 The quality is very fine, free from blight, and the prices very low. Seed Growing Establishment, Wisbech.

**NEW TREES.—**  
**PRUNUS PISSARDII.**—Originated in Persia. This Prunus is remarkable, not for its fruit, which is of second quality, but for its magnificent rich purple leaves, keeping so until end of November. This fine novelty has been rewarded at the last exhibitions of Paris, Moulins, Rouen, Orleans with a 1st Prize. Also rewarded with a First-class at the Horticultural Society of Paris and of France. The Prunus Pissardii, when planted by itself, in groups, or mixed with Acer, Negundo foliis variegatus, or Amygdalus foliis variegatus, produces one of those decorative effects unknown until now. Price each plant, 20 fr. When six plants are ordered one over with one sent gratis. Plants only budded last July, each 12 fr.; one plant over when six are ordered.  
**MAGNOLIA YULAN FLORE-PLENE.**—One of the finest novelties ever introduced from Japan. Plants grow bushy, settle well with flowers. Flowers of a pure white, very double, composed of twenty or thirty petals, and of a fine sweet and agreeable odour. Price, young plants, 15 fr. grafted, 10 fr.; six plants, 20 fr.; plants 2 yr. grafted, each 15 fr.; six plants, 80 fr.; some few 3-yr. or original plants from Japan, from 20 fr. to 25 fr.  
**NEW VINES from Kashmir.**—Varieties very vigorous, hardy, and giving very good Vines.  
 Var. **KATHEBOURE** and **OPIMAN**, young plants 2-yr. old, in open ground, each 2 fr. 50 c.; the do. in pots, 25 fr. The same cultivated in small pots, each 3 fr. 50 c. per dozen, 35 fr.  
 Var. **VAMP KAMF** very rare, each 5 fr. per dozen, 50 fr.; the same in pots, each 7 fr.; six plants 2 fr. 50 c.  
**Special Offer.—PEACH TREES.** 1-yr. old, the best varieties in the trade, 80 fr. per 100, 750 fr. per 1000.

Nice plants in 6-inch pots at 2s. 6d. each; larger, 3s. 6d. to 10s. 6d. each. Specimens, fine bushy plants, with plenty of bloom-bud on them, 1, 1 1/2, 2 and 3 guineas each.  
**Royal Nurseries, Ascot, Berks.**

**SPARAGUS.**—The finest roots that money can procure, 2s. 6d. per 100. This delicious vegetable does not require half the time to cook as the ordinary ones for planting, see **SEED LIST**, free on application.  
**RICHARD SMITH AND CO.,** Nurserymen and Seed Merchants, Worcester.

**THE EARLIEST WRINKLED PEA.**

**AMERICAN WONDER.**

This valuable new early dwarf Wrinkled Pea was introduced by us last season. It is as early as our Ringleader, which is still the foremost Round White Pea. The haulm is thickly covered with fine pods, each containing from seven to ten Peas of delicious flavour. Height, 10 to 12 inches.

From Mr. T. TURTON, Gr. to John Hargreaves, Esq.  
 "American Wonder" Pea proved most satisfactory; was sown the last week in February, and was fit for use the first week in June—quite as early as "Ringleader," sown the first week in January, and it is superior in quality; especially valuable for growing on borders where the trees are a consideration."

From Mr. T. LOCKIE, Gr. to the Right Hon. Lord O. Russell.  
 "American Wonder" is exceedingly well for forcing; 10 to 12 inches high; producing a good crop of fine large Peas, of excellent flavour. Sown in a cold frame, March 10, was ready for use May 10. For forcing it is far superior to "Little Gem" or "Tom Thumb."

Price, 5s. per Quart; 2s. 6d. per Pint.

THE QUEEN'S SEEDSMEN, { **Hutton & Sons** } READING, BERKS.

OBSERVE OUR TRADE MARK ON EVERY PACKAGE. **SUTTON & SONS HAVE NO AGENTS.**

**B. LARK AND RED CURRANTS.**—Strong 2-yr. transplanted, 8s. 6d. per 1000. J. GARWAY AND CO., Durham Down Nurseries, Clifton, Bristol.

A pot-root of each of these splendid kinds, post-free, 4s. 6d. We have the most complete collection of doubles, and always grow not less than 10,000 pot-roots, and can therefore offer best in cultivation. H. CANNELL AND SONS, The Home for Flowers, Swanley, Kent.

**Mangel Wurzel Seed.** CHARLES SHARPE AND CO., will be glad to make special offers of MANGEL SEED (of their own growth) on application. SLEAFORD.

**EDWARDS' VICTORIA KIDNEY.**—All the good qualities of the old varieties are centred in this magnificent Potato, for which a First-class Certificate was given by the Royal Horticultural Society in November last, after having been grown at Clifton and tested by the Committee. It is a seedling from Victoria Road, but hardier, a great cropper, ripening early in September, and will keep in excellent condition until July. The tubers are full-sized, but not at all coarse, and when cooked white as snow, and perfectly mealy. It was raised by Mr. Edwards, of Acton Burnell Gardens, Shropshire, who has for forty years cultivated all the best kinds, both home and imported.

OLDROD AND CO., Nurserymen and Seedsmen, Shrewsbury, have the sole disposition of the tubers, which they offer at 1s. 6d. per lb., 7 lb. for 8s. 6d.; 14 lb. for 14s.

**LILIAM AURATUM.**—Splendid direct L Imported and Home-grown Bulbs, 4oz., 5oz., 6oz., 75s., and 10oz. per 100.—SANDER AND CO., St. Alban's.

WRIGHT, Seedsmen, Market Square, Retford, Notts.

**Hyacinth candelans (Galtonia candelans).** LARGEST CULTIVATED STOCK in the WORLD. 1000 flower Bulbs ready for immediate Supply. E. H. KRELAG and SON, NURSERYMEN, MAN, SREDSMEN and FLORISTS, Haarlem, Holland, beg to offer this splendid Plant, the good qualities of which may be considered generally more valuable at present. It is a first-rate Plant for Bedding-out, to be placed in beds alone or allied with Gladioli breinchenyis or other plants with striking colours. The pure white flowers are very useful in Bouquets, &c. supply this Plant in three qualities, according to the size of the Bulbs, viz.:—First Size, 12 to 15, 50; per 100, 25s.; per 1000, 250s. Second " " 10 to 12, 50; per 100, 15s.; per 1000, 150s. Third " " 8 to 10, 50; per 100, 10s.; per 1000, 100s. The Bulbs of all three sizes are sufficiently large to give flowers next summer. Trade prices on application.

**GRAPE VINES.**—All the leading sorts, well ripened Cans in fruiting and planting sizes. Quantities of STRAWBERRIES also, in pots, to offer. Price, &c., on application. FRASER R. KINGHORN, Sheen Nurseries, Richmond, Surrey. Larch—Larch.

**JAS. BACKHOUSE AND SON** can supply extra fine LARCH—strong, clean, straight, and well-rooted—as under:—2 to 3 feet, 25s. per 1000. 3 to 4 feet, 25s. per 1000. 4 to 5 feet, 25s. per 1000. For quantities of 20,000, or more, special prices will be given. The Nurseries, York.—January, 1882.

**HYBRID GREEN HOLLY,** "Pyramids" of 12 to 15 feet, 6s. each; 60s. per dozen. 12 to 15 feet, 7s. 6d. per dozen. The above are vastly superior to the ordinary Green Holly, and will remove with safety. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

**To the Trade.** MANGEL WURZEL and TURNIP SEED. H. and F. SHARPE are prepared to make special offers of MANGEL WURZEL and TURNIP SEED, grown last season from carefully selected turnip and rape seed, of the quality of excellent, having been raised in fine order, and the prices will be fixed exceptionally low. Seed Growing Establishment, Wisbech.

**To Nurserymen.** LARCH, 2½ to 3 feet, 20s. per 1000; 1½ to 2 feet, 17s. 6d. per 1000; Seedling (native seed), 1s. 4d. per 1000.

SCOTCH, 2-yr. seedling, 1s. 6d. per 1000. SPRUCE, 2 feet, 10s. per 1000; 3 feet, 15s. per 1000. ASPEN, 2½ feet, 15s. per 1000. YEWs, Irish, single stems, 3 to 4 feet, 40s. per 100. CUPRESSUS LAWSONIANA, 18 inches to a foot, 10s. per 100, nice stuff. ROSES, Dwarf (all best sorts), 35s. per 100. LIMES, 5 to 6 feet, 6s. each. Also large POPLAR, ACERS, SYCAMORES, HORSE CHESTNUTS, LABURNUMS, &c. Prices on application. Above are clean, well-grown and well-rooted. Also GENERAL NURSERY STOCK, too numerous to detail. Prices and kinds on application. F. DALY AND SON, Nurserymen, Coleraine, Ireland.

**TO THE TRADE.** PLUMS, dwarf-trained, Victoria, very fine, 18s. per doz. ROSES, H.P.'s of the leading kinds, (on Manetti), strong, 6s. per dozen, 40s. per 100. ASPEN, Maidens, strong, of the leading kinds, 30s. per 100. GOLDEN QUEEN HOLLIES, well rooted, 15 to 18 inches, 6s. per 100. QUICK, transplanted, stout, 10s. to 25s. per 1000. LARCH, 10s. to 25s. per 1000. SPANISH CHESTNUTS, transplanted, 25s. per 1000. Also WALTER C. SLOOOCK, Goldsworth "Old" Nursery, Woking.

**POTATOS.**—Magnum Bonum, Sutton's variety, guaranteed true, all Seed size, 6s. per cwt., 80s. per ton. Apply to WALTER C. SLOOOCK, Goldsworth "Old" Nursery, Woking.

Cattleya Mendellii, &c.; Japanese Maples. **THE NEW PLANT and BULB COMPANY** beg to announce the arrival of the finest Consignments of the above they have ever received. A sight of the extraordinary masses of ODONTOGLOSSUM, PHALANOPSIS, TRIUMPHANS (large bulb), PHALANOPSIS, and the plump-bulbed pieces of the true CATTLEYA MENDELLII, will well repay a visit to Colchester. The extremely fine Collection of JAPANESE MAPLES contains many varieties, which are New or Rare, but all the most beautiful. A SPECIAL LIST will be ready in a few days. Lion Walk, Colchester.

CLERK and SHOPMAN.—Well acquainted with Book-keeping and the Retail Seed Trade. Good Penman. Satisfactory references as to character supplied.—H. 9, Hertingfordbury Road, Hertford.

EPPS'S COCOA. GRATEFUL AND COMFORTING. "By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicious, nourishing, and strengthening beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that many a constitution may be gradually built up until strong enough to resist every temptation to disease. Hundreds of subtle poisons are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by a careful application of this pure food and a properly-nourished frame.—Civil Service Gazette. Made simply with boiling water or milk. Sold only in packets, labeled JAMES EPPS AND CO., HOMOEPATHIC CHEMISTS, London. Makers of Epps's Chocolate Essence for Afternoon use.

HOLLOWAY'S PILLS.—Weary of Life.—Derangement of the liver is one of the most efficient causes of dangerous diseases, and the most prolific source of those melancholy forebodings which are worse than death itself. A few doses of these noted Pills act magnificently in dispelling low spirits, and repelling the covert attacks made on the nerves by excessive heat, impure atmospheres, over-indulgence, or exhausting excitement. The instant the system is relieved, the liver derive benefit from Holloway's Pills, which will regulate disordered action, brace the nerves, increase the energy of the intellectual faculties, and revive the failing memory. By attentively studying the instructions for taking these Pills and explicitly putting them in practice, the most desponding will soon feel confident of a perfect recovery. Received this day:—"In spite of the many novelties and largely advertised 'new preparations' for the Chest and Lungs, I find DR. LOCKOCK'S PULMONIC WAFERS first rank as affording the speediest relief in Thrust and Chest Affections."—(Signed) W. H. TURNER, M.P.S., Tottenham, Bristol, &c. The instant the system is relieved and rapidly cure Asthma, Consumption, Bronchitis, Coughs, Colds, Shortness of Breath, Pleurisy, Pains in the Chest, Rheumatism, and all these ailments. Sold at 1s. 1/6d. and 2s. 6d. per box, by all druggists.

We invite all to come and see and prove in our "Home for Flowers" that we have the best of everything we offer for sale. It is a question of flowers and seed saving and hybridizing was ever carried out in such practical and scientific principles as at Swanley—certainly no firm has

exhibited so much and so often at most of the large shows such remarkable productions, and carried off so many high honours for popular flowers; the fact is, we make all Florist Flowers and their Seeds our whole and sole pride and study, which the following will confirm.

# THE EDINBURGH KINGDOM SAHUS

And on March 4 see what the Horticultural Press says, of our Plants and Seeds.

Mr. TAYLOR, *Holbeck, Leeds, December 12, 1881.*  
"Last year I was induced by cheapness to go to another firm, with the result that not six out of twenty-five plants are true to name."

Mr. EDWARD SHIVEY, *Hallingbury, Bishop Stortford, Essex, July 2, 1881.*  
"Your catalogue is quite a favourite on my table—not to be moved. My daughters are delighted with it."

*Ans. Almondeley, June 22, 1881.*  
"Mrs. Wm. PARKER writes me that Mrs. Cannell her grateful thanks for the beautiful quantity of cuttings and plants which she received yesterday. They arrived quite safely. All her Pelargoniums are from Messrs. Cannell, and she has had them so much admired."

DAVID HOPPER, *Esq., Ganton, York, May 12, 1882.*  
"Plants received in first-class condition on Saturday. Thanks for the careful packing."

Mr. WILLIAM S. GOLDIE, *Gerran, Ayrshire, May 26, 1881.*  
"Your seeds have done the best in the district. They are really super."

Mr. W. GREENWAY, *Paradise Square, Oxford, March 4, 1881.*  
"I now take the opportunity of thanking you for the Floral Guide for 1881. It is, without doubt, the most interesting, comprehensive, and descriptive trade list extant. The copy I possess has been so long that I hope its journeys will turn out to the advantage of the proprietors of the 'Home for Flowers.'"

G. W. HUNT, *Wetherden, Stowmarket, June 21, 1881.*  
"The plants—*Chrysanthemum inodorum pinnatifidum*—most beautifully packed; in fact after being placed for one day in the frame, they appeared as fresh as when they left Swanley."

Mr. J. FRANK, *Widmore, Watonsuper-lare, Aug. 22, 1881.*  
"Dear Sir—Just send you my Pelargonium you sent me last April have far exceeded our expectations. They are the most beautiful I have ever seen."

Mr. HENRY WOOD, *Boxworth Park, Leicester, September 18, 1881.*  
"The cuttings and seeds have given me great satisfaction."

R. G. EOVY, *Esq., Bramley, September 22, 1881.*  
"The Geraniums have arrived safely, and I am very pleased with them. They have splendid trusses of bloom."

MESSE BURGHOUSES, *Mulbarton, May 9*  
"Mess BURGHOUSES received the plants in capital order, and much pleased with them."

Mr. C. J. SMITH, *The Gardens, Dingwall House, Wellesley Road, Croydon, January 9, 1882.*  
"Dear Sir—The Rubus Britanica Rose I had of you turned out splendid; it has been in flower now three months. I intend propagating it largely for next season. Every one likes it, and when more known it will certainly be largely grown. Your Primulas have also turned out well."

JAMES ALEXANDER, *Esq., Sandville, Strabane, Ireland, May 2, 1881.*  
"The Phloxes and Pelargoniums arrived in excellent condition, thanks to the extra care there is one feature in the catalogue in which I should like to mention, viz., the extra plants are not of inferior quality, but quite as good as those ordered."

PRESTON, *Esq., Embsay, Co. Wexford, May 9, 1881.*  
"I have to acknowledge the receipt of two dozen zonals, which came with your usual good care and in nice condition."

HENRY FIELD, *Esq., Lacey, Grimsby, June 24, 1881.*  
"I was much pleased with your zoos plants for conservatory, which even exceeded my hopes, although I know your liberality on experience."

Mr. E. EADA, *Edenhall, Perthshire, June 25, 1881.*  
"Many thanks for the Calceolaria seed you sent me. I have had the finest show of blossom I ever saw. My neighbours all round me say the same. Cinerarias very fine."

Mr. D. THOMPSON, *4, Leamhaat Terrace, Aberdeen, February 25, 1881.*  
"It is but justice to you to say that I received a quantity of your seed through your shop, which turned out splendid."

Mr. J. McLAGAN, *Mortevore, Gardens, Drogheda, Co. Louth, May 24.*  
"I am much pleased with the plants you sent the Hon. Mrs. Dunlop. They arrived safely, and are nice healthy plants, and have been much admired by all who saw them. I shall take every opportunity of recommending your establishment to my friends."

Mr. WILLIAM LONDON, *Leslie House, Leslie, Fife, January 17, 1880.*  
"I had a grand lot out of the packet of single Dahlia seed had from you last year, every colour except white, the most of them better than any of the named varieties I have seen."

Mr. C. W. LEARMAN, *Redrice, Andover, Hants, May 26, 1881.*  
"The Polyanthus grown from the seed I had from you has been the admiration of every one that has seen them. No more than three or four plants out of about 300 will have to be discarded."

Mr. JOSEPH LORD, *Barrow-upon-Saar, Longborough, August 25, 1881.*  
"Gentlemen—The Primulas came quite safe to hand this morning beautifully packed and in good condition, for which accept my best thanks."

Mr. P. T. MACDONALD, *Athole Arms Hotel, Blair Athol, April 21, 1881.*  
"The box of cuttings arrived in capital order to-day, and I am much obliged by you so handsomely sending me so many more than I paid for, and large plants with roots instead of mere cuttings, as I expected."

Mr. W. FYFFE, *Shutterly Hall, Stratford-on-Avon.*  
"The packet of Petunia seed I had from you in spring is the admiration of all who see them; they are splendid."

Mr. ISAAC GARRETT, *Queen's Road, Brighton, Sept. 5, 1881.*  
"The dozen Begonias you sent me (to order) in June last, for the small sum of 6s., and which were left to your selection, are at the present time in full bloom. The flowers and foliage are grand, and no two alike."

"The tuberos root Begonias I got from you this season have done splendidly."

R. HANNAN, *Esq., Villa Margerie, Triguay, Sept. 19, 1881.*  
"Blossom Dahlia, the one I had from you last year, was lovely. Juarez also is splendid, finer than represented in the Garden plate."

Mr. J. FRETTER, *Lazony Rectory, Penrith, Cumberland, March 24, 1881.*  
"I think it only just to tell you I have some most beautiful Cinerarias from your seed. They are very rich colours and large blooms, one especially it is a blue. I should say when fully expanded each bloom is nearly 3 inches across. I never saw anything like them before. They are admired by all who see them."

CHAS. FITTICK, *Esq., Tamar Villa, Bideford, Devon, October 31, 1881.*  
"Some of the Primulas I had from you a short time since are now in flower, and glorious ones they are."

Mr. GEORGE WILSON, *The Deanery, Ripon, August 4, 1881.*  
"I have a fine bed of seedling Verbenas from the packet of your seed."

Mr. J. RANSON, *Oaklands, Spital, Fishamble, Aug. 10, 1881.*  
"The plants—*Chrysanthemum inodorum pinnatifidum*—from the seed I had from you last year, are really splendid. Some of them are 1 foot 6 inches high and 4 feet through, and they are one mass of beautiful double flowers."

Mr. J. GILMAN, *Biltmore, near Wigan, April 30, 1881.*  
"Will you send me a packet of your French Marigold seed? The last packet I had from you I had some of the best blooms I ever saw in my life, quite 2½ inches in diameter, and beautifully striped. They took first prize wherever exhibited."

Mr. WILSON, *The Elms Cottage, Southwell, Notts, Feb. 1881.*  
"From the packet of Lobelia seed I had some sp. solid sorts—several very dwarf and quite new flowers."

Mr. J. ATKINSON, *Belmont Castle, Grass, Essex, April 27, 1881.*  
"Sir—I may here state that the seeds have given first-rate satisfaction."

G. H. BLACKBURN, *Old Market, Bradford, October 7, 1881.*  
"All plants and seeds I have had from you for six years have turned out A 1."

Mrs. THEONNICK, *Cassini Castle, Bellech, Ireland, July 20, 1881.*  
"The plants, as usual, came apparently as fresh as if just removed from the nursery."

REV. OSWALD SMITH, *Crudwell Rectory, Tetbury, July 15, 1881.*  
"The plants sent give great satisfaction."

Mr. THOS. MILLER, *The Gardens, Whitley Beaumont, Huddersfield, September 19, 1881.*  
"I received the two boxes of plants in splendid condition, and give me the greatest satisfaction."

Mr. E. OWEN, *Blackwell House, Croft Road, Darlington, September 24, 1881.*  
"I received the Annuals safe and they gave the greatest satisfaction. I never bought such good plants before from any place."

F. EVEREST, *Esq., Lady Place, Hurley, Great Marlow, August 10, 1881.*  
"Sir—The battle between my purchases and your valuable Catalogue is somewhat severe. The more I peruse the greater my wants. I at once forward enclosed order and cash for same, and please to oblige."

J. WILLIAMS, *Esq., The Gardens, Loton Park, near Shrewsbury, May 6, 1881.*  
"The plants of *Nertera depressa* and *Coleus* safe to hand, in first-class condition. The *Coleus* are particularly fine."

Miss ELLEN CROSS, *Red Scar, Preston, Lancashire, November 7, 1881.*  
"All the plants received have given great satisfaction."

Mr. JAMES PEBBLES, *Cow Gardens, December 12, 1881.*  
"I have received the plants this morning in first-class order; a nice lot they are. Many thanks for your liberality."

JAMES BUCKFORD, *La Chaux, Jura, May 14, 1881.*  
"Three boxes of plants arrived (by post) in beautiful order. Very nice stout little plants are."

Mr. NOTTIDGE, *Grange Garden, Goring, Dec. 13, 1881.*  
"I am pleased to inform you that I have taken four first prizes with the *Coleus* I had from you last spring; also first and second prizes for twelve *Primulas* from your seed."

Mr. HARGREAVES, *Milnshaw, Accrington, Dec. 15, 1881.*  
"Your seeds were very successful. The *Marigolds* were superb, and the *Cinerarias*, now in bloom, are very fine."

G. W. DUTTON, *Esq., Summerfield, Curzon Park, Chester, December 8, 1881.*  
"The *Chrysanthemum* cuttings arrived per post in splendid condition."

Mr. JAMES METHVEN, *Southover Hall, Burwash, Sussex, January 21, 1882.*  
"The *Roses* arrived quite safe. I am highly pleased with your selection."

Mr. ROBT. OWEN, *Henty-on-Thames.*  
"The *Primula* blooms you sent me were the grandest lot I ever saw for variety of colour. I never thought such existed. Some certainly grow from your seed in future."

J. B. SINCLAIR, *Esq., Park Road, Southborough, Tonbridge, December 19, 1881.*  
"The *Primula* I had from you last summer are certainly the finest I have ever seen."

Mr. NOTTIDGE, *Grange Garden, Goring, Dec. 13, 1881.*  
"I am pleased to inform you that I have taken four first prizes with the *Coleus* I had from you last spring; also first and second prizes for twelve *Primulas* from your seed."

Mr. HARGREAVES, *Milnshaw, Accrington, Dec. 15, 1881.*  
"Your seeds were very successful. The *Marigolds* were superb, and the *Cinerarias*, now in bloom, are very fine."

G. W. DUTTON, *Esq., Summerfield, Curzon Park, Chester, December 8, 1881.*  
"The *Chrysanthemum* cuttings arrived per post in splendid condition."

Mr. JAMES METHVEN, *Southover Hall, Burwash, Sussex, January 21, 1882.*  
"The *Roses* arrived quite safe. I am highly pleased with your selection."

Mr. ROBT. OWEN, *Henty-on-Thames.*  
"The *Primula* blooms you sent me were the grandest lot I ever saw for variety of colour. I never thought such existed. Some certainly grow from your seed in future."

STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, February 20, an importation of 5000 LILIUM AURATUM, just received from Japan, in fine condition; also 2000 LILIUM KRAMEI, and fifteen cases of LILIUM AURATUM, just received from Japan, a consignment of 3000 TIGRIDIA GRANDIFLORA, and 2000 Double TUBEROSES, from America; BELLADONNA LILIES, &c.

Phalænopsis Stuartiana, Cattleya Skinneri, and other CATILYEA LABIATA Varieties.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, February 20, at half-past 12 o'clock precisely, a choice assortment of 2000 Standard and Dwarf ROSES, comprising Dendrobium Wardianum, D. crassinode, D. Falconeri, D. Devonianum, Oncidium Marshallianum, Cattleya Skinneri, Oncidium grand mucosum; Cattleya Labiata, extremely varied in appearance, both Green and Red-leaved varieties amongst them, and many were seen in flower by the Collector last autumn during the month of November; also a consignment of several established Plants of PHALÆNOPSIS STUARTIANA, one in flower; and other choice ORCHIDS.

Wednesday Next.

IMPORTED ORCHIDS. MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, February 22, at half-past 12 o'clock precisely, by order of Messrs. Shuttleworth, Garder & Co., 171, Park Road, Clapham, S.W., an importation of CATILYEA AUREA, C. GIGAS, MASDEVALLIA SHUTTLEWORTHII, M. CHIMPERIA, M. TROCHILUS, M. GOUTTEAUX, and M. HARKYANA; ODONTOGLOSSUM VEXILLARIUM, fine dark varieties; O. CRISPUM (ALEXANDER), &c., from the best district, &c. Collected by Mr. John Gardner, in his own garden. May be viewed morning of Sale, and Catalogues had.

Thursday Next.

CATILYEA LABIATA PURPUREA (Rehb. f.). TRUE AUTUMN FLOWERING LABIATA. MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on THURSDAY NEXT, February 23, at half-past 12 o'clock precisely, a wonderful importation of this magnificent CATILYEA. It is well known there are numerous varieties among the old Cattleya labiata, such as Pescatorei, picta, &c., and the varied bulbs show that many varieties are actually offered. It is true autumn flowering. Flowers will be on view of this the finest Brazilian Cattleya: sepals and petals broad, deep rose or light purple, lip broad, erect, splendidly fringed, with rest deep velvety-purple; in some varieties quite one-half of the lip is dark, throat golden-yellow. We have never previously seen imported a Cattleya so well adapted for the open air. It has not flowered and whose spike does not show three and four flower sets. Mr. Seidl, the lucky discoverer, states that one mass alone had 300 flowers fully expanded, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far-distant coast. We are extremely pleased at being able to offer it to the public, having looked for without success for many years. The green and red-leaved varieties are among the importation, which altogether is in simply superb condition.

CYPRIPEDIUM SPICIANUM.

A few unsold lots of our last week's Sale. Masdevallia radiosa, very rare and fine. Odontoglossum nebulosum, "madrasense." "crystalinum," "vexillarium."

CATILYEA DOWIANA, very splendid lot. May be viewed morning of Sale, and Catalogues had.

First-class standard and Dwarf Roses. MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, February 22, at half-past 12 o'clock precisely, First-class Standard, Half-standard and Dwarf ROSES, from well-known English and French Nurseries; Pyramid and Dwarf-trained FRUIT TREES, Hardy Ornamental CONIFERS, CARNATIONS, FICUSES, PINKS, &c. of the value of £1000. Also 5000 OLD LILIUMS, ANEMONES, TIGRIDIAS, TUBEROSES, and other BULBS, Rustic GARDEN WORK, &c.

On view morning of Sale, and Catalogues had. Cattleya labiata Purpurea, Rehb. f. TRUE AUTUMN FLOWERING LABIATA.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, February 23, by order of Mr. F. Sander, a wonderful importation of this magnificent CATILYEA. It is well known there are numerous varieties among the old Cattleya labiata, such as Pescatorei, picta, &c., and the varied bulbs show that many varieties are among the lots offered. It is true autumn flowering. Flowers will be on view of this, the finest Brazilian Cattleya: sepals and petals broad, deep rose or light purple; lip broad, large, splendidly fringed, lower part deep velvety-purple; in some varieties quite one-half of the lip is dark, throat golden-yellow. We have never previously imported a Cattleya so floriferous; there is hardly a bulb which has not flowered, and whose spike does not show three and four flower sets. Mr. Seidl, the lucky discoverer, states that one mass alone had 300 flowers fully expanded when collected, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far-distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. The green and red-leaved varieties are among the importation, which is altogether in simply superb condition. The whole will be given into Mr. Stevens' hands, and comprise all that could be found, and none sold privately; but Mr. Sander earnestly invites prior inspection at the St. Alban Nurseries, which are easily reached by the Midland, London and North-Western, or Great Northern Railways, from any of the Metropolitan stations, Liverpool Street, King's Cross, or from St. Pancras, by fast train, in half-an-hour. On view morning of Sale, and Catalogues had.

2000 Extra Fine Standard and Dwarf Roses. MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, February 23, at half-past 12 o'clock precisely, a choice assortment of 2000 Standard, Dwarf, Climbing, and Pillar ROSES, including all the finest distinct varieties of the best Foreign and English Nurseries, from one of the most renowned English Rose Growers; also Pyramid FRUIT TREES, CONIFERS, HARDY FRUIT TREES, including CHERRY, CHERRY, LILUM, TIGRIDIAS, GARDEN TOOLS, &c.

Great Dendrobium Sale.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on MONDAY, February 20, numerous importations of DENDROBES in unusual masses and condition, consisting of: DENDROBIUM - Wardianum, 1000; Suavisissimum, 1000; Falconeri; Heterocarpon; Pictum; Hookeri; Calceolus; Saugoleucum; Parisii; Chrysanthum; Apolliniae; Moschatum; Taurinum; Farmeri; Seviniatum; Freemani. Crassinode; Thyrsiflorum; Cambridgeanum; Eburneum; Pictum; Fumbratum; Dalhousianum; Rhodopyrgium; Griffithi; Lilium; Bessendenianum; Crystallinum; Bigbigium; Taurinum; Superbicum; Wardianum among them.

CATILYEA DOWIANA. AN OCNIDIUM MACRANTHUM (HASTIFERUM); an altogether magnificent importation of this the finest Ocnidium; from Mr. E. Klaboch. The consignment is in superb health. On view morning of Sale, and Catalogues had.

Woking, Surrey. Mr. J. Trig's Nursery, Goldworth, 1 mile from Woking Station, London and South-Western Railway. IMPORTANT UNRESERVED SALE of well grown NURSERY STOCK.

MR. F. W. ABRHAM has received instructions from Mr. J. Trig, to sell by AUCTION, without reserve, on the Premises as above, on WEDNESDAY, March 1, and two following days, at 11 for 12 o'clock precisely each day, the whole of the valuable NURSERY STOCK, consisting of 2000 Gold and Silver Holly, from 1 to 5 feet; 2000 Green Holly, 1 to 6 feet; 1000 English Vines, 3 to 6 feet; 5000 Pure Portulacis, Sweet Peas, Picea Nordmanniana, Cotinus Decolorata, Magnolia, Camellia, and Standard and Pyramid Fruit Trees, Apples, Pears, Plums, Currants, &c., and quantities of Deciduous and Flowering Trees and Shrubs in great variety. The above may be viewed, and Catalogues obtained, four days before Sale, on the Premises; at the principal Places in the neighbourhood; or of the Auctioneer, Swiss Nursery, Loughborough Road, Eriston, S.W.

TO BE SOLD, A LEASEHOLD PLOT OF LAND, of about 4½ Acres, sixty-eight years unexpired, centrally situated on one of the best roads in Portobello, and adjoining railway station. Halfpenny per yard ground rent. On the property is upwards of 10,000 feet of good Glass Structures, well treated with hot water. Cold Water in every house, and well stocked with Vines in splendid bearing order. Apply, at once, to A. B. C., Examiner Office, Wigan.

TO BE LET, MARKET GARDEN and NURSERY GROUND, of nearly 4 Acres; well-bank Greenhouse of 120 to 150 long, part heated by Hot-water, and running numerous Fruit Trees, &c. Rent, £20 only; £2 left could be made rent-free by other lettings. Premium required for about fourteen years' lease, at 10 per cent. Apply to Mr. A. B. C., Examiner Office, Wigan.

PROTHEROE AND MORRIS, HORTICULTURAL MARKET GARDEN and ESTATA AUCTIONEERS and VALUERS, 8, New Broad Street, E.C. and at Leytonstone, E. Monthly Horticultural Register had on application.

SATTLER AND BETHEG, Decorative and Wholesale Gardeners, Queidling-on-H., Germany.

# NEW BROCCOLI—"LEDSHAM'S LATEST OF ALL."

WAITE, NASH,  
HUGGINS & CO.

Have much pleasure in introducing this splendid Novelty, the whole stock of which has been purchased by them from the Raiser,

Mr. SAMUEL LEDSHAM, Chester.

The above illustration (taken from a Photograph) gives a fair idea of its form and size; but the necessary removal of the leaves for the purpose of photographing prevents its true character, as THE BEST SELF-PROTECTING VARIETY extant being shown. As the Testimonials appended will show, this is the "LATEST OF ALL" Broccolis, lasting well until the time that the early Cauliflowers are ready. Its robust constitution enables it to withstand the most severe winters; while the mass of leaves by which it is protected prevents the heads from being injured by the summer sun. This variety has been famous in the neighbourhood of Chester for several years, and it is now with the greatest confidence offered for the first time to the general trade.

## THE FOLLOWING TESTIMONIALS SPEAK FOR THEMSELVES:—

**Extract from a Letter from Mr. LEWIS SOLOMON, Centre Row, Covent Garden.**  
"May 14.—Your Broccoli came safely to hand this morning. I have shown it to several good judges. They say, without exception, *they are the finest they have seen.* I have also been to one of the Committee of the Royal Horticultural Society, who also says *they are the very best.* If you have fifty dozen ready now we could dispose of them for you."

**Extract from Letters from A. F. BARRON, Esq., Royal Horticultural Society's Gardens, Chiswick.**  
"June 2, 1880.—After the Committee dispersed the examples of Cattell's Eclipse arrived, and were compared with yours by myself and several others, and *proved to be quite distinct.*"  
"June 23.—I brought forward yesterday the subject of your 'Broccoli.' The Committee *commented highly as a very excellent sort.*"  
"October 12, 1881.—The Committee considered the Broccoli to be a very fine late white variety."

**Extract from the GARDENERS' CHRONICLE.**  
"May 15, 1880.—Mr. Ledsham, Green Lane, Tarvin Road, Chester, sent examples of a very promising variety of late Broccoli. The heads range from small to medium size, the *best ideal of a first-class Broccoli* in size, shape, and whiteness, and, as we can affirm, of very delicate flavour."

**Extract from the GARDENERS' CHRONICLE.**  
"May 29.—Mr. S. Ledsham again sent a fine sample of his late white Broccoli, which, considering the winter the plants have passed through, and their fine quality as shown, is a variety of great merit."

**Extracts from JOURNAL OF HORTICULTURE.**  
"May 13, 1880.—We have received from Mr. Samuel Ledsham, Market Gardener, Boughton, Chester, some heads of late Broccoli of considerable merit. The heads are extremely solid, and almost as white as early Cauliflowers. They are not large, but quite large enough for a gentleman's table, being 4 inches across, and the same in depth, and they are, we think, the heaviest for their size we have noticed. Their whiteness is due to the marked self-protecting character of the variety, the heads being deep down in the plant and closely enveloped with leaves, these not having the twisted form of the Knight's protecting type. This Broccoli is a very good one, and if of dwarf habit and hardy it will prove highly worthy of cultivation, especially if, as we are informed, it will continue producing heads for three or four weeks longer."

"May 27.—We have received further specimens from Mr. Ledsham, Green Lane, Tarvin Road, Chester, of his late protecting Broccoli. The heads are larger than those referred to on p. 374, and are close, white, heavy, and of excellent quality."

Sold only in Sealed Packets. Price 2s. 6d.

May be obtained from all Nurserymen and Seedsmen throughout the Kingdom, and from

WAITE, NASH, HUGGINS & CO.,  
79, SOUTHWARK STREET, LONDON, S.E.

Early Goodrich Scotch Regent  
Beauty of Hebron Scotch King  
Fortyfold Fluke  
Dalmainoy Champion  
and other leading varieties.

Also 100 bushels of the NEW ARTICHOKESES, 3 to 4, York Street, Borough Market, S. E.

**GLADIOLI**—all the sorts worth growing.  
**DAHLIAS**—Pot-roots, 300 sorts. CATALOGUES to be had free of KELWAY AND SON, Langport, Somerset.

**FLOWERING SHRUBS,** in great variety, such as Hydrangeas, Lilacs, Deutzias, Spruces, Cytisus, 11 orn, Pyrus, Berberis, Double Cherry, Scarlet Hawthorn, Guelder Rose, &c., 8s. per dozen; 50s. per 100.  
Descriptive LIST on application.  
RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

**LILIAM AURATUM,** and other LILIES, the best picked Bulbs only. Size No. 1, 6d.; No. 2, 4d.; No. 3, 2s.; and the largest Bulbs imported, 12s. 6d. each. Equally low prices for other Lilies, and Special LIST of Orchids furnished on application to WM. GORDON, City Office, 10, Cullum Street, London, E. C. Special Price to the Trade.

**FOR SALE, SEAKALE** for Forcing and Planting, in large or small quantities. For price per 300 apply to S. BIDE, Alma Nursery, Farnham.

**PARKER AND SONS, St. Michael's Hill** Nursery, Bristol, offer the following:—  
LARCH, 2 to 4 feet.  
SCOTCH, 1½ to 2½ feet.  
SPRUCE, 1½ to 3½, and 4½ to 3½ feet.  
THORN, 2 to 4 feet.  
Prices on application.

**LILIAM AURATUM.**—Splendid direct Imported and Home-grown Bulbs, 20s., 40s., 50s., 60s., 75s., and 100s. per 100.—SANDER AND CO., St. Alban's.

**EDWARDS' VICTORIA KIDNEY.**—All the good qualities of the old varieties are centred in this magnificent Potato, for which a First-class Certificate was given by the Royal Horticultural Society in November last, after having been grown and tested by the Committee. It is a seedling from Victoria Round, but harder, a great cropper, ripening early in September, and will keep in excellent condition until July. The tubers are full-sized, but not at all coarse, and when cooked white as snow, and perfectly mealy. It was raised by Mr. Edwards, of Acton Burnel Garden, Wiltshire, who has for forty years cultivated all the best kinds, both home and imported.  
OLDROD AND CO., Nurserymen and Seedsmen, Shrewsbury, have the sole disposal of the above, which they offer at 12. 6d. per lb.; 7 lb. 6s. 6d.; 14 lb. for 12s.

**TREES FOR AVENUES and STREET PLANTING.**—The trees here mentioned have all stout stems, are handsomely furnished well balanced heads, and splendidly rooted. They have always had ample room and thorough exposure, and are without doubt the finest stock of Avenue Trees to be met with in any Nursery in Europe. The girth of the stems is taken at 4 feet from the ground, and not at the base, which is often deceptive:—  
ACER DASYCARPUM, 12 to 14 feet, girthing 5 to 6 inches; 15 to 18 feet, girthing 8 to 9 inches.  
PLATANOIDES (Norway Maple), 12, 14, to 16 feet, girthing 5 to 8 inches.  
ACACIA BESSONIANA, 10 to 12 feet, and 12 to 14 feet.  
BEECH, Common, 10 to 12 feet.  
Purpl. or Copper, 10 to 14 feet.  
CHESTNUT, Horse, 10 to 12 feet; 14 to 16 feet, girthing 7 to 10 inches.  
Scarlet, 10 to 14 feet, girthing 8 to 10 inches.  
LIMES, 12 to 14 feet, girthing 5 to 6 inches; 15 to 18 feet, girthing 10 to 12 inches.  
OAKS, Scarlet American, 12 to 14 feet, girthing 5 to 6 inches.  
PLANES, Deciduous, 12 to 14 feet, girthing 5 to 6 inches; 15 to 18 feet, girthing 7 to 10 inches.  
POPLAR, CANADENSIS NOVA, 12 to 14 feet; 14 to 18 feet, girthing 5 to 10 inches.  
SYCAMORE, 12 to 16 feet.  
Purple, 14 to 15 feet.

**ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.**  
**SINGLE DAHLIAS.**  
YELLOW DWARF, 12. 6d. each, 15s. per dozen.  
SCARLET GEM, 12. 6d. each, 15s. per dozen.  
COCCINEA, 12. 6d. each, 15s. per dozen.  
A pot-root of each of these splendid kinds, post-free, 4s. 6d. We have the most complete collection of doubles, and always grow not less than 10,000 pot-roots, and can therefore offer best in cultivation.  
H. CANNELL AND SONS, The Home for Flowers, Swanley, Kent.

**H. CANNELL & SONS'**

**IS NOW READY,**  
And sent Post-free for 1s.

We assure all lovers of flowers that it is by far the best we have ever issued, and probably the best ever published. Certainly it contains the greatest and most reliable information on Flowers and their Seeds. The printing 20,000 copies costs £570, the postage of the same £250. We simply mention this to show to what extent our efforts are appreciated.

Splendid Coloured Drawings of our CALCEOLARIAS, CINERARIAS, CYCLAMENS, and PRIMULAS by the best artists, as near like the actual flowers as skill and paint can produce. These make beautiful pictures. Post-free for 6d.

For the SEEDS, and the way to sow, grow, and obtain the finest specimens of the above, such as would carry off the first prizes, see H. C. & Sons' Floral Guide for 1s. All the above post-free for 1s. 6d.

**Violas.**  
**THE BEST SPRING and EARLY SUMMER BEDDING PLANTS.** We have large quantities of all the best and most effective colours—White, Yellow, and Blue. Plants showing bloom, 8s. per 100. VIOLETS—NEAPOLITAN, best Double, fine clumps full of flower, 20s. per 100. QUEBEC, the best Single, blooms resembling a Pansy. Fine clumps, 25s. and 15s. per 100.

**Spotted Calceolarias.**  
**H. CANNELL AND SONS** have now perhaps the most model-like small plants ever offered, so clean and vigorous that they would be sure to give satisfaction. 12. 6d. per dozen; in small pots, 2s. 6d.; larger, 5s. and 10s. per dozen. All are from our own well-known stock, the best of all strains. Special quotations for large quantities.

**Eliotropes.**  
**WHITE LADY and PRESIDENT GARFIELD.**—Never before have two new varieties so completely surpassed all older kinds; however, such is the fact, and perhaps never were there two more serviceable plants offered. Two First-class Certificates. 2s. each; one of each post-free for 4s.

**CHRYSANTHEMUMS.**  
Special Offer during February.  
We have now, perhaps, the finest house of Cuttings of the above ever seen; in all the varieties arranged as per Catalogue, consequently orders are despatched by return of post. Our selection of Cuttings, all distinct and true to name, 12s. per 100; 50 distinct kinds, 40s.; stock plants, our selection, in good kinds, 25s. per 100.  
Illustrated CATALOGUE post-free.

**SINGLE DAHLIAS.**  
YELLOW DWARF, 12. 6d. each, 15s. per dozen.  
SCARLET GEM, 12. 6d. each, 15s. per dozen.  
COCCINEA, 12. 6d. each, 15s. per dozen.  
A pot-root of each of these splendid kinds, post-free, 4s. 6d. We have the most complete collection of Doubles, and always grow not less than 10,000 pot-roots, and can, therefore, offer best in cultivation.

**New Chrysanthemum Mabel Ward.**  
**H. CANNELL AND SONS** beg to acquaint all lovers of the Chrysanthemum that they are now sending out good plants of the above at 2s. 6d. each, post-free. The Journal of Horticulture reports it thus:—"Mr. Martin also secured First Prizes in the classes for twelve and six cut blooms, distinct, with blooms scarcely inferior to the Prize Cup lot, and in each stand set up a bloom of Mabel Ward, which we venture to predict will be a splendid addition to our incurved varieties."

**REAL MANURE FOR POT PLANTS.**—The value of the above is demonstrated in our wonderful exhibits, and it is now an admitted fact that it is the safest and most effective manure for plants to attain the height of perfection ever offered. This is not a mere assertion, but an established fact, based on long successful experience for many years. 1 lb. tin, 1s.; 3 lb. tin, 2s. 6d.; 6 lb. tin, 4s. 6d.  
See our FLORAL GUIDE, post-free for 1s. Full particulars how to obtain First Prizes, and the success of Flower Growing a certainty.

**STRAWBERRIES.**—Why can we supply Strawberries, better plants, true to name, and in any quantities, probably superior to any other firm? Simply because we are located in the midst of hundreds of acres of all the best Kent kinds in cultivation. Plants in pots for immediate fruiting, 6-inch pots, 5s.; per 100; 5-inch pots, 25s. per 100; 3-inch pots, 10s. per 100. Prepared runners, 4s. per 100. Special price for large quantities.

H. CANNELL AND SONS, Swanley, Kent.

**ANTHONY WATERER**

respectfully invites the attention of intending Planters to the following List of desirable and in every way first-class Nursery Stock:  
BOX, Green and Variegated, many thousands, 4s, 5, 6, 7, and 8 feet high.  
YEWS (Common English), 5, 6, 7, and 8 feet high, many thousands.

Golden, many thousands, 3, 4, 5, to 10 feet high.  
The Golden Yews in this Nursery are quite unequalled, and purchasers will be highly gratified by an inspection—the only means of obtaining a correct appreciation of the plants.  
First, hundreds of specimens, 6, 7, and 8 feet high.  
HOLLIES, Common Green, many thousands, 3, 4, 5, 6, 8, 10, and 12 feet high.  
LAURIFOLIA, MYRTIFOLIA, SCOTICHA, HODGINS, and other fine varieties, a very large number, 5, 6, 7, 8, and 10 feet high.  
Variegated, many thousands, 5, 6, 7, and 8 to 10 feet high.  
Golden Yews, many handsome specimens, 4, 5, 6, to 10 feet high.  
Silver, in variety, 4, 5, 6, to 10 feet high.  
Water's, as Smilax and Pyramids, the finest plants in the Trade.

CHINESE JUNPEERS, 6, 7, 8, to 10 feet high; hundreds.  
PICEA PIN-SAKU, 6, 7, 8, to 10 feet high; hundreds.

H. CANNELL & SONS, THE HOME FOR FLOWERS

THE GREAT QUESTION OF THE DAY, HOW TO SAVE MONEY.

100 per Cent. saved by sending for Fidler's Potato Catalogue, gratis and post-free.

All persons having a Garden should avail themselves of the following advantageous offers:— SEED POTATOES, choice selected handpicked tubers. A complete change of Seed effected.

Table with 3 columns: Seed Name, Bush, Sack. Lists various seeds like Magnam Bonum, Reading Home, Woodstock Kidney, etc.

Fuller particulars contained in Catalogue, as above, upon application to

FIDLER'S POTATO GROWER'S PATENT POTATOES, 7, PRIAR STREET, READING.

New Fuchsias. To be sent out the Third Week in April. M. R. WILLIAM BULL has much pleasure in announcing the following magnificent collection of New Fuchsias; it includes the handsome varieties from the celebrated raisers, Mr. Bland and Mr. Eckford, from whom Mr. W. B. has purchased the stocks:—

- EXPANSION—A very distinct and pretty variety; tube and sepals bright rose, the sepals completely reflexed; light bluish-purple corolla, so widely expanded as to become almost flat; quite unique in form. 10s. 6d.
GENERAL—A fine showy flower with very large reflexed sepals of a deep rose colour, and large expanded double corolla, of a rich violet colour flaked with rose. 10s. 6d.
GERALD—A very fine flower with rich crimson tube and sepals, the latter completely reflexed; large expanded corolla of a rich purplish-crimson colour. 10s. 6d.
IMPERIAL—A splendid flower with a huge well-flamed corolla of a beautiful glossy plum colour, richly striped and flaked with pink; tube and sepals of a bright rosy-carmine colour, the latter elegantly recurved. 10s. 6d.
MARVELLOUS—Tube and sepals deep rose, the sepals oval in shape and reflexed; full, double, bright blue corolla, of a pretty rosette-like form. 10s. 6d.
MATCHLESS—A magnificent flower of good substance and excellent shape; tube and sepals deep crimson, the latter broad and elegantly reflexed; large thick well-formed corolla of a rich purple colour, striped and flaked with rose; so extremely attractive a variety. 10s. 6d.
MINSTREL—Tube and sepals bright rosy-crimson, short tube and broad recurved sepals; corolla very full and double, rosy-white, striped with rose at the base. 10s. 6d.
MONUMENT—An effective double-flowered variety, with full corolla of a rich purple colour, striped with rosy-carmine; tube and sepals of a rosy-crimson colour, the latter moderately reflexed. 10s. 6d.
STARTLER—Tube and sepals of a deep crimson colour; large, double, broadly-expanded corolla of a rich purple colour, striped and flaked with rosy-carmine; very effective. 10s. 6d.
TULIP—Crimson tube and sepals, the latter completely reflexed; very large and much expanded Tulip-shaped corolla of a rich purple colour; a remarkably fine flower of good substance. 10s. 6d.

ESTABLISHMENT FOR NEW AND RARE PLANTS, 556, King's Road, Chelsea, London, S.W. CHRYSANTHEMUMS—Speciality—300 best sorts. Good rooted Cuttings, fit for Exhibition purposes. Purchasers' selection, 2s. 6d. per doz., 14s. per 100; W. E.'s selection, 3s. per doz., 10s. per 100. Cuttings cheaper.

W. ETHERINGTON, Manor House, Swancombe, Kent.

Orchids a Speciality.

The stock at the Clapton Nursery is by far the largest hitherto seen in Europe, and is of such magnitude that, without seeing it, it is not easy to form an adequate conception of its unprecedented extent.

HUGH LOW & CO.

very cordially and respectfully solicit an inspection by all lovers of this interesting and beautiful class of plants, whether purchasers or not.

CLAPTON NURSERY, LONDON, E.

A SEED LIST

ILLUSTRATED and as full as can be desired of useful and reliable information on Garden and Flower Seeds, yet without any unnecessary costliness, post-free on application. Such a catalogue as this is claimed to be the most of necessity conduce to economy, both as regards purchaser and vendor.

In addition to the well-known and trusty favourites in Seeds, the

BEST NOVELTIES

are included, but unproved and excessively expensive kinds are omitted. Every endeavour is made to supply Seeds of the Finest Quality and of the Best Varieties at a Moderate Price, to attain which desirable object neither trouble nor expense are spared in the procuring and proving of the seeds.

THE GUINEA COLLECTION

(Carriage free), for the Amateur's Garden, has been much approved, and contains a most valuable and useful assortment of Vegetable Seeds.

All enquiries are gladly and promptly attended to.

Collected by Mr. John Carder. All in the best possible condition.

*May be viewed the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

## CATTLEYA LABIATA PERCVALIANA (Rchb. f.) TRUE AUTUMN-FLOWERING LABIATA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by Order of Mr. F. SANDER, on THURSDAY, February 23, a wonderful importation of this magnificent CATTLEYA. It is well known there are numerous varieties among the old Cattleya labiata, such as PESCATOREI, PICTA, &c., and the varied Bulbs show that many varieties are among the lots offered. It is true Autumn-flowering. Flowers will be on view of this the finest Brazilian CATTLEYA: sepals and petals broad, deep rose or light purple; lip broad, large, splendidly fringed, lower part deep velvety-purple: in some varieties quite one half of the lip is dark; throat golden-yellow. We have never previously seen imported a Cattleya so floriferous: there is hardly a Bulb which has not flowered, and whose spike does not show three and four flower seats. Mr. Seidl, the lucky discoverer, states that one mass alone had 380 flowers fully expanded when collected, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. The green and red-leaved varieties are among the importation, which is altogether in simply superb condition. The whole will be given into Mr. Stevens' hands, and comprise all that could be found, and none sold privately; but Mr. Sander earnestly invites prior inspection at the St. Alban's Nurseries, which are easily reached by the Midland, London and North-Western, or Great Northern Railways, from any of the Metropolitan Stations, Liverpool Street, King's Cross, or from St. Pancras, by fast train in half an hour.

*On view the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

**ASPARAGUS.**—The finest roots that money can procure, 2s. 6d. per 100. This delicious vegetable does not require half the expense usually incurred. For directions for planting, see SEED LIST, free on application.  
RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

**Gardenia intermedia.**  
**MESSRS. JOHN STANDISH AND CO.** have to offer a very extensive stock of GARDENIA INTERMEDIA of all sizes, every plant being in the most robust health, and guaranteed perfectly clean. Sizes plants in 6-inch pots at 2s. 6d. each; larger, 3s. 6d. to 10s. 6d. each. Specimens, fine bushy plants, with plenty of bloom-bud on them, 1, 1½, 2 and 3 guineas each.  
Royal Nurseries, Ascot, Berks.

**GAME or COVERT PLANTING.**  
GORSE, two years in drills, 5s. per 1000.  
SNOWBERRIES, strong, 2 to 3½ feet, 2s. per 1000.  
THOMAS PERKINS AND SON, 34, Drapery, Northampton.

**CEDRUS DEODARA**—“The Indian Cedar.”—Beautiful specimen trees, frequently transplanted and well-rooted, offered at the undermentioned low prices to effect a clearance—  
3 to 6 feet, 48s. per dozen | 7 to 8 feet, 72s. per dozen  
10 to 12 feet, 60s. per dozen | 10 to 12 feet, 84s. per dozen

**ABIES DOUGLASSII**—One of the most noble trees grown, well-rooted specimens—  
6 to 7 feet, 3s. 6d. each; 35s. per dozen  
7 to 8 feet, 4s. 6d. each; 42s. per dozen  
8 to 9 feet, 5s. 6d. each; 60s. per dozen

Hyacinthine candelans (Gaulonia candelans).  
**LARGEST CULTIVATED STOCK in the WORLD.**  
 100,000 flowering Bulbs ready for immediate supply.  
**E. H. KRELAGUE AND SON**, NURSERYMEN, SEEDSMEN, and FLORISTS, Haarlem, Holland, beg to offer this splendid Plant. The good qualities of which will be considered generally known at present. As a first-rate Plant for Hedging-out, to be placed in beds alone or allied with Gladiolus brecheneychensis or other plants with striking colours. The pure white flowers are very useful in Bouquets, &c. We supply this Plant in three qualities, according to the size of the Bulbs, viz.:—  
 First Size, per 12, 5s. 6d.; per 200, 25s.; per 1000, 240s.  
 Second "do", "do", 3s. 6d.; "do", 15s.; "do", 120s.  
 Third "do", "do", 2s. 6d.; "do", 15s.; "do", 120s.  
 The Bulbs of all three sizes are sufficiently large to give flowers next summer. Trade prices on application.

# THE EARLIEST WRINKLED PEA.

## AMERICAN WONDER.

This valuable new early dwarf Wrinkled Pea was introduced by us last season. It is as early as our Ringleader, which is still the farthest Round White Pea. The haulm is thickly covered with fine pods, each containing from seven to ten Peas of delicious flavour. Height, 10 to 12 inches.

From Mr. T. TURTON, *Gr.* to John Hargreaves, Esq.

"'American Wonder' Pea proved most satisfactory; was sown the last week in February, and was fit for use the first week in June—quite as early as 'Ringleader,' sown the first week in January, and it is superior in quality; especially valuable for growing on borders where the trees are a consideration."

From Mr. T. LOCKIE, *Gr.* to the Right Hon. Lord O. Fitzgerald.

"'American Wonder' is exceedingly useful for forcing; only 10 inches high; producing a good crop of fine large Peas, of excellent flavour. Sown in a cold frame, March 10, was ready for use May 19. For forcing it is far superior to 'Little Gem' or 'Tom Thumb.'"

Price, 5s. per Quart; 2s. 6d. per Pint.

THE QUEEN'S SEEDSMEN, *Sutton & Sons*, READING, BERKS.

**OBSERVE OUR TRADE MARK ON EVERY PACKAGE. SUTTON & SONS HAVE NO AGENTS.**

MAPLE—Norway (Acer platanoides), 5 to 10 feet, 9s. per dozen, 60s. per 100; 10 to 12 feet, 12s. per dozen.

WILLOW—Scarlet Palm, a Willow of extraordinary vigour. The bark of the young wood is of a deep purplish-red in winter, and it bears "lamb's tails" in spring of very large size. 4 to 6 feet, 3s. per dozen, 15s. per 100; 6 to 8 feet, 4s. per dozen, 20s. per 100; 8 to 10 feet, 6s. per dozen, 40s. per 100; 10 to 12 feet, 12s. per dozen.

EUONYMUS—radians argenteus variegatus, a very useful plant for edges to water beds. 3 to 4 in., 2s. per doz., 12s. per 100; 4 to 6 in., 3s. per doz., 16s. per 100.

ELDER—(Sambucus nigra) variegated: a beautifully variegated plant, which thrives close up to the sea; 6s. per dozen, 40s. per 100.

„ cut-leaved—a handsome lacinated form, and, like other Elders, extremely useful for ornamental planting close to the sea. 6s. per dozen, 40s. per 100.

A slight extra charge must in most cases be made for packing. Where cash in payment of goods is sent with the order, the amount for postage may be forwarded in stamps after despatch of goods. All the above prices are subject to the discounts named at head.

**THE GENERAL AUTUMN LIST**  
will be forwarded *Gratis* and *Post-free* to all applicants.

N.B. Post-office Orders should be made payable to EWING AND CO., at Eaton, near Norwich. Cheques crossed GURNEY AND CO., Norwich.

Trade Terms on application.

THURSDAY NEXT.**CATTLEYA LABIATA PERCIVALIANA**

(Rehb. f.)

**TRUE AUTUMN-FLOWERING LABIATA.**

**M**R. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. SANDER, on THURSDAY NEXT, February 23, at half-past 12 o'Clock precisely,

**A WONDERFUL IMPORTATION OF THIS MAGNIFICENT CATTLEYA.**

It is well-known there are numerous varieties among the old *Cattleya labiata*, such as *PESCATOREI*, *PICTA*, &c., and the varied Bulbs show that many varieties are among the lots offered. It is true Autumn-flowering. Flowers will be on view of this the finest Brazilian *CATTLEYA*—sepals and petals broad, deep rose or light purple; lip broad, large, splendidly fringed, lower part deep velvety-purple: in some varieties quite one-half of the lip is dark; throat golden-yellow. We have never previously seen imported a *Cattleya* so floriferous: there is hardly a Bulb which has not flowered, and whose spike does not show three and four flower-seats. Mr. Seidl, the lucky discoverer, states that one mass alone had 380 flowers fully expanded when collected, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far-distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. The green and red-leaved varieties are among the importation, which altogether is in simply superb condition.

**CYPRIPEDIUM SPICERIANUM,**

A few unsold lots of our last week's sale.

**MASDEVALLIA RADIOSA**—very rare: **ODONTOGLOSSUM ALEXANDRÆ**  
and fine  
**ODONTOGLOSSUM NEBULOSUM**        "       **MADRENSE**  
"       **CRYSTALLINUM**                       "       **VEXILLARIUM**

**CATTLEYA DOWIANA**—very splendid lot.*May be viewed morning of Sale, and Catalogues had.*

**WILLIAMS' FLORAL NOVELTIES**

FOR 1882.

POST-FREE.

The favourite genus CALCEOLARIA, which belongs to the Natural Order Scrophulariaceae, was originally introduced to this country from Chili and Peru, since which time it has undergone vast improvements, especially the herbaceous varieties, which now make such a brilliant and pleasing display in our flower gardens. The strain of this charming plant which I offer has been grown for me by one of the most successful Prize-takers in the Kingdom, and it never fails to give satisfaction to all who cultivate it. I have received numberless testimonials from all quarters of the globe in praise of its superior merits.

- CALCEOLARIA, Herbaceous, Williams' superb Strain . . . . . 1s. 6d. and 2s. 6
- CALCEOLARIA, Shrubby, useful for bedding purposes . . . . . 1s. 6
- CAPSICUM, Williams' Little Gem (new) . . . . . 1s. 6
- Awarded a First-class Certificate of Merit, . . . . .
- COCKSCOMB, Williams' Prize Strain . . . . . 2s. 6
- Never fails to take First Prizes wherever exhibited.

- DAHLIA, Single, Choice Mixed . . . . . 1s. 6
- DAHLIA, Double, Splendid Mixed Show varieties . . . . . 1s. 6

The seed of the above Dahlias has been grown by one of the oldest and most celebrated Dahlia growers in the Kingdom, and is the result of careful hybridisation of his Prize Plants, which may be expected to produce entirely new varieties.

The Single Dahlia, if sown in heat, in February, and submitted to the usual cultural treatment, will bloom the following autumn.

**SUPERB STRAIN of PRIMULAS.  
CHOICE VEGETABLE SEEDS.**

For further Particulars see **ILLUSTRATED SEED CATALOGUE** which will be forwarded, post-free, on application.

**B. S. WILLIAMS,**  
Seed Merchant and Nurseryman,  
VICTORIA and PARADISE NURSERIES,  
UPPER HOLLOWAY, LONDON, N.

**EVERY GARDEN SHOULD BE PLANTED WITH**

**SUTTONS' READING HERO POTATO.**

Practically Disease-proof and a Marvellous Cropper.

From Mr. R. GARLICK, *Coveage, Malmesbury.*  
"I have been reading the testimonials of your Reading Hero Potato, and write to tell you that I have beaten them all. From the 14 lb. I had of you last spring, I dug at the end of September the extraordinary weight of 840 lb."

From P. S. GRAY, *Esq., Raths.*  
"The Reading Hero was a large crop with me, free from disease and splendid in quality, both as to looks and boiling. I think they are the coming Potato for the main crop. From the 6 cwt. I have about 5 toos."

From Mr. J. H. COLLETT, *Seavage Farm, Bedford.*  
"The 2 cwt. of Reading Hero Potato I purchased from you last spring produced 3 tons 3 cwt. of sound tubers of first-rate quality, and excellent shape. It is quite as heavy a cropper as the Magnum Bonum, and I think will be an equally good disease-resister."

Prices and full particulars post-free on application.

THE **Gardeners' Chronicle.**

SATURDAY, FEBRUARY 18, 1882.

JOSEPH DECAISNE.

SINCE the death of Adolphe Brongniart French botany has not experienced so severe a loss as that to which it has lately been subjected by the death of this distinguished man. Decaisne, too, has claims on the horticultural world, as having risen from the position of a simple gardener to be the leading botanist in France, President of the Academy of Sciences, and Director of the Jardin des Plantes at Paris, and as having been the author of the finest, most carefully executed, and richly illustrated work on pomology that exists, as well as of various books on popular horticulture and botany, and of a whole series of articles on garden plants or groups of plants dispersed through the pages of the gardening periodicals. For these reasons some short account of his career will be acceptable to many of our readers, though the quiet, unobtrusive life of a hardworking man of science is destitute of those stirring incidents and sympathetic features which appeal to the public at large. Decaisne, though domiciled in Paris for very many years, was a Belgian by birth, having been born in Brussels in 1809. M. E. Morren tells us how his father, Charles Morren, was the schoolfellow and playmate of Decaisne, and how—as has been so often the case—the lad's first steps in the path of natural history were taken in the pursuit of butterflies.

In any case both turned their attention to botany. The earliest publication of Decaisne of which we find any record is dated in 1831, and a few years later another memoir on certain Japanese plants was written in association with his old playmate. Decaisne became attached to the Museum of Natural History in Paris, at first in the capacity of gardener, but he was soon appointed one of the assistant naturalists (1840), and we know him to have been the pupil and friend of Adrien de Jussieu and that he succeeded Mirbel as *Professeur de Culture* and Director of the garden. In this capacity he published many memoirs, to some of which we must allude at greater length, and specially he published that magnificent series of coloured illustrations of fruits and descriptive text known as *Le Jardin Fruitier du Museum*. His observations were made upon the living trees, many of which his predecessor, Thouin, had got together and they are characterised by the same minute accuracy of detail and careful historical research that marks his other works. In spite, however, of the many excellencies of this superb work it is doubtful whether in the future Decaisne's researches as a pure botanist will not be more highly appreciated than his pomological labours. In any case in mentioning the latter now we are inverting the natural order of things, for long prior to the publication of this work Decaisne had achieved reputation by his studies among the Algæ. In 1841 he was the first to show that the common Coralline of our seashores was a genuine seaweed, all encrusted though it be with lime, and not a polyp, as had previously

been supposed. In association with the lamented Thuret also, Decaisne made those discoveries with relation to the male organs of the common Bladder-wrack (*Fucus*), and to the fertilisation of these seaweeds, which entirely revolutionised what was known on these matters previously. His paper on the anatomy and physiology of the common Madder (*Rubia*), at one time so largely used for dyeing purposes, is a veritable masterpiece of lucid exposition and exhaustive treatment and, considering the time at which it was written, and the limitations of the subject, one of the most able memoirs that have ever been published on the physiological history of plants and their bearing on practical cultivation and manufactures. The memoir on the Mistletoe, also, is one of those monographs which no advance in science can ever completely supersede. Decaisne's more recent publications have been almost entirely descriptive and systematic. He elaborated the *Asclepiadaceæ*, and the *Plantaginaceæ* for De Candolle's *Prodromus*. The *Geraniaceæ* were treated of in the *Revue Horticole*. Other families and genera were monographed in the archives of the Museum, the *Annales des Sciences*—of which he was at first, in conjunction with Brongniart, and afterwards by himself, the botanical editor—in the *Flore des Serres*, and other journals. *Rosacææ*, and more especially *Pomacææ*, received very great attention at his hands. By his researches in the development of the flower-bud, from the earliest stages to the adult condition, he made known the fact, now generally accepted, that the so-called calyx-tube of these plants—that which forms the eatable portion of the Apple and the Pear—is the top of the flower-stalk rendered swollen and succulent. Decaisne was an admirable draughtsman, and this circumstance, combined with his long-continued and very extensive studies in almost all branches of the vegetable kingdom, lend particular value to the general history of the natural orders which he published in conjunction with Le Maout, and which was issued in an English version under the editorship of Dr. (now Sir Joseph) Hooker. The extent and comprehensiveness of his studies, and the fact that, to a large extent, he had, where circumstances permitted, availed himself of observations and experiments on living plants, for which his position at the *Jardin des Plantes* gave him exceptional facilities, give special importance to his views as to the nature, limitations, and development of species. On these points Decaisne seems to have held opinions intermediate between those who would elevate every variation to the rank of a species and those who would combine all variations into a small number of species. His studies on the variability of fruit trees, aided as they were by observation and direct experiment, led him to reject the theory of Jordan, who sees in each one of the many hundreds of varieties of Apples and Pears a distinct species bounded within its own limitations, incapable of transgressing them or of becoming merged in another. Decaisne, of course, recognised that out of these hundreds of varieties none could be called wild, and he asks, therefore, with much cogency, if all these varieties are true species, where are they now, or where were they once wild? To escape the difficulty M. Jordan was obliged to assume that the wild forms were antediluvian, and all lost during the catastrophe except those which had been domesticated prior to the Deluge and which Noah took with him into the Ark! It will be new to pomologists that Noah was the most eminent of their race.

By observing the countless variations from seeds of Pears, Apples, Strawberries, and the like, Decaisne was compelled to acknowledge that they had all proceeded from a few original forms, and to that extent he may be claimed as an evolutionist. Moreover, he distinctly announced his conviction that Nature has not two ways of working in this matter, "she acts

in the fields as she does in the garden." Nevertheless he retained to the last a firm conviction in the existence of species and genera as understood in the pre-Darwinian days, and in their limitation by definite, though often extremely wide and elastic boundaries. Thus he was firmly convinced that the Apple (*Malus*) and the Pear (*Pyrus*) were two absolutely distinct genera, and that those botanists who, following Linnæus, combined the Apple genus (*Malus*) and the Pear genus (*Pyrus*) under one and the same, acted in opposition to the plain teachings of Nature. He showed the numerous points of difference, morphological and structural, between them, and denied the existence of any transitional forms between them sufficient to constitute one genus. As an instance of the thoroughness with which he investigated things, he communicated with the writer of this notice as to the existence of certain forms of malformation peculiar to the Pear and to the Apple respectively; thus, while twin Apples are not uncommon, twin Pears—*Zc.*, two Pears more or less united together, side by side—are almost, if not quite, unknown. On the other hand, while prolificuous Pears, in some shape or other, are extremely common, M. Decaisne had never seen a similar malformation in an Apple, and the present writer only once or twice, as contrasted with the many scores of similarly affected Pears that have passed through his hands. Similarly, Decaisne could not give his assent to those who would combine the Sorbs and the Quinces with the Apples and Pears under one genus. The alleged transformation of the wild Radish, Carrot, or Cabbage into the cultivated varieties was not credited by him.

Comparisons have often been instituted between the *Jardin des Plantes* and other botanic gardens, but not always fairly. The funds at the disposal of the administration of the garden have always been very modest in amount, while the idea of the authorities has hitherto been to maintain it as an educational establishment solely, and in no sense as a pleasure-ground. Whether this was a wise procedure, and whether better cultivation, more attractive arrangement, and a more catholic appreciation of botany and horticulture as a means both of popular and of strictly scientific education, would not have secured in the end, in an establishment supported by public funds, even greater benefits for pure science, are questions we do not care to discuss in this place. The idea which Decaisne held was that the *Jardin des Plantes* was exclusively a scientific establishment, like a university botanic garden, and that by keeping the houses for the most part closed to the general public, and only available to professed students he was enabled to retain and cultivate a considerable number of plants of scientific interest, but which are not attractive to the general public by the elegance of their vegetation or the brilliancy of their flowers. Decaisne thoroughly identified himself with the establishment which he directed, and he was ever ready, as we have reason to acknowledge with gratitude, to dispense the resources of the garden among his fellow workers, and to communicate to them the results of his own observations and study. In this manner, on many occasions, the readers of this journal for several years past have profited by the experience and knowledge of the eminent French botanist and pomologist. His devotion to his work was specially manifested in those most trying days—in 1870-71—when the German army begirt Paris. In January, 1871, over eighty shells fell within the precincts of the garden; some of the stoves were shattered to atoms, such as the Orchid-house, the Fern-house, part of the Palm-stove, the aquarium, and a house wherein were grouped together a collection of plants of special botanical interest. This destruction occurred at a

time when the thermometer registered  $-10^{\circ}$  C. of frost. For more than a fortnight this frightful state of things continued, Decaisne sticking to his post and doing his best to protect the plants under his charge. In the midst of all his cares his observant faculty led him to remark on the singularly different effects which the projectiles had upon various groups of plants. Writing to us early in 1871 he remarks how the *Pandanus*, the *Cyclanthus*, the *Dracenas*, had their leaves torn to ribbons, while the *Bromeliads* were not only uninjured by the explosions, but were not hurt by the frost which destroyed so many nearly allied plants. It will be remembered that our horticulturists, headed by the Royal Gardens at Kew, did their best to repair the losses which were then experienced, and that the greatest sympathy was felt for the administrators of this famous establishment, but in many cases the losses were irreparable. As Decaisne wrote pathetically at the time, "Who will restore the *Malpighiaceæ* that *Adrien de Jussieu*, the monographer of the order, gathered together with such pains and assiduity? Who could replace the historical plants of *Aublet*, of *Commerçon*, or *Du Petit Thouars*?" Ten years and more have elapsed since that dreadful period—ten years in which Decaisne, whether in his capacity as Academician, or as a publishing botanist, remained as active as many a younger man who had not passed through such terrible experiences.

In the year 1871 we published a slight sketch of the interesting history of the establishment over which Decaisne presided, and in the same year we gave a portrait of the eminent botanist to whom on so many occasions the readers of the *Gardeners' Chronicle* have had reason to be grateful. Decaisne died somewhat suddenly on the 8th inst., and was buried on the 10th in the presence of a large concourse of his former friends and associates.

## New Garden Plants.

COLUMNÆA KALBEVERERIANA. (Fig. 32.)

We have already alluded to this plant at p. 44; a full botanical description, together with a coloured illustration, will, we believe, be given in the *Botanical Magazine*. Suffice it here to say that it is a stove plant, the foliage of which is very striking, from the manner in which the lance-shaped leaves, which are opposite, curve downwards on either side of the stem. One leaf of each pair is much larger than the other, and the large and small leaves alternate, so that while that on the right is large that next above it on the same side of the stem is small, and so on. The leaves are dull green above, sometimes spotted with pale yellow, the lower surface being of a deep claret-red. The calyx is yellow, as is also the corolla, which latter is not shown in our illustration, taken from the plant when first exhibited by Messrs. Veitch, when it received a Botanical Certificate, though in an unexpanded condition. The corolla exceeds the calyx in length, and is marked with red stripes in the interior. It will make a very striking plant for exhibition purposes. The plant is also mentioned in the *Florist and Pomologist* for the present month.

CATTLEYA DORMANIANA, n. sp.; *prope eadem*, que LÆLIA DORMANIANA.

The first flowers I had from Mr. R. Bullen proved to be as much *Lælias* as those of *Lælia elegans*. There were sometimes eight independent pollinia, with four much smaller ones, at other times four cohering on both sides with the caudicle. Now Mons. D. Massange de Louvrex kindly sends me a flower of what is a true *Cattleya*, with four pollinia only. There is also a good mark of distinction in the perigone itself, it being distinctly coloured. Neither the sepals nor petals are blotched at all, but tinted with cinnamon all around the borders, leaving the disk alone greenish-yellow. There are also purple longitudinal stripes on the back, sides and front of the column. The pseudobulb and the two leaves (of

light red for very long time, as Mons. D. Massange observes) appear not to differ at all from what I had from Mr. R. Bullen.

One might have expected such phenomena, and yet one cannot help wondering at them. I feel as convinced as possible in such a case that

doubt it would be very desirable to watch the individuals, to ascertain whether they are constant in the character of their anthers. *H. G. Rehb. f.*

ARALIA QUINQUEFOLIA GRACILIS.

This is a shrub of slender habit, with very long cylin-

segments. Though no other *Aralia* was in flower at the same time as the plant of *A. quinquefolia*, none of the seedlings have come true, two-thirds of the batch being of the type now called *gracilis*. *Aralias* are, however, notoriously variable, leaves of different forms very often occurring even on the same individual

FIG. 32.—COLUMNNEA KALBREYERIANA: LEAVES CLARET-RED, FLOWERS YELLOW. (SEE P. 216.)

the parents of this and of *Laelia Dormaniana*, the prior type, are *Laelia pumila* and *Cattleya bicolor*. We have now a typical *Cattleya*, a starved *Laelia*, and we may expect a typical *Laelia* with eight developed pollinia. The Massangean plant may be of different origin, since it was purchased of Mr. Williams at the Victoria and Paradise Nursery. No

drial leaf-stalks, the blades being divided palmately into five linear remotely toothed segments. It comes from Messrs. Rodger, McClelland & Co., of Newry, in whose nursery it was raised from seed saved there from the typical *A. quinquefolia*, which, like one called *A. Scheffleria* in Continental gardens, is closer in habit, with shorter leaf-stalks, and much broader

plant. The plant before us is a very nice one, and will be very useful, especially as Mr. Smith informs us a few degrees of frost will not hurt it.

ODONTOGLOSSUM WILCKEANUM PALLIDUM, n. var.

This is a variety with light whitish sulphur-coloured flowers. There is one large brown spot on each

sepal, but there are no spots on the well-toothed acuminate petals. The lip is rather acute, nearly fimbriate, and has a few brown spots. I have to thank Mr. W. Bull for it. *H. G. Rehb. f.*

**ONCIDIUM LANCEANUM (Lindl.) LOUVREXIANUM, n. var.**

A magnificent variety of this good old plant, with very yellow sepals and petals, nicely spotted and marbled in a very pretty manner. The greatest charm is that while the base of the lip is of the finest, darkest mauve, the front part is of the purest white. All the flowers I saw had two anther-like organs at the very base of the stigmatic hollow. It was purchased at a Sanderian sale in Mr. Stevens' Rooms, July 8, 1880, and flowered at the Château de Bailionville, Marche, in the fine collection of Mons. D. Massage de Louvrex. I feel pleased to dedicate it to this enthusiastic grower of Orchids. *H. G. Rehb. f.*

**CYRIPEDIUM DISCOLOR, *hyb. ex typ. C. venusi.***

Leaves very fleshy, dark glaucous, scarcely showing vestiges of narrow hieroglyphical markings. Peduncle dark purple-brown, hairy. Bract very short. Odd sepal triangular, with sixteen dark purple stripes between the green nerves. Sepals connate in a triangular much-tapered bidentate emarginate body with a few green nerves, brownish-purple at the base. Petals ligulate, blunt acute, light reddish, green at the base, with numerous dark purple spots at the base, and a few bristles over the base. Lip, as in all types of the affinity, a long blunt shoe with lateral horns at side of the mouth, pallid reddish-brown with ochre-coloured areas. Staminode transversely elliptic, with an incision at the back, one in front with an intermediate tooth, pallid green with some short dark green venations. This is one of those already mentioned hybrids or aberrations which were raised in the collection of Mr. S. Warner. They are now in the hands of Mr. B. S. Williams. The name *discolor* is given both on account of the great contrast of perigone outside and inside, and the curious difference of colours on the lip. *H. G. Rehb. f.*

**CYRIPEDIUM WILLIAMSIANUM, n. *hyb., dub. orig.***

This is a fine thing, reminding one of *Cyripedium villosum*, and comparable to *Cyripedium Harrisianum* and its nearest relation, *Cyripedium Dauthieri*, that came from the garden of M. Massage de Louvrex, of Saint Gilles, where it was grown by M. Charles Kramer.

The leaves have a distinct darker network. Peduncle light brown, hairy. Bract green, with rows of dark brown-purple spots. Odd sepal oblong acute, very large, white, with dark blackish-brown middle line and prominent nerves green. Sepals reaching three-fifths of the length of the lip, of the same colour, without a dark middle line. Petals oblong ligulate acute, with very short bristles on both sides, dark brown middle line, nice reddish, with some sepia, on the upper side, white, with hue of lightest copper on the lower side, chief nerves all green on both sides, but nearly vanishing on the upper side. There are numerous small dark spots in rows near the base. The lip is like that of *Cyripedium villosum*, but the side horns on either side of the mouth are much shorter, ochre-yellowish beneath, light brown above, with an ochre limb around the border. Staminode light copper-ochre coloured, with few green nervilli, covered with short hairs.

This is the best of the Warnerian derived hybrids. It is a curious fact that in plants derived from same cross there appear such very different individuals. Look to the *Cattleya fausta* of Messrs. J. Veitch & Sons. Thus I should not be surprised if all these Warnerian hybrids were produced by fewer crosses than there appear distinct types. At all events, this curious neatly shining plant may bear the name of its present indefatigable possessor, Mr. B. S. Williams. *H. G. Rehb. f.*

**LYCASTE SULPHUREA.\***

This has a smaller flower than a good *Lycaste creuta*. The sepals are more acute; the superior sepal ligulate acute, the side ones oblong, markedly acute, all pallid sulphur coloured, with very small red blotches inside; petals oblong, apiculate, light sulphur coloured, with a few brownish-purple spots, and

a large dark purple blotch at the base. Lip pallid sulphur, purple between the side lacinae internally; callus and angles of the side lacinae inside deeper yellow, nearly orange; column much like that of *Lycaste creuta*, plump, short, broad at the base, light sulphur, deep brown, purple at the base, with brown purple spots above. There are not so many hairs at the base as in *Lycaste creuta*.

I suppose this to be a cross between *Lycaste Deppi* and *creuta*. Curiously enough, it appeared nearly at the same time with Mr. Williams' *Lycaste Deppi punctatissima*. I obtained what I have seen of this plant from Mr. W. Bull. *H. G. Rehb. f.*

**TACSONIA PARRITTE, Mast., n. sp.\* (fig. 34, p. 225).**

This is a new and very remarkable *Tacsonia*, the introduction of which is due to Senor Parra, better known as Parrita, who communicated it to Mr. Carder. The materials at our disposal consist of dried flowers and foliage together with a coloured illustration, which though in more than one point not botanically correct, is sufficient to show how remarkable an addition to our stove climbers this species is. The three-lobed leaves are glabrous above, pilose beneath, the stipules entire, subulate acuminate, the leaf-stalks channelled on the upper surface and provided with a variable number of sessile glands. The flower-stalks are cylindrical, longer than the leaves. The bracts unfortunately are wanting in our specimen, and are not represented in the sketch. The flower-tube is long, slender, and glabrous, distended and sulcate at the base; the five sepals are of a rosy-orange tint, oblong-hooded and provided with a remarkably deep wing terminating in an acute point, the wing being much deeper than in any other *Tacsonia* of which we have any knowledge, and the sharp points of which are shown in the sketch, wherein, however, the conformation of the flowers is not well brought out. The oblong-fat petals are considerably shorter than the sepals, and are of a rich orange colour. Judging from the dried specimens, the corona in the throat of the tube consists of an outer row of tooth-like projections, and an inner membranous fold bent downwards. The stalk supporting the stamens and ovary is very slender, the ovary itself elliptical and pilose. We are not cognisant of any species with this floral conformation and this peculiar colour, nor can we find mention of any similar plant in Messrs. Planchon and Triana's monograph, issued since our own enumeration in the *Flora Brasiliensis*. The stock is in the hands of Messrs. Shuttleworth, Carder & Co., who have introduced the plant from Tolima, and at whose request the plant is named. *M. T. M.*

**PEACHES AND NECTARINES OUTSIDE.**

The uncertainty of obtaining anything like regular crops of Peaches and Nectarines of the older sorts on outside walls has led to a falling off in their culture; but this deficiency has been met in many cases by erecting glass structures in which to grow them. That first-rate trees can be grown on walls needs no proving, though really good trees, such as those at Ditton Park, which were noticed in the last volume of the *Gardeners' Chronicle*, are not often met with at the present day. Within the last few years quite a host of new Peaches and Nectarines have been added to our older sorts, and it is of some of these new sorts that I wish to speak, as, judging from the free way in which they have fruited here during the past three or four seasons, there is still hope of once again obtaining good crops of these choice fruits on open walls.

Among the new Peaches the first place as a sure fruiter must be given to Sea Eagle. It is a handsome, moderately late Peach, and it has not failed here to set a full crop of fruit during the past three seasons,

and the fruit has ripened perfectly by the end of September. As a mid-season kind, Goshawk has proved the best. It is a large pale-coloured Peach, of first-rate quality, but rather coarse in the skin. It ripens about a fortnight earlier than Sea Eagle, and has never failed to set and carry a crop of fruit under adverse conditions. Among the earlier kinds, Alexandra Noblesse is the hardest, and it will prove a valuable acquisition for outside culture. It is said to be a seedling from the old Noblesse, which it certainly resembles in the fruit, but in hardness and freedom of growth it far surpasses its parent. Among the older kinds of Peaches that we have most frequently seen carrying crops, both in the North and in the South, are Crawford's Early, Bellegarde, Dymond, Malta, and Late Admirable.

Out of the new Nectarines there are three that deserve special notice; these are Lord Napier, Darwin, and Humboldt. The first-named is the finest Nectarine in cultivation; and is equally suitable for indoor or outside culture. It is the latest to open its flowers, and the earliest to ripen. We have never failed in having good crops of this kind outside; and we have had fruits of it from under glass that weighed over 7 oz. The best to succeed Lord Napier is Darwin. This is an Orange Nectarine, very like the old Pitmaston Orange in appearance, but it is with us quite three weeks earlier than the Pitmaston, and is equally rich in flavour. This variety has pleased us so well outside, both in quality and appearance, that we have this season planted it under glass. As a late variety to fruit to the end of September Humboldt is the best. This has every season set well here and ripened its fruit perfectly. It is an Orange Nectarine of the largest size, and will yet become popular both for indoors and for outside walls. Another fine Nectarine that always sets well outside is Victoria, but it is only in the finest seasons that it ripens outside, and is seldom satisfactory except under glass. When favoured with these conditions it is the finest late Nectarine in cultivation. There are two of the older sorts that I have so often seen carrying good crops on walls that they deserve mentioning; these are Balgown and Downton, and they are both first-class kinds.

In selecting trees for outside culture preference should be given to trees on stems about 3 feet high that have been grown in good sound loam free from rank manures, as gumming generally lays hold of over-stimulated young Peach trees, and when this is the case the trees soon present a ragged and unbalanced appearance. A tree on a 3 or 4 feet stem has an advantage over a dwarf in having its most tender and vital parts farther removed from the dampness of the surrounding border. Trees of this character should never be planted on walls less than 10 feet high.

The border should be thoroughly drained to ensure success, as it is impossible to get the wood in the best condition in an undrained border, and the trees are much slower in going to rest in autumn under the latter conditions, and seldom set well in spring owing to the sappy condition of the young wood. The best soil for the border is a good calcareous loam, ramming it in thoroughly firm. Where a soil of this character cannot be had then we recommend the best strong loam that can be got, and to this should be added one good barrowload of chalk to every cartload of loam, with the addition of a little burnt earth.

In training the trees adopt the fan system, as in no other way can the walls be so regularly furnished with fruiting wood. Of late we have seen many recommendations to grow young Peach trees like Willows, but this system will not do for outside trees, as we do not want growths for making baskets, but to produce fruit. Aim at getting moderate growths while the trees are young, and spread these thinly over the wall, using the thumb and finger in regulating the trees in summer in preference to using the knife too freely in winter. In the early stages of the trees a slight check at the roots will sometimes be advisable, which should be done early in the autumn. We prefer the trees nailed to the walls to any system of wiring we have yet seen adopted, and great care should be exercised in the nailing, as a shoot once bruised sooner or later dies a premature death from gumming. When the trees reach fruiting size, it is sometimes advisable to thin out the foliage in early autumn as soon as the fruit is gathered. This lets in the sun on the wood and the wall, and this materially assists the wood in ripening. When the wood is not fairly ripened, the trees often get into growth before they

\* *Lycaste sulphurea*.—*aff. L. creuta*, Lindl.; fore pallide sulphureo; lacinia laciniis lateribus semiovatis angulatis, lacinia antica ligulata acuminata reflexa, callo mediano obtusangulo (non quadrato). *H. G. Rehb. f.*

\* *Tacsonia Parritte*, Mast., sp. n.—Folius breviter petiolatis, petiolis glandulis sessilibus præditis; stipulis subulato-acuminatis integris, laminae superne glabrae subtus albido pilosae, e basi cuneata ovatis profunde trilobatis, lobis lanceolatis apiculatis remote denticulatis, lobo medio longiore; pedunculis teretibus foliis longioribus; bracteis haud visis; floribus 6 poll. long., roseo aurantiacis, tubo cylindrico basi ventricoso sulcato, segmentis externis (sepalis) oblongis obtuse scaphiformibus profunde alano-carinatis alae superne aristatis; segmentis internis (petalis) quam sepala dimidio brevioribus oblongis obtusis rubro-aurantiacis; corona faucibus duplitis (extera externa e processibus dentiformibus obtusiusculis erectis confusa, series interna e plicis cartilagineis inflexis constans); corona basilarum ad basin tubo membranacea inflexa; gynaedrophoro gracili exserta; ovario elliptico piloso. flower; when this occurs no time must be lost in dis-budding early, otherwise the growths will take all the strength of the tree from the blossoms, and the result will be failure. During hot, sunny weather it will be an advantage to the trees to cover their stems with haybands up to a little above their union with the stock. *J. Roberts, Gammersbury.*

### NORMANTON PARK,

THE seat of Lord Aveland, in Rutlandshire, is pleasantly situated midway between Stamford and Oakham, in a picturesque district charmingly wooded and surrounded by a park of over 500 acres in extent, in which a fine herd of deer is kept. My ambition to pass through Empingham grew more intense when I learned that it was by the same route their Royal Highnesses the Prince and Princess of Wales had travelled in January of the present year when they honoured Lord Aveland by a visit to Normanton, where preparations on a grand scale were made for their reception.

The avenue leading to the house from Empingham is a solid, clean, and well-kept road, ornamented by two fine rows of Sycamore and Beech. The mansion is of the Ionic style, rebuilt on the site of the earlier house at the close of the past century.

At the bottom of the grounds there is a stream which has been broadened into a lake, with an island in the centre to afford cover for the water-fowl, which are numerous upon the lake. The stream is a tributary of Rutland's river, of the gwash or wash of which Drayton in his *Polyolion* said—

“What river ever rose from bank or swelling hill  
Than Rutland's wandering wash a delicateser rill.”

Looking from the house across the lake there are beautifully wooded slopes, of which Hamilton Hill is most conspicuous, and extensive views of rich scenery abound in the direction of Exton Park and Burley-on-the-Hill. The terrace garden is on the north-west front, and is adorned with statues and ornamental trees. Spring gardening is here of great importance, and perhaps after all the spring garden is the sweetest of all outdoor garden enjoyments. Plant that is well spoken of at Normanton is *Heuchera lucida*, which produces an insignificant flower, but the “bronzes” foliage is said to be very pretty in the spring—plants, however, colour differently in different soils and situations. A glance at the Golden Alder on the island referred to reminds me that it is seen to best advantage in a distant situation, and the colour is so strong that the plant should be sparingly used, unless, indeed, a whole bed of it is planted for some special purpose. April and May are the two months to see the flower garden at Normanton, although the vases, statuary, and specimen trees are always of interest to the visitor whose mind is not wholly absorbed in summer flowers. The north-west wall is gay with a grand specimen of *Pyracantha* trained horizontally; its berries are so numerous and profusely produced that the wall is a picture of livid red, which is well shown off by its association with evergreen trees and shrubs; indeed, a general superabundance of green requires something associated with it, contrasting in a greater or less degree, or the eye grows weary of so much sameness of colour if there is nothing striking to vary the scene and brighten up the general effect.

Several good specimens of *Toxodius* and *Wellingtonias* are thriving upon a lawn by the side of a border of shrubs and mixed flowers comprising *Snowdrops*, *Crocus*, *Daffodils*, *Anemones*, and spring flowers generally. Flower gardening upon the grass has been carried out here for many years, and very naturally the plants appear to be disposed under and between the trees and shrubs.

The finest specimen *Wellingtonia* in the grounds is 47 feet high. The rockery upon the north side of the pleasure grounds is planted with a very interesting collection of alpine plants and Ferns—the latter, however, not doing well during the past summer, in consequence of the extreme drought. Some of the plants that struck me as being well adapted to the place, as well as being pretty, include the following:—*Saxifraga Wallacei*, *S. Mlawanae*, not so good as the former; *Hellelathemum oculatum*, cream colour, with a yellow centre; and *Red Dragon*, also very handsome as a rock plant, and of good habit for a sloping border either among stones or roots. At the base of the rockery Mr. Grey has managed to

establish some healthy clumps of *Primula denticulata*. The plant has been killed in many places where every condition seemed favourable to its cultivation, and yet it spreads rapidly among rocks where it is shielded from cutting winds. Even with the hardiest of plants there are many points to be considered in their cultivation. Other plants adapted for rock gardening are *Saxifraga pelata*, which throws flower-spikes from 12 to 18 and 24 inches high, and *Campanula garganica*.

Outside the rockery are some notable trees of *Cupressus macrocarpa*, *Wellingtonias*, and the deciduous *Cypress*, *Liquidambar styraciflua*, *Mespilus vulgaris*, 100 years old, and the feathered *Sumach*, which is a very handsome shrub for pleasure grounds in autumn. The Cedars of Lebanon have suffered from the effects of the past winter, rather than from the weight of snow resting upon their branches than from injury from frost. A large Mulberry tree bears the mark of great age, and also other trees which are dying of decay; but Mr. Grey has anticipated the inevitable result of old age, and planted many young trees several years ago, which will fill their places, if not with as much interest, at least with more effect.

The kitchen garden is entered from the north-west side, and there are two long borders planted with horizontal trained cordons a foot high at the back, which are pretty either in flower or in fruit. The borders are planted with bulbs and spring-flowering plants, and are a notable feature in these gardens during the spring months. The south-east wall running parallel with these borders is planted with Peach trees of the usual run of established sorts, which were bearing heavy crops, and are in good health and free from the attacks of insects, which accounts for the size and quality of the fruit. In one of the borders I noticed several patches of ornamental grasses which appeared to me to be most useful for arranging with cut flowers in autumn, and save the interminable slaughter that is made amongst the choicer kinds of exotic Ferns. One of the best out of several seemed to be *Pennisetum longistylum*, a handsome grass with a feathery plume, which would at least be an agreeable associate with floral arrangements for the dinner-table. The garden, I should have stated, is a square cut in two by a broad central walk having borders of hardy flowers upon either side. The most prolific varieties of Apples here are *Lord Suffield*, *Stirling Castle*, *Warner's King*, *Scarlet Nonpareil*, *Keswick Codlin*, and *Jolly Beggar*, all of which are to be supported, so heavy was the crop, and the size and quality of the fruit were also good. The south-west wall is planted with Peaches, the north-west wall with Pears and Plums, and the border with plants for spring bedding. Adjoining the large kitchen garden, there are three smaller ones taking the form of three triangles, and the walls of which are planted with healthy trees in full bearing. Morellos, of course, are always relegated to the north side of walls, and no more profitable crop can be grown in a garden. Many of the borders are used for growing flowers for cutting and for raising plants for spring bedding. Among the showiest flowers I noticed *Ceanothus macrosiphon*, a Valerian-like flower, raised from seed sown in the spring; *Delphinium*, also raised from seed; *Schizostylis coccinea*, coming into flower, and *Gladiolus Colvillei alba*. Apricots succeed well in one of these gardens, and the trees for a wonder are free from canker or disease. In the framing-ground, Azaleas and large plants of *Imantophyllum* miniature are being hardened by exposure to the weather, and other winter flowering plants are looking equally prosperous. The hot-houses, pits and frames contain excellent examples of plant and fruit growing. The first structure that I have to notice is a fernery chiefly filled with varieties of *Adiantum* for cutting, and plants for furnishing, of which large stocks are required during the winter and spring months. Mr. Grey adopts a very good system with this class of plants: he lowers the temperature gradually through the autumn in order to secure that firmness or hardiness which is necessary for plants to possess that are subjected to the rough usage of exposure, gaslight, and other deleterious influences which furnishing generally entails upon plants. *Cypripedium insigne* is grown in a cool frame during the summer, and never fails to yield abundance of flowers, which come in under the cool system of cultivation at mid-winter, when it is most important to have them; *Frioulas* are grown in large quantities; *Browallia elata* in small pots, flowering *Begonias* by the hundred, and *Fuchsia*

splendens and *Tree Carnations* for winter flowering in proportionate quantities.

The *Selaginella* Mr. Grey also uses largely for table-work, his favourites being *apoda* and *Kraussiana*. In a house of miscellaneous plants I noticed, among others, *Ardisia crenulata*, *Begonia Froebelli*, *B. insignis* and *B. metallica*; *Crotons*, *Dendrobium*, *Phaius grandiflora*, *Plumbago rosea*, *Anthurium Scherzerianum*, &c.

Mr. Grey also grows *Chrysanthemum frutescens* and *C. Etiole d'Or*, planted out in the open borders, and grand plants they make for lifting in the autumn. In the vineries good crops of *Muscats* and *Lady Downe's*, as black as Sloes, were ready for cutting, the early houses of course being cleared of their crops some time ago. It is hardly necessary to say, in conclusion, of so experienced a cultivator as Mr. Grey that his charge does him credit, and that fruits, vegetables, and plants, and everything else under his management gives evidence of high cultural skill, and a system of garden administration of the first order. *W. H.*

### THE COFFEE-LEAF DISEASE.

[We have received a lengthy communication from Mr. Storck (now resident in Fiji), and who was assistant to the late Dr. Seemann in his mission to these islands) on the means for combating the leaf-disease, *Hemileia*. Mr. Storck reviews the previous attempts that have been made, and then details his own method, which he claims to be effectual, and the principle of which is the diffusion through the plantations of carbolic acid vapour, injurious to the fungus. It is obvious that the success of the plan depends upon very many circumstances, which should induce cautious experiment on a small scale before embarking on a large one, such as the depth to which the fungus penetrates, the state of the weather, the condition of the Coffee-plant, the influence of the poisonous vapour upon it, &c. Should Mr. Storck's experiments prove in other hands as successful as according to his statements, supported by other testimony before us, they are in his own, he will prove a veritable benefactor, and should receive the reward of his public-spirited endeavours to remove a great scourge. It is obvious that the principle is applicable *mutatis mutandis* to the treatment of other plants affected with superficial moulds. Ed.]

My own method of application, says Mr. Storck, is purely atmospheric, and for the benefit of the countries and planters suffering from the ravages of *Hemileia vastatrix* I will now give a description of it. In doing this I rely, as regards my rights of priority and proprietorship in an invention of great importance, upon that spirit of justice and fair play so generally obtaining in the scientific and planting world.

An acre of Coffee land contains thirty-six centres of vaporisation formed by tin vessels to be mounted upon short sticks, and covered in a peculiar manner, to protect the contents from rain and rubbish, thereby preventing waste and undesirable dilution by rain of the fluid contents of the vessel. They consist of a mixture of carbolic acid and water in the proportion of from 3 to 10 per cent. of Calvert's best No. 5 acid, at the option of the operator. Any strength not exceeding 25 per cent. may be used, since nothing touches the plants or the soil, nor injures the tenderest young leaf or flower-bud. In starting the treatment I would recommend a first charge of 10 per cent. (5 per cent. is sufficient), and then a weekly supply of a density of 5 per cent., which will keep the strength of the fluid up to 3 per cent. for many months. An average labourer can in this manner attend to at least 50 acres per week. The first season's outlay per acre, including the first establishment of the system over an estate, will not reach £2 10s. per acre, and for any subsequent year it will not exceed £1. The present model of the vessel has an evaporating surface of 4 inches, but I am contemplating an improvement in it, which will better regulate evaporation, and do away with weekly supplies, while a further reduction in the item of labour will be effected. The vessels, holding rather over half a pint, can be manufactured wholesale at 4s. each, and are so modelled as to allow of the closest packing, the two parts separately; they will last for many years.

After eleven months of immunity from leaf disease enjoyed by the trees treated and cured by me, and of a new nursery I had made in the same way, a gang of labourers from the upper river carried infection back to the place. Among the subjects infected were two

Liberian Coffee trees, one among a cluster of five, and another some short distance off in a small plantation of forty, all just in full spike, and to my dismay I also found the nursery badly infected. As soon as I could get the materials I started my system of vapourisation (July 4 last). The two Liberian trees I simply furnished with a small bottle each, partly filled with my mixture of only 3 per cent., hung into the angle of the lowest branches. Both trees have now been perfectly free of the fungus for some weeks, and not a single one of their close neighbours has been infected. They prove to have been completely isolated by the treatment, not a single spore living to reach and infect the others, although in some instances almost touching. With the nursery, covering about three-quarters of an acre, I proceeded in the following manner:—Judging that with so small an area as the above I should be working at a disadvantage through the gas escaping beyond the limits of the area and going to waste in every direction, I arranged my centres of vapourisation a little closer than would be necessary on a large field, and put them 8 yards apart each way. The receptacles of the fluid and their covers were represented by ordinary cups and saucers. Pressing the cups slightly into the ground and mounting the inverted saucers upon three or four short sticks stuck closely round the rim of the cups, I left a clear space of about 1 inch in depth between the rim of the cup and the cover. They were then charged with a dilution of 3 per cent., and the effects noticeable after a few days were most startling. The ripe spores with which the plants, then some nine months old, were fairly reeking, began to change colour from the well-known bright orange to a dull ochre, until they subsequently turned into dirty yellow and then greyish-white. They all, instead of as usual dispersing, remained in a manner glued to the leaves, and afterwards dropped with them, dead, harmless, incapable of propagation. As time went on, all rust which came out began to look dull in colour and sickly, quite different from a healthy crop of spores. By degrees pale rings round the rust patches began to show, indicating the circumference of the mycelia and where their further development had been arrested. In the third month a large proportion of the spots appeared pale green, whitish round the edges, and as if drying up in the middle; some pushed out a few sickly spores, but very frequently none at all. The spots turned into dry tissue, and most of those leaves, unless too severely attacked, remained on the trees. Thenceforth a little dirty-looking rust still continued to appear, but the presence of the disease, up to its complete disappearance, was chiefly indicated by dead and dying mycelia. From what I have witnessed, bare contact with the vapourised atmosphere seems, if not immediately to kill the spores, to effectually incapacitate them for germination. From moving round in the nursery, examining the effects of the treatment, as I frequently did, I would often go in among healthy trees, handle their leaves, pull suckers and the like, but not a single instance of further infection took place among those trees, Liberian and Arabian, which were healthy when the process was started. With grown trees, having leaves of denser texture and more uniform age than nursery plants, which are almost always growing, the effects, although apparently slower at the beginning, are in the end still more pronounced. They lose a greater proportion of leaves at the start, but all disease upon them and in them is dead before the fall, at once neutralising a fruitful source of re-infection. In the case of fairly vigorous trees a new coat of clean foliage, never again to be soiled by the devastating parasite, will have formed by the time the last spore has disappeared.

My method of permanent vapourisation is specially adapted for a country like Ceylon, for instance, when self-sown Coffee in the forest and native garden patches present a standing menace of re-infection, which will defy any other treatment. With the permanent atmospheric treatment any spore of *Hemileia vastatrix* which comes in any way whatever within the radius of its influence must die. As I have asserted elsewhere—"Any one employing my process will reap the full benefit of his outlay, even though his neighbour's field next adjoining or just across the road may be reeking with disease for want of treatment. No live spore can be carried out of the area under treatment—nothing carried in can live, and re-infection becomes impossible."

For the guidance of any planters who may wish to give my system a trial, I will here give the following

directions:—Before my treatment comes into general use, so as to induce the wholesale manufacture of the specific tin vessel, planters will have to make shift as I did, with cups and saucers, which must be so placed that they will not be overturned or buried by storm-water coming down the hillside, which contingency is avoided with the tin-vessel mounted on a stick. Presuming the distances between the rows and in the rows of Coffee trees to be as usual (6 feet), commence at the corner of the field, say working from right to left, start with the third tree in third row, then follow the base line, placing a vessel in every sixth row between the third and fourth tree. When the base line is thus marked off, start at right angles along the rows, count six and place your vessels between the sixth and seventh trees in a line with the trees, so as not to obstruct work and passage; put down your cups, drive three to four short pegs immediately round the cups so as to steady them, and let the inverted saucer rest on the top of the pegs. They must be of even height and long enough to allow the spout of a watering-pot or other feeding vessel to pass through the row to save the trouble of lifting it every time—but they should not be so high as to allow rain and rubbish to be blown in by the wind; and then place a stone up to the size of a fist to make all more secure. This done you may go on charging your vessels with a density of at least 5 per cent., but, as said above, I would for the first charge recommend a density of 10 per cent. The effects of the first week's dense vapour will amply repay the extra outlay in striking a deathblow, not only against the rust in full development, but—which is the greatest triumph of my system—against the mycelium of the fungus. This first blow will under these circumstances save a large proportion of the foliage, unless too far gone, by instantly arresting the development of the fungus, and killing all that may be still alive on the dead and dying leaves strewn the ground. If the disease is not visibly present, all the better; if the carbolic vapour will in a short time force it to show itself, chiefly in the character of dying mycelia, and save still more or all of the foliage which would have gone in the next attack of disease. The treatment may be started at any time with equal advantage. One week's ordinary weather will be found to evaporate about one-third of the contents of the cups, and thenceforth weekly supplies of 5 per cent. will be quite sufficient. Should at any time during a spell of wet cool weather so little water have evaporated (evaporation of the acid goes on continually) that there is not room in the cups to receive the ordinary quantity of diluted acid, raise the density to 15 per cent. or more, or only give a few drops of undiluted acid. All this is easily calculated, and must be left to the discretion of the operator.

If planters are disinclined to make large experiments, they may try my system with as few as two acres, and they will soon see the contrast between them and the untreated portions of the field. One acre with another will only take thirty vessels. Six months after starting the process those 10 acres and a considerable margin all round will be in full foliage and crop, when the area outside the limit of effective vapourisation may be standing without a leaf, and the crop shrivelling and starving for want of shelter and the centre of a good rose-acre field, and the experiment, conducted with ordinary intelligence and regularity, will in a few months convince the most sceptical of the value of my method.

The chief merits of my method of permanent vapourisation may be summarised in the following:—

1. Undeniable simplicity.
2. Economy of material and labour.
3. The most perfect control.
4. Complete isolation of material from soil and plants.
5. Complete and unconditional immunity from leaf disease.

I could bring the evidence of several neighbours who have witnessed the condition of the nursery and the few solitary trees, and the effects of my process, but as it could serve no practical purpose I abstain from doing so.

Some months ago I applied to the Fijian Government for protection of my invention, and was refused on the strength of the reading of the local Patent Ordinance, which only partly covers the subject of my discovery, and only applies to inventions of a purely mechanical nature. My process has to be exhibited for many months in the open field, and cannot be kept under lock and key like a new machine, not to mention paltry matters, patented every day. Therefore I commend myself and my interests once more to the good-will and love of justice of the public. *Frank G. Stock, Belmont Estate, Rewa River, Fiji Islands, Nov. 25, 1881.*

ROSES ON THEIR OWN ROOTS: WINTER ROSES. —Some of our readers may recollect that I drew attention last year to the fact that on the Genoise Riviera Roses get rest through summer-heat and drought, and that after a few months' rest thus obtained they flourish and bloom freely again in the autumn, when started naturally by the autumn rains, or artificially by watering. I then omitted to mention a fact communicated to me by my gardener, which may be of use in England in striking cuttings. He tells me that when cuttings are taken from these shrivelled-up dry Roses, put in the ground in the blazing sun in September and well watered, the day temperature being about 75° F., and the night about 70° F., they almost all succeed—95 per cent. They throw out leaves within ten days, form a callus in thirty, and sufficient roots to bear transplanting and potting within two months. We struck some hundreds in that way last September, and the 48-pots into which they were transplanted are now full of roots. On the other hand not more than 10 or 15 per cent. of the cuttings, taken at the same time from flourishing well-nourished plants, and similarly treated, have rooted. The cuttings were principally from Madame Safrano, Madame Falcot, Gloire de Dijon, Souvenir de Malmaison, Mdle. Nabonnard and Rubra vera, a Bengal. Of these Roses, the Safrano is decidedly the best winter Rose in this climate; indeed, it is the one on which florists all but entirely depend for commercial purposes in January and February. Not only is it the hardiest winter Rose and the freest bloomer throughout winter, but it has a most valuable quality for the trade—its buds open out in water several days after it has been cut: thus they open freely in Paris and in London when sent by post from the South. Mdme. Falcot has the same inherent quality, and is very much akin to Safrano, although of rather rosier darker hue, but is not, by any means, so free a winter bloomer. I have always had blooms of it so far in the garden, but I have not been able to cut handfuls as I have done of the Safrano all through the winter up to now, February 7. I have found Safrano a late Rose in my English garden, flowering late into the autumn. It is the winter trade Rose here, and probably would be the same in Paris and London, if cultivated under glass for that purpose. It is pretty as an expanding bud, but loses its charm when fully open, being then loose because deficient in petals.

The next best Rose here in winter, at least in my garden, is unquestionably Mdle. Nabonnard, a very lovely Rose, introduced by M. Nabonnard, of Golt Juan, near Cannes. It is a large Rose, of a handsome flesh or light salmon colour, with numerous petals, and looks its best when fully expanded, the colour being then rich in the extreme. The petals are numerous, but are distinct, and the central ones are not crumpled up like those of the Gloire de Dijon. Like Safrano and Falcot, its buds open out in water several days after cutting, but not so readily as the former; that is, the flower must be half open when cut to go on opening, whereas mere buds of Safrano and Falcot open in water. It is not very generally cultivated even here, although it deserves to be, for one or two blooms lighten up a room for days, but I presume it is more delicate to rear. This autumn all our cuttings of this Rose failed, but my gardener says the failure was quite accidental, and that he has often struck it like the others. Banksias grow very freely here, attaining a large size, and they are good stocks for grafting other Roses on, such as the Gloire de Dijon and Cloth of Gold (Chromatella). They succeed perfectly on it, and grow with great vigour. The Gloire de Dijon holds its own as a hardy Rose, and has flowered all winter with me, but the flowers only open thoroughly in January and February in a very sunny sheltered situation, on a warm wall or hedge, for instance. In other less warm positions large buds form, but do not open in mid-winter. When cut also it remains where it is at the time, the flowers opening no further in water. The buds do not open at all once cut.

The Bengal Rubra vera has flowered freely all the

winter, and decorates the garden, but is only of use as a bud in nosegays; these buds do not open, and the fully expanded flowers fall to pieces almost at once. We have had Tea Lamarques until recently, and plenty of white Banksias freely flourishing in hedges. We also have some other Teas in flower, of which I do not know the name; but none of them have the precious faculty of expanding in water from the buds, and of thus flowering and flourishing after several days' journey. Souvenir de Malmaison flowered until Christmas, and then gave in; it cannot be called a winter Rose here.

In December our mean minimum was 44°.1; and maximum, 55°.2. In January the mean minimum was 44°.2; and the mean maximum was 54°.5. In December we had more rain than usual; in January we have had none at all after the 3d. The sea has been calm, the sunshine constant, and the weather glorious. It has been all but midsummer, except the cool nights, all along the coast from Genoa to Hyeres. The mean minimum for fifteen years, as given in my work on the Mediterranean, for Mentone, is:—December, 44°.2; January, 42°.8. The mean maximum is:—December, 55°.1; January, 53°.5. Thus, December was true to that average, whilst January has been warmer—minimum, 44°.3 instead of 42°.2; maximum, 55°.1 instead of 53°.5. *Henry Bennet, M.D., Mentone, Feb. 7.*

**PRUNING ROSES.**—With reference to the hard pruning of some kinds of Roses advocated generally by "Wild Rose," I may mention that a couple of old trees of *Maréchal Niel* having become apparently somewhat exhausted, I put the knife into them hard, with the result that strong shoots are bursting forth

Economic-house, each span-roofed, and 45 feet long, 28 feet wide, and 18 feet high. Again, on either side are span-roofed Orchid-houses, 45 feet long, 22 feet wide, and 14 feet high. At one end of the range there is a plant stove, and at the other a Succulent-house, each 40 feet long, 30 feet wide, and 21 feet high. Then running back at right angles from each of the end houses is a wing composed of a span-roofed house 35 feet long, 19 feet wide, and 12 feet high, and a circular house 35 feet by 30 feet and 16 feet high; the houses in one wing being for dwarf tropical plants and tropical aquatics, and in the other for dwarf temperate plants, Ferns, &c.

The base of the houses, so far as exposed to view, is to be of polished stone, and all the wood work to be of the best Moulmein Teak wood. The range is to be heated by three of Mr. Bullen's flued wrought iron boilers, each 8 feet long, and a small saddle boiler is provided to heat a row of pipes round the base of the upper roof of the Palm-house. Besides the main range there are to be erected at the back four forcing-houses, each 40 feet long and 10 feet wide; four cool frames, each 30 feet long and 5 feet wide; potting, soil, seed, and tool sheds, and rooms for young men. The boiler-house will be under the north end of the Palm-house, and about 16 feet below the floor level. Provision for storing water has also been provided for, in the form of twelve slate cisterns; and in the heating apparatus there will be ninety valves; the heating and ventilating arrangements also including all the latest improvements. The site of the new range is alongside the Kibble Crystal Palace, which is constructed of iron and glass, and which, it will be remembered, was also built by the Messrs. Boyd.

wealth of catkins on the Nut trees, but I know of none very near. Then there is, some quarter of a mile distant, a large breadth of *Mahonia Aquifolium*, a small quantity of which is in bloom, but I am not sure whether that furnishes the pollen. I remark, however, that the bees when they take flight rise high, and dart right away, evidently bent on a long journey, and apparently with the same confidence they would show were it May instead of February. Whilst we may be in doubt as to whence this food is obtained, there can be none as to its purpose, and we may reasonably hope that it indicates plenty of early and strong brood, and, not least, some early swarms. *Busy Bee.*

## The Poultry Yard.

**MATING FOR BREEDING.**—All fowls which are to supply eggs for hatching this spring should now be mated for breeding. In many instances this will have been done; but for March eggs, and later on, there is yet time. One of the main points to be observed in mating is to have good male birds. Cockerels, and those two years old, are the best. After this age they are not so good; but, apart from age, it is most important that the male should not be related closely, or at all, to the hens. In-breeding only begets infirm chickens and diminutive forms. This is not a question relating to exhibition stock alone, it applies to table fowls most particularly, and farmers and others who only breed chickens for home use cannot pay too much attention to this, as it is with such as them that we generally observe the smallest fowls. The remedy is simple, and the result sure. No matter whether the stock is pure or crossed, unfertile eggs are generally the result of having too many hens with one cock. Five hens now and through-

FIG. 33.—VIEW OF THE PROPOSED NEW RANGE IN THE GLASGOW BOTANIC GARDEN.

from the old hard stems in a way that shows there is plenty of life and vigour in the old dogs yet. Not the least remarkable breaks are from solid stems as big as broomsticks and as hard, the buds bursting out in the most unlooked-for places, and with a strength that promises presently a fine robust growth. If this be secured, the trees will get a new lease of life. These are under glass and are about eleven years of age, thus showing that in some places the *Maréchal Niel* lives and thrives to a fair age. No doubt, this as well as many other Roses, if enjoying the protection of glass, will bear almost any amount of cutting, but if it is desired to ensure a large number of medium-sized buttonhole buds, the cutting must be directed to that end. If large blooms are needed, hard cutting will best ensure that result. Very coarse growths in the open air are often pithy, and fail to ripen well, so that when severe weather comes the wood is killed wholesale. Glass not only gives the wood protection in hard weather, but it assists to ripen it also, so that doubly it is benefited. Some kinds, Lamarque for example, break so freely that often where one shoot is hard cut half-a-dozen will break out, and some of these will grow very strong. As this Rose flowers best from side shoots, it is better not to cut too hard, and thus ensure plenty of bloom. The *Maréchal Niel* is peculiarly a Rose that needs recuperation, and this is best got by forcing it to make new strong growth by hard pruning, and also by top-dressing the roots, for it is of little use to hope for new life unless the plant is assisted by ample nutrition. *A. D.*

The numerous plans we have seen seem arranged with a view to practical utility; and with such a cultivator as Mr. Bullen, and such a Director as Prof. Bayley Balfour, the old Glasgow garden ought speedily to resume the importance it had under the management of the late Sir W. Hooker. Glasgow is so favourably placed for the importation of new plants, that with the facilities now about to be offered we may look for great things in the future.

## The Apiary.

WITH such a winter as is the present one there should be a good honey-harvest. Bees are having a good time of it; they can get out to obtain plenty of fresh air, and are in the bright sunshine much strengthened. Of course if not well supplied with honey they need feeding, and doubtless it is well to feed in any case, as good honey may thus be saved. But it is quite remarkable to note how much the insects are already helping themselves to natural food. Here, even as early as the 10th, when the sun shone out and the air was clear, the bees were working almost as busily as if it were a pleasant day in April, and coming in laden with pollen mostly of a dull white colour. So many, indeed, seemed to be collecting pollen that they would come tumbling in one over the other a dozen at a time, just as though some large breadth of seed were near and in bloom. I have been much puzzled to understand from whence this pollen could come, and should like to be enlightened. I have thought that a quantity of *Corse* on Hounslow Heath might be in bloom; but that would be two miles away. Then there is quite a

out March are enough, and after that two or three more may be added.

**FEEDING FOWLS.**—Extra attention should be given to this now. As all should be laying now, and every egg should be fertile, soft warm food in the morning, and plenty of grain in the evening, will be found to agree with them well. Spratt's patent food, mixed with about an equal quantity of barley-meal, is a grand mixture for them. Buckwheat, English Wheat, Oats, and Indian Corn, are all good grains. Made-up mixtures of all together we do not approve; giving each kind by itself is what we approve. Then a change may be given daily, and this is what they enjoy. Once or twice a week is often enough to give Indian Corn. It is very fattening, and hens which are over-fat never lay well, and the eggs they do lay are seldom fit for setting, as they are generally deformed. At this season we have had cocks in poor condition, as they will sometimes hardly eat unless the hens are with them, and then they attend more to finding for them than themselves. Their condition may always be judged by taking them in the hands when they are on the roosts at night, and if too light they may be shut up a little while by themselves daily, and given some extra food. Indian Corn is good here. They may call on their mates for a long time, but in the end they will eat, and afterwards they may be let out again. *Henwife, South Wales.*

## GLASGOW BOTANIC GARDENS.

By the courtesy of Messrs. James Boyd & Sons, of Paisley, the architects and contractors, we are enabled to place before our readers a view of the fine new range of glass-houses shortly to be erected in the Glasgow Botanic Garden on the site of the old one (fig. 33). In the centre there is a Palm-house, 80 feet long, 50 feet wide, and 42 feet high, and on either side an

**ABIES FORTUNEI, LINDL.**—In the *Journal of Botany* Dr. Hance notes the occurrence of this tree near Fu-chau, and adds:—"I believe Lindley was quite right in referring this handsome tree to *Abies*, though *Carrière* has made a special genus, *Keteleeria*, of it. The cone-scales are not persistent, as stated by Parlatore, but they do not fall so early or so readily as usual in the genus." In museum specimens, however, the scales are certainly persistent. Bentham also refers the plants to the *Silver Firs* (*Abies*). Our much regretted friend, Andrew Murray, however, was the first to unravel the synonymy of this species.

## Orchid Notes and Cleanings.

**PHALANOPSIS STUARTIANA.**—In a recent visit to Mr. Lee's famous collection of Orchids, Leatherhead, I had the pleasure of seeing three very fine plants of this new and rare Orchid, all in flower. Till then I had no idea how very distinct is P. Stuartiana from all other known Phalanopsis, or what a truly beautiful Orchid Mr. Low has introduced for us. Mr. Lee's largest plant has several leaves, one of which measured 12 inches long and over 3 inches broad. The spike, which was then carrying a score of flowers, had both branches and branchlets, from which fact I think we may safely conclude that P. Stuartiana is very free-flowering, even more so, I should say, than P. Schilleriana. Mr. Low possesses dried specimens where on one spike a hundred flowers can be counted, which number, judging from the strength of Mr. Lee's plant, may be reasonably expected under cultivation; P. Stuartiana will then be a grand companion for P. Schilleriana, more than which could not be said of even the chimerical scarlet Phalanopsis, supposing it really appeared. Mr. Lee's appetite for new and rare Orchids is evidently a very keen one, and his grower, Mr. Wolford, must think his responsibility increasing at a rapid rate. *J. C. Snyers.*

**MASDEVALLIA CHELSONI.**—This is a hybrid between Veitchiana and amabilis. The flowers are irregularly funnel-shaped, the tube of the funnel curved, and the limb divided into one smaller and two lateral larger segments, all broad at the base, acute, and prolonged into long thread-like tails. The colour is indescribably rich and brilliant, suggesting orange, crimson, rose, lilac, or a combination of all these according to the direction in which the light falls on the flower. No artist could render the colour of this flower faithfully, still more impossible would it be to describe it in words. We have before us a flower from Mr. Lee's collection.

**CATLEYA TRIANE.**—Amongst several varieties of this species in flower in Messrs. Veitch's nursery at Chelsea, the form named Dodgsoni stands out very prominently for the large size and exquisite beauty of its flowers; these are quite 8 inches across, the sepals and petals of a beautiful pinkish-blush. The front margin of the lip is crimson, the basal portion being pale yellow. C. Triane alba is also very lovely, being pure white, except the base of the lip, which is pale yellow. Amongst the ordinary forms there is one with a most beautiful crimson lip, richer by many shades than the Dodgsoni form. Some years ago a discussion arose in the *Gardeners' Chronicle* as to the length of time this *Catleya* remained in flower, one good grower contending that it did not last more than a week. It is enough to say that the individual flowers on C. Dodgsoni remained in beauty on the plant in Messrs. Veitch's nursery for five weeks.

**ANGRECEM HYALOIDES.**—Amongst the rare little gems *Angræcum hyaloides* is one of the most charming. It is a tiny plant, in the way of, but smaller than A. citratum. On one little plant with one growth I counted seven spikes not more than 2 or 3 inches long, on which the small pure white flowers are thickly placed. There is quite a thicket of spikes on a small collection of A. citratum in the same house. This fine species is being better appreciated as it becomes more common.

**ORCHIDS FROM SEED.**—When Mr. Day was advised by his gardener not to seed his rare *Cypripedium*, owing to the great risk, it was simply because of its rarity that such advice was given, as other plants had shown a great dislike to it and even in some cases death had resulted. It was my good fortune to spend three years at Tottenham previous to the dispersion of Mr. Day's collection, and during that time I had a great deal to do with plants in all stages of development as regards seeding, and from very careful observation I can truly say that I was in nearly every instance satisfied it was doing harm. During these three years, many plants of each genus were impregnated, as *Cypripediums*, *Lælias*, *Cattleyas*, *Phalanopsis*, *Odontoglossums*, *Oncids*, and in one or

two cases *Vandas*. As regards *Cypripediums* many of these were seeded both by Mr. Day himself and his gardener, both of them very enthusiastic hybridists; some of the *Cypripeds* bore the trial fairly well, while others would after a time bear sufficient testimony that for them it was not the right thing. I found C. superbiens, C. vexillarium, and most forcibly the beautiful C. Spicerianum, amongst those that resisted the hybridist's endeavours the most: the last-named on one occasion bore a very fine pod, the cross being vexillarium, but so much did it seem to suffer, that in order to keep the plant alive we felt at last compelled to cut off the pod in order to save the plant, which in time regained its usual vigour. With our *Phalanopsis* we tried again and again to procure a cross, but always failed even when success seemed at hand. In fertilising these care was taken always to set the lower flower, and also to remove all other flowers from the spike to feel certain there should be no undue strain put upon the plant; yet these one by one lost heart, and in nearly every instance died from what we justly, I think, laid to impregnation. *Cattleyas* and *Lælias*, also, at times showed unmistakable signs of distress, owing, I believe, to the unusual size of the pod, and to the long time it often takes to perfect its seeds. *Odontoglossums* and *Oncidium*s show, by the much smaller bulbs they make during the time of carrying a seed-pod, that it must be taking vigour from the young growth. In concluding this note I will give verbatim my present employer's views, he being a great lover of Orchids and a most thorough hybridist:—"I have myself lost numerous plants, including a fine variety of *Anguloa eburnea*, and a good plant of the rare *Cypripedium Fairrieanum*." I may say that all Mr. Day's plants were far from "the last-straw stage of existence," as Mr. Douglas so forcibly puts it. *H. C., Forest Farm, Windsor Forest.*

**EPIDENDRUM WALLISII.**—This species has made growths 6 feet long in one season in Sir Trevor Lawrence's collection, and by the strength of the young growth partly formed perhaps a greater length will be attained. The long stems are well furnished with clusters of golden-yellow flowers, the sepals and petals sparingly marked with small spots; the whitish lip is marked with maroon-purple lines. Another species seldom seen in flower is *E. rhizophorum*. Here a thrifty plant of it has a compact cluster of its rich orange-scarlet flowers with a pair lip. Like many others of its family, it forms long, rod-like stems.

**LÆLIA ANCEPS.**—Growers are beginning to find out that this succeeds well with cool treatment. The variety alba is doing well in Mr. Bull's nursery in a cool-house, and in the Burford Lodge collection. Mr. Snyers has placed some grand varieties in juxtaposition with *Dendrobium Jamesianum* and *D. infundibulum*. On a recent visit the rare and beautiful *L. anceps Dawsoni* was over, but the variety rosea is an admirable companion to it, and was beautifully in flower; it scarcely differs from the form shown by the Messrs. Veitch under the name of *L. Veitchii*. The sepals and petals are white, with the faintest tinge of colour, the lip edged with pale purple, the labellum marked with purple lines, and the throat yellow.

**DENDROBIUM CRASSINODE BARBERIANUM.**—The remarkable growths, as well as the compact habit of this plant, of which there are some splendid varieties in flower in Sir Trevor Lawrence's collection, and well flowered too, almost every node having its quota—would place it at least equal with the grand *D. Wardianum*. There are several forms; one well-flowered plant with two spikes had been in flower five weeks. *D. Findlayianum*, in flower too, is a most distinct and beautiful species. When this was exhibited before the Floral Committee it did not receive the highest award given to new flowers, but as it is to be seen now, with its distinct habit, the flowers freely produced, of a delicate pinkish tint, with a bright yellow latch at the base of the lip, it would doubtless be more highly esteemed.

**VANDA CATHCARTII.**—Of this Sir Trevor Lawrence has probably the most remarkable plant yet seen in cultivation. It had four spikes of flowers open at once; on one spike there were four flowers, and on the other three spikes three flowers each. The singular flowers were well described at p. 192.

**ANGRECEM CITRATUM** is now to be seen in full beauty in the Burford Lodge collection. On one plant there were five long spikes, which would be in flower in a few weeks; others had two long spikes, all of them giving evidence of its free-flowering character. A *Kotschy* had just come out of flower, but Mr. Snyers thinks very highly of it, and places it before A. Ellisii. The strongest plant had a spike 2 feet long. It has been recently figured and described.

## The Kitchen Garden.

**SEED SOWING, &c.**—Should the weather keep dry for a few days longer the ground will be in capital condition for proceeding with the following operations:—Plant out Shallots, Garlic, and Chives in beds 4 feet wide, with an alley 1 foot wide between each bed, in rows 9 inches apart and 6 inches in the row. The beds should have an even and somewhat firm surface, over which some wood-ashes have been strewn; it should be patted down with the back of the spade, and when the bulbs have been planted—the Shallots inserted by the pressure of finger and thumb barely under the surface of the bed, and the Garlic and Chives a couple of inches deep—the bottom of the alleys should be made level; the beds will then present, as all seed-beds should do, a neat appearance.

Onions, as a rule, succeed Celery, therefore no time should now be lost in taking up the latter and laying the stems in as deep as before in a north border, and the ground should be manured and well dug. The ground, assuming it to be light and pulverised, should be trodden when sufficiently dry to prevent its adhering to the feet, raked and made level with a wooden rake and then rolled with a light roller and again raked, this time and subsequently with an iron rake, the ground having first received a good surface-dressing of dry soil and wood-ashes, after which the drills can be drawn 1 inch deep and 1 foot asunder, and the seed sown thinly and evenly in the drills. The soil should then be closed in over the seed with the feet, and again trodden down over each individual drill and rolled, and finally raked over in the same direction as the drills, so that the bed when finished may present a fine, firm, and even surface. As to varieties, of which I gave a list at p. 82 in your number for January 21, I would remark that the long-keeping varieties and those which are grown chiefly on account of their fine size and for autumn use, should be sown in proportion to their keeping qualities, and a few rows of Early White Naples should be sown to succeed the autumn-sown ones, also a few beds of the silver-skin variety for picklers, the latter being sown broadcast and rather thickly in a poor, dry, and shallow border, in order to prevent them from growing too large.

Carrots and Parsnips should also be sown in the same way as recommended for Onions, except that the rows should be farther apart—from 15 to 18 inches between each row. However, it will be advisable to make two sowings of Parsnips (of which the Hollow Crown and Maltese are good varieties), one now and the other about the end of April, the former for early and the latter for late use. Another sowing of Turnips (Snowball and Carter's Jersey Lily) and Early Nantes Horn Carrot should be made adjoining those previously sown. A small sowing should also be made in a favourable situation of the following seeds, namely:—Wheeler's Imperial Cabbage (or any other early variety), Early Ulm Savoy, Brussels Sprouts, Leek (Musselburgh), green and white Paris Cos Lettuce, and Grand Admiral Cabbage Lettuce, round-leaved Spinach (a row between the ranks of early Peas), and Early White and Scarlet Turnip-rooted Radishes—the latter under a south wall between the trees. As soon as the Cauliflower and Lettuce plants, which should now (excepting those intended for early use), be all planted out as recommended in previous Calendars, have been removed from cold pits, the latter should be got ready for and planted with some of the early kidneys from the shelves in the Potato-house, taking care that the young shoots are not broken off in the operation.

**RHUBARB, SEAKALE, &c.**—Where large quantities of Rhubarb roots are taken up annually for forcing it will be necessary to make fresh plantations of that variety every year, by dividing the roots and planting the divisions with the buds a couple of inches under the surface in rich deeply-trenched ground—the soil being rather light than otherwise—in order to maintain an adequate supply of good established roots for that purpose; therefore advantage should be taken of

the present fine dry weather to get this, together with the overhauling and replanting of the herb-borders, and any other operation that will be as well, and perhaps better, done now than a month later. In covering Rhubarb and Seakale crowns, place a number of Rhubarb pots—more or less according to circumstances—over some of the best established plants of a good early variety and if necessary cover them with long stable litter, a little of which should also be placed over the remaining crowns, which are now on the move, to protect them from injury from frost. The individual rows of Seakale we cover with boxes 8 feet long, 9 inches deep, and about the same width (inside measurement) which are made as follows:—Two boards of the dimensions above given and two end pieces—the latter an inch higher than the sides to keep the lid in its place—are nailed together, and a board of the proper length and breadth placed upon the top as a lid. The necessary number of rows having been covered with these boxes, as the latter are covered over, and the space between them filled with decayed leaves so as to thoroughly exclude light and air from the interior of the boxes; the natural result of plants thus treated is “Kale” of the best description—short, thick, and crisp.

**FORGING DEPARTMENT.**—Sow in pots Long Red, Cayenne, and Squash or Tomato-shaped Capsicums, placing them in a warm frame near the glass, and potting off singly in thumb-pots as soon as large enough to handle, returning them to the frame. Celery plants, too, when large enough, should be pricked out in rich, finely-sifted soil, 4 or 5 inches apart, in a frame near the glass, or in pots and boxes. If the latter are more convenient, and placed in a similar position, and then watered through a fine rose to settle the soil around the roots of the plants, which should be shaded from the mid-day sun for a few days until the roots have taken hold of the soil, when it should be discontinued, and sufficient air admitted to the frame to prevent the plants making a weakly growth. As the plants increase in growth so also should the ventilation be increased, and subsequently the sashes should be tilted up at night. A pinch of Tomato seed—the Trophy, in my opinion is the best for outdoor culture—should be sown at the end of the present month, as also Marjoram and Basil; also a pinch of Leek seed in a box to be pricked off subsequently and grown on for special purposes where necessary. *H. W. Ward, Longford Castle, Wilts.*

**WHEN TO SOW ONION SEED.**—Under this heading a correspondent endeavours to show that February is a better month in which to sow Onions than the time usually chosen; but to those who may feel inclined to be venturesome enough to commit their seed to the ground thus early I would just reiterate *Punch's* advice to those about to marry, and say, “Don't,” for although, as “W. H.” says, frost does not hurt the seed, I know it does the plants, as on several occasions we have had the tender tops of ours much cut and injured, and yet we never sow till towards the middle of March, which in most districts is quite early enough, as little or no growth can take place till April, and any check from cold to young seedlings always tells seriously against their progress even after fine weather sets in. This being so, there can be nothing gained by making the sowing in February; and it is far better, in my opinion, to wait and be late if the land is not in good order at the ordinary season than to risk having the seed lie so long in the earth, where, if wet sets in, or snow falls, a great deal of it is likely to rot. *J. S.* [We should add that “W. H.” hails from Surrey, and “J. S.” from Suffolk, Ed.]

—I have on several occasions sown Onion seed in February, as recommended by “W. H.” at p. 185, and had very good crops of Onions. One year—the ground being in excellent order—we sowed on February 7, and had afterwards a heavy fall of snow, which lay on the ground for a fortnight, but did not injure the seeds in the least, as we had a splendid crop that year. We sowed on the 9th this year, as the ground was then in good condition here. *H. Henderson, The Gardens, Hall Place, Cranleigh, Surrey.*

#### NOTES ON VEGETABLES.

**CULVERWELL'S GIANT MARROW PEAS.**—Had I written the article (p. 141) on “New Vegetables of 1881” I should have given the above Pea as much

prominence as possible, as I feel certain that of all new vegetables introduced during the past year none can surpass this in genuine merit. No one could name a fault it possesses, and those who prefer small-podded varieties to it stand greatly in their own light, and may be regarded as obstructors of advancement in Pea raising and growing. It grows freely, has a robust constitution, a most prolific habit, and the pods are the largest and best filled of all, while the flavour is second to none. Last spring I had a few seeds direct from Mr. Culverwell and some from two different seed firms, and in all cases the above are the points which it showed most prominently. *J. Muir, Margam, S. Wales.*

**CARTER'S INCOMPARABLE CRIMSON CELERY.**—This grows with me from 18 to 20 inches high, thick, solid, and crisp, and has that rich nutty flavour so desirable in a good Celery. My experience of it is for a late crop, but doubtless it is all that can be desired for early work. Col. Clarke's Solid Red, and Leicester Red, both bolted with me three weeks back, for which I blamed the mildness of the season; but I lifted ten dozen of Carter's Crimson only last week not one of which showed any signs of starting to flower. This I take as conclusive that it is the best variety I am acquainted with. *R. Gilbert, Burghley.*

**THE MAZAGAN BEAN.**—This is still quoted in many catalogues as an early variety, but it is a misnomer to term it such when compared with the Seville Early Longpod and the ordinary Early Longpod. That it is a hardy and free-bearing variety cannot be denied; but the truest Early Longpod is unquestionably the Seville, while for its dwarf growth it is a great cropper. Too much cannot be said in praise of this variety as an exhibition Bean, especially at shows held during the first and second weeks in July; it is the longest podded variety known, the pods often reaching a length of 1 foot or more. So great an advantage has this bean over any other on the exhibition table that a class for Longpods should be provided in schedules, so that the Windsor type may form a class of themselves.

#### Peaches and Nectarines.

The present time is a very busy one in this department, especially where there are a number of houses. The chief work in the early and second house for some time will be disbudding, thinning the fruit, and heeling down the young shoots. Pinch in close any shoots at the base of which there are fruit, and which may be taken off after the fruit is ripe. A little manure-water may now be put in the evaporating troughs, to keep red-spider in check, and trees that have set a heavy crop will be very much assisted by being mulched with good rotten manure, and afterwards well watered with tepid water at about the usual temperature, 85°. Take advantage of bright sunny days to shut up early, allowing the temperature to run up to 75° or 80°, syringing the trees well backwards and forwards with tepid water, thoroughly wetting every particle of foliage, and always doing it early enough to allow the trees to get dry before night. Keep the night temperature about the same as already given. If treated according to directions given, the third house will now be in bloom, and the fourth close upon its heels. Fertilise with the brush daily, or, if the weather is dull, on alternate days will be sufficient. My bees are dead, from some cause or other, or I should have introduced them again, as they did me good service last year. As soon as the fruits are fairly set, give a thorough watering with tepid water. Proceed with cleaning and tying late houses, so as to get all finished as soon as possible; for with all the ventilation we can possibly give, if we have a continuation of mild weather the buds will be on the move directly. It has this season been sharp work to keep pace with them. *J. Wallis, Keele Gardens, Feb. 14.*

**THE BEEKEEPERS' ASSOCIATION.**—On Wednesday afternoon the annual meeting of this Association was held, under the Presidency of the Baroness Burdett-Coats. The annual report stated that the number of members continued steadily to increase, the present total being 331. There is also an increase in the county beekeepers' associations in affiliation with the central society.

**STOVE.**—In this department the majority of the plants will soon be making good progress, being greatly aided by the unusually mild weather we are experiencing, whereby a nice growing, healthy atmosphere can be maintained without excessive firing. Give close attention still to the watering of newly potted plants; these should on no account be carelessly watered along now, or the evil results will be apparent during the summer.

**STOVE BULBOUS PLANTS.**—These are at all times valuable; many of them can be grown where other plants will not thrive. Alocasias are grand things when well done. These should be potted now before active growth commences. A. Lowii, A. Veitchii, A. Thibautiana, and A. metallica will thrive well in a compost of peat, such as one would use for Orchids, with the addition of some fair-sized pieces of charcoal, some sphagnum moss and silver sand—a good open porous soil suiting these kinds. A. macrorrhiza variegata will develop its variegated leaves to greater perfection when grown in a poor soil, in which loam predominates. A. Marshallii and A. Jenningsii may be treated like Caladiums. The stock of these latter plants should be gone through and repotted before they emit fresh rootlets. Remove all the old soil and dead roots from the bulbs, and see that no decaying portion of the old bulb is left on when repotted. For this purpose use a clean, sweet, open soil, with a good supply of leaf-mould and silver sand, and pot into rather small pots for a start; the most promising can later on be shifted into larger sizes as occasion may require. A batch of Achimenes and Tydasas should now be started. When growing these our practice used to be to separate all the stock entirely from the soil about now, and keep all that are not wanted for the first batch in sand until required to be started in their turn. Generas should be kept dormant a while longer yet, but any of the Gloriosas should be potted without delay to endeavour to get a good growth before they commence to flower. Pancratiums may be repotted, removing the offsets where this can be done easily. One good strong bulb of these is better kept singly. If several are grown in one pot together they generally come into flower at one time, which is not desirable, the flowers being short-lived. A better succession can be kept by growing each bulb by itself. In potting these plants a predominance of good loam should be used. Ureolina aurea may be grown under like treatment. Of bulbs thriving best in a temperate stove or intermediate house the Amaryllis stand in the front rank; those that are throwing up their flower-spikes should now be more freely watered. The flowers, when expanded, will be of greater substance, and the young growth succeeding the flower-spike will not become unduly elongated. Imantophyllums grown in the same temperature will soon push up their spikes; liquid manure will be beneficial to these occasionally. Ixanthus should be kept rather dry until signs of flowering appear, then treat them more liberally.

**GREENHOUSE.**—Keep this structure well ventilated in mild weather, and do not entirely close up at night unless signs of frost appear. All specimen hard-wooded plants that are wanted for late summer blooming should be retarded as much as possible; for this purpose a house with north aspect is invaluable. Plants of Pimelea mirabilis and P. decussata may be made to bloom in June and July by pinching out the points of the shoots during this month. Dracophyllum gracile may be treated likewise; the individual spikes will not be quite so fine, but extra numbers will help to compensate for that deficiency. Hycynthus intended for the latest bloom should be kept as cool as possible; they are unusually early this year, no doubt caused by the mild weather. Plants of the hardy Primulas, denticulata, and courtoisides amœna, are very pretty objects grown in pots for the greenhouse or conservatory, being distinct and attractive. These will soon push up their spikes, see therefore that they are watered freely. *James Hudson, Gunnersbury House.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Feb. 20	Sale of Imported Orchids, at Stevens' Rooms. Sale of Lilies, &c., at the Mart, by Protheroe & Morris.
TUESDAY,	Feb. 21	
WEDNESDAY,	Feb. 22	Clearance Sale at The Nurseries, Fulham, S.W., by Protheroe & Morris. Sales of Imported Orchids, and Hardy Plants and Bulbs, at Stevens' Rooms.
THURSDAY,	Feb. 23	
FRIDAY,	Feb. 24	Sale of Imported Orchids, at Stevens' Rooms. Sale of Roses, Hardy Plants, &c., at Stevens' Rooms.
SATURDAY,	Feb. 25	

THE annual meeting of THE ROYAL HORTICULTURAL SOCIETY, which took place on Tuesday last, did not appear to excite much interest among the Fellows, who, as the President remarked, reversed the ordinary rules, and flocked to the meeting when the Society was in adversity, but kept away from it when prosperity seemed returning. The report, too, from the Council was not of a very exciting character, and generally the proceedings seemed to indicate that the Council had the confidence of the Fellows at large. Lord ABERDARE repaired one omission in the report by paying tribute to the memory of the late Dr. DENNY, an ardent horticulturist and a good supporter of the true interests of the Society. He might well have gone further and alluded to the retirement of the late Treasurer, Mr. WEBB, who devoted much time most beneficially to the interests of the Society, and who, by his genial manner and generosity, endeared himself to all who came into contact with him. The retirement of Dr. HOGG from the post of Secretary should also surely have been mentioned. It will be remembered that he took office in troublous times, when few would have been found willing to accept so thankless a position, and throughout he managed to retain the confidence of the horticulturists. His services during the troublesome litigation forced on the Society by the Commissioners must have been of no light kind. The new members of Council are all men in whom the horticulturists may fully confide as gentlemen devoted to horticulture and the legitimate work of the Society. To outsiders it would appear that Mr. HAUGHTON, to whose energy and zeal the Society owes so much, would as a business man have made an excellent Secretary. He, however, retains office as Treasurer, while Major MASON, an excellent horticulturist, fills the office vacated by Dr. HOGG. The only objection that can be raised to Major MASON—and in busy times it would be a serious one—is his residence at a distance from London. The number of Fellows is steadily increasing, the yearly revenue is improving, and the purely horticultural routine work at Chiswick and at the Committees is on the whole well done. That more is not done to raise the tone of the Society, extend its operations, so as to make it more truly an exponent of national and scientific horticulture, is due to two causes—one, the insufficiency of funds, and the other the absence of any competent head to manage and direct the whole Institution, and see that its higher functions are duly attended to. Under existing circumstances the supply of this deficiency seems to be an impossibility. The popular lectures and demonstrations of the Rev. GEORGE HENSLAW meet with very general approval; and we trust the Society may soon see its way to bring before the public his elaborate report on the effects of the late severe winters on vegetation. Such a report, carefully and thoroughly done, would be of very great value, and would do much to restore the influence of the Society in a department which, from force of circumstances, has been much neglected of late years.

The balance-sheet, as it stands, presents opportunities for unfavourable criticism, but we believe that the items which appear questionable are readily and satisfactorily explained, and that the great deficiencies under some

heads, and the large amounts under others are due, not to any real discrepancies, but to the manner in which it has been thought well to draw up and present the balance-sheet. It is a pity that an explanatory sentence was not added to the report to remove the impression which many must have had on a superficial perusal of the documents in question. Thus the small amount mentioned as paid in prize-money is simply due to the fact that by far the larger part has been paid since Christmas, so that really the financial statement, so far as the year is concerned, is satisfactory.

The Society appears to have been rather unfortunate in its dealings with the Sanitary Exhibition, and specially with the managers of the Smoke Abatement Exhibition, who, after occupying the arcades for some time, and killing or seriously injuring many of the noble specimens in the conservatory, announce a loss on their business of about £800, from which the prospects of the Horticultural Society in this connection appears the reverse of satisfactory. It is to be hoped that in any future negotiations of this kind the Society may be enabled to make better bargains than it has hitherto done.

As to the lawsuit hanging over the Society, it will be remembered that a decision in favour of the Society was obtained, but that this decision was appealed against with results not yet known, but which it is expected will speedily be determined. Till this matter is settled all attempts to get beyond the ordinary routine must of necessity be held in abeyance. On the whole, in spite of the sword of DAMOCLES which hangs over the Society, the thread supporting it seems a strong one, and the position and prospects of the Society are at any rate considerably better than they once were, and for this relief horticulturists owe their thanks to the present Council.

— BRICK KILNS.—At the late Gloucester Assizes, Mr. W. FOSTER, of Spillmann's Court Nursery, Stroud, sought to recover damages from a brickmaker on account of injuries to the plants in his nursery, alleged to have been sustained by fumes from the defendant's brickworks. The case is reported at great length in the *Stroud Journal* of February 11, and is worth reading by all similarly circumstanced. For the present we can only mention the case, and hope to revert to it at another time. It must suffice to say now that the jury apparently thought either that Mr. FOSTER'S injuries were not severe, or that they were caused by some other agency, such as frost, rather than by the fumes of the brick-kilns, seeing that they awarded Mr. FOSTER £1 damages only. We are informed that the Judge expressed his dissatisfaction with the verdict, and that an application for a new trial will be made in London. This being so, further comment would be inappropriate, but we may say without impropriety that the contention in the case lately tried turned very much on the question of the difference between the effects of frost or of noxious vapours on particular plants—a difference that in the main ought surely to be readily recognisable by experienced plant-growers conversant with local circumstances.

— BRAZILIAN BROMELIACEÆ.—MM. ED. MORREN and H. FONSY have published a French version of the descriptions of the Bromeliaceæ discovered by Dr. WAURA during the journey of the Princes AUGUSTUS and FERDINAND of Saxe-Coburg, preceded by a narrative of their travels, to which we may hereafter allude at greater length.

— THE RAISER OF MAGNUM BONUM POTATO.—MR. CLARK, a native of Christchurch, Hants, the raiser of this Potato, has fallen upon evil times, so that several gentlemen who know his sterling worth, and appreciate his labours as a successful raiser, are desirous of showing their sympathy in a practical form. Donations of £25 have been received from Messrs. SUTTON, others from LOUISA, Marchioness

of Waterford, J. K. WELCH, Esq., and others. Messrs. FRAMPTON & SON, Highcliffe, Christchurch, Hants, will receive further subscriptions.

— VEITCH'S "MANUAL OF CONIFERS."—The utility of this very serviceable book has been very considerably enhanced by the publication of a full index in place of the imperfect one before issued. As many persons may have obtained the book who are not known to Messrs. VEITCH, we are requested by those gentlemen to state that a copy of the index will be supplied to those who have purchased the book, on application to the Royal Exotic Nursery. With this addition the *Manual* becomes by far the most useful and accurate book of its class.

— MR. THOMAS MOORE.—In consequence of a misapprehension which appears to exist with reference to Mr. MOORE'S retirement, we are requested by him to state more explicitly that it is from the co-Editorship of this journal that he has recently retired, and not from the Curatorship of the Chelsea Botanic Garden, or the Editorship of the *Florist and Pomologist*.

— THE HORTICULTURAL SOCIETY OF SEINE AND OISE will hold its annual flower show at Versailles from Thursday, May 18, to Sunday, May 21, inclusive. It will take place, as usual, under a large tent in the park of Versailles, close to the Palace. This show is usually one of the best round Paris.

— EUPATORIUM GRANDIFLORUM.—From Mr. T. SMITH, of Messrs. RODGER, McCLELLAND & Co.'s nursery, Newry, we have received a specimen of this plant, which gives one a good idea of its character for conservatory decoration. It is bushy in habit, with large ovate, lanceolate, rough, coarsely-toothed leaves, and much branched terminal panicles of white flower-heads. Mr. SMITH writes:—"It is one of the best plants in flower here just now. The one sent is two years old, and it is unlike most of the genus, inasmuch as one-year-old plants do not develop the fine heads of bloom that older plants do. My practice is to cut them down after blooming, and plant them out in rich soil in the open ground at the end of May. I do not stop them at all, and lift and pot them in September. The plant is curious in another respect. After being housed in the autumn it requires to be carried right on slowly through the winter; if it is put in a cool-house in order to retard it the lateral spikelets never develop, and the terminal ones come miserably small."

— THE ARTHUR VEITCH MEMORIAL FUND.—It has given us much pleasure to learn from Mr. E. R. CUTLER that the committee of the Gardeners' Royal Benevolent Institution has received the sum of £800 14s. 2d., being the amount collected by the Arthur Veitch Memorial Committee to perpetuate the memory of that gentleman, and which, by the express wish of the Memorial Committee, has been placed to the account of the Pension Augmentation Fund.

— FLOWERS IN SEASON.—From Messrs. CRIPPS' nursery, Tunbridge Wells, we have received flowers of the old *Hamelis virginica*, and of the more recently introduced *H. Zuccariniana*, which appears to us to be very closely allied, if not identical with the plant figured by us some years ago as *H. arborea*, and which is not half so well known, as a winter-flowering shrub, as its merits demand. *Nuttallia ceratiformis* is also flowering freely, as well as double Lilac and white Primroses.

— THRIPS.—MR. TH. FERGANDE, 321, D Street, Washington, writes that he is making a study of the Thrips insects in their various forms, and is very desirous of obtaining specimens from all parts of the globe; and trusts that some of our readers, home and colonial, may favour him with specimens. These insects are very small, mostly vegetable feeders, and increase periodically, as gardeners and farmers know to their cost.

— SPORTING IN BEGONIAS.—In some of the Continental gardening papers it is stated that a gardener of Nancy has obtained several varieties in propagating *Begonia Contessa Ackermann*, according to the part of the plant employed. Thus, cuttings of

FIG. 34.—TACSONIA PARRITE: FLOWERS ROSY-ORANGE. (SEE P. 218.)

the stem produced plants bearing leaves of the same colour as the parent—that is, green suffused with red and dotted with white; whereas cuttings of the leaves produced plants bearing leaves not only more spotted but banded. Uncult leaves developed in their centre several plants whereof one had spotted leaves and the rest had banded leaves. We agree with Dr. REGEL that this result requires confirmation. It was probably an accidental circumstance.

— DR. NEUBERT'S "DEUTESCHES GARTEN-MAGAZIN."—We have received the first number of a new series of this gardening monthly, now under the joint editorship of MAX KOLEB, Inspector of the Royal Gardens, Munich, and Dr. J. E. WEISS, botanist. It has been enlarged, and it is to be more fully illustrated than heretofore. The present part contains coloured plates of *Nymphpha zanzibaricensis* and *Tilandsia Zahnii*. As far as the latter is concerned, the illustration is not very satisfactory. There are thirty pages of letterpress (large 8vo), devoted to the various branches of gardening.

— THE FUNCTION OF LIME IN GERMINATING SEEDS.—Dr. LIEBENBERG has recently published, in the organ of the Vienna Academy of Sciences, the results of some researches on the part played by lime in the germination of seeds, from which it appears that there is a great number of plants of which the seeds require lime during germination, or the young plants die off from want of it. On the other hand there are plants that do not need this supply of lime in germination. Dr. LIEBENBERG further observes that the plants that die off in consequence of an insufficient supply of lime, do not die from the injurious effects of the solutions devoid of lime, but because lime is required in the nutrition of the plant. The author, however, was unable to determine with certainty the purpose of lime in plants, though he proved beyond doubt that the absence of it did not affect the formation of starch.

— THE KEW MUSEUMS.—In the wood museum is now exhibited a life-size painting, reaching from floor to roof, of the gigantic Aroid, *Conophallus Titanum*, which has more than once been alluded to in our columns (see p. 781, vol. x.). The two life-sized portraits of Malays bearing the spadix and tuber of the gigantic plant on a pole resting on their shoulders, and standing beneath the shade of the enormous solitary leaf, constitute a very striking picture, and appeal to the spectator in a manner that no numerical indication of feet and inches could do. In the old museum the Cryptogam collections have been advantageously and most instructively displayed; while the gallery executed by Mr. FERGUSON, at the expense of Miss NORTH, for the reception of her drawings of flowers, as numerous as they are extraordinary, is rapidly approaching completion. The memorial as to the formation of a rock garden has been so far successful that plans are under consideration how best to carry out the scheme, which when realised cannot fail to add to the attractions and increase the value of these gardens. The vitality and energy pervading this great national establishment are subjects for congratulation.

— PULMONARIAS AS POT PLANTS.—Gardeners who can force plants into flower *ad libitum* need scarcely trouble their heads about getting hardy plants early into flower, except such indispensable things as Hyacinths, Tulips, Crocus, Violets, &c. But there are a great many who have but a cold house on which to depend for a supply of plants, and anything that is early and attractive is of use to this class of gardeners. The varieties of Pulmonaria officialis in the open border are pushing up their leaves and flower-stems, and if lifted, potted, and put in a cold frame or the cold house will soon display their beauty both of flowers and foliage, and they are equally of a high order. Some plants of what is known at Kew as *Pulmonaria saccharata grandiflora* that have been in pots all the winter in a cold house have already begun to flower, strong plants throwing up as many as five or six blooming spikes of pale red flowers, changing to blue as they age. The leaves, too, are rapidly developing, and when matured are handsomely spotted with grey on a whitish-green ground. All hardy plants of this character grown in pots for flowering in early spring should be planted out in a prepared bed after flowering, as if kept in pots in the house the foliage is apt to become infested

with red-spider. There is something akin to a feeling of liberty in plants so treated, as they make a free growth in good soil, and will bear division in autumn or when lifted for potting.

— EXHIBITION OF CANADIAN VEGETABLE PRODUCTS IN GERMANY.—Last autumn, as reported in NEUBERT'S *Deutsches Garten-Magazin*, an exhibition of Canadian cereals, grasses, fodder plants, fruits, &c., instituted by Dr. OTTO HAHN, was held in Reutlingen. The object of the exhibition was to instruct intending emigrants in the resources of the country and its advantages to those seeking a new home. The products were collected by four young German settlers—two gardeners and two farmers, and seem to have been of a very good quality. A collection of Apples is very favourably reported by the pomologist, Dr. E. LUCAS, who selects ten out of the fifty sorts, which he says are of superior quality, and at the same time excellent market fruit. These are:—Baldwin, Ben Davis, Ible Pearmain, Clyde Beauty, Falmouth, Hubbard's Nonesuch? ("Hubbards non such"—Hubbard's Fearnim) Irish Crofter, Northern Spy, Red Rombo, and Spitzenburg.

— HYGROSCOPIC PROPERTIES OF THE INVOLUCRAL LEAVES OF THISTLES.—A week or two ago we published a note on some hygroscopic plants belonging to the Compositæ, in which there is an incidental allusion to the hygroscopic properties of the involucre bracts of some of the Thistles. It will be remembered that the branches of the whole plant of *Asteriscus pygmeus* and *Gymnarhena micrantha*, under the influence of the drought that prevails after the flowering season close up over the flower-heads so tightly as to prevent the seed from being shed until the rains return, though driven hither and thither by the winds. These plants open and close repeatedly under the alternate influence of wet and drought. In some at least of the Thistles the involucre leaves surrounding the head of flowers close over the flowers or achenes in wet weather, and open in dry. Professor ROTHAY, of Vienna, as we learn from the *Gartenflora*, has been investigating this phenomenon, and he finds that the mechanism of the movement lies in a special tissue (sclerenchym) immediately under the epidermis of the under or outer side of the involucre leaves, which lengthens under the influence of imbibed moisture, and shortens when dry. How long the achenes usually remain enclosed within the involucre we are not told.

— LENGTH OF PINE CONES.—In a reprint of an article on *Conifere*, by Mr. STARKIE GARDNER, a statement that *Pinus excelsa* bears cones 1 to 2 feet long, took us so much by surprise that we have ascertained the length of the longest cones of several species of *Pinus* in the Kew Museum, though of course we are not prepared to say that longer ones do not exist. The largest of the Himalayan *Pinus excelsa*, is 15 inches; *P. Lambertiana*, a North-west American species, is represented by a cone 19 inches long—the longest in that rich collection; *P. Grevilleæ*, a Mexican species figured in the *Gardeners' Chronicle*, n.s., xv., p. 113, by one 15 inches long; and a cone of the Mexican *P. Ayacahuite* exceeds the last by half an inch.

— CURTISS' FLORIDA PLANTS.—Botanists occupying themselves with North American plants have for some time past appreciated the excellent specimens prepared and distributed by Mr. A. H. CURTISS, Jacksonville, Florida. We now learn that the same collector undertakes to supply living plants and seeds of many of the most ornamental and interesting Florida plants. As many of these plants cannot be procured through the ordinary channel, some of our readers may be interested in this announcement.

— PEZIZA' COCCINEA.—We were much pleased, a few days since, at Clifton, to see a basket containing beautiful specimens of *Peziza coccinea*, of which an orange-coloured variety has lately been shown to us, artistically packed in green moss, as a table decoration. We understand that it is frequently offered for sale in the market for this purpose. It is not the first time that we have heard of its being so used, indeed, we know of an instance where it was employed with such effect that a person present, charmed with its great beauty, became from that day a diligent student of fungi. The hint may prove a very useful one, for there are many species of equal beauty, though of

different habit, which could not fail if nicely disposed to attract admiration. Care should be taken to choose such kinds as do not lose their colour, and are free from any pronounced odour. Some of the more elegant kinds of moss, especially when in fruit, might make a very welcome addition. Fungi would then cease to be considered and despised as the exuvia of Nature, to be contemptuously trampled on or rejected. *M. J. B.*

— OUVIRANDRA FENESTRALIS.—This singular plant is now to be seen in capital condition in one of the Orchid-houses in the collection of Sir Trevor LAWRENCE, Bart., M.P., Burford Lodge, Dorking. In many gardens considerable expense has been incurred in order to grow this plant, but even when the conditions thought to be most favourable to it have been obtained it does not always succeed. Here it is grown in an oval tub, containing less than a dozen gallons of water, and a few inches of sandy loam at the bottom. The depth of water is just 8 inches. The water is packed full of leaves, many of them a foot long, and very nearly 6 inches across. There is a constant drip of water from a syphon placed in another vessel on a higher level, and that is all the conditions. The temperature of the house is regulated to suit other Madagascarian plants, such as *Angraecum*, &c. Mr. SPYERS is to be congratulated on growing this interesting plant so well.

— THE PHYSIOLOGICAL LABORATORY AT KEW.—We are pleased to find that the resources of this, one of the latest additions to the Garden, are at present utilised to the fullest possible extent. Mr. BOWER has been investigating the structure and development of *Welwitschia*, and the results are memoirs which, like those of Mr. MARSHALL WARD on the development of the embryo sac, made in the same establishment, do honour to British science, and go far towards removing the stigma that original research in this department of botany is comparatively neglected in England. Such work will compare favourably with the best work in German laboratories. In the last-named country, however, such institutes may be counted by the dozen. Professor CHURCH is also at work in the Kew Laboratory on the chemical history of the colouring matters of plants—a subject on which he has already published a valuable series of researches, and Messrs. CROSS and BEVAN are pursuing investigations into the life-history of plants in special relation to the formation and changes during growth in the bast tissues.

— TESTIMONIAL TO MR. GEORGE BAKER.—On the occasion of the annual meeting of the members of the United Horticultural Benefit and Provident Society, at the Caledonian Hotel, Adelphi Terrace, on Monday evening, the 13th inst., the members presented Mr. GEORGE BAKER, of Coombe, with a testimonial of their esteem and gratitude on his resigning the office of treasurer of the Society after a term of office of something like twelve years. Mr. BAKER was one of the original members of the Society since its formation in 1866, and he has ever been an earnest worker in its interest. The testimonial, which was privately subscribed for among the members, and of the existence of which Mr. BAKER had no knowledge till it was placed on the table before him, consisted of a silver teapot, sugar-basin, and cream ewer.

— FICUS MINIMA.—This chaste little wall-creeper, which has withstood the severity of the past three winters out-of-doors in Mr. KINGIORN'S nursery, Richmond, will make a welcome addition to our stock of evergreen creepers for select situations out-of-doors. The plant in Mr. KINGIORN'S nursery has its roots under glass, but it can hardly be supposed that this protection to its roots will contribute in any way to the hardness of the plant, rather the reverse. The plant occupies an east aspect, and seems quite weather-proof. The little tiny leaves of the plant (it is much smaller than *F. repens*) are so numerous, and are so thickly set upon the stems, as to form a dense green covering, which would give many an unsightly wall quite a cheery aspect at all seasons of the year, and will be especially useful to amateurs for covering naked places about villa residences, where a great many things have to be done within a limited space. It need hardly be added that the plant clings like Ivy, or like its congener, *F. repens*, while it is much neater and more chaste in appearance.

— *ARALIA LEPTOPHYLLA*.—Those who have much experience in furnishing are only too well aware of the losses sustained by using tender stove-plants in anything like quantity during the winter months. All the *Aralias* are somewhat expensive, owing to the fact that they have to be increased by grafting, and are not very rapid growers. But, notwithstanding this, the stove varieties, such as *A. Veitchii* and *A. elegantissima*, are commonly employed for purposes of furnishing, much to the detriment of the plants, and without yielding any compensating effect in proportion to their value. The variety under notice is a greenhouse plant, and is therefore less liable to injury from a low temperature than the more tender stove kinds. The habit of the plant is much superior to *A. Veitchii*, its long narrow drooping leaves being both graceful and effective. Effect is really the point aimed at in furnishing, and if this can be produced equal to, if not better, by the employment of half-hardy plants, it seems anything but economy to use tender-leaved plants for no better reason than that they cost a higher price.

— *AUBRIETIAS*.—It is only where the *Aubrietia* is left pretty much to its own sweet will that we see it in all its beauty. When transplanted twice in the year for spring bedding, and often propagated by pulling to pieces, it is seldom seen in even decent form; and, indeed, is perhaps one of the worst plants that can be used for such a purpose. Still farther, it does not thrive well where the soil is flat and stiff, for there the moisture in the winter months lies about the roots, and not only injures them, but also provokes decay in the leafage. Under no conditions are *Aubrietias* seen in better form than when growing over rock or rootwork, or on sharp slopes where there is no stagnant moisture. One of the very best masses of the *Aubrietia* we have seen is where some plants are in an old tub sunk in the ground, and elevated about 9 inches above the surrounding soil. Some stones placed about on the soil amongst the plants keep the growth dry and healthy and in a perfect mass of greenery, and presently of flower, and where the growth to a length of 12 or more inches runs down over the sides of the tub, it is quite luxuriant, and shows how capital a plant it is for the covering of narrow slopes. In places where, as under trees, turf will not thrive, the *Aubrietia* might well be tried as an edging plant, provided that it was thus enabled to trail downwards in its most natural way. Strong growing kinds, such as *Hendersoni* and *violacea*, both rich dark coloured forms, and *græca* and *Campbelli*, paler ones, are the best for the purpose. It is worthy of remark that *violacea* is a free seeder, and reproduces itself freely. As the seed is ripe in June, if sown at once quite large plants may be got for planting out in the autumn, and then with natural cultivation a rich display of dark coloured flower is ensured. Where the growth is thus natural, robust, and unharmed by frost or damp, the bloom is much earlier and more enduring, in fact, makes a good show for three months' duration.

— *THE DOUBLE WHITE PLUM* (*Prunus alba flore-pleno*).—Few plants are more charming to look at or more delicate in appearance than the subject of this note, which is an old plant, not exactly forgotten, but rather neglected than otherwise, considering its claims upon horticulturists as an early spring flowering plant. The profusion in which its double white flowers are produced, and the extreme delicacy blending so beautifully with its tender green leaves, need only be seen once to be duly appreciated and admired by those who have not already included it among their lists of forcing plants. Arranged in conjunction with scarlet Tulips or red and scarlet Azaleas it has a fine effect.

— *CULTIVATION OF FIGS IN THE COLONIES*.—*The Colonies and India*, in recommending the cultivation of the Fig in some of our colonial possessions, points out that "Plantations have already been made in certain districts in Australia, but in all parts of that continent there is abundant opportunity for the extensive cultivation of the tree if only for the sake of its beautiful foliage in the treeless wastes in some portions of the interior. Of all the numerous varieties of Ficus scattered over the tropical and temperate zones, there is none more easily cultivated, none more striking in appearance, and none more profitable than the *Ficus Carica*. Its fruits eaten green or sun dried are both palatable and nutritious, and the enormous

demand that exists for them is shown by the fact that the annual imports into Great Britain, chiefly from Southern Europe and the Levant, amount to over a thousand tons, while the United States import half a million dollars' worth yearly. According to the *New York Sun*, in Georgia, where the Fig bears two crops, an ordinary tree, six or seven years old, will produce 5 or 6 bushels of fruit annually, while twice or thrice that quantity may be expected from large old trees. There are trees in Eastern Florida that may be trusted to yield from 20 to 30 bushels of Figs a year. At Santa Barbara, California, it is said that a tree ten years old will bear about 800 lb. of fruit a year. In Alabama it is considered the most prolific of all fruit trees; and from Texas it is reported that the fruit succeeds perfectly all over the State. The tree is more hardy than is generally supposed, and if it will grow so well in tropical countries, and in the West Indies, in Fiji, throughout Australia and the greater part of New Zealand, in South Africa, in India—indeed, almost throughout our colonies and Indian empire. Figs ought to be a staple product. The ease with which the fruit is dried and packed is an important point in its favour."

— *CLOVE CARNATION MRS. LAZENBY*.—A good yellow self *Clove* is always acceptable, especially when in combination with a good habit. These two desirable characteristics are found in the variety under notice. It is, perhaps, more properly a *Picotée*; the flowers are large, well formed, of a good yellow colour, and it has, as already stated, a good habit of growth—in fact, a robust habit. Take *Courier*, *scarlet*; *Bella*, delicate blush; *Corsair*, rich deep purple; *Mrs. Lazenby*, yellow; *Eliza*, violet-purple; *Susan Askey*, white; and *Sybil*, beautiful bright rose, and we get a batch of beautiful varieties, good growers in the main, and most valuable for cutting from. It is easy to multiply these, but the foregoing gives a select collection to commence with, to which additions can be made as sterling varieties present themselves to notice.

— *KEISER'S KROON TULIP*.—This *Tulip*, which is of comparatively recent introduction, is a remarkably vigorous variety, and is an undoubted acquisition to its class. The flower is seen at its best before it is fully open. It is long, oval-shaped, rather a tall grower, and will be found in consequence to be a good variety for grouping with other spring flowers. The variety was sent out as being red and yellow, but the yellow is more of an orange, which adds to its merit and appearance. Mr. H. CHAPMAN has some good examples of it in flower in his nursery at Otland Park, Weybridge, Surrey, where it is highly spoken of as a showy variety, and is very effectively used in the show-house, where it has a conspicuous appearance, and quite bears out Mr. CHAPMAN'S eulogy of its usefulness for purposes of grouping.

— *THE WEATHER*.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending February 13, issued by the Meteorological Office, London.—The weather has been generally cloudy or dull, but towards the close of the period the sky cleared somewhat in the south and east, and at some stations the weather became very fine and bright. Temperature has been equal to the mean in "England, E.," but above it elsewhere; over Ireland and Scotland the excess was as much as 4° or 5°. The thermometer was highest on the 12th and 13th, when it rose to 57° in London, and to 55° or 56° at many other stations. The minimum reading for the period (28°) was registered at Cullompton on the 7th. Rainfall has again been less than the mean in England, but in Ireland and Scotland the fall slightly exceeded the average. Bright sunshine was still very little prevalent, the percentages varying from 25 in "Ireland, N.," and 23 in "Scotland, E.," to 12 in "England, N.W." Depressions observed:—During the whole of this period the barometer has again been highest in the south-east part of our area, and lowest to the westward or north-westward. The wind has consequently been between S. and S.W., and generally moderate in force, but owing to the passage of some depressions it freshened considerably at times on our west and north coasts, and on the 9th, 10th, and 13th reached the force of a gale.

— *GARDENING APPOINTMENTS*.—Mr. WALTER DANCE, late Gardener at Llwyngwair, Pembroke-shire, has been engaged as Gardener to Colonel LOWE, at Gosfield Hall, Halstead, Essex.

## THE KEW ARBORETUM.

THE OAKS.

*QUERCUS BRANTII*, Lindl., *Bot. Res.* 1840, App. p. 41, No. 74; Boiss., *Fl. Orient.* vol. iv., 1173; Kotschy, *Die Eich. Eur.*, tab. xxxvii., fig. of leaves; *Penny Encycl.* xi., p. 213; *Acorns: Discoveries in the Ruins of Nineveh and Babylon*, p. 666; *Gard. Chron.* 1853, p. 263, fig.—Kurdistan.

This handsome and singularly interesting Oak, remarkable for its large acorns and leaves, which, when fully mature, measure 6 inches in length by 3½ inches in width, and when young are clothed with thick down, was first discovered by Mr. J. Brant, II.M. Consul at Erzeroum, in 1839. It was not, however, until some time afterwards that it was successfully introduced into this country by Mr. (now Sir A. II.) Layard. In these columns for 1853, p. 263, it is stated that the whole tenour of Mr. Layard's descriptions "points to the probability of the Kurdistan Oaks . . . proving hardy." If so, we may boast not only of having gained a new element of decorative gardening, but of having secured the very tree—the sacred tree—before which Sennacherib was wont to sacrifice; for it is highly probable that its acorns represented at p. 160 (*Discoveries in Ruins of Nineveh and Babylon*) upon a translucent cylinder supposed to have been the signet or amulet of that monarch, belong to no other plant than *Q. Brantii*."

In the *Gardeners' Chronicle* for 1854, p. 691, in an article on the "Effects of the Previous Winter," the writer says, "the Kurdistan Oaks, especially *Q. Brantii*, disregard cold but do not like such frosts as those of April 24, which are in fact too much for any trees whatever in full leaf." This species was grown at Kew many years ago, but at present seems to be wanting in the Oak collection. The name is to be found in some catalogues, and it is possible that good plants of it exist in this county; will any one possessing it kindly state particulars of size, &c., for the benefit of all who are interested in hardy trees? It may be as well to add that a different plant, which I have not yet been able to determine satisfactorily, is grown in some Continental gardens under the name of *Q. Brantii*.

*Q. COCCIFERA*, L., *Loud.*, *Encyc. of Trees and Shrubs*, p. 883, figs. 1617, 1618; Kotschy, *Die Eichen Europa's und des Orients*, t. 29; J. D. Hooker, *Trans. Linn. Soc.*, vol. xxiii., tab. 37.—Along the Mediterranean from Portugal to Turkey, Asia Minor, The Kermes Oak.

A shrub a few feet in height, now and then assuming the character of a tree, with a trunk from 1 to 2 feet in diameter. The largest specimen at Kew is one about 9 or 10 feet high, with a compact head about 7 feet through. The species is a very interesting one, with small dark green rigid leaves, like those of a Holly in miniature. "It is celebrated as being the haunt of the Kermes insect, which yields so brilliant and permanent a blood-red dye that the old Flemish tapestries dyed with it two centuries ago have lost none of their brilliancy" (*Penny Cyclop.*, vol. xix., p. 213). For the manner of collecting Kermes and many interesting particulars see *Loud. Arbol. et Frut. Brit.*, vol. iii., p. 1908. According to Aiton *Q. coccifera* was cultivated in this country so long ago as 1683.

*Q. ALNIFOLIA*, Poech., *Enumer. Pl. ins. Cypri*, p. 12; Kotschy, *Die Eichen Europa's, &c.*, t. 6; *The Garden*, vol. xviii., p. 486 (fig.). *Q. Cypria*, Jaub. et Spach, *Illustr. Pl. Orient.*, i., p. 110, pl. 56; Boissier, *Flora Orientalis*, vol. iv., 1168.—Native of the hills of Cyprus.

This is quite a recent addition to British gardens. Its principal charm consists in the bright golden tomentum which clothes the under-surface of the small Alder-like leaves. As the snow persists for more than a month where this Oak grows it seems not unreasonable to expect that there may be many spots in the British Isles where it would flourish in the open air.

Kotschy states that the acorns are collected by the monks of the Greek convents, dried in the air, and then stored for mixing with the food of their domestic animals during winter.

Q. DENSIFLORA, Hook. and Arn., *Bot. of Beechey's Voyage*, Suppl. 391; Hooker, *Icones*, tab. 380; Nutt., *Sylvia*, 1, ii., t. 5. Q. *chinensis*, Torr., *Pacif. R. Rep.*, iv., 137, t. 19.—California.

Varying from a mere shrub from 5 to 7 feet high, to a pretty large tree, 50 or 60 or sometimes even 80 feet high. In foliage not unlike some of the forms of Q. ilex. This has stood fairly well in the open at Kew without protection for some years. Even during the winters of 1870-80 and 1880-81 only the young unripened shoots suffered from the cold.

Q. PHYLLIROIDES, A. Gray, *Bot. of Japan*, p. 406, in *Mem. of Amer. Acad. Arts and Sciences*; DC., *Prod. vol.* 39; Mast., *Gard. Chron.*, vol. 1, 1874, p. 362.—Japan.

A pretty evergreen Oak, which has done well in the open at Kew without protection for some years. Foliage not unlike that of some *Phyllitrea* such as P. media, &c.

## SALISBURY PALACE.

THE episcopal residence is situate within 400 yards of the city market place, and adjoining the cathedral. It is an extensive and picturesque building, in the Tudor style, and the gardens and grounds cover an area of 15 acres, nearly three of which are walled-in kitchen garden, and in which are situate the glasshouses, pits, sheds, and the head gardener's house, the latter abutting on Exeter Street, whence there is a private entrance. In the kitchen garden, which is exceedingly clean, well cultivated, and judiciously cropped with winter and spring vegetables, are also grown the hardy fruit trees of the kinds usually met with in such gardens. There is not much glass here—a few small vineries, plant stoves, hot-water pits and cold frames, and some of these were gay with *Primulas*, especially fine and attractive being Williams' P. alba magna, the individual blooms of this variety being nearly 2 inches across, with a well-defined-yellow eye, and beautifully fringed; P. Chiswick Red, another of Mr. Williams' varieties, a crimson-scarlet, making a striking contrast with the alba magna, but apparently not of so robust and free-flowering a habit as the latter. Mr. Smith, the persevering and intelligent gardener here, has a promising strain of his own, which he is still endeavouring to "improve."

In the plant stoves, which were filled with plants of an ordinary though useful description, I noticed a couple of nice plants of *Adiantum trapeziforme* and *Pegonia Prince Wallenstein*, the latter a very useful ornamental foliage and flowering variety, and not so much grown as it deserves to be, the young leaves and stems of which have the appearance of crimson velvet, and, with the white flowers, which are shaded with pink, are strikingly effective and greatly admired. A plant of *Passiflora racemosa*, in flower, depending from the roof, is also deserving of passing notice, as also is a well-flowered batch of *Marie Louise Violet*, which are planted near the glass in a three-light frame, situate at the sunny side of a high, well-trimmed New hedge, of which there are good examples on either side the principal thoroughfare in these interesting gardens.

The flower garden, which is divided from the small park, in which is a nice sheet of water, by a ha-ha and stone balustrade, is situate immediately opposite the south front of the Palace, against the walls of which are growing some good examples of *Magnolia grandiflora*, *Wistaria sinensis*, *Pomegranate* (*Punica granatum*), *Myrtles*, *Passiflora cœrulea*, and *Roses* in good condition. Several nice specimens of Irish Yew (*Taxus fastigiata*) occupy central positions in some of the circular beds within a few yards of the Palace walls, and a small fountain adjoining the balustrading is not the least interesting feature of the place, which historically and naturally is full of interesting matter.

In the grounds, which extend north, east, and west of the Palace, are several fine specimens of the Cedar of Lebanon (*Cedrus Libani*), fine bushes of English Yews from 9 to 10 feet high and 15 feet through, and sundry fine specimens of *Yucca* dot the greensward between the tall Cedars, *Pinus Lambertiana*, &c. In the midst of these lofty evergreen trees show conspicuously and somewhat strangely the branches of a fine specimen Plane (*Platanus occidentalis*), which at 4 feet from the ground measures 11½ feet in circumference, and had shed its bark pretty well from every branch. In conclusion, I may be permitted to add that several Fig and *Magnolia* trees are trained against the back of the cloister wall at the garden side, and between the huge buttresses which support that lofty wall, and which protect the trees from the force of the east winds. The good keep of the whole place reflects not a little credit upon Mr. Smith, who evidently understands his duties. *Tourist*.

## FRUIT NOTES.

Late Pears.—A recent correspondent complains that there are so few late Pears worth growing, and that the nurserymen do not offer any variety. I would suggest that the difficulty lies not so much in the direction of obtaining the fruit as in keeping them. Very few fruit-rooms are competent to preserve Pears in good condition to their proper season, and the recent summer-like weather, and wet and unkindly autumns, have not brought the fruit into a proper condition for storing. In 1881 there was both too much wet and too little continuance of good gradual ripening weather; a sudden drought, combined with an acceleration of solar heat, does not appear to produce that mellow flavour which is so much desired, while a sunless summer produces fruit that may be large, but it seldom ripens under such conditions, as witness the *Bœurré d'Amansils* Pears shown at the January meeting of the Fruit Committee in 1880 by that good Pear grower, Mr. Goldsmith, of Hollanden, Tonbridge. Now, if a gardener finds he cannot keep his ice, means are soon taken to remedy any apparent defect in the store, and if he cannot command the required heat for forcing, more pipes are added to the boiler, or those already in use are rearranged. If, then, late Pears are of any value at all, why should not the fruit-room be looked to and overhauled? Any sudden alteration of temperature, such as causes the fruit to sweat, is injurious, and should be guarded against by extra thatch—two outside mats, if one does not answer; and let the coming summer-time, when the fruit-room is not required, be utilised to set these matters right. Taken from a list at hand all these late Pears are good—not, perhaps, all in one season, but they may be depended on generally. Let some be tried on walls as young trees, or grafted on old ones—others as cordons, or pyramids, and on both Pear and Quince; and, excepting the accidents of season, the gardener may hope to have some English fruit to place on his employer's table at a time when its rarity will forbid too close criticism.

Pear Knight's Monarch.—I can endorse all that Mr. Morgan has said both for and against this Pear. When it does attain maturity it is the *me plus ultra* of all Pears, but unfortunately that has not happened above six times for the last thirty years here. In most cases it drops its fruit not only early but prematurely, consequently they become withered and shrivelled, in fact of no use at all. I have found such the case in wet and dry seasons alike. The trees here are worked on the Pear stock, grown as pyramids, espaliers, and on walls, and all are alike, the trees are healthy and bear fair crops yearly to no purpose. *David Lumsden, Bloxholm Hall Gardens.*

Dessert Apples.—I do not think I am far from wrong in my estimate of the good qualities of the King of the Pippins. I want to point out both to Mr. Carmichael and to Mr. Culverwell that in the selection of six dessert Apples I gave I had in view sorts that are usually fit for table and for exhibition at the same time; but, of course, freely admit that there are others quite as good that have different seasons. There is Old Red Quarenden, Early Harvest, Irish Peach, and Kerry Pippin, in their early season all first-rate, but their season is a short one. Then coming on till now there is the old Cockle Pippin, a most delicious Apple, one of the best dessert kinds we have. Winter Pearmain, fine and good; Royal Pearmain, Sturmer Pippin, and others, all first-class late season kinds; but none either of early or late give us such handsome samples as do the kinds I have before mentioned as good mid-season sorts. I have Lemon Pippin, so much praised by Mr. Culverwell, and I grew it as good samples in South Hants some years since, but I never thought it good. The flesh always

has seemed hard before the fruit was really ripe. Perhaps it does better on a cooler soil. Apples, like Potatoes, vary very much in size and quality on diverse soils, and in our discussions it is well to make full allowance for that undoubted fact. Then Mr. Culverwell does not think much of Blenheim Pippin as a dessert Apple, but curiously enough it is the most popular dessert kind in the London market. Perhaps Mr. Culverwell will say "So much the worse for the Londoners;" but then opinions differ. All Apples are not Ribston Pippins of course, any more than Medoc wines are the Chateau Lafites, but then many have various good qualities none the less. A. D.

## HOME CORRESPONDENCE.

*Senecio spathulifolius*.—For thus I spelt the name in the MS. of my paper in the *Journal of Botany*. It is derived from Gmelin, who spelt it *spathulifolia*. That I ventured in my *Manual*, ed. 8, to alter into the more correct form with an *s* in place of the *e*. Linnaeus and Smith would also have spelt it so. Plants of it kept sheltered from the weather, in a very cool greenhouse, have at this season enormous buds or rather rosettes of leaves of a cordate-spatulate shape, quite covered with most beautiful arachnid fibres. It is of much interest to trace the changes in the plant from these leaves to the long leaves usually found at the base of the stem in the summer even on seedling specimens. These winter leaves seem to be quite unknown to botanists, as they are not noticed nor figured anywhere, as far as I can discover. C. C. *Edlington, Cambridge, Feb. 11.*

Ants in the Peach-house.—In a Peach-house here the trees from which I have taken heavy crops of fruit annually for some years past have this season had the blossoms attacked and destroyed by ants in a remarkable manner. Until this season I had always looked upon the presence of ants in the house in question as of little or no importance; their chief occupation seemed to be that of turning up the soil in search of the excrement from the black-fly, with which the trees were infested, and which I failed to extirpate until last autumn. My attention was called to the subject while fertilising the blossoms with a camel-hair pencil. I found all the earliest blooms minus the pistil, and upon closer examination I found they had been eaten off just above the ovary, and lay shrivelled up among the stamens, while an ant was in the cavity of the flower, the object being to make an entrance. In a few instances I found an entrance made by eating through the flower at the base of the stamens, and the pistil uninjured; but in all cases the predator was inside. I have arrived at the conclusion that by annihilating the aphid I had deprived the ants of their natural food, and consequently they attacked the blossoms for the nectar they contain. So thoroughly had they done the mischief that had I not discovered it in time I feel convinced the crop would have been destroyed. I immediately took steps to stop their progress by wrapping several papers of brown paper round the stems of the trees, upon which was tied a roll of cotton wadding that had been steeped in paraffin, which proved an effectual barrier. I then put a man to destroy all the ants he could find upon the trees, and in a few hours the trees were rid of this (to me new) enemy. I should be glad to hear if any of your readers have had similar experience. However that may be, I cannot any longer look with indifference upon the presence of ants in a Peach-house. *Horace Woods, The Gardens, Maidston, Kent, Aberystwyth.*

*Sisyrinchium grandiflorum*.—I send you a clump of this charming early-blooming plant, to show how well it does in our stiff, holding soil. Quantities of it now make a fine appearance. *T. Smith, Newry.*

Potatoes to Grow.—A great number of gardeners throughout the country are expected to produce, among other things, a continuous supply of Potatoes. This rule is in force here, and to grow a sufficient quantity we usually plant from 2 to 4 acres. Being anxious to grow most new sorts having high characters we for some seasons planted a host of varieties, with this result, that in consequence of disease and other evils weak constitutioned sorts are subject to our supply generally became exhausted some considerable time before we could reasonably expect to dig and renew our stock. This state of things induced me to select as sorts to be relied upon four or five kinds which would give us a large supply the whole year. After testing various sorts our choice fell upon the following:—Ashleaf and Lapstone Kidney for the garden, Scotch Champion and a limited quantity of Magnum Bonum and Beauty of Hebron for field cultivation. We selected the Champion principally

because our field Potato ground is of a poor chalky nature, and as we grow for quality we use little or no manure at the time of planting, consequently the tender sorts fail, whereas the extraordinary constitution of the Champion enables it to grow and bear a crop of the highest quality. Since adopting the practice here stated we always have had Potatos and to spare. A. L. H.

**Cinerarias from Seed.**—What can be got out of a pinch of seed? I ask the question because last spring I bought a 2s. 6d. packet of seeds, as I had given up growing the named sorts, as to me they were a great trouble, and took up much useful room after they had bloomed which could have been used for other plants that were useful. I found many of the named sorts very weak, and they would not start into growth satisfactorily, now with my seedlings I have no trouble, I sow the seed early in March, and out of my pinch of seed I believed every one germinated, so that for 2s. 6d. I got four times as many plants as I wanted. These I took up little room or care until August and September, and succeeded in getting them put into pots for flowering. They were first sown in pans not too thickly; they were strong and fit to handle, they were potted into very small pots, and grown on in a very small space, the greater part of the summer. Now the plants are nicely in bloom I have no reason to regret discarding the old roots, for the blooms are as the packet described "superb," the colours various and everything I could wish for, some of the flowers measuring 2 inches across and of great substance. The cultivation is simple, and I am certain, that I would recommend all who want Cinerarias for bloom to grow them from seed; they grow in good soil, and require frequent watering with weak manure-water, a cold frame suits them best with the lights removed morning and evening, giving a light shade in bright weather. The seed should be lightly covered with soil and not watered for a few days after sowing. Cover with a bell-glass, and shade the pans; in this way every seed of mine germinated. *William Culverwell, Thorpe Perrow.*

**Sedum acre aureum.**—This beautiful Sedum deserves to be better known and more extensively grown than it appears to be at present, judging from the fact that we seldom meet with it in gardens, and yet when seen during the winter and spring months it never fails to excite admiration, the light green groundwork and the golden tops of the shoots being very effective. We have it now in its summer quarters in our flower garden, where it makes a striking contrast with the great cultivated silver-leaved Sedums, and the raised patches of it, in company with *Aubrietia purpurea*, have a very telling effect among the rock plants. This, like most of the other Sedums, is very easily propagated—a handful of it "miced" up and scattered over a piece of border with, or without, a little fine soil strewn over it: roots freely any time from April to October. H. W. W.

**Luculia gratissima.**—In the *Camellia*-house here, which is 96 feet long, 24 feet wide, and 21 feet high in the centre, there is a splendid plant of *Luculia gratissima*, 14 feet high, and 10 feet through. It has been planted at least thirty-five years in a raised border amongst *Camellias*. Owing to the large dimensions of the house, fire-heat is scarcely used save to exclude frost; indeed, in the winter of 1880, when the thermometer fell 2° below zero on two occasions, and when day after day the thermometer ranged from 20° to 30°, it could not be kept much above the freezing-point, yet the *Luculia* flowered better than usual, the blossoms being fine, scores of them measuring 6 to 8 inches in diameter. The *Camellias* are a speciality here (and the great majority of the plants are well furnished from the ground to the apex), and all other occupants of the house, whether permanent or temporary, are treated in the same way. The mildness of this winter precludes the use of much fire-heat; indeed, the house is kept as cool as possible in order to retard the *Camellias*, yet the *Luculia* is flowering fairly well, producing a flower almost at the point of every shoot. I may also add that, as a matter of course, when the *Camellias* have finished their growth, all the ventilation possible is given to the advent of frost. Gentlemen who are accustomed to travelling from place to place, assert that it is the best specimen of the *Luculia* they have seen, although they have seen it grown apparently under more congenial circumstances. When it has finished flowering its shoots are cut back to about three joints of last year's growth, kept rather dry at the roots, and well syringed. I find by thus treating it that it makes satisfactory progress. Am I right or wrong in shortening back the shoots, as I have been informed that it is considered wrong to cut back *Luculia* shoots—even that it is injurious to cut the flowers off? Of course, if it is desired to extend the plant as rapidly as possible in certain directions, I do not shorten the shoots much till that object is accomplished; still, I maintain that the use of the knife is in no way injurious to the well-being of the

*Luculia* by merely cutting back its shoots. *Thomas Lamb, Spring Grove Gardens, Beaulieu.* [You are right, of course, in judiciously cutting the shoots back. If you did not do so, the tree would grow out of all bounds. ED.]

**Garden Mice and How to Trap Them** (see p. 119).—The "Perpetual Mouse Trap" is decidedly the best and most simple, yet ingenious contrivance that I have ever before seen for the catching of these troublesome garden pests. It is about 12 inches long, 3 inches wide, and the same in depth. The sides and bottom are made of thin boards, the ends of wire, manger-iron, and the top glass through which shows the Wheat with which it is baited fixed in a framework on either side the depressed entrance, which is in the centre, about an inch wide, extending across the box, and a little more than half its depth. On a level with this entrance is a balance-board with an upright partition in the centre, and which, when a mouse treads on it—whether it has been attracted by the bait—is completely imprisoned in that division of the trap, and while being thus caught sets the one in the adjoining compartment for the next arrival, which is necessarily on the opposite platform, and so on, each mouse caught setting the trap in the adjoining prison for the next one, which on finding itself a prisoner makes its way through a wire contrivance, and through which it cannot return, to the light which is admitted through the wire end of the trap, which bars its further progress. These traps, as already stated, are always set, and require no fresh baiting, inasmuch as the latter is not within the reach of the mouse when inside the trap as it was when outside, provision being made in the bottom for removing the mice. One of these traps is capable of catching ten or twelve mice in one night. We keep several of them ourselves all the year through in our flower garden and grounds under the *Yew* hedges, in the *Rhododendron* and flower beds, &c., where during the last five or six weeks we have caught nearly as many dozen mice. The grass mice, however, are very shy of them, and as yet we have not occasionally caught them by baiting the traps with whatever foliage or flowers they had directed their attention to. The inventors of the "Perpetual Mouse-Trap" are Messrs. Colin, Pullinger & Sons, and the sole wholesale agents, Messrs. S. & E. Ransome & Co., 10, Essex Street, Strand, London. H. W. Ward.

—We have been very much troubled with mice here this winter. Field and house mice attacked our earliest sown Peas which a man aged to kill by the figure-of-four trap baited with toasted cheese. Our Tulip and Crocus bulbs are completely destroyed by the field vole, which we have been unable to trap, although we have used a number of the same traps, some baited with cheese and others with Peas and Beans. H. H.

**Teopelia cyanocrocus.**—After several failures I have at last succeeded in blooming two out of three bulbs of this lovely Chilean plant, for which I am indebted to the kindness of Mr. Max Leichtlin. I thought at first it would, like the *Trigidia* and *Nemostylis geminiflora* prove very fugacious, but this is by no means the case. One flower has remained expanded for four or five days, though it has been kept in a hot room with the window only open for a few hours every day. The lovely blue colour of the petals, almost exactly the same hue as *Gentiana acialis*, is set off to perfection by the white eye at their base. The pot in which the bulbs are planted has been kept during the winter in a cool greenhouse, close to a window always open in the day time except during severe frost. *H. Harpur-Crewe, Drayton-Beauchamp, Tring, Feb. 13.*

**Double-flowered Auricula.**—I have a few plants of a double white variety that I have obtained from a specimen I got from M. Louis Van Houthe, of Ghent, some four years ago, at a cost of 8 fr. It has mealed foliage, but is not a good bulb, perhaps because I fear I have treated it a little unskilfully. The flowers are not fully double—no nearly so double as those of purple and other fine varieties I have; and the colour is creamy rather than pure white. It throws up a strong truss of flowers. I hope to be able to exhibit it in the coming spring, when perhaps its identity with the form mentioned by Mr. Duncan Murdoch on p. 192 may be determined. The flowers of my double white are fairly well performed. The hard winter of the early part of 1881 has affected my double Auriculas, and they are only just recovering from its effects. *Richard Dean, Ealing, W.*

**Ice Storing in Sawdust.**—The antiquity or otherwise of the practice of preserving ice out-of-doors in sawdust is not a question which need take up much of your space. Mr. Ward tells us, however, in the *Gardeners' Chronicle* of January 8, 1876, that he used it then, a few inches in depth, on the surface of the ice, and over that 2 feet of leaves, and a covering of litter. Some of the correspondents who took part in the dis-

cussion then, say they knew of sawdust being used for covering ice many years before that time. Mr. Inglis mentions its being used at Hillyborton House in 1863. So far as the antiquity of the practice, which probably dates much further back than that time, if we only knew where to lay our hands on the records, Ice stacks covered with various materials, such as straw, leaves, turf, &c., were common enough in Loudon's time, but they do not seem, notwithstanding their cheapness, to have become very generally adopted as a means of preserving ice. That has been no doubt due to their uncertainty. It was nothing unusual to bear an ice stack in one situation and find it melting in another, or to keep an ice fairly well some seasons, while in another stack, made on the same principle, and in another locality, turned out an utter failure. Mr. Ward kindly informs me and your readers generally that it is not necessary to incur the expense of excavating pits, &c., in order to have a supply of ice all the year round. Mr. Inglis says stacks aboveground will answer the purpose as well and of course cost less. If anything will preserve ice, above or under ground, I believe sawdust will, but my experience of stacks aboveground is, that it does not keep nearly so well as in a sawdust pit, lined with wood, as described in the *Gardeners' Chronicle* for January 14 of the current year. I worked this question out for myself in 1874, 1875, and 1876, with stacks of ice, principally aboveground, before incurring a farthing of expense in the making of a sawdust pit. The results may be interesting to those who have not the opportunity to test the matter for themselves. In December, 1874, we stored 150 loads in a stack, and covered with sawdust; this furnished supplies till about the middle of October, 1875. In December, 1875, we stored 200 loads in the same way, which yielded supplies for season 1876 up to October 23, when the old ice-house had to be resorted to, to continue the supplies into November. These results, while better than those obtained by using leaves, straw, turf, &c., seemed still to leave considerable room for improvement. It occurred to me, if we could get three-fourths of the bulk below the ground level, in a thoroughly drained, wood-lined pit, that the ice would be easier managed in every way, better isolated, and less influenced by atmospheric changes than in a heap aboveground. It is true that a pit cannot be excavated, lined with wood, and thoroughly drained for nothing; but results often justify a little initial expenditure. It was so in this case. We generally finish the year with seventy or eighty loads at least to the good now after meeting all demands, besides saving the expense of filling the old ice-house, and that is worth something. While on the question of initial expenditure I may remark, for the comfort of Mr. Ward, that if an annual saving is thereby effected a few pounds once for all may be well spent. As an instance our freezing ponds were fully half a mile distant from the ice store. We spent a few pounds in making two natural depressions in the park, close to the store, available for flooding in winter with a view of procuring a good sheet of ice close at hand. The result is, that we get a larger supply of ice run in, in exactly half the time we used to do so, and that, too, with less labour and fewer carts. Where the ice can be got close at hand, and carts keep coming in rapidly, the advantage of a pit will be apparent, as the ice can be shot out of the carts directly into the pit by its own gravity, there to be spread about and broken. Were 200 to 250 loads to be built up entirely aboveground, and supposing there was no valley handy, as in Mr. Ward's case, to admit of the carts being taken to a higher level, I am afraid the annual expense would be something considerable, and the height of the heap would be something for the workmen to remember by the time they had got the last load to the top. *D. Melville, Dunsrobin Castle Gardens, Sutherland.*

**Winter Arctie as a Pot Plant.**—This is a particularly pretty little plant grown in pots for conservatory decoration, and one that associates well with *Crocuses* and *Snowdrops*. It flowers freely if treated in the same manner as *Crocuses* for pot culture, and plugged after potting in cocoa-nut fibre or some such material till the crowns are well up through the soil, when it will soon come into flower in a cool house near the glass. H. H.

**Setting of Peaches.**—Complaints are often made regarding the dropping of Peach-buds when they begin to expand, and when such occurs it is very tantalising, and the loss is a serious matter. Numerous reasons may be assigned for such misfortunes: over-cropping the season previous, especially when trees are not vigorous; dryness at the roots (often this is the case when it is least suspected by the surface being wet, and perhaps a foot or more downwards, when the feet may be as dry at a depth not reached by moisture); fire-heat injudiciously applied is most destructive to Peaches in their early stages of growth. But there is another evil very common, and not generally suspected, viz., crowding of buds. When a tree becomes thoroughly ripened buds are very abundant, and far too much for the

strength of the tree to combat with—their smother each other, and become so thoroughly debilitated that setting is almost impossible: all the manoeuvres to circulate the pollen and do justice in every respect are of no avail. For about twenty years past we have thinned the flower-buds unsparingly, allowing them to stand quite clear of each other, and leaving those best placed to receive light and air, as well as to be in the best positions when the fruit swells. During many years we have had to set the fruit in January or February, but do not remember at any time seeing buds drop, and crops have always been abundant. When the fruit-buds are being thinned we, at the same time, reduce the wood-buds, which are then just perceptible, often using the point of a sharp knife to pick them out, and when the work is finished all the wood not wanted for next season is disposed of; one is let to top each shoot and lead up the sap, and another at the base for next year's duty, and necessary a little topping and tying no further trouble is experienced with the current year's growth, we therefore make our Tree Crops very inexpensive so far as labour is concerned. But the conditions to secure unflinching success in setting is abundance of fibry roots, matted not far from the surface, in thoroughly firm but porous soil; under such circumstances, abundance of fresh air, thinned off and heavy crops always ripened. A.

## Reports of Societies.

**Royal Horticultural:** Feb. 14.—At the annual general meeting, held on Tuesday, there was but a small number of Fellows, and the proceedings were of but short duration. The President, the Right Hon. Lord Cardigan, occupied the chair, supported by the following members of the Council:—Sir Trevor Lawrence Bart., M.P., the Rev. H. Harpur-Crewe, Mr. G. F. Wilson, Mr. G. T. Clarke, Colonel Trevor Clarke, Major Mason, and Dr. Hogg. The minutes of the last annual general meeting having been read and confirmed, Dr. Masters and Mr. John Lee were appointed scrutineers of the ballot. The names of thirty candidates for the Fellowship of the Society were next read, and the whole unanimously elected. The following report of the Council for 1881 was then taken as read:—

### ANNUAL REPORT, 1881.

The Council have again to congratulate the Fellows on the increase in their numbers and in their income, which the past year has shown, and the more so as such increase has for several years past been progressive in both respects. The receipts from the Great Show in London, and from the favourable weather, which nullified the effect of the brilliant display made by the exhibitors and seriously affected the attendance of the public. The loss entailed thereby upon the finances of the Society fortunately was small, and the evening *fête*, which gave great satisfaction to the public, more than made up its expenses. The promenade shows in the conservatory, which are steadily growing in the public favour, did not in any way interfere with the scientific work of the fortnightly committee meetings, of which they were an extension. They have been a source of enjoyment to the Fellows and their friends who attended them, and have contributed large and attentive audiences at the interesting lectures delivered at them, some of which have been published in *extenso* in the Society's *Journal*. The other minor shows, including those of the Auricula and the elegant objects, maintained their usual high standard of excellence, and afforded much pleasure to visitors. The lawn tennis courts have been much used and appreciated by the Fellows resident near the South Kensington Gardens.

The International Medical and Sanitary Exhibition, for the purposes of which the Council granted a loan of £10,000 as part of the arcades of the Society, proved a success financially, and, the Council trust, has been useful to the nation, by teaching in a visible and practical way the leading principles of sanitation and the best external means of preventing and alleviating disease. The Council wish to record their sense of the cordial and pleasant nature of their relations with the gentlemen who represented the executive committee of this exhibition.

The Smoke Abatement Exhibition, which is still in progress, will, the Council hope, effect practical good in diminishing waste of fuel, and the injury to the health of the inhabitants and destruction of plants which smoke occasions in and around our great cities, towns, and manufacturing districts.

The Council have no doubt the aid they have given to the laudable objects of these exhibitions will have the approval of the Fellows.

The suit by the Commissioners of the Exhibition of 1881 against the Society and the debenture holders, the position of which was fully explained to the Fellows in last year's report, was referred to Mr. Justice Fry in due time, and was, after hearing, dismissed with costs, to be paid by the Commissioners to the Society, and to the representative of the debenture-holders. Against

this judgment the Commissioners have appealed, and the Council believe the appeal will very shortly come on for hearing. If the decision of Mr. Justice Fry be affirmed, as the Council have reasonable grounds for hoping will be the case, the Society will be placed in a much more advantageous position than it has occupied for many years.

The scientific work of the Society has been carefully attended to during the year.

The Chiswick Garden has been maintained in a high state of efficiency, and has enabled the Council to have much useful experimental work carried out there. In this work the Fellows appear to take an increasing interest, and the public generally receive as authoritative the results which have been obtained.

The Fruit Committee have had under examination 422 different sorts of Potatoes, and from America a number of unnamed seedlings. The season proving favourable for these, the experiments were very successful, and the committee were enabled to recommend seventeen varieties for the Society's certificates on account of their improved quality and appearance. Some new Peas were also grown, and of these three kinds received certificates. There were also many minor varieties of vegetables which received attention.

The kinds of Raspberries in cultivation being numerous, it has been thought desirable to institute a trial to ascertain their respective merits and character. With this view a large collection has been secured, and the result of the investigation will, when completed, be published in the *Journal*. Experiments will also be instituted in the coming season to ascertain the distinctive characters and uses of new varieties of Peas, Lettuce, Tomato, and Shallot.

The Floral Committee has been mainly occupied in examining Begonias, of which the Society possesses one of the most complete collections existing; and Begoniums, of which many striking varieties were presented by Lemoine, of Nancy, Pompon Dahlias, Nasturtiums, Pentstemons, Gloxinias, Ceanothus, Neriums, and other miscellaneous plants, have been examined.

The crops of fruit, though below an average, nevertheless furnished good opportunities for pomological inquiry, and to acquire a knowledge of the subject, there being a collection of 268 varieties of Apples alone, arranged for examination in the fruit-room. The Vines in the great conservatory continue to supply abundant crops.

Tea Roses, which, in accordance with the intention announced in last year's report, have been planted in the orchard-house, are making satisfactory progress.

The rockery, which was formed a few years ago, has been a great attraction to the Fellows and visitors, 115 plants with the choicest rock and alpine plants, which are now well established, and has during the year been considerably enlarged.

To aid in fostering a taste for hardy border flowers the Council have largely increased the number of those formerly in the garden.

Applications of 942 Fellows were granted as follows:

- 18,886 plants.
- 16,644 packets of seeds.
- 4,000 Gladioli bulbs.
- 5,472 Strawberry runners and cuttings of fruit trees.
- 45,002 total distribution.

In addition to the usual choice varieties of vegetable and flower seeds, seed of a selected strain of Begonia was gratuitously distributed during the present year.

The sales of garden produce during the year appear in the accounts. A large quantity of Grapes still remain, which are being disposed of.

A requisition having been made by the Chiswick, Tottenham Green and District Horticultural Society, of which the Duke of Devonshire is President, for the use of the garden in which to hold an exhibition, the Council gave their consent, and a show was held, which was so numerously attended and successful that the Council hope that at some future time they may be encouraged to make a similar use of the garden.

The Council have pleasure in acknowledging the liberal donations made to the Chiswick garden, among which are:—

The Royal Gardens, Kew, sixty-eight herbaceous plants.

The Royal Botanic Society, a specimen *Anacardium occidentale*.

Botanic Garden, Cambridge, seventy-seven herbaceous plants.

Mr. T. S. Ware, 147 herbaceous plants.

G. F. Wilson, Esq., thirty-seven herbaceous plants.

Messrs. H. Lane & Son, a collection of Roses.

Mr. Turner, a collection of Roses.

Messrs. Paul & Son, a collection of Roses.

Messrs. J. Laing & Co., a collection of Roses.

Mr. J. Fraser, a collection of Roses.

Mr. J. Turner, 111 varieties of Chrysanthemums.

Mr. H. H. West, a collection of Palms.

Baron Ferdinand von Mueller, of Melbourne, collection of seeds.

The Society is indebted to many Fellows and others for liberal donations of plants.

Lord Ashurst, in moving the adoption of the report, desired first of all to supply an omission in it, with reference to the death of Dr. Denny, whose loss his colleagues greatly felt, the deceased gentleman being a most ardent horticulturist, and an indefatigable worker in the interests of the Society. With reference to the work of the Society, its position and prospects, he, the Chairman, had little to say that was not contained in the report. He had

to congratulate them on the satisfactory increase in the number of Fellows during the past year, and also on the increase in the receipts, from £6820 in 1880 to £7031 in 1881. The expenses, however, were still somewhat large, but he hoped that with increasing prosperity the number of Fellows, and consequently the subscription lists would ere long show large returns. Their receipts last year had been greatly reduced by the unfavourable weather which prevailed while their large summer show was being held, but he was glad to say that all their liabilities, as contained in the revenue account, had been paid since January 1. The principal increase in the expenditure had been incurred by the appointment of the Rev. G. Henslow as lecturer, whose services he believed had been much appreciated by the Fellows. The decision of Mr. Justice Fry alluded to in the report had been appealed against, and the case was to have come on that day. It was probably at that moment before the court. If the Society gained it they would have another five years' tenure, irrespective of any further arrangement they might make. The exhibition held in the gardens by the Medical and Sanitary and Smoke Abatement Committee, had done good service, but he was afraid they must not expect to receive so much from the latter as they had from the former. Mr. Guedalla seconded the motion, which was carried unanimously.

The scrutineers then announced the result of the ballot—the unanimous election of Mr. E. Giles Loder, Mr. J. H. Mangles, and Mr. William Lee, as members of Council; and of the following gentlemen as office-bearers for the ensuing year:—President: Right Hon. Lord Aberdeen; Treasurer: Mr. William Haughton; Secretary: Major F. Mason; Expenses Committee: Mr. Lord Alfred S. Churchill; Major F. Mason, and Mr. William Haughton; Auditors: Mr. R. A. Aspinall, Mr. John Lee, and Mr. James F. West. A hearty vote of thanks was accorded to the Chairman, and the meeting closed.

SCIENTIFIC COMMITTEE.—Sir J. D. Hooker in the chair.

*Formed Acorns of Quercus Ilex*.—Specimens were sent from the Isle of Wight by Mr. F. Moore, which were referred to Dr. Masters for examination and report.

*Disease of Carnations*.—Mr. W. G. Smith exhibited specimens, furnished by Dr. Hogg, of what is termed "gout" in Carnations. The disease is caused by minute nematoid worms attacking the collar of the plant, and eating upwards through the parenchyma to the very tips of the foliage. The female worms are very prolific, and the plants mentioned were swarming with the worms and their eggs. The disease was illustrated in the *Gardeners' Chronicle*, December 3, 1881.

*Deformed Root*.—The specimen from Mr. Ingram, figured at p. 147, was exhibited.

*Lobed Leaves of the Pear*.—Mr. R. D. Blackmore exhibited a three-lobed leaf, which had been produced on one of his trees after root-pruning, which led to some discussion.

*Formed Fungi*, &c.—Mr. English, of Epping, exhibited specimens of flowers and fungi prepared by the process mentioned in his work on the subject, which originated a remark from Professor Church as to the use of plaster of Paris mixed with dry sand, for the purpose of speedy drying and retention of colour in flowers.

*Apparent Superfertility in the Pea*.—Mr. T. Laxton, of Bedford, forwarded a communication describing some experiments in fertilisation of the garden Pea. Taking Laxton's Peas as the standard, he impregnated a single flower with the pollen of other varieties. The pod thus treated bore eight Peas, which, on germination, were distinguished as *a, b, c, &c.*; and *d* had purple flowers, the rest white; *a* and *g* followed very nearly the type of the seed-bearer, Prolific Long-pod; *b* approached No. 4 variety; *c* more nearly resembled No. 3; *e, f, h* differed in various particulars from *a* and *g*, but these had pretty nearly the same characteristics of the pollen-bearer, Early Maple, or No. 4. Mr. Laxton drew the following conclusions as to the influence of the pollen of the different male parents:—*a*, from some of the Peas being wrinkled, were influenced probably by the pollen of Nos. 2 or 4, as both had taken effect; *b*, the colours of the seeds of some of which are wrinkled, indicating probably the influence of 2 or 4, or both; *c*, from the same appearances and from the position of the flowers, probably Nos. 2, 3, and 4; *d*, from the colour of the flower and the height, probably Nos. 1 and 2; *e*, from the colour and shape of the seeds, some being wrinkled, and the shape of the pods probably No. 2, and perhaps 4 or 5; *f*, from the colour and wrinkling of some of the seeds, probably Nos. 1 and 2, or 4; *g* (similar to *d*), Nos. 2 or 4, or both; *h* (similar to *f*), Nos. 1 and 2, or 4. From these facts he deduces:—1. That the pollen of more than one variety of Pea used to cross-fertilise the same flower may influence more than one ovule in the same ovary. 2. That there is some evidence of the pollen from more than one variety affecting the same ovule.

**Report on Winter Losses, &c., in Plants.**—The Secretary, the Rev. G. H. Rowley, has, in favour of the press he had made in compiling statistics for a "Report on the Meteorological Phenomena, and consequent Injury to Plants in Severe Winters." He had obtained particulars of several winters from A.D. 220 to 1881, but those during which destruction of, and injuries to, plants had been specially recorded, were the following seven:—1851-2, 1852-3, 1859-60, 1860-61, 1878-79, 1879-80, 1880-81. He had collected all the information he had at present been able to find with reference to these winters, and had drawn up first a short account of the principal meteorological phenomena of the year preceding each winter, as well as of the winter itself, as the behaviour of a plant under frost so much depends upon its previous conditions; in each case such was followed by details of injuries to, and losses of, plants over as many places in the British Isles as possible. The importance of registering meteorological phenomena and the losses in several winters lay in the fact that the conditions of the winters respectively differed in many ways from one another. The consequence was, that the immediate cause of a plant's succumbing to frost was not always the same. There would be an introduction dealing with several interesting matters bearing on meteorology and plant injuries, and it is proposed to complete it with copious indices, so that no difficulty would be met in finding the exact behaviour of any particular plant in any county and in any winter.—A discussion followed, in which the great importance of elaborating the report as fully as possible, and of speedily publishing it, were insisted upon.

**Specimens Exhibited.**—Mr. Houston showed specimens of dissections of flowers mounted in preservative fluid, and intended for use in classes in the winter, when fresh specimens are not available. Mr. G. F. Wilson showed a pretty little creeping Oxalis, well adapted for borders in conservatories or other places, where its objectionable facility for getting below the ground, and its habit of flowering early in the year, were its chief merits. Mr. Joseph Hooker identified it with *O. microphylla*. Mr. Harpur-Crewe showed the new and pretty *Muscari lingulatum*, a native of Cælia, one good point in which is its habit of flowering early.

**FLORAL COMMITTEE.**—G. F. Wilson, Esq., in the chair.—Fine groups of Cyclamens, Primulas, and Cinerarias, and a few other interesting objects made the Council-room quite gay for the annual meeting. Of the first-named flower Mr. Clarke, of Twickenham, sent a very fine group, the plants having good foliage and large flowers, pure and clean in colour, and well varied. A very fine white, named *giganteum compactum*, was much admired. A fine bank of Primulas and Cinerarias came from Mr. Henry Little, of Hillingdon Court, Uxbridge, included amongst the former being several well marked varieties, and one named *Magenta Queen*, a fine rich magenta in colour, which was singled out for the highest honours. From Sir Trevor Lawrence, Bart. (Mr. J.) came one of the finest specimens ever seen of *Odontoglossum pulchellum majus*, a plant with nearly forty spikes of flowers, many of which bore nine blooms on a spike. This was awarded a Cultural Commendation and recommended for the further distinction of a Medal. *Odontoglossum Kuckermanianum*, from the same collection, was also shown in fine condition. The weeping form of *Wellingtonia gigantea* sent out some years ago by Messrs. Little & Ballantyne, was well represented by a specimen about 6 feet high from the nurseries of Messrs. W. & J. Brown, Stamford. Mr. C. Edmunds, of Hillingdon, had in *Cyclamen persicum giganteum roseum compactum* [?] a good but much over-named plant, with light marbled leaves and large rosy flowers. From Heatherbank the Chairman brought a very handsome spike of fourteen flowers of a fine unspotted variety of *Odontoglossum crispum*—a perfect wreath in itself; also a nicely sized variety of the same species. Messrs. James Veitch & Sons showed a small group of fine white *Cyclamen* and other plants, including the excellent *Coccyne cristata Lemniana*, which has a pale lemon-yellow crest on the lip; and a hybrid *Rhododendron* named *Queen Victoria*, with flowers in colour a pretty shade between buff and nankin. From Mr. Gilbert, of Burghley, came a very striking white hardy Primrose, named Gilbert's Harbinger, with flowers  $1\frac{1}{2}$  inches in diameter, profusely produced, and rich in the way of variety in name, and particularly so in the way of colour. A pretty lot of hardy Primroses of different colors also came from Mr. Anthony Waterer. A very fine mass of the extremely showy *Cineraria cruenta*, and flowers of the pretty "blue Marguerite," *Agathe celestis*, came from Messrs. Cannell & Sons. Mr. James brought up some cut blooms of his fine strain of *Cinerarias*, Mr. Turner had some nice *Tree Camellians*, and from Chiswick came an excellent group of plants, the old double white and other double Primulas, *Cinerarias*, &c.

The following are the awards:—  
*First-class Certificates.*  
To Messrs. W. & J. Brown, Stamford, for *Sequola (Wellingtonia) gigantea pendula*.

To Mr. C. Edmunds, Hillingdon, for *Cyclamen persicum giganteum roseum compactum*.  
To Messrs. James Veitch & Sons, for *Coccyne cristata Lemniana*.  
To Messrs. Veitch & Sons for *Rhododendron Queen Victoria*.  
Mr. Gilbert, Burghley, for *Primrose Gilbert's Harbinger*.  
To Mr. R. Clarke, Twickenham, for *Cyclamen persicum giganteum compactum*.  
To Mr. H. Little, Hillingdon, for *Primula sinensis Magenta Queen*.  
To the Rev. H. Harpur-Crewe, for *Muscari lingulatum*.

**Cultural Commendations.**

To Sir Trevor Lawrence (Mr. Spyers, gr.), for *Odontoglossum pulchellum majus*.  
To Messrs. H. Cannell & Sons, for *Cineraria cruenta*.

**FRUIT COMMITTEE.**—H. J. Veitch, Esq., in the chair. Mr. J. Atkins, gr. to Col. Lloyd Lindsay, M.P., Locking Park, Wantage, showed at this meeting nine of the most perfect bunches of Black Alicante Grapes ever seen in the month of February, each bunch being a model of compactness and good finish, and in all respects as fresh as in the month of October—a triumph of skill all the more remarkable in the present has been one of the worst seasons for keeping Grapes that has been experienced for several years. The committee recommended the award of a Bronze Medal, but on what principle we failed to see, as on two former occasions Mr. Atkins received Silver Medals for examples unequal in merit to these Alicantes. Lady Dorothy Nevill contributed a number of Tangierine Oranges, fine, fresh, and pleasant in flavour. Messrs. Geo. Bunyard & Co., Maidstone, sent specimens of Smart's Prince Arthur Apple, a small and somewhat angular fruit, streaked with crimson on the sunny side, and supposed to be locally favoured in East Kent. Mr. J. F. Barber, of the Harrow Road, again showed some good Mushrooms grown in beds in the open air; and Mr. Green, gr. to Sir Geo. Macleay, contributed some ripe Bananas.

**Edinburgh Botanical:** Feb. 9.—The Society met this evening in 5, St. Andrew Square, Professor Ballou in the chair.

- I. "Notice of the late Sir Robert Christison, Bart." by the Chairman.
- II. "Obituary Notice of the late Professor George S. Blackie, M.D.," by John Sibbald, M.D., F.R.S.E.
- III. "Definition of a New Tree from East Australia (Dysoxylum Schiffereri)," by Baron Ferd. von Mueller, Ph.D., M.D., F.R.S., K.C.M.G.
- IV. "On Tillingering," by A. Stephen Wilson, Esq., North Kilmindry, Aberdeenshire. Illustrated by photographs.

By the word "tillingering," as applied to a cereal grass, is meant the producing of more stalks than one from a single seed. The plumule of the embryo grows into the first or primary stalk, and all the secondary stalks arise either directly from the primary stalk or from secondary tillers which arise from it. All the secondary stalks are buds growing out of stalks, and not out of roots. Indeed it cannot be properly said that the primary stalk itself grows from the roots; this stalk and the roots grow simultaneously, and have a biological interdependence, the roots more produce the stalk than a man's legs produce his head.

All the tillers or secondary stalks are thus of the nature of branches, the buds or beginnings of which arise from the two or three lowermost nodes of the primary or internodes. No such buds are thrown out upon the internodes. The secondary stalks or tillers, which are really branches, throw out roots from their bases and lower nodes, but no stalk whatever arises directly from any root. In some plants a stalk may arise directly from a root, or a root may arise directly from a stalk, but in the grasses, the stalk never arises from a root.

But this note is not intended to be an exposition of the principle of tillingering, but merely an introduction to the accompanying photographs of Barley and Oat plants. These plants were grown in the garden at North Kilmindry, with some others, not quite so prolific, in order to test the limits of tillingering. Previous experiments had shown that the main conditions necessary to ensure tillingering is shallow planting. When a seed is put down 2 or 3 inches the plumule is drawn out and dusted, or rather reaching the surface where the tillering arises. When a seed is merely covered with earth it goes into tillering at once. The first set of seeds were torn up by the sparrows, so that a part of the tillering season was lost. The second set were protected until safe. The best Barley plant produced about 140 stalks, 12 of which showed the seed out of the sheath. The second had 121 ears; others had fewer, diminishing down to about fifty. The Oat plant submitted stood through the winter and produced about 10,000 returns.

Now, as the tillering process in the Barleys was going on during the whole season, some of the ears were not ripe when the plants had to be pulled. But notwithstanding this, there can be no doubt that, in order to reap the full advantage of seed corn, it should be sown or deposited as near the surface as possible. This would be true of autumn sowing as well as spring sowing were the former not affected by frost; but a severe winter renders deeper seeding advisable for other reasons than those directly connected with the development of the seed.

V. "On the Phenology of the Upper Ward of Lan-

arkshire in 1799." By Henry Buchan, S.S.C., in a letter to the Assistant-Secretary. Quoted from an old manuscript diary, Mr. Buchan showed that at Brownlee, near Carlisle, on January 24, 1799, "Wind was west on a very mild warm day. The whole of this winter remarkably mild and fresh. Polyanthus, Primrose, and Auricula in blossom. A Carnation was continuing putting forth flowers all winter. Some Beans in blossom." On February 21 of the same year the bees were carrying on work, and on March 23 the Jargonelles began to blossom, while on April 4 a Cherry tree on the wall began to blossom; and on May 7 Cherries, Plums, and Pears were in blossom. But this mild winter and favourable spring of ninety-two years ago were not followed by an early harvest. September was very rainy; the depth of rain on the 19th of that month—3 inches at 8 o'clock at night—being the greatest the observer had ever noted. On October 10 the harvest was general; and on the 24th the corn was mostly cut down, but on November 7 some "victual" was still out. This, however, is a district in which early harvests are hardly looked for in any season.

VI. "On Temperatures at the Royal Botanic Garden, and Effects thereof on Vegetation." By John Sadler, Curator.

Since the year commenced the weather has continued very open and mild. During the month of January the thermometer at the Royal Botanic Garden only fell below the freezing point on six occasions, and on twenty-seven occasions in January, 1881. The two hardest mornings were on the 4th, when there were registered 28°, or 4° of frost; and on the 29th, when there were 26°, or 6° of frost. There were registered collectively for the month 13° of frost, while 359° were registered the same month last year. Since February commenced the thermometer has been below the freezing point on three occasions, viz., on the 2d, 29, or 3° of frost; on the 3d, 30°, or 2° of frost, and on the 7th, 28°, or 4° of frost. Owing to the mildness of the season and the occasional blinks of sunshine, many of the spring flowering plants are now in bloom. The growth of the young shoots of Roses, and flower and leaf-buds of many shrubs are further forward at this date than they have been for many years past. The following are some of the more conspicuous plants at present in flower on the rock garden:—*Galanthus plicatus*, G. Elwesii, *Crocus biflorus*, C. crassus, C. imperati, *Lecocjum vernum*, *Bulbocodium vernum*, *Orubus elegans*, *Primula denticulata*, *Sisyrinchium grandiflorum* (purple and white varieties), *Hebeborus colchicus*, and other species, and white and blue Hepaticas, &c. The Botanic Garden purple variety of the common Primrose is now in full flower in the rosy and rock garden. Yews, certain species of Alnus, Hazel, &c., are flowering freely. Grass has recently commenced growing, so that the scythe will ere long be in requisition.

**Natural History.**

**HABITS OF BIRDS AND ANIMALS FREQUENTING THE GARDEN.**—In a former communication on this subject, at p. 25, I am made to say that the common kite is in some parts of the country regarded as a bird of ill-omen, &c. I intended to have said the common yule or yorling, which in some parts of the country are names applied to the yellow ammer or yellow bunting (*Emberiza citrinella*). But why he should be regarded as a bird of ill-omen, or why the following doggerel couplet should be made to apply to him, I am quite unable to say; as he is certainly a very pretty bird, and although not much of a songster, he is nevertheless perfectly harmless. The couplet is as follows:—

"Part Paddy, part Taid, part Yellow Yorling,  
I drink a drop 'o' the Deil's bluid every Monday morning."

I ought also to have mentioned another nocturnal bird, allied to the owl, which in some parts of the country frequents light gardens, or gardens where the cockchafer abounds—I mean the nightjar (*Caprimulgus europæus*), which is not only a perfectly harmless bird, but does good service in gardens, where this horribly destructive insect abounds, as they feed greedily upon them. And any one who has witnessed the ravages which these terrible insects commit upon crops of various kinds, as well as upon trees and plants of nearly all species, will hardly fail to encourage by all possible means the nightjar, which, like the owl, passes noiselessly through the

summer evening's air in quest of its favourite food, which it seizes while on the wing, as well as when settled upon the leaves of fruit trees, &c., and the sharp snaps of his small, though powerful bill, may be distinctly heard in rapid succession. This bird, like many others, is migratory, and generally arrives upon the south-east coast about the middle of May, and departs towards the end of September. They form no nest worth calling such, and the female deposits her eggs upon the dry soil, not frequently in *Asparagus* plantations, or other sheltered and quiet situations, and like the partridge when disturbed while sitting upon her eggs or young, instinctively flutters upon the ground as if disabled, in order to draw attention from them. The bird also utters a peculiar quivering or jarring note, which when heard in the stillness of evening-tide is considered to indicate or foretell fine and settled weather. Although the bill or beak of this bird is small in proportion to its size, and is surrounded by long stiff bristles which point forward—a provision which no doubt assists it in capturing large insects, such as the cockchafer, and other large moths in flight—its gape is something enormous; so that in some parts of the Eastern Counties it is not unusual to hear it said of any one possessed of a wide mouth that he or she is like a nightjar—when his mouth is open his head is half off. Its legs are short, but its wings and tail are very long, which enables it to perform the most sudden evolutions, and to mount from a level flight instantaneously like a sky-rocket. This pretty and inoffensive bird is often wantonly shot, which is much to be regretted, as it is seldom or never numerous, and being entirely insectivorous, is of great service in the garden and elsewhere.

**THE RAT.**—Of all the rodents which are apt to infest gardens, the most mischievous, as well as the most destructive, is the ubiquitous rat—next to him, his troublesome little relative the mouse; and to diminish or check the increase of such vermin many well-known expedients are had recourse to, with varying success. The mole, too, when he finds his way into the garden, often proves exceedingly troublesome, not on account of what he eats, which no one would begrudge him, consisting as it does of earthworms and various noxious larvae, but on account of his excavations and consequent injury to crops of all kinds, and his disfigurement of lawns, &c., which renders his presence in the garden anything but desirable.

**THE COMMON SQUIRREL** (*Sciurus vulgaris*) is the most sprightly, active, and elegant member of the order Rodentia, and if he would restrict his diet to acorns and Beech mast, and forbear biting the tops of rare Conifers, &c., he would, no doubt, be universally respected and protected, as he is, in spite of his many shortcomings, universally admired. But unfortunately if he once discovers where the Filberts and other nuts are growing, nothing short of the gun will prevent him from transferring the whole or the greater portion of the crop to augment his store of provision for the coming winter—an example, it is true, of foresight and industry, but one which the owner of the nuts may fail to altogether approve of.

**THE SHREW** is one of the smallest of British quadrupeds, and is not infrequently found in gardens, but being, as far as I know, strictly insectivorous, does no harm, but probably some good.

**THE WEAZEL** preys upon the shrew, as well as upon the more formidable rat, and the mouse; indeed, this wonderfully agile little creature is possessed of such courage and ferocity that he does not hesitate to attack even the rabbit and the hare. So that while he keeps in the garden he is useful rather than otherwise, but when he gets into the covert the gamekeeper generally takes account of him, and weazels are consequently becoming very scarce.

**THE HEDGEHOG** seldom finds his way into the garden, and when he does so he does no harm whatever, but much good. This very inoffensive little animal is well known on account of his singular but most efficacious means of defence. His pace is very slow, and he cannot flee from the face of danger, nor has Nature furnished him with any effective means of defence further than the sharp prickles of his coat, and his power of so contracting his body as to effectually hide his head and feet, and so form himself into a prickly ball which few animals care to interfere with. Few animals have, however, been

more maligned than this poor little persecuted creature, who is accused of robbing orchards, ascending Apple and Pear trees like a squirrel or a cat, biting off the fruit, and carrying away the same upon the points of his spines. This he is, of course, supposed to do under the cloud of night, but I wonder if any of your readers ever met with him so encumbered. I never did so, and I have sometimes been abroad at night too; but by far the most extraordinary of his depredations is asserted to be that of milking cows. It was seriously stated in a country contemporary some time since that a valuable cow belonging to an extensive dairy from some inexplicable cause withheld her milk [Query, from aversion to the animal?], or a portion of it, until the cowman solved the mystery by discovering in her immediate vicinity the cause of all the mischief in the person of a full-grown hedgehog, upon which he at once inflicted condign punishment, for an offence of which he may have been about as guilty as the yellow yorling alluded to in the foregoing couplet is of taking his Monday morning draught.

It is strange, however, to think that such a belief should ever have been formed as to the existence of either the will or the power in this little animal to perform such an operation. It feeds, however, chiefly during the night, and may occasionally have been found in close proximity to reposing cows or other stock, and it is possible that it may seek such company for the sake of the warmth and shelter it affords. It is also, with possibly more feasibility, strongly suspected of sucking the eggs of the partridge and the pheasant, &c. This may or may not be the case; it is possible that in such matter he may sometimes finish what the rats have begun. At all events, there is a doubt in the case, the benefit of which, unfortunately for him, he never gets, as the gamekeeper invariably kills him wherever he finds him. His principal food is no doubt worms and insects of various kinds, even reptiles, as it has been ascertained that he will kill and eat even so formidable a reptile as the snake. He will also, to some extent, feed upon vegetables and fruit, and when in a state of domestication feeds on soaked bread or boiled Potatoes, &c. They are sometimes kept in kitchens and cellars, and are said to soon free them from cockroaches, blackbeetles, and other troublesome insects. They are also susceptible of kindness, and will allow themselves to be fondled by those who may have gained their confidence. When at liberty they form for themselves snug, warm nests of moss and dry leaves in some dry bank or similar situation, where in pairs they pass the winter coiled up in a state of semi-insensibility. *P. Grievé.*

**THE WRYNECK** (*Yunx*) has been heard in this neighbourhood for some days. On Sunday the 12th I first heard it myself, and remarking to a friend that it was very early for its arrival, he said that his attention had been called to it some days before by a person asking him to listen to "that strange bird," and he went on to say that there was a common opinion that after the advent of this bird little more severe weather was to be expected. Although one swallow does not make a summer, a wryneck before the middle of February is an early note that spring is coming. *M., Hurspierpoint.*

## CANADIAN NOTES.

We had a very peculiar fall. The Maples and Beeches remained green for a long time, and then all at once cast their leaves, and left us minus their usual autumn glories, and the only piece of agreeable scenery left us was in our woods of evergreen trees—the tall, jagged-topped Pines, and the towering pyramidal Spruces contrasting finely with the lighter green of the graceful Cedars and the pert little Balsams and the decided russet of the elegant Tamaracs. However, these effects are passed away, and after some fitful weeks of alternate snowing and thawing—requiring buggies to start out on a journey and cutters to return home—we now have winter nicely upon us, and delightful sleighing, and the roads are all alive with farmers drawing their grain and hay to market, and the woods are equally swarming with gangs of men either lumbering or getting out timber for paper manufacture or for all kinds of railway material for the Canada Pacific Railway, and all the various ramifications of lines intended to be connected with it. There have been considerable purchases of excellent

horses sent northwards for railway purposes, and the large sums of money spent in the work, although doubly paid for by the Dominion in both money and land, have put us all into good spirits, coupled with and principally on account of the favourable results of a generally good harvest and of high prices for all our produce. Wheat has realised from 1 dol. 18 c. to 1 dol. 32 c., and 1 dol. 18 c. again, for the bushel of 60 lb., and hay 12 to 15 dol. per 2000 lb., and Oats and Peas proportionately high. Potatoes, which began at 40 c. for the bag of 90 lb. are now, in consequence of extraordinarily large exportations to the United States, 1 dol. *Mitessing, Ontario, Canada, January 20.*

## Florists' Flowers.

**CYCLAMENS.**—An entire house devoted to the blooming of Cyclamens in a private garden is not a common feature; still less unusual do we see Cyclamens well done in such places. But at Syon Mr. Woodbridge has not only a house full of these plants, but they are also remarkably good; still more, they are useful to an extent that cannot easily be calculated. The Cyclamen is one of the most fertile producers of winter flowers we have; strong plants may be pulled from incessantly, and seem none the worse for the robbery. Then the blooms are so happily fitted for decorative uses; they have long stems that need no wiring, are stout and enduring, and generally give those light pleasing hues of colour that are so acceptable during the winter months. Any gardener who may contemplate the constant culture of the Cyclamen should first ensure the possession of a good even growing strain; one that produces very many flowers and good even heads of bloom is preferable to those leggy large-flowered strains that are not nearly so floriferous. The raising of a batch of seedlings need not be a work of difficulty, as for these a gentle heat will suffice to germinate the seed, and also to promote growth in the seedlings when they are pricked out into small pots. Any shelves, especially those used for the fruiting of Strawberries, and near the light, will suffice for the summer growth, as Cyclamens do not need heat when there is plenty outside. The great necessity in connection with the Cyclamen is a fitting house in which to bloom them, for they never thrive well if mixed up with other plants. They need plenty of light, to be near the glass, and to enjoy an even and fairly dry temperature, as damp brings spot in the flowers, and robs them of their highest charm—purity of colour. There ought to be no more difficulty in growing Cyclamens well in private gardens than is found in market growing establishments. A good deal is made at times of clever growers and secrets of culture, but there is much more in suitable houses and careful attention.

## PLANT PORTRAITS.

**GONEZA PLANIFOLIA**, Lindl., var. **CROCEA**, Regel, *Gartenflora*, t. 1053.—A Brazilian Orchid, chiefly of botanical interest.

**GRAPE EARLY MONTREUIL**, *Rev. Hort.*—A very early Grape, used for wine-making. Berries small, globose, black; flavour acidulous. Ripens at Paris in September.

**LILIU RUBESCENS**, Watson, *Garden*, Nov. 12.—The plant sometimes called *L. Washingtonianum* purepureum but here considered as a separate species by reason of its smaller erect darker coloured flowers.

**LILIU WASHINGTONIANUM**, *Garden*, Nov. 12.  
**MAXILLARIA OCHROLEUCA**, *Belg. Hort.*, t. xviii., 1880.—Pseudobulbs elongate, oblong leaves, strap-shaped flowers in loose racemes, perianth segments narrow, lanceolate, pale yellow, lip three-lobed, orange.

**NYMPHEA TUBEROSA**, A. Paine, *Bot. Mag.*, t. 6536.—Chiefly distinguishable from *N. odorata* by the small tubers on the sides of the rootstock. *Kew.*

**OPHIPOGON JABURAN VOL.**, *Rev. de l'Hort. Belg.*, December.—Leaves linear, strap-shaped,

green, prettily striped with white; flowers small, lilac, in long dense spikes.

**PELAGONISUS, Floral Mag.**, t. 467.—Show varieties—1, Chivalrous; 2, Martial. Mr. Charles Turner.

**PHILODENDRON BIPINNATIFOLIUM, Gartenflora**, t. 1029, f. 1 and 2.—A noble Aroid, of semi-scandent habit, and large, long-stalked, cordate ovate, bipinnatifid leaves, from the axils of which proceed the brownish, boat-shaped spathes, which enclose the thick columnar yellow spadices.

**PTICARIA ZEPHYLLA, Koch, Bot. Mag.**, t. 6535.—A Bromeliad with tufted leaves, in shape like those of the Maize, and with erect spikes of long curved white flowers emerging from scarlet boat-shaped bracts. Central America.

**SALVIA COLUMBARIE, Benth., Bot. Mag.**, t. 6595.—Annual, 1—2 feet high, with bullate, pinnatolobed leaves, and close heads of amethystine bracts and flowers. Native of California and Arizona. Introduced by Mr. Thomson, of Ipswich.

**SPARAXIS FULCHERRIMA, Garden**, Dec. 17.—Leaves lanceolate. Flower-stems slender, wiry, peduncles recurved, flowers 6-parted, bell-shaped, lilac. The plate of this beautiful flower was drawn from specimens in the Caledonian Nursery, Guernsey.

**SPATHIPHYLLOM PATINI, N. E. Br., Illust. Hort.**, t. 397.—A dwarf tufted Aroid, with elongated stalks supporting lanceolate leaves, and surrounding stalked spadices, with narrow white spathes. See *Gard. Chron.* 1876, p. 109; 1877, p. 139; 1878, p. 662, 783.

**Obituary.**

THE announcement of the death of Mr. WILLIAM HURST, formerly of 6, Leadenhall Street, and lately of 152, Houndsditch, which occurred on the 11th inst. at his residence, 16, Kensington Gore, at the age of fifty-two, will be received with general regret, especially among the representatives of the seed trade throughout the United Kingdom, among whom he was more generally known than in other branches of horticulture. At the head of what is unquestionably the largest wholesale seed establishment in the United Kingdom, with a high reputation both at home and abroad, his position was one of great importance and responsibility. Unfortunately, during the last two years he was afflicted with loss of sight, which necessitated his entire withdrawal from business at intervals, and this loss of sight seemed to be the precursor of a painful malady, to which he has in the prime of life succumbed. On leaving school at fourteen years of age, Mr. William Hurst was taken into the seed warehouse of Messrs. Hurst & McMullen, of 6, Leadenhall Street, his father being one of the founders, and the head of the business. Here he made himself thoroughly acquainted with the details of the trade, and travelled important business journeys, making himself acquainted with the leading customers in all parts of the country; and about twenty years ago, when Mr. McMullen retired from the firm, he was taken into partnership with his father, and the business was conducted under the designation of Hurst & Son. From this time onwards the business increased very largely both at home and in the colonies; at the present time his firm has extensive transactions with New Zealand and Australia. The late Mr. William Hurst was one of those men of whom it may be said his heart was thoroughly in his business; he gave his whole time to it, and under his generalship the firm consolidated and extended the high reputation it now enjoys.

As one of the trustees of the Gardeners' Royal Benevolent Institution Mr. Hurst was well known; he was a liberal supporter of the charity, and took a great interest in its progress and work. Mr. Hurst was the last surviving son of the Mr. William Hurst who founded the business; and the only remaining member of the family is his sister, the wife of Mr. Sherwood, a partner in the firm, who under the terms of the will of the deceased becomes the sole residuary legatee. The business of the firm will still be continued under the old and familiar designation by Mr. Sherwood, assisted by Mr. J. S. Johnson. It is not too much to state that the feeling of regret to which allusion has been made will be felt throughout the country, as well as Ireland and Scotland, where a visit from Mr. Hurst was looked upon in many cases as a leading event of the year. The business was carried on for forty years in Leadenhall Street, and two or three years ago was transferred to Hounds-

ditch, one of the City improvements requiring the premises hitherto held by the firm.

—Mr. CAREY TYSO, of Wallingford, whose name has been so long associated with the improvement and culture of the Anemone and Ranunculus, died at Wallingford on the 21st inst. at the age of sixty-seven. He was one of the oldest inhabitants of the town, and identified himself closely with many matters of public interest. He went to Wallingford with his father, the Rev. Joseph Tyso, as long ago as the year 1821. The Rev. Joseph Tyso was an enthusiastic cultivator of the flowers above-named, and this regard was shared by his son, the result being that the Rev. Joseph Tyso started in business at Wallingford fifty years ago. It gradually grew from a florist's into a general nursery business, and three years ago it was by Mr. Carey Tyso, when he retired, to Messrs. Ponnsett & Son, who now carry it on. For many years it was Mr. Tyso's practice to issue a catalogue of Anemones and Ranunculus, and he was the author of treatises on the cultivation of these flowers.

**The Weather.**

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 15, 1882.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.		HYGROMETRI- CAL DEVIATIONS FROM GLAISHER'S TABLES 6th Edition.	WIND.	RAINFALL.

Feb. 9.—A fine day, but overcast and dull. A fine night, with dark sky.  
 10.—A fine morning, sky overcast; a fine bright afternoon. Fine clear night.  
 11.—A fine bright day, sun shioing brightly. A fine, nearly calm night.  
 12.—A very spring-like day. Fine clear night.  
 13.—A fine day, but windy. Windy night. Highest temperature of this day took place at midnight.  
 14.—A fine bright day. Rain at night; dark sky.  
 15.—A dull, miserable day; overcast and rainy. A fine clear, cold night.

LONDON: Atmospheric Pressure.—During the week ending February 11, the reading of the barometer at the level of the sea decreased from 30.46 inches at the beginning of the week to 30.37 inches by 3 P.M. on the 5th, increased to 30.53 inches by 9 A.M. on the 6th, decreased to 30.51 inches by 3 P.M. on the 6th, increased to 30.53 inches by midnight of the same day, decreased to 30.42 inches by 3 P.M. on the 8th, increased to 30.55 inches by 9 A.M. on the 9th, and was 29.83 inches by the end of the week.

The mean reading for the week at the level of the sea was 30.35 inches, being 0.11 inch lower than last week, and 0.40 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 50.5, on the 11th. On the 9th the temperature did not rise above 36.5. The mean of the seven high day temperatures was 42.5.

The lowest temperature in the week was 28.2, on the 5th; on the 7th the lowest temperature was 38°. The mean of the seven lowest temperatures was 33.3.

The greatest range of temperature in one day was 16.5, on the 11th; the smallest was 5°, on the 9th. The mean of the seven daily ranges was 9°.

The mean daily temperatures were on February 5, 34°; on the 6th, 37.2°; on the 7th, 40.7°; on the 8th, 37.5°; on the 9th, 34.4°; on the 10th, 38.3°; on the 11th, 41.0°. Of these the 7th and 11th were above their averages by 1.6 and 2.9 respectively; all the rest were below their averages by 5°, 1.6, 1.6, 4.7, 0.7 respectively.

The mean temperature of the air for the week was 37.8, being 1.2 higher than last week, and 1.3 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 106°, on the 11th; the highest, on the 9th, was 39°. The mean of the seven readings was 61°.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 22°, on the 5th. The mean of the seven readings was 28.4.

Rain.—No rain fell. Fog prevailed on the 6th and 7th.

ENGLAND: Temperature.—During the week ending February 11, the highest temperatures were 54° at Sunderland, 53.2° at Cambridge, and 53° at Truro. The highest temperature at Wolverhampton was 44.6, at Brighton 45.2, and at Nottingham 46.7. The general mean was 49.4.

The lowest temperatures in the week were 26° at Truro, 28.2° at Blackheath, and 28.7° at Cambridge. The lowest temperature at Leeds was 37°, at Bradford 36.6, and at Liverpool 36.2. The general mean was 31.7.

The greatest ranges of temperature in the week were 27° at Truro, 24.5° at Cambridge, and 22.3° at Blackheath. The least ranges were 11° at Leeds, 11.3° at Liverpool, and 12.2° at Wolverhampton. The general mean was 17.7°.

The mean of the seven high day temperatures was highest at Sunderland, 49.7°, at Truro 49.4°, and at Plymouth 47.1°; and was lowest at Brighton, 42° at Blackheath 42.3°, and at Wolverhampton 42.8. The general mean was 45.2°.

The mean of the seven low night temperatures was highest at Bradford, 39°, at Liverpool 38.7°, and at Truro 38.6°, and was lowest at Cambridge, 32.8°, at Blackheath 33.3°, and at Brighton 33.4. The general mean was 35.8.

The mean daily range was greatest at Sunderland, 11.6°, at Cambridge 11.5°, and at Leicester 11.4°; and was smallest at Bradford, 6.7°; at Liverpool, 6.8°; and at Leeds, 7.9°. The general mean was 9.4°.

The mean temperature for the week was highest at Truro, 43.6°, at Sunderland 43.5°, and at Bradford 42°; and was lowest at Brighton, 37.3°, at Blackheath 37.8°, and at Cambridge 38.2. The general mean was 40.2°.

Rain.—The largest falls were 0.41 inch at Truro, 0.25 inch at Wolverhampton, and 0.24 inch at Liverpool. The least falls were 0.01 inch at Sunderland, and 0.02 inch at Bristol, Bradford, and Leeds; no rain fell at Brighton, Blackheath, Cambridge, or Hull. The general mean fall was 0.08 inch.

SCOTLAND: Temperature.—During the week ending February 11 the highest temperature was 54.8°, at Edinburgh; at Dundee the highest temperature was 49°. The general mean was 51.7°.

The lowest temperature in the week was 31°, at Dundee; at Greenock the lowest temperature was 36°. The general mean was 33.7°.

The mean temperature for the week was highest at Paisley, 44.3°; and lowest at Dundee, 40.9°.

Rain.—The largest falls were 1.47 inch, at Greenock, and 0.96 inch at Paisley; the least falls were 0.08 inch at Aberdeen, and 0.11 inch at Leith. The general mean was 0.53 inch.

JAMES GLAISHER, F.R.S.

**Answers to Correspondents.**

CYPRIPEDIUM, B. Frères. We do not recognise the *Cypridium*, but it is somewhat in the way of *C. Bollenianum*. It has small yellowish flowers, which hardly commend themselves to Orchid lovers.

EPHORBIA JACQUINIIFLOEA.—A. B. P. If the old plants have done flowering cut them down, and as soon as they break fresh pot in open peat and loam, and grow on in a stove. The young wood strikes freely in sandy soil in a good brick bottom-heat. If the flowers are wanted for cutting, a good plan is to strike them later on, and flower them in the cutting-pots.

INDOOR CLIMBERS: 7. Freeman. We recommend the following:—For stove—Allamanda Hendersoni, or A. Schottii, Clerodendron Balfourianum, Passiflora racemosa, and P. Buonanapartei, Bignonia venusta and B. Chamberlayni, Thunbergia Harrisii, Hexacentris myrsinensis, Combretum purpureum, Stephanotis floribunda, Stigmaphyllon ciliatum, Beaumontia grandiflora. To these might be added some of the beautiful *Æschynanthuses*, which will clothe the damp walls, rooting like Ivy. For intermediate Stove—Bougainvillea glabra and B. speciosa, Mandevilla sunavolens, Bignonia Chirri and B. speciosa, Passiflora kermesina and P. Imperatrice Eugénie, Solanum venustum, Hoya carnosca, Aristolochia Duchartrei, Dipladenia boliviensis, Bomarea Gardneri. There are some other fine Bomarea which might be added. For greenhouse—Lapageria rosea and L. rosea alba, Bignonia jasminoides, splendida, Passiflora cincinnata and P.

racemosa cœrulea, Clematis indivisa lobata, Trachelospermum jasminoides, Myrsiphyllum thalictroides, Taxonia exoniensis and W. Van Volckemii, Hibberia volubilis, Ruscus androgynus. The latter requires ample space.

INSECTS: D. N. The insects which are gnawing off your young Spiræas at the bottom are the larvae of one of the destructive weevils (Otiorynchus sp.). Remove and carefully sift the upper surface of the earth, and pick out and burn the grubs, which are easily seen. I. O. W.

LICHENS: E. Bullmore. Leighton's Lichen Flora (not illustrated, but the work on the subject). There is a smaller illustrated book, published by Lovell, Reave & Co.

NAMES OF PLANTS: A. D. C. Acacia dealbata.—H. H. Eranthemum pulchellum.—Hesperis, Acacia dealbata; can be bought at any good plant nursery.

NAME OF SEEDS: J. Miles. The scarlet seeds with black spot are those of Abrus precatorius, and the white ones probably those of the white-seeded variety of the same plant.

PRIMULAS: Mr. Osborne. Your seedling, to be called "Osborne's Brilliant," is remarkably deep in colour, a well-marked improvement, in size and depth of colour, on a variety grown under the name of Meteor. We have seen other "Osborne's Meteors," but yours is the best.—A. D. Saunders. A very good strain indeed, but doubtfully distinct from others, notably that of Mr. Tomkins of Birmingham.

SURVEYOR: H. C. Write to the Secretary of the Surveyors' Institute, George Street, Westminster, S.W. "VIRGINIAN SPICE PLANT": W. Willie. Oreodaphne californica, we presume.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this journal.

MARRIED.—On Thursday, February 16, HERBERT JAMES, eldest son of Mr. JAMES CUTBUSH, of the Highgate and Barnet Nurseries, to Miss GRACE EMMA MAILES, of Haverstock Hill.

Markets.

COVENT GARDEN, February 16.

A steady business doing, with a good demand for late Grapes and Apples. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit and Price. Apples, per 1/2-sieve, 2 0-6 0; Grapes, per lb., 3 0-10 0; Kent Cobs, per 100 lb, 6 0-6 5 0.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable and Price. Artichokes, Globe, per doz., 3 0-6 0; Asparagus, En, bun, 20 0-; Jersey, per bunch, 2 6-; Beans, per bush, 2 0-; Barbe de Capuciu, per bundle, 0 8-; Bish, French, En, 2 0-; Cish, green, p, 100 3 6-; Beet, per doz., 1 0-0 0; Cabbages, green, 1 0-0 0; Carrots, per bunch, 0 4-; Cauliflowers, Eng., 1 0-0 0; Irish, dozen, 2 0-4 0; Celery, per bundle, 2 6-; Celeriac, per head, 0 4-; Cucumbers, each, 1 0-0 0; Endive, per doz., 1 0-1 6; Garlic, per lb., 1 0-; Herbs, per bunch, 0 2-0 4.

Kent Regents, 100s, to 110s.; Roses, 80s. to 90s.; Myrti s, 300s. to 120s.; Champanis, 70s. to 70s.; Magnam Bonoms, 90s. to 110s.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant and Price. Aralia Sieboldii, doz, 18 0-42 0; Arbor-vitæ (golden), per dozen, 6 0-18 0; Asplenium, doz, 0 2-12 0; Azalea, per dozen, 24 0-24 0; Begonias, per doz., 6 0-12 0; Bougainvillea, per doz., 18 0-24 0; Cyclamen, per doz., 12 0-24 0; Cyperus, per doz, 6 0-12 0; Dianthus, per doz., 12 0-24 0; Epiphyllum, per doz, 18 0-30 0; Eucalyptus, various, per dozen, 6 0-18 0; Evergreens, in var., per dozen, 6 0-24 0; Ferns, in variety, doz., 4 0-12 0.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower and Price. Abutilon, 12 blooms, 3 0-6 0; Azalea, 12 sprays, 1 0-1 6; Bouvardia, per bun., 1 0-1 6; Camellias, 15 blooms, 3 0-6 0; Carnations, 12 bunch, 1 0-2 0; Cineraria, 12 bunch, 0 10-12 0; Cyclamen, 12 blooms, 3 0-6 0; Deutzia, 12 bunches, 6 0-12 0; Epiphyllum, 12 blms, 0 10-12 0; Eucharis, per doz., 4 0-12 0; Gardenias, 12 blms., 12 0-24 0; Heliotropes, 12 sps., 0 6-12 0; Helianthus (Roman), 12 sprays, 1 6-2 0; Iris (large), 12 spikes, 6 0-9 0; Lappageria, white, 12 blooms, 4 0-6 0; Lily, 12 blooms, 1 0-3 0; Lily of Val., 12 spr., 1 0-2 6.

CORN.

At Mark Lane on Monday the flatness noticed on the previous Friday was more confirmed. English Wheat declined 1s. to 2s. per quarter, and for foreign the larger fall was the most general. Flour was very dull, and, though not quoted lower, had a downward tendency. Fine-molting Barley was scarce, and for other sorts a very slow sale, but not notably depressed. Beans and Peas met a steady sale at late rates. Maize was rather lower. For new Russian Oats quotations ranged 6d. lower on the week.—On Wednesday English Wheat was not quoted differently from Monday, but prices were nominal, and for foreign the tendency was adverse. Flour was very dull of sale; Barley, Beans, and Peas were quiet and unchanged; Maize was drooping; and the prices of Oats, with a restricted demand, were unaltered.—Average prices of corn for the week ended February 17:—Wheat, 45s. 6d.; Barley, 32s. 5d.; Oats, 20s. 8d. For the corresponding period last year:—Wheat, 42s. 4d.; Barley, 32s. 9d.; Oats, 20s. 6d.

CATTLE.

At the Metropolitan Market on Monday rates for beasts, except choicest qualities, ruled about 2d. per stone lower than at last market. A fair number of sheep were penned, and late rates were supported, but they cleared more slowly. Prime calves were fully dry, and pigs met but little enquiry. Quotations:—Beasts, 45s. 2d. to 5s. 2d., and 5s. 4d. to 5s. 10d.; calves, 5s. to 6s. 6d.; sheep, 5s. 6d. to 6s. 6d., and 6s. 8d. to 7s. 6d.—On Thursday business was throughout extremely limited, both as regards beasts and sheep. Prices were about the same as above. Calves were steady, and pigs sold at late rates.

HAY.

Tuesday's Whitechapel Market report states that hay brought rather better prices. General supplies were moderate. Quotations:—Prime Clover, 120s. to 126s.; inferior, 70s. to 95s.; prime meadow hay, 100s. to 124s.; inferior, 55s. to 90s.; straw, 30s. to 55s. per load.—On Thursday there was a short supply of fodder on sale. The trade was fair, and prices were firm, as follows:—Prime Clover, 100s. to 125s.; inferior, 60s. to 95s.; prime meadow hay, 100s. to 124s.; inferior, 45s. to 90s.; and straw, 30s. to 55s. per load.—Cumberland Market quotations:—Superior meadow hay, 120s. to 128s.; inferior, 70s. to 95s.; superior Clover, 125s. to 135s.; inferior, 90s. to 108s.; and straw, 45s. to 55s. per load.

POTATOS.

The Borough and Spitalfields markets report state that supplies are more than adequate to demand, which is dull. Quotations:—Scotch Regents, 80s. to 100s.; Champions, 60s. to 70s.; Magnum Bonoms, 80s. to 90s.; Essex Regents, 80s.; flukes, 120s. to 120s.; Victoria, 100s. to 110s. per ton.

COALS.

The following are the quotations current at Market during the week:—Beside West Hartley, 14s. 3d.; Ravensworth West Hartley, 14s. 3d.; Walls End, Farnington, 14s. 3d.; Hemm, 16s.; Hemm Lyons, 14s. 6d.; Hawthorn, 14s. 6d.; Original Hartlepole, 16s.; South Hetton, 16s.; Tunstall, 14s. 6d.; Tees, 15s. 6d.; Lambton, 15s. 6d.; Wear, 14s. 6d.

Government Stock.—Consols closed on Monday at 99 1/2 to 100 1/2 for delivery, and 100 to 100 1/2 for the account. Tuesday's figures were, for delivery, 100 to 100 1/2, and 100 1/2 to 100 3/4 for the account. On Wednesday the closing prices were, for delivery, 100 1/2 to 100 3/4, and 100 1/2 to 100 3/4 for the account. The quotations on Thursday were, for delivery, 100 1/2 to 100 3/4, and 100 1/2 to 100 3/4 for the account.

GLASSHOUSES & HEATING. B. W. WARHURST. HIGHGATE ROAD, LONDON, N.W.

A new Pamphlet, containing thirty-seven Illustrations, will be sent, with Estimates for such work, to any one wanting the same, on receipt of particulars of their requirements. GLASS COPINGS, 2 feet wide, 4 in per 100 feet run. PEACH-HOUSES, 7 feet wide, for 9 or 10 feet wall, from 12s. per foot run; or up to 16 feet on glass, at 20s. per foot run. VINERIES, at similar prices—all glazed. ORCHARD-HOUSES, 4 1/2 feet x 7 1/2 feet, £80, complete with two ends and doors, glazed English 21-oz. glass and painted three coats. CUCUMBER or PLANT HOUSES, 16 feet wide, 35 feet long, £29; 20 feet, £32; 30 feet, £40. Or 17 feet wide, 43 feet long, £35; 8 feet, £110, complete with ends, &c. Illustrated Price Lists of the Simple, Economical, and Portable Paxton Roofs, of all sizes, with and without side lights.

CONSERVATORIES and GREENHOUSES of every description, in Wood, supplied and erected complete.

BEN'S BOILER

(Design and Title Secured). Bankian Medal, Royal Horticultural Society, 1881. A RIBBED and FLUED SADDLE, OF GREAT POWER. Made with and without Crossbridge; also with Top-feeder and Tubular Fire-bricks (Wrought or Cast); and with an Independent Boiler without Outside Brick Flues.

ONE OF THESE BOILERS, with Two Crossbridges and no Outer Flues, is now HEATING 7000 FEET OF PIPING

in Westminster, replacing a well-known powerful Boiler, which had given way (the second in four years) under the pressure—60 feet head of water.

When first lighted the pipes were warm within four hours, and the man in charge says that he now gets the heat up thoroughly with about half the fuel (coal and coke), and in much less than half the time of previous use: if banked up at 5.30 P.M. the fire is still burning and pipes hot at 9 next morning.

NO NIGHT STOKING. NO INCrustation

through boiling the water, as it is kept constantly circulating and so prevents deposit.

In Lancashire another one (3000 feet power) is "easily heating double the length of pipes previously heated by a 'CHECK-END SADDLE' of same size, and "the low-pipes are both wonderfully soon heated." A recent letter says:

The success of this one has led to a similar one being ordered for another 3000 feet, by a neighbour.

Near London a 4-foot long one (4200 feet by List) is easily heating 2000 feet, though the old pipes are very complicated, but Gardener reports:—"No trouble whatever; but any anything, generally use the common coke breeze."

Descriptive Circulars, with Prices, free. Also for BUTT'S PATENT COMBINED SADDLES.

To be had only from B. W. WARHURST, Horticultural Builder and Heating Engineer, (Successor to HERMAN and MORTON, formerly at Pall Mall and Tichborne Street), 33, HIGHGATE ROAD, LONDON, N.W.

"CHECK-END" SADDLES, to Heat 500 feet, £7 10s.; 1000 feet, £13; and 1500 feet, for £10, Carriage paid, to any English Railway Station. Independent BOILERS from 50s.

Hygienic Condensing Gas Stoves on Ritchie's and Clark's Patents. Gas Boilers, Ritchie's Water Spray, &c.

# RETIREMENT OF MR. THOMAS MOORE.

On the retirement of Mr. THOMAS MOORE from the joint Editorship of the *Gardeners' Chronicle*, a committee was formed for the purpose of arranging for a suitable recognition of his eminent services to Horticulture and Botany, as well as of his disinterested devotion to social and philanthropic movements in connection therewith.

The step thus taken has met with general approval, and the Committee have obtained many promises of support from horticulturists and florists, so that it is anticipated that a substantial presentation may be the result of this endeavour. It is, however, important that all who sympathise with this proceeding should manifest their sympathy as promptly as possible.

Mr. Moore is so well known, and his labours are so generally appreciated, that to urge the merits of the cause would be a waste of words. But it is pertinent to this appeal to say that the Committee have definite objects in view, and wish to carry them into effect without delay. The Committee are of opinion that the subscriptions of Gardeners—without regard to their respective amounts—would be not only appropriate to the occasion, but peculiarly gratifying to Mr. Moore.

Intending subscribers to the MOORE PRESENTATION FUND are desired to communicate to the Treasurer or Secretary, or any member of the Committee, naming the amounts promised by themselves and their friends.

Cheques may be crossed Union Bank of London, and Post-office Orders may be made payable at the Chief Office in London. Subscribers who cannot conveniently send Cheques or Post-office Orders may remit their amounts in Postage Stamps, in which case it will be advisable to forward them direct to the Secretary.

WILLIAM PAUL, Waltham Cross,  
Honorary Treasurer.  
SHIRLEY HIBBERD, 15, Brownswood Park, London, N.  
Honorary Secretary.

DICKSON & ROBINSON, 12, OLD MILLGATE, MANCHESTER.

The Best New Early Market Potato—KERR'S "QUEEN OF THE SOUTH," a new Seedling by the same raiser as "Reading Abbey" and "Fillbasket," a cross between "Early Goodrich" and "Myatt's Kidney"—quite a distinct early white variety, somewhat in shape like "Magna Bonum." Hitherto it has been entirely free from disease, grows a good cover of show, is an immense cropper, and for cooking qualities it cannot be surpassed. As an early market variety for extensive cultivation it can be very strongly recommended. Price 14 lb., 4s. 6d.; 56 lb., 15s.; 112 lb., 25s. Send for our Potato LIST, which contains all the best kinds at moderate prices. KERR and FOTHERINGHAM, The Royal Seed Establishment, Dumfries.

SEED POTATOS ASHLEAF KIDNEY, 4s. 10s. per ton. MYATT'S KIDNEY, 4s. 10s. per ton. REDSKIN FLOURISH BALL, 4s. 10s. per ton. CHAMPIONS, 4s. 10s. per ton. DALMAHOV, 4s. 10s. per ton. FORTYFOLDS, 4s. 10s. per ton. EARLY OXFORD, 4s. 10s. per ton. For Nett Cash, and free on rail at Edinburgh. PETER S. ROBERTSON AND CO., Trinity Nurseries, Edinburgh.

GORDON'S NEW VICTORIA POTATO.—This Potato was awarded the Special Prize of the Highland and Agricultural Society's Silver Medal, at the Northern Counties Show at Inverness in December, 1881, and also the First Prize in the Regent Class. It somewhat resembles the Earl of Essex's variety, being round shaped, moderate size, and a heavy cropper, and has hitherto almost entirely resisted disease or blight. It is of excellent cooking quality, boiling white and mealy, with little water, is a good keeper, and may be freely cut into sets. Sample Cwt. Bag sent on receipt of Postal Order for 7s. 6d., payable to R. STEUART, Dundale Farm, Gravesend. Price per Ton on application.

CEDRUS DEODARA, 4 feet, 18s. per dozen; 5 to 6 feet, 24s. per dozen; 7 feet, 36s. per dozen. PICEA NORDMANIANA, 3, 4, and 5 feet, 24s., 30s., and 36s. per dozen. NOBILIS, 3 to 4 feet, 48s. per dozen. LASIOCARPA, 1 foot, 72s. per dozen. ABIES ORIENTALIS, 4 feet, 80s. per 100. CRYPTOMERIA JAPONICA, 3 to 4 feet, 18s. per dozen. THUYPUSIS DOLABRATA, 1 to 3/4 feet, 40s. per dozen.  SEED POTATOS, in variety. Quotations and orders to  
 offer on application. LIST of Surplus Nursery Stock to offer  
 on application also.  
 Nursery and Seed Warehouse, Ayr.—February, 1882.

**NEW ONION,  
 CRANSTON'S "EXCELSIOR."**

This grand new variety has in every way fully realised our  
 expectations. It has already gained a popularity, both for  
 general crop and as a prizetaker, which few recent introduc-  
 tions can lay claim to. From all parts of the country we con-  
 tinue to receive eulogistic testimonials, thus proving it to be a  
 decided acquisition. It has a very handsome globe-shaped  
 bulb, with exceedingly small neck, and of a beautiful pale  
 straw colour; it possesses mild flavour and excellent keeping  
 qualities. The "Excelsior" has been grown alongside the  
 most popular varieties of Spring and Winter Onions, and proved  
 superior in every respect, many specimens weighing over 2 lb.  
 For Exhibition purposes it will undoubtedly supersede all  
 others.

First class Certificate of Merit, November 16, 1880.  
 Price per packet, 1s. 6d.

Seed supplied Direct, or from the following:—

 pound on application to  
 R. AND A. MORRISON, The Nurseries, Elgin, N.B.

**ORCHIDS.**

The Largest and Best Stock in Europe of  
 good Established Plants.  
 Tens of Thousands of Plants to select from.

**MR. WILLIAM BULL**

Begs to intimate that his Orchid-houses are always  
 quite a sight, from the large number of plants in flower,  
 and he will be pleased to show them to any one inter-  
 ested in this beautiful class.

**MR. WILLIAM BULL**

Recommends those desirous of having their Houses  
 gay with Orchid flowers, to purchase good established  
 well-cultivated plants, which bloom well, are far more  
 satisfactory, and comparatively cheaper than newly  
 imported or semi-established plants.

Establishment for New and Rare Plants,  
 636, KING'S ROAD, CHELSEA, LONDON, S.W.

Propagating Glasses, Hand Frames, Cucumber and Horticultural Glass, genuine White Lead, best Leased Oil Putty, Paints, Oils, and Colours.

## BELGIAN GLASS for GREENHOUSES, &c.

Can be obtained in all sizes and qualities of **BETHAM & SON,** 9, LOWER THAMES STREET, LONDON, E.C. B. & S. have always a large stock in London of 20-in. by 12-in., 20-in. by 14-in., 20-in. by 15-in., 20-in. by 18-in., in 15-oz. and 21-oz.; and also large sizes in all qualities for cutting-up purposes, in 20-ft. and 30-ft. cases.

**Roshers' Garden Edging Tiles.**  
THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "crown" Edgings, consequently being much cheaper.

**GARDEN VASES, FOUNTAINS, &c.** in Artificial Stone, very durable and of superior finish, and in great variety of design. **F. ROSHER AND CO.,** Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price Lists free by Post. The Trade supplied.

**ORNAMENTAL PAVING TILES,** for Conservatories, Halls, Corridors, Balconies, &c., from 5s. per square yard upwards. Pattern Sheet of Plain or more elaborate Designs, with Prices, sent for selection.

**WHITE GLAZED TILES,** for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c., and other Stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c.

**F. ROSHER AND CO.,** Brick and Tile Merchants. See Addresses above.

**SILVER SAND,** fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Stations. Samples of Sand free by post.

**FLINTS and BRICK BURKS** for Rockeries or Ferneries. **KENT PEATS or LOAM** supplied at lowest rates in any quantities.

**F. ROSHER AND CO.**—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A Liberal Discount on the Trade.

**Geometrical Mosaic and Encaustic TILES and PATTERNS,** for Conservatories, Verandahs, Entrance Halls, &c. Enamelled and Decorated Glazed Tiles, for Wall Linings, Fireplaces, &c.; also Patent Indestructible Terra-cotta Plant Markers. Patterns and Prices sent post-free on application.

**MAW AND CO.,** Pentlith Works, Broseley, Shropshire.

## JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler with the following improvements—viz, the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 1 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	800	13 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From **MR. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 20, 1873.**  
"Having given your Patent Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

**PRICE LISTS of HOT-WATER PIPES and CONNECTIONS,** with Boilers, of all sizes and shapes. ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

**J. JONES AND SONS,** Iron Merchants, 6, Bankside, Southwark, London, S.E.  
When ordering Boilers please refer to the above advertisement.

**A POWERFUL APPARATUS for TRANSPLANTING TREES.**—Apply to **MR. CHARLTON, Tunbridge Wells; Messrs. WEDLAKE, Horsham.** Complete, £5 7s. 6d.; 4s. 7s. 6d. Exhibited at 147, Regent Street, London, W.

The Best System of Heating is by Hot Water. The Best Hot-Water Joint is Jones' Expansion Joint.

## JONES & ATTWOOD, ENGINEERS & IRONFOUNDERS, STOURBRIDGE.

THE BEST EXPANSION JOINT! HOT-WATER JOINT.

Medal Awarded, Horticultural Show, Aston, 1875. SIMPLY, DURABLE, NEAT, CHEAP. Specially adapted for CHURCHES, SCHOOLS, MANSIONS, PUBLIC BUILDINGS, &c.

The improved CATALOGUE; also Estimates for Heating with the most improved BOILERS, EXPANSION JOINT PIPES, or COILS, on application.

This implement is admitted by the leading horticultural authorities to be unrivalled for Pruning and Trimming Trees of all kinds, Shrubs, Fruit Bushes, Vines, &c. Illustrated Circulars post-free. **STANDARD MANUFACTURING COMPANY, St. Alkmund's Churchyard, Derby.** Sold by the principal Ironmongers and Seedsmen.

## RIPPINGILLE'S PATENT PROPAGATING PLANT FRAME.

Heated by Patent Stove, to Burn Petroleum and other Mineral Oils. The Simplest and Best Invention ever introduced for RAISING SEEDS, STRIKING CUTTINGS, &c.

The only Frame of the kind for Outdoor Use. The above Illustration represents Rippingille's Patent Outdoor Plant Frame, which is so constructed that it will not blow out during the roughest weather; it is made upon the most scientific principles, but is so simple that it is impossible to get out of order, and in economy is unequalled, the cost of burning being only FROM A FAIRING TO A HALF-PENNY PER DAY.

The Stove will burn from thirty-six to forty hours without attention. The products of combustion do not enter the Frame at all, but at the same time all the heat is completely utilised. It is disconnected from the Frame for trimming the wick, lighting, replenishing with oil, &c. The top of frame slides off in other way, and is entirely removable; this is very convenient for Planting or removing Cuttings; Watering, Ventilation, &c. The heat attained is from 70° to 90° Fahrenheit, which is considered the best temperature for Forcing or Propagating purposes.

**PRESS OPINIONS.**  
"The Journal of Horticulture."—"A valuable aid to Amateur Gardeners."  
"The Gardener."—"It is a handy Plant Frame, likely to be much used when better known."  
"The Gardener's Magazine."—"Rippingille's Propagating Frame is a most valuable invention."  
"The Horticultural Record."—"This Frame ought to be in every small Garden, so that its owner could raise his or her flowers from seeds and cuttings, which gives so much greater zest to the pleasures attached to Amateur Gardening."

Sent packed free and carriage paid to any Railway Station in England.  
Illustrated LIST, with full particulars, further Press Opinions, Testimonials, sizes, &c., free on application to **THE HOLBORN LAMP & STOVE CO., 118, HOLBORN, LONDON, W.C.** SAY WHERE YOU SAW THIS ADVERTISEMENT.

GROOM, and to attend to small gardens.—Age 30, married; very good references.—C. BAKER, Friar's Place, Acton, London, W.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which will save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up from a state of weakness, and a propensity to disease. Hundreds of subtle malarial influences are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure and healthy nourishment.—"Civil Service Gazette."

Made simply with boiling water or milk. Sold only in packets, labelled, JAMES EPPS AND CO., HOMOPATHIC CHEMISTS, London.

Makers of Epps's Chocolate Essence for Afternoon use.

HOLLOWAY'S OINTMENT and PILLS will be found the best friend to persons afflicted with ulcerations, bad legs, sores, abscesses, fistulas, and other painful and complicated complaints. It is applied to the parts affected for the application of the Ointment are wrapped round each foot. Holloway's alterative Pills should be taken throughout the progress of the cure to maintain the blood in a state of perfect purity, and to prevent the health of the whole body from being jeopardised by the local ailments; bad legs, old age's great grievances, are thus readily cured, without confining the patient to bed, or withdrawing from him or her the nutritious and generous support so imperatively demanded, when weakening diseases attend advanced years or constitutions evincing premature decrepitude.

ONCIDIUM MACRANTHUM HASTIFERUM: an altogether magnificent importation of this finest Oncidium, from Mr. E. Klabbok. The consignment is in superb health. On view morning of Sale, and Catalogues had.

Imported and Established Orchids.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, March 7, at half past 12 o'clock precisely, an importation of ONCIDIUMS, CRISTATUS (ALEX. C. WEXLIARDI), ONCIDIUMS, CRISTATUS (PESCATORE), CATTLEYA AUREA, C. GIGAS, MASDEVALLIA HARKYANA, &c., from Messrs. Shuttleworth, Carder & Co. Also several small collections of Established Orchids, such as Flowering CATTLEYA LILIUUM AURATUM, just received from Japan in fine condition. On view morning of Sale, and Catalogues had.

Roses, Fruit Trees, Bulbs, &c.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, March 7, at half past 12 o'clock precisely, 200 choice named Standard and Dwarf ROSES, including Hybrid Perpetuals, Rambles, Moss, and other well-known English and French Nurseries; Pyramid and Dwarf-trained FRUIT TREES, CARNATIONS, PICOTEES, and PINKS, SPIRÆAS, ALYSSUM, and the YALLEY of WINDSOR; 1000 LILIUUM AURATUM, just received from Japan in fine condition. On view morning of Sale, and Catalogues had.

Thursday Next.

GREAT CATTLEYA SALE.

Second Portion of

CATTLEYA LABIATA, BECCALIANA, Rehb. f., TRUE AUSTRIAN-FLOWING LABIATA.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on THURSDAY NEXT, March 2, the Second Portion of a wonderful importation of this magnificent CATTLEYA. It is well known there are numerous varieties among the old Cattleya labiata, such as Pescatore, picta, &c., and the varied bulbs show that many varieties are among the lot offered. It is true autumn flowering. Flowers will be on view of this the finest Brazilian Cattleya: sepals and petals broad, deep rose or light purple, lip broad, large, and 3-4 inches long, lower part deep dark, throat golden-yellow. We have never previously seen imported a Cattleya so floriferous; it is hardly a bulb which has not flowered, and the plants have 10 to 15 flowers and four flower stems. Mr. Seidl, the lucky discoverer, states that one mass alone had 370 flowers fully expanded when collected, and many others had 100 to 150 pieces had to be cut into four, to facilitate its transport to the far-distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. It is one of the best red-leaved varieties among the importation, which altogether is in simply superb condition.

CATTLEYA TRIANE, ALBA, DELICATA, &c., from Mr. Schmidtmann, and from the same locality whence our last year's importation was made, and which are few and far and are unsurpassable. The importation consists of grand masses in extraordinary health.

- Cattleya Dowiaia. Cattleya Dayana.
Eldorado. Mosses, and of the width of 25 feet, 16 feet and 9 feet respectively, Seed-stock, Store-room, Plant Pits, and other requisite buildings, and about 12 acres of Ground. The buildings are in excellent repair, and on Lease from the Marquess of Anglesey for a term of which 83 years are unexpired, at the annual rent of £175 10s.; and the Nursery Grounds are held on Lease from the said Marquess for a term of which 26 years are unexpired, at the annual rent of £75 7s. 6d. Immediate possession can be had. The purchaser will have the option of taking to the growing Stock at a valuation. If not taken to it will be sold by Auction during the month of March.

For further particulars apply to the AUCTIONEERS, Liebfield; or to Mr. H. GODDGER, Solicitor, Burton-on-Trent.

Important Sale of Choice Double Camellias and AZALEA INDICA, beautifully set with Bloom-buds; GREENHOUSE PLANTS, in variety; about 400 Standard and Dwarf ROSES, of the best varieties; Selected FRUIT TREES, HARDY FRUIT TREES, and SHRUBS, such as GREEN SHRUBS, AMERICAN PLANTS, DAHLIAS, LILIUUMS, &c.

MESSRS. PROTHEROE AND MORRIS will sell by the above AUCTION, at the City Auction Rooms, 38 and 39, Gracechurch Street, E.C., on TUESDAY, February 28, at 12 o'clock precisely. On view the morning of Sale. Catalogues had at the Rooms, and of the Auctioneers, 8, New Broad Street, E.C.

Manchester.

MR. R. S. Yates, Nurseryman, in Liquidation. MESSRS. ARTINGSTALL AND HIND beg to intimate that the Trustee herein has secured, through the kindness of Mr. Anthony Water, Knapp Hill Nursery, Woking, Surrey, the 27,000 plants and men to superintend the arranging of the PLANTS proposed to be submitted at the forthcoming SALES by AUCTION, commencing on MONDAY NEXT, the 27th inst. at 10 o'clock of the correct coming. As far as practicable, of the well-known and valuable collection of RHODODENDRONS, AZALEAS, HOLLIES, and various other important and RARE PLANTS, which are all selected for the adornment of Lawns and other conspicuous positions.

The Nurseries, Brooklands.

ON MONDAY, FEBRUARY 27, and Five following Days. MR. R. S. Yates, in Liquidation. HIGHLY IMPORTANT SALE OF FINEST NURSERY STOCK, comprising 1300 of the finest selected choice named prize Hybrid Rhododendrons, the best varieties grown, and all truly selected, the greater portion of which are especially exhibited for a long number of years: 800 fine pyramid-shaped Green and Variegated Hollies, 75 to 125 feet high; 1200 Flowering of one of the Roses; 7 remarkably fine specimen Lagerasia alba, 9 feet high by 5 feet through; a large quantity of Hardy Ferns, Ivy, and other plants; Hericium, Bulbous, and Strawberry Plants, Fruit Trees, &c.; together with the whole of the very valuable Conservatories, and other glass horticultural Houses, fitted in all respects of considerable size, and in capital condition; Cold Pits, Frames, improved Boilers, some of large capacity; Hot-water Pump, Valves, &c.; Wooden Cover for Haystack, brick-built Fruit-house, Rockery, Stone, &c.

MESSRS. ARTINGSTALL AND HIND respectfully announce that they are instructed by the Trustee under the liquidation of Mr. R. S. Yates to sell by AUCTION, on MONDAY, FEBRUARY 27, at 10 o'clock, commencing at 10 o'clock each morning, at the Nurseries, Sale, a few minutes' walk from the Brooklands Station, near Manchester, the whole of the valuable NURSERY STOCK and HORTICULTURAL ERECTIONS now on the ground.

May be publicly viewed this day, from 10 to 4 o'clock, at the Nurseries, or may be further particulars, by applying to the Trustee, Mr. JAMES MARCHANTON (Messrs. Marchanton and Kendal's Chartered Accountants), 4, King Street, West; or to the Auctioneers, 51, Princess Street, all of Manchester.

Woking, Surrey.

Mr. J. Trigg's Nursery, Goldworth, 1 mile from Woking Station, London and South-Western Railway. IMPORTANT UNRESERVED SALE of well grown NURSERY STOCK.

MR. F. W. ABRAHAM has received instructions from Mr. J. Trigg by AUCTION, without reserve, on the Premises as above, on WEDNESDAY, March 1, and two following days, at 11 to 12 o'clock precisely each day, the whole of the valuable NURSERY STOCK, consisting of 5000 Gold and Silver Holly, from 1 to 5 feet; 7000 Green Holly, 1 to 5 feet; 10,000 English Yews, 3 to 6 feet; 5000 Portugal Laurels, Sweet Bays, Pines, Nordmann's Cedars, Thuys, Yew Trees, &c.; Standard and Pyramidal Fruit Trees, Apples, Pears, Plums, Currants, &c., and quantities of Deciduous and Flowering Trees and Shrubs in great variety. May be viewed, and Catalogues obtained, four days before Sale, on the Premises; at the principal Hotels in the neighbourhood; or of the Auctioneer, Swiss Nursery, Loughborough Road, Brixton, W.

Bucks.—(No. 558.)

TO BE LET or SOLD, 30 Acres of highly prolific FRUIT GARDEN LAND, planted with about 30,000 Trees and Bushes. Terms of Messrs. PROTHEROE and MORRIS, 8, New Broad Street, E.C.

London, S.W.—(No. 548.)

TO BE LET, in a first-class neighbourhood, about 6 miles from Covent Garden, a WELL-ESTABLISHED NURSERY, with 8 acres of premises, heated upon modern principles. Rent, £8 per annum. Full particulars of Messrs. PROTHEROE and MORRIS, 8, New Broad Street, E.C.

To Gardeners.

TO BE LET, a good COTTAGE, with STABLE SHED, GREENHOUSES, and conveniences, with 1 Acre of Garden Ground, wherein is large Peach-house, well-stocked Cucumber-house, and small Stone-house and Vegetables. Rent, £50. Close to a good Market Town, and within 22 miles of London. Former tenant made the fruit pay rent.

cuttings, 15s. per 1000. This variety should be grown in preference to all other yellows. Header's Spotted and Striped PEUNIA, 2s. per packet.

HENDER and SONS, Nursery, Plymouth.

# RETIREMENT OF MR. THOMAS MOORE.

On the retirement of Mr. THOMAS MOORE from the joint Editorship of the *Gardeners' Chronicle*, a committee was formed for the purpose of arranging for a suitable recognition of his eminent services to Horticulture and Botany, as well as of his disinterested devotion to social and philanthropic movements in connection therewith.

The step thus taken has met with general approval, and the Committee have obtained many promises of support from horticulturists and florists, so that it is anticipated that a substantial presentation may be the result of this endeavour. It is, however, important that all who sympathise with this proceeding should manifest their sympathy as promptly as possible.

Mr. Moore is so well known, and his labours are so generally appreciated, that to urge the merits of the cause would be a waste of words. But it is pertinent to this appeal to say that the Committee have definite objects in view, and wish to carry them into effect without delay. The Committee are of opinion that the subscriptions of Gardeners—without regard to their respective amounts—would be not only appropriate to the occasion, but peculiarly gratifying to Mr. Moore.

Intending subscribers to the MOORE PRESENTATION FUND are desired to communicate to the Treasurer or Secretary, or any member of the Committee, naming the amounts promised by themselves and their friends.

Cheques may be crossed Union Bank of London, and Post-office Orders may be made payable at the Chief Office in London. Subscribers who cannot conveniently send Cheques or Post-office Orders may remit their amounts in Postage Stamps, in which case it will be advisable to forward them direct to the Secretary.

WILLIAM PAUL, Waltham Cross, *Honorary Treasurer.*

SHIRLEY HIBBERD, 15, Brownswood Park, London, N., *Honorary Secretary.*

## Committee for Presentation to Mr. Thomas Moore.

MANGEL WURZEL and TURNIP SEED. H. AND F. SHARPE are prepared to make special offers of MANGEL WURZEL and TURNIP SEED, grown last season from carefully selected transplanted Bulbs. The quantities here offered have been harvested in fine order, and the prices will be found exceptionally low. Seed Growing Establishment, Wisbech.

SPECIAL NOTICE.

Messrs. CARTER were the originators of the "Box of Seeds" System, which has now found so many imitators amongst provincial seedsmen. Intending purchasers of the "Original Boxes" are warned against colourable imitations. The unwearied success of Messrs. CARTER'S Seeds has rendered these Boxes most extraordinarily popular, and is the best evidence of the advantages to be derived by obtaining supplies direct from the producers.

THE QUEEN'S SEEDSMEN,

237 & 238, High Holborn, London, W.C.

CHARLES TURNER'S

DESCRIPTIVE CATALOGUE OF SEEDS

FOR THE GARDEN AND FARM,

Is now ready, and may be had free on application.

THE ROYAL NURSERIES, SLOUGH.

Hyacinthus candicans (Galtuna candicans). LARGEST CULTIVATED STOCK in the WORLD. 100,000 Flowering Bulbs ready for Immediate Supply.

H. KRELLAGE AND SON, NURSEY-VAN, SEASDAM and FLORISTS, Haarlem, Holland, beg to offer this splendid Plant, the good qualities of which may be considered generally known at present. It is a first-rate Plant for bedding purposes, to be placed in beds alone or allied with Gladiolus brenchianensis or other plants with striking colours. The pure white flowers are very useful in Bouquets, &c. We supply this Plant in three qualities, according to the size of the Bulbs, viz.— First Size, 2s. 11. 5d.; per 100, 25s.; per 1000, 240s. Second " " 3s. 6d.; " " 20s.; " " 180s. Third " " 2s. 6d.; " " 15s.; " " 120s. The Bulbs of all three sizes are sufficiently large to give flowers next summer. Trade prices on application.

Verbenas—Verbenas.

VERBENAS.—Strong, healthy, well-rooted Cuttings, perfectly free from disease, of White, Purple, Scarlet, and Pink, &c., per 100, 20s. per 1000; 20s. strong rooted Cuttings, in twelve most splendid varieties, First-prize Flowers, for 7s. Terms cash. EXECUTORS of the late H. BLANDFORD, The Dorset Nurseries, Blandford.

TO THE TRADE.

CHARLES B. SAUNDERS, Nurserman, Jersey.

TO THE TRADE.—Thousands of Strong TARRAGON ROOTS, to be sold cheap. Apply to CRANSTON'S NURSERY AND SEED CO. (Limited), King's Acre, Hereford.

EDWARDS' VICTORIA KIDNEY.—All

the good qualities of the old varieties are centred in this magnificent Potato, for which a First-class Certificate was given by the Royal Horticultural Society in November last, after having been grown at Chiswick and tested by the Committee. It is a seedling from Victoria Round, but harder, a great cropper, ripening early in September, and will keep in excellent condition until July. The tubers are full-sized, but not at all coarse, and when cooked were as snow, and perfectly healthy. It was raised by Mr. Edwards, of our friend, Burnell Gardens, Shropshire, who has for forty years cultivated all the best kinds, both home and imported. OLDROYD AND CO., Nursermen and Seedsmen, Shrewsbury, have the sole disposal of the above, which they offer at 1s. 6d. per lb.; 7lb. for 2s. 6d.; 14 lb. for 4s.

GLOXINIAS.—JAMES CYPRER offers fine second bulbs of choicest varieties of GLOXINIAS, at 6s., 9s., and 12s. dozen.—Exotic Nursery, Cleehampton.

FOR SALE, SEAKALE for Forcing and Planting, in large or small quantities. For price per 100 or 1000 apply to

S. BIDE, Alma Nursery, Farnham.

FLOWERING SHRUBS, in great variety, such as Hydrangeas, Lilacs, Deutzias, Spiraeas, Cythus, Rhodus, Erythras, &c. Double Cherry, Sweet Hawthorns, Guelder Rose, &c., 8s. per dozen; 50s. per 100.

Descriptive LIST on application. RICHARD WIRTH AND CO., Nursermen and Seed Merchants, Worcester.

GLADIOLI—All the sorts worth growing.

DAHLIAS—Pot-roots, 300 sorts. CATALOGUES to be had free of KELWAL AND SON, Langport, Somerset.

BATH offers the following varieties of POTATOS for seed:— Myatt's Ashleaf Early Don Rivers' Royal Ashleaf Early Rose Snowflake Early Goodrich Beauty of Hebron Forystad Dalmahoy and other leading varieties of the above. Early Don Magnum Bonum Paterson's Victoria Scotch Regent York King's Fluke Champion

Also 100 bushels of JERUSALEM ARTICHOKE, 1 and 3, York Street, Borough Market, S.E.

THURSDAY NEXT.GREAT CATTLEYA SALE.

SECOND PORTION OF

**CATTLEYA LABIATA PERCIVALIANA**  
(Rehb. f.)

TRUE AUTUMN-FLOWERING LABIATA.

**M**R. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. SANDER, on THURSDAY NEXT, March 2,

THE SECOND PORTION OF A WONDERFUL IMPORTATION OF THIS MAGNIFICENT CATTLEYA.

It is well-known there are numerous varieties among the old *Cattleya labiata*, such as *PESCATOREI*, *PICTA*, &c., and the varied Bulbs show that many varieties are among the lots offered. It is true Autumn-flowering. Flowers will be on view of this the finest Brazilian *CATTLEYA*—sepals and petals broad, deep rose or light purple; lip broad, large, splendidly fringed, lower part deep velvety-purple: in some varieties quite one-half of the lip is dark; throat golden-yellow. We have never previously seen imported a *Cattleya* so floriferous: there is hardly a Bulb which has not flowered, and whose spike does not show three and four flower-seats. Mr. Seidl, the lucky discoverer, states that one mass alone had 380 flowers fully expanded when collected, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far-distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. The green and red-leaved varieties are among the importation, which altogether is in simply superb condition.

**CATTLEYA TRIANÆ, ALBA, DELICATA, &c.,**

from Mr. Schmidtchen, and from the same locality whence our last year's importation came, many of which have flowered, and are unsurpassable. The importation consists of grand masses, in extraordinary health.

**CATTLEYA DOWIANA**  
**CATTLEYA ELDORADO**  
**CATTLEYA WALKERIANA**

**CATTLEYA DAYANA**  
**CATTLEYA MOSSIÆ**  
**CATTLEYA SKINNERI ALBA.**

**ONCIDIUM LANCEANUM**—grand lot, with extra large leaves, and consisting of finest varieties.**ONCIDIUM MACRANTHUM HASTIFERUM**—from Mr. E. Klaboch.

**LÆLIA FLAVA,**  
very fine lot.

**MASDEVALLIA SPECIES,**  
lovely rose-coloured.

**CATTLEYAS** from the Brazils, sent home as **AMETHYSTOGLOSSA.***On view morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

SUTTONS COLLECTION OF SEEDS

For a year's supply of the Garden. SUTTON & SONS were (as is well known to all the earlier readers of the "Gardeners' Chronicle") the sole originators of this system. Their Collections, which still rank pre-eminently with Horticulturists, can only be had genuine direct from READING.

STRONG PLANTING CANES OF BLACK HAMBURGH and MUSCAT of ALEXANDRIA, 36s. per dozen. JAS. GARWAY AND CO., Durham Down Nurseries, Clifton, Bristol.

H. CANNELL & SONS'

IS NOW READY, And sent Post-free for 1s.

We assure all lovers of flowers that it is by far the best we have ever issued, and probably the best ever published. Certainly it contains the greatest and most reliable information on Flowers and their Seeds. The printing 20,000 copies costs £570, the postage of the same £250. We simply mention this to show to what extent our efforts are appreciated.

Splendid Coloured Drawings of our CALCEOLARIAS, CINERARIAS, CYCLAMENS, and PRIMULAS by the best artists, as near like the actual flowers as skill and paint can produce. These make beautiful pictures. Post-free for 6d.

For the SEEDS, and the way to sow, grow, and obtain the finest specimens of the above, such as would carry off the first prizes, see H. C. & Sons' Floral Guide for 1s. All the above post-free for 1s. 6d.

Violas. THE BEST SPRING and EARLY SUMMER BEDDING PLANTS.—We have large quantities of all the best and most effective colours—White, Yellow and Blue. Plants showing bloom, 8s. per 100. VIOLETS.—NEAPOLITAN, best Double, fine clumps full of flower, 2s. per 100. ODORATISSIMA, the best Single, blooms resembling a Pansy. Fine clumps, 25s. and 15s. per 100.

Spotted Calceolarias. H. CANNELL AND SONS have now perhaps the most model-like small plants ever offered, so clean and vigorous that they would be sure to give satisfaction, 2s. 6d. per dozen; in smaller pots, 2s. 6d.; larger size, 4s. per dozen. All are from our own well-known stock, the best of all strains. Special quotations for large quantities.

Heliotropes. WHITE LADY and PRESIDENT GARFIELD.—Never before have two new varieties so completely surpassed all older kinds; however, such is the fact, and perhaps never were there two more serviceable plants offered. Two First-class Certificates. 2s. each; one of each, post-free for 4s.

CHRYSANTHEMUMS. Special Offer during February. We have now, perhaps, the finest house of Cuttings of the above ever seen—all the varieties arranged as per Catalogue; consequently orders are despatched by return of post. Our selection of Cuttings, all distinct and true to name, 10s. per 100; 500 distinct kinds, 40s.; stock plants, our selection, in good kinds, 25s. per 100. Illustrated CATALOGUE post-free.

SINGLE DAHLIAS. YELLOW DWARF, 12s. 6d. each, 15s. per dozen. SCARLET GEM, 12s. 6d. each, 10s. per dozen. COCCINEA, 12s. 6d. each, 15s. per dozen. A pot-root of each of these splendid kinds, post-free, 4s. 6d. We have the most complete collection of doubles, and always grow not less than 10,000 pot-roots, and can therefore offer best in cultivation.

New Chrysanthemum—Mabel Ward. H. CANNELL AND SONS beg to announce the advent of the Chrysanthemum that they are now sending out good plants of the above at 2s. 6d. each, post-free. The Journal of Horticulture reports, it thus:—"Mr. Martin also secured First Prizes in the classes for twelve and six cut blooms, distinct, with blooms scarcely inferior to the Prize Cup lot, and in each stand set up a bloom of Mabel Ward, which we venture to predict will be a splendid addition to our incumbered varieties."

REAL MANURE for POT PLANTS.—The value of the above is demonstrated in our wonderful exhibits, and it is now an admitted fact that it is the safest and most effectual manure for plants to attain the height of perfection ever offered. This is not a mere assertion, but an established fact, based on our successful history for many years. 1lb. tin, 1s.; 3lb. tin, 2s. 6d.; 6lb. tin, 4s. 6d. See our FLORAL GUIDE, post-free for 1s. Full particulars how to obtain First Prizes, and the success of Flower Growing a certainty.

STRAWBERRIES.—Why can we supply Strawberries, better plants, true to name, and in any quantities, probably superior to any other firm? Simply because we are located in the midst of hundreds of acres of all the best Kent kinds in cultivation. Plants in pots for immediate fruiting—6-inch pots, 25s. per 100; 5-inch pots, 25s. per 100; 3-inch pots, 10s. per 100. Prepared runners, 4s. per 100. Special price for large quantities.

THE SECRET OF HIGH CULTIVATION IN POTS: How to Grow Soft-wooded Plants to the Highest possible State of Perfection, Fuchsias in particular, and other interesting and useful subjects, which, how one can build their own greenhouse (Illustrated). The two Post free, 1s. 6d.

Mr. Wm. BIRKETT, Featherstone, Halthwaite, 1-2 from you. Essays I have taken all the First Prizes at the Local Exhibitions. When setting up my Plants at our Show gentlemanly gardener said, "You may give Messrs. Cannell a challenge, but I told him that in a year you will."

H. CANNELL AND SONS, The Home for Flowers, Swanley, Kent.

W. ETHERINGTON, Manor House, Swanscombe, Kent.

SPARAGUS.—The finest roots that money can procure, 6d. per 100. This delicious vegetable does not require half the expense usually incurred. For directions for planting, see SEED LIST, free on application. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

This, the perfection of frame Cucumbers, is a cross between Telegraph and Tender and True; in form it has a resemblance to Telegraph, but is of a darker green and much longer—fruit 31 inches in length having been cut from it. In flavour it is superior to Tender and True, but its chief recommendation is its marvellous productiveness, in which it excels everything that has come under our notice, as many as 300 and 400 fruit having been cut at one time from twelve plants, in a 3-light pit 3-quarter span.

For succession it is unequalled, bearing as abundantly at Christmas as Midsummer; and in addition to its handsome form and lovely colour, it is a variety that seldom produces seeds, not one in a hundred containing a trace. This peculiarity has delayed sending out the stock for a year or two, and at one time it was so nearly lost that only by striking cuttings could it be preserved.

Retail Price per Packet, 3s. 6d.

## THE DESIDERATUM IN POTATOS. SHARPE'S DUKE OF ALBANY.

The Editor of the *Gardeners' Chronicle*, in the number for September 24, 1881, makes the following remarks in his report of the International Potato Exhibition, held at Manchester:—

"But we want other improvements; we want more large cropping, earlier kinds, and of the late sorts' considerable disease-resisting powers. First early sorts are rarely affected by the destructive fungus. Their season is short, their haulm growing usually of a medium character, and, as a rule, they ripen ere the disease becomes dangerous. Large cropping kinds, that will give a big bulk of good tubers capable of carrying on the needful supply for the family, or for the nation till Christmas, yet lifted ripe in August, would be an immense boon; and these, it is hoped, may come soon, because well-directed efforts in the shape of cross-fertilisation to secure the desired end are being made. . . . Although no special prizes were offered for these, there can be no doubt but that the special encouragement given to new sorts will tend to promote that desirable object."

Duke of Albany so exactly corresponds to the requirements above indicated, that had it been written for us as a description, it could not have been more exact.

Duke of Albany is a white Kidney—a cross between Beauty of Hebron and Early Goodrich; it has a short haulm with a pale flat leaf, is quite as early as Myatt's Prolific; as large in size, and as heavy a cropper as Magnum Bonum—than which it is ten weeks earlier; it is ripe early in August, and will keep until Spring, being a first-class Potato from the middle of July until the month of March. For flavour, quality of flesh, and good cooking properties, it leaves nothing to be desired.

Retail Price per Pound, 6d.

CHARLES SHARPE & CO., SLEAFORD.

## ORCHIDS.

The Largest and Best Stock in Europe of good Established Plants. Tens of Thousands of Plants to select from.

MR. WILLIAM BULL

Begs to intimate that his Orchid-houses are always quite a sight, from the large number of plants in flower, and he will be pleased to show them to any one interested in this beautiful class.

MR. WILLIAM BULL

Recommends those desirous of having their Houses gay with Orchid flowers, to purchase good established well-cultivated plants, which bloom well, are far more satisfactory, and comparatively cheaper than newly imported or semi-established plants.

Establishment for New and Rare Plants, 536, KING'S ROAD, CHELSEA, LONDON, S.W.

**GORDON'S NEW VICTORIA POTATO.**  
—This Potato was awarded the Special Prize of the Highland and Agricultural Society's Silver Medal, at the Northern Counties Show at Inverness in December, 1881, and also the First Prize in the Royal Class. It somewhat resembles the Paterson's Victoria, being of good shape, moderate size, and a heavy cropper, and has hitherto almost entirely resisted disease or blight. It is of excellent cooking quality, being white and mealy, with little waste, is a good keeper, and may be freely cut into sets.  
Sample Cwt. Bag sent on receipt of Postal Order for 7s. 6d., payable to **R. STUART**, Dundale Farm, Gravesend.  
Price per Ton on application.

**G A M E C O V E R .**

**LILIUM HUMBOLDTI**, beautiful, hardy, and easily grown, 18s. and 20s. per dozen; gigantic roots, 42s. per dozen.  
**LILIUM WASHINGTONIANUM**, a splendid, hardy, easily grown species, 30s. and 40s. per dozen.  
**LILIES OF VALLEY** and **SOULS**, either for Greenhouse, Conservatory, or Open Border, by the dozen, 10s. or 1000.  
**Mr. WILLIAM BULL'S** Establishment for New and Rare Plants, King's Road, Chelsea, London, S.W.

**NEW POPATO—PREMIER EARLY WHITE.**—This is a Potato of great merit, and proved to be the earliest in cultivation. It is a cross between Foster's Excelsior and Snowflake. The tubers are round and handsome, having small eyes not indented, and all but level with the surface. Its skin is rough, and of a light yellowish-brown, and very floury when cooked. The haulm is also very dwarf, as dwarf as Smith's Early, so that the Premier is well adapted for Forcing. Price per pound 3s. Sent out by **DOWNS AND LEED**, Edinburgh.

**TO MARKET GARDENERS, GENTLEMEN'S GARDENERS, and others about to commence business**—**JAMES FARRAR AND CO.** have to announce the publication of their Trade Seed CATALOGUE, which will be forwarded post-free upon application.  
Seed Warehouse, 15, Finsbury Street, Bishopsgate, London, E.C.

List on application.  
—All above Plants warranted true and strong, from the open ground (not raised in frames). No charge for package.  
**EDWARD LEIGH**, Wrotham Farm, Dunsfold, Godalming.

**Gynura aurantiaca.**  
**H. MAURER, NURSERYMAN**,  
Jena, Germany,  
Will be prepared to supply plants of the above splendid species (true) in April, at 5s. each. For beauty of foliage it has perhaps no superior. The entire surface of the stems and leaves are covered with innumerable hairs, soft to the touch, and of an exceedingly rich velvet. The flowers are of a brilliant orange, and contrast charmingly with the beautiful velvety foliage of the plant.  
Orders booked now. Plants will be accompanied either by stamps or Post-office Order.

**SPECIAL OFFER**, for one Month, to the Trade.—**JOHN HAYWARD**, The Nurseries, Cheadle, near Manchester, offers the following in strong, healthy plants, in quantities not less than 100 each, for 10s. per 100, 1/2 per 100, for cash with order:—**PANSIES**, Blue King, Mrs. Felton, Tory, Comet, David Smith, David Caven, George Vair, Mrs. Binkney; **VIOLAS**, Adonis, Alps, Amethyst, Acme, Alpha, Holyrod, Philig Puff, Sovereign PHLOX, leading sorts, 20s. per 100; **CARNATION**, Old Clove, 20s. per 100.

ALL KINDS OF  
Agricultural, Garden, and Flower  
**SEEDS**  
Of Best Quality.

A FEW OF THE SELECT SEEDS  
WE ARE NOW NOTED FOR:—

- BROCCOLI, Covent Garden White.
- Evesham Giant White (very protecting).
- BRUSSELS SPROUTS, Covent Garden Strain (the best  
varieties grown).
- CELERY, Covent Garden Red (large and very solid).
- COLEWORT, Hardy Green (hears like a Cabbage).
- PARSLEY, Perennial Moss-carled (splendid).
- PARSNIP, Hollow Crowned, select stock.
- SAVOY, Covent Garden Drumhead.
- VEGETABLE MARRROW, long white ribbed (the longest  
and best).

### FLOWER SEEDS.

- BEGONIA, choicest tuberous-rooted (from splendid col-  
lection).
- CANDYTUFF, New Carmine (splendid distinct colour).
- CARNATION, The Bride (the best white).
- .. choicest mixed.
- CYCLAMEN, Covent Garden strain (fine habit and colour).
- DAHLIA, Single (selected from all varieties in cultivation).
- GERANIUM, Ivy-leaved (choicest mixed).
- LOBELIA SPECIOSA, true dark (saved from cuttings).
- MYOSOTIS DISITIFLORA, true.
- .. AZORICA, true.
- POPPY, Dwarf French Rannunculus (all colours and select  
Double).
- .. Carriation-flowered (all colours and select Double).
- PYRETHRUM, Single (choice hybrids).
- SUNFLOWER, tall dark centred.
- .. yellow centred.
- .. Double orange.
- WALLFLOWER, Harbinger, early flowering dark.

Bulb Catalogue published in August.

**WILLIAMS' PRIMULAS AND CYCLAMENS**  
are the best in cultivation.

POST-FREE.

The quality of all is alike, the difference in price applying to the quantity of Seed put in the packets only.

- Williams' Primula sinensis fimbriata alba magnifica (New) .. 2/6 and 3/6
- Williams' Primula sinensis fimbriata Meteor (New) .. 5/0
- Williams' Primula sinensis fimbriata Chiswick Red (New) .. 2/6 and 3/6
- Williams' Primula sinensis fimbriata rubro-violacea (New) .. 2/6 and 3/6
- Williams' Primula sinensis fimbriata coccinea (New) .. 2/6 and 3/6
- Williams' Primula sinensis fimbriata, superb strain—Red, White, or Mixed .. 2/6 and 3/6
- Williams' Primula sinensis fimbriata rubra magnifica (King of Primulas) .. 2/6 and 3/6
- Williams' Primula sinensis fimbriata (Queen of the Whites) .. 2/6 and 3/6

- Williams' Cyclamen persicum, superb strain .. 2/6 and 3/6
- Williams' Cyclamen persicum, superb strain, Collection 6 varieties .. 5/0
- Williams' Cyclamen persicum, brilliant .. 2/6 and 3/6
- Williams' Cyclamen persicum giganteum .. 2/6 and 3/6
- Williams' Cyclamen persicum giganteum rubrum .. 2/6 and 3/6

All varieties of Choice Flower and Vegetable Seeds supplied.

For Descriptions see ILLUSTRATED SEED CATALOGUE, which will be forwarded, post-free, on application.

SATURDAY, FEBRUARY 25, 1882.

THE FORCING SEASON.

WITH the exception of the paucity of sunshine and the prevalence of fogs, the winter so far has been favourable to early forcing. Fortunately, too, these drawbacks are less felt in the earlier than in the later stages of growth. During the former, in fact, growth is more a manifestation of stored up force, the result of the previous season's work, than a building up of new, independent products; hence obscure light and the comparative absence of direct sunshine inflict but little injury on vegetation in its earlier growths. On the contrary, under certain conditions, as recently shown in our pages and abundantly illustrated in practice, tender dormant crowns and semi-dormant buds may be stimulated rather than retarded or injured up to a certain stage by semi-darkness, or the total absence of light; hence, with the exception of very early Peaches, Pines, Cucumbers, and Melons, probably vegetation has suffered but little by the comparative sunlessness and abnormal fogginess of the winter.

Be this as it may there can be no question that the mildness of the winter has resulted in an enormous saving of coal. The importance of the saving can hardly be exaggerated in a season like the present, while horticulture in nearly all private places is suffering more or less severely through the general depression of agriculture. Next to labour probably coal is the most expensive item in horticulture. It is, therefore, most fortunate that this far coal bills have been a half or three quarters lower than the average for December and January. In gardens where little or no forcing is indulged in coal bills have been well-nigh abolished. This fact is important in other ways than the mere saving of coal or money. Occurring at a time when many are meditating a reduction of their gardens, or the giving up of gardening for a time altogether, the saving of money in coal may help many to tide over the difficulty and keep up their gardens as heretofore. Already there are signs that the agricultural depression has reached its lowest limits and that things have begun to mend. We hear that the flocks and herds, notwithstanding a few outbreaks of disease, seldom were more thriving. It is certain that the Wheats never looked better.

Rent reductions have also reached their lowest limits, and farmers and others are once more indulging reasonable hopes that as the seed time so far has been so favourable a good harvest may also follow. Neither has the saving of coal through the mild winter been enjoyed only in gardens. The owners, occupiers, and workers on land, as well as the dwellers in towns and cities, and our trade and commerce, have all been assisted through a trying time by the boon of cheap coal. It has been affirmed, with some truth we believe, that commercial horticulture has suffered less than many other industries during the general depression, though the losses during the two

severe winters must have been serious, as well as the extra cost of maintenance and the diminished trade. We know for a fact that it has suffered, and that the saving of coal bills through the mildness of the winter will prove a most welcome boon to our nurserymen and florists.

What is economised in fuel will be expended in other and more profitable directions, and ultimately part of the benefits will be reaped by the nation at large. In this case there will be a double benefit; for less coal consumed means cheaper coal to purchase, and as coal is one of the most costly items in horticultural productions, such commodities are likely to prove more plentiful and more cheap, owing to the mildness of the season.

A mild winter also saves labour as well as coal; it becomes continuous, and not intermittent, and thus more work is done; the labour of covering and stoking are also reduced or abolished—these are often serious and expensive items in severe seasons. And then, too, time is saved as well as labour. It is immense gain in horticulture to be able to keep quite abreast or slightly ahead of the work to be done. Managed thus, horticulture may be carried on at little more than half the trouble or the cost. There is no work so expensive in its performance, so unprofitable in its results, as that which is done a day, or week, or month in arrear.

Those, however, must indeed be unfortunate or incompetent who are not abreast or ahead of their work at this time. Whatever amount of winter may yet be in store for us, the sun from henceforth works for us with increasing power; the heat of the sun carefully husbanded will render less coal necessary, and his increased energy quickens growth to such an extent that much more may be done in a given time than in December or even January. This suggests a large subject that we may probably return to again soon—whether time, coal, labour might not be saved, and equally good results obtained, by quickening the speed of some of our horticultural practices. Tropical produce races from the start to the finish as contrasted with that of more temperate climates, and in this age of telephones and telegraphs, electric light and motion, and rush and run and struggle of and for life, it may be wise and well to see whether weeks and days might not be saved in the production of many of our crops under glass. The idea that the pace kills—that is, weakens overmuch—has been accepted on insufficient evidence, much of which has been collected from conditions widely different to those within reach of the horticulturists of the present day, or, if it is not so, at least increased supplies at a cheap rate can readily be made to compensate for speedy exhaustion of worn-out material.

Thus, even where individual plants are killed in the race of rapid production the killing proves profitable. It does so virtually in regard to Lilies of the Valley, Spiraees, bulbs, and other plants by millions annually, and might yield a similar profitable result in regard to other plants. As our material grows the modes of propagation and the means of increase multiply almost to infinity, and as the demands for horticultural products become more urgent, the importance of individual plants sinks into comparative insignificance beside the one great problem of how to reap the largest profits at the least cost in the shortest space of time. A great step would be taken towards the profitable solution of this problem could the orthodox time between the start and the finish be shortened. For example, if Grapes can be finished in four and a-half or five months from the start instead of six, less coal and labour would be needed for their production—and so of other crops. To this end the electric light

may ultimately aid, though the cost of its production at the present time would of course be out of proportion to the results.

By deferring the start for a month, sometimes almost half the coal expended on the entire crop might be saved. The subject of thus economising the cost of production, important at all times, is vitally so in these seasons of severe rural depression, and we shall be very glad to hear what our practical readers have to say on the subject, and especially to chronicle facts relating to the actual periods within which ripe Grapes, Peaches, Cherries, Plums, Apricots, Melons, Cucumbers, Pines, have been cut or gathered from the starting of the buds, seeds, or suckers.

## New Garden Plants.

DENDROBIUM LEECHIANUM, *n. hybr.* (fig. 35.)

A HYBRID between *Dendrobium aureum*, Lindl., and *D. nobile*, Lindl., the last being the seed parent. It is well compared by Mr. Swan, who succeeded in raising it, with *Dendrobium splendissimum*, but it deserves a name of its own, as Mr. Swan also

FIG. 35.—DENDROBIUM LEECHIANUM.

thinks. The petals are narrower, more acute, very wavy. The lip is lobed, and this reminds one of *Dendrobium aureum*, Lindl. The flower bears the finest white of the best varieties of *Dendrobium nobile*, Lindl., the tips of the sepals, petals, and lip are of a rich rose-purple, and this appeared to me most striking when I opened the box, though it contained but a single flower of the novelty, which is always a very great embarrassment, in this case the less explicable, as it flowers in such profusion, as stated by Mr. Swan. Both sepals and petals are nearly totally rose-coloured outside. The anterior disk of the lip is occupied by a very large-toothed, dark purple blotch. Towards the base runs a broad callous line with fine purple stripes, and there are on each side radiating purple lines running outside. The column is quite green with purple longitudinal stripes, not with an ochre foot as is seen in *Dendrobium splendissimum*. Mr. Swan is very eloquent in pointing out the numerous good qualities of this novel hybrid, the best one being that bulbs of but 4 inches in height produce flowers. I entertain no doubt that Mr. Swan understands keeping the resting stems rather dry, not too wet, as Continental would-be Orchid growers often do. Mr. Swan expressed a strong desire that the new citizen in the State of Orchids might bear the name of Mr. W. Leech, Fallowfield, which we certainly agree to with pleasure. As to the names *Dendrobium aureum* and heterocarpum, we should finally adopt Dr. Lindley's name of *D. aureum*, and sink (as Professor Oliver is accustomed to say) Dr. Wallich's, which was only given to an Oriental drawing, most probably not representing *D. aureum*

at all, but *aureum* b. rhombum, Lindl. (rhombum, Lindl.), and though published in the same sheet with *D. aureum* yet enumerated after it, and with an unsatisfactory description from want of sufficient documents. *H. G. Rehb. f.* [The chief points in the crossing, sowing, and raising of this and other hybrids was given in our vol. xv., p. 302. Ed.]

LONGICERA ALBERTI, *Regel.*

We have frequently late had occasion to refer to the flora of Central Asia, especially in connection with the discoveries of Mr. Albert Regel. Of the numerous plants introduced into the Petersburg Botanic Garden by that gentleman, *Loniceria Alberti*, lately figured and described in the *Gartenflora*, is said by Dr. Regel to be the most valuable shrub. It is a very distinct and pretty species of the *Nyctostemum* section, having quite narrow leaves, usually less than an inch long, and rosy, fragrant flowers, about the size of those of *L. Nyctostemum* itself. Seeds of this hardy new Honeysuckle were collected in the alps of Eastern Turkestan, and plants were raised herefrom in the Petersburg garden, where they have proved perfectly hardy and where they flowered for the first time last June. Here is a translation of Dr. Regel's description:—A dwarf, glabrous, branching shrub, with diffuse, slender, dependent branches. Leaves opposite, glaucous, linear-oblong, rather obtuse, shortly petiolate, entire or furnished with two teeth on each side near the base. Peduncles axillary, shorter than the flowers. Outer bracts similar to the leaves, inner connate, forming a two-toothed involucre half as long as the calyx. Flowers fragrant, in pairs, but the ovaries not united. Corolla rosy-lilac, with a cylindrical tube and an almost regular 5-parted limb. In foliage this is not unlike a *Lyceum*, but it grows only 2 or 3 feet high. It has proved perfectly hardy at St. Petersburg.

DENDROCHILUM ARACHNITES, *n. sp.*\*

A curious botanical species with bulbs much like little Gherkins, ultimately furrowed, and exceeding an inch in length. The flowering-stem has no perfect bulb, this swelling later as in many plants of the *Ceologyne* group. The single leaf is lanceolate-oblong acute undulate, about 3 inches long by 1 inch in width over the most distinctly stalked base, of thin parchment-like texture. The peduncle slightly exceeds the leaf and bears a loose raceme of light greenish flowers having both sepals and petals tailed. The bracts are very narrow, almost linear, apparently persistent, exceeding the stalked ovaries. Lip lanceolate-ligulate acute, with three keels from the base to the centre, which are confluent. Column with a membranous toothletted margin around the anther and lower side laminae of rather fallacious outline. It was introduced by Mr. Stuart Low from the Philippine Islands. I have a nice living plant at hand, but I am afraid the novelty will create no sensation in the horticultural world. *H. G. Rehb. f.*

ODONTOGLOSSUM ACUMINATISSIMUM, *n. sp.*†  
(*hyb.*?) †

Whether this is a hybrid or a species I cannot say. Its hybrid nature might be inferred from the fact that it came amidst a great lot of *Odontoglossum crispum*, but this proves nothing. If I were to guess, I might conjecture its descent from *Odontoglossum Lindleyanum* and *cristatum*. Be this as it may the plant is remarkably distinct. The great pear-shaped acipitibus bulb has three ribs each side, and some of these fat impressions which are so distinct in *Odontoglossum neivium*, Lindl. The leaves are linear-ligulate, acute. The peduncle at hand is a few-flowered raceme, but it may well turn out a panicle, when the plant is more at home in Europe. The stellate flowers are nearly orange, with few large crimson bars. The lanceolate, acuminate, dark yellow lip has a broad cinnamon bar.

*Dendrochilum arachnites*, *n. sp.*—*Pseudobulbis* aggregatis cylindricis demum hinc impressis; caule supra basim monophyllo; folio brevi petiolato cuneato oblongo acuto undulato; pedunculo petalisque longis in apicem versus racemoso; bracteis linearilanceolis ovaria pedicellata superantibus; sepalis tepalisque lanceolatis, labello cuneato oblongo ligulato acuto, apice reflexo, lacinis callosis confluentibus tenuis a basi in discum; columna bifide; lacinis laterabilibus lacinis, cucullo circa androecium denticulato; floribus viridibus.—*Ex. ius.* Philippines, imp. cl. Low. *H. G. Rehb. f.*

*Odontoglossum acuminatissimum*, *n. sp.* (l.) *hyb.* (n.)—*Odontoglossum pseudobulbis pyriformis acipitibus utrinque trico-stato, planis quibusdam impressis; foliis linearilanceolis; racemo (nunc panicula?) paucifloro; sepalis tepalisque linearilanceolis acuminatis, labello subaequali ante basin flexo, lamella elongata pluridenticulata auribus a basi in medium, dentibus subulatis; columna trigona medio angulata, alis falcato-subulatis denticulato adventivis in margine infero.* *H. G. Rehb. f.*

There is a double lamellar keel from the base towards the middle with six to seven teeth on each side. The trigonous column has an angle in the centre, and a fine falcate-semilunar wing each side. This very curious novelty was sent by Dr. Wallace, New Plant and Hulb Company, Lion Walk, Colchester. *H. G. R. lib. f.*

*DIOSCOREA MULTICOLOR*, Lind. et And., *Ill. Hort.* 1871, vol. xviii., p. 52, t. 53.

This member of the Yam family was figured in the *Illustration Horticole* from barren specimens, nothing being known at the time of either male or female flowers. A plant has lately produced male flowers at Kew, enabling us to extend the description of an ornamental climber which should in the future occupy a place amongst our fine-foliage stove plants. It appears to be a free grower, the stems twining round their supports, and producing cordate leaves 3 to 5 inches long and 2½ to 3 inches wide, of a rich green, beautifully spotted and variegated with pale spots and blotches, most numerous near the principal veins; the under surface is uniformly pale lurid purple. In the young state a metallic blue pervades the leaves, vanishing with age. The panicle is gracefully branched, the branches (in our plant) numbering twelve to eighteen and measuring from 1½ to 2½ inches, on which the tiny flowers, scarcely a line long, are thickly arranged about eighteenths of an inch. The bracts are minute, broadly ovate, lengthened into an acuminate point and closely adpressed to the flowers (in the dried state a slight space intervenes, owing to the shrinking of the perianth tube). The perianth is narrowly campanulate, the dark purple oblong segments equalling only half the tube, which is yellowish-green. The three perfect stamens equal the perianth tube in length, the minute anthers are oblong, and the pollen bright yellow. The female flowers are unknown. It is a native of Northern Brazil, and was introduced from Rio Negro by M. Barazin, in 1868.

The figure cited represents leaves of six varieties—1, chrysophylla; 2, sagittaria; 3, melanoleuca; 4, metallica; 5, (sp ?) Eldorado; and 6, (sp ?) prismatica: of these our plant most nearly resembles melanoleuca. There seems no apparent reason why the first five may not be a variable form of one species, probably not permanent and unworthy of varietal names.

The sixth appears different, the veins only being partly white and the rest purple; the shape of the leaf also differs somewhat. *R. A. Rolfe, Acco.*

*NEPENTHES KENNEDYANA* (fig. 36).

The genus *Nepenthes*, as we have seen, is one that has its headquarters in the Malay Archipelago and the large islands of the Indian Ocean, especially Borneo. The species occur also at the extreme end of the Malay peninsula, in Ceylon, and in Cochin China. It is, therefore, quite in accordance with what might have been anticipated, to find the genus represented in North Tropical Australia. The present species, *N. Kennedyana*, comes from Cape York, in North Australia, and is abundantly distinct as a species. Our notes on the living plant were made in Messrs. Veitch's nursery, and have been checked by reference to dried specimens in the herbarium, and descriptions in the works of von Mueller, Bentham, and Hooker. The leaves in Messrs. Veitch's specimens taper at the base into a broadish stem-clasping stalk. In form they are oblong lanceolate, very acute, the parallel veins being nearly equidistant, though this is not so in the dried specimen, wherein, as is usually the case, the veins nearest the margin are much closer together than those near the midrib. The pitchers, which measure over 5 inches in length by 1½ inch in width [less in the dried specimens], are reddish, elongate cylindrical, slightly dilated below the middle, tapering at the base, and with deep, sharply fringed wings; the mouth is oblique, surrounded by a narrow finely-ribbed rim; the throat is glaucous violet; the lid suborbicular, as large as the mouth of the pitcher, glandular on the lower surface, and with a simple spur at the base. *M. T. M.*

where the road crosses a deep ravine, the trees are sawed off on a level, and the timber and trees laid on the stumps. In the centre of the ravine mentioned two huge Redwood trees standing side by side form a substantial support, and they are cut off 75 feet above the ground, and cars loaded with heavy saw logs pass over them with as much security as if it were framed in the most scientific manner. All roads lead to Rome except this one. The builders never contemplated a terminus at San Francisco, Petaluma, or Chicago, but merely to convey heavy timber from the woods to their mill. There are many places in our Redwood forests where this example might be followed profitably, as it would be cheaper to grade

THE AMARYLLIS.

ADMIRERS of the *Amaryllis* cannot have forgotten the large collections of these plants exhibited in London from the Chelsea nurseries of Messrs. James Veitch & Sons during the early months of the past year. Since that time a new house of considerable dimensions has been built specially for *Amaryllis*, and seems to be very well adapted for their culture. It is a span-roofed structure, in two divisions, and furnished with beds in the centre, as well as along the sides. Besides being efficiently heated with 4-inch pipes, there are also two rows of inch pipes fixed near the base of the rafters; and these two pipes, heated on one side of the house only, will keep the temperature up to 55° when it has fallen to 35° outside—an interesting fact when it is stated that the house is 70 feet long and 20 feet wide. All the beds are heated with pipes sufficient to do without fermenting material, the pots containing the plants being plunged in spent tan. Referring to the extensive groups of plants exhibited last year, it will be well understood by those accustomed to prepare plants for exhibition that in order to have from 200 to 400 in flower at one time it is necessary to retard some and push others on too fast; the plants have then to be taken out into a temperature near the freezing-point sometimes to get them to the show, which has seriously crippled very valuable plants.

Mr. Harry Veitch, who takes a great personal interest in the *Amaryllis*, has determined not to publicly exhibit them—at least, not to a large extent—this year, but has prepared a large show-house for them in the Chelsea nurseries. There is at present a very brilliant display, which will be kept up during the next two months. There are at present 600 in flower or showing their spikes, and the two houses contain altogether about 6000 bulbs. It is a most interesting and instructive study to trace the lineage of the newest seedlings from the original types and varieties to the present well-formed flowers with broad massive petals like the variety *John Neal*, and a new form with broad petals of considerable substance of a rich crimson colour flushed with lake, named *James Douglas*. *A. ulica* and *A. Leopoldi* gave the size and form to *John Neal*; crossing again with *A. Ackermannii pulcherrima* gave the colour. Both these fine varieties are in flower. Other new varieties are *Congings*, purplish-crimson, the centre of the petals marked with lake. The petals are not so broad as some, but it is distinct in character. *Madame Antoinette Sterling* is a fine variety, producing four flowers on a spike; it is from *Thalia* crossed with pollen from *Leopoldi*; and the colour is crimson-purple with whitish margins, and more white in the centre than usual. *Chelsoni* and *Brilliant* are two very fine varieties raised by crossing *Ackermannii pulcherrima* with *pardina*. They are both rich brilliant crimson in colour, the latter having much of the spotting of *pardina*. These two are also remarkable for the small size of the flowering bulbs.

Empress of India is again flowering very freely. This fine variety produces six of its very large brightly-coloured flowers in an umbel. Duke of Connaught is another flower of the type that produces six flowers on one stem, but it is still very scarce. Amongst lighter-coloured flowers *Sybil* is a distinct novelty. The flowers are 9 inches across, petals broad, tipped creamy-white, being curiously flaked and spotted with crimson. The *Syren* is a very fine form of the marginata type, also producing six flowers on a stem. The colour is light scarlet, the edges of the petals broadly marked with white. *Thomas Speed* is another six-flowered form, and one of the best for decorative purposes, as it is so free in growth. *Duchess of Connaught* produces four flowers on a stem, which are pure white, and very pleasing. Amongst the edged flowers *Cecilia* is a remarkably pretty flower of the *Leopoldi* type. The white is very pure, and the broad well-formed petals are of a rich crimson. *Lady Musgrave* is an older flower, but a fine showy variety of a crimson-scarlet colour. *Bosc of Cornwall*, a seedling of the *Hon.* and *Rev. T. Boscawen's*, is very fine, and of free growth. The colour is dark purplish-crimson. This variety has been crossed with the Chelsea seedlings, and some very fine richly-coloured varieties are the result. *Sir Garnet Wolseley* is the best of the true scarlet varieties in flower. It is quite a rich bright scarlet.

Of the true *pardina* type *Orsini* is a beautiful flower; it is densely spotted with reddish-

FIG. 36.—NEPENTHES KENNEDYANA.

through with a cross-cut saw and lay the ties on the stumps than to remove the trees. We can boast of a broad gauge, a narrow gauge, and a road in the tree tops—yet we are not all happy."

A RAILWAY IN THE TREE TOPS.

The following paragraph, from a recent issue of the *Argo* of Petaluma, California, has lately been communicated to *Notes and Queries*—"It may not be known outside of the neighbourhood where it is situated, but it is nevertheless a fact that in Sonoma County (Cal.) we have an original and successful piece of railroad engineering and building that is not to be found in the books. In the upper part of this county, near the coast, may be seen an actual roadbed in the tree tops. Between the Clipper Mills and Stewart's Point,

NEWFOUNDLAND TIMBER.—The most valuable timber grown in Newfoundland is the white variety of Pine (*Pinus Strobus*). It is especially prized for the manufacture of lumber. In the Gander country alone Mr. Howley estimates there are 850 square miles covered with this growth easily accessible by means of small boats on the Gander River. The yellow or red Pine (*Pinus resinosa*) is another well-known variety. Neither Beech, Elm, Oak, nor Cedar are found. Around St. George's Bay, and in the valley of the Humber also, are fine forests of timber. The colony derives no revenue from its forests, which are cut at will by all comers. *Journal of the Society of Arts.*

\* *Nepenthes Kennedyana*, F. v. Muell. *Fragment*, v., 1847. *Benth. Flor. Austral.*, vi., 1873, p. 41; Hook. I. in DC. *Prod.*, xvii., 102.

scarlet. There is also a goodly number of plants of Autumn Beauty, recently certificated. This has many of the characteristics of *A. reticulata*, with the larger better-formed flowers of the ordinary type, and flowers in winter or late in autumn. There are many new seedlings opening their flowers every day, besides a collection of all the best named varieties. Some novel forms have also been introduced from the Continent, and the collection altogether is the most representative one that has yet been formed.

### ALPINE RHODODENDRONS.

If *Pinus Cembra*, of which I spoke in a previous article, is the most beautiful tree of our Alps, the Rhododendron is their most brilliant decoration. It bears among our peasants the name *Rose des Alpes*, and is the alpine plant *par excellence*. It occurs indeed in the Pyrenees, but it may be supposed that it migrated there from the Alps. M. Boissier did not meet with it on the Sierra Nevada, nor does it occur in the Apennines. Dr. Christ, of Bâle, believes that this plant is of Asiatic origin, but modified by our climate. Its introduction goes back to the first glacial period, at which time immense glaciers covered the central plains of Europe, and the moraines of these glaciers that rose above their sides were covered with alpine vegetation such as we now see it.

There are in Switzerland two species of Rhododendron and a hybrid variety between the two. The range in altitude of the Rhododendrons averages from 1000 to 2500 metres. They generally form the transition between the forest vegetation and that of the alpine pastures. Dushes of them occur in vast masses, with which nothing else grows. Often they cover abrupt and rocky slopes, and prove of great assistance to travellers in scaling the rocks. It often happens also that isolated masses of Rhododendrons are met with on the great blocks of stone thrown down from above. These blocks in falling have carried with them a little humus filled with seeds of Rhododendrons, so that they retain the covering which characterised them at a higher elevation. It has been said that Rhododendrons grow on the slopes and in the meadows in a northern aspect and avoid a southern exposure. This is a complete error, as I may remind all those who have climbed the Alps and who have observed these delicious plants. The Rhododendrons have no marked preference, except that they love a damp and cool soil. If in certain parts of the Ormonts or the Vaudois Alps they adorn the northern slopes it is because they alone are sufficiently moist; but I have seen clumps of Rhododendrons exposed to the full sun.

*R. hirsutum* is so little affected by the sun that it descends into the plain in certain localities. It is likewise found in abundance on the rocks which border the lakes of Thun and Lowertz. At Vira, on the borders of the Lago Maggiore, it is met with at a height of 2400 metres braving the rays of the Italian sun. My friend Dr. Silvio Calloni saw, at the end of last October, on the borders of the Lago Maggiore, a group of Rhododendrons the flowers of which were completely open, and as beautiful as in July. In this delightful country of the lower Ticino, where the flora of the glacial countries mixes with that of sunny Italy, where the Anemone of the high Alps, the Edelweiss, the *Primula viscosa*, and many other alpine plants, mingle with the Fig and the Pomegranate—where the Arollé (*Pinus Cembra*) is associated with the Chestnut, and the Larch with the Olive—we find the alpine Rhododendron nearly everywhere. This is explained by the fact that in these countries water is very abundant, and descends from the Alps during the great heats. Evaporation goes on much more freely under a high degree of heat, and the atmosphere is never dry, as it is in the Canton of Valais, where the flora is well-defined.

*R. FERRUGINEUM*, L., is the most beautiful species as far as regards the leaves and habit. The leaves are large, of oblong form, rusty-brown underneath (hence the name ferrugineum), and of a dark shining green above. The foliage recalls on a small scale that of the Laurel, and on a large scale that of the Myrtle. From this point of view alone this species is worth cultivating. But what gives it its charm and constitutes its greatest attraction are its flowers. Grouped in little terminal clusters of a bright rose colour, and of a very graceful shape, these charming flowers are the admiration of all travellers. It is a species for the most part peculiar to granitic soils, but it is occa-

sionally met with on limestone mountains. It is certain that the summits of the Jura which surround Geneva contain it in great abundance.

Rhododendron ferrugineum often ascends to higher elevations than *R. hirsutum*, but it never descends into the plain. It is also more difficult to cultivate.

In *R. HIRSUM*, L., the foliage is bright green, and covered with hairs, the leaves are smaller and less beautiful than those of the preceding species, but the flowers are even more beautiful. The colour is much brighter than in *R. ferrugineum*, and it seems to flower more freely. This species grows on limestone rocks, and descends into the plains, and flowers on the borders of some of our lakes.

*R. INTERMEDIUM* is rarely met with in Switzerland. It is a hybrid between the two preceding species, of which it combines the characteristics. M. Paris, a nurseryman of Geneva, cultivates some fine examples of it.

*R. CHAMÆCISTUS*, L., is a charming Tyrolean species, the flowers of which are quite different to those of the other species, Cistus-like in shape and of a beautiful rose-colour. This species is very free-flowering but its foliage is small and not ornamental.

The white flowered Rhododendron is a very beautiful variety that is rarely met with in our Alps. M. De Candolle has from time to time distributed seeds to the directors of various gardens, but unhappily these gentlemen have not informed him if the seeds have germinated. If any of your readers can supply information on these points I should be gratified if they would do so, as it will be interesting to know if the peculiar characters of this extraordinary plant are reproduced by seed.

The Curé of Salvan, in the Valais, has in his garden a magnificent specimen of white Rhododendrons (of a very pure white), which flowers abundantly every spring.

Rhododendrons are exceedingly capricious and difficult to cultivate. Nevertheless they may be acclimated if care be taken to study the conditions under which they grow naturally and to imitate them. Generally they like a light, porous, and damp soil. *R. ferrugineum* grows generally on the granite and the other generally on the limestone soil, though there are sometimes exceptions to the rule. Whoever has a rock-work can have Rhododendrons upon it. In the rock garden at Valleyes (Vaud), M. Edmond Boissier possesses a fine collection of Rhododendrons which flower abundantly every year and are very thriving. The botanic garden at Geneva possesses a very beautiful specimen, 0.75 m. in height, which is covered with flowers every year. We have also young clumps covered with buds. M. J. Paris, nurseryman, has a large quantity growing in pots, and which sometimes flower when thus grown. To succeed well a mixture of leaf-mould, peat and sphagnum, moss and sawdust must be used, with a little sand, granitic or calcareous according to the species. Young plants are potted in this soil, raised in pots, until they are strong enough to flower in the open ground. Then they are placed on the rockery in a position well exposed to the light, well drained and frequently watered. In winter they may be covered with branches of Pine, but this would not be necessary in England. It is a long tedious process to secure them from seed. But it is not always easy to raise young specimens of Rhododendrons in the Alps. It is useless to look for young plants among the great masses of Rhododendrons on the stones, or the rocks covered with these shrubs. They must be sought in the sandy wastes that border the torrents on the edge of the moraines and in the pasturages bordered by the masses of Rhododendrons. But it is especially in the sands that the seedling plants are met with in abundance. On the Pennine Alps in the Valais there are great tracts of micaceous sand brought down by the torrents. In this sand there are hundreds and thousands of young plants of Rhododendron ferrugineum. These sands cannot supply the necessary nourishment for the plants, hence they never become covered with masses of Rhododendrons. The little plants, when at the age of five or six years, perish and get burnt up; thus it is a positive advantage to transplant the plants to a better soil, where they will not fail to succeed. Such sands are also met with near the Lake of Thun, and in these *R. hirsutum* as well as *R. ferrugineum* grows. I have never attempted to multiply these plants by grafting, but I am told that this plan is not without good results. *Henry Corveion, Inspector of the Botanic Garden of Geneva.*

### PLANT LABELS.

HAVING occasion to use some thousands of labels in my field and wood garden, and not having found one which answered all requirements, I suggested to the secretary of the Society of Arts to offer a prize to be provided by me. The Council agreed last year to offer a medal and a prize of £5. The reason why the Council of the Royal Horticultural Society was not applied to in preference is that horticulturists had already tried their hands on the subject, while to the large body of members of the Society of Arts, many of them with mechanical and inventive power, it was new ground. A number of labels were sent on competition, some quite new—to me, at least—others of different degrees of merit, others showing great ingenuity, but equal ignorance of what hardy plant labels are exposed to when in use. The medal and prize have been again offered for labels sent in before May, 1882. The labels sent in last year have most of them been exhibited in the arcade of the Royal Horticultural Society.

We have some zinc labels, made by Yates, I believe, on Rose trees, which are perfectly legible after fifteen years' exposure, while some in the cool Orchid-house have become indistinct in less than two years. We have tried heating the labels after writing, the better to fix the ink, and have varnished them afterwards; but the writing still is not as clear as could be wished. One of the most serviceable upright zinc labels I have seen at Mr. P. Neill Fraser's, near Edinburgh; he uses them extensively. They are made of stout zinc, 9 inches long, and  $\frac{3}{4}$  inch wide; they stand well up from the ground, and are not pushed out by frost; they were not exhibited. Among the best which were shown were ordinary zinc labels hung on galvanised iron stout wire.

Mr. Wolley Dod gave me an ingenious label which I have tried with success, and which is useful when you have Hazel in the hedges; a stick is cut into about 1 foot lengths, and a slice at the top taken off sufficiently long for the writing. Mr. Ewbank has improved on Mr. Wilson Saunders' good old label; he uses a small wooden label with two galvanised iron supporters; the label is painted white, and when used a thin coating of black paint is put on; the writing is done with a painted stick—this, by removing the black, shows the letters in white. Col. Trevor Clarke has a small wooden label stuck into an Elder stick to raise it up, the point of the label sticking in the pithy centre of the Elder.

There appears to be a number of serviceable labels for permanent use: but what is required in addition is a cheap rough-and-ready label, to be used when putting in a number of plants with little time to do it, and this, I think, to be sought in some modification of the present wood labels. Among the wooden labels exhibited which were new to me were Teak wood labels, from Mr. Johnston, of Renfrew, and Holly and Boxwood labels from Messrs. Wolstenholme & Son, of Manchester; these two last were cheap, and found favour with the committee as far as appearance went; Mr. Joad, whose death we have lately had to deplore, was much taken with them, and I know that many orders have been sent to the manufacturers. I have been trying these labels carefully in frames, and have exposed them to the severest test in a cool damp Orchid-house. The Holly wood is more affected by damp than the Box, soon becoming mouldy; the Box is discoloured after a longer time. Remembering that the committee in their report had suggested that some preparation should be used to make labels waterproof the words of the report were these—"Wood is probably the cheapest and best material for cheap labels. It is at present liable to the objection that the part in the ground rots, and the writing on the label becomes illegible. If by some process, such as perfect kyanizing, or treatment with paraffin, these objections could be removed, an excellent label would be the result.

In accordance with this suggestion I got some friends to dip for me in their laboratory some of the Holly and Boxwood labels in hot paraffin (I should say, as it has been confused with paraffin oil, that paraffin is a hard white substance, which, as its name denotes, does not change, and can have no injurious action on plants); the result was promising, but the small quantity of paraffin absorbed showed that the labels could not have been dry. Some thoroughly dried Boxwood labels have since been soaked for forty-eight hours in hot paraffin, of which they absorb

about 12 per cent.; these have so far stood the severest tests in the cool Orchid-house, and have the merit of not requiring any paint, the writing both in ink and in gardeners' pencil being easy, and showing clearly. Having plenty of gardening work I cannot undertake the label experiments, but strongly recommend label manufacturers to take them up. Paraffin is not now an expensive material. As it is not always easily procurable I have ascertained that Price's Patent Candle Company will supply it to label makers of sufficiently hard quality at 5*d.* per pound. I send specimens of labels—Hollywood and Box, as supplied by the makers; Hollywood exposed in damp Orchid-house unprepared; Boxwood exposed after being paraffined. The subject excites interest abroad as well as at home. I have received a paper from M. C. Joly, of Paris, on *Les Etiquettes Horticoles*, which carefully sums up the merits and demerits of the labels now in use. *George F. Wilson.*

### THE TONGA PLANT.

In consequence of the statement made by me in my note upon the Tonga plant on p. 180 of this volume of the *Gardeners' Chronicle*, that *Rhaphidophora pinnata* was the same plant as *Epipremum mirabile*, I have received from Mr. Lynch, the curator of the Botanic Garden at Cambridge, a fine flowering specimen of an Aroid that is grown there under the name of *R. pinnata*, but which is in fact the Indian *R. decursiva*, and is quite distinct from the Tonga plant. As I have no doubt that *R. decursiva* is also grown at other places under the wrong name of *R. pinnata* (it was so named at Kew a few years back), and cultivators having it so named may fancy they have the Tonga plant, a few words upon the most striking distinctions between the two plants may not be out of place.

The Tonga plant, *Epipremum mirabile*, Schott (synonyms, *Rhaphidophora lacera*, Hassk., *R. pinnata* and *R. vitensis*, Schott), is distinguished by having its adult pinnatisect leaves cut down to within about  $\frac{1}{2}$ — $\frac{1}{4}$  inch of the midrib; the segments are of nearly equal breadth throughout, and have one nerve up the centre of each, which runs out to the apex without branching, merely giving off slender veinlets, or in the case of two or more segments being united into one, there are two or more nerves in it, as many in fact as there are segments united, but the nerves are quite separate, and run from the midrib to the margin without branching; the leaf is also well characterised by the presence of numerous small perforations and pellucid spots, chiefly scattered along the region of the midrib, which are well seen if the leaf be held up to the light. But in *Rhaphidophora decursiva* the adult leaves are cut into segments right down to the midrib, the segments are broader at their middle than at their base or apex, and the rib of each segment divides into three near its base; there are no perforations or pellucid spots in the leaf.

When in flower the two plants may be readily distinguished by the structure of the ovary and number of ovules; in *R. decursiva* the ovary is incompletely 2-celled, with numerous ovules, whilst in the Tonga plant it is 1-celled, with only two basal ovules. *R. decursiva* was described and figured some years back in Regel's *Gartenflora*, vol. xiii., p. 5, t. 423, as *R. dilacerata*, C. Koch. On what authority Regel quotes it as *R. dilacerata*, Koch, I do not know, as I cannot find that Koch has anywhere described it under that name; but I presume that Regel thought it to be the same as *Monstera dilacerata*, Koch, and changed the genus without changing the authority for the specific name. As to *Monstera dilacerata* if any readers of this should possess that plant I should deem it a favour if they would send me a specimen, as the only specimen I have seen is the type specimen in Koch's herbarium, which consists of a bit of a juvenile stem and a few leaves only, but they are quite different from those of *R. decursiva*, and more like the juvenile form of leaf of the Tonga plant. *M. E. Brown, Herbarium, Acro.*

**BOTANIC GARDENS, CAPE TOWN.**—Mr. Robert Templeman, who has managed the seed and plant sales for several years, has now retired to establish a business of his own; and this department of the botanic gardens will henceforth be under the charge of Mr. Stephen Solly, son of Mr. S. Solly, of Ancrley, S.E.

**MULCHING THE ROOTS OF ROSE STOCKS.**—Not many Rose growers take the trouble to mulch the surface of the ground between the rows of Rose-stocks, as is done by Mr. D. S. Thomson, of the Wimbledon Nursery. Mr. Thomson finds it pays better to grow strong healthy Roses at a trifle more expense than to grow cheaper ones, which in the end are less satisfactory. When the stocks are planted the ground is covered with half-rotted litter to a depth of about 3 inches, and there remains during the whole season. It is a warmth and protection to the roots of the stocks, is conducive to the formation of healthy fibrous roots in greater number than would otherwise be obtained, and prevents evaporation in summer, by which the roots of the plants are kept in a medium moist state, and their leaves clean and healthy. It must not be supposed that this system is confined to the cultivation of a limited stock of extra fine plants, all the breaks of Rose-stocks in the nursery are so treated; and, after all, the labour is little compared with the excellent results obtained from the system.

**ROSES FROM THE GENEVOISE RIVIERA.**—We have received from Dr. Bennett some lovely cut blooms of three of the Roses mentioned by him in our last issue (p. 220) as flowering in the open air in his garden at Mentone. Of Safrano and Madame Falcot we need say nothing as to their qualities, but the flesh or light salmon-coloured *Mdlle. Nabonnard* is not so well known, and we would add as to this that the blooms are large, very pleasing, and deliciously but not strongly scented.

### THE SHEEN NURSERY.

This interesting nursery establishment, the property of Mr. F. R. Kinghorn, is situated in the centre of one of the most populous and fashionable districts in the vicinity of the metropolis, and is but a few minutes' walk from Richmond Station. The main walk of the nursery runs north and south from the Richmond Road to the South-Western Railway. Within the nursery gates a semicircle is described which is planted with ornamental and flowering shrubs, which gives the entrance an appearance so attractive that the show-houses, containing so many choice Palms and foliage plants, are closely rivalled by the unusual display of flowering shrubs in front of them. Notable among the latter are two extra large bushes of *Pyrus japonica* and *P. japonica* alba, in full flower at the end of January. These two varieties, planted in juxtaposition as Mr. Kinghorn has them, give a very cheerful effect. Why should we not plant alternate lines of them for early spring effects, or group them in large shrubby beds, as we do Ghent Azaleas and *Rhododendrons*? This is a very interesting plot indeed. A row of golden-topped Yews is planted by the margin of the rail fence bordering the main road, which is much admired by visitors and others interested in plants, and gives evidence of skill in treatment and cultivation. Then follows a selection of more graceful habited plants, including a very fine specimen of *Berberis stenophylla*, which, when adorned with its rich orange flowers, which droop and overlap each other, is a pretty sight indeed. During the summer months single Dahlias, Hollyhocks, Marguerites, and other flowers are planted among the shrubs, in order to have a seasonable display at all times, by which a visit to the nursery is removed above the dull sphere of business to that of pleasure.

The first of two span-houses is crammed with plants in or coming into flower, and a sprinkling of other plants grown for the beauty of their leaves, and, therefore, useful and valuable for the approaching busy season of decorating and furnishing. But although the plants are now arranged "show fashion" it is evident they have had plenty of house-room during their season of growth, for they are as perfect in form and as healthy as plants need be. The centre row,

elevated above the rest, consists of *Aralia Sieboldii*, with large glossy leaves, indicating both substance and vigour—the remainder of the plants on the centre stage being very fine samples of *Cytisus racemosus*, from one to three years old, just coming into flower: these plants are numbered by the thousand in this house alone, and in addition the side stages are bright with *Cyclamens*, *Primulas*, *Ilyacinths*, *Tulips*, and *Erica persoluta* alba. There are some grand spikes of *Ilyacinths*, including Charles Dickens (blue), and *Grande Vitette* (white), popular kinds of the first order. The next house, by the side of the one just noticed, is the conspicuous house of the nursery. It not only contains the finest and most valuable plants, but it is also the largest, in fact the central figure of attraction in the whole establishment. Mr. Kinghorn is his own architect and builder, and he evidently intended, when designing the house, to be able to sleep soundly during the equinoctial or other gales, for the substantial construction of the house renders it proof against all weathers. It is, however, while simple and substantial in design, also ornamental in appearance. The house is over 90 feet long and 20 feet wide, with a brick pit in the centre, and a flag path all round. The pit is low, in order to provide head-room for tall specimen plants. The house is supported by upright iron columns and horizontal cross stays fastened to both sides of the roof. Oblique bars of the same size are also used to tie the sides of the house with the roof, so that it is secured at all points against the violence of the weather, from whatever quarter it may proceed. All the ironwork is painted blue as a contrast to the woodwork, which is a clear white, and where the ironwork is not heavy the two contrasting colours have a very lively appearance. The hot-water piping is arranged in single rows above each other, by the sides of the paths, where the heat directly ascending from them does not come into immediate contact with the roots or leaves of plants.

Large Palms occupy the centre of the house, well raised up, and intermixed with *Pandanus Veitchii*, fine plants of which are splendidly coloured. The specimens in the centre consist of *Lantana borbonica*, *Scaevola elegans*, *Areca lutescens* and *Verschaffeltii*, *Chamaedorea glaucifolia*, *Phoenix reclinata*, *Chamaerops Fortunei*, and many other popular kinds suitable for general purposes of furnishing. These plants are not grown by the score or hundred, but by the thousand. Of *Lantana borbonica* 10,000 plants are grown, and others in proportion. Nor must it be understood that small quantities of anything mentioned are grown—all are cultivated by the hundred or thousand, according to their popularity, and in sizes varying from the young seedling to the specimen ready for exhibition. There is another point in the cultivation of these plants which is deserving of mention, and that is, that such a thing as insect-pest of any kind is not tolerated, owing to the strict supervision under which the plants are cultivated. Indeed, the health and cleanliness of the whole collection cannot be excelled.

But to proceed with a notice of the plants that seem to be the most largely grown, the two *Dracaenas*, *rubra* and *congesta*, so commonly used for furnishing, are here grown in immense numbers, clearly proving the popularity of these well-known varieties for decorative purposes. Mr. Kinghorn has a large stock of the "true variety of *rubra*" which is not so common as people think. There are several varieties which are easily distinguished in a large collection, when seen growing side by side with the true variety, which have no claim to the title of *rubra*, although in other respects they are not so unlike in appearance. There is a green variety of pendent habit after the style of Cooperi, which requires cooler treatment than the true *rubra* to keep the leaves in their normal rigid state, which makes an excellent table plant, and of which large quantities are grown by Mr. Kinghorn. The same characteristic is noticeable in the stock of *Dracaena congesta*. Some of the plants have much broader leaves than others, while many more have the leaves more thickly produced on the stems, and are gems of their kind for decorating rooms in "pairs to match," or indeed for any modern purpose of decoration.

It is a great advantage to be able to compare notes, or rather to take note, of the different varieties of certain species of plants, all of which are erroneously supposed to require the same treatment and temperature, whereas, upon becoming better acquainted with their habits and characteristics, we find how accom-

modating many of them are, and how well they stand a moderately low temperature, which enables amateurs and others to enjoy the possession of plants which under other circumstances would be useless to them. Aneut the existence of so many varieties, they are of course obtained from seed, but Mr. Kinghorn takes care that choice kinds are perpetuated from cuttings only, so that the stock of plants may be kept perfectly true to name.

Next to the plants already mentioned the stocks of Ferns are the most interesting and useful. It is a rare sight indeed to see *Pteris tremula* with such fronds and the plants grown in 6-inch pots; also young *Dicksonias*, *Asplenium Delangeri*, *Pteris serrulata cristata* (the common variety), and many other kinds for cutting and furnishing, including *Lastrea opaca*, quite hardy. Thousands of *Erica gracilis* are in this which is house on shelves near the glass; sturdy little plants of their kind, looking thoroughly prosperous and healthy. The main block of houses upon the north side of these, although not so showy to look at, is equally useful for plant growing—most of them could not indeed be much better for the different purposes for which they are required. The collection of stove *Draxnas* occupies the greater part of a house by themselves, and comprise well grown plants of Mrs. Willis, D. Rossi, anerylensis, Frederic, Salmonia, Mrs. C. J. Freake (very finely coloured), and many others; also *Crotons* and *Aralias* in variety. Another house contains a healthy and numerous stock of *Corypha australis*, *Ficus elastica*, and *Azaleas*. The collection of *Camellias* (also occupying the greater part of a house to themselves) consists of several choice specimens, of which a large bush of elegans is a show in itself, its pretty pink flowers being very conspicuous among scarlet and white and colours of various other tints. In this house also there is a good stock of the red and of the white *Lapageria*, and some beautifully grown specimens of *Todea superba* in a glass case, where they are specially attended to.

From the *Camellia*-house the visitor proceeds through extensive ranges of houses filled with soft-wooded plants, chiefly *Pelargoniums* and other useful subjects, such as *Ropala corcovadensis*, *Eurya latifolia*, golden *Euonymus*, and *Azaleas*. Other houses are stocked with *Ophiopogon spicatus*, *Aralias* of sorts, Maidenhair Ferns, *Abutilons* of all kinds in cultivation, *Epacris*, *Ficus elastica*, *Aspidistra lurida variegata*, and many others. The stock of show and fancy *Pelargoniums* consist of all the leading kinds, such as Digby Grand, Triomphe de St. Mandé, Duchess of Edinburgh, and La Patrie, which are grown under exceptionally favourable conditions in light span-roofed houses, where they enjoy abundance of light and air, and are therefore stocky and hardy in addition to being handsome in shape, with leaves covering the rim of each pot. *Primulas* are equally well grown, the old double white still being a great favourite in this nursery. Stock plants of *Fuchsias*, *Solanums*, *Bouvardias*, &c., are counted by thousands, most of them indeed showing signs of active growth, and producing healthy cuttings at every joint, which will soon be ready for the propagator to commence operation for another season.

The next house, or rather pit, is filled with small *Palms*, 2000 *Cocos Weddelliana*, and equal numbers of *Latanias*, *Scaorhthias*, *Phoenix reclinata*, *Areca luteescens*, and others. From this interesting department, the visitor is taken to a north house filled with *Camellias*, *Azaleas*, greenhouse *Rhododendrons*, golden *Euonymus*, *Clematis*, and small plants of *Acacia Riciana*, which makes the finest of conservatory bushes when planted out. Upon the south side of this house, a lean-to structure is filled with *Pelargoniums*, *Crassulas*, and Ivy-leaved *Pelargoniums*; the latter in grand trim and in great variety. A span-roofed Heath-house, running north and south, contains over 2000 plants, of one single variety—*Erica gracilis*; and the propagating-house already shows signs of briskness and preparation for the spring season. Pits and frames are filled with thousands of *Ericas*, *hyemalis*, *gracilis*, and *Caifra ventricosa*, also *Chrysanthemums*, young *Conifers*, and over 5000 Golden *Euonymus*. *Epacris* of sorts occupy a considerable area of pit-room, as also *Ceanothus*, *Gloire de Versailles*, *Veitchii*, and *divaricatus*. I noticed a very superior stock of Grape Vines in fine condition for planting, and an endless variety of herbaceous and alpine plants.

Talk about *Helioberes*: they are here by the thousand—white, or brown, or green, as the cultivator may choose to purchase them. For the writer's

part he still gives preference to the white varieties, and he would advise inexperienced purchasers to do the same, or at least not to purchase largely of the many varieties recommended without a trial. Large beds of *Euonymus* and other plants requiring partial protection in a young state are in a very satisfactory condition after the mild winter, and promise to shoot ahead vigorously during the coming season of growth. The outdoor nursery stock consists of the usual variety of ornamental trees and shrubs, *Conifers*, fruit trees, and *Roses*. A choice selection of all the finest plants are well arranged in borders on either side the principal walk before referred to. The walk itself is ornamented with two fine Weeping *Elms*, one planted about its centre, and the other at its extremity bordering upon the South-Western Railway. The weeping trees forming the back row are both choice and numerous, as also the great body of other plants, including *Juniperus chinensis*, *Cryptomeria elegans*, *Keinopsis*—all the leading kinds, *Cupressus* of sorts, *Thuyas*—all the finest kinds, and a sprinkling of spring and summer flowering shrubs. The great features, however, of the borders in summer are the pillar *Roses* and *Clematis*, which have an exceedingly graceful effect, and which are far too sparsely used in private gardens.

The specialties in outdoor stock consist largely of *Limes*, *Poplars*, *Chestnuts*, over 15,000 *Aucubas*, *Clematis*, a fine stock of *Deutzia scabra*, thousands of *Ivies*, dwarf *Roses*, *Euonymus radicans variegatus*, *Rhododendrons* in bud in all the best hybrid kinds, brakes of *Conifers*, quarters of fruit trees, and young stocks of *Caucasian* and other *Laurels*, flowering shrubs, &c. Before concluding this notice I may mention two fine samples of plants that are very uncommon which are within the gates of this nursery, and which would make elegant specimens planted singly in pleasure-grounds, if, indeed, they are to be readily obtained. One is the Chinese Lace-bark Pine (*Pinus Bungeana*), and the other *Torreya grandis*, a plant well named, but if appearances go for anything it bears a close affinity to the genus *Taxus*. W. H.

## The Arboretum.

NOTES ON WESTERN CONIFERS.—In another publication I intend to give a full account of the observations on *Coniferae* made in the Pacific States, when with Professor Sargent and Dr. Parry I explored their forests, but it seems proper that I should not withhold any longer the principal results arrived at.

*Abies amabilis* (Douglas), Forbes, is not a variety of *A. grandis*, as I had assumed; but a very distinct species peculiar to the higher mountains of the Cascade Range from Oregon to British Columbia. It is easily recognised by its dense, dark green, glossy leaves, very white underneath, usually emarginate, but on the fertile branchlets acute; by its large very thick purple cones, and oblanceolate acuminate bracts. [See *Gard. Chron.* 1880, vol. xiv, pp. 720, 725.]

*Abies nobilis* (Douglas), Lindley, is peculiar to the higher mountains of Oregon, and has not yet been found in California, nor, as far as I can learn, in Washington Territory. Its grooved leaves crowded on the branchlets, and its large purple cones with long exsert recurved bracts, well characterise it. The tree on Mount Shasta, which has gone by this name (also in the Flora of California), is distinguished by its quadrangular leaves, keeled on the upper side; its large cones considerably resemble those of *nobilis*, and have often, not always, exsert and recurved bracts; it is a form of *A. magnifica*, Murr., the common Red Fir of the Californian Sierras, which has bracts normally enclosed.

*Pinus reflexa*, n. sp. (*P. flexilis* var. *reflexa*, Eng. in Rothrock's *Rep. Bot. Exp.*, Wheeler), proves to be quite distinct from *flexilis*, not only by the reflexed scales of the cone, but also and principally by the long peduncled cylindrical female aments, erect in the first, recurved in the second year, which associate it with the true *Strobi*, while the large wingless seeds distinguish it from the other species of that section.

*P. albicaulis*, Eng., is specifically distinguished from *P. flexilis* by its subglobose purple cones with short, thick scales and its thin white at last scaly bark.

*P. chihuahuana*, Eng., observed by us in the Arizona Mountains, proves to be of peculiar interest as maturing its cones in the third year, the only American species with this character, which I have found only once more in the Mediterranean *P. Pinca*.

*P. Jeffreyi*, Murr., holds its characters well wherever we have seen it from the mountains west of Mount Shasta, where it was first discovered, down to the San Bernardino Mountains, affecting more particularly the eastern slopes. The glaucous branchlets, with pleasantly aromatic fragrance, thinner glaucous foliage, the great size of the cones, with thin, spiny recurved mucro on the scales, large seeds and more numerous cotyledons, distinguish it from *P. ponderosa*, which has brownish-green branchlets, with a turpentine odour, and dark green coarser foliage.

*Pinus arizonica*, Eng., has also been repeatedly collected by us as well as by subsequent explorers, and the question has been agitated whether it may not be also a form of *P. ponderosa*. The fact is that five-leaved forms of this species do occur on the Californian Sierras (Lemmon) and on the Arizona Mountains (Lemmon, Pringle), but the larger number of leaves is here a casual occurrence; the branchlets show the brown-green colour noticed above, the leaves are dark green, and have the structure described by me in Wheeler's report. *P. arizonica* has glaucous branchlets, thinner leaves, constantly in fives, and of different structure; its cones are thicker and shorter, with much more prominent umbos, but with not much weight can be put on this last character. G. Engelmann, in the "*Botanical Gazette*."

## DRACÆNA ELLIPTICA.

NOT long ago we had an opportunity of figuring *D. Goldiana*, and now, as a contrast to it, we lay before our readers the portrait of another *Dracæna* which flowered in Mr. Bull's establishment about the same time as the *Goldiana* (fig. 37). The plant has long been known, and was figured in the *Botanical Magazine*, t. 4787. The species is mentioned by Mr. Baker as occurring in North-East India and in the Malayan Islands. The variety figured has the leaves spotted with white, hence the name *maculata* given to the variety in question. The real nature of the inflorescence is the same as in *Goldiana*; but in this one the main stem is elongated in place of being contracted. The greenish flowers were observed by Mr. Smith to be protogynous, that is, the stigmas were ripe before the anthers, and protruded beyond the flower even in the bud stage, as shown in the figure, so that access of the flowers' own pollen was impossible. The flowers, therefore, though structurally hermaphrodite, are, as in so many similar cases, functionally unisexual at any given time. This separation of the sexes is carried a step further, as Mr. Smith figures some of the flowers with imperfect stamens only, others with perfect stamens and no ovary. The pollen is stated by Mr. Smith to be precisely like that of *D. Goldiana*. In the figure the plant is shown of natural size, and the floral details magnified.

## NEW ZEALAND GRASSES.

*TRIDIA EXIGUA*, T. Kirk, sp. nov. (*Danthonia pauciflora*, Buchanan, *Grasses of New Zealand*, t. xxvii. n. 2; not of R. Brown.—A small grass, forming a compact sward, root creeping, leaves tufted, 1 inch long, filiform, rigid, involute, pungent, glabrous, mouth of sheath clothed with a minute pencil of hairs, ligule o. Culms 1–2 inches high, slender, naked above; panicle reduced to a single spikelet, or rarely two, when the lower spikelet is pedicellate. Spikelets 2–3 flowered, empty glumes larger than the flowering, obtuse, flowering glume three-toothed at the apex, ciliate, nerved palea notched at apex. Caryopsis free.

Habitat: South Island, Canterbury, Broken River basin, 2500–3000 feet. Terraces of the Upper Waimakiriri, 1600–2500 feet (J. D. Enys and T. Kirk); Otago, Mount St. Bathans, and many places in the interior of the district (D. Petrie).

Mr. Enys and myself collected a few specimens of this grass several years ago, but as the season was so far advanced that little more than the outer glume remained, it was not possible to make out its affinities. Last year Mr. Enys visited the locality, and kindly sent me a supply of good specimens; I am also

indebted to Mr. Petrie for good specimens from Otago. In his *Indigenous Grasses of New Zealand* Mr. Buchanan has wrongly referred Mr. Petrie's plant to *Danthonia pauciflora*, Brown; but it is clearly a *Triodia*.

*Triodia exigua* occurs in great abundance in the

informs me that horses are especially fond of it, notwithstanding its dwarf habit.

*Danthonia pauciflora*, of Brown, is a more robust grass, with keeled leaves and culms, with sub-erect or drooping panicles, which are usually more or less branched, while the flowering glume is never three-

linear oblong, strict, rarely exceeding 1 inch in length, simple or with one or two short branchlets at the base. Spikelets minute on short capillary pedicels, 2-3 flowered, outer glumes unequal, obtuse; flowering glumes convex obtuse with five faint nerves; palea ciliate at the apex. Caryopsis oblong, free.

FIG. 37.—DRACENA ELLIPTICA MACULATA. (SEE P. 260.)

Broken River basin and in the Waimakiriri terraces, often forming a close sward, to the exclusion of all other grasses. Its red anthers, as I learn from Mr. Enys, give a perceptible tinge to the pasturage, which catches the eye when riding. Nearly all the specimens in this locality have the panicle reduced to a single spikelet. Some of Mr. Petrie's specimens are more robust, and exhibit two spikelets, the second, however, being often imperfect. Mr. Enys

toothed, and the lodicules are never ciliated, as in our plant. It has not been observed in New Zealand.

*ATROPIS PUMILA*, *T. Kirk, sp. nov.*—A slender tufted grass, 2-8 inches high, leaves 1-2 inches long, spreading, filiform, involute, with a minute pencil of hairs at the mouth of the sheath, and a few loose hairs at its base. Culms erect, extremely slender, leafy for over one half their length, panicle

Habitat: South Island. Common in the Otago district at an elevation of from 2000-3000 feet. D. Petrie.

This is one of many interesting plants added to our flora by Mr. D. Petrie, to whom I am indebted for all the specimens I have seen at present. It slightly resembles some forms of *Danthonia nuda*, but its nearest ally amongst New Zealand grasses is *Glyceria stricta*, Sm. *T. Kirk, F.L.S., Canterbury, New Zealand.*

## Orchid Notes and Hearings.

**WORK IN THE HOUSES.**—With the view of bringing the plants into a little more active growth with the lengthening of the days, a slight rise of temperature in all the houses will now be beneficial. The last Indian-house should now stand at 65° by night and 70° by day; the Mexican-house 60° by night and 65° by day; cool-house about 53° at night, and from 55° to 60° during the day; but should much fire-heat be needed to maintain these temperatures in the cool-house, it will be safer to lower them about 3° day and night. Any plants of *Odontoglossum* or *Masdevallias* in this house that need re-potting, or fresh surfacing, should now be done. All our plants of *O. crispum* that have recently flowered will be gone through during next week. The compost we use for this and most of the *Odontoglossums* is equal parts of selected peat and good sphagnum moss. The peat is first partially dried, and then rubbed through an inch meshed sieve; this process disintegrates it thoroughly; when we put a small quantity at a time into a sieve, the bottom of which is made of perforated zinc, and through this all the earthy matter is got rid of, and the fibry matter only retained. The sphagnum moss is chopped a little, and the two are thoroughly blended together. This, with a dash of silver-sand and a moderate quantity of charcoal powdered pretty fine, forms our favourite compost. In a soil prepared as above described there is very little cohesion, and the sand is only added to fill up the interstices of the soil, and as a root preserver also. The effect of the charcoal is that it tends to keep the foliage of the plants a good colour. Too great cohesiveness in the soil used round the roots of most Orchids has long been the bane of Orchid growing. When we see cool Orchids retain their old foliage for four or five years, and the plants continually gaining strength, flowering profusely, and often making double breaks, we may rest assured that this condition—the standard of excellence—has not been brought about by using pasty soils, as it is impossible to retain the roots more than a season or two in such soils, and as fast as the roots go off on the back bulbs the foliage is not slow in following suit. Many of the cool-house plants will now be in flower or showing their spikes, and any that may be in a weakly state or poorly rooted should be relieved of their flowers as soon as they open. The earliest plants of *Dendrobium Wardianum*, *D. nobile*, *D. crassinode*, *D. Pierardi*, and others that may now have finished flowering, should be taken in hand at once and receive a shift or resurfacing according to their requirements. Others, such as *D. clavatum*, *D. moschatum*, *D. Farmeri*, *D. thysiflorum*, and *D. densiflorum*, should be kept dry for the present, and if it is desired to retard them for early summer blooming they should be placed in a steady temperature of about 50° in a position free from cold draughts, with scarcely any water applied to their roots while in this temperature. In the East Indian-house the plants should now be beginning to root freely, and as these young roots are a favourite dish to the cockroach no effort should be spared to try and diminish the number of the latter, for it seems impossible to exterminate them. For their destruction we find nothing better than Chase's beetle poison, laying it in their haunts about twice a week for a short time, when we are generally free from them for two or three months. *J. Roberts, Gunnersbury.*

**ODONTOGLOSSUM EDWARDI.**—This species, which was introduced two or three years ago by the brothers Klaboch, and named in compliment to the late Mr. E. Klaboch, is now in flower in the collection of Walter Cobb, Esq., at Sydenham. It is not only distinct from any other *Odontoglossum*, but distinct in colour from any other Orchid. Mr. Cobb's plant produced a large branched spike on which were 120 flowers. These are about 3 inch across, and of a deep violet-purple colour, except the crest of the lip, which is orange. The two colours remind one of a flower of *Iris reticulata*. Mr. Sander, by whom it was distributed, told me that he had dried spikes with stems as thick as a man's finger, and the collector had counted nearly 1000 flowers on one spike.

If it can be grown like that in England, it will be indispensable in every collection. Mr. Cobb says it requires very cool treatment. *J. D.*

**ODONTOGLOSSUM LONDESBOUGHIANUM.**—The largest plant, or rather mass, of *Odontoglossum Londesboroughianum* in Sir Trevor Lawrence's collection, has furnished a number of long-branched spikes. Mr. Spyers thinks highly of this species, and probably it has not had full justice done to it in some gardens. The flowers are distinct in character, their best feature being the clear golden-yellow lip; the sepals and petals of the same colour are barred with brownish-crimson.

**CYPRIPEDIUM SPICERIANUM.**—This remarkable and beautiful species has now been imported in considerable quantities, and we may expect to see it much cheaper than heretofore. Mr. Sander, by whom the consignment was distributed through Mr. Stevens, says that the collector found it growing on the face of almost perpendicular rocks which were very moist; indeed the leaves themselves showed the state in which they were found, as they were covered with mud. As a hint to cultivators, Mr. Sander says that the plants were found growing in loam, so that they are likely to succeed in cultivation under the same conditions as *C. niveum*. The plants must also be placed in the warmest house. *J. D.*

**BLOCKS FOR CULTIVATED ORCHIDS.**—Some time ago Sir Joseph Hooker, in discussing the cultivation of tropical Orchids, suggested to me the advisability of growing such species as were suitable for the purpose on blocks made from the stems of Tree Ferns. I thought the suggestion a remarkably happy one, and proceeded immediately to carry it into execution. It will be remembered that at the base of nearly all the large Tree Ferns there is a large compacted mass of root-fibres (no doubt induced by the moist surroundings of moss, grasses, and vegetable debris usually accumulated there), measuring 3 or 4 feet in diameter, which admits of being sawn or cut, without breaking, into any shape desired. When carefully trimmed, blocks of this black mass, almost like charcoal, may be hung up in the Orchid-house by a hook or piece of wire; and they form, with the aid of some fibrous peat or sphagnum, a most congenial home for a large number of our smaller Orchids. Such blocks are superior to the coco-nut husks and blocks of wood ordinarily in use, as they keep sound for many years; and, moreover, are always sweet and clean, and never infested with rot or fungus. Those of your readers, placed within easy reach of districts where Tree Ferns abound, as in the mountain slopes of Jamaica, may have already tried the plan; if they have not the inevitable clearing of land for Coffee and Cinchona and the cutting down of these beautiful ornaments of our forests may, at least, be thus utilised. For the cultivation of such plants as *Compertia falcata*, the smaller *Epidendrums* and *Oncidiums*, *Ionopsis*, *Brassavola*, *Stellis*, *Pleurothallis*, *Octadesmia*, &c., nothing could be better than these Tree Fern blocks. *D. Morris, Jamaica, Jan., 29.*

**ORCHIDS IN FLOWER AT BRENTHAM PARK, STIRLING.**—The following Orchids are now in bloom in Mr. Smith's collection here:—

<i>Angracum citratum</i>	<i>Masdevallia igea superba</i>
<i>Brassavola oodosa</i>	„ „ <i>rubescens</i>
„ „ <i>glauca</i>	„ „ <i>aurantiaca</i>
<i>Buringtonia candida</i>	„ „ <i>Shuttleworthii</i>
<i>Cattleya chocoensis</i>	„ „ <i>polysticta</i>
„ „ <i>Trinani</i> (several)	„ „ <i>xanthina</i>
„ „ „	<i>Millettia grandiflora</i>
„ „ <i>Vesta</i>	<i>Miltonia cuneata</i>
„ „ <i>Venus</i>	<i>Odontoglossum cirrosom</i>
„ „ <i>Venus</i>	„ „ (several)
„ „ <i>Atalapa</i>	„ „ <i>Rossi majus</i> (several)
„ „ <i>Wareszewici alba</i>	„ „ <i>crispum</i> (several)
„ „ <i>amethystoglossa</i>	„ „ <i>Pescatorei</i> (several)
<i>Cymbidium Lowianum</i>	<i>Anderssonianum</i>
<i>Cypripedium insigne</i> (several)	„ „ <i>citratum</i>
<i>Sedeni</i>	„ „ <i>pulchellum majus</i>
„ „ <i>Bozallii</i>	„ „ <i>cordatum</i>
„ „ <i>albanum</i>	„ „ <i>Uro-Skinneri</i>
„ „ <i>Hookeri</i>	„ „ <i>gloriosum</i>
„ „ <i>Argus</i>	„ „ <i>nevadense</i>
<i>Coleogyne cristata</i>	„ „ <i>triumphans</i>
<i>Leptocneme</i>	„ „ <i>rosatum</i>
<i>Dendrobium Pierardi</i>	„ „ <i>blaudum</i>
„ „ <i>latifolium</i>	„ „ <i>Koezii</i>
„ „ <i>Dominii</i>	„ „ <i>Hallii</i>
„ „ <i>aggregatum majus</i>	<i>Pulmonaria fragrans</i>
„ „ <i>Wardianum</i> (several)	<i>Phalaenopsis grandiflora</i>
„ „ <i>moniforme</i>	„ „ <i>rosea</i>
„ „ <i>primitivum giganteum</i>	„ „ <i>Schilleriana</i>
„ „ <i>nobile</i> (several)	„ „ <i>chrysanthum</i>
„ „ <i>Emiliae</i>	<i>Saccolabium giganteum</i>
„ „ <i>luteolum</i>	<i>Vanda lanellata Bozallii</i>
„ „ <i>Farmeri</i>	„ „ <i>Cathcarti</i>
„ „ „	„ „ <i>tricolor</i> (small-sized var.)
„ „ <i>Dendrobium glutacum</i>	<i>Sophronites grandiflora</i>
<i>Epidendrum evictum</i>	<i>Oncidium Weltoni</i>
„ „ <i>humboldtii</i>	„ „ <i>Cavendishianum</i>
„ „ <i>humboldtii</i>	„ „ <i>chrysanthum</i>
<i>Lelia Hartwegii</i>	„ „ <i>speciosum</i>
<i>Lycaste Skinneri</i> (several)	„ „ <i>reilexum</i>
„ „ <i>alba</i>	„ „ <i>cauculatum</i> (several)
<i>Masdevallia Estradae</i>	„ „ <i>orthorhynchum</i>
„ „ <i>tovarensis</i>	<i>Zygopetalum lotermedium</i>
„ „ <i>ignea</i>	

*John McLeod.*

## The Flower Garden.

**PLANTING.**—The weather has been and is so favourable for the purpose that the planting of Roses, deciduous trees, and evergreen shrubs, &c., may still be carried on, but it is imperative that it should be brought to a close as soon as possible. So many things are now pressing for attention in the regular routine of operations, that unless there is an unlimited command of labour the gardener's hands ought not to be hampered with extra work at this season. It would be well for all concerned to remember that there are recognised times, the result of long experience, for the performance of certain operations, and that if this is not attended to at the proper time it will not be apparent at once, but the result will as certainly entail disappointment four, or five, or even six, months hence, when the cause has been entirely forgotten.

**SHRUBBERIES.**—In such a season as this has been, the digging of the borders of the shrubberies and arrangement of the shrubs should be well forward; the soil need only be turned over sufficiently deep to insure neatness of appearance, and to put fallen leaves and weeds out of sight. I do not agree with those who argue that this operation is superfluous, and ought not to be practised for the benefit of the shrubs, as I have observed that strong rooting sorts get possession of the ground, and gradually exterminate the weaker and often more valuable plants; but by annual, or in some cases half-yearly, diggings over, we ensure a neat appearance, a more certain destruction of weeds, and, by checking the strong surface-rooters, give the weaker a better chance. As this operation proceeds, the knife should be freely used upon such plants as Laurels, Portugal Laurels, Aucubas, Golden Yews, and other evergreens, to keep them in shape, and prevent crowding. Even such evergreen trees as *Thuja*, *Cypripis*, *Thuyopsis*, and other Conifers, may be greatly encouraged to grow thick and shapely by being shortened back freely, and notably so the Deodar.

**BEDDING PLANTS, &c.**—Plants of these in store-pots and boxes should be potted off at once, and immediate means be taken for the propagation of any sorts which may be deficient, particularly such as are usually required in large numbers, as, for instance, *Alternanthera*, *Mesembryanthemum cordifolium* variegatum, zonal *Pelargoniums*, of which the store plants potted up in the autumn, and forwarded in heat as before recommended, ought now to furnish plenty of cuttings for present propagation. Remember that they must have very little water until they are on the move; but the medium on which the pots are stood or plunged should be kept constantly moist.

**HERBACEOUS BORDERS.**—As the renovation and digging of these should now be in full progress, it may be as well to observe, that in rearranging the disposition of the plants a good effect may often be obtained by repetition of some conspicuous plants at equal distances throughout the mass, and a plant well adapted to illustrate the subject is the very common tall double white Rocket; *Agrostemma arosanguinea* is another; the *Fritoma uvaria* and *grandis*, and several others are conspicuous by their colour and habit for the production of good effect; but the principle must not be carried too far, or it will degenerate into formality. The entire interest of these borders consists in their variety, and they will generally present a mixed and sometimes muddled appearance, but the lover of plants will always appreciate their merits and beauty individually, and would not look for effect in a mass like bedding-plants, at the same time without detriment of design may be admitted without detriment if not carried too far; and whilst on the subject I would particularly recommend the *Hydrangea paniculata grandiflora* as a plant well adapted for the purpose in the autumn. It is impossible to speak too highly of the usefulness of this very free flowering plant, and where cut flowers are in much request it is invaluable. It should be well cut back every year. *John Cox, Redleaf.*

## Grapes and Vineries.

THE Grapes in the earliest vinery will be swelling fast, the mild weather being very favourable for forcing. Still keep the night temperature at 65°, and raise the temperature to 75° early in the day if the weather is bright, and admit air on the back ventilators early in the morning. Close early in the afternoon so that the thermometer may run up to 85°, and keep the evaporating pans filled with weak manure-water. Damp the paths and borders down several times daily with tepid water, but use much less atmospheric moisture on dull days. As a general rule, when the Grapes are swelling, no stopping is required; but sometimes a few laterals will require taking out if the Vines are very strong. Water the border thoroughly when dry with tepid manure or guano-water at 85°. Attend to the fermenting material on outside borders, and add fresh manure and leaves as the heat declines. Succession Hamburgs started in the early part of the year will soon be coming into bloom, and must be kept at 65° at night, with a rise of 10° by day. Tie the young growths down to the trellis, and stop them just before they come into bloom, and then let them go until they are set. It is a good plan to water the inside border a few days before they come into bloom, so that no more water will be required until they are set and thinned. If many bunches show cut off the surplus before they come into bloom, as the others will set better. When in bloom keep them as advised in previous Calendars. Muscats started on January 1 will be showing bunches, and can be kept at a night temperature of 67°, raising it to 70° when they are in bloom. Stop them at about four joints beyond the bunch, according to the room there is on the trellis, leaving sufficient to cover it without crowding. Water when necessary with clear tepid water, for if the borders are well drained they will take liberal supplies. Admit air early in the day on all favourable occasions, taking care to avoid cold draughts, and close the house early in the afternoon. The latest house of Muscats can be started now or left a few days longer, say till March 1. Before starting water the border thoroughly with clear tepid water at a temperature of 85°. If any borders of late houses require top-dressing do it at once, so that it can be completed and the houses be thoroughly watered before it is time to start them, for all late Grapes ought to be started gently by March 1. When starting such late varieties of Grapes, as Lady Downe's, Alicante, and Gros Colmar, keep them at a night temperature of 50°, with a rise of 10° by day. Keep the rods well syringed several times daily, and the paths and borders well damped down with tepid water. Late houses of Hamburgs must have the ventilators open night and day, for if this mild weather lasts there will be great difficulty in keeping them back. Early pot Vines must now have liberal supplies of tepid manure-water at the roots, and if wanted very early they will now stand a few degrees more heat in the day time, but 65° is sufficient for the lowest night temperature. Vine eyes in pots or on turves can be kept at 55° to 60° at night, with a rise of 10° by day. Late Grapes hanging in the fruit-room will not require any fire-heat if the temperature does not fall below 45° and the atmosphere is dry. Fill up the bottles with soft water as they require it. *Toshua Atkins, Lockinge Gardens, Wantage.*

## The Pine Stove.

FRUITING plants in various stages should have every facility afforded them to make a sound growth, and all due precautions should be taken that no check occurs to diminish the size of the fruits. Attend assiduously to the ventilation and temperatures for the next six weeks, as any inattention during that time will affect them the whole season. Keep all fruiting plants about 70° at night, with a rise of 10° by day, and close the houses up early, so that the temperature may rise as high as 85° for a short time. Do not keep to a rigid line, but rather be guided by the state of the weather. The bottom-heat for fruiting plants should be kept steady at about 90°. Carefully examine all newly made up beds, and if they are too hot lift the pots, which will make an opening for the rank heat to escape. Let the atmospheric conditions be equable and genial, but if too much moisture should accumulate in the axils of the leaves change the conditions by decreasing the moisture until the water has

evaporated. Keep the newly potted plants about 65° at night, with a rise of 10° by day, and in mild weather, with the aid of sunshine, it may rise to 80°. Give them a little air on every favourable opportunity, but ventilate cautiously. The plants should be plunged near the glass, with a south aspect, and the glass should be kept clean both inside and out, so that all the light possible may be diffused over and among the plants. These plants at this stage require careful watering for the next two months, and the soil should only be kept moist; if too much water is given the young roots will rot. The making up of hotbeds should be completed without delay, so that time is allowed for the heat to subside; make them of a good size, and build up the sides firmly, using the longest litter for this purpose, and let the inner layers bind the sides together, which will prevent them giving way. Use about two-thirds oak leaves and one-third long litter. Place the frames over them as soon as the beds have settled down; this keeps out the rain and prevents a too rapid decomposition of the materials—a point of importance in Pine beds. Those rooted suckers that were not large enough for putting into fruiting pots this month should have a small shift into 8 and 9-inch pots; these will form a second batch for transferring into fruiting pots during May. This, with the early lot, will form the principal succession for next year's fruiting. Those who only grow a few or a medium number should pot at either of these times, as they are not only more easily managed but the fruiting is more dependable and results alike satisfactory. *D. Wilson, Castle Hill, Devon.*

## The Hardy Fruit Garden.

THE slightly lower temperature we are experiencing with the lengthening days will prove advantageous in retarding the already too advanced buds of fruit trees, which were certain to be more rudely checked later, had they continued to advance as rapidly as they were doing. Those who leave the pruning of their Peaches and Nectarines until the spring will do well to proceed with such work without any undue delay, in order to have the work executed before the buds become so far developed as to be easily broken off in the performance of the operation. Where the whole of the available space on walls has not been covered, branches required for extension may be left entire, or of such length as the ripeness of the wood justifies. Growths in the interior of the tree that have borne fruit can be cut out and replaced by the shoot arising from the lowest break of last season. Prune such shoots of a suitable length to reach nearly to the next above, and do not risk crowding the tree by retaining more than are really necessary for the furnishing of the wall with growths at such distances as will allow of full development of the foliage without that of one branch overhanging that of another.

The growths being generally well ripened this season, and very full of bloom-buds, more than a sufficiency of bloom, if protected from frost, may be expected to set on trees with even sparsely arranged shoots. Should any gross growths that destroy the balance of the tree have been suffered to remain unchecked last season they should be entirely removed to prevent the emission of others of a like nature, which would result from cutting back such shoots at this season. If it be necessary in order to furnish thin portions of old trees with blooming wood to retain some of the weaker growths, see that a wood-bud be retained by putting in the shoot at full length if no triple buds exist. In nailing-in use no more fastenings than are absolutely necessary to straighten the shoot and support the probable weight of the crop, and avoid ugly bends at the base of shoots by fastening into a sufficiently acute angle with neat matting ties. If the trees are entirely renailed, as Peaches ought to be, there will be no need for noting the necessity of looking carefully after the removal of all tight ties, which work especial injury on all fruit trees liable to form gum when the bark is broken. Young trees can have all weak growths cut

well back where required to form branches, or removed entirely where not wanted in the formation of the tree; and well ripened strong shoots can be nailed in at full length, trusting to after-attention to restrict the summer growth where necessary to improve the balance of the tree. The leader can be well cut back, in order to furnish a sufficiency of shoots for the centre of fan-trained trees, or for modified forms of the same. Strawberry plantations may now have all old leaves cleared away, also weeds where such exist. The decayed manure may then be lightly pointed in with digging forks, carefully avoiding injury to the roots in executing the work, and if convenient a good dressing of long stable litter may be at once applied, which if thickly used will last in good condition until the fruit is ripe, and will have more time to be washed thoroughly clean than when applied late in the season. Where it is intended to make spring plantations of Strawberries from store beds the work may be proceeded with at once on well prepared ground which has been thoroughly enriched.

Raspberry plants for autumn bearing must now be cut over close to the ground, and new or extended plantations may be made at the present time, choosing an open situation well exposed to the sun, which is so necessary to the proper ripening of the fruit maturing in October, and which helps to arrest its speedy decay in damp weather. Where the tops of other Raspberries are left at full length until the spring, they may now be cut back to a little above the stakes or wires, and the surface-dressing applied in the autumn can be worked over, and the rougher portion removed for the sake of appearances. Now that the pruning of fruit quarters is all completed, and the forking over of fruit borders done, the department ought to present a neat and dressed appearance throughout, and if any arrears of work of any description, yet remain they ought to be seen to at once, before it is too late and a season lost. *Ralph Crossling, St. Fagan's Castle.*

## The Orangery.

THOSE trees from which all the fruits have been gathered may now be repotted, and any that do not require it should be surface-dressed. Sometimes the drainage becomes imperfect, and does not allow the water to pass through freely. When the trees are turned out of the pots, and it is found that the ball of earth is packed full of healthy roots, a pot one or two sizes larger will be required; put in plenty of drainage, and some tough fibrous loam over it. The potting material should be good moderately clayey loam, with a fourth part of rotten manure and some crushed bones added to it; some broken bits of charcoal will also help to keep the soil open. The compost must be packed in firmly round the sides of the ball. When the roots are not in good condition it may be necessary to pick out a considerable portion of the compost from amongst them, and in that case the trees may be transferred to the same sized pots. When surface or top-dressing only is required, the surface soil should be removed as deep as possible, so that the roots are not materially injured. The compost used to replace this should be rich, and contain a double quantity of manure and bones to that used for potting. The position of the trees in the house is another important element in their culture. We have always grown them on the back stages of the Pine-stove or Cucumber-house, as they require the same treatment. I find, however, that the trees keep in better health, when the pots can be plunged to half their depth in a bark bed, with a bottom-heat of about 55°. It will be a good opportunity when working amongst the trees to wash the leaves and stems with strong soapy water. Treat the trees that may have fruit ripening on them to a temperature of 65° at night. Those that have ripe fruit on them should be in a cooler drier atmosphere and be kept rather dry at the roots. *J. Douglas.*

TOBACCO IN KAFFRARIA.—Our contemporary, the *Colonist and India*, says Tobacco has long been grown successfully in Kaffraria, and its cultivation is rapidly extending. On a farm about 15 miles from the mouth of the Kili Mr. Keighley is planting out about 9000 plants. In virgin soil the weed grows most luxuriantly, quite rivalling anything produced in America or elsewhere.

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Feb. 27	Sale of Imported Orchids, at Stevens' Rooms.
WEDNESDAY, Mar. 1	
THURSDAY, Mar. 2	Sale of Imported Orchids, Lilies, Hardy Plants, Bulbs, &c., at Stevens' Rooms. Luncheon Society's Meeting, at R.F.M. Rooms.
SATURDAY, Mar. 3	Sale of Imported Orchids, at Stevens' Rooms. Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

THE annual PRUNING OF THE SHRUBBERY is one of those things that is too often pushed aside through stress of other matters, or wholly ignored or neglected; and yet, perhaps, there is not a more important matter within the entire range of gardening. We do not mean by this that all shrubs are to be cut back or beheaded as Gooseberry and Currant bushes mostly are, but rather that they should be looked over and moulded into form or kept within bounds, as the case may be. The common practice of planting shrubberies in mixtures renders this the more imperative, for, with the different species and varieties found in most shrubberies, the predominance and final prevalence of the strongest speedily ensues, unless the more robust are repressed, and the weaker are encouraged by wise and judicious pruning.

In other cases, too, where shrubs, such as Laurels, Yew, Box, &c., are planted in groups to form masses of verdure at given elevations, it is needful to prune them in a more formal and regular manner; otherwise what was designed for a green carpet often grows up into anything rather than green blinds. Good illustrations of this style of planting may be met with at Dalkeith, and many other places in Scotland, Sandringham, Eastwell Park, and many more in England. Such verdant carpets need cutting almost smooth once or twice a year, as otherwise they soon get out of condition. The question now before us is, not the policy of planting such masses in situations where grass might be more telling, effective, or enjoyable, but the necessity of care in pruning such masses where they exist, so as to keep them even as a bowling-green, and green as the best velvet lawn. This used to be attempted by clipping the surface even; but it was found that the shears cut so many leaves in halves and mutilated so many more, as to ruin the appearance as well as impair the health of the shrubs; so that now the knife is generally used, and with such skill, that not a mutilated leaf is seen, and hardly a twig seems out of place. But the pruning, or rather beheading of such shrub masses is simplicity itself compared with the pruning of mixed shrubberies in such a skilful manner as to bring out all the most telling features of each specimen and group in due prominence, without totally or partially hiding the effects of others. In such prunings, a good many plants may have to be cut right down to the ground, in order that they may form, as it were, a green base for others.

Inequality of height and distances are also among the most charming characteristics of the well managed mixed shrubbery. Originally planted at well-nigh equal distances, as most of them have been, to grow up rapidly into a thicket or screen, the greatest danger before them is that of growing up into dense monotonous masses, as like the masses of Laurel we have described as may be. But these are the very opposite of what a good shrubbery should be. The skilful pruner breaks up its uniformity by the process of keeping much of his material near to the ground by severe pruning. This not only fosters the rapid growth of the shrubs left intact, but adds by contrast to their apparent height. In this way it is possible, by pruning with skill, to create bold swelling projections and deep dark recesses, though the base line may be level. Of course, where these are varied, less pruning

may be needful, and what is given has far more effect. Laurels, Box, Rhododendrons, make admirable base lines for Hollies, Yews, &c.; and even where the shrubbery is mostly of one uniform character, such as Laurels, Hollies, Rhododendrons, &c., the effect may be very much heightened by encouraging the growth of many perfect specimens and groups among and above the others. Some of the finer and stronger growing Rhododendrons reach to the stature of trees thus encouraged to rise above the others, and indeed there is no single shrub that so much can be done with in the hands of skilful planters and pruners as the Rhododendron. Some of the species are very dwarf, others of them rise to considerable elevations, and their natural qualities and diversities of stature may be intensified by culture and treatment. Hence we often see Rhododendrons so dwarf and prostrate as to lie upon the turf, and others reaching up to the dignity of dwarf trees.

Hollies also form capital base lines as well as being among the richest furniture of shrubberies. Single plants or groups of these allowed to run up and out into full-sized specimens, are simply magnificent. With sufficient space to enjoy light and air all round, no plant needs less pruning than the Holly. But to maintain a good close base for cover or shelter, an annual pruning will probably be found the cheapest and easiest in the end. For nothing works more mischief among shrubs than the occasional slaughtering which some dignify with the name of pruning. Drawn up into a smothering thicket by overcrowding, the shrubs have become abnormally tender as well as weakly. Severe thinnings under such circumstances invite disease, arrest growth, and not seldom totally ruin shrubberies. Hence it is often better to stub up neglected shrubberies root and branch than to attempt to prune or cultivate them back to symmetry and beauty. The evil is in the neglect. Nothing takes a more severe revenge for neglect than the shrubbery. An annual examination or pruning is one of the surest antidotes to neglect. It lightens the work so very much to do it often, if possible annually; not that there may be very much to do every year, and so much the better. The mere examination will prove an antidote against neglect, and even neglected shrubberies may be resuscitated with skill, care, and patience. The pruner needs not only to know when and where and how to act, but also when to stop, the latter being the more important of them all.

As to the time to prune shrubberies no hard and fast lines are observed. Writing broadly, from October to March, inclusive, is the best time to prune deciduous shrubs, and from April to July evergreens. Though little has been said about the pruning of the former, it is as necessary to prune deciduous shrubs as evergreens, though it is seldom needful to prune them so often.

How many beautiful Lilacs have been hopelessly ruined for lack of pruning? Fine bushes have run up out of sight for lack of timely and judicious cutting back. Bushy specimens full of bloom have grown into something akin to Willow stools for lack of the timely removal of suckers and the thinning of their heads; and the same remarks are almost equally applicable to Spireas, Loniceras, &c. An occasional overhaul, an annual pruning, would keep each shrub in its place, and also enable it to fill its own niche to the best advantage; while it would also preserve and heighten the general effect of the entire shrubbery, and prevent it degenerating into seediness and weediness, which it too often does.

— FICUS ELASTICA.—We owe to Dr. TRIMEN the opportunity of figuring the remarkable group of indiarubber trees which bound one of the entrances to the Royal Botanic Garden at Peradenya, Ceylon (fig. 38).

The curious aerial roots, descending Banyan-fashion from the branches, and the bold, undulating buttresses which run along the ground, are very striking features, and must tend to prevent the trees from being overthrown by hurricanes. We cannot hope, even with the resources of a Kew, to produce such growth in this country, but as the means of travelling increase the numbers of those privileged to witness such marvels increase likewise. The mode of formation of these buttresses and the reason are not generally understood, and would form a good subject for further investigation. They are not confined to Figs, but occur on many other tropical trees, as may be seen in several fine sections in the Wood Museum at Kew. A figure of these buttresses, taken from an isolated tree, was given at p. 681 of our volume for 1873, after a sketch by Captain OLIVER.

— THE INTERNATIONAL POTATO EXHIBITION will be held in the Crystal Palace on the same dates as last year, viz., September 20 and 21. The schedule and general arrangements will be much the same as on former occasions. The Lord Mayor and Sheriffs have generously promised to open the exhibition with some amount of ceremony. We hear with satisfaction that a new and severe rule will be adopted to prevent the introduction of old varieties under new names.

— PARIS HYACINTHS.—Inquiries are being made with reference to a very early and hardy double-flowered Hyacinth known under this name. We have before us spikes of the pink form from Messrs. CANNELL, and there are also double blue and double white varieties. They are simply varieties of *H. orientalis*, and have not, in our opinion (we are speaking from the gardener's point of view), anything to do with the ordinary Roman Hyacinth (*Hyacinthus procerus*), the history of which was given in the *Gardener's Chronicle*, Feb. 1, 1879, p. 145. The Roman Hyacinth has nothing to do with *Hyacinthus Romanus*—one more proof of the inconvenience of using vague popular names instead of those which are subject to rule, and can be verified by those who care enough about the matter to take the necessary trouble.

— PTERIS FERRULATA CRISTATA.—Wherever there is much ferning to be done the "Chiswick variety" of this Fern should be cultivated as special ornaments for sitting-rooms or in suitable sizes for the dinner-table. The plant is somewhat expensive, owing to the fact that the stock cannot be raised from spores but by division, which of course renders it more valuable. It is, however, well worth its price; the points of the fronds are beautifully crested, and a pair of plants well grown and a good match would bear favourable comparison with anything else that could be mentioned as decorative subjects for a library or sitting-room. From experience we can also add that it stands gas well.

— BOTANIC GARDENS, TOMSK.—It has not fallen to the lot of many of our readers hitherto to have to address their letters to the Director of a Siberian botanic garden; nevertheless we hope that it may not be long before communications are opened up between the remote Siberian town and the rest of the horticultural world. A University has lately been founded there, and now M. SCHESTAKOFF is about to found a botanic garden there for the purpose of supplying the students with means of study, and of collecting together all the plants likely to resist the severe winters. Seeds can be sent by post to Tomsk, so that it is to be hoped that some of our amateurs and nurserymen will supply seeds to the Director, in return for which he will forward other seeds of shrubs, hardy perennials, and the like, from this region of North Central Asia. Funds are not forthcoming yet for the garden, so that M. SCHESTAKOFF will have an uphill task, but may rely, we hope, on the sympathy of his European confrères.

— PROLIFEROUS CONES.—Adverting to the cones alluded to and figured in a recent number (p. 112), Professor EICHLER, the Director of the Imperial Botanic Garden at Berlin, writes that in his opinion the seed-scale is only an excrescence from the outer scale or bract, so that the two really constitute one leaf, and the bud or branch in the axil of the bracts in proliferous cones are not to be considered as transformed seed-scales, but as axillary buds to the

FIG. 38.—INDURUMBER TREES IN THE ROYAL BOTANIC GARDEN, DEVON. (SEE P. 264.)

composite leaf just mentioned. The *Sciadopitys* offers no exception to this explanation. M. VAN VOLXEM's remark as to the frequency of the occurrence of proliferation in this plant in Japan is interesting in relation to the great frequency with which *Cryptomeria* is similarly affected here. If some of our Japanese friends would kindly send prolific cones of *Sciadopitys* in various stages they would be rendering a service.

— PRESENTATION TO MR. SAGE. — The *employés* in the gardens of the Earl of BROWNLOW at Ashridge presented Mr. SAGE, on the 13th inst., with an illuminated address and a writing desk of Spanish Walnut, as a slight acknowledgment of the kindly interest he has shown in their welfare during the twenty-four years he has been Head Gardener at Ashridge. As we have before mentioned, Mr. SAGE is about to take charge of Lord BROWNLOW's other garden establishment at Belton, Grantham, and it must be very gratifying to him to know that among the forty men and boys employed at Ashridge there is but one feeling—that of regret at his leaving—their loss being that of a good master and a true friend.

— "FLORA EUROPEA."—Prof. KANTZ, of Kolesov, has published, under the title of *Reliquie Grisebachianæ*, the small fragment of a *Flora Europæa* drawn up by the late Prof. GRISEBACH. Unfortunately it comprises but five orders—Ranunculaceæ to Crucifere, and is only interesting as showing what had been the author's intention.

— ESSEX FIELD CLUB. — We understand that at a meeting of this society to be held at Buckhurst Hill this (Saturday) evening, the desirability of directing public attention to the pressing necessity which exists that some means should be adopted for the protection of our native animals and birds from wanton destruction by gamekeepers and others will be brought before the Club by Sir FOWELL BUNTON, Bart., Verderer of Epping Forest. Zoologists, and lovers of Nature generally, whether members of the society or not, are earnestly requested to attend and take part in the discussion.

— THE SEASON. — "In the open air," Mr. BURBIDGE writes from Dublin, "we have *Chionodoxa Lucillie*, *Silla bifolia*, *S. sibirica*, *Leucoium verum*, *Narcissus Tazetta* var. *floribundus* (from St. Michael's Mount, Penzance), and one or two others of same race; *N. minor*, *N. pseudo-Narcissus*, *N. major*, *N. maximum*, all opening their first flowers. *Chionodoxa* is very variable; some small narrow-rayed stars very pale, nearly white in fact; others stout and broad-rayed flowers, nearly  $\frac{1}{2}$  inch across, and dense blue, with clear white centre. *Anemone fulgens* and seedling *A. coronaria* bear them company. In the houses: our *Ouvirandra* has a leaf-blade  $1\frac{1}{2}$  by  $\frac{1}{2}$  inches, petiole  $\frac{3}{4}$  inches. *Cologyne Lemoniana* is blooming nicely; so also *Cypripedium Dominionianum*, *Cattleya Warsceviczii* var. *delicata*, *Phalænopsis Schilleriana*, *Odontoglossum pulchellum majus*, *O. Rossii majus*, *Oncidium cucullatum* var. *atropurpureum* has been in bloom ten weeks, equal seventy days, and is yet fresh and sweet-scented. *Jasminum gracillimum* opened its first flowers with us to an Irish sun to-day, Feb. 21."

— KOLOSVAR. — We have received the exchange list of the Botanic Garden of Claudiopolis, better known as Kolesovar (Hungary). Dr. KANTZ's zeal and courtesy are well known.

— ST. PAUL'S CATHEDRAL. — A "Lover of Trees" writes to *Land* to propose that a handsome tree should take the place of the statue of Queen ANNE, in front of St. Paul's. We have heard doubts as to the desecration of this Royal lady, and we cannot help doubting the confident assertion of the writer aforesaid, that "A Cedar of Lebanon or a Deodar Cedar would look majestic in this position, and would probably last for centuries as a memorial of the Victorian era. I have before suggested," says the writer, "that the QUEEN should plant a City tree. What better opportunity than this could offer?" What a valuable suggestion—a majestic Cedar of Lebanon or a Deodar in such a situation! Can the gentleman have meant an "Arbor-vitæ," but even that would not last for centuries in such a place. A "Lover of Trees" may love well, but he certainly does not love wisely, or he would laugh at the absurdity of his own suggestion; but perhaps he is anticipating the results of the Smoke Abatement

Exhibition, and the purification of the soil from gas contamination consequent upon the general use of the electric light; but it is impossible to account for the imaginings of one who would plant a Cedar of Lebanon or a Deodar in front of St. Paul's.

— ROYAL FLORA SOCIETY, BRUSSELS. — We have received the programme of the important exhibition to be opened in Brussels on April 30. The schedule comprises 132 classes, and is so drawn up as to include several features of interest. English exhibitors should put themselves into communication with M. LUBBERS, 26, Rue de Berger, Ixelle.

— INDIANRUER IMPORTS FOR 1881. — From MESSRS. HECHT, LEVIS & KAHN'S caoutchouc report for 1881 we learn that the consumptive demand for all kinds of india-rubber was good throughout the year. Fine Para rubber realised the highest price of any in the market, commencing in January at 3s. per pound, and advancing almost without interruption to 3s. 7 $\frac{1}{2}$ d. in May, declining in August to 3s. 3 $\frac{1}{2}$ d., and rising gradually again till it reached 3s. 9 $\frac{1}{2}$ d. per pound in December. The total exports from Para to all ports are estimated at 930 tons, against 8450 tons in 1880—an increase of 580 tons against 1880. The imports into London and Liverpool have been 3855 tons in 1881, against 3768 tons in 1880, showing an increase of 87 tons. Of the total exports from Para, estimated at 930 tons, the United States have taken 5175 tons direct from Para, being again an increase of about 500 tons as compared with 1880. This, combined with the very heavy quantity taken from this country, shows a largely increased consumption in the United States.

— CORBULARIA MONOPHYLLA. — This lovely little *Narcissus*—one of the most charming of all hardy bulbous plants—is now in bloom in the herbaric department at Kew. It is planted out under a handlight in the open bed, the protection afforded it being directed more against superfluous moisture than mere cold. Mr. BAKER regards it as a white-flowered variety of the well-known Hoop-petticoat, *Narcissus bulbocodium*, the Medusa's Trumpet of the French. The late Mr. GILES MUNBY placed on record in these columns for 1869 (p. 335) some most interesting particulars about this little gem. He says:—"Having had occasion to-day to consult my herbarium concerning the genus *Narcissus*, I was surprised on finding two bulbs of *Corbularia monophylla* with living leaves about an inch long. One of these bulbs I gathered at Oran (Algeria) in January, 1843, and the other at Tlemcen, on the frontiers of Morocco, on March 23, 1857. I immediately planted the bulbs and put them in my greenhouse, where I have no doubt they will flourish, and in all probability flower next spring after (for one of them) a rest of twenty-two years." These bulbs did produce flowers, as Mr. MUNBY expected. Somewhat similar instances of prolonged vitality under similar conditions are on record; for example, *Lewisia rediviva*, the figure of which in the *Botanical Magazine* was prepared from a plant which had undergone treatment calculated to destroy every vestige of life even in the most tenacious subjects.

— NOTTINGHAMSHIRE HORTICULTURAL AND BOTANICAL SOCIETY. — The first monthly meeting of this newly organised Society was held in the Society's rooms, Morley House, Nottingham, on Thursday, Feb. 16, under the presidency of Mr. S. THACKER. The Society has been inaugurated with the object of advancing the horticultural interest, and holding monthly meetings at which members are invited to read papers on any subject connected with gardening. At the first meeting Mr. FOWNALL, of Lenton Hall, read an interesting and instructive essay on "The Gardener and his Position," which was afterwards fully discussed by the members present. Mr. SWANWICH, of Sherwood Lodge, showed a fine specimen of *Dracena Goldiana*, which was much admired; and from Mr. EDINGTON, of Woodthorpe Grange, came a very fine spike of *Lelia albida*, some flowers of which had been sent to Messrs. VEITCH, who expressed a very high opinion of the variety. The same exhibitor showed a fine collection of blooms of *Primula sinensis* remarkable for their size and colour. A vote of thanks was awarded the essayist and both exhibitors. We understand that the Society has every prospect of success, and is being taken up by the principal gardeners and amateurs in the neighbourhood. Although only a month in existence,

it already numbers upwards of fifty members and subscribers. The Honorary Secretary is Mr. JAMES DON, manager for Messrs. BARRON & SON, Nottingham.

— PLANTS OF ROMANIA. — Dr. KANTZ has now completed his enumeration of the plants of this region (Moldavia, Wallachia), originally published in the Hungarian *Journal of Botany*. The flowering plants amount to 1892 in number, 1573 of the number being Dicotyledonous.

— THE CITY OF LONDON DAY CENSUS. — The ordinary census is based on the enumeration of all those persons who slept or passed the night at a given date in a particular locality. It is evident, even in the case of the metropolis generally, that as so many persons now sleep in the suburbs, the result must be very fallacious, and this remark applies with special force to that comparatively small district the City proper. Small though it be no one will deny its vast importance from a commercial point of view. The City authorities then did wisely to organise a day census, and this they did by ascertaining the number of persons actually resident within the City boundaries, and the number of persons entering the City during the day on foot, by rail, or other conveyance. The report before us gives a very interesting summary of results, to some of which we may here allude. The number of persons residing in or employed in the City during the day was 261,061, of whom 195,377 were adult males; 44,179 were females, and 21,305 children under fifteen. The total number of persons who entered the City by one or other of the entrances amounted to 797,563. Of these, 589,468 entered between 5 A.M. and 5 P.M., 739,640 during the sixteen hours between 5 A.M. and 9 P.M. inclusive, and 57,923 between 9 P.M. and 5 A.M. The number of vehicles of all kinds (except railway trains), was 71,893, thus distributed:—53,312 between 5 A.M. and 5 P.M., 66,900 between 5 A.M. and 9 P.M., and 4984 between 9 P.M. and 5 A.M. Of the total vehicles 15,966 were cabs, 6176 omnibuses. It will be remembered in endeavouring to estimate the amount of the traffic that these figures represent the passage of persons and vehicles into the City only. The exits may be estimated at about an equal amount. The total number of persons who were in the City during the night of April 3-4, 1881, was 59,526, a reduction to the amount of 32.5 per cent, as compared with 1871. On the other hand, the results of the day census in 1881, as compared with that of 1866, shows an increase of 54.4 per cent. The increase of persons entering the City since 1860 has been at the rate of 90,942 daily. The daily traffic in one direction only over London Bridge is estimated at 78,943 passengers and 10,733 vehicles. The City stands first in rateable value and assessment for Income Tax of all the towns in England. More than 4000 houses occupied during the day are entirely unoccupied at night, being left entirely to police supervision. As an illustration of the fallacies that arise from considering the night population only as the general census does it may be mentioned that one building alone occupies 1 acre of ground, rated at £5000 per annum, and let out in 135 different tenancies, and occupied by 252 employers and 275 employées, making in all 527 persons: represented in the Imperial Night Census by only four people! The amount of Income Tax under Schedule D. (Commercial) is £39,263,424—a far larger sum than in any other district of the metropolis, and more than seventeen of the most populous towns in England put together. An analysis is given of the various trades and employments followed by the residents and frequenters within the City boundaries. Nurserymen do not make a very large show, as, indeed, might have been expected—the numbers under this head, including "Nurserymen and florists, horticultural sundriesmen, and gardeners," being only thirteen. Under the head of Fruit and Vegetables are included—"Fruit brokers, fruit salesmen, fruiterers, fruit merchants, fruit dealers (dried) [the fruit, we presume, not the dealers]; vegetable salesmen, Potato salesmen, greengrocers, Watercress salesmen, hay and straw salesmen"—the total amounting to 343.

— "AGRICULTURAL STUDENTS' GAZETTE." — The last number of this periodical, edited by students of the Royal Agricultural College, Cirencester, contains a report of Miss ELEANOR ORMEROD'S lecture on insects injurious to farmers, and on the mysteries of parasitic life, by Professor DROWN, in which, in addition to the older and better known parasites, the

Bacteria and the wonderful history associated with them are treated of.

— **BAILLON'S "HISTOIRE DES PLANTES."**—The part containing the Composite has just been issued, which it will be instructive to compare with the recent recension of Mr. BENTHAM in the *Genera Plantarum*. At a glance we perceive that the number of genera, which Mr. BENTHAM estimates at 800, is put down by M. BAILLON at 403. Dahlia is referred to Bidens. The woodcuts are of their usual excellence.

— **THE "FLORIST AND POMOLOGIST."**—The contents of the February number are varied and interesting. In addition to the articles descriptive of certain varieties of Dahlia and of Plums, to be alluded to under the head of Plant Portraits, there are articles on Vine and Vine culture, double Scabious, Arniculas. The register of novelties is likely to become a most useful feature.

— **BRITISH MOSS FLORA.**—We have the satisfaction of announcing that the fifth part of Dr. BRAITHWAITE'S illustrated *History of British Mosses* is now published. Both plates and text evince the care and fidelity of the author.

— **MESSES. HURST & SON.**—In reference to the future management of this business, to which allusion was made in the obituary notice of the late Mr. WILLIAM HURST, we are requested to state that at the time Mr. SHERWOOD was taken into partnership Mr. JOHNSON was also assigned an interest in the business, which will be continued as before, the business having been conducted by them conjointly during the illness of Mr. HURST.

— **PROLIFEROUS HYACINTHS.**—Mr. FRANK SOUTHAM, jr. to C. K. HAITER, Esq., The Cedars, Leamington, informs us that he has a bulb of *Norma*, in a 45-pot, which is now bearing fifteen spikes of flowers, with an average of 10—14 good pips on each spike.

— **LINNEAN SOCIETY.**—At the meeting to be held on Thursday, March 2, the papers to be read are—1. "On the Habits of the Coral-reef Annelid (*Palaio viridis*)," by the Rev. T. OS, POWELL. 2. "The Lichens of New South Wales" by CHAS. KNIGHT. 3. "Butterflies collected by Lord WALSHINGHAM in California;" by A. G. BUTLER.

— **THE WEATHER.**—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending February 20, issued by the Meteorological Office, London:—The weather, though clearer than of late, has been generally cloudy, with occasional showers of rain. Temperature has again been above the mean in all districts, the excess varying from 2° on our south-western coasts to 4° on our north-eastern coasts. The highest reading recorded (57°) was registered in London and at Strathfield Turgiss on the 14th; while the minima, which occurred generally on the 16th, ranged from 27° in "Scotland, E." to 33° in "England, N.W." The rainfall has been a little more than the mean over eastern and central England, and equal to, or slightly less than the mean value elsewhere. Bright sunshine shows a considerable increase everywhere, the percentages ranging from 22 in "England, N.W.," and 23 in "England, S.," to 39 in "England, N.E.," and 51 in "Scotland, E." Depressions observed:—Pressure during this period, though high and comparatively steady in the south, has been subject to great and rapid changes in the north. Several depressions, some of which were very deep, have passed in an easterly direction over our northern coasts and across the North Sea, causing the wind to increase to a fresh or very strong gale from west or north-west in all the more northerly parts of our islands. At the close of the period, however, the weather was less disturbed, a large anti-cyclone being shown in the south-west, with moderate or light westerly breezes in nearly all parts of the kingdom.

— **GARDENING APPOINTMENTS.**—Mr. W. J. GILKS, late Foreman to Mr. DOUGLAS at Loxford Hill, has been engaged as Gardener to A. BOWENICK, Esq., Higham Hill, Walthamstow.—Mr. JOSEPH THOMAS MULLIS, late Gardener to H. WILLIS, Esq., Pittmore, Worcester, has been engaged as Head Gardener to his Grace the Duke of DEVONSHIRE, Lismore Castle, Ireland.

## MILTON PARK,

ONE of the seats of Earl Fitzwilliam, 3 miles from Peterborough, in a park of over 1300 acres in extent and containing some remarkable specimen trees the history of which is almost as far-reaching as that of the noble family to which they belong.

At the east side of the park there is a huge Oak, 26 feet in circumference, in which the late Earl, who was a great lover of trees, took a deep interest. From the north front there is a grand view through an avenue of Oaks leading to the church, and a fine view of Thistlemore Wood. The north front of the house is in the Tudor style of architecture and the south front Italian, and good views of the surrounding country are obtained from all sides of the building. The River Nene, which parts Northamptonshire from Huntingdonshire, flows through the grounds, and is spanned by an ornamental bridge, from which a fine tract of country is in view, and many pleasant local sights, including the charming Allwath Linch, situated at a high elevation with the Nene running parallel with its base. The Linch, as it is locally called, is in the form of an avenue about 1½ mile long with a wood on the left and a steep bank on the right running down to the water's edge. On this bank there are some fine Cedars, Oaks, Beeches, Vines, &c., with openings which give some fine views of the country looking across the Nene valley.

The principal carriage drive is over a mile long through the sheep park and deer park, both of which afford much variety of scene and magnificent rural sights. There are several giant Elms in another portion of the grounds which are nearly eaten through by decay, but which are still preserved with the utmost care, and singularly enough, notwithstanding their decrepit appearance, there are still some of the limbs apparently possessing full life and vigour. The great interest which attaches to these trees is not so much because of their great age as because of their history. It was under their branches Sir William Fitzwilliam entertained Cardinal Wolsey, who had offended Henry VIII., and who had taken flight from the offended presence of his Majesty. Sir William, fearing to give offence to the king, and being in some way indebted to the Cardinal, selected the shelter of the Elm trees to hold a banquet, in order that it might not be said he had entertained the Cardinal in his own house. The trees, which form an ancient-looking group, are called the "Cardinal Wolsey trees," and are certainly more curious to look at than they are pretty in appearance. Traversing the pleasure-grounds from the mansion in a westerly direction there is a broad Yew avenue leading to the lake, by the side of which there is a curious group of Horse Chestnuts growing in the most grotesque manner. Their branches upon touching the ground curve like a hoop, and shoot up again perpendicularly with increased vigour, which forms a very interesting spectacle by the side of the lake. Whether the branches have been "layered" or have rooted of their own accord there does not appear to be any record, but to the practical eye the "curve" is too neatly formed to be of spontaneous growth. The conservatory is an old-fashioned structure with glass domes, and contains Tree Ferns, Orange trees, Camellias, and Myrtles. By the way, what a pity the latter are not more grown for the embellishment of such structures. The pyramids in the conservatory of Lowther Castle would tempt any one into growing Myrtles either for adorning conservatories in winter, or for turning out-of-doors in summer. From the front of the conservatory a pleasant peep is obtained of the lake, and also of several fine Chestnuts, Cedars, and Weeping Willows by the side of the lake. The fancy ducks of American breed are also very attractive upon the lake.

The kitchen gardens at Milton are extensive, the principal one enclosed by walls being over 4 acres, besides two or more smaller ones equally productive. The walled-in garden is cut in two by a central broad walk. The garden was entered by the south-east side, and at first sight you can see that order and skill are not wanting in its management. There is nothing untidy, nothing out of place, whether it be fruit trees, vegetables, or plants, of which many are grown in the long borders fronting the houses. The south-east wall is stocked with healthy Peach trees in bearing. Apricots are upon the north-west and west walls, and Plums upon the east wall. The ranges of glass structures are, of course, upon the south

wall. Mr. Trigger grows herbaceous plants extensively, and arranges them effectively. Perhaps there are few places where the same extent of borders are so well arranged with hardy plants, of which the following are the most striking and useful:—*Monarda didyma*, *Salvia glutinosa*, *Stachys latifolia*, *S. incana*, *Onothera macrocarpa*, *Epilobium angustifolium album* and *roseum*, *Echinops strictus*, *Veratrum nigrum*, *Funkia grandiflora*, *F. ovata*; *Geranium sanguineum*, *striatum*, and *pratense*; *Galega officinalis*, *Clematis integrifolia* and *C. integrifolia erecta*, the lovely *Boconia cordata*, *Tritoma aurea*, *Veronica longifolia*, *Tradescantia virginica*, *Hemerocallis flava* and *H. fulva*, and many others of less note and not so useful for practical purposes. The rock garden at Milton is more than the majority of things called by that name in most private places, and which unfortunately are often mere rocks or roots than plants either of interest to the plant lover or of utility to the practical gardener. Mr. Trigger has the hardy Ferns neatly arranged, legibly named, and in good health, so that if you are at all up in plant nomenclature you can read, judge, and admire for yourself to your heart's content. There are many Saxifages and other alpine plants in other parts of the rock garden, all of which succeed well and are showy during the spring months, when outside flowers are of all other seasons the most welcome and beautiful. The garden in which the rockery is located is enclosed upon the east side by a Yew hedge 15 feet high, which is a striking sight even now before a leaf has fallen, but which is much more handsome when deciduous trees are naked and there are few other counter attractions.

In the glass structures I noticed the fruit department was particularly well done; the early crops were at the time of my visit gathered, but the trees and plants of all kinds were in the most vigorous health, the Peach trees especially being unusually healthy and well grown. Mr. Trigger grows a nice collection of Orchids in the plant stove, and neither stove plants nor Orchids seem to be any the worse for each other's company. The plain fact is that Orchids can be grown with ordinary intelligence and care anywhere. The following list, grown in conjunction with stove plants, will serve to illustrate the accommodating nature of Orchids, and the simple conditions under which a great many species may be cultivated:—*Vanda teres*, *V. gigantea*, *V. tricolor*, and *V. insignis*; *Cattleya Skinneri*, *C. crispata*, *C. Trianae*, and *C. Mossii*; *C. vestigiata cristata* and *C. barbata*, *Calanthe Veitchii*, *C. vestita roseana* and *C. Turnerii*; *Laelia anceps* and *L. Dayana*, *Trichopilia suavis*, *Aspidos odoratum*, *Sobralia macrantha*, *Dendrobium Dahouianum*, *D. Dardanium*, *D. densiflorum*, *D. thyrsiflorum*, *D. macrophyllum*, *D. devonianum*, *D. heterocarpum*, and *Anselia africana*. Of course these are but a few of the best plants, many of which are approaching to specimen size, and are in a strong flowering condition. The stove plants that seemed worthy of mention consist of *Pandanus utilis*, *Cycas revoluta*, *Pancreatum fragrans*, *Alpinia nutans*, *Strelitzia regina*, several Palms, *Dracenas*, *Crotoms*, and other tropical plants, favourite kinds grown for special private purposes. The Rose-house is one of the most interesting structures upon the place, and although the plants were at rest it was clear from their condition that the time was not far distant when they would supply those rich treasures which are ever the product of a well-managed Rose-house, viz., cut Roses from November to March, after which the stock is plentiful enough everywhere. The greenhouse and show-house were gay with flowering *Begonias*, *Celosias*, *Pelargoniums*, *Balsams*, *Petunias*, and *Fuchsias*; and smaller structures were stocked with winter-flowering plants in quantities. Cucumbers and Melons are grown in span-roofed houses; and Tomatoes, a very fine strain, are grown upon every available foot of wall from 1 to 3 feet high. The crops of hardy fruits were plentiful, and vegetables of all kinds successfully grown in every quarter of the garden. Of vegetables a selection of Dell's Beet was a splendid crop of roots, such a strain as would be worth perpetuating, and which should be brought prominently into public notice. The various garden offices are commodious and in good order, even the compost ground and kindred places indispensable in a garden are each and all kept neat and tidy—and as it is a pleasure to inspect the cultural condition of the garden so it is an equal pleasure to note the system upon which the general management of the garden is conducted under the guidance of an able and intelligent practitioner, who succeeds with everything he undertakes in a manner that leaves nothing more to be desired. Reporter.

DEW AND HOAR FROST.

All plants require moisture in order to live and grow, and Nature has provided in the abundant supply of this element one of the principal factors which determine the greater or less vigour of the growth of plants upon the earth.

It is to the copious dews that we have in a great measure to attribute the productiveness of the meadows bordered by rivers.

Water covers about three-fourths of the surface of the globe as ocean, partly in a solid condition, as at the extreme north; partly fluid, as in all warmer regions; it flows through the land in all directions in the form of rivers; it ascends into the air as vapour, and falls again to the earth as rain, snow, or dew. This continuous circulation of "water" produced by "heat," is the especial agent which penetrates the earth, filling it with life and prosperity.

Where water exists the sandy desert changes into a luxuriant oasis; where it is absent, even the greatest richness of soil remains a "dew," and unproductive.

Dew, which forms our particular subject, is the humidity which the air under certain circumstances deposits in the form of minute water globules on the surfaces of the bodies in contact with it. For instance, on the withdrawal of the sun's rays the atmospheric air becomes colder, consequently the blades of grass, and leaves of plants become chilled from exposure to the influence of the cold, and in their turn cool the damp air which touches them, and cause it to drop its moisture upon their exposed surface. When the condensation of vapours occurs by contact with cold solid bodies it is called "dew;" when, on the contrary, the whole body of air is cooled, "mists," "clouds," or "rain" is formed. It is probable that if it were not for the effect of dew the rapid escape of heat from the earth by radiation, the temperature of the soil would become so depressed during the sun's absence, that the extremes of heat and cold in the course of twenty-four hours might be so great as to destroy vegetable life in the summer season; and it is generally after nights of copious depositions of dew that the mornings are the brightest, and the sun's heat the most powerful.

Dew is only formed beneath a calm and cloudless sky, and never in windy weather, for under the influence of wind the moisture of the earth is carried off with extreme rapidity. A north wind also checks its production, but a gentle southerly breeze, charged with humidity, will occasion a copious deposit. When the atmosphere has a temperature below the point of congelation, the dew, which might adhere to the substances exposed, passes into the form of hoar frost. It is also found that if the temperature of the earth's surface sinks during the night down to freezing point, the particles of water deposited become solid and form hoar frost.

A deposit exactly similar to dew is formed whenever the air becomes suddenly chilled, by touching any surface colder than itself. Thus the walls of long passages, vaults, or massive buildings generally, drip with wet during the early part of the summer, before the external warmth has sufficiently penetrated.

Leslie says—"In fine, calm weather, after the rays of the declining sun have ceased to warm the surface of the ground, the descent of the higher mass of air gradually chills the undermost stratum, and disposes it to dampness, till their continued intermixture produces a fog or low cloud. Such fogs are, towards evening, often observed gathering in narrow vales or along the course of rivers, and generally hovering within a few inches of the surface."

In clear and calm weather the air is always drier near the earth's surface during the day than at a certain height above the ground, but it becomes damper on the approach of evening; hence, dew is always more dense on grass and low-growing plants than on the leaves of shrubs which stand up some feet from the ground.

Many substances are endowed with the property of radiating their heat, and of thus becoming cool with different degrees of rapidity, and it is found that those substances which in the air become cool first, also attract the most quickly and abundantly the particles of falling dew.

Dr. Wells in his observations on the deposition of dew found that grass became 12° colder than ordinary garden mould, and 16°.5 colder than a hard gravel-walk; hence we find that dew deposits the most readily on living vegetation, and that well-pulverised soils draw much more dew than those which have a

hard surface, and are close and compact. Wherever the atmospheric air can freely penetrate there the depositions of dew under favourable circumstances take place. Sandy soils are powerful attractors of moisture, and on the sandy plains of Chili, where rain is scarcely ever known to fall, vegetation depends almost entirely on the nightly depositions of dew for its support.

It has been estimated by Dalton that the amount of dew which is annually deposited upon the soil amounts to about 5 inches, equal to more than 500 tons of water per acre. But the meteorological records inform us that the yearly rainfall on the eastern side of our island amounts to about 25½ inches, while 49 inches, or nearly double the quantity, is precipitated on the western side; and, as we find the rainfall varying considerably at different seasons and in different localities, so we know it is in the case of dew.

Steinmetz remarks that "the quantity of aqueous vapour in the atmosphere is greatest in equal latitudes on the sea-coast; it diminishes in proportion as we advance into the interior of a continent." In Algeria, at the stations on the coast, after the driest and hottest days, immediately the sun has set the soldiers' uniforms become wet with dew, and in a single night the blades of knives in the pocket become rusted, but at 30 miles from the sea night exposure is not attended with any inconvenience from the humidity of the air.

In countries near the equator the depositions of dew are much more abundant than in England, owing to the greater amount of heat absorbed from the sun during the burning heat of the day.

The quantity of vapour which the air is capable of holding in suspension is dependent upon the temperature, and we always find the atmosphere in the vicinity of currents of water more highly charged with moisture than it is in the uplands. In India the deposition of dew near the rivulets when all around is perfectly dry is said to be exceedingly marked. Colonel Sykes observes that "When in Poona in September and October, 1850, if there was no dew anywhere else it was found on the banks of rivulets and the Mota Molu river, but 15 to 20 feet from the water were the limits of the deposition."

Turning now to the composition of rain, dew, and hoar-frost, Boussingault has given the following analyses of samples collected at Paris and Liebfrauenberg in the year 1853—

Table 1.—Showing the Composition of Rain, Dew, and Fog, in Grains per Imperial Gallon.

	Ammonia.	Nitric Acid.	Total Nitrogen.
Rain { Paris .. .. .	0.2103	0.0708	0.2868
{ Liebfrauenberg .. .. .	0.0350	0.0440	0.0490
Dew { Liebfrauenberg } Maximum	0.4340	0.0785	0.5125
{ Liebfrauenberg } Minimum	0.0714	0.0030	0.0744
Fog { Paris .. .. .	5.6000	7.092	10.3092
{ Liebfrauenberg .. .. .	0.1799	0.0718	0.2508

It thus appears that in Paris the quantity of nitrogenous matter brought down in the rain-water is six times as great as it is in the country (Liebfrauenberg), a result no doubt due to the ammonia evolved during the combustion of fuel and to animal exhalations; and to the same cause may be attributed the excessive quantity of nitrogen found in the fogs of Paris. We also observe that dew is richer in plant-food than rain, which may serve to some extent to explain its remarkably invigorating effect on vegetation.

Again, Lawes, Gilbert, and Warington have lately published in the *Journal of the Royal Agricultural Society\** the following analyses of rain, dew, and hoar-frost collected at Rothamsted, and determined by Dr. Frankland.

Table 11.—Showing the Maximum, Minimum, and Mean Amounts of Certain Constituents in Sixty-nine Samples of Rain-water, collected at Rothamsted, in Paris per million.

	Total Solid Matter.	Carbonic Anhydride.	Organic Matter.	Nitrogen as			
				Ammonia.	Nitrates and Nitrates.	Total Nitrogen.	Chlorine.
Highest proportion ..	85.8	3.79	0.66	1.48	0.44	1.94	16.6
Lowest proportion ..	6.2	0.21	0.03	0.04	0.07	0.13	0.0
Mean, sixty-nine samples	33.1	0.50	0.19	0.37	0.14	0.70	3.1

\* Vol. xviii, ss., part i. † Mean of thirty-four analyses.

Table 111.—Showing the Maximum, Minimum, and Mean Amounts of Certain Constituents in Sixty Samples of Dew and Hoar Frost, Collected at Rothamsted, in Paris per million.

	Total Solid Matter.	Carbonic Anhydride.	Organic Matter.	Nitrogen as			
				Ammonia.	Nitrates and Nitrates.	Total Nitrogen.	Chlorine.
Highest proportion ..	80.0	1.50	1.06	2.31	0.50	4.55	8.0
Lowest proportion ..	26.4	1.95	0.26	1.07	0.28	1.66	3.5
Mean, seven samples ..	48.7	2.64	0.76	1.63	0.40*	2.79	5.3

In the analyses by Boussingault of aqueous deposits collected at Liebfrauenberg we find that dews are twice as rich in nitrogenous compounds as rain-water, while at Rothamsted, from analyses made by Dr. Frankland by improved methods, nearly twenty years later, we find that these small deposits condensed from the lower stratum of the atmosphere contain on an average three or four times the amount of organic carbon, organic nitrogen, ammonia, and nitric acid found in the analyses of rain-water. The total quantity of solid matter and the amount of chlorides is also larger, but the difference is much smaller than in the case of the other ingredients.

It may be asked why snow and hoar-frost should be white? The question is a natural one, but the answer is easily given. If snow had been black it would have rapidly absorbed the sun's rays and been thawed by the first sunshine which fell upon it, the result of which would have been that vegetation, being prematurely deprived of that protection which Nature intended to guard it against the cold, would have died in the frosty air as soon as the sun had set. But the heat-reflecting and non-conducting "white snow" and "hoar-frost" are of the utmost importance as a protection against sudden alterations of heat or cold, for while it is melting its temperature never varies from 32° Fahr., and the plants which are enveloped in it rarely suffer a much lower, and cannot be exposed to a higher temperature. Hence we observe that frosts in spring or in early autumn generally do more damage to vegetation than the prolonged frost and excessive cold of winter, because the sun's rays act quickly upon the unprotected frozen plants, and by a sudden alteration in their warmth induce a change inconsistent with their vitality. Therefore gardeners during the winter season should take as much care to protect their plants from the sun's heat as from the frost's cold. J. J. W., Harpenden, February, 1882.

PLANT PORTRAITS.

BATATAS PANCULATA, *Garden*, December 24.—A very handsome stove twiner, with deeply palmately lobed leaves with narrow segments and pink funnel-shaped flowers of large size and great beauty. Hort. Kew.

BEGONIA DAVIESII (double-flowered), *Floral Mag.*, t. 477.—A fine double red, symmetrically formed flower. Messrs. Laing & Co.

CARNATION CHISWICK RED, *Floral Mag.*, t. 480.—A Clove Pink, with small, very brilliant red flowers of medium size, good form, and very fragrant. Raised at Chiswick.

CHRYSANTHEMUM INODORUM FL.-PLENO, *Gartenflora*, t. 1055.—A reproduction, unacknowledged, of our figure at p. 753, vol. xii.

ONTOGLOSSUM VEXILLARIUM, *Belg. Hort.* t. 14, 1880; *Rehbl. J. Gard. Chron.* 1867, p. 901.—Figured in 1873, p. 644.

ONCIDIUM WELTONI SUPERBUM, *Rev. Hort.* December 1.—A fine variety, with a denser and more compact spike than usual.

OPUNTIA RAFINESQUII, *Garden*, Dec. 3.

PEACH BELLE IMPÉRIALE, *Bull. d'Arboriculture*, December, 1881.—A first-class late Peach of large size, fine colour, and vinous flavour. It originated at Montreuil in the garden of M. Chevalier, but nothing is said as to the character of the glands, size of flower, or nature of stone.

VRISIA SCALARIS, Ed. Mot., *Belg. Hort.* t. 15, 1881.—An epiphytal Bromeliad, with tufted leaves, broad at the base, narrowing into a stalk, and again expanded into an oblong lanceolate serrulate blade. The inflorescence is spiral, pendulous, the flowers remote one from the other, and spreading horizontally, so as to give the appearance of a ladder, hence the name. The individual flowers are long, cylindrical, yellow flowers emerging from scarlet bracts.

\* Mean of four analyses.

## HOME CORRESPONDENCE.

**New Sorts of Potatoes.**—I am anxious to get a complete list of all the kinds of Potatoes offered in commerce for the first time this season in Great Britain. I have already called for your advertising columns and other sources some twenty kinds, but am not sure whether there are not others not yet publicly mentioned. I think it will be found that the present year is the most prolific one of new kinds that has yet been known, and as a "Potatologist" I am very glad of it, because evidence is thus afforded that, so far from public interest in the Potato being on the wane, it is greatly on the increase. I am very hopeful, too, that many of the new kinds are really first-class acquisitions, and will make their mark. Although I am not authorised to say as much, yet it is just possible that the class for kinds of recent introduction in the next schedule of the International Potato Show will, because of the large number of new kinds, and also because these are excluded from specially named classes, be increased to six sorts, and be confined to those sent out for the first time this year. Whether this arrangement be adopted or not at least all exhibitors will be pleased to learn what are the new kinds eligible for the competition. In any case I anticipate in that class a much larger competition than usual, and so highly do I think of many of the new sorts as exhibition kinds that I believe it will be easy to get from them half-a-dozen sorts that should hold their own in any competition. Any information from raisers of the trade would be thankfully received. *Alex. Dean, Bedford, Hounslow, W.*

**Peziza coccinea.**—This beautiful little fungus will keep its colour and last for months in a London drawing-room, if placed under a glass shade and kept moist. I gave some to a friend a few years ago, together with some of the Hampshire children call "The feather-moss," and was astonished to see all looking bright and fresh in Miss B.—'s room full three months afterwards, when I went up to London to stay with her. She had placed moss and fungi in a shallow dish on a little mould, and covered them with a glass shade. *Helen E. Watney, Liss.*

**Pulmonarias.**—The charming *Pulmonaria saccharata grandiflora* alluded to at p. 226, has been in bloom here in the open ground for the past fortnight, and well ranks amongst the hardest of hardy plants. Very singular indeed is the change of hue which takes place in its blossoms, for they are both bright red and bright blue on the same bunch, indeed I can liken them to nothing so much as red and blue Pimpernels, so pretty are they and yet so strangely contrasting. This *Pulmonaria* is too robust for rockwork except where it has ample leaf space and room for, for the roots will strike deep and wide. It makes a fine clump in a mixed border, specially where during the summer and autumn months its large and finely marbled foliage can fully display itself. Oh hardly particulars I think this has the handsomest foliage. It is but one of many hardy plants seldom met with in gardens, and is, as too many hardy plants are, but little known. The peculiar floral passions of the age, in spite of what has been done to set them in a right direction, do not yet favour the growth of hardy plants. Five guineas is perhaps more often paid for a fashionable Orchid than for a hundred beautiful hardy plants; still worse, gardeners give them too little attention. Probably most of them understand more of all other departments than they do of hardy plants. *A. D.*

**Confers Attacked by Fungus.**—Our *Thuya*—especially *Thuya aurea* and *elaeagnifolia*—have for some time been covered with a parasite which rapidly proves fatal to them. I enclose you a sample of it, and shall feel much obliged if you will tell us its name, the reason of its appearance, if you are able, and also by what means we can most effectually rid ourselves from it, and prevent its visits in future. *C. K. W.* [The name of the fungus blackening and destroying our correspondent's *Thuyas* is *Capnodium australe*, a close ally of *C. Footii*, so frequently sent to us on Ivy, Laurels, and other evergreens. In some instances, but not in the present, this destructive fungus is associated with scale insects. *W. G. Smith.*]

**The Cyclamen.**—The treatment required by this useful plant has often been explained, but as there are comparatively few private places where convenience exists for giving it exactly the treatment usually recommended, a short account of the system which I have been fairly successful may be useful to some. The seed is sown in spring, not earlier than

March; the pan is placed in the stove until the plants are up, then removed to a vinery where the fruit is swelling. As soon as the corns are about the size of a Pea, they are pricked out about 2 inches apart in other pans, and when established removed to the greenhouse for a short time, and about the beginning of June to a cold frame. The frame occupies a sunny position, but is shaded from bright sunshine with tiffany; plenty of air is given throughout the day, but the plants are damped overhead and the frame closed early in the afternoon of bright days. Before the plants become overcrowded they are potted singly in 3-inch pots, the soil used fibrous loam, a little leaf-mould, rotten manure, and sharp sand. Though an advocate of firm potting for most things, I find that the Cyclamen and many other plants with thick roots require to be potted only moderately firm. During the month of August the lights are drawn off at night, to give the plants the benefit of the heavy dews; and in September they are kept off day and night. The plants are removed to a spaa-roof greenhouse about the beginning of October; this house contains a mixed collection of plants, so cannot be kept very warm; but the Cyclamens are placed at the warmest end, and in dull damp weather the pipes are just warmed every day, and the top ventilators opened a little. At the present time (February 18) the plants from seed sown last March have corns an inch or more in diameter, and bearing from twenty to thirty flowers; they will be potted in 5-inch pots in a week or two, and remain in the greenhouse until the beginning of June, when they will be put in a frame and treated the same as last season. The full exposure in September is important in preparing the plants for wintering in a rather low temperature, and is also conducive to a free blooming disposition. In this year the plants in the conservatory in good condition the first week in January, a little earlier than usual, owing most likely to the unusually large amount of sunshine in the early part of the winter. After flowering the plants are put in a cold frame, and about the end of April stood outdoors in a shady place; they are never allowed to become very dry at the root. Early in June they are turned out, the balls reduced, potted in 7-inch pots, and put in a frame to grow on, all the stocks of different sizes being under the same treatment at this time. The beginning of June is earlier than often advised for potting old plants; but under cool treatment it is necessary, in order to have growth completed and flower-buds showing before cold winter sets in. *W. Crane, Quarterton Park, Co. Cork.*

**Tecophilæa cyanocrocus and Leichthlini.**—Like my friend Mr. Harpur-Crewe, I also got three bulbs of the above-named most lovely of blue-flowered spring-flowering bulbs in the course of last autumn from Herr Max Leichthlin, of Baden (one of the deep blue type and two of the turquoise variety) and while we were talking to the conservatory in good bloom in a pot in my greenhouse, and are the admiration of every one who sees them; alongside of their large and more exquisitely coloured flowers the pretty little *Chionodoxa Lucillie* must hide its diminished head. When these bulbs came to me from Baden I was warned by Herr Leichthlin that being perfectly hardy (and having withstood a frost of 5° below zero in his garden in the open air without any protection and without sheltering in any way) they would be grown without any attempt to coddle or force them in order to flower them successfully; I therefore plunged the pot in which I had planted them in a narrow border close to a low garden wall on the south side, where they remained the whole winter and till the plants were an inch above-ground, when, finding the slugs beginning to pay them attention, I lifted the pot into the greenhouse, where the blooms expanded early in this month. Each bulb made two stems, and the stem blue form (or type) has the largest and the lighter blue variety a great one. They seem, however, to vary considerably both in size and substance of flower and in depth of colouring, as Mr. Crewe describes his flower in your last issue as with a distinct white throat, whereas mine is of the deepest gentian blue with only the faintest white lining towards centre; and in the paler variety the flowers of one of my bulbs is much thinner and less perfect than the other, and would be almost more correctly described as a white flower with pale blue tips to the petals, whereas the other bulb is distinctly blue flower with pure white throat. Herr Leichthlin says the flowers of his variety should be nearly twice the size of those of the type when the plant is grown altogether in the open air, but with me they are both about the same size. *W. E. Gumbleton.*

**Mice in Gardens.**—At different times, for some years past, these destructive animals have done much mischief in the garden here. We have five kinds, each one doing his share of mischief at different seasons, and in various ways. They are the house or barn mouse, the long-tailed field mouse, the short-tailed, called here the badger-mouse; the small black

mouse with long nose, which is not so troublesome as the former kinds; and last, but not least, the sleeper, or dormouse, which only comes in the summer season—but the mischief he does in a few hours is almost incredible, either among nuts or wall fruit, such as Apple-trees, Peas, Plums, Cherries, &c. As he works by daylight, a careful watch will trace out his path in the tree, when a small iron trap, called here clams, baited with a nut, will soon tempt him to his destruction. The two first are very fond of the seeds of Peas, Beans, Radishes, and all the Brassica tribe, after sowing. Both the long and short tail kinds are very destructive to young Cauliflowers, Lettuce, Endive, and Finks, in cold frames. This season they have barked the stems of Broccoli, some being eaten through the crown; others have the young leaves eaten out at the heart. In summer they visit the Peas when fit to gather and young Potatoes in the ground. One season, the ground being covered deeply with snow, they burrowed under the Seakale and Rhubarb pots, eating out the crowns and damaging the crop to a great extent. I always use the same trap and bait as mentioned before, and catch a great many. I have no doubt those who are troubled with these pests can do the same. The traps can be had at any ironmonger's at a cheap rate. I also use the same trap and bait for small birds in the seed-beds, &c. The "Perpetual Mouse-trap," mentioned at p. 229, is very good for the common mouse, but those that feed on herbage are not so easily tempted to enter in. *Wm. Divers, Wierton House, Maidstone, Feb. 20.*

**Protecting the Blossoms of Fruit Trees.**—Now that the time for taking action in the matter of protecting the blossoms of our choice fruit trees from the effects of frost, with a view to securing crops of fruit therefrom, is near at hand, a word or two respecting the next best material to glass for this purpose may be acceptable to those of your readers who may now, with this object in view, be contemplating the protecting of their fruit trees, but find it difficult to decide upon the best material with which to protect them. To those I wish to say, old and new, having lately called on Mr. Portlough, of Cornwall, the desired quantity of their No. 5 Web Hexagon Cotton Shading; it is made in three widths—54, 72, and 100 inches respectively—to suit walls varying in height, and is sold at 1s. 3d., 1s. 6d., and 2s. 6d. per running yard. The nature and make of this material render it more durable, elastic, and better adapted to serve the purpose for which it has been specially manufactured than any other material that has been had in use here or noticed elsewhere for a similar purpose, and for these reasons I think it is worthy of being noticed in the *Gardener's Chronicle*. *H. W. Ward.*

**Ants in the Peach-house.**—One day last week I was surprised to see that several of the Peach bushes, in one of the houses here, were without pistils, and found on investigation that the ants had eaten off the pistils just above the ovary as described by Mr. Horace Woods. We have been diligently pursuing a war of extermination against the ants for some time, by placing treacle in the vicinity of their haunts to attract them—round which they gather in hundreds—then scalding them with hot water. By this means we have succeeded in diminishing their numbers considerably. *J. Riddell, Wentworth, Kotherham.*  
—When visiting Manresa Gardens, Kochampton, in February last year, Mr. Davis drew my attention to several Peach-blossoms, the pistils of which had been destroyed by ants. A narrow strip of canvas was tied around the stems of each tree, near the ground, and painted occasionally, which had the effect of keeping the ants off. *S. P., Oldemsford.*

**Potato Beauty of Hebron.**—I am pleased to see this Potato is to some extent gaining favour amongst growers. I think, when its merits become more generally known, it will receive a corresponding share of patronage both for the garden as well as field culture. In my opinion it is one of the best—if not the best—of all the American introductions. No one, I think, can deny its extraordinary productiveness, and very few, I venture to say, can dispute its excellent cooking properties. Another great feature in its favour is, being a moderate early variety, it is less liable to the attack of the disease. The fact of its frequent appearance on the exhibition table also bears sufficient testimony to its adaptability for this purpose. My advice, therefore, to all intending planters is, to plant the Beauty of Hebron largely, and not in limited quantities, as decided upon by "A. L. H." (see p. 228). The result will, I feel confident, give every satisfaction. *E. Morgan, The Butts, Harrow-on-the-Hill.*

**Storing Ice Above-ground in Sawdust &c. Sawdust Pits.**—The antiquity of the plan of storing ice above-ground in sawdust is of little consequence, seeing that the system, when properly carried out, is so thoroughly successful; but as I have been the means of bringing the subject under the notice of

your readers in January, 1876, and again in your issue of the 4th inst., I would like to be allowed to remove the obstacle—the only and not very formidable one—that Mr. Melville, at p. 229, attempts to place in the way of the system being generally practised—a system which, as it becomes better known, will supersede every other mode of preserving ice; even the sawdust and wooded wall pits will have to give way to it, seeing that the same object for which it was deemed necessary to expend £25 in the making of the latter to secure is achieved by resorting to the “above-ground system” without the spending of a single penny in that direction. And this fact must not be lost sight of, inasmuch as it is, together with the extra labour incurred in getting the ice out of the pit, the only difference between the two systems, both of which answer their primary purpose equally well.

Respecting the obstacle in the way of the valley (referred to at p. 154 of your current volume), and of which Mr. Melville, writing from the lofty slopes of Dunrobin, is uneasy on the score of there not being always one at hand, a circumstance to the writer unknown to exist in the demesnes of establishments requiring a supply of ice the year through. It certainly does not exist at Dunrobin, for Mr. Melville tells us in your number for January 14, p. 45, that “the site selected for the pit was near the kitchen and larders, in the wood near the Castle, partially shaded, and with a northern exposure, while a rise of the ground to one side admitted of earth being brought above the level of the pit, so as to tip the ice down a shoot directly into it, while a hollow near by secured an outlet for a drain at any depth necessary.” Thus it will be seen that the situation selected for the formation of the “sawdust-pit” was admirably adapted for an “ice-stack,” or a rick, the latter being quite as suitable as the former—and, indeed, preferable, inasmuch as it obviates the question of insufficient slope arising to obstruct the system coming into general practice. Moreover, the rick, as a matter of course, should be made sufficiently long to compensate for loss sustained through deficiency of height. In conclusion, I beg to assure those of your readers who may feel disposed to give the “above-ground system”—a system which has everything to commend itself to general use—a trial, that by faithfully following the instructions given in the *Gardeners' Chronicle* for February 4 (p. 154) of the present volume respecting the process of preserving ice in sawdust above-ground as practised here success will be attained. I would further add that there is a right and a wrong way of doing everything, and it would appear that “storing ice above-ground” is no exception to the rule, for Mr. Melville tells us of his having heard of it succeeding in one place and utterly failing in another—a circumstance which fully demonstrates the fact of the procedure in the latter case being at fault, and that *mutatis mutandis* in the *modus operandi*, consequent upon the subject being discussed in the pages of this journal, better results may be looked for in the future. *H. W. Ward, Longford Castle, Wilts.*

## Florists' Flowers.

**CYCLAMENS AT TWICKENHAM.**—The superb lots of Cyclamens shown both at South Kensington and elsewhere by Mr. Clarke, of Twickenham, during the present winter have plainly shown that just now that grower occupies a leading position as a cultivator of this beautiful winter flower. It would seem, after all, that there must be either some special skill required for the successful cultivation of the Cyclamen, or else that there is particular virtue in particular places, for not only are the growers of this flower for market limited in number, but all, or nearly all, reside on the west side of London. Although just now Mr. Clarke doubtless has first place as a Cyclamen grower, it is as certain that but a year or two since his plants did not excel those grown by Mr. H. B. Smith, of Ealing, and who has yet a fine strain, especially of pure whites. Mr. Pestrige, of Brentford, and Mr. Walker, of Whittton, are both well known and large growers of “Sykes,” as they are best known in market phraseology, and these, we believe, are the chief market men who devote themselves specially to their culture. All of these, it will thus be seen, are West Middlesex men, so that we may be pardoned for assuming that there is something in the air of that district which favours the Cyclamen.

The extraordinary voracity of the London plant market is well shown in connection with the Cyclamen, for it annually swallows up tens of thousands; indeed, Mr. Clarke, who is certainly a large grower, annually disposes of some 20,000 in one way or another—an enormous quantity, certainly, to go out from one establishment. In spite of this large trade Mr. Clarke's nursery is of a very modest kind, for it is enclosed with high walls, and invites no public attention; indeed, market growing establishments seldom invite visitors, neither are they wanted—they are literally plant manufactories for the retail trade, and have no other show-rooms than are to be found in the London flower-market. The houses and pits in which the bulk of the plants are grown are far from being modern; in fact, in years past have been devoted to the growth of Vines and Pines, but have now been converted to their present uses by the introduction of stages lifting the plants up near to the glass, where they get plenty of light and air. The only modern house—a lean-to of some 125 feet in length, having in front a broad stage, and behind a stage in rising tiers—is the show-house, if such a term is applicable, for here are seen all the plants selected for seed stocks, and a grand lot they are. The front stage is occupied almost throughout with splendid plants in 24's or 7-inch pots in grand bloom—indeed, there must be many hundreds of them. These are all robust seedlings blooming for the first time from a sowing in August, 1880, and would astonish novices in the art of Cyclamen culture. The enormous quantity of bloom produced on a single plant is quite remarkable. Many that have been in bloom since November, and have even now perhaps fifty to sixty blooms open, are yet almost a mass of flower-buds, and will in a cool-house continue to bloom till well into May; so that strong plants of the Cyclamen will do what few other plants will do—bloom continuously for six months, and those from November to May. The great bulk of the market plants are in 48's, the regulation size, but the larger plants are only sold to special orders.

Seed is usually sown early in August, in 6-inch pots, about fifty seeds in a pot. These pots are stood on stages in the pits that keep them within 6 inches of the glass, but no artificial heat is needed to promote germination. On warm sunny days a little shading is given. Seedlings, when strong enough, are pricked up into other 6-inch pots in dozens, and from these are later on transferred into small 60's, then again into 48's, and the most robust and promising into 32's, and finally into 24's. Very gradual shifts are found best, as the roots sooner reach the sides of the pot. Large shifts would perhaps result in sodden soil, and then root-rot.

The most suitable compost for the Cyclamen is found to be two-thirds of sweet fibry loam, and the rest of well-decayed leaf-soil made from clean park leaves. Plants sown for seed, however, do not depend alone upon their seed-crop for profit, as the blooms are pulled and bunched in dozens for market, and their fine quality invariably brings a good price. Plants of the new Giganteum compactum strain have blooms of great size; a sample bloom had petals 2 inches in depth and 4 inch across, the plants full of bloom, and the habit all that can be desired. Although this habit runs through the whole stock of the Giganteum compactum strain has mostly white blooms with a deep purplish or crimson base; the rubrum flowers, deep mauve, are of similar size. There are pure whites of fine form and substance, and one form, known as Delicata, pure white with a delicate-tinted base, is a charming kind. The rose tints are singularly bright and cheerful. These vary more or less in shading, but all are very beautiful. A grand kind indeed is Crimson Gem, the colour deep red, a very fine colour, and flowers produced in marvellous abundance. This is one of the best deep-coloured forms we have seen. Brilliant, an older form, has smaller and deeper-coloured blooms, but they are small. The best purple, perhaps, seen, unlike the general run of this colour, has bloom of a very fast hue, the colour deepening with age to violet. This hue is not, however, favoured amongst market growers, and therefore it is not largely perpetuated; whites, roses, and rich reds are the favourite colours.

With a general clearance of the Cyclamens room is made for Strawberry plants in 24's, all just now housed for the winter in frames. None are forced early, but just soon enough to lead up to the incoming of the outdoor crop, the plants to produce which are all pot plants turned out and standing two years only. Mr. Clarke's Strawberries are of the finest that go to the London market.

**NAMED CINERARIAS.**—It is pleasant to see that some of these still find a place in catalogues, some of them, of the best quality, illustrating to a great extent the presence of the high qualities of form, colour, and arrangement that were so strongly insisted on twenty years ago. We are just now in great danger of being

encumbered with a race of large-flowered Cinerarias, in which size is the most striking feature, but in which symmetry, substance, and finish are to a large extent absent. There is any amount of floral ugliness, and we see large, staring white-ground flowers, with pale and grey discs, that would not have been tolerated years ago. The toil the last generation of florists underwent, and the patience with which they worked to secure—and did succeed in securing—certain desired ends, appear to be in danger of being forgotten in the desire to have something of what is termed decorative value. Mr. Shipleigh Hibberd has recently been laying down the principle that mere novelty in plants and flowers should be subordinated to merit, and in stating this much he is in harmony with the floral teaching of our forefathers. It is time some one made a new departure with Cinerarias, harking back to the old lines, and gradually working up to a high ideal. For a time his efforts may be frowned upon or misunderstood, but the day will surely come when his work will be appreciated, and his labours rewarded. We have had enough of large staring Cinerarias with pointed petals and clouded colours; it is time they made way for something better, possessing the refinement that lends such a charm to other qualities. The opportunity offers now—where is the man to avail himself of it? *R. D.*

**HARDY CLEMATISES.**—These, which are always early in starting into growth, have been most active all through the winter; indeed, almost as soon as last year's leaves began to decay the buds out of which have to come the spring shoots were plumping up. In the case of strong established plants it will always be noticed that growth is put forth at the points of the ripened wood farthest from the roots. It is best, on the whole, not to cut this away in the autumn or winter, but to leave it till February before the cutting back process is attempted. In the case of Clematises grown in beds it is sometimes necessary, in the interests of tidiness, to cut back earlier, but we are stating a generally acceptable rule. Our plan is to cut back almost to the ground, then to draw the soil away from the roots, add a good dressing of manure, and return the soil to the surface. In a short time the plants break into a vigorous growth, and if it is desired to cover a given space the young shoots should be trained in position or they will become interlocked with each other, and the growth is concentrated instead of being distributed. As a matter of course the foregoing remarks apply to what is known as the strong summer flowering varieties of the Jackmann type. Of these the following can be highly recommended:—Alexandra, pale reddish-violet; Jackmann, deep violet-purple; Rubella, velvety claret-purple; rubro violacea, maroon shaded violet; Star of India, reddish-violet purple; The Shah, deep lavender, changing to lilac, and turgidness, deep bluish-purple. The best white flowered variety to add to these would be *lanuginosa nivea*; and the best pale blue, *Lady Bovill*.

## The Apiary.

YOUR correspondent, “Busy Bee,” says, “With such a winter as is the present one there should be a good honey harvest.” May I ask the reason why? Having quite recently received a letter from a gentleman who has kept bees for a quarter of a century and is considered as an authority, in which he writes thus:—“Bees will be in a bad way shortly—mind that.” In the *Bee Journal* for February it is thus written:—“And within the beehive a forward state of things that cannot be considered wholesome or safe.”

“Or the chill blast from Eurus' mildew wing,  
Blight the fair promise of returning spring;  
Full many a hive, but late alert and gay,  
Droops in the lap of all-inspiring May.”

*North Norfolk.*

**BRITISH BEE-KEEPERS ASSOCIATION.**—The annual general meeting of the members was held in the board-room of the Royal Society for the Prevention of Cruelty to Animals, on Wednesday, 15th inst. There was a large attendance of members, including several ladies. The chair was taken by the Baroness Burdett-Coutts, the President of the Association, in the absence of the Rev. H. R. Peel, the Honorary Secretary. The report for the past year was read by Mr. T. W. Cowan, the chairman of the

committee. The report gave an excellent résumé of the Association's work during the past year, from which we learn that the subject of bee-keeping is being now much more extensively supported by many of the leading agricultural and horticultural societies than in former years. The Royal Agricultural and Royal Horticultural Societies of England have, for the last three or four years, given valuable assistance, pecuniary and otherwise, for the promotion of this art, and their example is becoming generally followed by the leading county societies. It was resolved to set apart the sum of £30, to be expended during the current year in assisting in the development of county bee-keepers' associations by means of lectures. A special committee was adopted for the purpose of carrying out a resolution for the adoption of a standard frame for general use throughout the United Kingdom. Prior to the above meeting a meeting of the acting committee was held at the Langham Hotel, at which the scheme proposed by the Hon. and Rev. H. D. Light for the promotion of cottage apiaries was finally agreed upon. Prizes of the value of £21 will be offered, and the competition will be confined to the county of Middlesex and those counties where county bee-keepers' associations are already established. Every information relating to this competition and other matters connected with the Association may be obtained of the Honorary Secretary, Rev. H. R. Peel, Thornton Hall, Stony Stratford, Bucks.

TRADE MEMORANDUM.

We learn from a note to hand from Mr. A. Knight that his present address is Finchfield, Wolverhampton.

The Poultry Yard.

WINTER LAYERS.—The old lady who said she could not understand how it was that always when eggs fetched a good price her hens would not lay, stumbled in a rough way upon a great fact. If hens would lay as well from autumn to spring as they do from spring to autumn, we should have eggs in plenty, but as they do not, of course it is the few who are blessed with winter layers who not only have eggs in a time of scarcity, but get a good return for them. Naturally the question is asked, How is it that some have winter laying hens and the many others have hens and pullets too that will not lay at that season. I can find the reason only in breed, and the great thing to know is which are the best winter laying breeds. I have some fifteen or so of early pullets—fine birds of several breeds, or rather mixtures—but out of the number two specially have proved to be the most remarkable winter layers I have ever met with, as they began in the middle of November, and have been laying ever since almost without cessation. I do not know the exact breed, as the eggs came with others in a sitting, but the birds are white, have large single combs, and are of good medium size. If they are white Dorkings they are small, but they are larger than Leghorns, and also have white legs. As my Tom is a game bird, of course I cannot preserve the breed pure. With reference to Toms and their wives, I should like to add that with a fine two-year-old Dorking Tom and sixteen hens last summer I never found one egg that was unfertile. D. B.

Obituary.

We regret to record the death, at Oakley, near Bedford, on the 13th inst., of Mr. ALEXANDER MCKAY, aged seventy-one. Mr. McKay was born at Fochabers, Banff, in 1810, and served his apprenticeship at Gordon Castle. From there he moved to Woburn Abbey, Beds, where for seven years he took charge of the forcing department, the late Mr. John Caie, of Inverness, being foreman of the plant department at the same time. An opening occurring at Endsleigh, near Tavistock, Mr. McKay was appointed by Georgiana Duchess of Bedford to fill it, and much of its present beauty is attributable to his well directed judgment and good taste. On the death of Mr. Forbes, in 1861, Mr. McKay went back to Woburn Abbey, which situation he continued to hold until the autumn of 1870, when he retired to Oakley, where, after a lingering illness, he died, having served four Dukes of Bedford over fifty years.

— Died suddenly, on the 15th inst., at Spring Valley, Morningside, Edinburgh, Mr. DANIEL MACKENZIE, aged seventy-three years. For forty-six years Mr. Mackenzie was the much respected representative of Peter Lawson & Son, and the Lawson Seed and Nursery Company (Limited).

— We have also heard of the death, recently, of Mr. FANCOURT, formerly nursery foreman to Messrs. J. Cutbush & Sons, Barnet, and to Messrs. Osborn & Sons, Fulham.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 22, 1882.

- Feb. 16.—A fine bright morning, dull afternoon, but fine. A dull cloudy night.
- 17.—A dull cloudy morning, fine, bright after. Fine night but cloudy.
- 18.—A fine fresh day. Strong wind. Fine night.
- 19.—A fine bright day, blue sky, cold wind. Fine clear night.
- 20.—A dull misty morning, day overcast. A fine clear night.
- 21.—A dull day, but fine. Fine clear night.
- 22.—A fine day, cloudy but fine night.

ERRATA.—In last week's report for 29.50 mean barometer reading, Feb. 15, read 29.74; and for -0.31 departure from average, Feb. 15, read -0.07.

LONDON: Atmospheric Pressure.—During the week ending February 18, the reading of the barometer at the level of the sea increased from 29.83 inches at the beginning of the week to 30.14 inches by midnight on the 12th, decreased to 30 inches by 3 P.M. on the 13th, increased to 30.26 inches by 3 P.M. on the 14th, decreased to 29.79 inches by 9 A.M. on the 15th, increased to 30.43 inches by 9 A.M. on the 16th, decreased to 30.25 inches by midnight of the same day, increased to 30.36 inches by midnight on the 17th, and was 30.30 inches at the end of the week.

The mean reading for the week at the level of the sea was 30.12 inches, being 0.23 inch lower than last week, and 0.13 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 54.5, on the 14th. On the 16th the highest temperature in the day was 48°. The mean of the seven high day temperatures was 51.4.

The lowest temperature in the week was 32°, on the 16th; on the 14th the lowest temperature was 46°. The mean of the seven lowest temperatures was 40.6.

The greatest range of temperature in one day was 16°, on the 16th; the smallest was 6°, on the 17th. The mean of the seven daily ranges was 10° S.

The mean temperatures were on February 12, 47.3; on the 13th, 47; on the 14th, 50.5; on the 15th, 41.8; on the 16th, 41.3; on the 17th, 47.4; on the 18th, 46.2. And these were all above their averages by 8.4, 8.1, 11.7, 3.1, 2.6, 8.7 and 7.4 respectively.

The mean temperature of the air for the week was 45.9, being 8.1 higher than last week, and 7.1 higher than the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 110°, on the 12th; the highest on the 13th was 53°. The mean of the seven readings was 83.6.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 30°, on the 16th. The mean of the seven readings was 36.2.

Rain.—Rain fell on two days to the amount of 0.54 inch, of which 0.38 inch fell on the 15th.

ENGLAND: Temperature.—During the week ending February 18 the highest temperatures were 62° at Sunderland and 59° at Truro. The highest temperature at Brighton was 51.6, at Bradford 53.6, and at Wolverhampton 53.8. The general mean was 55.4.

The lowest temperatures in the week were 29° at Hull and Wolverhampton, and 29.1 at Nottingham. The lowest temperature at Liverpool was 37.3, at Truro 36°, and at Bradford 34.9. The general mean was 32.6.

The greatest ranges of temperature in the week were 29° at Sunderland, 25.7 at Nottingham, 25° at Hull. The least ranges were 18.7° at Liverpool and Bradford, and 19.6° at Brighton. The general mean was 22.8.

The mean of the seven high day temperatures was highest at Sunderland, 55.4, at Truro 53.7, at Plymouth and Cambridge 52.1, and was lowest at Wolverhampton 48.4, at Bradford 49°, and at Brighton 49.6. The general mean was 51.1.

The mean of the seven low night temperatures was highest at Truro, 42.3, at Liverpool 41.9, and at Plymouth 41.1; and was lowest at Hull, 35.2, at Wolverhampton 36.6, and at Nottingham 38.3. The general mean was 39.7.

The mean daily range was greatest at Sunderland, 15.8, at Hull 15.4, and at Leicester 13; and was lowest at Bradford, 8.6; at Bristol and Liverpool, 8.8. The general mean was 11.4.

The mean temperature for the week was highest at Truro, 47.6, at Sunderland 47.1, and at Plymouth 46.2; and was lowest at Wolverhampton, 42.1, at Hull 42.6, and at Nottingham 44°. The general mean was 45.1.

Rain.—The largest falls were 0.98 inch at Truro, 0.93 inch at Leicester, and 0.92 inch at Cambridge. The least falls were 0.03 inch at Sunderland, and 0.06 inch at Leeds, and 0.22 inch at Hull. The general mean was 0.51 inch.

SCOTLAND: Temperature.—During the week ending February 18 the highest temperature was 56°, at Glasgow; at Greenock the highest temperature was 52.2. The general mean was 53.6.

The lowest temperature in the week was 28.4, at Aberdeen; at Leith the lowest temperature was 33°. The general mean was 31.7.

The mean temperature for the week was highest at Leith, 44.9; and lowest at Aberdeen, 42.1. The general mean was 43.4.

Rain.—The largest falls were 3.35 inch at Greenock, and 2.53 inch at Paisley; the smallest fall was 0.12 inch at Aberdeen. The general average fall was 1.55 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

- He that questioneth much shall learn much.—Bacon.
- CHERRY TREES GUMMING.—I have two acres of Cherry trees, which have been planted six years, and I lose annually from twenty to thirty trees from gumming. Can any of your readers suggest the probable cause, or give me a remedy? *Market Gardener, Darlington.*
- DUNCAN STRAWBERRY.—Will "Philomelos" please tell me where I can get the early variety recommended by him under this name? I cannot find it in any catalogue that I possess. *W. Clark, Staindrop, Darlington.*
- HOW TO DISSOLVE BONES.—What is the best method of dissolving bones, about 4 or 5 cwt. at a time? *Netherlon.*
- LOGWOOD CHARCOAL.—I send you a sample of refuse from burnt logwood, which I am assured is free from chemicals. Has it any value for horticultural purposes? *J. H. Cheadle.* [Suggesting it be what it appears to be, pure charcoal, there is no reason why you should not use it the same as any other charcoal. Ed.]

Answers to Correspondents.

- BLOOD MANURE: *Constant Reader.*—The best way of using blood as a manure is by mixing it with earthy or vegetable matter in the form of a compost, with which you may top-dress your Vine-border. It is of no good in a liquid form.
- BOOKS: *J. A., Manchester.* Thompson's *Gardeners' Assistants*, published by Blackie & Co.
- ERRATA.—M. p. 228, col. 2, line 8, for "summer-like" read "summerless" and in line 29, for "mats" read "walls".
- FUNGUS: *J. L., Langford.* The plants sent are examples of the true Mushroom—*Agaricus campestris*. *W. G. S.*
- HELLEBORE POWDER: *C. Gentry.* The powder is prepared from the Christmas Rose (*H. niger*), and we cannot account for its failure in the cases you mention. We should not, however, mix the powder with water, but dust the trees with it when they are damp.

NAMES OF FRUITS: *J. Lane*. We do not recognise any of them.

NAMES OF PLANTS: *J. W.* 1. *Epiobrythia japonica*; 2. *Physalis peruviana*; 3. *Polyala oppositifolia*. Send better specimens another time.—*M. N.* 1. *Adiantum tenacum*; 2. *A. decurium*; 3. *A. gracillimum*; 4. *Chelidonium hirta*; 5. *Polypodium neriofilium*; 6. *Salicigna Mertensii*—*M. A.* 1. *Zygopetalum crinitum*; 2. no flower; 3. *Epidendrum ciliare*; 4. *Asplenium viviparum*; 5. *Asplenium Belangeri*; 6. *Polypodium leycopodioides*.—*G. J. W.* Your specimens, very poor ones, arrived smashed. Send better ones, packed in a little damp moss.—*E. W. F.* *Colibrium*. 1. *Erica carnea*, a small, well-known variety of the common Cherry Laurel, sometimes, but very erroneously, called *Hartogia capensis*; 3. probably *Rhododendron hirsutum variegatum*—delightfully fragrant.

SAND WASTES OF SOUTH AFRICA: *H. B.* The experiment was suggested in the book you refer to, and, indeed, has been carried out to some extent in various parts of the colony.

STOVE CLIMBERS: *A. O. W.* *Plumbago rosea*, and *Euphorbia jacquiniiflora*, both of semi-annual growth, would do well on the back wall of a Cucumber house. The former is not so lasting as the latter in a cut state. Neither of them would be found to grow too strongly. *Jasminum Sambac*, fl.-pl., is a good winter-flowering climber, with sweet-scented flowers. *J. gracillimum*, of comparatively recent introduction, is also very floriferous and deliciously scented. Either of these should also do well in such a situation, but both of them would want to be watched closely for mealy-bug and white scale. No quarter, however, should be given these insects, especially in a well managed Cucumber-house, the temperature of which is at all times favourable to their rapid increase. The *Bomarea*s would not be found to do well in such a position; they require more sunlight, less atmospheric moisture, and a somewhat lower temperature, also liberal root-room.

VALU OF ORCHIDS: *A. R. L.* Your best plan would be to show them to some nurseryman. It is quite impossible for us to value your plants.

WEEDS: *Inquirer*. Arsenic is one of the very best weed destroyers, but of course requires to be used with extreme care. Boil 1 lb. in a gallon of water for half an hour, then add from 4 to 5 gals. of cold water, and pour it on the walks carefully. One dressing a-year is sufficient.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

SEEDS.

LONDON: Feb. 22.—Messrs. John Shaw & Sons, of 37, Mark Lane, E.C., report that there is a good steady consumptive business now passing in farm seeds. The spot supply of Canadian Clover seed being reduced to narrow compass, rather higher prices are now asked for same. Shipments from America continue on a moderate scale. Trefoil is noted £1 to £2 per ton dearer. For Alsike and white full prices are obtainable. More money is asked for perennial Ryegrasses. Imported Italian keeps steady. Sainfoin is exceedingly scarce. Spring Tares sell freely at full rates. The sale for bird seed is slow.

CORN.

At Mark Lane on Monday the supplies of English Wheat were light, but sales were only practicable at 1s. under Monday se night. Foreign ruled 1s. per quarter lower on good qualities, and 1s. to 2s. on inferior. Flour was dull, with a drooping tendency. Fine Barley was firm; secondary and grinding qualities quiet and unchanged. Beans and Peas were unaltered, with a quiet sale. Oats were rather dearer than on the Monday previous.—On Wednesday the business in Wheat was quiet of retail extent, leaving quotations unaltered. Flour remained dull. Grinding Barley, whilst quiet, was steady in value. Oats were firm on the spot, but the market was very quiet. Maize remained unchanged in value, with very little doing in any position.—Average prices of corn for the week ending February 18:—Wheat, 45s.; Barley, 31s. 10d.; Oats, 21s. 4d. For the corresponding period last year:—Wheat, 41s. 8d.; Barley, 32s. 1d.; Oats, 20s. 7d.

CATTLE.

At Copenhagen Fields on Monday prices for beasts ruled at fully late values to occasionally 2d. dearer. Among the sheep supplies were some good clipped wethers, which sold readily at 6s. 4d. to 6s. 6d., in some cases even rather over. The calf trade was dull, with prices lower. Pigs were a slow sale. Quotations:—Beasts, 4s. 4d. to 4s. 10d., and 5s. to 6s.; calves, 5s. to 6s. 4d.; sheep, 5s. 6d. to 6s. 4d., and 6s. 10d. to 7s. 6d.; pigs, 4s. to 4s. 10d.—On Thursday trade was dull, and prices were only saleable at a decline over 2d. per 8 lbs. Prime sheep were steady in value, but other breeds flat. Calves were scarce and dear.

POTATOS.

The Borough and Spitalfields markets reports state that supplies are ample and trade slow. Quotations:—Kent Regents, 80s. to 100s.; Champions, 60s. to 70s.; Essex Regents, 80s.; Champions, 50s.; Victorias, 100s. to 120s.; Blukes, 120s. to 130s. per ton.—The imports into London last week consisted of 127 tons from Roscoff, 136 tons Barleir, 2900 bags Hamburg, and 100 tons from Boulogne.

COALS.

The following are the prices current at market during the week:—Ravensworth West Hartley, 13s. 6d.; Bell-side West Hartley, 13s. 6d.; Walls End—Hawthorns, 14s. 3d.; Lambton, 15s.; Original Hartlepool, 15s. 6d.; Wear, 14s.; South Hetton, 15s. 5d.; Thornley, 14s. 9d.; Tees, 15s. 3d.; Hetton, 15s. 9d.; Hetton Lyons, 14s.

Government Stock.—Consols closed on Monday at 100 to 100½ for delivery, and 100½ to 100½ for the account. Tuesday's figures were respectively 100 to 100½, and 100½ to 100½. The final quotations on Wednesday were, for delivery, 99½ to 100, and 100 to 100½ for the account. Thursday's closing figures were 100 to 100½ for delivery, and 100½ to 100½ for the account.

**4000 Grape Vines.** THE LIVERPOOL HORTICULTURAL COMPANY (John Cowan), Limited, the Vineyard and Nurseries, Garston, near Liverpool, have a splendid stock of VINES grown from eyes this year, suitable for present planting. CATALOGUES free. Trade supplied.

**THE EARLIEST WRINKLED PEA.**

**AMERICAN WONDER.**

This valuable new early dwarf Wrinkled Pea was introduced by us last season. It is as early as our Kingleader, which is still the forwardest Round White Pea. The haulm is thickly covered with fine pods, each containing from seven to ten Peas of delicious flavour. Height, 10 to 12 inches.

From Mr. T. TURTON, Cr. to John Hargreaves, Esq.  
"American Wonder" Pea proved most satisfactory; was sown the last week in February, and was fit for use the first week in June—quite as early as "Kingleader," since the first week in January, and it is superior in quality; especially valuable for growing on borders where the trees are a consideration."

From Mr. T. LOCKIE, Cr. to the Right Hon. Lord O. Fitzc. "American Wonder" is exceedingly useful for forcing; only 10 inches high; producing a good crop of fine large Peas, of excellent flavour. Sown in a cold frame, March 10, was ready for use May 13. For forcing it is far superior to "Little Gem" or "Tom Thumb."

Price, 5s. per Quart; 2s. 6d. per Pint.

THE QUEEN'S SEEDSMEN, *Sutton & Sons*, READING, BERKS.

**OBSERVE OUR TRADE MARK ON EVERY PACKAGE. SUTTON & SONS HAVE NO AGENTS.**

## KEITH'S PATENT "CHALLENGE" BOILERS, FOR HOT-WATER HEATING.

Can be Heightened or Lowered to suit any requirements. They stand complete in themselves, and require no building work round them, being wholly "water jacketed," and thus entirely free from risk by fire.

These PATENT "CHALLENGE" BOILERS have about ten times the heating surface of the ordinary Saddle Boilers, and are certainly THE BEST, MOST POWERFUL, and MOST ECONOMICAL Hot-water Boilers in use.

See Prospectuses, References, &c.

One of these Boilers has been over a year in use, heating 7500 feet of 4-inch pipe (or nearly 1½ mile of pipe), at the Winter Gardens of Isaac Holden, Esq., Oakworth, Keighley. This Boiler has only a 30-inch square fire-grate surface, and has 306 square feet of effective heating surface directly over the fire.

# THE JOURNAL OF HORTICULTURE, AND HOME FARMER.

ALL GENTLEMEN, AMATEURS, and GARDENERS,  
who are interested in Grape Culture should read the Special Articles now appearing in the *Journal of Horticulture*, by  
Mr. Wm. TAYLOR, on the History and Management of the

## WONDERFUL VINES AT LONGLEAT.

On October 27, 1881, it was stated: "A similar example of Vine-growing has not been achieved by any cultivator in the Queen  
dominions." On November 3, 1881, four Muscat Vines, eleven years old, are described as covering nearly 3000 feet of trellis; stems  
18 inches in circumference. On December 15, 1881, Mr. Wills wrote: "I was gratified beyond measure; nothing equal to the  
sight can be witnessed at this period in any part of the kingdom."

All other Gardening Matters are fully and soundly treated in this widely-circulating and popular Journal.

Published Weekly, price 3d.; post-free, 3½d.

WANTED, a JUNIOR ASSISTANT, for Seed Shop.—Must be quick at Counter-work, to apply with references as to character and ability, to JOHN JEFFERIES and Co., Oxford.

WANTED, a young MAN, qualified to Assist in Seed Shop, and act as Salesman in Conservatory. Good references required.—GEORGE EDWARDS, Balham Nursery, London, S.W.

WANTED, a YOUTH, age from 16 to 18; good and quick Writer, acquainted with Book-keeping and to assist in Seed Shop. Must be well recommended.—M. G. M. Ross, Bookseller, Hertford.

WANTED, a NURSERY PACKER.—The undersigned require a thoroughly experienced practical Nursery Packer. Give full particulars of service, length of time in each situation, age, wages expected.—F. & A. DICKSON & SONS, The "Upton" Nurseries, Chester.

WANT PLACES.

IMPORTANT NOTICE.—Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES, at Post-offices, as Letters so addressed are not forwarded, but are sent at once to the Returned Letter Office.

NOTICE.—In reply to the large number of applicants for the Situation advertised in the Gardeners' Chronicle of the 4th inst., Mr. BRUCE FINDLAY adopts this means of stating that he has engaged a Man.

Scotch Gardeners.

LITTLE AND BALLANTYNE, NURSERYMEN, Carlisle, have exceptional opportunities for assisting Noblemen and Gentlemen in securing the services of first-class GARDENERS, UNDER GARDENERS, BALIFES and FOREMANS. They have at present several very excellent men on their Register, and will be glad to send particulars to them to any in want of such.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of FOREMAN or UNDER GARDENER, or FOREMAN or JOURNEVMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be glad to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

THE LIVERPOOL HORTICULTURAL COMPANY (John Cowan), Limited, are in a position to recommend an exceptionally good man as GARDENER, or STEWARD and GARDENER, to any Nobleman or Gentleman requiring such.—Address the MANAGER, Vineyard and Nurseries, Garston, near Liverpool.

GARDENER (HEAD).—Age 38, married, no family to support. Experienced in Early and Late Forcing, and the Management of a large Garden. Character of the strictest order.—E. JONES, 7, Portland Road, Spring Grove, Kingston-on-Thames.

GARDENER (HEAD), where two or three are kept.—Age 28; over ten years' practical experience. Can be well recommended. Single at present. Total abstinence.—Please send particulars to G. F. COATES, Calcut Gardens, Reading, Berks.

GARDENER (HEAD), where two or three are kept; or FOREMAN in a good establishment.—Age 24; understands Fruit, Flower, and Kitchen Gardening. A Premium for information that will lead to a good permanent situation.—G. K. 1, The Gardens, Walton Hall, Warwick.

GARDENER (HEAD); age 33, married.—A GENTLEMAN wishes to recommend his Head Gardener to any person requiring the services of a thorough practical and energetic man. Upwards of five years in present situation.—ARNOLD, Norton Manor Gardens, Presteigne.

GARDENER (HEAD).—Age 33, married; seventeen years' experience in all branches of the profession. Good character from last and previous employers, single-handed or otherwise.—Mr. W. BARLOW, York Nursery, St. Ann's Road, Stamford Hill, St.

GARDENER (HEAD), where three or more are kept.—Age 40, married; thoroughly understands Fruit, Flower, Cucumbers and Melons, Flowers and Vegetables, and Early and Late Forcing.—A. B., The Gardens, Appleby Hall, Atherton.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 34, single; twenty years' experience; thoroughly understands the profession in all its branches. Nearly four years in last situation. Good character.—J. COLLIER, New Headington, Oxford.

GARDENER (HEAD).—Married; Scotch. Thoroughly experienced in all the branches of Gardening. Can be highly recommended. In the first situation.—Apply, in the first place, to Messrs. W. W. WOOD AND SON, Nurserymen, Marshfield, Uckfield, Sussex.

GARDENER (HEAD); age 42.—JAMES KING, Gardener to George Simpson, Esq., Wray Park, Reigate, raiser of some of our most beautiful Calceolae, Wags to his services in any capacity. He has acquired a thorough practical man in all branches. Will be highly recommended by present employer.

GARDENER (HEAD, WORKING), where two or more are kept.—Age 26, single; good practical experience. Good character.—S. W., The Goldings, Great Warley, Brentwood, Essex.

GARDENER (HEAD, WORKING).—Age 32, married; experienced in all branches. Eight years' good character.—A. T., 21, Charlotte Terrace, Lyham Road, Brixton, S.E.

GARDENER (HEAD, WORKING).—Married, one child (age 10); thoroughly understands the profession in all its branches. Five and half years' good character.—F. M., 61, Foxhill Road, Reading.

GARDENER (HEAD, WORKING).—Married; twelve years in good places; five years as Foreman, could undertake a small Collection of Orchids. Good references.—6, Brooklyn Terrace, Eastbourne, Sussex.

GARDENER (HEAD, WORKING), where two or three are kept.—Age 36, married; twenty years' practical experience in all branches of the profession. Excellent testimonials as to character and ability.—H. F., 63, Eden Grove, Holloway, N.

GARDENER (HEAD, good WORKING), where one or more are kept.—Age 41, married, no family; through experience in all branches. First-class character. Will be attended to Poultry or Lodge Gate, or Assist in the House if required.—A. B., 5, Cazenove Road, Stamford Hill, N.

GARDENER (HEAD, WORKING).—The ADVERTISER (age 40), with nine years' good practical experience in all branches, is seeking his first place as Head Gardener, and would be pleased to engage with any Lady or Gentleman as above. First-class testimonials from present and previous employers.—H. W., 23, High Street, Rugby.

GARDENER (HEAD, WORKING).—Age 47, 40 family; thoroughly practical and energetic; excellent Grape and Plant Grower of all kinds. References and character of the highest class. Over six years' good character as Head Gardener and General Manager of North Wales.—J. LONDON, Friar's Place, Acton, near London, W.

GARDENER (HEAD, WORKING); age 34, married.—R. WATSON, eleven years Gardener to Theodore H. Bryant, Esq., Glencairn, Suburb Hill, offers his services to any Lady or Gentleman requiring a thoroughly practical man, well up in all branches. Reference as above.—5, Grafon Road, New Malden, S.W.

GARDENER (HEAD, WORKING), in good establishment.—Has had twelve years' practical experience in England and Wales. Thoroughly understands the growing of Fruit and Flowers under Glass, also Flower and Kitchen Gardening. Highest references to ability and character upon application.—W. SHEPPARD, Aldenhaym Abbey, Herts.

GARDENER (HEAD, WORKING), where others are kept.—Age 29; two in family. Has served upwards of six years in the strictest situation. Has above seventeen years' experience in the various branches of the profession. Character will bear the strictest investigation. Good reasons for leaving present situation.—H. H., 50, Clayhall Road, Old Ford, Bow.

GARDENER (HEAD), or FOREMAN, in a large establishment.—Age 26, married, no children; good character from last situation.—R. STAINISY, Mount View Lodge, Glossop Road, Sheffield.

GARDENER (HEAD), or good SINGLE-HANDED.—Age 27, married, one child.—Fourteen years' experience in all departments. Good reference from present and previous employers.—A. SKEGGS, Pumey House, Upper Richmond Road, Putney, S.W.

GARDENER (HEAD), or good SINGLE-HANDED.—Age 40, married, no children; thoroughable; under-stands all branches. Twenty-two years' good character from present and previous employers. Distance no object.—W. COOPER, Sandridge Park, Melksham, Wilts.

GARDENER (good SINGLE-HANDED, or where more are kept).—Married, three children (youngest 3½ years); does not object to useful. Good reference. State ages.—W. D., 15, New North Road, Brentford.

GARDENER (SINGLE-HANDED), or where help is given.—Well up in Stove and Greenhouse Plants and Flower and Kitchen Gardening. Good character.—J. GUNNER, 114, Hamilton Road, Lower Norwood, S.E.

GARDENER (SINGLE-HANDED, or SECOND).—Age 28, single; good practical knowledge of all branches. Total abstinence. Two years' good character from last place.—T. W., 9, Pleasant Cottages, Angel Road, Edmonton, Middlesex.

GARDENER (SINGLE-HANDED, or SECOND), where three or four are kept.—Age 34, married; understands thoroughly all branches of Gardening and Farming. Good character every respect.—E. COSHAM, Staplefield, Crawley, Sussex.

GARDENER (good SINGLE-HANDED, or where another is kept).—Age 25; has a good sound knowledge of Gardening in all its branches. Two years' good character from present situation. Good references.—C. EYMOUR, 8, Wingfield Terrace, Halfway Street, Elham, Kent.

GARDENER (SECOND), where four or five are kept.—Age 25; five years' good character.—G. W., 1, Hart Street, Church Road, Battersea, S.W.

GARDENER (SECOND).—Age 24; understands Vines, Melons, Cucumbers, Peaches, Stove and Greenhouse Plants, Flower and Kitchen Gardening.—E. RICHARDSON, The Gardens, Chispehead Place, near Sevenoaks.

GARDENER (SECOND, or otherwise).—Age 23; understands Stove and Greenhouse Plants, Vine, &c. Nine years' experience. Good character.—F., The Gardens, Harleyford Manor, Great Marlow, Bucks.

GARDENER (UNDER).—Age 19; has a good knowledge of Garden and Greenhouse Work. Good character.—W. H., 7, Midway Terrace, Chelmsford.

GARDENER (UNDER).—Age 20; has had several years' experience in and out of the Houses. Can be well recommended by the Gardeners he is now with.—C. HEARN, The Gardens, Wywood, Orpington, Kent.

GARDENER (UNDER).—Age 23; seven years' experience inside and out of two years' character from present situation. Glass preferred.—J. WALKER, 3, Albion Terrace, Child's Hill, London, N.W.

GARDENER (UNDER), in a good establishment.—Age 23, unmarried; six years' good gardening character.—Strictly sober.—Please apply, stating wages, to R. TUCKER, Brooklyn, Dawlish, Devonshire.

GARDENER (UNDER), where he could improve himself.—Age 20; fourteen months' character. Bother preferred.—E. GRENDAWAY, Letcombe Regis, Wantage.

GARDENER (UNDER), where he can improve himself.—Age 21; good references from last employer.—Please state full particulars to A. JAMES, 2, Park Road, Chislehurst, Kent.

GARDENER (UNDER), or as SECOND under a Foreman, in the Houses.—Can be well recommended.—H. J. Firth Head Mews, May Fair, London, W.

MANAGER.—Age 37; to Grow for Market Grapes, Peaches, Cucumbers, Tomatoes, Tea Roses, and Choice Plants for Cut Flower Trade. Thoroughly experienced in Market Work.—GARDNER, The Hay, Bushey.

MANAGER.—ADVERTISER wishes engagement in a Nursery, or as Propagator or Market. Good references.—J. OSBORNE, Key's Nursery, North Finchley, N.W.

IMPROVER.—Age 19; seven years' character. No objection to pay a small Premium.—JOHN CLARKE, The Gardens, Deansham Park, Leicestershire.

IMPROVER.—Age 19; five years' experience. Good character. Willing to pay a Premium.—F. FAICE, Priest, Alton, Hants.

IMPROVER, in a first-class establishment, where he can improve himself.—Age 20; five years' experience. Premium £5.—C. C., The Borough, Old Town, Eastbourne.

IMPROVER, in the Gardens of a Nobleman or Gentleman.—Age 27. Lancashire preferred. HENRY KERR, 3, Freckleton Street, Wigan Lane, Wigan.

IMPROVER (PROPAGATOR, or ASSISTANT).—Age 17; used to Hard and Soft Wood. Three years' good character.—A. D., 6, Model Cottages, Denmark Road, Wimbledon, Surrey.

IMPROVER, under a Foreman.—Age 19; understands Potting, Tynging, and Watering. Both preferred. Excellent character.—W. C., Vicarage, Fimwell, Hawkhurst.

IMPROVER.—ADVERTISER (age 21) desires a situation in a Nobleman's or Gentleman's establishment where he would have an opportunity of improving himself, especially in Stove and Greenhouse Plants. Total abstinence, and well recommended.—Small Premium given.—J. W. HALL, The Vineyard, West Lynn, Norfolk.

TO NURSEYMEN and SEEDSMEN.—A Situation wanted by a young man of some experience, as GENERAL ASSISTANT in the Shop and Office. Would be willing to go anywhere, and make himself generally useful. Unexceptionable references. Salary, honest, &c. Terms very moderate.—G., Messrs. A. Goodman & Son, Nurserymen and Seedsmen, Londonderry.

TO HEAD GARDENERS.—Mr. H. GILBERT is desirous of placing his son (age 22) in a Nobleman's or Gentleman's Garden where Early and Late Fruit Forcing are carried on extensively. Has had eight years' experience in different departments of Gardening. Good character.—The Gardens, Southwick Park, Fareham, Hants.

SHOPMAN (HEAD).—Married; total abstinence. Thoroughly experienced in every branch of Retail Trade. Has had entire charge for the past ten years. Efficient Correspondent in all matters. No objection to travel.—G., 43, Landon Road, Clapham, S.W.

SALESMAN, in a Florist's Shop.—Well up in the nomenclature of Plants, Buying, Pricing, Selling, Furothing, giving Estimates, &c. Thirteen years' experience with leading London firms. First-class testimonials as to ability, &c.—Apply, stating terms, to G. WOOTEN, 9, Park Terrace, Baker Street, W.

By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine old Epps' Cocoa, prepared by the Epps family, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up and strength restored after every tendency to disease. Hundreds of subtle maldies, creeping about us ready to attack and prey upon the weakest of us, are thus effectually expelled. We may escape many a fatal shaft by keeping ourselves well fortified with pure and healthy nourishment. Sold in packets, labelled, JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS, London.

Makers of Epps' Chocolate Essence for Afternoon use.

A Comfortable Night's Refreshing Sleep is insured by DR. LOCKOCK'S PULMONIC WAFERS.

—Mr. JOHN PEARSON, 67, York Street, Waterhampton, writes:—"I had no sleep for five weeks till I tried Dr. Lockock's Wafers, and I have had such relief to the cough that I could not have believed." Asthma, Consumption, Colds, Gout, Bronchitis, Rheumatism, and all nervous complaints, are instantly relieved and rapidly cured by Dr. Lockock's Wafers, which act pleasantly. Of all Druggists, at 1s. 3d. and 2s. 6d. per box.

HOLLOWAY'S PILLS.—Weak Stomach.—The wisest cannot enumerate one quarter of the distressing symptoms arising from imperfect or disordered digestion, all of which can be relieved by these admirable Pills. They remove casky taste from the mouth, flatulency and all other ailments. Holloway's Pills rouse the stomach, liver, and every other organ, thereby bringing digestion to that healthy tone which fully enables it to convert the food into the nutritious elements of our bodies. Hence these Pills are the strict strengtheners and the safest restoratives in nervousness, wasting, and chronic debility. Holloway's Pills are the best medicine for impaired appetite, eructations, and a multitude of other disagreeable symptoms which render the lives of thousands miserable indeed. These Pills are approved by all classes.

# GREEN'S PATENT "SILENS MESSOR" & "MONARCH" NOISELESS LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1882.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions,  
His Royal Highness the Prince of Wales,  
the King of the Belgians,

the late Emperor of the French, the Emperor of Russia,  
and most of the Nobility, Clergy, and Gentry  
of the United Kingdom.

Upwards of 105,000 of these Machines have been Sold since they were first introduced in the year 1853,  
And Thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

Schoolmaster Peerless

KNOWLEDGE AND KIDD offer to the Trade good Dwarf-trained MORELLI CHERRIES, 28s. per dozen. Canterbury Nurseries, Kent.

VERBENAS.—Strong Plants from Cutting-Pots, very healthy and well hardened, of Crimson, Purple, Scarlet, and White; best varieties for Bedding, 6s. per dozen.  
J. H. CARTER, Nurseryman and Seedsman, Keighley Works.

NEW POPATO—PREMIER EARLY WHITE.—This is a Potato of great merit, and proved to be the earliest in cultivation. It is a cross between Porter's and the Marston. The tubers are round and handsome, having small eyes not indented, and all but level with the surface. Its skin is rough, and its flesh white and solid, and very floury when cooked. The haulm is also very dwarf, as dwarf as Smith's Early, so that the Premier is well adapted for forcing. Price 3s. 6d. per cwt. sent out by DOVE & CO., LEAD, Old Londonburgh.

Special Offer.—7000 GEE'S superior CABBAGE, KALE, SAVOY, CAULIFLOWER, and other PLANTS, ASPARAGUS and SEAKALE ROOTS, BEDFORDSHIRE-GROWN SEEDS, &c. &c.

GEE is prepared to supply the above in any quantities for cash with orders as follows:—CABBAGE PLANTS, which are this season splendid, strong, healthy, thrice-rooted stuff, grown from his far-famed selected stocks, comprising Early Enfield, Early Nonpareil, Early Dwarf York, Imperial Thousand-Head, and extra large Double-headed, all 2s. per 1000 of roots. Very fine plants can also be supplied of above kinds, which are not grown from F. GEE'S own stocks, but which he believes are very good, at 2s. 6d. per 1000, or better in larger quantities. Very fine Red Kale, or "Pickling" ditto, at 2s. per 1000.  
SAVOYS, large Drumhead and Green Curled SCOTCH KALE, and BRUSSELS SEEDS, all at 2s. per 1000.  
LITCHES, true Old River Coe, and Hardy Hammer-smith, fine plants, at 4s. 2d. per 1000.

CAULIFLOWER PLANTS, splendid transplanted stuff, including the American Giant, at 2s. per 1000; Early London and Walcheren, 15s. per 200, 2s. per 1000.  
ASPARAGUS PLANTS or ROOTS (the true large French Market sort) with Giant, at 2s. per 1000; also the true French market (New Bed), 3s., 3s., and 5s. per 100; 15s. 2s., and 40s. per 1000.

RHUBARB ROOTS, Early Scarlet, Prince Albert, and Victoria, 2s., 2s., and 4s. per dozen, from 20s. per 1000.  
SAGE and COMMON THYME roots, at 8s. per 100, 2s. per 1000.

DAISIES, choice sorts, Bacchus' Dark Scarlet, and others, at 2s. 6d. per 1000, 20s. per 1000.

WALLFLOWER choice Dark Early, Flood-red, 50,000 fine plants, at 1s., 2s., and 3s. per dozen, 7s., 6d., 15s., and 20s. per 1000.

LITCHES, splendid rooted 1-yr.-old stuff, 8s. and 10s. per 1000. (See other Advertisement.)  
Choice Seed Potatoes, in any quantities, cheap and good. (See other Advertisement.)  
SEEDS, superior BEDFORDSHIRE-GROWN SEEDS of all kinds for the Farm or Garden. Every requisite supplied. Large buyers (stating quantities required) liberally dealt with.  
SALAD OILS, in application.  
Packages charged for, but which are returned if sent back at once, carriage paid and advised of.  
S. B. LITTLEWOOD Correspondence to save delay, should accompany their order with a remittance (either P.O.O. or Cheque), payable to the order of Messrs. GEE, Seed and Plant Grower, &c., Biggleswade, Bedfordshire.

**Gardenia intermedia.**  
**MESRS. JOHN STANDISH AND CO.**  
 HERMEDIA of all sizes, every plant being in the most  
 fit health, and guaranteed perfectly clean. Nice plants in  
 6-inch pots at 2s. 6d. each; larger sizes, 6d. to 10s. 6d. each.  
 Specimens, fine lady plants, with plenty of bloom-bud on  
 them, 1/2, a and 3 guineas each.  
 Royal Nurseries, Ascot, Berks.

**CEDRUS DEODARA**—"The Indian  
 Cedar."—Beautiful specimen trees, frequently planted  
 and well-rooted, offered at the undermentioned low  
 prices to effect a clearance:—  
 5 to 6 feet, 48s. per dozen | 7 to 8 feet, 72s. per dozen  
 6 to 7 feet, 60s. per dozen | 8 to 10 feet, 84s. per dozen  
**ABIES DOUGLASSI**.—One of the most noble  
 trees grown, well-rooted specimens,  
 6 to 7 feet, 5s. 6d. each; 36s. per dozen  
 7 to 8 feet, 4s. 6d. each; 42s. per dozen  
 8 to 9 feet, 5s. 6d. each; 60s. per dozen

The above-named Trees are highly suitable for Avenues,  
 Lawns, Shrubberies, or Woods, and the opportunity of purchasing  
 on such terms rarely occurs.  
**RICHARD SMITH AND CO.**, Nurserymen and Seed  
 Merchants, Worcester.

**Hardy Rhododendrons and Azaleas.**  
**ANTHONY WATERER** has to offer many  
 thousands of healthy well furnished and well budded  
 RHODODENDRONS of the best and most popular kinds.  
 Hardy AZALEAS of the most beautiful and useful kinds  
 known, all well furnished and well budded, many thousands.  
 AZALEA MOLLIS, seedlings and best named varieties,  
 covered with buds, many thousands.  
 Knapp Hill Nursery, Woking, Surrey.

**WEBB'S PRIZE COB and other FILBERT  
 TREES**, Calcot Gardens, near Reading.  
 Apply to Mr. COOPER, F.R.H.S., Calcot Gardens, near  
 Reading, Berks.

**STOCK PLANTS of VERBENAS.**—We  
 have ready at the present time a large stock of the above,  
 which for vigour and freedom from disease cannot be surpassed;  
 they are very lanky and bear readily large quantities of clean  
 healthy cuttings. Price 16s. per 100, or 140s. per 1000.  
 LIST of sorts may be had on application to  
**KYNS AND CO.**, Nurserymen, Salisbury.

**Carnations, Picotees, and Finks.**  
**THOMAS S. WARE** begs to announce that

**J. H. LEY;  
 ROYAL NURSERY, CROYDON.**

**Orchids a Speciality.**

The stock at the Clapton Nursery is by far  
 the largest hitherto seen in Europe, and is of  
 such magnitude that, without seeing it, it is not  
 easy to form an adequate conception of its un-  
 precedented extent.

**HUGH LOW & CO.**

very cordially and respectfully solicit an inspection  
 by all lovers of this interesting and beauti-  
 ful class of plants, whether purchasers or not.

**CLAPTON NURSERY, LONDON, E.**

**A SEED LIST**

 and as full as can be desired of useful and reliable information  
 on Garden and Flower Seeds, yet without any unnecessary  
 costliness, post-free on application. Such a catalogue as this is  
 claimed to be the most of necessary conduct to economy, both as  
 regards purchaser and vendor.

In addition to the well known and trusty varieties in  
 Seeds, the

**BEST NOVELTIES**

are included, but unproved and excessively expensive kinds are  
 omitted.  
 Every endeavour is made to supply Seeds of the  
**Finest Quality and of the Best Varieties**  
 at a Moderate Price,  
 to attain which desirable object neither trouble nor expense are  
 spared in the procuring and proving of the Seeds.

**THE GUINEA COLLECTION**

(Carriage free), for the Amster's Garden, has been most  
 approved, and contains a most valuable and useful assortment  
 of Vegetable Seeds.  
 All enquiries are gladly and promptly attended to.

DANIELS BROS., ROYAL NORFOLK SEED ESTABLISHMENT, NORWICH.

MASDEVALLIA ROEZLII

(RCHB. F.),

THE BLACK CHIMÆRA MASDEVALLIA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. SANDER, on THURSDAY, March 9, at half-past 12 o'Clock precisely, the above splendid new MASDEVALLIA. It belongs to the Chimæra section, and received a First-class Certificate at South Kensington. Professor Reichenbach says this fine Masdevallia is a Chimæroid species, of a wonderful dark blackish indigo-purple, with still darker warts, and very few short light purple hairs on the edges of the sepals. Flowers measure between tail ends 16 inches. At the same time will be sold importations of many fine DENDROBES, including D. SUAVISSIMUM, D. DEVONIANUM, D. WARDIANUM, D. THYSIFLORUM, D. FALCONERI, D. PARISHI, D. SANGUINOLENTUM, D. RHODOPTERYGIUM, and many others.

On view morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

**VICTORIA AND PARADISE NURSERIES,**  
UPPER HOLLOWAY, LONDON, N.

**NISBET'S VICTORIA TOMATO**

This is a seedling from Vick's "Criterion," and for cultivating under glass or in the open air there is no Tomato can approach it for fruitfulness. The plant requires no stopping, as it keeps growing and fruiting in the greatest abundance. The fruit is pyriform, and grows in bunches, each bunch containing from eight to twenty fruit, which are the size and colour of a Victoria Plum. It contains but few seeds, and for flavour is unsurpassed.

Per Packet, 1s.

By cultivating the Victoria Tomato there is no difficulty in obtaining a dish of Tomatos ALL THE YEAR ROUND. The plant requires plenty of room and a rich loamy soil, with liberal applications of liquid manure. There is no fear of its producing a quantity of wood without fruit, as the bunches of fruit show at every joint; it needs no stopping, as it keeps growing and fruiting in the greatest abundance, and either for cultivating under glass, or in the open air, it surpasses all others for fruitfulness.

To grow it in the greatest perfection a few of the many bunches should be removed and the fruit thinned out a little. This will produce fine, large, handsome fruit.

"The Original Plant is growing, under glass, at Aswarby, covering a space 15 feet by 6 feet, and at the present time is carrying a crop of 600 bunches of fruit, as many more having been gathered from it during the summer.

"August 30, 1879.

"RICHARD NISBET, Gardener, Aswarby Park."

## BOULTON & PAUL, Horticultural Engineers, NORWICH.

CONSERVATORIES, ORCHARD-HOUSES, PEACH-HOUSES, GREENHOUSES, &c. Illustrated Catalogue, Twelve Stamps; Illustrated Lists, Post-free.

### Independent Slow Combustion Boiler for Small Greenhouses.

TO HEAT BY HOT WATER; REQUIRING NO BRICKWORK.

Specially adapted for small greenhouses; for quick heating or slow combustion. Quite portable, and will heat properly for twelve hours. Made with strong wrought-iron cylinder set in a cast-iron base, with fire-bars and sliding door. Only one-tenth the cost of heating by gas, and much more effectual. Fitted with two 2-in. cast sockets, door for feeding, and socket for smoke-flue.

Cash Prices—Carriage paid.

of Boiler complete, as shown in illustration, but exclusive of piping:—

Size.	Total Height.	Diameter.	To heat 4-in. Piping.	Price.
1	27 in.	16 in.	45 ft.	£3 10 0
2	30 in.	16 in.	60 ft.	4 0 0
3	33 in.	16 in.	80 ft.	4 10 0
4	36 in.	16 in.	100 ft.	5 0 0

### Plain Saddle Boiler.

Plain Saddle Boilers are generally used for heating from 200 feet to 300 feet of 4-in. piping 2 above that quantity it is more economical to use our Check-end Boiler, as one of these, 3 feet long, will heat double the quantity of piping a 3-foot Plain Saddle will.

### The Perfect Throttle Valve.

2-in. .. .. 10s. 6d.  
3-in. .. .. 12s. 6d.  
4-in. .. .. 15s. 0d.

The whole of the working parts of these valves can be removed without disturbing or cutting the pipes.

### Screw Valves. Tight under any Pressure.

2-in. .. .. 15s. 0d.  
3-in. .. .. 20s. 0d.  
4-in. .. .. 25s. 0d.

### The Phoenix Slow Combustion Boiler.

We claim for our Phoenix Upright Boiler the following good qualities, viz.—It is made of the best materials; has no parts that are liable to failure; is provided with a flue that cannot be choked with fuel; will heat effectually the quantity of pipes stated with the smallest amount of fuel; can be easily regulated; and will hold fuel sufficient for keeping up the proper heat twelve hours; requires no brickwork, and takes up the smallest space of any boiler of its power.

Sockets can be placed in any position.

Cash Prices—Carriage paid.

Size.	Total Height without Feed Hole.	Diameter of Boiler.	Heating Power for 4-in. Piping.	Price.
1	25 in.	16 in.	150 ft.	£6 0 0
2	29 in.	16 in.	200 ft.	7 0 0
3	30 in.	16 in.	300 ft.	8 10 0
4	32 in.	18 in.	400 ft.	10 0 0
5	35 in.	18 in.	500 ft.	12 0 0

### Patent Check-end Saddle Boiler.

Check-end Saddle Boiler, simple and durable.

No.	Outside Length.	Outside Width.	Outside Height.	Cross Tubes.	Heating Power for 4-in Piping.	Price: Boiler only.
1	30 in.	20 in.	18 in.	1	300 ft.	£3 10 0
2	36 in.	20 in.	18 in.	1	500 ft.	10 10 0
3	42 in.	22 in.	18 in.	1	750 ft.	13 0 0
4	48 in.	24 in.	20 in.	1	1000 ft.	16 0 0
5	48 in.	27 in.	20 in.	1	1250 ft.	20 0 0
6	54 in.	27 in.	22 in.	2	1500 ft.	23 0 0
7	54 in.	29 in.	22 in.	4	1750 ft.	26 0 0
8	60 in.	33 in.	24 in.	6	2000 ft.	30 0 0

### The Terminal End Saddle Boiler.

This Boiler is much used, and is one we can confidently recommend.

Total Length.	Size of Boiler.				Heating Power for 4-in. Piping.
	Inside the Arch.	Outside Measure.	Width.	Height.	
30 in.	16 in.	16 in.	22 in.	27 in.	500 ft.
36 in.	16 in.	16 in.	22 in.	27 in.	750 ft.
42 in.	18 in.	16 in.	24 in.	27 in.	1000 ft.
48 in.	21 in.	18 in.	27 in.	30 in.	1250 ft.
54 in.	24 in.	18 in.	30 in.	30 in.	1500 ft.
60 in.	24 in.	18 in.	30 in.	30 in.	2000 ft.

Prices on application.

Boilers made to suit any position for Baths, Harness Rooms, Lavatories, &c., &c.

All sizes of Boilers given in this Advertisement are kept in stock, and are rated to effectually heat the quantity of Piping named with a minimum amount of fuel.

All Orders amounting to 40s. Carriage Paid to any Railway Station in England and Wales; also to Edinburgh, Glasgow, Dublin, and Belfast.

## ALL WHO WISH TO TAKE PRIZES WITH THE BEST VEGETABLES AND FLOWERS, SHOULD GROW

- CARTER'S TELEPHONE PEA.**—Awarded a First-class Certificate by the Royal Horticultural Society, 1879. Price, in sealed packets, 2s. 6d. per half-pint.
- CARTER'S PRIDE OF THE MARKET PEA.**—Awarded a First-class Certificate by the Royal Horticultural Society. Awarded five First Prizes, 1881. Price, in sealed packets, 3s. per pint.
- MONSIEUR LONG-PODDED NEGRO BEAN.**—Awarded First-class Certificate Royal Horticultural Society, 1879. Price, in sealed packets, 2s. per pint.
- CARTER'S LEVIATHAN BEAN.**—Produces enormous pods, 12 to 16 inches long. Takes First Prizes whenever exhibited. Price, in sealed packets, 2s. 6d. per pint.
- CARTER'S LONGSWORD DWARF BEAN.**—A second Canadian Wonder, but earlier and more fruitful than that splendid variety. Price, in sealed packets, 2s. 6d. per pint.
- CARTER'S DEFIANCE CAULIFLOWER.**—The earliest variety in cultivation. Price, in sealed packets, 2s. 6d. and 3s. 6d. per packet, post-free.
- CARTER'S DEPHAM FAVOURITE TOMATO.**—Awarded a First-class Certificate Royal Horticultural Society, 1881. Price, in sealed packets, 2s. per packet, post-free.

- CARTER'S NEW GOLDEN QUEEN ONION.**—A perfect model of an Onion. Skin a delicate straw colour. Price, in sealed packets, 1s. 6d. and 2s. 6d., post-free.
- CARTER'S NEW SILVER BALL ONION.**—A very distinct silver-stemmed Tripoli Onion, growing to the size of a Snowball Turnip. Price, in sealed packets, 1s. 6d. and 2s. 6d., post-free.
- CARTER'S GOLDEN GLOBE ONION.**—A splendid exhibition variety. The skin is a transparent golden-straw colour. Price, in sealed packets, 1s. 6d. and 2s. 6d., post-free.
- CARTER'S BLENHEIM ORANGE MELON.**—The finest scarlet-fleshed Melon in cultivation. Awarded First-class Certificate Royal Horticultural Society. Price, in sealed packets, 1s. 6d., 2s. 6d., and 3s. 6d. per packet, post-free.
- CULVERWELL'S TELEGRAPH PEA.**—An indispensable exhibition variety. Awarded thirteen Prizes, 1881. Price, in sealed packets, 2s. 6d. per pint.
- CARTER'S STRATAGEM PEA.**—The only Pea awarded a First-class Certificate by the Royal Horticultural Society in 1879. Awarded nine First Prizes, 1881. Price, in sealed packets, 3s. per pint.

- CARTER'S BLUE PRIMULA.**—The Greatest Novelty of the Year. First-class Certificate Royal Horticultural Society, January 10, 1882. Seed of this magnificent novelty will be ready for distribution in May next. Orders will be executed in strict rotation. To prevent disappointment it should be ordered at once. Price 5s. and 10s. 6d. per packet, post-free.
- CARTER'S NEW PRIMULAS. THE BRIDE.**—Purest snow-white, elegantly frimbriated. Price in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- ROYAL PURPLE.**—Immense trusses of bloom, shading off to crimson-lake. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- FLORENCE ROSE.**—Flowers delicate salmon-rose. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- CARMINE BEAUTY.**—Rich rosy-carmine. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- NEW DOUBLE, PRINCE OF WALES.**—Rich crimson. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- NEW DOUBLE, SNOWFLAKE.**—Pure white flowers of great size. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- VEUVIUS.**—The richest crimson-scarlet. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- SPOTTED QUEEN.**—Very curious and beautiful, each flower being splashed and spotted. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.

- NEW NASTURTIUM.**—Carters' Empress of India.—The Gardeners' Chronicle says:—"We know of nothing which comes so closely to it in colour as some of the bright crimson forms of Phlox; it will rank far ahead of anything of the kind previously known." Price, in sealed packets, 1s. 6d. and 2s. 6d. per packet, post-free.
- NEW VIRGINIAN STOCK.**—Carters' Fairy Queen.—The Gardeners' Magazine says:—"This new beauty combines richness and variety of colour; the flowers are the richest carmine-crimson colour imaginable." Price, in sealed packets, 1s. and 2s. per packet, post-free.
- NEW ESCHECHOLTZIA.**—Carters' Rose Cardinal.—The Garden says:—"It is a lovely variety, of a delicate rose colour, and is likely to prove an acquisition of considerable value." Price, in sealed packets, 1s. 6d. and 2s. 6d. per packet, post-free.
- NEW CYCLAMEN.**—Carters' White Swan.—This is the finest white Cyclamen in cultivation. Awarded First-class Certificate Royal Botanic Society. Price, in sealed packets, 2s. 6d. and 5s. per packet, post-free.
- NEW CALCEOLARIA.**—Carters' Cloth of Gold.—A pure canary-yellow colour, the flowers usually measuring 3 inches in breadth. Awarded First-class Certificate Royal Horticultural Society. Price, in sealed packets, 3s. 6d. and 5s. per packet, post-free.

SPECIAL GOLD MEDAL,  
Melbourne, 1880-81.  
PRIZE MEDAL, Paris, 1878.

"Melbourne, October 23, 1880.  
"Sir,—By direction of the Commissioners for the Melbourne International Exhibition I have to request that you will be so good as to convey their best thanks to Messrs. Sutton & Sons, of Reading, for their valuable Lawn Grass Seeds planted in the grounds of the Exhibition during the late winter. The seeds have germinated freely, and the lawns are now in splendid condition. Messrs. Sutton & Sons may accept my assurance that the introduction of their Lawn Grass Seeds into this country has been attended with very great success.—I have the honour to be, Sir, your most obedient servant,  
(Signed) GEORGE C. LEVEY, Secretary.  
To the Chief Clerk, Melbourne International Exhibition Offices, London.

The three splendid Lawns at the Paris Exhibition, 1878 produced from our seeds, were awarded a Prize Medal, and thus referred to by "L'Echo Agricole":—"The Lawns shown by Messrs. Suttons' Agent are at least equal in beauty, vigour, and luxuriance to those shown by any other Exhibitor. They are of extraordinary beauty and evenness, and form throughout one charming velvety carpet."

## PLANTS OF MYTHOLOGY.

THE welcome arrival of the early flowers recalls myths and fancies connected with them which have been passed on through ages of time, and which the world could ill afford to lose, idle though they be.

"Sweet was the fancy of these antique ages  
That put a heart in every stirring leaf,  
Writing deep moral upon Nature's pages,  
Turning sweet flowers into deathless sages  
To calm our joy and sanctify our grief."

The great inventors of pleasing fancies and stories about plants and flowers were the many-minded Greeks and the religious Romans: the people who invented "Dodonian Jove" and forty other gods must have been religious. Science has deprived us of some of the materials of the classic ages; it has driven the wood nymphs from their trees, and the dryads from their brooks and fountains, and the illusions of the "antique world" could hardly be revived by a modern poet as by Milton, when he wrote—

"By dimpled brook and fountain brim,  
The wood nymphs deckt with Daïsies trim,  
Their merry wakes and pastimes keep."

The world has grown too "knowing" for actual belief in the fancies of old times, but we can still feel pleasure in repeating them. There is a pleasure, too, in tracing the meaning of the many legends relating to the vegetable kingdom.

The "everlasting hate" entertained between the Vine and Ivy is easily explained, for the first-named trailer grows in the sun, and the Ivy affects shade, and twines upon old walls and ruins. Mrs. Hemans says of it—

"Thy home, wild plant, is where each sound  
Of revelly hath long been o'er;  
Where songs' full notes once pealed around,  
But now are heard no more."

It is as easy to explain Juno's dislike of the Myrtle, since Venus was adorned with that plant when Paris awarded her the prize of beauty. And for the same reason, although the Myrtle was a favourite flower of the Romans, worn by their heroes as a mark of victory, and by bridegrooms on the bridal day, they very delicately excluded it from the festival of Minerva, to avoid reminding the goddess of her defeat. It must have been the same sentiment of jealousy which rendered the Lily and the Lotus, flowers of Juno, obnoxious to Venus. Her flowers were the Rose, Anemone, Cypress, Apple, Poppy, Myrtle, and Violet. Anemones sprung from the tears she shed over the body of Adonis, and the blood of that handsome youth mingling with them, caused the instant appearance of the Flos Adonis.

"By this the boy that by her side lay killed  
Has melted like a vapour from her sight;  
And in his blood, that on the ground lay spilled,  
A purple flower sprung up, chequered with white."

Most unfortunately for our world purple flowers now spring from seed, and sometimes slowly; weeds alone grow by magic.

It is not at first sight obvious how the Rose—a flower dedicated to beauty, love, and wine, or, in other words, to Venus—should have become the emblem of silence; but the legend runs that Venus gave a Rose one day to Cupid, who

presented it to Harpocrates, the god of Silence, begging him at the same time to conceal such little slips and fallings among the gods as Cupid might occasion. So Roses were worn at festivals in sign that the confidence of the festive hours, which warm the heart and open the bosom's hiding-places, should not be abused. The sculptured Rose over the portals of ancient banquetting halls conveyed the same hint, and occasioned the phrase "*sub rosa*."

Notwithstanding the numerous flowers awaiting notice it is not easy parting with the Rose. Sappho's verses are irresistible:—

"Sweetest child of weeping morning;  
Gem, the west of earth adorning;  
Eye of flow'rets, glow of lawns,  
Bud of beauty, nursed by dawns:  
Soft's the soul of love it breathes,  
Cypris's brow with magic wreathes,  
And to the Zephyr's warm caresses  
Diffuses all its verdant tresses;  
Till, glowing with the wanton's play,  
It blushes a diviner ray."

Other poets have other theories on the colour of the Rose, as, for example, that the white Rose became red when Venus stepped on a thorn—

"And while the wound with crimson flows,  
The snowy flow'ret feels her blood and blushes!"

Or, according to Herrick—

"As Cupid danced among  
The gods, he down the nectar fung,  
Which, on the white Rose being shed,  
Made it for ever after red."

The Violet—favourite of the Athenians and of Napoleon—emblem of Athens, engraved on tablets erected throughout the city, is a flower of romantic origin, according to the poets, though they have given different versions of its creation. The trees were assigned, by poetic fancy, to various celebrities. The towering Ash was the tree of Mars, the Oak of Jove, the Pine of Pan, who turned a nymph beloved by him into a tree of that description, and whom we may hold responsible for the panic dread sometimes experienced in the depths of Pine woods when the wind moans and darkness closes around a dubious road. As a rule, the climbing plants avoid the various species of Pine, though the Mistletoe grows on some of them, finding better entertainment, as a parasite, on the branches than climbers could experience when rooted in a mass of Fir leaves covering an impenetrable layer of shallow surface roots.

The origin of the Fir belongs to mythology, for Atys was metamorphosed into a tree, which was the first Fir tree. Its evergreen habit was due to Zeus, who found Cybele beneath the tree, mourning for Atys, and immediately ordained that the Fir should remain evergreen. Thus it happened that Pines and Firs were dedicated to Cybele, as they also were to Neptune, because the first boats were constructed of their timber.

The Laurel is another tree due to metamorphosis and dedicated to Apollo, who pursued the virgin Daphne with felonious intent, and was just on the point of overtaking her when Divine interposition changed her to a Laurel. The exigencies of poetry have led to several botanical errors, and much confusion has arisen as to the Bay tree and the Laurel.

"The Laurel, meed of mighty conquerors and poets sage,"

sings an inaccurate bard, meaning, no doubt, the Bay. Cæsar wore a "Laurel crown" by special decree of the Senate, and he highly appreciated the opportunity of concealing his baldness, a defect which was reckoned a deformity among his countrymen and among the Jews, whose hair, as a rule, is singularly adherent. It is stated on good authority, however, that Cæsar's crown was not formed of

Laurel or Bay, but of *Ruscus hypoglossum*, a species of Dutcher's Broom, called Alexandrian Laurel, though native to Italy.

The most useful tree of the Mediterranean countries owed its miraculous origin to the dispute between Neptune and Minerva at the naming of Athens. The gods decided that the presentation of the best gift to mankind should confer on the giver the honour of naming the city. Neptune at once produced the horse, which sprang from the shore on his striking it with his trident; and the horse is certainly a useful gift, but it typifies war, and Minerva triumphed when she called into being the symbol of peace. Spenser thus describes the process:—

"She smote upon the ground, the which straight forth did yield  
A fruitful Olive tree with berries spread."

It is reported as true history that the Olive has been grown in Syria throughout the historic period, and that it was unknown in Italy at the building of Rome. Probably some Roman traveller brought it from Asia, and others afterwards carried it to Spain, Gaul, and England, where it ripens on a wall in Devonshire. But this prosaic statement warns us to desist from carrying our subject further at present. *H. E.*

## New Garden Plants.

### OCHNA MULTIFLORA.

THIS remarkable stove shrub is now in bloom at the Holloway Nurseries. The flowers are yellow, with five roundish petals and numerous stamens, whose anthers open by pores at the top. So far there is nothing very remarkable about the plant, but as the petals fall off the thalamus of the flower—that part from which all the other parts spring, and which is really the top of the flower-stalk—begins to swell, and finally assumes the form of a large, 5-sided, 5-angled cushion the size of a large Cherry or small Plum, bearing on each of the five angles a carpel or seed-vessel, becoming black when ripe. The sepals, unlike the petals, do not fall off, but remain and increase in size. So far this might be deemed a botanical curiosity only, but the brilliant crimson colour assumed by the thalamus and the persistent sepals give it a distinguished place among ornamental stove plants. It seems probable that the object of this brilliant coloration may be to attract birds, by whose agency the seed may be dispersed. The botanist will recognise in the swollen, brilliantly coloured thalamus a precise correspondence with the Strawberry, the edible portion of which is the thalamus, the pips being the seed-vessels, in this case arranged spirally, and not in a ring, as in the *Ochna*.

TACSONIA PARRIETI, *Mast.* (See *ante*, p. 218.)

Since writing our previous notice of this plant we have had the opportunity of seeing further material in the hands of Mr. R. S. Williams, who has had the plant since 1879. What we have seen at Mr. Williams' serves to confirm all we have said as to the distinctness and remarkable character of this species. If the flowers in cultivation present the same colour as they do in a wild state—salmon-orange—we may say that up to this time nothing like it has been seen among cultivated Passion-flowers.

### POLYSTACHYA DINANTHA, *n. sp.*\*

THIS is a curious species, in the way of *Polystachya rigida*. Rehb. f. It is much taller, and comes near in growth and nature of leaves to *Polystachya ensifolia*, Lindl. The raceme at hand is simple and the flowers are equal to those to *Polystachya bracteosa*, Lindl., ochre-coloured, with a quite distinct lip, whose side lobes are purple and the disk dark yellow. There is a half-sphere callus of orange colour in the disk. It was imported by Mr. T. Christy, of Malvern House, Sydenham, from the West Coast of Africa. *H. G. Rehb. f.*

\* *Polystachya dinantha*, n. sp.—Caulis teretiusculo diphylo; foliis linearibus ligulatis acutis; pedunculo flavo-angustato, vaginis terosis arctis; rhachi velutina laxiflora; bracteis triangulis ovatis puberulis brevioribus; flore "inverso"; sepalis lateribus in ovulatione elevatum magnum exsertis triangulis acuminatis puberulis; sepalis impari linearibus triangulis; tepalis linearibus falcatis acutis, labello a basi late cuneato dilatato laciniis lateribus medianis quadratis, laciniis medianis triangulis apiculatis, tota superficie pilulosa (non pulverulis); callo transverso semiquadrato in disco superiori.—*Ex Afric. occid. trop. imp. or. col. T. Christy. H. G. Rehb. f.*

## DAVALLIA BULLATA.

I CONSIDER this Fern to be one of the most valuable kinds grown among the whole family of Ferns. For durability in a cut state it has scarcely an equal during the summer and autumn months. Small plants of it are valuable in many ways, especially for furnishing, whilst as a specimen for exhibition it is most distinct, and always admired. Our large specimen is just pushing up its first crop of fronds, which in a few weeks will be a complete thicket of a beautiful pale green colour. It has just been top-dressed with a little fresh peat, sphagnum moss, and silver-sand, any straggling rhizomes being pegged on to the fresh soil.

We shall now remove it into a Peach-house where the fruit is set. There it will stand till the house is thrown open after the fruit is gathered. In this house it grows far better than under stove treatment. It was not shaded during the hottest weather of last summer beyond what the Peach trees afforded it; previously we have shaded with tiffany, but find it does better without any such attention. A close confined atmosphere does not suit it; the dense growth it makes will damp off under such conditions.

When the Peach-house becomes too cold for it we remove it again to a temperate-house, where it stands till growth commences again in the spring. When the fronds begin to decay in the late autumn (being a deciduous kind) we withhold water somewhat gradually, removing all the fronds a few at a time. It is a variety that is very easily increased by division of its rhizomes. I have often wondered why this useful Fern is not more grown than it is. It ought to be in every collection. *James Hudson.*

## RHODODENDRONS.

THE Editor writes to me:—"Is there any marked difference in the seedlings of *Rhododendrons*?" In venturing to give an answer to this question, so far as my observation and experience among Himalayan *Rhododendrons* permits, I will for the present confine the word "seedlings" to plants grown from seed imported from their native places, that is to say, plants of the first generation, and my answer must be in the negative. I believe that a packet of seed, gathered from the same species and in the same locality, will yield in Europe seedlings, not of course, absolutely uniform, but certainly showing no marked difference. This result, although often questioned, was surely to be expected, seeing that Himalayan *Rhododendrons* are mostly social plants, and must commend itself to the experience of our old-fashioned *R. ponticum*, which, when kept apart from other species and hybrids, continues very true for many generations. Certainly, for the first generation, the seedlings of Himalayan *Rhododendrons* are often produced in great numbers, almost absolutely alike. Sometimes this uniformity descends to later generations, and sometimes even to hybrids. Thus Mr. J. Sheppard has raised about 150 hybrids between *R. Edgeworthii* and *R. formosum*, most of which have bloomed, and he can see no difference whatever in any of them. I must not, however, at present go so far afield, but confine myself to the assertion that carefully collected native seed will, when grown in this country, faithfully reproduce the parent type.

I may see, perhaps, to have unduly laboured this highly probable statement. Nevertheless, the Editor's question is a very important one, even in my limited sense, and is not to be disposed of quite easily. For how comes it that in European collections there prevails such a variety of type with plants of the first generation as fairly to puzzle a connoisseur? Specialists are often justly accused of magnifying unimportant distinctions, but I hope to avoid this charge on the evidence about to be adduced. Take, for instance, *R. fulgens*, which has been derived exclusively from Sikkim or close by, figured very finely in Sir J. Hooker's magnificent work from his own drawing taken on the native spot. After while the seed transmitted by him to Kew produced plants and blossom, and a plate of that blossom appeared in the *Bot. Mag.*, prepared by the very best flower artist. Now, I defy any one to remark a most striking difference between the two portraits, and this in colour, but in character. The *Botanical Magazine* indeed mentions one difference, and the section of the ovary suggests another; but I have seen in living plants of the first generation quite enough to make

me believe both portraits correct, and each type distinct. Again, the late Mr. Gorrie was one of the first to grow Sikkim Rhododendrons, and in 1854 he was reporting on them to Sir J. Hooker, who published his reports. In these reports he noticed that he had apparently several forms of *R. fulgens*. Mr. Gorrie continued to grow Rhododendrons, and shortly before his death in 1880 he read a paper to the Edinburgh Botanical Society, in which he gave so extraordinary an account of a so-called *R. fulgens* that I thought it desirable to ask leave to inspect his plants. Among them I found one form of *R. fulgens*, but it was not so named. I do not marvel, however, that Mr. Gorrie did not recognise it, but described it as "*R.*—?, an unnamed species," for it is unlike both the types alluded to above. The plant which Mr. Gorrie named *R. fulgens* may possibly be yet another form of the species; but if so, it is a fourth form. His description is as follows:—"*R. fulgens*—a plant which is now about twenty-five years old, and only 15 inches in height by 33 inches in diameter—has never suffered from either winter or spring frosts, nor has it yet flowered, but its compact growth and the bright verdigris-green of its young leaves render it a favourite dwarf evergreen."

Once again, Mr. Luscombe has been growing Sikkim Rhododendrons from the very first, and his plants are, or were, of the first generation. He has written to me on the subject of *R. fulgens*, and he tells me that his type of the species is, "not like that in Sir J. Hooker's work, but loose-flowering like *R. Thomsoni*." Now, considering that Sir J. Hooker's *R. fulgens* has a cluster of many flowers crammed closely together, and that *R. Thomsoni* hangs its few flowers as loosely as may be, this is saying a great deal. Mr. Anderson-Henry considers that he has two or three varieties of the species, and not many weeks ago I discovered in Mr. Rogers' most picturesque nursery, near Southampton, a form which in foliage seemed different from all that I have described. But as this last was a grafted plant, I must not rely too much on its appearance. At Kew, there are several types, which with the kind assistance of the authorities I propose to study during the ensuing season.

Similar remarks might be made with regard to other species, such as *R. argenteum*, Falconeri, Thomsoni, and others; but I must postpone these for the present, and devote a few words to my explanation of the facts as illustrated by the example of *R. fulgens*. I may be wrong, but if so, I have the satisfaction of knowing that a most competent observer, who is much interested in the subject, will probably find this very spring be in a position to confute me on the spot. The explanation, then, is this:—That as the Himalayan range passes eastward through Nepal, Sikkim, and Ehotan, the genus Rhododendron becomes truly protean in form, and presents not only an extraordinary number of species in a small space, but also striking geographical varieties in very great abundance. Even *R. arboreum*, which, according to Dr. Thomson, is so uniform, except in colour westward, begins to yield to variation in Nepal. On some future occasion I may show how this notion of extreme variety is quite in accordance with high authority, and especially with the writings of Sir J. Hooker (who mentions the case of *R. Falconeri*, *R. Aucklandii*, and others), and I may then point out the curious resemblances, and yet the differences, between the Rhododendrons of Sikkim and Ehotan, which have now been brought together in the *Flora of British India*. For the present I will only add that the circumstances attending the collection of Rhododendron seed, and the fact that ripe seed and blossoms are sown to be sent together, will explain how many smaller differences have escaped the observation of collectors who have gathered the same species from different localities, from different elevations, or perhaps from different sides of the same valleys. Such an explanation is surely more philosophical than the notion that so many variations have arisen—not gradually, but all of a sudden—from cultural influences. My readers will apprehend how interesting botanically it is to find such a variety of types packed together in so small a compass, for instance, as Sikkim; but they will, of course, remember the character of the country and its climate, where alpine and almost tropical conditions occur side by side. The Heaths at the Cape of Good Hope give an example of great variation in the same family, but Dr. Deccari's remark on the Rhododendrons of Borneo offers the best, and a very curious, analogy.

His words are very striking:—"According to my personal observations it appears that almost every mountain top in Borneo has its own special forms, which do not seem to spread themselves, at least on the adjoining mountains." *J. H. Mangles, Valewood, Haslemere.*

SPRING-FLOWERING RHODODENDRONS.—On March 16, 1878, we devoted an article to the description of various early-flowering Rhododendrons, including *R. dahuricum*, *R. præcox*, and *R. Early Gem*. We need not repeat the history and descrip-

FIG. 39.—RHODODENDRON DAHURICUM.

tions then given, but as reminders of these very useful plants we may now give figures of *R. dahuricum* (fig. 39), which is a natural species, and *R. præcox* (fig. 40), which is a hybrid between *R. da-*

FIG. 40.—RHODODENDRON PRÆCOX.

huricum and *R. ciliatum*, raised by Mr. Davies, of Ormskirk. *R. dahuricum* blooms about a fortnight earlier than *præcox*, while *R. ciliatum* is later still. Both of these, as well as *R. Early Gem* (figured at p. 335, March 16, 1878), are most useful in the spring garden and for forcing purposes, *R. præcox* often flowering under such circumstances in November.

THE WEST OF SCOTLAND PANSY SOCIETY'S SHOW will be held in the City Hall, Candleriggs, Glasgow, on Wednesday, July 26.]

LAYING BOX EDGINGS.

So many substitutes have from time to time been recommended to take the place of Box edgings in gardens, that had not universal taste been overwhelmingly in favour of the latter it would probably have in great measure long ago disappeared from our gardens. Stone or tile edgings may possibly be cheaper in the end than Box, but they will not bear comparison with the natural appearance of Box when neatly laid and kept in proper order. There are, however, exceptional cases where it would be not only true economy, but also something gained in appearance, to discard the Box—as, for example, in a stiff, clayey soil, where Box seldom remains long in good health, and a stone or tile edging is certainly preferable to a patchy Box one. But in these days of economy and retrenchment in gardens it is hardly worth while discussing seriously any present probability of stone or tile edgings taking the place of Box in gardens of any considerable extent. If I had only my own personal taste to consult, I would not hesitate to undertake a little extra labour in planting the Box, to the extent of replacing an uncongenial soil with one of a more suitable nature, rather than look at the majority of clumsy-looking edgings that I have seen substituted for Box.

It is hardly necessary to point out the importance of having neat edgings in every cultivated garden, nor is it too much to say that the garden that is without them lacks one of its greatest and most conspicuous ornaments. We have now arrived at a season when Box planting may be undertaken with every prospect of success. Box laying in autumn is rather a risky business unless the soil is light and very dry, and the plants are well rooted. Severe frost claims a heavy mortality among newly laid plants; or, if it is not severe enough to kill them outright, they are often disfigured by the green leaves turning white, and do not regain their normal colour until the season is far advanced. For this reason Box planting upon an extensive scale is best performed during the spring months, when plants having the semblance of a root at all are sure to grow and flourish. I may here mention (although it is somewhat digressing from my text) that people who are in a hurry to "clip" their Box edgings sometimes get aipped by late frosts in May, which sadly disfigure the lines of Box for some time afterwards. But considerable judgment must be exercised in regard to the character of soil and climate. It will always pay those who are engaged in such work to take well their bearings as regards locality, and to look up the average degrees of frost annually registered in the neighbourhood, because what would be safe practice in one place might be the opposite in another.

Assuming, then, that a whole garden, or any portion of it, requires to be relaid, it would be well, if possible, to have the ordinary work well in hand, in order to be able to give concentrated attention to Box planting in fine weather. Two good men will get through more planting in a favourable week than they would otherwise accomplish in double the time, with more satisfaction generally, and better results in the end. To begin with, the gravel should be removed from the line of Box to the centre of the walk, and straight sticks from 1 foot to 18 inches in length should be inserted about the centre of the line at distances of from 10 to 15 yards apart. The sticks indicate to the workman his position while the ground is in process of being prepared for replanting. In cases where the Box has been neglected and has grown naked at the bottom there may be some difficulty in selecting suitable plants to relay the lines over again, in which case all plants that are obtainable with roots should be laid together, whilst those plants having little or no roots should be planted by themselves. If the spring should turn out a genial moist one the chances are that plants having very few roots will succeed equally well with those that are well rooted, but in any case the worst plants that can be imagined may be grown into useful stock in a season. All that is necessary is to lay or "heel them in" sufficiently deep to cover the naked portion of the stems, which, as may be observed by any one, are already covered with little white specks like warts, in reality young rootlets only requiring the natural conditions of soil and moisture to cause them to grow. In a season, then, these plants are grown into valuable stock.

It may be as well to state, for the benefit of those who have to purchase Box for laying, that it costs

## EMBER COURT.

about 6z. the running yard, and that one yard will lay three or thereabouts. With regard to the preparation for planting it is important to go about the work methodically and in the simplest manner possible. The operation, from beginning to end, should be directed by some one of experience, and above all things he should have a quick eye for levelling. This is especially necessary in dealing with walks having steep gradients, where a sharp eye is worth a whole set of levelling tools. A simple way of proceeding is to take levels at, say, 15 to 20 yards apart, which will be sufficiently near to guide the workman in preparing and levelling the ground. Beginners will avoid complications by simply calculating that the height of the newly laid Box should be about level with the centre of the walk. It is specially recommended that the ground should be properly dug about 6 inches upon either side the run of the line, and that every stone should be picked out that is likely to obstruct the downward passage of the spade when the trench or cut is being made to lay in the plants. Having done this the earth will have to be firmly trodden with the feet, and brought to within a shade of level with the sticks at the different points where levels were taken. Before proceeding further raise the earth round the pegs indicating the levels up to their proper height, viz., flush with the tops of the pegs, and then lay down a strong line and peg it close to the ground at each level. After this it is only necessary to fill in between the pegs, pressing the soil firmly until the line when freed dangles upon the surface from one end to the other.

The next step for consideration will be the making of the plants, which for "neat work" should be done by those who are about to lay them. This can be done during the mornings and evenings, or during wet days, when it is not practicable to work out-of-doors. No workman should be allowed to make or prepare plants who has not had some practice in laying. The plants should be made of equal length and thickness, and trimmed level upon the top, so that the line, when laid, will present an even surface. A sufficient number of plants being ready the line should be re-laid in its proper position, and tightened as much as the cord will bear, and then "pegged firmly down at every level point," in order that it may not be disturbed during the process of planting. The trench should then be cut flush with the line and slanting slightly inwards at the bottom, so that when the plants are pressed after being laid they take a perfectly perpendicular position. No more than one hand should be employed upon the same line unless in case of workmen who have had considerable practice together. After the plants are laid press them firmly at their roots, then fill in the spare soil which, when pressed firm as a board, should be sloped down with the spade from the line of Box in the direction of the walk, leaving a good margin of soil at the base of the cut for the roots of the Box to grow in. Then fill in with stones or rubble, and bring the gravel back to its former position.

It should be stated for the benefit of amateurs and others that Box should always be laid with its roots towards the walk whether in small designs or in ordinary cases of relaying the edges of garden walks. Happily for gardens and gardeners those Dutch gardens and scrolls laid in treble lines of Box have grown obsolete. I can remember being on my knees for ten weeks at one spell, assisting to lay one of those namby-pamby doll gardens, and looking back now with the experience of twenty years I can only say the garden was dear at the price. We first prepared the ground roughly, marked out the lines where the Box was to be laid, dug and cleared it of stones in the run of the line of Box, then firmed and levelled the whole surface and laid down the design. But what is advocated here is that it is worth an effort at this the most favourable season of the year to renew the edgings of walks with neatly laid Box, which together with clean well rolled walks are the most pleasing features of a well kept garden. *W. Hind.*

PEAR JALOUSIE DE FONTENAY. — Mr. Barron remarks in the *Florist and Pomologist* that there are few better Pears than this, which is one of the oldest of our high-class varieties, and yet is comparatively unknown. It is not a sensational Pear, but, like the Winter Nells, it is always good. The fruits are somewhat below the size in fashion at the present time, and it has the misfortune to come into use in October, when good Pears are abundant.

This charming country seat, the residence of C. J. Corbett, Esq., is situated in a beautiful and fertile district about half-way between Thames Ditton and Esher railway stations, and about 2 miles distant from Hampton Court Palace. The estate is of considerable historical interest, as may be seen from a perusal of the history of Surrey. The present proprietor has occupied the place over twenty-one years, during which time important additions have been made to the gardens and grounds. The carriage-drive leading to the mansion is approached from the Esher Road through substantial iron gates fixed into strong square stone pillars. The drive curves gently to the east front, from which there is a good view of the park, which is fertile in appearance, and well timbered. The house is a plain but substantial edifice of brick, partly stuccoed, with extended wings of a uniform character. The ceilings of the front hall are fitted up in the arabesque style, and the mansion contains a large collection of pictures.

The grounds upon the south side contain good specimens of *Abies cephalonica*, fine *Wellingtonias* and *Araucarias*, and at the south-west angle, outside the conservatory, a huge specimen of the *Oriental Plane*. The conservatory and fernery in three divisions run east and west, and communicate with the mansion, the fernery being very artistically arranged in the inside with cascades and rockwork. The conservatory is a large oblong structure, ornamented with creepers upon the roof of *Cobaea scandens*, *Tecoma jasminoides*, *Habrothamnus elegans*, *Lapagerias*, &c., and well furnished with fine Palms, Tree Ferns, *Musa Ensete*, *Sparmannia africana*, and other winter-flowering subjects. Orange trees and tall *Aralias* have also a good effect in this structure. In the three divisions of the fernery the principle of planting is the same throughout—projecting pieces of rock with pockets containing a handsome specimen Fern, and having a groundwork of *Selaginella Kraussiana*, and the jungles among the rocks treated in a similar way. The effect produced is largely owing to the fact that but few large Ferns are used, while the groundwork of medium-sized plants and the carpet of *Selaginella* is elaborate. The sides of the structure are also made to have a rustic appearance, by fastening pieces of cork to the woodwork, upon which dwarf-growing Ferns and mosses are kept green and fresh by supplying them with plenty of moisture. The passage from the fernery into the drawing-room is exceedingly pretty. As you ascend the steps the rockwork is composed of *Delishyia* spar, and is beautifully clothed with Ferns and mosses.

Flower gardening is carried out in a series of beds cut out of the margins of the lawns, and in geometrical groups in other portions of the grounds, which are also furnished with valuable ornamental trees and plants. In fact, flowers of one kind or another and trees and shrubs are closely associated with each other over the whole area of the dressed grounds, with more than ordinary taste and skill. The chief attraction of the grounds lies, however, in the meanderings of the Mole, or, rather, of the river Ember, a tributary of the Mole. Outside the conservatory, on the river's brink, stands a fine group of *Wych Elms*; and following the course of the river through the grounds in a northerly direction are some fine specimen Conifers and a stump of a fine old Willow (*Salix alba*) which was blown down about a year ago. The stump is over 4 feet in diameter, or 12 feet 6 inches in circumference, according to the ordinary rule of calculation. This is thought to be an extraordinary size for a tree of its kind.

In the north side of the grounds the nut-walk and rosey are said to be very pretty when in leaf, as also a large *Vistaria* planted against the north wall of the kitchen garden, which is 4 feet in diameter at 2 feet from the ground, and which covers a length of wall 27 yards in length, besides covering a framework, 10 yards in diameter, the same length. The branches are supported by stakes about 7 feet high from the ground, and a design underneath is planted with hardy ornamental shrubs.

Leaving the kitchen garden on the right, and pursuing the course of the river, which is spanned by several rustic bridges, the northern extremity of the grounds is reached, where there are some grand specimens of *Thuja Lobbi*, 50 feet high; *Cupressus Lawsoniana* and *macrocarpa*, a fine *Abies cephalonica*, and several good *Wellingtonias*. In these (commonly called the new) grounds spring

bedding and flowering shrubs are the chief feature. One must omit many things of interest in a brief notice of this kind, but before entering the kitchen garden I must mention a noble tree of *Taxodium distichum* by the brink of an outlet of the river, which is remarkable for its size, but it is feared it is in declining health.

The kitchen garden is a very compact walled-in oblong figure, divided into the usual quarters for the cultivation of fruits and vegetables. The walls are in excellent order, and also the trees, which are neatly trained, and the espalier-trained trees bear evidence of the same skilful treatment. The forcing houses are within the walls of this garden, and are in capital repair, and their occupants generally in first-rate order. The south wall is entirely covered in with glass for forcing Figs, Grapes, Peaches, and other fruits. One of the divisions is devoted to plant growing, and contains well cultivated samples of popular stove plants.

The second range is about equally divided between cultivating plants and fruits. Of the latter Pines, Grapes, Peaches, and Strawberries, may be mentioned; and of the former Orchids, Ferns, and miscellaneous plants generally. There are several detached forcing pits which are found useful, and a fine span-roof structure for growing Pines and New Holland plants.

In the division with the Pines Cucumbers are well grown in boxes placed over the hot-water pipes and trained up both sides of the roof. In the cool division there is a good show of seasonable flowers upon the side stages, while the centre stage is arranged with New Holland plants in considerable variety, intermixed with other flowering plants, which add immensely to the appearance of the house, and bear testimony to the skill of the cultivator (Mr. Bigg), who has been head gardener at the place for over nine years. *Albion.*

## PYRETHRUM INSECT-POWDER.

THERE are very few data at hand concerning the discovery of the insecticide properties of Pyrethrum. The powder has been in use for many years in Asiatic countries south of the Caucasus mountains. It was sold at a high price by the inhabitants, who successfully kept its nature a secret until the beginning of this century, when an Armenian merchant, M. Juntikoff, learned that the powder was obtained from the dried and pulverised flower-heads of certain species of Pyrethrum growing abundantly in the mountain region of what is now known as the Russian province of Transcaucasia. The son of M. Juntikoff began the manufacture of the article on a large scale in 1828, after which year the Pyrethrum industry steadily grew, until to-day the export of the dried flower-heads represents an important item in the revenue of those countries.

Still less seems to be known of the discovery and history of the Dalmatian species of Pyrethrum (*P. cinerarifolium*), but it is probable that its history is very similar to that of the Asiatic species. At the present time the Pyrethrum flowers are considered by far the most valuable product of the soil of Dalmatia.

There is also very little information published regarding either the mode of growth or the cultivation of Pyrethrum plants in their native home. As to the Caucasian species, we have reason to believe that they are not cultivated—at least not at the present time—statements to the contrary notwithstanding.\* The well-known Dr. Gustav Radde, Director of the Imperial Museum of Natural History at Tiflis, Transcaucasia, who is the highest living authority on everything pertaining to the natural history of that region, wrote us recently as follows:—"The only species of its genus — Pyrethrum roseum — which gives a good effective insect powder, is nowhere cultivated, but grows wild in the basal-alpine zone of our mountains at an altitude of from 6000 to 8000 feet." From this it appears that this species, at least, is not cultivated in its native home, and Dr. Radde's statement is corroborated by a communication of Mr. S. M. Hutton, Vice-Consul-General of the United States at Moscow, Russia, to whom we applied for seed of this species. He writes that his agents were not able to get more than about half a pound of the seed from any one person. From this statement it may be inferred that the seeds have to be

\* Report Comm. of Patents, 1837, Agriculture, p. 130.

gathered from the wild and not from the cultivated plants.

As to the Dalmatian plant it is also said to be cultivated in its native home, but we can get no definite information on this score, owing to the fact that the inhabitants are very unwilling to give any information regarding a plant the product of which they wish to monopolise. For similar reasons we have found great difficulty in obtaining even small quantities of the seed of *P. cinerarifolium* that was not baked or in other ways tampered with to prevent germination. Indeed, the people are so jealous of their plant that to send the seed out of the country becomes a serious matter, in which life is risked. The seed of *Pyrethrum roseum* is obtained with less difficulty, at least in small quantities, and it has even become an article of commerce, several nurserymen here, as well as in Europe, advertising it in their catalogues. The species has been successfully grown as a garden plant for its pale rose or bright pink flower-rays. Mr. Thomas Meehan, of Germantown, Pa., writes us:—"I have had a plant of *Pyrethrum roseum* in my herbaceous garden for many years past, and it holds its own without any care much better than many other things. I should say from this experience that it was a plant which will very easily accommodate itself to culture anywhere in the United States." Mr. Peter Henderson, of New York, another well-known and experienced nurseryman, writes:—"I have grown the plant and its varieties for ten years. It is of the easiest cultivation, either by seed or division. It now ramifies into a great variety of all shades, from white to deep crimson, double and single, perfectly hardy here, and I think likely to be nearly everywhere on this continent." Dr. James C. Neal, of Archer, Fla., has also successfully grown *P. roseum* and many varieties thereof, and other correspondents report similar favourable experience. None of them have found a special mode of cultivation necessary. In 1856 Mr. C. Willemot made a serious attempt to introduce and cultivate the plant\* on a large scale in France. As his account of the cultivation of *Pyrethrum* is the best we know of, we quote here his experience in full, with but few slight omissions:—"The soil best adapted to its culture should be composed of a pure ground, somewhat silicious and dry. Moisture and the presence of clay is injurious, the plant being extremely sensitive to an excess of water, and would in such case immediately perish. A southern exposure is the most favourable. The best time for putting the seeds in the ground is from March to April. It can be done even in the month of February if the weather will permit it. After the soil has been prepared and the seeds are sown they are covered by a stratum of earth mixed with some vegetable mould, when the roller is slightly applied to it. Every five or six days the watering is to be renewed, in order to facilitate the germination. At the end of about thirty or forty days the young plants make their appearance, and as soon as they have gained strength enough they are transplanted at a distance of about 6 inches from each other. Three months after this operation they are transplanted again at a distance of from 14 to 20 inches, according to their strength. Each transplantation requires, of course, a new watering, which, however, should only be moderately applied. The blossoming of the *Pyrethrum* commences the second year, towards the end of May, and continues to the end of September." Mr. Willemot also states that the plant is very little sensitive to cold, and needs no shelter, even during severe winters.

The above-quoted directions have reference to the climate of France, and as the cultivation of the plant in many parts of North America is yet an experiment, a great deal of independent judgment must be used. The plants should be treated in the same manner as the ordinary *Asters* of the garden or other perennial Compositae.

As to the Dalmatian plant, it is well known that Mr. G. N. Milco, a native of Dalmatia, has of late years successfully cultivated *Pyrethrum cinerarifolium* near Stockton, Cal., and the powder from the California-grown plants, to which Mr. Milco has given the name of "Buhach," retains all the insecticide qualities, and is far superior to most of the imported powder, as we know from experience. Mr.

\* Mr. Willemot calls his plant *Pyrethrum du Caucase* (*P. Willemoti*, Duchartre), but it is more than probable that this is only a synonym of *P. roseum*. We have drawn liberally from Mr. Willemot's paper on the subject, a translation of which may be found in the report of the Commissioner of Patents for the year 1854, Agriculture, pp. 223-331.

Milco gives the following advice about planting—advice which applies more particularly to the Pacific coast—"Prepare a small bed of fine, loose, sandy, loamy soil, slightly mixed with fine manure. Mix the seed with dry sand, and sow carefully on top of the bed. Then with a common rake disturb the surface of the ground half-an-inch in depth. Sprinkle the bed every evening until sown; too much water will cause injury. After it is well sprouted, watering twice a week is sufficient. When about a month old, weed carefully. They should be transplanted to loamy soil during the rainy season of winter or spring."

Our own experience with *P. roseum* as well as *P. cinerarifolium* in Washington, D.C., has been so far quite satisfactory. Some that we planted last year in the fall came up quite well in the spring, and will perhaps bloom the present year. The plants from sound seed which we planted this spring are also doing finely, and as the soil is a rather stiff clay, and the rains have been many and heavy, we conclude that Mr. Willemot has overrated the delicacy of the plants.

In regard to manufacturing the powder, the flower-heads should be gathered during fine weather when they are about to open, or at the time when fertilization takes place, as the essential oil that gives the insecticide qualities reaches, at this time, its greatest development. When the blossoming has ceased the stalks may be cut within about 4 inches from the ground and utilized, being ground and mixed with the flowers in the proportion of one third of their weight. Great care must be taken not to expose the flowers to moisture, or the rays of the sun, or still less to artificial heat. They should be dried under cover and hermetically closed up in sacks or other vessels to prevent untimely pulverization. The finer the flower-heads are pulverized the more effectually the powder acts and the more economical is its use. Proper pulverization in large quantities is best done by those who make a business of it and have special mill facilities. Lehn & Fink, of New York, have furnished us with the most satisfactory powder. For his own use the farmer can pulverize smaller quantities by the simple method of pounding the flowers in a mortar. It is necessary that the mortar be closed, and a piece of leather through which the pestle moves, such as is generally used in pulverizing pharmaceutical substances in a laboratory, will answer. The quantity to be pulverized should not exceed 1lb. at a time, thus avoiding too high a degree of heat, which would be injurious to the quality of the powder. The pulverization being deemed sufficient, the substance is sifted through a silk sieve, and then the remainder, with a new addition of flowers, is put in the mortar and pulverized again.

The best vessels for keeping the powder are fruit jars with patent covers, or any other perfectly tight glass vessel or tin box. *C. V. Riley*, in "*American Naturalist*."

(To be continued.)

## PLANT PORTRAITS

*ALOCASIA PUTZEYSII*, N. E. Brown, sp. n., *Illust. Hort.*, t. 439.—A Javanese Aroid, with stalked peltate leaves, 1-1½ foot long by 6-7 inches wide, hastate ovate lanceolate acute, dark green, with a light green edge, and with the nerves remote from one another and white; the under-surface is of a dark violet colour. Introduced by M. Linden.

*CAMPESSEDESIA PARAGUAYENSIS*, Hook. f., *Bot. Mag.*, t. 6604.—A Melastomaceae shrub, with small sessile ovate acute ciliate leaves, and terminal many-flowered cymes of rosy-lilac flowers about 1 inch across. Native of Paraguay. Messrs. E. G. Henderson & Son.

*CAMELLIA GUISEPPINA MERCATELLI*, *Bull. Soc. Toscana di Orticultura*, October.—Flowers white, sparingly striped with red, moderate in size, very double, and very symmetrically imbricated, inner petals somewhat pointed, outer ones rounded, faintly crenulate.

*GYNURA AURANTIACA*, *Illust. Hort.*, t. 436.—A remarkable Javanese Composite perennial, with a thick fleshy stem and shortly stalked ovate acute coarsely toothed leaves, pale, and of a violet or purple tint except near the apices. It is suspected that it will be a good plant for summer bedding. Hort. Linden.

*HIBISCUS ROSA SINENSIS*, Lucien Linden, *Illust. Hort.*, t. 447.—Flowers large, very double, yellowish, striped and variegated with brilliant red markings.

*IRIS SUSIANA*, *Berlin Monatschrift*, December. *LESPEDEZA BICOLOR*, Turczaninow, *Bot. Mag.*, t. 6602.—A hardy Papilionaceous shrub, native of North-eastern Asia, with glabrous 3-foliolate leaves with oblong leaflets. The flowers are numerous in branched panicles, each about the size of the flower of a Vetch and of a rosy-purple colour. Hort. Kew.

*MASDEVALLIA SHUTTLEWORTHII*, *Illust. Hort.*, t. 435.—Flowers yellowish, with broadly ovate segments, striped spotted and barred with red, and prolonged into a very long slender tail. See *Gard. Chron.* 1875, i., 170; 1876, vol. ii., 752.

*NECTARINE PEACH*, *Illust. Hort.*, t. 440.—Fruit of medium size, quite glabrous, like a Nectarine, golden-yellow, brilliant crimson next the sun, and with a small nipple and shallow suture. Flesh very juicy, greenish-white, darker towards the centre.

*PEAR JULES D'AIROLES* (Leon Leclerc), *Null. d'Arboriculture*, January, 1882.—Fruit large, pyriform oblique, brilliant red on the sunny side, eye shallow, stalk stout, short; flesh white, juicy, of first quality. Season, December.

*TOMATO TRENTHAM EARLY FILLBASKET*, *Florist and Pomologist*, December.—A cross between *Criterion* as the seed-parent, and *Trophy* as the pollen-parent. It has the fine flavour and colour of the latter with the productiveness of *Criterion*. Raised by Mr. Stevens, of Trentham.

## SHOREHAM PLACE.

SHOREHAM PLACE, near Sevenoaks, Kent, is situate about half a mile from the Shoreham station on the London, Chatham, and Dover Railway, and is the residence of H. B. Midway, Esq. The neat and practical manner in which gardening is carried out there is at once evident when the garden is entered, and in the various plant-houses may be seen many novelties of sterling merit, and which are also well grown. The flowering-house is a span-roofed structure 50 feet by 20, and is very gay with *Amaryllis*, *Cyclamen*, *Primulas* (Williams' *alba magnifica* and *rubro-violacea*, very fine), *Carnations* of sorts, *Cinerarias*, *Callas*, *Deutzias*, *Epacris*, *Salvias*, *Lilacs*, *Rhododendrons*, *Azalea indica* and *mollis*, *Abutilons*, *Gauldres Rose*, *Linum trigynum*, and that grand old *Delargonium ROLLISON'S Unique*, intermixed with *Camellias* and *Ericas*, form a very nice display. The *Orchid*-houses are also very gay, amongst others in flower being *Cypripedium boxallii*, *C. insigne* (a fine variety, with three dozen flowers), *C. villosum* (with twelve blooms), *Ceologyne cristata*, *Vanda gigantea*, *Dendrobium Wardianum*, *D. nobile*, *Lycaste Skinneri*, *Calanthe Veitchii* and *vestita*, *Vanda skinneri* and *tricolor* (fine varieties), *Phalenopsis Schilleriana*, *Dendrochilum glutameum*, *Lælia Pilcheri* (rare), *Cypripedium barbatum*, *Odontoglossum crispum* (many varieties), *Oncidium*, &c. These mixed with flowering plants of *Begonia odorata*, *nitida* and *manicata*, and several good Ferns, form a very imposing sight. The various growths in other varieties of *Orchids* show that they receive the attention they require; the cool *Orchids* are done remarkably well, and are grown in quantities for cutting purposes.

The stove contains a very fine collection of well-coloured *Dracenas* and *Crotons*, *Palms*, and other fine-foliage-plants. Flowering plants are also well represented. Fine specimens of *Anthurium Scherzerianum*, *Eucharis*, *Dipladenias*, *Allomandas*, &c., are most noticeable; and winter flowering *Begonias* are grown extensively, as also are *Thysanotus rutilans*, *Centropogon Lucyanus*, and such-like—these at this dull season of the year are very useful; a lean-to house planted with *Roses*—*Niphedots*, *Marchal Niel*, *Gloire de Dijon*, being particularly fine just now, and have been so all the winter. The fruit-houses are promising to produce good crops; *Peaches*, *Nectarines*, and *Figs*, are well set, and the *Vines* look remarkably well, carrying a good crop, clean, strong, and healthy.

Noticeable also in a late *Peach*-house are fine specimens *Ericas*, *ampullacea*, *cerinthoides*, *coronata*, &c., making fine growth. The various pits and frames are full of good useful flowering plants, suitable for cutting purposes. The forcing department is also now busily engaged. *Beans*, *Melons*, *Cucumbers*, and *Strawberries* are grown in great quantities, and are producing fine crops. The whole of this establishment is well done; it has been under the management of Mr. James Burt for sixteen years, and the condition of both indoors and out reflects great credit on his abilities as a gardener. O.

## THE HERBACEOUS BORDER.

**OMPHALODES VERNA.**—This pretty spring flowerer, which is now in full bloom here, like many other things, fully a month before its usual time, will be thought by many too common and too easily grown to require any notice. Yet how many gardens are without it, and in mine, for one, it used to be planted nearly every year only to perish before the next. Two years ago, I was at Grange-over-Sands, where the gardens are full both above and below ground of limestone rocks, about the edges of which this plant ran and flourished so luxuriantly as to become in some spots a troublesome weed. It did nowhere better than at the edges of drives covered with gravel and bounded by rocks. I had supposed from its resemblance to a *Myosotis* that it liked a damp and shady spot, and I am prepared to hear that it does well in such places in some gardens; but here the clouds give enough shade, and there is too much damp. However, I brought a large supply from Grange, and planted it everywhere. The finest batch is where it has strayed into a gravel walk on the upper ledge of a steep bank, a very well drained spot. But I have 200 or 300 yards of edging made of common square blue Staffordshire tiles. The soil on the border side of these is level with the top of the tile; on the other side, the walk is 4 inches below the top of the soil. When planted at the edge of the border quite against the tile, many rock plants which I cannot grow generally on a flat border seem quite at home, and grow over the edge down to the gravel. This is the place that just suits *Omphalodes verna*. It runs along the edge of the tiles, sending up its suckers as it goes, which again send their flowering shoots to hang over the side, and make what would otherwise be an ugly edging very ornamental. It requires, however, trimming and thinning, and replanting occasionally; for when it takes to a spot, the multiplication of its shoots is tremendous. *C. Wolley Dod, Edge Hall, Malpas.*

**PULMONARIAS.**—The variety sold as *P. sacharata grandiflora*, and also having several other names (the oldest and most correct, if I mistake not, being *P. officinalis* var. *caucasica*), is perhaps the most showy of the many varieties of Lungwort. It is remarkable for being this year far ahead of the other varieties in its time of flowering, having been fully out since the beginning of February. Two years ago a native form common in woods near Poole in Dorsetshire, whence I had it, was equally ahead of the others. In Bentham's *British Flora* it is stated that the two forms recognised as native, generally called *P. officinalis* and *P. angustifolia*, are only varieties of one species, and that intermediate forms are found in different parts of Europe connecting them. Having done my best to collect all the *Pulmonarias* in cultivation in England, I am disposed, as a gardener, to agree with Mr. Bentham. I except, of course, the plants now generally called *Mertensias*, and the delicate and rare *P. dahurica*, but I think that of the others—more than a dozen in number, and still more in name—a series may be formed, between the links of which it is difficult to draw a line. *Pulmonarias* vary a good deal according to soil and situation, and probably most of the so-called species are local varieties found wild in some parts of Europe or Asia. *Pulmonarias* are very unwilling to make seed in the garden, and I believe in England generally. Being asked for some seed for scientific purposes I searched all my plants last year, and a single seed, which was lost in transit, was all I was able to send. The very early flowering of *Pulmonarias* is to be regretted, as the colour of the flowers is spoilt by frost, though the plants do not suffer. *C. Wolley Dod, Edge Hall, Malpas.*

**DORAGO ORIENTALIS.**—Amongst the most conspicuous of outdoor herbaceous plants now in flower is the subject of the present note. It is quite hardy, but the pretty blue blossoms are sometimes discoloured and spoilt if severe weather sets in after they have opened. It grows about a foot high, and will take care of itself in the front of the ordinary shrubby border. It is a native of Eastern Europe and Western Asia, and was cultivated in the Chelsea Botanic Garden in 1752.

THE BURTON-UPON-TRENT HORTICULTURAL SOCIETY'S FLOWER SHOWS will be held this year on June 21 and August 23.

## SALIX BASFORDIANA.

UNDER the name *Salix Basfordiana*, the well-known Willow nurseryman, Mr. Scaling, has for many years distributed a very beautiful Willow which deserves general cultivation. Under the name *Salix sanguinea*, Mr. Scaling also sells another Willow having the closest resemblance to the first. The one is male and the other female; and I am satisfied they are the two sexes of the same species. I have not succeeded in finding any scientific description of this Willow, and I propose to describe it now under the appellation given to the male plant, *S. Basfordiana*.

When I first received this Willow from Mr. Scaling in 1871, he informed me that he had found it some years before growing in the Forest of Ardenness,

FIG. 41.—SALIX BASFORDIANA, HORT.: FEMALE.

in the North of France, from whence he subsequently obtained cuttings.

*Salix Basfordiana* belongs to the section of the Willows called "Fragiles," which, by the way, very little deserves the appellation: it is especially inapplicable to the species now under consideration. It grows of considerable height in a broad pyramidal shape: the foliage is bright, abundant, and handsome. But the most striking beauty of the tree is the bark, which is brilliant orange passing to red in the terminal twigs, with a shining, polished surface. The colour is very remarkable, and altogether surpasses that of our Golden Osier—*Salix vitellina*. The bark of the female plant is rather darker than in the male, especially on the small terminal branches. The female tree is slightly less vigorous in growth than the male, and perhaps rather less hardy.

*Salix Basfordiana* has considerable resemblances to three of our native *fragiles*. The foliage and glossy smoothness of the bark—though not its colour—

resemble *S. decipiens*: the female catkins and ovaries are very like those of *S. Russelliana*, while the male catkins resemble *S. fragilis*.

The early foliage and the catkins appear together, usually about the third or fourth week of April. The leaves are lanceolate, pointed, slightly serrated, and very glabrous. When the growth is very vigorous large stipules are produced; but they are often entirely wanting. The young twigs and the developing leaves are frequently stained with crimson, as in *S. decipiens*.

Female catkins cylindrical, about 1½ inch long. Ovaries adpressed to the axis, as in *S. Russelliana*. Scales smooth, very slightly ciliated at the edge, or not at all, about two-thirds the length of the ovary. Germen nearly sessile, lanceolate, smooth, closely resembling *S. Russelliana*. Style longer than the bifid stigma.

Male catkins cylindrical, often reaching 2½ inches in length. Scales slightly ciliated, about half the length of the stamens. The male catkins are handsome, abundant, pale yellow, with an agreeable perfume, and are much frequented by bees.

The provisional name, "*Basfordiana*," has been given to the Willow, after the parish, Basford, Notts, in which Mr. Scaling resides, and where he cultivates an enormous collection of species and varieties of *Salices* with great success.

This is the best season of the year for planting Willow cuttings, and it should be known that cuttings succeed far better than rooted trees transplanted. *James Saller, F.R.S., Basingfield, Basingstoke.*

[We have submitted the drawings to M. Crépin, the Director of the Brussels Botanic Garden, the authority for plants of the Ardenness, but that gentleman is not able to give an opinion as to the identity of this form. ED.]

## Notices of Books.

## The Names of Herbes.

MR. KRITTEN has edited for the English Dialect Society a reprint of William Turner's treatise on this subject, which dates as far back as 1548. Indexes giving the modern names of the plants are added, the necessity for which is apparent from the title-page, which runs thus:—"The Na-] mes of herbes in | Greke, Latin English, | Duch & Frenche, wth | the commune names | that Herbaries | and Apotheca- | ries use. Gathered by Wil- | liam Tur- | ner." The book is dedicated, in the long-winded and fulsome style then prevalent, "To the mooste | noble & mighty Prince Edward | by the grace of God Duke of Summerset, | Erie of Hereford, Vicount Beuchamp, | lord | Semour uncle unto the Kynges highnesse | of Englande, governor of his most roy- | all person, and Protector of al his realmes | dominions and subjectes," &c. The book was written "from your grace's house at Syon, anno Dom. MCCCCXLVIII," and it is interesting to find a park, still renowned for its fine trees, even at that time enjoyed a similar renown. Thus we are told that "Cypresses growe in great plenty in my Lordes graces gardine at Syon." Of "Pomgranat trees" also, which "growe plentifully in Italy and in Spayne," we are told that "there are certayne in my Lordes gardine at Syon, but their fruite cometh neuer vnto perfection." The Fig tree was in cultivation at that time also, as we learn from the following extract:—"Ficus is called in Greke Syce, in English a Fig tree, in Duch ein fyge baume, in frēch vng figuier. There are diuers Fyg trees in Englande in gardines, but nowhere els." Strawberries also were common enough, for we read that "Every man knoweth wyl inough where Strawberries growe."

Of *Narcissus* it is stated that there is one "wth a white floure, which groweth plentifully in my Lordes gardine at Syon, and it is called of diuerse, whyle Laus tibi; it maye also be called whyeke daffadyll."

The list will prove useful to those seeking the history of the introduction of various plants. Thus, while the Larch, the Fir, and the Pine—of which latter we are told, by the way, that "there groweth one fayre one in Richmuud"—are all mentioned—in some cases as "plated and set by mannes hande, both in England and in Germanie"—no mention is made of the Cedar. As to the *Platanus*, Turner tells us he "neuer saw any plaine tree in Englande sauinge one in North- underlande besyde Morpeth, and another at Barnwell Abbey besyde Cambrige." In reference to "radix," Radishes, it appears that while the long kinds were

common in England at that time, "the other kynde [with], a rounde root lyke a rape . . . called radix Beotia and radix Syriaca" had only been seen by the author "no where els sayunge onely in high Almayn [Germany]." Turner, like many of his successors, and with as little success, sought to impose English names where there were none. Asparagus, the Asperge of the French, was for Turner "sperage," a good enough word, at any rate better than the Sparrer-grass which has prevailed. Our Turnip Radish, he calls an "Alman or rape radices"—rape corresponding to Brassica Rapa, and not to the B. Napus or Turnip. The latter vegetable was not grown in England at that time; for though Turner says he has "hearde sume cal it in Englishe a

an arber for the tyme of summer." The name Smilax was also applied to the Yew.

The extracts we have made will suffice to show what interest attaches to the "names of herbes," and what service Mr. Britten has done by reprinting it.

### Natural History.

ABOUT BIRDS.—It is a matter of regret to all who take an interest in the pursuits of country life and the study of natural history that the opportunities of observing the habits of British birds are restricted, in the case of the majority who have no leisure for extended explorations, to the more common and well-known

preserved neighbourhoods, their numbers were terribly thinned. I wish a Rare Bird Fund could be established for rewarding keepers and others who could point out living specimens in the woodlands in their range, and not let the barn-door be the record of their skill in destroying life. I fear we have but few Waterfowls left amongst us—at least, none so bold and outspoken in condemning the cruel warfare waged against many birds of value and interest to the community at large, such as the owl, kestrel, &c. There is some comfort to be found in recent legislative acts which have thrown the onus of their protection over those birds that are esteemed of benefit, or that do not interfere prejudicially with our crops of corn or fruit. The Wild Birds Protection Acts have been undoubtedly beneficial, but while common birds increase and multiply, the more beautiful and interesting rather show decrease. And one reason, besides the avidity with which they are pursued by collectors and others is, that our rare birds have so few abiding places where they can roost in securely, and find a safe and undisturbed refuge in the nesting season.

It has occurred to me that those naturalists who are strongly in favour of the more complete preservation and protection of rare birds might by joint co-operation give greater effect to the wise and merciful laws recently enacted by imitating the sporting community and establishing coverts for the purpose of securing safe breeding places both for residents and migrants, and providing in such coverts, by the introduction of proper trees and shrubs, a certain amount of natural food, the produce of the plantation. It may seem a little utopian to uninterested people to propose devoting a certain acreage of land merely for the preservation of birds which may not be giving direct benefit to the community; but, properly explained, it is not more so than forming fox-coverts, and maintaining them for the harbour and increase of those animals. If on some of our great estates only one such wood were planted and kept sacred to birds, so fenced that no hare or rabbit or wily fox, or even predatory boy, could invade its guarded precincts, what a source of interest it would become; and it would have the merit of embellishing the landscape, if planted with the following trees and shrubs, all of which afford either food or shelter to nearly every kind of wild bird, always excepting the fen and heath birds. I would plant central groups of the Douglas Fir: this, with masses of Norway Spruce, the Scotch and Austrian Pine, would give shelter to our larger birds, and in time tempt even the banished crossbill. The Larch should also be included, and the Hemlock Spruce sparingly distributed; the two Cherries, Cerasus Mahaleb and C. Padus, with the Plums, myrobalana and spinosa, Pyrus Malus, Sorbus, and the Mountain Ash—all abundantly; the Elder and Viburnum opulus, Holly; and all these latter, which would be a third rank, should be followed as an outer fringe by Berberis communis and Mahonia, Cotoneaster Simonsi, Leycesteria formosa, the Dog Rose, and the Bramble, with Raspberries and some Gorse bushes, the whole hedged in with the common Thorn, bushes of which should find a place. An enclosure of, say, 4 acres would be insufficient for trees so valuable for birds as the Oak and Beech; the slow growth and unbragous character of these trees would be also against them. The trees named already as suitable would, fairly planted, grow rapidly, and in half a score years present a very fair covert, and would from the second year be valuable for some of the smaller song birds. *William Ingram, Delvoir, February.*

FIG. 42.—SALIX BAEFFORDIANA: MALE. (SEE P. 298.)

turnepe, and other some a nauet or nauet [navet, French], yet he mentions it as growing plentifully at Andernack (Andernach) in Germany. Moreover, he tells us that it may also be called "long Rape or navet gentle, as a Rape hath a round roote, so hath a nauet a longe roote and something ycalowishe." From this, it is clear that Globe Turnips were not known in those days. Raspberries were clearly not common, for all that is said is that "they growe in certayne gardines of Engleland," less than is said in the case of Savin. What we now call Scarlet Runners were then classed under Smilax hortensis—very wide of the mark, the more remarkable as under the head of Asparagus, as also under Smilax aspera, the writer shows that he knew the true Smilax. Be this as it may, there is no mistaking the author's meaning, for his Smilax hortensis, is a "some wryte, Phaseole. It may be called in English kydney beane, because the seede is lyke a kidney or arber beanes, because they serve to couer

forms of bird life. The less frequently met with examples, reported scarce, are becoming really rare. Our local newspapers record with painful iteration the destruction of rare birds, and but too frequently of the seldom seen and interesting Falconidæ; only this week I have read of a golden eagle having been shot in Glenalmond, on the Auchnafai Hills. In this neighbourhood several hazy buzzards have been cruelly killed. The newspapers recorded the appearance of the little bustard in Cambridgeshire, and their speedy destruction. The bittern is practically extinct in the British Isles. The ruff and reeve, once so common in Lincolnshire, may in many seasons be sought for fruitlessly. Amongst still smaller birds I miss the crossbill, thought it may be found in the great Scottish forests. That handsome bird, the hawfinch, was, prior to the winters of 1880 and 1881 sufficiently numerous in the Belvoir Woods; but, driven by hunger to less

THE WRYNECK.—I heard this bird in Hampshire on February 13 in a small plantation near the roadside, so I trust that the old folklore belief in the wryneck being the advent of a mild, early spring may be confirmed this year, though our spring flowers, such as Primroses, Potentilla, and wood Anemone are very late in showing bloom. *Helen E. Watney, Liss.*

THE SEED HARVEST OF 1881.—Messrs. James Carter & Co., of High Holborn, in a report just issued, state that, with few exceptions, the seed crop of 1881 was superior to that of 1880, both in quantity and quality. The extreme drought of July last, and the succeeding heavy rainfall in August, resulted, however, in a shorter crop of grass and some other seeds than the earlier anticipations warranted.

## Orchid Notes and Cleanings.

**DENDROBIUMS ON BARE BLOCKS.**—In the current number of *The Gardener* Mr. Spyers states that he has cultivated the following species successfully for several years with their roots attached to bare blocks of wood:—*D. aggregatum*, *D. teretifolium*, *D. Jenkinsii*, *D. linguiforme*, *D. chrysotoxum*, *D. suavisimum*, *D. capillipes*, *D. senile*, and *D. ciliare*. The blocks were in every case used green, with the bark attached, and were cut from such trees as Pear, Maple, Dogwood, Acacia, Box, Thorn, Elm, and Elder. The enormous specimen of *D. chrysotoxum* at Burford Lodge, which yearly produces over fifty spikes, was wired some six years ago to a cylindrical block of Pear-wood. The wood has long since perished, and the roots have penetrated it in all directions, much to the satisfaction of the plant. *D. Falconeri* is another plant that will grow well for years hanging from a block of wood to which the main of its roots are attached.

**ODONTOGLOSSUM KOEHLII.**—This species is in splendid cultivated condition in the well-assorted collection of David Tod, Esq., Eastwood Park, near Giffnock; in fact, the dozen or so of plants in the collection are quite unique, without a speck to mar the appearance of the leaves. Every leaf is perfect not only as regards the thrips' marks that uniformly prevail, but the extremity of the leaves without a black patch; and the plants, too, are of some size; one beautiful piece I counted had eight young breaks, and the old pseudobulbs had leaves 15 to 18 inches long. Many of the bulbs showed four flower-spikes each, and such flowers for size as would delight and astonish even the best-informed orchidophilist. All this is brought about by, in the first place, keeping the plants in a warmish temperature; in the second, by a regular process of feeding with well-diluted sheep-droppings, of course cautiously applied; and in the third place, by regular baths of soap-suds from the laundry. I confess I never saw such cultivation of what is acknowledged to be one of the most difficult plants, at least to grow to its size. It was not a solitary plant, I observe, but the batches showing the advantages of a good system. Both Mr. Tod and his excellent gardener say that they are the easiest to manage of any group they have. There is no doubt at all that cleanliness is the key to the secret of successful culture; for, no matter how clean and beautiful these plants are, they get their usual soap-sud bath and their usual feed, as a practised eye can easily detect from the mossy surfacing being in a measure furnished by the ablations. The whole plants in this collection are well handled, and particularly a superb plant of *Odontoglossum Andersonianum*, which has made a growth of Broddingnagian size, and reflect much credit on the skill of Mr. Ewart, the gardener. *James Anderson, Meadowbank.*

**TRICHOPIPLIA SUAVIS.**—A nice specimen of this lovely Orchid is just now in flower in the collection of D. B. Crawshaw, Esq., Rosefield, Sevenoaks. It bears nearly three dozen of its beautiful spotted flowers, and is a fine Orchid for flowering at this season of the year, especially when done as well as this plant is. *A. O.*

**CYPRIPEDIUM BARBATUM.**—Mr. Hopkins, The Gardens, High Cross, Framfield, sends us a flower-stem of this Orchid with two good blooms on it, and states that he has a small plant with two flower-stems branched in the same manner.

**ORCHIDS AT MESSRS. VEITCH'S.**—Amid a profusion of flowers, varieties of *Odontoglossum Cervantesii*, *cirrhosum*, and *crispum* are remarkable. A fine plant of that good old favourite, *Dendrobium nobile*, grown *au naturel*, is interesting, as showing how the plant grows in a natural state, and how much more impressive it is under such circumstances than when seen as it is usually. *Oncidium cucullatum*, with olive sepals and petals and lilac-spotted lip, offers a curious contrast of colours. *Dendrobium Cambridgeanum*, with its yellow flowers and dark

brown lip, is remarkable as flowering from the young shoot. Numerous forms of *Cattleya Trianae* are in bloom, one in particular, with flowers of medium size, the sepals and petals transparent white fringed and curled at the edges, and with the lip pale lilac with a yellow disk. *Dendrobium Ainsworthii* is particularly bright with its whitish flowers and lilac lip. *Miltonia cuneata* also, with narrow lilacy-brown sepals and hastate white lip, is noteworthy.

**ODONTOGLOSSUM ROSSII MAJUS.**—Among the numerous varieties of this useful Orchid now in bloom at Messrs. Veitch's there is one that is remarkable, not only for the large size of its flowers, but for the lilac flush of the sepals and petals, the veins of which are picked out with deeper lilac.

**AERIDES CYLINDRICUM.**—A small plant of this is now in bloom at Mr. Williams' Holloway nurseries. The plant has long cylindrical leaves, like those of *Vanda teres*, and pure white flowers, the segments being waved and crisped at the margin, the lip projecting into a large funnel-shaped spur, and the column of a slightly rose-coloured hue. It was illustrated in our columns in 1875, vol. iii., p. 537, from a plant in Lord Lonsborough's collection.

**ODONTOGLOSSUM PARDUNUM.**—Flowering specimens of this may now be seen in the Victoria Nurseries, Holloway. The flowers are in racemes, and have narrow pointed segments of a mustard-yellow colour, the lip being hastate-lanceolate, mustard-yellow, with brown spots.

**ODONTOGLOSSUM CRISPUM.**—It has been asserted that the varieties lately imported are not so fine as those which were introduced some years ago. We hardly think that those who are in the habit of looking round the London nurseries will agree to this statement. Good and bad varieties are imported now as then. Moreover, our taste has grown more critical. What would have been thought a good variety then, now-a-days would be but moderately esteemed. Of more interest is the alleged fact that each district has, as it were, its own varieties, some parts of the country furnishing much finer varieties than others, so that if the collector get into the wrong part of the country his despatch is likely to be of inferior quality. This phenomenon of local variation is very interesting from a scientific point of view, though not always equally so from that of commerce.

**ONCIDIUM LINGUIFORME.**—This is a very singular species, not often seen in cultivation, although it was introduced from Merida so long ago as 1840. It succeeds in a cool-house temperature, and makes very strong vigorous growth potted as one would a strong plant of *Odontoglossum crispum*. The singular butterfly-like flowers, of a yellowish-brown colour, the lateral sepals tipped with yellow, are very thinly placed on spikes from 9 to 12 feet long. It should be in every large collection of Orchids, and it may now be seen in capital condition in Messrs. Veitch's nursery at Chelsea.

**CATTELEYA AMETHYSTOGLOSSA.**—A distinct and very beautiful species, of which there are two fine forms in flower in Messrs. Veitch's nursery. Like *C. Leopoldii* it is a Brazilian species, producing its flowers on long stems furnished with two leaves at the top, from between which the spikes of flowers issue. It is very desirable for winter flowering. The sepals and petals are pale purplish-rose, irregularly spotted with purple, the lip deep purplish-crimson. It succeeds very well potted in turfy peat and sphagnum, like other *Cattleyas*; and, like *Cattleya Mossiae*, there are many distinct forms of it found amongst imported plants.

**DENDROBIUM JAMESIANUM** and *D. INFUNDIBULUM* are grown in the Mexican-house at Burford Lodge. Many good growers had arrived at the conclusion that these two fine species would succeed best in the cool-house with *Odontoglossums*. At many first-class establishments we have seen them do well with the coolest treatment. We noticed that Mr. Spyers had placed his plants at the coolest end of the Mexican-house, where they had made splendid growths, which were fast becoming studded with flower-buds. Most of them are grown in pots, but there was one very fine large plant on a block doing equally well.

## The Kitchen Garden.

WHERE new plantations of *Asparagus* are contemplated the ground should, if not already done, be got ready for planting the roots next month; it should be deeply trenched, and a liberal supply of well-rotted manure be incorporated with the soil as the trenching proceeds—should there be a uniform depth of soil, 3 feet at least, and if it be of a sandy alluvial nature, and impregnated with saline matters, it will in every respect, providing the drainage is good, be suitable for the growth of *Asparagus*. Existing beds should without further delay have the short dung that was laid on them last autumn carefully forked in, so as not to injure the crowns in the operation, and the soil broken fine with the fork as the work proceeds. The beds should then be lined off afresh, and a few inches of soil from the alleys laid on, which, after a few days' exposure to the weather, and when sufficiently dry should be raked over; and where leaf-mould is plentiful a few inches thick might then be put on the beds. This, in my opinion, causes the "grass" to come more crisp and of a better colour. Seed-beds and seedlings just coming through the surface of the bed will require being protected, with a piece of netting supported by short sticks, from the ravages of chaf-finches and sparrows.

Small sowings may now be made in a warm border of the following seeds:—Early London Cauliflower, Snow's Winter White Broccoli, Cotagers' and Scotch Kale, and a good breadth of Curled Parsley. Make another sowing of Broad Beans and Peas, and draw a little soil up to those sown at the end of December, and stick the latter forthwith. Old Cabbage stumps should be removed at once, and the ground be made ready for Potatoes, of which a small planting of the early kidneys may be made forthwith in rows, 2½ feet apart, and 10 or 12 inches in the row, between which Cauliflowers will be planted next month. It will be advisable to defer planting the main garden crop of Potatoes a couple of weeks longer with a view to their escaping late frosts, in the event of there being any. If the ground, having been heavily manured for the preceding crop, is moderately rank, it will be unnecessary to manure it for the Potato crop; indeed, the latter, under the circumstances, will be better in quality and quantity without it. Early plantings of Cauliflowers and Cabbages should, if not already done, have the Spruce boughs with which the plants have been protected removed and the latter earthed up, the blanks, if any, having been previously filled up. Make fresh plantations of Jerusalem Artichokes in a good open piece of ground in rows 2 feet apart and 1 foot asunder in the row. See that the Dutch hoe is used freely between the rows of Lettuce, autumn-sown Onions, Spinach, &c., not only as a means of keeping down weeds, but also to accelerate growth in the plants through the stirring of the soil.

**FORCING DEPARTMENT.**—See that the supplies of *Asparagus*, *Scakale*, and *Rhubarb* are equal to the demand, and that pits and frames in which Potatoes and Carrots are growing have sufficient air admitted to them to prevent the plants making a spindly growth; the former, however, must be regulated in accordance with the nature of the latter and the condition of the weather, which latter being favourable the sashes should be taken off advanced crops of Potatoes early in the morning and replaced late in the afternoon. French Beans, where grown in early vinerys and Peach-houses, will require extra attention in the application of water both to the roots and overhead, otherwise red-spill will be sure to attack the plants. Sufficient batches of seed should be planted at frequent intervals to maintain a good supply. Top-dress succession crops when about three inches above the rim of the pots with soil similar to that in which the plants are growing, and from which the chill has been taken off; and pinch the points of the shoots out to make them branch. Young plants of Brussels Sprouts, Cauliflower, Lettuce, and Leeks should be pricked out in a frame with a gentle bottom-heat as soon as large enough to handle, preparatory to being planted in the open later on. Sow Moore's

Cream Vegetable Marrow and Stockbridge Ridge Cucumber seed, and when large enough pot off singly, the latter in 48's and the former in large 60's; a sowing should also be made of red and white Celery of the varieties most approved of in individual establishments—Turner's Incomparable White and Cole's Red Defiance, or Leicester Red, are excellent varieties of the respective kinds. *H. W. Ward, Longford Castle Gardens, Wilts.*

ONION SOWING.—Whether it be the right time or not to sow Onions during February, I have endeavoured for many years to have the seed in the ground as soon after the middle of February as circumstances would allow. This year the main sowing (not a small one for a private place) was covered in, the ground all rolled and finished, on February 14. I have practised this in five counties in England, and in one cold northern district: I do not remember sowing later than February, and the crop never was second-rate. At the present time our soil is of the heaviest kind; the bulbs grown thereon are of great size, and keep well. *K.*

#### NOTES ON VEGETABLES.

PURPLE SPROUTING BROCCOLI.—The mildness of the weather has been much in favour of vegetables all through the past winter season, during the whole of which time there has been an abundant supply, and the old Purple Sprouting Broccoli has quite maintained its high character as being one of the best and most productive things in the garden. Not only do plants of it yield an enormous quantity of sprouts, but these latter are, when cooked, simply delicious—far superior in tenderness and delicacy to any other Broccoli grown; that is, when the Sprouts have escaped frost, which detracts from their flavour. To have fine large plants—and it is only these that are profitable—the seed must be sown not later than the middle of March, and as soon as the plants are large enough to handle they should at once be pricked out in light rich soil, at about 6 inches apart. This will prevent the stems elongating, as they always do in beds, and the removal will greatly increase the number of fibrous roots, and render the plants more fit for transplanting when ground becomes vacant. Like all the Brassica tribe Sprouting Broccoli are gross feeders, and require deep rich land, where they should be planted 2 feet 6 inches apart; or, better still, double that distance, with a row of Potatoes between. With such an increase of room they form huge bushes, and the amount of food they afford is something surprising, as they continue to branch and sprout for a very long period. *J. S.*

AIGURTH BRUSSELS SPROUTS.—As the season for sowing these is at hand I should like to say a few words in favour of the strain known as the Aigurth, which are a great improvement on the old imported kind, as they bear large compact solid sprouts that are of fine flavour when cooked. To have Brussels Sprouts at their best they require a long season's growth, and it is advisable to sow under glass early in March, and prick the plants out, that they may be sturdy and strong for the final removal. If thinly planted, at wide distances apart, so as to allow plenty of room, they form huge stems a yard high full of sprouts, large in proportion. Plants from late-sown beds are comparatively useless, and the more so if they receive a check or become drawn, after which they rarely make much progress, but remain stunted and poor. At one time gardeners would not think of sowing other than imported seed, but were selections to be made of the best among plantations of Brussels Sprouts there is no doubt but that we should soon have them greatly improved, as among a number of plants they vary much, and seed should only be saved from those showing distinctness of character. This is the plan pursued by market gardeners, who generally have good types of Brussels Sprouts and Cabbage, which may be seen at a glance by the regularity of their growth and general appearance. *J. S.*

EARLY FLOWERING SHRUBS.—In the early part of February we had no less than twelve shrubs in flower in and near our garden in West Sussex; the wild Gorse and a few flowers of Arbutus would add to the number—*Andromeda floribunda*, *Berberis japonica*, *Chimonanthus fragrans*, *Erica carnea*, *E. candonodes*, *Garrya elliptica*, *Jasminum nudiflorum*, *Kerria japonica*, *Lonicera Standishii*, *Prunus californica*, *Pyrus japonica*, and *Viburnum tinus*. *H. K.*

## Plants and their Culture.

STOVE FLOWERING PLANTS.—Under the ordinary treatment of the stove, *Gardenia intermedia* is now rapidly swelling its first flower-buds. If the plants are well rooted liberal supplies of liquid-manure will greatly aid them in the development of the blossoms. These, when cut from the plant, will look far better if a few inches of growth can be spared also; nothing looks so harmonious so well with these flowers as their own foliage. Plants of *Allamandas*, *Clerodendrons*, and *Douglasvilles* that have been started early will now be breaking freely. Keep them obtained as near the glass as possible, in order to obtain a sturdy, short-jointed growth. Plants of the shrubby *Clerodendrons*, as *Kempferi* and *fallax*, should be pruned into the hard wood, then shaken out and repotted into smaller sized pots; they want, in fact, about the treatment generally given to show *Pelargoniums*. They are grand subjects for the stove during the autumn. The stove *Vincas* will do well treated in a similar manner, keeping them constantly pinched at about the third joint until a bushy plant is formed. *Rondeletia speciosa* and the major form will always make more shapely plants if they are annually pruned in to the hard wood. It is a great mistake to grow these handsome flowering plants as climbers, in which manner they never flower so well. Where they are grown the pruning should not be deferred any longer. Pinch them once during the month of May, a regular break will then be secured; nearly every shoot will during the autumn produce a truss of flowers under this mode of culture. *Ixoras* may also be treated in a similar manner; but I should prefer in the case of these to grow on young plants and discard the oldest ones. *I. coccinea* is still one of the very best all-round varieties, no kind surpasses it for cut purposes. The young growths of *Dipladenias* should be trained on string or wires near the glass. On no account should the young shoots of these handsome flowering plants be constantly tied in to the trellis until a good crop of flower-spikes are well forward. Of plants suitable for growing in suspended baskets in the stove, the *Ischyranthus* in varieties and *Hoya bella* are among the best; young plants of these should be made up in the baskets, if it is convenient to grow them in this manner, as soon as possible, and a good season's growth will then be obtained. The *Epiphyllums* also do well under this mode of treatment. Of plants not generally grown in our stoves, *Mussaenda frondosa* is very singular and pleasing, so is *Dalechampia Roezliana rosea*, both with singular bracts. *Medinilla magnifica* is one of the grandest stove flowers; treat young plants of this liberally and give them plenty of room. The flowering panicles of this plant will soon appear, when this is the case water more freely. Where several plants of *Anthurium Scherzerianum* are grown, part of the stock may with advantage be retarded in a temperate-house. Cuttings of *Eranthenum Andersoni* struck now will make nice flowering stuff during the autumn. Seeds should also be sown of *Aphelandra aurantiaca Roezlii*, *Torenia Baillonii*, and *Fournerii*—the former to flower next winter, the two latter during the summer and early autumn. Attend to the general treatment of the stove as previously advised; slightly increase the day and night temperatures if any necessity for so doing should occur, otherwise it will be best not to rise too rapidly for a few weeks to come.

GREENHOUSE.—Beyond the ordinary routine of this department there is not much pressing work at present. All kinds of hard-wooded Cape and New Holland plants will require close attention for watering; any that are developing flower-buds must not be allowed to go too far on the dry side now, or crippled and ill-formed flowers will be the consequence—with Heaths in particular. Plants of winter-flowering Heaths and *Epacris* should be cut back and induced to break into fresh growth at once. *Pelargoniums* for the latest flowering may be pinched more; all the stock should have the growth tied out somewhat if good plants are desired. The latest *Cinerarias* should soon be removed to a cold pit, watching, however, for any frost. With this mild weather *Chrysan-*

them will be starting off rather freely; keep them well aired on all favourable occasions in order to keep them as sturdy as possible.

CONSERVATORY.—The *Camellias* will now be making a good display; plants now in full flower must be watered freely. What with the bulbs and forced plants there is no lack of flower to make a good show; do not, therefore, let anything remain when much past its best. Nothing detracts more from a good floral display than the oversight of not removing stale and decaying flowers. Young hands should also exercise their ingenuity in producing an effective grouping, varying the same as much as possible. *James Hudson, Gunnersbury House, W.*

## Peaches and Nectarines.

THE fruit in the early house will now have commenced stoning, during which time the night temperature already given (from 55° to 60°) will be quite high enough. It is much the best to err on the safe side rather than to keep a high night temperature and lose a quantity of fruit during the stoning period, keep a chink of air on "the front" as well as the back ventilators all night, and carry out the directions given in last Calendar as to tying down, &c. The third house will now have set its fruit, and may be gently syringed with tepid water twice daily, and will also require disbanding. I make a practice of doing a little of this daily. I never encourage spurs, as I have always found the best fruit produced on young well-ripened wood. If the trees in this house have not been watered since they came into bloom, they may now have a thorough soaking of tepid water. The fourth house will be in bloom and fertilising must be continually attended to. Late houses are coming on fast, and will soon be in bloom (if the mild weather continues), in spite of ventilators being kept open to the fullest extent night and day. *J. Wallis, Keele Gardens.*

## The Hardy Fruit Garden.

PROTECTING FRUIT BLOSSOMS.—The buds of Apricots, Peaches and Nectarines are now getting very forward, and the chances are that without good protection the blossoms will get cut off, as, judging from present appearances, they must be open at latest by the second week in March, when we may have cold winds and frosts too cutting for them to withstand. For protection by day I place great reliance on old fish-nets, such as are used for preserving fruits from the attacks of birds, which, put on double, so as to bring the meshes across each other, sift the wind and take from it its sting. What injures the flowers of Apricots and Peaches, perhaps, more than anything else is wet, which is more fatal than cold, as it is surprising what an amount of this blossoms will stand on which rain cannot fall. With a coping, and a double net in front strained straight down, rain will pelt in vain, as the drops dash against the meshes and are broken up and fall quickly down to the earth; and the same with snow and hail, which are intercepted in their course, and lodge where they cannot do harm. Wood copings are better than nothing, but glass copings are the thing, as they do not obstruct the light, and the trees can therefore set the whole of their flowers right up to the top. As to the injury they do by keeping off the night dews, &c., that is more imaginary than real, and I found ours of the greatest use last summer in protecting the fruit of the Apricots from wet, which saved them from rotting. This was strikingly proved with us, as we had one wall without coping, and the fruit on this, as is common with Apricots, spotted and decayed so after showers or damp nights that we had a difficulty in finding any fit for dessert. In contrast to these those on the walls with the coping, and growing on the same aspect, were fine and sound, and ripened splendidly; and it was the same with our *Walburton* and other late Peaches. The material we are using for blinds is a striped thick *Forfar*, which we get at the draper's at 5s. per yard. The width of it is a little over 4 feet; so that for £2 15s. or so we have enough for a wall 150 feet long. The material is so thick and strong in the thread that it will last for years if stored up and kept dry. *J. Sheppard.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Mar. 6	Rooms.	Sale of Liliun auratum Bulbs, at Stevens'
WEDNESDAY, Mar. 8		
THURSDAY, Mar. 9	Rooms.	Sale of Imported Orchids, at Stevens'
SATURDAY, Mar. 11	Rooms.	Sale of Hardy Plants and Bulbs, at Stevens'

It may seem early to write of FRUIT PROSPECTS, still it is already possible to read the state of the buds, and to tell whether or not there are any, and how many, fruit ones among them. It is pleasing to be able thus to note that fruit buds are a full average crop, Plums promising more than an average. Neither are fruit buds generally much earlier than usual. The wet autumn, dull winter, and few occasional frosts have held fruit buds back almost as effectually as the usual severities of our normal winters. The abnormal mildness of the winter seems so far to have expended its chief forcing powers on Roses rather than fruit trees. The former apparently intend, present weather continuing, to bloom in April or May rather than June—the latter to open their flowers about the usual time.

Of course the entire character of our fruit crop will turn on the time of blooming, the character of the weather at that particular crisis, and the means of assistance in the shape of protection we can give to the trees. Be the weather what it may, the blooming season cannot be much longer deferred. Apricots mostly bloom in March; Peaches, Plums, Pears early in April; Apples in April and May. As a rule, the later the blooming the more sure the setting. February has done comparatively little to its proverbial ditch filling this year, consequently the ground is drier than usual; hence March sunshine is likely to exert its full power in drawing out the bloom, unless its influence is counteracted by biting winds and stinging frosts. With fairly seasonable weather our prospects are promising. But should the winter weather that we have as yet steered clear of come upon us during the next three months, a full fruit basket can hardly be one of the welcome and pleasing gifts of 1882.

This suggests questions of what can be done to protect our fruit crops from inclement weather should it come, as is all too probable. Some affirm nothing is gained by our help. There may be this grain of truth in such sweeping assertions, viz., that over-protection is often far worse than none. Still it remains true, that judicious protection saves many a crop that would otherwise be wrecked by the weather. This being so, it is surprising that more protective expedients are not employed—the more so as they are generally successful in the exact ratio of their simplicity. A handful of bracken, a wisp of straw, an old newspaper, a roll of Frigi-domo, old fish-net, bunting or canvas, a screen of boughs or of furze—these prove among the most potent of all fruit blossom protectors. The more ponderous the more injurious; the more flimsy, light and mobile, the more efficient. This being so, the chief problem is to ensure sufficient stability against winds and enough resistance to frost without ponderous expensive expedients, or doing more mischief by our shade than we do good by our protection.

It should, however, be borne in mind that all shade in the spring is not only and wholly evil; on the contrary, we may retard as much by our shade as we shelter by our artificial husbanders of warmth. Hence the cheapest as well as the most efficient protectors are probably those that are permanent. They act with double force, and it is doubtful whether their holding back of the blossoms does not save as many of them as their keeping of them warm.

Loose straw bands, but for their litter-making,

are excellent protectors, and so is paper of all sorts, as long as it can be kept dry. The efficiency of woollen and most other nets is well known. Open as these are, they are safer, and probably, as a rule, even more efficient than bunting, canvas, and other close textile fabrics. A thin thatch of dead bracken fronds is a perfect screen, virtually weather-proof—a true regulator and mediator between extremes, shutting out the fierce warm beams of the sun as effectually, when these would prove mischievous, as it shuts in the heat, when all is too little to moderate the extreme energy of radiation from the tree or wall surfaces during clear frosty nights. The flimsiness and mobility of the gossamer-like dry Fern fronds all aid its protective power and help to make it more efficient. A screen of Spruce or other boughs is ponderous, clumsy, and inefficient compared to one of bracken. Asparagus tops cut before they are dead ripe, carefully dried and stored in bundles without being severely crushed, form an equally good though hardly so durable a screen. They are so brittle as to be practically useless unless harvested before they are quite ripe. It is the little juice left in them that imparts sufficient toughness for protective purposes.

Such substances as Raffia-grass, could it be had sufficiently cheap and in plenty, would also form a capital screen, as would some of the lighter Rushes, Reeds, and grasses, if carefully harvested. Most of the canvases, buntings, &c., specially manufactured for these purposes are too smooth. Flimsiness, fluffiness, combined with sufficient strength to make them durable, and enough thickness to afford sufficient resistance to 10° or 15° of frost, are the qualities desiderated as protectors for fruit tree blossoms; and only those that have tried such screens as are here commended will believe that they have proved generally able to save the crops without injuring or weakening the trees, or fostering the increase, or enlarging the destructive powers, of those insect pests which seem ever ready, lying in wait to wreck or ruin any fruit blossoms that the biting frosts and blasting winds may have left.

—STREPTOCARPUS GREENII ×.—This plant is the result of a cross between *S. Saundersii* and *S. Rexii*, *S. Saundersii* being the seed-bearing plant. The plant is much more compact and dwarfer than *S. Saundersii*. Mr. GREEN tells us that he grew a quantity for several years among other cool greenhouse plants, and found it very useful. The plant is very easily grown: first sow the seed in a pan of light sandy loam, then prick off or pot singly in very small pots, place them afterwards on a shelf as near the glass as possible, shade for a few days, after which they will bear the same treatment as *S. Rexii* with ordinary greenhouse plants.

—ROYAL HORTICULTURAL SOCIETY.—The Council announce an Implement Exhibition, and a general display of garden structures, tools and appliances, which will be held in the gardens at South Kensington from May 23 to July 5, 1882, comprehending the four great events of the season, viz.:—The Great Summer Show; the Evening *Fête*; the Pelargonium Society's Show, and the Grand National Rose Show. Increased facilities and accommodation are offered to exhibitors, and silver and bronze medals will be awarded for the best articles exhibited in the following classes:—Modes of heating a small conservatory attached to a dwelling; Boilers heating 50 feet of 4-inch piping with or without brickwork; Hot-water piping: modes of fixing and fitting the same, valves, &c.; Plant-house, vinery or orchard-house, span-roofed or otherwise, not exceeding 50 feet in length; Movable plant pits or frames; Improvements in glazing, ventilation, &c.; Decorations for conservatories, ornamental flooring, flower stands, vases, &c.; Hand mowers; Horse mowing machines, to cut not less than 30 inches; Wirework; Garden pottery, edging tiles, &c.; Garden seats, chairs, &c.; Garden engines, syringes, &c.; Garden tenting, shading materials, &c.; Complete set of lawn tennis apparatus; Miscellaneous subjects not included in

any of the classes; Garden cutlery; Garden tools, spades, rakes, hoes, barrows, &c.; Meteorological instruments; Plant guards and supports, flower stakes, labels, &c.

—THE GREAT WHITSUNTIME EXHIBITION AT MANCHESTER.—We have received a copy of the schedule of prizes offered for competition at the Annual Grand National Horticultural Exhibition to be held at Manchester from May 26 to June 2. There are seventy-seven classes in all, one being open, forty-five confined to amateurs, and the remainder to nurserymen. As usual the prizes offered are very liberal, and, as usual also, there can be no doubt, the show will be worthy of Mr. FINDLAY's efforts.

—EPACRIS ONOSMEFLORA.—A good many of the true species both of *Heaths* and *Epacris*, so deservedly popular a generation or so ago, seem to have become lost to cultivation. This is all the more to be regretted, as many of them vie in beauty with the productions of the hybridiser's art. The attention bestowed on the hybrids now so widely grown seems to have caused Nature's wildlings to be neglected and forgotten. A very pretty species of *Epacris*, *E. onosmeflora*, is now in flower at Kew. It is an interesting and very floriferous plant, with compact bushy habit, and short, broadly tubular white blossoms. It was sent to Kew at the close of the first quarter of the present century by A. CUNNINGHAM, who discovered it in peaty bogs on the Blue Mountains of Australia, at an elevation of 3400 feet above sea-level.

—THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—At the annual meeting of this Society, recently held, a very satisfactory report and statement of accounts was presented, showing the Society to be in a very solvent state, with a good surplus to the fore. The Treasurer's balance-sheet shows that the Society has now invested in the Bank of England in 3 per cent. Consols the sum of £2161 12s. 6d.; the number of members has materially increased during the past few years, and constant additions are being made. As the principles on which this Society are founded are not generally known, it may be remarked that a man must be a gardener when he joins it, but should he leave the gardening profession and follow some other occupation he does not lose his connection with the Society. It is a provident society in every sense of the word, differing from that in operation in relation to the Foresters and Oddfellows in that there is no burial fund. There are two scales of payment to the benevolent fund—one of 6d. per week, and the members who subscribe that sum receive 10s. 6d. per week in illness; and a larger sum of 9d. per week entitles the member to 16s. per week in illness. Members who do not subscribe to the benefit fund, but who may meet with an accident and are disabled from work for a time, receive a sum of money from the committee out of the benevolent fund. The good health of the members is shown from the fact that during 1881 the sum of £1 11s. 6d. only was paid as sick pay. The Secretary of the Society is Mr. JOHN McELROY, The Gardens, Moray Lodge, Campden Hill, Kensington, W., who will gladly supply particulars and copies of the rules of the Society to gardeners.

—MESSRS. VEITCH'S AMARYLLIS.—We have already alluded to the fine collection of these very showy plants raised by Messrs. VEITCH (p. 257). We allude to them again to advise those of our readers interested in these noble plants to pay an early visit to Messrs. VEITCH's, as fresh flowers of extraordinary richness of colour are expanding daily. Not only in colour, but in form and substance, great advance is being made, but, as usually happens, there is a tendency to run too much in one groove and produce a uniformity of form which, though pleasing to the specialist, would be more interesting to the ordinary lover of plants if more varied. In any case, we can but congratulate Messrs. VEITCH on the acquisition of so fine a strain.

—ROOT FORMATION.—Mr. BAINES sends us a mass of thick, fleshy roots of a Pavia, each about the thickness of the little finger, contorted and intertwined in all directions so as to form a globular mass. Four years ago, in order to prepare the trees for removal, the roots were cut through at a depth of 2 feet 6 inches beneath the surface, the result being the formation of a leath of fibrous roots, which either

FIG. 43.—STREPTOCARPUS GREENII: HALF NATURAL SIZE: FLOWERS PALE LILAC-BLUF. (SEE P. 302.)

met with some obstacle, or became so intertwined that they obstructed each other; in any case, they now form a ball of thick and twisted roots, as before said. Microscopic examination shows a thick corky rind of several layers of brown cells, the innermost forming a growing layer, or phellogen. Within this is a thick, spongy mass of ordinary cellular tissue, which, in its turn, surrounds a narrow continuous ring of woody and vascular tissue, while in the centre is more cellular tissue, forming the pith. In the normal fully developed root the wood zone occupies nearly the whole of the diameter of the root, so that in the abnormal specimen there is a great development of spongy cellular tissue, while the woody portion is relatively small. On cutting through the mass it may be seen that one of the smaller original roots, which is rather more than the thickness of the thumb where cut across, split into a  $\Lambda$ -shaped fork after the injury.

— RAILWAYS AND MARKET GROWERS.—The London and North-Western Railway managers have just made public an arrangement by which it is proposed to receive at Kew Bridge station loads of garden produce which will be delivered at Manchester, Liverpool, and other great centres of population in the North, early next morning. That there are at times far more of market vegetables grown around the metropolis than can be profitably disposed of there can be no doubt; but whether it will pay growers to send loads of vegetables and fruit 200 miles, and then find a salesman to dispose of it, is not so certain. A few ventures will soon dispel whatever doubt may be attached to them. No doubt it seems odd thus to find encouragement given to the sending of garden products away from London, but it is not exactly a case of sending coals to Newcastle. Lancashire has an enormous population, and it may be that it will gladly take at a remunerative price all those garden products which London does not need or cannot afford to purchase.

— ROCK GARDEN AT KEW.—An official response has been received to the memorial recently presented to the First Commissioner of Her Majesty's Works, &c., in which it is stated that "a rock garden is now in course of formation in the Royal Gardens, Kew." We congratulate the memorialists on the success of their endeavours so far, and trust, as indeed we have reason to do, that, in due time we may witness a rock garden worthy of the Royal Gardens—a source of gratification to the visitors, and a great addition to the means of scientific observation and research.

— SEEDLING RHODODENDRON.—MESSRS. VEITCH have now in bloom for the first time a very beautiful new Rhododendron, which appears to us to be distinct in colour from anything yet seen. It is a cross between *Duchess of Edinburgh* as the pollen parent and *R. javanicum* as the seed parent. The tree contains ten or a dozen somewhat funnel-shaped flowers with a flat limb divided into five rounded lobes of good form and substance and of a refined though brilliant colour which may be described as orange-scarlet suffused with crimson, and with a faint narrow edge of carmine. The anthers are of a deep carmine colour. If the habit should prove good this unnamed seedling will prove a great acquisition. Maiden's Bush is also in flower, the blossoms being of a pale flesh tint, of great solidity and substance and excellent form.

— ERICA HERBACEA.—This species, which is perhaps better known under the name of *E. carnea*, and is represented in cultivation by white, purplish, and flesh-coloured varieties, is one of the most desirable of early spring-flowering plants. A figure of the flesh-coloured form is given in the first volume of the *Botanical Magazine* (tab. II) nearly a century ago. It is a native of South Europe but quite hardy in this country. CURTIS, in the book just mentioned, speaks of the species as a modern introduction, and states that it may be had in flower "as early as March, especially if kept in a greenhouse or common hothed frame, which is the more usual practice." At the present time this pretty *Heath* is in full flower in many gardens, indeed in mild winters like the present one it commences to bloom in the open borders in January.

— FRITILLARIA SEWERZOWI.—In the letter-press accompanying the figure in a recent volume of the *Botanical Magazine*, Mr. BAKER speaks of this as

"one of the most curious—I would not say beautiful—of the many new bulbous plants that have rewarded the recent enterprising and assiduous researches of the Russian naturalists in Central Asia." It differs a good deal from the ordinary *Fritillaries* by its very distinct habit—the long raceme of unteselated flowers, lurid purple outside, and the largely developed leafy bracts. This species is quite hardy, and is now flowering in the herbaceous department at Kew. It is a native of the mountains of Turkestan, reaching an elevation of about 6000 feet above sea-level.

— CATALOGUE OF POTATOS.—Mr. SHIRLEY HIBBERD has published in the last number of the *Gardeners' Magazine* a list of 540 so-called varieties of Potatos, 140 of which are considered as synonyms. Indications are given as to the Form—kidneys or rounds; Colour—mottled, purple, red, or white; Size—large, medium, or small; Quality—excellent, second-rate, inferior; Productiveness—first-class, second-class, third-class; Height—tall, medium, or dwarf; Season—early, medium, or late. Accompanying the list are sundry articles on the dietetic value of the Potato, and its culture for exhibition purposes and otherwise. The list will be of such permanent value for reference that the thanks of all concerned are due to Mr. HIBBERD for this fresh example of his labour and patience.

— THE SINGLE BLUE ROMAN HYACINTH.—Under this name Mr. ROBERTS is growing at Gunnersbury Park a single blue variety that is much larger and later than the white Roman Hyacinth, and which is no doubt one of the Paris or Italian Hyacinths, and which some twenty years ago were known to the London trade as Belgian Hyacinths. When placed several bulbs in a pot it blooms freely; the spikes of bloom, which in point of size may be regarded as intermediate between the Roman and the ordinary Hyacinths, are very useful in a cut state. Mr. ROBERTS speaks very highly of it, and regards it as of great service to gardeners. But it is misleading to term it a Roman Hyacinth, as those who obtain it in the belief that it will bloom as early as the ordinary white Roman Hyacinth will be disappointed. Still it is a useful type, because coming into bloom between the latter and the ordinary forced Hyacinths.

— CHIONODONA LUCILLE.—This pretty spring-flowering plant promises to realise all the expectations formed of it, excepting perhaps in that it will scarcely be freer of bloom than *Scilla sibirica*. If a few bulbs be put in a pot, and brought on in a cold frame, they bloom freely, and are found by gardeners very useful to cut from. Mr. ROBERTS is growing a quantity at Gunnersbury Park in this way, and one good quality possessed by the plant is the comparatively short time after planting in which the plants come into flower. No doubt when it becomes well established in the open ground it will bloom much more freely than when grown in pots as fresh-planted bulbs, but it will be advisable to place a hand-light over a clump, to keep the flowers from harm, if it is intended to cut them for indoor use. It appears to be a plant that makes rapid increase, and it will no doubt soon become quite plentiful in gardens.

— A MINIATURE FIRE EXTINGUISHER.—A trial of a new and decidedly novel fire extingisher was carried out the other day in the nursery grounds of Messrs. JAS. CARTER & Co., at Forest Hill. That the test might be a severe one, a large pile of wood of the most combustible kind, flour barrels, bulb cases and similar material, had been broken up and piled into a heap some 8 feet in length, 3 feet in thickness, and about 6 feet in height. Still further, a quantity of tar had been thrown over the heap, so that it was likely to burn as furiously as could be desired. The extingisher is known as SPONG'S Patent, and has a pneumatic adaptation applied to it in the shape of an air-pump. It consists of an iron cylinder some 2½ feet high and about 10 inches in diameter, and holds 6 gallons of water; but it is the rule to put in about 5 gallons, so that ample room is left on the top for the compressed air which is forced into the cylinder by means of a small air-pump fitted to the side of the cylinder, and a small pipe inside conducts the air to the surface of the water. On the top of the cylinder is an indicator which tells exactly the internal pressure up to 100 lb. the square inch. It requires four minutes pumping to reach this point. When thus charged—as was the case several

times at the trial in question—the body of wood was set on fire, and then was allowed five minutes' start. Owing to the combustible nature of the material the whole pile was soon in a perfect mass of flame. Mr. SPONG, who was present, then had the cylinder lifted on his back, where, secured by shoulder-straps, it was carried with ease, and holding the small brass nozzle attached to flexible tubing, and which is fixed to the bottom of the can—turning the tap the stream of water, which was about the size of the stem of a clay tobacco-pipe, was driven against the flame with astonishing force, and one side of the heap was cleared of all flame in a trice, that quite surprised the onlookers. The same result followed as quickly when the other sides and the ends were played upon, and for all practical purposes the fire was fully mastered in about four minutes. It was then agreed that the mass should burn so far as to fall into a solid heap; and in the meantime the cylinder was recharged with clear water and compressed air; then, at a given time, the water was again turned on to the heap, then all ablaze, and in a few moments all flame was extinguished. Another and smaller wood fire, about 4 feet square and height, was then lit, and this having become a mass of flame was entirely extinguished in three minutes, and being allowed to re-burn, was again extinguished in the same time. A large quantity of tar spread on the ground and surfaced with paraffin was then set on fire, and instantly was a mass of flame, about 8 feet long and 12 inches wide. This was quite put out in four seconds—so to speak, instantaneously, and the most entire satisfaction was shown with the result. The real value of this patent would be found if one of the cans were on hand and fully charged, as they always can be, when a fire breaks out. It is not the volume of the water which is so potent, but the force with which it is projected, and which literally beats down the flame in a few moments. The pressure is strong enough to throw the water 30 feet into the air, and 40 feet laterally. As the can is thus carried on the back and the water is propelled with such regular force, the operator has but to give his entire attention to extinguishing the flames. Apart from the singular power thus evinced, the patent might be found exceedingly serviceable in cleansing wall trees, Roses, &c., of aphids, for no insects could withstand the force of the jet, which can be concentrated in one small stream, or be spread over a wider area. Amateur rosarians would probably find the patent of great use to them; and, indeed, for the washing of windows and glasshouses it would be of considerable service. Still, their primary object should render these pneumatic cylinders of great interest to all.

— COLOUR AT THE TIPS OF THE LEAVES OF HYACINTHS.—Mr. BURBIDGE sends leaves of Hyacinths marked at the tips with broad coloured spaces, pink or blue, in accordance with the colour of the flowers. The circumstance is not unusual—it is the extent of it alone which is remarkable. The arrangement of colour (other than green or that yellow tint which arises from the absence of leaf-green, chlorophyll) seems often, but not always, to be associated with relative arrest of growth: thus the tips of Hyacinth leaves once formed cease to grow, any further growth that ensues takes place at the base. Compare again the petals of a flower with a leaf: in the first case growth is arrested much sooner than in a leaf; so also the seed-coat, which soon stops growing, is often brightly coloured. The fact that the tips of the flower-segments in Hyacinths are often green does not materially invalidate our statement, for the apical growth is soon arrested. The tunics of a bulb when coloured, the skin of a purple-tubed Potato are other instances in point; note also the brilliant bud-scales of some of the Rhododendrons which have but a limited growth, and compare them with the green leaves of the same plant. If you want to get colour into the leaves of the Ivy-coloured Pelargoniums you put them close to the glass where, owing to the action of light, actual growth becomes checked, though the material for future growth is obtained. All these instances seem to point to a co-relation between arrested or intermittent growth and the development of colour. On the other hand, where growth is rapid and continuous, colour, other than green, is likely to be deficient.

— BOTANICAL NOMENCLATURE.—Mr. BRITTON raises a question in the *Journal of Botany* as to the advisability or otherwise of rigorously confirming to

an established botanical rule in virtue of which an author affixes his name or his initials as the authority for the species of which he is the first to publish an account, although it may be that some one else has preceded him with an unpublished name in the form of some manuscript note inscribed on a herbarium sheet or otherwise. Strictly speaking, no doubt if WHITE describes a new species for the first time, he is entitled to put his name to it, as vouching for the species, even although GREEN had previously recognised the species as new but had not published it. If GREEN should feel aggrieved, he has himself to thank for omitting to publish the name with the description. The good-nature of botanists, however, often leads them to violate the strict rule, and, on the do as you would be done by principle, WHITE, if he find a manuscript name of GREEN'S, is very likely not only to adopt GREEN'S name if suitable, but to write after it "GREEN MS." It is possible to carry this good-nature too far. Our imaginary GREEN might, without study or examination, choose to give names to half the species in the herbarium, and a certain proportion of them might be found valid by WHITE in the course of his study of them, but as GREEN gives no evidence beyond affixing a mere name, that he has made any study of the genus or of the species such as would justify him in the eyes of other botanists in publishing a new species, it would be hard upon WHITE, who has made a careful study, and publishes his results, to compel him to adopt GREEN'S names. In all such rules some latitude and discretion must be allowed; thus, when we find, as we constantly do, in the herbarium a note of BENTHAM'S, the HOOKERS, of REICHENBACH, of PLANCHON, of GRAY, or other recognised botanist, it becomes almost imperative—if not preventing—to adopt the name, and if giving the writer the credit for it, even though it be a mere manuscript name. One great objection to this practice is, of course, the absence of all guarantee that the manuscript name really represents the matured opinion of the writer, even of one as distinguished as those named. It may be a mere memorandum, subject to reconsideration. If so, then it is a pity that it should be allowed to remain permanently on record. We should hardly have alluded to so technical a point here, were it not that the rule concerns horticulturists. After saying—we are alluding to DE CANDOLLE'S *Laws of Nomenclature*, adopted by the Paris Botanical Congress—that the botanist who first publishes an account of the species is the one who should attach his name to it as responsible for it, even though some one else had previously affixed a manuscript, that is, an unpublished, name to it, the rule goes on—the names made use of in gardens are distinguished—*provisis*—by the mention of the name of the author who first publishes them (not necessarily of him who really gave the name). By this we take it that a garden tally cannot be taken as authoritative—and very few would so regard it! Nevertheless, when men with such extensive knowledge of plants as Messrs. VEITCH, BULL, WILLIAMS, HENDERSON, LINDEN, or other of our nurserymen who introduce new plants choose to give a name to the plants made known by their enterprise, it is surely something more than a matter of courtesy to cite their names, always provided there is no valid reason to the contrary, yet according to strict rule such names have little more right to consideration than the manuscript memoranda on a herbarium sheet. The solution to the question depends a good deal on the view taken as to "publication." A manuscript note in the herbarium clearly is no publication, even though as a matter of deference it is sometimes treated as if it were so, but a name given by a nurseryman to an exhibited plant is a publication, inasmuch as it is open to any one to inspect the plant so offered to the public. The nurseryman's name, so published, if not vitiated from any cause, has decidedly higher claims than a manuscript name in the herbarium. The one remains in the herbarium and does not find its way into books, the other may be dispersed broadcast with the specimens to which it refers, in exactly the same way as the names with the "exsiccata," or collections of type specimens of the botanist, and to which the right of adoption is unhesitatingly accorded. Moreover, the names in question are inserted in catalogues often illustrated and accompanied by a description, which, if not comparative and strictly scientific, is still useful for botanical purposes, and these cata-

logues enjoy a much wider circulation than any strictly botanical publication! The outcome of all which is that art. 50 of the *Lois*, notwithstanding it appears to us that, as a matter of justice, garden names of the kind indicated and to which no objection can be raised on botanical grounds, should be adopted without hesitation by publishing botanists, and that they should not, unless there is good reason to the contrary, affix their own names to such a species without at least adding "hort. Linden," or "hort. Maskey," or whatever it may be. It must not be overlooked—though we fear the matter, if not overlooked, is greatly misunderstood even by botanists themselves—that the mere attaching an author's name at the end of the specific appellation of a plant, confers no honour on him who does so. The object of affixing the name is merely to fix the responsibility on him who gives the name. It does not in itself confer any distinction whatever on the author of the name, but simply indicates to those concerned who it is that has proposed it. Other botanists, and those who have the means of testing and judging, will form their own opinions as to the value of the name and the weight to be given to the utterances of its propounder, but as far as the mere name goes the familiar initials, "D. C.," have no more and no less weight than those of the veriest tyro. The question may seem one of purely technical interest, but no one who sees the preposterous names given to plants exhibited before the Floral Committee will deny its importance, or acquit the Royal Horticultural Society of neglect of duty, if it do not do something to check the piling on, helter-skelter, of Latin epithets for garden productions.

THE HULL BOTANIC GARDEN.—Mr. PHILIP MACMAHON, a young gardener employed at Kew, has, on the recommendation of the Curator, Mr. SMITH, been appointed to succeed the late Mr. NIVEN, as curator of the Hull Botanic Garden.

THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending February 27, issued by the Meteorological Office, London.—The weather during the earlier part of the period was moderately fine and dry, but towards the latter part it became very unsettled, with frequent, and in some places heavy, rain. The temperature has continued above the mean in all districts, the excess ranging from 4° in the west and east of England to 7° in the east of Scotland. The maxima were high for the season, a reading of 61° being recorded at Arlington, North Devon, on the 22d, while at many other stations the thermometer reached 58° or 59°. The minima ranged from 37° at Cambridge, Marlborough, and Cullompton, to 33° or 38° in Ireland. The rainfall has been a little less than the mean in "England E.," but rather more in nearly all other parts of the kingdom. Bright sunshine shows a decided decrease, and over the greater part of the country was very deficient. The percentages ranged from 4 in "England E." to 43 in "Scotland E." Depressions observed:—During the first few days pressure was highest in the south-west, and lowest over Scandinavia, where some deep depressions were shown. The wind was consequently generally moderate or light from north-west or west. On the 24th, however, the barometer fell quickly in the west, and by the 26th a large "trough" of very low pressure, within which were three distinct minima, stretched from the north of Ireland to the north of Scandinavia. This "trough" moved slowly in a south-easterly direction, at the same time filling up somewhat. These distributions of pressure caused the wind to shift to south or south-west (and subsequently to east in Scotland), and to increase to a fresh or strong gale on nearly all our coasts.

GARDENING APPOINTMENTS.—Mr. WILLIAM DAVIS, of Trentham Gardens, has succeeded Mr. FRISBY as Gardener and Forester to HENRY CHAPLIN, Esq., M.P., Blankney, Lincolnshire. Mr. FRISBY has been Gardener at Blankney for the long term of thirty-one years, and has, we are pleased to know, retired on a handsome pension.—Mr. DAVID MCINTOSH, late Foreman at Bloxholm Hall, has been engaged as Gardener to Captain N. REEVE, Ashby-de-la-Laund, Sleaford.—Mr. JOSEPH HALL, Foreman to Mr. WILLARD, Holly Lodge, Highgate, has been engaged as Gardener to Lord BATEMAN, Sheldon Court, Leominster.—Mr. GEORGE POTTS, late Foreman at Hookfield Grove, Epsom, has been engaged as Gardener to D. W. BRYANT, Esq., Surbiton Hill, Surrey.

## BOTANICAL COLLECTORS.

GEORGE BARCLAY.—In 1833 George Barclay, a well educated young gardener, native of Huntley, in Aberdeenshire, entered the service of the Royal Gardens, Kew. In 1835, through the instrumentality of Mr. Robert Brown, the Admiralty appointed a botanical collector to the ship *Sulphur*, under the command of Captain Beechey (afterwards Belcher), which was about to survey several parts of the west coast of America, and Barclay was selected for that duty. As in all cases of this kind, he was furnished with collecting boxes, paper for drying specimens, &c. The ship left Portsmouth on December 22, 1835; on the voyage they touched at Madeira, Teneriffe, and Rio de Janeiro, where they remained two days, which allowed Barclay to visit the botanic garden. The next place they touched at was St. Catherine's, where they remained several days, and he made large collections of herbarium specimens and seeds. They had a very rough passage round Cape Horn, which occupied five weeks, arriving at Valparaiso June 9, 1836, where the ship remained some time, allowing him to make several excursions into the valleys of the Andes. On leaving Valparaiso they proceeded northward touching at several ports, and arriving at Callao, Barclay had sufficient time to visit Lima and make an excursion to the Andes. On leaving Callao they proceeded northward, and arrived at Guayaquil in September, in the bay of which are the islands of Puna and Sumaca, which Barclay visited, describing them as densely covered with vegetation, abounding in climbing plants; he made a large collection of specimens and seeds.

In March, 1837, the ship arrived at Panama, and he had the opportunity of botanising in the Isthmus of Darien. They left Panama March 15, and surveyed the coast about San Blas, from thence proceeding to the Sandwich Islands, remaining at Oahoo a few days, during which time Barclay was busy collecting. On leaving the Sandwich Islands they again proceeded to the American coast, which they surveyed northward, arriving at Sitka, where they stopped a fortnight. They next visited Nootka Sound, where they remained two days, sailing from there to San Francisco in Upper California, where they remained until November 26. Here Barclay was allowed time to visit Sierra Nevada, and obtained cones of Pinus Coulteri, from seed of which was raised the fine specimen of that Pine now growing at Kew. The next place of stoppage was Monterey, where they remained two days, and at San Blas they stayed two weeks, which allowed time to botanise in the interior, and to ascend the volcano of Central America, 6000 feet high. The ship again arrived at Callao, and he says:—"During our stay I made excursions into the interior, and have done pretty well in the way of collecting, but unfortunately I was attacked by a band of robbers, who robbed me of all the money I had on me and other articles; in the affray I received a musket ball in the thigh, the bone was not injured and the wound does not offer to be troublesome." They left Callao the latter end of August, 1838, to survey the coast of Sierra Argul, and again arrived at Guayaquil, remaining there about a month. From thence they proceeded to Panama, and in October proceeded to survey the coast of Central America and New Granada. On leaving Panama the ship proceeded a second time to the Sandwich Islands from thence northward to Columbia River, where they arrived in October, 1839. In a letter he says:—"I have just returned from a most splendid trip on the plains of the Columbia. I have seen many of the plants which Douglas sent home, but there are more yet to be sent. . . . I am sorry to say that the botanical collectors, Wallace and Banks, were drowned in this river a few months ago. I have seen the guide who was in the boat with them, and made particular inquiries, as it is said that the upsetting of the boat was caused by its being surrounded by Indians. This was not the case; the upset was accidental." On leaving Columbia they proceeded south, surveying parts of the coast, which they ultimately left for home, touching at the Sandwich Islands, Otaheite, Fiji, and the north coast of New Guinea, arriving at Singapore in October, 1840, where, consequent on the war with China, instructions were found for the ship to join the China fleet. Accordingly, Mr. Barclay with his collection took passage in an English bark bound direct for London, where he arrived in February, 1841, having been on board ship a little over five years. This surveying expedition, like

most others, failed in introducing many new plants to the garden, the principal introductions being seeds, of which many were of plants common to the shores of the tropics, and many between the time they were gathered and reaching England lost their vitality, and there was no room on board for cases of living plants. The collection of herbarium specimens, however, was large, and is deposited in the British Museum.

On Barclay's arrival he took up his residence at Kew, but his habits were entirely changed, being not at all commendable, and his great desire was to be again employed abroad. An opportunity for so doing soon occurred, he being engaged by Mr. Finck, a nurseryman of Exeter, to whom he was recommended by Dr. Lindley, to collect plants for him in South Brazil; but all that we afterwards learned of Barclay was that not long after his arrival at Buenos Ayres he became involved in a quarrel which led to a challenge to fight a duel, and as nothing more was heard of him it is believed that he shortly afterwards died in prison. *J. Smith, ex-Curator, Royal Gardens, Acro.*

## LIST OF GARDEN ORCHIDS.

### DENDROBIUM.

(Continued from p. 27.)

81. D. (DENDROCORNYNE) DENSIFLORUM, Wallich; *Lindl., Gen. and Sp. Orch.*, p. 90; *Wall., Pl. As. Ker.*, t. 40; *Bot. Reg.*, t. 1828; *Paxt., Mag. Bot.*, v. p. 121, with a coloured figure; *Flore des Serres*, t. 1327 (flowers incorrectly represented as not touching each other);—Nepal, India. Flowered by Messrs. Loddiges in 1830. A splendid species, allied to *D. chrysotomum* and *D. Farmeri*. Petals rather narrow, deep yellow; ciliated labellum, white. Hort. Kew.
- Var. ALBO-LEUCEM*, Hook., *Jard. Mag.*, t. 5780; *D. albiflorum*, Hort., *Gard. Chron.*, 1866, p. 269; n.s., v. p. 653, fig. 105; *Ill. Hort.*, n.s., t. 207; *Regel, Gartenflora*, t. 1021; *Floral Mag.*, n.s., t. 445;—Moulmein. Discovered and introduced from the *Bot. Low & Co.*, by the Rev. Mr. Parish, and flowered by Mr. Wentworth Buller, of Strete Kalgish, in 1867. A very beautiful variety, having white sepals and petals faintly tinged with yellow, and wholly orange, or orange-red, labellum. Hort. Kew.
- Var. SCHREDERI*, *Floral Mag.*, t. 502; *Gard. Chron.*, 1871, p. 1547.—This hardly differs from var. *albo-leucum*, except perhaps in the purer white of the flowers, and the golden labellum gradually shading off towards the margin, into a paler yellow.
82. D. (EUDENDROBIUM) DEVONIANUM, *Paxt., Mag. Bot.*, vii. p. 169, with a (bad) coloured figure; *Flore des Serres*, t. 647; *Belgique Horticult.*, iii. p. 204, with a coloured figure; *Ill. Hort.*, t. 145; *Bot. Mag.*, t. 4429; *Lemaire, Jard. Fleur.*, t. 11 (copied from the *Bot. Mag.*); *Warner, Sol. Orch.*, ser. 2, t. ii. See *D. pulchellum*.—Khasia Hills, India. Introduced for the Duke of Devonshire by Mr. J. Gibson in 1837. This has long, slender stems and narrow leaves, and has a loose, straggling habit of growth, yet its flowers are among the most gorgeous of the orchids, the ground colour yellowish-white, tipped with purple or rose, with two large golden blotches on the very broad fringed labellum. Hort. Kew.
- Var. CANDIDULUM*, Rehb., *J. Gard. Chron.*, n.s., v. p. 654.—Sepals and petals not tipped with purple-red.
- Var. ELLIOTTIANUM*, Rehb., *J. Gard. Chron.*, n.s., v. p. 756.—This variety has the sepals of a beautiful dark purplish hue.
- Var. RIGIDIFLORUM*, Rehb., *J. Gard. Chron.*, 1868, p. 682.—Flowers veined with violet-rose.
- D. DISCOLOR = D. undulatum.
83. D. (EUDENDROBIUM) DISANTHUM, Rehb., *J. Gard. Chron.*, 1865, p. 673; *Bot. Mag.*, t. 5561;—Moulmein. Introduced by the Rev. Mr. Parish for Messrs. Low & Co. 1862. The flowers are wholly yellow, the disk of the lip of a darker hue, hence the specific appellation. Of slender habit, with clusters of medium size flowers on the leafless stems. Hort. Kew.
84. D. DOMINIANA, Rehb., *J. Gard. Chron.*, n.s., ix. p. 202.—An ornamental hybrid between *D. Linawianum* and *D. nobile*. Flowers rose-purple, the petals of a darker hue than the sepals; lip with a dark blotch, a zone of white, and tipped with warm purple.
85. D. (NICRO-HESUTA) DRACONIS, Rehb., *Bot. Zeit.*, 1862, p. 214; *Yenia*, ii. p. 130, t. 146; *D. churucum*, Rehb., *L. MSS.*, ex Bateman; *Bot. Mag.*, t. 5459.—Moulmein. Introduced for Messrs. Low by the Rev. Mr. Parish about 1862. A pretty white-flowered species, in the way of *D. longicornum*, but having a very different elongated labellum. Hort. Kew.
- D. EBURNUM = D. Draconis.
86. D. ECERTONIAE, *Lindl., Bot. Reg.*, 1847, sub tab. 56; *Lindl. and Paxt., Fl. Gard.*, i. p. 69, fr. 41;—India, obtained from Saharapore by Sir Philip Egerton about 1847. Similar to *D. mesochorium*, but the very fragrant flowers are not half the size.
87. D. ELONGATUM, *Lindl., Gen. and Sp. Orch.*, p. 77; Miquel, *Pl. Nederl. Ind.*, iii. p. 633; *Demotrichum elongatum*, Blume, *Bijdr. tot Fl. Nederl. Ind.*, p. 332.—Java. Buitenzorg Botanic Garden, 1866. Inconspicuous. Hort. Kew.
- D. ELONGATUM, A. Cunn. = *D. gracilicaulis*.
88. D. ENDOCHARIS, Rehb., *J. Gard. Chron.*, n.s., v. p. 208.—A hybrid between *D. heterocarpum* and *moniliforme*, raised by Mr. Seden in Messrs. Veitch's establishment. Flowers milky-white, green, and ochraceous.
89. D. (PEDICULUM) ERYTHROXANTHUM, Rehb., *J. Gard. Chron.*, n.s., ix. p. 162.—Philippine Islands. Flowered by Mr. W. G. Bryner, in 1874. Flowers small, densely clustered, orange, striped with purple. Allied to *D. Bullenianum*.
90. D. EUBIENSIS, Rehb., *J. Hort. Gartenz.*, xvi. p. 15.—Java. Imported and cultivated by Consul Schiller, in 1850. Flowers small, white and green.
91. D. EXCAVATUM, Miquel, *Pl. Nederl. Ind.*, iii. p. 644; *Oxyotaphyllum excavatum*, Blume, *Bijdr. tot Fl. Nederl. Ind.*, p. 335.—Java. Buitenzorg Botanic Garden, 1866. Inconspicuous.
92. D. (EUDENDROBIUM) EXCISUM, *Lindl., Bot. Reg.*, 1841, Misc., n. 165.—Singapore. Introduced by Cuming and cultivated by Messrs. Loddiges. Habit of *D. pulchellum*, with inconspicuous white flowers.
93. D. EXCISUM, TUJING, *Bot. Mag.*, t. 5561; *Ill. Hort. Bogor*, reprint, p. 12.—Java. Buitenzorg Botanic Garden, 1866. Small yellow flowers.
94. D. EXTINCTORIUM, *Lindl., Bot. Reg.*, sub tab. 1756; *Walp. Ann.*, vi. p. 208; *Journ. Linn. Soc.*, iii. p. 11.—Moulmein. Probably introduced by Rev. Mr. Parish, as it flowered at Kew in 1871. A small-flowered species.
95. D. (EUDENDROBIUM) FALCONERI, Hooker, *Bot. Mag.*, t. 4044; *Flore des Serres*, t. 1197 (copied from *Bot. Mag.*); *Gard. Chron.*, 1866, p. 692; n.s., v. p. 654 (var. *adulatum*); *Zelt. Hort.*, 1867, p. 15 (tipped with rose); *Bot. Mag.*, t. 5028 (var. *sepals petalisque obtusioribus*); *J. Wardianum*, Warner, *Sol. Orch.*, t. 19; *Jennings, Orch.*, t. 2; *Ill. Hort.*, n.s., t. 277; *Jard. Mag.*, n.s., t. 412 (var. *Lovii*);—India, mountains between Ceylon and Bongan. Flowered apparently with Mr. G. Reid, Burnham. Some of the varieties of this species, having very long, slender, knotted stems, bearing flowers throughout their length, the flowers being among the largest and most brilliantly coloured of the genus. Few plants have them marked exactly as they are in the illustration. Some have white sepals and petals, suffused with pink, and, as well as the labellum, tipped with deep dark purple, labellum having a dark purple disk encircled by a zone of orange.
96. D. (DENDROCORNYNE) FARMER, *Paxt., Mag. Bot.*, xv. p. 241, with a coloured figure; *Flore des Serres*, t. 741 (copied from *Paxt., Mag.*); *Bot. Mag.*, t. 4059; *Lemaire, Jard. Fleur.*, t. 307 (copied from *Bot. Mag.*); *Pescatoris*, t. 1; *Jennings, Orch.*, t. 24.—India. Sent by Dr. Maclellan to the Duke of Devonshire's Garden to Mr. W. F. G. Farmer, Non-such Park, Chesham, after whom it was named, and with whom it flowered in 1849. A very fine species, resembling in many respects *D. densiflorum* var. *albo-leucum*, but the raceme is looser; there is a trace of red in the petals, some of the anterior part of the labellum is pale yellow. Hort. Kew.
- Var. ALBIFLORUM*, *Zelt. Hort.*, 1860, p. 321, with a coloured figure; *Kege's Gartenflora*, t. 595 (copied from *Kege's Gartenflora*); *Var. AUREO-FLAVUM*, *Bot. Mag.*, t. 5451.—Moulmein. Introduced by Mr. Parish. A fine variety with lemon-coloured sepals and petals, and a wholly orange-coloured labellum. Hort. Kew.
97. D. (STACHYBIUM) FIMBRIATUM, Hooker, *Foxt. Fl.*, t. 71; *Paxt., Mag. Bot.*, ii. p. 172, with a (very poor) coloured figure; *Knowles and Westcott, Floral Cat.*, iii. t. 109 (a pale variety).—India. Cultivated in the Liverpool Botanic Garden, whither it was sent from Calcutta Botanic Garden by Dr. Wallich, and which it flowered, 1823. One of the best of those having the flowers in loose pendulous racemes from near the top of the previous year's stems. Flowers wholly of a deep rich yellow, lip deeply and doubly fringed. Hort. Kew.
- Var. OCLUTUM*, Hooker, *Bot. Mag.*, t. 4160; *Lindl. and Paxt., Fl. Gard.*, iii. t. 81; *Lemaire, Jard. Fleur.*, t. 314 (copied from *Lindl. and Paxt., Fl. Gard.*); *Ill. Hort.*, t. 15; *Warner, Sol. Orch.*, ser. 2, t. 10; *D. Fuxtoni*, *Paxt., Mag. Bot.*, v. p. 196, with a coloured figure, non *Lindl.*; *Flore des Serres*, t. 725 (copied from *Paxt., Mag. Bot.*).—This variety has a purple-black disk on the labellum. It appears to have first flowered at Kew in 1843. Hort. Kew.
98. D. FIMBRIANUM, Parish and Rehb., *J. Trans. Linn. Soc.*, xxx. p. 119; *Gard. Chron.*, n.s., vii. p. 134; *Bot. Mag.*, t. 6138.—Moulmein. Discovered and introduced by the Rev. Mr. Parish; and first flowered by Sir Trevor Lawrence in 1877. A handsome species with thick knotted stems and large flowers. Sepals and petals white, slightly suffused with red; labellum with a golden disk encircled by a zone of pruinose. Hort. Kew.
99. D. FITZALANI, F. Muell. ex Schomburgk, *Cat. Fl. Adelaide Bot. Gard.*, 1871, p. 56, sine descriptione.—East Australia. Cultivated in the Adelaide Botanic Garden in 1871.
100. D. FITZGERALDI, F. Muell. ex Schomburgk, *Cat. Fl. Adelaide Bot. Gard.*, 1871, p. 56, sine descrip-

tione.—East Australia. Cultivated in the Adelaide Botanic Garden in 1871.

101. D. FLABELLUM, Rehb., *J. Bonplandia*, v. p. 56; *Yenia*, ii. p. 75, t. 118, fig. 77.—Java. Buitenzorg Botanic Garden, 1866. Inconspicuous.
102. D. (DENDROCORNYNE) FLORIDIMUM, Rehb., *J. Gard. Chron.*, iv. p. 772.—New Hebrides. Imported by Mr. Bull, in whose establishment it flowered in 1875. Flowers middle size, yellowish-green, with a dark purple-rimmed labellum.
103. D. (STACHYBIUM) FORKESII, Rehb., ex Lindl. in *Wallich Fl. Asiat. Rar.*, p. 34, t. 39; *Gen. and Sp. Orch.*, p. 81; *Roxb., Fl. Ind.*, iii. p. 485; *Bot. Reg.*, 1839, t. 64; *Paxt., Mag. Bot.*, v. p. 49, with a coloured figure; *Flore des Serres*, t. 225 (copied from *Wallich Fl. Ind.*);—India, in Sikkim, Nepal, and Martaban. It flowered at Chatsworth in 1838. A robust pendulous species with stout, leafy stems bearing clusters of large white flowers near their tips. Labellum with a yellow channel. Hort. Kew.
- Var. GIGANTEUM*, *Flore des Serres*, t. 1633.—Differs only in having large flowers. Stated to have been introduced by Messrs. Low. Hort. Kew.
104. D. (DENDROCORNYNE) FUGAX, Rehb., *J. Gard. Chron.*, 1871, p. 1257.—India. Flowered by Mr. J. Day. Flowers small, yellow, with a white lip marked with red. Raceme very inconspicuous. The flower is of the very thinnest texture, and lasts but a very short time.
105. D. FUSCATUM, *Lindl., Journ. Linn. Soc.*, iii. p. 8; *Bot. Mag.*, t. 6226.—Sikkim Himalaya and Khasia Mountains. Discovered by Sir Joseph Hooker. First flowered in 1847. Introduced by F. Curry, F.R.S., in 1874. A fine species, having flowers very much like those of *D. chrysanthum*, but they are arranged in loose pendulous racemes. Sepals and petals very deep orange; labellum paler, with two dark spots.
106. D. FUSCUM, Fitzinger, *Gard. Chron.*, n.s., xii. p. 680.—Queensland, Australia. Cultivated in the Botanic Gardens at Rockhampton, Australia. A robust species, with dingy flowers.
107. D. FUSCATUM, Bateman, *Gard. Chron.*, 1864, p. 100; *Fl. Derbyshire*, *Bot. Mag.*, t. 5444, non t. 559; *Moncl. Hort.*, t. 100 (copied from *Fl. Derbyshire*).—Mr. Parish and Colonel Fyche, and introduced by the former for Messrs. Low, with whom it first flowered in 1864. One of the prettiest of the small-flowered species. Flowers in close subterminal racemes. Petals and sepals with a variety of lateral lobes of the labellum, and a small spot of yellow at the base of the labellum. Petals broad.
108. D. GEMELLUM, *Lindl., Gen. and Sp. Orch.*, p. 81; *Bot. Reg.*, 1840, Misc. n. 102; *Walp. Ann.*, vi. p. 265.—Singapore. Introduced by Mr. Cuming, and flowered by Messrs. Loddiges. Stems tall, bearing grassy leaves, and small yellowish-green flowers.
109. D. (EUBOLBIUM) GEMINATUM, *Lindl., Gen. and Sp. Orch.*, p. 77; *Demotrichum geminatum*, Blume, *Bijdr. tot Fl. Nederl. Ind.*, p. 332.—India, Java. Cultivated by Consul Schiller, Hamburg, 1857.
110. D. (STACHYBIUM) GIBSONII, *Paxt., Mag. Bot.*, v. p. 169, with a coloured plate; *Lindl. and Paxt., Fl. Gard.*, iii. p. 135, fig. 204.—Khasia Hills, India. Introduced in 1837 for the Duke of Devonshire by Mr. John Gibson, after whom it was named. Very much resembles *D. fimbriatum* var. *oculatum*, but the labellum is represented as being longitudinally plicate.
111. D. GLAUCOPHYLLUM, Teijsm. et Binndend., *Nat. Tijdschr. Nederl. Ind.*, xiv. p. 10.—Java. Buitenzorg Botanic Garden, 1866. Stems 2 yards long, flowers citron-yellow, with crimson stripe along the middle of the labellum.
- D. GOLDIIE = *D. superbiens* var.
112. D. GOLDBI, Rehb., *J. Gard. Chron.*, 1866, p. 907; *Yenia*, ii. t. 169.—Singapore. Discovered and introduced by J. Gould Veitch.
113. D. GRACILICAULE, F. Muell., *Fragm. Phytogr. Austral.*, i. p. 129; *Bent. Fl. Austral.*, vi. p. 281; *D. elongatum*, A. Cunn., *Bot. Reg.*, 1839, Misc. n. 33; 1841, t. 55, non *Lindl.*; *Gen. and Sp. Orch.*, p. 77; *D. Brachiac.*, Rehb., *Walp. Ann.*, vi. p. 260.—Eastern Australia. Flowered by Messrs. Loddiges in 1841. Resembles *D. Kingianum*, but its dingy yellow flowers are spotted with red.
114. D. GRACIOSISSIMUM, Rehb., *Bot. Zeit.*, 1865, p. 99; *D. Bullenianum*, Hooker, *Bot. Mag.*, t. 5552.—Moulmein. Introduced for Messrs. High Low & Co. by the Rev. Mr. Parish, and first flowered by Mr. Wentworth Buller, of Strete Kalgish, Devon, about 1867. Flowers in twos or threes on the slender, knotted stems, which are white with pink; lip with a deep yellow disk. Hort. Kew.
115. D. (DENDROCORNYNE) GRIFFITHIANUM, *Hooker, Bot. Reg.*, sub tab. 1756; *Gard. Chron.*, n.s., vii. p. 590.—Birma. Flowered by Messrs. Low in 1877, and previously. It is a small, elegant thing, much in the way of *D. Lindl.*, but with yellow flowers . . . inflorescence loose, bracts narrow." . . .
116. D. GUBERTII, *Lindl., Cat. 1871*; *Rev. Hort.*, 1876, with a coloured figure; *Ill. Hort.*, n.s., t. 233; *Walp. Ann.*, vi. p. 166, Ind. Cultivated by M. Guibert, of Passy, Paris, in 1870. Probably only a broad-veined variety of *D. densiflorum*.
- D. HANBERGIANUM = *D. Rittiflorum*.
- D. HEBBESMUM = *D. Schomburgkii*.
- D. HENSALLII = *transparens*.

- 17. *D. herbaceum*, Lindl., *Bot. Reg.* 1846, Misc., p. 153.—India. Imported and flowered by Messrs. Loddiges. A small branching plant with small, greenish flowers.
- D. *HETEROCARPUM* = *D. aureum*.
- 18. *D. (PEDILONUM) HETEROSTIGMA*, Rchb. f., *Hamb. Garten.* xv., p. 57.—Java. Imported and cultivated by General Schimper, of Hamburg, in 1859. A very pretty species, with amethyst-red flowers, exceeding the best varieties of *D. secundum*.
- 19. *D. (DENDROCORYNTE) HEXADESMA*, Rchb. f., *Gard. Chron.* 1859, p. 710.—Native country not recorded. A modest species, having little subterminal yellowish-green flowers with a long lip, yellow at its apex. Hort. Kew.
- 20. *D. (STACHYBOBIUM) HEYNEANUM*, Lindl., *Gen. and Sp. Orch.*, p. 90; *Bot. Reg.* 1839, Misc., l. 41; *Wright, Ic. Pl. Ind. Or.*, iii., t. 999.—Western peninsula of India. Cultivated by Loddiges. Small white flowers, streaked with violet.
- D. *HILLII* = *D. speciosum*, var.
- D. *HOOKERIANUM*, *Bot. Mag.* = *D. chrysois*.
- 21. *D. HUTTONI*, Rchb. f., *Gard. Chron.* 1869, p. 686. Malayan Archipelago. Discovered by Mr. Hutton and imported by Messrs. Veitch. "Flowers much like those of *D. sanguinolentum*, light crimson; labellum of a deeper crimson."
- 22. *D. HYMENOPHYLLUM*, Lindl., *Gen. and Sp. Orch.*, p. 86; *Miquel, Ind. Nodul.*, Ind., p. 41. *Pedilium undulatum*, Blume, *Bijdr. tot Fl. Nederl. Ind.*, p. 322, t. 36.—Java. Buitenzorg Botanic Garden, 1866. Inconspicuous.

HOME CORRESPONDENCE.

The Fernery at Nash Court, Faversham.—This lovely fernery was erected for Mrs. Lade about two seasons ago, and is a span-roofed house about 80 feet long, 22 feet wide, and 15 feet high. As yet it was not made twice as high as the luxuriant growth of the Ferns are making will soon render them too large for their positions—some of the Dicksonias, Cyathas, Alsophilas, &c., already measure 17 feet across. The interior arrangement is very good, consisting of a winding walk, which at almost every step brings a fresh object into view. The waterfall arrangements are also very effective. I was pleased to see the distinct *Adiantum Williamsii*, which has been over 4 feet through the Fern for some weeks, also *Microlepia haria cristata*, *Adiantum concinnum* Latour, *A. decorum*, *A. cardiophyllum*, and the lovely *A. gracillimum*, *Todeas*, *Woodwardia*, *Lomaria*, and *Lycopodium* of all the best and most suitable sorts are here to be seen growing luxuriantly. Pockets are left for inserting in the summer season various fine-foliaged plants, such as coloured *Dracaenas*, *Caladiums*, &c., which form a lively and beautiful contrast. The whole of this work was carried out by Mr. Humphrey, the gardener, and reflects great credit upon his abilities, for he has evidently studied well the natural requirements of the various plants used in this lovely place. O.

Green with Cut Flowers.—There can be no question, I think, but that all flowers look best with their own foliage, but unfortunately we cannot at all times get enough of it, and have to resort to Ferns and other plants to make good the deficiency. At this season, and as long as it can be had forced, I find nothing equal to Solomon's Seal, the lovely delicate tint of the leaves of which are quite unsurpassed. Dug up from the open and put thickly in pots or boxes of light soil in heat it soon grows, and yields a long succession of gracefully arching shoots for cutting, which, thickly hung with their silvery bell-shaped blossoms, are a great ornament and finish to any vase or glass they may be placed in. The plan we adopt is to make a plantation under the Apple trees or among the Gooseberry bushes, so as to have plenty to run to, and the roots are stood away in the pots when done with for forcing and planted again. The first year they are not so strong, but that is often an advantage, as the smaller sprays are sometimes more useful for working up in bouquets. The leaves of *Spirea japonica* are also very good, but to last they must be fully grown and nearly mature. For drooping over the sides of tall glasses nothing can be better than the small, deeply cut *Ivy*, either plain or variegated, as they all have a natural look. Sweet *Brier* is most valuable, and as its scent is so delicious and refreshing, no vase should be without a sprig or two, which will perfume the air of a large room with rich odour. In the depth of winter we often use sprays of the large glossy leaved *Box*, and sometimes *Berberis Aquifolia*, the foliage of which, when set thin on the branches, is as nice-looking as anything that can be had. *Cupressus Lawsoniana*, with its thin, gracefully Fern-like pendulous shoots, is very effective; and in spring and

summer the Tamarisk, that grows so freely anywhere in sandy soil near the sea coast, is always available. A large bush or two of this is a great ornament in any garden, and is quite worth cultivating in pots. Coloured leaves, such as those of some of the *Crotons*, like *C. majesticus* and others, that are long and narrow, are not made half the use of they might be, as what can be more beautiful than they for mixing in with cut bloom, especially with such as is white? For lasting, I know of nothing equal to them, and they are grand when seen under artificial light. F. S.

*Myosotis dissitiflora*.—The illustrations we now give of the nuts (commonly called seeds) of *Myosotis dissitiflora* (fig. 44) will be interesting both to seedsman

FIG. 44.—STALKED "SEEDS" OF MYOSOTIS DISSITIFLORA AND STALKLESS SEEDS OF M. SILVATICA.

and to botanists. To seedsman, because they furnish a means of identification which will be useful in enabling them to distinguish them from the so-called seeds of *M. silvatica* and *alpestris*; to botanists, because they add another testimony to the distinctness of the species. It will be remembered that the species was introduced from Switzerland by Mr. Atkins, of Painswick, and was described by Mr. Baker as a new species in our columns, 1868, p. 599. That some doubt should have arisen as to the existence of a new species from a country so well worked as Switzerland was natural enough, but the character now depicted, in addition to those cited by Mr. Baker, renders the case complete. The so-called seeds of *Myosotis* are really seed-vessels, fruits, or nuts containing the seeds in their interior. In most cases these nuts spring from the receptacle of the flower without the intervention of any stalk, as in *M. silvatica*, figured for purposes of comparison; but in *M. dissitiflora* each nut is borne upon a small white stalk, as shown in the sketch. It is curious that of all the European species described and figured by Reichenbach the only other species that possesses this little stalk is *M. sparsiflora*, the name of which indicates a resemblance in the inflorescence to *M. dissitiflora*, but which in other respects is widely different. *Ancusa sempervirens* has its nuts supported by a similar stalk. The small white process at the rounded end of the nut then serves to distinguish the so-called seeds of *M. dissitiflora* from those of any species likely to be confounded with it. We owe this useful little means of knowing what is what to Mr. Barr, who brought it under our notice. ED.

Abnormal Growth of a Fungus.—Two curious specimens of abnormal growth in fungi were found last week at Hardingham, in Norfolk. The honey-

FIG. 45.—MORELL-LIKE AGARIC.

combed pileus, 1-inch in diameter, looked something like a filiputan Morell, with a stem 2 inches long and 2 lines thick, but a section through it showed that the resemblance was merely external. I sent one specimen to Mr. Worthington Smith, who referred me to a short note by himself which appeared in the *Gardener's Chronicle* for March 9, 1878, p. 299, in

which a precisely similar growth is figured and described. These latter Mr. Smith considered to be specimens of *Agaricus furfuraceus*, many normal specimens occurring among the others. I have no doubt that the Norfolk plants are deformed specimens of the same or some very closely allied *Agaric*. F. M. D. P.

*Casuarina sumatrana*.—A fine specimen of this lovely plant is producing a quantity of cones in the gardens at Wilderness Park, Sevenoaks, Mr. Carlton, the gardener, grows this extensively for table work; it is a gem for that purpose, and when large, as seen here, is a lovely object. O.

*Petunias*.—I had a bed, 10 feet by 7, filled with single *Petunias*, planted about 1 foot apart, or perhaps rather less. The soil had been well dug over after the bulb crops of Tulips, Hyacinths, and Crocuses, which made a good show, had done flowering), and a large barrowful of old manure dug in with it. Three dozen plants, costing about 5s., grown in small pots, were turned out into the newly-made bed early in April last, and for several months there was continuous bloom of large variegated self-coloured flowers that made a good show, though the wet and cold weather in September made them shabby. Carefully tended and pegged down occasionally, the bloom was gay and incessant. Larger or smaller patches of this bright flower would be very suitable generally for suburban gardening. Nothing is easier than their culture; in fact, they require only the most ordinary attention. Where no gardener is kept, or only a man occasionally called in to "tidy up" a small plot, it is sufficient if occasional visit were paid to the bed to see that the pegging-down is neatly carried out (and large hair-pins would make good pegs), dead flowers and weeds taken away, and water given during drought—not much for the lady of the house to look after—*out per annum out per se*—to secure a brilliant bed during all the summer months. The young plants can be purchased for less than 2s. per dozen, if separated from a clump and dibbled in; but young potted plants are altogether more satisfactory, and make at once strong growth. Those I had planted out including the plants, at the time, the digging up, manuring the bed, &c., came to, I think, only 7s., and certainly the brilliancy and continuance of the flowers was a good result from so small an outlay. Any shape of bed may of course be adopted, according to the adaptability of the ground, and suburban gardeners may thank you for the hint, if you think it proper to give it to them, for the coming summer. Several of the plants had exceptionally large flowers, in which the anther leaflets were quite striking. The florist from whom I bought them said the seeds were ordinary from which they were raised, and that he never noticed a similar growth; neither had I ever seen anything of the kind either here or in Bangalore where I used to grow them freely in effective masses for their gay appearance and delicate scent. But it may be common enough. The question that occurred to me was this—Would the seed saved from the best specimens of this sporting kind, and likely to produce double flowers, or exceptionally fine or "pedigree" flowers? In my neighbour's garden I found a double *Petunia* sending out anther leaves the same way. F. Packell, 13, Eliot Place, Blackheath, S.E. [In the specimens sent the "connective" of the anther was prolonged into a small petal—a condition not uncommon in *Petunias*. Ed.]

Spring Flowers.—I do not remember to have seen so many spring flowers in bloom at so early a period of the year. Fortunately fruit trees have shown less disposition to bud forth. The large beds of *Saxifraga linguata*, *Anemone fulgens*, *A. blanda*, are really wonderful in their perfection of bloom and precocity. The spring garden will be very bright and gay early in March, when *Aubrietia*, *Arabis*, *Heath*, and *Primrose* will be in full beauty. *Rhododendron dahuricum*, *R. præcox superbum*, and *R. Nobleanum* are making a great show at this moment. *Omphalodes verna* is blooming more abundantly now than I ever saw it. W. Ingram, *Belvoir*.

Market Gardeners' Liabilities.—When so much is being written and said about the responsibilities of landlords and in favour of tenants of land it is worth while to consider a case that is not an apocryphal one but a reality. Some years since a market gardener took a lease for twenty-one years at the high rental of £10 per acre annually—30 acres of land in a West Middlesex parish, that had been set apart under an Enclosure Act as poor's land, and which was placed in trust with the parish authorities, the rental being devoted to the purchase of coal chiefly, for distribution annually amongst the poorer residents as compensation for the loss of rights of turbery, &c., once enjoyed by all the inhabitants prior to the enclosure. The land at the time of letting was in good condition and fully cropped throughout with top and bush fruit. After a few years, the tenant finding the rent was too heavy

a hurlthen, induced the trustees, with the consent of the Charity Commissioners, to lower it to £8 per acre. Some four or five years of the lease have yet to run, but now the tenant shows such disregard of the future letting value of the orchard, that not only has the soil become throughout quite choked with couch and other perennial grasses, but for two years not one of the fruit bushes has been pruned, so that the crop is fast deteriorating. The point upon which information is desired is as to the duty of the tenant towards the land and the power of the trustees or parishioners as the landlord to enforce penalties against the tenant for thus permitting such obvious depreciation of the property to take place. It is evident that, should this neglect be continued, the land when the lease expires will be worth not more than one-third what is now paid for it, and the interests of the poor of the parish must greatly suffer. *A. D.*

**Cinerarias from Seed.**—I quite agree with Mr. Culverwell's remarks respecting Cinerarias raised from seeds at p. 229. We have now a fine lot in bloom from seeds, and have had for some weeks past, the flowers being everything in colour, size, substance, and form, one could wish for, and grown with half the trouble required for named sorts. *A. M.*

**Salvia cærulea alba.**—At the beginning, one may almost say, of the plant growing season a word of seasonable advice may be useful to plant growers. Those who live within a few miles of the metropolis, and who have frequent opportunities of visiting the leading shows and nurseries, seldom think of their brethren who are distant from London some hundreds of miles, and whose opportunities for obtaining knowledge about new or useful plants is solely derived from the horticultural press. Gardeners having large conservatories to keep gay—many of them are difficult enough even to fill—should grow *Salvia* more extensively than they do, and in greater variety. Writing as a gardener, and not as a critic, I have no hesitation in recommending the extensive cultivation of this class of plants. They are not dear to purchase, are easily grown, and as flowering plants they possess a grace and beauty exclusively their own. I have mentioned the variety above named having seen it in flower only a few days ago, its blue and white flowers being quite fresh and bright, and that at the end of February. When we know—and there is no harm in writing the naked truth—the hundreds of private gardens where only two or three of the old varieties have been grown for the last quarter of a century, and when we remember that a good collection may be bought for a few shillings, I think it follows that an addition to the general stock of conservatory plants would not be unacceptable where much variety has not previously existed. So much is expected from gardeners now-a-days, and in so short a time, that the nearest way to accomplish success will be by cultivating extensively plants of rapid growth that are readily obtained and attractive in appearance. *W. Hind.*

## FRUIT NOTES.

**Apple, Mela Carlo.**—Three or four months ago enquiry was made by one of your correspondents about the Mela Carlo Apple. I did not see any answer, so I send specimens. They were grown in the open, trained against the stone pillar of a Dutch barn facing the south. Their condition would have been better had I not taken them at the end of October a journey of 160 miles. They have remained ever since in paper in the basket in which they were carried. I had only four, and those were the first the tree (about twelve years old) had borne. The colour is not as high as I expected. *Philomelos.* [The fruits received are of medium size, ovate in form, with a small, depressed, closed eye, and short, slender fruit-stalk set in a deep basin, the skin of a clear yellow colour all over. The flavour is said to be most delicious, but these were past their best. *Ed.*]

**King of the Pippins and Golden Winter Pearmain.**—I do not see that your correspondent, John Scott, has thrown much light on the difference of opinion that prevails in regard to these two kinds of Apples, for in his *Orchardist*, p. 88, that he quotes from, he says that Golden Winter Pearmain far surpasses King of the Pippins in richness and flavour, yet, in his note on the subject, p. 82 of the last volume of the *Gardeners' Chronicle*, he makes it appear that King of the Pippins is best. How does he make the two statements agree? My own experience of the two fruits is that the flesh of King of the Pippins is yellowish, firm, with a nice flavour, and keeps much longer than Golden Winter Pearmain, whose flesh is white, with no flavour—only fit to grow

for its handsome appearance. I think Mr. Culverwell and Mr. Saul must have got Golden Winter Pearmain for King of the Pippins. *A. T. S.*

**The "Irish Crofter" Apple.**—I imagine the Irish Crofter mentioned in p. 226 as being selected by Dr. Lucas as one of the best ten Canadians, must be either the Early Crofton (Irish Peach), or the Scarlet Crofton, another Irish Apple. The first is one of the best early Apples we have, becoming ripe about the first week in August, the latter in December. *Lewis A. Killick, Mount Pleasant, Maidstone.*

## THE GOOSEBERRY.

It is somewhat remarkable that the most wholesome, and by no means the least delicious of the fruits cultivated in this country, should be, what few of them are, indigenous. But such is in reality the case as regards the Gooseberry, which is found wild in various localities in this country, and is known to botanists under the names of *Ribes grossularia* and *Ribes uva-crispa*, or the rough and the smooth Gooseberry. They belong to the natural order, Grossulariaceæ, an order which contains only one genus, that of the Ribes, which is, however, composed of many species, several of which are indigenous to Britain, others to the south of Europe, a few to Siberia, and some to North America. None of them, however, attain to the dignity of trees, but are all comparatively dwarf-growing shrubs, some of them remarkable for the beauty of their flowers; others, in addition to the two species mentioned, bearing useful fruit, such as the red, the white, and black Currants. The modern varieties of the Gooseberry are no doubt derived from a blending of the two species named; if, indeed, they ought to be regarded as distinct species, or if they are so considered they are certainly not separated by any very hard or fast line, as there are now many varieties which can hardly be said to be rough, and yet are not altogether smooth. But they have naturally, as it were, divided themselves into four distinct sections, viz., sorts bearing green, red, yellow, and white coloured fruit, and well-defined varieties in each section are very numerous.

The comparatively cool, moist atmosphere of the northern counties of England and of Scotland is better suited to the development of this fruit than the light land and drier air of some of the southern and south-eastern parts of England. And Lancashire has long been celebrated for its large and Drobbingnagian examples of this fruit; and plants of the Lancashire show varieties, as they are called, generally command a higher price, forming as they do a distinct class of this fruit. But it does not follow that the large-fruited kinds are also of the best quality; indeed, the reverse of this is rather in reality the case. But in each of the four sections there are numerous varieties remarkable for their quality or fine flavour, as well as for their immense size.

Like most of other fruits, the Gooseberry succeeds best in soil of moderately good quality, although it cannot be said to be very particular in this respect, but will generally succeed in any ordinary good garden soil. The plants are generally grown in the form of bushes, and should be planted in rows or lines at a distance from each other of not less than 7 feet. They should be annually pruned, and the branches should not be allowed to become too crowded, or the fruit will not be so fine as would otherwise be the case; and it is generally advisable to defer the annual pruning until the spring is somewhat advanced and the buds ready to unfold, as the bushes are liable to be attacked by bullfinches and other predators, who will sometimes, before being observed, strip off the swelling buds from the branches, and thus frustrate all expectations of a crop of fruit; and this attack, if made upon bushes which have been pruned, is more serious than when made upon them before this operation is performed, when there are, of course, more buds to spare. Late spring frosts are not infrequently prove destructive to this crop, so that in most cases it is advisable to defer pruning until all danger from this cause has passed.

The Gooseberry is also liable to be attacked by fungoid diseases, which sometimes prove troublesome, but possibly its most formidable enemy by far is the caterpillar, and for this pest the bushes should be carefully watched during the early spring months; and

there is possibly no better remedy for this evil than the application of powdered hellebore, which may either be applied to the bushes in the form of a powder, or in the form of a decoction of the same, which should be of about the strength of 1 lb. of the powder to 10 gallons of rain-water, and this should be allowed to stand some forty-eight hours before being used, and should be applied to the bushes with a syringe during a still evening; one dressing will generally prove a cure, but if not it should be repeated. Two years ago, for want of attention to this matter, in many gardens all over the country plantations of Gooseberries were to be seen with the bushes divested of every leaf for want of applying in due time this or some other simple remedy, and the consequence was that any fruit such plants bore was, of course, flavourless, if not altogether worthless.

Although, as has been said, this useful and delicious fruit is generally grown in the form of comparatively low or squat bushes, it is nevertheless amenable to other methods of training, such as the standard form, and trained to a north or other wall, where such late sorts as the Red Warrington may be kept in good condition until the middle or end of November, and we have some recollection of seeing in a garden in Perthshire years ago a single plant of the variety named covering the entire east end of a large building upwards of 30 feet high, and clothing many square yards of wall, and the plant was said to annually furnish heavy crops of fruit of excellent quality. We have never, however, seen this fruit more successfully grown than in the form of pyramids, and this was accomplished in the following manner:—The portion of land intended for the plantation was heavily manured and trenched; the surface was made quite level, and lines were drawn upon it each way at a distance of 6½ or 7 feet from each other, that is, the lines were drawn from north to south and from east to west, and at each intersection of these lines a strong Larch post was fixed in the soil; the posts were some 6 or 8 inches in diameter at the lower end, which had previously been well charred. The posts were then cut to a uniform height of 7 feet above the level of the soil, and in order to give increased stability to them a strong cord or wire was made to extend from the top of one post to that of the next, and so on. A healthy young Gooseberry tree was planted upon the south side of each post, and from each plant four shoots were allowed to grow, which were either nailed or tied to the posts, while from these leading shoots lateral branches were allowed to extend themselves, so as to get the plants into the desired pyramidal form; and as soon as the leading shoots reached the top of the post a shoot was trained along each wire or cord. When the plants forming the plantation attained to their full development the thing was considered unique and was much admired, and during the fruit season was much resorted to by ladies and others, as the fruit could be readily picked from the branches without the trouble of stooping to do so.

The Goosebushes, we believe, been successfully grown under glass in orchard-houses and similar structures, but it is doubtful if it would submit to anything like forcing, even if this were necessary or desirable, which can hardly be said to be the case. It has already been said that the Gooseberry is the most wholesome of fruit, and when quite ripe most of its varieties are delicious, and in all stages of its development it is useful; when in a green and unripe condition it is much used and appreciated for culinary purposes, and when ripe some of the varieties are made into the most delicious preserves, and green Gooseberry wine is even said to have done duty for champagne. *P. Grive.*

## THE SO-CALLED COMPASS PLANTS.

THE American Compass-plant was figured in the *Botanical Magazine* last year, plate 6534, and we reprinted the account there given of it by Dr. Asa Gray, and this brought several interesting communications (*Gard. Chron.*, n.s., xv., pp. 74, 276, 571, and 699) respecting this plant. And in one of these communications—that from Dr. Engelmann (*l.c.*, p. 276)—it is stated that other Compositæ with vertical leaf-blades have the stomates equally distributed on both surfaces of the leaf. This is especially the case, the writer states, with *Lactuca scariola*, a plant unknown here (St. Louis) formerly, but extremely abundant of late years in waste places. The leaves not only assume a vertical position, but also a meridional one, similar to those of the *Silphium*, though perhaps less pro-

nounced. The fact that the leaves of *Lactuca scariola* assume vertical positions has long been known, and is mentioned in several books; but it has only lately been recorded that they also stand in a meridional plane—that is, point north and south.

Whether Dr. Engelmann was the first to record this fact, as quoted above, or Professor E. Stahl, of Jena, we cannot say. But the latter botanist last year published an account of some experiments and observations he had made on this plant. Dr. Stahl's experiments were undertaken for the purpose of determining the cause of this remarkable orientation of the leaves. In order to determine the manner in which light affects the leaves of this *Lactuca*, Dr. Stahl cultivated a number of plants in diffused daylight. Plants cultivated in a room and only exposed to the light that entered at a north window bent the tips of their stems towards the window, whereas the leaves turned themselves vertically to the incidence of the light. Plants growing in ditches or among bushes, so that they were only exposed during growth to the diffused light of the firmament, had perfectly horizontal leaves. From this experiment it seems that the leaves of *Lactuca scariola* behave exactly like those of other dicotyledons under the influence of feeble light—that is to say, they are what Darwin terms diatelicotropic, or in a position transverse to the light by which it is caused.

In order to ascertain the effects of sunlight on the position of the leaves the following experiment was carried out.—Two flower-pots with plants of equal age were taken; the one was exposed from 10 A.M. to 3 P.M. to direct sunlight, and kept in the dark the rest of the time; and the other was kept in the dark from 10 to 3 and exposed the rest of the time. As the weather was continuously fine during the experiment the plants enjoyed direct sunlight during the hours of exposure. The plants grew, though slowly. The newly formed leaves of the plants exposed during the mid-day hours showed no tendency to the meridional position, whereas it was distinctly noticeable in the plants exposed up to 10 and after 3 o'clock.

As the foregoing experiment was not altogether satisfactory it was repeated in the following modified manner.—Some plants growing in the open air were so covered by a board resting on four posts that they were sheltered from direct sunlight during the mid-day hours, but exposed to it during the earlier morning and later afternoon hours. In these plants the newly formed leaves assumed the meridional position as decidedly as those of plants exposed all day to direct sunlight. Other plants were placed among bushes, so that the sun could only fall upon them when at a great altitude. Although these plants received diffused light all day long from above, the leaves were by no means horizontal. The effect of the sun-light was exemplified in the south or south-west direction of the upper surface of the leaf.

That the meridional position of the leaves of plants standing quite free is caused by the light of the sun on the horizon is evident. Dr. Stahl says, from the following experiment:—

A pot of young plants was placed near a window looking north, in which position the plants were exposed to direct sunlight for a few hours after sunrise and before sunset. All the leaves developed under these conditions inclined their tips towards the north, and the upper surface was turned either to the east or to the west. When the plants were removed so far from the window that the sun did not shine upon them at all, the above described vertical position to the diffused light.

This phenomenon is not an uncommon one, but the leaves of *Lactuca scariola* are much more sensitive to intense light than those of many other plants. The leaves of many Papilionaceæ—Beans, for example—assume such a position during intense heat that the least surface is exposed to the sun, thereby avoiding excessive heat and light. *H. B. II.*

### The Poultry Yard.

WINTER LAYERS.—The particular white hens to which I referred last week as being such capital winter layers, I now learn, are either the product of a cross between white Dorkings and white Leghorns, or between the former and white Spanish breeds. I incline to the former cross, especially as the Leghorns are such capital winter layers, but they have yellow legs and flesh, not a desirable table feature. My fowls are white throughout. *D. B.*

### Obituary.

ENGLISH visitors to Ghent who have experienced the courtesy of Count KERCHOVE DE DENTERGHEM, late Burgomaster of Ghent, will receive the announcement of his death, which occurred on the 21st ult., with sincere regret. The Count—a member of one of the oldest families in Flanders—took a leading part in agricultural and horticultural matters, and in this capacity he came into contact with English horticulturists, and always in such a manner as to secure their respect. The Winter Garden erected at Ghent by the late Count is one of the sights of that interesting city, and was freely opened for the inspection of visitors. We took occasion in 1875, vol. iii., to publish some illustrations of this noble house, in which a tropical ravine, with Palms in great beauty and variety, Tree Ferns, rocks, waterfalls, &c., is successfully and artistically imitated; and in 1876, vol. v., p. 181, we published a portrait of the deceased nobleman. Count de Kerchove identified himself with everything that was likely to promote the prosperity, not only of his native city, but of Flanders—indeed, of his country generally. It is no matter for surprise, therefore, to find that he was honoured alike by the Government and by his fellow-citizens.

Count de Kerchove was born in Ghent in 1819, and in early life took high honours at the Ghent School of Engineering. In 1848 he became a member of the Royal Society of Agriculture and Botany of Ghent; and in 1859 became honorary President of the society, and presided in this capacity over the great Exhibitions of 1868, 1873, and 1878. On the death of M. Edmond de Ghellinck de Walle, in April, 1875, Count Kerchove was nominated President of the Society, and also of the Cercle d'Arboriculture. In 1851 the Count was selected as "Conseiller Provincial" for the canton of Ghent, an office which he filled until 1864, when he was elected a member of the Chamber of Representatives for Ghent—a position to which he was several times re-elected. In 1857 his fellow-citizens elected him as "Conseiller Communal," and the late King Leopold appointed him burgomaster of the city—a high office, which he filled with honour and distinction, his government being marked by energy, firmness under circumstances of great difficulty, and great courtesy. Horticulturists will specially feel his loss, for the reasons already assigned. The late gentleman's eldest son, Count Oswald de Kerchove, Governor of the province of Hainault, who now succeeds to his father's title, has associated himself even more intimately with horticulture, and with the members of the horticultural press; on which account we feel that we do but interpret the feelings of English lovers of gardening, connected by so many ties with the old Flemish city, when we offer to the family a cordial expression of respectful sympathy with them in their distress.

—MR. E. FANCOURT.—In our obituary column last week appeared a brief notice of the demise of Mr. Edwin Fancourt, a name doubtless familiar to numbers not personally acquainted with him, as it was to the very many in one way or other connected with gardening who were. For it would be difficult to imagine any individual connected with the nursery business of this kingdom who has not at least heard of the most renowned of propagators, father and son, which this country has ever known. The remark is often made that it rarely happens that when a man has excelled in any particular art or calling, that his mantle descends upon his son. Yet here, at all events, was an exception; for, although the elder Fancourt has been looked on as the father of English plant propagators, his son, following his footsteps, was equally successful. A word here may not be out of place respecting Mr. John Fancourt, the father of the deceased. He commenced his career in connection with the trade in 1811, at the Bedford Nursery, New Road (Mr. Smith's); thence he went to the Ball's Pond Nursery; afterwards to the Clapton Nursery; and finally to Messrs. Henderson, at Edgware Road, where he remained thirty-three years. Edwin was born on the site now occupied by the Euston Station, a circumstance which reminds us of the ceaseless extension of bricks and mortar on this as on other sides of London—an extension as irresistible as the wave of lava from a volcano in eruption. At Messrs. Henderson's his father taught him the mode of multiplying in quantity plants the most difficult to increase, and soon he became an expert in the art. From the

Pine-apple Nursery he took a turn in a private establishment—the Marquis of Downshire's, after which he returned to the trade, and amongst other places was foreman with Knight & Perry, King's Road, Chelsea; Cant. of Colchester; Standish, of Ascot; and again at the Pine-apple Nursery; afterwards with Mr. William Cutbush, of the Barnet Nursery, for whom he was manager eighteen years; from there he went to Messrs. Osborn, of Fulham, where he stayed until shortly previous to his engagement with Messrs. James Dickson & Sons, of Chester. Here he remained until his death, which occurred on February 2, at which time he was in his fifty-seventh year. Although only a comparatively short time with Messrs. Dickson, we believe he earned their full confidence and esteem. During his long and painful illness these gentlemen treated him with the greatest kindness—a kindness alike worthy of the employers and the employed. Those who knew Mr. Fancourt intimately need not be told of his genial nature and unassuming manner, which at once enabled him to make a host of friends, and keep them. He died of heart-disease, and was buried at South Mimms, near Barnet. He has left a widow, two daughters, and four sons.

### The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MARCH 1, 1882.

Feb. 23.—A fine day, though overcast and dull. Fine night; dark sky.  
 24.—A fine but overcast and dull day. Fine night; thin clouds.  
 25.—A dull, cloudy, rainy day. Rough night, thin drizzling rain.  
 26.—Strong wind all day, with rain. Windy night.  
 27.—A fine bright day; warm; rain. Dull night.  
 28.—A dull, damp morning. A fine afternoon; overcast. Rain all the evening.  
 Mar. 1.—A fine day; sun shining; frequent showers. Rain-bow seen at 4 h. 53 m. Overcast; occasional rain, and strong wind at night.

LONDON: Atmospheric Pressure.—During the week ending February 25, the reading of the barometer at the level of the sea increased from 30.30 inches at the beginning of the week to 30.85 inches by 9 A.M. on the 20th, decreased to 30.62 inches by 9 A.M. on the 21st, increased to 30.72 inches by mid-night of the same day, and was 29.51 inches at the end of the week.

The mean reading for the week at the level of the sea was 30.41 inches, being 0.29 inch higher than last week, and 0.42 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 53°.5, on the 22d. On the 23d the highest temperature reached was 46°. The mean of the seven high day temperatures was 49°.4.

The lowest temperature in the shade in the week was 33°.5, on the 20th; on the 25th the lowest temperature was 43°.5. The mean of the seven lowest temperatures was 39°.7.

The greatest range of temperature in one day was 13°, on the 20th and 22d; the smallest was 6°, on the 23d. The mean of the seven daily ranges, 9°.7.

The mean temperatures were on the 19th, 42°.5; on the 20th, 40°.4; on the 21st, 46°.0; on the 22d, 46°.8; on the 23d, 42°.6; on the 24th, 44°.3; on the 25th, 49°. And these were all above their averages by 3°.7, 1°.5, 7°.7, 3°.4, 5°.5 and 9°.5 respectively.

The mean temperature of the air for the week was

44.5, being 1.6 lower than last week, and 5.4 higher than the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 92°, on the 19th; the highest on the 23d was 49.5°. The mean of the seven readings was 73.9.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 30.2°, on the 20th. The mean of the seven readings was 34.5°.

Rain.—Rain fell on one day (the 25th) to the amount of 0.06 inch.

ENGLAND: Temperature.—During the week ending February 25, the highest temperatures were 57° at Truro and Sunderland, and 56.4° at Cambridge. The highest temperature at Brighton and Leeds was 52.3°, and at Bolton 53°. The general mean was 54.2°.

The lowest temperatures in the week were 31° at Truro, 32.9° at Wolverhampton, and 33° at Nottingham. The lowest temperature at Liverpool was 38.7°, at Sheffield 37.5°, and at Bradford 36.2°. The general mean was 34.8°.

The greatest ranges of temperature in the week were 26° at Truro, 23.2° at Cambridge, and 21.3° at Nottingham. The least ranges were 16° at Leeds, 16.5° at Sheffield, and 17° at Bradford. The general mean was 19.4°.

The mean of the seven high day temperatures was highest at Sunderland, 55.7°, at Truro 53.6°, and at Plymouth 51.6°; and was lowest at Wolverhampton, 47.5°, at Bolton 47.9°, and at Liverpool 48.1°. The general mean was 50.1°.

The mean of the seven low night temperatures was highest at Liverpool, 42.9°, at Sunderland 40.4°, and at Bradford 40.3°; and was lowest at Bristol and Hull, 37°, and at Wolverhampton 37.2°. The general mean was 38.9°.

The mean daily range was greatest at Sunderland, 15.3°; at Truro 14.5°, at Plymouth 13.9°; and was lowest at Liverpool, 5.2°, at Bradford 9.1°, and at Blackheath, Bolton, and Leeds 9.7°. The general mean was 11.2°.

The mean temperature for the week was highest at Sunderland, 47.5°, at Truro 45.8°, and at Liverpool 45°; and was lowest at Wolverhampton, 41.8°, at Bolton 42.5°, and at Bristol 42.9°. The general mean was 44°.

Rain.—The largest falls were 0.79 inch at Truro, 0.47 inch at Bolton, and 0.30 inch at Brighton and Bradford. The least falls were 0.05 inch at Sunderland, 0.06 inch at Blackheath, and 0.07 inch at Nottingham. The general mean was 0.2 inch, and it fell on an average of two or three days.

SCOTLAND: Temperature.—During the week ending February 25 the highest temperature was 58°, at Glasgow and Dundee; at Leith the highest temperature was 53°. The general mean was 55.6°.

The lowest temperature in the week was 28.2°, at Greenock; at Edinburgh the lowest temperature was 37.6°. The general mean was 34.7°.

The mean temperature for the week was highest at Glasgow and Paisley, 47.6°; and lowest at Greenock, 43.9°. The general mean was 46.5°.

Rain.—The largest fall was 0.75 inch, at Greenock; the smallest was 0.03 inch, at Edinburgh and 0.04 inch at Leith. The general average fall was 0.02 inch.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

\* \* CATALOGUES OF FERNS, PALMS, ORCHIDS, &c.—M. Coffey, of the Botanic Garden, Geneva, writes that he would be glad to receive catalogues of the above.

CYCLAMENS: *S. H. C.* We have never experienced any difficulty in keeping these in good health in a window after they have come into flower. The main points in their management are to keep the soil sweet but not over-watering, to keep the leaves clean by occasionally sponging with suds, and not to permit the plants to suffer from down draughts. It is probably more from the latter cause than from any other that so many plants come to grief in town windows.

\* DUNCAN \* STRAWBERRY I had from Trasson Freres, Orleans. If your correspondent wishes it I will send him a plant and afterwards a box of Blackberries established in 6-inch pots. If he turns them out into the open ground without disturbing the roots he will be able to form a good idea of their position and comparative earliness in his situation. *Philomelos.*

GIANT HEMLOCK, &c.: *G. R.* Both are biennials, and may be raised in any quantity by mixing the seeds with soil and afterwards sowing down a few shovelfuls in different parts of the coverts you want them to grow in.

NAMES OF PLANTS: *S. M. O., Exeter.* It is not the Sea Buckthorn, but the tall shrubby Orache (*Atriplex Halimula*), a first-rate seaside plant.—*A. F.* A species of Hippury, which we cannot recognise without the fruit.—*M. R.* Asparagus mediceolus; *P. R.* Rhododendron pendulum;—*Salsberger, Co. Devon.* *Spherherdia canadensis.*

ORANGE TREES: *Constant Reader.* We cannot tell you anything about the price. Ask the nearest nurseryman.

PARTERRE: *L. P.* A book of designs was published at the *Journal of Horticulture*, Office, 171, Fleet Street; but it is, we believe, now out of print, and we know of no other.

PEA TRIALS: *D. H.* The last report on Peas tried by the Royal Horticultural Society was published in 1873. The best was a good one at Chiswick in 1878, but no official report was issued.

PRIMULA: *J. Kingsbury.* Pretty, but not new. Several varieties of the same character have been grown at Chiswick during the last few years. There is, in fact, a distinct strain of these speckled flowers, and which is of Continental origin.

ROSES, LIMES, &c.: *A. F.* 1. Yes, if you work from plants grown indoors; 2. Yes.

VINES: *Constant Reader.* The roots are swarming with the dreaded Phylloxera. By no means plant it, but send us some more packed in damp moss, and burn the remainder. The other Vines should have the roots put in quarantine—a tub of water—for twenty-four hours before planting.

\* \* \* Correspondents are specially requested to address, post paid, all communications intended for publication to the *Editor*, and not to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

CATALOGUES RECEIVED.

Markets.

COVENT GARDEN, March 2.

Market quiet, with no alteration to quote this week. *James Webber, Wholesale Apple Market.*

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit and Price. Includes Apples, Grapes, Kent Cobs, Lemons, Pine-apples, and Strawberries.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable and Price. Includes Artichokes, Herbs, Horse Radish, Lettuce, Mint, Mushrooms, Onions, Parsley, Peas, Potatoes, Radishes, Rhubarb, Spinach, and Tomatoes.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant and Price. Includes Aralia Sieboldii, Arabis virginica, Begonia, Cyclamen, and others.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower and Price. Includes Anemone, Azalea, Bouvardia, Camellia, Carnation, and others.

SEEDS.

LONDON: *March 2.*—The weather having lately been highly favourable, fields of grain are now an active demand for all kinds of farm seeds, and considerable quantities are daily changing hands. American rice continues firm: the imports into Liverpool this season are estimated at 570 tons, against 316 tons for 1881, and 1200 tons for 1880. In Trefoll a further advance is shown of 11 per cent. Alskae and white realise full rates. For Italian and perennial Ryegrasses the sale is brisk. Spring Tares on the spot are exceedingly scarce. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday trade opened very quiet at the previous Friday's level, but as the tone became more depressed as the day wore on, prices finishing 11s lower on the week after a very limited business. Flour has declined 6d. to 1s. per sack since Monday 5s 6d. night. Very little was done in barley, and grinding stores were about 3d. lower. Beans were written 1s. and Maize 6d. lower on the spot. Feet were without alteration in value; and, with moderate arrivals during the week, Oats met a quiet sale at unaltered rates.—On Wednesday English Wheat was rather more firmly held than on Monday, and foreign met only limited enquiry on the spot. Flour continued dull, 9s 10d. in Trefoll was quiet in positions; Beans and Peas sold in retail quantity at Monday's rates; Oats were steady; and Maize dull on the spot, but rather firmer forward.—Average prices of corn for the week ending February 25.—Wheat, 45s. 7d.; Barley, 31s. 4d.; Oats, 20s. 7d. For the corresponding period last year:—Wheat, 40s. 9d.; Barley, 31s. 10d.; Oats, 20s. 10d.

CATTLE.

At the Metropolitan Market on Monday trade in beasts was firm, with a fair demand, but not a very quick sale. Best qualities rather exceeded late value. Sheep supplies were light, and the market firm, with a fair trade, at former to occasionally rather dearer rates. Prime calves were scarce. Quotations.—Beasts, 4d. 6d. to 5s. 4d., and 5s. 6d. to 6s.; calves, 5s. 4d. to 6s. 6d.; sheep, 6s. 4d. to 6s. 8d., and 7s. to 7s. 6d.; lambs, 8s. to 8s. 6d.—On Thursday trade was firm in tone, but business was somewhat slow. Both beasts and sheep were in demand, and made full prices. Calves were steady, and pigs were quoted at late rates.

HAY.

Tuesday's Whitecap Market report states that trade was very dull, and best Clover 4s per load down, though supplies were moderate. Quotations.—Prime Clover, 120s. to 122s.; inferior, 70s. to 95s.; prime meadow hay, 100s. to 102s.; inferior, 55s. to 95s.; and straw, 38s. to 52s. per load.—On Thursday the supply of fodder on offer was moderate. The trade remained dull, though prices were without alteration.—Cumberland Market quotations—Superior meadow hay, 126s. to 132s.; inferior, 70s. to 95s.; superior straw, 125s. to 135s.; inferior, 90s. to 105s.; and straw, 48s. to 55s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that supplies, whilst not heavy, are adequate, and prices steady. Quotations.—Regents, 80s. to 100s.; Champs, 50s. to 70s.; Magnum Bonum, 80s. to 100s.; flukes, 115s. to 130s.; Victorias, 100s. to 120s. per ton.—The imports into London during last week comprised 5000 bags from Hamburg, 309 Bremen, 320 Boulogne, 555 New York, 10 barrels from New York, and 35 tons from Barleir.

COALS.

The following are the prices current at market during the week:—Walls End—Hetton, 15s.; Hetton Lyons, 13s. 6d.; Lambton, 14s. 6d.; Original Hartlepool, 15s.; West, 15s. 6d.; Thornley, 14s. 3d.

Government Stock.—Consols closed on Monday at 99½ to 100 for both delivery and the account. Tuesday's prices were, for delivery, 99½ to 100, and 100½ to 100½ for the account. Wednesday's closing prices were, for delivery, 100½ to 100, and 100½ to 100½ for the account. On Thursday prices for delivery were as on the preceding day, whilst those for the account were ½ lower.

NOTICE.—SELLING OFF OF NURSERY STOCK.

Great Reduction in Price for Cash Payments.

EWING & CO.,

Having determined to discontinue their Nursery Business at EATON, near NORWICH, and in order to induce a quick Sale of their Stock, offer the following discounts off List Prices, viz.:

They hold the following in great quantity and of the finest quality:—

ROSES—Dwarfs of the best old sorts of Hybrid Perpetuals, Bourbons, Mosses, &c., up to 25d. per dozen, 65s. to 100s. per 100, £30 to £40 per 1000.

CURRANTS—Black, good bushes on stems, 2s. to 6s. per dozen, 20s. to 30s. per 100; clear by the 1000.

SPECIAL OFFER. BECH, 4 to 8 feet. HAZEL, 1 1/2 to 4 feet. SPRUCE, various sizes. SPIRÆA, in variety. WILLOW, strong named kinds. Price on application to ROBERT VEITCH AND SON, Exeter.

STANDARD POTATO (Fenn).

FIRST-CLASS CERTIFICATE ROYAL HORTICULTURAL SOCIETY.

SUTTON and SONS strongly recommend this grand Potato. It is remarkably good for early borders and frames, and excellent in quality. This Potato was grown in the Chiswick trials of the Royal Horticultural Society, and in the report which appeared in the Gardeners' Magazine of September 3, 1881, it was alluded to as "highly approved for cropping qualities and handsome appearance." Also, "on being subjected to the test of cooking, 'Standard' was awarded a First-class Certificate." Price 5s. per 1 lb., 17s. 6d. per 5 lb. Much cheaper by the sack. THE QUEEN'S SEEDSMEN, READING.

ALTRINGHAM CARROT

(Sharpe's select stock.) This has been selected by us for years, and is the finest stock in the Trade. WHOLESALE OR RETAIL PRICES ON APPLICATION. CHAS. SHARPE and CO., Seed Growers, Sleaford.

## C. FIDLER, POTATO GROWER, READING, BERKS.

THE "AUTOMATON."

Sizes, 8 to 22 inches. THE BEST GENERAL PURPOSE MACHINE.

The "AUTOMATON" Lawn Mowers are thoroughly strong, well-made, and durable machines, and the best suited for general work and Gardeners' use. They cut the grass perfectly, leave no ribs, but produce a smooth velvety surface on the lawn, and are light in draught.

The "AUTOMATONS" have front rollers for general work, and side rollers for cutting long grass, or when it is necessary to roll the grass in front of the cutters. They have the best machine-made gearing, the best self-sharpening knives of steel and iron rolled together, and automatic silent drivers.

THOUSANDS IN USE.  
SENT CARRIAGE PAID.  
MONTH'S TRIAL ALLOWED.  
NO CHARGE FOR PACKING.

**RANSOMES' LAWN MOWERS ARE THE BEST.**  
 COMPLETE PRICE LISTS FREE BY POST.  
 THE HIGHEST AWARDED.  
 STOCK KEPT IN LONDON at Arch 92, Spitalfields Station, Bethnal Green, E., and Machines may be ordered from any respectable Ironmonger.  
 Ransomes, Head & Jefferies, ORWELL WORKS, IPSWICH.

The "WORLD" (late "GLOBE") Lawn Mowers are intended for cutting long grass; and, whilst similar to the Lawn Mowers imported from America, have the special advantages of the more accurate fitting and general durability of English manufacture and perfect adjustment.

The "WORLDS" will cut wet, dry, long, or short grass without clogging, and cut off almost all the "beats." They leave the surface smoother than similar machines, and are well adapted for getting over a large amount of work with little labour.

THE "WORLD."

Sizes, 8 to 24 inches. FOR CUTTING LONG GRASS.

Now Ready, a Revised Edition of the

Many sizes in stock ready for despatch. Full particulars and illustrations and prices on application. See also advertisement alternate weeks.

MESSENGER AND CO. Loughborough, Leicestershire.

**RIPPINGILLES PATENT PROPAGATING PLANT FRAME.**  
Heated by Patent Stove, to Burn Petroleum and other Mineral Oils.

The Simplest and Best Invention ever introduced for RAISING SEEDS, STRIKING CUTTINGS, &c.

The only Frame of the kind for Outdoor Use. The above illustration represents Rippingilles' Patent Outdoor Plant Frame, which is so constructed that it will not blow out during the roughest weather; it is made upon the most scientific principles, but is so simple that it is impossible to get out of order, and is economy in unequalled, the cost of burning being only from A FARTHING TO A HALFPENNY PER DAY.

The Stove will burn from thirty-six to forty hours without attention. The products of combustion do not enter the frame at all, but at the same time all the heat is completely utilised. It is disconnected from the Frame for trimming the wick, lighting, replenishing with oil, &c. The top of frame slides off either way, and is entirely removable; this is very convenient for planting or removing cuttings, watering, ventilating, &c. The heat attained is from 70° to 90° Fahrenheit, which is considered the best temperature for forcing or propagating purposes.

**PRESS OPINIONS.**  
The "Journal of Horticulture."—"A valuable aid to Amateur Gardeners."  
"The Gardener."—"It is a handy Plant Frame, likely to be much used when better known."  
"The Gardeners' Magazine."—"Rippingilles' Propagating Frame is a most valuable invention."  
"The Horticultural Record."—"This Frame ought to be in every small Garden, so that its owner could raise his or her flowers from seeds and cuttings, which gives so much greater zest to the pleasures attached to Amateur Gardening."

Sent packed free and carriage paid to any Railway Station in England.

Illustrated LIST, with full particulars, further Press Opinions, Testimonials, sizes, &c., free on application to

**THE HOLBORN LAMP & STOVE CO.,**

SAY WHERE YOU SAW THIS ADVERTISEMENT.

**LEAN-TO OR SPAN ORCHARD HOUSES,** consisting of top and front sashes in red deal framing, channelled and glazed without putty with 21-oz. glass. Sashes removable when not required for the trees. Price, 12s. 6d. per foot super-carriage paid. Specimens on view. Catalogues and Price Lists free. W. PARHAM, Northgate Works, Bath, and 411, Oxford Street, London, W.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a PATENT "DOUBLE L" SADDLE BOILER will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.		To heat of 4-in. Pipe.	Price.
High.	Wide.	Feet.	£ s. d.
10 in.	18 in.	300	7 0 0
20 "	18 "	400	8 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Batham Hill, S.W., May 29, 1873.  
"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers in way of work."

**PRICE LISTS OF HOT-WATER PIPES AND CONNECTIONS,** with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, South-west, London, E. E.  
When ordering Boilers please refer to the above advertisement.

The Best System of Heating is by Hot Water. The Best Hot-Water Joint is Jones' Expansion Joint.

 Samples and Price Lists free.  
**J. SMITH, The Royal Label Factory, Stratford-on-Avon.**

**HILL AND SMITH'S BLACK VARNISH**  
 for Preserving Ironwork, Wood, or Stone.  
*(Registered Trade Mark.)*

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced in the third year 1870 by the advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, New Gardens, and at the seats of many high nobility and Gentry, from whom the most flattering testimonials have been received.  
 Sold in Casks of about 30 gallons each, at 12. 6d. per gallon at the Manufactory, or 12. 8d. per gallon carriage paid to any Station in the Kingdom.

**UNSOLICITED TESTIMONIAL.**  
 "Pierrefield Park, June 21, 1876.—Sirs.—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with six good Varnish as the best we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow. — I am, Sirs, yours respectfully, Wm. Cox."

**CAUTION—HILL & SMITH** would particularly warn their Customers against the various cheap Varnishes now so much advertised.  
 H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade mark as above, without which none is genuine.  
 Large Illustrated Catalogue of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to **HILL AND SMITH, Brierley Hill Ironworks, Staffordshire;** and 186, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

IMPROVER, in a Gentleman's Garden.—Age 19; five years' excellent character.—JOSEPH HORNER, Cross Lanes, Leeds.

IMPROVER.—Age 19; seven years' CHARGE.—Apply to objection party, small Premium.—JOHN CLARKE, The Gossey, Eastcote Park, Leicester.

IMPROVER, in a Garden where several men are kept.—Age 18; good character.—R. PAWSEY, Admiral Luard's, The Lodge, Witham, Essex.

IMPROVER, in the Garden, by a thoroughly good working young man. A Premium if required, if the wages are good.—GARDENER, Barton Court, Colwall, Malvern.

IMPROVER.—Wanted, by a lad, age 17, a situation in a Gentleman's Garden—one where there is glass preferred.—G. COOPER, 9, Thorney Cottages, Ivry, Bucks.

IMPROVER.—Wanted, to place a youth under a good Gardener, who is a first-class Gardener. Premium given. Particulars to A. H., 17, Regent Street, Briton Ferry, Glamorganshire.

IMPROVER, under a Head Gardener.—Age 20, respectable; son of a Gardener. Has had three years' experience, principally under Glass.—A. E., 68, King's Road, Peckham, S.E.

IMPROVER; age 20.—Mr. F. FORD, The Gardens, Swallface Park, Banbury, wishes to recommend a young man to a good Gardener. Has had three years' used to Plants, Nailg, Moving, &c. Five years' experience; three years last place.

APPRENTICE, in a Gentleman's Garden or Nursery.—Age 18. Premium given, if required.—F. SPRAGG, Upton Grey, Odham, Hants.

COWMAN, or COWMAN and UNDER GARDENER.—Age 21; good character. Thoroughly understands Milking.—J. DAVIES, 14, Lorne Cottages, Albert Road, Richmond, S.W.

TO HEAD GARDENERS.—ADVERTISER can with confidence recommend a really useful young man (Age 21), accustomed to general indoor work in a large establishment.—GARDENER, Bushey Grove, Watford.

TO GARDENERS.—ADVERTISER (Age 28, single) seeks a situation in the Houses. Good Plants-man, Decorator, and Furnisher. Good references and testimonials.—POMONA, 17, Hermitage Street, Bath Road, Cheltenham.

TO GARDENERS.—Wanted, to place a respectable, well-educated lad, just on his fifteenth year, with a Nobleman's or Gentleman's Garden for two or three years. A small Premium would be given to a good kind man.—R. KEMP, Foulden, near Brandoo, Norfolk.

TO NURSERYMEN.—THE ADVERTISER (Age 24), who understands the general routine of a Market Nursery, requires a situation. Four years' reference from last employer.—A. B., 95, Beaufield Road, West Green Road, Tottenham, Middlesex.

To Market Growers.—MANAGER; age 37.—To grow extensively Grapes, Peaches, Strawberries, Cucumbers, Tea Roses, &c. Good references.—G. H., The Hall Nurseries, Bushey.

NURSERYMAN, or INDOOR FOREMAN, PROPAGATOR, GROWER, and SALESMAN.—ADVERTISER, active and energetic, and with thirty years' practical experience in the Nursery trade. Has a good Bouquetist, and can give first-class references.—HORTUS, 39, Foregate Street, Worcester.

MANAGER, TRAVELLER, or SHOPMAN.—Age 29; active and energetic; thirteen years' experience in good Houses. Thoroughly acquainted with every branch of the Seed Trade. Undesirable references.—H. E., 29, Donsel Gardens, Alpha Road, N.W.

CLERK, or HEAD SHOPMAN.—Age 38; 17 years' experience in the Seed and Nursery Trade; well acquainted with the routine of both. Efficient Correspondent and Book-keeper.—Y. Y. Z., *Gardener's Chronicle* Office, W.C.

CLERK, or SHOPMAN.—Well acquainted with Book-keeping, Nursery and Retail Seed Trade.—S., 9, Hertingfordbury Road, Hertford.

By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a pure, delicious, and healthful beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maldies are floating about our ready to attack wherever there is a weak point. We may escape many a fatal shock by keeping ourselves well fortified with pure blood and a properly-nourished frame.—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in packets, labelled, JAMES EPPS AND CO., HOMOEPATHIC CHEMISTS, London.

Makers of Epps's Chocolate Essence for Afternoon use.

HOLLOWAY'S PILLS.—Weak stomachs.—The distressing symptoms arising from enfeebled digestion are almost numberless, and all of them can be dispelled by these admirable Pills. They clean the irritated tongue and remove all unpleasant tastes from the mouth, with flatulency and constipation. Holloway's Pills are the surest and most efficacious means of restoring to healthy tone one which fully enables it to convert all we eat and drink into the nourishment of our bodies. Hence they are the surest strength-givers and the safest restoratives in nervousness, wasting, and chronic debility. Holloway's Pills are infallible remedies for impaired appetite, eructations, and a host of other disagreeable symptoms, which render miserable the lives of thousands of our fellow creatures. These Pills are approved by all classes

# THE HOME FOR FLOWERS AND SEEDS:

## GARDENERS' CHRONICLE.

**November 14, 1881.**  
 "Floral Committee of Royal Horticultural Society.—Many have been the horticultural triumphs of Messrs. CANNELL & SONS, none will probably bring them more renown than the collection of Primulas which today come to the notice of the public. Splendidly grown and flowered, and of well-selected varieties; it was a group that gained the admiration of all, and higher praise could hardly be given. Most strikingly distinct, and most attractive of all was the real red Primula—the Swaley Red—that took the popular fancy amazingly, and of which it may be said that it has no rival. Other sorts of undoubted quality were the Swaley White, Rubra Improved, Swaley Purple, and Swaley Carmineata, all represented by a number of plants, each in a 5-inch pot, in all respects remarkable for their stout leafy leaves and robust trunks of beautiful flowers. Grown sufficiently above the foliage to show every pip to the best advantage."

**May 20, 1881.**  
 "Tuberous Begonias.—Messrs. CANNELL & SONS send flowers of four very fine French sorts—two single and two double. The singles are Procadero, of a brilliant vermilion-orange, resembling the colour of the bright orange garden Nasturtium, the sepals oblong,  $\frac{1}{2}$  inches long, so that the flowers measure  $\frac{5}{8}$  inches over; 2nd Countess of Kingston, a deep crimson-scarlet, and enormous flowers. The doubles are Psephenora, which has long rounded guard petals  $\frac{1}{4}$  inch across, and a dense centre mass of smaller petals fully a inches across and in depth, the flower colour a deepish shade like a miniature Hollyhock; and Lucy Lemoine, which is taller, but of the same Hollyhock-like form, with petals of creamy white, and in which the flower colour is a shade of primrose-yellow at the base. They are all very handsome sorts of strikingly distinct character. The plants occupy a house in Messrs. CANNELL & SONS' nursery 150 feet long, and are now in grand condition."

**July 2, 1881.**  
 "Messrs. CANNELL & SONS have just sent us a box of blooms of the double forms of Aegleia. They are very beautiful, and evidently a very fine strain, and represent the greatest advance yet made in this direction. Amongst them was a very fine form of Aegleia, grown in double in the open garden at Swaley. No garden should be without these very pretty flowers, and the best way to get up a stock is to purchase seeds from a house that you can depend upon."

**May 21, 1880.**  
 "Messrs. CANNELL & SONS sent us a quantity of cut flowers of a remarkably good strain of herbaceous Calceolarias, the majority being pretty spotted, and they are also large in size, and well rounded in form, and thus represent a strain that may be highly commended for its quality."

**December 10, 1881.**  
 "Blue Primula sinensis, from Messrs. CANNELL & SONS of Swaley. We have flowers of a large well-shaped strain of Primula sinensis, in which the flower colour is a deep shade of mauve colour, making the nearest approach to a blue Chinese Primrose which we have as yet seen. When we consider the wonderful advances in colour which we are witnessing during the past three or four years, and remember their origin, we may now look forward to the eventual acquisition of a true blue Primula to this race of plants. Messrs. CANNELL & SONS also brought up a handful of flowers of Marguerite (Chrysanthemum grandiflorum), a most useful and pleasant plant at all seasons."

**October 13, 1881.**  
 "Royal Horticultural Society.—Some very highly coloured stalks of the Chinese Beet sent by Messrs. CANNELL & SONS of Swaley, afforded opportunity for remarks on the colouring matter in plants, and those in question were the admiration of all beholders, and the same in quality. Its broad-stemmed foliage cannot fail to render it most attractive."

**March 26, 1881.**  
 "Royal Horticultural Society.—A Silver Banksian Medal was awarded to Messrs. CANNELL & SONS for a nice group of Cinerarias."

"We have just received from H. CANNELL & SONS, of Swaley, Kent, samples of Petunia flowers of a remarkably fine strain, selected from those they are also large in size, and well rounded in form, and thus represent a strain that may be highly commended for its quality. The flowers are generally very large, some beautifully striped in a great variety of patterns, some of the richest velvety crimson. One variety was especially noticeable, and to us entirely novel and particularly fine."

**December 17, 1881.**  
 "Liverpool Chrysanthemum Show, November 30, 1881.—Messrs. H. CANNELL & SONS, of Swaley, Kent, sent a bright and very fine matchless collection of Primulas, which were greatly admired."

**August 27, 1881.**  
 "The Great International Show, Manchester.—A word of praise must be awarded to Messrs. CANNELL & SONS for a fine group of cut flowers. They were in CANNELL'S best style, and comprised a fine lot of cut Verbenas, Pelargoniums, single Dutch Delphiniums, and other flowers of the highest quality."

"Messrs. CANNELL & SONS brought up from Swaley individual flowers of twenty distinct varieties of Primula sinensis, of first rate quality; to us very interestingly admirable."

## JOURNAL OF HORTICULTURE.

"The Dahlia ground at Swaley has lately been the most striking feature, the plants being grown by the acre, and include all sections—showing the CANNELL & SONS for a fine group of cut flowers. They were in CANNELL'S best style, and comprised a fine lot of cut Verbenas, Pelargoniums, single Dutch Delphiniums, and other flowers of the highest quality."

"Messrs. CANNELL & SONS brought up from Swaley individual flowers of twenty distinct varieties of Primula sinensis, of first rate quality; to us very interestingly admirable."

into all gardens and pleasure grounds where Dahlias are grown. The flowers are small, double, but of formal and symmetrical, brilliant scarlet, and produced so freely that each plant is like a bouquet. Such a rich glow of colour is seldom seen as these plants, and Messrs. CANNELL & SONS may give the variety a good name, and propagate it largely."

**February 10, 1881.**  
 "Primulas and Cinerarias (Devon).—You appear to have a good strain of Primulas, the colour being varied, and some very rich; the flowers are also of good form; but there are better kinds in cultivation; for instance, some flowers we recently received from Messrs. CANNELL & SONS, of Swaley, were considerably finer in every respect."

**January 27, 1881.**  
 "Primula sinensis delimita, one of Messrs. CANNELL & SONS' varieties of the Chinese Primula, for which a First-class Certificate was awarded at the last meeting of the Royal Horticultural Society; it has long elegantly-cut Fern leaves, and the flowers are very distinct and pleasing."

**June 30, 1881.**  
 "Messrs. H. CANNELL staged a very handsome group of Foxgloves, Delphiniums being arranged between them, the edging being formed of the variegated Jacob's Ladder. This group was greatly admired by all visitors, and well merited the Silver Flora Medal awarded it."

**January 13, 1881.**  
 "Royal Horticultural Society.—Messrs. CANNELL & SONS, Swaley, staged cut blooms of some good Pelargoniums of extraordinary merit."

"The cut flowers of Salvia staged by H. CANNELL & SONS, of Swaley, at a meeting of the Royal Horticultural Society, and at the Royal Aquarium on the following day, attracted the attention of many visitors, who were apparently unacquainted with many of some special varieties at that season. But if a few flowers were sufficient to awaken so much admiration, it can readily be imagined that a house 100 feet long full of Salvia of such brilliantly-coloured forms as Pitcher, splendens, Brunati, Hethel, Rutlans, and Howe, must be simply unique. Yet at Swaley there is a house of the dimensions named devoted entirely to these charming plants, all in pots, vigorous and profusely flowered. The three, for which Certificates were awarded at Kensington, cannot be too strongly recommended."

**March 24, 1881.**  
 "Royal Horticultural Society.—Messrs. H. CANNELL & SONS secured a Silver Banksian Medal for a collection of Cinerarias, the colours of which were remarkably bright."

**July 18, 1881.**  
 "Messrs. CANNELL & SONS contributed stands of five Verbenas, comprising nearly all colours, also large and handsome African Marigolds, some 12 inches in diameter, globular and even in form, and brightly coloured."

"Just on the eve of going to press we have received a box full of single Petunias from Messrs. CANNELL & SONS, Swaley, Kent, which for size, richness of colour, and purity of markings surpass all that have previously come under our notice."

**April 28, 1881.**  
 "Royal Horticultural Society.—First-class Certificate for Cineraria Match Post.—Flower of great size and substance, exceeding 2 inches in diameter; rich crimson, with a narrow band of white near the centre; compact habit, and certainly a fine variety."

**August 11, 1881.**  
 "Royal Horticultural Society.—Malva moschata alba major.—Messrs. CANNELL & SONS were awarded a First-class Certificate for this plant, which is a beautiful variety of Malva, with pure white flowers. These are produced in great abundance, and the plant being quite hardy, it is a really valuable addition to the list of border plants. The flowers would prove very valuable for cutting."

**July 21, 1881.**  
 "The Chiswick Horticultural Society.—Amongst the flowers Messrs. CANNELL'S splendid contribution to Zonal Pelargoniums and Verbenas far surpassed any exhibits in competition, and added greatly to the beauty of the show."

**July 7, 1881.**  
 "Royal Botanic Society.—Medal was awarded to Messrs. H. CANNELL & SONS, Swaley, for a collection of Pelargonium blooms of the most beautiful varieties. Messrs. H. CANNELL & SONS carried off the principal bouquets."

**June 30, 1881.**  
 "Pelargonium Society Show.—For thirty-six double Zonals and twelve Ivy-leaved varieties, Messrs. H. CANNELL & SONS carried off the principal bouquets."

**September 8, 1881.**  
 "Recollections of Manchester.—We were very much pleased with the bouquet and single Dahlias. Of the latter there was a magnificent display from Messrs. CANNELL."

**September 15, 1881.**  
 "Royal Horticultural Society.—Messrs. H. CANNELL & SONS also had an extensive collection of Linnæa represented, and all the sections—Single, Pompons, Show, and Fancy varieties. Of the single varieties, Alba, a large pure white flower, and Parma, were the most noteworthy. Of the Pompons, Show, and Fancy forms it is almost impossible to make a selection, as nearly all the best in commerce were admirably represented. A magnificent display of the most beautiful varieties of French Marigolds (H. CANNELL).—They are splendid. We never saw finer marigolds, nor petals more regularly or brilliantly striped."

**September 22, 1881.**  
 "Royal Horticultural Society.—We were very much pleased with the bouquet and single Dahlias. Of the latter there was a magnificent display from Messrs. CANNELL."

**September 29, 1881.**  
 "Royal Horticultural Society.—Messrs. H. CANNELL & SONS were awarded the Silver Banksian Medal for a collection of Cinerarias, remarkably like high-class culture and the excellence of the strain."

"Magnificent collection of tuberous Begonias, comprising about 15 plants, generally of the most beautiful and finest in cultivation. Award of a Gold Medal was deservedly made."

**January 10, 1881.**  
 "H. CANNELL & SONS have favoured us with a boxful of blooms of Chinese Primulas. They comprise single, double, and semi-double flowers of many colours, but all of great size and substance, and whatever other characters are needed to constitute high quality. A variety with flesh-coloured flowers,

bearing narrow stripes of deep red, is novel and effective. A delicate flesh-coloured double is quite a gem in its way. The double carmine has a distinct decorative value. But the crowning glory of the group is the great single crimson, with flowers of a rich, deep red, the colour deepening to a rich, fiery glow. A household of such varieties constitute a delicate winter garden, and it is by no means a great task to have it within easy reach of every amateur of horticulture."

"H. CANNELL.—Your French Marigolds are really magnificent; we have not sent anything to equal them. The colour and marking is wonderfully bright and decisive, and the form can be summed up in the one word 'perfection.' A few stands of blooms like those before us would present a striking contrast, and have a grand appearance amongst, other cut flowers usually exhibited at this season of the year."

"A very noteworthy feature at the present moment is a house filled with Balsams, which for the splendid quality of the flowers and the skill evinced in their cultivation have certainly not been surpassed. The flowers are, indeed, so large in size and perfect in form that the strain may be described as one of the finest in existence. This house of Balsams is alone worth a journey to Swaley."

"We have just received from H. CANNELL & SONS a boxful of seedling Petunias and Fuchsias of the most sumptuous character. To describe them is simply impossible, and perhaps the best can do is to recommend those who are interested in such things to run down to Swaley and see and judge for themselves. At all events, we place it on record that we have never seen a finer lot of Petunias and Fuchsias than we have just received."

**December 18, 1881.**  
 "Primulas were superbly shown by Messrs. CANNELL, and included several strains of immense importance. The group consisted of crimson, purple, pink, blue, carmine, and fiery red strains, of which it was very difficult to speak too highly, so distinct are the colours and high quality of the flowers."

## THE GARDEN.

What the Rev. S. R. Hole says of the "Home for Flowers," at Swaley.

"When in Kent, not many days ago, I visited the nursery at Swaley. There was little externally to attract the eye, but frames full of healthy lilies of the valley, and other plants, not long weaned from the maternal plant, but of brightness of bloom, and the glass-houses (there must be a score, each roof of length looking white and cold, not that dull cloudy day. If this is 'The Home of the Flowers,' I thought, as it had been publicly declared to be, the inmates, like Irish landlords, and to speak more forcibly, like the inmates of a lunatic asylum. But Mr. CANNELL met me with a smiling face, and with none of those apologies which are not unrequited in the horticultural world.—'You have just come at the very worst time of all; we were magnificent, grand, glorious, ten days ago. Mr. Yao Tho's agent happened to call, and said there was nothing like it in England or on the Continent; but now all is a blank.' No! he led me with quiet confidence to one of the long houses aforesaid, and I should have started, were it not that seventeen stone takes a deal of starting, to see, as he opened the door, the stages on either side of the central path, and the plants, and the plants, and the plants, with a glowing display of zonal Pelargoniums, double and single, white, pink, rose and rosy-purple, red and orange-red, scarlet and crimson, which came upon me with such a sudden vivid beauty that I could scarce believe my eyes."

"Nor was this the only surprise; four others of these spacious structures were filled with French, charming as the Germanium, though out so varied in their colours, those being white, pink, mauve, and carmine, the prettiest of all (except in its application being the Swaley Red). Moreover, there was a large and brilliant collection of Begonias, pale yellow, deep rich gold, and flaming red, and among them the largest, loveliest specimen which I have as yet seen in this most interesting class, a bluish double flower, like an Oleander. I must now take leave of Swaley." *The Garden, November 12, 1881.*

"Pansies—These are still sheets of blossoms. Messrs. CANNELL'S nursery at Swaley, notwithstanding the hot weather and the dry soil of the district."

**April 30, 1881.**  
 "A First-class Certificate was awarded to Messrs. H. CANNELL & SONS, Swaley, for Cineraria Match Post, a new variety with unusually fine flowers, measuring  $\frac{1}{2}$  inches in diameter. The flowers, about a dozen, are broad and of great substance, and arranged in a perfect circular outline. The colour is a rich velvety crimson, inclined to purple, and with a conspicuous purple suffusion extending to the very centre of the flower, and profuse bloomer, while the flowers were large, and as near perfection as regards form as could possibly be."

**June 18, 1881.**  
 "Messrs. H. CANNELL & SONS, Swaley, exhibited an uncommonly fine collection of Pyrethrum, numbering some 200 blooms."

**June 14.**  
 "A vote of thanks was accorded to Messrs. H. CANNELL & SONS, Swaley, Kent, for the high standard of their flowers, comprising pretty varieties, including many of great excellence."

**March 26, 1881.**  
 "A fine group of named varieties of Cinerarias was exhibited by Messrs. H. CANNELL & SONS, Swaley. Most of the sorts were very beautiful and varied in their colour, while the flowers were large, and as near perfection as regards form as could possibly be."

**August 13, 1881.**  
 "From Messrs. H. CANNELL & SONS came a fine collection of double Petunias, comprising forty varieties. These represent a wonderful variation in colour, and also as regards the fringe of the petals."

**January 15, 1881.**  
 "Messrs. CANNELL, Swaley, sent some well-grown and profusely-flowered plants of their new variety, Salmon Queen, Lilian, Striped Fern-leaved, all with flowers of an uncommon high colour."

SALES BY AUCTION.

Imported and Established Orchids.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on WEDNESDAY, March 15, at half past 12 o'clock, precisely, IMPORTED and ESTABLISHED ORCHIDS from Messrs. H. Low & Co., Clapton; a small collection of ESTABLISHED ORCHIDS, the property of a gentleman giving in full particulars, also an importation of 5000 LILUM AURATUM, just received from Japan, in fine condition; a good seed of CEDRUS DEODARA, from India; several thousand TIGRIDIA GRANDIFLORA, and Double TUBEROSES, from America, &c.

On view morning of Sale, and Catalogues had.

Cattleya amethystoglossa.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C. on WEDNESDAY, March 15, at half past 12 o'clock precisely, by order of Messrs. High Low & Co., very fine imported plants in the best possible condition of the rare and lovely CATTLEYA AMETHYSTOGLOSSA, amongst them several grand masses of unusual size. This Cattleya is the finest of the section of the genus to which it belongs, and some of the best beauty met with in an inspection of a plant which will be on view which has produced upwards of thirty flowers on a spike. At the same time will be offered imported plants of CATTLEYA AGLANDIÆ, and other choice Orchids, and also 200 established plants of LÆNOPSIS SCHLERIÆRIANA, &c., the majority in bud or flower.

On view morning of Sale, and Catalogues had.

Thursday Next.

Third and Last Portion of CATTLEYA LINDLEYANA, Rehb. f., TRUE AUTUMN-FLOWERING LABIATA. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C. on THURSDAY NEXT, March 16, at half past 12 o'clock precisely, the Third and Last Portion of a wonderful importation of this magnificent CATTLEYA. It will be well known that there are numerous varieties among the old Cattleya labiata, such as Pescatorea, picta, &c., and the varied buds which that many varieties are among the lots offered. It is true autumn flowering. Flowers will be on view of this, the most Brazilian Cattleya; sepals and petals broad, deep rose or light purple, lip broad, large, splendidly fringed, lower part deep velvety purple; in some varieties the petals are rather more rounded, and yellow. We have never previously seen imported Cattleya so floriferous; there is hardly a bulb which has not flowered and some spike does not show three and four flower stems. Mr. Seidl, the lucky discoverer of this Cattleya, has had the flowers fully expanded, and many others had faded. The green and red-leaved varieties are among the importation, which altogether is in an excellent condition.

CATTLEYA AMETHYSTOGLOSSA.

A grand lot of this rare and superb CATTLEYA. The plants were collected in Bahia by Mr. Kiner, and grand specimens are among them.

On view morning of Sale, and Catalogues had.

Thursday Next.

PHALÆNOPSIS TETRASPIS, Rehb. f., and FLOWERING ORCHIDS. MR. J. C. STEVENS will include in his SALE BY AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C. on THURSDAY NEXT, March 16, some good imported plants of this charming White PHALÆNOPSIS, which have been sent home at great cost and trouble. Full particulars of these plants will be given on April 9, 1882. Also about 150 lots of choice ORCHIDS in flower and bud.

May be viewed the morning of Sale, and Catalogues had.

Thursday Next.

PHALÆNOPSIS TETRASPIS. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C. on THURSDAY NEXT, March 16, a consignment of the above new PHALÆNOPSIS, now offered for the first time. In habit it is like violacea, but the flowers are pure white, produced in quantity on spikes, and so sweet-scented are they that a very few flowers will perfume a whole greenhouse.

On view morning of Sale, and Catalogues had.

The Forge Nurseries, Winshill, near Burton-on-Trent. MESSRS. WINTERTON, BEALE and HLOUSTON will SELL by AUCTION, at the "Saracen's Head" Inn, Burton-on-Trent, in the County of Stafford, on TUESDAY, March 14, at 4 o'clock in the afternoon, subject to conditions of sale, the property of the late Mr. H. W. Cunningham. ESTABLISHED NURSERIES known as the Forge Nurseries, situate at Winshill, 1 mile from the town of Burton-on-Trent, with the Goodwill of the business for sale, together with the late Mr. W. Cunningham. The property comprises a Dwelling-house, 3 Glasshouses, each 33 feet long, and of the width of 25 feet, 16 feet and 9 feet respectively, Seed-shop, Store-room, Plant Pit, and other requisite buildings, and about 12 acres of Ground. The House and all the buildings are held on Lease from the Marquess of Anglesey for a term of which 83 years are unexpired, and the property is well watered, and the Nursery Grounds are held on Lease from the said Marquess for a term of which six years are unexpired, at the annual rent of 77 10s. 6d. Immediately after the sale of the above property will have the option of taking to the growing Stock at a valuation. If not taken to it will be sold by Auction during the month of March.

For further particulars apply to the AUCTIONEERS, Lichfield; or to Mr. H. GODDGER, Solicitor, Burton-on-Trent.

Important Sale of a First-class Collection of CARNATIONS, PICOTÉES, PINKS, CLOVES, 400 Standard and Dwarf ROSES, Selected FRUIT TREES, Hardy CONIFERÆ, SHRUBS, AMERICAN PLANTS, &c. MESSRS. PROTHEROE and MORRIS will SELL by AUCTION the above, at the City Auction Rooms, 38 and 39, Gracechurch Street, E.C., on MONDAY, March 13, at 12 o'clock precisely. Full particulars on view morning of Sale. Catalogues had at the Rooms, and of the Auctioneers, 8, New Broad Street, E.C.

Enfield, N. Close to the Great Eastern Railway Station. TO GENTLEMEN fond of HORTICULTURAL PURSUITS.

MESSRS. PROTHEROE and MORRIS are instructed by the owner to SELL by AUCTION, at the Mart, Takehouse Yard, City, E.C., on THURSDAY, March 16, at 12 o'clock precisely, an attractive Double-flowered FREEHOLD RESIDENCE, known as The Ferns, Essex Road, containing four Bedrooms, two Reception-rooms, Kitchen, good offices, and excellent day Garden. There are a well-built Conservatory, two Greenhouses, and range of three Vinerias, all heated by hot water, Pit, and Summer-house, standing in a large Garden, planted with established Fruit trees in bearing condition, Roses and Conifers. The property has a frontage of 70 feet by an extreme depth of 245 feet or thereabouts. Also a block of FREEHOLD BUILDING LAND, on the Bath Hill Park Estate, having a frontage of 125 feet to the Village Road, by a depth of 170 feet; suitable for the erection of a good residence. Full particulars of Messrs. R. and A. RUSSELL, 59, Coleman Street, E.C.; and of the Auctioneers, 8, New Broad Street, and Leytonstone.

Land for a Trial Garden. WANTED TO HIRE, about Two Acres of LAND, for a Trial Garden. Must be in good rich state of cultivation and within easy access of the City. A liberal price would be paid for the desired accommodation.

ALFRED LEGGIAN, Seed Merchant, 5, Ablegate, E.

FOR SALE (S.W. District), the LEASE, with GLASS, and STOCK of a well-situated Old-established NURSERY. For particulars apply to Messrs. PROTHEROE and MORRIS, 8, New Broad Street, London, E.C.

London: West End (No. 5551.) In a Busy Thoroughfare, opposite Railway Station.

FOR SALE, a well-established FLORIST and FRUITERER'S BUSINESS, also doing a good Furnishing and Landscape Gardening Trade. Nine-roomed House and attractive Shop, with Greenhouse attached; good Yard and Stocks in rear. Lease, 21 years. Rent only £80. Price for Lease, Goodwill, Fixtures, &c., on application to Messrs. PROTHEROE and MORRIS, 8, New Broad Street, E.C.

TO BE DISPOSED OF by Private Treaty, an Old-established NURSERY and SEED BUSINESS, in the North of England, established 1810; 4 Acres of Nursery Grounds, close to Railway (all stocked with Nursery, remainder Market Gardening), in admirable condition; good Dwelling and Business Premises, Greenhouses, Rent only house, &c. Centre of Town. Immediate possession can be arranged; very favourable terms. Full investigation. Principals only need apply in person to Messrs. HURST and SON, 159, Houndsditch, London, E.C.

PROCTOR, Nurseryman, Seedsman, and Florist, Ashgate Road, Cheshamfield.

STANDARD POTATO (Fenn).

FIRST-CLASS CERTIFICATE ROYAL HORTICULTURAL SOCIETY.

SUTTON and SONS strongly recommend this grand Potato. It is remarkably good for early borders and frames, and excellent in quality. This Potato was grown in the Chiswick trials of the Royal Horticultural Society, and in the report which appears in the Gardeners' Magazine of September, 1881, it was alluded to as "highly approved for cropping qualities and handsome appearance." Also, "on being subjected to the test of cooking, 'Standard' was awarded a First-class Certificate." Price 5s. per 14 lb. 17s. 6d. per 56 lb. Much cheaper by the sack. THE QUEEN'S SEEDSMEN, READING.

JOHN MOIR and SON (Limited) are prepared to RECEIVE OFFERS for Supplies, during the current season, of the following fruits:—STRAWBERRIES, RASPBERRIES, BLACK CURRANTS, RED CURRANTS, GOOSEBERRIES, KENTISH CHERRIES, and APPLES. For particulars apply to the SECRETARY, 148, Leadenhall Street, London, E.C.

Special Offer to the Trade. POTATOES. For not less than 1 Ton lots, Per Ton—£ s. d. MIVATT'S PROLIFIC EARLY KIDNEY... 3 10 0

STROBUS, 1 1/2 to 2 feet, 40s.; all per 1000. P. CEMBRÆ, 3 to 4 feet, 30s. per 1000; P. STROBUS, 3 to 4 feet, 20s. per 1000.

Always offered as unsoil on receipt of orders. W. P. LAIRD and SINCLAIR, Nurserymen, Dundee, N.B.

SPECIAL OFFER, for one Month, to the Trade.—JOHN HAYWARD, The Nurseries, Chesham, near Manchester, offers the following in strong, healthy plants in quantities of less than 100 of each sort, at 8s. per 100, £3 per 1000, for cash with order:—PANSIES, Blue King, Mrs. Felton, Terry, Comet, David Smith, David Gaven, GEORGE VALR, Mrs. Adams, WILLOW Admiral, Almond, Almond, Almond, Alpha, Holyrood, Phig Park, Sovereign, PHOXIA, leading sorts, 20s. per 1000. CARNATION, Old Clove, 20s. per 1000.

MALLOW (*Malva moschata alba major*).

When we brought the Single Dahlias from oblivion, as it were, many laughed and said they must return from whence they came; yet, strange to say, with hardly a single exception they find favour with these very critics. Not only in England but in America and Australia, they are eagerly sought after. We may rely that they will never cease to be grown so long as the eye has a desire for beauty. J. Haavey, Esq., of Wilmington Hall, grows them extensively in tubs, and places them where desired, and as soon as the frost threatens they are removed to the conservatory, and continue blooming until Christmas, and the effect amongst the Chrysanthemums is both unique and beautiful.

The above will take a similar position with every lover of beauty, and be sought after by all, particularly those (and there are few exceptions) who admire a pure white flower with a dense green foliage. Its delicious fragrance will most assuredly bring this plant into the highest repute, and it will be seen by the engraving how very curious but elegant are its flowers, and when intermingled in cut blooms with the round shaped florist flowers—and none are better adapted and last longer in water than, this—the contrast is beautifully pleasing, and, like the new Cretus Dahlia, only need to be seen to become a favourite. Being hardy it will grow in any ordinary border. For table decoration no flower is better adapted, and its beautiful Fern-like foliage lovely and valuable for garnishing dessert plates and dishes all the autumn; and to confirm its value the Floral Committee awarded a First-class Certificate on a small bunch of its flowers being brought before them.

2s. 6d. each; Seed, 2s. 6d. per packet.

Many that offer the POLYANTHUS, and issue peculiar drawings, probably never grew a named variety (old as it is), and are utterly unacquainted with its properties, which almost every exhibitor will confirm. Whereas we invite all to "Come and See" our Collection. Our "Haringer" (of the latter) which was honoured with a First-class Certificate of the meeting of the Floral Committee of the Royal Horticultural Society, is now splendid, and surpasses anything in its class.

Seeds: Polyanthus and Primroses, from our Named Collection, 1s. and 2s. 6d. per packet.

HOSE-IN-HOSE POLYANTHUS.

This class for general garden decoration must become the order and fashion of the day for several important reasons: First, two flowers in the space of one, is of longer duration, and the diversity of colours may justly be compared to the Belgian Pansy; some of their tints are brilliant and quaint, and the variety of peculiar shapes they assume is surprising; some partake of the Jack-in-the-Green type, others Jacknapes on horseback, and Galligaskins, &c., which render them not only old-fashioned but favourites of former days, and cannot fail to be grown and become valued favourites in every border by everybody.

1s. 6d. and 2s. 6d. per packet.

NICOTIANA AFFINIS (True).

*Nicotiana affinis* is a most extraordinary plant:—Firstly, because so good a plant should be a Tobacco plant.—Next, because it is so different, both in growth and flowers, to the ordinary kind.—Thirdly, because of its producing such splendid pure white flowers on long tubes, which renders it valuable for bouquets.—Fourthly, because it has such a delicious scent; in fact, it perfumes the whole surrounding atmosphere.—Fifthly, because its flowers fully expand at early evening and morning.

Its gigantic white Bouvardia-like flowers have a most striking effect all the summer. It is beyond doubt the greatest novelty of the garden for 1882. In our nursery it was the amazement of all, and the result of several hundreds of packets of seeds being sold. It will unquestionably make a splendid Greenhouse Plant, and probably adaptable for Market-work. At night it emits its most agreeable fragrance, when its flowers are fully expanded; very free, and only attaining the height of 2 feet in any ordinary soil.

W. CULLINGFORD, Esq., introduced this splendid novelty, to whom all honour is due.

Figured and highly eulogised in *Gardener's Chronicle*.

Seed 2s. 6d.; Plants, in May, 1s. each.

For further particulars of all the above see H. C. & Sons' Catalogue.

H. CANNELL AND SONS,  
THE HOME FOR FLOWERS, SWANLEY, KENT.

**Laurustinus.**

TOWN CLOSE NURSERIES,

NORWICH.

**RISBET'S VICTORIA TOMATO**

This is a seedling from Vick's "Criterion," and for cultivating under glass or in the open air there is no Tomato can approach it for fruitfulness. The plant requires no stopping, as it keeps growing and fruiting in the greatest abundance. The fruit is pyriform, and grows in bunches, each bunch containing from eight to twenty fruit, which are the size and colour of a Victoria Plum. It contains but few seeds, and for flavour is unsurpassed.

By cultivating the Victoria Tomato there is no difficulty in obtaining a dish of Tomatoes ALL THE YEAR ROUND. The plant requires plenty of room and a rich loamy soil, with liberal applications of liquid manure. There is no fear of it producing a quantity of wood without fruit, as the bunches of fruit show at every joint; it needs no stopping, as it keeps growing and fruiting in the greatest abundance, and either for cultivating under glass, or in the open air, it surpasses all others for fruitfulness.

To grow it in the greatest perfection a few of the many bunches should be removed and the fruit thinned out a little. This will produce fine, large, handsome fruit.

"The Original Plant is growing, under glass, at Aswarby, covering a space 15 feet by 6 feet, and at the present time is carrying a crop of 600 bunches of fruit, as many more having been gathered from it during the summer."  
"August 30, 1879. "RICHARD NISBET, Gardener, Aswarby Park."

**GOLDEN TANKARD MANGEL.**

WE HAVE A SPECIALLY FINE STOCK OF THE ABOVE, GROWN ON OUR OWN SEED FARMS, TO OFFER TO THE TRADE.

THE QUEEN'S SEEDSMEN,  
237 & 238, HIGH HOLBORN, LONDON, W.C.

## WILLIAMS' NEW HOTHOUSE SHADING.

The most suitable for Shading Orchids, Ferns, Palms,  
Stove and Greenhouse Plants.

The only kind of shading used at the Victoria Nurseries. It is a strong durable Netting, woven in squares, so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading. It withstands the weather better than any other class of Shading, and, on account of the thickness of its texture, it may be very beneficially used during cold weather to keep out the frost.

BLINDS MADE UP AND FIXED COMPLETE.

Sold in Pieces, 30 yards long by 1½ yard wide. Price, 45s. each.

B. S. WILLIAMS,  
VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

## CATLEYA AMETHYSTOGLOSSA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, March 15, at half-past 12 o'clock precisely, by order of Messrs. HUGH LOW & CO., very fine imported plants, in the best possible condition, of the rare and lovely CATLEYA AMETHYSTOGLOSSA, amongst them several grand masses of unusual size. This Catleya is the finest of the section of the genus to which it belongs, and some idea of its beauty may be formed by an inspection of a plant which will be on view, which has produced upwards of thirty flowers on a spike. At the same time will be offered imported plants of CATLEYA ACLANDIÆ, and other choice ORCHIDS; also 100 established plants of PHALÆNOPSIS SCHILLERIANA, &c., the majority in bud or flower.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,  
LONDON, W.C.

### THURSDAY NEXT.

## PHALÆNOPSIS TETRASPIS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Messrs. SANDER, on THURSDAY NEXT, March 16,

A Consignment of the above New Phalænopsis,  
Now offered for the first time.

In habit it is like VIOLACEA, but the flowers are pure white, produced in quantity on spikes, and so sweet-scented are they that a very few flowers will perfume a whole greenhouse.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,  
LONDON, W.C.

SEEDS OF STOCKS and ASIERS, 3d., 6d., and 12. packets, from the best grown in England and Germany.

COLLECTIONS, ANNUALS, 12. packets, distinct varieties, 12. 6d. or 25. ditto, 3d. or 6d.; 50 ditto 6d. or 10d. 6d.

COLLECTIONS, BIENNIALS and PERENNIALS, 12. packets, distinct varieties, 12. 6d. or 3d.; 50 ditto, 3d. or 6d.; 50 ditto, 6d. or 10d. 6d.

VEGETABLE SEEDS, see Catalogue. Carriage free for orders of 100. and upwards. 2d. and 6d. packets post-free of Beet, Borecole, Broccoli, Brussels Sprouts, Cabbage, Carrot, Cauliflower, Celery, Cress, Cucumber, Endive, Lettuce, Marrows, Melons, Mustard, Onion, Parsley, Parsnip, Radish, Spinach, Tomato, Turnips, Herbs, &c.

COLLECTIONS of the most useful VEGETABLE SEEDS made up liberally, carriage paid, for 100. 6d., 25s., 40s. and 65s. See Catalogue.

WM. CLIBRAN & SON,  
OLDFIELD NURSERY, ALTRINCHAM.

SEND FOR A PRICE LIST OF

# JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

*For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions,  
Fountains, Farms.*

No cost for Motive Power, which is obtained from the Stream of Water passing through the Rams.

NO OILING OR PACKING REQUIRED.

Made in sizes to raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet.

Special Rams for High Falls to send up Two Gallons out of every Five Gallons passing through them.

## APPLICATION OF BLAKE'S PATENT HYDRAULIC RAM B.

This Ram is worked by impure river water, whilst pumping pure water from a well and forcing it to a small reservoir on the hill, at an elevation of 295 feet, and a distance of 1 mile, from which reservoir the water is gravitated for fire extinguishing and general requirements of Mansion, Stables, Farm, and Village.

## TESTIMONIALS.

From Mr. WILLIAM LAIT, *County Surveyor, Compton Verney, Warwick, January 16, 1882.*—"I have much pleasure in stating that the Patent Hydraulic Ram I had from you for the Rev. J. Cardwell-Gardner, of the Vicarage, Butlers Marston, is, I consider, remarkably successful, as indicated below. 4120 gallons of water per day are passing through the Ram with a descent of 13 feet 8 inches; out of this small quantity, 1080 gallons are sent up to a height of 41 feet; showing 78 per cent. of useful effect; and the noise of its working is so slight as to be almost inaudible.

From V. F. BENNET-STANFORD, Esq., M.P., *Pyt House, Tibury, Wilts, August 20, 1880.*—"I have no hesitation in saying your Self-acting Hydraulic Ram and Apparatus for Extinguishing Fire, which you laid down here, including about 1 mile of pipes, are very satisfactory. The Ram forces upwards of 5000 gallons per day to a service reservoir, holding 25,000 gallons at an elevation of 295 feet, being 70 feet above the roof of the house, from which reservoir the water is distributed to the house, stables, home farm, and several cottages; and, in case of fire, four jets can be thrown on to the house from different sides at a great force and large volume. I consider the work has been done well and efficiently, and does you credit."

From the Right Hon. the Earl of GRANARD, *Castle Forbes, March 11, 1880.*—"The Hydraulic Ram, erected for me at Castle Forbes has answered perfectly. Considering the very small fall attainable by the nature of the ground, it is a great success, and throws up water to a cistern on the top of the tower 80 feet high. When Mr. Blake first proposed to put it up I doubted the possibility of its succeeding, owing to the nature of the ground; but I have been most agreeably undeceived."

From T. H. SIDDEBOTTOM, Esq., *Etherow House, Hasfield, February 23, 1876.*—"Induced by the good report of my cousin, Mr. T. A. Sidebottom, as to the working of the Hydraulic Ram he had from you, I ordered the one you fixed here a year ago, which I am pleased to say has since worked well night and day. Yet the two Rams you fixed at Snow's Hill Manor, Gloucestershire, for my brothers and myself, are I think a still more remarkable example of your success. We had a Ram fixed by a well-known firm, which proved a miserable failure, and which your Rams displaced. They are forcing the water through  $\frac{3}{4}$  of a mile of delivery pipe, a little in excess of the quantity you guaranteed to an elevation of 300 feet, and without the slightest hitch to the time of the last report from our tenant."

From the Right Hon. the Earl of ROMNEY, *56, Eaton Place, S.W., June 12, 1880.*—"Sir,—In reply to your inquiry, I have pleasure in stating that the Hydraulic Ram which you erected for me at Gayton, does its work remarkably well, and is a great success. I think the work is especially creditable to you on account of the very small fall of but 3 feet with which you had to deal, and I shall always be glad to recommend you.—Yours faithfully, ROMNEY."

From Sir ROBERT MENZIES, Bart., *of Menzies, Rannoch Lodge, Rannoch, August 20, 1880.*—"The Hydraulic Ram you fixed for me to supply water to Rannoch Lodge and Camessnick, two houses  $\frac{3}{4}$  mile apart, is a complete success. The extreme distance the water is carried is  $1\frac{1}{2}$  mile, and, though the elevations of the two houses are different, there is a regular supply of 7 quarts per minute to each house, which has never ceased since the Ram was set a-going, about three months ago. Your Ram took the place of one previously tried on the same spot, and which did not succeed, and was in fact a complete failure."

From CHAS. C. CAVEL, *The Crox Fisheries, Foot's Crox, Kent, March 30, 1881.*—"In reply to inquiry as to my opinion of the Patent Hydraulic Ram you fixed here, I may say that it has displaced two Rams by a reputed maker, which were so unsatisfactory that I put down a hot-air engine and pump, but this being a continual expense and trouble, I resolved to try your Ram, and am happy to say that my best hopes have been more than realized. The quantity of water sent up by the Ram is abundantly in excess of what I need to keep the Fisheries in perfect health, and this without any trouble."

From J. SPENDER CLAV, Esq., *Ford Manor, Lingsfield, Surrey, August 9, 1880.*—"In reply to your letter of enquiry I am glad to be able to say that the two Hydraulic Rams which you fixed here are working satisfactorily, and that out of 13 gallons 2 quarts per minute, the maximum yield of the spring, they deliver to the top of my house, distant a full mile from the spring, 4 gallons 1 quart per minute, or 6120 gallons per twenty-four hours, being 120 gallons above the quantity you guaranteed."

From Captain GANBY, *Castle Bank, Appleby, February 11, 1880.*—"The Self-acting Hydraulic Ram you erected for me is an excellent example of strength and good workmanship. Whilst working with 3 feet 4 inches fall it forces water 73 feet high, and so far gives me every satisfaction. It will do more work in one day than the old Ram of another make could do in a week."

From Captain TOWNSEND, *Witcham, February 10, 1877.*—"In answer to your inquiry I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long at the rate of 85,000 gallons per day, although you only promised 50,000."

JOHN BLAKE, Engineer, ACCRINGTON, LANCASHIRE.

SATURDAY, MARCH 11, 1882.

PLANTS OF POETRY AND FANCY.

A PERSON who dearly loves flowers, as many humble folk do, counted with surprise the various blossoms in her garden and upon the cottage wall on Christmas Day. Lists of flowers out of season—though a flower can never be ill-timed—have been often given by those who have noted them. Staying long or coming early—who can say which in a season when the Rose, and not the Christmas Rose, blossoms in mid-winter?—the Primrose, Snow-drop, Anemone, and Crocus might not have surprised us in a well sheltered garden, but beside the cottage porch the "summer's queen" showed both blossoms and promising buds on Christmas Day.

The poets are the best observers of Nature's good old fashions, and they have never discovered the Rose as a winter flower. Burns says—

"Mild be the sun on this sweet blushing flower,  
In the gay rosy morn as it bathes in the dew."

These words breathe of summer! And in the "Legend of the Rose," when the Rose tree itself relates the story of the origin of its thorns, the period of the event is clearly summer. Says the Rose—

"Young Love, rambling through the wood,  
Found me in my solitude,  
Bright with dew and freshly blown,  
And trembling to the zephyr's sighs."

He stooped to the flower to sip, when a bee flew out and stung his lip, and off flew Cupid to his mother. She, to please her boy, strung his bow with bees, from which she had first removed the stings.

"And none since that eventful morn  
Have found the Rose without a thorn."

But this winter has been exceptional, and it should be known in all countries where the Rose is met with—that is, throughout the northern hemisphere both in the Old World and the New, from Siberia to Bengal, from Northern Europe to Africa, from Lake Winnipeg and Hudson's Bay to Mexico—that the Rose blossomed on a cottage wall in Sussex on Christmas Day last year. "And what if it did?" says some morose person of purely commercial mind, busy perhaps just now, but destined to regret some day that flowers and gardens and simple tastes yield him no pleasure, and that all the world for him is as void as an empty eggshell. Bless all flowers, trees and plants of every kind, including Toadstools and fungi, especially those which are edible. Bless all floral fancies, legends and languages—all superstitions, errors and absurdities connected with plants—all heraldic badges, and emblems taken from the vegetable world, especially the Rose, the Thistle, and the Shamrock—all sacred trees and plants, such as the Deodar and Peepul, the Oak and Orchis spotted at Gethsemane, and others, plucked and put in royal bouquets, or in humble garlands and posies worn in caps or button-holes! Bless them!—erect or trailing, climbing, creeping, twining, tall like the Palm, or lowly as the Daisy, sleeping or waking, bless them all!

This invocation and the appearance of the early flowers may remind us of several floral and monkish symbols of religious festivals. A good Franciscan father loving flowers and observing the time of their appearing, invented a useful "timepiece" which, if it did not strike, blossomed with some regularity at about the period when the festivals recurred. The arrival of the pure Snowdrop, white and drooping, reminded the good priest to light the taper to the Virgin, at Candlemas, February 2; the Lady's Smock and the Daffodil ushered in the Annunciation, March 25; the Blue Bell the festival of St. George; the Ranunculus may remind the devout of the invention of the Cross. The scarlet Lychnis arrives about the date of St. John the Baptist's Day or thereabouts; the white Lily at the time of the Visitation of Our Lady, July 2; and the Virgin's Bower at her Assumption, August 15. On the same monkish authority we learn that the section of the stem of the Bracken bears, not the marks of pagan Oak or Roman eagle, as they may seem to some, but a distinct tracing of the sacred letters, I.H.S.

The catholicity of floral tokens, and the antiquity of their use as religious offerings may be recognised in the customs of all Churches; and even now, though superstitious usages are happily on the decline, yet floral decorations are still thought appropriate. Exactly the same flowers that were dedicated to Juno and Diana and to the northern Freya and Bertha, were afterwards devoted to the shrines of the Virgin Mary. The Lily and all white flowers were typical of the Virgin's purity, and the flowers of Diana—humble plants generally, growing in unfrequented glens and shaded dells, unvisited by man—were piled on the mediæval shrines of "Mary," with the same idea of their freedom from human taint. Among our native Mary's flowers were the Cost-Mary (Balsamita vulgaris), King Cup, Marsh Marigold, or "winking Marybud with golden eye," a very desirable talisman for the pocket in some companies, for it prevents angry words from being addressed to its possessor. Another Mary-gold, not the *Calendula officinalis*, was honoured like the above, as its name indicates; while Our Lady's Mantle possessed what some would regard as the divine quality of bringing to those who placed it under their pillow sound and sweet repose. Our Lady's Bed-straw, *Galium verum*, was taken as the plant on which the infant Jesus was laid in the manger, and in a painting of the Nativity, by N. Poussin, this "straw" is represented; and the spell attaching to it has rendered it, in France, with the superstitious, a specific against epilepsy to this day.

Since we are among the fancies of mediæval times another odd conceit of the same sort and date may be noticed in the white marks which spot the green leaves of Our Lady's Thistle, *Silybum Marianum*, where drops of the Virgin's milk fell on them. Several plants in classic story were as oddly stained, as the Rose when Venus pricked her foot, or the same flower when Cupid split the cup of nectar.

There are other plants dedicated by devout Roman Catholics to the Virgin, such as the Cuckoo-flower, otherwise called Our Lady's Smock—

"All silver white,  
Which paints the meadows with delight."

Shakspere used a little licence here, for the Cardamine pratensis is nearer lilac than white in colour; perhaps he referred to *C. amara*, which grows in meadows in masses white as linen sheets laid out to bleach. Without exhausting the long list of Mary's flowers, we may just mention in quick succession, Our Lady's Cushion, Our Lady's Fingers, Our Lady's Tresses, her Slipper, Seal, and Hair; also the "Fair Maid of February," the Snowdrop, a

flower of earliest coming whose appearance touches all hearts and awakens pure aspirations, such as Tennyson interpreted in lines of great beauty:—

"Make Thou my spirit pure and clean,  
As are the frosty skies;  
Or the first Snowdrop of the year  
That in my bosom lies."

Perhaps we should explain that Our Lady's Seal is the Black Briony; Virgin's Hair is the Quaking Grass. Flowers of more pomp and presence, dedicated to the Madonna, were the blossoming Almond, the white Iris, white Lily, and Narcissus. She has been herself called the Lily, as by Keble, in the lines beginning:—

"Ave Maria!—blessed maid!  
Lily of Eden's fragrant shade."

From the Virgin's tears sprang Lilies of the Valley, in imitation of several flowers as

FIG. 46.—LYGOCHEILUS FORSTERI, SHOWING HABIT.

strangely created among Greeks or Romans. Io's breath first called forth the Violets, and others came as suddenly at the wish of gods and goddesses, like the Narcissus, in full bloom.

The "Hail Mary!" of the verses just repeated, leads us to mention in conclusion the "Devotion of the Rosary of the Blessed Virgin Mary;" and the Rosary, the book of the unlettered, belongs to our subject, because it was originally—or at least frequently—a string of beads made of Rose leaves tightly pressed in moulds, and sometimes of Roses strung together. The Turkish and Buddhist Rosaries had 99 and 108 beads, and that of the Mohammedans had also 108 beads, a number corresponding to the number of sins possible to the Mohammedans, and to the prayers proper to be repeated daily. H. E.

The Lee, Blackheath, and Lewisham Horticultural Society's Summer Show is to be held on June 28 and 29.

## New Garden Plants.

ERIA VITTATA, Lindl.

THIS species has oblong cylindrical or oblong fusiform bulbs with some furrows, and reaches 4—5 inches in length. The two leaves are more than membranaceous, verging to thin fleshy, being very soft, as in *Eria stellata*. The shape is cuneate oblong-lanceolate acute. The lateral raceme is not many flowered. The green hairless flowers have the sepals, petals, lip, and even the column adorned with red stripes. The oblong crenulate lip has five pointed lamellæ, which are edged with red. The column has a square projection on each side. The flowers are equal in size to those of *Eria profusa*, Lindl. This is a most remarkable curiosity from a botanical point of view. Till now the plant was only known from Cathcart's drawings, prepared in Sikkim Himalaya by Indian artists, and lent by Sir J. (then Dr.) Hooker to Dr. Lindley, who described the plant from the drawing in his second *Contributions to Indian Orchidology*. I feel quite persuaded that the plant at hand is the same as that described, for it corresponds in all details. The glorious dense inflorescence, however, which makes one think of *Saccolabium Blumei*, may be the product of an exaggerated phantasy, perhaps in consequence of a smoke of opium!

I am indebted for good materials to Messrs. Veitch, who tell me they had them from Mrs. Russell Sturges' garden, at Grove Farm, Leatherhead. A great discrepancy exists in the statement that the plant was of Cingalese origin. I do not think this can be correct. It may, indeed, have been sent by somebody who grows Orchids in Ceylon. The indications of locality sent by possessors of collections of Orchids must be looked at with great caution. Recently *Cymbidium longifolium*, Don, *Calceandra Baueri*, Lindl., *Phaius Tankervillei*, Bl., came to my hands—all reported as coming from Madagascar, in lieu of Himalaya, Mexico, China. Many such instances might be recorded. H. G. Rehb. f.

BULBOPHYLLUM CUPREUM (Lindl.) FLAVUM.

A variety with light yellow flowers instead of the red ones. It was sent by Messrs. J. Veitch & Sons, who obtained it from Mr. James Routledge, gardener to C. L. Wood, Esq., Freeland House, Bridge of Earn. H. G. Rehb. f.

EPIDENDRUM CINGILLUM, n. sp.\*

A botanical curiosity. An *Epidendrum* with thick, very strong stems, the branches at hand shorter than a span. The five leaves are grassy, measuring 3 inches in length, by 3—4 lines in width. The few-flowered raceme of ochre-coloured flowers has lanceolate bracts nearly equalling one-third of the stalked ovary. Sepals and petals linear-lanceolate, the former a little broader. The lip is very curious. It is much broader at the base and cordate, much narrower towards the fore part and retuse. There are two semilunar orange calli at the base, the median vein is keeled a little, and there is a kind of semilunar line around the keel consisting of dark purple spots. The column has at the top some sordid mauve spots. The flower is equal in extent to the smaller flower of an *Epidendrum* *inversum*. It was sent by Messrs. J. Veitch & Sons, but it came into their hands from Mr. Parr, gr. to Mrs. Russell Sturges, Grove Farm, Leatherhead. H. G. Rehb. f.

PHALENOPSIS SCHILLERIANA VAR. VESTALIS, n. var.

As we are not rich in good novelties, there is a very pronounced tendency to break up the immense masses of some species into varieties. There is a great difficulty in avoiding hairsplitting, and the practice of naming individual plants whose differences are so slight, that the next individual may break down the

\* *Epidendrum cingillum*, n. sp.—*Epidendrum calibus teretibus aculis rigidulis ramosis*; foliis in caule ad 3 membranaceis lanceolatis oblique acutis; racemo foliis breviori paucifloro; bracteis linearisetaceis acutis ovaria pedicellata longe non aequantibus; sepalis linearisetaceis acutis; tepalibus linearibus; labello adnato cordato utriusque connatis subquadrate, antice breviter retuso, callo semilunari utriusque ante basin, carmine elevatius terminis antepositis, lateralibus tamen obscurissimis. Flos ochraceus illi *Epidendri inversi* parvis subaequalis. Labelli calli aurantiaci circumdati linea cingillari macularum furbarum. Aurantice vertex maculis sordide violaceo purpureis. Ex hort. Veitch. H. G. Rehb. f.

character, or whose flowers in the next season may present just the same claim for new names, though indeed they may be borne on the same plant. There have been very trustworthy observations as to this point, since the exposition to light, air, heat, have decided influence on the intensity of colour, and even the markings. An immense difficulty results from the interest of importing firms who do not care to let the origin of their plants be known to their dear fellow-workmen, as they may show a decided inclination to hunt upon the grounds of their competitor. If we could watch the importations geographically, we might enjoy many a success we lack now. I have explained my views about this in a memorandum about *Cattleya labiata* Percivaliana which may appear one day in these columns. It is provoking to be urged to name a single flower of a *Cattleya* of the labiata group. Some help might be given as to geographical statements. I am pleased to have before me the inflorescence, and at the same time the water-colour sketch (prepared by Mr. Henry G. Moom, of Stamford Hill) of a white *Phalenopsis Schilleriana*.

the plant. I have carefully dried the glorious flower, so that such of my English visitors who may have a Thomasian sceptic feeling may see and state the truth of my assertions. I feel quite persuaded that Mr. Stuart Low stands now in a grave dilemma. For helping Orchidists he has either to send a traveller afresh to fetch new individuals, or he may deliver to his fellow workmen a speech at Mr. Stevens' about the exact details of the habitat—perhaps his maiden speech in this line. *H. G. Rehb. f.*

FREESIA LEICHTLINII MAJOR.

We have been favoured by Messrs. Charles Smith & Son, Caledonia Nursery, Guernsey, with some very fine cut blooms of the charming *Freesia refracta* alba, and of a hybrid between that plant and *F. Leichtlinii*, for which they propose the name of *F. Leichtlinii* major, the flowers being as large as those of *F. refracta* alba, and much larger and stronger than those of the typical *F. Leichtlinii*. The colour of the flower is pale cream, the lower segment having at its base a blotch of bright orange. The base of the tube

J. Smith separated it as a distinct genus. Unfortunately the character of the venation is hardly perceptible on a superficial glance, and is not represented in the figure.

The plant is a native of the Polynesian Islands, and is therefore not so hardy as the North American and Japanese species commonly cultivated. The plant is not new to gardens, but is much less frequently seen than its merits justify.

SEASONS OF SHAKSPERE'S PLAYS.

REV. H. N. ELLACOMBE has collected for the Shakspeare Society a number of references giving incidental evidence as to the season of the year in which the action in sundry of the plays was supposed by the author to take place. It is obvious that, except in certain special cases, this is not a matter of any great importance, but sometimes it is so, and never is it devoid of interest. Mr. Ellacombe has

FIG. 47.—LYGODICTYON FORSTERI: BARREN AND FERTILE FRONDS WITH SPORES, VENATION RETICULATE.

Every one of us might have guessed its occurrence; but, as I believe, no one had hitherto seen it. It is now before us in Messrs. Low & Co.'s glorious collection of *Phalenopsis*. If there is no artistic liberty in the drawing, then it is a great recommendation of Mr. Low's management, since there is an immense difference between the very small first leaf and the fine last one. Orchids are very eloquent. They tell their master, by their appearance, how they are treated. They praise a good grower, and they resent the careless behaviour of would-be gardeners who neglect those lovely ornaments of tropical paradises. *H. G. Rehb. f.* [We learn from Messrs. Hugh Low & Co., that the leaves of the *Phalenopsis* are accurately represented, as regards size, in the drawing referred to by Professor Reichenbach. Ed.]

PHALENOPSIS STUARTIANA, *Rehb. f.*

Mr. Norman C. Cookson, Oakwood, Wylam-on-Tyne, has kindly sent me a flower that surpasses the finest wild-grown flowers I had from Mr. Stuart Low, and which equals that of a very good *P. amabilis* flower. Such news may stimulate the demand for

is also of a yellow colour. Like the white-flowered species, the flowers are fragrant.

ODONTOGLOSSUM PESCATOREI FLAVEOLUM.

This is a highly curious variety, with very blunt oblong petals. There is some sulphur on all parts of the perigone. It was sent by Messrs. J. Veitch & Sons.

LYGODICTYON FORSTERI.

At one of the recent meetings of the Floral Committee considerable interest was occasioned by the exhibit of a plant of this desirable climbing Fern. As will be seen by the illustrations now given (figs. 46, 47), the plant has entirely the habit of the species of *Lygodium*, and is suitable for growing on pillars, or on rock-work in a warm fernery. The general character of the foliage is more handsome than that of the species of *Lygodium* generally, and as it is of fine growth it is preferable to them on the ground of effectiveness. The barren and fertile fronds vary considerably in appearance, as may be seen in our drawing. From *Lygodium* the present plant differs particularly in its much more branched venation, on which account Mr.

naturally sought for indications in the mention of flowers and fruits, and prefaces his paper by a complete list of plants mentioned in each play. Mr. Ellacombe admits that his results are not directly of importance, but he very truly adds, as may be done with every piece of honest work, that the value of the research is not to be measured by the visible results at the moment, for it is certain that at some time or another the utility of genuine work will become manifest. In the present case Mr. Ellacombe tells us that the inquiry has confirmed his previous opinion, "that even in such common matters as the names of the most familiar everyday plants Shakspeare does not write in a careless haphazard way, naming just the plant that comes uppermost in his thought, but that they are all named in the most careful and correct manner, exactly fitting into the scenes in which they are placed, and so giving to each passage a brightness and a reality which would be entirely wanting if the plants were set down in the ignorance of guess-work. Shakspeare knew plants well, and though his knowledge is never paraded, by its very thoroughness it cannot be hid."

As an illustration of the manner in which Mr. Ellacombe has executed his self-imposed task we may

quote what he says with regard to *Midsummer Night's Dream* :—

"The name marks the season, and there is a profusion of flowers to mark it too. It may seem strange to us to have 'Apricocks' at the end of June, but in speaking of the seasons of Shakspeare and others, it should be remembered that their days were twelve days later than ours of the same names; and if to this is added the variation of a fortnight or three weeks, which may occur in any season in the ripening of a fruit, 'Apricocks' might well sometimes be gathered on their midsummer day. But I do not think even this elasticity will allow for the ripening of Mulberries and purple Grapes at that time, and scarcely of Figs. The same, however, being laid in Athens and in Fairyland, must not be too minutely criticised in this respect. But with the English plants the time is more accurately observed. There is the 'green corn'; the Dewberries, which in a forward season may be gathered early in July; the 'lush Woodbine' in the fulness of its lushness at that time; the Pansies, or 'Love in Idleness,' which (says Gerard) 'flower not only in the spring, but for the most part all summer thorow, even until autumn'; the 'sweet Musk Roser and the Eglantine,' also in flower then, though the Musk Roses, being rather late bloomers, would show more of the 'Musk Rosebuds' in which 'Titania bid the elves 'Kill cankers' than of the full-blown flower; while the Thistle would be good in the state for 'Monsieur Cobweb' to 'kill a good red-hipped humble bee on the top of it' to 'bring the honey-bag' to Bottom. Besides these there are the flowers on the 'bank whereon the wild Thyme blows; where Oxlips and the nodding Violet grows,' and I think the distinction worth noting between the 'blowing' of the wild Thyme, which would then be at its fullest, and the 'growing' of the Oxlips and the Violet, which had passed their time of blowing, but the living plants continued 'growing.'"

## PYRETHRUM INSECT-POWDER.

(Concluded from p. 297.)

APPLICATION OF PYRETHRUM IN FUMES.—The powder burns freely, giving off considerable smoke and an odour which is not unpleasant. It will burn more slowly when made into cones by wetting and moulding. In a closed room the fumes from a small quantity will soon kill or render inactive ordinary flies and mosquitoes, and will be found a most convenient protection against these last where no mosquito bars are available. A series of experiments made under our direction indicates that the fumes affect all insects, but most quickly those of soft and delicate structure.

This method is impracticable on a large scale in the field, but will be found very effective against insects infesting furs, feathers, herbaria, books, &c. Such can easily be got rid of by enclosing the infested objects in a tight box or case, and then fumigating them. This method will also prove useful in green-houses, and, with suitable instruments, we see no reason why it should not be applied to underground pests that attack the roots of plants.

ALCOHOLIC EXTRACT OF PYRETHRUM POWDER.—The extract is easily obtained by taking a flask fitted with a cork and a long vertical glass tube. Into this flask the alcohol and Pyrethrum are introduced and heated over a steam-tank or other apparatus. The distillate, condensing in the vertical tube, runs back, and at the end of an hour or two the alcohol may be drained off, and the extract is ready for use. Another method of obtaining the extract is by reprecipitation, after the manner prescribed in the American Pharmacopœia. The former method seems to more thoroughly extract the oil than the latter; at least, we found that the residuum of a quantity of Pyrethrum from which the extract was obtained by reprecipitation had not lost a great deal of its power. The first method is apparently more expensive than the other, but the extract is in either case more expensive than the other preparations, though very conveniently preserved and handled.

The extract may be greatly diluted with water, and then applied by means of an atomiser. Prof. E. A. Smith, of Tuscaloosa, Ala., found that, diluted with water at the rate of one part of the extract to 15 of water, and sprayed on the leaves, it kills cotton-worms that have come in contact with the solution in a few minutes. The mixture in the proportion of one part of the extract to 20 parts of water was equally efficacious; and at the rate of 1 to 40 it

killed two-thirds of the worms upon which it was sprayed in 15 or 20 minutes, and the remainder were subsequently disabled. In still weaker solution, or at the rate of 1 to 50, it loses its efficacy, but still kills some of the worms and disables others. Prof. Smith experimented with the extract obtained by distillation, and another series of experiments with the same method was carried on last year by Prof. R. W. Jones, of Oxford, Miss. He diluted his extract with twenty times its volume of water, and applied it by means of an atomiser on the cotton-worm and the boll-worm with perfect success. Mr. E. A. Schwarz tried last summer the extract obtained by reprecipitation, and found that 10 drachms of the extract, stirred up in 2 gal. of water and applied by means of Whitman's fountain pump, was sufficient to kill all cotton-worms on the plants. Four drachms of the extract to the same amount of water was sufficient to kill the very young worms.

PYRETHRUM IN SIMPLE WATER SOLUTION.—So far as our experiments go this method is by far the simplest, most economical, and efficient. The bulk of the powder is most easily dissolved in water, to which it at once imparts the insecticide power. No constant stirring is necessary, and the liquid is to be applied in the same manner as the diluted extract. The finer the spray in which the fluid is applied the more economical is its use, and the greater the chance of reaching every insect on the plant. Experiments with Pyrethrum in this form show that 200 grains of the powder stirred up in 2 gal. of water is amply sufficient to kill the cotton-worms, except a very few full-grown ones, but that the same mixture is not sufficiently strong for many other insects, as the boll-worm, the larva of the *Terias nicippe*, and such species as are protected by dense long hairs. Young cotton-worms can be killed by 25 grains of the powder stirred up in 2 quarts of water.

The Pyrethrum water is most efficacious when first made, and loses power the longer it is kept. The powder gives the water a light greenish colour, which after several hours changes to a light brown. On the third day a luxuriant growth of fungus generally develops in the vessel containing the fluid, and its efficacy is then considerably lessened.

THE TEA, OR DECOCTION.—Prof. E. W. Hilgard, of Berkeley, Cal., is the only one who has experimented with Pyrethrum in this form, and he expresses himself most favourably as to the result. He says :—

"I think, from my experiments, that the tea, or infusion, prepared from the flowers (which need not be ground up for the purpose) is the most convenient and efficacious form of using this insecticide in the open air; provided that it is used at times when the water will not evaporate too rapidly, and that it is applied, not by pouring over in a stream, or even in drops, but in the form of a spray from a syringe with fine holes in its rose. In this case the fluid will reach the insect despite of its water-shedding scales, hairs, &c., and stay long enough to kill it. Thus applied I have found it to be efficient even against the armoured scale-bug of the Orange and Lemon, which falls off in the course of two or three days after the application, while the young brood is almost instantly destroyed. As the flower tea, unlike whale soap and other washes, leaves the foliage perfectly clean, and does not injure even the most tender growth, it is preferable on that score alone; and in the future it can hardly fail also to be the cheaper of the two. This is the more likely as the tea made of the leaves and stems has similar, although considerably weaker, effects; and if the farmer or fruit grower were to grow the plants, he would save all the expense of harvesting and grinding the flower-heads by simply using the header, curing the upper stems, leaves, and flower-heads all together, as he would Hops, making the tea of this material by the sledge, and distributing it from a cart through a syringe. It should be diligently kept in mind that the least amount of boiling will seriously injure the strength of this tea, which should be made with briskly boiling water, but then simply covered over closely, so as to allow of as little evaporation as possible. The details of its most economical and effectual use on the large scale remains, of course, to be worked out by practice."

The method of applying Pyrethrum in either of the three last-mentioned forms is evidently far more economical in the open field, and on a large scale, than the application of the dry powder, and, moreover, gives us more chance of reaching every insect living upon the plant to which the fluid is applied. The relative merits of the three methods can be established only by future experience. C. V. Riley, in "American Naturalist."

## ORCHIDS AT OAKLANDS.

ONE is so accustomed to read accounts of the largest collections of Orchids in the country that it may not be amiss to offer some remarks on a collection which I have many times had the pleasure of inspecting at different periods—a collection which may not be noted for the quantity of plants grown, but certainly for the quality or varieties under culture. It has seldom been my good fortune to see finer cold Orchids grown than those in Mr. Allan Edwards' collection at Oaklands, Dawlish. Many people would grow Orchids but who hesitate for fear of not having suitable houses; the general idea is you must have at least four or five houses. This is quite a mistake, as numbers of small collections in the country prove. Here the cool-house is a low span with path up the centre and stages on each side; on these is spread small coal, and on this stand the pots. The plants are all close to the glass—an important point. This house is heated by a single flow and return pipe. There are ventilators 1 foot apart right round the house, fixed in the brickwork.

Now for the plants. A more healthy and finer looking lot of cool Orchids it is impossible to see anywhere; leaves thick and leathery, not a speck of dirt on them; bulbs in every case far exceeding in size the imported ones, which is saying a good deal. As to varieties of *Odontoglossum crispum* to be seen here I can only say that the finest only are grown; as each plant flowers for the second time, and is found to be below the standard, it is at once weeded out, so that only the finest formed flowers are here to be seen—those with large sepals and petals almost overlapping, and forming, as it were, a square. Some are much spotted with dark brown, others with spots of a purple tint, others highly suffused with pink, others pure white. Here are also several fine plants of *Lycaste Skinneri* of different colouring, among them the rare *Lycaste Skinneri alba*; *Oncidium macranthum hastiferum*, O. Pescatorei, blocks hanging with *Cattleya citrina*—among these a plant which has never been taken off the branch upon which it was found growing in its native home, and which annually sends down two flowers on one stem from each bulb made; O. Rossi, very strong, and doing well; several of O. nebulosum—one especially was the finest for size and quality of flower that I have seen. *Dendrobium Jamesianum* seemed to be quite at home here, as were *Masdevallias*, among them "bull's blood var." of *Hairyana*. O. cordatum, the finest variety, to which Mr. Sander made reference in the *Gardeners' Chronicle* of July 3, 1880, and which last year had over forty flowers on the spike.

The next is the *Dendrobium*-house, containing a grand lot of the favourite *D. noble*, *D. Wardianum*. The flowers on one superb variety were found to be 4 inches across. Near it hung the old and original variety, now so scarce, also *D. Ainsworthii* x. Several *D. Cambridgeanum*—one plant a mass of deep golden flowers; many *D. formosum giganteum*, *D. chrysanthum*, *D. chrysoxanthum* and var. *superbum*, *D. thyrsoiflorum*, *D. densiflorum*, one plant of which carried last year thirty odd spikes; *D. Falcoeri*, *Lowii*, *heterocarpum*, and variety *philippinense*, and many others.

The next house is devoted to *Cattleyas* and other Orchids, which Mr. Edwards considers do well together. The house is about 40 feet long, has centre and side stages. Here dwell what are considered the gems; it is enough to mention a few—the grand old *C. labiata*, autumn-flowering variety, represented by six or seven plants; as many of *C. exoniensis*—Mr. Dominy's lovely hybrid. I should mention that among these is a variety I have never seen anywhere else; sepals and petals almost pure white, the lip long and deep crimson-purple, with all the other exoniensis properties. Near these stood the rare *C. Keineckiana*, which proved itself by its flowers last year to be a fine variety; *C. Wagneri*, *Lælia Jongheana*, with three spikes, the strongest plant I have seen of this; *C. Dawsonii*, the rare variety of *C. Mossie*; named *Mariaux*, with its white sepals and petals; *C. vernalis*, and the very rare *C. Alexandræ*. On the warmest side of the centre stage stand plants of *Lælia elegans* type, *alba Bluntii*, *Turneri*, and *Wolstenholmei*. In a warm corner were located plants of *C. Triane*; these are now a fine sight. Among named ones in flower I saw varieties *Hillii marmorata*, very lovely; *Atalanta*, *ivæ*, *Vesta*, grandis, *splendens*, besides many other splendid forms from a noted importation. The rare

\* "If the title of Myrtle" (see iv. p. 31) is to be strictly limited to May-Day, the title of a *Midsummer Night's Dream* does not apply. The difficulty can only be met by supposing the scene to be laid at any night in June, even in the last night, which would coincide with our 12th of May."

\* *Vide American Entomologist*, vol. iii. p. 259, 263.

† From 1 lb. of the powder 1 pint of extract was made, each drop of the extract representing 1 grain of the powder. The actual cost of making the extract was 5 cents.

and lovely *Trichopilia lepida*, *T. crispata marginata*, *T. suavis*, all were close to the glass, hanging over the paths. I must not omit the *C. Warneri* family, one variety of which I understand the Messrs. Veitch described as the finest they had seen of this lovely Orchid. The *Vandas* are strong and healthy, and do well here. *V. suavis* now carrying several spikes. *V. lamellata* Boxalli, *V. tricolor*, &c.; *V. teres* Andersoni, which last summer carried several spikes. Mr. Edwards does not consider this hard to flower if managed properly. I was perhaps most struck by the rude health of the *O. vexillarium*—such leaves and growths. The fine plant of *O. vexillarium giganteum* is making growth this year even larger than that of last year, when it threw a spike of nine flowers, each flower measuring  $4\frac{1}{2}$  inches across. Two fine large plants of *C. gigas* were enjoying all the sun they could get.

Among the many plants of that most useful winter Orchid, *Lælia anceps*, I noticed several very superior varieties, one truly a *subperispermia*, and *grandiflora*, with the other varieties, *alba rosea*, *Dawsoni*, *Barkeri*. A grand plant of *L. purpurata*, the variety with pure white segments with over thirty bulbs and several fine leads, promised well to make as fine a display as it did last year at the Devon and Exeter Horticultural Show. Near it, in rude health, with over twenty blooms, I noticed the rare *C. amethystoglossa*; the *C. Mendelli* class are well represented by two or three of the pure white variety, with long deep coloured lip, and several others. The quantities of *C. Mossie*, which have an entire side stage to themselves, again promise a grand sight this year. On this same stage last year over 230 blooms of *C. Mossie* were open at one time. A photograph of this grand sight I was shown. Many in this batch have not yet flowered; all inferior forms have been weeded out, as in the case of *O. crispum*. *7. B.*

## CROCUS VERNUS.

A VERY agreeable study of some of the least known forms of the spring Crocus is just now being afforded on the rock-work at Chiswick. The various varieties have bloomed very finely this season, owing probably to the mild open weather and the absence of frost and withering cold winds. For novelty and distinctness of colour and charming appearance there is nothing to compare with a self-coloured variety named *L'Unique*, which is of a pretty rosy-lilac colour, lively in tint, and of much individuality of character. It may be said to stand alone among the self-coloured flowers, and it can be particularly recommended for pot culture. The flowers are not so large as some, but they are of good size and shape, and, as *Crocuses* go, appear to flower very freely. Among other blue or purple varieties *Baron Brunon*, rosy-purple, very fine, distinct and good; *Grand Lilas*, bright lilac-purple; and *Sir John Franklin*, deep violet, are all good. Of white flowers *Blanchard*, *Mont Blanc*, *Queen Victoria*, and *Snowflake* were very good. As a matter of course, there is an inevitable amount of sameness in the white varieties, but they differ in size, shape, purity of colour, and prominence or otherwise of the stamens. The striped flowers now represent a large section, including those that are very dark to those that are almost white. *La Majestueuse*, *Mdlle. Mena*, *Lord Fielding*, *Brunette*, stripes and flakes of magenta-purple, very fine and distinct; and *Lady Stanhope*, are particularly noticeable for their large, bold, and handsomely-marked flowers. How many reputed varieties of *Crocus vernus* there are may be inferred from the fact that one of the foremost of the Haarlem bulb catalogues numbers forty-four blue varieties, one violet, twenty-eight white, and thirty-one striped and variegated—114 in all, and these lists do not include names found in some Dutch and English catalogues. It was once remarked, but many years ago, that one good blue, one white, and one striped, would do for all in their several sections. This was not seriously intended in all probability, and less so now than in times more remote. Additions are constantly being made by seedlings and also by sports, and the increase goes on year by year. The *Crocus vernus* represents an extremely interesting class of flowers, and we should be glad to see Mr. Barron take in hand a representative collection for the purpose of showing what advance has been made during the past quarter of a century. A word or two

is necessary in reference to Mr. Barron's method of carpeting the ground in which the *Crocuses* are growing at Chiswick. This is done with dwarf *Saxifrages*, and the *Crocuses* send up their flowers through these tufts, and by-and-by flowers and foliage both decay, leaving the *Saxifrages* to enliven the spot, which they do for the remainder of the year.

## The Rosery.

ROSES UP CHIMNEYS AND TREES.—Some years since attention was directed to the prodigious waste of running rosettes on bare chimneys and bald roofs and fences; and an earnest appeal was made that these should be draped with verdure and clothed with beauty. Since then a good deal has been done in these directions; still, a great deal more has been left undone. Turn where we may, walls, fences, roofs, chimneys, all seem bald and bare. Cottages, outbuildings, sheds, warehouses, might be greatly improved, and the bald outlines of much hideous architecture hidden, were *Roses* and other plants and trees more generally planted against our buildings. Chimneys also offer special advantages to tender plants, such as *Roses*. Most of them are storehouses of warmth, and many scarce tender *Roses*, such as *Maréchal Niel*, *Climbing Devoniansis*, &c., that might languish on bleak roofs and bare walls, would grow luxuriantly and flower profusely on the genial surface of a chimney. And then the flowering drapery of the *Rose* would not only redeem the chimney from stiffness and ugliness, but convert it into a thing of beauty, if not a joy for ever. And if *Roses* could thus transform chimneys into beautiful objects, what could they not do by way of artistic embellishment to the trunks of trees? It is only needful to look at trees in woods or hedgerows clothed with *Ivy* or *Traveller's Joy*, to see what climbing or trailing plants can accomplish in this way. And *Roses* can do as much or more than these; for, in addition to their foliage, they provide flowers of the most varied colours, and odours of the sweetest fragrance. The latter is most valuable quality in woods. For after the first blush of spring has passed away with its fresh odours of *Violets* and *Primroses*, woods are apt to become dark and damp, and to lack sweetness. *Beech*, *Limes*, *Lilies* of the *Valley*, may prolong the sweetness of woods, but long before the autumnal tints lighten them with the hectic flush of coming death the perfume has departed. But wreath the trees round with the sweet *Eglantine*, *Roses*, and wild *Honeysuckle*, and the woods remain fragrant till leaf-fall. Not would *Roses* up trees bring fragrance only, but wild and tangled luxuriance and highest beauty. Who that has seen the common *Sweet Brier* or the *Dog Rose* in its simple elegance and wild tangled masses, up or among trees, can ever forget the sight? Such plants are like glowing fountains of beauty. The more are petals that fall the more buds seem to open, and there appears to be neither measure nor end to their rich prodigality of sweetness and beauty. *Briers* and *Roses* up the trees of our home woods and plantations would so greatly enrich them as to lend a new charm to the landscape. The verdure of our woods is so deep and dark at times, as to greatly need enlivening with lighter graces and more brilliant colours. It is this that renders *Rhododendrons* so valuable as base lines; rich and beautiful in themselves, the contrast they impart deepens the verdure of the masses of woods and plantations. But *Roses* being less formal are far more effective. They impart the much needed colour without either the formality or the stiffness incident to most sub-plants. *Roses* also climb to every possible variety of height, and droop down from infinitely varied elevations. Their erratic heights and distances, the varying bulk of their masses of branchlets, their varying colours and odours, render them invaluable in woods and plantations.

Apart from the value of *Roses* and *Briers* to run up or climb or roam wild over or among trees, many of them are capable of making respectable underwood or valuable cover. Where *Roses* are too scarce or valuable for such purposes *Sweet* and other *Briers* form no bad

substitute for them. For if it be true—and it is—that beauty unadorned is adorned the most, it is equally or more so that the wilding *Roses* or *Briers* are often by far the more beautiful in woods and plantations; and besides, a good stock of the several varieties of *Dog Rose* and *Sweet Briers* may be sown or planted with the wood. It is easy to cut these out if not wanted, and there is no means of establishing *Roses* in woods equal to working them plentifully on to the arms and branches of wilding *Briers*; plants or cuttings of some of the more common and free growing *Roses* should also be planted in woods, and shrubberies. Some of these may be encouraged to run up trees, and others permitted to ramble into wild masses. There is little fear in having too many of these, and it is easy to reduce them, but most difficult to establish or make *Roses* grow freely on old-established wood unless one has the vigorous roots of *Briers* or the plants already well established to work upon. In all cases where it is needful to establish *Roses* in old woods blocks of roots and soil should be taken clean out, and some impenetrable barrier established between the new soil and the old, as otherwise the tree roots will speedily impoverish the soil provided for the *Roses*, and but little progress will be made in draping the forest trees with higher beauty. The following are among the most suitable varieties for this purpose:—*Gloire de Dijon*, *Maréchal Niel*, *Climbing Devoniansis*, *Cheshunt Hybrid*, *Madame Beard*, *Belle Lyonnaise*, *Climbing Aimée Vibert*, *Lamarque*, *Celine Forestier*, *Rêve d'Or*, *Coupe d'Hebe*, *Paul Verdier*, *Fulgens*, *Charles Lawson*, *Blairii* No. 2, *Chénédué*, *Madame Plantier*, *Climbing Victor Verdier*, *Général Jacqueminot*, *Anna Alexiév*, *Duke of Edinburgh*, *Maréchal Vaillant*, *Monsieur Bonhomme*, *Souvenir de la Reine*, *Gréville*, *Glory of Waltham*, and also the so-called climbing hybrid perennials.

The more distinctly climbing *Roses* of the *Arlyshire*, *Boursault*, evergreen and hybrid *China* varieties, such as *Dundee Rambler*, *Queen of the Belgians*, *Splendens*, *Elegans*, *Gracilis*, *Félicité Perpetuelle*, *Princess Louise*, *Rampant*, *Russelliana*, *Queen of the Prairie*, *Selina*, *The Garland*, &c., would all answer well. In mild sheltered positions even the *Banksian* *Roses* might do well up trees, especially the common yellow variety, which is more hardy than the larger flowered richer yellow *Jaune Serin* or the common white and the robust *White Fortune*. But any free-growing rosette *Roses* will look well up trees, though perhaps those of the most slender growths and with the smallest flowers are the more effective, combining as they do the maximum at once of grace and beauty. *D. T. F.*

THE ROSE-HOUSE AT MILTON PARK, as described at p. 267, is a lean-to with a pit in the centre and a path and staging all round. It is built against an ordinary garden wall about 14 feet in height; aspect south-east. Part of the stock is planted out and part grown in pots. Treatment: encourage liberal growth by retopping or top-dressing after flowering, plunge in bed of ashes in full blaze of the sun during summer, and water regularly; syringe every evening to keep clean and healthy; pinch off all buds as they appear, and in autumn take out of ashes and stand on hard bottom in full sun, giving less water in order to get wood well ripened and let plants go to rest. Take indoors about the end of September and encourage to make fresh growth, which will flower from November to March. Those planted out are treated in a similar manner, and come in for succession, being later kinds such as *Maréchal Niel*, *Gloire de Dijon*, &c. The sashes should be movable so that they can be taken off in summer to let the plants go to rest after making growth. I do not recommend a lean-to *Rose-house* where one has to be built, but an "unequal span," or a "span-roofed structure with a pit in the centre," and "movable sashes," for reasons stated. Best winter-flowering kinds are *Niphetos*, *Safrano*, *Madame Falco*, *Isabella Sprunt*, *Souvenir d'un Ami*, *Sombreuil*, *Madame Ducher*, *Abricot Montplaisir*, *Belle Lyonnaise*, *Madame Trife*, and *Devoniansis*. *Reparier*.

NEW ROSE "THE EARL OF SHEPHERDE."—On Saturday last Mr. H. Bennett, of Shepperton, kindly sent me a bloom of his new *Rose*, named as above. The colour is intense, clear, deep crimson, and, judging from the specimen sent, which was said to have been cut from a small plant in a 4-inch pot, I should say it is a *Rose* of great promise; and it is certainly not open to the objection of being scentless, as it possesses the most exquisite perfume. *T. Chailly*.

## The Herbaceous Border.

**GEUM COCCINEUM AND HYBRIDS.**—We have lately had many lists of precocious children in the garden coming into flower a fortnight or a month before their right time, but I have seen no mention of *Geum coccineum*, many plants of which are full of forward buds, and some are already in flower in my garden. I refer to the semi-double variety, which has now almost superseded the old single form, though that has merits of its own. But the new favourite has a longer flowering period, the flowers last longer when cut, and the colour is deeper and richer. Being only semi-double it produces seed freely, and is very easily raised; so that it is desirable to keep a young stock constantly on hand, though the plants last for several years. By a judicious succession of plants of different ages they may be had in flower every year from April till November; but during the past winter the plants have never been quite without flowers. I generally make two sowings, one in February and another in April. The first sown come into flower in August, when the old plants are going out of flower. The second sowing are set with buds by winter, and if the winter is severe the buds are killed back, and the plants flower with the old ones in May and June; but if the winter is mild, like the last, they come in with the earliest spring flowers. Last spring I bought two hybrids, probably between *Geum coccineum* and *Geum montanum*—both have single orange-coloured flowers, and one I bought from Mr. Robert Parker, of Tooting, under the name of *G. miniatum*. It was a strong plant, such as Mr. Parker always sends to his customers, and in the summer I divided it into twelve pieces, each of which is now a strong plant. The other, which has a strong family likeness to it, was raised and brought out by Mr. Cliban, of Altrincham. This, too, is a very strong grower, and increases very rapidly. They are distinct and new in colour, and seem better adapted to light soils than to heavy strong soils, in which they have a tendency to grow coarse. *C. Wolley Dod, Edge Hall, Malpas, March 5.*

**SANIFRAGA STRACHEVIL.**—This is perhaps the finest of the cordata section of Saxifages. A fine plant is now in flower in the hardy herbaceous house of James Dickson & Sons, Newton Nursery, Chester. In the same house we saw the rare *Primula floribunda* in fine flower. It is well named, being one mass of flower, and very attractive from the remarkable brilliant yellow colour of the flowers. No collection of *Primulas* should be without it. *Ebor.*

**ANEMONES.**—The mild weather we have had has coaxed these into flower, and most valuable have they been for cutting, especially the bright scarlet variety, *A. fulgens*, which, associated with either the Christmas Rose or *Eucharis amazonica*, produces a most striking effect. Seeing the great use to which *Anemone fulgens* may be put, and the early season at which it comes into bloom, it should be largely planted in sheltered sunny spots under walls, or on warm borders where, if necessary, the plants could be protected by having hand-lights placed over them. I once tried them in pots for forcing, but found them impatient of artificial heat, and now I mean to plant along the fronts of some of the houses, close up to the bricks. There I think they will feel just sufficient warmth below to help them into blossom, and if so, a warmth of them will afford something to cut at. I find the best way of getting the other tuberous-rooted kinds is to sow seed in beds, where they come up thickly, and yield masses of blossoms. If sown at once they will flower freely in the autumn, and at the same again early in spring. *Anemones* like rich loam soil in which there is plenty of sand to keep it open and porous; so favoured the roots lie snug, and keep from rot, to which they are subject in ground that remains wet and cold. *J. S.*

**SANIFRAGA BURSERIANA.**—Let the praises of this little gem be sung ever so often, yet it will richly deserve everything recorded in its favour. Mr. Barron has it now at Chiswick in pots in a cold frame, and also on the well-furnished rockwork, and in both cases it is most charming. Under glass the flowers are larger and purer in colour than on the rockwork, and look like so many floral bowls raised upright on their tiny stems. On the rockwork it is also exceed-

ingly pretty, and very free; while it is all the more valuable because blooming so early. It requires to be let alone till it becomes nicely established on tufts, and it should have a somewhat elevated position on the rockwork. There is a great number of these dwarf Saxifages, and the one under notice is a chief gem among them.

## FORESTRY.

FORESTRY divides itself into two branches: the first is called silviculture, or the culture of woodlands in all that concerns the crop which grows upon them; the second refers to their administration from an economic point of view, or in regard to the supply of timber for sale or use by the community, and the revenue to be derived from them.

As regards the first, it may be said that there is no mystery in scientific forestry. It means simply to observe the action of Nature in a forest, and to follow it, or to utilise it for our advantage when we are able to do so. Its object, then, should be to obtain the utmost possible advantage from the soil, by keeping it always covered with a growing crop of trees; and, when the trees arrive at maturity, to remove them in

cultivation will show that a tree 100 feet in girth, which makes a ring of wood of only one-eighth of an inch in thickness, adds to its bulk at the rate of rather more than 1 cubic foot of timber annually for every 100 feet of the length of its stem—or, in other words, such a tree, if its stem be 30 feet in height, will in thirty years have increased in bulk by at least 100 cubic feet of solid timber. At the same time, during these thirty years the young trees which are springing up will become perfectly hardy and capable of supporting the whole force of the summer heat and winter frost. Nothing, then, is lost by the system of natural reproduction, as must be the case when a forest is cut down to be replanted; for not only in the latter case is there a degradation of soil from exposure, but also a dead loss in the production of woody material during the whole time that both the old crop and the young can remain on the ground together with mutual advantage.

But it is not only in the removal of the timber and the reproduction of the forest that we ought to study the action of Nature. It is equally necessary that we should do so in the felling for improving the growing crop, or, as they are commonly called, thinnings. To understand this, let us glance at the constitution of a high timber forest in its natural state, that is to say, a forest, whatever be its age, springing from seed, and therefore capable of living and thriving through a long series of years. In such a forest the

FIG. 48.—VIEW OF WOAD MILL AT PARSON DROVE, NEAR WISEBECH. (SEE P. 335.)

such a manner that the smallest possible interruption may be caused to the productive work of Nature in the forest.

### PRACTICAL MANAGEMENT.

In a natural state, the reproduction of the forest is effected by the germination of the seed which falls from the trees in it, whenever the necessary air, light, and warmth are admitted to the ground, by the fall of any tree, either from accident or age; the work being carried out gradually, and the soil never being exposed over any large area at once. For the young seedlings which spring up would wither and perish at once, unless they were sufficiently shaded. So in forest operations, when the time has come for the removal of the timber, on no account should the ground be anywhere cleared of trees at once; but a commencement should be made by felling a tree here and there, and so breaking the thick cover of the forest, to allow sufficient air and light to reach the ground, and so cause the seed which has fallen to germinate. In this way, about one-fifth of the mature trees should be removed every five or six years, never breaking the cover by making large gaps in it, but taking a tree here and there, and always leaving the finest and most vigorous trees till the last; so that in about thirty years the whole of the old trees will be cleared off, and a new forest established in their place. Thus the seeding of the forest will be effected by the agency of the finest trees, which will be themselves all the while increasing in bulk, and thus the productive power of the soil will be utilised to the fullest possible amount. A short cal-

tures will, when young, form an almost impenetrable thicket of various heights; later on they begin to assume a definite form, and being in close contact with each other they soon begin gradually to lose their lower branches, which fall off and wither; but as a compensation they throw all the vigour of their growth into their heads, and as these push themselves upwards, seeking the light of the sun, the stronger ones overtake the weaker, so that a certain number of the latter perish and disappear each year. When about half their full age the trees will have attained their full height; but from that time till they arrive at maturity they go on always augmenting the diameter of their stems, but at the same time decreasing in number; so we may calculate that, if 1600 trees of 4 inches in diameter can stand and thrive on an acre of ground, there will not be above 400 when the trees are 8 inches, 200 when they have attained 12 inches, and from 100 to 140 when they are 16 inches in diameter. In our thinning operations, then, these considerations should be our guide. In the early stages of a forest's growth, there is little to be done except to keep the heads of the young trees of the most valuable species from being overtopped by those which stand near them; and this can be best done, not by removing the others, but by cutting off or breaking their tops, for it is in this stage that the process of natural pruning is going on, which Nature does so much better herself than we can do it for her, and to this end it is necessary that the trees should grow as close as possible together. Later on, when the trees have taken a more regular form, we can

assist Nature, and at the same time save much valuable produce by judicious thinnings, which should be arranged so as to pass through the whole forest at intervals of from ten to fifteen years, so that the whole area may be operated on in turn. In executing these, the most delicate of all forest operations, it will be well to remember that their object is to give room to the heads of the trees, and not to their stems; for the stems will never be too close together as long as the heads have room properly to develop themselves. The details, however, which govern the operation of thinning differ for almost every species of tree operated on, and to touch on them would be to enter upon a whole course of lectures on forestry. It will be enough to say here that in every case the favouring of the most promising trees and the removal of the weaker ones, together with the preservation of continuous shade to the surface of the ground, while all the trees have sufficient room to grow, should be the objects aimed at.

**ECONOMIC MANAGEMENT.**

The second point to be considered is the administration of forests from an economic point of view or with reference to the revenue to be derived from them.

The basis on which all sound forest management depends is the revenue which any forest can be made to pay—that is to say, the income which it will

whole of the present crop of trees will be removed, and the youngest now on the ground will have come to maturity. This will be about 200 years for Oaks, 120 to 150 for Beeches and Scotch Firs, and so on. These divisions are again subdivided into (usually) four or five working subdivisions, or compartments, to each of which a sub-period of thirty years or thereabouts is assigned, as being sufficient for the removal of all the old trees in it, and the reproduction of the new crop. There must be, then, as many sub-periods in the number of years assigned for the complete working out of the forest as there are sub-divisions in the whole forest. We take whichever of these subdivisions contains the greatest number of mature trees, and assign to it the first sub-period of thirty years, calling it No. 1. We count and measure the trees in it (neglecting all, if there be any, of less than 4 inches in diameter), and ascertain the total volume of timber they contain. This, divided by thirty, or whatever is the number of years in the sub-period, will give, as is evident, an amount or volume of timber somewhat short of the possible annual yield, but near enough to it for all practical purposes; it remains, then, only to remove each year from this compartment the quota of timber indicated above, following, in doing so, the method for the reproduction of forests explained just above—that is, we should remove one-fifth of the trees from one-sixth of the surface of the subdivision each year, or thereabouts,

But besides forests which spring from seed, there are others which consist of shoots springing from the stools or stumps of trees which have been felled, and which are commonly called coppiced forests. In many cases these give very good returns for hop-poles, mine-stays, bark, and other purposes for which large timber is not wanted. Their management is well understood, and the only points on which suggestions may be offered, are—

1. The necessity of giving sufficiently long intervals between each felling, as every time the copse is cut the soil suffers from exposure, and its fertilising power is wasted, as it is also by the production, during the first four or five years after the cutting, of a mass of useless grass and leaves, which profit nothing.

2. The necessity of using sharp instruments for felling and cutting the wood close to the ground, leaving the stools or stumps of such a form that the wet may run off them. These precautions are necessary for ensuring healthy re-shoots.

3. The cutting of the copse, if possible, in the early spring instead of in the winter, as is usually the case. If the work is done just before the sap begins to move the shoots are made at once, before wet and rot have attacked the stools, and rendered the production of healthy vigorous shoots impossible.

It may be added that the more standard trees that are reserved in a coppiced forest the greater will be its value; and there is nothing to prevent their flourishing over the lower growth, which serves to keep up their heads, and to give them a clean stem.

Now what is the practical application of all this? We have in Scotland about 800,000 acres of forest which have been planted during the last 100 years, for few of them exceed that age. Besides these, there is a small remnant of the old natural forests in Strathspey. In England we have, belonging to the Crown, about 50,000 acres of forest, the greater portion of which has been planted within the last hundred years also, with some remnants of the old natural forest, chiefly in the New Forest. It is impossible to speak too highly of the admirable work done by the able men who have created these forests at Scone, Blair Athole, Dunkeld, in Strathspey, on the Findhorn, and at Douly, Scotland, as well as in some of the English Crown forests. In our colonies, including India, there are millions and millions of acres of forest land, some of which is of the greatest value, so that Great Britain is perhaps the country most richly endowed in forest wealth of all the countries of the earth. Every one, not only in our own country but elsewhere, is interested that all this great wealth should not be wasted or frittered away by a single generation of men. But nevertheless what is the future of all the forests? I have visited many of them, and scarcely anywhere did I see any of that young growth which is the link uniting the forest now on the ground with that of the future. Can any one say, then, that the future of these forests is assured? As they exist at present one of two conditions must befall them—either they will be cut down by the timber sold, or they will in due course perish naturally and disappear of themselves. In either case the result is deeply to be deplored, for when once a forest disappears it can only be replaced at a great expense of time and money. *Extracted from Col. Pearson's Lecture before the Society of Arts.*

FIG. 49.—WOOD MILL: SHOWING CONSTRUCTION OF THE WALLS. (SEE P. 339.)

produce in proportion to the volume of the standing trees; or, in other words, its capitalised value. To this end a forest should be considered as so much capital, represented by so many cubic feet of wood, while the amount of wood produced each year by its growth represents the interest thereon, and, in fact, is the revenue of the forest. It is evident that it is possible to cut and remove every year a quantity of timber equal to this annual increase of wood without diminishing the volume of the standing crop. The quantity that can be so removed is the proper yield of the forest—that is to say, the continuous yield; and French foresters have called it "the possibility" or possible annual yield—of the forest.

Now, if we suppose that a period of 150 years will be required for the youngest trees in a forest to arrive at maturity, it is evident that the 150th portion of it might be felled every year, and that the increase of timber in the rest of the forest would equal the volume taken away. But, as we cannot apply such a plan in practice, and at the same time insure the reproduction of a high timber forest, we arrive at the possible annual yield in another way.

1st. In order that we may have to deal only with areas of a workable size, the forest is divided, in the first place, into large blocks or divisions, which should not be more than 2500 or 3000 acres each, and arranged generally so as to be convenient for the roads, rivers, or other means of transport for the timber. Each of these must be considered, and dealt with as a separate forest by itself; and to each a period is assigned, in which the

taking care not to exceed the volume indicated as the possible annual crop.\*

The other subdivisions or counterparts will be numbered 2, 3, 4, &c., and to each of them a sub-period will be assigned in succession. In the meanwhile, the necessary thinning, and the removal of trees that would otherwise perish, must be carried on continually during the first sub-period in all the other subdivisions, so as to go over the whole ground at regular intervals, not exceeding fifteen years each. At the conclusion of the first period No. 1 will contain a young crop of trees, from one to thirty years old; and then No. 2 will be taken in hand; and after No. 2 then No. 3, and so on, until in the full period the whole forest will have been renewed without the ground having been once entirely cleared of trees. Any one visiting Baden Baden will do well to explore the forests in the beautiful valleys of the Oos and the Murg in its immediate neighbourhood, which furnish a splendid example of the successful working of forests on this system. As examples of private forests which have been admirably managed in the same way, I may mention those of Prince Furstenburg, near Rippoldsau, to the east of Baden Baden, where there are some excellently constructed and most ingenious devices for bringing timber down the mountain torrents to points from which it may be carted away.

\* Trees cannot be made to grow spontaneously in a forest, as we can place the men on the squares of a chess-board. The distribution of the fellings must therefore really depend on numerous natural exigencies which develop themselves from time to time, which time will not admit our noticing here.

**WOOD MANUFACTURE AT WISBECH.**

In the *Gardener's Chronicle* for June 18 last, p. 787, an interesting description was given of the manufacture of wood from the leaves of *Isatis tinctoria* as still carried on in the neighbourhood of Wisbech—a curious survival from the times when, as Cæsar tells us, the Britons stained themselves blue with woad. Prof. Oliver has succeeded in obtaining sketches both of the exterior and interior of these rude mills, and I am indebted to him for the loan of the illustrative sketches. Fig. 48 is a general view of the building. Upon referring to the article before mentioned it will be found that the central building is described as being circular with a conical thatched roof. Fig. 49 represents the portion of the mill, the walls of which are described as being built with turf, about 3 feet wide at the base and narrowing upwards. The blocks of turf are about a foot deep, cut in a slanting direction and arranged in a herring-bone fashion resembling old Saxon brick-work.

Fig. 50, p. 339, represents the grinding machine, which is contained in the circular building before alluded to. This machine is worked by three horses, one being attached to each of the crushing wheels, which, as will be seen, are somewhat conical in shape. They are 7 feet high on the outside and 6 feet 6 inches on the inner. The cross bars are of iron, and the woad leaves being thrown into the well, and these drums or wheels passing over, are soon reduced to a pulp. *John K. Jackson, Kesw.*

## Orchid Notes and Cleanings.

**WORK IN THE HOUSES.**—In the East Indian-house the winter-blooming species of Saccobulbium, such as *S. giganteum*, *S. Harrisonianum*, and *S. violaceum*, should be cleaned, and have all the old material removed from about their roots, re-surfacing them over with freshly-gathered sphagnum moss. We prefer growing these soft-rooted species in baskets or cylinders, as in this way they are better aërated, and the roots are in a better condition for taking up supplies of nourishment from the atmosphere than when they are confined to pots. The early-flowering variety of *Angraecum sesquipedale*, which will now have passed the flowering stage, should be treated in the same way as advised for the Saccobulbium, except that this, being a harder-rooted plant than the Saccobulbium, it will be found to do and retain its roots in a healthy state as long in a pot as in a basket. The late-flowering form of this plant, which is much the finer of the two, will now be showing its spikes freely if the plants are healthy and strong. They are shy-rooting plants, and require to be very carefully handled when they need repotting. *Vanda gigantea* will now be passing out of flower, and should be sponged over and put right at the roots for the season. Any small plants of *Aerides* and *Vandas* that a shift would benefit ought to have that attention, so as to get them re-established before the sun obtains much power. Most of these will grow well in pots, giving them abundance of drainage, and crocking them up over the roots nearly to the surface of the pots, finishing off with a couple of inches of sphagnum moss. Where a careful hand guides the water-pot, 3 or 4 inches of sphagnum moss may with advantage be placed over the roots of these young plants, but it should be rammed in firmly so as not to hold too much moisture, and a sprinkling of sand through the moss will assist in preserving the roots. Some of the *Aerides* do better in baskets than in pots, especially the shy-rooting species, such as *A. Veitchii*, and *A. roseum*; and even when in baskets these species should not be overloaded with sphagnum about their roots, as when this is the case and the plants are not carefully watered a spotty and diseased condition in the plant is soon induced. A light fumigation once a fortnight or so through the spring months will do much towards keeping the plants in this house clear of the yellow thrips for the season. Good shag tobacco should be used for fumigating these plants, as a light dose of this will be more effectual than a strong dose of the best tobacco-paper. Plants of *Odontoglossum Phalenopsis* that have finished flowering may be divided and repotted, giving ample drainage, and using the best fibrous peat with a little sphagnum moss about their roots. We find when this plant is grown on large enough to occupy a 24-sized pot that many of the old bulbs commence to get decayed, and if this is not arrested the whole plant soon gets affected. When the plants get into this state we split them up into pieces large enough to fill 48-sized pots, when they soon get established, and grow away freely for several seasons. *J. Roberts, Gimmershaw.*

**PHALENOPSIS SCHILLERIANA.**—In March, 1881, I saw three plants in bloom at Mr. C. Perkins, Kirkley Hall, the original plant with over 160 flowers, and the other two, which had been taken off a flower-spike on the old plant some years previously with over 80 and 120 flowers each. I have lately seen these plants again in flower, but all with an increased number. The original plant had thrown up a rooted growth from last year's spike, which Mr. Perkins kindly allowed me to cut off and take home, and this plant, not twelve months old, then carried no less than fifty-eight fully developed flowers. The variety is much more than usually sweet-scented, of good colour and fair form and size. The plants are grown in a mixed stove, where they get more light and less shade than is usually allowed Phalaenopsis. These have thick leathery leaves, considerably longer and not so round and broad as is generally the case with home-grown plants; in fact, they strongly resemble the leaves of the strongest imported plants. *Norman C. Coakson, Oakwood, Wylam-on-Tyne.*

**TRICHOPILOIA SPAYIS ALBA.**—This rare and beautiful variety is now flowering with Mr. B. S. Williams at Holloway. It is a charming plant, and is very free-

flowering, producing its white blossoms when white flowers are in much request. In habit of growth it resembles the type, and the fine bold dark green leaves make a striking contrast to the delicate flowers. It succeeds well in the cool-house, and requires treatment similar to other cool Orchids.

**MR. BULL'S COLLECTION.**—In Mr. Bull's nursery the *Odontoglossum*-house still contains some fine examples of this genus. *O. crispum roseum* is a lovely variety with well formed flowers; and amongst some good forms of *O. triumphans* there is a remarkable specimen with two spikes—one has twenty-five flowers and the other twelve. In the Cattleya-house *C. Trianae* is flowering very profusely, some of the varieties being remarkable for the rich colour of the lip. One has been named *C. Trianae magnifica*. It is of fine form, the sepals and petals delicate rose, the petals having a spot or blotch of crimson on the tips—a distinctive mark not at all common.

**PHALENOPSIS TETRASPIS.**—This rare, very distinct, and beautiful species, is now in flower at Messrs. Veitch's, Chelsea. The habit and characteristics of the plant are those of *P. Ludemanniana*; the flowers are rather larger than those of the latter species, and are pure white, except the crest of the lip, which is yellow.

**THE BLENDON HALL COLLECTION.**—Blendon Hall is the residence of W. C. Pickersgill, Esq., at Bexley, who has a comparatively small collection of Orchids, but which are excellent in quality, many of the varieties indeed being magnificent. At the present time there is a grand display of *Lycaste Skinneri*, forming quite a show in themselves, two of the varieties being exceptionally good—the finest I have ever seen. One named *gigantea superba* measured 6½ inches across the outer segments and 2½ inches in breadth, the colour a beautiful bluish-white; the petals are very broad, and suffused with rosy-purple; the labellum white, with light rosy-purple markings in the centre. This flower, as its name implies, is gigantic. The variety *virginalis* is a great beauty—I think the gem of the collection; the outer segments are pure white, sparkling as if studded with diamonds, upwards of 6 inches across and 2 inches in breadth; petals white, slightly suffused with pink at the base; labellum delicate rose with white margin. *Formosa* is a light variety, and very handsome in contrast with the highly coloured *rubella*. But the most remarkable plant in this collection is *Dendrobium heterocarpon*, probably the finest specimen in this country, having upwards of thirty gigantic pseudobulbs, and showing eight young growths. The largest pseudobulbs are upwards of 2 feet in height; and six of them are at the present time laden with fragrant blossoms; the variety leaves nothing to be desired, being simply superb. There is also a chastely beautiful large variety of *Cymbidium eburneum* in flower. The collection includes besides some grand specimens showing for bloom, the most noticeable being *Cattleya labiata* Warneri, with about thirty pseudobulbs and four flower-sheaths—a magnificent variety, producing enormous flowers; *Saccobulbium retusum*, a grand plant, showing two flower-spikes; *Dendrobium Farmeri*, a handsome healthy specimen, showing fourteen flower-spikes; *D. thysiflorum*, with splendid growths; and some very healthy *Vandas*. A grand plant of *Aerides Lobbi* has fourteen pairs of leaves—a really handsome plant. Of *Cattleya gigas imperialis* there is a fine specimen with thirty pseudobulbs. This is one of the very finest forms of this splendid species. There is a remarkably fine specimen of the long-bulbed variety of *Cattleya exoniensis*, with between twenty and thirty large pseudobulbs. *Cypripedium caudatum* is also well represented, this specimen producing annually from fifteen to twenty flowers. *Dendrobium superbiens* is evidently quite at home, making grand progress. Of *Miltonia Morelana atrobens* there is also a large pan, in the best of health; also *Laelia anceps* alba and many other fine things. Nearly all the Orchids in this collection have been grown from small plants in an ordinary span-roofed plant-stove, where *Draconas*, *Marantids*, *Crotons*, *Ferns*, *Gardenias*, and a general collection of stove plants are cultivated, and the condition of the plants abundantly proves that they are quite at home. That they are handled in a practical and masterly manner is very evident, and a word of praise is due to Mr. F. Moore, whose management of this place for upwards of ten years has, it is needless to say, given his employer every satisfaction. *Leo Gordon.* We have had an opportunity of seeing flowers of the *Lycastes* and of the *Cymbidium*, which bear out our correspondent's statements, Ed.]

## The Flower Garden.

**LILIUM AURATUM, &c.**—These grand additions to the herbaceous flower borders should now be planted, and if the operation can be carried on simultaneously with the digging of the borders so much the better. A light, rich, and deep soil, with thorough drainage, appears to suit them best. The best situation is at the back of the borders, with a sheltering background of shrubs and a southern aspect. We usually take out the soil to the depth of 6 inches, on which is placed an inch of silver-sand, and on this the bulbs, either three, five, or seven, according to the size of the patch required; but, as a rule, five will make a very fine display. These are covered with another inch of sand, and the soil levelled, the site being marked with a stout oaken peg a foot or so long. They will amply repay for any amount of trouble bestowed upon them. They are also very suitable for planting in patches amongst Rhododendrons. The shelter afforded by these appears to suit them well, and they thrust up and expand their flowers over the tops of the Rhododendrons at a time when the flowering season of the latter is quite over. Many of the hardier sorts, such as *L. candidum*, *L. auratum*, and *L. tigrinum*, are also very suitable for the above purposes, as is also the Yellow Turk's Cap Lily. These must all be carefully marked, and only disturbed at long intervals when the roots become very much crowded. *Gladiolus brechenleyensis* in particular, and many other sorts in general are great additions to the herbaceous border, and should be planted at once about 5 inches deep, and be well embedded in sand; there is no more useful and showy plant than *G. brechenleyensis* for the purpose, and it is so accommodating that many little sheltered nooks may be found where they can thrust up their spikes and interfere with nothing else.

**HARDY ANNUALS.**—A first sowing of the early flowering and most showy sorts should be made at once in small and under glass for filling up vacancies in the herbaceous borders; such fine showy things as Prince's Feather and Love-lies-Bleeding, however, may be sown at once in the open border in patches where they are intended to flower—from 6 to 8 feet from the margin of beds is best, and they will pay for a deep and rich soil. A very showy bed of *Antirrhinum* may be obtained by sowing the seed at once where the plants are intended to flower, so also will *Erysimum Perofskianum* make a good orange-coloured bed in the autumn if sown at once in good ground and well thinned afterwards.

**TENDER ANNUALS.**—It is as well to bear in mind that the sowing of the various sorts of tender annuals must soon take place, so that attention must be directed to the accumulation and preparation of fermenting material for securing a gentle bottom-heat for the purpose, and as at this season such materials are in great request in every department, it will be fortunate for those who have been able to secure a good supply of tree leaves, as a small quantity of fermenting dung mixed with these forms a far better and sweeter medium for obtaining the required temperature than all manure, which is apt to be too violent.

**ROCKERY.**—Several things here are now in flower, or growing fast and showing for flower, so that a neat appearance becomes imperative, and the necessary reduction in size of the strong growers may be commenced at once. Sedums, the moss Saxifrage and scarlet Monards are very apt to outgrow their bounds, and must be kept under, the great object being to get as great a variety as possible in the space. The ground should be thoroughly well cleared of all extraneous matter, then well top-dressed with some rich new compost, which should be simply picked in as the operation of regulating the plants proceeds; it is not yet safe to fill up vacancies from the stores in cold pits.

**PLEASURE-GROUNDS.**—It is astonishing to see the rate at which the grass has been growing through the winter, and it is worthy of note that, commencing on January 25, we went over a considerable portion of the lawns with the mowing-machine, and edged the

flower-beds, giving them quite a summer-like appearance; and we find that, according to present appearances, this practice must be followed up, and that we may expect that the season for the general routine of pleasure-ground work will be much earlier than usual, so that if any improvements or alterations are in progress, no time must be lost in bringing them to a close at once, and all operations connected with the digging and renovating of empty beds, or beds with flowering shrubs, &c., must be completed, so that nothing may interfere with the requisite finished appearance of the dressed grounds. *John Cox, Red-leaf.*

### Grapes and Vineries.

THE earliest house can still be kept at a night temperature of 65° with a rise of 10° by day. Raise the temperature to day heat early in the morning, so that the forcing is done when there is the greatest amount of sun and light; on cold sunny days a few degrees lower will be better than excessive fire-heat. Admit air early in the day on the back ventilators, and increase it as the temperature rises, being careful to avoid cold draughts. On bright days close the house early enough for the temperature to reach 85° after closing, and thoroughly damp down paths and borders. Water the border when dry with tepid manure-water, giving sufficient to go thoroughly through the border, for if not done well the Vines will suffer for want of moisture; keep the evaporating pans filled with manure-water, as the ammonia will greatly assist the Vines, and keep red-spider down. Add fresh fermenting materials to outside borders as the heat declines. Succession Hamburgs will now be ready for thinning, and if not already done take off all surplus bunches at the first opportunity, for if left on longer they only weaken the Vines and rob the other bunches. After thinning is completed give the border a thorough watering with tepid manure-water, and keep the temperature as advised in previous Calendars. Hamburgs started about February 1 can be kept at a night temperature of 60°, with a rise of 10° by day. Muscats in bloom keep at a night temperature of 70°, and if the nights are very cold a few degrees lower, with a rise of 10° by day. Damp the paths and borders with tepid water early in the day, so that it will dry up before noon; and then damp the house again at closing time on bright days, but if cold and sunless do not damp the house in the afternoon. Tap the rods twice daily to disperse the pollen, and if they do not set freely fertilise them with Hamburg pollen, but where the Vines are in a good state tapping the rods will be sufficient for them to set well. Let the evaporating pans go dry until they are out of bloom, and admit air on the back ventilators early in the day. Do not stop the growths during the period they are setting, but take off the surplus bunches as soon as possible. I usually take a good many of the bunches off before they come into bloom, and the remainder never fail to set well. If not already done start the latest house of Muscats at once, at a night temperature of 50°, with a rise of 10° by day, letting it run up to 75° at closing time on bright days, to save fire-heat. Keep the evaporating pans filled with clear water, and syringe the rods thoroughly several times daily. All late varieties of Grapes for keeping through the winter should by this time be started, for a little fire-heat now will save a great deal next autumn, and the Grapes will keep much better than if ripened late. All our black Grapes were thoroughly ripe last year by the middle of September, and cut from the Vines on January 7, and they have all kept satisfactorily and will do until April. Keep them at a night temperature of 50°, with a rise of 10° by day. Keep late Hamburgs as cool as possible, leaving the ventilators open night and day. Do not close for a few degrees of frost, but if severe close them. Early pot Vines must have liberal supplies of manure-water, and the paths and borders be damped down several times daily. Keep the night temperature at 65°, with a rise of 10° by day. Grapes still hanging in the fruit-room keep as near 45° as possible, but with the mild weather we have had this winter our Grape-room has sometimes stood at 50° without fire-heat. Do not use fire except to dispel damp if the temperature keeps up to 45°. Fill the bottles with soft-water of the same temperature as required. *Joshua Atkins, Lockinge Gardens, Wantage.*

THE Twelfth Spring Exhibition of the Bristol Chrysanthemum and Spring Show Society will be held in the Victoria Rooms, Clifton, on March 22 and 23.

### The Pine Stove.

NEVILY-POTTED plants making their first growth have a tendency to become drawn at this stage, owing to the absence of sunlight; therefore extreme caution is necessary to prevent this by judicious ventilation and by keeping the plants close to the glass. Give a little air on every favourable opportunity; this is best done at mid-day, say from 11 A.M. to 2 P.M., if the temperature does not recede below 70°. This is an important point that should not be lost sight of, for should the plants become drawn now they will never afterwards assume a robust and sturdy habit or acquire the same stamina in after-growth. Those plants that were potted into fruiting pots last September and kept steadily growing all through the winter in a light structure will now require more room. These are a useful lot, which will show their fruits in July and August and ripen them in November and December, after the summer batch is finished. A good method of plunging is to get a number of empty duplicate pots exactly the same size as those containing the plants that are about to be shifted, place the empty pots at measured distances of 2 feet apart each way in the places where the plants are intended to occupy; this distance will be ample for the large varieties, such as Smooth Cayenne and Charlotte Rothschild, &c.; a distance of 22 inches will be sufficient for Queens or the small varieties. When the empty pots are placed in position tread the tan or other plunging materials firmly round the pots: when this is done remove the empty pots one at a time, then place the plants in the holes thus made, putting the largest at the back. Any plants that have drawn to one side should be placed with the leaning side to the north, when the action of the sun and light will draw them back into a vertical position. Examine those plants that have stood in the beds some time; see that the pots are level, to take water, and if the plunging material has shrunk from the sides of the pots make it good. If the beds have sunk generally make them up to their proper level with tan or other material. The young leaves in succession plants and growth made during the dull winter months have a tendency to stick together, in that case they should be assisted to unfold their leaves by carefully disentangling them by the hand or a gentle touch with a stick, and those leaves that touch the glass should likewise be got down with care. Where succession plants are shifted put them into their permanent place so as to avoid unnecessary moving, which only breaks the finest leaves. Where the plants are transferred from one place to another never under any circumstances tie up their leaves, as it is an error to do so. *D. Wilson, Castle Hill, Devon.*

### The Hardy Fruit Garden.

FINISH at once the pruning and tying of any fruit trees that from any cause yet remain undone, with the exception of protected Fig trees, from which it would be unsafe to remove the covering material for some time as we may yet experience severe weather. All pruning, training, and staking ought now to be completed; and the freshly forked borders, with the effectual mulching and labelling of newly planted trees will combine in giving a finished appearance to the winter routine work in this department. Where the Gooseberry bushes are much affected by caterpillars, means should be taken to subdue the plague in every stage of its existence, and if nothing has been done in the way of removal of the surface soil from beneath the affected bushes, that operation may yet be performed with advantage. In the case of established bushes that bear heavy crops a liberal use of rich surface dressing to replace the removed soil will be of great assistance; while the destruction of the chrysalids will be best secured by using the old soil for the purpose of covering up heaps of rubbish being charred. Before the wall trees break into bloom it will be well to carefully scan them over in order to see that no scale has been suffered to escape, and again touch with mineral oil if it be found necessary. American blight on Apple trees should also be carefully looked for in the early part of the season. Use a strong infusion of Quassia, tobacco-water, sulphur, and soft soap applied with force from the garden engine on all fruit walls before the bloom-buds burst; and

where aphides have been very troublesome during the previous season it may be necessary to use the same materials thickened with clay and applied with a brush to all nail-holes and other cavities, if not already done, especially on Cherry walls.

Protecting materials will now soon be required for the most forward blossoms. Prepare for its immediate use should bright sunshine prevail, tempting forward the bloom, by looking over the available stock, repairing it where necessary, seeing to the security of any loops, strings, or rings used, and procure additional appliances where required. The branches of Silver Firs, where obtainable, are means of protecting the bloom from frost that ought not to be despised where more convenient material is wanting. Where stocks have been duly prepared by being headed back, as advised some time ago, grafting may now be proceeded with. Rind grafting may be adopted for the large limbs of cut-back trees with advantage, having ease of execution combined with good results in its favour. For smaller stocks no form is better than the whip graft, which may be depended upon as being one of the best modes of performing the operation. Small stocks are not, however, much worked in private gardens, except to increase some local variety, or when the operator has a hobby for the work; but for the establishment of approved varieties on large healthy trees previously producing inferior sorts, grafting becomes one of the most useful operations of the hardy fruit department. It may not be out of place to remark that old trees which have become unhealthy are rarely rendered more vigorous by being cut over and regrafted, and such trees certainly are not worth the trouble of the attempt. If clay be used for covering the junction in preference to grafting-wax, it ought to be well tempered some time before it is required for use, mixing well with cowdung and moss, or chopped hay. Let all dwarf stocks be worked as low as possible, and after claying let them be earthed-up, to prevent the drying and consequent cracking of the clay. A good covering of moss should be firmly bound over all elevated grafts, which, with occasional sprinklings from the rose of a water-pot in drying weather, will preserve the clay in a sufficiently moist condition. A useful grafting wax can be made from equal parts of resin, tallow, and bees-wax, by simmering over a slow fire, and which will save much of the attention required to prevent cracking where clay is used. *Ralph Crossling, St. Fagan's.*

### FRUIT NOTES.

Apple Cox's Pomona.—This is, in my opinion, one of the very best kitchen Apples in cultivation. The tree is a great and constant bearer, producing fruit both large and handsome, which keeps in good condition for several months; in fact, it has kept with me better than the Blenheim Orange, which is enough to show its good qualities. I would advise all who have not grown it to give it a trial. It would be a boon to market growers; for, besides being a sure and heavy cropper, its appearance is such that when placed side by side with its rosy-checked rivals from across the Atlantic, it seems to put them quite in the shade. *H. L., Syndale Park, Faversham.*

Apple Golden Harvey.—To any one requiring a dessert Apple of the highest quality, in use from December to August, I can recommend the Golden Harvey as being equalled by few, if any, for richness and flavour. To have it in the best possible condition the fruit must be thoroughly ripe, and not removed from the tree till the leaves begin to fall, and are therefore no longer of use in maturing and elaborating the juices so necessary to produce flavour of the richest description. After being gathered the fruits should be laid on boards till dry, and then be packed in air-tight boxes, when they can be taken out as required, and will be found to be quite firm, and to have arrived at the highest point of excellence. *A. L. H.*

SCILLA BIFOLIA.—There are not many early-flowering hardy plants which can vie with this in beauty, and still fewer which surpass it. Perhaps the type, with its lovely blue blossoms, is preferable to either the pure white or the flesh-coloured varieties. The "Starrie Inaght" of the old writers still seems to be the same place in the affections of the horticultural world that it did many generations ago.

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Mar. 13	Exhibition of Camellias, &c., at Regent's Park, open to end of week. Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.   Scientific Committee, at 1 P.M.
TUESDAY,	Mar. 14	
WEDNESDAY,	Mar. 15	Exhibition in Town Hall, Manchester. Sale of Imported Orchids, at Stevens' Rooms. Linnæan Society's meeting, at 8 P.M.
THURSDAY,	Mar. 16	
FRIDAY,	Mar. 17	Sale of Imported Orchids, at Stevens' Rooms. Sale of Hardy Plants and Bulbs, at Stevens' Rooms.
SATURDAY,	Mar. 18	

A VERY important paper on the TEACHING OF FORESTRY was read recently at the Society of Arts by Colonel PEARSON, and by courtesy of the Society we are enabled to lay before our readers in another column some lengthened extracts relating to the more practical portions of the subject. Colonel PEARSON began his observations by defining the nature and objects of scientific forestry as follows :

"1. The obtaining, within approximate limits, of a regular sustained revenue from the land which the forest covers ; 2. The utilisation, to the fullest extent possible, of the natural productive powers of the soil ; 3. Progressive improvement in the value of the property ; 4. Final realisation of the crop to the greatest advantage."

In this country the management of woods has hitherto been confined mainly to cultural operations, designed rather with a view to the present advantage of individuals, than to future requirements of the country at large, though of course not wholly so.

We cannot follow Colonel PEARSON in his historic survey of the condition of forests in this and other countries, and of the gradual rise of systematic forestry as now practised in Germany, France, and some parts of India ; nor is it necessary here for us to say anything as to the advantage that may accrue from the extension of properly devised schemes of forest management in our colonies, and, indeed, also at home, for they are obvious to any one who has paid the least attention to the subject. The forest management in India has proved very successful, and in a way that commends itself to the revenue officers, who are apt to look coldly enough upon expenditure which is not reproductive. Thanks, however, to such men as Drs. BRANDIS and CLEGHORN, forest administration is successful even from a commercial point of view. In order to secure a supply of properly trained forest officers—men competent to administer as well as execute all the complex details relating to forest management, men versed in the best means of administering forest law so that while the immemorial rights of the natives are protected or compensated for, the proper development of the forests in the future shall be secured—recourse had hitherto been had to the forest schools of Germany and France. A certain number of young Englishmen have been trained in these establishments, and, as we have said, their work has been of a satisfactory character and is full of well grounded promise for the future.

Little or nothing, however, has been done at home for the advancement of forest science. When the subject has been mooted we have been told that it was impossible to carry out such a scheme here, as the conditions of our woodlands, the tenure under which they are held, and the legal and fiscal regulations pertaining to them are so different from those of India and the colonies that any instruction that could be given here would be totally inadequate. On the other hand, where forestry has been reduced to a science, and where large areas of forest are under Government control, facilities exist which are not available at home.

Admitting our deficiency we fail to see any valid reason why the deficiency may not be in a very large measure supplied. No one will, we presume, doubt that the general principles which underlie successful forest management can be learnt in London, Edin-

burgh, Dublin, or any other centre as well as Tharandt or Nancy. Vegetable physiology, botany, chemistry, entomology, surveying, draining, road-making, forest laws, and the general details of estate management can surely be as well learnt here as on the Continent. Is it not practicable to devise a scheme of education like that carried out at Cirencester but so extended that it should be available for students in all branches of estate management, forestry, agriculture and horticulture ? It is surely not utopian to advocate the formation of one or more universities of this nature in each of the three kingdoms and which would surely prove of immense advantage in the future. When a thorough grounding in the principles of those sciences and arts which underlie all cultural operations of whatever nature have been obtained the pupils might be drafted off, some to the forests, some to the farms, some to the gardens and nurseries, to learn how to apply to the best advantage in practice the principles learnt in the laboratory and college. Practical knowledge can only be gained by practical work, but there can be no question that he who has been best trained in the principles, and knows how best to apply them to new and varying conditions, is likely to be the best practitioner. The thing is so obvious and the necessities of the case are so urgent throughout our great empire, especially in the face of the great competition and the disadvantages under which we now labour, that the time has surely come when a determined effort should be made to bring this matter to a practical conclusion. It is a shame to our boasted civilisation and progress that this matter has not been energetically taken in hand before, and we trust Colonel PEARSON'S paper may tend towards the realisation of a plan the necessity of which all admit, but the practical difficulties of which seem hitherto to have scared our administrators. Whether limited to forestry or taken up on the broader basis we would advocate, we cannot believe that we are a whit less able or less deficient in the means to supply these deficiencies than Germany, France, Belgium, or America with their scores upon scores of forest schools, schools of horticulture, agricultural stations, and the like. If it be not practicable to found new establishments for the purposes we have indicated, let us, at least, turn to better account than we have done the resources open to us in London, Cirencester, Edinburgh, Dublin, and elsewhere. Even in the matter of practical instruction, if we have not the vast and systematically administered forest areas of Germany and France, we have surely sufficient, if properly availed of, to supply a sound practical training which might, if necessary, be supplemented by experience gained elsewhere, and which would enable us to hold our own, and be less dependent on foreign aid.

In the discussion which followed upon Colonel PEARSON'S paper, Mr. THISELTON DYER forcibly pointed out the disastrous results arising from greed and neglect that have rendered some places mere cinder-heaps, and pointed out the great need that exists in almost all our colonies of a carefully regulated system of forest management ; and it was satisfactory to hear from General STRACHEY of the desire of the Indian Government to obtain for its forest officers the necessary education in England. "That idea was about to be acted on, and no doubt before long a school would be established here, whether the Home Government joined in it or not." These words are about the most hopeful we have heard on the matter, and we earnestly trust that the General's expectations may shortly be fulfilled.

— THE SEASON'S PROSPECTS. — It cannot be said that the marvelously open and comparatively mild winter has yet created any need for doubt or

distrust, for few are the things which show undue precocity, and, indeed, surprise generally is felt that with such an open time vegetation should yet be so stagnant. This apparent quietude on the part of Nature, however, is one of the most hopeful features of the season, whilst it is also proof that although we have had one of the most open genial winters man can remember, yet we have had others which, if not so even in temperature and pleasant, have yet had softer or milder periods when Nature has been unduly forced and the worst results have followed. Pessimists even now will not allow that such a winter as the present can pass without leaving behind its sting. These will always regard pleasant things in Nature as wasps in disguise, charming humanity with its beauty and then administering a sharp sting, just to remind the too credulous beings that under its sweetness it hides a store of venom. Why may we not reasonably hope that the winter will remain complaisant and the spring will be as delightful. We have had a remarkable winter, and a remarkable spring would be one devoid of keen biting east winds and sharp white frosts. If the forces of Nature are just now in array in a diverse clime, if the winds prefer to kiss the melancholy Atlantic rather than the ice-bound surface of the Arctic seas, why may not the same mood prevail till the summer sun in all its warmth and glory shall have rendered the winds innocuous ? One special feature of the season is the very equable temperature of the soil. It has not been subject to fluctuations of intense frost and of relaxing thaw—changes that seem for the time to hold Nature in the grip of iron, and then to loosen it with stimulating activity. These sudden rebounds in Nature are far more provocative of early growth than is the moderate, even, but comparatively resting temperature such as has marked the present winter. We hear on every hand of the grand promise of the cereals, of the abundance of winter pasture, of the restriction of cattle diseases, and of hopeful prospects for agriculturists. Gardeners may well be not less hopeful, their prospects are good also ; the soil works well, seeds are going in well, and in all departments the crop promise well. It is only the croak of the human raven that is heard amidst so much that is bright and promising.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We understand that at a meeting of the Committee of Management, held on Monday evening last, Mr. N. SHERWOOD, of the firm of HURST & SON, Houndsditch, was unanimously elected a Trustee of the Institution, in the place of the late Mr. WILLIAM HURST. With reference to the Pension Augmentation Fund, we are requested to call the attention of the friends of the Institution to the list of collectors published in our advertising columns, and to state that the amount collected was so satisfactory that the committee have decided upon repeating the experiment during the forthcoming autumn. It is also considered that it should be more widely made known that when any subscriber or collector has raised and sent in the sum of 10 guineas he will be entitled to all the privileges of a life subscriber. The total amount of the funded property of the Institution, including £500 raised last summer for the Augmentation Fund, and £800 received from the ARTHUR VEITCH Memorial Committee, is £15,350, leaving the sum of £4650 to be raised by voluntary contributions before the committee will be in a position to increase the amount of each pension by £4 per year. As one objection to the Institution has hitherto been the small amount of the annual pension, we trust the means now taken to remove this may be crowned with success.

— HIBBERTIA DENTATA.—Amongst cool-house climbers which flower during the dull winter months this deserves honourable mention. It is, moreover, a plant of the easiest cultivation. The dark bronzy leaves furnish a striking contrast to the rather large bright yellow blossoms. *H. dentata*, too, does not possess the extremely fetid odour which characterises one or two otherwise very desirable species of the same genus.

— MEZEREON.—In very many old-fashioned gardens *Daphne Mezereum* and its white-flowered variety occupy honoured places. Of all the shrubs which "take the wind of March with beauty" probably none can vie with this both in the beauty and the fragrance of its blossoms. As a set-off, however, against this it may be as well to repeat the fact that

all its parts are acrid and poisonous. LINNÆUS speaks of a person having been killed by a dozen Mezezon berries; and in Sweden they are employed to poison wild animals. It is also asserted that Russian and Tartarian women sometimes rub the berries of the Mezezon on their cheeks to produce a slight irritation, which of course gives the effect of rouge, only in a more permanent degree.

— A NEW DRACONTIUM.—A good many visitors to Kew last year could not fail to notice an Aroid of striking appearance and noble size growing in one of the warm compartments of the T range. It attained a height of about 8 feet, and did not look unlike *Godwinia gigas*, as far as leaf was concerned. Like a number of the Aroids, the flowers and leaves of this are produced at different seasons; an infor-

is a very distinct and good variety, purplish-crimson, the margin and tips of the petals white. Excelsior, fine light scarlet, quite  $7\frac{1}{2}$  inches across, broad well formed petals. Indeed in this matter of good form the Chelsea *Amaryllis* excels all others, if the richness of colouring is taken into account. Empress of India is yet in grand form.

— GIANT CYCLAMEN AND PRIMULAS.—There is a grand show of these at the Victoria and Paradise Nurseries, Holloway, at the present time; the plants of Cyclamen are very large, and well represent Mr. WILLIAMS' superb strain. There is also a fine lot of *Primula alba magnifica* in flower, as well as the Chiswick Red and rubro violacea, raised by Mr. BARRON, at Chiswick. There is also a fine show of *Amaryllis*, for which these nurseries have long been

Jewish villages of pulling up the root by means of a dog which was killed by its shriek. A very interesting résumé of the superstitions connected with this plant is given in the chapter on "Mystic Plants," in Dr. M. C. COOKE'S recently-published book, *Freaks of Plant Life*. Apart, however, from its history, &c., the Mandrake with its compact tuft of lance-shaped leaves and its numerous rather pretty purplish-tinged flowers, is well worth growing for its own sake. A good specimen of it is now finely in flower in the herbaceous department at Kew.

— HOW THEY MANAGE MATTERS IN BELGIUM.—The *Bulletin d'Arboriculture* contains an account of a *fiête* lately given in honour of M. BOSSAERTS, sub-curator (*sous chef de culture*) of the Botanic Garden, Ghent, on the occasion of the

FIG. 50.—INTERIOR OF WOAD MILL AT PARSON DROVE: THE CRUSHING WHEELS. (SEE P. 335.)

essence has just been developed, and proves that the plant is a new and undescribed one. It was introduced to Kew from the forests of British Guiana.

— MESSRS. VEITCH'S AMARYLLIS.—Again referring to the new forms of *Amaryllis* in flower at the Chelsea nurseries, we may state that Miss Alice Gair is a star of the first magnitude. It received the highest award given to new flowers last year from the Royal Horticultural Society. This really fine flower is nearly 8 inches across; it has fine bold petals of great substance, of a rich scarlet colour shading to crimson at the centre of the petals. Mr. H. Little, also certificated last year, is finely in flower; it is of a purplish-crimson tint with fine broad petals very distinct. *Thalia*, a flower evidently from the same cross, is also very fine. Iris, scarlet with broad petals of good form, is a valuable acquisition. Royal Standard, also certificated last year, is true to its maiden promise of goodness, as the Auricula fanciers would say. It

noted. We also noticed some grand specimens of *Imantophyllum miniatum splendens* in full bloom, with many spikes of great strength.

— THE METEOROLOGICAL SOCIETY.—At the ordinary meeting of this Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 15th inst., at 7 P.M., there will be an exhibition of anemometers and of such new instruments as have been invented and first constructed since the last exhibition. During the evening the President, Mr. J. K. LAUGHTON, M.A., F.R.A.S., will give a historical sketch of the different classes of anemometers, and will also describe such forms as are exhibited.

— MANDRAKE.—*Mandragora officinarum* in bygone times has played a very important part in the superstitions of many people. Some belief in its power was evidently current amongst the Hebrews, and JOSEPHUS gives an account of the custom in

twenty-fifth anniversary of his appointment in that establishment. The director of the Botanic Garden and the Professors of the School of Horticulture invited M. BOSSAERTS to a banquet, toasted him of course, and presented him with three magnificent bouquets! A deputation of the pupils of the School of Horticulture offered their congratulations, and one of the number recited a poem in Flemish in honour of M. BOSSAERTS, who was farther presented with a copy of the poem engrossed on vellum within a garland of Roses. After that our system of testimonials seems tame.

— BRITISH GUIANA.—It is intended to publish, under the editorship of Mr. EVERARD IM THURN, a half-yearly journal, to be devoted to the transactions of the Royal Agricultural and Commercial Society of British Guiana, and which will contain papers and occasional notes on agricultural, commercial, geographical, meteorological, chemical, botanical, ornithological,

entomological, anthropological, and literary subjects connected with British Guiana. As an indication of the scope of the journal it may be mentioned that the Editor has already at his disposal papers "On the India-rubber-bearing Trees of the Colony," by G. S. JENNMAN, Superintendent of the Botanic Gardens; "On the Poisonous Principles in Bitter and Sweet Cassava (*Jamipha*)," by E. E. H. FRANCIS, Government Analytical Chemist; "On Cane Soil and Manures," by the same author; "On Cocoa Cultivation in British Guiana," by A. H. HENSON, of Anna Catherina; "On Farming and Irrigation," by the Hon. WILLIAM RUSSELL; "On the Reason why the Red Men of America Tame Wild Animals," by the Editor; "On the Literature of Guiana: being an Attempt at a Complete List of all Works published on the subject," by the Editor; "On the Recent Journey of an Orchid Collector in the Neighbourhood of Koraima," by DAVID BURKE; "On the Best Method of Weighing Canes: a Discussion," by various Authors; "On the Encouragement of Small Industries," by J. S. BLAKE, of Skelton. A meteorological record will, as soon as it can be organised, form a regular feature in the journal. Lists of the known flora and fauna of the country will be given from time to time, as they can be prepared. A series of vocabularies of the Indian languages of Guiana is also in preparation. Folklore, collected from the Negroes and Indians, will occasionally be given, and many other kindred subjects will be treated. Subscribers in England are requested to send their names to WILLIAM WALKER, Esq., 48, Hilldrop Road, London, N. Subscriptions in the colony may be paid to the Librarian, at the rooms of the Society; subscriptions in England may be paid to Messrs. RIDGWAY & SONS, 2, Waterloo Place, London, S.W.

— **FUCHSIA PENDULIFLORA.**—For grouping at exhibitions of private purposes it would be hard to name another variety better calculated to produce a rich effect. The plant is a rapid vigorous grower, bearing long acuminate leaves with a violet midrib. The flowers are freely produced, those from the terminal points hanging gracefully over. Such rich foliage gives a massive appearance, at once taking to the eye and giving tone and substance to an ordinary collection of plants.

— **LINNEAN SOCIETY.**—The papers to be read at the meeting to be held on March 16 are:—1, "The Action of Carbonate of Ammonia on the Roots of Certain Plants," CHARLES DARWIN; 2, "The Action of Carbonate of Ammonia on Chlorophyll Bodies," CHARLES DARWIN; 3, "On the British Salmon," Dr. F. DAY; 4, "Observations on the Breaking of the Shropshire Meres," WILLIAM PHILLIPS.

— **AMERICAN BLIGHT.**—M. PRILLIEUX has made the injuries inflicted by the American blight the subject of study, and has published the results in a pamphlet which has only lately been issued though dated 1879. After describing the insect and the superficial appearances of the injuries it inflicts, M. PRILLIEUX proceeds to investigate matters more closely by describing first the normal structure of the shoots of the Apple. The insect inserts its sucker, composed of three canets, into the bark so as to reach the cambium between the bark and the wood and where is stored up the greatest quantity of nutritive matter required for the growth of wood and bark. As a consequence the bark is not much affected but the young wood-cells become much enlarged, their walls remain thin and not strengthened by woody deposit, at the same time the cells do not cohere but are disposed loosely so as to form a spongy mass, which ultimately increases so as to cause the bark to crack open, the tumor protrudes, becomes covered over with a corky investment which however offers no sufficient shield either against the insect or the weather; so that when frost comes the spongy tissue is soon killed, dries up, and leaves a cavity in the wood which forms a convenient shelter for the insects during the winter and from which they emerge next spring to renew their destructive attacks upon the new tissue formed at the edges of the wound in the attempt to repair it.

— **THE FROST AND THE PINE WOODS.**—During the two winters immediately preceding the present thousands of *Pinus maritima* planted on hitherto sandy wastes in France unfortunately perished

from the frost. The timber of these trees fetched a very low price, and the turpentine did not flow from incisions in the bark, as in the case of the living tree. M. PRILLIEUX, in investigating this matter, has ascertained that the frozen wood is as rich in resin as that which was not injured, but that it did not flow when the bark was notched, this defective flow being due to an alteration in the cells. The cells of the frozen wood lose their water, become flaccid, and thus exert no pressure on the resin canals as they do in the healthy condition when filled with water. Nevertheless, there is as much water or more in the wood that has been frozen, only it is no longer in the cells, but infiltrated among the tissues in such a way as to produce neither turpentine nor tension.

— **GREVILLEA ACANTHIFOLIA.**—This species was first discovered by ALLAN CUNNINGHAM in peaty bogs on the Blue Mountains of Australia. In general outline its handsome dark green rigid leaves do suggest a resemblance to those of the *Acanthus*. It is a neat-habited bushy plant, and, apart from its racemes of pale purple flowers, is well worth growing for its distinct and striking foliage character. Specimens are now in bloom in the Winter Garden at Kew.

— **WHITE CZAR VIOLETS IN POTS.**—Those who grow Violets in pots for sitting-rooms or other purposes will find in the White Czar a good companion for the common Czar or Victoria Regina, the latter of which makes a splendid pot variety. Violets are always welcome in whatever way they are presented, but as pot plants they are perhaps more enjoyed because not so common as in a cut state. The double white French kind, Belle de Chateaufort, which produces fine large blooms, does fairly well planted out under the protection of glass or even in the open air in a mild climate, but the percentage of ill-formed blooms upon a single plant makes it out of the question to recommend it as a pot variety. A variety to be suitable for growing in pots must be a profuse bloomer, and in this respect the White Czar will make not only a good companion but a very pleasing contrast to other varieties.

— **"EUROPEAN FERNS."**—The last part of this publication (CASSELL & Co.), has lately been issued. It contains, in addition to a full index, for which the readers are, or should be, grateful, a coloured plate, representing various species of *Asplenium* and *Ceterach*.

— **HELIOTROPE WHITE LADY.**—This is one of the best of Mr. CANNELL'S productions, and as seen at Swanley it is the freest flowering variety in a young state in cultivation. A remarkable peculiarity of the plant is that it grows and flowers from a rooted cutting—the flowering apparently being no impediment to growth, and this not only in the case of an exceptional plant or two, but with hundreds in all stages of growth. Even rooted cuttings are flowering freely. Gardeners having much house-work to do will find in this plant a true helpmate. Who ever heard of a gardener having too many sweet-scented flowers in winter? This variety will have a fine effect arranged alternately in jardinettes with some of the purple varieties, say a zig-zag row round the outside, having a suitable object for a centre. Free-growing plants which can be grown from cuttings in a few weeks are those that gardeners can best afford for decorating rooms, and if these are sweet-scented they will be more valued than would other plants of much greater intrinsic worth.

— **TURKESTAN PLANTS.**—Dr. REGEL has published a series of descriptions of plants found in Turkestan and Kokan by FEDTSCHEKO. Nearly 200 species are described in Latin, with annotations in Russian. An index is given.

— **ST. VITUS' DANCE AND SENSITIVE PLANTS.**—We have constantly new illustrations of the identity in structure between plants and animals, and the close analogy, sometimes amounting to identity, in the life history of the two. One of the latest attempts in the direction is that of Dr. WARNER, the lecturer on botany at the London Hospital, who essays to show that the movements of Sensitive-plants are analogous to those so-called nervous movements more or less unconsciously and unwittingly made by unhealthy children. In plants the movements are, speaking broadly, the result of the sudden afflux of fluid now to this cell or set of cells, now to that, and the con-

sequent "turgescence" of the cells under certain conditions, some of which are known, while others are still mysterious. Dr. WARNER'S hypothesis is that in these ill-nourished or morbid children certain of the cells of the brain are in a condition analogous to those which are implicated in the movements of plants, and consequently that similar results accrue. It may be so, but the movements in the case of the child are far more complex. In the plant the motor machinery, if we may so call it, is at the spot where motion takes place. In the child the machinery is in the brain or spinal-cord, and its influence has to be conveyed to muscles at a distance, just as the "lead" from a magnetic machine conveys the electric force to a distant point and there bursts into light or heat or motion. Dr. WARNER scarcely more than brackets the subject, but it is evident that, to follow up the matter to any useful end, he must take into consideration movements essentially connected with unequal or intermittent growth; and others, such as those connected with the opening and closing of flowers not directly connected with growth. The turgescence above alluded to is supposed by BERT to be due to the large formation of glucose in the cells under the influence of light. This glucose has great osmotic power—a great tendency, that is, to mix with water or other fluid thinner than itself, in consequence of which a rush of this fluid to the cells containing the thicker one occurs, and consequent turgescence. The remarkable movements of the side leaflets of *Desmodium gyrans* might be commended to Dr. WARNER'S notice, as their object is at present quite unknown, while their irregular character, and the fact that they are manifested in organs so little developed that they might be called rudimentary, present at least superficial points of resemblance to choreic movements in a child. The following note, taken from the *British Medical Journal*, showing how the movements of an ordinary Sensitive-plant are influenced by good feeding, and how they are increased by poor living, is a point not only of interest to the physician, but also to the gardener, on which account we cite it:—"Three years ago some seed of the Sensitive-plant (*Mimosa pudica*) was set to grow, and at a moist heat of about 90° Fahr. it soon germinated. Before the compound foliage growth had commenced the seedlings were potted off into different earths and sand. Those planted in a soil of two parts of decayed vegetable mould to one of sand grew more vigorously both in height and foliage than the others; and after two months growth they were much less sensitive than others planted in two-thirds of silver-sand and only one-third of leaf-mould. One or two plants were grown entirely in silver-sand. These showed extreme sensitiveness to the slightest touch; even a breath of air, or the slightest jerk of the pot in which they grew caused all the foliage to shut up. Those plants having no nourishment beyond the gases in the air or sand soon turned yellow and died. The plants in two-thirds sand and one-third decayed vegetable mould were not so robust or strong as those grown in a greater proportion of vegetable mould. They failed to produce any flowers, and died off at the lowest temperature to which all the plants were exposed; while those planted in two-thirds vegetable mould and one-third sand fully matured their growth, flowering in a temperature of 50° or 60°, the foliage being of that full green colour denoting the fact that the spongioles of the roots had necessarily been supplied with the various chemical gases in the soil (set free by a due amount of moisture) requisite for producing the continued support of the plants. Their sensitiveness had at the end of August almost left them; indeed, after a blow on the leaf with a twig the foliage would fall, but almost immediately regain its horizontal position."

— **ANEMONE STELLATA FLORE-PLENO.**—What is found in trade catalogues under the name of *Anemone hortensis flore-pleno* is now to be seen in Covent Garden Market, and in the flower shops. It would appear to be somewhat largely grown for cut flowers, the blooms being double and something like those of a small *Chrysanthemum*, and generally of a scarlet colour—some pale and some deeper in tint. Possibly the flowers are brought on in frames, as it would appear to be in bloom earlier than in the open ground. It may be that the exceptionally mild winter has something to do with its precocity. The fact is, the ordinary forms of *A. coronaria* have never ceased to bloom in the open ground during the

winter, and the plants are now producing their flowers in great abundance. The Anemone represents a group of most useful spring flowering plants, commencing with the scarlet *A. fulgens*, and following on with *Apennina*, the varieties of *Hepatica*, *stellata*, *coronaria*, *sylvestris*, and the varieties of *A. nemorosa*. All of them do well in the open ground, and when they become firmly established flourish with freedom and do a rare service in the garden.

— CLASSIFICATION OF POTATOS. — In the *Revue Horticole* is given an abstract of M. HENRY VILMORIN'S classification of Potatoes. The main groups are five—yellow, rose, red, violet, and variegated. Each of these five main groups is subdivided according as the tubers are round, elongated, flattened, smooth, or notched. Further points of distinction are to be sought in the eyes, which are violet, yellow, rose, or white, and in the colour of the flowers—grey, lilac, white.

— CAMELLIAS AND HYACINTHS. — On Wednesday Messrs. WILLIAM PAUL & SON, of Waltham Cross, opened an extensive and very interesting exhibition of Camellias and Hyacinths, &c., in the Royal Botanic Society's Garden, Regent's Park. Intending visitors should make a point of going early in the ensuing week.

— SEEDLING POTATOS. — The judging of seedling Potatos by the International Committee at the Exhibition of September 20 and 21 is intended to be as thorough and comprehensive as possible. Raisers of seedlings will find the terms stated in the schedule under classes P, Q, R, S, but it may prevent mistakes and disappointments if we at once endeavour to state the case clearly. An intending exhibitor must at once forward "a sufficient number of tubers of each variety" to Mr. BARRON, Royal Horticultural Gardens, Chiswick, and a memorandum on the subject to the Secretary of the International Potato Exhibition, 23, Upper Thames Street. The judges will require to have before them on September 20 a dish of nine samples of each competing seedling, and an extra parcel of six for cooking, and as a matter of course these should not be exposed to the light in any way. The judges will act on the report as to cropping, on the report as to tasting, and on the appearance of the exhibition samples. The object of all this trouble is, of course, to render the final decisions as much as possible beyond question, and of real public importance.

— THE WEATHER. — General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending March 6, issued by the Meteorological Office, London:—The weather has been very unsettled and dull, with rather heavy rain in the south, and rain, snow, or sleet in the north. The temperature, though lower than during last week, has still been above the mean in England and Ireland, but in Scotland it was slightly below. The thermometer was generally highest on the 5th or 6th, the maxima ranging from 51° in "Scotland, W." to 55° at some of our south-western stations, and 57° at Hereford. The minima were lower than of late, and varied from 27° in the "Midland Counties" to 35° in "Ireland, S." The rainfall has been more than the mean in all districts, the excess in the west and north-west being rather large. Bright sunshine shows a decrease in the extreme north-east but an increase elsewhere. The percentage was greatest (38) in "England, S.," and least (11) in "England, N.W." Depressions observed:—At the commencement of the period the barometer was rising in all parts of our area, with moderate southerly or south-westerly winds; but by 8 A.M. on March 1 the mercury had fallen rapidly, and an irregularly-shaped area of low pressure, around which were steep gradients, was shown over England and Ireland. This disturbance caused at first strong easterly winds or gales in the north, and fresh or strong westerly gales in the south; but as it slowly filled up the force of the wind gradually abated, and by the evening of the 3d had become very light from the east on all our coasts. From the 4th until the close of the period the barometer was highest in the southern part of our area, while depressions travelled in an easterly direction across our northern coasts, giving us south-westerly to north-westerly winds, which occasionally increased to a strong breeze or fresh gale.

HOW TO DISTINGUISH ORCHIDS OUT OF FLOWER.\*

In the *Gardener's Chronicle*, n.s., xiv., p. 750, there is a translation of an analytical key to the vegetative characters of various Orchids and groups of Orchids, originally published by Dr. Pfützer in the *Verhandlungen des Naturhist.-Med. Vereins zu Heidelberg*; and in an introductory note thereto most of the technical terms there and here employed are explained. What is there set forth in a tabular form is elaborated and illustrated by additional examples in the book before us. Ignoring altogether the floral characters, Dr. Pfützer attempts to construct a comparative classification or subordination of Orchids from the characters afforded by their vegetative

characters according to their vegetative characters than does the abstract referred to above. It might have been expected that the author would exhaustively examine the results obtained, and have indicated how far they might be used in conjunction with the characters of the floral organs in a systematic classification of the order; but he has not done so. Neither has he attempted the classification of all the species of a single large genus. What he has done is to study a number of species of various genera—as many, it may be presumed, as offered sufficient materials—and to construct a framework of a classification from their vegetative characters. It is not clear what value the author himself attaches to his work, or how far he anticipates that characters of the vegetative organs can be utilised in a systematic classification. At p. 7

FIG. 51.—AERIDES SCHRÖDERI.

An example of a monopodial Orchid, in which the main stem continues to grow at the point, the inflorescence shoots being given off at the sides from the axils of the leaves.

organs—that is to say, their stems, leaves, and inflorescences; but partly in consequence of the great value of living plants of many species, partly in consequence of many species and genera being only known from portions of plants preserved in herbaria, this classification, as the author acknowledges, though embracing all the tribes of the order, is fragmentary and incomplete. Nevertheless, it may serve as a basis for further researches in the same branch of knowledge, and the author has done well to publish the results of his labours at once, instead of delaying it until he could fill up the gaps. At the same time, it is disappointing to find that this massive quarto volume contains nothing nearer finality in the classification.

he mentions that Mr. Benthams, in his essay on the tribes of the Orchidaceae,\* makes no use of the abstract published in this journal and elsewhere, from which it might be inferred that he considers use might have been made of it. At p. 8 he distinctly states that he would not think of classifying Orchids by their habit alone; yet he does not say how far he would go. We are left to determine how far this is feasible as best we may from the body of the work.

With regard to the genera *Bletilla*, *Prepanthe*, and the relationship of *Phaius*, *Calanthe*, and *Limodorum*, alluded to at p. 4 as instances of Orchids closely allied in vegetative characters, and even in their floral characters, except the pollinia, it may be mentioned that *Elmuc* and *Benthams* have stated that *Bletilla* and *Prepanthe* were separated from *Bletia* and *Calanthe* respectively, owing to a mistaken view as to the nature of their pollen. And Mr. Benthams would

\* *Grundzüge einer vergleichenden Morphologie der Orchiden* (Outlines of a Comparative Morphology of the Vegetative Organs of the Orchidaceae). Von Dr. Ernst Pfützer, O. Professor der Botanik an der Universität Heidelberg. 4to, pp. 191, with one coloured and three uncoloured plates and thirty-five woodcuts. Carl Winter's Universitätsbuchhandlung, 1882.

\* *Journal of the Linnean Society*, xviii., pp. 281—350.

refer *Limatodes rosea* to the genus *Calanthe*, hence, if this view be correct, a hybrid between the former and *C. vestita* is no very extraordinary phenomenon. In these instances it appears to have been proved that the supposed differences in the pollen did not exist, therefore there can be no justification for establishing new genera, and placing them in different places in the system. But now with reference to the value of vegetative characters in classification it seems pretty clear that, although the great divisions of flowering plants (dicotyledons and monocotyledons) are with some few exceptions distinguishable from each other by evident vegetative characters, yet generally speaking vegetative characters cannot be employed in the successive divisions until we come to the subdivision of genera. Judging from Dr. Pfitzer's results this holds good for Orchids, as well as other families of plants. We are not losing sight of the fact that certain orders, sub-orders, and tribes are characterised by habit as well as floral affinities. But very little investigation teaches us that certain vegetative types—physiognomical types, they might be designated—are repeated in numerous natural orders of the most distant affinities, showing that they are the outcomes of external conditions, such as climate, medium, and associations. We must, however, be careful to distinguish between purely physiognomical modifications of vegetative organs, and those that coincide with or accompany the genetic affinities. Dr. Pfitzer recognises the fact that certain vegetative Orchid types are repeated in genera possessing widely different floral structure; but he also states that his primary vegetative characters are genetic rather than physiognomical. He primarily divides Orchids into those which grow continuously in one direction (monopodial), and those in which the growth is arrested at one point and continued from another (sympodial). These definitions, if not absolutely exact, are sufficiently so for all practical purposes. Monopodial Orchids have stems which lengthen indefinitely at the tip, season after season, and bear lateral inflorescences, as in *Acridies Schroederi* (see fig. 51). In sympodial Orchids the growth of the main axis soon ceases, usually at the end of the growing period, and a lateral shoot continues the further development. The first is a comparatively small group, comprising, as far as at present known, most of Benthani's sub-tribe *Sarcantheae*, the American genus *Dichaea*, of the sub-tribe *Maxillarieae*, and the widely-spread Neotlineous genus *Vanilla*. The genera *Vanda*, *Renanthera*, *Sarcanthes*, *Acridies*, and *Phalenopsis*, belong here, and mostly inhabit Africa and Asia. The sympodial Orchids are again divided into two groups, the *Pleurantheae*, and the *Acrantheae*—in other words, those having lateral inflorescences, as *Dendrobium*, *Oncidium*, and *Angraecum Scottianum* (fig. 52), but not in other *Angraecums*, and those in which the inflorescence terminates the stems, as in *Epidendrum*, *Cypripedium*, and *Cattleya* (fig. 53). For further particulars we must again refer the reader to the abstract, *ante*, vol. xiv., n.s., p. 750. That abstract, or key, has a somewhat formidable appearance, but it is very simple when we know that the plan of its construction is a succession of contrasted characters. Thus, in tracing out the affinity of a plant, supposing it has not the character of I., we pass on to II., and under that, if it has not a lateral inflorescence, as defined under A., we pass to B., and so on. Incomplete as it is, the key contains a vast deal of information respecting the vegetative organs of Orchids in a small space; and, although in no case do the primary and secondary divisions correspond to the whole of a tribe or tribes, yet the ternary division leads us to the *Ophrydeae* and the *Neotlineae*, and, what is of more importance, to large genera. But, as we have already stated, we anticipate greater usefulness from the characters afforded by the vegetative organs in the subdivision of genera and in the description of species. Practised nurserymen are able to distinguish species and varieties of shrubs and trees by their vegetative characters to an extent that seems unattainable to the beginner, but such knowledge could never be learnt from a book, even if it could be put into words, and it is not likely that descriptive vegetative characters alone will lead to the identification of Orchids. We have little space left to notice Dr. Pfitzer's concluding chapters on the habitats and mode of life, &c., of Orchids, &c., but it may be mentioned that one of the points upon which he most strongly insists is, that Orchids, with comparatively few exceptions, love the sun, and would

thrive better under cultivation were they not shaded so much. In the circumscription of the genera Dr. Pfitzer follows Mr. Benthani, but it would have been better in the references to have cited the names employed in the places to which reference is made. Thus at p. 21 we are referred to the *Gard. Chron.*, n.s., i., p. 473, for the dimensions of a plant of *Staurospis lissochiloides*, Benth., which is very perplexing, if the reader has overlooked the fact, recorded at p. 14, that *Vanda Batemani* (*Fielidia lissochiloides*) is a synonym, as that is the name used in the place referred to. In the same way *Vanda Cathcartii* becomes *Arachnanthe Cathcartii*; and in the index Blume's genus *Arachnanthe* is inadvertently attributed to Reichenbach. *Vanda Loweii* (*Renanthera Loweii*) should also have been referred to *Arachnanthe*. One word with regard to the title of the book. As it stands it is misleading, and needs the qualification expressed by the words "of the vegetative organs." The work is copiously illustrated with woodcuts, most of which have appeared in these columns, and of which due acknowledgment is made. *W. B. Hensley.*

have by sending for it and paying the carriage. I finally got it when it had been in her keeping for three days. *C. Wolly Dod, Edge Hall, Malpas, March 2.*

**Stephanotis in Fruit.**—We have a plant of *Stephanotis floribunda* that has been planted out for several years, and has always flowered freely, but never till now has borne fruit. It has one about the size of a turkey's egg, and like a Plum in shape. I shall be glad to know whether any of your correspondents have ever fruited it. [Yes; many of them. Ed.] *J. Baylis, Leiston Old Abbey, Suffolk.*

**To Prevent Birds from Eating Fruit-Buds.**—Reading Mr. Grievie's excellent article on the Gooseberry in your last issue it occurred to me to make known to you the plan I adopt here to preserve the buds of Gooseberries, Currants, and Plums from the depredations of birds. As soon as the attack on the buds begins the whole of the bushes and trees are at once pruned, and a large quantity of limewash is prepared sufficiently thin to admit of its passing through a coarse syringe. With this a man follows the pruners, squirting it plentifully over both bushes and trees. If done on a dry day it dries in two hours, and no

FIG. 52.—*ANGRAECUM SCOTTIANUM.*

An example of a sympodial Orchid: the main stem here ends in an inflorescence which bends downwards, and so appears opposite to a leaf (in the axis), while the originally side-shoot becomes terminal, and continues to grow in the direction of the main stem.

## HOME CORRESPONDENCE.

**Continental Express Parcel Post.**—Some of us have been looking forward to this as likely to give long-desired facilities for getting a rapid delivery of parcels of fresh plants from distant parts of Europe. I may say that it is an arrangement concerted between the chief European Continental states, by which parcels under 1 lb. in weight should be carried at a cheap rate as quickly as letters, and that it came into operation on the first day of this year. But nothing seems to have been done in England to enable us to derive any advantage from the arrangement. A parcel started on the address to be plants, and requiring immediate delivery, was sent to me from Erfurt last week. It seems that the English agents for the Continental Parcel Post are not, as one would hope, the Post-office authorities, nor any large railway company, but a firm of private carriers. The parcel was handed over to them fully and very legibly addressed to me; it was then forwarded to the local agent of these private carriers, a woman who keeps a small fancy shop at a country town 9 miles distant from me. She wrote to me by post saying a parcel had arrived for me from Germany which I might

amount of rain will then wash it off, neither will any bird even perch on bush or tree. Four years ago this winter I walked about gun in hand from morn till eve day after day to keep the bullfinches in check, as I had planted a great many young bushes and Plum trees; but the birds, in spite of me, cleared every bush, so that they were only skeletons when spring came. Ever since I have used limewash, as stated above, and have no trouble in securing immunity from birds. *W. Armstrong, Ford Manor.*

**Pendell Court.**—Amongst the many novelties in the houses at Pendell Court (Sir G. Macleay's), Bletchingley, worthy of notice now, is a fine specimen of *Coffea arabica*, about 9 feet high and 6 feet through, which is bearing a fine crop of berries, some of the shoots having over fifty berries, which come in threes and fours from the axis of the leaves. Also a grand specimen of the noble *Platyserium grande*, which measures over 5 feet in diameter, and is in splendid condition. The lovely *Canna iridiflora*, var. *Ehmanni*, is still in flower; it is nearly to feet high, and has fine spikes of its bright crimson flowers; it has been in bloom over seven months. The rare and beautiful fine cut-leaved *Anemone cespensis* is just opening its flowers; a new *Asplenium pteridioides* is very distinct, and will prove to be a lovely greenhouse

Fern; this was recently shown by Mr. Green, and worthily received a certificate; the old *Cineraria cruenta* is also grown, it is seldom seen, but is a gem for cutting from. The houses contain many plants seldom met with, and which, under the care of Mr. Green, are sure to succeed. *A. O.*

**Mice in Gardens.**—We were sadly pestered with mice in the garden last spring until a friend of mine caught a grey owl, which he gave to me. I got a box made for it, and placed it in one corner of our walled garden, merely clipping one wing before letting it go. Within a month there was not a scratch of a

potted in the autumn, and put into gentle heat, it will come into bloom early in January. *H. C. O. G.*

**Ants in Peach-houses.**—Having been troubled with ants very much in one of my former places, a few words respecting the plan we adopted to clear them out may not be out of place. Treacle no doubt is a very good thing to attract them, as Mr. Riddel informs us. But our plan was to plunge saucers in the borders up to the rim, with a piece of sponge dipped in sugar placed in each one, also a piece round the stem of each tree. The ants would gather in hundreds and feed on the sugar, then conceal themselves

believe my eyes, I pulled it up to send to the Editor of the *Gardeners' Chronicle*, which I have done. On examination I think that one of the small root-bulbs has come up exactly in the hollow centre of the dead stalk, and having grown through the tube has produced the curious appearance described. Is it so? *C. Walley Don, Edge Hall, Malpas, March 5.* [Yes; the length of the dead hollow stalk through which the young plant has passed being no less than 5 inches. *Ed.*]

**Plant Labels.**—Having read with interest the discussion about labels, I send you one for your in-

FIG. 53.—CATTLEYA GIGAS.

An example of a sympodial Orchid with terminal inflorescence

mouse to be seen, and I have not seen the sign of one since. *C. Lucas, The Gardens, Belmont, Taunton.*

**White Broom for Forcing.**—The White Broom, *Cytisus albidus*, is a great acquisition in conservatory decoration, and requires but little heat and ordinary attention to bring it into bloom at a season when flowers are rather scarce. We have had a large plant of it in splendid flower for the last six weeks, and it looks so fresh at the time of writing that I imagine it will last fully six weeks longer. Others may have forced this Broom successfully for many seasons without thinking it worth while to bring it into prominent notice; but those who have not done so, and who wish to have a good show, would do well to give it a trial. If

in the sponge; then by going round several times during the day with boiling water and shaking the ants into it we soon cleared them out of the houses. *A. M., Dorset.*

**Lilium Leichtlini.**—As might be inferred from Mr. Elwes' picture of it, this seems to be a very prolific Lily. It was the first to appear above-ground in a cold frame I have had made to grow Lilies in free soil. A bulb which made two flowering stalks last year has already sent up twelve shoots, the strongest being a fortnight old and 6 inches high. The most remarkable circumstance about it was that the old stalk, cut off 4 inches above the ground, seemed to be breaking at the end into new growth. Not being able to

speculation. I use them for my herbaceous plants, and they answer admirably, and are almost indestructible. They have a great many good qualities; snails will not run away with them, and magpies have not as yet taken them to line their nests; they are not likely to be dug up or in, and any one can fit the wire to the label. *Edward Morse, The Nurseries, Epsom.* [The arrangement of stout galvanised wire with a loop at the top, on which hangs a zinc label. *Ed.*]

**A Remnant of a Submerged Forest.**—On the east coast of Sutherland, at a point about half a mile westward from Golspie, the recent storms have laid bare at low water the edge of a field of peat, from 6 inches to 1 foot in thickness, and extending about

100 yards in length along the shore at the level of low-water mark. Attention was first attracted to it, by large pieces of peat being found thrown up on the beach near high-water mark by the action of the tide after some of the recent storms. Examination of some of the pieces shows the remains of trees and roots of considerable size. The wood is not in any way petrified, but is rather soft when first taken out, and of a reddish colour, and bears evidence of having been at some period or another subjected to considerable pressure. Many of the smaller branches, from 1 to 2 inches in diameter, may be seen as flat as ribbons, nothing of the wood remaining now, but simply ribbon-like pieces of bark. Small seeds have been found in some of the pieces, also Hazel-nuts in fair preservation, and many wing cases of small beetles. Three kinds of trees have been made out by the wood and bark—viz., the Birch, the Alder, and the common Hazel or Filbert. Some of the members of the Sutherland Field Club visited the place, with a view of finding out the overlying strata, and tracing the peat bed, if possible, from the point where exposed for some way inland. The incoming tide and the appearance of water before the peat field was reached prevented anything being done in the way of ascertaining its extent. Some of the first trials, about twenty paces from low-water mark, showed that the peat was overlaid by a deposit of blue clay about 1 foot in thickness, the blue clay being in turn overlaid by about 6 inches of yellowish sandy clay, gravel and sand forming the remainder between the yellow clay and the surface. No shells were found in the yellow clay, but the blue clay was thickly studded with the commoner bivalve shells usually found on the sea coast. One thing is clear, a forest once flourished on this part of the bed of the Dornoch Firth. When and how it came to be submerged is a matter for geologists to crack. *D. McNeill, Dunrobin Castle Gardens.*

**A Monster Wistaria.**—To all lovers of this beautiful climber there may be seen at the present time, at the seat of W. Young, Esq., Valence, Westerham, Kent, a magnificent old plant covered with pale lilac blossoms. I thought it might be of interest to quote a few of its dimensions. At the base its circumference is exactly 4 feet, and at 6 feet from the base it measures 3 feet in circumference, from which point it extends two immense trunks, travelling round the whole of the conservatory, at a distance of 140 feet, besides its numerous minor branches. The sight presented before the visitor, and the agreeable fragrance with which it fills the whole house, is one never to be forgotten. It is well worthy a visit, and may be viewed on application to the gardener, Mr. Haffenden. I may mention that the same variety was planted outdoors in the same year, and trained to a wall, but the dimensions are not a quarter of this indoor-cultivated one. I should be glad to hear from your readers if there is another such a fine specimen in the country. *A. O. Watkins, Westerham.*

**The Tenby Daffodil.**—This Daffodil, which grows wild at Tenby, whence I had it and name it, was the first of the genus to flower in my garden this year, having come into flower on February 25—two days before the first flower of *Narcissus nanus*. The latter, however, came into flower all over the garden at once, whilst the Tenby Daffodil comes in a long succession, each individual flower lasting longer than those of any other variety of *Narcissus*. Mr. Peter Barr told me last year that less is known about the origin and history of this Daffodil than any other. He calls it *N. obvallaris*—for want, as he said, of a better name. In Sowerby's *English Botany* it is called *Broomfieldi*. Mr. Barr also told me that it is unknown in Continental nurseries, and that he went to the Netherlands without having met it. It may, or once be distinguished by the shortness and stiffness of the outer segments of the perianth, the tube, which is wide and open, projecting far beyond them. It is the only variety except *nanus* which regularly ripens seed in my garden; and I have this year tried to cross it with *Horsfieldi* and *Empress*, which I have forced for the purpose. With the same treatment these two came into flower on the same day, *Horsfieldi* having, as usual, the larger flowers of the two, but *Empress* being taller; *Horsfieldi* seems to me to produce no pollen. *C. Wolley Dod, Edge Hall, Malpas, March 8.*

**United Horticultural Benefit and Provident Society.**—In your notice of this Society last week an important feature of the Society is omitted, and that is, what becomes of the members' annual contributions to the benefit fund after the share to the sick pay is deducted. This is placed out at interest by the Society in some safe investment, as allowed by the Friendly Society's Acts of Parliament. I notice the names of this Society without having any of its papers this day received my annual balance-sheet, and by it I see my share towards sick pay for the past year was "fivepence," and the balance due to me in the society's books, £34 17s. 3½d. I may say that I am the first member on the books, although there are

several others about the same date. This money goes on accumulating year by year, until the member dies or attains the age of seventy years, when if he wishes he can withdraw it or allow it still to accumulate. This will explain why there is no "burial fund." The Secretary will gladly give any further explanation, and send copies of rules of this useful society. Young gardeners especially will find it a good and safe investment. *William H. Heale, 16, Simpson Street, Newcastle-on-Tyne.*

## Foreign Correspondence.

**HORTICULTURE IN SWITZERLAND.**—Our little country is often considered behindhand as regards horticulture. It is true that gardening pursuits do not take so important a place with us as they do in Belgium or Holland, countries in extent as small as Switzerland. We have also few specialities in the way of cultivation. This arises no doubt from the nature and configuration of the soil and its sterility over large areas. In the alpine districts horticulture carried on as it is in the plains is impracticable. Nevertheless, when the necessary allowances are made it will be found that we are in no wise behind our neighbours. It must be borne in mind that there are in Switzerland three distinct stocks or races of people welded into one common country. The cities of *Geneve* and *Basle* are cosmopolitan, but *German Switzerland*, with *Zurich* at its head, receives its impulse from Germany. *Latin (Romande) Switzerland*, which borders upon France on one side and Italy on another, adopts the cultivation pursued in France, especially in the matter of fruit tree culture. Attention is here chiefly directed to what may be grown out-of-doors, while in *German Switzerland* stove plants, window plants, the manufacture of bouquets, &c., attract most attention.

In *Italian Switzerland*, which is, though politically Swiss, geographically Italian, the customs of Italy prevail. *German Switzerland* possesses numerous and important commercial horticultural establishments, of which the most notable is that of *MM. Froebel*, of *Zurich*. All branches of the nursery trade are carried on there, but special attention is given to the cultivation of plants under glass. With us at *Geneva* our largest nursery establishment is that of *MM. Vaucher & Cardinaut*, who have a reputation for hardy trees and shrubs, Conifers, and specially for fruit trees. It is well known that we have at *Geneva* the two finest Cedars of *Lebanon*, brought by *Jussieu*, and planted by him at *Beaulieu* about the same time as that in the *Jardin des Plantes* at *Paris*, which, however, is not nearly so fine a specimen as those at *Beaulieu*. In the neighbourhood of *Geneva* are several fine old gardens. In the time of *Voltaire*, who resided in one of the suburbs, there was much taste shown in the laying out of gardens. At *Geneva*, also, was established the first botanic garden in *Switzerland* under the auspices of our illustrious fellow-citizen, *M. de Candolle*. At *Geneva*, also, under similar auspices, was established the first Swiss horticultural society, in the year 1855. It publishes a journal, which is greatly esteemed by the members and by the fellows of corresponding societies, and by its exhibitions has contributed greatly to the development in this country. It has a rival even in *Geneva*, which numbers 500–600 members, and the existence of these two societies side by side in our little centre may be taken as an indication of the prosperous state of horticulture. In this respect *Geneva* surpasses most of the towns of Europe of equal size. There are two horticultural journals in *Geneva*, the *Revue Horticole* of *M. Vaucher*, and the *Jardinier Suisse*. In *German Switzerland* there are only certain horticultural periodicals of minor importance, and exhibitions and horticultural societies are few and far between. The *Canton de Vaud* has its horticultural society, numbering many members, and publishing a journal which brings up the number of publications in French *Switzerland* to four—not an insignificant number, all things considered.

The only special characteristic of Swiss horticulture is the cultivation of alpine plants. Throughout *Switzerland*, whether the people be of *Romande* or *Germanic* race, there is a strong taste for mountain excursions. It is, therefore, not to be wondered at that the flora of our mountains is appreciated by a large number of our citizens. For many years the cultivation of alpine plants in the plain has been carried on at *Geneva*, the city of botanists and of students of alpine natural history; but it is only

within the last ten years that the cultivation of these plants has been taken up as a branch of trade. *Messrs. Froebel* were the first to undertake this department on a large scale, and many others have since followed suit. With this exception, we have no speciality in *Switzerland*, and no parks and pleasure-grounds on the scale of those in *England*; but so far as we can we have imitated the taste and procedures of our masters, and we may safely say that horticulture in *Switzerland* has already a well-defined position, and a future full of promise. *H. Correvon, Inspector of the Botanic Garden, Geneva.*

**CAMBRIDGE, MASS., U.S.A.**—The Horticultural Society of Boston, Mass., held an exhibition on February 18 in the Horticultural Hall, a noble stone building, very solid and ornamental from top to base. The library is extensive, and open at all times to all members. Boston, in this respect, puts London to shame. The Society is a sound affair, not in debt, and managed by practical men, who put life into it. The meeting was well attended by about 200 members, though the country was clothed in a sheet of snow about 18 inches deep. Mr. C. M. Hovey had a group of cut *Camellias*, C. M. Hovey and Mrs. A. M. Hovey being the best; and a similar group came from Mr. F. B. Hayes, Lexington. Two pots of fine *Mignonette* came from Mr. Atkinson, gr. to Mr. J. L. Gardener, of Brooklyn. Some good Lettuces came from Mr. Vaize. From Mr. Ward, of Salem, came the grandest bunch of *Marchal Niel Rose* I ever saw—such, indeed, that Mr. Paul might covet. A paper was then read by Mr. Philbrick on "Garden Vegetables." The paper was good practical matter, and a discussion followed, the leading points brought out being that deep culture, plenty of manure, and good selected seed should be used. English Cauliflower seed was spoken of as not to be depended upon. The Council and the members freely mixed, not as at South Kensington. Such discussions, as you have often urged, would give interest and value to Kensington meetings.

When the ordinary business of the meeting was over, Mr. H. J. Veitch, of Chelsea, London, a well known horticulturist, was elected a corresponding member.

I have seen some of the best gardens in the neighbourhood of New York and Boston. The Americans are coming along, though they have none of the old establishments as in *England*, yet like gardens, and are, in my opinion, men of better taste than most English people. In the windows of New York and New Jersey and Boston you see *Agaves*, *Opuntias*, *Callas*, *Crassulas*. In all gentlemen's places I have seen, *Agaves* and *Cacti* are more numerous than *Pelargoniums*. Mr. *Pelargonium*-Society-man would go mad out here. In one of the largest and best kept gardens of New England the gardener, Mr. Harris, said he only wanted about 24 pots for his cuttings, but he had about 100 *Agaves*. Mr. John Hoey, of Long Branch, N.J., has two houses, 300 feet long, devoted to a splendid collection of *Cacti*, *Agaves*, and such things; also *Palms*, *Dracenas*, *Crotons*, *Ferns*, *Orchids*, and general stove and greenhouse plants in profusion. Here, as in all gardens I have seen, they grow *Roses*, and quantities of *Myrsiphyllum asparagoides*, on wire, for decoration. Mr. Rathbun, of South Amboy, N.J., has a fine lot of *Orchids*, *Crotons*, *Cycads*, *Cacti*, *Agaves*, &c.

At *Messrs. Pratt's*, *Watertown, Mass.*, I saw *Orchids* well done, *Crotons*, *Dracenas*, *Agaves*, &c. Here I saw some splendid canes of *Black Hamburg Vines*; *Grapes* grow well here, as do also *Violets*. The sun is as bright as in *England* in June, but in one night the thermometer fell 50°; what do you think of that? They don't look at the kitchen garden for about four months. *Bays*, *Rhododendrons*, *Hollies*, *Azaleas*, &c., are kept in winter in a pit underground, with a wooden floor, and a few lights on the top; they keep well so, and are planted out in spring. *Oaks*, *Abies excelsa*, *Maples*, *Juniperus virginiana*, *Abies canadensis*, *Larch Firs*, are most planted. *Abies excelsa* is used for making hedges, and good ones they are.

At Mr. Hunneywell's, *Wellesley, Mass.*, I saw a fine lot of *Phalenopsis* in flower as good as in *England*; *Douglasvillea* does splendidly here. I saw here also a splendid lot of new *Dracenas*; *Aloes*, *Yuccas*, *Cacti*, *Bearcaucans*, and other succulents were plentiful and good; *Calanthes* and cool *Orchids* are well done, and *Cypripediums*.

At *John L. Gardener's*, *Brooklyn, Mass.*, I saw

the best basket as a bracket yet; it contained Pelargonium peltatum, Lantana Chadwinii, rose—the effect was fine. Here I saw good Indian Azaleas, Velandia viridiflora, Heterocentron roseum, Deutzias; and, as in all places, Begonia venusta, splendix; all appear to grow good old climber, which appears to grow rampantly, and flowers the same.

In the trade Mr. Such, of South Amboy, has a good general lot of plants, especially Nепенthes. Mr. C. M. Hovey, of Cambridge, Mass., has a large collection of plants, but his forte is Camellias, which are fine. Here I saw a splendid pair of a robust form of Chamerops humilis, not seen before.

Mr. Falconer, of the Botanic Garden, Cambridge, has a garden of plants which are a credit to his energy, considering that gardening here is not so easy as in England. G. 7.

The low reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 25° on the 4th. The mean of the seven readings was 36°.

Rain.—Rain fell on five days to the amount of 0.92 inch, of which 0.28 inch fell on February 28.

ENGLAND: Temperature.—During the week ending March 5 the highest temperatures were 62° at Sunderland, 58° 7' at Cambridge, and 56° at Leeds. The highest temperature at Bolton was 50° 5', at Liverpool, 51° 2', and at Wolverhampton 52° 3'. The general mean was 54° 4'.

The lowest temperatures in the week were 27° 5' at Wolverhampton, 28° 8' at Cambridge, and 29° at Truro. The lowest temperature at Plymouth was 33° 6', at Sunderland 33° and at Bradford 32° 8'. The general mean was 31° 1'.

The greatest ranges of temperature in the week were 29° 9' at Cambridge, 29° at Sunderland, and 25° 1' at Nottingham. The least ranges were 18° 5' at Bolton, 19° 5' at Liverpool, and 21° 2' at Bradford. The general mean was 23° 3'.

The mean of the seven high day temperatures was highest at Truro, 52° 8', at Cambridge 52° 6', and at Plymouth 52° 31', and was lowest at Bolton, 44° 3', at Bradford 46° 2', and at Hull and Liverpool 46° 3'. The general mean was 48° 8'.

The mean of the seven low night temperatures was highest at Plymouth, 41° 9', at Brighton 41° 1', and at Bristol 40° 8'; and was lowest at Wolverhampton, 36° 9', at Sunderland 37°, and at Bolton 37° 6'. The general mean was 39° 4'.

The mean daily range was greatest at Truro, 12° 5', at Sunderland 12°, and at Cambridge 11° 9', and was lowest at Liverpool, 6° 3', at Bolton 6° 7', and at Bradford 6° 9'. The general mean was 9° 7', and at Truro 46°; and was lowest at Bolton, 40° 4', at Wolverhampton and Hull 41° 6'. The general mean was 43° 4'.

The mean temperature for the week was highest at Plymouth, 46° 5', at Cambridge 46° 1', and at Truro 46°; and was lowest at Bolton, 40° 4', at Wolverhampton and Hull 41° 6'. The general mean was 43° 4'.

Rain.—The largest falls were 2.43 inches at Bolton, 2.23 inches at Bradford, and 2.02 inch at Bristol. The least falls were 0.45 inch at Cambridge, 0.75 inch at Dighton, and 0.92 inch at Blackheath. The general mean was 1.47 inch; it fell on an average of six days, but at Nottingham it fell on every day in the week.

SCOTLAND: Temperature.—During the week ending March 4 the highest temperature was 57°, at Paisley; at Dundee and Greenock the highest temperature was 51°. The general mean was 54° 2'.

The lowest temperature in the week was 30°, at Greenock; at Aberdeen the lowest temperature was 33° 7'. The general mean was 31° 8'.

The mean temperature for the week was highest at Paisley, 43°; and lowest at Dundee, 39° 3'. The general mean was 40° 9'.

Rain.—The largest falls were 2 inches, at Dundee, and 1.04 inch at Aberdeen; the smallest fall was 0.66 inch at Glasgow. The general average fall was 1.03 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—BACON.

AROMATIC CALVILLE APPLE.—Can any of your correspondents put me in the way of getting a graft of "Aromatic Calville" (Calville jaune rayée d'Automne)? *Phi. omelo.*

Answers to Correspondents.

AGRICULTURAL SHOWS: *Young Farmer.* The Bath and West of England Society meets at Cardiff on May 29; the Royal at Reading on July 10.

CINERARIAS: *E. M. B.* Bright showy flowers, but by no means of a quality that would satisfy a florist.

CINERARIAS, DOUBLE: *R. H. Vertegans.* Judging from the flowers before us your strain of seedling double-flowered Cinerarias is unquestionably a good one. The finest flowers are those of *Vortigen* (No. 7), bright rose-purple self; *Cobalt* (No. 9), purple-lilac; and *Raincuculis* (No. 8), white ground, tipped with rose. No. 3 (Mr. R. H. Vertegans), violet-shaded rose, is large, but not so pleasing in form as the others.

DENDROBIUM SEEDLING: *F. R.* Your hybrid between *D. noble* and *D. Pierardi* produces somewhat larger flowers and broader segments than *D. noble*, but in other respects we do not see any improvement.

FANCY PRIMROSES: *A. C.* Pretty border flowers, but of no special merit otherwise.

GREEN HYACINTH: *Messrs. G. & W. Yates* send us a curious specimen of the Gigantea Hyacinth, in which the flowers are ordinarily white, but which in this instance are green. The flower segments are small and greenish, the stamens normal, while the pistil is prolonged into a long green tube twice or thrice as long as the flower. A similar change was met with by the late Mr. Wilson Saunders in the case of the variety *Royal Steiger*. We are unable to assign any

cause for this deviation. The flowers have, as it were, changed their minds, and assumed more or less of a leafy condition, but under what inducement we do not know.

HEATING: *S. B. C. Hood*, in *Warning and Ventilating*, &c., states that stoves requiring a temperature of 65° to 70° in the coldest weather will require 45 feet of 4-inch pipe for each 1000 cubic feet of space; and if a temperature of 70° to 75° is required, 50 feet of 4-inch pipe must be allowed for each 1000 cubic feet of space.

KENT COBS AND FIBRETS: *L. Pabst*, Mr. George Bunyard, in his *Fruit Farming for Profit*, mentions the Lambert Fibret, or Kentish Cob, the Kent Fibret, Welf's Fibret, Cob, and Gosford, as the sorts most favoured. The same author gives the distance apart at which they should be planted as 12 feet. They pay their way in five or six years, and the average yield is about 8 cwt. per acre.

LAWN DRESSING: *An Old Subscriber.* Superphosphate of lime is, of course, intended. The cost of the mixture is about 15s. per cwt.

LODDIGES, MR. WILLIAM F. C. This gentleman's death took place on December 28, 1849.

NAMES OF PLANTS: *C. J., Broadhurst.* *Helleborus foetidus*, — *J. Robertson.* *Allium neapolitanum*. — *P. Ireland*, 1. *Calliandra purpurea*, 6, a Carex which we do not recognise. Of the others you must send better specimens when they are in flower. — *J. H. Stone.* *Petasites fragrans*. — *John Hoeman.* *Alonsoa incisulata*. — *J. G.* *Anemone pavonina.* Consult a trade list as to price. — *E. M.* *Bifrenaria acaulis fulva.*

ORCHIDS AU NATUREL.—If *Orchid Grower* will comply with our rules by sending his name and address, we will endeavour to enlighten him.

PINES: *H. W. G.* We believe most of the large nurserymen deal in them, but we cannot name any one in particular. Mr. Wilmut still carries on business at Isleworth.

STANWICH NECTARINE: *A Young Gardener.* The statement is quite true. The fruit trees propagated (24 lots) were sold by public auction in May, 1850, realising £164 17s., which sum was given by the Duke of Northumberland to the Gardeners' Royal Benevolent Institution.

- 7.—A fine bright day and night.
- 8.—A fine overcast day. Fine night.
- 9.—A fine day generally, cloudy. A dark cloudy night.

LONDON: Atmospheric Pressure.—During the week ending March 4, the reading of the barometer at the level of the sea decreased from 29.51 inches at the beginning of the week to 29.09 inches by 3 P.M. on the 26th, increased to 29.61 inches by 9 A.M. on the 25th, decreased to 28.99 inches by midnight of the same day, increased to 29.68 inches by 9 A.M. on March 4, decreased to 29.67 inches by 3 P.M. on the same day, and was 29.77 inches by the end of the week.

The mean reading for the week at the level of the sea was 29.34 inches, being 1.07 inch lower than last week, and 0.63 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 54° on Feb. 26. On Feb. 28 and March 3 the highest temperature in the day was 48° 5'. The general mean was 50° 5'.

The lowest temperature in the week was 32°, on March 4; on February 26 the lowest temperature was 48°. The mean of the seven lowest temperatures was 40° 1'.

The greatest range of temperature in one day was 17° on March 4; the smallest was 6°, on February 26. The mean of the seven daily ranges was 10° 4'.

The mean temperatures were on February 26, 50° 5', on the 27th, 47° 9'; on the 28th, 44° 9'; on March 1, 46° 1'; on the 2d, 43° 5'; on the 3d, 40° 9'; and on the 4th, 39° 7'. And those of the 26th, 27th, 28th, 1st and 2d were above their averages by 11° 8, 8°, 4° 8, 5° 8, 3° 1 respectively, and those of the 3d and 4th were 0° 5 and 0° 8 below their averages respectively.

The mean temperature of the air for the week was 44° 7', being 0° 7 higher than last week, and 4° 6 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 110° on March 3; the highest on February 28 was 67°. The mean of the seven readings was 88° 4'.

SEEDS.

LONDON: March 8.—There is now an active consuming demand for farm seeds. Stocks being unprecedentedly light, the tendency of values is to rise. Alsike, white, and Trefoil, are dearer. American Clover seed is firm, shipments continuing on a moderate scale. An advance on the price of Sainfoin has been established of 2s. per quarter. More money is also asked for Lucerne. Just now there is a great scarcity of spring Tares. Winter Vetches are still in brisk request. Bird Seed is dull. John Siskin & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday business opened very quiet, but eventually there was rather more doing than on Friday, at about 12, decline for 1000 Wheat; on inferior qualities the decline was greater. Flour was dull, and prices, except for fine qualities, were mostly 1s. per sack lower. Maize was quiet on the spot. Barley was about 3d. lower for grinding sorts; Beans and Peas were quiet and unaltered, and new Oats were the firm lower. On Wednesday Wheat met little inquiry, and the tendency of prices was against sellers. Maize was steady at Monday's rates, and Barley very firm. For Beans and Peas prices were unaltered, and the demand for Oats was very slow.—Average prices of corn for the week ending March 4:—Wheat, 41s. 7d.; Barley, 30s. 8d.; Oats, 21s. 8d. For the corresponding period last year:—Wheat, 41s. 7d.; Barley, 31s. 7d.; Oats, 21s. 2d.

CATTLE.

At Copenhagen Fields on Monday the beast market was fairly supplied, and the trade steady at about the rates of Monday 5th night. Sheep were very short, and brought in many cases enhanced rates. Prime calves were scarce and dear. Quotations:—Beasts, 4s. 2d. to 5s. 2d., and 5s. 6d. to 6s.; calves, 5s. to 6s. 10d.; sheep, 5s. 6d. to 6s. 8d., and 7s. to 7s. 10d.—Thursdays' trade, though not active, was dear. Beasts sold slowly at extreme quotations, and fully late rates were paid for sheep. Calves remained scarce, and pigs were firm.

POTATOS.

The Borough and Spitalfields Markets reports state that there were good supplies and a moderate demand at the following quotations:—Scottish Champions, 50s. to 60s.; ditto Regents, 70s. to 80s.; ditto Marston Bonnies, 80s. to 90s.; flukes, 130s. to 140s.; and Victorias, 110s. to 120s. per ton. German reds, 3s. to 4s. 15s. per bag.—The imports into London during the preceding week were 10,583 bags from Hamburg, 1200 Ruen, 97 Boulogne, 403 Bremen, 156 Haringen, 66 tons Lauderdale, and 123 tons from Rouen.

COALS.

The following are the prices current at market during the week:—Walls End—Haswell, 15s.; Hawthorns, 13s. 6d.; Lambton, 14s. 6d.; Wear, 13s. 6d.; South Hetton, 15s.; Tees, 14s. 6d.; Hetton, 15s.; Hetton Lyons, 13s. 6d.; Tunstall, 13s. 6d.

Government Stock.—Consols closed on Monday at 100½ to 100 for delivery, and 100½ to 100½ for the account. Tuesday's figures were, for delivery, 100½ to 100½, and 100½ to 101 for the account. The final quotations for Wednesday were, 100½ to 100½ for delivery, and 101½ to 101½ for the account; whilst on Thursday the former gave way ¾th, and the latter ½th.

## SEEDSMEN

By Royal Command To Her Majesty Gracious  
To H.R.H the Prince of Wales. *Carters* To Her Majesty Gracious  
The Queen.  
237 and 238, HIGH HOLBORN, LONDON, W.C.

THE "AUTOMATON."  
SIZES, 8 to 22 inches.  
THE BEST GENERAL PURPOSE MACHINE.

The "AUTOMATON" Lawn Mowers are thoroughly strong, well-made, and durable machines, and the best suited for general work and *Gardener's* use. They cut the grass perfectly, leave no ribs, but produce a smooth velvety surface on the Lawn, and are light in draught.

The "AUTOMATONS" have front rollers for general work, and side rollers for cutting long grass, or when it is unnecessary to roll the grass in front of the cutters. They have the best machine made gearing, the best self-sharpening knives of steel and iron rolled together, and automatic silent drivers.

THOUSANDS IN USE.  
SENT CARRIAGE PAID.  
MONTH'S TRIAL ALLOWED.  
NO CHARGE FOR PACKING.  
COMPLETE PRICE LISTS FREE BY POST.  
STOCK KEPT IN LONDON at Arch 92, Spitalfields Station, Bethnal Green, E., and Machines may be ordered from any respectable Ironmonger.

**RANSOMES' LAWN MOWERS ARE THE BEST.**  
MELBOURNE EXHIBITION, 1881, THE HIGHEST AWARD.  
Ransomes, Head & Jefferies, ORWELL WORKS, IPSWICH.

THE "WORLD."  
SIZES, 8 to 24 inches.  
FOR CUTTING LONG GRASS.

The "GLOBE" (late intended for cutting long grass; and, whilst similar to the Lawn Mowers imported from America, have the special advantages of the more accurate fitting and general durability of English manufacture and perfect adjustment.

The "WORLDS" will cut wet, dry, long, or short grass without clogging, and cut off almost all the "beats." They leave the surface smoother than similar machines, and are well adapted for getting over a large amount of work with little labour.

## "ARCHIMEDEAN" AMERICAN LAWN MOWERS.

AWARDED  
HIGHEST PRIZE  
At the PARIS EXHIBITION, 1878;  
And the Jury, in their Report, say—"THE 'ARCHIMEDEAN' did the BEST WORK of any Lawn Mower exhibited."  
ALSO  
At SYDNEY EXHIBITION, 1879-80,  
AND AT  
MELBOURNE EXHIBITION, 1880-81.

OPINIONS OF THE PRESS.  
"Far superior to any of ours."—*Vide The Field.*

THE COVENTRY.

(REGISTERED).

NETTLEFOLD & SONS desire to call especial attention to their "COVENTRY" LAWN MOWER, which they can confidently recommend as the best and cheapest in the Market.

It has all the improvements which have of late been introduced into this class of Machine, either in England or America; and for the mower in which it does its work, its lightness, and the ease with which it can be used, cannot be surpassed. Its cheapness brings it within the reach of every one, and in this respect it defies competition with any American machine before the public. It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron. These Machines can also be supplied with ROLLERS AT SAME PRICE, and GRASS BOXES at a small extra cost.

PROTECT YOUR PLANTS. "FRIGI DOMO."

Registered Trade Mark.

"Horticultural Society's Garden, Turinham Green." Frigi Domo is now largely employed here as a protecting material instead of mats. All houses and pits to which it can be usefully applied are covered with it at night, and it is found to give entire satisfaction. It lasts longer than mats, is cheaper, and keeps out frost more surely.

"Broom House, Fulham." "FRIGI DOMO-After two winters' experience of this material as a protection from frost, I have come to the conclusion that it is the best covering for pits and frames which ever came under my notice. It will keep out more frost than two mats, while it only costs the price of one; it is more tidy than loose litter, and fits more closely than straw hurdles, and it is much more manageable, for when fitted on to a roller roadway, covering and uncovering can be effected in half the usual time, and there is no danger of breaking the glass. In wet weather it lies quite close to the glass, but as soon as frost sets in it becomes almost as tight as a drum, thus forming a space between it and the glass, a thing very desirable where the edges fit tightly, which they do. I believe that any greenhouse plant is perfectly safe under it until the thermometer indicates 'to' of frost.-J. RUST."

To be had of all Nurserymen and Florists. FOR PRICE LIST & PARTICULARS ADDRESS-BENJAMIN EDGINGTON, 2 DUKE ST. LONDON BRIDGE

EPPS'S COCOA. "By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine food which God has made for us in Milk, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which will save us many a heavy doctor's bill. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maldies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood. It is a properly-nourished frame.—Civil Service Gazette." Made simply with boiling water or milk. Sold only in packets, labelled. JAMES EPPS and CO., HOMEOPATHIC CHEMISTS, London. Masters of Epps's Chocolate Essay for Afternoon use.

HOLLOWAY'S OINTMENT and PILLS.—Whenever the weather is variable and the temperature constantly changing, the weak and delicate must be very careful to neglect no symptom of disordered action or ill-health. Weakness and straggling subjects, and in these noble remedies the means of casting out the bad humours which originate and prolong their sufferings. The Ointment should be well rubbed twice a day over the chest and back, and the Pills taken in moderate doses. It will penetrate and act most wholesomely and energetically on the diseased structure. This remedies manifest a wonderful power in removing all taints from the blood, and consequently in curing a multitude of chronic ailments, which seemed to be almost irremediable.

THURSDAY NEXT, MARCH 23.

# MASDEVALLIA CHIMÆRA, RCHB. F.

DISCOVERED BY M. ROEZL.

The true species, with its flowers 2 feet in diameter. Much has been written about this species, and various kinds have been sold for it, but excepting the few plants sold by us in 1880, none have been imported. M. Roezl discovered it in 1871, and he tried for years to get it home alive, but without success. His nephews also failed, although for some eight years they sent it home, or came home with it, almost annually. We are extremely pleased at being able to offer now a very splendid lot brought home by Mr. Chesterton, and the importation is in splendid health, the majority of the plants being very grand. The flower-spike is from 1 to 2 feet long, and the immense flowers are produced in succession, as many as seven and eight open one after the other, the diameter between the tail ends being 2 feet, each sepal being 1 foot long. The marking of the flowers varies from rose to crimson, on a yellow hairy ground. Several of our 1880 importation have flowered, and proved this to be the finest of the section. It was figured in the *Gardeners' Chronicle*, July 23, 1881. The plants have the upright spikes on them.

# MASDEVALLIA REICHENBACHIANA, ENDRES.

We are extremely pleased at being able to offer, for the first time, this truly superb new species. It is, without doubt exceedingly lovely. Professor Dr. Reichenbach says:—"The beautiful plant was discovered in Costa Rica, by my late friend Endres, and was named by him." The flowers are large, fully 2 inches in diameter, the tails very short, and the colour of the flower is white, the inner half blood-red, in some varieties crimson. The distinct two colours (white and red), the striking flowers, and its fine, full, open shape, make it one of the showiest of Masdevallias, and we most earnestly commend it to the special notice of growers. We may also mention that only a few plants of it existed in Costa Rica, and that Mr. F. C. Lehmann has sent home to us every plant that could be found. The consignment is in really grand condition.

**ODONTOGLOSSUM VEXILLARIUM** | **DENDROBIUM WARDIANUM.**

Klaboch's autumn-flowering variety.

A specially large and fine consignment.

**CATTLEYA DAVIANA.**

**CATTLEYA CITRINA.**

# Wormleighton Seedling Potato.

"THE IMPROVED MAGNUM BONUM."

VIDE FOLLOWING LETTER:—

"WORMLEIGHTON SEEDLING and MAGNUM BONUM.—These two Potatos are said by some to be identical. Here the Magnum Bonum never did grow handsome, but the Wormleightons with me last season were pictures, and I feel sure it is a great improvement on Magnum Bonum—in this place particularly so.  
 "R. GILBERT, Burgbley."

J. C. & Co. offer the above variety, guaranteed True to Name.

Price 2s. per Bush. of 56 lb.; 50s. per Sack of 168 lb.  
 CARRIAGE FREE. STOCK LIMITED.

*Carters*

THE QUEEN'S SEEDSMEN,

From Mr. E. CLARK, King's Langley, Herts,  
 October 29, 1881.

From Mr. KERRY, Halton Holegate, Spilsby,  
 October 27, 1881.

"From the one pound of WHITE ELEPHANT POTATO I have lifted 206 lb. weight."

"The one pound of WHITE ELEPHANT has turned out very fine. I have lifted 220 lb. from it."

**DANIELS BROS.,**  
 ROYAL NORFOLK SEED ESTABLISHMENT,  
 NORWICH.

**ASPARAGUS PLUMOSUS.**

An elegant evergreen climber, from South Africa, with slender smooth stems, and numerous spreading branches; the hermaphrodite white flowers are produced from the tips of the branches. It is an exceedingly handsome ornamental plant for the Greenhouse or Conservatory, and its pretty feathery growths are extremely useful for cutting for Decoration. *ros. 6d., 15s., and 1 guinea.*

**ASPARAGUS PLUMOSUS NANUS.**

An exceedingly graceful evergreen plant, very useful for all kinds of decorations, and from its exquisite beauty, particularly well adapted for furnishing out sprays for intermingling with flowers; it is also charmingly elegant when grown in pots as a Table-plant. Mr. W. B. having imported a large quantity from South Africa, is enabled to offer good plants at *ros. 6d., 15s., and 1 guinea.*

**ASPARAGUS VIRGATUS.**

This remarkably elegant feathery-looking plant, of fruticose habit, has been recently introduced from the Cape of Good Hope. The stems, which issue from the crown of the stout fleshy roots, are of a dark green colour, and bear at the upper end a corymbose head of erect branches, of which the lowest is the youngest or most recently developed. These branches are again twice branched, the ultimate branchlets being furnished with acicular cladodes, 1/4 inch long, which grow usually in threes. The berries are round, about as large as an early frame pea. *7s. 6d. and 10s. 6d.*

**NEW PLANTS of 1881** } which were introduced } **MR. WM. BULL,**

NEW HYBRID FUCHSIA, FORMOSA.

SIX NEW ZONAL PELARGONIUMS, of sorts.

EIGHT NEW FANCY PELARGONIUMS, of sorts.

TWELVE NEW COLEUS, of sorts.

FIVE NEW FRENCH COLEUS, of sorts.

NEW VARIEGATED-LEAVED PELARGONIUM, with double flowers, Chelsea Gem.

**NEW FUCHSIAS,**

To be sent out the Third Week in April.

**MR. WILLIAM BULL**

Has much pleasure in announcing the following magnificent collection of new Fuchsias; it includes the handsome varieties from the celebrated raisers, Mr. Hanks and Mr. Eckford, from whom Mr. W. B. has purchased the stocks:—

- EXPANSION—A very distinct and pretty variety; tube and sepals bright rose, the sepals completely reflexed; light bluish-purple corolla, so widely expanded as to become almost flat; quite unique in form. *1s. 6d.*
- GENERAL—A fine showy flower with very large reflexed sepals of a deep rose colour, and large expanded double corolla of a rich violet colour, fringed with rose. *10s. 6d.*
- GERALD—A very fine flower with rich crimson tube and sepals, the latter completely reflexed; large expanded corolla of a rich purplish-crimson colour. *10s. 6d.*
- IMPERIAL—A splendid flower, with a huge, well-formed corolla of a beautiful glossy plum-colour, richly striped and flaked with pink; tube and sepals of a bright rosy-crimson colour, the latter elegantly recurved. *10s. 6d.*
- MARVELLOUS—Tube and sepals deep rose, the sepals oval in shape and reflexed; full, double, bright blue corolla, of pretty rosette-like form. *10s. 6d.*
- MATCHLESS—A magnificent flower of good substance and excellent shape; tube and sepals deep crimson, the latter broad and elegantly reflexed; large thick well-formed corolla of a rich purple colour, striped and flaked with rose; so extremely attractive variety. *10s. 6d.*
- MINSTREL—Tube and sepals bright rosy-crimson, short tube and broad recurved sepals; corolla very full and double, ivory-white, striped with rose at the base. *10s. 6d.*
- MONUMENT—An effective double-flowered variety, with full corolla of a deep purple colour, striped with rosy-crimson; tube and sepals rosy-crimson, the latter horizontally reflexed. *10s. 6d.*
- STARTLER—Tube and reflexed sepals of a deep crimson colour; large, double, broadly-expanded corolla of a rich purple colour, striped and flaked with rosy-crimson; very effective. *10s. 6d.*
- TULIP—Crimson tube and sepals, the latter completely reflexed; very large and much expanded Tulip-shaped corolla of a rich purple colour; a remarkably fine flower of good substance. *10s. 6d.*

The Principal Parks, &c.,  
IN EUROPE.

"Melbourne, October 29, 1880.  
"Sir,—By direction of the Commissioners for the Melbourne International Exhibition I have to request that you will be so good as to convey their best thanks to Messrs. Sutton & Sons, of Reading, for their valuable Lawn Grass Seeds planted in the grounds of the Exhibition during the late winter. The seeds have germinated freely, and the lawns are now in splendid condition. Messrs. Sutton & Sons may accept my assurance that the introduction of their Lawn Grass Seeds into this country has been attended with very great success.—I have the honour to be, Sir, your most obedient servant,  
(Signed) "GEORGE C. LEVEY, Secretary.  
To the CHIEF CLERK, Melbourne International Exhibition Offices, London.

- PRICES.—  
SUTTONS' MIXTURE FOR LAWNS and CROQUET GROUNDS, 3s. 3d. per gallon; 25s. per bush.  
SUTTONS' MIXTURE FOR LAWN TENNIS GROUNDS and BOWLING GREENS, 3s. per gallon; 22s. 6d. per bushel.  
SUTTONS' MIXTURE FOR CRICKET GROUNDS, 2s. 9d. per gallon; 20s. per bushel.

HOW TO MAKE and IMPROVE LAWNS, see Suttons' Pamphlet, New and Enlarged Edition, gratis and post-free on application.

## TRAVELS OF PLANTS.

SO far as the plant world is concerned man inherited a defective world, which in many regions was a desert ill provided with useful plants. The indigenous fruits of Australia were small, and its earliest population fed on Fern and other roots. The fruits of Europe before the period of the Romans were inferior Apples, Pears, Plums, and Raspberries, with Blackberries, Beech-mast, and Hazel-nuts. The ancient Britons must have fared much like the people of Arcadia—

"Acorn-meals chieft called they from the sheds  
Of forest Oaks; and in their wintry month  
The wild wood-wortle with its purple fruit  
Fed them, larger then, and more amply poured.  
And many a boon beside, now long extinct,  
The fresh formed earth her hapless offspring dealt."

The existing vegetation of Europe appears to have been derived from the North by means of natural migration, or the scattering of seeds each year further afield. Wide gaps may now divide the sites of the original vegetation. There is an Oak (*Quercus cerris*), growing generally in Asia Minor, which is found in Europe only in a few widely separated stations, such as the Apennines, parts of Sicily, and on the banks of the Loire. The Pinus excelsa is another tree without a link between its stations, which are now as wide apart as the Himalayas and the mountains of Roumelia.

The continuity of the ancient forests has been destroyed by changes in the surface. There is a shallow sea now between the forests of Scotland and those of Norway, and between the Oak and Beech woods of Denmark and those of our shores; and the sunken forests round our coast, especially on the coast of Norfolk, are the remains of the chain of vegetation which at one time stretched between England and the Continent. At the dawn of the present stage of creation Northern Europe appears to have been denuded of its vegetation by glaciers. Earlier floras had been already buried beneath many and many a layer; a more recent one was now destroyed or driven into alpine heights.

In consequence of such catastrophes as that of the Ice Period Europe became bare of plants at a time when Asia was a garden, and accordingly we may believe that long before the dawn of history plants were moving westward and southward to occupy Europe, just as population did at a later period. The origin of the most useful plants is legendary, as might have been expected. The Vine, a migratory twiner—which has run round the globe, climbed high in man's affections, and made surprising inroads on his pocket—has several disputed birthplaces. According to the legends, Africa owed it to Osiris, and Europe to Bacchus. The Jews claimed it for the slopes of Hebron. Its real birthplace was, perhaps, that same Persian paradise which produced the Fig, Peach, and Apricot. The Orange, which was unknown to the ancients, was not the "golden fruit" planted by the poets in the garden of the Hesperides, but a Chinese fruit, introduced into the West by the Arabians.

The "golden fruit" referred to is believed to have been the Citron.

These are a few of the most essential or interesting plants which several of the leading nations possessed in a period too dim to admit of its obscurity being penetrated. Barley has been traced to Tartary, and Wheat to the banks of the Indus; and here the learned have lost sight of these important cereals, and have taken up their pens for discussion with such rage as detectives feel when baffled. The Greeks were by no means incurious about plants, and in hunting down the Olive to its original site they came to the conclusion that it must have been created by Minerva and brought to Greece by Hercules. But for the destruction of the Alexandrian Library we might know more of the origin of useful plants: we must be content to utilise such knowledge as we do possess. The Crocus first sprung amid the grass on Mount Ida at the instant of an embrace between Juno and her wandering husband, greeting her there unexpectedly. As a very widespread plant it must have afterwards sprung up in many other places—perhaps on similar occasions.

Having lingered rather long in the fields of conjecture let us now push on into those of history. The most useful plants were distributed by colonists and conquerors. Tyre was an emporium from which the Apples which the Romans found in Britain may have been introduced by the Phœnicians, who came to Cornwall for tin, and who carried the Mulberry to the western shores of the Mediterranean, and planted Carthage, a city famed for farming beyond all other places of antiquity.

After the destruction of Tyre by Alexander plants continued to be distributed chiefly by the hands of soldiers. Rice accompanied Alexander from Persia, and followed the Moors to Spain, *en route*, it may be said, for America.

Cotton has a long history, and has travelled far. Alexander the Great observed it in the Punjab previous to its cultivation in Egypt, where Herodotus found linen cloth in universal use; but in the time of Pliny, Egypt, like India, was clad in cotton. This "tree wool," as the astonished Germans named it, found a congenial home afterwards in America, whence it revisits its native country in the form of fabrics from the mills of Lancashire. Rome in her day became the rendezvous of plants, which she collected with great assiduity. Italy had been bare of native fruits; Rome made her rich in subtropical productions suited to her climate, and filled her gardens with nearly all the culinary vegetables which are now in use, including that curious Cabbage, the Cauliflower, which appears to have been developed by successive steps from the cliff Cabbage, in the luxurious island of Cypress. A Cherry tree in full fruit from Pontus entered Rome at the triumph of Lucullus. All the fruits of Persian paradises which had not been already introduced into the basin of the Mediterranean by the Greeks, reached Rome direct from their native places. The fig, it will be remembered, had sheltered the wolf which suckled the founder of the city. It is a fruit which is said to have rendered Bacchus corpulent, and which reached the neighbourhood of Olympus early.

The vegetable acquisitions of the Romans were distributed among her colonies. The Plane reached the tomb of Diomedes in Apulia from "the East," according to Pliny and thence spread over Greece and Italy, arrived in Sicily, and was in Gaul A.D. 79, the people being taxed at that time for planting it. The Cherry was in England within five years of the annexation. The Box, the Peach, the Walnut, the Vine, and the Poplar followed, as did the Pear, Mulberry, Fig, Damson, and Medlar. The Roman generals and governors in England were both anxious and able to surround their handsome villas with the trees and shrubs of Italy. The Bay or

Laurel of the ancients came with other sweet-smelling plants, which the Romans held in great favour. Our common Laurel is a *Cerasus* or Cherry, a native of Trebizond and the shores of the Black Sea, and was introduced from Civita Vecchia A.D. 1614, or about 1600 years later than the nobler shrub. The old English Elm is not a native, like the Wych Elm, and in all probability we owe it to the Romans.

It has been said that Barley was introduced into Germany and Britain by Cæsar; but in that case those countries were far behind their neighbours who possessed Barley as early as the Stone Age. *Bar*, the Saxon name for Barley, is the root of the word beer, a beverage, and here, a coarse kind of Barley grown in Scotland. The hardier kinds of this hardy cereal have reached nearer the poles, and have ascended higher up the sides of mountains than any of the other grain-bearing grasses, succeeding wherever there is a mean temperature of 48° during ninety days of the year. In Lapland, at 66° N. lat., where it cannot be sown until June, it has just sown and time enough for ripening, and none to spare; while in England our two-rowed Barley—the parent of the Barley family—enjoys a career of five or six months from the day of sowing to the day of ripening, and, having acquired a certain habit as to the pace at which it proceeds between seed-time and harvest, it suffers a good deal in hot summers, when hurried by the effects of the unusual warmth.

The Moors succeeded the Romans as carriers of plants westwards, and Spain owes them that very useful Persian forage plant, *Alfa* or *Lucern*. The Olive, which yields the cream and butter of Spain, had arrived previously. At the commencement of the Dark Ages, when the North enchained Southern Europe, plants ceased to travel. Afterwards we hear of Charlemagne's garden on the banks of the Rhine, and a little later the monks became cultivators and the Crusader's brought agricultural information from the East. But the circumstances of the age were against the travels of plants until the close of the Middle Ages and the epoch of Elizabeth. Then the Rose beds which the wars of the rival houses had trampled under foot were replanted. As early, however, as 1453, when the Eastern Roman Empire fell, "Dutch bulbs" were first grown in Holland. The *Ranunculus*, *Anemone*, *Tulip*, *Hyacinth*, and *Narcissus*, were all originally oriental, and were first brought from Persia to the west shores of Europe in the bales of Dutch traders. Dutch gardening was afterwards introduced here and Dutch bulbs brightened English parterres at Nonsuch, Hampton Court, Hatfield, and other places. There is a long list of ornamental trees and other plants which arrived here at the commencement of the age of industry after the close of the Middle Ages. Hops at length (A.D. 1523) followed Barley, which in the light and bitter beer of Burton they have now almost superseded. Fulham became famous for its foreign foliage, as it is still, under the auspices of Bishop Grindal. Cecil, Bacon, Gerard the herbalist, and Raleigh, all aided the travels of plants, and the latter, imitating Hercules, brought home some exceedingly useful seeds, or tubers, in his pocket, on returning from his travels. *H. E.*

(To be continued.)

**LACHENALIA NELSONI.**—It will be in the remembrance of many that this new variety received a First-class Certificate from the Royal Horticultural Society two years or so ago; it is now in nice bloom at Chiswick, and is remarkable for the prevailing hue of orange in the flowers; it is at once strikes the eye among other plants, and is a set-off against the gaudy hues of *Tulips*, *Hyacinths*, *Cinerarias*, &c. It is not at all unusual to meet with *Lachenalias* in pots in gardens, showing that gardeners are fully alive to their value as easily cultivated winter and spring flowering plants, and they possess a decorative value that makes them doubly useful.

#### BULBOPHYLLUM MANDIBULARE, n. sp.\*

This is a very curious plant, quite delightful for a real orchidist. For those who prefer that name, it may be called *Sarcopodium*. If we search for affinities it might rank best near to *Bulbophyllum lasianthum* of Lindley, though it has decidedly *Sarcopodium*-like flowers, and such peculiar airs to the column, that thirty years ago one would have regarded it as the type of a glorious new genus. It was discovered in Northern Borneo by Mr. Burbidge, and has now flowered, the specimen at hand being kindly sent by Mr. Harry Veitch.

It has a glaucous bulb, over 2 inches long, much compressed, pear-shaped. The large leaf is cuneate oblong acute, a span high, 3–4 inches broad. The fine slender-stalked raceme surpasses a little the leaf; the bracts are concave, triangular, not quite equalling the ovary. The flowers are a little longer, though not so wide as those of *Lycaste tetragona*. The sepals and petals are brown, washed with light green. Petals more vivid and striped internally with purple lines. There is a white area at the base. The lip is straw-coloured, with purple, and with purple prickles. The column is whitish, purple at the base, and with similar spots above. It is a very curious thing, though nothing in the eyes of lovers of grand beauties. *H. G. Rehb. f.*

#### DENDROBIUM NOBILE (Lindl.) VAR. NOBILIS, n. var.

A grand variety! The sepals and petals of these giant flowers are of the most resplendent purple, and the lip is darker and finer in its mottlings than any I had ever seen before. It came from Sir Trevor Lawrence, who fully appreciates his curiosity, and who kindly states that the bulbs are exactly those of the common *Dendrobium nobile*. What a pity!

Something nearly like it, but much smaller in dimensions, was sent me by Mr. William Lee, of Leatherhead, but I had no indication about the appearance of the bulbs, hence I do not feel quite sure about it. *H. G. Rehb. f.*

[This most lovely *Dendrobium* came originally from Rollisson's, at whose sale it was bought by Mr. James, of Lower Norwood, an ardent and intelligent lover of Orchids. He has with long care and persistence (for the plant was nearly dead when sold), raised a small stock, of which he lately had only one left. The variety leaves all *D. nobile*, even the darkest, far behind. *T. L.*]

#### MADEVALIA SHUTTEWORTHII XANTHOOCORYS, n. var.

A lovely variety of this well-known species, with a nearly yellow odd sepal, finely striped with brown lines. The spots on the side sepals are flat, less numerous, and the whole flower is thinner. I have to thank for this Sir Trevor Lawrence, M.P., Bart., who is always bringing out some curious novelty. *H. G. Rehb. f.*

### THE DATE PALM.

In my garden at Mentone I have planted many Date Palms (*Phoenix dactylifera*) which flourish all along the Genoese Riviera in the more sheltered regions. They are thriving but developing slowly, except in two instances, which throw a light on the peculiarities of the tree. On one terrace there is a row of Palms planted twelve years ago, all healthy, but small. One of these Palms is an exception to the rule. It is six times larger than the others—2 metres

\* *Bulbophyllum mandibulare*, n. sp.—Pseudobulbo compresso pyriformi plano; folio cuneato oblongo acuto spithameo; racemo folium subæquante gracili paucifloro, candidifloro; bracteis concavis ovatis acutis ovatum pedicellatum non omnino sequantibus; foribus magnis illis *Lycastis* tetragonæ æquilongis, micuis albis, carosulis; mento obtuso; sepalis ligulatis acutis dorso carinatis; tepalis subæqualibus acutis brevioribus levibus; labello carnosio cordato triangulo medio late impresso sulcato; extrorsum utriusque hispido mucronato muculis brevibus; columnæ prope brachium magis arduibus ligulatis curvatis superne mucronatis.—In Borneo insula detex. cl. Burbidge. Col. cl. Veitch. *H. G. Rehb. f.*

25 centimetres (7 feet) in circumference, whilst the rest, planted at the same time, are only 75 centimetres r foot from the ground. It is quite a tree, and bears yearly fruit that ripens, some of the other Palms being male plants and flowering at the same time. I was long unable to explain why this one Palm should have developed in so rapid and extraordinary a manner as compared with its compeers, but one fine day the mystery was solved. Twelve feet below the terrace on which the Palm grows, on the other side of a thick masonry wall, is a conservatory in which there is a water-tank. On cleaning it out a mass of Palm roots were found at the bottom. They had descended to the bottom of the terrace, passed underneath the masonry wall, and had reached the water. Thus the axiom of the Arabs was literally accomplished—for a Palm to flourish, its roots must be in the water and its head in the flames.

In another part of the garden the same lesson is taught in another manner. One of my neighbours had a right of way through my property, and the water passed over a terrace which had been carefully trenched to the rock to a depth of about 5 feet. On this terrace are planted various Palms, and the water passed once a week during the summer in the immediate vicinity of a *Livistona australis*, a *Chamærops australis*, a *Latania borbonica*, and a *Cycas revoluta*. The recently trenched ground let the water soak in like a sponge, and the four plants named have grown so rapidly that they are now five times the size of all the others in the terrace. My neighbour came to me a year or two ago, and with tears in his eyes begged my plants of drinking up half his water on its weekly passage. In the face of their preposterously rapid growth I could not deny the impachment, so I made him a channel outside the property into which the water was diverted. I thus also got rid of his right of presence on his water days.

The entire mountain district in which my property is situated owes its vegetation to a spring that rises in a neighbouring ravine about as thick as one's arm. In winter, by immemorial prescription, this spring belongs to three mills for crushing Olives. From June 1 until September 15 it is owned in hours each week by the peasant proprietors; each property, or proprietor, has so many hours a-week, which he can, if he wishes, sell independently of the land, or retain, selling the land. This water is valued at 1000 fr. (£40) the hour. I have bought four hours and a-half for 4500 fr. (£180), which enables me to cultivate and water my garden in summer. Without it I should be all but reduced to *Cactaceæ*. We build reservoirs in which to store this water, and what rain-water we can divert or seize hold of. I have a dozen, large and small. These reservoirs we can generally fill in spring with the rain-water, thus preparing for the season of drought. My reservoirs hold about 300 cubic metres of water. My water rights bring in about the same quantity, so that I have in all 600 cubic metres or yards of water wherewith to irrigate during the usual four or five months' drought, viz., from May to October. Thus, we have to husband the water most carefully, and principally succeed with plants that grow naturally in regions where there are long droughts, such as Mexico, Peru, Chili, the Cape of Good Hope, Australia, &c.

To return to the Date Palms. They do not thrive in regions where they cannot reach water by means of their long strong roots, or where they cannot be watered. The largest Palm forest I have ever seen is at Elche, in the province of Murcia, in Spain. It is many miles in circumference, in a moist arid, burnt up spot, but then a small river runs through it; round every tree there is a large saucer or depression, and at intervals throughout the summer the river is turned into these saucers by irrigation canals throughout its entire extent. The trees are grown for profit. They produce ripe edible fruit, which are sold in all the markets of this part of Spain as an important article of food. The Dates, however, are not the saccharine Dates we see and eat in the North as a sweetmeat, but a farinaeous dry Date which grinds into flour, and is consumed as such. I was told in Algiers that they cultivate in the desert oases sixty different kinds of Date. I saw very few Date trees in the vicinity of Algiers and along the coast. They are principally cultivated on the southern side of the Mount Atlas, in the numerous oases that are found in the desert within a short distance from the southern basis of the Atlas range.

The existence of these desert oases is easily accounted for. An immense quantity of rain falls in

Algeria every winter on the Atlas Mountains, the prevalent winds being north-east or north-west, that is, moist sea winds. Immense masses of water thus fall down the southern slopes of the Atlas, mostly calcareous, and reach the sandy desert at their base. Sinking into the sand they form regular rivers underground, running along the base of the mountains from west to east, or east to west, at a variable depth, according to the amount of earth or of granitic sand that covers the calcareous rocks. Every now and then these subterranean streams come near the surface, forming a marsh or "shot," as it is called, or a fertile oasis if a spring rises to the surface, or even if the water can be tapped by wells. It is in these regions that the Date Palm grows and flourishes by tens of thousands, forming the principal food staple. If the roots reach the water all is well, as with my Palms; if not, and water can be got from deep wells, the Arabs accept the necessary labour and water them.

It is a remarkable fact that most of these marshes and oases springs are strongly impregnated with salt, which seems to suit the tree. The native Arabs get accustomed to these salt waters and thrive on them, but it is a great difficulty with Europeans, and is one of the greatest drawbacks the French troops have to encounter in their campaigns in and occupation of the desert oases. The young Date trees can be planted in soil the water of which is so greatly impregnated with salt as to be undrinkable even by the natives, and that without suffering in the least. They can, it is said, flourish in water containing as much salt as a drachm to a pint. These deep waters are easily reached by artesian wells, which the French are introducing all over the region of the oases at the base of the Mount Atlas range or within moderate proximity.

No other fruit tree thrives, nor do vegetables thrive, in these saline soils, and the vaunted fertility of the oases, except in the case of the Date Palm, is a fable; moreover, in Southern regions, singularly enough, deep shade, such as that given by groves of Palm trees, all but destroys vegetation underneath. Light does not seem to penetrate under shade as in the North, deep shade all but killing ground vegetation; I see this exemplified in my garden. To give partial shade to a patch of artificial grass on a terrace I formed a canopy with a very vigorous *Buddleia madagascariensis*.

I have been obliged to thin it out, for the grass would not grow underneath as it would have done in England. This fact is general, I believe, in the South of France and in all countries where the sun is ardent and the air dry. Light is broken and more diffused in northern regions with a cloudy sky.

Date Palms seem to thrive best in sandy, granitic, schistic soils, but in the proximity of calcareous rocks or disintegrated calcareous soils, at least it has so seemed to me. The sands of the oases of Sahara lie on calcareous rocks, and are watered by rain falling on calcareous mountains. At Bordighera, on the Riviera coast, where these Palms grow in great luxuriance, the soil is principally sand, brought down by the Roya river from granitic mountains, but this sand lies on calcareous rock. In my garden the soil is entirely calcareous, but with plenty of water, as I have said, Palms grow rapidly. The deduction from the above facts is that lime and salt might be advantageously introduced in the artificial cultivation of the Date Palm, and perhaps of other Palms, and that in their period of summer growth they cannot have too much water.

In conclusion, I would add that I have at home at Weybridge a dozen Palms—*Phoenix dactylifera*, *Phoenix palmetto*, *Chamærops humilis*, and *Livistona australis*—which I imported from Algeria ten years ago, and which have ever since then passed the four summer months in the garden, plunged in the soil. They are planted in the long cylindrical pots I introduced some years ago (30 inches deep), now known as Palm-pots. They are at present fine large plants, and pass the winter in an unused washhouse through which passes a brick flue from a stove. The temperature has generally been between 40° and 50° Fahr. In summer we water them freely, and they are very ornamental in my garden. I put them out June 1, and take them in October 1. My gardener generally gets the prize for Palms when he exhibits in the local flower shows in competition with regularly stoved Palms, and my example proves that the hardy Palms might be much more utilised out-of-doors in summer than they usually are. The position of my Weybridge garden is by no means exceptional. We

are very liable to late frosts in spring and to early frosts in winter. But a few degrees of frost does not inconvenience the Date Palm in the least. He has to bear it wherever he grows. According to Canon Tristram (*The Sahara*) hoar frosts are frequently seen at sunrise in the oases of the desert during the winter. *Henry Bennet, M.D., Mentone, March 7.*

## COOMBE BANK, SEVENOAKS.

THIS charming country seat, the residence of V. Spottiswoode, Esq., President of the Royal Society, is situated about half way between Westerham and Sevenoaks, Kent, in a district which for picturesqueness is not surpassed in the whole county. There are five entrances to the estate, all of which intersect the grounds at different parts where the park scenery is most beautiful, but the drive from Sevenoaks is the principal one and brings the visitor to the east or carriage front, from which there is a magnificent prospect. The mansion stands on a commanding site and is a substantial oblong block in the Elizabethan style with four towers projecting slightly from two sides of the building. Early Roses and other flowering and ornamental creepers are successfully grown upon the walls. The house and grounds are lighted with the electric light, which has a grand effect, especially in the vicinity of the lake on the north side of the mansion and upon the south side upon the margin of a steep slope clad with various kinds of trees and underwood overlooking the Warren Park, a sweeping valley surrounded by wooded elevations of considerable height. At night the beauty of the scene is very great, but only those who have been through the grounds and understand their formation can form any idea of the rich diversities which they present of rocks and rugged slopes, of fine trees, of masses of low evergreens, of velvet lawns, of valleys fertile and verdant, watered by the river Darent, which flows along the Westerham valley and through the south side of the park. Within the mansion the electric wires appear to the naked eye no larger than threads. They are run round the principal rooms under the ceiling, and the little Swan lamps are suspended from them by other wires of the same thickness about 2 feet in length. The lamps can, of course, be increased or diminished at pleasure. The small wires are also conveyed to the chandeliers and the lamps fixed to them in any numbers that may be desired. Outside the mansion a large electric lamp is fixed to each corner of the building, the whole arrangement giving the most complete satisfaction.

The terrace walk upon the south side is over a quarter of a mile in length, having fine rows of Beech upon either side, and the slope facing the park thickly planted with evergreens, among which there is a splendid row of evergreen Oaks peeping above them. The villages of Chipstead and Ide Hill are noticeable objects from here, and the north park is rendered interesting by its view of Knockholt Beeches and the rising hills beyond. There are two noble Cedars at the north-west corner of the mansion. The west front is strikingly attractive, being bounded with fine trees, including handsome specimens of English Yews upon the south, which convey the eye westward to Brasted church—a conspicuous object from the steps of this side of the mansion. The spire of Sunridge church towering above the adjacent woods is also visible from the south-east corner. A large Cedar of Lebanon at the west end of the terrace is said to be the largest in England, and is surrounded by a distant ring of large Beeches beautifully feathered to the ground.

Upon the south-west side of the terrace are the sandstone rocks, one of the greatest attractions of the place. These caves, which are scooped out of the greensand rock, are said to have been a hiding place for smugglers in days gone by, but whether this be so or not certain it is that they are none the less interesting to the visitor. Hardy Ferns and other suitable plants are grouped in front of the caves, and there are also one or two mineral springs oozing from the rocks, which is a further attraction. The gardens are upon the east side of the house, and the woodland walks are very prettily laid out, and bordered in many cases with St. John's Wort. Perhaps the most charming spot is that in front of the Fern and Camellia house, where there are several beds of a rustic character, and the Warren Park, previously alluded to, sweeping away to the river Darent. There are fine specimens

of Ferns and Camellias in the fernery, comprising *Cibotium regale*, *Dicksonia antarctica* and *squarrosa*, and *Alsophila excelsa*. The plants are well grown specimens of their respective kinds. Before reaching the walled-in garden I noticed a good orchard of healthy young fruit trees, which bear good crops of fruit.

The kitchen garden, a rhomboid or square slightly squeezed out of shape, is in three divisions, enclosed within brick walls. The walls of the first division are stocked with an assortment of choice hardy fruits, and the second division is arranged in the same way, except the south wall, which is covered in with glass. A new range for growing a succession of Peaches, Strawberries, and other fruits, as well as plants for various purposes, either for the flower-garden or for producing cut flowers, of which large quantities are required at all seasons. The south wall of the third division is covered with two ranges of vinerias and a plant-house. The show-house is gay with splendidly grown specimens of Azaleas, and several fine Orchids, including *Dendrobium Wardianum*, *Statiea profusa*, and flowering *Begonias* in variety. The Vines are worthy of the fine houses in which they are grown and of the grower, upon whom their condition reflects the utmost credit. They are fruitful and vigorous, and promise to bear heavy crops as they annually do.

There is a range of small forcing-houses in four divisions, well appointed in every respect, in which Cucumbers, Melons, Strawberries, and plants are forced with success—early Strawberries being a grand crop. Flowering plants of Azaleas, Hyacinths, *Deutzias*, *Eriostemons*, *Kennedya*, &c., are kept in a cool-house, and specimen stove and greenhouse plants are grown in several other structures of the usual type, such as *Allamandas*, *Clerodendrons*, *Stephanotis floribunda*, *Panacratium caribæum*, *Fraxineas*, *Ixoras*, *Dipladenias*, *Anthuriums*, and many others. Mr. Bolton is a successful plant and fruit exhibitor, and an enthusiast as well. Every department of the garden is in high cultural order, giving evidence of a liberal employer and discreet management upon the part of those who are responsible for results.

Reporter.

## NOTES FROM DUBLIN.

GLASNEVIN.—Few gardens can compare favourably with this: the advantages of its natural formation, with its gently undulating surface, its river alongside and its great wealth of fine old trees, renders it at all seasons an interesting and beautiful place; its natural advantages are also much aided by the care and skill which Mr. Moore bestows on it: everything is neat and tidy, the subjects well arranged and properly labelled with the best obtrusive label. In the houses the different varieties of *Hakea*, *Grevillea* and *Banksia* are so very beautiful and attractive as to cause one to regret the decline of these always lovely plants in public estimation—several fine specimens, particularly of *Hakea Victoria* and *Banksia speciosa* with its singular bottle-brush-like formations scattered among the branches, being quite studies, an immense plant of that most beautiful of all weeping plants, *Grevillea Mangliesii* being equally lovely. The next great feature in the great tropical houses are *Brownea grandiceps* (20 feet), covered with bloom; and an equally large specimen of *Brownea ariza*, more beautiful still, and bearing innumerable large heads of orange-scarlet flowers. It is pleasant to note that here the Bromeliaceous plants are being worked up; even now a large collection is classified, and at some future time an immense and full collection may be expected. The class sadly wants taking up. The immense plants of Palms and Tree Ferns, frequently noted before, are clean and vigorous as usual. The house containing the species of *Rhododendron* and the immense collection of *Ericas* and New Holland plants is a sight to remember. The Filmy Fern-house is at present a wilderness of fresh green seaweed-like foliage. These things are grown quite without heat, as they always must be to keep them good. The numerous collections of Orchids contain many rare plants, all in good condition, and a fair percentage in flower—among an immense bank of them arranged with pretty foliage plants we may enumerate a few of the more striking:—*Cymbidium Lowianum*, *Cypripedium Dayanum*, *C. Veitchii*, *C. Hookeræ*, *C. Argus*, *C. Lawrenceanum*, *Uropidium Lindeni*, *Lycaste fulvescens*, *L. Skinneri*, *L. Lawrenceana*, *L. cruenta* and *Vandas*, many, including *Vanda gigantea*; *Cattleya*

*Triana*, *Dendrochilum glumaceum*, *D. filiforme*, *Dendrobium Wardianum*, *D. leucoleum*, *Phalenopsis Schillerianum* (a fine variety), *Oncidium leucochilum*, *Angræcum eburneum*, and many more. The *Sarracenia*, *Nepenthes*, *Droseras*, *Disas*, are fine as ever, and the immense plant of *Darlingtonia* bears pitchers over 2 feet in height. The whole of the garden is interesting, and when viewed as I saw it under a bright sun and with a healthy breeze it is a treat indeed.

TRINITY COLLEGE BOTANIC GARDENS.—The whole of the outdoor part of these gardens is devoted to hardy herbaceous, alpine and bulbous plants and shrubs, and nothing could exceed their beauty at this season. Here for the first time in my life did I fully realise the meaning of a permanent hardy plant garden. No other class of plants could possibly give such brilliant flushes of colour in the present, nor promise a greater display for the future than these. Let us note a few of the objects which form the most telling points. Here and there great patches of *Anemones* many feet across, bright and clean, gracefully nodding their heads in the gentle breeze, the most brilliant and precocious of them being *A. fulgens*, which here bears flowers often 4 inches across, and of an intense glowing scarlet unknown in any other flower. Then great patches of all the varieties of *Aubrietias* placed side by side for comparison, for Mr. Burbidge, although a true artist in the arrangement of his plants never loses sight of the botanical requirements of the place.

Frequently on rock and in border we come across great patches of the varieties of *Saxifraga oppositifolia* generally planted together, the light and dark rose varieties being prettily intermingled with the pure white one, each clump bearing thousands of flowers. These masses while growing in a natural manner beat any outrageous carpet bed for neatness, and their untrained beauty even when not in flower far exceeds anything that the toilsome labour of the shearing gardener can produce. *Orobis verna* is lovely here, and *Rhododendrons præcox* and *barbatum* very showy, particularly in the distance when the eye has to range over huge masses of *Aralias* white as snow, various coloured *Crocuses*, and large patches of the different *Scillas*. *Anemone apennina* is pretty everywhere, but it appears to greatest advantage growing naturally on the turf. This arrangement of plants is much studied here and its effect is exceedingly good, everywhere in the grassy glades a few artistically placed flowers greatly enhance the beauty of the scene.

But amid the maze of beauties one gets lost; let us therefore only just notice the wonderful collection of *Narcissi*. All the sorts in cultivation are here, and many of them by the thousand. *Daffodils* everywhere—in the grass, in the wild garden, and properly classified, in the trim, but to me melancholy-looking botanical ground. The *Ilellobores* are also here represented by a full collection. They are now in great beauty, and are in themselves well worth going to see. I thought I knew *Ilelloborus fetidus*, but when I saw it with over 400 flowers I doubted it. The *Hollies* and weird-looking *Arbutus* are wonderful, many of the specimens being 30 feet high, and nearly as much across, fresh and shining. We must not omit to notice the edgings of the borders and the cappings of the walls, which are being made very neat by using up spare stonework to form seats and low rock for the reception of suitable close-growing plants. In this way the only really pretty edging I have ever seen is produced, and in several places the irregular, verdure-clad tops of the walls altogether changes and extends the scene, forcibly reminding me that Mr. Burbidge, the designer, is an artist as well as a plantsman.

Hastening by the rockery and pond let us notice a few of the good things under glass here; in spite of the old-fashioned and often inconvenient construction of the houses, everything seems flourishing and going on instead of back. Among the Orchids at present here are in bloom or bud a fine plant of the true old *Cattleya Warscewiczii* delicata, *Cattleya labiata*, several fine plants; *Dendrochilum glumaceum* and *D. filiforme*, every one's pet; *Cypripedium Dominianum*, *C. Boxalli*, *C. villosum*, *C. javanicum*, *C. niveum*, *C. Harrisianum*, *C. pardinum*, several *Lycaste Skinneri*, *Cymbidium Lowianum*, *Odontoglossum* and *Masdevallias*, some fine varieties of *Ceoloyne cristata*, *Angræcum eburneum*, several *Dendrobis*, the most noticeable of which was a grand variety of *D. primuminum giganteum*. Here also in the warmer house we find the rare *Phalenopsis*

*violacea* and an immense plant of the old form of *Phalenopsis grandiflora*, with leaves over a foot in length, and large many-branched spikes. As a single specimen this now rare variety is far superior to those of recent importation; it grows three times the size of the other, and is easily distinguished by its long unequally lobed pointed leaves.

In the greenhouses, among a number of wonderful things we find fine plants of the rare *Xanthorrhiza hastilis* and *quadrangularis*. The warm houses are skilfully arranged with Pitcher-plants, Ferns, Palms, and other fine-foliage plants, the edges of many of the stages having *Panicum*, *Tradescantia*, *Fittonias*, and mosses creeping over them, while the walls are mostly covered naturally with Maidenhair, which greatly improves the appearance of the houses, and helps to keep a healthy moisture in them. The filmy Ferns here are grand—as in most places in Ireland—and the *Droseras* and *Disas* equally good. Altogether Mr. Burbidge must be complimented on the success which has attended his efforts to produce lovely hardy flowers, effectively arranged without their botanical interest or use being in the least interfered with, and finely-grown plants in houses of that comfortable temperature which makes a visit to them so pleasant.

MOUNT MERRION.—Always fresh and fair with great beauty of its own, and a grand panorama of beautiful views of sea, mountains, and city, is now in fine order. I found Mr. Welch with his children, the Orchids, and very pleasantly they seemed to be looking at him too. The whole collection is in fine condition, some few things being extraordinarily fine—one plant of *Leelia superbiens* with a spike to feet long, bearing thirteen large flowers, being worth a long journey to see. *Cypripedium villosum aureum* is also very distinct, and quite the best variety of *C. villosum*; *C. Boxalli*, a grand variety, with five black-spotted dorsal sepal. *Mesopidinium sanguineum* is here represented by a splendid variety, which makes it a very desirable plant. The air of Dublin seems to be very beneficial to Orchids; wherever you see them they are healthy and without disease.

MOUNT ANNVILLE.—Here the principal features are the wonderful natural fernery, rockery, and cascade under glass (in this place any lover of Ferns could spend a whole day), the Orchids, and the immense collection of fine-foliage plants and Ferns. In the extensive houses here it would not be difficult to pick out enough large specimens to furnish forth the whole display at a large flower show; how such an immense collection gets the care and attention it most certainly must have with an ordinary garden staff is beyond my comprehension. The only thing that will account for it is that Mr. Fisher must be a clever organiser of the labour at his command. Among a general collection of well grown Orchids a good feature is a houseful of fine plants of *Vandas*, most of them in flower—their beauty most surely pointing to the fact that their star will again be in the ascendant shortly. The conservatory is the gayest I have ever seen at this season, flowers being exhibited as thickly as possible in cleverly arranged groups among Ferns and fine foliage plants. *James O'Brien*.

SPRING FLOWERING DECIDUOUS TREES.—Of all the useful subjects that are either in flower or coming into bloom just now, two stand out distinctly as having conspicuous merits. These are the Cherry Plum, known as the *Pyrus myrobalana*, and the well known Almond. Both are most profuse of bloom this season, and this is their general characteristic. The former is found here and there only, possibly because its fruit is of inferior quality, though useful for tart making and other purposes. At Cliswick and other places, good sized standard trees are in full bloom, a considerable way ahead of other Plums in this respect. The branches are literally sheets of white blossom for their full length. It deserves a prominent place in every shrubbery border, though it is seldom met with. Being of vigorous growth, it should, when planted, be allowed ample space in which to develop itself. The Almond tree is more generally grown, and it is this season most prodigal of its blossoms. Whenever it is to be met with, thick clusters of its pretty pink flowers, that cover the branches from base to tip, give it an appearance most welcome at this season of the year. The colour of the flowers is in marked contrast to the snowy whiteness of the Cherry Plum, but both are extremely attractive.

# Orchid Notes and Gleanings.

**CEOLOGYNE MASSANGEANA.**—The illustration of this fine plant, which accompanies the present number, was taken recently in Mr. B. S. Williams' nursery at Holloway. The colour of the flowers varies under different conditions—the specimen figured and described in the *Orchid Album*, t. 29, having a deeper yellow tint in the flower-segments than others that we have seen, and in which the colour was creamy-yellow, with the lip light brown or ash coloured, with yellow stripes, and edged with white. The plant is a native of Assam, and was named in honour of Mons. D. Massange, of Baillonville, in whose collection it first flowered (see *Gard. Chron.* 1878, x. 684). It is a free-growing plant, of

to those in his own establishment; he is, in consequence, able to select for illustration the finest and most distinct varieties, and those most remarkable for rarity or other characteristics. The technical descriptions by Mr. Moore are in English, Mr. Williams himself supplying the cultural notes. Incidental notes relating to remarkable Orchids, or to noteworthy collections, are also given, which add to the interest of the book. The particular plants illustrated will be catalogued under the head of Plant Portraits.

**DENDROBIUM ON BARE BLOCKS.**—There are some very fine plants of *D. Pierardi* growing in Messrs. Veitch's nursery on this system, and a wonderfully fine plant of *D. nobile* hangs in a pan, from which the roots cannot now derive any sustenance, so that it also may be practically termed a block plant. There is also an immense specimen of *Ceologyne cristata* at present in flower at Messrs. Veitch's, but what is most remarkable in this plant is that one bulb

## COLONIAL NOTES.

**A COCOA-NUT GROVE IN QUEENSLAND.**—On the Pioneer River, exactly opposite to the town of Mackay, is to be seen one of the most remarkable sights in all Australia, the Cocoa-nut groves of Mr. Barnes. It is some sixteen years since Mr. Barnes conceived the idea of growing Cocoa-nuts, and he selected his present homestead with that particular view, and it appears to be eminently suitable for the purpose. The land is a low-lying sandy and vegetable deposit, at one time covered with Mangrove trees, and just about on a level with high spring tide mark. In fact, dams are made in places in order to keep back these tide waters.

Mr. Barnes has a grove of 1200 of these beautiful trees now healthily growing upon 10 acres of land. The oldest planted are perhaps some 20 feet in height, but the majority are not yet up to that. The age at which these trees commence to bear fruit varies much, some beginning at four years old, and some not for some eight years later. When once they commence fruiting they continue without intermission—that is, a flower-stem shoots out from the base of every leaf as it is formed, so that fruit in all stages, from the flower to ripeness, will be upon the one tree at the same time. The fruit of the Cocoa-nut improves with the age of the tree, and these at Mackay are not yet up to their best, therefore Mr. Barnes has not as yet troubled about looking for an export market. The Kanakas on the various plantations buy a large number, so that it pays the proprietor better to sell, say, one-half the produce at a retail price, and let the other half waste, than to hunt for a distant wholesale buyer. For the same reason he has not commenced to dry the fruit, or express the oil, or utilise the fibre. Thus any selector thinking to go in for Cocoa-nut growing will see that it is entirely owing to the circumstance of Mr. Barnes being so close to a large town that the industry has been made to pay.

In these gardens there are many other trees as well, the most noticeable being Date Palms, of which there are 300 planted. These grow quite as well as the Cocoa-nuts, and are equally handsome. Between 300 and 400 Orange trees also are planted out, most of which are in full bearing; some of these were evidently suffering from dryness or poverty of the soil, and a great many were injured from having been planted too near the Date trees, which rival the Bamboo in the way in which their roots ramify and rob the moisture from every neighbouring plant or tree. Many Bananas and Pine-apples are grown, and Mr. Barnes adopts the safe plan of frequently changing the ground upon which he grows these, and also plants them wide distances apart. Melons in great quantities are also grown, and are ripe in early September. As this is a full month sooner than they appear in the Brisbane market, doubtless a trade will some day be carried on in the way of the North exporting them to the South. *Queenslander.*

**ADELAIDE, January 19.**—We have to contend with a very dry summer. Since the beginning of October only about 1 inch of rain has fallen. Yesterday (January 18) the heat rose to 112° in the shade, and 180° in the sun. The latter is the highest without exception hitherto recorded, and exceeded anything yet experienced. During the previous winter, in August, the thermometer registered between 2° and 3° below freezing point, which sufficed to kill or injure many of our tropical plants out-of-doors. The garden is now suffering much, and the effects of the heat, especially on European forest trees, alpine and other tender plants, is disheartening. The leaves of the Poplars, Ash, Willows, &c., are burnt as if a fire had run over them. *R. Schomburgk, Botanic Garden, Adelaide.*

## FRUIT NOTES.

**Apple Sturmer Pippin.**—Now, when dessert fruits are scarce, I find this Apple most acceptable at the table, for it is a great favourite with every one who tastes it. The Ribston Pippin is its parent, so that one is not surprised at its excellent flavour. There are two great mistakes often made respecting it—first, the fruit should never be gathered till the middle or end of October, and it ought to be stored away in a very cool and somewhat damp place, where it will keep fresh and plump till May, or even June. The tree is hardy, and a good bearer. *F. Rust, Eridge Castle.*

FIG. 54.—DENDROBIUM FORMOSUM GIGANTEUM.

easy cultivation, requiring plenty of light, shading from the burning sun, and plenty of moisture, especially in the growing season.

**PHAIUS GRANDIFOLIUS.**—I saw a fine specimen of this lovely old Orchid in bloom the other day at Nonsuch Park, Cheam. It had five spikes produced from one bulb, the tallest measuring about 5 feet, and the others nearly so. Standing as it did on a centre stage reaching the roof, it looked grand indeed. *G. A.*

**THE "ORCHID ALBUM."**—We have several numbers of Mr. B. S. Williams' *Orchid Album* now before us. The illustrations are noteworthy, not only for their faithfulness, but from the care which has been taken to select fine varieties, such as Mr. Williams' variety of *Lælia purpurata*, Mr. Day's *Phalenopsis amabilis*, *Cattleya guttata* Leopoldi, *Dendrobium Ainsworthii* roseum, *Lælia xanthina*, *Cattleya velutina*, and many others. Mr. Williams has access to many of the finest collections in the country in addition

has thrown up two fine spikes. It has this occurred before?

**DENDROBIUM FORMOSUM GIGANTEUM.**—Orchid growers who have once seen this fine variety are sure to wish to add it to their collections. It is a variety of *D. formosum*, and like it, has pendulous spindle-shaped pseudobulbs, with racemes of very large white flowers, with the lip blotched with orange-yellow. The plant flowers in early summer, and lasts several weeks in flower, having, in addition to its beauty, the additional charm of sweet fragrance. The plant is a native of the eastern Himalayas.

**CATTELYA TRIANE VARS.**—Amongst numerous fine forms of *Cattleya Triane* in the Messrs. Veitch's nursery, *C. Triane formosa* may be described as the finest. The sepals and petals are pure white, with just the faintest suffusion of pink. The centre of the lip is yellow, the margin broad and well defined, of a pale lilacy-purple colour.

## Florists' Flowers.

**NEW ABUTILONS.**—The group of new varieties from Mr. J. George, which was exhibited at the meeting of the Royal Horticultural Society on Tuesday last, marks a decided advance in point of colour. The hue of fiery orange, which has been deepening towards red of late, has now assumed that colour in the later productions; and the Floral Committee wisely ratified the advance by giving to the best of the reds—*La Grande*—a First-class Certificate of Merit. This has very large and well-formed flowers of a decided pale-red tint, is good in habit and bloom, and remarkably free. Whether this result came from starving the plant or not remains to be seen, but it was a great point in its favour. It did appear as vigorous as any of the others, but it was characterised by a more marked freedom of bloom. The deepest coloured red was *Dazzle*, of a very bright dark red, the flowers of fine form; *Lustrous*, bright red, the flowers of good globular shape; and *Splendour*, bright red, also of good shape. These red-flowered varieties are scarcely distinct enough to be included in one batch, though they do differ in small degrees in shape and colour. *Criterion*, maroon-red, deep in colour, is quite distinct and good, but inferior to *Emperor*, which is in the same way, but deeper in colour, and very large and striking. *Cloth of Gold*, also awarded a First-class Certificate of Merit, is the best yellow yet seen, the colour clear pale gold, and the flowers of fine form. The colour appears at its best and in its most striking aspect when the flowers are sufficiently raised to admit of the eye fastening on the interior of the blossoms. *Orange Gem* is of a decided orange-red hue, but with the blossoms expanding too much to give them a symmetrical appearance. Of pink shades, *Enchantress*, pale rose-pink, is very attractive in colour; and *Mrs. Garfield*, silvery-pink, has very large expanding flowers, not unlike the shape taken by some of the *Fuchsias* with large mauve corollas. The *Bride* has pretty bluish-pink flowers, of a very pleasing character.

It is as summer bedding and as autumn and winter flowering plants for a warm greenhouse, that the *Abutilon* is most useful. Young plants grown on during the summer months answer best for the latter purpose. They want to be on a raised stage, near the glass, in a warm and slightly moist house. This is how Mr. Barron treats his plants at Chiswick, and with so much success. Mr. George appears to have hit upon a compact-growing section of *Abutilons*, and quite miniature plants bore several flowers. Whether this strain will prove useful or not remains to be seen, but a compact habit of growth is not always an improvement, unless the plants are required to fulfil some special purpose.

**CYCLAMENS.**—Never before perhaps has such a fine batch of *Cyclamen persicum* been submitted to public view as that Mr. Henry Little staged at the Royal Horticultural Society's meeting on the 14th inst. There were about 200 plants, generally of large size, finely grown, splendidly flowered, and with scarcely an inferior form among them. They were all selected seedling plants, blooming the second year, and not only was there a decided preponderance of crimson and purple shades, but the blossoms of these were very fine, indeed they rivalled in size and symmetry the finest of the large-flowered section. No doubt it is comparatively easy—given the necessary skill and knowledge of the plant to grow them in a satisfactory manner—to bloom a batch of seedling plants, but the skill of the cultivator is brought into play when the bulbs or corms have to break into growth for the second year's flowering. It is then that great care is required, and success is to a large extent a matter of care and attention. Mr. Little's plants had all the vigour of seedlings combined with the highest quality of flower. *Crimson Gem*, awarded a First-class Certificate of Merit, has very large and handsome clear crimson flowers, of great size and fine form. This bids fair to make a rare parent for crossing and seedling purposes. *White Gem* is unquestionably the finest white yet raised; the flowers of great size and of singular purity, as well as being very symmetrical. This also was awarded a First-class Certificate of Merit. *Rose Queen*, like the two foregoing, belongs

to the large-flowered section, but obtained a Second-class Certificate only—an award which is of very questionable value. The flowers are of a pretty pale rose colour, and they are produced with great freedom. A variety named *Striata* is of a very novel character, the flowers having a pale rosy-lilac ground distinctly striped with white. This variety may, perhaps, be made the progenitor of a distinctly striped section, but it will need to be isolated, the *Cyclamen* being so prolific of pollen that a slight shaking will distribute it. It is of a versatile character in consequence; and though a variety may be carefully fertilised with its own pollen, it will in many instances produce a varied progeny. The *Cyclamen* is being improved with such great rapidity that it is hazardous to predict its future, or limit the extent of its improvement.

**CINERARIAS AT REDLEES.**—Mr. James' superb strain of *Cinerarias* at Isleworth is now making a brave show, and tells far more forcibly than words can how truly strains can differ. At one time a private grower writes in ecstatic language of the grand lot of flowers he has from seed, and then another writes deploring the loose-petalled starchy flowers which it is his misfortune to possess, and protests that only named flowers are worth growing. Now the remarkable feature of the *Redlees* flowers is the very fine quality seen throughout; there is not a thin flower amongst them, but in every case the petals are stout and broad, overlapping each other, and with that singular regularity which marks now any first-class strain. A box of gathered blooms all showing this notable peculiarity naturally leads to the suspicion that they have been specially dressed for the occasion. A single glance at the fine heads of bloom in the houses at *Redlees* will suffice to show that, so far from being an artificially produced feature, it is but the product of good culture applied to a fine strain. In all directions we see flowers that are absolutely perfection in form and in colour showing some novel and most brilliant hues. Sells largely predominate, the most striking perhaps being a rich mazarine-blue, with a red tinge at the base of each petal—really a grand truss of bloom. Other striking hues allied to superb quality are crimson-maroon, crimson-magenta, bright magenta, rosy-cerise, violet-blue, deep purple, and many other tints, whilst there are numerous bicolors, of which fine forms are found in *Sarah Winter* and *Master Colvin*, both very large flowered kinds, having broad belts of heavy red hues. None of the plants are now grown as specimens, but all are in 48's, thus giving room for a large variety. If all *Cineraria* strains were as fine as Mr. James' there would be no room for complaint, but probably it is because this one and some few others stand out so markedly in their quality that private growers of inferior strains find cause for dissatisfaction.

**ANEMONES.**—The double form of *Anemone stellata* is a poor thing compared with the broad-petalled and large-flowered single and semi-double forms of fulgens. I have them all here in a lump, and they are doubtless the produce of a batch of seedlings, the variations in form and shade of colour being considerable. Growing here on a warm south border that is fully exposed to the sun now, and in a hot position during the summer, the plants began to throw up bloom early in November, have continued blooming all through the winter, and for the past month have been glorious. A lady who called in the other day exclaimed, "Oh, dear, this reminds me of Nice!" and doubtless it did. But I think position has much to do with this early and abundant bloom, for I have heard complaints from several amateur gardeners, whose roots had been planted in cooler or moister situations, that they could not get bloom, or but very little. Perhaps enough account has not been made of the fact that this *Anemone* is a native of a very warm clime, and strong sunshine is necessary to ripen the roots, and fully mature them for free blooming. I know that last summer mine, in the long spell of heat and drought we then experienced, were nearly roasted, but they have never bloomed so superbly as this season. Exposure to really strong sunshine for several hours, however, has its disadvantages when the blooms are at their best, as it causes them to expand to an extent that is almost ungainly. The richest tints are seen in flowers that are about half open, and always on broad-petalled ones. The more the petals are narrowed and increased the paler the colour. No doubt the diurnal opening and closing of the blooms has much to do with their comparative endurance; but once the blooms are cut the motion ceases,

and the flowers remain expanded. In vases mixed with other white flowers and green foliage the scarlet *Anemone* is singularly attractive; but, praise and extol *Anemone fulgens* as much as you may, literally the queen of the *Anemone* family is found in the beautiful garden varieties of *Anemone coronaria*, for not only are these more enduring, often from established clumps blooming for six months, and even longer, but the deep hues and many varied colours found in a good strain allied to the stout massive petals and good form renders these *Anemones* immensely attractive. I have a scarlet so brilliant that before it fulgens literally pales its ineffectual fires; and blues, purples, reds, whites, and mottled flowers in great variety give in a mass a brilliant display such as may well rival the *Tulip*. Then all the *coronaria* family are hardy and not difficult to please in the matter of culture, though well repaying for extra care and attention. But they are any one's flower to raise from seed and increase enormously. Last spring I saved seed from a few good coloured blooms, and as soon as I had got all that was wanted, and it was thoroughly ripened, I sowed in a broad shallow box in fine sandy soil, and stood the box in a frame, shading somewhat till the seed had fully germinated, which it did in a week or two. In the month of August these seedlings were dibbled out singly into a bed to the number of nearly 2000, and I believe the major portion of them will bloom at once. Next year, given double the room they now have, they will make a mass of bloom that will be really magnificent. No other hardy plant can give such good results in such a short time, for these *Anemones* are not only for to-day, but literally for years hence. I fear we have not made much progress in the production of the single and semi-double forms for forty years, since they were grown to a degree of excellence not since seen. The really double forms of *coronaria*, of which there are many named sorts, are indeed beautiful; literally the colours are gorgeous. I am growing some of these in pots this year for the first time, and hope to get a superb show of flowers presently. If some few enthusiastic florists would but take up the culture, improvement, and exhibition of the *Anemone* they would soon work wonders in helping to beautify our gardens.

A. D.

## PLANT PORTRAITS.

**CANNA IRIDIFLORA EHEMANNI**, *Garden*, January 21.—A noble variety, with groups of pendulous crimson flowers, each 3 inches or more in length.

**CATTLEYA AUREA**, *Garden*, Feb. 4, 1882.—A very beautiful *Cattleya*, nearly allied to *C. Dowiana*, a native of Costa Rica, whilst this is from New Grenada.

**DRACENA FRAGRANS VAR. MASSANGANA**, *Bol's Hort.* 1881, t. xvii.—Leaves elliptical, acute, shortly stalked, shining green, with a yellow centre. MM. Jacob-Makoy, Liège.

**LONICERA ALBERTI**, Regel, *Gartenflora*, t. 1065.—A very pretty dwarf glabrous shrub, with spreading branches and small, nearly sessile, linear oblong, sparingly toothed leaves. Flowers rosy, in pairs, with long slender corolla-tubes and spreading 5-lobed limb nearly an inch across. Native of Eastern Turkistan. It is likely to make an attractive hardy shrub.

**LYCOPodium DICHOtOMUM**, Swarz, *Gartenflora*, t. 1067.—A species with rather thick, fleshy, forking stems; leaves in many rows, linear, spreading. West Indies.

**MAXILLARIA HYACINTHINA**, Kchb. fil, *Gartenflora*, t. 1066.—A native of Caracacs, with sulcate pseudobulbs, ovate-oblong leaves tapering at the base, and spikes of medium-sized white flowers springing from the base, of no special value as an ornamental plant.

**MODIOLA GERANOIODES**, *Garden*, January 28.—A pretty Malvaceous annual, with deeply-cut palmate leaves, with linear toothed segments and rosy-lilac flowers nearly 2 inches across.

**PARNASSIA NUBICOLA**, Wallich, *Bot. Mag.*, t. 6609.—Leaves spatulate, stalked; flowers on long stalks, greenish-white, with the structure of the European Grass of Parnassus. Himalaya. Hort. Kew.

**PITCAIRNIA ALTA**, Hasskarl, *Bot. Mag.*, t. 6606.—A handsome West Indian Bromeliad, with loose tufted strap-shaped recurved leaves, glabrous above, white-veined beneath; flowers elongated, scarlet, in loose panicles. Hort. Bull. It is the *P. ramosa* of Koch, but not of Jacquin. Hort. Kew.

## The Kitchen Garden.

As a consequence of the unusually mild winter—if the term be applicable to the weather which we have experienced during the last three or four months—the supply of Broccoli is good and plentiful—especially good at the present time being Cooling's Matchless, Backhouse's Winter White, and Dilcock's Bride. Following these are Richmond Late White, Frogmore Protecting, Chappell's Cream, Carter's Champion, and Cattell's Eclipse—all sterling varieties. Seeds of Connover's Colossal Asparagus should now be sown in drills 2 inches deep and 12 inches apart, in a border where the soil is of a light, rich, and sandy nature, for transplanting the following year. Sea-kale seeds should also be sown, either in a nursery bed, in drills 2 inches deep and 1 foot between, in patches (about three seeds in each patch, which subsequently should be thinned out to one), 6 inches apart in the row, or else in the situation in which the plants are ultimately to be forced, in rows 2 feet apart and 18 inches in the rows, in light rich soil, from 2 to 3 feet deep. Plantations may also be made from cuttings of the roots, which if cut into lengths of about 4 inches and placed in a box, intermixed with sand, as recommended in our Calendar for October 29, last volume, should be dibbled in from 10 to 12 inches apart and 18 inches between the rows. These thongs, or root cuttings, will furnish plants to be taken up for forcing next November; but if they are intended to be forced in their permanent situation by the aid of pots, dung, and leaves, then the distance should be as recommended above—2 feet between the rows and 18 inches from plant to plant, and the thongs should be set about an inch under the surface of the soil. A sowing of Chervil should now be made in shallow drills; also another breadth of Turnips, Radishes, and All the Year Round Cabbage, and Victoria Cabbage Lettuces; also of the Paris Green Cos, and Paris White Cos varieties. A small sowing of each should be made at short intervals, so as always to have a good supply of young plants wherewith to make frequent plantings in order to maintain a good succession. Make another sowing of Peas every fortnight for the next three or four months of such varieties as Carter's Stratagem, Carter's Telephone, Culverwell's Telegraph and Ne Plus Ultra; also Seville Longpod and Taylor's Broad Windsor Beans; and Spinach in sufficient quantity to meet the demand for the same at the proper time.

**FORCING DEPARTMENT: TOMATO PLANTS.**—These, whether they are growing in pots, or planted out and trained like Melons to a trellis under the roof of the structure which they occupy, will now—especially in the latter case—require frequent attention in the way of pinching out lateral growths and thinning the leaves, as anything like over-crowding of the shoots and leaves would be prejudicial to success in Tomato culture. The application of water to the roots must be guided by the space allotted to the latter, together with the condition of the plants and the weather; and no stimulants should be applied until the plants have set their fruit, when they should be thinned out—leaving, of course, all the best-shaped and most even-sized fruits. When the plants are in flower a drier and more airy atmosphere should be maintained. Plants which are intended to fruit in pots, and to yield a supply of ripe fruit by the middle of May, should now be ready for shifting into 12-inch pots, which should be amply drained by placing a large piece of crock over the hole in the bottom of the pots, then a couple of inches deep of three smaller-sized ones, filling in the chinks on the top with the smallest, and over them a few handfuls of half-rotted leaves. Thus drained there need be no apprehension of the pots getting water-logged, or the plants when established suffering from being over-watered. The plants should be thoroughly watered the evening before being shifted into the larger pots, after which they will not require being watered until the roots have pushed into the new soil; the latter should on this occasion consist of three parts of good loam and lime-rubble (about one-third of the latter

and one of well-rotted manure. A stiff stick, between 5 and 6 feet long, should then be put to each plant, and the latter secured to it; and if the plants are stood together in single rows, on raised stages, in the forcing-houses to fruit, as is the case here, the sticks which are supporting the individual plants should be braced together by tying a few long ones longitudinally to the upright sticks at about 3½ feet from the surface of the pots, which will keep the plants in position when laden with fruit. All lateral growths should be pinched back to within one joint of the main stem, and in other respects treated as recommended in the case of those planted out; and as soon as the pots become filled with roots, and the fruit set, liberal and frequent supplies of liquid manure in a diluted state should be given to the roots. Let the temperature at night range from 55° to 60°, and by day 65° to 70°, running up to 80° with sun.

**POTATOS.**—Successional pits of Potatoes should be earthed up, and with those in a more advanced stage of growth, together with Carrots and Radishes, watered when the soil becomes moderately dry. *H. W. Ward, Longford Castle, Wilts.*

## Peaches and Nectarines.

ALTHOUGH we still have very mild weather, we have had but very little sun during the past few weeks—only now and then having a bright sunny day until the last three days, which have been indeed beautiful. Every advantage should be taken of such favourable conditions by closing early, allowing the temperature to run up, according to the directions given in former Calendars, moistening every available surface in order to induce an early and free growth that will get thoroughly ripened early in the season. Final disbudbing and heeling down in the early and second house should by this time be pretty well finished except on late varieties in the second house, of which it is desirable to have at least one tree in each house, so as not to have too many fruit ripe at once, and to prolong the season of each house. This is very essential, and doubly so where there are only two or three houses. Give good supplies of tepid water at the roots as the trees require it, never allowing them to get at all approaching dryness. Weak manure-water may be given to any weakly trees, or to any that are carrying a heavy crop of fruit. Stop any strong leaders or gross shoots that are taking the lead, in order to get an equal flow of sap. Keep a sharp look-out for red-spider, which usually makes its appearance in bright sunny weather, especially where there is any foliage near the pipes. Wash at once with a little weak Gishurst Compound, or a little soap and water, before they get thoroughly established. The trees in succession-houses (third and fourth) will now require disbudbing, and the most forward shoots may be heeled down. Fly the syringe freely, and fumigate at once, if there are any signs of greenfly, which is almost inevitable where plants such as Strawberries, &c., have been introduced, and a Peach-house is generally a favourite place to bring them on where there are suitable shelves for doing so. Still keep late houses as cool as possible, only just keeping out the frost when the blooms are expanding. *J. Wallis, Keele Gardens.*

## Plants and their Culture.

**STOVE FINE-FOLIAGED PLANTS.**—These are indispensable subjects in every collection of exotic plants; they add greatly to the general effect, the more so when flowers are somewhat scarce. Attend to the young stock now making good growth. Propagate the necessary quantity to keep up the supply required of all kinds that are used for table plants and other decorative purposes in the household. For this purpose select vigorous, clean, and well-coloured growths of Crotons; cuttings of these in themselves large enough for table plants may be struck readily in a brisk heat and close atmosphere. Large-sized cuttings should be steadied with a stick. Of *Dracenas* the tops may be cut off and struck quickly enough; the tap roots of these will also make excellent plants, taking longer of course to develop the character of the respective kinds. The old stems should also be cut in pieces and struck similar to Vine eyes where it

is desired to quickly increase any given kind. Marantas can be readily propagated by division, now being a favourable time for this operation. Do not overlook *M. tubispatha*; being a deciduous kind, it may during its dormant state be forgotten and allowed to become too dry. The *Peperomias* are very effective plants in a stove, thriving well in partial shade; for the outer edges of groups of stove plants they are very distinct. These can also be increased by division during the spring. In many stoves are to be found damp walls; these, in most cases, could be readily covered with *Ficus repens*, thus turning an unsightly object to a good account, growths of this *Ficus* being at all times valuable for decorative purposes. We have the back wall of a low lean-to stove nearly covered with seedling *Adiantums*; these give a good supply of cut fronds of not too vigorous growth.

The blinds that have been taken down during the winter should now be re-fixed. The bright sunshine now to be expected will be trying to some plants, a little shade to which will be beneficial. During the prevalence of a biting easterly wind or a frost they may with advantage be let down at night, saving firing, and aiding in keeping the necessary moisture in the house. Five degrees can often be saved by keeping the blinds down at night. Shut up early during bright sunshine, allowing the thermometer to rise for a few hours to 85° or 90°. Syringe freely, and damp down the walls and paths. The night temperature may be steadily increased.

**FERNS.**—Any of these not yet potted should be seen to at once, increasing the stock of those most in request either by spores or division. All the old and shabby fronds may be safely thinned to give room for the proper development of the younger ones. Where any brown-scale abounds this operation should be done all the more severely. Keep the young rhizomes of *Gleichenias* pegged closely to the soil, turning the points inwards where possible, and top-dress slightly with a little fresh soil. Some kinds can be increased easily if, instead of pegging the rhizomes into the old plant, they are secured firmly on small pots filled with peat and sand. When these are considered to be rooted into the pots sufficiently, they may be divided from the old stool and then kept in the shade for a little time. Young growths of any *Gleichenias* proceeding from the sides or terminal points of the old fronds should be regulated, to ensure their proper development. Look to all deciduous Ferns, such as *Leucostegia immersa*; several of the *Adiantums*, and some *Davallias* will now be pushing up their first fronds quickly. Do not let these Ferns be kept too much shaded by other plants or the stems of the fronds will become too much elongated, and not so well able to support the weight.

**FORCING PLANTS.**—Any of these that are gone out of flower should not be overlooked, Indian *Azaleas* should have their seed pods picked off, and then be induced to make an early growth. *Deutzia gracilis* will flower all the better next year, if, after their flowers are faded, they are kept growing for a time, and gradually hardened off. *Azalea mollis* should be treated likewise. Spiræas past their best should also be protected for awhile. Many plants grown for forcing purposes are frequently injured for another season by being placed on one side and neglected after they are gone out of flower.

**GREENHOUSE.**—*Solanums* that can now be dispensed with should be cut back into the hard wood and started into fresh growth to secure an early set of berries for another autumn. Cuttings that have been struck as previously advised should be potted off and kept pinched for a while; they will make better stuff than seedling plants. Winter flowering Heaths and *Eparis* should be cut down and started into growth again in a little heat to ensure an early set for another season. Tuberous *Begonias* should not be hastened in too much heat, a Peach-house at work seems to suit them very well. Another batch of seeds should be sown of such as *Rhodanthes*, *Stucks* (ten weeks), and *Mignonette* to succeed the earlier stock. Some promising young plants of *Heliotropis* should be potted on for conservatory and indoor work. Of sweet-scented flowers this is an accepted favourite. The kind called *White Lady*, I find, is very floriferous and deliciously scented. Cuttings of *Fuchsias* struck now will give useful plants for the late summer and autumn; keep all the stock now in active growth constantly pinched if stocky plants are valued. *James Hudson, Gunnersbury House, Acton.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Mar. 20	Sale of Lillium auratum Bulbs, at Stevens' Rooms.
WEDNESDAY,	Mar. 22	Spring Show at Clifton, Bristol. Fulwood Horticultural Society's Show. Sale of Standard and Dwarf Roses, at Stevens' Rooms. Sale of Imported Orchids, at Stevens' Rooms.
THURSDAY,	Mar. 23	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.
SATUR. EV.	Mar. 25	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

THE magnificent hybrid Amaryllids lately exhibited by Messrs. VEITCH and others raise some important questions as to what should be considered the typical form for these grand bulbous plants. As to such matters as robust habit, number of flowers and their colour, there is not likely to be any dispute or difference of opinion. Fine foliage, robust habit, free-flowering qualities, substance of petal, variety, richness and distinctness of colouring—these are all points upon which general agreement may be anticipated. Such otherwise grand flowers as Leopoldi are deficient in that only two or three flowers are produced in a truss; on the other hand, many of the Continental forms, though robust and free-flowering, are condemned as not being good enough as to form.

The florist's ideal is a six-parted starlike flower with a relatively short, bold, funnel-shaped tube, and broad even segments, all alike in size and form. Some such form as this, it is obvious, is the one most likely to meet with the approval of florists. The leading principle here is easy to be ascertained—it is that which demands an approximation to geometrical regularity of form, and symmetry and equality as regards proportion. Let it be assumed that this is the principle to be acted on, then it follows it should be acted on in all its details, and stamens upturned at their points and of unequal lengths should be eschewed, and any irregularity of disposition in the matter of colour should be equally condemned.

That is one way of looking at things, but there are other things worth consideration. The form of the flower before it was altered to suit the taste of the florist is something very different. In place of symmetry and geometrical regularity, the flower in a natural state spreads horizontally from its stalk, or is even bent down upon it, and is almost two-lipped. Take the old Amaryllis formosissima, for instance—the flower is abruptly bent downwards upon its stalk; the three uppermost segments form one lip, as it were, placed almost vertically, the three lower ones form a lower lip placed at a different angle. Rich as the colour is of these flowers no florist would accept it as a type to be followed, neither should we do so. But we think the florist would do well to consider the probable meaning of that form. No one can look at that flower now-a-days and observe its position, the form and arrangement of its segments, the manner in which the lower ones are rolled round into a tube at the base, the varying lengths of the stamens, and their direction downwards, without being convinced that this deviation from the geometric arrangement of a six-parted, regular, star-shaped flower, has a distinct purpose, and that purpose the fertilisation of the flower by insect agency. The bright colour of the flower, and the abundance of nectar, lead to the same conclusion.

Again, the fact that the stigma is protruded beyond the anthers, and so bent away from them that access of pollen from the stamens of the same flower is rendered difficult if not impossible—a difficulty intensified by the fact that the anthers are ripe at one time, the stigma at another—renders cross-fertilisation a necessity. It is clear then that the flower is, so to speak, adapted for special purposes. Fundamentally, as we have said, a geometrically regular 3-parted flower, with an outer row of three segments, and an inner row of similar segments alternat-

ing with the outer, three outer and three inner stamens, and so on. All this is no theory, it is a fact, as any one may prove for himself by examining a flower in its earliest conditions. The irregular arrangement, the unequal lengths, the varied disposition of colour, are all later developments—adaptations adapted for the benefit of the plant and its offspring.

The florist is apt to overlook all this, and to lay down an artificial standard of form to suit his particular purpose. To this proceeding on his part there can be no objection raised—he is free to do what he pleases; but as consistency to a guiding principle is, to say the least, under any circumstances, desirable—is, indeed, what he aims at—then we may point out that in reverting, as he attempts to do, to the original geometric plan upon which the flower is founded, he should endeavour to carry out the process consistently, else he is likely to produce a meaningless, expressionless flower, which is unpleasing to the eye even when the spectator fails to see wherein the source of the unpleasant impression lies. To have a perfectly funnel-shaped Amaryllis flower, with the colour regularly disposed, in combination with stamens of unequal lengths and bent downwards, is, to our thinking, altogether false taste, for it is suggestive of something false—of something that no longer exists; it tells of an arrangement of parts and of a state of things no longer of any use—their purpose is gone, their presence in such a shape is an anachronism.

If then an Amaryllis is to be judged according to the ordinary standard of form regulating florists' flowers, let the thing be done thoroughly, completely, and with intelligence, else you produce a sort of mermaid or centaur, a monstrosity half one thing half another—a thing the history and meaning of which are, if not entirely destroyed, at least perverted and distorted. In illustration of our meaning we may allude to *Vallotta purpurea*, in which the flowers are erect, nearly if not quite regular, with the stamens of equal length and regularly disposed. Some such form as this, subject to any modification which the nature of the case demands, is in our judgment the standard of form in an Amaryllis, at least it is a consistent and intelligible one.

—PROLIFEROUS PINE.—Pine growers know the value of gills and suckers in their proper place, but they are not likely to be greatly enamoured of such a specimen as that now figured (fig. 55). Nevertheless, it is interesting as showing the essential identity of the "pips" in the ripe fruit with shoots. For some reason or other, what we know not, the flowers and fruits have not been developed, but in their place an infinitude of shoots or suckers, each one of which would serve to perpetuate the plant, and as each one would in all probability form a "fruiter" under the ordinary treatment, the peculiar appearance of the parent might be condoned. The specimen was sent to us from Arundel Castle Gardens by Mr. WILSON.

—MENTONE.—We are informed that Dr. BENNET's garden at Mentone has been placed at HER MAJESTY'S disposal during her stay on the Riviera. We have on former occasions given illustrations of this remarkable garden on the hillside, facing the sea, where from the hard rocky soil and the full exposure gardening is carried on with difficulties—difficulties, however, which the enthusiasm and physiological knowledge of plants and their requirements possessed by Dr. BENNET enable him to overcome, as is evidenced indeed in the communication from his pen that appears in the present issue. Dr. BENNET's letters on gardening in the Riviera, and on the vegetation of that lovely region, will be remembered by many of our readers, and much of them has been incorporated in his well-known work, *Winter and Spring on the Shores of the Mediterranean*, and to which renewed attention will be attracted in consequence of HER MAJESTY'S visit. We hope shortly to publish further illustrations of Dr. BENNET's garden.

—ACACIA VERTICILLATA.—This species was one of the very first of all the numerous Australian and Tasmanian Acacias to find its way into English gardens. According to PAXTON'S *Botanical Dictionary* it was introduced in 1780. It is a desirable plant for conservatory decoration, has whorls of Gorse-like phyllodia and stalked oblong heads of lemon-yellow flowers. Sir JOSEPH BANKS, in an article "On Inuring Tender Plants to our Climate," in the *Transactions of the Horticultural Society*, instances this as a plant which, if his suggestions were followed, might prove hardy or almost hardy in the country. In the article in question Sir JOSEPH strongly advocates the propagation by means of English-ripened seed of several successive generations of Myrtles, Cherry Laurel, Sweet Bay, and other more or less tender shrubs. In order to point his moral, that a few generations would in all probability mark a decided increase in ability to withstand frost, &c., he mentions that *Zizania aquatica*, the Canada Rice—a grass which of late has begun to attract the attention of paper-makers—after once fairly starting, grew larger and stronger each successive generation until some of the plants were 6 feet high, and the whole pond in which they grew was in every part covered with them as thick as Wheat on a well-managed field.

—THE ROYAL BOTANICAL SOCIETY OF BELGIUM.—The twentieth volume of the *Proceedings* of this Society contains a full list, with localities, of the plants native to the Canton de Vaud, by MM. PITTIER and DURAND, and a notice on certain old trees in Switzerland.

—DAPHNE ELAGAYANA.—For the rockwork or for pot-culture for cool-house decoration, this pretty *Daphne* (figured at p. 245 of vol. xiii.) is eminently suitable. It is a dwarf grower with large terminal clusters of pleasantly-scented, creamy-white flowers. A recent introduction (from the Carpathian Alps) to British gardens, and perfectly hardy. *Nipalans* are now in flower at Kew.

—THE FLORIST AND POMOLOGIST.—The March number contains plates of the double-flowered *Wistaria*, Bedford Prolific and Bigearre Gros Coeur Cherries. Mr. James continues his articles on *Cinerea culture*, while Mr. BARRON'S very useful descriptive list of Vines is brought to a conclusion; altogether ninety-four varieties are described.

—ANEMONES FROM THE SOUTH OF FRANCE.—Miss CLARA MANGLES sends us from Cannes a bouquet of Anemones, wild varieties of *A. hortensis*, very varied in form and colour, including the forms known as *A. fulgens*, intensely rich in colour, *A. pavonina*, with very double scarlet flowers, the segments linear, the inner ones tipped with white; *A. stellata*, with whitish and rose-coloured and lilac flowers; the whole forming a series ranging from white to crimson and lilac, all very bright and vivid. With them also comes a cut spray of *Bougainvillea speciosa* of a most intense purplish-lilac colour, much finer than anything seen under glass in this country.

—THE BOTANICAL MAGAZINE.—The plants figured in the March number are—t. 6611, *Catalpa Kempteri*; t. 6612, *Mascarenhaisia Carooiwana*; t. 6613, *Wahlenbergia saxicola*; t. 6614, *Talamia Candollei* var. *Galeotiana*; and t. 6615, *Scutellaria Hartwegi*. Further details will be given in our register of Plant Portraits.

—FICARIA GRANDIFLORA.—This is an extremely fine plant of its kind, and it seems to have found happy conditions in the Cambridge Botanic Garden among the bog plants, where it is growing 6 inches above the water. It is so robust as to look almost like a small *Galba*, and the golden flowers are quite 2 inches across.

—PRIMULA CARPATICA.—This rare and interesting species is now blooming in the Cambridge Botanic Garden, where it is much earlier than its immediate allies. It comes near the Cowslip, but is quite distinct. The present plant has a scape with ten flowers, eight of which are open. They are nearly an inch across when spread, of pale yellow colour, without an eye, and possess a somewhat remarkable perfume, which may be described as aromatic, and something like that of *Lycaste* are-

FOLIAGE  
ONE HALF REAL SIZE

CCEOLOGYNE MASSANGEANA.

matica, though less intense. The features which now appear the most striking comparatively are the dark, stiff-looking leaves, the thick clothing of soft hairs on the scape, short pedicels, and the peculiar perfume. The first scape was produced a few weeks ago. It was contributed by Dr. KANTZ, of the Klausenburg Botanic Garden. *Primula rosea* is first in blossom in the open where sunk between four bricks to preserve

through is too generous in its profusion to suit the market grower. Abundance may mean plenty to take to market, but then it means plenty everywhere, and as a result the returns are by no means commensurate to the size of the loads sent, or to the labour involved in the gathering. When a big sack of Turnip-tops brings but a miserable sixpence it needs little arithmetical ability to deduct from that sum the cost of

Broccoli, but the heavy losses incidental to this crop during the previous three or four winters have naturally made growers chary of largely planting, so that when once the hardier greens have disappeared—and they cannot last long—we must expect a long interregnum in the spring ere Peas and Broad Beans will be ready to fill the void. Spring Cabbages are not so universally grown as could be desired. They will not thrive

FIG. 55.—A PROLIFEROUS PINE-APPLE. (SEE P. 372.)

moisture, and the protection appears to have forwarded it. In our own garden there are at present no signs of flower in this species.

— MARKET GARDENS.—Market gardeners are so busy getting in their crops, and are working under such exhilarating influences that they worry much less than might otherwise be the case over the very poor prices obtainable for green stuffs of all kinds. In truth, such a winter as that we have just passed

production and marketing, but very much indeed of knowledge to discover the profits. What holds good of Turnip-greens is relatively equally true of the bushes of sprouting Broccoli, of curled Kale, of Brussels heads, and similar members of the Brassica family. Not only are all these various field crops turning in all at once, but they are quite a month earlier than usual, and thus the market is being unduly forced and glutted. The most natural succession to these hardier greens would be large breadths of white

well on all soils, and too often for various reasons turn in as "bolters" rather than as good profitable heads. The chief spring green crop will be Spinach, but that, too, cannot long endure, as the advancing season will push it on rapidly also. If, however, market returns are so poor for present crops the splendid weather and the free working conditions of the soil, the enormous abundance of seed Potatoes, and the generally moderate charges for other seeds, all combine to shed over market gardening a hopeful

aspect. Not only should such a spring-time indicate abundant crops presently, but work everywhere should become plentiful, and buyers richer than they have been of late.

—*PRUNUS DIVARICATA*.—This species, although rarely producing fruit in this country is well worth growing as an ornamental tree. It makes a nice specimen for the lawn, and its numberless snow-white blossoms, so much in advance of those of most of the other species of the genus, render it a welcome inmate of the shrubbery or park. It is a native of Eastern Europe and Western Asia, and in all probability several of our cultivated Plums derive their origin from it. A good sized tree is now in full bloom on a lawn near the Cactus-house at Kew.

—*NEW COMMERCIAL PLANTS*.—Mr. CHRISTY'S publication of this name, just issued, relates to tanning materials, and their respective values and uses, for the guide of colonists and others. Oaks, Mimosa barks, Babool, Mangrove, Quacbracho, Divi-divi, Betel-nut, Myrobalans Valonia, and various other substances containing tannin, are mentioned, and the means for ascertaining the percentage of this material described.

—*STENOCASTRA CONCINNA*.—This beautiful little plant first flowered in this country rather more than twenty years ago in the establishment of Messrs. VEITCH. At that time it was not known who imported it, or even what country could boast of being the home of such a floral gem. The stalked leaves, borne in little rosettes, are green above, and covered with a network of deep red veins beneath; the Gloxinia-like blossoms are of large size—it one considers the stature of the pigmy plant which produces them—and of a pale lilac colour, deep blue on the upper part of the tube and throat, yellow below, the throat spotted with purple. A native of Tropical America.

—*ACER OBTUSATUM* AND *A. NEAPOLITANUM*.—Amongst the earliest flowering and most striking of the larger ornamental trees and shrubs are the two above named forms of the rather widely distributed and variable *A. opulifolium*. Some round-headed compact trees of these are now covered with bloom at Kew. The flowers are borne in terminal corymbs, the sepals and petals are yellow slightly tinged with green, the stamens being bright yellow. Some good spring effects could easily be produced by planting this species where it could be made to afford a pleasing contrast with the deep red-flowered *A. rubrum* and the lighter-coloured Silver Maple, *A. dasycarpum*.

—*FORESTRY*.—The College of Agriculture at Downton, near Salisbury, includes this subject in its course of tuition, as will be seen from the following extract from the prospectus:—

"*Forestry*—The history, propagation, treatment, uses, and value of timber trees. Management and valuation of underwood. The planting, thinning, and general management of Fir plantations. Measurement of felled timber, and of converted timber. Use of sliding-scale. Sale of timber and underwood. The economy of woods and forests in the management of estates. The lectures are supplemented by practical classes in the neighbouring woods.

"*Mensuration and Land Surveying*.—Measurement of surfaces. Quantity of land cultivated by various implements. Areas occupied by crops. Mensuration of solids, and estimates of the contents of tanks, ditches, wells, manure-heaps, walls, ricks, stacks, timber, road metal, cuttings, and embankments.—Field and road surveying. Flating and drawing of plans, and determination of areas surveyed. Levelling and plotting of levels. Use of prismatic compass, quadrant, &c. Details of the chain, theodolite, and levelling staff. Mode of keeping surveying and levelling books. The Ordnance Survey, Ordnance maps, and bench-marks.

—*CASSANDRA CALYCVLATA*.—"The calyculated Cassandra," according to LOUDON'S *Arboretum*, and "Leather-leaf," according to GRAY'S *Manual*, are the English equivalents of the by no means cumbersome botanical name of this pretty plant. The first-named one is hardly likely to be adopted even by the most rigid advocate for popular names, and the latter, to English ears at least, does not convey or suggest any definite idea of this plant in particular. *C. calyculata* is a neat-habited shrub of easy cultivation, requiring simply the treatment under which Rhodo-

dendrons and a host of other peat-loving plants flourish. Its blossom-buds are formed during the summer and expand the following spring. At the present time its white flowers are being produced in profusion. According to LOUDON this species was introduced in 1748; it is on record, however, that at that period it was cultivated by the Duke of ARGYLL, "the tree-monger," so it does not seem improbable that to that nobleman is due the credit of introducing it to this country. A native of the North Temperate Zone.

—*AMERICAN BLIGHT*.—According to the *Wiener Illustrirte Garten-Zeitung*—the organ of the Vienna Horticultural Society—the "Monatsblatt" of the *Gartenbau-Gesellschaft von Mästricht* recommends an unfailing remedy for this pest. It is simply to grow at the foot of the Apple trees the common Nasturtium or Indian Cress, *Tropaeolum majus*. Probably few cultivators in this country would possess sufficient faith in this so-called unfailing remedy as to give it a trial; still, in the case of newly-planted trees especially, it would be very easy to test its merits or demerits even in a single season. Grow Nasturtiums near one lot of trees, and keep them clear from another similar lot under the same physical conditions, and then report progress at the end of the season. In some nurseries where large numbers of Apples are annually grafted train-oil is applied with a brush to the stems wherever the "blight" puts in an appearance. In other establishments, where an equally clean-stemmed good stock is reared, a dry brush is used, or even simply the hand, to crush the insect. In the *Transactions of the Horticultural Society* Sir JOSEPH BANKS gives a series of "Notes" on the first appearance of the Aphid lanigera, together with various experiments on infested Apple trees. Flowers of brimstone, soft soap, &c., seem then to have been not a whit more successful than friction with the hand. A note dated January, 1794, says:—"Mr. DICKSON, who at my desire had seen Mr. DUTHIS' gardener at Bethnal Green, above mentioned, brings word from him that when the insect first appeared in the autumn of 1789 he thought himself wholly ruined, but that now he receives very little damage by it. . . . Since that time he employs men to rub the insects with their hands between the stocks, and in this manner one man will clean a thousand grafted stocks in a day. He says that care must be taken to tread the ground close to the roots, as the greatest damage is done by these insects when by means of cracks in the earth they are enabled to fix themselves on the tops of the roots, or on the stems, where the roots are inserted."

—*GESNERA ELONGATA*.—If but a single flower or even a cluster of blossoms from this plant be compared with those of a host of others belonging to the same family, and some, indeed, belonging to the same genus, the comparison from such material could not fail to be disadvantageous to the subject of this note. When, however, its habit, and the profusion with which its scarlet flowers are produced are taken into consideration, it will be at once admitted that these characters abundantly make up for the small size of the flowers. The species makes a shrub several feet in height, and the contrast between the green leaves and the long-stalked blossoms, which are generally borne in fours, is most pleasing. A good specimen is now in bloom in No. 8 house at Kew.

—*THE COFFEE LEAF DISEASE*.—A very interesting memoir has lately been published in the *Quarterly Journal of Microscopical Science* by Mr. H. MARSHALL WARD, who was on special duty as cryptogamist to the Ceylon Government. The matter is not only of consequence to the cultivators of Coffee—as in the case of every disease it is of prime importance to ascertain the exact nature of the Cryptogam to which the disease is attributed—but because, in a scientific point of view, it modifies very materially the views which have hitherto been entertained on the subject. The parasite, when first discovered, seemed so abnormal in its structure that Messrs. BERKELEY and BROOME, who first described it in this journal, Nov. 6, 1869, were unable to come to any definite opinion as to its affinities; but in their memoir of the Fungi of Ceylon they placed it amongst the Uredineæ, and when it was stated by THWAITES that the spores when germinating gave rise to a species of *Aspergillus* the matter seemed still more perplexed. Mr. ABBAY, whose observations are pub-

lished in vol. xvii. of the *Journal of the Linnean Society*, found on the germination of the spores that they gave rise to a very remarkable species of *Penicillium*, and considered the so-called spores to be sporangia, which seemed to modify the matter still further, though we did not consider the production of sporidia, if they may be so called, within the sporangia as of material consequence, as similar conditions are sometimes produced in abnormal growths, as in the foot fungus of Madura, and indeed in the yeast fungus. Mr. WARD, however, has shown, by a very careful series of observations, that after the spores are produced another set arises, which are clearly of the same nature as the teleutospores of Uredineæ; that these germinate and produce conidia; and consequently that the plant really belongs to that tribe of fungi, and that the first spores are Uredo spores. On referring to Mr. ABBAY'S memoir it is clear that he had observed these teleutospores (see tab. 13, figs. 11, 12), but unfortunately he regarded them as "barren cyst-like bodies," and so by the merest chance failed in ascertaining the true affinities. It is to be observed that Mr. WARD did not see anything either of the *Aspergillus* or *Penicillium*. It appears from the account of the disease by Mr. DYER, in the twentieth volume of the same journal, that a second fungus, the *Aspergillus* or *Penicillium*, grows on distinct spots (see tab. 9, fig. 1), and that therefore it might very possibly be mixed with the *Hemelia*, so as to cause some difficulty about ascertaining the real nature of the germination. Mr. DYER, after the observations of Mr. ABBAY and Mr. MORRIS, was led to regard the spores as sporangia. We have now, therefore, at last the true history of the parasite, and are in a position to work out the remedy, or at least to work in the right direction. It is impossible to speak in too high terms of Mr. WARD'S labours. M. J. E.

—*COMMON LAURELS AS FLOWERING SHRUBS*.—The value of many of our common shrubs for giving ornamental effects is not so generally known as in the interests of horticulture it should be. What, for instance, can be more despised than the common Laurel? although, of course, its rare habit and rapid growth is fully recognised for various purposes of planting where other things would not survive or grow sufficiently dense and thick to answer certain purposes. But clumps of Laurels in full flower at this season are vastly more used as garden or pleasure-ground ornaments than the majority of people suppose. At Luscombe Castle, South Devon, there are clumps furnished to the ground upon slopes by one of the carriage drives which are aglow with beautiful white flowers, and have been for some weeks past. There is a dense background of green as well as a healthy green carpet beneath the clumps, which enhances their attractions and reminds one that rich effects may be produced by using very ordinary material in the way of plants. Where they are planted *en masse* in other portions of the grounds they bear a different aspect, and although gaily dressed with abundance of flowers there is a monotony about them which wearies rather than charms the eye. This is mentioned because it is the common way of planting, but it does not follow that because a plant is common a position cannot be found for it where it may look a striking ornament. Laurels have been in flower at Luscombe for several weeks past, but it should be stated that the situation is exceptionally well sheltered and the climate all that can be desired.

—*OLIVE OIL IN SICILY*.—It is stated that Olive oil produced in Sicily has very much improved of late years. The mode of preparing it has been hitherto the cause of its not attaining that delicacy of flavour possessed by oils of Italian and French manufacture. Oil in every respect equal to that produced at Lucca may now be obtained at Termini from Olives grown in the vicinity of that town at about 60s. per cwt.

—*Berberis Darwinii*.—Large plants from 10 to 15 feet high are now in flower in the grounds at Luscombe Castle, Dawlish, where they are in charming contrast to green Hollies, Portugal Laurels, and other evergreen plants. They are chiefly planted by the sides of walks and occupying conspicuous corners, where they have a most pleasing and cheerful effect—such an effect as is difficult to describe, owing to the profusion of orange-coloured flowers with which the bushes are clothed. They seem to

## FORESTRY.

droop so naturally, one branch overlapping another, while in many instances a vigorous branch or two shoots out a couple of feet or more from the rest, as if Dame Nature had taken particular pains in the completion of the floral picture.

— **HYACINTHS IN HOLLAND.**—We learn that owing to the mild winter and spring, the bulbous plants in Holland are much earlier than usual. The early varieties of Hyacinth, such as Homer, Maria Cornelia, Latour d'Auvergne, are already in full bloom. By the end of the month, if the weather continue, the Hyacinths will be in full beauty, and those who defer their visit till the middle of April as usual, will be too late. The most convenient routes from London are *via* Queensborough and Flushing, or Harwich and Rotterdam. The traveller from Leyden to Haarlem may now avail himself of the steam tramway between these two towns, and which passes through the Hyacinth fields, stopping at numerous stations. Passengers by rail between these points see little of the flowers. The Crocuses are already past their best.

— **THE BERNE CONVENTION.**—The Belgian Government has announced its adhesion in principle to the modified Berne Convention of November, 1881, relating to the transit of plants, in countries where, owing to the panic concerning the Phylloxera, severe restrictions are still in force. This will allow the Belgian horticulturists to partake of certain privileges and exemptions relating to the transit of plants, and to have a voice in the matter of framing the regulations that may be necessary in future.

— **THE WEATHER.**—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending March 13, issued by the Meteorological Office, London.—The weather though generally dull during the earlier part of the period, with rain in the west and north, became very fine and dry towards its close. The temperature has been above the mean in all districts, the excess ranging from 5° in most of the western districts to as much as 7° over eastern and central England. The highest reading (64°) was registered at Colmpton on the 7th, and at Nottingham on the 10th, whilst at most other stations the maxima varied between 55° and 63°. The minima occurred either on the 7th or 13th, and were rather low, ranging from 28° in "Scotland, E.," and the "Midland Counties," to 35° in "Ireland, S." Rainfall has been a little more than the mean over Scotland and in "Ireland, N.," but less elsewhere. Bright sunshine shows a slight increase in most districts the percentages varying from 17 in "England, W.," and 18 in "Ireland, S.," to 41 in "Scotland, E.," and 36 in "Ireland, S." Depressions observed.—The barometer has been highest over France, and the extreme south of England, and lowest over Scotland and Scandinavia. Depressions travelled in a north-easterly direction across our north coasts during the greater part of the week, causing the gradients for south-westerly winds to grow steep, and the wind to increase to a fresh or moderate gale on our western and northern coasts. Towards the close of the period, however, the barometer became more uniform, and the winds light or moderate in all parts of the kingdom.

— **GARDENING APPOINTMENTS.**—Mr. W. CRUMP, for the last six years gardener to the Duke of Marlborough, Blenheim Palace, Woodstock, has sent in his resignation, and is going into business at Leamington as flower and fruit grower for market.—Mr. HENRY HATCH, late Foreman at Stanwick Gardens, near Darlington, has been engaged as Gardener and Bailiff to Colonel HOWARD VISE, The Manor Cottage, Old Windsor.—Mr. ARTHUR HOLLOWAY, late Foreman at Foxbury Gardens, Chislehurst, has been appointed (through Messrs. CHAS. LEE & SON) Gardener to R. REID, Esq., Barra Hall, Hayes, Middlesex.—Mr. R. PEGG, late Foreman to Mr. PRATT, The Gardens, Hawkstone Park, Shrewsbury, has been engaged as Gardener to C. HILL, Esq., Clevedon Hall, Somersetshire.—Mr. H. WARD, late Foreman to Mr. MUSSELL, Cadland Park, Southampton, has been appointed Gardener to Sir PHILIP EGERTON, Oulton Park, Tarporey, Cheshire.—Mr. R. SAUNDERS, late Foreman at the Marquis of Downshire's, Easthamstead Park, has been engaged as Gardener by the Hon. A. G. J. PONSONEY, Heatherfield, Ascot.

**HEDGES.**—Next to plantations nothing so much beautifies and adorns the landscape and the country in general as hedges, and the more will hedges be appreciated both for beauty and utility. Any one who for the first time beholds the garden-like field formation and distribution of Thorn hedges in Roxburghshire, the Lothians, Ross-shire, and some other districts of Scotland, is alike pleased and surprised with their beauty and utility. The first consideration, after determining its purpose, in planting a hedge is what description of plants to plant so as to suit the soil, and effect the purposes of protection and afford shelter to the kind of stock upon the farm. Unless the soil is of sufficient quality to grow a good strong plant, and maintain it in health and vigorous growth in future, it is unadvisable to plant hedges upon it.

After many trials, long practice, and frequent failures, the following among other successful results have been achieved:—In planting common Whitethorn hedges the first thing to do is to trench, lime, and otherwise thoroughly prepare the ground, which should either be of a clayey or strong loamy nature. The plant bed should be about 4 feet wide by at least 2 feet deep, and the ground both underneath and on all sides well broken to a good depth, and thoroughly drained. It is advisable to have the preparation of the ground done in summer or autumn, and the planting done as early the succeeding season as possible. The plants preferred are strong seedlings (two or three years old), and should be put in without any cutting except in extreme cases where the roots are extra long and bare, in which case they should be slightly shortened with the knife. I plant nine or ten plants to the yard, and keep the hedge clean by hoeing and raking for several years thereafter, and never cut over the plants till they have made two years' growth, when, with a sharp hedge-bill, or pruning-knife, they are cut over to within three inches of the ground.

At the end of the second two years' growth they are again cut over at 18 inches from the ground, and again at two years afterwards at 3 feet from the ground; thus, at six years from the time of planting, there is a close and good hedge 3 feet high, and as they seldom require to be more than 4 to 5 feet in height altogether; this height is attained at the end of seven years, after which the hedges may be pruned either once or twice a year as circumstances suggest. One rule ought to be, never to prune the hedges at midsummer till they have attained their full desired height. No young hedges—that is, such as have not attained their full height—should be pruned in the summer season, nor till the young wood is perfectly ripe and matured, otherwise pruning stiffens and throws the hedge into a state of distorted and gnarled growth, from which it never afterwards quite recovers.

Beech hedges should be planted much in the same way as Thorn hedges are, with these differences:—The soil for Beech should be as light and dry as possible, and it thrives well in the remains of an old turf dyke which has been levelled down. It should never be pruned, except the straggling outside lower branches kept within bounds till the hedge is about as high as required, after which the top growth may be stopped and the hedge allowed to thicken at pleasure, and after it has attained its full size may (but not till then) receive a mid-summer pruning, for the sake of beauty and neatness. Beech hedges do well for affording shade and shelter, but are too soft as a protection against animals, unless grown upon the top of, or, rather, behind a wall or face dyke, where they answer remarkably well. As a roadside fence, too, they do good service, and have a fine clothed appearance both in their velvety summer green and russet winter brown.

I prefer planting hedges comparatively thick, and when they require it thin them out with a pruning knife, which is a commendable practice, as thereby the remaining plants derive more room and consequently grow stronger.

Holly hedges are both serviceable and beautiful at all seasons, but specially in winter. The ground, preparatory to planting, should be trenched to a depth of 3 feet, and about 4 feet wide, and the soil should be a sandy loam, neither too light nor too heavy, but rather heavy than light. Like the Beech,

it should not have its top shoots at all interfered with till as high as it is wished to be grown, after which the top of the hedge should be cut level and the hedge ever afterwards cut once or twice a year as taste and other circumstances recommend.

The *Prunus myrobalana* appears also to be (for it has not been long much in use) a very good hedge plant, but requires mixing either with common Thorn, Sweet Brier, or other less rapid growing species to thicken and give compactness to the hedge. This kind of hedge is planted and treated in every way the same as Thorn hedges, but the plant requires a still better soil to grow in, nor is it certain if it will grow to such old age as the Thorn even under the most favoured circumstances.

The Elder makes a useful and suitable shelter hedge for many exposed places when inferior soil and climate are also to contend with. It grows readily from cuttings, and any soil, if at all loose and deep, is suitable to it. It can be trained up to a good height, and affords excellent shelter to animals, which are by no means fond either of eating its leaves or gnawing its bark.

The Willow, of which there are many varieties, grows well almost anywhere, and will either succeed in very light dry soils or in soils of the opposite extremes. In dry soils it survives to old age, but in wet soils it rarely attains middle age. It should be constantly, that is, annually pruned, and, like the Elder, trained to a considerable height, and thereby form one of the very best screens or protection fences for sheltering Hop gardens, young plantations, paddocks for young and tender animals, &c.

The common Backthorn (*Hippophaë*) is an excellent hedge plant, and does well to mix along with Willows on tops of turf dykes, or embankments near the sea, or indeed almost anywhere and in any soil. It requires pruning annually, otherwise it grows stunted and does not spread either root or branch satisfactorily. It grows from seed and from cuttings, but best of all from layers or runners, which are easily obtained from plants growing on light soils anywhere.

Whins or Gorse also make good hedges, which succeed well on turf dykes, but in consequence of their liability to die periodically from the effects of frost and their attraction for rabbits they are less planted now than formerly. The Whin hedge is sown (rarely planted), and the common method is to make a scratch in the ground, as if for sowing Turnips, and from a bottle with a goose-quill fitted into the mouth the seed is sown and covered with a small rake or hoe. The plants come up the same season as sown, and require little further treatment beyond keeping the grass from choking them the first and second season, and annually pruning the hedge after shedding its flowers.

It is an excellent plan to extend one or two runs of wire in both Whin and other hedges as near the top as possible, to constitute a back-bone to them, which is of the greatest importance wherever cattle are to fence against, for there are few hedges in which there are not some weak parts, and the strength of a hedge, as of a chain, is determined by its weakest part.

Mixing hedges, as Thorn and Beech, though common, is not commendable, because if the soil is adapted to Beech it outgrows and kills the Thorn, and if suitable to Thorn it grows much better without the Beech. In winter, too, a hedge composed of Beech and Thorn always presents a gappy appearance at a distance, for in spite of all efforts the one or other die out. Evergreen hedges for their own sake should be annually pruned in May, when all the old and withered foliage is pruned off, and the young shoots allowed freedom and time for completing their growth before the end of the season. There are, however, opposing considerations which have to be taken into account, such as the flowering of Whins, Rhododendrons, &c., and it is not till these and others have shed their blossoms that pruning is admissible. The beauty and neatness also which a newly pruned hedge presents at midsummer has of itself such attractions that it may be some time before Nature's laws are, in regard to pruning, fully obeyed. *C. Y. Michie, Cullen House, Cullen.*

**ROSE FORTUNE'S YELLOW AT WESTONBIRT.**—An extraordinary plant of this favourite Rose may now be seen in full flower in a cool-house in the gardens at Westonbirt House, the residence of R. S. Holford, Esq. Mr. Chapman, the gardener, informs me he has cut over 800 blooms this season, and the plant is now entirely covered. The value of such a plant can scarcely be over-estimated. *Tristram.*

## HOME CORRESPONDENCE.

**Garden Prospects.**—The winter of 1881-82 has been quite to my mind, and I am inclined to pronounce it the perfection of a winter; and if we could but foresee that in future all our winters would be like it, the "agricultural depression" would vanish, the horticultural world rejoice, because there would be no more reductions in gardens, and market growers would leap for joy, in that they were no more to be handicapped in the market by the produce of my lord duke's garden, such produce being required for home consumption. But, alas! our fickle climate has so often jilted us that all confidence that it means to permanently mend its ways is gone, and therefore, whilst hoping for the best it will be wisdom to prepare for the worst. The promise of a more fruitful season could not be possible, and our hopes having attained so high a pitch, a failure would be proportionately heavy, so that to prevent such a disaster it is worth while to take extra precautionary measures to protect tender flowers, vegetables, and especially fruit blossoms. Peaches and Apricots are now with us (Hants) in full flower, and flowers, too, the like of which, for individual vigour and profusion, we have not seen for years; their appearance is sufficient incentive to determine us to spare no pains in warding off "Jack Frost." Pears, too, are marvelously well budded, and unfortunately some are opening; those on walls are easy of protection by boughs, netting, tiffany, &c., but the low standards and pyramids are more difficult to deal with; still we don't mean to be mastered, and some—the choicer kinds, at all events—will be protected by large spray branches of Birch, Laurel, or Spruce Fir, the thick end being fastened into the soil, and the spray amongst the branches, with here and there a tie to prevent wind chafing. Plums and Cherries are also literally covered with buds, and all that can be done to protect them should be done at once. Coming to vegetables, kitchen gardens have more the appearance they usually present at the end of April than the middle of March. Without any special attention we have never failed of a supply of Cauliflower or Broccoli since we commenced cutting the early Cauliflower at the beginning of June last, and now there is a superabundance which, for the double purpose of prolongation and protection from frost, is being lifted and heeled-in under a north wall. The less advanced I looked over for the purpose of being covered with their own covers whenever there seems to be any likelihood of frost. The earliest Cauliflowers that are intended to succeed the late Broccoli are already planted out in deep drills; they are thus sheltered from cold winds, and little or no earthing-up is necessary other than levelling in the drills as soon as growth admits of it. Radishes, Early Horn Carrots, and the earliest open-air sowings of Cauliflowers, Broccoli, Savoy, and Cabbage receive partial protection by using the Strawberry nets or three ply thick. The early border Potatoes are already peeping above the soil, and earth is drawn to and over them so long as it is practicable to do so, afterwards they are protected with long litter. Peas sown January 6 are already 4 inches high; earthing and a screen of evergreen boughs on the windward side is the best protection for these, but happy shall we be if none is required. Certainly we are not yet out of the wood, and it may be risky to proceed to get in the general stock of seeds and Potatoes; but the ground grows so well, and all other conditions are so very tempting, that, risk or no risk, we mean to get them in, and by way of a change have a leisurely April. *H.*

**An Error in Exhibiting.**—At the last meeting of the Royal Horticultural Society one exhibitor showed a tray of double Cinerarias placed on a background of vivid mauve-coloured paper. The effect on the flowers was ruinous; the blooms, although good in colour themselves, were destroyed by this flaming mauve colour: it made all the blooms look dead and livery by contrast. All brightly coloured flowers should be exhibited on dull-coloured backgrounds—a dull even olive green is perhaps the best contrast. A bad fashion seems now very prevalent of dressing little girls in brilliant crimson head-dresses: the effect on the face of the child is that it makes it look like a corpse. The delicate and pure hues of a healthy face require tints of a sober nature to harmonise with them. How would a delicate flesh-coloured Tea-scented Rose look muffled round in a mass of blood-red velvet? *H. G. S.*

**The Season at Edinburgh.**—As instances of the very exceptional temperature of this season, I send for your use two facts which I believe are unprecedented in Edinburgh horticultural history. In the

middle of February a Carnation in a perfectly open and unprotected border had a flower perfectly expanded, and another is now fully out on the same plant. Again, in the grounds of St. Roque, a villa on the south side of the city, a bush of Camellia Storyi, about 4 feet high, which was put out last autumn in a perfectly open and unprotected outside border, had a flower well expanded in the beginning of the last week of February, and two others are now well expanded on the same bush. *T. Ivory, 23, Walker Street, Edinburgh.*

**Nicotiana affinis.**—I have a great many plants, but I cannot get any of them to bloom during the daytime. They only open in the evening, and close soon after sunrise in the morning. Mr. W. H. Cullingford tells me this is quite his experience with this plant. *T. Christy, Malvern House, Sydenham.*

**Heating Experiments.**—A little over a year ago, when referring to the then announced great show at Kensington, I suggested there would be a good opportunity for a boiler trial. As, however, there were no preparations made, and if there had been there was no time for it, no trial took place, though the medal awarded was for the best boiler "practically and scientifically considered." There is now a better opportunity in the forthcoming implement show, extending over six weeks, at Kensington, as there are three classes with six medals specialising in heating appliances, but the judges—even if the best gardeners in the world and thoroughly competent to decide on the best flowers and fruit and general implements—may not be practically acquainted with the details of hot-water heating, or with what constitutes a perfect apparatus, without something to guide them in the way of a test. The question of glazing and ventilation, too, is one about which there may be, and always is, a great difference of opinion, and yet it is one which could be very simply and easily observed on different days, with thermometers to ascertain the maximum at night and minimum by day (if in sunshine all the better), so as to show the least variation in temperatures in twenty-four hours. Lawn-mowers are tested, and rightly too, while the other twelve classes are such as may be judged readily. Considering that the erection of glasshouses and the heating thereof are the preliminaries (and most expensive ones too) in our climate to the successful growing of the varied flowers and fruits so extensively staged at all our great exhibitions, it is surprising to me that societies like the Royal Horticultural and other kindred ones do not test annually and publish reports on the various appliances, in the same way that they do with flowers, fruit, vegetables, and small implements, I believe. For instance, there are at Chiswick many houses and several varieties of boilers in use; it would be a simple matter to keep a record of the sizes and shapes of boilers, quantity of piping attached, with description and quantity of fuel burnt daily, each, with either a detailed or averaged daily temperature kept up above the outer atmosphere. One or two houses or ranges, too, could be set apart specially for testing new boilers, a week at a time, during the late spring or summer months, when the pipes were not particularly wanted, so that an inventor might send (if so inclined) and fix one there himself, and by payment of a small fixed sum to cover expenses and the privilege of trial, have an unbiased report on its working and consumption of fuel, &c., which would often present a worthwhile article being offered to the public. Such a set of trial pipes might be permanently fixed at Kensington, either in the arcades or adjoining the conservatory (its pipes even might be divided and used) or near the offices and Council-room, arranged in groups or coils of 300 and 400 feet each, so that any size of boiler, from 600 to 2000 feet power, could be readily tested. Gentlemen about to commit themselves to an expenditure of £1000 or more in new gardens would willingly pay as much as £10 to have a boiler, or a system of glazing tested, and avoid the costly blunders of others they have heard of, believing that amount might often be saved to them afterwards in the cost of fuel alone. If such trials were instituted and properly carried out, we should very soon be able to arrive at some tabulated statement that would rectify the erroneous calculations founded on experiments when hot-water heating was in its infancy, and there would not only be a justification for such trials, but a well known London nursery (as an instance) two years ago, when certain "improved" boilers were put in, which did not heat the pipes with more than double the fuel consumed subsequently in more powerful boilers, which reduced fuel, by-the-by, is more than ought to be burned to heat the quantity of piping. In the face of such corrected tables as might be obtained of the actual working powers of boilers, manufacturers and engineers would not pull in their powers, though stated as "approximate," are known to be wrong; but because one or two makers will keep these figures on their lists, all the others must do likewise, or lag behind in the struggle or business; while it cannot be expected that

a gentleman or his gardener can have the special knowledge necessary to calculate for himself in the absence of any reliable rule for doing so. This leads me to the question of the judging of boilers at shows, and without wishing to be unjust in any way, or to appear too critical, I fancy it would be a strange commentary on the judgment given at some of our recent exhibitions, if the successful boilers and some of those left out in the cold could be tried together under the same conditions. Judges are but human, and, as the merits which decide them in cases of fruit and flowers, and in the case of the implement classes, appear more directly to the eye, it will happen (perhaps unconsciously) that the mere look or finish of a boiler and its accessories, in the absence of any strongly marked points, will go a long way in influencing their awards. The position of a judge is a thankless one at the best, as I know, there being always some disappointed exhibitor who thinks his article the best; but in some classes, and especially those I refer to, the judges' duties would be lessened, and their decisions more understandable, if the points on which they were to adjudicate were made known to all alike beforehand by the committee. If times had been more prosperous, I should, ere this, have started an experimental house or two for the purpose of revising the heating-tables still referred to, the necessity for which revision is evident by a quotation from Mr. Pawkes' new book, in which he gives the formulas of Tredgold and Hood, as well as his own observations. It is necessary, says the one, to have 202 feet of pipe per 1000 ft. of wall to obtain an on opposite page it says that 55 to 65 feet only of pipe are required. The two sets of figures are confusing, and on examination, the former is found to be to heat so much air per minute; but whether so much air requires to be heated per minute or per hour is not generally known or ever explained. The same writer's lectures, now publishing in the *Gardener's Magazine*, will be useful in correcting some wrong impressions as to how much fuel is being employed on heating; but such information compiled by an influential and independent body like the Royal Horticultural Society, and published in all the gardening periodicals, would educate our gardeners on subjects almost as important as the soils to use, and the treatment to be observed in the cultivation of plants. *Engineer.*

**The Single Blue Roman Hyacinth.**—I agree with the writer of the note at p. 284 of the *Gardener's Chronicle*, that it would be better not to call this Hyacinth Roman, but instead of that Paris or French Hyacinth, which is the true name, although French growers now offer it as Blue Roman. I doubt, however, if the Hyacinths which are said to have been sold twenty years ago in London as Belgian Hyacinths can be considered as identical with this plant, and I suppose this as well as other French Hyacinths (except the earliest white Roman Hyacinth not been known long in England). These Belgian Hyacinths were probably the *Scilla variegata*, Hofim. et Link (S. nutans, Smith), of which the various forms were called in Dutch and other gardens for a long period, and even now sometimes, *Hyacinthus belgicus*, or Belgian Hyacinth. *J. H. Krelage, Haarlem.*

**Cianthus magnificus.**—The enclosed truss is sent to show you a rare example of the mild winter in the north of Scotland. The plant from which it is taken had been trained up the rafters of a greenhouse, and was turned out of the pot about the beginning of May last to fill up a hole in the garden, and was left in the front of my house. It has not received any protection of any kind excepting shelter from a plant of *Ceanothus aureus* growing beside it. Some of the branches are heavily loaded with flowering racemes. Previous to 1868 a plant in a similar situation lived through several winters, and flowered freely later on in the spring. It is much harder than panicles. *J. W. Webster, Gordon Castle, Forchabers.*

**The Winters of 1760-61 and 1881-82.**—The following may prove interesting, as it shows the mildness of the winter of the year 1760-61, which somewhat accords with that of 1881-82.—"December, 1760: On the 21st a raven's nest, with young ones very ill fed, was taken from a tree in a ground belonging to Mr. Johnson, of Gedney, in Lincolnshire." "January, 1761: This season is so forward that on the 14th instant there was in Combe Wood, between Wimbledon and Streatham, in Surrey, a thrush's nest with four eggs in it, some of which were very fresh, the thrush sitting very close on them. First-mosses and *Daisies* have appeared ten days before, and at a place near Regyate a plate of strawberries was produced a few days since at a gentleman's table. And from Swansea, in South Wales, we have the following letter, dated the 23d inst.—"I saw several flocks of swallows and other summer birds were seen here, occasioned by the mildness of the season; but 'tis thought that the present Frost

(which came pretty sudden and severe) must have destroyed the greatest part of them, as many have been found frozen to death. A few days since there was a Pear tree in full blossom in a gentleman's garden not far from this town; and a Gooseberry bush which stood under a wall and was fenced from the north wind had Gooseberries as large as Cherry-stones; and 'twas thought bad the mild weather continued, several sorts of summer fruit would have been ripe before Easter.' We likewise hear from Eshgill, near Alston, in Cumberland, that on Christmas day last a gentleman there had Marigolds and ten other different kinds of flowers in full bloom (the same as in the months of May and June), and all the trees in his garden in bud, owing to the mildness of the season—a circumstance never known before in the memory of man, so far north. *Annual Register.* Harrison Weir.

**Primulas.**—I have grown most of the leading strains of *Primula sinensis* during the last thirty years, but I consider Mr. B. S. Williams' *Alba magnifica* the finest white *Primula* I have yet seen. It not only produces beautiful flowers, but the habit of the plant is so good, with its rich beautifully curled foliage, not unlike the curled Mallow used for garnishing. Its lovely flowers are carried well up above the foliage—a habit which adds much to its beauty. I have during the present season used a different compost to any I have used previously, and with very good result. It is as follows:—One part of turfy loam, one part of turfy peat, and one part of leaf-mould, with a little charcoal and bone-dust, and a liberal quantity of Bedfordshire coarse sand. With this compost, well-drained pots, and careful watering there is little fear of damping-off at the stem. *H. Ellis, Gr. to W. Agnew, Esq., M.P., Summerhill, Pendleton.*

**Tulipa chrysantha.**—I have now in bloom a bulb which answers almost precisely to Mr. Baker's description of *Tulipa chrysantha*. The flower is large, pale straw-colour, with a dull orange eye, the back of the petals flushed with pink. It is a very distinct, handsome, and conspicuous species, and when more common will be a great addition to the hardy bulb garden. In habit of growth it resembles *T. altaica* and *Schrenkii*. I received the bulb without a name from my kind friend M. Max Leichblin, who told me it came to him from Bokhara. I have great hopes that it will go to seed. *H. Harpur-Creux, Drayton-Beauchamp Rectory, Tring, March 13.*

## Reports of Societies.

**Royal Horticultural:** Col. Trevor Clarke in the chair. The Rev. G. Henslow directed attention to a beautiful series of cut blooms of true Himalayan species of *Rhododendron*, cultivated by Mr. Mangles, and which were exhibited at the meeting of the Scientific Committee. He next called attention to the collections of *Cyclamens* exhibited, and specially to two fine plants, a pure white and a pure crimson, both obtained from "The Gem," which received a Floral Certificate from the Royal Botanic Society in March, 1879, and grown by Mr. Little. The lecturer remarked on the effects of crossing, and alluded to the curious habit of *Cyclamens* in burying their pods to acquire additional nourishment. He then called attention to some remarkable malformations—a *Primrose* with a green corolla, shown by Mr. Draper, of Seaham Hall, and a Chinese *Primrose* with a foliaceous calyx, and he pointed out that a flower is only a metamorphosed group of leaves which in these cases were, so to say, asserting themselves. A curious proliferous form of *Anthurium Scherzerianum album*, with every flower at the base of the spadix replaced by a miniature spadix in a small white spathe of bloom, exhibited by Mr. Child, was next commented on, and its resemblance to a similar process in Egyptian Wheat, which bears several ears on one stalk, was pointed out. Mr. Henslow took the opportunity to correct the popular error that Wheat found in the catacombs of Egypt and called "Mummy Wheat," and probably 3000 to 4000 years old, ever germinated; this being confounded with the former, which is occasionally grown in this country, has led to the mistake. He stated that he had sown Wheat apparently quite sound, but seventeen years old, and not a grain germinated.

At the conclusion of the lecture it was proposed and seconded, and carried unanimously (with three cheers, led off by the Chairman), that an address be sent to the Queen, the Patron of the Society, heartily congratulating Her Majesty on her recent providential escape from assassination.

The Council-room well filled with gay and interesting plants, a strong muster of the several committees, and a fair attendance of visitors, augur well for the coming season. The main features which struck the eye on entering were fine collections of

*Cyclamens* from Mr. H. Little and Mr. H. B. Smith, in which brilliancy of colour and general refinement of character are associated with free-flowering tendencies. The *Amaryllis* and *Abutilons*, which contri-

get away from the haphazard system heretofore prevalent. Among the Orchids a grand plant of *Cymbidium churruum*, from Lord Rendlesham's collection, attracted much attention, being in perfect health; and bearing twenty-nine of its ivory-white flowers; and hardly less was bestowed upon Mr. J. C. Bowring's fine plant of *C. Lycaste fulvescens*, with its sheaf of bold leaves overarching a dense tuft of light olive-brown flowers in number no less than 355; and another object of much interest to cultivators was a handsome pan of *Pleione humilis* exhibited by Sir Trevor Lawrence (Mr. Spyer, gr.). Many other plants of interest were shown, of which detailed notice is given further on.

The proceedings of the Fruit Committee call for no special remark. At the Scientific Committee the special feature of interest was Mr. Smith's interesting and suggestive paper on a fungus disease affecting grass, and possibly injurious to animals also. The cut blooms of *Sikkim Rhododendrons*, together with the remarks thereon by Mr. Mangles, were highly appreciated by the members.

**SCIENTIFIC COMMITTEE.**—Dr. Maxwell T. Masters, F.R.S., in the chair.

**Malformed Oaks.**—Dr. Masters reported that the specimens sent to the last meeting by Mr. F. Moore from the Isle of Wight probably owed their peculiar appearance to some agency (insects?), which had injured the tip of the fruit-spike and arrested growth, so that the acorns, instead of being separated one from another by marked intervals, were crowded together into one mass, giving the appearance of profliferation.

**Disease of Thuyas.**—Mr. W. G. Smith exhibited specimens of *T. compacta* attacked by the Australian fungus named *Capnodium australe* by Dr. Montagne. *Thuja compacta, aurea*, and elegantissima are sometimes covered by this *Capnodium* in autumn and in the following early spring are found to be quite dead, the roots as well as the tops. The fungus was described by Mr. Berkeley in the *Journal of the Royal Horticultural Society*, vol. iv., p. 253, as surrounding the laminae of Conifers from the Swan River. An illustration of this fungus is given by Mr. Berkeley at p. 259 of the volume referred to.

**Disease of Grass.**—During the last two years (said Mr. Smith) the grass of Sussex, and especially that of Kent, has been attacked by a curious and, as regards this country, probably new fungoid disease. The grass attacked by the fungus (*Isaria fusiformis*, B.) is popularly believed to be capable of causing the death of such animals as feed upon it. As far as is known, the disease has only been known for certain as British for little more than two years; it came into prominent notice in Kent in September, 1880. One person, however, a Kentish gardener, states that he has known the disease for twenty years.

The grasses it chiefly attacks are the *Festucas*, and chiefly perhaps *F. ovina*. The fungus grows most plentifully on sandy soils, it is not uncommon in chalky positions, but it is apparently absent from clay soils. It does not appear on young grass, but on the old. It is first seen about September, and fades away about the following January. In a damp, warm winter like the present the fungus remains much longer in the fields, so that even now, in the month of March, the fungus can still be found.

The general appearance of the fungus (fig. 56) may be aptly compared with fine short tufts of minute scarlet or crimson seaweed. The tufts spring from an effused, mucous, pinkish mycelium, which has a tendency to glue different parts of the attacked grass together. These fine threads or tufts grow on the leaves and stem, from which they break away and then fall to the ground. The fungus might from the first have been overlooked had it not been for the brilliant red coloration—in this it resembles pink coral. As with the fungus of the Hollyhock disease and the disease of *Thuyas*, this new pest of grasses appears to be of Australian origin; it is described by the Rev. M. J. Berkeley amongst Australian fungi in the *Journal of the Linnean Society* for 1873, vol. xiii., p. 175, under the appropriate name of *Isaria fusiformis*. Mr. Berkeley describes it as growing "on some germinating cereals" from Mount Gambier, and states the colour to be pallid. Mr. Berkeley himself, however, identifies the English plant as the same with the Australian one, the only difference apparently being that of the colour. Dr. Cooke in March of last year announced the fungus as British *Grevillea*, vol. ix., p. 94. Mr. Berkeley's description is "pallid, slender, filiform, sparingly branched, branches acute, spores very minute, globose."

This description, with the exception of the colour, is very precise, and exactly agrees with the Kentish plants of our illustration, made from nature (fig. 58), and enlarged five diameters. The solid black parts of the drawing are in Nature crimson: this tint seems to be permanent, at any rate the colour remains perfectly unchanged in dried specimens for several months.

The microscopic structure of the fungus is very simple, it is one compacted mass of cells, the larger

FIG. 56.—DISEASE OF GRASS: ISARIA FUSIFORMIS.

FIG. 57.—LIVING BEE WITH FUNGUS GROWTHS.

FIG. 58.—DISEASE OF GRASS: ISARIA FUSIFORMIS.

buted so much to the general effect, are alluded to elsewhere, as also the collection of pedigree Roses sent by Mr. Bennett. The Tea characteristic was strikingly manifest in the perfume of these Roses. Whatever may be the ultimate verdict of specialists on these plants Mr. Bennett's procedures are methodical and worthy of commendation as an attempt to

cells occupying the centre of the branches, and the smaller ones the outside; as the smaller outside cells gradually reach the tips of the branches they break up into innumerable extremely small globose spores, conidia, or seeds, as shown at the upper part of fig. 58, enlarged 320 diameters.

This Isaria disease on grass is supposed by many persons in Kent to be capable of killing cattle. In September, 1880, an instance occurred where two cows died from an affection of the lungs, and when a *post-mortem* examination was made it was found that the lungs were covered with a fungus-like material, not unlike, it is said, the fungus which attacks the throat in diphtheria. The veterinary surgeon who conducted the examination declared his opinion that this fatal ailment had been contracted from the Isaria-infected grass. The same doctor is said to have led two rabbits on infected grass only, and that they both died therefrom. It is necessary to say that these two cases are far from proved; at the same time it would not be wise to immediately say that cases of this nature are impossible.

In favour of the doctor's view it may be said that some members of the order Isariaceae grow upon decaying animal substances, chiefly hymenopterous insects; sometimes these insects are, however, in a living state. *Isaria farinosa* grows on dead pupae, I. arachniphila on dead spiders, and I. sphingum on dead moths. These creatures are, however, attacked while in a living state. The genus *Isaria* is supposed to be a sort of conidiophorous or larval condition of the genus *Torubia* (or *Cordiceps*) amongst fungi; several British species of this genus grow on the pupae and larvae of moths, one grows on an ichneumon, and another (*Cordiceps sphaerocephala*) upon living wasps (*Cyrtus vegetans*) in the West Indies. This fungus seems to have no place at present in lists of British fungi, yet it seems probable that the fungus now exhibited and growing from the body of a bee is no other than that species (fig. 57). The bee was caught in this country as it was inconveniently flying with its fungus burden. An allied fungus, named *Microcera oecophylla*, is parasitic on bees. These instances were mentioned by Mr. Smith, not with the idea of showing that *Isaria fulvicornis* is capable of killing cattle, but to indicate that members of the order really can and do grow upon living animal substances; added to this, it may be stated that *Torubia*, which is the same as *Isaria*, is the next genus to *Claviceps* or *Ergot*, and that the genus *Isaria* is at present imperfectly known and understood, so that there is a good opportunity in this case for original observations.

For the specimens of infected grass exhibited and for a considerable part of the information contained in these notes, Mr. Smith acknowledges his indebtedness to the Rev. Chas. W. Shepherd, of Trottscliffe Rectory, Maidstone.

#### PLANTS EXHIBITED.

Mr. Elwes showed flowers of *Korolkovia Scerzavii*, which, in place of the ordinary dark purple colour of the normal flower, were seen to be green with a dark centre only.

*Frillillaria obliqua*?—A species supposed to be of Russian origin, but concerning which nothing definite is known; it has very dark purple flowers and twisted leaves.

*Muscari Elwesii*, a species also of uncertain origin, with small compact spikes of deep blue, bell-shaped flowers edged with white.

*Leucoium astrivum* var. *pulchellum*.—A variety which Mr. Elwes has cultivated for some years, and which constantly blooms much earlier than the type. Mr. Mangles recognised it as having seen it in the South of France.

*Chionodoxa Lucidii*.—Mr. Elwes showed specimens of this from self-sown seeds, the seedlings having flowered in the second year. "In Asia Minor," the plant," says Mr. Elwes, "comes up with a rush" immediately after the melting of the snow, and is of compact habit, with short pedicels, while in this country, owing to the slower growth, from our variable climatal conditions, the habit is laxer and the pedicels much shorter.

*Satyrion nepalense*, from Nepal, is a terrestrial Orchid, with a close spike of pinkish flowers, of which an illustration will shortly be given in the *Botanical Magazine*.

*Rhododendrons*.—Mr. Mangles showed cut flowers of *R. argenteum* (syn. *R. grande*) with noble foliage, the leaves lanceolate, silvery beneath, the flowers white, in fine terminal trusses, each individual flower having the appearance of a Brodiaingian Lily of the Valley. The species is very variable, and the specimens shown were much superior to those figured in Sir Joseph Hooker's *Rhododendrons of Sikim Himalaya*. *R. Hookeri* is a species discovered by Booth in Bootan, allied to *R. Thomsoni* in the colour and form of the flowers, but with rows of scales along the nerves on the underside of the leaves. Mr. Mangles obtained his plant from Mr. Anderson-Henry. *R. ciliatum*, showing something of the lilac tint of the one figured in the *Rhododendrons of Sikim*, but the

uniform lilac coloration of which is now believed to have been a mistake. *R. pendulum*, a dwarf trailing epiphyte with the habit and appearance of *Edwardsii* but on a smaller scale; *R. fulgens*, a species found at great elevations, and hence comparatively hardy; *R. arboreum*, a very variable species; *R. Falconeri*, a species nearly allied to *R. grande* (*argenteum*); and *R. dahuricum*, the species figured by us last week. A vote of thanks was unanimously accorded for the splendid exhibit and the interesting account which accompanied them.

*Oregon Conifers*.—Dr. Masters showed specimens of the cones and foliage of several species collected for Messrs. Veitch, and which will be further alluded to in our next issue. The *Paria* root, described at p. 302, was shown, as also the seedling *Welwitschia*, figured at p. 15. The Earl of Romney sent various leaves of diseased plants for observation and report. Some of them were apparently affected with the parasitic worm *Tylenchus*, of which so much has been said lately, and concerning which a further report will be made. A green-flowered Primrose was also exhibited.

Botanical Certificates were awarded to *Platoballis glossopogon*, remarkable among its genus for its large flowers, the segments of which are 3 inches in length, the base, and prolonged into a very long slender tail, as in some of the *Masdevallias*. The lip is small, oblong, chocolate-coloured, with a fringe of hairs at the tip. A similar award was made to the beautiful *Spathoglottis Lobbi*, a plant with a very slender, wiry flower-stalk, with a single flower 1½ inch in diameter, clear canary-yellow, with broad ovate segments, and a lip with a narrow stalk and a spoon-shaped blade.

FLORAL COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. The subjects of greatest interest introduced to public notice on this occasion, and which received awards from the committee, were *Amaryllis Duchess of Connaught*, a medium-sized white of beautiful form; *Amaryllis Charles Dickens*, a fine bold flower, with broad smooth overlapping segments, scarlet in colour with a white longitudinal band in the centre of each; *Amaryllis Baron Schroeder*, a flower of excellent shape, and remarkable also for its intense crimson-red colour; *Rhododendron* (Princess Alexandra × Dickens of Edinburgh), a most pleasing novelty with a large truss of orange-salmon coloured blossoms; *Rhododendron Excelsior* × (*Princess Royal* × *Javanicum*), a very fine hybrid, with large flowers of a salmon shaded buff colour with reflexed lobes; and *Oncidium fuscatum* album, a variety with a broad white lip, having a large lilac blotch in the centre, all from the nurseries of Messrs. James Veitch & Sons; *Galeandra nivalis*, a remarkable and rarely seen Orchid, from Sir Trevor Lawrence, and especially slender spindle-shaped, glaucous pseudobulbs and grassy foliage, and flowers in racemes, each flower having narrow, reflexed, rich olive segments and a funnel-shaped lip, the fore part expanded into a broad, flat white lobe, with a large central violet blotch. *Odontoglossum crispum* var. *Stevensi*, from Mr. Stevens, Trentham, a form with flowers measuring 3 inches across; sepals oblong-lanceolate, petals of the same form but waved at the edges, heavily barred and spotted with brown; lip oblong, spotted with a clear yellow disc. *Cuslogyne glandulosa* with flowers 1½ inch in diameter, stary in outline, clear white, with the front lobe of the lip ovate acute, and white with yellow lines, from Mr. Parr, gr. to Mrs. Russell Sturgis, Givon's Grove, Leatherhead. *Cyclamens*, White Gem, Crimson Gem, and Rosy Morn, from H. Little, Esq. (see p. 370); *Abutilons* La Grande and Cloth of Gold from Mr. George (see p. 370); and *Cineraria* Mr. Cullingford, a large, handsome, refined, and of a rich crimson colour, with a shade of lake round the disc— from Messrs. H. Cannell & Son, Swanley. The Messrs. Veitch also had a flowering plant of the ivory-white *Phalenopsis tetraspis*, mentioned last week; *Dendrobium micans*, said to be a hybrid between *D. litiflorum* and *D. Wardianum*, but presenting only the appearance of a poor *D. litiflorum*; *Loropetalum chinense*, an old but valuable hardy Chinese shrub, allied to *Hamamelis*, but with linear white petals, and leaves like those of *Ficus repens*; *Abelia serrata*, a pretty half-hardy shrub, with slender branches, small ovate leaves, and pale flesh-coloured, funnel-shaped flowers; *Rhododendron Early Gem*, an admirable variety for early forcing; and *Cydonia japonica* alba, a pure white-flowered variety of great beauty and usefulness. Messrs. Paul & Son, Chess-hunt, showed some well-flowered half specimen *Roses*, nice examples of such well-known sorts as *Anna Alexieff*, La France, Madame Victor Verdier, Madame Lacharme, Princess Mary of Cambridge, Madame de St. Joseph; and with these were also some well-flowered small Ghent Azaleas and a new perpetual *Polyantha* Rose named *Mignonette*, dwarf and neat in habit as a Fairy Rose, with double peach-coloured blossoms. Mr. John Odell, Florist, Gould's Green, Hillingdon, had Mr. Williams' *Primula alba* magni-

fica, and another good white named *Purity*; and Mr. E. S. Williams had a choice group of his fine strain of gigantic *Cyclamens*. The superb *Cineraria* March Past and other fine varieties, together with purple and white Violets, the latter Swanley White, and the finest double white yet introduced; and *Polyanthas* James Douglas, a dark ground, gold-laced flower, with very bright and clearly defined lacing, came from Messrs. Cannell & Son. Mr. Salter, gr. to J. Southgate, Esq., Streatham, had a small flowering plant of *Dendrobium Brymerianum*, the species so remarkable for its clear yellow flowers with its deeply ringed and bearded lip. Mr. Bennett, of Shepperton, had a nice lot of cut blooms of some of his pedigree *Roses*, and flowering plants from the graft of Lady Fitzwilliam and Earl of Embroke, both unmistakably showing the Tea cross, the latter especially both in foliage and scent, and which should, moreover, be welcomed for its fine dark colour. *Narcissus bulbocodium*, a form with paler sulphur-yellow coloured flowers than the ordinary *Hort*-petticoat *Narciss*, came from Mr. Mearns, gr. to J. L. Lewelwy, Esq., Atherton Green, Wimbledon. Amongst interesting *Cinerarias*, shown in a cut state must be included *Cineraria Webbiana*, with narrow violet-pink ray florets, and curious as being found wild in the Canary Islands only; *Anemone capensis* with very deeply cut rigid dark green evergreen Parsley-like foliage, and large lilac flowers; and *Arisema Sieboldii*, with bold 3-lobed leaves and purple spathes incurved at the tip, all grown and exhibited by Mr. Green, gr. to Sir G. Mackley. Very fine blooms of double-flowered *Cinerarias* of various colours, from Mr. Vertegans, of the Chad Valley Nurseries, Birmingham; those of *Vortiger*, bright rose-purple; *Edgastonia*, dark rose-purple; and *Purple Perfection*, a bunch of Violets in miniature, being especially commendable. A pretty rose-coloured variety of *Rhododendron* in the way of *R. Nobleanum*, grown in the open air, from J. J. Whibley, Esq., Bulmershe Court, Reading; very beautiful blooms of various varieties of *Rhododendrons*, all from the open air, and sent by Mr. Martin, The Brake, St. Austell, Cornwall; delicately scented blooms of the fine white *Hymenocallis macrostaphana*, from Mr. Woodbridge, Syon House; seedling Tree Carnations, of bright colour, good form, and grateful odour, from Mr. Turner, of Slough; and Violets, blue and white, the latter Swanley White, the finest double white variety yet introduced, from Messrs. Cannell & Son.

#### First-class Certificates.

To Messrs. Veitch & Sons, for *Amaryllis Duchess of Connaught*.

To Messrs. Veitch & Sons, for *Amaryllis Baron Schroeder*.

To Messrs. Veitch & Sons, for *Amaryllis Charles Dickens*.

To Messrs. Veitch & Sons, for *Rhododendron Excelsior*.

To Messrs. Veitch & Sons, for *Rhododendron Montich*.

To Messrs. Veitch & Sons, for *Oncidium fuscatum album*.

To Mr. Stevens, for *Odontoglossum crispum Stevensi*.

To Sir Trevor Lawrence, Bart., M.P. (Mr. Spyers, gr.), for *Galeandra nivalis*.

To Messrs. Cannell & Son, for *Cineraria Mr. Cullingford*.

To Mr. George, for *Abutilon La Grande*.

To Mr. George, for *Abutilon Cloth of Gold*.

To H. Little, Esq. (Mr. Wiggins, gr.), for *Cyclamen persicum Crimson Gem*.

To H. Little, Esq., for *Cyclamen persicum White Gem*.

To Mr. Parr, for *Cuslogyne glandulosa*.

#### Second-class Certificate.

To H. Little, Esq., for *Cyclamen persicum Rose Queen*.

#### Cultural Commendations.

To J. C. Bosc, Esq. (Mr. Spyers, Clinkhumbury), for a specimen of *Lycaste investiens* with 325 blossoms.

To Sir T. Lawrence (Mr. G. G. G., gr.), for handsome pan of *Pleione humilis*.

#### Medals.

Silver-gilt Flora to H. Little, Esq., for group of *Cyclamens* and *Cinerarias*.

Silver Flora to Mr. H. B. Smith, Ealing Road, for group of *Cyclamens*.

Silver Flora to Messrs. Paul & Son, Chesshunt, for a group of pot *Roses*.

Bronze Banksian to Mr. B. S. Williams, for a group of *Cyclamens*.

FRUIT COMMITTEE.—H. J. Veitch, Esq., in the chair. At this meeting seedling Apples, the March Queen and Barnack Beauty, from Mr. Gilbert, of Burghley, and Henry Webb, from Mr. Laxton, of Bedford, were submitted for judgment, but were not considered improvements on existing sorts. Mr. Tadmor, Bushy Bottom, Tooting Common, sent some French Beans named *Australian Prolific*, which were stated to be four days earlier, under the same treatment, than *Osborn's Early Forcing*, the results perhaps of the seeds having been ripened in an earlier climate. Mr. Barter, of the Ifarow Road, again brought some good Mushrooms, grown in the open-air beds.

Notices of Books.

On and Off Duty; being Leaves from an Officer's Note-book. By S. P. Oliver, late Captain R.A., &c. With Illustrations by the Author. London: W. H. Allen & Co.

Too often we lay down books of travel with a feeling of sorrow, if not of downright vexation, that it should have fallen to the lot of the author to have had opportunities of travel and observation which he could not, or did not, turn to any good account. It is not indeed to be expected that every traveller can be a trained observer capable of recording faithfully all he sees, of whatever nature, or a writer skilled in the art of laying before his readers clear and vivid accounts of what is most noteworthy. Nevertheless, the reader has a right to expect in all and every case an intelligent and faithful narration, while absence of detail relating to particular subjects is readily overlooked if the writer is careful to avoid writing about what he has no knowledge of. Anything more aggravating, for instance, to the reader desirous of obtaining some information as to plants and the particular conditions under which they grow than the way in which some writers allude to the subject can hardly be conceived. Only the other day we had occasion to comment on the raptures of one traveller over the Bougainvillea in Madeira—raptures justifiable enough in themselves, but which rendered the writer ridiculous when he went on to assert that the plant could not be grown in England, all oblivious of the fact that there are few conservatories in the kingdom of which the plant does not form a chief ornament.

Captain Oliver is no such traveller. Although he modestly disclaims any reputation as a man of science it is abundantly clear that his natural faculties and tastes, aided, no doubt, by his military education, have made him an excellent observer. His information is so extensive, his appreciation so catholic that every page betokens a well-read and keenly observant man, with sympathetic appreciation of the questions which are uppermost in scientific circles. With some exceptions the places visited by Captain Oliver are now so well known that a passing visitor has little chance of hitting upon anything not already thrice chronicled. Over the most well-trodden ground, however, Captain Oliver proves himself a delightful and cheerful companion, even on the look-out for what is noteworthy, and always keenly appreciative of the humour of the situation. But Captain Oliver has to tell, not only of Malacca, Ceylon, and of Chinese and Japanese seaports, but of the much less generally known districts, such as Madagascar, Réunion, St. Helena, and Central America. Captain Oliver's travels extended over many years, so that his narrative suffers in some cases from the delay that has taken place in its publication. This is notably the case in reference to Japan, the author's account of which seems meagre by the side of the more recent and complete narrative of the opening up of the country has rendered possible. On the other hand, for the very reasons we have mentioned, Captain Oliver's book will have a distinct historical value; and as the old order is rapidly changing, his faithful account of things as they were will be so much the more valuable. The visit to Tsing Yuen and Peking soon after the Treaty of Tientsin, and to Yeddo, soon after the attack on the Legation, are instances in point; at that time there was much truth in the saying that "a night at the Legation at Yeddo was not unlike a day's duty in the trenches before Sebastopol."

Perhaps the most novel part of Captain Oliver's book is the chapter relating to Réunion. In that island the author partook of the "Palmist" or Cabbage Palm—a circumstance we allude to here because one of our correspondents, a traveller also, lately threw doubts upon the frequency of the use of the "Cabbage," on which account we quote from the volume before us— "There were several kinds of vegetable, but Palmist predominated, and both as a salad and au gratin it was excessively good. These Palmistes or Cabbage Palms are cultivated extensively in Bourbon for the sake of their choss [chou] or Cabbage. . . There are three descriptions of the Chou Palmiste, viz., Areca alba, A. crinita, and A. rubra. The tree is cut down to obtain the soft tender shoot in its spathe which forms the Cabbage. But the thrifty Bourbonnais never cut down one tree without planting another, and they have them planted in rows in succession, in order that as the tree arrives at its early maturity for the table, there are others ready to take its place." On the other hand one Areca, A. lutescens, is reputed poisonous; the glaucous colour of its foliage, and the bitter taste of its Cabbage render it readily recognisable. The occurrence of a poisonous species is noteworthy among Palms.

Captain Oliver has taken pains to insert from the narratives of more recent travellers fuller details where the nature of the subject demands it, while by his copious and well selected references to writers on the geology, natural history, and ethnology of the countries visited he has rendered his work a veritable book of reference, of the more usefulness as it is provided with an index. But we are trespassing on the patience of our readers, for is not Captain Oliver known to them as the author of many notes in these pages, and have they not been enriched by numerous singularly effective representations of tropical scenery and vegetation from his sketch pencil, many of which are reproduced in the present volume? To such a friend no introduction is needed; many, however, will be glad to learn that the versatile and accomplished author's narrative is now published in a separate and much extended form the only defect in which, so far as we see, is a lack of condensing power, several statements of interest only to the author or his immediate friends being allowed to be made public.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MARCH 15, 1882.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, Hygrometrical Data, WIND, RAINFALL. Includes data for Mar. 10-15 and a weekly mean.

- Mar. 9.—A fine warm day. Overcast. Mild night.
10.—A fine warm day. Overcast. Fine warm night.
11.—A fine, overcast day. Gloom and darkness in the morning, rain all the evening.
12.—A fine morning; fog and darkness prevailed for a time. Fine night.
13.—Hoar frost and fog in early morning. A fine bright day; sun shining. Fine night.
14.—A very fine bright day; sun shining brightly. Fine night.
15.—A very fine bright day; sun shining brightly. Fine night.

LONDON: Atmospheric Pressure.—During the week ending March 11, the reading of the barometer increased from 29.77 inches at the beginning of the week to 29.80 inches by 9 A.M. on the 5th, decreased to 29.58 inches by midnight of the same day, increased to 29.28 inches by midnight of the 6th, decreased to 30.23 inches by 3 P.M. on the 7th, increased to 30.27 inches by 9 A.M. on the 8th, decreased to 30.24 inches by 3 P.M. of the same day, increased to 30.37 inches by 9 A.M. on the 9th, decreased to 30.29 inches by midnight of the same day, and was 30.46 inches at the end of the week.

The mean reading for the week at the level of the sea was 30.19 inches, being 0.85 inch higher than last week, and 0.08 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 55° on the 8th and 10th. On the 6th the highest temperature reached was 49°.5. The mean of the seven high day temperatures was 53°.

The lowest temperature in the shade in the week was 36° on the 7th; on the 10th the lowest temperature was 48°.5. The mean of the seven lowest temperatures was 43°.2.

The greatest range of temperature in one day was 16°.5 on the 7th; the smallest was 5°.8, on the 9th. The mean of the seven daily ranges was 9°.8.

The mean temperatures were, on the 5th, 46°.5; on the 6th, 43°.8; on the 7th, 45°.8; on the 8th, 50°.8; on the 9th, 50°.7; on the 10th, 51°.4; and on the 11th, 48°.8. And these were all above their averages by 6°, 3°.3, 5°.3, 10°.3, 10°.2, 10°.8, and 8°, respectively.

The mean temperature of the air for the week was 48°.3, being 3°.6 higher than last week, and 7°.7 above the average of the week.

The highest reading of a thermometer with black-

ened bulb in vacuo, placed in the full rays of the sun, was 82°.5; on the 9th; the highest on the 7th was 54°. The mean of the seven readings was 67°.

The lowest readings of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 30°.8, on the 7th. The mean of the seven readings was 38°.9.

Rain.—Rain fell on two days to the amount of 0.19 inch.

ENGLAND: Temperature.—During the week ending March 11 the highest temperatures were 67° at Sunderland, 63° at Sheffield, and 62°.4 at Nottingham. The highest temperature at Blackheath was 55°, at Plymouth 55°.3, and at Bristol and Bolton 50°.5. The general mean was 59°.1.

The lowest temperatures in the week were 29° at Hull, 30°.5 at Wolverhampton, and 30°.7 at Bolton. The lowest temperature at Truro was 43°, at Bristol 38°.5, and at Liverpool 38°.4. The general mean was 34°.7.

The greatest ranges of temperature in the week were 35° at Sunderland, 31° at Hull, and 30°.8 at Nottingham. The least ranges were 17° at Truro, 18° at Bristol, and 18°.4 at Liverpool. The general mean was 24°.4.

The mean of the seven high day temperatures was highest at Sunderland, 62°.5; at Cambridge 57°, and at Truro, 56°.3; and was lowest at Bolton, 50°.8; at Bradford 52°.5, and at Brighton, Blackheath, and Wolverhampton, 53°. The general mean was 54°.6.

The mean of the seven low night temperatures was highest at Truro, 47°, at Plymouth 45°.5, and at Bristol 45°.4; and lowest at Hull, 37°.6, at Wolverhampton 39°.5, and at Sunderland 39°.8. The general mean was 42°.3.

The mean daily range was greatest at Sunderland, 20°.7, at Hull 17°.7, and at Nottingham 15°.5; and was least at Bristol and Plymouth, 8°.2, and at Truro, 9°.3. The general mean was 12°.3.

The mean temperature for the week was highest at Truro, 50°.9, at Cambridge 49°.7, and at Sunderland 49°.4; and was lowest at Bolton, 44°.8, at Wolverhampton 45°.4, and at Hull 45°.8. The general mean was 47°.7.

Rain.—The largest falls were 0.46 inch at Liverpool, 0.45 inch at Bolton, and 0.43 inch at Plymouth and at Bristol. The smallest falls were 0.03 inch at Leicester, 0.05 inch at Sunderland, and 0.07 inch at Nottingham. The general mean was 0.23 inch; it fell on an average of from three to four days.

SCOTLAND: Temperature.—During the week ending March 11 the highest temperature was 57°.6, at Aberdeen; at Greenock the highest temperature was 53°. The general mean was 55°.4.

The lowest temperature in the week was 29°.2, at Aberdeen; at Paisley the lowest temperature was 33°.5. The general mean was 30°.9.

The mean temperature for the week was highest at Paisley, 46°.2; and lowest at Greenock, 42°.5. The general mean was 44°.5.

Rain.—The largest falls were 2.74 inches, at Greenock, and 1.81 inch at Paisley; the smallest was 0.35 inch at Aberdeen. The general average fall was 1.35 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—BACON.

ICE STORING IN SAWDUST.—Has any antiquary among your correspondents traced this practice to an earlier date than the casual experiment recorded in your journal for January 10, 1857, pp. 20 and 38? A. M. V.

POMEWATERS.—I am anxious to ascertain about the word "Pomewaters." It is the name of a kind of Apple made use of some two hundred years ago medicinally. Will you tell me what it means? Can you refer me to any book which will tell me about this variety of fruit? [Webster states—"Pomewater, a sweet juicy Apple." "Ripe as a Pomewater's Shakspeare; Love's Labour Lost." See also Gerard's Herball, where the medicinal virtues are enlarged upon. This Apple, which is now not known, is also the subject of comment in Mr. ELLacombe's Plant Lore of Shakspeare.] Also, what is meant by "Pomum Canisum"? What does the adjective "canisurum" signify as used of Apples, thus—"Take of 'Pomum canisurum' 2." J. W. O.

Answers to Correspondents.

ANEMONES: H. Loth. Fine varieties of Anemone hortensis and A. coronaria.

AZALEA APOLLO: J. Hoskin, Toronto. It is quoted in the catalogue of the nurserymen who grow greenhouse plants for sale, and we should think there would be no difficulty in getting it from any leading nurseryman in the States.

"CHARITY" E. W. Pamplin. The plant popularly called Charity is Polemonium coerulescens.

ERATUM.—At p. 258, in the paragraph on Plant Labels, for "painted" labels, read "pointed" labels.

GOOSEBERRY CULTURE IN LUCERNE: J. W. For

anything we know the Gooseberry ought to grow quite well in the canton of Luce.

HYACINTH MALFORMED: C. L. S. A very common occurrence.

NAME OF APPLE: H. W. Emperor Alexander.

NAMES OF PLANTS: A. M. We cannot name florists flowers. You should take them to some nursery where Camellias and Azaleas are specially... D. M. Helloborus viridis... W. G. W. We are glad to assist so far as we can... with our more paramount engagements...

ORCHIDS AU NATUREL: Orchid-grower. What was intended was simply that the plant spoken of is grown in such a way as closely to imitate natural conditions, being pendulous from a slab of wood or bark, as if growing upon a tree.

PEACH BLOOMS NOT SETTING: Gardener. We cannot tell you, in the absence of any details as to the manner in which you have been treating the trees. If they are in a proper state as regards moisture and bracing, there should be no difficulty; though of course you cannot expect them to do so well as those more favourably situated.

PRIMULA: S. K. A poor form of Chiswick Red.

SENECIO SPATHULIFOLIUS: C. W. D. According to Prof. Babington (Journal of Botany, February, 1882) this is distinct from S. campestris. You can refer to the catalogue in question, the compiler being an authority on such questions.

COMMUNICATIONS RECEIVED: J. H. B., Mentone.—C. G., Fendell Court, not uncommon.—M. Lafosse (we are greatly obliged for your note on the subject). You can refer to the catalogue in question, the compiler being an authority on such questions.

DIED, at Mid-Vell, Shetland, on the 7th inst., WILLIAM DALRYMPLE PATERSON, L.R.C.S., and L.R.C.P. Edinburgh, eldest son of Dr. Paterson, Bridge of Allan. All friends will kindly accept of this the only intimation.

Markets.

COVENT GARDEN, March 16. The fine weather is bringing early forced fruits and vegetables in large quantities to our market, and prices have considerably fallen all round, Grapes alone maintaining their full value. James Webber, Wholesale Apple Market.

A SEED LIST

ILLUSTRATED and as full as can be desired of useful and reliable information on Garden and Flower Seeds, yet without any unnecessary costliness, post-free on application. Such a catalogue as this is claimed to be must of necessity conduce to economy, both as regards purchase and use. In addition to the well known and trusty varieties in Seeds, the BEST NOVELTIES are included, but unproved and excessively expensive kinds are omitted.

Every endeavour is made to supply Seeds of the Finest Quality and of the Best Varieties at a Moderate Price, to attain which desirable object neither trouble nor expense are spared in the procuring and proving of the Seeds.

THE GUINEA COLLECTION

(Carriage free), for the Amateur's Garden, has been much approved, and contains a most valuable and useful assortment of Vegetable Seeds.

All enquiries are gladly and promptly attended to. RICHARD SMITH & CO., Seed Merchants & Nurserymen, Worcester. ESTABLISHED 1804.

The quality is excellent, having been harvested in fine order, and the prices will be found exceptionally low.  
Seed Growing Establishment, Wisbech.

# CONTINENTAL COMPANY OF HORTICULTURE

(Formerly J. LINDEN),  
52, RUE DU CHAUME, GAND. 5, RUE DE LA PAIX, PARIS.

## NEW "BEDDING-OUT" PLANT,

ANNOUNCED FOR THE FIRST TIME, AND WHICH WILL BE SENT OUT ON APRIL 1, 1882. ORDERS WILL BE ATTENDED TO CONSECUTIVELY.  
GYNURA AURANTIACA.

The eminent botanist of the Royal Kew Herbarium, Mr. N. E. Brown, speaks thus of this beautiful plant in the ILLUSTRATION HORTICOLE for 1881, the last part:—  
"The *Gynura aurantiaca* is a hardy plant belonging to the Compositae, and is of such an ornamental character as to allow of one's saying that it is not surpassed by any other plant of the same class. The stem and leaves are clothed throughout their entire length with a thick covering of hairs, soft to the touch, and of a beautiful deep violet colour, which gives an appearance of richest velvet to the plant. This is more especially the case with the young leaves, and when combined with the brilliant orange of the flowers, the aspect of the plant is truly superb."  
"Without doubt it will gain great favour as an ornamental plant for the open borders."

As this plant in all probability will become as popular as *Iresine Lindeni* and *Coleus Verschaffeltii*, both sent out by this establishment, it will be sent out at a very low price in order that it may spread as rapidly as possible.  
Two plants 10s., 50s. per dozen.  
Orders will be booked from to-day, and all communications must be addressed to  
THE COMPAGNIE CONTINENTALE D'HORTICULTURE, 52, RUE DU CHAUME, GAND.  
The Illustrated CATALOGUE (English Edition) of NEW PLANTS will appear on April 1 next.

 SUITABLE FOR ALL CROPS.

Price, £3 10s. per Ton, in Bags, at Aylesbury.

A single 1 cut. Sample Bag sent, Carriage Paid, to any Railway Station upon receipt of Post-office Order for 5s.

This valuable Manure, prepared from Sewage by the "A B C" process, has been extensively used, for several years, by Farmers, Gardeners, and others, whose reports testify to its fertilising properties.

**EXTRACTS FROM LAST YEAR'S REPORTS:**

**WILLIAM CRUMP, Gr. to Duke of Marlborough, Blenheim Palace Gardens, December 10, 1881.**

"Used for Vines, Peach trees, and other fruit trees, also Potatoes, Carrots, Parsnips, Onions, &c. Results: satisfactory. Fruit trees assumed rich dark green foliage, increased vigour, whilst the fruit swelled up to a very fine size. Potatoes came out in splendid condition; other roots too were benefited by its application. No other manure used. Native Guano. Undoubtedly a valuable fertilising agent, and I shall lose no opportunity of recommending it to gardeners and others."

**SEASON'S REPORTS:—**

**A. BLAKE, Head Gr. to H. Cozenove, Esq., The Lilies, Wotton, January 3, 1882.**

"Used for Peas, Potatoes, Onions, Cabbage, Cauliflowers, Celery, Vines, Cucumbers, &c.; Chrysanthemums, Primulas, Geraniums, Fuchsias, &c. Results: Onions, Cabbage, Cauliflowers, and Peas good; Cucumbers, first-rate; Potatoes, a good crop, and I consider it a good manure for pot plants. I think the Native Guano only requires to be more known to the public to be largely used."

Sixteen Prizes awarded at Birmingham Show, 1881.

The Annual Show of Farm and Garden Produce, grown with Native Guano, will be held at Aylesbury in October next. Schedules and Prizes and all particulars, together with testimonials, &c., may be obtained upon application to

**The Native Guano Company (Limited), Aylesbury, Bucks.**

**WILLIAMS' NEW HOTHOUSE SHADING.**

The most suitable for Shading Orchids, Ferns, Palms, Stove and Greenhouse Plants.

After several years' successful trials at home, I have much pleasure in bringing this article before the notice of Orchard Growers, as being better adapted to the culture of Orchids and other plants than any other Shading. It is largely used by R. Warner, Esq., of Chelmsford, and many other successful cultivators of Orchideaceous Plants.

It is a strong durable Cotton Netting, woven in squares, so close as to exclude the direct rays of the sun, but at the same time admitting the greatest amount of light attainable through Shading. It withstands the weather better than any other class of Shading, and may be used beneficially during cold weather to keep the frost out, on account of the thickness of its texture. It stands exposure much longer than canvas, and is altogether a better article. It is astonishing to see the difference in the growth of Orchids shaded with this material, and those shaded with canvas; in the one case the plants receive the greatest amount of light attainable through Shading, and consequently grow more robust, and produce stronger spikes and better coloured flowers—in the other the plants are drawn up, the houses appear quite dark, the spikes become slender and weak, and the plants in many cases do not flower at all.

Blinds made up to any size and fixed complete.

Sold in pieces, 30 yards long by 1½ yard wide. Price, 45s. each.

Illustrated Circulars post-free. Standard Manufacturing Co., St. Edmund's-Churchyard, Derby. Sold by the principal Ironmongers and Seedsmen.

JONES'S PATENT "DOUBLE L" CONSTRUCTION SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	13 in.	18 "	300	7 0 0
20 "	18 "	24 "	400	8 0 0
24 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	10 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1200	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.  
From Mr. CHARLES YOUNG, Nurseries, Balkham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have worked."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, South-ward, London, S.E.  
When ordering Boilers please refer to the above advertisement.

Oil Paint No Longer Necessary.  
HILL and SMITH'S BLACK VARNISH,  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.  
Sold in Casks of about 20 gallons each, at 12. 6d. per gallon at the Manufactory, or 12. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.  
"Pierrefield Park, June 21, 1876.—SIR,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sir, yours respectfully, WM. COX."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade mark as above, without which none is genuine.  
Large Illustrated CATALOGUE of Heating, Hurdles, Field and Entrance Gates, &c., sent free on application to HILL and SMITH, Brerley Hill Ironworks, Staffordshire; 218, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

THE "AUTOMATON"  
  
SIZES, 8 to 22 inches.  
THE BEST GENERAL PURPOSE MACHINE.

The "AUTOMATON" Lawn Mowers are thoroughly strong, well-made, and durable machines, and the best suited for general work and Gardeners' use. They cut the grass perfectly, leave no ribs, but produce a smooth velvety surface on the Lawn, and are light in draught.

The "AUTOMATONS" have front rollers for general work, and side rollers for cutting long grass, or when it is necessary to roll the grass in front of the cutters. They have the best machine made gearing, the best self-sharpening knives of steel and iron rolled together, and automatic silent drivers.

R. H. & J. also manufacture "REVERSIBLE" Lawn Mowers for small Gardens and Borders, and "HORSE-POWER" Lawn Mowers for Large Lawns, &c.

MELBOURNE EXHIBITION, 1881, THE HIGHEST AWARD.

COMPLETE PRICE LISTS FREE BY POST.

STOCK KEPT IN LONDON at Arch 92, Spitafields Station. Bethnal Green, E., and Machines may be ordered from any respectable Ironmonger.

Ransomes, Head & Jefferies, ORWELL WORKS, IPSWICH.

THE "WORLD" (late "GLOBE") Lawn Mowers are intended for cutting long grass; and, whilst similar to the Lawn Mowers imported from America, have the special advantages of the more accurate fitting and general durability of English manufacture and perfect adjustment.

The "WORLDS" will cut wet, dry, long, or short grass without clogging, and cut off almost all the "bents." They leave the surface smoother than similar machines, and are well adapted for getting over a large amount of work with little labour.

FORESTER.—Married; experienced in Forestry and Estate Work in general. Highly recommended by present employer.—J. MITCHELL, Pole, Southmillford, Yorks.

By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the new and superior properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which will save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a family can be gradually built up until strong enough to resist every temptation to disease. Hundreds of subtle miasmas are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shak by consulting with Epps' Cocoa, and by the use of pure blood and a properly-couished frame.—*Civil Service Gazette.*

MADE SIMPLY WITH BOILING WATER OR MILK. Sold only in packets, labelled JAMES EPPS and CO., HOMOEOPATHIC CHEMISTS, London. Makers of Epps's Chocolate Essence for Afternoon use.

HOLLOWAY'S PILLS.—Nervous Irritability.—No part of the human machine requires more constant supervision than the nervous system.—For upon it our health, and even life depends. These Pills strengthen the nerves and are the safest general purifiers of the blood.—Nausea, headache, giddiness, umbrauses, and mental apathy yield to them. They displace in a summand manner the disturbing causes, symptoms, stomachic pain, fulness at the pit of the stomach, abdominal distension, and regulate alike capricious appetites and confined bowels. They are equally efficacious in cases of defective or diminished nerve tone. Holloway's Pills are particularly recommended to persons of studious and sedentary habits, who gradually fall into a most irritable state, unless some such restorative be occasionally taken.

# GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1882.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

the King of the Belgians,

the late Emperor of the French, the Emperor of Russia,  
and most of the Nobility, Clergy, and Gentry  
of the United Kingdom.

Upwards of 105,000 of these Machines have been Sold since they were first introduced in the year 1856,  
And Thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

## Single-handed Lawn Mower.

To cut 6 inches ... ..	Price £1 15 0
Can be worked by a Lady.	
To cut 8 inches ... ..	2 10 0
Can be worked by a Lady.

By a Man and Boy.	
*To cut 22 inches. By Two Men ...	8 10 0
*To cut 24 inches. By Two Men ...	9 0 0
* If made stronger, suitable for Donkey, 30s. extra.	

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

### DONKEY and PONY MACHINES.

To cut 26 inches ... ..	£14 0 0
To cut 28 inches ... ..	16 0 0
To cut 30 inches ... ..	18 0 0
Leather Boots for Donkey ... ..	1 0 0
Leather Boots for Pony ... ..	1 4 0

### HORSE MACHINES.

To cut 30 inches ... ..	£22 0 0
To cut 36 inches ... ..	26 0 0
To cut 42 inches ... ..	30 0 0
To cut 48 inches ... ..	34 0 0
Leather Boots for Horse ... ..	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the Machine.

# GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

### PRICES.

Without Grassbox.

To cut 6 in. ... ..	£1 7 0
To cut 7 in. ... ..	1 8 0
To cut 8 in. ... ..	1 15 0

This Mower is specially designed to meet an almost universal want experienced by those who have small lawns or grass plots, to have a good and useful machine at a low price. The inventor having seen this want continually increasing, year by year, has brought out the Mower to meet the requirements of the public by supplying a good and useful machine at a cheap rate.

It is simple in construction, easily adjusted, is well adapted for mowing small plots, cutting borders, verges, round flower beds, the edges of walks, &c.; it is a most handy, serviceable machine, and very easy to work.

### PRICES.

With Grassbox.

To cut 6 in. ... ..	£1 5 0
To cut 7 in. ... ..	1 13 0
To cut 8 in. ... ..	2 0 0

## GREEN'S PATENT GRASS EDGE CLIPPER.

Specially designed to cut the overhanging grass on the edges of walks, borders, flower beds, &c., and to do away with the tedious operation of cutting with shears.

### SIZE and PRICE.

Wide.	Diam.
8 inch ..	7 inch ..
Packing Case, 2s.	

## GREEN'S PATENT LAWN TENNIS COURT MARKER.

This Machine is of novel design and construction, and the simplest and most effective in its operations.

In the trough containing the liquid there is a loose drum which revolves when the machine is in motion, and conveys the marking material to the intermediate pulley, which in its turn transmits it to the front one, so that the ground is marked effectively as the machine is pushed along.

Price, 21s.

Small Bag of Patent Marking Composition, Mat, and Packing, 1s. 6d.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Garden Seats and Chairs, and Horticultural Implements of every description, Wire Netting, &c., &c.

Descriptive Illustrated Price Lists free on application to

THOMAS GREEN & SON (Limited), Smithfield Ironworks, Leeds; and 54 and 55, Blackfriars Road, London.

ROYAL HORTICULTURAL SOCIETY, South Kensington, S.W.

NOTICE.—COMMITTEES' MEETINGS, Fruit and Floral, at 11 A.M.; Scientific, at 3 P.M.; General Meeting for the Election of Fellows, &c., at 7 P.M., on TUESDAY NEXT, March 28.

SPECIAL PRIZES OFFERED BY A FELLOW OF THE SOCIETY FOR AMATEURS. For nine pots of Hyacinths, twelve spikes, distinct kinds; and nine pots of Tulips, not less than three kinds.

PRIZES FOR AMARYLLIS. An Amateur, anxious to encourage the cultivation of this fine tribe of Plants, offers the following Prizes to be completed for at the Royal Horticultural Society's Meeting, on TUESDAY, March 28.

(A) For the Best Seedling.—1st Prize, £5 .. 2d Prize, £3 .. 3d Prize, 15s.
For form and substance are the points especially aimed at in the prizes in Class A. To be eligible the flower must be smooth in petal, of good firm substance, without the unevenness of the Margenta conspicua type, and as little pointed in the petal as possible. Colours will not be considered unless two flowers should be in the two pots, considered equal in merit; the better colour of the one would then receive the higher prize.
(B) For the best six Amaryllis, named, three to be dark and three light varieties.—1st Prize, £5 .. 2d Prize, £3.
These prizes will be awarded only on condition that the exhibits are considered to be of sufficient merit. Form, substance, and breadth of petal are necessary points.

ROYAL BOTANIC SOCIETY GARDENS, Regent's Park, W.

THE FIRST SPRING EXHIBITION will take place on WEDNESDAY NEXT, the 29th inst. Closes open at 2 o'clock. All entries should be made five days before the Exhibition.

Wm. CLEVERAN AND SON, Oldfield Nursery, Altrincham.

**WILLIAMS'**  
**PRIMULA SINENSIS FIMBRIATA**  
**ALBA MAGNIFICA;**  
*Sold only in Sealed Packets, bearing my Trade Mark.*  
Per packet, 2s. 6d., 3s. 6d., and 7s. 6d.

This magnificent Primula, of exquisite form and substance, was sent out last year for the first time. It is now acknowledged by Amateurs and Cultivators of all descriptions to be the finest White Primula yet introduced. It is of an exceedingly compact habit, with deeply indented leaves of a bright green colour; the flowers measure 2½ inches in diameter, and are of a pure white colour, with a large, bright, yellow eye in the centre: each petal is deeply and beautifully fringed. It retains its blooms longer than any of the other Primulas.  
Numerous testimonials have been received from all parts of the world, which bear ample testimony to the surpassing merits of this splendid Primula, and my customers invariably express, in the most unqualified terms, the satisfaction it has given them.  
*The seed should now be sown.*

Mr. H. ELLIS, *Gr. to W. Agnew, Esq., M.P., Sunnyside, Pentonville, Manchester, writes in the "Gardener's Chronicle" of March 3, 1882, as follows:—*  
"I have grown most of the leading strains of Primula sinensis during the last thirty years, but I consider Mr. B. S. Williams' *alba magnifica* the finest White Primula I have yet seen. It not only produces beautiful flowers, but the habit of the plant is so good with its rich beautifully curled foliage, not unlike the curled Mallow used for garnishing. Its lovely flowers are carried well above the foliage—a habit which adds much to its beauty."

For further particulars of FLOWER and VEGETABLE SEEDS see Illustrated SEED CATALOGUE, which will be forwarded, post-free, on application.

**B. S. WILLIAMS,**  
*Seed Merchant and Nurseryman,*  
VICTORIA and PARADISE NURSERIES,  
UPPER HOLLOWAY, LONDON, N.

**ORCHIDS.**  
The Largest and Best Stock in Europe of  
good Established Plants.  
Tens of Thousands of Plants to select from.

**MR. WILLIAM BULL**  
Pegs to intimate that his Orchid-houses are always  
quite a sight, from the large number of plants in flower,  
and he will be pleased to show them to any one inter-  
ested in this beautiful class.

**MR. WILLIAM BULL**  
Recommends those desirous of having their Houses  
gay with Orchid flowers, to purchase good established  
well-cultivated plants, which bloom well, are far more  
satisfactory, and comparatively cheaper than newly im-  
ported or semi-established plants.

**Establishment for New and Rare Plants,**  
636, KING'S ROAD, CHELSEA, LONDON, S.W.

**Orchids a Speciality.**

The stock at the Clapton Nursery is by far  
the largest hitherto seen in Europe, and is of  
such magnitude that, without seeing it, it is not  
easy to form an adequate conception of its un-  
precedented extent.

**HUGH LOW & CO.**

very cordially and respectfully solicit an inspection  
by all lovers of this interesting and beautiful  
class of plants, whether purchasers or not.

CLAPTON NURSERY, LONDON, E.
