firma; and having collected all the memoirs he could procure, he compofed his work "Del Defcubrimento y Conquifta de la Provincia del Peru," firft printed at Antwerp in 1555, 8vo. and reprinted at Seville, 1577, folio: the firft edition being regarded as moft authentic. It has been tranflated into Italian and French, and is commended as a work of reputation and credit by Dr. Robertfon. Moreri. Robertfon's America.

Zarate, in *Geography*, a town of South America, in the province of St. Martha; 15 miles S. of Teneriffe.

ZARAYOS, or Sharayos, a fuppofed lake of America, in the courfe of the river Paraguay, which only exifts during the annual inundations, that are on a far grander fcale than thofe of the Ganges, and may be faid to deluge whole provinces.

ZARCA, a town of Egypt, on the eaft branch of the Nile; 10 miles S. of Damietta.

ZARCHAS, or Tcharkas, a town of Perfia, in the province of Chorafan, or Khoraffan; 150 miles N. of Herat.

ZARCOIA, a town of Perfia, in the province of Segeftan; 12 miles W. of Zarang.

ZARDAM. See Sardam.

ZARE, a town of Perfia, in the province of Chorafan, or Khoraffan, on the north fide of a lake fo called; 70 miles S. of Herat.—Alfo, a lake of Perfia, in the province of Segeftan; 60 miles N. of Zarang. See Zerreh.

ZARED, in *Ancient Geography*, a torrent beyond Jordan, on the frontier of the Moabites. This torrent had its fource in the mountains, E. of the country of Moab, and proceeding from the E. to the W. difcharged itfelf into the Dead fea. The Ifraelites paffed it 38 years before their departure from Kadefh-Barnea. Numb. xxi. 12. Deut. ii. 13, 14.

ZAREPHATH. See Sarepta.

ZARESH-SHEKER, or Sarat-Afer, a city of Reuben, beyond Jordan. Jofh. xiii. 19.

ZARETHÆ, or Zaretæ, a people comprifed under the name of Scythians, on this fide of the Imaus, fouth of mounts Maffæi and Alani. Ptol.

ZAREX, a port of Laconia, on the Argolic gulf, S. of Cyphanta. Near this port was a temple of Apollo, with a ftatue of this god, holding in his hand a lyre. To the fouth, and parallel to the coaft, was a mountain called Zarex.

ZARFA, in *Botany*, a name given by Leo Africanus, and others, to the *lotus*, or nettle-tree.

ZARGIDAVA, in *Ancient Geography*, a town fituated on the bank of the river Hierafus, in the interior of Lower Mœfia, a little above Tamafiava.

ZARIASPA, or Zariaspe, a town of Afia, in Bactriana, watered by a river of the fame name, which difcharged itfelf into the Oxus. Strabo. It was alfo called Bactra. Steph. Byz.

ZARIFU, a word by which fome of the chemical writers have expreffed tin.

ZARIK, in *Geography*, a town of European Turkey, in the Morea; 22 miles E. of Mifitra.

ZARIMA, a town of South America, in the province of Quito; 220 miles S. of Quito. S. lat. 3° 36′. W. long. 79° 36′.

ZARJON, a town of South America, in the government of Buenos Ayres; 300 miles N.N.W. of Buenos Ayres.

ZARLINO, Giuseppe *da Chioggia*, maeftro di capella of St. Mark's church at Venice, and the moft general, voluminous, and celebrated theorift and writer on mufic in the Italian language during the 16th century, was born in 1540, and author of the following mufical treatifes, which, though feparately printed, and at different periods, are generally bound up together in one thick folio volume:—"Inftitutioni Harmoniche," Venice, 1558, 1562, 1573, and 1589; "Dimoftrationi Harmon." Ven. 1571, and 1589; and "Sopplimenti Muficali," Ven. 1588. We difcover by thefe dates, that Zarlino firft appeared as an author at the age of 18; and from that period till he had arrived at 49, he was continually revifing and augmenting his works. The

Z A R

The muſical ſcience of Zarlino, who died in 1599, may be traced in a right line from the Netherlands: as his maſter Willaert, the founder of the Venetian ſchool, was a diſciple of John Mouton, the ſcholar of the great Joſquin.

A commentary upon the voluminous writings of this author would occupy too large a portion of our work; and to refer the reader to the analyſis of his ſeveral treatiſes by Artuſi would be doing him little ſervice, as the writings of Artuſi would be difficult to find. There are few muſical authors whom we have more frequently conſulted than Zarlino, having been encouraged by his great reputation, and the extent of his plan, to hope for ſatisfaction from his writings concerning many difficulties in the muſic of the early contrapuntiſts; but we muſt own, that we have been more frequently diſcouraged from the purſuit by his prolixity, than enlightened by his ſcience: the moſt trivial information is involved in ſuch a crowd of words, and the ſuſpenſe which it occaſions is ſo great, that patience and curioſity muſt be invincible indeed to ſupport a muſical inquirer through a regular peruſal of all his works.

He begins his Inſtitutes with a panegyric upon muſic, in the uſual ſtrain; then we have its diviſion into mundane and humane, faithfully drawn from Boethius; after this, there is a great waſte of words, and parade of ſcience, in attempting to explain the ſeveral ratios of greater and leſs inequality, proportion, and proportionality, &c. where, in his commenting on Boethius, we have diviſions of muſical intervals that are impracticable, or at leaſt inadmiſſible, in modern harmony.

In his account of the ancient ſyſtem, he diſcovers much reading; and that is what he chiefly wiſhes the reader ſhould know.

In deſcribing the diatonic genus, in which the tetrachord is divided into tone major, tone minor, and major ſemitone: $\frac{9}{8}$, $\frac{10}{9}$, and $\frac{16}{15}$, for which diviſion, commonly called the ſyntonous, or intenſe of Ptolemy, he conſtantly contends, we have the ſubſtance of his diſpute with Vincenzio Galilei, which will be mentioned hereafter. The ſecond part of his Inſtitutes is chiefly employed in meaſuring and aſcertaining intervals by means of the *monochord*, and an inſtrument called the *meſolabe*, which is ſaid to have been invented either by Archytas of Tarentum, or Eraſtohenes, for the purpoſe of *halving* an interval. Whether the practical muſicians of antiquity applied theſe calculations or imaginary diviſions to their flutes and lyres, we know not; but of this we are moſt certain, that the greateſt performers of modern times are Ariſtoxenians, and make the *ear* the only inſtrument of calculation; which, by means of harmony, and the conſtant opportunities of compariſon which the baſe or other accompaniment affords them, during performance, is rendered a much more truſty guide than it could be in playing a ſingle part. It ſeems, however, as if the ancient inſtruments, upon which all the tones are *fixed*, had more need of the aſſiſtance of calculation and mathematical exactneſs in regulating their intervals than thoſe of the violin-tribe at preſent; which, except in the open ſtrings, which often lead the performer to erroneous intonation, depend on the ſtrength and dexterity of the muſician's hand, and accuracy of his ear, *during performance*. See an ingenious and uſeful work, called "Eſſay upon Tune," publiſhed at Edinburgh, 1781; where the imperfections in the ſcales of modern inſtruments are clearly ſhewn, and remedies for correcting them preſcribed.

The elements of counterpoint, and fundamental rules of compoſition, which chiefly concern the practical muſician, are given in the third part of the Inſtitutes; and theſe are more ample, and illuſtrated with more examples, than in any preceding writer; particularly the laws of canon and fugue, for which no inſtructions have been given by Franchinus, though they were in ſuch high favour during his time. P. Aaron and Vicentino have indeed ſtarted the ſubject, but the purſuit of it was left to Zarlino.

In the fourth part of the Inſtitutes we have a ſhort hiſtorical account of the inventors of the ſeveral eccleſiaſtical modes: it is, indeed, a mere ſkeleton of aſſertions or conjectures without proof, more derived from traditional than written evidence. He here likewiſe gives inſtructions for compoſing in all theſe modes, in which he religiouſly keeps within their legal limits, and ſubmits to all the reſtraints which antiquity had preſcribed.

Padre Martini, ſaggio di contrappunto, in recommending the ſtudy and imitation of ancient maſters, has well deſcribed the difficulties they had to encounter; where, after confronting the eccleſiaſtical ſcales with the ſecular, we have the following paſſage: "From an attentive and comparative view of theſe ſcales, any one deſirous of learning the art of counterpoint for the ſervice of the church, will ſee what diligence and efforts were neceſſary to unite the different qualities of canto-fermo and canto-figurato; and by carefully examining the examples given of both, will diſcover what artifices were uſed by ancient maſters to avoid ſuch ſounds as differed from the canto-fermo, and with what parſimony they admitted ſuch accidents as canto-figurato requires, particularly in the third and fourth tones; where, inſtead of modulating into B *mi*, the 5th of the mode or key, as is conſtantly practiſed at preſent, they have paſſed to the key of A in the fourth tone, and C in the third, by which means they have been able, dexterouſly, to unite the different qualities of canto-fermo with thoſe of canto-figurato."

He gives excellent rules for compoſing motets and madrigals; but it is remarkable, that he adviſes the compoſer to make the *tenor* proceed regularly through the ſounds of the mode he ſhall chooſe; and above all, that this part be ſo much the more ſmooth, regular, and beautiful, as the reſt are to be built upon it; whence, ſays he, its ſounds may be called the nerves and ligaments of all the other parts: by which it appears that the cantilena, or principal melody, was not given, as it is by modern compoſers, to the *ſoprano*, or *higheſt* part; that caſtrati were not ſo common as at preſent; and that the tenor being the kind of voice moſt eaſily found, and more generally good than that of any other pitch, was judiciouſly honoured with the principal melody.

Zarlino ſays, that ſo great was the rage for multiplying parts in muſical compoſitions, that ſome maſters, not content with three or four, which ſufficed to their predeceſſors, had increaſed them to fifty; from which, he truly obſerves, nothing but noiſe and confuſion could ariſe. However, in another part of his book, he tells us, that Adriano Willaert had invented maſſes *à Due Cori, over a tre*, or, as ſome call them, *à Cori Spezzati*, which had an admirable effect. We know not how Okenheim diſpoſed his thirty-ſix parts in the motet already mentioned; but they would have furniſhed nine choirs of four voices each. In the large churches of Italy, where the performers are divided into two bands, placed in oppoſite galleries, all the imitations and ſolo parts are diſtinctly heard, and when united in at leaſt eight *real* parts, completely fill the ears of the audience with all the charms of congregated ſound.

ZARMISOGETUSA Regia, in *Ancient Geography*, a capital town of Dacia, upon the river Sargetia. When this city became a Roman colony, it joined to its ancient name "Colonia Ulpia Trajana," or that of "Auguſta Dacica."

ZARN, in *Geography*, a town of the duchy of Berg; 4 miles E. of Duifburg.

ZARNAB, in the *Materia Medica*, a term ufed by Avicenna and Serapio to exprefs the carpefia of the ancient Greeks.

ZARNACH, the fame as the word *zarnich*, the name of the orpiment of the Arabians.

It was not confined, however, to this fenfe alone, but was ufed as a name for other things ufed in painting, and particularly for the *lapis armenus*. However, Diofcorides and Theophraftus call the *lapis armenus* by the name of *armenion*, and the *zarnach* by that of *arrenecon*, that is, orpiment.

ZARNAK, in *Geography*, a town of Turkeftan, on the Sirr; 100 miles W. of Toncat.

ZARNATA, a town of European Turkey, in the Morea; 16 miles S.W. of Mifitra.

ZARNAW, a town of Poland, in the palatinate of Sandomirz; 32 miles N. of Sandomirz.

ZARNICH, in *Natural Hiftory*, the name of a genus of foffils, the characters of which are thefe: They are inflammable fubftances, not compofed of plates or flakes, but of a plain, fimple, and uniform ftructure, not flexile nor elaftic, foluble in oil, and burning with a whitifh flame, and noxious fmell, like garlic.

That thefe foffils are really fulphuretted arfenics is evident from fundry experiments. When fet on fire, the arfenical as well as the fulphureous fmell is plainly diftinguifhable. If triturated with quickfilver, and expofed to a fuitable heat, the fulphur is detained by the mercury, and a pure white arfenic fublimes. A mixture of fixed alkaline falt, with any vegetable or animal fubftance, as the compound called by the affayers black flux, in like manner keeps down the fulphur, and at the fame time revives the arfenic into its reguline or metallic form. Thefe native minerals have been ufed as medicines in the eaftern countries, and by fome imprudently recommended in our own. Lewis.

Of this genus there are four known fpecies: a red one, which is the true Sandarach; a yellow one, found in the mines of Germany, and brought to us under the name of orpiment; a greenifh one, common alfo in the mines of Germany, and fold in our colour-fhops under the name of a coarfe orpiment; it is alfo found in the tin-mines of Cornwall; and a whitifh one, which has the property of turning black ink into a florid red, common in the mines of Germany, but of little value. Hill.

ZARNOWITZ, in *Geography*, a town of Pruffian Pomerelia, on a bay of the Baltic; 40 miles N.N.W. of Dantzic.

ZARNOWNO, a town of Auftrian Poland, in the kingdom of Galicia, on the Dniefter; 15 miles N.W. of Halicz.

ZAROW. See SORAW.

ZARP, a river of Afia, which runs into the Tigris, 40 miles below Mofful.

ZARPANA, or ROTA, or ST. ANN, one of the Ladrone iflands, about 40 miles in circumference, with a port on the S. coaft, and another on the N.W. coaft; 21 miles from Guam.

ZARUANA, in *Ancient Geography*, a town of Afia, in Greater Armenia. Ptolemy.

ZARUBINA, in *Geography*, a town of Ruffia, in the government of Irkutfk; 60 miles N.W. of Ilimfk.

ZARUMA, a town of South America, in the audience of Quito.

ZARUTHAN, in *Surgery*, a word ufed by fome to exprefs a hard and unequal tumour of the breaft, attended with a burning heat, and a violent but not continual pain.

This is by fome referred to the cancer, and accounted a fpecies of that terrible diforder: its caufe is fuppofed to be a fharp ichorous humour in the blood.

ZARZA, in *Geography*, a town of Spain, in Eftremadura; 22 miles S.W. of Plafencia.

ZARZEDO, a town of Portugal, in Eftremadura; 20 miles N.E. of Caftel Branco.

ZARZINA. See SARSINA.

ZASAWA, a town of Bohemia, in the circle of Kaurzim; 8 miles S.W. of Kaurzim.

ZASHIVERSK, a town of Ruffia, in the government of Irkutfk; 1320 miles N.N.E. of Irkutfk. N. lat. 67° 25′. E. long. 138° 14′.

ZASLAW, a town of Poland, in Volhynia; 24 miles N. of Conftantinow.

ZASMUKI, a town of Bohemia, in the circle of Kaurzim; 4 miles S.S.E. of Kaurzim.

ZASNARAS, a town of Tranfylvania; 16 miles S.W. of Weiffemburg.

ZASPEL, in *Commerce*, a meafure for linen and yarn at Leipfic; where a piece of woollen or cotton yarn confifts of 4 ftrehns, or 12 zafpels, and a piece of linen yarn confifts of 6 ftrehns, or 12 zafpels. A zafpel contains 20 gebinds, 400 fadens, or 1600 ells.

ZATETZ, in *Geography*. See SAATZ.

ZATHAG, or ZATAG, a town of Arabia, in the province of Hedsjas; 20 miles S.E. of Karac.

ZATHUA, in *Ancient Geography*, a town of Afia, in Greater Armenia. Ptol.

ZATIBA, in *Geography*, a town of South America, in New Grenada; 36 miles N.N.E. of Tunja.

ZATMAR, a town of Hungary. This is properly two towns, namely, Zatmar, on an ifland in the river Samos; and Nemethi, oppofite to it, on an arm of the river: but in the year 1715, both were erected into one town; the firft of which is fortified. The reformed held a national fynod here in 1646; 56 miles N.N.W. of Colofvar. N. lat. 47° 47′. E. long. 22° 24′.

ZATOR, a ftrong town of Auftrian Poland, in Galicia; 22 miles W.S.W. of Cracow.

ZATSCHIT KABANOVSKAIA, a fort of Ruffia, in the government of Kolivan; 20 miles S. of Biifk.

ZATUENEBO, a town of the ifland of Cuba; 65 miles S.S.E. of Havannah.

ZATURCE, a town of Poland, in Volhynia; 20 miles W.S.W. of Lucko.

ZAUALA, a town of Mexico, in the province of Mechoacan; 110 miles N. of Mechoacan.

ZAUARA, a river of Africa, which runs into the Indian fea, S. lat. 24° 15′.

ZAVARA. See ASINARA.

ZAUDNITZ, a town of Silefia, in the principality of Troppau; 9 miles N.N.E. of Troppau.

ZAUECES, in *Ancient Geography*, a people of Africa, in the weftern part of Libya, and in the vicinity of the Libyans Mexycans. According to Herodotus, when thefe people went to war, their wives conducted their cars or chariots.

ZAUED UL BAHRI, in *Geography*, a town of Egypt, on the left bank of the Nile; 8 miles S. of Shabur.

ZAVEL, a river of Perfia, which paffes through Chorafan, or Khoraffan, and lofes itfelf in lake Zare, or Zarreh.

ZAVELSTEIN, a town of Wurtemberg, near which is a medicinal fpring; 2 miles N. of Bulach.

ZAVIDEI, an ifland of Ruffia, at the entrance of the gulf

gulf of Tchaunſkaia, in the Frozen ſea; about 60 miles in circumference. N. lat. 71° 50′ to 72° 20′. E. long. 166° 14′.

ZAVODE BIRUILEVA, a town of Ruſſia, in the government of Irkutſk, on the Argunia; 121 miles N.E. of Stretenſk.

ZAVODE *Dutcharſkoi*, a town of Ruſſia, in the government of Irkutſk; 88 miles S.E. of Stretenſk.

ZAVODE *Gazimurſkoi*, a town of Ruſſia, in the government of Irkutſk; 44 miles S.S.E. of Stretenſk.

ZAVODE *Irbinſkoi*, a town of Ruſſia, in the government of Kolivan; 40 miles E. of Abakanſk.

ZAVODE *Kutamarſkoi*, a town of Ruſſia; 100 miles E.S.E. of Nertchinſk.

ZAVODE *Lanina*, a town of Ruſſia, in the government of Irkutſk, on the W. coaſt of the Baikal lake; 80 miles N.E. of Irkutſk.

ZAVODE *Midnoi Kuruzulaevſkoi*, a town of Ruſſia, in the government of Irkutſk; 32 miles S. of Nertchinſk.

ZAVODE *Niznei Suzuiſkoi*, a town of Ruſſia, in the government of Kolivan; 32 miles S.E. of Kolivan.

ZAVODE *Novopavlovſkoi*, a town of Ruſſia, in the government of Kolivan; 80 miles S.S.E. of Kolivan.

ZAVODE *Popovo*, a town of Ruſſia, in the government of Kolivan. N. lat. 56° 31′. E. long. 95° 32′.

ZAVODE *Sibiria Kova*, a town of Ruſſia, on the Argunia; 100 miles E.S.E. of Stretenſk.

ZAVODE *Tiſova*, a town of Ruſſia, in the government of Irkutſk, on the river Poim; 124 miles N.N.W. of Niznei Udinſk.

ZAVODE *Verchoturova*, a town of Ruſſia, in the government of Irkutſk, on the Argunia; 132 miles N.E. of Stretenſk.

ZAVOLOCZE, a town of Ruſſia, in the government of Polotſk; 50 miles N.E. of Polotſk.

ZAURGATCH, a town of Ruſſia, in the government of Tobolſk, on the Irtiſch; 80 miles E.S.E. of Tobolſk.

ZAUROS, in *Ichthyology*, a name given by the ancient Greeks to that fiſh which we call ſaurus and lacertus, and which is called at Rome the tarantula.

It is diſtinguiſhed by Artedi by the name of the oſmerus, with eleven rays in the pinna ani; and in the Linnæan ſyſtem it is the ſalmo ſaurus, with ten rays in the pinna ani.

ZAUZAN, in *Geography*, a town of Perſia, in the province of Chorafan; 70 miles N.W. of Herat.

ZAWAJA, a lake of Abyſſinia, in the ſouthern extremity of the kingdom, which is the chief ſource of the river Hawaſh.

ZAWEH, a diſtrict or province of Perſia, bounded on the N. by Karaſm, on the E. by Choraſan, on the S. by Mazanderan, and on the W. by the Caſpian ſea.—Alſo, a town of Perſia, and capital of a diſtrict, on the river Tedjen, about 24 miles from the Caſpian ſea; 81 miles N. of Meſchid.

ZAWICHOST, a town of Poland, in the palatinate of Sandomirz; 8 miles N. of Sandomirz.

ZAWIEH, a town of Aſiatic Turkey, in the government of Diarbekir, on the Euphrates; 24 miles E. of Anah.

ZAWILA. See ZUBELA.

ZAWOLOW, a town of Auſtrian Poland, in Galicia; 20 miles N.E. of Halicz.

ZAXO SULTAN, a town of Aſiatic Turkey, in the government of Diarbekir; 5 miles S. of Rahabeh.

ZAYRE. See ZAIRE.

ZAYTE, a river on the W. ſide of the iſland of Celebes, which runs into the ſea, N. lat. 30′. E. long. 120° 15′.

ZAZIMOWICZE, a town of Lithuania, in the palatinate of Brzeſk; 32 miles N.E. of Brzeſk.

ZAZIVNOI, a fort of Ruſſia, in the government of Upha, on the Ural; 68 miles W. of Orenburg.

ZBANITZ, a town of Bohemia, in the circle of Chrudim; 5 miles E. of Hohenmant.

ZBARAS, a town of Poland, in the palatinate of Braclaw; 36 miles N. of Braclaw.

ZBIROW, a town of Bohemia, in the circle of Beraun; 12 miles S.W. of Beraun.

ZBORRI, a town of Hungary; 16 miles N.N.E. of Szeben.

ZBORROW, a town of Auſtrian Poland, in the new kingdom of Galicia, near which an obſtinate battle was fought between the Poles on one ſide, commanded by their king John Caſimir, and the combined army of the Coſſacks and Tartars on the other. In this engagement the latter were defeated, and left 10,000 men dead on the ſpot; but the day after, a treaty of peace was concluded on terms diſadvantageous to Poland; 63 miles E. of Lemberg.

ZBRASLAWIZ, a town of Bohemia, in the circle of Czaſlau; 10 miles S.W. of Czaſlau.

ZDANICHA, a river of Ruſſia, which runs into the Chatanga, N. lat. 70° 40′. E. long. 98° 14′.

ZDAUNSKY, a town of Moravia, in the circle of Hradiſch: 15 miles N. of Hradiſch.

ZDIAR, a town of Bohemia, in the circle of Prachatitz; 8 miles N.W. of Horaſdiowiz.

ZDISLAWITZ, a town of Bohemia, in the circle of Kaurzim; 10 miles S.E. of Beneſchow.

ZDZIECOL, a town of Lithuania, in the palatinate of Novogrodeck; 12 miles W. of Novogrodeck.

ZEA, in *Botany*, a name borrowed from the ancient Greeks, whoſe ζεια, however, appears to have been ſome kind of *Triticum* or *Hordeum*, agreeing with our preſent American genus, the Maize, only as being a grain cultivated for the food of man.—Linn. Gen. 480. Schreb. 621. Willd. Sp. Pl. v. 4. 200. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 235. Purſh 46. Juſſ. 33. Lamarck Illuſtr. t. 749. (Mays; Tourn. t. 303—305. Gærtn. t. 1.)—Claſs and order, *Monoecia Triandria*. Nat. Ord. *Gramina*, Linn. Juſſ.

Gen. Ch. corrected by Schreber. Male flowers diſpoſed in diſtinct lax ſpikes. *Cal.* Glume two-flowered, of two ovate-oblong, ſwelling, pointed, beardleſs valves, the outermoſt rather the longeſt. *Cor.* Glume of two oblong beardleſs valves, about the length of the calyx; the outermoſt ſwelling, obtuſe; the innermoſt terminating in two teeth. Nectary of two very ſhort fleſhy ſcales, dilated upwards, abrupt, furrowed at the ſummit. *Stam.* Filaments three, capillary; anthers ſomewhat priſmatic, cloven, burſting at the top.

Female flowers in a very denſe ſpike, below the male, on the ſame plant, concealed by the leaves. *Cor.* Glume ſingle-flowered, of two permanent, roundiſh, thick valves, membranous and fringed at the margin; the outer one thickeſt. *Cor.* Glume of four unequal, membranous, tranſparent, broad, ſhort, permanent valves. *Piſt.* Germen very ſmall; ſtyle thread-ſhaped, extremely long, pendulous; ſtigma ſimple, downy towards the ſummit. *Peric.* none. *Common Receptacle* very large and long, with five or more angles, and as many rows of cells, tranſverſely excavated, in each of which are imbedded the fruits of two flowers, ſurrounded with their own calyx and corolla. *Seed* ſolitary, roundiſh,

roundiſh, ſtalked, longer than the glumes; angular and compreſſed at the baſe.

Obſ. Two out of the four valves of the female corolla appear to belong to an abortive flower. *Schreber.*

Eſſ. Ch. Male flowers in diſtinct ſpikes. Calyx a two-flowered beardleſs glume. Corolla beardleſs.

Female, Calyx a glume of two valves. Corolla of four valves. Style one, thread-ſhaped, pendulous. Seeds ſolitary, imbedded in an oblong receptacle.

1. Z. *mays.* Common Maize, or Indian Corn. Linn. Sp. Pl. 1378. Willd. n. 1. Ait. n. 1. Purſh n. 1. (Frumentum indicum; Camer. Epit. 186. F. aſiaticum, turcicum et indicum; Ger. Em. 81, 82. Moriſ. ſect. 8. t. 13. f. 1, 2, 3.)—Leaves entire. — Native of America. Cultivated there, as well as in the ſouthern countries of Europe. One of the largeſt of the family of corn or graſſes. *Root* annual, of innumerable fibres. *Stem* erect, ſomewhat branched, round, ſtout, jointed, leafy, from five to ten feet high. *Leaves* ſheathing, lanceolate, concave, acute, ribbed, two or three feet long, and three or four inches broad. *Male flowers* in numerous, aggregate, terminal *ſpikes*, each three or four inches long, greyiſh, downy, with purple *anthers*. *Female ones* below, in a generally ſimple, cylindrical ſpike, covered by the large ſheaths of the upper leaves. *Styles* ſix or eight inches long, very numerous, of a ſhining yellowiſh or reddiſh hue, hanging down like a long ſilken taſſel. *Seeds* white, yellow, red, or purpliſh, forming a heavy, teſſellated, cone-like, naked *ſpike*, from ſix to ten inches long. There are innumerable varieties, in the ſize, figure, colour, and qualities of the grain, which, though valuable for many purpoſes, and yielding an abundant crop, is far inferior to wheat as a bread corn. It requires a richly manured ſoil. Mr. Purſh mentions a variety, brought lately by governor Lewis from the Mandan nation, on the Miſſouri, which promiſes to be particularly valuable, as ripening earlier than any other ſort, and yielding an excellent produce. See Maize.

2. Z. *Curagua.* Chili Maize. “Molina Chil. German edition, 107.” Willd. n. 2.—Leaves ſerrated.—Native of Chili. Annual. Smaller in all its parts than the foregoing. *Molina.* Of the qualities or hiſtory of this ſpecies, we have no further account.

Zea, in *Gardening*, contains a plant of the hardy herbaceous annual kind, of which the ſpecies cultivated is the maize, or Indian corn (Z. mays).

It has a large ſtrong, herbaceous ſtalk, which ſometimes riſes to the height of ten or twelve feet; and there are varieties; with yellowiſh-white ſeeds, with deep yellow ſeeds, and with purple-blue ſeeds. This plant is moſtly cultivated in the garden and pleaſure ground for the ſake of its ſingular tall growth.

Method of Culture.—Theſe plants may be raiſed by ſowing feed in the ſpring, as March or April, in a dry warm ſituation, where the plants are intended to remain, in patches of two or three ſeeds or more in each, about an inch and a half deep: when the plants are come up, they ſhould be thinned out to one or two of the ſtrongeſt. But to have the plants more forward, ſo as to produce ripe ſeed-ſpikes more effectually, ſome ſhould be ſown in a hot-bed at the ſame time, and when the plants are three or four inches high, be forwarded by pricking them out upon another hot-bed, either under a deep frame, or an awning of hoop arches, to be covered with mats occaſionally, allowing them plenty of free air; and when they have ſufficient growth, as in May, they may be tranſplanted, with balls of earth about their roots, into the full ground in the borders or ſhrubbery clumps, in warm ſunny ſituations, being well watered; and when the ſummer proves warm and dry, they often produce perfect heads, and the ſeeds ripen in a good manner.

As the plants moſtly run up in tall ſtalks, it is proper to ſupport each with a tall neat ſtake, eſpecially where much expoſed to wind and rain.

Theſe plants in the different varieties have a fine effect in the back parts of borders, clumps, and other places, in warm ſheltered ſituations.

It is obſerved by a late writer, that he has planted a ſmall quantity of this ſort of grain in his garden, and it turned out ſuperior to his expectations; and he is of opinion, that this crop may be raiſed to advantage in the field on ſome light ſoils, particularly the poor ſands of Norfolk and Suffolk, or on any hot burning lands; as the countries where it grows naturally are light hot ſoils. And he adds, that he prefers the drill method of culture for it in this country; as the ſmall hillocks in planting the ſeeds ſeparately make the land unſightly and improper for other crops. But to raiſe the greateſt produce in corn, the hills are, he conceives, the beſt way; however if the crop is intended chiefly for fodder, then drills are beſt. The ſeed is to be put about an inch deep in the ground. And that when the corn firſt appears above the ſurface, the hillocks or drills muſt be examined, to ſee whether it all comes up properly; and if it has not, there muſt be freſh ſeeds put into the vacant places to prevent a loſs in the crop. And as ſoon as the plants take root in the ground, the crop ſhould be examined again to ſee whether any have died away, or the birds have taken the ſeed. The plants muſt alſo be thinned to two on a hill, and good plants ſubſtituted for weak ones.

In the cultivation while growing in the hill-way, the hoe muſt be uſed at every operation to the plants, and earth be given to them, as the land cannot be made too light for this crop; but when in drills, the corn muſt be hoed in the ſame manner as garden peas.

He alſo further obſerves, that when the corn gets out of the milk, the blades below muſt be all pulled off while green: tie them up in ſmall bunches, about the ſize of a birch-broom, and hang them on the top of the ſtalks of the corn; for at the ſame time that the blades are pulled, the tops muſt be cut off, and ſet up in round bunches to dry, and tied round the topmoſt part to keep them from falling: when theſe are dry, they muſt be harveſted. The blades are generally ready in four or five days, but the tops take longer; when theſe blades and tops are properly harveſted, they are excellent food. And it is ſuggeſted, that as theſe proceſſes will be finiſhed about the end of Auguſt, the land might be ploughed and then ſown with rye. If ſeeds were required, he is of opinion that it would be very proper to ſow the ſeeds at that time on this poor hot land; as the warm ſeaſon would be over, and the ſeeds would have ſufficient time to take root before winter. If only rye was wanted, he would eat it with ſheep in the ſpring or during the winter. But the ſtalks muſt, he ſays, ſtand, for the corn to ripen after the rye is ſown; and the corn ought to hang on the ſtalk till it is hard. In America, it is often December before the white corn can be pulled, or September for the yellow corn: if it is pulled before it is hard, and the cob is perfectly dry, it will mould and ſpoil, and the corn will be apt to rot, therefore great care ſhould be taken not to pull it too ſoon.

This ſort of corn is, it is ſaid, given to horſes, cattle, and hogs, without ſhelling, and only huſked in the ear; but when given to fowls, or intended for ſale, it is rubbed off by burning a cob in the fire till hard, and then rubbing the corn with it. It is a sort of grain which is sometimes given to pigs, but more frequently when ground to fowls. Count Rumford has shewn in his Essay on Food, that this is perhaps the most nutritious grain, except wheat, either as human sustenance, or as provender for brute animals. See MAIZE.

ZEA, in *Geography*. See ZIA.

ZEAGONG, a town of Birmah; 12 miles N.N.W. of Raynangong.

ZEAL, ZELUS, Ζηλος, the exercise of a warm animated affection, or passion, for any thing.

Some will have jealous *zeal* to be properly a mixed or compound sensation, where one affection is raised or inflamed by another. On these principles, jealousy may be defined an affection arising from love and indignation, which cannot bear a thing to be given to another, that a person desires for himself, or one whom he loves and favours. Others make it consist in an eager study, or desire, to keep any thing inviolate; or a fervour of mind, arising from an indignation against those who abuse or do evil to a person beloved.

The Greek philosophers make three species of *zeal*. The first, of *envy*; the second, of *emulation*, or imitation; the third, of *piety*, or devotion; which last makes what the divines call *religious zeal*.

Josephus speaks much of a party, or faction, called the *Zealous*, or *Zealots*, which arose among the Jews during the war with Vespasian and Titus. Lib. xiv. cap. 6. Antiq. and lib. iv. cap. 12. de Bello Judaico.

ZEALAND, or ZEELAND, or *Seeland*, (in Danish *Sizland*,) in *Geography*, the largest island belonging to the kingdom of Denmark, bounded on the north by the Scaggerac, on the east by the Sound, on the south by the Baltic, and on the west by the Great Belt; about 65 miles in length from north to south, and where widest 60 from east to west, though in some parts scarcely 30, and in no part above 20 miles from the sea: reckoned about 700 miles in circumference. The coast is much intersected with large bays; and within the country are several lakes, which, as well as the rivers, abound in fish. The country is pleasant; the soil is generally fertile, and produces corn, chiefly barley and oats, more than sufficient for the inhabitants, with excellent pastures; and in most parts is plenty of wood, except towards the centre of the island, where the inhabitants generally use turf for fuel. The fields are separated by mud-walls; the cottages are of brick or white-washed: sand-hills are sometimes destructive on the coast; and the best protection from their ravages, says Catteau, is the elymus anemaria. Copenhagen is the capital. N. lat. 55° 2′ to 56° 6′. E. long. 10° 58′ to 12° 40′. See DENMARK.

ZEALAND, *State of*, one of the former United Dutch States, and now part of the recently established kingdom. It consists of islands which are formed by those branches and outlets of the Scheldt, called Zeeuwsche Stromen, or Sea Streams; on the north it is bounded by Holland, eastward by Brabant, southward by Flanders, and westward by the North sea: its name sufficiently indicates its natural position and situation. The islands of Walcheren and Schouwen, on the western coast, are defended against the violence of the sea, by downs or sand-hills, and on the other sides, like the rest of the islands of Zealand, by vast dykes, which, at the bottom, have a breadth of 25 German ells, and at the top are so wide, that two carriages may pass abreast: the height is also proportioned to their thickness; notwithstanding which, in high tides and stormy weather, the waves in many places force a passage, or even flow over them: the first formation of these dykes must have been attended with immense expence, the very repair and maintenance of them requiring large sums. Emanuel van Meteren, in the sixteenth book of his Commentaries, says, and confirms it by the attestations of the workmen employed in them, that the dykes in this province alone, if placed in one direction, would form a length of 40 miles, each mile to be reckoned at 1400 rods, and that the expence of one rod with another was a pound Flemish, or six Dutch guilders. Thus the charge of the outward dykes taken together amounts to 340,000*l*. sterling. Though the inhabitants of the other provinces, and foreigners in general, complain of the air being heavy, disagreeable, and unhealthy, yet no people look better, or enjoy a more confirmed state of health, than the natives who are born and bred up in it. The soil too is very fruitful, and famed for its excellent wheat, as likewise for madder, the cultivation of which furnishes out great employment for the inhabitants of Zealand: it abounds also in good fruits, and its rich pastures are covered with flocks of fine sheep. The waters around the islands supply them with plenty of fish, particularly with oysters, lobsters, and muscles, of an uncommon size and goodness. Zealand enjoys likewise an affluence of all kinds of provisions, but fuel is very scarce there, especially turf, which, being brought from other provinces, bears a high price; great quantities of English coals are used here. In the whole province are 121 towns and villages, some of which are very large. The inhabitants are reckoned the most wealthy in all the Netherlands, which is, in a great measure, owing to their traffic by sea, and for this, indeed, they have every conveniency that can be desired. (See HOLLAND.) The right bank of the Scheldt, called the East Scheldt, divides this province into two quarters, *viz.* into that on the east and that on the west of the said river. The quarter on the West Scheldt is composed of five islands, *viz.* Walcheren, South Beveland, North Beveland, Wolfersdyk, and St. Joostland. The quarter of the East Scheldt contains four islands, *viz.* Schouwen, Duiveland, Tholen, and St. Philip's Land.

ZEALAND, *New*, two islands in the South Pacific ocean, first discovered by Tasman, a Dutch navigator. In the year 1642, he traversed the eastern coast from lat. 34° to 43°, and entered the strait called Cook's Strait; he was attacked by the natives soon after he came to an anchor in the place, to which he gave the name of Murderer's Bay, and never went on shore: he gave the country the name of Staaten Land, in honour of the states-general, and it is now generally distinguished in our maps and charts by the name of New Zealand. As the whole of this country, except that part of the coast which was seen by Tasman from on board his ship, had from his time to the voyage of the Endeavour, in the year 1770, remained altogether unknown, it was by many supposed to be part of a southern continent. It is, however, now known to consist of two large islands, divided from each other by a strait or passage, which is about four or five leagues broad. The northernmost of these islands is called by the natives Eaheinomauwe; and the southernmost Tovy, or Tavai Poenammoo. The latter is the name of a lake, and signifies the water of green talc. This lake is situated in the northern part of the island, and the country adjoining it only is known to the natives under this name. From my observation, says captain Cook, and from other information, it appears to me, that the New Zealanders must live under perpetual apprehensions of being destroyed by each other; there being few of their tribes that have not, as they think, sustained wrongs from some other tribe, which they are continually upon the watch to revenge; and perhaps the desire of a good meal may be no small incitement. They will even preserve their enmity from father to son, fon, and the fon never lofes fight of an injury done to his father. The method of executing their horrible defigns is by ftealing upon their enemies in the night; and if they find them unguarded, (which however is but feldom the cafe,) they kill every one indifcriminately, not even fparing the women and children: the dead bodies they either devour on the fpot, or carry them home for that purpofe. If they are difcovered before they can execute their bloody purpofe, they generally fteal off; and fometimes are purfued and attacked by the other party in their turn. They never give quarter, or take prifoners. This perpetual ftate of warfare renders them fo circumfpect, that they are never off their guard either by night or day. According to their fyftem of belief, the foul of the man whofe flefh is devoured by the enemy is doomed to perpetual fire; while the foul of him whofe body has been refcued, as well as thofe who die a natural death, afcend to the habitation of the gods. They do not eat the bodies of their friends who have been refcued. Their common method of difpofing of the dead is by burying in the earth; but if they have more of their flaughtered enemies than they can eat, they throw them into the fea. They have no fuch things as morais, or other places of public worfhip; nor do they ever affemble together with this view. But they have priefts who alone addrefs the gods in prayers for the profperity of their temporal affairs. Whatever the principles of their religion may be, they are ftrongly inculcated from their infancy: of this I had a remarkable inftance in the youth who was firft deftined to accompany Taweiharooa. He refrained from eating the greateft part of the day on account of his hair being cut; though every method was tried to induce him to break his refolution; and he was tempted with the offer of fuch victuals as he was known to like beft. He faid, that if he ate any thing that day, the Eatooa would kill him: however, towards evening the cravings of nature got the better of the precepts of religion, and he ate, though but fparingly. Notwithftanding the divided and hoftile ftate in which the New Zealanders live, travelling ftrangers who come with no ill defign are well received, and entertained during their ftay; which, however, it is expected will be no longer than is requifite to tranfact the bufinefs that they come upon. Polygamy is allowed amongft the people: the women are marriageable at a very early age; and one who is unmarried is but in a forlorn ftate: fhe can with difficulty get a fubfiftence, and is in a great meafure without a protector, though in continual want of a powerful one. The New Zealanders feem to be perfectly fatisfied with the little knowledge they are mafters of without attempting in the leaft to improve it; nor are they remarkably curious either in their obfervations or inquiries. Tovy Poenammoo is for the moft part a mountainous, and to all appearances a barren country, and thinly peopled. Eaheinomauwe has a much better appearance; it is indeed not only hilly, but mountainous, yet even the hills and mountains are covered with wood, and every valley has a rivulet of water; the foil in thefe valleys and in the plains, of which there are many that are not overgrown with wood, is in general light, but fertile, and fit for every kind of European grain, plants, and fruit. From the vegetables that were found here, there is reafon to conclude the winters are milder than in England, and the fummer not hotter, though it was more equally warm: dogs and rats are the only quadrupeds that were feen, and of the latter only a few. The inhabitants breed the dogs for the fole purpofe of eating them. There are feals and whales on the coaft, and a fea-lion was once feen. The birds are, hawks, owls, quails; and there are fong-birds, whofe note is wonderfully melodious. There are ducks and fhags of feveral forts, not unlike thofe of Europe; and the gannet, which is exactly the fame. The fea-coaft is vifited by albatroffes, fheer-waters, pintados, and penguins. The infects are, flefh-flies, beetles, butter-flies, fand-flies, and mufquitoes; and the neighbouring fea abounds with fifh, which are equally delicious and wholefome food. Captain Cook feldom came to anchor but they caught enough, with hook and line only, to fupply the whole fhip's crew; and when they fifhed with nets, every mefs in the fhip, except thofe who were too indolent, falted as much as fupplied them when at fea fome time after. The fifh was not lefs various in kind than plentiful in quantity; there were many forts they had never before feen, but the failors readily gave names to all of them. The higheft luxury which the fea afforded was the lobfter, or fea cray-fifh. Here were alfo feveral fpecies of the fkate, or ftingray: foles, flounders, and fhell-fifh, were abundant. This country abounds with forefts filled with very large, ftraight, and clean timber. There is one tree about the fize of an oak, which was diftinguifhed by a fcarlet flower, that appeared to be compofed of feveral fibres; the wood of which was hard and heavy, excellently adapted to the ufe of the mill-wright: and another which grows in fwampy ground, very ftraight and tall, bearing fmall bunches of berries, and a leaf refembling that of a yew-tree; the wood of which is very tough, and thick enough to make mafts of any fize: about 400 fpecies of plants were found, all of which are unknown in England, except garden night-fhade, fow-thiftle, two or three kinds of fern, and one or two forts of grafs. They found wild celery, and a kind of creffes, in great abundance on the fea fhore, and of eatable plants raifed by cultivation, only cocoas, yams, and fweet potatoes. There are plantations of many acres of thefe yams and potatoes. The inhabitants likewife cultivate the ground; and the Chinefe paper mulberry-tree is to be found, but in no abundance. There is only one fhrub or tree in this country which produces fruit, and that is a kind of a berry almoft taftelefs; but they have a plant which anfwers all the ufes of hemp and flax. There are two kinds of this plant, the leaves of one of which are yellow, and the other deep-red, and both of them refemble the leaves of flags; of thefe leaves they make lines and cordage, and much ftronger than any thing of the kind in Europe. Thefe leaves they likewife fplit into breadths, and tying the flips together form their fifhing-nets. Their common apparel by a fimple procefs is made from leaves, and their finer by another preparation is made from the fibres. This plant is found both on high and low ground, in dry mould, and deep bogs; but as it grows largeft in the latter, that feems to be its proper foil.

The men of this country are as large as the largeft Europeans. Their complexion is brown, but little more fo than that of a Spaniard. They are full of flefh, but not lazy or luxurious, and are ftout and well fhaped. The women poffefs not that delicacy which diftinguifhes the European ladies, but their voice is fingularly foft, which, as the drefs of both fexes is fimilar, chiefly diftinguifhes them from the men. The men are active in a high degree; their hair is black, and teeth are white and even. The features in both fexes are regular; they enjoy perfect health, and live to a very advanced age; they are of the gentleft difpofitions, and treat each other with the utmoft kindnefs, but they are perpetually at war, every little diftrict being at enmity with all the reft, and towards their enemies they are implacable, never giving quarter. They have neither black cattle, fheep, hogs, nor goats; fo that their chief food being fifh, and that not at all times to be obtained, they are in in danger of dying through hunger: they have a few, and but a very few dogs; and when no fish is to be got they have only vegetables such as fern-root, clams, yams, and potatoes to feed on; and if by any accident these fail them, their situation must be deplorable. This will account for their shocking custom of eating the bodies which are slain in battle, for he who fights through mere hunger will not scruple to eat the adversary he has killed. The inhabitants of New Zealand are modest and reserved in their behaviour and conversation. The women, indeed, were not dead to the softer impressions; but their mode of consent was, in their idea, as harmless as the consent to marriage with us, and equally binding for the stipulated time. If any of the English addressed one of their women, he was informed, that the consent of her friends must be obtained, which usually followed on his making a present. This done, he was obliged to treat his temporary wife at least as delicately as we do in England. They anoint their hair with oil, melted from the fat of fish or birds. The poorer people use that which is rancid, so that their smell is very disagreeable: but those of superior rank make use of that which is fresh. They wear combs, both of bone and wood, which are considered as an ornament when stuck upright in the hair. The men tie their hair in a bunch on the crown of their head, and adorn it with the feathers of birds, which they likewise sometimes place on each side of the temples. They commonly wear short beards; the hair of the women sometimes flows over the shoulders, and sometimes is cut short. Both sexes, but the men more than the women, mark their bodies with black stains called *Amoco;* in general the women stain only the lips, but sometimes mark other parts with black patches; the men, on the contrary, put on additional marks from year to year, so that those who are very ancient are almost covered. Exclusive of the Amoco, they mark themselves with furrows: these furrows make a hideous appearance, the edges being indented, and the whole quite black. The ornaments of the face are drawn in the spiral form, with equal elegance and correctness, both cheeks being marked exactly alike, while the painting on their bodies resembles fillagree work, and the foliage in old chased ornaments, but no two faces or bodies are painted exactly after the same model. These Indians likewise paint their bodies, by rubbing them with red ochre, either dry, or mixed with oil. Their dress is formed of the leaves of the flag, split into slips, which are interwoven, and made into a kind of matting, the ends which are seven or eight inches in length hanging out on the upper side. One piece of this matting, being tied over the shoulders, reaches to the knees; the other piece, being wrapped round the waist, falls almost to the ground. These two pieces are fastened to a string, which, by means of a bodkin of bone, is passed through, and tacks them together. The men wear the lower garment only at particular times. What they consider as the most ornamental part of their dress is the fur of dogs, which they cut into stripes, and sew on different parts of their apparel. As dogs are not in plenty, they dispose these stripes with great economy. They have a few dresses ornamented with feathers; and one man was seen covered wholly with the red feathers of the parrot. The women never tie their hair on the top of their head, nor adorn it with feathers; and are less anxious about dress than the men. Their lower garment is bound tight round them, except when they go a-fishing, and then they are careful that the men shall not see them. The ears of both sexes are bored, and the holes stretched so as to admit a man's finger. The ornaments of their ears are, feathers, cloth, bones, and sometimes bits of wood: a great many of them use nails, which were given them by the English for this purpose; and the women sometimes adorn their ears with the white down of the albatross, which they spread before and behind the hole, in a large bunch. They likewise hang to their ears by strings, chisels, bodkins, the teeth of dogs, and the teeth and nails of their deceased friends. The arms and ancles of the women are adorned with shells and bones, or any thing else through which they can pass a string. The men wear a piece of green talc, or whalebone, with the resemblance of a man carved on it, hanging to a string round the neck.

The houses are from sixteen to twenty-four feet long, ten or twelve wide, and six or eight in height. The frame is of slight sticks of wood, and the walls and roof are made of dry grass, pretty firmly compacted. Some of them are lined with bark of trees, and the ridge of the house is formed by a pole, which runs from one end to the other. The door is only high enough to admit a person crawling on hands and knees; and the roof is sloping. There is a square hole near the door, serving both for window and chimney, near which is the fire-place. A plank is placed near the door, adorned with a sort of carving, and this they consider as an ornamental piece of furniture. The side walls, and roof, projecting two or three feet beyond the walls at each end, form a sort of portico, where benches are placed to sit on. The fire is made in the middle of a hollow square in the floor, which is inclosed with wood or stone. They sleep near the walls, where the ground is covered with straw for their beds. Besides the fern-root, which serves them for bread, they feed on albatrosses, penguins, and some other birds. Whatever they eat is either roasted or baked, as they have no vessels in which water can be boiled. No plantations of cocoas, potatoes, and yams, were seen to the southward, though there were many in the northern parts. The natives drink no other liquor than water, and enjoy perfect and uninterrupted health. When wounded in battle, the wound heals in a very short time, without the application of medicine; and the very old people carry no other marks of decay about them than the loss of their hair and teeth, and a failure of their muscular strength, but enjoy an equal share of health and cheerfulness with the youngest.

The canoes of this country are not unlike the whale-boats of New England, being long and narrow. Those of the larger sort seem to be built for war, and will hold from 30 to 100 men; one of these measured near seventy feet in length, six in width, and four in depth. It was sharp at the bottom, and consisted of three lengths, about two or three inches thick, and tied firmly together with strong plaiting: each side was formed of one entire plank, about twelve inches broad, and about an inch and a half thick, which were fitted to the bottom part with equal strength and ingenuity. Several thwarts were laid from one side to the other, to which they were securely fastened, in order to strengthen the canoes. These vessels are rowed with a kind of paddles, between five and six feet in length, the blade of which is a long oval, gradually decreasing till it reaches the handle; and the velocity with which they row with these paddles is surprising: their sails are composed of a kind of mat or netting, which is extended between two upright poles, one of which is fixed on each side. Two ropes fastened to the top of each pole serve instead of sheets. The vessels are steered by two men, having each a paddle, and sitting in the stern; but they can only sail before the wind, in which direction they move with considerable swiftness.

These

These Indians use axes, adzes, and chisels, with which last they likewise bore holes. The chisels are made of jasper, or of the bone of a man's arm; and their axes and adzes of a hard black stone. Their tillage of the ground is excellent, owing to the necessity they are under of cultivating, or running the risk of starving. A long narrow stake, sharpened to an edge at bottom, with a piece fixed across, a little above it, for the convenience of driving it into the ground with the foot, supplies the place both of plough and spade. The soil being light, their work is not very laborious, and with this instrument alone they will turn up ground of six or seven acres in extent. Their fish-hooks are of shell or bone; and they have baskets of wicker-work to hold the fish. Their warlike weapons are, spears, darts, battle-axes, and the patoo-patoo, in which they chiefly confide. This is fastened to their wrists by a strong strap, lest it should be wrenched from them, and the principal people generally wear it sticking in their girdles, considering it as a military ornament and part of their dress, like the poinard of the Asiatic and the sword of the Europeans. The spear, which is pointed at each end, is about twenty-six feet in length, and they hold it in the middle, so that it is difficult to parry a push from it. Whether they fight in boats or on shore, the battle is hand to hand; their contests must be bloody. The war-dance consists of a great variety of violent motions and hideous contortions of the limbs, during which the countenance and tongue perform their parts. This horrid dance is always accompanied by a song, every strain of which terminates with a deep and loud sigh.

The employment of the men is supposed to consist in cultivating the ground, making nets, catching birds, and fishing; while the women are engaged in weaving cloth, procuring fern-roots and shell-fish, and dressing food. With regard to religion, they acknowledge one superior being, and several subordinate. Their mode of worship could not be learned, nor was any place proper for that purpose seen. There was indeed a small square area, encompassed with stones, in the middle of which hung a basket of fern-roots on one of their spades. This they said was offered to the gods, in the hope of a plentiful crop of provision. The inhabitants of the southern district said they disposed of their dead by throwing them into the sea; but those of the north said they buried them in the ground: captain Cook's crew, however, saw not the least sign of any grave, or monument; but the body of almost every inhabitant bore the marks of wounds which they had given themselves, in token of grief for the loss of their friends and relations. Some of these scars were newly made, which is a proof that their friends had died while the ship's crew were there, yet no one saw any thing like a funeral, as the islanders conceal every thing respecting the dead with the utmost caution. A great similitude was observed between the dress, furniture, boats, and nets of the New Zealanders, and those of the inhabitants of the South sea islands, which furnish a strong proof that the ancestors of both were natives of the same country. The language of New Zealand and Otaheite is radically the same; and that of the northern and southern parts differs chiefly in the pronunciation. S. lat 34° to 48°. W. long. 181° to 194°. Cook's Voyages by Hawksworth, vol. iii.

ZEAMAH, a river of Algiers, which runs into the Mediterranean, 6 miles S.S.E. of Cull.

ZEAN, a town of Hindoostan, in Dooab; 20 miles S. of Canoge.

ZEB, or Zib, a town of Syria, near the sea-coast, anciently called Achsaph, Achzib, and Ecdippa; 9 miles from Acre.

ZEBAIDE, a town of Persia, in the province of Farsistan; 80 miles E. of Schiras.

ZEBDAINEH, a village of Syria, built on the spot where it is said by some that Cain slew his brother Abel; 14 miles N.W. of Damascus.

ZEBE, or Zaab, in *Ancient Geography*, a town which once formed a part of Mauritania Sitifensis; it was situated at the foot of the chain of mount Atlas.

ZEBEE, in *Geography*, a river of Abyssinia, which runs into the Indian sea.

ZEBEER, a town of Arabian Irak; 12 miles W. of Bassorah.

ZEBEN. See Szeben.

ZEBET, a word used by some of the chemical writers to express dung.

ZEBID, in *Geography*, a city of Arabia, in the province of Yemen. Zebid was once the place of a sovereign's residence, and the most commercial city in all Tehama; but since the harbour of Ghalefka was choked up, its trade has been transferred to Beit el Fakih and Mocha, and this city now retains nothing but the shadow of its former splendour. Viewed from a distance, it appears to some advantage, by means of the mosques and kubbets, of which it is full. Several of those mosques were erected by different pachas, who resided here during the short period while this part of Arabia was in the possession of the Ottoman Porte. Zebid had once eight gates; of these only five are now standing, and the river is gradually breaking down a part of them. The walls of the old city are demolished, and the very ruins are sold by poor people, who gather out the stones, and sell them for building new houses. The present buildings occupy about one half of the ancient extent of the city. Zebid is still distinguished for an academy, or university, for the Sunais, as that of Damar is for the Seidites, in which the youth of Tehama, and a part of Yemen, study such sciences as are cultivated among the Mussulmen. This is besides the seat of a dola, a mufti, and three cadis; 52 miles N. of Mocha. N. lat. 14° 12′. E. long. 43° 15′.

ZEBIO, a mountain of Italy, which sometimes emits flames; 6 miles S. of Modena.

ZEBLICIUM Marmor, in *Natural History*, a name given by several authors to a soft green marble, variegated with black and white; and though the authors who have described it have not observed it, yet it no way differs from the white ophites of the ancients. See Ophites.

ZEBOIM, in *Ancient Geography*. See Seboim.

ZEBRA, in *Zoology*. See Equus *Zebra*.

ZEBU, a name given by M. de Buffon to a variety of the bos taurus of Linnæus, or bison of other writers, or the camel. This variety resembles the Indian ox, or bos Indicus, but is extremely small, being found in some parts of India of a size scarcely larger than a great dog. In colour it differs like the common cattle, being either grey, brown, white, &c., or variously spotted. The Indian ox, which is found in many parts of India, as well as in the Indian and African islands, and particularly in Madagascar, is of a reddish colour, of a very large size, and is distinguished by a very large protuberance over the shoulders.

Zebu, in *Geography*. See Sibu.

ZEBULUN, or Zabulon, in *Scripture Geography*, one of the Jewish tribes in Lower Galilee, on the S. of the tribes of Asher and Naphtali, having the Mediterranean on the W., the sea of Galilee on the E.; separated on the N. from Asher by the river Jepthael, and on the S. from Issa-

 char

char by that of Kishon. Its ports, on account of its vicinity to the sea, were numerous, and its commerce extensive. Its cities were, Zebulun the capital, Bethsaida, Magdalen, Joppa, Jotapa, Cinnereth, (since Tiberias, on the lake of that name,) Cartha, Bethulia, Rimmon, Dothaire, Damna, Sommerom, Tabor, both the city and mount, Sopha, Saffa or Siporis, Nazareth, Cana the lesser, commonly called Cana of Galilee, Iconium, and Sicaminum or Porphyrem, anciently Hiepha, or Ceipha, situated northwards at the foot of mount Carmel.

ZEBULUN, or *Zabulon*, the capital of the fore-mentioned tribe, situated on the Mediterranean, near the mouth of the Jepthael, and once styled Zabulon Andron, or of men, on account of its extraordinary populousness. It was adorned with fine buildings, after the manner of Tyre, Sidon, and Berytus, and much admired on that account by Cestius, the Roman general, who nevertheless took, plundered, and burnt it to the ground. In the early ages of Christianity it was the see of a bishop, but now it is a poor place, in ruins.

ZECHARIAH, or the *Prophecy of Zechariah*, in *Biblical History*, a canonical book of the Old Testament.

Zechariah was contemporary with Haggai, and prophesied in the second year of Darius Hystaspes. The design of the first part of this prophecy is the same with that of Haggai, *viz.* to encourage the Jews to go on with rebuilding of the temple, by giving them assurance of God's assistance and protection: from whence the author proceeds to foretel the glory of the Christian church, the true temple of God, under its great high priest and governor, Jesus Christ, of whom Zerubbabel and Joshua the high priest were figures. The latter part of the prophecy, from chap. ix., probably relates to the state of the Jews under the Maccabees, and then foretels the rejection of the Messiah, and some remarkable incidents that should happen to them in the latter ages of the world.

Mr. Mede, and some other learned men, think, that the 9th and following chapters of Zechariah are parts of the prophecy of Jeremiah.

ZECHIN, or ZECCHINO, in *Commerce*. See SEQUIN.

ZECHINI, in *Geography*, a small island in the Grecian Archipelago; 2 miles S.E. of Stanchio. N. lat. 36° 48'. E. long. 26° 51'.

ZECHLIN, a town of Brandenburg, in the mark of Pregnitz; 9 miles E. of Witstock.

ZEDIC, a town of Africa, capital of a district in Tripoli, situated in a bay of the Mediterranean, called the bay of Zedic; 150 miles E.S.E. of Tripoli.

ZEDLISCHT, a town of Bohemia, in the circle of Pilsen; 5 miles N.W. of Hayd.

ZEDOARY, ZEDOARIA, or *Kæmpferia Rotunda* of Woodville, or *Curcuma Zerumbet* of Dr. Roxburgh, in the *Materia Medica*, a medicinal root, belonging to a plant growing in the East Indies (the *amomum scapo nudo, spica laxa truncata*, of Berg. Mat. Med.), whose leaves are like those of ginger, only longer and broader.

The *Curcuma Zedoaria* of Dr. Roxburgh, with small bulbs, and with the long palmate tubers inwardly yellow, leaves broad lanceolar, subsessile on their sheaths, sericeous underneath, and the whole plant green, is the AMOMUM *Zedoaria* of Linnæus and Willdenow; which see. It is a native of various parts of India; flowers during the hot season, April and May, when the plant is destitute of leaves: soon after they appear. The dry root, it is said, agrees pretty well with the drug known in England by the name of zedoaria rotunda. The Sanskrit name implies that the drug is used as an antidote to poison.

The *Curcuma Zerumbet* of Roxburgh, with small bulbs, and palmate tubers pale straw-colour; leaves green-petioled, broad-lanceolar, with a purple cloud down the middle; and flowers shorter than their bracteas, is the AMOMUM *Zerumbeth* of Retzius; which see. This is a native of various parts of India, and its flowering-time the hot season, before the leaves appear. The pale colour of the roots, crimson coma, and ferruginous mark down the centre of the leaves, which is a constant mark in this elegant species, readily point it out from every other. The dry root appears to be the zedoaria of the shops in England. See Asiatic Researches, vol. ii. p. 332—334.

The root is brought over in oblong pieces, about the thickness of the little finger, and two or three inches in length; or in roundish ones (the *zerumbeth* of the Paris Pharmacopœia), about an inch in diameter; it is of an ash colour on the outside, and white within. The difference of these, in strength, if any, is very inconsiderable, and therefore the college allows both to be used indiscriminately.

This root has an agreeable camphoraceous smell, and a bitterish aromatic taste. It impregnates water with its smell, a slight bitterness, a considerable warmth and pungency, and a yellowish-brown colour: the reddish-yellow spirituous tincture is in taste stronger, and in smell weaker, than the watery. In distillation with water, it yields a thick, ponderous essential oil, smelling strongly of the zedoary, in taste very hot and pungent: the decoction, thus deprived of the aromatic matter, and concentrated by inspissation, proves weakly and disagreeably bitter and subacrid. A part of its odorous matter rises also in the inspissation of the spirituous tincture; the remaining extract is a very warm, not fiery, moderately bitter aromatic, in flavour more grateful than the zedoary in substance.

Zedoary-root is a very useful warm stomachic; and has been commended in colics and hysteric affections, for promoting the menses, &c. It has been employed by some as a succedaneum to gentian root; but from the above analysis it appears to be not entirely similar to that simple bitter; its warm aromatic part being the prevailing principle, in virtue of which its spirituous extract (the most elegant preparation of it), has been made an ingredient in the cordial confection of the London Pharmacopœia. Lewis's Mat. Med.

Carthenser, who ascribes its virtues to a camphoraceous volatile oil, considers it as a general remedy for most of the chronic diseases with which human nature is affected; but as the camphor contained in it can avail but little, and its effects as a bitter or aromatic are so very inconsiderable, this root is now deemed to possess very little medicinal power, and might be safely expunged from the materia medica. Cullen. Woodville.

The zedoary wash, which is a cooler yellow than saffron, though full as bright, and valuable for many purposes in painting with water-colours, may be prepared by boiling an ounce of the root in a quart of water, till the water is sufficiently tinged to make a stain on paper, of a full yellow colour; and straining the liquor through a linen filtre. This wash may be dried in shells, and will again dissolve and spread kindly with the addition of water.

ZEEDLITZ, in *Geography*, a town of Silesia, in the principality of Neisse; 3 miles N. of Ottmuchau.

ZEFERDEN. See SUFFERDAM.

ZEFR, a word by which some of the chemical authors express pitch.

ZEFRIO, in *Geography*, a mountain of Naples, in Calabria Ultra; 10 miles N.N.E. of Bova.

ZEGEDIN, or SZEGED, a town of Hungary, near the conflux of the rivers Maros and Theisse. It is strong, and a place a place of ſome trade, particularly in cattle. In the year 1503, all its defence was a moat and rampart; but falling ſome time after into the hands of the Turks, they erected a brick fort. In 1686, the Imperialiſts diſpoſſeſſed the Turks of it; 68 miles N. of Belgrade. N. lat. 46° 15′. E. long. 19° 56′.

ZEGGO, a town of Africa, in the country of Melli, in the road from Kong to Caſhna; 100 miles N.N.W. of Malel. N. lat. 14°. E. long. 8°.

ZEGHAMA, a town of Dar-Fur; 60 miles N. of Cobbé.

ZEGHEN, a town of Fezzan; 65 miles N. of Mourzouk.

ZEGI, Zagi, a word uſed by Avicenna and others to expreſs all the ſeveral vitriolic minerals. See Chalcitis, and Colcothar.

ZEGMA, in *Geography*, a town of Aſiatic Turkey, in the province of Diarbekir, on the Euphrates, oppoſite to Romkala.

ZEGUTI, a town of Imiretia; 20 miles S.W. of Cotatis.

ZEGZEG, a city of Africa, and capital of a country of the ſame name, ſituated to the eaſt of Agades; 370 miles N.N.E. of Caſhna. N. lat. 20° 45′. E. long. 16°.

ZEHDENICK, a town of Brandenburg, in the Ucker Mark, on the Havel. In it is a convent for ladies of noble deſcent, conſiſting of a domina and ſix ſiſters. It carries on a large trade in wood and corn: in the paſtures, near the town, iron-ore is met with in great abundance, and accordingly there is a mill here for that purpoſe, which is driven by the Havel. At this place likewiſe is a foundery, where bombs, grenadoes, bullets, mortars, pots, weights, and even ſmall cannon are caſt; 28 miles S.S.W. of Prenzlow. N. lat. 52° 58′. E. long. 13° 22′.

ZEHDIN, a town of Brandenburg, in the New Mark; 40 miles E. of Oderberg.

ZEHERECH, a word uſed by ſome of the chemical writers to expreſs flowers of braſs.

ZEHISTA, in *Geography*, a town of Saxony, in the margravate of Meiſſen; 3 miles S. of Pirna.

ZEHRENDORF, a town of Brandenburg, in the Middle Mark; 3 miles S. of Zoſſen.

ZEIDOURE, a diſtrict of Algiers, between Tremecen and Oran.

ZEIL, a town of Bavaria, in the biſhopric of Bamberg; 12 miles W.N.W. of Bamberg. N. lat. 50° 1′. E. long. 10° 40′.—Alſo, a town and caſtle of Germany, which gives name to a county; 4 miles N. of Leutkirch.

ZEILA, or Zella, or *Sejla*, a ſea-port town of Africa, in the kingdom of Adel, ſituated on the coaſt of the Arabian ſea, at the mouth of the Hanazo, or Hawaſh, which forms a bay, called the Bay or Gulf of Zeila. It receives a governor from the dola of Mocha. N. lat. 10° 45′. E. long. 44° 20′.

ZEILSHEIM, a town of the duchy of Wurzburg; 4 miles N. of Volckach.—Alſo, a town of the duchy of Wurzburg; 4 miles E.N.E. of Arnſtein.

ZEINDEROOD, or Zenderoud, a river of Perſia, in the province of Irak, which has its ſource in the Kohi-zard, or Yellow mountain, where an aqueduct may yet be ſeen, by which Abbas the Great attempted to unite its waters with thoſe of the Karoon. The Zeinderood paſſes through the city of Iſpahan, and is ſaid to be abſorbed in the irrigation of the neighbouring territory, or to loſe itſelf in a lake, 15 miles S.W. of Lauriſtan. On this river are three bridges, two of which are in good repair; particularly that of the Char Baug (four gardens), ſo called from its connecting the upper and lower Chaur Baug, the name given to a ſpacious avenue, which runs from the royal ſquare to the foot of the mountains E. of Iſpahan.

ZEISELMAN, a town of Auſtria; 3 miles E. of Tulln.

ZEISPERG, a town of Auſtria; 3 miles E.N.E. of Crems.

ZEITHAYN, a town of Saxony, in the margravate of Meiſſen, famous for a pleaſure-camp which king Auguſtus II. made there, in 1730, at the expence of five millions of rix-dollars. On the ſpot which was uſed for this camp, and the exerciſing of the army, are erected ſix large pyramids; and medals have likewiſe been ſtruck upon it, and a grand repreſentation thereof engraved on copper; 8 miles W.N.W. of Groſſenhayn.

ZEITLOSS, a town of the duchy of Wurzburg, on the river Sinn; 10 miles N. of Gmunden.

ZEITON, a town of European Turkey, in Theſſaly, on a gulf to which it gives name. Here are about 400 Chriſtian families, but the greater part of the inhabitants conſiſts of Turks; 48 miles S.S.E. of Lariſſa. N. lat. 39° 6′. E. long. 22° 58′.

Zeiton, a gulf or bay of the Egæan ſea, on the E. coaſt of Theſſaly, N.W. of the iſland of Negroponte.

ZEITOON, a town of Perſia, in the province of Fars or Farſiſtan, containing about 2000 inhabitants, and ſituated in a pleaſant valley, fertilized by both the branches of the river Tab, which here form a junction. Zeitoon is about fifteen miles diſtant from Behaban, the capital of the mountainous diſtrict of Khogilſea, which extends from the valley of Ram Hormuz to the vicinity of Kazeroon.

ZEITOUN, a town of Aſiatic Turkey, in the government of Sivas, on the Kizilermak; 33 miles W. of Samſoun.

ZEITRABRA, a term uſed by ſome of the chemiſts to expreſs any thing that is fluxile.

ZEITZ, in *Geography*, a town of Saxony, in the biſhopric of Naumburg, anciently the ſee of a biſhop, founded by the emperor Otho I. afterwards transferred to Naumburg, after this town had been ſacked and almoſt deſtroyed by the Vandals in the year 982; 15 miles E.S.E. of Naumburg. N. lat. 51° 3′. E. long. 12° 2′.

ZEKELHEIB, a town of Hungary; 8 miles N.N.W. of St. Job.

ZELA, a town of Perſia, in the province of Segeſtan; 25 miles S.W. of Ferah.

Zela, Ziela, or *Zeleja*, in *Ancient Geography*, a town of Thrace, afterwards called Flaviopolis.—Alſo, a town of Aſia, in Cappadocia Pontus, near the Lycus. It was celebrated by the defeat of Triarius, the Roman general, and afterwards by that of Pharnaces. Here was a famous temple, repreſented upon ſome medals, conſecrated to the goddeſs Anaitis, a Perſian divinity, whoſe pontiff was very powerful under ancient kings; but in proceſs of time his authority and revenues were diminiſhed. The town and the miniſters of the temple were dependent on Pithodiris, who poſſeſſed a part of the territory; other parts were ceded to the pontiffs of Zela and Comanes, and the reſt was annexed to the Roman province. According to Strabo, Zela and its territory were ſituated to the left of the river; the ſacred lands of the temple, and the domains of the pontiff, were in the environs of the town. He adds that it was fortified and built in the retrenchment of Semiramis; and in the firſt times it had only ſome houſes near the temple; but Pompey made it a town.

ZELAH, or Sela, a city of Benjamin (Joſh. xviii. 28.), where Saul was buried in the tomb of his father, Kiſh. 2 Sam. xxi. 14.

ZELAN, in *Geography*, a mountain in the county of Tyrol; 20 miles N.E. of Trent.

ZELANDY, a small island in the East Indian sea, near the W. coast of Sumatra. N. lat. 0° 53′. E. long. 98° 14′.

ZELANICA, a cape on the N. coast of Nova Zembla. N. lat. 78°. E. long. 77° 24′.

ZELATE, a town of the country of Candahar; 30 miles N.E. of Candahar.

ZELEBI. See SCHELEBY.

ZELEEFA, a town of Africa, in the country of Tunis; 10 miles S.E. of Cairoan.

ZELEH, a town of Asiatic Turkey, in the government of Sivas, anciently a town of Pontus, and called Zela. Near this place the Romans, under Triarius, were defeated by Mithridates; and Pharnaces, son of Mithridates, was afterwards defeated by Julius Cæsar; 21 miles W.S.W. of Tocat. See ZELA.

ZELEIA, in *Ancient Geography*, a town built, according to Homer, at the foot of mount Ida. It was watered by the Tarsius, and had to the S. the lake Aphnitis. According to Strabo, it had also in ancient times an oracle, but in his time it was not consulted.

ZELEM, in the *Materia Medica of the Ancients*, a name given by Avicenna and others to a fruit common in Africa in their time, and much esteemed by the people of that country, and called there by some *piper nigrorum*, the black people's pepper, or negro-pepper.

Avicenna tells us, that the zelem was a fattish seed, of the size of a chich, and of a high flavour, in colour yellow on the outside, and white within, and that it was brought from Barbary.

He adds, that there was another plant, properly called *fulful alsuaden*, that is, *piper nigrorum*. This, he says, was a seed contained in pods like kidney-beans, and was black, and of a pungent and acrid taste.

ZELENIN, in *Geography*, a small island in the Frozen ocean, near the S.W. coast of Nova Zembla. N. lat. 70° 50′. E. long. 56° 24′.

ZELENOIKOLOK, a fort of Russia, in the government of Caucasus, on the Ural; 44 miles N. of Guriev.

ZELES, in *Ancient Geography*, a town of Hispania, in Bœtica, upon a strait which separated Hispania from Africa, according to Strabo. This author reports, that the Romans transported the inhabitants into Mauritania, together with others drawn away from Tingis, established the town of Julia Joga.

ZELETAWA, in *Geography*. See SCHELETA.

ZELEZENSKAIA, a fort of Russia, in the government of Kolivan, on the E. side of the Irtisch. N. lat. 53° 25′. E. long. 75° 40′.

ZELITO, or ZILITO, a fort of South America, in the harbour of Carthagena.

ZELL, a town of Austria; 14 miles N.N.W. of St. Wolfgang.—Also, a town of Bavaria, in the bishopric of Bamberg; 10 miles W. of Bamberg.—Also, a town of Germany, in the principality of Culmbach; 12 miles S.S.W. of Hof.—Also, a town of the duchy of Wurzburg; 3 miles N. of Schweinfurt.

ZELL. See LIEBENZELL.

ZELL *im Ham*, a town of Germany, on the Moselle; 25 miles N.E. of Treves. N. lat. 50° 4′. E. long. 7° 7′.

ZELL *in the Pizgau*, a town of the archbishopric of Salzburg, on the Zeller See; 30 miles S.S.W. of Salzburg.

ZELL *in Zillerthal*, a town of the archbishopric of Salzburg, on the Ziller; 50 miles S.W. of Salzburg.

ZELL *am Hammersbach*, a town of Germany, situated in the vale of Hammersbach. The town was imperial, and assessed twenty-one florins till 1802, when it was given to the margrave of Baden; 9 miles W. of Freudenstadt. N. lat. 48° 23′. E. long. 8° 7′.

ZELLA, in *Ancient Geography*, a town of Africa, which was ruined during the war of Cæsar against Scipio. Strabo.

ZELLANG, in *Geography*, a town on the W. coast of the island of Celebes. S. lat. 4° 20′. E. long. 120° 3′.

ZELLE, or ALTENZELLE, a town of Saxony, in the circle of Erzgebirg; 2 miles W. of Nossen.

ZELLE, a city of Westphalia, in the principality of Luneburg. This is a fortified and well-built town, situated on the Aller, which is here navigable, and behind the New Town is joined by the Fuhsee. The town itself, in conjunction with the suburb of Fritzenweise, consists of 564 houses; but including the other suburbs, summer-houses, and buildings without the gates, the number of them amounts to about 1400. At this place was held the high court of appeals for the several territories of the electoral house of Brunswick-Luneburg, together with the chancery and chief tribunal of the principality of Luneburg. Here also stands the provincial house for the diets of the principality, together with one of its superintendencies, and a special superintendency which is administered by the general superintendant, who is always first minister of the town church. The other public edifices in it are, the Guildhall, the riding-house, the mews, and the armoury. The magistracy is possessed of the lower jurisdiction in the town, and likewise in some parts of the suburbs. At this place, too, are manufacturers and artificers in various branches, particularly in gold and silver. The prince's seat, near the town, is walled and moated in, and was the residence of the Zelle line of Brunswick-Luneburg, which failed in 1705. It was built by duke Henry, in the year 1485, and afterwards improved; 40 miles S. of Luneburg. N. lat. 53° 42′. E. long. 10° 14′.

ZELLENBERG, a town of France, in the department of the Upper Rhine; 9 miles N. of Colmar.

ZELLER SEE, a lake of Germany, in the archbishopric of Salzburg; 28 miles S.S.W. of Salzburg.

ZELLERFELD, a town of Westphalia, in the Harz Forest; silver to the value of 20,000 imperial crowns is annually coined in this town; 6 miles S.S.W. of Goslar.

ZELLERNDORFF, a town of Austria; 3 miles S.E. of Schrattentaal.

ZELLHOFEN, a town of Austria; 10 miles N.W. of Grein.

ZELLIA, in *Ancient Geography*, a country of Upper Pannonia, inhabited by the Slavi.

ZELLIN, in *Geography*, a town of the New Mark of Brandenburg; 13 miles N.W. of Custrin.

ZELLINGEN, a town of the duchy of Wurzburg; 8 miles N. of Wurzburg.

ZELLITZ, a town of the duchy of Stiria; 8 miles W. of Marburg.

ZELON, a town of Thibet; 27 miles S.W. of Lassa.

ZELOTTI, BATTISTA, in *Biography*, was born at Verona in 1532. He was a pupil of Titian, according to Vasari, and a fellow-student with Paolo Veronese, with whom he co-operated in several important works at Venice. He particularly excelled in fresco, and that induced Paolo to court his assistance in many of the great works in which he was engaged. In consequence many of his works are given to Veronese, and those in the hall of the Council of Ten, in the palazzo S. Marco, have been engraved by Le Febre as the works of that master. His picture of the Holy Family, in the Carara collection, is painted with the strength and warmth of Titian, and others of his works in

oil

oil are deservedly esteemed and admired, particularly the Conversion of S. Paul, and Christ with his Disciples in the Fishing-boat, in the cathedral at Vicenza. He fell short of the grace and taste of Veronese, yet his invention was not lacking in energy; his touch is free and animated, and his compositions managed with skill and judgment. He died in 1592, aged 60.

ZELPHI. See ZENDA.

ZELPITSCH, in *Geography*, a town of Istria; 10 miles N.E. of Mitterburg.

ZELTURINSKOI, a fort of Russia, in the government of Irkutsk; 72 miles S.S.E. of Tunginskoi.

ZELUIA, a town of Lithuania, in the palatinate of Novogrodek; 25 miles N.W. of Slonim.

ZEM, a river of Albania, which runs into the Moraca, 12 miles W. of Cattaro.

ZEMA, a word used by many of the old writers for a decoction or apozem.

ZEMARAIM, or SEMARAIM, in *Ancient Geography*, a city of Benjamin near Bethel. Josh. xviii. 22.

ZEMARITES, an ancient people of Syria, mentioned by Strabo, who places them on a plain, two leagues to the N. of mount Libanus, and gives them the term of Simyra.

ZEMASARUM, a word used by some of the chemical writers as a name for cinnabar.

ZEMBLA, NOVA, *Novaya Zemlia*, or *New Land*, in *Geography*, a Russian island, or rather a group of five islands, with the intervening channels always filled with ice, situated in the Frozen or Northern ocean. Of the numerous islands in this ocean, Novaya Zemlia and Kalgeva are the most considerable; but both are uninhabited, and frequented only by fishermen and hunters. The former is indeed well supplied with water; but is rocky, unfertile, and destitute of wood, furnishing vegetation only for a few stunted bushes and polar plants. It abounds, however, with rein-deer, white bears, white and blue foxes; and the shores swarm with morses, walruses, and various kinds of fish. Its magnitude is estimated at 950 versts in length, 520 in breadth, and 3090 in circumference, without following the sinuosities, and 425,509 German miles of superficies, according to Mr. Storch. On the northern side it is entirely encompassed with ice mountains; and to the south is the sea of Cara, Kara, or Karskoge, in which the tide flows about two feet nine inches. Among the lakes of this island there is one of salt water. From the middle of October till February the sun is not at all visible; but they have the advantage of numerous and strong north-lights and of much moon-light. In summer they have no thunder-storms. The snow falls in many places to the depth of four arshines. For two months, *viz.* June and July, the sun never sets. Between this island and the main land is the famous passage known by the name of Vaggat's or Waygat's straits.

ZEMECH, a word used by some writers as a name for *lapis lazuli*.

ZEMENIE, in *Geography*, a town of European Turkey, in Romania; 16 miles S.W. of Gallipoli.

ZEMIA, Ζημια, among the *Athenians*, is sometimes taken in a large and general sense for any kind of punishment; but more frequently for a pecuniary mulct or fine laid upon the criminal, according to the degree of his offence.

ZEMLIANSK, in *Geography*, a town of Russia, in the government of Voronez; 44 miles N.N.W. of Voronez. N. lat. 52° 12′. E. long. 38° 42′.

ZEMLIN, or SEMLIN, a fortress of Sclavonia, at the union of the Save and the Danube, opposite Belgrade. Here is a lazaretto, where travellers and merchandise from the Levant are detained to prevent infection. The number of inhabitants is about 1200 Rascians, Greeks, Jews, Armenians, and Turks: during a fire at Zemlin, Joseph II. emperor of Austria, assisted in person to suppress it.

ZEMME, a town of Grand Bucharia, on the Gihon; 60 miles S. of Bucharia.

ZEMOKARTLI, a town of Turkish Armenia, in the government of Cars; 50 miles N. of Ardanoudji.

ZEMORGET, or ZERMOGETE, a small island in the Red sea, 30 miles from the coast of Egypt. This island was called by the ancients "Ophiodes," from the abundance of serpents, and the island of topazes from the number of those precious stones found there. N. lat. 23° 25′. E. long. 53° 5′.

ZEMOVAH, a town of Pegu; 50 miles S. of Prone.

ZEMPHYRUS, in the *Materia Medica of the Ancients*, a name give to a precious stone, the fragments of which they use as a cordial and sudorific.

It appears by their accounts, that this stone was blue; and hence many have too hastily judged, that it was the lapis lazuli; but in truth it was the sapphire.

The word *zemphyrus* is no where used but in the writings of the later Greeks, and it is plainly formed, as most of their names of things are, on the Arabian word expressing the same thing. This Arabian word is *semphir*; and this, in Avicenna and Serapio, is always used as the name of a sapphire, never as that of any other gem. We find also by their accounts, that this sapphire was not the sapphire of the ancient Greeks, but the fine blue pellucid gem we now know by that name; for the sapphire of Theophrastus, and the other old writers, was only a kind of lapis lazuli.

ZEMPLIN, in *Geography*, a town of Hungary; 16 miles N.E. of Patak.

ZEMPOALA. See ZAMPALA.

ZEMZEM, the holy well of *Mecca*, which see.

ZENANICH. See SELANIEH.

ZENATI, a river of Algiers, formed by the union of two streams, which soon after changes its name to Seibouse.

ZENDA, a general term coined by Paracelsus, by which he and his followers express extraneous or equivocal generation, or the production of bodies without a seminal principle. The word *zerunda* is used to express this particular sort of generation of men, and *zelphi* in regard to other animals.

ZENDAVESTA, by contraction *Zend*, and, as it is vulgarly pronounced, *Zundavestow* and *Zund*, in *Antiquity*, denotes the book ascribed to ZOROASTER, (see his article,) and containing his pretended revelations; and which the ancient Magians and modern Persees, called also Gaurs, observe and reverence in the same manner as the Christians do the Bible, and the Mahometans the Koran, making it the sole rule of both their faith and manners. See MAGI, PERSEES, GEBRES, &c. See also GENTOOS.

The word, it is said, originally signifies any instrument for kindling fire, and is applied to this book to denote its aptitude for kindling the flame of religion in the hearts of those who read it.

Zendavesta is compounded of *Zend*, denoting the letters of the book, and *Avesta*, signifying the language in which it was written. See PERSIA, *Language of*.

M. Anquetil du Perron, to whose account we shall refer more at large in the sequel of this article, has taken pains, in the 37th volume of the work cited below, to prove that Zoroaster lived under Hystaspes, the father of Darius, in the sixth century before Christ.

The Zendavesta, or Zend, contains the system of doctrine and duty, which is said to have been supernaturally communicated

municated to Zoroaſter, and which his followers hold in very extraordinary veneration. A copy of this book is kept, ſays Dr. Prideaux, to this day in every oratory and fire-temple, and portions of it are read at ſtated times by the prieſts to the people: and to this they appeal as the ſtandard of the good and evil of their actions. This work, aſcribed among other numerous writings to Zerduſht, or the Perſian Zoroaſter, and eſteemed by his followers as of ſacred authority, is ſaid to have been written in the Perſian language, and to have conſiſted of two parts; one of which contains their forms of devotion and order of ceremonies, the other the precepts of religion and morality. A compendium of it, called the Sadda or Sadder, is read to the people on every ſacred day by their prieſts. There is, however, much reaſon to queſtion, whether this book be of ſuch ancient date as the time of Zoroaſter; and it has been ſuggeſted as probable, that it was written about the time when many Jews and Chriſtians reſided among the Perſians; that is, about the 4th or 5th century. In proof of its being later than the time of Zoroaſter, but written ſince the days of Mahomet, it is alleged, that the word *ſhaitam* occurs in it, which is peculiar to the Arabs; for in other oriental languages it is written *ſatam*, or *ſaton*.

Dr. Hyde gives us the following account of it. The Zend is the general name of the book, which is alſo called the book of Abraham; and it conſiſts of twenty-one or twenty-two ſeparate parts, with diſtinct names. Its contents were originally written on twelve hundred ſkins; and the ancient copies of it, like the original, are in the pure old Perſian language; but the later copies are in the ſame language, mixed with modern Perſic or Arabic words, ſerving to explain ſuch as were becoming obſolete. Some parts of the Zend contain the original text, and others contain Zerduſht's ſecond thoughts ſubjoined, for more fully explaining his doctrine. Some writers ſuggeſt, that Zerduſht firſt intended to compriſe his book in four parts, *viz.* the *Zend*, containing the liturgy and chief doctrine of his religion, and the *Pazend*, or commentary upon the former; and that the farther additions were occaſioned by the oppoſition of adverſaries, and unforeſeen circumſtances that occurred. The character in which the Zend is written is that of the old Perſian, called Pehlavi; and the Pazend character differs in a ſmall degree from this.

Dr. Hyde has given a catalogue of the ſeveral parts of the Zend, each of which is called *noſh* or *nuſh*.

In proceſs of time, when the old Perſian language became antiquated, and little underſtood, one of their deſtours or biſhops (about A.D. 1500) compoſed the *Sadda*, which is a compendium, in the vulgar or modern Perſic tongue, of thoſe parts of the Zend that relate to religion, or a kind of code of canons and precepts, drawn from the theological writings of Zoroaſter, ſerving as an authoritative rule of faith and practice for his followers. This Sadda is written in a low kind of Perſic verſe, and, as Dr. Hyde informs us, it is *bonorum et malorum farrago*, having many good and pious things, and others very ſuperſtitious and trifling.

The Zend contains a reformed ſyſtem of Magianiſm; teaching that there is a Supreme Being, eternal, ſelf-exiſtent, and independent, who created both light and darkneſs, out of which he made all other things; that theſe are in a ſtate of conflict, which will continue till the end of the world; that then there ſhall be a general reſurrection and judgment; and that juſt retribution ſhall be rendered unto men according to their works; and that the angel of darkneſs with his followers ſhall be conſigned to a ſtate of everlaſting darkneſs and puniſhment, and the angel of light with his diſciples introduced into a ſtate of everlaſting light and happineſs; after which light and darkneſs ſhall no more interfere with each other. The Zend alſo enjoins the conſtant maintenance of ſacred fires and fire-temples for religious worſhip, the diſtinction of clean and unclean beaſts, the payment of tithes to prieſts, which are to be of one family or tribe, a multitude of waſhings and purifications, reſembling thoſe of the Jewiſh law, and a variety of rules and exhortations for the exerciſe of benevolence and charity.

Dr. Prideaux charges the Zend with allowing the worſt kind of inceſt; and Dr. Hyde alſo intimates that it was allowed by Zoroaſter, till it was at length aboliſhed; but no authority has been cited to juſtify this charge.

The above-mentioned doctrines of the Zend are accommodated to the eaſtern taſte by a great intermixture of fable.

In this book there are many paſſages evidently taken out of the Scriptures of the Old Teſtament, particularly out of the Pſalms of David: the author repreſents Adam and Eve as the firſt parents of all mankind, gives in ſubſtance the ſame account of the Creation and Deluge with Moſes, differing indeed with regard to the former by converting the ſix days of the Moſaic account into ſix times, comprehending in the whole three hundred and ſixty-five days; and ſpeaks alſo of Abraham, Joſeph, Moſes, and Solomon. Moreover, Dr. Baumgarten (Univ. Hiſt. Suppl. vol. ii. p. 367, &c.) aſſerts, that this work contains doctrines, opinions, and facts, actually borrowed from the Jews, Chriſtians, and Mahometans; whence, and from other circumſtances, he concludes, that both the hiſtory and writings of this prophet were probably invented in the later ages, when the fire-worſhippers under the Mahometan government thought fit to vindicate their religion from the ſuſpicion of idolatry.

The Zoroaſter, ſays the abbé Foucher, (ſee ZOROASTER,) who was the author of the Zend, is repreſented by him as an apoſtate Jew, a ſubtle philoſopher, and an obſequious artful courtier, who inſinuated himſelf into the favour of Darius Hyſtaſpes; and he ſays that his great deſign was to reconcile the Hebrew with the Perſian religion by a mixture of the leading and eſſential doctrines of each, to revive the credit of the Magi, and to accommodate, by a proper colouring, the Jewiſh religion to the weakneſs and prejudices of the Medes and Perſians, by taking from it that excluſive character that rendered it offenſive to other nations, and mixing with it the reveries and viſions of the ancient Zoroaſter. See Hyde's Religio Veterum Perſarum. Prideaux's Conn. of the Old and New Teſtament, vol. i. p. 317, &c. edit. 9. Univ. Hiſt. vol. ii. p. 206, &c. fol.

The account more lately given both of the Perſees and Zend, by M. Anquetil du Perron, differs in ſeveral particulars from that of Dr. Hyde. This gentleman made a voyage to India, and employed himſelf between the years 1755 and 1761 in ſtudying the Perſic and Sanſkrit languages, and in collecting and tranſlating manuſcripts, many of which he brought with him, and depoſited in the king of France's library. His account was read to the Royal Academy of Sciences at Paris, and a tranſlation of it was publiſhed in the Gentleman's Magazine for 1762, and alſo in Dodſley's Annual Regiſter for 1762, part ii. p. 101—127. Of the Perſees or Parſſes, the diſciples of Zoroaſter, he ſays, a very numerous body has been eſtabliſhed more than nine hundred years in Guzerat, to which place they came fugitives from Kerman, A.D. 767, on account of the Mahometan

hometan perfecutions, where their genius for commerce and induftry, which are their known characteriftics, procured for them very confiderable fettlements. Concerning the hierarchy of the Parffes, this writer obferves, that their minifters of religion are divided into five claffes, *viz.* erbeds, mobeds, deftours, deftour mobeds, and deftouran deftours, or deftours of deftours. An erbed is a perfon who has fubmitted to the purification directed by the law, who has read, during four days without interval, the Izefchne and the Vendidad, and who is inftructed in the ceremonies of the worfhip eftablifhed by Zoroafter. If the erbed afterwards continues to read publicly the Zend works, which conftitute the liturgy, and to perform the minifterial functions, he becomes a mobed, though he does not underftand the Zendavefta; but if he contents himfelf with ftudying the law, the Zend, and the Pehlvi, or Pehlavi, without exercifing the minifterial functions, he is called a deftour.

The deftour mobed is he who unites the qualifications of the mobed and deftour; and the deftouran deftour is the principal deftour of a city or province, who decides cafes of confcience, and determines points of law, and to whom the Parffes pay a tithe of their revenues.

As for thofe Zend writings, which the Parffes attribute to their legiflator, and for which they have the fame veneration as the Jews have for their Hebrew text, M. du Perron inclines to think, though he does not affirm, that they are really the works of Zoroafter, whofe reputation has been acquired by laws that have fubfifted two thoufand five hundred years.

The law, which was either framed or regulated by Zoroafter, was divided, as we are told by modern authors, into twenty-one nofhs, or parts: feven treat of the creation and hiftory of the world; feven of morality, and civil and religious duties; and feven of phyfic and aftronomy. Among the Parffes it is an univerfally received tradition, that Alexander the Great condemned thefe twenty-one volumes to the flames, after having caufed them to be tranflated into Greek. Thofe which efcaped are, the Vendidad, the Izefchne, the Viffpered, the Jefchts, and the Neaefchs, in Zend, and fome other Pehlvic tranflations of Zend originals. The Parffes have alfo a great number of prayers, which they call nerengs, and which in general are written in modern Perfic, with Zend characters, which they affect to ufe in all writings that treat of religion, though compofed in modern Perfic. The writings of Zoroafter, which ftill remain, fpeak of the creation of the univerfe, of the terreftrial paradife, and the difperfion of mankind; of the caufe of the refpect paid to fire, of the origin of evil, natural and moral; of the angels appointed to the government of the univerfe; of feveral particulars relating to the end of the world, and the refurrection, &c. &c. They alfo contain predictions with refpect to the latter times, fome excellent moral precepts, and a very extenfive ceremonial code.

The Zend, according to Du Perron, is not the name of Zoroafter's writings, but merely of the characters, though generally ufed to fignify the language itfelf, in which they were written: the language of the original text is called Avefta, and is a dead language, and was entirely unknown to the Parffes before the time of Zoroafter, who, he apprehends, brought it from the mountains; and is totally different from the Pehlvi or ancient Perfic, fpoken in the time of Zoroafter. He farther fuppofes, that the works of Zoroafter, ftill extant in the Pehlvi, were tranflations made into that language during the life of this legiflator, or foon after his death.

The Pazend, which Dr. Hyde makes to be the name of a work, is, according to Du Perron, the name of a language, which is a dialect or corruption of the Avefta, and almoft extinct, except that a few words of it are preferved in the Pehlvic tranflation. The characters of the Avefta and Pehlvi are different; the former, which are properly the Zend letters, being much the neateft; the Pazend has no peculiar alphabet, but adopts that of the Zend or Pehlvic indifferently. (On this fubject, fee *Language of* PERSIA.) For M. du Perron's account of the eighteen MSS. of which he brought duplicate copies with him, and an abftract of their contents, we muft refer to the Ann. Reg. &c. *ubi fupra.*

This writer has publifhed a tranflation of the Zendavefta, with remarks and illuftrations, &c. in 3 vols. 4to. at Paris, in 1771.

The Zend, as fir W. Jones fuggefts (Works, vol. iii. p. 115, 8vo.), bore a ftrong refemblance to Sanfkrit, and the Pehlvi to Arabic, being a dialect of the Chaldaic. Sir W. Jones, from a perufal of two vocabularies, exhibited in this work, one in Zend, and another in Pehlvi, and derived from a collection of traditional pieces in modern Perfian, was confirmed in his opinion concerning the Chaldaic origin of the Pehlvic; and in perufing the Zend gloffary, he was furprifed to find, that fix or feven words in ten were pure Sanfkrit. M. Anquetil, he fays, moft certainly, and the Perfian compiler moft probably, had no knowledge of Sanfkrit, and could not therefore have invented a lift of Sanfkrit words: it muft therefore be an authentic lift of Zend words, which had been preferved in books or by tradition; and hence it follows that the language of the Zend was at leaft a dialect of the Sanfkrit, approaching perhaps as nearly to it as the Pracrit, or other popular idioms which are known to have been fpoken in India 2000 years ago. As foon as M. Anquetil publifhed the above-mentioned work, fir W. Jones immediately difcovered that the work was fpurious, and by no means to be attributed to Zoroafter; in confequence of which he publifhed in the fame year, "Lettre à M. A—— du P—— dans laquelle eft compris l'Examen de fa Traduction des Livres attribués à Zoroaftre." This letter is contained in the 10th volume of his works, ed. 8vo. In Germany this verfion of M. Anquetil has met with more fuccefs, and has not only been tranflated into German, but applied to the purpofes of explaining the New Teftament. This ufe of it has been fuggefted by Michaelis, and exemplified in the illuftration of the introduction to St. John's gofpel, and particularly of the term "word," which is ufed in the Zendavefta in the fame fenfe as by St. John and the Gnoftics for the name of a perfon, and determines the proper tranflation of λογος. (Michaelis by Marfh, vol. i. p. 161.) Several other perfons, befides fir W. Jones, have queftioned the authenticity of the work which M. Anquetil has tranflated, or its being a genuine remain of Zoroafter.

Mr. Richardfon, in his "Differtation on the Language, Literature, and Manners of the Eaftern Nations," originally prefixed to his Perfian, Arabic, and Englifh Dictionary, 1778 (chap. i. fect. 2.), is very fevere, both on Dr. Hyde and M. du Perron. Thofe fragments of the fuppofed works of Zoroafter, which Dr. Hyde has given us under the title of *Sadder*, are, he fays, the wretched rhymes of a modern Parfi deftour or prieft, who lived about three centuries ago; whilft the publications of M. Anquetil du Perron carry palpable marks of the total or partial fabrication of modern times. The Zend language, he fays, is not genuine; and M. du Perron has produced no difcovery which can ftamp his publication with authority.

He adds, the fpecimens of old Perfian in Hyde's Religio Veterum

Veterum Perfarum are fimply modern language in ancient characters.

In the "Memoirs of the Royal Society of Gottingen for 1799," *i. e.* "Commentationes Societatis Regiæ Scientiarum Gottingenfis, &c." we have a memoir by M. Chriftopher Meiners, who enters into a critical examination of the authenticity and antiquity of the books publifhed by M. Anquetil du Perron, as genuine writings of Zoroafter; and alleges many plaufible arguments to prove them recent and fpurious. He fhews, that they contain a multitude of fables, totally unknown to the ancient Perfians, and contrary to the fpirit of their laws and religion; and alfo many opinions and ceremonies, which had their firft rife many ages after Zoroafter. The differtations of profeffor Meiners, relating to the Zendavefta, are printed in the 8th volume of the Novi Commentarii Soc. Reg. Gotting.; and in the 1ft and 3d volumes of the Commentationes.

Some have thought that the truths which are obfervable in Zendavefta, Vendidad Sadi, and other writings of the eaftern nations, were derived from the difciples of Neftorius, who were found very early on the coaft of Malabar. But this, Mr. Bryant thinks, is a groundlefs furmife; becaufe the religious fects, among which thefe writings have been preferved, are widely feparated, and moft of them have no connection with Malabar or the Chriftians of that quarter. And befides, the Brahmins and Banians adhere clofely to their own rites, and abhor all other perfuafions; and they are influenced by cuftoms and fcruples, which prevent their intercourfe with other people. In their writings there occurs no trace of Chriftianity, or of its founder; and thence Mr. Bryant infers, that whatever truths may be found in the writings of thefe people, they were derived from a higher fource, and by a different channel. See Anal. of Anc. Mythology, vol. iii. p. 599, &c.

We fhall terminate this article with adding, that Dr. Hyde prefented the copy of part of the Zend writings in his poffeffion to the univerfity of Oxford; and that the whole Zend was afterwards brought from India by Mr. Frazer, and is lodged with his other oriental MSS. in the Radcliff library at Oxford.

ZENDERO, in *Geography*. See GINGIRO.

ZENDEROUD. See ZEINDEROOD.

ZENDGIN SERAI, a town of Grand Bucharia; 30 miles S. of Samarcand.

ZENDORFF, a town of the duchy of Stiria; 12 miles E. of Landfperg.

ZENECHDON, a term ufed by the Arabian phyficians for a preparation of arfenic, for external ufe; *zeech* being their name for arfenic.

ZENEXTOR, one of the many names by which the chemifts have called mercury.

ZENGAN, ZENIGAN, or *Zinjan*, in *Geography*, a town of Perfia, in the province of Irak, faid to have been fortified many years before the Chriftian era, and at one time to have contained 20,000 houfes. It was entirely deftroyed by Timur Bec when he firft paffed through that part of Perfia; but being informed that it had long been the feat of learning and fcience, on his return from Turkey he in part rebuilt it. Since that time it has been frequently facked and deftroyed by the Tartars and the Turks. It contained in the 17th century about 2000 houfes. It is a large, and now apparently a profperous town, capital of the extenfive diftrict of Khumfeh, which is 71 miles down an uneven country, full of deep ravines, from hence to the banks of the Kizilozien, or golden ftream, the natural boundaries of Irak and Azerbijan; 21 miles N.W. by W. of Sultania.

ZENGH. See SEGNA.

ZENGHI, a river of Armenia, which runs into the Aras, 10 miles S. of Erivan.

ZENGIFUR, a word by which fome of the chemical writers have expreffed cinnabar.

ZENGITZA, in *Ancient Geography*, a promontory of Africa, in Ethiopia, upon the gulf of Barbary. Ptolemy.

ZENGUIA, in *Geography*, a town of Syria, in the pachalic of Aleppo, on the Euphrates; 55 miles N.N.E. of Aleppo.

ZENHAGA. See ZANHAGA.

ZENI, a word ufed by many of the chemical writers as a name for vitriol.

ZENIC, or ZENIK, in *Zoology*, a fpecies of weafel. See VIVERRA.

ZENICON, the name of a poifon, compofed of feveral ingredients, and ufed to poifon the tips of the arrows with which the Celtic hunters fhot at the beafts they purfued for food. The poifon was known to be of that quick fpreading nature, that as foon as the beaft was fallen, the huntfman ran up to it, and cut out a large piece of the flefh about the wound immediately, to hinder the venom from fpreading farther. The antidote to this poifon was fuppofed to be the leaves of oak, beech, and other trees.

ZENIEH, in *Geography*, a town of Afiatic Turkey, in Caramania; 15 miles of Selefkeh.

ZENITH, in *Aftronomy*, is derived from an Arabic word fignifying *point*, and is that peculiar point in the vifible celeftial hemifphere, which, at a given time, is vertical to a fpectator, fituated on any part of the earth's furface, and from which, if a perpendicular line were demitted through the place of the fpectator, it would proceed to the centre of the earth. Of all the points in the apparent concavity of the vifible hemifphere, the *zenith point* is the moft interefting; it is not only the pole of the local horizon of every place, and of all parallels of altitude, but is the point to which all the grand circles of the fphere are referred, and through which not only the great circles connecting the cardinal points, but all the circles of azimuth pafs and interfect one another; and further, it is the only point in the celeftial expanfe that is not affected by atmofpheric *refraction*. If the earth had no annual or diurnal motion, nor any nutation of its axis, the zenith of each place on the earth's furface would be fo many fixed points in the heavens; but as none of thefe is the cafe, the actual zenith of every place, except over the two poles of the earth, is continually changing. The annual orbit of the earth is indeed fo fmall in comparifon of the diftance of a ftar from it, that the parallax arifing therefrom is too fmall to be appreciable with certainty even by the beft inftruments; but the effect of *nutation* of the earth's axis is very perceptible, as is alfo the *aberration* of light occafioned by the earth's progrefs in its annual orbit; and thefe will both confpire to render the *apparent* a little different from the *true* zenith. It is, however, the earth's diurnal motion that produces the principal change in the celeftial fituation of the zenith; for as this planet revolves on its axis, any given place on its furface has a correfponding fucceffion of zeniths, which defcribe a circle, at the diftance of its co-latitude from the neareft pole; and hence a fucceffion of ftars fituated in this circle will appear to tranfit the zenith in a direction contrary to that of the earth's diurnal motion in every fidereal day, or time of one entire rotation. Hence, though the zenith of any place may be confidered as a fixed point in the heavens, as to its *direction*, when viewed by a fpectator; yet as it has reference to the apparent place of a heavenly body, it is not fixed, becaufe the earth's motion is continually carrying the fpectator's eye in a circle that produces the optical effect of an apparent circumpolar revolution of the celeftial bodies. Whatever point of the hemifphere is at any moment vertical to an obferver on any part of the globe, *that point* is the *zenith* for the time *then paffing*, and will again be the zenith, or very nearly fo, after an interval of one complete rotation of the earth; and, therefore, ftrictly fpeaking, in every place there are as many fucceffive zeniths in this period, as there are appreciable points in the circle generated in the heavens by the fuperior end of the vertical line carried round by the globe in rotation.

Becaufe every point of the horizon is juft 90° diftant from the exifting zenith, in every place, and at all times, it will be readily apprehended, that the complement of the altitude of any heavenly body will, at any inftant, be the angular diftance of that body from the zenith of the place of obfervation; but as this diftance varies inverfely with the altitude, it is more properly called the *co-altitude* than the *zenith-diftance*, the former being a variable, and the latter a limited quantity. The *zenith-diftance* of any ftar is properly the complement of its *meridian* or *greateft* altitude in any given place, and as the latitude of the place varies, fo will the zenith-diftance of the fame body, but inverfely; the diftance of the zenith to the pole being always the complement of the latitude. Hence it is obvious, that when the zenith-diftance of a ftar is obferved by any inftrument that meafures it accurately, the latitude of the place may be inferred from the tabular polar diftance of that ftar, as well as from the declination, which is its complement; and, therefore, it is a matter of no importance in theory, whether the altitude or zenith-diftance of a body tranfiting the meridian be taken, for the purpofe of afcertaining its place in the heavens, when the latitude of the obferver is known, or for the purpofe of determining the latitude of the place, when the declination, or polar diftance of the body, is known. Accordingly, in the circular inftruments that have been recently introduced into obfervatories, and that will reverfe in pofition, it is ufual to number the divifions and fubdivifions fo, that when they read altitudes with the graduated plane facing the eaft, they read zenith-diftances (on the meridian) when the fame is made to face the weft, and *vice verfâ;* fo that not only are the oppofite errors of collimation of the telefcope and of the bubble or plumb-line thus corrected, but when atmofpheric refraction is allowed for, the fum of the two readings, or of the averages of feveral, will be exactly 90°, or otherwife 180°, if the obfervations be truly taken, and the inftrument duly adjufted for zero and collimation; which check is of great practical importance in the delicate operations of the aftronomer.

Zenith-*Sector* is an *aftronomical* inftrument, by means of which the angular diftance of a ftar is accurately meafured from the zenith point of any given place towards the north or fouth. The firft inftrument made ufe of for this purpofe was contrived by Dr. Hooke, with a view of determining the annual parallax of a fixed ftar, agreeably to the fuggeftion of Galileo. The telefcope, which Dr. Hooke, in the year 1669, made the effential part of his inftrument, was thirty-fix feet long, the principle of achromatifm not being at that time practically applied, fo as to allow of confiderable power with a fhort focal diftance of the object-glafs; but the length of the radius of his arc of meafurement promifed advantages over every other inftrument, which juftified the conception and execution of the plan, though its accomplifhment failed of correfponding fuccefs. Indeed, the nice arts of conftructing achromatic telefcopes, and of dividing the arc of a circle with extreme precifion, had neither of them yet been perfected. From the Cutlerian Lectures we learn, that the firft obfervation with this inftrument was made on the 6th of July of the above-mentioned year, on the ftar denominated γ Draconis, which, on that evening, was found to pafs at the diftance of 2′ 12″ to the north of the zenith of Grefham college; which was alfo found to be the cafe on the 9th of the fame month: but on the 6th of Auguft next following, the diftance was only 2′ 6″; and on the 21ft of October after only 1′ 48″, or 1′ 50″; whence it was concluded, that the meafurement of a zenith-diftance taken by this inftrument was liable to an error of 24″, or perhaps more; and it was confidered, therefore, that the inftrument was quite incompetent to the purpofe for which it was intended. But an original idea once fuggefted, as the bafis of ufeful fpeculation, is not readily abandoned, even under an apparent want of fuccefsful application. The Hon. Samuel Molyneux afterwards availed himfelf of the manual fkill of the ingenious Graham, and by the affiftance of Dr. Bradley put up a zenith-fector at Kew, in the year 1725, which turned out to be much more accurate than its predeceffor, though the focal length of the object-glafs of its telefcope was only 24¼ feet. With this inftrument, and with one of about one-half its focal length, were made two of the moft important difcoveries in aftronomy that have graced the annals of this fcience; *viz.* the *nutation* of the earth's axis, and the *aberration of light* in its paffage from the heavenly bodies. As the hiftory of aftronomical difcoveries, and that of aftronomical inftruments, are mutually illuftrative of each other, and as a detail of the *minutiæ* is always interefting, that connect great refults with primary meafures, that might otherwife be confidered as infignificant, we will make no apology for introducing here Dr. Bradley's own account of his proceedings, as inferted in the Philofophical Tranfactions of London, N° 406. p. 149 of the Abridg.

"The following obfervations," fays the author, "were begun by the honourable Samuel Molyneux at Kew, continued and repeated by myfelf at Kew and Wanftead, in hopes of verifying thofe that Dr. Hooke formerly communicated to the public, concerning the *parallax of the fixed ftars.* (London, 1674.) Therefore the fame ftar was made choice of by Mr. Molyneux, almoft the fame method followed, and his inftrument conftructed upon principles nearly the fame, but greatly exceeding the doctor's in exactnefs, which was chiefly owing to our curious member (of the Royal Society) Mr. George Graham, to whom the lovers of aftronomy are alfo indebted for feveral other exact and well-conftructed inftruments. Mr. Molyneux's apparatus was completed and fitted for obferving about the end of November, 1725; and on the 3d day of December following, the bright ftar in the head of Draco (marked γ by Bayer) was for the firft time obferved, as it paffed near the zenith, and its fituation carefully taken with the inftrument. The like obfervations were made on the 5th, 11th, and 12th days of the fame month; and there appearing no material difference in the place of the ftar, a farther repetition of them at this feafon feemed needlefs, it being a part of the year wherein no fenfible alteration of parallax in this ftar could foon be expected. It was chiefly, therefore, curiofity that tempted me (being then at Kew, where the inftrument was fixed) to prepare for obferving the ftar on Dec. 17th, when, having adjufted the inftrument as ufual, I perceived that it paffed a little more foutherly this

 day

day than when it was obſerved before. · Not ſuſpecting any other cauſe of this appearance, we firſt concluded, that it was owing to the uncertainty of the obſervations, and that either this or the foregoing were not ſo exact as we had before ſuppoſed; for which reaſon we propoſed to repeat the obſervation again, in order to determine from whence this difference proceeded; and upon doing it on Dec. 20th, I found that the ſtar paſſed ſtill more ſoutherly than in the former obſervations. This ſenſible alteration the more ſurpriſed us, in that it was the *contrary way* from what it would have been had it proceeded from an annual parallax of the ſtar; but being now pretty well ſatisfied that it could not be entirely owing to the want of exactneſs in the obſervations, and having no notion of any thing elſe that could cauſe ſuch an apparent motion as this in the ſtar, we began to think that ſome change in the materials, &c. of the inſtrument itſelf might have occaſioned it. Under theſe apprehenſions we remained ſome time; but being at length fully convinced, by ſeveral trials, of the great exactneſs of the inſtrument, and finding by the gradual increaſe of the ſtar's diſtance from the pole, that there muſt be ſome regular cauſe that produced it, we took care to examine nicely, at the time of each obſervation, how much it was: and about the beginning of March, 1726, the ſtar was found to be 20″ more ſoutherly than at the time of the firſt obſervation. It now, indeed, ſeemed to have arrived at its utmoſt limit ſouthward, becauſe in ſeveral trials made about this time, no ſenſible difference was obſerved in its ſituation. By the middle of April, it appeared to be returning back again towards the north; and about the beginning of June, it paſſed at the ſame diſtance from the zenith as it had done in December, when it was firſt obſerved.

" From the quick alteration of this ſtar's declination about this time, (it increaſing a ſecond in three days,) it was concluded, that it would now proceed northward, as it before had gone ſouthward of its preſent ſituation; and it happened as was conjectured; for the ſtar continued to move northward till September following, when it again became ſtationary, being then near 20″ more northerly than in June, and no leſs than 39″ more northerly than it was in March. From September the ſtar returned towards the ſouth, till it arrived in December to the ſame ſituation it was in at that time twelve months, allowing for the difference of declination on account of the preceſſion of the equinox.

" This was a ſufficient proof that the inſtrument had not been the cauſe of this apparent motion of the ſtar; and to find one adequate to ſuch an effect ſeemed a difficulty. A *nutation of the earth's axis* was one of the firſt things that offered itſelf upon this occaſion; but it was ſoon found inſufficient; for though it might have accounted for the change of declination in γ Draconis, yet it would not at the ſame time agree with the phenomena in other ſtars; particularly in a ſmall one almoſt oppoſite in right aſcenſion to γ Draconis, at about the ſame diſtance from the north pole of the equator; for, though this ſtar ſeemed to move the ſame way as a nutation of the earth's axis would have made it, yet in changing its declination but about as much as γ Draconis in the ſame time, (as appeared upon comparing the obſervations of both made upon the ſame days, at different ſeaſons of the year,) this plainly proved that the apparent motion of the ſtars was not occaſioned by a real nutation, ſince, if that had been the cauſe, the alteration in both ſtars would have been near equal.

" The great regularity of the obſervations left no room to doubt, but that there was ſome regular cauſe that produced this unexpected motion, which did not depend on the uncertainty or variety of the ſeaſons of the year. Upon comparing the obſervations with each other, it was diſcovered, that in both the fore-mentioned ſtars, the apparent difference of declination from the *maxima* was always nearly proportional to the verſed ſine of the ſun's diſtance from the equinoctial points. This was an inducement to think, that the cauſe, whatever it was, had ſome relation to the ſun's ſituation with reſpect to thoſe points. But not being able to frame any hypotheſis at that time, ſufficient to ſolve all the phenomena, and being very deſirous to ſearch a little farther into this matter, I began to think of erecting an inſtrument for myſelf at Wanſtead, that, having it always at hand, I might with the more eaſe and certainty inquire into the laws of this new motion. The conſideration, likewiſe, of being able by another inſtrument to confirm the truth of the obſervations hitherto made with Mr. Molyneux's was no ſmall inducement to me; but the chief of all was the opportunity I ſhould thereby have of trying in what manner other ſtars were affected by the ſame cauſe, whatever it was. For Mr. Molyneux's inſtrument being originally deſigned for obſerving γ Draconis, (in order, as I ſaid before, to try whether it had any ſenſible parallax,) was ſo contrived, as to be capable of but little alteration in its direction, not above ſeven or eight minutes of a degree; and there being few ſtars within half that diſtance from the zenith of Kew bright enough to be well obſerved, he could not, with his inſtrument, thoroughly examine how this cauſe affected ſtars differently ſituated with reſpect to the equinoctial and ſolſtitial points of the ecliptic.

" Theſe conſiderations determined me; and by the contrivance and direction of the ſame ingenious perſon, Mr. Graham, my inſtrument was fixed up, Auguſt 19, 1727. As I had no convenient place where I could make uſe of ſo long a teleſcope as Mr. Molyneux's, I contented myſelf with one of but little more than half the length of his, (*viz.* of about $12\frac{1}{2}$ feet, his being $24\frac{1}{4}$,) judging from the experience which I had already had, that this radius would be long enough to adjuſt the inſtrument to a ſufficient degree of exactneſs; and I have had no reaſon ſince to change my opinion: for from all the trials I have yet made, I am very well ſatisfied that when it is carefully rectified, its ſituation may be ſecurely depended upon to half a ſecond. As the place where my inſtrument was to be hung in ſome meaſure determined its radius, ſo did it alſo the length of the arc, or limb, on which the diviſions were made to adjuſt it; for the arc could not conveniently be extended farther than to reach to about $6\frac{1}{4}°$ on each ſide my zenith. This indeed was ſufficient, ſince it gave me an opportunity of making choice of ſeveral ſtars, very different both in magnitude and ſituation; there being more than two hundred inſerted in the Britiſh Catalogue, that may be obſerved with it. I needed not to have extended the limb ſo far, but that I was willing to take in *Capella*, the only ſtar of the firſt magnitude that comes ſo near my zenith.

" My inſtrument being fixed, I immediately began to obſerve ſuch ſtars as I judged moſt proper to give me light into the cauſe of the motion already mentioned. There was variety enough of ſmall ones, and not leſs than twelve that I could obſerve through all the ſeaſons of the year; they being bright enough to be ſeen in the day-time, when neareſt the ſun. I had not been long obſerving, before I perceived that the notion we had before entertained of the ſtars being fartheſt north and ſouth, when the ſun was about the equinoxes, was only true of thoſe that were near the ſolſtitial colure; and after I had continued my obſervations a few months,

months, I discovered what I then apprehended to be a general law observed by all the stars, *viz.* that each of them became stationary, or was farthest north or south, when they passed over my zenith at six of the clock, either in the morning or evening. I perceived likewise, that whatever situation the stars were in with respect to the cardinal points of the ecliptic, the apparent motion of every one tended the same way, when they passed my instrument about the same hour of the day or night; for they all moved southward while they passed in the day, and northward in the night; so that each was farthest north, when it came about six of the clock in the evening, and farthest south, when it came about six in the morning.

"Though I have since discovered, that the *maxima* in most of these stars do not happen exactly when they come to my instrument at those hours; yet not being able at that time to prove the contrary, and supposing that they did, I endeavoured to find out what proportion the greatest alterations of declination in different stars bore to each other, it being very evident that they did not all change their declination equally. I have before taken notice, that it appeared from Mr. Molyneux's observations, that γ Draconis altered its declination about twice as much as the fore-mentioned small star almost opposite to it; but examining the matter more particularly, I found that the greatest alteration of declination in these stars was as the sine of the latitude of each respectively. This made me suspect that there might be the like proportion between the *maxima* of other stars; but finding that the observations of some of them would not perfectly correspond with such an hypothesis, and not knowing whether the small difference I met with might not be owing to the uncertainty and error of the observations, I deferred the farther examination into the truth of this hypothesis, till I should be furnished with a series of observations made in all parts of the year, which might enable me not only to determine what errors the observations are liable to, or how far they may safely be depended upon, but also to judge whether there had been any sensible change in the parts of the instrument itself.

"Upon these considerations, I laid aside all thoughts at that time about the *cause* of the fore-mentioned phenomena, hoping that I should the more easily discover it, when I was better provided with proper means to determine more precisely what they were.

"When one year was completed, I began to examine and compare my observations; and having pretty well satisfied myself as to the general laws of the phenomena, I then endeavoured to find out the cause of them. I was already convinced that the apparent motion of the stars was not owing to a *nutation* of the earth's axis. The next thing that offered itself was an *alteration* in the *direction* of the *plumb-line*, with which the instrument was constantly rectified; but this, upon trial, proved insufficient. Then I considered what *refraction* might do, but here also nothing satisfactory occurred. At last I conjectured that all the phenomena hitherto mentioned proceeded from the *progressive motion of light*, and the *earth's annual motion in its orbit*. For I perceived that if light was propagated in time, the apparent place of a fixed object would not be the same when the eye is at rest, as when it is moving in any other direction than that of the line passing through the eye and object; and that when the eye is moving in different directions, the apparent place of the object would be different."

The author then proceeds to deduce from his observations the relative velocities of light, and of the earth in its annual orbit; shews what variation in the right ascension and declination of stars differently placed may arise out of the *aberration* of light; and concludes that light, agreeably to such deductions, must travel from the sun to the earth in about $8' \, 7''.5$ of time. (See ABERRATION, LIGHT, and STARS.) The discovery of the earth's *nutation* was not, however, published until the year 1737. See NUTATION.

After our readers have seen what important discoveries and deductions have been derived from Graham's zenith-sector in the hands of a skilful astronomer, they will be naturally disposed to become acquainted with its construction, which we will now proceed to describe.

Zenith-Sector by Graham.—The zenith-sector that we have said Graham made for Mr. Bradley, afterwards Dr. Bradley, was removed to Greenwich, when the proprietor became astronomer royal, and is the same instrument which Dr. Maskelyne used with great success in adjusting, by comparison, the zero of the large quadrants. It still remains at Greenwich, and is yet capable of measuring zenith-distances to the accuracy of half a second, according to Bradley's original report, or even less. *Fig.* 1. of *Plate* XXXIII. of *Astronomical Instruments*, is a representation of the essential parts of this instrument: A B represents the iron tube of the vertical telescope, which is suspended by two small metallic cylinders projecting at right angles from the superior end, one of which is seen at *a*, and the other is hidden by the tube. These cylinders, which constitute the axis of motion, rest in a pair of Ys, attached to the solid wall facing the north, and also occasionally to another pair fixed to a wall facing the south; which additional pair allows the ends of the cylinders, or axis of motion, to be reversed in position. The brass bar C D is fixed to the same wall to which the pair of Ys are attached, at opposite sides of the room, and bears a cock to which the micrometer-screw E is fixed, which measures the fractional portion of a minute on its head *b*; and the second screw *c* is made to relieve it. The ends of these screws press against studs inserted into the tube of the telescope, while the weight F pulls a string round the fixed pulleys G and H, by means of a pliable cord, attached to the tube at the point *d*, and keeps the telescope home. The graduated arc I K contains $12\frac{1}{2}°$, each subdivided into twelve parts, or five minute spaces, and is fixed exactly at right angles to the tube, over the point where the wires intersect the field of view. This arc was originally of brass, but Sisson put on an arc of steel, containing gold pins to receive the dots of division. A plumb-line suspended from the superior end of the tube, over the centre of one of the cylinders *a*, and having an adjusting screw *e*, to bring the point of suspension to the upper dot, falls near the face of the arc, and indicates the distance from zero at the middle of the arc; if the plumb-line covers one of the dividing dots of the scale, when a star near the zenith is cut by the horizontal wire, then the quantity is read by the plumb-line and arc alone; but otherwise the fractional portion is ascertained by means of the micrometer-screw, which is made to press against the tube until the suspended line coincides with the next nearest dividing dot of the scale. The value of the micrometer-head, which is divided into thirty-four equal parts, was ascertained by trying how many revolutions of the screw would measure a degree, or other portion of the arc, exactly; and on an average of several trials made in different parts of the arc, it was ascertained, that one revolution was not precisely $34''$, but $33''.6328$, and one of its divisions on the head, therefore, only $0''.9892$, instead of $1''$, as was intended by the maker. The instrument had originally a single lens for its object-glass; but at the request of the late Dr. Maskelyne, Mr. Dollond substituted

ſtituted an achromatic object-glaſs, which has modernized the inſtrument, and put it nearly on a level with the new inſtruments which have lately been conſtructed and erected in the Royal Obſervatory by Troughton, on the beſt principles. If the zenith-ſector had been made to reverſe in poſition in the ſame ſituation, *i. e.* without being carried acroſs the room, its uſe would have been more convenient, and the obſervations more certain, inaſmuch as the ſame diſtance would have been preſerved between the axis of motion of the teleſcope, and the point acted upon by the micrometer-ſcrew, without any reſulting allowance. Beſides, the inſtrument would have been leſs liable to accidents; and reverſed obſervations might probably have been made on the ſame evening. When Bird afterwards made a zenith-ſector for the Oxford Obſervatory, he noticed theſe inconveniences, and obviated them by making the tube of the teleſcope turn round in its own place, ſo that the poſitions of the axis can be reverſed by an azimuthal motion that carries the plumb-line round at the ſame time; and when the plumb-line will cover the dot at zero during this whole motion, the teleſcope is truly vertical.

The adjuſtment for collimation is effected by an apparatus that moves the wires in the eye-piece, as in the tranſit-inſtrument, and may be thus effected: Let the graduated arc face the eaſt, and view a ſtar paſſing in or near the zenith, the proper time for doing which may be known from the ſtar's right aſcenſion, by means of a ſidereal clock, or by converſion of ſolar into ſidereal time, and note the diſtance from zero when the plumb-line is quiet, which it will ſoon be if the plummet is immerſed in a goblet of water, and mark down this quantity as read partly by the diviſions on the ſcale, and partly by the micrometer-head; which call the *eaſtern* meaſure with N. or S. annexed, accordingly as the ſtar paſſes to the north or ſouth ſide of the zenith point: then reverſe the poſition, and on a ſucceeding night, which will be $3' 56''$ ſooner on every ſucceſſive night, meaſure the zenith-diſtance of the ſame ſtar in like manner with the graduated ſcale facing the weſt; and call it the *weſtern* meaſure: then if the two quantities thus meaſured be ſimilar, the collimation for zenith-diſtance will be true; but if otherwiſe, one half of the difference of the two readings will be the *error* of collimation, which may be either corrected by the proper apparatus at ſucceſſive trials, or, which is perhaps better, may be allowed for in each obſervation. When the inſtrument has been uſed for ſeveral obſervations, it will be ſtill better to take an average of all the obſerved errors, as aſcertained by different ſtars, and to apply it with its proper ſign in future ſingle obſervations, ſo long as the inſtrument remains in all reſpects unaltered. It is hardly neceſſary to obſerve, that in uſing this inſtrument, when a ſtar is very near the zenith of any place, the micrometer alone, without reference to the graduated ſcale or arc, will give the due meaſure. How the latitude of any place may be very accurately determined from the meaſured zenith-diſtance of a ſtar, of known declination, will be ſeen preſently.

Zenith-Sector by Ramſden.—While the trigonometrical ſurvey of England was carrying on, it was found deſirable to have a portable zenith-ſector to aſſiſt in meaſuring an arc of the meridian, and as Ramſden had one in an half-finiſhed ſtate, that had been ordered by the duke of Richmond, the parties were prevailed on to have this finiſhed for the purpoſe, which was nearly done in Ramſden's life-time, in the year 1801, and completed in April 1802 by his ſucceſſor Berge. It was firſt tried at Greenwich, and then removed to the Iſle of Wight, where the operations began, and from whence they were continued northward from ſtation to ſtation, as deſcribed in the "Trigonometrical Survey," by captain William Mudge, and publiſhed from time to time by Mr. Faden, of Charing-Croſs. The original account of this complex inſtrument has reference to ſix large plates, and is too long for us to copy. (See vol. ii. p. 6. *& ſeq.* of part ii.) *Fig.* 2. of our *Plate* XXXIII. of *Aſtronomical Inſtruments*, gives a reduced perſpective view of this inſtrument, from an examination of which a better idea will be formed of its general conſtruction than by any detailed account we can give of its parts without the additional plates.

Captain Mudge ſays, "that Mr. Ramſden has here obviated the inconveniences attendant on the uſe of former ſectors; and has alſo diminiſhed, in a very conſiderable degree, the errors unavoidably reſulting from their imperfect conſtruction. The principles, he adds, on which he has founded the ſeveral improvements, conſiſt in the means of uniting the ſectorial tube to its axis, ſo as to enſure the permanency of the length of its radius, when erected for obſervations; more accurate methods of adjuſting the inſtrument vertically; and an eaſy way of placing the face of its arc in the plane of the meridian." The frame exhibited in our figure conſiſts of two parts; the external ſtand of mahogany, which ſupports the apparatus to which the ſectorial tube is attached; and an inner frame, containing that apparatus with the tube itſelf. The ſtand, or outer frame, is in the ſhape of an obtruncated pyramid, having a baſe ſix feet ſquare, and its vertex three. It unites ſtrength with ſimplicity of conſtruction. The inner frame, within which the ſector is ſuſpended, is ſupported at top in every lateral direction, while its lower extremity is terminated by a cone reſting in a metallic concavity, on which it turns in azimuth; and it can be kept in any poſition by a clamping apparatus acting with an azimuth circle, made faſt to the bottom of the external frame. The teleſcope of the ſector has an object-glaſs nearly eight feet long, with an aperture of four inches, near which is made faſt the tranſverſe axis of motion, ſimilar to that of a tranſit-inſtrument. The wires of the eye-piece of the teleſcope are illuminated by reflected light, entering the axis in the uſual way; and a plumb-line, with the ghoſt apparatus for adjuſtment to zero, is made a leading feature in the conſtruction. The arc is divided into 15°, which was the concluding work done by Berge, and each degree is ſubdivided into $5'$ ſpaces, as in Graham's inſtrument. A ſecond teleſcope, of 29 inches focal length, is attached to the long tube, and moves in the plane of the divided arc to any given elevation, but partakes of the azimuthal motion when the long vertical teleſcope is turned round: with this 29-inch teleſcope horizontal angles are meaſured, by the help of the azimuth circle, which therefore is divided for this purpoſe. Beſides theſe eſſential parts, there are various appendages and bracing parts, rendered neceſſary by the ſize of the inſtrument, particularly a microſcopic tube reaching up to the upper dot of the plumb-line, and bent at both ends into a horizontal poſition for convenience of the obſerver. This contrivance required reflectors, both of the light, and of the image of the piece of mother-of-pearl that is biſected by the wire, conſtituting the plumb-line. The micrometer meaſures minutes and ſeconds in the uſual way, and the plummet is immerſed in a ſmall veſſel of water to prevent vibration. We mention theſe particulars *generally*, not only becauſe their particular uſes and modes of application have been previouſly deſcribed, when we explained other inſtruments, ſuch as CIRCLES, EQUATORIALS, TRANSIT-*Inſtruments*, &c.; but becauſe this inſtrument has furniſhed hints to others who have copied in part, or wholly, ſeveral of Ramſden's contrivances. It was moreover neceſſary to introduce various weights, pulleys, cords, ſprings, &c. to facilitate and keep ſteady the motions of the different acting parts, which, together with the reading microſcopes, lamps, rods, and adjuſting ſcrews, give the inſtrument the appearance of great complexity.

The manner of adjuſting the inſtrument for obſervation is thus performed, according to Mr. Mudge's own words: *viz.* "The feet of the external ſtand ſhould be firſt carefully brought into a horizontal plane; and when they are ſo, the azimuth circle will be neceſſarily parallel to it, having its centre under the middle of the opening in the mahogany frame ſcrewed on the top of the ſtand. This being done, and the inſtrument ſet up, the plane of the arc ſhould be brought parallel to one of the ſides of the ſtand, in which ſituation the internal frame is to be clamped to the azimuth circle, and the wire brought to its proper diſtance from the limb, by means of the adjuſting ſcrew attached to one of the ſliders, which carries the concave receptacle and conical point. The dot at zero ſhould then be brought exactly under the plumb-line, as ſeen through the magnifier, and the point on the micrometer-head, at which its index ſtands, noted. The inſtrument is then to be turned half round; and if the ſame dot on the arc ſtill continues biſected, it will afford a proof of the internal ſtand being upright in one direction. But if the dot ſhould not continue biſected by the plumb-line, it muſt be made to do ſo, and the revolutions, or parts of a revolution, counted; half of which is to be turned back on the micrometer-head. The ſame dot, zero, is then to be brought under the plumb-line (wire), by means of the other adjuſting ſcrew, beneath the azimuth circle. If the ſtand is pretty accurately ſet up, one operation is ſufficient for bringing the interior frame upright in one direction, *viz.* either in that of the meridian, or the one at right angles to it. The arc is then to be turned round 90°, and the ſame operation gone through. This being properly done, the interior frame is made perfectly upright. The next ſtep to be taken is that of placing the long level on its axis above, and rectifying that axis by means of the Y plate ſcrews. If this be done carefully, the bubble will remain between the pointers of the level, whatever poſition the ſector may be placed in. Having thus rectified the inſtrument, by making the internal frame upright, and the axis horizontal, the only remaining point to engage attention is, placing the plumb-line at a proper diſtance from the arc: this is done by means of the ſcrew acting on the ſpring juſt under its point of ſuſpenſion. If great care be uſed in going through theſe ſeveral adjuſtments, the inſtrument may, at any future time, be accurately adjuſted for obſervation by turning the proper ſcrew belonging to the azimuth circle, and bringing the arc to its uſual diſtance from the wire."

In order to ſhew the accurate reſults that may be obtained from an inſtrument of this deſcription, and alſo the care that is neceſſary in uſing it, and in clearing the obſervations of errors ariſing from natural cauſes, we will ſubjoin a few Tables that were found uſeful in the grand trigonometrical operations, by means of which, in the years 1802 and 1806, the meridian arcs were compared with the correſponding terreſtrial meaſurements.

Besides these observations, various others were taken of different stars in Draco, Cygnus, Ursa Major, Hercules, Perseus, and Auriga, from an average of all which the final results were obtained; but before the true or *mean* zenith-distances can be exactly known, the *apparent* measures must be corrected by certain equations for *aberration, nutation, semi-annual solar equation, precession,* and *refraction;* the Tables proper for which are chiefly given under our article DECLINATION. It was deemed sufficient for our purpose in this place to confine ourselves to the consideration of the observations made on γ Draconis alone, which being a star of the second magnitude, and very near the zenith of London, and of the southern parts of England, was considered as the best object. We will therefore subjoin the reduction of the observations made on this star by way of illustrating their application in practical astronomy.

Reduction of the Observations contained in Table I.

	Face of Limb West.				Face of Limb East.			
		°	′	″		°	′	″
Greenwich Observatory, 1802.	April 16. - -	0	2	28.37	April 22. - -	0	2	19.05
	19. - -	0	0	29.92	23. - -	0	0	20.54

	Mean - -	0	2	28.94	Mean W. - -	0	2	28.94
					2)	0	4	48.73
Apparent Mean of both positions					=	0	2	24.36
And also, half the difference, or collimation					=			4.57
Then in Bode's Catalogue Dec. N. of γ Draconis, 1801					=	51	31	5.
Subtract for annual diminution .7 + .3					—			1.
True declination					-	51	31	4.
And 2′ 24″.36 + 0.03″ (sum of Equations) true zenith-distance					-		2	24.39
The true latitude of Greenwich Observatory, as deduced from γ Draconis					=	51	28	39.61

When the reductions are thus made for the observations taken at the other places, the zenith-distances and corresponding latitudes will stand thus, *viz.*

	Zenith Distance.				North Latitude.		
Dunnose	1°	50′	5.24″	N.	50°	37′	7″.36
Clifton	1°	56	26.64	S.	53	27	30.64
Arbury-Hill	0	42	22.75	S.	51	15	26.75
Delamere For.	1	42	18.09	S.	53	13	19.09
Burleigh Moor	3	3	19.09	S.	54	34	20.09

In obtaining the latitudes of the two last places, the declination of γ Draconis is diminished 3″ to bring it to the year 1806, and in all the cases where S is annexed to the zenith-distance, it is *added* to the declination. The reductions are made to the first of January of the respective years, and the latitudes come out very nearly the same as those determined from terrestrial measurement, and also from an average of all the observed stars.

"From the observations made at the station in Delamere forest with the zenith-sector in 1806, combined with those at Dunnose, 1802, taken with the same instrument," says the author of the Survey, "it is found, that the difference in latitude of those is 2° 36′ 12″.2 (by γ Draconis alone in our examples 2° 36′ 11″.73), making a difference of 1″ between the calculated and observed amplitudes, which, setting aside the consideration of the spherical figure of the earth, is at the rate of $\frac{4}{10}$ths of a second in one degree. Perhaps, under the consideration of each meridianal line being obtained independently of the other, and admitting that neither of them can be measured with perfect accuracy, together with the chances of the amplitudes being in some small degree either in excess or defect, we may consider the result as sufficiently consistent and satisfactory, and may take 60823 fathoms, in latitude 52° 34′, or the centre of England, as the length of 1°." Trigonometrical Survey, vol. iii. p. 332, &c.

ZENITH-*Micrometer* is an instrument of very recent date, and is scarcely yet known to the generality of astronomers. It differs from the zenith-sector in this respect; that the measures taken with it are all taken within the tube of the telescope, whereas those taken by the zenith-sector are all external: consequently the range of the zenith-micrometer's scale is confined to the extent comprised within the field of view, which will always be inversely as the magnifying power of the glasses used; hence the greater the power of the telescope, the smaller the number of stars that will pass within the range of the micrometer-screw; but then corresponding accuracy may be expected from the great powers and delicate construction of modern micrometers; and what is wanting in the extent of the scale will be made up by superior precision. The telescope, which constitutes the basis of the zenith-micrometer, may be either of the reflecting or refracting construction; and within a short space of time one of each description has been constructed; the former by Troughton, for the Greenwich observatory, and the latter by Dollond, for the use of those geodæsic commissioners, who are employed by the English government to ascertain the proper line of demarcation across the American lakes. We will give a short account of each of these instruments, such as will enable our readers to form an opinion of their respective merits, as prototypes for future imitation.

Zenith-Micrometer by Troughton.—It is probable that the first

first idea of a zenith-micrometer occurred to Mr. Troughton, and certain that he was the first who executed one, and gave it its name. It was in 1806 that he proposed it to Dr. Maskelyne, and in 1812 that he erected it at the Royal Observatory, as an appendage to the mural circle.

The telescope of this instrument is a Newtonian reflector, the tube of which forms the vertical axis, through which axis a plumb-line passes centrically from end to end; and, therefore, is not made to vibrate by turning. The tube or axis, 10 feet long, and 5 inches diameter, at the lower end terminates in a pivot, while the upper end is received by a right angle, against the sides of which it is gently pressed by two springs; contrivances which produce free and steady azimuthal motion.

All the zenith instruments require for collimation two positions, which in the sectors are called *face east* and *face west;* two at 180° distance from each other are equally necessary for the micrometer, and in that under consideration are indicated by the contact of stops, without regarding any divisions.

The large mirror at the lower end, as well as the pivot, are perforated, in order that the plumb-line may pass freely through them, the latter sustaining the plummet in a water vessel several inches below. The axis of the mirror is somewhat inclined to that of the tube, for the purpose of placing the plane mirror out of the way of the plumb-line, which latter, as before observed, occupies the centre. The rays of light, thus rather obliquely reflected up the tube, are turned into a horizontal direction by the plane mirror, and come to a focus a little beyond the side of the tube, where, with appropriate adjustments, is fixed a double micrometer for measuring zenith-distances.

When the instrument is stopped with the micrometer toward the south, one of the moveable wires is made to bisect a star a little before it comes to the centre of the field of view; then the instrument is turned to the opposite stop with the micrometer towards the north, which may be done in three seconds, and then the other moveable wire is made to bisect the star. It is evident now, that the opening between the wires is double the zenith-distance of the star, and if the axis was truly vertical, the middle between them is the point zenith. The revolutions of the screws are counted in the field of view, and the parts to the third decimal figure read off upon the micrometer heads, which revolutions and parts are to be reduced to angular measure.

The plumb-line is suspended from a fixed point at the upper end, and near the lower end is a rectangular arrangement of microscopes with adjustments, which, together with the adjustments of the pivot, accomplish the means of bringing the axis and plumb-line coincident with each other, and of assuring the vertical position of the former.

The conception of this instrument was not confined to a reflecting telescope, it was seen that a refracting one would succeed equally well: in the latter case, the pivot at the lower end must be perforated to receive the eye-glass, and the plumb-line should be exterior to the main tube, but inclosed in a smaller one to protect it from the action of the wind. In the case of the Greenwich instrument, of which the foregoing is a description, the reflector was preferred on account of its allowing the central position of the plumb-line, which, being free from vibration, shortens the time required for adjustment; a consideration indeed of very little value; for it is now known (but was not then) that instruments properly constructed, and used with care, which they now are at our national establishments, seldom or never want re-adjustment. A better cause for adopting the reflector was, that the horizontal view is more easy than the vertical one, especially as in the former the hands and whole body are unembarrassed, and fit for action. But whichever construction of the telescope is employed, we know that Troughton considers the zenith-micrometer as one of the most elegant of his inventions.

Zenith-Micrometer by Dollond. — The zenith-micrometer which is represented in *Plate* XXXIII. by *figs.* 3, 4, 5, and 6, has great advantages in the simplicity of the construction and use, that former instruments for the same purpose do not possess, and is portable: the plan was proposed by Mr. Pond, the astronomer royal, and the instrument executed by Mr. Dollond for transatlantic measurements. It is drawn from a scale of two inches to the foot, and is represented without a stand or support. It can be applied to either, as occasion may require. The component parts are these; *viz.* an achromatic refracting telescope A A, (*figs.* 3, 4.) of 42 inches focal length, with an aperture of $2\frac{3}{4}$ inches; a micrometer B, with two screws, each moving a separate wire through the field of view, which is extended to two degrees. The transverse axis C is 18 inches long, and glazed for a telescope, with cross wires that adjust, so that when the principal telescope A is taken out, (and for which there is a provision,) the line of collimation may be truly adjusted to the pivots, and when replaced will be correctly at right angles to the principal telescope. The use of the axis being formed into a telescope, is, for the purpose of placing the instrument correctly in the meridian, by a mark that must be found to the east, and also by another to the west, so that when the star has been observed with one of the micrometer wires, and the instrument is changed for the purpose of observing the same star with the other micrometer wire, it may be correctly replaced, the mean of the two observations being the correct zenith-distance. The instrument is also furnished with a plumb-line D, and with a dot at E, the image of which is brought to the place of the plumb-line by a lens; this is known by the name of the *ghost* adjustment. The plumb-line is suspended from a piece at F. The two screws G G are used for bringing the dot carried by the telescope, to coincide with the plumb-line; and is observed to be so by the lens at H. This contrivance affords one of the greatest advantages of the instrument, as it enables the observer, at the moment before he observes the conjunction of the star with the micrometer wire, to ascertain the correct position of the instrument by the plumb-line; for the correctness of the observation will depend on the accuracy with which the plumb-line is made to coincide with the dot; and by this method the *error* of *division* is *done away.* The level (*fig.* 6.) is used for levelling the axis, and the circular piece (*fig.* 5.) with the Ys *a a* attached, in which the pivots of the transverse axis rest, may be applied to a mahogany-framed stand, or on a stone pier, or bracket: it is represented as it was made for a mahogany stand (which had adjusting screws at the feet); it consists of two strong brass plates, and is furnished with a circular motion for bringing the instrument into the meridian, which motion is given by a pinion *b*; and it is made fast by the four screws *c*, *c*, *c*, *c*. The two adjusting screws G G, *fig.* 3. must also be attached to a bracket or framed piece in the stand; and the support for the water, in which the plummet is immersed, may also be applied to this bracket. The wires are illuminated through the axis in the same manner as in the transit-instrument. The value of the micrometer-screws is to be found in the usual manner, and reduced into seconds.

The foregoing are the distinguishing properties of this instrument,

instrument, and as the method of using it may be understood sufficiently from what we have said of the zenith-sector, from which it differs only in the small range of its scale, it will be unnecessary to give any further explanation of either its adjustments or practical application.

Other Instruments.—Besides the zenith-sectors and zenith-micrometers, which we have above described, there are other instruments, which may be used as substitutes for these, at the same time that they may be used for their own respective purposes. Of these, the transit-circles of large dimensions, particularly those which move with their pivots supported by stone piers, claim our principal notice. As the professed use of these circles is to ascertain both right ascensions and declinations at the same time, and as zenith-distances are only complements of altitudes taken in any latitude, it is obvious, that those instruments that measure altitudes accurately, at all elevations, will also measure zenith-distances, or their complements; and in fact, the divisions are now numbered in such way, that altitudes and zenith-distances are read alternately in the reversed positions. Of this description is the excellent circle of Mr. Groombridge at Blackheath; but the large circle at Greenwich, not having a plumb-line or level used, nor being capable of reversion, is not of the same class; though a very superior instrument for its own purpose of measuring polar distances from the exact polar point, without any reference to latitude, altitude, or zenith-distance.

We have also before us an 18-inch transit-circle with a $3\frac{1}{2}$-feet telescope, very lately made by Mr. Thomas Jones, of Charing-Cross; the axis of which is supported by a cast-iron frame, that very conveniently admits of measures being taken in or near the zenith, as well as in any other degree of elevation. This instrument comprises many new and useful contrivances, but they cannot be described under this head, consistently with our general plan of dividing our subjects.

ZENITH is a word used by some writers to express the first appearance of the menses in young women.

ZENKABAD, in *Geography*, a town of the Arabina Irak; 22 miles S. of Sherban.

ZENKOV, a town of Russia, in the government of Tchernigov; 140 miles S.E. of Tchernigov. N. lat. 50°. E. long. 34° 14′.

ZENN, a river of Franconia, which runs into the Rednitz, near Vacha, in the margravate of Anspach.

ZENN. See LANGENZENN.

ZENNAR, the name of a mystical thread worn by Brahmans, and by many individuals of other tribes of Hindoos. So prolix and minute are the authors of the Ordinances of the Hindoos, that rules for almost every occurrence of life, however trifling, have been laid down. Not that any thing connected with the zennar has been deemed trifling by those who ordained it, by those who wear it, or those who revere it. On the contrary, the individuals to be so distinguished, the mode of manufacturing the sacred article, and its investiture, with many particulars, have occupied the attention of lawgivers, and are attended to with great respect by their obedient followers.

Brahmans affect to consider the zennar as of highly mysterious and sacred import, and do not consider an individual as fully a member of his tribe until he have assumed this holy emblem. A Brahman should be invested with it at the age of eight years, by the hands of his father, who, with his Guru, or spiritual preceptor, twists that first put on. A Kshetriya receives it at eleven, from a Brahman. A Vaisya at twelve years of age. A Sudra is on no account permitted to wear it. A description of these four grand divisions, comprising the whole race, will be found under SECTS *of Hindoos*.

The zennar must be made by a Brahman: it is composed of three threads, each measuring ninety-six hands, twisted together, and folded into three; then twisted again so as to consist of nine threads: these are again folded into three without twisting, and each end fastened with a knot. It is put over the left shoulder next the skin, and hangs down the right thigh as low as the fingers can reach. Of these cords a Brahman wears four; the other privileged tribes but three. Some writers call this the Brahmanical, or priestly, or sacerdotal thread; but not, it would appear, in strict correctness; it not being confined to the priestly tribe, but worn, as we have seen, by three out of the four sects of Hindoos.

In the Institutes of Menu (see MENU), c. 11. v. 36. the revered legislator ordains, that "in the eighth year from the conception of a Brahman, in the eleventh from that of a Kshetriya, and in the twelfth from that of a Vaisya, let the father invest the child with the mark of his class."

The two next verses allow, on particular occasions, the assumption of the sacrificial thread, as it is often called, in the fifth, sixth, or eighth years respectively; or it may, in like manner, be delayed until the individual be double the age mentioned in verse 36. "After that, all youths of these three classes, who have not been invested at the proper time, become outcasts, degraded from the Gayatri, and contemned by the virtuous," v. 39. Of the Gayatri, see under our article O'M.

In ancient books, the three first classes, from being thus invested with this sacrificial thread, are called *twice born*; a regeneration being effected by this mystical second birth. But it has been thought, that in later times, the Brahman only has the advantage of being thus *born again*. The term *twice born* is very common; a *third* birth is sometimes mentioned: this, we believe, is at the decease, or the burning of the body. "The first birth is from a natural mother; the second, from the ligation of the zone; the third, from the due performance of the sacrifice: such are the births of him who is usually called twice born, according to a text in the Veda. Among them, his divine birth is that which is distinguished by the ligation of the zone and sacrificial cord; and in that the Gayatri is his mother." Menu, ii. 169, 170.

This cord is never taken off; even when sleeping and bathing, it is worn and disposed of in a particular manner. When worn out, it is committed to the water with due and appropriate ceremony, and another is as duly put on. It is seen on the most ancient of Hindoo sculptures, and on many of the figures; for instance, in the cavern temple at Elephanta. (See MAHAKALA.) It has several other names; among them Janwi, or Jahnuvi, Maurvi, &c. The latter is applied to the cord of the military tribe, being made from the leaves of a species of hyacinth, called murva, of which bow-strings are also made: the Brahman's cord is made of cotton. The name Jahnuvi given to this sacred, triple, mystical, regenerating thread, has been derived from Jahnu, an ascetic, who, in a very extravagant way, gave a second birth to the equally sacred, triple, mystical, regenerating river Ganga (the Ganges), which is hence called Jahnuvi. Of this we have taken some notice under JAHNU; and of the triple union of the Ganga, and other sacred rivers, under TRIVENI.

Brahmans, and their enthusiastic followers, are very mystical concerning regeneration, and have divers modes of effecting the second birth, in cases where the purity derived from the ligation of the zone, or investiture with the sacrificial thread,

thread, hath been loſt by the contaminations of unlawful acts, as from accidental defilements. Of this, ſee under our article YONI.

ZENO, in *Biography*, called the *Eleatic*, in order to diſtinguiſh him from Zeno the Stoic, was a native of Elea, in Magna Græcia, and ſaid to have been the adopted ſon of Parmenides, whoſe diſciple he was, flouriſhed about the year 463, B.C. and choſe to live in his native city rather than at Athens, for the ſake of maintaining his independence. He is repreſented as a zealous friend of civil liberty, and as having loſt his life in his oppoſition to a tyrant. It is ſaid, that having been detected in a conſpiracy againſt the petty tyrant of the place of his nativity, he endured the moſt cruel torments, becauſe he would not betray his accomplices; and that at length his countrymen, rouſed by his fortitude, fell upon the uſurper and ſtoned him to death. To him the invention of the dialectical art has been erroneouſly aſcribed.

According to Ariſtotle, Zeno taught that nothing can be produced either from that which is ſimilar or diſſimilar; that there is only one being, and that is God; that this being is eternal, homogeneous, and ſpherical, neither finite nor infinite, neither quieſcent nor moveable; that there are many worlds; that there is in nature no vacuum; that all bodies are compoſed of four elements, heat and moiſture, cold and dryneſs; and that the body of man is from the earth, and his ſoul an equal mixture of theſe four elements. He argued with great ſubtlety againſt the poſſibility of motion. If Seneca's account of this philoſopher deſerves credit, he reached the higheſt point of ſcepticiſm, and denied the real exiſtence of external objects.

Upon the whole, his ſentiments ſeem to have been ſo fluctuating and unſtable, and his method of arguing ſo verſatile, that it is not certain whether he allowed or denied a properly divine nature. Moſheim, not improperly, applied to the doctrine of Zeno the words of Terence:

"—— Incerta hæc, ſi tu poſtules
Ratione certa facere, nihilo plus agas,
Quàm ſi des operam, ut cum ratione inſanias."

"Things thus uncertain, if by reaſon's rules
You'd certain make; it were as wiſe a taſk
To try with reaſon to run mad." COLMAN.

Bayle depreciates the practical philoſophy of Zeno, on account of his vindication of the warmth with which he reſented reproach, by ſaying, "If I were indifferent to cenſure, I ſhould alſo be indifferent to praiſe." His works, though unknown to the moderns, were held in high eſtimation among the ancients. Diog. Laert. Bayle. Brucker by Enfield, vol. i.

ZENO, the founder of the *Stoic* ſect, was born about the year 366, before Chriſt, and died, as it is ſaid, in the 1ſt year of the 129th Olympiad, or 264 B.C. For an account of him, ſee the article STOICS.

ZENO, Roman emperor of the Eaſt, was a deſcendant of an Iſaurian family of diſtinction, and at firſt bore the name of "Traſcaliſſæus." Being a commander of the Iſaurian troops in the ſervice of Leo I., he married Ariadne, a daughter of the emperor, who created him a patrician, and raiſed him to the chief command of all the armies in the Eaſt. Upon the death of Leo in the year 474, the empire was tranſmitted to his grandſon by Zeno and Ariadne, and Zeno, by the influence of the dowager-empreſs Verina, was appointed his colleague, and when the young emperor died, Zeno poſſeſſed the whole imperial power. But Verina, being incenſed by his ſcandalous conduct, formed a conſpiracy againſt him, ſo that Zeno was obliged to ſeek refuge, firſt at Chalcedon, and afterwards in Iſauria, his native country. Baſiliſcus, the empreſs's brother, who had aſſumed the empire, became ſo unpopular, that Zeno was reſtored, and the degraded emperor periſhed in priſon. About this time the weſtern empire terminated; and Zeno, receiving deputies from the Roman ſenate, who recognized Conſtantinople as the ſeat of univerſal empire, and requeſted the title of patrician for Odoacer, proclaimed king of Italy, was flattered with the title of ſole Roman emperor, and commenced an amicable correſpondence with Odoacer. The remaining period of his reign was both turbulent and inglorious. The inſurrections againſt his government were numerous, and his temper, which was naturally ſevere, was thus rendered more hoſtile and cruel towards thoſe whom he conſidered as his enemies. The irritability of his diſpoſition proved eventually a collateral cauſe of his death, by aggravating a diſorder in his bowels, which proved fatal in the year 491, at the age of 65, after a reign of ſeventeen years and three months. His widow Ariadne married very ſoon after his death. His reign was famous for the confeſſion of faith, called the HENOTICON, or *Henoticum*, (which ſee.) Gibbon's Hiſt. Rom. Emp. vols. vi. vii. viii.

ZENO, in *Geography*, a river of Italy, which runs into the Taro, oppoſite Fornovo, in the duchy of Parma.

ZENOBIA, *Queen*, in *Biography*, was a native of Syria, in the third century, who claimed deſcent from the Macedonian kings of Egypt. This female was celebrated for the beauty of her perſon, the harmoniouſneſs of her voice, her mental talents and literary acquirements, and her diſtinguiſhed heroiſm and valour, as well as her modeſty and chaſtity. "Her manly underſtanding," ſays Gibbon, after recounting her perſonal beauties and excellencies, "was ſtrengthened and adorned by ſtudy. She was not ignorant of the Latin tongue, but poſſeſſed in equal perfection, the Greek, the Syriac, and the Egyptian languages: ſhe had drawn up for her own uſe an epitome of oriental hiſtory, and familiarly compared the beauties of Homer and Plato, under the tuition of the ſublime Longinus." She was allied by marriage to Odonatus, king of Palmyra, and delighted in thoſe exerciſes of war and the chace to which he was devoted. Many of his victories have been aſcribed to her military ſkill and valour. After the death of her huſband, about the year 267, ſhe aſſumed the ſovereignty of the Eaſt, and governed with equal vigour and policy; ſo that by her ſucceſs in warlike expeditions, as well as by the wiſdom and firmneſs of her adminiſtration, ſhe aggrandized herſelf in Aſia, and her authority was recognized both in Cappadocia and Bithynia, when Aurelian ſucceeded to the Roman empire. Envious of her power, and determined to diſpoſſeſs her of ſome of the rich provinces that were comprehended within the extent of her dominion, he marched at the head of a powerful army to Aſia, and having defeated the queen's general Zabdas, near Antioch, ſhe retreated to Emeſa, whither ſhe was purſued by Aurelian. Under the walls of that city another engagement with Zenobia, which was commanded and animated by herſelf, took place, in which the emperor was again victorious. The queen, thus unfortunate, withdrew the relics of her vanquiſhed forces to Palmyra, her capital; and was purſued thither by Aurelian. The favourable terms that were offered to Zenobia being refuſed, the city was beſieged; which, after long reſiſtance, the queen determined not to ſurrender; but as ſhe apprehended famine within the walls, ſhe mounted a ſwift dromedary, and haſtened towards the Euphrates, with a view of ſeeking an aſylum in the Perſian territories. But being overtaken in her flight, ſhe was brought back to Aurelian, who

who received her with a ſtern countenance, and queſtioned her how ſhe could dare to reſiſt the emperors of Rome. She replied, "Becauſe I could not acknowledge as ſuch a Gallienus and others like him; but I recognize by that title you who know how to conquer." At Emeſa, the fate of Zenobia was ſubmitted to the judgment of a tribunal, at which Aurelian preſided; and the Roman ſoldiers demanded her death. She, in a manner unworthy of her former fame, ſaved her own life by throwing the blame of her reſiſtance on her miniſters and counſellors; Longinus was one of theſe, who, with ſeveral others, was put to death, in the year 273.

Zenobia was reſerved to grace the triumph of Aurelian; and on the appointed day ſhe preceded, on foot, a magnificent chariot, which ſhe had deſigned in the days of her proſperity for a very different kind of entry into Rome. She was encircled, it is ſaid, with chains of gold, and almoſt ſunk under the load of jewels with which ſhe was adorned. Afterward ſhe was treated with humanity by the victor; and had aſſigned to her an agreeable reſidence near the Tiber, where ſhe paſſed the remainder of her days as a Roman matron. Whether ſhe contracted a ſecond marriage with a Roman ſenator, as ſome have affirmed, is uncertain; but however this be, her ſurviving ſon Vhaballat withdrew into Armenia, and poſſeſſed a ſmall principality granted to him by the emperor, and her family was not extinct in the fifth century. Gibbon's Hiſt. of Rome, vol. ii.

Zenobia, *Zelebi*, in *Ancient Geography*, a town of Aſia, in the Euphratenſis, upon the banks of the Euphrates, five miles from fort Mambri, and on this ſide of the ſmall town of Sura. According to Procopius, it was founded by Zenobia, wife of Odonatus, prince of Palmyra. After it had been ruined, Juſtinian re-eſtabliſhed it, and re-peopled it, and made it one of the bulwarks of the empire. After having rebuilt the town and fortified it, he embelliſhed it, conſtructing magnificent churches, public baths, galleries, and lodgments for the ſoldiers. It was ſituated S.E. of Nicephorium.

Zenobia, a place of Italy, near the palace of Adrian, aſſigned to queen Zenobia for her reſidence.

ZENOBII Insulæ, the name of ſeven iſlands in the Indian ocean, upon the coaſt of Arabia Felix, at the entrance of the Sathalite gulf. Ptolemy.

ZENODOTIUM, a town of Aſia, in Oſrhoené, in the vicinity of Nicephorium, according to Appian. Steph. Byz. This town, ſays Plutarch, was forcibly taken by Craſſus, who ruined it, and ſold the inhabitants by auction.

ZENONIS Chersonesus, a town mentioned only by Ptolemy, and placed by him in the Tauric Cherſoneſus, along the weſtern coaſt of the Palus Mœotis. M. Peyſonnel thinks this was not a town, but an iſthmus, called at preſent Zeniſké.

ZENSON, in *Geography*, a town of Italy, in the Treviſan; 9 miles E.N.E. of Trevigio.

ZENSUS, in *Arithmetic*, a name which ſome authors give to a ſquare number, or the ſecond power.

The higher powers they call *zenſizenſus*, *zenzicubus*, *zenſizenzenſus*, *zenſurdeſolidus*, &c. See Power.

ZENTA, in *Geography*, a town of Hungary, on the river Theys; memorable for a ſignal victory obtained, in the year 1697, by prince Eugene, over the Turks, commanded by the emperor Muſtapha II. in perſon: 20,000 Turks were killed, 10,000 wounded, and 3000 taken priſoners; 52 miles N. of Belgrade.

Zenta, a diſtrict of Dalmatia, on the confines of Albania.

ZENTILMANDAIK, a town of Aſiatic Turkey, in Natolia; 8 miles N. of Eregri.

ZENUPH, in the *Jewiſh Antiquities*, a kind of tiara worn by the kings of Judah. See Cidaris.

ZEOBID, in *Geography*, a town of the Arabian Irak, on the Euphrates; 28 miles S. of Bagdad.

ZEOLITE, in *Mineralogy*, a mineral ſo named by Cronſtedt, from the Greek word ζεω, *to foam*, on account of its intumeſcing and foaming very much before the blow-pipe. Haüy makes two diſtinct ſpecies of the zeolite, which he denominates meſotype and ſtilbite. Werner makes four ſub-ſpecies of zeolite, which he calls mealy zeolite, fibrous zeolite, radiated zeolite, and foliated zeolite. Beſides this he makes zeolite a generic name, placing it at the head of what he calls the zeolite family, in which arrangement he is followed by profeſſor Jameſon, who claſſes with the zeolite family the following minerals: prenhite, (ſee Prenhite,) zeolite, apophylite, cubicite, called by Haüy analcime, chabaſite, croſsſtone, laumonite, dipyre, natrolite, and wavellite. (See Wavellite.) In the claſſification of ſpecimens at the Britiſh Muſeum, theſe minerals, ſo nearly allied in chemical compoſition, and in many of their external characters, are arranged together under the appropriate denomination of zeolitic ſubſtances, by which the confuſion incident on making the ſame word repreſent both a genus and ſpecies is avoided. Theſe ſubſtances, except wavellite, are compoſed of ſilex, alumine, lime, or an alkali, and a conſiderable portion of water. To the latter, they owe the property of intumeſcing before the blow-pipe, that many of them poſſeſs. Some of theſe minerals form a jelly when diſſolved in acids. Zeolitic minerals occur principally in the cavities of volcanic and baſaltic rocks. Of the different members of the zeolite family, prenhite has been already deſcribed. (See Prenhite.) Zeolite, compriſing mealy zeolite and fibrous and radiated zeolite, are the various meſotypes of Haüy, mealy zeolite being the *meſotype alterée aſpect terreux* of the French mineralogiſt. This mineral is white, inclining to yellowiſh, greyiſh, or reddiſh, and is ſometimes red. It occurs maſſive, and kidney-ſhaped, and corrolloidal. Sometimes it forms a cruſt over other zeolites. The luſtre is dull or feebly glimmering: it is opaque, very ſoft, and rather ſectile; it has an earthy fracture, ſometimes inclining to fibrous. It is very light, and eaſily frangible, and feels rough and meagre. It appears to be zeolite in a decompoſing ſtate. It intumeſces before the blow-pipe, and forms a jelly with acids. The conſtituent parts are,

Silex	60
Alumine	15.6
Lime	8
Oxyd of iron	1.8
Loſs by expoſure to heat	11.6
	97

Fibrous Zeolite, *Meſotype*, Haüy, is of a ſnow-white colour, paſſing to greyiſh, yellowiſh, or reddiſh-white, and ſometimes into red and yellowiſh-grey, yellowiſh-brown, or ochre-yellow. It occurs maſſive, in kidney-ſhaped balls, and in capillary cryſtals. The external ſurface of the kidney-ſhaped varieties is rough and dull; internally it is ſtrongly glimmering, paſſing into gliſtening, and the luſtre is pearly: it is faintly tranſlucent. The ſtructure of this mineral is fibrous, either diverging on one ſide or ſtellular, and paſſes from delicately fibrous to coarſe or to narrow radiated. It is brittle, breaking into ſplintery or wedge-ſhaped

ſhaped fragments; it yields eaſily to the knife. The ſpecific gravity is from 2.158 to 2.197. Before the blow-pipe it intumeſces, and forms a jelly with acids. It may be diſtinguiſhed from needle zeolite by its inferior luſtre, fibrous ſtructure, and low degree of tranſparency and hardneſs, and alſo by its want of regular cryſtallization.

Needle Zeolite, Meſotype, Haüy; and *priſmatic meſotype* of ſome mineralogiſts. Its colours are, greyiſh, yellowiſh, or reddiſh-white: it occurs both maſſive and cryſtallized. The cryſtals are acicular-rectangular four-ſided priſms, terminated by low four-ſided pyramids, the faces of which are ſet on the lateral planes of the priſm. Sometimes there are only two terminating planes, forming an acute bevelment, ſet on obliquely. The rectangular priſm is ſometimes truncated on the edges, forming an octahedron, with four large and four ſmall planes. The lateral planes of the cryſtals are longitudinally ſtriated, but the acuminating planes are ſmooth. Sometimes the cryſtals are diverging, and ſometimes promiſcuouſly aggregated. The cryſtals are externally ſhining or ſplendent, internally gliſtening; the luſtre is vitreous, inclining to pearly. The ſtructure is lamellar, with joints parallel to one of the ſides of the priſm; alſo at right angles to the axis, and parallel to the two diagonals of the priſm. Of theſe, the firſt cleavage only is generally viſible. The croſs fracture is imperfectly conchoidal; the luſtre between vitreous and pearly. It is tranſlucent or tranſparent, with double refraction. It yields to the knife, but ſcratches calcareous ſpar, and is brittle. The ſpecific gravity varies from 2.17 to 2.27. This mineral, like the preceding, intumeſces before the blow-pipe, and gelatinizes with acids. It becomes electric by heat; the extremity of the cryſtal, terminated by a pyramid or bevelment, ſhews poſitive the bottom of the cryſtal negative electricity. According to Vauquelin, the conſtituent parts of meſotype are,

Silex - - - -	50.24
Alumine - - - -	29.50
Lime - - - -	9.46
Water - - - -	10
	99.2

Needle zeolite, or meſotype, is diſtinguiſhed from radiated zeolite, or ſtilbite, by its vitreous luſtre, diſtinct priſmatic concretions, and greater tranſparency and brittleneſs. The latter has alſo more of a nacry luſtre.

Radiated Zeolite, Stilbite, Haüy, is generally of a yellowiſh or greyiſh-white colour, and rarely paſſes into reddiſh-white or red. It occurs maſſive in angular pieces, and globular, and alſo cryſtallized in broad, rectangular, four-ſided priſms, rather acutely terminated by four planes ſet on the lateral edges of the priſm. Of theſe planes two adjoining ones are more inclined to the axis of the priſm than the other two. The ſummits of the terminating planes are ſometimes more or leſs deeply truncated. Sometimes the priſm is ſo thin as to form a long ſix-ſided table, bevelled on the ſhorter terminal planes. The cryſtals are aggregated in diverging radii, and frequently ſo cloſely joined to each other, that the pyramidal terminations of each cryſtal are only viſible. The broader lateral planes of the cryſtals are ſmooth, and the ſmaller longitudinally ſtriated. The ſtructure is lamellar, with joints in one direction, parallel to the axis of the priſm. The ſurfaces of the broader lateral planes are ſplendent and pearly; internally the luſtre is more or leſs ſhining, and is pearly. The cryſtals are tranſlucent, or ſemi-tranſparent. The diverging radii of the aggregated cryſtals are more or leſs broad, paſſing from fibrous to foliated. It is brittle, and the fragments are wedge-ſhaped and ſplintery. Stilbite ſcratches calcareous ſpar. The ſpecific gravity of this mineral is from 2.13 to 2.16. It intumeſces before the blow-pipe, yielding a phoſphoric light: it becomes white when laid on a glowing coal: it does not gelatinize with acids. The conſtituent parts are,

Silex - - - - -	40.98
Alumine - - - - -	29.09
Lime - - - - -	10.95
Water - - - - -	16.50
	97.52

Foliated Zeolite, Stilbite, Haüy.—The colours of this mineral are nearly the ſame as thoſe of the preceding, being chiefly yellowiſh and greyiſh-white, and rarely milk-white, ſnow-white, reddiſh-white, or red; it ſometimes is yellowiſh-grey, and pinchbeck-brown. It occurs both maſſive, diſſeminated, globular, amygdaloidal, and cryſtallized. The form of the cryſtals is a low, very oblique, four-ſided priſm; ſometimes truncated on the acute lateral edges, and alſo on the angles of the acute lateral edges. Sometimes all the angles are truncated. It occurs alſo in low ſix-ſided priſms, and equi-angular ſix-ſided tables; alſo in eight-ſided priſms. The cryſtals are generally ſmall; the lateral planes are tranſverſely ſtriated, and the terminal planes are ſmooth. It has a pearly luſtre, which is either ſhining or ſplendent. The pinchbeck-brown variety has a ſemi-metallic luſtre. It has a foliated and ſlightly curved ſtructure, with a ſingle cleavage, parallel with the terminal planes of the priſms. Sometimes a conchoidal croſs fracture may be obſerved. It is brittle, and the fragments are angular and blunt-edged, and ſometimes tabular. The maſſive varieties are ſtrongly tranſlucent; the cryſtals are tranſlucent, ſemi-tranſparent, or tranſparent. It yields to the knife, but ſcratches calcareous ſpar. The ſpecific gravity of this mineral is 2.2; and, like the preceding mineral, it intumeſces and melts before the blow-pipe, giving out a phoſphoric light: it does not form a jelly with acids. According to Meyer, the conſtituent parts are,

Silex - - - - -	58.3
Alumine - - - - -	17.5
Lime - - - - -	6.6
Water - - - - -	17.6
	100

According to Vauquelin,

Silex - - - - -	52.6
Alumine - - - - -	17.5
Lime - - - - -	9
Water - - - - -	18.5
	97.6

All theſe zeolitic ſubſtances, claſſed as meſotype and ſtilbite by Haüy, paſs by imperceptible gradations into each other, and occur, as we have before obſerved, in baſaltic and volcanic rocks.

The eaſy fuſibility of zeolites was at one time regarded as rendering their occurrence in volcanic rocks a ſubject of difficult explanation; but the experiments of ſir James Hall, referred to under SYSTEMS *of Geology,* demonſtrate the

the poſſibility of cryſtalline arrangements taking place under compreſſion in ſubſtances that would be diſſipated by heat under the common preſſure of the atmoſphere. It is probable, however, that many zeolitic ſubſtances which occur in baſalt or lava have been infiltrated into the cavities at a later period, and are even forming at the preſent day in ancient lavas and baſalts.

Some of the minerals claſſed with the zeolite family have been deſcribed in our preceding volumes. See APOPHYLITE, or ICTHYOPTHALMITE.

Analcime, or *Cubicite*, formerly called by Werner *cubic zeolite*, is generally white, ſometimes reddiſh-white, or red. It occurs ſometimes maſſive, but more generally cryſtallized in perfect cubes, or with the angles more or leſs deeply acuminated, or in twenty-four-ſided cryſtals, like thoſe of the leucite, having each of the ſides equal and ſimilar trapeziums. The ſtructure preſents ſlight indications of cleavage, parallel with the ſides of a cube. The fracture is compact and flatly conchoidal, paſſing into fine-grained, uneven. It is tranſlucent, ſemi-tranſparent, or tranſparent, and has a ſhining luſtre, between vitreous and pearly. It is ſufficiently hard to ſcratch glaſs, but is eaſily frangible. The ſpecific gravity of cubicite is 2.44. It becomes electric by rubbing. Before the blow-pipe it melts into a tranſparent glaſs. According to Vauquelin, the conſtituent parts of this mineral are,

Silex	58
Alumine	18
Lime	2
Soda	10
Water	8.5
	96.5

This mineral occurs moſt frequently in cavities in rocks of the trap formation, accompanied with zeolite; but it is ſometimes found in metallic veins in ſchiſtoſe rocks, accompanied with various ores, and with calcareous ſpar and quartz. The name *analcime* was given to it by Haüy, ſignifying a body with little power, on account of the feeble electricity excited in it by friction.

Chabaſite, *Chabaſie*, Haüy, is nearly allied to cubicite, and was formerly claſſed with it. The cryſtallization is different; the form is not perfectly cubical, but ſlightly rhomboidal, the angles of the rhomboid being 94° and 86°, either perfect, or with the obtuſe lateral edges truncated, and ſometimes both the ſix obtuſe lateral edges and ſix obtuſe angles are truncated. The cryſtals are tranſparent or tranſlucent. The luſtre is vitreous, and externally ſplendent, internally gliſtening; the fracture is imperfectly conchoidal, or fine-grained, uneven. It ſcratches glaſs a little. The ſpecific gravity of this mineral is 2.7. It is fuſible into a white ſpongy enamel. According to Vauquelin, the conſtituent parts are,

Silex	43.33
Alumine	22.66
Lime	3.34
Soda with potaſh	9.34
Water	21
	99.67

The ſituation in which this mineral occurs is nearly the ſame with that of analcime. The name was given it by Haüy, from chabazion, an unknown ſtone mentioned in the poems of Orpheus.

Laumonite, *Zeolithe efflore ſcente*, Haüy.—Its colours are, yellowiſh-white, ſnow-white, and greyiſh-white. It occurs maſſive and cryſtallized in octahedral priſms, with edges apparently rounded; the ſummits of the cryſtals are dihedral. The cryſtals are ſmall, lining druſy cavities. The ſtructure is lamellar, and has a two-fold cleavage: it is tranſparent or tranſlucent when freſh; but on expoſure to the atmoſphere ſoon becomes opaque, loſing its hardneſs, and yielding to the preſſure of the finger. When freſh it ſcratches glaſs. The ſpecific gravity is 2.23. Bournon. It forms a jelly with acids. Before the blow-pipe it intumeſces, and is changed into a white enamel. According to Vogel, the conſtituent parts are,

Silex	49
Alumine	22
Lime	9
Water	17.5
Carbonic	2.5
	100

This mineral, which agrees in its principal characters with zeolite, was firſt found in Brittany, by M. Gillet Laumont, after whom it has been named by Werner. It has been found alſo at Paiſley, in Renfrewſhire, in amygdaloid, accompanying cubicite. Laumonite diſintegrates ſo rapidly, that for its preſervation it requires to be kept in well-cloſed bottles.

Croſs-Stone, *Harmotome*, Haüy, occurs in ſmall cryſtals: the form is generally a broad rectangular priſm, terminated on each extremity by four rhombic faces, with their acute angles ſet in the lateral edges of the priſm. Sometimes the edges of the rhombic faces are bevelled in one direction. But the name croſs-ſtone is derived from the frequent occurrence of two priſms interſecting each other, having one common axis. The broader planes by this interſection project, and form the figure of a croſs when the priſm is viewed at the end, or in the direction of the axis. The colour of croſs-ſtone is generally a greyiſh-white, which paſſes into ſmoke-grey: it is ſometimes a yellowiſh-white, paſſing into cream-yellow, and red. It is tranſlucent or tranſparent, with a luſtre between vitreous and pearly. The fracture is uneven, or imperfectly conchoidal. It is ſuppoſed, by profeſſor Jameſon, to have an imperfectly foliated ſtructure. It ſcratches glaſs feebly. The ſpecific gravity is 2.33. Before the blow-pipe it emits a yellowiſh phoſphoric light, and melts with intumeſcence into a colourleſs glaſs. It does not gelatinize with acids. This mineral differs from other members of the zeolite family, by containing barytes as an ingredient in its compoſition. According to Klaproth, its conſtituent parts are,

Silex	49
Alumine	16
Barytes	18
Water	15
	98

Dipyre, Haüy; *Schmelzſtein*, Werner.—Its colours are, light pearl-grey, greyiſh-white, or reddiſh-white. It occurs maſſive and cryſtallized, in aggregated, ſlender, octahedral, acicular priſms. The ſtructure is lamellar, with joints parallel to the ſides, and to the diagonal of a rectangular priſm. The luſtre is intermediate, between vitreous and pearly: it is tranſlucent. This mineral is ſufficiently hard to ſcratch glaſs; but is very frangible. The ſpecific gravity

vity is 2.630. Before the blow-pipe it intumesces, and melts with great eafe, giving out at the fame time a phosphoric light from this double effect of heat upon it. Haüy gave it the name of *dipyre*, on account of its eafy fufibility: it was called *fchmelzftein* by Werner. Its conftituent parts are,

Silex	60
Alumine	24
Lime	10
Water	2
	96

It is faid by Brongniart to occur in fteatite, along with iron pyrites, near Mauleon, in the Weftern Pyrenées.

The other members of the zeolite family are defcribed in the preceding volumes. See NATROLITE and WAVELLITE.

ZEOPHILOS, a word ufed by Quercetan as the name of an antimonial medicine.

ZEOPHYRUM, in the *Materia Medica*, the name of the *triticum æftivum*, or *hordeum nudum*, as it is called by fome authors, the naked barley.

ZEPHANIAH, a canonical book of the Old Teftament, containing the predictions of Zephaniah, the fon of Cufhi, and grandfon of Gedaliah; being the ninth of the twelve leffer prophets. He prophefied in the time of king Jofiah, a little after the captivity of the ten tribes, and before that of Judah; fo that he was contemporary with Jeremiah. He prophefies chiefly againft Judah, who continued very corrupt, notwithftanding the king's pious zeal for reformation, and the good example he gave to his fubjects.

ZEPHAT, in *Ancient Geography*. See SEPHAAT.

ZEPHIRA, in *Geography*, a fmall ifland in the Grecian Archipelago, near the N. coaft of Antiparos.

ZEPHIRE, in *Ancient Geography*, an ifland fituated on the coaft of that of Crete, before the promontory Samonium. Mela.

ZEPHRON, or ZEPHRONIA. See ZIPHRON.

ZEPHYRI FŒTUS, a term ufed by Hartman, and fome other writers, to exprefs a mole, or falfe conception.

ZEPHYRINUS, *Pope*, in *Biography*, fucceeded Victor in the Roman fee in the year 201. A perfecution at the commencement of his papacy obliged him to conceal himfelf, and when he was at liberty to exercife his functions, he was engaged in the fuppreffion of prevalent herefies, which difturbed the latter years of his pontificate. He died in the year 218 or 219. Bower.

ZEPHYRIUM, in *Ancient Geography*, a promontory of Afia, on the confines of Cilicia Propria. According to Strabo and Ptolemy, this promontory and that of Sarpedon formed the mouth of the river Calycadnus.—Alfo, a town at the extremity of this promontory.—Alfo, a promontory of the ifle of Cyprus, towards the S.W., at the extremity of a peninfula, which on the W. inclofes the gulf, at the bottom of which was Paphos.—Alfo, a promontory of Italy, on the eaftern coaft of Brutium, between the promontory of Hercules and the town of the Locri. Strabo.—Alfo, a promontory of Africa, in the Cyrenaica, upon the coaft of the Pentapolis. Ptolemy. Strabo diftinguifhes two promontories of this name on the coaft of Cyrenaica.—Alfo, a town of Afia, on the coaft of Paphlagonia.—Alfo, a town of Afia, in the interior of Cappadocian Pontus. Arrian gives it a port, and ftates it to be 120 ftadia from the ifle of Arrenthias, and 90 ftadia from the town of Tripolis.—Alfo, a promontory on the coaft of Egypt, between Campé and Alexandria, where was a chapel of Venus Arfinoe, and hence fhe took the name of Zephiritis.—Alfo, a promontory of Afia Minor, on the coaft of Caria, in the vicinity of the town of Myndus. Strabo.—Alfo, a town of the Tauric Cherfonefus; fituated on the fea-coaft, N.E. of Theodofia. Pliny.—Alfo, a promontory on the eaftern coaft of the ifle of Crete.

ZEPHYRIUM *Jugum*, a facred mountain of Hifpania, upon which was a fortrefs.

ZEPHYRUS, or ZEPHYR, Ζέφυρος, the weft wind; a wind blowing from that cardinal point of the horizon oppofite to the eaft.

The poets perfonify it, and reprefent Zephyrus as the mildeft and moft gentle of all the deities of the woods: the character of his perfonage is youth and gentlenefs.

It is alfo called *Favonius*, and *occidens*; and, by many, has been confounded with the *Africus*. See WIND.

ZEPS, in *Geography*, a town of the duchy of Warfaw; 20 miles E. of Wladiflaw.

ZERA, a town of Italy, in the Veronefe; 7 miles S. of Verona.

ZERANIA REGIO, in *Ancient Geography*, a country of Thrace. Steph. Byz.

ZERBITA, in *Geography*, a town of South America, in the government of New Grenada; 30 miles W.S.W. of Pamplona.

ZERBST, a town of Germany, in the principality of Anhalt Zerbft. It is the refidence of the prince, and the largeft and handfomeft town in the whole principality of Anhalt. The refidence-houfe here is remarkably grand. In the town are two Lutheran churches, one of which is ufed by the Calvinifts, together with an univerfity, common to all the princes of Anhalt, and founded in 1582, out of a fchool: it has a rector, with three Calvinift and one Lutheran profeffors. The principal trade is in beer, with manufactures of gold and filver; 8 miles N.N.W. of Deffau. N. lat. 52° 3′. E. long. 12° 10′.

ZERDA, in *Zoology*, a name given by the Moors to an animal which inhabits the defert of Sahara, extending beyond mount Atlas.

This is the *canis cerdo* of Linnæus, with a ftraight tail, a palifh or yellowifh-white body, with prolonged upright ears, internally rofe-coloured. It is the fennec of Bruce, and a beautiful African and Afiatic animal, and is principally found in Arabia.

Pennant claffes it under the genus of dog; and defcribes it as having a pointed vifage, long whifkers, large bright black eyes, very large ears of a bright rofe colour, internally lined with long hairs, and orifice fo fmall, as not to be vifible, probably covered with a valve or membrane; legs and feet like thofe of a dog, and taper tail; its colour is between a ftraw and pale brown; its length from nofe to tail ten inches, its ears three inches and a half long, tail fix, and height not five. It burrows in the fandy ground, and is fo exceffively fwift, that it is very rarely taken alive; feeds on infects, efpecially locufts; fits on its rump; is very vigilant; barking like a dog, but with a fhriller found, and chiefly in the night; and is never obferved to be fportive.

M. Buffon fays of this animal, that it is found to the fouth of the Palus Tritonides, in Lybia; that it has fomething of the nature of the hare, and fomething of the fquirrel; and that it lives on the palm-trees, and feeds on the fruits: hence probably it derives its name fennec from φοινιξ, a palm-leaf. Bruce's Travels, vol. v.

ZERDUSHT, in *Biography*. See ZOROASTER.

ZEREA, in *Geography*, a town and fortress of Persia, in Farsistan: this town was taken by the troops of Timur Bec, with great slaughter; 18 miles N.N.E. of Schiras.

ZEREB, a town of Persia, in the province of Segestan; 130 miles N.W. of Zarang.

ZEREWICA, a town of Lithuania; 5 miles S.W. of Slonim.

ZERIB, a town of Kurdistan; 25 miles W. of Gulamerik.

ZERICHUM, a name given by some of the chemical writers to arsenic.

ZERKI, in *Geography*, a town of Kurdistan; 30 miles S.W. of Betlis.

ZERKWITZ, a town of Lusatia; 2 miles W. of Lubbenau.

ZERMA. See SURMA.

ZERMAGNA, a river of Dalmatia, which runs into the Adriatic, opposite Pago.

ZERMONY, a town of Lithuania; 10 miles N.W. of Lida.

ZERNA, a mountain of Carinthia; 3 miles N.W. of Milstatt.

ZERNA, a word used by some of the chemical writers to express an ulcerated lepra or impetigo. The chemical authors use it also as a name for the foulnesses which they call the *lepræ metallorum*, or leprosies of metals.

ZERNEMBL, or TSCHERNEMBL, in *Geography*, a town of the duchy of Carniola, on a small river which runs into the Kulpa; 4 miles S.S.W. of Rudolfswerth. N. lat. 45° 50′. E. long. 15° 5′.

ZERNENSIUM COLONIA, in *Ancient Geography*, a colony of Dacia, founded by Trajan.

ZERNETZ, in *Geography*, a town of Switzerland, in the Upper Engadine. In the late war it was taken by the French, and soon after retaken by the Austrians; 8 miles N. of Zultz.

ZERNITZ. See CZERNETZ.

ZERO, a river of Italy, which runs into the sea, 7 miles N. of Venice.

ZERO, denotes the point from which the scale of a thermometer is graduated. Thus Celsius's and Reaumur's thermometers have their zero at the freezing-point, while the thermometer of Fahrenheit has its zero at that point at which it stands when immersed in a mixture of snow and common salt. In Wedgwood's pyrometer, the zero corresponds with 1077° of Fahrenheit's, each degree of which is equal to 130° of Fahrenheit. Consequently 180° Fahr. = 100° Cels. = 80° Reaum. = 150° De Lisle = $\frac{1}{13}$ Wedgw. See THERMOMETER.

ZEROGERE, in *Ancient Geography*, a town of India, on this side of the Ganges, E. of the river Namadus. Ptolemy.

ZEROWITZ, in *Geography*, a town of Bohemia, in the circle of Bechin; 3 miles W.S.W. of Potschaken.

ZERREH, or ZURRAH, *Lake of*, a lake of Persia, in the province of Seistan or Segestan, into which the river Heermund, or *Hindmund*, (the ancient Etymander,) navigable for boats from Bost to Zarang, flows through the centre of it, from the mountains of Huzara, beyond Cabul. This lake is said to be 30 fursungs in length, and 6 in breadth, or about 100 miles long, and 20 broad at the widest part. It is principally formed by the waters of the rivers Heermund and Ferrah, and in the dry season resembles more a marsh than a lake, being covered with rushes and reeds. In the middle the water is fresh; but brackish towards the shore, as the sandy plains which surround it are impregnated with salt. The lake is full of fish and wild fowl; and in its centre there is a fortified town, called "Kookhozerd," built on a high island, where the treasure of the principal families of Seistan used to be deposited when the province was invaded. It is said that on the borders of this lake is a town named "Nassarabad," which is described as being four days' journey for a loaded camel, W. of the city of Dooshak, the present capital of the province.

ZERTA, or SERTA, the *Zerte*, or *Serte*, in *Ichthyology*, a fish caught in the rivers of Italy, and some other places, of the figure of the chub, and called by authors *capito anadromus*, and the *blike*. It seldom grows to more than ten pounds weight, and at times lives in rivers, at times in the sea; and is esteemed a very well tasted fish, especially a little before the season of its spawning, either fresh, salted, or prepared in various ways by pickling, &c.

The zerte is that species of cyprinus described by Gesner and others under the name of *capito anadromus*. See CYPRINUS *Vimba*.

This is the silvery-blueish carp, olivaceous above, with the dorsal, caudal, and anal fin blueish, the rest reddish, and the nose protuberant. It is a native of Germany, Russia, Sweden, and other parts of Europe, inhabiting rivers, and migrating into the Baltic sea.

ZERVINKA, in *Geography*, a town of Servia, on the Danube; 10 miles N.W. of Belgrade.

ZERUIS, in *Ancient Geography*, a town of Thrace, on the route from Dyrrachium to Bysance, between Dymæ and Plotinopolis. Anton. Itin.

ZERUMBET, in *Botany*, a name first used by Serapio, and apparently either of Arabian or Indian origin. It belongs to one of the aromatic roots of the natural order of *Scitamineæ*, the produce of the East Indies, but rather to a *Kæmpferia*, than to the species of Ginger to which Linnæus has applied it. (See ZINGIBER.) Dale has very justly observed on this subject, *Pharmacologia*, 275, that in the present instance, as well as innumerable others, the Arabian writers are so brief, as well as vague, in their descriptions, and so contradictory amongst themselves, that we can scarcely tell whether they were acquainted with any particular object or not.

Wendland, Jacquin, and Poiret, (Lamarck Dict. v. 8. 857,) have most unaccountably made a genus of *Alpinia nutans*, and called it *Zerumbet;* but this cannot on any principle be maintained.

ZERYNTHUS, in *Ancient Geography*, a town of Thrace, which had a cavern of the same name, and which the ancients called Zerynthium Antrum. This cavern was consecrated to Hecate, to whom they sacrificed dogs. Suidas.

ZERZEN, in *Geography*, a town of Arabia, in Yemen; 36 miles S.E. of Ghezar.

ZESEMITZ, a town of Bohemia, in the circle of Chrudim; 8 miles N. of Chrudim.

ZESSEL, a town of Silesia, in the principality of Oels; 5 miles N.E. of Oels.

ZEST, the woody thick skin quartering the kernel of a walnut. Some physicians prescribe this zest, dried, and taken with white wine, as a remedy against the gravel.

The word is also used for a chip of orange or lemon-peel; such as is usually squeezed into ale, wine, &c. to give it a flavour; or for the fine thin oil that spurts out of that peel on squeezing it.

Hence, to zest an orange or lemon, among confectioners, is to cut the peel from top to bottom into small slips, as thin as possible; or, to zest, is to squeeze the peel over the surface of any thing.

ZESTO-

ZESTOLUSIA, a term ufed by fome medical authors to exprefs bathing in warm water, by way of diftinction from *pfuchrolufia*, or bathing in cold water.

ZETA, or ZETECULA, a little clofet, or withdrawing chamber, with pipes running along the walls, to receive from below either the cool air, or the fteam of warm water.

The word is formed either from ζεειν, *to be warm*; or of ζην, *vivere, to live*, on account of the ufe made hereof for love and enjoyment.

ZETA, or *Zetta*, (*Menzil*,) in *Ancient Geography*, a town of Africa Propria, fituated near the fea, E. of Vicus Augufti.

ZETETÆ, Ζητηται, among the Athenians, were officers appointed upon extraordinary occafions, to inquire after the public debts, when, through the neglect of the receivers, or by other means, they were run up to large fums, and began to be in danger to be loft, if not called in.

ZETETICE, Ζητητικς, formed from ζητεω, *I feek*, or zetetic method, in *Mathematics*, the method made ufe of to inveftigate or find the folution of a problem.

The ancient Pyrrhonians were fometimes called *Zetetici*, q. d. *feekers*.

ZETIN, in *Geography*, a town of Croatia; 28 miles W.N.W. of Novi.

ZETLAND, or SHETLAND, the name of a clufter of iflands, fituated in the Northern ocean, between the 59th and 62d degrees of N. latitude, and a very little to the W. of the meridian of London. The moft fouthern part is nearly 100 miles N.N.E. from the northern county of Scotland. Thefe iflands exceed one hundred in number, of which only thirty-four are inhabited; the others, confifting chiefly of rocks and fands, are unfitted for human fupport. By different writers, they have been named Hethland, Hialtland, Zetland, Schetland, and Shetland; which names, Dr. Edmondfton fays, "are of Norwegian origin, and are fuppofed to be defcriptive of their form or appearance." The moft correct and approved orthography is that of Zetland. The general appearance of thefe iflands is bleak, bare, and rocky; but fome interior parts of the main-land are cultivated, clothed, and cheerful. In many places on the coafts, rocks of immenfe fize are feen to rife above the foaming waves, fome of which are at confiderable diftance from the fhores. Some of thefe are alfo perforated by vaft natural arches; in other parts there are deep caverns and fubterranean receffes. Two of thefe are called the Seranda, one of which extends above 300 feet in depth. Almoft all the large iflands are deeply interfected by tortuous bays, or voes, as they are provincially called, which afford facilities for internal communication, and excellent harbours for veffels. Several of them are commodious, and well fheltered from dangerous winds. Some of the iflands have lakes, the largeft of which is not more than two miles in length. The higheft hill is Mons Ronaldi, in the parifh of Northmaven; the height of which, from barometical meafurement, is 3944 feet above the level of the fea. Some of the headlands are lofty and grand, one of which, Nofs-head, is above 600 feet in height.

According to the population reports of 1811, the following is the enumeration of houfes and inhabitants, and the names and number of parifhes. The total number of houfes 8230, inhabited by 9038 families, 16 houfes building, and 101 unoccupied. The whole population was 46,153, confifting of 20,151 males and 26,002 females. The parifhes are, 1. Aithfting and Sandfting; 2. Breffay, Burra, and Quarff; 3. Delting; 4. Dunroffnefs, Sandwick, Cunnifbrough, and Faria ifle; 5. Lerwick and Gulberwick; 6. Lunnafting, Nefting, Skerries, and Whalfay; 7. Northmavine; 8. Tingwall, Whitenefs, and Weifdale; 9. Unft; 10. Walls, Sandnefs, Papa, and Fonta; 11. Yell (North) and Fellar; 12. Yell (South and Middle).

As the chief hiftories and topographical peculiarities of the Zetland iflands have been fully detailed under the words MAINLAND, LERWICK, and SCALLAWAY, the reader is referred to each word refpectively.—A View of the ancient and prefent State of the Zetland Iflands, by A. Edmondfton, M.D. 2 vols. 8vo. 1809.

ZETLAND *Iflands*, *Fowla* or *Fula*, the moft weftern of the Shetland iflands, and is fuppofed to be the "Ultima Thule" of the ancients. It is about three miles long and one and a half broad, nearly twenty miles diftant from any land, W. of the clufters of Orkney and Shetland, to which it is politically annexed: it affords excellent and extenfive pafture for fheep; and is inhabited by 26 or 27 families.

ZETTERITZ, a town of the principality of Culmbach; 11 miles S.W. of Culmbach.

ZETUS, a word ufed by fome of the chemical writers as a name for vitriol.

ZEVACO, in *Geography*, a fmall ifland in the Pacific ocean, near the coaft of Veragua. N. lat. 8°. W. long. 81° 46′.

ZEVEN. See CLOSTER *Seven*.

ZEVENAER. See SEVENAER.

ZEUF, or GAER, a town of the kingdom of Balk; 100 miles S.E. of Balk.

ZEUGITÆ, Ζευγιται, among the Athenians, the third clafs of the people, or thofe who had an eftate of two hundred medimni.

ZEUGITES, in *Botany*, an ancient name, adopted by Browne, but no otherwife applicable to the prefent genus, than as far as concerns its reedy habit. The *Zeugites* of Pliny was a large Bœotian reed, fo called from ζυγος, *a yoke*, becaufe it was bound together, in portions of different lengths, to make the paftoral pipes; as wheaten ftraws are, by our fhepherd's boys, to this day; but the Weft Indian grafs, of which we are now to give an account, has not even this coincidence with the original.—Browne Jam. 341. Schreb. Gen. 810. Willd. Sp. Pl. v. 4. 204.—Clafs and order, *Monoecia Triandria.* (Rather *Triandria Digynia.*) Nat. Ord. *Gramina*, Linn. Juff.

Gen. Ch. *Common Calyx* a glume of two valves; the outer one broadeft, concave, abrupt and jagged, ribbed; membranous at the edges; the inner narrower, fharper and keeled. *Male Florets* two, fmalleft, on a common ftalk the length of the folitary female floret, within the common calyx. *Perianth* none. *Cor.* Glume of two ovate-oblong, compreffed, bluntifh, awnlefs, equal valves. *Stam.* Filaments three, capillary, the length of the corolla; anthers oblong, cloven at each end.

Female within the larger glume of the common calyx, feffile. *Perianth* none. *Cor.* Glume of one oblong concave valve, twice the fize of the calyx, bordered towards the top with a dilated membrane, awned; the awn terminal, capillary, ftraight, half as long again as the glume. *Pift.* Germen oblong; ftyle divided; ftigmas long, fhaggy. *Peric.* none. *Seed* folitary, oblong.

Obf. Schreber remarks, that this grafs differs fo entirely, in every character, from *Apluda*, with which Linnæus combines it, that they are totally irreconcileable. We fhould refer both, with all other true *Gramina*, as in *Fl. Brit.* to the clafs *Triandria*.

Eff. Ch. Common Calyx of two valves, with three flowers; the female one feffile; the males ftalked. Corolla of of the males of two beardlefs valves; of the female of one awned valve. Style divided. Seed oblong.

1. Z. *americanus.* Jamaica Yoke-grafs. Willd. n. 1. (Z. arundinaceus, ramofus, minor, rufefcens; paniculâ fparfâ terminali; Browne Jam. 341. t. 4. f. 3. Apluda Zeugites; Linn. Sp. Pl. 1487. Amœn. Acad. v. 5. (not 6), 412. Swartz Obf. 384.)—Native of Jamaica. Found by Dr. Browne at Cold-fpring, in the mountains of New Liguanea, in a rich foil, and fhady fituation. His original fpecimens are in the Linnæan herbarium. The *root* is faid to be perennial. *Stem* two feet high, much branched, afcending, round, jointed, polifhed, brownifh, leafy, rather flender. *Leaves* alternate, on flender ftalks, each with a long fheathing bafe, reclinate, or nearly pendulous, ovate, acute, entire, fmooth, many-ribbed, from an inch to an inch and a half long, and from half an inch to an inch broad. *Panicles* terminal, from the fheaths of the uppermoft leaves, compound, fpreading, with fmooth flender branches. *Glumes* green, ftriated, fmooth. The habit is no lefs foreign to the genus *Apluda* than the generic characters.

ZEUGMA, Ζευγμα, literally denoting a joining together; from ζευγνυω, *I join*, a figure in *Grammar*, whereby an adjective, or verb, which agrees with a nearer word, is alfo, by way of fupplement, referred to another more remote.

Thus Terence, "Utinam aut hic furdus, aut hæc muta facta fit." So Virgil, "Hic illius arma, hic currus fuit." In which cafes, the words *facta fit* agreeing primarily with *hæc muta*, are alfo made to agree or extend to *hic furdus:* and the verb *fuit* is not only referred to *hic currus*, which it properly refpects, but farther to *hic illius arma*.

Of this fpecies of ellipfis, which differs from the ellipfis properly fo called, in that the word which is to be underftood once or oftener, has been already mentioned, Meffieurs De Port Royal enumerate three forts; *viz.* when we repeat the noun or verb in the fame manner it has been already expreffed; or when the word expreffed cannot be repeated without receiving fome alteration in gender, cafe, number, or perfon; or when, after a word which includes the whole, a diftribution of the parts is made without repeating the verb. Latin Gram. vol. ii. p. 183.

The Latins, it may be here obferved, take a liberty in conftructions, which fome of the nicer critics among the moderns, particularly the French, will not allow in the modern tongues.

Zeugma, (*Roum-Kala*,) in *Ancient Geography*, a town of Afia, or a place on the right bank of the Euphrates, S.E. of Samofata, and over-againft Apamea.

ZEVICO, in *Geography*, a town of Spain, in the province of Leon; 10 miles S.E. of Palencia.

ZEVIO, a town of Italy, in the Veronefe; 10 miles S.S.E. of Verona.

ZEVKETI, a town of the principality of Guriel; 25 miles S.E. of Puti.

ZEULEN, a town of Bavaria, in the bifhopric of Bamberg, on the Rotach; 21 miles N.N.E. of Bamberg. N. lat. 50° 13′. E. long. 11° 16′.

ZEULENRODA, a town of Saxony, in the county of Reuffen, containing two churches and 350 houfes. Here is a manufacture of ftuffs, and a confiderable one of ftockings; 10 miles W. of Greitz. N. lat. 50° 36′. E. long. 11° 51′.

ZEUS, in *Ichthyology*, a genus of fifh, of the order of the *thoracici;* the characters of which are, that the head is compreffed and declining; the upper lip is arched by means of a tranfverfe membrane; the tongue is awl-fhaped; the branchioftegous membrane has feven perpendicular rays, the loweft placed tranfverfely; the dorfal fins, in moft fpecies, furnifhed with projecting filiform rays; and the body is compreffed, broad, thin, and of a bright colour. The fpecies enumerated by Gmelin and Shaw are the following:

Vomer. Silvery dory, with the fecond ray of the dorfal fin very long. Bloch. (See Vomer.) Its fhape is rhomboidal, length fix or eight, or more, inches, body thin, without fcales, tinged on the upper parts with a blueifh caft, mouth with fmall teeth. Native of the American feas, and fometimes feen in thofe of the north of Europe: eatable, but not much efteemed.

Gallus. Silvery dory, with the tenth ray of the dorfal and fecond of the anal fin longer than the body. Shape and length, and body, like thofe of the former; back tinged with a greenifh hue, head large, mouth wide. Native of the American and Indian feas, efculent: when firft taken grunting, like the gurnards. The abacatuaja of Marcgrave.

Faber. Gold-green, fuliginous dory, with a dufky central fpot on each fide of the body, or with a rounded tail, brown fpot on the middle of the fides and two anal fins. Linnæus. This is the common dory (fee Doree), which is a native of the Mediterranean, Northern, and Atlantic feas. Its head is large and long; length generally twelve or fifteen inches, and weight ten or twelve pounds; mouth wide, lower jaw longer than the upper, teeth fmall and fharp, eyes large, body covered with fmall fcales, and marked by a curved lateral line, which defcending pretty fuddenly from the gill-covers, paffes on to the tail; back arched, and furnifhed with a row of ftrong, fmall prickles, continued along the curve of the abdomen; two very ftrong and fharp fpines at the bafe of the pectoral fins. The introduction of this fifh, as excellent food, to the tables of the higher ranks, is of no remote date; Mr. Quin being confidered as the founder of its peculiar reputation in the polite circles. This fifh is of a very voracious nature, preying on fmaller fifhes and their fpawn, as well as various kinds of fea-infects, the fmaller fhell-fifh, &c. It emits a noife like that of the gurnards and fcorpænas, when firft taken, by violently forcing out the air from its gill-covers.

Aper. Reddifh dory, with rough fcales and even tail; a fmall fpecies about three inches long, refembling the common dory in habit; fnout protuberant, and turning upwards; no perceptible teeth; eyes large, with white irides; two dorfal fins, the anterior having nine ftrong and fharp fpines, the firft low and fcarcely vifible, the fecond four times longer, and the third very long and thick; the fecond dorfal fin confifting of twenty-three foft rays; the vent-fin having twenty-fix rays, the pectoral fins about fourteen, and the ventral fix. This fifh generally refides at the bottom, and is accidentally taken after great ftorms: it is not eatable, being fmall, coarfe, and of an unpleafant odour. It is a native of the Mediterranean.

Insidiator. Silvery dory, with fides fpeckled with black, and narrow extenfile mouth; fhape rhomboidal; fmaller than Z. ciliaris; colour bright-filvery, blueifh-green above, and fpeckled with black points; body without fcales; lower lip retractile, and mouth capable of forming a tubular fnout, for ejaculating a drop of water againft fuch infects as happen to alight on or fly about the aquatic plants near the fhores of the waters it inhabits, and thus obtain its prey. A native of the rivers and frefh-waters of India.

Ciliaris. Silvery dory, with fome of the rays in the dorfal and anal fin exceffively long; body rhomboidal, thin, without fcales, and of a bright-filver colour, with a blueifh or or greenifh caft on the back, and fmall and floping; lower jaw longer than the upper; teeth fmall and fharp; feveral of the laft rays of the dorfal and anal fin extending farther than the tail itfelf, the long and flexible filaments of which count de Cepede imagines attract fmall fifhes, which miftake them for worms, the dory himfelf lying concealed among fea-weeds, &c. and waiting for its prey: the count alfo conceives that thefe may ferve to fuftain the fifh by coiling round the ftems of fea-plants, &c. A native of the Indian feas; but not efteemed as food, being fmall and coarfe.

Luna or Opah. Dory with fomewhat lunated tail; the body being generally either red, green, or purple, with oval white fpots. This is a fuperb fpecies, and found, probably wandering from the warmer regions, in the Mediterranean and Northern feas, the largeft fpecies of the kind, being between four and five feet in length, in colour varying from a bright filvery-green ground to a bright gold colour, and variegated on the fides with pretty numerous and moderately large oval white fpots, while the fins and tail are bright fcarlet; the fkin feemingly deftitute of fcales and perfectly fmooth.

Specimens of this fifh have been occafionally thrown on the Britifh coafts, one of which is defcribed under the article Opah. A dried fpecimen of this fifh may be feen in the Britifh Mufeum.

Quadratus. Grey dory, with tranfverfe dufky or a cinereous body, and even tail. This fifh, found in the fea that wafhes the coaft of Jamaica, is defcribed by fir Hans Sloane, as five inches long and four broad in the middle, narrowing from thence gradually to the head and tail; mouth fmall, but with rows of fmall, fharp teeth; tongue round and cartilaginous; pupil large and black, in a white circle; feven fins; tail almoft fquare; whole body clothed with grey or afh-coloured fcales, having three or four tranfverfe black lines; with a very crooked line from head to tail.

Zeus, a fpecies of fcorpæna. See Scorpæna Porcus.

ZEUXIS, in *Biography*, a celebrated ancient painter, who is faid to have been a native of Heraclea, either in Greece or Magna Græcia, and to have commenced the practice of his art in the fourth year of the 95th Olympiad, B.C. 397. According to Quintilian, he is the firft artift who underftood the proper management of lights and fhades, and to have excelled in colouring; but ambitious of imitating the ftrength and grandeur of Homer's manner, he is charged with giving unfuitable bulk to the heads and maffivenefs to the limbs of his figures. Notwithftanding thefe alleged imperfections, he attained diftinguifhed excellence; and in the profecution of it he was attentive even to the minuteft circumftance. Many inftances occur in his hiftory to this purpofe. In his picture of Helen, executed for the Crotonians, as an ornament for their temple of Juno, he determined to combine every quality that might conftitute a perfect beauty; and with this view he felected five of the handfomeft females of Crotona, and transferred to his picture, from their naked charms, an affemblage of all that were moft perfect in their kind. This figure has been extolled as the fineft fpecimen of art exifting; and under it the painter, not unconfcious of his merit, infcribed the lines of Homer, in which Priam expreffes his admiration of the beauty of the real Helen. Every one who faw it, before it was placed in the temple, paid the painter a fee, which, added to the liberal recompence of the Crotonians, amply repaid him for his fkill and labour. This enabled him to gratify his vanity by making prefents of his pictures, for which no adequate price could be given. To fuch a degree was he enriched by his art, that he was able to indulge his vanity by appearing at the Olympic games with his name embroidered in golden letters upon his mantle. Such were the failings of a man, who rendered his name illuftrious by the fupereminent exercife of his art. Among his moft famous performances are enumerated a Jupiter on his throne, with the other gods ftanding round;—a Hercules in his cradle, ftrangling the ferpents, Alcmena and Amphitryon witneffing the exploit with terror;—a Penelope, with an expreffion conformable to her character;—a Cupid crowned with rofes, for the temple of Venus at Athens;—a Marfyas bound, afterwards placed in the temple of Concord at Rome;—and a group of Centaurs. The time of his death is not known; but as to the manner of it, the following whimfical anecdote is recorded: after having painted an old woman, whilft he was attentively furveying it, he was feized with fuch a violent fit of laughter, that he died on the fpot. Pliny Hift. Nat. Gen. Biog.

ZEYA, in *Geography*, a river of Auftria, which rifes near Ernfprung, and runs into the Marfch, 6 miles E. of Zifterfdorf.

ZEYL. See Zeil.

ZEYLAND, a fmall ifland near the coaft of Lapland. N. lat. 70° 10′.

ZEYRING, a town of the duchy of Stiria; 6 miles N.W. of Judenburg.

ZEZARE, a river of Portugal, which rifes in the eaft part of Eftremadura, and runs into the Tagus, at Tancos.

ZEZARINE, or Kierazin, a fmall ifland in the Perfian gulf, hardly half a mile in length. N. lat. 28° 8′.

ZFOKEN, a town of Saxony, in the circle of Erzgebirg; 8 miles N.W. of Grunhayn.

ZHA, a river of Africa, which forms the eaft boundary of Fez, and runs into the Mullooiah.

ZHEHOL, Zheho, or *Geho*, a town of Chinefe Tartary, in the country of the Mandfhars, not far beyond the great wall, and fummer refidence of the emperor of China; 120 miles N.E. of Peking.

ZIA, an ifland in the Grecian Archipelago, anciently called "Ceos" and "Hydraffa," about 16 leagues in circumference. The inhabitants are Greeks, who have a bifhop. The foil is fertile, and they have a good breed of cattle, with plenty of wild fowl, efpecially partridges and pigeons. The chief manufactures are, filk, camlets, and a fort of cloaks made of goats' hair. Among the productions of the ifland may be reckoned the velani, a fpecies of acorn much efteemed. Of four confiderable towns or cities in this ifland, the only one at prefent remaining is Carthea, or Zeia, containing about 2500 houfes, with a harbour capable of receiving veffels of confiderable burden, and where a whole fleet may ride in fecurity from every gale, in every depth of water, and in very good anchoring ground. The entrance into this creek or arm of the fea is very fafe by keeping it, according to the fea-phrafe, open; but when once within it, fhips of whatever burden may ride where they pleafe to an anchor; 10 miles E. of Cape Colonni. N. lat. 37° 30′. E. long. 24° 24′.

Zia, *Ziba*, or *Siba*, in *Ancient Geography*, a city beyond Jordan; 5 miles W. from Philadelphia.

ZIATEK, in *Geography*. See Saatz.

ZIB. See Zeb.

ZIBA, a town of Arabia, in the province of Hedsjas; 20 miles S.S.W. of Madian.

ZIBATSKOI, a fort of Ruffia, in the government of Kolivan, on the Irtifch. N. lat. 54° 44′. E. long. 92° 20′.

ZIBEL-

ZIBELLINA. See Mustela *Zibellina*, and Sable.

ZIBER, in *Geography*, a town of European Turkey, in Bulgaria, on the Danube; 24 miles S.S.E of Viddin.

ZIBET, or Zibethi. See Zebid.

ZIBETHA, in *Zoology*. See Viverra *Zibetha*.

ZIBETHUM, or Zibeta, in *Natural Hiſtory*, *civet*, a perfume contained in a bladder, in the groin of a civet-cat. See Civet.

ZIBIBIÆ, a name given by ſome authors to a large ſort of raiſins, reſembling the ſtones of dates in ſhape; they have much pulp, but very little moiſture.

ZIBREIRA, in *Geography*, a town of Portugal, in the province of Beira; 30 miles S. of Alfayates.

ZIBRITZ, a river of European Turkey, which runs into the Danube, near Ziber, in Bulgaria.

ZIBU. See Sibu.

ZICCARA, a name of an Indian fruit, reſembling a pine-cone, and containing twenty, thirty, or more kernels, of no known uſe in medicine.

ZICHIANS, in *Geography*, one of the tribes of mount Caucaſus, collaterally related to the Tſcherkeſſians or Circaſſians. The Zichians or Tſchekians, called by the Ruſſians Yaſi, are the principal inhabitants of the iſle of Taman. They formerly paid a ſmall tribute to the Krimean khan; in all other reſpects they are governed by their own beys. The iſle Atſchuk or Atſchuyef is likewiſe inhabited by Zichians. The Auchaſſians and Zichians are two tribes, which, properly ſpeaking, are only one collateral branch of the Tſcherkeſſians, have belonged to the Ruſſian empire, as inhabitants of the Kuban, ſince the year 1783. See Circassia.

ZICKAR, a mountain of Algiers, anciently called "Garaphi;" 18 miles S. of Sherſhell.

ZIDDIM, or Assedim, in *Ancient Geography*, a city of Naphtali. Joſh. xix. 35.

ZIDRACH, in *Natural Hiſtory*, the name given by Cuba, and ſome other authors, to that ſpecies of the ſyngnathus of Artedi, commonly called the hippocampus.

ZIECKRA, in *Geography*, a town of Saxony, in the circle of Neuſtadt; 4 miles S. of Auma.

ZIEGELBACH, a river of Germany, which runs into the Rhine, near Gernſheim.

ZIEGENBALG, Bartholomew, in *Biography*, a Lutheran German divine, was born in 1683 at Pulnitz, in Upper Luſatia, and finiſhed his education in the univerſity of Halle. In 1705 he was ordained at Copenhagen, with a view of being ſent as a miſſionary by Frederick IV. king of Denmark to India. In 1706 he arrived at Tranquebar, but he was there oppoſed and impriſoned, ſo that he reſolved, upon his releaſe, to return to Europe. In 1715 he landed at Bergen in Norway, and after having viſited Copenhagen, in order to give an account of his miſſion, and to receive further inſtructions, he travelled through Germany and Holland into England, and from thence to India in March 1716. On his return to Tranquebar, he eſtabliſhed a Portugueſe and Malabar printing-houſe, in which many of his own works were printed. In the faithful and laborious diſcharge of his miſſionary duty he employed 13 years, at the cloſe of which period his life terminated by a diſorder probably owing to his intenſe application. This event happened in February 1719, in the 36th year of his age. His works were numerous, and of theſe the principal are mentioned in the Gen. Biog.

ZIEGENFELD, in *Geography*, a town of Bavaria, in the biſhopric of Bamberg; 12 miles N.E. of Bamberg.

ZIEGENHALS, a town of Sileſia, in the principality of Neiſſe: this place is famous for its manufactures of beautiful glaſſes. Here are ſome iron-works; 10 miles S. of Neiſſe. N. lat. 50° 12′. E. long. 17° 17′.

ZIEGENHAYN, a town of Germany, and chief place of a county of the ſame name, in the principality of Heſſe. It is ſituated in a moraſs, and can be occaſionally inundated. In this place were kept the archives of the ſovereign families of Heſſe. The counts of Ziegenhayn are extinct; 15 miles S. of Fritzlar. N. lat. 50° 50′. E. long. 9° 15′.

ZIEGENRUCK, a town of Saxony, in the circle of Neuſtadt, on the Saal; 10 miles S. of Neuſtadt. N. lat. 50° 32′. E. long. 11° 42′.

ZIEGLER, James, in *Biography*, a learned writer of the 16th century, was born at Landſhut in Bavaria, and having ſtudied in the univerſity of Ingolſtadt, finiſhed his education by viſiting the libraries of foreign countries, and cultivating the ſociety of learned men. He reſided ſeveral years at Rome, collecting in the hiſtory of Leo X. and Clement VII. every anecdote that tended to the diſcredit of the papal court; and in his conferences with learned Swedes, materials for a correct hiſtory of Scandinavia, and of the cruelties committed by Chriſtian II. of Denmark. It appears that, beſides ſome other poſts which he occupied, he was for ſome time profeſſor at Ingolſtadt, and, as ſome ſay, of mathematics at Upſal. He was for a conſiderable time a teacher at Vienna, from whence, for fear of the Turks, he retired to Wolfgang, biſhop of Paſſau in Bavaria, under whoſe protection he compoſed ſome of his works; and he died at Paſſau in 1549. The earlieſt of his publications, whilſt he was a Catholic, was written againſt the Waldenſes, and printed at Leipſic in 1512. His other works are multifarious, conſiſting of geographical, hiſtorical, political, mathematical, and controverſial tracts, abounding with literary reſearches. Although he did not openly renounce the Roman Catholic religion, he favoured the cauſe of Luther and the reformers. Thuan. Hiſt. Moreri. Gen. Biog.

ZIELENZIG, in *Geography*, a town of the New Mark of Brandenburg. This town belonged in a conſiderable degree to the knights of Malta; 18 miles S.E. of Cuſtrin. N. lat. 52° 30′. E. long. 15° 16′.

ZIENWALD, a town of Saxony, in the margravate of Meiſſen; 4 miles S.S.W of Lauenſtein.

ZIERCKOWITZ, a town of the duchy of Stiria; 4 miles E.S.E. of Windiſch Feiſtritz.

ZIERENBERG, a town of the principality of Heſſe Caſſel; 11 miles N.W. of Caſſel. N. lat. 51° 22′. E. long. 9° 20′.

ZIERIA, in *Botany*, was ſo named by the writer of the preſent article, in memory of the late Mr. John Zier, F.L.S., who, as Dr. Sims records in the Botanical Magazine, "having been appointed to a profeſſorſhip in a Poliſh univerſity, was preparing to leave this country, but was prevented by a chronic diſeaſe, which terminated in death." That Mr. Zier was "a learned and induſtrious botaniſt," we are moſt ready to confirm by our own teſtimony. He was no leſs meritorious in his private character, and bore with modeſty and patience thoſe privations, which too often belong to literary merit in a foreign country, eſpecially where canting and time-ſerving are out of the queſtion. We have been informed that Mr. Zier was the coadjutor of Mr. William Curtis (ſee that article), in part, at leaſt, of the celebrated *Flora Londinenſis;* taking upon himſelf the technical Latin deſcriptions, while Mr. Curtis was engaged in thoſe practical obſervations, experiments, and ſcientific diſtinctions, which make the peculiar merit of the work.

work. Mr Zier died about the year 1796, perhaps rather earlier, at no advanced period of life.—Sm. Tranf. of Linn. Soc. v. 4. 216. Jackfon in Andr. Repof. v. 9. 606. Sims in Curt. Mag. 1395. Poiret in Lamarck Dict. v. 8. 859.—Clafs and order, *Tetrandria Monogynia*. Nat. Ord. *Rutaceæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in four deep, ovate, rather acute, equal, permanent fegments. *Cor.* Petals four, ovate, pointed, fomewhat coriaceous, downy, equal, longer than the calyx, alternate with its fegments. *Stam.* Filaments four, alternate with the petals, awl-fhaped, fimple, fmooth, inflexed, much fhorter than the corolla, each inferted into a globular gland, projecting above their bafe at the infide; anthers terminal, roundifh, with a minute point. *Pist.* Germen fuperior, roundifh, four-lobed; ftyle terminal, erect, columnar, the length of the ftamens, deciduous; ftigma capitate, four-lobed. *Peric.* Capfules four, connected at their inner edge, each compreffed, abrupt, of two valves and one cell. *Seeds* folitary, oval, compreffed, each enclofed in a horny elaftic tunic of two valves.

Eff. Ch. Calyx in four deep fegments. Petals four. Stamens fmooth, each inferted into a gland. Style fimple. Stigma four-lobed. Capfules four, combined. Seeds with an elaftic tunic.

We are acquainted with four fpecies of this genus, confifting of fhrubs, natives of New South Wales, with oppofite, ftalked, ternate *leaves*, and white *flowers*. It is allied to *Boronia*, (fee RUTACEÆ,) as well as to CROWEA, ERIOSTEMON, CORRÆA, PHEBALIUM, and MELICOPE, to which we refer the reader. *Zieria* is effentially characterized by the infertion of each of its *ftamens* into the outfide of one of four large glands, ftanding on the *receptacle*, at the bafe of the germen; as well as by the fimplicity of thofe *ftamens*, in the other part of their ftructure. All the fpecies abound with refinous dots on their *leaves*, *ftalks*, and *calyx*, lodging an effential oil, whofe qualities are more or lefs acrid and aromatic.

1. Z. *lanceolata*. Lanceolate Zieria. Brown MSS. (Z. Smithii; Andr. Repof. t. 606. Curt. Mag. t. 1395. Ait. Epit. 376.)—Clufters axillary, repeatedly three-forked. Leaflets lanceolate, flat, acute. Branches and ftalks warty.—Sent from Port Jackfon, New South Wales, by Dr. John White, in 1795. It is faid by Mr. Aiton to have been introduced into the Englifh gardens in 1803, where it proves a tolerably hardy green-houfe fhrub, flowering in the fpring and early part of fummer, and may be increafed from cuttings. The *ftem* is bufhy, of humble growth, being fcarcely three feet high, with round, purplifh, leafy *branches*, rough with glandular warts, and when young, befprinkled with minute, ftarry, rigid pubefcence. *Footftalks* warty, channelled, near an inch long, deftitute of *ftipulas*, each bearing three lanceolate, flat, entire, fmooth, fingle-ribbed *leaflets*, contracted at each end, the middle one rather the largeft, being two inches, or two and a half, in length. *Panicles* oppofite, axillary, often two together, fomewhat leafy, repeatedly forked, many-flowered, various in length, fpreading, flightly downy; their ftalks quadrangular, purplifh. *Flowers* white, each about the fize of a Privet-bloffom, with yellow *anthers*. *Capfules* brown, dotted with glands. Tunic of the *feeds* white and fhining. We agree with Dr. Sims in preferring an expreffive fpecific appellation to one taken from the name of a botanift, and, therefore, as the genus in queftion was not eftablifhed on this fpecies more than the reft, all, except the laft, having been equally confidered, we are happy to fet the example of an alteration, in which we can have no other motive than propriety and common advantage. We had called this fpecies *multiflora;* but we confider the fynonym in the Botanical Magazine as a publication of the unexceptionable name given by Mr. Brown.

2. Z. *lævigata*. Smooth Zieria.—Clufters axillary, three-forked, corymbofe. Leaflets linear, revolute. Branches and ftalks very fmooth.—Gathered by Dr. White, near Port Jackfon, New South Wales. The *branches* of this pretty fpecies are quadrangular, and very fmooth, like every other part, except the *petals*. *Leaves* fmaller than the foregoing, with fomewhat of a glaucous hue. *Footftalks* about half a quarter of an inch long. *Leaflets* fcarcely an inch, acute, polifhed, ftrongly revolute, dotted with glands, and fomewhat tinged with purple. *Flowers* a little larger than the laft, and much fewer, the *panicles* being always folitary, much lefs compound, and fituated chiefly towards the upper part of each branch. The *ftalks* are acutely quadrangular, and very fmooth. *Calyx* brown or reddifh, taper-pointed, likewife quite fmooth. *Petals* downy on both fides, like a piece of woollen cloth.

3. Z. *pauciflora*. Few-flowered Zieria.—Stalks axillary, with one or three flowers. Leaflets linear-obovate, fomewhat revolute. Branches and ftalks hairy. Segments of the calyx lanceolate, taper-pointed.—Sent from Port Jackfon, with the former, by Dr. White, in 1795. A fmall *fhrub*, with flender, round, fcarcely quadrangular, *branches*, which are more or lefs copioufly clothed with erect briftly hairs. *Leaves* about half the fize of the laft; their *leaflets* dilated upwards, and obtufe, a little crenate towards the end; copioufly dotted, rarely hairy, on the upper fide; fometimes very hairy beneath, but occafionally quite fmooth even in that part. *Flowers* very fmall, often quite folitary, on an axillary ftalk, with a pair of fmall acute *bracteas;* fometimes there are three flowers on each ftalk. Segments of the *calyx* broad at the bafe, but tapering fuddenly into a long point. *Petals* minutely dotted with tufts of ftarry hairs, giving them a warty, or granulated, afpect. *Capfules* tuberculated, fometimes hairy; curioufly reticulated at the infide. *Seeds* black, rather opaque, with a fhining, white, at length convoluted, tunic, whofe edge is minutely fringed. The hairy and nearly fmooth varieties of this plant look different at firft fight, but we cannot detect a fpecific diftinction.

4. Z. *cytifoides*. Downy Zieria.—Stalks axillary, three-forked, leafy. Leaflets obovate, entire, downy on both fides. Branches and ftalks downy.—Native of New South Wales, from whence we obtained a fpecimen through the favour of earl St. Vincent in 1805. Whether this be Mr. Brown's *arborefcens*, mentioned by Dr. Sims, we have at prefent no means of knowing, and therefore we are obliged to defcribe it by a name which appears to us very expreffive. Every part is clothed with fine denfe foft pubefcence, appearing ftellated and entangled under a high magnifier. *Branches* round. *Footftalks* half an inch long. *Leaflets* about an inch in length, entire, flightly revolute; their upper fide peculiarly foft and velvet-like; the under moft hoary. When held againft the light, they appear full of pellucid dots. *Calyx* very downy; its fegments broad and ovate. *Petals* about twice as long, and of the fame fhape, downy. We have not feen the ripe *fruit*.

ZIESAR, or ZIEGESAR, in *Geography*, a town of the Middle Mark of Brandenburg; 18 miles S.W. of Brandenburg.

ZIETZ, a town of the Middle Mark of Brandenburg; 10 miles S.W. of Brandenburg.

ZIEZAR, a town of Spain, in the province of Murcia; 22 miles N.W. of Murcia.

ZIFIUS, in *Ichthyology*, a name given by Albertus to the xiphias, or ſword-fiſh. See Xiphias.

ZIGADENUS, in *Botany*, a genus of Michaux, Boreal.-Amer. v. 1. 213. Purſh 241. The name, formed of ζυγος, *a yoke*, and αδην, αδενος, *a gland*, evidently alluding to the pair of glandular depreſſions in each petal, ought therefore to have been *Zygadenus*. We do not, however, believe that this genus can be ſeparated from Helonias. See that article.

The ſpecies are,

H. *glaberrima*. Smooth-leaved Helonias. Ker in Curt. Mag. t. 1680. (Zigadenus glaberrimus; Michaux as above; 214. t. 22. Purſh n. 1. Ait. Epit. 376.)—Leaves linear, channelled, recurved. Stalk leafy. Bracteas ovate, pointed as well as the petals.—In low meadows of Virginia and Lower Carolina, perennial, flowering in June and July. *Purſh*. *Root* bulbous. *Leaves* a ſpan long, concave, ſpreading. *Stalk* two feet high, bearing ſeveral, gradually diminiſhing, *leaves*, and terminating in a *panicle* of ſeveral greeniſh-white *flowers*, the ſize of *Veratrum album*, each of whoſe *petals* is marked, near the baſe, with a double glandular, apparently nectariferous, depreſſion. *Stamens* diſtinct from the petals. *Seeds* tunicated. We know not whether they be ſo in any other *Helonias*.

H. *elegans*. Elegant Helonias. (Zigadenus elegans; Purſh n. 2.)—Leaves linear, flat, erect. Stalk nearly naked. Bracteas linear. Petals acute.—On the waters of Cokahlaiſhkit river, near the Rocky Mountains, found by governor Lewis, flowering in July. Radical *leaves* erect, linear, very long, ſmooth, ribbed, flat. *Stalk* taller than the foliage, about two feet in height, round, ſimple, bearing one or two ſhort leaves. *Cluſter* many-flowered, occaſionally branched at the bottom. *Bracteas* as long as the partial ſtalks, membranous, ribbed. *Flowers* whitiſh, the ſize of *Melanthium virginicum*. *Petals* ovate, acute, with ſomething of a claw, marked at the baſe with two vermilion ſpots. *Filaments* ſhorter than the corolla. *Stigmas* three, reflexed. *Purſh*.

ZIGÆ, in *Ancient Geography*, a people of Aſiatic Sarmatia, on the bank of the Tanais. Pliny.

ZIGALOVKA, in *Geography*, a town of Ruſſia, in the government of Irkutſk; 16 miles N.W. of Tutura.

ZIGANEAH, a mountain of Algiers; 18 miles S. of Conſtantina.

ZIGANSK, a town of Ruſſia, in the government of Irkutſk, on the Lena; 1472 miles E. of Tobolſk. N. lat. 67°. E. long. 120° 32′.

ZIGEIRA, or Zigira, in *Ancient Geography*, a town of Africa Propria, between the town of Thabraca and the river Bagradas. Ptolemy.

ZIGER, a word uſed by ſome of the old writers to expreſs a very fine kind of caſſia, extremely aromatic to the taſte, and of a purpliſh-black colour.

ZIGERE, in *Ancient Geography*, a town of the interior of Thrace, on the borders of Lower Mœſia.

ZIGET, in *Geography*, a town of Hungary, ſituated between the ſtreams of a ſmall river, which unite below the town, and ſoon after run into the Drave. It is on every ſide ſurrounded by a moraſs, and defended by moats, walls, and baſtions; 44 miles S.E. of Caniſcha. N. lat. 46° 8′. E. long. 17° 56′.—Alſo, a river of Hungary, which runs into the Drave, 12 miles S. of Ziget.

ZIGIRA, in *Ancient Geography*, a town of Aſia, in Aſſyria, towards the N., and at a great diſtance from the Tigris. Ptol.

ZIGURELLA, in *Ichthyology*, the name by which ſome have called the julis, a ſmall but very beautiful fiſh, common about Genoa, and in ſome degree approaching to the nature of the turdus or wraſſe.

It is a ſpecies of the labrus, according to Artedi, and is diſtinguiſhed by the name of the palmaris labrus, with two large teeth in the upper jaw. See Labrus.

ZIGZAG Trefoil, in *Agriculture*, a term ſometimes applied by farmers to the perennial red clover, marl graſs, or wild red clover. See Clover and Trifolium *Purpureum Perenne*.

ZIKLAG, or Sicalag, in *Ancient Geography*, a city which Achiſh, king of Gath, gave to David, while he took ſhelter among the Philiſtines (1 Sam. xxvii. 6.), and which afterwards always belonged to the kings of Judah. Joſhua had allotted it to the tribe of Simeon. (Joſh. xix. 5.) Euſebius ſays, that it lay in the ſouthern part of Canaan.

ZILA, in *Geography*, a river of Moldavia, which runs into the Pruth, 30 miles S.E. of Jaſſy.

ZILEH, a town of Turkiſh Armenia; 30 miles S.S.W. of Arzingan.

ZILGA, a river of Ruſſia, which runs into the Oka, N. lat. 53° 4′. E. long. 101° 14′.

ZILIS, in *Ancient Geography*, a town of Africa, in Mauritania Tingitana, marked in Anton. Itin. 24 miles from Tingis, between Tabernæ and Ad Mercuri. This was a colony eſtabliſhed by Auguſtus, exempt from the juriſdiction of the kings of Mauritania, and dependent upon Bœtica in Hiſpania.

ZILKEFEL, in *Geography*, a town of the Arabian Irak; 18 miles S.W. of Helleh.

ZILLEBA, a town of Arabia, in the province of Yemen; 35 miles E. of Loheia.

ZILLER, a river of Tyrol, which runs into the Inn, 2 miles above Rattenburg.

ZILLY. See Cilly.

ZILMISSUS, in *Ancient Geography*, a hill of Thrace, on which was a temple dedicated to the god Sabadeus. Macrobius.

ZILTAN, in *Geography*, a town of Africa, in the deſert of Barca; 150 miles W. of Angela.

ZIMARA, in *Ancient Geography*, a town of Aſia, in the Greater Armenia, at the foot of mount Capotis, in the place where the Euphrates has its ſource.

Zimara, in *Geography*, a town of Aſiatic Turkey, in the government of Sivas; 55 miles E. of Sivas.

ZIMBAOA, or Zimbao, a town of Africa, in the kingdom of Sofala, and capital of Mocaranga. S. lat. 16° 40′. E. long. 33° 40′.

ZIMBRA. See Zowamore.

ZIMENT-Water, or Copper-*Water*, in *Natural Hiſtory*, the name by which ſome have called water found in places where there are copper-mines, and lightly impregnated with particles of that metal.

The moſt famous ſpring of this kind is about a mile diſtant from Newſol in Hungary, in the great copper-mine called by the Germans *herrn grundt*.

The water in this mine is found at different depths, and is received into baſons, for the purpoſe of ſeparating the copper from it; in ſome of theſe it is much more fated with this metal than in others, and will make the ſuppoſed change of iron into that metal much ſooner. The moſt common ſpecies of iron uſed in the experiments are, horſeſhoes, nails, and the like; and they are found very little altered in ſhape, after the operation, except that their ſurfaces are more raiſed.

The water appears greeniſh in the baſon where it ſtands; but if a glaſs of it be taken up, it looks clear as cryſtal: it has no ſmell, but a ſtrong vitriolic aſtringent taſte, inſomuch that the lips and tongue are bliſtered and ſcorched upon taſting it.

The miners are well acquainted with the virtue of this water in changing the metals; but they alſo uſe it as a medicine: whatever ſickneſs they are ſeized with, they firſt attempt its cure by a large doſe of this water, which uſually both vomits and purges them very briſkly.

They alſo uſe it in diſorders of the eyes, in ſome of which it muſt be of great power; but in others, it is very improper; ſo that upon the whole they do more harm than good with it.

The copper produced from theſe waters is valued by the people much beyond any other copper, as being much more ductile, and running eaſier in the fire: the people in the neighbourhood have many veſſels of it; but it is to be obſerved, that its ductility and hardneſs increaſe after it is taken out of the water; for while immerſed in it, it is friable.

It is obſerved, that after great rains the ſprings are always fuller than at other times, and the virtues of the water conſiderably leſs.

A pound of this water, when ſtrongeſt, evaporated over a gentle fire, becomes firſt turbid, and afterwards depoſits a yellowiſh ſediment, which evaporated to dryneſs, weighs two ſcruples and a half; and when warm water is poured upon this and filtered, ſix grains of yellowiſh earth will be left in the filtre; and the greeniſh ſolution being again evaporated to a pellicle, and the operation being ſeveral times repeated, ſomewhat more than two ſcruples of a blueiſh-green vitriol will be ſeparated in ſmall cryſtals.

A ſmall quantity of oil of tartar being added to a pound of this water, the whole becomes turbid, and on filtration leaves a large reſiduum in the filtre, which dried, weighs about two ſcruples and a half, and is found to be a cupreous vitriol, with a ſmall mixture of a neutral ſalt. If a pint of this water be put into a bottle, and a ſmall piece of iron thrown into it, bubbles will appear on the iron, which will gradually be changed to a copper colour. On the ſecond day, the water will be turbid, and afterwards whitiſh, and white filaments will gather about the bottom and ſides of the glaſs, and about the iron, which will appear throughout of a coppery colour. From theſe experiments, we may eaſily underſtand what the true nature of the water is; that it contains a large quantity of vitriol of copper, which it probably owes to a ſolution of that metal, by means of the acid of the common pyrites and water: when this is known, the effects are not difficultly accounted for, there being no real change of one metal into another; but the true ſtate of the caſe being, that the particles of one metal are diſſolved and carried away, and thoſe of another metal depoſited in their place. A water thus impregnated is a menſtruum capable of diſſolving iron, and in the ſolution of that metal becomes ſo weakened as to let go the copper it before contained in ſmall parcels. This is ſeen to be the caſe, by examining the changed metal while it lies in the water, the copper then appearing not a ſoft malleable and even maſs, but a congeries of granules cloſely placed together, and reſembling the ſmall granules, or ova, in the ſpawn of fiſhes; and it is very friable and fragile while in this ſtate.

This ſolution of one metal, and depoſition of the particles of another in its place, is a thing very familiar in chemiſtry, and is ſeen every day in numerous inſtances; but in none ſo familiar as in a like caſe, or ſolution of iron and copper in the ſame menſtruum. Thus, if a piece of copper be diſſolved in aqua fortis, and when this ſolution is perfected a piece of iron be thrown into the liquor, the ſame thing will be ſeen that is in this ſpring, for the iron will be diſſolved, and the copper which was before diſſolved in the menſtruum will be ſlowly precipitated and depoſited in the place of it. Phil. Tranſ. N° 479, p. 355, &c. See on this ſubject the articles Copper and Vitriol.

ZIMEX, a word uſed by ſome of the old chemical writers for verdigriſe.

ZIMITI, in *Geography*, a town of South America, in the province of Carthagena, near a lake; 60 miles S. of Santa Fé de Bogota. N. lat. 7° 42′. W. long. 74° 6′.

ZIMMER, an iſland of the Red ſea, much ſmaller than *Fooſht*, (which ſee,) without inhabitants, and without water; though, by the ciſterns that now remain, and are ſixty yards ſquare, hewn out of the ſolid rock, there is reaſon to imagine that this was once a place of conſequence: rain, at certain ſeaſons, falls here in abundance. It is covered with young plants of rack-tree, whoſe property it is to vegetate in ſalt water. It has alſo a conſiderable number of Saiel, or Acacia-trees. In this iſland there are antelopes and hyænas; and hence we may infer that water, without which theſe animals could not ſubſiſt, is found in ſome ſubterranean caves or clifts of the rocks, unknown to the Arabs or fiſhermen. Mr. Bruce found here plenty of the large ſhell-fiſh called Biſſer and Surrumbac, but no other. Fooſht bears from this iſland 8 miles N.W. by N. ¼ W. N. lat. 16° 7′.

Zimmer, in *Commerce*, a term uſed for reckoning in Germany, and denoting 40 pieces.

ZIMMERBACH, in *Geography*, a town of France, in the department of the Upper Rhine; 5 miles W. of Colmar.

ZIMMERMAN, John George, in *Biography*, an eminent phyſician and miſcellaneous writer, was born in 1728 at Brug, in the canton of Bern. Having completed his preparatory education at Bern, and choſen the medical profeſſion, he placed himſelf in the univerſity of Gottingen, under the tuition of the celebrated Haller; and on graduating in 1751, the ſubject of his theſis was the doctrine of irritability. His reſpect for Haller was teſtified in the account he gave of him in the journal of Neufchatel, printed in 1752. Having married at Bern a relation of Haller, he ſettled as a phyſician in his native town. The retirement of his ſituation afforded him an opportunity of compoſing many pieces in proſe and verſe; and in 1756 he publiſhed the firſt ſketch of his popular work "On Solitude." This publication was followed by an eſſay "On National Pride," in 1758; by his work "On the Experience of Medicine," in 1763, and ſeveral others; and by "A Treatiſe on Dyſentery," in 1766. In 1768 he accepted an invitation to occupy the vacant poſt of phyſician to the king of England for Hanover, whither he removed. In this ſituation, the accumulation of buſineſs furniſhed in ſome meaſure an antidote to that conſtitutional irritability of temper, and tendency to hypochondriacal complaints, which in the retirement of a ſmall town had rendered him unhappy; and having occaſion to place himſelf under the medical care of a ſurgeon at Berlin, on account of a local diſeaſe under which he laboured, his removal thither in 1771, and the notice that was taken of him by ſeveral perſons of diſtinction, and even by the king, were favourable both to his health and ſpirits, and of courſe to his happineſs. Having loſt his firſt wife, he formed a ſecond matrimonial connection in 1782; and to this union he was indebted for many of thoſe comforts which counterbalanced and alleviated his afflictions. His remaining years were chiefly devoted to the completion of his work "On Solitude," which was publiſhed in four volumes. In the year 1786, Zimmerman was ſent for to attend the great Frederick in his laſt illneſs; and this

this visit gave him an opportunity of publishing an account of his "Conversations" with that celebrated prince. He was induced also, by the notice that was taken of him, to undertake a defence of the character of Frederick against the censures of count de Mirabeau. The severe criticisms to which these writings exposed him, and the part he took in the controversies that agitated the continent with regard to the principles that produced the French revolution, irritated his feelings and disquieted a mind like his peculiarly susceptible of contumely and reproach. His political and religious principles led him to view with jealousy and detestation those societies which, in his judgment, and in that of others of similar sentiments, aimed at the subversion of established forms and authorities, and to declare war against them. Such were his abhorrence and dread of them, that he addressed a memoir to the emperor Leopold, recommending the suppression of them by force; and he subjected himself to a prosecution for a libel by a charge brought against a person by name for an unavowed publication. His mind had arrived to such a state of irritation, that the approach of the French towards Hanover in 1794 almost subverted his reason. Dreading the consequences of their arrival, he abstained from food, wasted to a skeleton, and died absolutely worn out in 1795, at the age of 66. "Such," says his biographer, "was the melancholy end of a man whose moral and intellectual qualities rendered him in a high degree the object of private friendship and public esteem." Tissot's Life of Zimmerman. Gen. Biog.

ZIMOVE, in *Geography*, a village of Russia, in the government of Irkutsk, where is a custom-house; 52 miles S.E. of Barguzinsk.

Zimove *Tchiskoi*, a town of Russia, in the government of Irkutsk; 16 miles S.W. of Vitimskoi.

Zimove *Yasaschnoe*, a winter habitation of Russia, on the N. coast of Baikal lake, in the government of Irkutsk. The word *Zimove*, in Russian, means a house or inn, built at a distance from a town, for the accommodation of travellers, where are generally found a warm room, fresh bread, and a kind of liquor called *quass*. N. lat. 55° 20′. E. long. 109° 14′.

Zimove *Zaminskoi*, a town of Russia, in the government of Irkutsk, near lake Baikal; 76 miles S.E. of Vercholensk.

ZIMOVSKAIA, a town of Russia, in the country of the Cossacks, on the Choper; 48 miles W. of Arkadinskaia.

ZIN, Sin, or *Senna*, in *Ancient Geography*, a city S. of the land of promise. (Numb. xxxiv. 4.) See Sin.

ZINARI, in *Geography*, an island in the Grecian Archipelago. N. lat. 36° 59′. E. long. 26° 10′.

ZINARIA, a word used by the Arabians for a kind of vitiated bile, called æruginous bile.

ZINC, in *Chemistry*, the name of a metal, in Latin *zincum*. The ancients do not appear to have been acquainted with this metal. *Cadmia* was the name by which they seem to have known one of its ores, which was so called from Cadmus, who, it is said, taught the Greeks how to form brass by its means. It is first mentioned by Albertus Magnus, but it is doubtful if he had ever seen it. The word *zinc* first occurs in the writings of Paracelsus. This metal has been also called *spelter*.

Zinc has never been found in Europe in a state of purity, and chemists were late in discovering a method of extracting it from its ores. Henkel seems to have been one of the first who effected this about the year 1720, and he was soon followed by others. Zinc is of a brilliant white colour, with a shade of blue, and seems to be composed of a number of thin plates adhering together. It imparts a perceptible smell and colour to the skin when rubbed by it for some time; hence it is rather soft. Its specific gravity is said to vary from 6.86 to 7.1, the lightest being esteemed the purest. When hammered, its specific gravity becomes as high as 7.19.

This metal is by no means so malleable as copper, lead, or tin; it is not however brittle. It yields, and becomes somewhat flatter, when struck with a hammer. When heated a little above 212°, it has the remarkable property of becoming very malleable, and in this state may be reduced into very thin plates, either by hammering or rolling. When heated to about 400°, it becomes so brittle that it may be reduced to powder in a mortar.

Zinc may be drawn into wire. According to Muschenbroeck its tenacity is such, that a wire of $\frac{1}{10}$th of an inch in diameter is capable of supporting a weight of about 26 lbs.

Zinc melts at a temperature of about 680°, according to Dr. Black. If the heat be increased it evaporates, and may be easily distilled over in close vessels: upon this property of zinc, Von Swab's method of extracting it from its ore was founded. When allowed to cool slowly, this metal crystallizes beautifully in small bundles of quadrangular prisms disposed in all directions, which, if exposed to the air while hot, assumes a blue changeable colour.

When exposed to the air, zinc soon tarnishes, but it scarcely undergoes any other change. When kept under water, its surface becomes black, the water is decomposed, hydrogen is emitted, and the oxygen combines with the metal. If heat be applied, these changes go on more rapidly; and if the steam of water be made to pass over zinc at a high temperature, it is very rapidly decomposed.

When this metal is kept melted in open vessels, it soon becomes covered with a grey pellicle of oxyd. If the heat be very strong it takes fire, and burns with a brilliant white flame, and at the same time emits a great quantity of very light white flakes. This is merely the oxyd of zinc. It was well known to the ancients, and received from them many whimsical names, such as *pompholyx*, &c. Among the alchymists it was known by the names of *nihil album*, *lana philosophica*, *flowers of zinc*, &c.

Zinc appears to combine with only one proportion of oxygen, which has been stated by different chemists to vary from 24.16 to 25 of oxygen to 100 of the metal. According to the first of these determinations, the weight of the atom of zinc will be 41.39; according to the second 40. Dr. Thomson has decided upon 41.25 as the most probable weight of the atom.

Zinc combines readily with chlorine, and forms a chloride of zinc. It may be prepared by dissolving zinc in muriatic acid, or by exposing the metal to the gas, when the two combine by a species of combustion. The chloride may be also obtained by distilling zinc-filings with the oxy-muriate of mercury, or *corrosive sublimate;* and thus obtained, it was formerly denominated the *butter* of zinc. When thus prepared, it sublimes on the application of heat, and crystallizes in needles; but according to Dr. Davy, when the common muriate is heated in a glass tube, it does not sublime even at a red heat, but remains in a state of fusion. Exposed to the air, it soon deliquesces. According to Dr. J. Davy's analysis, it is composed of

Chlorine - - -	100
Zinc - - - -	100

But if we suppose it to be composed of an atom of zinc and

and an atom of chlorine, and the atom of zinc to weigh as above, its conſtituents ſhould be

Chlorine - - -	100
Zinc - - - -	91.6

Zinc readily combines with iodine by heat. The compound, or *iodide*, is white. It is volatile, and cryſtallizes in fine quadrangular priſms. It deliqueſces in the air, and is very ſoluble in water. The ſolution is colourleſs, and does not cryſtallize. Gay Luſſac has ſhewn, that this compound conſiſts of one atom iodine, and one atom zinc, or by weight of

Iodine - - -	100
Zinc - - - -	26.52

No compound of zinc with fluorine is at preſent known. Zinc does not combine with azote nor hydrogen; nor are we acquainted with any compound of this metal with boron and ſilicon.

Zinc may be combined with phoſphorus by dropping ſmall bits of phoſphorus into it while in a ſtate of fuſion. Phoſphuret of zinc is of a white colour, and poſſeſſes a metallic luſtre, which more reſembles lead than zinc. It is ſomewhat malleable. It emits the odour of phoſphorus when filed or hammered, and if expoſed to a ſtrong heat it burns like zinc. Phoſphorus alſo appears to combine with the oxyd of zinc, and to form a peculiar compound.

Sulphur cannot be combined artificially with zinc; but if melted with the oxyd of zinc a peculiar compound is formed. A ſimilar compound is formed when ſulphuretted hydrogen in combination with an alkali is dropped into a ſolution of zinc. It is at firſt white, but becomes darker on drying. Dr. Thomſon conſiders this compound as a ſulphuret of zinc. Mr. E. Davy aſcertained, that when the vapour of ſulphur is paſſed over zinc in fuſion a yellowiſh compound is obtained, ſimilar in appearance to blende.

One of the moſt common ores of zinc is *blende*, deſcribed below, and which is a ſulphuret of zinc, compoſed, according to Dr. Thomſon's experiments, of

Zinc - - - -	100
Sulphur - - -	48.84

Hence he conſiders it as a compound of one atom zinc, and one atom ſulphur.

The alloys of zinc and the metals of the fixed alkalies are ſpeedily decompoſed by expoſure to the air or immerſion in water. We are not acquainted with the alloys of zinc and the metallic baſes of the alkaline earths.

Zinc may be combined with arſenic by diſtilling a mixture of it and arſenious acid. With iron, zinc combines with difficulty; the alloy when formed, according to Lewis, is hard, ſomewhat malleable, and of a white colour, like ſilver. Malouin has ſhewn, that zinc may be uſed inſtead of tin for covering iron plates; a circumſtance which demonſtrates an affinity between the two metals.

Zinc does not appear capable of combining with nickel or cobalt by fuſion. The alloys of zinc with mangaueſe, cerium, and uranium, are unknown.

For the other alloys of zinc, ſee the different metals; particularly for the moſt important of them or braſs, ſee Brass and Copper.

Salts of Zinc.—Almoſt all the acids act with energy on zinc, in conſequence of its powerful affinity for oxygen. The ſalts of zinc, therefore, are very eaſily formed, and on account of their being but one oxyd of zinc are not much liable to variation.

Nitrate of Zinc.—The nitric acid attacks zinc with ſuch energy, that it is commonly neceſſary to moderate its action by diluting it with water. Even then much heat is evolved, and a ſtrong effervеſcence is produced by the eſcape of nitrous oxyd gas. The ſolution is tranſparent and colourleſs, very cauſtic, and yields by evaporation flat, ſtriated, tetrahedral priſms, terminated by four-ſided pyramids. Theſe cryſtals attract moiſture on expoſure to the air, and are ſoluble in water and alcohol. When heated they melt, and if thrown on burning coals, detonate with a red flame.

Carbonate of Zinc.—*Calamine*, one of the ores of zinc, is a native carbonate of zinc, as deſcribed below. This ſalt uſually exiſts in the form of a white powder, and may be obtained by precipitating zinc from its ſolution in acids by an alkaline carbonate.

Phoſphate of Zinc.—The phoſphoric acid unites in two proportions with the oxyd of zinc. The neutral phoſphate is a taſteleſs white powder inſoluble in water. The biphoſphate is ſoluble in water, if not expoſed to too great a heat. It does not cryſtallize, and is ſtrongly acid.

Sulphate of Zinc.—Concentrated ſulphuric acid ſcarcely acts upon zinc without the aſſiſtance of heat; but when diluted it acts upon the metal very ſtrongly, and hydrogen gas is given out in abundance. In this caſe, the water is decompoſed, its oxygen combines with the metal, while its hydrogen eſcapes. The ſolution, when concentrated, yields cryſtals in abundance.

This ſalt, formerly known under the name of *white vitriol*, was diſcovered in Germany, about the middle of the 16th century. When quite pure, it is perfectly white. The form of its cryſtals is that of flat quadrangular priſms, terminated by four-ſided pyramids. At a temperature of 60°, it diſſolves in about 1.4 times its weight of water. In boiling water, it diſſolves in any quantity whatever. The conſtituents of this ſalt are,

1 Atom of ſulphuric acid - -	31.74
1 Atom of zinc - - -	32.54
5 Atoms of water - - -	35.72
	100.00

When heated, the cryſtals part with their water, and if the heat be ſtrong, the whole of the acid likewiſe ſeparates, and leaves the oxyd of zinc in a ſtate of purity. See Vitriol, *White*.

Muriate of Zinc.—See *Chloride of Zinc, ſupra.*

Sulphite of Zinc.—This ſalt exiſts in the form of cryſtals, ſoluble in water, but inſoluble in alcohol. On expoſure to the air, they are ſoon converted into the ſulphate of zinc. Fourcroy and Vauquelin deſcribe a *hypo-ſulphite* of zinc, which aſſumes the form of four-ſided priſms, terminated by four-ſided pyramids. They are ſoluble in water and alcohol.

Borate of Zinc is a white inſoluble powder. It may be formed by pouring borate of ſoda into the nitrate or muriate of zinc.

Arſeniate of Zinc is a white inſoluble powder, and may be formed by mixing ſolutions of the alkaline arſeniates with the ſulphate of zinc.

Acetate of Zinc.—This ſalt exiſts in the form of rhomboidal or hexagonal plates of a talky appearance, and is not very ſoluble in water. Solutions of this ſalt form an excellent external application to inflammations.

Oxalate of Zinc.—This ſalt is a white powder, little ſoluble in n water, and may be formed readily by double decompofition.

Tartrate and Citrate of Zinc. — Both thefe falts exift ufually in the form of powders, and are but little foluble in water. They may be procured, like the oxalate, by double decompofition.

The other falts of zinc are of very little importance or intereft, and do not therefore merit to be enumerated here. The falts of zinc may be diftinguifhed in general by their forming colourlefs folutions in water, by their yielding white precipitates with pruffiate of potafh, fulphuretted hydrogen, and the alkalies, and by the characteriftic circumftance that zinc is not precipitated in the metallic ftate by any other metal.

Ufes of Zinc and its Compounds.—Neither this metal nor its compounds, if we except *brafs*, are much employed in the arts nor in medicine. A chief ufe of zinc is in the formation of galvanic apparatus, and in electrical experiments. (See GALVANISM and ELECTRICITY.) As it is not a poifonous metal, it has been recommended inftead of tin and lead for domeftic purpofes; but the eafe with which it is oxydized makes it very unfit for all forts of culinary apparatus.

The ftrong affinity of zinc for oxygen renders it of great ufe as a chemical agent for precipitating other metals from a ftate of folution in the metallic ftate. The oxyd of zinc is ufed in medicine, both internally as a tonic, and externally mixed with hog's-lard as an ointment. The native carbonate is alfo ufed in the fame manner as an external application. See UNGUENTUM *Calamine*, and UNGUENTUM *Zinci.*

The *fulphate* and the *acetate* are the only falts of zinc ufed in medicine; for the properties of which, fee above.

ZINC, *Ores of*, in *Mineralogy.* The ores of zinc are generally affociated with lead-ores, and exift abundantly in various parts of England; particularly in veins in the mountain lime-ftone of Derbyfhire, Durham, Cumberland, Yorkfhire, Somerfetfhire, and North Wales. The ores of zinc are either oxyds, carbonates, or fulphurets of zinc, and are principally known as calamine or blende. There is an ore of zinc hitherto found only in North America, called by Dr. Bruce red zinc-ore; it occurs in feveral of the iron-mines in Suffex county, New Jerfey.

Red Zinc Ore is of a blood-red or aurora-red colour: it occurs maffive and differninated. The frefh fracture is fhining, but becomes dull after long expofure to the air, and is covered with a pearly cruft; the principal fracture prefents a foliated ftructure; the crofs fracture is conchoidal. It is opaque or tranflucent on the edges; it yields a brownifh-yellow or orange ftreak; it is brittle. The fpecific gravity is 6.22. It is infufible without addition by the blow-pipe, but melts into a tranfparent yellow bead with borax. When pounded and mixed with potafh, and expofed to heat, it melts into an emerald-green mafs, which, on folution in water, yields the fame colour; but on the addition of the mineral acids is immediately changed to rofe-red. This ore is foluble in the mineral acids. Its conftituent parts are,

Zinc - - - - -	76
Oxygen - - - - -	16
Oxyds of manganefe and iron	8
	100

Bruce's American Mineralogical Journal, p. 69.

According to Dr. Bruce, this ore poffeffes advantages in the manufacture of brafs over thofe generally ufed; for without any previous preparation, it affords with copper brafs of the very fineft quality, poffeffing a high degree of malleability, and fuited for the moft delicate workmanfhip. Red zinc-ore is characterized and diftinguifhed from red filver-ore and red lead-ore by its infufibility; the latter melting into a blackifh flag before the blow-pipe. Red orpiment, with which it might be confounded, is diftinguifhed from red zinc-ore by its volatility, and the garlic fmell which it yields. This ore of zinc has greater fpecific gravity than red copper-ore, and its folution in acids is colourlefs; but thofe of red copper are green. Calamine is divided by fome mineralogifts into four kinds, fparry calamine, compact calamine, earthy calamine, and electric calamine.

Sparry Calamine: Zinc Carbonaté, Haüy.—Its colours are greyifh and yellowifh-white, and fometimes green and reddifh-brown. It occurs maffive, botryoidal, cellular, ftalactitic, and cryftallized, in acute and obtufe rhomboids, and in longifh quadrilateral tables: the cryftals are fmall. The luftre of fparry calamine is between refinous and vitreous. The ftructure is imperfectly lamellar, and fometimes radiated. It is tranflucent, or more or lefs tranfparent; it yields eafily to the knife. The fpecific gravity is 4.3. It is infufible before the blow-pipe, and lofes about 34 *per cent.* by ignition. With muriatic acid it effervefces, and is diffolved. According to Smithfon, the conftituent parts of this ore from Derbyfhire are,

Oxyd of zinc - -	65.2
Carbonic acid - -	34.8
	100.

From Somerfetfhire,

Oxyd of zinc - -	64.8
Carbonic acid - -	35.2
	100.

Compact Calamine: Zinc Carbonaté, Haüy.—Its colours are, greyifh, greenifh, or yellowifh, and often brown, from an intermixture with iron. It occurs maffive, botryoidal, differninated, ftalactitical, reniform, and mamillated: it has a dull, feebly gliftening, refinous luftre. The fracture is uneven and coarfe-grained, or fplintery, and fometimes even a flatty conchoidal. It fometimes occurs in concentric lamellar concretions: it is opaque. Its chemical characters and conftituent parts are the fame as of the fparry calamine, thefe minerals being only varieties differing in form from each other.

Earthy Calamine: Zinc Carbonaté, Haüy.—It is of a greyifh or yellowifh-white colour, fometimes fnow-white; externally it is frequently covered with a tint of yellowifh-brown. It occurs maffive, and coating other minerals; it is opaque, and has an earthy fracture; it yields to the nail, and adheres to the tongue. The fpecific gravity is 3.358. According to Smithfon, the conftituent parts are,

Oxyd of zinc - -	71.4
Carbonic acid - -	13.5
Water - - -	15.1
	100.

Electric Calamine: Zinc Oxydé, Haüy.—Its prevailing colours are, greyifh, blueifh, or yellowifh-white; externally it is fometimes brownifh or blackifh. It occurs cryftallized, mamillated, botryoidal, ftalactitical, and maffive. The cryftals are fix-fided prifms, with dehedral fummits, or acute octahe-

octahedrons; ſometimes truncated on the ſummits. The cryſtals are ſmall, and either ſolitary, or radiating in groups, like zeolite. The luſtre is ſhining, gliſtening, and vitreous: the ſtructure is imperfectly lamellar, or divergingly fibrous. It is ſometimes opaque, and ſometimes tranſlucent or tranſparent: it yields to the knife, but is much harder than common calamine. The ſpecific gravity is 3.4. When gently heated it is ſtrongly electric; it is infuſible, and loſes about 12 *per cent.* by ignition. It is ſoluble in muriatic acid with effervеſcence: the ſolution gelatinizes on cooling. According to Klaproth, its conſtituent parts are,

Oxyd of zinc - - -	66
Silex - - - - -	33
	99

According to Smithſon,

Oxyd of zinc - -	68.3
Silex - - - - -	25.
Water - - - - -	4.4
	97.7

Calamine ſometimes occurs in what are called ſuppoſititious cryſtals, as if it had been moulded over cryſtals of other minerals, and the internal cryſtal had diſappeared. In Derbyſhire, the working miners are of opinion, that the calamine deſtroys the lead-ores when they occur together; or, as they expreſs it, the calamine eats up the lead. That ſome proceſs of decompoſition or change takes place where theſe ores are aſſociated there can be no doubt; but by what means this is effected we are at preſent ignorant. See VEINS, *Metallic.*

Calamine, commonly called lapis calaminaris, when cleaned and roaſted, is uſed for the fabrication of braſs, forming a compound with copper. (See BRASS.) Its uſes in the making of braſs is of very high antiquity, being mentioned by Ariſtotle.

Calamine is alſo the moſt valuable ore from which metallic zinc is extracted.

The uſes of calamine were not known in England before the reign of queen Elizabeth, and even ſo late as the year 1700 it was commonly carried out of the kingdom as ballaſt by the ſhips which traded to Holland. The calamine raiſed in Derbyſhire about the year 1780 amounted to 1500 tons. Sixty years before that time the quantity got did not exceed 40 tons, the greater part being thrown away through ignorance of its nature and value.

The dreſſing of calamine conſiſts principally in picking out all the pieces of lead-ore, lime-ſtone, iron-ſtone, heavy ſpar, and other minerals mixed with it in the mine. The picked calamine is then calcined in proper furnaces, and loſes by calcination between a third and fourth part of its weight, which is the carbonic acid. In great works, where calamine is prepared for the braſs-makers, after its calcination, it is carefully picked again, the accidental ingredients being rendered more diſcernible by the action of fire. It is afterwards ground to a fine powder, and waſhed in a gentle rill of water, to free it from earthy particles with which it may be intermixed; for theſe being lighter are carried off by the water: it is then made up for ſale.

A ton of the crude Derbyſhire calamine, as dug from the mine, is reduced, by the various proceſſes it undergoes before it becomes fit for uſe, to about twelve hundred weight. Part of the zinc is loſt in calcination, particularly if too ſtrong a fire be made: this is evident by the flame viſible over the furnace. It would be practicable to uſe calamine without calcining it, for the carbonic acid would be expelled by the heat applied in making braſs; but then there would be ſeven or eight hundred weight put into the braſs pots which would be of no uſe in the operation: it is therefore better to get rid of ſo large a quantity of unſerviceable matter, and thereby avoid alſo an increaſed expence of carriage from the calamine-furnace to the places where the braſs is made. Watſon's Chemical Eſſays, vol. iv.

Blende compriſes various ſulphurets of zinc, differing in the proportion of their conſtituent parts, and the admixture of other mineral ſubſtances.

Yellow Blende, or Phoſphoreſcent Blende: Zinc Sulphuré Jaune, Brongniart.—The prevailing colours of this ore are yellow, paſſing into green, and ſometimes hyacinth-red, aurora-red, or browniſh-red. It occurs maſſive, diſſeminated, and cryſtallized. The cryſtals are generally ſmall, middle-ſized, and ſo cloſely aggregated, that it is difficult to determine the preciſe figure, which appears either the rhomboidal, the dodecahedron, the octahedron, or the tetrahedron. Yellow blende is tranſlucent, paſſing into tranſparent, and has a ſplendent adamantine luſtre. It yields to the knife, and affords a yellowiſh-grey or yellowiſh-white ſtreak: it is brittle. The ſpecific gravity rather exceeds 4: according to Karſton, it is 4.1.

It decrepitates before the blow-pipe, and becomes grey; but is infuſible either alone or with borax. By friction it becomes phoſphoreſcent, and, according to Bergman, acts as powerful in this reſpect in water as in air.

Foliated Brown Blende: Zinc Sulphuré Brun, Brongniart.—It is of a reddiſh or yellowiſh-brown, paſſing into blackiſh-brown and dark red. It occurs maſſive, diſſeminated, and cryſtallized. The form of the cryſtals is a rhomboidal dodecahedron, either perfect or truncated on the alternate lateral angles and edges, or an octahedron, either perfect or truncated. It occurs alſo in tetrahedrons, perfect or truncated, and in rectangular four-ſided priſms, ſix-ſided priſms, and acicular cryſtals. Sometimes the cryſtals are joined, forming a twin cryſtal. The luſtre is ſhining or ſplendent, and either reſinous, adamantine, or ſemi-metallic; it has a ſtraight lamellar ſtructure, with a cleavage in ſix directions. It is more or leſs tranſlucent; it yields to the knife, and affords a yellowiſh-grey or yellowiſh-brown ſtreak; it is brittle, and eaſily frangible. The ſpecific gravity of this ore varies from 3.7 to 4. It is infuſible, and yields an hepatic odour when digeſted in ſulphuric acids. The conſtituent parts of blende are given as under; but ſome varieties of foreign blende contain ſilex, arſenic, and mangancſe, which may be regarded as accidental.

Blende from Satilberg, according to Bergman:

Zinc - - - -	44
Iron - - - -	5
Sulphur - - - -	17
Silex - - - -	24
Alumine - - -	5
Water - - - -	5
	100

From Allonhead, in Northumberland, according to Dr. Thomſon:

Zinc - - - -	58.8
Iron - - - -	8.4
Sulphur - - -	23.5
Silex - - - -	7.
	97.7

Fibrous

Fibrous Blende.—The colour is reddiſh-brown: it occurs reniform and maſſive. The ſtructure is divergingly fibrous in one direction, and concentric lamellar in the other: its luſtre is reſinous; it is opaque or faintly tranſlucent at the edges; it agrees in other characters with foliated blende. The conſtituent parts are given as under in the Journal des Mines, t. xlix. No. 13.

Zinc - - - -	62
Iron - - - -	3
Lead - - - -	5
Arſenic - - - -	1
Sulphur - - - -	21
Alumine - - - -	2
Water - - - -	4
	98

Black Blende: Zinc Sulphuré Noir, Haüy.—It is of a greyiſh or velvet-black colour, and ſometimes browniſh-black. When tranſlucent, it appears blood-red; it is ſometimes tarniſhed with various colours. It occurs maſſive, diſſeminated, and cryſtallized, in the ſame forms as brown blende; internally it is ſhining, ſometimes ſplendent; and the luſtre is adamantine, inclining to metallic. It has a foliated ſtructure, and ſix-fold cleavage. The fragments are angular, and rather ſharp-edged. It is almoſt always opaque. The ſtreak is intermediate, between yellowiſh-grey and lightiſh-brown: it is eaſily frangible. The ſpecific gravity varies with the admixture of ingredients in this ore, from 3.9 to 4.1. Auriferous blende from Nagyag, as given by Muller, is 5.39. The conſtituent parts of black blende are as under:

Zinc - -	45	53
Iron - -	9	12
Lead - -	6	0
Arſenic - -	1	5
Sulphur - -	29	26
Silex - -	4	0
Water - -	6	4
	100	100

Blende is diſtinguiſhed from tin-ſtone by its inferior hardneſs; it yields pretty eaſily to the knife. It may be diſtinguiſhed from other ores which reſemble it, by the ſulphureous odour which it yields when thrown into an acid, or triturated in a mortar. The common name given to this ore by the Engliſh miners is Black Jack. It frequently occurs in the upper part of the metallic veins in Cornwall, that are rich in other ores below. Blende is not ſo valuable an ore of zinc as calamine: it muſt be freed from its ſulphur by calcination before it can be applied to the making of braſs. Some blendes loſe one-fourth of their weight, others one-ſixth by calcination. It has been for many years uſed for making braſs at Briſtol as well as calamine; but ſo little was this application of it known in other parts of the kingdom, that in the year 1777 we are informed by Dr. Watſon, in his Chemical Eſſays, that its uſe in Derbyſhire was but recently diſcovered; and he was requeſted not to divulge the purpoſe to which it might be applied, probably to evade the dues on minerals payable to the duchy court of Lancaſter.

ZINCHI, or ZICCHI, in *Ancient Geography*, a people of Aſiatic Sarmatia, upon the coaſt of the Euxine ſea, and ſeparated from the Sanichæ, by the river Achæus. Arrian.

ZINCKGRABEN, in *Geography*, a town of Bavaria, in the biſhopric of Bamberg; 5 miles E. of Lichtenfels.

ZINDIKITES, a ſect among the Mahometans; ſo denominated from their leader Zindik, whom Grotius makes to be one of the magi, and a follower of Zoroaſter.

The Zindikites believe no providence nor reſurrection: they allow no other God but the four elements; and, in this ſenſe, they aſſert, that man, being a mixture of thoſe ſimple bodies, returns to God when he dies.

ZINDINSKAIA, in *Geography*, a fort of Ruſſia, on the confines of China, in the government of Irkutſk; 80 miles S. of Selenginſk.

ZINETUS, a word uſed by Paracelſus as a name for one of the braſs-like marcaſites.

ZINGANE-IS-KELESI, in *Geography*, a town of European Turkey, in Romania; 6 miles S. of Burgas.

ZINGAR, a word uſed by ſome of the chemical writers for verdigriſe; and by others for the flos æris, or flowers of copper or braſs.

ZINGHA, in *Geography*, a town of Africa, in Whidah; 20 miles N.W. of Sabi.

ZINGI, in the *Materia Medica*, the name of a ſeed, ſometimes alſo called the aniſum ſtellatum, or ſtarry-headed aniſe.

ZINGIBER, in *Botany*, ζιγγιβερις of Dioſcorides, a name which the Greeks ſeem to have taken, when they obtained the plant itſelf, from the Arabians. Gærtner, diſſatisfied with Linnæus's application of the ancient name *Amomum*, to a genus of the *Scitamineæ*, under which they both of them confounded very different things, ſubſtituted *Zingiber* in its place, as undoubtedly belonging to one or other of the ſpecies. But ſince this tribe, and its generic diſtinctions, have been cleared up by Mr. Roſcoe, it becomes neceſſary to diſcriminate between *Amomum* and *Zingiber*, and conſequently both names are employed.—Roſcoe Tr. of Linn. Soc. v. 8. 347. Dryandr. in Ait. Hort. Kew. v. 1. 5. (Amomum; Lamarck Illuſtr. t. 2. f. 3.)—Claſs and order, *Monandria Monogynia*. Nat. Ord. *Scitamineæ*, Linn. Brown. *Cannæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, of one leaf, tubular, ſheathing, membranous, ſplitting at one ſide. *Cor.* of one petal: tube twice the length of the calyx, a little ſwelling upwards: outer limb ringent; the upper lip undivided; lower in two deep, equal, deflexed ſegments: inner limb a large, ſpreading, three-lobed lip, of which the middle ſegment is the largeſt, all of them more or leſs wavy and crenate. *Stam.* Filament one, erect, oblong, extended beyond the anther in an awl-ſhaped incurved beak, involute at the edges, embracing the ſtyle; anther attached by its back, below the beak of the filament, oblong, of two cloſe, parallel, linear lobes, meeting round the ſtyle, burſting in front. *Piſt.* Germen inferior, roundiſh, ſmall, crowned with a pair of glands; ſtyle thread-ſhaped, embraced by the filament, and ſcarcely extending beyond its beak; ſtigma ſmall, concave, fringed, projecting a little beyond the point of the beak. *Peric.* Capſule?

Eſſ. Ch. Anther two-lobed. Filament elongated beyond the anther, with an awl-ſhaped, channelled beak, embracing the ſtyle. Outer limb of the corolla ringent; inner a three-lobed lip.

Obſ. Juſſieu had already, after Adanſon, remarked a difference between the infloreſcence of the Ginger and the Cardamom tribes, though both have been comprehended by all botaniſts under *Amomum*. In the former, the flowers compoſe a denſe ſpike, ſupported by a radical ſtalk; in the latter, they are panicled at the baſe of the ſtem. So important a difference in habit, between plants whoſe general ſtructure is ſo uniform and ſimple, might lead us to look for ſome generic difference in the parts of fructification. This Mr. Roſcoe has detected in the *filament*, according to the

the principle which runs through all his generic diſtinctions of this tribe, and which is ſupported throughout by the inflorescence, as well as the parts of the flower in general. Nothing more perfect has ever been accompliſhed in ſyſtematic botany. See SCITAMINEÆ.

1. Z. *officinale*. Narrow-leaved Ginger. Roſcoe n. 1. Ait. n. 1. (Z. majus; Rumph. Amboin. v. 5. 156. t. 66. f. 1. Amomum Zingiber; Linn. Sp. Pl. 1. Willd. Sp. Pl. v. 1. 6. Jacq. Hort. Vind. v. 1. 31. t. 75. "Inſchi; Rheede Hort. Malab. v. 11. 21. t. 12.")—Bracteas ovate, acute. Segments of the outer limb of the corolla linear, revolute. Middle lobe of the lip entire.—Native of the Eaſt Indies; naturalized in Jamaica. A ſtove plant in England, flowering in September. It appears to have been cultivated here by Edward lord Zouch, before the year 1605. The *root* is perennial, tuberous, fleſhy, with long ſtout fibres, well known for its hot, gratefully aromatic, flavour, and cordial qualities. The whole *herb* is ſmooth, and partakes of the flavour of the root. Barren *ſtems* ſeveral, erect, herbaceous, wand-like, leafy, about three feet high. *Leaves* alternate, linear-lanceolate, acute, entire, ſingle-ribbed, ſpreading, with long, cloſe, ſheathing, abrupt *footſtalks*. *Flower-ſtalks* radical, a foot high, clothed with tubular ſheathing *bracteas*. *Spikes* ſolitary, erect, club-ſhaped, enveloped in broader, ſhorter, leſs pointed, crowded *bracteas*, each accompanied by a ſolitary, ſeſſile *flower*, twice its own length, of a delicate texture and ſhort duration. The outer limb of the *corolla* is of a very pale yellow, or ſtraw colour, revolute; the upper ſegment rather the broadeſt. *Lip*, as well as the incurved point of the *filament*, ſpotted with crimſon. We have never been able to procure any ſpecimen or account of the *fruit*, which is perhaps in conſequence of the great increaſe of the *roots*, not often perfected, or if produced, it is moſt probably overlooked by the cultivators, who may find it expedient for the advantage of their crop, to cut away the ſtalks before they run to ſeed.

2. Z. *Zerumbet*. Broad-leaved Ginger. Roſcoe n. 2. Ait. n. 2. Sm. Exot. Bot. v. 2. 105. t. 112. (Z. ſpurium; Koenig in Retz. Obſ. faſc. 3. 60. Z. latifolium ſylveſtre; Herm. Lugd.-Bat. 636. t. 637. Amomum Zerumbet; Linn. Sp. Pl. 1. Willd. Sp. Pl. v. 1. 6. Jacq. Hort. Vind. v. 3. 30. t. 54. Lampujum; Rumph. Amboin. v. 5. 148. t. 64. f. 1. "Katou-inſchi-kua; Rheede Hort. Malab. v. 11. 27. t. 13.")—Bracteas ovate, obtuſe. Segments of the outer limb of the corolla ſtraight. Middle lobe of the lip cloven, ſlightly wavy. Rib and ſheaths of the leaves ſmooth.—Native of the Eaſt Indies. The *roots* are ſaid to be bitter, without the flavour and pungency of the true Ginger; but the young foliage, according to Rumphius, is uſed in Amboyna as a pot-herb. This ſpecies is not uncommon in our ſtoves, being eaſy of culture, and flowering frequently at the end of autumn. Many perſons who grow it think themſelves poſſeſſed of the real Ginger. The habits of the two plants are indeed very ſimilar, but the barren *ſtems* of the preſent ſpecies are rather the talleſt, being four or five feet high, with elliptic-lanceolate *leaves*; ſilky beneath when young. *Flower-ſtalks* eighteen inches or two feet high, thick and firm. *Spike* ovate. *Flowers* pale yellow, without ſcent, each laſting but a few hours. Upper ſegment of the outer limb ovate, erect, concave: two lower ones lanceolate. *Lip* yellow, its large central lobe emarginate.

3. Z. *Caſumunar*. Caſumunar, or Hairy Ginger. "Roxb. in Aſiatic Reſearches, v. 11. 347. t. 7." Sims in Curt. Mag. t. 1426. Ait. Epit. 376. (Caſſummuniar; Dale Pharmac. 275. Caſumunar; Lewis Diſp. ed. 4. 121.)—Bracteas ovate, rather acute. Segments of the outer limb of the corolla ſtraight. Middle lobe of the lip cloven, dilated, criſped, and crenate. Rib and ſheaths of the leaves hairy.—Native of the Eaſt Indies, from whence it was ſent by Dr. Roxburgh to this country, and flowered in Auguſt 1811, in the ſtove of James Vere, eſq. at Kenſington Gore. The roots had long ago been introduced into the Materia Medica as a powerful ſtimulant and tonic, in hyſteric, paralytic, and other nervous diſorders, poſſeſſing a warm bitteriſh flavour, with the ſmell of Ginger; but they have long gone out of uſe. Their ſhape is leſs elongated and compreſſed than that of Ginger, and more annulated, tuberous or knotty. *Herbage* moſt like the laſt ſpecies, but diſtinguiſhed by the hairy ſheath and mid-rib of the *leaves*. *Flower-ſtalks* not above ſix or eight inches high. *Spike* ovate, browniſh. *Corolla* pale yellow, diſtinguiſhed from *Z. Zerumbet* by the greatly dilated, inverſely heart-ſhaped, criſped and crenate, middle lobe of its *lip*; the two ſide lobes being erect and entire, not larger than in *Zerumbet*. The plant is ſaid to be propagated by cuttings of the *root*.

4. Z. *Mioga*. Japaneſe Ginger. Roſcoe n. 3. Ait. n. 3. (Amomum Mioga; Thunb. Jap. 14. Willd. Sp. Pl. v. 1. 7. Banks Ic. Kæmpf. t. 1. Dsjooka, vulgò Mjoga, ſeu Mionga; Kæmpf. Am. Exot. 826.)—Bracteas ovate, acute. Spike nearly ſeſſile. Segments of the outer limb of the corolla erect, acute. Middle lobe of the lip concave, entire.—Found near Nagaſaki, and in other parts of Japan, flowering in September. *Thunberg*. Kæmpfer ſpeaks of this as an eatable kind of Ginger, with a mild flavour. The leafy *ſtems* are from one to two feet, or more, in height, and with the foliage reſemble thoſe of the three foregoing ſpecies. The *flower-ſtalk* is radical, and remarkably ſhort, or ſcarcely any. *Spike* ovate, with numerous, large, white, pointed, ſtriated, concave *bracteas*; the outer ones largeſt, concealing many within. The *flowers* ſmell faintly like Butter-bur, and have a yellow, very concave, undivided *lip*, and a white *limb*. *Filament* greeniſh-white, beaked, embracing the thread-ſhaped *ſtyle*, according to the generic character, as is faithfully deſcribed by Thunberg, who ſpeaks of the fruit as a nearly ovate, obtuſe *capſule*, with three cells and three valves, and numerous minute *ſeeds*, inſerted into the central column.

5. Z. *roſeum*. Roſe-coloured Ginger. Roſcoe n. 4. (Amomum roſeum; Roxb. Coromand. v. 2. 15. t. 126.) — Bracteas lanceolate, coloured. Spike nearly ſeſſile. Segments of the outer limb of the corolla revolute. Middle lobe of the lip flat, entire.—Native of moiſt valleys in Hindooſtan, flowering in the rainy ſeaſon. The Telingas call this plant Bumacatchicay. *Root* creeping, cylindrical, branched, not knotty. No aromatic or other quality is recorded concerning it, or any other part of the plant. Leafy *ſtems* two or three feet high. *Spikes* nearly ſeſſile at the root, ovate, two or three inches long. *Bracteas* looſely imbricated, erect, lanceolate, acute, of a fine roſe colour, as are alſo the *calyx*, and the narrow revolute ſegments of the outer limb of the *corolla*. The *lip* is whitiſh, obovate, entire, not concave, but ſomewhat reflexed. Beak of the *filament* yellow. No account is given of the *ſeed-veſſel*.

6. Z. *purpureum*. Purple Ginger. Roſcoe n. 5. Ait. n. 4.—"Bracteas ovate, coloured. Segments of the outer limb of the corolla erect. Middle lobe of the lip divided."—Native of the Eaſt Indies. Introduced into the Engliſh ſtoves, by the right honourable ſir Joſeph Banks, in 1796, and obſerved by Mr. Roſcoe in the Botanic garden at Liverpool. It flowers in September.

ZINGIBER, in the *Materia Medica*. See GINGER.

ZINGIS, otherwife Jenghiz-khan, or *Genghiz-khan*, in *Biography*, the founder of the Mogul empire, was the fon of Bifukai, or Jefukai, a chief over thirteen hordes of Moguls in the Tartarian range between China and the Cafpian fea, and born about the year 1161 or 1163, his firft name being Temugin. In the year 1205 he was inftalled in the Mogul empire, and declared his purpofe of giving a new code of laws to the nation; the object of which was the prefervation of peace at home, and the conduct of war abroad. The penalty of death was denounced againft murder, adultery, perjury, and the theft of a horfe or ox, which were the chief articles of Tartarian property. The nation was interdicted all fervile labour, the performance of which was affigned to flaves and ftrangers, and was confecrated to the fole profeffion of arms. The weapons which they were appointed to ufe were bows, fcymetars, and iron maces; and the troops were diftributed into divifions of hundreds, thoufands, and tens of thoufands. The foldiers and officers were made individually refponfible for the fafety and conduct of one another; and it was an eftablifhed rule, that peace fhould never be granted without previous conqueft. With regard to religion, Zingis eftablifhed univerfal toleration. As for himfelf, his only article of faith was the exiftence of one God, the creator and governor of all things; but his Mogul and Tartar fubjects were idolaters, Jews, Chriftians, and Mahometans, all of whom were allowed to practife their feveral rites without moleftation, and without any difference of privileges. Having thus fettled the affairs of the proper Mogul empire, he fucceffively, by his own arms, and thofe of his lieutenants, reduced the different tribes of the defert, and rendered himfelf the undifputed monarch of the paftoral nations who pitch their tents from the wall of China to the Volga. For a fketch of his conquefts, we refer to the article of the Mogul *Empire*. Thefe conquefts were attended with many acts of favage cruelty. In his invafion of Kitay, the northern empire of China, he took 90 cities, deftroyed by fire a number of towns and villages, and maffacred many thoufands of people; at the fame time obliging the Kin emperor to purchafe peace at the price of a Chinefe princefs, 500 youths and maidens, 3000 horfes, and a large tribute in gold and filk. At his departure, he inhumanly ordered all the children whom he had taken in four provinces to be butchered. In a fecond expedition he laid fiege to the capital city Yen-king, now called Pekin, which, after a long refiftance and grievous fuffering by famine, was ftormed by the Moguls, with the conflagration of the imperial palace; and after the defolation of China, its five northern provinces fubmitted to the dominion of the Mogul conqueror. In the bloody conflicts between Zingis and Mohammed, fultan of Kharifm or Charafm, all the rich and populous cities and countries of Tranfoxiana, Kharifm, and Khorafan, were taken or laid wafte by the Moguls. Mohammed died a fugitive in a defert ifland of the Cafpian fea; but his fon, Gelaleddin, boldly refifted the invader, and checked his progrefs, till overpowered by numbers on the banks of the Indus, he was under a neceffity of fpurring his horfe into that rapid river, the oppofite fide of which he reached in fafety. Zingis, admiring his heroifm, and forbidding the purfuit of him, faid to his fons, "Any fon might wifh to fpring from fuch a father." Neverthelefs he ordered all the fultan's male children to be killed. After the defeat of Gelaleddin, Zingis, remaining for fome time in Khorafan, purfued his cuftomary operations of facrificing lives, and defolating whole tracts of country. Returning to Bokhara, or Bucharia, in 1223, he inveftigated the antiquities of Balk and the doctrines of Zoroafter, and held conferences with the Mahometan doctors, the refult of which was his affent to their tenets, the neceffity of a pilgrimage to Mecca excepted. In 1224 he held a grand diet in the plain of Tonkat, which, though feven leagues in length, could fcarcely contain the tents of all the diftinguifhed perfons that were affembled. In the following year he paffed through Tartary to the borders of northern China, and fubjugated the kingdom of Hya or Tangut. In the province of Shen-fi, on the mountain of Lu-pan, whither he went in order to pafs the fummer heats, he was taken ill; and as he perceived his end approaching, he fummoned the generals of his army, before whom he declared his fourth fon regent, till the arrival of his brother Octai, whom he appointed his fucceffor in the dignity of grand khan of the Moguls and Tartars. Recommending unanimity, and advifing the conduct of the war againft Kin, he expired in Auguft 1227, at the age of 66 years. His remains were interred with great pomp under a beautiful tree which he had fixed upon in returning from a hunting expedition. He had many wives, and left a numerous progeny. "This emperor," fays one of his biographers, "poffeffed the civil and military qualities neceffary for the founder of a mighty monarchy, together with a penetrating and inquiring mind, which, with fuperior culture, might have placed him in the lift of truly great princes. His memory now furvives as that of one of the great conquerors whofe deeds have aftonifhed the world, to which they have proved the moft terrible of fcourges. His fimple laws were long the rule of the countries he governed, and are ftill religioufly obferved by the Crim Tartars." D'Herbelot. Gibbon's Hift. Univ. Hift. Gen. Biog.

ZINGST, in *Geography*, a fmall ifland in the Baltic, near the coaft of Pomerania, and a little to the weft of the ifland of Ufedom. N. lat. 54° 28′. E. long. 12° 50′.

ZINIAR, a name given by the old chemical writers for verdigrife.

ZINIAT, a word ufed by the old chemical writers to exprefs either the action of fermentation, or any thing that is capable of exciting it in bodies.

ZINK. See Zinc.

ZINKOW, in *Geography*, a town of Poland, in Podolia; 32 miles N. of Kaminiec.

ZINN, John Godfrey, in *Biography*, an anatomift and botanift, was born in 1726, ftudied under Haller at Gottingen, and became botanical profeffor in that univerfity. His firft experiments were undertaken in order to afcertain the fenfibility of different parts of the brain; he then proceeded to the examination of the eye, which produced his efteemed work, intitled "Defcriptio Anatomica Oculi Humani, Iconibus illuftrata," Gotting. 4to. 1755. Botany was alfo the fubject of his affiduous ftudy, the refult of which appeared in feveral papers, and in a catalogue of the plants in the academical garden and vicinity of Gottingen, arranged according to the fyftem of Haller. His premature death happened at the age of 32, in April 1758. He was a member of the Academy of Sciences at Gottingen, the Inftitute of Bologna, and the Royal Society of Berlin. Haller. Eloy.

ZINNA, in *Geography*, a town of the duchy of Magdeburg; 18 miles N. of Wittenberg.

ZINNIA, in *Botany*, was fo named by Linnæus, in honour of Dr. John Godfrey Zinn, profeffor of phyfic and botany at Gottingen, author of a *Catalogus Plantarum Horti Academici et Agri Gottingenfis*, printed there in 1757. This work, making an octavo volume, is claffed after Haller's method. Its author has, befides, publifhed various botanical and phyfiological treatifes, and would probably have contributed much more to the advancement of fcience, had he not been cut off, at the early age of 32, in 1758. Haller, whofe whose disciple and successor he was, speaks of him with much complacency; but it is easy to see that his favour was greatly conciliated by Dr. Zinn's preference of his system to that of Linnæus. One principle of the learned Swede he indeed very justly approved, that plants nearly related on the whole ought not to be separated on account of a difference in one particular part. Yet in the application of this rule he surely has wandered widely from the truth, in wishing to unite *Geum, Comarum, Potentilla, Tormentilla,* and *Fragaria.* Such it seems was the avowed opinion of Zinn, in his *Prælectio,* published in 1755; but he has not followed it in his work above-mentioned. In that volume occurs, if we mistake not, the first figure of a *Zinnia,* under the name of a *Rudbeckia;* though the author justly declares it to constitute an indubitably new genus.—Linn. Gen. 437. Schreb. 563. Willd. Sp. Pl. v. 3. 2139. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 91. Pursh 565. Juss. 188. Lamarck Illustr. t. 685. Gærtn. t. 172.—Class and order, *Syngenesia Polygamia-superflua.* Nat. Ord. *Compositæ oppositifoliæ,* Linn. *Corymbiferæ,* Juss.

Gen. Ch. *Common Calyx* ovato-cylindrical, smooth, imbricated, with numerous, obtuse, erect, permanent scales. *Cor.* compound, radiated. Florets of the elevated disk several, all perfect, funnel-shaped, five-cleft, internally villous; those of the radius from five to ten, ligulate, roundish or oblong, abrupt, larger than the disk, permanent. *Stam.* in the perfect florets, Filaments five, very short; anthers united into a cylindrical tube. *Pist.* in the perfect florets, Germen oblong, with two very unequal awns; style thread-shaped, cloven half way down; stigmas two, erect, obtuse: in the female florets, Germen oblong, triangular, without awns; style capillary, cloven half way down; stigmas two, recurved. *Peric.* none, except the unchanged calyx. *Seeds* in the perfect florets, solitary, oblong, quadrangular, compressed. Down of two points, one of them awned. In the female florets solitary, pointless, crowned with the permanent petal. *Recept.* chaffy, with tongue-shaped, channelled, deciduous scales, the length of the calyx.

Ess. Ch. Receptacle chaffy. Seed-down of two erect unequal awns. Calyx imbricated, somewhat ovate. Florets of the radius from five to ten, permanent, undivided.

1. Z. *pauciflora.* Yellow Zinnia. Linn. Sp. Pl. 1269. Willd. n. 1. Ait. n. 1. (Bidens calyce oblongo squamoso, seminibus radii corollâ non deciduâ coronatis; Mill. Ic. v. 1. 43. t. 64. Rudbeckia foliis oppositis hirsutis ovato-acutis, calyce imbricato cylindrico, radii petalis pistillatis; Zinn. Gott. 409. t. 1. Chrysogonum peruvianum; Linn. Sp. Pl. ed. 1. 920, excluding the synonym, which is wrong, and a heap of confusion; see Feuillé 766.)—Flowers sessile. Leaves somewhat heart-shaped, sessile, clasping the stem.—Native of Peru. Cultivated by Miller, but not commonly preserved in our gardens like the following, being less hardy, and not so ornamental. The *root* is annual. *Stem* erect, three or four feet high, branched, angular, leafy. *Leaves* opposite, deflexed, two or three inches long, acute, roughish, entire, rough-edged, with three principal ribs; their base broadish-heartshaped. *Flowers* solitary at the ends of the branches, nearly or quite sessile, with the uppermost pair of leaves close to the base of the *calyx; disk* brownish; *radius* yellow. We perceive a difference between several specimens and figures of this plant, but cannot trace an absolute or constant specific distinction between them. In the Linnæan specimen, the small number of *florets* justifies the specific name, and the *flower* itself is quite sessile. This is undoubtedly Miller's plant, though the radiant *florets* are much more numerous in his figure, and the whole *flower* larger. A specimen under this same name of *pauciflora,* given us by sir Joseph Banks, from Jacquin's herbarium, is what Zinn's figure exactly represents. The *leaves* are shorter, more rounded and heart-shaped, and the *flower* is large, with more or less of a stalk. Its radiant *florets* are numerous, broad, and yellow. How far these characters are permanent, culture and repeated observations must determine. We are rather inclined to suspect the Linnæan specimen, raised in the Upsal garden, is a starved one, the *flowers* perhaps being rendered diminutive by their lateness. It is most probable that a portion of the same seed was sent by Jussieu to Linnæus and to Miller. The plant indeed flowered at Upsal before the year 1753, when Miller says he received his seeds, because it is described, in the first edition of Sp. Pl. printed that year, from the garden specimen now before us.

2. Z. *multiflora.* Common Red Zinnia. Linn. Sp. Pl. 1269. Willd. n. 2. Ait. n. 2. Pursh n. 1. Curt. Mag. t. 149. Linn. Dec. 23. t. 12. Jacq. Obs. fasc. 2. 19. t. 40.—Flowers stalked. Leaves opposite, ovato-lanceolate.—Native of North America. Found on the banks of the Mississippi, flowering in July and August. Annual. *Rays* yellow, orange, and sometimes brick-red. *Pursh.* The latter colour is most common in the gardens of Europe, where this plant is treated as a rather tender annual, like the different species of *Tagetes,* being best raised on a hot-bed, and planted out so as to flower in the autumn. A yellow variety, almost equally common, is less singular and striking in colour. We are not by any means certain that this variety may not be sometimes taken for the foregoing; yet the plant of Zinn and Jacquin, of which we have just given an account, is too different in the great breadth of its *leaves* to be confounded with the present species. The Z. *multiflora* has a more hairy *stem* than the *pauciflora,* much narrower and elongated *leaves,* with three ribs; their surface roughish to the touch. The *flowers* stand each on a hollow, deeply furrowed, terminal stalk, from one to two inches long, much thicker than the stem, and gradually swelling upwards. The *disk* is conical and acute, composed of reddish or tawny *florets,* accompanied by the prominent, dark-green, or blackish, scales of the *receptacle:* the *radius* consists of ten or more broad, elliptical, usually emarginate *florets,* of a deep brick-red, and very smooth, above; pale, greenish, and rough beneath; reticulated with veins, and finally becoming rigid, or membranous.

3. Z. *verticillata.* Whorl-leaved Zinnia. Andr. Repos. t. 189. Willd. n. 3. Ait. n. 3.—Flowers stalked. Leaves whorled, ovato-lanceolate. Radiant florets very numerous.—Native of Mexico. Raised by Messrs. Lee and Kennedy at Hammersmith, about the year 1789. We cannot suppose this to be any thing more than a luxuriant variety of the last. Annual plants, pampered with manure, and every possible advantage of cultivation, are liable to acquire aggregate *leaves,* double *flowers,* and many other characters, which do not appear in a state of nature. These it is the business of the gardener to encourage, and of the botanist to beware of. Having seen no specimen of this plant, we can only judge by the figure, in which we cannot discover any specific distinctions. The *flowers* indeed are rendered very splendid, by their multiplied *radius* of a deep scarlet, and their *disk* seems broader, and less conical, or pointed, than in either of the foregoing species. This last character, if constant, is more material than any which has been mentioned.

4. Z. *elegans.* Purple-flowered Zinnia. Jacq. Ic. Rar. t. 589. Willd. n. 4. Ait. n. 4. (Z. violacea; Cavan. Ic. v. 1. 57. t. 81. Andr. Repos. t. 55.)—Flowers stalked. Leaves opposite, ovate-heartshaped, sessile, clasping the stem, harsh on both sides. Scales of the receptacle jagged and fringed.

fringed. Tubular florets with a hairy disk.—Native of Mexico; said to have been brought to England from Madrid, in 1796, by the late marchioness of Bute; whose botanical acquisitions in Spain, made with no less intelligence than taste, have eminently enriched the gardens of England. This is also a tender annual, flowering from Midsummer to the end of autumn. The *herbage* is stouter, the *leaves* broader, and much more harsh to the touch, like a file, than in any other of the genus. *Flowers*, in a cultivated state at least, as large as the last, with a conical, but rather obtuse, *disk*; the prominent orange-coloured scales of the *receptacle* have many finely-fringed segments; the upper surface of the yellow tubular *florets* is densely shaggy; the *radius* consists of numerous, spreading, obovate *florets*, of a deep lilac, or light purple, colour, less harsh, or scariose, after flowering than in the *multiflora*.

5. Z. *tenuiflora*. Slender-flowered Zinnia. Jac. Ic. Rar. t. 590. Willd. n. 5. Ait. n. 5. Curt. Mag. t. 555. (Z. revoluta; Cavan. Ic. v. 3. 26. t. 251.)—Flowers stalked. Leaves opposite, ovato-lanceolate, pointed. Calyx cylindrical. Radiant florets linear, revolute.—Native of Mexico. Raised here in 1799, by the late captain Woodford, at Vauxhall. This very distinct species requires the same treatment as the rest. They may all, perhaps, succeed, in favourable seasons, as hardy annuals, but are best raised with artificial heat in the spring. The present has much narrower *leaves* than the last, which moreover are nearly smooth. The *flowers* are the smallest of their genus, and distinguished by their bright red, narrow, revolute *radiant florets*, very rough at the edges; the tubular *florets* are yellow, roughish in their disk.

Zinnia, in *Gardening*, contains plants of the annual flowering kind, in which the species cultivated are, the few-flowered yellow zinnia (Z. pauciflora), and the many-flowered red zinnia (Z. multiflora).

These are both plants of the annual flower kind.

Method of Culture.—These annual plants are increased from seeds, which should be sown on a slight hot-bed in the early spring, as March; and when the plants are a few inches high, they should be pricked out on another bed previously prepared to receive them, where they should remain till the advance of summer, when they may be taken up and planted out in the borders of the pleasure-ground, where they blow and complete their seeds for the year following.

They have a fine effect in their leaves and flowers in these situations.

ZINNORE, in *Geography*, a town of Hindoostan, in Guzerat, on the Nerbuddah; 30 miles N.E. of Baroach.

ZINTEN, a town of Prussia, in the province of Natangen, near which the Poles were defeated in 1520; 30 miles S.S.W. of Königsberg. N. lat. 54° 23'. E. long. 20° 20'.

ZINTI, a town of South America, in the viceroyalty of Buenos Ayres, and archbishopric of La Plata; 90 miles S. of La Plata.

ZINU, a province of South America, in the viceroyalty of New Grenada, situated to the north of Choco, and west of Carthagena.

Zinu, or *Sinu*, a town of South America, and capital of a province, on a river of the same name, which runs into the Spanish Main; 90 miles S. of Carthagena. N. lat. 8° 58'. W. long. 75° 48'.

ZINWALD, a town of Bohemia, in the circle of Leitmeritz; 18 miles N.W. of Leitmeritz.

ZINZENDORF, Nicholas Louis, in *Biography*, was born at Dresden in May 1700, and was educated under the inspection of his grandmother, who was a pious woman, accustomed to the perusal of the Scriptures. He was thus led into an early acquaintance with the principal doctrines of the Christian religion, and manifested a peculiar taste for spiritual songs. Under professor Franke at Halle, he became a good classical scholar; and his facility in composing verses was such, that he indited them faster than he could write them. Such, however, was his proneness to dissipation, and particularly gaming, that he squandered away not only his money, but all his effects. From his youth he was fond of forming religious societies, and it is said that he had established seven associations of this kind between the year 1710 and the year 1716, when he left Halle. One of his companions in forming these institutions was baron Frederick von Watteville, in intercourse with whom he first conceived the idea of attempting the conversion of the heathens. With this view they bound themselves by an oath, and determined to employ others in accomplishing this design who were properly qualified for the office. This resolution seems to have taken its rise from a baptized native of Malabar, who had been brought to Halle by the missionary Ziegenbalg. In 1716 Zinzendorf removed to Wittenberg, where he applied diligently to his studies; and in 1719 he quitted Wittenberg, in order to gratify his relations by pursuing his travels. On his tour he remained for some time at Utrecht, prosecuting his studies in history and jurisprudence; but his chief attention was directed to theology, as he had formed a purpose of becoming a preacher. From Holland he proceeded to Paris, where he associated with his friend, Henry, prince of Reuss, and endeavoured to spread his doctrine among the Catholic nobility, by some of whom they were treated with respect, while others contemptuously denominated them Jansenists and Pietists. At this time he was introduced by Father de la Tour, general of the Society of the Oratory, to the archbishop of Paris, and attempts were made, without effect, for gaining him over to the Catholic church. During his abode at Paris he formed an acquaintance with several other persons of distinction. From Paris he proceeded through Switzerland to Germany in 1720, and having arrived at Hernsdorf, in Lusatia, he found his grandmother still living, and employed himself in communicating instruction to the domestics, and corresponding with his friends. Soon after, retaining his purpose of becoming a preacher, he went to Dresden, and having received his property from those with whom it had been entrusted, he purchased the lordship of Bertholdsdorf, in Lusatia, and marrying a sister of the prince of Reuss, distinguished for her piety and virtue, he assigned to her his whole property, that he might not be incumbered and diverted from the prosecution of his design by the cares of the world. About the year 1722 he indulged the notion of a purer church discipline, of which he observed some traces among the Bohemian and Moravian brethren, who, from their earliest connection with the Waldenses and true followers of John Huss, had formed a peculiar religious community. The Christians of this description had undergone from the year 1458 to 1627 severe persecutions, so that they were almost extirpated from Germany; but a small number of them remained, under oppression, in Moravia; and about the year 1720 the sect revived: so that they held frequent meetings, read the Scriptures with their old books of hymns, celebrated in secret the holy sacrament, and introduced, at least in their houses, the ancient church discipline. One of their number, of obscure condition, obtained an introduction to count Zinzendorf, who gave them leave to settle on his estate at Bertholdsdorf. Availing themselves of this permission, a small number of them, consisting of three men, two women,

women, and five children, came hither from Moravia, in Whitfuntide, 1722, and erected on a hill, in a wild marfhy diftrict, a wooden habitation, expofing themfelves to the derifion of the adjacent inhabitants. They were fo poor that the countefs fent them a cow to fupply milk for their children. However, they gradually gained new converts; and when the count and his confort vifited this new fettlement of the Moravian brethren in the month of December, he gave them a cordial welcome, and falling upon his knees, pronounced a benediction on the infant colony. Such was the origin of the village of Hernhut. (See HERNHUTERS and MORAVIANS.) The count, whilft he afforded them protection, left them at full liberty to think for themfelves; more efpecially as he found, upon examination, nothing improper in their doctrine. From this time, count Zinzendorf, in connection with fome other perfons fimilarly difpofed, took pains in giving inftruction to his fubjects, and educating their children; avowing himfelf a true Lutheran, but wifhing that his people might remain totally ignorant of the difputes that fubfifted among Proteftant divines. In 1723 he publifhed a fmall catechifm, entitled "The pure Milk of the Doctrine of Jefus," which, he fays, coft him more labour than all his other works. The count, devoted to the profecution of the work he had undertaken, refided fometimes on his eftate in Lufatia, and fometimes at Drefden, but declined every offer of a place at court. He employed himfelf in the compofition and occafional publication of books adapted to his defign; one of which, being a periodical work, and entitled "The German Socrates," was fuppreffed by order of the council, probably becaufe it cenfured the prevailing indifference about religion, and called upon his fellow-citizens to live in a manner more agreeable to what their religion required, or entirely to renounce it. In 1727 he quitted Drefden, that he might be nearer his favourite object Hernhut, and that he might be at leifure to devote his whole time and attention to the improvement and increafe of his congregation. With this view he made a tour through the greater part of Germany, occafionally preaching, and endeavouring to gain converts. In 1731 he extended his tour to Denmark, and being prefent at the coronation of Chriftian VI., who conferred upon him the order of Dannebrog, which five years afterwards he refigned, becaufe he thought it improper to appear as the inftructor of his flock with the infignia of his order. In this tour he acquainted himfelf with the ftate of the Danifh miffions in the Eaft Indies and Greenland; and on his return he took meafures for carrying into execution the defign he had formed at Halle with his friend Watteville. From this commencement, in the year 1732, arofe that miffionary fyftem of the Moravians which has fince been fo widely and fo wonderfully extended. Between 1732 and 1766 nearly 4000 negroes in the Danifh iflands were baptized; and in 1768 the congregation of New Hernhut and Lichtenfels, in Greenland, amounted to 784 perfons. When the congregation at Hernhut had increafed in 1732 to 500 perfons, the Saxon court became alarmed, and appointed a commiffion for the purpofe of examining their doctrine and principles. Although they were found to be inoffenfive, the count was forbidden to bring any more new emigrants from Moravia; and foon after he received an order to fell his eftate and property, which was a kind of fentence of banifhment from his country. He alfo perceived a coldnefs and referve in the difpofition of his friends. Accordingly he quitted Hernhut, and repaired to his friend count Reufs at Eberfdorf. He now thought ferioufly, as he had done twenty years before, of entering regularly into the church; but the countefs and his friends diffuaded him from adopting this meafure. With a view of becoming tutor to the children of Richter, a merchant at Stralfund, to which he was urged by his pecuniary circumftances, he was examined for orders, and having obtained a flattering teftimonial, was formally ordained at Tubingen. But a change taking place in the circumftances of Richter, this plan did not fucceed. In 1735 he made an attempt to vifit Sweden, but was forbidden to enter the kingdom by an order of government; and this occafioned the compofition of one of his moft important works, entitled "A Letter to the King of Sweden in regard to the general Belief of himfelf and Congregation," which he widely circulated, and which produced various plans for extirpating the Moravian brethren from the empire. In the fame year he vifited Switzerland, and in 1736 he and the countefs made a tour to Holland, where, at the defire of the princefs dowager of Orange, he founded a new colony at Yffelftein, called Heerendyk, which was afterwards removed to Zuyft. On his return he found at Caffel a copy of a Saxon refcript, by which he was forbidden the territories of that electorate, and banifhed from his native country. He was thus reduced to the neceffity of making various excurfions; and on his return he was invited to a conference with the king of Pruffia, who was fo well fatisfied with his doctrine and character, that he advifed him to be regularly ordained. For this purpofe he recommended him to the chief court preacher Jablonfky, by whom he was confecrated bifhop of the Moravian congregation in May 1737. In this year he vifited London, and eftablifhed the brotherhood in England. Here he became acquainted with John Wefley, and maintained a difpute with him on the impoffibility of men's attaining moral perfection, for which the Englifh preacher contended. Although he obtained permiffion to return to Hernhut, it was on condition of his making certain declarations with which he could not comply, and therefore he became a voluntary exile; and was forbidden ever to enter Saxony. In the year 1738 he undertook his firft voyage to America, in the courfe of which he compofed a work entitled "Jeremiah a Preacher of Righteoufnefs." Upon his arrival at the ifland of St. Thomas, he found that all the miffionaries had been thrown into prifon, but he immediately procured their releafe, and liberty for his congregation to affemble. After his return he vifited Holland and Switzerland, wrote in his own defence againft the accufations of his German enemies, and held public affemblies at Geneva. In 1742 he made a fecond voyage to America, and preached alternately with their own minifter to the Lutheran congregation at Germantown, in Pennfylvania, and built for them a place of worfhip. In a Latin fpeech at Philadelphia he laid afide the title of count, and affumed the name of Von Thumfteen, which belonged to his family. The Quakers generally ftyled him friend Lewis. He alfo eftablifhed the celebrated colony at Bethlehem, and made a tour among the Indians, who received him favourably, and, as a token of their friendfhip, gave him the wampum belt. In America, however, he fuffered much abufe and calumny. In 1743 he returned to Europe; and having proceeded to Riga with a view of fettling fome differences among his followers at Livonia, he was arrefted, conveyed to the frontiers, and ordered never to enter the imperial territories any more. In 1747 he obtained permiffion to return to Saxony, after an exile of ten years; and the king, having received from one of the Moravians a confiderable fum of money for the caftle of Barby and diftrict of Doben, iffued a declaration that the fociety fhould be allowed, in every part of his territories, the fame privileges which they had enjoyed at Hernhut. In 1748 he he succeeded in obtaining a commission, which, after particular examination, declared the members of the Moravian community to be true adherents to the Augsburg confession. In the following year he visited England, and obtained an act of parliament for the protection of his followers in the British dominions in America. In 1757 he made his last tour to Switzerland, and from thence proceeded to Holland. In 1760 he died at Hernhut, after an illness of four days, and his funeral was attended by 2000 of his followers, and as many spectators; and his coffin was carried to the grave by thirty-two preachers and missionaries, some of whom had come from Holland, England, Ireland, North America, and even Greenland. Count Zinzendorf was somewhat above the middle size; and his countenance combined seriousness with animation. In early life his manners were elegant, but as he withdrew from intercourse with the world, in more advanced life they became stiff and reserved. To money he was perfectly indifferent, and as he gave to every mendicant, he was often pennyless. His disposition was lively, but he was capable of long-continued and intense application. His memory was prompt and comprehensive, but as he was of a lively imagination it was not very retentive. In his style he bid defiance to all the rules of grammar, and his ambiguous mode of expression subjected him to many inconveniences, so that his meaning was often mistaken and misrepresented. To persons of the lower order he was condescending, and in his intercourse with all mild and candid. In his temper he was irritable and passionate, but placable and forgiving. His activity in doing good and serving others was indefatigable and unbounded; he often promised, it is said, with the best intentions, beyond his ability of performance; and he is charged with having used art and flattery to carry on his own purposes, and to gain converts to his cause. Mosheim, &c. Gen. Biog.

For a further account of the tenets and partisans of the sect with which he was connected, and of which he was, according to his own statement, a reformer, and not a founder, we refer to the articles Hernhuters, Moravians, and Unitas *Fratrum*.

ZINZIBER, Ginger. See Zingiber and Ginger.

Zinziber *Rubrum*, *Red Ginger*, a name by which some authors have called the officinal casumunar-root.

Zinziber *Caninum*, *Dog's Ginger*, in *Botany*, a name given by some of the old writers to the *persicaria urens*, or biting arsmart; a plant which is very hot, and pungent to the taste, and grows in watery places. It had hence the name of *hydropiper*, water-pepper, among the Greeks, and was called *zinziber caninum*, or dog's ginger, by Avicenna and others, from its heat, and from an opinion that it would poison dogs that eat of it.

The Arabian name is *zinzibil alkeleb*.

Zinziber *Caninum* is also a name given by some authors to the *capsicum*, or Guinea-pepper. Ger. Emac. Ind. 2.

ZINZIG, or Sinzig, in *Geography*, a town of France, in the department of the Roer; 18 miles N.N.W. of Coblentz. N. lat. 50° 33'. E. long. 7° 12'.

ZINZILLA, a name by which some medical writers have called that species of the herpes, which we usually call the shingles.

ZINZOACZA, in *Geography*, a town of Mexico, in the province of Mechoacan, anciently the residence of a cacique.

ZIOBERIS, in *Ancient Geography*, a river of Asia, in Hyrcania, which discharged itself into the Rhydage, according to Quintus Curtius. Diodorus Siculus calls it Stiboetes.

ZIOLO, in *Geography*, a town of Italy, in the Paduan; 10 miles S.E. of Padua.

ZION, in *Ancient Geography*. See Sion and Jerusalem.

ZIPH, a town of Palestine, in the tribe of Judah. (Josh. xv. 24.) St. Jerom says, that in his time they shewed the village of Ziph, 8 miles from Hebron eastward. David for some time concealed himself in the wilderness of Ziph. (1 Sam. xxiii. 14, 15.) There was another city called Ziph, near Maon and Carmel of Judah. Josh. xv. 55.

ZIPHRON, or Zephronia, a city N. of the land of promise, now unknown. Numb. xxxiv. 9.

ZIPOETIUM, a town of Asia Minor, in Bithynia, near mount Lyperus, and which had been founded by king Zipoteus. Steph. Byz.

ZIPPORIS, a name which the ancients gave to the town of Sefora or Sauffori. It was the strongest place in Galilee, and its position might be regarded as the key of the province, according to Josephus.

ZIPSERCHLOSS, in *Geography*, a town of Hungary; 6 miles E. of Leutsch.

ZIRBALIS Hernia, a term used by medical writers to express that kind of rupture which is caused by a descent of the omentum into the scrotum.

ZIRBUS, the name by which the Arabian physicians have called the omentum.

ZIRCON, in *Mineralogy*, *Jargon de Ceylon*, Romê de Lisle, *Zircon*, Haüy, a gem originally found in the island of Ceylon, in the sands of rivers, along with spinel, sapphire, temmaline, and iron-sand. Zircon, the gem called the hyacinth, and zirconite, are regarded by most mineralogists as varieties of the same species. They are essentially composed of the earth called zircon, (see Zirconia, in *Chemistry*,) with silex, and a minute portion of iron, which may be regarded merely as the colouring matter. The primitive form of the crystals of zircon, according to Haüy, is an octahedron, composed of two four-sided prisms, whose sides are isosceles triangles. The inclination of the planes of the same pyramid to each is 124°.12; the inclination of the sides of one pyramid to those of the other 82°.50. The angle of the summit is 73°.44. The common forms in which it occurs are rectangular four-sided prisms, rather flatly terminated by four-sided pyramids, the planes of which are set on the lateral planes of the prism under equal angles. The above figure is often truncated in the lateral edges. The angles of the prism, in junction with the pyramid, are often bevelled, and sometimes the prisms are terminated by four planes at each end, two of which at each end form very obtuse angles, and are set on the lateral planes of the prism. The crystals are generally small, and occur loose or imbedded. The surface of the crystals is sometimes rough, and sometimes smooth and shining; that of the grains is uneven, and glistening internally. Zircon is splendent or shining, with a lustre intermediate, between adamantine and resinous. The structure is imperfectly foliated, with the folia parallel to the lateral edges of the prism. The fracture is flatly conchoidal. The prevailing colour of zircon is grey; it is sometimes white, green, and brown, and occasionally yellow, blue, and red. The colours are pale; it is sometimes transparent, but more frequently semi-transparent or translucent: it refracts doubly. Zircon is harder than quartz, but softer than the diamond. The specific gravity varies from 4.5 to 4.7. It is infusible without addition by the blow-pipe.

According to Klaproth, the conftituent parts are,

Zircon - -	69	63
Silex - -	26.50	33
Oxyd of iron -	50	1
	96.	97

Hyacinth: Zircon Hyacinth, Brongniart. — The prevailing colour of this mineral is orange-red; it is fometimes yellow, grey, and green, and very rarely white. It occurs in angular grains, but more frequently in fmall cryftals, which have the following forms. A rectangular four-fided prifm, terminated by four rhomboidal faces at each end, fet on the lateral edges of the prifm; the prifm is fometimes truncated on the edges. Sometimes it occurs in an irregular garnet-fhaped dodecahedron, and fometimes in a flat octahedron. The ftructure is foliated; it has a double rectangular cleavage, and the folia are parallel with the diagonal of the prifm. Hyacinth is tranfparent or tranflucent, and refracts doubly: the luftre is refino-vitreous and fplendent. It is very hard, fcratching quartz with eafe. The fpecific gravity varies from 4.3 to 4.7. Before the blow-pipe it lofes its colour, but not its tranfparency, and is infufible. According to Klaproth, the conftituent parts of hyacinth of Ceylon are,

Zircon - - -	70
Silex - - -	25
Oxyd of iron - -	0.50
Lofs - - -	4.50
	100.

According to Vauquelin, the conftituent parts of hyacinth of Expailly are,

Zircon - - - - -	64
Silex - - - - -	32
Oxyd of iron - - - -	2
Lofs - - - - -	1
	99

Zirconite does not appear to differ from zircon, except in the fituation in which it is found. It occurs in fmall cryftals of a reddifh-brown colour, imbedded in fienite. According to Klaproth, its conftituent parts are,

Zircon - - - -	65
Silex - - - - -	33
Oxyd of iron - - - -	1
	99

Zircon and hyacinth, as we have ftated, were originally found in Ceylon; they have fince been found in various parts of Afia and Europe.

Zircon occurs in confiderable quantities along with fapphire and iron-fand in volcanic fand, in a rivulet near Expailly in Auvergne; alfo near Pifa, and in the volcanic fand of the Vicentine. It has been found in trap-rocks in Bohemia, and in the vicinity of Lifbon. It was firft found in its native fituation at Freidrickfchwarn, in the diftrict of Chriftiana, in Norway, imbedded in fienite. It was alfo found in bafalt near Expailly, and in the mountain of Anife in Auvergne, and alfo in volcanic fcoria in the fame country. It has been found in rolled maffes of fienite by profeffor Jamefon in Scotland, in the county of Galloway; and has fince been met with in granite near Cuffel, in Dumfriesfhire.

Zircon has been found in South America, and in the province of New Jerfey, in the United States.

Zircon and hyacinth are characterized by their great fpecific gravity. Common zircon has been frequently confounded with the diamond, but the fpecific gravity alone would be fufficient to diftinguifh them; that of the diamond not exceeding 3.5. The hyacinth has often been confounded with other minerals. The oriental hyacinth of Romé de Lifle is orange-coloured fapphire. The occidental hyacinth of Dutens is yellow-coloured topaz.

Cruciform hyacinth is crofs-ftone; brown volcanic hyacinth is vefuvian; white hyacinth of Somma is meionite.

The hyacinth of Deffentis, mentioned by Sauffure, is a variety of garnet.

Common zircon is frequently cut and polifhed by the jewellers as a gem. The greyifh-white and yellowifh-white varieties are the moft prized, on account of their refemblance to the diamond. The darker coloured varieties may be deprived of their colour by heat. It is cut into the fame forms as the diamond, and exhibits faintly the fame play of colours, and is not unfrequently fold as an inferior kind of diamond. The hyacinth is alfo employed by jewellers in various kinds of ornaments; but pale garnets and rock cryftals are frequently fold for hyacinths.

ZIRCONIA, or ZIRCON, in *Chemiftry*, the name of a peculiar earth, hitherto only met with in the minerals termed *hyacinth*, and *zircon* or *jargon*. See the preceding article.

Zirconia exifts in the form of a fine white powder, which feels rather harfh when rubbed between the fingers. It has neither tafte nor fmell. It is infufible before the blow-pipe; but when heated violently in a charcoal crucible it undergoes a fort of imperfect fufion, and acquires a greyifh colour and porcelanious appearance. In this ftate it is very hard, and its fpecific gravity is 4.3.

Zirconia is infoluble in water, but has a confiderable affinity for that liquid. It does not combine with oxygen, azote, or any of the fimple combuftibles, but appears to have a ftrong affinity for many metallic oxyds, efpecially for that of iron.

It is infoluble in alkaline folutions, neither can it be fufed with them by the affiftance of heat; but it is foluble in the alkaline carbonates. Sir H. Davy fubjected this earth to the action of galvanifm, and obtained evidences of its containing a metal as its bafis. To this metal he gave the name of *zirconium*. Nothing fatisfactory is known refpecting its nature.

No very accurate analyfis of the falts of this earth have been yet made. From fome experiments of Klaproth and Vauquelin, Dr. Thomfon fixes the weight of its atom at 46.25, though it is probable that this is not to be abfolutely relied upon.

Salts of Zirconia: Nitrate of Zirconia.—This falt may be formed by pouring nitric acid on newly precipitated zirconia. It always contains an excefs of acid, and does not cryftallize. It is decompofed by heat, and moft of the vegetable acids, except perhaps the acetic.

Carbonate of Zirconia is a white infoluble powder. It may be formed by double decompofition with the alkaline carbonates, and folutions of zirconia in acids.

Sulphate of Zirconia.—This falt exifts in the form of a white powder, but may be obtained in fmall needle-formed cryftals. It has no tafte, and is infoluble in water. It is eafily decompofed by heat.

Acetate of Zirconia.—This salt has an aftringent tafte. It does not cryftallize. It is very foluble in water and alcohol.

The other falts of zirconia are moftly white infoluble powders, very little known, and apparently poffeffing very little intereft. With refpect to the general properties of zirconia and its compounds, it may be remarked, that the alkalies and alkaline earth feparate this earth from its combinations with acids. The falts of zirconia have an aftringent, harfh, difagreeable tafte, fimilar to fome of the metallic falts. They are moft of them infoluble in water. Thofe which are foluble yield white precipitates when fulphuric acid, carbonate of ammonia, oxalate of ammonia, tartrate of potafh, and infufion of nut-galls, are dropped into their folutions. Thefe properties fufficiently diftinguifh this earth from *alumina* and *yttria*. For further particulars refpecting this earth, fee the articles above referred to.

ZIRCONITE. See Zircon.

ZIRCONIUM, the metallic bafis of zirconia. See Zirconia *fupra*.

ZIRIANKA, in *Geography*, a fmall river of Ruffia, which runs into the Enifei, near its mouth.—Alfo, a town of Ruffia, on the Niznei Tungufka. N. lat. 16° 16′. E. long. 106° 54′.

ZIRICZEE, a town of Holland, one of the moft ancient in Zealand, and capital of Schouwen, built and furrounded with walls in the year 859, by a perfon named Ziringus, from whom it is called. It was the ancient refidence of the comtes of Zealand, and was at that time a place of much more confequence than it is at prefent, the port being filled with fand. The inhabitants carry on a confiderable trade in grain, falt, and fifh: the town is large and populous, and has feveral good buildings; the church, called the "Munfter," dedicated to St. Levinus, is a handfome ftructure. N. lat. 51° 40′. E. long. 30° 48′.

ZIRKNA, a river of Syria, which runs into the Mediterranean, 8 miles S. of Tortura.

ZIRKNITZ. See Cirknitz.

ZIRKWITZ, a town of Silefia, in the province of Oels; 14 miles N. of Breflaw.

ZIRL, or Cirl, a town of the county of Tyrol, on the Inn; 7 miles W. of Innfpruck.

ZIRNOE, a town of Ruffia, in the government of Saratov; 32 miles S.W. of Saratov.

ZIRO, Lo, a town of Naples, in Calabria Citra; 9 miles E. of Umbriatico.

ZIROVAIA, a fmall river of Ruffia, which runs into the Penzinfkaia gulf, 32 miles S.W. of Oklanfk.

ZIRUA, a fmall ifland in the Mediterranean, near the coaft of Tunis. N. lat. 33° 39′. E. long. 11° 39′.

ZIRWITZ, a town of Silefia, in the principality of Oels; 3 miles E. of Trebnitz.

ZIRZING, a town of Auftria; 6 miles E. of Steyregg.

ZIS, a river of Africa, which rifes in the Atlas, paffes by Sugulmeffa, and lofes itfelf in the fands, in the country of Tafilet.—Alfo, a mountain of Africa, between Sugulmeffa and Fez; 40 miles S.S.E. of Fez.

ZISEL, in *Zoology*, a name given by Buffon to the earlefs marmott, or *mus citellus* of Linnæus. See Citellus.

ZISKA, John, in *Biography*, a diftinguifhed leader among the Huffites, was the fon of a Bohemian gentleman, named "De Trocznou," and celebrated for military valour in his youth. Zifka, denoting "one-eyed," was an appellation, which he bore in confequence of having loft an eye in a combat, on occafion of the perfidious execution of John Hufs and Jerome of Prague, at the council of Conftance. Their followers took up arms, and invited Zifka to be their commander. In 1519 he accepted the invitation; and having affembled a body of peafants, he foon difciplined them fo as to be equal to veteran troops. From a fortrefs which he conftructed on an elevated fituation, and called Thabor, the Huffites derived the name of Thaborites. At the fiege of Rabi he loft his other eye; but though totally blind, he executed his office as commander with great vigour and fuccefs. At Auffig on the Elbe he gained a complete victory over the Catholics, and left 9000 of them on the field, retaliating the feverities which they inflicted on the Reformers, by demolifhing their churches, committing their priefts to the flames, maffacring thofe who were prifoners, and laying wafte their country, and thus rendering his name formidable. Having made himfelf mafter of the new town of Prague, it was invefted by the emperor Sigifmund and other princes: but Sigifmund, being defeated with great flaughter by the Thaborites, was obliged to retreat into Moravia, while Zifka laid fiege to Wifrhade. When the emperor with a frefh acceffion of forces renewed the attack, he loft his whole army, and the town furrendered to Zifka. He alfo difperfed an army of crufaders commanded by an archbifhop; and in 1422 he again routed the army of Sigifmund. In the mean time the Huffites renounced their allegiance to Sigifmund, and chofe for themfelves a king; but this meafure was difapproved by Zifka and the Thaborites, becaufe they were inclined to a republican government; and the new king was compelled to abdicate his crown. Such were the reputation and importance which Zifka acquired, that Sigifmund propofed to him terms of accommodation; but in his journey to hold a conference with the emperor, he was feized with the plague, which terminated his life in 1524. Although the ftory of his having ordered his flefh to be given to the birds and beafts, and his fkin to cover a drum, for the purpofe of founding difmay to his enemies and courage to his friends, be fabulous, it is certain that the Bohemians regarded his memory with fuperftitious veneration. Un. Hift. Gilpin. Gen. Biog.

ZISPATA, in *Geography*, a bay of the Spanifh Main, on the coaft of South America; 80 miles S. of Carthagena.

ZISTERSDORF, a town of Auftria, with a citadel. In the year 1704, this town was miferably laid wafte by the Hungarian rebels; 20 miles N.E. of Vienna. N. lat. 48° 28′. E. long. 16° 43′.

ZITARA, a town of South America, in New Grenada, and capital of a diftrict, to which it gives name, in the province of Chocos; 120 miles S.W. of Santa Fé de Antiquia. N. lat. 6°. W. long. 76° 30′.

ZITHA, or Sitha, in *Ancient Geography*, a town of Afia, in Mefopotamia, on the bank of the Euphrates. Ptolemy.

ZITTAU, in *Geography*, a river of Germany, which runs into the Saal, 4 miles S.S.E. of Bernburg.—Alfo, a town of Lufatia, on the river Neiffe. This town is confidered as one of the beft in Lufatia, and fortified in the ancient manner; it contains two churches within the walls, and three without, with three hofpitals and an orphan-houfe; 17 miles S. of Gorlitz. N. lat. 50° 49′. E. long. 14° 56′.

ZITWA, a river of Lithuania, which runs into the Niemen, 20 miles S.E. of Lida, in the palatinate of Wilna.

ZIVAGEE, or Archachera, a town of Hindooftan, in Concan, on the Pirate coaft; 30 miles S. of Severndroog.

ZIUF, a town of Africa, in the kingdom of Tunis.

ZIVOLO, in *Ornithology*, a name by which fome authors have

have called the smaller species of yellow-hammer, from its constant note, which is only *zi, zi.*

It is of the size of the common sparrow; its beak is thick and short; its breast and belly yellowish, spotted with brown; and its head, back, wings, and tail, of a dusky-brown, but two of the tail-feathers on each side have a variegation of white.

The difference between the male and female in this species is, that the male is yellow, and has some yellow spots on its neck and sides, which are wanting in the female. It is almost always seen on the ground, and feeds on seeds, &c. It seems but little if at all essentially to differ from the common yellow-hammer; and Mr. Ray has some suspicion that they are the same species.

ZIWICA, in *Geography*, a town of Austrian Poland; 35 miles S.W. of Cracow.

ZIZA, in *Ancient Geography*, a town in the interior of Arabia Petræa. Ptol.

ZIZANIA, in *Botany*, an ancient name, ζιζανιον of the Greeks, synonymous with the *infelix lolium* of the Latins, as well as with our Darnel, and belonging to an unprofitable weed, of the tribe of Grasses, which greatly injured the crop of corn, and into which Corn itself was supposed to degenerate. (See Lolium.) Our translators of the New Testament call it Tares! Αιρα was another Greek name for Darnel, and is still used for *Lolium temulentum* in the Morea. *Zizania* was merely adopted, as an unoccupied classical name, by Gronovius and Linnæus, for the present genus, which yields an inferior sort of grain, used by the inhabitants of some parts of North America. We cannot applaud this application of ancient names, to plants to which they could not possibly have originally belonged, though Linnæus often practised it. Gærtner has successfully opposed this principle, but did not always change things for the better.—Linn. Gen. 491. Schreb. 639. Willd. Sp. Pl. v. 4. 394. Mart. Mill. Dict. v. 4. Pursh 60. Ait. Hort. Kew. v. 5. 278. Juss. 33. Poiret in Lamarck Dict. v. 8. 863. Lamarck Illustr. t. 768. Gærtn. t. 82. (Elymus; Mitchell in Ephem. Nat. Cur. v. 8. append. 210.)—Class and order, *Monoecia Hexandria*. Nat. Ord. *Gramina*, Linn. Juss.

Gen. Ch. Male, *Cal.* none. *Cor.* Glume of two lanceolate, membranous, ribbed, clasping valves, one rather larger than the other, and most pointed. Nectary of two ovate obtuse scales. *Stam.* Filaments six, capillary, very short, equal; anthers pendulous, linear, notched at each end, shorter than the corolla.

Female in the same panicle, larger, *Cal.* none. *Cor.* Glume of two valves, closed, except a vacancy at each side just above the base; the outer valve largest, concave, long, straight, rigid, revolute at the edges, embracing the inner at each side, and terminating in a long straight awn; the inner narrower, lanceolate, involute at the edges. Nectary of two acute scales. *Stam.* sometimes present, though minute and imperfect, with small incomplete anthers. *Pist.* Germen superior, oblong; styles two, spreading, capillary, short; stigmas feathery, projecting between the valves of the corolla. *Seed* solitary, oblong, even, polished, naked, unconnected with the glumes.

Eff. Ch. Male, Calyx none. Corolla of two valves; the outer one pointed.

Female, Calyx none. Corolla of two unequal closed valves; the outermost largest, revolute at the edges, with a terminal awn. Styles two, divaricated. Seed solitary, enclosed in the plaited corolla, but unconnected with it.

1. Z. *aquatica*. Canadian Wild-Rice. Linn. Sp. Pl. 1408, excluding the synonym of Sloane. Ait. n. 1. Pursh n. 1. Lambert Tr. of Linn. Soc. v. 7. 264. t. 13. (Z. clavulosa; Michaux Boreal.-Amer. v. 1. 75. Willd. n. 3. Z. palustris; Linn. Mant. 295. Willd. n. 4. Schreb. Gram. v. 2. 54. t. 29.)—Panicle pyramidal, compound, with numerous male flowers, in the lower part; spiked and female above.—Common in all the waters, from Canada to Florida, flowering in July and August, and known by the name of *Tuscarora*, or Wild Rice. *Pursh.* Sir Joseph Banks introduced it into this country in 1790, and still cultivates it abundantly in the ponds of his delightful villa of Spring Grove. The seeds were obtained from Canada in jars of water. Mr. Lambert is of opinion, that this grain might be cultivated in many shallow lakes of Ireland, and turn to considerable advantage. The *root* is certainly annual; not, as Mr. Pursh marks it, perennial; and consists of numerous, long, stout, hairy fibres. *Stems* several, two or three feet high, round, jointed, hollow, leafy. *Leaves* grassy, long, narrow, smooth, with long, close, striated, smooth sheaths. *Stipula* short, somewhat pointed, membranous, decurrent, entire. *Panicle* two feet, or more, in length, erect, and terminating in a compound, close, straight, spiked *cluster*, of numerous *female flowers*; the lower part consisting of still more numerous, drooping *male ones*, of a smaller size, with green or purplish *glumes*, and yellow *anthers*, composing an elegant spreading assemblage, of compound *branches*. We have from Mr. Fraser a mutilated specimen, of what Michaux and Willdenow call *clavulosa*, a name well expressing the appearance of the female flower-stalks, after the *flowers* are gone; being larger than in the common specimens. Other writers consider this is not even a variety of the plant in question, and we submit to their opinion. Linnæus, who cultivated the *Z. aquatica* at Upsal, confounded with it originally a Jamaica species, which he afterwards distinguished. But he by inadvertence, in his *Mantissa* above quoted, applies the name of *palustris* to his original *aquatica*, and cites Browne's Jamaica, who has two *Zizaniæ*, neither of which appears to be this North American grass. We shall attempt to set this matter right under the next species.

2. Z. *effusa*. Jamaica Wild-Rice. (Z. aquatica; Linn. Syst. Veg. ed. 13. 714. ed. 14. 855. Willd. n. 1. Z. n. 1; Browne Jam. 340. Arundo alta gracilis, foliis e viridi cæruleis, locustis minoribus; Sloane Jam. v. 1. 110. t. 67.)—Panicle loose, much branched. Male and female flowers interspersed.—Common in all the waters, or lagoons, of Jamaica. Sloane calls it the Trumpet reed. The *stems* are as thick as the little finger, and appear to be several feet high. *Leaves* longer and broader than in the foregoing, with a strong mid-rib. *Panicle* large, with numerous, whorled, repeatedly compound branches, whose ultimate divisions are quite capillary, and very smooth. We have seen but a few damaged *flowers*. This is unquestionably a very distinct species from the last, though it does not appear that Linnæus ever described it as such. He did not, in fact, distinguish between the names of *aquatica* and *palustris*, but used one at one time, and another at a different period, for the same plant, to which he misapplied Browne's synonym. This has caused great confusion, to remedy which we are obliged to choose a new name, which has some meaning attached to it.

3. Z. *miliacea*. Millet-seeded Wild-Rice. Michaux Boreal.-Amer. v. 1. 74. Willd. n. 2. Pursh n. 2, excluding the references to Willdenow and Sloane.—"Panicle loose, much branched. Male and female flowers interspersed. Glumes with short awns. Seed ovate, smooth."—In meadows and ditches overflowed by the tide, in Pennsylvania and Carolina, perennial, flowering in August. *Pursh.* The *stem* is

is described as rather thick. *Panicle* long and large, much branched. Permanent *corolla* tumid, and, as well as the *seed*, somewhat ovate, with very short awns. We have seen no specimen of this species, but the ovate tumid *glumes*, with the similar form of the *seed*, which gave occasion to the specific name, appear to constitute a very clear distinction between this and both the preceding, nor is the figure of Sloane, which we have referred to our *effusa*, by any means reconcileable to the present plant.

4. Z. *fluitans*. Floating Wild-Rice. Michaux Boreal.-Amer. v. 1. 75. Willd. n. 5. Pursh n. 3.—"Spikes solitary, axillary, about four-flowered; the upper ones male. Glumes beardless."—On the banks of lakes Champlain and St. Laurence; perennial, flowering in July. Of humble stature, with slender, branched, floating *stems*. *Leaves* floating, linear, flat. *Spikes* bristle-shaped; the lower ones female. All the *glumes* are destitute of awns. *Michaux*, *Pursh*.

5. Z. *terrestris*. Land Wild-Rice. Linn. Sp. Pl. 1408. Willd. n. 5. (Katou-Tsjolam; Rheede Hort. Malab. v. 12. t. 60. Raii Hist. Pl. v. 3. 617.)—Panicle nearly simple.—Native of sandy ground, on the coast of Malabar. *Stems* round, leafy, jointed. *Leaves* long and narrow, green, rigid, sharply pointed. *Flower-stalks* slender, from the sheaths of the leaves. *Glumes* leafy, bearing round, blackish, glassy *buds*, (we presume *seeds*). These bruised with the juice of Betle-nut, and applied to the tongue, are supposed to cure the thrush to which children are subject. *Ray*. We have seen no specimen. Linnæus described this species from the *Hortus Malabaricus* alone, and we presume its genus may, at least, be doubtful.

ZIZDRA, in *Geography*, a town of Russia, in the government of Kaluga; 60 miles S.W. of Kaluga. N. lat. 53° 43'. E. long. 34° 54'.

ZIZERIA, a word used by Apicius, and some other authors, to express the intestines of fowls of the gallinaceous kind, often used in decoctions for glysters, &c.

ZIZERS, or ZITZERS, in *Geography*, a town of the Grisons, in the Cadee league; 6 miles N. of Coire.

ZIZEVON, a town of Persia, in the province of Farsistan; 23 miles E.S.E. of Schiras.

ZIZIPHORA, in *Botany*, a mongrel name, composed, as it is said, of *Zizi*, an Indian word, and φέρω, *to bear;* but what is meant by *Zizi*, we are not informed. Morison appears to have received from Aleppo one of the species of this genus, under the name of *Ziziforum*, and Linnæus, with a slight correction, adopted it.—Linn. Gen. 16. Schreb. 21. Willd. Sp. Pl. v. 1. 123. Vahl Enum. v. 1. 216. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 49. Sm. Prodr. Fl. Græc. Sibth. v. 1. 12. Juss. 111. Poiret in Lamarck Dict. v. 8. 865. Lamarck Illustr. t. 18. Gærtn. t. 66.—Class and order, *Diandria Monogynia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, cylindrical, very long, striated, bristly, with five minute marginal teeth, and bearded in the orifice. *Cor.* of one petal, ringent: tube cylindrical, the length of the calyx: limb minute; its upper lip ovate, flat, reflexed, undivided; lower spreading, broadest, in three round equal segments. *Stam.* Filaments two, simple, spreading, about the length of the corolla; anthers oblong, distant. *Pist.* Germen superior, four-cleft; style bristle-shaped, the length of the corolla; stigma cloven, pointed, inflexed. *Peric.* none, except the calyx remaining unchanged, a little gibbous at the base. *Seeds* four, oblong, obtuse, gibbous at one side, angular at the other, very much shorter than the calyx.

Eff. Ch. Corolla ringent; its upper lip reflexed, flat, undivided. Calyx thread-shaped. Seeds four.

The plants of this genus are slender, generally aromatic herbs, or diminutive shrubs, of humble growth, with the habit of *Thymus*, or *Clinopodium;* but distinguished by their long and slender *calyx*, as well as almost capillary tube of the *corolla*, even more than by having only two *stamens*. Their texture is hard and rigid, and they inhabit dry sunny situations. The *leaves* are opposite and undivided. *Flowers* whorled or capitate, red or purplish. *Root* mostly annual; sometimes perennial, and rather woody.

1. Z. *capitata*. Oval-leaved Ziziphora. Linn. Sp. Pl. 31. Mant. 317. Willd. n. 1. Vahl n. 1. Ait. n. 1. Sm. Fl. Græc. Sibth. v. 1. 10. t. 13. (Thymus humilis latifolius; Buxb. Cent. 3. 28. t. 51. f. 1. Clinopodium fistulosum pumilum Ind. Occid. summo caule floridum; Pluk. Phyt. t. 164. f. 4.)—Flowers fasciculated, terminal. Leaves ovate.—Native of Syria, Tauria, and the isle of Cyprus. A hardy annual, flowering in July and August, sometimes kept in botanic gardens. Miller seems to be the first person who raised this plant in England. The *root* is fibrous, branched and zigzag. *Stem* erect, three or four inches high, when cultivated much taller, square, leafy, usually with two opposite spreading branches, besides the central part, clothed all over with fine, short, curved, hoary pubescence. *Leaves* hardly an inch long, entire, hoary, roughish at the edges, furrowed with parallel veins. *Footstalks* one-eighth as long as the leaves. *Bracteas* four at the top of each branch, nearly sessile, like the leaves, but larger, more pointed and fringed; somewhat heart-shaped at the base; about the length of the *flowers*, which are numerous in each head. *Calyx* half an inch long, furrowed, bristly, a little wavy, with slender, sharp, purple teeth. *Corolla* with a white, downy, zigzag *tube*, and pale purplish *limb*. *Stamens* prominent, about as long as the lower lip, with blueish *anthers*. We scarcely perceive any aromatic flavour in the dried plant. Plukenet was much misinformed as to this *Ziziphora* being of West Indian origin.

2. Z. *hispanica*. Spanish Ziziphora. Linn. Syst. Nat. ed. 10. 853. Sp. Pl. 31. Amœn. Acad. v. 4. 263. Willd. n. 2. Vahl n. 2. Ait. n. 2.—Flowers axillary. Leaves obovate, pointed, many-ribbed.—Gathered by Lœfling in Spain. *Root* annual. The *stem* is three or four inches high, cross-branched and bushy, downy with minute recurved hairs. *Branches* leafy. *Leaves* a quarter or one-third of an inch long, fringed; tapering at the base; marked on both sides with conspicuous glandular dots: the lower ones smaller, and somewhat crenate. *Flowers* two or three together, sessile. *Calyx* tapering upwards, strongly furrowed, hispid, about the length of the leaves. *Corolla* externally downy. Linnæus considered the branches as *spikes* and the *leaves* as *bracteas*, but we can see no more reason for this than in any of the following species. The *leaves* in the original specimen still retain a powerful smell of Pennyroyal.

3. Z. *spicata*. Spiked Ziziphora. "An. Hist. Nat. Madr. v. 4. 254." Vahl n. 3.—"Flowers in racemose spikes, imbricated. Bracteas ovate, acute, ribbed. Leaves lanceolate, somewhat toothed."—Native of Spain. Annual. *Stem* from ten to eighteen inches high, throwing out from the base a branch or two as tall as itself. *Leaves* ribbed; the lower ones stalked; the upper sessile. *Flowers* several, on short stalks, standing near together. *Bracteas* broad, entire, acute, fringed. Perhaps a mere variety of Z. *hispanica*. Yet it seems to differ in having the stem *leaves* lanceolate, narrower than those that accompany the *flowers*, which are ovate, not obovate. *Vahl.* We have seen no specimen;

ſpecimen; but this deſcription ſeems to make the inflorescence of the preſent ſpecies really ſpiked rather than whorled, though it does not alter our opinion as to the laſt.

4. Z. *tenuior*. Spear-leaved Ziziphora. Linn. Sp. Pl. 31. Willd. n. 3. Vahl n. 4. Ait. n. 3. (Acinos ſyriaca, folio mucronato, capſulis hirſutis; Moriſ. v. 3. 404. ſect. 11. t. 19. f. 3; alſo A. ſyriaca, tenuiore folio, capſulis hirtis; ibid. f. 4.)—Flowers axillary. Leaves ovato-lanceolate, taper-pointed, acute, entire.—Native of Syria. Sent to Moriſon from Aleppo, by the Rev. Dr. Huntington. We preſume, from a remark of Moriſon under a plant immediately following, that the two varieties here indicated, as well as perhaps a third, with a ſmoother *calyx*, his f. 2, were all ſent him in ſeed, and that he raiſed the plants. If ſo the introduction of this ſpecies ſhould be dated before the time of Miller. The *root* is annual. *Stem* a ſpan high, with many ſquare, downy, leafy *branches*. *Leaves* an inch long, nearly ſeſſile, ſtrongly ribbed, downy, dotted, entire, more or leſs fringed with ſtrong white hairs. *Flowers* ſtalked, moſtly in pairs, altogether axillary. *Calyx* about half the length of the leaves, hoary with fine recurved pubeſcence, more or leſs intermixed with long, prominent, briſtly hairs; its lower part ſwelling much, as the ſeeds ripen. *Corolla* pale, hairy externally, with a dilated throat.

5. Z. *acinoides*. Baſil-leaved Ziziphora. Linn. Sp. Pl. 31. Willd. n. 4. Vahl n. 5. Ait. n. 4. (Clinopodium ſupinum incanum; Amm. Ruth. 51.)—Flowers axillary. Calyx hairy. Leaves ovate, ſtalked, ſomewhat ſerrated.—Native of Siberia. Introduced into England by the late Dr. William Pitcairn, in 1786. Mr. Aiton marks it as perennial. The *ſtems* are diffuſe, branched, bluntly quadrangular, finely downy. *Leaves* ſcarcely aromatic, though dotted with pellucid ſpots, many-ribbed, rough-edged, and ſomewhat fringed, from half to three-quarters of an inch long, on *footſtalks* about half or a third as much. *Flowers* all axillary, three, four, or more, together; on downy *ſtalks*, half the length of the footſtalks. *Calyx* cylindrical, ſtrongly ribbed, not downy, but beſet with numerous, prominent, horizontal hairs. *Corolla* hairy, its limb larger than in the firſt and ſecond ſpecies, ſcarcely ſo long as the third, of a light purple, or lilac, eſpecially the lip. *Anthers* large, ovate, purple.

6. Z. *taurica*. Narrow-leaved Ziziphora. Bieberſt. Taur.-Caucaſ. v. 1. 18.—Flowers axillary. Leaves linear-lanceolate, ſtriated, obtuſe, entire.—Native of mount Caucaſus and its neighbourhood, among lime-ſtone rocks, or about the ſtony banks of torrents, flowering in June and July. We received ſpecimens of this, and all the following ſpecies, from the Chevalier de Steven. The *root* is annual, long, tapering and zigzag. *Stems* one or more, ſcarcely divided, except at the bottom, aſcending, near a ſpan long, not compoſed of oppoſite *branches* croſſing each other, as in Z. *tenuior*, to which the author of the Flora Taurico-Caucaſica conſiders this plant very nearly allied. Without adverting to the greater ſize of the *corolla*, which is very likely to vary, and to the pubeſcence of the *calyx*, which certainly does, the *leaves* appear to be much narrower and more obtuſe; not acute or ſpinous-pointed. The whole herb ſmells ſtrongly, but pleaſantly, of Penny-royal, and its *leaves* are dotted as in the *tenuior*. One of our ſpecimens has broader *leaves* than the other, and rather ſhakes our opinion of its being a diſtinct ſpecies.

7. Z. *ſerpyllacea*. Thyme-headed Ziziphora. Bieberſt. Taur.-Caucaſ. v. 1. 18. (Serpyllum orientale, folio pulegii vulgaris; Tourn. Cor. 13.)

β. Bieberſt. ibid. (Serpyllum orientale, folio pulegii cervini; Tourn. Cor. 13. Herb. Tourn.)

Cluſters terminal, capitate, ſomewhat leafy. Leaves lanceolate, naked, even, obtuſe. Stems rather ſhrubby, aſcending.—Native of the graſſy hills of Caucaſus, flowering from June to Auguſt. β of open fields in Georgia, about Teflis; communicated by the Chevalier de Steven. The *ſtems* are rather woody, their *branches* hoary, with fine, recurved, denſe hairs. *Leaves* ſmooth, with copious pellucid dots, and the flavour of Penny-royal. They have a mid-rib, but no lateral ribs, veins, or furrows. *Flowers* ſtalked, crowded at the ſummit of each branch into a cloſe tuft, ſome of the lowermoſt being axillary. *Flower-ſtalks* round, clothed with fineſt poſſible hoary pubeſcence, as are alſo the ſtrong ribs of the *calyx*, whoſe teeth are fringed with long white hairs. Limb of the *corolla* rather large, and *ſtamens* prominent. The variety β, which is all we have ſeen, is ſaid to differ only in having narrower, perfectly entire, *leaves*, which are alſo more crowded than in α. If there be any affinity between the two varieties, neither of them can poſſibly be the Z. *ſerpyllacea* of Curt. Mag. t. 906. See the following ſpecies.

8. Z. *daſyantha*. Hairy-headed Ziziphora. Bieberſt. Taur.-Caucaſ. v. 1. 18. (Z. ſerpyllacea; Sims in Curt. Mag. t. 906. Ait. n. 5. Z. Pouſchkini; Sims in Curt. Mag. t. 1093. Ait. n. 6.)—Cluſters terminal, capitate, ſomewhat leafy. Calyx denſely hairy. Leaves ovate, obtuſe, notched. Stems procumbent.—Native of mountainous parts of Georgia, towards Caucaſus, flowering from July to September. Introduced into this country by Mr. Lodgiges. The *root* is perennial, and rather woody, as is the lower part of the ſpreading, nearly proſtrate, hairy, purpliſh *ſtems*. *Leaves* ſtalked, about a quarter of an inch long, roundiſh-ovate, ribbed and veiny, diſtantly ſerrated, dotted, roughiſh with ſhort hairs, eſpecially the ribs beneath. *Flowers* numerous, crowded into very denſe oval heads. *Calyx* in our ſpecimens quite concealed by very long, denſe, ſpreading, hoary hairs, much more remarkable than in any other known ſpecies. Limb of the *corolla* rather large. *Stamens* more or leſs prominent, though variable in length, with large *anthers*. The colour of the *flowers* may very well vary between the two extremes repreſented in the Botanical Magazine. The ſmell of the *herb* may alſo be variable. We cannot but think the original opinion of our judicious friend Dr. Sims far preferable to that which induced him to ſeparate the above two plants. Leſt we ſhould be wrong however, it is proper to announce that our ſpecimen of Z. *daſyantha*, from the Chevalier de Steven, has little or no ſcent, and agrees beſt with Z. *Pouſchkini*. The *Flora Taurico-Caucaſica* ſpeaks of a variety, found in the elevated fields of Georgia, in which the *leaves* are rather narrower, and the hairs of the *calyx* ſhorter, as well as fewer. The author eſteems this to be cloſely related to Z. *hiſpanica*, ſee n. 2, of which perhaps he had not examined an authentic ſpecimen. No two ſpecies of this genus, or any other, can be more diſtinct, than the Linnæan *hiſpanica*, and the plant of which we are treating.

ZIZIPHUS, perhaps *Zizipha* of Pliny, though reckoned by him among the kinds of apples; certainly *Ziziphus* of Columella; as well as of Caſpar Bauhin and others of the earlier modern botaniſts; ζίζιφι of the modern Greeks. Shaw, in his *Specimen Phytographiæ Africanæ*, n. 631, traces this word to the African or Mooriſh name of the ſame fruit *Aſafiſa*; but its Arabic appellation, *Zizouf*, comes much nearer.—Juſſ. Gen. 380. Tourn. t. 403. Lamarck Dict. v. 3. 316. Illuſtr. t. 185. Purſh 188.

 Gærtn.

Gærtn. t. 43. (Z. excluding PALIURUS, ſee that article; Willd. Sp. Pl. v. 1. 1102. Sm. Prodr. Fl. Græc. Sibth. v. 1. 159. Ait. Hort. Kew. v. 2. 18. Rhamni ſpecies; Linn. Gen. 105. Schreb. 142.)—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Dumoſæ*, Linn. *Rhamni*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, nearly flat, in five ſpreading, ovate, equal, coloured, deciduous ſegments. *Cor.* Petals five, minute, obovate, between the ſegments of the calyx, but much ſhorter, oppoſite to the ſtamens, ſpreading horizontally. *Stam.* Filaments five, ſhort, lying over the petals, and not half ſo long; anthers roundiſh, of two lobes. *Piſt.* Germen ſuperior, orbicular, depreſſed; ſtyle one, very ſhort; ſtigmas two or three, obtuſe. *Peric.* Drupa oval, or roundiſh, pulpy, of one cell. *Seed.* Nut ſolitary, the ſhape of the drupa, of one or two cells, with ſolitary kernels.

Eſſ. Ch. Calyx flattiſh, in five deep ſegments. Petals five, oppoſite to the ſtamens. Drupa ſuperior. Nut of one or two cells.

Obſ. We have already (ſee RHAMNUS and PALIURUS) declared our determination of ſeparating all theſe genera, though, like Willdenow and ſome others, the writer of this has united *Ziziphus* and *Paliurus*, in the *Prodromus Fl. Græc.;* an error which will be corrected in the *Flora Græca* itſelf. With reſpect to ſome of the ſpecies, we can only rely on thoſe who have deſcribed the *fruit*, on which the diſtinction chiefly depends. They are all ſhrubby, and for the moſt part thorny, with alternate, ſimple, undivided, deciduous, ſtrongly ribbed *leaves*, and ſmall, axillary, tufted, ſometimes racemoſe and partly terminal, *flowers*, of a yellow or greeniſh colour, and inconſpicuous appearance; their *calyx* more flat, for the moſt part, than that of *Rhamnus*. The *fruit* is in moſt inſtances eatable, or medicinal. In a few inſtances, the *petals* are wanting.

Sect. 1. *Thorns or prickles none.*

1. Z. *lineata.* Veiny Jujube. Willd. n. 1. (Rhamnus lineatus; Linn. Sp. Pl. 281. Amœn. Acad. v. 4. 308. Oſbeck It. 219. t. 7. Engl. ed. v. 1. 353. t. 7.)—Stem erect, unarmed. Leaves roundiſh-ovate, obtuſe, wavy. Cluſters terminal; their lower flowers axillary.—Gathered by Oſbeck, on the French iſland, in the river of Canton, flowering in September. A buſhy ſhrub, often as tall as a man, with copious, alternate, round, leafy, finely downy *branches*. *Leaves* alternate, on ſhort ſtalks, of a roundiſh, abrupt, often emarginate, figure, half an inch long at moſt, ſmooth on both ſides; dark green above; paler and yellowiſh beneath, with very elegant, oblique, parallel, red veins. *Flowers* about the ends of the branches, ſtalked, partly axillary, partly collected into terminal ſmooth *cluſters*. *Calyx* a little concave, or bell-ſhaped, at the baſe; its ſegments lanceolate, as are likewiſe the *petals*. *Anthers* black before they burſt. *Drupa* ſmall, oval, ſeated on the orbicular permanent baſe of the calyx.

2. Z. *volubilis.* Twining Jujube. Willd. n. 2. Ait. n. 1. Purſh n. 1. (Rhamnus volubilis; Linn. Suppl. 152. Walt. Carol. 101. Jacq. Coll. v. 2. 236. Ic. Rar. t. 336.)—Stem twining, unarmed. Leaves ovate, acute, ſomewhat wavy. Umbels axillary and terminal, ſtalked.—In deep ſwamps, near the ſea-coaſt, from Virginia to Carolina, flowering in June. *Flowers* ſmall, greeniſh-yellow. *Fruit* oblong, violet-coloured. It aſcends the higheſt trees of *Cupreſſus diſticha*, in the Diſmal ſwamp, near Suffolk in Virginia, and is known there by the name of Supple-Jack. *Purſh.* The *branches* are round and ſmooth. *Leaves* ſtalked, drooping, one and a half or two inches long, and near one broad, acute, and tipped with a ſmall point, ſmooth, with oblique parallel veins, more numerous than in the laſt; their under ſide rather the paleſt. *Flowers* ſmall, pale. *Drupa* ſmall, blackiſh, of a long oval ſhape. *Nut* of two cells in the wild ſtate, according to Walter, though Jacquin, in the cultivated plant, found only one. Lamarck, in an obſervation at the end of this genus, though he allows this ſpecies to have the proper fruit of *Ziziphus*, gives his reaſons for keeping it in *Rhamnus;* theſe are the concave *calyx*, and the want of a fleſhy diſk, or, in Linnæan language, "receptacle of the flower." Probably the ſame remarks would apply to the preceding ſpecies, which Lamarck alſo excludes from *Zizyphus*. We are ready to allow that they both have more of the habit and foliage of *Rhamnus*, and their *fruits* are ſo ſmall, it may be difficult to ſay whether they are *drupas* or *berries*. Not having had an opportunity of inveſtigating this point ourſelves, we muſt rely on thoſe who have.

3. Z. *peruviana.* Peruvian Jujube. Lamarck n. 12.—Stem unarmed. Leaves elliptic-obovate, ſparingly and minutely toothed, ſomewhat angular, rather fleſhy, ſmooth. Petals acute, longer than the calyx.—Native of Peru. Long cultivated in the public garden at Paris, from whence the younger Linnæus procured a ſpecimen, and where Lamarck ſaw it flowering for many ſucceſſive years, but without producing fruit, which led him to ſuppoſe the flowers might be dioecious. The plant itſelf appears now to be no longer in exiſtence there, no mention being made of it in profeſſor Deſfontaine's Tableau de l'Ecole de Botanique au Jardin du Roi, ed. 2. printed in 1815. This is an evergreen, branching, looſely ſpreading *ſhrub*, about three feet high, ſmooth in every part. *Branches* a little zigzag, nearly round. *Leaves* ſcattered, ſtalked, from an inch to an inch and a half long, generally obovate, blunt, or ſometimes pointed, thick and ſomewhat fleſhy, of a glaucous green, with a mid-rib, and a few ſcattered veins, none of which ſeem to be viſible but in a dried ſtate, and then but ſlightly. The margin is irregularly angular, each angle tipped with a glandular tooth. Our ſpecimen has no *flowers*. Lamarck ſays they are ſmall, axillary, two or three together, or ſolitary, ſtalked, yellowiſh-white, widely expanded, five-cleft. *Petals* oval, pointed, flat, larger than the *calyx*.

4. Z. *emarginata.* Notched Jujube. Swartz Ind. Occ. 1954.—Stem erect, unarmed. Leaves roundiſh-ovate, emarginate. Umbels axillary, ſtalked. Petals none.—Gathered by Mr. Fahlberg, in the Weſt Indian iſland of St. Bartholomew. The *ſtem* is ſhrubby, with round, erect, rigid *branches*, whoſe bark is grey and ſmooth; their extremities angular. *Leaves* ſtalked, alternate, but approaching each other in pairs, ſo as to become nearly oppoſite, rather membranous, very ſmooth on both ſides, an inch or an inch and a half long, entire, the extremity only being ſlightly emarginate. *Footſtalks* ſhort. *Umbels* oppoſite. *Stalks* the length of the footſtalks, thickened as the fruit advances. *Partial ones* from three to ſix, rather longer, ſingle-flowered. *Calyx* concave, with a ſpreading limb, in five acute ſegments, divided as it were into two cavities. *Petals* none. *Filaments* very ſhort, inſerted below the diviſions of the calyx. *Anthers* ovate, embraced at each ſide by the hollows in the ſegments of the calyx. *Stigmas* two, obtuſe. *Drupa* roundiſh-ovate, ſmooth, the ſize of Allſpice, crowned with the permanent *ſtyle*. *Nut* of two cells, with ſolitary kernels. *Swartz.*

Sect. 2. *Branches prickly.*

5. Z. *Lotus.* Lotus Jujube. Willd. n. 4. Lamarck n. 2. Ait. n. 3. (Z. ſylveſtris; Tourn. Inſt. 627. Shaw Afric.

Afric. n. 632. f. 632. Rhamnus Lotus; Linn. Sp. Pl. 281. "Desfont. in Act. Paris, for 1788. 446. t. 21. Mungo Park's Travels, 99, with a plate.")—Prickles in pairs; one of them hooked. Leaves elliptic-oblong, flightly crenate, three-ribbed, fmooth on both fides.—Native of Africa, efpecially of the kingdom of Tunis, "in a tract called *Jereed*, which was formerly the country of the *Lotophagi*. The Arabs know this plant by the name of *Seedra*. It has the habit of a *Rhamnus*, and the *flowers* of the Common Jujube. But the *fruit* is fmaller, rounder, and fweeter; the fize of Sloes, with a large ftone. This *fruit* is borne on every part of the branches, like Goofeberries; whereas that of the Common Jujube grows only on the flender annual fhoots, thrown out from the ends of the branches. The *Z. vulgaris* is 20 feet, or more, in height, with a large furrowed *ftem*, twifted *branches*, knotty at the extremities, and larger oblong *leaves*; but the *Lotus* is fcarcely three or four cubits high, with numerous fhoots from the fame root, which are fmoother, ftraighter, and paler, or whitifh; the *leaves* fmall, round, and more rigid. The *fruit* is ripe, and fit for eating, in December and January." Such is Dr. Shaw's very intelligent account; to which we may add, that the *prickles* grow in pairs, both of them very ftraight, flender, and fharp, when young, but in procefs of time one becomes thick and hooked, the other much elongated, remaining quite ftraight. The *leaves* are at moft an inch long, perfectly fmooth, naked, and green, on both fides; their three ribs fometimes feparate, fometimes more or lefs combined.

6. Z. *Napeca*. Smooth Indian Jujube. Willd. n. 5. Lamarck n. 11. (Rhamnus Napeca; Linn. Sp. Pl. 282. Rh. n. 87; Linn. Fl. Zeyl. 36. Jujuba indica fpinofa, folio et fructu longiori; Pluk. Almag. 199. Prunus zeylanica fpinofa, &c.; Pluk. Phyt. t. 216. f. 6. Vidara littorea; Rumph. Amboin. v. 2. 119. t. 37.)—Prickles generally in pairs, hooked. Corymbs axillary, many-flowered. Leaves ovate, acute, finely ferrated, fmooth on both fides. Fruit elliptical.—Native of Ceylon, Amboyna, and other iflands of the Eaft Indies. We know this only by the fpecimen in the Linnæan herbarium, which does not quite agree with the defcription in the *Flora Zeylanica*, the *leaves* being neither oblique, unequal, nor bluntifh, but exactly as reprefented by Plukenet and Rumphius. The *branches* are fomewhat zigzag, round, or a little angular, with a fmooth whitifh bark; rough with mealy down when young, like the flower-buds, ftalks, and young leaves. *Prickles* ftout, recurved, dark brown. *Leaves* an inch, or an inch and a half long, elliptic-ovate, acute, tipped with a fmall glandular point, finely and bluntly ferrated, ftrongly three-ribbed; paler and yellowifh beneath. *Footftalks* quarter of an inch long, a little downy. *Flowers* very numerous, in denfe, compound, downy or mealy, corymbofe clufters, on fhort axillary ftalks. *Drupa* like an olive, elliptical, or fomewhat ovate; its flavour acid and aftringent. Rumphius fays, this fruit is feldom eaten but with falt, or as a fauce to fifh or other food, for the purpofe of exciting an appetite. Lamarck unites this fpecies, or at leaft its fynonyms, with the *Rhamnus Spina-Chrifti* of Linnæus, of which we fhall fpeak hereafter; fee n. 15.

7. Z. *Jujuba*. White-leaved Indian Jujube. Willd. n. 6. Lamarck n. 6. Ait. n. 4. (Rhamnus Jujuba; Linn. Sp. Pl. 282. Rh. n. 89; Linn. Fl. Zeyl. 36. Manffanas; Sonnerat Nouv. Guin. 134. t. 94. Malum indicum; Rumph. Amboin. v. 2. 117. t. 36. Perin-toddali; Rheede Hort. Malab. v. 4. 85. t. 41.)—Prickles folitary, deflexed. Corymbs axillary, many-flowered.—Leaves roundifh-ovate, obtufe; downy and fnow-white beneath.—Native of the Eaft Indies. A ftove plant in England, flowering in April and May. When wild, it makes a *tree* of a moderate fize. The *branches*, *flower-buds*, *ftalks*, and backs of the *leaves*, are all white with fine, denfe, entangled, rather ftarry, pubefcence. Form and fize of the *leaves* much like the laft, but rather rounder and more blunt; the margin crenate, or bluntly ferrated; upper fide very fmooth, of a fine green. *Inflorefcence* like the laft. *Flowers* white; fometimes fix-cleft and hexandrous. *Style* divided. *Drupa* globular, or fomewhat heart-fhaped. *Nut* rugged, with two green kernels. Sonnerat reckons this fruit among the beft that are the produce of New Guinea. Rheede fpeaks of it as "agreeably acid," and more olive-fhaped than in Sonnerat's figure. Cultivation perhaps may account for thefe differences. Hence we prefume *Z. mauritiana*, Lamarck n. 7, may be but a variety of this.

8. Z. *Xylopyrus*. Wooden-fruited Indian Jujube. Willd. n. 7.—"Prickles folitary, recurved. Leaves ovate, rather acute, fomewhat heart-fhaped; downy beneath. Flowers corymbofe."—Native of defert places, at the bottoms of hills in the Eaft Indies. A *tree*, fcarcely taller than a man. *Branches* hoary. *Leaves* broadly-ovate, often in fome degree heart-fhaped, not unfrequently oblique; unequally ferrated; dark coloured above; clothed beneath with very fine white down. *Prickles* few, fmall, folitary under each footftalk. *Flowers* in axillary ftalked corymbs. *Calyx* downy. *Drupa* dry, infipid, flightly aftringent, larger than a cherry. *Nut* rugged. *Retzius*, *Willd.* Poffibly this may be *Z. rugofa*; Lamarck n. 8, for which that author cites *Frutex bifnagaricus fpinofus*, &c.; *Pluk. Phyt.* t. 29. f. 7.

9. Z. *Oenoplia*. Velvet-leaved Jujube. Willd. n. 8. Lamarck n. 5. Mill. Dict. ed. 8. n. 3. (Rhamnus Oenoplia; Linn. Sp. Pl. 282. Rh. n. 88; Linn. Fl. Zeyl. 36. Jujuba aculeata, nervofis foliis, infra fericeis, flavis; Burm. Zeyl. 131. t. 61.)—Prickles folitary, conical, recurved. Leaves unequally ovate, or half-heartfhaped, acute; filky beneath.—Native of Ceylon. A fmall *tree*, with downy branches, and fhort, thick, hooked *prickles*. *Leaves* two inches long, very obfcurely ferrated; remarkably uneven or oblique at the bafe, the three ribs alfo being much nearer one margin than the other; the under fide finely filky and yellowifh; the upper alfo filky while young, but in a lefs degree. *Flowers* in little denfe, filky, axillary tufts.

10. Z. *iguanea*. Lizard Jujube. Lamarck n. 4. (Rhamnus iguaneus; Linn. Sp. Pl. 282. Jacq. Amer. 74. Jujube americana fpinofa, loti arboris foliis et facie, fructu rotundo parvo dulci; Commel. Hort. v. 1. 141. t. 73.)—Prickles in pairs, unequal, divaricated. Leaves ovate, pointed, ferrated, fmooth on both fides. Clufters axillary, monoecious. Petals wanting. Fruit roundifh.—Native of the Weft Indies, as well as of the neighbouring continent, in bufhy, rocky, or ftony places, where the *Lacerta Iguana*, reported to be fond of this fruit, is likewife frequently to be met with. This is an inelegant trailing *fhrub*, with round, zigzag, fcarcely downy, *branches*. *Leaves* thin, pliant, three-ribbed, very fmooth, two or three inches long, fometimes more, Jacquin fays eight inches, though rarely, in which cafe they are more elliptical. The *prickles* are long and flender, in pairs under each footftalk; one of them always ftraight; the fhorteft fometimes curved, but not remarkably. *Flowers* fmall, yellow, according to Jacquin deftitute of *petals*. *Drupa* roundifh or ovate, yellow, twice the fize of a pea, with a fweet pulp, and a rugged *nut*, of one cell. Willdenow feems to have omitted this fpecies entirely.

11. Z. *ſinenſis.* Chineſe Jujube. Lamarck n. 3. Deſfont. Tabl. 231.—“ Young branches prickly, downy; old ones unarmed. Leaves ovate-oblong, ſharply ſerrated. Petals reflexed under the calyx.”—Cultivated in the public garden at Paris, and ſaid to be a native of China. As this point is uncertain, how much better might the name of *cryptopetala* have been choſen! Lamarck deſcribes the preſent ſpecies as a *ſhrub*, only three or four feet high, loſing its ſlender, unequal, briſtle-like prickles as the *branches* advance in age. *Leaves* of a very pale green, crowded, three-ribbed, rather ſmaller than thoſe of *Z. vulgaris* hereafter deſcribed; we preſume they are quite ſmooth. *Footſtalks* ſhort and downy. *Flowers* ſmall, whitiſh, axillary, ſolitary or in pairs, remarkable for having their *petals* ſo completely reflexed, and concealed by the *calyx*, as not to be viſible when we regard the flower vertically. *Lamarck.*

12. Z. *rotundifolia.* Round-leaved Jujube. Lamarck n. 9. (Jujuba, ſive Ziziphus, zeylanica rotundifolia crenata minor, foliis ſubtus lanuginoſis; Pluk. Phyt. t. 197. f. 2. Burm. Zeyl. 132.)—“ Prickles in pairs; one of them recurved. Leaves roundiſh-oval; downy beneath.”—Native of Ceylon. *Leaves* ſmall, perhaps hardly an inch long, rather more rounded than in Plukenet's figure, ſlightly toothed; ſmooth above; cottony beneath; on very ſhort *footſtalks*. *Branches* ſlender, cylindrical. *Prickles* ſmall. An Indian ſpecimen in the Linnæan herbarium, attached to *Z. Napeca*, to which it certainly is very little related, agrees in many points with this deſcription of Lamarck, except that the very ſmall *prickles* are ſolitary, nor are the footſtalks very ſhort. We know not to what other ſpecies of *Ziziphus* to refer this ſpecimen. It is marked *Ber*, and ſaid to afford gum lac, which is collected from it by winged inſects.

13. Z. *angulata.* Angular-branched Jujube. Lamarck n. 10.—“ Prickles in pairs, ſtraight. Leaves roundiſh-oval, ſomewhat toothed, ſmooth on both ſides. Branches acutely angular.”—Deſcribed from the herbarium of Juſſieu, without fructification. The angular *branches* ſtrikingly diſtinguiſh this ſpecies from all the reſt. They are woody, ſmooth, zigzag, ſquare, with prominent acute angles. *Leaves* three-ribbed, an inch and a half broad, on ſhort *footſtalks*. *Lamarck.* Nothing is recorded of the native country of this plant.

14. Z. *vulgaris.* Common Jujube. Willd. n. 9. Lamarck n. 1. Ait. n. 5. Sm. Fl. Græc. Sibth. t. 241. (Z.; Dod. Pempt. 807. Zizypha; Camer. Epit. 167. Rhamnus Zizyphus; Linn. Sp. Pl. 282. Pall. Roſſ. v. 1. part 2. 24. t. 59. C. L. Willich Obſ. 5. Jujube Arabum, ſive Ziziphus Dodonæi; Ger. Em. 1501.)—Prickles in pairs, unequal. Leaves ovate, abrupt, bluntly ſerrated, ſmooth. Flowers in axillary tufts. Fruit elliptical.—Native of the ſouth of Europe. Gathered by Dr. Sibthorp about Megara, and on mount Parnaſſus. It has been cultivated in England ever ſince Parkinſon's days, but requires the ſhelter of a green-houſe, and though it may ſometimes bloſſom, never bears fruit. Pliny ſays the Jujube-tree was brought, in his time, from Syria into Italy. When wild it attains the ſize of a ſmall *tree*, with round, ſmooth, glaucous *branches*, zigzag and leafy when young. The *prickles* make no appearance on the young leafy ſhoots, but the following year they become ſtrong thorns, one of them an inch long, the other much ſhorter, and ſometimes, not always, recurved, as Willich well obſerves. *Leaves* rather crowded, deciduous, on ſhort ſtalks, ovate, ſomewhat tapering into a broad blunt point, frequently emarginate; their edges copiouſly though bluntly ſerrated; both ſurfaces ſmooth; the under paler, ſtrongly three-ribbed; their length an inch and a quarter or an inch and a half. *Flowers* yellowiſh, on ſhort ſtalks, in little axillary tufts, not much longer than the footſtalks. *Petals* obtuſe, half the length of the *calyx*. *Stigmas* two or three. *Drupa* the ſize and ſhape of an olive, blood-red, ſweet, mucilaginous, eſteemed good in foreneſs or inflammation of the mouth and throat, but are out of uſe in our preſent practice. If Pallas's plate above quoted be the true *Z. vulgaris*, of which we cannot help feeling ſome doubt, a compariſon of that plate with the old wooden cut of Camerarius, may ſerve to ſhew how ſuperior the artiſts of thoſe earlier times were to ſome of our modern delineators and colourers.

15. Z. *Spina Chriſti.* Chriſt's-thorn Jujube. Willd. n. 10. (Z. africana; Mill. Dict. ed. 8. n. 4. Rhamnus Spina Chriſti; Linn. Sp. Pl. 282. Oenoplia ſpinoſa; Cluſ. Hiſt. v. 2. 313. Nabca, Paliurus Athenæi credita; Alpin Ægypt. 16. t. 19. Jujube ſive Zizyphus africana, mucronatis foliis, ſpinâ gemellâ; Pluk. Almag. 199. Phyt. t. 197. f. 3.)—Prickles in pairs, ſtraight. Corymbs axillary, ſtalked, many-flowered. Leaves ovate, finely crenate, ſmooth on both ſides. Fruit globoſe.—Native of Ethiopia and Paleſtine. Seeds collected near Jeruſalem, by Haſſelquiſt, produced the plant deſcribed by Linnæus, a wild ſpecimen of which, ſent alſo by Haſſelquiſt, is preſerved in the Linnæan herbarium. Miller alſo raiſed this ſpecies from Syrian ſeeds, ſo that it is entitled to a place in Hort. Kew. Reſpecting Plukenet's ſynonym, we feel no doubt. The cut of Alpinus as much reſembles *Z. Napeca*, n. 6, in the foliage, but the globoſe *fruit* agrees beſt with the ſpecies before us. The *prickles* are hardly viſible on our ſpecimen, which is a young luxuriant leafy branch, in flower. They perhaps acquire their full proportion on older branches, as in *Z. vulgaris*, n. 14. The *leaves* are ſcattered, of a broad-ovate, ſomewhat roundiſh, obtuſe figure, two and a half or three inches long, and two wide, ſtrongly three-ribbed, with tranſverſe veins, minutely and ſlightly crenate rather than ſerrated, very ſmooth and even on both ſides; paler beneath. *Footſtalks* ſcarcely an inch long; downy on their upper ſide. *Corymbs* forked, downy, many-flowered, each on a ſolitary axillary ſtalk, ſhorter than the *footſtalk*. *Bracteas* awl-ſhaped. In our only expanded *flower*, the ſegments of the *calyx*, as well as the *petals* and *ſtamens*, are ſtrongly reflexed, quite under the baſe of the *calyx*. The *drupa* is ſaid to be the ſize and ſhape of a Sloe.

ZIZITH, in the *Jewiſh Cuſtoms*, a name given by the Jews to the tufts or fringes they uſed anciently to wear at the four quarters of their upper garments, but which they now only wear under their clothes, fixed to a ſquare piece of cloth, which repreſents the garment they anciently wore in their own country before their diſperſion. The zizith of the modern Jews is a tuſt made of eight threads of yarn, ſpun on purpoſe for this uſe, each having five knots, which take up half the length. That which is not knotted, being furled out, makes a kind of tuft or fringe. Numb. xv. 38. Deuter. xxii. 12. Leo of Modena, Cerem. of the Jews, part i. chap. 5. Calmet. Dict. Bibl. in voc.

ZIZYPHA, in *Botany*. See ZIZIPHUS.

ZLABINGS, in *Geography*, a town of Moravia, in the circle of Iglau; 28 miles W. of Znaym.

ZLATOUSTOVSKOI, a town of Ruſſia, in the government of Upha; 60 miles W. of Tcheliabinſk.

ZLEBY, a town of Bohemia, in the circle of Czaſlau; 4 miles S.E. of Czaſlau.

ZLIN, a town of Moravia, in the circle of Hradiſch; 15 miles N.N.E. of Hradiſch.

ZLOTI, a money of account in Poland, where accounts are kept in zloti, guldens, or florins of 30 groſchen or groſz, grofz, and each grofchen is divided into 18 pfenings. The florin alfo contains $2\frac{1}{2}$ fkoftacks, 90 fchillings, or 270 pfenings. A fkoftack is worth 12 grofchen, or 36 fchillings; a grofchen, 3 fchillings; and a fchilling, 3 pfenings.

ZMEINOGORSKAIA, in *Geography*, a fort of Ruffia, on the river Porobalika; 200 miles S. of Kolivan. N. lat. 51° 10′. E. long. 82° 10′.

ZMILACES, in *Natural Hiftory*, a name given by Pliny to a ftone found in the river Euphrates, refembling marble, and of a blueifh-green colour.

ZMILAMPIS, the name of a gem, defcribed by Pliny and the ancients, which they tell us was very like the Proconnefian marble, except that in the centre of the ftone there was always a blueifh fpot, refembling the pupil of an eye.

The Proconnefian marble of the ancients was of a fine clear and elegant white, variegated with irregular black veins. Pliny's defcription is fo fhort, that it has been fuppofed from him that the zmilampis was a fort of marble; he only fays of it, that it was like the Proconnefian marble, but blue in the middle. Many had inferred from this, that he meant no more by it than that this was a ftone, which had blue veins inftead of the black ones in the Proconnefian kind. But when we examine the reft of the ancients, and find that it was a fmall ftone, found in the river Euphrates, and worn in rings, and that its blue fpot was like a pupil of an eye, we may eafily determine that it was one of thofe gems which we call *oculus beli*, or *bellocchio;* of which there is a vaft variety found in the rivers of the Eaft Indies, and many have a fine opaque white ground, and a blueifh or greenifh fpot for the pupil.

ZMILANTHES, a name given by Solinus and fome others to a gem called by the more correct writers *zmilampis*.

ZNAMENSKOI, in *Geography*, a town of Ruffia, in the government of Tobolfk, on the Irtifch; 28 miles N.N.W. of Tara.

ZNAYM, a town of Moravia, in the circle of the fame name, near the river Teya. This town was built about the year 1222, at a little diftance from another town, laid wafte by the Bohemians. It contains a citadel, four cloifters, and a college; the circle borders on Auftria; 68 miles S.W. of Olmutz. N. lat. 48° 48′. E. long. 15° 51′.

ZNENDEI, a river of Ruffia, which runs into the Vitim, N. lat. 53°. E. long. 115° 14′.

ZNIN, a town of the duchy of Warfaw; 20 miles N. of Gnefna.

ZNONIGRAD, a town of Croatia; 36 miles S. of Bihacs.

ZOAGLI, a town of Genoa; 20 miles E. of Genoa.

ZOANA, in *Ancient Geography*, a town of Afia, in the Leffer Armenia, upon the route from Satala to Arabiffus, between Tonofa and Gundufa. Anton. Itin.

ZOANNES, a name given by Strabo to a people half-favage, that inhabited the mountains of the Colchide.

ZOAR, ZOARA, *Segor*, or *Bela*, a city of Pentapolis, on the fouthern extremity of the Dead fea. It was preferved by deftruction from fire by means of the interceffion of Lot. (Gen. xiv. 2.) Its name before this circumftance was Bela; but when Lot requefted it to be fpared as a place of refuge for himfelf, he reprefented it as a *fmall* place; and hence it had the name *Zoar*, or Segor, which, in Hebrew, fignifies fmall or little. The Romans kept a garrifon at Zoar. St. Jerom obferves, that the name Bela was given to this city, becaufe, as foon as Lot left it, an earthquake caufed it to be fwallowed up; *bela* in Hebrew fignifying to fwallow up. Jerom alfo fays, that the Hebrews think that Zoar bears alfo the name of Shalifha. (1 Sam. ix. 4.) They pretend that this city has been often demolifhed by earthquakes.

ZOAR, in *Geography*, a town of Arabia, in the province of Hedsjas, on the fouth coaft of the Dead fea, at the mouth of the Safia; 30 miles N. of Karac.

ZOAR. See TSOR.

ZOARA, a town of Africa, in the country of Tripoli; 60 miles W.N.W. of Tripoli.—Alfo, a town of Africa, in the country of Barca; 140 miles S.W. of Tolometa. N. lat. 32° 35′. E. long. 11° 56′.

ZOBAYA, a town of Mexico, in the province of Guatimala; 30 miles N. of Guatimala.

ZOBEIR, a town of the Perfian empire, in the pachalic of Bagdad, about 10 miles W. of the city of Baffora, fituated on the dry canal of the Djurre Zade, fuppofed to be the former bed of the Euphrates. It is by fome faid to be the ancient Bafra, and derives its prefent name from Zobeir, who was defeated and flain in the battle of the Camel, fought near this place.

ZOBELN, a town of the duchy of Courland; 20 miles E. of Goldingen.

ZOBERA, a town of Arabia, in the province of Yemen; 35 miles S.E. of Chamir.

ZOBERN, a town of Saxony, in the Vogtland; 8 miles W. of Oelfnitz.

ZOBIN, a town of Germany, in the principality of Oettingen Wallerftein; 6 miles W.N.W. of Nordlingen.

ZOBING, a town of Saxony, in the margravate of Meiffen; 15 miles S. of Deffau.—Alfo, a town of Auftria; 3 miles N. of Crems.

ZOBLITZ, a town of Saxony, in the circle of Erzgebirg. This place confifts of 110 houfes, and the inhabitants fubfift principally by working the ferpent-ftone, which is found here, into pitchers, bowls, tea and coffee difhes, mortars, cups, &c. The ferpent-ftone is dug juft above the town, and farther on to the eaft of it is found a red fpecies, which is reckoned among the fineft, and for that reafon is alfo confidered by the fovereign as his property, together with a yellow, green, grey, and black fort. In the electoral red quarry is alfo found afbeftos of divers colours and granites; 17 miles S. of Freyberg. N. lat. 50° 36′. E. long. 13° 11′.

ZOBOWITZ, a town of Pomerelia; 14 miles S. of Dantzic.

ZOBTEN, a town of Silefia, in the principality of Schweidnitz; 9 miles E.N.E. of Schweidnitz. N. lat. 50° 48′. E. long. 16° 41′.

ZOBTENBERG, a mountain of Silefia, fituated in a country otherwife level, 2424 Paris feet above the level of the fea, near Zobten.

ZOCCO, ZOCCOLO, *Zocle*, or *Socle*, in *Architecture*. See SOCLE.

ZOCELAR, in *Geography*, a town of Croatia; 2 miles S.W. of Bihacs.

ZOCHINACAZTLIS, in *Botany*, a name by which fome authors have called the *flos auriculæ*, a flower of New Spain, ufed in making of the Spanifh chocolate.

ZODIAC, ZODIACUS, in *Aftronomy*, a fafcia, or broad circle, whofe middle is the ecliptic, and its extremes two circles parallel to it, at fuch diftance from it, as to bound, or comprehend, the excurfions of the fun and planets.

The word is formed from the Greek ζωον, *animal*, by reafon of the conftellations in it, which have the forms of animals given them; others derive it from ζωη, *life*, from an an opinion, that the planets have a great influence on animal life.

The fun never deviates from the middle of the zodiac; *i. e.* from the ecliptic: the planets all do more or lefs. Their greateft deviations, called latitudes, are the meafure of the breadth of the zodiac; which is broader, or narrower, as the greateft latitude of the planets is made more or lefs. Accordingly fome make it 16, fome 18, and fome 20 degrees broad.

The zodiac interfecting the equator obliquely makes an angle with it of 23 degrees and a half; or, more precifely, of 23° 29′; which is what we call the *obliquity of the zodiac*, and is the fun's greateft declination. See Ecliptic.

The zodiac is divided into twelve portions, called *figns*; and thofe divifions, or figns, are denominated from the conftellations which anciently poffeffed each part. But the zodiac being immoveable, and the ftars having a motion from weft to eaft, thofe conftellations now no longer correfpond to their proper figns; whence arifes what we call the *preceffion of the equinoxes*.

When a ftar, therefore, is faid to be in fuch *a fign of the zodiac*, it is not to be underftood of that fign, or conftellation, of the firmament, but only of that twelfth part of the zodiac, or dodecatemory of it.

Caffini has alfo obferved a tract in the heavens, within whofe bounds moft of the comets, though not all of them, are obferved to keep, which, for this reafon, he calls the *zodiac of the comets*.

This he makes as broad as the other zodiac, and marks it with figns, or conftellations, like that; as Antinous, Pegafus, Andromeda, Taurus, Orion, the Leffer Dog, Hydra, the Centaur, Scorpion, and Sagittary.

Zodiac, *Hindoo*. The early inveftigators of Hindoo mythology, which comprehends not only their aftronomy, but every fcience, and almoft every art, of which the Hindoos have any knowledge, were furprifed to find that the days of the week were named, as with us, after the planets, and in the fame order. It was natural enough to fuppofe that the Hindoo almanac was borrowed from the Arabians. The few Brahmans who at that time had accefs to Europeans of fcience, fuppofed the fame of us, when they difcovered the fimilitude of fable and of name. But it has been made manifeft by the inveftigations of later writers, that the Hindoo zodiac is of very great antiquity. Such of our readers as may be defirous of extended information hereon, are referred to the differtations of fir William Jones and Mr. Colebrooke; on the Hindoo zodiac, in the 2d and 9th volumes of the Afiatic Refearches; and to the Hindoo Pantheon. In both works, plates of the Hindoo zodiac are given from different authorities; and in the latter work feparate engravings alfo of the perfonified planets. We will extract from it a fort of table, fhewing the Englifh and Sanfkrit names, and the vehicles affigned to the feveral planets by the latter fabulifts.

Names of Planets, &c.		Days over which they refpectively prefide.		Vehicles or Seats, according to the Plate of	
Englifh.	Sanfkrit.	Englifh.	Sanfkrit.	Sir William Jones.	The Hindoo Pantheon.
Sun	Surya	Sunday	Aditvar	Lion	Chariot
Moon	Soma	Monday	Somavar	Antelope	Antelope
Mars	Mangala	Tuefday	Mangalvar	Horfe	Ram
Mercury	Boodh	Wednefday	Budhvar	Eagle	Carpet
Jupiter	Vrihafpati	Thurfday	Vrihafpatvar	Boar	Do.
Venus	Sukra	Friday	Sukervar	Camel	Rat
Saturn	Sani	Saturday	Sanivar	Elephant	Raven
Dragon's Head	Ketu			Frog	Carpet
Dragon's Tail	Rahu			Tortoife	Owl

Under the Sanfkrit names of the planets we have given fhort articles defcriptive of their mythological and hiftorical attributes and allufions. To them (Surya, Soma, &c.) we therefore refer for farther particulars, and to the article Vahan for an account of the vehicles affigned to them and other mythological perfonages of Hindoo fable.

ZODIACAL Light, a brightnefs refembling that of the milky way, but lefs bright, and which is fometimes perceived in the heavens, at certain times of the year, after fun-fet, or before its rife. Some have fuppofed, that this phenomenon is the fame with that which the ancients called *trabes*, a term by which they denoted a meteor, or impreffion in the air like a beam. Thus Pliny (lib. ii.) fays, "emicant trabes, quos docos vocant." The form of this light refembles that of a pyramid, lying lengthways in the zodiac, within which its point and axis are always enclofed, its bafe being towards the fun, and placed obliquely with refpect to the horizon. In the torrid zone, the zodiacal light is frequently, or almoft conftantly, feen. At or near our latitude it may be feen about the time of the equinoxes. The beft time for feeing it is about the 1ft of March, at 7 o'clock in the evening, when the twilight is ending, and the equinoctial point in the horizon. This phenomenon was firft difcovered by Defcartes, and by Childrey about the year 1659. It did not engage general attention till it was defcribed and named by M. Caffini the elder, in 1683. It was afterwards obferved by M. Fatio, in 1684, 1685, and 1686, and by M. Kirch and Eimmart, in 1688, 1689, 1691, 1693, and 1694. See Mairan, Suite des Mem. de l'Acad. Royale des Sciences, 1731, p. 3.

In 1707, April 3, it was obferved by Mr. Derham in Effex. It appeared in the weftern part of the heavens, about a quarter of an hour after fun-fet, in the form of a pyramid, perpendicular to the horizon. The bafe of this pyramid he judged to be the fun. Its vertex reached 15° or 20° above the horizon. It was throughout of a dufky-red colour, and at firft appeared pretty vivid and ftrong, but fainteft at the top. It grew fainter by degrees, and vanifhed about an hour after fun-fet. This folar atmofphere has alfo been feen about the fun in a total folar eclipfe, a luminous ring appearing about the moon at the time when the eclipfe was total.

M. Fatio conjectured that this appearance arifes from a collection of corpufcles encompaffing the fun in the form of a lens, reflecting the light of the fun. M. Caffini fuppofed that it might arife from an infinite number of planets revolving about the fun; fo that this light might owe its exiftence to thefe bodies, as the milky way does to an innumerable number of fixed ftars. It is now, however, generally fuppofed, that it is matter detached from the fun by its rotation about its axis. The velocity of the equatorial parts of the fun being the greateft would throw the matter to the greateft diftance, and on account of the diminution of velocity towards its poles, the height to which the matter would there rife would be diminifhed; and as it would probably fpread a little fideways, it would form an atmofphere about the fun fomething in the form of a lens, whofe fection perpendicular to its axis would coincide with the fun's equator. And this agrees very well with obfervation. There is, however, a difficulty in thus accounting for this phenomenon. It is very well known that the centrifugal force of a point of the fun's equator is a great many times lefs than its gravity. It does not appear, therefore, how the fun, from its rotation, can detach any of its grofs particles. If they be particles detached from the fun, they muft be fent off by fome other unknown force; and in that cafe they might be fent off equally in all directions, which would not agree with the obferved figure. The caufe is probably owing to the fun's rotation, although not immediately to the centrifugal force arifing therefrom.

The zodiacal light, according to M. de Mairan's ingenious and plaufible hypothefis, is nothing but the folar atmofphere, a rare and fubtile fluid, either luminous by itfelf, or made fo by the rays of the fun furrounding its globe; but in a greater quantity, and more extenfively about its equator than any other part. As it always accompanies the fun, it is natural to afcribe it to a folar atmofphere, extending beyond the orbit of Mercury, and fometimes even beyond that of Venus. Accordingly, the zodiacal light has been fuppofed to be a fection of this atmofphere, which, being extremely flat at its poles, cannot be conceived to partake of the fun's monthly motion. Dr. T. Young (Lectures, vol. i. p. 502.) obferves, that the only probable manner in which it can be fuppofed to retain its figure, is by means of a revolution much more rapid than that of the fun's motion. To that purpofe, M. de la Lande remarks, that it feems now to be generally believed, that the zodiacal light is the atmofphere of the fun; for it always accompanies that luminary; and the equator of the fun is in the direction of this light: confequently he fays, that in all probability the zodiacal light is an atmofphere fituated round the fun, in the direction of its equator, and flattened by its rotatory motion. Aftrom. Paris, 1771. § 845 to 849.

The zodiacal light is more or lefs vifible according to circumftances; but the folar atmofphere is not always vifible by means of this light, though it be always feen about the globe of the fun in total eclipfes.

One of the moft effential circumftances for the perception of the folar atmofphere by the zodiacal light is its having fufficient length on the zodiac; for without this its brightnefs is entirely hid from us by the twilight.

M. de Mairan fays, it may be proved from many obfervations, that the fun's atmofphere fometimes reaches as far as the earth's orbit, and there meeting with our atmofphere produces the appearance of an aurora borealis.

The length of the zodiacal light varies fometimes in reality, and fometimes in appearance only, from various caufes.

The oblique pofition of this light, little different from that of the plane of the ecliptic, does not permit us to fee it diftinctly, and fufficiently elevated above the horizon; but fome time after fun-fet, towards the end of the winter, and in fpring, or before fun-rifing in autumn, and towards the beginning of winter. Several caufes hinder our feeing it, any more than the milky way; fuch as moon-light and ftrong twilights, among others.

M. Caffini often mentions the great refemblance of the zodiacal light to the tails of comets. M. Fatio has made the fame obfervation; and M. Euler has lately endeavoured to prove them owing to fimilar caufes. Decouverte de la Lumiere Celefte que paroit dans le Zodiaque, art. 41. Lettre à M. Caffini, printed at Amfterdam, 1686. Euler, in Mem. de l'Acad. de Berlin, tom. ii.

The figure of this folar atmofphere muft be lenticular, or that of a flatted fpheroid. M. de Mairan gives us a draught of its appearance and projection.

The extent of the zodiacal light from the fun to its point is feldom lefs than 45, fometimes 150 degrees in length; M. Pingré being on the torrid zone faw it 120 degrees: and its breadth varies from 8 to 30 degrees.

This light feems to have no other motion than that of the fun itfelf.

M. Euler obferves, that if the fun has an atmofphere, the force of the impulfe of light iffuing from that globe muft drive particles of that atmofphere before it; but as gravity is very ftrong at the fun, this impulfe would never drive thofe particles beyond the limits of their atmofphere, were it not for the centrifugal force arifing from the fun's motion round its axis. This being oppofite to the action of gravity, diminifhing its effects, the impulfe of the light may confiderably dilate the figure of the folar atmofphere, from what it would be if it arofe from the gravity and centrifugal force of its particles only: and this dilatation will be very confiderable near the fun's equator, and very fmall towards its poles. The action of light thus diminifhing the action of gravity, M. Euler attempts to calculate how far this diminution of gravity may increafe the extent of the fun's atmofphere about its equator. He finds a cubic equation, the roots of which exprefs the femi-axis, or greateft amplitude of this atmofphere. He adds, that this equation having three real roots, it is poffible that the folar atmofphere may become a ring furrounding the fun's globe, as the ring of Saturn furrounds the body of that planet. As the electric fluid is now generally acknowledged to be the caufe of the aurora borealis, which M. de Mairan afcribes to the folar atmofphere, which produces the zodiacal light, and which is thrown off principally and to the greateft diftance from the equatorial parts of the fun, in confequence of his rotation on his axis, and extending vifibly, in the form of a luminous pyramid, as far as the orbit of the earth, falls into the upper regions of our atmofphere, and is collected chiefly towards the polar parts of the earth, in confequence of the diurnal revolution, where it forms the aurora borealis: it is no improbable conjecture, that the fun may be the fountain of the electric fluid, and that the zodiacal light, and the tails of comets, as well as the aurora borealis, lightning, and artificial electricity, are its various and not very diffimilar modifications. See *Theory of* ELECTRICITY.

ZODZISZKI, in *Geography*, a town of Lithuania, in the palatinate of Wilna; 52 miles E. of Wilna.

ZOEGEA, in *Botany*, was fo named by Linnæus, in honour of his pupil and correfpondent Dr. John Zoega, who vifited Iceland, and communicated from thence, as well as from the neighbouring ocean, many new or rare plants, efpecially of the cryptogamic tribes, to the great Swedifh naturalift. Dr. Zoega wrote a *Flora Iflandica*, which has been ſeveral times printed, with Olafsen's, and von Troil's, accounts of that country. In the latter book this *Flora* is a mere catalogue of Linnæan names, the ſynonyms and deſcriptions being omitted. He wrote alſo a mineralogical work on Zeolites. The plant which bears his name was raiſed in the Copenhagen garden, from Siberian ſeeds, and communicated by himſelf to Linnæus.—Linn. Mant. 15. Schreb. Gen. 577. Willd. Sp. Pl. v. 3. 2276. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 143. Juſſ. 174. Poiret in Lamarck Dict. v. 8. 868. Gærtn. v. 2. 452.—Claſs and order, *Syngeneſia Polygamia-fruſtranea*. Nat. Ord. *Compoſitæ capitatæ*, Linn. *Cinarocephalæ*, Juſſ.

Gen. Ch. *Common Calyx* ovate, imbricated, of numerous lanceolate, fringed ſcales; the inner ones linear-lanceolate, chaffy, longeſt. *Cor.* compound, radiant. Florets of the diſk numerous, perfect, of one petal, with a ſlender tube, and a limb in five deep, lanceolate, erect ſegments: thoſe of the radius fewer, neuter, of one flat, ligulate, abrupt, ſharply five-toothed petal. *Stam.* in the florets of the diſk, Filaments five, ſhort; anthers united into a cylindrical tube. *Piſt.* in the ſame florets, Germen ſhort; ſtyle capillary, very long, erect; ſtigma ſhort, cloven: in the radiant florets, Germen a rudiment only, without ſtyle or ſtigma. *Peric.* no other than the unaltered cloſed calyx. *Seeds* in the florets of the diſk, ſolitary. Down briſtly. In the radius none. *Recept.* briſtly.

Eſſ. Ch. Receptacle briſtly. Seed-down of ſimple briſtles. Florets of the radius ligulate. Calyx imbricated.

Obſ. Linnæus juſtly obſerves that this genus is very intimately related to Centaurea (ſee that article). Indeed the only difference conſiſts in the flat, or ligulate, not tubular, florets of the radius. How far that diſtinction is ſufficient, ſome perſons have doubted; eſpecially as the preſence of the radiant florets themſelves in *Centaurea*, has been thought but a caſual occurrence, equivalent to double flowers in other natural orders. As long, however, as the Syngeneſious family continues to be characterized at all by the different figure of the florets, *Zoegea* muſt remain ſeparate from *Centaurea*.

1. Z. *Leptaurea*. Yellow Zoegea. Linn. Mant. 117. Suppl. 383. Willd. n. 1. Ait. n. 1. L'Herit. Stirp. Nov. 57. t. 29. (Z. aleppica; Jacq. Col. v. 1. 89. Ic. Rar. t. 177.)—Native of Siberia, according to a manuſcript correction of Linnæus in his own Mantiſſa: other authors ſay, of the Levant. It appears to have been cultivated in Mr. Blackburne's celebrated garden at Orford, Lancaſhire, before the year 1779, when the catalogue of that rich collection was printed. This plant is a hardy annual, flowering in July and Auguſt. The *ſtem* is much branched, ſpreading in every direction, leafy, angular and roughiſh, twelve or eighteen inches high. *Leaves* alternate, diſtant, roughiſh, entire; the lower ones pinnatifid; the reſt undivided, obtuſe, tapering down into a *footſtalk*. *Flowers* ſolitary, on long terminal ſtalks, large, near two inches broad. *Scales* of the *calyx* delicately fringed with tawny briſtles. *Corolla* of a ſhining golden yellow.

Another ſpecies is deſcribed in the *Supplement* by Linnæus himſelf, under the name of *Z. capenſis*. This is *Relhania pedunculata* of L'Heritier. See Willd. Sp. Pl. v. 3. 2136, and is the ſame thing as *Athanaſia pumila*, Linn. Suppl. 362.

ZOFALA, in *Geography*. See Sofala.

ZOFFANY, Johan, in *Biography*, was born at Frankfort, about the year 1735. He came to England as a painter of ſmall portraits when he was about 30 years of age. After paſſing ſome time with very little encouragement, he at length was fortunate enough to attract public attention by a portrait of the earl of Barrymore, and thenceforward enjoyed conſiderable favour and encouragement. The moſt conſiderable of his productions at this period were portraits of the moſt celebrated dramatic performers in their favourite characters; as Garrick, in Abel Drugger, ſir John Brute, and lord Chalkſtone, &c.; Foote, in major Sturgeon; and Jacob, as Jacob Gallop; Foote and Weſton, as Dr. Laſt and the Preſident, in the Devil on Two Sticks; Parſons, Moody, Branſby, Aicken, and many others, whoſe likeneſſes he preſerved moſt admirably, with all the variety of expreſſion required for the characters they perſonified. One picture he painted of the members of the Royal Academy, in the hall of the Academy devoted to the ſtudy of the living figure, round which they here aſſembled, and it received univerſal applauſe.

He had the honour to be employed by his majeſty, and painted portraits of the royal family; and he was engaged by the queen to paint for her a view of the Tribune of the Gallery at Florence. He was ſomewhat of a humouriſt, and it is ſaid of him, that whilſt he was engaged painting in the Florentine Gallery, the emperor of Germany viſited the grand duke, and coming up to Zoffany in the Gallery, was much pleaſed with his performance, and aſked him his name; and on hearing it, inquired what countryman he was; when he anſwered, an Engliſhman. Why, ſaid the emperor, your name is German. True, returned the painter, I was born in Germany, that was accidental; I call that my country where I have been protected!

Soon after his return from Italy, he went to the Eaſt Indies, where he was much employed, and acquired a conſiderable fortune; but it diſappeared upon his return home, and was only reſtored by a ſecond adventure to the ſame hot-bed of wealth and diſeaſe. He again returned to England, but with diminiſhed powers: yet he ſtill continued to paint, and, among other works, produced an elaborate picture of the ſacking of the wine vaults at the Tuileries, in 1792; a diſguſting diſplay of the atrocities of that eventful period. He lived to a very advanced age, but was reduced exceedingly in intellectual powers for ſome years before his deceaſe, which happened in 1808. He was a member of the Royal Academy.

ZOFFINGEN, in *Geography*, a town of Switzerland, in the canton of Berne, on the Wigger. It was at one time imperial, after which it put itſelf under the count of Habſburg. In the 13th century it was ſubject to the houſe of Auſtria, from which it was taken by the Bernois, in the year 1415, and is the principal place of a bailiwick, with conſiderable privileges; 26 miles N.N.E. of Berne.

ZOGNO, a town of Italy, in the department of the Serio; 5 miles N. of Bergamo.

ZOGOCARA, in *Ancient Geography*, a town of Aſia, in Greater Armenia. Ptol.

ZOGOR, in *Geography*, a town of Thibet; 16 miles W.S.W. of Zuenga.

ZOHAUB, one of the diſtricts of the province of the Lower Kurdiſtan, in the pachalic of Bagdad, which has a ſeparate hakem or governor. See Solymania.

ZOHAUK, a town of Grand Bucharia; 12 miles N.E. of Bamian.

ZOHRA, a town of Egypt, on the left bank of the Nile; 5 miles N.N.E. of Miniet Ebn Kaſib.

ZOIKA, a town of Ruſſia, in the government of Archangel, near the mouth of the Petchora; 160 miles N.E. of Mezen.

ZOILUS, in *Biography*, a carping critic belonging to the claſs of grammarians, was a native of Amphipolis, and lived

lived in the time of Ptolemy Philadelphus, about the year B.C. 270. His natural difpofition to depreciate eminent characters is faid to have been ftrengthened by the courfe of his education, as a difciple of Polycrates, who wrote an accufation againft Socrates. This difpofition, which he was in the habit of indulging, gave occafion to his being denominated the rhetorical dog; rhetorical, as his ftyle was elegant, and dog, from his practice of fnarling. Both his perfon and mind are very unfavourably exhibited by Ælian; who fays of him, that being once afked, why he *fpoke* ill of all mankind?—he replied, "becaufe I cannot *do* ill to them." Ambitious of gaining reputation, he endeavoured to acquire it by degrading others; and valued himfelf by having eftablifhed a kind of claim to the title of "Homeromaftix," or the fcourge of Homer. Suidas informs us, that he wrote nine books of grammatical remarks upon this poet. Plato and Ifocrates, as well as Homer, were objects of his critical feverity. Zoilus was the author of feveral works; particularly a hiftory commencing from the theogony, and continued to the death of Philip of Macedon, and a hiftory of his own city. His attack upon Homer feems to have been an unpardonable offence, and threw a fhade over every other good quality he poffeffed; for if we may credit Dionyfius of Halicarnaffus, he teftifies that he was actuated by the love of truth, and he ranks him with Ariftotle, and other eminent philologifts. But his virtues and talents, whatfoever they were, could neither fecure him from poverty whilft he lived, nor guard his memory from reproach. Vitruvius reports, that when he vifited Alexandria, he recited his writings againft the Iliad and Odyffey of Homer to king Ptolemy, which gave the king fuch offence, that he would take no notice of him; and afterwards, when urged by indigence, he folicited charitable affiftance, Ptolemy repulfed him with this contemptuous reflection; that if Homer, who had been dead 1000 years, could by his works give maintenance to many thoufand people, a writer fo much his fuperior might furely maintain himfelf. It is further faid, that the king was fo much difpleafed with his conduct, that he treated him as if he had been guilty of parricide; and that he was put to death, as fome fay, by crucifixion, and as others fay by ftoning; and according to another account, he was burnt alive at Smyrna. Vitruvius adds, "that whichfoever of thefe was his fate, he well deferved the punifhment." The penalty, however, if this ftatement be true, feems to have been much more than adequate to the offence. Ælian Hift. Var. Voff. Hift. Græc. Gen. Biog.

ZOISITE, in *Mineralogy*, *Epidote*, Haüy, a mineral fo called by Werner after baron Von Zoïs of Laybach.

Common Zoifite.—Its colours are yellowifh and blueifh-grey; it occurs maffive and cryftallized in very oblique four-fided prifms. The cryftals are middle-fized, and deeply ftreaked longitudinally. The ftructure is lamellar, and the joints parallel with the axis of the cryftal. The internal luftre is fplendent; the luftre of the crofs fracture is gliftening, and between pearly and refinous; it is tranflucent, hard, and eafily frangible. The fpecific gravity is 3.31. According to Klaproth, the conftituent parts are,

Silex - - - -	42
Alumine - - -	29
Lime - - - - -	21
Oxyd of iron - -	3
	95

Friable Zoifite is of a reddifh-white colour, fpotted with pale peach-bloffom red; it occurs maffive. The fracture is intermediate, between earthy and fplintery; the fragments are very fharp-edged, and tranflucent on the edges; it is rather hard and brittle. The fpecific gravity of this mineral is 3.3. According to Klaproth, its conftituent parts are,

Silex - - -	44
Alumine - - -	32
Lime - - -	20
Oxyd of iron - -	2.50
	98.50

Zoifite was firft found in Carinthia, but has fince been difcovered in various parts of the continent of Europe, and at Glenelg in Invernefsfhire. It is nearly allied to tremolite, with which it was at firft arranged.

ZOITIUM, in *Ancient Geography*, a town of the Peloponnefus, in Arcadia; 15 ftadia from Tricolons. Steph. Byz.

ZOK, Sokor, in *Geography*. See Sokor *Zok*.

ZOKOL, a town of Servia; 16 miles S. of Sabatz.—Alfo, a town of Bofnia; 45 miles E. of Bofnaferai.

ZOL Engers. See Engers.

ZOLCA, in *Ancient Geography*, a town of Afia, in Galatia, which belonged to the Paphlagonians, and was fituated on the coaft of the Euxine fea. Ptol.

ZOLDO, in *Geography*, a town of Italy, in the Bellunefe; 18 miles N.W. of Belluno.

ZOLDORF, a town of Bohemia, in the circle of Boleflaw; 6 miles W.N.W. of Jung Buntzel.

ZOLERI, a town of the county of Tyrol; 8 miles S.S.E. of Trent.

ZOL-HUYS. See Tol-huys.

ZOLLERN, a caftle of Germany, fituated on a mountain, in the principality of Hohenzollern, to which it gives name; 10 miles S. of Tubingen.

ZOLLICKOFEN, a town of Switzerland, and principal place of a diftrict, in the canton of Berne; 2 miles N.W. of Berne.

ZOLNOK, a town of Hungary, on the river Theyffe; 48 miles W.S.W. of Debriczin.

ZOLOGEV, a town of Ruffia, in the government of Charcov; 24 miles N.N.W. of Charcov. N. lat. 50° 20′. E. long. 35° 44′.

ZOLOTITZA, a town of Ruffia, in the government of Archangel, on the eaft coaft of the White fea; 60 miles N. of Archangel.

ZOLOTONOSCHA, a town of Ruffia, in the government of Kiev; 72 miles S.S.E. of Kiev. N. lat. 49° 30′. E. long. 31° 58′.—Alfo, a river of Ruffia, which runs into the Dnieper, near Zolotonofcha, in the government of Kiev.

ZOLOTTA, or Szelotta, a filver coin of Turkey, containing 30 paras, the para being = 3 afpers.

ZOMBA, in *Geography*, a town of Africa, in the kingdom of Congo; 70 miles E. of St. Salvador.

ZOMBAR, a town of Hungary; 40 miles S. of Colocfa. N. lat. 45° 56′. E. long. 19° 12′.

ZOMERAW, a town of Pruffia, in Oberland; 12 miles N.E. of Bifchofswerder.

ZOMUCHANA, in *Ancient Geography*, a town of Afia, in Aria. Ptol.

ZONA, or *Zona Uxoris Regiæ*, a very fertile country of Perfia. It was fo called becaufe its revenue was deftined for the accommodation of the queen. Plato.

Zona, a word ufed by fome authors for that fpecies of of herpes, which others call the *zinzilla*, and we term the *shingles*.

ZONCHIO, in *Geography*, a cape of European Turkey, on the coast of the Morea; 12 miles N.N.W. of Navarin. N. lat. 37° 12′. E. long. 21° 30′.

ZONCHIO, a sea-port town of European Turkey, in the Morea: the harbour is large, but not commodious; 8 miles N. of Navarin.

ZONCOLCUCAN, a mountain of Mexico, in the province of Guaxaca.

ZONDAGS, a river of Africa, which runs into the Indian sea, N. lat. 31° 20′. E. long. 29°.

ZONDORO, a town of Hungary; 26 miles S.W. of Caschau.

ZONE, ZONA, ζωνη, q. d. *belt, girdle*, in *Geography* and *Astronomy*, a division of the terraqueous globe, with respect to the different degrees of heat found in the different parts of it; formed by the two tropics and two polar circles, which divide the surface of the earth into five parts.

The zones are denominated *torrid, frigid*, and *temperate*.

ZONE, *Torrid*, is a fascia, or band, surrounding the terraqueous globe, and terminated by the two tropics.

Its breadth, therefore, is 46° 56′. The equator running through the middle of it, divides it into two equal parts, each containing 23° 28′.

The ancients imagined the torrid zone uninhabitable.

ZONES, *Temperate*, are two fasciæ, or bands, environing the globe, and contained between the tropics and the polar circles. The breadth of each is 43° 4′.

ZONES, *Frigid*, are segments of the surface of the earth, terminated, the one by the antarctic, and the other by the arctic circle; or included between these circles and the poles. The breadth of each is 46° 56′.

The difference of zones is attended with a great diversity of phenomena.

1. In the torrid zone, the sun passes through the zenith twice a year; and his recess from the equator towards the pole, which is above the horizon, is twice a year equal to the height of the pole.

2. In the temperate and frigid zones, the least height of the pole exceeds the greatest distance of the sun from the equator; and therefore, to the inhabitants of it, the sun never passes through the zenith; yet if, on the same day, the sun rises, at the same time, to a greater height, the height of the pole is the less, since the inclination of the circles of diurnal revolution to the horizon is less.

3. In the temperate and torrid zones, the sun rises and sets every natural day, because the distance of the sun from the pole always exceeds the height of the pole; yet every where but under the equator, the artificial days are unequal, and the inequality is the greater as the place is less distant from the frigid zone.

4. Where the temperate zones terminate on the frigid, the height of the pole is equal to the sun's distance from the pole, when in the neighbouring tropic; and consequently, once a year, the sun, in its diurnal motion, performs an entire revolution, without going down under the horizon.

5. Every where, in a frigid zone, the height of the pole is greater than the least distance of the sun from the pole; and therefore, during some revolutions of the earth, the sun is at a distance from the pole less than the pole's height; and, during all that time, does not set, nor so much as touch the horizon. Where the distance from the pole, as the sun recedes from it, exceeds the height of the pole, or latitude of the place, the sun rises or sets every natural day.

ZONE, *Cingulum*, or girdle, part of the ecclesiastical dress of the Roman Catholic ministers. The use of it being derived from the church of Rome, it was called *zona Romana*.

ZONE, *Ciliary*, in *Anatomy*, the black impression of the ciliary processes on the vitreus humour. See EYE.

ZONE, *Greater and Smaller, of the Iris*, arterial circles produced by the anastomoses of the arteries. See EYE.

ZONGHAN, in *Geography*, a town of Cochinchina, near the sea. N. lat. 14° 30′. E. long. 108° 48′.

ZONGO, or MORENA, a river of Africa, which runs into the Atlantic, near Old Benguela.

ZONITES, in the *Materia Medica of the Ancients*, a name given to a kind of tutty, called also *placitis*. It had the latter name from the Greek πλακος, *a crust*, it being formed by way of crust on the sides of the furnaces. The latter name *zonites* was given from its being formed of several coats, which, when broken transversely, had the appearance of belts or zones. See TSAPHARI, and TUMEX.

ZONITIS CADMIA, a name given by some authors to a kind of *cadmia fornacum*, from its usually surrounding the upper parts of the furnaces like a girdle or belt.

ZONITIS, in *Entomology*, a genus of the *coleoptera* order of insects, the characters of which are, that the antennæ are setaceous; the palpi four and filiform, and shorter than the whole jaw; and the lip emarginated. There are two species; *viz.*

CHRYSOMELANA. Yellow, the wing-sheaths having a point in the middle, and the apex black: found in Egypt and the East.

FLAVA. Reddish, with wing-sheaths yellow, and black at the apex.

ZONNAR, a kind of belt, or girdle, of black leather, which the Christians and Jews of the Levant, particularly those of Asia, and the territories of the grand signior, are obliged to wear, to distinguish themselves from the Mahometans.

The word is corrupted from the vulgar Greek; a contraction of ζωναριον, or ζωνη, *girdle*.

It was Motavakkel X. kaliph, of the family of the Abassides, that first enjoined the Christians, &c. to wear the zonnar.

The ordinance to this effect was published in the year of the Hegira 235.

Hence, as most of the Christians of Syria, Mesopotamia, &c. are either Nestorians or Jacobites, those sectaries are often called *Christians of the girdle*.

ZONOSBIO, in *Geography*, an Indian town, belonging to the Seneca tribe; 2 miles N. of lake Seneca.

ZONS, a town of France, in the department of the Roer, situated on the Rhine, with a castle: at this place a river-toll is paid; 13 miles N.N.W. of Cologn. N. lat. 51° 4′. E. long. 6° 43′.

ZOOGRAPHY, formed of ζωον, *animal*, and γραφω, *I describe*, denotes a description of animals.

ZOOLATRIA, Ζωολατρια, composed of ζωον, *an animal*, and λατρια, *worship*, a species of idolatry, in which divine worship was offered to animals.

ZOOLOGIA, ZOOLOGY, Ζωολογια, compounded of ζωη, *life*, or ζωον, *animal*, and λογος, *speech, discourse*, a discourse or treatise upon animals, or living creatures.

Zoology makes a considerable article in natural history, comprehending what relates to the form, structure, method of living, feeding, propagating, &c. of the divers species

ſpecies of brute creatures, and the deſcriptions of every kind. This makes one of the three kingdoms, as they are called, of natural hiſtory; the vegetable and the mineral being the two others: in theſe, however, there is this difference made by writers, that while vegetables and minerals are treated of together, as all of a piece in each, the ſubjects of zoology are divided, and it is made to compoſe, as it were, ſeveral kingdoms. Whoever is to write on plants and minerals, calls his work a treatiſe of botany, or mineralogy; and we have no words to expreſs any ſubdiviſion of them into kingdoms; but in zoology, we treat, as different ſubjects, the different parts of it; and the hiſtory of birds is ſeparated by ſome from the reſt under the name of *ornithology;* that of quadrupeds, under the name of *tetrapodology;* and we have for the reſt, the words *entomology*, *amphibiology*, and the like, expreſſing thoſe things which are properly but the parts of zoology, as ſo many diſtinct and ſeparate ſtudies.

This may eaſily be amended by our conſidering the animal world as we do the vegetable and mineral, and dividing it, as we do the others, into its proper families; it will then be found that theſe are no better diſtinctions than thoſe of the families of theſe things, and that the authors may as well ſet up ſeparate ſtudies under the names of *bulbology*, *umbelliferology*, and the like, as thoſe.

A natural diviſion of the ſubjects of zoology, on this principle, will afford ſix ſeveral families of its ſubjects. 1. The hairy quadrupeds. 2. The birds. 3. The amphibious animals, ſuch as ſerpents, lizards, frogs, and tortoiſes. 4. The fiſhes. 5. The inſects. And, 6. Thoſe loweſt order of animated beings, the zoophytes. Artedi's Ichthyol. See Quadruped, Bird, Fish, &c.

ZOOMBO, in *Geography*, a town on the weſt coaſt of Celebes. S. lat. 3°. E. long. 119° 10′.

ZOOMINERALIA, a word uſed by ſome writers to expreſs certain ſubſtances which are of animal origin, yet have ſomewhat of the nature of ſtones, as pearls.

ZOOPHORIC Column. See Column.

ZOOPHORUS, or Zophorus, in the *Ancient Architecture*, the ſame thing with the *freeze* in the modern.

It was thus called in Greek, becauſe anciently adorned with the figures of animals: from ζωον, *animal*, and φερω, *I bear.*

The Greeks ſometimes alſo call the *zodiac* zoophorus, becauſe of the ſigns and conſtellations in it.

ZOOPHTHALMUS, in *Botany*, a name given by the ancient Greeks to the *ſedum majus*, or common great houſeleek.

It had this name from the Greek ζωον, *an animal*, and οφθαλμος, *an eye*, as expreſſing a reſemblance to the eyes of large animals, in the round and radiated growth of its cluſters of leaves. They alſo called it *ambroſia.*

ZOOPHYTON, Zoophyte, Ζωοφυτον, compounded of ζωον, *animal*, and φυτον, *plant*, q. d. *plant-animal*, in *Natural Hiſtory*, a kind of intermediate body, ſuppoſed to partake both of the nature of an animal and a vegetable.

In the Linnæan ſyſtem, the zoophytes, which conſtitute the fifth order of worms, (ſee Vermes,) are compoſite animals, reſembling a flower, and ſpringing from a vegetating ſtem. This order contains 15 genera, as the Tubipora, Madrepora, Millepora, Cellepora, Isis, Antipathes, Gorgonia, Alcyonium, Spongia, Flustra, Tubularia, Corallina, Sertularia, Pennatula, and Hydra: ſee each reſpectively. The ſpecies enumerated and deſcribed in Gmelin's Linnæan ſyſtem are 489.

The fœtus, while in the womb, appears to many to be a real zoophyte, growing to the mother by the funiculus umbilicalis, as plants do to the earth by their ſtem. See Fœtus, and Embryo.

Concerning the zoophyte called *borametz*, ſee Agnus *Scythicus.*

Zoophyte-*Marygold.* See Marygold.

Zoophytes, *Chemical Compoſition of.* See Shells and Vermes.

ZOOTOMY, Ζωοτομη, compounded of ζωον, *animal*, and τεμνω, *I cut*, the art, or act, of diſſecting animals, or living creatures.

Zootomy amounts to the ſame with anatomy, or rather comparative anatomy. See Anatomy.

ZOPARITUS, in *Ancient Geography*, a town of Aſia, in Melitene, on this ſide of the Euphrates. Ptol.

ZOPH, in *Geography*, a town of Syria; 25 miles S.S.E. of Jeruſalem.

Zoph, a diſtrict in the N. part of the government of Diarbekir.

ZOPHA, a town of Pruſſia, in Pomerelia; 10 miles S.W. of Marienburg.

ZOPHOCIDELUS, in *Botany*, a word uſed ſometimes as an epithet with the word *chamæleon*, and ſometimes ſingly as the name of a plant, in both caſes expreſſing the black chamæleon-thiſtle, which the ancients carefully diſtinguiſhed in their writings from the white kind; the former being a poiſonous plant, the other not ſo.

ZOPHORIC. See Zoophoric.

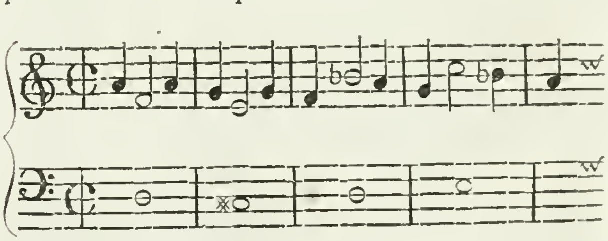
ZOPHORUS. See Zoophorus.

ZOPISSA, Ζωπισσα, *naval pitch*, a kind of mixture of pitch and tar, ſcraped off from the ſhips that have been a long time at ſea. See *Naval* Pitch.

The word ſeems formed from ζεω, *bullio, I boil*, and πισσα, *pitch;* q. d. *concocted pitch.*

This matter, by being gradually penetrated by the ſalt of the ſea, becomes impregnated with its qualities; and, being applied to the body externally, is found reſolutive and deſiccative.

ZOPPO, in the *Italian Muſic*, is applied to all thoſe counterpoints deſcribed under the article Obligato, &c. Thus they ſay, *contra-punto alla zoppa*, a lame or hopping counterpoint; becauſe, in theſe, a note is placed between two others, each of half its value in time. When this comes to be played or ſung, the voice or inſtrument ſeems to proceed by unequal leaps or ſteps, like thoſe of a lame perſon. See the example here annexed.



There are *contra punto alla zoppa ſopra il ſogetto*, as well as *ſotto il ſogetto*, *i. e.* above and below the ſubject. See Sogetto.

ZOPPOLA, in *Geography*, a town of Italy, in Friuli; 13 miles N.N.W. of Concordia.

ZOQUES, a diſtrict of Mexico, in the province of Chiapa, bordering on Tabaſco.

ZORABA, a word uſed by ſome of the chemical writers to expreſs vitriol.

ZORAH, in *Geography*, a town of Africa, on the coast of Barca. N. lat. 30° 45'. E. long. 18° 30'.

ZORAMBUS, in *Ancient Geography*, a river of Asia, in Carmania. Ptol.

ZORBIG, or Little Zerbst, in *Geography*, a town of Saxony, in the circle of Leipsic, with a citadel; 15 miles S. of Dessau. N. lat. 51° 40'. E. long. 12° 18'.

ZORECZA, a town of Lithuania; 80 miles E.S.E. of Pinsk.

ZORGE, a town of Saxony, belonging to the abbey of Walkenried; 6 miles N.E. of Walkenried.

Zorge, a river of Thuringia, which runs into the Helm, 5 miles W. of Nordhausen.

ZORIGA, in *Ancient Geography*, a town of Asia, in the Greater Armenia, to the left of the Euphrates, and at some distance from it. Ptol.

ZORILLE, in *Zoology*, a species of weasel, having the back and sides marked with short stripes of black and white, the last tinged with yellow; the tail long and bushy, partly white, and partly black; the legs and belly black. This animal inhabits Peru, and other parts of South America: its pestilential vapour overcomes even the panther of America, and stupefies that formidable enemy. Pennant. See Viverra.

ZORITA, in *Geography*, a town of Spain, in New Castile; 12 miles N.W. of Huete.

ZORLESCA, a town of Italy; 8 miles S.S.E. of Lodi.

ZORN, a river of France, which rises near Saverne, in the department of the Lower Rhine, passes by Brumath, and enters a canal which communicates with the Rhine, 8 miles N. of Strasburg.

ZORNDORF, a town of the New Mark of Brandenburg, where the king of Prussia defeated the Russians in the year 1758, near Custrin.

ZORNIA, in *Botany*, received that name from the late professor Gmelin of Gottingen, the compiler of a very faulty edition, at least as to the botanical department, of the *Systema Naturæ* of Linnæus. He chose this appellation for one of Walter's anonymous genera, which he himself knew nothing of. It has been adopted by Michaux and Pursh, and seems intended for the commemoration of Mr. John Zorn, an apothecary of Kempten, in Bavaria, who was born in the year 1739, and may possibly be still living. He has published five volumes in octavo of *Icones Plantarum Medicinalium*, each volume containing one hundred plates, with a Latin and German text. These figures are coloured in the Nuremberg stile; at which place the work appeared, between the years 1779 and 1784. There was, moreover, a Dr. Bartholomew Zorn of Berlin, who published there, in 1714, *Botanologia Medica*, a thick German quarto, with six plates. He edited also, in 1673, the *Herbarium portatile* of Thomas Pancorius, and according to Driandr. Bibl. Banks, v. 5. 496, died in 1717, at the age of 78.—Gmel. Syst. Nat. v. 2. 1096. Michaux Boreal.-Amer. v. 2. 76. Pursh 484. Poiret in Lamarck Dict. v. 8. 872. (Anonymos n. 279; Walt. Carol. 181.)—Class and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminosæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped, two-lipped; upper lip broad, abrupt, emarginate; lower in three deep segments, the middle one longest. *Cor.* papilionaceous: standard inversely heart-shaped, reflexed, revolute at the sides: wings ovate, erect, smaller than the standard: keel divided at the base, bluntly rectangular, the length of the wings. *Stam.* Filaments in two sets? anthers five of them oblong, five alternate ones globose. *Pist.* Germen ovate; style awl-shaped, horizontal; stigma simple. *Peric.* Legume of several, roundish, compressed, single-seeded joints, hispid with barbed prickles, not bursting. *Seeds* solitary, kidney-shaped.

Eff. Ch. Calyx bell-shaped, two-lipped; the upper lip abrupt. Standard revolute. Keel angular. Five alternate anthers oblong; five globose. Legume of several single-seeded, closed, hispid joints.

Obs. The habit of this genus is so peculiar, and so unlike Hedysarum, much more resembling Stylosanthes, (see those articles,) that we are very glad of any characters that may serve to keep it distinct, and we hope the above may suffice. The plants are herbaceous, with one or two pair of conjugate *leaves*, without an odd one. *Flowers* small, in axillary *spikes*, with large leafy *bracteas*. The species have not yet been well discriminated. We shall endeavour to explain them, with the help of original specimens.

1. Z. *angustifolia*. Narrow-leaved Zornia. (Hedysarum diphyllum α; Linn. Sp. Pl. 1053. Willd. Sp. Pl. v. 3. 1178. Lamarck Dict. v. 6. 404, excluding the variety H. n. 291; Linn. Zeyl. 134, excluding Sloane's synonym, and the variety β. H. bifolium, siliquis articulatis echinatis; Burm. Zeyl. 114. Onobrychis maderaspatana diphyllos minor, siliculis hirsutis; Pluk. Phyt. t. 246. f. 6. "Nelam-mari; Rheede Hort. Malab. v. 9. 161. t. 82." Raii Hist. v. 3. 404.)—Leaflets two, lanceolate, uniform. Bracteas ovate, ribbed, fringed, imperfectly reticulated, shorter than the legume, marked with glandular dots. Prickles of the legume rough.—Native of the East Indies, in a sandy soil. *Root* annual, tapering, warty. *Stems* several, diffuse, from four or five inches to a foot long, round, slender, zigzag, smooth, leafy, with short alternate branches. *Leaves* simply conjugate, alternate; *leaflets* from half an inch to an inch long, elliptic-lanceolate, entire, bluntish, tipped with a small point, unequal at the base, smooth on both sides, not quite sessile at the extremity of the common *footstalk*, which is about the length of the leaflets, cylindrical, smooth, with a longitudinal furrow above. *Stipulas* half-arrowshaped, ribbed, entire, pointed at each end. *Flowers* yellow, in axillary, solitary, stalked, lax, bracteated *spikes*, longer than the leaves, each spike of from three to eight alternate flowers. *Bracteas* one pair to every flower, twice as long, two-ranked, converging, flat, ovate, acute, entire, strongly fringed, three or five-ribbed, besprinkled with resinous dots, elongated at the base into a short oblique spur, permanent, their surface smooth. *Legume* near an inch in length, longer than the bracteas, of about four semi-orbicular joints, finely reticulated, and beset with spreading, brown, barbed prickles, which are rough with minute reversed hairs, but we cannot perceive that the surface of the legume itself is downy, at least not invariably. The resinous dots scattered over the *bracteas* seem peculiar to this species. Those parts are full as much fringed in this as in the *H. conjugatum* of Willdenow, though his definitions indicate otherwise.

2. Z. *reticulata*. Reticulated Zornia. (Hedysarum diphyllum β; Willd. Sp. Pl. v. 3. 1178. δ; Lamarck Dict. v. 6. 404. H. diphyllum; Swartz Obs. 285. H. n. 10; Browne Jam. 301, excluding the synonyms. H. minus diphyllum, flore luteo; Sloane Jam. v. 1. 185.)—Leaflets two, lanceolate; the lower ones elliptical. Bracteas ovate, as long as the legume, strongly reticulated and fringed, without glandular dots. Legume and its prickles downy.—Native of the dry sandy parts of the savannahs of Jamaica. Our specimens are from Browne himself. The *root*, though said to be annual, is somewhat woody. *Herb* larger than the last, and most unquestionably specifically distinct. The *stems* are straight, a foot long, scarcely branched. *Leaflets* an inch

inch or an inch and a quarter in length; thofe of the lower leaves half an inch broad. *Spikes* many-flowered, thrice as long as the leaves. *Flowers* yellow; the ftandard fometimes purplifh. The *bracteas* afford a clear fpecific diftinction, in their ftrongly-marked, elevated, veiny reticulations, and the total want of refinous or glandular dots, though their whole furface is minutely granulated, as it were, like thofe of the foregoing fpecies. The *legumes* have three or four joints, and their furface, as well as their prickles, is downy. They are almoft entirely covered by the *bracteas*.

3. Z. *conjugata*. Ovate Zornia. (Hedyfarum conjugatum; Willd. Sp. Pl. v. 3. 1178. H. diphyllum β; Linn. Sp. Pl. 1053. H. n. 291, β; Linn. Zeyl. 135. H. bifolium, foliolis ovatis, filiculis afperis, geminis, inarticulatis; Burm. Zeyl. 114. t. 50. f. 1. Onobrychis maderafpatana diphyllos, filiculis afperis; Pluk. Phyt. t. 102. f. 1.)—Leaflets two, ovate, uniform. Bracteas ovate, ribbed, fringed, imperfectly reticulated, fhorter than the legume, without glandular dots. Legume fringed; its difk and prickles fmooth.—Native of Ceylon and Tranquebar. This fpecies approaches the laft in fize, but differs in many effential points. The *leaflets* are ovate, not near fo long as their common *footftalk*. *Bracteas* more pointed and elongated at the bafe, ribbed, but not ftrongly reticulated; their fubftance quite deftitute of pellucid dots, though fome of them occafionally bear little black opaque prominences, which feem the effect of injury, or are perhaps a minute parafitical fungus. *Legumes* confiderably longer than the bracteas, though each confifts of fcarcely more than two orbicular joints, full twice the fize of either of the preceding fpecies, from which they differ in the fmoothnefs of their difk and prickles, though fringed at the edge. The *flowers* are yellow.

4. Z. *latifolia*. Broad-leaved Zornia. (Hedyfarum diphyllum; Aubl. Guian. 774, excluding all the fynonyms.)—Leaflets two, roundifh-ovate; the lower ones orbicular. Bracteas linear-lanceolate, ribbed, fomewhat hairy, longer than the downy legumes.—Gathered in Guiana by Aublet, from whom we have fpecimens, which abundantly fhew his plant to be different from any of the foregoing, and juftify him in faying that, with refpect to it at leaft, Plukenet's figures are bad. This has a woody, but perhaps annual, *root*, and feveral proftrate *ftems*, from fix inches to a foot long, ftraight, round, downy. *Footftalks* alfo downy, rather longer than the *leaflets*, which in the lower *leaves* are about half an inch in length, nearly orbicular, obtufe; in the upper gradually more elongated, ovate, or ovato-lanceolate, acute; all of them fomewhat hairy or filky, efpecially beneath, where alfo they are a little glaucous. The narrow *bracteas*, very differently fhaped from any of the three preceding fpecies, are the diftinguifhing characteriftic of this: they have three very ftrong crowded ribs, originating from their point of infertion, below which is a blunt elongation downwards, moft like that of *Z. reticulata;* they are fomewhat hairy, as well as flightly fringed. *Corolla* yellow. *Legume* of only two joints, unlefs any have been broken off, which is not apparent; the prickles downy, and the difk quite woolly. Willdenow fpeaks of a fuppofed variety of *Hedyfarum diphyllum* from Portoricco, which is larger than the common kind, and whofe *leaves* are "*ftrigofe beneath;*" by which expreffion is probably meant briftly, or hairy. This, if not our *Zornia latifolia*, muft be a hitherto nondefcript fpecies, of which we have not materials to give a definition.

5. Z. *heterophylla*. Various-leaved Zornia. (Hedyfarum tetraphyllum; Thunb. Act. Nov. Upfal. v. 6. 44. t. 3. Prodr. 132. Willd. Sp. Pl. v. 3. 1203. Lamarck Dict. v. 6. 405, variety δ.)—Leaflets three or four, lanceolate. Stipulas half-arrowfhaped. Bafe of the bracteas elongated and acute.—Gathered by Thunberg in the interior part of the country, above the Cape of Good Hope, near Galgebofch, flowering in November and December. The *ftem* is herbaceous, decumbent, thread-fhaped, fmooth, a foot or more in length. *Footftalks* rather longer than the *leaflets*, which are three or four together, elliptic-lanceolate, acute, entire, hardly an inch long. *Stipulas* much elongated at the bafe, acute at each end. *Spikes* axillary, many times longer than the leaves, (at leaft the lower fpikes,) and confifting of ten or twelve *flowers*, concealed by the ovate three-ribbed *bracteas*, each of which is elongated at the bafe into an ovate acute appendage, nearly half its own length. *Legume* longer than the bracteas, of four joints, faid by Thunberg to be rough, but in what manner, or degree, is not mentioned: his figure reprefents them fmooth and globofe, which is evidently an inaccuracy.

6. Z. *tetraphylla*. Four-leaved Zornia. Michaux Boreal.-Amer. v. 2. 76. t. 41. Purfh n. 1. (Z. bracteata; Gmel. n. 1. Anonymos bracteata; Walt. Carol. 181. Hedyfarum tetraphyllum; Lamarck Dict. v. 6. 405, α.)—Leaflets four, lanceolate. Stipulas ovate. Bafe of the bracteas fomewhat elongated, obtufe.—Native of fandy fields in Lower Carolina. Perennial, flowering in July and Auguft. About a foot high, much branched. *Flowers* yellow. *Purfh*. We have here ventured to diftinguifh this from the laft-defcribed fpecies, by the characters afforded in the plates cited, without our having ever feen a fpecimen of either. We are fully aware of the hazard of fuch a proceeding; but as it is highly probable that a Cape plant will hardly prove, on comparifon, the fame fpecies as a Carolina one; and the fpecies of this genus very nearly refemble each other, and have been much confounded, we propofe the above characters. If the figure of Michaux be exact, as to the *ftipulas* and *bracteas*, there can be no doubt on the fubject, and it was drawn by no lefs an artift than Redonté. The *ftipulas* are there reprefented perfectly ovate, without any fpur, or elongation, at the bafe, and not half the ufual fize in this genus. Thofe of Thunberg's plate are like the reft of the fpecies. This is the moft important difference, though the fhort and blunt fpur of the *bracteas* is very ftriking alfo. The *flowers* feem larger in thefe two laft, than in any of the foregoing.

On reviewing the whole genus, we cannot but repeat that the abruptly-compounded *leaves* afford a moft important mark of difference, compared with *Hedyfarum*, nor are the yellow *flowers*, in this cafe, entirely unworthy of confideration. There is moreover fo clofe a refemblance between all the fpecies of *Zornia*, as to induce a perfuafion of their conftituting a very natural genus. The fame may be faid of Stylosanthes, to which we have already referred the reader as being next akin to *Zornia*.

Which of the above fix fpecies, or rather which of the firft four, is entitled to a place in the *Hortus Kewenfis*, we cannot prefume to determine. In v. 4. 340. of that work, Dr. Houftoun is recorded as having fent to Miller, before the year 1733, fomething which has always paffed for *Hedyfarum diphyllum*. This muft have come from South America, or the Weft Indies, and was therefore not *Nelam-mari* of Rheede, our *Zornia anguftifolia;* nor the *conjugata*, a plant of Ceylon. It muft have been either the Weft Indian *reticulata*, or more probably perhaps the South American *latifolia*.

ZOROANDA, Hazour, in *Ancient Geography*, a place of of Asia, on a part of mount Taurus, called Nicephates, where the Tigris opened a subterranean passage, N.W. of Amida.

ZOROASTER, Zerdusht, or Zardusht, in *Biography*, an eminent Eastern philosopher, concerning whom, as well as the age in which he lived, learned writers have entertained very different opinions. Some have ascribed this title, the derivation of which is uncertain, to many eminent persons; whilst others have maintained that there was but one Zoroaster, and that he was a Persian. Others have said that there were six celebrated founders of philosophy of this name. Ham, the son of Noah, Moses, Osiris, Mithras, and others, both gods and men, have by different writers been asserted to have been the same with Zoroaster. Many different opinions have been also advanced concerning the time in which he flourished. Aristotle and Pliny fix his date at so remote a period as 6000 years before the death of Plato: Hermippus says, that he lived 5000 years before the Trojan war; but these are idle tales, which should, without doubt, be classed with the report of the Chaldæans, concerning the antiquity of their astronomical observations. According to Laertius, he flourished 600 years before the Trojan war; according to Suidas 500. We shall in the sequel of this article detail the opinions of some of our principal modern writers on this subject. According to Brucker, the most probable hypothesis is, that there was a Zoroaster, a Perso-Median, who flourished about the time of Darius Hystaspes, and that besides him there was another Zoroaster, who lived in a much more remote period among the Babylonians, and taught them astronomy. The Greeks and Arabians are agreed concerning the existence of the Persian Zoroaster; and the ancients unanimously ascribe to a philosopher, whom they call Zoroaster, the origin of the Chaldæan astronomy, which is certainly of much earlier date than the time of Hystaspes; so that it seems necessary to suppose a Chaldæan Zoroaster distinct from the Persian. Concerning this Zoroaster, however, nothing more is known, than that he flourished towards the beginning of the Babylonish empire, and was the father of the Chaldæan astrology and magic. (See Chaldæan *Philosophy* and Magi.) All the writings which have been ascribed to the Chaldæan Zoroaster are unquestionably spurious. The Persian Zoroaster was probably of Persian extraction, and born in Media. Although much of what has been related concerning this Zoroaster or Zerdusht, and the instruction which he received from the Jews, is fabulous; nevertheless it is not improbable that he might have learned some things from the Israelites who resided in Babylon, that might enable him to correct the doctrine of the Persian magi; but it is not easy to specify particulars. Several miracles are ascribed to Zoroaster, but they are of such a kind as an impostor would not find it very difficult to perform. (See Magi.) To Zerdusht, or the Persian Zoroaster, many writings are ascribed; particularly the Zend. (See Zendavesta.) Fragments of a work, entitled "The Oracles of Zoroaster," are still extant. Several editions of them under the form of verses have been published, and pains have been taken to explain them. Stanley has subjoined to his "Lives of the Philosophers" a correct translation of them. The philosophers of the Alexandrian school highly venerate them as genuine remains of Chaldæan wisdom: but they have so many evidences in their ideas and language of their origin in that school, as to render it probable that they were written by some Platonist, about the beginning of the second century; a period in which spurious writings were produced in order to support the sinking credit of Gentile philosophy.

The learned Dr. Hyde, and after him Dr. Prideaux and several others, are of opinion, that Zoroaster was the same with the Zerdusht of the Persians, who was a great patriarch of the Magians, and that he lived between the beginning of the reign of Cyrus, and the latter end of that of Darius Hystaspes.

Dr. Warburton (Legation, vol. ii. part i. p. 8.) censures Hyde and Prideaux for making an early Bactrian law-giver to be a late Persian false prophet, and says this whole story of him is mere fable, contradicting all learned antiquity, and supported only by the romantic relations of later Persian writers under the caliphs.

Dr. Baumgarten likewise (Anc. Un. Hist. Suppl. vol. ii. p. 365, &c.) represents it as doubtful, whether the Persian Zoroaster ever existed, calls in question the credibility of the oriental writers who give his history, and makes the whole to be a forgery in later times by the fire-worshippers of Persia.

The learned Mr. Bryant (Anal. Anc. Mythol. vol. ii. p. 107.) observes, that there are more persons than one spoken of under the character of Zoroaster; though there was one principal to whom it more truly related. Of men, styled Zoroaster, he says, the first was a deified personage, reverenced by some of his posterity, whose worship was called Magia, and the professors of it Magi. This worship was transmitted from the ancient Babylonians and Chaldæans to the Persians, who, succeeding to the sovereignty of Asia, renewed under their princes, and particularly under Darius, the son of Hystaspes, those rites which had been in a great degree effaced and forgotten. The Persians, says this learned writer, originally derived their name from the deity Perez, or Parez, the sun; whom they also worshipped under the title of Zor-After. On occasion of the distress to which they were reduced upon the death of their last king Yesdegerd, they retired into Gedrosia and India, where people of the same family had for ages resided, and carried with them some shattered memorials of their religion in writing, whence the Sadder, Shaster, Vedam, and Zendavesta, were compiled; and upon these the religion of the Brahmins and Persees is founded. The person who is supposed to have first formed a code of institutes for this people is said to have been one of the Magi, named Zerdusht; the same, as Hyde and others suppose, both in character and name, with Zoroaster: but Mr. Bryant discovers no resemblance between them. There were, indeed, many persons of this name in different parts of the world, who were magi or priests, and denominated from the rites of Zoroaster, which they followed. We read of an Assyrian, Medo-Persian, Proconnesian, Bactrian, Pamphylian, Chinese, &c. Zoroaster, supposed by Dr. Hyde to have been one and the same. But Mr. Bryant thinks that their respective histories furnish evidence sufficient of their being different persons; and besides, there seems to have been one person more ancient and celebrated than the rest. As for the Zoroaster or Zerdusht of Hyde, he lived in the reign of Darius, the father of Xerxes, about the time of the battle of Marathon, and consequently not a century before the birth of Eudoxus, Xenophon, and Plato. This Zerdusht, who was the renewer of the Sabian rites, could not be the person so much celebrated by the ancients, and referred to the first ages. Xanthus Lydius makes him above 600 years prior to the reign of Darius; Suidas places him 500 years before the war of Troy; Hermodorus Platonicus, Hermippus, and Plutarch, refer him to 5000 years before that era; Eudoxus supposed him to have flourished 6000 years before the death of Plato; and Pliny places him

many

many thousand years before Moses. Upon the whole it appears, that no memorial upon record is placed so high as the ancient writers have carried this personage; and though their accounts are for the most part exaggerated, yet they fully ascertain the antiquity of this person.

The title Zoroaster, Mr. Bryant conceives, originally belonged to the sun, and was metaphorically bestowed on sacred and enlightened personages. Some have thought, that the first among men to whom this title was applied was Ham; others have taken him for Chus, for Mizraim, and for Nimrod, and Huetius for Moses. But Mr. Bryant, after examining the primitive characters given of him by different writers, supposes, that they concur only in Noah, who was the first deified mortal, and the prototype in the Magian worship. This writer supposes, that, as the object of the Persic and Chaldaic worship was the sun, and most of their titles were derived thence, Zoroaster denoted Sol Asterius; Zor being the sun, and Aster signifying star.

The abbé Foucher, in a long series of memoirs, inserted in the 25th, 26th, 27th, 28th, 30th, and 31st vols. of the Histoire de l'Academie Royale des Inscriptions et Belles Lettres, &c. Paris, has given an ample account of the religion of the Persians. This learned author maintains, on the authority of Pliny, that the most celebrated Zoroaster was an ancient sage, who lived under Cyaxares, king of the Medes, restored the worship of fire, was revered by the Persians as a celestial prophet, and whose extacies, prodigies, and revelations, made a great noise in the world. See Zendavesta.

ZOROPASSUS, in *Ancient Geography*, a town of Asia, in Lesser Armenia, dependent on the prefecture of Murianne. Ptol.

ZORVI, in *Geography*, a town of Asiatic Turkey, in the province of Diarbekir; 22 miles E. of Ana.

ZOSAWA, a river of Moravia, which runs into the Frisawa, 5 miles W. of Hohenstadt.

ZOSIMA, in *Botany*, an umbelliferous genus, thus called by professor Hoffmann, in compliment to three brothers, Anastatius, Nicholas, and Zoa Zosima, distinguished for their editions of numerous works of the Greek classics. This botanical commemoration seems chiefly owing to the great propensity, ("*magna propensio*,") of the latter of these brothers, for natural history. We presume not to dispute the claim, because the author of this name is, doubtless, better able to judge of its propriety than we can possibly be.—Hoffm. Umbell. v. 1. 145. t. 1. B. f. 9.—Class and order, *Pentandria Digynia*. Nat. Ord. *Umbelliferæ*.

Gen. Ch. *General* and *partial Umbel* of many unequal rays. *General* and *partial involucrum* of many, linear-lanceolate, acute, unequal, villous, permanent leaves. *Perianth* of five unequal, very short, permanent teeth. *Cor. Universal* nearly regular and uniform; *flowers* partly perfect and fertile; the central and lateral ones, in each umbel, male: *partial* of five, nearly equal, spreading, inversely heart-shaped, deflexed petals; rather concave, on each side, at the keel; tapering at the base; obliquely inflexed at the point, which is linear-lanceolate, acute, involute, channelled. *Stam.* Filaments five, spreading or deflexed, straight, longer than the involute corolla, dilated at the base; anthers versatile, roundish, two-lobed. *Pist.* in the perfect florets, Germen inferior, ovate, compressed, villous; styles two, thread-shaped, channelled; their tumid base wavy and crenate at the margin; at length reflexed and permanent; stigmas simple, obtuse. *Peric.* Fruit roundish-obovate, compressed, finely downy, bordered; the border externally tumid, and somewhat corrugated, internally striated; emarginate at the summit, crowned with the styles on their short, nearly sessile, crisped base; thickened at the bottom; the disk elevated and striated. *Seeds* two, of a similar shape, convex in the middle, with three elevated, narrow, central ribs, and two marginal ones; their interstices, in the upper half, occupied by four coloured stripes.

Eff. Ch. General and partial involucrum of many permanent leaves. Corolla uniform. Some flowers male. Calyx tumid, five-toothed. Petals nearly equal, obovate, inflexed. Fruit roundish-obovate, compressed, villous, with a *corrugated* border; the disk ribbed.

1. Z. *orientalis*. Oriental Zosima. Hoffm. n. 1. (Heracleum absinthifolium; Venten. Choix de Pl. 7. t. 7. Marsch. a Bieberst. Taur.-Caucas. v. 1. 224. Sphondylium orientale humilius, foliis absinthii; Tourn. Cor. 22.)—Native of Persia, Georgia, and other countries about Caucasus, flowering in the early part of summer. The *root* is biennial, tap-shaped, milky. The whole herb when bruised smells like Smallage, *Apium graveolens*. *Stem* erect, near two feet high, cylindrical, furrowed, somewhat branched, and slightly leafy, about as thick as a swan's quill, rough to the touch with short whitish hairs. *Leaves* opposite, stalked, thrice pinnate, hoary with short pubescence; *leaflets* small, wedge-shaped, lobed; entire at the edges. *Umbels* two or three inches in diameter, on long stalks, terminal: *partial* ones of from twelve to fifteen *flowers*, which, according to Ventenat, are milk-white, but Hoffmann describes the *petals* of a yellowish-green. *Germen* downy. If the *flowers* are really white, we should suspect this plant to be nearly related to *Heracleum tomentosum*, Sm. Prodr. Fl. Græc. Sibth. v. 1. 192, which will be exhibited in t. 281. of the Fl. Græca; but the shape of the *fruit* of the latter is very unlike Hoffmann's figure, nor does it better agree with the representation in Ventenat's work. This last indeed is itself so unlike Hoffmann's t. 1. B. f. 9, (he himself erroneously cites f. 7,) that we cannot but suspect some mistake. Nor are we, after all, persuaded that the plant under consideration ought to form a separate genus from *Heracleum*. In so natural a family, the skill of a botanist is shewn in combining, rather than dividing, which last is the most easy thing in the world, and the most pernicious to science. We do not, however, pretend to decide in the present case; because the generic distinctions of Umbellate plants are still *sub judice*.

ZOSIMUS, in *Biography*, a Greek historian, who held various civil offices under the younger Theodosius, about the commencement of the fifth century, and left a history of Roman affairs in six books; the first of which furnishes a slight view of the emperors, from Augustus to Diocletian; and the others detail the public events that occurred to the second siege of Rome by Alaric, and the pontificate and deposition of Attalus. Something seems to be wanting towards the end. The style of this historian is concise, perspicuous, and pure; but his prejudices against the Christian emperors have misled him; and particularly in his account of Constantine the Great. Leunclavius has attempted to justify him; and it has been allowed that he has divulged some truths which other historians have suppressed. Gibbon says, "credulous and partial as he is, we must take our leave of this historian with regret." The first edition of his work was that of R. Stephens, in 1581; others have been published by T. Smith, Gr. and Lat. Oxon. 1679, 8vo.; and the Variorum by Cellarius, 8vo. 1679, 1712.

Zosimus, *Pope*, a native of Greece, was elevated to the pontifical throne in March 417, as successor to Innocent I.; at the time when the Pelagian controversy prevailed. Cælestius, the chief disciple of Pelagius, presented his confession of faith to this pope, who approved it and admitted him

him to his communion. That of Pelagius was likewife approved. The African bifhops, however, who were hoftile to the Pelagian doctrine, interefted the emperor Honorius in their favour; and obtained from the pope an anathema of the doctrine of Pelagius and Cæleftius, with a fentence of excommunication if they refufed to abjure their tenets. A council was affembled, in which other bifhops, who concurred in the Pelagian creed, were degraded from their epifcopal dignity. The fluctuations and inconfiftencies of Zofimus's conduct depreciated the character of the pope, and furnifhed reafon for queftioning his infallibility. Other inftances occurred, in which he was hardly able to maintain his authority. This pope died in December 418, leaving the character of an able man of bufinefs, but hafty, tenacious, and imperious. His thirteen epiftles, that are extant, are written with fpirit and elegance. He was canonized, as Bower fays, by a miftake of cardinal Baronius, who fuppofed him to be a St. Zofimus in the martyrology of Bede. Dupin. Bower.

ZOSITERPUM, in *Ancient Geography*, a town of Thrace, in the province of Rhodope. Procopius.

ZOSSEN, in *Geography*, a town of Brandenburg, in the Middle Mark; 13 miles S.E. of Potzdam. N. lat. 52° 10'. E. long. 13° 17'.

ZOSTER, in *Ancient Geography*, a borough of Attica, upon the fea-coaft, with a promontory of the fame name, extended into the Saronic gulf; but it is not known to what tribe it belonged. Minerva, Apollo, Diana, and Latona, were honoured here. As Zofter bore fome refemblance to zone, or cincture, the inhabitants pretended that the borough bore this name, becaufe Latona, finding herfelf in this place, and feeling that her time was approaching, unloofened her cincture. Pauf. in Attic. c. 31.

Zoster, a word ufed by fome to exprefs that kind of herpes, called by others *zona* and *zingilla*, and by us ufually known under the name of the fhingles.

ZOSTERA, in *Botany*, fo named by Linnæus from ζωςηϱ, *a girdle*, alluding to the ribband-like appearance of its long linear foliage.—Linn. Gen. 472. Schreb. 615. Willd. Sp. Pl. v. 4. 179. Vahl Enum. v. 1. 14. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 7. Prodr. Fl. Græc. Sibth. v. 1. 2. Purfh 2. Brown Prodr. Nov. Holl. v. 1. 338. Juff. 24. Poiret in Lamarck Dict. v. 8. 872. Lamarck Illuftr. t. 737. Gærtn. t. 19. (Alga; Raii Syn. ed. 3. 52. Ruppia; Moehring in Phil. Tranf. v. 41. 217.)—Clafs and order, *Monandria Monogynia*, Fl. Brit. and Vahl. (Gynandria Polyandria, *Linn.* Monoecia Monandria, *Schreb.* and *Willd.*) Nat. Ord. *Piperitæ*, Linn. *Aroideæ*, Juff. *Aroideis affine*, Brown.

Gen. Ch. *Cal.* Spadix linear, flat, fheathed by the bafe of a leaf, bearing an indeterminate number of flowers on one fide. Perianth none. *Cor.* none. *Stam.* Filament none; anther feffile, erect, clofely preffed to the fpadix, fimple, cylindrical, a little wavy, tapering at each end. *Pift.* Germen folitary, parallel to the anther, and of nearly a fimilar fhape; ftyle one, obliquely curved, fhorter than the germens; ftigmas two, linear, acute, fpreading. *Peric.* Capfule pendulous, elliptical, membranous, of one cell, not burfting. *Seed* folitary, oblong, ftriated.

Eff. Ch. Spadix linear, fheathed by the bafe of a leaf, bearing the flowers on one fide. Perianth and Corolla none. Anther feffile. Stigmas two, linear. Capfule with one feed.

Obf. The above is the view of the genus in queftion, firft given by Gærtner, and confirmed from actual obfervation in the *Englifh Botany* and *Fl. Brit.* Vahl adopts the fame idea as ours of the place of this genus in the artificial fyftem. The *feed* has a large, oval, half divided *cotyledon*, as we would call it; Gærtner terms it a *vitellus*. (See the article Yolk *of the Seed*.) From this genus is to be feparated the *Z. oceanica* of Linnæus, which belongs to *Caulinia* of De Candolle and Brown; *Poffidonia* of Konig in Ann. of Bot. v. 2. 95. t. 6; *Kernera* of Willd. Sp. Pl. v. 4. 947; but which is different from Caulinia of Willdenow; fee that article.

1. Z. *marina*. Common Grafs-wrack. Linn. Sp. Pl. 1374. Willd. n. 1. Vahl n. 1. Fl. Brit. n. 1. Engl. Bot. t. 467. Fl. Dan. t. 15. Purfh n. 1. Brown n. 1? (Zoftera; Linn. It. W. Goth. 166. t. 4.)

β. Fucus marinus, feu Alga marina graminea mino; Raii Syn. 52. (Algoides; Mich. Ic. Ined. t. 60. f. 2.)

γ. Fucus, five Alga marina graminea anguftifolia feminifera ramofior; Raii Syn. 52. (Algoides; Mich. Ic. Ined. t. 59?)

δ. Potamogeiton marinum in utriculis epiphyllofpermon minus; Raii Syn. 53.

ε. Alga anguftifolia vitrariorum; Raii Syn. 53.

Leaves entire, obfcurely three-ribbed. Stem flightly compreffed. Native of the fea-fhore, or falt muddy ditches and creeks throughout Europe, poffibly of New Holland and North America alfo, flowering towards autumn. The *root* is perennial, fibrous. *Stems* roundifh, fmooth, decumbent at the bafe, and trailing to a great extent, throwing out tufts of fibres here and there; their branches floating and leafy, fimple, a little compreffed. *Leaves* alternate, tapering at the bafe into a kind of fheathing footftalk, linear, a foot, or much more, in length, flat, fmooth, bluntifh, quite entire, fplitting longitudinally a little above the bafe, on the upper fide, and putting forth from that fiffure a linear, obtufe, flat *receptacle* or *fpadix*, two inches long, covered in front with a feries of naked *flowers*. Each of thefe *flowers* confifts of a green *anther*, and a *piftil* of the fame hue, parallel to it; but in fuch an alternate order, that the *anther* of each flower is contrary to that of its neighbour, and ftands above the *piftil* of the latter. The whole *herb* is flaccid and tender; yet Linnæus fays it is ufed in fome parts of Sweden to make a thatch, which is very durable, and likewife to ftop up chinks in wooden buildings. It ferves alfo for manure, as well as the various kinds of fea-weed.

Whether the varieties above indicated may any of them prove diftinct fpecies, muft be left for future inquiry. The β is a fmall flender plant, differing in nothing but its leffer dimenfions from the common kind. It is well reprefented in one of Micheli's unpublifhed plates. γ is larger, more compact, and branched; we can fcarcely doubt its being Micheli's t. 59. Of the others we know no more than can be gathered from Ray's *Synopfis*.

Z. oceanica of Linnæus is quite different from any of thefe fuppofed varieties, conftituting a diftinct genus, called *Poffidonia Cavolini*, by Mr. Konig, in Ann. of Bot. v. 2. 95. t. 6; and well defcribed by don Philip Cavolini of Naples, in a differtation on thefe plants. De Candolle has named it *Caulinia*, but it is not Willdenow's. In Micheli's unpublifhed figures above cited, t. 58, is a good figure of this. We never met with any authority for its being a native of the Britifh coaft; but Mr. Horner, in a paper publifhed by the Geological Society, in their Tranfactions, v. 3, mentions the fubmarine remains of a foreft, on the Suffex coaft, in the brown vegetable earth, accompanying which are found fragments of a plant, whofe *leaves* were thought by Mr. Brown to refemble *Zoftera marina*, except that, being much broader than ufual, he fufpected they might belong to *Z. oceanica* above-mentioned. If thefe leaves were fufficiently perfect to exhibit the three ribs, that queftion might perhaps be determined. As to the breadth, or fize, of the *leaves* in in this whole tribe, nothing is more variable. We have Z. *ciliata* of Vahl; to which he attributes *leaves* an inch or more in breadth: whose *leaves*, in our different specimens, are but one-third or one-fourth of an inch wide, and from three inches to eight inches long. Z. *marina* differs with us from one-eighth to one-fourth of an inch in width, and if the above synonyms be all right, its variations are still greater.

2. Z. *uninervis*. Single-ribbed Grass-wrack. Forsk. Ægypt.-Arab. 157. Vahl n. 2. Willd. n. 2.—"Leaves entire, single-ribbed. Stem compressed; swelling at the joints."—Found by Forskall on the coast of the Red sea at Mocha, growing under water, and resembling overflowed grass. The *stem* is yellow, with bent joints. *Leaves* a span long, or more, narrower than in Z. *marina*, with an obscure mid-rib, unattended by lateral ones; and their base is sheathing.

Z. *ciliata*, Vahl n. 3; and *stipulacea*, his n. 4; found by Forskall at the same place as the last, with whose fructification Vahl was, in both instances, unacquainted, are referred by Mr. Konig, in Ann. of Bot. v. 2. 97, not without some doubt, to a new dioecious genus, denominated *Thalassia* in Dr. Solander's MSS., of whose fructification no figure has appeared, and of which the male flowers only have been observed. They are indeed sufficiently remarkable, as the following characters evince. *Sheath* single-flowered, of one leaf, in two oblong obtuse segments. *Perianth* of three ovate-oblong, obtuse leaves. *Cor.* none. *Filaments* none. *Anthers* nine, converging, linear-lanceolate, shorter than the calyx. The want of a slit in the *leaves* of these two last-mentioned plants proves them to be no *Zosteræ*.

ZOTENBERG, in *Geography*, a mountain of Silesia, in the principality of Schweidnitz, on which is a celebrated chapel; 20 miles W. of Breslau.

ZOTHECA, among the *Ancients*, the place where the animals designed for sacrifice were kept.

ZOUF, in *Geography*. See GAUR.

ZOUF, a river of Grand Bucharia, which runs into the Dehasp, 45 miles S. of Balk.

ZOU-KEOU-KIAOU, a town of China, in Pe-tche-li; 5 miles S.W. of Peking.

ZOULNOUN, a town of Asiatic Turkey, in the government of Sivas; 10 miles S.S.W. of Amasreh.

ZOUR EL HAMMAN, or *Island of Pigeons*, a small island in the Mediterranean, near the coast of Algiers. N. lat. 36° 26′. E. long. 12° 38′.

ZOUR, *Shahr e.* See SHAREZUR and SOLYMANIA.

ZOWAMORE, or ZIMBRA, an island in the Mediterranean, near the N.E. coast of Tunis, called by the ancients Ægimurus; 18 miles N.N.W. of Cape Bon. N. lat. 36° 50′. E. long. 11° 8′.

ZOWHAREEN, a town of Africa, in the kingdom of Tunis; 16 miles E.S.E. of Keft.

ZOW-WAN, or ZAGWAN, a town of Africa, in the kingdom of Tunis. It is a small flourishing town, built upon the north-east extremity of a conspicuous mountain of the same name. It is in great repute for the dyeing of scarlet caps, and the bleaching of linen; great quantities of both being daily brought thither for that purpose from Tunis, Susa, and other places. The stream which is employed at present for this use was formerly, together with the river Zungler, conveyed to Carthage; and over the fountains of it there was a temple erected, the ruins of which continue likewise to this day: upon this ancient gate, which regards the south-east, there is a ram's head, armed, in basso relievo, with AUXILIO, in large letters, below it. This may, perhaps, instruct us, that Zow-wan, or whatever was its former name, was under the immediate influence and protection of Jupiter Ammon; 36 miles S.W. of Tunis. N. lat. 36° 14′. E. long. 10° 6′.

ZOXO, a town of Asiatic Turkey, in the government of Diarbekir; 20 miles S.S.E. of Kerkisieh.

ZOYSIA, in *Botany*, was so named by the late professor Willdenow, in honour of the baron Charles de Zoys, a dignified ecclesiastic, resident in Carniola, who has long pursued with ardour the investigation of the botanical treasures of that country, and who is celebrated by Host, Wulfen, Jacquin, and other eminent writers, for the assistance which he has at various times afforded them.—"Willd. in Nov. Act. Nat. Cur. Berol. v. 3. 440." Brown Prodr. Nov. Holl. v. 1. 208. ("Matrella; Pers. Syn. v. 1. 73.")—Class and order, *Triandria Digynia*. Nat. Ord. *Gramina*, Linn. Juss.

Gen. Ch. *Cal.* Glume of one valve, single-flowered, ovate-oblong, compressed, cartilaginous, smooth, rigid, keeled, incurved, gaping at the apex of one edge; convex on one side; flattish on the other. *Cor.* Glume of two thin, membranous valves, enclosed within the calyx, awnless. Nectary none. *Stam.* Filaments three, capillary, short; anthers hastate. *Pist.* Germen superior, linear, minute; styles two, the length of the calyx; stigmas prominent, feathery. *Peric.* none, except the permanent glumes. *Seed* solitary, linear, invested with the calyx and corolla.

Ess. Ch. Calyx of one valve, single-flowered, compressed, cartilaginous. Corolla of two membranous valves, within the calyx. Stigmas feathery. Seed linear, invested with the glumes.

1. Z. *pungens*. Sharp-pointed Zoysia. Willd. as above. Brown n. 1. (Agrostis Matrella; Linn. Mant. 185. Willd. Sp. Pl. v. 1. 366. "Matrella juncea; Pers. Syn. v. 1. 73.")—Gathered in sandy ground, on the coast of Malabar, by Koenig; and near Port Jackson, New South Wales, by Mr. Brown. This is a small perennial grass, with a creeping *root*, enveloped in sheathing furrowed scales. *Stems* alternate, ascending, slender, thread-shaped, simple, leafy, three or four inches high. *Leaves* two-ranked, spreading, involute, sharp-pointed, smooth, an inch or an inch and a half long, with pale, furrowed, close *sheaths*, concealing the joints of the stem. *Stipula* of several spreading hairs. *Clusters* terminal, solitary, quite simple, of ten or twelve nearly sessile, alternate, erect *flowers*, remarkable for their smooth ivory-like *glumes*, about two lines in length, out of which, at the tip, project the feathery *stigmas*.

Linnæus was inclined to make this a distinct genus by the name of *Matrella*; derived from *matrix*, and alluding to an anatomical resemblance, too obscure to be very instructive, if it were liable to no other objection. Such allusions were allowable enough while botany remained the abstruse study of philosophers and physicians; but in proportion as it becomes general and popular, they are either useless or censurable. This grass might be forced into *Agrostis* as the definition of that genus stood in Linnæus, but has certainly no natural habit, nor any precise character, in common therewith. Mr. Brown remarks, that the *corolla*, (his *perianthium*,) is inverted, or contrary to the single-valved *calyx*; on which account, added to the nearly spiked *inflorescence*, he ranges *Zoysia* near *Rottböllia*. We cannot but think it rather more related to *Panicum Dactylon* of Linnæus, Haller's *Digitaria*; though in fact so distinct in its nature, as not to associate well with any thing.

ZOZONISIUS, in *Natural History*, a name of one of the gems of the ancients, but of which our accounts are so short, that we can make no conjecture of what it was. Pliny only tells us, that it was found in the river Indus, and used by the magi.

ZRATSCHE, in *Geography*, a town of Bohemia, in the circle of Czaſlau; 16 miles S.W. of Czaſlau.

ZRIN, a town of Croatia, near the river Unna; 40 miles E.S.E. of Carlſtadt. N. lat. 45° 16′. E. long. 16° 55′.

ZSCHOPA. See TSCHOPA.

ZSCHORLAU, a town of Saxony, in the circle of Erzgebirg; 10 miles S.S.E. of Zwickau.

ZSOKEN, a town of Saxony, in the circle of Erzgebirg; 8 miles N.W. of Grunhayn.

ZUAQUI, a town of New Mexico, in the province of Sonora; 8 miles S.S.E. of Pitquin.

ZUATA, a town of New Grenada; 45 miles N.N.E. of Tunja.

ZUBETH, a town of Perſia, in the province of Chuſiſtan; 105 miles N.W. of Suſter.

ZUBIA, a town of Spain, in the province of Grenada; 4 miles S.E. of Grenada.

ZUBTZOV, a town of Ruſſia, in the government of Tver, on the Volga; 68 miles S.W. of Tver. N. lat. 55° 46′. E. long. 34° 50′.

ZUCARELLO, a town of Genoa; 7 miles N.N.W. of Albenga.

ZUCCAGNIA, in *Botany*, ſo named by the late abbé Cavanilles, in honour of Dr. Attilius Zuccagni, ſuperintendent of the garden at Florence.—Cavan. Ic. v. 5. 2. Poiret in Lamarck Dict. v. 8. 875.—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Lomentaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, coloured; tube turbinate; limb in five deep, oblong, obtuſe, permanent ſegments, the lower one a little the longeſt. *Cor.* Petals five, obovate, inſerted into the calyx; the uppermoſt broadeſt, vaulted. *Stam.* Filaments ten, awl-ſhaped, aſcending, hairy in their lower part, about as long as the corolla; anthers roundiſh, of two lobes, divided by a furrow. *Piſt.* Germen ſuperior, roundiſh, compreſſed; ſtyle capillary, of the length and poſition of the ſtamens, ſmooth; ſtigma funnel-ſhaped. *Peric.* Legume ovate, oblique, compreſſed, hairy, of one cell and two valves. *Seed* ſolitary, ovate, compreſſed, attached by its ſtalk to the ſummit of the legume. *Cavanilles.*

Eſſ. Ch. Calyx bell-ſhaped; its limb in five permanent ſegments. Petals five, obovate; the upper one broadeſt, vaulted. Legume of one cell and two valves. Seed ſolitary.

1. Z. *punctata*. Dotted Zuccagnia. Cavan. as above, t. 403. Poiret n. 1.—Native of hills in Chili, between *Portillo* and the ſprings commonly called *Manantiales*, bearing flowers, as well as ſeed, in January. It was communicated to the author by Louis Née, to whoſe diſcoveries in South America and New Holland his *Icones* are ſo much indebted. The *ſtem* is ſhrubby, four or five feet high, with numerous, twiſted, glutinous *branches*. *Leaves* alternate, abruptly pinnate, of numerous, alternate, ſeſſile, elliptical, entire, glutinous *leaflets*, each one-third of an inch long, marked on both ſides with blackiſh reſinous dots. *Cluſters* terminal, ſolitary, ſimple, of ſeveral rather ſmall *flowers*. *Partial ſtalks* one-third of an inch long, each with a little acute *bractea* at its baſe. *Calyx* ſmooth, reddiſh-brown, rather ſhorter than the corolla. *Petals* a line and a half long, ſaffron-coloured, with darker veins. *Anthers* deep orange. *Legume* about three lines in length, clothed with long ruſty hairs. *Seed* of a ſhining brown. This pretty ſhrub does not appear to have been raiſed in the gardens of Europe.

ZUCCARO, or ZUCCHERO, TADEO, in *Biography*, was a painter of conſiderable renown, born at S. Agnolo in Vado, in the duchy of Urbino, in 1529. His father Ottaviano Zuccaro was alſo a painter, but of moderate talents; and Tadeo was principally indebted to Pompeo de Fano for initiation in the art. Having, as he imagined, exhauſted the ſtore of information to be derived from his preceptor, animated by love of his art and a deſire to free his father from further charge on his account, he, at the age of 14, went to Rome, unknowing and unknown. His relation Franceſco d'Agnolo was then engaged painting, with Pierino del Vaga, the grotesques of the Vatican, and he had ſome hope of aſſiſtance from him; but his application was vain, and he was obliged to earn his daily bread by grinding colours in different ſhops, wherever he could find employment. He divided his time between this labour and copying from the works of Raphael, in the Palazzo Ghigi particularly, and was often compelled to ſleep under the loggie of the palace, being unable to procure better accommodation. Weary at length of ſo much miſery, he returned to his father, but ſoon left him to reviſit the great emporium of art. Fortune now began to ſmile upon him; he became known to an artiſt named Giacomone, and having improved much with him, and acquired ſome credit, his relation Franceſco d'Agnolo noticed him, and for a time they worked together. Afterwards he was engaged by Daniello da Parma, a ſcholar of Corregio and Parmegiano, to aſſiſt him in painting a chapel of Santa Maria, in a church at Vitto, in Abruzzo. The work was in freſco, and Zuccaro, according to Vaſari, painted a large portion of the ſubjects required. When this was done, he returned to Rome, and was employed by G. Mattie to paint a façade of the Palazzo Mattei in freſco, where he executed, in chiaro oſcuro, nine hiſtorical pieces relative to the hiſtory of Furio Camillo. He was then only 18, and the execution of them was a matter of ſurpriſe to all who ſaw them. By this his firſt public work he gained ſo much reputation, that he ſoon acquired conſiderable employment. The duke d'Urbino, hearing of his fame, ſent for him to Urbino, and gave him a commiſſion to paint in freſco the chapel of the Duomo there, which was delayed by various cauſes, and he returned to Rome in the time of Julius III., who employed him, under Vaſari, in the Vatican, to paint in a frieze the labours of Hercules, which were afterwards deſtroyed by pope Paul IV. to make room for other works. Hitherto he had been principally employed upon ornamental ſubjects, but now a ſerious one was entruſted to his pencil; and he painted in freſco, for the church of Santa Maria della Conſolazione, ſeveral ſubjects of the paſſion of the Saviour, which are regarded as among his beſt productions. He was afterwards called upon to exert his ſkill, by the cardinal Farneſe, in the Palazzo Caprarola. This is his greateſt work, and is that whereon his reputation moſt depends. He was liberally paid by the cardinal. The whole ornamental part of the building was entruſted to his care, and he laboured with great earneſtneſs to make it honourable to himſelf and pleaſing to his employer. It has been engraved by Prenner in a ſet of 45 plates. Tadeo Zuccaro died at Rome in 1566.

ZUCCARO, FEDERIGO, was a younger brother of Tadeo juſt mentioned, and born in 1543. He received his inſtruction from his brother, with whom he was placed at Rome, when very young, and who paid him the moſt affectionate attention. He ſoon rendered himſelf uſeful to Tadeo in his great works, and engaged alſo in ſome labours for himſelf. Pope Pius IV. employed him, in conjunction with F. Barrocio, in the Palazzo Belvidere, where he gained great reputation. The brothers continued to work together without rivalry, and co-operated at the Vatican and the Villa

Villa Farnese. He was invited to Florence by the grand duke to finish the cupola, left imperfect by Vasari, and succeeded in pleasing his employer.

Gregory XIII. engaged him to paint the vault of the Capella Paolina; but having some dispute with the officers of his holiness, he avenged himself by a satirical picture which he exhibited. By this the pope was offended, and Zuccaro was obliged to fly, and leave his great work unfinished. He took refuge in France, where he was sometime employed by the cardinal of Lorrain; and from thence he went to Flanders, where he painted cartoons for tapestries.

In 1574 he visited England, and was received very favourably. Here he painted portraits. The queen sat to him, and many of the nobility. How long he remained here is not exactly known. When he returned to Italy, he went to reside at Venice, where the patriarch Grimani employed him in his chapel to finish the fresco ornaments begun by Battista Franco, and he added some designs of his own to them. He also painted there a large picture of the Adoration of the Magi. In conjunction with the great masters then living in Venice, he was employed in the hall of the grand council of that city, and he obtained as his reward the honour of knighthood. He soon after returned to Rome, and the pope not only overlooked his indiscretion, but allowed him to complete the work he had begun in the Capella Paolina.

On the accession of Sixtus V. he was invited to Madrid by Philip II. to adorn the walls and ceilings of the Escurial; but though he painted with his usual skill, and covered immense quantities of space, he had not his usual success in affording pleasure to his patron. Philip was not gratified with his works, and Zuccaro was dismissed; not, however, without being munificently rewarded for his labours. The works he left behind him were afterwards covered over by others from the hand of Pellegrini Tibaldi. On his return to Rome he established the academy of St. Luke, for which he received letters patent from Gregory XIII., and to which, at his death, which happened in 1609, he bequeathed all his property.

The talents of the Zuccaros were more splendid than great. They designed and executed with facility; but aiming at grandeur, fell into manner; and the vice of mannerism touches also the colour and chiaro oscuro of their productions. Sometimes happy in all parts, but more frequently defective in the principal one of expression and feeling, their works please without gratifying; and though they attract, do not absorb the spectator.

ZUCCHABARI, Chadara, in *Ancient Geography*, a town of Mauritania Cæsariensis, situated on the left bank of the river Chinalaph, and towards the north-east of mount Zalacus. This is very probably the Succabar and Colonia Augusta of Pliny.

ZUCCHARA, Zung-gar, an ancient town of Africa, and the most northerly of those which lay between Zingitania and Biracium. Its magnificent ruins and its temple are the coverts of Arabs.

ZUCCHERELLI, Francesco, in *Biography*, a very pleasing landscape painter, was born at Pitigliano in Tuscany, in 1702. He for some time attempted history, but abandoned it, and adhered solely to landscapes, which he adorned with very agreeably composed groups of figures. In 1752 he visited England, where he was much encouraged; but our greatest debt to him is due for his having persuaded Wilson to adopt landscape for his object, instead of portrait. For this liberal act what adequate thanks can be offered to his memory? At the foundation of the Royal Academy he was chosen an original member. After remaining here twenty years, he returned to Italy, and settled at Florence, where he had the misfortune to be reduced to indigence, by the suppression of a monastery where he had lodged the money he had acquired. He again resumed the pencil to support himself, and died at Florence in 1788, aged 86.

ZUCCO, in *Geography*, a town of Italy, in the county of Friuli; 5 miles N.W. of Friuli.

ZUCCORA, a river of European Turkey, which runs into the Morava, near Nissa.

ZUCHABARUS, in *Ancient Geography*, a mountain of Africa Propria, in which the river Cyniphus and the fountain Acaba have their source. Herodotus called it "Charitum Mons."

ZUCHIS, a lake of Africa Propria, which is, according to Strabo, 400 stadia in circuit; and on the bank of the lake is a town of the same name.

ZUCHOW, in *Geography*, a town of Poland, in Volhynia; 32 miles E. of Lucko.

ZUCKMANDEL, a town of Silesia, in the principality of Neisse, the see of a bishop; 17 miles N.N.W. of Jagerndorf. N. lat. 50° 8'. E. long. 17° 16'.

ZUCKTOK, a town of Mexico, in the province of Yucatan; 80 miles S. of Campeachy.

ZUDA, a town of Arabia, in the province of Yemen; 12 miles W. of Chamir.

ZUDISHTIRA, in *Hindoo Mythology*, is one of the heroic sons of Pandu, whose wars and adventures occupy a considerable portion of the Mahabarat, an epic poem of great celebrity in the Shanscrit language. See Mahabarat and Shanscrit.

ZUEECA, in *Geography*. See Giuducca.

ZUEELA, Zuila, or *Zawila*, a considerable town of Africa, in the kingdom of Fezzan, said to have been anciently the capital, containing many rich merchants, situated in a fertile country. The remains of ancient buildings in this town, the number and size of the cisterns, and the construction of the vaulted caves, intended perhaps as repositories for corn, exhibit such vestiges of ancient splendour, as will probably attract, and may highly reward, the attention of the future traveller; 60 miles E.N.E. of Mourzouk. N. lat. 27° 35'. E. long. 16° 45'.

ZUENGA, a town of Thibet; 176 miles W.S.W. of Lassa. N. lat. 28° 32'. E. long. 88° 10'.

ZVENIGOROD, a town of Russia, in the government of Moscow, on the Moskva; 28 miles W. of Moscow. N. lat. 55° 40'. E. long. 35° 34'.

ZUENZIGA, a desert district of Africa, in the country of Sahara, situated to the south of Tafilet.

ZVERINOGOLOVSKAIA, a fort of Russia, on the Tobol; 52 miles S. of Okunevsk.

ZUEVA, a town of Russia, in the government of Irkutsk, at the union of the Kotoi and the Angara; 60 miles N.N.W. of Irkutsk.

ZUF, a town of the country of Candahar; 50 miles N.W. of Candahar.

ZUFFERABAD, a town of Hindoostan, in the subah of Moultan, near the Rauvee; 25 miles N.E. of Moultan.

ZUFFIRWAL, a town of Hindoostan, in Lahore; 10 miles N.N.E. of Sealcot.

ZUFFOLO, in the *Italian Music*, a little flute or flageolet, having a very shrill sound, like the whistling of small birds.

ZUF-FOONE, or *Mers el Fulom*, in *Geography*, a seaport of Algiers; 36 miles W.N.W. of Boujeiah.

ZUG, a canton of Switzerland, bounded on the north and eaſt by Zuric, on the ſouth by Schweitz, and on the weſt by Lucerne; only about ten miles long, and nearly as much in breadth. The paſtures here are excellent, and it produces alſo a ſufficiency of grain, with plenty of fruit, and ſome wine. On one ſide of the Zug lake, the country is covered with cheſnut-trees, which form a very profitable branch of trade, by the ſale of the nuts to the neighbouring countries. This diſtrict, on the extinction of the counts of Lenzburg, devolved to thoſe of Kyburg, which latter alſo failing, it came to the counts of Habſburg, and in them to the houſe of Auſtria, towards which it always manifeſted an inviolable attachment; but in the year 1351, the town of Zug being beſieged by the Helvetian confederacy, and not only neglected by the archduke, but even recommended by him to ſurrender, it followed his advice, and was admitted into the confederacy, to which its territory had previouſly acceded. The generoſity of the conquerors rivalled the courage of the vanquiſhed; for, in conſequence of their ſubmiſſion, the canton of Zug was reſcued from the yoke of a foreign maſter, obtained liberty and independence, and was admitted into the Helvetian confederacy upon equal terms. This canton is the ſeventh in rank, and among the leſſer ones the fifth; beſides which, it is in a particular manner connected with Lucerne, Uri, Schweitz, and Underwalden, commonly called the five territorial confederates. The government of this little canton is exceedingly complicated; and the inhabitants of the town have ſomewhat more influence, and enjoy a greater ſhare in the adminiſtration of affairs, than thoſe of the capital burghs in the five other democratical cantons. The ſupreme power reſides in the inhabitants of Zug, Bar, Egeri, and Meutzingen, who aſſemble yearly to enact laws, and chooſe their magiſtrates. The landamman, reciprocally elected from each of the four diſtricts, continues three years in office when taken from Zug, and but two years when choſen from each of the three other diſtricts. The general adminiſtration of affairs is entruſted to the council of regency, compoſed of forty members, of whom thirteen are ſupplied by the diſtrict of Zug, and twenty-ſeven ſelected equally from the three remaining communities. This council, as well as the landamman, reſides always in the capital. Zug was the only one of the ſmall cantons which did not ſend its contingent to the army, but made a ſhew of reſiſtance to the impoſition of the new conſtitution. On the 29th of April, Zug was inveſted by French troops, ſurrendered on the 30th, and on the 1ſt of May accepted the new conſtitution. The people of this canton are reckoned the moſt reſtleſs of Switzerland: their general aſſemblies are often tempeſtuous, though ſeldom attended with bloodſhed.

Zug, a town of Switzerland, and capital of the above deſcribed canton, is beautifully ſituated at the north-eaſt extremity of a lake, in a fertile valley, abounding with corn, paſture, and wood. It contains two churches, a convent, a town-houſe, arſenal, corn-magazine, a college, hoſpital, &c. The titular ſaint of this place is Oſwald, king of Northumberland in the ſeventh century, who was defeated and ſlain in 624 by Peuda, king of the Mercians. In the church is his ſtatue, with this inſcription: "Sanctus Oſwaldus Rex Angliæ Patronus hujus Eccleſiæ." This king was much renowned for his chaſtity, piety, and power of working miracles; 15 miles S. of Zurich. N. lat. 47° 6'. E. long. 8° 16'.

Zug, a lake of Switzerland, eight miles long, and two wide, abounding in fiſh. It receives its name from the town on its coaſt.

ZUGANA, in *Ancient Geography*, a town in the interior of Arabia Felix. Ptol.

ZUGAR, a town of Africa Propria, between the rivers Bagradas and Triton.

ZUGARI, in *Geography*, a town of Naples, in Calabria Ultra; 6 miles N. of Nicotera.

ZUGLIANO, a town of Italy, in Friuli; 4 miles S. of Udina.

ZUHREE, a diſtrict of the province of Balouchiſtan, or Ballagiſtan, which is conſidered by ſome as a province diſtinct from Mekran or Mecran, and by others as the northern diviſion of it. However this be, Balouchiſtan is a confuſed maſs of tremendous mountains, affording paſture nevertheleſs for numerous flocks of ſheep and herds of cattle, and producing great quantities of wheat. The territories of its chief comprehend all the countries that lie between 20° 30' and 30° N. lat., and from 65° to 69° E. long.; and Balouchiſtan is divided into the two mountainous provinces of Ihalawnam and Sarawan, the low country of Cutch Gandava to the eaſt, and the provinces of Zuhree and Anund Dajal, to which may be added the ſmall diſtricts of Shat and Muſtung, lying north of Kelat. Zuhree, though it is entirely ſubject to the khan of Kelat, pays very little to him, as its revenues are enjoyed by Zadir Bukſt, of the Zuhree tribe of Balouches. The chief town is Zuhree, which contains from one to two thouſand houſes. The ſecond town, nearly as large, is Dadur; beſides which, there are many populous villages; and upon the whole, this is ſpoken of as the moſt civilized part of Balouchiſtan, the capital of which is Kelat.

ZUIA, a river of Spain, which runs into the Guadiana, a little above Medellin.

ZUICK, a town of Pruſſia, in Natangen; 8 miles N.W. of Lick.

ZUILA. See Zueela.

ZUINGLE, or Zwingle, Ulric, in *Biography*, the *Swiſs Reformer*, was born January 1, 1484, at the village of Wildhauſen, in the county of Tockenburg; and having diſcovered in his youth a ſtudious diſpoſition, was intended by his father for the church. Accordingly he was ſent for education firſt to Baſil, and then to Berne, where attempts were made to fix him in the convent of the Dominicans; but in order to prevent their taking effect, his father removed him to the univerſity of Vienna, which was then in high reputation. Returning from thence to Baſil, he was choſen claſſical tutor in his 18th year, where he made very conſiderable advances in knowledge, and particularly in that of the profeſſion to which he was deſtined, whilſt he taught others; availing himſelf of the lectures of Thomas Wyttembach, who, without renouncing the ſyſtem of the ſchools, allowed his pupils to think freely for themſelves. After a reſidence of about four years at Baſil, Zuingle took the degree of M.A., and being choſen paſtor of Glarus, was ordained by the biſhop of Conſtance. Having commenced a courſe of liberal inquiry, he indefatigably purſued it, critically examining the New Teſtament as the directory of his faith, and conſulting a variety of writers who had incurred the cenſure of the church of Rome. The conſequence of this mode of ſtudy was a diſcovery of the deviation of the eccleſiaſtical ſyſtem, generally adopted and eſtabliſhed, from that of Chriſtianity, both in doctrine and practice. But he was ſlow in publiſhing the theological ſentiments which he had imbibed, and for ten years purſued a courſe of practical inſtruction at Glarus, which ſecured to him the reſpect and affection of his pariſhioners, ſo that the bigotted clergy could not ſucceed in their attempts to do him injury. From Glarus he removed to the celebrated abbey of Einſidlin, where he accepted the office of preacher, and where he had an opportunity of aſſociating with

with perfons of learning, and of contributing to the education of candidates for the miniftry. Whilft he was at Glarus he expofed feveral fuperftitions of the church of Rome; and at Einfidlin he gained additional reputation by preaching againft vows, pilgrimages, and offerings. Here he employed his influence fo effectually, that he ordered the infcription over the abbey-gate, "Here plenary remiffion of fins is obtained," to be effaced, and the relics to be buried; and, among other rules which he eftablifhed in a convent of females under his direction, he introduced one for obliging the nuns to read leffons in the New Teftament, inftead of reciting their hours. He was alfo intrepid and zealous in propagating rational fentiments of religion, and with this view he availed himfelf of a public occafion, when a crowd was affembled, to deliver a fermon defigned to fhew that no fuperior fanctity refided in any place fo as to confer peculiar merit on vows addreffed from it, but that their acceptance depended upon the purity of the heart and life of the worfhipper. Declarations of this kind, whilft they gained the approbation of fome of his auditors, excited the indignation of others, and alarmed the monks of this and neighbouring convents. Although he was regarded with jealoufy and terror by thofe whofe intereft led them to oppofe reformation, he was fo much refpected, that his ecclefiaftical fuperiors manifefted no difpleafure againft him; and by his correfpondence with Erafmus, Glareanus, Hedio, Rhenanus, and other learned perfons, he eftablifhed a reputation which enabled him to encourage liberal ftudies. In 1518 he was invited to occupy the vacant poft of preacher in the cathedral of Zurich, and before he was inftalled he announced his propofed plan of preaching, which differed from that which had been before practifed, and which gave him an opportunity of explaining the books of the New Teftament in an uninterrupted feries, without regard to texts that were marked for each Sunday and Saint's-day in the year. This plan was approved by the majority of the chapter, and drew together a crowded auditory, who expreffed in high terms their admiration of the preacher. A circumftance occurred which afforded him a complete victory over an emiffary of pope Leo X., who was employed in the fale of indulgences, infomuch that he was obliged to quit the city and retire into Italy. Some writers, efpecially among the Catholics, have referred the origin of the reformation, and of the oppofition of both Zuingle and Luther to the papal authority, to the difputes about indulgences; but, although this quarrel might have contributed to the promotion of it, the people were previoufly prepared for the event by the preaching and conduct of Zuingle, and by the judgment and prudence with which he had planned and purfued his meafure for this purpofe. Luther proceeded very flowly to that exemption from the prejudices of education, which Zuingle, by the force of an adventurous genius, and an uncommon degree of knowledge and penetration, eafily got rid of. And we learn from the moft authentic records of hiftory, that he had explained the Scriptures to the people, and called in queftion the authority and fupremacy of the pope, before the name of Luther was known in Switzerland. In procefs of time, after Luther had taken up arms againft Rome, Zuingle, being then minifter of the chief church in Zurich, concurred with him; preaching openly againft indulgences, then againft the interceffion of the faints, then againft the mafs, the hierarchy, the vows and celibacy of the clergy, abftinence from flefh, and alfo many things which Luther was difpofed to treat with toleration and indulgence; fuch as images, altars, wax-tapers, the form of exorcifm, and private confeffion, &c. Zuingle, at an early period of his miniftry, had declared his decided difapprobation of all wars, excepting thofe that were undertaken for the defence of the country; and fuch was the influence of his opinion, that the canton of Zurich refufed to concur with the other cantons in a fubfidiary treaty with the French king. The refult of his arguments and remonftrances to this effect was a law paffed by the affembly of the canton in 1522, abolifhing all alliances and fubfidies for the term of 25 years. He laboured at the fame time to enforce a regard to the rules of the gofpel in preference to the refpect that was generally manifefted to thofe of ecclefiaftical difcipline. Accordingly he defended thofe perfons who had been denounced to the magiftrate for infringing on the "faft of Lent" without a difpenfation; and publifhed on this occafion his treatife "On the Obfervation of Lent," which contained fome free opinions on the obligation of fafting and keeping particular days. When the bifhop of Conftance remonftrated againft his proceeding, and endeavoured by his charge and letters to excite apprehenfions among the people, and in the council and chapter of Zurich, that he would fpread through Switzerland fuch a flame as Luther had kindled in Germany, Zuingle obtained permiffion to reply; and compofed a tract to prove that the gofpel alone is authority from which there is no appeal, and that the decifions of the church are binding only inafmuch as they are founded on Scripture. When the bifhop of Conftance had prevailed with the deputies of the Helvetic diet to order the arreft of a paftor accufed of preaching the "new doctrine," Zuingle, who had now adopted and openly avowed the principles of the reformation, addreffed to the heads of the cantons, in his own name and that of his friend, a fummary of his doctrine, annexing an intreaty that they would allow liberty for the preaching of the gofpel. In a conference before the deputies of the bifhop of Conftance, in the prefence of the great council of Zurich, held in 1523, Zuingle gave an account of his doctrine; and the colloquy terminated in the following declaration of the council: "That Zuingle, having been neither convicted of herefy, nor refuted, fhould continue to preach the gofpel as he had already done; that the paftors of Zurich and its territory fhould reft their difcourfes on the words of Scripture alone; and that both parties fhould abftain from all perfonal reflections." Zuingle, having been thus fupported by the magiftrates, and having obtained a public fanction of the principles of the reformation in this canton, has been charged, both by Catholics and Proteftants, with allowing to the fecular power an undue degree of authority in ecclefiaftical matters; however it has been urged in his defence, that he did not intend to transfer to government the abfolute power over confciences claimed by the popes; but that, for the prefervation of order and tranquillity, he thought that the depofitories of lawful authority ought to have a fhare in the direction of ecclefiaftical affairs. Zuingle, though thus fupported, proceeded with caution in promoting alterations in the ceremonies and modes of public worfhip, and was principally anxious to lay a proper foundation of change by enlightening the underftanding and convincing the judgment of the people. When fome zealous reformifts inftigated a mob to pull down a crucifix that had been erected at the gate of the city, and the culprits were brought before the council to be tried and punifhed, Zuingle interpofed; and whilft he vindicated the offenders from the charge of facrilege, he gave it as his opinion, that they deferved fome punifhment for having pulled down the crucifix without the authority of the magiftracy. This difpute led to a general colloquy, which was held in October 1523; and the refult was, that all the culprits, except Hottinger their ring-leader, and the perfon who had actually

tually committed the offence, were fet at liberty; but Hottinger was banifhed from the canton for two years; and he was afterwards put to death for herefy, in confequence of a fentence pronounced by the deputies of feven cantons at Lucerne, notwithftanding the interceffion of Zurich. The queftion of the celibacy of the clergy was agitated in thefe colloquies, and though no decifive opinion was given by the council, feveral clergymen married, and among them was Zuingle himfelf, who had expreffed his fentiments againft the queftion, at the age of 40. In 1524, the council of Zurich proceeded to the reformation of public worfhip according to the plan propofed by Zuingle. They began with caufing all pictures and ftatues to be removed by thofe whofe anceftors had confecrated them; and of thefe feveral were deftroyed. Thefe meafures occafioned alarm and complaint in the other cantons; and acts of hoftility were meditated. Without entering into a detail of the various circumftances that occurred on one fide and on the other, we fhall content ourfelves with obferving, that fanaticifm and bigotry were engaged in oppofition to each other, and produced in Switzerland effects fimilar to thofe that have attended innovation and reformation in other countries. At Zurich, the total fubverfion of the Romifh worfhip was accomplifhed, by prohibiting proceffions and other ceremonies, and by the abolition of the facrifice of the mafs. The latter event took place by the activity of Zuingle in 1525; and on Eafter Sunday the Lord's Supper was celebrated according to his idea of this rite, which was that of a merely commemorative and fymbolical fervice. Our reformer difplayed in another inftance a difinterefted fpirit, which reflects great honour on his memory. Although he was one of the canons who compofed the chapter of the cathedral, and this body was independent of the council, and poffeffed its own jurifdiction and property, he prevailed with the majority of his colleagues to confecrate the large revenues of the chapter to eftablifhments for public inftruction, and to transfer its temporal power to the government. In the conduct of this event he manifefted no lefs wifdom and moderation than difintereftednefs; for the chapter charged itfelf with the payment of as many paftors as were neceffary for the public worfhip of the city, to which fervice thofe canons who were capable of fervice were devoted. Thofe who were old and infirm were allowed to preferve their benefices for life; and their revenues, as they became vacant, were to be employed in founding profefforfhips for lectures, to which admiffion was to be gratuitous. Thefe liberal conditions were religioufly obferved, and the regulations thus framed are ftill continued at Zurich. The orders of mendicants, and other religious houfes, were abolifhed; and their revenues were appropriated to the fupport of hofpitals, and other charitable inftitutions, as the old members dropped off. Zuingle was afterwards commiffioned to organize a fyftem of public inftruction, in which he difplayed a cultivated and liberal mind.

The reputation which Zuingle had acquired, and the fuccefs which had crowned his plans and labours in the caufe of reformation, were not fufficient to fecure him againft the prejudices of fanatics, and the hoftile attacks of malignity. Attempts were made to affociate him with Munzer, one of the leaders of the Anabaptifts; but he happily avoided the fnare that was laid for him, and inftead of taking part in thofe violences which called forth the interpofition of the civil power, and which terminated in the death of one of the perfons concerned, he did all that lay in his power to prevent them; and though he could not preferve the life of one difturber of the public peace, he compofed the tumult occafioned by the intemperate zeal of others. Notwithftanding the fingular prudence and moderation which influenced his whole conduct, his reputation excited envy, and a confpiracy was formed againft his life. Under the protection of the magiftracy of Zurich he was fafe; but his enemies infidioufly propofed a conference at Baden, in Argovia. His friends, however, were not unapprifed of his danger, and well knowing that the cantons were actuated by inveterate hoftility againft his perfon as well as his doctrines, they would not confent to his leaving Zurich. At the conference, which he prudently declined to attend, enmity was avowed both againft him and his adherents. Some of the cantons, however, withheld their concurrence; and this was particularly the cafe with refpect to the canton of Berne. In this canton, the reformation had made confiderable progrefs, fo that in 1527 feveral of its municipalities addreffed the fenate for the abolition of the mafs, and the introduction of the form of worfhip eftablifhed at Zurich. The reformers at Berne fummoned a convocation, to which the clergy of the other Helvetic ftates, and the neighbouring bifhops, were invited. Zuingle's attendance was alfo requefted; and he thought it his duty to appear in that affembly, profeffedly convened for the advancement of the reformation. Haller was the leader of the party in this canton, and in connection with Zuingle and other coadjutors the caufe to which they were devoted obtained a complete triumph; fo that the grand council of that canton fully adopted the meafures of that of Zurich. Upon this, five of the cantons which were attached to the old religion entered into a folemn engagement not to fuffer the doctrines of Zuingle and Luther to be preached among them. At length the hoftilities that fubfifted between the Catholic and reformed cantons were amicably terminated by the treaty of Cappel in 1529. The animofity, however, between thefe cantons was not extinguifhed. It broke out again with greater violence than ever; and the fenate of Zurich has been charged with the firft aggreffion, by arbitrary acts in favour of the reformed preachers in the common bailiages. Its project of fecularizing the abbey of St. Gall, which belonged to the Helvetic confederacy, was a greater grievance; and on the other hand, the five affociated Catholic cantons refufed to concur with the others in expelling the Spaniards from the Valteline, and perfecuted the reformed in their jurifdictions with the greateft feverity. The fufferers fought the protection of Zurich, and the eloquence of Zuingle was employed in recommending their cafe to the fenate. The breach widened, and a majority of the Proteftants agreed in ftopping the tranfit of provifions to the five cantons, which depended upon foreign fupplies. Zuingle in vain remonftrated againft this cruel act; and the five cantons took up arms, and having publifhed a manifefto, marched into the field in October 1531. A detachment was ordered to prevent the junction of the forces of Berne with thofe of Zurich, and the main body advanced towards Cappel. This intelligence alarmed the people of Zurich; and they could only fpare 700 men for the relief of their countrymen at Cappel. Zuingle was appointed to accompany them. A battle enfued; and though the Zurichers, animated by his exhortations, defended themfelves valiantly, they at length were compelled to yield to fuperiority of numbers, and were entirely routed. Some died at their pofts; others fled: and Zuingle received a mortal wound at the commencement of the action, and fell fenfelefs to the ground. As foon as he had recovered fufficiently to raife himfelf up, he croffed his arms on his breaft, and lifted his languid eyes to heaven. In this condition he was found by fome Catholic foldiers, who, without knowing him, offered to bring a confeffor;

but

but as he made a sign of refusal, the soldiers exhorted him to recommend his soul to the holy virgin. On a second refusal, one of them furiously exclaimed, "Die then, obstinate heretic!" and pierced him through with a sword. His body was found on the next day, and the celebrity of his name drew together a great crowd of spectators. One of these, who had been his colleague at Zurich, after intently gazing on his face, thus expressed his feelings: "Whatever may have been thy faith, I am sure thou wert always sincere, and that thou lovedst thy country. May God take thy soul to his mercy!" Among the savage herd some voices exclaimed, "Let us burn his accursed remains!" The proposal was applauded; a military tribunal ordered the execution, and the ashes of Zuingle were scattered to the wind. Thus, at the age of 47, he terminated a glorious career by an event deeply lamented by all the friends of the reformation, and occasioning triumph to the partisans of the Romish church.

"In the character of Zuingle," says one of his biographers, "there appears to have been united all that makes a man amiable in private society, with the firmness, ardour, and intrepidity that are indispensible in executing the great task of reformation. By nature mild, his earnestness was the result of his sense of the importance of the cause he engaged in to the best interests of mankind, not of a dogmatic or dictatorial spirit. His views were large and generous, and his opinions rose above the narrow scale of sect or party. It was no small proof of liberality in that age that he ventured to assert his belief of the final happiness of virtuous heathens, and of all good men who act up to the laws engraven on their consciences. His temper was cheerful and social, somewhat hasty, but incapable of harbouring resentment, or indulging envy and jealousy. As a reformer he was original; for he had proceeded far in emancipating himself from the superstitions of Rome by the strength of his own judgment, and had begun to communicate the light to others, whilst Luther still retained almost the whole of the Romish system, and long before Calvin was known in the world. He was more learned and more moderate than the first of these divines, and more humane and kind-hearted than the last. He wrote many works of utility in their day; and the reform, of which he was the author, still subsists unchanged among a people distinguished by their morals and mental cultivation." Life of Zuingle, by J. G. Hess. Mosheim's Eccl. Hist. Coxe's Travels in Switzerland, vol. i. See ZUINGLIANS.

ZUINGLIANS, in *Ecclesiastical History*, a branch of ancient Reformers or Protestants; denominated from their author Ulric or Huldric Zuinglius. See ZUINGLE.

As to the eucharist interpreting *hoc est corpus meum*, by *hoc significat corpus meum*, he maintained, that the body and blood of Christ were not *really* present in the eucharist; and that the bread and wine were no more than external *signs* or *symbols*, designed to excite in the minds of Christians the remembrance of the sufferings and death of the divine Saviour, and of the benefits which arise from them. This opinion was embraced by all the friends of the reformation in Switzerland, and by a considerable number of its votaries in Germany. On the other hand, Luther held his doctrine, which was *consubstantiation*, with the utmost obstinacy; and hence arose, in 1524, a tedious and vehement controversy, which terminated, at length, in a fatal division between those who had embarked together in the sacred cause of religion and liberty. From this time, Zuingle propagated his doctrine concerning the eucharist in a public manner by his writings, after having entertained and taught it privately before that period. His "Commentary on true and false Religion," containing his sentiments on this subject, was published in 1525, and followed by a learned treatise of Œcolampadius on the same subject.

With a view of bringing this controversy, which reflected much discredit on the Protestant cause, to an amicable issue, Philip, landgrave of Hesse, invited, in 1529, to a conference at Marpurg, Luther and Zuingle, together with some of the other principal leaders of their respective parties; who disputed, during four days, in presence of the landgrave. Luther attacked Œcolampadius, and Melancthon disputed against Zuingle. Before they parted, the Swiss and German theologians signed their mutual assent to 14 articles, containing the essential doctrines of Christianity, and expressed a hope that their difference with respect to the real presence would not interrupt their harmony. The landgrave required from the two leaders a declaration that they would regard one another as brothers. Zuingle readily consented; but Luther would engage no farther than that, speaking of the Swiss, he would for the future moderate his expressions. In this conference Zuingle was accused of heresy, not only on account of his explication of the nature and design of the Lord's Supper, but also in consequence of the false notions he was supposed to have adopted relating to the divinity of Christ, the efficacy of the divine word, original sin, and some other parts of the Christian doctrine. But though he cleared himself to the satisfaction even of Luther from the greatest part of these accusations, their dissension concerning the manner of Christ's presence in the eucharist still remained. Nor did it terminate with the death of Zuingle in 1531, nor with that of Luther in 1546. Melancthon and Calvin made several attempts towards promoting a reconciliation between the contending parties. With this view Calvin proposed a system, with respect to the eucharist, more conformable to the doctrine of the Lutheran church than that of Zuingle. He acknowledged a spiritual presence of Christ in this sacrament, and supposed that a certain divine virtue or efficacy was communicated by Christ with the bread and wine to those who approached this holy sacrament with a lively faith, and with upright hearts; and to render this notion still more satisfactory, he expressed it in almost the same terms which the Lutherans employed in inculcating their doctrine of Christ's real presence in the eucharist. But whilst the followers of Zuingle asserted, that all Christians, without distinction, whether regenerate or unregenerate, might be partakers of the body and blood of Christ, Calvin confined this privilege to the pious and regenerate believer alone. Besides, the sentiments of the Zuinglians, with regard to the divine decrees, differed very little from that of the Pelagians; nor did they hesitate in declaring, after the example of Zuingle himself, that the kingdom of Heaven was open to all who lived according to the dictates of right reason; whereas Calvin maintained, that the everlasting condition of mankind in a future world was determined from all eternity by the unchangeable order of the Deity, and that this absolute determination of his will and good pleasure was the only source of happiness or misery to every individual. Moreover, Zuingle and Calvin differed in their notions of ecclesiastical government. The former ascribed an absolute and unbounded power, in religious matters, to the civil magistrate; allowing at the same time of a certain subordination among the ministers of the church, and placing at their head a perpetual president or superintendent, with a certain degree of inspection and authority over the whole body; but Calvin, on the contrary, reduced the power of the magistrate, in religious matters, within narrow bounds; declaring the church a separate and independent body, endowed with the power of legiflation for itfelf, and maintaining that it was to be governed, like the primitive church, only by prefbyters and fynods, *i. e.* by affemblies of elders, compofed both of the clergy and laity, and leaving to the civil magiftrate little elfe than the privilege of protecting and defending the church, and providing for what related to its external exigencies and concerns. Thefe and other circumftances prevented the union of the Lutheran and reformed churches; though in procefs of time almoft all the latter churches adopted the theological fyftem of Calvin. Mofh. Eccl. Hift. Eng. ed. 8vo. vol. iii. and vol. iv.

ZULAUF, in *Geography*. See SULAU.

ZULE, a town of South America, in the new kingdom of Grenada; 5 miles S. of Pamplona.

ZULIANA, a town of the republic of Ragufa; 30 miles W.N.W. of Ragufa.

ZULLICHAU, a town of the New Mark of Brandenburg, formerly in the duchy of Croffen. This town is the capital of a diftrict, or circle, and the feat of an ecclefiaftical infpection, fituated in a low plain, half a German mile diftant from the Oder, and about the fame diftance from the Ober. The town itfelf confifts only of 250 houfes, one parifh-church, and a grammar-fchool; but it has four large fuburbs: without the walls is a feat belonging to the king of Pruffia, fortified with walls and moats, which ferves for the refidence of the king's receiver of the prefecturate; in this part alfo ftands the Calvinift church. Zullichau contains a good woollen manufacture; 37 miles S.E. of Francfort on the Oder. N. lat. 52° 8′. E. long. 15° 45′.

ZULPHA, or JULFA, a town of Perfia, in the province of Irak, on the S. fide of the Zenderoud, about a mile and a half from Ifpahan, to which it is confidered as a kind of fuburb: it was built by Abbas I. after he had deftroyed Zulpha, in Armenia. In the year 1722 this town was taken by the Afghans, under Maghmud, who demanded of the inhabitants the fum of 70,000 tomans. This fuburb has been reduced from 12,000 to 600 families, which is the cafe with refpect to moft of the others; and a perfon may ride for miles amidft the ruins of the immenfe capital, Ifpahan, which neverthelefs ftill boafts of 200,000 fouls. In the fuburb of Julfa, there ftill remain nine churches, in which weekly fervice is performed.

ZULPHA, or *Julfa*, a town of Perfian Armenia, on the Aras or Araxes, fuppofed to be the ancient Arriammene. This town was taken and deftroyed by Abbas I., who removed the inhabitants to Ifpahan, where they built a fauxbourg, called *Zulpha*, containing 4000 houfes; fome families, neverthelefs, returned back to their native place, and took up their refidence among the ruins; 60 miles N. of Tauris.

ZULPICH, or ZULCH, a town of France. This town contains three churches, and feveral cloifters. In the year 406, Klodwig, king of the Franks, overcame the Alemanni near this place; 18 miles S.W. of Cologn. N. lat. 50° 43′. E. long. 6° 34′.

ZULTZ, or BIALA, a town of Silefia, in the principality of Oppeln, and capital of a circle; 20 miles S.S.W. of Oppeln.

ZULUCK, a fmall river of Ruffia, in the country of the Coffacks, which runs into the Kardai, near Baberezovfkaia.

ZULZ, a town of the Grifons, in Upper Engadine, on the Inn; 31 miles N.N.E. of Chiavenna.

ZUM BOIRS, a town of Germany, in the county of Bregentz, on the river Bregentz; 18 miles S.S.E. of Bregentz.

ZUM *Clofterlin*, a town of Germany, in the county of Pludentz, on the river Alfens; 9 miles E. of Pludentz.

ZUM *Hofts*, a town of Germany, in the county of Bregentz, on the river Bregentz; 15 miles S.S.E. of Bregentz.

ZUM *Stein*, a town of the duchy of Berg; 3 miles N.E. of Blankenberg.

ZUM *Vogelfang*, a town of France, in the department of the Roer; 3 miles S.E. of Juliers.

ZUM *Zontags*, a town of Germany, in the county of Bregentz; 24 miles S.S.E. of Bregentz.

ZUMAIA, or CUMAIA, a town of Spain, in the province of Guipufcoa, near the coaft of the bay of Bifcay; 14 miles W. of St. Sebaftian. N. lat. 43° 17′. W. long. 1° 51′.

ZUMAMPA, a town of South America, in the government of Tucuman, in the Rio Dolce; 90 miles S. of St. Yago del Eftero.

ZUMELLA, a town of Italy, in the Trevifan; 10 miles N.W. of Ceneda.

ZUMIC ACID, in *Chemiftry*, a name given by Dr. Thomfon to a peculiar acid principle lately obtained by M. Braconnot from rice, and which that gentleman had abfurdly called *Nanceic acid*, from *Nancy*, the name of the city where he refided.

This acid was obtained by fermenting rice in water by the application of a gentle heat. An acid liquor was obtained, which on evaporation to drynefs left a gummy mafs, having a very four tafte. This was digefted in alcohol, which on evaporation let fall cryftals compofed of the peculiar acid and lime. The lime was thrown down by barytes, and the barytes afterwards feparated by fulphuric acid, and thus the acid obtained in a feparate ftate.

Zumic acid is colourlefs, has a very acid tafte, and does not cryftallize. It precipitates none of the metals from their folutions, except zinc from very concentrated folutions of its falts.

With potafh and foda it forms incryftallizable deliquefcent falts, foluble in alcohol. With ammonia it forms a cryftallizable falt.

The neutral zumate of lime cryftallizes confufedly in a form fomewhat refembling a cauliflower. It is opaque, very white, has little tafte, and has the appearance of having efflorefced.

We do not think it neceffary to detail the properties of the other compounds of this acid, which have been but little examined, and appear to be totally devoid of intereft.

Dr. Thomfon thinks the zumic acid is the fame with the lactic acid, the latter being probably difguifed as ufually obtained, by the prefence of fome animal matter.

ZUMPANGO, in *Geography*, a town of Mexico; 90 miles S. of Mexico.

ZUMPANO, a town of Mexico; 20 miles N. of Mexico.

ZUNAC, a town of South America, in the audience of Quito; 30 miles N.W. of Macas.

ZUNAPA, a fmall ifland in the Adriatic. N. lat. 43° 7′. E. long. 17° 7′.

ZUNCOLO, a town of Naples, in Principato Ultra; 17 miles S. of Conza.

ZUNDEL, a town of Silefia, in the principality of Neiffe; 5 miles S.S.E. of Grotkau.

ZUNGER, a town of Pruffia, in Pomerelia, at the mouth of the Nogat; 8 miles W.N.W. of Elbing.

ZUNG-GAR, a town of Tunis, anciently called *Zuchara*. Here are the ruins of a temple, and an aqueduct erected for the purpofe of conveying water to Carthage; 48 miles S.W. of Tunis.

ZVORNICK.

ZVORNICK. See Zwornick.

ZUPU, a town of Circassia; 160 miles E. of Theodosia.

ZUR Gugel, a town of Prussian Pomerelia; 20 miles S.S.E. of Marienburg.

Zur *Osa*, a town of the duchy of Bremen; 5 miles S.S.W. of Bremervorde.

ZURA, a town of European Turkey, in Moldavia, on the Dniester; 22 miles E. of Orhei.

ZURARA, a town of Portugal, in the province of Entre Duero e Minho, at the mouth of the Ave, opposite Villa de Conde.

ZURBARAN, Francisco, in *Biography*, was a Spanish painter, born at Triente da Cantos, near Seville, in 1596. He was a disciple of Pablo Roclas, under whose tuition he acquired very considerable talent, and soon enjoyed a good reputation as an artist. He adopted the style of M. A. Caravagio, painting with great boldness, force, and truth. His first public work was painted for the convent of La Merced Calzada, from the history of S. Pedro Nolasco, by which he added much to his fame. There are many other works of his in the public edifices at Seville and Cordova, particularly in the Collegio di San Pablo. He was invited to Madrid about 1630, and was appointed principal painter to the king, and employed in the Buen Retiro, where he painted the Labours of Hercules. His productions may also be found in the Casa da Campo, and other royal palaces, as well as in private collections. Zurbaran died in 1662, aged 63.

ZUREITA, in *Geography*. See Zuweita.

ZURIC, or Zurich, a canton of Switzerland, and the first in rank, bounded on the N. by Swabia and the canton of Schaffhausen, on the E. by the Thurgau and the county of Toggenburg, on the S. by the cantons of Schweitz and Zug, and on the W. by the county of Baden. This canton is not unaptly called an epitome of all Switzerland, as containing in it hills, valleys, plains, corn-lands, vineyards, lakes, rivers, vegetables of all kinds, and whatever else is necessary to the support of life. Grain is cultivated all over the country; but it ripens later in the mountainous parts, where the air is coldest, than in the levels or sunny valleys. The hilly grounds in the E., W., and S. borders, afford a specimen of the fertile Alps, as abounding in cattle, milk, butter, and cheese; at first the wines have a tartness attending them, yet they improve by keeping; and, after lying some years in the cask, become smooth, pleasant, and wholesome. Fruits also are every where found in great plenty, and very good. The most remarkable minerals and fossils are, chalk, potters' earth of several sorts and colours, sulphur, and pit-coal; some mineral springs are likewise found. The proportion of grain to the other productions of the earth will appear from the following calculation: there are 217,424 acres, of 36,000 square feet each, laid out in grain, 14,466 in vines, 94,553 in meadows, 42,549 in pasturage, and 103,772 in forests. As sufficient corn is not produced for the interior consumption, the deficiency is chiefly supplied from Swabia. In order to prevent a scarcity of this material article, a public granary is maintained, at the expence of government, for grain at the common price; but in seasons of scarcity, it is sold considerably cheaper than it can be purchased at the market. The wine is mostly consumed in the country, and little of it is spared for foreign commerce. The canton contained, in 1784, 174,572 souls, including 10,500 in the capital: this large population, in proportion to the size of the canton, is owing to the trade of Zuric; as at least two-thirds of the inhabitants derive their livelihood by spinning thread and silk, and making linen for the manufactures of the town. The sovereign power resides exclusively in the burgesses of the town, consisting of about 2000; but a contracted disposition prevails in most of the states of Switzerland, so that they seldom confer the burghership. In Zuric, it is said, a new citizen has not been admitted for the last 150 years.

The burghers, beside the advantage of electing their magistrates, and of aspiring to the administration of affairs, enjoy the sole right of commerce; all strangers, and even subjects, being excluded from establishing manufactures in the city, or in any part of the canton.

The burghers of Zuric are divided into thirteen tribes; one of which is called Constaffel, or the tribe of nobles, although at present not absolutely confined to persons of that description: it enjoys the privilege of giving eighteen members to the Sovereign Council, and six to the Senate, whereas each of the other tribes only supply twelve to the former, and six to the latter.

The legislative authority is vested by the burghers in the Sovereign Council of two hundred; consisting, however, of two hundred and twelve members drawn from the thirteen tribes, and comprising the Senate, or Little Council. This Senate, composed of fifty members, including the two burgomasters, has jurisdiction in all causes civil and criminal: in civil cases, when the demand is of a certain importance, an appeal lies to the Council of two hundred; but in criminal affairs, their sentence is final, and, when once passed, there is no reversal or mitigation.

It is to be regretted, that in this republic, as in most other states of Switzerland, there is no precise code of criminal law. The Caroline, or code of Charles V., is ostensibly followed; but on account of its obsolete usages and extreme severity, the sentence is ultimately left to the discretion of the magistrates.

The power of the Senate, considered in a collective capacity, is very considerable: it judges finally in all criminal causes, has the care of the police, and supplies the principal magistrates. But as too great a power of individuals is dangerous in a republic, the members of this assembly are liable to be changed, and a revision or confirmation is annually made, in some instances by the Sovereign Council, in others by the particular tribes to which the senators belong. This annual revision is a great check to mal-administration, and at the same time prevents the Senate from gaining so great an influence as to be detrimental to the liberties of the people. A burgher is qualified to vote at twenty; is eligible into the Sovereign Council at thirty; and into the Senate at thirty-five. The canton of Zuric is divided into districts or bailiages, which are governed by bailiffs nominated by the Sovereign Council, exercising an authority subject to certain restrictions. The reformation was begun by Zuinglius, in the year 1517, in the town of Zuric; and in 1524, gained footing in the whole canton.

The militia of the canton amounted, in 1781, to 25,718 infantry, 1025 artillery, 886 dragoons, and 406 chasseurs; in all 28,235 effective men. The arsenal is well supplied with cannon, arms, and ammunition; and contains a reserve of muskets for 30,000 men. This canton had formerly a regiment and some companies in the service of France, a regiment in that of Holland, and some companies in the service of the king of Sardinia.

In ecclesiastical affairs the Senate is supreme: the canton is divided into fourteen districts, each governed by a dean, chosen by the synod, from three candidates proposed by the clergy of the diocese. The synod, composed of the whole clergy, and several assessors on the part of the Little Council, meets twice a year. The principal ministers and professors in in the town conſtitute, in conjunction with ſeveral magiſtrates and other aſſeſſors, deputed by the civil power, an eccleſiaſtical and academical council: to this committee the deans recur in all concerns, which ſeem to exceed their juriſdiction: it determines leſſer affairs, and refers caſes of importance to the Senate.

During the French revolution, the canton of Zuric, after a feeble reſiſtance, ſurrendered to the arms of the invaders; and the national aſſembly, which had been convoked, acceded to the new organization of the Helvetic conſtitution.

Zuric, a city of Switzerland, and capital of a canton of the ſame name, ſituated on a large lake, where the river Limmat is diſcharged, which divides it into two parts; ſuppoſed to have been built on the ſcite of the ancient Tigurum, which was deſtroyed by the Allemanni.

The environs are very delightful; an amphitheatre of hills gradually ſloping to the borders of the water, enriched with paſture and vines; dotted with innumerable villages, cottages, and hamlets; and backed on the W. by the Utliberg, a bold and gloomy ridge ſtretching towards the Albis, and that chain of mountains which riſes gradually to the Alps. Of the two parts into which the town is divided, the old part is ſurrounded with the ſame ancient battlements and towers which exiſted in the thirteenth century, and the ſuburbs are ſtrengthened by fortifications in the modern ſtyle, but too extenſive. The ditches, inſtead of being filled with ſtagnant water, are moſtly ſupplied with running ſtreams. The public walk is pleaſantly ſituated in a lawn, at the junction of the Limmat and the Sil, an impetuous and turbid torrent, which deſcends from the mountains of Einſidlin: two rows of lime-trees planted by the ſide of the Limmat, and following its ſerpentine direction, afford an agreeable ſhade in the heat of ſummer. The inhabitants are very induſtrious; and carry on with ſucceſs ſeveral manufactures: the principal are thoſe of linens and cottons, muſlins, and ſilk-handkerchiefs. The manufacturers do not in general dwell within the walls; but the materials are moſtly prepared, and the work is completed in the adjacent diſtricts. For this reaſon, Zuric does not exhibit the activity and numbers of a great commercial city. The environs, on the contrary, are ſo extremely populous, that perhaps few diſtricts in the neighbourhood of a town, whoſe population ſcarcely exceeds 10,000 inhabitants, contain within ſo ſmall a compaſs ſo many ſouls. The ſtreets are moſtly narrow; the houſes and public buildings accord more with plainneſs and convenience, than with the elegance and ſplendour of a capital. In 1780 the town contained 10,559 ſouls; but the population had decreaſed from the difficulty of obtaining the burgherſhip; whereas luxury and opulence had very conſiderably increaſed. In general, however, the manners of the inhabitants are ſimple. Dinner is uſually ſerved at twelve: in the afternoon the gentlemen aſſemble in clubs, or ſmall ſocieties, in the town during winter, and at their reſpective villas in ſummer. They frequently ſmoke, and partake of wine, fruit, cakes, and other refreſhments. The women, for the moſt part employed in their domeſtic occupations, or devoted to the improvement of their children, are not fond of viſiting. This reſerve, however, has much abated, and gives place to a more ſociable intercourſe. Such, however, is the prevalence of national habit, that a few families, which form a more agreeable mixture of company, are conſidered as differing from the eſtabliſhed cuſtoms, and are ſtill known by the name of the French Society. Sumptuary laws are well obſerved. Amongſt theſe, the uſe of a carriage in the town is prohibited to all ſorts of perſons except ſtrangers; and it is almoſt inconceivable, that in a place ſo commercial and wealthy, luxury ſhould ſo little prevail.'

Zuric was formerly an imperial city, and obtained from the emperor Frederick II. very conſiderable privileges; which were acknowledged and augmented by ſeveral of his ſucceſſors. The civil war between the magiſtrates and the people in 1335 nearly reduced the city to ruins; but the former being baniſhed, the citizens, in 1337, eſtabliſhed a new form of government, which was confirmed by the emperor Louis of Bavaria. The exiles, after ſeveral fruitleſs attempts, were at length re-admitted; but engaging in a conſpiracy againſt the citizens, were diſcovered and put to death. In conſequence of this execution, the nobles in the neighbourhood took up arms; and Zuric, after having ineffectually applied for aſſiſtance to the emperor Charles IV., formed an alliance with Lucerne, Uri, Schweitz, and Underwalden, and was admitted a member of their confederacy. This event happened in the year 1351. The four cantons yielded the pre-eminence to Zuric: a privilege it enjoys at preſent; being the firſt canton in rank, and the moſt conſiderable in extent, both of territory and power, next to Berne. In the ſame year, Zuric was aſſiſted by the four cantons againſt Albert, duke of Auſtria, who beſieged the town, and was repulſed with great loſs.

Zuric was the firſt town in Switzerland that ſeparated from the church of Rome, being converted by the arguments of Zuingle.

The charitable eſtabliſhments at Zuric are, the orphan-houſe, which is regulated with extreme attention and care; an alms-houſe for poor burghers; an hoſpital for incurables, and that for the ſick of all nations, which uſually contains between ſix or ſeven hundred patients; and the Allmoſen-Amt, or foundation for the poor: this excellent inſtitution puts out children as apprentices; and diſtributes money, clothes, and books of devotion to poor perſons, as well in the town, as in different parts of the canton, at the recommendation of the reſpective miniſters. Here is alſo a chirurgical ſeminary, formed by voluntary ſubſcriptions, to the ſupport of which, Dr. Rhan, an eminent phyſician, was a liberal contributor.

At Zuric public education is a concern of the ſtate, and under the immediate protection of government. The office of a profeſſor gives rank and eſtimation, and is often held by a member of the Senate and of the Great Council. The principal literary eſtabliſhments for the inſtruction of youth are, the Caroline college for ſtudents in divinity; *Collegium Humanitatis*, or the college for polite literature; and the ſchool of arts: the firſt has twelve profeſſors, the ſecond two, and the laſt ſeven. The learned languages, divinity, natural hiſtory, mathematics, and in ſhort every ſpecies of polite learning, as well as abſtruſe ſcience, is taught at a ſmall expence in theſe reſpective ſeminaries.

In conſequence of the peculiar attention paid by government, ſince the reformation, to the education of youth, Zuric has produced many perſons, who have diſtinguiſhed themſelves in all departments of literature: among theſe we may reckon Zuingle and Bullinger, Conrad Geſner, Hottinger, Simler, Spon, Scheutzer, Heidegger, Breitinger, Bodmer, Hirtzel, Solomon Geſner, and Lavater. For each of theſe diſtinguiſhed perſons, ſee our biographical articles.

Dr. Hirtzel was a learned phyſician, and deſervedly ſtyled the Swiſs Plutarch: he diſtinguiſhed himſelf, among various publications, by the Socrate Ruſtique, and by the lives of Sultzer and Heidegger. Leonhard Meiſter, profeſſor of hiſtory and morality in the ſchool of arts, deſerves mention, on account of his numerous and valuable publications, in all which he has diſplayed great zeal for the promotion of

literature,

literature, correctnefs of tafte, liberality of fentiment, and extenfive hiftorical and biographical knowledge. In his obfervations on fanaticifm and intolerance, he has forcibly evinced their dreadful effects on government and civil fociety by hiftorical facts, and approved himfelf an able writer in combating perfecution, and in repreffing the prevalent fpirit of fanaticifm.

The public library at Zuric contains about 25,000 volumes, and a few curious MSS., of which latter are, the original MS. of Quintilian, the Pfalms in the Greek tongue, written on parchment dyed of a violet colour, the letters being filver and golden, and the marginal reference red, fomewhat fimilar to the "Codex Argenteus" of Upfal, and fuppofed to have once formed a part of the "Codex Vaticanus," and feveral MSS. of Zuingle. Zuric is a diftrict 41 miles S.E. of Bâle, and 36 S.W. from Conftance. N. lat. 47° 18′. E. long. 8° 25′. Coxe's Travels in Switzerland, vol. i.

Zuric, a lake of Switzerland, fituated in the canton to which it gives name, about 10 leagues in length, and one in breadth, of an oblong form; and though not fo large as that of Conftance, more thickly ftudded with villages and towns. The adjacent country is finely cultivated, and well peopled; and the fouthern part of the lake appears to be bounded with the high ftupendous mountains of Schweitz and Glarus. The fcenery is picturefque, lively, and diverfified.

ZURIMACZOW, a town of Auftrian Poland; 22 miles S. of Luckow.

ZURITA, a town of Spain, in New Caftile, on the left bank of the Tagus; 48 miles N.E. of Toledo.

ZURITO, a town of Peru, in the diocefe of Cufco; 12 miles N.W. of Cufco.

ZURLINDEN, a town of Pruffia, in the palatinate of Culm; 18 miles E.N.E. of Thorn.

ZURMENTUM, in *Ancient Geography*, a town in the interior of Africa Propria, S. of Adrumetum. Ptol.

ZURNAPA, in *Zoology*. See Camelopardal.

ZURUPALCA, in *Geography*, a town of Peru; 44 miles S. of Potofi.

ZURZACH, a town of Switzerland, in the county of Baden, on the Rhine, chiefly celebrated for its fairs, at which great quantities of goods are fold by the merchants from Germany, France, and Italy; 25 miles E. of Bâle.

ZURZONZA, a town of Mexico, in the province of Mechoacan, fituated on an ifland in a lake; 20 miles W. of Mechoacan.

ZURZURA, in *Ancient Geography*, a town of Afia, in the Greater Armenia. Ptol.

ZUSAM, in *Geography*, a river of Bavaria, which runs into the Danube, oppofite Donauwert.

ZUSCHEN, a town of Germany, in the county of Waldeck; 4 miles N.W. of Fritzlar.

Zuschen, or *Zuchenau*, a town of Germany, in the duchy of Weftphalia; 5 miles S.W. of Medebach.

ZUSEL, a river of France, which runs into the Roer, at Sufteren.

ZUSMERSHAUS, a town of Bavaria, in the territory of Augfburg; 13 miles N.W. of Augfburg.

ZUSNIN, a town of Iftria; 11 miles N.N.E. of Pedena.

ZUTPHEN, a city of Holland, and capital of a county to which it gives name, fituated on the river Berckel, which paffes through the middle of it, fills its ditches, and immediately joins the Iffel. It takes its name from the two Flemifh words "Zudt Vunen," which fignify Southern Meadows. The principal buildings are, the church of St. Walburge, the town-houfe, the college of the deputies of the comté, and an ancient building, which they call "s'Graven-Hof," or Palace of the Comté. Otho I. of Naffau, acquired this country in the 11th century, by his marriage with the heirefs of Gerlach, count of Zutphen, fince which it has ever been annexed to Guelderland; 7 miles S. of Deventer. N. lat. 52° 10′. E. long. 6° 5′.

Zutphen *Iflands*, a group of fmall iflands, in the ftraits of Sunda. S. lat. 5° 50′. E. long. 105° 42′.

ZUTZ, a town of Switzerland, in the league of the Grifons, on the Inn. This town, though not the largeft, is reckoned the principal place of Upper Engadine, becaufe it contains the criminal court of juftice. This court confifts of the landamman of Sotto, one of the two communities of Upper Engadine, who is prefident, and fixteen jurymen, called Trouadors, taken equally from each diftrict. Juftice is faid to be more equitably adminiftered in this court than in any other throughout the Grifons, excepting at Coire. The vicinity of Zutz, and alfo of Scampf, is the fineft part of the valley of Engadine; it there produces fome rye and barley, and the mountains are clothed with verdure to their very fummits.

ZUURE-VELDT, a divifion of Graaf Reynet, which is an extenfive plain country, ftretching from the Sunday river, in Zwartkop's bay to the great Fifh river, and is the fame kind of good arable or pafture land as the plains of the Autiniequas divifion in Zwellendam; but it is now exclufively in the poffeffion of the Kaffers, from whom it was originally taken by the Boors. The great chafms towards the fea-coaft, that are filled with thickets, abound in elephants and buffaloes; and in the great Fifh river are, occafionally at leaft, found a few of the hippopotamus, or river-horfe.

ZUWEITA, or Zureita, a town of the Arabian Irak; 35 miles S.E. of Helleh.

ZUYDER-ZEE, or Zuider-See, a great gulf or bay of the German ocean, which extends from fouth to north, in the United Provinces, between Friefland, Overiffel, Guelderland, and Holland. It is fo called from its fituation towards the fouth, and is faid formerly to have been a lake, and that the land is fwallowed up that united North Holland with Friefland.

ZUZAN, a town of Perfia, in that part of Khoraffan which extends from N. lat. 32° 30′ to 34° 40′, and from 56° to 62° of E. long. It is the ancient "Sufa," now an inconfiderable place, fituated at the fame diftance from Pufhing as the latter is from Herat.

ZUZON, a town of Spain, in Old Caftile; 22 miles N.E. of Siguença.

ZUZYGIUM, in *Botany*. See Syzygium and Calyptranthes, to which latter genus belongs the original *Suzygium* of Browne.

ZWAMMERDAM, or Zwadenburgerdam, in *Geography*, a town of Holland, on the Rhine, which was pillaged and burned by the French, in the year 1762; 6 miles N. of Gouda.

ZWARTE-BERG, as well as *Cango* and *Trada*, are divifions of Zwellendam, which are the Karroo plains, fituated between the firft and fecond chains of mountains, but being well watered by the mountain ftreams contain fertile patches of ground. Their great diftance, however, from the Cape, and very bad roads, prevent an extenfive tillage. In thefe plains are numerous oftriches, and herds of quachas, zebras, and hartebeefts. Behind the firft chain of mountains, in thefe divifions, are two hot fprings of chalybeate water.

Zwarte-berg is alfo a divifion of Graaf Reynet, which is is a portion of the mountain of the ſame name, in the diſtrict of Zwellendam, to which it ought properly to belong. Sheep and horned cattle are the chief produce of the farmers.

Zwarte-kop's *River* is a fertile and extenſive diviſion of Graaf Reynet, lying to the ſouthward of Zwarte-Ruggens, and capable of producing an abundant ſupply of grain, convenient to be delivered at a trifling expence at the bay. About 15 miles to the weſtward of the bay are large foreſts of timber-trees, near which is an appearance of a rich mine of lead. Near the bay is alſo a ſalt lake, which yields a plentiful ſupply of that article. Wax from the myrica cerifera and aloes might be furniſhed by this diviſion as articles of commerce.

Zwarte-ruggens, a diviſion of Graaf Reynet, which is a ſtony tract of country to the ſouthward of Camdeboo, another diviſion lying at the foot of the ſnowy mountains. It is very ſcantily ſupplied with water, and produces little except ſucculent plants, among which are two or three ſpecies of euphorbia. Few families are found in this diviſion, but here and there in the neighbourhood of the Sunday river, which runs through it. The cattle and ſheep are ſmall, but generally in good condition.

ZWARTKOP's Bay. See Algoa *Bay*.

ZWARTLAND, East, and *Twenty-four Rivers*, are two diviſions of the diſtrict of Stellenboſch and Drakenſtein, conſiſting of widely-extended plains, ſtretching, in breadth, from the Berg river to the great chain of mountains, and to the Picquet Berg, in length, to the northward. Theſe are conſidered as the granaries of the colony. The crops, however, in Zwartland, are as uncertain as the rains, on which their ſucceſs almoſt entirely depends. In the Twenty-four rivers, the grounds may be irrigated by the innumerable ſtreamlets that iſſue from the great chain of mountains, in their courſe to the Berg river. Theſe form ſwamps, that have been productive of very fine rice. Wheat, barley, and pulſe, are the principal articles that are cultivated in thoſe two diviſions; but they have alſo plenty of fruit, and make a little wine for family uſe.

ZWELLENDAM, a tract of country in ſouthern Africa, which lies upon the ſea-coaſt between Breede river on the W., and Camtoos river on the E., and extends northerly to the ſecond chain of mountains, called the Zwarte-Berg, or Black mountains. The length is about 380 and breadth 60 miles, comprehending an area of 19,200 ſquare miles, which is occupied by 480 families, ſo that each family has, on an average, 40 ſquare miles of land. The population of Zwellendam, aſcertained on oath in the year 1798, conſiſted of 3967 Chriſtians, and 2696 ſlaves and Hottentots, making a total of 6663. The ſtock and produce comprehended 9049 horſes, 52,376 horned cattle, 154,992 ſheep, 220½ leggers of wine made, 16,720 muids of wheat reaped in 1797, and 10,554 muids of barley and rye.

Zwellendam, *Droſdy*, or village of, a diviſion of Zwellendam, ſituated at the foot of the firſt chain of mountains that runs E. and W., or parallel to the ſea-coaſt, and diſtant from Cape Town about 140 miles. It is compoſed of about 30 houſes, ſcattered irregularly over a ſmall but fertile valley, down the middle of which runs a plentiful ſtream of water. At the head of the valley ſtands the houſe of the landroſt, to which is annexed a large garden well ſtocked with a variety of fruits, and a ſpacious vineyard; the whole encloſed and planted with oaks and other trees. In the middle of the village a large church has been lately erected, which is the only place of worſhip in the whole diſtrict. The other diviſions of Zwellendam are, the country between the droſdy and Gauritz river, named according to the rivers that croſs it, Cango, Zwarte-Berg, Trada, Moſſel bay, Autiniequas land, Plettenberg's bay, Olifant's river, Kamnaaſic, Lange-Kloof, and Sitſikamma. Barrow's Southern Africa, vol. ii.

ZWENCKAU, a town of Saxony, in the principality of Merſeburg, on the Elſter. In the year 1429, this town was burned by the Huſſites; 5 miles S. of Leipſic. N. lat. 51° 14′. E. long. 12° 18′.

ZWENTENDORFF, a town of Auſtria; 6 miles W. of Tulln.

ZWERCHBACHLEIN, a river of Wurtemberg, which runs into the Nagold, near the town of Nagold.

ZWERNITZ, a town of the principality of Culmbach; 10 miles S.W. of Culmbach.

ZWERNTLDORFF, a town of Auſtria; 6 miles E. of Weikendorff.

ZWETHAN, a town of Saxony; 20 miles S.E. of Wittenberg.

ZWETL, a town of Auſtria, at the conflux of the Zwetl and the Kamp; 26 miles W.N.W. of Crems. N. lat. 48° 33′. E. long. 15° 7′.

Zwetl, a river of Auſtria, which riſes about four miles weſt from Weitra, and runs into the Kamp, at Zwetl.

ZWETZEN, a town of Thuringia; 3 miles N. of Jena.

ZWETZEY, a town of Croatia, on the river Mreſnitza; 12 miles S. of Sluin.

ZWEYBRUCKEN. See Deux-Ponts.

ZWEYDRITTELSTUCK, or *Piece of Two-thirds*, in *Commerce*, a ſilver coin in Germany, worth two-thirds of a rix-dollar of account.

ZWIAHEL, in *Geography*, a town of Ruſſian Poland; 90 miles E. of Luckow.

ZWICKAU, a town of Saxony, in Erzgebirg, on the Mulda. It has a citadel, three churches, and a Latin ſchool, in which is a good library: here is a manufacture of cloth, and another of cards, for the uſe of wool-combers; with a conſiderable inland trade; 38 miles S.S.E. of Leipſic. N. lat. 50° 39′. E. long. 12° 25′.—Alſo, a town of Bohemia, in the circle of Boleſlau; 4 miles W. of Gabel.

ZWIELAUKA, a town of Moravia, in the circle of Olmutz; 26 miles W. of Olmutz.

ZWIFALTEN, a princely abbey founded in the year 1089. In 1802, it was given among the indemnities to the duke of Wurtemberg; 58 miles W. of Augſburg. N. lat. 48° 17′. E. long. 8° 30′.

ZWINGENBERG, a town of Heſſe Darmſtadt, ſituated on the Bergſtraſſe. In 1693, the greater part of this town was deſtroyed by the French, ſince which it has been rebuilt in a better manner; 10 miles S. of Darmſtadt.

ZWINGENDORFF, a town of Auſtria; 2 miles S. of Laab.

ZWINGERA, in *Botany*, a genus taken from Aublet, dedicated under this name to the memory of ſeveral Swiſs botaniſts of the family of Zwinger, who for three generations have cultivated this ſcience at Baſil, chiefly, indeed, with a reference to the medical qualities of plants. Theodore Zwinger, profeſſor of anatomy and botany in that univerſity, who died in 1724, aged 67, publiſhed in 1696 a folio German Herbal, of 995 pages, with wooden cuts, borrowed from Geſner and Camerarius, which is little known out of his own country. Some botanical diſſertations alſo appeared under his preſidency. His ſon Frederick gave an enlarged edition of the above Herbal in 1744; and has publiſhed in the *Acta Helvetica*, v. 1. 50, a plate and deſcription of a very remarkable fungus, apparently belonging to

Peziza,

Peziza, but of which we find no notice taken by Perſoon. The NOLANA of Linnæus, (ſee that article,) was once publiſhed under the name of *Zwingera humifuſa*, by John Hofer, in *Act. Helvet.* v. 5. 267. t. 1, but this plant has had many names beſides.—Schreb. Gen. 802. Willd. Sp. Pl. v. 2. 569. Mart. Mill. Dict. v. 4. (Simaba; Aubl. Guian. 400. Juſſ. 373.)—Claſs and order, *Decandria Monogynia.* Nat. Ord. *Terebintaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, ſmall, in five deep, ovate, acute ſegments. *Cor.* Petals five, oblong, obtuſe, ſpreading. *Stam.* Filaments ten, capillary, dilated and hairy at the baſe, ſhorter than the corolla; anthers ovate. *Piſt.* Germen ſuperior, ſeated on a glandular receptacle, roundiſh, with five deep furrows; ſtyle longer than the ſtamens, thread-ſhaped, ſtriated; ſtigmas five, ſimple. *Peric.* Capſules five, coriaceous, ovate, ſpreading, of one cell. *Seeds* ſolitary, ovate.

Eſſ. Ch. Calyx in five deep ſegments. Petals five. Filaments dilated and hairy at the lower part. Capſules five, coriaceous, ſeated on a fleſhy receptacle. Seeds ſolitary.

Obſ. The flowers are ſaid to be occaſionally only four-cleft and octandrous. This genus is not much akin, as Willdenow thought, to QUASSIA, but rather to CNESTIS (ſee thoſe articles); differing from the latter in having one *ſtyle* inſtead of five. How far their *fruits* correſpond, we know not enough of the ſeed-veſſel of *Zwingera* to determine.

1. Z. *amara.* Bitter Zwingera. Willd. n. 1. (Simaba guianenſis; Aubl. Guian. 400. t. 153.)—Native of the woods of Orapu in Guiana, bearing flowers and fruit in June. A *ſhrub*, not more than ſeven or eight feet high, whoſe *ſtem* is three or four inches in diameter, with a white ſoft wood. *Branches* numerous, alternate. *Leaves* alternate, ſtalked, either ternate, or pinnate, of two or three pair, with an odd one, of elliptic-lanceolate, pointed, emarginate, entire, ſmooth *leaflets*, the largeſt of which are three and a half inches long, and an inch, or more, in breadth. *Flowers* five or ſix together, in little axillary cluſters. *Petals* whitiſh, ſurrounding the green *diſk*. *Fruit* yellow; the inner rind green and bitter. Nothing is recorded concerning the qualities or uſes of this ſhrub.

ZWISEL, in *Geography*, a town of Bavaria, on the Regen; 42 miles E. of Ratiſbon.

ZWITTAU, or ZWITTAWA, a town of Moravia, in the circle of Olmutz; 30 miles N.W. of Olmutz. N. lat. 49° 43′. E. long. 16° 16′.

ZWITTAU, a river of Moravia, which riſes in the ſouth-eaſt part of Bohemia, and joins the Swarta, near Brunn.

ZWOL, or SWOL, a town of Holland, in the department of Overiſſel, ſituated on the river Aa, between the Iſſel and the Vecht, in the country of Zallant. It is a ſtrong place, well fortified, and ſurrounded with a double ditch, filled with the waters of the Aa. Its ſituation is very advantageous, on an eminence which commands the country, and is the ordinary paſſage from Holland to the provinces of Frieſland, Groningen, and Overiſſel. It was formerly a free and imperial city, and ranked among the Hanſe towns. The magiſtracy is compoſed of eight echevins, and eight common-council. The celebrated Thomas à Kempis, otherwiſe called Hamerken, was a regular canon in a priory of Auguſtines in this place, and died here in 1471, aged 91; 28 miles S.W. of Covorden. N. lat. 52° 32′. E. long. 6° 1′.

ZWOLFAING, a town of Auſtria; 8 miles S.S.E. of Vienna.

ZWONIGRAD, a town of Dalmatia, and capital of a diſtrict; 60 miles S.E. of Segna.

ZWONITZ, a town of Saxony, in the circle of Erzgebirg; 4 miles N.N.W. of Grubenhagen.

ZWORNICK, a town of Boſnia; 68 miles S.W. of Belgrade. N. lat. 44° 37′. E. long. 18° 50′.

ZWOTA, or TZWODA, a river of Bohemia, which runs into the Egra, near Falckenau.

ZYDACZOW, a town of Auſtrian Poland, in Galicia; 30 miles W.N.W. of Halicz.

ZYGÆNA, in *Ancient Geography*, an iſland in the northern part of the Arabic gulf. Ptolemy.

ZYGÆNA, in *Ichthyology*, a ſpecies of *ſqualus*, which ſee; called by Willughby *balance-fiſh*. See alſo SHARK.

ZYGASTICUM, Ζυγαστικον, formed of ζυγος, *a balance*, among the *Ancients*, money paid for weighing things.

ZYGER, in *Geography*, a river of Hungary, which runs into the Kyros, 5 miles W. of Boros Jeno.

ZYGES, in *Ancient Geography*, a people of exterior Libya, towards the coaſt of the Mediterranean ſea, W. of the Mareotide Nome. Ptolemy.

ZYGI, a people of Aſia, of the number of thoſe who inhabited the Cimmerian Boſphorus, between the Athæi and Heniochi. Strabo.

ZYGIA, in *Botany*, ζυγια of Theophraſtus, the ſecond kind of his σφενδαμνος, or Maple, remarkable for its yellow and veiny wood, is ſpoken of as a mountain-tree, but botaniſts have not aſcertained the preciſe ſpecies. Pliny's account of this matter is extracted and abridged from the above Greek author, but is not made at all more clear. He however ſeems to have been acquainted with a beautiful wood, of the Maple kind, which he ſays was compared to a peacock's tail, and grew chiefly in Iſtria and Rhœtia. Can this have been the *Acer Opalus* of modern authors? (See Willd. Sp. Pl. v. 4. 990.) Anguillara has long ago ſuſpected that tree, which Linnæus and many other botaniſts have ſtrangely overlooked, to have been the ζυγια of Theophraſtus. Its native country, and veined yellow wood, ſometimes very beautiful, are in favour of this opinion. De Theis, following Bodæus a Stapel, and other commentators on Theophraſtus, who are led by the obvious derivation of the name from ζυγος, *a yoke*, take the tree in queſtion for our *Carpinus*, whoſe hard and tough wood ſerves to make yokes for oxen. He ingeniouſly ſupports this opinion by the Celtic origin of *Carpinus*, from *car*, *wood*, and *pin*, *head;* and further by its Engliſh ſynonym, *Hornbeam*, oxen being yoked by their horns. The wood of the Carpinus, however, is neither yellow nor beautifully veined, and it is moſt probable ζυγια had ſome other origin, or alluſion. Robert Conſtantine, cited by Bodæus a Stapel, ſeems to confound the *Acer Opalus* with *Viburnum Opulus*, which he terms "the *Opulus* of Columella, a French ſhrub, uſed for bowers." This laſt has nothing in common with the hiſtory of the ζυγια.

Whatever may have been the ancient *Zygia*, Dr. Patrick Browne, finding this name unoccupied, has applied it to a Jamaica ſhrub, which appears to belong to *Mimoſa;* ſee Browne Jam. 279. t. 22. f. 3. Nor is this application ſo unſuitable as may ſeem at firſt ſight; for the author had evidently in his mind the yoked leaflets, to which he alludes in his ſpecific definition. We do not find that Linnæus, except in manuſcript, or any other author, has adopted this as a *Mimoſa*. Juſſieu, in his Gen. Pl. 366, ranges Browne's *Zygia*, with a few other genera, at the end of his *Leguminoſæ*, adding a reference to *Mimoſa Bourgoni*, Aubl. Guian. t. 358, as a ſimilar plant or genus. We do not ſee why it was

was not placed near *Mimoſa*, in the firſt ſection of that natural order. Swartz, Ind. Occ. 980, ſpeaks of Browne's figure of the flower of *Zygia*, as exactly like his own *Mimoſa comoſa*, Prodr. 85; but he adds that the plants are different, without any further elucidation of the former. There is no ſpecimen of *Zygia*, amongſt the plants in the Linnæan herbarium, collected by Browne, and ſent by Solander to Linnæus. In a manuſcript catalogue of Jamaica plants, in Dr. Browne's own hand, given to the writer of this article by A. B. Lambert, eſq., *Mimoſa Zygia* ſtands between *fagifolia* and *Unguis Cati*, with this remark, which is not in the author's Hiſtory of Jamaica, "*folia bijugata, ſive ſuſtentaculis bipartitis, ſingulis diphyllis.*" This plant is there called Yoke-wood. In the printed work it is denominated Horſe-wood, or Hoop-wood, the wood being "pretty tough, and ſometimes cut for hoops. The ſhrub is very common in St. Mary's, growing chiefly in low moiſt lands; but is ſometimes found in the mountains, where it commonly riſes to the height of ten or twelve feet, or better." Theſe are all the particulars we can gather relative to Browne's *Zygia*.

Zygia, in the *Inſtrumental Muſic of the Ancients*, a flute peculiar to weddings, according to Apuleius. (Metam. lib. iv.) The word *zygia* is a Greek adjective, which implies *nuptial*. The zygia was probably a double flute; for Julius Pollux (Onomaſt. lib. iv. c. 10.) ſays, "there was alſo a flute air for the wedding; executed on two flutes, one longer than the other."

Zygia, in *Entomology*, a genus of inſects belonging to the order of coleoptera, the characters of which are, that the antennæ are moniliform, the palpi unequal and filiform, the lip elongated and membranaceous, and the jaw unidentated. There is one ſpecies, *viz.*

Oblonga. Found in the Eaſt, oblong, red, with head and wing-ſheaths cyaneous.

ZYGIANA, in *Ancient Geography*, a country of Aſia Minor, in Bithynia. Ptolemy.

ZYGIS, in *Botany*, the ſpecific name of a ſpecies of Thymus, (ſee that article, n. 9,) ſuppoſed to be the ζυγις of Dioſcorides. De Theis, who writes this word ζιγις, without any authority that we can find, derives it from ζιγγος, *the hum of bees*, which is confirmed, apparently without his knowledge, by the modern Greek name of the ſame plant, σμαζι, *the delight of bees*. Such an appellation is peculiarly ſuitable to a plant well known to be highly grateful to thoſe inſects, and which is ſuppoſed to give its aromatic flavour to the famous honey of mount Hymettus, a ſpot where this *Thymus* abounds. Undoubtedly there are other ſpecies of the ſame genus, as well as of *Thymbra*, *Satureia*, &c., found in the ſame neighbourhood, which contribute to produce this flavour, in as powerful a degree perhaps as the above.

ZYGITÆ, in the *Roman Galleys*, a term uſed to expreſs thoſe rowers in the triremes, or three-rowed galleys, who ſat on the ſecond row, that is, above the thalamitæ, and below the thranitæ.

ZYGOMA, Ζυγωμα, in *Anatomy*, a bone of the head, otherwiſe called os jugale; or, it is the bony arch under which the temporal muſcle paſſes.

The word is formed from ζευγνυμι, *I join*; ſo that zygoma, properly ſpeaking, is the juncture of two bones. See Cranium.

ZYGOMATIC Process of the temporal bone and os melæ: the parts contributing to form the zygoma.

ZYGOMATICUM, Os, the cheek-bone, ſo called becauſe it contributes largely to the formation of the zygoma. See Cranium.

ZYGOMATICUS, *Major and Minor*, muſcles of the face, connected to the corner of the mouth. See Deglutition.

Zygomaticus is alſo an epithet given to the ſuture that binds the two proceſſes of the zygoma together.

ZYGOPHYLLUM, in *Botany*, ſo named by Linnæus, from ζυγος, *a yoke*, and φυλλον, *a leaf*, each leaf, of moſt of the ſpecies, being compoſed of a pair of leaflets, yoked, as it were, together, and ſomewhat reſembling the foliage of the garden bean, *Vicia Faba*; whence this genus obtained, from Dodonæus and Tournefort, the name of *Fabago*. Hence alſo aroſe its Engliſh appellation of Bean-Caper, given by Gerarde. *Fabago* was properly deemed inadmiſſible, being compounded of another name, though of one no longer in uſe as generic. We may obſerve moreover, that it conveys an erroneous idea; for the plant in queſtion does not "bear beans," but leaves, reſembling bean leaves.—Linn. Gen. 212. Schreb. 288. Willd. Sp. Pl. v. 2. 560. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 39. Sm. Prodr. Fl. Græc. Sibth. v. 1. 273. Juſſ. 296. Lamarck Dict. v. 2. 441. Illuſtr. t. 345. Gærtn. t. 112. (Fabago; Tourn. t. 135.)—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Gruinales*, Linn. *Rutaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of five ovate, obtuſe, concave, erect leaves. *Cor.* Petals five, dilated upwards, obtuſe, emarginate, rather longer than the calyx. Nectary of ten converging, pointed leaves, or ſcales, ſometimes divided, embracing the germen, each of them attached to one of the filaments near its baſe. *Stam.* Filaments ten, awl-ſhaped, attached to the outſide of the nectary, ſhorter than the corolla; anthers oblong, incumbent. *Piſt.* Germen ſuperior, oblong, tapering at the baſe; ſtyle awl-ſhaped, the length of the ſtamens; ſtigma ſimple. *Peric.* Capſule oblong, or roundiſh, with five angles and five intermediate furrows, five cells and five valves, the partitions linear, from the middle of each valve. *Seeds* ſeveral, roundiſh kidney-ſhaped, inſerted alternately, in two rows, into the middle of the valves.

Obſ. Linnæus remarks, that the ſeed-veſſel differs in ſhape in the different ſpecies, and that in ſome the flowers are four-cleft and octandrous. Schreber records an obſervation of Reichard, merely taken from the *Mantiſſa* of Linnæus, that Z. *album* has five *ſtigmas*; but we do not find this to be correct. Our fifteenth ſpecies is ſaid to have five diſtinct *ſtyles*.

Eſſ. Ch. Calyx of five leaves. Petals five. Nectary of ten ſcales, embracing the germen, and bearing the ſtamens. Capſule of five cells, ſuperior.

The plants of this genus are, for the moſt part, ſhrubby, with ſimple or twin *leaves*, (rarely ternate or pinnate,) which are oppoſite, moſtly ſtalked, entire, often fœtid, of a thick or ſucculent texture, accommodated to the dry and ſunny ſituations where the greater part of the ſpecies grow. A very few are found in South America, or Guinea; the reſt are natives of Syria, Arabia, Siberia, and eſpecially of ſouthern Africa, about the Cape of Good Hope. The *flowers* are ſolitary, axillary, yellow, white, or reddiſh, often brilliant and rather handſome. The *ſeed-veſſel*, though anſwering in general to the above deſcription, which is made from Z. *Fabago*, is variouſly ſhaped in the different ſpecies, and in ſome appears to be lined with a ſort of horny elaſtic coat, analogous to the tunic of the *ſeeds*, ſo remarkable in the genuine *Rutaceæ*. Such is the caſe in Z. *microphyllum*, the

the edges of whose inflexed valves seem to constitute the partitions; yet the cells do burst at the outer margin, as well as at the inner. Willdenow defines fourteen species, which we shall find a necessity of extending to sixteen.

1. Z. *simplex*. Cylindrical-leaved Bean-Caper. Linn. Mant. 68. Willd. n. 1. (Z. portulacoides; Forsk. Ægypt.-Arab. 88. Ic. t. 12. f. B.)—Leaves simple, sessile, cylindrical.—The most common of all plants in the driest parts of the deserts of Arabia, where it is known by the name of *Garmal*, and esteemed by the Arabs very good for removing specks in the eyes, for which purpose the bruised leaves are applied, mixed with water. For this we have the authority of Forskall, who sent seeds to Linnæus. These vegetated at Upsal, but the plants did not live to produce flowers. The *root* is simple, tapering, apparently annual. *Stem* prostrate, repeatedly forked, round, smooth. *Leaves* sessile at each joint, spreading, an inch long, obtuse, somewhat dotted. *Flowers* yellow, quarter of an inch in diameter, almost sessile. *Petals* round, with long claws.

2. Z. *cordifolium*. Heart-leaved Bean-Caper. Linn. Suppl. 232. Willd. n. 2. Thunb. Prodr. 80. Ait. n. 1. —Leaves simple, sessile, opposite, roundish, somewhat heart-shaped.—Gathered by Thunberg, at the Cape of Good Hope, from whence it was sent by Mr. Masson to Kew garden, in 1774. This is a green-house *shrub*, flowering in October. We have seen no specimen.

3. Z. *Fabago*. Common Bean-Caper. Linn. Sp. Pl. 551. Willd. n. 3. Ait. n. 2. (Capparis Fabago; Dod. Pempt. 747. Ger. Em. 897. Besl. Eyst. æstiv. ord. 10. t. 1. f. 1. C. leguminosa; Lob. Ic. v. 2. 58. Fabago Belgarum; Dalech. Hist. 456. Telephium Dioscoridis; Column. Ecphr. 132. t. 131. Morgsani; Rauw. It. t. 113.) —Leaves conjugate, stalked; leaflets obovate. Calyx smooth. Petals entire. Capsule oblong. Stem herbaceous. —Native of Syria, Persia, Barbary, &c. A hardy, but not common, herbaceous perennial in our gardens, flowering in autumn, cultivated by Gerarde, in 1596, and seen a few years afterwards, in the garden of cardinal Aldobrandini, at Rome, by Fabius Columna, who took this plant for the *Telephium* of Dioscorides, and has left us a most faithful representation of it, too much neglected by Linnæus and recent authors, who only refer to Dodonæus. Whether Columna erred or not with respect to the name, the reader will judge by consulting the article TELEPHIUM. The *root* is tapering, fleshy, producing from its crown several spreading, alternately branched, leafy, round, herbaceous, smooth *stems*, one and a half or two feet high. *Leaflets* an inch long, entire, smooth, green, unequal at the base, furnished with a principal rib, and one or two smaller ones. *Footstalks* rather shorter than the leaflets, swelling upwards, smooth, channelled, crowned with a small, intermediate, awl-shaped point, like an abortive leaflet. *Stipulas* between the footstalks, in pairs, membranous, ovate, pointed, oblique. *Flowers* yellow, on simple, axillary, opposite, nearly upright stalks, hardly so long as the footstalks. *Calyx-leaves* concave, quarter of an inch long, green, even, with a membranous edge. *Petals* rather longer, obtuse. *Nectaries* jagged, almost pectinate. Five of the *stamens* deflexed, five ascending. *Capsule* above an inch in length. *Seeds* numerous.

4. Z. *fœtidum*. Fœtid Bean-Caper. Schrad. Sert. Hannov. 17. t. 9. Willd. n. 4. Ait. n. 3. (Z. insuave; Curt. Mag. t. 372.)—Leaves conjugate, stalked; leaflets obovate. Calyx downy. Petals jagged. Capsule roundish. Stem shrubby.—Native of the Cape of Good Hope, from whence it was introduced in 1790, by Mr. Masson. This is a hardy green-house shrub, flowering all summer long, but rendered undesirable by the strong fox-like scent of its *leaves*, resembling that of the Crown Imperial, and peculiarly offensive when the house is either shut up, or warmed by the sun. The shrubby *stem* distinguishes this species from the last; but the short, roundish, or obovate, *fruit*, and jagged *petals*, which are five times the length of the calyx, and marked with a red spot at the base of their limb, afford essential marks of difference. *Z. retrofractum* of Thunberg, cited with a mark of doubt by Willdenow, has no resemblance to either.

5. Z. *maculatum*. Spotted-flowered Bean-Caper. Ait. ed. 1. v. 2. 60. ed. 2. n. 4. Willd. n. 5.—"Leaves conjugate, stalked; leaflets linear-lanceolate."—Native of the Cape of Good Hope, from whence it was introduced, in 1782, by George Wynch, esq. A green-house shrub, flowering in October and November. The *petals* are yellow, with a red heart-shaped spot, at the base of each, above which, in the three upper ones only, is a transverse red line. *Aiton.*

6. Z. *coccineum*. Scarlet-flowered Bean-Caper. Linn. Sp. Pl. 551. Willd. n. 6. (Z. desertorum; Forsk. Ægypt.-Arab. 87. Ic. t. 11. Fabago arabica teretifolia, flore coccineo; Shaw Afric. n. 231. f. 231.)—Leaves conjugate, on a fleshy stalk; leaflets cylindrical, smooth. Capsule oblong.—Plentiful in the arid valleys of the desert, between Cairo and Suez. The Arabs call this plant *Rottræjt*. All kinds of cattle, even the camel, refuse to eat it. *Forskall.* The *stem* is shrubby, ascending, much branched, often a foot and a half high. *Leaflets* half or three-quarters of an inch long, obtuse, thick and succulent, quite smooth, supported in pairs on a club-shaped *footstalk*, somewhat more in length. *Petals* red, pointed. *Capsule* near an inch long. The shape of the *capsule* and *leaflets*, not to mention the colour of the *flowers*, distinguishes this species from the following.

7. Z. *album*. White Bean-Caper. Linn. Sp. Pl. 551. Mant. 379. Willd. n. 7. Ait. n. 5. Linn. fil. Dec. 1. 11. t. 6. Sm. Fl. Græc. Sibth. t. 371, unpublished. (Z. proliferum; Forsk. Ægypt.-Arab. 87. Ic. t. 12. f. A.)—Leaves conjugate, on a fleshy stalk; leaflets obovate, downy and hoary. Capsule roundish, five-lobed.—Native of Egypt, Cyprus, Barbary, &c. Forskall found it very abundantly about Alexandria; and Desfontaines near Tripoli, as mentioned by Shaw. Mr. Masson met with it in the Canary islands, and sent plants or seeds to Kew, in 1779, where this species is said to be kept in the dry stove, but not yet to have flowered. The *stem* is woody, diffuse, much branched, and very leafy. *Leaves* opposite, or aggregate, being accompanied by axillary tufts of smaller ones. The *leaflets*, as well as their *footstalk*, are thick, round, and juicy, both hoary, like the young *branches*, with fine, short, dense pubescence: the former are obovate, or almost globular, seldom a quarter of an inch long: the *footstalk* twice as much, and club-shaped. *Flowers* a third of an inch broad. *Calyx* reddish. *Petals* white, obtuse, crenate. *Germen* roundish, depressed, downy, with five rounded lobes. *Capsule* of the same shape; its coat, according to Forskall, pulpy, and there are only two *seeds* in each cell. The *stigma* is represented, in Mr. Ferdinand Bauer's drawing, rather slightly notched, not simple, as described by the younger Linnæus; but still less can we discern the five acute *stigmas*, mentioned in the *Mantissa*.

8. Z. *Morgsana*. Four-leaved Bean-Caper. Linn. Sp. Pl. 551. Willd. n. 8. Ait. n. 6. (Fabago capensis frutescens major; Dill. Elth. 142. t. 116. f. 141. F. triphylla et tetraphylla, flore quadripetalo, fructu membranaceo quadrangulari; Burm. Afric. 7. t. 3. f. 2. Planta africana

frutescens,

frutescens, portulacæ folio, *Morgsani* syrorum, ex brevi pediculo binis; Pluk. Amalth. 173. t. 429. f. 4.)—Leaves conjugate, nearly sessile; leaflets obovate, flat, smooth. Stem shrubby. Capsule roundish, tumid, five-lobed.—Native of the Cape of Good Hope. A green-house shrub in England, flowering most part of the summer. *Aiton.* The *branches* are somewhat quadrangular, very smooth. *Leaflets* an inch long, succulent, but not tumid; their common *footstalk* very short, or altogether wanting. *Stipulas* in pairs, lanceolate, pointed, reflexed. *Flower-stalks* the length of the leaves, unilateral, in pairs, declining. *Flowers* large, yellow, turning white in decay; their *petals* obovate, entire, streaked with purple at the base. *Nectaries* jagged or fringed, as in n. 3, 4, and perhaps some other species. *Capsule*, as represented by Burmann, an inch in diameter, globose, with five large, rounded, prominent lobes. We find the *petals* uniformly five, and entire; Linnæus says four, rarely five, and somewhat emarginate. There is reason to believe he confounded more than one species under the present. He has applied a specific name, which properly belongs to *Z. Fabago*.

9. Z. *sessilifolium*. Sessile-leaved Bean-Caper. Linn. Sp. Pl. 552. Willd. n. 10. Ait. n. 7. (Fabago capensis frutescens minor; Dill. Elth. 142. t. 116. f. 142. F. humilis quadrifolia glabra, flore albido fructu rotundo; Burm. Afric. 4. t. 2. f. 1. F. africana arborescens, flore sulphureo, fructu rotundo; Commel. Rar. 10. t. 10.)—Leaves conjugate, sessile; leaflets obovate, flat, smooth. Stem shrubby. Capsule globose, undivided.—Native of the Cape of Good Hope. A green-house shrub, flowering in July and August, which appears to have been known in our gardens for above a century. Its size is inferior to the last, from which, according to Dillenius and Burmann, this species is essentially distinguished by the *fruit*. The *capsule* is either exactly globular, or, as Dillenius says, depressed like a Dutch cheese, its diameter not half an inch, nor is it furrowed, nor parted into large tumid lobes, like *Z. Morgsana*. The *leaves* too are smaller, and more perfectly sessile. Linnæus defines them "rough-edged," which we can find nothing to countenance, even in his own specimen. The *flowers* are drooping, orange-coloured, turning white as they fade; the *petals* crenate at the end, not much spreading. The *nectaries* are smaller, and much less conspicuously jagged than in the preceding.

10. Z. *fulvum*. Tawny Bean-Caper. Linn. Sp. Pl. ed. 1. 386. (Z. sessilifolium β; Linn. Sp. Pl. ed. 2. 552. Willd. n. 10, β. Fabago flore luteo, petalorum unguibus rubris, fructu sulcato oblongo acuto; Burm. Afric. 6. t. 3. f. 1.)—Leaves conjugate, sessile; leaflets obovate, flat, smooth. Stem shrubby. Capsule ovate, five-angled, acute.—Native of the Cape of Good Hope. Linnæus latterly considered this as a variety of the last, but we cannot discover on what his opinion was founded, there being nothing in his herbarium to represent *Z. fulvum*. There is indeed a specimen, referred by him at one time to *Z. Morgsana*, and at another to *coccineum*, on which, having no affinity to the latter, we are led to suspect he wrote *coccineum* by accident for *fulvum*. In this the *leaves* have something of a common *footstalk*, though very short. The *nectaries* are long and jagged, as in *Morgsana*. There is unluckily no *fruit*. Burmann's figure of the *capsule* is so precise, that, considering the analogy of other species, so well distinguished by this part, we can have no hesitation in re-establishing *Z. fulvum*, as essentially differing from *sessilifolium*, whether our specimen be what Linnæus intended or not. The *capsule* of the real plant is above an inch long, with five acute angles, and as many deep intermediate channels, and terminates in a point, being equally unlike *sessilifolium* on one hand, and *Morgsana* on the other.

11. Z. *spinosum*. Spinous Bean-Caper. Linn. Sp. Pl. 552. Mant. 380. Willd. n. 11. (Fabago tenuifolia spinosa, fructu rotundo; Burm. Afric. 5. t. 2. f. 2.)—Leaves conjugate, sessile; leaflets linear, fleshy, smooth; flat above. Stem shrubby. Permanent stipulas hooked, spinous.—Native of the Cape of Good Hope. The *stem* is bushy, shrubby, about a foot high, branched from top to bottom; the branches acutely quadrangular. *Leaves* numerous, fleshy like those of a *Sedum;* the *leaflets* acute, scarcely an inch long, blunt, with a small point; their under side convex, or hemispherical. *Stipulas* in pairs, small, lanceolate, spreading, at length becoming hardened, hooked, and pungent, so as to form two, three, or four prickles at every joint. *Flowers* drooping, large and handsome, on longish, solitary, lateral stalks. *Calyx* reddish. *Petals* yellow, fading to white, nearly or quite entire. *Nectaries* entire, not fringed. *Capsule*, according to Burmann, "round, smooth, compressed, terminating in the very acute *style*."

12. Z. *microphyllum*. Small-leaved Bean-Caper. Linn. Suppl. 232. Willd. n. 9. Thunb. Prodr. 80.—Leaves conjugate, somewhat stalked; leaflets inversely heart-shaped, smooth. Stem shrubby, with ascending branches. Capsule roundish, abrupt, of five compressed lobes. Style permanent.—Gathered by Thunberg, at the Cape of Good Hope. This is one of those hard, rigid, small-leaved, much branched *shrubs*, so characteristic of the botany of its native country. The *branches* are round, knotty, spreading, slightly hoary, or glaucous. *Leaflets* from one to three lines long, thick, oblique, sometimes obovate, but more frequently cloven, so as to become inversely heart-shaped; they are supported on a manifest, though short, thick *footstalk*. *Stipulas* minute. *Flower-stalks* thread-shaped, solitary, longer than the leaves, from the same buds. *Flowers* drooping, rather small, yellow. *Calyx* reflexed. *Capsule* the diameter of a pea, consisting of five rounded, vertical, compressed lobes, crowned with the spinous style, their surface rather reticulated: each of them bursts at the inner, as well as outer, edge into two elastic, or cartilaginous, valves, coated with a thin skin.

13. Z. *retrofractum*. Recurved Bean-Caper. Thunb. Prodr. 80.—Leaves conjugate, stalked; leaflets obovate, smooth. Stem shrubby, with spreading recurved branches. Flower-stalks shorter than the leaves.—Gathered at the Cape of Good Hope, by professor Thunberg, from whom we have a specimen. His short specific character was Willdenow's only guide, when the latter reduced this plant to *Z. fœtidum*, to which it has no affinity, and very little resemblance. The present, though a very distinct species, is most allied to *Z. microphyllum*, but the long, spreading, deflexed *branches* afford a characteristic difference of habit. The *leaflets* too are smaller, and seem to be always obovate, not obcordate. *Flowers* very small, their little thick *stalks* hardly so long as the *calyx*. *Nectaries* lanceolate, entire. *Germen*, after the other parts of the flower are fallen, elliptic-oblong, deeply five-lobed, acute, crowned with the style; but we have none in an advanced state, to enable us to judge whether the lobes ever extend into a rounded semi-orbicular shape, like the last, as may very probably be the case.

14. Z. *æstuans*. Surinam Bean-Caper. Linn. Sp. Pl. 552. Willd. n. 12.—Leaves conjugate, sessile; leaflets obovate, abrupt. Stems herbaceous, diffuse. Stipulas five at each joint.—Gathered in Surinam by Rolander, who sent seeds to Linnæus; but the plants raised from them

died without flowering. The *ftems* are a foot long, fmooth, roundifh, except a flatnefs on the upper fide. *Leaves* oppofite, without veins. *Stipulas* reflexed; two between each pair of leaves, at the uppermoft fide of the ftem; one between the fame pair, on the lower fide; one between the leaflets of each leaf. *Linnæus*. This laft feems to anfwer to the little point, or rudiment of a leaflet, which occurs in feveral others of the broad-leaved fpecies.

15. Z.? *lanatum*. Woolly-jointed Bean-Caper. Willd. n. 13.—"Leaves ternate; leaflets papillary beneath. Styles five. Stem zigzag, woolly at the joints."—Native of Sierra Leone. A plant of a doubtful genus, feen by the above author in a dried ftate only. The *ftem* appears herbaceous, round and fmooth, except the joints, which are remarkably woolly. *Leaves* oppofite, fmall, on *footftalks*. *Leaflets* three, on very fhort partial *footftalks*, roundifh, tapering at the bafe, pointed at the end; fmooth on the upper fide; befet underneath with prominent points. *Flower-ftalks* axillary, folitary, fingle-flowered, erect; drooping after flowering. *Calyx* of five linear, obtufe leaves; downy on the infide, and at the edges. *Corolla* not prefent; perhaps fallen. *Filaments* but little dilated at the bafe. *Germen* club-fhaped. *Styles* five, long, and thread-fhaped. *Stigmas* obtufe. *Capfule* ovate, with five angles, five cells, and five valves with keel-like edges, burfting at the bafe. *Seeds* folitary. *Willdenow*. The ternate *leaves* afford a ftrong prefumption againft this being a *Zygophyllum*, and the want, as it feems, of *nectaries*, with the five *ftyles*, decide the queftion, in our judgment. Not having feen the plant, we leave it here for further inquiry.

16. Z. *arboreum*. Tree Bean-Caper. Jacq. Amer. 130. t. 83. Linn. Sp. Pl. 1673. Willd. n. 14.—Leaves abruptly pinnate. Stem arboreous.—Native of South America. Found by Jacquin, in uncultivated valleys about Carthagena, as well as in woods on the fandy fea-fhore, flowering in July. A very handfome *tree*, forty feet high; the *trunk* being about fix feet; the *head* denfe, widely fpreading, and extremely ornamental; the *branches* oppofite, or forked. *Leaves* very numerous, oppofite, four inches long, of about feven pair, without a terminal one, of alternate, feffile, elliptic-oblong, obtufe, entire, fmooth, fhining *leaflets*, an inch or more in length. *Clufters* axillary and terminal, fhorter than the leaves, compound, lax, generally forked. *Flowers* large and handfome, without fcent. *Calyx* yellowifh-green, fmooth. *Petals* orange-coloured, roundifh, emarginate; their claws as long as the calyx. *Nectary* fringed; its fcales gradually larger towards the upper fide of the flower. *Stamens* erect, converging. *Germen* tapering at the bafe, into a long, thick, five-furrowed ftalk. *Capfule* with five large membranous lobes. When it bloffoms this tree affords a moft magnificent fpectacle, from the innumerable flowers, covering the bright green leafy head. Before the inflorefcence appears, the leaves might incautioufly be fuppofed doubly pinnate. The inhabitants give the name of *Guay-acan* to this tree, which is a general appellation for all kinds of hard wood that is ufeful for cabinet or other work. The trunk is reported to become changed into ftone by lying in the earth, being incapable of corruption. *Jacquin*.

Zygophyllum, in *Gardening*, comprifes plants of the herbaceous and woody fucculent exotic kind, among which the fpecies are, the common bean-caper (Z. Fabago), the African bean-caper (Z. feffilifolium), the purflain-leaved Ethiopian bean-caper (Z. Morgfana), the thorny bean-caper (Z. fpinofum), and the white Egyptian bean-caper (Z. album).

The firft has a deep flefhy root, and foft herbaceous ftalks, which decay in the winter.

The fecond is of a fhrubby growth, and there are varieties, with yellow flowers, with fulphur-coloured flowers, with white flowers, with copper-coloured flowers, having moftly a reddifh or brown fpot near the bafe of each petal.

The third has alfo a fhrubby ftem, and there is a variety with flame-yellow-coloured flowers.

And the fourth has an under fhrubby growth.

Method of Culture.—The firft fort is raifed from feeds, which fhould be fown in the fpring in pots filled with light fandy mould, or on a hot-bed. When the plants have a few inches growth, they fhould be removed into feparate pots, plunging them into a hot-bed, admitting air fo as gradually to harden them to the open ground. They fhould be protected for a winter or two, and then be turned out into borders, or other parts, where the fituation is warm, and the foil dry and rubbifhy, as they are of a fucculent nature.

The other forts are capable of being increafed by cuttings and feeds; the cuttings fhould be planted out in the fpring or fummer in pots filled with light fandy mould, and plunged in a hot-bed, being occafionally watered, when they quickly emit roots, and fhoot at top; and when fown in the fummer months, they may be planted in a fhady place, or in pots placed in the fhade, giving frequent waterings, when they will alfo take good root. In either method, they fhould be potted off feparately towards autumn, in order to be moved into the green-houfe or glafs-cafe in the beginning of autumn.

The feed fhould be fown in the fpring in pots of light earth, and be plunged in a hot-bed, where they foon come up: when a little advanced in growth, they fhould be pricked out in feparate fmall pots, being watered and re-plunged into the hot-bed till well-rooted, when they fhould be gradually hardened to the full air, and in June fet out to remain till the autumn, when they fhould be placed in the green-houfe, or fome other place, where they may have protection for the winter.

The firft fort affords variety in the borders, as well as among other potted plants; and the others in collections of the green-houfe kind.

ZYGOPOLIS, in *Ancient Geography*, a town of Afia, in the Colchide, near the town of Trapezunte.

ZYGOSTATES, among the *Ancients*, an officer who was the overfeer of weights, and was to take care that tradefmen ufed none but what were juft.

ZYGRIS, in *Ancient Geography*, a town on the coaft of the nome of Lybia; and *Zygritæ* are the people who inhabit this nome.

ZYMAR, a name given by fome of the chemical writers to verdigrife.

ZYME, a word ufed by many authors to exprefs ferment or leaven.

ZYMOLOGY, in *Chemiftry*, a term ufed by fome writers to exprefs a treatife on fermentation, or the doctrine of fermentation in general.

Mr. Sympfon has written a treatife on this fubject, in which he refers the whole to the internal conflicts of acid and fulphur in bodies, and feems to think that the phenomena of hot-baths, the generation of minerals, and the production of mineral waters, the grand appearances of light, heat, and fire, and the generality of the fubterranean phenomena of damps, earthquakes, and fiery eruptions, and the appearance of meteors, may be all explained by the doc-

 trine

trine of fermentation, eftablifhed on this bafis. Sympfon's Zymol. Chym.

ZYMOSIMETER, formed from ζυμωσις, *fermentation*, and μετρον, *meafure*, an inftrument propofed by Swammerdam, in his book "De Refpiratione," wherewith to meafure the degree of fermentation occafioned by the mixture of different matters; and the degree of heat which thofe matters acquire in fermenting; as alfo the heat, or temperament, of the blood of animals.

ZYMOSIS, a word ufed by fome to exprefs fermentation, and by others for a flatulent tumour of the liver, or other of the vifcera.

ZYMUM, in *Botany*, apparently from ζυμη, *a ferment*, a name which, De Theis fays, is given to a plant of the Mauritius, by Norôna, a Spanifh botanift, but without any explanation of its meaning, or application. This name is, neverthelefs, retained by Aubert du Petit-Thouars, in his *Plantes des Ifles d'Afrique*, fafc. 4.

ZYORY, in *Geography*. See SOHRAU.

ZYPE, a kind of ifland of North Holland, formed by canals cut from the Zuyder Zee to the German ocean. It was formerly a morafs, but is now converted into rich meadow land. On this fpot the duke of York was pofted, when he made terms with the French general Brune to evacuate Holland; having it in his power, by taking up the fluices, to inundate the country.

ZYRAS, in *Ancient Geography*, a river of Thrace, which watered the town of Dionyfiopolis. Pliny.

ZYRMA, a town of Thrace, near which ran the river Hebrus. Ptolemy.

ZYTHOGALA, formed of ζυθος, *cerevifia*, and γαλα, *lac*, *beer poffet*, a drink recommended by Sydenham, as good to be taken after a vomit, for allaying the acrimonious and difagreeable tafte it has occafioned, as well as to prevent gripes. Syden. Obferv. de Morb. acut. p. 39.

ZYTHUM, or ZYTHOS, a fort of malt liquor, in ufe among the ancient Germans.

Matthiolus reprefents the ancient *zythum*, and *curmi*, as the fame with our beer and ale.

ZYTOMIERS, in *Geography*, a town and fortrefs of Ruffian Poland; 65 miles W. of Kiev. N. lat. 50° 16′. E. long. 28° 54′.

A, B, C, DARIA, in *Botany*, a name given by Rumphius, Herb. Amboin. v. 6. 145. t. 65, to the *Verbesina Acmella* of Linnæus, see Spilanthus, n. 3. The above appellation is designed to express the use made of this plant by the black school-masters at Amboyna, who cause their young pupils to chew the flowers or the root, either alone or with Betle-nut, in order that they may more easily pronounce some of the difficult Arabic letters, such as *Tscha* and *Ze*, both which they commonly confound with *S*. The Malay name, *Daun murit*, School-boy's herb, given to this *Spilanthus*, as well as to *Bidens pilosa* of Linnæus, has the same allusion. Such plants agree with Pellitory of Spain, *Anthemis Pyrethrum*, in a peculiar property of stimulating the mouth, accompanied by a sense of coolness, and a slight saline taste, all which together cause a great flow of saliva. Hence they are beneficial in tooth-ache arising from cold rheum, but the slight numbness and tingling of the nerves, which attend their use, should seem rather unfavourable to precise enunciation. The recent flowers of *Spilanthus oleracea*, slightly rubbed upon the gums, are perhaps the best of the whole tribe for producing the above effects.

ABDALLAH, Ebn-Zobeir, l. 4, Heg. 63.

ABDAS, in *Biography*, a Persian bishop of the fifth century, who deserves to be exhibited in the page of history as a cautionary example of the folly of supporting any cause by persecution. Having destroyed a pagan temple belonging to the worshippers of fire, the king of Persia, instigated by the Magi, ordered him to rebuild it at his own charge; but as he refused to comply with this order, a dreadful persecution was commenced against the Christians, which lasted 30 years; and in this persecution Abdas lost his life. Bayle.

ABDOMINAL Ring. For Obliqui, &c. *r.* Obliquus.

ABELICEA, in *Botany*, Ἀβελικέα in modern Greek, see our ninth species of Ulmus.

ABERAERON, in *Geography*, a small town and port of Cardiganshire, much frequented by small coasting-vessels, which convey the corn and other produce of the district to the

the Englifh markets. The harbour has been lately much improved by the conftruction of a pier. A market has been lately eftablifhed here.

ABEREMOA, in *Botany*, altered by Aublet from the Caribbean appellation of the fame plant, Aubl. Guian. 610. t. 245; fee GUATTERIA hereafter.

ABERPORTH, in *Geography*, a little fifhing-town of Cardiganfhire, pleafantly fituated at the entrance of the river which flows by Blaenporth. The craft belonging to this port are chiefly employed in bringing lime-ftone from Pembrokefhire and other parts, which are burnt here, to fupply the neighbourhood with manure, and for other purpofes.

ABILDGARDIA, in *Botany*, a genus of Profeffor Vahl's, dedicated by him to the memory of the late Peter Chriftopher Abildgaard, a native of Denmark, formerly profeffor of the veterinary art, who contributed much information to Profeffor Rottböll on the fubject of Graffes. Mr. Brown retains this genus, not without a hint of its too near affinity to FIMBRISTYLIS; fee that article. We truft the barbarifm of the double *a* may be difpenfed with, and we have ventured to make that alteration.—Vahl Enum. v. 2. 296. Brown Prodr. Nov. Holl. v. 1. 229.—Clafs and order, *Triandria Monogynia*. Nat. Ord. *Calamariæ*, Linn. *Cyperoideæ*, Juff. *Cyperaceæ*, Brown.

Gen. Ch. *Cal.* a fingle fcale to each flower, ovate, pointed, concave, compreffed, forming a fpike, imperfectly two-ranked. *Cor.* none. *Stam.* Filaments three, rarely but one, inferted beneath the germen, gradually elongated by age, anthers linear, longer than the filaments. *Pift.* Germen fuperior, acutely triangular, rather contracted at the fummit; ftyle bulbous and pyramidal at the bafe, the bulb triangular, broader than the germen, permanent, the upper part briftle-fhaped, deciduous; ftigmas three, fhorter than the ftyle. *Peric.* none. *Seed* one, fnow-white, nearly pear-fhaped, with three angles, contracted at the bafe, crowned at the fummit with the pointed bafe of the ftyle, convex at the fides, and rough with minute dots, without any furrounding briftles. *Recept.* thread-fhaped, gradually elongated, minutely cellular, dotted with brown, the edges of the cells membranous, from the permanent bafes of the fcales.

Eff. Ch. Glumes chaffy, imbricated, imperfectly two-ranked. Corolla none. Style three-cleft, with a triangular, pointed, permanent bafe. Seed folitary, pear-fhaped, triangular, without any briftles at its bafe.

The *ftems* of this genus are angular, flender, without joints; leafy at the bottom. *Leaves* narrow, channelled, fheathing. *Spikes* ovate-oblong, acute, compreffed, often twifted; their *fcales* clofely imbricated, keeled, very fmooth and polifhed, white, dotted with purple, the green keel of each elongated into a little point; the two lowermoft narrower than the reft. *Vahl. Brown.*

Mr. Brown remarks, that the ftyle is certainly deciduous, and the fpike, when in feed, by no means perfectly two-ranked; circumftances which bring the prefent genus very near to *Fimbriftylis*. The following are the only defcribed fpecies.

1. A. *monoftachya*. Single-fpiked Abildgardia. Vahl n. 1. Br. n. 1. (Cyperus monoftachyos; Linn. Mant. 180. Willd. Sp. Pl. v. 1. 271. Swartz Obf. 29. Rottb. Gram. 18. t. 13. f. 3. Gramen cyperoides minimum, fpicâ fimplici compactâ, radice tuberofâ odoratâ; Sloane Jam. v. 1. 120. t. 79. f. 2.)—Spike folitary. Scales uniform, nearly all fertile.—Gathered, by Kœnig, in fhady fituations in the Eaft Indies; in the paftures, and fea marfhes, of Jamaica and Hifpaniola, by Sloane and Swartz; and in the tropical part of New Holland, as well as at Port Jackfon, by Mr. R. Brown. The *root* appears to be perennial, with many long fimple fibres. *Herb* flender, fmooth and glaucous, forming tufts, about a foot high, with linear, very narrow, *leaves*, which fometimes break off, as Vahl remarks, at a fort of joint, below the middle of each. *Stem* fimple, flender, angular, and ftriated, taller than the leaves. *Spike* half an inch long, two-ranked, fubtended by a linear rough-edged leaf, fometimes, in the Linnæan fpecimen, exceeding its own length. The *glumes*, or *fcales*, have a green keel, accompanied by two white ribs, next to which is an affemblage of purple dots, the reft being cream-coloured. Two or three of the lower *glumes* are fmall, and apparently barren. There is faid to be but one *ftamen* to each *flower*. Sloane's fynonym feems, to us, doubtful.

2. A. *fchoenoides*. Rufhy Abildgardia. Br. n. 2.—"Spike folitary, naked. Outer fcales fhorter and barren; terminal ones narrower, with fpreading points."—Gathered by Mr. Brown, in the tropical part of New Holland. We have feen no fpecimen of this or the next.

3. A. *vaginata*. Sheathing Abildgardia. Br. n. 3.—"Spikes about three together; the middle one feffile. Scales pointed. Stem briftle-fhaped, angular, leaflefs; fheathed at the bafe."—Found by Mr. Brown, in the tropical part of New Holland.

4. A. *triftachya*. Three-fpiked leafy Abildgardia. Vahl n. 2. (Cyperus triflorus; Linn. Mant. 180. Willd. Sp. Pl. v. 1. 272. Schoenus cyperoides; Retz. Obf. fafc. 4. 8.)—Spikes about three together; the middle one feffile. Stem femi-cylindrical; round, bulbous, and leafy, at the bafe.—Native of the Eaft Indies, in hard dry ground. *Kœnig*. The *ftems* are from one to two feet high, rufhy and rigid, erect; according to Vahl, bulbous at the bottom, and wrapped with dry brown fheaths among the foliage. The *leaves* are fmooth, channelled, not fo tall as the ftem. *Spikes* two, three, or four, twice the fize of the firft fpecies, tumid, ovate, acute, twifted, of a dirty but polifhed white; three of them generally fpringing from one fhort leafy fheath, the two lateral ones elevated on long, flattened, ftriated, fmooth ftalks. *Stamens* three; *Vahl. Stigmas* long and downy.

ABINGTON, in *Geography*, a town of Maffachufetts, in Plymouth county, containing 1704 inhabitants.—Alfo, a townfhip of Pennfylvania, in Montgomery county, having 1236 inhabitants.—Alfo, a townfhip of Pennfylvania, in Luzerne county, having 511 inhabitants.

ABUTA, in *Botany*, a Braſilian name, firſt publiſhed by Barrere, adopted by Aublet, and recently by De Candolle, as well as Juſſieu. It may remain for the preſent, till the characters of the genus are known. Theſe are hitherto involved in great uncertainty, the flowers not having been obſerved by any botaniſt.—Barr. Hiſt. Nat. de la France Equinoxiale, 1. Aubl. Guian. 618. Juſſ. 286. De Cand. Syſt. v. 1. 542.—Claſs and order, *Dioecia Dodecandria?* (Polyandria Polygynia, *Aubl.*) Nat. Ord. *Meniſperma*, Juſſ.

Eſſ. Ch. Male, unknown.

Female, Fl. unknown. Berries two or three, ovate, ſomewhat compreſſed, dry, ſingle-ſeeded.

Lamarck and Willdenow have conſidered this genus as not diſtinct from Menispermum, ſee that article; but Profeſſor De Candolle reckons the large, dry, ovate, not kidney-ſhaped, *berries*, ſo termed, we preſume, becauſe of the brittle ſhell of their ſeed, as affording a ſufficient character, even without the flowers. He is more inclined to refer *Abuta* to his own genus of *Cocculus*, ſeparated by him from *Meniſpermum;* but their habits are ſomewhat different. Two ſpecies of *Abuta* are defined by this writer, but *A. amara* of Aublet, Guian. 620. t. 251, is referred, on the authority of Richard, to *Ariſtolochia*. Theſe are large twining ſhrubs, with ovate *leaves*, whoſe pinnate ribs ſpring nearly from one point at the baſe.

1. A. *rufeſcens*. Reddiſh Abuta, or Falſe Pareira-brava. Aubl. Guian. 618. t. 250. De Cand. n. 1. (A. ſcandens, ampliſſimo folio cordiformi, ſubtus tomentoſo; Barr. Fr. Equin. 1. Meniſpermum Abuta; Lamarck Dict. v. 4. 100. Willd. Sp. Pl. v. 4. 828.)—Leaves ovate, acute, entire; downy beneath.—Native of woods in Braſil, Cayenne, and Guiana. Aublet found it in almoſt every foreſt of the laſt-mentioned country, that he examined, bearing fruit in January. The Portugueſe confound this plant with the true *Ciſſampelos Pareira*, and conſider its root of equal efficacy in jaundice, diſorders of the kidneys and bladder, as well as internal abſceſſes, and menſtrual ſuppreſſions. The climbing *ſtem*, and downy branches, reach to the tops of trees, and bear large, alternate, ſtalked, coriaceous, veiny, entire *leaves*, from four inches to a foot long; ſmooth above; covered beneath with prominent, reticulated, downy veins, ſpringing copiouſly from five principal ribs, which radiate from nearly the baſe of the leaf. The *footſtalks* are about half the length of the leaves, round, finely and denſely downy. *Berries* elliptical, downy, an inch long, three upon each receptacle, and forming large axillary branches. There is ſaid to be a variety whoſe woody parts, as well as the pubeſcence of the foliage, is reddiſh. The Creoles make a decoction of the branches of the red and white varieties indifferently, to cure obſtructions of the liver, to which they are very ſubject. *Aublet.*

2. A. *candicans*. Whitiſh-leaved Abuta. De Cand. n. 2. Richard MSS.—"Leaves ovate, pointed, ſomewhat crenate, or minutely lobed; ſmooth and whitiſh beneath."—Gathered in Cayenne by M. Richard, who unluckily did not meet with the flowers. The *branches* are round and ſmooth. *Footſtalks* four inches long, round and ſmooth likewiſe. *Leaves* five to ſeven inches long, three or four broad, nearly entire, or ſlightly criſped, or toothed, in the margin; even and ſmooth above; pale or nearly white underneath, but, as it ſeems, quite ſmooth; the ribs pinnate, the two lower lateral ones cloſe together. The inhabitants of Cayenne call this plant *Liane amère*, Bitter Vine. *De Candolle.*

ABYSSINIAN Music. See Music.

ACACIA, in *Botany*, an ancient Greek name, derived from ακαζω, *to point* or *ſharpen*, in reference to its thorny habit. De Theis deduces all words of this etymology from the Celtic, *ac*, a point. The ακακια of Dioſcorides, book i. chap. 133, was a ſort of Egyptian thorn, "of a diffuſe or ſpreading mode of growth, with a white flower, and a pod reſembling lupines." Its expreſſed juice, dried in the ſhade, was an aſtringent medicine much in uſe, and the ſhrub yielded alſo a clear white gum. This may very well have been a plant of the preſent genus. Willdenow, who eſtabliſhed this genus, firſt ſeparated it from the Linnæan Mimosa (ſee that article), which has become inconveniently numerous in ſpecies, and unqueſtionably is capable of diviſion by the characters of the fruit, of which Willdenow has very well taken advantage. He leaves in *Mimoſa* ſuch ſpecies as have a *lomentum*, or legume ſeparating into ſingle-ſeeded joints. Of theſe he defines 32, having a five-toothed corolla, and only eight ſtamens; and to many of them, being ſenſitive, the name *Mimoſa* is properly appropriated. For his other genera taken from hence, ſee Desmanthus, Inga, and Schrankia. We muſt obſerve however that the *Acacia* of Tournefort is not analogous to what is now before us.—Willd. Sp. Pl. v. 4. 1049. Ait. Hort. Kew. v. 5. 459. Purſh 305.—Claſs and order, *Polygamia Monoecia*, or rather perhaps *Polyandria Monogynia*. Nat. Ord. *Lomentaceæ*, Linn. *Leguminoſæ*, Juſſ.

Eſſ. Ch. Calyx five-toothed. Corolla five-cleft. Stamens indefinite, from four to an hundred. Piſtil one. Legume of two valves. Some flowers male.

Obſ. The flowers, ſometimes four-cleft, have, in ſome inſtances, a corolla which ſeparates into four or five diſtinct petals. We have not had an opportunity of examining a ſufficient number of ſpecies to give a full generic character. Willdenow reckons up 102, in ſeven ſections; to which Mr. Brown has made numerous additions from New Holland, partly deſcribed in *Ait. Hort. Kew.* above cited. We ſhall give ſome examples of each ſection.

Sect. 1. *Leaves ſimple*. Sixteen ſpecies in Willdenow, to which ten are here added, nine of them from *Hort. Kew.*—Of this ſingular tribe, firſt diſcovered by our Britiſh circumnavigators, all the ſpecies, as far as hitherto known, bear, in a ſeedling ſtate, compound pinnate *leaves*, ſoon replaced by leafy or ſpinous ſimple footſtalks, which latter conſtitute the only foliage of the adult plant. There are no proper thorns or prickles in theſe. Their *ſtem* is ſhrubby, or arboreous, as well as throughout the whole genus. We have ſlightly adverted to this ſection at the end of our article Mimosa.

A. *verticillata*. Whorl-leaved Acacia. Willd. n. 1. Ait. n. 1. (Mimoſa verticillata; L'Herit. Sert. Angl. 30. Curt. Mag. t. 110. Venten. Malmaiſ. t. 63.)—Leaves whorled, linear-awlſhaped, rigid, ſpinous-pointed. Spikes ſolitary, cylindrical.—Gathered in Van Diemen's iſland, by the late Mr. David Nelſon, who ſent ſeeds to ſir Joſeph Banks in 1780. Hence this ſingular ſhrub became known in the Engliſh green-houſes, where it flowers in the ſpring, and ripens ſeed. The firſt two or three *leaves* of ſeedling plants are conjugate and pinnate, with elliptical obtuſe entire *leaflets:* the reſt are accurately whorled, ſimple, pungent, flattiſh thorns rather than leaves, ſix or eight in each whorl, about half an inch long, ſomewhat unequal, ſpreading horizontally. *Flowers* in denſe, yellow, thick, obtuſe *ſpikes*, which are an inch, more or leſs, in length, each on a ſimple, ſlender, axillary ſtalk, but there are ſometimes two or more of theſe ſtalks together. *Legume* linear, compreſſed, corrugated, of one cell with ſeveral kidney-ſhaped *ſeeds*.

A. *juniperina*. Juniper-leaved Acacia. Willd. n. 2. Ait. n. 2. (Mimoſa juniperina; Venten. Malmaiſ. t. 64.

"M. ulicifolia;

"M. ulicifolia; Wendl. Coll. 25. t. 6." *Willd.*)—Leaves imperfectly whorled, linear-awlshaped, rigid, spinous-pointed. Spikes solitary, globose.—Found near Port Jackson, New South Wales, from whence sir Joseph Banks is said to have received seeds about the year 1790. We have specimens from Dr. White. This differs from the foregoing in having its spinous *leaves* more crowded, and less distinctly whorled, more hairy *branches*, and globular heads of *flowers*, each flower, according to Ventenat, accompanied by a little ovate, pointed, stalked *bractea*.

A. *acicularis*. Needle-leaved Acacia. Brown in Ait. n. 3.—"Leaves scattered, roundish-awlshaped, pointed, rigid. Stipulas deciduous. Young branches smooth. Spikes solitary, globose."—Said to have been found in New South Wales, by colonel William Paterson, from whence it was sent to Kew in 1796. It flowers at the same season as the two preceding, and requires the same treatment. If we understand this species aright, the *leaves* are full an inch long, being twice the length of the two foregoing, and more slender. We received specimens answering to this description before 1796, from Dr. White.

A. *sulcata*. Furrowed Needle Acacia. Brown in Ait. n. 4.—"Leaves thread-shaped, furrowed on all sides, with a harmless point. Heads of flowers usually in pairs. Bracteas ovate, concave, permanent, at the base of the flower-stalk. Legumes zigzag."—Observed by Mr. Brown on the south-west coast of New Holland, from whence it was introduced, in 1803, by Mr. Peter Good. This is likewise a green-house shrub, flowering from May to August.

A. *suaveolens*. Sweet-scented Acacia. Willd. n. 4. Ait. n. 5. (Mimosa suaveolens; Sm. Tr. of Linn. Soc. v. 1. 253. Labill. Nov. Holl. v. 2. 87. t. 236. M. angustifolia; Jacq. Hort. Schoenbr. v. 3. 74. t. 391. M. obliqua; Lamarck Journ. d'Hist. Nat. v. 1. 89. t. 5.)—Leaves linear, pointed; tapering at the base. Clusters oblong, axillary. Flowers four-cleft. Branches triangular.—Native of New South Wales. Cultivated, before 1790, by Mr. Thomas Hoy, in Sion gardens. A green-house shrub, flowering in the spring. The acute edges of the *branches* are bright red. The first *leaves* are conjugate, pinnate, with thick elliptical leaflets, and a lanceolate common footstalk; the rest alternate, narrow, coriaceous, four or five inches long, rather glaucous, smooth, thick-edged. *Flowers* simply racemose, yellowish-white, fragrant, their *corolla* deeply four-lobed. *Stamens* very numerous. *Legume* elliptical, an inch and a half or two inches long, and one inch broad, finely glaucous.

A. *stricta*. Double-headed Acacia. Willd. n. 8. Ait. n. 8. (Mimosa stricta; Andr. Repos. t. 53. Curt. Mag. t. 1121.)—Leaves linear-obovate, obtuse; tapering at the base. Spikes globose, stalked, axillary, in pairs, divaricated.—Native of New South Wales, from whence sir Joseph Banks is recorded to have received seeds in 1790. This requires the same treatment, and flowers at the same time, as the last, from which its capitate five-cleft *flowers*, and more dilated rounded-pointed *leaves*, at once distinguish it. Dr. Sims, in Curtis's Magazine, under this species, has given but too just reasons for retaining the genus *Mimosa* entire for the present, which principally refer to our ignorance of their fruit in a number of instances. Our learned friend, however, has since conformed to the new arrangement; and we think, with Willdenow, that enough is known for us to venture on the division this author has proposed, which may generally be supported by analogy, if not by absolute demonstration.

A. *melanoxylon*. Black-wooded Acacia. Brown in Ait. n. 12. Curt. Mag. t. 1659.—Leaves elliptic-lanceolate, many-ribbed, slightly falcate. Spikes globose, in short clusters. Flower-stalks and young branches angular, powdery. "Umbilical cord coloured, plaited, nearly surrounding the seed."—Found by Mr. Brown, in Van Diemen's island. From him we adopt the singular character of the umbilical cord. This is a considerable *tree*, raised by John Walker, esq. of Arno's Grove, Southgate, who received the seeds under the name of Black-wood, about the year 1808. The young twigs are covered with rusty mealiness. *Leaves* stalked, three inches long, and one broad, slightly glaucous, usually five-ribbed. *Flowers* pale-yellow, their globular spikes disposed in short axillary clusters, about twice the length of each footstalk. We have no account of the *legume*.

A. *Sophoræ*. Sophora-podded Acacia. Br. in Ait. n. 13. (Mimosa Sophoræ; Labill. Nov. Holl. v. 2. 87. t. 237.)—Leaves oblong-obovate, equilateral, many-ribbed. Spikes cylindrical, axillary, in pairs. Petals four. Legumes linear, curved, pointed. Umbilical cord plaited.—Found by Labillardiere, as well as by Mr. Brown, in Van Diemen's island. Its seeds were brought by the latter to Kew Garden, and raised there in 1805, but the plants have not yet blossomed. The young *leaves* are represented by Labillardiere as pinnate and trijugate; the rest obovate, two or three inches long. *Spikes* nearly sessile, hardly an inch long, and very slender. *Flowers* small. *Legumes* five or six inches in length, tumid, and twisted, a quarter of an inch broad. Each *seed* is subtended by a cup-like tunic, which we presume is the umbilical cord of Mr. Brown.

A. *marginata*. Marginate-leaved Acacia. Br. in Ait. n. 14.—"Leaves oblong-lanceolate, rather falcate, bordered, single-ribbed; their anterior edge somewhat narrowed, with a solitary gland. Heads about four-flowered, disposed in clusters."—Observed by Mr. Brown on the south-west coast of New Holland, from whence seeds were sent in 1803, by Mr. Peter Good. A green-house shrub, flowering from April to June. *Aiton.*

A. *myrtifolia*. Myrtle-leaved Acacia. Willd. n. 14. Ait. n. 15. (Mimosa myrtifolia; Sm. Tr. of Linn. Soc. v. 1. 253. Bot. of New Holl. 51. t. 15. Curt. Mag. t. 302.)—Leaves elliptic-lanceolate, oblique, thick-edged, single-ribbed, with a solitary gland at their anterior margin. Heads of flowers clustered, aggregate.—Native of New South Wales. Raised by Mr. Thomas Hoy, before the year 1789. A green-house shrub, flowering from February to May, or late in autumn. The *stem* is three or four feet high, with angular branches. First *leaves* conjugate, pinnate; the rest about two inches long, broadly lanceolate, pointed, very rigid, somewhat glaucous, often wavy, smooth. *Flowers* pale yellow, fragrant, three or four in each round head, the heads disposed variously in somewhat compound axillary clusters, nearly equal in length to the leaves. *Legume* linear, curved, tumid, with very thick edges.

A. *hispidula*. Little harsh Acacia. Willd. n. 15. Ait. n. 16. (Mimosa hispidula; Sm. Bot. of New Holl. 53. t. 16.)—Leaves elliptical, acute, oblique, minutely toothed, rough on each side and at the margin. Young branches harsh. Flowers four-cleft, in solitary axillary heads.—Native of New South Wales, from whence specimens were sent to us, with coloured drawings, in 1794, and seeds about the same time to sir Joseph Banks. The roughness of the *foliage* and *branches* is very remarkable, caused by short, rigid, prominent hairs, or points. The *leaves* are sessile, an inch long, vertical, very stiff, deep-green. *Heads* stalked, globose, many-flowered. *Legume* thick-edged, elliptic-oblong, sometimes with one or two contractions. *Seeds* few.

A. *hastulata*.

A. *haſtulata.* Little Halberd-leaved Acacia.—Leaves deltoid, ſpinous-pointed, roughiſh; their upper angle glandular. Stipulas briſtle-ſhaped, permanent. Branches rough. Flowers in ſolitary axillary heads.—Gathered near King George's ſound, on the ſouth-weſt coaſt of New Holland, by Mr. Menzies, to whom we are obliged for a ſpecimen. This remarkable new ſpecies is evidently allied to the two laſt-mentioned, though abundantly diſtinct from both. The ſhrubby *ſtem* bears numerous, erect, round, rough, wand-like *branches*, beſet with innumerable, ſpreading, vertical *leaves*, about a quarter of an inch long, ſingle-ribbed, unequally deltoid, with an elongated ſpinous point, thick-edged, rough with minute points; their lower angle either rounded or ſomewhat toothed; the upper more prominent, and tipped with a gland. *Stipulas* ſlender, erect, in pairs at the baſe of each leaf. *Flowers* three or four in each of the little ſtalked heads, which are very numerous all along the branches.

A. *decipiens.* Paradoxical Acacia. Br. in Ait. n. 17. Curt. Mag. t. 1745. (Mimoſa decipiens; Konig in Ann. of Bot. v. 1. 366. t. 8. Adiantum truncatum; Burm. Ind. 235. t. 66. f. 4. Linn. Syſt. Veg. ed. 13. 790.)—Leaves triangular-wedgeſhaped, ſpinous-pointed, ſmooth; their upper angle glandular. Stipulas briſtle-ſhaped, deciduous. Branches ſmooth. Flowers in ſolitary axillary heads.—Gathered by Mr. Menzies on the ſouth-weſt coaſt of New Holland, and not on the weſt ſide of North America, as mentioned in the Annals of Botany. Seeds were ſent to Kew in 1803, by Mr. Good, and the plant is marked by Mr. Aiton as a green-houſe ſhrub, flowering from March to June. Its hiſtory is certainly curious; ſpecimens without flowers having been taken by profeſſor Burmann, who miſled Linnæus, for an *Adiantum*, which error was detected by the late Mr. Dryander, on ſeeing Mr. Menzies's ſpecimens. Thoſe of Burmann were reported to have come from Java, in which there may be a further miſtake. At any rate this plant is nearly related to our laſt-deſcribed, and grows in the ſame country. The *leaves* differ in being larger, half an inch to an inch long, erect, and differently ſhaped, their inner, or upper, glandular angle being greatly extended, while the lower or rounded angle, ſeen in *A. haſtulata*, is wanting. The *flowers* are more numerous, from ſeven to ten, in each round head.

A. *biflora.* Two-flowered Acacia. Br. in Ait. n. 18.—"Leaves triangular; the outer angle ſpinous; inner glandular. Stipulas briſtle-ſhaped and ſpinous, permanent. Young branches downy. Heads two-flowered."—Obſerved by Mr. Brown, on the ſouth-weſt coaſt of New Holland, from whence it was ſent to Kew by Mr. Good, in 1803. A green-houſe ſhrub, flowering from March to June. We have ſeen no ſpecimens.

A. *armata.* Simple-leaved prickly Acacia. Br. in Ait. n. 19. Curt. Mag. t. 1653.—"Leaves oblong, halved, ſmooth, with a ſmall point; their ſolitary rib near and parallel to the ſomewhat abrupt interior margin. Stipulas ſpinous. Heads ſolitary, globoſe. Branches hairy."—Obſerved by Mr. Brown, on the ſouth coaſt of New Holland. Sent to Kew, by Mr. Good, in 1803. A green-houſe ſhrub, flowering from April to June. *Leaves* dark green, an inch long, ſeſſile. *Flowers* yellow, numerous.

A. *alata.* Wing-ſtalked Acacia. Br. in Ait. n. 20.—"Stem winged on two ſides. Leaves decurrent, ſingle-ribbed, tipped with a ſmall ſpine; their inner margin with one glandular tooth. Stipulas ſpinous. Heads ſtalked, moſtly ſolitary."—Gathered by Mr. Brown, on the ſouth-weſt coaſt of New Holland, from whence ſeeds were ſent to Kew, by Mr. Good, in 1803. This is likewiſe a ſhrubby green-houſe plant, flowering from April to July.

Sect. 2. *Leaves conjugate, pinnate.* Seven ſpecies in Willdenow, to which one of Mr. Brown's is to be added from *Hort. Kew.* The *Prodromus* of this able author, when completed, will probably furniſh more New Holland ſpecies to this ſection.

A. *xylocarpa.* Wooden-fruited Acacia. Willd. n. 17. (Mimoſa xylocarpa; Roxb. Corom. v. 1. 68. t. 100.)—Leaves conjugate, pinnate; leaflets four pair, ovate-oblong, acute. Heads globoſe, many-flowered, lateral, ſtalked, in pairs.—Native of the mountainous parts of the Circars of Hindooſtan, caſting its leaves during the cold ſeaſon, and flowering when the hot weather begins. This is one of the largeſt trees of this genus or any of its allies; the timber very hard, of a chocolate colour towards the centre, and much eſteemed for purpoſes where hardneſs, toughneſs, and durability, are requiſite, as in ploughs, the natives ſeldom uſing iron in that implement. The *leaves* are large, ſmooth, paler beneath, conſiſting of two diviſions, or wings, and thoſe of four pair of *leaflets* each, except that the innermoſt leaflet on each ſide, at the bottom, is wanting: the lower leaflets are about two inches long; the upper four or five. *Heads* of flowers whitiſh, the ſize of a cherry, on ſimple ſtalks, two or three inches in length. *Corolla* bell-ſhaped, five-cleft. *Stamens* ten. *Legume* only one from each head, ovate, compreſſed, very large and woody, three or four inches long, the ſtalk becoming neceſſarily greatly thickened. *Seeds* about ten, oval, ranged near the lower edge, as large as kidney-beans.

A. *pulchella.* Zigzag Spiny Acacia. Br. in Ait. n. 22.—"Leaves conjugate, pinnate, with a ſtalked gland between the wings, each of which has from five to ſeven pair of leaflets. Stipulas ſpinous, nearly equal to the leaves. Heads ſolitary. Branches zigzag."—Obſerved by Mr. Brown, on the ſouth-weſt coaſt of New Holland, from whence ſeeds were ſent to Kew, in 1803, by Mr. Good. A green-houſe ſhrub, flowering from April to July.

Sect. 3. *Leaves doubly pinnate. Stem without thorns. Spikes oblong.* Eleven ſpecies in Willdenow, the laſt of which, *A. Houſtoni*, we ſhall remove to the following ſection.

A. *muricata.* Warty Acacia. Willd. n. 25. (A. latifolia alopecuroides, flore albo; Plum. Ic. 6. t. 11. Mimoſa muricata; Linn. Sp. Pl. 1504.)—Thorns none. Leaves doubly pinnate; firſt diviſion of five pair; ſecond of many pair; leaflets abrupt. Spikes axillary, aggregate, nearly cylindrical. Branches warty.—Gathered in South America, or the Weſt Indies, by Plumier, whoſe figure is the only authority for this ſpecies. The *branches* are round, and warty, as well as the lower part of the *flower-ſtalks*, which laſt are evidently axillary, not, as Willdenow ſays, terminal. They are longer than the large compound *leaves*, and bear four or five alternate denſe *ſpikes*, on partial ſtalks. *Leaflets* numerous, crowded, elliptical, veiny, emarginate, about a half or three-quarters of an inch long. *Flowers* numerous, very ſmall. *Legumes* ſeveral, ſpreading, four or five inches in length, linear, flat, veiny, wavy at the edges, with many oval flat *ſeeds*.

A. *pallida.* Pale South-American Acacia. Willd. n. 26.—"Thorns none. Leaves doubly pinnate; firſt diviſion of two pair; ſecond of twelve pair; leaflets linear, obtuſe, downy. Spikes thread-ſhaped, much longer than the leaves."—Gathered by Humboldt and Bonpland, in South America. *Branches* round, warty, divaricated. *Leaflets* obtuſe at each end, ſometimes but ten pair; clothed ſparingly on the upper ſide, more denſely on the under, with fine pubeſcence; the edges fringed. There is a cup-ſhaped ſeſſile *gland* between the ſecondary diviſions of each leaf (indications of which appear likewiſe in Plumier's plate of the foregoing).

Footstalks hairy. *Spikes* axillary, solitary, three or four inches long, being thrice the length of the leaves. *Flowers* opposite, of five *petals*. *Willdenow.*

This seems much allied to the last, but the shape and downiness of the *leaflets*, and the solitary *spikes*, indicate a sufficient difference.

A. *arenosa.* Sand Acacia. Willd. n. 29.—"Thorns none. Leaves doubly pinnate; first division of six pair; second of sixteen pair; leaflets linear, acute. Spikes thread-shaped, in pairs."—Found by Mr. Bredemeyer at the Caraccas, about the sandy banks of rivers. A *shrub* ten or twelve feet high, with angular downy *branches*. *Leaflets* fringed, from sixteen to twenty-four pair. *Footstalks* clothed with hoary down; the partial ones accompanied by an acute intermediate gland. *Spikes* axillary, measuring three or four inches, generally rather longer than the leaves. *Flowers* opposite, white, fragrant. *Calyx* with four or five teeth. *Corolla* in four or five deep segments. *Stamens* twice as many, and thrice as long. *Willdenow.*

A. *guianensis.* Guiana Acacia. Willd. n. 32. Ait. n. 25. (Mimosa guianensis; Aubl. Guian. 938. t. 357.)—Thorns none. Leaves doubly pinnate, each division of about ten pair; leaflets elliptical, obtuse. Common footstalk with a convex gland. Spikes thread-shaped, axillary.—Observed by Aublet in Cayenne and Guiana, flowering in November, and bearing ripe seeds in January and February. This is a large *tree*, whose *trunk*, thirty or forty feet high, is a foot or more in diameter, with a smooth grey bark, and white brittle wood; the *branches* widely spreading. *Leaflets* elliptical, about half an inch long. The first divisions of the *leaves* are sometimes not more than seven or eight. *Stipulas* rounded, deciduous. *Spikes* axillary, from two to five together, on square simple stalks, the *flowers* small and densely crowded. *Calyx* with five teeth. *Corolla* of one petal, in five sharp lobes. *Stamens* ten, inserted into the calyx below the corolla, long, slender, with heart-shaped *anthers*, each of which bears a little leafy stalked appendage. *Legume* linear-oblong, flattish, brown, smooth, three or four inches in length, with several *seeds*.

A. *lophantha* more properly belongs to this section, though placed in the next.

Sect. 4. *Leaves doubly pinnate. Stem without thorns. Spikes globose.* Thirty-one species in Willdenow, to which we have three to add, besides *A. Houstoni.*

A. *ciliata.* Ciliate-winged Acacia. Br. in Ait. n. 23.—"Without thorns, hairy. Leaves doubly pinnate; first division of two pair; second of two or three pair. Stipulas nearly setaceous, deciduous. Heads solitary."—Gathered by Mr. Brown, on the south-west coast of New Holland; and sent to Kew, by Mr. Good, in 1803. A green-house shrub, flowering from March to June, of which we have not seen either specimen or figure.

A. *nigricans.* Unequal-winged Acacia. Br. in Ait. n. 24. (Mimosa nigricans; Labill. Nov. Holl. v. 2. 88. t. 238.)—Without thorns, smooth. Leaves doubly pinnate; first division of two pair; second of two or three pair in the lower, and from five to seven pair in the upper. Stipulas slender-awlshaped. Heads solitary.—Native of the south-west coast of New Holland, from whence Mr. Good sent seeds to Kew, in 1803. A green-house shrub, flowering from May to July, said to be about six feet high in a wild state. The *leaflets* are uniform, elliptical, obtuse, one-third of an inch long. *Heads* axillary, stalked, one, two, or three together. *Corolla* deeply five-cleft. *Stamens* about 150. *Legumes* one or two from each head, linear-oblong, one inch and a half in length, and one-third of an inch in breadth. *Labillardiere.*

A. *odoratissima.* Fragrant Coromandel Acacia. Willd. n. 37. Ait. n. 27. (A. non spinosa, &c.; Pluk. Amalth. t. 251. f. 4. Mimosa odoratissima; Linn. Suppl. 437. Roxb. Coromand. v. 2. 12. t. 120.)—Thorns none. Leaves doubly pinnate; first division of four pair; second of ten or twelve pair; leaflets obtuse, the lowermost very minute. Heads panicled, terminal.—Native of the mountainous parts of the coast of Coromandel, flowering in the hot season. The *wood* is hard, and equally useful with that of *A. xylocarpa.* (See Sect. 2.) The *leaves* are a span long, with uniform *leaflets*, an inch in length, glaucous beneath, very unequal at their base. *Flowers* numerous, white, highly fragrant, in numerous, aggregate, stalked, globular *heads*. *Legume* coriaceous, about six inches in length, and one in breadth, with a central row of *seeds*.

A. *arborea.* Rough Tree Acacia. Willd. n. 38. Ait. n. 28. (A. non spinosa jamaicensis, foliis latâ basi in metæ formam fastigiatis; Pluk. Almag. 6. t. 251. f. 2. A. arborea maxima non spinosa, pinnis majoribus, flore albo, siliquâ contortâ coccineâ ventricosâ elegantissimâ; Sloane Jam. v. 2. 54. t. 182. f. 1, 2. Mimosa arborea; Linn. Sp. Pl. 1503. Swartz Obs. 390. Browne Jam. 252. n. 3?)—Thorns none. Leaves doubly pinnate; first division of seven pair; second of seventeen pair; leaflets halved, acute. Heads axillary, stalked. Legume contorted, tumid. Seeds spherical.—Native of fields and woods in Jamaica, where it is called Wild Tamarind, and is one of the largest trees of that island. The *wood*, according to Sloane, is durable, though soft and white. *Leaves* of numerous, small, dark-green, smooth leaflets. *Heads* globular, of numerous sweet-scented *flowers*, whose *corolla* is reddish, the *stamens* whitish, very long. *Legume* as if beaded, four or five inches long, red; its valves of a blood-red on the inside. *Seeds* globular, of a shining black. This species was cultivated by Miller, but is now unknown in our gardens, nor are botanists in general well acquainted with it; Forskall and Thunberg having given the name of *Mimosa arborea* to two plants very different from this, as well as from each other.

A. *Julibrissin.* Smooth Tree Acacia. Willd. n. 39. Ait. n. 29. (Mimosa Julibrissin; Scop. Insubr. v. 1. 18. t. 8. Ait. ed. 2. v. 3. 440. M. arborea; Forsk. Ægypt.-Arab. 177. Gmel. It. v. 3. 372. t. 40.)—Thorns none. Leaves doubly pinnate; first division of about ten pair; second of many pair; leaflets halved, obtuse with a point. Heads lax, aggregate, terminal. Legume flat, membranous, smooth.—Native of the Levant. Forskall saw it cultivated at Constantinople, where it was called *Djul ibrzim*, by the Turks; which name, denominating *a silky flower*, in allusion to the stamens, appears to be the origin of the specific appellation chosen by Scopoli. We have seen this species as large as a common apple-tree, covered with a profusion of blossoms, in the open ground at Turin, nor could any thing be more elegant or splendid. In England it is usually treated as a green-house plant, and flowers sparingly; though it succeeds well against a wall, with some protection in winter. The *leaves* are large and spreading, of numerous *leaflets*, half an inch long, very unequal in their two halves. *Flowers* lilac, with long monadelphous *stamens*, forming most beautiful tassels like white silk. *Legume* half a foot long, thin, pale brown, corrugated, unequal in breadth, with many small flattish *seeds*.

A. *villosa.* Downy Jamaica Acacia. Willd. n. 46. (Mimosa villosa; Swartz Prodr. 85. Ind. Occ. 982.)—Thorns none. Leaves doubly pinnate; first division of five or six pair; second of many pair; leaflets elliptical, oblique, downy. Stalks and branches hairy. Heads rather oblong,

oblong, panicled, terminal. Legume hairy, flat.—Found by Dr. Swartz, on mountains in the south of Jamaica. Browne seems by his herbarium to have confounded this with the real *A. arborea*, just described. The present is much smaller, being merely a *shrub*, six feet high, with hairy furrowed *branches*. *Leaflets* downy on both sides, smaller and more obtuse than in the *arborea*; glaucous underneath; from ten to twelve pair in each subdivision. *Clusters* terminal, composed of many oblong and obtuse, rather than globular *spikes*, on very hairy stalks. *Flowers* small, white, with numerous capillary *stamens*, of a tawny hue, inserted into the lower part of the *receptacle*. *Legume* short, very different from that of *arborea*.

A. *discolor*. Two-coloured-leaved Acacia. Willd. n. 47. Ait. n. 32. Curt. Mag. t. 1750. (Mimosa discolor; Andr. Repos. t. 235. M. botrycephala; Venten. Hort. Cels. t. 1.)—Thorns none. Leaves doubly pinnate; first division of five pair; second of about ten pair; leaflets lanceolate, pale beneath. Heads in terminal and axillary clusters, much longer than the leaves.—Native of New South Wales, from whence seeds and specimens were among the first brought into this country, in the year 1788. It is now not an uncommon green-house plant in general collections, flowering at various seasons. The *branches* are angular and zigzag. *Leaves* rather stiff, their *footstalks* hairy like the young branches; leaflets not half an inch long, acute, smooth; dark green above; very pale beneath. *Flowers* yellow, in numerous globular heads, disposed in very conspicuous long clusters.

A. *pubescens*. Hairy-stem'd Acacia. Br. in Ait. n. 33. (Mimosa pubescens; Venten. Malmais. t. 21. Curt. Mag. t. 1263.)—Thorns none. Branches hairy. Leaves doubly pinnate; first division of about eight pair; second of about fifteen pair; footstalks without glands; leaflets obtuse. Heads in axillary clusters, longer than the leaves.—Native of New South Wales, from whence its seeds are said to have been procured by sir J. Banks, about the year 1790. This pretty delicate species has an arborescent *stem*, with drooping *branches*, and its copious fern-like *foliage* exhibits a most elegant appearance. Both sides of the *leaflets* are of a similar bright green. The whole compound *leaf* measures usually two inches; the numerous clusters of yellow capitate *flowers*, which smell like new hay, being about twice that length.

A. *lophantha*. Two-spiked New Holland Acacia. Willd. n. 53. Ait. n. 34. (Mimosa distachya; Venten. Hort. Cels. t. 20. M. elegans; Andr. Repos. t. 563.)—Thorns none. Leaves doubly pinnate; first division of ten or twelve pair; second of about twenty pair; leaflets lanceolate; top and bottom of the common footstalk glandular. Spikes oblong, axillary, in pairs.—Observed by Mr. Brown, on the south-west coast of New Holland, from whence seeds were sent to Kew, in 1803, by Mr. Good. A tall *shrub*, or perhaps a *tree*, with furrowed warty *branches*. *Leaves* large, drooping, dark green, with innumerable narrow smooth *leaflets*. *Spikes* stalked, ovate or oblong, not globose, of numerous, crowded, sulphur-coloured *flowers*, having each about 200 monadelphous *stamens*. *Legume* oblong, flat, thick-edged, somewhat constricted here and there occasionally, where the seeds happen to be abortive.

A. *brachyloba*. Illinois Acacia. Willd. n. 54. Ait. n. 35. Pursh n. 1. (Mimosa illinoensis; Michaux Boreal.-Amer. v. 2. 254.)—"Herbaceous, without thorns. Leaves doubly pinnate; first division of five to eight pair; second of many pair, with a gland between the lowermost. Heads globose, axillary, solitary. Legumes lanceolate, straight."—In the extensive natural meadows of Illinois and Kentucky, flowering in June and July. Perennial. *Flowers* white, with only five *stamens*. *Pursh*. *Stem* smooth, furrowed. *Leaflets* from sixteen to twenty-four pair, linear, acute, slightly fringed at the base. *Footstalks* nearly smooth. *Heads* of flowers the size of a pea, stalked. *Legume* the length of the nail. *Willdenow*.

A. *glandulosa*. Glandulous Acacia. Willd. n. 55. Ait. n. 36. Pursh n. 2. (Mimosa glandulosa; Michaux Boreal.-Amer. v. 2. 254. Venten. Choix. t. 27.)—Herbaceous, without thorns. Leaves doubly pinnate; first division of about twelve pair; second of many pair, with a gland between each. Heads globose, axillary, solitary. Legumes oblong, curved.—On the banks of the rivers Tennessee and Mississippi, flowering in July. *Flowers* white, pentandrous. *Pursh*. This appears to be very nearly related to the last. Both are herbaceous, with perennial *roots*, and have been introduced into the English gardens, but we have not had any account of their success. They require the shelter of a green-house.

A. *decurrens*. Decurrent Acacia. Willd. n. 56. Ait. n. 37. (Mimosa decurrens; Venten. Malmais. t. 61.)—Thorns none. Leaves doubly pinnate; first division of about eleven pair; partial of innumerable linear leaflets, on a winged stalk, with a gland near the base, on the common stalk. Heads globose, in axillary clusters.—Native of New South Wales. Sir Joseph Banks is said to have introduced this plant at Kew, in 1790. It flowers in the early part of summer, and is a green-house *shrub*, of an elegant fern-like aspect, with strongly angular zigzag *branches*. The *leaves*, though their common stalk is subtended by a projection from the branch, are not really decurrent. *Flowers* yellow, forming short clusters of little round heads.

A. *grandiflora*. Great Red Acacia. Willd. n. 61. Ait. n. 39. (Mimosa grandiflora; L'Herit. Sert. 30. Thornton Illustr. t. 4. Andr. Repos. t. 592.)—Thorns none. Leaves doubly pinnate; first division of about fifteen pair; second of very numerous, elliptic-lanceolate, straight leaflets. Heads about five-flowered, in a terminal cluster.—Native of the East Indies, from whence it is said to have been introduced into the English stoves, by Mrs. Norman, about the year 1769. No figure of this stately plant, (Plukenet's synonym, cited by Willdenow, being too uncertain,) had ever appeared, till Dr. Thornton published his magnificent plate. The *stem* is shrubby, erect, slightly branched, downy, twelve feet or more in height, even in our gardens. *Leaves* large and spreading, with downy *footstalks*; their *leaflets* a quarter of an inch long, slightly fringed, bluntish, unequal at the base, but not curved or falcate. *Clusters* solitary, large, terminal, erect, of many alternate stalks, solitary or in pairs, clothed with rusty down, each stalk bearing a *head* of from four to six *flowers*, whose *corolla* is but half an inch long, of a pale greenish-red; but the very numerous *stamens*, two inches in length, and of a fine shining crimson, like tassels of silk, render this one of the most beautiful of its tribe.

A. *Houstoni*. Houstoun's Purple Acacia. Willd. n. 34. Ait. n. 26. (A. americana non spinosa, flore purpureo, staminibus longissimis, siliquis planis villosis, pinnis foliorum tenuissimis; Houst. Ic. ined. t. 20. Mill. Ic. 4. t. 5. Amman. Herb. 584. n. 17. Mimosa Houstoni; L'Herit. Sert. 30. Banks Rel. Houst. 12. t. 26. Gleditsia inermis; Linn. Sp. Pl. 1509, excluding the synonyms, except Miller's; and place of growth.)—Thorns none. Leaves doubly pinnate; first division of five or six pair; second of very numerous, linear, somewhat falcate leaflets. Heads of few flowers, in a terminal cluster.—Gathered at Vera Cruz, in South America, by Dr. Houstoun, who sent seeds to Miller, in 1729. These produced plants which flowered in the stove at Chelsea. The present species is certainly next akin to the last, however differently its inflorescence may have been described or delineated by authors, in which respect indeed Miller and Houstoun disagree. The plate of the former however has all the appearance of fidelity, and it is possible the partial *flower-stalks* may vary in length, or, more probably, be elongated as the flowers open. Having seen no specimens, we must be guided by the materials before us, from which we gather that the *leaves* of *A. Houstoni* have not half so many *pinnæ*, and that their *leaflets* are narrower, longer, more acute, and more curved. The *petals* are purple. *Legume* thick-edged, hairy, tapering at the base. The leaf in *Parad. Lond.* t. 64, cited in *Hort. Kew.* appears to belong to this species, but the *flowers*, and perhaps the *legume*, which is smooth, seem those of *A. grandiflora*. If this be the case, the smooth *legume*, not tapering at the base, would be an important addition to the specific character of *grandiflora*.

Sect. 5. *Leaves doubly pinnate. Stipulas becoming spines. Spikes elongated.* Ten species in Willdenow.

A. *juliflora*. Long-flowered Acacia. Willd. n. 66. Ait. n. 41. (Mimosa juliflora; Swartz Prodr. 85. Ind. Occ. 986, printed by mistake *piliflora*. M. diffusa, spica oblonga, siliquis longioribus compressis; Browne Jam. 252. n. 2.)—Spines stipulary, in pairs. Leaves doubly pinnate; first division of two pair, with intermediate glands; second of about twenty pair of oblong leaflets. Spikes axillary, two or three together, cylindrical, pendulous.—Native of very dry fields in the south part of Jamaica, flowering in the middle of summer. The *stem* varies from six to thirty feet in height. *Branches* long and spreading. *Spines* strong, four or five lines in length, prominent, curved upwards. *Leaves* spreading, with narrow, obtuse, smooth, ribbed *leaflets*. *Spikes* two or three inches long, lax, many-flowered. *Flowers* crowded, sessile, very numerous, yellow, sweet-scented. *Corolla* internally hairy. *Stamens* eight or ten, distinct. *Legume* from three to five inches long, compressed, smooth, often twisted, containing several oblong brown *seeds*, separated by fleshy partitions. There are numerous *flowers* in each spike destitute of a *pistil*. Cattle feeding on the leaves and young branches, unless gradually accustomed to them, are poisoned, and the sweet legumes are reported to be noxious. The inhabitants of Jamaica call this plant *Cashew*. Browne erroneously gives it the name of *Poponax*, which belongs to *Mimosa* (*Acacia*) *tortuosa*. *Swartz*. See Sect. 6.

A. *caffra*. Hottentot Acacia. Willd. n. 70. Ait. n. 42. (Mimosa caffra; Thunb. Prodr. 92.)—"Spines stipulary, in pairs, incurved. Leaves doubly pinnate; first division of twelve pair; second of many pair; with a gland on the footstalk. Spikes axillary, cylindrical."—Found by Thunberg in Southern Africa. Sent to Kew in 1800, by W. Somerville, M. D. The *branches* are round and striated. First divisions of the *leaves* from seven to twelve, second from twenty to thirty, pair; *leaflets* linear, obtuse, smooth. *Footstalks* nearly smooth; the common one bearing a depressed gland above its base. *Spike* stalked, two inches long. *Legume* the same length, linear-lanceolate, flat. *Willdenow*.

A. *Catechu*. Medicinal Acacia. Willd. n. 73. Ait. n. 44. (Mimosa Catechu; Linn. Suppl. 409. Woodv. Med. Bot. 183. t. 66. Roxb. Coromand. v. 2. 40. t. 175. Terra Japonica; Kerr in Med. Obs. and Inqu. v. 5. 151. t. 4.)—Spines stipulary, hooked, in pairs. Leaves hairy, doubly pinnate; first division of ten or twelve pair; second of many pair; with a gland at each extremity of the common footstalk. Spikes cylindrical, axillary, two or three together.—Native of the mountainous parts of Coromandel. A large tree, of which seeds have been sent by Dr. Roxburgh to sir J. Banks. These have vegetated at Kew, but the plants have not arrived at a flowering state. The *branches* are round, downy when young; the older ones beset with numerous pairs of small recurved thorns, originating in the *stipulas*, as in all the plants of this section. *Leaves* slender and delicate, finely hairy, pale green; their *leaflets* crowded, hardly a quarter of an inch long, linear, rounded at each end, unequal at the base. *Spikes* slender, three or four inches long, hairy, stalked, pale yellow. *Legume* oblong, acute at each end, flat, smooth, with three or four distant flat *seeds*. "The *wood*," says Dr. Roxburgh, "is good, and applied to various uses; but the natives have no idea of extracting from it, or any other, the *Catechu*, or *Terra Japonica*. Yet I believe there are many trees as fit to yield this extract, as the present." Mr. Kerr, assistant surgeon to the civil hospital at Bengal, has however described the mode of preparing the CATECHU, (see that article,) by boiling the interior coloured part of the wood of this species, till an inspissated extract is obtained, which is the drug in question, long supposed to be an earth produced in Japan. Another sort of *Catechu*, or *Gutta Gambir*, made in Sumatra, Prince of Wales's island, &c., has been shewn by Mr. Hunter, secretary to the Asiatic Society, in Transactions of the Linnæan Society, v. 9. 218. to be the produce of a species of NAUCLEA. (See that article, spec. 7.) We presume that Mr. Kerr and Mr. Hunter are equally correct, and that the two distinct kinds of *Terra Japonica*, known to druggists, are thus accounted for.

Sect. 6. *Leaves doubly pinnate. Stipulas becoming spines. Spikes globose.* Sixteen species in Willdenow.

A. *macracantha*. Long-thorned Acacia. Willd. n. 76. —"Spines stipulary, in pairs, lanceolate, compressed, nearly as long as the leaves, which are doubly pinnate; first division of twelve pair; second of many pair; with a depressed gland at each extremity of the common footstalk. Spikes stalked, globose."—Gathered by Humboldt and Bonpland in South America. The *branches* are striated, and nearly round. *Leaflets* about thirty pair in each division, linear, obtuse, fringed. *Footstalks* downy. *Spines* two inches or more in length, sharp-pointed, spreading at a right angle. *Heads* of *flowers* the size of a pepper-corn, on long stalks, in pairs, either axillary, or disposed in a sort of cluster at the ends of the branches. *Willdenow*. This species appears very remarkable, on account of the great size of its thorns.

A. *eburnea*. Ivory-thorned Acacia. Willd. n. 78. (Mimosa eburnea; Linn. Suppl. 437. M. leucacantha; Jacq. Hort. Schoenbr. v. 3. 75. t. 393.)—Spines stipulary, in pairs, cylindrical-awlshaped, combined at the base, spreading. Leaves doubly pinnate; first division of three or four pair; second of six or more pair; leaflets distant, elliptic-oblong. Heads axillary, stalked, aggregate.—Sent by Kœnig from the East Indies. Jacquin by mistake makes it a native of Africa. He cultivated it at Schoenbrun, but we have not met with this species in any English stove, the following one having been miscalled by the above name. The true *A. eburnea*, of which the original Linnæan specimen lies before us, is a twisted irregularly branched *shrub*, whose twigs are round and zigzag, armed with tremendous straight *spines*, which are white, smooth and polished, almost like ivory, but brown and very sharp at the end: the longest measure nearly two inches; some are but a quarter that size: they taper gradually from a thick confluent base. *Leaves* about two inches long, with smooth *leaflets*, placed at the distance of their own width from each other. *Common foot-*

stalk

ſtalk with two depreſſed glands in the upper part. *Flower-ſtalks* either axillary, or terminal and racemoſe, more or leſs aggregate, each bearing a globular *head*, of yellow ſweet-ſcented *flowers*. We know nothing of the *legume*.

A. *horrida*. Awl-thorned Acacia. Willd. n. 79, excluding the ſynonym of Jacquin, and perhaps Forſkall. (A. maderaſpatana, foliolis parvis, aculeis e regione binis prægrandibus horrida, cortice cinereo; Pluk. Phyt. t. 121. f. 4. A. eburnea; Ait. n. 46, but not of Willd. Mimoſa horrida; Linn. Sp. Pl. 1505. Vahl Symb. v. 1. 81? M. eburnea; Roxb. Coromand. v. 2. 54. t. 199.)—Spines ſtipulary, in pairs, linear-awlſhaped, angular, ſpreading, longer than the leaves; ſome much ſhorter and recurved. Leaves doubly pinnate; firſt diviſion of two or three pair; ſecond of many pair; leaflets crowded, on a hairy ſtalk. Heads axillary, ſtalked, aggregate.—Native of the Eaſt Indies, flowering in the cold ſeaſon, ſent by Dr. Roxburgh to ſir Joſeph Banks in 1792. This is a ſmall ill-looking *tree*, or large buſhy *ſhrub*, whoſe *branches* ſpread in every direction, and are round, purpliſh, wavy, very rigid, armed with formidable *thorns*, of various ſizes. Some of the latter are two inches long, white, ſpreading horizontally in oppoſite directions, ſcarcely combined at the baſe, much more ſlender and linear than in the *A. eburnea*, flat or channelled along their upper ſide; when young they are much ſmaller, needle-like, and hairy: others, on the ſame branch, and of the ſame age, with the large ones, are very ſhort and hooked. The *leaves* are not half the ſize of the laſt ſpecies. *Heads* of *flowers* globoſe, with a purpliſh *corolla*, and yellow *ſtamens*. *Legume* linear, twiſted, two inches long, ſmooth. The *flowers* are ſaid by Dr. Roxburgh to be ſeparated from each other, on their globoſe *receptacle*, by abrupt, fringed, chaffy ſcales, of which we can find no traces in our ſpecimens.

A. *tortuoſa*. Poponax Acacia. Willd. n. 82. (A. americana, ſiliquis teretibus ventricoſis, floribus luteis; Sloane Jam. v. 2. 56. Mimoſa tortuoſa; Linn. Sp. Pl. 1505. Swartz Obſ. 391. Browne Jam. 251. n. 1.)—Spines ſtipulary, in pairs, awl-ſhaped, much ſhorter than the leaves, round, downy. Leaves doubly pinnate; firſt diviſion of three or four pair; ſecond of many pair; leaflets crowded, on a downy ſtalk. Heads axillary, on downy ſtalks, ſolitary or in pairs. Legume externally fleſhy.—Very common in the low ſandy lands of Jamaica. The *ſtem* is ſhrubby, with ſpreading wavy *branches*, rendering the plant uſeful for hedges according to Dr. Swartz; but Browne ſpeaks of it as of little ſervice, the ſmell of every part being ſo rank and diſagreeable, that it cannot be uſed even for fire-wood. The taſte is bitter, and the *flowers* have an oppreſſive ſmell. Both theſe authors mention the *legumes* as furniſhed with a glutinous juice under their ſkin, whoſe qualities are eminently bitter and aſtringent. Sloane appears to confound the *A. Farneſiana* and others with this ſpecies. The true *tortuoſa*, of which we have Browne's own ſpecimen, comes near to *horrida* in botanical characters, but the *leaves* and *leaflets* are much larger; *thorns* ſmaller, not angular, but more tapering; *flower-ſtalks* downy, not ſmooth. There are no ſcales on the *receptacle* between the *flowers*, but the teeth of the long tubular *calyx* are very denſely and finely fringed. Dr. Swartz ſays this is the tree really called *Poponax* in Jamaica, Browne erroneouſly attributing that name to *A. juliflora*. Both are frequently met with in the ſame ſituations.

A. *farneſiana*. Sponge Acacia. Willd. n. 83. Ait. n. 47. (A. indica farneſiana; Aldin. Hort. Farneſ. 3. t. 2. 4. Mimoſa farneſiana; Linn. Sp. Pl. 1506.)—Spines ſtipulary, in pairs, awl-ſhaped. Leaves doubly pinnate; firſt diviſion of from five to eight pair; ſecond of many pair; leaflets crowded. Heads ſtalked, axillary. Legume tumid, coriaceous.—Native of Hiſpaniola, from whence the ſeeds were brought to Italy, early in the 17th century. This ſhrub is occaſionally ſeen in our ſtoves, being eſteemed for the peculiarly delicious ſcent of its balls of yellow *flowers*, which are produced during ſummer. A coloured figure is much wanted. The dry tumid *legume* diſtinguiſhes it clearly, as a ſpecies, from the laſt. The whole plant is ſmoother, nor have we ever obſerved the herbage to be fœtid.

A. *arabica*. Eaſt Indian Gum-Arabic Acacia. Willd. n. 86. (A. altera vera, &c.; Pluk. Almag. 3. t. 251. f. 1. Mimoſa arabica; Lamarck Dict. v. 1. 19. Roxb. Coromand. v. 2. 26. t. 149. Nella Tooma of the Telingas.)—Spines ſtipulary, awl-ſhaped, in pairs. Leaves doubly pinnate; firſt diviſion of five pair; ſecond of many pair. Heads axillary, about three together. Legume necklace-like, flat, denſely downy.—Native of the Eaſt Indies, whether of Arabia alſo may be doubted. Dr. Roxburgh ſays it is abundant over every part of India, thriving beſt in a low, ſtiff, uncultivated ſoil, and flowering moſt part of the year. Beſides yielding a great quantity of Gum Arabic, this tree is one of the moſt uſeful in India for its tough and hard wood, ſerving many valuable purpoſes in ſhip-building, wheel-carriages, &c. The aſtringent bark ſerves for dyeing, and making ink. The *branches* are round. *Spines* diſtinct, an inch, more or leſs, in length. *Leaves* like ſeveral of the foregoing, as are alſo the aggregate globular heads of yellow *flowers*. But the *legumes* afford a moſt ſtriking character, being flat, four or five inches long, covered with denſe hoary pubeſcence, like fine velvet, and remarkably contracted into numerous orbicular portions, in each of which is lodged a flattiſh *ſeed*. Cattle are very fond of the tender branches and young pods.

A. *vera*. Egyptian Gum-Arabic Acacia. Willd. n. 87. Ait. n. 48. Veſling Ægypt. 6. t. 8. Bauh. Hiſt. v. 1. p. 2. 429. (Mimoſa nilotica; Linn. Sp. Pl. 1506. Haſſelq. Travels, Engl. ed. 250. Woodv. Med. Bot. 187. t. 67.)—Spines ſtipulary, in pairs, linear-awlſhaped. Leaves doubly pinnate; firſt diviſion of five or ſix pair; ſecond of many pair; common ſtalk glandular. Heads axillary, about three together. Legume necklace-like, nearly flat, ſmooth. —Native of the ſandy deſarts of upper and lower Egypt, from whence Haſſelquiſt ſent ſpecimens to Linnæus, who ſeems to have deſcribed the ſame plant under the name of *Mimoſa Senegal*. This original Gum Arabic tree was known to our earlier botaniſts, and Gerarde appears to have cultivated it in his garden, whence it has obtained a place in Mr. Aiton's valuable work; but few perſons at preſent are acquainted with living, or even dried, ſpecimens, eſpecially of the *legumes*. Theſe clearly diſtinguiſh the ſpecies, being more ſtrictly contracted into orbicular portions than the laſt, with an obliquity well expreſſed in the wooden cut of Veſlingius. Their ſurface is brown, nearly or quite ſmooth, pale at the edges; the diſk of each lobe rather tumid, from the ſwelling of the *ſeeds*. In the *leaves* or *flowers* of theſe two ſpecies, we cannot, from the dried ſpecimens, detect any great difference; but the *ſpines* of *A. vera* are almoſt as remarkable for their length and whiteneſs as thoſe of *horrida*. For the moſt valuable produce of this tree, ſee Arabic, *Gum*.

Sect. 7. *Leaves doubly pinnate. Prickles ſcattered.* Eleven ſpecies in Willdenow.

A. *cæſia*. Grey Acacia. Willd. n. 97. Ait. n. 49. (A. ſpinoſa, indiæ orientalis, foliis ſubtus cæſiis, floribus globoſis luteis; Pluk. Mant. 1. Phyt. t. 330. f. 3. A. zeylanica ſarmentoſa, flore luteo globoſo; Burm. Zeyl. 3. Mimoſa cæſia; Linn. Sp. Pl. 1507.)—Branches and foot-

ſtalks

ftalks prickly. Leaves doubly pinnate; firft divifion of feven pair; fecond of fixteen pair; leaflets oblong-oval; a gland on the main footftalk. Spikes globofe, in terminal panicled clufters.—Native of the Eaft Indies, from whence it was procured for Kew garden, by fir J. Banks, in 1773, but appears not yet to have flowered. We have feen no authentic fpecimen of this fpecies.

A. *pennata*. Fine-leaved Acacia. Willd. n. 98. Ait. n. 50. (A. aculeata multiflora, foliis pennas avium referentibus; Burm. Zeyl. 2. t. 1. A. zeylanica, flofculis globofis luteis, foliis pinnatis tenuiffimè incifis, fpinis minoribus; Burm. Zeyl. 3. Mimofa pennata; Linn. Sp. Pl. 1507.)—Branches prickly. Leaves doubly pinnate, with many pair of general divifions, and very numerous linear leaflets; a gland on the common ftalk. Panicle terminal, fpreading; heads ftalked, aggregate; general flower-ftalks, like the bafe of the common footftalks, prickly. Legume flat, fmooth; wavy at the edges.—Native of Ceylon, and other parts of the Eaft Indies. Sent to Kew, in 1773, by fir J. Banks. We have fpecimens from Dr. Roxburgh. The very delicate flender *leaflets*, which, in the dried plant at leaft, fold together, give a feathery appearance, well expreffed in Burmann's plate. The *panicle* is very large and compound, with downy rufty ftalks; its main branches only armed with fmall hooked prickles. The *legumes*, not hitherto defcribed, but very important in difcriminating this multifarious tribe, are about three inches long, tapering, though rather blunt, at each end, flat, thick-edged, wavy or finuous at both margins. *Seeds* about four.

A. *Ceratonia*. Round-leaved Acacia. Willd. n. 101. Ait. n. 52. (A. repens aculeata, flore albo, foliis Siliquæ; Plum. Ic. 4. t. 8. Mimofa Ceratonia; Linn. Sp. Pl. 1508.)—Branches, and all the ftalks, prickly. Leaves doubly pinnate; leaflets three pair, roundifh-obovate, oblique, three-ribbed. Panicle terminal. Heads globofe. Legume flat, prickly at the edges.—Native of the Weft Indies, from whence the prefent duke of Marlborough is faid to have introduced it into his rich collection, before the year 1800. The remarkable roundnefs of the *leaflets*, which would have authorized the name of *rotundifolia*, and their greater fize, diftinguifh the prefent fpecies from all we have hitherto noticed. Every part is extremely prickly, but devoid of pubefcence. The heads of *flowers* are rather fmall, and, according to Plumier, white. He delineates the *legume* of a flat, oblong, obtufe figure, two or three inches long and one broad, fringed with hooked prickles.

A. *tamarindifolia*. Tamarind-leaved Acacia. Willd. n. 102. Ait. n. 53. (A. aculeata, flore albo, foliis Tamarindi; Plum. Ic. 4. t. 7. Mimofa tamarindifolia; Linn. Sp. Pl. 1509. Jacq. Hort. Schoenbr. v. 3. 77. t. 396.)—Branches prickly. Leaves doubly pinnate; firft divifion of five or fix pair; fecond of about fifteen pair; a gland on the common ftalk; leaflets oblong. Stipulas and bracteas heart-fhaped. Clufters terminal. Heads globofe. Legume flat, fmooth.—Native of South America and the Weft Indies. Said to have been cultivated by Kennedy and Lee, at Hammerfmith, in 1774. The name is very expreffive of the afpect of the *leaves*. The very broad heart-fhaped *ftipulas*, and the fmaller, more ovate, *bracteas*, give a peculiar character to this fpecies. *Inflorefcence* rather racemofe than panicled, deftitute of hairinefs or fpines, though the *branches* of the ftem are armed with ftrong prominent prickles. *Heads* of a few white *flowers*, each on a long ftalk, folitary or in pairs. *Legume*, according to Plumier's figure, linear-oblong, flat, ftraight, deftitute of prickles at the edges, acute, about three inches long and one broad. *Seeds* numerous, oval.

A. *acantholoba*. American Prickly-podded Acacia. Willd. n. 95.—"Branches prickly. Leaves doubly pinnate; firft divifion of three pair; fecond of ten pair; leaflets linear, obtufe; downy beneath. Heads globofe, nearly feffile, racemofe. Legume prickly at the edges."—Gathered in South America, by the celebrated travellers Humboldt and Bonpland. *Branches* round. *Leaflets* ten or eleven pair, clothed beneath with clofe-preffed hairs. *Footftalks* downy. *Prickles* fcattered, hooked, compreffed. *Heads* fmall, almoft feffile, difpofed in a terminal clufter. *Legume* an inch and a half in length, oblong, flat, membranous, fmooth, befet with prickles at the margin. *Willdenow.* This author declares himfelf to have been poffeffed of feveral fpecimens of the *Mimofa* tribe, which were too imperfect to be enumerated or defined. We are not only in this fituation, but we have feveral in fufficiently good condition, which on account of the incomplete defcriptions of authors, efpecially concerning the *fruit*, we cannot afcertain to be defcribed or not.

ACADEMY. The *Academy of Arts* at Peterfburg was eftablifhed by the emprefs Elizabeth in 1758, and annexed to the Academy of Sciences. At the fuggeftion of count Shuvalof, the late emprefs Catharine, in 1764, formed it, &c. Next col. after l. 54, add,

The academy of painting, fculpture, and architecture, at Vienna, was founded in the year 1705.

Under *Academies of Nonconformift Minifters*, inftead of Manchefter *r.* York, *dele* Exeter, and inftead of Wrexham *r.* Llanfylling.

ACÆNA, in *Botany*, ακαινα, *a thorn*, alluding to the prickly fruit. This genus, fuppofed to confift of only one fpecies, was defcribed by Mutis, who communicated his account of it to Linnæus, without any fpecimen, and it was publifhed in Linn. Mant. 2. 145, 200. Some time afterwards Forfter founded his *Anciftrum*, Forft. Nov. Gen. t. 2, feveral fpecies of which have been defcribed by the younger Linnæus, Lamarck, and other writers. (See ACÆNA and ANCISTRUM.) Vahl firft difcovered thefe to be one and the fame genus, and has greatly added to the number of fpecies. We fhall extract from his work a compendious view of the whole.—Vahl Enum. v. 1. 293. Linn. Mant. 2. 145. Schreb. Gen. 87. Willd. Sp. Pl. v. 1. 693. Mart. Mill. Dict. v. 1. Ait. Hort. Kew. v. 1. 67. Juff. 336. (Anciftrum; Forft. Gen. t. 2. Linn. Suppl. 10. Schreb. Gen. 25. Willd. Sp. Pl. v. 1. 154. Mart. Mill. Dict. v. 1. Juff. 336. Lamarck Illuftr. t. 22. Gærtn. t. 32.)—Clafs and order, *Diandria Monogynia*. Nat. Ord. *Senticofæ*, Linn. *Rofaceæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, turbinate, permanent, with four teeth, each fometimes tipped with an upright briftly awn, barbed at the point, or the whole body of the calyx is fo armed. *Cor.* Petals four, roundifh, inferted into the border of the calyx, and fhorter than its awns. *Stam.* Filaments two or four, thread-fhaped, longer than the petals, inferted into the border of the calyx; anthers roundifh. *Pift.* Germen fuperior, oblong; ftyle thread-fhaped; ftigma many-cleft, tufted. *Peric.* none, except the permanent calyx. *Seed* folitary, ovate, coated with the thickened bafe of the calyx.

Eff. Ch. Calyx of one leaf, armed with barbed briftles. Petals four, inferted into the calyx. Stigma tufted. *Seed* folitary, coated with the calyx.

Obf. The *petals* are fometimes wanting. *Flowers* occafionally five-cleft, with five *ftamens*. The *ftem* is herbaceous, or fometimes fhrubby. *Leaves* alternate, pinnate with an odd one, deeply ferrated or cut, often hairy or filky; their common *footftalks* fheathing, bordered with a pair of membranous

branous combined *ſtipulas*. *Flowers* ſmall, greeniſh, in a globoſe head, or interrupted ſpike. *Fruit* reddiſh, dry.

1. A. *lappacea*. Bur Acæna. Vahl n. 1. "Fl. Peruv. v. 1. 66. t. 103. f. *a*."—"Leaflets oblong, ſerrated. Flowers racemoſe. Fruit all over prickly. Stem erect."—Native of craggy ſunny ſpots in the diſtrict of Tarma, Peru. *Stems* rather ſhrubby, numerous, a foot high, ſlightly branched, round, villous. *Leaflets* four pair, deeply ſerrated, hairy; becoming ſmooth by culture. *Flower-ſtalks* axillary, four times as long as the leaves, bearing from five to ſeven diſtant, ſtalked *flowers*.

2. A. *elongata*. Mutiſian Acæna. Linn. Mant. 200. Vahl n. 2. Willd. Sp. Pl. v. 1. 693.—Leaflets oblong, ſerrated; downy beneath; bearded at the tips of the ſerratures. Spikes elongated, compreſſed. Fruit all over prickly. Stem nearly erect.—Found in Mexico, by the celebrated Mutis. *Stem* woody, perennial, with very long, aſcending, ſomewhat compound branches, two feet in length. *Leaves* ſcattered; *leaflets* ſeſſile, crowded; the lower ones very ſmall, linear, acute, entire; from four to eight of the upper pair larger, oblong, ſerrated. *Spikes* axillary, erect, rigid, a ſpan long. *Bracteas* ſolitary, cloſe to the calyx, concave, ovate-oblong. *Flowers* alternate, nearly ſeſſile. *Mutis*.

3. A. *latebroſa*. Hairy Acæna. Vahl n. 3. Ait. n. 1. (Anciſtrum latebroſum; Willd. Sp. Pl. v. 1. 155. A. decumbens; Thunb. Prodr. 6. Agrimonia decumbens; Linn. Suppl. 251.)—Leaflets oblong, cut, hairy. Stem creeping. Spikes elongated, ſtalked, many-flowered.—Native of the Cape of Good Hope. The *germen* is downy, beſet with many barbed prickles, which, as the *fruit* ripens, project through the ſkin of the *calyx*. See Gærtner f. 2, and Lamarck f. 4.

4. A. *pinnatifida*. Deep-cut Acæna. Vahl n. 4. "Fl. Peruv. v. 1. 68. t. 104. f. *b*."—Leaflets oblong, deeply ſerrated, almoſt pinnatifid; hairy beneath. Spikes cylindrical. Stem erect.—Found on dry expoſed hills in Chili. Commerſon gathered what appears to be the ſame, at Monte Video, not, as Vahl by miſtake ſays, at the ſtraits of Magellan. The *ſtem* is quite ſimple, a ſpan high, leafy, very hairy in the upper part. *Leaves* numerous at the root, and ſeveral on the ſtem, with eight or nine pair of *leaflets*, beſides the odd one; the largeſt near an inch long, copiouſly and deeply cut, like *Potentilla anſerina*. *Spike* obtuſe, an inch or inch and half long, denſe, many-flowered, dark purple. *Germen* beſet with ſtrong barbed thorns, not proceeding from its teeth.

5. A. *Sanguiſorbæ*. Burnet-leaved Acæna. Vahl n. 5. Ait. n. 2. (Anciſtrum Sanguiſorbæ; Linn. Suppl. 89. A. diandrum; Forſt. Prodr. 10. A. anſerinæfolium; Forſt. Gen. 2. Lamarck Illuſtr. v. 1. 76. t. 22. f. 1.)—Leaflets obovate, deeply ſerrated; ſilky beneath. Spikes globoſe. Stem decumbent. Calyx-teeth awned.—Native of New Zealand, Terra del Fuego, and Staten-land. Introduced into Kew garden by ſir J. Banks, in 1796. Perennial and hardy, flowering in June. The *ſtems* are a ſpan or more in length. *Leaves* reſembling Burnet; ſmooth above. *Heads* of *flowers* globoſe, denſe, on long ſtalks.

6. A. *ovalifolia*. Oval-leaved Acæna. Vahl n. 6. "Fl. Peruv. v. 1. 67. t. 103. f. *c*." Ait. n. 3. (Anciſtrum repens; Venten. Jard. de Cels, t. 6.)—Leaflets elliptic-oblong; villous beneath. Spikes globoſe. Stem creeping. Calyx-teeth awned. Stigma unilateral.—Native of Peru, in moiſt ſhady places. Cultivated at Paris, by the late M. Cels, and at Kew by Mr. Aiton, where it is hardy, flowering in May and June. We can diſcover no difference between this and the foregoing, the *ſtigma* being perhaps accidentally imperfect.

7. A. *argentea*. Silvery Acæna. Vahl n. 7. Fl. Peruv. v. 1. 67. t. 103. f. *b*. (Proquin; Feuill. Voy. v. 3. 55. t. 41.)—Leaflets elliptic-lanceolate, acute, ſerrated; ſilky beneath. Spikes globoſe. Stem creeping.—Native of Chili, in moiſt ground. The Indians uſe it as a vulnerary. The *branches* are two feet long. *Leaves* ſhining and ſmooth above; ſilvery beneath. *Flowers* in globular heads, on long ſtalks. *Stamens* two or four. *Calyx* with two, three, or four terminal awns.

8. A. *lucida*. Shining Deep-cut Acæna. Vahl n. 8. Ait. n. 4. (Anciſtrum lucidum; Willd. Sp. Pl. v. 1. 155. Lamarck Illuſtr. v. 1. 77. t. 22. f. 3.)—Leaflets in three or five deep oblong ſegments; hairy beneath. Spikes oblong. Stem almoſt buried.—Native of the Falkland iſlands, from whence Dr. Fothergill procured it in 1777. Commerſon gathered the ſame in the ſtraits of Magellan. The *ſtems* run juſt under the ſurface of the ground, ſending up numerous leafy tufts. *Leaves* linear-oblong, of many pairs of ſmall, elliptic-oblong, deeply divided *leaflets*. *Spikes* partly interrupted. *Fruit* reddiſh, ſmooth, entirely unarmed, as well as the *calyx*, in our ſpecimens. Vahl attributes four awns to the latter.

9. A. *trifida*. Three-cleft Acæna. Vahl n. 9. Fl. Peruv. v. 1. 67. t. 104. f. *c*.—"Downy and hoary. Leaflets wedge-ſhaped, in three or five ſegments. Spikes globoſe. Stem erect."—Native of paſtures, fields, and hills in Chili. Denſely villous. *Stems* ſeveral, unequal, the longeſt meaſuring about a foot. *Leaflets* ſeven or eight pair; the lowermoſt often undivided. *Flower-ſtalks* terminal, often bearing one or two little round heads, beſides the principal one. *Bracteas* linear. *Calyx* ſometimes five-cleft. *Stamens* two to five. *Fruit* obovate, denſely villous, with four or five angles, and as many awns. *Vahl*.

10. A. *magellanica*. Magellanic Acæna. Vahl n. 10. (Anciſtrum magellanicum; Lamarck Illuſtr. v. 1. 76. t. 22. f. 2.)—Leaflets obovate, deeply ſerrated, three-cleft; hoary beneath. Spikes globoſe. Stem erect, ſmooth.—Gathered by Commerſon, at the ſtraits of Magellan. *Stems* rather ſhrubby, three or four inches high, branched, ſmooth; ſometimes hoary at the ſummit. *Leaves* at the ends of the branches: leaflets five or ſix pair, ſcarcely half the length of the nail; the uppermoſt with ſeven or nine teeth, lower with about three, loweſt of all entire. *Flower-ſtalks* axillary, at the top of each branch, erect, purpliſh, ſlightly villous at the upper part. *Head* twice the ſize of a pea. Very nearly akin to the laſt, but the ſmoothneſs of the *ſtem*, *branches* clothed with imbricated baſes of the *footſtalks*, crowded *leaves*, and ſmooth *bracteas*, diſtinguiſh this ſpecies. *Vahl*.

11. A. *adcendens*. Aſcending Smoothiſh Acæna. Vahl n. 11. (A. lævigata; Ait. n. 5? Anciſtrum magellanicum *β*; Lamarck Illuſtr. v. 1. 76.)—Leaflets oblong or obovate, ſerrated, nearly ſmooth. Spikes globoſe. Stem decumbent.—Gathered by Commerſon at the ſtraits of Magellan. We do not find any ſpecimen from him in the Linnæan collection; but Mr. Menzies has communicated ſome, by the name of *Anciſtrum alpinum*, which appear to anſwer to Vahl's deſcription, except being conſiderably hairy. Theſe were gathered on the ſummits of the mountains near Cape Horn, along with *Viola tridentata*. (See VIOLA n. 76.) Vahl ſpeaks of the *ſtems* as a ſpan long, ſmooth. *Leaflets* from five to ſeven pair, oppoſite or alternate, bluntly ſerrated, veiny, ſomewhat hairy at the rib. *Flower-ſtalks* terminal, elongated. *Head* the ſize of a cherry.

Calyx

Calyx with four awns. The hairinefs of the upper fide of the *leaves* in our plant, and the fmaller fize of the *heads* of *flowers*, may be owing to a very lofty or expofed fituation. We merely guefs this to be Mr. Aiton's *lævigata* from the fynonym of Lamarck.

12. A. *cylindriftachya*. Cylindrical-fpiked Acæna. Vahl n. 12. "Fl. Peruv. v. 1. 68. t. 104. f. *a*."—"Leaflets oblong, ferrated; filky beneath. Spikes cylindrical, on nearly radical ftalks. Stems fubterraneous."—Found on hills in Tarma, Peru. *Herb* clothed with filky pubefcence. *Leaves* radical, numerous; leaflets ten or eleven pair, obtufe, furrowed. *Flower-ftalks* feveral, from three to nine inches high, bearing a few fimple leaves. *Calyx* purplifh, with four awns. *Stamens* two.

13. A. *pumila*. Smooth Dwarf Acæna. Vahl n. 13.—Leaflets oval, convex, ferrated, very fmooth; polifhed on the upper fide. Flower-ftalks almoft radical. Spikes cylindrical.—Gathered by Commerfon at the ftraits of Magellan, and by Mr. Menzies in Staten-land, near Cape Horn. The *root* is tuberous. *Stems* very fhort, or fcarcely any. *Leaflets* about twelve pair, with blunt revolute teeth; veiny on both fides; paler and opaque beneath. *Flower-ftalk* flightly leafy. *Spike* interrupted in the lower part. *Germen* befet with very numerous little barbed briftles.

ACALZIKE. After Tartary, add: the capital of *Akifka* (which fee); a populous and commercial city, fituated in an open valley, on the left bank of the Kur. The inhabitants are, Jews, Turks, Greeks, Armenians, and Georgians.

ACANTHI, in *Botany*, Juffieu's third natural order of his eighth clafs, or the thirty-fixth of his general feries, named from the moft celebrated and confpicuous genus which it contains. For the character of the clafs, fee GENTIANÆ. The *Acanthi* are thus defined.

Calyx divided, permanent, often bracteated. *Corolla* moftly irregular. *Stamina* either two; or four, two of which are fhorter than the others. *Style* folitary; with a two-lobed, rarely fimple, *ftigma*. *Fruit* capfular, of two cells, often many-feeded, with two elaftic valves, and a partition contrary, or oppofite, thereto, inferted into their middle, fplitting from top to bottom into two uninterrupted *receptacles*, bearing feeds on each fide, rendering the valves femibilocular. *Stem* either herbaceous or fhrubby. *Leaves* for the moft part oppofite, as well as the *flowers*.

Sect. 1. *Stamens four, in unequal pairs.*

This contains *Acanthus* of all authors; *Dilivaria* of Juffieu, founded on *Acanthus ilicifolius* of Linnæus; but furely on the flighteft poffible characters; *Blepharis* of Juffieu; *A. maderafpatenfis* of Linnæus, as flightly diftinguifhed; *Thunbergia* of Linn. Suppl.; *Barleria;* and *Ruellia*.

Sect. 2. *Stamens only two.*

Jufticia and *Dianthera*.

Mr. Brown, who retains this order by the name of *Acanthaceæ*, Prodr. Nov. Holl. v. 1. 472, has enriched it with many valuable remarks, and fome new genera. He combines, like Profeffor Vahl, *Dianthera* with *Jufticia*, but extracts from the latter the *Hypoeftes* of Solander; with *Eranthemum*, originally founded by Linnæus; and eftablifhes moreover two genera of his own by the names of HYGROPHILA and NELSONIA. (See thofe articles.) We perceive alfo that this intelligent writer retains Vahl's *Elytraria*. He propofes alfo *Aphelandra*, confifting of *Jufticia pulcherrima* and its allies; *Aetheilema*, founded on Forfkall's *Ruellia imbricata*, and various undefcribed Eaft Indian and African fpecies, of which therefore we can give no account. LEPIDAGATHIS of Willdenow, Sp. Pl. v. 3. 400, of which we propofe to fpeak hereafter, is admitted by Mr. Brown, as well as a new genus of Juffieu's named *Blechum*. Some others are lefs diftinctly indicated. We felect from the work of our learned friend the following additional obfervations upon the *Acanthi*, or *Acanthaceæ*.

The *anthers* are either of two cells, fometimes equal, fometimes unequal in their infertion, or of only one cell; and burft longitudinally. *Germen* furrounded at the bafe with a glandular difk. *Seeds* roundifh, moftly fubtended by *retinacula*, props, or awl-fhaped afcending proceffes from the partition. *Skin* of the feed lax. *Albumen* invariably none. *Embryo* either curved or ftraight. *Cotyledons* large, nearly orbicular. *Plumula* inconfpicuous. Thefe plants are chiefly tropical. Their pubefcence, if any, is fimple, occafionally capitate, very rarely ftarry. *Leaves* oppofite, rarely four in a whorl, without *ftipulas*, fimple, undivided, either entire or ferrated; feldom finuated, or flightly lobed. *Inflorefcence* terminal or axillary, fpiked or racemofe, fafciculated, panicled, or folitary. The order is certainly natural, though not eafily to be defined. In fome inftances the props of the *feeds* are wanting. The rudiments of a fifth ftamen frequently occur. The elaftic mode of burfting in the *capfule* is nearly univerfal.

The following principles by which the genera are to be difcriminated, are thus propofed by Mr. Brown in fucceffion, according to their relative importance. 1. Seeds with or without props. 2. Partition combined with the valves or feparate. 3. Anthers of two cells or of one. 4. Anther-bearing ftamens two or four. 5. Limb of the irregular corolla with one lip or two. 6. Calyx equal or unequal. Cells of the capfule containing each two or more feeds. The following is the order of Mr. Brown's genera. *Hypoeftes*, *Jufticia*, *Eranthemum*, *Ruellia*, *Hygrophila*, *Acanthus* including *Dilivaria* of Juffieu, and *Nelfonia*, which may be found in their proper places.

ACANTHONOTUS, in *Ichthyology*, a genus of fifh, whofe characters are, that the body is elongated, without dorfal fins, and that it has feveral fpines on the back and abdomen. There is one fpecies, a native of the Eaft Indies, defcribed by Bloch under the name of

NASUS; Snouted Acanthonotus, which is grey, with the back tranfverfely barred with brown. This fifh is of confiderable length, that defcribed by Bloch being two feet and a half: the head is large, the teeth fmall, forming a row along each jaw, the eyes large, and the noftrils confpicuous; the body, moderately wide for about a third of its length, tapers towards the extremity; head and body are covered with fcales, of a blueifh tinge, filvery on the abdomen; the pectoral fins brown, of a moderate fize, the ventral of like colour, and fmall; the lateral line ftraight, nearer to the back than to the abdomen; with ten fpines, ftrong but fhort, along the narrow part of the back, and towards the abdomen from twelve to thirteen others, followed by the anal fin, which is fhallow, and continued into the tail, which is very fmall. Shaw's Gen. Zool.

ACANTHURUS, a genus of fifh, confifting of fuch fpecies of the Linnæan genus *Chætodon* (which fee) as, in contra-diftinction to the principal character of that genus, have, in general, moderately broad and ftrong teeth, rather than flender and fetaceous ones; they are alfo furnifhed on each fide of the tail with a ftrong fpine. Their generic character is as follows: Teeth fmall, in moft fpecies lobated; tail aculeated on each fide; habit and general appearance as in the chætodon. The fpecies are,

UNICORNIS. Grey-brown, with a frontal horn ftretching

ing forwards over the snout, and two spines on each side of the tail. See CHÆTODON *Unicornis*.

NASUS. Grey, speckled with black, with a rounded frontal tubercle, and two spines on each side of the tail. A native of the Indian seas, and, according to Cepede, first described by Commerson.

TEUTHIS. Blue, with the middle of the body paler, and a spine on each side of the tail. See TEUTHIS *Hepatus*.

CHIRURGUS; Lancet Acanthurus. Orange-yellow, with the body crossed on the hind part by transverse brown stripes, and a spine on each side of the tail. See CHÆTODON *Chirurgus*.

NIGRICANS. Blackish, sub-argenteous beneath, with a spine on each side of the tail. See CHÆTODON *Nigricans*.

MILITARIS. Brown, with rhombic-ovate body, and strong spine on each side of the tail. Native of the Indian and American seas.

TRIOSTEGUS; Triradiated Acanthurus. Greenish-brown, with four transverse dusky bands, and a spine on each side of the tail. Native of the Indian seas. See CHÆTODON *Triostegus*.

HARPURUS; Guarded Acanthurus; Rhombic-ovate brown Acanthurus, with extremely minute scales, and two spines on each side of the tail. Native of the Indian seas.

SOHAL; Dusky Acanthurus, with longitudinal violet streaks, and two spines on each side of the tail imbedded in a red depression. See CHÆTODON *Sohal*.

NIGRO-FUSCUS; Dusky Acanthurus, with ovate body, and spine on each side of the tail. A variety of the preceding. See CHÆTODON *Nigro-fuscus*.

ACHILLES; Brown, ovate Acanthurus, with a bare ovate red spot on the hind part, aculeated in the middle.

LINEATUS; Ovate-brown Acanthurus, with numerous longitudinal white stripes, and spine on each side of the tail. See CHÆTODON *Lineatus*.

UMBRATUS; Brown-ovate Acanthurus, with extremely minute scales, and a spine on each side of the tail. Native of the Indian seas.

MELEAGRIS; Blackish-brown Acanthurus, thickly marked with round white spots, and spine on each side of the tail. Native of the Indian and American seas.

VELIFER; Broad-finned, whitish Acanthurus, with roundish-ovate body, marked by numerous brown transverse bands, and spine on each side of the tail. Native of the American seas. Shaw's Zool.

ACANTHUS, in *Botany*. In addition to the observations of our predecessor, we would remark, what the writer of the present article has elsewhere hinted, (*Considerations respecting Cambridge, more particularly relating to its Botanical Professorship*, 37,) that every mention of this plant in Virgil accords with the Common Holly, *Ilex Aquifolium*, so far, at least, as the words of the poet indicate any thing in particular. The passages in question are,

——— *baccas semper frondentis acanthi.*—Georg. 2. 119.
——— *aut flexi tacuissem vimen acanthi.*—Ib. 4. 123.
Ille comam mollis jam tum tondebat acanthi.—Ib. 4. 137.
Et molli circum est ansas amplexus acantho.—Ecl. 3. 45.
Mixtaque ridenti colocasia fundet acantho.—Ib. 4. 20.
—— *circumtextum croceo velamen acantho.*—Æn. 1. 653.
——— *pictum croceo velamen acantho.*—Ib. 1. 715.

The flexible twigs, ever-green leaves, bright or gay saffron-coloured berries, (as the term *croceus* is used with considerable latitude by Latin writers,) the head of the plant being clipped by gardeners in the early spring, all sufficiently well apply to the Holly, which is a common wild, as well as garden, shrub, throughout Italy, but of which we can find no mention whatever in all Virgil's writings, if these passages allude to any thing else. They are acknowledged to be inapplicable to the ακανθα of Dioscorides, which is evidently the Linnæan *Acanthus*. They are no less so to the ακανθος of Theophrastus, which is a tree bearing pods, or legumes. These Greek names, simply meaning a thorny or prickly plant, are variously applied, not only to different trees or shrubs, but to many kinds of thistles. The *Acanthus Dioscoridis*, Linn. Sp. Pl. 891, a species adopted by Linnæus from other writers, without seeing a specimen or figure, seems to be merely a narrow-leaved, or starved state of *A. spinosus*; of which *A. mollis* may, on the other hand, be a cultivated, or more luxuriant, variety. The latter was found by Dr. Sibthorp in Sicily, not in Greece; the former, apparently the natural state of this herb, as described by Dioscorides, occurs in moist stony places, as well as about the borders of fields, in the southern part of Greece, and the islands of the Archipelago, and is very common in Crete.

ACARNA, a name adopted from the Greeks, whose ακαρνα was, like this, some sort of thistle. This name is now applied in Willdenow's Sp. Pl. v. 3, 1699, and from thence by Mr. Aiton, Hort. Kew. v. 4. 490, to a genus separated by these writers from the Linnæan ATRACTYLIS (see that article); from which it differs in the want of a radius. The species referred to *Acarna* are, 1. *Atractylis gummifera* of Linn. Sp. Pl. 1161; 2. *A. macrocephala*, Desfont. Atlant. v. 2. 253; 3. *A. macrophylla*, ibid. 255. t. 226; 4. *A. cæspitosa*, ibid. 254. t. 225; 5. *A. lancea*, Thunb. Jap. 306; 6. *A. ovata*, ibid. 306; and 7. *A. cancellata*, Linn. Sp. Pl. 1162.—We can by no means concur in this alteration. Nothing is less certain than such a generic distinction as the above, when unsupported by any natural character. Willdenow has also separated from *Atractylis* the *purpurata* and *mexicana* of Linnæus, perhaps with more propriety, their receptacles being nearly naked, and their seed-down simple, to say nothing of a difference in the structure of the radiant florets of the former, which rather invalidates than confirms the new-established genus. See ONOSERIS.

ACCELERANDO, l. 11, *r.* refinements.

ACCOUNT CURRENT, the personal account of a merchant or trader with each of his correspondents or customers, a copy of which account is transmitted to the person whose name it bears, shewing the state of affairs between the parties at the current or present time when made out.

ACCURSIUS, *r. Mariangelus*.

ACER, l. 6, *r. Tribilatæ Acera*. Juss.

ACERA, in *Botany*, the sixth natural order, of the 13th class in Jussieu's system; the 66th in his general series. See the characters of this class under the article GERANIA. The *Acera* are defined as follows.

Calyx of one leaf. *Petals* definite, very rarely wanting, inserted around the disk, which is under the germen. *Stamina* inserted into the middle of the same disk, definite, but often

often unequal in number to the petals. *Germen* ſimple, ſtanding on the before-mentioned diſk; *ſtyle* one, or rarely two; *ſtigma* one or two. *Fruit* of ſeveral cells, or ſeveral capſules, the cells or capſules three or two. *Seeds* in each ſolitary, or at the utmoſt three, attached to the inner angle, ſome of them frequently abortive. *Corculum* deſtitute of *albumen*, the *radicle* lying on the lobes. *Stem* arboreous, or ſhrubby. *Leaves* oppoſite, without *ſtipulas*. *Flowers* raceinoſe or corymboſe; ſometimes by the abortion of one or other part becoming ſeparate in ſex.

Sect. 1. *Fruit of ſeveral cells*, contains only *Aeſculus*.

Sect. 2. *Fruit of ſeveral capſules*, only *Acer*.

Sect. 3. Conſiſts of genera allied on the one hand to the *Acera*, on the other to MALPIGHIÆ; ſee that article. Theſe are *Hippocratea* and *Thryallis*.

There is ſome doubt, even in the mind of Juſſieu himſelf, whether *Aeſculus* properly belongs to this natural order; and he juſtly adverts to its great affinity to his SAPINDI, (ſee that article,) with which its fruit undoubtedly very cloſely accords.

ACERAS, ſo named from *α*, *without*, and *κερας*, *a horn*, alluding to the want of a nectariferous ſpur to the lip.—Brown in Ait. Hort. Kew. v. 5. 191. Sm. Compend. Fl. Brit. ed. 2. 128.—Claſs and order, *Gynandria Diandria*. Nat. Ord. *Orchideæ*.

Gen. Ch. *Cal.* Perianth ſuperior, of three ovate, concave, equal, converging leaves. *Cor.* Petals two, linear-lanceolate, concealed by the calyx, and about the ſame length. Nectary an oblong, flat, pendulous lip, much longer than the petals, with two pair of deep, linear, flat, dependent lobes, but no poſterior ſpur. *Stam.* Filament none; anther erect, oblong, attached by its back, parallel to the ſtyle, of two cells, opening in front, the maſſes of pollen club-ſhaped, each attaching itſelf, by a taper baſe, to two glands in a ſingle pouch near the ſtigma. *Piſt.* Germen inferior, linear-oblong, twiſted; ſtyle columnar, very ſhort; ſtigma below the anther, rather concave. *Peric.* Capſule oblong, with three blunt angles, twiſted, of one cell and three valves, ſplitting by three lateral fiſſures. *Seeds* numerous, minute, each with a chaffy tunic.

Eſſ. Ch. Calyx converging. Lip without a ſpur, flat. Anther nearly terminal, fixed to the ſtyle, of two cells.

This genus was firſt eſtabliſhed by Mr. Brown, who ſeparates it from OPHRYS, (ſee that article,) on account of the converging *calyx*, and eſpecially the ſituation of the two glands, which receive the *pollen*, being in one pouch, not in two diſtinct and diſtant ones. The latter character, though excellent in this inſtance, appears to us in others leſs ſatisfactory (ſee GYMNADENIA hereafter); and even in the characters of *Aceras* and *Ophrys*, the flat lip of the former, contraſted with the convex one of the latter, ſeems a more obvious and natural diſtinction. In affinity the preſent genus comes neareſt to ORCHIS, but wants the ſpur.

1. A. *anthropophorum*. Green-man Aceras. Br. n. 1. Sm. Compend. 130. (Ophrys anthropophora; Linn. Sp. Pl. 1343. Willd. Sp. Pl. v. 4. 63. Sm. Fl. Brit. 937. Engl. Bot. t. 29. Curt. Lond. faſc. 6. t. 66. O. n. 1264; Hall. Hiſt. v. 2. 133. t. 23. O. anthropophora oreades; Column. Ecphr. 318. t. 320. f. 1. O. flore nudi hominis effigiem repræſentans; Rudb. Elyſ. v. 2. 193. f. 6. Vaill. Pariſ. t. 31. f. 19, 20.)—Lip of the nectary longer than the germen.—Native of dry calcareous paſtures, in Italy, France, Switzerland, and England, flowering in June. The *root* conſiſts of two roundiſh-ovate, nearly equal, downy bulbs, or knobs. *Herb* ſmooth, of a bright, ſlightly glaucous, green, about ten or twelve inches high. *Leaves* ſeveral, ovato-lanceolate, all radical, except one which ſheaths the lower part of the ſtalk. *Spike* erect, of numerous rather ſcattered *flowers*. *Calyx* convex, green, with reddiſh-brown edges. *Petals* green, erect. *Lip* pale yellow, pendulous, near an inch long, in four narrow, rather ſpreading lobes, of which the two lowermoſt are uſually the ſhorteſt; the whole flower having nearly the ſhape of *Orchis militaris*, except the want of a ſpur, and of a ſmall central lobe, often obſervable in that plant. We have found at Valcimara, on the Apennines, what ſeems a mere variety with a red *lip*.

2. A. *anthropomorphum*. Short-lipped Aceras. (Ophrys anthropomorpha; Willd. Sp. Pl. v. 4. 63.)—Lip but half the length of the germen.—Found on hills in Portugal, by profeſſor Linck. About a ſpan high, the *ſpike* an inch long. *Bracteas* oblong, membranous, half the length of the germen, nor does the lip exceed that proportion. Willdenow thinks it can ſcarcely be a variety of the former. We have ſeen no ſpecimen.

ACERIC ACID, in *Chemiſtry*, lately diſcovered by profeſſor Scherer, of Vienna, in the ſap of the *acer campeſtre*, or common maple. Its properties have been very imperfectly deſcribed. The acerate of lime is white, ſlightly tranſlucent, has a weak acidulous taſte, and is not altered by expoſure to the atmoſphere. 1000 parts of cold water diſſolve 9 parts, and 1000 parts of boiling water 17 parts of this ſalt. Schweigger's Journal, iv. Thomſon's Chemiſtry, iv. new edition.

ACETATES, or ACETITES, a claſs of ſalts, the characteriſtics of which are, that they are all very ſoluble in water; that they are decompoſed by the action of heat; and that they afford acetic acid when diſtilled with ſulphuric acid. Accordingly we have acetates of barytes, of potaſh, of ſoda, of lime, of ammonia, of magneſia, &c. See ACETIC *Acid*.

ACETIC ACID. It is now univerſally admitted by chemiſts, that the acetic acid differs in no reſpect from common vinegar, or what was formerly termed *acetous* acid, but in the degree of concentration only. This opinion, firſt advanced by Adet, has lately been fully confirmed by the experiments of Darracq and Prouſt. What has been ſaid, therefore, on the ſubject of *acetous* acid and *vinegar* in the Cyclopædia, is to be underſtood as applicable to dilute *acetic* acid; and the ſalts termed *acetites* are to be conſidered as *acetates*. The following facts are important, and deſerve a place here.

The ſpecific gravity of acetic acid does not enable us to determine its ſtrength. The ſpecific gravity is ſtated by Dr. Thomſon to be a maximum when the liquid is a compound of one atom, and three atoms water. When the proportion of water is either increaſed or diminiſhed, the ſpecific gravity diminiſhes. Acid compoſed of one atom real acid and one atom water, and acid compoſed of one atom real acid and nine and a half of water, are ſtated by the ſame chemiſt to have the ſame ſpecific gravity.

The following table, drawn up chiefly from the experiments of Mollerat by Dr. T., exhibits the ſpecific gravity of acetic acid of various ſtrengths.

Atoms.		Weight of		
Acid.	Water.	Acid.	Water.	Sp. Gr.
1 +	1	100	14.78	1.0630
	2	100	25.21	1.0742
		100	37.99	1.0770
	3	100	48.43	1.0791
		100	52.94	1.0800
		100	59.38	1.0763
	4	100	71.90	1.0742
	5 —	100	83.90	1.0728
	6 +	100	116.25	1.0658
	7	100	127.73	1.0637
	$9\frac{1}{2}$	100	166.34	1.0630

Acetic

Acetic acid of the ſp. gr. 1.063 is the ſtrongeſt that can be procured. It cryſtallizes at the temperature of 55°, and the cryſtals melt ſlowly when heated to $72\frac{1}{2}$°. This had been long ago obſerved by Courtenvaux. Lowitz has propoſed an ingenious method of obtaining it of the requiſite degree of ſtrength to cryſtallize. This conſiſts in making diſtilled vinegar into a thick paſte with well-burnt charcoal, and expoſing the mixture to a temperature of 212°. The watery part is driven off, and the acid remains. The acid itſelf may be ſeparated by a higher degree of heat, and thus obtained in a very concentrated ſtate. It is commonly neceſſary, however, to repeat the proceſs before it can be made to cryſtallize.

Mr. Chenevix, by diſtilling the *acetates*, obtained a peculiar ſubſtance different from acetic acid, and which he has denominated *pyro-acetic* ſpirit. The acetates of potaſh and ſoda gave a greater proportion of this principle than any of the metalline acetates; but when the acetate of barytes is diſtilled, the whole liquid product conſiſts of this ſpirit without any mixture of acid whatever. No other genus of ſalts tried, ſuch as the oxalates, tartrates, or citrates, yielded this ſpirit, nor was acetic acid converted into it by heat.

Pyro-acetic ſpirit is a white and limpid fluid. Its taſte is at firſt hot and acrid, but it becomes cooling and rather urinous. Its ſmell is peculiar, and is compared by Mr. Chenevix to that of a mixture of oil of peppermint and bitter almonds. Its ſpecific gravity is .7864. It burns with a flame, white exteriorly, but of a fine blue within, and leaves no reſidue. It boils at a temperature of 165°. It mixes with water, alcohol, and volatile oils, in any proportion. With hot olive-oil it alſo mixes in any proportion; but with that oil cold it only mixes in certain proportions. When hot it diſſolves wax and tallow. It diſſolves alſo a little ſulphur and phoſphorus, and is an excellent ſolvent of camphor. It diſſolves potaſh, and becomes dark-coloured, but it may be obtained again unaltered by diſtillation. Strong ſulphuric acid blackens and decompoſes it. Nitric acid renders it yellow, and changes its properties. Muriatic acid renders it brown. When diſtilled with this acid a combination takes place, and a ſubſtance is formed poſſeſſing very different properties from muriatic ether. Theſe properties are ſufficient to ſhew, that the pyro-acetic ſpirit is a diſtinct ſubſtance, and differs entirely from alcohol, ether, and volatile oils. Of courſe, therefore, as Dr. Thomſon obſerves, it deſerves a diſtinct place among compound combuſtibles.

Many attempts have been made to analyſe the acetic acid. Thoſe moſt worthy of notice are by Gay Luſſac and Thenard, and Berzelius. The former burnt a mixture of acetate of barytes and chlorate of potaſh. The reſults were carbonic acid and water. Berzelius's analyſis was made on the ſame principles, but the ſalt he employed was ſuppoſed to be quite free from water. The following are the reſults of theſe celebrated chemiſts:

	Hydrogen.		Carbon.		Oxygen.		Acid.
Gay Luſſac	5.629	+	50.224	+	44.147	=	100
Berzelius	6.35	+	46.83	+	46.82	=	100

If, with Dr. Thomſon, we conſider the reſults of Berzelius moſt entitled to credit, acetic acid conſiſts of

3	atoms or proportions of hydrogen, weighing		0.375
4	——— of carbon	———	3.000
3	——— of oxygen	———	3.000

Or of ten atoms or proportions, and the weight of an integrant particle, will be 6.375; and this weight, as the ſame chemiſt has ſhewn, accords very well with the conſtitution of the acetates.

ACHARIA, in *Botany*, a genus dedicated by Profeſſor Thunberg, to the honour of his countryman Dr. Eric Acharius, knight of the order of Waſa, a member of various learned ſocieties, and one of the moſt diſtinguiſhed botaniſts of the preſent day, particularly with regard to the *Lichen* tribe, which he has profoundly ſtudied, and moſt learnedly illuſtrated. (See Lichenes.) Dr. Acharius is now Regius Profeſſor of Phyſic, at Vadſtena, in Sweden.—Thunb. Prodr. præf. n. 7. Willd. Sp. Pl. v. 4. 327. Lamarck Illuſtr. t. 755.—Claſs and order, *Monoecia Triandria*; or rather, perhaps, *Triandria Monogynia*. Nat. Ord. *Eleagni*, Juſſ.?

Gen. Ch. *Cal.* Perianth inferior, of two ſmall, ovate, acute, permanent leaves. *Cor.* of one petal, tubular-bell-ſhaped, downy, in three deep, equal, elliptical ſegments, permanent. *Stam.* Filaments three, very ſhort, inſerted into the top of the tube of the corolla, oppoſite to its ſegments; anthers roundiſh, of two lobes. *Piſt.* Germen ſuperior, roundiſh; ſtyle ſolitary, thread-ſhaped, half as long as the corolla; ſtigma three-cleft. *Peric.* Capſule ovate, of one cell, and three valves. *Seed* ſolitary? globoſe, rough. The *ſtamens* are moſt perfect in the upper flowers, the *piſtil* in the lower.

Eſſ. Ch. Calyx of two leaves. Corolla of one petal, three-cleft. Capſule of one cell, and three valves. Seed ſolitary?

Obſ. Nothing can be more imperfect or puzzling than the character and natural affinity of this genus, according to the materials furniſhed by Thunberg, eſpecially what regards the *capſule* and *ſeed*. He defines the fruit, "*capſule* of one cell, with three *ſeeds*." Willdenow, who ſeems to have had no other authority than Thunberg's figure, ſays, "*capſule* of one cell and three valves, with a ſolitary *ſeed*," which laſt account beſt agrees with that figure. With reſpect to the natural order of *Acharia*, if we take for *bracteas* what Thunberg terms a *calyx*, the *flower* will indicate one of Juſſieu's *Eleagni*, though the *capſule* of three valves is very anomalous, and the lobed *leaves* no leſs ſo. By the ſpecific name *tragodes*, or rather *tragioides*, and the place where the genus is introduced, Thunberg appears to have conſidered it as akin to Tragia, (ſee that article,) which idea the aſpect of the *leaves*, and the ſomewhat monoecious *flowers*, might probably ſuggeſt.

1. A. *tragodes*. Lobed Acharia. Thunb. Prodr. 14. t. 1. Fl. Cap. v. 1. 160. Willd. n. 1.—Gathered by Profeſſor Thunberg, near Van Stade's river, and in other parts of the interior of Africa, above the Cape of Good Hope, flowering in December and January. *Root* fibrous, annual? *Stem* ſolitary, herbaceous, erect? from four to twelve inches high, branched from the bottom to the top, ſmooth; *branches* alternate, angular, erect, ſomewhat zigzag, wand-like, ſubdivided. *Leaves* alternate, on ſtalks about their own length, about an inch long, three-lobed, finely downy; lobes obovate, variouſly cut. *Flowers* in effect monoecious, axillary, ſolitary, on ſhort ſtalks, reflexed, ſmall, the male about the upper part of the plant, female lower down. The *corolla* is about a quarter of an inch long, downy all over, as are likewiſe the *germen* and *ſtyle*. *Capſule* ovate-oblong, acute, thrice the length of the permanent corolla. *Seed* nearly the ſize of a pepper-corn, apparently black and rough.

ACHERON, l. 1, *r.* Theſprotia.

ACHILLINI, l. 25, for 40 *r.* 49.

ACHIMENES, in *Botany*, ſo named by Browne, poſſibly fibly from α, and χειμαζω, *to be wintry, or tempeftuous*, meaning that the plants in queftion are not calculated to endure rough weather. He tells us they thrive beft in the cooler parts of Jamaica. When cultivated in Europe, they require great heat. This genus is founded on two fpecies only, and thofe as generically different as two plants of the fame natural order can well be. See Browne's Jamaica, 270. t. 30. f. 1, and Juff. Gen. 119. The latter writer, following Browne, did not diftinguifh thefe plants. One of them is *Columnea hirfuta*, the other our CYRILLA; fee that article.

ACHOR, laft line, *r*. PORRIGO inftead of TINEA *Capitis*.

ACHROCORDES. Add, See SERPENTES.

ACHTIL, ACHTELIEG, or *Martel*, a corn-meafure in Germany, which contains 4 fimmers, 8 metzers, 16 fechters, or 64 gefcheides. See MALTER.

ACIANTHUS, in *Botany*, from ακις, *a point*, and ανθος, *a flower*, becaufe of the briftly tips of the calyx-leaves, unufual in this family.—Brown Prodr. Nov. Holl. v. 1. 321.—Clafs and order, *Gynandria Monandria*. Nat. Ord. *Orchideæ*.

Gen. Ch. *Cal.* Perianth three-leaved, fomewhat ringent, awned; its two fide-leaves placed under the lip; upper one broadeft, vaulted, erect. *Cor.* Petals two, linear-lanceolate, much fmaller than the calyx. Nectary a prominent undivided lip, fhorter than the petals, with two fwellings at the bafe, but no appendage to the difk. *Stam.* Anther terminal, permanent, of two cells clofe to each other; maffes of pollen in each cell four, or two divided ones. *Pift.* Germen inferior, oblong, angular; ftyle erect, femi-cylindrical, without any auricles or wings at the fummit; ftigma in front. *Peric.* Capfule of one cell. *Seeds* numerous, minute.

Eff. Ch. Calyx fomewhat ringent; its fide-leaves under the lip. Lip without a fpur, fhorter than the petals, undivided, with two prominences at the bafe. Anther terminal, without appendages, permanent. Pollen powdery. Column femi-cylindrical.

This genus is next akin to MICROTIS of the fame author (fee that article); to whofe effential character fhould be added, " Anther with two auricles. Column funnel-fhaped."—*Acianthus* confifts of little fmooth herbs, with folitary, undivided, naked, downy *bulbs*, or *tubers*, throwing out a few fibres, along with a downy fhoot, at whofe extremity the young bulb is fituated, on a partial ftalk. *Stem* very fhort, its bafe enclofed in a fhort, tubular, pointed fheath. *Leaf* folitary, deeply heart-fhaped, acute, with three ribs, and many reticulated veins; its under fide red or purple. *Flowers* fmall, reddifh, either cluftered or folitary, their common ftalk without *bracteas*, except beneath each flower.

1. A. *fornicatus*. Vaulted Acianthus. Br. n. 1.—Flowers racemofe. Awns four times fhorter than the perianth. Petals nearly erect. Lip bearing longitudinal glands. Column concealed.—Native of the neighbourhood of Port Jackfon, New South Wales, from whence we, long ago, received fpecimens in fpirits, as well as dried, by favour of Dr. White, and where Mr. Brown has alfo gathered this curious little plant. The *leaf* is about an inch in diameter. Common *flower-ftalk* from three to fix inches high, bearing from two to fix *flowers*, about the fize and afpect of the *Corallorrhiza*, each with an ovate *bractea* at its bafe. Lower leaves of the *calyx* linear-lanceolate, very narrow in comparifon of the upper one. *Petals* linear-lanceolate, very delicate. *Lip* fomewhat flefhy, having a longitudinal furrow, the ridges bearded horizontally with papillary glands. This is the only fpecies we have feen.

2. A. *exfertus*. Prominent Acianthus. Br. n. 2.—" Flowers racemofe. Awns very fhort. Upper calyx-leaf tapering at the bafe. Petals horizontally reflexed. Lip glandular at the extremity. Column prominent."—Gathered by Mr. Brown, near Port Jackfon.

3. A. *caudatus*. Long-awned Acianthus. Br. n. 3.—" Stalk with one or two flowers. Awns very long. Leaf wavy at the margin."—Gathered by Mr. Ferdinand Bauer, in the neighbourhood of Port Jackfon.

4. A.? *bifolius*. Two-leaved doubtful Acianthus. Br. n. 4. (Epipactis reflexa; Labill. Nov. Holl. v. 2. 60. t. 211. f. 1.)—" Stalk fingle-flowered. Leaves two, radical, hooded. Perianth without awns, its three leaves uniform; the lateral ones reflexed. Petals? linear, narrow." —Gathered by Labillardiere, at Cape Van Diemen. Mr. Brown doubts whether this fpecies, which he appears not to have examined, is moft akin to *Acianthus*, or to another genus of his, hereafter to be noticed, named *Chiloglottis*. It agrees with the former in having four maffes of pollen, a column deftitute of a joint, and a lip without any appendage: with the latter in bearing two radical leaves, a perianth without awns, and very narrow petals. Thefe laft are reprefented in the plate, at *fig*. 2, as if fituated on the outfide of the calyx, which the defcription, and, if we miftake not, the other figures, fhew to be an error of the draughtfman or engraver.

ACICARPHA, fo named by the celebrated Juffieu, from ακις, *a point*, and καρφη, *a chaffy fcale*, becaufe the fcales of the receptacle, as he thought, become armed with a fpinous point, when the feeds, which they feparately envelop, approach towards maturity.—Juff. in Annal. du Muf. d'Hift. Nat. v. 2. 347. Willd. Sp. Pl. v. 3. 2327.—Clafs and order, *Syngenefia Polygamia-neceffaria?* Nat. Ord. *Compofitæ capitatæ*, or rather *Aggregatæ*, Linn. *Corymbiferæ*, *fect*. 5. Juff.

Gen. Ch. *Common Calyx* of one leaf, in five deep, linear, fpreading fegments, permanent. *Cor.* compound, difcoid. Florets all uniform, tubular, funnel-fhaped; their limbs fomewhat bell-fhaped, five-cleft, obtufe; the central ones male, leaft numerous; thofe of the circumference more abundant, each furnifhed with ftamens and piftil, but not all fertile. *Stam.* Filaments five, very fhort; anthers oblong, united, fhorter than the limb of the floret. *Pift.* Germen oblong; ftyle thread-fhaped, longer than the corolla; ftigma club-fhaped, notched. *Peric.* none, except the hardened fcales of the receptacle. *Seeds* folitary; oblong, deftitute of crown or wing, each enclofed in a greatly enlarged, hardened, concave, fpinous-pointed fcale of the lower part of the cylindrical chaffy *receptacle*.

Eff. Ch. Receptacle chaffy. Seed-down none. Calyx in five deep fegments. Florets uniform, tubular. Seeds feparately enclofed in the fpinous fcales of the receptacle.

1. A. *tribuloides*. Caltrop Acicarpha. Juff. as above, 348. t. 58. f. 1. Willd. n. 1.—Leaves oblong, deeply toothed.—Gathered by Commerfon, on the fea-fhore at Monte Video. *Root* tapering, annual. *Stems* one or more, herbaceous, afcending or decumbent, a fpan long, fomewhat branched, leafy, fmooth. *Leaves* alternate, feffile, oblong, obtufe, flefhy, fmooth, an inch and a half to three inches long, deeply and coarfely toothed; tapering at the bafe. *Flower-ftalks* terminal and lateral, oppofite to the leaves, and about as long, fimple, fingle-flowered, erect. *Flowers* white, hemifpherical, one-third of an inch in diameter. *Fruit* a globular head, armed with unequal, rigid, fharp, pale, divaricated, or recurved fpines, and crowned with

with a tuft of withered male florets, like a taffel. The intermediate *florets* feem to be abortive, though furnifhed with the moft confpicuous *piftils*.

2. A. *fpathulata*. Spatulate Acicarpha. Brown Tr. of Linn. Soc. v. 12. 129.—Leaves fpatulate, moftly entire.—Sent from Brazil by Mr. Sellow. A fmooth, diffufe, apparently annual plant, with angular afcending *branches*. *Leaves* fcattered, ftalked, without *ftipulas*, fpatulate, with a very fhort little point, rather thick, and perhaps glaucous, an inch and a half long; the lower ones fometimes toothed from above the middle. *Footftalks* linear, a little dilated at the bafe; the lowermoft longeft. *Heads* of *flowers* yellow, folitary; either ftalked and oppofite to the leaves, or terminal and nearly feffile. *Involucrum* of five leaves in a fimple row, longer than the flowers. *Receptacle* conical, flender, chaffy, with lanceolate pointed fcales. *Florets* tubular, uniform, fmooth. Thofe of the circumference in two or three rows, with perfect *ftamens* as well as *piftils*. Tube of the *corolla* flender, cylindrical, clofely united to the *germen* and bafe of the *ftyle*; limb funnel-fhaped, five-cleft, fegments parallel at the edges, half-lanceolate, flat, three-ribbed. *Stamens* five, inferted into the corolla, alternate with its fegments, their *filaments*, as well as the lower half of the anthers, united into a tube. *Germens* combined, each crowned with a five-cleft partial *calyx*, whofe teeth, alternate with the fegments of the *corolla*, become fpinous, each germen containing one pendulous *feed*. *Style* thread-fhaped, fmooth. *Stigma* fimple, obtufe, rather hairy. The numerous upper *florets* are rather fmaller, with a membranous *calyx*, and imperfect *germens*. The ripe *fruit*, originating from the florets of the circumference, confifts of clofe *pericarps*, combined together, not burfting, each crowned with its own enlarged fpinous *calyx*. *Seed* ovate, pendulous. *Albumen* flefhy, large, white. *Embryo* nearly cylindrical, central, about the length of the albumen, with two linear *cotyledons*. By this account it appears that Mr. Brown differs from M. de Juffieu, in thinking the prefent genus belongs to the Linnæan order of *Aggregatæ*, and not to the *Compofitæ*. This laft account of the *fruit* is evidently more natural than the above, and the character, if Mr. Brown, which we doubt not, be correct, muft be altered to "*Seeds* crowned with the fpinous partial calyx."

ACID, Acidification, in *Chemiftry*. When thefe articles were written for the Cyclopædia, the theory of Lavoifier, that oxygen was the only principle of acidification, was almoft univerfally received. Since that period, however, a great revolution has taken place in chemiftry, and the doctrine in queftion is now no longer admitted. This indeed has been noticed in fubfequent parts of this work, more efpecially under Oxygen and Oxymuriatic *Acid*; fo that little more is neceffary than to refer our readers to thefe articles. It may not be deemed fuperfluous, however, to mention here very briefly the difcoveries that have led to thefe important changes.

The firft circumftance which gave the death-blow to the doctrine of Lavoifier, was the demonftration by Gay Luffac and Thenard, and more efpecially by Davy, that oxymuriatic acid, or *chlorine*, as it is now termed, contains no oxygen, but is a fimple elementary fubftance. Chemifts indeed had never been able to demonftrate fatisfactorily that oxygen actually exifted in this fubftance; but mifled by the plaufibility of the Lavoifierian doctrines, had tacitly admitted its prefence from analogy: and fo ftrongly was this belief founded, that there are a few, we believe, who adhere to the old opinions even to the prefent time.

More recently, however, the old opinions have been rendered ftill further improbable, and the new ones corroborated by the difcovery of *iodine* and *cyanogen*; the one an elementary, the other a compound fubftance, both which have been unequivocally demonftrated to form acids by combining with hydrogen. The analogy, alfo, of fulphuretted and telluretted hydrogen, compounds free from oxygen, but poffeffing the properties of acids, have been likewife urged in proof of the new opinions, and as quite irreconcileable with thofe of Lavoifier.

Our readers will find further information on this fubject in the articles Chlorine, Cyanogen, Iodine, Muriatic *Acid*, Oxygen, and Oxymuriatic *Acid*.

ACINACIFORME, Folium, in *Botany*, a Scimitar-fhaped Leaf, is fcarcely ufed but for one fpecies of *Mefem bryanthemum*, which bears this fpecific name. (See Leaf. It is of a fucculent texture, compreffed, one edge conve and thin, the other ftraighter and thick.

Acinaciforme, *Pericarpium*, a Seed-veffel of a fimilar fhape, is exemplified in the cells of the capfule of the fame genus of *Mefembryanthemum*; fee Linn. Phil. Bot. 224.

ACINUS, in *Botany and Vegetable Phyfiology*, a Grain, is technically ufed for each pulpy portion, containing a folitary feed, of a compound Berry. (See Bacca.) The fruit of the Rafpberry, Bramble, &c., confifts of feveral *acini*; and perhaps the fame term may be applied to the feparate portions of a Mulberry, though originating in the calyx of each flower become pulpy. In *Paffiflora* the *capfule* is lined with very juicy *acini*, each lodging a fingle feed. Gærtner improperly extends the above term to the fimple many-feeded berries of the Vine, Goofeberry, &c. The laft-mentioned fruit, in an early ftate, rather refembles the *Paffiflora*.

ACONITUM, in *Botany*, (fee our former article,) has received confiderable elucidation from profeffor De Candolle, in his *Regni Vegetabilis Syftema Naturale*, v. 1. 364, where this genus is treated of as one of the natural order of Ranunculaceæ. (See that article.) Its generic references are, Linn. Gen. 274. Schreb. 368. Willd. Sp. Pl. v. 2. 1232. Mart. Mill. Dict. v. 1. Ait. Hort. Kew. v. 3. 321. Sm. Prodr. Fl. Græc. Sibth. v. 1. 372. Purfh 372. Juff. 234. Tourn. t. 239, 240. Lamarck Illuftr. t. 482. Gærtn. t. 65. "Koelle Monogr. 1788. Erlang. in 8vo."—Clafs and order, *Polyandria Pentagynia*. Nat. Ord. *Multifiliquæ*, Linn. *Ranunculaceæ*, Juff. De Cand.

Eff. Ch. Calyx none. Petals five; the uppermoft vaulted. Nectaries two, ftalked, recurved. Capfules three or five.

M. De Candolle, following Juffieu's view of the fubject, gives the following characters, ufing the term *fepala* for *calyx-leaves*, and *petala* for *nectaries*.

Calyx of five petal-like, deciduous leaves; the upper one (hood) large, concave, helmet-fhaped; two lateral ones, (wings,) orbicular; two lowermoft oblong. Petals five, fometimes irregular in number; three very minute, claw-fhaped, often converted into ftamens; two uppermoft with long claws, hooded, fheltered under the helmet-fhaped leaf of the calyx, dilated at the top into a bag, whofe bottom, the fummit, or fpur, of the petal, is callous, incurved, its mouth extended into an oblong, emarginate limb, or lip. Stamens indefinite. Capfules three to five, with an indefinite number of feeds.

Perennial herbs, with tuberous *roots*, whofe knobs in fome inftances bear fibres, in others are oblong, and mixed therewith. *Stem* leafy. *Leaves* ftalked, deeply palmate, with from three to five fegments, varioufly cut, cloven and toothed. *Clufters* terminal. *Stalks* fingle-flowered, from the bofoms of the *bracteas*, each bearing two fmaller *bracteas*.

Flowers

Flowers large, irregular, fometimes fulphur-coloured, fometimes blue, or white.

All the fpecies are poifonous; the *Anthoræ* lefs dangerous; the *Napelli* highly noxious. The root is always the moft poifonous part, the herbage lefs acrid, and though in a frefh ftate injurious to animals, by drying, or by boiling in water, it becomes fo mild, that fome fpecies, *A. feptentrionale* for inftance, are eatable! Dr. Storck, who found Aconite fo ufeful in chronic rheumatifm, confirmed gout, and venereal fwellings of long duration, employed *A. paniculatum;* but other phyficians have often, without fufficient attention, promifcuoufly given every kind with blue flowers.

The twenty-eight fpecies at this time known inhabit rough bufhy or woody places, in the northern hemifphere; eleven are found in Europe, eleven in Siberia, one in Japan, one in North America, and one is common to Siberia and the weftern part of North America.

This is a moft natural genus, but very difficult as to the determination of its fpecies, nor has it been properly inveftigated. Clufius in his time was extremely well acquainted with the European kinds, and requires to be confulted in preference to all other writers.

Aconitum may be diftributed by the habit, rather than by any characters, into five fections, or divifions, as follows.

Sect. 1. *Anthora.* Flowers pale yellow. Hood convex. Leaves in numerous deep linear fegments. Species 1 and 2.

2. *Lycoctonum.* Flowers pale yellow, or very rarely blue. Hood conical, elongated, fcarcely pointed in front. Leaves in wedge-fhaped lobes. Species 3—10.

3. *Napellus.* Flowers blue or white. Hood convex. Leaves in numerous deep linear fegments. Species 11—14.

4. *Cammarum.* Flowers blue or white. Hood conical, or very convex, with a long point in front. Leaves with wedge-fhaped lobes. Species 15—20.

5. *Anabates.* Flowers blue or white. Hood convex. Stem climbing, fomewhat twining. Species 21—25.

† Such as are not fufficiently defcribed; 26—28.

†† Such as are doubtful, or uncertain; 29—35.

Sect. 1. *Anthora.*

To the above characters are added—Hood acute at the apex. Root with two oblong knobs.

1. A. *Anthora.* Wholefome Wolf's-bane. (No. 5 of our former article.) Linn. Sp. Pl. 751. Willd. n. 5. Ait. n. 4. Jacq. Auftr. t. 382. (Anthora Matth. Valgr. v. 2. 441. Camer. Epit. 837. Rivin. Pentap. Irr. t. 128. A. vulgaris. Cluf. Hift. v. 2. 98. A. five Aconitum falutiferum; Ger. Em. 969. A. vera, flóre luteo; Barrel. Ic. t. 609.)

β. atrovirens; leaves and ftalks fmooth. (A. falutiferum elatius pyrenaicum, foliis atro-virentibus, flore majore; Tourn. Inft. 425.

γ. confertiforum; clufter cylindrical, denfe, downy. (A. tuberofum; Patrin, unpublifhed.)

Hood convex, terminating in a point; fpurs fpiral; lips inverfely heart-fhaped. Leaves in numerous linear fegments. —Native of rough bufhy places, on the mountains of Europe; in Switzerland, on the Apennines, and in Siberia; *β* on the Pyrenees; *γ* on mount Caucafus.

Var. *α* has either a fimple or branched *ftem*, which, like the *flower-ftalks*, is either fmooth, or finely downy. *β* has fmooth dark-green *leaves*, a taller and fmooth *ftem*, lefs convex *hood*, with a more abrupt and pointed *beak*. *γ* is fmaller, with a clofer more cylindrical *clufter*, whofe main ftalk, as well as the partial ones, are clothed with velvet-like down; it may be a diftinct fpecies. *De Candolle.*

We have not followed, here or elfewhere, our learned friend, in his elaborate affemblage of fynonyms, nor in his chronological arrangement of them. To the latter we have objections, and the former would only be burthenfome to our plan. We wifh to give our readers an idea of his powers of difcrimination, and to profit by them ourfelves.

2. A. *anthoroideum.* Prominent Wholefome Wolf's-bane. (A. pyrenaicum; Pallas Itin. v. 2. 316, by his herbarium.) —Hood convex; its back protruding forward, over the pointed beak; fpurs fpiral; lips inverfely heart-fhaped. Leaves in numerous linear fegments.—Gathered by Pallas in Siberia. This is fo like *A. Anthora,* that perhaps it may be efteemed a mere variety. It differs only in this refpect, that the back, or ridge, of the *hood* is not merely convex, but ftretched forward over the point in front. This plant varies like the former as to the denfity of its *clufter*, and the fmoothnefs or fine downinefs of the *flower-ftalks*. *De Candolle.* We moft readily concur in the opinion of its being a variety of the firft fpecies.

Sect. 2. *Lycoctonum.*

Flowers pale yellow, whitifh, or blueifh: their hood conical, elongated, obtufe, fcarcely pointed in front. Root tuberous, fending out fibres. Leaves with fomewhat wedge-fhaped lobes, deeply toothed, or jagged, at the extremity.

3. A. *barbatum.* Bearded Wolf's-bane. Patrin, unpublifhed. "Perf. Enchir. v. 2. 83. Poiret Suppl. to Lamarck Dict. v. 1. 114."—Hood conical, obtufe; fpurs ftraight; lips obovate; wings bearded with a fringe. Bracteas minute. Stem downy. Leaves in five deep divifions, with linear pointed lobes.—Native of the eaftern part of Siberia, about Irkoulfk. *Patrin.* Intermediate between *Anthora* and *Lycoctonum*, differing from the former in having a conical *hood*, from the latter in the linear lobes of its *leaves;* from both in the ftraight *fpurs*, or fummits of the *nectaries*, (De Candolle's *petals*). *Stem* round, finely downy, not hifpid. *Leaves* with long fcattered hairs on the *footftalks*, and here and there on the under fide; the upper appearing downy when magnified; their outline circular, divided nearly to the bafe into five fomewhat cohering lobes, pinnatifid, with linear pointed fegments. *Clufter* erect, long and denfe. *Stalks* erect, downy, fhorter than the flowers, having under each a linear-awlfhaped, fcarcely downy, *bractea*, ftill fhorter; as well as a fmaller clofe *bractea* half way up. *Flowers* whitifh, according to Patrin; pale yellow when dry; externally downy; hood elongated; wings orbicular, with long hairs on their margin and inner furface. *Germens* downy.

4. A. *hifpidum.* Rough-ftalked Wolf's-bane. De Cand. n. 4.—Hood conical, obtufe; fpurs ftraight; lips obovate; wings flightly bearded. Bracteas awl-fhaped, hairy. Stem hairy. Leaves in five deep divifions, with linear, rather acute, lobes.—Found by Pallas, in the eaftern part of Siberia. *Lambert.* Differs from the laft in its hifpid, not downy, *ftem;* more deeply five-cleft *leaves*, whofe lobes are not pointed, but rather obtufe, with a little callous apex; more hairy *bracteas;* and fcarcely bearded *wings.* The *leaves* are very like *Anthora*, but with broader lobes; *flowers* like *Lycoctonum*, but with ftraight *fpurs*. *Stem* erect, round, fimple; hifpid chiefly at the bafe, with foft, rather deflexed, hairs; the top almoft fmooth. Lower *leaves* on long hairy *ftalks*, their outline orbicular; upper fide fcarcely downy; ribs of the under one hairy. *Clufter* fimple, rarely with one fmall branch, cylindrical, erect. *Stalks* erect, fhorter than the *flowers*, which are pale yellow, refembling the laft, but lefs bearded. *Bracteas* awl-fhaped, fhaggy, two lines long; two fmaller ones in the middle of each ftalk. *De Candolle.*

5. A. *fquarrofum.* Spreading-lobed Wolf's-bane. Linn. MSS. in Herb. propr. De Cand. n. 5. (A. n. 2; Linn. Hort. Upf. 152, excluding the fynonyms. A. pyrenaicum; Linn. Sp. Pl. 751, excluding the fynonyms, and the Pyrenees

as

as its place of growth.)—Hood conical, obtufe; fpurs fpiral; lips inverfely heart-fhaped. Clufter drooping at the fummit before expanfion. Leaves in five deep divifions; lobes pinnatifid, with fpreading, recurved, acute fegments.—Native of Siberia and Tartary; cultivated in the Upfal garden. Very nearly allied to *Lycoctonum*, but differing in the *leaves* being divided to the very bafe into many pinnatifid portions, whofe elongated, acute, widely fpreading fegments are entire, not at all cut or ferrated. *Clufter* long, its upper part drooping while the flowers remain in bud. *Bracteas*, both general and partial, very fmall. *Stalks* fhorter than the flowers, but much longer than their refpective *bracteas*. The reft as in *Lycoctonum*. *De Cand.* To this original fpecimen is attached a different one from Siberia, which we concur with profeffor De Candolle in thinking no other than *Lycoctonum*. Hence Linnæus is no authority for *A. pyrenaicum*, which depends upon other authors, as follows. His herbarium indeed contains, if we miftake not, a fpecimen of this fpecies, brought by baron Alftroemer from Spain, but confounded by Linnæus with *Lycoctonum*.

6. A. *pyrenaicum*. Pyrenean Wolf's-bane. Lamarck Dict. v. 1. 33. Desfont. Tabl. 149. "De Cand. Franc. ed. 3. v. 4. 916. v. 5. 642." (A. pyrenaicum, ampliore folio tenuiùs laciniato; Tourn. Inft. 424. A. n. 6; Camer. Epit. 831, with a figure.)—Hood conical, obtufe; fpurs fpiral; lips obovate. Leaves palmate below the middle, with from feven to nine three-cleft, deeply cut lobes, lying over each other.—Native of rugged meadows on the Pyrenees, among lofty thickets, flowering in July and Auguft. Tournefort and De Candolle. Related to *Lycoctonum*, but certainly diftinct. A handfome plant, three or four feet high, downy, with large, long-ftalked, almoft circular *leaves*, whofe main lobes are unequally divided, wedge-fhaped at the bafe, feparated upwards into acute, cut lobes, dilated fo as frequently to overlap each other. *Clufter* long, cylindrical, denfe, more or lefs branched at the bafe. *Stalks* often fhorter than the flowers. *Lower bracteas* in three or five lobes; *upper* linear, in the middle of each ftalk, fpreading, from two to five lines long. *Flowers* pale yellow, externally covered with velvet-like down. *Germens* hairy. Thefe characters are not very ftrong, but they are conftant. Specimens gathered by De Candolle in the Pyrenees differed in no refpect from thofe which have been cultivated at Paris, ever fince the time of Tournefort. *De Candolle.* We have had no opportunity of enquiring what ftands for this fpecies in the gardens of England, but Miller is moft likely to have received the true plant from France. Our Linnæan Spanifh fpecimen, mentioned under the laft, correctly anfwers, in every point, to the above defcription.

7. A. *lycoctonum*. Great Yellow Wolf's-bane. Linn. Sp. Pl. 750. Willd. n. 1. Ait. n. 1. Jacq. Auftr. t. 380. Bulliard Fr. t. 63. Villars Dauph. v. 3. 703, from the author. (A. lycoctonum vulgare, luteo flore; Cluf. Hift. v. 2. 94. A. luteum ponticum; Lob. Ic. 677. Ger. Em. 970. A. reticulata radice, flore fulphureo-albicante; Barrel. Ic. t. 599, 600. A. n. 2; Camer. Epit. 827. Matth. Valgr. v. 2. 431. Napellus flore luteo; Rivin. Pentap. Irr. t. 129.)—Hood conical, obtufe; fpurs fpiral; lips obovate. Leaves downy, divided more than half way, into from three to five lobes, which are three-cleft and jagged. Partial bracteas in the middle of each flower-ftalk.—Native of woods, thickets, and graffy paftures, on the mountains of Switzerland, France, Germany, and Italy, flowering in fummer. This is probably, as M. De Candolle indicates, the real ακονιτον λυκοκτονον of Diofcorides, with whofe imperfect account it fufficiently agrees. It is one of the moft common of this genus, but not found in Britain. The *ftem* is from two to four feet high, nearly fimple, or very much branched, fmooth or downy. Lobes of the *leaves* more or lefs deep, either clofe or fpreading. *Flowers* crowded or diftant. M. De Candolle hints that fome of thefe diverfities may afford fpecific diftinctions, but we can fcarcely fuppofe this. He obferves that *A. lycoctonum* differs from *barbatum*, *hifpidum*, and *ochroleucum* in its fpiral fpurs; from *pyrenaicum* in having from three to five, not feven to nine lobes in the *leaves*, and thofe not lying over each other, as well as in the *germens* being fmooth, fcarcely at all downy or hairy, and the *ftalks* moftly longer than their flowers. From the following one, hitherto confounded herewith, it differs in having pale-yellow, not blue, *flowers*, and the partial *bracteas* fituated half way up the flower-ftalks, not near their bafe.

8. A. *feptentrionale*. Blue Northern Wolf's-bane. "Koelle Acon. 22." Willd. n. 7. De Cand. n. 8. Ait. n. 6. (A. lycoctonum; Linn. Fl. Lapp. ed. 2. 185. Tour in Lapland, v. 1. 36. 47. 278. v. 2. 123. 277. Fl. Dan. t. 123. Calceolus Lapponicus; Schæff. Lapp. 360.)—Hood conical, obtufe; fpurs fpiral; lips obovate. Leaves downy, divided more than half way, into from three to five divaricated fharply cut lobes. Partial bracteas at the lower part of each flower-ftalk.—Native of mountainous thickets and paftures on the fides of the Lapland alps, and throughout Norway, as well as in fome parts of Siberia, and on the Carpathian mountains. Linnæus noticed it alfo about the bafes of the larger hills in Medelpad and Angermanland; but though he has recorded in Fl. Lapp. that the *flowers* are of a greyifh-blue; not yellow, as defcribed in all the accounts of *A. lycoctonum*; yet he ftill fuppofed his to be the fame fpecies. His own fpecimen retains evident traces of this blue or grey colour, and anfwers to the diftinctive characters of the *feptentrionale*, as given by De Candolle. The *leaves*, as that excellent writer remarks, are more acutely toothed. With refpect to the fituation of the partial *bracteas*, they are rather on the lower part, than at the bafe, of the *flower-ftalks*. The *flowers* are lefs downy, and of a thinner texture, than in *lycoctonum*. Perhaps if living fpecimens were compared, better characters might be difcovered, for there is every reafon to prefume this a diftinct fpecies. Linnæus in Fl. Lapp. fpeaks of the leaves being boiled and eaten with impunity; and in his Lapland Tour, v. 2. 123, records another inftance of the fame fact. He was juftly aftonifhed, knowing the poifonous quality attributed by all writers to *A. lycoctonum*. Perhaps this may ftrengthen our opinion of thefe plants being truly diftinct, for we find no record of the true *lycoctonum* being ufed as food, in any ftate. Haller was one of the firft botanifts who fuggefted the propriety of feparating thefe fpecies; fee his Hift. Stirp. Helvet. n. 1200. Yet there feems little reafon for his wonder, there expreffed, that this *Aconitum* fhould be fatal to wolves. When recent its qualities are probably very different.

9. A. *ochroleucum*. Pale Wolf's-bane. Willd. n. 4. De Cand. n. 9. Ait. n. 3. Marfch. Taurico-Caucaf. v. 2. 14, excluding the fynonym of Tournefort.—Hood conical, elongated; fpurs curved; lips lanceolate. Leaves deeply palmate, five-lobed, fcarcely downy beneath; lobes deeply three-cleft, acutely jagged and toothed.—Found in mountainous meadows of mount Caucafus; frequent about the mineral fprings of Narzana; flowering in fummer. Communicated to us by Dr. Fifcher. The habit entirely refembles *A. lycoctonum*, but the furface of the herb is nearly fmooth; the lobes of the *leaves* are more fharply toothed; and the *fpurs* of the *nectaries* are rather curved than fpiral. *Stem* erect, round, pale green, three or four feet high, with ftraight branches. *Clufter* long, branched at the bottom.

Lower bracteas in three or five segments, often reflexed; *upper* linear; *partial ones* in the middle of each *flower-stalk*, two lines long. *Flowers* pale buff, crowded, remarkable for their long and slender *hood*, measuring above an inch. *Stalks* shorter than the flowers. *Spurs* of the *nectaries* curiously involute.

10. A. *japonicum*. Japan Wolf's-bane. Thunb. Jap. 231. Willd. n. 2. De Cand. n. 10. (Soo Huso of the Japanese.)—Hood conical, obtuse. Leaves palmate, three-lobed; lobes obtuse, cut; their segments rounded, with a point.—Gathered in Japan by Thunberg, who describes this species as allied to *lycoctonum*. The *stem* is round and smooth. *Leaves* stalked; their lateral lobes in two segments; middle one in three; all obtuse, deeply toothed; their teeth rounded, with a point. *Cluster* short. *Thunberg*.

Sect. 3. *Napellus*.

Flowers blue or white, never buff-coloured; their hood convex, tapering into a point in front. Stem straight. Cluster cylindrical. Roots fibrous, from a rather tuberous stock. Leaves lobed in a palmate manner, many-cleft; their segments linear.

All the species of this section having been confounded under *A. Napellus*, De Candolle has thought right to lay aside that specific name entirely. But even he is doubtful whether they are not all one species!

11. A. *vulgare*. Common Monk's-hood. De Cand. n. 11. (A. Napellus; Linn. Sp. Pl. 751. "Koelle Acon. 14, with a figure." Woodv. Med. Bot. t. 6. Sm. Prodr. Fl. Græc. Sibth. v. 1. 372. A. lycoctonum 6, Napellus vulgaris; Cluf. Hist. v. 2. 96. Napellus; Matth. Valgr. v. 2. 440. N. verus cæruleus; Ger. Em. 972. N. flore minore; Rivin. Pentap. Irr. t. 130.)—Germens three, smooth. Wings hairy on the inside. Cluster cylindrical, elongated. Leaves in five divisions to the very base, with many linear acute segments, each with a longitudinal furrow on the upper side.—Native of mountainous meadows in most parts of Europe, from Switzerland, Germany, France, Spain, and Italy, to Greece, flowering in summer, and one of our most common garden plants ever since the days of Gerarde. Dr. Leèch sent us specimens from Scotland; but there is reason to doubt the plant's being really wild in Britain. De Candolle distinguishes this from all its relations, though, as he says, with difficulty, by the simple, straight, upright *stem*, almost always terminating in a simple cylindrical close *cluster*, and not corymbose; *leaves* with linear segments, that are hardly at all dilated at the extremity, marked with a furrow, and not resembling any others, except perhaps those of *A. tauricum*, whose *cluster* is the only one more dense than the present; *hood* convex, rather acute at the summit, but not gibbous or elevated at the back, as in *intermedium*, *rostratum*, and *variegatum*; *wings* hairy on the inside, which in *tauricum*, *paniculatum*, &c. are smooth; *germens* smooth, never more than three, not five, and hairy; *capsules* six lines long, and not an inch, as in *A. neubergense*. The present species however, being very common, is extremely variable; the whole surface is sometimes quite smooth, sometimes downy, especially about the *flowers*; the furrow on the segments of the *leaves* is more or less distinct; the *flowers* naturally blue, or (in the variety called by Schultz *bicolor*) white at the base, blue at the summit, become in gardens white, rose-coloured, purple, or variegated. *De Candolle*. Their most usual and well-known colour is a deep and gloomy blue; we have seen no other. Dr. Sibthorp's Greek plant must rest on his own authority, being only mentioned in his MSS., without any accompanying specimen; nor were the species of this genus so accurately noted in his time.

12. A. *strictum*. Straight Monk's-hood. "Bernh. Monogr." De Cand. n. 12.—Germens three, smooth. Wings hairy on the inside. Cluster cylindrical, elongated. Leaves in five divisions to the very base; their lobes wedge-shaped, jagged at the summit.—Native country unknown. Closely related to the last, but differing in the three or five divisions of the *leaves* being wedge-shaped in their lower part, and cut at the extremity into oblong lobes, which are shorter, blunter, and twice as broad as in that; the *cluster* is shorter, with little short branches at its base. Perhaps this may not be sufficiently distinct from the following. *De Candolle*.

13. *A. neubergense*. Broad-leaved Monk's-hood. De Cand. n. 13. (A. Napellus; Herb. Linn. Jacq. Austr. t. 382. Ehrh. Pl. Off. n. 87. "Palmstr. Suec. t. 46." A. lycoctonum, vel neubergense; Cluf. Hist. v. 2. 96. Moris. sect. 12. t. 3. f. 11. A. purpureum neubergense; Ger. Em. 973. A. foliorum laciniis linearibus, supernè latioribus, lineâ exaratis; Linn. Hort. Cliff. 214. Moræus in Stockh. Trans. for 1739. 43. t. 2. Napellus flore majore; Rivin. Pentap. Irr. t. 131.)—Germens three, smooth. Wings hairy on the inside. Cluster cylindrical, elongated, lax; stalks downy, rather spreading. Leaves in five deep, wedge-shaped, three-lobed, jagged segments.—Native of alpine meadows in various parts of Germany, Hungary, Siberia, &c., flowering rather later than *A. vulgare*, and no less common in gardens than that species, with which it is generally confounded. Clusius having originally met with this plant in the greatest abundance on the mountain called Neuberg, in Styria, De Candolle has chosen the above specific name, which is indeed preferable to the mongrel one of *neomontanum*, adopted by some writers. The species before us is said to differ from *vulgare*, in having broader *leaves*, whose rather wedge-shaped divisions are more connected at the base; three-cleft and cut at the extremity, into acute segments, thrice the breadth of *vulgare*, and not marked with any furrow. The *cluster* also is more lax, its stalks always downy, more spreading, and longer than the *flowers*. The *capsules*, according to Wahlenberg, are three, above an inch long, spreading, those in the middle part of the cluster exceeding the length of their stalks.

14. A. *tauricum*. Taurian Monk's-hood. Wulf. in Jacq. Coll. v. 2. 112. Jacq. Ic. Rar. t. 492. De Cand n. 14. "Koelle Acon. 15." (A. Napellus; Bull. Fr. t. 45? *De Cand.* A. lycoctonum quartum tauricum; Cluf. Hist. v. 2. 95. A. violaceum; Ger. Em. 973.)—Germens three, smooth. Wings smooth. Cluster cylindrical, elongated, very dense; stalks smooth, shorter than the bracteas. Leaves in five divisions to the very base, somewhat pedate, with linear lobes.—Native of the alpine heights of Tauria, Carinthia, &c. flowering in summer. Very like *vulgare*, but the smooth *wings* and *flower-stalks*, the latter shorter than their *bracteas*; the short dense *cluster*, whose main stalk is concealed; and the pedate, more wedge-shaped, linear-lobed, scarcely furrowed *leaves*, are thought by De Candolle to afford sufficient differences.

Sect. 4. *Cammarum*.

Flowers blue or white; hood very convex, or conical, ending, often abruptly, in a point in front. Cluster lax, somewhat corymbose. Stem straight. Leaves deeply divided, in a palmate manner, into wedge-shaped lobes. Roots navew-shaped, intermixed with small fibres.

For the same reason as concerns the last section, the specific name *Cammarum* is here laid aside, having been variously applied by different botanists. De Candolle suspects all the species of the present section, or at least the first four, may be varieties of each other!

15. A. *intermedium.* Ambiguous Monk's-hood. De Cand. n. 15. (A. neomontanum; Willd. n. 9, excluding the synonyms. "Hoppe Pl. Exsicc." *De Cand.* Thora italica, seu Napellus minor, flore cæruleo; Barrel. Ic. t. 610.)—Germens three, smooth. Wings internally hairy. Cluster lax, corymbose; stalks smooth. Hood very convex, somewhat conical.—Found in mountainous woody parts of Germany and Flanders, flowering in July. In habit like the two following, but the hairy *wings*, (De Candolle by mistake says *lips*,) distinguish this species from all the rest of the section. We have seen no specimen.

16. A. *paniculatum.* Panicled Monk's-hood. Lamarck Franc. ed. 1. v. 3. 646. n. 1224. Dict. v. 1. 33. De Cand. n. 16. (A. Napello simile, sed minus, cæruleum, præcocius; Bauh. Hist. v. 3. 656. Chabr. Sciagr. 531. Napellus; Camer. Epit. 836. Storck Libell. 69. t. 3.)

β, cluster drooping. De Cand. (A. cernuum; "Koelle Acon. 17." Willd. n. 12. A. lycoctonum octavum, comâ nutante; Clus. Hist. v. 2. 97. A. maximum nutante comâ; Ger. Em. 971. A. septimum; Matth. Valgr. v. 2. 436. Camer. Epit. 832.

Germens three, smooth. Wings internally smooth. Cluster lax, corymbose; stalks downy. Hood convex.—Found in various alpine parts of Europe, flowering towards autumn. The *roots* are roundish, tapering downwards, bearing many long fibres. *Stem* erect, smooth. *Leaves* somewhat pedate; their lobes wedge-shaped below, acutely pinnatifid upwards. *Cluster* usually erect, with long downy *stalks;* downy; the lower ones branched. *Flowers* large, of a brighter blue than *vulgare*, with a convex *hood*, whose point is more remarkable than in the 3d section. It may be important, if any person should repeat Storck's experiments, to be aware that this is the plant he used, and not our Common Monk's-hood, *A. vulgare.*

17. A. *rostratum.* Beaked Monk's-hood. De Cand. n. 17. (A. *Cammarum;* Lamarck Dict. v. 1. 33. Willd. n. 14? A. lycoctonum nonum judenbergense; Clus. Hist. v. 2. 97. A. maximum judenbergense; Ger. Em. 973. A. lycoctonum, flore maximo; Bauh. Hist. v. 3. 659.)—Germens three, smooth, or only fringed at the inner edge. Wings smooth. Cluster somewhat corymbose, of few flowers, with smooth stalks. Hood conical, elevated, abrupt in front, with a prominent beak.—Native of the Austrian and Swiss alps, flowering in summer. We have it in Mr. Davall's herbarium, but the plant seems unknown to cultivators. The *roots* are roundish, tapering downward. *Stem* a yard high, straight, round, smooth, purplish. *Leaves* somewhat pedate, with wedge-shaped, jagged, acute lobes. This species differs from the preceding, as well as from the following, in the very large and high *hood*, accompanied by a very considerable *beak*, being conspicuous for the greater size, and rather paler blue, of its flowers.

18. A. *hebegynum.* Downy-fruited Monk's-hood. De Cand. n. 18. (A. Cammarum; Linn. Sp. Pl. 751? Willd. n. 14? Ait. n. 11? Jacq. Austr. t. 424.)—Germens from three to five, all over finely downy. Wings nearly smooth. Cluster rather corymbose, of few flowers; stalks downy. Hood convex, beaked in front.—Native of rugged bushy places on the alps of Switzerland, from whence we have it; as well as of Austria and the recesses of the Carpathian mountains, flowering in summer. A large handsome species, with ample *foliage*, whose segments are acutely pinnatifid. *Flowers* dark-blue; their hood rounded, much less elevated than in the preceding. The *germens* clothed with fine velvet-like down afford a clear specific character. There are no means of perfectly ascertaining the *A. Cammarum* of Linnæus, he having left no specimen, and his synonyms pointing to different plants. His character of "*floribus subpentagynis*" is all that indicates the present species, which is probably the plant of the gardens. De Candolle says all the synonyms of his first, or principal, variety of *paniculatum*, may just as well serve for *hebegynum;* but surely Storck's figure cannot be mistaken for this. The plants themselves can never be confounded, provided the *germens* be attended to; for which discovery we are indebted to professor De Candolle.

19. A. *variegatum.* Variegated Monk's-hood. Linn. Sp. Pl. 750. Willd. n. 13. Ait. n. 10. "Koelle Acon. 18." (A. lycoctonum decimum, Thora italica; Clus. Hist. v. 2. 98. A. lycoctonum cæruleum parvum; Ger. Em. 971. Napellus flore mixto; Rivin. Pentap. Irr. t. 133.)—Germens three, smooth as well as the petals. Cluster lax; stalks smooth; the lower ones many-flowered, twice the length of their many-cleft bracteas; their lower partial bracteas cut. Hood elevated, conical, obtuse, with a short beak in front.—Native of woody rather alpine situations, in Carniola, Bohemia, and Italy, flowering in August. *Root*, according to Clusius, tuberous, with ovate knobs, or rather perhaps buds. Whole *herb* smooth. *Stem* erect, with spreading branches. *Lower leaves* on long stalks, their outline orbicular, their upper side of a shining green, lower pale; their three or five deep principal divisions wedge-shaped at the base, dilated and many-cleft at the extremity, with oblong acute segments; *upper leaves* sessile; *floral* ones in three deep divisions, copiously, but not deeply, cut. *Lower stalks* of the *cluster* distant, each bearing three or four flowers. Partial *bracteas*, which are under each flower, linear. *Flowers* large, perfectly smooth, blue (or blue and white); the *hood* very large, above an inch long, and extremely convex, not at all covering the wings, its beak short; *wings* orbicular, six or seven lines long; *germens* smooth, slender. *De Candolle.* This description answers to the Linnæan specimen, and nearly to our garden plant, except that we have always seen the *flowers* principally white, with a portion of blue on the beak and wings, and that the *stem* in ours is rather of the twining or wavy kind, as in the next section; by no means straight, though supporting itself. This character appears in the old wooden cuts, and may possibly have escaped M. De Candolle, only because, as he himself mentions, he had seen no other than a dried specimen. The figure of Rivinus indeed is erect, and yet, notwithstanding the annexed representation of five *capsules*, we can scarcely doubt that synonym.

20. A. *album.* White Monk's-hood. Ait. ed. 1. v. 2. 246. ed. 2. n. 5. Willd. n. 6. De Cand. n. 20. (A. orientale; Mill. Dict. ed. 8. n. 10. A. lycoctonum orientale, flore magno albo; Tourn. Cor. 30. Napellus flore albo; Rivin. Pentap. Irr. t. 132?)—Germens four or five. Hood conical, with a long claw. Cluster lax, simple. Stalks erect. Leaves in three or five deep, ovate-wedge-shaped, three-cleft, toothed segments.—Found in the Levant by Tournefort, who sent seeds to the royal garden at Paris, and from thence, according to Miller, it came to England. Hence there can be no doubt respecting Tournefort's synonym; and yet his appellation of *lycoctonum*, and the place in his *Inst.*, where he directs this species to be inserted, might favour the application of his synonym to *ochroleucum*, n. 9, as in the Flora Taurico-Caucasica. The plant of Aiton, and consequently of De Candolle, is totally different from the *ochroleucum*, and very near *variegatum*. The *stem* is described by Miller six feet high, or more. We have a specimen from Dr. Schrader, sent to be compared with *Napellus*, which appears to be this very species, and agrees well with the figure of Rivinus indicated above, except the *flowers* being blue; but that circumstance can be

be of no moment. The *ſtem* is round and ſmooth. *Leaves* ſmooth; their wedge-like lobes ſharply pinnatifid. *Cluſter* lax, with ſome axillary branches below. *Stalks* erect, ſmooth. *Hood* near an inch and a half long, obtuſe, even, bent forward with a ſlightly recurved, notched, beak; its *claw* longer than the large round *wings*. *Germens* five, ſmooth.

Sect. 5. *Anabates.*

Flowers blue or white; hood convex. Cluſter lax. Stem twining, climbing.

21. A. *erioſtemon.* Hairy-threaded Monk's-hood. De Cand. n. 21. ("A. volubile; Koelle Acon. 21, but not of Willdenow." *De C.*)—Stem twining, ſomewhat downy with cloſe hairs. Footſtalks naked. Leaves in three or five deep, pinnatifid lobes, with lanceolate ſegments. Cluſter lax. Germens two or three, very ſmooth. Stamens hairy. —Gathered by Koelle in Siberia; cultivated at Montpellier. *Stem* round, its fine cloſe hairs ſcarcely viſible with a microſcope. *Leaves* ſmooth, with diſtant, oblong, acute ſegments. *Upper branches* flowering at their extremities. *Lower bracteas* in three or five diviſions; *upper* oblong, undivided; *partial ones* linear. *Stalks* downy. *Flowers* pale blue, hardly at all downy; *hood* gradually tapering into an acute beak, with a ſpace between it and the *wings*, which are fringed, but nearly or quite ſmooth on their inſide. *Filaments* hairy! *De Candolle.*

22. A. *ciliare.* Fringed Monk's-hood. De Cand. n. 22. (A. volubile; Willd. n. 11, but not of Koelle. Ait. n. 9. Donn Cant. ed. 5. 135.)—Stem twining, clothed with ſpreading hairs. Footſtalks fringed. Leaves in three or five deep pinnatifid lobes, with linear-lanceolate ſegments. Cluſter lax. Germens five or more.—Native of woods in Siberia. We received a ſpecimen in flower, in Sept. 1801, from the rich garden of the late Rev. Mr. Watts, of Aſhill, Norfolk. The *ſtem* is round, ſlender, purpliſh, ſix feet high, varying in its degree of downineſs. *Leaves* in ſize and figure not unlike *Malva moſchata.* *Cluſter* branched, lax. *Flowers* of a middle ſize, rather light blue, downy; *hood* convex, rounded, with a beak in front; *ſpurs* hooked, with an obtuſe, inverſely heart-ſhaped, lip. *Germens* five or ſix, elliptic-oblong, ſmooth. *Stamens* ſmooth. Our ſpecimen rather anſwers to the more hairy variety of De Candolle, which he ſuſpected might prove a diſtinct ſpecies; we have ſeen no other, and can therefore form no opinion.

23. A. *tortuoſum.* Twiſted Monk's-hood. Willd. Enum. 576. De Cand. n. 23. (A. n. 8; Matth. Valgr. v. 2. 437? A. comâ inflexâ, foliis latioribus; Tourn. Inſt. 425?)—Stem twining, ſmooth, as well as the footſtalks. Leaves in three deep, ovate, pointed, coarſely and deeply toothed lobes. Cluſter lax. Germens two or three, quite ſmooth, as well as the ſtamens.—Seen in a cultivated ſtate only, by Willdenow and De Candolle, who knew not whence it came. The *ſtem* riſes to the height of ſix or ſeven feet, branching, round, and ſmooth. *Leaves* ſmooth; their lobes wedge-ſhaped at the baſe; the lateral ones deeply cloven. *Flower-ſtalks* downy. *Lower bracteas* three-cleft; *partial ones* awl-ſhaped, placed about half way up each ſtalk. *Flowers* ſmooth, pale blue; *hood* convex, gradually tapering into an acute beak. The figure of Matthiolus expreſſes the habit, but may probably belong to ſome other ſpecies. *De Candolle.* Indeed many of that author's figures are curved, evidently to accommodate them to the dimenſions of the wooden block.

24. A. *glabrum.* Smooth Twining Monk's-hood. De Cand. n. 24.—Stem twining, ſmooth like the footſtalks. Leaves in five deep, lanceolate, wedge-ſhaped, coarſely and deeply toothed lobes. Cluſter lax. Hood ſtalked, elongated, conical, with a long, erect, cloven beak.—Native country unknown. Deſcribed from the herbarium of Profeſſor Desfontaines. The whole herb is ſmooth. The *flowers* are pale blue, and remarkable for the long linear lobes which terminate the *beak*, and ſtanding erect, are nearly on a level with the top of the *hood*, which appears to be the great peculiarity of this little-known ſpecies.

25. A. *uncinatum.* American Monk's-hood. Linn. Sp. Pl. 750. Willd. n. 15. Ait. n. 12. Purſh n. 1. Curt. Mag. t. 1119. De Cand. n. 25.—Stem ſomewhat twining, ſlightly downy. Footſtalks ſmooth. Leaves abrupt at the baſe; lobes three or five, acute, with three teeth. Cluſter lax. Hood ſtalked, elongated, convex.—In ſwamps, and by the ſides of rivulets, on the high mountains of Virginia and Carolina, flowering in June and July. *Flowers* large, of a fine blue, and ſingular ſtructure. *Purſh.* *Stem* round, ſomewhat branched, minutely downy. *Footſtalks* ſmooth, round, with a longitudinal furrow. *Leaves* coriaceous, ſmooth, dark-green, lobed only about half down; lobes three-ribbed. *Lower ſtalks* of the *cluſter* long and divided; *upper* ſimple and crowded; all downy in their upper part. *Bracteas* two, oblong, not far from the *flowers*, which are large, of a rich violet purple; *hood* tapering into a ſharp beak; wings orbicular, hairy rather than fringed. *Germens* three to five, downy. Such is our Linnæan ſpecimen, from J. Bartram.

M. De Candolle ſaw in the herbarium of Michaux, mixed with the above, ſpecimens, whoſe *hood* was twice as long, almoſt conical, without any hook or beak. This he conſiders as the *uncinatum* of that author, Fl. Boreal.-Amer. v. 1. 315, and poſſibly a diſtinct ſpecies.

Mr. Purſh ſays,—"On the foot of the Peaks of Otter, and about the ſweet ſprings, another ſpecies occurs, with ſmaller *flowers*, and a climbing *ſtem* which ſometimes attains the height of nine feet; but unfortunately I have no materials at preſent to give a correct deſcription thereof."

Hence it appears that the hiſtory of this long-eſtabliſhed genus is not yet complete. M. De Candolle enumerates three ſpecies, of which he had not ſufficient information to define them correctly. Theſe are,

26. A. *delphinifolium*, of which there are three varieties. 1. *Americanum*, found by David Nelſon, in Sledge (not Hedge) iſland, with an erect *ſtem*, from ſix to twenty inches high, downy upwards; *leaves* like *Delphinium pentagynum*, ſmooth, in numerous pinnatifid ſegments; and blue racemoſe *flowers*, whoſe *hood* is convex, acute at the ſummit. 2. *Sibiricum*, gathered in Siberia by Pallas, has larger *flowers*, with *nectaries* but half the length of the hood. 3. *Kamtchaticum*, has from three to ſix rather ſcattered, ſomewhat ſmaller, *flowers*, and rather longer *nectaries*. *Root* of tufted fibres. *De Cand.*

27. A. *biflorum.* (A. grandiflorum; Fiſcher Hort. Gorenk. 1808. 77.)—Native of the Altai mountains. *Root* tuberous, ovate, the ſize of a pea. *Stem* four inches high, ſlender, finely downy at the ſummit. *Leaves* in five deep, palmate ſegments, with linear acute lobes; the lowermoſt on long ſtalks. *Flowers* two, terminal, nearly ſeſſile, pale blue; *hood* convex, externally downy at the back, tapering into an acute beak; *wings* obovate, or roundiſh, ſmooth. *Stamens* ſmooth. *Germens* three, villous. *Nectaries* hooked, obtuſe, with very minute lips. *De Cand.*

28. A. *maximum.* Pallas herb.—Native of Kamtchatka. *Stem* ſix feet high, erect, round, ſmooth. *Leaves* ſmooth, ſtalked, wedge-ſhaped at the baſe, in three or five dilated, wedge-ſhaped, five-cleft lobes. *Cluſter* ſhort, of eight or ten pale-blue *flowers*, on downy *ſtalks*, with a convex acute *hood*, like that of *delphinifolium*, but ſmaller. *De Cand.*

The

The feven following are fcarcely to be afcertained.

29. A. nonum; Matth. Valgr. v. 2. 438. Dalech. Hift. 1741. f. 2. A. comâ inflexâ, floribus rarioribus, et foliis eleganter diffectis; Tourn. Inft. 425.—We fhould fuppofe this an unnatural pofture of *A. Anthora*, n. 1.

30. A. lycoctonum quartum, five lynceanum; Cluf. Hift. v. 2. 96. Bauh. Hift. v. 3. 657.—No figure.

31. A. ramofum, parvo flore; Bauh. Pin. 183. Bauhin cites A. octavum, Matth. Valgr. v. 2. 437. See our n. 23.

32. A. fpicâ florum pyramidali; Morif. Præl. 226. A. pyramidale multiflorum; Tourn. Inft. 425. A. pyramidale; Mill. Dict. ed. 8. n. 6.—Efteemed by De Candolle a variety of *A. vulgare*, n. 11.

33. A. *feptimum*. Matthioli; Debry Floril. Nov. t. 42, but not the plant of Matthiolus.

34. A. minus autumnale infulæ Cheufan, finicè *Tfou-u;* Pluk. Amalth. 5.

35. Napellus major cæruleus montanus, anthoræ radice; Bocc. Muf. 74.—Native of Monte Cofcione, in Corfica.

ACOTYLEDONES, conftitute a clafs of plants in the natural fyftems of moft authors, but efpecially of Juffieu, in whofe method this clafs ftands firft. In thefe the *corculum* of the feed is defined to be deftitute of cotyledons, and confequently undivided in the procefs of germination, though forming a root below, and more or lefs of a ftem, or at leaft a frond, above. The parts of fructification in many of this tribe are obfcure, anomalous, or altogether unknown. The orders in the above-mentioned writer are fix; FUNGI, ALGÆ, HEPATICÆ, MUSCI, FILICES, and NAIADES; all which articles the reader will find in their proper places. From our account of *Mufci* and *Filices* he may obferve, that the denomination of the fuppofed natural clafs in queftion, and its effential character above-mentioned, are far from being univerfal or unexceptionable, thofe two orders having manifeft cotyledons, or fomething equivalent; while many plants, fuppofed to have a folitary cotyledon, have really none at all. See the article MONOCOTYLEDONES, where this fubject is difcuffed. See alfo COTYLEDONES and GERMINATION.

ACOUCHY. See AKOUSCHY.

ACOUROA, in *Botany*, apparently a vernacular name in Guiana, by which Aublet has chofen to defignate a papilionaceous diadelphous plant, which Juffieu, with great reafon, fufpects to be a fpecies of PTEROCARPUS (fee that article); as well as another genus, named by the fame author *Vatairea*. See Aubl. Guian. 753—756. t. 301, 302.

A. *violacea*, the only fpecies, is a tree, found about the margins of falt-water creeks in Guiana, bearing flowers and fruit in July. The *trunk* is twelve or fifteen feet high, and a foot in diameter, fending out from its fummit many fpreading branches; the bark reddifh, cracked, and wrinkled; the wood whitifh externally, but the heart is reddifh, hard and compact. *Leaves* alternate, alternately pinnate of feven or nine ovate, pointed, entire, firm, fmooth *leaflets*, gradually larger upwards, the lowermoft being an inch and a half or two inches long, the uppermoft or terminal one four or five. *Stipulas* fmall, deciduous. *Clufters* about the ends of the branches, long, compound, many-flowered. *Bracteas* fmall, folitary at the bafe of each flower. *Calyx* of one leaf, in five fharp unequal fegments. *Corolla* papilionaceous, violet-coloured. *Stamens* ten, diadelphous, the odd one diftinct. *Stigma* obtufe. *Pericarp* dry, reddifh, nearly orbicular, concave on one fide, convex on the other, not burfting. *Seed* folitary, lenticular. *Aublet*.

The *Vatairea*, Aubl. t. 302, is a much larger tree, the *trunk* being fifty feet in height, with a fmooth whitifh bark, and light brittle wood. *Leaves* pinnate, as in the former, but more elliptical. *Flowers* unknown. *Pod* flat on both fides, with a thick edge, chefnut-brown, of an irregularly orbicular fhape, about three inches in diameter, containing one large *feed;* which, when beaten in a mortar with purified pork lard, is ufed to cure tetters or ring-worms, whence the inhabitants of Guiana call this feed *Graine à dartres*. The tree grows by river fides in that country. *Aublet*.

ACQUACKNACK. Add, containing 2023 inhabitants.

ACRE, col. 3, l. 29. The tobacco of Acre is highly efteemed; and coarfe muflins, remarkable for the durability of their dye, are fold at a low rate. The inhabitants make ufe of wooden tubes for their tobacco-pipes, garnifhed with a fwathing of filk, or linen, for the purpofe of abforbing water. This being kept moift, cools the fmoke, as it rifes, by the conftant evaporation. A modern traveller, in the account of his Journey from Acre to mount Carmel, mentions the exportation to Venice of the fand of the river Belus for the glafs-houfes of that city. (See GLASS.) At Acre there are the remains of an ancient church, with pointed arches, other inftances of which, demonftrating the exiftence of the Gothic architecture, occur in the Holy Land.

ACROSTICHUM, in *Botany*, a Linnæan name, whofe meaning therefore is to be fought in the obfcure hints left by its author. He derives the word in *Phil. Bot.* 183, from ακρος, *top*, and στιχος, *an order or row*, but its application has been thought rather difficult. We agree with De Theis, that ακροστιχον literally means the beginning, or the firft letters, words, or lines, of a fet of verfes; but we cannot affent to his explanation, of its being given to thefe plants "becaufe feveral of them bear, on the back of the leaf, lines refembling the beginnings of words;" there being in fact no fuch thing, nor has Linnæus defcribed any fimilar marks. It feems natural to trace his ideas in the appearance of the moft remarkable of the original fpecies, four of which are delineated in *Amoen. Acad. v.* 1. *t.* 10, and in two or three of thefe, the *rows* of linear appendages, or *leaflets*, at the *top* of the *frond*, fufficiently explain the meaning of Linnæus. Thefe fpecies indeed are now removed from the eftablifhed genus of *Acroftichum*, which has undergone much alteration fince its firft publication, and the view of its fpecies already given, (fee ACROSTICHUM,) requires to be totally reformed. Many of them are removed to other genera, while a great number of new ones have more than fupplied their places. Willdenow, the lateft general writer on *Filices*, which make the moft original and accurate part of his *Species Plantarum*, defines fixty-two fpecies, under fix fections, of which we fhall take a general view, firft, as ufual, prefixing the generic fynonyms and characters.—Linn. Gen. 559. Schreb. 756. Willd. Sp. Pl. v. 5. 100. Mart. Mill. Dict. v. 1. Ait. Hort. Kew. v. 5. 500. Sm. Mem. de l'Acad. de Turin, v. 5. 147. Tracts 230. Prodr. Fl. Græc. Sibth. v. 2. 271. Swartz Syn. Fil. 9. Ind. Occ. 1587. Spreng. Crypt. Engl. ed. 84. t. 2. f. 18. Brown Prodr. Nov. Holl. v. 1. 145. Purfh 658. Juff. 15. Lamarck Dict. v. 1. 34. Illuftr. t. 865 f. 4.—Clafs and order, *Cryptogamia Filices*. Nat. Ord. *Filices dorfiferæ*; fect. *annulatæ*.

Gen. Ch. *Capfules* globular, of two equal valves, bound by a jointed elaftic ring, and difpofed in broad, continued, indeterminate, denfe maffes, more or lefs intermixed with hairs, or fine fcales, over the back of the *frond;* either entirely, or partially at the upper part of the whole, or of its fegments or leaflets, which are often contracted, or otherwife changed, in their fructifying portions. *Involucrum* entirely wanting, (unlefs the above-mentioned hairs, or fcales, be taken for fuch.)

Eff. Ch. Capfules occupying the back of the frond, in uninterrupted

uninterrupted ſhapeleſs maſſes, either partially or entirely. Involucrum none.

The whole genus, as it now ſtands, is chiefly tropical, a very few ſpecies only being found in the ſouth of Europe, and one in North America. None are arboreſcent. The ſpecies removed from the catalogue of the genus, in our former article, are the following; and are thus diſpoſed of by Willdenow, we believe, on the whole, very correctly.

A. *lanceolatum*, is Polypodium acroſtichoides, Willd. Sp. Pl. v. 5. 156.
heterophyllum, P. adnaſcens, ibid. 145.
punctatum, Linn. Sp. Pl. 1524, P. lingulatum, 159.
ſpicatum, Sm. Pl. Ic. t. 49, Lomaria ſpicata, 289.
Lingua, Polypodium Lingua, 162.
haſtatum, P. tricuſpe, 163.
ſeptentrionale, Aſplenium ſeptentrionale, 307.
auſtrale, A. auſtrale, 308.
pectinatum, Schizæa pectinata, 85.
dichotomum, S. dichotoma, 87.
digitatum, S. digitata, 86.
ferrugineum, Polypodium incanum β, 175.
polypodioides, P. incanum α, 174.
rufum, Hemionitis rufa, 129.
punctatum, Linn. Suppl. 444, altered to *punctulatum* by Swartz, Syn. 13, retains the latter name in Willd. Sp. Pl. v. 5. 118.
areolatum, Woodwardia anguſtifolia, Sm. unjuſtifiably altered to W. onocleoides, ibid. 416.
marginatum, Pteris grandifolia, 369.
ſanctum, Polypodium ſanctum, 198.
platyneuron, Aſplenium ebeneum, 329.
ſiliquoſum and *thalictroides*, reduced to one ſpecies, as Pteris thalictroides, 378; but perhaps they require further inveſtigation.
ilvenſe, Polypodium ilvenſe, 198. See Woodsia.
furcatum, Mertenſia furcata, 71; a genus reduced by Mr. Brown to Gleichenia. See that article, and Mertensia.
aculeatum, Davallia fumarioides, 480.
barbarum, Todea africana, 76, our Osmunda *barbara*.
viviparum, Darea vivipara, 302.
ſerrulatum, Grammitis ſerrulata, 141.
graminoides, G. graminoides, 141.

To which we muſt add that *A. ebeneum* is made by Willdenow the variety β of *calomelanos*, 124; and *petiolatum* is reduced to *viſcoſum*, 103. Fifteen ſpecies therefore, out of our former liſt, are all that are retained by Willdenow, and the generic name remains with plants that do not by any means anſwer to it, though they agree correctly with the generic character.

We proceed to give examples of the ſeveral ſections.

Sect. 1. *Frond ſimple, undivided.* Twenty-five ſpecies. We ſhall here venture to unite two of them, *latifolium* and *longifolium*, adding a new one, *limbellatum*.

A. *nummularifolium*. Money-wort Acroſtichum. Willd. n. 1. Swartz Syn. Fil. 419 and 191. t. 2. f. 1.—Barren fronds roundiſh, obtuſe, ſomewhat heart-ſhaped; hoary and downy beneath: fertile ones obovate. Common ſtalk thread-ſhaped, ſcaly, creeping.—Found by Thunberg in Java. The *common ſtalk* creeps extenſively, attaching itſelf by copious, tufted, black radicles, and bearing ſeveral alternate ſimple *fronds*, or *leaves*, not an inch long, on ſhort partial foot-ſtalks; theſe are ſmooth on the upper ſide, veinleſs; the hoary down of their under ſurface is interſperſed with ſtarry hairs. The fertile *fronds* are fewer and ſmaller, tapering at the baſe, ſometimes beſprinkled with ſtarry hairs; their backs covered with ſhining-brown capſules, intermixed with ſtarry hairs of a ruſty hue. *Swartz.*

A. *fimbriatum*. Fringed Acroſtichum. Willd. n. 3. "Cavan. Annal. de Nat. Scienc. v. 1. 102." Swartz Syn. Fil. 11.—Fronds lanceolate, fringed. Stalks briſtly.—Native of ſhady mountainous places in the kingdom of Quito.—We have been favoured with a ſpecimen, gathered by William Swainſon, jun. eſq. of Liverpool, on damp rocks in woods, among the mountains at Rio Janeiro, which anſwers to the above definition, but we are not authorized, without better information, to aſſert that it is Cavanille's plant. The *fronds* of ours grow eight or ten together, in tufts, with a fibrous, blackiſh, ſcarcely hairy, *root*: each being an inch and a half long, one-third of an inch wide, bluntiſh, ſhaggy on both ſides with coarſe, briſtly, reddiſh-brown hairs, ſpreading copiouſly beyond the edges. *Stalks* ſimple, equally ſhaggy, rather longer than the fronds. The fertile *fronds* are convex above, almoſt hooded; their concave under ſurface covered with brown *capſules*. The ſize and habit of this fern reſemble *Blechnum Lanceola*, of Swartz, in Stockholm Tranſ. for 1817, 71. t. 3. f. 2, a native of Braſil; but the latter is ſmooth and naked, with the proper fructification and *involucrum* of a *Blechnum*.

A. *viſcoſum*. Glutinous Acroſtichum. Willd. n. 8. Swartz Syn. Fil. 10 and 193. (A. petiolatum; Sw. Ind. Occ. 1588.)—Fronds linear-lanceolate, pointed, ſmooth on both ſides; their ribs, as well as ſtalks, ſcaly and viſcid: fertile ones linear; hairy beneath and covered with capſules to the very margin.—Found on the moſſy trunks of trees, on the higheſt mountains of Jamaica. *Root* ſlightly creeping. *Stalks* crowded, ſlender, angular, roughiſh, ruſty and ſcaly, three or four inches high. Each *frond* is a ſpan long, erect, rather rigid; the *barren* ones linear-lanceolate, pointed, ſomewhat membranous, ſmooth, beſprinkled at the back with minute, prominent, browniſh, glandular dots; their ribs ſcaly; *fertile* ones on longer ſtalks, more linear, either ſmooth or ſlightly hairy, covered entirely at the back with pale ruſty powdery *capſules*. The clammineſs of the *ſtalks*, and the haírineſs of the fertile *fronds*, diſtinguiſh this ſpecies from its allies. *Swartz.*

A. *limbellatum*. Narrow-bordered Acroſtichum. (Lingua cervina anguſtifolia, coſtis et pediculis villoſis; Plum. Fil. 113. t. 129.)—Fronds linear-lanceolate, wavy, pointed, ſmooth on both ſides; their ribs and ſtalks hairy: fertile ones nearly linear, with a ſmooth naked border.—Gathered by Plumier, on moſſy rocks about the ſource of a little rivulet, called Le Morne Rouge, near fort St. Pierre, in Martinico. The *root* is long, creeping, cylindrical, reſembling a worm, covered with little black fibres. *Fronds* numerous, erect, above a foot high, each of their fine tranſverſe veins ending in a little dot, before they reach the margin; at leaſt ſuch is their appearance in Plumier's figure. This character, the greater height of the *fronds*, and the fertile ones having a ſmooth naked border, over which the *capſules* do not extend, cauſed Dr. Swartz to omit citing Plumier's figure under the laſt-mentioned ſpecies. We have no doubt of theſe plants being very diſtinct from each other. Plumier is one of the few authors whoſe fidelity is always to be relied on, and he is therefore the ſole authority for ſeveral of Linnæus's ſpecies of ferns, deſcribed from his plates and deſcriptions.

A. *villoſum*. Shaggy Bordered Acroſtichum. Willd. n. 10. Swartz Syn. Fil. 10. Ind. Occ. 1592. (Lingua cervina villoſa minor; Plum. Fil. 110. t. 127. f. D.)—Fronds lanceolate, wavy, pointed, ſhaggy on both ſides: fertile ones ſomewhat elliptical, with a naked border; fringed at the edge. Stalks hairy, elongated.—Gathered by Plumier

mier in wet woods in Hifpaniola; by Swartz on the hollow moffy fides of hills in the fouth of Jamaica. *Root* tufted, not creeping. *Stalks* about half as long as the *fronds*, fhaggy with coarfe rufty hairs, fuch as cover both fides of the leafy part, efpecially at the edges. There is a vacant fpace, as in the laft, between the *capfules* and the margin of the leaf, well expreffed by Plumier, and mentioned by Swartz.

A. *hirtum*. Great Hairy Acroftichum. Willd. n. 11. Swartz Syn. Fil. 419 and 194.—Fronds elliptic-lanceolate, pointed, fcaly on both fides, like their ftalks; the margin dotted, and fomewhat crenate: fertile ones much narrower, covered to the edge with capfules and convoluted fcales.—Suppofed by Swartz to be a native of Madeira, but we have always believed our fine fpecimens to have been gathered by the late Mr. Smeathman, in the Weft Indies. The *root* is thick and fcaly, apparently fomewhat creeping. *Fronds* a fpan long, on fcaly *ftalks* often exceeding that length; thickly befprinkled fometimes on both fides, but efpecially on the under one, which is the paleft, with fmall, ovate or heart-fhaped, pointed, peltate, clofe-preffed fcales, of a pale fhining brown. Many of the tranfverfe *veins* terminate, near the margin, in depreffed dots. The fertile *fronds* are much fhorter and narrower, fomewhat heart-fhaped at the bafe, covered entirely at the back with fhining rufty *capfules*, intermixed with lanceolate, convoluted, tubular fcales. We have one *frond*, two-thirds of which are barren and broadly elliptical, but the upper part is fuddenly contracted into a lanceolate form, covered with *capfules* and fcales. The main rib is always very fcaly beneath.

A. *undulatum*. Wavy Hairy Acroftichum. Willd. n. 14. (Lingua cervina villofa, major et rufefcens; Plum. Fil. 110. t. 126.)—Fronds ovato-lanceolate, fomewhat wavy, briftly on both fides, like their ftalks; the margin flightly crenate and obfcurely dotted: barren ones emarginate: fertile ones acute.—Found by Plumier on the trunks of old trees, in Martinico. Nearly related to the laft, but diftinct. The *fronds* are fmaller and narrower, with much lefs evident marginal dots. The briftly hairs, fcattered over both furfaces, and alfo clothing the *ftalks*, in fome degree indeed partake of the nature of fcales, and are channelled, or flightly tubular, at their bafe; but they totally differ from the flat clofe fcales of the foregoing. The end of each barren *frond* is more or lefs emarginate, with a little tuft, or bud, of fcales in the fiffure.

A. *latifolium*. Broad-thick-leaved Acroftichum. Willd. n. 15. Swartz Syn. Fil. 9. Ind. Occ. 1589. (A. n. 1; Browne Jam. 104. A. longifolium; Willd. n. 16. Jacq. Coll. v. 2. 105. Swartz Syn. Fil. 9. Lingua cervina rigida et glabra; Plum. Fil. 118. t. 135.)—Fronds oblong-lanceolate, bordered, contracted at each end, fmooth on both fides, as well as the ftalks: fertile ones of the fame fhape, with a fmooth, narrow, membranous edge. Native of rocks, and old moffy trunks of trees, in Jamaica and Martinico. The *root* is thick and creeping, clothed at the extremity, and about the bottoms of the ftalks, with large, brown, chaffy fcales. *Fronds* fcattered, from a fpan to twelve or eighteen inches long, erect, entire, rigid, with a narrow, thin, membranous, entire border, a ftout reddifh rib, and fcarcely any traces of veins, both furfaces being peculiarly even and fmooth. The *ftalks* are fmooth and naked, angular, fometimes as long as the fronds, but generally fhorter. The fertile *fronds* agree with the barren ones in fhape and fize, as well as in their narrow, membranous, naked border, but the whole under fide, except that border, is denfely clothed with innumerable, minute, fnuff-coloured *capfules*, unaccompanied by any fcales or hairs. Jacquin defcribed his plant independent of Swartz, but we cannot find the leaft pretence for diftinguifhing them, even as varieties, the revolute pofition of the feed-bearing frond, in Plumier's plate, being merely owing to its young ftate, as his defcription implies. The *ftalks*, at an early period, may probably be fomewhat fcaly, though afterwards naked, even in the fertile *fronds*.

A. *crinitum*. Hairy Oval Acroftichum. Linn. Sp. Pl. 1523. Willd. n. 23. Ait. n. 2. Swartz Syn. Fil. 11. (Lingua cervina villofa, amplis foliis fubrotundis; Plum. Fil. 109. t. 125. Phyllitis crinita, latiffimo folio; Petiv. Fil. n. 145. t. 13. f. 14, copied from Plumier.)—Fronds elliptical, obtufe at each end, hairy, denfely fringed. Stalk and mid-rib hairy.—Gathered by Plumier in Martinico. Brought from the Weft Indies to Kew Garden, by Admiral Bligh, in 1793. A very fine and large fpecies, fpecimens of which are rare. Each *frond* is about a foot long, and half as much in breadth, flefhy; of a fomewhat yellowifh-green on the upper fide, befprinkled with flender briftly hairs, which, as well as the thick fringe, and the copious hairs on the *ftalks*, are coal-black. The fructification of this plant has not been afcertained, for what Plumier noticed, on the very young leaves, were moft probably the tumid or glandular bafes of the hairs; nor was he at all confident on this fubject. It may well, however, by analogy, be confidered as an *Acroftichum*. The *root* is tufted and fhaggy. We place this fern next to fpecies with which it moft nearly accords; the following one being incorrectly inferted before it by Willdenow.

A. *citrifolium*. Lemon-leaved Acroftichum. Linn. Sp. Pl. 1529. Willd. n. 22. Swartz Syn. Fil. 9. (A. n. 3; Linn. Amoen. Acad. v. 1. 269. Hemionitis parafitica; Linn. Sp. Pl. 1535. H. n. 2; Browne Jam. 95, from the author. Lingua cervina fcandens, citrei foliis, minor; Plum. Fil. 101. t. 116. Lonchitis vanilîæ folio; Petiv. Fil. n. 150. t. 15. f. 1.)—Fronds alternate, ovate, pointed; tapering at the bafe, on fhort ftalks, fmooth, reticulated with veins. Common ftalk creeping, fcaly.—Found on trees near rivulets in Martinico, and in the cooler, fhady, inland woods of the mountainous parts of Jamaica. The common *ftem*, or main *root*, creeps to a great extent, among moffes, or *Jungermanniæ*, up the old trunks of trees, attaching itfelf by numerous fhaggy radicles. It is clothed with large, acute, reticulated, finely toothed, pellucid fcales. The *fronds* are fituated alternately, about one or two inches from each other, on fhort bordered ftalks, fpreading in two directions, and are ovate or elliptical, of a fine fhining green, rather flefhy, very fmooth, two or three inches long, and one or one and a half broad, obfcurely crenate. There is only about half way up any decided mid-rib, but the principal veins, parallel at firft, branch out into regular, very elegant reticulations. Some of the uppermoft and youngeft *fronds*, according to Plumier, are entirely covered at the back, with minute, denfely crowded, bright chefnut, *capfules*, except a central naked line, indicating a mid-rib. We have no fpecimen in fructification, but feveral *capfules* accidentally fticking to one of the barren fronds, are remarkably fmall, very pale, with dark jointed rings. Linnæus originally adopted this fern, as an *Acroftichum*, from Plumier. When he received fpecimens of the fame from Browne, as a *Hemionitis*, he did not difcover that he had already claffed the plant in his fyftem; hence it occurs twice, even in his Sp. Pl.—*Hemionitis obtufa*, Willd. Sp. Pl. v. 5. 127, agrees very nearly with this *Acroftichum*, in fize and texture of the *fronds*, and moft precifely in their veiny reticulations; but its fructification is defcribed as effentially different.

Sect. 2. *Frond fimple, divided.* Four fpecies.

A. *pel-*

A. *peltatum*. Shield Acroftichum. Willd. n. 26. Swartz Syn. Fil. 11. Ind. Occ. 1593. (Ofmunda peltata; Swartz Prodr. 127. Lichen digitatus, geranii facie; Plum. Fil. 141. t. 50. f. A. Hepatica digitata fungoides; Pet. Fil. n. 188. t. 11. f. 3.)—Barren fronds in many forked, linear, radiating fegments: fertile ones undivided, roundifh-kidneyfhaped, finely crenate. — Found on the moffy trunks of trees, in Jamaica and Hifpaniola. This remarkable little fern has the habit of a *Trichomanes;* or of fome very fingular *Jungermanniæ*, brought by Mr. Menzies from New Zealand. The trailing creeping *root* throws up feveral ftalked, vertical, membranous, barren *fronds*, deeply divided into two principal lobes, and each of thofe irregularly into numerous, linear, fingle-ribbed fegments, all fpreading like a fan. The fertile *fronds* are about as tall, but fmaller, not an inch broad, roundifh, or fomewhat kidney-fhaped, horizontal; pale green and fmooth above; covered beneath with fmall, brown, fhining, annulated *capfules*.

A. *alcicorne*. Stag's-horn Acroftichum. Willd. n. 29. Swartz Syn. Fil. 12. 17. and 196. Brown n. 1. Ait. n. 3. (" A. Stemaria; Beauvois Fl. d'Oware, 2. t. 2." A. bifurcatum; Cavan. Leccion. 241. n. 587. Neuroplatyceros æthiopicus, nervofis foliis, cornu cervinum referentibus; Pluk. Amalth. 151. t. 429. f. 2. Cornu alcis Simbor dicta; Bont. Hift. Nat. 121, with a figure.)—Fronds fomewhat tufted, forked, coriaceous, ribbed; downy at the back; from a peltate, leafy, fpongy bafe.—Native of Guinea, Madagafcar, Java, and New South Wales, growing on the trunks of trees. This is a very large and ftriking fpecies, attached to the trees, or fometimes to rocks, by a peltate, dilated, fomewhat membranous, irregular, veiny, lobed bafe, of a fhining brown, a foot in diameter; thin at the edges; thick and fpongy in the centre, where it is fixed by downy branching *radicles*, and from whence it throws up two or three erect, flat, irregularly forked *fronds*, a foot or two in height, rather dilated upwards, entire at the edges, from one to two inches broad in the different parts; tapering at the bafe into a ftout, channelled, winged *footftalk*. The ultimate divifions are level-topped, linear, bluntifh, near a finger's length, each bearing at its back, in the lower half, a broad, irregular, denfe, naked mafs of innumerable brown *capfules*, fo difpofed, in clofe lines, that the whole mafs appears ftriated. The whole *frond* is ftrongly ribbed; green and fmooth above; whitifh and downy beneath; the ribs forked, fmooth, reddifh. We cannot but think the fingular dilated bafe of this fern is no other than one of its feminal leaves, or reputed *cotyledons*, greatly enlarged, and more permanent than ufual. *Polypodium quercifolium* of Linnæus, Willd. Sp. Pl. v. 5. 170, has fomething analogous in its barren *fronds*, which are only advanced a ftep nearer towards the proper habit of a fern. See Ger. Em. 1133.

Sect. 3. *Frond ternate.* Two fpecies.

A. *quercifolium*. Oak-leaved Acroftichum. Willd. n. 30. Swartz Syn. Fil. 12. Retz. Obf. fafc. 6. 39. " Schkuhr Crypt. 2. t. 3." (Ofmunda trifida; Jacq. Coll. v. 3. 281. t. 20. f. 3.)—Fronds ternate, bluntly lobed; fertile ones contracted, linear-oblong, fomewhat cut.—Found on trees in Ceylon, by Koenig. A delicate flender fern, whofe fmall, creeping, fcaly *root* fends up feveral erect *fronds*, from fix inches to a foot high, whofe downy *ftalks* are alfo fcaly in their lower part. The terminal *leaflet* is much the largeft, two or three inches long, and one broad, in the barren *fronds*, with downy ribs and edges, obtufe, flightly and varioufly finuated; the lateral ones an inch long, rounded, fomewhat lobed. The fertile *fronds* have each a much taller fmoother ftalk, but their *leaflets* are, as ufual, much fmaller and narrower, their backs covered, except the ribs and margin, with minute, ftalked, annulated *capfules*.

A. *auritum*. Eared Acroftichum. Willd. n. 31. Swartz Syn. Fil. 13. and 198. (Filix florida; Rumph. Amboin. v. 6. 78. t. 35. f. 1.)—Fronds ternate, pinnatifid, cut; fertile ones doubly pinnate, with linear entire fegments.—Native of Amboyna and Java, growing among coarfe graffes, on the banks of rivers. *Rumphius*, *Thunberg*. *Stalks* from one to two feet high, flender, angular, fmooth, black and fhining. *Fronds* fmooth, flightly veiny, of three principal *leaves* varioufly pinnatifid, lobed and cut, feveral inches long; the middle one largeft: the fertile *fronds* are more compound, with extremely narrow linear *leaflets* or fegments.

Sect. 4. *Frond pinnatifid.* Three fpecies.

A. *ferrulatum*. Finely-ferrated Acroftichum. Willd. n. 32. (Polypodium fufcum tenuiffimis denticulis ferratum; Plum. Fil. 63. t. 81.)—Fronds deeply pinnatifid; fegments linear-lanceolate, parallel; thofe of the barren ones finely ferrated, of the fertile ones entire.—Gathered by Plumier, in the forefts of Hifpaniola. The long, creeping, nearly fmooth, blackifh *root* fends up feveral *fronds*, twelve or eighteen inches high, on fhortifh fmooth *ftalks*. The outline of each is lanceolate, taper-pointed, compofed of a great number of crowded parallel fegments, divided almoft to the mid-rib, each fegment linear, acute, finely and fharply ferrated, fmooth on both fides, thin and almoft membranous, with a rib and many fimply forked veins. From the very extremity of the root fprings one *frond*, a little fmaller than the reft, but of a fimilar ftructure, except that its fegments are nearly all entire at the margins, and bear on their backs a denfe affemblage of minute chefnut-coloured *capfules*, fome few of the upper fegments only, with the point, being naked and ferrated. By the figure, this fern would be judged a *Blechnum*, and poffibly it might, if examined in a young ftate, prove to be fuch, the capfules extending over the leaf at an advanced period only, when the *involucrum* is often reflexed, or obliterated; but as no botanift, befides Plumier, appears to have feen the plant, we muft rely on his account of the matter, and he very precifely fays the back of this fertile *frond* is at firft, as it were, chagreen'd, and chefnut-coloured, being fubfequently entirely covered with fine duft, of the fame hue.

The others of this fection are, *A. lepidopteris* of Langfdorff and Fifcher, Ic. Fil. t. 2, from Brafil; and *A. brunneum* of Willdenow, from the Caraccas.

Sect. 5. *Frond pinnate.* Fifteen fpecies, befides one of Mr. Brown's.

A. *bifurcatum*. Slender Forked Acroftichum. Willd. n. 35. Swartz Syn. Fil. 12. " Schkuhr Crypt. t. 2. f. 3." (Ofmunda bifurcata; Jacq. Coll. v. 3. 282. t. 20. f. 4. Filicula corniculata infulæ Sanctæ Helenæ; Pluk. Mant. 83. Phyt. t. 350. f. 4.)—Fronds pinnate; leaflets linear, deeply divided, fpreading: thofe of the fertile fronds rounded; the lower ones more or lefs ternate; upper folitary.—Native of St. Helena and the Weft Indies. A flender delicate fern, allied in habit to *A. quercifolium*, defcribed in the third fection, but much fmaller, and with very different barren *leaflets*. Its height is about fix inches; the *ftalks* wiry, or almoft capillary.

A. *forbifolium*. Service-leaved Acroftichum. Linn. Sp. Pl. 1526. Willd. n. 38. Ait. n. 4. (Onoclea forbifolia; Swartz Syn. Fil. 112. Filix fcandens latifolia ferrata; Plum. Amer. 8. t. 12. Lingua cervina fcandens, foliis

laurinis

laurinis ferratis; Plum. Fil. 102. t. 117. Lonchitis calamifera, pinnis ferratis; Petiv. Fil. n. 153. t. 9. f. 8.)—Fronds pinnate, fmooth; leaflets of the barren ones lanceolate, pointed, ferrated; wedge-fhaped at the bafe: of the fertile ones linear, entire. Common-ftalk climbing, fcaly.—This climbs up the ftems of trees in various parts of the Weft Indies, the fcaly *common ftalk* being the thicknefs of a goofe-quill. *Fronds* alternate, fomewhat ftalked, a foot long, lanceolate; barren *leaflets* an inch and a half or two inches long, half an inch broad; fertile ones rather fhorter, and very much narrower; their edges flightly inflexed when young; the mid-ribs hairy; all the reft of the under furface denfely covered with *capfules*. Linnæus, long after he had publifhed this fpecies, confounded with it a very different plant, figured in Sloane's Jamaica, v. 1. t. 38, and in Pluk. Phyt. t. 287, (not 286,) f. 3, which is preferved in the Linnæan herbarium; but for want of knowing the fructification, we cannot determine its genus with any certainty. The *main-ftalk* of each *frond* is flightly winged, and the habit of the whole like a Danæa, (fee that article,) except the *leaflets* being alternate.

A. *aureum*. Great Golden Acroftichum. Linn. Sp. Pl. 1525. Willd. n. 41. Swartz Syn. Fil. 13. Purfh n. 1. "Schkuhr Crypt. 2. t. 1." (Lingua cervina aurea; Plum. Fil. 87. t. 104. Filix paluftris aurea, foliis linguæ cervinæ; Plum. Amer. 5. t. 7. Phyllitis ramofa aurea; Petiv. Fil. n. 142. t. 8. f. 5.)—Fronds pinnate; leaflets alternate, uniform, coriaceous, oblong, bluntifh, entire, fmooth, with reticulated veins; wedge-fhaped and unequal at the bafe: upper ones fertile, of the fame fize.—Native of bogs and wet places in the Weft Indies. Purfh found it in deep fwamps near the fea-coaft of Florida, in July. This is a noble *fern*, from five to nine feet high, confpicuous for its large broad *leaflets*, from a fpan to twelve inches in length, curioufly marked with oblong veiny reticulations. About four or five of the uppermoft, and perhaps the lower part of the next, are denfely covered at the back with innumerable *capfules*, of a golden chefnut colour.

A. *fraxinifolium*. Great Afh-leaved Acroftichum. Br. n. 2.—"Fronds pinnate, fmooth; leaflets ftalked, oblong-tonguefhaped, pointed, entire, reticulated: upper ones fertile, contracted."—Difcovered by Mr. Brown, in the tropical part of New Holland. Very clofely related to *A. aureum*, but differing in its acute and fhort-pointed *leaflets*.

A. *punctulatum*. Dotted Acroftichum. Willd. n. 45. Swartz Syn. Fil. 13. (A. punctatum; Linn. Suppl. 444, but not Sp. Pl. 1524. A. auriculatum; Lamarck Dict. v. 1. 36.)—Fronds pinnate; fertile leaflets lanceolate, acute, entire; dotted on the upper fide; lowermoft auricled; uppermoft fomewhat confluent.—Native of the ifle of Bourbon. This fpecies is known only from the Linnæan fpecimen, communicated by Thouin, which confifts of one *frond*, about two feet high, entirely fertile, with a longifh fmooth *ftalk*, and eight *leaflets*, each near three inches in length, and almoft one in breadth, tapering at both ends, undulated or fomewhat crenate; fmooth and bright green, befprinkled with depreffed dots, above; covered, nearly to the edge, with tawny capfules, beneath. The two lowermoft have each, at the outer fide, a large lobe, or auricle; the two or three uppermoft are more or lefs decurrent, fo that the top ones are confluent.

A. *alienum*. Various-lobed Acroftichum. Willd. n. 48. Swartz Syn. Fil. 13. Ind. Occ. 1595. (Filix latifolia, in pinnulas obtufas, et leviter crenatas, divifa; Plum. Fil. 10. t. 10. Ofmunda pulverulenta, pinnis vix ferratis; Petiv. Fil. n. 154. t. 8. f. 1.)—Fronds pinnate; leaflets pinnatifid; the upper ones confluent; lobes rounded, diftantly toothed, fmooth, reticulated with veins: fertile ones with narrower, lefs divided, leaflets.—Found by Plumier in Martinico; by Swartz on the mountains of Jamaica. Our fpecimens came from St. Kitt's. This is a fine fpecies, the *fronds* crowded, three or four feet high, fmooth and membranous, of a fine tranfparent green; the bafe of each common *ftalk* tumid, permanent. The lower *leaflets*, a foot long, are deeply pinnatifid, and fomewhat auricled; the middle ones roundly lobed; uppermoft wavy, and ftrongly confluent. All the ribs are white and fmooth. Fertile *fronds* entirely diftinct, fmaller and lefs divided or lobed in every part, but their fegments are extremely various. The under fide, except the ribs, is denfely covered, to the very edges, with brown *capfules*. None of the *ftalks* are fcaly.

Sect. 6. *Frond doubly pinnatifid, or doubly pinnate.* Thirteen fpecies, befides one of Mr. Brown's.

A. *cervinum*. Hart's-tongue Acroftichum. Willd. n. 50. Swartz Syn. Fil. 14 and 200. (Ofmunda cervina; Linn. Sp. Pl. 1521. O. linguæ cervinæ foliis; Plum. Fil. 132. t. 154. O. racemifera, phyllitidis folio; Petiv. Fil. n. 162. t. 8. f. 13.)—Barren fronds pinnate, with obliquely ovate, pointed, entire, bordered leaflets; fertile doubly pinnate, with linear, parallel, obtufe leaflets.—Apparently, by Plumier's account, not uncommon in wet woods, or about the banks of rivers, in Martinico. Dr. Swartz feems to have met with the fame in Jamaica, and we have it from St. Kitt's. The *root* is tufted, large, with numerous, long, branched, woolly fibres, and crowned with a great number of long, very narrow, tapering, brown and fhining fcales, among which ftand feveral *fronds*, about a yard high, very fmooth in every part. The *barren ones* are fimply pinnate, with 18 or 20 ftalked *leaflets*, a fpan long, and near two inches broad, entire, taper-pointed, with one rib, and many fine parallel tranfverfe veins, not reticulated; the bafe of each obliquely, and very unequally, wedge-fhaped. *Fertile fronds* fewer, doubly pinnate, confifting entirely of numerous fmall, feffile, parallel, but not crowded, *leaflets*, a quarter or one-third of an inch in length, covered at the back with light-brown ftalked *capfules*.

A. *Marantæ*. Scaly European Acroftichum. Linn. Sp. Pl. 1527. Willd. n. 53. Swartz Syn. Fil. 14. Prodr. Fl. Græc. n. 2344. Fl. Græc. t. 964, unpubl. "Schkuhr Crypt. 4. t. 4." Sprengel Crypt. 89. t. 2. f. 18, not good. (Lonchitis afpera Marantæ; Camer. Epit. 666.)—Fronds doubly pinnate, uniform; leaflets oblong, obtufe, entire, dilated or lobed at the bafe; the upper ones confluent; all clothed beneath with imbricated hair-pointed fcales. Stalks fhaggy.—We have already defcribed this fern (fee the article Notholæna, n. 1); but a more careful examination has induced us, both here and in the Prodr. Fl. Græc., to retain it in *Acroftichum*, as well as the two following fpecies; for the *capfules* appear to cover every part of the under fide of its *fronds*, except their fcaly mid-rib. With refpect to *Notholæna trichomanoides*, we readily concur with Mr. Brown in keeping it diftinct from *Pteris*; not having feen his *N. vellea* or *Pumilio*, we cannot form an opinion of thofe fpecies.

A. *velleum*. Woolly European Acroftichum. Willd. n. 54. Swartz Syn. Fil 14. Ait. n. 5. Prodr. Fl. Græc. n. 2345. Fl. Græc. t. 965, unpubl. (A. lanuginofum; Desfont. Atlant. v. 2. 400. t. 256. "Schkuhr Crypt. 8. t. 1. Lonchitis mollior lanuginofa, Ceterach facie; Barrel. Ic. t. 857, 858. Filicula crifpa, lanugine hepatici coloris veftita, ex infulis fortunatis; Pluk. Almag. 150. Phyt. t. 281. f. 4.)—Fronds doubly pinnate, elliptic-oblong, uniform; leaflets obtufe, ovate or heart-fhaped, notched laterally, very fhaggy on both fides, like the ftalks.

—Native

—Native of Spain, Barbary, Madeira, and Zante, in the fiſſures of rocks. Rather ſmaller than the laſt, with ſhorter *ſtalks* and denſer *fronds*, whoſe *leaflets* are ſhort and rounded, hairy on both ſides rather than ſcaly; their *common ſtalks* of a mahogany colour, their pubeſcence hoary, without the golden, or bright copper, hue of *A. Marantæ*. The *root* is neither ſcaly, nor creeping.

A. *diſtans*. Diſtant-winged Acroſtichum. (Notholæna diſtans; Brown Prodr. v. 1. 146.)—Fronds doubly pinnate, linear-lanceolate, uniform; branches oppoſite, diſtant, ſomewhat deltoid; leaflets oblong, obtuſe; the lower ones pinnatifid. Stalks and ribs ſhaggy, with hair-pointed ſcales. (See NOTHOLÆNA n. 2.) The *capſules* decidedly cover every part of the under ſide of each *leaflet*, except the ſcaly *rib*, in as broad and continuous patches, as in any other *Acroſtichum;* at leaſt when, like our ſpecimen, they are arrived at maturity.

A. *ſulphureum*. Sulphur-coloured Acroſtichum. Willd. n. 56. Swartz Syn. Fil. 15. Ind. Occ. 1597. Schkuhr Crypt. 4. t. 4.—Fronds doubly pinnate; leaflets oblong-wedgeſhaped, pinnatifid, cloven and notched; clothed with pale yellow powder at the back.—Native of ſhady rocks, in the ſouthern part of Jamaica. *Swartz*. Linnæus had numerous ſpecimens of this fern, which he left undetermined, or perhaps confounded with the following, from which they differ in the wedge-like ſhape, and more delicate texture, of their *leaflets*, as well as the pale ſulphur colour of the powder that covers their under ſurface. The maſſes of *capſules* are moſt denſe about the middle of each leaflet, the tips being naked.

A. *calomelanos*. Mealy Acroſtichum. Linn. Sp. Pl. 1529. Willd. n. 57. Hort. Berol. t. 41. Swartz Syn. Fil. 15. "Schkuhr Crypt. 4. t. 5." (Filix albiſſimo pulvere conſperſa; Plum. Fil. 30. t. 40. Pet. Fil. n. 156. t. 9. f. 11. F. non ramoſa major, caule nigro, ſurculis raris, &c.; Sloane Jam. v. 1. 92. t. 30. f. 2. Adiantum, nigro ſimile, albiſſimo pulvere conſperſum; Plum. Amer. 30. t. 44. A. calomelanos americanum; Pluk. Phyt. t. 124. f. 3.)

β. A. ebeneum; Linn. Sp. Pl. 1528? (Filix non ramoſa minima, caule nigro, ſurculis raris, &c.; Sloane Jam. v. 1. 92. t. 53. f. 1.)

Fronds doubly pinnate; leaflets elliptic-oblong, clothed with white powder beneath; lowermoſt cut or pinnatifid, with an auricle from the upper edge at the baſe; upper ones ſerrated; uppermoſt confluent.—Native of ſhady ſituations in the Weſt Indies. The *fronds* are tufted, and, when full grown, 12 or 18 inches high, with black ſhining *ſtalks;* the *leaflets* ſmooth, and of a fine deep green above; tapering, or wedge-ſhaped, at their baſe; in the upper part of each frond decurrent. Thoſe which bear *capſules* are leſs white, and rather grey, beneath, beſprinkled with white dots, the *capſules* moſt crowded about the middle region of each. Willdenow, on the poſitive aſſertion of Swartz, makes *A. ebeneum* of Linnæus a variety, Swartz eſteeming it the ſame plant in a young ſtate, when the *fronds* are only ſimply pinnate. But Willdenow declares that he had 100 times raiſed *calomelanos* from ſeed, without ever ſeeing the young *fronds* as repreſented by Sloane, t. 53. f. 1; and that his own figure was taken from a plant of one year's growth. Still we are diſpoſed to believe Sloane's plant belongs to *calomelanos;* though it is far otherwiſe with the Linnæan *ebeneum*, the original ſpecimen of which is ſimply pinnate, with broad, ſeſſile, tranſverſe, partly pinnatifid, *leaflets*, white beneath; the maſſes of *capſules* nearer the margin than the rib. The upper *leaflets*, indeed, are decurrent and confluent. Having ſeen but this ſingle ſpecimen, we are afraid to form any poſitive opinion.

A. *chryſophyllum*. Golden Acroſtichum. Willd. n. 58. Swartz Syn. Fil. 15. Ind. Occ. 1598. (Filix aurea, pinnulis rotundè inciſis diviſa; Plum. Fil. 33. t. 44. Adiantum pulverulentum aureum; Petiv. Fil. n. 160. t. 9. f. 9.) — Fronds doubly pinnate; leaflets ovate-oblong, obtuſe, ſtriated, poliſhed; clothed beneath with deep-yellow powder; lower ones pinnatifid; upper confluent and wavy.—Native of rather mountainous paſtures, in various parts of the Weſt Indies. We are indebted to J. V. Thompſon, eſq. for a ſpecimen of this elegant plant, which is conſpicuouſly diſtinguiſhed by the copious deep lemon-coloured powder, entirely covering the back of its *leaflets*, among which the *capſules* ſeem ſparingly, but uniformly, diſperſed and ſunk.

A. *albidulum*. Whitiſh Round-leaved Acroſtichum Willd. n. 61. Swartz Syn. Fil. 16 and 205. t. 1. f. 2.—Fronds doubly pinnate; leaflets rounded, obtuſe; powdery and white beneath; lowermoſt three-lobed; uppermoſt ſimple and undivided. Capſules denſely crowded towards the margin.—Gathered by Louis Nee, in South America. *Swartz*. A delicate little fern, three or four inches high, with a capillary *ſtalk*. The whole *frond* is oblong, once or twice compounded, in a ternate manner. *Leaflets* ſmooth and flat above; clothed beneath with white powder, which ſeems to conceal their mid-ribs. The *capſules* are brown, each with a ſhining ring, and are very numerouſly crowded, in denſe maſſes, over two-thirds of each lateral portion of the *leaflet*, from the edges, leaving a bare ſtripe in the middle. Hence this ſpecies ſhould ſeem referable to Mr. Brown's genus NOTHOLÆNA, to which we have already alluded (ſee that article); but the *capſules* compoſe much broader maſſes than in *N. trichomanoides*, and ſeem unattended by hairs.

A. *pteroides*. Bordered Acroſtichum. Brown n. 3.—"Fronds doubly pinnate, ſmooth; leaflets linear, reflexed at the margin."—Gathered by Mr. Brown, in the tropical part of New Holland. This ſpecies ſeems to anſwer to the character of Willdenow's *Lomaria*. We have ſeen no ſpecimen.

ACROTRICHE, ſo called by Mr. Brown, from ακρος, *terminal*, and θριξ, τριχος, *a hair*, in alluſion to the bearded points of the corolla.—Brown Prodr. Nov. Holl. v. 1. 547.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Epacrideæ*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of five erect, concave, obtuſe, permanent leaves, with a pair of ſmaller ones at their baſe. *Cor.* of one petal, funnel-ſhaped, longer than the calyx; limb in five equal, ſpreading ſegments, each furniſhed, towards the point, with a tuft of hairs directed inwards. Nectary a cup-ſhaped gland, ſlightly lobed, ſurrounding the baſe of the germen. *Stam.* Filaments five, thread-ſhaped, equal, inſerted into the tube of the corolla, and not projecting beyond the mouth; anthers roundiſh-oblong, incumbent. *Piſt.* Germen ſuperior, globoſe; ſtyle columnar, ſhort; ſtigma ſimple. *Peric.* Drupa globular, depreſſed, ſlightly pulpy. *Nut* ſolitary, of five lobes and five cells, its ſurface minutely cellular. *Seeds* ſolitary.

Eſſ. Ch. Outer calyx of two leaves. Corolla five-cleft, funnel-ſhaped; ſegments with a deflexed beard at the extremity. Drupa nearly dry. Nut of five cells, its ſurface minutely cellular.

This genus, the produce of New Holland, conſiſts of humble much-branched ſhrubs, their *branches* generally divaricated. *Leaves* ſcattered. *Spikes* ſhort, lateral, or axillary. *Flowers* ſmall, white. *Drupa* ſmall, with but little

little thicknefs, or pulp. We have examined only one fpecimen of this fruit, but the above appears to be the true meaning of the author whom we follow, that the fhell of the *nut* is covered with fmall external cells, like a minute irregular honey-comb, to which the pulp of the *drupa*, filling the interftices of the lobes of the nut only, is attached. This character Mr. Brown feems to confider as very peculiar.

1. A. *divaricata*. Spreading-leaved Acrotriche. Br. n. 1.—Leaves lanceolate, pointed, divaricated, flat, green on both fides. Spikes axillary.—Found by Mr. Brown, at Port Jackfon, New South Wales. We are not certain of having met with this fpecies, among the various fpecimens fent by Dr. White, though one of them anfwers nearly to the characters, as far as we are able to inveftigate them. This fpecimen greatly refembles Monotoca *fcoparia* (fee that article); but the *leaves* are more divaricated, or deflexed, and not glaucous at the back.

2. A. *aggregata*. Aggregate Acrotriche. Br. n. 2.—"Leaves oblong-lanceolate, rather concave; glaucous beneath; fmooth at the edges."—Obferved by Mr. Brown, in the tropical region of New Holland.

3. A. *ramiflora*. Flowery-branched Acrotriche. Br. n. 3.—"Leaves linear-lanceolate, pointed, divaricated; ribbed, and difcoloured, beneath; recurved at the edges. Spikes fmall, fituated on the branches."—Gathered by the fame diftinguifhed botanift, on the fouthern coaft of New Holland.

4. A. *ferrulata*. Finely-ferrated Acrotriche. Br. n. 4.—Leaves linear-lanceolate, fpinous-pointed, fpreading, hairy or nearly fmooth; their edges fringed. Spikes axillary.—Gathered by Mr. Brown in Van Diemen's ifland, as well as on the fouth coaft of New Holland. We have fpecimens collected by general Grofe, communicated by A. B. Lambert, efq. A fmall dwarf *fhrub*, with denfely tufted, hairy *branches*. *Leaves* crowded, one-third or half an inch long, each tipped with a yellowifh prickle; three-ribbed, and rather glaucous, beneath; more or lefs hairy on both fides; their edges fringed with minute ftiff hairs, as if ferrated. *Flowers* in fhort, lateral, erect clufters. *Drupa* the fize of hemp-feed, depreffed, glaucous, or rather filky. *Nut* of five radiating lobes, or cells, the furface curioufly and minutely cellular.

5. A. *patula*. Spreading-branched Acrotriche. Br. n. 5.—"Leaves ovato-lanceolate, fpinous-pointed, flattifh, divaricated as well as the branches. Spikes fmall, axillary."—Native of the fouthern coaft of New Holland. *Brown*.

6. A. *ovalifolia*. Oval-leaved Acrotriche. Br. n. 6.—"Leaves ovate or elliptical, obtufe, pointlefs, flat, fmooth-edged. Spikes axillary. Drupa flightly cellular."—Gathered by Mr. Brown in the fame country as the laft.

7. A. *cordata*. Heart-leaved Acrotriche. Br. n. 7. (Styphelia cordata; Labill. Nov. Holl. 46. t. 63.)—Leaves heart-fhaped, flat; ftriated beneath. Flowers axillary, folitary or in pairs.—Found by Labillardiere, in Van Leuwin's land. A fpan high, erect, with fmall, rigid, thick *leaves*. *Drupa* fcarcely bigger than muftard-feed. Mr. Brown, not having feen this plant, is not abfolutely certain of its genus; though Labillardiere's defcription of the *corolla* anfwers to *Acrotriche*.

8. A. *depreffa*. Proftrate Acrotriche. Br. n. 8.—"Leaves ovate, fomewhat heart-fhaped, pointed, divaricated; convex above; veiny beneath. Stem depreffed. Spikes fmall, on the branches."—Gathered by Mr. Brown, on the fouth coaft of New Holland without flowers, and with unripe fruit.

ACT *of Faith*, l. 2, day which was held; and let the whole article refer to paft time. To the article fubjoin, fuch were the horrors of the inquifition in the reign of Philip II. *Auto da Fes* have not been frequent in late times; and it is perhaps more than half a century fince the laft, in which criminals were burnt.

Act *of Honour*, in *Commerce*, an inftrument drawn by a notary, when a bill is accepted for the honour of another perfon.

Acts, in *Poetry*, col. 2. l. *ult.*, dance, are indeed divided; but to compenfate for this retrenchment, the two concluding dances are fpun, &c.

ACTÆA, in *Botany*, fee our former article, (thus named, it is generally thought, from ακτη, *the fhore*, as being a plant that inhabits the fea-coaft, or the margins of waters. But this is not appropriate; and we fhould rather fuppofe Linnæus, the author of the name, had in his mind the refemblance of the plant, in fome refpects, to Elder, ακτεα of the Greeks.)—De Cand. Syft. v. 1. 381. Linn. Gen. 261. Schreb. 349. Willd. Sp. Pl. v. 2. 1139. Mart. Mill. Dict. v. 1. Sm. Fl. Brit. 562. Prodr. Fl. Græc. Sibth. v. 1. 356. Ait. Hort. Kew. v. 3. 286. Purfh 366. Juff. 235. Lamarck Illuftr. t. 448. Gærtn. t. 114. (Chriftophoriana; Tourn. t. 154. Cimicifuga; Linn. Syft. Veg. ed. 14. 505. Am. Acad. v. 8. 193. Schreb. 369. Willd. Sp. Pl. v. 2. 1244. Mart. Mill. Dict. v. 1. Ait. Hort. Kew. v. 3. 324. Purfh 372. Juff. 234. Lamarck Illuftr. t. 487. Gærtn. t. 140.)—Clafs and order, *Polyandria Monogynia*, (or rather perhaps *Pentagynia*.) Nat. Ord. *Multifiliquæ*, Linn. *Ranunculaceæ*, Juff. *Spuriæ*, De Cand.

Eff. Ch. Calyx of four leaves. Petals four. Germens one or more, fuperior, ovate. Stigma nearly feffile. Pericarp of one cell, with many feeds.

Perennial herbs. *Leaves* ftalked, fimple, lobed, or varioufly cut, imitating compound leaves, according to De Candolle; (moft of them are certainly compound.) *Flowers* racemofe, white; *calyx* and *corolla* very fugacious; *ftamens* generally longer than the *petals*. Number in the parts of the *flower* very variable. *Stamens* fometimes imperfect in one flower, *piftils* in another.

The *roots* are draftic purges, in fome degree poifonous, and the herbage is not to be trufted.

Eight fpecies are wild in bufhy rocky ground, or cold woods, of the northern hemifphere; one in Europe; in Siberia or Japan two; in North America five.

This genus is very natural, notwithftanding a diverfity of characters in the feveral fpecies. In the *Cimicifugæ*, (which approach *Xanthorrhiza* and *Pæonia*,) the *germens* are numerous, which, as in true *Ranunculaceæ*, become aggregate *fruits*, burfting at their inner angle. The fecond fection, *Macrotys*, has a fimilar but folitary *fruit*, nor ought it to be feparated from the *Cimicifugæ*, any more than *Confolida* from *Delphinium*. *Actæa* of Linnæus, the third fection, has likewife a folitary *fruit*, exactly fimilar as to internal ftructure, but flefhy; yet not more to be feparated on that account, than the fomewhat berried fpecies of *Clematis* from the reft. From thefe confiderations, and the hints of Michaux and Richard, I return to the original opinion of Linnæus, and diftribute *Actæa* as follows. *De Candolle*.

We would obferve, in fupport of this decifion of our learned friend, that the anomalies in the *fruit* of *Fumaria*, whence many genera have been formed, appear to us analogous to thefe of *Actæa*. We are always happy to concur in the definition and confirmation of natural genera, in preference to the endlefs fplitting and fubdividing of fuch into artificial ones; which laft, being the eafieft of all things, is moft tempting to a beginner, efpecially as he thinks that, in purfuing it, he is exercifing great fagacity, and refining on on the wiſdom of ages. We ſhould however certainly keep *Actæa* and *Cimicifuga* ſeparate, were it not for *Macrotys*, which evidently, and almoſt neceſſarily, combines them.

Sect. 1. *Cimicifuga*. Fruit aggregate, burſting. Species one to four.

Sect. 2. *Macrotys*. Fruit ſingle, burſting. Species five and ſix.

Sect. 3. *Chriſtophoriana*. Fruit ſingle, not burſting. Species ſeven and eight.

Sect. 1. *Cimicifuga*. Linn.

Flowers with many ſtyles. Fruit dry, burſting, aggregate.

1. A. *Cimicifuga*. Bug-wort Actæa. De Cand. n. 1. Linn. Sp. Pl. 722. (Cimicifuga; Gmel. Sib. v. 4. 181. t. 70. Linn. Am. Acad. v. 2. 354. C. fœtida; Linn. Syſt. Nat. ed. 12. v. 2. 659.)—Germens four, nearly ſeſſile, very hairy. Cluſters panicled. Leaves divided in a once or twice ternate manner; their ſegments ovato-lanceolate, deeply toothed.—Native of various parts of Siberia, and of the north-weſt coaſt of America. See our former article Cimicifuga.

2. A. *podocarpa*. Stalked Actæa. De Cand. n. 2. (Cimicifuga americana; Michaux Boreal.-Amer. v. 1. 316.)—Germens four or five, ſtalked, ſmooth. Cluſters panicled. Leaves twice compound.—Found by Michaux, in ſhady woods on the mountains of Carolina, flowering in Auguſt and September. *Herb* two feet high, with the habit of *A. racemoſa*. *Calyx* of five ovate, concave leaves. *Capſules* four or five, ſmooth, compreſſed, pointed with the *ſtyles*, and each ſupported by a ſtalk half its own length. *De Cand.*

3. A. *cordifolia*. Heart-leaved Actæa. De Cand. n. 3. (Cimicifuga cordifolia; Purſh 373, excluding the ſynonym.)—Germens two or three, ſmooth, ſeſſile. Cluſters panicled. Leaves divided in a twice ternate manner; their ſegments five or ſeven lobed, ſerrated, heart-ſhaped at the baſe.—In ſhady woods on high mountains of Carolina, flowering in July. Reſembles *A. Cimicifuga* very much in general habit. *Purſh.* Like *A. racemoſa* and *podocarpa*, differing from the former in having numerous *capſules*, from the latter in their being ſeſſile. *Leaves* ſmooth, their broad ſegments, (we ſhould ſay *leaflets*,) almoſt reſembling vine-leaves. *Cluſters* elongated, wand-like, panicled, ſmooth, with a little acute *bractea* under each partial ſtalk, and two ſmaller lateral ones at its baſe. *De Cand.*

4. A. *palmata*. Palmate Actæa. De Cand. n. 4. (Cimicifuga palmata; Michaux Boreal.-Amer. v. 1. 316. Purſh 373. Hydraſtis; Lamarck Illuſtr. t. 500, which therefore is to be ſtruck out of our article Hydrastis. "H. canadenſis; Poir. Suppl. to Lam. Dict. v. 3. 71, but not of Linnæus.")—Germens twelve to fifteen, in a roundiſh head. Cluſters ſomewhat panicled, forked. Leaves palmate.—In the beds of mountain rivulets in Virginia and Carolina, flowering in July and Auguſt. A very tall and handſome plant; the *leaves* very large, and the *flowers* in great abundance. *Purſh.* The whole plant is ſmooth. *Stem* erect, ſimple, hollow. *Leaves* two, alternate; the *lower one* with a broadiſh *ſtalk*, an inch and a half long; the upper nearly ſeſſile; both wedge-ſhaped at the baſe, very broad, with from three to five oval lobes, rather acute, and cut or ſerrated in their upper part. *Flowers* terminal, corymboſe; their ſtalks forked, minutely downy; ſingle-flowered and naked at the extremity; bracteated below. *Calyx* of four orbicular leaves. *Germens* diſtinct, crowded into a head. *De Cand.*

Sect. 2. *Macrotys*. "Raf. Schmaltz in Bot. Journ. v. 2. 170."

Flowers with a ſingle ſtyle. Fruit dry, burſting.

5. A. *racemoſa*. Long-cluſtered Actæa, or Black Snake-root. Linn. Sp. Pl. 722. De Cand. n. 5. Willd. n. 2. Ait. n. 2. See Actæa n. 2. (Cimicifuga ſerpentaria; Purſh 372. Chriſtophoriana americana procerior et longiùs ſpicata; Dill. Elth. 79. t. 67.)—Piſtil one. Cluſters very long. Fruit dry, burſting. Leaves divided in a thrice-ternate manner, ſerrated, and ſomewhat cut.—In ſhady ſtony woods, from Canada to Florida, flowering in July and Auguſt. *Purſh.* Herbage like *A. ſpicata*, but larger; *flowers* like *A. Cimicifuga*, but monogynous; *fruit* like *A. cordifolia*, but of a ſingle *capſule*. It varies however occaſionally with two *piſtils*. *Cluſters* downy, very long and denſe. *Flowers* pale, fœtid, with ſmall, thick, gibbous, ſtalked *petals*, each tipped with a briſtly point. *Capſules* of two valves. *Seeds* oblong. *De Cand.* This ſpecies is often cultivated in England, as a hardy perennial. The copious white *flowers* are ornamental, but intolerably fœtid, like the ſcent, well known to ſurgeons, of a carious bone. The plant is often ſix or ſeven feet high.

6. A. *japonica*. Japaneſe Actæa. Thunb. Jap. 221. De Cand. n. 6. Willd. n. 3.—Piſtil one. Spikes very long. Leaves in three heart-ſhaped, palmate diviſions, with from three to ſeven lobes.—Gathered in Japan by Thunberg, who deſcribes it thus. *Herb* entirely ſmooth. *Leaves* ſtalked, ternate; leaflets ſtalked, ſimple, heart-ſhaped, cut, with five or ſeven notched lobes, ſerrated, a palm in length and breadth; pale underneath. General and partial *footſtalks* ſtriated, longer than the leaflets. *Spike* from a palm to a ſpan in length. *Calyx* and *corolla* ſoon falling. *Germen* oblong, ſmooth. *Style* none. The author gives no account of the fruit, ſo that it is impoſſible to ſay whether this ſpecies belongs to the ſecond or third ſection.

Sect. 3. *Chriſtophoriana* of Tournefort.

Fruit ſingle, pulpy, not burſting.

7. A. *ſpicata*. Black-berried Actæa, or Herb Chriſtopher. Linn. Sp. Pl. 722. Willd. n. 1, α. Ait. n. 1, α. Fl. Brit. n. 1. Engl. Bot. t. 918. Bull. Fr. t. 83. Fl. Dan. t. 589. (Chriſtophoriana; Cluſ. Hiſt. v. 2. 86. Ger. Em. 979. Lob. Ic. 682.)—Piſtil one. Berry nearly globular. Petals as long as the ſtamens. Cluſter ovate. Leaves divided in a twice or thrice ternate manner; ſegments ovato-lanceolate, ſerrated and cut.—Native of moiſt and ſhady mountainous ſituations, in moſt countries of Europe; very rare in England, being confined to the north-weſt part of Yorkſhire; flowering in May. *Roots* fibrous. *Berries* always black. See Actæa n. 1.

8. A. *brachypetala*. Red or White-berried Actæa. De Cand. n. 8. (A. americana; Purſh 366. A. ſpicata β et γ; Willd. n. 1. Ait. n. 1. A. rubra; Willd. Enum. 561. Bigelow Boſt. 129. Aconitum baccis niveis et rubris; Cornut. Canad. 76. t. 77. Moriſ. ſect. 1. t. 2. f. 7.)—Piſtil one. Berry ovate-oblong. Petals ſhorter than the ſtamens. Cluſter ovate. Leaves divided in a twice or thrice ternate manner; ſegments ovato-lanceolate, ſerrated and cut.—In ſhady rocky woods, in rich vegetable mould, from Canada to Virginia, principally on the mountains, flowering in April and May. Known by the name of Red-and White Cohoſh, and conſidered by the natives as a valuable medicine. *Purſh.* *Root* more tuberous than in the laſt. *De Cand.* *Berries* bright red, or white; there is ſaid to be a blue-berried variety alſo. A plant with ſmaller white *berries*, tipped with red, on large thickened *ſtalks*, is thought by Dr. Bigelow a diſtinct ſpecies. His ſpecimen juſtifies this opinion, and differs alſo in the terminal *leaflets* being ovate, not three-lobed. This merits further enquiry.

ACTINEA, from *ακτιν*, *a ray*; meaning merely a radiated flower; nor is there any thing unuſual or ſtriking, relative to the part in queſtion in the inſtance before us.

us.—" Juff. in Ann. du Muf. v. 2. 425." Willd. Sp. Pl. v. 3. 2213.—Clafs and order, *Syngenefia Polygamia-fuperflua.* Nat. Ord. *Compofitæ difcoideæ*, Linn. *Corymbiferæ*, Juff.

Gen. Ch. *Common Calyx* nearly flat, of many fpreading, lanceolate, fomewhat imbricated, nearly equal, permanent leaves, fhorter than the florets. *Cor.* compound, radiated; *florets* of the difk perfect, numerous, tubular, longer than the calyx, five-toothed; thofe of the radius in a fimple feries, ligulate, wedge-fhaped, obtufe, flat, three-cleft almoft half way down, twice as long as the calyx. *Stam.* in the tubular florets, Filaments five, capillary, fhort; anthers acute, united into a prominent tube. *Pift.* in the fame, Germen oblong, downy; ftyle thread-fhaped, nearly as long as the ftamens; ftigmas two, capitate, divaricated between the points of the anthers. In the ligulate florets, ftyle very fhort. *Peric.* none. *Seeds* in each floret folitary, oblong, hairy, crowned with feveral membranous long-awned fcales. *Recept.* convex, naked.

Eff. Ch. Receptacle naked. Seed-down of feveral chaffy, pointed, awned fcales. Calyx of many equal leaves.

1. A. *heterophylla.* Various-leaved Sun-wort. Willd. n. 1. Juff. as above, t. 61. f. 2.—Gathered by Commerfon at Monte Video. The *ftem* is fhrubby, angular, furrowed; the *branches* leafy, downy when young, fingle-flowered. *Leaves* alternate, feffile, linear-oblong, an inch or two in length, rather flefhy, flightly downy on both fides, blunt, with a fmall point; the lower ones generally furnifhed with a ftrong tooth at each fide; the upper fmaller, narrower and entire. *Flowers* folitary, on long, naked, downy ftalks, at the end of each branch, erect, an inch in diameter. *Calyx* downy. *Radius* fhort, yellow. *Difk* broad, convex, darker coloured; the *florets* numerous, externally hairy in their upper part. Awns of the *feed-down* reddifh, as long as the partial *corolla.*

This plant appears to us very nearly related to HELENIUM, (fee that article,) into which genus it might, without any violence to nature, have been introduced. Even the *calyx* fcarcely betrays a difference, for that of *Helenium* can hardly be confidered as of one leaf, any more than thofe of *Helianthus*, *Rudbeckia*, &c. The ftructure of the *radius*, downinefs of the *feeds* and of the tubular *florets*, pointed chaffy *feed-crown*, all agree. We have not indeed feen the defcription given by the learned author of this genus, nor will our fpecimen admit of an inveftigation of the more recondite parts of fructification, without injury to fo great a rarity; but we fhould not fcruple to fink *Actinea* in *Helenium*, according to our prefent means of judging.

ACTINELLA, a diminutive of ACTINEA, (fee that article,) and therefore inadmiffible, as being contrary to one of the foundeft laws of nomenclature. Nor is this genus, probably, any more than *Actinea*, diftinct from *Helenium*, next to which *Actinella* is placed by Purfh, Fl. Amer. Sept. 494. 560, who defcribes it as follows, citing Perf. Syn. v. 2. 469, and, as a fynonym, *Actinea*, Juff. in Ann. du Muf. v. 2. 425.—Clafs and order, *Syngenefia Polygamia-fuperflua.*

Eff. Ch. Receptacle naked. Seed-crown of from four to fix chaffy-awned fcales. Calyx of many equal leaves.

1. A. *lanata.*—Clothed all over with woolly down. Leaves linear; pinnatifid upwards. Stalks elongated, fingle-flowered. Radiant florets with two teeth. Seeds five-fided, fmooth.—Found by Governor Lewis, on the high lands of the Koofkoofky. Perennial, flowering in June and July. The whole *herb* is clothed with white woolly down. *Stem* branched, round. *Branches* alternate, fubdivided in the upper part; their ultimate divifions fingle-flowered. *Leaves* of the main ftem alternate, linear, dilated and pinnatifid upwards, toothed; thofe of the branches linear, undivided. *Flower-ftalks* terminal, fwelling towards the end. *Flowers* orange-coloured, the fize of *Tagetes erecta.* *Calyx* oblong, fimple, of from twelve to fourteen linear-lanceolate acute leaves. *Florets* of the *radius* from twelve to fourteen, oblong, ribbed, each with two teeth; thofe of the *difk* tubular, of the fame colour. *Down* of from four to fix whitifh, acute, chaffy fcales, occafionally torn. *Seeds* oblong, prifmatic, with five angles. It refembles in habit Juffieu's *Actinea* in Ann. du Muf. v. 2. t. 61. f. 2. *Purfh.*

We are entirely at a lofs to account for the change in the generic name, if the genera are fuppofed the fame, and it feems fortunate that both are likely to be funk in *Helenium.*

ACTINOCARPUS, from ακτιν, *a ray*, and καρπος, *fruit*, alluding to the radiating pofition and form of the capfules. Mr. Brown was obliged to invent this very expreffive name for the *Damafonium* of Juffieu, becaufe the latter appellation has been adopted for another genus, in the works of Schreber and Willdenow.—Brown Prodr. Nov. Holl. v. 1. 342. (Damafonium; Juff. Gen. 46. Tourn. t. 132.)—Clafs and order, *Hexandria Hexagynia.* Nat. Ord. *Tripetaloideæ*, Linn. *Junci*, Juff. *Alifmaceæ*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of three ovate, concave, permanent leaves. *Cor.* Petals three, roundifh, flat, fpreading, larger than the calyx, deciduous. *Stam.* Filaments fix, awl-fhaped, fhorter than the corolla; anthers roundifh. *Pift.* Germens fix or eight, erect, combined at the bafe; ftyles fhort, fpreading; ftigmas fimple. *Peric.* Capfules as many, combined at the bafe, fpreading in the form of a ftar, compreffed, pointed, of one cell, burfting at the upper edge. *Seeds* two, elliptical, ftalked, one erect, inferted into the bottom of the capfule, the other at its curve, horizontal.

Eff. Ch. Calyx of three leaves. Petals three. Capfules fix or eight, compreffed, combined at the bafe, fpreading ftar-wife. Seeds two.

1. A. *Damafonium.* Great Starry-plantain. (Alifma Damafonium; Linn. Sp. Pl. 486. Willd. Sp. Pl. v. 2. 277. Sm. Fl. Brit. 401. Engl. Bot. t. 1615. Curt. Lond. fafc. 5. t. 28. Ait. Hort. Kew. v. 2. 332. Damafonium ftellatum; Dalech. Hift. 1058. Tourn. Inft. 257. Raii Syn. 272. Plantago aquatica minor ftellata; Ger. Em. 417.)—Capfules fix, burfting lengthwife; without wings at the bafe.—Native of watery places on a gravelly foil, in England, near London, as well as in Shropfhire, Suffolk, and Suffex. It grows alfo in France and Siberia; flowering in June and July. The *root* is perennial, of many long fimple fibres, as ufual with aquatic herbs. *Leaves* all radical, floating, ftalked, elliptic-oblong, fmooth, two inches long, with a ftrong mid-rib, and two finer ribs, at each fide, near the margin. *Footftalks* dilated and winged below. *Flower-ftalks* one or two, radical, erect, taller than the leaves, round, fimple, each bearing two or three umbels of whitifh *flowers*, giving it a whorled appearance. The *capfules* refemble thofe of the *Illicium*, or Starry Anife, in fize and general figure.

2. A. *minor.* Smaller Starry-plantain. Br. n. 1.—"Capfules eight, burfting tranfverfely; with eight permanent wings at the bafe. Leaves three-ribbed."—Native of the neighbourhood of Port Jackfon, New South Wales, where it was obferved by Mr. Brown.

We have here admitted this genus, from deference to the authority of Mr. Brown, who efteems it abundantly different from *Alifma*, in the definite number of the *capfules*, their ftellated difpofition, their combination at the bafe, and their two *feeds*. In the habit of the plants there is no difference.

 The

The Linnæan remark that "there is rarely a genus in which one or other part of the fructification does not prove lefs conftant, or uniform, than the reft," *Phil. Bot. fect.* 170; a rule too much neglected by founders of new genera in all ages and countries, fhould teach us caution in every inftance, and in the prefent perhaps might juftify keeping the Linnæan ALISMA entire. See that article.

ACTINOTUS, fo named by M. Labillardiere, Nov. Holl. v. 1. 67, from ακτινωτος, *radiated*, alluding to the form of the involucrum. See ERIOCALIA, which laft name is retained by Profeffor Sprengel, in his *Prodr. Plant. Umbellif.* 27, who gives the following effential character of this very curious genus.

Fruit ovate, villous, with five flender ribs, and crowned by the calyx. Umbel capitate. Involucrum very long, woolly.

The only two fpecies hitherto difcovered are defcribed in their proper place.

ACTON, fecond article, for 853 *r.* 885. Add, Alfo, a town of Vermont, in the county of Windham, containing 245 inhabitants.

ACWORTH, l. 3, in 1810, 1523 inhabitants.

ADAIR, in *Geography*, a county in the diftrict of Kentucky, which, with the town of Columbia, has 6011 inhabitants, including 956 flaves.

ADAM, ROBERT. For Kirkaldy, in Fifefhire, *r.* Edinburgh; and for Edinburgh *r.* that city.

ADAMAH. For Nephtali *r.* Naphtali.

ADAMS, in *Geography*, l. 2, *r.* 1763. At the clofe, add —Alfo, a town of New Hampfhire, in the county of Coos, containing 244 inhabitants.—Alfo, a county of Ohio, containing 9434 inhabitants.—Alfo, a townfhip of Ohio, in the county of Wafhington, having 620 inhabitants.—Alfo, a county of Pennfylvania, containing 15,152 inhabitants, of whom 71 are flaves.

ADANSON, MICHAEL, in *Biography*, the article already given requires fome correction. This celebrated botanift belonged to a Scottifh family, attached to the fortunes of the Pretender. He died of *mollities offium*, Auguft 3d, 1806, and not before, aged 79 years and 4 months. M. Cuvier, in the *Memoires de l'Inftitut*, v. 7, has publifhed an elaborate *eloge* of Adanfon, in which great juftice is done to his ardour and acutenefs in the purfuit of botany, and to his patience and magnanimity under great fufferings and privations, incident to the political convulfions of his country. The writer of this knew him at Paris in 1786. He was evidently a man of an active and penetrating mind, but devoted to his own imaginations and hypothefes, always attacking, as might be expected, the botanical fyftem of Linnæus, but betraying a weaknefs unworthy of his own talents, in contemptuoufly reprobating the whole principles and performances of the illuftrious Swede. Yet we are poffeffed of two letters from Adanfon to Linnæus, both amicable and complimentary in the higheft degree. In the firft, dated June 28, 1754, the writer offers to communicate his difcoveries and remarks made at Senegal, fpeaks of Gum *Bdellium* as the *Thus*, or Frankincenfe, of Europeans, ufed for fumigation in churches, and exhorts Linnæus to continue to illuftrate botanical fcience. The fecond, dated October 2, 1758, acknowledges the receipt of a moft welcome letter from Linnæus; laments the recent death of Anthony de Juffieu, and the illnefs of Bernard de Juffieu, which obliged Adanfon to undertake the department of herborizing with the ftudents. He fubjoins an account of the African tree Baobab, which Bernard de Juffieu had named *Adanfonia*, and gives its natural generic character at length, profeffedly in the Linnæan manner, with feveral articles of information which Linnæus afterwards introduced into his account of *Adanfonia*. This letter moreover contains fome matters relating to Zoology; mentions the great want of accuracy in the characters of almoft all the exotic genera of plants, defcribed by travellers, which the writer had examined at Senegal, and concludes with moft refpectfully thanking Linnæus for his promife to make Adanfon a member of the Upfal Academy of Sciences. This promife appears never to have been fulfilled. It might well be difpenfed with when Adanfon, in the following year, read before the *Academie des Sciences*, at Paris, that hiftory of botany, which now makes a part of the preface of his work, entitled *Familles des Plantes*, publifhed in 1763. In this the fyftem of Tournefort is exalted above the natural as well as artificial methods of Linnæus, and the perfon whofe correfpondence he had been courting, and to whofe "favour and friendfhip" he had fo lately recommended himfelf, is depreciated in the moft contemptuous manner, in almoft every thing he had done for the fcience of botany. This has been attributed to the correfpondence of Adanfon being flighted by Linnæus; but there was hardly time for fuch a confequence. He rather appears to have found it expedient and popular to attack the fame of the great naturalift, to whofe merit the French were then becoming fenfible, and who threatened to eclipfe the honours fo long enjoyed by Tournefort. Notwithftanding Tournefort's merits, Adanfon tells us, p. 154, that "he has reafon to think his own *Familles* will be adopted, as containing the fum of all the knowledge acquired in the fcience of botany." An author feldom errs more than when he prophefies the fuccefs of his own works. Had Adanfon foretold that his performances would never be refuted, he had been right, for they have flept in almoft total neglect. We have given a fufficient account of his method and nomenclature, under the head of NATURAL ORDERS. We are aware that it is ftill popular at Paris to commend him, nor would we deprive him of any praife which he can enjoy, without injuftice to his predeceffors, or without his authority leading to fcientific error, and hiftorical miftake.

ADDISON, JOSEPH, l. 2, *r.* Ambrofbury for Abrofbury.

ADDISON, *County*, l. 5, contained, in 1810, 19,998 inhabitants, difperfed in 24 townfhips.

ADDISON, l. 4, for 401 *r.* 1100. Add—Alfo, a town of Wafhington county, in the diftrict of Maine, containing 399 inhabitants.—Alfo, a townfhip of Pennfylvania, in the county of Somerfet, having 678 inhabitants.

ADENANTHOS, in *Botany*, fo named by Labillardiere, from αδην, *a gland*, and ανθος, *a flower*, on account of the glands, in the form of fcales, attached to the permanent bafe of the corolla.—Labill. Nov. Holl. v. 1. 28. Brown Tr. of Linn. Soc. v. 10. 151. Prodr. Nov. Holl. v. 1. 367.—Clafs and order, *Tetrandria Monogynia*. Nat. Ord. *Proteaceæ*, Juff. Brown.

Gen. Ch. *Cal.* Involucrum fingle-flowered, of from four to eight fhort, imbricated leaves. *Cor.* of one petal, inferior, tubular, cut round near the bafe, and from above that part deciduous; its limb in four deep, lanceolate, flat fegments, turned to one fide. Nectary four glands, united with the permanent bafe of the corolla at its infide. *Stam.* Filaments four, fhort, inferted into the difk of each fegment of the corolla; anthers oblong, erect. *Pift.* Germen fuperior, roundifh; ftyle thread-fhaped, longer than the corolla; ftigma vertical, awl-fhaped, rather thicker than the ftyle. *Peric.* Nut tumid, of one cell, with a fingle *feed*.

Eff. Ch. Involucrum imbricated, fingle-flowered. Corolla four-cleft, fplitting circularly near the bafe. Nectary of four glands, attached to the bottom of the corolla. Style longer

longer than the corolla. Stigma vertical, awl-ſhaped. Nut tumid.

A ſhrubby New Holland genus. *Leaves* ſcattered, various in the different ſpecies. *Flowers* axillary, ſolitary, reddiſh; rarely terminal, ſomewhat aggregate, and yellowiſh. *Brown.*

1. A. *obovata.* Obovate-leaved Adenanthos. Labill. Nov. Holl. v. 1. 29. t. 37. Brown n. 1.—Leaves obovate, entire, ſmooth.—Obſerved by M. Labillardiere, as well as by Mr. Brown, on ſtony hills in Lewin's land, on the ſouth coaſt of New Holland. *Branches* round, thickly clothed with coriaceous *leaves*, near an inch long, broadly obovate, triple-ribbed, beſprinkled with blackiſh glandular dots; their lateral ribs ſending off veins towards the margin. *Flowers* axillary, ſolitary, twice as long as the leaves. *Involucrum* of ſix or eight ſmooth ſcales. Points of the *corolla* ſcarcely hairy on the inner ſide. *Style* hairy, except at the top and bottom. *Stigma* rather ſwelling. *Labill.*

2. A. *cuneata.* Wedge-leaved Adenanthos. Labill. Nov. Holl. v. 1. 28. t. 36. Brown n. 2.—Leaves wedge-ſhaped, ſilky; bluntly toothed at the extremity.—Gathered near the ſea-coaſt at Lewin's land, by Brown and Labillardiere. We have a ſpecimen from the latter. This *ſhrub* is about the height of a man. *Leaves* hardly an inch long, erect, ſtalked, ſilky and ſilvery on both ſides, with three principal ribs, ſometimes combined at the lower part; their abrupt extremity unequally and bluntly notched. *Flowers* towards the tops of the branches, axillary, ſtalked. *Involucrum* fringed, ſilky, as well as the outſide of the *corolla*, whoſe ſegments are denſely bearded on the inſide. *Style* ſwelling and hairy in the middle.

3. A. *ſericea.* Silky-leaved Adenanthos. Labill. Nov. Holl. v. 1. 29. t. 38. Brown n. 3.—Leaves thread-ſhaped, twice-ternate, ſilky. Flowers axillary, ſolitary. Style ſmooth.—Native of the ſandy ſea-coaſt of Lewin's land, where it was found by the authors cited. Our ſpecimen was gathered by Mr. Menzies, at King George's ſound, on the weſt coaſt of New Holland. The *branches* are round and ſilky, the younger ones moſt denſely leafy. *Leaves* about an inch and a half long, twice or thrice deeply three-cleft, in narrow blunt, thread-ſhaped ſegments, clothed with ſilky hairs. *Flowers* towards the tops of the branches, denſely hairy, rather longer than the leaves. *Style* ſmooth in every part, rather ſwelling in the middle.

4. A. *terminalis.* Terminal-flowered Adenanthos. Brown n. 4.—"Leaves thread-ſhaped, three-cleft; their lateral ſegments cloven; middle one undivided. Flowers terminal, ſolitary or three together. Style ſhaggy."—Gathered by Mr. Brown, at Flinder's land, on the ſouth coaſt of New Holland, in low ground near the ſea-coaſt.

ADENODUS, ſo called by Loureiro, from ἀδὴν, *a gland*, becauſe of the glands of the flower, which remain to accompany the fruit.—Loureir. Cochinch. 294.—Claſs and order, *Dodecandria Monogynia.*

Gen. Ch. *Cal.* Perianth inferior, of five lanceolate, reflexed, deciduous leaves. *Cor.* Petals five, ovate, nearly erect, the length of the calyx, divided half way down into many thread-ſhaped ſegments. Nectary five large, depreſſed, permanent, two-lobed glands. *Stam.* Filaments fifteen, ſhort, ſpreading, inſerted into the receptacle; anthers oblong, quadrangular, erect, ſplit and reflexed at the ſummit. *Piſt.* Germen ſuperior, elongated; ſtyle awl-ſhaped, the length of the ſtamens; ſtigma acute. *Peric.* Drupa ovate-oblong, ſmall, ſmooth, ſingle-ſeeded. *Seed.* Nut oblong, rugged.

Eſſ. Ch. Calyx five-leaved, inferior. Petals five, fringed. Nectariferous glands two-lobed, permanent. Drupa with a ſingle ſeed.

1. A. *ſylveſtris.* Cây Côm tláng, of the Cochinchineſe.—Native of woods in Cochinchina. A middle-ſized *tree*, with ſpreading branches. *Leaves* alternate, ovato-lanceolate, ſerrated, ſmooth. *Spikes* nearly terminal. *Flowers* variegated with red and white. *Loureiro.*

De Theis, Gloſſaire de Botanique, 6, has anticipated us in the remark, that this plant approaches the genus ELÆOCARPUS. (See that article.) Indeed we have ſcarcely a doubt of its being one of that genus, though, having ſeen no ſpecimen, we cannot abſolutely aſſert this point. Still leſs can we determine whether Loureiro's plant be any of the ſpecies already known.

ADENOSMA, a word compoſed of ἀδὴν, *a gland*, and ὀσμὴ, *a ſcent*, which expreſſes the glandular and fragrant nature of the herbage.—Brown Prodr. Nov. Holl. v. 1. 442.—Claſs and order, *Didynamia Angioſpermia.* Nat. Ord. *Perſonatæ*, Linn. *Scrophulariæ*, Juſſ. *Scrophularinæ*, Brown.

Eſſ. Ch. Calyx in five deep ſegments; the upper one largeſt. Corolla ringent; upper lip undivided, lower in three equal lobes. Anthers approaching each other. Stigma dilated. Capſule ovate, beaked, ſeparable into two parts. Receptacles united to the ſutures.

1. A. *cærulea.* Blue Adenoſma. Br. n. 1.—Gathered by ſir Joſeph Banks, and Dr. Solander, in the tropical region of New Holland. Seen by Mr. Brown in a dry ſtate only. An annual downy *herb*, beſprinkled with glands, and ſmelling like mint, turning black in drying. The *ſpike* is leafy; or the *flowers* may be termed axillary. *Calyx* rough with jointed hairs, and accompanied by a pair of *bracteas*. *Corolla* blue. *Brown.*

This author remarks, that *Ruellia uliginoſa* and *balſamea* conſtitute a genus nearly akin to the preſent, and that both are related to the order of *Acanthi*, or *Acanthaceæ*, but eſpecially *Adenoſma*, on account of its beaked *capſule*.

ADENOSTEMMA, Forſt. Gen. t. 45. See LAVENIA.

ADEODATUS, POPE, in *Biography*, denominated "Dieu donné," God's Gift, was by birth a Roman, and by profeſſion a monk. He became pope in 672, and died in 676.

ADEPS. Subjoin, See CELLULAR *Subſtance.*

ADERME, in *Commerce.* See QUINTAL.

ADIANTUM, in *Botany*, an ancient Latin name, which by Pliny's account, book 22. chap. 21, appears to have belonged to the very ſpecies of fern, *Adiantum Capillus-Veneris*, to which it is ſtill applied. But that account, like half his work, as we have it, is a manifeſt jumble of various ill-aſſorted materials. What he hints there, as well as in the beginning of the 17th chapter of his 21ſt book, relative to the permanency of the leaves, whether originally reported of the ſame plant, or of ſome other, is not contrary to truth, inaſmuch as this fern is almoſt always verdant. His derivation of the name, from α, *without*, or *contrary to*, and διαίνω, *to moiſten*, becauſe water trickles off the leaves without wetting them, may ſatisfy us, for want of a better; but how much better would ſuch an explanation ſuit any glaucous herb, like the cabbage.—Linn. Gen. 560. Schreb. 757. Willd. Sp. Pl. v. 5. 427. Mart. Mill. Dict. v. 1. Swartz Syn. Fil. 120. Sm. Fl. Brit. 1138. Prodr. Fl. Græc. Sibth. v. 2. 278. Brown Prodr. Nov. Holl. v. 1. 155. Ait. Hort. Kew. v. 5. 524. Purſh 670. Juſſ. 15. Tourn. t. 317. Lamarck Dict. v. 1. 40. Illuſtr. t. 870.—Claſs and order, *Cryptogamia Filices.* Nat. Ord. *Filices dorſiferæ*, *annulatæ*.

Eſſ.

Eff. Ch. Maffes of capfules oblong, or roundifh, inferted into each marginal, reflexed, limited involucrum.

Such is the character of the original *Adiantum* of all authors, a numerous genus, from which Dr. Swartz has firft diftinguifhed his CHEILANTHES, to be treated of hereafter in its proper place, whofe character is, that the maffes of *capfules* are really placed on the margin of the leaf itfelf, each being covered only by its refpective *involucrum*. The difference is nice, and efcaped every previous obferver, but we believe it to be a very found one, inafmuch as it is attended by a difference of habit, and the *involucrum* of *Cheilanthes* is not always neceffarily interrupted, though the maffes of capfules, *fori*, are diftinct.

In our former article, (fee ADIANTUM,) forty-fix fpecies are briefly enumerated, with a particular account of two, which need not here be repeated. As the genus now ftands, Willdenow has fifty-four, (befides nineteen of *Cheilanthes*,) difpofed in fections, of which we fhall give examples, with additions of new fpecies.

Sect. 1. *Frond fimple.* Three fpecies in Willdenow.

1, A. *reniforme*, Linn. Sp. Pl. 1556; 2, *afarifolium* of Willdenow, Lamarck f. 2; and 3, *philippenfe*, Linn. Sp. Pl. 1556. We have none to add. For *A. fagittatum*, fee LINDSÆA.

Sect. 2. *Frond ternate.*

4, A. *triphyllum* only. Sm. Plant. Ic. t. 74.

Sect. 3. *Frond pinnate.* Twelve fpecies in Willdenow.

5, A. *macrophyllum*, Swartz Ind. Occ. 1707; 6, *obliquum*, Willd.; 7, *lunulatum*, Willd. Phytog. t. 9. f. 1; 8, *arcuatum*, Sw.; 9, *pumilum*, Sw. Pluk. Phyt. t. 251. f. 4; 10, *caudatum*, Linn. Mant. 308; 11, *hirfutum*, Willd. from the ifland of Mauritius; 12, *rhizophorum*, Sw. Syn. 320, from the fame country. We have two to add.

A. *platyphyllum.* Broad-leaved Maidenhair. Swartz in Stockh. Tranf. for 1817. 74. t. 3. f. 6.—Frond pinnate; leaflets ftalked, ovate, taper-pointed, nearly entire; oblique, and dilated upwards, at the bafe; glaucous beneath. Dots oblong, contiguous along the whole margin.—Native of fhady woods in Brafil. *Freyreis.* A foot high, or more, confifting of from three to fix alternate *leaflets*, two inches long and one broad, with numerous divaricating veins; the barren ones very inconfpicuoufly ferrated. *Common ftalk* fmooth, of a fhining black. The infertion of the *capfules* is by no means well explained, either in the figure or defcription.

A. *paradoxum.* Ambiguous Maidenhair. Br. n. 1.—"Frond pinnate; leaflets heart-fhaped, oblong-ovate, or lanceolate; their veins underneath obfolete. Dots linear, uninterrupted."—Gathered by Mr. Brown, near Port Jackfon, New South Wales.

Sect. 4. *Frond partly bipinnate.* Five fpecies.

13, A. *deltoideum*, Sw. Ind. Occ. 1705; 14, *denticulatum*, ibid. 1711; 15, *falcatum*, ibid. 1715; 16, *varium*, Willd., found by Humboldt and Bonpland, near Caripe, in South America; 17, *ferrulatum*, Linn. Sp. Pl. 1557.

Sect. 5. *Frond three-branched, digitate, or pedate; the branches pinnate.* Seven fpecies.

18, A. *ternatum*, Willd., found near Caripe, in South America, by Humboldt and Bonpland; 19, *radiatum*, Linn. Sp. Pl. 1556; 20, *pedatum*, ibid. 1557, fee our former article; 21, *Lindfæa*, Cavan. Leccion. 271, gathered by Louis Née, at Quito; 22, *patens*, Willd., found by Bredemeyer at the Caraccas; 23, *pubefcens*, Willd., which is *pedatum* of Forft. Prodr. 83; 24, *flabellulatum*, Linn. Sp. Pl. 1557. This laft is unqueftionably *A. fufcum*, Retz. Obf. fafc. 2. 28. t. 5, the figure of which precifely anfwers to the Linnæan fpecimen of *flabellulatum*, except that the upper fides of the *branches* in the latter are clothed with fine fhort rufty down, like velvet, which might efcape the notice of profeffor Retzius. The *common ftalk*, except at the very top, is quite fmooth and naked, as defcribed by him.

Sect. 6. *Frond twice, thrice, or four times, pinnate.* Thirty fpecies.

25, A. *Lancea*, Linn. Sp. Pl. 1557; 26, *ftriatum*, Sw. Ind. Occ. 1717. Jacq. Ic. Rar. t. 646; 27, *tetraphyllum*, Willd., found by Humboldt and Bonpland near Caripe; 28, *politum*, Willdenow, found by the fame at Cumana; 29, *pyramidale*, Willd., which is *Polypodium pyramidale*, Linn. Sp. Pl. 1554. This is *Filix ramofa pyramidalis, pinnis parvis*, Petiv. Fil. n. 40. t. 4. f. 12, not f. 2. Linnæus adopted this fpecies entirely from Petiver's figure, and was thus led to make it a *Polypodium*. But that figure is copied from *Lonchitis ramofa tenuis, pediculis fpinofis*, Plum. Fil. 42. t. 54, where the characters and habit of an *Adiantum* are confpicuous; 30, *melanoleucum*, Willd., adopted by this author, without feeing a fpecimen, from *Adiantum lunulis albicantibus fignatum*, Plum. Fil. 79. t. 96; 31, *criftatum*, Linn. Sp. Pl. 1558; 32, *nervofum*, Swartz Syn. 123. (fee *hifpidulum*, Br. n. 2, at the end of this fection); 33, *hifpidulum*, Swartz Syn. 124 and 321, fufpected by Mr. Brown to be the fame as n. 32; 34, *villofum*, Linn. Sp. Pl. 1558; 35, *monoforatum*, Willd., gathered at the Caraccas by Bredemeyer; 36, *ferrato-dentatum*, Willd., found by Humboldt and Bonpland near Caripe, and in Brafil; 37, *crenatum*, Willd., taken up entirely from *Lonchitis ramofa, rotundè crenata*, Plum. Fil. 41. t. 53; 38, *pulverulentum*, Linn. Sp. Pl. 1559; 39, *umbrofum*, Willd., found by Bredemeyer, in fhady fituations at the Caraccas; 40, *trapeziforme*, Linn. Sp. Pl. 1559, a Weft Indian fern, ftrangely fuppofed to grow in Scotland, becaufe Sibbald's rude figure of a variety of *Afplenium marinum* was taken for it; fee Sm. Fl. Brit. 1128; 41, *pentadactylon*, Langfdorff and Fifcher, Ic. Fil. t. 25, found in Brafil; 42, *affine*, Willd., which is *trapeziforme* of Forft. Prodr. 84. "Schkuhr Crypt. t. 121. b;" 43, *Capillus Veneris*, Linn. Sp. Pl. 1558. Fl. Brit. 1138. Engl. Bot. t. 1564, fee our former article; 44, *emarginatum*, Willd., found by Bory de St. Vincent, on rocky margins of torrents in the ifle of Bourbon; 45, *cuneatum*, Langfdorff and Fifcher, Ic. Fil. t. 26, found in Brafil; 46, *tenerum*, Swartz Ind. Occ. 1719; 47, *fragile*, ibid. 1721; 48, *concinnum*, Willd., which is *tenerum*, Schkuhr Cryt. t. 121, (but not of other authors,) gathered by Humboldt and Bonpland in the Caraccas; 49, *fumarioides*, Willd., communicated by Flügge, from the ifle of Bourbon; 50, *æthiopicum*, Linn. Sp. Pl. 1560; 51, *trigonum*, Labill. Nov. Holl. v. 2. 99. t. 248. f. 2, confidered by Mr. Brown as not different from the following; 52, *affimile*, Swartz Syn. 125 and 322. t. 3. f. 4; 53, *pallens*, Swartz Syn. 125 and 323, figured in Pluk. Phyt. t. 403. f. 2; 54, *polyphyllum*, Willd., found at the Caraccas by Bredemeyer. We fubjoin the following.

A. *hifpidulum.* Roughifh New Holland Maidenhair. Br. n. 2. Swartz Syn. 124? See n. 33, above. (A. nervofum; Swartz Syn. 123? See n. 32, above. A. pedatum; Forft. Prodr. 83, on the authority of his herbarium.)—Frond doubly pinnate; loweft branches divided; leaflets ovate-rhomboid, toothed in front, ftriated, rather hairy, and rough. Involucrum nearly orbicular, hairy. Common ftalk and ribs rough.—Gathered by Dr. White, as well as by Mr. Brown, in New South Wales, and by the latter in the tropical part of New Holland. A foot high, or more, with a ftrong tufted *root*, whofe crown is fcaly. *Stalks* purplifh-black, harfh. *Leaflets* fomewhat ftalked, ſtalked, numerous on each long partial *branch*, crowded, oblique, jagged, half an inch in length, of a fine green. *Involucrums* crowded moſt about the inner, or upper, angle of the baſe, brown, round or kidney-ſhaped, rough with fine briſtly hairs; their under ſide covered with little brown crowded *capſules*, which are quite unconnected with the leaf.

A. *formoſum*. Elegant New Holland Maidenhair. Br. n. 3.—" Frond repeatedly compound, deltoid; branches triply pinnate; leaflets rhomboid, obtuſe, ſmooth; the lower ones cut. Involucrum kidney-ſhaped. Partial ribs downy. Common ſtalk rough."—Diſcovered by Mr. Brown, near Port Jackſon, New South Wales. We know not that we have ever ſeen a ſpecimen.

A. *aſſimile*. Rounded New Holland Maidenhair. Br. n. 4. Swartz Syn. 125 and 322. t. 3. f. 4. (A. trigonum; Labill. Nov. Holl. v. 2. 99. t. 248. f. 2; ſee n. 51 and 52 above.)—Frond repeatedly compound, very ſmooth; leaflets roundiſh-rhomboid, deeply notched in front; the notches contracted, each bearing a ſmooth kidney-ſhaped involucrum. Common ſtalk and ribs perfectly ſmooth.—Gathered by Dr. White and Mr. Brown, in the neighbourhood of Port Jackſon, and by the latter, as well as M. Labillardiere, on the ſouth coaſt of New Holland, and in Van Diemen's iſland. From one to two feet high, compoſed of numerous little, fan-like, ſtalked, ribbed, bright-green *leaflets*, between whoſe rounded marginal ſegments the ſmooth, light-brown *involucrums* are ſtationed. Theſe by age become reflexed, and turn up the numerous pale *capſules* which cover their under ſurface.

A. *ſubcordatum*. Heart-leaved Maidenhair. Swartz in Stockh. Tranſ. for 1817. 75.—" Frond triply pinnate; leaflets ſtalked, ſomewhat heart-ſhaped, pointed, ſlightly crenate, with radiating veins. Involucrums at each margin, roundiſh-creſcent-ſhaped."—Gathered by Mr. Freyreis, in ſhady woods in Braſil. *Common ſtalk* round, dark purple, ſmooth and poliſhed. *Frond* eighteen inches long, its outline ovate, or deltoid. Primary and ſecondary *branches* alternate, widely ſpreading, ſtraight, round, ſmooth, the colour of the ſtalk. *Leaflets* alternate, rather diſtant, ſome regular, others oblique and dilated at the upper angle of the baſe, an inch in length, with a long point to each; ſmooth on both ſides; ſtreaked beneath with copious, forked, radiating veins, and ſlightly glaucous; the margin obſcurely ſerrated. *Common rib* ſlightly zigzag, poliſhed. *Dots* at the upper and under edges, not at the baſe or apex, roundiſh, diſtinct, covered by brown creſcent-ſhaped *involucrums*. *Swartz*. This mode of expreſſion muſt not be taken literally, for then the plant would be a *Cheilanthes*. The author adds, that this ſpecies is very diſtinct in the ſhape of its *leaflets*; for ſo only can we underſtand "*forma pinnarum*," as meaning *pinnularum*.

A. *intermedium*. Intermediate Maidenhair. Swartz in Stockh. Tranſ. for 1817. 76.—" Frond doubly pinnate; leaflets halved, wedge-ſhaped, oblong-rhomboid, obtuſe, ribbed and ſtriated; with a right angle at the upper ſide of the baſe; ſerrated and fructifying at the front and apex. Stalk and ribs rough and downy."—Gathered by Mr. Freyreis in low woods, in the interior part of Braſil, in September. *Root* creeping. *Common ſtalks* a foot high, triangular, rigid, roughiſh, browniſh-black, beſet with ruſty hair. *Fronds* half as long, deltoid: firſt diviſions oppoſite, linear-lanceolate, curved upwards, of three pair of *leaflets*, half an inch in length, beſides an odd one rather longer, all ſomewhat ſtalked, ſlightly falcate, obtuſe, crowded, ſmooth on both ſides, of a browniſh-green. *Dots* four or five, diſtinct, each with a ſemicircular, curved, brown *involucrum*. Intermediate, as it were, between *criſtatum* of Linnæus, and *nervoſum* of Swartz, n. 31 and 32, but differing from the former in having the *common ſtalk* not rough with prominent points, nor the lower *branches* deeply divided; from the latter in having wedge-ſhaped *leaflets*, ſomewhat falcate in front, and other particulars. It is perhaps too nearly related to *A. acuminatum* of Deveaux. *Swartz*.

ADJIDSING. See BUNDELA and REWAH.

ADIPOCIRE, in *Chemiſtry*, is deſcribed at length in the Cyclopædia; but the curious fact that this ſubſtance forms a principal ingredient in ſome ſpecies of BILIARY *Calculi* has been omitted under both articles.

ADJUSTMENT, the ſettling of the averages or loſſes on policies of aſſurance. See AVERAGE.

ADONIS, in *Botany*, was ſo named in memory of the favourite of Venus, reported by the poets to have been changed, by that goddeſs, into a flower. But whether ours is the very plant, known by this name to the ancients, would be almoſt as difficult to prove as the original fact. Our former article requires correction, in conſequence of the publication of De Candolle, by which we have profited ſo much in ACONITUM, ACTÆA, &c.—De Cand. Syſt. v. 1. 220. Linn. Gen. 281. Schreb. 377. Willd. Sp. Pl. v. 2. 1303. Mart. Mill. Dict. v. 1. Sm. Fl. Brit. 586. Prodr. Fl. Græc. Sibth. v. 1. 379. Ait. Hort. Kew. v. 3. 350. Juſſ. 232. Lamarck Illuſtr. t. 498. Gærtn. t. 74.—Claſs and order, *Polyandria Polygynia*. Nat. Ord. *Multiſiliquæ*, Linn. *Ranunculaceæ*, Juſſ. De Cand.

Gen. Ch. *Cal.* Perianth inferior, of five obtuſe, concave, cloſe-preſſed, ſomewhat coloured, deciduous leaves, ſometimes with a ſmall ſpur at the baſe. *Cor.* Petals from five to fifteen, oblong, obtuſe, poliſhed, with ſimple naked claws. *Stam.* Filaments numerous, very ſhort, awl-ſhaped, inſerted into the baſe of the receptacle; anthers oblong, inflexed. *Piſt.* Germens numerous, ovate, inſerted into the oblong-conical receptacle, crowded, above the ſtamens, each pointed with a very ſhort, partly decurrent, ſtyle; ſtigmas acute, reflexed. *Peric.* none. *Recept.* oblong, ſpiked. *Seeds* numerous, irregular, angular; gibbous at the baſe; reflexed at the point, rather prominent, without awn or wing.

Eſſ. Ch. Calyx of five leaves. Petals from five to fifteen, deſtitute of nectaries. Seeds naked.

Herbaceous plants, with leafy *ſtems*. *Leaves* deeply cut, in a pinnate manner, their lobes many-cleft, in very numerous, linear ſegments. *Involucrum* none. *Flowers* ſolitary, at the ſummits of the ſtem, or branches, yellow, ſcarlet or crimſon, never blue.

All the ten ſpecies are found in Europe, or in the adjoining countries of northern Africa and Aſia; thoſe of the firſt ſection in cultivated plains; of the ſecond in rugged mountainous ſpots.

The perennial kinds have acrid, bitteriſh, purgative *roots*, capable of ſupplying the place of Hellebore. The annual ones are almoſt inactive.

The genus is diviſible into two ſections, by the habit and duration, confirmed by differences in the *flowers* and *fruit*, as follows.

Sect. 1. *Adonia*. De Candolle.

Adonis of C. Bauh. Pin. 178.

Petals from five to ten, concave or flat. *Stam.* eighteen or twenty. *Seeds* collected into an ovate or cylindrical ſpike, always ſmooth, each beaked with a ſtraight conical ſtyle. *Roots* pale, annual, tapering, but little divided. All theſe annual ones are ſo nearly akin, that they have been taken by ſeveral

ſeveral authors, perhaps not improperly, for varieties of one ſpecies. The following ſynonyms therefore are equally applicable to all of them.

Adonis. Matth. Valgr. v. 2. 257.

Flos Adonis, aliis Eranthemum. Bauh. Hiſt. v. 3. p. 1. 125, 126.

Adonis radice anna. Linn. Hort. Cliff. 231, not 321. Sauv. Monſp. 253.

A. annua. Lamarck Dict. v. 1. 45. Brot. Luſit. v. 2. 376.

A. n. 1158. Hall. Hiſt. v. 2. 66.

The following plants may, in M. De Candolle's opinion, be eſteemed, with equal propriety, either ſpecies or varieties. He therefore propoſes them with heſitation, recommending them to the obſervation of practical botaniſts. Whatever difficulties may attend ſome of theſe, we are perſuaded that they cannot all be united, even though the *autumnalis* and *æſtivalis* ſhould prove the only two that are permanently diſtinct, and the foundations of all the reſt.

1. A. *autumnalis.* Corn Adonis, or Pheaſant's-eye. Linn. Sp. Pl. 771. De Cand. n. 1. Willd. n. 2. Sm. Prodr. Fl. Græc. Sibth. n. 1263. Fl. Brit. n. 1. Engl. Bot. t. 308. Curt. Lond. faſc. 2. t. 37. (Flos Adonis; Cluſ. Hiſt. v. 1. 336. Raii Syn. 251. Park. Parad. 293. f. 5. Ger. Em. 387. Lob. Ic. 283. Adonis; Camer. Epit. 647. A. hortenſis, flore minore atrorubente; Moriſ. ſect. 6. t. 8. f. 1. Eranthemum flore rubro; Beſl. Eyſt. æſtiv. ord. 5. t. 11. f. 2.)—Calyx ſmooth. Petals concave, converging, ſcarcely larger than the calyx. Seeds ſomewhat reticulated, collected into an ovate head. Stem branched.—Native of corn-fields in various parts of Europe, from Germany to Greece, flowering through the ſummer to the end of autumn; not frequent in England, except in gardens, where it is often cultivated amongſt other hardy annuals, and as De Candolle obſerves, preſerves itſelf unaltered from ſeed. The *root* is ſomewhat ſpindle-ſhaped. *Stem* branched, buſhy, round, ſtriated, occaſionally downy. *Leaves* alternate, dark green, thrice compound, with innumerable, crowded, rather ſhort ſegments. *Calyx* pale green; ſometimes purpliſh. *Corolla* of that peculiar intenſe crimſon, or blood-colour, which gave occaſion to the name of Pheaſant's-eye, and probably to the original application of the fable to this very plant, whoſe beauty well merits the compliment. Each *petal* has a violet-coloured baſe. *Petals* inverſely heart-ſhaped, uſually about eight. *Fruit* ovate-oblong, meaſuring hardly an inch. *Calyx-leaves* gibbous below their inſertion. M. De Candolle remarks, that there is occaſionally, though rarely, a paler variety. This ſeems, by Dr. Withering's ſpecimens, to be what he found on Saliſbury plain, and took for *æſtivalis.* Its *petals* are rounded, and do not extend beyond the *calyx.*

2. A. *flava.* Yellow Field Adonis. Villars Cat. Straſb. 247. De Cand. n. 2. (A. flore pallido; Camer. Epit. 648. "A. ſylveſtris, flore citrino; Tabern. Ic. t. 790." A. ſylveſtris, flore luteo, foliis longioribus; Mill. Ic. t. 14. f. 2? *De Cand.*)—Calyx ſmooth, with ſhort ſpurs. Petals flat, oblong, twice the length of the calyx. Seeds nearly ſmooth, collected into an oblong head. Stem ſcarcely branched.—Common in corn-fields and vineyards in every part of France, and apparently in Germany alſo, flowering in June and July. The *ſtem* is almoſt always quite ſimple. *Flowers* yellow, or lemon-coloured, rarely pale orange. *Calyx-leaves* elongated and unattached at the baſe, almoſt as in *Sedum* and *Myoſurus.* *Petals* flat, nearly linear. The *flowers* generally almoſt rival the ſize of *A. vernalis,* but there is a variety only half as large; they run into each other. *De Candolle.*

3. A. *micrantha.* Small-flowered Adonis. De Cand. n. 3.—Calyx ſmooth; not ſpurred at the baſe. Petals flat, oblong, rather longer than the calyx. Seeds ſomewhat reticulated, collected into an ovate head. Stem ſomewhat branched.—Found in the ſouth of France, in fields about Toulouſe, Avignon, &c., flowering in May and June. A doubtful ſpecies. *Flower* ſmall, yellow, or flame-coloured. *Germens* few, from ſeven to ten, compoſing a very ſhort head. *Stem* ſimple at the baſe, but often a little branched at the ſummit. *De Candolle.*

4. A. *microcarpa.* Small-fruited Adonis. De Cand. n. 4. (A. annua, flore minimo, ſpicâ tenui longiſſimâ; Moriſ. ſect. 6. t. 9. f. 4?)—Calyx ſmooth. Petals flat, oblong, twice the length of the calyx. Seeds reticulated, collected into an oblong head. Stem nearly ſimple.—Native of corn-fields in Spain, near Tudela; *Dufour:* in the iſle of Ivica; *Delaroche:* in Teneriffe; *Brouſſonet.* Perhaps not diſtinct from *flava,* n. 2. It appears to differ in the *ſtem* not being half ſo tall, with more crowded *foliage.* The *calyx* is ſcarcely, or not at all, ſpurred at the baſe. *Seeds* about half the ſize of *flava,* more numerous, and much more reticulated, in a head eight or nine lines long. The *corolla* is either of a lemon-yellow, or ſomewhat flame-coloured. *De Candolle.* We take the liberty of introducing Moriſon's ſynonym, which ſeems to anſwer beſt to this ſpecies, though applied by De Candolle to the ſeventh.

5. A. *citrina.* Lemon-coloured Adonis. Hoffm. Germ. v. 1. 251, under n. 1. De Cand. n. 5. (Ranunculus arvenſis, foliis chamæmeli, flore minore luteo; Tourn. Inſt. 291? *De Cand.*)—Calyx hairy at the baſe. Petals flat, oblong, longer than the calyx. Seeds collected into an ovate-oblong head. Stem nearly ſimple. Flower almoſt ſeſſile among the leaves.—Native of corn-fields in France, Germany, Teneriffe, &c. A ſmall plant, with an erect, moſtly ſimple, *ſtem,* and little yellow ſolitary *flowers.* Baſe of the *calyx* rough with hairs. Perhaps the ſynonyms may rather belong to *microcarpa,* or to *micrantha.* *De Candolle.*

6. A. *flammea.* Flame-coloured Adonis. Jacq. Auſtr. t. 355. De Cand. n. 6. Willd. n. 3. Ait. n. 3. Hoſt. Syn. 308. Hoffm. Germ. v. 1. 251. (Eranthemum flore flammeo; Beſl. Eyſt. æſtiv. ord. 5. t. 11. f. 3?)—Calyx hairy at the baſe. Petals flat, oblong, ſomewhat acute, longer than the calyx. Seeds collected into a cylindrical head. Stem branched. Flowers ſtalked.—Native of corn-fields in Auſtria, flowering in ſummer; *Jacquin.* In Brunſwick; *Hoffmann.* The *ſtem* is two feet or more in height, branched from the bottom all the way up, furrowed, ſmooth or hairy. *Footſtalks* hairy. *Leaves* light-green, with lanceolate ſegments. *Flowers* large, on long ſtalks. *Calyx* acute, jagged, reddiſh. *Petals* eight or nine lines in length, ſomewhat obovate, but more or leſs acute, and frequently toothed; their colour orange-ſcarlet.

7. A. *æſtivalis.* Tall Scarlet Adonis. Linn. Sp. Pl. 771. De Cand. n. 7. Sm. Fl. Brit. 587, note. Tour on the Continent ed. 2. v. 3. 16. Prodr. Fl. Græc. Sibth. n. 1262. (A. miniata; Jacq. Auſtr. t. 354. Hoffm. Germ. v. 1. 251. A. annua, flore majore phœniceo; Moriſ. ſect. 6. t. 9. f. 3. A. ſylveſtris, flore phœniceo; Bauh. Pin. 178. Anemone tenuifolia; Cord. Annot. 151, good.)—Calyx hairy at the baſe. Petals flat, oblong, obtuſe, twice the length of the calyx. Seeds reticulated, collected into a long cylindrical ſpike. Stem ſlightly branched. Abundant in corn-fields of the ſouth of Europe, France, Italy, &c.; frequent in Greece, according to Dr. Sibthorp, who from that circumſtance, and its coincidence with a figure in the famous old manuſcript copy of Dioſcorides, at Vienna, was led to conſider this ſpecies as the ἀργεμώνη of that ancient botaniſt.

This

This *Adonis* is one of the talleſt, with a copiouſly-branched, furrowed *ſtem;* light-green *leaves;* and long-ſtalked *flowers*, which we cannot, with De Candolle, term ſmall ones, being, as far as we have ſeen, of the full ſize of any annual ſpecies of its genus. The *petals* are uſually numerous, of a moſt vivid ſcarlet. *Fruit* long, but not interrupted, except by accident. We cannot but conſider our friend M. De Candolle as having cited Moriſon, on the preſent occaſion, with leſs accuracy than uſual, and we have made an alteration herein; ſee ſpecies 4th.

8. A. *dentata*. Toothed-ſeeded Adonis. "Delile Egypt. 17. Deſcr. t. 53. f. 1." De Cand. n. 8.—"Calyx hairy at the baſe. Petals flat, oval-oblong, rather longer than the calyx. Seeds reticulated; tuberculated and toothed at the baſe; diſpoſed in a long uninterrupted ſpike."—Native of corn-fields and barren ground, in Egypt and Cyprus; as well as in Provence, between Digne and Colmars. The *ſtem* is angular and ſtriated, firm, branched. *Flowers* on ſhort ſtalks. In the Egyptian ſpecimens, the *petals* are oval, yellow, with blackiſh claws; *ſeeds* furniſhed at the baſe with tooth-like prickles, finely corrugated, leſs creſted at the back, and diſpoſed in a ſlender ſpike. In the Provence variety, the *petals* are oblong, and flame-coloured; *ſeeds* leſs toothed or tuberculated at the baſe, more crowded, lying over each other with their creſts, ſo as to form a continued ſpike an inch long. *De Candolle.*

Sect. 2. *Conſiligo*. Matthioli, De Candolle.

Petals from eight to fifteen, always oblong, flat. *Stamens* from 25 to 30. *Seeds*, collected into an ovate head, each ovate, beaked with its hooked recurved ſtyle. *Roots* perennial, thick at the crown, blackiſh, with cluſtered fibres.

9. A. *vernalis*. Spring Adonis. Linn. Sp. Pl. 771. De Cand. n. 9. Willd. n. 4. Ait. n. 4. Curt. Mag. t. 134. Lamarck f. 3. (A. apennina; Jac. Auſtr. t. 44. Elleborus niger verus; Trag. Hiſt. 406, not 206. Helleborinum; Cord. Annot. 93. Helleborus niger ferulaceus; Lob. Ic. 784. Park Parad. 291. f. 6. Ger. Em. 746.)

β. Mentzelii; De Cand. excluding the ſyn. of Linnæus. (Helleborus niger ferulaceus, caule geniculato, flore magno, tulipæ minoris inſtar; Mentz. Pugill. t. 3; copied in Moriſ. ſect. 6. t. 9. f. 2.)

γ. Sibirica, *Patrin;* De Cand. (A. n. 43; Gmel. Sib. v. 4. 200.)

Root ſomewhat tuberous. Stem branched from the bottom. Petals ten, fifteen, or more, elliptic-lanceolate. Calyx downy. Seeds hairy.—Native of mountainous or alpine ſituations, or open hills, in the iſle of Oeland, Germany, the ſouth of France, Switzerland, and Italy. Frequent with us in gardens, flowering in the early ſpring. The tuberous crown of the black perennial *root*, ſends down many long, ſimple, rather ſtout fibres. The *ſtems* are herbaceous, a foot high, ſtriated, leafy, more or leſs branched from the lower part, in an alternate order, rarely beſprinkled with a few looſe ſcattered hairs. *Leaves* crowded, ſeſſile, alternate, ſmooth, in many three-cleft, linear, acute, entire ſegments; channelled above. *Flowers* terminal, ſolitary, nearly ſeſſile, large and handſome, an inch and a half or two inches broad, of a bright ſhining yellow. *Calyx-leaves* concave, ovate, downy, ſtriated. *Petals* twice as long, ſometimes above an inch, uſually ten or twelve, but ſometimes, even in a wild ſtate, above twenty; purpliſh beneath; varying in breadth, but always ſomewhat elliptical, either obtuſe or acute, a little crenate. *Stamens* numerous, capillary, ſhort, with vertical quadrangular *anthers*. *Germens* numerous, ovate, compreſſed, more or leſs covered with ſhort ſoft hairs, and hooked with the recurved *ſtyles*, collected into a globular head, the *ſtalk* much elongated as the *fruit* ripens. We readily follow De Candolle in thinking the plant of Mentzelius, (ſee *β*.) a very inconſiderable variety, differing only in having ſhort and ſimple *ſtems*, with larger *flowers:* but Linnæus has ſurely committed a great error in referring this plant to his *apennina*. The *γ* of De Candolle is ſaid to have likewiſe a large flower.

10. A. *apennina*. Apennine Adonis. Linn. Sp. Pl. ed. 1. 548, excluding Mentzelius's ſynonym, ed. 2. 772. Willd. n. 5.—Root ſomewhat tuberous. Stem branched at the top. Petals fifteen, obovate. Calyx ſmooth. Seeds fringed.—Native of Siberia and the Apennines, according to Linnæus, who cultivated this plant at Upſal, as appears by the original ſpecimen in his herbarium. He always conſidered this ſpecies as very near the laſt, and has been unuſually preciſe in marking their differences. The *ſtem* of the preſent is fifteen or eighteen inches high, with ſeveral branches about the upper part, not from the lower. *Segments* of the *leaves* more numerous, lanceolate, and ſhining. *Calyx* yellowiſh, ſmooth, flat, without veins. *Petals* obovate, imbricated, generally more numerous. *Stamens* much reflexed. The *germens* ſeem to be fringed only, not all over downy. Linnæus concludes by obſerving that the former is entirely a vernal plant, as we find it; but the preſent laſts far into the ſummer. Neverthelefs our intelligent friend M. De Candolle, who never ſaw this ſpecies but in the Linnæan collection, was induced, probably by the ſynonym of Mentzelius, which cannot be the ſame, to reduce it to *vernalis*. We find more difficulty in underſtanding the two following.

11. A. *volgenſis*. Wolga Adonis. De Cand. n. 9. *addend. 545. ("A. apennina; Pallas Nov. Act. Petrop. v. 10." *Steven*, who ſent ſpecimens to De Candolle.)—"Radical and lower ſtem-leaves reduced to ſlightly ſheathing ſcales; middle and uppermoſt leaves ſeſſile. Seeds ſomewhat downy. Calyx externally hairy. Petals ten or twelve, oblong."—Gathered by Mr. Steven, near the banks of the Wolga. Perennial. Intermediate between *vernalis* and *pyrenaica*, differing from the former in having a branched *ſtem*, more diſtant *leaves*, often wanting on the lower part of the *branches*, and much leſs downy *ſeeds*. From the latter it is diſtinguiſhed by having its lower *leaves* abortive, like ſcales, and the *ſeeds*, at leaſt while young, ſomewhat downy. From both it differs in the *calyx* being externally downy or finely hairy, not ſmooth. Mr. Steven met with *A. vernalis* likewiſe in Tauris. *De Candolle.* Theſe remarks of our learned friend cauſe us no ſmall perplexity. All our ſpecimens of *A. vernalis*, from Switzerland and the ſouth of France, as well as the authentic Linnæan ſpecimen, and one from profeſſor Jacquin, have a downy *calyx*, and moſt of them branched *ſtems*. The half-ripe *ſeeds* in Jacquin's plant are ſparingly downy all over; the *germens* of thoſe from Switzerland ſcarcely downy at all.

12. A. *pyrenaica*. Pyrenean Adonis. De Cand. n. 10. "Fl. Franc. v. 5. 635." (A. apennina; Gouan Illuſtr. 33.)—"Radical leaves on long ſtalks, ternate; leaflets in many deep ſegments: upper leaves ſeſſile. Fruit ſmooth. Petals eight or ten, oblong-wedgeſhaped, undivided."—Found by Gouan in the valley of Eynes, in the eaſtern Pyrenees, flowering in July. The other places of growth, mentioned by De Candolle, are all beſt omitted. He directs us in his *Addenda* to ſtrike out the reference to Pallas, as belonging to *A. volgenſis;* and perhaps alſo that of Fiſcher, *A. chærophylla*. To the latter alteration we heartily aſſent. Dr. Fiſcher's own ſpecimen, ſeen in our hands by De Candolle,

Candolle, has nothing but ſcales in the place of radical *leaves*, and certainly agrees in every reſpect with Jacquin's ſpecimen of *vernalis* above-mentioned. The *calyx* is in the ſame manner hairy at the baſe only, a circumſtance, indeed, on which, the more we enquire into it, the leſs we find reaſon to rely. Our ſpecimen will not admit of an examination of the *germens*. M. De Candolle ſpeaks of his *pyrenaica*, (a ſpecies entirely unknown to us,) as "akin to *vernalis*, but moſt certainly diſtinct. The *ſtem* is often above a foot high, and branched. *Radical leaves* on long three-cleft *footſtalks*. *Flower* nearly ſeſſile, at its firſt expanſion among the uppermoſt leaves. Head of *ſeeds* raiſed on a greatly elongated ſtalk. *Petals* eight to ten, ſmaller and more obtuſe than in *A. vernalis*. *Fruit*, even before it is ripe, ſmooth."

We do not preſume to form any deciſive opinion concerning the perennial ſpecies of *Adonis*, without the examination of ſufficiently perfect ſpecimens, in every ſtate of growth; but it appears to us that they are by no means well determined at preſent, nor do we perceive that any characters hitherto ſuggeſted are ſufficient for the purpoſe. The *vernalis* and *pyrenaica* are probably very diſtinct, for which we have the weighty opinion of De Candolle; but whether the latter may not be found in many other countries, and confounded by the generality of botaniſts with *vernalis*, is a point we cannot ſatisfactorily determine.

ADPRESSA Folia, Cloſe-preſſed Leaves, are ſuch as have the upper ſurface cloſely applied to the ſtem, or branch, on which they grow. This is ſo complete in ſome plants, ſuch as *Paſſerina hirſuta*, that only the under ſurface of each leaf being expoſed to the air and light, the latter part appears to perform the functions proper to the upper ſurface of moſt leaves, and, in the inſtance juſt mentioned, aſſumes the deep green hue, and poliſhed cuticle, uſual on the upper ſide of leaves in general. Such is likewiſe the caſe with *Xeranthemum proliferum* and *ſeſamoides* of Linnæus, now referred to Elichrysum. See Leaf.

ADRASTÆA, ſo named by profeſſor De Candolle, from Adraſtea or Adraſtia, a ſurname of the goddeſs Nemeſis, who was a daughter of Oceanus; becauſe the plant in queſtion is a native of New Holland, which has been called by ſome perſons *Oceania*.—De Cand. Syſt. v. 1. 424.—Claſs and order, *Decandria Digynia*. Nat. Ord. *Magnoliæ*, Juſſ. *Dilleniaceæ*, De Cand.

Eſſ. Ch. Calyx inferior, of five permanent pointed leaves. Petals five, oval, ſhorter than the calyx. Filaments flat. Anthers linear, of two cells burſting lengthwiſe. Germens two, globoſe. Styles ſtraight, cloſe together, awl-ſhaped; conical at the baſe. Capſules membranous, of one cell. *Seeds* ſolitary?

1. A. *ſalicifolia*. Willow-leaved Adraſtæa.—Native of bogs in New South Wales. Deſcribed by De Candolle from a dried ſpecimen in Mr. Lambert's collection. This is a ſmall ſhrub, approaching Hibbertia, (ſee that article,) in general appearance. The *branches* are round, long and ſlender, reddiſh-brown; downy when very young, but caſting their cuticle in long portions when old. *Leaves* linear, entire, except three or five callous teeth at the extremity, the point being callous; their baſe ſomewhat contracted; their upper furface ſmooth, without veins; the under hoary with ſhort ſilky hairs: their length is an inch and a half; breadth three lines; and they reſemble the leaves of *Salix alba*, or of the Olive. *Flowers* at the ends of the young branches, ſolitary or in pairs, ſeſſile between three or four crowded leaves, which exceed them in length. *Calyx-leaves* keeled, covered with cloſe ſilky hairs; their margin membranous; their point tipped with a briſtle. *Stamens* ten, half the length of the calyx. *Germens* ſmooth.

ADRIANOPLE, col. 2, l. 3, *r.* 1453.

ADVICE, in *Commerce*, denotes the information given by *letter* of a bill drawn by one merchant upon another.

ADVOCATE, l. 24, *r.* paſſed A.U. 549. Col. 2, l. 8, *r.* revived.

AECIDIUM, in *Botany*, from αικια, *a wound or injury*, becauſe the parts of a plant to which this genus of paraſitical *fungi* attaches itſelf, always, in conſequence, become diſeaſed, diſcoloured, and either tumid, or, as it were, blaſted.—Perſ. Obſ. Mycol. faſc. 1. 97. Syn. Fung. 204. —Claſs and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eſſ. Ch. Head conſpicuous, ſeſſile, round, membranous, at length burſting, with a toothed orifice. Seeds mealy, naked.

This genus is always paraſitical on the backs of the leaves, or on the ſtem, of certain plants. In addition to what is ſaid of it already, we ſhall ſubjoin illuſtrations of a few ſpecies. Perſoon defines twenty, in two ſections.

Sect. 1. *Aggregate*. *Heads aſſembled in patches, forming blotches on various leaves*. Fourteen ſpecies.

Ae. *cornutum*. Horned Aecidium. Perſ. n. 1. Obſ. Mycol. faſc. 2. 22. t. 4. f. 2, 3. Sowerb. Fung. t. 319. (Lycoperdon corniferum; Fl. Dan. t. 838. L. corniculatum; Ehrh. Crypt. 200.)—Baſe yellowiſh. Heads nearly cylindrical, very long, curved, greyiſh-olive.—Found in autumn, on the leaves of the Mountain Aſh. On the upper ſide of the leaf is ſeen an orange-coloured ſpot; on the under a ſwelling, out of which proceed ſix or ſeven briſtle-like *heads*, a line and a half in length; each rather tumid at the baſe; contracted at the point, where it burſts irregularly.

Ae. *cancellatum*. Reticulated Aecidium. Perſ. n. 2. Sowerb. Fung. t. 410. (Lycoperdon cancellatum; Jacq. Auſtr. v. 1. 13. t. 17. Fl. Dan. t. 704.)—Baſe tawny. Heads oblong, ſplitting into fibrous maſſes, cohering at the ſummit.—Not rare on the leaves of garden pear-trees. We firſt ſaw it on a baking pear at ſir A. Hume's, Wormleybury, many years ago, where it ſtill frequently occurs, without injury to the tree or fruit. The *heads* are much thicker and ſhorter than the foregoing, and when ripe, diſcharge their powdery *ſeeds* between the tough, browniſh, permanent fibres of the *head*, which laſt as long as the leaf, and actually ſeem an extenſion of its woody fibres. We cannot but conceive Mr. Sowerby's t. 409 to be a different plant, belonging to the genus Sphæria (ſee that article); or rather perhaps Næmaspora, to be hereafter deſcribed.

Ae. *oxyacanthæ*. White-thorn Æcidium. Perſ. n. 3. (Ae. laceratum; Sowerb. Fung. t. 318. Lycoperdon penicillatum; Fl. Dan. t. 839?)—Baſe unequal, ruſty. Heads aſh-coloured, cylindrical, ſplitting nearly from top to bottom, into numerous, fibrous, ſpreading ſegments.—Found on the leaves, or young buds, of Common Hawthorn. Perſoon deſcribes his ſpecimens as divided to the very baſe, and therefore preſumes the plant of *Fl. Dan.*, which appears not ſplit half way down, may be another ſpecies; but Mr. Sowerby's ſeems intermediate between both, and we can ſcarcely doubt his being the ſame as Perſoon's.

Ae. *tuſſilaginis*. Colt's-foot Æcidium. Perſ. n. 10. Relh. 546. Sowerb. Fung. t. 397. f. 1. (Lycoperdon epiphyllum; Linn. Sp. Pl. 1655. Fl. Suec. ed. 2. 459. With. v. 4. 383.)—Baſe tawny-purple. Heads ſunk, level-topped, with a many-cleft, reflexed border.—On the under ſide of the leaves of Colt's-foot and Butterbur, extremely common, in the form of broad orange-coloured ſpots, beſprinkled

ſprinkled with the little ſtarry whitiſh orifices of the *heads*, full of orange powder. *Lycoperdon epiphyllum* of Hudſon and Lightfoot are different from this, and perhaps from each other. *Uredo tuſſilaginis* reſembles our plant in general aſpect, but on near examination will be found leſs diſtinct, in the form of an orange powder, intermixed with the cotton of the Colt's-foot leaf, without diſtinct white ſtarry heads.

Ae. *berberidis*. Barberry Æcidium. Perſ. n. 11. Sowerb. Fung. t. 397. f. 5. (Lycoperdon poculiforme; Jacq. Coll. v. 1. 122. t. 4. f. 1.)—Baſe orbicular, ſcarcely convex. Heads cylindrical, ſomewhat elongated, yellow.—Found on leaves of the Barberry, in cold wet autumnal weather, ſometimes in the ſpring, conſiſting of very conſpicuous and prominent tawny ſpots, the *heads* projecting much. The orifice of each is neither dilated, nor conſpicuouſly toothed or jagged. The whole turns brown, or black, in decay, and may be obſerved in that ſtate on the fallen leaves during winter.

Sect. 2. *Simple. Heads ſcattered, not combined by any diſtinct cruſt, or baſe.* Six ſpecies.

Ae. *euphorbiæ*. Spurge Aecidium. Perſ. n. 15. "Humb. Friberg. 128." ("Lycoperdon euphorbiæ; Schrank. Bavar. v. 2. 631." Eſula degener; Rivin. Tetrap. Irr. t. 113. f. 2.)—Simple, crowded. Heads pale, cylindrical, reflexed at the margin. Powder orange-coloured.—Frequent in ſummer on the leaves of *Euphorbia Cypariſſias*, in Germany, France, and Switzerland, cauſing the whole plant to aſſume a diſeaſed appearance, and often to fail of producing flowers. We ſcarcely think Rivinus, as Perſoon hints, meant to conſider this diſeaſed *Euphorbia* as a diſtinct ſpecies.

Ae. *tragopogi*. Goat's-beard Æcidium. Perſ. n. 15, *b*. Sowerb. Fung. t. 397. f. 2.—Scattered. Heads ſomewhat elliptical, with an irregularly torn white margin. Powder yellow.—On the ſtem and leaves of *Tragopogon pratenſis*. Conſpicuous for its ſhort white heads. *Perſoon*. That author certainly means to deſcribe this as a diſtinct ſpecies from the laſt, though by an error, which ought to have been corrected in printing, he has given the ſame number to both. Hence he has really twenty ſpecies in all, though apparently but nineteen.

Ae. *anemones*. Wood-Anemone Æcidium. Perſ. n. 17. Uſt. Annal. v. 20. 135. (Lycoperdon anemones; Pulten. Tr. of Linn. Soc. v. 2. 311.)—Simple, ſcattered. Heads cylindrical, rather prominent, pale, moſtly toothed, filled entirely with white powder.—Found in the ſpring on leaves of *Anemone nemoroſa*, rendering the plant ſickly, and often barren. Dr. Pulteney obſerved that this *fungus* originates under the cuticle, and may be ſeen, in a young ſtate, through that membrane. At length each individual aſſumes a nearly globular form, burſting with lacerated edges, the cavity being lined with white powdery *ſeeds*, intermixed with minute fibres. In fading, each turns yellowiſh, then brown, and finally "each *fungus* is reſolved into a farinoſe particle, reſembling the fructification of a Polypody." *Pulteney*. The *Æ. fuſcum*, Relh. Cant. 546. Sowerb. Fung. t. 53, found on the leaves and petals of the ſame ſpecies of *Anemone*, without injuring the plant, is the *Puccinia anemones*, Perſ. Syn. Fung. 226, a genus deſcribed as deſtitute of a head, or *peridium*. In this reſpect we find it difficult to draw a line between Mr. Sowerby's figure, and his various repreſentations of *Æcidia*, t. 398, though we doubt not the ſpecific difference of the above two plants. Which of them is the "Conjurer of Chalgrave's Fern," Dill. in Raii Syn. 124. t. 3. f. 1, may be doubted; but we rather ſuppoſe the *Puccinia*.

Ae. *punctatum*. Yellow-Anemone Æcidium. Perſ. n. 18. Uſt. Annal. v. 20. 135. (Ae. anemones; Hoffm. Germ. v. 2. t. 11. f. 1.)—"Simple, ſcattered. Heads partly ſunk, their border nearly cloſed. Powder compact, browniſh."—Found rarely on the leaves of *Anemone ranunculoides*, which it marks with brown dots. The border of the orifice is but ſlightly, if at all, toothed. *Seeds* cheſnut-coloured. *Perſoon*. We have not heard of this ſpecies in Britain.

Mr. Sowerby has repreſented ſeveral more ſpecies of this genus in his *Engliſh Fungi*, t. 397, 398, ſuch as *Æ. corni, confluens, rubi, fragariæ, menthæ, ſalicis, cardui, rhei;* but we do not ſee clearly how the generic difference between *Æcidium* and *Puccinia* is, in moſt of them, to be determined.

ÆGÆ, l. 4, *r*. M. Gebelin.

AEGERITA, in *Botany*, ſo called from αιγειρος, *a Poplar*, or rather *Alder tree*, becauſe the firſt-diſcovered ſpecies of this minute genus grows on the wood of the Alder, and was thence called *Sclerotium Aegerita*, which laſt word, on the eſtabliſhment of the preſent genus, was taken for its generic name.—Perſ. Syn. Fung. 684.—Claſs and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eſſ. Ch. Seſſile granulations ſolid, filled with a ſomewhat mealy powder.

1. Ae. *candida*. White Aegerita. Perſ. Diſp. Fung. 40. (Sclerotium Aegerita; Hoffm. Germ. v. 2. t. 9. f. 1.)—Crowded, ſmooth, pure white.—Found not unfrequently in autumn, on the dry rotten wood of Alder, in moiſt ſituations. This *fungus* conſiſts of numerous little crowded granulations, the ſize of millet-ſeed, globular or elliptical, as white as ſugar-plums, ſolid but friable, the internal ſubſtance appearing, when highly magnified, full of ſeed-like bodies. *Hoffmann*.

2. Ae. *pallida*. Pale Aegerita. Perſ. ibid.—Scattered, pale, ſomewhat warty.—On the fallen branches of Oaks. Diſtinguiſhed by the inequality of its ſurface. *Perſoon*.

3. Ae.? *cæſia*. Grey Doubtful Aegerita. Perſ. n. 3.—Scattered, glaucous or whitiſh.—On the trunks of trees in winter. Reſembles ſmall pale dots, of a ſoftiſh ſubſtance; diſappearing when dried. *Perſoon*.

AEGIALITIS, αιγιαλιτις, *an inhabitant of the coaſt*, alluding to its place of growth.—Brown Prodr. Nov. Holl. v. 1. 426.—Claſs and order, *Pentandria Pentagynia*. Nat. Ord. *Aggregatæ*, Linn. *Plumbagines*, Juſſ. *Plumbagineæ*, Brown.

Eſſ. Ch. Calyx of one leaf, coriaceous, five-toothed, with folded angles. Petals five, their claws combined at the baſe, bearing the ſtamens. Stigmas capitate. Pericarp prominent, angular, nearly cylindrical, coriaceous, without valves. Seed germinating, without albumen. Plumula conſpicuous.

1. Ae. *annulata*. Gathered by Mr. Brown, in the tropical part of New Holland, growing among *Rhizophoræ*, near the ſea-ſhore. A perfectly ſmooth *ſhrub*, of humble growth, having round, brittle *branches*, marked with annular ſcars, where the leaves have been. *Leaves* alternate, without *ſtipulas*, flat, coriaceous, ovate, entire; their *footſtalks* bordered, dilated and ſheathing at the baſe. *Spikes* panicled. *Flowers* white, alternate, ſomewhat imbricated, with three *bracteas*. *Brown*.

Akin to STATICE. See that article, and TAXANTHEMA.

AEGICERAS, ſo called from αιξ, *a goat*, and κερας, *a horn*, in alluſion to the horn-like ſhape of the curved ſeed-veſſel, the following is to be ſubſtituted in the place of our original article.—Gærtn. v. 1. 216. t. 46. Schreb. Gen. 156. Willd. Sp. Pl. v. 1. 1183. Mart. Mill. Dict. v. 1.

Konig Ann. of Bot. v. 1. 132. t. 3. Brown Prodr. Nov. Holl. v. 1. 534.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Myrſineæ*, Brown.

Gen. Ch. reformed. *Cal.* Perianth inferior, of five roundiſh-oblong, concave, coriaceous, permanent leaves, thickeſt at the baſe, obliquely imbricated at the margin. *Cor.* of one petal, ſalver-ſhaped, ſomewhat coriaceous.; tube the length of the calyx, nearly cylindrical, thickiſh, rounded at the baſe; limb the length of the tube, in five deep, ovate, pointed, equal, reflexed ſegments. *Stam.* Filaments five, prominent, awl-ſhaped, twice the length of the tube, united at the bottom into a ring, attached to the baſe of the corolla; anthers arrow-ſhaped, incumbent, verſatile, of two lobes and two cells, burſting longitudinally. *Piſt.* Germen ſuperior, linear-oblong, compreſſed, dotted, with rudiments of ſeveral ſeeds; ſtyle erect, the length of the ſtamens, tapering, permanent; ſtigma ſimple. *Peric.* Follicle cylindrical, coriaceous, curved, pointed, of one cell. *Seed* ſolitary, oblong, nearly filling the pericarp, and germinating there, attached by a thin flat umbilical cord, of its own length, which is dilated into a hood-like, pointed, partial tunic, cloſely covering the minute cotyledons, and part of the radicle; albumen none; embryo erect; radicle very large.

Eſſ. Ch. Calyx in five deep imbricated ſegments. Corolla ſalver-ſhaped, five-cleft, reflexed. Filaments joined at the baſe. Stigma ſimple. Follicle coriaceous, cylindrical. Seed ſolitary, with a hooded tunic.

1. Ae. *fragrans*. Fragrant Aegiceras. Konig as above. Br. n. 1. (Ae. majus; Gærtn. as above. Willd. n. 1. Rhizophora corniculata; Linn. Sp. Pl. 635. Burm. Ind. 108. Pou-Kandel; Rheede Hort. Malab. v. 6. 65. t. 36. Mangium fruticans corniculatum; Rumph. Amboin. v. 3. 117. t. 77.)—Native of the maritime woods and thickets of the Eaſt Indies, as well as of the tropical and eaſtern coaſts of New Holland. The *ſtems* are rather ſhrubby than arboreſcent, ſeveral from the ſame root, ten to fourteen feet high, three or four inches in diameter, with numerous ſlender ſpreading branches. *Leaves* alternate, or imperfectly oppoſite, ſtalked, obovate, or ſomewhat elliptical, emarginate, entire, coriaceous, ſmooth, ſingle-ribbed, from one to four inches long. They are reported to have a briny taſte; and Mr. Browne noticed a ſaline efflorefcence, or excretion, on their upper ſurface. *Flowers* white, fragrant, about half an inch broad before their *corolla* is reflexed, collected into *umbels* at the ends of the ſhort lateral, as well as principal, branches. *Seed-veſſel* near an inch and a half long, pointed, curved, but not ſpiral, as the generic name would ſeem to imply.

This ſhrub, which Linnæus confounded with his *Rhizophora*, is the only known ſpecies of a very diſtinct genus; the *Æ. minus*, Gærtn. t. 46, having been ſhewn by Mr. Konig to be *Connarus ſantaloides* of Vahl, Symb. v. 3. 87, *Santaloides*, Linn. Zeyl. 192. n. 408, a totally different plant in genus and natural order, though Gærtner has quoted for a ſynonym, *Umbraculum maris*, Rumph. Amboin. v. 3. 124. t. 82. This laſt, as well as *Mangium floridum* of the ſame writer, v. 3. 125. t. 83, appear very nearly related to our *Ægiceras fragrans*; inſomuch that, without ſpecimens, no one can ſafely diſtinguiſh them from it, or from each other, for the difference of ſize in their reſpective *flowers* is of no avail in Rumphius's, always variouſly diminiſhed, plates.

AEGINETIA, a reſtored genus, firſt founded by Linnæus, ſubſequently reduced by himſelf to OROBANCHE, and originally named in honour of PAUL ÆGINETA. (See thoſe articles.)—Linn. Gen. ed. 5. 280. Dryandr. in Roxb. Coromand. v. 1. 63. Willd. Sp. Pl. v. 3. 346.—Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. *Perſonatæ*, Linn. *Pediculares*, Juſſ.

Gen. Ch. *Cal.* Perianth ſheath-like, inferior, of one leaf, ovate, concave, inflated, coloured, permanent. *Cor.* of one petal, tubular, longer than the calyx; tube globular at the baſe, bent horizontally towards the middle, ſwelling upwards; limb ſpreading, in five ſhort, rounded, equal ſegments. *Stam.* Filaments four, incurved, two ſhorter than the reſt; anthers oblong, ſimple, converging in pairs, ſlightly bent. *Piſt.* Germen ſuperior, ovate; ſtyle ſimple, curved, the length and poſition of the ſtamens; ſtigma capitate, large. *Peric.* Capſule ovate, pointed, of two valves? with many cells. *Seeds* numerous, minute. *Receptacles* ſeveral, convoluted, attached to the valves.

Eſſ. Ch. Calyx of one leaf, opening lengthwiſe. Corolla with five equal ſegments. Capſule of many cells. Seeds numerous.

1. Ae. *indica*. Indian Aeginetia. Linn. Sp. Pl. v. 1. 632. Roxb. Coromand. v. 1. 63. t. 91. Willd. n. 1. (Orobanche Aeginetia; Linn. Sp. Pl. ed. 2. 883. "Tſiem-cumulu; Rheede Hort. Malab. v. 11. 97. t. 47.")—Native of Malabar, in the hilly parts of the Circars, but rare. *Roxburgh*. *Root* of many ſimple fibres, probably paraſitical and annual. *Stems* ſeveral, purpliſh, a ſpan high, ſimple, ſingle-flowered, and naked, except a lanceolate, brown, ſheathing ſcale at the bottom of each. *Calyx* ruſty-coloured, an inch long, turning green as it fades. *Corolla* half as long again as the calyx, and more ſlender, of a violet purple; the tube pale; deciduous. *Style* permanent as the fruit ripens, curved, projecting laterally out of the calyx. *Seeds* and *receptacles* tawny.

The generic diſtinctions between this plant and *Orobanche* are obvious enough; the ſingle-leaved ſpathaceous *calyx*, regular *corolla*, undivided *ſtigma*, and many-celled *capſule*, whoſe internal ſtructure Dr. Roxburgh ſays he could never well determine, but the numerous convoluted *partitions*, or *receptacles*, which he deſcribes, are ſufficiently different from *Orobanche*. As to habit, theſe genera nearly agree, both having a ruſty pubeſcence, a purple hue, and, if we miſtake not, paraſitical *roots*; though the *infloreſcence*, and the form of the *calyx*, differ in each. *Aeginetia* appears to want the nectariferous *gland*, found at the baſe of the *germen*, in front, in *Orobanche*; it wants alſo the *bracteas*, obſervable in every ſpecies of the laſt-named genus, except the *uniflora*.

ÆGISSUS. See ÆGYPTUS.

AEGLE, in *Botany*, the name of one of the HESPERIDES, (ſee that article,) choſen by Mr. Correa de Serra for this genus, as Linnæus had already dedicated one to her ſiſter *Arethuſa*.—Correa Tr. of Linn. Soc. v. 5. 222. Ait. Hort. Kew. v. 3. 284.—Claſs and order, *Polyandria Monogynia*. Nat. Ord. *Aurantia*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, ſmall, with five ſhallow lobes, at length deciduous. *Cor.* Petals five, ovate, acute, ſpreading, many times longer than the calyx. *Stam.* Filaments numerous, ſhort, awl-ſhaped, inſerted into the external part of the elevated receptacle of the flower; anthers oblong, erect, heart-ſhaped at the baſe. *Piſt.* Germen ſuperior, ovate; ſtyle ſhort, thick; ſtigma oval, obſcurely furrowed. *Peric.* Berry coated, globular, ſmooth, almoſt woody when ripe, not burſting, of ten or twelve cells obliterated as the pulp arrives at maturity. *Seeds* ovate, compreſſed, numerous in each cell, in a ſimple row, each inſerted by a ſhort partial ſtalk into the central column; albumen none.

Eſſ.

Eſſ. Ch. Petals five. Calyx five-cleft, inferior. Berry coated, of numerous cells. Seeds many.

1. Ae. *Marmelos.* Thorny Aegle, or Bengal Quince. Correa as above, 223. Willd. n. 1. Roxb. Coromand. v. 2. 23. t. 143. (Cratæva Marmelos; Linn. Sp. Pl. 637. Willd. Sp. Pl. v. 2. 853. Cydonia exotica; Bauh. Pin. 435. Cucurbitifera trifolia indica, fructûs pulpâ Cydonii æmula; Raii Hiſt. v. 2. 1665. Pluk. Phyt. t. 170. f. 5. Bilacus; Rumph. Amboin. v. 1. 197. t. 81. Covalam; Rheede Hort. Mal. v. 1. 37. t. 37. *Maredoo* of the Telingas.)—Native of the mountainous parts of the coaſt of Malabar, ſometimes of the low lands, flowering during the hot ſeaſon. This is a rather large tree, whoſe *trunk* is nearly erect, clothed with aſh-coloured *bark*. *Branches* ſcattered. *Spines* ſtipulary, in pairs, awl-ſhaped, pungent, ſtrong, an inch in length, ſometimes wanting. *Leaves* irregularly ſcattered, on downy *ſtalks*, ternate; *leaflets* elliptic-oblong, with a blunt point, ſerrated, ſingle-ribbed, veiny, ſmooth; tapering at the baſe; unequal in ſize; the odd one largeſt, about three inches long. *Flowers* of a dirty white, in ſhort, aggregate, terminal and axillary, cluſters. *Fruit* the ſize of a large orange, with a hard ſmooth greyiſh ſhell, from which the Dutch in Ceylon are ſaid to prepare a perfume. Dr. Roxburgh ſpeaks of this *fruit* as delicious to the taſte, and exquiſitely fragrant, of a laxative quality, which renders it particularly ſerviceable in habitual coſtiveneſs. A clear tenacious gum, enveloping the ſeeds, makes a good cement. The wood of the tree is hard and durable, of a light chocolate colour, variegated with dark veins, and ſerves for many purpoſes. Mr. Correa mentions another, likewiſe arboreous, ſpecies of *Aegle*, found in the Eaſt Indies, and preſerved in ſir J. Banks's herbarium, but of this he has unfortunately neglected to give either a name or deſcription, nor have we ſeen any ſpecimens. See FERONIA for a genus next akin to the above.

AEGOPOGON, already mentioned and explained, in its proper place, as a ſynonym of the *Spiræa Ulmaria*, or rather perhaps *S. Aruncus*, is now adopted for the generic appellation of a South American genus of graſſes, by Willdenow, after Humboldt and Bonpland.—Willd. Sp. Pl. v. 4. 899. Paliſot de Beauvois Agroſt. 122. t. 22. f. 3, 4. Kunth Nov. Gen. et Sp. v. 1. 132.—Claſs and order, *Polygamia Monoecia*. (Rather *Triandria Digynia*.) Nat. Ord. *Gramina*.

Eſſ. Ch. Calyx of two valves, ſingle-flowered; the valves cloven, with an intermediate awn. Corolla of two valves; the outer with three awns; inner with two. Seed ſolitary, unconnected with the glumes. One or two lateral male flowers.

1. Ae. *cenchroides*. Spreading Aegopogon. Willd. n. 1. Paliſ. de Beauv. as above, f. 3. Kunth n. 1. t. 42.—Cluſter lax. Flowers all equally ſtalked.—Gathered by Humboldt and Bonpland, on the expoſed ſummit of mount Avila, near the town of Caraccas; alſo in Quito; flowering from January to April. *Root* perennial. *Stems* numerous, branched at the baſe, forming a tuft; thoſe which do not flower, about as long as the finger; the reſt a ſpan in height, naked above, denſely leafy below. *Leaves* linear; the lowermoſt an inch, or an inch and a half long; the upper ones ſhorter. *Sheaths* ſtriated, ſmooth, ſlightly membranous at the edges. *Stipula* divided. *Cluſter* ſimple, rather turned to one ſide, but ſpreading looſely. This graſs has the aſpect of *Cenchrus ciliaris*, or of *Lappago racemoſa*. *Willdenow*. We know it only from this author's deſcription, and the figures cited. From M. de Beauvois our knowledge of the following ſpecies is entirely derived.

2. Ae. *puſillus*. Small Aegopogon. Paliſ. de Beauv. as above, f. 4.—Cluſter denſe, turned one way. Perfect flower ſeſſile.—Native country not recorded. The perfect *flowers* of this ſpecies, whoſe *cluſter* is repreſented about half the ſize of the foregoing, are ſeſſile, their *calyx* apparently of two equal, awl-ſhaped, undivided glumes. The two lateral, or male, *flowers* are elevated on equal, ſlender, parallel ſtalks, twice their own length, though but half as long as the intermediate perfect *flower*. The inner valve of their *calyx* ſeems entire, though awned. Their *corolla* conſiſts of two entire, not cloven, valves, one of which only is awned. We do not pretend, without the inveſtigation of ſpecimens, to reconcile theſe contradictions of the generic character, nor to judge how far M. de Beauvois is right in uniting with this genus Mr. Brown's AMPHIPOGON, hereafter to be noticed in its proper place.

3. Ae. *geminiflorus*. Twin-flowered Aegopogon. Kunth as above n. 2. t. 43.—Male flower ſolitary.—Gathered by Humboldt and Bonpland, on the banks of the river Orinoco, between Cerro Duida and Rio Tamatama, near Eſmeraldam, flowering in May. Habit much like the firſt ſpecies, but the *ſpikelets* are conſiderably ſmaller, while the central awn of one valve of the perfect *flower* is remarkably long, ſtout, and rough. Each *flower* is ſupported by a ſhort partial ſtalk, and there are only two to each *ſpikelet*, not three as in the two foregoing ſpecies.

ÆOLUS, in *Mechanics*, ſubjoin, ſee VENTILATOR.

ÆON, l. 4, add—Homer Π. v. 453. Pindar Olym. A. v. 18. Hence by an eaſy figure it is uſed to denote the cuſtoms and manners of life. Eſper. ii. 2.

AERIDES, in *Botany*, from ἀηρ, *aër, air;* becauſe one of the principal plants of this genus has long been celebrated, under the name of *Flos aëris*, for living entirely, as was ſuppoſed, upon air. This plant, and ſeveral others agreeing with it in habit, though not all perhaps in generic character, have been ſent from the Eaſt Indies to Europe, in baſkets, without earth or any other apparent ſource of nutriment, and have not only ſurvived, but bloſſomed during their voyage, as well as after their arrival. Their ſtout fibrous roots, always more than half naked as they run over the branches of trees, having entwined themſelves among the ſticks of the baſket, might perhaps imbibe ſuſtenance from the air in thoſe circumſtances, as readily as in their natural ſituation; juſt as a pea will germinate and grow in moiſt cotton.—Loureir. Cochinch. 525. Swartz in Schrad. Journ. v. 2. 233. t. 2. f. 4. Ejuſd. Neues Journ. v. 1. 88. Kon. Tracts 195. t. 8. f. Y. Willd. Sp. Pl. v. 4. 130. Ait. Hort. Kew. v. 5. 213.—Claſs and order, *Gynandria Monogynia*. Nat. Ord. *Orchideæ*.

Gen. Ch. reformed. *Cal.* Perianth of three equal, ſpreading, coloured leaves, gradually dilated upwards, ſomewhat wavy, rather obtuſe. *Cor.* Petals two, much like the calyx-leaves in colour, ſize, and figure. Nectary a lip without a ſpur, ſhorter than the petals, inſerted into the baſe of the ſtyle, gibbous underneath like a bag, often reverſed over the column. *Stam.* Anther a vertical, hemiſpherical, moveable, deciduous lid, of two or four cells; maſſes of pollen globular, ſtalked, in pairs. *Piſt.* Germen inferior, oblong; ſtyle erect, ſemi-cylindrical, concave in front; ſtigma in front, near the anther. *Peric.* Capſule obovate-oblong, with three large and three intermediate angles, of one cell and three valves, ſeparating between the angles. *Seeds* numerous, minute, each inveſted with a chaffy tunic.

Eſſ. Ch. Calyx and corolla ſpreading, nearly uniform. Lip pouch-like, without a ſpur. Anther a vertical moveable lid.

The

The ſpecies of this rare oriental genus are not at all diſtinctly known. Willdenow enumerates ſeven, to which we have ſome additions.

1. A. *retuſum*. Blunt-leaved Air-bloſſom. Swartz n. 1. Willd. n. 1. (Epidendrum retuſum; Linn. Sp. Pl. 1351. Limodorum retuſum; Swartz Nov. Act. Upſ. v. 6. 80. Anſieli Maravara; Rheede Hort. Malab. v. 12. 1. t. 1. Raii Hiſt. v. 3. 588. Orchis abortiva aizoides malabarienſis, flore odoratiſſimo variegato, intus aviculam repræſentante; Rudb. Elyſ. v. 2. 220. f. 5.)—Leaves nearly radical, linear, with two equal terminal notches. Cluſter many-flowered, twice the length of the leaves. Capſules obovate.—Native of trees in the Eaſt Indies, flowering at the beginning and end of the rainy ſeaſon, that is, in April and October, and laſting long. The plant is three feet high, attached to the bark by thick inflexed downy-coated fibrous *roots*, of a muſky ſmell. *Leaves* ſpreading in two ranks, linear, ſtout, rigid, channelled, ſmooth, abrupt as if bitten off at the end, which ſeems characteriſtic of the genus; in this ſpecies the two notches are repreſented in the figure, which is all our authority, as equal and uniform. The *flowers* are very numerous, about forty, in ſeveral ſtalked, terminal *cluſters*, all expanded at once, whitiſh beſprinkled with red, blue and duſky ſpots. The *lip* is ſaid to be pure white on both ſides, with a tongue-like appendage, brilliant with blue and red. Each *flower* is leſs than an inch in diameter.

2. A. *præmorſum*. Jagged-leaved Air-bloſſom. Willd. n. 2. ("Bitim Maram Maravara; Rheede Hort. Malab. v. 12. 5. t. 2." Raii Hiſt. v. 3. 589. Orchis abortiva aizoides malabarienſis altera, flore odorato ſanguineo colore, intus aviculam purpuream referente; Rudb. Elyſ. v. 2. 221. f. 6.)—Leaves radical, linear, variouſly and unequally notched at the end. Cluſter many-flowered, twice the length of the leaves. Capſules cylindrical.—Found on trees in Malabar. Nearly akin to the preceding, the *flowers* being in like manner ſpotted with red and blue, and moreover with yellow and green. The *column* is purple. Rheede ſays this ſpecies acquires a poiſonous property by growing on the *Canſjira*, a ſhrub or tree akin to *Daphne;* which, if correct, is very remarkable. Perhaps fragments of the bark of that tree, which may well be ſuppoſed highly virulent, may have been gathered with the roots of the paraſitical plant.

3. A.? *laſiopetalum*. Woolly-flowered Air-bloſſom. Willd. n. 3. (Epidendrum Flos aëris? Retz. Obſ. faſc. 6. 64.)—Stem branched, creeping. Leaves ovate-oblong, each ſeated on a bulb. Calyx externally woolly, acute as well as the petals.—Found by Kœnig, on trees in the Eaſt Indies. There is nothing in Kœnig's deſcription of the *flower* to convince us of this being an *Aerides*, while the account of its acute leaves, (not deſcribed as jagged or abrupt,) and their bulbous accompaniment, render it probable that Willdenow has here made a miſtake. We retain this ſpecies and the next, merely as we find them in his work, for future enquiry.

4. A.? *matutinum*. Morning Air-bloſſom. Willd. n. 4. (Epidendrum Flos aëris, vel Saaronicum; Retz. Obſ. faſc. 6. 58.)—This having a ſpur to the *nectary*, according to Kœnig's deſcription, cannot belong to the genus before us. We therefore decline attempting a ſpecific character, or any neceſſary correction of Willdenow's.

5. A. *odoratum*. Fragrant Air-bloſſom. Willd. n. 5. Ait. n. 1. (A. odorata; Loureir. n. 1.)—Stem aſcending. Leaves linear, emarginate, reflexed. Cluſters axillary. Lip three-cleft; lateral ſegments obtuſe.—Found on trees in China and Cochinchina, ſometimes pendulous. *Root* of numerous thick fibres, entangled together. *Stem* nearly erect, a foot high. *Leaves* large and thick. *Cluſters* ſimple, long, drooping. *Flowers* pale, rather fleſhy, ſweet-ſcented. If this ſpecies be hung up in a houſe, it will continue to grow, and to flower for many ſucceſſive years; which Loureiro ſays he had long experienced. Sir Joſeph Banks is recorded to have introduced this *Aerides* into the ſtoves at Kew, in 1800, but it has never flowered. The late ducheſs of Portland received an air-plant, as it was called, from China or the Eaſt Indies, about twenty-five years ago, which we rather believe to have been the *Epidendrum teſſellatum*, Roxb. Corom. v. 1. 34. t. 42, *Cymbidium* n. 34. Willd. Sp. Pl. v. 4. 102; or at leaſt very near that ſpecies. It came in a baſket, without earth, in perfect health, and afterwards bloſſomed in the ſtove at Bulſtrode; whether it received any different treatment there we have no recollection.

6. A. *arachnites*. Great Japaneſe Air-bloſſom. Swartz n. 2. Willd. n. 6. (Epidendrum Flos aëris; Linn. Sp. Pl. 1348. E. n. 7; Linn. Act. Upſ. ann. 1740. 37. Limodorum Flos aëris; Swartz Nov. Act. Upſ. v. 6. 80. Angurek Katong-ging; Kæmpf. Amœn. Exot. 868. t. 869. f. 1.)—Stem aſcending. Leaves linear-lanceolate. Calyx-leaves and petals linear, revolute; dilated at the extremity. Lip cloven in front, with an internal cloven appendage.—Native of Japan, growing paraſitically on trees, and much admired for the muſky ſcent of its large handſome flowers. The *leaves* are ſaid to be narrow, thick, and ruſhy. *Flowers* from ſeven to twelve together, in a looſe ſimple *cluſter*. *Calyx-leaves* and *petals* all nearly ſimilar, each two inches long, linear; convex above; concave underneath; ſuddenly dilated at the end into a quadrangular form, all lemon-coloured, beautifully ſpotted with purple. *Nectary* much ſhorter than the *petals*, ſomewhat ſtalked, conſiſting of a hollow abrupt *lip*, ſmooth, cloven deeply in front, ending below in a ſhort point, from whoſe cavity ſprings an erect, fleſhy, divided lobe or appendage. Such is the *nectary* of the plant figured by Dr. Swartz, of which two ſpecimens are preſerved in the Linnæan herbarium; but Kæmpfer's figure exhibits a very different appearance of the ſame part, like three hairy leaves ſurrounding the *column*, in a manner we have never witneſſed in any one of the *Orchideæ*. We ſuſpect two ſpecies may be confounded by authors.

7. A. *coriaceum*. Leathery-leaved Air-bloſſom. Swartz n. 4. tab. 2. f. 4, *e*, *f*. Willd. n. 7.—"Stem-leaves ovate, pointed, ſomewhat coriaceous, ſtriated. Spikes panicled." —Found on trees in Madagaſcar. The *flower* as repreſented in Dr. Swartz's figure, which is all we know of this plant, is hardly an inch wide; the *lip* a deep pouch, bearing in front a ſmall deflexed appendage. *Column* very ſhort.

8. A. *Boraſſi*. Fan-palm Air-bloſſom. Buchanan MSS. —Leaves radical, linear-oblong, obtuſe, obliquely emarginate. Cluſter leafleſs, radical. Lip with a revolute undivided border.—Found by Dr. Buchanan growing on *Boraſſus flabellifer*, in the Myſore. The thick cracked or jointed fibres of the *root* have each a central tough thread. *Stem* none. *Leaves* equitant, about ſix, a ſpan long and an inch wide; their points rounded, but unequally, one ſide extending further beyond the notch than the other. *Cluſter* ſimple, ſcarcely ſtalked, twice the length of the foliage, deflexed, many-flowered, lax, with a few ſheathing ſcales at the baſe. *Flowers* about an inch and a half in diameter. *Calyx-leaves* ovato-lanceolate, obtuſe, ſomewhat revolute, near an inch long, pale buff with a purpliſh central ſtripe. *Petals* like them, but flat, and rather broader. *Nectary* half

as long, red, ringent, its revolute border as long as the pouch.

9. A. *maculatum*. Spotted-ſtalked Air-bloſſom. Buch. MSS.—Stem creeping. Leaves elliptic-oblong, equally emarginate. Cluſter lateral, ſtalked, corymboſe. Lip the length of the petals; its border pointed, dilated at each ſide.—Gathered by Dr. Buchanan, on trees in the Myſore country. The *ſtems* ſend out very long curling fibrous *roots*. *Branches* ſhort, leafy. *Leaves* obtuſe, emarginate, hardly two inches long; ſheathing at the baſe. *Flower-ſtalk* lateral, oppoſite to the loweſt leaf on the branch, and protruding through its ſplit baſe, a ſpan long, erect, copiouſly ſpotted with dark purple, furniſhed with a few ſcattered *bracteas*, and terminating in a denſe corymboſe *cluſter* of ſix or eight yellow unſpotted *flowers*, with a ſimilar *bractea* to each partial ſtalk. *Calyx-leaves* and *petals* obovate, about half an inch long, nearly uniform. *Lip* ſomewhat boat-ſhaped, with a deep keel, and prominent aſcending point, accompanied at each ſide by a rounded dilatation of the margin. The back of the *flower* is tinged with greeniſh or purpliſh brown.

10. A. *daſypogon*. Denſely-bearded Air-bloſſom.—Stem aſcending. Leaves ovate, with a jagged point. Umbels denſe. Border of the lip kidney-ſhaped, denſely bearded.—Found by Dr. Buchanan, in Upper Nepaul. *Roots* compoſed of long, white, entangled fibres, running over the moſſy branches of trees. *Stems* ſolitary, ſhort, recurved, leafy. *Leaves* alternate, ſheathing, broadly ovate, about three inches long, fleſhy; ſmooth above; minutely ſcaly beneath; ſomewhat revolute; with three crowded, unequal, ſharp teeth at the point. *Flower-ſtalks* lateral, ſolitary, half the length of the leaves, each bearing a denſe *umbel* of numerous, nearly ſeſſile, very beautiful and ſingular, reverſed *flowers*, each hardly an inch in diameter. *Calyx-leaves* and *petals* ſimilar, obovate concave; dark red on the upper ſide; green on the under. *Lip* keeled, but not very deeply, globoſe, yellowiſh, ſpotted with red; its border as long as the *petals*, dilated, kidney-ſhaped, white; dotted on the ſmooth diſk with crimſon; fringed and thickly clothed towards each ſide with ſhort, fibrous proceſſes, reſembling velvet. *Capſule* three inches long.

11. A. *calceolare*. Slipper Air-bloſſom. Buch. MSS.—Stem creeping. Leaves linear-oblong, falcate, unequally jagged at the point. Umbels ſpreading. Border of the lip hemiſpherical, denſely bearded.—Gathered by Dr. Buchanan, on the moſſy branches of trees, in Upper Nepaul. *Stem* creeping, by means of very long, ſimple, ſtout fibres, thrown out from within the ſheaths of former leaves; its upper part aſcending, leafy, three or four inches long. *Leaves* two-ranked, ſpreading, aſcending, a ſpan long, hardly an inch broad; jagged, with two ſharp teeth, at one ſide of the point only. *Umbels* oppoſite to ſeveral of the lower leaves, ſolitary, ſtalked, lax, each of about five *flowers*, which are rather ſmaller than thoſe of the laſt ſpecies, but the pouch of the *lip* is conſiderably larger in proportion, prominent, yellow variegated with red, as well as the diſk of its border, which laſt is denſely bearded with white fibres like the foregoing. *Calyx-leaves* and *petals* uniform, obovate, incurved, yellow ſpotted with red.

12. A. *rigidum*. Rigid Air-bloſſom. Buch. MSS.—Stem creeping. Leaves oblong, obtuſe, rounded, unequally at the point, four times as long as the corymboſe cluſters. Lip with an obovate ſmooth border, the ſize and ſhape of the petals.—Found by Dr. Buchanan, running over rocks and large ſtones in Upper Nepaul. The *ſtem* is woody, a yard long, and as thick as the finger, creeping among moſſes, and ſending out here and there, through the baſes of the leaves, very thick radicles. *Leaves* two-ranked, alternate, a foot long, extremely thick and coriaceous, three-ribbed, oblique at the termination, one ſide being greatly extended, in a round lobe, beyond the rib, the other ſloping off below it. The lower part of each leaf has a joint, where it finally ſeparates, leaving the ſheathing permanent baſe, or *footſtalk*, as in *A. Boraſſi*, *maculatum*, and others of this genus and natural order. *Flower-ſtalks* oppoſite to the leaves, ſolitary, alternate, about three inches long, diſtantly racemoſe in the lower part, corymboſe at the ſummit, each bearing from five to ſeven nearly or quite ſeſſile *flowers*, yellow ſpotted with red, about the ſize of the laſt. *Calyx-leaves* and *petals* obovate, uniform, erect. *Lip* agreeing with them in colour and ſhape, except the ſmall prominent pouch at its baſe, and the apex being a little reflexed.

13. A. *undulatum*. Wavy-flowered Air-bloſſom. (Epidendrum præmorſum; Roxb. Corom. v. 1. 34. t. 43. Cymbidium præmorſum; Swartz Nov. Act. Upſ. v. 6. 75. Schrad. Neues Journ. v. 1. 75. Willd. Sp. Pl. v. 4. 103. Thalia Maravara; Rheede Hort. Malab. v. 12. 6. t. 4. Raii Hiſt. v. 3. 590. Orchis abortiva, floribus luteis minoribus, radiis rubris; Rudb. Elyſ. v. 2. 222. f. 8.)—Stem aſcending. Leaves linear, channelled, abrupt, acutely pointed, thrice as long as the corymboſe cluſters. Lip with an obovate flat border, the ſize and ſhape of the petals.—Native of trunks and branches of trees, in the hilly parts of Malabar and Coromandel, flowering in October. The *roots* conſiſt of numerous long ſtout fibres. *Stem* aſcending, leafy, four or five inches high. *Leaves* two-ranked, alternate, recurved, coriaceous, ſix inches long and one broad, concave, ending in a ſemicircular notch, whoſe two extremities are pointed, and nearly equal. *Infloreſcence* like the laſt. *Flowers* rather ſmaller, fragrant. *Calyx-leaves* and *petals* obovate, equal, ſlightly wavy at the edges, yellow, marked with tranſverſe, crimſon, undulating lines. *Lip* the ſize and ſhape of the petals, white dotted with red, its pouch but ſlightly indicated in parts of Dr. Roxburgh's figure, and probably ſo little obvious in nature, as to have eaſily eſcaped the artiſt's notice. Notwithſtanding this apparent exception to the generic character, the preſent plant, improperly confounded by Linnæus with his *Epidendrum furvum*, is ſo ſtrikingly allied to the laſt, and conſequently to the two immediately preceding, that we muſt preſume it to be an *Aerides*. If, on examination, it ſhould prove to want the pouch, a freſh inveſtigation muſt be inſtituted, reſpecting the diſtinguiſhing characters of this genus and *Cymbidium*.

The habit of *Aerides* is peculiar, though not perhaps excluſively ſo, in the termination of its *leaves*, always more or leſs abrupt, unequal, or jagged. We have never ſeen a living ſpecimen of any of the genus, but Dr. Buchanan's fine and ſcientific coloured figures, drawn from nature under his own inſpection, are as preciſe and ſatisfactory as poſſible, and that excellent botaniſt has himſelf pointed out to us the characters and habit of *Aerides*, as a natural genus.

With regard to the name, it well expreſſes the quality of living upon air alone, for which ſeveral ſpecies have attracted notice. Linnæus, who included the whole, with various other things, in his genus of Epidendrum, (ſee that article,) particularly applied the ſpecific name of *Flos aëris* to our ſixth ſpecies, citing with a query in *Act. Upſ.* the 2d chapter verſe 7th of the Wiſdom of Solomon. This, in the Engliſh tranſlation is, "Let no flower of the ſpring paſs by us." In a Latin verſion before us this text is rendered "*ne prætereat nos jucundus aër.*" Whence this ambiguity aroſe, or whether Linnæus had any where read *flos veris*, which he confounded with *flos aëris*, we have not materials to determine. At any rate, the text in queſtion has evidently no reference to this, or to any other particular plant whatever.

AESTIVATIO, in *Botany and Vegetable Phyfiology*, a term ufed by Linnæus for the mode in which the petals, or the fegments, of a *corolla* are arranged with refpect to each other, particularly before they expand. (See COROLLA.) The word comes from *æftas*, fummer, and *æftiva*, fummer-quarters, fummer being the ufual flowering feafon, and the *corolla* the fhelter or accompaniment of the organs of fecundation. So *Vernatio* expreffes the arrangement of the leaves of plants in the bud, or, in other words, their vernal condition. *Aeftivatio imbricata*, expreffes the divifions of the *corolla* being imbricated, or folded over each other, either from left to right, that is, with the motion of the fun, as in *Ciftus*; or the reverfe, of which latter Linnæus has in his manufcripts mentioned *Phlox* as one example, and we would point out *Hypericum* as another. *Aeftivatio valvata* is when the divifions of the *corolla* meet in the bud like valves, fide by fide, as in *Protea* and its allies. Of this *Periploca* is an inftance, notwithftanding the obliquity obfervable in the fegments of that flower after expanfion. Linnæus, in the MSS. above cited, fpeaks of *Pæonia* as having, like its near relation *Aconitum*, one petal exterior to all the reft, though the *corolla* is what would be termed regular in the firft genus, and very irregular in the fecond. Such a diverfity indeed is of fmall moment, for Mr. Correa has obferved that every natural order, as far as he could examine, poffeffes irregular and regular flowers. In general the direction of the parts of a *corolla*, as to their æftivation (if we may ufe that word), are invariably alike in genera of the fame natural order. But HERMANNIA, (fee that article,) affords a remarkable exception, every one of its fpecies that we have feen bearing two *flowers* on the fame ftalk, has the *petals* of one of thofe flowers rolled to the right, while thofe of the other are difpofed in a contrary pofition. Mr. Brown, in his learned *Prodromus* of New Holland plants, has paid more attention to the æftivation, in defining his natural orders, than any other botanift, and the term *æftivatio valvata* is, if we miftake not, his own invention.

ÆTH, l. 4, infert after Bruffels. It is the chief place of a canton, in the department of Jemappe, and diftrict of Tournay. The place contains 7634, and the canton 14,828 inhabitants. The territory includes 115 kiliometres, and 11 communes. See ATH.

AETHIONEMA, in *Botany*, fo named by Mr. Brown, apparently in allufion to fome tawny or fun-burnt tinge in the ftamens, from αιθω, *to fcorch*, and νημα, *a ftamen*. We perceive in our dried fpecimens an occafional purple hue in thefe parts. It may perhaps be more remarkable in the fpecies we have not feen.—Brown in Ait. Hort. Kew. v. 4. 80.—Clafs and order, *Tetradynamia Siliculofa*. Nat. Ord. *Siliquofæ*, Linn. *Cruciferæ*, Juff.

Eff. Ch. Pouch with boat-like winged valves (fometimes not burfting). Longer filaments either combined, or finely toothed towards the top. Infertion of the calyx unequal. *Brown.*

1. Ae. *faxatile*. Rock Aethionema. Ait. n. 1. (Thlafpi faxatile; Linn. Sp. Pl. 901. "Schkuhr Handb. v. 2. 223. t. 180." See THLASPI, n. 6.)—Longer filaments diftinct. Leaves oblong, tapering at the bafe.—Native of the fouth of Europe. Cultivated by Miller in 1759.

2. Ae. *monofpermum*. One-feeded Aethionema. Ait. n. 2.—"Pouch fingle-feeded, without valves. Leaves oval or obovate."—Native of Spain. Cultivated in 1778, by Lee and Kennedy, at Hammerfmith. A hardy biennial, flowering in July and Auguft. We have feen no fpecimen of this fpecies. Our doubts refpecting the genus may be found under THLASPI.

AFER, DOMITIUS, col. 2, l. 11, for vanity *r.* variety.

AFFINITY, in *Chemiftry*. The celebrated doctrine of Bergman is the laft in order difcuffed under the article AFFINITY in the Cyclopædia: fince that time, however, very important changes in opinion have taken place, among chemifts, refpecting the nature and caufe of chemical affinity. Some of thefe are mentioned in fubfequent parts of the Cyclopædia, efpecially in the articles *Chemical* PROPORTIONS, SIMPLE *Bodies*, and *Atomic* THEORY; but it may not be deemed fuperfluous to give a fummary and connected view of the whole in this place.

Bergman's doctrine of *elective* affinity, fo amply explained in the article above referred to, was univerfally admitted among chemifts till 1803, when Berthollet publifhed his Differtation on Affinity in the Memoirs of the Inftitute, and about the fame time his Chemical Statics. Berthollet confidered affinity as an *attraction* exifting between combining bodies. This attraction he appeared to confider as fimilar in its nature to that which exifts between the planets, or in fhort, the principle of gravitation. It confequently, in his opinion, increafed with the *mafs* of bodies. According to this doctrine, therefore, bodies which have an affinity or attraction for one another, have a tendency always to combine, in a greater or lefs degree, chiefly in proportion to their mafs. Thus, though barytes appears to poffefs a ftronger affinity for fulphuric acid than potafh, yet if we prefent a great quantity of potafh to a fmall quantity of fulphate of barytes, the potafh will feparate a portion of the acid.

According to Berthollet, therefore, affinity is not *elective*. A fubftance which has a ftronger affinity is not capable of feparating entirely thofe which have a weaker, unlefs fome other caufe than mere ftrength of affinity operates. Inftead of feparating entirely the weaker body, it divides with it the bafe to which that body was united, each combining with a part of fuch bafe in the compound proportion of the ftrength of its affinity and of its quantity.

But no facts in chemiftry are better eftablifhed than thofe in which the addition of a third body frequently feparates two fubftances previoufly united, the third body taking the place of one of the conftituents, which is thereby feparated altogether. Thus, if fulphuric acid be dropped into a folution of nitrate of barytes, or potafh into a folution of nitrate of lime, the fulphate of barytes and the lime will precipitate, leaving, in the firft inftance, the nitric acid in a free ftate, and in the fecond, the potafh combined with the nitric acid inftead of the lime. Thefe and many other well-known facts appearing, at firft fight, contrary to Berthollet's doctrine, it was neceffary for him to reconcile them to it. For this purpofe, he called in the aid of the different modes of exiftence of bodies. According to him, therefore, whenever decompofition takes place, it is owing either to the *infolubility* or the *elafticity* of the ingredient which feparates. Sulphate of barytes being infoluble in water, while nitrate of barytes and nitric acid are foluble in that liquid, it muft happen,

happen, when the ſubſtances are mixed, that the inſoluble ſalt precipitates, on account of its inſolubility. It is the inſolubility of lime that cauſes it to precipitate when potaſh is dropped into nitrate of lime. Accordingly, when potaſh is dropped into nitrate of ſoda, no precipitation whatever takes place, becauſe both the potaſh and the ſoda are very ſoluble in water; but if we concentrate the ſolution ſufficiently by evaporation, cryſtals of nitrate of potaſh will be depoſited, becauſe that ſalt is much leſs ſoluble in water than nitrate of ſoda. So alſo, when nitric acid is poured upon carbonate of lime, the carbonic acid is diſengaged, and flies off, becauſe its elaſticity induces it to ſeparate from the ſolid, and aſſume the gaſeous ſtate as ſoon as the nitric acid weakens the attraction, by means of which it was attached to the lime.

"Thus," ſays Dr. Thomſon, to whom we have been particularly indebted in the compilation of the preſent article, "we have two doctrines reſpecting affinity oppoſite to each other. According to Bergman, affinity is *elective.* The body which has the ſtronger affinity diſplaces that which has a weaker, and the ſtrength of affinity may be meaſured by decompoſition. According to Berthollet, affinity is *not elective.* It never produces decompoſitions, but only combinations, and the decompoſitions which take place are owing to the agency of other cauſes. The ſtrength of affinity is not an abſolute quantity, but increaſes with the maſs of the attracting body. Berthollet's doctrines lead to the opinion, that bodies are capable of uniting together indefinitely in any proportion whatever: Bergman's, that they unite only in determinate proportions, and that theſe proportions are independent of the relative quantities of the combining ſubſtances which are preſent." See *Atomic* THEORY.

A moſt important fact reſpecting the combination of bodies was aſcertained by Richter. This was illuſtrated in an elaborate work, publiſhed at different times between 1792 and 1802, which contains the reſult of his reſearches on the decompoſitions and combinations of chemical bodies. He obſerved, that when two neutral ſalts, which mutually decompoſe each other, are mixed together, the two newly formed ſalts ſtill retain the ſame neutral ſtate as the two original ones, from which they were formed. He likewiſe obſerved, that the ſame proportions of baſes that ſaturate a given weight of one acid, ſaturate all the other acids; and the ſame proportion of acids that ſaturate one baſe, ſaturate all the other baſes; which law enabled him to explain why two neutral ſalts form, as above-mentioned, two new ſalts, likewiſe neutral. Theſe experiments and obſervations of Richter likewiſe enabled Fiſcher to attach a ſet of numbers to the acids and baſes, indicating the weight of each which will ſaturate the numbers attached to all the other acids and baſes.

Mr. Dalton, without being aware of the law already diſcovered by Richter, turned his attention to the ſubject about two years afterwards, and was ſtruck with the ſmall number of proportions in which ſimple ſubſtances are capable of combining, and the conſtancy of theſe proportions. This led him to form the doctrine of definite proportions, or atoms, as it is uſually termed, and which, as well as Gay Luſſac's modification of it, our readers will find fully explained in the article *Definite* PROPORTIONS.

About the ſame period, that is, in the year 1803, the grand law reſpecting the agency of the galvanic battery in the decompoſition of bodies was diſcovered by Berzelius and Hiſinger. This law is, that *oxygen and acids* are accumulated round the *poſitive pole;* while *hydrogen, alkalies, earths,* and *metals,* are accumulated round the *negative pole.* From this general law Berzelius deduced the conſequence, that the decompoſitions in ſuch inſtances were owing to the attractions exiſting between the bodies and the reſpective electricities. This opinion was afterwards extended by Davy, and the opinion in its extended form ſubſequently adopted by Berzelius himſelf. According to theſe celebrated chemiſts, chemical affinity is identical with electrical attraction, and bodies which unite chemically poſſeſs different kinds of electrical attractions. Every body, in their opinion, poſſeſſes a permanent elective ſtate, either reſinous or vitreous. Two bodies in the ſame ſtate of electricity have no affinity for each other. Thoſe in oppoſite ſtates have an affinity, and the ſtrength of the affinity is proportional to the degree of intenſity of the different electricities in the two bodies; and in order to make bodies ſeparate from each other, we have only to bring them into the ſame electrical ſtate, by making them both vitreous or both reſinous. See ELECTRICITY and GALVANISM.

Such is a ſummary account of the revolutions in opinion which have taken place reſpecting the nature of chemical affinity, and the principal diſcoveries which have given origin to theſe changes ſince the time of Bergman. We ſhall conclude this article with a few general remarks upon the ſubject.

In the firſt place, the queſtion whether the affinities of ſubſtances for one another be definite quantities capable of being repreſented by numbers, cannot, in the preſent ſtate of chemical ſcience, be ſatisfactorily determined. For though ſome ſubſtances always appear capable of ſeparating others, as, for example, barytes, potaſh; yet the reaſon may be, that the ſalts of barytes are leſs ſoluble than the ſalts of potaſh. Again, iron, as is well known, ſeparates oxygen from water at all temperatures; but, on the other hand, it has been equally well aſcertained, that the oxyd of iron is reduced when heated in hydrogen gas: "hence," ſays Dr. Thomſon, "we have no data for determining whether iron or hydrogen have the greateſt affinity for oxygen; each ſeeming capable of depriving the other of oxygen in the very ſame circumſtances."

In certain caſes, alſo, of double decompoſitions, it is often equally difficult to diſtinguiſh on which ſide the ſtrongeſt affinities lie. Thus, as is well known, carbonate of barytes and ſulphate of potaſh, when digeſted together, decompoſe each other, and are converted into ſulphate of barytes and carbonate of potaſh; but on the other hand, it has been equally ſatisfactorily ſhewn by Mr. Philips, that carbonate of potaſh is capable of decompoſing the ſulphate of barytes.

Pfaff, however, has ſhewn, that the tartrate of lime and the oxalate of lead are completely decompoſed by the addition of no more ſulphuric acid than is neceſſary to form ſulphate of lime and ſulphate of lead; and hence he infers, that the affinity of ſulphuric acid for lime and lead is actually ſuperior to the affinities of tartaric and oxalic acids for the ſame baſes reſpectively.

Berthollet has attempted to account for the firſt of the above experiments by the effect of *maſs;* and the experiments of Pfaff he endeavours to explain by the ſolubility of tartrate of lime and oxalate of lead, and the inſolubility of the ſulphate of lime and ſulphate of lead in acids. And this brings us,

In the ſecond place, to make a few remarks upon the ſuppoſed effects of *maſs,* and the *modes of exiſtence* of bodies in modifying chemical decompoſitions. With reſpect to the effects of *mass*, though at first sight there appear to be some circumstances favouring the opinions of Berthollet respecting its influence in chemical operations, yet we can by no means agree in supposing its influence so great as represented by that eminent chemist. No quantity of water, for example, would decompose sulphate of magnesia, though the affinity of sulphuric acid for water is very great, and though the insoluble nature of magnesia would, according to Berthollet's views, favour the union of the water with the acid. *Mass* here, therefore, either does not operate at all, or very feebly; and there are numerous analogous instances, well known to every chemist, to which the same remarks are equally applicable.

Again, it has been sufficiently established, that gases unite with reference to their volume, and cannot be made to unite in intermediate proportions, even although the result of their union be likewise a gas. Thus, for example, one volume of chlorine gas and one volume of hydrogen gas unite together, and form, without any condensation, or other apparent physical change, two volumes of muriatic acid gas, nor can they be made to unite in any other proportions. Here then is an example of chemical union, in which the effects of *mass* and *mode of existence* are quite out of the question.

From these, and particularly from many recently established facts, we think it proved beyond a doubt, that the power which determines bodies to combine in certain proportions is a property inherent in the original cause of their union, and consequently is a power totally different from that exerted by mass or other external circumstance, though it is not perhaps altogether independent of their influence. For further information, we refer our readers to sir Humphry Davy's Elements of Chemical Philosophy, where, besides an excellent account of the subject in general, they will find a masterly refutation of Berthollet's doctrines.

AFORE, l. 2, for stern *r.* stem; l. 4, ditto.

AFZELIA, in *Botany*, (see that article,) is *Gerardia cassioides*, Pursh 424. (G. Afzelia; Michaux Boreal.-Amer. v. 2. 20. Anonymos cassioides; Walt. Carolin. 171.)—"Panicled, with wand-like branches. Leaves pinnatifid, with linear bristle-like segments."—In dry sandy woods of Carolina and Georgia. Annual, flowering in July and August. *Flowers* small, yellow. *Pursh.*

Afzelia, Sm. Tr. of Linn. Soc. v. 4. 221, so named in honour of its discoverer, Adam Afzelius, M.D. Demonstrator of Botany at Upsal, author of several dissertations on Swedish Roses, and of other learned botanical treatises, is a very noble genus, of which we have long expected from Dr. Afzelius himself an illustration of the species. They are all natives of Sierra Leone.—Class and order, *Decandria Monogynia*. Nat. Ord. *Lomentaceæ*, Linn. *Leguminosæ*, Juss.

Ess. Ch. Calyx tubular; limb in four deciduous segments. Petals four, with claws; the uppermost very large. Two upper stamens imperfect. Legume with many cells. Seeds with a tunic at the base.

This genus consists of trees with large, smooth, abruptly pinnate, alternate *leaves*. The *flowers* are racemose, crimson, with small *bracteas*. *Legumes* woody and ponderous, smooth, ovate, acute. *Seeds* near an inch long, parallel, ovate, black, the lower half of each invested with a fleshy *tunic*, of a brilliant permanent scarlet, and a rather waxy appearance. The native Africans remove this tunic, and use the seeds for beads.

AGASTACHYS, from αγαστος, *remarkable*, and σταχυς, *a spike*, alluding to the abundance of its spiked flowers.—Brown Tr. of Linn. Soc. v. 10. 158. Prodr. Nov. Holl. v. 1. 371.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Proteaceæ*, Juss.

Ess. Ch. Corolla regular, of four petals, cohering at the base, bearing the stamens in the middle. Filaments distinct. Nectary none. Germen sessile, triangular, single-seeded. Stigma unilateral.

1. A. *odorata*. Fragrant Agastachys. Br. n. 1.—Found in the southern part of Van Diemen's island, near Adventure bay, by Mr. David Nelson, and afterwards by Mr. George Caley. A *shrub*, perfectly smooth in every part. *Leaves* scattered, entire, flat. *Spikes* numerous, simple, terminal, as well as axillary from the upper leaves. *Flowers* alternate, sessile, with a solitary, hooded, permanent *bractea* to each. *Corolla* yellowish, deciduous. *Pistil* shorter than the *stamens*. The *fruit* has not yet been examined. *Brown.*

AGATE, col. 2, l. 15. They are conveyed from Germany in blocks; and cut by means of diamond powder into leaves for making caps for the pivots of mariners' needles, and other purposes.

AGATHARCHUS, in *Biography*, a painter of the isle of Samos, who is said to have been instructed by Æschylus in the art of introducing perspective into the decorations of theatres, and to have been the first who wrote on this subject, and communicated the art to Democritus and Anaxagoras.

AGDESTIS, in *Botany*, a fanciful name, adopted by De Candolle, from the authors of an unpublished Mexican Flora, whom he cites as Moç. and Sessé. It is applied to a doubtful genus, related to *Menispermum*, and perhaps a sort of *lusus naturæ*, having stamens and pistils in the same flower, which is almost unexampled in this tribe. The above denomination is that of a fabulous monster, said to have been male as well as female, and produced by Jupiter from the stone *Agdos*. This genus therefore being not clearly understood, and as yet very little known, may hereafter be abolished as well as its name.—Class and order, *Polyandria Monogynia*. Nat. Ord. *Sarmentaceæ*, Linn. *Menisperma*, Juss. *Menispermeæ*, De Cand.

Ess. Ch. Calyx inferior, of four leaves. Petals none. Filaments thread-shaped. Anthers oblong, cloven at each end, incumbent. Germen and style with four furrows. Stigmas four, spreading. Capsules four, combined.

1. A. *clematidea*. Bowery Agdestis.—Native of New Spain. A smooth shrub, with a branched, twining, round, striated *stem*. *Leaves* alternate, distant, stalked, exactly heart-shaped, entire, pointed; their lobes very obtuse. *Flowers* reddish, corymbose, axillary and terminal; their stalks three-cleft. *Fruit* unknown. This plant appears very nearly akin to *Clematis*.

AGGREGATÆ, the title of the 48th order in Linnæus's fragments of a natural system, placed between the *Stellatæ* and *Compositæ*. (See Aggregate.) This is a very miscellaneous and ill-defined order, of which it is by no means easy to seize the idea, much less to give any definition, or distinctive character. Vaillant first laid the foundation of this order, in the Memoires de l'Acad. des Sciences for 1722. "The natural order of *Aggregatæ*," says Linnæus, *Præl. in Ord. Nat.* 528, "was first investigated by Vaillant, in the *Mem. de l'Acad. des Sciences*. They agree with the *Compositæ* in having generally a common calyx as well as receptacle, collecting together many sessile florets, each of which has always an inferior germen. But there is a total difference with respect to the remaining parts of fructification, nor can these two orders be, by any means, united. The *calyx*, as above said, is common to many flowers,

flowers, or florets. The *common receptacle* is either naked, villous, hairy, or ſcaly. In the place of a *partial calyx* is the *corolla*, generally monopetalous, either regular or irregular, four-cleft or five-cleft, rarely polypetalous. *Stamens* four, with ſeparate *anthers*. *Germen* inferior (with reſpect to each floret). *Fruit* ſingle-ſeeded. The *flower* is therefore complete in this tribe, except only *Valeriana*, whoſe *calyx* is ſcarcely apparent. The *leaves* are often oppoſite. *Stem* often ſhrubby."

The genera which compoſe this order at the end of *Gen. Pl.* are, Sect. α. *Statice* only. β. *Hartogia, Brunia, Protea, Globularia, Leucadendron, Hebenſtretia, Selago, Cephalanthus, Dipſacus, Scabioſa, Knautia, Allionia*. But in his own copy Linnæus has drawn a line between *Selago* and *Cephalanthus*, removing the β to that place, and characterizing his ſection α "*alternifoliæ inferæ*," the remainder of the whole order beginning with *Cephalanthus*, being "*oppoſitifoliæ ſuperæ*." γ. *Valeriana, Morina, Boerhavia, Circæa*, to which *Mirabilis* is added in MSS. δ. *Lonicera, Chiococca, Trioſteum, Mitchella, Linnæa, Morinda, Conocarpus, Loranthus, Viſcum*, to which *Liſianthus* and *Hillia* are added, certainly with no propriety.

This order in fact is not one of our great botaniſt's moſt finiſhed or happy performances. It comprehends Juſſieu's *Dipſaceæ, Proteaceæ, Caprifolia*, with various ſolitary genera from different orders. *Statice* was always a ſtumbling block with Linnæus, nor does it aſſimilate with any thing among the *Aggregatæ*, being itſelf, however natural a genus, and as we think improperly ſubdivided by Tournefort and others, compoſed of ſpecies whoſe infloreſcence is eſſentially different among themſelves.

In his manuſcripts Linnæus has extended his firſt ſection as far as *Selago* incluſive, eraſing *Hartogia*, and giving the characters of alternate leaves, and a ſuperior germen to this ſection. To the ſecond ſection, which begins with *Cephalanthus*, he attributes oppoſite leaves, and an inferior germen. He thought *Statice* akin to *Brunia*, and *Protea* the ſame genus as *Leucadendron*. To his third ſection he more happily adds *Mirabilis*; but to the fourth he very unfortunately introduces *Liſianthus* and *Hillia*.

The intelligent botaniſt will without difficulty trace the numerous errors of the above arrangement to various cauſes. Several natural orders, now well defined, had not entered into the conception of Linnæus, ſuch as the very natural and diſtinct one of *Proteaceæ*; and of the *Caprifolia*, ſketched in his fourth ſection, he had evidently but an obſcure perception. Of the differences of the Proteaceous genera he had ſcarcely any knowledge. That he ſhould not have formed a right idea of *Hebenſtretia* and *Selago*, whoſe affinities are ſtill in ſome uncertainty, is not wonderful; but they are unqueſtionably much out of place here. See DIPSACEÆ for further obſervations reſpecting ſome of the *Aggregatæ*.

AGLABITES, l. 5, add, and governor in Africa, Heg. 184, A.D. 800. This dynaſty laſted till the year of the Hegira 296, A.D. 908, and poſſeſſed the country which extended from Egypt to Tunis.

AGLAIA, in *Botany*, αγλαια, *ſplendour and beauty*, alluding to the ſhining verdure of the leaves, and elegance of the whole plant.—Loureir. Cochinch. 173.—Claſs and order, *Pentandria Digynia*, Lour. (rather perhaps *Pentandria Monogynia*.) Nat. Ord. *Trihilatæ*, Linn. *Meliæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, with five notches, minute, permanent. *Cor.* Petals five, ovate, concave, fleſhy, converging almoſt cloſely into the form of a globe. Nectary tubular, with five plaits, rather ſhorter than the petals. *Stam.* Filaments none; anthers five, ovate, included in the folds of the nectary. *Piſt.* Germen ovate, ſuperior; ſtyle none; ſtigmas two, oblong, erect. *Peric.* Berry ovate, ſmooth, watery, of one cell. *Seed* ſolitary, ovate, ſlightly compreſſed, with four furrows.

Eſſ. Ch. Calyx inferior, five-toothed. Petals five, converging in the form of a globe. Berry with one ſeed.

1. A. *odorata*. Fragrant Aglaia. *Cây ngâu* of the Cochinchineſe. (Camunium ſineuſe; Rumph. Amboin. v. 5. 28. t. 18. f. 1.)—Native of Cochinchina and China. Commonly cultivated in the latter country, for the ſake of its great beauty and agreeable ſcent. Rumphius ſays it was imported from thence to Amboyna, where it ſtill retained the Chineſe name of *Tſjiulang*, and was continually in leaf and bloſſom; being eaſily propagated by cuttings of the larger branches, whoſe bark muſt be bruiſed ſlightly, and then covered for the ſpace of a month with good earth and dung, till roots are thrown out, which are then to be cut off and tranſplanted. Loureiro deſcribes this plant as a *tree* eight feet high, with a yellowiſh hard *wood*, thin brown *bark*, and ſpreading *branches* forming a very denſe head. *Leaves* pinnate with an odd one, conſiſting of three or five oval, entire, ſmooth, ſhining *leaflets*, tapering at the baſe, on ſhort footſtalks. *Cluſters* axillary, oblong. *Flowers* yellow, very minute, globoſe, odoriferous. *Berry* ſmall, red.

Rumphius deſcribes the *flowers* orange-coloured, never producing fruit in Amboyna.

We cannot find that this plant of Rumphius is taken up by any author, nor is his deſcription ſufficient to procure it a place in any ſyſtematic work. Loureiro, however, has furniſhed us with ſufficient characters to enable us to judge of its natural order, and to determine that it is not, as he ſuſpected, the ſame genus with Thunberg's *Bumalda*.

AGUILLAS, CAPE. *Dele Cape* NEEDLES.

AGUILLAS *Bank*, a bank on the ſouthern coaſt of Africa, ſtretching from Cape Point acroſs the entrance of Falſe bay to the mouth of Rio Infanta, or Great Fiſh River, and to the 37th parallel of Southern latitude. Mr. Barrow conjectures that this bank at one time formed a part of the continent.

AHM, in *Commerce*. See STUBGEN.

AHMEDABAD. For AGMED'*s r.* AHMED'*s*; l. 6, *r.* Sebermathy.

AHMEDNAGUR, l. 2, *r.* Dowlatabad.

AHOUAS. Add—This was once a large and flouriſhing city, the capital of a province of the ſame name, and the winter reſidence of Artabanes, the laſt of the Parthian kings; but it is now a wretched town, containing 600 or 700 inhabitants, and ſituated on the banks of the river Karoon; 48 miles S. of Shuſter.

AIDAN, col. 2, l. 18, for biſhop *r.* king.

AIDERBEITZAN. At the cloſe add—It is ſeparated from Armenia by the river Araxes, and from Irak by the Kizilozoin, or Golden ſtream. This province, including Erivan with the Karabag and Karadag, is divided into twelve diſtricts, *viz.* Urumea, Ardebil, Tabreez, Maraga Khoee, Kulkham, Serab, Gumrood, Sa Bulagh, Karadag, Erivan, Nuckſhivan, and Miſkeen, yielding a revenue of 89,405 tomauns. The moſt pictureſque, and at the ſame time moſt flourishing division of Aiderbeitzan, or Azerbijan, lies along the N. and W. borders of the lake Urumea from Tabreez to the confines of Armenia, in which direction are the towns of Shebuster, Tasoui (in ruins), Selmast, Khoee, and Urumea.

AIDIA, in *Botany*, a genus of Loureiro's, unknown to us but from his description, whose name, from αιδιος, *eternal*, alludes to the indestructible nature of the wood.—Loureir. Cochinch. 143.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Caprifolia*, Juss.

Gen. Ch. *Cal.* Perianth superior, tubular, five-toothed, erect. *Cor.* of one petal, salver-shaped; mouth of the tube woolly; limb in five deep lanceolate segments. *Stam.* Filaments none; anthers five, linear, inserted into the corolla between its segments. *Pist.* Germen ovate, inferior; style on a level with the anthers; stigma ovate-oblong. *Peric.* Berry ovate, "calycine," (meaning crowned by, and confluent with, the calyx,) small, umbilicated, of one cell. *Seed* solitary, ovate.

Eff. Ch. Corolla salver-shaped, woolly in the throat. Anthers linear, sessile between the segments of the corolla. Berry calycine, single-seeded.

1. *A. cochinchinensis*. Everlasting-wood. *Cây Tlai* of the Cochinchinese.—Native of Cochinchina. A large *tree*, with spreading *branches*. *Leaves* opposite, lanceolate, entire, smooth. *Flowers* white, in short, lax, axillary *clusters*. The *wood* is white, heavy, composed of thick fibres, and not handsome. Its chief use is for building the lower parts of houses, and foundations of bridges, being extremely durable, either under ground or in water. *Loureiro*.

AIMONTE. Add, See AYEMONTE.

AINSWORTH, ROBERT, l. 2, for Woodyale *r.* Woodyate.

AIR, col. 11, l. 44, insert elastic, and *r.* whatever elastic matter, &c.

AIR, *Atmospheric*, in *Chemistry*. The most recent experiments shew that atmospheric air is composed by bulk of about 21 *per cent.* of oxygen and 79 *per cent.* of azote; and this coincides so nearly with four volumes of azote and one of oxygen, that Dr. Prout has been induced to consider this proportion as the true composition of atmospheric air, and consequently that it is a real chemical compound composed of one atom oxygen and two of azote. Upon this supposition, and the supposition that the atom of oxygen be 10 and the atom of azote be 17.5, atmospheric air will be composed by weight of

$$\left.\begin{array}{ll}\text{Oxygen} & 22.22\\ \text{Azote} & 77.77\end{array}\right\}\text{ and by bulk of }\left\{\begin{array}{l}20\\80\end{array}\right.$$

And the specific gravity of oxygen gas will be 1.1111 and of azote .9722, atmospheric air being 1.000. See ATOMIC *Theory*, *Addenda*.

The reasons upon which the above opinion is chiefly founded are, in the first place, the impossibility of accounting on any other than chemical principles for the remarkable uniformity observed in the composition of atmospheric air all over the world. This fact is universally admitted, and no one can adduce even the slightest argument why this uniformity should be explained on principles different from those which govern other definite compounds, as, for example, water.

Secondly, experiment coincides extremely near with the above supposition, perhaps as nearly as it has ever done in any similar example, even in those on which the doctrine of volumes itself was founded by M. Gay Lussac. Those versed in eudiometry, and who know the imperfections of all eudiometrical methods hitherto advanced, will feel little inclined to vouch for the *perfect* accuracy of their results, and to deny the possibility of an error of one *per cent.* Besides, when we reflect how liable the atmosphere is to contaminations of every kind, the chance of such an error is still further increased.

About the same time (November 1815) that the above opinion was advanced by Dr. Prout, a similar opinion was published by Dobereiner, in a paper inserted in Schweigger's Journal. Thomson's Annals of Philosophy, vol. vi. p. 321.

AIR, in *Music*, l. 5, for rhyme *r.* rhythm.

AIR, in *Geography*, a township of Pennsylvania, in the county of Bedford, containing 1179 inhabitants.

AIRY. See AERY.

AITZEMA, l. 2, *r.* Dockum.

AKISKA, in *Geography*, one of the Turkish pachalics of Armenia, which lies near the limits of the Turkish empire, and has the Black sea to the W., Immeritia to the N., Kars and Erzeroom to the S., and Georgia to the E. It extends a considerable way along the banks of the Kur, and contains much arable land, with many cities and villages, and minerals in its mountainous parts. Akalzike (new Castle) or Akiska, which gives name to the province, is the capital: it is a populous and commercial city, without walls or fortifications, and only defended by a ruined citadel, standing in an open valley on the left bank of the Kur, and inhabited by Jews, Turks, Greeks, Armenians, and Georgians.

ALA, in *Botany*, l. 4, for upwards *r.* downwards.

ALANGIUM, so denominated by Lamarck, by a slight alteration of one of its Malabar names, *Alangi*; and if any barbarous generic appellations are to be tolerated, this certainly may.—Lamarck Dict. v. 1. 174. Juss. Gen. 323. Vahl Symb. v. 2. 61. Willd. Sp. Pl. v. 2. 1174. Ait. Hort. Kew. v. 3. 302.—Class and order, *Icosandria Monogynia*. Nat. Ord. *Hesperideæ*, Linn. *Myrti*, Juss.

Gen. Ch. *Cal.* Perianth superior, of one leaf, short, permanent, with from six to ten small erect teeth. *Cor.* Petals from six to ten, linear, undivided, much longer than the calyx into which they are inserted, spiral in the bud, afterwards recurved. Nectary cup-shaped. *Stam.* Filaments ten or twelve, inserted into the calyx, erect, thread-shaped, hairy below, scarcely half the length of the petals; anthers terminal, vertical, linear, obtuse, rather broader and longer than the filaments, bursting at each side longitudinally. *Pist.* Germen turbinate, inferior; style cylindrical, erect, rather longer than the stamens; stigma capitate, lobed, very large. *Peric.* Berry globular, with a rather coriaceous coat, crowned with the calyx, internally fleshy, of one cell. *Seeds* from one to three, nearly lenticular.

Eff. Ch. Calyx superior, with from six to ten teeth. Petals from six to ten. Berry coated, of one cell, with few seeds.

Obs. We do not scruple to remove this genus from the class *Polyandria*, where Willdenow has placed it, but with which the insertion of the stamens does not agree, to *Icosandria*, where it ranges with its natural allies. LEMNISCIA (see

(see that article) answers in habit, and in several characters, to *Alangium*; but its fruit is not sufficiently known to allow of an absolute decision, nor do the anthers agree.

1. A. *decapetalum*. Sage-leaved Alangium. Lamarck n. 1. Willd. n. 1. Ait. n. 1. Vahl Symb. v. 2. 61. (Grewia salvifolia; Linn. Suppl. 409. Angolam; Rheede Hort. Malab. v. 4. 39. t. 17. Arbor indica baccifera, fructu umbilicato rotundo, cerasi magnitudine dicocco; Raii Hist. v. 2. 1497.)—Flowers with ten petals. Branches becoming spinous.—Native of the East Indies. Kœnig sent specimens to Linnæus, and in the year 1779 he also communicated seeds from Ceylon to Kew garden; but their progeny has not yet flowered, if it be still alive. Rheede describes this as a handsome *tree*, an hundred feet high, and twelve in circumference, with spreading branches, white hard wood, and a bitterish, acrid, aromatic bark. The *root* is fungous, reddish, fragrant and bitter, with a yellowish bark. The *branches* bear leaves and flowers together, and finally assume a sharp spinous termination. *Leaves* alternate, on short downy stalks, ovate-oblong, obtuse, entire, ribbed, veiny, four or five inches long, pliant, fragrant; smooth and shining above; paler, reticulated, and roughish, beneath. *Flowers* axillary, either solitary, or two or three together, on simple, short, downy stalks. *Calyx* downy. *Petals* rather silky externally; white within. *Anthers* bright red. *Fruit* the size of a large cherry; downy when young; purplish when ripe, full of sweet fragrant pulp, which is esteemed very delicious, and contains one, two, or three black *seeds*. The inhabitants of Malabar compare the *flowers* to an imperial diadem, and therefore consider this tree as an emblem of royalty. The expressed juice of the root is purgative, and used for expelling intestinal worms. Its powder is thought an antidote for the bites of serpents, and other venomous animals.

2. A. *hexapetalum*. Broad-leaved Alangium. Lamarck n. 2. Willd. n. 2. Vahl Symb. v. 2. 62. (Kara Angolam; Rheede Hort. Malab. v. 4. 55. t. 26. Arbor indica prunifera, fructu umbilicato corticoso persici simili; Raii Hist. v. 2. 1483.)—Flowers with six petals. Branches not spinous.—Native of the coast of Malabar, in stony, sandy, mountainous places, always in flower and leaf. Its trunk is of lofty stature, but inferior to the former. *Leaves* broader, more ovate, and pointed, smooth, bitter and acrid, but not aromatic; paler beneath. *Flowers* smaller, whitish, nearly sessile, with only six *petals*. *Fruit* globose, the size of a small apple, having a thick, downy, purple coat, and viscid acid pulp.

3. A. *tomentosum*. Downy Alangium. Lamarck n. 3.—"Branches scarcely spinous. Leaves oblong, bluntish; their ribs downy beneath, like the footstalks."—Found in the East Indies by Sonnerat. Allied to the first species in the form of its *leaves*, and to the second in the nature of its *fruit*. The *flowers* are unknown. The young shoots, stalks, calyx, and ribs of the leaves, are clothed with short cottony down. *Lamarck*.

AL-ARAF, l. 5, for Alcoran *r.* Koran.

ALASAN, in *Geography*, the *Auxan* of Strabo, a river of Georgia, which separates this province from Shirvan, and taking its rise near that of the Araqui, not far from the gates of Caucasus, pursues a S.E. course, until it meets the Kur or Cyrus at Douhizil. About 30 miles above this place it is joined by the Kabri or Yari, which fertilizes the greatest part of the province of Kaket.

ALBA LONGA, l. 8, for furrowed *r.* farrowed.

ALBANIA, col. 2, l. 5, add—Mr. Hobhouse rates the population of Albania at about 1,200,000 souls.

A L B

ALBANS, ST., a township of America, l. 3, for 256 *r.* 1669.

ALBANY. Add after Saratoga—It is now restricted to an area of 462 square miles, or 295,689 acres. By the census in 1810, its population consisted of 34,661 souls, its senatorial electors were 2971, and the number of slaves was 772.

ALBANY, l. 4. This city and suburbs in 1812 contained about 12,000 inhabitants, 1800 houses and stores, 10 houses for public worship, and several public buildings.

ALBANY, a township of the district of Maine, in the county of Oxford, with 165 inhabitants.

ALBEMARLE, a county of America, &c. contained, in 1810, 18,268 inhabitants, of whom 9226 were slaves.

ALBERT I., l. 9, for between *r.* with. Col. 2, l. 11 from the bottom, for Rhees *r.* Reus, and *dele* near Schaffhausen.

ALBERT'S or *Current Dollar*, with $\frac{1}{2}$ and $\frac{1}{4}$ ditto, Dutch silver coins valued at 50, 25, and $12\frac{1}{2}$ stivers, each about 1 *per cent.* agio. Albert's dollar is also used as a money of account at Riga. See RIX-DOLLAR.

ALBUMEN, in *Chemistry*. Considerable additions have been made to our knowledge respecting this important animal principle since the first volume of the Cyclopædia was published. These we shall briefly notice here.

The first thing deserving to be mentioned is the distinction between *coagulation*, *gelatinization*, and *precipitation*, terms which had been always confounded till Dr. Bostock defined their difference. By *coagulation* is now understood the passing of a substance from a fluid to a solid state by the agency of heat only, or, in some instances, without the immediate co-operation of any external agent; as, for example, in the *coagulation* of the fibrin of the blood. *Gelatinization* is the property which a warm solution of jelly possesses of becoming concrete as it cools. *Precipitation* is the effect which different substances or re-agents produce by combining and forming solid compounds with the principles operated upon.

The next circumstances deserving of notice are the effects of galvanism upon albumen, as ascertained by Mr. Brande.

Mr. Brande found, that when albumen was exposed to the action of a galvanic battery, an apparent coagulation took place at the negative pole, as well as at the positive. The effects of this agent, however, were different, according to its intensity. Thus, with a comparatively high power, the coagulation went on rapidly at the negative pole, and slowly at the positive; whereas, with a very low power, the coagulation was comparatively rapid at the positive pole, while at the negative pole no coagulation took place, the small proportion of albumen being retained in solution by the alkali attracted thither. Dr. Murray, however, who saw these experiments repeated in a general manner by Mr. Ellis, thinks that Mr. Brande was deceived, and that the appearance of coagulation was produced only from the numerous aërial bubbles entangled in the viscid albumen.

The opinion entertained by chemists at present respecting the coagulation of albumen, does not differ much from that of Bucquet, who considered it as a sort of soap, the animal matter being retained in solution by the soda present. An opinion, closely resembling this, has been successively advanced by Dr. Thomson, sir Humphry Davy, and Mr. Brande, who appear to consider this albumen as merely a solution of an animal matter in water and soda, and that all the agents known to coagulate or precipitate it, act by abstracting the soda and water.

The effects of acids and other re-agents upon albumen, although they have been mentioned in a general manner in the

the Cyclopædia, deſerve to be more fully detailed here, as much additional light has been thrown on the ſubject within the laſt few years, from the labours of Berzelius and others.

Acids, as is well known, precipitate albumen immediately; at leaſt this is the caſe with all the mineral acids when concentrated. Dilute phoſphoric, fluoric, and acetic acids, however, do not precipitate albumen. Coagulated albumen, according to Berzelius, is charred by concentrated ſulphuric acid; but when diluted with ſix or ſeven times its weight of water, and digeſted with it, the acid aſſumes a reddiſh colour, but diſſolves ſcarcely any thing. The portion not diſſolved he conſiders as a compound of albumen with exceſs of acid. On depriving it of this exceſs of acid, by waſhing it with pure water, a neutral combination is obtained, which is ſoluble in water. This ſolution reddens litmus paper, and yields a precipitate with acids as well as alkalies, the former being combinations of the albumen with the acid employed, and which may be again rendered ſoluble by waſhing in water, the latter being again ſoluble with a ſlight exceſs of alkali. Hence he conſiders ſulphuric acid to be capable of combining with albumen in two proportions; one in which the acid is neutralized, and which is ſoluble in water; the other, in which the acid is in exceſs, and which is inſoluble in water. In dilute muriatic acid ſcarcely any of the albumen is diſſolved, even by boiling, neither does the acid liquor afford any precipitate with ammonia, or pruſſiate of potaſh. Evaporated to dryneſs, a browniſh reſidue is obtained, from which potaſh diſengages a little ammonia. Concentrated muriatic acid decompoſes albumen by boiling, and produces a red or violet-coloured ſolution. The albumen that has been digeſted in weak muriatic acid, by waſhing repeatedly with water, is converted into a gelatinous maſs, which is perfectly ſoluble in tepid water: this is to be conſidered as a neutral combination of albumen with the acid, while the former one contains an exceſs. The ſolution has the ſame properties nearly as that of ſulphuric acid above-mentioned. Nitric acid of ſp. gr. 1.25, digeſted with albumen, renders it yellow, and diminiſhes its coheſion. The fluid becomes yellow, and a ſmall quantity of fatty matter is formed. During this proceſs, azotic gas is given out in abundance. After twenty-four hours, the albumen is converted into a pulverulent maſs of a pale citron colour, which is depoſited at the bottom. This matter being ſeparated and well waſhed acquires a deep orange colour, which Berzelius conſiders as the *acide jaune* of Fourcroy and Vauquelin, who obtained it by digeſting muſcular fleſh with nitric acid. This is ſoluble in alkaline leys, and imparts to them an orange colour; and it is alſo ſoluble in acetate of potaſh and ſoda. Thus, according to Berzelius, albumen is capable of exiſting with the nitric acid, as well as with the other acids, in two diſtinct ſtates of combination, the one having an exceſs of acid, and of a pale yellow colour, and the other neutral, and of an orange hue. Berzelius ſeems to conſider the different nature of the compounds formed with nitric acid to depend upon the formation of the malic acid, by the action of the nitric acid upon the albumen, which at the ſame time combines with it. Hence, in his opinion, they are triple compounds of albumen, nitric and malic acids. Mr. Hatchett found, that if albumen, after being ſteeped in diluted nitric acid, be waſhed, and then boiled in water, it is diſſolved, and forms a pale yellow liquid, which gelatinizes when properly concentrated, and has all the properties of gelatine. Perhaps this boiling deprives it of the malic acid above-mentioned, or perhaps the malic acid was not formed by the dilute nitric acid; for Berzelius, who ſeems not to have been acquainted with this fact, found alſo, that when albumen was precipitated from its ſolution in acetic acid by the nitric acid, the yellow precipitate was rendered gelatinous by waſhing, and ſoluble in water, like the compounds of albumen with the other acids above-mentioned; all which compounds are probably ſimilar to the above, and which was conſidered by Mr. Hatchett as gelatine. The acetic acid readily diſſolves albumen by the aſſiſtance of heat, firſt converting it, if previouſly coagulated, into a tremulous jelly. The ſolution is colourleſs, and of a mawkiſh and ſlightly acid taſte. When ſufficiently evaporated, it again becomes gelatinous; and when completely exſiccated is a tranſparent maſs which reddens litmus, but is inſoluble both in hot and cold water, without a freſh addition of acetic acid. Ammonia and pruſſiate of potaſh produce from this ſolution in acetic acid a whitiſh precipitate. Alkalies alſo produce a precipitate which is again diſſolved on their being added in ſlight exceſs. Sulphuric, muriatic, and nitric acids produce precipitates, which are compounds of the albumen with the acid employed, the acid being in exceſs; hence, if they are waſhed in water, as before obſerved, they become neutral, and capable of ſolution in water, like gelatine.

Solutions of the different earths, and even ſome of their ſalts, as alum, ſulphate of magneſia, and ſilicated potaſh, were found by Dr. Thomſon to have no effect upon albumen when diſſolved in water, in the proportion of one white of an egg to a pint of water. The caſe, however, was very different with the metallic ſalts and oxyds, moſt of which were found to have a powerful effect upon it, eſpecially the ſulphates, muriates, and nitrates of the metals, while the pruſſiates, and one or two others, had no effect. One of the moſt delicate teſts of albumen, according to Dr. Boſtock, is a ſolution of oxymuriate of mercury: a ſingle drop of this, let fall into water, containing only $\frac{1}{2000}$ parts of its weight of albumen, produces an evident milkineſs, and a curdy precipitate falls. Heat renders the operation of this teſt more effectual. Perhaps the teſt of albumen leaſt liable to ambiguity, is that recommended by Berzelius above-mentioned; namely, the addition of the pruſſiate of potaſh to a ſolution of albumen in acetic acid. Albumen is compoſed of hydrogen, carbon, oxygen, and nitrogen or azote, in the proportions, according to the experiments of Gay Luſſac and Thenard, of

Hydrogen - -	7.540
Carbon - - -	52.883
Oxygen - - -	23.872
Azote - - -	15.705
	100.000

Albumen never exiſts in an abſolutely pure ſtate in animal bodies, but is always combined with other animal matters, and various ſalts. See Blood and *Animal* Fluids.

ALBURGH, in *Geography*, a town of America, in Vermont, and county of Grand Iſle, containing 1106 inhabitants.

ALBUS, in *Commerce*, a ſmall coin and money of account at Caſſel, Cologne, and other places in Germany. The whole principality of Heſſe keeps accounts in rix-dollars of 32 albuſes, ſubdivided into 9 pfenings, or 12 hellers current. A ſpecie rix-dollar is worth 42$\frac{2}{3}$ Heſſian albuſes. Coins in ſilver are, pieces of 8, 5$\frac{1}{3}$, 4, 2$\frac{2}{3}$, and 1$\frac{1}{3}$ albuſes; and in copper, pieces of 1 and 2 albuſes. Cologne keeps accounts in rix-dollars ſpecie of 80 albuſes, or or rix-dollars current of 78 albuses; the albus being reckoned at 12 hellers: and albuses are silver coins.

ALCEDO *Capensis*, l. 2, for short-tailed *r.* long-tailed. A. *rudis*, l. 3, *r.* long-tailed.

ALCEDO. Add—Dr. Shaw has described some other species, and referred some of those above-mentioned to other titles under *Alcedo*, and to *Galbula*. The A. *gigantea* is the *fusca* above-noted: the *afra* is the *maxima:* the *amazona* is glossy-green, white beneath; the sides of the neck white; those of the body variegated with green, and the wing and tail feathers spotted with white; the amazonian K. of Latham, about the size of the belted K., or A. *alcyon:* a native of Cayenne. A. *Malimbica*, sea-green or beryl K. with the throat and belly white; the wing-coverts and streak across the eyes black: is much allied to the A. *capensis* in the form of its belt and distribution of its colours; numerous in Malimba, about the sea-coasts, feeding on worms and fish. A. *javanica*, blue K., with sea-green back, yellowish-white head, neck, and body; the crown of the head streaked with black. (See A. *leucocephala.*) A. *canerophaga*, greenish-blue K., yellowish beneath, with black wing-coverts and eye-stripe, and ferruginous bill; crab-eating K. of Latham: native of Senegal, where it is called Crab-eater. (See A. *Senegalensis.*) A. *Coromanda*, pale-violaceous rose-coloured K., rufescent beneath, with the rump marked by a longitudinal blueish-white band, and white throat: a native of Coromandel, an elegant species. A. *collaris*, blue-green K., white beneath, with white collar; Latham's variety of A. *sacra:* a native of the Philippine islands. A. *bicolor* of Gmelin, referred to A. *inda*. A. *capistrata*, white-collared K. of Latham. (See A. *cærulea* above.) A. *albirostris* referred to GALBULA. A. *cyanocephala*, described under A. *cæruleo-cephala*. A. *tribrachys*, tridigitated K. of Nat. Misc., deep-blue K., ferruginous beneath, with blackish wings and three-toed feet; a native of New Holland: to this the azure K. of Latham is much allied.

ALCINA, in *Botany*, Cavan. Ic. v. 1. 10. t. 15, so named by that author, in memory of Francis Ignatius Alcina, a learned Spanish Jesuit, who resided long in the Philippine islands, and devoting his leisure hours to natural history, left a folio MS., of which Cavanilles speaks as likely to be published. This supposed genus, however, is now sunk in WEDELIA; see that article.

ALCOHOL, in *Chemistry*. A new analysis of alcohol has been lately published by M. de Saussure. He employed for his analysis alcohol of the sp. gr. .8302, at the temperature of 62.8, obtained by rectifying common spirits. This alcohol he considered as a compound of 13.8 water, and 86.2 of the Richter's absolute alcohol; and the water being subtracted from the products obtained, the residue gave the composition of the absolute alcohol of Richter. His method of analysis was to pass the vapour of alcohol through a red-hot porcelain tube, and along a glass tube surrounded by ice nearly six feet in length. The products were carefully collected and weighed. There was a little charcoal deposited in the porcelain tube, and a very little oil in the glass tube. The water obtained amounted to $\frac{1000}{7364}$ of the weak alcohol employed, which was 1256.7 grs., and it contained $\frac{1}{281.5}$ of its weight of absolute alcohol. The combustible gas weighed 912.3 grs., and there was a loss of 55.82 grs. The gas was proved to possess the properties of olefiant gas. Hence it follows that alcohol may be considered as composed of olefiant gas and water; and the result of the analysis was, that the absolute alcohol of Richter is composed of

Hydrogen - - -	13.70
Carbon - - -	51.98
Oxygen - - -	34.32
	100.00

Or the composition may be stated thus:

Olefiant gas - -	61.63
Water - - -	38.37
	100.00

If, with Dr. Thomson, we suppose alcohol to be a compound of one volume of olefiant gas, and one volume of vapour of water, condensed into one volume, its specific gravity in a state of vapour will be just equal to that of these two elastic fluids added together. The specific gravity of these two bodies is,

Olefiant gas - - -	.974
Vapour of water - -	.625
	1.599

And M. Gay Lussac determined by experiment the specific gravity of the vapour of alcohol to be 1.613, which very nearly coincides with the above. Hence there is every reason for presuming that the above is the true composition of alcohol, which, stated more correctly on this supposition, will be as follows:

3 atoms hydrogen -	3.75
2 atoms carbon -	15.
1 atom oxygen -	10.
	28.75

Or *per cent.* of

Hydrogen - - -	13.04
Carbon - - -	52.17
Oxygen - - -	34.79
	100.00

Or,

Olefiant gas - -	60.86
Vapour of water -	39.14
	100.00

See FERMENTATION, *Addenda*.

ALCOHOL *of Sulphur*, now generally termed *sulphuret of carbon*, is a curious compound of sulphur and carbon, first described by Lampadius. See CARBON, and particularly SULPHUR, in the Cyclopædia; where the recent experiments of Berzelius and Dr. Marcet on this substance are detailed.

ALDRICH, col. 2, l. 5, *r.* ascribed to him, but, as some say, erroneously.

ALE, col. 2, l. 28, after parliament, add—The gross duty on ale, or strong beer, is 10*s.* *per* barrel, with an allowance of 10*d.*, so that the nett duty is 9*s.* 2*d.* For table-beer not worth more than 24*s.* the gross duty is 2*s.* *per* barrel, with an allowance of 2*d.*, so that the nett duty is 1*s.* 10*d.*

By 48 Geo. III. c. 143. the several duties imposed upon ale-

ale-licences by former acts were repealed, and a new duty of 2*l.* 2*s.* impofed. All perfons who fhall fell ale or beer by retail, or fhall fell cyder or perry, to be confumed in their houfes or premifes, fhall firft take out an excife-licence, within the limits of the chief office of excife in London, under the hands and feals of two or more of the commiffioners of excife in England, or of fuch perfons as they, or the major part of them, fhall appoint for that purpofe: and in other parts of England, the licences are to be granted under the hands and feals of the feveral collectors and fupervifors of excife within their refpective diftricts. The duration of fuch licences is limited to the 10th of October next enfuing the time of granting thereof. All licences granted at the general licenfing day fhall be made for one year only, to commence on the 29th day of September.

Ale-*Houfes*, l. 4, after houfes, add—under penalty of 3*l.* 6*s.* 8*d.* 5 & 6 Ed. VI. c. 25. 26 Geo. II. c. 31.

L. 9, after cofts, add—But no perfon fhall be liable to the faid penalty, for felling ale or beer in cafks containing not lefs than five gallons, or in bottles, not lefs than two dozen quarts, not to be drank in his houfe, out-houfe, yard, garden, orchard, or other place. 38 Geo. III. c. 54. Penalties may be mitigated for the firft offence; and all penalties fhall be fued for and determined within fix months after the offence committed.

L. 15, after only, add—The day and place for granting licences fhall be appointed by two or more juftices for the divifion, by warrant under their hands and feals, at leaft ten days before fuch meeting, directed to the high conftables, requiring them to order their petty conftables, or other peace officers, to give notice to the feveral inn-keepers and alehoufe-keepers within their refpective conftablewicks, of the day and place of fuch meeting: and all licences granted at any other time and place fhall be void. And no licence fhall be granted to any perfon not licenfed the year preceding, (except in cities or towns corporate,) unlefs he produce a certificate under the hands of the minifter and the major part of the churchwardens and overfeers, or elfe of three or four reputable and fubftantial houfeholders of the place, fetting forth that fuch perfon is of good fame and of fober life and converfation; and it fhall be mentioned in fuch licence that fuch certificate was produced, otherwife the licence fhall be void. No juftice of the peace, being a common brewer of ale or beer, inn-keeper, or diftiller, or a feller of and dealer in ale or fpirituous liquors, or interefted in any of the faid trades, or being a victualler or maltfter, fhall be capable or have any power to grant licences for felling ale or beer, or any other liquors, but the fame fhall be void. All mayors, town-clerks, and other perfons whom it may concern, fhall make out ale-licences duly ftamped before the recognizance be taken; on pain of 10*l.*, half to the king, and half to the profecutor, with cofts. 6 Geo. c. 21. 1 Ann. ftat. 2. c. 22.

L. 18, after tippling, &c. add—1 Jac. c. 9. 1 Ch. c. 4. By 21 Jac. c. 7. innkeepers who fuffer tippling are difabled from keeping an ale-houfe for three years. By 30 Geo. II. c. 24. if any perfon licenfed to fell any forts of liquors, or who fhall fell or fuffer the fame to be fold in his houfe, out-houfe, ground, or apartment thereto belonging, *fhall knowingly fuffer* any gaming with cards, dice, draughts, fhuffle-boards, miffiffippi, or billiard-tables, fkittles, nine-pins, or with any other implement of gaming in his houfe, out-houfe, ground, or apartment thereunto belonging, by any journeymen, labourers, fervants, or apprentices, and fhall be convicted thereof on confeffion, or oath of one witnefs, before one juftice, within fix days after the offence committed; he fhall forfeit for the firft offence 40*s.* and for every other offence 10*l.* by diftrefs by warrant of fuch juftice; three-fourths of which fhall be to the churchwardens for the ufe of the poor, and one-fourth to the informer.

And if any journeyman, labourer, or apprentice, or fervant, *fhall game* in any houfe, out-houfe, ground, or apartment thereto belonging, wherein any liquors fhall be fold, and complaint thereof fhall be made on oath before one juftice where the offence fhall be committed, he fhall iffue his warrant to the conftable or other peace-officer of the place wherein the offence is charged to have been committed, or where the offender fhall refide, to apprehend and carry the offender before fome juftice of the place where the offence fhall be committed, or where the offender fhall refide; and if fuch perfon fhall be convicted thereof by the oath of one witnefs or confeffion, he fhall forfeit not exceeding 20*s.* nor lefs than 5*s.* as the juftice fhall order, every time he fhall fo offend, and be convicted as aforefaid, one-fourth to the informer, and three-fourths to the overfeers for the ufe of the poor; and if he fhall not forthwith pay down the fame, fuch juftice fhall commit him to the houfe of correction, or fome other prifon of the place where he fhall be apprehended, to be kept to hard labour for any time not exceeding one month, or until he fhall pay the forfeiture.

If any perfon (allowing for fome excepted cafes under 1 J. c. 9.) fhall continue drinking or tippling in any inn, victualling-houfe, or ale-houfe, he fhall on conviction thereof before a mayor or juftice of the peace on view, confeffion, or oath of one witnefs, forfeit for every offence 3*s.* 4*d.*, to be paid within one week next after the conviction to the churchwardens, who fhall be accountable for the fame to the ufe of the poor; and if he fhall refufe or neglect to pay the fame, it fhall be levied by diftrefs. And if he be not able to pay the forfeiture, then the mayor, juftice, or court where the conviction fhall be, may punifh the offender, by fetting him in the ftocks for every offence by the fpace of four hours. 1 J. c. 9. 4 J. c. 5. f. 4. 21 J. c. 7. f. 2. 1 C. c. 4.

If any alehoufe-keeper fhall be convicted of the faid offence, he fhall moreover for the fpace of three years be difabled to keep any fuch ale-houfe. 7 J. c. 10. 21 J. c. 7. f. 4.

ALECTORIA, in *Botany*, feems to derive its name from αλεκτωρ, *unmarried*, becaufe nothing has been made out refpecting the male flowers. This is one of the tribe of filamentous Lichens, eftablifhed as a genus by Acharius, (fee Lichenes,) and we fhall endeavour to explain its characters.—Achar. Syn. 291. Lichenogr. t. 13. f. 1—4. Sm. Prodr. Fl. Græc. Sibth. v. 2. 323.—Clafs and order, *Cryptogamia Algæ*. Nat. Ord. *Lichenes*.

Eff. Ch. Frond cartilaginous, branched; fpongy within. Shields feffile, thick, bordered, flattifh, of the fubftance of the frond; their difk flightly coloured.

1. A. *jubata*. Wiry Alectoria, or Rock-hair. Achar. n. 1. Prodr. Fl. Græc. n. 1. (Parmelia jubata; Achar. Meth. 272. Lichen jubatus; Linn. Sp. Pl. 1622. Achar. Prodr. 219. Weftring Lich. 183. t. 14. Engl. Bot. t. 1880. Schrad. Journ. v. 1. 83. t. 3. f. 4. Ufnea jubata nigricans; Dill. Mufc. 64. t. 12. f. 7.)

β. Lichen chalybeiformis; Linn. Sp. Pl. 1623. Achar. Prodr. 220. (Ufnea rigida, horfum-vorfum extenfa; Dill. Mufc. 66. t. 13. f. 10. Parmelia jubata δ; Achar. Meth. 273.)

Frond thread-fhaped, fmooth, very much branched, of a fmokya smoky-brown; branches capillary, compressed at their subdivisions. Shields sessile, blackish, with an entire margin; at length convex and rugged. Warts tumid, powdery, white.—Found on the trunks and branches of old trees, especially of the fir kind, throughout Europe, from Lapland to the Bithynian Olympus. *β.* On pales, rocks, and stones. The shields are extremely rare. The older specimens hang in long blackish tufts, like the mane of a horse, from aged trees in mountain forests; the variety *β* grows prostrate and entangled. There is no central fibre, the inside being hollow, or slightly spongy. White powdery *warts* are frequent and conspicuous on the pendulous variety, but these are not now considered by Acharius as having any share in the fructification. The matter has not been decided either way by sufficient experiments. The learned author, whom we have just named, reckons up four more varieties, by the names of *capillaris* (which is *Lichen setiformis* of Ehrhart); *lanestris; cana* (figured by Westring above cited, at his t. 14. f. B.); and *setacea.* These we have not examined. The *cana*, which is hoary, with pale flesh-coloured shields, appears to have some claims to specific distinction.

2. A. *crinalis.* Mane Alectoria. Achar. n. 2. Lichenogr. 594.—"Frond slightly compressed, much branched, greyish, very brittle; branches thread-shaped, roundish towards the upper part. Shields? convex, brown."—Found often mixed with other filamentous Lichens, on the trunks and branches of trees. *Acharius.*

3. A. *usneoides.* Flattened Alectoria, Arabian Usnea. Achar. n. 3. (Parmelia usneoides; Achar. Meth. 270. Lichen Usnea; Linn. Mant. 131. Swartz Ind. Occ. 1912. Usnea ceratoides candicans, glabra et odorata; Dill. Musc. 71. t. 13. f. 14? and certainly t. 84. f. 10.)—Frond compressed, flat, longitudinally striated, much branched, pale and whitish; the branches somewhat fibrous. Shields flat, entire, of the same colour.—On trees in warm countries, in Asia, Africa, and America. Generally pendulous, always spreading, from six to eighteen inches long, linear, flat, cream-coloured, very smooth to the touch; fragrant and musky when fresh; easily splitting when old and dry into two flat layers, exposing a pure white internal powder. The *shields* are very small. By age the whole becomes of a dirty-buff colour. The Arabian physicians used this moss as a cordial, and thought it also procured sleep. See our n. 6.

4. A. *sarmentosa.* Trailing Alectoria. Achar. n. 4. (Parmelia sarmentosa; Achar. Meth. 271. Lichen sarmentosus; Achar. Prodr. 180. New Stockh. Trans. v. 16. 212. t. 8. f. 2. Schrad. Journ. v. 1. 83. t. 3. f. 4. Engl. Bot. t. 2040. L. longissimus, ex cinereo candicans, rugosus et mollior, receptaculis florum rufescentibus; Mich. Gen. 77. t. 39. f. 2. Usnea loris longis dichotomis, extremitatibus tenuioribus; Dill. Musc. 59. t. 11. f. 2. U. dichotoma; Hoffm. Pl. Lich. t. 72.)—Frond roundish, somewhat angular and pitted, much branched, forked and divaricated, whitish; ultimate branches capillary and lax. Shields livid, rather concave, with a pale entire border.—Native of mountainous tracts in various parts of Europe, on trees or rocks. Mr. Borrer and Mr. Hooker met with it on the mountains of Inverness-shire in 1808. The *fronds* are of an ivory white, creeping, widely divaricated, sometimes powdery, hollow; their ultimate branches peculiarly fine and numerous. *Shields*, communicated by Dr. Acharius, small, with a greenish flesh-coloured hollow disk, finally becoming flattened and dilated.

5. A. *thrausta.* Brittle Alectoria. Achar. n. 5. Lichenogr. 596.—"Frond round, somewhat compressed, branched, white; black at the base; branches unequal, zigzag, minutely fibrous and somewhat tendril-like."—Native of France and Switzerland. *Acharius.*

6. A. *arabum.* Arabian Alectoria. Achar. n. 6. Lichenogr. 596. (Usnea ceratoides candicans, glabra et odorata; Dill. Musc. 71. t. 13. f. 14.)—Frond round, somewhat compressed, branched, white; branches forked; the ultimate ones pointed and curved.—Native of the East Indies, St. Helena, and Madagascar. Professor Acharius adopts this from Dillenius without examining a specimen, considering it a distinct species from his *usneoides*, n. 3, with which other botanists have confounded it. He relies also on Dillenius for the present plant being the true *Usnea* of the Arabians. But as Dillenius confounded the two, and had no authority for taking one more than the other for the Arabian *Usnea*, we cannot place any reliance on him in this respect. How far the two plants, so very similar in his figures, are specifically distinct, can only be known by an examination of the specimen of his t. 13. f. 14. at Oxford. The other is sufficiently well known, and was drawn by him from the herbarium of Mr. Charles Du Bois.

7. A. *canariensis.* Canary Alectoria. Achar. n. 7. (Usnea dichotoma compressa, segmentis capillaceis teretibus; Dill. Musc. 72. t. 13. f. 15. Muscus arboreus aurantiacus, staminibus tenuissimis, ex insulis Portunatis; Pluk. Almag. 254. Phyt. t. 309. f. 1.)—Frond compressed, branched, orange-coloured; branches simply or triply forked; their ultimate segments round and capillary.—Native of the Canary islands. Acharius adopts this species entirely from Dillenius, who describes it from a span to a foot in length, compressed, undivided in the lower part, but in the upper copiously and repeatedly branched; the branches occasionally three together, and their summits very fine. The whole is neither very rigid, nor soft, smoothish, of a dull yellow inclining to red. It tinges the saliva with a reddish-orange colour, but has no particular smell.

ALEMBERT, col. 4, l. 28, for Memoires *r.* Membres.

ALEPYRUM, in *Botany*, *α*, *without*, λεπυρον, *a bark, shell*, or *covering*, alluding to the want of corollaceous glumes, by which this genus is distinguished from DEVAUXIA of the same author, to be described in its proper place hereafter.—Brown Prodr. Nov. Holl. v. 1. 253.—Class and order, *Monandria Polygynia.* Nat. Ord. *Restiaceæ*, Brown.

Gen. Ch. *Cal.* Sheath of two concave, keeled, permanent valves, clasping each other at the base, containing one or more flowers. *Cor.* none. *Stam.* Filament one, capillary, drooping, about as long as the calyx; anther simple, oval. *Pist.* Germens several, from six to eighteen, ovate-oblong, superior, inserted into one side of a central oblong receptacle, and all turned one way; styles as many, thread-shaped, combined at the bottom, spreading or deflexed at the upper part; stigmas linear, downy. *Peric.* Capsules as many as the germens, membranous, oval, of one valve and one cell, bursting longitudinally at one side. *Seed* solitary, obovate, pendulous.

Eff. Ch. Sheath of two valves. Corolla none. Anther simple. Germens unilateral. Capsules bursting longitudinally at one side. Seed solitary.

A genus of small herbaceous plants, nearly allied to the more numerous one of *Devauxia*, and, in Mr. Brown's own opinion, scarcely to be separated therefrom, the want of petals in *Alepyrum* being the only difference. The three species described by this author are all natives of the south coast of New Holland, where he gathered them himself; nor do they appear to have been met with by any other botanist or collector. The *roots* are fibrous. *Leaves* radical,

cal, fimple, linear-lanceolate, or fetaceous. *Flower-ftalks* radical, unbranched, fingle-flowered.

1. A. *polygonum.* Many-jointed Alepyrum.—Sheath fingle-flowered; the outer valve with a leafy point. Germens from fifteen to eighteen. Stalk twice or thrice the length of the leaves.

2. A. *Pumilio.* Dwarf Alepyrum. — Sheath fingle-flowered; the outer valve with a leafy point. Germens from fix to nine. Stalk the length of the leaves.

3. A. *muticum.* Pointlefs Alepyrum.—Sheath with a few flowers; the outer valve pointed.

ALEXANDER, in *Geography*, a townfhip of Ohio, in the county of Athens, having 765 inhabitants.

ALEXANDRIA, col. 6, l. 24, for Anaftáfius *r.* Anatolius.

Alexandria, a town of New Ruffia, &c. add—Alfo, the principal Ruffian fettlement in the Fox iflands, and the refidence of the governor on the ifland of Kodiak. (See Kodiak and Fox *Iflands.*) The harbour is excellent, and fheltered by feveral fmall iflands lying to the S.W. It confifts of about 50 houfes built of logs, the rooms of which are caulked with mofs, and covered with grafs. This is the principal depôt of the African company, where the furs are collected. This town is named St. Paul by captain Lifianfky. It has a church, a barrack for the Ruffian convicts, a fchool, and feveral ftore-houfes belonging to the N.W. Company. Campbell's Voyage round the World, p. 108.

Alexandria, in Grafton county, &c. for 298 *r.* 409.

Alexandria, in Hunterdon county, &c. for 1503 *r.* 2271; and for 40 *r.* 46.

Alexandria, in Pennfylvania. Add, containing, in 1810, 156 inhabitants.

Alexandria, a town of the diftrict of Columbia, having 7227 inhabitants, of whom 1488 are flaves. The county of the fame name, exclufive of the town, has 1325 inhabitants, including 353 flaves.

ALFORD, l. 2, for 577 *r.* 322.

Alford, a town of America, in the diftrict of Maine and York county, containing 1106 inhabitants.

ALLANTODIA, in *Botany*, from αλλας, αλλαντος, *a faufage*, alluding to the tumid oblong figure of the *Sori*, or lines of capfules, wrapped in their membranous coverings. —Brown Prodr. Nov. Holl. v. 1. 149. — Clafs and order, *Cryptogamia Filices.* Nat. Ord. *Filices.*

Eff. Ch. Fructification in fcattered oblique lines, accompanying a vein. Involucrum vaulted, originating laterally from the vein, and inferted into it by both margins; at length feparating at the inner one.

The habit of this genus, fays Mr. Brown, is between Nephrodium and Diplazium. (See thofe articles.) *Polypodium umbrofum*, Hort. Kew. ed. 1, affords an example of it, and there are fome unpublifhed fpecies. The cylindrical *involucrum* prohibits its union with *Afpidium* or *Athyrium* of various authors, and that membrane, being inferted by both margins into the fame vein, and truly burfting, differs from the *involucrum* of *Afplenium*, whofe upper edge is not connected with the frond.

We felect the examples indicated by the author, not being quite fatisfied of the limits of this genus, which is reduced to *Afpidium* in the fecond edition of Hort. Kew. poffibly not with Mr. Brown's concurrence, his moft indubitable genus of Woodsia (fee that article) being likewife there rejected.

We are poffeffed of many, perhaps of all, the nondefcript *Allantodiæ* of which he fpeaks. To thefe fome other *Afpidia* of Hort. Kew. may be akin; but *A. æmulum*, placed next to *umbrofum*, is not one of them, any more than a few of the neighbouring fpecies, referred by the writer of this article to *Cyathea* in Fl. Brit. whofe *involucrum* furely does not anfwer to the above character, their *fori* being orbicular.

A. *umbrofa.* Madeira Wood Saufage-fern. (Polypodium umbrofum; Ait. Hort. Kew. ed. 1. v. 3. 466. Afpidium umbrofum; ed. 2. v. 5. 513. Willd. Sp. Pl. v. 5. 283. A. axillare; Schkuhr Crypt. t. 61.)—Frond triply pinnate; ultimate fegments lanceolate, decurrent, deeply ferrated; the lower ferratures cloven. Lines contiguous; finally confluent.—Gathered in fhady woods in Madeira, by the late Mr. Maffon, who fent roots to Kew, in 1779, and gave fpecimens to the younger Linnæus. An elegant finely divided *fern*, about three feet high, with roughifh *ftalks.* *Leaflets* two or three inches long, and nearly one broad, pointed, pinnatifid almoft to the mid-rib; the fegments numerous, parallel, oblong, obtufe, decurrent, veiny, fmooth, of a fine green; moft ferrated at their extremity and upper margin; one or two of the lower ferratures often cloven at the point. *Lines* moft copious about the lower part of each leaflet. *Capfules* brown. *Involucrums* pale, varioufly torn and reflexed.

A. *auftralis.* Southern Saufage-fern. Br. n. 1.—Frond doubly pinnate, deltoid, membranous, flaccid. Leaflets pinnatifid, tapering at the point; lobes oblong, obtufe, deeply ferrated, many-flowered. Involucrum oblong.—Native of Van Diemen's ifland.

A. *tenera.* Tender Saufage-fern. Br. n. 2. — Frond doubly pinnate, membranous, flaccid. Leaflets pinnatifid; lobes oblong, obtufe, ferrated, flowering at the bafe. Spots linear.—Gathered by Mr. Brown, in the neighbourhood of Port Jackfon, New South Wales.

The *Afpidium axillare*, Willd. Sp. Pl. v. 5. 273. Ait. ed. 2. v. 5. 512, fhould feem, if the fpecific character of Willdenow were right, to belong to the prefent genus. But we fufpect that character to have been taken from fomething elfe. The *fori* are by no means *recti*, or ftraight, but remarkably recurved, much beyond kidney-fhaped, finally affuming almoft the peltate form of a real *Afpidium.* In an early ftate indeed they are ftraight; but the inner margin is loofe, dilated, and fringed. In habit nothing can be more clofely allied to *Allantodia umbrofa* than this *Afpidium axillare.*

ALLASIA, from αλλας, *a faufage*, or *black-pudding*, in reference to the fhape and colour of the fruit.—Loureir. Cochinch. 84. — Clafs and order, *Tetrandria Monogynia.* Nat. Ord. *Cucurbitaceæ*, Linn. Juff.

Gen. Ch. *Cal.* of one leaf, inferior; tube fhort; limb in five,

five, rather acute, hairy segments. *Cor.* superior, of four small, roundish, concave, very hairy petals. *Stam.* Filaments four, awl-shaped, thick, about the length of the calyx; anthers inverted, two-lobed, each lobe of two cells. *Pist.* *Germen* roundish, between the calyx and corolla; style awl-shaped, the length of the stamens; stigma acute. *Peric.* Berry large, oblong, obtuse, smooth, fleshy, pendulous, of one cell. *Seeds* numerous, ovate, tumid, somewhat compressed, imbedded in pulp.

Eff. Ch. Berry with numerous seeds. Germen between the five-cleft calyx, and corolla of four petals.

1. A. *payos.* Black-pudding tree. *Muringuiringue* of the Africans. — Observed by Loureiro, at Mozambique, near the eastern coast of Africa. A large *tree*, with spreading *branches*, destitute of thorns. *Leaves* opposite, digitate, of five oval, entire, hairy leaflets. *Stalks* many-flowered, nearly terminal. *Fruit* reddish-brown. A cataplasm of the leaves, applied to the back, below the kidneys, is said to promote delivery. Loureiro compares his plant, as to the leaves and fruit, with the *Jaracatia*, Pis. Braf. 160. It is easy to trace the natural order of this *Allasia*, and its relationship to *Carica*. Having seen no specimens, we cannot undertake to correct some apparent inaccuracies, nor to define the real character of the genus; neither is it necessary here to criticise, or to alter, the generic or specific name.

ALLEGANY, in *Geography*, a county of New York, containing 1942 inhabitants, of whom 21 are slaves.

ALLEGHANY, or ALLEGHANY *County*, l. 5, for 10,309 *r.* 25,317, and for 159 *r.* 24.

ALLEGHANY, in Maryland, l. 5, for 4809 *r.* 6909, and for 258 *r.* 620. Add—Also, a township of Pennsylvania, in Cambria county, having 610 inhabitants.—Also, a township of Pennsylvania, in the county of Armstrong, containing 820 inhabitants.—Also, a township of Pennsylvania, in Somerset county, having 271 inhabitants. — Also, a township of Pennsylvania, in the county of Venango, having 299 inhabitants.—Also, a township of Huntingdon county, in Pennsylvania, with 1159 inhabitants.

ALLEN, a township of Pennsylvania, in Cumberland county, having 1837 inhabitants.

ALLENSTOWN, l. 2. for 254 *r.* 346.

ALLEN-TOWN, for 90 houses *r.* 1291 inhabitants.

ALLIGATOR, after LACERTA insert, see LIZARD.

ALLIUM, in *Botany*, an ancient Latin name, of which many different etymologies have been proposed, but none has been thought perfectly satisfactory, is deduced by De Theis from the Celtic, *all*, signifying hot, pungent, or burning, than which nothing can be more suitable, whether we consider the various kinds of Garlic, Onions, &c. in common use, or the numerous wild ones. Several species require to be added to the fifty-seven enumerated by our predecessor, the late Dr. Woodville, in the first volume of this work. (See ALLIUM.) We shall indicate their respective places in each section, interspersing, in the same order, a few remarks concerning other species.

Sect. 1. *Stem leafy. Leaves flat. Umbel bearing capsules only.*

1. A. *Ampeloprasum.* Willd. Sp. Pl. v. 2. 63. n. 1. Engl. Bot. t. 1657. Fl. Græc. t. 312, unpubl. Curt. Mag. t. 1385.

β. Smaller, with sweet-smelling bright crimson flowers.—This variety is a native of the Cape of Good Hope, being the *A. Ampeloprasum* of Thunb. Prodr. 65. It must not be confounded with the *β* of Curt. Mag. 1385, Waldst. and Kitaib. Hung. v. 1. 84. t. 82, which Mr. Ker now thinks a variety of *arenarium*, deprived of its flower-bulbs. The same botanist, so deeply skilled in the plants of this natural order and their allies, has expressed, like Linnæus, an opinion of the real *Ampeloprasum* not being specifically distinct from the garden Leek, *A. Porrum*, n. 2. It seems to us that the simply sheathed biennial *root* of this latter is essentially different from the large, globose, aggregate, perennial *bulbs* of the other; and the keels of the *petals* in *Porrum* are certainly much less rough, if ever at all so, than those of *Ampeloprasum*. A good figure of *A. Porrum* is much wanted.

Between 2 and 3. A. *Dioscoridis.* Sibth. in Prodr. Fl. Græc. n. 764. (μωλυ; Diosc. book 3. chap. 4.)—Found in dense bushy shady situations, in Caria, Mysia, and Cyprus. "The *stem*, in a rich soil, sometimes attains the height of five or six feet. *Umbel* large. *Flowers* white, somewhat resembling those of *Peganum Harmala*, as Dioscorides observes in speaking of the latter plant, book 3. chap. 53." Such is all the information afforded by Dr. Sibthorp's MSS., for he has left no specimen nor drawing of this interesting plant, supposed by him to be the μωλυ, or *Moly*, of Dioscorides. He has not afforded us any materials for a specific character. Can his plant be the A. orientale latifolium, flore magno lacteo; Tourn. Cor. 26? Of this a specimen may perhaps be found, in the collections at Paris or Oxford.

Sect. 2. *Stem leafy. Leaves flat. Umbel accompanied by bulbs.*

Here perhaps ought to have been inserted, on account of its near affinity to *roseum*, our *ambiguum*, figured in Curt. Mag. t. 978, and destined to appear in Fl. Græc. t. 327. See Sect. 4.

Sect. 3. *Stem leafy. Leaves nearly cylindrical. Umbel bearing capsules only.*

20, 21. A. *margaritaceum.* Pearly Garlick. Sm. Prodr. Fl. Græc. Sibth. n. 770. Fl. Græc. t. 315, unpubl.—Stem bearing round leaves and an umbel of capsules. Leaves channelled. Stamens three-pointed, prominent. Petals obovate, obtuse.—Gathered by Dr. Sibthorp, about Prusa in Bithynia, as well as on mount Athos, and in the islands of Naxos, Cyprus, and Cimolis. The *bulb* is about the size of a filberd, coated with brown ribbed scales. *Stem* solitary, a foot high, erect, round, slender, leafy in its lower half. *Leaves* about four, spreading, tapering, as thick as a crow's quill, rather glaucous, smooth, six inches long; channelled along the upper side; sheathing at the base; the two lowermost shorter and soon withering. *Umbel* erect, oval, obtuse, dense, attended at the base by several short, reflexed, jagged, white involucral scales. *Flowers* on slender, ascending or upright, simple *stalks*, an inch long at most. *Petals* obovate, concave, not a quarter of an inch in length, converging, streaked with green, white at the edges, purple at the keel. *Stamens* white; three of them simple, awl-shaped; three linear, with two long, lateral, spreading, narrow segments. *Germen* turbinate, with six prominent angles.

26, 27. A. *caucaseum.* Crimson Caucasian Garlick. Ker in Curt. Mag. at the end of p. 1143. (A. paniculatum; ibid. t. 973, but not t. 1432. A. globosum; Redout. Liliac. t. 179, not t. 96!)—Stem bearing thread-shaped sheathing leaves, and an umbel of capsules. One valve of the sheath elongated and cylindrical. Stamens simple. Petals ovate, acute. Germen globose.—Native of mount Caucasus. Raised by Mr. Loddiges, from seeds imported from Russia. The cylindrical *leaves*, globose *umbel*, shorter *involucrum*, ovate, not obovate *petals*, and round, even, not oblong and channelled, *germen*, as well as the rose-coloured *flowers*, are sufficient marks of distinction between this plant and *A. paniculatum*, of which an imperfect figure, representing the *leaves* as cylindrical (contrary to nature and the description) is given in Curt. Mag. t. 1432.

A. *mar-*

A. *montanum.* Crimson Olympian Garlick. Sm. Prodr. Fl. Græc. Sibth. n. 775. Fl. Græc. t. 319, unpubl. (A. montanum, radice oblongâ; Tourn. Inst. 384, according to Sibthorp.)—Stem bearing nearly cylindrical leaves, and an umbel of capsules. Sheath elongated, deflexed. Stamens simple. Flower-stalks uniform.—Found in the grassy pastures of the Bithynian Olympus, by Dr. Sibthorp. The *bulb* is ovate-oblong, red, with a ribbed angular coat, fibrous at the summit. *Stem* four or five inches high, smooth, round, bearing about two slender, smooth, grass-green *leaves*, a little channelled on their upper side, one of them rising above the *umbel*, which is rather lax. *Petals* obovate, pale rose-coloured with a crimson mid-rib. *Germen* ovate-oblong, with six deep furrows.

A. *staticiforme.* Thrift-like Garlick. Sm. Prodr. Fl. Græc. Sibth. n. 776. Fl. Græc. t. 320, unpubl.—Stem bearing nearly cylindrical leaves, and an umbel of capsules. Stamens simple. Germen three-lobed. Umbel many-flowered, somewhat capitate.—Gathered by Dr. Sibthorp, in the isle of Cimolis. The *bulb* is globular, about the size of a hazel nut, with several lateral offsets. *Stem* a span high, reddish. *Leaves* about three, shorter than the stem, recurved, with striated reddish sheaths. *Umbel* dense, of about an inch and a half in diameter, rose-coloured. *Petals* obovate. *Germen*, as well as the *capsule*, turbinate, abrupt, of three rounded lobes.

A. *pilosum.* Hairy-leaved Crimson Garlick. Sm. Prodr. Fl. Græc. Sibth. n. 777. Fl. Græc. t. 321, unpubl.—Stem bearing nearly cylindrical leaves, and an umbel of capsules. Stamens simple. Leaves and their sheaths very hairy.—Found by Dr. Sibthorp in the island of Cimolis, and we believe in the Peloponnesus also. *Bulb* globular, small, purplish. *Stem* a span high. *Leaves* about four, spreading, tapering, remarkably rough with spreading hairs, as are likewise their long, striated, purplish *sheaths*. *Umbel* lax, hemispherical, many-flowered, smooth, the *flowers* and their *stalks* of a pale purplish crimson. *Petals* elliptic-obovate, obtuse. *Germen* of three hemispherical lobes, not turbinate.

A. *junceum.* Rush-leaved Purple Garlick. Sm. Prodr. Fl. Græc. Sibth. n. 778. Fl. Græc. t. 322, unpubl.—Stem bearing thread-shaped leaves, and an umbel of capsules. Three alternate stamens five-cleft. Umbel capitate. —Discovered in the island of Cyprus, by Dr. Sibthorp, who took it for *A. Schoenoprasum*, from which, however like at first sight, it differs essentially. Our plant is more allied to *A. ascalonicum*, but still distinct, and the *stem* is truly leafy. *Bulbs* aggregate, ovate, with dark-brown, striated, elongated coats. *Stem* a foot high, slender, erect, leafy about one-third of its height. *Leaves* two, nearly as tall as the stem, very slender, tubular, quite round, smooth, a little glaucous, somewhat spreading at the top. *Umbel* globular, dense, its *sheath* of two broad, ovate, acute, concave, close leaves, shorter than the flowers. *Flower-stalks* green, but half the length of the *petals*, which are elliptic-oblong, acute, purplish, with a darker mid-rib. *Stamens* white; three of them simple, awl-shaped; the intermediate ones flat, dilated upwards, terminating in two taper vertical teeth, on each side of a similar one bearing the *anther*. *Germen* elliptical, with three slight furrows.

Sect. 4. *Leaves radical. Common Flower-stalk naked.*

35. A. *inodorum.* Carolina Garlick. Ait. Hort. Kew. ed. 1. v. 1. 427. ed. 2. n. 25. Willd. n. 33. Curt. Mag. t. 1129. (A. fragrans; Venten. Hort. Cels. t. 26. Redout. Liliac. t. 68. Pursh n. 2.)—"Stalk naked, obscurely triangular. Leaves linear, flat; keeled at the back. Umbel level-topped, capsule-bearing. Stamens simple."—On the mountains of Virginia and Carolina, flowering in June. Perennial. *Flowers* white, with red veins. *Pursh*, who had seen it living. It is marked in *Hort. Kew.* as a hardy perennial, flowering in March and April, and introduced by the late Duchess Dowager of Portland, in 1776. We presume Dr. Solander to be the author of the above characters, given in *Hort. Kew*, and that the plant of the Botanical Magazine and that of Redouté are the same, though in the former work the *petals* are obovate, and remarkably elongated at the base; in the latter ovate, without any such elongation. One or other is a great, and very material, error, but not having seen the plant, we know not where the fault lies. There are errors also in the detail of its history. *Redouté t.* 6 for 68; *Venten. Malmais.* copied by Pursh from the Magazine, for *Venten. Hort. Cels.*, which proving that the work was not consulted by Pursh, takes away our confidence in that author, as to synonyms. The name *inodorum* is acknowledged to express the want of the Garlick fœtor in the herbage, while that of *fragrans* alludes to the sweet scent of the *flowers*. We retain the original appellation. Mr. Ker, at the end of the history of t. 1293, in Curt. Mag. declares his conviction that *A. gracile*, our n. 55, is the same plant. We cannot assert the contrary, but we do not feel convinced, and there has been such a diversity of opinion on the subject, that till we can compare living specimens, we must leave the question in doubt. It is remarkable that Willdenow says *A. inodorum* "is like *angulosum* of Linnæus, but twice as large, and differing in the specific character," which chiefly amounts to the *stalk* of the latter being two-edged, and the *leaves* channelled. He had both plants living. But *angulosum* is most excellently represented in Curt. Mag. t. 1149, and surely few of the genus can bear less resemblance to t. 1129! It is scarcely more like Redouté's figures, named *fragrans*. We proceed to notice the species most akin to *inodorum*; for so at least it must be presumed to be.

35, 36. A. *gracile.* Jamaica Garlick. (See our n. 55.) Dryandr. in Ait. Hort. Kew. v. 1. 429. ed. 2. n. 38. Willd. n. 52. Andr. Repos. t. 107. Ker in Curt. Mag. at the end of p. 1293, var. 1. (A. striatum; Redout. Liliac. t. 50. Curt. Mag. t. 1035? and t. 1524?)—"Stalk naked, round, very long. Leaves linear, channelled. Stamens awl-shaped, connected at the base."—Native of Jamaica, from whence it was sent to Kew, by Hinton East, esq., and flowered in the stove, in February. *Aiton. Leaves* a foot long, resembling those of a Narcissus. *Stalk* three feet high, slender. *Petals* erect, white, with claws, which are united with the *stamens* below, into a green tube. Perhaps this plant may form a distinct genus. *Dryander* as above. The writer of the present article happened to be with Mr. Dryander, when the original specimens of this *Allium* were brought from Kew, and on being asked for a name suggested the above. He then obtained a specimen, which is now, along with others gathered at Kew in 1788, in his herbarium, as well as one more, undoubtedly the same species, procured from Mr. Vere's collection, in 1814, as a rare plant, by the name of *A. striatum*. He can therefore speak to the whole *herb* being destitute of the Garlick odour, and to the want of scent in the *flowers*, by day at least, though they may very probably be, as reported, fragrant at night. He can also vouch for the fidelity of Mr. Andrews's figure; nor does he hesitate concerning t. 50 of Redouté; whatever scruples a deference to Mr. Ker may suggest, as to the two figures named *striatum* in Curt. Mag. The suspicion of a generic difference between this plant and *Allium*, arose in Mr. Dryander's mind, from the combination of the *stamens*, and was strengthened by the want of the garlick flavour.

flavour. The *leaves* are certainly not remarkably ſtriated at the back, as in the real *ſtriatum*, of which we ſhall next ſpeak.

A. *ſtriatum*. Streaked-leaved Garlick. (See our n. 37.) Jacq. Coll. v. 5. 51. Ic. Rar. t. 366. Willd. n. 35. Ait. n. 27.—Stalk naked, ſlightly triangular. Leaves linear, ſomewhat channelled; convex, with many furrows, but no keel, beneath. Umbel level-topped. Petals oblong-lanceolate. Stamens ſimple.—Native of the Cape of Good Hope, flowering in the garden in September and October. Whole plant ſmooth, without much ſcent. *Bulb* the ſize of a hazel-nut, white, coated. *Leaves* about four, all radical, ſix inches or more in length, linear, bluntiſh, oblique, but little channelled; rather convex and ſtriated at the back, but not triangular. A tranſverſe ſection, under a magnifier, ſhews a ſingle row of perpendicular tubes, each running behind one of the furrows; but the *leaf* is not itſelf hollow, or tubular. *Stalk* radical, obſcurely triangular, ſlender, erect, as tall as the leaves, or taller. *Umbel* of ſeven *flowers*, more or leſs, the partial ſtalks an inch and a half long. *Sheath* of two erect, ovate, pointed, membranous valves. *Petals* long-lanceolate, rather acute, ſpreading, white with a green longitudinal line in the middle. *Filaments* awl-ſhaped, equal, ſhorter than the petals. *Anthers* oblong, incumbent, yellow. *Jacquin.*

This figure and deſcription ſurely do not ſuit our *gracile*. But whether the *ſtriatum* does really come from the Cape, or from Virginia and Carolina, we are quite in the dark. Purſh's *ſtriatum* is our *ornithogaloides*, n. 57. Curt. Mag. t. 1524 anſwers better to his deſcription than t. 1035, but we cannot prove them the ſame. We have endeavoured to unravel the original materials which concern theſe three ſpecies, but having had no means of comparing freſh ſpecimens, nor having indeed ſeen any at all of Jacquin's plant, we are unable to attempt good ſpecific characters, and therefore leave the whole for future examination, ſatisfied of one thing, at leaſt, that theſe ſpecies are not at preſent well underſtood. To illuſtrate them, great attention to the outline of the *petals*, ſhape and inſertion of the *ſtamens*, and form of the *germen*, circumſtances not yet well obſerved in *Allium*, will be found of primary importance.

39. A. *pedemontanum*. Red Piedmonteſe Garlick. Willd. n. 37. (A. nigrum; Allion. Pedem. v. 2. 158. t. 25. f. 1. A. roſeum; Linn. Sp. Pl. ed. 2. 432, but not Sp. Pl. v. 1. 296.)—Stalk obſcurely quadrangular. Bulb cylindrical. Leaves linear, obtuſe, keeled at the back. Umbel rather denſe, of few flowers. Petals elliptical.—Native of mountainous ſituations in Piedmont. Specimens from Allioni and Bellardi prove this ſpecies, as diſtinct from *nigrum* as from *roſeum*, to have been confounded by Linnæus with the latter, which has a globoſe, very prolific *bulb*, a ſomewhat leafy *ſtem*, and far more numerous, brighter-coloured, *flowers*.

39, 40. A. *ſtellatum*. Miſſouri Garlick. Ker in Curt. Mag. t. 1576. Ait. Epit. 363. (A. anguloſum; Purſh n. 4, excluding the ſynonyms.)—Stalks ſomewhat two-edged, recurved before flowering. Bulb ovate-oblong. Leaves linear, triangular, ſharply keeled. Umbel many-flowered, lax, level-topped. Stamens combined at the baſe. Germen depreſſed, bluntly triangular.—Found on the banks of the Miſſouri, by governor Lewis and Mr. Nuttall, flowering in July, and imported by Mr. Fraſer, in whoſe nurſery it bloomed in June 1813. Purſh by miſtake ſays the *flowers* are white. In the Botanical Magazine they are repreſented of a deep pink, and the herbage ſomewhat glaucous. The *ſtalks* are two or more. The *ſheath* is of only one valve; but Mr. Ker doubts the permanency of that character.

A. *cernuum*. Bowed-umbelled Garlick. "Roth. Nov. Pl. Spec. in Roem. Archiv. n. 3. 40. Catal. Bot. faſc. 2. 33. t. 2." Sims and Kon. Ann. of Bot. v. 2. 27. Ker in Curt. Mag. t. 1324. Ait. Epit. 363.—Stalk angular; recurved at the ſummit. Leaves linear, ſlightly channelled, pointed. Umbel drooping, many-flowered. Stamens ſimple, twice as long as the corolla; tumid at the baſe. Germen turbinate.—Native of mount Caucaſus, according to Mr. Aiton, who ſays it was introduced into England in 1801. The *bulbs* are oblong, tapering, aggregate. *Stalk* eighteen inches high; roundiſh, compreſſed, and recurved, at the top. *Leaves* bright-green, narrow. *Flowers* white, with a delicate roſe-coloured tinge. *Petals* ovate. *Stamens* unequal at firſt, but finally all about twice the length of the corolla. *Germen* three-horned. *Ker.*

A. *rubellum*. Reddiſh Iberian Garlick. Marſch. Taur.-Caucaſ. v. 1. 264.—"Stalk nearly naked, round. Leaves ſemi-cylindrical, channelled. Sheath ſhort. Umbel convex, many-flowered. Stamens ſimple, half as long as the corolla."—Gathered by Mr. Steven in Georgia. *Bulb* the ſize of a filberd. *Stalk* with one or two leaves ſheathing the baſe, on which account the author cited doubts whether this ſpecies and the following might not be referred to the third ſection; but there are many of the fourth whoſe foliage, when the bulb is deep, becomes in ſome degree cauline. *Leaves* a line broad, rather fleſhy. *Flower-ſtalks* ſlender, much longer than the *flowers*, which are hardly ſo big as thoſe of *A. Ampelopraſum*, of a pale purple, with acute *petals*.

A. *ſaxatile*. Stone Garlick. Marſch. Taur.-Caucaſ. v. 1. 264. Sims and Kon. Ann. of Bot. v. 2. 436, excluding the ſynonym of Gmelin.—"Stalk almoſt naked, round. Leaves ſemi-cylindrical. Sheath pointed, longer than the umbel. Stamens ſimple, longer than the corolla." —Frequent on the lime-ſtone rocks of Taurida, flowering in July and Auguſt. *Bulbs* aggregate, oblong, with dark brown coats. *Stalk* with a few ſheathing leaves at the baſe, like the foregoing. *Petals* ſpreading. There is a variety with purpliſh *flowers*, on the eaſtern mountains of Caucaſus. This ſpecies is very cloſely related to *A. ſtellerianum*, Willd. n. 49, ſee our n. 51; but differs in having a long awl-ſhaped *ſheath*. *Marſchall.*

A. *biſulcum*. Jonquil-leaved Garlick. Redout. Liliac. t. 286. Curt. Mag. t. 1381. Ait. Epit. 363.—Bulb cylindrical. Stalk round. Leaves two-ranked, ſemi-cylindrical, channelled, acute. Umbel denſe, convex. Petals oval. Filaments awl-ſhaped, the length of the corolla; three of them broader at the baſe.—Native country not known. The plant is ſaid to be quite hardy, and of eaſy culture, flowering in June and July. Mr. Ker remarks its great reſemblance to *ſeneſcens*, (ſee n. 32,) Curt. Mag. t. 1150, next to which perhaps it ought to be placed, though akin alſo to our laſt, from which the ſhortneſs of the *ſheath* diſtinguiſhes the preſent plant. The narrow and thick *leaves* are very different from *ſeneſcens;* and Redouté has obſerved that the inner ones are channelled on both ſides; which may, as Mr. Ker thinks, be occaſioned by preſſure in an early ſtate.

40, 41. A. *triflorum*. Three-flowered Garlick, or Mountain Leeks. Purſh n. 5.—"Stalk naked, round, ſhorter than the leaves, which are lanceolate and ribbed. Umbel of few flowers."—In ſhady woods, on the high mountains of Pennſylvania, flowering in May and June. Perennial. *Purſh.*

44, 45. A. *lacteum*. Milk-white Garlick. Sm. Prodr.

Fl.

Fl. Græc. Sibth. n. 781. Fl. Græc. t. 325, unpubl. (A. album; Bivona Sic. cent. 1. 16. "Santi Viagg. al Montam. 352. t. 7. Bertol. Gen. 51. Savi Etrufc. v. 2. 210.)—Stalk naked, triangular. Leaves lanceolate, feffile. Petals obtufe.—Native of fields in Italy and Sicily, flowering in March. This is one of thofe plants, which, on account of their novelty, or rarity, Dr. Sibthorp admitted into his *Flora Græca*, having gathered them in the courfe of his travels, though perhaps not in Greece itfelf. *A. lacteum* agrees with *triquetrum*, n. 44, next to which it fhould be placed, in having an acutely triangular *ftalk*; but differs in the lanceolate *leaves*, and fhorter, broader, more obtufe, *petals*. The *ftigma* moreover is fimple, not three-lobed.

A. *ambiguum*. Bulbous Rofe Garlick. Sm. Prodr. Fl. Græc. Sibth. n. 783. Fl. Græc. t. 327, unpubl, (A. rofeum β; Ker in Curt. Mag. t. 978. Bivona Sic. cent. 1. 18. Savi Etrufc. v. 2. 210. "A. carneum; Targioni Tozzetti Ift. Bot. ed. 2. v. 2. 242. t. 6. Moly anguftifolium campanulatum, flore rofeo, nodofum; Cupani Pamph. v. 2. t. 219." Moly ferpentinum vocatum; Lob. Ic. 160.)—Stalk naked. Leaves femi-cylindrical. Stamens fimple, fhorter than the corolla. Umbel bulbiferous.—Native of Italy and Sicily, flowering in May. Frequent about Pifa. *Savi*. On the hills of St. Martino near Palermo. *Bivona*. This *Allium*, which, with refpect to the *Flora Græca*, ftands in the fame predicament as the laft, is made by all authors a variety of *rofeum*; for the difference between the fpecies with bulbiferous, and thofe with feed-bearing, *umbels*, is acknowledged to be, in many inftances, not infallible. In the plant before us, however, there is a great difagreement, as to the character of *rofeum*, which is defcribed with flat *leaves* and a leafy *ftem*. But the dried fpecimens are very much alike, not difcovering in either the femi-cylindrical and hollow ftructure of the *leaves*, fhewn by Dr. Sibthorp's figure. As to the *ftem* being leafy or not, many fpecies are in this refpect ambiguous, and *rofeum* is perhaps improperly confidered as of the former denomination. Their *roots* are precifely alike. The *flowers* of *rofeum* are far more numerous, and of a finer pink hue.

We cannot conclude our furvey of *Allium* without a remark that the whole genus requires to be reformed, with regard to the arrangement of the fpecies, and the fpecific characters of many of them. We are alfo aware of feveral that might be added to the above lift, but of which we want fufficient fpecimens or information clearly to difpofe of them, fo as to elucidate rather than confound the fubject.

ALLOCHROITE. See MINERALOGY, *Addenda*.

ALLOY, in *Chemiftry*, a combination of two or more metals. In addition to what has been faid on this fubject in the Cyclopædia, we may add the following tabular views from Dr. Thomfon, of the general properties of the different alloys, as far as they have been examined. The chemiftry of alloys is at prefent but little underftood, and, as Dr. Thomfon juftly remarks, thefe compounds in general appear to be much better known to artifts and manufacturers than to chemifts.

The firft of the following tables comprehends the alloys of the malleable metals with each other; the fecond, the alloys of the brittle metals; and the third, the alloys of the malleable and brittle metals. In thefe tables, the letter M fignifies *malleable*; B, *brittle*; S, *fubmalleable*, ufed when the alloy is malleable in certain proportions, but brittle in others. O is ufed when the metals do not unite. The fign + is ufed when the alloy occupies a greater bulk than the feparate metals; the fign − when the alloy occupies a fmaller bulk. The firft indicates an expanfion; the fecond, a condenfation.

ALMANAC, col. 2, l. 15, add, see STAMP.

ALMUDE, in *Commerce*, a liquid measure in Portugal, &c. (See *Table* XXXII. *of* MEASURES.) At Lisbon, wine and oil are sold by the pipe of 26 almudes; but the pipe of Lisbon wine sent to England contains about 31 almudes, and the standard gauge at the London Custom-house is 140 gallons; the Lisbon almude is therefore reckoned at 4½ English gallons. At Oporto, the pipe is divided into 21 almudes, which almude and its subdivisions are 49⅐ *per cent.* greater than those of Lisbon; so that the standard gauge of a pipe of port at the Custom-house of London is 138 gallons, so that the almude of Oporto is accordingly equal to six English gallons and five pints nearly.

ALNUS, in *Botany*, the Alder, an ancient Latin name, which De Theis derives from the Celtic, *al*, near, and *lan*, the brink of a river, the letters having become transposed for easy pronunciation. This is suitable enough to the tree in question, which always grows near water, even on the loftiest mountains, nor have we met with a better etymology.—Willd. Sp. Pl. v. 4. 334. Sm. Compend. 133. Prodr. Fl. Græc. Sibth. v. 2. 232. Ait. Hort. Kew. v. 5. 258. Pursh 622. Raii Syn. 442. Tourn. t. 359. Gærtn. t. 90. (Betula, as to the character; Linn. Gen. 485. Sm. Fl. Brit. 1011. Engl. Bot. 1508. Lamarck Illustr. t. 760. f. 3. See BETULA.)—Class and order, *Monoecia Tetrandria*. Nat. Ord. *Amentaceæ*, Linn. Juss.

Gen. Ch. Male, *Cal.* Catkin cylindrical, imbricated every way, lax, composed of wedge-shaped, three-flowered, abrupt, three-cleft scales. *Cor.* compound, of three equal, tubular, four-cleft florets, sessile on the disk of each scale; their segments deep, equal, ovate, obtuse, spreading. *Stam.* Filaments four, minute, inserted into the base of each segment, and not quite so long as the segment; anthers of two round lobes.

Female, on the same plant, *Cal.* Catkin elliptical, imbricated, close, consisting of two-flowered, rounded, pointed, obscurely three-cleft, concave scales. *Cor.* none. *Pist.* Germens two to each scale, ovate, minute, depressed; styles two to each germen, tapering, rather longer than the scale; stigmas simple. *Seed.* Nut naked, compressed, of two cells, with solitary kernels.

Ess. Ch. Male, Calyx the scale of a catkin, of one leaf, three-cleft, three-flowered. Corolla deeply four-cleft.

Female, Calyx the scale of a catkin, of one leaf, obscurely three-cleft, two-flowered. Styles two. Nut compressed.

The presence of a *corolla* in the male flowers, with a determinate number of *stamens* equal to that of its segments, are sufficient marks of generic distinction between this genus and *Betula*, which has no *corolla* in either flower, and whose *stamens* are numerous, and indefinite. The fertile *catkin* moreover is elliptical in *Alnus*, cylindrical in *Betula*. Gærtner finds differences in the *seed*, which, if the *germen* be attended to, appear to us less decisive. By an accidental oversight, *Alnus* was neglected to be separated from *Betula*, in our PLANTS OF BRITAIN; see that article.

1. A. *glutinosa*. Common Alder. Gærtn. v. 2. 54. Willd. n. 1. Ait. n. 1. Sm. Compend. n. 1. Pursh n. 1. (Alnus; Matth. Valgr. v. 1. 127. Camer. Epit. 68. Lob. Ic. v. 2. 191. Ger. Em. 1477. Loes. Pruss. 10. t. 1. A. n. 1630; Hall. Hist. v. 2. 300.)

β, incisa; leaves roundish, notched. *Willd.*

γ, laciniata; leaves oblong, pinnatifid, with acute segments. *Willd.* Ait. β.

δ, quercifolia; leaves oblong, sinuated, with obtuse segments. *Willd.*

Leaves roundish-wedgeshaped, obtuse, wavy, glutinous; downy at the branching of the veins beneath.—Native of swamps and the neighbourhood of rivers and pools, in low lands, as well as on mountains, throughout Europe, the north of Asia, and of Africa, as also in Canada and on the north-west coast of America, (*Pursh*,) flowering in March or April. In landscape this tree often supplies the want of the rich dark foliage of the Oak, where the latter will not thrive. The *leaves* are not fully expanded till the end of May, but they remain late in autumn. For the uses and further history of this tree, see BETULA, n. 6. Our γ is the only variety cultivated for ornament, or rather curiosity, in England.

2. A. *oblongata*. Turkey Alder. Willd. n. 2. Ait. n. 2. (A. folio oblongo viridi; Bauh. Pin. 428. Hort. Angl. 5. Betula oblongata; Ait. ed. 1. v. 3. 338.)—Leaves elliptical, bluntish, glutinous; the branching of the veins naked beneath.—Native of the south of Europe. Cultivated in England ever since the year 1730, at least, but not much in request. The *leaves* are smaller than the foregoing, obovate, or elliptic-oblong, sharply serrated. *Catkins* of *seeds* nearly globular.

3. A. *incana*. Hoary Alder. Willd. n. 3. Ait. n. 3. (Alnus; Linn. Fl. Lapp. ed. 1. 260. A. folio incano; Bauh. Pin. 428. A. hirsuta; Bauh. Matth. 133. A. altera; Clus. Hist. v. 1. 12. A. n. 1631; Hall. Hist. v. 2. 301. Betula incana; Linn. Suppl. 417. Ait. ed. 1. v. 3. 339. Ehrh. Arb. 116. Beitr. v. 3. 22. Willd. Arb. 45. B. Alnus β; Linn. Sp. Pl. 1394.)

β, angulata; leaves green beneath, with green footstalks. *Ait.*

γ, pinnata; leaves pinnate, hairy beneath; young branches hairy. *Willd.*

(Betula pinnata; "Lundmark in Stockh. Trans. for 1790, 122. t. 5.")—Leaves elliptic-oblong, acute; downy beneath; the branching of the veins naked. Stipulas lanceolate.—Native of marshes and the banks of rivers throughout Lapland. *Linnæus.* It occurs also in alpine situations, in Germany, Switzerland, &c. The variety γ, of which we have specimens from Dr. Swartz, has been met with in one part of Sweden only, Waermland, and is increased by root only. The *leaves* are small, pinnate, and jagged. The usual appearance of *A. incana*, except its hoariness, and the glaucous hue of the back of its *leaves*, is not very unlike *A. glutinosa*. The *leaves* however are more acute, and their *footstalks* are reddish. This last character, as well as the glaucous hue just mentioned, is wanting in variety β. The general pubescence of the under side of the *leaves* renders it difficult to say how far the veins differ at their origin from those of the Common Alder, but though downy, they certainly want the glandular roughness so remarkable in that species. See BETULA, n. 7, for a further account of this tree.

4. A. *undulata*. Curl-leaved Alder. Willd. n. 4. Ait. n. 4. (A. crispa; Pursh n. 2. Betula crispa; Ait. ed. 1. v. 3. 339. Michaux Boreal.-Amer. v. 2. 181.)—"Leaves oblong, acute; rounded at the base; veins hairy beneath, like the footstalks, but naked at their origin. Stipulas ovate-oblong."—In Canada, and on the high mountains of Pennsylvania, in swamps overrun with Bog-moss, flowering in April. A *shrub*, not above three or four feet high. *Leaves* doubly serrated. *Pursh.* See BETULA n. 13. Willdenow seems to have unwarrantably changed the name of this species.

5. A. *serrulata*. Hasel Alder. Willd. n. 5. Ait. n. 5. Pursh n. 3. (Betula serrulata; Ait. ed. 1. v. 3. 338. Michaux Boreal.-Amer. v. 1. 181. Willd. Arb. 45. Smith Ins. of Georgia v. 2. 183. t. 92. B. rugosa; Ehrh. Beitr. v. 3. 21. "Wangenh. Amer. 86. t. 29. f. 60.")—Leaves obovate,

obovate, finely ferrated; veins and their origin hairy beneath. Stipulas elliptical, obtufe.—Native of North America. Common every where in fwamps, and by river fides, flowering in March. A *fhrub*, from fix to ten feet high, growing in clofe thickets. *Purfh.* See BETULA n. 12. The *leaves* do not appear to be glutinous, or at leaft not fo much fo as the Common Alder, from which alfo they differ in being regularly and finely ferrated, not notched, or jagged.

ALOEXYLUM, ἀλοηξυλον, *Aloes-wood*, a name given to the tree which produces this precious wood, by Loureiro; Fl. Cochinch. 267. See AGALLOCHUM.—He refers it to the Clafs and Order, *Decandria Monogynia*, and its Natural Order feems to be *Lomentaceæ*, Linn. *Leguminofa*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of four acute, hairy, deciduous leaves; the lowermoft falcate, incurved, nearly twice as long as the reft. *Cor.* Petals five, unequal, longer than the calyx. *Stam.* Filaments ten; anthers .... *Pift.* Germen fuperior, elongated, curved, compreffed; ftyle thread-fhaped; ftigma ...... *Peric.* Legume woody, fmooth, falcate. *Seed* folitary, oblong, curved, tunicated.

Eff. Ch. Calyx of four acute deciduous leaves; the lower one longeft. Petals five, unequal. Legume curved. Seed folitary, tunicated.

1. A. *Agallochum.* Fragrant Aloes-wood.—Native of the loftieft mountains of Cochinchina, near the great river which runs between that kingdom and Laofios. A large lofty *tree*, with erect *branches*. *Bark* fibrous, brown, fmooth, not thick. *Leaves* alternate, ftalked, lanceolate, flat, entire, fmooth, rather coriaceous, eight inches long. *Flower-ftalks* terminal, many-flowered. *Loureiro.* This genus is manifeftly different from AQUILARIA. (See that article.) Loureiro defcribes the wood as white and inodorous, becoming refinous and fragrant in confequence of fome injury, till the tree dies. No part of this tree is milky, nor poifonous. He adds, that all the forts of genuine aloes-wood are produced by this tree, even the moft precious, termed *Calambac*, which is found no where but on the mountains of Champávæ, belonging to Cochinchina, fituated about the 13th degree of north latitude. The inferior fpecies, or rather varieties, are obtained in various places, fometimes in pieces weighing thirty pounds or more. "There are," fays Loureiro, "other fragrant woods, called by ignorant perfons *Agallochum*, and *Lignum Aloe*, differing greatly from each other, and the produce of different plants." The common writing paper of Cochinchina is made of the bark of this tree. Yet the plant itfelf feems rare, Loureiro having long enquired in vain for the flowers, and having obtained them but once, in a bruifed and mutilated condition.

Whether the *Agallochum*, or *Calambac*, Rumph. Amboin. v. 2. 29, of which that author gives no figure, be the plant of Loureiro, we cannot pofitively determine, though it feems likely. The *Agallochum fecundarium*, or *Garo*, of the fame volume, 34. t. 10, is certainly the *Aquilaria*. We have received from Dr. Roxburgh fpecimens of the wood itfelf; as well as of the fruit, agreeing exactly with Rumphius's figure, and evidently the *Gyrinops Walla* of Gærtner, v. 2. 276. t. 140. In Tr. of Linn. Soc. v. 11. 230, the writer of this has hinted at the probable affinity of *Aquilaria* to the *Euphorbiæ*.

ALONSOA, a genus eftablifhed by Ruiz and Pavon, Fl. Peruv. Syft. 150, and adopted in Ait. Hort. Kew. v. 4. 27, is founded on two fpecies of HEMIMERIS, (fee that article,) nor can we difcover the leaft poffible character to diftinguifh them from the latter; which having been much confufed in its hiftory by Linnæus, was perhaps not underftood by the authors of the *Flora Peruviana*. Thefe fpecies are our *H. urticifolia*, (Alonfoa incififolia; Fl. Peruv.) and *H. linearis*, (A. linearis of the fame work.) Profeffor Willdenow, though he had never feen more than one *Hemimeris*, the montana, and that in a dried ftate, could not overlook the identity of thefe genera, nor can we account for its having efcaped the learned editors of the Hortus Kewenfis. But it is evident from their generic character of *Alonfoa* that they did not contraft the two genera; for thefe are proved the fame by the character itfelf, which runs thus, and is equally fuitable to both.

Calyx in five deep fegments. Corolla nearly wheel-fhaped, reverfed, five-cleft; the uppermoft fegment largeft. Stamens declining; with fmooth filaments; and converging uniform anthers. Capfule of two cells.

Hemimeris, being a long-eftablifhed Linnæan name, of appropriate and unexceptionable meaning, muft, of courfe, be retained.

ALPINIA, the article already given requires reformation, in confequence of fubfequent difcoveries, chiefly owing to Mr. Rofcoe's inveftigations. (See SCITAMINEÆ and ROSCOEA.) Recurring to the original genus, founded by Plumier, and adopted by Linnæus, as the bafis of the whole, we do not, in quoting various authors, who have followed thefe, confider as *Alpiniæ* all that they have included herein. We fhall limit the characters after Mr. Rofcoe's principles, fo as to exclude what does not belong to this very natural genus, and, on the other hand, to introduce what has, under other names, been improperly feparated from it.—Linn. Gen. 3. Schreb. 4. Willd. Sp. Pl. v. 1. 11. Mart. Mill. Dict. v. 1. Ait. Hort. Kew. v. 1. 3. Rofcoe Tr. of Linn. Soc. v. 8. 343. t. 20. f. 7. Sm. Ex. Bot. v. 2. 93. Roxb. Afiat. Ref. v. 11. diff. 7. Juff. 63. Gærtn. t. 12. (Alpina; Plum. Gen. 26. t. 11. Renealmia; Linn. Suppl. 7. Schreb. 2. Willd. Sp. Pl. v. 1. 6. Mart. Mill. Dict. v. 4. Catimbium; Juff. 62. Zerumbet; Wendl. Sert. Hannov. t. 19. Jacq. Fragm. Bot. 50. t. 68.)—Clafs and order, *Monandria Monogynia*. Nat. Ord. *Scitamineæ*, Linn. *Cannæ*, Juff.

Gen. Ch. *Cal.* Perianth fuperior, of one leaf, tubular, irregularly fplitting into two or three teeth. *Cor.* of one petal, irregular, tubular at the bafe: limb double, unequal; the outermoft two-lipped, in three deep fegments, of which the upper one is ufually broadeft, and concave, the two lower equal and narrower; innermoft of a fingle lip, ftraight, as long or longer than the outer limb, dilated, lobed, or jagged, at the extremity, furnifhed at the bafe with a pair of awl-fhaped teeth. *Stam.* Filament one, oppofite to the lip, fhort and ftout, quite fimple; anther terminal, erect, thick, fimple, without any appendage, convex at the back, emarginate, divided in front into two parallel, clofe, oblong lobes, burfting longitudinally. *Pift.* Germen inferior, elliptic-oblong, with three furrows; ftyle thread-fhaped, erect, fmooth, the length of the ftamen, embraced by the lobes of the anther; ftigma peltate, umbilicated, hairy. *Peric.* Capfule flefhy, oval, abrupt, umbilicated, with three furrows, three valves, and three cells. *Seeds* numerous, tunicated, ovate, angular, abrupt, inferted into a pulpy receptacle.

Eff. Ch. Anther two-lobed, terminal, embracing the ftyle, without any appendage. Inner limb of the corolla a fimple lip. Capfule flefhy.

Dr. Roxburgh, who had opportunities of ftudying the various fpecies of this, and many other Scitamineous genera, in their native fituations, fpeaks of *Alpinia* as a good natural genus, having, befides the proper characters in the fructification, certain peculiarly ftriking ones in the habit. The *roots* are perennial, tuberous, ftrong, thick, crooked, running nearly horizontally, a little below the furface of the ground, and

and ftrongly marked with annular fcars where former leaves have been; thefe fend down copious, long, thick, fibrous radicles. *Stems* either biennial or perennial, numerous, tufted, ftraight, erect, or more or lefs recurved at the fummit, denfely leafy, each terminating in a copious *clufter*, or *panicle*, of large gaudy *flowers*, "except *Cardamomum*," fays Dr. Roxburgh; but that plant, which has a radical panicle, is now excluded from *Alpinia*, and called by Dr. Maton *Elettaria* in Tr. of Linn. Soc. v. 10. 249, having fufficient marks of generic diftinction in the *ftamen*. We fhall endeavour to collect under one view the numerous fpecies of this fine genus, of which we can find any account, or have feen any figures or fpecimens.

1. A. *racemofa*. Simple-cluftered Alpinia. Linn. Sp. Pl. 2. Willd. n. 1. Ait. n. 1. Rofc. Tr. of Linn. Soc. v. 8. 345. Swartz Obf. 5. (Alpina racemofa alba, cannacori foliis; Plum. Ic. 11. t. 20. Zingiber fylveftre minus, fructu e caulium fummitate exeunte; Sloane Jam. v. 1. 165. t. 105. f. 1.)—Clufter fimple, erect. Outer bracteas lanceolate, longer than the flowers. Calyx bell-fhaped, with three blunt equal fegments. Germen fmooth. —Native of rather mountainous fhady woods in the Weft Indies. Notwithftanding Dr. Swartz's doubts, we have no fcruple refpecting Plumier's fynonym. *Root* branching, flefhy, with the flavour of Ginger; ufed in Jamaica as a poultice for cancers and other fores, according to Sloane, with good fuccefs. *Stem* herbaceous, two or three feet high, round, fmooth, flender, fimple, leafy. *Leaves* alternate, elliptic-lanceolate, entire, fmooth, pointed, a foot long, with narrow fheathing *footftalks* exceeding them in length. *Clufter* terminal, folitary, ftalked, unbranched, fmooth, many-flowered. *Outer bracteas* lanceolate, blood-red; the loweft an inch and a half long, the reft about an inch; *inner* bell-fhaped, containing one or two flowers, fhorter than the calyx, permanent. *Calyx* red, with broad and fhallow teeth. *Corolla* white; tube flender, longer than the calyx; outer limb with three nearly equal, ovate, erect fegments; inner fomewhat heart-fhaped, three-lobed, the middle lobe notched. *Germen* bluntly triangular, quite fmooth, as well as the *capfule*. *Seeds* fhining.

2. A. *Galanga*. Galangale Alpinia. Rofc. Tr. of Linn. Soc. v. 8. 345. Roxb. n. 1. Willd. n. 2. (Maranta Galanga; Linn. Sp. Pl. 3. Swartz Obf. 8. Amomum Galanga; Loureir. Cochinch. 5? Galanga major; Rumph. Amboin. v. 5. 143. t. 63. Dale Pharmac. 276. Ger. Em. 33.)—Clufter compound, erect. Bracteas all lanceolate, fhorter than the flowers. Calyx bell-fhaped, with three rather pointed equal fegments. . Germen flightly downy.—Native of various parts of the Malay Archipelago, communicated by the late Dr. Roxburgh, from the Calcutta garden, where this plant flowered during the hot feafon, and ripened feed, though very rarely, in November. The *root* proved to be the real *Galanga major* of the fhops. The *ftem* is faid to be feven or eight feet high. *Leaves* eighteen or twenty-four inches long, foft to the touch, though fcarcely confpicuoufly downy. *Clufter* large, with very numerous, crowded, fhort, racemofe branches, all downy. *Bracteas* uniform, lanceolate, downy; thofe at the bafe of each principal branch very fmall. *Flowers* white. *Calyx* befprinkled with minute refinous dots. *Corolla* elongated; lip externally downy, cloven at the extremity. "*Capfule* fmall, obovate, fmooth, deep orange-red, not opening fpontaneoufly. *Seeds* only two in each cell, even in the germen, bitter and naufeous, each three-fourths covered with a white tunic." *Roxburgh*. See GALANGAL.

3. A. *occidentalis*. Scaly-cluftered Alpinia. Swartz Ind. Occ. 9. Rofc. Tr. of Linn. Soc. v. 8. 345. Willd. n. 4. Ait. n. 2. (Amomum minus, fcapo veftito, floribus fpicatis; Browne Jam. 113, excluding Sloane's fynonym. Paco-feroza minor multicaulis; Plum. MSS. cum icone.)—Clufter compound, erect, on a fcaly leaflefs ftem. Partial bracteas imbricated, fheathing, dilated, abrupt, hairy. Calyx turbinate, with three broad obtufe fegments. Germen flightly downy.—Native of moift parts of the mountainous woods of Jamaica, flowering all the year, but efpecially in fpring. *Root* knotty and flefhy. *Barren ftems* fix feet high, erect, herbaceous, fimple, leafy. *Leaves* elliptic-lanceolate, acute, very fmooth, attached by a fhort contraction to their fheathing *footftalks*, as in the other fpecies. *Flowering ftems* as tall as the others, round, fmooth, erect, not leafy, but clothed from top to bottom with fheathing, oblong, obtufe fcales, and terminating in a denfe, erect, cylindrical, compound, many-flowered *clufter*, with hairy ftalks. *Flowers* all turned upwards, crowded, their partial ftalks concealed by concave, fheathing, abrupt, partial *bracteas*, while each common ftalk, or branch of the clufter, has at its bafe a very different, lanceolate, acute *bractea*, half its own length. *Calyx* coloured, hairy at the bafe; its fegments fmooth, rounded and obtufe. *Corolla* pale yellow; tube the length of the calyx; lip veiny, cloven at the end. "*Capfule* rather fmall, coriaceous and flefhy, of three valves, red when ripe, pulpy within. *Seeds* yellow, two or three in each cell." *Swartz*. We are indebted to Mr. Lambert for a drawing of this plant, copied from Plumier's fketches at Oxford.

The habit of this fpecies may, at firft fight, feem to invalidate the character of a leafy *ftem*, with terminal *inflorefcence*, attributed to this genus in our introductory remarks. We think however that the difference between this and the others is more apparent than real. The fcales may be confidered as abortive *leaves*, not perfected on the flowering *ftems*, while thofe *ftems* which luxuriate in foliage, do not alfo bear *fructification*. Perhaps the *roots* are more prolific than in other fpecies.

4. A. *Allughas*. Ceylon Alpinia. Rofc. Tr. of Linn. Soc. v. 8. 346. Roxb. n. 2. Ait. n. 3. (Hellenia Allughas; Willd. Sp. Pl. v. 1. 4. Andr. Repof. t. 501. Heritiera Allughas; Retz. Obf. fafc. 6. 1. t. 1.)—Clufter panicled, erect. Calyx bell-fhaped, two-lobed. Germen hairy. Lip two-lobed.—Native of the Eaft Indies. Very common in Bengal, flowering throughout the rainy feafon, and ripening fruit in October and November. We received in 1786 a flower from Kœnig's fpecimen of this plant, fent to profeffor David Van Royen by the name of *Grana Paradifi Zeylanica*. It appears without doubt to be the *Alughas* of Hermann, mentioned, but not afcertained fyftematically, in Linn. Zeyl. 207. n. 449, and it is faid to be the *Mala-infchi-kua*, Rheede Hort. Mal. v. 11. t. 14. The illuftrious fir William Jones has defcribed it, by the Sanfcrit name of *Táraca*, in the Afiatic Refearches, v. 4. 240. The *ftem* is two feet high, fimple, leafy. *Leaves* lanceolate, pointed, fmooth, with long fheaths. *Clufter*, or rather *panicle*, varioufly fubdivided, lax, many-flowered, with denfely downy ftalks. *Bracteas* fmooth, for the moft part very fmall, but thofe under the principal fubdivifions of the inflorefcence are fometimes elongated and lanceolate, and one or two of the lowermoft occafionally become very large and leafy. *Calyx* downy, efpecially at the bafe, remarkable for having only two marginal acute fegments. Segments of the outer limb of the *corolla* oblong, equal, coloured green by Mr. Andrews, crimfon, like the *lip*, in Retzius's plate, but the latter is probably accidental, the author having had no living fpecimen. The *lip* is longer than thofe fegments, and, like them, externally hairy; its two lobes appear to be fometimes cloven. *Stamen* long, with a large *anther*, reddifh as well as the *ftyle*. *Fruit* globofe,

purplifh-purplish-black, with numerous tunicated *feeds*. This fpecies was raifed from feed by A. B. Lambert, efq. at Boyton, in Wiltfhire, where it flowered very finely; but it is faid to have been previoufly fent by Mr. Peter Good to Kew, in 1796.

5. A. *alba*. White Alpinia. Rofc. Tr. of Linn. Soc. v. 8. 346. (Hellenia alba; Willd. Sp. Pl. v. 1. 5. Heritiera alba; Retz. Obf. fafc. 6. 18. Languas vulgare; Kœn. in Retz. Obf. fafc. 3. 64.) — Clufter panicled. Calyx bell-fhaped, three-lobed. Lip two-lobed. Leaves callous and fringed at the margin.—Native of China; cultivated in the Eaft Indies. Kœnig terms this plant *Galanga alba*, and fpeaks of it as in much ufe among the Malays. The *roots* are white, thicker than the thumb. *Stems* taller than a man, tuberous at the bottom, a little drooping at the top. *Leaves* about eighteen inches long, and hardly three broad, two-ranked, fmooth on both fides; their edges callous, whitifh, and rather rough with hairs. Five or fix of the lower *fheaths* are unaccompanied by leaves. *Clufter* oblong, with fmooth ftalks, except the partial ones, which are rather hairy. *Bracteas* lanceolate, acute, rufty-coloured, deciduous. *Calyx* with fnow-white fegments. Outer limb of the *corolla* greenifh-white; lip inverfely heart-fhaped, deeply two-lobed, jagged and crifped at the margin, white, with fine rofe-coloured veins. *Capfule* fcarlet, membranous, rather rigid, ftriated. Kœnig's full and correct defcription of the flower, leaves no doubt as to the genus of this plant, though we have feen no fpecimens.

6. A. *chinenfis*. Chinefe Alpinia. Rofc. Tr. of Linn. Soc. v. 8. 346. (Hellenia chinenfis; Willd. Sp. Pl. v. 1. 5. Heritiera chinenfis; Retz. Obf. fafc. 6. 18. Languas chinenfis; Kœn. in Retz. Obf. fafc. 3. 65.)—Clufter panicled. Calyx bell-fhaped, three-toothed, obtufe. Lip emarginate, finely-toothed. Leaves recurved at the point; membranous, and fringed with fcattered hairs, at the margin.—Native of China? where at leaft it is cultivated, for medical ufe, in gardens. *Root* aromatic, with an acrid burning flavour, white, as thick as the middle finger. *Stems* two or three feet high, a little drooping at the fummit. *Leaves* a fpan long, and two inches or two inches and a half broad, with a white rib and margin. *Clufter* narrow, three or four inches long, its ftalks more or lefs clothed with clofe-preffed hairs. *Calyx* green. *Corolla* yellowifh; the *lip* marked with a broad orange-coloured longitudinal ftripe, and tranfverfe waves of the fame colour, accompanied by four blood-red veins. Fruit a *capfule*. *Kœnig*.

7. A. *aquatica*. Water Alpinia. Rofc. Tr. of Linn. Soc. v. 8. 346. (Hellenia aquatica; Willd. Sp. Pl. v. 1. 5. Heritiera aquatica; Retz. Obf. fafc. 6. 18. Languas aquaticum, l. fylveftre; Kœn. in Retz. Obf. fafc. 3. 67.)—Panicle fomewhat drooping at the top, with forked branches. Calyx bell-fhaped, three-toothed. Lip four-toothed, erect; its lateral teeth with an oblong gland at the bafe, on each fide. — Found in marfhy places, among bufhes, by the fides of rivulets in the Eaft Indies, but not very common. *Roots* numerous, thread-fhaped, white, fending forth runners. *Stem* about four feet in height, leafy, as thick as the finger. *Leaves* oblong, acute, coriaceous, of a beautiful green; rather roughly ftriated on the upper fide; fmooth at the back; the margin befet with minute callous teeth. *Panicle* flender, with two deciduous *bracteas* at the bafe; *flower-ftalks* forked, two-flowered, divaricated, round, fmooth, white, fhorter than the flowers. *Bracteas* two or three, attached to the lower flower-ftalks, linear-lanceolate, concave, membranous, whitifh, deciduous. *Calyx* fmooth, pure white, fometimes fplit at the inner fide. *Corolla* white. *Lip* fmall, brown on the inner fide, rofe-coloured near its union with the filament. *Anther* reddifh, crowned with a fmall, coloured, erect, femi-orbicular membrane. *Berry* oval, fmooth, black. *Seeds* five or more, triangular. *Kœnig*. The membrane crowning the *anther* forms a fmall exception to the generic character, but can hardly invalidate it, or require the eftablifhment of a feparate genus; unlefs the fructification, when examined according to our prefent advanced knowledge, fhould afford other diftinctive marks.

8. A. *malaccenfis*. Malacca Alpinia. Rofc. Tr. of Linn. Soc. v. 8. 345. Roxb. n. 3. (Maranta? malaccenfis; Willd. Sp. Pl. v. 1. 14. Burm. Ind. 2. Galanga malaccenfis; Rumph. Amboin. v. 5. 176. t. 71. f. 1.)—Clufter fimple, erect. Leaves villous beneath. Lip broader than long, toothed, concave, obfcurely three-lobed; lateral lobes incurved. — Native of Chittagong, from whence it was brought to the botanic garden at Calcutta, and flowers there in April and May. "This," fays Dr. Roxburgh, "is the moft ftately and moft beautiful of our Scitamineous plants. The *flowers* are particularly large; the *bracteas*, and exterior limb of the *corolla*, pure, fmooth, lucid white; the large lip variegated with crimfon and yellow." *Stem* from twelve to fifteen feet high, villous. *Leaves* eighteen or twenty inches long, the breadth of five or fix fingers, filky or downy beneath. *Flowers* about twelve, alternate. *Rumphius*, *Burmann*. This has not yet found its way to England, where it would doubtlefs be a great acquifition, as, by the above defcription, it feems to excel the magnificence and beauty of the following.

9. A. *nutans*. Drooping Alpinia. Rofc. Tr. of Linn. Soc. v. 8. 346. Sm. Exot. Bot. v. 2. 93. t. 106. Roxb. n. 4. Ait. n. 4. (Globba nutans; Linn. Mant. 2. 170. Willd. Sp. Pl. v. 1. 153. Redout. Liliac. t. 60. G. fylveftris; Rumph. Amboin. v. 6. 140. t. 62, 63. Renealmia nutans; Andr. Repof. t. 360. Edwards t. 1. Thornt. Illuftr. t. 13. Zerumbet fpeciofum; Wendl. Sert. Hannov. t. 19. Jacq. Fragm. Bot. t. 68.)—Clufter fomewhat compound, drooping. Leaves fmooth on both fides. Lip inflated, crifped. Calyx irregularly toothed, tumid, burfting at one fide.—Native of the interior parts of Bengal. *Roxburgh*. Alfo of Amboyna, and other places. It was introduced into the Englifh ftoves, in 1792, by fir Jofeph Banks, and flowering a few years after, excited the admiration of all beholders. The number of figures of this plant which have been publifhed, prove it a general favourite. The tuberous odorous *root* is fometimes, as Dr. Roxburgh afferts, brought to England for *Galanga major*; fee n. 2. *Stem* from five to eight feet high in India, but with us twelve to eighteen, perennial, erect, as thick as the finger, leafy. *Leaves* a foot long or more, with long fheaths, each fheath crowned with a *ftipula* which is externally filky. The *flower-buds* before they expand are of a fhining white, tinged with rofe-colour, and are enveloped in large, concave, toothed *bracteas* of the fame porcelain-like fplendid whitenefs, all together compofing a denfe pendulous *clufter*, like a bunch of oblong grapes. When the *flowers* open, they difplay the magnificent concave *lip* yellow at the margin, internally variegated and ftreaked with every fhade of crimfon. The *ftamen* and its *anther* are fhort and thick. *Germen* hairy. *Capfule* fpherical, opening at the fides. *Seeds* aromatic, as is likewife the young germen. Linnæus has greatly confounded the hiftory of this plant, with which he had no acquaintance but from the work of Rumphius. Yet he fubfequently cited the fame fynonym and figures under his *Renealmia exaltata*, which is indeed an *Alpinia*, as we fhall prefently fhew, but a widely different fpecies. The

The real genus GLOBBA is totally diſtinct from both; ſee that article.

10. A. *mutica.* Pointleſs Narrow-leaved Alpinia. Roxb. n. 5.—Cluſter erect, compound. Leaves ſhortly ſtalked, linear-lanceolate, poliſhed. Lip three-lobed; without a ſpur at the baſe. Capſule pulpy. Seeds numerous, angular, with an evaneſcent tunic.—Found by Mr. W. Roxburg, the ſon of our ever-lamented Eaſt Indian botaniſt, in the foreſts of Prince of Wales's iſland, from whence being brought to the Calcutta garden, it flowered, more or leſs, during the whole year, but chiefly in the hot ſeaſon, March, April, and May. This is alſo an elegant ſpecies, and holds a middle rank between *nutans* and *calcarata. Roxburgh.*

11. A. *calcarata.* Spurred Narrow-leaved Alpinia. Roſc. Tr. of Linn. Soc. v. 8. 347. Roxb. n. 6. Ait. n. 5. (Renealmia calcarata; Andr. Repoſ. t. 421. Globba erecta; Redout. Liliac. t. 174.)—Cluſter erect, ſomewhat compound. Leaves linear-lanceolate, poliſhed. Lip ovate-oblong, cloven at the point. Segments of the outer limb linear-oblong.—Native of China, from whence it was introduced into the Calcutta garden in 1799, according to Dr. Roxburgh, who communicated the plant to Mr. Lambert. The numerous ſtems are from three to five feet high. *Leaves* narrow, acute, ſmooth. *Cluſter* three or four inches long, downy, rather denſe, the ſtalks, though partly compound, ſome of them bearing two or three flowers, being ſo ſhort that the whole cluſter reſembles a ſpike. *Leaves* twelve or fifteen inches long and one broad, pointed. *Bracteas* elliptical, concave, hardly equal to the *calyx*, which is tubular, white, ſplit half way down at one ſide, and on the other very ſlightly and bluntly notched. Outer limb of the *corolla* pure white, the length of the tube, in three deep, equal, obtuſe, flat, rather narrow ſegments. *Lip* nearly twice as long, concave, but not ſo tumid or inflated as in *A. nutans*; its upper ſide crimſon, beautifully ſtreaked; the extremity flattiſh, ſlightly cloven, more or leſs notched or curled. The baſe of the *lip* being furniſhed, as in *A. nutans* and ſome other ſpecies, with two ſmall ſpurs, or awl-ſhaped appendages on the upper ſide, which are wanting in the laſt, ſeems to have occaſioned the ſpecific name, which is rather calculated to miſlead. Dr. Roxburgh had once an intention of changing it to *ſpicata*, which would not have been more correct, and the above being printed by Andrews, it was ſuffered to remain. *A. anguſtifolia* would have been preferable to either.

12. A. *maculata.* Spotted-leaved Alpinia. Roſc. Tr. of Linn. Soc. v. 8. 347.—"Leaves ovate, ſpotted."—Cultivated in the botanic garden at Liverpool. It is thus mentioned by Mr. Roſcoe, but with a mark of doubt, nor have we met with any further information reſpecting this ſpecies.

13. A. *ſpicata.* Small Spiked Alpinia. Roxb. n. 8.—"Spike oblong, compactly imbricated, with narrow-lanceolate acute bracteas."—Native of Sumatra. Brought by Mr. William Roxburgh, from Bencoolen to the Calcutta garden, in 1803. At the cloſe of the rains of 1808, it bloſſomed for the firſt time, and was then only about two feet high, being the ſmalleſt of the genus ever ſeen by Dr. Roxburgh. This is all the account he has left us of the preſent ſpecies.

14. A. *Renealmia.* Surinam Alpinia. (Renealmia exaltata; Linn. Suppl. 79, excluding the ſynonym of Rumphius, and the account of the ſtem and leaves taken from that author. Willd. Sp. Pl. v. 1. 6. "Neue Bot. Ann. v. 3. 136." Myriſma n. 64; Linn. Pl. Surinam. in Amoen. Acad. v. 8. 251. n. 3, excluding the ſynonym of Merian, t. 54.)—Cluſter lateral, compound. Calyx tubular, irregularly toothed.—Native of Surinam. The hiſtory of this plant is ſo confuſed, that we think it neceſſary to lay before the reader all the original materials. The generic deſcription, Linn. Suppl. 7, and the ſpecific one, p. 79 of the ſame work, beginning at the word *Racemus*, appear to have been made, with ſufficient accuracy and fidelity, from ſpecimens of a cluſter of the *flowers*, and a quantity of the *fruit*, with a *leaf*, ſent in bottles of ſpirits to Linnæus. The former was taken out and dried by Linnæus himſelf, for his herbarium, where it now lies, marked by him *Heliconia*, he having taken this ſpecimen for Merian's t. 54, *Heliconia Bihai*, which it ſomewhat reſembles in general aſpect. The *flowers*, however, when examined, prove theſe plants totally different; but this miſtake of Linnæus accounts for his erroneous reference to Merian. The ſpirits in the bottle of the *fruit* being gone, the latter is alſo dried; but enough remains to ſhew it has been a fleſhy, very fibrous, oval, *capſule*, above an inch long, of three valves, ſtrongly umbilicated, and containing numerous, roundiſh-obovate *ſeeds*, now of a ſhining brown. Their flavour is loſt. A Dutch manuſcript, ſent from Surinam with the collection to which the above belonged, contains the following information. "No. 64 is a ſort of reed, and has upon each ſtalk four ſuch leaves as are here to be ſeen; two uppermoſt next to each other, and then the other two a ſpan under the uppermoſt, and a ſpan between theſe two, downwards to the fruit. The fruit is at firſt red; black when ripe. The ſeed in the fruit taſtes exactly like Cardamom. The ſtalk to which the fruit grows is two feet and a half long, beſet with twenty-five to twenty-ſeven fruits." Such is as literal a tranſlation as we could obtain. It ſeems indubitably to aſcertain the ſituation of the *inflореſcence* to be lateral, and in this point agrees with the following account given by Willdenow, we know not on whoſe authority. "A *tree* twenty feet high. *Leaves* five or ſix feet long, lanceolate, waved at the margin. The *cluſter* originates from the *trunk*, above the root." *Neue Bot. Ann.* as above. If this laſt deſcription really belongs to the Linnæan *Renealmia*, our ideas of the plant are very incomplete. The lateral *inflореſcence* would form a ſtrong preſumptive argument againſt its being an *Alpinia*; but we can aſſert, from a careful examination of one of the *flowers*, immerſed in hot water, and compared with a living flower of *A. nutans*, that their ſtructure agrees exactly, without the leaſt mark of a generic difference, eſpecially the eſſential part of the *anther*. This indeed appears from Linnæus's remarks in the *Supplementum*, without which our hiſtory would be incomplete. We ſhall leave the reader to compare it with the deſcriptions of other ſpecies, only obſerving beforehand that Linnæus conſiders the flower as reverſed, placing the *nectary* uppermoſt.

Suppl. p. 7. RENEALMIA. Eſſ. Ch. *Corolla* three-cleft. *Nectary* oblong. *Calyx* of one leaf. *Anther* ſeſſile, oppoſite to the nectary. *Berry* fleſhy.

Nat. Ch. *Cal.* Perianth ſuperior, tubular, of one leaf, burſting at the top into two or three irregular teeth. *Cor.* of one petal. Tube ſtraight, cylindrical. Limb three-cleft: two upper (properly *under*) ſegments oblong, rounded, equal: lower ſegment ſcarcely longer, channelled, oblong. Nectary united with the tube, aſcending under the upper ſegments, ſtraight, the length of the corolla, oblong, with a tooth at the baſe on each ſide, and a hollow behind; dilated, and bluntly three-lobed, at the extremity. *Stam.* Filament none. Anther ſolitary, inſerted into the mouth of the tube, in the boſom of the lower (*upper*) ſegment of the corolla, oppoſite to the nectary, unconnected, ſtraight, linear,

linear, emarginate, marked with a furrow on the inner fide, its length and breadth equal to the fegment of the corolla. *Pift.* Germen inferior, oblong, obfcurely triangular, fmooth. Style thread-fhaped, very fmooth, erect; the length of the corolla. Stigma peltate, a little flat head, abrupt on the fide towards the nectary, an orifice running into the ftyle. *Peric.* Berry oblong, round, with three furrows, fmooth, flefhy, with an umbilicated termination; three-celled in the centre; the cells foft and membranous. *Seeds* numerous, oblong, abrupt, quadrangular, very fmooth.

P. 79. R. *exaltata.* *Clufter* with alternate, lanceolate, channelled, fmooth, ribbed, deciduous *bracteas.* *Flower-ftalks* in the bofoms of the bracteas, folitary, incurved, depreffed, downy, fhort, each terminating in a *fheath* of one leaf, which burfts at the top, like the calyx, into two or three fegments, to allow the flowers to protrude. Within this fheath is a *flower*, as well as *another two-flowered fheath*, fo that each ftalk bears three flowers. The *calyx* is exactly fimilar to thefe fheaths, infomuch that it would be a fheath, if not feated on the top of the germen. Scarcely any other of the *Scitamineæ* has an anther fo unconnected, and with fo much of the common appearance of that organ. The *fruit* forms a compound pendulous clufter, refembling the fruit of *Momordica Elaterium* in fize and figure; its cortical part thick and flefhy, hot, reddifh; the triangular central cell has foft, juicy, membranous partitions. *Seeds* fmall, very fmooth, black, very like thofe of *Amomum Cardamomum.* The preferved fruit is efteemed by the inhabitants of Surinam.

The following three fpecies are lately added to *Alpinia* by Mr. Rofcoe, from the infpection of fome Chinefe drawings, in the poffeffion of the right honourable lord Stanley, V.P.L.S.

15. A. *pennicellata.* Pencilled Alpinia. Rofc. Tr. of Linn. Soc. v. 11. 280.—Clufter terminal, pendulous. Segments of the outer limb fhort, pointed. Lip emarginate. Leaves lanceolate, fimple at the margin.—Native of China. The *lip* or *nectary* is broad, fimple, emarginate, bright yellow regularly ftreaked with crimfon. *Leaves* regularly nerved. The unfolded *bloffoms* have, like fome other fpecies, the appearance of fine China ware.

16. A. *diffiffa.* Cloven Alpinia. Rofc. ibid.—Clufter inclining. Segments of the outer limb ovate. Lip flat, panduriform. Leaves lanceolate, glaucous beneath. Stamen deeply cloven to the bafe.—Native of China. The margin of the *leaves* is ftrongly nerved. *Lip* broad, bright yellow, with a central rib, from which diverge crimfon ftreaks. The *filament* is deeply cloven, each portion bearing its proper *anther*, (or rather we fhould fay, one lobe of the *anther*,) between which rifes the *ftyle*, perfectly free, and not inclofed in a double anther, as in the reft of the proper *Scitamineæ*. This circumftance is fo peculiar, that Mr. Rofcoe thinks it may poffibly entitle the plant to rank as a new genus; but being in other refpects truly an *Alpinia*, he prefers retaining it here.

17. A. *bracteata.* Bracteated Alpinia. Rofc. ibid. 281.—Panicle loofe. Leaves downy. Lip in three, nearly equal, lobes; fpurred at the bafe.—From the fame country. The *ftem* is jointed, rather fpiral. *Footftalks* of the upper *leaves* uniting with the *bracteas.* *Calyx* concave, ovate. *Nectary* broad, flat, nearly circular, deeply indented at each fide, yellow, with purple rays diverging from its bafe. *Anther* ovate. " Habit rather of a *Coftus* than an *Alpinia*, but the inflorefcence is a loofe *panicle*, not a bracteated *fpike*, and the whole conftruction of the *corolla* feems decifive of the genus." *Rofcoe.*

A. *Cardamomum*, Roxb. n. 7, the valuable Cardamom of the fhops; *Amomum repens* of Sonnerat and other authors, Willd. Sp. Pl. v. 1. 9; is now properly, we believe, removed from *Alpinia*, and propofed by Dr. Maton, Tr. of Linn. Soc. v. 10. 249, as a new genus, diftinguifhed by two tranfverfe proceffes at the top of the filament, and called by him ELETTARIA, under which name we propofe hereafter to treat of this plant.

ALQUIER. Add—The fanega, which is the 15th part of the moyo, is = 4 alquiers = 8 moyos = 16 quarters = 32 outavas = 64 mequias. The alquier meafures 675 French, or 817 Englifh cubic inches; fo that 21 alquiers are nearly = 1 Englifh quarter; or, more correctly, 50 alquiers = 19 Englifh bufhels.

ALSOPHILA, in *Botany*, fo named, we prefume, from ἄλσος, *a grove*, or *foreft*, and φιλέω, *to love*; alluding to the favourite ftation of the beautiful tribe of Tree Ferns, to which this belongs.—Brown Prodr. Nov. Holl. v. 1. 158.—This genus is founded on our *Cyathea afpera*, *C. extenfa* of Swartz, *Polypodium lunulatum* of Forfter, and fome other allied fpecies; but we fcarcely think the deeper fegments of the burfting *involucrum*, or the fituation of the *fori* at the divifion, inftead of the fide, of a vein, can authorize a feparation of thefe from CYATHEA. See that article.

ALSTEAD, in *Geography*, a town of America, in New Hampfhire, and county of Chefhire, having 1694 inhabitants.

ALSTONIA, in *Botany*, received that name from Mr. Brown, in memory of Dr. CHARLES ALSTON, formerly Profeffor of Botany at Edinburgh. (See that article.) The genus originally dedicated to this gentleman, in the Supplement of Linnæus, is now funk in SYMPLOCOS. (See that article, and ALSTONIA.)—Brown Tr. of the Werner. Soc. v. 1. 75.—Clafs and order, *Pentandria Monogynia.* Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Juff. Brown.
