THE TRAINING OF FRUIT TREES ON WALLS.—The remarks by *B.*, p. 149, relative to the old-time method of training fruit trees on walls are interesting. The note by *E. M.* on the subject, p. 172, is of too sweeping a character, if not wholly inaccurate, as applied to professional gardeners. During a long experience in representative gardens in England, Ireland, and Scotland, I have never once come across such examples of training fruit trees on walls as described by *E. M.* in gardens presided over by duly-qualified gardeners. The shoots of the Peach and Morello Cherry should be trained at 4 inches apart on the prescribed wall space allowed to each tree, and should radiate at the same angle from the centre on either side. The Peach, Nectarine, and Morello Cherry need the same methods of pruning and training. They only require the shoots to be thinned out a little and shortened, those of the Peach and Nectarine to a wood-bud. Strong, leading shoots should be cut out where they can be dispensed with in order to ensure an equal distribution of the shoots over the space allotted to each tree on the wall. These trees require more time and skill to train them properly than any other kind of fruit tree, including Apricot, Pear, and Plum. The pruning and training of the Morello Cherry should be proceeded with as soon as the leaves drop; but January is quite soon enough to prune and trim Peaches and Nectarines. I always cut out as many of the old branches of Fig trees in May as there are shoots of the previous year's growth to take their place. By so deferring the pruning of these trees the wounds bleed very little, if at all, because the sap is drawn to the leaves. The writer has had charge of gardens for over a quarter of a century, in which there is nearly a mile of walls devoted to fruit trees. Nearly 300 yards of these walls, from 9 to 12 feet high, are devoted to Peach and Nectarine trees, more than 150 yards to Morello Cherries, and nearly as much space to Fig trees. Four men were engaged in nailing and training fruit trees from November to February, at which date the head nailer (after the Figs were attended to) took charge of the trees for the remainder of the summer and early autumn months. *H. W. W.*

POLYSTICHUM ACULEATUM GRACILLIMUM DRUERYI.—From Mr. Druery's courteous rejoinder (see p. 188) to my note, two facts become evident. First, that his notions of nomenclature are somewhat hazy, as he states that two out of the four names are specific, whereas the first is, of course, generic, and the second only specific. The next in order (third, which is really varietal) he states "is descriptive, and distinguishes the Fern clearly from the one of the same section previously certificated." But how can such vague terms as "pulcherrimum" and "gracillimum" be considered descriptive and distinctive? On Mr. Druery's own showing (p. 98), the true distinction of *P. a. pulcherrimum* is in "the terminal pinnules of the frond," being "deeply serrate, forming a sort of fringe." A truly descriptive and distinctive name, therefore, would have been "serratissimum" or "fimbriatum." It is interesting to learn that the fourth was originally intended to indicate the authority for the name, but was included through an accident, and it was not thought worth while to correct the error. (Shades of Linné and his binomial system!) Second, that Mr. Druery's statements are not intended to be taken too literally, for, although he avers that "it is not stated that they (the seedlings) reverted to another allied species, but that they had a strong resemblance to it," a reference to p. 98 will make it clear that he did state "but several reverted to an extremely near approach to . . . *P. angulare*, a closely-allied species." As to the R.H.S. finding difficulty in enforcing the regulations of the Vienna Code of Botanical Nomenclature upon the varieties of plants submitted for awards, there is no need for attempting

this in the case of "fancy names"; but where scientific names are concerned, it should not be beyond the wits of the R.H.S. Committees to follow these regulations, seeing that the whole of them (English edition) are contained in 23 pages 8vo., and it should, moreover, be borne in mind before anything that names, once published, are not the exclusive property of those "in the cult," but belong to the far wider, general, scientific public. *Tyro.*

MARKET GARDENING IN FRANCE.—At a time when the French system of intensive culture is being much talked of in this country, the following extracts from an article in a recent issue of *La Tribune Horticole* may be of interest:—"In the majority of the 'regions maraicheres,' especially in the environments of Namur, the forcing of vegetables on hot-beds is not profitable, and the growers are unanimous in acknowledging it. The culture of vegetables on hot-beds entails considerable labour, and is costly; the grower cannot always procure as much manure as is necessary, and often he has to pay a very high price for it. Fermentation is not always uniform, and cannot be regulated; it is never durable enough for subjects of slow growth. For these it is necessary to remake the beds, and even then growth is often checked for several weeks. Further, the fermentation of the manure creates excessive moisture, which does not easily evaporate, seeing that one cannot ventilate regularly during dull weather; the result is an abnormal vegetation, with tissues gorged with water. Early vegetables can be produced more easily and more economically from structures heated by hot water than by culture on hot-beds." *W. Aulon, Brougham Gardens, Penrith.*

THE WONDERBERRY.—Another American creation, this time a cousin to the Potato and the Tomato, but more remarkable than either; more even than the Pomato from the same source! Two *Solanums*, namely, *S. guineense* and *S. villosum*, were taken, juggled with, and out came a miracle, the "Wonderberry." It will grow anywhere in any soil, except rich; it will fruit as no other plant can; and its fruits are just the thing for tarts and jam. A few seeds in a small packet, bearing on one side a portrait of this marvel, and on the other the cultural instructions—"Sow early under glass like Tomatoes, and transplant to garden at the proper time." Nothing simpler. An enthusiastic friend sent me a packet, and told me not to worry over Black Currant mite or Gooseberry-mildew any more, but to grow Wonderberry and make my family happy. The seeds looked ordinary and the given origin excited curiosity, so I proceeded to look up the history of the two reputed parents. They proved to be nothing other than forms of *S. nigrum*, a weed in every country*; therefore, the Wonderberry is *S. nigrum* also. The seeds, on careful comparison, proved it beyond doubt. Then I remembered that this same story had been round in another form about two years ago, but the name given then was Huckleberry, instead of Wonderberry, and it came from a Toronto nurseryman—"Easily grown, quite hardy, matured from seeds in five months, black fruits, no stones, nothing to equal it for pies, jams, sauces, and canning, insect-proof, and frost improved the flavour." We grew some plants of it from seeds obtained from Toronto, and they turned out to be simply Nightshade—*S. nigrum*. What does it all mean? Every intelligent child shuns the fruits of this weed of waste land and manure heaps, the poisonous properties of which are undoubted. Children who have eaten the fruit have died soon after from its effects, which are very distressing—vomiting, colic, convulsions, &c. Mr. N. E. Brown informs me, however, that in some countries the fruits of *Solanum nigrum* are not only innocuous, but they are actually eaten, and on consulting various books I found several records to that effect. A Russian chemist who had investigated the question as to the berries being poisonous in some countries and harmless in others concluded that the difference was not due to any difference in the plants, but to variations in the climatic conditions under which the fruits were grown, the narcotic principle being either undeveloped or finally dispelled

under the influence of certain conditions, of which heat and light were probably the most important. It is, therefore, quite possible that the Nightshade is poisonous in Great Britain and harmless in America. After all, are we so hard up for fruit as to be forced to turn to one of our most pestiferous weeds, which is also known to be a deadly poison, because we are advised to do this by some seedsmen in America? *W. W.*

EUPHORBIA PULCHERRIMA (see p. 156).—We have cultivated plants in these gardens that have measured 18 inches across the bracts and well formed in every respect. The usual size, as *E. H. J.* remarks, is 10 to 12 inches. The cuttings from which these plants were propagated were taken the third week in May from rested plants in pots of the previous year's flowering. They were made with a heel of the old wood and inserted in thumb-pots in a propagating frame. When rooted, they were potted several times, the last shift being to 7-inch pots. The plants were placed in a cool house during the summer months, but when the weather became colder they were shifted to an intermediate house. When the bracts appeared they were put into a still warmer house, where the temperature was 70°, but they were returned to the intermediate house when the bracts had fully developed. Care in watering is one of the chief items in the successful cultivation of these plants; when dry at the roots they soon lose their bottom leaves. Some cultivators keep their plants in a heated structure all through the growing season, but this is a mistake. *Moschosma riparium* is an excellent companion plant for *E. pulcherrima* in decorative work. The white blooms of the *Moschosma* form an excellent background to the scarlet bracts of the *Euphorbia*. *T. A. C., Canons Park, Edgware.*

THE NEW GRAPE BOTTLE (see p. 175).—As the idea for this bottle was conceived by myself I may, perhaps, be allowed to reply to the criticism passed upon it by members of the Fruit and Vegetable Committee as stated by *D.* in last week's issue of the *Gardeners' Chronicle*? Absorption takes place only from the end of the stem inserted in the water; therefore, there is no advantage in having a greater length of stem in the bottle than is provided for. If the end of the stem were to rest on the bottom of the bottle this would hinder absorption. Although a small length of stem only is provided for by the curved neck of bottle, the bunch may be cut with the same length of stem attached as formerly. This will allow for pieces being cut off periodically in the case of long-keeping Grapes, but with this advantage—instead of being inserted in the bottle right up to the bunch, the Grapes will stand well clear of the neck, and thereby prevent all risk of the berries being rubbed or bruised by contact. But care will be necessary to prevent the bottle overbalancing. The advantages I claim for this bottle are:—(1) The bottle can be filled with water either before or after the bunch of Grapes is placed in it without the slightest fear of spilling any water among the berries. (2) Either a short-stemmed or long-stemmed bunch can be preserved with equal success. (3) Any ordinary flat shelf or stand can be utilised for the purpose of supporting the bottle. *W. Bullock, Copped Hall Gardens, Epping.*

SOCIETIES.

ROYAL HORTICULTURAL.

MARCH 23.—Another successful meeting was held in the Society's Hall, Vincent Square, on Tuesday last. It was very similar to the preceding exhibition, there being a splendid array of bulbous and other hardy flowering plants, forced shrubs, Carnations, Orchids, Azaleas, Ferns, Cyclamen, Cinerarias, and other greenhouse plants. The FLORAL COMMITTEE granted one First-class Certificate and five Awards of Merit; the ORCHID COMMITTEE conferred three Awards of Merit. The FRUIT AND VEGETABLE COMMITTEE had little brought to its notice, and made no award to a novelty. At the three

o'clock meeting a lecture on "Rock-gardens: Natural and Artificial" was delivered by Mr. R. Lloyd Praeger.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. George Paul, W. J. James, E. H. Jenkins, W. Cuthbertson, Chas. E. Shea, C. E. Pearson, Charles Dixon, Arthur Turner, W. Bain, C. Blick, H. J. Cutbush, W. Howe, J. F. McLeod, C. R. Fielder, R. Hooper Pearson, W. J. Bean, R. C. Notcutt, J. R. Green, and R. C. Reginald Nevill.

MESSRS. WM. CUTBUSH & SON, Highgate, London, N., exhibited large collections of forced trees and shrubs, Alpine and rock-garden plants and perpetual-blooming Carnations. *Prunus triloba*, *Laburnum*, *Azaleas*, *Camellias*, *Viburnum Opulus*, *Magnolias*, and similar subjects made an effective display of blooms. The rock-garden exhibit was presented in a pleasing style, and planted with a wealth of spring bulbous and other plants. *Sanguinaria canadensis* and *Ranunculus amplexicaulis* are both interesting. In the former the flower is held, as with a stake, by the leaf which clasps its lamina around the peduncle. (Silver Flora Medal.)

Scented-leaved *Pelargonium* in variety were shown by Messrs. HEATH & SON, Cheltenham. *P. multibracteatum* is a valuable greenhouse climber. The same firm showed a *Carnation* raised from *Souvenir de la Malmaison*, crossed with a tree variety; it is named after the Hon. Lady Audley Neeld.

MESSRS. PAUL & SON, the Old Nurseries, Chess-hunt, contributed a group of considerable size of varieties of Lilacs propagated and cultivated in this country, in no point showing inferiority to those from the Continent. We observed among the varieties *Souvenir de L. Thibaut* (massive in spike and large in regard to the individual blooms), *Comtesse de Choiseul*, *Leon Simon*, *Souvenir de Louis Späth* (of a dark lilac tint), and *Maréchal de Bassompierre* (a variety having a very large and massive spike). Messrs. PAUL also showed standard plants of *Calceolaria Burbidgei*, a shrubby hardwood species, bearing its large yellow blooms in lax clusters. (Silver-gilt Banksian Medal.)

Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, showed a large floor group of hardy *Azalea* Anthony Koster (a well-known variety), Lilacs in pots, and *Weigela Eva Rathke*, the group having a row of tall Palms at the back. He also showed on an adjacent table some handsome *Bertolonias* with finely-developed leaves, and *Cordylines* (*Dracanas*) having well-coloured foliage. (Silver Flora Medal.)

An assortment of greenhouse flowers was exhibited by Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea. A bold display of colour was furnished by numerous plants of Indian *Azaleas* that were literally smothered with flowers; there were also various species of *Citrus* in bloom, a batch of brilliant *Anthuriums*, blue-flowered *Hydrangeas* intermixed with *Camellia reticulata* (a pleasing combination), *Boronias*, *Streptosolen Jamesonii*, &c. As a separate group, Messrs. VEITCH exhibited plants of hardy *Rhododendrons*, including *Ascot Brilliant* (having abundant trusses of bloom of a rosy-scarlet colour), the beautiful *Pink Pearl* (splendidly flowered), and *R. mirabile* (a variety with rosy-crimson flowers developed in large trusses). (Silver-gilt Flora Medal.)

MESSRS. R. & G. CUTHBERT, Southgate Nurseries, Southgate, London, exhibited well-bloomed specimens of *Azalea sinensis*. The plants were excellent little specimens, well furnished with flowers in a variety of colours. (Silver Banksian Medal.)

MESSRS. H. CANNELL & SONS, Swanley, Kent, made a fine show with *Begonia Saturne*, for which an Award of Merit was granted, a row of *B. nitida alba odorata* being arranged at the back. (Silver Banksian Medal.)

MESSRS. SUTTON & SONS, Reading, filled a large table with *Cinerarias* of the Cactus-flowering type. The plants were admirable specimens, compact, dwarf, and each with a large, broad inflorescence. The assortment of colours was wide. (Silver-gilt Banksian Medal.)

MESSRS. H. B. MAY & SONS, The Nurseries, Edmonton, showed a miscellaneous group, including *Cinerarias*, scented-leaved *Pelargoniums*,

* In the *Index Kewensis* these two names stand for distinct species, but herbarium specimens show them to be merely forms of *S. nigrum*.

dwarf Roses, Azaleas, and an assortment of choice Ferns, including many crested, plumose, and other forms of hardy species. (Silver Flora Medal.)

Mr. W. P. HORTON, Seaford, Sussex, made a show of ordinary greenhouse plants.

The ST. GEORGE'S NURSERY CO., Harlington, Middlesex, contributed a striking display of Cyclamens. Especially fine were the varieties Princess of Wales and Princess May. The variety Brilliant is one of the darkest crimson-coloured Cyclamens. (Silver-gilt Banksian Medal.)

Messrs. JARMAN & Co., Chard, Somersetshire, showed Cinerarias of the Stellata-Cactus strain, tall and of straggling habit.

In view of the exhibition held by the Perpetual-Flowering Carnation Society on the following day, several specialists in this flower made attractive exhibits. Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, put up a similar display to the one they arranged last year, having a round, open kiosk arranged very prettily with Carnations in vases and relieved with greenery. Baskets were suspended from the roof portions, and at intervals arose pillars crowned and entwined with blooms. The same firm also showed species of Acacia, Genista elegans, Grevillea alpina, Boronias, Chorizema ilicifolium, and other greenhouse plants. (Silver-gilt Flora Medal.)

Mr. F. BURNETT, Guernsey, made a very beautiful exhibit with Carnations, having very large and excellently-coloured blooms of all the best kinds. Particularly good were Enchantress, Mrs. H. Burnett (pink), Britannia (scarlet), White Perfection, and Aurora (buff yellow flaked with red). (Silver-gilt Banksian Medal.)

Carnations were shown in large numbers by Mr. W. H. PAGE, Tangle Nurseries, Hampton, in his customary manner, along with Lilies. (Silver-gilt Banksian Medal.)

Mr. LANCASHIRE, Guernsey, made a striking feature with the variety Rose Doré, a bloom of regular form, 3 inches in diameter, with the edges of the florets deeply dentate. (Silver Banksian Medal.)

Messrs. C. B. BROOKS & Co., Worthing, Basingstoke, showed flowers of varieties of Primula sinensis, amongst which were many very fine kinds. We were especially impressed with the large, white Queen Alexandra, Brilliant King (a fine shade of crimson), and Orange King varieties.

Messrs. ROBERT SYDENHAM, Ltd., Tenby Street, Birmingham, again showed the value of fibre for cultivating bulbous plants in vases without drainage material.

Messrs. CARTER, PAGE & Co., 52, London Wall, E.C., showed cut blooms of Violas in great variety under names.

Mr. GEO. REUTHE, Keston, Kent, again showed varieties of rare and interesting shrubs, including species of Rhododendron, together with hardy flowers and spring bulbs, of which Irises and Crocuses were a feature. (Bronze Flora Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, London, W.C., also showed spring flowers, including Anemones, Hepaticas, Irises, Helleborus orientalis, of which were seen some with spotted flowers; Fritillaria citrina, Saxifraga burseriana, Crocuses Harlequin and Blue Celeste, two excellent varieties; Iris Krelagii, with claret-purple flowers, and Rosmarinus officinalis prostrata.

Several trade firms displayed rock-gardens arranged with seasonable flowers. A very large exhibit of this type was shown by Messrs. JOS. CHEAL & SONS, Crawley, Sussex. (Silver Banksian Medal.)

Messrs. BAKER'S, Wolverhampton, also showed an exhibit of this kind in which were seen Sarracenia purpurea in flower, the interesting Sanguinaria canadensis, and some well-bloomed Primulas, P. denticulata being prominent.

Messrs. T. S. WARE, LTD., Feltham, Middlesex, set up a rock-garden, and planted it with dwarf Conifers, Alpine plants, Crocus, Chionodoxa, Thymus of species, &c., and showed likewise new and old varieties of Primula obconica. (Silver Flora Medal.)

Miss ALICE SMITH, The Bungalow, Barnham, Bognor, showed hardy flowering plants in trays filled with soil and masked with real bark. We

noted a rich, crimson-coloured, double-flowered Primrose named Mme. Pompadour.

Messrs. G. & A. CLARK, Nurserymen, Dover, illustrated on the floor how an amateur could produce effects by a combination of flower beds and borders with rockwork and cocoanut fibre refuse.

Messrs. J. PLED & SON, The Nurseries, West Norwood, London, S.E., showed succulents in variety growing in small pots, Primulas of various hardy species, Lachenalias, &c. This firm likewise exhibited a collection of cut blooms of perpetual-flowering Carnations. (Bronze Flora Medal.)

Lord CLARENDON, Watford (gr. Mr. C. Harris) showed blooms of Violet La France of large size and great length of flower stalk.

The Misses HOPKINS, Mere Gardens, Shepperton-on-Thames, arranged Alpine flowers in a temporised rock-garden, a feature being coloured Primroses. (Bronze Banksian Medal.)

Varieties of Clivia miniata were shown by Messrs. JOHN LAING & SONS, Forest Hill, London, intermixed with fine-leaved Aralias, Chlorophytum, Ficus radicans variegata, Cocos Palms and Ferns. The best of the Clivias was the variety Charming, rather larger and better coloured than the type.

Messrs. WM. BULL & SONS, King's Road, Chelsea, showed a few Hippeastrums set off by Dracænas, Aralia triloba, A. Veitchii, Eugenia myriophyllum, Codiaëums, and other stove foliage plants.

AWARDS.

Begonia Saturne.—A very dwarf-grown, fibrous-rooted Begonia, with bright-green leaves, tall, stout flower-stalks and pale-pink flowers. The plants are exceedingly free bloomers. "Saturne" is probably a variety of *B. hydrocotylifolia*, a well-known Mexican species. Shown by Messrs. CANNELL & SONS. (Award of Merit.)

Carnation Rose Doré.—A very large rose-coloured tree Carnation, with fringed florets. The blooms are not sweet-scented, but they have the advantage that they do not split the calyx. Shown by Mr. W. H. LANCASHIRE, Guernsey. (Award of Merit.)

Cineraria stellata.—Messrs. SUTTON & SONS exhibited a group of dwarf plants of the stellate type of Cineraria. The plants were of dwarf habit, and they had magnificent heads of large flowers, in which the segments were rolled, giving them an appearance that is termed Cactus-like. An Award of Merit was deservedly awarded the strain.

Crocus Sieberi versicolor.—A very brightly-coloured variety of this species. The three outer segments are feathered with purple on white, almost as occurs in Tulips. The three inner segments are white, but the interior base of the flowers is yellow and the stigmata deep orange. Shown by Mr. G. REUTHE. (Award of Merit.)

Pteris aquilina congesta.—A plumose variety of the common Bracken, growing about 1 foot or 14 inches high. The pinnules are more than usually developed, and the fronds therefore have a congested appearance. Shown by Messrs. H. B. MAY & SONS. (First-class Certificate.)

Rose Rhea Reid.—This is a hybrid Tea Rose of soft rose colour with a slight purple tint in it. The blooms have plenty of substance, but, as forced, they have no perfume. The variety has a free-growing habit, and blooms freely. Shown by Mr. G. W. PIPER, Uckfield Nurseries, Sussex. (Award of Merit.)

Narcissus Committee.

Present: H. B. MAY, Esq. (Chairman), and Messrs. A. R. Goodwin, G. H. Engleheart, W. T. Ware, E. M. Crosfield, Charles T. Digby, J. T. Bennett-Pöe, F. Herbert Chapman, Joseph Jacob, Wm. Poupert, R. Sydenham, W. Goldring, P. R. Barr, G. Reuthe, A. Kingsmill, R. W. Wallace, Christopher Bourne, G. W. Leak, James Walker, and Charles H. Curtis (hon. secretary).

Messrs. CARTWRIGHT & GOODWIN, Kidderminster, staged a collection of Narcissus. The group was arranged in the shape of a crescent, the flowers being excellent examples. Among the more notable varieties were Evangeline, a chaste and beautiful creamy-white flower with

lemon-coloured cup; Seagull; Blood Orange, with a fiery-coloured crown; Fairy Queen, a variety of Leedsii group; the bold and beautiful Weardale Perfection, Victoria, Gloire de Leiden, Mrs. H. J. Veitch (a fine yellow Ajax), Salamander, of the Engleheartii set, with fine, spreading crowns, and Queen Sophia that resembles a pale form of the well-known variety Will Scarlett. The peerless Mme. de Graaff and the drooping Johnstonii Queen of Spain were also shown in excellent condition. (Silver-gilt Banksian Medal.)

Messrs. R. H. BATH, LTD., Wisbech, displayed a large collection of Narcissus and Tulips grown in ornamental bowls in moss-fibre and shell. This was one of the finest exhibits of the kind we have seen. Some of the larger bowls were furnished with two or three dozen handsome flowers. Notable kinds were Sir Watkin and Emperor. Neither the stature of the plants nor the size of the flowers had in the least suffered by this system of culture, and, indeed, this remark applies to the entire collection. The Daffodils included Weardale Perfection, Gloire de Leiden, Gloria Mundi, and Victoria, together with varieties of the Poeticus type. Of Tulips we noted Brutus, Joost van Vandel, Vermilion Brilliant, Duchesse de Parma and Prince of Austria. (Silver Flora Medal.)

Messrs. ROBERT SYDENHAM, LTD., Birmingham, also displayed a variety of bulbous plants grown in moss-fibre. They included Narcissi Glitter, Victoria, Queen of Spain, Mrs. Thompson, Odorus rugulosus obvallaris, C. J. Backhouse and others.

Messrs. BARR & SONS, Covent Garden, W.C., displayed a group in which we noticed Mrs. Moorland Crosfield (a very fine bi-colour), Admiral Togo, Admiral Makaroff, Janet Image, Hamlet, a fine yellow Ajax, Barri conspicua, Duke of Bedford, and Firebrand. The last-named variety has a brilliantly-coloured cup. Messrs. BARR also staged a very excellent collection of Darwin Tulips in many of the leading varieties. (Silver Banksian Medal.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. secretary), Harry J. Veitch, de B. Crawshaw, H. Little, W. Boxall, F. J. Hanbury, J. Forster Alcock, Stuart Low, F. Sander, J. Charlesworth, W. H. Hatcher, J. Cypher, A. Dye, H. G. Alexander, W. P. Bound, H. A. Tracy, Gurney Wilson, J. Wilson Potter, W. Bolton, F. M. Ogilvie, R. G. Thwaites, and A. A. McBean.

Colonel G. L. HOLFORD, C.I.E., C.V.O., Westonbirt, Tetbury (gr. Mr. H. G. Alexander), showed remarkable examples of fine cultivation in a grand specimen of Cymbidium Lowioeburneum "Westonbirt variety," with 19 flower-spikes bearing altogether 91 flowers, and a still larger plant of *C. eburneo-Lowianum* with 32 spikes of 155 flowers, the largest spike having seven blooms. A Cultural Commendation was given to the gardener, Mr. H. G. Alexander. (Silver Flora Medal.) Colonel HOLFORD also showed *Lælio-Cattleya Tarquinius* (L.-C. callistoglossa × C. Schilleriana), a very brightly-coloured hybrid; *Cattleya Trianae* Empress of India, a clear white flower with bluish-mauve front to the lip; *Lælio-Cattleya Tigris* (L. Cowanii × L.-C. Dominiana), and other fine hybrids.

Messrs. J. & A. A. McBEAN, Cooksbridge, were awarded a Silver-gilt Flora Medal for a group rich in Odontoglossums, which they cultivate so well. The numerous forms of *O. crispum* were of the finest type, and included some magnificent white varieties; also a selection of handsomely-spotted forms. One seedling out of *O. c. Franz Masereel* was exceptionally beautiful, and showed well the markings of that deep violet-purple tint for which the parent is noted. Another variety was an improvement on the handsome *O. c. Lady Jane*, and with similar red lines on the sepals and petals. *O. Ruckerianum* Pitt's variety, *O. Pescatorei*, *O. Hallii*, and other Odontoglossums were also included in the display, the effect of the tall spikes of violet-coloured *O. Edwardii* being very striking. Various *Dendrobiums* gave further variety of colouring.

H. S. GOODSON, Esq., Fairlawn, West Hill, Putney (gr. Mr. G. E. Day), was awarded a

Silver Flora Medal for an attractive group of *Odontoglossums*, *Cattleyas*, *Dendrobiums*, &c. With them were *Lælia Jongheana* "Nellie Blanche," a fine, clear, white flower having orange-coloured ridges on the lip. We also noticed a variety of *Odontioda Goodsonia* having a uniformly red flower; *Odontoglossum crispum* Mrs. Humphrey, O. c. Ernest Henry, white blotched with violet-purple; *Cattleya Schröderæ* The Prince, &c.

Messrs. CHARLESWORTH & Co., Haywards Heath, staged a group containing *Phalaenopsis Lady Rothschild* (*intermedia* × *Sanderiana*), a pretty white flower delicately tinged and marked with rose; four fine specimens of the fragrant white *Angræcum modestum*, with long, drooping racemes; *Celogyne Sanderæ*, a pretty and rare species; *Brasso-Cattleya Digbyano-Schröderæ* Bradshawia, with clear, white flowers; a plant of *Selenipedium caudatum Lindenii*, bearing six of the curious, pouchless flowers; *Maxillaria præstans*, *Lælio-Cattleya Hypatia*, and other *Lælio-Cattleyas*; *Odontoglossum Thompsonianum* Charlesworth's variety (*crispum* × *Edwardii*), by far the best yet shown of this cross; the finely-formed, claret-purple flowers are tipped with blush-white. (Silver Flora Medal.)

Messrs. MOORE, LTD., Rawdon, Leeds, were awarded a Silver Flora Medal for an attractive group, in which were some pretty hybrid *Dendrobiums*. Very choice was *D. Austin*, a large and richly-coloured flower, and an advance on the true *D. nobile nobilius*. *D. Donnesia* resembles a very dwarf and stout form of *D. Jamesianum*, but with pure white flowers as large as *D. formosum*.

Messrs. J. CYPHER & SONS, Cheltenham, secured a Silver Flora Medal for an effective and well-arranged group of well-flowered *Dendrobiums*, having in the centre of the display fine forms of *Cattleya Schröderæ*, *C. Trianae*, and one plant of *C. Mendelii*, together with *Brasso-Cattleyas* and *Odontoglossums*. There were also examples of *Cymbidium insigne*, *Sophronitis*, *Epiphronitis Veitchii*, the singular feather-lipped *Bulbophyllum tremulum*, and the rare *Notylia bipartita*.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Banksian Medal for a group in which were many plants of botanical interest, including *Erica monostachya*, *Aërides*-like in growth, and with an upright spike of whitish flowers; also *Eria densiflora* with drooping racemes of white flowers. We also noticed the yellow-flowered fragrant *Polystachya pubescens*, *Hexadesmia fasciculata* with bunches of greenish blooms, and *Selenipedium caudatum Lindenii* (*Uropedium Lindenii*). The showier examples included *Dendrobium crassinode* and its rare variety *album*, and *Cymbidium Schröderianum*.

Messrs. HUGH LOW & Co. secured a Silver Banksian Medal for a group in which were noted *Cymbidium Holfordianum*, *C. insigne*, some showy scarlet *Sophronitis*, the dark violet *Bollea cælestis*, *Odontoglossum cordatum* Low's variety, and a selection of *Cypripediums* and *Dendrobiums*. The rare *Bulbophyllum miniatum*, with an erect spike of dark flowers with white feather-like lip, was interesting.

Mr. A. W. JENSEN, Lindfield, Haywards Heath, was awarded a Silver Banksian Medal for a select group containing his fine type of *Odontoglossum crispum* and *Cattleya Schröderæ*.

Monsieur MERTEENS, Mont St. Amand, Ghent, secured a Silver Banksian Medal for a group of hybrid *Odontoglossums*. This exhibitor displayed two plants of the clear white *Cattleya Suzanne Hye de Crom*.

Mrs. HAYWOOD, Woodhatch, Reigate (gr. Mr. H. G. Bassett), showed two hybrid *Dendrobiums*.

Mrs. TEMPLE, Leyswood, Groombridge (gr. Mr. Bristow), exhibited two light-coloured varieties of *Lycaste Skinneri*.

J. FORSTER ALCOCK, Esq., Northchurch, sent a distinct hybrid *Cypripedium* (? *bellatulum* × *javanicum*) with greenish ground colour spotted with dark purple.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks, (gr. Mr. Stables), sent a handsome form of *Odontoglossum Lambeauianum*.

Messrs. A. J. KEELING & SONS, Bradford, sent a good *Odontoglossum nebulosum* and samples of glass tubes for storing Orchid pollen.

AWARDS.

AWARDS OF MERIT.

Brasso-Cattleya Digbyano Mendelii perfecta, from Colonel G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander).—A superb flower, with all the segments well displayed, and especially the broad, fringed lip. The ground colour is silver-white with a delicate blush-pink tint; the disc of the lip is Cowslip yellow.

Dendrobium Schneiderianum Westonbirt variety (aureum × Findlayianum), from Colonel G. L. HOLFORD.—This beautiful and fragrant hybrid has the fine form and size of *D. Findlayianum*, whereas the greater number of those previously shown have had the narrower segments of *D. aureum*. The flowers are white, with rose tips to all the segments, the disc of the labellum being deep orange colour.

Sophræ-Lælio-Cattleya Olive (S.-L. Psyche × C. Enid), from J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis).—A desirable acquisition, with flowers of good size and of a deep reddish-mauve colour with gold markings on the lip. The erect inflorescence bore three flowers. Mr. FOWLER showed for comparison the bright-red *Sophræ-Lælia Psyche* (*L. cinnabarina* × *S. grandiflora*), which, with *Cattleya Enid* (*Warszewiczii* × *Mossia*), produced *S.-L.-C. Olive*.

Fruit and Vegetable Committee.

Present: George Bunyard, Esq. (Chairman), and Messrs. Geo. Woodward, Alex. Dean, Ch. O. Walter, H. Parr, E. Beckett, A. R. Allan, J. Davis, Geo. Reynolds, J. Jacques, C. Foster, H. Somers Rivers, and C. G. A. Nix.

Mr. JOHN GARLAND, Broadclyst, Exeter, showed a large, well-coloured fruit of *Uvedale's St. Germain Pear* and fruits of *Apple Star of Devon*.

Miss C. M. DIXON, who carries on, in conjunction with other ladies, a market-garden at Elmcroft, Chichester, showed 14 pots of *Strawberry Royal Sovereign*, with ripe and ripening fruits. (Bronze Banksian Medal.)

Mr. JOHN POUPART, Rainham, Essex, showed fine samples of *Rhubarbs Linnæus*, *Champagne* and *Victoria*; selected *Seakale* and *Mortlake Giant Asparagus*. The vegetables were of good quality and such as would command the highest prices in the market. (Silver Knightian Medal.)

FORCED VEGETABLES

The competition for forced vegetables was only represented by one exhibit, although prizes were offered in three classes. In the class for six kinds, open to amateur exhibitors, the 1st prize was awarded to the Hon. VICARY GIBBS, Aldenham House, Elstree, Herts. (gr. Mr. Ed. Beckett). The varieties were the Sutton *Rhubarb* with stalks 3 feet in length, of a rosy-red colour; *Christmas Salad Chicory*, compact, strong plants fully blanched; *Twentieth Century Mushrooms*; *Selected Canadian Wonder French Beans*, the pods measuring 6-7 inches in length; *Perfection Asparagus*; and well-blanched heads of a pink-tipped *Seakale*.

THE LECTURE.

A meeting of the Fellows took place in the lecture-room at three o'clock, when Mr. R. Lloyd Praeger delivered an address on "Rock-gardens: Natural and Artificial." The lecture was illustrated by many lantern slides. These showed well-known rock plants in their native habitats, the mind of the audience being taken from the Alps to the Pyrenees, and thence to the arctic regions. Numerous illustrations were given of natural rockeries, especially some on the west coast of Ireland. Two or three pictures evidenced the astonishing force exercised by the wind on trees and hedges in that wild and exposed district. The most beautiful pictures, however, were those of some cultivated rockeries, and specially that in the Royal Botanic Gardens, Glasnevin. The lecturer, in his concluding remarks, dealt with the formation of rockeries, and some outline sketches on the sheet enabled the audience to follow him readily. Mr. Praeger pointed out how essential it is that the rains should penetrate deep into the crevices between the rocks.

PERPETUAL-FLOWERING CARNATION.

MARCH 24.—This increasingly popular Society held its sixth show at the Royal Horticultural Society's Hall, Vincent Square, Westminster, on the above date. The larger proportion of the exhibits was contributed by amateurs, but trade firms furnished some groups. The exhibits on this occasion were decidedly of higher quality than at previous shows. The blooms seem to have gained in size, form, and shades of colour. For exhibiting the blooms very tall glasses were almost universally requisitioned.

An important class was that for a group of not fewer than 12 varieties arranged on a table 10 feet by 3 feet. The use of any kind of foliage for decorative purposes was allowed. There was only one exhibit, this being staged by Mr. HAYWARD MATHIAS, Medstead, Hants., who showed Mrs. Lawson, *White Perfection*, Mrs. H. Burnett, *Britannia* (one of the best and freshest in the show), *Gladwys* (a smooth-petalled bloom of perfect form, dark crimson in tone, and having petals not too much crowded), *Winsor* (in fine form), *Enchantress*, *Rose Enchantress*, *White Lawson* and *Robert Craig*. (Gold Medal.)

A challenge cup was offered by the American Carnation Society for three vases containing novelties in Carnations sent out by American firms during 1906, 1907 and 1908. There was a good competition. The cup was awarded to Messrs. BELL & SHELDON, Guernsey, for the varieties *Winsor*, *Afterglow* and *Aristocrat*, the last-mentioned being especially good; 2nd, Mr. A. F. DUTTON, The Nurseries, Iver, Bucks., who had the varieties *Victory* (of bright scarlet colour and deeply dentated edges to the petals), *Afterglow* and *Winsor*; 3rd, Mr. C. ENGELMANN, Saffron Walden, Essex, who exhibited *White Enchantress* in good form.

COLOUR CLASSES.

These formed the most important part of the exhibition. Classes were provided for varieties of certain colours, and in each case there was a class for 36 blooms and another for 18 blooms.

White.—The best exhibit of 36 blooms was shown by Mr. W. H. LANCASHIRE, Victoria Vineries, Guernsey; 2nd, THE NEWPORT CARNATION NURSERIES, Newport, Essex. In the smaller class for 18 blooms Messrs. BELL & SHELDON won the 1st prize with *Lady Bountiful*; 2nd, Mr. C. ENGELMANN with *White Perfection*.

Blush.—Mr. W. H. LANCASHIRE, Guernsey, won the 1st prize in the larger class with grand blooms of the variety *Enchantress*.

For 18 blooms of any blush variety Mr. C. ENGELMANN was placed 1st with *Enchantress*.

Light pink, rose or salmon.—Messrs. BELL & SHELDON, Guernsey, were awarded the 1st prize in the class for 36 blooms having very bright and fresh-looking blooms of *Winsor*; 2nd, Mr. W. H. LANCASHIRE with Mrs. W. H. Burnett.

The best 18 blooms of these colours were shown by Mr. A. F. DUTTON, Iver, his variety being *Rose Pink Enchantress*; 2nd, Mr. C. ENGELMANN with *Welcome*, a flower of a pleasing tint.

Deep pink or cerise.—For 36 blooms Mr. W. H. LANCASHIRE was placed 1st for large and full blooms of Mrs. T. W. Lawson.

The best 18 blooms were exhibited by Messrs. BELL & SHELDON, who showed *Afterglow*.

Crimson (36 blooms).—1st, Mr. C. ENGELMANN, with the new variety *Carola*, of a deep tint, fair substance, and with serrated petals; 2nd, Mr. W. H. LANCASHIRE, with *President*, the flowers being smaller and less full than some others.

For 18 blooms of a crimson variety, Messrs. BELL & SHELDON were awarded the 1st prize. They showed fine blooms of *President*.

Scarlet.—The 1st prize in the larger class was won by THE NEWPORT CARNATION NURSERIES, Newport, Essex, with *Victory*, the blooms being not large but bright and of fresh appearance. 2nd, Mr. W. H. LANCASHIRE, with fine, perfect blooms of *Robert Craig*.

For 18 blooms of a scarlet variety, Messrs. BELL & SHELDON won the premier prize with *Britannia*; 2nd, Mr. D. M. COLLINS, Swanley, with the same variety.

Any other colour.—A class was provided for 36 blooms of any other colour or "fancy" than

MARKETS.

COVENT GARDEN, March 24.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—E.D.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers and their prices, including Acacia (Mimosas), Anemone fulgens, Azalea, Bouvardia, Calla aethiopica, Camellias, Carnations, Cyclamen, Daffodils, Deadstock, Eucyrtis, Freesias, Gardenias, Hyacinths, Lilacs, and Tulips.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage and their prices, including Adiantum, Agrostis, Asparagus, Berberis, Croton, Cycas, Daffodil foliage, Ferns, Galax leaves, Hardy foliage, Honesty, Ivy-leaves, Myrtle, Ruscus, Smilax, and various other plants.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their prices, including Ampelopsis, Aralia, Araucaria, Aspidistra, Asparagus, Azaleas, Begonia, Boronia, Cinerarias, and Clematis.

Plants in Pots, &c.: Average Wholesale Prices (Contd.).

Table listing plants in pots (continued) and their prices, including Hardy flower roots, Hyacinths, Isolepis, Kentia, Lantana, Liliolum longiflorum, and Liliolum lancifolium.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples (California, Newtown Pippin, etc.), Bananas, Cane fruit, Grapes, Lemons, Limes, Mandarins, Nuts, Peaches, Plums, and Pears.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, Beetroot, Brussel sprouts, Cabbages, Cardoon, Carrots, Cauliflower, Celery, Chicory, Cucumbers, Endive, Horseradish, Kale, Leeks, Lettuce, Mint, Mushrooms, Mustard and Cress, Onions, Parsley, Parsnips, Peas, Potatoes, Radishes, Rhubarb, Salsify, Savoys, Sea-kale, Spinach, Stachys, Turnips, and Tomatoes.

REMARKS.—There has been a good trade for Oranges during the past week, and their prices remain firm; Mandarines are dearer. Apples are arriving in fewer quantities, and the demand for them is somewhat smaller. Rhubarb has been scarce during the past week owing to very small consignments from the Leeds district; supplies from Essex and Middlesex have also been very small. Horseradish has risen in value. Good Savoys have sold for as much as 20s. per tally. Consignments of Egyptian Onions are expected next week. Foreign Tomatoes are received in an excellent condition. Mushrooms are cheaper. Trade generally is fair. E. H. R., Covent Garden, Wednesday, March 24, 1909.

those named. 1st, Mr. C. ENGELMANN, with Jessica, a scarlet flaked flower of large size.

For 18 blooms of any other colour or "fancy," THE NEWPORT CARNATION NURSERIES, Essex, were placed 1st with Jessica; 2nd, Mr. A. F. DUTTON, with Imperial, a scarlet flaked flower.

For 12 blooms of any variety not in commerce, 1st, Mr. C. ENGELMANN, with Carola.

LORD HOWARD DE WALDEN won the 1st prize in the class for three blooms of a white variety with White Enchantress. 2nd, Sir RANDOLPH BAKER, with the variety Sarah Hill.

For three blooms, light pink, rose, or salmon, again LORD HOWARD DE WALDEN was 1st, with fine blooms of Mrs. Burnett; 2nd, H. J. KING, Esq., Eastwell Park, Kent, with the same. The last-named exhibitor, whose gardener is Mr. J. G. Weston, was 1st for three blooms of a deep pink or cerise variety.

DECORATIVE CLASSES.

One vase of a decorative variety.—1st, Messrs. BELL & SHELDON, with a pink variety, set off by Asparagus sprays; 2nd, Mr. D. M. COLLINS, Swanley, who used a "Malmaison" variety.

A basket of market Carnations.—1st, E. J. JOHNSTONE, Esq. (gr. Mr. Paskett), Groombridge, a simple negligé arrangement of grand modern varieties in scarlet, white, crimson and pink set off by Asparagus growths.

A bouquet of Carnations.—1st, Messrs. R. F. FELTON & SON, Hanover Square, with a composition of mauve-coloured ribbon, pink Carnations, and Asparagus. It was a bouquet to be observed from one side only; 2nd, Messrs. BELL & SHELDON, with blooms of Mrs. Burnett, Asparagus trails, and blue ribbon.

Three ladies' sprays.—1st, Sir RANDOLF BAKER, Bart. (gr. Mr. Usher), Blandford, with pale pink, blush, and white Carnations and Asparagus.

There was considerable competition for six Carnations buttonholes, and the 1st prize fell to Sir RANDOLF BAKER, Bart.

GROUPS AND PLANTS.

The most important class was for a group of plants arranged on a semi-circular space measuring 25 square feet. Small Ferns or other plants were allowed as groundwork. The 1st prize was a challenge cup offered by Lord Howard de Walden. The trophy is to be held by the winner until again competed for, and a replica of the cup becomes the winner's property. The only competitor was C. F. RAPHAEL, Esq. (gr. Mr. A. Grubb), Shenley, Herts. The plants were shown in excellent condition, and staged in first-class manner. The group was awarded the 1st prize. We noticed a fine seedling "Malmaison" of a cerise tint. Others of extra merit were Mrs. Burnett, Enchantress, and Britannia.

LORD HOWARD DE WALDEN, Saffron Walden (gr. Mr. J. Vert), was the only exhibitor in the classes for six plants in six varieties, and three plants in three varieties respectively. In each case he was awarded the 1st prize.

TRADE EXHIBITS.

A group of Carnations was staged by Mr. H. BURNETT, Guernsey. The group contained blooms of the best varieties, all admirably grown and well displayed. (Gold Medal). Messrs. W. CUTBUSH & SON, Highgate and Barnet, exhibited Carnations extensively, and received the award of a Silver Medal. Messrs. H. Low & Co., Bush Hill Park Nurseries, Enfield, made a capital display of cut blooms of Carnations in tall glasses, jars of earthenware, and metal bowls, in great variety, and showing good cultivation. The plants and cut blooms were arranged in a kind of circular temple. We observed a new Carnation, named Black Chief—a very free-flowering variety, and the colour that of the Old Clove. (Silver-gilt Medal.) Mr. C. ENGELMANN, The Nurseries, Saffron Walden, made a very large display with cut blooms of Carnations. (Gold Medal). Messrs. HEATH & SON, Nurserymen, Cheltenham, showed a perpetual-flowering variety named Hon. Lady Audley Neeld, a cross from a variety of Souvenir de la Malmaison with an ordinary perpetual-flowering variety. Mr. W. H. PAGE showed Carnations and other plants. (Silver-gilt Medal.) Messrs. J. PEED & SON, West Norwood, made a small exhibit of Carnations. (Silver Medal.)

Obituary.

JOHN FIDLER.—We regret to record the death of Mr. John Fidler, of Cambridge Lodge, Croydon Road, S.E. The deceased gentleman, who was 66 years of age, cultivated Cacti and other succulents, of which plants he possessed a fine collection.

C. STOCKING.—We regret to record the death of this gardener, which occurred on March 20, after a fortnight's illness. The late Mr. Stocking was, at the time of his death, gardener at Southgate House, Old Southgate. He received his first training under his father at Didlington Hall, Norfolk. Afterwards he was engaged at Floors Castle, and later at Tortworth, and other places. He was appointed gardener and bailiff at Southgate House about 10 years since. Deceased leaves a widow and four children.

* * * The Editor will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for forming Supplementary Illustrations to this Journal.

EDITOR AND PUBLISHER.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the EDITOR. The two departments, Publishing and Editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

ASPARAGUS: *Anxious.* Asparagus may be forced very well under the stage of a heated house, provided a little daylight can reach it and the roots are not allowed to become too dry. It succeeds best in a temperature of from 55° to 65° Fahr. The roots should be taken up and planted immediately on about 6 inches of good ordinary soil, covering the crowns from 3 to 4 inches in depth. Apply a thorough watering, and syringe twice daily with tepid water. Probably the best way of forcing Asparagus at this season of the year is to do so in portable frames on very mild hot-beds composed chiefly of Oak, Beech, or Spanish Chestnut leaves. The roots must be kept in very moist conditions.

BEGONIA GLOIRE DE SEAUX: *H. G.* There is no disease present in the plant. The unhealthy condition is due to excess of moisture and the need for fresh air. The Pelargoniums have also suffered from unsuitable conditions. With warm, bright weather the plants will soon grow out of their enfeebled state.

BOTANY: *G. R.* Get *The Young Botanist*, by W. Percival Weston and C. S. Cooper. You can obtain the book from our publishing department. We are unable to advise you respecting shorthand, as you have given no particulars respecting the position you fill, or expect to fill. As a rule, gardeners have not much use for shorthand.

CORDYLINES (DRACENAS) AND OTHER PLANTS: *A. E.* The Cordylines are enfeebled specimens and are not worth retaining. Propagate some healthy plants from the top shoots. The roots are in an extremely unsatisfactory condition. The Pandanus and Codiaums appear to have suffered from neglect.

"FRENCH" GARDENING: *W. S.* Write to Mr. Paul Aquatias, Tudwick, Tiptree, Essex.

HYACINTHS WITH UNHEALTHY ROOTS: *W. D.* As the soil in which the Cucumbers and Melons were grown last year was badly infested with eelworm, it should not have been used for plant culture again unless it were well sterilised.

LIMING OF FRUIT TREES: *E. M. B.* The stems of orchard fruit trees are limewashed in autumn for the purpose of destroying insect pests mainly by suffocation.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time; they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in one issue are requested to be so good as to consult the following numbers.*

PLANTS: *H. T. H.* Dendrobium Ainsworthii and Trichosma suavis.—*W. H. 1.* Asplenium bulbiferum; 2, A. pramorsum; 3, Polystichum aculeatum; 4, Aspidium podophyllum syn. Lastrea Sieboldii.—*J. McH. 1.* Thuypopsis dolabrata; 2, Hedera Helix Roegneriana; 3, Phillyrea media; 4, Thuya gigantea.—*F. C.* Gerbera Jamesonii, Barberton Daisy.—*W. D.* Reineckia carnea variegata; 2, Heliconia metallica; 3, Dracena Goldiana.—*A. E. 1.* Streptosolen Jamesonii; 2, Agapanthus umbellatus variegatus—*Torbay.* Iris tuberosa.—*F. R. 1.* Oncidium flexuosum; 2, Pteris tremula; 3, Adiantum hispidulum.—*R. T. H.* Dendrobium cariniferum.—*Tyhe.* 1, Codiaum Langui; 2, C. angustifolium maculatum; 3, C. variegatum; 4, C. interruptum; 5, C. trilobum; 6, C. Weissmannii.—*M. A.* Odontoglossum Andersonianum of good quality, and of the variety known as "hebraicum."—*W. G. 1.* Cœlogyne flaccida; 2, Masdevallia tovarensis; 3, Cœlogyne speciosa; 4, Dendrobium Pteradii.—*J. L. S. 1.* Abies nobilis glauca; 2, Acalypha Godeffiana; 3, Hamamelis virginiana; 4, Cymbidium pendulum; 5, Cestrum fasciculatum, commonly called Habrothamnus in gardens; 6, Codiaum Queen Victoria, or a similar variety.

SEAKALE PLANTS; FLOWERING CROWNS: *J. R. B.* When the young seedling plants are taken up, the top of each, with all the crown-buds, should be cut clean off before being transplanted, so as to prevent the plants sending up flower-stalks during the summer. The removal of the crown—a very thin shilling-like slice—from each individual plant will result in the formation of several buds, and the subsequent shoots will not have a tendency to flower the first year after planting. Should any flower-stems, however, appear during the summer months on either your Seakale or Rhubarb plants, remove them forthwith.

"TAKING" BUDS OF CHRYSANTHEMUMS: *W. B.* The most suitable dates for the varieties you mention are as follow:—Nellie Pockett, middle of April, second crown buds; W. Duckham, middle of April, second crown; Mrs. Barkley, third week in April, second crown; F. S. Vallis, second week in April, first crown; Lady Ridgeway third week in April, first crown; Baron Hirsch, second week in April, second crown; Alice Byrom, natural break, first crown; Souvenir de W. Cliban, second week in April, second crown; Mrs. E. Thirkell, third week in April, second crown; Godfrey's King, second week in April, second crown; General Hutton, second or third week in March, second crown; Lady Hanham, second week in April, second crown; Lady Conyers, third week in April, first crown; Soleil d'Octobre, stop twice or three times for cut flowers, or "take" buds in the second week in April. Soleil d'Octobre is not suitable for an exhibition to be held on November 11.

VIOLETS: *E. L.* The plants show no trace of disease. The injury is due to some external cause, such as injurious fumes.

VIOLETS DISEASED: *C. D.* See reply to *T. B.* in last week's issue, p. 192.

COMMUNICATIONS RECEIVED.—*F. G. B.* (next week).—*W. A. C.*—Linnean Soc.—*C. F.*—*R. A. Rolfe*—*J. G. W.*—*E. J. H.*—*R. P. B.*—*E. S.*—*W. J. B.*—*W. M.*—*J. Whitton*—*W. W. P.*—*A. D. W.*—*A. REMARKS.—Trade remains steady. Best tubers have an increased demand, and the prices all round have a slight upward tendency. *Edward J. Newborn, Covent Garden and St. Pancras, March 24, 1909.*

COVENT GARDEN FLOWER MARKET.

The milder weather has caused all flowers to develop rapidly, and the market is now overloaded with them. Trade, however, is not good.

CUT FLOWERS.

Roses of the best quality are over-abundant. Splendid blooms of Catharine Mermet were on sale on Tuesday last, but no one appeared anxious to buy them, even though offered at considerably reduced prices. Some of the best blooms of Bridesmaid are worth 4s. per dozen. Richmond, Kaiserin A. Victoria, and General Jacqueminot are favourite kinds. There are some fairly good flowers of the old Maréchal Niel, but Perle des Jardins is now a popular market yellow Rose. Carnations are of improved quality, but it cannot be recorded that their prices advance. A few special blooms realise 3s. per dozen, but 2s. is about the average price for good quality flowers. It is rarely one sees the variety Mrs. Burnett for sale late in the morning. White Perfection takes the lead as a white kind. Of Daffodils there are large quantities from the Scilly Islands and other warm climates. Best English grown flowers are not so plentiful, and during the past week their prices have advanced. Emperor still remains one of the most popular kinds. Most growers have finished with the indoor crop of Golden Spur. Sir Watkin is good; and Horsfieldii is the best bi-color. Narcissus ornatus has been selling for higher prices, but this morning supplies are larger again. Lilac is good from English and from French growers. Gardenias are more plentiful and Eucharis is procurable at lower prices. Lilioms have been making advanced prices, but it is doubtful if they will be sustained for supplies are increasing. Lily of the Valley varies greatly in value; small spikes can be had at 6s. per dozen bunches, while the best make 15s. Tulips now include some fine Darwin varieties.

POT PLANTS.

Trade has improved a little, country orders for the Easter trade making a larger demand for foliage plants. There has also been a rather better clearance of flowering plants. Azaleas are the most prominent subjects and are remarkably good this season. Ericas include E. Cavendishii, E. persoluta alba, E. Willmoreana and E. W. alba. Borenia megastigma is also seen. Marguerites, although not plentiful, are very good. Better Mignonette is seen. White intermediate Stocks, Cinerarias, Cyclamen, Tulips, and Hyacinths are all plentiful. A fresh start has been made with the sale of hardy flower roots. Pansies in flower are already seen, also Double Daisies, Primroses, Aubrietias, &c., and almost any flower roots may be procured, and Bedding plants in store boxes. Hardy climbers, fruit trees, Conifers, and other evergreens are selling better, also Roses for planting. *A. H., Covent Garden, Wednesday, March 24, 1909.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending March 24.

A change to warmer weather.—The recent long spell of cold weather lasted from the 7th of February to the 18th inst., or for 40 days. During that period there occurred only four days which were in any way unseasonably warm, and not a single unseasonably warm night. During the past week there have been only two warm days, and those only moderately above the average in temperature, but six warm nights. The ground is now at about a seasonal temperature, both at 1 and 2 feet deep. Rain fell on four days, but only to the total depth of less than half-an-inch. There has been some percolation on each day through both of the percolation gauges, but in gradually decreasing quantities. The sun shone on an average for only 1 hour 52 minutes a day, which is 2 hours a day short of the average duration of bright sunshine at this period of March. On one day the sun shone for 5 hours, whereas on two other days no sunshine at all was recorded. Light airs have mostly prevailed during the week. The mean amount of moisture in the air at 3 p.m. exceeded a seasonal quantity for that hour by as much as 22 per cent. A selected patch of yellow Crocuses in my garden first showed an open flower on the 18th, which is exactly three weeks later than its average date in the previous 21 years, and later than in any of those years. A selected bush of the wild Hazel first showed a female flower on the 19th, which is 29 days later than its average date for the previous 18 years, and also later than in any of those years. *E. M., Berkhamsted, March 24, 1909.*

GARDENING APPOINTMENTS.

Mr. THOS. THOMPSON, for the past 5 years Gardener to Mrs. G. T. NEWTON, at Pottersbury Lodge, Stony Stratford, as Gardener to B. C. FOSTER, Esq., Duncote Hall, Towcester, Northants.

Mr. JOHN CLARKSON, of Gunnersbury Park Gardens, previously at Welford Park, Newbury, and Bedale Hall, Yorks, as Gardener to HERBERT HARRIS, Esq., Bowden Hill Gardens, Chippenham, Wiltshire. (Thanks for 2s. sent for R.G.O.F. box.)

Mr. MAX BAUER, previously Gardener to the Rev. A. H. GRIFFITH, Lockington, Yorks, as Gardener to Capt. FARTRIDGE, Battledene, Newbury, Berks. (Thanks for 2s. 6d. sent for R.G.O.F. box.)

Mr. F. A. CHASE, for the past 4 years Foreman at Hollycombe Gardens, Liphook, Hants, as Gardener to Major ORMAN, Forest Mere, Liphook, Hants.

A SURREY SCHOOL-GARDEN.

HALE is a village situated about midway between Farnham and Aldershot. It lies on the south side of a long, barren hill, part of which is called Hungry Hill—a name very aptly describing its soil, which consists almost entirely of layers of sand and gravel. Excavations for gravel have honeycombed almost the whole of its surface, the flints thus obtained being conveyed to various parts of the country, chiefly for the purpose of making and repairing roads.

The village has a large population for a rural district, composed almost entirely of the working class, employed either as labourers in the gravel pits or as artisans in the neighbouring towns.

The Hale school gardens were commenced nearly 30 years ago. At that time there was a very large playground attached to the school, and, as my own garden was small, the school managers gave me permission in 1879 to utilise one end of the playground as a kitchen garden. The interest that the school children took in the cultivation of this strip of land, which was in no way fenced off from the play-

ground, suggested to my mind the idea of providing gardens for the elder scholars to manage themselves. Eventually the greater portion of my playground garden was divided into some 24 small plots, half of them about two-thirds of a rod each for 12 boys to grow vegetables. The remaining 12 were of still smaller area, and were given to 12 girls for the cultivation of flowers. The children eagerly took possession of the gardens and showed great enthusiasm in the work. With some help from myself they found tools, as well as seeds and manure. To sustain their interest it was decided to hold a show in August, and offer prizes for vegetables, flowers, and the best-cropped and neatest gardens. Having proved successful the first year, the show has been continued up to the present time. The simple display of those early days has grown into an extensive exhibition of school work generally, which fills our large central hall each August, and includes vegetables and flowers from more than 40 garden plots, and bouquets of wild flowers from some 150 children.

In 1892 the Surrey County Council, which was the pioneer authority in establishing and systematising a school-garden scheme, appointed Mr. John Wright, V.M.H., as the first county Superintendent of Horticulture. Mr. Wright's expert knowledge, energy, and enthusiasm soon began to make itself felt at Hale. Under his direction and advice, and with the financial aid of the County Council, the Hale gardens entered on a new phase. The old situation was given up, a larger area of the playground was enclosed and trenched, some hundreds of loads of flints removed, and the land divided into 24 small gardens, with borders for seed-beds and fruit-plots.

Unfortunately, a few years after the establishment of our County Council gardens, a portion of the land was required for the erection of new school buildings, and thus the number of gardens was reduced to twelve.

The Surrey County Council Scheme, in addition to the trenching and laying-out of the land into garden plots, also provides for:—

1. Lessons on horticulture to classes of boys during the winter season.

2. Practical gardening through the spring and summer. (The County Council supplies tools and tool-shed, manure and seeds, and its superintendent inspects the gardens three or four times in the season.)

3. Prizes for good cultivation, arrangement and excellence of crop, awarded to workers in the continuation-school gardens, according to marks given by the superintendent at his visits. The lads are also allowed the produce of their own gardens.

4. Visits (under the supervision of the superintendent or local instructors) to private and nurserymen's gardens and glasshouses in the neighbourhood for practical illustrations of the cultivation and raising of special classes of plants and flowers, showing the use of frames, and pointing out examples and effects of fertilisation, budding and grafting.

5. Lectures by the superintendent on horticulture to teachers and others during the winter season.

6. Exhibitions at Wye College to teachers for two weeks during the long holidays, in order that they may qualify as teachers of gardening at schools.

The oral lessons of the winter season are, of course, preparatory to the practical work in the spring and summer. The lessons are illustrated by blackboard drawings and diagrams and by experiments with actual objects; the pupils are required to practise the operations of potting, grafting, layering and making cuttings, and each

scholar is supplied with a notebook, in which his drawings and descriptive notes are entered.

The course includes lessons on:—

1. The soil, its formation and constituents, treatment, &c.

2. The seed, its formation, constituents, &c.

3. The plant, its life history, physiology, and food requirements.

4. Manures, natural and chemical, and their application.

5. Operations such as trenching soil, sowing seed, grafting, pruning, &c.

6. Insect pests and insecticides.

7. The special cultivation of each kind of the more important vegetables.

THE CONTINUATION SCHOOL.

The twelve plots in our Continuation-school gardens each measure rather more than a square rod. They stretch lengthwise from E. to W., so that they can be cropped with rows running N. and S. A path surrounds each garden. Our method of cropping has been:—At the beginning of the season to draw a plan of a garden-plot on a large scale, showing the order and position of the different crops, the distance separating them, time of sowing, &c., and to insist that all the gardens are planted according to the plan. A few of the most experienced boys need only such a plan to guide them in the cropping operations, but the teacher keeps an eye on them to see that they do not sow and plant too thickly. With the rest, often the simplest and most elementary operations have to be shown before the pupils can proceed with their work at all. But recently the results of the teaching of gardening in the day-school have been quite appreciable in the superior knowledge and skill shown by the boys who have been through the more elementary course.

The actual superintendence of each operation of almost every boy takes up a great deal of the instructor's time, especially if the boys are allowed to come any evening during the week for personal instruction. To obviate this as much as possible, all the boys are required to be present on Mondays and Wednesdays for the special work in hand. But as the boys are at various kinds of employment during the day, and oftentimes work at long distances from the gardens, this is not always possible; consequently, and especially during the planting season, almost every evening is utilised. Hoeing and weeding may be carried on by the boys independently of the presence of the instructor.

The main object of the garden work being educational, as many kinds of vegetables and flowers are grown as possible, generally in very small quantities, the more useful and common kinds having two rows, the less common one row, and some kinds only two or three specimen plants.

The flower borders adjoin the central path. Each border contains a standard Rose tree, and last season there were also cultivated Lobelias, Stocks, Asters, Petunias, Antirrhinums, Balsams, Mignonette, Sweet Williams, Pansies, Verbenas, Nasturtiums, and other hardy and half-hardy annuals, as well as Sweet Peas, all raised from seed, and numbers of Zonal Pelargoniums from cuttings.

During last season we paid considerable attention to the culture of Sweet Peas, and the 2nd prize for 12 varieties of Sweet Peas at the Farnham Rose Show, in the open class, was gained by the Hale Schools, against about a dozen competitors, the 1st prize being won by a professional grower.

The fruit plot lies to the south of the vegetable and flower gardens; it is cultivated in common by instructor and pupils. Among the operations carried on are:—Pruning (root as well as

branch), thinning, hoeing and mulching, and preparing and applying spraying mixtures for pests. The trees include Apples (standard, bush, and cordon), Pears, Plums, Gooseberries, Currants, and Raspberry canes.

A small greenhouse on the premises and two or three cold frames afford practice in cultivation under glass, and provide a supply of early plants and flowers to be transferred to the various gardens in the spring. The propagation of these plants and flowers has been almost entirely the work of the boys (either evening or day), who are sufficiently interested to be always ready and eager to assist their teacher during the dark evenings of early spring in the watering, sowing, and pricking-out required.

The patience and perseverance of our lads were severely tried at the commencement of the gardens on the new site. Strive as we would, we could not reach the top of the county list, the soil was so poor. But, after some years of strenuous endeavour, we had the satisfaction, in 1900, of taking the lead in the Surrey County Council gardens, and have, by continual application and more favourable circumstances, been successful in holding the position ever since.

To show the progress of steady improvement in the workmanship and skill of the pupils in the Surrey schools generally, I quote the following from the County Council reports:—

Year...	1894.	'96.	'98.	1900.	'02.	'04.	'06.	'08.
Average County mark	45	56	73	83	96	100	105	106

E. Casar, Head Master.

(To be continued.)

NOTES FROM A "FRENCH" GARDEN.

CULTURE OF MELONS.

As Melons are the chief crop in a "French" garden during the summer, the planting or sowing of spring crops is so arranged as to provide for the frames and lights being at liberty for the final plantation of the Melons. There are two batches of Melons. Plants to fruit from the end of June till the end of July are raised from seeds sown in the middle of February. They are planted early in April. The main-crop plants are raised from seeds sown from between March 15 and March 31. These later plants are put out in May, and they ripen fruits from the end of July till the first week in September. The best variety is "Prescott Small Early Frame," which is a Cantaloup, or Rock Melon. "Melon of Chypre," or "Kroumir," which is grown by some gardeners, is very hardy and suitable for late sowing.

The seeds are sown on a hot-bed 2 feet 6 inches deep when trodden. When the heat of the bed is about 70°, the seeds are set 1 inch apart, and the lights closed until the plants appear above the soil. In the case of the heat inside the frame diminishing, the manure around the outside is replaced by fresh manure. A week after the plants have appeared, another bed is prepared in a similar manner.

Melons are potted in good loam, and the pots filled up to the rim to prevent excessive dampness at the roots. When the heat of the bed is from 65° to 70°, the pots are plunged into the beds, putting 90 pots under each light. The lights are then kept closed for eight or 10 days till growth commences, when a little ventilation is given. A week before the final planting, the young Melons are stopped at the second leaf. This is done by cutting through the stem just below where the third leaf arises. By this method the stem is not so liable to split, for splitting or cracking of the stem is one of the chief causes of canker, as the disease readily spreads from a fractured spot. The cotyledons are also removed, because, if they remain on the plant, they are liable to cause delay. The beds are

prepared for the final planting as soon as the two young shoots growing from the main stem are 1 inch long. A trench 2 feet 6 inches wide and 10 inches deep is dug out of the top of the ground allotted to the culture of Melons, and the soil is carted to the end of the ground. The trench is filled again with long, strawy manure, which is well trodden down, and the centre left 3 inches higher than the level of the ground. The frames are then set straight and level, and filled with the soil taken from the trench of the next row of frames. The paths between the frames are filled with hot manure. As soon as the beds have become warm, two Melons are planted in the centre of each light, care being taken not to disturb the young roots, nor to set the plants too deeply. The lights are well covered at night and kept closed. If the sun is too hot in the middle of the day before the plants are well established, they can be shaded with mats. Afterwards ventilation may be given, and the amount may be increased as the weather becomes warmer and the plants stronger. Melons, especially those grown in the first season, require very little water prior to setting their fruits. As soon as the young shoots have reached the sides of the frames, they are stopped

early in July the lights may be left open at night. Towards the end of July, or early in August, the frames may be safely removed altogether. The fruits are left on the plants till ripe, and this condition may be determined by the base of the stalk turning white. They can then be picked and placed in a cool cellar for a few hours.

The culture of Melons will be found very simple if the following instructions are carried out:—(1) The maintenance of even temperatures; (2) the plants must not suffer a check in the seedling stage; (3) a good bottom heat must be provided when planting the Melons in their final quarters; (4) very cautious watering before the fruits have set; (5) ventilation of the frames according to the growth of the plants and the state of the weather. *P. Aquatias.*

ORCHID NOTES AND GLEANINGS.

THE GLEBELANDS COLLECTION.

The fine collection of J. Gurney Fowler, Esq., at Glebelands, South Woodford, contains the most vigorous plants in the London district.

FIG. 88.—GROUP OF VEGETABLES TAKEN FROM THE HALE CONTINUATION-SCHOOL GARDENS (OCTOBER, 1908).

to the fourth or fifth leaf. This stopping forces the plants to develop shoots, which are again stopped at the second leaf. It is the third stopping that provides the shoots which will bear the fruits. The plants must not be weakened by severe pruning, but only the shoots or leaves that are unnecessary may be removed.

The female flowers always appear later than the male flowers, and they are more numerous in plants raised from seeds that are three or four years old. The soil at the period of flowering must be kept damp, so that there will be no necessity to water the plants during the setting of the flowers. These require no artificial pollination, especially when ventilation is given. When the fruits are the size of a hen's egg, care is taken to keep the best shaped as far as possible from the collar of the plants; but, in order to obtain a few early fruits, exception may be made in some of the lights, although in these cases the fruits cannot be expected to grow to a large size. One fruit per plant is sufficient. The supply of water is increased as the fruits swell, and it is always applied in the morning. Ventilation is given whenever possible, and

They prove that if proper accommodation is given, and the plants skilfully treated, even the London fogs cannot harm Orchids. The large *Odontoglossum* house at Glebelands is one of the best appointed in Europe, and the plants leave nothing to be desired in the matter of health and flower-production. The season of that general favourite, *Odontoglossum crispum*, and its beautiful though high-priced blotched varieties, has now commenced, and henceforth, for the next few months, they will command a large amount of the attention of orchidists. At present there is the beginning of a very fine show of them at Glebelands, those in bloom showing the features of the finest type; while the blotched forms have for their best the showy *O. crispum* Carmania, and *O. crispum* Fowlerianum (fig. 90), the latter being a superb form, with uniform, deep, ruby-red blotching. Of hybrid *Odontoglossums*, none at present in bloom can compare with the unique *Odontoglossum Smithii* (Rossii rubescens × *crispum*-Harryanum) (fig. 91), which is again well in bloom. Another remarkable hybrid, *Odontoglossum* Wyonianum, of unrecorded parentage, is

blooming for the first time (see fig. 89). It is a charming white flower, with reddish-purple markings clustered in the inner parts of the segments. The collection of

does. The plants of *D. Devonianum* are also old stock.

A batch of *Cattleya Gaskelliana*, grown for several years, has a surprising number of very

rose-pink blotch on the lip. A great mass of the white *C. Warscewiczii* Madame Melanie Beyrodt promises to give a grand show of flowers, and a good effect in colour is made by *Laelio-Cattleya luminosa*, with its purple and gold-bronze flowers; the very dark rose and claret-coloured *Laelia Iona nigrescens*; *L. harpophylla*, with orange blooms on plants grown here for 20 years; scarlet *Epiphronitis Veitchii*, *Sophræla Psyche*, and other. In the lean-to house of *Dendrobiums*, the back wall is covered with *Epidendrum O'Brienianum*, with crimson and scarlet flowers, and *E. Boundii*, orange and red, both beginning a flowering which will continue throughout the greater part of the year. *B.*, March 15.

FIG. 89.—ODONTOGLOSSUM WYONIANUM FROM MR. GURNEY FOWLER'S COLLECTION. THIS HYBRID GAINED AN AWARD OF MERIT AT THE ROYAL HORTICULTURAL SOCIETY'S MEETING ON MARCH 9, 1909.

Odontiodas, including the original *O. Charlesworthii*, has, among others, the brightly-coloured *O. heatonensis* in bloom. The *Masdevallias* are beginning to make a good show, some very fine plants of *M. Schröderiana* and varieties of *M. coccinea* being in bloom, together with some of the smaller species; a specimen of *M. Chestertonii* is bearing several of its pretty flowers.

In one of the warm houses a fine specimen of the now extremely rare *Eulophiella Elisabethæ*, probably the sole survivor of the original importation, is in excellent condition; and suspended overhead is another example of the same kind in *Eulophiella Peetersiana*, which not only grows vigorously at Glebelands, but is propagated. A still more remarkable instance is to be found in the cases containing seedlings, where healthy little plants of *Arachnanthe Rohaniana*, a close ally of *A. Lowii*, raised from seeds from the plant which flowered at Glebelands some time ago, are growing satisfactorily.

The *Cypripediums* always present some bloom. It is interesting to note that the remarkable *C. Leeatum* J. Gurney Fowler, which did not make much progress after flowering at the time when it was illustrated in the *Gardeners' Chronicle*, is now robust, and one or two divisions from it have been established. In flower are *C. Beeckmannii*, varieties of *C. Euryades*, *C. Chapmanii*, *C. triumphans*, *C. Cassandra*, *C. Tityus superbum*, *C. Reginald Brade*, a very good and prettily-marked flower, and many others. Among specially good things in fine condition are *Cypripedium Thalia* "Mrs. Francis Wellesley," a charming flower, the handsome *C. F. K. Sander*, *C. Earl of Tankerville*, and *C. Aeson giganteum*.

Dendrobium Wardianum is flowering especially well. Few succeed in growing this plant for nine or ten years in the manner Mr. Davis

stout growths. *Cattleya Trianae* and *C. Schröderæ* are in bloom, one pretty variety of *C. Trianae* having pure white flowers, with a bright

THE FERNERY.

SPRING TREATMENT OF HARDY FERNS.

SINCE all the species and beautiful varieties of native Ferns are now beginning active root-action, in preparation for the unrolling of their fronds, no better time than the present can be chosen for the necessary operations of repotting, shifting, or division of the crowns for increasing the stock. The primary advantage is that, if these operations are effected before the fronds rise, there is the less chance of causing damage to the latter; a secondary advantage is that, after the long rest, the root activity is such that practically no check is experienced, such as would be likely to ensue if the fronds were well up and unfolding. It must not, however, be assumed that, because the fronds are not in evidence, the crowns will bear roughly handling. In point of fact, the fronds are snugly packed within the crowns, and if the crowns are crushed, the result may be that when the fronds unfold they will be misshapen. Another point to be remembered is that fresh roots emerge from the base of the new fronds some time before these fronds begin to elongate. These should be preserved from damage as far as possible.

As regards repotting, it is not advisable to shift a healthy Fern which has attained full

FIG 90.—ODONTOGLOSSUM CRISPUM FOWLERIANUM.

size and is already in a fair-sized pot. Ferns so established succeed well for years if supplied with sufficient water. Smaller specimens, on the contrary, which have not attained full size, naturally require shifting, and, in doing this, pots only one size larger should be used, and the new soil carefully worked down, without causing much disturbance to the roots. Dead, black roots, however, may occur if the plant has not done well, and in such cases it is better to remove these and any soured soil associated with them, and repot the plant in the same sized pot, or even, in bad cases, in a smaller one. The pots should be well drained with crocks, and the soil used should be a porous compost of half leaf- or peat-mould, half good loam, and a liberal dash of coarse silver sand. It is not well to stand the pots in saucers, as a constantly sodden state of the soil is apt to cause sourness, and, much as Ferns like moisture, in nature, nearly all of them grow in well-drained soil. "Let well alone" is a good motto for healthy, established specimens; but Ferns of the shuttlecock type, i.e., which have their fronds arranged round a central caudex or root-stock, develop their particular varietal character to much better advantage if kept to single crowns by removal of the lateral offshoots which they are very apt

rambling root-systems, whence the fronds spring separately, these are best left alone, or, if necessary, shifted *en masse* into larger pans, pan and not pot culture being preferable for these shallow rooters. For propagative purposes, pieces of the creeping root-stock, provided with a frond or two and a growing point, can be severed, and they will soon establish themselves, if planted on or close to the surface of the soil. Out-of-doors, given shelter from hot sunshine and protection from high winds, most of the species thrive in ordinary garden soil, if not of too clayey a nature. In such a case, an admixture of leaf- or peat-mould is desirable, special stations being made when planting or replanting.

Bog-loving Ferns, such as *Osmunda regalis*, should be planted low down on rockeries or banks where they can get a large amount of moisture at the roots. Lady Ferns also like plenty of moisture; but what may be termed wall or rock Ferns, such as the Spleenworts, do better in chinks higher up, or, if placed in pots, these must be extra well drained. *Blechnum spicant* is fond of humid conditions, but most of the other species, such as Shield, Buckler and Hartstongue Ferns, do well under ordinary garden conditions, and need no special study. *Chas. T. Drury.*

FIG. 91.—ODONTOGLOSSUM SMITHII IN MR. GURNEY FOWLER'S COLLECTION.

to produce. Hence, if left alone, an originally single crown, with fronds, perhaps, 3 feet or more in length, forming a handsome circlet of symmetrical form, is apt to degenerate into a bush of 2-foot fronds, intricately intermingled, and consequently losing much of their natural grace. Separation is easy enough. Each crown has its own bunch of roots, and as it is only attached to the parent by a neck, it can be prised off with a trowel or blunt instrument, and pulled away practically intact. Some Ferns, especially the Lady Fern, multiply into the bush form by a process of division or splitting-up of the main crown, rather than by lateral offsets, and in this case separation can only be safely effected when each crown has developed so far that there is a well-defined neck to it. The crowns can then be separated by making a shallow cut in the indentation between the necks, and forcing them apart by gentle pressure, when, as in the case of offsets, they will be seen to have their independent root-systems, and can be accordingly separated.

With regard to such Ferns as *Polypodium*, which do not form definite crowns, but have

A BORDER OF SUMMER FLOWERS.

I AM prompted to write about the merits of a few simple garden flowers, having in mind the appearance presented by a very artistic and pleasing border during the summer of 1908. This particular border, during the spring of the previous year, was occupied by a crop of Spring Cabbages, followed by another of Tomatos, these latter plants remaining until the first frosts appeared. The border occupied a dry situation, and was backed by a wall, which made it still drier and warmer. It was, therefore, well manured with cow dung and left rough for the winter. The ground remained in this condition until the following March and April, when it was planted with its summer flowering occupants. Many were biennials, and those that were not were treated as such, including a variety of *Hollyhock* of a soft rose shade, with semi-double flowers. These were fine, strong plants raised from seeds sown the previous May. Sweet Peas raised from seeds sown in pots the previous October and kept in cold frames throughout the

winter included the following varieties:—Nora Unwin (white), Frank Dolby (lavender), Mrs. Collier (cream), Constance Oliver (cream ground, orange-pink flush), Mrs. C. W. Breadmore (cream or buff with pink edge), Elsie Herbert (white with pink edge), Helen Lewis (orange), and Countess Spencer (pink). The clumps of Sweet Peas were placed 12 feet apart, and the back wall was clothed with tall *Nasturtiums*, including *Salmon Queen*, a very beautiful variety having salmon-pink coloured flowers, and *Fairy Queen*, whose colour ranges from pale pink to primrose. A wire at the base, and another at the top of the wall, served to attach vertical strings for the support of the growths. *Campanula pyramidalis* and *pyramidalis alba* were also employed. These were raised the previous spring in pans of fine soil. The seed was sown during March, placed in gentle warmth, and the seedlings pricked into small pots separately and planted in the open ground early in June. They were transferred to the border in the following April. *Canterbury Bells* (*Campanula medium*) were used in quantity. Those with rose, mauve and white flowers of both single and "cup and saucer" varieties were used. These were raised in the previous July, being sown in the open and pricked off in the vegetable quarters 9 square inches apart. They remained in that position until the following March, when they were planted in the border. These *Campanulas* made a glorious show during June and early in July. They were planted in blocks of separate colours sufficiently far apart to allow of placing other plants between them, so that there should be no serious break of flowers during the height of the season. *Scabious* of the variety *Azure-Farie* and blue and gold-coloured *Salpiglossis*, with the newer giant forms of *Sweet Sultan* in mauve, white and yellow shades, were the plants used to take the place of the *Canterbury Bells* when they were past flowering. The succession plants were all raised in gentle warmth, and were carefully planted and attended to until re-established. *Sweet Williams* in one variety only were used, *Pink Beauty* being the one selected. This flower was sown and treated in the same manner as the *Campanulas*. It is, without exception, the most beautiful *Sweet William*, and, apart from its great beauty, the blooms are very lasting. All the plants do not produce flowers of the same shade of salmon-pink, but they are all admired, and when in their full beauty attract the notice of visitors. Long-spurred hybrid *Aquilegias* were freely employed towards the front of the border. The seeds were sown in pans the previous May, the seedlings being pricked out in the open when large enough and transferred to the border towards the end of March. These long-spurred hybrids are very beautiful and graceful. The best plan is to treat these plants as annuals, or, rather, to raise them annually to obtain growing plants that will flower freely. They should be planted 1 foot apart: they are very scanty leaf producers, and to prevent a bare space when their flowering is over, sow, after planting the *Aquilegias*, either a double-flowered salmon-coloured variety of *Clarkia* or *Godetia Schaminii*. The annuals will take the place of the *Aquilegias* when their flowering is over. These flowers may be freely used in other portions of the border, for, provided that they are thinned to a proper distance, they are amongst the most valuable annuals. No border is complete without the graceful *Gypsophila paniculata*. This should be sown the previous spring in pots or pans, planted in the open for the summer and winter, and transferred during March to the flowering position, taking care to preserve the long, thong-like roots from injury. The plants quickly re-establish themselves after transplantation. The inflorescences are so valuable for decorative purposes, this *Gypsophila* should be grown in various positions to provide a succession of blooms. *Lupinus*

polyphyllus roseus, L. p. Somerset (a fine yellow variety), and L. p. Mørheimii (with rose and white-coloured flowers) make a stately show of flowers easily raised. The plants are from seeds sown the previous June, and transferred to the border in the following spring. Of the dwarfier plants used, the pretty Iceland Poppy, *P. nudicaule*, with orange, yellow, scarlet and white flowers, was conspicuous. The plant is treated as a biennial. A very pretty annual plant freely used upon the extreme edge of the border was *Leptosiphon hybridus* (Gilia), a most interesting plant to study. A wonderful range of colouring is to be had amongst these flowers. Pansies were freely used about the front. If an occasional plant is not of an altogether desirable colour it, being placed so embracingly near the earth, rarely clashes with other and softer shades. There are many strains of Pansies, and almost any one of them will give a fine assortment of beautiful colours. Candytuft in the newer, soft shades was very thinly sown, also the excellent white spiral variety: these annuals require much more room than is often given them. They are very lasting, and always more showy when allowed plenty of space. The small, elegant *Linarias* are also showy plants. They were massed along the front of the border in white, yellow, mauve and other shades. Even when mixed they are very pleasing. The *Mignonette* employed was raised in a little warmth in March, and pricked off into boxes and finally planted in the border in May. On many occasions we have had the finest results from such treatment, and the flowering is earlier. The variety *Machett* and the white, red and yellow giant forms are all showy, especially if each plant is allowed from 9 to 12 inches to develop. The beautiful *Nigella* "Miss Jekyll" was also judiciously used. It is one of the most charming of summer flowers. A few plants of *Larkspur* (rosy-scarlet) and *Lavatera alba splendens* and *L. rosea splendens* were also employed. These were sown in their flowering positions early in April, and were very effective in late summer. The smaller *Helianthus* of the primrose, stella, and orion types are charming in the early autumn, and continue in bloom until destroyed by frost. A few plants of the *Shirley Poppy* were also employed in the border: although of short duration, they are always admired when in flower. There were also included varieties of *Coreopsis*; some of the dwarfier-growing kinds of such colours as crimson, yellow, brown and gold formed suitable subjects for the foreground. Such was the completed list of plants employed for this floral arrangement. The greatest perfection was reached when the *Canterbury Bells*, *Sweet Williams* and *Aquilegias* were at their best. The border is no longer a flower border, but other positions have been prepared in like manner for a similar display in the coming summer. Charles Foster.

OLEARIA MYRSINOIDES.

THIS elegant shrub appears the hardiest species of the genus. The severe frosts which have been experienced both in February and March have not injured it in the least, yet the foliage of the *O. Haastii* has been severely damaged in several situations in the same garden. *O. Haastii* is one of the finest evergreen shrubs, and is especially valuable for town gardens, thriving and flowering freely in places where many shrubs fail. Whilst this plant is the best of the genus for general purposes, there is still room for *O. myrsinoides* (see fig. 92) as a neat evergreen shrub for the front row of the shrubby border. It forms a spreading bush about 2 feet high, with rigid, erect or sub-erect stems, densely clothed with hard, leathery leaves, which are 1 to 2 inches in length, glabrous above, densely tomentose beneath, and with prettily undulate, serrate margins. The

flowers are produced in the month of June, and, as may be seen from the illustration, are borne in a dense mass along the upper parts of the stem, forming a leafy, elliptic, or oblong panicle. The individual flower-heads are about an inch in diameter, the ligulate florets being pure white, those of the disc being yellow, fading with age to brown. The stamens are large, with conspicuous linear, yellow anthers.

This species is extremely variable in habit, and in the size of its flowers and leaves. Two well-marked varieties have been described. The variety *erubescens*, which is in cultivation at Kew, is a much stronger grower than the type, with leaves often 3 inches long, and with a rigid,

[Photograph by C. P. Raffill.]

FIG. 92.—OLEARIA MYRSINOIDES.

acute tip, the whole plant being more densely tomentose. The flower-heads are slightly larger, and often tinged with light purple-red; the ligulate florets are fewer in number, often only four or five in each head, and the whole plant is less floriferous under cultivation than the plant illustrated. In the variety *serrata*, the plant is dwarfier and weaker in habit, the leaves are sessile, or nearly so, usually $\frac{1}{2}$ to 1 inch long, the apex obtuse, and the margins serrate, while the plant, further, has the habit of sending up suckers at intervals, which are so weak as to require the support of Grasses and other neighbouring plants.

O. myrsinoides is a common plant in Tasmania, and occurs also in Victoria and New South Wales, growing in poor, sandy soil, or rocky, barren, scrubby places, where little else in the way of plant life can exist. The common name of "Daisy Bush" is applied both in Australia and in New Zealand to the members of this genus, the well-known *O. Haastii* being also known in the latter country, of which it is a native, under the name of "Snow-in-Summer." C. P. R.

PLANT NOTES.

NERTERA DEPRESSA.

THIS pretty plant always attracts attention when in fruit, and doubtless many would grow it who now abstain from doing so did they appreciate the hardiness of the plant and its simple cultural requirements. It was at one time freely used in carpet-bedding arrangements, but of late years it is not frequently seen. In the days when the plant was in demand, I cultivated it extensively, always dividing and repotting it in the early months of the year prior to its flowering. A cold frame was requisitioned the year round, the pots being plunged in ashes. The plants gave little or no trouble, their principal requirement being waterings overhead when growth had begun. During the flowering period this watering was discontinued, and in sunny weather the lights were removed altogether. Thus treated, the plants fruited abundantly. Much of my success I attributed to the annual division of the root-stocks that resulted in a free lax growth. When placed in a warm greenhouse, the plant is liable to become drawn, in which condition it fruits less freely. E. J.

CANARINA CAMPANULA.

IN the words of *Nicholson's Dictionary*, this is "a greenhouse herbaceous perennial of considerable beauty." In these gardens we have had a plant, three years from seed, in continuous flower from the beginning of October to the present time; so that, as this covers a period when greenhouse flowering plants are comparatively scarce, it may be termed a plant of no little value. The large flowers, which are of an uncommon colour—orange-purple, with red nerves—are solitary, at the ends of drooping branchlets, which branch immediately behind the flowers into a pair of growths, each terminated in a large bell-flower. The corollas are six-lobed at the apex, and, being of good substance, the individual flowers last for a very long time. Their peculiar colour is admirably set off by the graceful Pea green subcordate leaves. The plant grows well in a rather light soil, such as fibrous loam, with a fourth part leaf-soil, and a good sprinkling of sand. As abundant moisture is necessary during the season of growth, care should be taken to provide good drainage. The principal shoots of a plant in a 6 or 7-inch pot will be about 4 feet long, and, at this height, throw out the secondary pendulous branchlets. Unless allowed to ripen seed, which sets freely, the plant quickly dies down when its flowering is completed. At this stage, water, which has been given less copiously during the flowering season, should be withheld for a time. *Nicholson* recommends repotting the tuberous roots in January, but, as the flowering season is stated to be "January to March," this must be an error. The best time for repotting is just as the roots begin to grow. Cuttings do not root readily, but propagation may be effected by division of the root or by seeds. As the generic name implies, the plant is a native of the Canary Islands, from whence it was introduced so long ago as 1696. The specific name, *Campanula*, fittingly describes the flowers. A. C. Bartlett, *Pencarrow Gardens, Cornwall*.

COLONIAL NOTES.

WATER HYACINTH PROHIBITED IN CEYLON.

THE Water Hyacinth (*Eichornia crassipes*) is appreciated in this country as a stove plant on account of its trusses of lilac-coloured flowers standing erect from amongst the leaves. As is well known, it is an aquatic plant, having beneath the surface of the water a dense mass of roots, whilst the bases of the leaf-stalks are swollen out into large bladder-like structures, which enable the plant to float high in the water. The plant multiplies with great rapidity under favourable conditions, and since it is easily blown along by the wind, and small detached portions readily grow, it is well adapted for establishing itself and spreading when introduced to a suitable environment. That this is the case several countries have already found to their cost, and the Water Hyacinth, originally native to South America, is a serious pest in some rivers and other waterways in places as far apart as Java, Australia and Florida, where it has been introduced and flourishes to such an extent as to impede, if not actually to prevent, navigation in some localities. When once thoroughly established, it is a difficult and costly matter to keep it under control, and its complete extermination is, perhaps, impossible.

Attention was recently directed by Dr. J. C. Willis, Director of the Royal Botanic Gardens, Ceylon, to the fact that the Water Hyacinth was to be seen in a few places in the island, grown as an ornamental plant, and he pointed out the danger of allowing it to get a foothold in the colony. Ceylon has already suffered much from land plants introduced from South America, notably Lantana, "Sunflower" (*Tithonia* sp.), and the sensitive plant *Mimosa pudica*, which, between them, cover large areas. The possibility of a similar invader choking her waterways is not a risk lightly to be run. Practical effect has, therefore, been given to Dr. Willis's warnings in a recent number of the *Ceylon Government Gazette*, wherein is published a draft ordinance prohibiting, under a penalty of 200 rupees (about £13), the importation of the Water Hyacinth.

COFFEE-LEAF DISEASE IN THE EAST AFRICA PROTECTORATE.

THE fungus *Hemileia vastatrix*, closely allied to the rust of Wheat, first came into notoriety about 1880, when it was instrumental in destroying the then flourishing Coffee industry of Ceylon. It is usually known as the "Coffee-leaf disease," and may be recognised by the clusters of yellow spores which appear chiefly on the under-sides of the leaves of the affected bushes. Some idea of the material damage which this fungus has caused may be gained by noting that, whereas, in 1880, the Coffee exports of Ceylon were of the approximate value of £3,000,000, they are now only about £25,000. All through the Coffee countries of the East the pest has done great harm. In his "Revision of the Genus *Hemileia*" (*Kew Bulletin*, 1906), Masee records its geographical distribution. In the East it occurs in Ceylon, India, Java, Sumatra, Malacca, Singapore, and the Philippines. Samoa, Fiji, Mauritius, and Madagascar are other places in which it is found. The African mainland has not escaped, and in Natal, German East Africa, and in the neighbourhood of Victoria Nyanza, *Hemileia vastatrix* has been found attacking Arabian Coffee.

The northern part of the Transvaal had, until some years ago, a small but flourishing Coffee industry. This has now been destroyed by the ravages of this pest.

With the development of British East Africa, attention is being given to Coffee amongst other crops, and official action has recently been taken to guard against the introduction of the disease, which would soon make short work of

any Coffee plantations which might be raised. Recent issues of the *Government Gazette* contain notices prohibiting the importation of Coffee plants or seeds from either German East Africa on the one side, or Uganda on the other. W. G. F.

The Week's Work.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LOOER, Bart., Leonardslee, Sussex.

Planting trees and shrubs.—Any arrears in this work should be finished as speedily as possible. April is considered the best month for shifting Hollies and Conifers, but I do not think it offers any appreciable advantage over October and November.

The Rose garden.—Complete planting operations as soon as possible. Pruning will now require attention. The finest flowers are obtained from plants that are severely pruned, but although such pruning may be desirable in the case of blooms required for exhibition purposes, it does not give the best result from a garden point of view. Small shoots which are incapable of producing flowers should be entirely removed, also dead and decaying branches. The vigorous shoots should be cut back to about four or five buds, varying according to the type and variety. After the pruning the plants should be tied securely to the stakes, and if pegging down the shoots is practised this work must be seen to. When the prunings have been burned and the beds made tidy, apply a little chemical fertiliser to the beds.

Ivy on walls.—This should be clipped almost to the wall, and all rubbish removed. The young leaves will soon push forth and clothe the walls again.

Ferns.—The old fronds and rubbish may now be cleared away from these plants. It is a suitable time to afford top-dressings to Ferns, or to replant them. Some of the more tender species should have their young growths protected as soon as they appear through the soil. This especially applies to *Adiantum pedatum* and *A. Capillus-veneris*. Among the most suitable Ferns for the flower-garden are *Cyrtomium falcatum* and the variety *caryotideum*; *Cystopteris fragilis*, *C. alpina* and *C. montana*; *Allosorus crispus* (Parsley Fern), with species of *Polystichum*, *Scolopendrium*, *Lastrea*, *Polypodium*, *Asplenium*, *Blechnum* and *Lomaria*.

Bedding plants in pots.—These should be given increased room. Seedlings and cuttings should be potted as soon as they are sufficiently rooted. Sweet Peas in frames should have the lights removed whenever the weather permits, especially in the early morning, provided there is no frost. *Calceolarias*, *Pentstemons* and similar plants should be afforded sufficient room for each to properly develop. Tuberous *Begonias* are best planted out in frames, so that they may make a considerable amount of growth before they have to be shifted out-of-doors.

Annuals.—Hardy annuals should be sown as soon as the ground can be got ready for the seeds. It is a good plan to cover the seeds with some old potting soil. Among the best annuals for display are *Godetias*, *Nemophila*, *Chrysanthemum* of species, *Lupinus*, *Clarkia*, *Gypsophila*, *Saponaria*, *Calliopsis*, *Lavatera*, *Eschscholtzia*, *Centaurea*, *Poppies*, *Dimorphothea*, *Sweet Sultan* and *Linum*.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Asparagus beds.—The wintry weather has delayed the work of tidying the permanent beds, but this should now be seen to at once. The surface should be neatly raked, and the coarse soil and other material placed in the bottom of the alleys. After this work is finished, give the beds a good dressing with a suitable chemical manure. The best time to plant *Asparagus* is when the growth commences to push forth. The crowns should be planted immediately after they are lifted, it being important to prevent the roots

becoming dry, as this causes them incalculable harm. If the soil was prepared during the winter months, all that is needed now is to break it up finally, and place the crowns at a distance of about 15 inches apart, spreading the roots out evenly. Three rows will suffice for each bed. The crowns should be covered carefully 3 to 4 inches deep with very fine soil. After the planting is finished, the surface of the bed should be raked over neatly. Seeds may be sown early in April in rows placed at 1 foot apart. When the seedlings are quite small, thin them to 12 inches apart.

Forcing Asparagus.—There is still time to make one more good planting of *Asparagus* in an unheated frame. Owing to the scarcity of vegetables generally this season, this *Asparagus* will be more than usually valuable.

Peas.—Plants that have been raised under glass for planting in the open should be thoroughly hardened before they are placed out-of-doors, which should be done at the earliest favourable opportunity. If the work of transplanting is done expeditiously, the plants will scarcely experience a check. On the contrary, they will succeed better than those raised in the open garden. Any Peas that are a few inches above the ground should have stakes placed to them, and they should be netted at the same time, if birds are troublesome. A final sowing may be made under glass, and, at the same time, a few rows may be sown in the open. Peas require an abundance of ventilation when they are grown under glass, and when they have developed a reasonable number of pods the points of the leading shoots should be pinched out and all laterals removed.

Broad Beans.—Plants raised in boxes under glass should now be planted out in well-prepared ground. Sowings should also be made in the open. Broad Beans in pots should be placed where they will receive plenty of sunlight in a cool house. Afford an abundance of fresh air whenever the weather is favourable, even at night-time. Each plant should be supported by a separate stick.

Winter greens.—Make the first sowing of these vegetables on a south border.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Grafting.—About this date the stocks are generally in a suitable condition for grafting, and no time should be lost after the sap commences to rise. There are several methods of grafting, but "crown" or "rind" and "whip" or "tongue" grafting are those usually practised. In most gardens there are some healthy trees which either bear inferior fruits or crop meagrely. By grafting better varieties on such specimens, they can be converted into profitable trees, and the scions will come quickly into bearing. In the case of trees of a moderate or large size "crown" or "rind" grafting (see illustration in *Gardeners' Chronicle*, March 28, 1908) should be adopted. The branches, having been sawn off in the winter about 5 or 6 inches above the part where the graft will be inserted, should now be cut off with a sharp knife to the part itself, leaving the surface quite smooth. The scions having been taken from the border in which they have been "heeled," should be cut to about 6 or 8 inches in length, and all the buds except four on the upper part of the shoot removed. The basal portion of the scion should be cut obliquely and made so as to fit neatly in an incision which must be made in the bark of the stock. When the scion has been nicely fitted, the bark must be bound tightly against the scion with matting and the surface afterwards smoothed over with wax or grafting clay to keep out wet and air.

"Whip" or "tongue" grafting (see illustration in *Gardeners' Chronicle*, March 28, 1908).—This method is best for very young stocks and for cordon trees. Cut the stock to the required length, making the incision through a node, and slit the bark in a perpendicular direction. The base of the scion should then be prepared so that it will fit properly in the slit made on the stock. A slit is made in the stock to form a tongue, and

a similar one in the scion in which the tongue is inserted. This holds the scion and stock securely together, and the final work is to tie with matting and to cover up the juncture either with prepared grafting wax or clay. These materials about the graft should be examined occasionally, and if they are found to be cracking, the clay must be damped and made airtight. This is the more necessary during dry, windy weather.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Strawberries in pots.—These plants will require great attention in regard to watering. On no account must they be allowed to become dry at the roots, as this would affect the flavour of the fruits. Red spider, too, spreads rapidly on plants which have been allowed to flag, and, if the Strawberries are occupying shelves in fruit houses, this pest will be liable to spread to the fruit trees. Strawberry plants should be afforded liberal supplies of stimulants while their fruits are swelling, and the foliage should be drenched with tepid rain water two or three times a day. If the plants are shifted to a cooler and drier house when the fruits commence to colour, the flavour of the berries will be improved.

The orchard house.—When the fruits of Peach, Nectarine, Apricot, and Plum have set, they may require thinning. Remove first those fruits which are not in a position to obtain the full benefit of the sun's rays. In the case of Apples and Pears it will be prudent to wait till the fruits are swelling freely before thinning is practised, as large numbers of these fruits drop naturally at an early stage. At this period no severe forcing must be attempted with either the Apple or the Pear, as this would cause very many of the fruits to drop. The final disbud-ding of the shoots should now be done, and growths which are being retained may be stopped when they have made four or five leaves. Any fruitless wood not required for furnishing the tree should be cut back to a basal growth. Maintain a moist atmosphere by damping the paths, &c., and use the syringe freely on fine days. An occasional syringing with an insecticide will help to keep the trees clear of insect pests, but, should aphids appear on the leaves, fumigate the plants with some nicotine compound.

Tomatos.—If ripe fruits are required very early in the season, some of the more forward plants of the earliest batch which have set three or four trusses of fruit should be placed in a warm house and quite close to the glass. Pinch out the top of the leading shoot and remove the side growths as they appear. Give the roots a surface dressing of some rich material. Tomatos may now be frequently watered with liquid manure or some approved fertiliser. The later plants must be induced to set their fruits by lightly tapping the trellis to which they are trained. Keep the atmosphere dry, and admit plenty of fresh air when the weather permits. Shift plants of later batches into larger pots before they become pot-bound, and expose them fully to the light.

PUBLIC PARKS AND GARDENS.

By J. W. MOORMAN, Superintendent of Victoria Park, London.

Playing fields.—The park season for hockey and football ended on March 31. During April no games of any sort are permitted on the playing fields, and this allows the turf to recover somewhat after the hard wear caused by the football and hockey teams. Opportunity is taken during March to renovate any turf that needs it, either by returfing or the sowing of grass seeds. Hoing and rolling are also performed frequently, so as to get the sward in as good a condition as possible before the summer games commence. The summer games, commencing on May 1, are cricket, tennis, bowls, and croquet. Cricket is only permitted until September 30, but tennis, bowls, and croquet may be played till the end of October. Specially-prepared lawns are allotted to each of these games.

Cricket pitches.—In thirty of the L.C.C. parks and open spaces special areas are apportioned to cricket, and these number in all nearly 500 pitches. In Victoria Park provision is made for twenty-eight matches to be played at one time. The number of clubs who apply for pitches, especially on Saturday afternoons, is far more numerous than we can cater for. Therefore a system of balloting is adopted, and the secretaries of the successful clubs are sent tickets, which have to be presented to the person in charge of the ground. Should any club fail to make use of a pitch after it has been allotted at 4 p.m., the ground is offered to another team, and there are always plenty ready to take this opportunity. The wickets must not be pitched nearer than 40 yards from any public path or roadway.

Tennis.—This is another popular game in the L.C.C. parks. Thirty-two tennis courts are provided in Victoria Park. Persons can make use of these courts free of charge. They are required to sign their names in a book which records the number of the court allotted them, and they are allowed to play for one hour, but if no other person desires the court the time is then extended to two hours. In nearly all cases, we prepare double courts, as these are mostly in demand.

Bowls.—An excellent sward is required for this game. Sweeping, rolling, and watering must be constantly practised to have the turf in a suitable condition. Persons making use of either the tennis courts or the bowling greens are required to wear rubber-soled boots. No charge is made by the L.C.C. for any games provided in their public parks and open spaces.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Euphorbia.—The stock plants of *Euphorbia* (*Poinsettia*) *pulcherrima* which have been resting, should now be pruned back to firm wood, and placed near to the glass, in order that they may make sturdy, short-jointed growths to furnish good cuttings. The roots will not need water for some little time afterwards, but the plants should be syringed freely. They must not be subjected to a great heat, or they will form weakly shoots. *E. fulgens* (syn. *jacquinæflora*) requires a long season of growth, therefore the cuttings should be inserted earlier than those of *E. pulcherrima*. The shoots, being taken with a heel of the old wood attached, should be inserted in sandy soil in a propagating case so that a close atmosphere may be maintained. *E. splendens* flowers almost perpetually, but it requires the warmth of a stove.

Nepenthes.—The usual and best method of growing these plants is in hanging baskets. A suitable rooting medium is composed of two parts loam and one part Sphagnum-moss. Propagation is effected by means of cuttings of one-year-old shoots which require rooting in a considerable amount of bottom heat. Much heat and atmospheric moisture are necessary for the cultivation of *Nepenthes*, especially during summer and autumn, and no draughts of cold air must be allowed to enter the structure. Any plants which have straggly growths may have such growths shortened.

Begonia Gloire de Lorraine.—Plants which have been rested during the winter months and have been trimmed by pruning may be placed in warmth to encourage them to make fresh growths, which may be used as cuttings. They should be shaded from bright sunshine, and be given frequent syringings with clear water. Suckers will soon form from the base of the plants, and these growths make admirable cuttings. The cuttings should be potted up and placed in a warm house, but a close atmosphere is not advisable, although shade from sunshine should be provided. The best results are obtained from plants which are grown without a check.

Solanum capsicastrum.—If the berries have commenced to shrivel, the plants should be pruned and placed near the roof glass. When growth recommences, turn the plants out of the

pots, remove a portion of the old soil and re-pot them in receptacles of the same size or slightly larger.

Miscellaneous seedlings.—These should be carefully transplanted as soon as they are sufficiently large. Shade them from direct sunshine, but do not place the material so close to the pans as will create a stagnant atmosphere, this condition being the cause of damping off. Seedlings of *Begonia*, *Gloxinia*, and *Gesnera* should be shifted from the seed pan at the earliest opportunity.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Terete species of Vanda.—It is now time to return the resting plants of *Vanda Hookeriana*, *V. teres*, and the hybrid "Agnes Joaquim," to the lightest position in the warmest house. Abundance of water should now be given them, as no gain can be got from further prolonging the resting season.

Dendrobium.—Such species as *D. fimbriatum*, and its fine variety *oculatum*; *D. moschatum*, *D. Dalhousianum*, *D. clavatum*, *D. thrysi-florum*, *D. densiflorum*, *D. Schröderi*, *D. Farmeri*, *D. suavissimum*, and *D. chryso-toxum* will now be showing their flower-buds. They will need more water at the roots, and a warmer atmosphere than that in their resting quarters. On bright, sunny days frequently spray the under-sides of the leaves with tepid rain-water.

Pleiones.—The Indian *Pleiones* as *P. maculata*, *P. lagenaria*, *P. Wallichiana*, *P. præcox*, and *P. concolor* are now growing and rooting freely. They should occupy a light, airy position close to the roof glass of the *Cattleya* or intermediate house. From the present time these plants will require copious waterings and occasionally some weak liquid manure. During fine weather the under-side of the foliage should be syringed each day. The cooler-growing varieties, which include *P. humilis* and *P. Hookeriana*, and which thrive well in the *Odontoglossum* house, have now finished flowering. These plants should be repotted at once, using a compost consisting of peat, loam, and Sphagnum-moss in equal proportions, with a moderate quantity of small crocks and coarse silver sand mixed well together. For a few weeks afterwards water must be afforded sparingly.

Odontoglossum crispum.—In the cool house there are many *Odontoglossums* of the *O. crispum* section now showing their flower-spikes. Strong, healthy plants frequently produce two spikes from one pseudo-bulb, but these are too much for a plant's well-being, therefore cut off the one from the side where the leaves are shortest. Plants of *O. citrosimum* now require much water at the root. Place them in a moderately warm, moist atmosphere, and see that slugs and woodlice are not allowed to injure the tender young spikes.

Habenarias.—Such *Habenarias* as *H. militaris*, *H. rhodochila*, *H. Susanæ*, *H. carnea* and its variety *nivosa*, also the new *H. Uganda*, are now commencing to grow, and the tubers should be carefully turned out of the old soil and re-potted. When the plants are strongly grown, some of the tubers will be about 3 inches in length, and for these long thumb pots are the most suitable, on account of their depth. The tubers of *H. Uganda* are sometimes as long as 9 inches, therefore correspondingly larger pots must be used. Place one tuber in each pot, filling around the tuber to half its length with crocks, keeping the point just below the rim of the pot and above the crocks. The compost should be of fibrous loam and peat two parts, and finely-chopped Sphagnum-moss, crocks, and a little coarse silver sand, two parts. Pot with moderate firmness, just covering the top of the tuber, then place the plants in a warm, moist atmosphere, and see that the pots are kept close up to the roof glass in good light, but without exposure to strong sunshine. When the points of the new growths are seen pushing up through the new compost, an occasional spraying from a fine rose watering can is necessary, the quantity being gradually increased as the growths strengthen. An occasional spray overhead when in full growth is beneficial.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR APRIL.

SAURDAY, APRIL 3—Berlin International Exh. (to 13th inst.). Soc. Franç. d'Hort. de Londres meet.

TUESDAY, APRIL 6—Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by the Rev. Professor G. Henslow, M.A., on the "Effects of the Forces of Growth"). British Gard. Assoc. Ex. Council meet.

WEDNESDAY, APRIL 7—Roy. Caledonian Hort. Soc. Spring Fl. Sh. at Edinburgh (2 days).

THURSDAY, APRIL 8—London Branch B.G.A. lecture on "Commercial and Co-operative Gardening."

MONDAY, APRIL 12—Bank Holiday.

TUESDAY, APRIL 20—Roy. Hort. Soc. Coms. meet. and Nat. Auricula and Primula Soc. combined Show at Hort. Hall, Westminster (Prizes for Daffodils and Carnations. Lecture at 3 p.m. by Mr. Eric Drabble, D.Sc., on "Pansies"). Devon Daffodil and Spring Fl. Sh. at Plymouth (2 days). Shropshire Hort. Soc. Spring Fl. Sh.

WEDNESDAY, APRIL 21—Roy. Hort. Soc. of Ireland Spring Fl. Sh. at Dublin. Roy. Meteorological Soc. meet. Ipswich Spring Fl. Sh. Roy. Hort. Soc. Examination in General Horticulture.

THURSDAY, APRIL 22—Midland Daffodil Soc. Exh. at Bot. Gardens, Birmingham (2 days).

TUESDAY, APRIL 27—Huntingdonshire Daffodil and Spring Fl. Sh. in Corn Exchange, Huntingdon.

WEDNESDAY, APRIL 28—Nat. Auricula Soc. (Midland Sec.) Exh. Roy. Hort. Soc. Exam. of School Teachers in Cottage and Allot. Gard.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—46°1'.

ACTUAL TEMPERATURES:—LONDON.—Wednesday, March 31 (6 P.M.): Max. 52°; Min. 43°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, April 1 (10 A.M.): Bar. 29.9; Temp. 45°; Weather—Overcast.

PROVINCES.—Wednesday, March 31 (6 P.M.): Max. 51° Essex, S.E.; Min. 42° Durham.

SALES FOR THE ENSUING WEEK.

MONDAY—Hardy Border and Herbaceous Plants, Lilioms, Begonias, and other Bulbs, Azaleas, Ferns &c., at 12; Roses and Fruit Trees at 1.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

TUESDAY—Gladioli, Begonias, and other Bulbous Plants, 55,000 Tuberoses, Numerous Hardy Bulbs and Roots, 150 cases Japanese Lilioms, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.

WEDNESDAY—Perennials and Border Plants, Hardy Bulbs, Lilioms, &c., at 12; Roses at 1.30; Palms, Azaleas, Bays, Ferns, &c., at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

It is a fact at once significant and extraordinary that in Carlyle's anthology of Heroes the man of science finds no place. Yet history shows no nobler records of heroic devotion than those of men of science who have sacrificed their lives in the pursuit of knowledge. In the pages of some new anthology their names and deeds will be enshrined. To the priest and poet and man of letters Carlyle has paid a splendid tribute; but a like honour still awaits the scientific explorer: the man who sets out, not oblivious of risk and difficulty, to discover new lands, to chart un-

known seas, to master the secrets of the ocean's depth or those of the ocean of air, to learn, despite the shadow of death which falls across his path, the causes of disease and the means of their prevention.

In the foremost rank of this devoted band of willing martyrs to the cause of science is Commerson. To the general public Commerson is unknown: to the majority of botanists and zoologists he is little more than a name; only the specialists in systematic botany and those biologists with a feeling for and knowledge of the history of the science know the magnitude of the debt which the world of learning owes to him. Yet Commerson, during his life, brought all whom he encountered, and chiefly the great men among them, under the sway of his magnetic personality. Therefore we welcome with the greatest satisfaction the appearance of *The Life of Philibert Commerson, D.M., Naturaliste du Roi*, written by Captain Oliver and edited by G. F. Scott Elliot.

The book, like its subject, is fascinating. All its pages testify to the bond of sympathy existing between authors and subject. Himself a traveller of distinction, Captain Oliver could appreciate the indomitable courage and splendid achievement of this pioneer travelling naturalist. To the editor, as well as to the writer, all lovers of good books owe thanks, for to the judicious use of the materials which Captain Oliver, shortly before his death, put at Mr. Scott Elliot's disposal is due the admirable picture which the book presents of Commerson's wanderings and vicissitudes. Philibert Commerson was born in the Pays des Dombes, near Lyons, in 1727. He was a born naturalist. From his earliest youth he collected fishes (preserving the smaller specimens by pressing and drying them between sheets of blotting-paper), insects, and more particularly plants. He was born in a fortunate hour, in the sense that Linnaeus had cast his spell over Europe and created such enthusiasm for botany as has been known neither before nor since. Such was Commerson's enthusiasm as a collector that he spared himself no pains nor fatigue nor risks to add to his collections. Indeed, his ardour was to cost him dear, for, daring to lay hands on some specimens in the Botanic Gardens of Montpellier, he incurred the petty but potent wrath of his professor, Sauvages, who forbade him access to the gardens and blighted, as it seemed, his career at the moment when it appeared all promising.

But Commerson, though discredited by his paltry professor, continued to work alone. His fame grew. Wherever he journeyed he left behind converts to botany, who became collectors like himself and founded gardens—his botano-maniacs he called those proselytes to botanical science whom he was for ever making.

In 1766 his chance came. He was offered and accepted the post of naturalist to the exploring expedition under de Bougainville which France was sending out to circumnavigate the globe and, perchance, to found new colonies in the place of those recently lost.

During the voyage of the "Boudeuse" and "Etoile," the ships of the expedition, Commerson amassed huge collections and vast stores of observation. Much of the latter

has passed unacknowledged into the common stock of knowledge. His collections also, such as were not lost, passed into other hands: sometimes with due acknowledgment, sometimes to rot in attics.

When the voyage was nearly at an end, the "Boudeuse" and the "Etoile" having reached Mauritius, Commerson took service as botanist to that colony. After exhausting the resources of Mauritius, he explored Madagascar and brought to light many of the remarkable plants and animals of that wonderful island. From Madagascar he passed to Bourbon and, with plans of travel to India and China, returned to Mauritius. Worn out by disease due to exposure and privation, dispossessed of his office by intrigues of colleagues, but working to the last, he died in 1773 at the age of forty-six. Such, in meagre and cold outline, is the Odyssey of Commerson. His body lies in Mauritius in a forgotten grave, for the plants which he loved took him to their embrace. Near the place of his burial a little column, shaded by Eucalyptus trees, serves as a memorial. But each year, as the world comes to a saner view of the meaning of greatness and of what is worthy of pursuit by man, his reputation must increase. Though to the layman it may not mean much that he collected some 3,000 new species and 60 new genera of plants of which he himself described about 1,000, such facts will appeal to the expert. But in reading the life of Commerson, layman and expert alike can learn of the ardour, enthusiasm, courage and endurance out of which Commerson's genius was compounded.

OUR SUPPLEMENTARY ILLUSTRATION portrays the inflorescence and foliage of *Thalictrum dipterocarpum*, a new species from China, introduced by Messrs. JAMES VEITCH & SONS, through their collector WILSON, who discovered it at elevations of 4,000 to 5,000 feet. This *Thalictrum* is perfectly hardy, and forms a useful addition to the list of border plants. The foliage is glaucous-green; the panicles rise some 4 to 5 feet high, producing in a lax manner a number of small, rose-purple flowers. The plant succeeds best in a sunny position, and enjoys a rooting medium containing plenty of gravel. An Award of Merit was given to this plant by the Floral Committee of the Royal Horticultural Society, at the meeting held on August 18, 1908.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place on April 6. At 3 p.m. a lecture on "Illustrations of the Effects of the Forces of Growth" will be delivered by the Rev. Prof. G. HENSLOW, V.M.H.

HORTICULTURAL COLLEGE, SWANLEY.—The annual meeting of the Swanley Horticultural College for Women was held, by permission of Miss BALFOUR, at 4, Carlton Gardens, London, on March 24. The chairman, Sir JOHN COCKBURN, in moving the adoption of the report and balance-sheet, laid stress on the admirable work done by the College in meeting the two great requirements of the day, viz., rural education and the higher education of women. Mr. CHARLES BATHURST, in seconding the resolution, drew attention to the great and growing demand on the part of local educational authorities for teachers qualified to give instruction in nature study and school gardening, in both elementary and secondary schools.

* *The Life of Philibert Commerson*, by the late Captain S. Pasfield Oliver, R.A., and edited by G. F. Scott Elliot, F.L.S., F.R.G.S. (John Murray.) 10s. 6d.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, April 26, when a paper will be read by Mr. E. H. BLAKE (Fellow), entitled "Some Notes on Warming and Ventilation." The chair will be taken at 8 o'clock.

HORTICULTURE AT THE WHITE CITY EXHIBITION, SHEPHERD'S BUSH.—Mr. J. JACQUES has again been appointed chief of the horticultural department at the White City Exhibition. The arrangements for the season are not complete, but it is probable that there will be some flower shows on an extensive scale.

THE "WOOD" FUND.—Since our last issue Mr. GEO. MONRO has received the following sums:—Mr. W. H. PRATT, Kingston-by-Sea, £1 1s.; Mr. F. E. SPARKES, Worthing, £1 1s. The total amount received is £87 10s.

"BOOK OF PRUNING, GRAFTING AND BUDDING."—The author of this instructive little work is well known as a successful gardener and cultivator of fruit, who has occupied the office of chief horticultural instructor for the county of Worcester for 18 years. He was one of the pioneers of allotment and cottage gardens in that county: his experience in all branches of practical gardening is exceptional, and his authority beyond question. We have nothing but unstinted praise for his admirable book of instructions on pruning, grafting, and budding, not only on fruit trees, but also on Roses and numbers of hardy-flowering shrubs and climbing plants. The author recognises how imperfectly pruning is understood and practised by many cultivators, and how essential it is, in order to obtain complete success, to know how, when, and why certain operations must be performed. We all know how neglect of pruning and unskilled pruning cause mischief that is irreparable, reduce the annual produce of orchards and gardens, and, in many cases, extinguish all chances of profitable returns. The various chapters on pruning for wood, for form, for restriction, and for better and more fruit, which are brief, but to the point, are rendered intelligible to beginners by means of simple diagrams and illustrations. Particulars of the best methods of pruning and training standard, bush, and pyramid trees are given, and also the formation of cordons, both single and double, half-standards, goblet, and espalier trees, from the first year from the bud or graft, is explained. The pruning and seasonable treatment of the Plum, a very important Worcestershire fruit, is described in some detail. Root-pruning and top-pruning, and what they bring about, are described. We are told, on the authority of Professor BAILEY, that, in the fruit-growing areas of the U.S.A., the soil, for a depth of several feet, is of an equally good quality, that the trees are allowed to take their natural habit, and fruiting comes naturally with the maturity of the tree. Unfortunately, our soils, as well as those of most parts of Europe, are less favoured, hence the need for such books as Mr. UDALÉ'S.

CEDAR WOOD FOR CIGAR BOXES.—It has recently been stated in the public Press that the supply of Cedar wood is becoming scarce and that all cigar boxes except those for the most expensive brands will in future be made of paper. This statement would appear to refer to Cuba or Havana cigars only, and, if so, would consequently refer only to the wood of

Cedrela odorata, which, though not a true Cedar, is the source of the Cuban and West Indian Cedar of commerce. Years ago many buyers of Havana cigars were guided in their choice of a cigar almost as much by the character of the wood of which the boxes were made as by the appearance of the cigar itself; but even when it could be proved that the boxes were made of the native Cedar, it was no proof that the cigars were Cuban make. Logs of Cuban Cedar were at that time imported into Hamburg, where they were cut up and made into cigar boxes, ready to receive the so-called real Havanas, which were also made in Germany, so that the deception was complete. But the question as to the use of paper for cigar boxes is one that might be met by the continued use of one or the other of the numerous woods which are known under the common name of Cedar, for, beside the species of *Cedrela* just referred to, there are others furnishing woods more or less similar, and notably *Cedrela Toona*, a large tree from 50 to 60 feet high, found throughout the hilly districts of Central and South India to Burma and also in Java and Australia. In India it is known as the Toon or Indian Mahogany tree, also as the Moulmein Cedar, under which name the wood is known in England. It is similar in general appearance to West India Cedar, and is much used in India for furniture and Tea boxes, and in Australia, where it is known as Australian Cedar; it is greatly valued for cabinet work. There are some splendid examples of this wood in the Kew museums. From the close relationship that exists between these so-called Cedars and the mahoganies of Tropical America, Cuba and the Gambia, it might naturally be expected that the woods should have some similarity. This is the case, though the *Cedrelas* are for the most part softer woods than those either of the genus *Swietenia*, which is the source of Tropical American mahogany, or of *Khaya*, from which the Gambia mahogany is derived. All these species belong to the order Meliaceæ, as does *Soymida febrifuga*, a large tree of Central and Southern India, the wood of which is known as Red or Bastard Cedar, though the wood is totally distinct from that of species of *Cedrela* or even *Swietenia* or *Khaya*, being hard, heavy, and of a dark colour. The wood of the true Cedar, or Cedar of Lebanon (*Cedrus Libani*) differs considerably from that of the *Cedrelas*, as all coniferous woods do. It is of very little use for any purpose, though that of its closely-allied species the *Deodar* of India (*C. Deodara*) is very much used for many purposes of construction in India, such as sleepers for railways, bridges, &c., as well as for furniture. Other coniferous trees known as Cedars are *Juniperus virginiana* and the allied species *J. bermudiana*, from both of which the soft, easily-cut wood used for making lead pencils, and known as pencil Cedar, is obtained. Amongst many other plants to which the name of Cedar is applied, we may mention the white Cedar (*Thuja gigantea*), the New Zealand Cedar (*Libocedrus Bidwillii*), and the yellow Cedar of America and Canada (*Chamæcyparis nutkaensis*). From amongst some of these it might be possible to find a substitute for *Cedrela odorata* without resorting to paper pulp for cigar boxes.

VEGETABLES.

ONIONS FOR MARKET.

A SURREY farmer writing to me the other day mentioned that, having sold the produce of half an acre of Onions for £11, he was so satisfied with his crop that he proposed to sow an acre of Onions this year. That far more than £22 per acre could be made from Onions grown under different conditions than are adopted in ordinary field culture, there can be no doubt, and as it is evident that there is a market for Onions, it is a matter for surprise that more of those bulbs are not grown. At the present moment, in towns, at any rate, consumers are dependent on Spanish or Portuguese Onions, which are worth 2d. per pound. In many of the rural districts, even so early as the late autumn, Onion consumers are largely dependent for their supplies on the Brittany peasants, who hawk Onions from place to place. The other day Mr. E. Beckett exhibited at the R.H.S. meeting some superb Onions, weighing from 28 to 30 ounces each.

If Onions are planted 12 inches apart each way, no fewer than 270 bulbs per rod are needed. This quantity should, if the ground has been deeply worked, well manured, and the variety be Ailsa Craig, give quite 200 lbs. weight. This yield, sold as cheaply as 1s. per 14 lbs., would yield, roughly, 15s. per rod. But even if the crop sold for 10s. per rod, the return per acre would be £80, and it would be interesting to learn what crop could excel that in value from the same area of land. To obtain this quantity of Onions some 2 lbs. of seed would be required to be sown in frames early in February. This amount of seed would furnish the 43,500 plants needed. The ground should be trenched, and have mixed with it 20 loads of good farmyard manure per acre. The entire cost, including cultivation of soil, manure, seed, and planting, should not exceed £30; while the additional cost of harvesting and marketing the crop would be about £10 more, and this would leave a profit of £40. This does not allow anything for rent, or salemen's commission, nor for the frames; but a succeeding crop of early white Cabbages would be sufficient to defray those charges, and admit of a part payment of the cost of the frames. A. D.

STACKPOLE COURT, PEMBROKESHIRE.

Owing to the enterprise of the Great Western Railway Co. in opening their new route to Ireland, via Fishguard, Pembrokeshire has been brought in point of time much nearer to the Metropolis and the large inland centres.

In the southern part of the county it is strange to find that, judged by their language and customs, the people are neither Welsh nor English. The district is sometimes spoken of as "Little England beyond Wales." This thrifty, clean, but reserved community, whose dwellings are mostly built of mud and wattle, are the descendants of Flemish settlers, who were allowed on certain conditions to occupy this peninsula.

Some four miles seaward from the town of Pembroke is the extensive estate and mansion of Earl Cawdor, whose family's connection with the county is by no means modern. A castellated mansion existed at Stackpole at a very early date, possibly on the site, or near to, where the great-great-grandfather of the present Earl built Stackpole Court. The mansion overhangs a beautiful artificial lake, which is spanned by an elegant stone bridge, and commands a view of a most delightful landscape, including

Bluebells, &c., and canopied, but not too densely, by a variety of trees. A winding path leads to a tennis ground formed of concrete: this was previously a battery ground, and from here the north front of the residence is entered by a massive archway.

A pair of old Spanish guns, dated 1754 and 1756, guard the front entrance. Escallonias, Hydrangeas, and Myrtles are planted on the spacious lawn, and there is a fine specimen of Fraxinus Ornus, and also a large Cockspur Thorn (*Cratægus Crus-galli*), the branches of which have arched over and sweep the ground, forming a tent with no entrance. Fine Yews, Copper Beeches, and a number of large evergreen Oaks, whose branches arch and depend in such a manner as to suggest vaulted chambers, are also met with. On the lawns are many large evergreen Oaks, magnificent gnarled Limes, huge Silver Firs, and big trees of English Oak and Sycamore. One of these last-mentioned has a straight stem of 30 feet to the first branch. Other notable trees are Pinus Lambertiana (60 feet), a beautiful specimen of Sequoia sempervirens (probably planted 60 years ago and now 60 feet high), Tulip trees, Planes, Abies Smithiana, Cryptomeria japonica (50 feet), Cupressus Lawsoniana (50 feet in height and 35 feet in

and produce annually large crops of Peaches, Nectarines, Plums, Figs, &c.

Grapes are also well grown by Mr. Fisher; one vine, 90 feet long, planted with Black Alicante and Muscat of Alexandria varieties, was, on the occasion of my visit, a magnificent spectacle. A vine of Black Alicante, worked on a stock of Mrs. Pince, produces Grapes which have an appreciable flavour of the Mrs. Pince variety. Gros Colmar flourishes finely, in company with the Muscat of Alexandria. I have also seen Foster's Seedling in fine form in this garden.

Of the very large walled-in kitchen garden and its crops of fruits, flowers, and vegetables much might be written, but I will leave that aspect of the garden; suffice it to say that everything shows the same excellent order and cultivation as is seen in the parts I have more fully described. *A. P. Rowler.*

THE WISTARIAS.

The genus *Wistaria* is small in point of numbers, containing only four or five species. The best of these is the common *Wistaria*; but the other members of the genus are worthy of notice, as they flower at different times, and are distinct in habit and in the colour of their flowers. The genus was named after Caspar Wistar, an American scientist, who lived about a hundred years ago. The following are the most distinct species for garden purposes:—

W. CHINENSIS.—One of the most useful and largest-growing climbers, the branches of *W. chinensis* attain a spread of upwards of 300 feet in course of time, with a stout, woody stem, 6 inches or more in diameter. It can be used in a variety of ways; as an outdoor climber for covering walls, pergolas, or old tree stems; and in the conservatory it can be grown in pots or tubs as a small standard, or trained in balloon shape on hoops. When used for indoor decoration, the plants should be spurred back after flowering, and be liberally treated during the following growing season. The leaves of *W. chinensis* are pinnate, consisting of nine to eleven pale green leaflets, nearly glabrous on their upper surfaces, but having the veins on the lower sides covered with fine hairs. The Pea-shaped flowers are borne in pendulous racemes, a foot or more in length; they are comparatively large, and of a pale purplish-blue colour, fading to nearly white in the centre of the flower. The variety *flore albo* has white flowers, but is a rather shy bloomer; *flore pleno* has double flowers, which last a considerable time in bloom; *macrobotrys* has longer racemes of a paler colour than the type; and *foliis variegatis* has leaves irregularly marked with white, but has no great decorative value. *W. chinensis* is a native of China and Japan, and was first introduced from the former country in 1816.

W. BRACHYBOTRYS.—This plant has been classed as a form of *W. chinensis*, but, for garden purposes, it is distinct. It is a comparatively rare plant in Japan in a wild state, but is frequently met with in cultivation in that country. The leaves resemble those of *W. chinensis* in size, but they are of a deeper green. The rich purple flowers are borne in racemes little more than 6 inches in length, and open about the middle or end of April. The plant is of dwarfer, bushier habit than *W. chinensis*, and is well adapted for pot culture.

W. FRUTESCENS.—A native of the United States, and a fairly strong-growing climber, with bright green pinnate leaves, glabrous on the upper surfaces, except on the midrib, which is downy, as also are the undersides and the young stems. The flowers are of a light purplish-blue, thickly clustered on short racemes, 4 inches to 6 inches in length. In the variety *alba* the flowers are white, and in the variety *magnifica* the racemes are upwards of a foot in length. It is superior to the typical form when well grown. *W. frutescens* and its

FIG. 93.—STACKPOLE COURT, PEMBROKESHIRE, THE RESIDENCE OF EARL CAWDOR.

woodland, lake, and park. A wide terrace on the south front runs the length of the house, which is about 360 feet, and a flight of steps leads to a further terrace extending 200 or more feet. The tender plants that thrive in the pleasure grounds, and particularly on this terrace, betoken the mild character of the climate. Standing unprotected in the grounds are such plants as *Agapanthus umbellatus*, *Fuchsia gracilis*, *Escallonia exoniensis*, *Chimonanthus fragrans*, *Calycanthus floridus*, and *Pittosporum Tobira* (a plant of this tree is about 15 feet high and 18 feet in diameter). There is a remarkable plant of *Magnolia grandiflora*, having a massive stem, gnarled by age, and filling a large space on the wall of the residence. Banksian Roses, too, of great size, flourish, with *Garrya elliptica*, *Photinia serrulata*, *Buddleias*, *Magnolia Soulangiana*, *Honeysuckle*, &c. A spacious winter garden adjoins the mansion. Climbers such as *Cobea scandens* and *Bougainvilleas* lightly drape the roof, Palms and other suitable plants furnish the floor, whilst carved figures and vases stand in prominent positions.

A charming woodland is entered from the terrace. It is planted with native Ferns, the commoner varieties of Daffodil, Winter Aconite,

diameter). The Hartstongue Fern (*Scolopendrium vulgare*) grows plentifully under the towering trees, and in the hedgerows. Continuing in this direction, a spot that was once a flower-garden is reached. Such plants as *Phormium tenax*, *Gunnera scabra*, *Ginkgo biloba*, and *Benthamia fragifera* are met with in this old flower-garden. The *Benthamia* flowers and fruits freely: one specimen is 35 feet high. Other plants of interest are *Quercus glabra* and *Juniperus japonica aurea* (a good plant of this golden Juniper), *Laurus nobilis*, *Cupressus Lawsoniana lutea*, grand specimens of Oriental Plane, and Tulip tree. At a short distance is a group of nine gigantic Beech trees, forming a circle, their heads a dome, and constituting a grand natural temple.

The glass structures at Stackpole are extensive, and well furnished with plants such as the requirements of a large establishment necessitate. Carnations and Chrysanthemums are numerous and successfully grown; Roses in pots are a feature.

Mr. W. B. Fisher, who has had the care of these gardens for many years, is a most successful fruit grower. The fruit trees, both out of doors and under glass, are excellently trained,

varieties bloom some three weeks later than *W. chinensis*.

W. JAPONICA.—This species is a strong-growing climber from Japan, but is comparatively rare in this country, and can be best described as one of the least ornamental of the genus. The white flowers are individually small, borne in short racemes, and sometimes do not open properly.

W. MULTIJUGA (W. GRANDIFLORA).—Though *W. multijuga* has been ranked as a form of *W. chinensis*, it is, for garden purposes, distinct. The leaflets are more numerous than those of the latter species, and are individually smaller. They are bright green, and glabrous on both surfaces. The flowers, nearly blue with touches of white, are disposed laxly in racemes 2 feet to 3 feet in length. It forms a good successor to *W. chinensis*, blooming some two or three weeks later. The variety *alba* resembles the type, except that the flowers are pure white.

All the *Wistarias* thrive in any deep, well-drained garden soil, provided it is not too dry. A dressing of well-rotted manure and old mortar rubbish may be worked into the soil at the time of planting, but it should not be placed directly about the roots, and an occasional soaking of water can be given with advantage the first season after planting. Like most leguminous plants, *Wistarias* make long, wiry, deeply-descending roots, which, while enabling them to withstand prolonged drought when once established, also render them difficult to transplant, for which reason they are nearly always grown in pots. Propagation is effected by layering, the young plants, as a rule, taking two years to root. They can also be increased by seeds, which must be procured from abroad, as the plant rarely ripen seeds properly in this country. *J. Clark, Bagshot, Surrey.*

DENDROBIUM SPECIOSUM.

This evergreen Orchid is a native of Eastern Australia, whence it was introduced to this country in 1824. It is a well-known garden plant, and forms one of the most showy of cool greenhouse Orchids. The culture of the plant is simple, its principal requirements being a period of rest, without undue shrivelling of the pseudobulbs, after the growths have been formed. The photograph from which our illustration at fig. 94 was prepared was kindly sent us by Mrs. Dukinfield H. Scott, East Oakley House, Oakley, Hants., who photographed the plant on January 2. Mrs. Scott states that the plant was brought from New Zealand about 10 years ago, and, although it was afforded every care, for many years it failed to flower. In consequence of this, it was (in 1908) neglected, and placed in an out-of-the-way position on a dry shelf, where it received little attention. But, under these conditions, the plant developed several fine flower-spikes, and has done so again this year. It is well known that a plant possessing a rich rooting medium and plenty of moisture will often develop vegetative at the expense of floral organs; whilst in a starved condition, the same plant will often hasten to produce a crop of flowers.

FORESTRY.

TIMBER PLANTING IN GREAT BRITAIN.

At the meeting of the Royal Society of Arts, on March 24, a paper on "Afforestation and Timber Planting in Great Britain and Ireland" was read by Dr. J. Nisbet. The chairman, Sir Charles Dilke, in introducing the reader of the paper, expressed himself in favour of the systematic planting in this country of Oak and Ash, and, perhaps, of other hard-wooded trees. He considered that the experiment of growing Douglas Fir in Scotland is promising; but held that it had not yet been proved that the

planting of coniferous trees in this country would be profitable.

Dr. J. Nisbet, in the course of his introductory remarks, referred to the fact that, during the last 25 years, no fewer than four committees and commissions have been appointed by Government to deal with the question of forestry in the United Kingdom. Dealing with the report of the last of these bodies—the Royal Commission on Coast Erosion (see *Gardeners' Chronicle* (pp. 56 and 60, Jan 23), he expressed the opinion that the view taken by this commission that afforestation would provide a considerable amount of work for the unemployed is somewhat too sanguine, and preferred the more moderate statements of the Irish Forestry Committee. This committee reports that, in its opinion, forestry cannot be considered as a specific for curing the evil of unemployment; but that, with the growth of forestry, employment would be provided for the agricultural population in the vicinity of the forests.

Like the chairman, Dr. Nisbet criticised adversely the financial calculations published in the report of the recent commission, and, whilst declaring himself strongly in favour of timber planting in these islands to the utmost extent possible, pointed out that a great national scheme of afforestation should rest on broader

FIG. 94.—DENDROBIUM SPECIOSUM.

and surer economic bases than those indicated in the report. Nevertheless, he claimed that afforestation ought to prove a sound and remunerative investment if made prudently and on a large scale.

Unlike the chairman, who pinned his faith to the planting of hard-wooded trees on suitable ground, Dr. Nisbet looked rather to satisfactory results from the planting of coniferous and soft-wooded timber on waste lands and poor pastures. In support of the need for home-grown supplies of such timber, he cited figures giving the rate of increase of the imports of coniferous wood for such purposes as pit-props and pulp-making. Dr. Nisbet took a gloomy view of the possibility of finding the money for financing a big scheme, but suggested that, by selling some of its estates, which bring in an income of over £500,000 per annum, the Commissioners of Woods, Forests and Land Revenues might, with the consent of the Treasury, provide the necessary capital.

As to available and suitable land, Dr. Nisbet considered that the estimate of the recent commission of 6,000,000 acres for Scotland was altogether too high, and dissented from the suggestions of the commission as to the mode whereby the State should acquire land for the purpose of timber planting.

In concluding his paper, Dr. Nisbet reassured those who fear that extensive forests

will increase the rainfall, impair the climate, or affect the national character.

In the discussion which followed, Sir Herbert Maxwell insisted on the importance of an ample and reasonably cheap supply of timber, stated that he did not take so pessimistic a view of the economic aspect of the question as that expressed by Dr. Nisbet, and insisted on afforestation as a means of keeping the rural population on the land.

Mr. H. J. Elwes, F.R.S., concurred in Dr. Nisbet's criticisms of the report of the Royal Commission, and Professor J. B. Farmer pointed to the need of proper practical education in forestry.

The chairman, in concluding the discussion, pointed out the need for further information with respect to the possibility of growing profitably the Douglas Fir. He drew attention to the fact that, along the shores of the Mediterranean, the poorer sorts of coniferous timber grow in abundance, and referred to the excellent progress made by the Dean Forest School of Forestry.

TIMBER FOR HOME USE.

MUCH is written from time to time in the *Gardeners' Chronicle* as to the advantage of planting trees for profit. After 30 years' experience on this estate I have come to the conclusion that little money can be made in a lifetime by the aid of forestry. At Swanmore the soil is of a varying character—some being nearly pure clay. On other parts of the estate, even in the same field as the clay, chalk occurs within 8 inches of the surface. The bulk of the land is high and generally dry: the average rainfall is 30 inches, and the altitude is 400 feet above sea-level. A stranger would say Swanmore is just the place to grow timber for profit when looking at the foliage on the Elm trees, and the growth annually made by the Larches, which grow from 2 feet to 4 feet in a season up to 15 years old. Corsican Pines grow from 18 inches to double that in one season.

The natural tree here is Beech. Oak and Ash grow slowly, but produce timber of excellent lasting quality. The undergrowth in the woods is mainly Hazel, which is used for sheep hurdles, hoops for casks, &c. The local custom with the underwood is to cut it in breadths at 10 years old. Its value ranges from 10 shillings to £3 per acre. A few years since the same wood could be sold for £5 per acre. Now that hoops imported from France can be bought cheaper at Bristol than they can be sent from here to Bristol, the industry is destroyed. It will be seen from the above that in the natural wood crop there is but little remuneration after 10 years waiting. A plantation of Larch growing here up to 15 years would delight a stranger, as the trees grow luxuriantly and without a speck or blemish upon them. After that time the dreaded Larch disease affects them: a blotch here and there allows of the oozing out of the sap, leaving a big scar, which, as all foresters know, is detrimental to a timber tree.

Various reasons have been advanced to account for this disease—spring frost, situation, insects, and want of other forest trees amongst the Larch. My opinion, based upon the experience gained here, is that it is due to a lack of preparation of the soil at the time of planting. Generally our subsoil is a hard pan of an exceedingly inert character, which, in its natural state, does not admit of a quick percolation of water. Thus the soil is cold during winter and spring, causing a check to growth. But while the roots of the trees are in the upper layer of soil, they are not greatly influenced by the wet and cold subsoil. That this theory is reasonable is proved by Larch trees growing well upon deeply-trenched soil after having been planted 30 years, and with no trace of disease.

Because of this disease the planting of Larch is no longer practised here. Fortunately, other

Conifers beside Larch have been planted, commencing in 1878 with Spruce and Austrian Pines. Two years later a plantation of Corsican Pine (*Pinus Laricio*), Austrian Pines (*Pinus L. var. nigricans*), Scotch Fir (*Pinus Sylvestris*) and Spruce (*Picea excelsa*) was made, the different species being in separate blocks to test the suitability of each. From this plantation we are now cutting valuable material for estate use, particularly for repairs and building purposes.

The Spruce furnishes trees 30 feet long and 12 inches in diameter at the base, which, by the aid of a circular saw, are cut into useful boards. From the Corsican Pines we cut rafters 8 inches by 2 inches, and also boards, which are easily worked. As this timber is planed very easily, and gives a smooth surface, the boards are valuable for use indoors. From the Austrian Pine and Scotch Fir we obtain similar material, not so free from knots, as these trees do not grow with the same luxuriance as does the Corsican Pine. My regret is that we did not plant more trees of *Pinus Laricio* and Spruce instead of so many Larch. In all 500,000 Conifers have been planted here during the last 30 years. In the autumn of 1885, 2,000 plants of *Thuja Lobbii* (syn. *gigantea*) were put in alternately with Larch as an experiment to test the relative growth of each kind of tree. The soil is stiff and moist. Growth was rapid from the start; here and there a Larch headed the *Thujas*, but on the whole the latter kept ahead, until now all the Larch have been cut, leaving the *Thujas* which are 25 feet high. They form a very fine plantation, judged by external appearances, but I am in doubt as to whether the timber will be of much value. Some specimens cut on this estate furnished wood which was very light and soft, although the trees were 30 years planted.

If this age were trebled, *T. Lobbii* might furnish desirable timber. My conclusion is that the best trees to plant for profit during the lifetime of an owner are the Corsican Pine, Spruce, Scotch Fir, Austrian Pine, and Larch. Although I have said little in favour of Larch, I find the trees useful for supplying llop poles and materials for pergolas, pillars (for training Roses), and fences, &c. Larch is a useful tree on an estate, but when we are told how valuable it is for timber without discrimination as to site and conditions of soil, climate, &c., I do not hesitate to say such teaching is against all practical experience. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

TREES AND SHRUBS.

TOWN PLANTING.

PROBABLY no work connected with horticulture requires more judgment and good management than the planting of trees and shrubs in urban districts. The materials and soil of which streets and town gardens are usually formed are ill fitted for sustaining a healthy condition in trees and shrubs for any length of time. This fact, coupled with the impurities of the atmosphere in densely-populated centres, has to be constantly borne in mind. In more favourable districts all that is necessary is to open a pit of sufficient size to contain the roots of the tree or shrub to be planted, but in towns the soil, often hard as iron and composed mainly of refuse building materials, contains but little plant food. For many years past careful observations have been made, not only in London, but in Glasgow, Liverpool, Manchester, and Warrington as to which trees and shrubs succeed best in the most smoky localities of each town, and it is mainly by tabulating these different experiences that satisfactory information on the subject has been obtained. Coal smoke from the chimneys in the larger and more crowded centres of industry is no doubt bad enough, but when we have to contend with an atmosphere

that is largely impregnated with the outcome from chemical, gas or iron works the difficulties to be encountered are correspondingly increased. When compared with Continental cities—Paris, Brussels or Berlin—where tree-culture is carried out most successfully, the atmosphere of British towns is impregnated to a far greater extent with noxious fumes. Dry and confined areas, particularly where excessive heat and atmospheric impurities are present, are decidedly the worst, while open and high-lying districts, though in the centre of a town, offer fewer difficulties.

That certain trees and shrubs succeed best in particular towns is a well-known fact, and the smoke-proof London Plane is by no means the best tree for some of the colliery districts; in Sheffield, for instance, its place is largely taken by the Canadian Poplar. In Manchester the Lime would appear to thrive best, after which the Elder, Thorn, and Plane succeed in the order named. The variegated-leaved Sycamore and the Horse Chestnut are favourites where the smoke from collieries is most offensive. But many such cases could be pointed out, and even in the case of bedding plants certain species succeed best in particular localities. In the gardens about the Royal Mint, and where exposed to the deleterious fumes from gold-refining works, *Fuchsias* do remarkably well; indeed, the dwarf edging variety, *Golden Treasure*, thrives so well that advantage has been taken of the fact to propagate the stock annually required for some of the parks from cuttings taken at the Mint. In the East End of London the Creeping Jenny (*Lysimachia*) thrives well as a window plant, while in the chemically impure atmosphere of Lambeth one of the *Veronicas* is the favourite plant for indoor culture. The *St. John's Worts* (*Hypericum*) do not as a rule thrive well in London, yet around the Tate Gallery, which is only divided by the river from the Lambeth pottery district—the worst in the metropolis for atmospheric impurities—one species at least flourishes amazingly, and has produced flowers in abundance for many years past. In Chancery Lane, at the Record Office, the common Ivy, Bladder Senna and *Yucca* do best. In other parts of London the pretty white and blue varieties of *Campanula isophylla* are largely grown. It is a somewhat strange fact, too, that some varieties of trees and shrubs succeed better than the type species in smoky localities, as witness the London Plane (a variety of *Platanus orientalis*), variegated-leaved Sycamore, fastigate Poplar, two varieties of *Pyrus*, Weeping Elm, Weeping Ash, and several varieties of *Acacia*, notably *Robinia pseud-acacia inermis* and *R. pseud-acacia Bessoniana*.

Amongst shrubs we have the dwarf Holly, golden *Euonymus*, *Privet*, *Ribes*, double-flowered *Gorse*, *Euonymus radicans variegata*, and others. With Grasses, too, some curious experiences might be related. At the British Museum, the Yarrow has completely ousted the Grasses from the plots in front of that building, and in the moat of the Tower of London several Grasses that succeed in less smoky parts of the metropolis quickly die out. Near the main entrance to the Tower of London, and close to Billingsgate Fish Market, considerable difficulty was experienced in getting the Plane trees established, though in the matter of soil and choice of strong, sturdy specimens everything that could be thought of was accomplished. At last it was found that the drip from the fish carts was the cause of the evil, and a remedy was quickly found. In another garden, where dust, smoke and soot are plentiful, a species of *Lychnis*, the common Marigold, and Rye Grass seem to positively revel. In situations almost constantly subjected to the sulphurous fumes of the railway engines near Camden Town, and in the poorest of soils, the *Poa annua* would appear to be quite at home. The chemical fumes from the pottery works at Lambeth are well known to act injuriously on vegetation gener-

ally, but the Mulberry, Sycamore, Turkey and Evergreen Oaks thrive as well there as they do in any other part of the metropolis. With the largely increased use of coal gas for cooking purposes the atmosphere of certain districts of London has, however, become much less smoky than was the case a few years ago, and in consequence vegetation generally succeeds better. This is especially the case in some of the low-lying districts adjoining the Thames, where the "slot" system of providing gas for cooking purposes has caused a great decrease in the consumption of coke and coal, with a corresponding reduction of the attending evils of smoke and soot. In one of the poorest parishes many of the inhabitants have taken advantage of the facilities offered by the gas company in the matter of cooking by means of gas provided by the "slot" system, which, in comparison with coal, has been found not only cheaper, but cleaner and handier to use. According to a competent authority, the smoke nuisance has, in consequence, become greatly abated, and with the purer air the cultivation of window and other plants, as well as trees and shrubs, has been to some extent simplified. The electrification of the Underground Railway has also had a beneficial effect on vegetation. *A. D. Webster.*

FUCHSIAS.

A VAST number of varieties of *Fuchsia* have been distributed within the last 20 years, yet many of the older kinds still hold their own, while comparatively few of the newcomers have passed into general cultivation. New varieties, therefore, do not usually excite much interest, but there are exceptional cases. This was well illustrated last year at the Holland Park Show, where Messrs. Cannell & Sons put up a group of distinct varieties, which were a source of great interest. These particular varieties of German origin suggested, in their general appearance, that three species had played a part in their production, namely, *F. corymbiflora*, *F. fulgens*, and *F. triphylla*. At all events, the varieties formed a distinct group, and I am informed that there is now considerable demand for them.

This success should encourage raisers to experiment with some of the other species of *Fuchsia*, for there are many beautiful kinds that do not appear to have been yet employed by the hybridist. This is particularly noticeable among the vigorous-growing species, such as are seen to great advantage when treated as roof plants. It might be urged that the progeny of these would be of too straggling a growth to become popular; but, in crossing with a compact-growing kind, this difficulty might be obviated. A good illustration of this is to be found in the hybrids between *F. corymbiflora* and *F. triphylla*, which inherit a good deal of the compact habit of the last-named parent.

One of the first hybrids that stand to the credit of the late John Doiny was a *Fuchsia*, namely, *F. Dominiana*, obtained by the crossing of *F. serratifolia* and *F. splendens*. This hybrid, which, 40 years ago, was very popular, appears to have almost, if not quite, dropped out of cultivation. The plant produces its long-tubed, rosy-scarlet flowers during the greater part of the year.

The two species that contributed to its raising are now very uncommon, perhaps the more generally met with being the Mexican *F. splendens*, with curious, yet showy, scarlet and green flowers. It is also questionable whether further use might not be made of *F. corymbiflora*, certainly one of the most showy of all *Fuchsias*, and its striking variety *alba*, in which the tube of the flower is white. This was raised about 50 years ago at the Versailles Nursery, Hammersmith, from which, at that time, many of the Continental novelties found their

way into this country. Though somewhat less vigorous than the typical form, this white-flowered variety of *F. corymbiflora* forms a desirable companion to it.

A strong, rambling-growing species has been long grown at Kew under the specific name of *dependens*; it is very handsome when trained up the roof of a greenhouse. The flowers are borne in long peduncled clusters; they are tubular in shape and nearly 3 inches long. The tube is of a deep, rosy red, but the petals are of a scarlet tint. Some of the tiny-flowered species are well worth growing for their intrinsic merit, while they might prove valuable for hybridising. Such are *F. bacillaris*, *F. microphylla*, and *F. thymifolia*.

Of curious kinds, especial mention may be made of the New Zealand *F. excorticata*, of which a large specimen, almost a tree in stature, formed one of the earlier occupants, now many years ago, of the Temperate House at Kew. The flowers, borne often on the old wood, are of a dull, reddish colour, with purple petals, while the anthers are bright blue, and the stigma yellow—a strange combination. Another curious feature is the manner in which the old bark peels off, hence the specific name of *excorticata*.

A second New Zealand species, *F. procumbens*, is totally unlike any other member of the *Fuchsia* family in general cultivation. Its habit is well expressed by the specific name, as its slender stems are long and creeping. They are clothed with roundish leaves, half an inch or so in diameter, while the flowers are erect, bell shaped, and in colour green, red, and yellow. The large, reddish-purple berries of this *Fuchsia* form a very notable feature. When grown in a suspended basket, *F. procumbens* is seen to considerable advantage.

Lastly come the hardy *Fuchsias*, to which much attention has been directed in late years. There are now many different forms of this section, a goodly number having been raised by M. Lemoine, of Nancy. Nearly all these hardy *Fuchsias* are now regarded as forms of *F. macrostemma*, whereas, at one time, many of them were assigned specific rank. *W. T.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

EXHIBITING CARNATIONS.—At the recent exhibition of the Perpetual-Flowering Carnation Society, the displaying of unsupported flowers on yard-long stems did not produce the best effect. Flower-stems of the variety *Enchantress* were describing a complete arc, and, with bowed heads, the full beauty of the flowers was hidden from view. Those of *White Perfection* were in a worse condition, for many of the rigid stems had snapped off at the level of the vase. The flowers of both these varieties as shown were of the largest size, and apparently too weighty for the stalks to hold them erect. The schedule required the flowers to be shown as grown; but, whether pot or bench grown, the flowers were, in culture, undoubtedly supported by wires, strings, hoops, or sticks. That the Society recognises supports to flowers in some circumstances was evidenced in the non-competitive groups, some of which received high awards. The schedule might be framed to make the use of wire supports optional; but, by allowing points in favour of its non-use, the Society could continue to encourage the development of the self-supporting stem. *E. H. Jenkins.*

LIGUSTRUM NEPHRITICUM.—This is mentioned in *Petro van Musschenbrock's Elementa Physica*, second edition, published at Leyden in 1741. He there refers to a curious optical property of an infusion of the wood, that of showing different colours with change of position of the illumination or of the eye: "id quoque conspicuum est in infuso Ligni Nephriticæ, quod pro diverso tam oculi, quam lucis situ, alio colore apparet." This at once suggested fluorescence to me, and Mr. Jackson's note on p. 187

confirms my conjecture: quinine solutions are standard examples of fluorescent substances. The suggestions in a previous letter that the wood is that of *Moringa* is clearly ruled out if, as stated, this tree was only introduced in 1759, 18 years after van Musschenbrock's book. *John H. Shaxby, Wynnstow, Llanishen, Glamorganshire.*

—A specimen of this wood exists in the Museum of the Pharmaceutical Society of Great Britain, in Bloomsbury Square, in a collection of drugs that dates back to the middle of the 18th century. The wood appears to have been well known, and used during the 17th and 18th centuries. It was official in the Edinburgh Pharmacopœias during the greater part of the 17th century, but so far as I can learn its botanical source has not yet been determined. According to *Pomet (1748)* it was brought from New Spain, chiefly from the kingdom of Mexico, where it is called "Coatli" or "Tlapalcypatli," and is described as having the mode of growth of our Pear tree, with leaves like Chick Peas, but much smaller. The wood is described as having a bitter taste and giving a blue colour to water in which it is infused. *Lemery*, erroneously, I think, refers it to the tree which yields oil of Ben (*Moringa aptera*). *Lunan*, in *Hortus Jamaicensis*, refers the Nephritic tree to *Unguis-Cati (Pithecolobium Unguis-Cati Benth.)*, but as he states that the bark is used in kidney disease, it is probably not identical with the Mexican wood. *Lewis*, in his *Materia Medica (1768)*, gives a definite account of its appearance and properties. He describes it as an American wood "brought to us in large, compact, ponderous pieces without knots; the outer part of a whitish or pale-yellowish colour, and the medullary substance of a dark brownish or reddish colour. When macerated in water for half-an-hour or an hour it imparts a deep tincture, appearing when placed between the eye and the light of a golden colour, in other situations of a fine blue, a property in which it agrees with the Ash tree and differs from all other known woods. The wood has a bitterish, somewhat pungent taste, and when rasped emits a faint aromatic odour. The blue, aqueous infusion was used as a common drink in kidney and urinary diseases, and was said to possess the advantage over other remedies of not causing irritation." *John Hill*, in his *Materia Medica (1751)*, enters into more detail concerning the plant that yields it. He says, "The tree which affords it is the Coatli of Hernandez, and grows to the height of our Pear tree. The leaves are small and oblong, not exceeding half-inch in length or a third of an inch in breadth; they are not notched at the edges, and are green above, with a few hairs scattered over them, but of a silvery-grey underneath. The flowers are small and of a pale yellow and oblong shape, and they stand in spikes. The cup they stand in is divided into five segments, and is covered with reddish down." This is the best description of the tree that can be collected from what has hitherto been written of it. *Hernandez (1651)*, under *Coatli*, remarks, on p. 119, "E. genere leguminum esse colligitur, non tantum ex foliis ciceris sed ex eo quod apud nos Genista vim habeant ad calculum pellendum, et reliqua fere omnium leguminum genera." He was, therefore, obviously of opinion that it is the wood of a leguminous tree. Perhaps this description may enable some Mexican botanist who reads this note to recognise the plant that yields the Nephritic wood, and thus solve another of the many problems in ancient *Materia Medica* that still await investigation. *E. M. Holmes.*

GRISELINIA LITTORALIS.—I agree with the remarks of *F. M.*, p. 196, upon this shrub. As its name implies, *littoralis* means a plant which pertains to the seashore. I advise its inclusion amongst collections of shrubs. When planted by itself it forms a beautiful specimen shrub, and is as handsome as any other known to me. Its beauty is in the pale yellowish-green stems and leaves; its flowers are of no great merit, they are small and of the same colour as the foliage. As a hedge plant, I am more than convinced that it has no equal amongst all the hedge plants in existence. Where *Ligustrum ovalifolium* fails to keep evergreen, the *Grisealinia* succeeds. Here, in the extreme end of North Lancashire, against the Irish Sea coast, I find this shrub most hardy. I am planting

more than 1,000 young plants of my own raising in our new public park, and I am also propagating it in thousands for future uses. *Grisealinia littoralis* stands clipping as well as either *Thorn* or *Privet*, and, by planting either in double or treble rows, it forms an impenetrable fence very quickly. I agree with Mr. Elgar in his remarks on *Cupressus macrocarpa* as a hedge plant; but I would advise him to try the *Grisealinia* also for this purpose. *Victor H. Lucas, Gardener to Borough Council, Barrow-in-Furness.*

THE TEMPERATURE OF RESPIRING PLANTS.

—In your interesting leader on this subject (*Gardeners' Chronicle*, March 27), there seems to be a slight omission, inasmuch as no mention is made about the relationship of temperatures to the absorption of oxygen, with increase of carbonic acid gas expired. It is said that "the leaves of such plants as Apple and Hornbeam actually kill themselves by the high temperatures," which may in part "be ascribed to wound-fever." But will not the actual cause of death in closed vessels be rather suffocation? Unless oxygen be artificially supplied, respiration must sooner or later cease when the vessel will be full of CO₂. It has long ago been shown by *MM. Bonnier and Magnin (Ann. des Sci. Nat., xix., p. 253, 1884)*, experimenting on respiration in darkness, that, when no photosynthesis can take place, the increment of CO₂ expired goes on *pari passu* with the increase of heat; so that the curve of the volumes of CO₂ expired is a parabola. This means that there are no maxima and minima, but that the plant will increase its respiration till it dies. It would seem to be rightly suggested by the writer that cut ends of shoots bearing leaves could hardly cause wound-fever in the latter; at least, it does not seem that such has been proved. But, as the heat due to respiration was confined, it would naturally go on accumulating, like that in a greenhouse exposed to the sun, and this increase of temperature would react, increasing the respiration, till death ensued. If the flasks were exposed to light, a certain amount of photosynthesis would take place; but the abnormal conditions would seem to so increase the respiration to an abnormal extent as to outweigh any slight and contrary effects the process of assimilation might produce. If the preceding has any practical value, it means that, in a closed glass-house, with insufficient ventilation and a superabundance of plants, there may be an accumulation of heat from the sun, or artificial overheating, together with the respiration, which would still further enhance the respiration abnormally, and so, perhaps, injuriously. *George Henslow.*

"THE ORCHID STUD-BOOK."—One or two remarks upon this work (see p. 184) call for a reply. It is said "The authors' rules, indeed, are opposed to the spirit of one of the Vienna recommendations, viz., Art. 50, &c.," but the name that may not be changed or modified is a name given in accordance with the rules of binomial nomenclature (though of faulty construction). It had already been provided (Art. 26) that the said name must be binomial, and, as *De Candolle* originally remarked, "Names or forms of nomenclature which are contrary to a rule cannot in practice be maintained." How can an author evolve order out of chaos, to use your appropriate phrase, if he is to be bound hand and foot by half-a-dozen conflicting systems of nomenclature? The reference to the "yet more arbitrary but in the long run more logical proposals now before the Scientific and Orchid Committees of the R.H.S." is quite beside the point, for that sub-committee was appointed to deal with multigeneric hybrids (none of which have yet flowered), and it has endorsed the system of naming generic hybrids followed (not originated) in the *Stud-Book*, which is that of its earlier Nomenclature Committee, printed in the Society's own *Plants, &c., Certificated by the Society* (p. 210), under the heading, "The Naming of Orchids for Garden Purposes." The authors are members of that sub-committee, and it is no secret that they both strongly supported the proposal now put forward by it as the provisional recommendation for adoption in the naming of multigeneric hybrids. With one exception, the rules objected to are not ours. That exception is the one stating that secondary hybrids should as far as possible

be dealt with uniformly with primary ones, i.e., that seedlings from the same capsule, or of the same parentage, should be treated as forms of one. It was drawn up at a time when the difficulty of dealing with secondary hybrids was imperfectly realised, and is still the system largely in use. But the authors are fully aware of the difficulties entailed, as is shown by the paragraph entitled "Secondary and More Complex Hybrids," on pp. v., vi. of the Preface. The original idea was to deal with primary hybrids only, but it was felt that this plan would greatly curtail the utility of the work, and with the decision to include them came the conviction that the advantages of a uniform system altogether overbalanced its disadvantages. The description of our rule respecting specific names, that such names are "Latin, Greek or Græco-Latin" is erroneous. It reads "Latin or classical, consisting of a single word—the use, however, of two short words being permissible where they can be connected with a hyphen." And many names are adopted which are not even classical. The objection to the modification of *Cattleya* × *Lady Ingram* into *C. × Ingramiæ* need not have been written, if the Orchid Committee had carried out the Society's own rules. At p. 210 (aforementioned) we read: "The Orchid Committee should decline to recognise any unauthorised name, or any name that is deemed unsuitable, or one which is not applied in uniformity with the preceding rules." We have only carried out the rule that the Orchid Committee neglected to apply when they gave the plant an Award of Merit. It may be that the hybrids included under *Lælio-Cattleya* × *Fournieri* will have to be re-examined, and had we discovered that the one called *Berthe Fournier* was only a synonym of the earlier *L.-C. × Lucila*, we should not have hesitated to refer to it as a synonym, as has been done in numerous cases. We cannot hope to have detected every error, and in the attempt to remedy some of them may have fallen into others of our own, which will have to be corrected later on, but to have made "a definite step towards the evolution of order out of chaos" is to have achieved something. *R. A. Rolfe.*

THE "BURBANK" POTATO.—From time to time we hear of what our American cousins term the Burbank "creations," but it is rare that full details reach us such as are vouchsafed in an article before us published in the *Weekly Examiner* from San Francisco. The article deals mainly with the financing of Mr. Luther Burbank on a colossal scale to enable a group of American millionaires to supply the world in a wholesale way with the fruits of Burbank's creation; such, for example, as the spineless Cactus, destined to supply the starving millions of India with succulent food, and, by virtue of selective cultivation, to replace both Beet and Sugar-cane in the production of sugar and alcohol. The Burbank Potato, however, seems to rank first "as the advance agent of a challenging army of marvellous productions of plant life." This Potato "has conquered the earth, and is practically the only one grown on the American continent from Alaska to Mexico." Since its introduction, "Burbank has estimated that enough Burbank Potatoes have been grown to pave a street 200 feet wide entirely round the world at the equator." "Last year alone 14,000,000 bushels were produced with the Burbank label." That "Burbank has given to the world a new botany," and that "Burbank has gone beyond nature" are examples of the encomiums launched upon the "plant wizard" of Santa Rosa; but the most curious and remarkable feature of the whole report is that in another part, preceding these wonderful statistics, it claims to be "the first announcement of the discovery of this Potato, the secret of which has been kept so closely that, although it has been for years 'a household word all over the West,' even the people of Santa Rosa know nothing about it." It is obviously as difficult to reconcile these two statements as it is to comprehend the fact that our horticultural and agricultural experts are ignorant of the multitude of other Burbank creations, which are constantly cropping up in print, but never in our gardens or orchards. It is to be hoped, however, that the millionaire combination will see to it that, while supplying the "world," the expectant British Empire may not be so entirely ignored in the future as in the past. *C. T. D.*

ANEMONE TRAVERSII.—Mr. Gumbleton has drawn my attention to an error in my reference to this plant on p. 179. I have transposed the colours; it is the type plant which is white, and the variety *elegans* rose. My error is inexcusable, as it was through the kindness of Mr. Gumbleton that I became possessed of the variety *elegans*, which has bloomed beautifully in my garden. *S. Arnott, Sunnymead, Dumfries.*

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

MARCH 23.—*Present:* Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the Chair); Sir Daniel Morris, K.C.M.G., Dr. Rendle, Messrs. R. H. Curtis, G. Massee, J. Douglas, H. T. Güssow, J. T. Bennett-Poë, W. Fawcett, A. Worsley, F. J. Baker, G. Saunders, and F. J. Chittenden (hon. secretary). Visitors: Messrs. F. W. Smith and G. Wilson, F.L.S.

Roots of Sweet Peas dying.—Mr. MASSEE reported that he had examined the roots of the Sweet Peas sent to the last meeting and had found that the cortical cells and root hairs were all killed and browned. He thought they were perfectly free from any disease due to insects or fungi, but had probably been injured by some injurious substance in the soil, or by some fertiliser. Possibly peaty soil with Sphagnum had been used, and humic acid had caused the damage.

Parsnips from wild stock.—Mr. F. J. BAKER showed some roots of Parsnips of the sixth generation from the wild plants. The roots were of good size, although grown on poor land, and had lost the greater part of the tough woody fibre of the original stock. In form they showed a near approach to the well-known "Hollow-crown" type of Parsnip. Mr. BAKER said there was just a possibility that the plants had in one generation been crossed with pollen from cultivated plants. He found the roots far less liable to rust than the ordinary plants, though they were not entirely free from it.

Orchid malformations.—Mr. GURNEY WILSON showed malformed flowers of *Odontoglossum Harryano-crispum* on behalf of Mr. W. BOLTON, of Warrington. There appeared to be symmetry about the multiplication of parts in these flowers, and Mr. Wilson remarked that, as in the present case, when a portion is removed from an established plant, in the next season it is not very unusual for the older portion to bear malformed flowers, while the portions removed bear normal flowers. He also showed a flower of *Selenipedium caudatum* var. *Lindenii*, from Messrs. CHARLESWORTH. In this variety the labellum is not slipper-shaped as in the type, but is replaced by a very long and tapering petal entirely similar to the two lateral petals; there are also three fertile stamens. The variety was figured by Reichenbach (*Lindl. Orchid. Linden*, 28, 1846), under the name of *Uropedium Lindenii*. The form occurs wild.

Gummosis in Lemon.—Mr. WORSLEY showed a branch of a Lemon with leaves beginning to shrivel, attacked in its lower portion by gummosis, a considerable mass of gum exuding from the stem, and the bark being browned all round for a considerable distance. It was remarked that in some cases gumming of trees had been found to be associated with the presence of a fungus, and often appeared to start at a wound, but in the present case no wound could be discerned. Sir DANIEL MORRIS said that in Florida the gumming usually occurred in the trees where they had been budded, and Mr. FAWCETT said he had seen trees affected in a manner similar to that shown by Mr. WORSLEY's example in the West Indies, where the disease was thought to be associated with too liberal manuring with nitrogenous manures, or with heaping earth around the stems. The disease was treated by cutting out the affected portion and dressing the wound with tar.

Eucrosia bicolor.—Mr. J. T. BENNETT-POË showed flowers of this peculiar plant from Miss WILLMOTT's garden. The plant was figured in 1817 in the *Botanical Register*, t. 207.

Grease bands.—Mr. WALTER VOSS reported that no winter moths of any kind had been caught on the grease bands placed on the fruit trees at Enfield since the end of November.

Diseased plants.—Mr. MASSEE showed a piece of a Rose stock attacked by the fungus *Leptosphaeria diplocladia*, a well-known fungus on the stems of the Dog Rose and rarely attacking the cultivated varieties. In this case 15,000 bushes had been affected. Mr. MASSEE also showed shoots of Apple affected by the winter stage of the Apple scab, *Fusicladium dendriticum*. Mr. MASSEE also showed a branch of Pear which had been damaged by hailstones in the summer. The wounds had healed, and were now free from danger of attack from fungi, but the circular places which had been damaged by the stones had dried, and were sunken and black.

LINNEAN SOCIETY.

MARCH 18.—Miss Sibyl Longman gave the substance of a paper, communicated by Prof. Keeble, Sc.D., entitled "The 'Dry-Rot' of Potatoes," illustrating her account by diagrams. She pointed out, as the result of her researches, that the disease of the Potato tuber, known as "dry-rot"—due to the fungus *Fusarium Solani*, is not necessarily preceded by "wet-rot," but may be set up in sound tubers by inoculation with spores or mycelium of *Fusarium Solani*, which species is not a parasite of the resting tuber only: it may also attack and kill the shoots of Potato plants. The fungus, which probably exists as a widely-distributed saprophyte in the soil, infects the growing Potato plant through the root; it also spreads from tuber to tuber during the storage and diseased tubers may produce diseased plants. Heat sterilisation of the resting Potato tuber, with respect to *Fusarium Solani*, is impracticable, for the death-temperature of the fungus is higher than that of the Potato. A pycnidial stage occurs in the life-history of *Fusarium Solani*, which should therefore be placed in the highest group of the Fungi Imperfecti, the Sphaeropsidaceæ and not, as is the case at present, in the Hyphomycetes.

An animated discussion followed, in which Mr. G. Massee stated that various forms were usually found in conjunction with the fungus described, and alluded to Bernard's theory of tuberculation being always dependent upon some species of *Fusarium*. The debate was continued by Mr. A. D. Cotton, by Prof. Keeble, who mentioned that Miss Longman's cultures had been derived from a single spore, from a hanging drop, and upon material sterilised according to modern bacteriological methods, and by Mr. Arthur W. Sutton, who invited Prof. Keeble and the author of the paper to determine specially healthy Potato plants in the Reading trial grounds, so that their tubers might give rise to an immune race. To these remarks the author briefly replied.

The second paper, by Mr. A. S. Horne, B.Sc., F.G.S., "On the Structure and Affinities of *Davidia involucreta*, Baill.," communicated by Prof. J. B. Farmer, F.R.S., was, in the absence of the author, explained by Dr. Otto Stapf, F.R.S.

The paper dealt with the structure and affinities of a genus referred by various authorities to the natural orders Combretaceæ, Cornaceæ, and Hamamelidaceæ. The investigation, carried out under the direction of Professor J. B. Farmer, was made upon material brought by Mr. E. H. Wilson from Szechuen in 1904. Evidence was advanced in favour of interpreting the inflorescence as consisting of a number of congenitally-fused, apetalous, multi-staminate, male flowers, or of male and, in addition, a single, obliquely-situated, apetalous, hermaphrodite flower with epigynous stamens arranged in series. From a detailed study of the flower, ovary, ovule and seed, the author is inclined to believe that *Davidia* is distantly related to *Alangium* and *Nyssa*, and still more distantly related to the *Araliaceæ*, and that the genus occupies a somewhat isolated position owing to having pursued an independent course of development from the plexus of primitive groups which included the ancestral forms of the *Araliaceæ*, *Nyseeæ* and *Alangieæ*.

In the discussion which followed Prof. F. W. Oliver, F.R.S., the general secretary, Mr. R. Morton Middleton, and the President took part.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

MARCH 18.—*Committee present:* Messrs. E. Ashworth (chairman), Thorp, Cowan, Ward, Warburton, Sander, Upjohn, Shill, Keeling, Holmes, Ashton, Cypher, Parker, and P. Weathers (hon. sec.).

A. WARBURTON, Esq., Haslingden (gr. Mr. Da'gleish), was awarded a Silver-gilt Medal for a group of *Odontoglossums*. First-class Certificates were awarded to *O. crispum* Luci-Marie, *O. crispum* variety Hofer; *O. × ardentissimum* variety Vanguard; *Cattleya Schröderæ* variety Ulixes (an intensely dark-coloured flower with a rich velvety lip), and *C. Percivaliana* var. Little Gem. *Odontoglossum crispum* var. Brutus was voted an Award of Merit.

The Rev. J. CROMBIEHOLME, Clayton-le-Moors (gr. Mr. Marshall), received an Award of Merit for *Cypripedium × apiculatum* var. atratum.

J. McCARTNEY, Esq., Bolton (gr. Mr. Holmes), was awarded a Silver Medal for a group of *Cattleyas* and *Lælias*. *Cattleya Trianae* var. Lucifer and *C. T.* var. Fascinator received Awards of Merit.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Fletcher), obtained Awards of Merit for *Odontoglossum × Lambeauianum* var. Fletcheri and *O. × L.* var. Ashlandense. Another fine plant in this exhibitor's group was *O. × ardentissimum* var. album.

J. T. CLIFTON, Esq., Lytham (gr. Mr. Float), was awarded a Silver Medal for a group consisting principally of *Dendrobiums*.

Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate (gr. Mr. Collier), made a handsome display with *Dendrobiums*.

O. O. WRIGLEY, Esq., Bury (gr. Mr. Rogers), displayed *Lycastes* in variety and some well-grown plants of *Lælia Jongheana*.

H. J. BROMILOW, Esq., Rainhill (gr. Mr. Morgan), was awarded a Silver Medal for a group of *Cypripediums*. *C. × Alcibiades* var. Illustrious was awarded a First-class Certificate.

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), staged a group of *Odontoglossums* in variety. *O. crispum* var. Meteor received an Award of Merit.

Messrs. J. CYPHER & SONS, Cheltenham, were awarded a Silver Medal for a group, amongst which were several good hybrid *Cypripediums*.

Messrs. HUGH LOW & Co., Enfield, were awarded a Silver Medal for a miscellaneous group.

BRITISH GARDENERS' ASSOCIATION.

At the last meeting of the association, Mr. E. F. Hawes in the chair, 41 new members were elected, bringing the total membership to 1,473.

It was decided that the annual general meeting of the association should be held at the Essex Hall, Essex Street, Strand, W.C., on Wednesday, May 26, at 7 p.m., the second day of the Temple Show.

(LONDON BRANCH.)

THE next general meeting takes place on Thursday, April 8, at 8 p.m., when Mr. R. Lewis Castle will give a lecture on "Commercial and Co-operative Gardening."

The first annual meeting of the branch will be held on Wednesday, April 14, at 8 p.m. Members of the association only will be admitted at this meeting.

PERPETUAL-FLOWERING CARNATION.

MARCH 24.—The annual dinner of this society was held at the Hotel Windsor on the evening following the show; Mr. J. S. Brunton presided over a company of about 30 members and friends. A letter from the president, Lord Howard de Walden, was read regretting his inability to be present at the dinner, and a similar communication was received from C. F. Raphael, Esq., a vice-president.

The President's Challenge Cup and the Silver Cup given by the American Carnation Society were handed to the winners.

After the usual toasts had been submitted, a discussion on "The Value of the Carnation as an Amateur's Flower" was opened by Rev. J.

Jacob. The speaker emphasised the value of scent in flowers, but of this attribute the present varieties of perpetual-flowering Carnation were lacking. He urged the society to withhold their First-class Certificates from new varieties that were scentless. Mr. R. F. Felton thought a much more effective display could be obtained in the various classes if the schedule permitted the use of supports for the flowers, as in many cases the stems were too weak to hold themselves erect. The general opinion of the meeting was that the use of wire for supporting the flowers was not desirable.

TORQUAY DISTRICT GARDENERS'.

MARCH 25.—The society held a highly successful spring show in the Bath Saloons, Torquay, on this date. The entries were nearly double those of last year, and, considering the lateness of the season, the exhibits reached a high standard of perfection. The show was favoured with fine weather, and the attendance of visitors was exceptionally large. One of the features of the exhibition was a display of Orchids by Sir JOHN EDWARDS-MOSS, Roby Hall, Watcombe. Much of the success of the show was due to the nurserymen's exhibits, many trade firms staging collections of spring flowers. Messrs. BARR & SONS, King Street, Covent Garden, London, showed a collection of Daffodils, including Peter Barr, Firebrand, Ariadne, Isolde, Cherry Ripe, Salmonetta, Mountain Maid, Strongbow, Cygnet, White Queen, and White Lady. The DEVON ROSERY, Torquay, had a very attractive stand, containing cut Roses, Azaleas, Freesias, Tree Carnations, Spiræas, Anthuriums, Acacias, Boronias, Crotons, and Palms. Messrs. R. VEITCH & SON, Exeter, staged *Phœnix Rœbelinii*, *Dracænas*, *Erica Veitchii*, *Thyrsacanthus rutilans*, *Primula Kewensis*, *Rehmannia angulata*, *Magnolias*, and a collection of rock plants. Messrs. W. H. SMALE & SON, Torquay, showed *Cinerarias*, *Pelargoniums*, *Hyacinths*, *Calceolarias*, *Clivia miniata*, *Nicotiana Sanderæ*, and *Cycas revoluta*. Mr. J. HEATH, Kingskerswell, showed a collection of Violets, comprising several new seedlings, including one named *Devonia*, a variety having large, deep-purple flowers.

Obituary.

GEORGE HARRIS.—We regret to record the death of Mr. G. Harris, late gardener to Mrs. Rowley-Conwy, Bodrhyddan, North Wales, after a brief illness, at the age of 65 years. After serving for a period of seven years in Kew Gardens, Mr. Harris, in 1866, took charge of Bodrhyddan Gardens. Here he remade the flower gardens and did much to improve and beautify the place generally. The funeral took place at Dysarth on March 19, amidst many manifestations of sorrow. Deceased was the oldest member in the North Wales district of the National Fire Brigade's Union. Firemen attended from many towns and lined the route to the churchyard.

WILLIAM ROUPELL.—The late Mr. William Roupell, whose death at Streatham was recorded on March 25, was a well-known visitor at the meetings of the Royal Horticultural Society. He took an active interest in gardening matters, and was a successful fruit cultivator, especially of Grapes. He often exhibited produce from his orchard at Harvey Lodge, Streatham, before the Fruit and Vegetable Committee. Mr. Roupell was a strong supporter of the gardening charities and gave much of his time to advocating their claims. He was the president of the Streatham, Brixton, and Clapham Horticultural Society, many of whose members attended the funeral, which took place on Monday, March 29. The first portion of the service was held in the church with which Mr. Roupell had been connected for many years, and the interment took place afterwards at Norwood Cemetery.

DEBATING SOCIETIES.

DEVON AND EXETER GARDENERS'.—At the last meeting of this association, held at the Guildhall, Exeter, a paper by Mr. G. Camp, Culver House Gardens, Exeter, was read by the chairman, Mr. Andrew Hope, the subject being "Arches, Pergolas, and Pillars." Roses and Clematis were recommended as suitable subjects for clothing such structures, which are best made of Oak or Pine in preference to iron. A list of suitable climbing Roses and Clematis was given. After the reading of the paper the chairman referred with regret to the impending departure from the district of Mr. T. Slade, Pollimore Park, and Mr. J. Coutts, Killerton, both of whom had been of great service to the association. A. H.

WARGRAVE AND DISTRICT GARDENERS'.—A paper on "The Culture of Violets" was read at a recent meeting by Mr. James Knight, of Thistledown Gardens, Sbiplake. Mr. Knight makes a speciality of these plants, and he therefore gave his personal experiences. He explained the methods of cultivation he employs from the preparation of the ground to the time the plants are in flower. A good discussion followed. Mr. Knight showed some excellent clumps of violets in full bloom, as well as a number of bunches of flowers as prepared for market.

BOURNEMOUTH & DISTRICT GARDENERS'. A meeting of the above association was held at the Avenue Restaurant, on March 16, with Mr. Reeves, hon. treasurer, in the chair. A paper on "British Orchids" was read.

CROYDON & DISTRICT HORTICULTURAL.—At the meeting of this association held on Tuesday, March 16, at the Sunflower Temperance Hotel, Mr. P. F. Bunyard, F.Z.S., gave a lecture on a trip to North Uist. The lecturer showed a picture of the double white Pheasant's Eye *Narcissus* growing in large quantities. Some very good views of birds, birds' nests, and eggs were also shown.

CARDIFF GARDENERS'.—The fortnightly meeting of the above society was held at St. John's Schools on March 16, when Mr. Mountney, vice-chairman, presided. A lecture was given by Mr. Cobb, the Pyffryn Gardens, Cardiff, on "Summer Bedding." The various methods of summer bedding were explained and much useful information was given.

REDHILL, REIGATE AND DISTRICT GARDENERS'.—A meeting of this association was held on Monday, March 22. Mr. Bound presided over an assembly of about 50 members. Mr. Duncan, Merstham House Gardens, read a paper on "The Culture of Vines." The lecturer described the best kinds of vinerias, the proper soil to use in forming the borders, the making of the border, the watering, top dressing, the pruning of the vines, and the painting of the rods in winter.

READING AND DISTRICT GARDENERS'.—A large number of the members of this society met in the Abbey Hall, Reading, on Monday, March 22, when Mr. T. J. Powell, of The Gardens, Park Place, Henley-on-Thames, gave a lecture entitled "The Value of System in the Cultivation of Fruit." The president, Mr. Alderman Parfitt, occupied the chair. One of the best discussions that has ever taken place in the Abbey Hall followed the lecture. As an object-lesson in good storing Mr. Powell staged 42 dishes of Apples in excellent condition.

BATH AND DISTRICT GARDENERS'.—A meeting of this society was held on March 22, when Mr. W. T. Rich read a paper on "Hardy Herbaceous Plants." The lecturer described the simplest and best methods of preparing a border for perennial plants, and enumerated suitable varieties for planting. He also described the methods of planting, watering, and the summer work generally for these plants.

KINGSTOWN GARDENERS'.—At the concluding meeting for the session of this society, a lecture on "Maures," illustrated by lantern slides, was delivered by Mr. L. J. Humphrey, of the Department of Agriculture. After pointing out the objects sought to be attained by the use of maures, the lecturer spoke of the various chemical maures available, and pointed out that the results of experiments had shown that garden methods of manuring might frequently be modified with advantage. J. M'D.

BRISTOL AND DISTRICT GARDENERS'.—A meeting of this association was held on March 25. Mr. W. E. Budget occupied the chair. Mr. Bailey, a representative of the Reading Association, gave a lecture upon "Propagation by Layering," with a practical demonstration. Mr. Bailey said layering could be practised with *Ampelopsis*, *Aristolochia*, *Clematis*, *Begonia*, *Honeysuckle*, *Wistaria*, *Aucuba*, *Ceanothus*, *Weigelia*, *Cotoneaster*, *Garrya*, *Ivy*, *Ilex*, *Heaths*, *Magnolia*, *Rhododendron*, and *Azaleas*.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

Mr. J. G. PEARCE, late of Boycott Manor Gardens, Buckingham, as Gardener to Lord HUNTINGFIELD, Heveningham Hall, Yoxford, Suffolk.

Mr. ROBT. WELLWOOD, for 2½ years Gardener to G. H. LEATHER, Esq., at Wyther House, Kirkstall, Leeds, as Gardener at Fylde Farm School, Poulton-le-Fylde, Lancashire.

Mr. H. E. GRIBBLE, for many years Gardener at Wynyard Park Gardens, as Gardener at Seaham Hall Gardens, which he will supervise in addition to the gardens at Wynyard Park.

Mr. W. SUTTON, for the past 4 years and 8 months Foreman at Latimer Gardens, Chesham, as Gardener to the Hon. Mrs. DOUGLAS PENNANT, Lillingstone Dayrell, Buckingham.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending March 27, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather was generally very unsettled, with much cloud and frequent falls of rain, but certain parts of Scotland were less rainy than other districts. A good deal of fog or mist prevailed on the coast and at some places inland early in the week. Thunder was heard at Dublin on Saturday afternoon.

The temperature was above the average except in Scotland E., but the divergence from the normal was not large. The highest of the maxima were recorded on rather variable dates and ranged from 59° in England N.W. to 50° in Scotland E. The lowest of the minima, which were registered at most stations either on the 21st or 27th, varied from 25° in England S.E. and Scotland E. and W. to 30° in England E. and N.E., and to 33° in the English Channel. The lowest grass readings reported were 13° at Llangammarh Wells, 20° at Buxton, Newton Rigg, and Dublin, and 21° in several other isolated localities.

The mean temperature of the sea.—Except on the south-west coast of England and Ireland the water was colder than during the corresponding week of last year. The actual values for the week ranged from 48.5° at Seafield and 47.7° at Plymouth to about 41° along the east and north-east coasts of Great Britain generally, and to 39.2° at the Shipwash Lightship.

The rainfall was much less than the normal in Scotland N., and rather less in Scotland W., but above it in all other districts, the excess being large in several parts of England and the south of Ireland.

The bright sunshine was less than the average over the whole kingdom, except in Ireland N. The percentage of the possible duration ranged from 31 in England N.W., and 30 in Ireland N. and the English Channel, to 22 in the Midland Counties, 17 in Scotland N., and 13 in Scotland E.

THE WEATHER IN WEST HERTS.

Week ending March 31.

Another moderately warm and wet week.—The day temperatures, as in the previous week, were as a rule only about seasonable, whereas the night readings were with one exception high for the time of year. On the warmest day the temperature in the thermometer screen rose to 57°, which, although only 6° above the average maximum for the end of March, is nevertheless the highest reading as yet recorded here this year. The ground temperatures have been slowly rising during the week, and are now about average at 2 feet deep, and one degree warmer at 1 foot deep, than is seasonable. Rain fell on all but one day, and to the total depth of 1½ inches. That the ground is now thoroughly saturated is shown by the fact that of that amount 5 gallons of rain-water have already come through the bare soil gauge, and 4½ gallons through that on which short grass is growing. The sun shone on an average for 2½ hours a day, which is 1½ hours a day short of the average duration for this period of the year. On three days no sunshine at all was recorded. At the beginning of the week the wind continued high, and in the windiest hour the mean velocity reached 19 miles—direction W.S.W. The average amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by as much as 10 per cent. A selected patch of *Chionodoxa Luciliae* growing in my garden came first into flower on the 19th, which is 11 days later than its average date for the previous 22 years, and later than in any year for 14 years. An Early Rivers Peach, growing on a south wall, came first into blossom on the 31st, or eight days later than its average date for the previous 23 years, and the latest date, with one exception, since 1895. E. M., Berkhamsted, March 31, 1909.

SCHEDULES RECEIVED.

Croydon Chrysanthemum show, to be held on Wednesday and Thursday, October 27 and 28, at the Adult School, Park Lane, Croydon. Secretary, Mr. W. B. Beckett, Woodcote, Smitham Downs Road, Purley.

Women's Agricultural and Horticultural International Union's show, to be held in the Royal Botanic Gardens, Regent's Park, on Wednesday, July 21. Secretary's address, 61, Lower Sloane Street, S.W.

Kent County Chrysanthemum Society's annual exhibition at the Rink, Blackheath, S.E., to be held on October 27 and 28. Secretary, Mr. Fox, The Gardens, The Cedars, Lee, S.E.

Southend-on-Sea and District Horticultural Society's summer show to be held on Tuesday and Wednesday, July 6 and 7; and Chrysanthemum show to be held on Tuesday and Wednesday, November 2 and 3. Both exhibitions will be held in the Palace Hotel, Southend-on-Sea. Hon. secretary, Mr. C. W. Limmer, 177, Cambridge Road, Southend-on-Sea.

Bolton Horticultural and Chrysanthemum Society's twenty-third exhibition to be held on Friday and Saturday, November 19 and 20, in the Albert Hall, Bolton. Secretary, Mr. George Corbett, Heaton Grange Gardens, Bolton.

Sutton Rose Society's twenty-eighth annual exhibition, to be held on Saturday, July 3rd, in Manor Park House grounds. Hon. secretaries, Mr. E. L. Dixon, Silverley, Sackville Road, Sutton, and Mr. F. J. Borland, Stalheim, Brunswick Road, Sutton.

Bradford and District Chrysanthemum Society's twenty-third exhibition to be held on November 12 and 13, in St. George's Hall, Bradford. Secretary, Mr. H. Spencer, Horton, Park, Bradford.

National Dahlia Society's exhibitions, to be held on Thursday and Friday, September 2 and 3, at the Crystal Palace, Sydenham, S.E.; and on Tuesday and Wednesday, September 21 and 22, at the Royal Botanic Gardens, Regent's Park, N.W. Show superintendent, Mr. E. F. Hawes, Royal Botanic Gardens, Regent's Park, London, N.W.

Societe Royale d'Horticulture et de Botanique de Gand, 17th exhibition, to be held on October 30 and 31, and November 1.

* * * The Editor will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for forming Supplementary Illustrations to this Journal.

EDITOR AND PUBLISHER.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the EDITOR. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

ABUTILON VITIFOLIUM FAILING TO FLOWER: H. N. Give the plants less water at their roots, maintain a dry atmosphere and raise the temperature of the house in which they are planted.

BETTER EATING ONCIDIUM CONCOLOR: W. T. The insect is one of the common weevils. These creatures feed at night-time and hide during the day. Hunt them with a light or trap them with slices of some vegetables such as Carrot, Potato, &c.

CRICKETS IN A GREENHOUSE: W. H. R. Place jars or bottles partly filled with beer or some sweet spirit about the house. A more effectual method of destroying these pests is by the use of poisons. "Phosphor paste," borax powder, or arsenic mixed with some food, such as Potatoes, &c., will kill them.

DOUBLE DAFFODIL: A. H. The abnormal condition, resulting in twin flowers, is termed fasciation, and is due to a fusion of growth. We frequently receive examples showing fasciation. In the issue for March 20, p. 192, there is a notice of a spike with three blooms.

FIGURE OF 4 TRAP: F. G. B. This is a very simple trap (see fig. 95) for the destruction of small animals such as mice. It is made with three pieces of wood, and either a brick, slate, or slab of stone, as the "fall." It is necessary that the pieces of wood used be thin so as not to impede the brick or slate when it falls. Pieces of ordinary plasterers' laths are suitable for the purpose. The upright (B) is pointed at one end like a chisel, and this fits into a groove in another piece (E), which in its turn fits into a groove in the trigger or bait stick (F). The

FIG. 95.—FIGURE OF 4 TRAP.

sticks are arranged in equilibrium supporting the brick or slate (A), and as soon as the animal or bird destroys the balance by nibbling at the bait (C) the whole collapses. A slab of stone or thick slate (B) is sometimes placed beneath the trap when the ground is soft. For mice, a bait of cheese or bread may be used. In plantations where game is present, pheasants are liable to be caught by these traps and killed.

MICE DAMAGING SHRUBS: W. C. The creature which is damaging your shrubs is no doubt the common wood mouse (*Mus sylvaticus*), which often nibbles the bark from trees in the orchard and kitchen garden. Mice may be killed by placing in their holes some moistened bran or meal, to which some white arsenic has been added. If poultry is present, a temporary enclosure of wire netting should be put up where there are most mice, and where it is practicable to feed them for a short period. This will draw large quanti-

ties to the feeding-place, and they can be killed in this manner. The surplus poison can be dug in the ground, and the netting, if necessary, removed to a different part of the garden and used again in the same way.

NAMES OF FRUITS: L. R. Russell. 1, King of Tompkins County; 2, Northern Spy; 3, Minchull Crab.—H. A. R. 1, Lady Lennox; 2, Norfolk Stone Apple; 3, Gooseberry Pippin.—Brev. Beauty of Kent.—W. K. 1, Byford Wonder; 2, Tower of Glamis; 3, Dredge's Fame; 4, Baldwin.

NAMES OF PLANTS: R. L. 1, *Picea excelsa* Clan-brassilliana; 2, *P. e.* variety laxa; 3, *Cupressus obtusa tetragona aurea*; 4, *C. o. aurea*.—F. H. *Odontoglossum Adrianae*, a natural hybrid between *O. crispum* and *O. Hunnewellianum*. Your flower approaches the *O. crispum* more than ordinarily.—W. B. 1, *Brunfelsia* (*Franciaea*) calycina; 2, *Spiraea Van Houttei*; 3, *Abutilon Fire Fly*; 4, *Jasminum pubescens*; 5, *Prunus sinensis flore albo pleno*; 6, *Pieris floribunda*.—A. R. 1, *Colygone flavida*; 2, *C. corrugata*; 3, *Oncidium pubes*; 5, *Pleurothallis rubens*; 5, *Ornithidium ochraceum*.—H. H. B. 1, *Adiantum formosum*; 2, *Asplenium lucidum*; 3, *Adiantum cuneatum gracillimum*; 4, *Pteris hastata*.—E. F. *Rhododendron Countess of Haddington*, a hybrid of the *R. fragrantissimum* section.—F. S. & S. *Smilax aspera*.

ODONTOGLOSSUM LEAF SPOTTED: F. H. Damaged leaves such as you send do not always indicate disease. Insect pests are often the cause of the injury, or it may be due to some accident during fumigation or spraying. But the most frequent cause of this leaf-spotting is the retaining of the foliage on the plants for a much longer period than would be the case were they growing in their native habitat. It is chiefly a matter of climatic influence. You will find that it is the older leaves which are invariably affected. These would fall from the plant in its native habitat, and cultivators, who are aware of this, assist nature by removing such foliage about half an inch above the pseudo-bulb as soon as signs of decay appear. In a collection of *Masdevallias* at least double the number of old leaves that are required are usually allowed to remain on the plants. The same applies relatively to many other Orchids of the more or less evergreen class. Remove all unsightly leaves at once.

SEWAGE FARMS: Cairo. Mr. W. D. Scott Moncrieff, The Red House, Laleham, Staines, recently gave an address on this matter before the members of the Royal Horticultural Society. No doubt he will be willing to give you information on the subject.

STERILISING SOIL: Wessex. Many experiments of sterilising soil are being conducted at the present time, and in some cases a marked increase of the yield of a crop has been obtained as a result. But before the method of sterilising soil can be advocated in practice, further and more extensive trials are required, especially in determining, in the case of heat sterilisation, the proper temperature to which the soil should be subjected. Certain bacteria are killed at a much lower temperature than others; for example, the nodule organism is destroyed at the comparatively low temperature of 70° C. It has yet to be shown whether methods of partial sterilisation are always productive of good results. The whole question opens up a very interesting field for experiment. Much information on sterilisation, and also the use of antiseptics for the purpose, may be obtained in the *Abstracts of the Journal of the Chemical Society* for 1907-8.

WOOLLY INSECT ON FERN ROOTS: W. C. The roots are infested with *Ripersia terrestris*, a pest allied to the mealy bug. Make holes in the soil of the pots with a piece of stiff wire and pour in each a small quantity of bisulphide of carbon. Vaporite would also be effectual in ridding the plant of this pest.

DEFORESTATION IN NEW ZEALAND.

IN the *Gardeners' Chronicle* for November I described the conditions existing in the North Island. The following remarks therefore relate exclusively to the South Island. The soil is not so rich as that in the North Island, but the climate is drier, colder and more bracing. There is less rainfall, that on the east coast being comparatively light, whereas on the west coast the heavy fall is limited to the small strip of country between the watershed and the Pacific Ocean. We find, in fact, the same conditions as in Fiji. The range of mountains which runs down the west coast condenses all the moisture-laden clouds of the Pacific and dry winds sweep the eastern portion of the Island. The mixed forest, therefore, of still further reduced Polynesian affinities, is limited to the north-western, rainy slopes of this chain, and the *Nothofagus* forest of South American affinity clothes the shady sides of the endless spurs and outliers of the main range up to a height of 4,500 feet. This is the winter snow level on the lower ranges, but in the Mount Cook district, where the mountains range from 9,000 to 12,300, 5,000 feet is the level of perpetual snow. The plants of this montane region of winter snow show mostly South American and Antarctic

affinities with adaptation to wind-swept, dry conditions and constantly shifting foothold from rapid disintegration of the shaly rock of which these mountains are composed.

The mixed forest of the west coast is too soaked with moisture to burn easily, and is therefore comparatively safe from bush fires; but all the best trees are being rapidly cut out by saw mills wherever a railway is accessible, as is the case on the line from Greymouth to Otira, where every station represents a saw mill. Rimu, I believe, is the principal timber that is in demand. The chief industries along the west coast, where sea transport is generally available, are saw-milling, coal and gold mining. The natural forest growth, if worked on scientific principles, would form a magnificent asset to the resources of any country. As it is, in such mixed forest, each kind of tree is limited in numbers, and when cut without regard to age, only the old and aborted specimens are left standing, and the forest is, in consequence, unable to regenerate itself. The resulting thinning alters the prevailing conditions as to light, moisture, and wind, and allows of the ingress of rabbits, which devour all young vegetation, and so prepare the way for an army of alien herbaceous plants and shrubs, including Blackberries, Sweetbriar, Gorse and Broom, which luxuriate in the virgin soil. Fungal diseases attack the weakened, indigenous trees, which will have no further chance to re-establish themselves, so that all commercial value in wood, which forms one of New Zealand's exports and its chief scenic charm, goes into the pocket of the first man who comes to enjoy the unrestricted exploitation of the virgin forest.

The *Nothofagus* forest begins on Cook Straits from Picton to Nelson, a country of narrow valleys and ridges, running up in a few cases to 6,000 feet, the tree level being about 4,500 feet. *Nothofagus fusca* and *N. Menziesii* clothe the lower slopes, with *N. Solandri*, the handsome *N. Cliffortioides*, and sometimes *N. Menziesii* running up to the winter snow line, where they dwindle to dwarfed and windswept examples. These Beeches are all evergreen, of typical Beech habit, showing the horizontal branching and dorsiventral leaf adjustment, with the mottled smooth stems of our European *Fagus*, also the glinting light, and mossy undergrowth, so characteristic of Beech woods. *Nothofagus fusca* has herbaceous leaves and would probably be deciduous in Europe. *N. Menziesii* has small, serrated, dark-green, coriaceous leaves which, when young, are of a tender, delicate green, contrasting delightfully with the older foliages. *N. Solandri* has also very small, coriaceous leaves and is very near to *N. Cliffortioides*, of which a male tree in flower almost equals in charm the much-praised *Rata* (*Metrosideros robusta*). The small, leathery leaves are dark green on their upper and pure white on their lower surfaces, which are seen a good deal, so that with each branch bearing its terminal bunches of red stamens which form the male flowers, the effect is most fascinating. On the slopes of the Dun Mountain, near Nelson, in December, this Beech was flowering profusely. The fruits of all these Beeches are very small, about half an inch across, and, nesting amongst the leaves towards the end of the branches, add to the charm of the trees in the autumn. Thanks to the kindness of

Mr. F. C. Gibbs, of Nelson, a most enthusiastic botanist, I was enabled to appreciate the salient features of the barren Dun Mountain, and to ascend Ben Nevis, a peculiarly interesting expedition, as the top of that mountain (about 6,000 feet) is above the tree level, and therefore shows the bare cap of the winter snow line, which characterises the higher peaks. The view extends over a vast expanse of wooded mountains and valleys. Mr. Gibbs' knowledge of this district is unrivalled, and his excellent work on these ranges has not only added many new and interesting species to the New Zealand flora, but has led to interesting and otherwise unattainable observations on prevailing edaphic and ecologic conditions, his interests not being limited to botany, but including geology as well.

An unexplained feature of the Dun Mountain range is the so-called "Mineral Belt," which winds like a red thread through the mountains, and can not only be followed distinctly from a commanding height, but is recognisable by its colour and characteristic plants when it is struck unexpectedly on the slopes. It forms a definite break in the forest, as trees do not grow on it. Dwarfed shrubs, like *Hymenanthera crassifolia*, *Pittosporum rigidum*, *Aristotelia fruticosa*, and *Gnidia*, all show the spreading habit, with tortuous, interlaced, and almost leafless stems of their ultra xerophytic form. The santalaceous *Exocarpos Bidwillii*, with *Phyllocladus alpinus*, were also flowering in December, as well as certain herbaceous plants, like the fine *Euphrasia Munroi*, *Notothlaspi australe*, *Colobanthus quitensis*, *Muehlenbeckia axillaris*, *Claytonia australasica*, all plants of open mountain regions, with *Pimelea Suteri*, which is only known on the Dun Mountain.

Disafforesting is proceeding as vigorously in this district as elsewhere. Along the Maitai Valley there originally existed an interesting mixed forest, the last remaining patch of which Mr. Gibbs was making strenuous efforts to have reserved. Here again clearing exposes the shaly soil, which nothing but trees can bind together. There is very little surface soil even in the forest, undergrowth being limited to Ferns and Mosses, the evergreen foliage forming but little humus. The results of wholesale clearing in such country are seen in the arid sheep runs of Central Otago. Not only the rainfall, but the storage of water in the soil must be ultimately affected by this reckless tree-felling.

From Nelson the journey south is down the Buller river, which runs north to south and forms a convenient highway to the central portion of the island. It is a tedious two days' coach drive following the river banks, through Beech forests, which, however, are being cleared rapidly, as good alluvial soil exists by the river bed.

The upper portion of this valley is characterised by enormous numbers of water-worn boulders. The very hills are formed of them, and in clearings resulting from old mining operations they lie like huge cannon balls, one on the top of the other. Forces sufficient to cause such denudation must have been terrific. Nature has since been busy covering up the traces with luxuriant forest growth, the destruction of which will simply re-create the original barrenness. In many sections along the road the thin covering, about a foot thick,

formed by the roots of the trees and undergrowth, resting on the rounded boulders, was very evident.

In early December *Loranthus tetrapetalus* was wonderfully effective, the profuse and brilliant red blossoms showing up even on the slopes of distant hills. It forms regular bushes on the Beech trees, some being quite 8 feet high, and broad in proportion.

About Longwood the river bed widens into the flat, shingly bottom so typical of the rivers of the South Island, where the beds shift from season to season, or even after each "Fresh." Under natural conditions the forest trees bind the shingles together; in the case Kahikatea, as can be seen by the wretched remains of the few survivors. Now Blackberries have taken possession of acres of this river bed.

The Otira Gorge running east forms part of the great highway between the east and west coasts, at about the centre of the South Island. Once through the Gorge we enter the country of dry, rainless winds and tussock plains be-

Canterbury Plain, the district which, together with the Hawkes Bay and Gisborne districts in the North Island, comprises the best agricultural land in New Zealand. These plains stretch in unbroken monotony down the East Coast, running up to the dividing range, having been formed, in fact, from the denudation of that range. The detritus has been carried down by the rivers, which are still active in this respect, their beds shingling out to an immense breadth, with ever-shifting channels.

How far the comparison holds I cannot say, but Darwin's descriptions of Southern Patagonia seem very suggestive of this country, which was originally wooded and intersected, I believe, by large swamp areas. It is now cut up by long, straight roads running at right angles to each other, and enclosing rectangular paddocks bordered by Gorse hedges, with a possible variation of an equally symmetrical plantation of Eucalyptus, *Pinus insignis*, or even Larch. Each plantation is enclosed by two hedges, which ring the changes on *Cupressus macrocarpus*, *Pinus pin-*

of Guildford, Kingston, and Wimbledon; whereas now there are 88 day-schools at which instruction in practical horticulture is given, the approximate number of scholars receiving such teaching being 1,500, not counting those in the three boroughs mentioned. The Board of Education, recognising the importance of this subject in the elementary school curriculum, has recently appointed a special inspector to superintend and control the instruction throughout the country.

Our day-school gardens are arranged on a plan very similar to that of the continuation-school group, with the exception of the cottage garden plot, which is simply divided into two by a central path. The 28 plots are smaller than the plots worked by the older boys, the majority of them being only 24 feet by 8 feet. The aspect, like that of the aforementioned group, is good, but the soil is still very poor, although it is improving. The general outlines of the method of instruction vary little from those of the evening class. Two hours or more a week are set apart in the school time-table for the subject.

The indoor study of this subject lends itself freely to co-ordination with other school lessons. With us, it not only forms the basis of drawing and composition exercises, but the teaching of arithmetic, mensuration, and the drawings of plans to scale is connected more or less with it.

Our method in teaching the junior boys, i.e., those cultivating the 28 small gardens, is to gather a group round a certain plot, and then show them practically how to perform the particular operation in hand, each pupil subsequently putting the instruction into practice in his own garden. All the "whys" and "wherefores" that every teacher would, of course, require are deduced during the brief lesson. A garden line is stretched directly across the whole set of plots for the guidance of the pupils, and the special crop is then sown, or planted in line, so that continuous rows of the same vegetable, broken only by the paths, are carried across the section from north to south. This gives a regular and orderly appearance to the group, and is helpful in assessing and comparing the value of the crops and workmanship.

The cottage-garden plot is, I believe, a new departure in school horticulture in this part of the country. Nearly 20 square rods of land are cultivated in common by the senior group of 14 boys, on a scheme suitable for a cottage garden. During the season numerous consultations by teacher and scholars are held as to the most useful crops for a cottager to grow, the general arrangement and rotation to be followed, the special treatment required, and the area to be devoted to each crop.

For purposes of reference, all the day-garden boys keep notebooks, in which are recorded brief accounts of each day's work, specially—

- (1) Date of sowing or planting of each crop.
- (2) Particulars as to cultivation and depth of sowing.
- (3) Date of harvesting the crops, with a record of the time each has occupied the ground.
- (4) Quality and quantity of produce, &c.

The above is additional to the labelling of each kind of vegetable with the date of sowing or planting.

In connection with this course of instruction, the boys keep a daily register of (1) outdoor temperature (maximum and minimum), (2) rainfall, (3) direction of wind, (4) general condition of weather, and (5) the reading of the barometer. Summaries also are worked out for the month and year. By the girls, in the same register are also entered during spring and summer Nature notes and observations, chiefly on wild flowers. Fourteen of our elder girls have also a small flower-garden each.

In conclusion, I may say, that, as far as my experience extends, the influence of the gardens is distinctly for good. It helps to make school life, and afterwards adult life, healthier and happier. *E. Casar, Head Master.*

FIG. 96.—BOYS AT WORK IN A SURREY SCHOOL-GARDEN.

tween bare tussock hills, yellow even in the beginning of December; all sheep runs, the grass burnt off every year, and rabbits ubiquitous. Here one shrub, *Discaria Toumatou*, or "Wild Irishman," holds its own. It is a veritable mass of thorns (arrested branches), with inconspicuous, green leaves and white flowers. It grows singly in the wide, river beds, on sheltered mountain slopes and in the plains. Otherwise not a tree is visible; that would mean fewer sheep to the acre, and the unfortunate animals in the blaze of the sun find such shelter as they may under the *Discaria*.

It is a familiar sight to see them crowding under what can be only shade in their imagination, and it makes one question whether it is really advantageous, or is merely an atavistic idea inherited from ancestors accustomed to more luxuriant conditions. These places must all have been wooded at some time not far distant. Nothing else could account for the extraordinary paucity of herbaceous plants, of which *Craspedia uniflora* is one of the few which occurs in any quantity on the plains.

By Broken River the hills run out, and here the remains of Beech forest are evident. Once past the river we sweep out on the so-called

aster and Eucalyptus species as wind screens, and finally one of Gorse.

Fortunately, the railway runs all down this East Coast, and also up the principal valleys for a certain distance. *L. S. Gibbs.*

(To be continued.)

A SURREY SCHOOL-GARDEN.

(Concluded from page 210.)

DAY-SCHOOL GARDENS.

The Board of Education first recognised practical gardening as a special subject entitled to receive monetary grants in elementary day-schools in 1895, but the subject does not appear to have been taken up with any enthusiasm in the country till quite recently. In Surrey very little was done previous to 1903, when the County Council took control of elementary education; but since then, through the liberal scheme adopted by the Surrey Education Committee, and the encouragement given by H.M. Inspectors, progress has been rapid. In 1901 and 1902 the number of day-schools in the county giving instruction in this subject was only seven, including those of the three boroughs

NOTONIA GRANTII.

THIS handsome succulent received the above name from a very imperfect specimen collected on Speke and Grant's expedition to discover the sources of the Nile. It was discovered in the Mozambique district in 6° 50' S. latitude,

plant has very handsome orange-scarlet heads. The species has been identified with *Cacalia semperviva*, Forsk., from tropical Arabia, and applying the rules of priority for specific names, Ascherson has named it *Notonia semperviva*, under which designation it is likely to remain in some Continental botanic gardens. Senecio

the *Kew Bulletin* for 1897, under the name *Senecio* (*Kleinia*) *nyikensis*, where the author has:—"ad *S. longipedem*, Baker, *somaliensem magis accedit.*" Whether this is really specifically different, and also in cultivation, it is difficult to say, but I believe the name has been given to a cultivated plant. There are several dried specimens at Kew bearing the name of this *Notonia*, all of which are more robust than ordinary *N. Grantii*, as introduced by Miss Edith Cole from Somaliland, and first raised from seeds by Mr. Lynch, Curator of the Cambridge Botanic Garden.

It may be asked what is the difference between *Kleinia* and *Notonia*, as genera, and the answer is that it is limited to the latter having the branches of the style terminating each in an ovate appendage. It seems, therefore, that if one is reduced to *Senecio* the other should follow.

Notonia Grantii is a free-growing and free-flowering subject. *W. B. H.*

NOTES FROM A "FRENCH" GARDEN.

WE are now preparing beds for the planting of Endive. The ground is well manured and levelled previous to the placing of the frames or the cloches in position. Thirty-six Endives are planted under each light, and the same number under four cloches.

The young plants will not be ready for the final planting before the middle of April, as the cold weather has somewhat retarded their growth. Great care must be taken with this crop, as the plants are liable to run to seed when they have been checked in their early stages.

Part of this batch of plants may be reserved for planting outside at the end of April.

We are now planting *Cos Lettuce Hardy White* in the open, allowing a distance of 18 inches between the rows and 14 inches from plant to plant. Where plenty of space is available, one row of *Cos Lettuce* and one row of *Cauliflower* may be planted, as this system admits of the ground being cropped for a longer period.

The Lettuces in the hot-beds must now be cleared off to make room for the young Carrots which require to be thinned and weeded. When the weather permits, ventilation may be given, especially if the Cauliflowers are growing freely.

The Cauliflowers are now planted among the Lettuces *Passion* and *Little Black Gott* in the cold frames, and also in the open, 2 feet apart each way. This planting has been delayed on account of the ground being in an unfavourable condition.

The *Cos Lettuces* planted under the cloches are growing well; they will require careful attention as the weather gets warmer. Mats are spread over the lights when the sun is shining brightly to prevent the "heart" from becoming soft. These mats are also used at night time whenever the thermometer falls to freezing point.

The Celery sown in the middle of March is just breaking through the soil. Fresh air is given whenever possible to prevent "damping off," which is so prevalent at this stage of a plant's development.

We are pricking off the seedling Tomatos intended for planting later as an intercrop between early Potatos. They will be planted at the end of May. One hundred and sixty of these seedlings are planted per light; early next month we shall transplant them a second time, allowing only 100 per light.

Turnip seed sown in the middle of March is pushing through the seed bed. Ventilation will be freely afforded whenever the weather permits in order to prevent the Turnip roots becoming spindle-shaped. *P. Aquatias.*

FIG. 97.—NOTONIA GRANTII: FLOWERS ORANGE-SCARLET.
(From specimens exhibited by Messrs. James Veitch & Sons, Ltd.)

and is the *Kleinia* sp. of Speke's *Nile Journal*, p. 638. In a note attached to the original specimen in the Kew Herbarium, Colonel Grant describes the flowers as blood-red or port-wine coloured. The colour varies; the cultivated

(*Kleinia*) *longipes*, Baker, in *Kew Bulletin*, 1895, p. 217, is reduced to *Notonia Grantii* in the *Botanical Magazine*, wherein the plant is figured, tab. 7691. A very similar plant was subsequently described by Mr. J. C. Baker in

HARDY FLOWER BORDER.

EUCOMIS PUNCTATA.

Of the ten or more species of *Eucomis* the above is almost the sole representative in ordinary gardens. In many parts of the country it is hardy, and when given good treatment, the bulbs throw up such strong spikes as to astonish those who know it only as a plant growing in 6 or 7-inch pots in a greenhouse. To be seen at its best, *Eucomis punctata* should be grouped. When thus disposed the flower-spikes gain in dignity and impressiveness what they lack in floral beauty. As an outdoor plant, it is well adapted for use in such narrow borders as those in front of glasshouses, or at the foot of a wall. It thrives best in a light, rich, deeply-worked soil, and the bulbs should be planted at a depth of 4 to 5 inches, where they will be safe from most frosts. For pot culture, it is best to use a rich soil, and grow the plants at the cooler end of the greenhouse; they would do well in an unheated house. Abundance of water is necessary until the flower-spikes reach full size, and when the pots are full of roots, liquid manure may be given freely. The greeny-brown flowers open during June and last for a long time. Whilst the tuft of leaves which the spike surmounts would look incongruous if associated with brightly-coloured flowers, it seems singularly in keeping with *Eucomis*, and gives the plant a distinct character. *A. C. Bartlett.*

NOTICES OF BOOKS.

* PRONUNCIATION OF PLANT NAMES.

As stated on the title page, this handy little volume has been reprinted from its original issue in the closing months of 1908, and forms an admirably well-adapted volume for a young gardener or a plant lover to slip into his pocket for reference at odd moments. The work has too recently appeared in this journal to need much description, for its plan and performance must be familiar to all our readers. Prepared in the first place by the Rev. Charles Butler, M.A., we have the assurance that each instance of pronunciation has been carefully considered, and if we venture to criticise, it must be owned that the Editor has disarmed criticism in advance by stating the lack of definite rules which would be admitted as valid by all, and that ordinary usage has been allowed full weight, even when it contradicts etymological principles.

It may be conceded at once that the largest collection of generic and specific names, accented and marked for pronunciation is that produced by the late Rev. Percy Myles, and included in the fourth volume of Nicholson's *Dictionary of Gardening*. But in this storehouse of facts usage has been set aside, and correctness alone followed; it is therefore too hard for the practical man to follow without incurring the charge of being pedantic. On the other hand, in the latest edition of Johnson's *Gardeners' Dictionary*, 1894, which might be held to embody the general usage, the plan of marking the accent fails to show whether the stressed vowel is short or long. The little work under review is therefore an improvement, and is more convenient in many important respects than its predecessors.

There are some misprints, but they are few, compared with the total number of names given. Our eye has fallen upon certain names which are not familiar, such as *Agate* (Agati?), *Mohoe*, *Nola* and *Personia* (not *Personia*, which is also given). Such slips as *Fadgenia* for *Fadenia* and *Leptaleum* for *Leptaleum* are due to the printer misreading copy, and would probably not mislead the reader.

We would, however, protest against the value of one J being given to such words as *Leucojum*,

Najas, *Serjania*; these should, strictly speaking, be printed *Lencoium*, *Naias*, *Seriania*, but the mediæval confusion of I with J and U with V has persisted in some Continental printing offices to the present day.

There is still another point on which we could write much, but must confine our remarks to a very succinct statement. Many generic names are derived from personal names—how should these be pronounced? Theoretically, we suppose, they should conform as nearly as may be to the name of the eponymous hero. Sometimes that is practicable; in this volume we have "Ko-hu'-ni-a" for *Colquhounia*, and *Stokesia* for *Stokesia*, but not *Reevesia*; why not? We should prefer *Dön'-i-a* to *Dö'-ni-a*, because the genus was named after Don; *Neel'-ya* for *Neillia*, named after Patrick Neill, of Edinburgh; *Nip-hof'-i-a* after Kniphof, *Ra-o-mür'-i-a* after Réaumur—the accent is often forgotten. *Forskahlia* is badly represented by "fors-kähl'-i-a," for Linnæus emphasised the sound of the second syllable by publishing the genus as *Forskolea*.

The retort may be made that it is impossible for the ordinary reader to be prepared to give proper expression to names drawn from various languages. Whilst that is true to a large extent, we venture to think that when the proper pronunciation is well known, we should endeavour to give effect to it, a statement to which most will agree, the difficulty being as to how far we can give currency to local pronunciation. *B. Daydon Jackson.*

* THE BOOK OF THE COTTAGE GARDEN.

THE author is a gardening enthusiast, and he is in rebellion against the prevailing taste in laying out and planting a garden, whether it be that of the wealthy or the comparatively poor. He asks if "the growing of produce for the table, the culture of flowers, so that their blossoms may be gathered to brighten dingy rooms, the providing of lawns for tennis and croquet, the laying-out of ornamental grounds that we may live amid trim, orderly surroundings—are the considerations that from time immemorial have quickened in the minds of men and women of refined instincts the love and need of a garden?" "If so, it means that our gardens are not gardens at all, but merely pieces of cultivated land, which combine the material possibilities of market establishments with the facilities of recreation grounds." But supposing, after all, that these things are not so; that the cottage garden is not garden craft in its crudest and most elementary aspect, and far from being an attempt to ape the splendours of more pretentious gardens, is in reality our nearest approach to the ideal. And that this presumption is not false but true is exactly what the author hopes to prove, so far as the limit of this book will allow, at the same time showing the possibilities which the small country garden offers in the way of achieving real and lasting beauty by the simplest and most natural means.

Tended with the utmost care, or, as is sometimes the case, left to work out unaided Nature's scheme of floral design, these little gardens are often models worthy of much consideration. Their simplicity disarms criticism, the homely flowers are like old friends, their fragrance stirs us with memories which are not awakened by the same flowers grown in the gardens of the rich.

The cottage-garden paths are moss-grown, have no spotless gravel spread over them, and creepers of many kinds drape porch and eaves in a natural way. "Bedding out" is not practised, but borders are filled with a goodly company of hardy plants, which greet the seasons as Nature intended. No one troubles to remove the fallen leaves and petals; they drop to earth to nourish the plants that gave them life. "Many such a garden might teach lessons that great gardeners should learn, and are pretty

* By Charles Thonger, author of *The Book of Garden Design, The Book of Rock and Water Gardens, &c.* Crown 8vo., pp. 90. London: John Lane, The Bodley Head, New York: John Lane Co.

from Snowdrop time till the Fuchsia bushes bloom nearly into winter," as W. Robinson wrote in the *English Flower Garden* 40 years ago.

The author is a great believer in thorough preparation of the land before laying turf or sowing Grass seeds, and he inclines to the latter method, although a lawn may be longer in becoming perfect in smoothness and finish. Full instructions are given on lawn making, and these are to the point.

The cottage garden is, first and foremost, a home for flowers, and we want them in profusion, in variety at all seasons, excepting mid-winter. The summer display must be the brightest, because, in this grey climate of ours, we long for colour and warmth. The hardy flower border is the best for the cottager.

Information in regard to planting and the species to plant is given in detail. The work is liberally illustrated, and the chapter on Roses will help the reader to clear away the mystery surrounding much that is written about them. No plants are easier to cultivate than Roses; but there are some sections which the small grower would do well to avoid.

TREES AND SHRUBS.

THE BAYFORDBURY PINETUM.

BAYFORDBURY, the seat of Mr. H. Clinton Baker, is situated two or three miles south of the town of Hertford. It is notable among the country houses of the south of England in containing the famous series of portraits of members of the Kit-cat Club. This club, it will be remembered, was founded in 1688, by the leading Whigs of the time.

To gardeners, however, the interest of Bayfordbury is of another kind, for in its demesne is contained one of the finest private collections of Conifers in England. Not only does the fine development of the individual specimens make it attractive to those who love trees for themselves alone, but the richness of the collection in species and varieties renders it particularly interesting also to the botanical student and connoisseur. This pinetum was well known to the late Dr. Masters, in his day the leading authority on Conifers in Great Britain, and frequent references to it may be found scattered through his published papers.

The Bayfordbury pinetum appears to have had its beginning in 1763, when 10 Cedars of Lebanon were planted to commemorate the building of the house. It is on record that the young trees, then 9 inches high, had been raised from seeds produced by the famous Uvedale Cedar at Enfield. These trees (see fig. 98) are now probably the noblest of their kind in Hertfordshire, a county by no means deficient in fine Cedars. They stand on the lawn not far from the house, and the largest of them has a girth of 27 feet 6 inches at 1 foot from the ground. This particular tree branches low down, but a second, with a better defined trunk, is 20 feet 6 inches round at 5 feet from the ground, whilst a third is but a few inches less.

Seventy years later, when the travels of Douglas in Western North America had attracted attention to some of the most marvellous tree growth in the world and had created a great interest in Conifers in England, the fine development of these Cedars (the largest of which was already 17½ feet in girth) appears to have suggested to the late Mr. W. R. Baker the idea of forming a comprehensive pinetum at Bayfordbury. A situation within easy distance of the house, but separated from it by a picturesque valley, was selected in 1837, and about 10 acres of this was planted the following year. J. C. Loudon, then at the height of his fame as a landscape gardener and writer on arboriculture, assisted in an advisory capacity. The collection was made as complete as was possible at that period, but during the severe

winter of 1844, when 37 degrees of frost were recorded, many of the more tender species from Mexico and elsewhere perished. A similar misfortune happened in 1860. All this time, however, the genuinely hardy species—and these are the only forms that really matter—were thriving admirably in the fine soil and air of Bayfordbury. The founder of the pinetum lived to watch and tend his trees for nearly 60 years. He died in November, 1896, at 87 years of age.

It is a happy instance of heredity in tastes that his grandson, the present owner, should be an enthusiastic student and cultivator of this family of trees. Through his efforts, the collection has been very much augmented in recent years, so that at the present time it is practically complete in species hardy enough to thrive in

species dealt with is to be given, so that a collection of plant portraits will be available practically complete so far as arborescent species of Conifers hardy in the British Isles are concerned.

The following are brief notes on the more remarkable specimens. The Lebanon Cedars, from their size and history, stand first in interest, but, following them closely are several examples of the Redwood—*Sequoia sempervirens*—one of which is 75 feet high and 10 feet 3 inches in girth. This and other slightly smaller trees of this species are noteworthy for the finely-butressed base of the trunk; they were planted in 1850. The companion species, *S. gigantea* or *Wellingtonia*, is 94 feet high. A singularly impressive tree is one of *Pinus ponderosa*, just over 100 feet high, erect and stately,

Scrub Pines of North America, *P. inops*, planted in 1842, is 48 feet high; *P. mitis*, 34 feet; and *P. pungens*, 33 feet. The Sugar Pine (*P. Lambertiana*) is 64 feet high, and has twice produced its remarkable cones.

There is no more interesting tree in the collection than *Pinus tuberculata*. This species is one of those that produce an enormous crop of cones and retain them on the branches for several years. Few specimens in the British Isles show this characteristic so strikingly as that at Bayfordbury. On a portion of a branch 3 feet long I have counted more than 40 cones; they are rather narrow and tapering, 4 inches or so long, and produced in whorls of three to six.

It will thus be seen, even from this small selection, that the exotic Pines make a very remark-

FIG. 98.—CEDARS AT BAYFORDBURY, HERTFORDSHIRE.

the climate of Hertfordshire. Such, in brief, is the history of the Bayfordbury pinetum. A fortunate circumstance in connection with it is the existence of records, made by successive owners, of the planting, development, and various events connected with individual trees.

An important work is in course of preparation by Mr. Clinton Baker, assisted by Mr. A. B. Jackson. It is to consist of two quarto volumes containing a description and illustration of every species of Conifer in the Bayfordbury collection, with historical notes on the specimens. These volumes promise to be more complete on the pictorial side than any other work on the subject yet published. An illustration, natural size, of the foliage and cone (or fruit) of every

its straight, tapering trunk measuring 9 feet 4 inches in circumference at the base. There is also at Bayfordbury the curious and now uncommon form of this Pine, with yellowish shoots and foliage, once known as *Pinus Parryana*. A Corsican Pine is 98 feet high, and there is a fine group of its variety *Pallasiana* with the characteristic erect side branches. A specimen of *Pinus Coulteri*, which grew not far from the house until its death a few years ago, must have been one of the very finest in Great Britain; from its trunk planks 2 feet 9 inches wide were cut (see *Gardeners' Chronicle*, March 28, 1885). The uncommon *Pinus resinosa* is represented by two notable specimens 54 feet and 50 feet high respectively. Of the curious

able assemblage. Yet no nobler tree exists at Bayfordbury than a Scots Pine, growing some distance from the pinetum proper, in a wood of Oak and Ash. The tree is now 95 feet high, with a beautiful, clean, smooth trunk, 9 feet 7 inches in girth at breast high, and clear of branches for 50 feet from the ground.

Among the Firs, a notable example is *Abies cephalonica*, planted in 1847, and now 70 feet high and 7 feet in girth. *A. Lowiana*, often erroneously called *lasiocarpa*, is about the same size; the true *A. lasiocarpa*, a rare species, is represented by a tree 13 feet high. *A. magnifica*, planted in 1850, is 55 feet high, with the perfectly erect, tapering trunk, and having the narrow, pyramidal form characteristic of the species

wherever it thrives well. Of the true *Abies Mariesii*, one of the rarest of all Firs, there are several young specimens. The ordinary Douglas Firs are not of unusually fine development, but the collection possesses a very striking pendulous variety, over 60 feet high. Among Larches, the most notable tree is a specimen of *L. dahurica*, 61 feet high, that produces cones abundantly.

The fame and interest of the pinetum tend, perhaps, to make one overlook the attractions of the "hardwoods" at Bayfordbury. But there are many that claim admiration. The common Oaks, Field Maples, and Yews would in themselves give distinction to any demesne. The American Oaks, too, are good, especially *Quercus rubra*, *Q. Phellos*, and *Q. palustris*, as are several trees also of the hybrid *Q. Turneri*, of semi-fastigate habit. Another interesting tree, similar in form to the last mentioned, is the fastigate variety of the curious Whitebeam tree, *Pyrus pinnatifida*, forming a crowd of erect, slender branches, and 35 feet high. Two fine old trees of *Cratægus tanacetifolia*, one of the most attractive of all Thorns in flower beauty, and producing large yellow haws, having a rather Apple-like flavour, probably date back to the time of Loudon, who was a great admirer of Thorns, and planted them largely. Another fine flowering tree is *Arbutus Menziesii*, the "Madroño" of the Californian forests, 25 feet high, which bears annually, not only flowers, but fruits. *Ulmus campestris viminalis*, that curious Elm, with small leaves and very slender twigs, is represented by a variegated form 30 feet high—one of the most effective of garden trees that have no beauty of flower.

Mr. H. Clinton Baker was one of the first to appreciate the present shortage in the supply of suitable Willow timber for the making of cricket bats. On the banks of the River Lea he has a prosperous plantation of Willows well on the way to a marketable size. *W. J. B.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Perpetual-fruiting Strawberries.—There are about half-a-dozen varieties of this type of Strawberry in general cultivation. The first that attracted attention was the one known as St. Joseph. This was afterwards crossed with Royal Sovereign, one of the progeny being the well-known St. Antoine de Padoue variety, which has fruits larger and of better flavour than those of St. Joseph. A variety of later introduction is Laxton's Perpetual, which, with the other two described, constitute the best varieties for planting. Another which is sometimes included in this class is Louis Gauthier. This bears large, white, or bluish-white fruits. The plant is a vigorous grower and a prolific fruiter. As the name perpetual-fruiting indicates, these Strawberries will fruit over a very extended period; but it is best to pluck off the flower scapes during the time the ordinary Strawberries are in fruit, so that the energies of the plants may be conserved until August and September. They will then give a succession of good fruits, and, if a little protection is afforded them during unfavourable weather, the supply will be maintained late in the season. I adopt the following treatment for these Strawberries. They are planted in a sunny position on ground trenched and heavily manured the previous winter. In the early spring the ground is afforded a good dusting of wood ashes, lime and soot, well mixed with the upper soil. Strong runners are planted 2 feet apart either way. This amount of space is necessary in order that the air may circulate freely about the plants during the dull days of autumn. Should the weather be dry after planting, water is afforded until the roots are established. The plants grow strongly, and before the hot weather sets in they are afforded a mulching of decayed manure. It is essential that copious waterings should be given whenever the ground is dry. By the end of May or June, the plants commence to develop their

flowers; but, as stated, these, together with any runners, are picked off as soon as they are detected. This stopping is practised till the end of July, after which date the trusses of bloom are allowed to develop. At that stage the bed receives a soaking of manure water, or a dressing of artificial manure, which is washed into the soil by copious waterings. After these manurial stimulants have been applied, clean straw is placed around the plants. If extra fine berries are desired, the trusses are thinned of most of their flowers. The fruits are supported on twigs or wire supports that are sold for the purpose by the sundriesmen. Slugs are fond of these fruits, and must be guarded against.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Early pot vines.—As soon as the Grapes on pot vines, which were started into growth in the autumn, commence to colour, less moisture will be needed in the atmosphere. Discontinue the afternoon damping, and, as the Grapes approach to ripeness, keep the house quite dry. This, however, does not apply to the roots, which must be liberally supplied with moisture, but manurial stimulants must be gradually withheld as the fruits become ripe. Admit plenty of fresh air in theinery during fine weather, both through the top and bottom ventilators. The top ventilators may be allowed to remain open a little during the night-time. The lateral shoots may now be allowed to grow unchecked.

Early permanent vines.—Examine the bunches for any further thinning which should be done before the berries become too crowded. In the case of Black Hamburg variety, nothing much is needed beyond the removal of a few of the seedless berries. If the foliage has covered the whole of the trellis-work, the lateral growths must be kept in check by pinching. Guard against mealy bug, and should mildew appear dust the affected parts with flowers of sulphur. A little of this substance should also be placed on the hot-water pipes.

Mid-season vines.—The stopping and regulating of the shoots will need attention. Should the vines be very close to the glass, extra care will be needed in tying the laterals. This work is best done either at the end of the day or during dull weather, as at such times there is less danger of the shoots being damaged. As soon as the fruits have set and it can be determined which are the best bunches, remove any that are not required. The thinning of the berries must not be delayed, as they swell quickly at this season of the year; when they are crowded, the thinning cannot be accomplished so evenly or well. After the vines have passed their flowering stage they will probably need watering; this is a suitable time to give them a good soaking with liquid manure.

Cherries in pots.—Established trees which are carrying a good crop of fruits must be top-dressed with some rich compost. They should also be watered two or three times a week with liquid manure, or be given chemical manures. The syringe must be used freely during fine weather, and the paths, &c., damped frequently in order to maintain a moist atmosphere. An occasional syringing with soft soapy water assists to keep the Cherry-fly in check. Guard against a small grub which will be found inside curled leaves. These pests will later attack the fruits and cause much damage to the crop. If it is desired to hasten the ripening of the fruits this may be done by closing the house earlier in the afternoon, but on no account afford excessive fire heat at night-time. When the fruits are ripening the syringing must be discontinued, and a free circulation of air permitted to prevent the fruits from cracking.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Climbers.—The shoots of climbing plants in greenhouses require to be frequently thinned, in order to produce the best results in flowering. Weakly shoots should be at once removed, and the others regulated so that there is no overcrowding. Seedlings of such subjects as *Momordica*, *Lagenaria*, *Luffa*, *Trichosanthes*, *Cucumis sativus* and other tropical gourds can be potted into large pots or may be planted out in mounds of soil placed on the stages. The

soil can be hidden by dwarf trailing plants such as *Selaginellas*, *Panicum variegatum*, and *Episcia fulgens*. Ornamental gourds grown under glass require a similar treatment to that afforded Cucumbers.

The Rose house.—Established trees are growing freely and will be benefited by occasional applications of tepid manure water. When the weather permits, the foliage should be syringed twice daily with clear water until the flower-buds are showing colour. Spraying in the afternoon must be practised on fine days only, and under such conditions that the foliage becomes quite dry before dusk. Avoid a high temperature in the house at night-time. Fumigate the house once a week to keep green fly in check. Pot Roses in flower should be removed to a house with a dry atmosphere. Place fresh batches of pot Roses in the forcing house for successional blooming.

Tree Carnations.—The young plants must not be allowed to suffer a check through having their roots potbound; they must therefore be transferred to larger receptacles as soon as they have filled the smaller pots with roots. The stopping of the shoots is a much-debated question. Many persons recommend the first pinching of the shoots whilst the plants are in the small pots. Other growers claim that plants which are not stopped until they are established in 5-inch pots and about 8 or 9 inches high produce a greater number of strong-flowering shoots than those that are stopped earlier. At whatever stage the pinching of the shoots is done it must be after the plants have recovered from the disturbance of repotting.

Jacobinias.—Cuttings of these plants should be inserted in light sandy soil. As soon as the cuttings are rooted they should be potted singly into small pots, and shifted subsequently to larger receptacles as required. The best inflorescences are obtained from plants which have not stopped. Large specimens may be obtained by placing into one large receptacle all the cuttings rooted in a single pot.

Campanulas.—*Campanula isophylla* and its varieties may be divided, or, if large specimens are required, potted on into larger pots. These plants should be grown under a cool treatment. Seeds of *C. pyramidalis* should be sown now to provide plants for flowering next year. The strongest plants of last year's raising will soon require repotting. Good results are obtained when this *Campanula* is wintered on an outside border and potted up just before the flower-spikes appear.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Hollies.—These should be pruned, lightly forked at the roots and given a top-dressing of rich soil and manure. Specimen plants on lawns or terraces will require to be trimmed very carefully in order to preserve their shape. They are best cut with a knife of a pair of sécateurs; when a pair of shears is used, many of the leaves are cut in halves. For trimming large hedges of Holly shears should be used. There is a large number of varieties of this evergreen shrub and nearly all of them are worthy of places in the garden.

Ornamental Maples may now be planted. The dwarf-growing varieties form excellent groundwork to tall-growing Liliums, which should be planted as pot specimens.

The herbaceous border.—Complete any planting that has been delayed by the unfavourable weather. *Ostrowskia magnifica* is a very handsome and distinct border plant. It is impatient of disturbance at the roots and should, if possible, be planted from a pot. *Monarda didyma* forms a fine subject for the mixed flower border. The *Inulas* provide a very effective display during the late summer and autumn months. They prefer a somewhat moist situation. *Rudbeckias*, *Thalictrums*, *Epimediums*, and the newer varieties of *Michaelmas Daisies* are all attractive when in flower at the end of the summer.

Mistletoe.—This plant may be made to grow upon the Apple, Poplar, Thorn and Lime, by making a crack or crevice in the bark and inserting the seeds, afterwards plugging the cavity with a piece of cotton-wool. This precaution is necessary or birds and mice may carry off the seeds.

Annual climbers.—Hardy varieties may be sown in small pots. These include *Tropæolum*, *Maurandya Barclayana*, *Convolvulus*, *Ipomœa*, and *Ecchremocarpus*. Gourds may also be raised for training over poles, arches, or old walls. Another excellent plant for this purpose is *Mandevilla suaveolens*. If it is desired to shift *Tropæolum speciosum*, a deep hole should be made about the roots, which descend very deeply in the ground. This *Nasturtium* may be planted on the north side of a wall or tree, in which situation it succeeds very well.

General work.—Remove any protecting material placed about tender plants, and top-dress their roots with fresh, rich soil. Camellias and Palms are benefited by bonemeal and soot, which should be lightly forked in about their roots. Make trim the shrubberies, beds, and borders, pruning and staking the plants and then forking the soil. Place a fresh stake to any plants that require it. The stakes will last much longer if the parts that enter the soil are either dipped in pitch or charred; the ends may also be treated with sulphate of iron, and when dry immersed in strong lime water.

The Alpine garden.—Many *Primulas* are easily raised from seeds, including *P. capitata* and *P. pulverulenta*. Afford a little top-dressing of loam, leaf-soil, bonemeal and soot to *P. rosea*, *P. japonica* and others of a similar type.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Catasetum, *Cynoches* and *Mormodes* are not only curious and interesting plants, but many of the species, when well cultivated, produce handsome spikes of flowers that have a decorative value; some of their blossoms are fragrant. The following are amongst the best plants of these genera from a garden point of view:—*Catasetum Russellianum*, *C. splendens*, *C. s. imperiale*, *C. s. punctatissimum*, *C. s. leucanthum*, *C. O'Brienianum*, *C. tabulare*, *C. Darwinianum*, *C. Bungeothii* (pileatum), *C. B. Lindenii*, *C. B. aurantiacum*, and *C. B. Randii* (all of these have received either a First-class Certificate or an Award of Merit from the Royal Horticultural Society). Among the *Cynoches* may be enumerated *C. pentadactylon*, *C. maculatum*, *C. peruvianum*, *C. Egertonianum*, *C. chlorochilon*, and *C. versicolor*. The best of the *Mormodes* include such beautiful species as *M. luxata*, *M. l. eburna*, *M. Rolfeana*, *M. pardina*, *M. buccinator*, *M. Wendlandii*, *M. badia*, and *M. Lawrenceana*. These plants enjoy a long rest during the winter months, but they are now commencing to grow, and will require immediate attention. As soon as the young growths are seen pushing from the base of the pseudo-bulbs, the plants should be turned out of the old compost, especially if it consists of ordinary peat and moss. Cut away the dead roots to within 2 inches of the pseudo-bulbs; the portions of roots which remain will be found useful when fixing the pseudo-bulbs in the new soil. Last year our plants were potted in the following compost, in which they grew exceedingly well, and produced strong spikes of bloom:—*Osmunda* fibre and *Polypodium* fibre in equal parts cut up moderately fine and mixed well together, with the addition of small broken crocks. No *Sphagnum*-moss was used. Owing to the lasting qualities of the compost, very few of the plants will need re-potting this season.

Repotting.—We use ordinary flower-pots, with three holes drilled at equal distances just under the rim, to which suitable copper wire handles are attached. These handles are about 12 or 15 inches in length, according to the size of the pseudo-bulbs. The pots are filled with material for drainage purposes to about a quarter of their depth, clean, broken crocks being employed. The plants are potted firmly, with the base of each young growth a trifle above the rim of the pot, to guard against damping. All long, heavy pseudo-bulbs should be securely tied to the wires to keep them in position. For several weeks after repotting, water must be afforded sparingly, as very little moisture is necessary until the growths are well advanced; but as soon as the roots have obtained a firm hold of the compost, they will need copious waterings. The plants should be suspended well up to the roof glass of the East Indian house. One of the main conditions of success is a quick development of the growths.

Temperatures in the various houses.—East Indian house, 65° to 75°; *Cattleya* house, 60° to 70°; the intermediate house a trifle lower; and the cool or *Odontoglossum* house, 50° to 60°. The lower temperatures given are for night-time, and the higher for mid-day. The Mexican house should be about 55° at night, and rise during the day, by sun's heat, to 80° or 85°, at the same time plenty of ventilation should be afforded. The *Odontoglossum* house should have plenty of fresh air admitted when the weather is mild; the other houses will require a moderate amount of ventilation throughout the day. In all the houses we leave the bottom ventilators open a trifle at night-time whenever the weather is favourable. All the houses must now be damped down at least once in the morning and again during the afternoon.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, Hertfordshire.

Spinach.—This has proved a most valuable green vegetable this winter, as the plants have almost entirely escaped injury from frosts. A little chemical manure and a dusting of soot about the roots, with frequent hoeings of the soil, will do much to assist the growth and improve the edible qualities. Sowings of Spinach should be made frequently on borders facing south or west.

Chinese Artichokes (*Stachys tuberosa*).—This Artichoke, when properly cooked, forms a valuable addition to our list of autumn and winter vegetables. To produce the best tubers, it needs careful cultivation. The plant does best in a light, sandy loam, which should be enriched with well-decayed manure and leaf-mould. If the tubers are not already planted, this should be done at once, placing them in rows 12 to 18 inches apart, allowing 9 to 12 inches between the plants in the rows. Planting may be done with a dibber, or the tubers may be placed in deep drills made with a hoe. On heavy land, it is advisable to place about the tubers a quantity of old hot-bed manure or some well-decayed leaves.

Globe Artichokes.—Remove the material that has been placed about the plants for protection, and apply a quantity of cinders or ashes about the roots. This, with plenty of farmyard manure, should be forked into the ground between the rows. Suckers which were potted up in autumn and have wintered in pots should be planted on well-prepared ground at a distance of 4 feet from row to row, and 3 feet between the plants.

Chicory.—This is a valuable salad plant, as well as an extremely useful vegetable for cooking. Ground intended for growing Chicory should be deeply trenched and well manured during the winter months. Two sowings should be made, one during the present month and another in May. Sow in drills drawn 1 foot apart.

Cabbages.—The ground about the plants should be deeply and constantly hoed. Draw the soil up to the stems to prevent the wind from blowing them about. Cabbages are benefited in spring by occasional applications of quick-acting manures.

Cauliflowers.—Autumn-raised plants should now be planted in their permanent quarters. These give much the finest heads, although many persons depend on plants raised from seeds sown in the spring. Two reliable varieties are *Walcheren* and *Magnum Bonum*. To ensure a succession, plant in different aspects and at intervals.

THE APIARY.

By CHLORIS.

Robbing.—When the supply of nectar is short, bees resort to robbing their weaker neighbours. As the weather of late has been cold and wet, there will probably be much robbing this season.

How to detect robbing.—The scene of the trouble is on the alighting board near the entrance. When all is well within the hives, bees alight and pass in with their load, and nothing like strife is seen. But when robbing is being carried on there is a great commotion. The bees are seen struggling together in twos and threes, or even more, and rolling to the ground tightly embraced, and there will be found many dead bees on the ground near the hive.

How to cure it.—The first step is to ascertain the cause. Perhaps it is due to the carelessness of the beekeeper, who has spilled some of the syrup whilst feeding; it may be a general shortness of food; or it may be that a hive is queenless. A colony without a queen does not offer a very determined stand against marauders. Having found the cause and remedied it, the next thing is to guard against further trouble. If robbing be discovered in its early stages, it may be easily checked by closing the entrances, so that only one bee can pass in or out. Some time ago I heard of an excellent device. A beekeeper had been much troubled with robbing, and nothing he did had any effect. He eventually placed a square of glass before the entrance, which made it possible for bees to pass in and out at the sides, but the robbers flew against the glass and failed to find the entrance.

Painting hives.—Those who failed to paint their hives last autumn should do so now as speedily as possible. First rub the hives with glasspaper to ensure a smooth surface. Mix the paint as follows:—1 lb. of white lead mixed in unboiled linseed oil and a little turpentine (boiled linseed oil causes paint to blister). Strain the paint through a piece of muslin, or an old stocking, working it through with the brush. If a colour be desired (white reflects the heat best) a little sienna will give a stone colour; the addition of red lead will produce a pink tone, and a slate tint is produced by adding lamp black. Remember in applying the paint that the object is not to put on as much as possible, but to apply a thin, even coat. This will take time, but it will be time well spent. Give two coats, and after the first is applied stop any holes or crevices with putty.

PUBLIC PARKS AND GARDENS.

By J. W. MOORMAN, Superintendent of Victoria Park, London.

Seats.—A plentiful supply of seats is necessary in every public garden. They should be placed in positions where good views are obtained, or in shady spots, such as beneath trees, or against a shrubbery. The type of seat that is principally used in the London parks consists of three iron castings, one at either end and the other in the centre, to which wooden seat-rails are secured by means of small galvanised bolts. The largest of these seats is formed with 13 wooden rails, each of which is about 2½ inches wide and 1 inch in thickness. A smaller seat is sometimes used, which only takes four laths—two for the back and two for the bottom. Another type of seat is made from old Oak timber, such as may be had from the ship-breaking yards, the wood being bolted to a galvanised iron frame. This timber is very durable and requires no painting, an occasional coating of boiled oil being all that is necessary. Rustic seats, formed of branches of trees, are, when properly constructed, strong, and harmonise with their surroundings. One of the best places for a rustic seat is around the bole of a large tree near to the pathway. Such seats are best made in a circular or octagonal shape, with dividing arms, so as not to allow a person to recline at full length, this being prohibited in the L.C.C. parks. All the seats are free to the public, except in a few places where folding chairs are specially provided at a small charge.

Fences.—In addition to the proper safeguarding of the shrubberies, fences are necessary for such temporary purposes as enclosing a piece of worn turf, preventing a beaten track being made across the grass, and protecting the verges, &c. To stop people treading on the grass edge, iron posts, about 15 inches high, are fixed alongside the pathway at intervals from 6 to 9 feet, and through these are strained a flexible wire. Another form of dwarf fence is sometimes used, with standards 2 feet in height, set in concrete, and bearing two strands of wire about 14 inches apart. A strong post with a cog-wheel arrangement for straining the wire is provided at intervals. The common five-bar hurdle is used largely in the case of shrubberies; unclimbable fences are placed in spots which require careful protection. This latter kind of fencing is made in 6 feet lengths, and can be had from 3 feet 6 inches to 5 feet in height. Although termed unclimbable, small boys often surmount it.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations. The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—

Herbaceous and Border Plants, Lilliums, &c., at 12; Roses at 1.30; Palms, Azaleas, &c., at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Choice Established and Imported Orchids in large variety. Orchids in flower and bud. At 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—46.7°.

ACTUAL TEMPERATURES:—

LONDON.—Tuesday, April 6 (6 P.M.): Max. 52°; Min. 43°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Wednesday, April 7 (10 A.M.): Bar. 30.2; Temp. 55°; Weather—Sunshine.

PROVINCES.—Tuesday, April 6 (6 P.M.): Max. 52° Cambridge; Min. 43° Scotland, E.

The great International show of the present year is now being held in Berlin, in the presence of a considerable number of foreign visitors. Every effort has been made to get together such an exhibition as cannot fail to have an influence on the development of German horticulture, and in this endeavour the Prussian Horticultural Society has been successful. A prodigious amount of work is connected with an event of this kind, and the most skilful organisation is necessary, therefore those societies which have already held similar exhibitions have most valuable experience to work upon. Except for occasional events which have taken place in France, most of the International horticultural displays for years past have been made in Belgium by the Ghent Botanical and Horticultural Society. The interval of five years between the successive shows gives time for the perfecting of the organisation and leads to unqualified success. Here, in Germany, there has been no serious attempt at any great show during the past twenty years, though it will be remembered that as recently as four years ago a smaller show was held at Düsseldorf. In these circumstances the Prussian Horticultural Society is entitled to our congratulations, for it is certain that the gathering together of the exhibits from other nations has a first-rate educational effect upon the home cultivators in any country, however skilful they themselves may be in horticultural practice.

The present show is divided into 31 sections, each of which was judged by a separate group of jurors. There were 150 jurors, including representatives from

France, Belgium, Holland, Sweden, Russia, Denmark, Italy, and England. Such an exhibition needed a very large covered area, and the Society was fortunate in obtaining the two magnificent buildings at the Zoological Gardens. These have only been erected during the past two years, and were designed for this and similar purposes. They are lofty, and, in addition to the floor space of the main buildings, there are spacious galleries, separate rooms and annexes, all of which are utilised for the display of the exhibits. The area covered is 12,000 square metres, or about 2½ acres. The rent that has to be paid for the buildings during the fortnight the exhibition will remain open is 50,000 marks, or about £2,500. Beside providing this sum the Society offered prizes amounting to the value of 70,000 marks, or £3,600. The wall at one end of the first building is decorated with a painting representing the Kaiser's residence at Corfu, and the effect has been enhanced by reproducing in front of the painting some of the external features of that island (see fig. 100). The Kaiser, who, with the Kaiserin, visited the exhibition on Wednesday, appeared to be keenly interested in this representation of the famous Achilleion. The Imperial party was escorted through the exhibition by Mr. Otto Beyrodt, one of the vice-presidents. The same building contains most of the Indian Rhododendrons, stove plants and similar exhibits, the other building being used principally for the hardier plants.

Of the exhibits themselves it may be said that they more than equal expectation; but, at the same time, there is little, if anything, superior to what is usually seen in England. Probably about two-thirds of the exhibits have been contributed by German exhibitors, and one-third by those of other nationalities. Altogether there are 420 exhibitors. Belgium contributes most of the fine foliage plants, including the excellent group from the Van Houtte Nurseries at Ghent. The Dutch Bulb-Growers' Society have produced a striking colour effect with their Hyacinths and Tulips, and Holland also exhibits a considerable quantity of vegetables and salads, which are in every respect creditable. From France there are choice Orchids from Mons. Lambeau, hybrid Gerberas from Mons. Adnet, Cinerarias from Messrs. Vilmorin, Andrieux and Co., and various growers have sent cut Carnations, collections of fruit, vegetables and salads, which latter exhibits are amongst the best in the show. Particulars of most of these classes will be found in the report on another page, but we may draw special attention to the hybrid Gerberas. Flowers of some of the earlier hybrids have been seen at the Temple shows in London, but we have never seen such a presentment of their infinite variety and beauty as that now shown by Mons. Adnet. The development of this plant must be highly gratifying to Mr. Lynch, who, we believe, raised the first hybrids at the Cambridge Botanic Gardens.

England is represented by but few exhibits of which the chief are Orchids from Messrs. Charlesworth and Co., Carnations from Mr. C. Engelmann and Mr. G. Lange, and Pelargoniums from Messrs. H. Cannell and Sons. For various reasons, the horti-

cultural trade between Germany and this country is not equal, for instance, to that between ourselves and Belgium, and even in respect to the actual trade it may be said that we are usually the purchasers rather than the sellers. This fact may explain in some measure the comparative indifference on the part of British growers on the present occasion, but we believe that, in the event of the Berlin authorities holding a similar show again, our own people, amateur as well as trade cultivators, will be found to be more willing to send exhibits.

One of the surprises which the exhibition offers is the extraordinary number of hardy fruits that are staged, mainly by German cultivators. No such extensive display has been seen at an exhibition in England so late in the season as April, though smaller collections of no less excellent preservation and quality have been exhibited even at the Temple shows. These exhibits at Berlin may be taken to show that fruit preservation is well understood generally by cultivators, and that this question of preservation is an important matter to be studied if the culture of hardy fruits is to be made profitable. It was appropriate, therefore, that the Crown Prince and Princess should offer a special prize for the best collection.

Indian Azaleas were well shown by Mr. T. J. Seidel, of Dresden, who was the principal exhibitor of these plants. The uncongenial weather of the present spring, however, has been much against these and other plants that in more favourable circumstances would have appeared to better advantage. Englishmen were impressed with the excellence both of the Cyclamens and of *Primula obconica*. We have never seen such fine displays of *Primula obconica* as those at Berlin. The development of this plant has been of an extraordinary character; in the varieties exhibited the colours ranged from white through mauve, pink and red to the deepest crimson, whilst in some varieties the flowers measured as much as two inches across. Cyclamen cultivation is evidently well understood in Germany, the groups of these plants in the exhibition being remarkable for their unusually large and finely-coloured flowers produced in the greatest profusion.

Like most of the Continental shows, the Berlin Show is remarkable for the good taste evinced in the arrangement of the exhibits. In this respect, though not in the excellence of the individual classes, the Berlin Show is superior to the exhibitions to which we are accustomed in this country. In Berlin each several exhibit contributes to the general harmony. There is but little need for stages, since most of the plants are bedded out in natural groups. The pots for the most part are hidden, there are no obstructive labels, and any architectural features in the building that were considered inelegant are either draped with pleasing colours or covered with branches of Spruce.

Contributions to the scientific side of the exhibition are made by the State schools at Geisenheim and Dahlem.

Nothing could exceed the hospitality extended by the Prussian Horticultural Society to the foreign guests. On April 1st the

judges assembled at 8.30 a.m., and were addressed by the Presidents of the Society and jury. After the adjudication of the prizes the jurors were entertained at luncheon. On the following morning at ten o'clock the exhibition was formally opened by the Crown Prince and Princess. In the evening the foreign guests and others attended a performance at the Royal Opera. On Saturday evening they, to the number of about 300, were entertained at a banquet in the buildings of the Zoological Gardens. The President and others welcomed the guests in appropriate speeches, and responses were made by representatives of each country. Sir Daniel Morris, K.C.M.G., who represented the Council of the Royal Horticultural Society, replied on behalf of England and expressed regret that English exhibitors were not better represented. He related a few facts concerning the Royal Horticultural Society, and said that English horticulturists desired to have friendly relations with those in Germany and all other countries. On Sunday and Monday there were organised excursions to the Imperial Gardens at Potsdam and the Imperial Botanic Gardens at Dahlem.

The hope was expressed at Berlin that, in the near future, England would take steps to organise an International exhibition. We commend the proposal to the consideration of the Council of the Royal Horticultural Society. Many in this country would welcome an opportunity to show their appreciation of the generous hospitality extended to Englishmen on many occasions.

OUR SUPPLEMENTARY ILLUSTRATION represents a flower of the fine hybrid between *Lælia Jongheana* and *Cattleya Dowiana aurea*, raised by Mr. H. G. ALEXANDER, Orchid grower to Colonel G. L. HOLFORD, C.I.E., C.V.O. This hybrid gained a First-class Certificate at the Royal Horticultural Society's meeting on February 23 this year. Although, in point of form, the features of *L. Jongheana* can be traced in the flower, it is evident that the influence of the more ample *C. Dowiana aurea* has predominated. In the matter of colour, however, the yellow of the *Cattleya* has been suppressed by the rose tint of *Lælia Jongheana* in the manner often seen where yellow and rose have been crossed with each other. The flowers of *L.-C. Pizarro* are of very fine substance, of a bright purplish-rose colour, darkest at the base, whence a series of gold-coloured lines extend to the front.

NATIONAL AURICULA AND PRIMULA SOCIETY (SOUTHERN SECTION).—The annual exhibition of this Society will take place at the Horticultural Hall, Vincent Square, Westminster, on Tuesday, April 20, in conjunction with the fortnightly meeting of the Royal Horticultural Society.

HOW THE AMERICAN GOOSEBERRY-MILDEW SPREADS.—An outbreak of this disease having occurred at Eaton, in Norfolk, Mr. GARNSEY, the chief inspector of the Board of Agriculture, made several visits to the district, and, in consultation with Mr. J. WARD, the local inspector, traced one case to its source. A workman employed in the garden of a private owner took some cuttings, which he reared in his own garden. These developed mildew. On inquiry of the owner of the bushes, it was found that he had obtained them from a firm in Essex.

BRITISH GARDENERS' ASSOCIATION.—We learn from *The Journal* of this association that the sub-committee appointed by the council to consider the question of a garden to which unemployed members might be drafted, has met on several occasions, and discussed the matter from all points of view. Whilst desirous of doing everything possible to assist members who are out of employment, the sub-committee is unable to recommend any definite scheme to the executive council, owing to the great financial responsibility that would be involved. The sub-committee is of opinion, however, that such a scheme could be carried on with greater advantage if conducted either as a limited liability company, or privately, the association having a number of places at its disposal for members during their period of unemployment. If a conveniently-situated piece of freehold land could be purchased at a reasonable price, a gentleman would be willing to buy the land, and to let it to the association on such annual terms as would ultimately render it the property of the association.

THE "BOTANICAL MAGAZINE."—In the issue of this work for the current month, the following plants are illustrated and described:—

IMPATIENS HAWKERI, tab. 8247.—This plant was at one time rather extensively cultivated in gardens, but it suffered so frequently from the attacks of the *Begonia mite* (*Tarsonymus*), that it is now rarely met with. It was introduced by Messrs. BULL, of Chelsea, in 1886, and in the same year a full-page illustration of the plant was given in the *Gardeners' Chronicle*, p. 760, June 12. The plant requires a warm temperature, with plenty of atmospheric moisture.

MICROLOMA TENUIFOLIUM, tab. 8248.—This is the Coral Limber of South Africa, a pretty *Asclepiad*, having waxy, Hoya-like blossoms, produced in axillary bunches. A note on the plant by Mr. W. E. GUMBLETON is given in the *Gardeners' Chronicle*, February 1, 1908, p. 79. This gentleman received three plants from Port Elizabeth, and furnished the material from which the *Botanical Magazine* plate was prepared. The flowers produced on specimens cultivated in greenhouses in this country are not comparable with those developed in the plant's natural habitat.

ARBUTUS MENZIESII, tab. 8249.—This is one of DAVID DOUGLAS'S introductions, and, although he first sent plants home in 1825, the tree has never become common in gardens. There are, however, a few fine trees in this country; one at Bassett Wood, near Southampton, is nearly 50 feet high. One of the most interesting features of the tree is its smooth, cinnamon-coloured stems and branches. In common with most *Ericaceae* plants, this *Arbutus* succeeds best in a rooting medium of peat, and, failing that, a sandy loam.

STROPHANTHUS PREUSSII.—This tropical climber is a native of the regions of the Gold Coast and the Congo. The inflorescences form terminal cymes, the individual flowers having long tails to the corolla lobes, as much as 12 inches long. The flowers are pale orange, the filiform appendages being red. The anthers also are red. The specimen figured was raised from seeds forwarded to Kew in 1902 by Mr. W. H. JOHNSON, from the Botanic Station at Aburi, Gold Coast.

ANTHURIUM TRINERVE, tab. 8251.—This species is nearly allied to *A. violaceum*. It is one of the few *Anthuriums* which are attractive on account of the bright colour of their fruits. In this instance the berries are lilac-coloured. The plant is not the same as *A. trinervium* of Kunth, a plant which has much larger cordate leaves than those of *A. trinerve*.

METROPOLITAN PUBLIC GARDENS ASSOCIATION.—In the twenty-sixth annual report are given detailed lists of the work which the Association has carried through during the past year, and of the various projects which it has on hand, together with an account of several new parks, recreation grounds and extensions to existing open spaces in the acquisition of which it has assisted. Amongst these may be mentioned the Barking Road recreation ground at East Ham—which was opened on July 15 by H.R.H. Princess LOUISE, Duchess of ARGYLL—and an addition of 12 acres to Ruskin Park. Trees have been planted in many thoroughfares, including several miles of streets in East Ham and Walthamstow; seats have been placed in existing gardens, open spaces, and public pathways; and prizes have been given in connection with window-gardening competitions in various parts of London.

RUSKIN PARK, CAMBERWELL.—Twelve acres of adjoining land have been added to this recently-acquired park, largely through the instrumentality of the Bishop of SOUTHWARK, a vice-chairman of the Metropolitan Public Gardens Association, and Mr. F. TRIER. The Association contributed £400 to the purchase fund. The total cost of the land was £24,000, of which one-half was contributed by the London County Council, £1,000, £2,000, and £750 by the Camberwell, Lambeth, and Southwark Borough Councils respectively, and £500 by the City Corporation, the remainder being obtained from voluntary sources. The purchase has still to be completed. The ground will be laid out and maintained by the London County Council, and is intended especially for the playing of games.

THE ISLAND OF ST. HELENA.—In a paper read before the members of the Royal Society of Arts, Mr. JOHN C. MELLIS, M.Inst.C.E., F.G.S., stated that St. Helena presents some extremely interesting problems in natural history, which, up to the present time, have completely puzzled the most able scientists. The indigenous flora of St. Helena comprises 77 different kinds of plants, locally known as "Cabbage-trees," "gumwood," "red wood," "dog wood," "scrubwood"; and also 26 kinds of tree and smaller Ferns. Some 50 of these plants are peculiar to the island, and cannot be regarded as specific allies of any other plants. A peculiar feature connected with them is that, with scarcely an exception, all the flowering plants produce pure white blossoms. There are some 20 varieties of marine fish which are peculiar to the locality. Some 20 species of land shells are indigenous, and have not been met with elsewhere. Thirteen of the 20 have already become extinct, and are now found only in a dead state on the surface of the ground, where the native vegetation has disappeared. Out of a total of 203 species of beetles found on the island, some 129 are true aborigines, and have been found nowhere else on the globe. How did these plants and insects originate? How did they get to this remote and isolated spot, and why are they gradually becoming extinct? The gradual dying out of the native plants has been attributed to the introduction of exotic plants and goats, which, in the one case, have overgrown and killed the native vegetation, and, in the other, have destroyed the young plants; but anyone who has studied the subject on the spot cannot fail to arrive at the conclusion that these reasons are wholly insufficient to account for the facts. Change of climate may possibly be a contributory cause of the passing away of this wonderfully interesting, indigenous flora and fauna. That such a change has occurred is very probable, seeing that the island was, at some remote period, much larger and more elevated than it is at present.

THE ROSARY.

CULTURAL NOTES FOR APRIL.

THE severe weather of February and early March killed many Roses in all parts of the country; whilst many which were not killed outright have been badly injured. All damaged shoots must be cut back to sound wood, pruning to a prominent outside bud. Although this severe pruning may appear a great sacrifice of growth now, it will result in the formation of strong shoots that will do much to place the bushes once again in a good condition. In late districts, the second and third week in April will be soon enough to start pruning dwarf Roses that will furnish a supply of early blooms. The damage caused this winter has shown the value of thinning out all weakly and unripened shoots during the summer and autumn months, thus enabling those which remain to become well ripened and hard enough to escape damage by cold. Long, well-ripened shoots of dwarf Roses may be bent carefully down to within 6 inches of the soil and secured by pegs.

All materials placed about the bushes for protection and soil that has been earthed up about the stems should now be removed. There will be many vacancies to be made good amongst the plants, and these will be better supplied by pot plants that have been wintered in cold frames. All newly-planted Roses, as well as those which are established, should have fresh mulchings of fermented manure placed over their roots, and the manure should be lightly covered with soil. Mulching should also be applied to cuttings, and if the soil about these has been loosened by the frost, it must be made firm again by treading.

Any plants that have lost their bottom branches should be cut hard back. This will cause the dormant buds at the base of the stem to break, and thus furnish a number of new growths. This remark applies especially to pillar and climbing varieties. These new growths will be stimulated if a top-dressing of some rich soil and manure is given the plant.

ROSES INDOORS.

The last batch of dwarf Roses intended for forcing should now be placed under glass. If submitted to gentle forcing, they will be in bloom just prior to the Roses in the open. It will suffice if artificial warmth is afforded during the night-time only, allowing the thermometer to reach 65° or 70°. During the daytime, ventilation can be freely afforded, and plenty of moisture sprinkled about the house. The ventilators should be closed early during the day, so as to avoid the necessity for too much fire heat during the night-time. Directly aphid is detected on the foliage, fumigate with some nicotine compound. This pest may be kept in check by syringings of clear water; but do not moisten the foliage when the sun's rays are shining directly on them. Red spider is another pest of Roses indoors; but this may be kept down by damping and syringing with clear water. The repotting of plants grafted last autumn and winter should now be completed. They will not need much attention, except staking and fumigating. When the temperature in the house reaches 60°, the top ventilators may be opened. A considerable number of the cuttings will now be well rooted, and should be potted into 4 or 4½-inch pots. They should be plunged in a new hot-bed, prepared in advance, which will also serve for the rooting of other cuttings. The old hot-beds should have linings of fresh manure placed around them in order that the heat may be maintained. These cuttings must be carefully shaded and watered. It will be advisable to cover the frames at night-time with mats, to assist in maintaining the requisite degree of warmth. The plants that have furnished these cuttings should be hardened off gradually, so that they may be placed outside, where they will

remain throughout the summer to mature their new shoots. Afford them a warm, sunny position, and they will form excellent subjects for early forcing next winter. Pot Roses used for forcing should be discarded after the third or fourth year, as, after that period, they produce inferior blooms. Where Roses are required in quantity early in the season, it is desirable to have the plants potted up in the late spring—the present being the proper time—so that the plants may be well established by the autumn.

Roses planted in borders under glass should be given an abundance of fresh air during the daytime, and the ventilators may remain open a little during the night. After the end of April, artificial heat may be dispensed with; but it is advisable to maintain sufficient warmth in the houses at night-time to keep the air in circulation. If the air becomes stagnant, the plants are liable to mildew, especially if the atmosphere is kept very humid. Do not neglect to fumigate the plants whenever aphid is detected. A mulching of manure spread over the roots will assist the plants with their last crop of flowers, which will be ready for cutting during May. After that month the houses may be thrown wide open, and, if the lights are removable, they may be taken off entirely. J. D. G.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

CULTURE OF CUCUMBERS.—Mr. E. H. Jenkins states (p. 193) that "before the Cucumber disease (*Cercospora melonis*) became prevalent, it was possible to maintain a continuous supply of fresh Cucumbers from May to September inclusive," adding that "he had cut, from plants raised in April, superb young fruits in October," remarking that "unfortunately this cannot be done to-day, owing to plants becoming a prey to the leaf-spot." Before and since the appearance of *Cercospora melonis* a continuous supply of fresh Cucumbers has been maintained annually in many private and market-garden establishments not only from May to September inclusive, but from the end of February to the end of the following January, and this, too, in market-garden Cucumber houses, and without the aid of bottom heat, the plants being simply set out on small ridges, consisting of light, loamy soil and half-rotted stable manure in equal parts formed on the floor of the house. In the case of Cucumbers grown for market three plantings are made during the year, in order to have a continuous supply of fruits. I have cut excellent Cucumbers from the same plants for a period extending over 15 months, the plants being grown in boxes 2 feet long, 1 foot deep, 9 inches wide at the bottom, and 12 inches wide on the top. They were placed over and within a few inches of a flue in the back wall of a three-quarter span Pine stove and within 2 feet of the roof glass. The plants were fed liberally with top-dressings and artificial manure, &c. Moisture was applied to the roots three or four times a day during hot weather, including frequent waterings of liquid manure. The growths were kept well thinned out and stopped, the old wood being cut out from time to time to make room for young growths. Since the disease-resisting Cucumber has been introduced into market nurseries, the "spot" disease has practically become a thing of the past. In the fourth paragraph of Mr. Jenkins's article, he says "that, disastrous as the results of this fungal disease are, cultural errors are responsible for a loss equal, if not, indeed, greater, than that caused by the fungus," adding "this is all the more to be regretted, because it is preventable." The cultural errors referred to by Mr. Jenkins are the "uniform advice of Calendar writers to stop the leading shoots of the young plants at 3 feet or when they have reached the third wire." I fail to see anything wrong in this advice, seeing that Cucumber houses erected for market purposes are, as a rule, the same width and height. Mr. Jenkins avers "that young Cucumber plants should be allowed to grow unchecked until they have reached to within 1 foot of the ridge in a house

10 or 11 feet wide and 7 or 8 feet to the ridge." He considers stopping of the young plants to be "wrong in principle and in practice." Long experience convinces me that this principle is right, and that Mr. Jenkins is wrong. All engaged in growing Cucumbers for market stop the young plants at the third or fourth wire of the trellis, to induce the plants to send out fruit-bearing laterals and to bear fruit fit for marketing weeks earlier than would otherwise be the case, thereby obtaining higher prices for the earlier fruits. After an interval of a few days a fresh leader pushes from each plant, and this is stopped when it has attained to a length of about 2 feet. Fruit-bearing laterals follow this stopping in due course, and a few more wires of the trellis are clothed with healthy growths. In due time the young leading shoots are stopped once more midway between the top wire of the trellis, and within a short time the latter will become furnished throughout with healthy foliage and a profusion of young fruits in various stages. H. W. W.

ONIONS FOR MARKET (see p. 217).—I am surprised that the cultivation of such a profitable vegetable as the Onion is not carried out on a much larger scale than it is in this country. A. D. advises sowing the seeds in frames early in February, and afterwards transplanting the seedlings in their permanent quarters, 12 inches apart. Is this a better system than sowing the seeds in the open, 10 inches between the rows, and afterwards thinning to the same distance from plant to plant? Would the small Onions removed in thinning and sold as spring Onions for salads, &c., compensate for the extra labour and seeds. A. D. mentions the variety Ailsa Craig, and if that variety only were grown, his practice would be the best, for this Onion does best raised under glass and transplanted. But are there not other good varieties which, if cultivated as I suggest, would yield a crop quite equal in weight to that of Ailsa Craig grown as A. D. suggests? The expense of the frames is considerable. S. J. Martin, *Craig Wen Gardens, Menai Bridge, Anglesey.*

—The system of culture advocated by A. D., on p. 217, for the raising of large Onions for market, I carried into effect a few years ago. Ten tons of Onions were grown as described last week, the variety being Cranston's Excelsior. I found, however, that the only large demand for English Onions is in the case of those of the white Spanish type, such as Rowsham Park Hero, the best of that class perhaps. Instead of making £60 per acre, we realised no more than was sufficient to pay the expenses of planting-out, cultivating, harvesting, and burning those unsold. The Dutch growers flooded the market with Onions at £2 10s. per ton. In any case, white Spanish is the only type that should be sown in the open. Thomas Kitley, *Oldfield Nurseries, Bath.*

THE DECLINE OF WOODLAND INDUSTRIES.—It is correct, as Mr. Webster points out on p. 195, that rural industries are vanishing rapidly. In the case of underwood, this was formerly worth £6 per acre, but now 30s. is the top price. To spend time and labour in making the material into faggots is now useless, as there is little demand for them. Coal has superseded wood for brick burning and steam for bread baking. Hurdle-making is also a declining industry. The only remedy I can see is to clear the woods and grow more agricultural produce. Hop poles were in much demand a few years since, but many of the hop plantations have been grubbed up, whilst wire and coconut fibre string have largely superseded the use of poles as supports. Those who wish to grow timber for use on estates or for selling should plant Corsican Pines and Spruce Fir in batches by themselves in rows 5 feet by 4 feet. Keep the trees free from rank undergrowth and vermin. Remove the lower boughs as they die, and in 30 years' time much valuable material will be available for home use. E. Molyneux.

GRISELINIA LITTORALIS (see pp. 196 and 221).—Recently in a South Coast nursery I saw rows of well-grown plants of *Griseelinia littoralis* 4 feet high planted in a light soil killed by the recent frosts. The nurseryman was greatly regretting this mishap, as he had on his books numerous orders for this plant. E. M.

BERLIN INTERNATIONAL SHOW.

(See also page 232.)

APRIL 2-13.—The great international horticultural exhibition organised by the Prussian Horticultural Society was opened by their Imperial Highnesses the Crown Prince and Princess of Germany on Friday, April 2. Their Imperial Majesties the Kaiser and Kaiserin had visited the exhibition two days earlier and before the exhibits were perfectly arranged. In the following report we deal only with the exhibits in a general manner, indicating the most important features. No attempt is made to study each individual class or to enumerate all the prize-winners.

Another exhibition will be opened on April 7, composed of florists' exhibits, and it is expected that the Kaiser and Kaiserin will again visit the show on that day.

The three principal special prizes, namely, that offered by the Emperor, that by the Crown Prince, and the large exhibition Gold Medal offered by the Prussian Horticultural Society were awarded by ballot of all the jurors. The result of the ballot was as follows: The Emperor's prize for the best exhibit of culture in the show was given to Mr. DONNER, Tuttingen, for an exhibit of Carnations; the Crown Prince's prize for the best group in the show to Mr. ADOLF KOSCHEL, Charlottenburg; and the Society's large Gold Medal for the most decorative exhibit to the DUTCH BULB GROWERS' ASSOCIATION for their parterre of Hyacinths.

ORCHIDS.

For an international exhibition, the display of Orchids was disappointing. Germany was represented chiefly by Mr. OTTO BEYRODT, Berlin, whose speciality is the production of Orchid blooms for market. His group contained a collection of *Odontoglossums*, among which we noted some good forms of *O. excellens*, *O. formosum*, and *O. harvengtense*, some of the most useful of *Cattleyas*, and a number of well-flowered *Oncidium concolor*.

The chief collections came from Belgium, France, and England, that from F. LAMBEAU, Brussels, being by far the largest, and it contained a considerable number of the choicest kinds. Among his *Odontoglossums* were fine forms of *O. excellens*, *O. altum*, *O. crispum* J. N. Whiteley, *O. Lambeauianum*, bearing a spike of nine perfect flowers, *O. crispum* Von Armin Czicwen, and *O. crispum* Kronprinz Wilhelm, in which the whole flower is coloured deep chocolate brown, the sepals, petals and lip all having a narrow margin of white. Some first-rate varieties of *Cattleya Schröderæ*, *Miltonia Bleuana*, *Brasso-Cattleyas*, *Lælio-Cattleya Digbyana* crosses, *L.-C. Dominiana Kaiserin Augusta Victoria*, bearing a huge flower coloured rich rose purple, with an enormous crimson maroon lip; *Cymbidium insigne*, and *Cattleya nivea*.

From Mr. CHARLES MARON, Brunvy, came a large collection of choice Orchids, among which were many of his own hybrids, chiefly *Cattleyas* and *Lælio-Cattleyas*, and two large beautifully-flowered plants of *Cattleya intermedia alba*.

Messrs. CHARLESWORTH & CO. sent a small collection of their best, among which we noted two good varieties of *Odontoglossum Ossulstoni*, one bearing a spike with about 40 flowers, *O. Pescatorei* Duchess of Westminster, *O. ardentissimum virginale*, four *Odontodas*, *Cattleya Empress Frederic*, and various *Cypripediums* and *Brasso-Cattleyas*.

PALMS, FERNS, AND OTHER FOLIAGE PLANTS.

There were no very large collections of Palms, Cycads, &c., such as are seen at the great Belgian exhibitions, nor were there many exceptional specimens. The plants generally consisted of marketable specimens of convenient size for use in ordinary room decoration, and good in quality. The best collection of big specimens was exhibited by the SOCIÉTÉ ANONYME HORTICOLE, Ghent (Louis van Houtte Père). It contained many first-rate examples of Aroids, Cycads, *Dracænas*, Palms, and Bromeliads, as well as flowering plants such as Orchids and *Hippeastrums*, and, arranged across the end of the

great hall, the group was particularly striking. A collection of 50 Palms from FLANDRIA, Bruges, contained beautiful examples of *Phoenix Roëbelinii*, *Cocos*, *Rhapis*, and the yellow *Latania*. We have never seen better plants of *Cocos Weddelliana* than those shown by "LE LION," Ghent; they were from 3 to 6 feet high, and in perfect condition. There were very few collections from amateurs, the best being a large display of *Dracænas* shown by FRAU GEHEIMRAT SPINDLER, Spindlersfeld, who also showed a collection of *Crotons*, which were well grown, but poor in colour. *Nepenthes* were poorly represented, and the Ferns consisted chiefly of *Adiantums*, several groups of *A. tenerum* Farleyense being good in quality. Other Ferns were entirely of the easily-grown, popular market kinds. There were collections of *Rex Begonias* and *Caladiums*, but the plants were small and unfinished. There were groups of Palms, *Aspidistras*, and other foliage plants, which had been supplied by the Berlin florists and arranged as much for the purpose of embellishing the exhibition building as to show the kind of plants employed and the method of ar-

BORNEMANN, Blankenburg, also showed a fine group of *Clivias*. There were good collections of Bromeliads, but they were not fully in flower. The best groups were shown by Mr. FIRMIN DE SMET, Ghent. We were under the impression that these plants were specially favoured by German gardeners, and were therefore disappointed to find them so poorly shown by German exhibitors. The handsomest specimen Bromeliad was a magnificent example of *Tillandsia zebrina*, shown by Mr. FIRMIN DE SMET. *Begonia Gloire de Lorraine* was shown in the very pink of condition, perfect little specimens about 18 inches high and wide, and simply spheres of bloom. These came from Messrs. STRAHL & FALCKE, Berlin. Another group of equal merit came from Dr. BAARDSE, Aalsmer, Holland; the plants, although only about a foot high, were perfect examples of good cultivation, and consisted of the four best varieties, viz., *Caledonia*, *Lionel Rothschild*, *Turnford Hall*, and the type.

Anthuriums were exhibited by L. VAN HOUTTE PÈRE, Ghent, whose group of forms of *A. Scherzerianum* contained a selection

FIG. 99.—DUTCH BULB-GROWERS' EXHIBIT AT THE BERLIN SHOW.

range ment practised by the German decorators, among whom Messrs. J. C. SCHMIDT and ADOLF KOSCHEL are leaders. Of this character was an annexe of the building, which had been fitted up to appear like a conservatory and tastefully furnished with Palms, Azaleas, Ferns, Lily of the Valley, &c. An ornamental fountain, with coloured lights playing on the water, served to heighten the effect, which was decidedly German.

STOVE FLOWERING PLANTS.

Hippeastrums have become popular garden plants in Germany, and there were some large groups shown. Most of the seedlings were not of extra merit, falling short of the standard set by Col. Holford, Messrs. Ker & Son, Messrs. Veitch, and other home breeders and growers. The best collection came from "Labelliflos," Voorschoten, The Hague, whose group of 100 seedlings contained many that would hold their own among the best of those raised in England. L. VAN HOUTTE PÈRE also sent a collection of *Hippeastrums* of good average merit. *Clivias* were well shown, the quality of the flowers and size of the heads being first-class, but the plants were in every case limited to a single growth with one head of flowers. The best collection was from Messrs. STRAHL & FALCKE, Berlin, some of their seedlings being remarkable for colour and fullness of flower and for exceptional width of leaf. Mr. G.

of well-grown examples of the best varieties; from the same exhibitor came a group of hybrid Anthuriums of fair merit.

"DUTCH" BULBS.

The chief display of "Dutch" bulbs, by which term we mean such plants as Hyacinths and Tulips, was made in the second of the large halls.

As in the Casino building at Ghent, a bridge, from which views could be obtained of the whole exhibition, connects the two buildings. The bridge was covered with Spruce branches, somewhat too heavily to get the best effect, but, nevertheless, providing a good background for the exhibits as seen from the extreme ends. In front of the bridge in the second building was the chief display of bulbs. The collective exhibit of Hyacinths from the DUTCH BULB GROWERS' ASSOCIATION, and the exhibit of Tulips from Mr. E. H. KRELAGE, Haarlem, were arranged and planted in a design by Mr. F. J. Goemans, a Dutch landscape gardener and an old Kewite. The entire exhibit represented a terrace flower garden such as might be planted in front of a dwelling-house. The area thus covered was 360 square metres, and about 20,000 bulbs were employed in the decoration. The beds were planted with red, blue and pink Hyacinths of different shades, and the Tulips (Mr. E. H. KRELAGE) in round beds near

the margin of the greensward, which was somewhat inadequately represented by moss. The design also included two large oval beds of pink Astilbes (*Spiræas*), such as *Queen Alexandra* and others, contributed by Messrs. GEERT VAN WAVEREN & KRUYFF, Sassenheim. The general effect was exceedingly good, and gained for this firm the special prize offered for the most decorative exhibit in the entire exhibition.

The German exhibits of the same type were not displayed so well, and compared unfavourably with those from Holland.

ROSES.

The principal exhibits of Roses were made by Mr. ADOLF KOSCHEL, Charlottenburg. He had a large number of plants, disposed as if planted in a rosery, and representing standard plants and other forms of training, whilst the varieties included the most popular kinds for the purpose. Still, the cultivation was not equal to that which we see at home from such expert growers as Mr. Mount, of Canterbury. Mr. KOSCHEL was awarded most of the important prizes in this section, including a special prize for the best exhibit.

LILY OF THE VALLEY.

An exhibition in Berlin in April would certainly be incomplete if it failed to represent the industry in Berlin crowns of Lily of the Valley. This popular flower was not only well represented, but it could be seen in one form or another

GERBERA HYBRIDS.

Mr. R. ADNET, Cap d'Antibes, France, exhibited a most elegant and wonderful collection of varieties of Gerbera. In a recess in the gallery containing the more important of the French exhibits was a triangular bed, the floor of which was covered entirely with growths of *Asparagus Sprengeri* pegged down on the bed level. Thickly dotted over this green carpet were green tubes, each containing blooms of Gerbera and a spray or two of *Asparagus*. In the centre of the bed was placed a bamboo stand 6 feet in height, with receptacles from base to top furnished with flowers and greenery. The effect was delightful. But the chief interest lay in the large number of varieties displayed. From pure white there were shades all through yellow and orange-rose, red and rich crimson. A large portion of the space was devoted to one charming variety of a shade of rose or red and quite new to us as a tint in Gerbera hybrids. The first hybrids were raised by Mr. LYNCH in the Cambridge Botanic Garden, and Mr. ADNET obtained his first plants from Cambridge.

Mr. HENRY A. DREER, 714, Chestnut Street, Philadelphia, U.S.A., exhibited two plants of a new variety of *Nephrolepis exaltata*, known as "*Schöelzelii*." The pinnules were very plumose, but scarcely so congested as in *N. e. Todeoides* and some other earlier raised sorts.

Mr. FIRMIN DE SMET, Vinderhoute, near Ghent, Belgium, exhibited several fine varieties

and full as those of Pink Pearl and the individual flowers of similar form and size, their charm being enhanced by the colour of the buds, a rich red, which sets off the blush and pure white of the fully expanded flowers. Being hardy in England, this variety is certain to take a front place among *Rhododendrons*, whilst for forcing in pots it has every good quality. The same exhibitor sent a collection of hybrids from *R. Aucklandii*, one of which is exactly like Pink Pearl, with the margins of the petals elegantly crisped and waved. This unnamed seedling was labelled as having been "sold to Royal Gardens, Kew," so we may hope to see it later. There were numerous groups of the ordinary *Rhododendrons* from German, Dutch and Belgian raisers, but we saw nothing among them that may not be seen in the collections of English growers, and the plants, in size and finish, were inferior to many seen at a Temple Show. The principal exhibitors in addition to Messrs. C. B. VAN NES & SON, were T. J. SEIDEL, Dresden; Messrs. KOSTER & SON, Boskoop; RICHARD GÜNTHER, Berlin, and D. & J. KESSEN, Aalsmer, Holland.

AZALEAS.

The whole of the central area of the principal exhibition hall was filled with large groups of *Rhododendron indicum* (*Azalea indica*), the effect of which was magnificent. The principal exhibitor was Mr. T. J. SEIDEL, Dresden, the leading grower of Azaleas in Germany. His group of big standards contained many splendid examples, and as he grafts his Azaleas on *Rhododendron Cunninghamii*, they are characterised by vigour and, at the same time, looseness of growth, the heads being less table-like than those of the big plants grown by the Belgians. Other exhibitors were Messrs. OTTO PLATZ, Charlottenburg; STRAHL & FALCKE, Berlin; HENRICH KRÜGER, Rohrbeck; ADOLF KOSCHEL, Berlin; and LOUIS VAN HOUTTE PÈRE, Ghent. The last-named exhibitor sent a collection of 200 sorts, which fully maintained the reputation of the Belgian growers of Azaleas. In another part of the hall there were collections of smaller plants of Azaleas, such as the florists in Germany turn to account in making up baskets, &c., for room decoration.

Among new Indian Azaleas shown by Mr. T. J. SEIDEL was one labelled "*Herme*." This plant has semi-double or double flowers of clear pink colour, the petals being margined with white. It is a very attractive variety, and it is likely to become popular. The exhibit was purchased by an American grower.

CACTACEOUS PLANTS.

Most of the cactaceous plants were shown in a room, on the walls of which were scenes representing characteristic habitats of this type of plant. The specimens were not shown on a stage as pot plants, but the pots were plunged in moss litter or similar material, and, for the most part, were planted and grouped in the manner in which they occur in nature. But the most quaint were certainly the least natural examples, consisting of certain species with others grafted upon them. Amongst the chief exhibitors were Mr. JOH. WEISE, Somersfeld, Frankfurt; Mr. RICHARD TUCHTENHAGEN, Waidmannslust; RICHARD GÜNTHER, Friedrichsfelde, Berlin; and ALBERT WAGNER, Leipsic.

CARNATIONS.

The winter-flowering Carnations, for which valuable prizes were offered, were represented by large collections, including two from England, viz., those sent by G. LANGE, Hampton, and C. ENGELMANN, Saffron Walden. They were in fine condition, and, indeed, constituted one of the chief attractions of the exhibition. Souvenir de la Malmaison Carnations in pots were shown by GRAF MANFRED VON MATUSCHKA, Silesia. Though they were small plants, each bearing but one flower, they were, nevertheless, greatly admired, and received the Emperor's prize for the best exhibit in the show.

LILACS.

Among the plants that are forced for their flowers, the Lilac occupies a very important place in Germany. There were numerous large groups of plants from 3 to 5 feet high, well

FIG. 100.—REPRESENTATION OF THE ACHILLEION.
The Kaiser's residence in Corfu.

in almost all parts of the exhibition. Passing for the moment the smaller exhibits in the collections of miscellaneous plants, a word is deserved by the display of flowers made in a room in one of the galleries. Imagine a room measuring 40 feet by 70 feet filled with Lily of the Valley! The flowers were contributed by various growers, and for the greater part were forced in boxes in a similar manner to that practised by the market growers, and the boxes, packed closely together in the centre of the room represented a huge bed of flowers. At the sides of the room were pillars, globes and other fanciful shapes covered with the white, fragrant blossoms. This was effected by covering the shapes with moss held in place by wire netting and inserting the Lily crowns in the moss before forcing.

SOME NOVELTIES.

IMPATIENS HOLSTII NANA LIEGNITZIA.—A group of plants exhibited under this name by Mr. OSKAR OTTO, Leignitz, appeared quite distinct from the form of this species known as "*nana*" in this country. Each plant was in a 4-inch pot, and was not more than 6 inches above the top of the pot, yet in some cases there were 20 shoots, and each little specimen was perfectly covered with the fiery-red flowers. *I. Holstii* has been considered to have too coarse a habit, but in this variety it is entirely changed.

of *Vriesia*, one known as *V. Mdle. Suzanne de Smet*, obtained from a cross between *V. mirabilis* and *V. van Geertii*, was remarkable for the richly coloured bracts; the flower had not expanded, but this hybrid and others will be valuable.

CORDYLINA (DRACENA) BRUANTII VARIEGATA is a plant we saw at the Ghent Show last year. Mr. EMIL VERCAUTEREN, Melle-lez-Gand, Belgium, showed two dozen plants, which varied in size from 6 inches high in 3-inch pots to 3 feet in 7-inch pots. The variety is one of very great merit, most of the leaves are green with liberal variegation of yellow, and the brown tint of *C. Bruantii* is seen in the youngest leaves. It is a perfect plant for vase ornamentation, but we are informed that the variety, which originated as a sport, is very apt to revert to the type. Probably, the beautiful plants now exhibited were selected from a very large batch.

RHODODENDRONS.

The best exhibits in this section were from the Dutch growers, and Pink Pearl was a long way ahead of everything else, the plants being large and well grown and beautifully flowered. What is known as White Pearl was shown in lovely condition by Messrs. C. B. VAN NES & SON, Boskoop, Holland. This proves to be a much better *Rhododendron* than had hitherto been supposed, the trusses being quite as large

furnished with foliage and sturdy racemes of flowers in perfect condition, the whites being quite equal to the coloured forms. The Dutch growers had also sent quantities of Lilac, both plants and cut flowers. The art of forcing Lilac so that the flowers do not lose in substance and are all open at the same time does not appear to be known in England, at any rate, we have not seen such examples of forced Lilacs as are to be met with in Berlin.

MISCELLANEOUS GROUPS.

Mr. OTTO BEYRODT, Berlin, made an elaborate display with Japanese dwarf trees backed by Rhaps and other Palms, and arranged more or less on the plan of the Japanese garden, with stone lanterns, bronze cranes, and other figures disposed among the Conifers, Acers, &c.

Mr. L. SPÄTH, Berlin, arranged a collection of hardy Conifers, Rhododendrons, and other evergreens to enhance the effect of the painted scene which occupied the whole of the stage back and represented the house and garden of the Emperor at Corfu.

A novelty at horticultural exhibitions consisted of a collection of tropical economic plants sent by Mr. LOUIS VAN HOUTTE PÈRE, Ghent, who has for many years cultivated most of the plants which are grown in tropical countries for their fruits, medicines, fibres, and other properties.

Mr. E. NEUBERT, Wandsbek, near Hamburg, showed a large ground exhibit containing Palms, Azaleas, and forced Lily of the Valley. The

crowns and roots of various ages, as well as fruits and cleaned seeds of Asparagus, Lettuces, Cauliflowers, indeed, most kinds of vegetables and salads. There were good examples of forced Lilac, flowering plants of Tree Carnations, &c.

MM. VILMORIN, ANDRIEUX ET CIE., Paris, had a bed planted with a good strain of Cineraria, but not better than may be seen in England. Mr. B. CARRIAT, Antibes, showed the best Carnations, and Mr. L. FÉRARD, Paris, had a group of plants of double-flowered Daisies (*Bellis perennis*), some of whose blooms had a diameter of 2½ inches, but were of a heavy, somewhat unattractive appearance.

Mr. G. DEBRIE, Paris, exhibited some imposing decorations with *Lilium speciosum*.

EXHIBITS AND VISITORS FROM ENGLAND.

It has been stated already that Messrs. CHARLESWORTH & Co., Bradford, sent a fine exhibit from England. Mr. C. ENGELMANN, Horneybrook Nursery, Saffron Walden, contributed a grand lot of Carnation blooms, exhibiting these in several classes and gaining prizes.

Another exhibit of Carnations was sent by Mr. G. LANGE, Hampton, Middlesex, who also gained prizes.

Messrs. H. CANNELL & SONS, Swanley, Kent, had an exhibit of flowers of their choice Zonal Pelargoniums, including the following varieties: Berlin and Vesta (scarlet), Snowdrop (white), Sydney (pink), Mauretania (white, with pink

Some of the plants, including several shown in a glass-covered case, are the most developed of any of this type we have seen. The flowers are circular in outline, and 4 inches across. The petals are duplicated, and the colour of a particularly fine variety is pink, with deep crimson "eye."

Mr. H. KIAUSCH, Nurseryman, Zehlendorf, Berlin, showed a large number of Cyclamens as part of a varied exhibit. The Cyclamens were in groups, with the effect that they appeared to be planted in scroll-like beds, around which many small plants of *Adiantum cuneatum* represented a greensward. A variety of Cyclamen, similar in tint to what is known in this country as "Salmon Queen," has larger flowers than this type, and is a distinctly good variety.

PRIMULA OBCONICA.

This plant was shown, like the Cyclamens, in great groups, and in excellent quality. The strains were among the most developed we have seen, the flowers surpassing in size and colour anything yet exhibited in London. Some of the flowers have a colour similar to that of Crimson King in *Primula sinensis*, and the variation is becoming as great as in the Chinese species. Some of the best collections were contributed by the following exhibitors:—Mr. BENJAMIN NIEMETZ, Rixdorf, Berlin, Mr. GEORG ARENDS, Ronsdorf, L. FÉRARD, Paris, Messrs. STRAHL & FALCKE, Berlin, and Mr. J. MENSING, Aalsmer, Holland.

FRUITS AND VEGETABLES.

Hardy fruits constituted one of the surprising features of the exhibition. Although the season was so late, table after table contained hundreds of dishes of Apples, Pears, and Quinces. At no time have we seen such a large display in England at a similar season of the year. Reference has already been made to fruits and vegetables contributed by the French growers, and emphasis should also be laid upon the exceedingly creditable nature of the exhibit of hardy fruits made by the city authorities of Berlin. The Pears and Apples were uncommonly good, and the high quality was maintained throughout a very extensive exhibit. The fruits of Ribston and Cox's Orange Pippins, for instance, were sufficiently good to exhibit at any place in the world.

A collection of Apples and Pears from Holland contained some fruits which had probably been kept in cold storage. It would be difficult otherwise to account for the excellent specimens of Beurré Diel Pears still in perfectly sound condition. Of Apples, we noticed fruits of Cox's Pomona and Bismarck equal to any seen in England. The Dutch growers also contributed a large exhibit of vegetables, including many varieties of Cabbage, Leeks, Carrots, Kale, Beet, Brussels Sprouts, Radishes, Endive, and Turnips. Lettuces were very fine, and they were staged as growing. Cucumbers were remarkably good, and included specimens of the white-fruited variety.

In numerous competitive classes there were, in addition to those we have noticed, a very large number of fruits of most excellent quality.

ROYAL HORTICULTURAL.

APRIL 6.—At the fortnightly meeting held on Tuesday last, practically the whole of the available space in the Hall was fully occupied by varied, bright and beautiful groups. Forced spring-flowering shrubs constituted one of the finest features and were staged magnificently by several growers. Exhibits of Roses and Carnations were not numerous, but the quality was especially fine. Orchids were handsome and varied in character. A magnificent display of these plants by Messrs. ARMSTRONG & BROWN received a Gold Medal.

The FLORAL COMMITTEE granted three Awards of Merit to novelties; the ORCHID COMMITTEE gave four First-class Certificates and five Awards of Merit; whilst the FRUIT and VEGETABLE COMMITTEE granted an Award of Merit to a variety of Rhubarb.

At the 3 o'clock meeting in the lecture-room the Rev. Geo. Henslow lectured on the "Effects of the Forces of Growth."

Floral Committee.

Present: Mr. W. Marshall (Chairman), and Messrs. C. T. Drury, J. Green, G. Gordon,

FIG. 101.—THE GREAT HALL, BERLIN EXHIBITION.

word Neubert is formed across a groundwork of *Nephrolepis Whitmannii*.

Mr. F. HENKEL, Nurseryman, Darmstadt, the only exhibitor of aquatic plants, had a very interesting collection, most of the species being shown in great glass jars.

Mr. WILLIAM PFITZER, Stuttgart, showed varieties of *Begonia semperflorens*, including Pfitzeri, Triumph and others varying in their colours, but apparently of good habit for bedding purposes. His *Myosotis* "Ruth Fischer" and Zonal Pelargonium "Wilhelm Pfitzer" are also novelties.

Mr. HEINRICH KRÜGER, Berlin, exhibited Polyantha Roses and standard plants of *Genista fragans*.

SOME OF THE FRENCH EXHIBITS.

We have already referred to some of the French exhibits, including Orchids from M. MARON, and the Gerberas from M. ADNET. Another important contribution from France consisted of fruits, vegetables and salads exhibited by various growers. The fruits included excellent samples of Black Alicante, Gros Colmar and other varieties of Grapes, including many of the vineyard sorts in addition to the choice dessert kinds. In addition to Grapes, there were ripe Cherries of extra good quality, ripe Pineapples, Figs and Plums—ripe, although staged on March 31. Considerable quantities of forced Asparagus of various kinds, also

marking), Naples and Sir F. Hanbury (crimson), Paris Shell (white, with picotee edge), and Cactus Prince (a single, red variety, with narrow petals). The only other exhibit from England was a collection of plant illustrations from the *Gardeners' Chronicle*, Ltd.

The following gentlemen officiated as judges: William Watson, Stuart H. Low, Louis Sander, S. T. Wright, and R. Hooper Pearson.

Sir Daniel Morris, K.C.M.G., attended as a member of the deputation from the Royal Horticultural Society, but Mr. Harry J. Veitch, who was also appointed in the same capacity, was unable to travel to Germany owing to indisposition.

CYCLAMENS.

We have never seen Cyclamens better exhibited than at Berlin. There were numerous exhibits of big groups, and but little to distinguish one collection from another so far as quality is concerned. First prizes have been won by the following exhibitors:—Mr. F. SCHNEIDER, Potsdam, J. C. SCHMIDT, Erfurt (four 1st prizes), H. KIAUSCH, Berlin, and OTTO PLATZ, Charlottenburg. Most of these collections and others that gained 2nd and even 3rd prizes represented excellent strains of this popular greenhouse flowering plant.

Mr. J. C. SCHMIDT, Erfurt, showed a strain of fringed Cyclamens, known as the "Rokoko."

J. Douglas, J. F. McLeod, J. Jennings, W. Howe, H. J. Cutbush, C. Dixon, A. Turner, C. E. Pearson, W. P. Thomson, E. H. Jenkins, W. J. James, J. Hudson, G. Paul, C. R. Fielder, W. J. Bean, J. W. Barr, and R. C. Notcutt.

Messrs. J. VEITCH & SONS, LTD., Chelsea, arranged an attractive group of shrubs, in which *Pyrus floribunda* *atrosanguinea*, *P. Malus Scheidekeri*, *Prunus triloba*, *Forsythia suspensa*, *Wistaria sinensis*, *Laburnum vulgare*, and *Cytisus præcox*, with *Rhododendrons caucasicum album*, *Blanche Superbe*, and *Mons. Thiers* were conspicuous. Plants of *Azalea indica* sent from the Chelsea nursery were magnificently flowered and made a blaze of colour. *Civias*, *Anthuriums*, *Boronias*, *Gerberas*, *Hippeastrums*, and the blue *Hydrangea Hortensia* were also well shown by Messrs. VEITCH & SONS. (Silver-gilt Flora Medal.)

Mr. F. Anderson (gr. to Mrs. C. BISCHOFFSHEIM, Warren House, Stanmore) contributed a number of well-grown and flowered plants of *Lachenalia tricolor*. (Bronze Banksian Medal.)

Handsome-leaved *Caladiums* were the feature of a group sent by Messrs. J. PED & SON, West Norwood. Many of the leading varieties were represented, and the foliage was beautifully coloured. This firm showed also groups of Alpines in pots, and a few Cacti. (Silver Banksian Medal.)

Messrs. R. WALLACE & Co., Colchester, exhibited one of the miniature rockeries which have become so popular at exhibitions. *Fritillarias*, *Anemone pulsatilla*, *Daphne Cneorum majus*, *Iris reticulata*, *Primula rosea*, *Viola gracilis*, and various *Crocuses* helped to make a bright and interesting display. (Silver Flora Medal.)

The flowering shrubs arranged by Messrs. W. M. PAUL & SONS, Waltham Cross, were wreathed in blossoms. *Pyrus angustifolia* fl. pl., *P. Scheidekeri*, *Ceanothus Veitchianus*, and *Pyrus Malus floribunda*, were especially fine. A few *Camellias* added interest to the group. (Silver Flora Medal.)

One of the handsomest exhibits in the Hall was a group of forced shrubs arranged by Messrs. R. & G. CUTBERT, Southgate. The plants were varied, splendidly grown and grandly flowered. There were *Wistarias*, *Lilacs*, *Azaleas*, *Pyrus*, *Magnolias*, *Laburnums*, and several other kinds. (Silver-gilt Flora Medal.)

Mr. L. R. RUSSELL, Richmond, arranged a group of much interest, for it was practically restricted to single and double *Lilacs*. All the best varieties were shown in splendid condition, and the plants varied considerably in shape. (Silver Banksian Medal.)

Messrs. H. B. MAY & SONS, Upper Edmonton, showed a small but interesting group of Ferns. *Polypodium Knightiæ*, *P. Mayi*, *P. hastæfolium*, with several *Davallias*, *Lomarias* and *Adiantums* were noticeable. Miniature *Roses* in pots came from the same firm, and included *Phyllis*, *Mdme. Lavasseur*, *Princess Ena*, *Baby Dorothy*, and *White Pet*. Messrs. MAY also showed a few *Clematises*, and the scented-leaved *Pelargonium Clorinda*. The fragrance is sweet and the flowers fine. (Silver Flora Medal.)

Mr. H. C. PULHAM, Elsenham, Essex, arranged a small rockery, in which were seen a few plants of interest. Mr. J. T. Tubbs (gr. to Miss ALEXANDER, Oakbank, Seal, Sevenoaks) sent cut *Roses*, *Mignonette*, and *Violas*, all well grown and delightfully fragrant. (Silver Banksian Medal.)

Mr. W. H. PAGE, Tangle Nursery, Hampton, arranged a most artistic group of *Carnations*, *Roses*, and *Liliums*. There were splendid *Carnations* including *Red Lawson*, *White Lawson*, *Britannia*, *My Maryland*, *Enchantress*, *Mrs. T. W. Lawson*, and *Winsor*. The *Roses* included *Mrs. W. J. Grant*, *Frau Karl Druschki*, and *Captain Hayward*. (Silver Flora Medal.)

The Misses HOPKINS, Mere Gardens, Shepperton, arranged a bright miniature rockery of Alpines. Flowers of *Primulas*, *Fritillarias*, *Hepaticas*, *Anemones*, *Primroses*, and *Daisies* were charming. (Silver Banksian Medal.)

Single *Cinerarias*, arranged in blocks of distinct colours, were contributed by Messrs. SUTTON & SONS, Reading. The plants were clean and healthy, and carried splendid flowers. This firm sent also three hybrid *Freesias* that were distinct and fragrant. (Silver Banksian Medal.)

The rock plants shown by Messrs. G. JACKSON & SON, Woking, were not numerous, but these were excellently grown and flowered. The blue *Primrose* was very fine, as were *Primula denticulata*, *Scilla sibirica*, *Arabis alpina* with variegated foliage, and single white and blue-flowered *Hepaticas*. (Silver Banksian Medal.)

The plants shown by Messrs. PAUL & SON, The Old Nurseries, Cheshunt, were few in numbers, but of interest. Fine features were *Roses Lady Godiva* and *Snowstorm*, *Deutzia gracilis carnea*, *Cytisus Daisy Bell* and *C. Firefly*, with *Daphne Mezereum atro-rubrum* and *D. M. Paul's Snow White*.

Messrs. R. GILL & SONS, Falmouth, sent a wonderful collection of trusses of *Rhododendrons*, all from the open. The varieties were numerous and the quality very fine.

A bright feature of the varied group arranged by Mr. G. REUTHE, Keston, was a central mass of fine *Rhododendrons*. *Hepaticas*, hardy *Primulas*, and *Saxifragas* were also interesting, and all the plants were well grown. (Silver Banksian Medal.)

A considerable number of grandly-flowered plants of *Primula verticillata* were shown by Sir EVERARD HAMBRO, Hayes Place, Hayes (gr. Mr. Grandfield).

Mr. ROBERT SYDENHAM, Tenby Street, Birmingham, contributed a charming group of *Narcissi*, *Freesias*, *Hyacinths*, and *Lily of the Valley* grown in moss fibre.

Messrs. CARTER, PAGE & Co., London Wall, arranged a bright exhibit of *Pansies* and *Violas*. The varieties were numerous and the colours rich.

Winter-flowering *Carnations* in grand form were staged by Messrs. HUGH LOW & Co., Bush Hill Park. Some of the finest varieties were *White Perfection*, *Helen Gould*, *Britannia*, *Winsor*, *Harlowarden*, *Jessica*, *Beacon*, *Black Chief*, *Enchantress* and *Mikado*. The same firm sent also splendidly-grown *Erica persoluta alba*, *Boronia megastigma*, *Acacia Drummondii*, and *A. armata*, with other plants and *Roses*. (Silver Flora Medal.)

Pyrus malus floribunda, *Wistaria sinensis alba*, *Prunus triloba*, *Azaleas* in variety, *Cerasus Watereri*, *Lilacs* in variety, and *Magnolia Haleana* were conspicuous in one section of the group arranged by Messrs. W. CUTBUSH & SON, Highgate. The second section was devoted to hardy plants, including *Primulas*, *Hepaticas*, and many others. A third group from this firm was composed of winter-flowering *Carnations* in variety. Some of the best were *The President*, *Enchantress*, *Marmion*, *Victory*, *Britannia*, *White Perfection* and *Robert Craig*. (Silver-gilt Banksian Medal.)

THE GUILDFORD HARDY PLANT NURSERY, Milmead, Guildford, displayed *Ericas*, *Hellebores* and other hardy plants in variety.

Mr. GEORGE PRINCE, Lougworth, Berks., had some beautiful *Roses*, including *Prince de Bulgarie*, *Mrs. Sophia Neate*, *Maréchal Niel*, *Antoine Rivoire*, *Climbing Mrs. Grant*, *Catherine Mermet*, *Richmond* and *Lady Roberts*. (Silver Flora Medal.)

Messrs. H. CANNEL & SONS, Swanley, contributed a collection of *Begonias*, among which were *B. manicata aureo maculata*, *B. nitida*, *B. gigantea rosea* and *B. Erfordia*. The same firm displayed *Star Cinerarias*, *Grey Friar*, and *Gem of the Stars*. (Silver Banksian Medal.)

Messrs. T. S. WARE, LTD., Feltham, arranged a rockery containing *Spiræa confusa*, *Anemone fulgens Suttonii*, *Saxifraga Elizabethæ*, *Fritillaria aurea*, *Chionodoxa sardensis*, *Primula denticulata alba*, *Hepaticas* and many others. (Silver Banksian Medal.)

Rambling *Roses* from Messrs. FRANK CANT & Co., Braiswick Nurseries, Colchester, made a very attractive group. Some of the brightest were *Mrs. F. W. Flight*, *Leuchtstern*, *Aglaiä*, *Trier*, *Joseph Billard* and *Debutante*. (Silver Banksian Medal.)

Major LISTER, Haywards Heath (gr. Mr. F. Baker), sent a small but magnificent group of *Hippeastrums*. (Silver Banksian Medal.)

Messrs. G. & A. CLARK, LTD., Dover, had a rockery in which were growing hardy plants of dwarf stature with a few taller-growing subjects of interest.

Messrs. WHITELEGGE & PAGE, Chislehurst, contributed a bright collection of splendidly-grown *Cyclamen latifolium*.

Mr. H. BURNETT, Forest Road, Guernsey, sent some superb *Carnations*, including *Enchantress*, *Fortuna*, *Britannia*, *White Perfection*, *Mikado* and *Marmion*. (Silver Flora Medal.)

Messrs. BAKERS, Wolverhampton, had a miniature rockery containing several bright and interesting Alpine plants. (Bronze Flora Medal.)

GROUP OF CARNATIONS.

Competition was invited for a group of winter-flowering *Carnations* to cover an area of not less than 100 square feet. The class was open to amateurs only. The only exhibit was arranged by Mr. A. T. PASKETT (gr. to E. H. JOHNSTONE, Esq., Burr's Wood, Groombridge). This group received the premier award, which included the Veitch Memorial Medal, the R.H.S. further honouring it with a Silver Banksian Medal. Some of the best varieties were *Enchantress*, *Rose-pink Enchantress*, *Sarah Hill*, *Afterglow*, *Beacon*, *White Perfection*, *Britannia*, and *Mrs. T. W. Lawson*.

AWARDS.

Hippeastrum Marcus (J. VEITCH & SONS, LTD.).—A deep crimson variety of perfect form. (Award of Merit.)

Hippeastrum magnificent (R. KER & SON).—Rich crimson centre, with cream-coloured, reflexed tips to the segments. (Award of Merit.)

Saxifraga apiculata alba (GUILDFORD HARDY PLANT NURSERY).—A pure white form of a well-known plant. (Award of Merit.)

Narcissus Committee.

Present: Mr. H. B. May (Chairman), and Messrs. W. Poupert, J. Walker, J. Jacob, W. A. Milner, G. W. Leak, G. Reuthe, C. Dawson, A. M. Wilson, R. Sydenham, H. A. Denison, F. H. Chapman, P. D. Williams, E. M. Crosfield, W. W. Fowler, A. R. Goodwin, C. T. Digby, E. A. Bowles, R. W. Wallace, P. R. Barr, H. Backhouse, J. de Graaff, J. D. Pearson, A. Kingsmill, W. Goldring, and C. H. Curtis.

Miss F. W. CFREY, Lismore, Co. Waterford, staged a beautiful collection of *Narcissi*, including representatives from practically all sections. An incomparabilis flower named *Tita* was most attractive, owing to the brilliance of the colouring in the crown.

Messrs. JAS. CARTER & Co., High Holborn, constructed a rock-garden, in which the occupants were practically all bulbous plants. By far the finest feature was the splendid central group of *Daffodil King Alfred*.

The lateness of the season was exemplified in the groups of *Daffodils*. These were comparatively few in numbers, but Messrs. BARR & SONS, Covent Garden, made an excellent display with many of the most popular varieties and a few novelties. The same firm sent a small group of *Hellebores* and boxes of Alpine plants in bloom. (Silver Banksian Medal.)

A very charming group of *Narcissi* was arranged by Messrs. CARTWRIGHT & GOODWIN, Blakebrook, Kidderminster. Very fine were *Brigadier*, *Castele*, *Orangeman*, *Evangeline*, *Weardale Perfection*, *Beacon*, *King Alfred*, *Citron*, *Cresset*, and *Crown Prince*. (Silver Flora Medal.)

Messrs. LILLEY'S, Guernsey, arranged a group of *Narcissi* in considerable variety, with beautiful crown *Anemones*.

Mr. CHARLES DAWSON, Rosemorran, Gulval, Penzance, sent a considerable number of seedling *Narcissi*, several of which were of decided promise, and also some named varieties. (Silver Banksian Medal.)

Tulips constituted the outstanding feature of the group from Messrs. R. H. BATH, LTD., Wisbech. *Chionodoxas* in variety were also splendidly shown from the same source.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), de B. Crawshay, H. Little, W. Boxall, J. Forster Alcock, F. J. Hanbury, W. Waters Butler, H. J. Chapman, W. P. Bound, F. M. Ogilvie, R. G. Thwaites, W. H. Hatcher, J. Cypher, J. Charlesworth, H. G. Alexander, H. A. Tracy, H. Ballantine, A. Dye, Gurney Wilson, J. Wilson Potter, and W. Cobb.

The most notable exhibit in the Hall was a group of Orchids staged by Messrs. ARMSTRONG & BROWN, Tunbridge Wells. The exhibit extended the entire width of the Hall, and it was awarded a Gold Medal. The centre of the group was composed of fine plants of *Cymbidium Woodhamsianum*, *Odontoglossum Ossulstonii*, *O. amabile*, *O. ardentissimum*, and fine forms of *O. crispum*, among which were several good blotched forms. On either side of these were selections of good hybrid *Dendrobiums* and varieties of *D. nobile*. There were also about 200 finely-flowered plants of the pure white *D. nobile virginale*.

Col. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander), exhibited *Dendrobium Magda magnifica* (*Melanodiscus Rainbow* × *nobile nobilium*), *Cattleya Robert de Wavrin* (*Schilleriana* × *Schröderæ*), and others. (See Awards.)

Messrs. CHARLESWORTH & CO., Haywards Heath, were awarded a Silver Flora Medal for a select group in which was a magnificent plant of *Cœlogyne pandurata*; also several varieties of *Odontioda Lutetia*, a very dark form of *Lælio-Cattleya Dominiana*, L.-C. Marathon, *Odontoglossum Lambeauianum*, and other *Odontoglossums*, *Brasso-Cattleyas*, *Phaius Norman*, *Trichopilia suavis*, and the white *T. Backhousiana*, &c.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was voted a Silver Flora Medal for a group in which the best plants were *Odontoglossum Lambeauianum* Goodson's variety—a very dark form, and a new *Odontioda*. (See Awards.) The rest of the group was comprised of good *Odontoglossums*, *Cattleyas*, *Odontioda Bradshawia*, &c.

Messrs. J. & A. A. McBEAN, Cooksbridge, secured a Silver Flora Medal for a group of fine *Odontoglossums*. In the centre was a plant of the richly-blotched *Odontoglossum crispum* *Ashworthianum*, appearing in better form than ever before seen. Other good blotched forms of *O. crispum* and a superbly-flowered specimen of *O. fascinator* were also noticed in this group.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a group in which were *Odontoglossum Rolfeæ album*, a very remarkable white form of this favourite hybrid; *Cattleya Schröderæ Princess Mary of Wales*, and C. S. Magali Sander, both handsome novelties, *Angræcum sesquipedale*, some good *Odontoglossums*, *Lælio-Cattleyas*, &c.

Messrs. JAS. VEITCH & SONS, Chelsea, showed a group in which fine forms of *Cattleya Schröderæ* were prominent. With these was a grand variety of *Brasso-Lælio-Cattleya Veitchii*; also the fine *Cypripedium Countess of Carnarvon*. (Silver Flora Medal.)

Mr. A. W. JENSEN, Lindfield, Haywards Heath, was awarded a Silver Banksian Medal for a selection of his fine type of *Cattleya Schröderæ* and some blotched forms of *Odontoglossum crispum*.

Messrs. HUGH LOW & CO., Enfield, were awarded a Silver Banksian Medal for a group containing *Dendrobium crassinode*, *D. primum*, *D. Jamesianum*, *Cattleya Schröderæ*, one named "Ayesha" having a violet-purple zone on the lip.

Monsieur MERTENS, Mont St. Amand, Ghent, was awarded a Silver Banksian Medal for a group of showy hybrid *Odontoglossums*, including varieties of *O. percultum*, *O. amabile*, *O. laudatum*, *O. Lambeauianum*, *O. Lawrenceanum*. This exhibitor also displayed a plant of the white *Cattleya Suzanne Hye de Crom*.

R. G. THWAITES, Esq., Chessington, Streatham (gr. Mr. Black), showed a fine selection of varieties of *Dendrobium Thwaitesiae*, *D. Chessingtonense*, and other yellow hybrid *Dendrobiums*.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), again showed the superb *Odontoglossum triumphans Lionel Crawshay*; also a selection of his pretty hybrid *Odontoglossums*.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed two plants of the fine white *Cœlogyne Sanderæ*, each with three flower-spikes; *Lycaste Smeeana*, *Maxillaria variabilis*, and the very singular *Megaclinium Bufo*. (See Awards.)

Messrs. J. CYPHER & SONS, Cheltenham, staged a group of showy *Dendrobiums* and other Orchids.

Major LISTER, Warninglid Grange, Haywards Heath, showed a good variety of *Cymbidium insigne*.

J. S. MOSS, Esq., Wintershill, Bishop's Waltham, sent *Odontoglossum Kenchii* (*O. Kegejani* × *O. Denisonia Mossia*), an attractive cream-white flower speckled with chestnut-brown.

J. FORSTER ALCOCK, Esq., Exhims, Northchurch, sent *Cypripedium Chapmanii nigrescens* and C. Wm. Lloyd *superbum*, both darker in colour than other forms.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Cattleya Trianae Marie Fedorovna*, a very charming silver-white flower, slightly tinged with lavender colour, and with violet front to the lip. It is a very distinct and beautiful flower of fine shape.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed *Odontoglossum Arnoldii*, a beautiful hybrid of unrecorded parentage, and allied to that previously shown as *O. caloglossum*. The sepals and petals are of a deep claret-brown colour, with silver margin; the lip marbled with purple. Also *O. crispum Winnie*, a good blotched variety.

J. S. BERGHEIM, Esq., Belsize Court, London, showed *Megaclinium falcatum*.

W. THOMPSON, Esq., Walton Grange, Stone (gr. Mr. Stevens), exhibited *Odontoglossum crispum Harryanum Regina* and *O. Ossulstonii nigrum*, both very finely flowered.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya Schröderæ The Baron, from Col. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander).—An unique variety, which had previously secured a First-class Certificate, but which was withdrawn on account of a flower not being available for sketching. The plant is illustrated in the *Gardeners' Chronicle*, June 3, 1905. The peculiar salmon-orange disc of the lip contrasts finely with the Peach-blossom tint of the flower.

Odontoglossum percultum Cookson's variety, from NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr. Mr. H. J. Chapman).—A model flower with broad segments that are heavily blotched with claret-purple colour.

Cattleya Schröderæ Irene, from Mr. A. W. JENSEN, Lindfield.—A noble flower, delicately tinged with lilac, the very large, fringed lip having a deep yellow disc.

Odontioda Ernest Henry (O. Queen Alexandra × O. Noezliana), from H. S. GOODSON, Esq.—A fine novelty nearest to *O. Charlesworthii*, but having deep mahogany-red flowers with orange crest.

AWARDS OF MERIT.

Odontoglossum Dreadnought (Prince Albert × Sceptum), from Messrs. SANDER & SONS.—Flowers large, yellow, heavily marked with reddish-brown, the crimped yellowish labellum having a large chestnut brown blotch.

Odontoglossum Sylvia Westonbirt variety (cirrhosum × Rolfeæ), from Colonel G. L. HOLFORD (gr. Mr. H. G. Alexander).—A pretty hybrid of the *O. elegans* form with yellowish flowers blotched with chocolate-purple.

Odontoglossum crispum Angela, from NORMAN C. COOKSON, Esq. (gr. Mr. H. J. Chapman).—A large flower, heavily blotched with purple.

Cattleya Schröderæ Alexandra James, from W. JAMES, Esq., West Dean Park, Chichester.—Flowers large, blush white, with orange disc to the lip.

Lælio-Cattleya Frederick Boyle var. Kerchova.—Flowers uniformly blush white. From Sir TREVOR LAWRENCE, Bart.

BOTANICAL CERTIFICATE.

Megaclinium Bufo.—A very remarkable, large species, with a stout, upright inflorescence, the upper part of which is a blade-like rachis, densely spotted with purple and bearing up the mid-ribs a single row of curious brownish flowers on either side.

Polystachya rhodoptera.—A slender species, bearing on the upper part short spikes of yellowish flowers tinged with rose. Both shown by Sir TREVOR LAWRENCE, Bart., K.C.V.O. (gr. Mr. W. H. White).

Fruit and Vegetable Committee.

Present: Mr. George Bunyard (Chairman); and Messrs. A. H. Pearson, C. G. A. Nix, H. S. Rivers, J. Harrison, A. Dean, E. Beckett, F. Perkins, A. R. Allan, J. Davis, J. Lyne, G. Hobday, G. Kelf, J. Jacques, O. Thomas, J. McIndoe, G. Wythes, J. Vert, W. H. Divers, and P. D. Tuckett.

Messrs. J. VEITCH & SONS, Chelsea, exhibited several splendid specimens of Lettuce Veitch's Golden Queen, also French Frame Black Crêpe, a particularly fine Cabbage variety. This firm also included in its group Radishes Extra Early Forcing Turnip, Early Gem and French Breakfast as well as Cucumber Veitch's Sensation. (Silver Banksian Medal.)

A splendid collection of Oranges was exhibited by Messrs. THOS. RIVERS & SON, Sawbridgeworth. There were plants in flower and fruit, as well as gathered fruit of many varieties, including Egg, Brown's, St. Michael's, Navel, White, Seville, Acbilles, Sustain and Excelsior. There were also Citrons in grand condition. (Silver-gilt Knightian Medal.)

Mr. T. E. DAWES, Syderstone, King's Lynn, showed Rhubarb Challenge—a variety of immense length of petiole and rich colour.

Mr. F. HARVEY (gr. to the Rt. Hon. Lord MONSON, Burton Hall, Lincoln) exhibited some choice Apples, including Beauty of Kent, Cox's Orange Pippin, Bramley's Seedling, Lane's Prince Albert, King of the Pippins, and several others. (Silver Banksian Medal.)

Messrs. SUTTON & SONS, Reading, staged a collection of Lettuces, including Golden Ball, French Tom Thumb, Nonesuch, Improved Tom Thumb, Early Paris, Commodore Nutt and Little Gem. The same firm also showed seeds of garden Peas. (Silver Banksian Medal.)

AWARDS.

RHUBARB CHALLENGE (*T. E. Dawes*).—A grand variety for early use. The stalks are long, thick and exceptionally rich in colour. (Award of Merit.)

COLLECTION OF SALADS.

There was a competitive class for a collection of three salads, two varieties of a kind being permissible. Mr. E. Beckett (gr. to the Hon. VICARY GIBBS, Aldenham House, Elstree, Herts.) was the only exhibitor, and received the premier prize. There were Lettuces Sutton's Forcing, and Sutton's Golden Ball, Radish Sutton's Forcing, French Breakfast, Cucumber Sutton's Peerless, Onion, Mustard, Cress and Chicory.

Obituary.

BENJAMIN SIMONITE.—We regret to record the death of this well-known florist at 38, Derwent Street, Park, Sheffield, on March 29. Mr. Simonite was a most successful cultivator of Auriculas, Carnations, Picotees, and Tulips. Brought up to follow his father's craft—that of a table-blade forger—he worked with Messrs. Joseph Rodgers & Sons, Sheffield. His delight, however, was to be amongst flowers, and he retired from table-blade forging some 28 years ago, and gave his entire attention to his favourite occupation. His success in the raising and cultivating of Auriculas was phenomenal. "The workman florist," as he was occasionally called, raised his flowers under difficult conditions, his garden being in one of the most smoke-ridden districts of Sheffield. Amongst the many excellent Auriculas which he raised was the beautiful green-edged Rev. F. D. Horner. Talisman was also raised by him, and, later still, James Hannaford, which at its best may be regarded as a green George Lightbody. Frank, often called Frank Simonite, grey edge, Heather Bell, white edge, Mrs. Douglas, a charming blue self, and Ruby, a fine red self, are other noted Auriculas raised at Rough Bank. Mr. Simonite pursued his occupation up till about three weeks ago, when he was taken ill and gradually sank, death taking place early on Monday, March 29. He was 74 years of age, and is survived by a son and daughter.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending April 6.

A cold and dry week.—The last two days have been moderately warm for the time of year, but previous to this the day temperatures were rather low. The nights were all cold, and on each of them the lowest temperature indicated by the exposed thermometer was below the freezing-point. On the coldest night 13° of frost were registered. The ground is at the present time 1° colder than is seasonable, both at 1 and 2 feet deep. No rain has as yet fallen this month. The ground, however, still remains moist below the surface, as small amounts of rain water still continue to come each day through both percolation gauges. The sun has shone on an average during the last 6 days for nearly 7 hours a day, or for 2½ hours a day longer than is usual at this period of April. On the sunniest day the record amounted to nearly 11½ hours. Light airs have, as a rule, prevailed, the direction being principally some point between north and east. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by as much as 14 per cent.

MARCH.

Very cold and extremely wet and sunless.—This was the coldest March since 1901, or for eight years. The days proved, as a rule, much more unseasonably cold than the nights. Again, the first half of the month was very cold, whereas during the last twelve days the temperature, particularly at night, was above the average for the time of year. On the warmest day the temperature in the thermometer screen rose to 57°, which is a very low extreme maximum for March. On the other hand, on the coldest night the exposed thermometer indicated 19° of frost, which is the lowest extreme minimum temperature in March for 12 years. Rain, snow, or hail fell on as many as 23 days, and to the aggregate depth of 9½ inches—which is 1½ inches in excess of the average for the month. In the last 54 years there have been only four other Marches with as heavy a rainfall. The sun shone on an average for only 2 hours 18 minutes a day, which is 1 hour 24 minutes a day below the March average, and the smallest record for that month during the last 23 years. This was on the whole a calm month. In fact, on the one very windy day the mean velocity for the windiest hour only reached 19 miles—direction W.S.W. The average amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by 9 per cent.

OUR UNDERGROUND WATER SUPPLY.

With March, came to an end the winter half of the present drainage year. The total rainfall for those six months fell short of the average quantity by nearly 5 inches, which is equivalent to a loss of 111,070 gallons on each acre in this district. At the same time last year there was an excess of 54,970 gallons per acre. *E. M., Berkhamsted, April 6, 1909.*

ANSWERS TO CORRESPONDENTS.

ANTS: *H. K.* Ants may be destroyed by pouring boiling water in their burrows. The fumes of bisulphide of carbon or vaporite will also destroy them. An arsenical poison prepared by Messrs. Alex. Cross and Son, Glasgow, known as the Ballikinrain Ant Destroyer is to be recommended.

APPLE-GROWING IN ENGLAND FOR PROFIT: *A. S., Cincinnati, U.S.A.* The conditions of Apple-growing in this country and in America are totally different. We do not advise you to come back from America in the hopes of making a successful venture of Apple cultivation. In the first place, the cost of production in this country is very much greater than in America, chiefly because of rent, rates, and taxes. Although it may appear that the carriage would account for a great loss of profit in shipping from America to England, this is not so, as fruit is brought thousands of miles by sea almost as cheaply as we can send it to various parts of our own country. The reason why American Apples are so largely imported into this country is that they arrive at a season when the home crop is finished, and, as Apples have always a demand here, they meet with a good market.

BRANCHES OF SHRUBS FOR FLOWERING IN WATER: *D. Mason.* Branches of the following shrubs, if cut in winter and placed in a warm greenhouse, with their ends in water, will furnish a display of blossoms:—Flowering Almonds, Peaches, Cherries, and Plums, notably *Prunus cerasifera* var. *atropurpurea* (syn. *Pissardii*), *P. triloba* flore pleno, and *Pyrus floribunda*. The common Apple, Pear, Peach, Cherry, and Plum may also be treated in the same manner. Other plants suitable are *Daphne Mezereum*, *Staphylea colchica*, *Magnolia*, *Spiræas*, *Cornus Mas*, *Dentzia gracilis*, and *Lilacs*. Keep the shoots in a warm, dark place, with their ends in warm water, till the flower-buds are prominent, when they should be brought into the light. Change the water at intervals. In addition to splitting the stems, the outer bark near the base of the shoot should be removed in order to expose some of the xylem or water-carrying tissue.

EVERGREEN AMPELOPSIS (VITIS): *Warsash.* There are no hardy, evergreen species of Ampelopsis, but there are several tender, evergreen species of Vitis, one of which may be the one to which you refer. Botanically, Ampelopsis is a synonym of Vitis. The following species are evergreen, but they all require the protection of a plant house:—*V. antarctica*, *V. capreolata*, *V. hypoglauca*.

FLOWER SHOWS IN 1909: *Australian.* You will find the dates of all the important London and provincial flower shows given in our Almanac published with the issue for January 2. The most important exhibitions in London are held by the Royal Horticultural Society. Other exhibitions are held in the Royal Botanic Gardens, Regent's Park. Important provincial shows include those at Shrewsbury, Birmingham, York, Wolverhampton, Hanley, and Saltaire.

FOREIGNERS AND THE R.H.S.: *G. B., Clermont-Ferrand.* Fellowship of the Royal Horticultural Society is open to persons of all nationalities. A foreigner may exhibit plants at the Society's meetings. They should be sent to the secretary, carriage paid, and be despatched so as to reach the officials a day before the show. Only in very exceptional circumstances does the Society undertake to return plants sent from abroad, per the secretary, for exhibition.

GRUBS IN SOIL: *A. Richmond.* The grubs are young "leather jackets," or the larvæ of the common crane-fly. If they are attacking root crops or herbaceous plants, we would recommend the application of Paris Green (poison) at the rate of 3 ounces to 20 gallons of water. The roots around the crown of the plant should be thoroughly soaked, and the mixture kept well stirred. Try the effect on a few plants first, and, if found successful, apply the mixture to the whole crop. The usual method of trapping with squares of turf placed in the ground near infested plants has met with a certain amount of success, as also has the application of Kainit.

IRISH YEW FROM SEEDS: *J. S. H.* The Irish Yew is generally increased by means of cuttings or by grafts, but it can be raised from seeds. A percentage of the seedlings develop the fastigate form, the remainder reverting to the common Yew. As a rule, the seeds germinate freely, but they sometimes require 12 months to do so. You should experience no difficulty in growing a common Thistle in a pot. Obtain an ordinary flower-pot, fill it with moderately heavy soil, and sow the seeds.

LIQUID MANURE: *A. B.* Weight for weight, animal urine is twice or three times as rich in plant-food as are the solid excrements. For example, the urine of the horse contains, per ton, 42 lbs. of nitrogen, 33 lbs. of potash, and 17 lbs. of lime. The urine of the cow contains 11 lbs. of nitrogen, 31 lbs. of potash, and 3 lbs. of lime. The urine of the pig is the weakest of the animal manures, and contains, per ton, but 8 lbs. of nitrogen, 4 lbs. of potash, 1 lb. of lime, and 29 lbs. of phosphoric acid. On comparing these figures, it will be seen that neither the urine of the horse nor cow contains any phosphoric acid, while that of the pig contains a large quantity. In common practice, therefore, it is advisable to mix 4 ozs. of superphosphate to each gallon of urine, then to dilute the whole with three times the quantity of rain-water. Liquid manure has a powerful influence upon all vegetable life, and should, therefore, be applied to garden vegetables just after a rainfall. There can be no question that the time of active growth in both roots and branches is the proper time for using liquid manure, and for fruit-bearing plants when the fruits are beginning to swell, that is, soon after they are set. Another point of importance is that, as a rule, the slower growth a plant naturally makes the less able is it to utilise strong liquid manure. A good dose of weak liquid manure applied once a week in the active growing season is much better than strong manure applied at longer intervals.

MOSS: *D. R.* The moss is a very common and abundant species, *Brachythecium purum* (syn. *Hypnum purum*). The synonym is the older and better-known name. It is useful for placing over crocks in seed boxes before filling them

with soil, as it assists the free formation of roots in the seedlings. This moss does not absorb water so readily as Sphagnum, and is not to be recommended as a substitute for Sphagnum in Orchid culture.

NAMES OF PLANTS: *A. B.* 1, *Lonicera Standishii*; 2, *Prunus Laurocerasus* var. *colchica*; 3, *Tsuga canadensis*; 4, *Picea orientalis*; 5, *Libocedrus decurrens*; 6, *Cupressus sempervirens* var. *A. C.* Scented-leaved Pelargoniums: 1, *tomentosum*; 2, *radula*; 3 and 4, *crispum major*; 5, *crispum minor*; 6, *ardens minor*; 7, Mrs. Kingsbury; 8, Pheasant's foot; 9, Purple Unique; 10, Scarlet Unique; 11, *quercifolium* var.; 12, Prince of Orange. You send more than six. A small donation to the R.G.O.F. would be appropriate.—*R. B., Cork.* 1, *Goldfussia isophylla*; 2, send in flower; 3, *Bryophyllum calycinum*; 4, *Platyloma flexuosa*; 5, *Peperomia argyrea*; 6, *Abutilon Savitzi*; 7, *Asparagus virgatus*.—*J. G.* 1, *Cupressus Lawsoniana erecta viridis*; 2, *Andromeda floribunda*; 3, *Elaeagnus pungens medio-aurea*; 4, *Berberis stenophylla*; 5, *Diplopappus chrysophyllus*; 6, *Cornus Mas*.—*J. W.* *Diplopappus chrysophyllus*.—*J. M.* *Cornus Mas*.—*H. J. W.* 1, *Cœlogyne flaccida*; 2, *Dendrobium nobile*; 3, next week; 4, *Sparaxis grandiflora*; 5, *Cupressus funebris*.—*India.* 1, *Cirrhopetalum Roxburghii*; 2, *Aerides odoratum*; 3, *Oberonia* species (send again when in flower); 4, *Aerides multiflorum* (roseum); 5, *Rhynchostylis* (*Saccolabium*) *retusa*; 6, The bulb resembles *Hæmanthus*, send when in flower.—*N. E. B.* *Franciscea Hopeana*.—*R. H.* 1, *Oncidium flexuosum*; 2, *O. barbatum*; 3, *Masdevallia triangularis*; 4, *Pleurothallis rubens*; 5, *Polystachya pubescens*; 6, *Ada anrantiaca*.—*Foveman.* 1, *Odontoglossum triumphans*; 2, *Oncidium candidum*; 3, *Pteris tremula*.

NUMBER OF PLANTS KNOWN TO SCIENCE: *X. Y. Z.* It is probable that upwards of 200,000 species of plants are known, and of this number it is estimated that 136,000 are flowering plants.

PLANTS FOR PLACING BETWEEN STEPPING STONES: *A. H. T.* The following is a list of plants suitable for growing between stepping stones:—*Arenaria balearica*, *Alyssum montanum*, *Antennaria dioica*, *Arabis procurrens*, *Armeria alpina*, *Aubrieta deltoidea* var. *Campbellii*, *Aubrieta deltoidea* var. *taurica*, *Bellium bellidioides*, *Campanula pulla*, *Campanula Portenschlagiana*, *Cotula squalida*, *Draba aizoides*, *Draba bruniaefolia*, *Erinus alpinus*, *Gentiana acaulis*, *Geum montanum*, *Hypericum reptans*, *Linaria alpina*, *Lysimachia nummularia*, *Mazus pumilio*, *Mesembryanthemum pomeridianum*, *Mesembryanthemum pyropeum* *Nocca alpina*, *Papaver alpinum*, *Paronychia argentea*, *Phlox subulata* vars., *Polygonum capitatum*, *Pratia angulata*, *Saxifraga hypnoides*, *Sedum album* or *S. anglicum* or *S. dasyphyllum*, *Veronica Teucrium* var. *dubia*, and *Waldsteinia trifolia*.

SEAKALE FOR A PERMANENT BED: *Anxious.* Seakale plants which have been forced may be used for making a permanent bed; but these will not be nearly so satisfactory as young crowns. If you decide to plant the old stools, the roots should be cut off level at the crown, and, as the shoots develop, all but the strongest should be removed. *Cerastium tomentosum* is the one usually employed for carpet bedding.

VIOLAS AND CALCEOLARIAS: *Anxious.* *Violas* and *Calceolarias* should be planted where they are intended to flower by the end of April. For both plants it is best to select a position where they will be shaded from the sun for a couple of hours during the middle of the day.

WEED IN LAWN: *T. S.* The plant is one of the *Cerastiums*, probably *C. alpinum*. Apply nitrogenous manure to the lawn. These will favour the growth of the Grasses, and they will in time crowd out the weeds.

PERPETUAL-FLOWERING CARNATIONS.

CONTRARY opinions are sometimes expressed as to the behaviour of certain varieties of tree or perpetual-flowering Carnations; the two English-raised sorts, Mrs. H. Burnett and Britannia, in particular have been much discussed. Many growers complain that these varieties being so subject to disease (*Helminthosporium echinulatum*), it is better to discard them altogether in favour of others having stronger constitutions. I am bound to admit that these sorts are particularly liable to this fungus disease, but it may at least be useful to relate my own experience with them, and I do so in the hope that it may prevent others from ceasing to cultivate them, for they are admittedly very charming varieties. The best way to preserve these sorts from disease is to keep the plants under glass at all times, or, failing this, they should be placed in such a position out-of-doors that they can be easily protected from rains and ungenial weather. Exposure to rains is the most frequent cause of failure. The usual practice, especially with plants required to flower during winter, is to place them out-of-doors as soon as they have become established in their flowering pots. This practice I have followed myself, but

have always housed them again before the advent of autumnal rains. Last year we housed our plants in the middle of August, and they were thus preserved from the torrential rains experienced in the latter part of that month and in September. The plants have succeeded so well since that time, I feel certain it is due mainly to this one point in their culture. But I have further reason for believing that indoor culture is essential in the case of the two varieties already mentioned. We have plants here that were placed out-of-doors during the summer of 1907. These were not taken indoors until nearly the end of September, and they quickly showed signs of disease. I have no faith in the many advertised remedies and therefore every infested leaf was picked off the plants and destroyed by burning. This treatment caused the plants to appear very shabby for that season, but it was persevered with, and in the following season (1908) the plants being continuously in bloom, they were kept under glass. At the present time there is no disease noticeable on these old plants. Some younger plants that were placed out-of-doors as usual, have again suffered to a much greater extent than other varieties. These young plants in their turn will be kept inside during the coming season, and I feel sure they will rapidly improve in condition.

Out-of-door treatment in this country is not likely to be so successful as it has proved in the United States. Whether the more humid condition of the atmosphere in these Isles has something to do with it or not, the fact is impressed on me by the study of the collection under my own charge. Not only does this and that variety succeed better, but all the plants improve in the second season if they remain under glass. The blooms I send the Editor along with this note were obtained from old plants that have been continuously under glass for the last 18 months. [These were excellent examples.—EDS.]

Another mistake that inexperienced cultivators make is that of over-manuring their plants. Carnations do not require anything like the amount of manure sometimes given them in the early stages of growth, but it is admitted that when the pots are full of roots, and the plants in robust health, artificial manure may be given in small quantities, and the results will justify the treatment.

After several years' experience with them, I find that some of the earliest varieties are still the best. Lady Bountiful (pure white), though not so solid and heavy as White Perfection, is an exquisitely-formed flower, and is very free; I do not find White Perfection so good in these respects. Harlowarden, crimson, is still the best of its colour, and its general behaviour here is very satisfactory.

Hannah Hobart, not often seen on the showboards, is a very good grower, and it produces blooms of exquisite form, with rounded edges. It is deeper in shade than Mrs. T. W. Lawson and is more effective when seen in artificial light than in daylight. Jessica, one of the best of the flaked varieties, is a splendid grower, as are also Aurora and Oriflamme, of the same class.

Longer experience with Nelson Fisher confirms my earlier experience that this variety is not a good doer, though I am aware it succeeds well with some cultivators. Floriana, though small, has a good habit, and

produces excellently-formed flowers, but it is not so suitable for blooming in winter as some varieties. Plants of Lord Rosebery make straggling growth, but this variety has good crimson blooms. Neither Aristocrat nor Elliott's Queen have succeeded here as we expected them. Winsor is a beautiful variety, but dwarfer in habit than most others. Fair Maid has a very floriferous habit, and the colour of the flower is a beautiful shade of pink; it is not suitable for exhibition. Enchantress and its various sports are always favourites. Neither White Lawson nor Reliance are particularly good in this collection. Mikado, being a deep shade of heliotrope, is a favourite colour with many. Robert Craig makes satisfactory growth, and the flowers are bright scarlet. Flamingo and Crusader are also good scarlet varieties. Concerning some of the newer varieties complaints are made that the blooms are thin, but many of these varieties will be likely to improve under cultivation. Any plants of these winter or perpetual-flowering Carnations that become leggy may be cut back to the old wood. If the roots are kept rather dry the old stems will produce an abundance of young shoots in the course of a few weeks, and they can be grown into large plants for another season. Such treatment may be desirable in cases of rare or valuable varieties. J. G. Weston.

ORCHID NOTES AND GLEANINGS.

CŒLOGYNE PROLIFERA.

ALTHOUGH not a showy species, this rare *Cœlogyne* has interesting features. The pseudo-bulbs, which are nearly as large as those of *C. cristata*, are distantly placed on a stout, scaly rhizome, and bear one or two petiolate, lanceolate leaves. The inflorescence rising from the apex of the mature pseudo-bulb is about 9 inches in height and clothed with closely-fitting bracts on the upper part, from which the flowers proceed, after which the bracts are shed, leaving those not furnished with flowers still in position. The flowers, which are 1 inch across, have rather broadly-lanceolate, light sepia-brown sepals, and narrow, linear, abruptly-recurved petals. The base of the lip and column are white, with the same greenish-yellow tint which suffuses the whole flower; the front is sepia brown, with a narrow yellow margin, two elevated lines running from the base. It flowered with Mr. James O'Brien.

CATTELEYA TRIANÆ "MARIE FEODOROVNA."

CATTELEYA TRIANÆ varies more than any of the large-flowered Cattleyas in the colour of its flowers, and if any importation is of the best type, all are worth growing. But the proportion of distinct forms worthy of varietal names is small, and hence the great value of good ones. Under the above name, one of the most charming forms is blooming in the gardens of Francis Wellesley, Esq., Westfield, Woking (gr. Mr. Hopkins). It is an ideal florists' flower, all the segments being broad and regularly arranged. The sepals are white; the petals, which, when expanded, are 7 inches from tip to tip and nearly 3 inches wide, are silvery white, without any trace of colour when placed in the shade, but showing a faint lavender tint when looked at in a bright light. The base of the lip is white and the front violet, with a slight rose shade; the disc is orange-coloured, with thin white lines. It is very interesting, but expensive, to make a collection of these fine varieties of Cattleya. O'B.

RIBES MENZIESII.

This elegant little species of Ribes is a true Gooseberry with an armature much more formidable than that of a Red Rough variety. The flowers are not showy, but they persist until the crimson berries have nearly attained their full size. It is a native of North-west America, growing 4 to 6 feet high, and quite hardy in this country. The generic name Ribes has been displaced by Grossularia by some American botanists.

Ribes Menziesii is recorded as having been introduced into Great Britain in 1830, and there is a figure of a flowering branch in the *Botanical Register*, 1847, vol. xxxiii., plate 56, bearing this name; but Mr. Coville, author of a recent monograph of the genus, cites it for this species with a doubt. The small crimson flowers are represented as borne in twos and threes. *W. B. H.*

COLONIAL NOTES.

AN ENGLISH GARDENER IN KELOWNA.

WE have received the following communication from Mr. Charles E. Stiff, late gardener to Sir Daniel F. Goddard, Oakhill, Ipswich:—"My wife, family, and myself have spent nearly a year in this lovely orchard city of the Far West. Kelowna is comparatively a new city; its name means 'Grizzly Bear.' About 60 years ago there was a French Roman Catholic mission in the district. The members subdued the Indians, intermarried with them, and turned these hunting grounds of the Rocky Mountains into a cattle ranch. We are situated 1,100 feet about sea level, on a flat tableland of 35 square miles, sheltered by surrounding Rocky peaks and Selkirk ranges. English settlers started a fruit-growing industry. The trees were brought on the backs of mules, and this district finally developed into one of the noted fruit lands of British Columbia. Much of the 35 square miles of this rich fruit land is already under cultivation, and the cultivation is of the highest order. The spraying, cleansing, training, and pruning of the trees are extraordinarily well done. The amount of sunshine is very great, and the mountain air is bracing. The natural irrigation by seepage of mountain spring water, which percolates through tablelands to the Okanagan Lake, causes the trees to grow splendidly. Plum and Apple trees make branches averaging some 10 feet; whilst the leaves are large, clean, and of a rich, dark green, reminding one of highly-fed Chrysanthemums. Fruit is produced in such abundance as I have never before witnessed. A severe thinning of the fruits of all trees is carried out, the result being handsomely-coloured fruits of great size and colour. I feel some pride because trees I pruned produced the two boxes of Apples (Grimes' Golden) which won the 1st prize at Spokane, U.S.A., and were sold in the show for \$25 each. The boxes contained 40 lbs. weight each. We grow Apples, Pears, Plums, Prunes, Grapes, Peaches, Apricots, Nectarines, Quinces, Strawberries, Tomatos, Melons, Cucumbers and all ordinary vegetables, and Indian Corn, which is eaten largely whilst green. The Japanese Plums and Prunes in some 15 varieties have afforded me this last season an interesting study. I have inspected various orchards, and find that the trees have not suffered from cold, notwithstanding the temperature has been as low as 14 degrees below zero. The very dry climate, the incessant sunshine, and constant care of the trees in disbudbing and thinning, secures hard, ripened wood that frost fails to harm. Kelowna is a city corporate, with mayor, town council, aldermen, and about 1,500 people. We have our cargo and passenger boats on the lake. The city is lighted by electricity; there are waterworks, a fire brigade, brickfields, cement works, saw-

mills, cigar factories, two newspapers, four churches, hospital, &c. The lake covers an area of four miles by two miles, and is really a bay of the much larger Okanagan Lake. As regards the labour market, there are no opportunities for emigrants, excepting a few first-class mechanics." *Charles E. Stiff, Kelowna, Okanagan Valley, British Columbia.*

PLANT NOTES.

HIPPEASTRUM PARDINUM.

ALTHOUGH there exists many excellent garden hybrids of Hippeastrum, some of the true species are well worthy of inclusion in a collection. Hippeastrum pardinum is an exceedingly pretty and most distinct member of the family. It is one of the Veitchian introductions, having been sent home by their collector, Richard Pearce, while travelling in South America in the autumn

which the different forms of Hippeastrum are still known in many gardens. In the same year that it first flowered, namely, 1867, *H. pardinum* was distributed by Messrs. Veitch at a price of two and three guineas each. It is interesting to note that another new plant of that year was *Oplismenus Burmannii*, a popular variegated Grass, sent out as *Panicum variegatum*, which is the name still generally applied to it. Hippeastrum pardinum was soon employed by the hybridist in the production of new varieties, but it was never extensively used for that purpose. The Supplementary Illustration to the *Gardeners' Chronicle*, April 27, 1907, portrays the variety Queen of Spots, raised by the late Dr. Bonavia, of Worthing. This was the result of a cross between *H. pardinum* and a garden variety. The influence of the first-named parent can be plainly seen in the progeny.

The cultural requirements of *H. pardinum* are much the same as those of the ordinary forms.

FIG. 102.—RIBES MENZIESII: FLOWERS AND FRUITS CRIMSON.
From specimens supplied by Mr. Smith, Newry.

of 1865. This Hippeastrum first flowered at Chelsea in the spring of 1867, and was distributed into commerce in the same year. At the time of its blooming, it was thus described in the *Gardeners' Chronicle*, March 30, 1867:—"It is perfectly distinct from all known kinds of Amaryllis, and is remarkable for its form, which is spreading, with scarcely any tube, so that the whole inner surface is displayed, and for its colour, which reminds one of the spotted varieties of Calceolaria or Tydæa, so closely is it covered with small dots, more or less confluent, of crimson red on a cream colour ground."

Although this was written 42 years ago, it is just as applicable now as it was then, and very little can be added thereto. The markings of the flower show a considerable amount of variation, some flowers having the red portion disposed in small blotches rather than dots. To this form the varietal name of *superbum* has been applied. It will be noted that the plant was at first referred to as an Amaryllis—a name by

CALCEOLARIA BURBIDGEI.

WELL-FLOWERED standards of this plant were exhibited at the meeting of the Royal Horticultural Society on March 23, which demonstrated how valuable the plant is for grouping purposes in a greenhouse. *Calceolaria Burbidgei*, as is generally known, was raised by the late Mr. F. W. Burbidge, at Trinity College Gardens, Dublin. Its parentage is rather a puzzle, for Mr. Burbidge, with whom I have discussed the matter many times, always regarded it as a hybrid between *C. deflexa* (*C. fuchsiae* of gardens) and the strong-growing *C. Pavonii*. I pointed out the resemblance between the hybrid and the well-known *C. amplexicaulis*, and stated that, judging by appearances, I should select this species and *C. Pavonii* as the parents. Mr. Burbidge said this could not be the case, as *C. deflexa* was the seed-bearer. The *Kew Hand List* agrees with my theory, as it is thus recorded: "*Calceolaria Burbidgei*, garden hybrid, *amplexicaulis* × *Pavonii*." *W.*

THE ROCK GARDEN.

THE WAHLENBERGIAS.

This genus of Campanulaceæ was named in honour of George Wahlenberg, of Upsala, the author of *Flora Laponica*. Our native species, *Wahlenbergia hederacea*, was formerly known as *Campanula hederacea*. It is a pretty, creeping plant, preferring a cool, lightly-shaded position, its natural habitat being a damp position amongst short grass and other herbage.

Most species of *Wahlenbergia* succeed well in gardens, and are free in flowering. Any difficulties experienced in their culture can generally be traced to unfavourable positions and faulty planting. They require the protection of a stone or rock, placed so as to direct the water to their roots, and yet to protect the foliage from actual contact with the damp soil. The rooting-medium should be rich in plant food and of a good depth, liberally mixed with stone chips and some crushed chalk. Into this staple the roots readily enter, for they will always find it moist during periods of drought. Ample drainage must be provided when preparing the site. In spring a light top-dressing is beneficial, whilst in autumn a quantity of crushed stone placed around the collar of the root-stock lessens the danger of decay from damping. Provided that these conditions are obtained, then a hot, sunny position is best. Do not allow any coarse plant to encroach upon them. Their habit is very dwarf, therefore plant them so that they will be seen to the best advantage when in flower. The following species are some of the most suitable for garden purposes:—

WAHLENBERGIA SERPYLLIFOLIA (SYN. *CAMPANULA SERPYLLIFOLIA*) (see fig. 103).—The growths of this species form a miniature carpet, and develop small Thyme-like leaves. Each prostrate shoot terminates in a solitary, purple-violet, bell-shaped blossom, upturned to the sky. It is a charming plant, especially when in flower in June.

WAHLENBERGIA PUMILIO is a silvery-leaved plant, requiring full exposure to sunshine. It forms a tufted mat of close-set stems, having narrow, pointed, silver leaves. From the shoots arise the big, upturned, pale purple flowers, the inflorescences being solitary. The plant is beautiful either in or out of flower, as the foliage is conspicuous by reason of its silvery-grey appearance.

WAHLENBERGIA SERPYLLIFOLIA VAR. DINARICA (SYN. *PUMILIORUM*) (see fig. 104).—This is a larger and less neat-habited plant than either of the foregoing. The plant flowers with great freedom, producing numbers of its solitary inflorescences from the middle till the end of June. The foliage is long, narrow, and less silvery than that of *W. pumilio*, and forms a loose mat of grey leafage.

WAHLENBERGIA DALMATICA.—A species having purple-violet flowers, formed in terminal, crowded heads. The foliage is long, narrow, and pointed, the leaves from the root-stock forming small rosettes.

WAHLENBERGIA GRAMINIFOLIA.—This species resembles *W. dalmatica* in the clustered flower-heads, which, in this instance, are purple. The leaves are narrow and grass-like.

WAHLENBERGIA TENUIFOLIA.—A distinct species, though generally confounded with *W. dalmatica*.

WAHLENBERGIA KITABELII is the only other species common in gardens. Both *W. tenuifolia* and *W. Kitabelii* belong to the group having terminal clustered flower-heads, and in either plant the colour of the flowers is a shade of purple.

All the species and varieties are extremely sensitive to the effects of damp in winter. Slugs are exceedingly partial to the crowns and young leaves in springtime. *Thomas Smith, Walmsgate Gardens, Louth.*

DEFORESTATION IN NEW ZEALAND.

(Concluded from page 226.)

WHEN once we leave the coast-line the soil is poorer, the surface soil decreases as the watershed is reached, and there are the bare, brown sheep runs again over the plains and the outlying ranges, which run up from 4,000 to 5,000 feet.

Not a tree is to be seen, except small groups of Poplars and Willows, which mark distant stations, and the inspiring *Discaria*, associated with *Olearia virgata* of less pronounced habit, but with pleasing, sweet-scented flowers.

FIG. 103.—WAHLENBERGIA SERPYLLIFOLIA: FLOWERS PURPLE-VIOLET.

As we ascend higher, say, to 1,500 or 2,000 feet, *Aciphylla Colensoi* becomes an important constituent of the "herbage," and occurs in association with *Epilobium tenuipes*, *Vittadinia australis*, *Tillæa purpurata*.

Very striking is the total absence of herbaceous leguminous plants from the native flora. *Carmichaelia Petriei*, a wiry shrub whose branches were chewed down to white, fibrous tufts by grazing animals, occurred sparsely, but the Clovers of European herbage would not grow in such conditions, where alien plants are limited to what we should call weeds of dry places, and are transported by sheep.

These plains, thanks to the agency of man, run up to the foot of Mount Cook, and, as far

FIG. 104.—WAHLENBERGIA SERPYLLIFOLIA VAR. DINARICA: FLOWERS PALE LAVENDER PURPLE.

as I could make out, they constitute the sub-alpine meadows of New Zealand ecologists. Older settlers assured me that many finer varieties of grass have been burnt out, which is not surprising, owing to annual fires, together with the constant grazing by sheep and rabbits.

All the way from Lake Pukaki to Lindis Pass the soil had become so acid that in many places it only grew *Rumex acetosella* and *Raoulia aus-*

tralis, the latter an invaluable plant, but one that was pointed out to me with contempt as disdained by sheep, and even by rabbits.

It forms a flat carpet of Axminster texture, often two or three yards in circumference, grey green in colour, studded by its yellow, rayless, composite flowers. The root system is extraordinary, every branchlet produces roots, and every node sends down long anchor roots, besides the primary one. There could be no better agent for binding shifting shingle or forming a humus layer on old river beds and terraces. The mass of black soil about its often-charred remains testifies well to the plant's pertinacity, as well as to the settler's scorn.

From Omarama, where the desert-like *Acæna Buchanani* abounds, many beautiful streams are passed, but their banks are as devoid of vegetation as their waters are teeming with trout.

It is a three days' drive from Mount Cook to Lake Wanaka, and for the whole way there is no native tree to be seen. I was told there was "bush" in the "back country," so that it must once have existed in the front, but this country of huge sheep runs, where every station has to keep a gang of rabbiters, tells its own tale. Deer have also been introduced, and are increasing to a large extent, much to the disgust of the run holders, whose property is all leasehold; for where there is little enough for the sheep and rabbits, the deer are naturally not welcome guests. Round about Lake Hawea and on the Clutha river, where farming is carried on, expensive deer-fencing is not an acceptable charge to the occupiers. In the Cromwell plain *Hypericum gramineum* and *Gentiana antipoda* were the only striking native plants; both species afford evidence of poor soil, and there was nothing to suggest a richer spring flora.

At Lake Wanaka, one of the most charming of the large lakes of the South Island drainage system, there was the same baneful deforestation, sheep-run bareness and poverty of soil. The mountains in the background show up green, for the runs have not got so far back yet, the country being practically unexplored. *Hypericum gramineum* and *Pimelea sericeovillosa*, a cushion of hairiness, as the name implies, were very general. Around Pembroke introduced trees were growing freely.

Again, from Wanaka to Queenstown, up the tedious Cardrona valley and over the Crown range at an altitude of 4,000 feet, nothing but Tussock and *Aciphylla Colensoi* is seen as the level rises. Dropping over the range, the general deforestation reveals the interesting glacial terminal moraines of Lake Wakatipu, and some farms show up green on the apparently unpromising slopes of the Remarkables.

The mountains surrounding Lake Wakatipu, the deepest and largest of the Southern Lakes, are all bare and recall the Alpes Maritimes of the even nearer mountains of Savoy and Dauphiné.

In deeper gulleys the bush has survived, the green lines forming a grateful contrast to European eyes, but all round the lake a greener fringe shows the Bracken area, which marks what was formerly forest. Some woods which still clothed the slopes at the head of the lake were burnt down during my stay there through the carelessness of trippers. It is now necessary to go 11 miles up the Dart Valley to Paradise before reaching virgin forest. Here tree-clad valleys radiate out, making a beautiful contrast with the snow-capped summits, but tourists are plentiful there every year, and the sheep farmers are gradually encroaching.

South of Lake Wakatipu are Lakes Te Ano and Manipouri which form part of the great Government reserve, and their welcome forest growth is consequently protected. It is, however, the steepest of granite country, and an excessive

rainfall, by encouraging a perfect covering of luxuriant moss alone, permits the growth of trees in the crevices and fissures.

Down the Clinton and Arthur Valleys this covering, with the trees and ferns it holds together, can be seen washed off in sheets during heavy rains, and the granite walls which line these narrow valleys are one series of cascades, providing a magnificent sight. Avalanches also sweep the slopes in winter, continually necessitating the alteration of the track to Milford Sound. Such country could not pasture a goat, much less a sheep, and no economic factors have been sacrificed by its reservation, as it would be impossible to treat it even as a forest reserve, though as a sanctuary for the undisturbed perpetuation of the flora and fauna of the country, it is admirably adapted.

Forest Officers, who replant as necessity arises. But India is in the happy position of being able to treat questions of national importance from a scientific rather than a party standpoint. In New Zealand the Government alone can act in the matter, as for economic reasons the private owner is helpless and the mere occupier different. Labour costs 10s. a day, and is difficult to obtain at that, therefore private enterprise is discouraged. *L. S. Gibbs.*

ARAUCARIA IMBRICATA.

AMONGST the whole of the Coniferæ there is no more stately or ornamental tree than a well-grown specimen of the Chili Pine, *Araucaria imbricata*. Unfortunately, it only succeeds in this

ceed?" He further states: "The finest *Araucaria* I have ever seen in England or elsewhere is in the gardens of Ben Rhydding Hydropathic Establishment, on the Yorkshire hills. Of this I enclose a photograph"—(reproduced at fig. 105). "Its green branches touch the ground, and it is perfect in its symmetrical form. This is of the drooping kind. Only a few yards away is one with upturned branches, which is practically a skeleton. In all parts of the garden the one variety seems to thrive, and the other has this tendency to cast its branches. Presumably, soil that suits one variety does not suit the other."

The only two types of this tree generally known are those differing in sex. With rare exceptions the trees are unisexual, only a few instances being known (as at Bicton and Pencarrow) of male and female cones appearing on the same tree. It was thought that male and female trees differed in habit, the female being the handsomer and larger tree. But this theory has not stood the test of experience, and the habit of an *Araucaria imbricata* cannot be said to give any indication of its sex. Soils sometimes vary greatly in small areas, and it is not unlikely that the root medium in the case of one tree is quite different to the other, even in such a short distance as described by our correspondent.

A MARKET FRUIT-GROWER'S YEAR.

RAIN or melted snow was measured at my station on 19 days in March, amounting to nearly 4 inches, as compared with three and less than a quarter of an inch in February. The month of March, one of the most important periods of the year for farming and gardening, has been practically lost this season. Severe frost and snow in the first and third weeks of the month, and rain nearly every day in the rest of the period rendered the land unworkable, and it was only in stolen opportunities that some early Potatoes and Peas were planted in a free-working soil. As a period of wasted time for workmen employed on the land, March was one of the worst months in my experience. The unfortunate circumstances prevented the finishing of digging (forking) in the fruit plantations, although some of it was done when the land was far too wet, for the sake of finding a job for the workmen.

Although vegetation made up a little for lost time in the last fortnight of March, so that it was not as extremely backward at the end of the month as it was in the middle, it is still much behindhand. Records have been taken with respect to certain trees, shrubs, and flowers in 16 seasons. For the last 10 years they have been made in the same place near the south coast, and previously for six years at a point about 50 miles to the north. The only season in the last 10 in which vegetation was as backward at the end of March as it has been this year was in 1901. A few examples may be given. Yellow Crocuses were in full bloom on March 21, whereas they were in flower on March 6, 1894, and some were in blossom as early as January 31, 1898. Double yellow Daffodils, of which only a few were blooming at the end of last month, were as forward on February 28, 1903, and were in full beauty on March 15, 1906, while in most other years of the 16 they were well out by the end of the latter month. Wallflowers, not at all in bloom at present, began to flower on the first day of March 1903, and a few were gathered as early as January 31, 1908. The Almond had no flower-buds burst at the end of last month, showing backwardness approached in only four seasons out of the last 16. It was in full blossom on February 22, 1898, and on March 1, 1903.

Turning now to fruit trees and bushes, Gooseberry leaf-buds were only just generally bursting on March 31, while at the corresponding date in 1903 and 1905 the bushes were fully in blossom,

FIG. 105.—FINE SPECIMEN OF ARAUCARIA IMBRICATA.

Isolated reserves here and there are of no use from a physiological, economic or rainfall point of view. In a naturally-wooded country like New Zealand the question should be treated as a whole on some recognised plan drawn up by competent forest officials who have been trained not only in the great schools of Nancy, Munich, and the magnificent economic forests of France and Germany, but also in the management of virgin forest, which under scientific guidance has achieved such a success in India.

There, above 5,000 feet, the forest is secure, for no clearing is allowed.

In the Teak forests of Burma, in order to prevent risk of fire, no felling is allowed in the dry season. Every tree to be felled is marked by the

country in exceptional soils and situations, and specimens such as is shown in fig. 106, with the lower branches decayed, and a ragged head, are as common as a well-furnished tree such as is presented in fig. 105. The tree appears to flourish well for a time, until its roots reach some unsuitable medium, and then decay of the lower branches sets in. There may be other causes for this failure of the lower branches. A correspondent who sends the photographs now reproduced, suggests that there are two types of the tree, one with stiff side growths, and the other having branches that sweep downwards. He writes:—

"It appears to me that when one of these types with upturned branches, for instance, fails, the other, with drooping branches, may suc-

and in several other seasons they have been half out in leaf by the middle of March. In 1895 and 1896 they were in nearly full foliage by February 8. The buds of Black Currants were as generally bursting at the beginning of March in 1903, 1904, and 1906 as they were this season at the end of that month. For Red Currants, which are a little later developing than Black, a similar comparison holds good. Peach trees in the open were in full bloom on March 20, 1894, March 21, 1896, March 25, 1903, and March 31, 1899 and 1902. No variety of Plum has shown blossoms up to the time of writing, whereas there were a few out at the end of March, 1905, and the trees were in full bloom at the corresponding period of 1903. In 1899 early Pear buds were open, showing clusters of flower-buds, as early as February 20, which was quite exceptional; but in 1897, 1898, and 1902 they were in the same stage on March 24, while the trees were in full blossom on March 31, 1903. This year not a bud had burst by the end of last month. In only three out of the 16 seasons have Apple buds burst by March 31 or a few days earlier, and this season they are less behind the normal stage of development than most other kinds of fruit. Out of nine years in which notes on the development of the Cherry have been made, a few blossoms were seen by the end of March in 1903 alone. This year there was no close approach to blooming at that date.

BENEFIT OF LATE FLOWERING IN FRUIT TREES.

This lateness of flower development in fruit trees is a great safeguard, and, so far as my observation is a guide, it seems probable that there will be a productive season for most kinds of fruit, if late frosts do not cause injury. It is too early to judge as to bush fruits or Strawberries, but Apples, Pears, Plums, and Cherries are well studded with fruit-buds. For the first time in the ninth season from planting, my Rivers's Early Prolific Plums promise a great profusion of blossom. Other varieties were much quicker in coming into full bearing. The outlook for Cobnuts and Filberts is doubtful, as the great majority of the catkins appear to have been killed by frost. On some trees nearly all are quite brown, and no pollen can be shaken from them. The female blossoms are only just fully out, and the question is whether there are enough male blossoms to provide pollen to fertilise the ovules.

One important operation of the past month was that of looking carefully at all Black Currant bushes, picking off the big buds, or cutting off shoots containing many, and uprooting badly infested bushes. In a plantation containing Lee's Prolific, now in the ninth season from planting, many big buds were found; but in nine acres of Boskoop Giant, planted partly in the autumn of 1905 and partly in 1906, less than a pint of big buds was found. Yet more than half of these bushes were raised from cuttings on a piece of land less than 100 yards from the plantation that contained the infested bushes of Lee's Prolific. This seems to indicate either that the mites do not migrate any considerable distance, or that Boskoop Giant is more nearly immune from attack than is commonly supposed. It is true that the infested plantation was looked over twice in each season to remove bad bushes and to pick off isolated big buds, but this did not entirely prevent the spreading of the attack in the plantation itself. The planting of cuttings so near to the infested bushes was a piece of thoughtlessness, and it is fortunate that the results were less disastrous than might have been expected. It is further to be observed that nearly all the big buds found in the young plantation were on 200 bushes which were purchased to supply a deficiency in the number raised at home, although they showed no signs of mite when received.

The pruning of Plums last month disclosed more fully than passing observation had done the remains of injury among trees of

Victoria caused by the immense crop of 1907. This variety is naturally prone to develop shoots that curve over towards the ground, and a great weight of fruit upon the branches increases the tendency. Pruning to upright buds has been persistently pursued, but the heavy cropping of 1907 and the moderate yield of 1908 have done much to counteract the result of such cutting. The Victoria Plum can hardly be pruned too severely in the early years of growth. In Pond's Seedling there is a converse habit of growth even more difficult to correct. The branches have an exasperating tendency to grow towards the centre of the tree, in spite of pruning back to buds which point outwards. Attacks of aphid, however, are partly accountable for unshapely

FIG. 106.—POOR SPECIMEN OF ARAUCARIA GROWING CLOSE TO THE TREE ILLUSTRATED AT FIG. 105.

growth in my trees of this variety. In a younger and more exposed plantation, not affected at present by aphid, and on stronger soil, the trees of this Plum are more vigorous and shapely.

The grafting of Apple stocks, usually done in the latter part of March, was postponed till April, as the lateness of vegetation led to the supposition that the sap would not be running freely enough to render the work thoroughly successful.

Just when the Gooseberry buds were beginning to open, the bushes were sprayed profusely with a solution of lime and sulphur, 20 lbs. of each to 100 gallons of water, mainly in the hope that it will check the attack of Botrytis men-

tioned last month, and partly as a preventive to a possible attack by birds. As to this latter trouble, this season appears to be one of rare immunity from bud injury by birds. Whether this immunity is due to the presence of other food than buds, or to the scarcity of bullfinches is uncertain. The former explanation seems improbable, considering the severity of the weather in parts of February and March and the occasional covering of the land with snow. Most of the few bullfinches noticed were shot, but these are not the only budgeaters, and why other kinds of birds hardly touched the buds of Gooseberries or Plums is a mystery. The only considerable trouble from birds experienced this season was in connection with a few Gooseberry bushes at the top of a small plantation close to the homestead, where sparrows abound. These invariably destroy most of the buds, in spite of applications of distasteful washes. In my home orchard birds began to eat the buds on some choice Plum trees, notwithstanding the double washing with lime, sulphur, and caustic potash referred to last month; but the mischief was stopped by the killing of four bullfinches, by tying sheets of newspaper to many of the branches, so that they would blow about and make a rustling noise, and by setting up a couple of guys in the orchard. *A Southern Grower.*

TREES AND SHRUBS.

CUPRESSUS MACROCARPA.

ALTHOUGH this Cupressus is a fast-growing tree, I doubt if it is so suited for a hedge plant as *Thuja Lobbii* (*gigantea*). This latter tree has none of the defects pointed out by Mr. Elgar on p. 196, such as dying off suddenly and suffering from drought in a light soil. This winter has proved that *Cupressus macrocarpa* is not so hardy as was believed. One large tree at Swanmore has many injured limbs, and a nurseryman on the south coast informs me that many plants of this Cupressus in his district have been killed to within 6 inches of the ground.

Tbuya Lobbii grows fully 2 feet or even 3 feet annually when in a vigorous condition. It is not injured by pruning or clipping, and plants with large side boughs will break back into fresh growth close to the main stem after pruning. The foliage assumes a pleasing bronzy hue in the autumn. *E. M.*

VEGETABLES.

EFFECTS OF COLD WEATHER.

HARDY SPROUTING KALE.—Last year I spoke in high terms of this Kale as being one of the most productive varieties amongst several other well-known and extensively-cultivated kinds. This year it has not only maintained that reputation, but has proved by far the hardiest Kale. The severe frosts experienced during the past winter have in many instances killed several plants of some of the well-known kinds, while scarcely a plant of the hardy sprouting variety has been injured. Without this variety we should have been short of a supply of green vegetables.

DWARF GEM BRUSSELS SPROUT.—I am more than pleased with my plants of this variety. The Sprouts are medium in size, very solid, and abundant. We also cultivate a quantity of the Wroxtton variety, which generally furnishes a large supply of solid Sprouts.

BROCCOLI.—No matter whether early or late varieties, or whether they were planted on firm, or very firm, land, the greater number of this vegetable have been killed. Those remaining will

be very small in size. The warm weather of autumn favoured a late growth, and the stems were too tender and sappy to withstand severe frost. Our best plants are those that were heeled over, and these are only moderate in quality.

YOUNG CABBAGE plants have not been injured in the least, but older plants, which usually produce nice sprouts at this season, have fared badly. *H. Markham.*

THE FERNERY.

THE LIFE CYCLE OF A FERN.

EVERY living organism, plant or animal, in the course of its existence, passes through more or less complex changes, and it is these changes which form what is termed its life cycle. Thus, the butterfly or moth, commencing with the egg, proceeds as a caterpillar to become a chrysalis, and within this a wonderful metamorphosis takes place, so that eventually the form of moth or butterfly which laid the egg is reproduced and the cycle is completed. There are far more complicated life cycles than this; even man himself, simple as his life cycle may appear to be, passes through a wonderful series of prenatal stages of development. In the plant world the life cycles are comparatively simple; there are no such transformations as those described. Flowering plants produce, in conjunction with their flowers, embryo seeds, which, being fertilised by the pollen, become capable of reproducing the parental plant direct, so that the cycle is simply seed, plant, and seed again, without any intermediate changes. Non-flowering plants, such as Ferns, Mosses, Horsetails, Fungi, and other genera termed cryptogams, because their modes of fertilisation are concealed, have a longer chain of phases. Taking the Ferns as exemplifying the general principle, the non-production of flowers prevents the production of seeds in the same way as flowering plants, but the equivalents of flowers and seeds are produced before a new generation of Ferns arises, and this involves a lengthening of the life cycle in the following way. Instead of seeds, there are minute reproductive bodies termed spores. These are produced in immense numbers in little capsules on the fronds, and when ripe the capsules burst and scatter their contents far and wide. The spore then, under congenial conditions, swells, bursts its tiny shell, protrudes a rootlet from a contained green cell, which multiplies itself by fission, and in time forms a small, green, heart-shaped scale attached to the soil by a multitude of hair-like rootlets. It is underneath this scale that two sets of organs are formed, one consisting of spherical bodies attached by a short neck and the other of larger, bluntly-conical hollow projections, at the base of each of which is what is practically an embryo seed embedded in a thickened part of the scale. The spherical bodies then burst and send forth into the dewlike moisture present under proper conditions on the underside of the scale, a number of extremely minute tadpole-like organisms, which swim actively about and make their way eventually to the embedded seeds and fertilise them. This done, the seed grows and perfects itself, finally budding forth into a frond-bearing Fern like the original parents which bore the spore. The normal life cycle of the Fern is thus: spore, scale (prothallus), sexual apparatus, seed, and Fern. It has, however, been discovered that this sequence of phases is varied in every conceivable way in the varietal Fern form. Thus, in some Ferns the cycle is spore, scale, and non-sexual bulbil, which produces the Fern by a short cut (apogamy). In other Ferns the spore is dispensed with and the scale is produced direct either on the back of

the frond, where the spore should be, or by simple extension of growth of the frond points (apospory). When this occurs, in most cases the cycle is Fern, scale, sexual apparatus, seed, and Fern again, but in one case it is shortened to Fern, scale, Fern, the Fern being produced by a non-sexual bud (apogamy and apospory combined). Even this short cut, however, is equalled by one recorded case where the scale bore spores without fronds being produced, the cycle then being spore, scale, spore, and the Fern, as we know it, was entirely left out. These are all variations of the cycle, which includes some phase of the scale stage, which represents only the two so-called alternatives of generation peculiar to Ferns and their allies, but there is in addition the capacity of reproduction by direct bulbil growth on the fronds, which bear the Fern without any intermediate stages at all. It is to be noted in this connection that there do not appear to exist in Ferns any arrangements for securing cross-fertilisation such as are so prevalent in flowering plants proper. Flooding at the critical period certainly tends to distribute the fertilising bodies beyond the area of the scale which bore them, and cross-fertilisation has been effected purposely and accidentally in that way; under normal conditions, however, self-fertilisation is almost certain to occur, and as cross-fertilisation is undoubtedly a potent factor in evolution of new types, we may see in this disability the reason why the Ferns of the present day so closely resemble those of the far-distant Coal Age in all essential points, while flowering plants have become so much more diversified. Ferns, however, as we have seen, have apparently done their best to vary the monotony of normal reproduction to the utmost, and have reproduced themselves by every conceivable variance of the life cycle. *Chas. T. Drury, V.M.H.*

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Late Muscat vines.—These vines are now approaching the flowering stage. Examine the borders, and if the soil is approaching dryness apply a good watering with tepid water. Attend to the necessary stopping of laterals before flowering commences, but unless the shoots are touching the glass they need not be tied down to the trellis until the fruits have set. The atmosphere must be kept dry during the time the vines are flowering; therefore, if there are any pot plants in the house they had better be removed. If the bunches in former years have failed to set their berries properly it will be advisable to dust the flowers with pollen obtained from some free-setting variety, such as Black Hamburg. The pollen may be collected on sheets of paper and applied to the flowers by means of a camel's hair brush or a rabbit's tail. When the berries have set and have commenced to swell, the borders should be thoroughly soaked with diluted liquid manure that has been made tepid. Do not be in a hurry to cut off the surplus bunches until it can be determined which are the best to allow to ripen. A medium-sized bunch of compact build is to be preferred to one that is larger but straggling. Thinning must be attended to as soon as the berries are large enough, and some of the bunches will require the shoulders looped up neatly with a piece of raffia. Bunches with large shoulders must not be severely thinned, especially towards the top. During the operation of thinning keep the scissors clean, as neglect of this often disfigures the berries. When thinning is finished, some artificial fertiliser should be sprinkled over the borders and lightly forked in. Afterwards apply a good dressing of farm-yard manure, and directly after this a good watering with tepid water. The atmospheric temperature of theinery at night-time should range from 65° to 70°. During genial weather fresh air should be admitted early each morn-

ing, and in the day-time the heat may be allowed to rise gradually to 85° or 90°. Sudden fluctuations of temperature may be prevented by giving proper attention to the ventilation. Muscat of Alexandria Grape is very liable to attacks of red spider. As a preventive the hot-water pipes may be dusted with flowers of sulphur when they are very hot. At other times the atmosphere must be kept moist by frequently damping the floor. If the pest does appear, sponge the leaves with a weak mixture of soft soap and sulphur in water. Should it be necessary to shade the foliage to prevent scorching by the sun's rays, mix a little slaked lime in water and syringe this on to the glass.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Dendrobiums.—The numerous species and hybrids of these plants have for several months past provided a pleasing display of flowers in the warmer plant houses. Those plants which bloomed early will require attention in the matter of repotting, an operation that should be carried out when the young growths are but a few inches high. At this stage the plants produce fresh roots, and these delight in a sweet, fresh compost. Such erect, strong-growing kinds as *D. nobile*, *D. Juno*, *D. Ainsworthii*, *D. Wiganii* and *D. Domini* thrive well in pots, provided the compost is so light and open that moisture passes quickly away. The more slender and pendulous-habited varieties, including *D. Pierardii*, *D. lituiflorum*, *D. primulinum*, *D. cetaeum* and *D. crepidatum*, should be planted in pans or pots that can be suspended from the roof. When repotting, very great care must be taken to prevent the roots being injured. Overpotting is detrimental to healthy growth. The *Dendrobiums* at Burford last season did exceedingly well in the following compost:—*Os-munda* and *Polypodium* fibre in equal parts, with a moderate quantity of *Sphagnum*-moss, chopped up finely and well mixed together, with sufficient small crocks to keep the mixture porous. The moss should be cut up much smaller than the Fern material. Seedling *Dendrobiums* grow freely and blossom well when potted in this compost. In their case, the pots or pans should be half filled with potsherds for drainage purposes, and the plants should be potted firmly. Directly potting is finished, a few stakes should be inserted, and a number of pseudo-bulbs tied to them to keep the plant secure in the pot. If this is deferred until later, there is a risk of injuring the young roots.

Treatment of old plants.—Any large specimens that have deteriorated should be turned out of the pots, trimmed, and repotted into as small pots as can be conveniently used. For the first few weeks after repotting the soil should be kept on the dry side, and it is better to apply the water around the rim of the pot than in the centre. Later, when the young growths have made roots, increased moisture may be given, both in the soil and in the atmosphere. When thoroughly established and growing freely, an abundance of water may be given, and the foliage sprayed with tepid rainwater at closing time on warm, sunny afternoons. The majority of *Dendrobiums* should be accommodated in the warm East Indian house, but if such a structure is not available, an ordinary plant stove will suit them. Some species, including *D. sulcatum*, *D. subclausum*, *D. glomeratum*, *D. Jerdonianum*, *D. Falconeri*, and its variety *giganteum*, thrive best in a somewhat lower temperature than that maintained in the East Indian house, a suitable place for them being the *Cattleya* or intermediate house. Others that do better in a still cooler temperature are *D. rhodostoma*, *D. sanguinolentum* and *D. speciosum* (these may be placed in the Mexican house); *D. Jamesianum*, *D. Wattianum*, *D. infundibulum* and *D. longicornu*. The blue-flowered *D. cœleste* (*Victoria Regina*) grows well when suspended in a light position in the *Odontoglossum* house. Plants of *D. nobile* type can be easily propagated by laying the pseudo-bulbs which have not flowered on *Sphagnum*-moss in a hot propagating case, or they may be laid on the surface moss of pots containing such plants as *Aerides* and *Vandas*.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Fruit prospects.—The recent severe weather has had the beneficial effect of retarding the development of the fruit-buds, and, should no late frosts occur when the blossoms are expanded, we may expect a bountiful crop of all fruits. The worst results happen when, February and March having been mild and genial, wintry conditions prevail just after the trees have started into growth. Fruit trees and bushes appear extremely promising. Apple trees are bristling with plump flower-buds, whilst Cherry, Plum and Pear trees are all satisfactory. Strawberries have withstood the severe weather well; very few of the plants have been killed, and in the case of both young and old plantations the crowns are starting rapidly into growth.

General work.—The work of transplanting, pruning and spraying is finished. Disbudding and pinching the shoots and thinning the fruits will next claim attention. The first tree that will need attention in this respect is the Apricot. The flowers have just commenced to open, and, with a continuation of bright, sunny weather, the blooming period will soon be over. After this the growths will soon advance sufficiently to allow of disbudding and pinching. The trees should be examined at intervals of a few days, for the work must be done regularly, it being a mistake to remove a large number of the shoots and buds at one time. Shoots that are in unsuitable positions for training may be removed entirely, or pinched back to form spurs, according as is required. Extra care must be taken when regulating the shoots of young fruit trees: do not commit the common error of overcrowding the tree with growths.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

The rock-garden.—Seedlings of the various plants which are raised annually may now be planted on the rockery. Of Saxifraga there is an endless variety. Some of the best for gardens are *S. Rhei*, *S. R. superba*, *S. aizoides*, *S. Fergusonii*, *S. × Guildford Seedling*, *S. muscoides*, *S. oppositifolia*, *S. Wallacei*, *S. Boydii*, *S. Bursariana*, *S. aretioides*, *S. longifolia*, *S. Macnabiana*, *S. marginata*, *S. valdensis*, *S. Kotschyi*, *S. marginata* and *S. Rocheliana*. Amongst the *Androsaces* may be mentioned *A. coronopifolia*, *A. lanuginosa*, *A. sarmentosa*, *A. villosa*, *A. sempervivoides* and *A. Chumbyi*. These make a charming show when good clumps are formed. In order that they may appear to the best advantage, they should be planted in irregular batches. The rare *Scoliopus Bigelovii* is finely in flower at Leonardslee. It requires to be planted in a moist and shady position. Many Alpines need a deep rooting medium, delighting to ramble for a considerable distance amongst the fissures of the rocks. Slugs are apt to do much damage to bulbous plants in showery weather, and they must be sought for and destroyed. The *Erythroniums* are now making a fine display, as are also the *Narcissi*, especially *N. minimus*, *N. cyclamineus* and *N. obvallaris*. See that all shrubs growing on the rockery are pruned so as to keep them a suitable size.

Bog plants.—These should now be cleaned, and any that need top-dressing or dividing may be attended to forthwith. Any planting should be done at once. Among the more important subjects are *Inulas*, *Spiræas*, *Funkias*, *Gunneras*, *Kniphofias*, *Osmundas*, *Petasites* and *Eulalias*.

Aquatic plants.—These will now require attention, and any protective covering should be loosened. The beautiful *Caltha polypetala* may now be planted in the water. *C. palustris* and *C. monstrosa picta*, are effective when planted in masses. *Acorus calamus*, *Aponogeton distachyon*, *Butomus umbellatus*, *Cyperus longus*, *Eriophorum*, *Hippuris vulgaris*, *Lythrum roseum superbum*, *Menyanthes trifoliata*, *Orontium*, *Peltandra*, *Ranunculus*, *Rumex*, *Sagittaria*, *Scirpus*, *Zizania*, and many similar plants do well in ponds and lakes. The best method of planting aquatics is to bind their roots in some good fibrous loam and drop them into the water. The weight of the soil will keep the plant steady

till root action commences. Callas may be planted in the same manner.

Lawns and tennis grounds should be well swept and rolled previous to mowing. The verges should be trimmed. Box edgings should be clipped, and all made tidy.

General work.—Beds and borders containing spring flowering plants and bulbs must be kept clear of weeds and decaying foliage. Fork the soil lightly to give a tidy appearance. Prick off annuals as they become ready, and gradually harden those that were raised earlier. All bedding plants that are forward enough should be grown under as cool conditions as possible. *Lobelia* and plants of that class may still be boxed up and grown on in heat. Keep all the flowers picked off these plants. Place slender Hazel or Bamboo stakes to support the flowers of the taller-growing *Narcissi* of the King Alfred type, or they may break with their own weight.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Planting.—The soil is now in a splendid condition for working, therefore every opportunity should be taken to make up arrears in planting.

Potatos.—Proceed with the planting of early, mid-season and late varieties, exercising great care in the preparation of the sets as well as in placing them in the ground. Each Potato should be planted with a good, sturdy shoot, about 1 inch in length, in well-prepared trenches or deep drills. Do not use a dibble for planting Potatos. See that sufficient space, according to the variety, is allowed both between the tubers and the rows, so that, when in full growth, they will obtain the benefit of sun and air. Successional varieties in pits and frames must be earthed up when the growths are from 3 to 4 inches in height.

Caroons.—These plants require a long season of growth. They should be planted in a rich soil, and, during their growing season, be given an abundance of water at their roots. Prepare trenches, as for Celery, 2 feet deep and 2 feet wide, and, after breaking up the bottom soil, nearly fill the trench with well-decayed farm-yard manure. Do not sow the seeds until the end of April or the beginning of May, otherwise a large percentage of the plants will flower prematurely. It will be necessary to allow a distance of about 20 inches between the plants. Sow three seeds together, and when it can be determined which is the strongest of the three plants, the other two can be removed.

Celery.—Harden off the earliest plants that have been pricked out into boxes, so as to prepare them for planting out. Prick out seedlings from late sowings, putting them on a warm bed.

Winter Greens.—Sow the main batch of these thinly broadcast in beds on an open site, which should be netted to prevent birds stealing the seeds. Make another sowing at the end of this month or the beginning of May, especially of Broccoli and Savoys.

Onions raised under glass and thoroughly hardened must be planted out on well-prepared ground, at a distance of from 12 to 15 inches between the plants, and from 15 to 18 inches between the rows. Surplus plants which have not been pricked off, if planted out somewhat thickly, will be found to do well and ripen early.

Turnips.—Sow small quantities of early varieties of this vegetable once a fortnight.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Bougardias.—Robust plants may be quickly cultivated if 1-inch portions of stout roots are laid in pans of sandy soil, covered with glass, and placed over a mild bottom heat. Stem-cuttings root readily, but give more trouble, and seldom prove so satisfactory as plants raised from root cuttings. Old plants that are to be retained for another year should be pruned and re-potted after they break into growth. Shake away the greater portion of the old soil, and prune the roots so that the plants may be kept in comparatively small

pots. A suitable potting medium consists of a mixture of fibrous loam, leaf-mould, dried cow dung and silver sand. After potting, which must be done firmly, place the plants in a house having a warm, moist atmosphere.

Strobilanthes Dyerianus.—This plant should be potted in a light soil and grown in a brisk heat and plenty of atmospheric moisture. To obtain well-coloured examples, care must be taken that the plants receive no check whilst growing. Cuttings may be rooted readily.

Hibiscus rosa-sinensis and its varieties are useful either as bush plants or for training along the roof of an intermediate house. Under stove culture, they are apt to grow too freely to flower well. Although the individual flowers are evanescent, they are produced very freely, and plants of a goodly size continue in flower for a long period. It will be found more suitable to grow the double and semi-double flowered kinds under the rafters, as the weight of their flowers will cause them to hang downwards. Cuttings of this shrub root freely in heat, and quickly form flowering plants.

Cyclamens.—As it is not customary to cultivate the plants a second year, except, perhaps, in the case of any that it is especially desirable to keep, the old plants should be thrown away as soon as they cease to be ornamental. Seedlings intended for furnishing next season's flowering plants will now require larger pots. See that they are not over-potted at this stage, and keep the corms well above the surface soil, which should be similar to that used for the last potting.

Clerodendron fallax.—This plant must not be allowed to become pot-bound until it is in its flowering pot. Seedling plants of this *Clerodendron* are usually the most satisfactory.

Zonal Pelargoniums.—Cuttings should now be inserted to supply plants for autumn and winter flowering. Select good firm cuttings and insert them thinly around the sides of 5-inch pots. Place them in an intermediate house where they will soon form roots, and as soon as this takes place, pot them singly into small pots. After this is done, place the plants in a frame where they will receive plenty of light and air. For the first few days the frame must be kept closed, but afterwards, whenever the weather permits, ventilation may be afforded freely. All flower-buds must be removed until the latter part of August.

THE APIARY.

By CHLORIS.

Dysentery in bees.—Damp conditions and bad ventilation are the principal causes of this disease, which is not uncommon among bees during a wet spring. It may also be caused by giving the bees unsuitable food. When dysentery is present in a colony of bees, it may be known by (1) the bees voiding their excrement, which is of a muddy colour, on the comb and the alighting board. Bees in a healthy condition discharge their excrement when on the wing. (2) The bees appear weak and display a general loss of energy. (3) On opening the hives and raising the quilts a disagreeable odour is noticeable. The remedy consists in removing the colony to a dry, warm and well-ventilated hive. Provide the bees with some sealed honey as food, or, failing this, a syrup made with good candy, and allow the bees to remain undisturbed.

The wax moth.—The wax moth is likely to make its appearance in apiaries where the bee-keeper leaves little pieces of comb and wax lying about and empty combs in unused hives. The moths soon find these, and deposit their eggs, which hatch and thus infest the colony, the wax providing the larvæ with food. The presence of the wax moth may be detected by the presence of excreta, which resembles gunpowder. This may be observed on the tops of the frame. If the colonies are strong and the bee-keeper is vigilant, the pest may soon be exterminated.

Earwigs.—Earwigs and ants may be prevented by placing the legs of the hive in saucers containing paraffin.

Wasps.—Keep a sharp look-out for these pests and destroy any that are found.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, APRIL 20—

Roy. Hort. Soc. Coms. meet. and Nat. Auricula and Primula Soc. combined Show at Hort. Hall, Westminster (Prizes for Daffodils and Carnations. Lecture at 3 p.m. by Mr. Eric Drabble, D.Sc., on "Pansies"). Devon Daffodil and Spring Fl. Sh. at Plymouth (2 days). Shropshire Hort. Soc. Spring Fl. Sh.

WEDNESDAY, APRIL 21—

Roy. Hort. Soc. of Ireland Spring Fl. Sh. at Dublin. Roy. Meteorological Soc. meet. Ipswich Spring Fl. Sh. Roy. Hort. Soc. Examination in General Horticulture.

THURSDAY, APRIL 22—

Midland Daffodil Soc. Exh. at Bot. Gardens, Birmingham (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—48.5°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, April 14 (6 P.M.): Max. 60°; Min. 47°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, April 15 (10 A.M.): Bar. 29.2; Temp. 58°; Weather—Sunshine.

PROVINCES.—Wednesday, April 14 (6 P.M.): Max. 56° Cambridge; Min 43° Scotland, E.

SALES FOR THE ENSUING WEEK.

MONDAY AND FRIDAY—

Herbaceous and Border Plants, Lilies, and Hardy Bulbs, Ferns, Greenhouse Plants, &c.; at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.

WEDNESDAY—

Perennials and Herbaceous Plants, Lilies, Gladiolus, and other Hardy Bulbs, at 12; Palms and Plants, Ferns, &c., Seeds, 100 dwarf trees, &c., at 4; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

THURSDAY—

Specimen Gold, Silver, Green, and other Hollies, Conifers, Rhododendrons, and other stock, at The Nurseries, High Beech, Essex, by order of Messrs. Paul & Son, by Protheroe & Morris, at 12.

FRIDAY—

Choice Imported and Established Orchids in variety, Orchids in Flower and Bud; at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The British Flora is from time to time increased by the addition of new plant species which find their way into this country by other than natural means.

The majority of these intruders, many of them weeds of cultivated ground, appear only at intervals, and have no permanent effect upon the flora; a few, finding the conditions congenial, become established, and may even compete successfully with native plants on their own ground.

This has been the case, for instance, with the American Pondweed, or Water Thyme (*Elodea canadensis*), which was introduced into Ireland about 1836, appeared in England about 1841, and has increased so rapidly that it often proves a source of trouble by blocking streams and ditches. It is now ubiquitous in rivers, streams, and waterways all over the country, competing successfully with most British aquatic species. The plants do not fruit in this country, but they succeed in spreading, owing to their extremely

vigorous vegetative growth, branches being constantly detached and carried by the current, or other means, to give rise to fresh colonies. The success of such plant invaders depends on their adaptability to climatic conditions, and their capacity for spreading is regulated by their means of dispersal.

Local floras abound in records of plants which are either certainly aliens or are strongly suspected of alien origin; but it is comparatively seldom that anything definite is known as to their first appearance. It is, therefore, of some interest to record the appearance, or reappearance, of a little plant which is of greater botanical interest than the majority of intruders.

Azolla caroliniana is a small aquatic Fern, a member of the group of Ferns known as Hydropterids, owing to the water-habitat of the four genera included in it, only one of which, *Pilularia globulifera*, is a member of the British flora. Two of the genera, *Azolla* and *Salvinia*, are small, floating aquatics, commonly grown in botanic gardens, and more rarely in greenhouses in private gardens.

The species *A. caroliniana* is a native of the United States, and has already been recorded from streams near London as an escape from gardens. It has recently appeared in Berkshire, in a small tributary of the Thames, where it is apparently competing successfully with its neighbours.

Along the banks, where the current is slowest, *Azolla* has established itself in abundance, and in places appears to be ousting the Duckweed (*Lemna minor*), which, presumably, preceded it, and which flourishes elsewhere in similar positions. During the past summer the colonies of *Azolla* increased rapidly, and the plant now extends up the smaller ditches and rivulets for some distance. Despite the severe winter, it still appears vigorous and uninjured by the cold, although the plants show a tendency to fragment into small pieces, and the foliage has become reddish-brown instead of green. It will be a matter of some interest to see if it resumes growth in the spring, and if so, it would appear to be only a matter of time for it to spread down to the Thames and thence to other localities.

The little plants multiply freely by vegetative means, new branches being constantly formed and detached from the parent, and even if the winter should prove to have been too severe for the leafy parts, there is the possibility that sporocarps were formed and these may survive.

The appearance of such plant visitors, even when introduced by undoubtedly artificial means, as in the case of *Azolla*, leads to a consideration of the many interesting features in the constitution of the British flora, and ultimately to an examination of the factors which determine geographical distribution in general.

In his *Origin of the British Flora*, Mr. Clement Reid concludes that the present flora of Britain is entirely composed of plants which reached this country after the passing away of the more or less Arctic conditions which prevailed during the Glacial Period, and since the final separation of England from the continent of Europe is believed by geologists to have also taken place about that time, the plant species which found their

way across the Channel from Western Europe were those which possessed the most effective means of dispersal by various natural means.

It is still held by a few observers that certain isolated members of the flora, for instance, the so-called Lusitanian flora of South Cornwall and South-west Ireland, which includes several species of Heath which do not now occur wild nearer than Portugal, represent survivors from the sub-tropical flora which is known to have existed in Britain in pre-Glacial times; but since indications of Arctic conditions have been found as far south as Bovey Tracey, in Devonshire, the evidence, on the whole, seems to favour the truth of the general statement made above, that the British flora consists essentially of a selection of the species occurring also in North-western and Western Europe, which are best equipped in various ways for distribution by natural means.

It is customary to designate as alien plants such species as have been introduced through the agency of man, although their appearance may now be general throughout a large area. Such aliens may occur as escapes from gardens, as *Azolla* no doubt has done, and, in these cases, their origin is rarely in dispute.

Among many examples of this kind may be noted the red-spurred Valerian (*Centranthus ruber*), naturalised on walls and cliffs in many places in the south of England, but almost always in the vicinity of houses. It is a native of Southern Europe, and is rarely found in this country north of Birmingham.

The Lesser Periwinkle (*Vinca minor*) is regarded as a true native in the south of England, but occurs elsewhere as an escape from gardens, as does the allied species *Vinca major*.

Geranium phæum, a native in Belgium, but not occurring in Northern France and Germany, is found in many places in England, and there seems to be no geographical reason why it should not be regarded as indigenous; but it is almost invariably confined to the neighbourhood of villages, and in all recorded stations in England it is probably of garden origin.

Many other plants might be cited which have had a similar origin, and to these may be added others which appear as the result of seed impurities in imported agricultural seeds. Many of the latter establish themselves as common cornfield weeds, and some of our most familiar field and hedgerow plants belong to this class. A few alien species appear on the coast, near seaports or docks, brought as seeds in ballast or cargo.

The facts are often difficult to trace in the case of old-established weeds, the test that is usually applied being the nature of the surroundings in each case. If a plant occurs invariably associated with artificial conditions, such as are induced by cultivation, and is never recorded from a perfectly natural habitat, the case is strong against it being a native, since it would be necessary to assume that it had disappeared from the intervening areas in natural surroundings, and such cases of extinction are rare.

In all, over 900 species of such plant invaders have been recorded, of which about 330 are believed to be due to arboriculture and horticulture.

OUR SUPPLEMENTARY ILLUSTRATION gives a view of the lake in the Melbourne Botanic Garden. This botanic station is situated on the banks of the River Yarra, about a mile from the city of Melbourne. It adjoins the grounds of Government House and the Public Domain, of which it forms a part. The older portions of the garden contain numerous fine specimens of Palm, Conifer, especially *Araucaria*, various Oaks, Elms, and other deciduous trees, *Grevilleas*, of which *G. robusta* forms a splendid picture when in flower, and numerous native trees and shrubs. An extensive "Fern gully" has been formed, and this is a feature of much interest. In the lower portion of the grounds, near the river, is the beautiful lake, occupying about 14 acres, spanned in places by rustic bridges, and dotted with charming islands which, being planted with ornamental trees and shrubs, afford a very picturesque effect. A portion of the native vegetation has been allowed to remain, and this adds much to the interest of the garden. It will be seen from the illustration that *Cyperus Papyrus* grows freely around the water's edge. In fig. 107 is reproduced a photograph of a bed of succulent plants also growing in the Melbourne garden, which is under the care of Mr. W. R. GUILFOYLE.

THE FLOWERING OF THE ALMOND.—The lateness of the present season has been strikingly illustrated by the flowering of the Almond trees in the London district. The first flowers on a tree situated in a favourable position in Wandsworth, five miles south-west of London, expanded fully on Thursday, April 1, as against March 23 last year, March 20, 1907, February 28, 1906, March 7, 1905, and March 21, 1904.

ROYAL HORTICULTURAL SOCIETY. — The Council of the Royal Horticultural Society have accepted the offer of the following prizes, to be competed for in March, 1910, from the Royal (General Dutch Bulb Growers' Society at Haarlem:—Division I. (for amateurs and gentlemen's gardeners).—Class 3 (18 Hyacinths, distinct): 1st prize, £6 6s.; 2nd, £5 5s., with four other prizes. Class 4 (12 Hyacinths, distinct): 1st prize, £5 5s.; 2nd, £4 4s., with three other prizes. Class 5 (six Hyacinths, distinct): 1st prize, £2 2s.; 2nd, £1 10s., with two other prizes. Class 6 (four pans containing Hyacinths, 10 roots of one variety in each pan, the blooms of the bulbs in each pan to be of distinctly different colour to those of the other three pans): 1st prize, £4 4s.; 2nd, £3 3s., and two other prizes. Division II. (for trade growers).—Class 7 (collection of 200 Hyacinths in at least 36 varieties, grown in pots or glasses): Prize, the Gold Medal of the General Bulb Growers' Society at Haarlem. Class 8 (collection of 200 Hyacinths in 20 varieties in pans, 10 roots of one variety in each pan): Prize, the Gold Medal of the General Bulb Growers' Society at Haarlem. For Classes 3, 4 and 5 each bulb must be in a separate pot, size optional. Classes 3, 4, 5 and 6 must all be single spikes; no spikes may be tied together. Exhibitors may only compete in one of the classes numbered 3, 4 and 5. All bulbs must have been forced entirely in Great Britain or Ireland. The bulbs used in Classes 6 and 8 should be of varieties most suitable for outdoor bedding purposes.

FLORAL ART AT THE BERLIN EXHIBITION.—The display of floral designs in connection with the International Horticultural Exhibition held in Berlin, was one of more than ordinary interest. Judged from a purely artistic standpoint, the arrangements set up by M. LAUCHAUME, Paris, stood far in front of everything else. The Parisians appear to be peculiarly gifted in the

art of producing pleasing effects by means of flowers and foliage, whether it be for the ornamentation of tables, halls or rooms, or for personal adornment with sprays, bouquets, or garlands. In his colour effects, M. LAUCHAUME was often daring, but never at fault. Nothing could be richer or more elegant than a tall, loose stand fully 7 feet high built up with big leaves of red and yellow Croton, orange-coloured *Clivias*, salmon-red *Cattleyas*, large spikes of *Cymbidium*, and long, well-flowered pseudo-bulbs of *Dendrobium Wardianum*, the whole held together with fronds of *Adiantum tenerum Farleyense* and *Asparagus plumosus*. Another elegant floral trophy was composed of Yellow Arums, *Iris Susiana*, pink Roses, long spikes of *Odontoglossum* and *Phalænopsis*, with sprays of light-green Japanese Acers and Fern fronds. It is difficult to adequately describe these arrangements, they need to be seen to be properly appreciated. The Germans appear to employ flowers and foliage rather as emblems or symbols of plant lore than for their mere decorative effect. They express by means of certain flowers or leaves some emotion, as *Ophelia* did when she gave Rue and Rosemary: "There's Rosemary, that's for remembrance; pray you, love, remember." To some extent we make a like use of flowers, the wreath of Orange blossom at weddings, the Mistletoe at Christmas feasts, and the Primroses on Good Friday being of this character. Flower lore is, however, rapidly disappearing with us, and in most of our uses of flowers and foliage we are merely decorative, sentiment being unconsidered by either florist or employer. In Germany many of the floral designs have a sentimental meaning. Perhaps the prettiest is the spray of Myrtle worn on the head of the bride. According to mythology the plant received its name from Myrsine, a favourite of Minerva; and when she was changed into this shrub it was consecrated to Venus. Among the Berlin exhibits there were many dainty arrangements of Myrtle leaves and flowers. The catkin-laden branches of the Goat Willow are largely employed in wreath making. The significance of Willow is for slighted or forsaken lovers. "In love the sad forsaken wight the Willow garland weareth." It is probable that the use of Pine branchlets for garlands, crowns, wreaths, &c., has been copied from the Greeks, who wore them in their Olympian games. The use of Poppy heads, which occurred frequently in wreaths and big crosses, is difficult to understand, unless they signify eternal sleep. Juniper, Ivy, Bay, Douglas Fir, *Erica carnea*, *Daphne Mezereum*, Grey Lichen, Cypress, Lilac, and Alder all entered largely into the compositions of wreaths, crosses, columns, and shields. Lily of the Valley, Violets, Roses and Forget-me-Nots were much used in the general floral designs. There were excellent effects with Orchids, Lilies, Arums, Azaleas, Primulas, Lilac, and other favourite florists' flowers, but generally German art in this direction was not really first-class. A design in which variegated Kale leaves were used in combination with *Cattleya* flowers was somewhat grotesque. Both *Viburnum Opulus* (Snowball) and *Hydrangea* were largely used for wreaths and crosses as well as in table decorations, but invariably the flowers were only half-developed and of a soft green colour, a condition in which they appear to be preferred. *Primula obconica* was much in evidence. Stocks also were used for wreaths. Perhaps the plant most generally employed in all the compositions, whether of foliage or flowers, was *Selaginella Watsonii*; the variegation appears to please the German taste. This plant was also used to form the groundwork in the groups of plants arranged in the big exhibition halls. The principal German exhibitors of

floral designs were Messrs. STRAHL & FALCKE, Berlin, Mr. MAX BRUST, Berlin, Mr. HEINRICH KRÜGER, Berlin, and J. C. SCHMIDT, Berlin. This florists' show was opened on the 7th inst., after our report of the main exhibition had been despatched.

HORTICULTURAL CLUB.—The next house dinner of the Club will take place on Tuesday, the 20th inst., at 6 p.m., at the Hotel Windsor. Mr. E. A. BUNYARD will give an address on "The Colours of Plants."

ROYAL METEOROLOGICAL SOCIETY.—A meeting of this society will be held at the Institution of Civil Engineers, Great George Street, Westminster, S.W., on the 21st inst., at 7.30 p.m. The following papers will be read:—(1) "Percolation, Evaporation and Condensation," by Mr. BALDWIN LATHAM; (2) "The Meteorological Conditions in the Philippines, 1908," by the Rev. JOSÉ ALGUÉ.

A NEW USE FOR EUCALYPTUS TREES.—In recommending that Eucalyptus trees be more extensively planted on Sugar estates in the West Indies, the *Journal of the Jamaica Agricultural Society* mentions that the leaves possess a property which makes them useful for cleaning purposes. If the leaves are boiled, the resulting decoction will soften any incrustation of lime that may have formed, so that it can easily be removed.

RAFFIA AND RAFFIA WAX.—When Raffia, or Roffia, as it was first called, displaced the old "Cuba bast"—the inner bark of the West Indian Mahoe tree (*Hibiscus elatus*)—as a tying material for garden purposes, little or nothing was known of its origin. After a while, however, it was discovered to be the produce of the Madagascar Palm *Raphia Ruffia*, imported from the Mauritius. Raffia consists of the thin cuticle or skin of the leaf, and, notwithstanding its thinness, is very strong. The natives of Madagascar tear it into fine thread-like strips, and when dyed (chiefly in red, yellow, or black) use it for making mats. In England, Raffia has been used, and probably is used still, for making ladies' hats. In more recent time Madagascar Raffia has had competitors in some of the West Tropical African species of *Raphia*, the cuticle of the leaves of which is similar to that of the Madagascar species, both in strength and appearance. Twisted into cord, the natives use it for the making of hammocks. Judging from a recent consular report from Madagascar, the *Raphia Palm* seems to have been attracting some attention as a wax-producing species. It appears that, when collecting the leaves for preparing the Raffia fibre, the natives bring them into camps, where, after the fibre is extracted, they are left lying about, often in considerable quantities. So far back as 1905, a colonist, while examining these abandoned leaves, discovered that, when shaken, they yielded a white substance, which, upon being boiled, yielded wax. The natives were, at the time of its discovery, induced to prepare about 100 lbs. of this wax, which was offered for sale in the market, and sold in lots at 1s. per lb. The preparation of the wax has never been repeated, nor any shipment made, as it has been considered that the resultant wax is too small in quantity, and the cost too high for it to become a commercial article, a very large number of leaves being required to produce even one pound of wax. The facts prove, however, that wax is present, though it may be only in small quantities, in other species of Palms besides the two well-known sources *Ceroxylon andicum* and *Copernicia cerifera*.

THE GRAFTING OR BUDDING OF LILAC.—It may not be generally known, writes a correspondent, that Lilac worked on Privet stocks is not to be recommended for plants intended for forcing. The common Lilac, *Syringa vulgaris*, is much better as a stock, resulting, in three to four years, in fine bushes or standards fit for forcing. Besides this advantage, Lilacs on the common form live longer than those grafted on the Privet.

ing varieties of the show Auricula, Carnation, and white ground Picotees. In 1876 at Manchester SIMONITE exhibited in a competitive class for 24 Carnation blooms, and he won the 1st prize, twenty-three out of the twenty-four varieties being his own seedlings. He also exhibited Picotees at the same show, and secured eleven First-class Certificates for these flowers. At that time he was a working cutler, making table knives at his own house for the large Sheffield firms. His garden was a small strip of ground

green-edged Auricula placed into commerce by this raiser is Shirley Hibberd. Others are Henry Wilson and the Rev. F. D. Horner. There is no grey-edged flower to his credit, but he has raised many good white-edged varieties, of which Heather Bell is the best. Frank is distinct and good: both flowers have a violet-coloured ground. Venus is a good white-edged flower, but it is little known. Among self-coloured Auriculas of Mr. SIMONITE's raising still in cultivation are Ruby, a red self;

FIG. 107.—SUCCULENT PLANTS ON A ROCKERY IN THE MELBOURNE BOTANIC GARDEN.

(See page 249.)

THE LATE BEN. SIMONITE (see p. 239).—Writing on the Auricula in 1876, the Rev. F. D. HORNER penned these words:—"Where our florist fathers rested in the evening of their day is the point we start from in the morning of our own, and we should ever have this purpose before us in our floral pursuits to leave something added, something better than we found." Mr. HORNER took up the work left by his father, Dr. HORNER, of Hull, and Mr. SIMONITE took up that left by his father, JOHN SIMONITE. As early as 1873 the younger SIMONITE had done good work in rais-

ing varieties of the show Auricula, Carnation, and white ground Picotees. In 1876 at Manchester SIMONITE exhibited in a competitive class for 24 Carnation blooms, and he won the 1st prize, twenty-three out of the twenty-four varieties being his own seedlings. He also exhibited Picotees at the same show, and secured eleven First-class Certificates for these flowers. At that time he was a working cutler, making table knives at his own house for the large Sheffield firms. His garden was a small strip of ground

green-edged Auricula placed into commerce by this raiser is Shirley Hibberd. Others are Henry Wilson and the Rev. F. D. Horner. There is no grey-edged flower to his credit, but he has raised many good white-edged varieties, of which Heather Bell is the best. Frank is distinct and good: both flowers have a violet-coloured ground. Venus is a good white-edged flower, but it is little known. Among self-coloured Auriculas of Mr. SIMONITE's raising still in cultivation are Ruby, a red self;

NATIONAL AURICULA AND PRIMULA SOCIETY (MIDLAND SECTION).—We are asked to draw attention to the alteration of the dates of the show of this society from April 28, 1909, to May 5 and 6. This has been found necessary on account of the extreme lateness of the plants this season. The hon. show secretary is Mr. TOM J. STEVENS, 74, Harbury Road, Cannon Hill, Birmingham.

TIMBER FOR AEROPLANES.—The best wood for making aeroplanes has been found to be that of the black Spruce, *Picea nigra*. Regarding the value of British-grown timber of this tree, it may be of interest to refer to an article written by Mr. A. D. WEBSTER, which appeared in the *Gardeners' Chronicle*, February 2 and March 2, 1895, under the heading of "Quality of British-grown Coniferous Timber." "*Picea nigra*; ages (when cut) varying from 30 years to 50 years; timber nearly white, sometimes yellowish-white, soft, long of grain, very light, and readily indented. Lasts well when kept dry and in an equable temperature, but it is of little or no value, comparatively speaking, for out-of-door work." The timber referred to was grown at Penrhyn Castle, in Wales.

"CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE."*—Great advances have been made during the last few years in the cultivation of the early-blooming and decorative sections of the *Chrysanthemum*. It is not every flower lover who has the necessary skill and time to devote to the cultivation of the large show varieties. Mr. CRANE's purpose in writing this book has been to show that beautiful displays of *Chrysanthemums* may be obtained without much trouble or expense. He has revised the long lists of varieties, and the descriptive notes accompanying each variety make his list valuable. The book is comprehensive, and begins by describing various methods of propagation. Then follow accounts of outdoor culture, greenhouse culture, market culture, varieties and selections, and miscellaneous matters, such as insect pests and diseases, hints on exhibiting, window culture, &c. The market men are told that they have of late years made a great mistake in confining their attention to a few varieties, and those of Japanese origin. Mr. CRANE might, however, with advantage, have reduced greatly the number in his portentous list.

PUBLICATIONS RECEIVED.—*Familiar Wild Flowers*, by F. Edmund Hulme, F.L.S., F.S.A. New edition, with 360 coloured illustrations. (Part I.) To be completed in 43 fortnightly parts. (London: Cassell & Co., Ltd.) Price 6d.—*Trees and their Life Histories*, by Percy Groom, D.Sc., &c. (Part I.) To be completed in 13 fortnightly parts. (London: Cassell & Co., Ltd.) Price 1s.—*The Country Home*. (April.) (London: Archibald Constable & Co., Ltd.) Price 6d.—*Twenty-Sixth Annual Report of the Metropolitan Public Gardens Association for the year 1908*. Price 6d.—*Kew Bulletin of Miscellaneous Information, Appendix II*. (1909.) Containing Catalogue of the Library. Additions received during 1908. (London: Wyman & Sons, Ltd., Fetter Lane, E.C.) Price 4d.—*Ontario Department of Agriculture*. Bulletin 169: Legume Bacteria. Further Studies of the Nitrogen Accumulation in the Leguminosæ, by S. F. Edwards, M.S., Professor of Bacteriology, and B. Barlow, B.S., Demonstrator in Bacteriology. Bulletin 170: Mitchell-Walker Test Bottle. A new form of Babcock Test Bottle, by J. W. Mitchell, B.A., and W. O. Walker, M.A. (Ontario: L. K. Cameron)—*U.S. Department of Agriculture*. Miscellaneous Papers: The Orange Thrips, by Dudley Moulton. Papers on Deciduous Fruit Insects and Insecticides. The Peach-Tree Bark-beetle, by H. F. Wilson. Farmers' Bulletin 347: The Repair of Farm Equipment, by W. R. Beattie. Circular No. 108: House Fleas, by L. O. Howard. (Washington: Government Printing Office.)—*Cottage Gardens: Practical Hints on Cultivation and Management*. (Second edition.) By Colonel the Hon. R. Stapleton-Cotton. (Birmingham: Cornish Bros., Ltd.) Price 4d.—*Quarterly Journal of Forestry*. (April.) (London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd.) Price 2s.—*The Journal of the Royal Horticultural Society*.

* By D. B. Crane. Edited by T. W. Sanders. Second edition. Price 2s. 6d.

(March.)—*Botany*, by Elizabeth Healey. (London: Macmillan & Co., Ltd.) Price 1s. 6d.—*Estate Magazine*. (April.) Price 6d.—*Journal of the Kew Guild (1908)*.—*The County Council for the County Palatine of Lancaster. Education Committee, Agricultural Department*. (Farmers' Bulletin No. 13.) Summary of Experiments of the Manuring of Potatoes in Lancashire, by Edward Porter, B.Sc., F.A.C., (Glas.), and R. C. Gant, B.Sc., N.D.A., Lecturer on Agriculture.—*Beautiful Gardens and how to Maintain them*, by Walter P. Wright. Enlarged edition. (London: Cassell & Co., Ltd., La Bille Sauvage, E.C.) Price 6s.—*Lawns and Greens*, by T. W. Sanders, F.L.S. (London: Amateur Gardening Office, 148-9, Aldersgate Street, E.C.) Price 1s.

LAW NOTES.

SALE OF POISONOUS SUBSTANCES FOR AGRICULTURAL AND HORTICULTURAL PURPOSES.

THE following are the regulations under the Poisons and Pharmacy Act, 1908, issued at the Court at St. James's the 2nd day of April, 1909,† affecting the sale of poisonous compounds used in horticulture and agriculture:—

1. A licence shall not be granted to any person unless the local authority are satisfied that he is fit to be entrusted with the sale of the poisonous substances.

2. In granting licences for the sale of poisonous substances for use exclusively in horticulture, preference shall be given to nurserymen, florists, seedsmen and other persons whose business is specially connected with horticulture.

3. Applications for licences shall be in the form set forth in Schedule A. to these regulations.

4. Before sending an application for a licence to the local authority the applicant shall publish notice of his intention to apply in two newspapers circulating in the district of the local authority, and shall also send notice by registered post to the Chief Officer of Police of the Police area within which his premises are situated.

5. A licence shall not be granted until after the expiration of at least 14 days from the receipt of the application by the local authority, and the local authority, before granting a licence shall take into consideration whether in the neighbourhood where the applicant for the licence carries on or intends to carry on business the reasonable requirements of the public with respect to the purchase of poisonous substances are satisfied, and also any objections they may have received from the Chief Officer of Police or from any existing vendors of the substances to which the application relates.

6. A licence shall be in the form set forth in Schedule B. to these regulations.

7. A licence shall expire on such day in the year as the local authority fix, but may on application being made in the form set forth in Schedule C. to these regulations, be renewed from time to time for one year at a time, subject to the same provisions as in the case of the grant of a licence, except that it shall not be necessary to publish or give to the Chief Officer of Police notice of the application. The renewal of a licence shall be in the form set forth in Schedule D. to these regulations.

8. A licence may be revoked or suspended for such term as the local authority think fit, if the local authority are satisfied that the licensee has failed to comply with the requirements of these regulations or of the Poisons Acts, or that the licensee is not a fit person to be entrusted with the sale of poisons.

9. A licensee shall, on being required to do so by any officer of the local authority or any police officer, produce his licence, and any renewal thereof.

10. The fees charged in respect of the grant and renewal of a licence shall be such as the local authority may determine, not exceeding in the case of the grant of a licence, 10s. 6d., and in the case of a renewal of a licence, 1s. 6d.

† Order in Council making Regulations under Section 2 of the Poisons and Pharmacy Act, 1908 (8 Edw. 7 c. 55), as to the Sale of certain Poisonous Substances for Agricultural and Horticultural Purposes.

11. A licence shall not authorise the licensee to sell or keep open shop for the sale of poisonous substances except from or on premises (to be specified in the licence) within the area of the local authority which granted it, and for the purpose of these regulations, a municipal borough the council of which is a local authority for those purposes, and in Scotland a police burgh, shall not be treated as forming part of any county.

12. Every local authority shall keep a register of the licences granted by them for the time being in force, and any person shall, at all reasonable times, upon payment of such reasonable fees as may be fixed by the local authority, be entitled to inspect and to make copies of, or take extracts from, the register.

13. All poisonous substances shall be kept in a separate drawer or closed receptacle apart from any other goods, and poisonous substances shall not be sold upon the same premises as articles of food for human consumption unless the Local Authority are satisfied that convenient arrangements for their sale cannot otherwise be made, and in that case they must be sold at a separate counter. For the purpose of this regulation a part of a counter which is shown to the satisfaction of the Local Authority to be adequately separated from the rest of the counter shall be treated as a separate counter.

14. A poisonous substance shall not be sold except in an enclosed vessel or receptacle as received from the manufacturer, distinctly labelled with the name of the substance and the word "Poison," and with the name and address of the seller, and with a notice of the special purpose for which it has been prepared.

15. Liquid preparations shall be sold only in bottles, tins, drums, or casks of sufficient strength to bear the ordinary risk of transit without leakage. Each bottle, tin, drum, or cask shall have the word "Poisonous" indelibly printed, marked, or branded in easily legible characters in a conspicuous position apart from the label, and the label must bear the word "Poison." When sold in bottles, the bottles shall be of a distinctive character so as to be easily distinguishable by touch from ordinary bottles.

16. Solid preparations shall be securely packed in such a manner as to avoid, so far as possible, the risk of breaking or leakage from transport, and the package shall have indelibly printed, marked, or branded in easily legible characters in a conspicuous position notice that it must not be used for any other purpose.

17. All premises from or on which a licensee is authorised to sell or keep open shop for the sale of poisonous substances shall at all reasonable times be open to inspection by officers appointed by a local authority.

18. For the purposes of these regulations the expression "poisonous substances" means the poisonous substances to which section 2 of the Poisons and Pharmacy Act, 1908, applies for the time being, and the expressions "chief officer of police" and "police area" have in England and Scotland the same meanings as in the Police Act, 1890, and the Police (Scotland) Act, 1890, respectively.

PETREA VOLUBILIS.

THIS member of the Verbenacæ is a native of tropical America, and is usually cultivated as a stove plant in botanical gardens in this country. Our issue for January 13, 1900, contained a Supplementary Illustration showing a splendid inflorescence which occurred on a plant in Sir Trevor Lawrence's garden at Burford. In the same issue appeared a reproduction of a photograph received from Sir Daniel Morris, which represented a white-flowered variety in the Newcastle Plantation, Barbados, where it is known as the "White Wreath." Our present illustration (fig. 108) depicts a fine plant of the type in full bloom in the Royal Botanic Garden, Peradeniya, Ceylon, where in succeeds admirably in the open ground. The purple flowers of this twining shrub are very beautiful, and the species might well be more generally cultivated in stoves as a climber. The plant being very subject to mealy bug, this pest must be kept in check.

NOTES FROM A "FRENCH" GARDEN.

THE fine weather of the past week has been of great benefit. Watering has occupied a considerable portion of each morning, as the plants require much moisture in sunny weather, especially the Carrots. The lights are allowed to remain open throughout the day, and we shall soon leave them open a little at night-time for the purpose of hardening both the Carrots and the Cauliflowers. We shall remove the frames and lights altogether next month, when they will be required for the Melon crop. The Cauliflowers raised from seeds sown in February may be planted out-of-doors as soon as the ground is available for the purpose. The watering of

second planting are thriving well, and the more forward will soon have their shoots stopped. Those raised from the sowing made at the end of March require potting into 3-inch pots and placing in a new hot-bed. It will be noticed that the leaves of the young Melon plants placed in frames that have been freshly tarred have curled. This is due to the fumes from the tar; the remedy is ventilation and the removal of the plants from too close proximity to the boards.

Turnips are growing well, and when the nights are warm ventilation can be afforded them. The applications of water should be moderate but frequent, for the purpose of inducing a quick, soft growth, for when growth is slow and the

at about the middle of May. The principal work in progress is that of attending to the ventilation and the watering of the different crops. Mats are still required at night-time, especially for the protection of Melon plants, and for seedlings of other crops. *P. Aquatics, April 12.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

SURREY SCHOOL GARDENS.—Since Mr. Cæsar wrote (see pp. 209 and 226) his interesting description of the development of school gardening at Hale, Surrey, 10 new centres have been added, and some 200 plots formed; therefore 200 additional lads will receive garden instruction this season. The number of school gardening centres is now 100 at least. They are found only in what is termed the administrative county, which excludes boroughs like Kingston, Richmond, Wimbledon, Croydon, Reigate and Guildford. Of these I can speak for Kingston only, which has established four garden centres, each having 28 plots making a total of 112. These figures go to show that elementary school gardening is progressing. *A. D.*

PROFITABLE ONION CULTURE (see pp. 217 and 234).—There are few crops that can be grown so successfully on a large scale, on such a variety of soils, and under such varied climatic conditions, as that of Onions. One reason why Onions have not been more generally grown is the mistaken idea that it is impossible to grow them without the application of vast quantities of farmyard or stable manure; but we have been taught by Dr. Bernard Dyer and his assistant, Mr. F. W. E. Shrivell, that certainly at Tonbridge larger and more economical market-garden crops, including Onions, have been grown by the aid of chemical fertilisers than could be produced by farmyard dung alone. At the same time, their experience, now extending over several years, indicates that it is very unwise to grow Onions without dung, however liberal the supply of chemical fertilisers. Market gardeners seldom use a dressing of less than 25 tons of dung per acre, costing in round figures £10 per acre—a quantity quite insufficient to grow the best crops. They often use as much as 50 tons, costing £20 per acre in one dressing. Dr. Dyer says it had long been his conviction that such heavy dressings must be wasteful, and that market-gardeners should use smaller dressings of purchased dung and spend a portion of the money thus saved on concentrated fertilisers, keeping the balance in their pockets. This conviction did not involve any blindness to the particular virtues of dung. Farmyard dung increases the store of humus or organic matter in the soil, and thus corrects the inherent physical shortcomings peculiar in the one extreme to sandy soils and in the other to heavy clays. It is probable that the beneficial effects of dung are in a considerable degree due to its influence on the mechanical condition of the soil, rendering it more porous and easily permeable to the surface roots upon the development of which the success of the Onion crop so much depends. Something may be due to moisture and to an increased temperature of the surface soil engendered by the development of so large an amount of organic matter within it, whilst the carbonic acid evolved in the decomposition of the dung, with the aid of moisture, serve to render the mineral resources of the soil more soluble. In selecting land for Onions, it is advisable to choose soil that is not likely to be affected much in the event of a prolonged drought, therefore it should contain a large amount of humus. It is next to an impossibility to raise a profitable crop of Onions unless there is a fairly good supply of moisture when the plant is making its strongest growth; therefore, it is important that the gardener treats his soil from the start with that object in view, viz., to conserve an adequate supply of moisture for the plant to draw upon during the season of dry weather. For this purpose it is well to observe an old adage, that the watering of the Onion crop should be done in the winter.

FIG. 108.—PETREA VOLUBILIS GROWING IN THE ROYAL BOTANIC GARDEN, PERADENIYA, CEYLON.

(See p. 251.)

this crop must be done very carefully. We have sown another batch of Cauliflowers of the variety Lenormand. They will be ready to plant on the ground in the open upon which the Cos Lettuces were planted last week. The Melon plants are well established in their fruiting quarters. They will require to be shaded during the middle hours of the day for a few days, after which time they will be given a little ventilation for a few hours daily. As soon as fresh growth is observable, the plants will be afforded a good watering, which is generally sufficient for two or three weeks, especially during dull weather. The young plants intended for the

tissues hard, the plants frequently run to seed. We have sown a batch of Turnip "Marteau" in well-prepared ground out-of-doors. This crop will require frequent waterings. We are cutting the Cabbage Lettuces that were grown with the Cos Lettuces under the cloches. They should have been ready by the end of March, but owing to the cold weather they are very late. The Passion Lettuces grown in the open are succeeding well; they will soon require watering. We are pricking off seedlings of Celery "Chemin" for the earliest batch. Each light contains 140 plants. The main batch from the same sowing will be transplanted in the open

That is to say, the dung, whether a large or a small quantity, should be applied and dug into the soil during the winter season, so as to be well incorporated with the land by sowing time. The artificial manures may be applied just previous to sowing the seed; this will encourage the young plants to send down their roots into the decomposing organic matter of the dung, and will tend to prevent any ill-effects of drought. The following table shows the relative economy of different systems of manuring in the growth of spring Onions at Tonbridge in 1900 and 1901:—

Annual manuring per acre.	Annual cost of manure per acre.	Weight of Onions per acre.	
		1900.	1901.
25 tons London dung ...	£ s. d. 10 0 0	tons. cwt. 8 11	tons. cwt. 10 7
12½ tons London dung ...	5 0 0	7 0	11 11
12½ tons dung, superphosphate (no potash) and 2 cwt. nitrate of soda ...	6 15 0	7 7	9 12
12½ tons dung, superphosphate (with potash) and 2 cwt. nitrate of soda ...	7 5 0	8 16	11 16
12½ tons dung, superphosphate (no potash) and 4 cwt. nitrate of soda ...	7 15 0	8 18	9 15
12½ tons dung, superphosphate (with potash) and 4 cwt. nitrate of soda ...	8 5 0	9 10	8 14
12½ tons dung, superphosphate (no potash) and 6 cwt. nitrate of soda ...	8 15 0	10 2	10 12
12½ tons dung, superphosphate (with potash) and 6 cwt. nitrate of soda ...	9 5 0	10 0	11 8
No dung, superphosphate (no potash) and 8 cwt. nitrate of soda ...	4 15 0	1 6	5 2
No dung, superphosphate (with potash) and 8 cwt. nitrate of soda ...	5 5 0	6 1	8 0

It will be seen that chemical fertilisers, used in addition to a moderate quantity of dung, produced in 1900 a highly valuable return, and that it proved advantageous in that season to use as much as 6 cwt. of nitrate of soda per acre. Even 2 cwt. of nitrate per acre, in conjunction with superphosphate, potash salts, and a light dressing of dung, gave a better yield than the heavy dressing of stable manure, showing the danger of relying exclusively upon this manure. Chemical fertilisers alone, without the aid of dung, gave much less satisfactory results than when a moderate quantity was used in conjunction with them. The great dependence of Onions not only upon phosphates and nitrogen, but also upon potash salts, is strongly shown in both years on the plot which has been throughout the experiments kept without dung. *J. J. Willis, Harpenden.*

—Having grown Onions in many parts widely separated in England, I can speak definitely of this bulb as furnishing a profitable garden and field crop, even at the low price of 2s. 6d. per bushel. In a Hampshire garden, overlying the green-sand formation, I have grown with fair thinning of the plants, three bushels to the rod, which is equivalent to £60 per acre. Of course, this is less in weight than that given by *A. D.*, who wrote of transplanted bulbs, but the cost of raising his 200 lbs. of bulbs takes a little off the total returns for the crop. I often wonder why the Englishman has need to purchase from Spain, Egypt, Bosnia, France, and other distant places Onions that he could grow easily at home. This is exactly a crop for the small holder and peasant cultivator; and there are similar ones if we would but look around. *F. M.*

—I read with interest the articles on cultivating Onions for market in the last two issues of the *Gardeners' Chronicle*. Apparently, from *A. D.*'s article (p. 217), in few ways, excepting the French system of vegetable culture, can fortunes be made so easily as by growing Onions. I can see only one difficulty, and that is in obtaining customers to buy them. Mr. Martin (p. 234) may be assured that the system of cultivation recommended by *A. D.* is to be preferred for many reasons, the cost of the frames being the only drawback. It results in a great saving of seeds, whilst sowing in frames is not dependent on the weather. The transplanted crop grows faster and therefore has a longer season for ripening, and the ground is left fallow for a longer time after trenching. This enables it to be more thoroughly worked, whilst vacant

ground can be easily kept clean of weeds. Transplanting takes longer than seed sowing, but it can be undertaken when seed sowing could not be performed. Also, there is no thinning to be done. This is an operation that is sometimes unavoidably delayed, to the detriment of the crop, and green Onions have no great value. For several years I have seen various varieties of Onions transplanted from frames and the same varieties sown direct on the bed. The ground in both cases has been treated precisely the same, but the difference has in every case been most marked, the crop from the transplanted plants being nearly double that of the other, owing to the increased size of the bulbs. *F. A. Edwards, Arlington Court Gardens, Barnstable.*

—Such communications as those of Mr. Kitley on this subject (see p. 234) constitute the despair of earnest people. They are the wet blankets of commerce and progress. Even if at one time good bulbs of English-grown Onions were not productive of high prices, may not the market methods adopted have been responsible for the unsatisfactory results. At the present time, judging by the market returns published in the *Gardeners' Chronicle*, there are no English Onions in the market, except bulbs for pickling. Spanish and Dutch bulbs are quoted at from 15s. to 23s. 6d. per case or bag. No wonder that, with no other Onions in shops or stores, I cannot purchase imported bulbs at less than from 2d. to 2½d. per lb. These are deep, globular bulbs, and not flat ones. If French peasants can sell these Onions at a profit here prettily roped, so also can home growers. It is our imperfect methods of marketing which are to be blamed. *A. D.*

FORCED STRAWBERRIES AT PIT HOUSE GARDENS, CHUDLEIGH.—I am sending a photograph (not reproduced) of Strawberries in pots as cultivated in these gardens. The plants were layered the first week in September, 1908, and the photograph was taken on March 27, 1909. Each plant is carrying from six to nine good fruits, the individual berries weighing from ½ oz. to 1½ oz. I am sending by the same post samples of the fruits. *W. Worth, Pitt House Gardens, Chudleigh, S. Devon.* [Some exceptionally fine berries were sent by Mr. Worth.—*Eds.*]

EVERGREEN HARDY VINE (see p. 240).—*Vitis striata* is a fairly well known evergreen vine. One of its garden names is *Ampelopsis semper-virens*. This member of the vine family is a native of Uruguay, from whence it was introduced in 1881. The leaves are small, digitate, thick in texture, and of a very deep green tint. The plant is not quite hardy, even in the neighbourhood of London, but it is much the hardiest of any of the evergreen vines. *W.*

FENCING IN PUBLIC PARKS.—The wooden rod hurdles used in the L.C.C. parks and open spaces must prove very expensive, considering how badly they are treated by the public. In some parks they are being replaced by a six-bar wooden hurdle, which offer good practice for vaulting by children. The unclimbable iron fencing made in 6 feet lengths would be much cheaper in the end and better for protecting newly-sown seeds, &c. When holted together they are firm and not easily knocked down. *John Carville.*

CULTURE OF CUCUMBERS.—Let me assure *H. W. IV.* that he is in error in assuming that "all engaged in growing Cucumbers for market stop the young plants at the third or fourth wire of the trellis." I do not stop the plants in the manner *H. W. IV.* describes, although a market grower of Cucumbers for many years past and one who has tried both the methods. Having experience of both ways, and a decided preference to the more natural method of culture, I ask *H. W. IV.* if he has really tried the method which in my case he condemns. The plants that I referred to as giving a continuous supply of fruits into October might have been cropped much longer. Most persons who cultivate Cucumbers on a large scale complain that the plants do not give more than one good "throw" of fruits in consequence of the weakening effects of the disease. In fact, instead of the plants bearing

continuously for months together, it is now a question of weeks. Your correspondent has recorded the interesting fact that plants have continued in fruit for 15 months, but it would be equally interesting to have details of the fuel bill and the value of the crop for the same period. The chief cultural error to which I referred was that of allowing the main stem to grow for several feet unchecked and suppressing the whole of the laterals. *E. H. Jenkins.*

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

APRIL 6.—*Present:* E. A. Bowles, Esq., M.A., F.L.S. (in the chair); Prof. G. S. Boulger, Messrs. A. W. Sutton, J. T. Arkwright, E. M. Holmes, W. Hales, J. W. Odell, C. E. Shea, W. Fawcett, G. Masee, J. Douglas, F. J. Baker, H. T. Güssow, A. Worsley, J. Frazer, G. S. Saunders, and F. J. Chittenden (hon. secretary). Visitors: Messrs. E. Laxton and J. H. Drummond, F.L.S.

Gummosis in Lemon.—Mr. H. T. Güssow reported that the specimens of Lemon shown by Mr. WORSLEY at the last meeting had been examined microscopically. After dissolving the gum in warm water at each of the places where the gum exuded, a wound was noticeable extending some way into the wood. The injured portions had no connection with each other, but were well defined nearly all round the stem. The distance between the two places where gum was seen oozing out was about 4 inches. The bark was peeled off and some of the gum was transferred with a sterilised needle to a cover glass, and was diluted with distilled water. After drying and finding this preparation it was stained for bacteria, and in every preparation a large number of them were revealed. The presence of the bacteria does not certainly prove that the gumming was caused by them, but the examination plainly showed that the injury could not have been due to some cause or other within the range of the root. Mr. WORSLEY kindly sent me the root and stem of the diseased Lemon, and the roots were found to be perfectly healthy, with a good many fibres and small rootlets; the stem just above the root showed next to a thorn an injury which according to additional information from Mr. WORSLEY, had first exhibited the gumming. The specimen examined was a seedling. It is frequently the case that bacteria gain entrance in the place of grafting, and cause profuse outflow of gum in all kinds of stone fruits. A fine culture of the organisms has been made, and it will be used in infecting a young Cherry tree. The bacteria isolated from Cherries, Plums, and Peaches, which showed gumming bore great resemblance to those isolated from the Lemon. The withering and flagging, and the silvery appearance of the shoots and leaves above the place of injury are certainly the natural results of the sap-conducting vessels being clogged by the gum.

Inheritance of characters in Pea seeds.—Mr. A. W. SUTTON exhibited a long series of preparations showing the seeds of plants raised by crossing a Pea which he found growing wild in Palestine (? *Pisum arvense*), with forms of the cultivated garden Pea (*Pisum sativum*), and with bicolor-flowered Peas (*Pisum arvense*), &c. Twenty-two crosses were made in 1907, and of these four were immature in the seed in F₁ and failed to germinate; four died off before flowering in F₁; seven flowered but produced no seeds; seven only produced any seeds in F₂ (these latter were shown on cards 1 to 7). In most cases it would appear that the plants were almost or quite sterile. Cards 8, 9 and 10 were the results of crosses made between the Palestine Pea and *Pisum sativum* by Mr. DARBISHIRE, and grown at Reading. They practically confirm Mr. SUTTON'S experiments. Mr. SUTTON also exhibited a growing plant of the wild Pea from Palestine, and a plant of *Pisum quadratum* (?) grown from seeds received from Kew. This plant much resembles the Palestine Pea in all respects except the foliage. He also exhibited a collection of the various forms of seeds of the garden Pea (*Pisum sativum*), and of bicolor

blooming types (*Pisum arvense*), &c. Among the remaining cards, some which showed that when Improved William 1st, with semi-wrinkled seeds, is crossed with a wrinkled Pea, the resulting types of seed do not follow the Mendelian ratio of 3:1, were particularly interesting. This Pea contains starch grains of similar form to those which are common to those found in round seeds, and not of the form found in wrinkled seeds, so that unless the wrinkled character of the seed were unconnected with the form of the starch grains the usual Mendelian ratio could scarcely be expected. Mr. J. H. DRUMMOND contributed a series of specimens from his own herbarium and from the herbarium of the Royal Botanic Gardens, by the courtesy of the director, showing that the plant Mr. SUTTON had collected in Palestine was in all probability *Pisum humile* of Bossier, and not *Pisum sativum* or *P. arvense*.

Wild species of Asparagus and Rhubarb.—Mr. SUTTON also exhibited plants of *Asparagus* (probably *Asparagus filicinus*) and *Rhubarb* (apparently *Rheum Moorcroftianum*) sent him from the Punjab by a correspondent. The roots of the *Asparagus* were tuberous, and were no doubt organs in which water was stored. The young leaves of the *Rheum* were cup-shaped, the leaf-stalk springing from the base of the cup.

Hippeastrum hybrid.—Mr. WORSLEY showed a flower of a deep dragon's blood red, a first cross between the two species *Hippeastrum alicum* and *H. vittatum*. The flower is of very good form and splendid colour.

Polystichum sp.—Mr. J. FRASER showed specimens demonstrating the resemblance between *Polystichum lobatum*, Presl., and *P. Lonchitis*, Roth. If the pinnæ of the latter were lobed or lobulate instead of being merely serrated, the two forms would be closely similar, judging from the size and form of the pinnæ in the two cases. The comparison between *Polystichum lobatum*, Presl., and *P. aculeatum*, Sw., was less obvious.

Seed from S. Africa.—Mr. E. M. HOLMES reported that the seed exhibited by Mr. VEITCH at a recent meeting was *Voandzeia subterranea*, often called Bambarra ground nut, and used in tropical and South Africa as food.

Malformed Orchids, &c.—Mr. J. W. ODELL showed some malformed Orchids, and some flowers of *Auricula* wherein the filaments of the stamens were becoming transformed into petals, thus showing the beginning of a double flower.

Dendrobium hybrids.—R. G. THWAITES, Esq., Streatham, sent flowers of *Dendrobium Thwaitesiae* × *D. Wiganiae xanthochilum* and *D. Wiganiae* × *D. Wiganiae xanthochilum*, both being white with a zone of purple on the disc of the lip. He wrote: "Of the first cross three have flowered like those sent, and of the second six plants have flowered. You will notice the pollen caps and stems are also white. I feel sure it would be quite useless to use those flowers for obtaining white hybrids, and it may be that the unsuccessful attempts to obtain white flowers (hybrids from apparently white parents) is due to coloured parentage somewhere behind the flowers used. These and other results, though apparently confusing, may later on assist in throwing light upon the question of albinism, as notwithstanding the contradictions which are appearing, I feel sure there is some logical law relating to it." *D. Wiganiae* is a hybrid between *D. nobile* and *D. signatum*, *D. Wiganiae xanthochilum* being a seedling out of the same pod, while *D. Thwaitesiae* represents the result of further crossing *D. Wiganiae* and *D. Ainsworthii* (*nobile* × *aureum*). The original parents are therefore either purple or yellow flowers, and the cause of the peculiarity is not apparent.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

APRIL 5.—The monthly committee meeting was held at the Horticultural Hall, Vincent Square, S.W., on this date. Mr. Thomas Winter occupied the chair. Nine new members were elected. The usual quarterly payments were granted. Any member not having received the annual report and balance sheet is requested to write to the secretary for a copy.

NURSERY AND SEED TRADE ASSOCIATION.

APRIL 5.—The annual general meeting of this association was held at the offices of the association, 32, Gresham Street, London, E.C., on this date. The members present included Mr. George Bunyard (Chairman), Mr. J. B. Slade (Messrs. Protheroe & Morris), Mr. H. W. W. Nutting (Messrs. Nutting & Sons), Mr. John Green (Hobbies, Ltd.), Mr. H. E. Silberrad (Messrs. Silberrad & Sons), Mr. B. B. Maller (Messrs. B. Maller & Sons), Mr. G. H. Barr (Messrs. Barr & Sons), and Mr. H. Simpson (Messrs. Cooper, Tabor & Co., Ltd.).

The annual report and balance-sheet were submitted to the meeting and accepted. The association's financial position showed still further improvement during the past year.

Mr. N. N. Sherwood, of Messrs. Hurst & Son, was re-elected president, Mr. W. J. Nutting treasurer, and Messrs. H. Simpson and G. H. Barr trustees.

SCOTTISH HORTICULTURAL.

APRIL 6.—The monthly meeting of this association was held at 5, St. Andrew Square, Edinburgh, on this date. The President, Mr. Whytock, occupied the chair. There was a moderate attendance of the members. A paper was read by Mr. L. B. Stewart, Royal Botanic Garden, Edinburgh, on "Insectivorous Plants."

Messrs. DOBBIE & Co., Rothesay, exhibited a collection of *Violas*. These were raised from cuttings rooted in August and placed in a cool house in September. The varieties *Bethea*, *Bullion*, *Kitty Bell* and *Snowflake* flowered 10 to 12 days earlier than others of the collection.

Mr. P. KEIR, Edinburgh, exhibited *Narcissus* Emperor in pots. The bulbs were planted at different depths, but were all in bloom.

Five new members were elected.

A paper will be given at the meeting to be held on May 4 by Dr. W. G. Smith, Edinburgh, on "Economic Botany and its Application to Horticulture."

ROYAL CALEDONIAN HORTICULTURAL.

APRIL 7, 8.—The spring show of this society was held in the Waverley Market, Edinburgh, on these dates. The exhibition generally was equal to those of previous years, and this notwithstanding the very inclement weather of the previous month. As is usual at this spring show the nurserymen's exhibits made a good display. Messrs. DICKSON & Co., Edinburgh, had a large exhibit, in which plants of *Rhododendron* "Pink Pearl" formed the principal feature; this firm also showed some very fine seedling *Hippeastrums*. (Gold Medal.) Amongst other local firms who set up large exhibits were Messrs. R. B. LAND & SONS, LTD. (Silver-gilt Medal), and Mr. JOHN DOWNIE (Silver-gilt Medal). Messrs. CUTBUSH & SON, Highgate, displayed an interesting exhibit of flowering shrubs and herbaceous plants (Silver-gilt Medal); Messrs. BARR & SONS, London, showed *Narcissi* (Silver-gilt Medal); Mr. R. E. GILL, Falmouth, exhibited cut blooms of *Rhododendron* (Silver Medal); Mr. Roche (gr. to Lady ANNALY, Gowrain Castle, Kilkenny) showed *St. Brigid Anemones* (Silver Medal); THE SCOTTISH MUSHROOM CO., LTD., Edinburgh, displayed *Mushrooms* (Silver Medal); Mr. F. LILLEY, Guernsey, showed a collection of *Narcissi* (Silver Medal); Mr. FORBES, Hawick, staged *Alpine* and *hardy border plants* (Bronze Medal); Messrs. STORRIE & STORRIE, Glencarse, staged *Primulas* (Bronze Medal); Messrs. KEELING & SONS, Bradford, showed *Orchids* (Bronze Medal); and Messrs. DOBBIE & Co., Rothesay, *Violas*.

A Certificate of Merit was awarded to a new variety of *Narcissus* named "The Sirdar," exhibited by Messrs. BARR & SONS.

SCHEDULES RECEIVED.

Horticultural Exhibition, to be held in connection with the Lincolnshire Agricultural Show at Louth on July 14, 15, and 16. Secretary, Mr. A. Bellamy, High Holme Road, Louth.

National Carnation and Picotee Society's exhibition, to be held at the Royal Horticultural Hall, Vincent Square, Westminster, S.W., on Wednesday, July 21. Secretary, Mr. T. E. Henwood, 16, Hamilton Road, Reading.

HARDY FLOWER BORDER.

HYACINTHUS AZUREUS.

THIS species is the old *Muscaria præcox* of gardens, a plant of miniature growth, and a habit that ever delights the eye. The small pyramids of turquoise-blue flowers usually appear in February, and, despite the frost and the snow, the plant this year has not been much behind its proper season of flowering. The blooms are welcome both in the rock-garden and the Alpine house, where, if the plants are grown in pans, they are most effective.

NARCISSUS MINIMUS.

NARCISSUS MINIMUS is a little gem too small for the open border, where its beauty would not be seen. It is better suited for growing in pans in a cold house. The small trumpet flowers are of a rich, deep yellow colour, and perfect in form. The species is unique among the early flowers of the year.

NARCISSUS PALLIDUS PRÆCOX.

NOT merely is this plant one of the most fascinating of all *Daffodils* by reason of the rich colour and great variety of form and size of its flowers, but it is one of the best for early blooming, and it is absolutely hardy. The buds can endure fresh and heavy snows for a fortnight, and later continue to expand as though nothing had happened, although in the meantime growth was perfectly arrested. This Pyrenean species appears more at home in the woodland than in the garden. E. J.

Obituary.

WILLIAM BURTON.—We regret to record the death of this gardener at 37, Whitehall Park, Hornsey Lane, on Saturday, April 3. Mr. Burton began his gardening career in 1848 in the

THE LATE WILLIAM BURTON.

nurseries of Messrs. R. Veitch and Son, Exeter. Later he was engaged for two years at Ashley Court, Tiverton, and afterwards at Messrs. E. G. Henderson & Son's Wellington Road Nurseries, St. John's Wood, where he remained for 10 years. In 1862, when Messrs. Parker and Williams dissolved partnership, Mr. Burton entered the service of the late B. S. Williams as manager of the Victoria and Paradise Nurseries, Upper Holloway. In 1888 he left the service of Messrs. B. S. Williams and Son, and engaged with Mr. John Russell, of Haverstock Hill. He afterwards retired from business. His remains were laid to rest in Islington Cemetery, Finchley, on Wednesday, April 7, in the presence of members of his family and a large number of friends.

MARKETS.

COVENT GARDEN, April 14.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Acacia, Anemone, Azalea, Calla, Carnations, Catleyas, Cypripediums, Daffodils, Dendrobium, Eucnaris, Freesias, Gardenias, Hyacinths, Iris, Lilac, Liliun auratum, Lily of the Valley, Marguerites, and Mignonette.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Adiantum, Agrostis, Asparagus, Berberis, Croton, Cycas, Daffodil foliage, Ferns, Galax leaves, Hardy foliage, Honesty, Ivy, Myrtle, Ruscus, and Smilax.

Plants in Pots, &c.: Average Wholesale Prices (Contd.).

Table listing various plants in pots and their prices, including Kentia, Latania, Liliun longiflorum, Lily of the Valley, Marguerites, Mignonette, and Pelargoniums.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples (Australian), Bananas, Cape fruit, Cranberries, Custard Apples, Grapes, Lemons, Limes, Melons, Nuts, Oranges, and Strawberries.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, Beetroot, Bussel Sprouts, Cabbages, Carrots, Celery, Chicory, Cucumbers, Endive, Horseradish, Kale, Lettuce, Mint, Parsnips, Peas, Potatoes, Radishes, Rhubarb, Salsafy, Seakale, Spinach, Stachys, Turnips, and Watercress.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Acacias, Ampelopsis, Aralia, Aspidistras, Asparagus, Boronia, Cinerarias, Clematis, Cocos, Crotons, Cyclamen, Cyperus, Daffodils, Dracaenas, Erica, Eucnaris, Ficus, Genista, Grevilleas, Hardy flower roots, Hyacinths, Hydrangea, Isolepis, and Juncus.

COVENT GARDEN FLOWER MARKET.

The warm sunny days preceding Easter developed flowers rapidly, and supplies last week were abundant. Better prices were made on Good Friday than on Saturday. There were large consignments of cut flowers from the south of France, the Channel and Scilly Islands. Early on Saturday, 10th inst., there was a fair trade; later in the day larger quantities of flowers arrived and prices fell considerably. Good Roses on long stems were sold at 6s. per dozen bunches, whilst Daffodils realised no more than 6d. per dozen bunches. This morning (Wednesday) the Foreign Market was glutted with flowers.

POT PLANTS.

Flowering plants have sold at fairly good prices. Azaleas are still remarkably good; there are, in addition to plants in 5-inch pots, larger specimens which make from 7s. 6d. to 10s. 6d. each; varieties of Azalea mollis do not sell freely. Rhododendrons in well-flowered plants are seen. Lilacs, although well flowered, have no great demand. Amongst Roses, there are some excellent plants of Dorothy Perkins variety. Dwarf Polyantha varieties are well flowered. Marguerites are again plentiful; some of these plants have sold for 15s. per dozen. Other plants seen in quantity include Cinerarias, Spiraeas, Hydrangeas, Mignonette, Stocks, and Genistas.

HARDY FLOWER ROOTS AND BEDDING PLANTS.

There are large supplies of Pansies with expanded flowers. At the present time there is nothing that sells more readily than these pretty border flowers. Violas also sell well. Primroses, Polyanthuses, and double varieties of Daisies are also in demand. Large quantities of hardy border plants are seen, also summer bedding plants such as Zonal Pelargoniums, Calceolarias, and Marguerites; a variety of tender plants in store boxes, and annuals in pots, including Sweet Peas, Tropaeolum canariense and Dwarf Nasturtiums sell readily for suburban planting.

CUT FLOWERS.

Carnations are plentiful again. Roses have developed rapidly, and their prices have fallen considerably. Blooms of Liliun longiflorum are abundant. I noticed fine flowers of the variety grandiflorum this morning (Wednesday). Blooms of L. lancifolium rubrum are good. Of Lilac the ordinary mauve variety is much cheaper. Tulips are over-abundant, but supplies of this flower will soon fall off. The Darwin varieties are very fine, and will be available until the end of May. Parma Violets are still very cheap. Flowers of Spanish Irises in several colours are seen. Callis are over-abundant. In fact, supplies of all seasonable flowers are plentiful. A. H., Covent Garden, Wednesday, April 14, 1909.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

- List of gardening appointments including Mr. A. BEVAN, Mr. A. T. SMITH, Mr. G. A. HOLMES, Mr. J. WREN, and Mr. J. LOVATT.

DEBATING SOCIETIES.

BRITISH GARDENERS' (LONDON BRANCH).—The monthly meeting of this branch of the B.G.A. took place on Thursday, April 8. A debate on "Commercial and Co-operative Gardening" formed the principal business of the evening. Mr. J. Weathers, the general secretary, gave some interesting advice upon the business side of horticulture. A. J. H.

BRISTOL AND DISTRICT GARDENERS'.—The last of this association's meetings for the session was held on April 8. Mr. C. H. Cave gave a lecture upon "Daffodils." Mr. Cave said that lifting should be done in July, and all replanting finished by the end of August; he gave a comprehensive list of varieties suitable for various purposes. H. W.

WARGRAVE AND DISTRICT GARDENERS'.—At a recent meeting of this association, Mr. W. Pope of "The Willows" Gardens, Wargrave, read a paper on "The Culture of the Amaryllis." He gave cultural directions with regard to resting the bulbs, their propagation, soils and general management.

At the last meeting of the association an address on "French Gardening" was given by the hon. sec., Mr. H. Coleby. The chief points referred to by the lecturer were the system of peasant proprietors in France, the amount paid by English consumers for early produce from France, the various French gardens established in England, methods of working, the different crops raised and the best varieties of each, and lastly, "packing" for market.

READING GARDENERS'.—A meeting of the Association took place in the Abbey Hall on Monday, April 5. The chairman, Mr. A. F. Bailey, presided over a good attendance of the members. The lecturer for the evening was Mr. H. C. Loader (vice-chairman), who read a paper entitled "Our Association—Some of its Advantages." Mr. Loader spoke of the association as a partnership for the promotion of horticulture.

REMARKS.—Oranges from Valencia and Denia are arriving in a bad condition; best samples are much dearer. French Apples continue to sell freely but at lower prices. Australian Apples are arriving in slightly increased quantities, and are generally cheaper. Forced Rhubarb from the Leeds district is now practically finished, as also are Gros Colmar Grapes. Mushrooms are plentiful. Vegetables generally are cheaper. E. H. R., Covent Garden, Wednesday, April 14, 1909.

Potatoes.

Table listing potato varieties and their prices, including Kents, Scottish Triumphs, Up-to-Date, Lincolns, Royal Kidney, Brits-b Queen, Maincrop, Evergood, Lincolns, King Edward, Blacklands, Dunbars, Langworthy, and Yorks.

REMARKS.—Potatoes are much dearer and supplies are shorter. Prices have a tendency to advance still further. Stocks in London are very low. Edward J. Newborn, Covent Garden and St. Pancras, April 14, 1909.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending April 10, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—During the greater part of the week the sky was almost cloudless, but some rain fell in Ireland and the west and north of Scotland on Sunday, and on Saturday a considerable amount of cloud was experienced in Ireland and Scotland, with a little rain in places.

The temperature was above the average in all districts, the greatest divergence being 3.6° in Scotland N., and the smallest 0.8° in England E. The highest of the maxima were recorded generally on the 9th or 10th, and ranged from 74° in England S.W., 73° in the Midland Counties, and about 70° in several other districts to 63° in Scotland N. The maxima were generally low on the east coast of England, on some days below 50°. The lowest of the minima, which were mostly registered early in the week, varied from 18° in Scotland E. (at Balmoral on the 6th), 22° in England S.W. (at Llangamarch Wells on the 10th) and 24° in the Midland Counties to 29° in Ireland, and to 39° in the Channel Islands. The range of temperature during the week was unusually large; at many inland stations it exceeded 40°, at Bawtry it amounted to 46°, Raunds and Marlborough 47°, and at Llangamarch Wells 48°. The lowest grass readings reported were 9° at Llangamarch Wells, 15° at Balmoral, 16° at Birmingham, and below 20° in some other localities.

The mean temperature of the sea.—At nearly all stations except those on the east and south-east coasts of England the water was rather warmer than during the corresponding week of last year, the actual figures ranging from nearly 50° at Seafield and about 48° at Plymouth and Salcombe to below 44° on the north-east and north coasts of Great Britain and to 40.7° at Burnmouth.

The rainfall.—Over the kingdom as a whole the week was without rain, and the few falls which occurred in the north and west were very slight.

The bright sunshine.—Over the kingdom generally the week was among the brightest ever recorded, the percentage of the possible duration ranging from 89 in England E., 87 in England S.E., 82 in the English Channel, and above 70 in the other English districts to 51 and 48 respectively in Scotland W. and N. The highest percentage of the possible amount reported from individual stations was 93 at Lowestoft, Yarmouth, Felixstowe, Tunbridge Wells, and Worthing.

THE WEATHER IN WEST HERTS.

Week ending April 14.

A remarkably good record of sunshine.—In the early part of the week the days were warm, while the night temperatures were below average. Since then the days have been of about a seasonal temperature, and the nights warm. On the warmest day the highest reading in the thermometer screen was 72°—which is a remarkably high temperature for so early in April. On the other hand, on the coldest night the exposed thermometer registered 10° of frost. At 2 feet deep the ground is now 1° warmer, and at 1 foot deep 2° warmer, than is seasonal. Rain fell on two days, but to the total depth of less than a quarter of an inch. There has been scarcely any percolation through either of the soil gauges during the week. The sun shone on an average for 8½ hours a day, or for more than three hours a day longer than is usual at this period of April. The average record for the first three days was 12 hours a day; on the sunniest of those days the sun was shining brightly for exactly 12 hours. The first few days of the week were calm, but since then the wind has been as a rule moderately high. The mean amount of moisture in the air at 3 p.m. fell short of a seasonal quantity for that hour by as much as 10 per cent. On the first four days of the week the atmosphere was singularly dry. In fact, early in the afternoon on those four days the differences between the readings of an ordinary thermometer and one with its bulb kept constantly moist were respectively 16°, 18°, 19°, and 15°. E. M., *Berkhamsted, April 14, 1909.*

* * * The Editor will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for forming Supplementary Illustrations to this Journal.

AZALEA LEAVES DISEASED: T. D. W. The leaf-galls are formed by the fungus *Exobasidium rhododendri*. Hand-picking and burning the infested portions is the only remedy.

"BIG BUD" ON BLACK CURRANT BUSHES: S. F. & Co. The buds are infested with the Currant bud mite, *Eriophyes ribis*. At this season of the year the mites are migrating, and it is during this time that they may be combated. The following remedial measures are recommended by the Board of Agriculture in a leaflet on this subject:—(1) The grower should cultivate from clean stock only, rejecting bushes that show swollen buds. Cuttings from infested plants should not be used. (2) Where the disease is limited to a few bushes these should be uprooted and burned. (3) Handpicking the swollen buds may, in an

isolated area, keep the pest in check. (4) Hard pruning followed by the removal by hand of suspiciously large buds has often been tried, sometimes with fair results, sometimes without manifest improvement. (5) Fumigation with hydrocyanic acid gas has been experimented with, but the results are not such as to justify a recommendation of this treatment, especially in view of the difficulties attending fumigation over a wide area in the open. (6) Dusting or spraying with a mixture of lime and sulphur. Very encouraging results—amounting in some cases to a cure—have attended the experiments of Collinge with the lime and sulphur treatment. The spray fluid used consisted of a mixture of 1 lb. of lime, 1 lb. of sulphur, and 20 gallons of water. This treatment to be successful must be thorough and repeated. More successful even than this was the dusting with lime and sulphur. One part of unslaked lime and two parts of flowers of sulphur should be mixed together and dusted three times on the bushes when they are wet, at the end of March or the beginning of April, again in the middle of April, and again in the first week of May.

CYCLAMEN: A. W. P. Place the plants in a tight position and keep them growing for a time after flowering to form stout corms. Afterwards dry them off very gradually, but not severely. In August shake away the old soil and pot them into a suitable compost. Place them in frames until it is time to bring them into the plant house to develop their flowers. Cyclamens are not usually grown after the second year of flowering. See also a note in the "Plants Under Glass" Calendar on p. 247.

HYACINTH BULBS FAILING TO ROOT: A. S. The bulbs are badly infested with the bulb mite, which has destroyed the roots as they appeared.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. Correspondents not answered in one issue are requested to be so good as to consult the following numbers.

FRUITS: F. C. E. Dredge's Fame.

PLANTS: T. H. 1, *Aerides virens*; 2, *Dendrobium crystallinum*; 3, *D. Pierardii*.—R. B. *Erica vagans*.—J. H. C. *Ansellia congoensis*, native of tropical Africa.—Scot. 1, *Chionanthus virginica*; 2, probably *Exochorda Albertii*; 3, *Psoralea pinnata*.—H. J. W. 3, *Calceolaria violacea*.—T. H. *Butea frondosa*.—C. N. Co. *Picea excelsa* var. *stricta*.—R. T. 1, *Cologyne fuliginosa*; 2, *Eria convallarioides*; 3, *Dendrobium transparens*; 4, *Polystachya Ottomiana*.—Cornish. 1, *Stachys lanata*; 2, *Centranthus ruber*; 3, *Sempervivum tectorum*; 4, *Sedum Sieboldii variegatum*; 5, *Mesembryanthemum spectabile*; 6, *Sedum carneum variegatum*.—S. F. *Adonis aestivalis*.—H. H. 1, *Poly-podium Dryopteris*; 2, *Lastrea rigida*; 3, *Adiantum pedatum*; 4, *Asplenium trichomanes*.—B. *Dendrobium heterocarpum* (aureum), and a light form of *Cypripedium Leeanum*.—F. G. *Dendrobium luteolum*.

PEACH BUDS DROPPING: X. Y. Z. The trouble has been caused by some check. It is generally the result of allowing the borders to become too dry during the winter.

PELARGONIUM LEAF SPOTTED: F. E. S. & Co. The plants are attacked by *Botrytis cinerea*. Spray them with a rose-coloured solution of permanganate of potash. Admit more fresh air into the structure in which they are cultivated.

PINEAPPLE NECTARINE: J. D. The tree is affected with "silver-leaf" disease. Not much is known about this complaint, but it has been attributed to a fungus, *Sterium purpureum*, which is said to enter through the roots and

grow upwards into the stem. It has been asserted that deleterious substances given off by the fungus are carried up in the sap to the leaves, and there act in a disintegrating manner upon the cells of the leaf, so that they become widely separated, and with large air spaces between them. These air spaces give the pale colour to the foliage, whence the name "silver-leaf." No cure for the disease is known.

PLANTS FOR COMPETITION: Col. R. H. We are unable to assist you in this matter.

POTATO SCAB: *Wessex*. Both sawdust and seaweed are to be recommended for preventing scab in Potatoes. The main cause of this complaint is the placing of farmyard manure in the rows when planting.

ROSE FORTUNE'S YELLOW: A. E. S. This Rose, when cultivated under glass, may be termed evergreen, and when close pruning is not practised after flowering, the older leaves drop freely. If the plant is allowed to become dry at the roots, or a too dry atmosphere is maintained in the house, the leaves on the current season's flowering shoots will drop. The plant should be well watered and fed with manurial stimulants during the season of active growth and flowering. Cut the shoots hard back when flowering is finished.

STRAWBERRIES: W. W. There is no disease in the plant, although it has failed to develop many leaves or flowers. The trouble must be due to some cultural error, which only a person on the spot could determine.

TOMATOS DISEASED: G. P. The plants are affected with sleepy disease (*Fusarium lycopersici*). The fungus which causes the disease flourishes in the soil and enters the plant by the root. During its development it passes through three stages, the first of which usually lasts about a week, the stem at the end of that time being much decayed and covered with a gelatinous mass. During the last stage the spores are resting and preparing to attack the young plants another year, or whenever a suitable opportunity presents itself. The plant can only be attacked by the fungus in the last stage of its existence. Diseased plants never recover, and therefore no attempt to save the plant is successful. As the disease grows inside the plant it is useless to spray with a fungicide. All diseased plants should be uprooted immediately the disease is noticed and burned. If it is not practicable to remove the soil in which the plants have been grown, it should receive a liberal dressing of gas-lime. This should be allowed to lie on the surface for 10 days, and should afterwards be thoroughly incorporated with the soil. After this the soil should remain for at least 10 weeks before anything is planted in it. It should be soaked with water once a week. Lime should be mixed with the soil in which Tomatos are grown.

TULIPS FAILING TO FLOWER: J. Betts. As other varieties have succeeded under exactly the same conditions, and the variety you mention failed for two seasons, it is obvious it is not suitable for forcing.

WILD GARLIC: *Macedon*. Mow the Grass very closely. This will prevent the leaves of the Garlic developing and thus cause a check to the bulbs. At the same time dress the land with nitrogenous manures, which will favour the development of the Grasses, so that in time they will crowd out the intruder.

WIREWORMS IN SOIL: J. S. The larvæ may be trapped with Potato or Beetroot placed in holes and covered with soil. Mark the position of the traps with a stick. Superphosphate applied as a dressing to the land is useful for destroying wireworm. In small areas a quarter of an ounce of bisulphide of carbon applied to each square yard of soil is effectual in combating this pest. Vaporite will also destroy wireworm in certain conditions.

SPRING IN THE MARITIME ALPS.

WHEN Mons. Emile Burnat undertook the compilation of that great work, the *Flore des Alpes Maritimes*, which will be one of the very finest and most reliable European *Floras*, he wisely included not only the range of mountains, partly in Italy and partly in France, commonly called the Maritime Alps, but also the adjoining French Department of Alpes Maritimes.

Napoleon fixed the limit between the Maritime and the Ligurian Alps at the Col d'Altaire, under which passes the railway from Turin to Savona; and this opinion was endorsed by the Italian Geographical Congress of 1892, because the pass forms the most clearly-defined depression in the ranges round the Gulf of Genoa, and, as remarked by the great botanist and mountaineer, John Ball, in his celebrated *Alpine Guide*, there are geological reasons which favour this arrangement.

The truly Alpine district west of this pass is separated from the lower Ligurian moun-

tains, which are more Apennine in character, by the famous Col di Tenda, over which the great road runs from Nice to Cuneo and Turin. This Alpine region may be called the Argentera district, after the Punta dell' Argentera (10,883 feet), the highest point of the whole range; but there are many peaks which rise to 9,000 and 10,000 feet.

The Chestnut zone in the Maritime Alps has the most varied flora, because many plants of the distinct Mediterranean group are found growing side by side with those which have descended from the mountains, in addition to many which are only found in this particular zone.

The Maritime Alps have the advantage of being accessible perhaps a month earlier in summer and later in autumn than the Swiss Alps. Visitors to the French or Italian Riviera in spring, which is at its best in April and May, especially from the point of view of vegetation, could not do better than return via the Col di Tenda to Turin, and spend a week at that charming spot, San Dalmazzo di Tenda, on the way.

From the Italian side of the frontier, say, from San Remo or Bordighera, or nearer Genoa, one might spend an intermediate week both pleasantly and profitably, as far as plants are concerned, at one of the picturesque hill villages of Liguria, such as Pigna or Bajardo. Pigna is prettily situated 1,000 feet above Bordighera, among Olives and Sweet Chestnuts. The Chestnuts begin to appear about 400 feet above the sea, and extend to 3,000 feet on Monte Toraggio. At this altitude their place is taken by Pines, which, in their turn, give way to Larches, which mount the summits of the mountains. The top limit of Olive trees is about 1,800 feet in this district. Visitors should take with them Mr. Bicknell's excellent little *Flora of San Remo and Bordighera* (1896).

Pteris cretica is well established on the banks of a stream near Pigna. Though this Fern is found in Asia, Abyssinia and America, in Europe it is chiefly confined to Italy, Sardinia, Sicily and Crete. *Cheilanthes odora* is another Mediterranean Fern frequently seen in the district. The three handsome Lilies, *L. croceum*, *L. pomponium* and *L. Martagon*, occasionally adorn some of the grassy slopes in this neighbourhood, *L. pomponium* growing even at a height of 6,000 feet on some of the mountains.

Monte Toraggio, though not more than 6,400 feet, is a fine rugged mass, beautifully proportioned, and it lends itself to exquisite effects of colour. The lower slopes are covered with dense thickets of Oak and brushwood. Some of the wooded valleys remind one of the combes of Exmoor or the Quantock Hills; but they are deeper and more extensive. At 5,000 feet are the highest "alps"—an alp is a mountain pasture used in summer. Early in June, before these alps are mown, they are bedecked with Gentians, Anemones, *Cerinth* minor, *Orchis globosa*, *O. ustulata*, and *O. sambucina*, *Narcissus poeticus*, *Pedicularis comosa* and *P. gyroflexa*, and a host of other brilliant flowers. On the highest slopes grow great patches of *Pæony* (*P. peregrina* Mill.) and the mauve flowers of *Aster alpinus*. On the rocks above grow various Saxifragas, including the endemic *Saxifraga cochlearis* and the still more beautiful *S. linguata*.

But the Tenda district is of most interest to botanists. San Dalmazzo, beautifully situated at the junction of two lateral valleys with the main valley, is the place to stay at. It can be reached on the south from either Nice or the frontier town of Ventimiglia, whence the drive up the long Roya valley is shorter, and the main Tenda road is joined at Breil. If economy be an object, a somewhat primitive diligence may be taken the whole distance for three francs. The drive from Ventimiglia occupies six hours, but the route is very interesting, especially to the artist, botanist, and geologist. The fact that the Franco-Italian frontier is very irregular, so that one must pass from Italy into France and vice versa several times, adds to the interest. The narrow Gorge of Saorge, which the river has cut out of the limestone, is a prominent feature in the landscape. In June some of the rocks are festooned with the wax-like blossoms of *Saxifraga cochlearis*; while *Alyssum halimifolium* is abundant by the roadside.

The hotel at San Dalmazzo is new, and the rooms are good and clean. A step across the road leads into the shade of an ancient Chestnut grove, with brilliant flowers on all sides. These comprise various *Campanulas*, *Astrantia major*, *Thalictrum minus*, *Epipactis atrorubens*, and *Cephalanthera rubra* 2 feet high. *Epipactis atrorubens* seems to hybridise freely here with *E. latifolia*. The rocks by the roadside above the hotel are the home of Pinks and *Helianthemums* of different species, *Lilium croceum* and the white-rayed *Orlaya grandiflora*. Below the hotel across the river are screes and limestone cliffs, where many rare plants are found, including *Micromeria Piperella*, *Asperula hexaphylla*, *Thymelea dioica*, *Potentilla saxifraga*, and *Mœhringia*. Among the thickets and rocks above the road to Briga the handsome spikes of *Delphinium fissum* rear their heads, but, fortunately, are not easily found. *Telephium Imperati*, that puzzler to systematic botanists, grows on the roadside wall and among the broken limestone. It has for companions the handsome *Inula montana*, the woolly *Micropus erectus*, *Trigonella monspeliaca*, *T. gladiata*, whose strong scent in the herbarium is so powerful, *Ervum nigricans*, the elegant *Vicia onobrychioides*, and many other sun-loving plants. H. S. T.

(To be continued.)

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM CRISPUM XANTHOTES MRS. F. M. OGILVIE.

A SMALL, undeveloped plant of *Odontoglossum crispum xanthotes* in Mrs. Ogilvie's garden has proved to be one of the most gorgeous varieties of *xanthotes* that has yet been seen. It has been named after Mrs. F. M. Ogilvie. Imagine a snow-white bloom with finely-formed overlapping petals, and place upon the sepals three twin coalescent blotches of the most brilliant orange-yellow with a large oblong ovate lip carrying a large similar blotch and some spots, and you have a mind's picture of this lovely variety. In addition, the channel and column are similarly marked.

The title "*Bonnyanum xanthotes*" would exactly fit the plant. The illustration in fig. 110 affords a good idea of the flower. *de B. Crawshaw.*

COLONIAL NOTES.

*AN EXPERIMENTAL STATION IN MONTREAL.

In Montreal and vicinity there are about one-half million square feet under glass devoted to commercial floriculture and vegetable forcing. It is not necessary for me to state that a number of problems of great interest to florists could be worked out at considerable saving to the trade at some suitable place erected for the purpose. So far as I know, no aid has been sought for such work in this province. Yet you have at your service, without any cost and without any effort on your part, a range of greenhouses thoroughly up-to-date in every particular, given by Sir Wm. C. Macdonald, of your city, and situated at Macdonald College, P.Q., where experiments in your interests are conducted. This is a gift of which florists and gardeners should be proud, for we shall now be able to keep pace with those engaged in similar work in parts of America, and who receive more or less State, or provincial aid.

Our houses are well known to most of you. They comprise four 100-foot houses built in block, with glass partitions dividing each span of 21½ feet, and these houses are again divided, giving eight divisions, each under thermostatic control. What was in mind when developing the plan was to assist those who intend to make a living by cultivating plants under glass, so that they will be able to get the largest possible crop at the least possible expense, and thus supply plants at the lowest rate. In order to conduct effective experiments, crops must be grown on a commercial scale, and marketed in a commercial manner. A considerable quantity of each crop must be produced and placed upon the market. This process must be continued for a number of years, in order that reliable information may be obtained. In our experiments the business end is kept always in view, not by assuming what we might have got, but by actually placing our produce on the market and competing with growers in general. It always seemed to me that many of the provincial and State-aided experiment stations cut off their work at the business end, simply because some grower feels that to place such goods on the market would infringe on his business. The idea is entirely wrong from every standpoint. It is possible to abuse the practice, but if honestly carried out no one suffers.

The only fault I can find with the greenhouses is that they are only about half large enough to carry on efficient work. As an educational institution we have to devote considerable space to demonstration and for the practice of students.

Our intention at the start was to erect several styles of construction, but on close investigation it was decided that the difference in form of up-to-date construction, so far as utility goes, is slight, and that a whole range of uniform construction, such as the average grower might put up, would be more valuable.

Possibly, our experiments to determine some of the best styles of bench are the first of the kind. We have the solid side benches, 2½ feet high, in some cases filled with earth up to the cultivated soil, in other cases with rough excava-

tion stone, and in others with cinders. Some of the benches have 2½ feet sides, with openings into 2½-inch tiles, laid closely together below the bench soil, and below these again there is simply soil, excavation stone or cinders. In other benches with 2½ feet sides there are 4-inch openings in line 4 inches apart, and 18 inches below the top of the bench, leading into the excavation rock or cinder, which fills the centre of the bed. There are low benches, with simply 8-inch coping, and also elevated benches. These benches are arranged differently in various houses. The object is to determine the most suitable style of bench for different crops, and the best arrangement of these benches in the house.

In the construction of the benches, we aimed to take up as little space as possible with the thickness of the bench sides. The benches are all made of cinder concrete, reinforced with wire. The bench sides, except of the elevated benches, were made of cement slabs, 3 inches thick at the bottom, and 2 inches at the top; they are 2 feet 8 inches wide, and 5½ feet long. These were made on the flat, and electric weld wire placed in the middle of the slab, allowing 4 inches to project at each end of the slab. After they were

FIG. 110.—ODONTOGLOSSUM XANTHOTES VAR. MRS. F. M. OGILVIE.
(See page 257.)

well set, they were lifted and taken to the house, set in place, and the wire at the ends hooked together. Thin concrete was then run in between the joints by putting up boards to hold it, and the whole braced on the inside by an occasional cement beam to prevent spreading.

We have not been long enough at the work to give any information on the relative merit of these benches, but hope to do so in course of time.

The question of the best soil for greenhouses will receive our attention. An experiment that we propose to take up is the growing of a crop on the benches, principally in the summer, for the purpose of leaving fibrous roots in the soil, and by having a rotation of crops, save renewing the bench soil so often. This is impracticable with some crops, but it seems possible that quick-growing, heat-loving plants may be so treated.

The physical condition of the soil for various crops has not received the attention the subject deserves; in this connection we intend to make experiments in which the soil has been incorporated with chopped alfalfa in varying propor-

tions. Experiments for the purpose of getting more definite information as to the physical property of soils best suited to greenhouse crops will be commenced as soon as possible.

The best time for benching up different crops has not been determined in our northern districts, therefore we intend to devote some time to the subject. The selection of cuttings from the most productive plants in order to increase the yield will be studied from a commercial basis. If florists are shown by concrete experiments an increase in bloom equal to 25 cents a plant they will surely pay some attention to this important matter. Then we have the problem of getting pure fresh air into our houses during the cold winter months, when no ventilators can be opened. The question of the amount of moisture in the air during the winter months is also worthy of study.

Experiments to determine the temperature at which we can develop different crops most economically during winter is one on which several thousand dollars could profitably be expended.

There are countless experiments that may be expected to throw light on problems connected with commercial horticulture. But limited space, the need for continuing each experiment over a number of years, and the fact that several different experiments cannot be conducted at one time in the same house, will operate to make progress in such matters less quick than we could desire.

THE ALPINE GARDEN.

RED-FLOWERING SAXIFRAGAS WITH CRUSTED FOLIAGE.

From the European Alps and Pyrenees there have been obtained a few interesting members of the genus Saxifraga, which form a distinct section, having crusted leaves and red flowers. Red flowers are not uncommon in this genus; they are to be found in the oppositifolia group, as well as in those species belonging to the Megasea section. These few species, however, combine crusted foliage, red flowers and partly red stems, and are placed by Engler in the section "Kabschia," which includes such well-known garden plants as *S. Burseriana* and *S. apiculata*. They are all somewhat similar in habit, and in the form of their flowers, the principal differences between the species being found in the foliage and inflorescences. They might well be considered widely-divergent geographical forms of one variable species; but, for garden purposes, they are distinct. Given a well-drained, sunny position, in stony soil, they are quite hardy on the rockery; but, like many early-flowering Saxifragas, may be seen to better advantage when grown in pans and given the shelter of a cold house when in flower.

The five species comprising the group may be divided naturally into two sections, three having a spicate or subspicate inflorescence, while the other two have branching ones:—

Spicate or Subspicate Inflorescence.	Branching Inflorescence.
<i>S. porophylla</i> <i>S. Frederici-Augusti</i> (thessalica) <i>S. Grisebachii</i>	<i>S. media</i> (calyciflora) <i>S. Striburyi</i>

It seems strange that the two with branching inflorescences should form the two geographical extremities of the group, *S. media* being found in the Pyrenees, while *S. Striburyi* comes from Bulgaria.

S. POROPHYLLA.—This species is a native of the Italian Alps, where it is found growing on calcareous rocks. The plant forms rosettes of mostly spatulate leaves, one-half to three-

* Extracts from an address by Prof. W. S. Blair (Macdonald College, P.Q.), before the Montreal Gardeners' and Florists' Club.

quarters of an inch in diameter, and produces flower-stems 2 to 3 inches high. These are densely villous and glandular. They are coloured red toward the top, like the flowers, which are sometimes shortly pedicellate, and somewhat bell-shaped, with a contracted mouth, while the calyx is large and almost encloses the corolla.

S. FREDERICI-AUGUSTI (*S. THESSALICA*).—This species is evidently the more eastern form of *S. porophylla*, of which it is sometimes quoted as a synonym. It is found in Greece and Macedonia. This species differs from *S. porophylla* in having narrow, acute, strap-shaped leaves, in dense rosettes, one-half to three-quarters of an inch in diameter; they have chalk pits on their margins. The flower-stems in both species are about the same in height, but in *S. Frederici-Augusti* the flowers are almost sessile. The plant flowers towards the end of April. The name *Frederici-Augusti* was one of several

is figured in the *Gardeners' Chronicle*, February 21, 1903, p. 123. There is a variety in cultivation with flowers having longer pedicels than the type.

S. MEDIA (*S. CALYCIFLORA*).—A native of the Pyrenees, where it grows on high, calcareous rocks. The leaves are slightly spatulate and acute. The flower-stems are about 3 inches high, and bear a corymbosely-branched inflorescence, having flowers on relatively long pedicels. The stems, branches and sepals are covered with glandular hairs, and in this species also the calyx is larger than the corolla. *S. media* is figured in the *Botanical Magazine*, t. 7315.

S. STRIBNRYI.—This is a recent introduction, having been received from the Belgrade Botanic Gardens by Mr. Farrar. At Kew it came up amongst seeds of *S. Grisebachii*, which seems to show that the two plants grow together. Although only lately introduced to cultivation, it

S. BERTOLONII.—This plant was distributed by Mr. F. Sundermann, of Linden, as a hybrid between *S. Frederici-Augusti* and *S. porophylla*, but it has more the appearance of a cross between *Frederici-Augusti* and *S. Grisebachii*. It is identical with the variety with longer pedicels which appeared amongst seedlings of *S. Grisebachii*. The stem is red, with green-tipped bracts, and the inflorescence is nodding. *W. I.*

THE ROSARY.

FRAGRANT ROSES.

I HAVE always regarded the want of fragrance in a Rose, however beautiful it may be in colour and form, as a serious defect. Such Roses, for example, as *Baroness Rothschild*, *Spenser*, and

FIG. III.—PINUS MURICATA, WITH SPREADING HABIT, IN ROYAL GARDENS, KEW.

(See page 260.)

formerly wrongly applied to the yellow-flowered *S. apiculata*.

S. GRISEBACHII (*S. MEDIA* VAR. *MONTENEGRINA*).—This Macedonian species is undoubtedly the finest plant in the group, and is a valuable garden plant, flowering in March or sometimes earlier. The silvery leaves are produced in handsome rosettes 2 to 2½ inches in diameter, while the stems reach a height of 9 inches or even more. At the top is the nodding inflorescence of purplish-crimson flowers, having yellow stamens. The coloured stems are furnished with green-tipped, bract-like leaves, and are covered with white hairs. The flowers remain attractive for a long time before they gradually lose their brilliant colouring. This plant was given an Award of Merit at a meeting of the Royal Horticultural Society in the spring of 1903, and

was found by Stribnry, after whom it is named, on the rocky mountains of Backovo, in Bulgaria, in 1893. The rosettes of leaves are similar to those of *S. Grisebachii*, while the inflorescence resembles that of *S. media*, but it is more branched. The whole stem, branches and flowers are covered with glandular hairs, and more or less tinged with red.

There are several recorded hybrids of these species, three occurring in the Pyrenees between *S. media* × *S. arctioides*, viz. :—

S. AMBIGUA.—Nearest to *S. media*, with sepals and petals red.

S. LAPEYROUSEI.—Nearest to *S. arctioides*, with green sepals and yellow petals.

S. LUTEO-PURPUREA.—Intermediate between the parents. It has red sepals and yellow petals.

Her Majesty, however attractive in other respects, lose a great deal in the estimation of many persons by their lack of this attribute. To my mind perfume in a flower is almost as valuable as colour. There are many cultivators who hold the opinion that Roses which have not, in some degree, the essential element of fragrance are not worth cultivating. It is much to be regretted that some of our finest dark crimson varieties, such, for example, as *Duke of Edinburgh* and its numerous variations, have so little attractiveness in this special direction. The extinction of such scentless pale pink Roses as those which I have indicated need not be regretted so long as we possess more decided pink varieties of a widely different description, such as *Mrs. Sharman Crawford*, *Mrs. John Laing*, and *Mme. Gabriel Luizet*.

[Photograph by E. J. Wallis.]

Most of the hybrid perpetual Roses have fragrance, many of them, however, only to a limited extent. Among the sweetest of these are Marie Baumann, Beauty of Waltham, Crown Prince, and Captain Hayward. The last-named variety was raised by Henry Bennet, and is, perhaps, the most richly fragrant of them all. Mr. Cranston's Crimson Bedder, which I cultivate in my garden, is a beautiful, luxuriant, and fragrant Rose. Most of the China, Moss, and Provence varieties possess a delicate aroma. Among these may be mentioned Mme. Laurette Messimy, Queen Mab, and Duke of York; Cramoisie Superieure, Anne Marie de Montravel (sweetest in my estimation of the dwarf Polyanthas, and possessing an odour peculiarly its own), White Bath and Blanche Moreau, the queens of the Moss section; and the eminently beautiful Crested Moss. Very fragrant alike in flower and foliage are the Austrian, Persian, and Penzance Briars. The Penzance Briars are fascinating long after they have ceased to bloom.

Nearly all the finest Noisettes and Teas have a fragrance which is at once delicate and refined. Of the former may be instanced L'Idéal, Lamarque, and the superb Marechal Niel. Of hybrid Noisettes, by far the sweetest (and most profuse in flowering) is Mme. Alfred Carrière. The perfume of Gloire de Dijon is very pleasing; so also is that of Bouquet d'Or and Belle Lyonnaise. Of Tea Roses, perhaps the most attractively fragrant are Souvenir d'un Ami, and Souvenir de S. A. Prince. Niphetos and Mme. Bravy have exquisite perfume, while Catherine Mermet, Bridesmaid, the Bride, and Muriel Grahame have a fragrance of a very peculiar character, resembling that of a ripe Peach. The most odorous of the Bourbon Roses are Mrs. Paul, Acidale, and Mme. Isaac Pereire. The variety Mrs. Paul was raised at Cheshunt in 1891. It is very vigorous; the flowers are unique in colour, and have a perfume resembling that of the variety named after Viscountess Folkestone.

The most fragrant of all Roses are the hybrid Teas. The most fascinating are La France, Caroline Testout, Cheshunt Hybrid, Duchess of Albany, Camoens, Viscountess Folkestone, Lady Mary Fitzwilliam, White Lady, Bessie Brown, and Reine Marie Henriette. *David R. Williamson.*

PINUS MURICATA.

THERE are few more interesting hardy Conifers than *Pinus muricata*, and this in spite of the fact that as a tree to grow for ornament it is not, perhaps, in the very first rank, nor in stateliness of growth does it equal such species as *P. Laricio* or *P. Coulteri*. It will thrive in positions where most members of its tribe would die, even in exposed places in the Channel Islands, where it has to withstand the effects of salt-laden winds. In inland situations it forms a dense and rather bushy tree with a thick, rugged trunk. In its native habitat in the coast regions of California it grows, according to Sargent, usually 40 to 50 feet high, and occasionally it rises to twice that height. Its power of withstanding sea winds, under cultivation in the British Isles, is an inherited one, for, according to the same authority, it often occupies positions "on steep bluffs and bold headlands in full sweep of the ocean spray." *Pinus muricata* was first introduced to Europe by Hartweg, in 1846, although it had been discovered by Coulter 15 years previously.

The leaves are produced in pairs, each pair being clasped at the base by a persistent sheath $\frac{1}{2}$ inch long; the leaves are from 4 to 7 inches long. The cones measure from $2\frac{1}{2}$ to $3\frac{1}{2}$ inches in length; they are ovoid in the main, but often oblique through the restricted development of the less exposed side; the scales are armed with

a stout spine. The most interesting feature about the cones is the length of time they remain on the branches. Some of the trees at Kew bear cones which must have developed more than a quarter of a century ago. Other Pines have the same character,

that frequently ravage the forest regions of the Far West. The cones have undoubtedly the power to preserve the seeds alive during a conflagration of this kind, and then, by releasing them, to enable a new generation to rise on the ashes of the old trees. But it requires a larger

FIG. 112.—PINUS MURICATA: FOLIAGE AND MALE INFLORESCENCE NAT. SIZE; STAMEN AND POLLEN GRAIN MAGNIFIED.

notably *P. insignis* and *P. tuberculata*, but none perhaps so strikingly as *P. muricata*. The theory has been advanced that this character has been evolved to enable the species to survive the fires

faith than some of us possess to accept all that is implied in the theory.

The illustration (in fig. 111) of a single specimen growing at Kew in the vicinity of the

Pagoda shows this Pine in an unusual and, I think, attractive form. It has assumed a low-spreading shape, and although the tree is of considerable age it is at its tallest only 10 feet high. The branches spread over the ground 30 feet or more and form an irregular mass of rich, ever-green foliage of a pleasing and uncommon aspect, although quite the opposite of a typical well-grown

tree. It is in perfect health, and its curious mode of growth is no doubt due to the attacks (at an early stage of its career) of a boring larva which kills many of the winter buds and thus prevents the formation of a leading growth and induces an excessive branching. The process is analogous to the well-known practice of cultivators, who "pinch" the growths of many plants when

young, to make them assume a bushy habit. During a visit to the Edinburgh Botanic Garden I was shown a similar instance in the case of Deodar. A group of Deodars, planted many years ago, now form a spreading mass only a few feet high and make a very pleasing effect. In this case, I believe, the leading growths were originally destroyed by rabbits. W. J. Bean.

FIG. 113.—BRANCH OF PINUS MURICATA BEARING CONES WHICH REMAIN ATTACHED FOR MANY YEARS.

TOWN PLANTING.

(Continued from page 220.)

TREES intended for planting in towns, and especially alongside streets and footpaths, should be specially prepared in the matter of transplanting and pruning. As tree guards are a necessity in protecting trees by the sides of streets, the trees must have their stems free of branches, therefore the buds and branches on the stems, for a distance of 6 or 7 feet, need to be removed, whilst surplus leading shoots and ungainly branches should at the same time receive attention in pruning. The tree also needs to be frequently transplanted in order that an abundance of fibrous roots may be produced, and every effort made to produce healthy, vigorous specimens suitable for the ungenial surroundings of their permanent quarters. In street planting it is advisable to plant trees that are from 12-14 feet in height, and if these, for some years previous to their final shift, have been specially prepared in the way of frequent transplanting and careful pruning, little fear for their future welfare need be entertained. Autumn or early spring planting is to be recommended, the former time being in most cases preferable. As little time as possible should be allowed to elapse between the time the tree is lifted in the nursery and its plantation in the new position. Spread the roots out to their full extent around the stem and avoid planting too deeply; the nursery line on the stem serves as the best guide for the depth at which to plant. Planting too deeply under the mistaken idea that it will secure the tree in the ground is a fruitful source of decay and ultimate death of many street trees planted in the Metropolis, and it is not uncommon to see whole avenues of trees that have made little or no progress for many years owing to this cause. After a tree has been placed in an upright position on the prepared site and the roots properly disposed, the soil should be filled in and trampled firmly both amongst and over the roots. It may be well to warn planters against the pernicious practice of allowing leaves, packing materials, or grassy turf to come in contact with the roots of newly-planted trees. In dry situations a saucer-shaped hollow may be left around the stem of the newly-planted tree, while mulching applied during dry and warm summers is to be recommended. The planting of shrubs should be carried out with as much care as in the case of trees. It is preferable to trench land in which shrubs are to be planted rather than to make a separate pit for each shrub.

Fencing and staking.—In order to prevent damage, newly-planted trees should be fenced and staked at once. Of fences or guards there are many kinds; they are made of wood, wire, or iron. The iron tree guard has many advantages over those of wood or expanded metal, and being made in two sections it can be readily placed in position after the tree has been planted. For trees from 12 to 14 feet high the guards need not exceed, say, 7 feet in height, and preference should be given to those in which the uprights are bent outwards at the top, for this not only lessens the risk of interference with the branches, but is pleasing in appearance. Sometimes it may not be considered necessary to protect town trees, particularly such as are growing in side streets or squares, but in every case firm staking is necessary in order to prevent damage from wind.

Wooden tree guards consist of about half-a-dozen poles or uprights, about 7 feet long, joined together around the tree trunk by means of wire. When compared with those of iron they have, however, several disadvantages, for they may be climbed with ease and they do not last long. Where it is found sufficient to stake the trees without having recourse to guards. Ash poles from 2 to 3 inches in diameter and 10 feet high should be driven firmly into the ground as close to the stem as possible. The tree should be tied with specially prepared tar rope, which should be crossed between the stem and stake to prevent damage by rubbing. From time to time it will be necessary to see that the band of string does not become too tight. On rare occasions only is it necessary to stake shrubs, but this is sometimes needed in exposed positions or in the case of shrubs of unusually large size. *A. D. Webster.*

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Melons.—As soon as the fruits on the earliest batch of plants show signs of ripening, the atmosphere must be kept drier and more air admitted, the amount of ventilation being determined by the prevailing weather. Do not allow the rooting medium to become dry too quickly, or the flavour of the fruits will be impaired. The appearance and flavour are both improved by gathering the fruits a few days before they are required for dessert, storing them in a cool room. Raise a fresh batch of plants so as to have them ready to replace the older ones when they have ripened their fruits. Before planting afresh, the house should receive a thorough cleansing. If woodlice have been troublesome, it will be better to clear out all the old soil and manure and then to thoroughly saturate everything with boiling water. Woodlice often cause canker in Melons by injuring the stem of the young plant. After the glass and woodwork have been washed and the walls coated with lime-wash, the house will be ready for planting. This season of the year good crops of Melons may be grown in unheated pits. Hero of Lockinge is a suitable variety for this purpose. Make up a hot-bed of stable-litter and half-decayed leaves, and tread these materials firmly. Towards the head of the pit place mounds of soil on the hot-bed, using loam, mixed with a little old mortar rubble, and crushed bones if the soil is poor. Close the pit early in the afternoon, after spraying the plants with lukewarm rain-water. Stop the points of the leading shoots when they have reached to a foot or thereabouts of the limits of the pit, and when three or four female flowers are open on each plant these should be artificially pollinated about midday. During this stage, keep the atmosphere dry. Cover the lights with mats at night-time, and add fresh litter around the outside of the pits occasionally to maintain the atmospheric temperature at 70°. Ventilate the structure early in the morning to allow the products of fermentation to escape.

Strawberries in pots.—Plants which have not yet been brought into the forcing house will be benefited by receiving diluted manure water at intervals. Remove any dead leaves or weeds that appear in the pots, but do not take them out of the plunging material until they are to be brought indoors.

Late vines.—Attend to the disbudding of late vines before the shoots become large. It must be remembered in the case of late vines that, in order to have the grapes in a good condition over as long a period as possible, an abundance of healthy foliage is necessary, but nevertheless overcrowding cannot be permitted. Give the borders a soaking with diluted liquid manure before the vines open their flowers. Do not leave Strawberries to ripen in late vinerias if it can be avoided, as red spider is almost certain to be present on the Strawberries, and this pest would infect the vines.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Mushrooms.—It is now time to make the beds that are to furnish the summer crop. They should be formed in the coolest place available, none being more suitable than a thatched shed on the north side of a wall or building. The beds are best made on the floor, and if the house is sufficiently wide there should be a central path. In forming Mushroom beds at this season of the year, the manure cannot be made too firm, and it is best not to remove very much of the short litter. In the case of Mushroom beds now in bearing, the structure containing them should not be kept at a higher temperature than 50° or 55°. Beds which have been in bearing for some time should be given copious waterings with diluted liquid manure made from farmyard dung. The paths may be damped with this liquid manure, and the walls, roof, and other bare spaces should be syringed with clear water of the same temperature as the atmosphere of the house two or three times each day.

French Beans.—Plants which are cropping freely will now succeed best if afforded merely

the temperature of an ordinary greenhouse. Thoroughly syringe the foliage twice daily, and apply manure water at every other watering. Plants raised in small pots may be safely planted out in cool frames, provided the frames are closed early in the day and the lights are covered with protective material at night-time. To ensure a continuous supply until the outside crop is in bearing, one more sowing may be made under glass. Sow the seeds in the frame in which they are to be cultivated. At the same time make a sowing in small pots and transplant the seedlings later into a sheltered border in the open.

Lettuce.—Continue to plant out in various parts of the garden plants which have been forwarded under glass, protecting them from slugs and birds. Fine cinder ashes should be freely used as a preventive of slugs, and black cotton, if stretched fairly tight about 2 inches above the young plants, will provide a defence against birds. Make further sowings of both Cabbage and Cos varieties about once every 10 days or a fortnight. A suitable position will be found on the centre of the ridges between the rows of Leeks and Celery.

Parsley.—Plant out on well-prepared ground those plants which have been raised in heat. To ensure the best results, allow plenty of room—not less than from 10 to 12 inches—between the rows and plants. Make the ground very firm, and apply a thorough dusting with fresh soot.

Leeks.—The earliest plants should now be sufficiently advanced to be planted out in the trenches. When this has been done means should be taken to draw up the plants so that a long length of blanched stem will be obtained. This is best done with brown paper collars, which can either be purchased or made at home. Late sowings will need to be pricked off, prior to planting, on a finely-prepared open piece of ground.

Hoing.—The soil around all crops should be frequently hoed, not only to check the growth of weeds, but to break the surface, which is now encrusted.

PUBLIC PARKS AND GARDENS.

By J. W. MOORMAN, Superintendent of Victoria Park, London.

Holiday-time in the parks.—During the past fortnight the playing fields and grounds have been much occupied by the public, principally school children. On Good Friday and subsequent days it appeared in Victoria Park as if every child for many miles around had made its way there. It was a matter of wonder how such a crowd could play together without injuring themselves in their gambols. Such times as these impose a great deal of work on the working staff. Each morning a general clearing up has had to be done. It is better for this work to be undertaken by fair-sized gangs of men rather than allow the men to work one or two together. The best tool for gathering the larger pieces of paper is a sharp-pointed piece of iron or steel, fixed to a wooden handle. With this a large field can be quickly cleared of litter, but for the smaller rubbish and for clearing paths, &c., the birch broom must be utilised.

Refreshment rooms.—The catering is done by contractors, who are required to adopt a tariff of prices fixed by the Council, and no beers, wines, or other alcoholic drinks are permitted to be sold. Most of the larger L.C.C. parks have also first-class refreshment rooms, in which the prices charged are rather higher than in the ordinary rooms.

Public meetings in parks.—In some 25 parks and open spaces under the control of the L.C.C., and in those under the control of the Office of Works Department, including Hyde Park and Regent's Park, speakers are allowed to address the public in certain places. In the L.C.C. parks meetings can be held without obtaining permission, but sanction must be obtained before literature can be sold, whilst before a collection can be taken, it must be shown that it is not for the profit or gain of an individual, but for the benefit of a society. In some cases, music is allowed to be used at these meetings, whilst in other cases it is forbidden. Those who wish to have music must go to the sites that are reserved for the purpose, and thus they do not annoy other persons.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Strawberries.—Employ the Dutch hoe freely between the rows on fine days to destroy seedling weeds, which at this season germinate in great numbers. When the soil is perfectly clear of weeds, apply a dressing of soot and lime about the plants to ward off slugs. After the ground has been made tidy place some clean straw about the plants, but do this before the flower-spikes are far advanced. The straw, besides preventing the fruits from becoming gritty, acts as a mulching, and in hot, dry weather is of especial value in preventing the evaporation of moisture from the soil. Very early plants in warm corners or sunny borders will need to have the flowers protected from frost; if glass lights can be spared they are very suitable for the purpose, and will have the effect of hastening the development of the fruits. They can be temporarily arranged on wooden supports, or even on large flower-pots. They will need to be removed during warm rains or, failing this, artificial watering must be practised. Get the nets and the necessary supports in readiness as work in the fruit garden is not so pressing now as it will be when the Strawberries are expected to ripen. It is more economical to purchase good nets than to buy those of inferior quality merely because they are cheap. In these gardens we erect wooden supports or poles about 4 or 5 feet high, and fix a piece of wire netting 3 feet deep all around the ground to be enclosed. On the top we place ordinary fish netting, the lower part of the net meeting the wire netting. This prevents the nets from lying on the ground, and from getting torn.

Raspberries.—The soil in the rows between the Raspberries should be hoed the same as advised for Strawberries. The Raspberry is a cross-feeding plant, therefore a heavy dressing of farmyard manure should be placed about the stools if this has not already been applied. As the young shoots develop, they should be thinned, leaving sufficient only to furnish fruiting canes for next season, unless new stools are required for planting. Even in this case do not leave very many, or the permanent canes will be weak and unfruitful.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Miltonia vexillaria.—Plants of this well-known Orchid are fast pushing up their flower-spikes, and the young pseudo-bulbs should be making roots from their base. Woodlice are very fond of these roots, and if not diligently sought after and killed, they will destroy every root immediately it becomes visible. These pests may be trapped by laying some pieces of vegetable, such as Potato, Turnip, or Carrot on the surface of the compost. Numbers may also be caught after the plants have been watered, when they frequently appear on the top of the soil. Now that the plants are growing quickly, some of the leaves will be seen to adhere to each other so firmly as to check growth. When this is observed, the leaves should be liberated with a smooth piece of thin wood, or the handle of an ordinary budding knife, taking care at the same time to see that none of the tender young spikes is in any way checked in the axils of the leaves. *M. vexillaria* thrives well in a cool, light position in the intermediate house. Where no such convenience exists, some growers cultivate the plants in the Cattleya house. As soon as the temperature of the Odontoglossum house rises to 55° by night without the aid of fire heat, the plants should be removed from the warmer house, and if one end of the Odontoglossum house is warmer than the other, let them be placed in that position. From the present time until the flowers open, plants of this *Miltonia* will require much moisture, both at the root and in the atmosphere.

Maxillaria.—In the cool intermediate house such plants as *Maxillaria grandiflora*, *M. venusta*, *M. fractiflexa*, *M. picta*, *M. callichroma*, *M. tenuifolia*, *M. præstans*, *M. ochroleuca*, *M. Amesiana*, *M. lepidota*, *M. striata*, *M. phonicanthera*, *M. scurrilis*, *M. Turneri*, and *M. nigrescens* should be examined as to their need for more pot room or potting material. Such species as *M. Sanderiana*, *M. fuscata*, *M. Hubschii*, *M. leucamata*,

M. luteo-alba, and others that are now showing for bloom should not be disturbed until they have flowered. *Maxillarias* may be cultivated in pots or shallow pans, but such species as *M. Sanderiana* and *M. Lindenii*, which sometimes push their flowers in a downward direction, like *Stanhopeas* and *Acinetas*, should be grown in teakwood baskets. No crocks should be used for drainage, as they would prevent the spikes from coming through the bottom of the basket. All species of *Maxillaria* grow well in a mixture of *Osmunda* and *Poly-podium* fibre in equal parts. The materials should be cut up moderately fine and mixed well together. We use no *Sphagnum*-moss, but mix plenty of very small crocks with the compost. The pots are about half-filled with crocks for drainage, and the plants potted firmly. Repotted plants must be afforded extra shade from strong sunshine. For several weeks, until the plants are well rooted, merely water around the edges of the pots.

Shading cool Orchids.—The inmates of the cool houses will require to be shaded whenever the sun shines on the roof, this being especially necessary where canvas blinds only are used. As regards lattice-wood blinds, these do not afford sufficient protection for the *Odontoglossums* of the *O. crispum* type, as the light admitted through the laths causes the foliage to become far more of a bronzy-red than is desirable. To counteract this, a good plan is to lightly "stipple" the roof glass with a mixture of flour and water. The preparation should be painted on when the sun is shining full on the glass, that the mixture may dry quickly; it is important that the glass should be quite clean and free from dust. This mixture will keep the glass perfectly cool even during the hottest day in summer. Should rain fall before the stippling is well dried on the glass, stop up the stack pipes which lead from the gutters of the roof into the soft-water tanks, or much valuable water will be spoiled.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Fibrous-rooted Begonias.—The old plants of *Begonia Gloire de Sceaux*, *B. Mrs. Heal*, and similar kinds which have been rested and pruned, have made sufficient growth for the supply of cuttings. If such cuttings are inserted during the next few weeks they will furnish plants to flower next winter and spring.

Violets.—Plants should now be propagated to obtain young stock for planting in the frames next October. Some cultivators prefer to employ cuttings, whilst others raise their plants from runners. The former method has the advantage that plants so raised do not produce many runners during their cultivation in the frames. Whichever method of propagation is adopted the procedure is very similar. Cuttings or runners are firmly planted out-of-doors in a well-prepared plot of ground, placing the double-flowering varieties at distances of 10 or 12 inches apart. Single-flowered varieties are nearly always propagated from runners, and they should not be planted at closer distances than 15 inches. The soil should be kept moist and the leaves may be sprinkled occasionally with water until root action has commenced. Following this stage, the surface of the ground should be loosened with the hoe at frequent intervals, and the plants should be sprayed frequently towards the close of each afternoon, this latter practice being a useful preventive of red spider. It will be as well to select a site for the plants which is slightly shaded from the mid-day sun, but in no case is excessive shade advisable, its effects being to induce the plants to make fleshy leaves, and thus the ripening of the crowns is hindered.

Gerbera Jamesonii.—It is only in the most favoured localities that the beautiful "Transvaal Daisy" can be expected to thrive out-of-doors, but in all districts it is an admirable plant for pot culture in the greenhouse, or it may be planted in frames extending by the side of glass-houses. Seeds may now be sown in moderate heat, and a good proportion of the seedlings may be expected to flower in their second year. Pot plants now flowering should be removed to a cool frame when the flowering stage has passed. After they have been there for a short time, they may be placed out-of-doors on a base composed of ashes, where they may remain during summer

and autumn. *Gerbera* flowers, when cut, are very elegant for vase decoration, possessing uncommonly attractive tints, and having a capacity for lasting fresh for a considerable time.

Balsam.—Seeds may be sown thinly in well-drained pans of light, porous soil, which should be placed in a warm house. Prick off the seedlings into small pots as soon as they are large enough to be handled. Do not allow the plants to become pot-bound until after the final potting. In the process of potting, it is advisable to keep the stem rather lower in the soil than is usual in the case of most plants. Do not pinch the leading growth. Let the surroundings be kept always moist.

Achimene.—These plants should now be moved into a cooler house, exposing them to a greater degree of light and air, which will tend to strengthen the growths. Some means of support is needed for plants in pots, and slender birch twigs, if placed just inside the rim of the pot, will answer the purpose very well.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Summer bedding plants.—These should be removed to cool frames in order to harden them gradually. On sunny days the lights should be entirely removed, placing them in position again at about 5 p.m. If the ground intended for planting *Calceolarias* is vacant, these plants may now be planted. Place them rather closely together, unless it is intended to mix other plants with them at a later date.

Violets.—Cuttings that were rooted two months ago are sufficiently developed to be placed in the open. Select a rich piece of land and mix plenty of soot and bonemeal with the surface soil. The planting should be done with a trowel, placing the plants in lines drawn at about 18 inches apart. A space of 15 inches may be allowed between each plant in the rows, excepting in the case of such single-flowered varieties as the *Princess of Wales* type; these require to be placed 18 inches apart. Plant firmly, and should the weather at the time of planting be dry, sprinkle the foliage occasionally with water. After making the ground tidy, place a label against each variety. Among the more useful varieties for all purposes are *Princess of Wales* (rich violet), *La France*, *Admiral Avellan*, *Wellsiana*, *Comte de Brazza*, *Marie Louise*, *Neapolitan*, and *Lady Hume Campbell*.

Amaryllis Belladonna.—Fork the ground lightly around the bulbs of these plants and apply a sprinkling of soot and bonemeal. If the ground is in a warm, dry situation, afford copious waterings at intervals.

Agapanthus umbellatus.—The present is a suitable time to overhaul these plants. Clear away any dead or decaying foliage, and remove the old soil down to the roots, replacing it with some fresh loam. Ram the soil as tightly as possible. The *Agapanthus*, when planted in green tubs, are excellent subjects for placing on terrace walks or around the edges of ornamental water.

Lobelia cardinalis.—The plants should be placed in their summer quarters, and any which have remained out-of-doors all the winter should be given a little fresh soil, containing some fine leaf-mould.

Lilium.—The various species of *Lilium* will be starting into growth, especially those growing on sunny borders. A dusting with soot will help to keep slugs from the plants. Slugs may also be trapped with cabbage leaves and similar bait.

General work.—Bulbous plants that have finished flowering may be planted in the wild garden, or amongst shrubs. Plants of *Cerasus*, *Lilac* and species of *Prunus* that have been forced should be pruned rather severely and planted out-of-doors in moderately rich soil. They will make useful plants for forcing again in two years. It is time to graft *Rhododendrons*, and to sow seeds of these plants and *Azaleas*. Transplant *Mignonette* from boxes for flowering early out-of-doors. Where *Sarracenias* are cultivated in the open the plants should be afforded some *Sphagnum*-moss. *Pinguicula*, *Darlingtonia* and *Drosera* are insectivorous plants requiring similar treatment. They associate well with the cotton grass, *Eriophorum angustifolium*.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, APRIL 27—

Huntingdonshire Daffodil and Spring Fl. Sh. in Corn Exchange, Huntingdon.

WEDNESDAY, APRIL 28—

Nat. Auricula Soc. (Midland Sec.) Exh.
Roy. Hort. Soc. Exam. of School Teachers in Cottage and Allot. Gard.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—48.9°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, April 21 (6 P.M.): Max. 58°; Min. 39°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden London—Thursday, April 22 (10 A.M.): Bar. 29.7; Temp. 59°; Weather—Sunshine.

PROVINCES.—Wednesday, April 21 (6 P.M.): Max. 55° Ireland N.W.; Min 42° Durham.

SALES FOR THE ENSUING WEEK.

MONDAY—

Perennials, Border Plants, Lilliums, and other Bulbs, Ferns, &c., by Protheroe & Morris, at 67 & 68, Cheapside, E.C., at 12.

WEDNESDAY—

Herbaceous and Border Plants, Lilliums and other plants and bulbs, at 12; Palms, Plants, Ferns, &c., at 4; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Imported and Established Orchids, Orchids in flower and bud, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

In recent years the use of acetylene gas for lighting purposes in country houses has greatly increased. The generator is usually situated in the garden, and therefore the gardener is required to look after it. Acetylene generators yield a large quantity of refuse, and, judging from the enquiries which from time to time are addressed to us as to the manurial value of this waste material, there seems to be considerable doubt as to its composition. The fact that it is composed almost entirely of slaked lime has led to its being regarded as of equal value to lime for use as a manure. That it is not quite the same as lime is obvious to the senses both of the eyes and nose. These differences are due to the presence of small quantities of impurities in the original calcium carbide used in the preparation of the gas. The impurities may greatly reduce the value of the refuse for manure, and even make it positively injurious to plant life. The following experiments, carried out at the Wye Experimental College, seem to indicate that this is the case. In the first place an experiment was conducted as follows:—

Twelve 5-inch pots were filled with soil containing a large proportion of leaf-mould. The pots were divided up into six lots, each lot containing two pots. To the soil of one of the lots 1 per cent. by weight of the dry,

powdered refuse was added, and thoroughly mixed with the soil. Four more of the lots treated received 10 per cent., 20 per cent., 30 per cent., and 50 per cent. of the refuse respectively. The sixth lot received none, and therefore it acted as a check or control.

In each pot eight Mustard seeds were sown, the pots being stood in a cool house.

After 14 days the pots presented the following appearance:—

In the pot in which no refuse was used, and also in that which contained 1 per cent., all the seeds had germinated, and 16 well-developed seedlings were showing.

In that to which 10 per cent. was added only two seedlings had appeared. They were both small. In the other three lots no seeds had germinated.

After 15 days one plant had died in the pots containing 1 per cent., one more seedling had appeared in the pots with 10 per cent., and one in those containing 20 per cent.

The plants were now distributed as follows:—The control pots had 16 seedlings. The pots containing 1 per cent. of refuse, 15 seedlings, slightly smaller than those in the control pots. In the pots containing 10 per cent. there were three seedlings, in those containing 20 per cent. one seedling, and in those with 30 per cent. and 50 per cent. there were no seedlings.

On the 17th day the condition of affairs had altered as follows:—In the control pots 16 plants showed the rough leaf, in the pots containing 1 per cent. of refuse there were 13 plants showing rough leaf and one weakly seedling; in those containing 10 per cent. there were three seedlings, whilst there were none at all in the other pots.

On the 21st day the experiment was stopped, as it was thought that no further germination would take place. At this stage only lots known as 0 per cent., 1 per cent., and 10 per cent. contained plants. There were 16 plants in lot 0 per cent. and 13 in lot 1 per cent. The plants were equal in size and appeared equally healthy. In lot 10 per cent. there were only three seedlings of small size, none of them showing rough leaf.

These experiments are not extensive enough to base any conclusion upon, but they indicate that carbide refuse has a marked effect on germination. This process is almost entirely stopped where 20 per cent. is present in the soil, greatly lessened and retarded with 10 per cent., and slightly so even with only 1 per cent.

The seedlings which died showed a shrivelling of the hypocotyl close to the soil, closely resembling damping off, but the fungus which causes this disease was not present.

It was now desired to see if the refuse had a bad effect on older plants. For this purpose Mustard plants showing two rough leaves were used. The same pots were used as in the experiment already described.

All the plants were removed from the pots except that three plants were left in one each of the pots of lots 0 per cent., 1 per cent., and two in one of the 10 per cent.

In one each of the vacant pots of all the lots, three of the Mustard plants were planted. The arrangement was now as follows:—

Lot 0 per cent. contained one pot with three transplanted plants and one pot with three of the original plants. Lot 1 per cent. was the same as 0 per cent. Lot 10 per cent. was the same, except that there were only two original plants. Lots 20 per cent., 30 per cent., and 50 per cent. each contained one pot with three transplanted plants. On the third day the condition of the plants was as follows:—Those in lots 20 per cent., 30 per cent., and 50 per cent. had all shrivelled at the base of the stem, fallen over and died. In the other lots all the plants were growing.

On the 15th day the plants in lot 0 per cent. were all healthy. The average height in both pots was about 7 inches. Lot 1 per cent. was similar, except that the average height of the plants was only about 5 inches. Lot 10 per cent. by this time was showing the effect of the refuse. In the transplanted pot there were three plants about 2 inches high. Unlike the plants in the preceding lots, their cotyledons had entirely withered. In the original pot the two plants still survived. They were about 1½ inches high and carried very dark green leaves.

The final observations were made on the 35th day:—In lot 0 per cent. the plants were in full flavour. The average height was 22 inches, the transplanted plants being a little the smaller. Those in lot 1 per cent. were similar to the 0 per cent. plants, but were smaller, the transplanted plants having an average height of 20 inches, whilst the original ones measured 17 inches.

The plants of lot 10 per cent. were not in flower, and were considerably smaller. The three transplanted plants ranged in height between 10 and 5 inches, whilst in the original pot the two plants were only 6 inches and 2 inches high respectively.

From this experiment it is seen that the amount of growth was inversely proportional to the amount of carbide refuse present. Even 1 per cent. had a bad effect, whilst 20 per cent. completely prohibited growth.

From this it appears that care should be exercised in the use of the material as a manure. We do not know if any definite cultural experiments have been made in the garden, but the refuse has been applied to various garden crops during the last five years and no marked improvement of the crop has been noticed, although the soil was one which should respond to lime—being sandy and heavily dunged. In some cases bad results have followed its use. On two occasions Strawberries have failed badly after treatment with the refuse.

Until further experiments have been carried out cultivators are recommended to use great caution.

OUR SUPPLEMENTARY ILLUSTRATION represents a specially well-cultivated specimen of *Vanda cœrulea* in the gardens of Brougham Hall, Penrith. Mr. W. ANTON, the gardener, informs us that the photograph was taken on December 18 last. The plant had 12 racemes, which bore an aggregate of 109 flowers, all perfectly developed. The sepals and petals were pure white on opening, but a tinge of blue developed with age, the lip being deep blue. The specimen being cultivated in the cooler end of one of the hottest houses, the atmospheric temperature is about equal to that which Orchidists term an intermediate house.

ROYAL HORTICULTURAL SOCIETY.—In respect to the Orchids at the coming Temple Show, we are requested to state that attention has been drawn to the possibility of misunderstanding arising from the use of the word "unrestricted" in Classes I, A and B. It must, therefore, be clearly understood that the word is governed by Rule 4, which gives 200 square feet as the maximum. In other words, Classes I, A and B, are unrestricted in size only, so long as they do not exceed the 200 square feet permitted by the rule.

JOURNAL OF THE KEW GUILD.—Somewhat belated, but none the less interesting, this little brochure relating the doings of Kew men past and present appears for the sixteenth time. Much of its contents is necessarily of most interest to members of the Guild, such as the record of the social gatherings, the report of the sports club and the information concerning the alleged grievances of the present staff. But the doings of those members now working in remote parts of the world are of quite a different character. Letters from these men give the reader an idea of the gardening in such places as the White Nile, in Honolulu, Lucknow, and Rhodesia. One member writes from a point 220 miles south of Khartoum. He is the only white man in the district, "looking to break the monotony, in the advent of tourists." The frontispiece is an excellent portrait of Mr. GEORGE MASSEE, Chief of the Cryptogamic Section in the Herbarium at Kew. The accompanying text is from Mr. MASSEE'S pen and records, in characteristic style, the chief events in his career. Another illustration is a group of the permanent staff taken in December, 1906. The same picture was reproduced in the *Gardeners' Chronicle*, January 6, 1906. No fewer than six of the group, namely, Sir W. T. T. DYER, Mr. W. B. HEMSLEY, Dr. D. H. SCOTT, Mr. J. F. DUTHIE, Mr. W. HACKETT, and Mr. J. STOCKS have since retired from Kew. We learn that the journeyman gardeners now have half their wages withheld during sickness, but it may be assumed that on some occasions such sickness may be caused by working in high temperatures such as that which is maintained in the Palm House. The number of visitors to the garden in 1908 was 2,710,220. The obituary list includes Mr. GEORGE NICHOLSON, who was curator of the gardens from 1886 to 1901, and Mrs. R. WARD, who, as Miss JESSIE NEWSHAM, worked as a student at Kew for 16 months.

EXHIBITION OF GARDEN PICTURES.—At the New Dudley Gallery in Piccadilly an exhibition of garden pictures will be on view from the 20th until the 29th inst. The exhibition will contain landscapes in water-colour by Miss ALSWEN MONTGOMERIE, water-colour drawings of the Isles of Scilly by the Misses DORRIEN-SMITH, and sketches at home and abroad by Lady MABEL SOWERBY. The drawings by the Misses DORRIEN-SMITH are specially interesting to gardeners and others who have visited the famous gardens at Tresco Abbey.

SEEDSMEN AND THE SALE OF POISONS.—According to the *Glasgow Herald*, considerable correspondence has passed between the secretary of the North British Branch of the Pharmaceutical Society and the Dalkeith Town Council concerning the new Poisons and Pharmacy Act. All the registered chemists in Dalkeith had intimated to the secretary that they were prepared to sell the poisonous substances referred to in the Act, and, therefore, he held, the occasion for granting licenses to any other persons did not arise. He submitted that the Town Council had acted somewhat prematurely in disposing of any application for a license under the Provisional

Order, which had not been formulated, and he suggested that the matter should be reconsidered. The clerk made a statement at a meeting of the Town Council on the 12th inst. in connection with the granting of applications of Dalkeith seedsmen, and it was agreed that these merchants should have their licenses confirmed on fulfilling the conditions now made known in the schedule, as it was felt by the councillors that these firms who had been trading in the articles in question for a long period could not now be reasonably prevented from supplying the demands of their customers.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—In aid of this Institution Mr. EDWARD SHERWOOD will give a new musical play on May 12 next entitled "In Cyderland." The play has been written by Mr. R. CARY TUCKER, and the music is by Mr. EDWARD SHERWOOD. The performance will take place at the Cripplegate Theatre, Golden Lane, London, E.C. A full orchestra, by the courtesy of "The HURST & SON" Musical Society will be present, under the direction of the composer. Tickets may be obtained from 3s. to 10s. 6d. each from Mr. N. N. SHERWOOD, Dunedin, Streatham Hill; Mr. G. J. INGRAM, 175, Victoria Street, Westminster; or Mr. EDWARD SHERWOOD, 152, Houndsditch. Remembering that the funds of the Royal Gardeners' Benevolent Institution are greatly in need of help, we hope as many of our readers as can will help Mr. N. N. SHERWOOD to make this event successful.

SHIPWRIGHT'S PATENT ADJUSTABLE TAP UNION.—Our attention is directed by a correspondent to this patent tap union. It has been designed to obviate the tendency of the ordinary hose union to blow off the tap. The union consists of upper and lower plates drawn together by two small thumb-screws, one on each side of the union; between the plates a moulded band of rubber is fitted, and being enclosed on the upper, lower, and outside, it expands when the plates are drawn together on the inner side against the surface of the tap, forming a joint which is perfectly watertight and one that will stand any pressure without allowing the union to be blown off the tap. Perhaps some of our readers have given this new union a trial?

JAMAICAN PLANTS FOR GLASGOW.—The Glasgow Parks Committee have accepted an offer by Professor F. O. BOWER, of Glasgow University, to send to the corporation a collection of rare plants from the island of Jamaica, which he intends visiting in July to study the Fern flora.

THE BULB SHOW AT HILLEGOM.—The 30th anniversary of the Hillegom section of the General Society of Dutch Bulbgrowers is now being celebrated by a flower show in the open ground in the Hof Gardens, at Hillegom. The show was opened on Thursday, April 8, by the MAYOR OF HILLEGOM. On account of the late season, but few flowers were then fully developed, but the arrangement of the beds and borders showed that the exhibition will be interesting when the flowers are at their best. The show will remain upon until May 8. Hyacinths, Tulips, and Narcissus are expected to be in full bloom before that time.

A BOTANICAL GARDEN IN EAST JAVA.—In an interesting note, dated January 18, written by Mr. BUYSMAN, from Hortus Tenggerensis, Lawang, Java, the writer states:—We are now experiencing the rainy season, and almost every day the water pours down, not continuously, but mostly in showers. A dry day, however, is a rare thing now; nevertheless, the temperature has not been lower than 16° C., and the lowest daily maximum observed was 18½° C.;

the mean for December was 19.05° C. Vegetations grows rapidly. Among European plants, the common Dandelion (*Taraxacum officinale*) grows as luxuriantly here as in Europe; the same is the case with *Bellis perennis*, except in the rainy season, when the Daisy does not flower. *Ceratonia Siliqua* (the Carob tree) ceases to grow in the rainy season, but starts again in the dry season. Many European plants grow very slowly when sown in the open, but do well when cultivated in pots and protected from rain. Of Lilies, *L. longiflorum* and *L. tigrinum* do best. Species of Iris rarely flower. *Melilotus* species grow well, but only *M. italica* has flowered up to the present. *Tropaeolum majus*, *Mirabilis Jalapa*, and *Thunbergia alata* are weeds of the roadside; as also are *Oxalis sensitiva* and *Isoloma longiflorum*. These plants must be escapes from cultivation. The same is the case with *Cyphomandra betacea*, known here as *terong blanda* (Dutch Solanum). This latter plant is largely cultivated in Java. *Furcraea gigantea* is beginning to escape from gardens, as is *Montbretia crocosmaeflora*. *Verbena hybrids*, *Dahlia variabilis* and *Tritoma Uvaria* flower the whole year round. Escaped *Roses* are seen everywhere. *Begonia ricinifolia* is always flowering, with stems of 1 to 1½ metres in height; *Gardenia florida* flowers the greater part of the year. *Cannas* are common in gardens everywhere; Wheat, Barley, Oats, and Rye all do well, even in the rainy season. They produce an abundance of seeds, but they are not cultivated, because Sugar, Coffee, and Rice at present pay better. I presume, however, that these grains will be cultivated ere long, as trials have been made here on a relatively large scale, with good results. European Grasses flourish and produce abundance of ripe seeds. *Narcissi*, *Hyacinths*, and *Tulip* species do not flower, but they produce luxuriant foliage. *N. Pseudo-narcissus*, however, flowered this year in the dry season, and, seeing that the flowers were normal, it is curious that it blooms so seldom. *Papaver Rhoëas*, *Eschscholtzia californica*, and hundreds of other annuals flourish. The most interesting feature, however, is the growing and flowering of succulents in this most humid climate.

NURSERY NOTES.

HIPPEASTRUMS AT CHELSEA.

On a recent visit to the Royal Exotic Nursery in the King's Road, Chelsea, the chief establishment of Messrs. J. Veitch & Sons, Ltd., I was especially interested in the Hippeastrums, which were opening nicely into bloom. These plants are accommodated in a light, span-roofed house 60 feet in length and 22 feet in width. In the middle is a central bed 7 feet in width, with a narrow gangway for the convenience of the gardener in applying water, and inspecting the plants. There are likewise other beds of 3½ feet in width, for the plunging of younger bulbs. Beneath the beds are hot-water pipes to heat the plunging materials. The plants that were in bloom were chiefly those of crimson, scarlet, or pink colours, and many of the lighter-coloured varieties were showing colour in the bud and would soon be expanding. These handsomely-formed cross-bred Hippeastrums are the descendants of the Brazilian species *H. Leopoldii*, which gave the fine form to the race. The species has creamy-white flowers with a crimson centre, the tips of the segments being white. *H. Leopoldii* was crossed with *H. × Empress of India*, a hybrid raised in Holland, and from this cross the present race has descended. The efforts of the firm are now largely directed to the production of a good yellow-coloured variety, and indications of that colour are to be noticed in some of the newest varieties, but only in a minor degree. Among fully-expanded flowers the following varieties were conspicuous:—*Sybil* is a large flower with a white ground netted with crimson and furnished with a white lower segment; *Cerebus*, flowering for the first time, is a handsome crimson flower, but is not of a first-class shape, the segments being narrow, and the points too pronounced. *Lavacea* is a pure crimson self, without the least trace of other colour, and it is of perfect form. The variety *Acme* develops an immense scarlet flower, the wide segments having a

white band extending down the centre. *Ovington* is a scarlet flower, of fair size; *Nysa* is a good, dark-crimson flower of capital form; *Marcus* is also crimson, and unexcelled in the form of the flower; this variety has obtained an Award of Merit from the Royal Horticultural Society, and is shown in fig. 114. *Neila* is scarlet, with a white band on two of its segments; *Julian* is a very large crimson variety, having an orange-coloured tint, with white rays and central band on each of the segments. *Gamos* is of an orange-scarlet tint, with a yellowish-green tinge at the base of the segments; *Idothea* is a finely-formed crimson self; *Queen Alexandra* has a white flower flamed with bright scarlet. Seedling No. 9 is one of many derived from one seed-pod. It has a light-red flower with greenish rays and a decided orange tint. *Ilfra* is a very large crimson variety with a yellow tinge in the middle of the segments; *Optima* is a scarlet self, with a band of white on all the segments excepting the lowermost. *Ravenna* is of royal scarlet colour; *Lodore* is a flower of a

mens for sitting-room and dinner-table adornment. Fine specimens of *D. Goldiana* stood at the back of the bed, and smaller ones of *D. Sanderiana* were dotted about.

The main stock of Orchids is cultivated at the Langley nursery. In the Orchid house at Chelsea there were some plants in bloom, including *Odonoglossum crispum*, *Cymbidium Lowianum*, several *Dendrobiums*; *Pleione pogonioides*, a low-growing Chinese species, bearing light-purple flowers; *Maxillaria luteola*, and a great number of forms of *Cattleya Schröderæ*.

The Rockery house was delightfully furnished with *Adiantum* in great variety, *Asparagus plumosus*, ornamental-leaved *Begonias*, &c. *Anthuriums* formed an interesting display. Many of the plants were furnished with their showy spathes, especially the species *A. Scherzerianum* and its varieties. Others in bloom included *Duvivierianum*, *Madame Dalliere*, *Rothschildianum*, and *Wardii*, also varieties of *A. Andreanum*. The show house was gay with many of the finest varieties of *Camellia*,

FIG. 114.—HIPPEASTRUMS AT CHELSEA.

At back, *Enid*, white with a little red colour in centre; at front, *Omar*, red with white stripes; to the left-hand, *Romola*, orange-scarlet; and at right, *Marcus*, crimson.

deep crimson tint, having a tinge of purple in it. *Tamos* has a white flower rayed with scarlet—a very fine variety; *Adia* is white, with some faint red lines on the segments; *Vidette* is a dark crimson-coloured variety, with segments greatly reflexing; *Quirites* has prettily-tessellated segments of a crimson colour. *Titan* is a large-flowered variety; the upper segments are white, striped with crimson, the lower segments white with the points well reflexed. There are three other varieties, in addition to *Marcus*, shown in our illustration, namely, *Enid*, a white flower with slightly coloured centre; *Romola*, a self-coloured flower of orange-scarlet tint; and *Omar*, a red flower with white stripes.

The plants are in splendid condition, with strong vigorous foliage. They are well rooted, most of the bulbs being seedlings 2½ years old and flowering for the first time.

The best varieties and species of *Dracenas*, perfect plants in most instances, filled one of the small houses. I noted the narrow-leaved varieties *The Queen*, *Duchess of York*, *Doncettii*, *Ernestii*, and *marginata rosea* in excellent speci-

Rhododendron indicum, and *N. sinense* *Staphylea colchica*, finely-grown and flowered *Lilacs*, *Viburnum Opulus*, *Streptosolen Jamesonii* (admirably flowered for the time of year), *Prunus* in variety, *Narcissus*, *Tulips*, *Lily of the Valley*, and *Mignonette*. *F.*

NOTES FROM A "FRENCH" GARDEN.

The Carrots in the frames have been cleaned and thinned. The frames are now ventilated day and night. If the Cauliflowers are growing very fast among the Carrots the lights can be raised by placing them on 5-inch pots or bricks. In this case a good watering must be given before the lights are tilted, as it is very difficult to apply water after the lights have been arranged that way. This method is only practised in small gardens; in larger ones cultivators prefer to lift the frames and lights a few inches from the ground.

We are now planting one Cauliflower under each cloche.

The Cos Lettuces under the cloches require careful shading in the middle of the day, but this must not be excessive or it will cause the Lettuces growing between the cloches to become drawn. The space under the rim of the cloche must be kept well opened for ventilation.

We are just finishing our planting of Cos Lettuces in the open ground. These plants were raised on hot-beds early in January, and are as forward as those raised in December, which are late, owing to the bad weather which prevailed in February and March.

Endive "La Rouennaise" is now being planted in beds measuring 12 feet wide and 70 feet long. The ground has been well prepared and manured. The plants are set 10 inches apart each way. Care is taken not to set the plants too deeply.

The first batch of Melons is now well established, and they are given ventilation in the middle of the day. We have lined the frames with hot manure to maintain a good heat in the beds.

Melon plants intended for the main batch are doing well. We stop them at different times in order that the fruits may not ripen all at once. We have received the manure for the making of the hot-beds, as we expect to start the final planting early next week. This operation will be the chief work next month, and must be carried out as quickly as possible.

The Passion Lettuces which were planted in the unheated frames are now hearting, and will therefore require plenty of water.

The Turnips growing in frames must be given ample ventilation during the day and night as the frames and lights will soon be removed for the Melons. The soil must always be kept moist.

We are now pricking off for the second time our strongest Tomato plants, putting 100 plants in each light. The soil is made very firm at the roots, and the plants are set deeply to induce new roots to grow from the stem. The lights are kept closed and shaded for two or three days after the planting is done. *P. Aquatias.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

PERPETUAL-FLOWERING CARNATIONS.—In his excellent article on Perpetual-flowering Carnations (see p. 241), Mr. Weston mentions the variety Harlowarden as being the best of its colour. Another crimson variety of comparatively recent introduction is Gwladys. This plant flowers very freely, and the blooms are perfect in form, being even larger than those of Harlowarden. The variety has long, strong stems, smooth-edged petals, and rich Clove scent. *J. Johnson.*

GRISELINIA LITTORALIS.—I notice that several writers in the *Gardeners' Chronicle* have recently referred to this plant. *E. M.* states on p. 234 that he has seen many plants of this species killed by frost. My experience here is that even small seedlings are perfectly hardy. I have twice planted *G. lucida* var. *macrophylla* in the open, and each time it has been killed by frost. *G. J. P. Mayor, Lamellen, St. Tudy, Cornwall.*

GRAFTING OR BUDDING THE LILAC.—In the *Gardeners' Chronicle* for April 17 is a valuable caution from a correspondent against using Lilacs worked on Privet stocks for forcing purposes. Apart from other considerations, my experience of the Lilac when grafted on the Privet stock is that the plants are apt to die suddenly without any apparent cause, whether employed for forcing or for planting out-of-doors. Nearly all the dwarf, bushy plants sent to this country from abroad, which are intended for flowering in pots, are grafted or budded on the common Lilac, and they usually make effective specimens. It is, however, necessary to keep a sharp look-out for the removal of suckers, and doubly so if the plants are afterwards placed in the shrubbery

border where suckers quickly detract from the vigour of the specimen. Such being the case, I much prefer Lilacs on their own roots, though they are sometimes difficult to obtain in this form. Continental nurserymen are notoriously fond of grafting, whether this is necessary or not, but in the catalogue of Mons. Lemoine et Fils occur the following words:—"Our Lilacs are not grafted." As this firm raised nearly all the double-flowered forms and some of the single ones, the fact that they have discontinued grafting is strongly in favour of plants on their own roots. *W.*

THE VACANT LAND CULTIVATION SOCIETY.—The work of this society during its first season has been so successful in actual, tangible results, that it confidently appeals to the public for help. From landowners or their agents, we solicit the loan of unused and vacant plots of land, no matter where, in the metropolis or country. We agree to deliver up such lands within seven days, whenever called upon to do so by the owners or their agents. From seedsmen, growers and merchants we solicit seeds and plants, hoes, shovels, spades and rakes for the use of our cultivators. From bait-stable proprietors we ask contributions of manure and street-sweepings. From those able and willing to subscribe money in large or small amounts we solicit donations, on the assurance that none will go in the usual form of charity, but to provide opportunity for the heads of poor families to grow their own food by their own work, without any stigma attaching to them of receiving alms. The society requires £2,000 for the present season's work. *Joseph Fels, Hon. Sec.*

HIMALAYAN RHODODENDRONS AT TREMOUGH, PENRYN.—There is now a magnificent display of Himalayan Rhododendrons at Tremough, Penryn, Cornwall, where Mr. R. Gill has specialised in these beautiful plants for a great many years. One of the early owners of Tremough was the late Mr. Shilson, who formed the lovely garden at Trevarrick, St. Austell, now in the occupation of Mr. Martin F. Hitchens, of Sweet Pea fame. Mr. Shilson was a great lover of Rhododendrons, and his name is commemorated in the splendid hybrid Rhododendron *Shilsonii*, which was obtained from a cross between *R. barbatum* and *R. Thomsonii*. Among many beautiful Rhododendrons which I noted at Tremough during my visit at mid-April were the following:—An unnamed cross between *R. Griffithianum* and *R. Johusonii*, a large flower of charming colouring, blush with bright rose edge, *Triumph (Aucklandii × Thomsonii)*, a noble hybrid with immense carmine flowers; *R. barbatum*, a grand scarlet flower; *Duchess of Cornwall*, carmine-rose, fine pyramidal truss; a form of *R. Thomsonii* with a red calyx, the flower bearing a strong resemblance to *Lapageria rosea*; *Nuttallii*, having huge white flowers with faint lemon suffusion; *Countess of Haddington*, blush-coloured with long tube; several forms of *Shilsonii*, with very rich, decided colours, and the small but charming blush-coloured *ciliatum*. Mr. Gill has a good stock of young plants of such interesting Rhododendrons as *Wightii argenteum*, *glaucum* and *racemosum*; likewise of that splendid plant *Embothrium coccineum*. He imports seed of Rhododendrons from the Himalayas. The Tremough Rhododendrons ought to be good until nearly the end of May this year, as the season is late. The place is within three miles of Falmouth. *W. P. W.*

COMMON MUSK.—Is there such a thing now as a Common Musk with the old Musk perfume? Many friends of mine contend that there is not, and I myself am sceptical. *T. Smith, Newry.*

EVERGREEN AMPELOPSIS.—I enclose a fragment of a plant which I believe is an evergreen species of *Ampelopsis*. The plant has grown for some 20 years here against an east wall, the soil being very poor. It has never received protection during cold weather. *G. J. P. Mayor, Lamellen, St. Tudy, Cornwall.* [The specimen sent is *Vitis striata*. This species was not included on p. 240 in the list of tender evergreen species, for although in a few favoured places in the south-west counties it can be grown successfully on a wall, it is not generally hardy, and will not succeed out-of-doors in the neighbourhood of London. It is a native of the most southern part of Brazil, on the borders of Uruguay, and forms a

neat growing plant with small compound leaves. In a few gardens in Cornwall fine examples exist, notably at Tregothnan, near Falmouth. A few years ago, in September, a specimen in that garden was heavily laden with small black fruits of handsome appearance. The species has several synonyms and has been called *Cissus striata* and *Ampelopsis sempervirens*. It is probable that the evergreen species mentioned on p. 240 will thrive in any garden where *V. striata* is known to succeed.—Eds.]

ONIONS FOR MARKET.—I regret *A. D.* should think me a wet blanket. I only wrote as I did because his ideas so completely coincided with my own enthusiastic mistake. Many seedsmen inform the public in their catalogues that the best White Spanish type is the only good sort for a general market crop. I did not believe them, to my sorrow. Some of my regular customers would not even look at a sample. I sent them to Birmingham, and took London advice. The Bristol men told me they had not touched an English Onion all the season. They said they had "plenty of Dutch." It would be calamitous if we grew an immense English supply of the wrong sort of Onion. I thought myself of capturing the market. My bulbs were fine samples; but I was unsuccessful. *P. Kitley.*

SOCIETIES.

ROYAL HORTICULTURAL.

APRIL 20.—An excellent display of flowers was seen at the meeting held on Tuesday last in the Society's Hall, Vincent Square, the building being filled even to the annexes with exhibits. Flowering bulbs were numerous, also Roses, forced shrubs, Carnations, Orchids, *Cinerarias*, Rhododendrons, and hardy spring flowers generally.

The FLORAL COMMITTEE granted two First-class Certificates and eight Awards of Merit. The ORCHID COMMITTEE conferred one First-class Certificate and five Awards of Merit. The NARCISSUS COMMITTEE granted a First-class Certificate to *Narcissus "Queen of the West."*

The annual exhibition of the National Auricula and Primula Society was held on the same day; a report of this show is given on p. 270.

At the three o'clock meeting in the lecture-room a paper on "Pansies" was given by Mr. Eric Drabble, D.Sc.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. C. T. Drury, Jno. Green, R. Hooper Pearson, C. R. Fielder, George Gordon, J. H. Barr, J. F. McLeod, W. Howe, W. Bain, Chas. Dixon, Chas. E. Pearson, Ed. Mawley, Chas. E. Shea, J. T. Bennett-Poe, W. Cuthbertson, W. P. Thomson, Jas. Douglas, E. H. Jenkins, George Paul, E. T. Cook, and R. C. Reginald Nevill.

Several exhibits of forced Roses were shown. Mr. GEO. MOUNT, Canterbury, staged in his usual excellent style, a collection of popular varieties, having such beautiful kinds as Dean Hole, Mrs. John Laing, Richmond, Ulrich Brunner, Mrs. R. G. Sharman Crawford, Frau Lilla Rautenstrauch, a German variety with pale, conical blooms lightly tipped with rose, and Liberty, in first-class condition. (Silver Flora Medal.)

Messrs. WM. PAUL & SON, Waltham Cross, exhibited pot Roses, several being tall pillar varieties. These latter included the beautiful Waltham Bride variety and Veilchenblau, the so-called blue-flowered Rambier, a vigorous grower with blooms a poor shade of violet. We also noticed a batch of the beautiful Aennchen Müller, which formed the subject of our Supplementary Illustration in the issue for June 1, 1907. There were also seen Lyon Rose, with plump buds of a coppery-rose tone, and Marguerite. (Silver Flora Medal.)

Messrs. B. R. CANT & SONS, Colchester, staged cut blooms of many varieties of Roses, an epergne filled with the beautiful Fortune's Yellow variety being noticeable.

Some excellent blooms of this delicate Rose were also shown by Lady COWPEN, Panshanger, Herts. (gr. Mr. Staward), who also exhibited a collection of Violets.

Messrs. FRANK CANT & Co., Colchester, showed an assortment of Rambler Roses trained up tall stakes. All the plants were freely flowered, the selection of varieties including Lady Gay, Hiawatha, Mrs. F. W. Flight, Minnehaha, and Crimson Rambler.

Messrs. GEO. PAUL & SON, The Old Nurseries, Cheshunt, showed a number of small plants of a dwarf, perpetual-flowering *Wichuraiana* variety named Agate, also others of a single variety named Sea Shell, one of the parents of this latter variety being a Tea variety. The group contained prettily-flowered *Cystissus*, one labelled Firefly being very fine. Another interesting plant was *Osteomeles anthyllidifolia*, with pinnate leaves and *Olearia*-like inflorescences.

Mr. G. PRINCE, Oxford, exhibited Roses, some as pot plants. Blooms of Mrs. Ed. Mawley, Mrs. Longworth, a new H.T. variety, Florence Pemberton, and other varieties were shown in excellent condition. (Silver Flora Medal.)

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, had many Roses in an exhibit of miscellaneous flowers. A white sport from the beautiful Killarney variety attracted attention. Carnations shown by this firm were of the high quality usually seen in their exhibits of this popular flower. They also made a feature of *Acacias* in assortment, and large plants in bloom of *Meterosideros floribunda*, *Chorizema cordata*, *Ericas*, and *Grevilleas*. (Silver Flora Medal.)

Mr. W. H. PAGE, Hampton, had one of his usual magnificent exhibits of Carnations associated with *Lilium longiflorum* and red Roses. It was a grand display, all the flowers alike showing excellent culture. (Silver Flora Medal.)

Messrs. WM. CUTBUSH & SON, Highgate, London, N., also presented a fine assortment of these flowers, the blooms being staged with taste and the varieties representative of the best in commerce. Adjoining the Carnations, the same firm showed forced shrubs in assortment, the whole providing a wealth of blossom. (Silver Flora Medal.)

Many interesting flowers were shown from the garden of Sir EDMUND LODER, BART., Leonardslee, Horsham, Sussex (gr. Mr. W. A. Cook). Amongst several species of *Magnolias* was a flower of the rare *M. Campbellii*; *Camellias* were equal to those grown under glass, the old *C. Donckelaarii* being especially fine; blooms of *C. reticulata* were 8 inches across. *Rhododendrons* included *R. Fosterianum*, one of the most fragrant of the family; also *R. Gibsonii*, *R. Aucklandii*, *R. multiflorum*, and *R. ciliatum*. The beautiful *Narcissus* King Alfred was represented by exceptionally large blooms, and equally good was *N. maximus*. There were also plants of *Primula rosea*, *P. denticulata*, *P. cashmeriana*, and many other spring flowers. (Silver Bankian Medal.)

A large table was filled by Messrs. SUTTON & SONS, Reading, with Italian *Hyacinths* in blue and white-flowered varieties. These are excellent for furnishing cut flowers. At intervals were arranged vases of *Freesia Leichtlinii*, which, with small Ferns and Palms, afforded relief to the *Hyacinths*. In the centre was an unnamed species of *Cineraria*. (Bronze Flora Medal.)

A Bronze Flora Medal was also awarded to Messrs. H. CANNELL & SONS, Swanley, for an exhibit of *Zonal Pelargoniums*.

Messrs. JAMES CARTER & Co., High Holborn, London, adopted a pleasing style in exhibiting their plants of *Schizanthus*. Instead of the orthodox table arrangement, they furnished a circular kiosk with hanging baskets of these flowers, and grouped them on the floor and about the sides. The standards were entwined with *Smilax*. The whole formed a bower of flowers. (Silver Flora Medal.)

Messrs. JAMES VEITCH & SONS, King's Road, Chelsea, showed *Cinerarias* of much beauty; some were of beautiful shades of blue, others had rose, mauve, white, and pink blossoms. They were compact specimens, with healthy foliage and huge flower-trusses. The variety *Fantasy* has revolute florets of deep, rosy, mauve colour. Most interesting was *Cineraria flavescens*, raised from *Cineraria Feltham Beauty* × *Senecio auriculatissimus*; the buds are quite yellow and the expanded blooms are a shade of lemon, almost cream. Messrs. VEITCH also showed hybrid *Gerberas*, varieties of *Hippeastrum*, the floriferous *Malvastrum hypomodorum* (see *Gardeners' Chronicle*, June 20, 1908, fig. 176), and a batch of *Clerodendron myrmecophilum*. (Silver Flora Medal.)

Messrs. H. B. MAY & SON, The Nurseries, Edmonton, showed baskets of *Pansies*, *Verbena* Miss Willmott, *Statice profusa*, the dwarf-habited *Roses Phyllis* and *Mme. N. Levavasseur*, and large-flowered *Clematis* of the Marcel Moser and Miss Bateman varieties. Arranged amongst the flowering plants were decorative Ferns. Another exhibit shown by this firm consisted of hardy Ferns. Amongst these were crested forms of exceptional merit of the common *Scolopendrium*. (Silver Flora Medal.)

Colonel HOLFORD, Westonbirt, Gloucestershire (gr. Mr. Chapman), showed varieties of *Hippeastrum*, one receiving an Award of Merit (see Awards) Harvest Moon is of beautiful form, white flushed with rose; *Mirabel* is a rosy cerise shade and *Phoebus* brilliant scarlet.

Hardy flowers were plentiful, several exhibitors arranging their plants in temporised rock-gardens. Messrs. R. WALLACE & Co., Colchester, staged a rockery, somewhat similar to their exhibit at the previous meeting, and planted it with choice species of *Iris*, *Saxifraga*, *Anemone*, *Primula*, &c. (Silver Bankian Medal.)

Messrs. T. S. WARE, LTD., Feltham, also showed an exhibit of this kind, having many subjects of interest to cultivators of hardy plants, including a fine batch of plants of *Primula pulverulenta*. (Bronze Bankian Medal.)

Similar exhibits were arranged by Mr. H. G. PULHAM, Elsenham, Essex; Messrs. JOHN PEED & SON, Forest Hill, Norwood; Messrs. G. & A. CLARK, Dover; Messrs. GEO. JACKMAN & SON, Woking, Surrey (double-flowered *Primroses* and *Primulas cashmeriana* and *denticulata* were excellent in this exhibit); Misses HOPKINS, Mere Gardens, Shepperton-on-Thames; and Miss ALICE SMITH, Barnham, Bognor, Sussex.

Other exhibitors of hardy garden and Alpine plants were Messrs. G. BUNYARD & Co., Maidstone, whose double-flowered *Primroses* were noteworthy; Messrs. JOSEPH CHEAL & SONS, Crawley, Sussex; Mr. G. REUTHE, Keston, Kent (this exhibitor showed a fine dark form of *Primula rosea*, the pretty *Calypso borealis*, *Shortia uniflora*, &c.); THE GUILDFORD HARDY PLANT NURSERY, whose *Aubrietias*, *Primula nivalis*, *Doronicum Clusii*, *Cassandra calyculata*, and *Orob. azurum* were all well cultivated (Bronze Bankian Medal); Messrs. PHILLIPS & TAYLOR, Bracknell, Berks. (this group included a good strain of *Auriculas*); and Messrs. BAKER'S, Wolverhampton. This last-named firm showed a fine *Aubrieta* labelled *J. S. Baker*, also *Polyanthuses*, a batch of *Trilliums*, and the red-flowered *Primula Cockburniana*.

Messrs. BARR & SONS, King Street, Covent Garden, exhibited *Tritonia Prince of Orange*. The blooms are of regular form and not unlike a pale-coloured *Nasturtium*.

Named varieties of *Polyanthus* were shown by Messrs. STORRIE & STORRIE, Glencarse, Perthshire.

Pansies and *Violas* in variety were shown by Messrs. DOBBIE & Co., Rothesay (Bronze Bankian Medal), and Messrs. CARTER, PAGE & Co., 52, 53, London Wall, London.

AWARDS.

FIRST-CLASS CERTIFICATES.

Bougainvillea Rosa Catelina.—As shown, this plant appears to be a variety of *B. glabra*, and may, therefore, be expected to possess the good habit of that species. The purple colour of the type is next to eliminated from the bracts, which are a shade of rose. A large flowering branch was shown by Colonel PETRE, Westwick House, Norwich (gr. Mr. G. D. Davison), who stated that the variety was obtained from Las Palmas, Grand Canary.

Primula Forrestii.—This is an interesting new species from the high alps of Yunnan, China (9,000 to 11,000 feet altitude). The species possesses many points of uncommon interest. The root-stocks are described by Mr. Forrest, who collected this species and others for Mr. A. K. Bully, as growing in the crevices of dry, shady limestone cliffs, where they become 2 to 3 feet in length. Only a few inches of the tapered root-stalk are generally enclosed in the crevices of the rock, the remaining part of the plant being pendulous for almost its full length, a few inches of the growing apex only being turned out and upwards. It is estimated that some of the native plants are from 50 to 100

years old. The plants shown by Messrs. BEES, LTD., were about 2 inches high, and bore simple, ovate-elliptical leaves with crenate margins. The flowers were borne on erect scapes, and were deep yellow with orange-coloured eye. Both flowers and foliage were fragrant. The older leaves were mealy on the under surface. The species is described as perfectly hardy in Cheshire.

AWARDS OF MERIT.

Auricula (Alpine) Admiration.—A grey-edged flower with sulphur-coloured centre.

Auricula (Alpine) Claud Halcro.—This flower has a yellow centre and crimson petals falling to bronzy-red at the margin.

Auricula (Alpine) Robert Bruce.—A grey-edged flower with sulphur-coloured centre.

Auricula (Alpine) Ulleswater.—A very large purple-edged flower with whitish centre.

Carnation "Lady Coventry".—This is a magnificent variety of the *Souvenir de la Malmaison* type, the flowers being of extra large size, and carmine-lake in colour. One plant, which was cultivated in a 3-inch pot, was 2 feet in height and bore a flower of immense size. The blooms are very fragrant. Shown by Messrs. W. CUTBUSH & SONS.

Hippeastrum Graechus.—This is a deep crimson flower without any sign of another colour. It is the richest and deepest in tint of this type yet exhibited. Shown by Messrs. JAS. VEITCH & SONS, LTD.

Hippeastrum Pinkie.—This flower has excellent form and good substance in the imbricated petals. These are of glistening white, but marked with rose-coloured veins, the colour occasionally suffusing between the veins. The centre of the flower is pale green. Shown by Col. HOLFORD, C.I.E., C.V.O., Westonbirt, Tetbury (gr. Mr. A. Chapman).

Saxifraga decipiens hybrida grandiflora.—Those who know the moss-like *Saxifragas* and can recall a plant having somewhat of the habit of *S. cespitosa*, may form a good idea of the habit of growth of this novelty. In other respects it may be compared to a large, free-flowering plant in the way of *S. "Guildford Seedling"*, except that the plant promises to flower more freely. The plants exhibited were but 4 inches or 5 inches in height, the richly-coloured flower stems harmonising with the blood-crimson of the flowers. This variety represents an advance on all crimson-flowered *Saxifragas* hitherto known. From Mr. KITLEY, Bath.

Narcissus Committee.

Present: H. B. May, Esq. (Chairman); Miss E. Willmott, and Messrs. W. Poupard, W. A. Milner, Henry Backhouse, P. D. H. Williams, P. R. Barr, F. H. Chapman, Arthur R. Goodwin, Christopher Bourne, G. W. Leak, J. D. Pearson, W. F. M. Copeland, J. T. Bennett-Poë, Robert Sydenham, W. W. Fowler, James Walker, H. A. Denison, C. T. Digby, R. W. Wallace, Walter T. Ware, John Pope, and Chas. H. Curtis.

There were many good collections of *Narcissus*. One of the largest and most comprehensive groups was staged by Miss F. W. CURRY, Lismore, Ireland. Notwithstanding their long journey by sea and land, the blooms appeared fresh and good. Among the many excellent varieties, we noticed *Maggie May*, *Queen of Spain*, *Horace*, *Dante*, and *Lycidas* of the *Poeticus* section; *Lord Kitchener*, a handsome variety of the *Leedsii* group; *King Alfred*, *The Geraldine*, *Lady of the Snows* (a white *Ajax* kind), *Lady Margaret Boscawen*, and *Apricot*. (Silver-gilt Bankian Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, London, showed, in addition to a remarkably good collection of unnamed seedlings, the giant white *Leedsii* *Lord Kitchener* and the unrivalled *Peter Barr*, also *Loveliness*, *Mascotte*, and *Torchlight*, while the bicoloured *Seraphim* was in every respect excellent. A superb variety of the *Engleheartii* type was seen in *Red Emperor*; *Czarina* is a giant flower of the *Leedsii* class. (Silver Flora Medal.)

Messrs. POPE & SON, King's Norton, displayed many good kinds of *Narcissi* such as *Olympus* (a choice yellow *Ajax* variety), *White Lady*, *Bernardine* (with a rich orange crown), *Will Scarlett*, *J. B. M. Camm*, *Ben Simonite* (a fine

bicolor), Sebastian (of the Leedsii section), Boat-swain (a flower with soft yellow trumpet), Judge Bird (a bicolor flower of large size), Torch, Gonzola, Weardale Perfection, and a large number of promising seedlings. (Silver Flora Medal.)

Messrs. HOGG & ROBERTSON, Dublin, also exhibited a choice assortment of these flowers, their extensive display being composed of standard varieties and novelties. King Alfred was especially good. (Silver Flora Medal.)

Messrs. R. H. BATH, LTD., Wisbech, staged a collection of well-grown Narcissi, the varieties including King Alfred, Silver Strand, Weardale Perfection, Primrose Queen, Lucifer (with a fine orange-coloured cup), King's Norton (a big yellow self), Harmony (white), Fireflame, and Crystal Queen. (Silver Banksian Medal.)

Mr. G. CHURCHER, Alverstoke, and Mr. W. WATTS, St. Asaph, also displayed exhibits of these flowers, a Silver Banksian Medal being awarded in each case.

FIRST-CLASS CERTIFICATE.

Narcissus Queen of the West.—A yellow Ajax Daffodil of fine proportions and of that rich yellow colour so desirable for a market variety. It may be likened to a glorified flower of Golden Spur in regard both to its colour and form. The handsome crown is more widely expanded than in the older variety. An Award of Merit has been previously granted the variety, and on this occasion the Committee gave the higher award of a First-class Certificate. Shown by Messrs. WALTER T. WARE, LTD., Bath.

Orchid Committee.

Present: J. Gurney Fowler, Esq., (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), de B. Crawshay, H. Little, W. Boxall, J. Forster Alcock, Stuart Low, F. Sander, R. G. Thwaites, W. Cobb, J. Cypher, W. H. Hatcher, J. Charlesworth, H. G. Alexander, W. H. White, A. Dye, H. Ballantine, Gurney Wilson, J. Wilson Potter, W. Bolton, H. A. Tracy, W. Waters Butler, and F. J. Hanbury.

Colonel G. L. HOLFORD, C.I.E., C.V.O., Westonbirt, Tetbury, Glos. (gr. Mr. H. G. Alexander), staged a selection of fine hybrids raised at Westonbirt, including *Odontoglossum Phæbe* "Westonbirt variety," a fine white flower evenly blotched with deep ruby-red; *Laelio-Cattleya* × *Dorothy* var. *fulgens*, a pretty salmon-tinted flower having an orange ground; and *L.-C. Dorothy splendens*.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford, Dorking (gr. Mr. W. H. White), showed a selection of rare *Masdevallias*, including *M. deorsa*, *M. pachyantha*, varieties of *M. ignea*, *M. Shuttleworthii*, *M. Shuttryana*, *M. leontoglossa*, *M. Chamberlainiana*, and *M. Fraseri*. (See also Awards.)

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), was awarded a Silver Flora Medal for an effective group, in which were several varieties of *Odontoglossum crispum* with finely-blotched flowers, and a selection of good hybrids. Among species noted were *Cyrtopodium punctatum*, *Odontoglossum Edwardii*, two good specimens of *Epidendrum Wallisii*, *Oncidium Marshallianum*, *O. leucochilum*, *O. concolor*, white forms of *Cattleya intermedia*, and a plant of *C. citrina* with six flowers.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for a select group consisting chiefly of fine hybrids, and all splendidly grown. Amongst the best plants were *Odontioda Bradshawiae* with flowers of a light shade of scarlet; the fine pure white flowered *Brasso-Cattleya* "Queen Alexandra"; *Odontoglossum ardentissimum xanthotes*, snow-white with some orange spots on the lip; the rare white-flowered *Trichopilia Backhousiana*; a very beautiful home-raised, heavily-blotched form of *Odontoglossum crispum*; the dark scarlet *Renanthera Imschootiana*; *Diacrium bicornutum*; *Cattleya Trianae* Edgar Knight, a variety of the Emperor class with a deep violet-purple lip showing but little yellow in the throat; *Aërides Fieldingii* and other species.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a group which included another specimen of their new *Odontoglossum Dreadnought*. The central plant was a

grand specimen of *Miltonia Bleuana* Sander's variety with six flower-spikes. Amongst others noted were *Laelio-Cattleya Dominiana* magnifica; *Laelia Cholletiana* with four flower-spikes; *Odontoglossum crispum Thompsonii*, bearing large white flowers finely blotched with purple. We also noticed a remarkable white form of *O. crispum* with very firm substance in the petals; *Vanda cœrulescens*, *Polystachya bracteosa*, *Scuticaria Steelii*, and other uncommon species.

Messrs. JAS. CYPHER & SONS, secured a Silver Flora Medal for a group rich in *Dendrobiums*. *D. infundibulum* was finely flowered; other species were *D. atrovioleaceum*, *D. nobile virginale*, *D. Apollo grandiflorum*, *D. Devonianum*, and *D. Dalhou-nobile*. We also noted the white *Chysis bractescens*, *Miltonia Warszewiczii*, *Cattleya intermedia alba*, and various *Brasso-Cattleyas*.

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, were awarded a Silver Flora Medal for a group in which were several distinct forms of *Cattleya Schröderæ* of the coloured type; also a clear white variety of this plant. The *Dendrobiums* comprised good examples of *D. barbatum*, *D. Devonianum*, *D. Jamesianum*, and *D. Wardianum* of a specially fine type, one specimen bearing 125 flowers. Others noted were *Cymbidium Lowianum concolor*, *C. Lowgrinum*, a

Schröderæ *Silvia* James, a fine flower of a pale lilac tint.

J. T. BENNETT-POË, Esq., Holmewood, Chess-hunt (gr. Mr. Downes), exhibited cut spikes of *Cymbidium Colmanæ* Holmewood variety.

H. S. GOODSON, Esq., Putney (gr. Mr. Day), showed *Cattleya Mendelii* Goodson's variety and *Odontoglossum Rolfeæ* Ernestii.

NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr. Mr. H. J. Chapman), showed *Odontoglossum crispum* Millicent, a beautifully-blotched home-raised variety; also a fine form of *O. percultum*.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed his very beautiful new hybrid *Odontoglossum Theodora* (see fig. 115), a very fine dark blood-red *Odontioda Charlesworthii*, and *Odontoglossum Vulpex* (Pescatorei × *Vuykstekei*).

AWARDS.

FIRST-CLASS CERTIFICATE.

Odontoglossum Theodora (*Rossii rubescens* × *triumphans*), from DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables).—One of the most remarkable of *Odontoglossums*, and comparable to the handsome *O. Smithii* in its compact habit and size of flower. The sepals and petals are of a clear canary-yellow ground colour, the sepals showing little yellow except on

FIG. 115.—ODONTOGLOSSUM × THEODORA.

Awarded R.H.S. First-Class Certificate on Tuesday last.)

large specimen of *Masdevallia Pourbaixii*, pretty plants of *Ionopsis paniculata*, and *Cirrhopetalum Amesianum*.

Monsieur MERTENS, Ghent, secured a Silver Flora Medal for a group of select hybrid *Odontoglossums*, including *O. Lawrenceanum*, *O. Wigianum*, *O. amabile*, *O. illustre*, and *O. percultum*.

Mr. A. W. JENSEN, Lindfield, Haywards Heath, was awarded a Silver Banksian Medal for a group consisting of good forms of *Cattleya Mendelii*. Two of the plants carried 21 and 23 flowers respectively. With the *Cattleyas* were several good plants of *Odontoglossum crispum*, one having rose-tinted flowers bearing many small brownish spots, similar to the *punctatissimum* class.

The Duke of MARLBOROUGH, Blenheim Palace (gr. Mr. Hunter), showed *Odontoglossum crispum* virginale Blenheim variety.

Mrs. TEMPLE, Leyswood, Groombridge (gr. Mr. Bristow), sent *Laelio-Cattleya* Mrs. Temple (*L.-C. Hy. Greenwood* × *C. Mossiæ*).

HENRY LITTLE, Esq., Baronshalt, Twickenham (gr. Mr. Howard), showed *Cattleya Mendelii* Baronshalt variety, a good flower of peculiar colour with a purplish-crimson lip, showing but little of the usual yellow disc.

W. JAMES, Esq., Chichester, showed *Cattleya*

the tips and as shading between the closely-arranged bars of reddish-claret colour. The petals have a wide margin and are tipped with canary-yellow, the central two-thirds bearing bars of confluent reddish-claret blotches. The lip has a broadly ovate fimbriate blade, white with a slight tinge of lavender, the base having a yellow crest, in front of which is a horseshoe-shaped reddish-brown blotch.

AWARDS OF MERIT.

Laelio-Cattleya Goldencrest (*C. Schröderæ* × *L. Cowanii*), from Col. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander).—A beautiful hybrid bearing an erect inflorescence of many pretty flowers of a clear chrome-yellow colour, with darker veining on the lip.

Cattleya Robert de Wavrin (*Schröderæ* × *Schilleriana*), from Col. G. L. HOLFORD.—A large flower of fine substance, the sepals and petals being white, tinged with pale rose; the broad labellum is deep rose, with a yellow disc from which light crimson veining, derived from *C. Schilleriana*, extends to the front.

Odontoglossum loochristiense aureo-fulvum, from Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White).—A finely-formed flower with bright yellow sepals and petals distinctly barred and blotched, with dark-

reddish chocolate. The lip is white with a yellow crest around which are some brown spots.

Miltonia Bleuana Sander's variety, from Messrs. SANDER & SONS, St. Albans.—A grand form with large, almost circular, white flowers, the petals having their bases tinged with violet; the lip a distinct mask of reddish lines. The plant bore six spikes.

Epi-Lalia Lionetii (L. purpurata × E. atropurpureum), from Messrs. CHARLESWORTH & Co., Haywards Heath.—A singular hybrid, producing an erect inflorescence, after the manner of *E. atropurpureum* (macrochilum), bearing flowers greatly resembling in shape those of that species, and of a bright rose colour.

BOTANICAL CERTIFICATE.

Pleurothallis Birchenallii, from Messrs. CHARLESWORTH & Co.—A singular species, bearing spikes of long reddish-purple flowers with narrow, white petals resembling *P. Scapha*.

Oncidium barbatum, from GURNEY WILSON, Esq., Glenthorne, Haywards Heath.

CULTURAL COMMENDATION.

To Mr. H. G. Alexander, Orchid grower to Col. G. L. HOLFORD, for a notable specimen of *Cattleya Enid* "Westonbirt variety," with seven flowers on a spike. The same award was given for a fine plant of *Odontoglossum Pescatorei*, with 153 flowers on three spikes, shown by this exhibitor.

Mr. W. H. White, Orchid grower to Sir TREVOR LAWRENCE, BART., showed three finely-flowered plants of *Dendrobium crepidatum*, and was granted a Cultural Commendation.

Fruit and Vegetable Committee.

Present: A. H. Pearson, Esq. (in the Chair), and Messrs. P. D. Tuckett, J. Vert, H. Parr, A. Dean, O. Thomas, J. Lyne, W. Bates, G. Wythes, F. Perkins, J. Davis, J. McIndoe, W. Crump, C. Foster, G. Hobday, W. Fyfe, A. R. Allan, J. Harrison, and W. Poupert.

A collection of Pineapples, including very small fruits of the Queen variety and larger examples of smooth Cayenne were displayed by THE SOUTH AFRICA CONSTANIA FRUIT CO.

MESSRS. SUTTON & SONS, Reading, set up an interesting and meritorious group of "April" Cabbage some 150 in number. These were from a sowing made early last August, and were specially planted 9 inches apart in the open to furnish early heads. All were small, very conical, and quite firm. (Silver Banksian Medal.)

Lady COWPER, Panshanger, Herts. (gr. Mr. Steward), staged a collection of seven dishes, distinct, of frame-grown Potatoes. They were good samples, but much the finest was Midlothian Early Kidney. Other varieties were Sharpe's Express, Duke of York, Sharpe's Victor, Britannia, Tweedale, and Early Balfour. The same exhibitor showed excellent Canadian Wonder Dwarf Beans and Dainty Scarlet Turnip-rooted Radishes. (Silver Banksian Medal.)

Sir EDMUND LODER, BART., Leonardslee, Horsham, Sussex (gr. Mr. W. A. Cook), showed heads of late Broccoli.

COMPETITIVE CLASSES.

Mr. J. POUPART, Brentwood, staged five large flat bundles of Asparagus. Two of these were in competition in a trade class, and secured a Silver Knightian Medal.

Mr. E. BECKETT, Aldenham House Gardens, was the only exhibitor of two dishes of Dwarf French Beans, having the varieties Canadian Wonder and Ne Plus Ultra, both in excellent pods. The exhibit secured the first prize. There was no other competitor.

NATIONAL AURICULA & PRIMULA. (SOUTHERN SECTION.)

APRIL 20.—The annual exhibition of this Society was held at the Horticultural Hall, Vincent Square, Westminster, in conjunction with the fortnightly exhibition of the Royal Horticultural Society. Owing to the cold weather, the season for these flowers is late, and few growers of the Auricula had their plants in bloom. The number of entries was much fewer than on former occasions, and very poor competition resulted. The Society has lost by death several prominent members, whose exhibits were missed on this occasion, notably Mr. Martin Smith, Mr.

Charles Turner, and Mr. Ben Simonite. In the larger classes for Auriculas Mr. James Douglas easily surpassed his competitors, his flowers being much superior to any of the others.

SHOW AURICULAS.

Twenty-four Auriculas in not fewer than twelve dissimilar varieties.—There were three competitors in this class, viz., Mr. JAMES DOUGLAS, Great Bookham, Surrey; Mr. W. M. SHIPMAN, Altrincham; and Mr. J. H. WILSON, Handsworth, Sheffield, the prizes being awarded in the order of their names. Mr. DOUGLAS had by far the finest flowers. He staged Mrs. Phillips, Prince Charming (a very commendable example), Henry Wilson, Marmion, Seedling Grey Edge, Queen of Sheba (one of the best in the collection), Sultan, Rev. F. D. Horner, Ouida, Dinham, Lovebird, Favourite (2) (this variety was in good form), Harrison Weir (2) (also shown well), Queen of Spain, Geo. Lightbody, Shirley Hibberd (good), Abraham Barker, Eucharis (2), Abbé Liszt, and Colonel Champneys. In the 2nd prize exhibit were good examples of Mikado, Acme, Shirley Hibberd, and Dinham. Mr. WILSON'S best examples were Heroine, Cleopatra, and Ruby.

Twelve show Auriculas of dissimilar varieties.—Mr. JAMES DOUGLAS and Mr. W. SMITH, Bishops Stortford, contested in this class, the former winning, but not so easily as in the larger class. Mr. DOUGLAS had Dido, Abbé Liszt, Favourite, Beauty, Harrison Weir, Westhumbra, Lovebird, Mrs. Phillips, Marmion, Conservative, Prince Charming, and George Lightbody. The 2nd prize group contained good specimens of Abbé Liszt, Harrison Weir, Dr. Hardy, and Snowdon.

Six show Auriculas, dissimilar.—Mr. J. T. BENNETT-POË, Ashley Place, London, S.W., was the only exhibitor, and he was awarded the 1st prize. His varieties were Richard Heady, Mrs. Henwood, J. Hanniford, Mrs. Phillips, Rev. F. D. Horner, and Vesta.

Four show Auriculas, dissimilar.—There were two exhibits, staged by Mr. BENNETT-POË and Mr. F. W. PRICE, Beckenham, who were awarded 1st and 2nd prizes respectively. The premier four were Prince Charming, Rachel, Mrs. Phillips, and Mrs. Henwood.

The best single specimen of a green-edged variety was Abbé Liszt, shown by Mr. DOUGLAS; the best grey-edged variety Stately, shown by Mr. W. SMITH; the best white-edged variety Acme, shown by Mr. F. W. PRICE; and the best coloured flower, Favourite, shown by Mr. DOUGLAS.

For seedling varieties never before exhibited, the 1st prizes were awarded as follow:—Green-edged, Harbinger; grey-edged, Grey Friar; and fancy, Majestic; all shown by Mr. W. SMITH.

The premier show Auricula was Queen of Spain, a maroon "self" variety, shown by Mr. DOUGLAS.

ALPINE AURICULAS.

Twenty-four Alpine Auriculas in not fewer than twelve varieties.—There were two competitors, viz., Mr. JAMES DOUGLAS and Messrs. PHILLIPS & TAYLOR, Bracknell. Mr. DOUGLAS won the 1st prize easily with Admiration, Dazzle, Rosy Morn, Mrs. James Douglas, Janet, Sweetness (new), Brightness, Argus, Phyllis, Purple Glory, Robert Bruce (very finely shown), Janet, Firefly, Ettrick, and Mrs. Markham.

Twelve Alpine Auriculas, dissimilar.—The same two competitors as in the last-named class, with Mr. W. M. SHIPMAN, contested this class. Mr. DOUGLAS again won the 1st prize, followed by Messrs. PHILLIPS & TAYLOR. In Mr. DOUGLAS'S collection was Phyllis, the premier Alpine Auricula in the show.

Six Alpine Auriculas, dissimilar.—There were four competitors in this class, Lady COWPER, Panshanger, Herts. (gr. Mr. Steward), was awarded the 1st prize, for very fair specimens of Seedling Maggie, Blue Bell, Argus, Rosy Morn, Teviotdale, and Flora McIvor; 2nd, Mr. F. W. PRICE, Beckenham.

POLYANTHUSES.

These flowers also were not up to the usual exhibition standard, owing to their backwardness.

In the class for 12 varieties Mr. WATTS, St. Asaph, was awarded the 1st prize, and Messrs.

TITT & SON, Windsor, the 2nd prize, these two being the only exhibitors.

Messrs. TITT & SON took the 1st prize in a class for 12 Primroses, of dissimilar varieties, having some excellent plants.

Mr. WATTS showed the best specimen Primrose in a pale yellow variety with a deep orange-coloured "eye."

The best group of Primrose and Polyanthus plants arranged for effect and occupying an area of 4 feet by 3 feet, was shown by Mr. MORTIMER, Rowledge, Farnham, Surrey. All were seedlings of an exceptionally fine strain. 2nd, Messrs. STORRIE & STORRIE, Glencarse, Perthshire, with named varieties.

AWARDS.

The Certificate of the Society was awarded to each of the following Auriculas:—

Sweetness.—An Alpine variety of fine form, the colour being purple shading to lilac.

Queen of Spain.—A self show variety, colour maroon. Both these were shown by Mr. J. DOUGLAS.

Harbinger.—A green-edged show variety, exhibited by Mr. W. SMITH.

Bracknell.—An Alpine variety with a large yellow eye, shown by Messrs. PHILLIPS & TAYLOR.

Alexander Dean.—An Alpine variety of deep maroon colour, with a yellow centre. Shown by Mr. F. W. PRICE.

A non-competitive exhibit of Polyanthus was shown by Mr. JOHN CROOK, The Avenue, Camberley, Surrey.

CORNWALL DAFFODIL AND SPRING FLOWER.

APRIL 15.—On account of the backwardness of the season, it was found necessary to postpone the date of the show from March 30 to April 15. This alteration suited exhibitors, for the entries exceeded those of any previous show, and the exhibition was certainly the best that has ever been held. The displays of Daffodils were quite equal to those of previous seasons; the exhibits of hard-wooded flowering shrubs were superb, Violets were exceptionally fine, and the collections of spring flowers generally were varied and interesting. The show was held in the great Market Hall, Truro. The weather was fine and the exhibition was attended by a large number of visitors. The Hon. John Boscawen has occupied the post of hon secretary since the inception of the society 13 years ago.

In the class for 30 varieties of Daffodils, the 1st prize was won by Mr. E. J. WILLIAMS. Among the best specimens shown by this exhibitor were White Queen, Horace, Incognita, Lucifer, Lady Margaret Boscawen, King Alfred, and Homespun. 2nd, the Rev. A. T. BOSCAWEN, whose exhibit was held by many to surpass that which received the 1st prize.

For 30 varieties of Daffodils, not necessarily in commerce, the 1st prize was awarded to Mr. J. C. WILLIAMS. This stand was one of the most remarkable features of the exhibition. It included a collection of seedling varieties, numbered but not named. Amongst them were some beautiful bicolor trumpets, a fine golden trumpet, an improved White Queen, and several very fine flat-crowned flowers with pale, dark yellow, and glowing orange-crimson centres.

Miss CLARICE VIVIAN won the 1st prize for six Magni-coronati varieties, and for the same number of Medio-coronati flowers. This lady also showed the best collection of three varieties of the Leedsii section, the best six Parvi-coronati flowers, and won the 1st prizes in several other classes. Other successful exhibitors of Narcissi included Miss MABEL WILLIAMS, Col. NOEL-USTICKE, Mr. P. D. WILLIAMS, Mr. E. H. WILLIAMS, and Mr. C. DAWSON.

In the class for 20 hard-wooded flowering shrubs or creepers, equal 1st prizes were awarded to Mr. T. B. BOLITHO and Mr. C. HEXT. Mr. BOLITHO'S collection contained by far the rarer varieties and included *Buddleia madagascarensis*, *Acacia cordata*, *Chorozema Lowii*, *Cerasus Watereri*, *Acacia verticillata*, *Magnolia stellata*, *Boronia heterophylla*, *Hardenbergia monophylla*, *Calceolaria Burbidgei*, *Spiraea arguta*, *Andromeda formosa*, *Sutherlandia frutescens*, *Grevillea Preisei*, *Skimmia Fortunei*, *Lotus peliorhynchus*, *Camellia reticulata*, *Prunus pendula*, *Jasminum primulinum*, *Embothrium coccineum* and *Boronia megastigma*.

NURSERYMEN'S EXHIBITS.

The nurserymen provided a very bright display with their exhibits. Messrs. R. VEITCH & SON, Exeter, received an Award of Merit for *Rhododendron* Dr. Stocker. They also staged *Azalea obtusa* alba, A. Marie Louise, *Prunus spinosa* flore pleno, *Grevillea sulphurea*, *G. ornithopoda*, *Brachysema Drummondii*, *Kennedyia rubicunda*, as well as rock plants and *Hippeastrums*.

The DEVON ROSERY, Torquay, showed a fine collection of pot Roses, including the varieties Mollie Sharman Crawford, John Cuff, Dorothy Page Roberts, and Elizabeth Barnes.

Mr. G. REUTHE, Keston, Kent, exhibited an interesting assortment of Alpines and received an Award of Merit and Cultural Commendation for *Calypto borealis*.

Messrs. BARR & SONS, King Street, Covent Garden, London, provided a superb show of Daffodils, including the varieties Mrs. G. H. Barr, Peter Barr, Fair Maiden, Horace, The Bride, Weardale Perfection, Mountain Maid, Katharine Spurrell, Monarch, Albatross, Resolute, Buccaneer, and Admiral Togo.

Messrs. CARTWRIGHT & GOODWIN also showed a very fine selection of Daffodils, amongst which were noticed Goldseeker, Yellowhammer, Home-spun, Outpost, and Alice Knights.

Messrs. CUTBUSH & SON staged *Adonis amurensis* flore pleno, *Tulipa pulchella*, *Anemone vernalis*, *Ranunculus amplexicaulis*, and many other spring flowers.

Messrs. HEATH & SONS, Cheltenham, exhibited *Saxifragas*, *Glaucium flavum tricolor* and *Lathyrus cyaneus*.

A Cultural Commendation was given to Mr. T. H. ARCHER HIND for varieties of *Helleborus*.

Mr. J. H. WATSON showed a collection of *Acacias* grown in the open; they included *A. hastulata*, *A. Drummondii*, *A. acinacea*, *A. ovata*, *A. armata*, *A. armata angustifolia*, *A. diffusa*, *A. floribunda*, *A. melanoxylon*, *A. leprosa*, *A. hæmatophylla*, *A. longifolia mucronata*, *A. longifolia magnifica*, *A. ulicina*, *A. verticillata*, *A. Riceana*, and *A. juniperina*.

DEVON DAFFODIL AND SPRING FLOWER.

APRIL 20.—A very successful show, under the auspices of the above society, was held in the Guildhall, Plymouth, on this date. The entries, both in the open classes and those restricted to growers in Devonshire, were numerous, and the exhibits generally were of a high order of merit. In judging the Daffodils the new classification was adopted.

The following exhibitors were prominent prize winners in the classes for Narcissi:—Mrs. TYACKE, Miss CLARICE VIVIAN, Messrs. POPE & SON, and Mrs. CHRISTY.

In the class for 12 hardy spring flowers, the 1st prize was won by Mr. H. W. GRIGG with a fine stand, which contained *Leucojum æstivum*, *Fritillaria imperialis*, *F. verticillata*, *F. obliqua*, *F. meleagris* alba, *Triteleia uniflora*, *Iris bucharica*, *Scilla italica*, *Muscari conicum album*, *Anemone Robinsoniana*, *Erythronium giganteum*, and *Tulipa florentina* major.

The best six bunches of Anemones were shown by Mr. SOLTAU-SYMONS, and the best six bunches of *Anemone fulgens* by Mrs. CORYTON.

In the classes reserved for residents in Devonshire the following exhibitors were successful in obtaining 1st prizes:—Mr. SOLTAU-SYMONS, Mrs. GAGE-HODGE, Mrs. PARLBY, Miss HINCHCLIFF, Miss G. HAWKER, Hon. Mrs. COLBORNE, Mr. T. BATSON, Mr. H. G. HAWKER, Mrs. DUKE YONGE, Mrs. J. J. MALLOCK, Mr. R. WATTS, Mrs. BAINBRIDGE, and Mrs. A. FROUDE.

Messrs. ROBERT VEITCH & SON, Exeter, showed a fine collection of plants, among which were *Lotus peliorhynchus*, *Eriostemon nerifolius*, *Correa cardinalis*, *Exochorda Albertii macrantha*, *Acacia Drummondii*, *A. armata*, *Gerbera Jamesonii*, *Prunus triloba*, *Pimelea spectabilis*, *Magnolia stellata*, *Hibbertia dentata*, and numerous rock plants. The Devon Rosery, Torquay, staged a splendid selection of pot Roses in full bloom, embracing many of the newer varieties.

Messrs. BARR & SONS, King Street, Covent Garden, London, arranged a display of Daffodils, amongst which were many new varieties. Messrs. JOHN WEBBER & SONS exhibited a collection of miscellaneous plants.

Obituary.

WILLIAM MILLER.—The death of William Miller, who for upwards of 40 years was gardener to the Earls of Craven, at Combe Abbey, Warwickshire, occurred on the 16th inst. at Berkswell. Miller belonged to an old school of Scotch gardeners who received their early tuition under Fleming, at Trentham, in Staffordshire. He was born at Knockdow, in the parish of Inderchoalin, Argyleshire, on November 29, 1828. His father was then gardener to James Lamont, of Knockdow, having commenced service in this family as a gardener in 1821. He served three generations, extending over a period of 52 years, and died on August 3, 1873, in his 85th year. In an autobiographical note, which William Miller contributed to these pages in the year 1875, he states that he was educated at the parish school, Toward, until he was 14 years of age, when he was sent to teach two orphan grandchildren belonging to a wealthy sheep farmer in the neighbourhood. At the end of this service he was put to work under his father, who was then manager on the Lamont estate, already mentioned.

THE LATE WILLIAM MILLER.

Plantations of Larch, Scotch Fir, Spruce and Oak were being plentifully made at that time on this and other estates on the west coast, for purposes of shelter and timber. Although still a lad, Miller could measure land. When a piece of land was set out for planting, he was frequently sent to survey it, and to work out the number of plants that would be required. Subsequently Miller was appointed foreman in the Lamont gardens in succession to his elder brother John. After serving for a time in this capacity, he entered the gardens at Erskine House, on the Clyde, the seat of Lord Blantyre. The gardener at that time was George Shiels. He had the best walled garden in the West of Scotland. The bothy at Erskine was a good one for those days, and in the evening the young men read assiduously. It was here that Miller commenced horticultural drawing, which he pursued ever afterwards. How he succeeded may be seen in the flower garden which he designed at Combe Abbey, and in various designs for flower gardens which he has contributed to this journal, and to the Paris Exhibition of 1900. He only remained at Erskine for one year, and then, having no situation to go to of a suitable character, he entered for the winter the Andersonian Univer-

sity at Glasgow. In the following spring he went as journeyman to Dysart House, where Mr. John Laing, the founder of the nursery of John Laing and Sons, Forest Hill, was then gardener. During the time Miller was at Erskine, John Laing succeeded in flowering *Rhododendron Dalhousia* for the first time in this country. It was John Laing who sent Miller to Trentham. At the end of two years he left Trentham for Gowran Castle, Ireland, to become head gardener to Viscount Clifden, where he remained four years. In 1859, Fleming, of Trentham, sent for Miller to take up the bailiffship on the Trentham home farm. Miller wrote afterwards that he cited repented most bitterly that ever he left the service of such a kind and indulgent family. The post at Trentham proved to be hedged with difficulties of a personal rather than professional character. Leaving Trentham again in the spring of 1861, he worked under Mr. Eyles in the new gardens of the Royal Horticultural Society at South Kensington for three months, and then, with the help of several friends, including Fleming, of Trentham, he obtained an appointment as head gardener at Combe Abbey. The late Earl of Craven was a man of great taste, fond of horticulture and of improving his estate; he possessed a good knowledge of trees. Miller's first duty at Combe was to erect new forcing-houses. He afterwards commenced a series of improvements in the pleasure grounds, and this work was continued for many years. Large trees were transplanted, and many Conifers and other new trees and shrubs were planted. Extensive green drives were formed and trees and hedgerows were cleared away in order to open up views and increase the interest of the pleasure grounds and park. In the 'sixties Miller was a frequent exhibitor at the competitive horticultural exhibitions. Some of the best shows in this country were then held at the Royal Botanic Society's Gardens, Regent's Park. In 1867, 1868, and 1869 Miller won successively the gold medals offered by this Society for the best collections of fruit.

During a week-end visit the writer spent with Miller about ten years ago at Combe, he related a great many interesting details connected with his service there. He could look up to Poplars 60 feet in height which he had planted. He could point to the most interesting flower garden and say that it had been formed not only by himself, but from plans which he had designed. The flower garden portrayed an idealistic tree growing from an ornamental vase, nearest the house, and spreading in fanciful curves over the space the garden covers, some of the branches terminating in little beds, similar in form to the Shamrock leaf; and others resemble the flower-head of a Thistle. The vase and its ornamentation was planted in semi-carpet-bedding style, and the branches of the trees were like so much tracery, the beds being only from three-quarters of a foot to about 1½ feet in width. The planting of such beds can only suitably be done with neat-habited plants, and Pelargoniums and other showy species were most effective. By the sides of this tracery there were two long beds in which a very bright display was made by hardy perennial and summer-bedding plants, disposed in a mixed pin-cushion system, thus affording a feature in the same view of entirely different style.

In every direction the features at Combe had been formed or developed by Miller. He was not only a practical gardener but a student as well. Whenever he could obtain leisure he might be found in his room studying works upon horticulture or botany, or drawing new plans. He studied British botany closely, and in this respect the flora around the large and magnificent lake at Combe offered considerable facilities.

A few years ago Miller resigned his position at Combe. Being well over 70 years of age at the time, he might reasonably have claimed some rest after an exceedingly energetic and busy life, but instead he preferred to commence a business and nursery at Berkswell, near Coventry,

where he has since practised as a landscape gardener. For 40 years past Miller has been a frequent and valued correspondent to this journal. His brother John, who will be remembered as gardener at Workop Manor, Nottinghamshire, and Ruxley Lodge, Surrey, died in 1902 at the age of 80 years. John had four sons, who adopted gardening as a profession. William leaves several sons, but all have selected other occupations. One of them, Mr. Hugh Miller, a civil engineer, contributed several articles on the use of motors in horticulture to this journal in the spring of last year.

SAMUEL LAIRD.—The death of this gardener occurred at Arbroath. For nearly two years deceased had been in indifferent health, but it was only within the past month or two that his illness took a serious turn. Mr. Laird was for 23 years head gardener to the late Earl of Southesk at Kinnaird Castle, and he had held a similar position at Dunninald Castle. Nine years ago he commenced business as a seedsman and fruiterer in Arbroath. Mr. Laird, who was 68 years of age, was a native of Newcastle, Co. Down, Ireland. He leaves a widow and family.

* * * The Editor will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for forming Supplementary Illustrations to this Journal.

EDITOR AND PUBLISHER.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the EDITOR. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

ALLEGED MISREPRESENTATION: Nusselt. You will have to prove misrepresentation as to the character of the place and that you were thereby induced to take the situation. Subject to this, you should succeed in obtaining damages at least sufficient to cover the expenses of your removal both going and coming, assuming that you decide not to stay. A jury might give you even more than this. You should get a local solicitor to draw the claim and work up the evidence.

ARAUCARIA: C. J. L. It has not been determined if the plants were grown in pots, and the roots, therefore, injured by the severe restriction. This is scarcely a likely explanation of the failure of the poor specimens.

BLACK CURRANT BUD-MITE: W. P. R. Mr. A. H. Pearson's remedy, which he described in communications published in this journal on May 21, 1904, p. 298, and May 13, 1905, is as follows:—Spray the bushes at intervals of 10 days during May and June with a mixture of soft soap, Quassia, and water, at the strength of 2 ounces of soft soap and 4 ounces of Quassia to each gallon of water, applied by means of the Knapsack sprayer (Vermorel's). Bushes that were slightly affected before the spraying will probably be found to be quite free from the pest at the end of the season, but if they are not, Mr. Pearson stated they will certainly be clean after such treatment in two seasons. In the autumn, when the leaves have fallen, the bushes should be very carefully inspected, and, if any big buds are found, remove them to the fire.

BLUE FLOWER: B. L. The Muscari would be the better plant both as regards its permanent character, and the class of soil you mention. The plant is by no means fastidious, but owing to its free increase by means of offsets should be planted thinly if desired to form a permanent group. We are assuming that you require the plant to grow alone and not in actual association with the Chionodoxa. It would not be suited for such an association. Should you require a third subject you might with advantage select Hyacinthus azureus, a pretty plant with turquoise-blue flowers that appear in February or early in March.

BLUE PRIMROSES: W. H. H. There appears to be nothing remarkable in the flowers received, but they were so withered on arrival that it is impossible to see exactly what they have been.

CAMELLIA LEAVES SPOTTED: J. D. C. There is no disease present in the foliage; the injury is due to some external cause, probably scorching. It is not advisable to plant Camellias against a wall; the radiation of heat from the bricks dries up the young shoots, and in time kills them.

COMPENSATION FOR IMPROVEMENTS: Northern. (1) The amount of compensation to be awarded under the Agricultural Holdings Act, 1908, is "such a sum as fairly represents the value of the improvement to an incoming tenant," and such sum would be fixed by arbitration under the Act quite independently of whether there is a new tenant forthcoming or not. (2) The tenant, on leaving can claim compensation for "repairs to buildings necessary for the proper cultivation or working of the holding other than repairs which he is himself under an obligation to execute, provided that the tenant, before beginning to execute any such repairs, shall give to the landlord notice in writing of his intention, together with particulars of such repairs, and shall not execute the repairs unless the landlord fails to execute them within a reasonable time after receiving such notice." We certainly do not consider that the tenant could recover the cost of glass broken during his tenancy. (3) Ask a local solicitor to arrange a mortgage for you.

CORRECTION.—Messrs. R. B. Laird & Sons, Ltd., inform us that our reporter was in error in stating that a Silver-gilt Medal was awarded for their exhibit at the Edinburgh show. The exhibit was entered on the understanding that no award would be made.

CROCUS: Mrs. S. E. One of the most effectual means of keeping sparrows from destroying Crocus flowers is to stretch black cotton across small sticks driven into the ground at various intervals about the Crocuses. The cotton should be 4 to 6 inches above the flowers, and form an almost invisible network above them. The birds coming in contact with the cotton, are thus frightened and fly away. Poison is the other alternative. It is well known that the Dutch yellow Crocus is sterile, but its definite history is unknown. It is supposed to be derived from *C. aureus*, a native of South-eastern Europe. *C. aureus* is a smaller and more refined flower than the common yellow Crocus, and it produces seeds.

CUCUMBERS: C. V. D., Holland. The variety referred to on p. 234 is known in this country as Butcher's Disease-resisting Cucumber.

CYCLAMEN: A. S. *Cyclamen persicum* is stated to have been first cultivated in Europe at Lille in 1731, having been introduced from Persia. There is, however, doubt as to its origin, because the plant is not found wild in Persia; it probably came originally from Syria. The florist's *Cyclamen* is a cultivated form of *C. latifolium*, a native of Syria. The first authority for the name *C. persicum* is Miller, in his *Gardeners' Dictionary*, 1768.

EUONYMUS SHOOTS KILLED: E. W. The damage has been caused by frost; the injury is common in most parts of the country this season, even in suburban gardens around London.

FORESTRY PERIODICAL: T. W. C. There is no such publication as you require. The book you mention will be of service. *Tree and Shrub Culture*, by William Dallimore, is a cheap but valuable work on the subject. It may be obtained from our publishing department.

MARGUERITE LEAF-MINER: Constant Reader. The foliage you send is attacked by the Marguerite leaf-miner. The female punctures the leaves and deposits her eggs in the interior. Directly the young caterpillars are hatched, they commence to feed upon the leaves, and tunnel about between the two surfaces in their quest. Subsequently the caterpillar becomes a chrysalis, thus completing the cycle. Preventive measures would include the spraying of the plants with quassia extract or other distasteful liquid, in order to prevent the females from depositing their eggs upon the leaves. When plants have been so sprayed at intervals, it has been found to be very effective. Remove badly-affected leaves and burn them.

MARKET MEASURES: Correspondent. A bundle of Asparagus contains, approximately, 150 shoots; a bag of green vegetables weighs 40 lbs. Carrots are not packed in pads, but are sold in bundles, containing 12 roots. A tally of Cabbages is 60 heads. Horse-radish is sold in bunches of 12 sticks. Turnips are bunched, 12 to 15 roots forming a bunch. The sieve varies; it is practically equivalent to one bushel. In weight it may be estimated at 40 to 50 lbs., according to the produce.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in one issue are requested to be so good as to consult the following numbers.*

PLANTS: Foreman. *Bifrenaria Harrisoniae*, often known in gardens as *Lycaste Harrisoniae*.—*F. F.* A good type of *Oncidium Marshallianum*.—*T. H. O.* 1, *Brassia brachiata*; 2, *Catasetum maculatum*; 3, *Oncidium flexuosum*; 4, *O. sphecelatum*.—*T. T.* 1, *Pulmonaria officinalis*; 2, *Valeriana Phu aurea*; 3, *Nephrolepis Todeoides*; 4, *Adiantum decorum*; 5, *Selaginella Wildenowii*; 6, *Asplenium bulbiferum*.—*Anxious.* 1, *Daphne Mezereum*; 2, probably *Acacia Farnesiana*; 3, *Draecena Sanderiana*; 4, *Begonia subpeltata*; 5, *B. metallica*.—*A. G.* *Dendrobium heterocarpum (aureum)*.—*S. E. L.* 1, *Mesembryanthemum blandum*; 2, *M. inclaudens*; 4, *M. Brownei*; 5, *Teucrium fruticans*.—*Reader.* 1, *Leedsii* type; 2, *Bicolor* Empress; 3, *Emperor*; 4, *Incomparabilis* Queen Bess; 5, apparently one of the discarded varieties of the *incomparabilis* type; 6, probably a poor bloom of the variety *Sir Watkin*.

PERENNIAL BUCKWHEAT: T. W. C. The only perennial species of the Buckwheat family in cultivation is *Fagopyrum cymosum* (Beech-wheat). It is a strong growing plant, reaching to a height of from 5 to 6 feet, and is a native of the Himalayas. Both the other species, *F. esculentum* and *F. tataricum*, are annuals or biennials.

TO PREVENT BEES SWARMING: R. O. F. The following methods will discourage swarming, but we do not know of any certain means of prevention:—(1) By the caging of the queen in a "pipe cover" cage, afterwards examining the hive and cutting out all queen cells. This latter operation needs care, for often one cell is missed and all one's calculations are upset. After about eight days examine the hive for queen cells and release the queen. (2) Some give increased space by extracting from the brood combs, and if the machine be not worked too swiftly, the brood will not be injured. (3) The removal of frames containing honey and replacing frames fitted with full sheets of foundation. This is a valuable device, for the queen requires more breeding space, and this provides the requisite room. (4) Tiering up too rapidly will cause swarming, but oftener than not more space is not allowed in time, and the bees, feeling cramped, are induced to swarm. Where very large apiaries exist, beekeepers often omit the use of the queen excluder, so the queen roams at will over the whole hive, if so disposed, and the number of swarms does not exceed two or three per cent.

HYBRID GERBERAS.

UNDER the title "Hybrids of Gerbera Jamesonii," an important account of Hybrid Gerberas is given by Philippe de Vilmorin in a recent issue for March of the *Revue Horticole*. He first discusses the genus Gerbera, then the species *G. Jamesonii*, giving descriptions of its varieties, and deals afterwards with the hybrids, presenting conclusions of a scientific and practical character. Mons. P. de Vilmorin has set forth the origin of a novelty which already has assumed considerable importance and is likely to become a feature among special cultures in some parts at least of the Riviera. He points out the duty of recording the history and origin of novelties when making them known, and desires to be the chronicler of these new plants so enthusiastically remarked upon at a recent exhibition of the Société d'Horticulture de France. This, he says, is not difficult, because he has received sufficient information from Mr. Irwin Lynch and M. Adnet to throw light on the birth and development of these plants. For the most part he allows the originators of the Hybrid Gerbera to speak for themselves.

The genus Gerbera is dedicated to the German botanist, Gerber (Gronov., in *Linn. Gen. ed.* 2, p. 16, 1737). It belongs to the Composite, Durand placing it in the tribe Mutisiaceæ. The species are distributed in Africa from Abyssinia and Madagascar to

the Cape, being especially abundant in South Africa. They are found also in South America (in Chili, the Argentine, and especially in Brazil), in the Himalaya, Japan and China. In the last-mentioned country Franchet describes four species. The *Index Kewensis* mentions 37 species, and the supplements add 15. Apart from *G. Jamesonii*, the greater number of the species by themselves possess but little horticultural interest. *G. Anandria*, *Schult. Bip.* of Japan resembles a small Daisy of bluish-white colour, and is rather dull. *G. asplenifolia*, *Spreng.* of South Africa, has violet flowers carried on long, woolly peduncles, with short leaves resembling those of a Fern. With regard to *G. viridifolia*, *Schult. Bip.*, which is one of the parents of the magnificent hybrids, M. de Vilmorin remarks that there is some doubt as to the description, because the plant has been lost. Mr. Lynch describes it as having flower-heads about 2 inches across, white inside, with pale yellow exterior tinted with lilac towards the tips of the rays. In the *Prodomus* this plant occurs under the name of *Lasiopus viridifolius*, *D.C.*, described as having yellow ray florets slightly red below. Three varieties are given: *hirsutus*, *medius* and *oblongifolius*. *Gerbera aurantiaca* must also be cited. It was introduced by Mr. Max Leichtlin, is allied to *G. Jamesonii*, has red flowers, the ray florets being yellow beneath. It flowered at Kew for the first time in 1905. The importance of these species, of those cited by Mr. Lynch (*Flora and Sylva*, 1905, p. 208, *cum tab.*), and of those that we know by herbarium specimens, is rendered evident by the success obtained in crossing Gerbera Jamesonii with *Gerbera viridifolia*, one of the most insignificant species in appearance.

G. Jamesonii was introduced into England in 1887, and flowered first with Mr. Tillet at Norwich, then at Kew, and other places. Under the head of varieties it is stated that the wild plant, according to Mr. Lynch, varies from intense red to coral-pink, and also yellow, as in the form named Sir Michael. This important fact must be noted in view of the variations produced by hybridisation. Under the head of forms obtained in cultivation must be placed Gerbera Jamesonii "Brilliant," raised by Lynch by crossing typical Jamesonii and Sir Michael. In this cross the red of Jamesonii is rendered clearer and more brilliant by the yellow of Sir Michael. M. Sprenger, of Naples, who was one of the first to be interested in Gerbera, has obtained, by variation of the type, *G. Jamesonii atrosanguinea*, with blood-red flowers. To him also we owe the form named *illustis*, with flowers larger and more brilliant than those of the type. *G. Jamesonii transvaalensis* is given without description by Mr. Lynch as of Belgian origin. M. Sprenger has informed the author that he has attempted cross-fertilisation between Gerbera and *Gazania* without success. M. Adnet, before commencing his work upon the hybrids, had already obtained from typical Jamesonii very distinct variations of pale red, salmon and light fawn (chamois). These evidently, from a phylogenetic point of view, are in accordance with the variations indicated by Mr. Lynch.

THE HYBRIDS.

But to obtain an absolute break from the type it was necessary to have recourse to hybridisation. This was done by Mr. Lynch, who, in a letter recently received by Mons. P.

de Vilmorin, owned himself entirely responsible for that work. It is a responsibility, the author says, that many would have been very happy to assume. The first attempt was between *G. viridifolia* and *G. Jamesonii*, the resulting plants having flowers that varied from white to deep pink; another cross before-mentioned between Gerbera Jamesonii Sir Michael and *G. Jamesonii* having given the plant named "Brilliant." Afterwards *G. Sir Michael* and the first hybrids were intercrossed, and all the new forms between them. From that moment it might be said that almost the complete scale of colours was obtained, as was proved by the plate published in *Flora and Sylva* in 1905. In the article which accompanied this plate Mr. Lynch gave details, corroborated, moreover, by information which M. Adnet has given to M. de Vilmorin, demonstrating the facility and almost the necessity for crossing. "I knew," says Mr. Lynch, "that many of the Composites are sterile with their own individual pollen. It is the case with Gerbera. At all events, the female organs first mature and are receptive before the pollen is ready."

But to return to the history of the hybrids. Mr. Lynch's collection, already very rich and getting too considerable for the means of a botanic garden, being of considerable horticultural interest and having obtained one of the highest awards at the Temple Show in 1904, was disposed of to an English horticultural establishment. Unhappily, from circumstances which have nothing to do with our present subject, the collection was dispersed, and all the work might have been lost, especially as we have seen that *G. viridifolia* had disappeared, and from that time has not been re-introduced.* But some plants had been preserved in the Botanic Garden at Cambridge, which, crossed and multiplied afresh, have reproduced the greater part of the forms and colours of the first hybrids and crosses.

The other important point is that M. Adnet, who for several years had devoted himself in his establishment of "La Roseraie," at the Cap d'Antibes, to the culture of Gerbera Jamesonii, was deeply interested in the new hybrids. Of Mr. Lynch's dispersed collection he could obtain only four plants—at first three with pink flowers, viz., a light pink, a deep pink, and one intermediate between these two; later he procured one of a dull yellow, rather insignificant in itself. In 1906 Mr. Lynch sent to M. Adnet three plants with pink flowers and some seeds of crosses between pink and white and yellow and white. Such is the origin of M. Adnet's large collection, and of which the specimens he exhibited last autumn have given him such a just renown. Up to the present M. Adnet has made 2,700 crosses, all with a registered number giving the colour of both parents, and he possesses nearly 25,000 hybrid plants representing the fourth generation of his seedlings. It is interesting to note that on account, no doubt, of the disturbed hybrid character of the forms employed by him, and because also of the variability of *G. Jamesonii*, he has obtained wonderful results: thus, a light pink crossed by a deep pink has given him, even in the first year, both white and yellow flowers. L.

(To be continued.)

* It may here be remarked that a plant, no doubt to be regarded as conspecific, has been recently introduced to Kew. It is, however, quite different, having broader leaves and ray-florets distinctly coloured purple below. The Cambridge plant had an advantage, perhaps, in being practically colourless, though dirty and very poor indeed for a white.

NEW OR NOTEWORTHY PLANTS.

PRIMULA FORRESTII, BALF. FIL.

(See figs. 117 and 118.)

THIS is a handsome new species which was discovered by Mr. George Forrest on the eastern flank of the Lichiang range in N.W. Yunnan at an altitude of 9,000 to 11,000 feet. It has been raised by Bees, Ltd., from seed sent home by Mr. Forrest. Writing of it in *Notes from the Royal Botanic Garden, Edinburgh*, for April, 1908, where the species was described and figured, Mr. Forrest says that it "is a curious as well as a beautiful species, and a lover of dry, stony situations. The flowers are large and numerous, of a rich deep shade of orange, and fragrant. The foliage is densely coated with glandular hairs, and, in the fresh state, has a peculiar, but not unpleasant, aromatic odour. The plant is specially adapted to the situation in which it is commonly found, i.e., the crevices of dry, shady limestone cliffs, in having a long, extremely tough, woody rootstock of 2 to 3 feet in length. The base of the rootstock is very tapered, generally only a few inches being enclosed in the crevices of the rocks. From this point the plant is pendulous for almost the full length of the remainder of the rootstock, a few inches of the growing apex being turned out and upwards. The rootstock, for two-thirds of its length, is covered with the induræ of previous year's foliage, which, at the apex, form a dense matted mass, with the fresh foliage and flowers arising from the centre. Judging from the length of the rootstocks of specimens seen growing, allowing two whorls of leaves for one year's growth—a liberal estimate—some plants must reach the age of 50 to 100 years. Another feature which pointed to great age in the species was that the cliffs behind some of the larger specimens were scored and worn to the depth of fully an inch by the motion of the plants in the wind." To this account of it may be added that the golden farinose, under surface of the young leaves increases the effectiveness of the plant. Of its cultivation, Mr. Forrest writes: "There is not the slightest doubt in my mind as to the hardiness of the species, but it *will not* do with damp. The most sunny and dry situations are what you should try, and do not forget to give it plenty of lime. The situations in which I found the species in greatest luxuriance were the crevices and ledges of *dry limestone cliffs*."

The plant belongs to the small section *Bullata* of the genus *Primula*—a section restricted, as we know it, to the mountain ranges of Eastern Tibet and North-west Yunnan, and of which no species is yet in our gardens. Its nearest allies are *P. bullata*, Franch., and *P. bracteata*, Franch. From the latter its farinose leaves and long scape separate it, and from the former it is distinguished by the densely pubescent scape, pedicels, and calyx.

The plant is an acquisition to horticulture. It whets the appetite for more of the novelties which the enterprise of Mr. Bulley and the skilful exploration of Mr. Forrest have brought to this country, and which we long to see in general cultivation. It was exhibited by Bees, Ltd., at the Royal Horticultural Society's meeting on April 20, when it received a First-class Certificate. *I. B. B.*

EPICATTELEYA WOLTERIANA. KRANZL.
(*EPIDENDRUM AURANTIACUM* ♂ × *CATTELEYA SCHRODERE* ♀).

THIS hybrid is a medium-sized plant of no striking peculiarities in habit. The pseudo-bulbs are about a span high (15-17 cm.), one-leaved; the leaves oblong, blunt, of the same length, and 3-3.5 cm. wide. The spikes in the two specimens I have seen are two-flowered; the pedicels are 6 cm. (about 2½ inch) long, pale green, with or without a darker somewhat purplish hue. The flowers are 7-7.5 cm. (3 inches) in

FIG. 117.—*PRIMULA FORRESTII*, A NEW SPECIES FROM CHINA: FLOWERS YELLOW.

(Awarded F.C.C. at R.H.S. meeting on the 20th ult.)

diameter, and in the two flowering specimens I examined, two varieties differing somewhat in size and colour were to be observed. The sepals are lanceolate, acute; the petals are oblong or rhombic, thrice as wide as the sepals and a little shorter. The lip is entire without any trace of division and funnel-shaped. The colour of the bigger flowers is exactly what we call salmon colour, the smaller have the same ground colour, but there is a purplish hue upon the whole flower, especially on the sepals and the border of the lip. In the purely salmon-coloured form the lip has two mauve-purple stripes on its base, and the column has also two stripes of the same colour and a corresponding mauve-purple sign at its base, whilst the other form (the smaller with the purplish hue) has no trace either upon the lip or column, the latter being pure white.

It is a question whether such a hybrid should be described as bigeneric. *Epidendrum aurantiacum* is one of the species so near *Cattleya* that Reichenbach, in the sixth volume of *Walper's Annals*, placed the plant among the true species of this genus, for evidently no better species he could find for connecting together *Cattleya* and *Epidendrum*. Nevertheless, it is better to follow precedent, especially in questions of no systematical but merely horticultural interest, and therefore I keep *Cattleya* distinct from *Epidendrum*. For this reason I have adopted the generic name *Epicattleya*. The plant was raised by Mr. Paul Wolter, Magdeburg, Wilhelmstadt, from the parents I have named, and flowered there for the first time. It may be assumed that adult and vigorous plants will produce more and perhaps still bigger flowers than those which have yet appeared. The seeds were sown in 1903, and the two plants flowered after five years and some months. *Fr. Kränzlin, Berlin.*

THE CHEMISTRY OF HEATED AND OF PARTIALLY STERILISED SOILS.

SOME communications appeared in the *Gardeners' Chronicle*, Aug. 10 and Aug. 31, 1907, on work which was in progress on the question of the influence of bacteria on the germination of seeds, and on the root-formation of trees. The subject has since been pursued, and most of the results will be found in the *Journal of Agricultural Science*. The view originally taken, that bacteria affected the germination of seeds, has been definitely disproved, and it has been shown that the inhibitory action of heated soils is due to the heating having resulted in the formation of a toxic substance, which is a soluble organic, and, probably, nitrogenous compound. The amount formed increases with the temperature of heating from 60° to 200° C., and it appears to be present to a certain extent even in soils which have not been heated above ordinary atmospheric temperatures. The inhibitory action on the germination of seeds is roughly proportional to the amount of this toxic substance present. The treatment of soils with antiseptics results in a chemical change, independent of any bacterial change, similar to that produced when the soil is heated to 60°-70°.

The heating of a soil, and, in a lesser degree, the treatment of it with an antiseptic, results in a considerable increase in the soluble organic and nitrogenous matter present in it, and such soils, therefore, are more favourable than ordinary soils for the growth of plants, and for an increased nitrogen assimilation by them. This is, apparently, a sufficient explanation of the results hitherto published of the behaviour of plants in such soils. It appears, however, that the substance which is toxic towards germination, and which is formed by the heating or treatment of soils, is really toxic also towards plant growth, and, if the heated soils are used for growing plants before that toxic substance has been

eliminated, then the plants grow less vigorously, instead of more vigorously, in the heated soils. It has been found that the toxic substance becomes destroyed by oxidation under those circumstances usually prevailing in cultivation, but, when destroyed, there is still left in the heated soil much of the extra organic matter which had been rendered soluble by the heating. Heated soils, therefore, may behave in diametrically opposite ways towards plant growth, according to the conditions to which the soil has been subjected after the heating. There is no evidence at present to show that the phenomena observed with these heated or treated soils are due to bacterial operations, and not simply to ordinary chemical changes. *Spencer Pickering.*

VEGETABLES.

EARLY CABBAGE.

EARLY Cabbages are always appreciated; but in seasons when green vegetables are scarce, they

TREES AND SHRUBS.

MAGNOLIA STELLATA.

THIS *Magnolia* was awarded a First-class Certificate by the R.H.S. on March 19, 1878, and it is probable that that was the first occasion on which plants of this species were publicly exhibited in England. It was exhibited by Messrs. James Veitch & Sons under the name of *M. Halleana*, a name given in honour of Dr. G. R. Hall. Mr. S. D. Parsons, a nurseryman of Flushing, U.S.A., describes its introduction in a letter to *The Garden* (June 15, 1878). He says that "he had long been trying to find a suitable man to send to Japan, but owing to difficulties attending the entry of foreigners into Japan he had been unable to secure the right person." One day in 1862, however, Dr. Hall entered his office and offered his collection of Japanese plants, which he had brought with him in Wardian cases. Many choice shrubs appear to have been contained in

FIG. 118.—*PRIMULA FORRESTII* GROWING IN YUNNAN, CHINA. ALT. 9,000 TO 11,000 FT.

(See p. 274)

are doubly welcome. We commenced cutting nice heads of "Flower of Spring" on April 1, at which time also the variety "April" was ready. These two varieties, with "Favourite," have withstood the severe weather of the past winter excellent, and they are three fine Cabbages in other respects, being of excellent table quality.

The seeds were sown on August 20, and the seedlings pricked out into plots on October 15 and 16. Other good Cabbages are Early Heartwell (sown now, this furnishes fine heads for summer use) and Carter's Model. I would recommend Mammoth Beefheart. By judicious selection and careful management, a supply of young Cabbages may be had all the year round. They should be planted thickly on a warm border in the autumn, and, after the Cabbages are cut, the borders can be planted with early crops of Peas, Carrots, Potatoes and Turnips. If the ground has been well prepared and manured for the Cabbages little more will be necessary for these other crops beyond digging. *W. A. C.*

these cases, including *Thuja dolabrata*, Japanese Maples, the double-flowered *Deutzia crenata*, *Hydrangea paniculata*, *Cupressus obtusa*, *Picea polita*, and two *Magnolias*, one of which was *M. stellata* (syn. *Halleana*). An interesting mention, with regard to this collection, is made of *Lilium auratum*, a few bulbs of which were sold to a firm in Europe for \$80 a bulb.

Although *Magnolia stellata* has been known in this country for upwards of 30 years, very little was done to popularise it until half that period had passed, and it is only in late years that it has become fairly well known in gardens. The flowering period is April, and, in the absence of frost, the pure white, star-like blossoms, 3 inches across, have a charming effect. The blossoms are borne with such freedom as to hide the branches. At Abbotsbury Castle, in Dorsetshire, is one of the oldest and finest specimens in the country. When selecting a position for planting, it is advisable to choose a spot sheltered from the east, so that when the flowers are frosted the

sun will not shine on them until they have thawed. The plant is well adapted for forcing into bloom. In addition to the type there is a variety with pink flowers. W. D.

PRUNUS TOMENTOSA.

ALTHOUGH this is by no means a new shrub, it is only within the last five years that its value as an ornamental plant has been appreciated. The plant is a native of Northern and Western China, and was first brought to notice by Bretschneider. It was introduced to European gardens from Japan, where it is cultivated. *Prunus tomentosa* has a wide distribution, for it has been found by various travellers in the mountainous districts of places so widely separated as Manchuria, Szechuen, and Kashmir. Under cultivation it forms a well-developed bush, 5 to 6 feet high and as much through, a considerable amount of growth being formed annually. The bark is

NATURAL DESIGN IN WATER GARDENS.

NOTWITHSTANDING the attraction a mere expanse of water has for most people, there is a greater pleasure in the cultivation of aquatic plants on the margins of a brook, pond, or lake if these are grown with an artistic sense of the fitness of their surroundings. There is no class of vegetation that suffers more if deprived of the background of its natural surroundings, than aquatic plants. *Nymphæas* are beautiful under any circumstances, but when grown artificially in tubs or square cement tanks they lose much of their attractiveness. Compare, for example, a Water Lily grown under such conditions and a similar plant revelling in a sunny spot in a well-designed pool or lake with rustling sedges and rushes in the background and glowing tints of *Spiræas*, Water Iris, and other plants of a similar nature pushing their vigorous growth into the

Mimulas, *Myosotis* and *Polygonums*. In the shallow water may be cultivated *Sagittarias*, *Acorus*, *Ranunculus*, *Typhas*, and in the deeper portions floating plants such as *Nymphæas*, *Villarsia* and *Nuphars*. If these and similar plants are disposed in proper positions the effect will be not only one of the most beautiful in the garden, but it will be reflected in the water below.

Although a perfectly natural design is best for the water garden, it is not necessary to undervalue the introduction of such aquatics as *Nymphæas* into the water portions of a scheme where the design is necessarily formal. The stately formality of certain styles of landscape gardening has its uses, and where an expanse of water is edged with a geometrical design in stone the addition of some Water Lilies is a decidedly attractive embellishment. Nevertheless, such an arrangement remains merely an embellishment,

FIG. 119.—A WATER GARDEN IN MESSRS. WALLACE'S NURSERY AT COLCHESTER.

brown in colour and tomentose. The leaves are more or less elliptic and rather sharply acuminate. The flowers are borne in April, appearing about the time that the leaf-buds burst. They are usually produced singly from both sides of each bud on shoots of the previous season, and are white, slightly flushed with pink, especially in the bud stage. The fruit is of a shade of orange-scarlet and in shape resemble an Apricot, but is only about the size of a small Cherry. So far fruits have not been produced in any great quantity in this country, but in China and Japan the plant is stated to be cultivated exclusively for its fruits. When in full bloom the species forms an exceedingly ornamental shrub. The petals are very delicate and liable to be damaged by storms; during unsettled weather the flowers are very fugitive. The stock may be increased by means of cuttings or layers. W. D.

water! It is not that the plant itself is less beautiful, but there is a sense of the unfitness of things in the former case that detracts from its charm.

Were these points so well understood generally as they ought to be there would be much less of the incongruous in modern gardening. Streams of water now running to waste might be utilised for producing effects of the most charming description. By damming the streams at suitable points and by effecting some slight excavation, it is possible to provide breadths of water that in themselves possess some attraction. But the banks and margins may be clothed with Japanese Iris, groups of *Astilbes* and *Spiræas*, American Bog Lilies, such as *Lilium canadense*, *pardalinum* and others; *Trollius*, such species of *Primula* as love moisture, including *P. japonica*, *P. denticulata*, and others; *Calthas*, *Rodgersias*,

and the effect can never be equal to that afforded by a more natural garden.

The illustrations at figs. 119 and 120 represent views taken in the nurseries of Messrs. R. Wallace and Co., Colchester. Their water garden shows what combinations and effects may be obtained by making the most of favourable circumstances. Everything that is possible under circumstances necessitating the production of plants for commercial purposes has been done to effect an arrangement rich in beautiful grouping.

In fig. 119 may be seen the vigorous growth of *Rumex hydrolopathum*, *Astilbe*, and *Iris Kämpferi*, all in the background, whilst the foliage of *Iris cuprea* in the foreground are some of Mons. Marliac's *Nymphæas*. In fig. 120 a fine specimen of *Nymphæa* "James Brydon" planted three years ago has for its background a clump of *Acorus* and *Iris* foliage. C.

FLORISTS' FLOWERS.

SOME OF MR. HAYDON'S NARCISSI.

AMONG the names of the pioneers in the improvement of the Daffodil, that of Rev. G. P. Haydon will always stand high, especially for the many Trumpet varieties which he has produced since 1895. Among the chief of these may be mentioned The Pearl of Kent, C. H. Curtis, his own namesake G. P. Haydon, Lord Medway, The President, and Benenden. Exceptional interest, therefore, attaches to the records of the parentage of his seedlings, which are, with Mr. Haydon's sanction, given herewith.

SEEDLINGS FROM SEED SAVED IN 1895.

M. CROSS.—MME. DE GRAAFF ♀ × MONARCH ♂.—Beatrice Barlow, Bella, Bugler, C. H. Curtis, Drummer Boy, Dr. Kumura, Duke of Kent, Duchess of Kent, Fanny Haydon, Gwendolen, Hatfield Beauty, Heliodora, Kuroki, Mme. Kuroda, Marchioness Oyama, Miss Sato, Okapi, Our Nellie, Pearl of Kent, Philippe de Vilmorin, Pyramus, Stourmouth, Wearmouth.

N. CROSS.—MONARCH ♀ × MME. DE GRAAFF ♂.—Cygnet, Castaway, C. W. Nunn, E. Arnold,

MME. DE GRAAFF ♀ × GLORY OF LEIDEN ♂.—Lily, White Horse of Kent (1901), Rectitude (1902).

WEARDALE PERFECTION ♀ × MME. PLEMP ♂ (1903).—Milner, Euphonium.

KING ALFRED ♀ × DUKE OF BEDFORD ♂ (1903).—Benenden.

In the following varieties (all seed of year 1902), referring to the "M. Seedling" used as pollen parent, Mr. Haydon says: "These are of the 1895 M. cross; I can't say which of them, as they were all in one bed with numbers, and I could not say which I took the pollen from; but all were of the same cross."

MONARCH ♀ × M. SEEDLING ♂.—Hereward, Cuckoo, Goodwin Sands, Earl Goodwin. The parentage of these is, therefore, three-fourths Monarch and one-fourth Mme. de Graaff.

WEARDALE PERFECTION ♀ × M. SEEDLING ♂.—April Fool, Chart. The parentage of these is, therefore, one-half Weardale Perfection, one-fourth Monarch, and one-fourth Mme. de Graaff.

KING ALFRED ♀ × M. SEEDLING ♂.—The President, Sea Horse, Stockwell. The parentage of these is, therefore, one half King Alfred,

felt about the cross of Mme. de Graaff × Glory of Leiden, for Mme. de Graaff is a free-seeder, while the pollen of Glory of Leiden is notoriously infertile, and Mr. Haydon says, with regard to one of the two 1901 seedlings: "I should say White Horse of Kent was self-fertilised." On the other hand, he is of the opinion that "Lily decidedly shows Glory of Leiden cross."

There is no doubt that the high quality of these seedlings is due mainly to the choice of parents of refined form, for Monarch and Mme. de Graaff, even when compared with the latest varieties, are of the highest class in form, though neither are exceptional in size or quite pure in colour. This is a point which most, if not all, breeders agree is of the greatest importance. Size and colour matter less, and colour seems to be quite beyond any forecasting in Daffodils at present, self-yellows, bicolors, and whites coming, apparently, at random from such crosses as Monarch × Mme. de Graaff, and even from Weardale Perfection × Mme. de Graaff. But, perhaps, something also depends on the conditions under which a cross is made, for the same varieties have been used by many others, and not always with such successful results. Mr. Haydon himself says: "I find that seasons have much to do with the satisfactory crossing of Narcissus." In 1895 he obtained the wonderfully high proportion of 49 first-class seedlings out of 74 seeds sown, or 66 per cent.; while in 1899 he only obtained one seedling worth naming. *A. J. Bliss.*

FIG. 120.—NYMPHÆA "JAMES BRYDON" IN A NURSERY WATER-GARDEN.
(See p. 276.)

Edith, E. T. Cook, Dropmore, G. Honeysett, Henri Vilmorin, Knight Errant, Pharaoh.

O. CROSS.—WEARDALE PERFECTION ♀ × MME. DE GRAAFF ♂.—Blanche Hill, Crawford Barlow, Houth Beauty, Isolde, Lady Warren.

R. CROSS.—GLORY OF LEIDEN ♀ × MONARCH ♂.—Bull Pup, Chinaware, Euphrosyne, Guinea Gold, G. P. Haydon, Jack, Lacquerware, Leiden Jar, Sunshine.

Ten other crosses, made in 1895, including N. Emperor × N. bulbocodium, which gave "monstrosities," were mostly failures, except, perhaps for Maydew, a seedling from N. biflorus × Pyrenean Poeticus.

The following varieties were from seed saved in the years 1899 to 1903, as noted after them:—

MME. DE GRAAFF ♀ × PYRENEAN POETICUS ♂.—Our Bessie (1899).

MME. DE GRAAFF ♀ × N. TRIANDRUS CALATHINUS ♂ (1900).—Our Joe, Preference, Premier, and Policy.

MONARCH ♀ × MME. DE GRAAFF ♂.—Lord Medway, Goise, Broom (1900), The Secretary (1901), Pantiles (1903).

WEARDALE PERFECTION ♀ × MME. DE GRAAFF ♂.—The Grey Mare (1900), The Golden Dustman (1901).

one-fourth Monarch, and one-fourth Mme. de Graaff.

Many of the 1895 seedlings are now well known, as they have been before the public for several years. Most of the later ones have been shown at the annual shows of the Kent and Sussex Daffodil Society, at Tunbridge Wells, during the last three years.

The parentage given in the above lists is always that of the actual crosses made, and, in most cases, it can be traced more or less clearly in the seedlings. The possibility of self- or cross-fertilisation by wind or insects was not entirely excluded, but, as those who have experience in the hybridising of Daffodils are aware, this seldom occurs, or, at any rate, much less often than might be supposed when the work is carefully done and the pollen applied early.

There is one seedling—The Golden Dustman (Weardale Perfection × Mme. de Graaff, 1901)—that at first sight appears to show an unexpected result. Its colour (uniform bright yellow) and form suggest fertilisation by a chance grain of pollen of Monarch. But, of the 25 seedlings of this cross, Mr. Haydon tells me that they were "all of them dark yellow." Some doubt might also be

SPRING IN THE MARITIME ALPS.

(Concluded from page 257.)

THE favourite walk from S. Dalmazzo is up the beautiful Val Miniera to the west, and leading to Val Casterino, where Mr. Clarence Bicknell has a summer cottage. There is not a yard of the way which is not interesting. In the mossy banks by the pathway *Listera cordata* and *Herminium Monorchis* are happily overlooked by the casual passer-by. The large blue flowers of *Aquilegia Reuteri*, the rose blossoms of a species of *Geranium*, and the yellow *Digitalis media* few could fail to notice. The flora becomes more and more Alpine in character as we ascend the gentle slope. Higher up, *Aquilegia alpina* takes the place of *Reuteri*, which it so closely resembles, and near the head of the valley the nearly black *A. atrata* is found. *Cardamine asarifolia* is frequent near the water, and *Lamium longiflorum* among the stones. Above the fork of the valley, where the mines are to be found which give their name to it, many of the ordinary Alpine plants luxuriate. *Primula viscosa*, *Orchis sambucina*, *Atragene alpina*, *Pulsatilla alpina*, *Anemone narcissiflora* and *A. hepatica*, *Gentiana verna* and *G. excisa*, *Dryas*, *Viola calcarata*, and *Saxifraga exarata* are but a few. Yet there are still traces of Mediterranean influence in this valley, as shown by such plants as *Astragalus monspessulanus* and others. In this district the flowers of *Nigritella nigra* are almost invariably of a beautiful rose colour.

Primula marginata, *P. latifolia*, *P. intricata*, *P. suaveolens* (the southern form of Cowslip), *Orchis speciosa* and *O. sambucina*, both yellow and purple, adorn the ground in many places, the two yellow *Primulas* appearing where the snow has only just melted, and, consequently, where the ground is still brown. In fact, they keep company with the *Crocus* and the *Soldanella*.

Still higher, words fail to convey an impression of the wealth of floral beauty which the eye meets in the glorious sunshine of a morning in June. Among the moss under the topmost Pines the golden-starred *Gagea Liotardii* seemed to strive for more light. The first surprise was *Adoxa Moschatellina* at this altitude (about 6,500 feet). It is not found at all on the Mediterranean. On gaining a ridge, acres of the

ground were white with *Ranunculus pyrenæus*, large numbers of the flowers being so double that they contained five or six whorls of petals. Close at hand, and interspersed with blue and white *Crocuses*, were masses of handsome dwarf Tulips (*T. australis* var. *alpestris*), their finely-moulded yellow petals being deeply tinged with red on the exterior. They reminded me of the taller but similarly-coloured Tulip (*T. gallica*) I had seen in the foothills of the Var a few weeks before.

Among the rocks not far off the large blue blossoms of *Linum montanum* and the milk-white flowers of an Iberis gave a change of form and colour for a while. But the Tulips were everywhere. Only less abundant were the spotted purple-brown blossoms of *Fritillaria Burnatii*, one of the many great rarities of the Maritime Alps. It was puzzling not to find the other *Fritillaria* (*F. Moggridgei*), with its yellow flowers, which, I knew, grew somewhere there, so I cut diagonally down and across the shoulder of the mountain, and soon came across thousands of the large nodding blossoms of this most handsome plant. Here and there a few of the purple variety appeared with the yellow one.

On the swampy sides of the streams above Val Casterino, *Gentiana Rostani* is found. It is, perhaps, only a variety of *G. bavarica*, and in habit much resembles the beautiful violet *G. pyrenaica*, which is never found in the Alps, though it appears in Hungary and again in Western Asia. In other directions such rarities as the glandular *Saxifraga pedemontana*, *S. retusa*, *S. diapiensoides*, and *Galium Tenda* were found; and later in the summer appear *Silene campanula*, *Potentilla Valderia*, *Saxifraga florulenta*, and *Phyteuma Balbisii*, to mention four more species endemic in the Maritime Alps.

A very rare hybrid, *Gymnadenia conopsea* × *Orchis latifolia* = *Orchigymnadenia Lebrunii* from Val Casterino di Tenda, is now in the Herbarium at Kew.

It is remarkable to find on the cliffs above Fontan and by the river, only a few kilometres below San Dalmazzo, which is 2,284 feet above the sea, masses of the handsome *Cineraria maritima*, which, except in gardens, is rarely seen save in warm nooks on the shores of the Mediterranean. The curious *Ballota spinosa* is one of the endemic plants abundant at the foot of the limestone cliffs at Fontan and Saorge, but it is not a plant worthy of cultivation in gardens.

Space does not permit me to refer to any of the interesting plants about the little town of Tenda, or below the bold pinnacles of limestone which overlook the town. Nor can I mention any of the other treasures to be found higher up the Col di Tenda or on the northern side of the long tunnel towards Limone.

Tenda itself is most romantically situated, and a fragment of the old castle still hangs over the town. Although Tenda is higher than S. Dalmazzo, it is not so inviting a place to stay at, particularly because trees are but few there. *H. S. T.*

HARDY FLOWER BORDER.

ANEMONE BLANDA SCYTHINICA.

THE flowering of this pretty plant affords a picture of rare beauty and interest in the garden at the present time. A colony with hundreds of its blossoms expanded in the warm sunshine is a sight not easily forgotten. Like all the forms of *A. blanda*, the plant has tuberous roots, starts early into growth, and the flower-buds appear with the leaves. At first the buds are coloured a deep shade of indigo blue, which presently changes to deep violet, a shade which contrasts well with the pure white of the expanded blossoms. The flowers at their best are larger than a half-crown piece, and in a large group the shades of colour are seen as the flowers expand and close, while at mid-day and for some hours a carpet of white yellow-centred blossoms meet the eye. The plant is not more than 6 inches high, and the finely-cut leafage which covers the soil preserves the blossoms for a long time. The plant is easily grown in sandy loam, and if the root-run is of a cool nature so much the better. *E. J.*

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Pineapples.—Plants of The Queen variety, which are now swelling their fruits, need copious waterings, for their roots are very active, and a check at this stage would interfere with the development of the fruits. Manurial stimulants may be given more frequently and in slightly increased doses than hitherto. Drainings from the farmyard, and guano water are excellent manures for Pineapples. Keep the atmosphere of the house moist by frequently damping all the paths and other spaces. Should the crowns show a tendency to become disproportionately large, the centres may be stopped, but this must be done carefully, otherwise growth will again commence and the fruit be disfigured. Excessive overhead syringing is a frequent cause of the crowns growing too fast. Close the house early in the afternoon after syringing, and do not allow the temperature at night-time to fall below 70°.

Successional Pines.—Plants which were potted early in the year must be encouraged to grow freely. Admit a little fresh air at the top of the pit early in the morning when the weather is fine, increasing the ventilation as the sun gains power. It is important that the structure should be closed early in the afternoon, when the plants are syringed. If the atmosphere is well charged with moisture the temperature may be allowed to rise from 95° to 100°. After the plants have made plenty of roots, weak manurial stimulants may be afforded, increasing the strength as the plants make further progress. Occasional waterings with weak soot water are beneficial. Attend to any plants which need repotting before they become pot-bound.

Shading.—Harm may be done to Pineapples by the excessive use of shading. The plant loves sunshine and, therefore, no shade should be applied except to plants which have been recently repotted or planted out. Even in such cases, the shading should be dispensed with as soon as the roots are again active. The excluding of sunshine from the plants, even during the hottest part of the day, has an injurious effect upon its growth, and is often the cause of the plants failing to develop their fruits at the proper time.

Bananas.—Musas should, if possible, be planted out in a bed in a very warm house, where there is plenty of room for the plants to develop their large leaves. Strong suckers should be potted in readiness to replace the old plants after they have fruited. A suitable rooting medium for the Banana is rich loam mixed with well-rotted manure and crushed bones. When the plants have become established they should be watered frequently and occasional applications of liquid manure will be useful, more especially if they are applied when the fruits are in course of development. During their season of growth Bananas require a very hot and moist atmosphere. One of the best Bananas for fruiting in hothouses is *Musa Cavendishii*.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Runner Beans.—These plants should be raised under glass, not only because they will fruit much in advance of those raised out-of-doors, but also because they suffer less from the attacks of slugs and other pests, and from inclement weather. The very best varieties only should be cultivated, and there is now a wide selection available, the best kinds being of the Ne Plus Ultra type. Sow the seeds either in boxes, or singly in small pots in a cool house or frame. As soon as germination takes place, admit an abundance of fresh air so as to thoroughly harden the plants before they are put out into the open ground towards the end of the present month. Runner Beans are best grown in trenches, and if these are not already prepared, the work should be undertaken without delay.

Peas.—Plants in bearing under glass should be given an abundance of fresh air both night and day whenever the weather permits. Manure water should be given freely. Successional plants growing in pots or boxes may now be placed out-of-doors in a sheltered position. Whenever frost is likely to occur, some protec-

tion must be afforded them. Transplant Peas raised in boxes for successional fruiting. Make regular sowings of main crop varieties for succession during the next six weeks according to the demand.

Cauliflowers.—Make another small sowing of the Autumn Giant variety, sowing the seeds thinly in the open. The plants from this sowing, although very late, will be excellent for lifting and planting in cold frames or other suitable structures late in the autumn. Continue to plant out Cauliflowers raised from sowings made under glass as they become ready. Select rich ground for their planting and make the soil about them very firm. Early Cauliflowers still growing in pots, or which have been planted out in the orchard house or in pits, should be heavily mulched and otherwise liberally fed. Tie the leaves together immediately after the heads have formed.

Beetroot.—The principal sowing of this vegetable should be made within the next ten days or fortnight. The larger the variety the later should it be sown. On many kinds of soil it will be necessary to bore deep holes and fill up the spaces with soil as previously advised for Carrots. Seedlings under glass must be given an abundance of fresh air, and care must be taken that they are not overcrowded in the seed-pans.

Capsicums and Chillies are alike useful for decorative and culinary purposes. They form pleasing subjects in an intermediate house during the latter part of the summer and early autumn. The young plants should now be ready for potting into their fruiting pots. Use pots 5 or 6 inches in diameter, and place the plants in a brisk heat. Guard against aphids. These plants seldom ripen their fruits satisfactorily in the open, but if large plants are placed on a warm border about the first week in May they will give satisfactory results if the summer is favourable.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Peaches and Nectarines.—The weather having been genial during the time the trees were in bloom, the fruits are already set in most localities. When this is the case disbudding should be no longer delayed. It may be practised over a period of two or three weeks. Should the weather again become cold enough to retard growth, it will be advisable to postpone further disbudding for a few days, remembering that the young shoots serve to protect the fruits. In disbudding, remove first those shoots which are known as fore-right shoots; these grow at right angles to the wall. Afterwards remove any that are very close to the wall, or that in other respects may be regarded as misplaced; and then giving a moderate thinning to the shoots all over the tree. After an interval of a week or ten days the final thinning should be done, leaving sufficient shoots to furnish any portions of bare wall and to provide fruiting wood for next year. Should any leaves develop leaf-curl or blister (*Exoascus deformans*) cut off the points of infested shoots and burn them. If blistered leaves and shoots are removed early in the season and the tree is otherwise in a good condition, the disease may be expected to disappear as the weather improves. When all the blooms have set, spray the plants with a suitable insecticide for destroying aphid or green fly. This pest must not be allowed to spread, or much damage will result.

Gooseberries.—The promise for a fine crop of Gooseberries is exceptionally good, but a severe frost when the plants are in flower might still ruin the crop. If the caterpillars of the Gooseberry saw fly are detected they must be picked off by hand and destroyed. Dusting the bushes with Hellebore powder is a favourite preventive, but owing to the poisonous nature of this powder it must not be applied for some time before fruits are gathered for consumption. The American Gooseberry-mildew appears to be spreading rapidly in this country, and it will be wise to be on the watch for its appearance. According to a leaflet issued by the Board of Agriculture and Fisheries, it attacks both the fruits and the foliage, first appearing in the form of delicate white patches which gradually become thick and felt-like, but later change to a dingy-brown colour.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Stippling the roof glass.—Continuing my remarks respecting the stippling of the roof glass of the houses, I may mention that the flour and water mixture recommended last week keeps the glass much cooler than a mixture composed of mineral matter—a very important factor in hot weather for inmates of the cool house. It is liable, however, to be washed off by rain, if not thoroughly dried by the sun immediately after application. For the warmer houses, such as the East Indian, Cattleya and Mexican divisions, in addition to lattice wood blinds, we use a stippling composed of white lead and whiting, which, once it adheres to the glass, remains till towards the end of the summer, though it gradually becomes worn, and consequently much thinner, thus enabling more light to reach the plants. At that time of the year *Dendrobiums*, *Cattleyas*, *Lælias*, *Catasetums* and *Calanthes* are the better for this gradual decrease in shading. To about half a pound of white lead add one pound of whiting, with sufficient paraffin oil to make it into a thin paint. Stipple this on very thinly, choosing a bright day, with the sun shining full on the glass, so that the mixture will dry quickly. On span-roofed houses which run north and south we stipple the east side in the morning and the west after mid-day. By adopting this method of shading we need not use the blinds quite so frequently, it being unnecessary to work them up and down for every trifling change in the weather. Another advantage is that the blinds need not be let down nearly so early in the morning, or kept down so long in the afternoon. The plants thus receive far more natural sun heat; therefore a better atmosphere can be preserved inside than if blinds were used exclusively.

Dendrobium Phalaenopsis.—To some growers the young shoots of this species appear to be very thin and weak, but, under proper treatment, they soon gain strength and swell rapidly. When the new shoots are a few inches high, a number of roots will appear at their base, and just before these are visible, the plants should be repotted, or, if not in need of repotting, the old worn-out material may be carefully picked out from between the roots and fresh compost afforded. The plants will thrive in pots, shallow pans, or baskets; but whichever receptacle is preferred, it should be small in proportion to the size of the plants; it is equally important that these receptacles should be clean and well drained. Many growers, including myself, have found considerable difficulty in cultivating plants of this species thoroughly well for five or six consecutive seasons. Generally, the contrast between imported and home-grown pseudo-bulbs is obvious. For a number of years our plants were steadily deteriorating. Last year the plants were placed in ordinary flower-pots, with suitable copper wire handles attached, and suspended in a fairly shady position in the warm, moist plant-stove, where they improved considerably. They are now rooting and growing with increased vigour. The plants were potted in *Osmunda* and *Polypodium* fibres, with plenty of small crocks intermixed, but no *Sphagnum* moss was used. Having been potted with extra firmness, the material is still quite good, and the plants need not be disturbed this season. Carefully water plants that have been repotted, but when roots become numerous and growth is advancing satisfactorily afford them water more freely, both at the roots and in the atmosphere. Keep the roots and young growths free from the ravages of insect pests. *D. superbiens*, *D. bigibbum*, *D. Statterianum*, *D. undulatum*, and others of like growth should receive similar treatment.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Rhododendron indicum (Azalea indica).—As these plants cease to flower they should be encouraged to make growth. Remove the faded flowers and seed vessels, and place the plants in a warm, moist atmosphere. Syringe the foliage at least twice daily (directing the water well underneath the leaves) to prevent thrips getting a lodgment. If the pest is already present on the plants, fumigate them with the XL-All vaporis-

ing compound, or syringe them with some good insecticide. Copious waterings and occasional applications of manure water are necessary during the season of growth. Repotting is best done early in autumn.

Primulas and Cinerarias.—The plants obtained from the earlier sowings of seed require to be potted singly into 3-inch pots. For a few days following this operation, place the plants in a moist and shady position in a frame or low-roofed house; afterwards expose them to more light. When a few weeks have elapsed, they may well be grown in an unheated frame. Seed sown as late as the present date will yield useful plants.

Manure.—Now that most pot plants are growing freely, they require some manurial assistance. Liquid manure should never be given to plants when the soil is very dry. Whatever the nature of the stimulant may be, it is necessary to be cautious in its use, and to err rather on the side of applying it in a much-diluted condition. Many gross-feeding plants, however, may be safely watered with liquid manure of a strength which would be fatal to most hard-wooded plants. For general use, liquid manure obtained from soaking sheep-droppings may be recommended; but it is advisable to apply organic and chemical manures in their various forms as changes of food to the plants. Take care to water the plants several times with clear water between each change. Strong-smelling stimulants should not be used in the show houses.

Sanchezia nobilis.—The *Codiaeums* have long since driven this ornamental-foliaged plant from popular favour, but whilst well-grown specimens are as beautiful as many *Codiaeums*, they certainly do not require such great heat. Cuttings of the young wood root readily in a close, warm atmosphere. The plants thrive in rather a light soil, such as one consisting of fibrous loam, with a third part leaf-soil, and plenty of sand. Make the soil firm, and use pots of comparatively small size. The two varieties, *glaucophylla* and *variegata*, differ from the species in their leaf markings.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODGE, Bart., Leonardslee, Sussex.

Gunnera.—The stock of any particular *Gunnera* may be increased by division, which should be carried out at the present time. If additional plants are not required, the crowns should still be thinned in order that the shoots retained will have sufficient room for their proper development. When the leaves are crowded they are small, and much of the beauty of the plant is lost. Any material that has been placed about the plants for protecting purposes should now be removed. It may, however, be advisable to place a little dried Bracken over the crowns to save them from late frosts, for if the leaves are injured when young they continue to show the disfigurement throughout the season. The flower-spikes of these plants appear about this time, and must be removed. When planting *Gunneras*, choose a position near the water's edge or some other place where the ground is always moist. The plants will be benefited by an occasional dressing of farmyard manure and a sprinkling of nitrate of soda.

Helleborus.—The present is a suitable time to remove these plants. If they are not succeeding in their present positions they should be lifted, have all the soil about the roots carefully removed, and be replanted in fresh leaf-soil and loam. It will be necessary to shade the plants until they have become established in the new soil. Apply copious waterings, especially in dry weather.

Rhododendrons.—As soon as the early-blooming varieties have finished flowering, pick off the seed vessels and, if necessary, afford the plants a watering and a top-dressing of cow dung. Newly-planted *Rhododendrons* should not be allowed to develop many inflorescences, and if the plants are weak all the flower-spikes should be removed. See that the shrubs are firm in the ground, and that the roots are not suffering from lack of moisture.

Staking Trees and Shrubs.—Examine all trees and shrubs that are supported by stakes and see that the string is neither so tight that it will cut the bark, nor so loose as to cause chafing.

Replace any faulty stakes. If any of the plants have become loose in the soil tread the ground firmly.

Annals.—Seeds of these plants, including many that are half-hardy, may now be sown in the open. *Portulacas* should be sown in a warm situation, such as a dry bank, or in some portions of the rock-garden. The newer *Centaureas* or *Sweet Sultans* have flowers twice the size of the older forms, and they are developed on long stalks. The *Centaurea* is one of the finest annual-flowering plants. *Marguerite Carnations* should now be planted where the plants are required to bloom. They require a rich soil which contains plenty of soot, and in these conditions generally provide a good display of flowers in the late summer months; to ensure very large blooms, the flower-spikes should be disbudded. A liberal sowing of the various kinds of *Poppies* and of annual *Chrysanthemums* should be made. All annuals should be thinned sufficiently to allow every plant to develop to its maximum size.

Chrysanthemums.—Summer and autumn-flowering varieties should now be planted in their flowering quarters. Allow a distance of 15 inches between each plant; the spaces between them can be planted with *Mignonette*, which will flower before the *Chrysanthemums* require the room.

Carnations.—Place stakes to early-flowering varieties and dress the plants with a suitable fertiliser, stirring the soil occasionally with the Dutch hoe.

THE APIARY.

By CHLORIS.

When to place on shallow frames and sections.—Generally speaking, supers should be placed in position as soon as the upper cells in the brood chamber are tipped with new, white wax. Many beekeepers delay this operation, consequently the bees store surplus honey in the brood chamber. This robs the queen of cells intended for accommodating eggs, with the result that queens are reared and swarming takes place. Even if the bees do not swarm, it will be found at the end of the season that no honey is stored in the supers, although there is a superabundance of it below, and the colony is extremely weak, consisting mainly of old bees. As a result, the stock is exceedingly weak the following spring. In the case of an established hive ready for supers to be attached, it is often best to place a super of shallow frames containing drawn-out drone comb. The bees generally take readily to these, and when the comb is about two-thirds filled with honey, a super of sections may be placed beneath, taking great care to keep the hive warm. It is impossible to make the bees too comfortable at this time of the year. A non-conductive material will not only keep the heat in the hive, but also keep it out, when the heat from the sun at noon is intense. In the case of swarms recently hived, if starters are placed below and drawn shallow frames above, then the bees, having plenty of storing room, will proceed to build worker comb. If this is not attended to, they will build drone comb for the storage of honey in the brood chamber. When honey is plentiful and the weather fine, the bees may require an additional super in from seven to ten days. This will allow the combs in the brood chamber to remain free for the use of the queen, and thus swarming is kept somewhat in check. The work of adding a fresh super is best carried out at noon, when the bees are occupied in the fields. It will be necessary to puff smoke at the entrance, carefully raise the supers with an iron chisel or screwdriver, if they are firmly fixed with propolis, give another puff of smoke above the brood chamber, and place the new super below the old one.

Removing supers.—As the frames in the supers are filled with honey they should be removed. If a super clearer is used for the purpose, this will be easily accomplished. All that is necessary is to place the "clearer" at night-time below the super to be removed, and next morning it will be ready for removal, because it will then be free of bees. If the super contains shallow frames the sooner they are placed in the "extractor" the better and easier the work will be accomplished. The empty super may be replaced at once if the bees are storing honey fast.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR MAY.

SATURDAY, MAY 1—

Soc. Franç. d'Hort. de Londres meet.

MONDAY, MAY 3—Royal Academy opens.

TUESDAY, MAY 4—

Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. C. C. Hurst, on "Mendel's Law and its Application to Horticulture"). Brit. Gard. Assoc. Ex. Council meet.

THURSDAY, MAY 6—

Roy. Gardeners' Orphan Fund Festival Dinner at Hotel Cecil, Strand. Croydon Spring Fl. Sh. Linnean Soc. meet.

MONDAY, MAY 10—

United Hort. Ben. & Prov. Soc. Com. meet.

THURSDAY, MAY 13—

London Branch B.G.A. lecture by Prof. Bottomley on "Nitrogen Fixation."

TUESDAY, MAY 18—

Roy. Hort. Soc. Coms. meet and Nat. Tulip Soc. Combined Show at Hort. Hall, Westminster (Lecture at 3 p.m. by Mr. A. Clutton Brock, on "Alpines in their Native Homes.")

MONDAY, MAY 24—Anniversary meet. of Linnean Soc.

TUESDAY, MAY 25—

Roy. Hort. Soc. Sh. in Temple Gardens, Thames Embankment (3 days). Ann. meet. and dinner of the Kew Guild at the Holborn Restaurant.

WEDNESDAY, MAY 26—

Bath and West and Southern Counties Sb. at Exeter (6 days).

MONDAY, MAY 31—

Whit Monday. Chesterfield Spring Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—50.2°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, April 28 (6 P.M.): Max. 60°; Min. 43°.

PROVINCES.—Wednesday, April 28 (6 P.M.): Max. 56° Bedford; Min. 43° Ireland N.

SALES FOR THE ENSUING WEEK.

TUESDAY—

The whole of the Greenhouse Plants, Frames, Utensils, &c., at the Nurseries, Chelmsford, by Protheroe & Morris, at 12.30.

WEDNESDAY—

Herbaceous and Border Plants, Bulbs and Tubers, at 12; Azaleas, Palms, Ferns, &c., at 4; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Imported and Established Orchids in variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Importation of Currant Bushes.

The prohibition of the importation of Currant bushes has been rescinded, and, provided that a license of the Board of Agriculture and Fisheries is produced at the point of landing, such bushes may now be introduced into this country. The conditions attaching to the granting of licenses are numerous. The exporter must cleanse the plants of all earth, the bushes must be packed so that they cannot come in contact with others on the journey, and yet the package must be such that one end must be capable of being opened for inspection.

The importer must obtain a guarantee that the bushes are free from American Goose-

berry-mildew, Black Currant mite, and other disease, together with statements of the kinds of bushes, number, proposed date of landing, port, name and address of exporter, place where the bushes are to be planted and where to be permanently grown, together with answers to many other questions.

We are inclined to think that only those who are very anxious to possess imported Currant bushes will have the patience to furnish the information required, and would ask: What living person who knows anything about the subject would be willing to give a guarantee that a given plant is free from "all other disease"? In this kind of legislation, the redundancy of language dear to the legal mind should be abandoned in favour of simple common-sense statements of the law. If these restrictions are really necessary, it would be simpler and wiser to continue the prohibition; if they are not necessary, the restrictions should be abandoned.

It might be simpler to start a system of isolation and to require of the port authorities that they should set up Currant-bush quarantines.

Vine Culture.

Probably no horticultural subject has more attractions for gardeners generally than the cultivation of the Grape vine. The varied experiences of growers in different parts of the country are always read eagerly, and controversies that arise from time to time concerning methods and results are engaged in with spirit and enthusiasm. This is remarkable in some respects, because, in a natural state, the vine is one of the most easily grown plants, and thousands of examples of the fact can be seen in cottage gardens throughout England. But it is also an interesting illustration of the variability and difficulties which are introduced by any kind of artificial treatment. The conditions under which the same variety of Grape is grown in glasshouses necessarily vary greatly in different gardens, hence the diversity of results from similar procedure; from this, too, arises the interest with which growers compare notes, criticise, and disagree. It is, therefore, with peculiar pleasure that we welcome a work on the subject,* by Mr. Alexander Kirk, of Norwood Gardens, Alloa, N.B., for he is a veteran grower of long experience. In the vineries under his charge during the past thirty years or more, and at many exhibitions in that period, he has so consistently proved his skill as a producer of fine Grapes that he is amply entitled to take a high rank amongst British horticultural specialists.

Mr. Kirk has given to his readers exactly what might be expected from a practical gardener of such experience, namely, a plain recital of the essential details in Grape growing, pointing out the difficulties and mistakes, and relating the simplest means by which these can be prevented or overcome. No attempt has been made to produce an elaborate or polished treatise.

Thirty-three chapters are included in the book, but many of these are very short, some less than half a page, and the remarks are condensed as much as possible, while there is very little of the repetition which is frequent

in horticultural works, and occasionally unavoidable. Starting with the construction of vineries, the author proceeds to relate the details of drainage and border-making and other matters that need attention up to the time of planting the vines. Following this comes pruning, disbudding, stopping, thinning bunches and berries, watering, mulching, and ventilation, temperatures being indicated under each section as the work proceeds. Renovating borders, root-pruning of old and young vines, diseases and insect pests, propagation and storing, receive due attention, and the chapters contain many useful hints which should illuminate difficult points for beginners.

Probably the majority of readers will turn with special interest to that part of the book which deals with exhibiting, where they will find full descriptions of boards, boxes, and methods of packing, with valuable instructions in regard to staging bunches at shows. Mr. Kirk relates that his first experience was in 1874, when he took Grapes from Kirkeudbrightshire to the Crystal Palace, a distance of 300 miles. He had two and four bunches on boards, but the Grapes travelled so badly that ever since he has used boards for single bunches only. Subsequently he again exhibited a collection at the Crystal Palace—this time travelling 350 miles—on the improved system; the Grapes not only arrived in excellent order, but easily secured the first prize. We had the pleasure of seeing the exhibits on both occasions, and though the single boards are certainly more convenient, in this particular case we think Mr. Kirk's ability as a Grape grower had considerably advanced since he exhibited the earlier bunches.

In his concluding chapter Mr. Kirk advocates separating the roots of all vines in the borders by means of single-brick walls both inside and out. These are recommended to be 2½ feet high and 3½ feet apart, and the author adds: "My experience of 35 years has convinced me that this system of allotted space for each vine is the right one." There is something to be said for this when many different varieties are grown in one house, and the subject is therefore worth discussion.

ROYAL HORTICULTURAL SOCIETY.—A meeting of the Committees will take place on Tuesday, May 4, in Vincent Square Hall, Westminster. In the afternoon a lecture on "Mendel's Law and its Application to Horticulture" will be delivered by Mr. C. C. HURST.

HORTICULTURAL EXHIBITION IN HOLLAND.—According to the *Journal* of the Board of Agriculture, the Horticultural Exhibition, which is to be held at Zeist, Holland, from August 25 to September 16 of the present year, will be on a large scale, and will include foreign as well as native exhibits. The central committee of the exhibition invites the participation of foreign countries with a view to extending commercial relations.

ROYAL GARDENERS' ORPHAN FUND.—We desire to remind our readers that the annual Festival dinner in aid of this fund will take place on Thursday next, May 6, at the Hotel Cecil, Strand, at 6.30 for 7 o'clock. His Grace the Duke of Rutland will preside. All interested in the gardening charities are asked to support the Orphan Fund on this occasion. The secretary,

* *Grape Culture Up to Date*, by Alexander Kirk. Pawson and Brailsford, Sheffield. Price 7s. 6d.

Mr. BRIAN WYNNE, will be pleased to hear from anyone desiring to be present. His address is 35, Surrey Street, Strand.

SPRING FLOWER GARDENING.—Mr. DIVERS informs us that the spring flowers at Belvoir Castle are now at their best. Himalayan and other early Rhododendrons are flowering more freely than usual this season. They have not suffered from frost. The Duchess Garden is open to the public on every weekday.

APPOINTMENTS AT KEW.—We learn from the *Kew Bulletin* that the designation of the post of Principal Assistant in the Royal Botanic Gardens has been changed by authority of the Treasury to Assistant Keeper. Mr. G. MASSEE, F.L.S., hitherto a Principal Assistant in the Herbarium, and Mr. C. H. WRIGHT, whose appointment as successor to Dr. STAFF was notified in *Kew Bulletin*, 1909, p. 24, will rank as Assistant Keepers. The President of the Board of Agriculture and Fisheries has been pleased to appoint Mr. N. E. BROWN, A.L.S., hitherto an Assistant in the Herbarium, and Mr. L. A. BOODLE, F.L.S., hitherto an Assistant in the Jodrell Laboratory, Assistant Keepers.

THE SELBORNE SOCIETY'S SOIREE.—Lord AVEBURY will take the chair at the annual conversation of the Selborne Society, which will be held on May 7 at the offices of the Civil Service Commission (Old London University). Two lectures will be given, the first on "How Birds Fly," by Mr. F. W. HEADLEY, F.Z.S., and the second on "How Men Fly," by Mr. T. W. K. CLARKE, B.A., A.M.I.C.E. Mr. JAMES BUCKLAND, the original promoter of the Plumage Bill, will exhibit a number of lantern slides illustrating the birds that are in danger of extermination in various parts of the world. There will also be a display of microscopes and natural history exhibits. Messrs. WATSON & SONS will demonstrate the processes of making microscope lenses. Messrs. J. J. MARSHALL & Co. will show a paper-making machine. The CARAVAN CLUB will send an exhibit illustrating the application of caravaning to the study of natural history. Tickets can only be obtained through members of the society. All communications should be addressed to Mr. WILFRED MARK WEBB, honorary general secretary, at 20, Hanover Square, W.

NURSERYMAN AS CHAIRMAN OF DISTRICT COUNCIL.—Mr. S. G. RANDALL, a nurseryman and fruit grower, has just been elected Chairman of the Skegness District Council. Mr. RANDALL was also chairman of the same council in 1897.

FLOWERS IN SEASON.—From Messrs. DOBBIE & Co., Rothsay, we have received an assortment of Pansy and Viola blooms. The wide range of colouring, combined with large flowers of exceptionally good form seen in such a collection as is sent us by Messrs. DOBBIE, shows the great advance that has been made in these popular flowers. Of the 50 varieties sent us, the following are a few of the more noteworthy:—Pansies: Mrs. Campbell, a yellow coloured variety, with large blotches of claret colour and most perfect outline of petal; Mrs. R. P. Butler, dark violet, with creamy-white edges mottled with purple-crimson, the upper petals are marked with crimson; Mrs. Harry Stuart, the lower segments are deep crimson, bordered with yellow, the upper petals being very faint yellow, shaded with rose. Of Violas, very fine are Jenny McGregor, a shade of violet striped with mauve; Lizzie Storer, the lower petals are dark and tipped with lavender, the upper petals being wholly of this latter colour; Mrs. J. H. Rowland, a beautifully-formed flower shaded with rose colour; Robert Menzies, a shade of purple, with markings of lavender on the upper petal; Mary Burnie, not new, but

still one of the most lovely of all violets, the pale primrose blossoms being margined with dark heliotrope; and Hugh Reid, a magnificent flower of the best form suffused with rosy-purple, slightly fainter on the upper petal.

—Some exceptionally fine inflorescences of *Clivia* are sent us by Mr. E. ROGERS (gr. to Mr. WRIGLEY, Bridge Hall, Bury). They are amongst the largest we remember to have seen, and of excellent shades of orange-scarlet. Mr. ROGERS states they were raised by Mr. WRIGLEY at Bridge Hall, and are the result of more than 20 years selecting and breeding. —We have received several interesting plants from Mr. W. A. COOK, gardener to Sir EDMUND LODER, Bart., at Leonardslee, Sussex. The Skunk Cabbage of the United States, *Symplocarpus foetidus* (syn. *Spathyema foetida*) is an evil-smelling Aroid. The inflorescence appears before the foliage, as in many of its congeners. It is an interesting plant for the bog garden. *Scolopus Bigelowii* is a dwarf-habited Liliaceous plant having greenish flowers striped with purple. A figure of this plant was given in the issue for March 3, 1894, p. 267. A fasciated flower-spike of *Narcissus cyclaminus* had five fully developed blooms. Mr. COOK also sent flower trusses of *Rhododendron barbatum*. —Messrs. WILLIAM BULL & SONS, King's Road, Chelsea, send blooms of their strain of *Cinerarias*. They represent a desirable type of this useful greenhouse plant. —Flowers of *Primula obconica* received from Mr. THOS. DENNY, Down House Gardens, Blandford, show a great advance on those of the type, the blooms being large and of excellent colour.

THE LATE G. H. SAGE.—Some weeks ago reference was made in these pages to efforts that were being made by Mr. W. A. Cook and others to raise a sum of money for the widow of the late Mr. G. H. SAGE. Mr. COOK now informs us that he has been able to hand over to the widow the sum of £27, and he has reason to believe that there will be further donations.

THE GEORGE MONRO CONCERT COMMITTEE.—We are informed that as a result of the 13th annual concert, held at the Queen's Hall on February 25 last, the following donations have been made:—Gardeners' Royal Benevolent Institution, £15 15s.; Wholesale Fruit and Potato Trades' Benevolent Society, £10 10s.; Surgical Aid Society, £6 6s.; Charing Cross Hospital, £5 5s.; Royal Ophthalmic Hospital, £2 2s.; Covent Garden Lifeboat Fund, £3 7s.; Geo. Monro, Ltd., Pension Fund, £4 4s.; Geo. Monro, Ltd., Outing Fund, £3 3s.

SPRING FLOWERS AT CROYDON.—The ninth annual exhibition of spring flowers, under the auspices of the Croydon and District Horticultural Society, will take place on Thursday next in the Horniman Hall, North End, Croydon. These exhibitions have proved the possibility of holding successful flower shows without charging fees for entry or offering prizes. The secretary is Mr. H. BOSHER, 62, High Street, Croydon.

WATER-COLOUR DRAWINGS AT THE NEW DUDLEY GALLERY.—We referred in the last issue to an exhibition of water-colour drawings by the four Misses DORRIEN-SMITH, of Tresco Abbey, St. Mary's, Scilly; Hampshire scenery, by Miss ALSWEN MONTGOMERIE; and of Malta and Sicily by Lady MABEL SOWERBY. At Tresco many introduced plants from Australia, New Zealand, and Japan, flourish vigorously, although they suffer some injury from the Atlantic gales. In a drawing of a patch of *Iris tingitana* by Miss CICELY DORRIEN-SMITH, the harmony of the adjacent blue sea, with the colour of the *Iris*, makes a pretty whole, admir-

ably contrasted with a scattered group of *Kniphofia Uvaria*. Another picture by the same artist represented Tree Ferns (*Cyathea*), and purple-flowered *Crocuses*. "On the Shore in May," was a piece full of colour and variety. "Gorse at Saint Mary's," showed the plants of a tint rarely seen on the mainland. A striking example of Miss GWENDOLINE DORRIEN-SMITH's landscape work was remarked in "Garrison Hill, St. Mary's," wherein a Heather-covered headland showed Gorse in bloom, and the ever-present sea at the back of the view. Another was a view from the upper terrace, Tresco—a garden subject—consisting of a carpet of *Thymus*, a *Pinus Pumilio*, dwarf in stature, and wind-blown; together with *Agaves* and other succulent plants. A seascape showed Grimsby Harbour, Tresco, and *Hydrangeas* with pink and very deep blue flower-heads. In "Sunset Glow" the artist had caught the exact moment very happily. Her pictures of Orange *Phoenix* and *Soleil d'Or* Daffodils gave the idea of the abundance of *Narcissus* blooms in the Scilly bulb fields. The patch of *Soleil d'Or* had groups of *Iris germanica* and tree-like *Dracæna australis* growing in an irregular manner among the bulbs. The view of the Neptune Steps in Tresco Gardens showed a curious combination of art and semi-wild nature. Himalayan *Rhododendron* in flower, nicely drawn and accurate in colour, probably *R. arboreum*, was the work of Miss CHARLOTTE DORRIEN-SMITH. Studies of garden plants such as *Iris Kämpferi*, *Mesembryanthemums*, *Hydrangeas*, *Fuchsias*, *Aloes*, *Azaleas*, &c., were contributed by one or other of the Misses DORRIEN-SMITH. Miss A. MONTGOMERIE's pictures exhibited views of Hampshire, mostly of swampy places, such, for example, as "Low Tide," "Eling Wharf," "Evening in the Water Meadows," "A Desolate Waste, New Forest," "The Dying Day," "The Mists in the Valley," "Approach of Night," "The Haunt of the Heron," and many more of a rather depressing character, but cleverly drawn and coloured. Among Lady MABEL SOWERBY's contributions to this collection of water-colour drawings were subjects from Malta and Sicily, of which the more conspicuous were "An Arab Pony and Cart" and "Old Age," both old and ill-fed, sorry specimens of the horse, "The Strada," "Britannica at Night," "Smelting Hatpins," "Maltese Fishing from a Quay," a well-worn subject. Various seascapes by Miss E. INNIS DORRIEN-SMITH, a tempestuous sea rolling in shore was one of the best of the works of this artist.

NEW PUBLIC PARK FOR BISHOP'S STORTFORD.—The Saxon castle and grounds at Bishop's Stortford, which were recently acquired from private ownership by the town council for the purposes of a public park and recreation grounds, have been formally opened. The castle and grounds cover 8 acres, and the purchase money will be a charge on the rates for 60 years.

TRADESCANT'S TOMB.—In Lambeth churchyard there is the tomb of JOHN TRADESCANT, who was gardener to Charles I. in 1629. Near by was his famous botanical garden, in which as late as 1749 might have been seen many rare and curious plants, including unusually large specimens of *Arbutus* and of *Rhamnus Catharticus*, the latter about 20 feet high and nearly a foot in diameter of stem—truly a giant specimen of the native Buckthorn. It was hard to realise during a recent visit to the Lambeth Borough Recreation Ground, containing miserable-looking, soot-incrusted specimens of the *Euonymus*, *Holly* and *Aucuba*, and surrounded by an atmosphere full of chemical fumes, that little more than a century and a half ago the same site should have been that of the most famous museum and botanical garden of its day.

BRUSSELS INTERNATIONAL EXHIBITION.—The Government of this country is "waking up" to the importance of giving official aid to the organisation of British exhibits at important exhibitions. To this end a Royal Commission, presided over by His Royal Highness the Prince of WALES, has been appointed by his Majesty the KING, to assist the Board of Trade in the organisation of exhibits illustrative of British art, industry, and agriculture both at the 1910 Brussels Exhibition and at the 1911 Turin Exhibition. We commend to the notice of our readers the fact that Group 8 in the general classification of the Brussels Exhibition is devoted to horticulture and arboriculture. This group includes appliances and processes in horticulture and arboriculture, kitchen-garden plants, fruit trees and fruit, trees, shrubs, ornamental plants and flowers, greenhouse plants, horticultural and nursery seeds and stocks. It is to be hoped that British horticulture will be adequately represented at Brussels.

medal and \$250. Another class is arranged for a display of a similar nature, but to include not fewer than 10 Orchid genera and bigeneric hybrids. There are also classes for a recently introduced Orchid plant not previously exhibited in the United States, a new seedling Orchid, a new species of stove or greenhouse plant in bloom, a new species of stove or greenhouse foliage plant, a new species of coniferous plant, not yet in commerce but likely to be hardy in Massachusetts; a new species of shrub or climber in bloom, likely to be hardy in Massachusetts; and for a new species of hardy herbaceous plant in bloom. The secretary is Mr. WILLIAM P. RICH, and his address is at Boston, Massachusetts.

A PROPOSED WOMEN'S GARDEN OR PARK.—

In connection with the proposed conversion of the disused burial ground behind the Chapel of the Ascension in the Bayswater Road, London, into a public park, efforts are being made by

reason, to make use of the free seats in the parks. There should also be some place of shelter from the rain."

ACETYLENE GAS REFUSE.—The experiments on this subject related on p. 264 of the last issue were carried out by Mr. W. B. BURGESS, of the South-Eastern Agricultural College, Wye, in his private capacity, and not at the college, as was inadvertently stated.

* **"FAMILIAR WILD FLOWERS."**—We have received Part I. of a new edition of this work by the late F. EDWARD HULME. There will be 45 fortnightly parts, and these will be illustrated with 360 coloured plates. We recommend the work to anyone desirous of acquiring an elementary knowledge of native British flowering plants. The recent death of the author has robbed popular botany of one of its most enthusiastic teachers.

PUBLICATIONS RECEIVED.—*Mendel's Principles of Heredity*, by W. Bateson, M.A., F.R.S., V.M.H. (Cambridge: University Press). Price 12s. net.—*Transactions and Proceedings of the Botanical Society of Edinburgh*. Vol. XXIII. Part IV. (Edinburgh: Royal Botanic Gardens).—*Kew Bulletin*. (No. 3, 1909). FIG. 121.—ROSE "WHITE KILLARNEY."

(From a photograph obtained after the bloom had been brought from America in a cut state.)

ORCHID SHOW IN AMERICA.—We have received a preliminary schedule of prizes to be offered at an exhibition that will take place under the auspices of the Massachusetts Horticultural Society on May 26-30, 1910. Orchids will constitute a leading feature at this show. The chief prizes are offered for a "display of Orchid plants in bloom, arranged for effect, embracing at least 20 Orchid genera and bigeneric hybrids and unlimited as to the number of species, varieties, and hybrids, to fill 400 square feet of space." Cut blooms of rare sorts not exceeding in number 5 per cent. of the total number of varieties of Orchid plants in the exhibit will be admissible. The points will be awarded as follows:—Varieties of Orchids, 30 points; quality, 35 points; arrangement and decorative effect, 25 points; novelty of Orchids, 10 points. The first prize in this class will consist of a gold medal and \$1,000, the second prize of a silver medal and \$500, and the third prize of a bronze

a number of influential people to induce the authorities to form a garden or park for the exclusive use of women. The following paragraph is taken from a letter printed in the *Times*:—"We are convinced that it would be a great boon to many women to know of a place where they could walk, sit down, rest and saunter at their ease, under other conditions than obtain either in the streets or in the parks. Particularly in summer, towards the close of the long hot days, must it be the longing of many to escape from narrow or crowded surroundings to be in the open air and not compelled to trudge. The garden that we suggest would be essentially a place for rest and ease—not a playground—a garden rich in flowers with shady and with sunny walks, and with broad spaces of lawn between the flower walks. It is desirable that the garden should be provided with many seats. This provision would be greatly appreciated by women who hesitate, not without

ROSE WHITE KILLARNEY.

THIS Rose has excited considerable interest in America recently, especially amongst the florists who supply the horticultural markets. Although a sport from the well-known pink variety, it is said to have more substance in the petals than the type. It is a large flower, and possesses a delicious perfume. This variety will be valuable for forcing, as the flowers are larger than any of the white varieties specially suitable for the purpose. The photograph reproduced in fig. 121 was taken in the Royal Horticultural Society's Hall, Vincent Square, on the 20th ult., and the flower photographed was brought from America in a cut condition, in the cold room of the "Mauretania," by Mr. H. A. Barnard, a representative of Messrs. Hugh Low & Co.

* Cassell & Company, Ltd. Price 6d. each part.

PROPAGATION OF HYACINTHS IN HOLLAND.

(See Supplementary Illustration.)

THE Hyacinth does not naturally form a large number of new bulbs, but only a few offsets occasionally develop. When a bulb is broken at its base, or is in some way injured, however, a number of buds or bulbils appear about the wound. It was the observance of this fact that led to intentional wounding or cutting of the bulbs on the part of the cultivator with a view to increasing his stock. In our Supplementary Illustration are to be seen the various stages in the propagation of Hyacinths on a Dutch farm by what is known as the notching or cross-cut system. The base of the bulb is notched as is

Meulder, at Lisse. A series of trays is arranged from floor to ceiling so that the propagator can conveniently examine the bulbs from time to time. These trays are formed very much after the manner of those in which Potatoes are stored for seed purposes. The bottom is constructed of laths, and the openings allow of a free circulation of air. The bulbs are cut in June, after which they are placed directly into the trays and kept in a high temperature. Soon afterwards there appears in every wound a number of tiny buds or bulbils. By this system flowering bulbs can be obtained one year earlier than if the base of the bulb were hollowed. This is because, fewer being formed, they receive more nourishment individually than in the case of those

sold each bulb is inspected. Those that are suitable are packed in paper bags or cases amongst husks of Buckwheat.

Haarlem, the city of the Counts of Old Holland, as is well known, has long been occupied with the raising of flowering bulbs, and every field and meadow about the city is now cultivated as a bulb farm. It is the narrow strip of sandy ground situated immediately behind the dunes that has proved exceptionally suitable for such culture. Tulips, and particularly Narcissi, can be propagated and grown for commercial purposes in many parts of the British Isles, and in the Scilly Islands and in Ireland, but in the case of Hyacinths the whole of the commercial output, for Europe at the least, is raised in Holland.

The bulb fields during the latter part of April always present a glorious sight, but a visit to the district in autumn is not less interesting. Along the banks of the canals and rivers, strips of land are covered with bulbous plants. The country from Leiden to Beverwyk, 12 miles north of Haarlem, is one continuous bulb farm 30 miles in length. Even around the Hague many orchards have been destroyed, the trees grubbed up, and bulbs planted in their stead. Until about 1860 bulb cultivation in Holland was limited to the immediate neighbourhood of Haarlem, the country beyond being either meadow or orchard land, but bulb-culture has proved to be more profitable. The farmer, therefore, became a bulb-grower, and his sons soon adapted themselves to a commercial life. They learned foreign languages and travelled in other countries for the purpose of disposing of their stocks. For the photographs we are indebted to Mr. Piet Ammerlaan, Amsterdam.

(To be continued.)

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

THE SEASON IN MID-WALES.—With reference to Mr. Markham's note on p. 245, the following remarks may be of interest. Scotch, Cottagers', and Asparagus Kales are plentiful and good. Broccoli have withstood the severe weather well, and without any protection. We cultivate the following varieties of this vegetable: Self-protecting Autumn, Snow's Superb Winter White, Frogmore Protecting, Cattel's Eclipse, Late White May, and June King. They have all been grown between Potatoes planted 3 feet apart. Spinach (Green Beet) has furnished plentiful crops during the winter; the prickly-seeded kind will soon be plentiful. Of Celery, the variety Major Clarke is keeping well. Turnips Chirk Castle, Black Stone, and Orange Jelly have been, and still continue, in good condition. Autumn-sown Peas were ruined by the severe weather in March. Broad Beans are later than those sown in January outside. Autumn-sown Onions of the Giant Rocca variety are very good; of Ailsa Craig we lost quite 50 per cent. of the plants. Onions and Parsnips sown outside in February promise well. Of autumn-planted Cabbage, Ellam's Early Dwarf is late, but quite healthy, and will be ready to follow late Kales. Fruits of all kinds are very satisfactory. Hybrid Perpetual and climbing varieties of Roses are breaking well, but Tea Roses have been damaged by the cold weather. Rose Beauty of Glazenwood, or Fortune's Yellow, growing on a south wall and with no protection during March, will soon be a glorious sight. *Retinospora Sanderae*, a beautiful coloured Conifer, refuses to grow here; probably the plant requires shelter from wind, as it appears quite hardy. Ribes, in five varieties, are charming just now. *Euonymus* trees are badly damaged, particularly the green variety. The shoots of *Escallonia* are badly browned, but the plants will soon be green again with new growth. *Veronicas*, except the variegated variety of *V. Andersonii*, which is cut to the ground, are unharmed; our plants include *V. salicifolia*, *V. Burkii*, *V. Traversii* and *V. cupressoides*. *Con-toneaster angustifolia* is cut badly by the frost. The flowering shrubs were unharmed, although

FIG. 122.—NARCISSUS "QUEEN OF THE WEST."

(Obtained R.H.S. First-Class Certificate on 20th ult. as a good market variety.)
(See *ante* p. 269.)

shown, or it is scooped out, as will be illustrated in a later number. Immediately after the bulb is scored in this manner, the wounds are exposed so as to dry them. In former times they were exposed to the sun's rays, but it is the practice now to apply some absorbent material, such as ash or lime, which prevents the exudation of sap. It is usual to set apart a portion of a bulb store for use as a "nurse-room," in which the formation of the bulbils takes place and their development continues until they are ready for planting. Our illustration shows a part of one of these rooms in the nursery of Mr. F. de

obtained by the other treatment. In October or November the bulbils are detached and planted in ground which is liberally dressed with cow-dung in the preceding year. In the following season the bulbs do not flower, but merely produce foliage. They are lifted with the other bulbs in June, placed in the bulb stores and spread out on laths to dry. When this is accomplished they are cleaned of the foliage and loose leaf scales, and stored in a well-ventilated room until planting time in the following autumn. As soon as they are of a proper flowering size, which takes usually three years, they are ready for the market. Before they are

without protection: *Olearia Haastii*, *O. nitida*, *Rhododendrons*, including the variety "Pink Pearl"; *Stuartia pentagyna*, *Caryopteris Mastacantha*, *Elæagnus choisyi*, *Buddleia globosa*, *B. variabilis*, *Choisya ternata*, and *Cassinia fulvida*. The shoots of *Cistus* in several varieties have been killed by the frost, but they have been pruned and are breaking freely. *Styrax japonica*, *Edwardsia grandiflora*, and *Azara microphylla* are, I am afraid, damaged beyond recovery. The foliage of *Rhododendron elegantissima* is quite brown, but the buds appear to be alive. *R. præcox*, which lost all its foliage, is now in flower. *R. odoratum* is quite hardy with us, although a very shy bloomer. *Carpenteria californica*, which was lightly protected, is quite green. These trees and shrubs have all been planted within the last five years. The soil is a stiff clayey loam, which has been well drained and worked; all are growing at an exposed altitude of 600 feet. *Yucca filamentosa*, *Tricyrtis hirta nigra*, and *Opuntia Rafinesquii*, planted in prepared soil, have withstood the winter well. Pampas Grass, planted four years ago as offsets, are damaged, but not severely. Specimens of *Romneya Coulteri* have been cut to the ground; they were weak when planted. The shoots are now breaking through the soil again. A plant of *Lilium auratum platyphyllum*, which developed 44 flowers last season, is now 6 inches high, the only protection it has had being an inverted flower-pot. A patch of *Anemone hortensis plena* is now a blaze of colour, whilst several varieties of *A. coronaria* will be charming for some weeks to come. Plants of *Meconopsis integrifolia*, raised from seed sown in a cold frame last June and planted out in October, are healthy and strong. Seeds sown in the open air last August appear to be doing well. Our first Almond tree to flower opened its blossoms on the 17th inst. *J. E., Welshpool.*

CRIMSON CARNATIONS.—Mr. Weston and Mr. Johnson take different views (see pp. 241, 267) as to which variety of perpetual-flowering Carnations should be regarded as the best crimson variety. Having tested all varieties from the old General Maces to the new variety known as Black Chief, I think that this latter variety is to be recommended with confidence. A seedling from Harlowarden, Black Chief has a stronger stem and more robust habit of growth than its seed parent. It possesses a rich Clove scent, which Harlowarden does not, and it is capable of producing almost double the crop of bloom. Gwladys is a beautiful variety, but it is too slow in growth, producing its main crop of flowers in spring. When a flower is cut from this variety it takes more than seven months before the same growth will produce another bloom. Harlowarden will do so in six months, but Black Chief requires only five months. Harry Fenn and The President require a better winter climate than we possess, Governor Roosevelt is too slow, whilst Harvard, the American novelty, produces large flowers, but they are somewhat few. Black Chief is the best crimson perpetual-flowering Carnation up to the present date. *Montagu C. Allwood.*

CULTURE OF CUCUMBERS.—Mr. Jenkins states (p. 253) that I am in error in assuming that "all engaged in growing Cucumbers for market stop the young plants at the third or fourth wire of the trellis," adding that he himself does not do so, "although a market grower of Cucumbers for many years," thereby proving the truth of the old axiom about there being "an exception to every rule." All market growers of Cucumbers that I am acquainted with stop their young plants as I described in order to hasten the production of fruit-bearing laterals, and to have good Cucumbers earlier than would otherwise be the case. The individual laterals are stopped, as a rule, immediately beyond the second joint, and no fruits are allowed to develop on the main stems of the plants. Mr. Jenkins says (p. 193), "When the second or third rough leaf has been made the seedlings may be planted out." Young plants, however, are as a rule shifted from 3-inch pots into others having a diameter of 6 inches, and are not planted on the ridges until they have developed five or more rough leaves, the plants being grown on in the meantime in a position pretty close to the roof glass. In order to secure good crops of saleable fruits over as long a period as possible, liberal top-dressings of suitable manures should be

afforded before applying water at the roots two or three times in the week. The top-dressings are given in addition to a fresh compost of good loam and manure in about equal parts at intervals of a few weeks. Mr. Jenkins asks if I have tried the method which he advocated on p. 193. I have not, simply because it would not result in so great a profit as the one I now practise, and is wholly unsuited for commercial purposes. I have grown Melons extensively in the manner described by Mr. Jenkins for several years when in private practice, and with very satisfactory results. But satisfactory as this system was in a private establishment, I am satisfied that it would not do for market growers. With regard to my fuel bill, the cost was practically nothing, inasmuch as the plants were grown, as stated at p. 234, in boxes over a flue in the back wall of a three-quarter span pine stove, which, during the winter and early spring months, contained fruiting plants. *H. W. W.*

ACETYLENE GAS REFUSE.—I have been using this in my garden for six years, and though I have not put it to any kind of scientific test, I have had no reason to think that its effects were other than those of ordinary dressings of lime. I might add that the weeds grow freely on the piece of waste ground where my man washes out the tins. If there were any seriously injurious effects from the refuse one would have thought it would be seen here more than anywhere, but the grass does not appear to be affected by the liquid which runs over it. *Chas. E. Pearson.*

THUJA LOBBII AS A HEDGE PLANT.—There can be no doubt as to the general excellence of *Thuja Lobbii* as a hedge plant as recommended by *E. M.*, p. 245; but by far the most ornamental, evergreen hedge is furnished, in my opinion, by *Thujopsis dolabrata*. Here at Rotherfield Park we have some hedges formed of this Conifer which never fail to command admiration. The plant does not, perhaps, equal *T. Lobbii* in rapidity of growth, but it makes a very dense and excellent hedge. The only pruning necessary is an annual cutting of the side growths with a knife; they should not be clipped with shears. *Cupressus Lawsoniana* also makes a good hedge. *W. H. G., Alton, Hants.*

SOCIETIES.

ROYAL HORTICULTURAL.

The following circular letter is being distributed from Wisley:—

Royal Horticultural Society's Laboratory,
Wisley, Ripley, Surrey, April, 1909.

In view of the great severity of the weather in the past winter (1908-9) in certain parts of the country and the large number of new plants recently introduced to our gardens, it is desirable to collect all available information concerning the damage done by frost in order that it may be made public in the Royal Horticultural Society's *Journal*.

Will you, therefore, be so good as to fill in the forms sent herewith and return them to me at your convenience? Additional forms will be sent with pleasure if required.

No doubt the extent of the damage done will not be apparent until the middle or end of May, but may we be allowed to suggest that notes of the apparent damage should be made at once and checked subsequently at the time the plants should be in full growth.

In some cases it will be impossible to answer all the questions, but any exact information that can be given will be of immense service in drawing up the report and will be of great value to the Fellows of our Society.

Yours truly, FRED. J. CHITTENDEN.

SCHEDULE OF QUERIES.

1. Locality of garden.
2. Height above sea level.
3. Is the surrounding country open or is the garden sheltered by hills, &c.?
4. Is there any large body of water near?
5. Has the garden suffered any great damage from frost during the winter of 1908-9? If possible, please say how the amount of damage compares with that experienced in previous severe winters.
6. What are the lowest temperatures re-

corded during the winter, with dates?

- (1) On grass
- (2) In screen

If the thermometers are placed in positions other than these please give exact situation and exposure.

7. Have the thermometers been verified at Kew?
8. If not, are the thermometers ordinary minimum thermometers or "Six's"?
9. How do the temperatures compare with those experienced during other winters?
10. How long did the frosts last?
11. Was snow on the ground at the time? If so, about how much?
12. What was the general character of the autumn months in the district?
13. What is the nature of the soil and sub-soil?
14. Please give any further particulars regarding the climatic conditions that you think may be of service in drawing up the report.

[Two further forms accompany this one; one is intended for the enumeration of plants that have received injury, and the other for the enumeration of newly-introduced plants.]

Scientific Committee.

APRIL 20.—*Present*: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Sir Daniel Morris, G.C.M.G., Prof. Church, F.L.S., Messrs. A. Worsley, G. Masee, A. W. Hill, J. Douglas, C. Drury, J. T. Bennett-Poë, J. W. Odell, W. Cathbertson, and F. J. Chittenden (hon. secretary).

Fatsia injured by gnawing animals.—Mr. J. W. ODELL reported that he had examined the plants of *Fatsia* in the garden of Mr. KINGSMILL, at Harrow Weald, who had sent specimens of the injured stems to be examined by the committee, and found that the injury had been caused by the long-tailed field mouse, which had gnawed off the bark of some of the branches all round for a considerable length.

Double Auricula.—Mr. DRURY called attention to a double-flowered *Auricula* of an exceedingly dark purple colour, shown by Mr. J. DOUGLAS. The plant had been raised by Mr. C. B. GREEN, of Acton, from seed bought of Mr. DOUGLAS. The example was particularly interesting, since Mr. DOUGLAS stated that never before in his experience had a double *Auricula* been raised from seed of his plants. Sir DANIEL MORRIS raised the question of whether such a variation as this suddenly occurring from seed could rightly be called a sport. The discussion of the proper application of this term was deferred.

Various plants.—Mr. WORSLEY showed flowers of Tulips which he had received under the name of *Tulipa Fosteriana* from Holland, and commented upon the amount of variation in colour which these showed, especially in the presence and absence of the dark blotch at the base of the perianth segments. He considered that the plant approached very closely to *Tulipa Eichleri*. Mr. WORSLEY also offered some remarks upon a plant shown at the previous meeting, which he had identified as *Urceolina miniata*, a native of the Peruvian Andes.

From Mr. A. W. SUTTON came an unnamed Composite, apparently a native of Tropical Africa. In appearance the flowers somewhat resembled those of a *Cineraria*, but did not seem identical with any known species. Mr. SUTTON was asked to show the plant again when ripe fruit could also be seen.

Sir DANIEL MORRIS remarked that he had recently seen, in a garden in the New Forest, a white-flowered shrub about 5 feet or 6 feet in height, which there passed under the name of *Leucopogon Cunninghamii*, but which was really *Spiræa Tunbergii*. He desired to know whether *Leucopogon Cunninghamii* was hardy in England.

Presentation to the Library.—Prof. A. H. CHURCH presented three books which he had had privately printed, being catalogues of some 6,000 manuscripts, scarce pamphlets, &c., contained in the library of the Royal Society, and dating from about 1606 to the beginning of the nineteenth century, containing many interesting references to well-known botanists and other scientific men of this and foreign countries, to which Prof. CHURCH briefly referred. Prof. CHURCH was heartily thanked for these interesting additions to the library.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

APRIL 1.—*Committee present:* E. Ashworth, Esq. (Chairman); and Messrs. R. Ashworth, H. Thorp, Z. A. Ward, F. W. Ashton, A. Warburton, J. C. Cowan, W. Holmes, A. J. Keeling, C. Parker, W. B. Upjohn, and P. Weathers (hon. sec.).

A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), exhibited *Cattleyas* (Bronze Medal), a group of *Odontoglossums* (Silver Medal), and another of *Cypripediums* (Bronze Medal), the combined display receiving a Silver-gilt Medal. From this collection the following plants received awards, viz., First-class Certificate to *Odontioda Goodsonae* Vine House variety and *Odontoglossum crispum* var. *Inoticus*. *Cattleya Schröderæ* var. *Countess Deepore*, C. S. var. *Matador*, and C. S. var. *White Queen* received Awards of Merit.

H. J. BROMLOW, Esq., Rainhill (gr. Mr. Morgan), was awarded a Silver Medal for a group of *Cypripediums*. C. × *Hopkinsonianum*, a hybrid between C. *bellatulum* and C. *Mastersianum*, received an Award of Merit.

Messrs. MOORE, LTD., Leeds, were awarded a Silver Medal for a fine display of *Dendrobiums*.

Mr. W. SHACKLETON, Gt. Horton, near Bradford, was awarded a Bronze Medal for a small group of plants consisting of *Cypripediums* and *Odontoglossums*. *Odontoglossum crispum* Shackleton's variety received an Award of Merit.

J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), was awarded a Silver Medal for a group of *Cattleyas*; a fine white variety named *Cattleya Schröderæ alba* var. *Mrs. J. McCartney* was awarded a First-class Certificate, whilst *Cattleya Schröderæ* var. *Model* received an Award of Merit.

Mr. J. ROBSON, Altrincham, was awarded a Silver Medal for a miscellaneous display, in which were some well-grown plants of *Dendrobium* and *Odontoglossum* in great variety.

Mr. A. W. JENSEN, Linfield, Sussex, exhibited a number of distinct forms of *Cattleya Schröderæ* and some choice forms of *Cattleya Mendelii*.

Mr. A. J. KEELING, Bradford, was awarded a Bronze Medal for a group in which were many interesting plants. *Cypripedium* × *Eurybel* received an Award of Merit, and a similar award was given to a good form of *Dendrobium Cambridgeanum*.

G. S. BALL, Esq., Burton, Westmoreland (gr. Mr. Herdman), received Botanical Certificates for *Bulbophyllum Lobbii* var. *Siamensis* and *Cirrhoptalum picturatum*. P. W.

HORTICULTURAL CLUB.

THE COLOURS OF PLANTS.

APRIL 20.—At the usual monthly meeting of this club, at the Hotel Windsor, on this date, Mr. W. J. Jefferies presiding, Mr. A. E. Bunyard gave an interesting lecture on the underlying causes of colour and change of colour in plants. By means of a number of lantern slides, some representing flowers in their natural colours, and others prepared microscopic sections of the colour-producing plant cells, he showed the many subtle ways in which colours are widely varied by minute modifications of the colouring matter, or even only of its rearrangement. In the first place, he explained that we recognise colours by virtue of the varying powers possessed by the colouring materials of absorbing white light, e.g., sunlight, and breaking it up, as in prisms, into those constituent tints which are seen in the rainbow or in the spectrum. When so broken up, these components are partly absorbed and partly thrown off or reflected, and it is by virtue of the reflected rays, and not the absorbed ones, that our eyes are affected and we see the colour concerned. Thus a red body absorbs all the rays of the spectrum except the red; these, reflected, fall upon the eye and give rise to the sensation of redness. He then went on to explain that the colouring matter in plants is of two kinds, sap, or liquid colours, and "plastids," or minute microscopic bodies of a granular nature.

In one very remarkable slide representing a section of a flower petal, he showed how these two kinds, say, one yellow, the other red, may be associated in separate but adjoining cell layers

in definite patches, and in such a fashion that, when both were exactly superimposed, a very intense colour appeared; while a less exact coincidence would allow the lighter tint to appear between the darker one, and in this way produce more or less marked gradations of tint.

Mr. Bunyard next explained that the chief colouring matter of plants, viz., the chlorophyll, contained in the green granules to which leaves owe their colour, is associated with a yellow colouring matter termed Carotin.

In foliage the yellow colour of the Carotin is masked by the predominating green chlorophyll, but when the green chlorophyll decomposes in the autumn the yellow tint becomes visible, and, in conjunction with other pigments, produces the brilliant reds and yellows of the autumn landscape. Another interesting point brought out by the lecturer was the practical identity of blue and red sap colours, the acidity or alkalinity of the sap holding the pigment in solution determining the colour (blue or red) of that pigment. Hence a very slight change in the composition of the soil or in the plant itself may lead to a change from red to blue flowers, or vice-versa as is seen in the much-discussed cases of the *Hydrangea*. A further series of slides illustrated the peculiar forms taken by the coloured plastids (chromoplasts) in the epidermal layers of fruits, the Melon displaying under the microscope curious arrangements of rods and ribbons, while in other cases the matter takes the form of minute crystal-like bodies. Flowers usually contain chlorophyll in their incipient stages, but eliminate it later as they assume their distinctive colours; in the green flowers, however, such as green Roses and Dahlias, this elimination does not occur; in them the chlorophyll persists.

Mr. Bunyard referred to the well-known fact that a colour which may be entirely absent in the flower may betray its presence elsewhere in the plant's system, and stated that varieties even when not in flower may thus be recognised. Such examples may be found in the white Lilac, the leaf-buds differing from those of the coloured Lilacs by an absence of a tint in the foliage which the latter invariably show. In the subsequent discussion Messrs. Druery, Cuthbertson, Pearson, Barr, Sanders and Dr. Shillitoe took part.

IPSWICH AND EAST OF ENGLAND HORTICULTURAL.

APRIL 21.—The annual spring flower exhibition of this society, otherwise known as the Daffodil show, was held at the Public Hall, Ipswich, on this date. The show was marked by exceptional success, both as regards the number and quality of the exhibits. The classes were divided into those for amateurs, with no restriction as to the number of gardeners employed, amateurs employing no regular gardener, and ladies' classes. In a group of classes for amateurs, Mr. F. L. BLAND took a prominent place. He was awarded the 1st prize for 24 varieties of *Narcissus*, the collection including *Seagull*, *Albatross*, *Mme. de Graaff* and *Lucifer*; 2nd, Mr. W. P. BURTON, with a collection which contained good blooms of *Glory of Leiden*.

For 12 varieties of *Narcissus*, exhibitors in the previous class not being eligible, Major CAUTLEY was placed 1st, his finest varieties including *Lucifer* and *Duke of Bedford*.

Mr. F. L. BLAND was again successful for one bloom each of 12 varieties of *Narcissus*. *Wear-dale Perfection* was shown in good condition in this exhibit. 2nd, Major W. O. CAUTLEY, Newton, Bury St. Edmunds.

Amongst the classes for yellow *Magni-coronati* varieties, Mr. DONALD WARNES won the 1st prize, his exhibit including a specially good specimen of *Glory of Leiden*. Mr. BLAND was 1st with the sulphur varieties, and also the white and yellow, his example of *Wear-dale Perfection* being awarded Major W. O. Cautley's prize offered for the best bloom in the section.

The next three classes were devoted to varieties of the *Incomparabilis*, *Barrii* *conspicuus* and *Leedsii* sections. Major CAUTLEY was 1st in two classes, and Mr. BLAND was 1st for three bunches of *Barrii* *conspicuus*. The last-named gentleman secured Major Cautley's Silver Medal offered for the best bloom in these classes with a fine example of the variety *Seagull*.

Mr. F. L. Bland offered a Silver Medal for the

best bloom of *Parvi-coronati*, which was won by Mr. G. H. SAVILLE. Mr. SAVILLE, who does not employ a regular gardener, won remarkable success with his exhibits of *Narcissus*. He won the 1st prizes offered for the *Sir Watkin* variety, for a collection of *Narcissus*, and for one bloom each of six varieties of *Narcissus*.

For a vase of 12 *Daffodil* blooms of any one variety, Mr. ROBERT DEATH was successful with fine blooms of *Emperor*. Mr. R. Dow was 1st for six bunches of spring flowers.

Pot plants.—The open classes for pot plants were responsible for some of the most brilliant effects in the show. There were four semi-circular groups of miscellaneous plants, and these formed a most creditable display. Mr. W. P. BURTON's group was much the best, both in arrangement and quality. Mr. NOTCUTT won two 1st prizes for *Palms*; the best *Lilacs* were shown by Mr. F. PORLEY, and the best *Clivias* by Mrs. LUTHER HOLDEN.

There was keen competition in the classes for *Azaleas*. Mr. W. F. PAUL won the 1st prize both for *Azalea indica* and *Azalea mollis*, his plants being full of bloom.

Some attractive pots of *Cinerarias* were shown by Mr. R. Dow, who beat both Mrs. LUTHER HOLDEN and Mr. W. F. PAUL. For *Cineraria stellata*, Mr. PORLEY was 1st; but Mr. W. PIPE also staged some good examples.

Mrs. W. H. BURROUGHS was 1st for both *Spiræa japonica* and other varieties of *Spiræa*.

Mr. W. F. PAUL showed some finely-grown *Calceolarias*, taking 1st honours; and Mr. W. PIPE's *Schizanthus* were beautiful specimens. Mr. V. D. COLCHESTER won easily with his fine *Tulips*. Mr. R. Dow's three pots of *Hyacinths* and also his *Narcissus* were a long way ahead of anything in the same classes. There was some very fine *Mignonette* to be seen.

TRADE EXHIBITS.

Non-competitive exhibits formed an attractive feature of the show. Mr. R. C. NOTCUTT, of Woodbridge and Ipswich, had a very fine exhibition, effectively displayed, which consisted largely of hardy spring-flowering shrubs, slightly forced and in full bloom. Also several varieties of *Roses* in full bloom. Mr. NOTCUTT had, in addition, an exhibit in the form of a rock-garden.

Messrs. WILLIAM CUTBUSH & SON, Highgate, London, N., showed *Carnations*, the more noticeable, perhaps, being the new *Souvenir de la Malmaison* variety named *Lady Coventry*.

Mr. CHARLES H. BUCK, Tresco Nurseries and St. Matthew's Street, Ipswich, showed some excellent results of the French system of gardening.

Messrs. FRED SMITH & Co., Suffolk Seed Stores, Woodbridge and Ipswich, had a well-arranged exhibit, in the centre of which were fine blooms of *Emperor Narcissus*.

Mr. R. H. BATH, the Floral Farms, Wisbech, and Mr. FRANK LILLEY, of the Bulb Nurseries, Guernsey, showed bright groups of bulbous and other spring flowers.

COLCHESTER ROSE AND HORTICULTURAL.

APRIL 22.—This society having abandoned their summer exhibition for this year, held instead a spring show on this date. Cut flowers were remarkable for their excellent quality and the exhibits of plants were also good, especially *Roses* from the celebrated Colchester rosarians.

In the class for a group of foliage and flowering plants, Mrs. H. DE LARPENT, Holwood, London Road, Colchester (gr. Mr. G. W. Richardson), was awarded the 1st prize; Mr. DIAPER, Priory Street, Colchester, being placed 2nd.

In the similar but small class G. H. GOODY, Esq., Colchester (gr. Mr. G. H. Spurgeon), won the 1st prize; 2nd, E. J. SANDERS, Esq., Colchester (gr. Mr. J. Wood).

Excellent *Roses* were staged by Messrs. F. CANT & Co. in a class for 12 of these plants, many being of the Rambler type. Messrs. B. R. CANT & SONS were awarded the 2nd prize. In the smaller class for *Roses* the awards were reversed, Messrs. B. R. CANT & SONS being placed 1st and Messrs. F. CANT & Co. 2nd.

The classes for bulbous flowers were in some cases weakly contested, but in others splendid blooms were staged. Major W. O. CAUTLEY, Newton, was awarded the 1st prize for 12 varieties of bulbous plants. Mrs. CHESHIRE had the

best bulbous plants growing in bowls or vases. Mr. SANDERS had the best collections of Polyanthus and Primroses.

Table decorations were a feature of the exhibition, and all were tastefully arranged. The 1st prize was won by Miss A. F. HARWOOD; this lady employed Solomon's Seal and Gypsophila largely. 2nd, Mr. TURNER, Colchester.

The class for decorated bowls or vases was strongly contested. Mrs. O. G. ORPEN, West Bergholt, was placed 1st with a charming arrangement of *Azalea mollis* and *Narcissus Leedsii*.

HONORARY EXHIBITS were numerous. Messrs. R. WALLACE & Co., Colchester, showed fine bulbous and Alpine plants; Messrs. B. R. CANT & SONS had a fine display of Roses; Messrs. PRIOR & SONS, Colchester, staged excellent Roses and other flowers; Mr. R. C. NORCUTT, Woodbridge and Ipswich, exhibited forced shrubs in variety; Messrs. W. CUTBUSH & SONS, Highgate, displayed Carnations, including their new variety named Lady Coventry; Mr. CHAS. TURNER, Slough, showed Auriculas; and Messrs. DOBBIE & Co., Rothesay and Mark's Tey, Violas.

MIDLAND DAFFODIL.

APRIL 22, 23.—The Midland Daffodil Society's 11th annual exhibition was held at the Botanical Gardens, Edgbaston, on the above dates. The weather on the first day was wet, and greatly interfered with the attendance of visitors to the show, which was visited by a deputation from the Royal Horticultural Society, consisting of Messrs. H. B. May, E. A. Bowles, A. Kingsmill, and C. H. Curtis.

Mr. Peter Barr, who was present, declared the exhibition to be the best Daffodil show in the world. It certainly was one of the best held at Birmingham, and the all-round quality of the flowers, especially new seedlings, was surprisingly good. Mr. E. M. CROSFIELD is to be congratulated upon winning both the "Bourne" and the "Cartwright" Challenge Cups for seedlings and new varieties, as well as the 1st prize in the open championship class and 1st prizes in all classes in which he exhibited.

The new system of classification of Daffodils drawn up by the Royal Horticultural Society was used, and came in for some criticism.

In the evening Mr. Robert Sydenham entertained the principal exhibitors, judges and visitors to dinner at the Grand Hotel. An interesting discussion on the classification and registration of Daffodil names was opened by the Rev. Joseph Jacob.

CUT FLOWERS (OPEN CLASSES).

The premier class was one for a collection of 50 varieties of Daffodils. There were four entries, and the 1st prize of five guineas was awarded to Mr. E. M. CROSFIELD, Cossington, Bridgwater, whose flowers were of an unusually high standard of excellence. A few of the best varieties were Prelude, Draco, Hamlet, Schem, Northern Light, Cassandra, Incognita, Lucifer, Homespun, Horace, Pilgrim, Honeybird, and Cohort. Messrs. CARTWRIGHT & GOODWIN, Blakebrook, Kidderminster, won the 2nd prize; their exhibit contained exquisite flowers of Monarch, King Solomon, Hamlet, Homespun, Admiral Togo, Diamond, Circle and Incognita. 3rd, Messrs. POPE & SON, King's Norton.

Messrs. CARTWRIGHT & GOODWIN were awarded 1st prizes in each of the following six classes:—(1) Twelve distinct varieties of long-trumpet Daffodils; (2) six distinct varieties of short-trumpet Daffodils; (3) 12 distinct varieties of large-cupped Daffodils; (4) 12 distinct varieties of small-cupped Daffodils; (5) six distinct varieties of flat-cupped Daffodils; and (6) three distinct varieties of double Daffodils. The same exhibitors shared equal 1st with Mr. F. H. CHAPMAN, Rye, in a class provided for six distinct varieties of *N. poeticus*. It is difficult to particularise where flowers were so numerous and the quality uniformly high, but the specimens exhibited by Messrs. CARTWRIGHT & GOODWIN were models of good culture and refinement and artistically arranged.

In a class for six varieties of Daffodils selected from moderate-priced varieties, such as Emperor, Golden Spur, Empress, Victoria, Sir Watkin, Mrs. Langtry, &c., there were four competitors, and the Rev. T. BUNCOMBE, Black Torrington, N. Devon, gained the 1st prize with

beautifully-fresh flowers of *Barri conspicuus*, John Bain, Emperor, Leonie, Flora Wilson, and Frank Miles. 2nd, J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer).

AMATEURS' EXHIBITS.

In the section reserved for amateurs the leading class was for 25 varieties of Daffodils, and eight good exhibits were placed before the judges, who awarded the 1st prize to Mr. N. Y. LOWER, Presteign, for a beautiful set of flowers, in which the following varieties were of outstanding merit:—Horace, Homer, Gloria Mundi, Weardale Perfection, Blood Orange, Chancer, Glory of Leiden, Albatross, Mme. Plemp, Lucifer, Cresset, and J. B. M. Camm. 2nd, Mr. H. B. YOUNG, Metheringham, whose best flowers were Lucifer, Gloria Mundi, Weardale Perfection, Leonie and *Barri conspicuus*. The Rev. T. BUNCOMBE, who obtained the 3rd prize in this class, beat 10 competitors in a class for nine distinct varieties of long-trumpet Daffodils. He showed very clean, shapely blooms of Mme. de Graaff, Victoria, Emperor, Weardale Perfection, Glory of Leiden, J. B. M. Camm, M. J. Berkeley, and Empress. Mr. H. B. YOUNG was a close 2nd, and the Rev. G. P. HAYDON, Canterbury, 3rd.

In a class for nine distinct varieties of large-cupped Daffodils the Rev. T. BUNCOMBE again took the lead with exceedingly good flowers, except two, namely, Artemis and Minnie Hume. 2nd, the Rev. G. P. HAYDON, who succeeded in winning 1st prizes in the undermentioned classes:—(1) Nine distinct varieties of small-cupped Daffodils; (2) three distinct varieties of flat-cupped Daffodils; and (3) three distinct varieties of double Daffodils.

The Rev. T. BUNCOMBE had the best exhibit of three distinct varieties of bunch-flowered Daffodils in the varieties *Aspasia*, Irene and *Elvira*. 2nd, J. A. KENRICK, Esq. gr. Mr. A. Cryer).

Messrs. Pope & Sons offered five prizes for six distinct varieties of Daffodils, none of which was of a greater value than 3s. per dozen bulbs. 1st, Mr. H. B. YOUNG, with beautiful flowers of *Horsfieldii stella superba*, Sir Watkin, C. J. Backhouse, *præcox grandiflorus*, and Minnie Hume; 2nd, Mr. N. Y. LOWER.

Six classes were provided for exhibitors, who had never won a 1st or 2nd prize at any of the Society's exhibitions, and several creditable displays were made, especially by Mr. H. R. DARLINGTON, Potter's Bar, who won 1st prizes for (1) six varieties of small-cupped Daffodils; (2) six varieties of small-cupped Daffodils; (3) distinct varieties of double Daffodils; and (4) three distinct varieties of bunch Daffodils.

Mr. F. W. MITCHELL, Warwick, beat Mr. H. R. DARLINGTON and three other competitors in a class for 12 distinct varieties of Daffodils.

SINGLE BLOOMS.

The most successful prize-winners in this section were Messrs. E. M. CROSFIELD, P. D. WILLIAMS, C. DAWSON and J. MALLENDER.

SEEDLINGS AND NEW VARIETIES.

The Bourne Challenge Cup was offered for 12 distinct varieties of Daffodils raised by the exhibitor, and although only four entries were made, compared with eight a year ago, the quality of the flowers was particularly good. The winner of the Cup on the present occasion was the redoubtable Mr. E. M. CROSFIELD, who showed exquisite flowers of *Crystal*, Pixie, Honeymaid, Gaybird, Casilda, Flashlight, Frostbound, Tara, Renee, Ecu, Phantasy, K.G.5 and Pedestal; 2nd, Mr. P. D. WILLIAMS, St. Kevern, Cornwall, for a very choice collection of flowers, shown mostly under numbers.

The next class was for six varieties of Daffodils raised by the exhibitor, but not in commerce. The 1st prize was awarded to Mr. T. BATSON, Beauworthy, who showed the following varieties:—Downcast, Melissa, Chryseis, Infanta, Adria, and Aktis; 2nd, Messrs. POPE & SON.

Mr. F. H. CHAPMAN was the only competitor in a class for three seedling Daffodils raised by the exhibitor and not in commerce. Only those who had not previously won a prize for seedlings were eligible to compete. The varieties exhibited by Mr. CHAPMAN were much admired. They were Henry James, Spindrift, and Signal.

THE CARTWRIGHT CHALLENGE CUP.

This was offered for 12 distinct varieties of Daffodils that have not been in commerce more than four years. Last year's winner, Mr. E. M. CROSFIELD was again placed first. He showed refined flowers of Herod, Chandos, Radiant, Artus, Ecu, Helm, Silver Sheen, Bernardino, Bedouin, Pedestal, Phantasy, and Honeymaid; 2nd, Messrs. CARTWRIGHT & GOODWIN; 3rd, the Rev. G. P. HAYDON.

In a similar but smaller class Messrs. POPE & SON beat Mr. F. H. CHAPMAN.

MISCELLANEOUS CUT FLOWERS.

Mr. R. Usher (gr. to J. A. KENRICK, Esq., Harborne) carried off the first prizes in classes for (1) six varieties of Darwin Tulips and (2) six varieties of Spanish Irises. Mr. A. Cryer (gr. to J. A. KENRICK, Esq., Berrow Court, Edgbaston) beat the above exhibitor and Messrs. POPE & SON in a class for 12 distinct varieties of hardy flowers.

PLANTS GROWN IN POTS.

Daffodils and Tulips in pots were well represented, Mr. A. CRYER taking the lead in classes for (1) 12 pots of Daffodils (bunch-flowered section excluded), (2) six pots of bunch-flowered (Polyanthus) Daffodils, and (3) 12 pots of single Tulips. Mr. R. USHER was successful in the classes provided for (1) six pots of Daffodils and (2) six pots of single Tulips.

Mr. A. CRYER took 1st prizes in two classes for Daffodils grown in moss-fibre without drainage.

TABLE DECORATIONS.

The 1st prize for an arrangement of cut hardy spring flowers arranged on a round table 2½ feet in diameter, suitable for a drawing-room, was won by Mr. JOHN SCEANEY, Harborne, with a dainty arrangement of small Daffodils relieved with Asparagus. The best bowl of cut Daffodils came from Messrs. POPE & SON; Mr. JOHN SCEANEY was 2nd.

CUPS AND MEDALS.

Messrs. Barr & Sons' Daffodil vase, offered to the most successful amateur exhibitor in certain classes, was won by the Rev. T. BUNCOMBE.

The medals offered by the Birmingham Botanical and Horticultural Society were awarded as follows:—The large Silver Medal as champion prize in the open classes was won by Messrs. CARTWRIGHT & GOODWIN, and the large Bronze Medal by Messrs. POPE & SON. The large Silver Medal offered to the most successful exhibitor in the amateur classes was won by the Rev. T. BUNCOMBE, and the Bronze Medal by the Rev. G. P. HAYDON.

Silver and Bronze Medals were offered in another section, and these were won by Mr. A. CRYER and Mr. R. USHER respectively.

HONORARY EXHIBITS.

Gold Medals were awarded to Messrs. BARR & SONS, for Daffodils; and Messrs. BAKERS, for Alpine plants.

Silver-gilt Medals to Mr. H. D. PHILLIPS, for new Daffodils; to Mr. C. DAWSON, for new Daffodils; to Miss CURREY, for Daffodils; and Messrs. SUTTON & SONS, for Cinerarias, Stocks, &c.

Large Silver Medals to Messrs. J. R. PEARSON & SONS, for Daffodils; to Sir JOSSLYN GORE-BOOTH, Bart., for Daffodils; to Messrs. GUNN & SONS, for hardy plants and shrubs; and Mr. S. MORTIMER, for Carnations.

Small Silver Medals to Messrs. R. H. BATH, for Daffodils; and Messrs. ROBERT SYDENHAM, LTD., for Daffodils, &c.

AWARDS TO NOVELTIES.

FIRST-CLASS CERTIFICATES

to *Narcissus Homespun*, from Mr. H. D. PHILLIPS, Olton Birmingham; *N. Great Warley*, from Mr. W. T. WARE, Bath; *N. Queen of the West*, from Mr. W. T. WARE, Bath.

AWARDS OF MERIT

to *Narcissus Bedouin*, from Mr. E. M. CROSFIELD, Bridgwater; *N. Cossack*, from Mr. C. DAWSON, Penzance; *N. Red Chief*, from Mr. C. DAWSON, Penzance; *N. Poeticus St. George*, from Messrs. BARR & SONS, London; *N. White Slave*, from Mr. H. D. PHILLIPS, Olton; *N. Giraffe*, from Messrs. CARTWRIGHT & GOODWIN, Kidderminster; *N. Poetaz Scarlet Gem*,

from Messrs. CARTWRIGHT & GOODWIN; N. Red and Gold, from Messrs. CARTWRIGHT & GOODWIN.

R.H.S. AWARDS.

The Awards made by the deputation from the Royal Horticultural Society to competitive and non-competitive exhibits were as follow:—

Gold Medals to Mr. E. M. CROSFIELD, for Daffodils; to Messrs. CARTWRIGHT & GOODWIN, for Daffodils; to Mr. C. DAWSON, for new Daffodils. Silver-gilt Flora Medals to Messrs. BARR & SONS, for Daffodils; to Messrs. J. R. PEARSON & SONS, for Daffodils.

Silver-gilt Banksian Medals to Mr. H. D. PHILLIPS, for new Daffodils; to Sir JOSSLYN GORE-BOOTH, Bart., for Daffodils; to Messrs. BAKERS, for Alpine plants; to Messrs. SUTTON & SONS, for Cinerarias, Stocks, &c.; to Mr. P. D. WILLIAMS, for seedling Daffodils in Class 31; to Messrs. POPE & SON, for Daffodils.

Silver Flora Medals to Miss CUREY, for Daffodils; to Mr. F. H. CHAPMAN, for Daffodils.

Silver Banksian Medals to Mr. S. MORTIMER, for Carnations; to Messrs. GUNN & SONS, for hardy flowers; to Messrs. R. H. BATH, LTD., for Daffodils; to ROBERT SYDENHAM, LTD., for Daffodils, &c.; to Messrs. HOGG & ROBERTSON, for Daffodils and Tulips; to Messrs. W. H. SIMPSON & SONS, for Daffodils; to Mr. N. ELLISON, for Ferns.

AWARD OF MERIT to Daffodil Lowdam Beauty, from Messrs. J. R. PEARSON & SONS, Lowdam.

Special Commendation to Mr. W. T. WARE, for Daffodils.

HUNTINGDONSHIRE SPRING FLOWER.

APRIL 27.—The fourth show of the above society was held at Huntingdon, on this date. Both the number of visitors and entries constituted records. The cup offered by Messrs. Barr & Sons for a collection of Daffodils was won by A. R. DARLING, Esq., Potter's Bar; 2nd, J. CATOR, Esq., Woodbastwick. Trade exhibits contributed much to the success of the show. Messrs. BARR & SONS, Covent Garden, London, Messrs. R. H. BATH, LTD., Wisbech, Messrs. J. R. PEARSON & SONS, Lowdam, Mr. J. MALLENDER, Bawtry, Messrs. W. & J. BROWN, Stamford, Mr. PERKINS, Huntingdon, Messrs. LAXTON BROS., Bedford, and Mr. G. REUTHE, Keston, displayed showy groups of spring flowers. Lady DE RAMSEY showed Tree Carnations.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending April 28.

A showery and sunny week.—All the days and nights of the past week have been more or less warm for the time of year, but on the warmest day the temperature in the thermometer screen at no time rose higher than 64°, and on the coldest night the exposed thermometer showed only 3° of frost. The temperature of the ground is now 1° warmer at 2 feet deep, and 2° warmer at 1 foot deep, than is seasonable. Rain has fallen on each of the last 6 days, but to the total depth of less than 1/2 of an inch. For the last five days there has been no measurable percolation through the bare soil gauge, and for the last three days no percolation at all through that on which short grass is growing. The sun shone on an average for 8 hours a day, which is more than 2 1/2 hours a day longer than is usual at this period of April. On the sunniest day the sun was shining brightly for 12 hours. The wind has been, as a rule, moderately high, and mostly from some point between south and west. The mean amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by 3 per cent. E. M., Berkhamsted, April 28, 1909.

GARDENING APPOINTMENTS.

Mr. G. WAGSTAFFE, decorator at Belvoir Castle Gardens, Grantham, as Gardener to J. WILSON, Esq., Anlaby, Hull. Mr. J. GOUGH, late of Booton, as Gardener at Heyden Hall, Reepham. Mr. G. PHILLIPS, for the past 14 years Gardener at Sandrone Castle, Shrewsbury, as Gardener to Sir WILLIAM MATHER, Bart., Bramble Hill Lodge, Bramshaw, New Forest, Hants. Mr. J. K. HOARE, late of Iwerne Minster, Grenehurst Park, and South Lodge, as Gardener at Stanmer Park, Lewes. Mr. H. W. DAWES, late Foreman in the employ of Sir WM. HART-DYKKE, Bart., Lullingstone Castle, Dartford, Kent, and previously Foreman at Ratton Park, Eastbourne, as Gardener to H. H. C. HORSEFALL, Esq., Penn's Hall, Birmingham.

MARKETS.

COVENT GARDEN, April 28.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their wholesale prices, including Anemone fulgens, Azalea, Calla aethiopica, Carnations, Cypripedium, Daffodils, Dendrobium, Eucharis, Freesia, Gardenias, Gladiolus, Gypsophila, Hyacinths, Iris, Lilac, Liliun auratum, Lily of the Valley, Marguerites, Mignonette, Myosotis, Narcissus, Ranunculus, Roses, Snowdrops, Spiraea, Stocks, Sweet Peas, Tuberoses, Tulips, and Violets.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their wholesale prices, including Adiantum, Agrostis, Asparagus plumosus, Berberis, Croton, Cycas, Daffodil foliage, Ferns, Galax, Hardy foliage, Honesty, Ivy-leaves, Moss, Myrtle, Smilax, and various other foliage types.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants and their wholesale prices, including Acacias, Ampelopsis, Aralia Sieboldii, Araucaria excelsa, Aspidistras, Asparagus, Clematis, Cocos Weddelliana, Crotons, Cyclamen, Cyperus, Dracaenas, Erica, Euonymus, Ferns, Galax, Hardy foliage, Honesty, Ivy-leaves, Moss, Myrtle, Smilax, and various other potted plants.

Plants in Pots, &c.: Average Wholesale Prices (Contd.).

Table listing various plants in pots and their wholesale prices, including Hardy flower roots, Heliotropiums, Hydrangea, Isolepis, Kentia, Latania, Liliun longiflorum, Lily of the Valley, Marguerites, Mignonette, Pansies, Pelargoniums, Primulas, Rhodanthe, Rhododendrons, Roses, Selaginella, and various other plants.

Fruit: Average Wholesale Prices.

Table listing various fruits and their wholesale prices, including Apples (Tasmanian, Cox's Orange, Pippin, Alexander, Prince Alfred, Australian), Bananas, Berries, Grapes, Lemons, Limes, Melons, Nuts, Oranges (California, Valencia), Peaches, Pineapples, Plums, and various other fruits.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their wholesale prices, including Artichokes, Asparagus, Beans, Beetroot, Cabbages, Cardoon, Carrots, Cauliflower, Celery, Chicory, Cucumbers, Endive, Horseradish, Kale, Leeks, Lettuce, Mint, Mushrooms, Parsley, Peas, Potatoes, Radishes, Rhubarb, Spinach, Stachys, Turnips, and various other vegetables.

REMARKS.—Forced Strawberries are plentiful and slightly cheaper, 2s. 6d. per lb. being an average price. Supplies of fruit from Cape Colony have practically finished; there are a few Plums, Grapes, &c. left from the last consignment. Australian and Tasmanian Apples have been received in small quantities; prices for these fruits remain about the same as those of last week. Lemons are slightly cheaper, but sound packages of Oranges continue to sell at advanced prices. French Asparagus is more plentiful and much cheaper. Forced Rhubarb is practically finished for the season. Trade generally is quiet. E. H. K., Covent Garden, Wednesday, April 28, 1909.

Potatoes.

REMARKS.—Trade is very slow, and supplies are larger than the demand; in consequence prices are lower.—*Edward J. Newborn, Covent Garden and St. Pancras, April 28, 1909.*

COVENT GARDEN FLOWER MARKET.

Plants for window-boxes are in demand. Large numbers of Ivy-leaved Pelargoniums are used for this purpose, especially the varieties Galilee and Madame Crousse. The plants are rather larger than those formerly used for window-boxes; Zonal Pelargoniums in 48 and large 60 pots are also largely used for this work, the semi-double-flowered kinds being most favoured. Raspail, Ville de Poitiers, Mrs. Lawrence and King of Denmark are the leading varieties seen. Hermione is the favourite semi-double white, and Albion and Snowdrop the best single white-flowered varieties. Paul Crampel is the best scarlet. The old Henry Jacoby is also in demand, and I find some buyers favour King Edward VII., but plants of this variety do not succeed in a poor soil. Mrs. Cannell appears to be the best single salmon. Intermediate Stocks are very good; there is a demand for the pink variety, but those with crimson and white flowers sell most readily. Mignonette has been over-plentiful, but I have not seen any spring-raised plants, and these are more suitable for window-boxes. Marguerites are remarkably good; plants of a moderate size are most in demand. Heliotropiums are good, particularly the dark-flowered variety. Fuchsias are well flowered. Plants of the ordinary market size are worth about 10s. per dozen, but extra tall plants have sold readily at 18s. per dozen. Herbaceous Calceolarias in dwarf, well-flowered plants are seen, but they do not meet with a brisk demand. Cinerarias are abundant, but if the warm weather continues they will soon be over. Many growers have finished with Azaleas for the season. Spiræas are abundant. The pink varieties have not proved such good market plants as was anticipated. Rambler Roses in various sizes are well-flowered; I noticed some very fine specimens of Cant's Blush. Bulbous-flowering plants will soon be past. Hardy flower roots are abundant, but some growers have almost cleared their stocks. Pansies are abundant; there has been a good demand for these plants. There is also a fair demand for Violas.

CUT FLOWERS.

The large consignments of Daffodils will soon be over, and then trade for other flowers will improve. There was a large demand for Roses on St. George's Day, and last Thursday and Friday their prices increased, but this week they are cheap again. Many Carnations are either wasted or sold at low prices. Gladiolus The Bride and the bluish pink variety are seen on the stands. Irises (Spanish) from the Channel Islands are abundant, and their prices are much lower. Parma Violets are over for the season. There is a great falling off in consignments of other flowers from the South of France. Supplies of Callas and Liliams are abundant. Darwin Tulips are very good, and there are large quantities of Parrot Tulips, but these latter are cut without foliage. Ordinary Dutch Tulips are almost finished for the season. *A. H., Covent Garden, Wednesday, April 28, 1909.*

DEBATING SOCIETIES.

BRITISH GARDENERS' (RICHMOND BRANCH).—The first outing of the members of this branch will take place on Saturday, May 1, when a visit will be paid to Messrs. J. Veitch & Sons' Nursery at Combe Wood, Kingston. The party will assemble at the Star and Garter Hotel, Richmond Hill, at 1.30 p.m.

BRISTOL AND DISTRICT GARDENERS'.—The annual meeting of this association was held on Thursday, April 22, at St. John's Parish Rooms. Mr. A. O. Shelton presided. The annual report and balance sheet showed that the society is in a more favourable position than in previous years. Colonel Carey-Batten was again elected president. Mr. Shaddick was elected chairman for the ensuing season, and Mr. Hayball, vice-chairman. The other officers were also appointed. Mr. E. T. Parker offered a silver medal to the most successful exhibitor at the meetings during the coming session. Six new members were elected.

READING GARDENERS'.—The final meeting of the spring session took place in the Abbey Hall, on Monday, April 19, there being a large attendance of the members. The president, Mr. Alderman F. B. Parfitt, occupied the chair. The evening was devoted to competitions in floral arrangements. This being "Hospital Night," flowers brought by the members were next day sent to the Royal Berkshire Hospital. More than 100 bunches of cut flowers were contributed. A collection on behalf of the Hospital realised a sum of more than £3.

WINCHESTER GARDENERS'.—At the meeting held on April 20 in the Oddfellows' Hall, a lecture on "French Gardening" was given by Mr. W. F. Giles. Mr. W. Cardy presided. Views of "French" gardens were shown by means of a lantern; and varieties of forced vegetables were illustrated. Mr. Giles reminded his hearers that French Gardens entailed a great expense for materials, labour, and manure.

SCHEDULES RECEIVED.

Forest Gate and Stratford Chrysanthemum Society's 18th annual exhibition, to be held on November 4, 5, 6, at the Town Hall, Stratford. Secretary, Mr. A. J. Palmer, 19, Thorngrove Road, Upton Park, E.

Haywards Heath Horticultural Society's 21st annual flower show, to be held on Wednesday, July 28, in the Victoria Park, Haywards Heath. Secretary, Mr. Geo. Prett, The Rosary, Haywards Heath.

ANSWERS TO CORRESPONDENTS.

* * * *The Editor will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for forming Supplementary Illustrations to this Journal.*

EDITOR AND PUBLISHER.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plans to be named, should be directed to the EDITOR. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

"BIG-BUD" IN CURRANT: *D. O.* The buds are infested with *Phytoptus ribes*, the mite causing "big-bud." See reply to *W. P. R.*, p. 272, in the last issue; also to *S. F.*, p. 256, in the issue for April 17.

BULBS FAILING: *G. W. W.* The bulbs have failed to form a satisfactory root-system. This may be due to an unsuitable rooting medium, or some other condition which only those on the spot could determine.

COMPENSATION FOR ENCROACHING TREES: *Brae-side.* Your proper course is to give notice to the owners of the adjoining land requiring them to cut back the trees so as to prevent their overhanging your premises, and if they do not comply with this notice within a reasonable time, you can cut back the overhanging branches yourself. If you cannot reach the branches from your own land, you should ask permission to enter on the adjoining land for the purpose, and if this permission is refused, the Court would grant you an injunction against them. (2) The question of encroaching roots is a point on which legal authorities have somewhat differed from time to time; but the balance of legal opinion is in favour of your having a right to cut away the roots in the same way as the branches referred to above. (3) Unless the adjoining owners refuse to have the matter put right, you would not have much chance of obtaining damages, as you need not have put up with the annoyance for so long, but you would probably be content with an injunction to prevent any further continuance, and unless there were exceptional circumstances, the adjoining owners would have to pay your costs. You will find these matters fully discussed in a lecture given by Mr. H. Morgan Veitch before the Royal Horticultural Society, which was reported verbatim in Vol. XXXIII. of the *Royal Horticultural Society's Journal*.

FERNS IN COMPETITION: *H. F., Port Elizabeth.* The wording of the schedule is not sufficiently definite. "Six *Adiantums*, distinct," may be taken to mean six distinct species, or merely six varieties or species, in which *Adiantum cuneatum* and the variety *elegans* would count as two plants. The compilers of the schedule, rather than the judges, are to be blamed.

LAWN TENNIS COURT AND CROQUET GROUND: *H. R.* The following particulars are taken from the *Calendar of Garden Operations*:—The diagram will illustrate the amount of ground required, and the lines that are usually made and kept in a tennis court:—

PLAN OF A LAWN TENNIS COURT.

The lines A B and B A indicate a double court for three or four players; S S, S S, a single court for two players; A A and B B are the base lines; C C and C C, service lines;

H H, half-court line; N N, net. A court for the single game is 27 feet wide and 78 feet long; and for the double game, 78 feet long and 36 feet wide. The posts for supporting the net should be placed 3 feet beyond the sides. The service lines run parallel to the net, and are 21 feet distant from the same. The net should be 3 feet high in the centre, and 3 feet 6 inches at the posts, which are put 2 or 3 feet outside the line, to allow of the net dropping. —For the purpose of playing the game of croquet, a well-rolled level grass lawn not less than 30 yards long by 20 yards wide is required. A full-sized croquet ground measures 40 yards long by 30 yards wide. The following diagram will show what is needed:—

PLAN OF A CROQUET LAWN.

In the line through the centre of the ground, 8 yards from the boundary at either end, put the croquet pegs, and at 16 yards from either end a hoop. Let the corner hoops be placed in a line with the pegs, and 7 yards from the pegs.

- NAMES OF PLANTS:** *W. J. F.* 1, *Cupressus Lawsoniana* var. *aureo-variegata*; 2, *Pseudotsuga Douglasii*; 3, *Cupressus obtusa* var. *filifera*; 4, *Pseudotsuga Douglasii* var. *glauca*; 5, *Erica lusitanica* (codonodes).—*Enquirer.* 1, *Pyrus* (syn. *Cydonia*) *japonica*; 2, *Pulmonaria officinalis*; 3, *Coronilla Emerus*; 4, *Garrya elliptica*; 5, *Cedrus Deodara*.—*B. P.* *Juniperus Sabina*. Yet, this plant is poisonous, and if it is eaten in large quantities by domestic animals during pregnancy it produces abortion.—*A. H.* 1, *Adiantum cuneatum elegans*; 2, *A. tenerum*; 3, *A. Pacotii*; 4, *A. trapeziforme*; 5, *A. concinnum latum*; 6, *Dendrobium chrysothoxum*.—*J. S.* *Magnolia conspicua*.—*W. E.* *Chrysosplenium oppositifolium*.—*Orchis.* *Bifrenaria Harrisonæ*.—*R. B., Cork.* 1, *Erica mediterranea*; 2, *Cytisus albus*; 3, *Berberis stenophylla*; 4, *Magnolia conspicua*; 5, *Forsythia viridissima*; 6, *Pyrus japonica*.—*F. R.* 1, *Odontoglossum Lindleyanum*; 2, *Oncidium pubes*; 3, *Oncidium divaricatum*; 4, *Brassia verrucosa*.—*A. W. T.* 1, *Juniperus chinensis variegata*; 2, *Pulmonaria officinalis*; 3, *Orobus vernus*; 4, *Polygala Dalmaisiana*.—*H. B.* 1, *Spiræa confusa*; 2, *Diplopappus chrysophyllum*.—*W. M. B.* 1, *Trillium grandiflorum*; 2, *Erythronium Dens-canis*; 3, *Epimedium Perralderianum*; 4, *Bryonia dioica*; 5, *Spiræa arifolia*.

PEACH LEAVES: *T. B.* There is no disease present in the leaves: they are, however, very thin, and such as would be found on an ill-nourished tree. The specimens arrived in a bad condition, being improperly packed.

R.H.S. EXAMINATION: *Jas. G.* Particulars of these examinations may be obtained on application to the Secretary, Royal Horticultural Hall, Vincent Square, Westminster.

SCUM ON PONDS: *H. R.* The lowly forms of vegetation causing the scum would be killed by the sulphuric acid, but this would also harm the fish. Try the effect of a weak solution of copper sulphate or the Bordeaux mixture at half strength.

TREGOTHNAN.

THE beautiful grounds of Tregothnan are approached on the Probos side by a drive four miles in length from the lodge to the mansion. This drive is bordered on either side by Evergreen Oaks, and skirts on the right hand a creek of the Fal, where at high water swans may be seen swimming placidly on the still surface. The house is a noble, well-proportioned building, and, with its mellowed stonework, presents a stately appearance when seen from the broad lawns on a sunny day. From the front of the mansion a charming view is obtained of the Fal winding its way between wooded banks. The grounds are spacious and afford a variety of prospects of great beauty. Here, beneath lofty deciduous trees, the sward is carpeted in the springtime with Primroses; there groups of Yuccas and Cordylines display their foliage; there, again, giant bushes of the Himalayan Rhododendrons and tall Acacias brighten the scene with their blossoms, whilst the water garden, surrounded by picturesque vegetation, presents an attractive picture. Camellias are grown more extensively at Tregothnan than in any other garden in England. In the capacious grounds, prettily diversified by hill and dale, there must be fully a thousand huge bushes, bearing flowers from purest white to richest crimson, and spreading veils of colour around them with their fallen petals. The stable wall, 80 yards in length and 25 feet in height, is completely covered with trained Camellias. Against the house *C. reticulata* has reached a height of 14 feet, and in the spring is covered with hundreds of great semi-double, rose-pink blossoms. Recent winters have been exceptionally severe in the south-west,

and every garden where tender plants are grown has suffered serious losses. At Tregothnan the following species have died:—*Adenandra linearis*, *Boronia polygalifolia*, *Buddleia ficifolia*, *Cassinia leptophylla*, *Camarina tenuissima*, *Dianthus arboreus*, *Echium candicans*, *Erica Cavendishii*, *E. coronata*, *E. Savileana*, *E. Spenceriana*, *Eucalyptus tereticornis*, *Euryops virginicus*, *Genetyllis fuchsoides*, *Hakea petrophylla*, *H. salignus*, *Leschenaultia formosa*, *Luculia gratissima*, *Myoporum laetum*, *Oleander*, *Polygala grandis* and *P. mixta*. However, such a large quantity of rare plants find a congenial home there that at the present time the gardens possess a larger collection than almost any garden in England. This winter 12 degrees of frost have been registered on two occasions, but no harm appears to have been done. Lady Falmouth is an enthusiastic gardener and spares no trouble to obtain every rare and tender plant

ceed well at Tregothnan. A group of *A. dealbata*, about 40 feet in height, backed by Evergreen Oaks, forms a lovely picture in March, when their heads are a cloud of gold standing out against the dark background. Other Acacias grown are *A. armata*, *A. calamifolia*, *A. cordata*, *A. cultrifolia*, *A. decurrens*, *A. diffusa*, *A. latifolia*, *A. longifolia* (20 feet in height and 15 feet through), *A. linifolia*, *A. melanoxylon*, *A. pycnanthera*, *A. Riceana* and *A. verticillata*. There is a fine example of the Fan Palm, *Trachycarpus (Chamærops) excelsus*. Around this plant numerous self-sown seedlings have sprung up. From the summer-house an extensive view is obtained of the river and surrounding country. On the wide lawn fronting it is a fine group of about 30 plants of *Yucca gloriosa*, there are also colonies of Azaleas, Magnolias and Cordylines, whilst the trees on either side are fringed with Rhododendrons. The water garden is formed by four ponds, one

[Photograph by S. Wyndham Fitzherbert.

FIG. 123.—TREGOTHNAN, CORNWALL.

that is likely to succeed at Tregothnan. Many examples have been received from Kew of late years. In Mr. William Andrews she possesses a highly-efficient head gardener, whose solicitous care for his charges leaves nothing to be desired. Of Himalayan Rhododendrons there is a fine collection. A specimen of *R. Falconeri* was, three years ago, 23 feet in height and 30 feet in diameter. This is well furnished with foliage to the ground level, and is probably the finest example in England. A few years ago it bore fully 2,000 bloom trusses. There is also a splendid plant of *R. grande (argenteum)* about 18 feet in height and 24 feet through. This has borne 300 flower trusses, and in that year it was a beautiful picture in the closing days of March (see fig. 124). There are also excellent specimens of *R. Griffithianum (Aucklandii)* and many other species. Acacias suc-

lower than the other. They are edged by Gunneras, Bambusa, Arums, Phormiums and *Eryngium pandanifolium*, and form a charming feature in a dell flanked by tall Firs. The woods are margined with Benthamias, members of the Prunus family and Heaths, while Daffodils are planted by the thousand in the grass. The house is adorned with climbing plants, whilst others are grown on high walls in the vicinity. Many tender shrubs are given the protection of a wall. Among the climbers are *Akebia quinata*, *Berberidopsis corallina*, *Brachysema lanceolata*, *Bucklandia populnea*, a Himalayan plant with large, handsome leaves; *Cassia corymbosa*, *Clematis indivisa lobata*, a lovely sight in the early spring; *Clianthus puniceus*, *Hibbertia Reidii*, *Kennedyia nigricans*, *K. rubicunda*, *Mandevilla suaveolens*, *Sollya heterophylla* (the Australian Bluebell creeper), *Stauntonia latifolia* and *Trachelospermum*

(*Rhynchospermum*) *jasminoides*, which produces its small, scented, white blossoms for months together. Against the front of the house the fragrant Gum, *Eucalyptus citriodora*, has reached a height of over 20 feet. The *Boronias* and *Grevilleas* succeed excellently in front of walls. *Boronia elatior* is 6 feet high and 4 feet through, *B. heterophylla* is about 2 feet less in height and *B. megastigma* 3 feet, while of the *Grevilleas* *G. alpina*, *G. longifolia*, *G. pendula*, *G. Preissii* and *G. sulphurea* are doing well. The members of the Heath family have a little garden to themselves. They include *Erica gracilis*, *E. hyemalis*, *E. magnifica*, *E. perspicua nana* and *E. persoluta*, whilst the larger *E. mediterranea* grows into great bushes. The *Epacris* race is also very ornamental. Of these there are *E. ardentissima*, *E. candidissima*, *E. delicata*, *E. magnifica* and *E. Vesuvius*, which is often bright pink with bloom at Christmas. Among other shrubs are the pink-flowered *Abelia floribunda* from Mexico, which does well in the southwest, even without wall protection, the South

flower in March, *Cinnamomum Boisseri*, the Lily of the Valley tree, *Clethra arborea* from Madeira, the hardy Japanese Orange, *Citrus trifoliata*, *Cytisus elegans*, the South African *Diosma capitata* and *D. ericoides*, *Daphne indica*, *D. hybrida Dauphinae*, *Drimys Winteri* (from the Straits of Magellan), which bears its ivory-white blossoms in profusion, and the smaller-flowered *D. (Tasmania) aromatica*; *Edwardsia (Sophora) chrysophylla* and *E. grandiflora*, the Australian *Eriostemon linifolius* and *E. neriifolius*, the Chilean *Eucryphia cordifolia*, Japanese *Euonymus fimbriatus*, a handsome shrub, but rare in gardens, whose young leaves are of a brilliant crimson colour, giving it the appearance of being in flower; *Eutaxia myrtifolia* from Australia, the Brazilian *Feijoa Sellowiana*, *Garrya elliptica*, very decorative in the winter when covered with its drooping catkins, *Gnidia carinata* from the Cape of Good Hope, *Lagerstroemia indica* from China, the New Zealand *Leptospermum scoparium*, the Chilean *Lomatia ferruginea*, an exceptionally handsome foliage shrub, which has proved quite hardy, *Metrosideros lucidus*

the open are *Strelitzia Reginae*, *Iris fimbriata* or *chinense*, *Musa japonica* and *Pourettia mexicana*. The fine, large-flowered form of *Rosa laevigata* is grown, and Fortune's Yellow Rose does well. *Muehlenbeckia complexa* has covered an old tree stump to a height of over 20 feet, and several examples of *Clematis montana* clamber aloft over trees. Among the notable trees is a fine specimen of the rare *Pinus Montezumae*. Cape bulbs, such as *Ixias* and *Sparaxis*, are grown, and the *Agapanthus* does well in the open. The rare *Gladiolus tristis* and its self-coloured form known as *concolor* or *sulphureus* are largely represented.

The glasshouses, which are kept in the best of order, include vineries and houses devoted to Figs, Roses, Carnations, Crotons, Palms and a general collection of greenhouse plants. *S. W. Fitzherbert.*

HYBRID GERBERAS.

(Concluded from page 273.)

COLOURS.—M. Philippe de Vilmorin remarks: "I give here word for word what M. Adnet has written to me on the question of colour":—"The scale of colours is of incomparable richness. I had commenced an endeavour to identify the tints, making use of the *répertoire de couleurs* of the *Chrysanthemum* specialists. But I was obliged to give it up; there were too many of them. It might have been necessary to give them numbers, could they have been conscientiously numbered, and had it not been absolutely impossible to the keenest eye to catalogue them at sight. It would have been necessary every time to have recourse to the *répertoire*, but every comparison requires from five to ten minutes, if one wishes to do it well. It is necessary to know how to limit oneself, and also to make the abundance of tints classify themselves into groups. This is how I regard the question.

1. **PURE WHITE.**—Colour clear, unique. Then all the scale of whites; greenish white, and yellowish white leading insensibly by degrees to yellow.

2. **YELLOW.**—Proceeding from scarcely yellow to Buttercup yellow by an absolute gradation of tints.

3. **ORANGE.**—Here also there is an infinity of tints in gradation, sinking insensibly to orange red, very near to typical *Jamesonii*.

4. **SALMON.**—Obtained by crossing yellow and pink. Here also the scale is extensive between light and dark.

5. **PINK.**—In this colour there is a scale of gradation of vast extent. Crosses between pale pink and white have given me pinks of palest tint, more tender, for example, than the outside petals of a 'Malmaison' Rose. The pink tint disappears by deepening to the deepest pink colour, passing a number of intermediate shades, arriving at—

6. **CHERRY RED.**—Ruby red, pure red in a word, a red in which there is no trace of yellow, and which, to my mind, will be the most esteemed by the florist by reason of its richness and purity.

7. **VIOLET RED.**—A new tint, my best achievement, the one I like the best, and which I hope will lead to deep violet.

VARIATION.—With respect to variation M. de Vilmorin states that it is almost infinite, as one might well expect in a plant so strongly disturbed in character. Many of them are without practical importance, and are rather monstrosities to be eliminated. It is desirable,

FIG. 124.—RHODODENDRON GRANDE AT TREGOTHNAN, 18FT. IN HEIGHT, AND BEARING 300 FLOWER TRUSSES.

[Photograph by S. Wyntham Fitzherbert.]

African *Adenandra fragrans*, with rose-coloured blossoms, *Agapetes Mannii*, *Andromeda floribunda*, 6 feet in height and 8 feet in diameter, *Anopterus glandulosa* from Tasmania, *Aralia quinquefolia*, a handsome foliage shrub, *Aralia papyrifera*, with leaves 2 feet 6 inches in length, *Banksia integrifolia* and *B. reticulata*. *Banera rubioides*, a little shrub from New South Wales with pink flowers. *Beaufortia splendens*, a native of Australia with scarlet blooms, the New Zealand *Brachyglottis repanda*, the rare *Bowkeria Gerardiana* from South Africa, which bears white, *Calceolaria*-like flowers; *Buddleia Colvillei*, nearly 20 feet in height, which blooms profusely every summer; *B. salicifolia*, a rare plant, *Calceolaria violacea*, a great bush 6 feet across, which was badly injured two winters ago; *C. integrifolia*, which creates a brilliant effect in July; *Cantua dependens* from the Peruvian Andes, *Callistemon lapanthus* and *C. salignus* from Australia, *Casuarina quadrivalvis* and *C. tenuissimus* also Australian plants. *Cedralia serrata*, *Ceratonia Siliqua*, *Chorizema Lowii*, which is often in

from New Zealand, *Mitraria coccinea* from the island of Chiloe off the coast of Chili; *Michelia (Magnolia) fuscata*, whose purplish flowers are deliciously scented, *Olea fragrans*, the rare *Olearia insignis*, *O. myrsinoides* and *O. Solandri* from New Zealand, *Osteomelas anthyllidifolia*, said to be a native of the Pacific islands; the Australian *Pimelea spectabilis*, the New Zealand *Pittosporum*, *P. crassifolium*, *P. eugenoides*, which blooms freely, *P. Mayii*, 30 feet in height, *P. Tobira* and *P. variegatum*; the South African *Polygala Dalmaiana*, *Rhapiolepis Decouri*, *Senecio Greyii*, *S. natalensis* and *S. rotundifolius* from the Cape, the Chilean *Tricuspidaria lanceolata*, better known as *Crinodendron Hookeri*, and the newly-introduced, white-flowered *T. dependens*, *Veronica Gauntletii* and *V. Hulkeana*, the most beautiful of all the New Zealand shrubby *Veronicas*; the Australian *Westringia triphylla* and *Xanthoceras sorbifolia* from China. The foregoing list will give some idea of the number of rare plants from foreign climes grown successfully at Tregothnan. Among other subjects that are cultivated in

however, to note them, and we have to thank M. Adnet for making the record.

1. **DISC.**—Discs are red, pink, white or yellow, with the centre green; there are red flowers with pink disc, pink flowers with white disc, yellow flowers with disc of paler or deeper yellow, yellow flowers with red disc, &c.

2. **FORM OF THE FLOWER.**—The range of variation in the form is as great as that of the colour of the flower. One finds, so to speak, all dimensions and all dispositions of the ligule. Certain plants present broad ligules, imbricating as in a Daisy, and taking away the starry lightness of the type; on the contrary, there are flowers with ligules so slender that they are almost filiform; others have trumpet-shaped ligules more or less spreading, sometimes curving in the horizontal plane and giving the flower a helicoid appearance. Certain flowers have their

flowers of the same peduncle more or less separated.

5. **DWARF FORM.**—Certain colours, especially the yellow, give a large proportion of dwarf plants, which produce themselves fairly true from seed.

FOLIAGE.—The slender and graceful peduncles of *Gerbera* proceed generally from a rosette of spreading leaves, rather insignificant. The hybrids from this point of view present some variations worthy of remark. In general, the leaves are more erect, longer, less divided, thicker and more coriaceous than the type. Their lower surface is often furnished with short and stiffish hairs, their edges are irregularly undulated, and there are some of a shining green, as if varnished. Lastly, M. Adnet has observed some individuals of which the peduncles present the rudiments of leaves, and of these he is carefully observing the descendants: if the occur-

flowering season than the two types in the cross.

Though the method by which the first hybrids were obtained at Cambridge is known, it is extremely difficult either to establish the descent of each form, or to study the influence of each parent from the point of view of the transmission of its special characters. It is, therefore, probable, in spite of the very precise notes taken by M. Adnet through four generations of hybrids, that we shall be unable to find any precise fact by which, in *Gerbera*, the laws of Mendel can be studied. We must wait until the different colours are fixed, producing themselves true from seed, and that, I believe, will soon be done.

If we now pass to the horticultural side of the question, we see in the hybrids of *Gerbera* one of the most interesting introductions of recent years. It is impossible to describe the elegance, the lightness, the originality, distinctness, or the colours so varied and delicate of this pretty Composite. Recently, even the violet colour, which, if I mistake not, was wanting in the forms produced by Mr. Lynch, has made its appearance with Mons. Adnet.

As cut flowers, those of *Gerbera* are valuable, provided that they are gathered fully open, when the male organs are well developed; the flower-heads last two or three weeks in water, and make bouquets of incomparable charm. During this winter the Parisian florists have commenced to receive them from the south, and the welcome that these flowers have been given is a sure guarantee of their success in the future. L.

FIG. 125.—RHODODENDRON ADENOPODIUM FLOWERED FOR THE FIRST TIME IN EUROPE BY M. MAURICE DE VILMORIN. FLOWERS PALE ROSE COLOUR.

ligules recurved on their longitudinal axis so that their extremities show the lower surface. One also finds more or less tubular ligules, some even with lacinated ligules or slashed in the form of an arrow head.

3. **DOUBLING.**—This, which may seem to be an improvement for many flowers, is not so for *Gerbera*, of which lightness is the first quality. The plant seems, however, to have a tendency to doubling, either by the appearance of ligules on the disc, or by the formation of a collarette between the latter and the normal ligules. In the last case the collarette, which may be of one or several rows, is often of lighter colour than the flower—light pink in the flowers of deep pink, and almost white in the flowers of pale pink.

4. **FASCIATIONS.**—Fasciations are very frequent, as could be remarked in the set exhibited by M. Adnet in the month of November, 1908. It is not rare to find two or three

ence can be fixed, it will constitute a definite advance.

HARDINESS.—I do not here speak of their power of resistance to cold, which is, naturally, not great, but rather to their power of resisting moisture. Rotting off, which is one of the great difficulties in the culture of *Gerbera Jamesonii*, is much less to fear in the hybrids, which, from this point of view, are distinctly superior to the type.

CONCLUSIONS.—The conclusions to be drawn from this brief account are of two kinds—the scientific and the practical. From the scientific point of view it is necessary to note the disturbance produced in the species by the introduction of the pollen of *Gerbera viridifolia*; not only has the number of colours been multiplied, so to speak, indefinitely, but numerous individuals have been found with flowers larger than those of the parents; others are more floriferous, though of shorter

NEW OR NOTEWORTHY PLANTS.

RHODODENDRON ADENOPODIUM.

This *Rhododendron* (see fig. 125) is one of the many new species brought into notice by recent exploration in Central China. It appears to have been first discovered by L'Abbé Farges in Eastern Setchuen. From seed forwarded by this gentleman in 1901 M. Maurice de Vilmorin raised the plant which has recently flowered at Les Barres, and from which the illustration at fig. 125 has been prepared. The species was subsequently found by Mr. E. H. Wilson in Western Hupeh, whilst collecting plants on behalf of Messrs. Jas. Veitch & Sons. Young plants raised from seeds sent home by this collector are now in cultivation at the Coombe Wood Nursery of Messrs. Jas. Veitch & Sons and at the Royal Gardens, Kew. The species was named and described by Franchet in the *Journal de Botanique* for 1895, p. 391. According to Wilson, *R. adenopodium* forms a bush 4 to 10 feet high. The leaves are 3 to 6 inches long, oblong-lanceolate with an acutely-pointed apex, coriaceous, smooth above, but covered beneath with a close white tomentum. The inflorescence is described by Franchet as few-flowered, bearing from four to six flowers only. The plant may, however, prove more floriferous under cultivation. The corolla is bell-shaped, and has five rounded lobes. The blooms are stated by M. de Vilmorin to be nearly as fine as those of *R. × kewense*. I have not seen the flowers, but they are described by M. de Vilmorin as of pale rose, and from 2½ to 3 inches across. A distinctive character of the plant is the hairiness of the flower-stalks and seed vessels. The specimens at Kew and Coombe Wood are but a few inches high, so it is probable that a few years will elapse before flowers are produced in this country. M. de Vilmorin's plant flowered in an unheated glass structure, but the species will probably prove hardy in the South of England, especially if protection is given the plants when young. W. J. Bean.

FLORISTS' FLOWERS.

CACTUS DAHLIAS.

UNTIL as late as the second week in May young plants may be shifted into 5-inch pots. It is not advisable to have Dahlia plants too large at the time of planting out, as large plants suffer more severely from the check of transplanting, and hence, should dry weather prevail just after they have been transferred to their flowering quarters, they suffer more from the drought than do plants of moderate size. The best are those about 14 inches high, with stout shoots that are growing freely. Very small plants often grow freely and are very healthy, but much time is lost before they reach the flowering stage. In other respects the small plant has much to recommend it, especially in the case of double-flowered varieties grown for producing specimen blooms, as the growth is unchecked from first to last—an important matter in Dahlia cultivation. Of the two I greatly prefer a small, actively-growing plant to one that is larger but somewhat hard in the wood and root-bound. In most seasons, by the time such a plant has made sufficient roots to support its abundant foliage, the little plant has made a very good foundation, and probably in a week or two outstrips the bigger one. An assortment of vermin usually accompanies the Dahlia to its summer quarters, and for six weeks after planting the various pests give an immense amount of trouble. Much of this may be avoided by dipping the plants in a suitable insecticide the day before they are transferred to the open ground. The damage caused to Dahlias by thrip is enormous. The unhealthy appearance of so many young Dahlias is caused by this pest, which is apt to infest the plants practically throughout the whole period of their growth. Thrip may often be found on the plants late in the autumn, but the damage caused by them is not so much in evidence when the heavy dews and rains of autumn appear. If the land was deeply dug during April, all that is needed now is to prepare it for planting. Dahlias thrive in a heavy soil, provided it has been sufficiently worked and exposed to the influence of the weather. When the weather is wet day after day the grower who has a heavy soil cannot successfully compete with one whose land is light and friable. Our system is to turn up the soil, and, after it has been allowed to dry for one day, the clods are broken. The plot is then re-dug and left rough again on the top, and the process is repeated until the whole of the land is brought into a suitable condition. It is inadvisable to prepare the land in small patches just where each plant is to be placed. I have often seen this done during bad weather, the intention being to finish digging between the rows at some future time. In most cases this proceeding results in certain parts of the land never getting tilled at all. I am referring, of course, to heavy land. In the case of light soil, cow manure should be employed, taking care to bury it well. This may be applied until near planting time, but earlier is better. The following varieties of Cactus Dahlias are to be recommended:—

Mrs. Walter Baxter.—The most reliable of the dark varieties. The habit is dwarf, free in flowering, and the blooms are of the best form.

C. B. Wilkins.—This is a lovely pink variety, although the blooms do not remain long in a perfect condition. For this reason it is advisable to grow several plants to ensure a supply of the best flowers.

Harold Peerman.—Unlike the preceding variety, this lasts well, and is very reliable, being free in blooming and of great depth of flower. The colour is a pure shade of yellow.

Ivornia.—The flowers of this variety are of great size and the habit good. The colour is a bright fawn. This variety needs but little thinning.

Rev. Arthur Bridge.—The blooms of this variety develop quickly and fade quickly. It is

of the loveliest colour, being yellow and tipped with deep rose pink. The stem being rigid, it is one of the best varieties for bunching.

Flame.—This is a plant easily cultivated, producing reliable little flowers. It is fine in floret, and has a pretty centre. The name is indicative of the colour.

Foxhunter.—Scarlet flowers have become rare amongst Cactus Dahlias, of which this is a useful variety, although but little known. It has straight, narrow florets.

Helium.—One of the largest of Cactus Dahlias, although it has none too many florets. The bloom, however, has a capital centre, and never comes shallow. The plant is a very gross grower, and may be allowed to carry three buds instead of one only, as is usual.

Mrs. F. Grinstead.—This dwarf variety especially requires a good, deep root medium. The colour is a purplish shade of crimson.

Mrs. W. H. Raby.—A free-flowering, white variety. Although not quite pure, it is one of the best white Dahlias yet produced.

Hyacinth.—A good variety, but one which flowers in an erratic manner, and it may not have a single bloom out on a show day. Owing to this fault we plant this variety in as many stages and aspects as possible.

Ruby Grinstead.—A beautiful salmon-pink flower of very great depth, and one that lasts well. It is rather later in flowering than the majority, and should be obtained as farward as possible at the time of planting.

Eureka.—A large, rather coarse flower. The colour is a rich, velvety-crimson.

Kathleen Bryant.—This is a rather weakly grower, but it produces excellent flowers of dark-crimson colour.

William Marshall.—Though not new, it is still one of the best kinds. Colour orange and yellow.

Nelson.—A huge flower, but very uncertain in its behaviour. It should be given a trial in all collections, because where it does succeed it is magnificent.

Other first-rate sorts include Victorian, Sirius, J. B. Riding, Faunus, T. A. Havemeyer, Recam, Lustre, Mercury, and Brutus.

DECORATIVE VARIETIES.

It is doubtless a fact that some flowers with the finest florets have but indifferent stems. However, the exhibitor cares not much about the stem, provided the bloom be good. It is a very different matter when one wishes to use them as cut blooms. There are plenty of Cactus Dahlias having good blooms and stout stems. The following varieties possess both these desirable qualities, although the form of some of them is what is termed by exhibitors "heavy."

Dorothy.—A lovely pink flower, possessing a stiff stem and with flowers of exhibition quality.

Mrs. J. Emberson.—One of the fancy Cactus Dahlias. The flower-stems are long and stiff, and the flower is of large size. It is shy in flowering, but otherwise it is a variety of great merit.

Celia.—A beautiful, rich pink colour, excellent in the late autumn. The flower-stems are perfectly erect.

Caradoc.—This is one of the best-stemmed yellow Dahlias. The flowers are quite equal to the best exhibition type.

E. Cadman.—A free-blooming variety with red flowers.

Rosa Starr.—Another of the pink varieties: it possesses all the qualities necessary for a garden Dahlia.

Dreadnought.—One of the largest, and, as a flower irrespective of exhibition points, probably the most popular. The blooms are a shade of crimson-maroon.

Of older sorts suitable for garden purposes may be given:—Zoe, William Jowett, Wm. F. Balding, T. G. Baker, Primrose, Mrs. S. Gas-kill, Khaki, Mrs. E. Mawley, Mrs. Brousson, Thos. Parkin, and Star. All these varieties have stiff-stemmed flowers.

The shoots should be thinned a little at intervals, and the roots be given a moderate supply of water during dry weather. *Harry Stredwick.*

WORCESTERSHIRE DAFFODILS.

A FEW days after the Birmingham Daffodil show, I was afforded an opportunity of inspecting Mr. Arthur Goodwin's Narcissi, which are grown in a garden on the high ground near Kidderminster, commanding an extensive view over the Severn Valley, and situated at an altitude of 500 feet above sea-level. The soil, which is of fertile loam interspersed with small nodules of sandstone, is excellently adapted to Daffodil culture, as the plants were all in the most perfect health and bore flowers of very large size. Messrs. Cartwright and Goodwin were very successful at Birmingham, winning the Champion prize for the greatest number of points and exhibiting several remarkable flowers, among which were Giraffe, Scarlet Gem, a new seedling between Horace and Jaune à Merveille, and the double Red and Gold, all of which received Awards of Merit, as well as Chloe, Lemon Star, Inga, and Evangeline. Mr. Goodwin must, at the present moment, have fully 50,000 seedlings raised from the best varieties, that have not yet flowered. M. J. Berkeley, a variety that sometimes proves difficult to grow, was in the best of health with deep blue-green foliage, and was bearing seed; Golden Spur, fertilised with special pollen, had the seed-pods well formed. A batch of Lucifer seedlings were flowering for the first time, some being very brilliant in the colouring of their cups. Glory of Noordwijk, Weardale Perfection, and Emperor were bearing enormous flowers, and Lady Margaret Boscawen was exceptionally fine; a seedling between the last-named variety and N. calathinus, bearing three flowers on a stem, was very pretty. A cross between Madame de Graaff and Minnie Hume showed a distinct break in having the trumpet edged with apricot. A very beautiful picture was presented by thousands of the delicate, white Waterwitch with drooping blossoms swaying in the breeze. Madame de Graaff was doing very well, and Princess Ena (Award of Merit, R.H.S.) was very similar in appearance. A beautiful flower with a flat, white perianth and green-centred cup edged with glowing orange, was a hybrid between N. Bernardii, from the Pyrenees, and a variety of N. poeticus. Circle, which obtained an Award of Merit from the R.H.S. in March, and has a wide, overlapping, white perianth and spreading, yellow cup, was present in numbers. Of trumpets, Mrs. J. H. Veitch is one of the best yellows; Cornelia, of the same colour, is fine in quality and large; and Cleopatra, another golden trumpet, is a striking flower, white Ailsa, the whitest of the white trumpets, is a beautiful flower. Musidorus is a good late variety raised by Mr. Engleheart from N. poeticus of Linnæus. Others of Mr. Engleheart's raising were Commodore, a very healthy grower of good habit; Resolute, a hybrid from Grandee; Sceptre, and the double Argent. One of the best of the parvi-coronati section was Ethelbert, raised by Mrs. Backhouse, of Hereford, and shown at Birmingham. There was a very lovely collection of Minnie Hume and triandrus seedlings with scarcely a bad flower amongst them, mostly with two blossoms on the stem; and some pretty seedlings between Mme. de Graaff and Minnie Hume. A cross between King Alfred and N. triandrus was flowering in its third year and bearing pale yellow trumpet flowers of exquisite shape. Elvira, a poetaz, was being fertilised with the pollen of brightly-coloured varieties of N. poeticus and perfectus; an incomparabilis, with very flat, broad perianth, was being used as a seed-bearer. An unnamed seedling, with

pure white, overlapping perianth $4\frac{1}{2}$ inches across and deep yellow cup edged with orange-scarlet, should make a sensation when distributed. Other notable flowers were Giraffe, a hybrid between Princess Mary and Mme. de Graaff; Evangeline, with white, broad-petalled perianth and rich yellow cup; Alton Locke; Fusilier, very bright; Ariadne, white spreading perianth, lemon cup; Fairy Queen, a lovely, pure white, one of the most beautiful of all Daffodils; Beacon; Ceres, a cross between Grandee and *N. poeticus*; the popular Citron, Arnold Rogers (a flower of high merit); Homespun, Incognita, Seagull, Albatross, Blackwell, Catharine Spurell, and J. B. M. Camm. *P.*

MEGACLINIUM PURPUREO-RACHIS, WILDEM.

At the meeting of the Orchid Committee of the Royal Horticultural Society, on April 6, a very remarkable *Megaclinium* (see fig. 126) was shown by Sir Trevor Lawrence, Bart., K.C.V.O., as *M. Bufo*. The only illustration of *M. Bufo* known to us is the small figure showing a portion of an inflorescence in the first volume of the *Gardeners' Chronicle*, (1841, p. 348). This was taken from the original plant which flowered with Messrs. Loddiges, and differs much from the plant shown by Sir Trevor Lawrence. This newer plant has since been identified at Kew as *Megaclinium purpureo-rachis*, Wildem. It is a very remarkable species, the flowers on each side of its flattened purple rachis being concealed whilst in the bud stage by curiously-formed bracts; lately the bracts reflex as the flowers in succession approach maturity. The flowers are yellowish, spotted with purple.

The genus is a singular one, peculiar to Tropical Africa, and it is not surprising that the flowering of *Megaclinium Bufo* in 1841 should have been regarded as an event of considerable importance. The note which accompanied the illustration was as follows:—

“Vegetable Reptiles. The *Megaclinium Bufo* or Toad Orchid is thus described in the *Botanical Register*. Let the reader imagine a green snake to be pressed flat like a dried flower, and then to have a row of toads, or some such speckled reptiles, drawn up along the middle in single file, their backs set up, their fore legs sprawling right and left, and their mouths wide open, with a large purple tongue wagging about convulsively, and a pretty considerable approach will be gained to an idea of this strange plant, which, if Pythagoras had but known it, would have rendered all arguments about the transmigration of souls superfluous. The figure will show that the language of this account is justified by the plant itself, which is really one of the most strange-looking things that we have in gardens. We only regret that the queer motion of the tongue cannot also be shown.”

The moving labellum is peculiar to the genus, and Mr. Worthington G. Smith's drawings of the parts show their arrangement in this species.

NOTES ON IRISES.

IRIS GRANT-DUFFII AND ITS ALLIES.

WILL any reader of the *Gardeners' Chronicle* who has succeeded in inducing *I. Grant-Duffii* to flower give his experience? It was one of the very few Irises that baffled the late Sir Michael Foster. I remember his telling me, as he gave me some roots, that he had grown them for 25 years from the time that General Grant Duff gave them to him, and that he had never had a flower. These plants I still have, and others imported from Palestine, but I have never yet seen a flower.

I. Aschersonii, however, is flowering freely this year with me, and I attribute this to the fact that I am growing it in moist, rich soil. *I. Grant-Duffii*, too, seems to be doing better under these conditions, and I hope to see

FIG. 126.—MEGACLINIUM PURPUREO-RACHIS, AS SHOWN BY SIR TREVOR LAWRENCE, BART., AT THE ROYAL HORTICULTURAL SOCIETY'S MEETING ON APRIL 6 LAST

flowers next year. A correspondent in Jaffa told me that these Irises grow in swamps, which means, I take it, that the soil is moist in spring and yet parched in the height of summer. *I. ochroleuca* and *I. Monnieri* are found wild, I believe, in similar situations, and need moisture and rich feeding to flower well. It remains to be seen whether *I. Grant-Duffii* will respond to this treatment, or whether the secret of its needs has yet to be discovered.

The new *Iris melanosticta* is said to be a member of the same group, and a purple-flowered form, *I. Masiaë*, is also in cultivation.

AN IRIS DISEASE.

Of late years Iris growers have from time to time suffered from the ravages of a disease which attacks the rhizomes of *Pogoniris*, generally at the flowering time. The leaves turn yellow first at the tip, and then all over, and flower-stems topple over and are found to be rotten at the base. The disease is said to be due to a fungus which attacks the skin of the rhizome, after which a bacillus enters in by the wound and completes the destruction. Lime has sometimes been suggested as a remedy, but though this may discourage the fungus, it tends, I believe, to encourage the bacillus.

The only remedy, and this a partial remedy, is to take up affected plants at once, when it will be found usually that it is the old central rhizomes that are affected, whilst the young side growths are intact. These may be cut off, and possibly washed in some such disinfectant as permanganate of potash, and replanted in fresh ground. Since *Pogoniris* make a fresh set of roots at flowering time, the plants will grow strongly at once, and be well established before autumn. I have also found that diseased rhizomes, which I pulled up and left lying on the surface of the ground under a light all through last summer, are now growing healthily. *W. R. Dykes, Charterhouse, Godalming.*

NOTES FROM A "FRENCH" GARDEN.

THE lights and frames may now be removed from the Carrots and Turnips, and set in position on the site intended for the culture of Melons. In order to prevent the soil from being displaced and to keep the sides of the beds intact, some short manure should be put against the beds.

The Carrots are forming nice roots, and need abundant waterings.

The first batch of Cos Lettuce is ready for market. We tie the plants before they are pulled from the ground to prevent the leaves from breaking.

The cloches will now be placed over Rows I., IV., and VI., as shown in the diagram, p. 164, fig. 70.

The plants are given a copious watering before being covered with the cloches, and they are shaded with mats in the middle of the day.

The lights and frames should now be removed from the Endives planted early in April, the appliances being required for Melons. The Endives will require light, but frequent, waterings.

We are pulling Radishes sown as an intercrop with the "Passion" Lettuces in the open. When this crop is cleared, the ground will be well hoed. These Lettuces will require no further attention beyond waterings until they are ready for market about the middle of May.

We are sowing a batch of "Witloof" Chicory as a winter crop. The seeds are sown thinly in well-manured ground in drills drawn 1 foot apart. Hot-beds are being prepared for Melons, the seeds having been sown in three different batches: the last of the seedlings will be stopped early next week. All our plants are healthy and forward, so that we shall be compelled to finish the making of the beds by May 15.

Before planting the Melons we wait until the manure has fermented, which generally occupies three or four days. After planting, the frames are lined with fresh manure, and mats are placed on the lights for the whole of the first day. These are afterwards removed early in the mornings, but the shading is again placed on the glass when the sun is shining brightly. We have made tidy the beds of Onion "White of Paris," the seeds of which were sown last August. The bulbs are now swelling, and we expect that they will be ready for marketing within a fortnight. *P. Aquinas, May 1.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Out-of-door vines.—Early attention should be paid to the disbudding of outdoor vines, rubbing out all but two or three of the shoots on each spur. After an interval of a week or two the shoots may be again thinned to one on each spur, it being possible at that time to determine which will carry the best bunch of fruit; one shoot is quite sufficient, and it should be stopped when it has made two leaves beyond the fruit. Subsequently all lateral shoots should be stopped at the first leaf. Keep the growths well thinned out so that the leaves, being fully exposed to the sun and air, may grow hard and leathery in texture. They will thus the better withstand attacks of insects or of such fungus diseases as mildew. The first appearance of mildew should be looked for assiduously, and on its appearance the plants should be sprayed immediately with a fungicide. Outdoor vines being usually cultivated against walls and buildings facing south, they require a considerable amount of water applied at the roots. Later, when the fruits are swelling, frequent applications of manure water should be given them.

The watering of young fruit trees.—Young trees that were planted last season, and especially those that were planted against walls, must be examined frequently that water may be given to them before they suffer from drought. When drying winds prevail, such trees suffer irreparable injury if they are also dry at the roots. A slight spraying overhead in the afternoon will be beneficial in keeping the wood in a plump condition, thus encouraging them to make growth. If these trees have not already been given a mulching of some light material, as was advised in a former Calendar, it should be applied at once. Manure from a spent Mushroom bed is probably the best material to use; but if this nor any other short manure is procurable, then the mown grass from the lawns may be used in their stead. Disbud these young trees carefully, and endeavour to get each to form a good foundation for its future development.

Plums.—The trees are now growing rapidly. At this season suckers are more than usually troublesome. Remove any that are seen before they become difficult of eradication.

Apple blossom weevil.—This pest will now attack the Apple blossom. If the trees were thoroughly sprayed during the winter with a caustic alkali solution, there will be less reason to fear attack. Unwashed and otherwise neglected trees, bearing rough bark with moss upon it, provide ideal hiding places for this pest. Soon after the weevil has entered an Apple blossom the petals turn a brown colour as if affected by frost. If such blooms are closely examined a weevil will generally be found in them, or a little hole will be discovered in the petals indicating that the weevil has escaped. If young trees are attacked some of the weevils may be caught by shaking the trees suddenly on a calm day, for on this provocation the weevils will drop suddenly from the tree. A sheet is usually placed under the tree before it is shaken, and the weevils are gathered up and destroyed.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Fig trees in pots.—As soon as the fruits are taken from the earliest trees in pots, these trees should be thoroughly cleansed of any insect pests there may be present on them. It is not advisable to allow pot trees to bear a second crop, especially if they are needed for forcing early next season. Therefore, the house should be kept as cool as possible. Syringe the trees with clear water thoroughly each morning and afternoon in hot weather, and exercise care that the roots are never allowed to suffer from drought. Thin out any shoots necessary to allow the others to be fully exposed to the light, and pinch the points of those which are growing freely. As soon as the weather is favourable, the trees may be removed out-of-doors, and plunged in ashes in a position exposed to the sun.

Fig trees in borders.—Afford liberal supplies of manure water to trees on which the fruits are approaching the ripening stage, but withhold manures as soon as ripening has

actually commenced. During warm weather the house should be ventilated freely both at the top and bottom, and the top ventilators may be left open just a little during the night. Stop and regulate the shoots on later trees, in order that every shoot may be fully exposed to the sunshine, and that the air may circulate freely amongst the shoots. Spray the foliage with tepid water each morning and at closing time in the afternoon. During the day a moist atmosphere may be promoted by damping at frequent intervals all the available surfaces in the house. Trees carrying a full crop of fruit, especially if they are growing in shallow or restricted borders, must be fed liberally, and the borders should be covered with a mulch of decomposed horse manure, if this material has not already been supplied. Very little fire heat is needed at this season of the year, indeed, merely sufficient to maintain a circulation in the atmosphere.

Early Peach and Nectarine trees in pots.—Manures must be withheld from these trees directly the fruits begin to ripen; water even must only be given in moderation. If the pots are at present exposed to the sun's rays, they should be shaded by some means in order that watering may not be needed so frequently. Syringing must not be practised during the time the fruits are ripening. When all the fruits have been gathered, the trees must be removed to a cool house, where they should be syringed twice a day. If red spider is present on the leaves, the plants had better be laid on their sides and thoroughly syringed with an insecticide. Later, when the weather is warmer, plunge the pots in ashes out-of-doors in a sunny position.

Early Peaches in borders.—These trees should be given a thorough watering just before the ripening stage commences, it being inadvisable to apply water during the time the fruits are actually ripening. At that stage the house must be kept dry. Remove any laterals that are shading the fruits, and if there are any fruits on the undersides of the shoots, they must be exposed to the light by placing a label or some similar prop under them. In determining whether a Peach is ripe or not, the underside of the fruit near to the stem alone should be felt. The fruits should be gathered as early in the morning as possible. Certain varieties of Peaches—and particularly Nectarines—are liable to suffer from scalding during the ripening season, and this causes the skin of the fruit to shrivel. The trouble may be prevented by covering the glass with a double thickness of fish netting.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Salsafy.—This is one of the most useful of winter vegetables and deserves to be more generally cultivated. The last sowing for the season should now be made, selecting deeply tilled and finely-worked soil. Sow the seeds thinly in drills, drawn at 15 inches apart, and as soon as the young plants are large enough, thin them out to 12 inches or so apart. If perfectly shaped specimens are required it may be necessary in some soils to bore deep holes as advised for Carrots, and to fill them with finely-sifted soil of a sandy nature.

Scorzenera.—This requires much the same kind of treatment as Salsafy, but it is important that the seed is not sown too early. The best time to sow is from May 12 to May 20.

Seakale.—The young sets of Seakale planted out last month should have their eyes or shoots reduced to one, leaving the strongest. Every encouragement should be given the plants to make a robust growth. In showery weather a slight application of some approved fertiliser may be made and the surface soil should be disturbed frequently by means of a Dutch hoe.

Brussels Sprouts.—Plants that were pricked out from the earliest sowings may now be sufficiently advanced to be put in their permanent quarters. Lift each plant carefully with a ball of soil attached to its roots. It is scarcely possible to make the soil too firm about the roots. The rows should be 3 feet distant from each other, and the distance between each plant in the row should not be less than 2 feet 6 inches. If Brassica crops on this soil have been in the habit of showing club disease, it will be well to fill in the holes with finely-sifted cinder ashes. I have found this material a splendid preventive of club disease.

Cabbage.—Quick-maturing varieties that were raised in boxes and afterwards pricked out should be ready for planting. Most of these may be planted at 15 inches apart in rows 2 feet distant from each other.

Spinach (New Zealand).—This vegetable frequently has great value during a hot season, ordinary Spinach thriving but poorly in very hot weather. Seeds of New Zealand Spinach may now be sown in boxes, and the seedlings afterwards planted out, or seeds may be sown on a warm border out-of-doors.

Cucumbers.—If Cucumber plants have been properly hardened, they may safely be planted in portable frames, which have already done duty for other vegetable crops. It will be necessary, however, to make the best use of the sun heat by closing the lights very early in the afternoon and spraying the surfaces with chilled water. Cover the lights entirely with some protective material on cold nights, but do not neglect to ventilate the frame early each morning. Peg down the growths, stop, and thin them out as they require it. The best varieties of ridge Cucumbers are worth cultivation in any garden. They should be brought into bearing as soon after planting as possible. The warmest available place, therefore, should be given them, it being all the better if a moderate hot-bed can be formed for their use. The seeds should be sown at once, and the plants may be put out towards the end of the present month. Hand lights or cloches may be used for a short time in order to give them a better start. Failing these, the plants may be covered at nights with flower-pots or some other form of shelter.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Cattleya and Lælia.—Now that such plants as *Cattleya Schröderæ* and *C. Lawrenceana* are passing out of bloom, they should be placed in the coolest part of the house, and be kept comparatively dry at the root, otherwise they may recommence to grow instead of getting to rest. Each plant should be watched, and immediately root action commences those plants which require it should be repotted. Plants of *C. Mendelii*, *C. Mossiæ*, *C. Skinneri*, *Lælia purpurata*, and the various *Cattleya* and *Lælio-Cattleya* hybrids developing flower-spikes, will require to be kept fairly moist at the root till the flowers expand. Over-watering must be carefully guarded against, for if the plants are kept too wet whilst in bloom, some of the pseudobulbs and leaves may decay soon after the flowers have faded. Plants of the autumn flowering *C. labiata*, *C. Gaskelliana*, *C. gigas*, *C. Dowiana*, *C. D. aurea*, *C. Bowringiana*, and others that are starting to grow should be placed in the warmest part of the house. Elevate the plants well up to the roof glass, so that they will be well exposed to the light. If the *Cattleya* house is situated at a high elevation and in a naturally dry position, the plants in growth will probably require a moderate supply of water at the root twice a week, but in low-lying districts where the house is less exposed to drying winds, about one watering a week for the present will be found sufficient. In either case the compost should be allowed to become moderately dry before water is again applied to the roots. When the flower-sheaths are seen developing in the young growths the quantity of water may be slightly increased. *C. Luddemanniana* (*speciosissima*) may also be included with the varieties mentioned as regards its present requirements, but better flowering results may be obtained with this species if the plants are suspended as near to the roof glass as possible. In such a position the plants take more water than those down upon the stage, and it is better for them to do so. Plants of *C. Trianae* starting to grow and needing room for further development may be repotted. The young growths will soon produce roots which will quickly enter the new compost. Plants of *C. Percivalliana*, *C. amethystoglossa*, *C. Harrisonæ*, and others now commencing to grow may also be repotted. In most collections there will be some plants of *C. Mendelii* and *C. Mossiæ* that have failed to produce flower-spikes, or others that have deteriorated and require breaking up. These may also be attended to at this season. Plants that

are unhealthy or shrivelled should be relieved of their flower-sheaths. The pots for these *Cattleyas* and *Lælias* should be about half filled with clean crocks for drainage, over which a layer of the roughest part of the compost should be placed with a sprinkling of small crocks intermixed. This should be made quite firm on the surface. The compost should consist of *Osmunda* fibre and *Polypodium* fibre in equal parts. Cut both materials up together, but not too finely, and mix with them plenty of small broken crocks. For these plants we do not use *Sphagnum*-moss, but some growers prefer to mix a little with the compost, and results are equally good. Over-potting should be avoided. Pot rather firmly, especially in the centre, and keep the rhizome of each plant about on a level with the rim of the pot. Tall-growing plants like *Lælia elegans* and *Cattleya amethystoglossa* may require to have a pseudobulb here and there tied to neat sticks to hold the plant firmly in its place. When the plants have been repotted, place them on the shady side of the house, and for a few weeks keep them rather dry at the root, but the surroundings may be kept fairly moist by syringing between the pots several times each day according to the condition of the weather outside.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Coleus.—The earliest plants of *Coleus* should now be growing in 7-inch pots. Those that were propagated later should be potted off as soon as they have made roots. Continue to insert fresh batches of cuttings at intervals, remembering that well-grown plants, upon a single stem, in 3-inch pots, are useful for furnishing small vases in the house. As a rule, however, there is no advantage in retaining a plant after it has done duty in a dwelling-room. For the present let the plants be kept in a warm, moist house, and in a position that is well exposed to the light.

Begonia.—Varieties of *B. Rex* may easily be propagated from the older leaves. Take the leaves and make a few incisions on the under side of the ribs. Then lay them flat on pans of light sandy soil. Be careful not to over water the soil, but shade the leaves from sunshine. Established plants should be cultivated in partial shade and in a moist atmosphere. If the plants are to be used as vase plants they should be turned round frequently, otherwise all the leaves will face in one direction. Tuberous-rooted varieties may now be grown in an unheated frame facing to the south. The plants should be arranged on a bed of cinders, and may be sprayed overhead twice each day during fine weather. In the middle hours of bright, sunny days, slight shade may be afforded.

Boronia.—As the plants complete their flowering, *B. elatior*, *B. heterophylla*, and *B. megastigma* should be pruned severely and placed in a warm, moist house. Do not water them much at the root for some time after the pruning has been done, but syringe the plants overhead whenever the weather is bright. When they have completed their growth they may be removed to a cooler house.

Nerine.—When the foliage shows signs of turning yellow, the supply of water at the roots should be gradually decreased, until when the leaves have quite withered the roots may be kept dry. *Nerines* require a long season of rest, and during this period they should be fully exposed to sunshine in a cool house or frame.

Staking.—Many plants now require some means of support, and it is bad gardening to withhold stakes in cases where they are necessary. At the same time it is equally wrong to use more than are absolutely essential. The vivid green stakes sometimes seen are objectionably prominent when associated with certain plants. It is difficult to get shades of painted green that are not conspicuous when associated with living stems and leaves. As a rule home-grown stakes are best. In the Western counties many of us are able to use Bamboo canes that we ourselves have cultivated. These are chiefly obtained from the Metake (*Arundinaria japonica*). This Bamboo, being similar in colour to the leaves and stems of many plants, makes a fairly inconspicuous stake. A stake should never be out of proportion to the size of the plant it

supports. In the case of quick-growing plants under glass it is better to affix another in the course of a few weeks rather than to use one larger than is needed. Whilst the ties must be made sufficiently tight to keep the plant steady, it is obvious that allowance ought to be made for the increase in size of growing stems.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir Edmund G. Loder, Bart., Leonardslee, Sussex.

Preparations for bedding-out.—Preparations should be pushed forward for the bedding-out of tender plants, which may be possible towards the end of the present month. The best preparation consists in thoroughly preparing the plants for their period out-of-doors by gradually hardening them to exposure. It may still be necessary to protect many of them during cold nights. Take every care that none is allowed to suffer from drought at the roots, the danger of this happening being very acute in the case of those growing in tiny pots.

Propagation.—It is now time to commence preparations for propagating plants that will be used in the spring flower garden next season. Many plants can be raised either from cuttings or from seeds as the cultivator desires, but the best stocks are usually obtained from cuttings. Excellent cuttings may be taken at the present time from *Aubrietias*, these being half-ripened shoots. Insert them in boxes or in prepared beds in the nursery, using a compost consisting mainly of leaf-mould. Dibble the cuttings in very firmly. Choose a partially-shaded position, or if this is not available shade the cuttings from the midday sun. Stocks of *Alyssum* and *Arabis* may be raised similarly. The cuttings root very readily if detached with a heel of the old wood adhering to them. Some good varieties of *Aubrietias* include *Fire King*, *Leichtlinii*, *Moerheimii*, *Dr. Mulcs*, *purpurea*, and *Richards' Nine to One*. Varieties of *Arabis* include *A. aubrietoides*, *A. Allioni*, *A. Halleri*, and *A. albidæ*, fl. pl. Of *Alyssums*, there are *A. saxatile*, *A. s. compactum*, and *A. spinosum*.

Wallflowers.—Seeds of *Wallflowers* should be sown to provide plants for putting out in the autumn. Select an open border that is shaded from the midday sun, and rake the soil very finely, working in a little soot during the process of raking. Draw broad drills at distances of one foot apart and sow the seeds very thinly. The variety *Helen Willmott* is especially to be recommended. Seeds should also be sown of *Canterbury Bells* (*Campanula medium*), and *Silene*, *Pansies*, *Campanula pyramidalis* and *Delphinium hybridum*. *Campanula pyramidalis* makes better decorative plants for pots if it is cultivated out-of-doors during the summer. Indeed, in many districts, they may remain out-of-doors during the winter if the pots are plunged, or the border containing them is mulched. All the *Delphiniums* are best sown out-of-doors if we except *D. nudicaule*. Seeds of this somewhat delicate species should be sown in boxes in frames, and the seedlings planted out afterwards in rich, fine soil. Slugs are very destructive to *Delphiniums*, and the plants must be carefully preserved from these during the earlier stages of growth.

Polyanthus and Primrose.—Varieties of both these plants should be sown on well-prepared borders in comparative shade. Frequent supplies of water must be given them in dry weather. The leaves being liable to attack from red spider, they must be treated with an insecticide at intervals during the summer. All plants raised from seeds should be carefully pricked out as soon as they can be handled, that they may not become weak and drawn, owing to overcrowding in the seed drills.

Perennial Asters.—Cuttings that have been rooted in the present spring should now be planted out in the reserve nursery. They will make strong plants by autumn.

Hardy Fernery.—Top-dress any of the hardy Ferns in need of this attention. Remove all weeds from the fernery, and place a few evergreen branches to protect delicate Ferns whose young fronds are liable to become injured by frost. A little soot scattered over the surface of the soil, avoiding dusting the fronds, is a good fertiliser. Ferns favouring limestone, should be given a dressing of this material mixed with leaf-mould.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, MAY 10—

United Hort. Ben. & Prov. Soc. Com. meet.

THURSDAY, MAY 13—

London Branch B.G.A. lecture by Prof. Bottomley on "Nitrogen Fixation."

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—52°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, May 5 (6 P.M.): Max. 60°; Min. 47°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, May 6 (10 A.M.): Bar. 30.2; Temp. 68°; Weather—Sunshine.

PROVINCES.—Wednesday, May 5 (6 P.M.): Max. 59° Bedford; Min. 46° Scotland E.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—

Border Plants and Perennials, Lilioms, and other bulbs, at 12; Palms and Plants, Ferns, &c., at 3, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Cypripedium Hybrids, Imported and Established Orchids, at 12.45, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

The Sensitiveness of Plants to Gases.

The investigations of physiologists have brought to light the fact that plants respond in various ways to a large number of external agents. One form of response—the tropistic or curving response—consists in a bending of the root, stem, or other part of the growing plant in a definite direction with respect to that in which the agent or stimulus acts. The curving of the stem of a plant illuminated from one side so that its tip is directed towards the light is a well-known example of such a tropistic reaction. Plants which are free to move, as, for example, the swarm-spores of Algæ, show a like reaction; though in their case the movement is not a bending, but an actual progression in the line of action—toward or away from—the stimulus. Chief among the directive agents for the higher plants are, of course, gravity and light, and it is by their regular, definite, and purposeful reactions to these stimuli that plants acquire their characteristic positions. Without such ever-present guides it is difficult to believe that a seedling could adjust itself to its environment sufficiently to obtain adequate supplies of material from soil and air.

But, besides these well-known manifestations of plant-sensitiveness, the general results of which are clear and beneficial, there are other responses to stimuli, the meanings of which are less obvious. For example, after a considerable amount of discussion and conflicting experiment, it has now been shown

that both the roots and stems of plants respond by definite curvatures when they are exposed to what may be called a non-uniform gaseous environment: that is to say, when one side of the plant is exposed to a gas which is absent or, at all events, present in smaller quantity on its other side. Such conditions do not occur with sufficient regularity in Nature for the curvatures which they induce to be recognised. Nevertheless, when these conditions are set up artificially, when, for instance, a seedling is so placed in a bell-jar that a stream of carbon-dioxide falls on it from one side, the plant responds to the stimulus by curving toward or away from this gas. The curvature directs the tip toward the carbon-dioxide when the amount of that gas is but small; away from it when it is larger. A similar behaviour is exhibited by both roots and stems when they are exposed in this one-sided way to oxygen. To other gases, however, the plant remains indifferent. Thus, neither hydrogen nor nitrogen induce curvature; although, if the nitrogen contains a mere trace of ammonia, a curvature takes place. The marked reaction to carbon-dioxide is interesting inasmuch as the roots of plants are peculiarly sensitive to this gas. For example, it suffices to kill a plant to direct for a comparatively short time a supply of carbon-dioxide to its roots. It may be that the marked curvature away from considerable quantities of carbon-dioxide represents the plant's mode of escape from the injurious influence of that gas. Though why this curvature should be manifested by the shoot as well as the root—although the shoot requires carbon-dioxide for the manufacture of its food-materials—is by no means clear. The whole question of these adjustments of the plant to the several factors, light, gravity, moisture, &c., of its environment, is fascinating. From the study of such adjustments it has become evident that the plant possesses as fine a sensitiveness as the animal, and an equally marked power of response. Though its nervous system is not represented by brain or nerve, it nevertheless has at its command powers of perception of stimuli, just as the animal has eyes for the perception of light; and also powers of response by movement, like those which animals exhibit. By the exercise of these powers of response to stimuli the organism adjusts itself with supreme nicety to its surroundings, and, as it were, feels its way safely in spite of the changes and chances of its life. It is not at all improbable that the sensitiveness of plants is far more varied than is at present suspected; nor, considering how ignorant we still are of the physiology of plants, that many examples of sensitiveness may be discovered for which explanations in terms of utility may not be forthcoming.

OUR SUPPLEMENTARY ILLUSTRATION.—In the last issue the Supplementary Illustration showed the various processes in the propagation of Hyacinths by scoring the base of the bulbs in a series of cross-cuts. This week the system illustrated is that of hollowing out the base by the "scooping method." As we explained last week, this latter method produces a larger number of bulbils than develop after scoring the bulbs, but, in consequence of this, the development of the bulbs is slower, and therefore more time is required

before they are fit for planting out and before the bulbs reach the flowering stage. Like the former photographs, these now reproduced were taken by Mr. PIET, Amersham, in the bulb nursery belonging to Mr. H. DE MEULDER at Lisse.

FLOWERS IN SEASON.—A box of magnificent flowers of the St. Brigid strain of Anemone has been sent us by Mr. G. ROCHE, Gowran Castle Gardens, Co. Kilkenny. The blooms are of extra large size and the shades of colour as pleasing as they are varied. We cannot speak too highly of these Anemones, and their value is the greater since they are capable of lasting in good condition in water for upwards of a week.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—In aid of the funds of the Worcester Auxiliary, the gardens and grounds of Madresfield Court will be opened to the public on Thursday, May 13. The admission from two to four o'clock will be 1s., but afterwards 6d. Should the weather be wet on that date, the gardens will be opened on the following Thursday.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, the 10th inst., at 8 p.m., when a paper will be read by Mr. A. B. HOWES (Fellow), entitled "Quantity Surveyors: A Review of their Legal Position." The next country meeting will be held at Cardiff on May 20 and 21. Visits have been organised to various works and places of interest in or near Cardiff for the afternoon of the 20th, including the Bute Docks, the Dowlais Steel Works, Cardiff Castle, and Llandaff Cathedral. The following excursions have been arranged for the following day:—(1) Excursion to Ilfracombe via Barry Docks; by boat along the Devon and Somerset coast to Minehead; (2) a visit to the Bargoed Colliery and to Caerphilly Castle.

NATIONAL TULIP SOCIETY.—The sixteenth annual southern exhibition of this Society will be held at the Horticultural Hall, Vincent Square, Westminster, on Tuesday, May 18, in conjunction with the fortnightly meeting of the Royal Horticultural Society. All particulars can be obtained from the secretary, Mr. W. PEETERS, Farcet House, Cambridge.

SOCIÉTÉ ROYALE D'AGRICULTURE ET DE BOTANIQUE DE GAND.—This Society will hold an international exhibition of fruits, vegetables, and flowers on October 30, 31, and November 1 next. The principal feature of this exhibition will be Chrysanthemums, for which a number of liberal prizes are offered. There are also classes for other flowers in season, including Orchids. Twenty-seven classes are arranged for hardy and tender fruits, and 15 for vegetables. The schedule comprises in all 136 classes, and the exhibition promises to be one of considerable interest. The secretary for the exhibition is Mons. LUCIEX DE COCK.

THE "JOURNAL" OF THE COOPER RESEARCH LABORATORY.—We have received with pleasure the first number of the *Journal* of the Cooper Research Laboratory. The laboratory was founded in 1902 by Sir RICHARD COOPER in order to carry on agricultural investigations and to keep the agriculturist informed on all matters where biological or chemical science can offer him assistance. Information is given free of charge to genuine enquirers. The work carried out during the past year includes experiments with insecticides and fungicides; the use of lime in agriculture, with special reference to "Finger-and-toe"; the life-history and habits of the woolly-aphis. We wish the Cooper Research Laboratory all success in its career.

"THE BOTANICAL MAGAZINE."—In the issue of this publication for May there are illustrations and descriptions of the following plants:—

DENDROBIUM BRONCKARTII, tab. 8252.—This plant was first described by Mr. WILDEMAN in *Gardeners' Chronicle*, June 16, 1906, page 380. It is most closely allied to *D. thyrsoiflorum*, but is readily distinguished by its larger size, its ampler and laxer inflorescence. The flowers are pale-rose colour, the disc of the lip being marked with a large orange-coloured blotch. They are produced on pendant racemes.

LARIX OCCIDENTALIS, tab. 8253.—This species, originally described by NUTTALL, was figured in the *Gardeners' Chronicle* for May 22, 1886, page 652, when Professor SARGENT, of the Arnold Arboretum, Massachusetts, wrote an interesting account of it, and of *Larix Lyallii*. *Larix*

at Verrières-le-Buisson, near Paris, also cones freely, but has never yet given seed.

MUSSAENDA TREUTLERI, tab. 8254.—This is an old plant that has been known heretofore as a variety of *M. frondosa*. It was originally mistaken by Dr. WALLICH, when he discovered the plant in the mountains of Nepal, for a form of *M. frondosa*, but was subsequently confused with *M. macrophylla*, under which name it has usually been cultivated. Dr. STAPP now raises the plant to specific rank for the first time. It was introduced to cultivation by Messrs. KNIGHT & PERRY about 1840. It is a stove plant, and forms a shrub about 3 feet high. The flowers are produced in terminal heads, the only colour being in the limb of the corolla, which is reddish-orange. The plant gains some of its decorative value from its leaflike white sepals.

p. 665) that the tree cultivated in European collections as *Pyrus Pashia*, which DECAISNE has distinguished from the typical form of that species as *P. Kumaoni*, may be no more than a glabrous variety of *P. Pashia* proper. A careful study of the material in the herbarium at Kew has enabled Dr. STAPP to completely confirm this view. According to LOUDON (*Encyc. of Trees and Shrubs*, p. 424), *P. Pashia* was first introduced into England in 1825. The tree from which the plate of *P. Pashia Kumaoni* has been prepared has been growing in the collection of Rosaceae at Kew for many years, but its precise history is not known. The flowers are exceedingly attractive, by reason of the deep-red anthers, which show up strongly against the pure white petals. The individual flowers are remarkable for their full-rounded contour, and are produced in unusually compact flower-trusses.

[Photograph by W. J. Vasey.]

FIG. 127.—SOUVENIR DE LA MALMAISON CARNATION "LADY COVENTRY," AS EXHIBITED BY MESSRS. CUTBUSH AND SON AT THE R.H.S. EXHIBITION ON APRIL 20. FLOWERS CARMINE-LAKE. (See ante p. 263.)

occidentalis was first observed by LEWIS and CLARK in the forests of the Upper Clearwater River. It was seen also by D. DOUGLAS in 1827 near Fort Colville, on the Upper Columbia, but was mistaken by him for the European Larch. NUTTALL collected it from the Blue Mountains in 1834, and first described it in *Sylva*. Certain foresters in England have the opinion that this American Larch may prove to be a useful substitute for the European Larch, owing to the susceptibility of the latter to the attacks of the fungus *Peziza Willkommii*, the cause of Larch-canker. Mr. BOTTING HEMSLEY states that the trees at Kew fruit freely, but that the cones have never yet been found to contain fertile seed. A tree in the garden of Mr. P. L. DE VILMORIN,

DEUTZIA SETCHUENSIS, tab. 8255.—This species was described in the *Gardeners' Chronicle* by Mr. LEMOINE on October 8, 1898, page 265, as *D. corymbiflora*. Mr. HUTCHINSON now points out that *D. corymbiflora*, Lemoine, has been identified by Mr. FRANCHET with this species; Mr. HUTCHINSON, however, states that LEMOINE's plant appears to have smaller, less acuminate leaves and pinkish-white flowers. The figure now given in the *Botanical Magazine* was presented to Kew in 1897 by Mr. M. L. DE VILMORIN. It has white flowers, and blooms early in July.

PYRUS PASHIA VAR. *KUMAONI*, tab. 8256.—Dr. STAPP says that it has already been suggested by Dr. SCHNEIDER (*Ill. Handb. Laubholz*, vol. i.,

WHAT AILS YOUR PLANTS?—Under the above title the *Garden Magazine* (New York), May, 1909, publishes a valuable contribution from Mr. PORTER FELT, State Entomologist, New York. Drawn up in tabular form are lists of ornamental shrubs, small fruit, orchard trees, shade trees, vegetables, and plants of the flower garden. Opposite each plant is given the symptom of the injury or disease to which it is liable, the time of its appearance, its cause, name, remedy, or preventive means to be adopted, and remarks and cautions. As the editor remarks, most tables and spray calendars assume an acquaintance on the part of their users with the insect or fungus causing the disease. KIRCHNER's excellent book adopts a similar method with respect to European pests, but, being in German, is not generally available. It is to be hoped that some competent entomologist or fungologist will draw up a similar table dealing with the common pests of this country.

EXHIBITS OF WILD FLOWERS.—The wild flower exhibition at the People's Palace, Glasgow Green, Glasgow, which proved so successful last year, is to be repeated. The daily exhibits of freshly-culled wild flowers will continue from the present time until the last week of September. District librarians and headmasters of schools in the neighbourhood have promised to assist all they can by the loan of books and by giving simple botanical teaching.

THE TRANSVAAL DEPARTMENT OF AGRICULTURE.—No better testimony to the activity of the Transvaal Department of Agriculture could be provided than that supplied by the report of the work of the department during the year July, 1907, to June, 1908. The volume embodying the report consists of 328 pages, and contains the records of the several sub-departments, which include those of Botany, Plant Pathology, Entomology, Horticulture, Forestry, Co-operation and others. Among many interesting items dealt with in the report the following may be noticed: the rapid development of the Transvaal as a Maize-growing region and the progressive policy adopted by the Department of Agriculture for the provision of pure and suitable seed for this crop; the vigilance exercised in the discovery of imported plant diseases and the rigorous destruction of diseased plants. It is noteworthy that dry-rot of Potatoes (*Nectria solani*) has proved itself capable of attacking the crop as well as the stored tuber. Our readers will recollect that this has been shown recently to be the case both in America and in this country. Attempts to discover or breed rust-resisting strains of Wheat have not as yet proved successful, though in the light of the experiments made by Professor BIFFEN, at Cambridge, it would seem probable that this much-desired end is not unattainable. Lastly, it is interesting to observe that the gospel of co-operation is being preached, and not vainly, to the farmers of the Transvaal.

STONE SEAT IN KEW ARBORETUM.—Enquiries are from time to time made as to the stone seat among the Beech trees towards the southern end of the gardens. The seat, which was placed in the position it occupies in February, 1904, was presented to Kew by a group of friends of the late Miss CASSELL, who was for 20 years Lady Superintendent of the College for Working Women. It was provided as a memorial by past and present students of the college, to express their sense of Miss CASSELL'S unique personality. "That it should be a resting-place in sight of sky and trees in such an altogether beautiful place as Kew, and within reach of working Londoners, seems, in accordance with her life spent in working for the working poor, what she would like," is a sentence which occurs in a letter on the subject, written by Mrs. MACLEHOSE, at whose instance the memorial was erected, to her brother, Mr. G. MACMILLAN. In the same letter Mrs. MACLEHOSE says:—"We should like some motto or words carved on it, but no obviously memorial words—no names." The actual inscription is:—

"Life—the gift
Let us take hands and help this day we are
alive together
Look up on high and thank the God of all."
—*Kew Bulletin*.

"**THE ROSE ANNUAL, 1909.**"—This excellent publication of the National Rose Society progresses in importance with the Society itself. The number before us is a valuable contribution on matters pertaining to the Rose. Mr. E. B. LINDSELL, who has won the principal trophy at the Society's shows no fewer than 17 times since 1890, writes upon Rose shows. In an admirable résumé of the shows of 1908, Mr. LINDSELL winds up with a plea for a permanent date for the Society's principal summer exhibition. A selection is given of the best Climbing Roses in their several colours, and Mr. MAWLEY'S analysis shows the number of times a certain variety appeared on the show board in 1908. The article on Wichuraiana Hybrids by Dr. A. H. WILLIAMS is an admirable disquisition on the subject, and no one should know more of the hybridisation of Roses than Mr. ALEX. DICKSON, who writes on this subject. The history of the Frau Karl Druschki Rose is given by Mr. ALLISON, who states the parents were Merveille de Lyon and Caroline Testout. How this beautiful flower was passed over for a considerable time makes interesting reading. Other chapters deal with Enemies of the Rose; Banksian Roses; Climbing Roses; Rose Growing in Winter on Shallow Benches; and descriptions of some of the newer varieties. The frontispiece is a portrait of the President, Rev. F. PAGE-ROBERTS. Numerous other pictures appear in the text.

* "**GARDEN LIFE YEAR BOOK, 1909.**"—We have just received a Year Book published by the proprietors of *Garden Life*. It contains a calendar of garden operations for each month, and various articles upon subjects of interest to gardeners. For instance, "The Rose Season of 1908," by Rev. JOSEPH H. PEMBERTON; and "Sweet Peas," by CHARLES FOSTER. A list is given of the flowers, fruit, and vegetables certificated by the Royal Horticultural Society in 1908; another of select varieties of common vegetables and fruits, and there are illustrated articles upon certain well-known gardens. An interesting feature of the Year Book is the section "Who's Who in Horticulture." In this appear biographical notes of a number of well-known men in gardening circles. It is the first time such a list has been prepared, and probably for this reason it is far from complete, many well-known names being omitted.

* Hatton House, Great Queen Street, W.C. Price 1s. net.

VANILLA CULTIVATION IN HAWAII.—If there is anything at once easy and profitable left to the horticulturist, it must be Vanilla growing in Hawaii. From the book entitled *Agriculture in Hawaii*, by J. G. SMITH, we learn that the climbing Orchid (*Vanilla planifolia*) is planted as a cutting on any tree or any soil. The cutting soon emits its characteristic aerial roots and begins to flower in its second or third year. A

AN UNSATISFACTORY REPORT.—To those who are aware of the extraordinary activity displayed by the dominions of the Empire, by certain of its Crown Colonies, and by the United States and Germany in furthering the interests of agriculture and horticulture, the annual report on the Botanical, Forestry, and Scientific Department of the Uganda Protectorate (1908) cannot be other than disappointing. All that is apparently worth

FIG. 128.—ALPINE AURICULA CLAUD HALCRO: FLOWERS YELLOW IN CENTRE, WITH CRIMSON ON EACH SEGMENT, PASSING TO BRONZY-RED AT MARGIN.

(Gained an Award of Merit when shown by Mr. Douglas at R.H.S. meeting on April 20. See *ante* p. 262.)

little weeding is about all that is necessary in the way of cultivation. Artificial pollination is necessary to ensure the formation of the pods. The pods are then cured, by which process the required colour and aroma are induced. The yield is worth from \$400 to \$500 per acre.

recording is contained within 19 pages, of which *all but five* are devoted to meteorological tables. We learn from the introduction to the report that an agricultural department was formed from April 1, 1907 (ominous day), but that no suitable person could be found for the appointment

as head of the department. It is difficult to believe that the search could have been very profound or prolonged. The report contains a few remarks on Rubber, Cocoa, Cotton, &c., but a perusal of its pages does not indicate that Uganda has undertaken the task of developing its undoubted resources in a thoroughgoing and scientific manner.

PRESENTATION TO MR. J. H. GOODACRE.—

The garden-holders of Nottingham have presented Mr. GOODACRE, gardener to the Earl of HARRINGTON, Elvaston Castle, with a silver salver. The presentation took place at the Welbeck Hotel, Nottingham, on Saturday, May 1. The salver was inscribed, "Presented to Mr. J. H. GOODACRE by the garden-holders of Nottingham for the many valuable services rendered them in the art of horticulture."

diminished vitality of the plant strike me as remarkably interesting. *Alfred O. Walker, Ulcombe, Maidstone.* [*Elodea* flourishes now as well as ever it did in rivers and streams under our own observation in the home counties. We shall be glad if it can be proved that the plant is generally less troublesome in this country than formerly.—Eds.]

HIPPEASTRUM [AMARYLLIS].—*Hippeastrums* succeed well in these gardens and make magnificent plants. We have them in flower from December until March. The plants do not require a high temperature, and succeed best if allowed to remain in the same pot for a few years. Our plants are repotted every three years, one-third each season. The soil used is turfy loam, leaf-soil, and sand, with a good sprinkling of bonemeal, charcoal, and lime rubbish. The plants that are not repotted this year are top-dressed with the same soil as is used in potting. The bulbs are started in a

Spinach, Onions, Carrots, Parsnips, Turnips, Broccoli, Cabbage, and Brussel Sprouts. We have also used it as a dressing for new plantations of Strawberries. In all cases it has benefited the crop. I may repeat, however, that it must not be used in a fresh condition. I saw a tennis court marked out with it in the ordinary way as with whitening. It killed all the Grass it touched, and the turf never recovered. Grass land would, no doubt, be benefited by its application if used in conjunction with double its quantity of soil or wood ashes, and spread evenly after it has been exposed to the air for some time. This refuse forms a suitable whitewash for outbuildings or walls, applied in the same manner as lime wash. *F. R. Staddon, East Oakly House, Haats.*

CUPRESSUS MACROCARPUS.—We planted a hedge here some four years ago to protect a Rose garden. It grew rapidly, and is now a thick wall 18 inches through and 5 feet high—the height we require it. At the present time the hedge has a very scorched appearance, owing to the severe winter, and I am afraid a tree here and there is killed outright. *A. Gooden, Burton Park, Petworth.*

PRIMULA FORRESTII.

We have now the opportunity of illustrating a plant of *Primula Forrestii*, which has been in cultivation at the Edinburgh Royal Botanical Garden for the past two years. Professor Bayley Balfour, to whom we are indebted for the photograph, states that the plant has been cultivated in an unheated frame during the past winter, that it flowers and seeds very freely, and that it is likely to become a general favourite. The illustration certainly proves that the plant has good decorative qualities.

SOCIETIES.

ROYAL HORTICULTURAL.

MAY 4.—The Society's Hall was the scene of another brilliant display of floral exhibits on this date, and there was a large attendance of visitors. The main building and the annexes were filled with groups of Roses, bulbous flowers, Orchids, Auriculas, Carnations, forced shrubs and trees, Ferns, Phyllocacti, Rhododendrons, Azaleas, Cinerarias, and many other subjects. An exceptional number of novelties were presented to the FLORAL COMMITTEE for award, and this body granted one First-class Certificate and six Awards of Merit. The ORCHID COMMITTEE conferred one First-class Certificate and two Botanical Certificates. The NARCISSUS COMMITTEE made no award to a novelty. Not much was brought before the notice of the FRUIT AND VEGETABLE COMMITTEE, and no award was made in this section.

At the 3 o'clock meeting, a lecture on "Mendel's Law and its Application to Horticulture" was delivered by Mr. C. C. Hurst. A resumé of the lecture is given on p. 302.

Floral Committee.

Present: H. B. May, Esq. (Chairman), Messrs. George Paul, W. J. James, E. H. Jenkins, W. P. Thomson, C. T. Druery, W. Cuthbertson, Chas. E. Pearson, A. Turner, W. Bain, J. F. McLeod, Wm. Howe, C. R. Fielder, R. C. Notcutt, T. W. Turner, John Green, Jas. Douglas, Jas. Hudson, J. W. Barr, Charles E. Shea, H. J. Cutbush, J. Jennings, Charles Blick, E. T. Cook, A. Kingsmill and R. W. Wallace.

As at the last meeting, there were many beautiful displays of Roses. Mr. G. MOUNT, Canterbury, Kent, exhibited in his usual excellent style a large display of these flowers. The blooms were beautifully fresh and bright, of the largest size, and on long, stout stems, with handsome foliage. The majority were of well-known varieties in large hatches, such as the magnificent white Frau Karl Druschki, shown in splendid condition, Mrs. John Laing, Ulrich Brunner, Mrs. R. G. Sherman Crawford, Mme. Abel Chatenay, and, amongst red Roses, Captain Hayward, General MacArthur and Richmond. There were also numerous other kinds in smaller numbers, the

(See also figs. 117 and 118 in the last issue.)

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

ELODEA CANADENSIS.—In the interesting article on p. 248 on "Plant Invaders," you speak of *Elodea canadensis* as "now ubiquitous in rivers, &c., all over the country." I am curious to know if this is really the case, for certainly in the neighbourhood of Chester, where I used to live, and where I remember some 30 years ago the canal was so blocked with it that the barge traffic was seriously impeded, the plant has now become quite scarce. My friend Mr. J. D. Siddall, of Chester, to whom I wrote on this subject, replies as follows:—"I wanted some *Elodea* two months ago, and had quite a job to find a bit, and what I got at last was feeble and small as compared with the plants of, say, 20 years ago. Then, at any time in the winter or summer, it was plentiful, and in winter the cell contents of the stems were most active and interesting, but I have quite failed this last winter to stir them up into anything like their old activity, even after keeping them warm in the house for a week or two." Mr. Siddall having devoted much attention to this plant, his remarks on the apparently

temperature of 65°, and as the flowers open are removed to a cool house. We grow the plants in 6-inch pots, and give them liquid manure every time they require water until growth is completed. They are then removed to an unheated pit, and are never allowed to become dry, but kept slightly moist. Some of our bulbs carried two spikes, and most of them seven flowers to the spike this season. *J. B. Pow, Dunsany Gardens, Co. Meath.*

ACETYLENE GAS REFUSE.—We have found that a thin layer of this material placed over the ground will rid it of wireworm and other harmful grubs. I have not ascertained if it has killed the wireworm, but they have left the ground where it was put on. It is best applied to vacant land, where it should be dug in, and no plant should be placed on the land for at least two months after the gas lime is applied. The best time for the application is autumn or spring. Do not put it on fresh from the generator when wet, but in some out-of-the-way corner of the garden, where it can stay until it is well drained and nearly dry. I do not advocate using it on the same plot of land every year, once in three or five years being sufficient. We have used it for the following crops:—Potatoes, Peas, Beans, Celery.

whole forming a magnificent display. (Gold Medal.)

Messrs. G. PRINCE & Co., Oxford, exhibited Rambler Roses and a few Hybrid-Tea varieties. Plants of Dorothy Perkins, Hiawatha, Crimson Rambler, and the beautiful single-flowered Blush Rambler were crowded with their pretty blossoms.

Messrs. B. R. CANT & Co., Colchester, had a group of climbing varieties of Roses, amongst which the beautiful Austrian Yellow variety was conspicuous. (Silver Floral Medal.)

Another similar exhibit was staged by Messrs. FRANK CANT & Co., Colchester. (Silver Banksian Medal.)

Messrs. W. PAUL & SON, Waltham Cross, Herts., arranged as a corner exhibit Roses of the climbing Polyantha type, many of the varieties being old, but equally as beautiful as the newer kinds. Waltham Rambler was shown even better than at the last meeting; Bordeaux bears large trusses of blooms tinged with a shade of purple. The colouring of Lyon Rose is superb; perhaps rose shaded with gold best describes it. (Silver Flora Medal.)

A bold display of Himalayan Rhododendrons was made by Messrs. R. VEITCH & SON, Exeter. There were large plants, lifted from the border, of such fine varieties as Doctor Stocker, Glory of Penjerrick, R. niveum, R. Falconeri, and a new variety named Princess of Orange (R. Thomsonii \times indicum). The flowers of this hybrid are suffused with rose on a pale ground. (Silver-gilt Flora Medal.)

Messrs. JOHN WATERER & SONS, LTD., Bagshot, Surrey, staged a magnificent group of Rhododendron Pink Pearl. (Silver Banksian Medal.)

Mr. G. REUTHE, Keston, Kent, displayed Rhododendrons in great assortment, having also many Alpine and garden plants along the front of the group. *Viburnum Carlesii*, which received a First-class Certificate on this occasion, was noticed in this group. (Bronze Flora Medal.)

Rhododendrons were largely exhibited by Messrs. R. GILL & SONS, Penryn and Falmouth. The variety Gill's Triumph (R. Thomsonii \times R. Griffithianum), which received an Award of Merit last season, was one of the most noticeable; the large flowers are a shade of rose. Messrs. GILL also showed R. Falconeri and R. Thomsonii very finely. R. niveum has lilac-coloured flowers; the under surfaces of the foliage are white. Sprays of *Embothrium coccineum* were crowded with the scarlet blossoms. (Silver Banksian Medal.)

Messrs. JOSEPH CHEAL & SONS, Crawley, Sussex, displayed cut branches of uncommon and choice shrubs and trees, *Mespilus canadensis*, Magnolias in variety, the floriferous *Spiraea arguta*, *Exochordia grandiflora*, *Acer palmatum sanguineum*, *Pyrus Malus floribunda*, and many other choice subjects for the shrubbery and pleasure ground were shown by this firm.

Carnations of the Souvenir de la Malmaison type were shown as pot plants by C. F. RAPHAEL, Esq., Shenley (gr. Mr. A. Grubb). They were mostly of the pink Princess of Wales variety, but there were a few plants of the darker Maggie Hodgson kind and others of the scarlet King Arthur, which provided assortment. As examples of high culture, the plants would be hard to surpass; each bore several finely-developed blooms, and appeared in perfect condition. (Silver-gilt Flora Medal.)

There were several exhibits of perpetual-flowering Carnations. Mr. H. BURNETT, Guernsey, displayed popular kinds, such as Britannia, Enchantress, Mrs. H. Burnett, White Perfection, &c., in magnificent examples, a great feature being the high colouring, due in part, no doubt, to the favourable climate in which they were grown. (Silver Banksian Medal.)

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, also showed Carnations of this type, these plants being a speciality of this firm. The Carnations formed a portion only of Messrs. Low's exhibit, for they had in addition Roses, Hydrangeas, Ericas, Spiraes, *Clianthus puniceus*, *Azalea roseiflora*, and other greenhouse flowering plants. (Silver Banksian Medal.)

Messrs. W. CUTBUSH & SON, Highgate, London, N., displayed an assortment of the perpetual-blooming Carnations. The new Lady Coventry variety of the Souvenir de la Malmaison type was noticed (see fig. 127). Some of the blooms measured 6 inches across. Messrs. CUTBUSH also showed forced shrubs in variety. (Silver Flora Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, showed an assortment of greenhouse plants including Verbenas, scented-leaved Pelargoniums, dwarf Roses, *Statie profusa*, and varieties of Pansies and Violas. Adjoining the flowering plants was a select group of Ferns, all with their spring foliage. The more handsome were *Nephrolepis exaltata Amerpholii*, the best of these new decorative Ferns; *Polypodium Knightiae*, the long fronds being delicately incised; P. *Billardieri cristatum*, a rare variety; *Gymnogramme schizophylla superba*; *Lomaria platyptera*, a fast-growing, elegant tree Fern; and *Leucostegia immersus*, with fronds tinted rose colour. (Silver Flora Medal.)

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, showed several exhibits of diverse flowers. On the table they usually occupy was a magnificent collection of Phyllocacti, mostly hybrids raised in the Veitchian nurseries. Especially fine were the varieties *Pytho*, *Thalia*, *Gem*, and *Hilda*. Another exhibit was of *Schizanthus*, the plants representing a choice strain of this greenhouse plant. As a floor exhibit, Messrs. VEITCH showed flowering Cherries—*Cerasus Watereri*, also *Amagdalus persica* fl. pl. (Silver-gilt Flora Medal.)

Mr. JAMES DOUGLAS, Edenside, Great Bookham, Surrey, contributed a grand display of Auriculas. Of the 400 plants which comprised the exhibit each was shown in best exhibition style. There were no fewer than 80 varieties, many of them of Mr. DOUGLAS'S raising. As being especially good, we may enumerate *Argus* (deeply shaded with purple), *Flora MacIvor* (of rosy purple colouring with a yellow centre), *Acme* (a white-edge variety), *Miss Willmott* (a dark maroon self flower of large size and with a perfectly-formed truss: this variety is not yet in commerce); *May Day* (a yellow self variety), *Phyllis*, *Teviot Dale*, *Heather Bell*, and *Mildred Jay*. (Gold Medal.)

Large-flowering varieties of Clematis, intermingled with Ferns and backed by a row of Laburnum plants, were shown by Mr. L. R. RUSSELL, Richmond.

Heliotropes in variety were shown by THE KING'S ACRE NURSERY Co., Hereford. Some of the trusses of flowers were 9 or 10 inches across. (Silver Banksian Medal.)

Messrs. J. CARTER & Co., High Holborn, London, made an attractive exhibit with *Cinerarias*, the brightly-coloured flowers furnishing a gay effect. The group was staged in a formal but attractive manner. (Silver Flora Medal.)

Exhibits of Violas and Pansies were again shown by Messrs. DOBBIE & Co., Rothesay (Silver Banksian Medal), and Messrs. CARTER, PAGE & Co., London Wall, London (Bronze Banksian Medal).

Much the best strain of Polyanthus exhibited was shown by Mr. S. MORTIMER, Rowledge, Farnham, Surrey. The plants were arranged in batches of yellow, crimson, white, and mixed varieties, and their flowers were so numerous as to hide the foliage. (Bronze Flora Medal.)

Messrs. GILBERT & SON, Dyke, Bourne, Lincolnshire, showed their specialities amongst Anemones, the beautiful King of Scarlets variety predominating.

Messrs. H. CANNELL & SONS, Swanley, Kent, made one of their characteristic displays of Zonal Pelargoniums and a row of the Regal or Show type. The following varieties in the Zonal section are all noteworthy:—Dublin (magenta), Sydney (rose-pink), Berlin (scarlet), Claremont (white), Paris (white and pink), and New York (scarlet). (Bronze Flora Medal.)

Messrs. HEATH & SONS, Cheltenham, staged scented-leaved Pelargoniums, of which plants this firm possesses a great variety.

Messrs. W. & J. BROWN, Cheltenham, showed a big white Daisy named *Venus*, a rather coarse-flowered yellow *Gaillardia*, *Lotus peliorhynchus*, and small well-flowered plants of *Olearia stellulata*.

Mr. CHAS. BREADMORE, Winchester, showed Sweet Peas, including a new cream-coloured variety named *Princess Juliana*. Mr. BREADMORE also staged Carnations.

Messrs. R. & G. CUTBERT, Southgate, London, N., showed hybrids of Rhododendron (*Azalea sinense*, the plants being densely covered with their attractive flowers. (Silver Flora Medal.)

Exhibits of Alpine and hardy border plants formed a very considerable portion of the exhibi-

tion. Mr. AMOS PERRY, Enfield, Middlesex, had an interesting group, amongst which we noticed especially fine examples of *Adonis vernalis*, *Corydalis nobilis*, *Mertensia virginica*, *Arnebia echioides*, and a good strain of *Polyanthuses*. (Bronze Flora Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, London, W.C., showed hardy flowering plants, intermixed with bulbous flowers.

Mr. A. R. UPTON, Hardly Plant Nursery, Guildford, showed an assortment of spring flowers. The peerless *Gentiana acaulis*, one of the most beautiful of all blue flowers; *Polemonium confertum melitum*, and *Haberlea rhodopensis* were specially noteworthy.

Mr. MAURICE PRICHARD, Christchurch, Hants, exhibited Alpine and hardy flowers. The plants were finely in flower, and staged with great skill. We noticed many species of uncommon interest, and there were Irises, Anubrietas, Tulips, *Ranunculus amplexicaulis*, and other species. (Silver-gilt Banksian Medal.)

Another excellent exhibit of Alpine plants was shown by Messrs. J. PEED & SONS, Forest Hill, London. Many succulent plants were included in the display. Messrs. PEED also exhibited, as a separate group, an assortment of ornamental-leaved Maples, interspersed with Callas and large-flowered Clematis. (Silver-gilt Banksian Medal.)

Other exhibitors of Alpine and hardy border plants were Mr. W. P. HORTON, Cravenhurst, Seaford, Sussex; Messrs. PHILLIPS & TAYLOR, Lily Hill Nurseries, Bracknell, Berks: some well-flowered Auriculas were shown by this firm; the Misses HOPKINS, Mere Gardens, Shepperton-on-Thames; Messrs. T. S. WARE, LTD., Feltham (Bronze Flora Medal); Messrs. BAKER'S, Wolverhampton (Silver Banksian Medal); Messrs. G. & A. CLARK, LTD., Dover (Silver Banksian Medal); Messrs. GEO. JACKMAN & SON, Woking, Surrey; Mr. H. C. PULHAM, Elsenham, Essex; and Messrs. GEO. BUNYARD & Co., LTD., Maidstone (Bronze Flora Medal.)

Messrs. PAUL & SON, The Old Nurseries, Chess-hunt, showed varieties of ornamental trees and shrubs; also climbers and a few pot plants of hard-wooded species in flower. (Bronze Flora Medal.)

A Cultural Commendation was awarded to Mr. W. Bain (gr. to Sir TREVOR LAWRENCE, Bart., Burford, Dorking) for a splendidly-flowered plant of the curious *Tacca cristata*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Viburnum Carlesii.—This beautiful and fragrant white-flowered shrub has previously received an Award of Merit. This Award is now superseded by a First-class Certificate. The species was described and illustrated in *Gardeners' Chronicle*, May 30, 1908, p. 346, fig. 155. The plant now exhibited had been lifted from the open on the day previous to the meeting, and had been grown without the least protection. Having endured 29° of frost without injury, it is but reasonable to conclude that the plant is perfectly hardy, and thus is a welcome addition to flowering shrubs. Exhibited by Sir TREVOR LAWRENCE, Bart., Dorking (gr. Mr. W. Bain).

AWARDS OF MERIT

Saxifraga Clibranii (see fig. 130).—A deep-red flowering variety of the mossy section. The habit is quite distinct, and the plant flowers profusely. From Messrs. CLIBRANS, Altrincham.

Saxifraga decipiens Arkwrightii.—A handsome, distinct and pure white-flowered variety of this section of the mossy Saxifragas. The flat-tish flowers are nearly the size of a shilling, and the plant blooms very freely. From Messrs. BAKERS, Codsall, Wolverhampton.

Cineraria flavescens (Cineraria Feltham Beauty \times Senecio articulatissima).—A remarkable novelty, and probably the first step to a yellow-flowered *Cineraria*. The exhibited plant was particularly well grown and flowered, the heads of blossoms being equal to those of well-grown *Cinerarias*, with a somewhat modified leaf growth. The opening blossoms are of clear canary-yellow tone, the expanded blossoms merging into a deep cream shade and finally becoming white. From Messrs. JAMES VEITCH & SONS, LTD., Chelsea.

Primula \times Unique improved.—This plant has been raised from a cross between P. Cockburni-

ana and *P. pulverulenta*, the latter species being the seed-bearing parent. The colour is intermediate between the parents, but in size of blossom, leafage and the mealy character of the leaves and stems, there is much to suggest the influence of *P. pulverulenta*. It is a more robust plant than *Primula* × *Unique* figured in *Gardeners' Chronicle*, June 15, 1907. The older plant was raised from the same parents, but in this case *P. Cockburniana* was the seed-bearer. From Messrs. JAS. VEITCH & SONS, Chelsea.

Nephrolepis lycopodioides.—A further addition to this densely plumose set of Ferns. The fronds are smaller than in the case of some other varieties already in commerce. From Messrs. T. ROCHFORD & SONS, Turnford Hall, Herts.

Hydrangea hortensis alba.—A pure white variety, and one that should prove of much value. From Messrs. HUGH LOW & CO., Enfield.

Narcissus Committee.

Present: H. B. MAY, Esq. (Chairman), and Messrs. G. W. LEAK, Henry Backhouse, W. A. MILNER, Christopher Bourne, W. POUPART, R. SYDENHAM, F. W. CURREY, P. R. BARR, Joseph Jacob, R. W. WALLACE, James Walker, F. HERBERT CHAPMAN, E. WILLMOTT, W. T. WARE, A. KINGSMILL, J. T. BENNETT-POE, E. M. CROSSFIELD, G. H. ENGLEHEART, and P. D. WILLIAMS.

A large number of new varieties were submitted for award, but none was considered worthy.

The most comprehensive exhibit was shown by Messrs. BARR & SONS, King Street, Covent Garden. In addition to a large collection of flowers of other types, the group contained an almost unique collection of triandrus hybrids with flowers of varying degrees of size. Not a few of these were flowering for the first time this year. Of the kinds already in commerce we noticed the giant *Leedsii Czarina* with its great perianth 5 inches across; *Masterpiece*, a fine flower of the *Engleheartii* section with characteristic flat and flame-coloured crown; *Challenger*, another handsome variety of the same group; *Lord Morley*, a giant of the hybrid triandrus set, with a creamy, drooping crown; *Snow King*, probably the biggest of the poeticus section; *Cassandra*, *Apricot Phoenix*, with double flowers; *White Lady*, and *Fire King*, which has a particularly rich and intensely-coloured crown, the shade of orange being thrown into greater relief by a base of green; and *N. odoratus rugulosus maximus*, a flower of medium size and a rich tone of yellow. (Silver-gilt Banksian Medal.)

Mr. F. HERBERT CHAPMAN, Rye, had a small collection of *Narcissus poeticus* in variety, a section to which this gentleman directs special attention.

Miss F. W. CURREY, Lismore, Ireland, exhibited choice varieties. *Will Scarlett*, *White Lady*, *Red Star*, *Warley Scarlet* (a fine flower of the incomparabilis type, and *Maggie May* were conspicuous.

Messrs. WM. BULL & SONS, King's Road, Chelsea, displayed a general collection of the later-flowering varieties of *Narcissus*.

Mr. H. D. PHILLIPS, Olton, Warwickshire, who was exhibiting for the first time at these meetings, had a particularly choice assortment of *Narcissus*. Especially good were *Horace*, *Inognita*, *Rymister*, *Seville* (which may be described as a much-improved *Will Scarlett*), *Gloria Mundi* (very fine in colour), *Una* (a big *Leedsii* in which there is more orange colour in the crown or cup than is usual in this section), *Evangeline*, and *Weardale Perfection*. (Silver Flora Medal.)

Messrs. R. W. WALLACE & CO., Colchester, had a capital assortment of Tulips, including early-flowering Cottage and Darwin kinds.

A group of a fine seedling *Narcissus* was shown by Messrs. SUTTON & SONS, Reading. It appeared to be intermediate between *Evangeline* and *White Lady* in colour, but a much larger flower than either of these.

Messrs. R. H. BATH, LTD., Wisbech, brought a rich display of early single, double and other Tulips, also a choice collection of *Narcissus*, the latter including *Torch*, *White Lady*, the large-flowered *Una* of the *Leedsii* group, *Princess Ena* (a giant hybrid from triandrus King Alfred), *Larissa* (a superb *Engleheartii* variety), *Gloria Mundi*, *Sulphur Phoenix*, and *Cassandra*. (Silver Banksian Medal.)

Messrs. HOGG & ROBERTSON, Dublin, displayed an excellent group of early-flowering Tulips, the flowers being characterised by much freshness and beauty. (Silver Banksian Medal.)

Mr. E. H. CAVE, Mangotsfield, near Bristol, showed a beautiful lot of unnamed seedling *Narcissus*. (Silver Banksian Medal.)

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, had a large assortment of *Narcissus* and Tulips, the former including *Primrose Phoenix*, *Sulphur Phoenix*, *Will Scarlett*, *Gloria Mundi*, *Poetaz Aspasia*, *Mme. de Graaff*, and *Thelma*.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. JAS. O'BRIEN (hon. sec.), de B. CRAWSHAY, H. LITTLE, W. BOXALL, J. FORSTER ALCOCK, R. G. THWAITES, F. M. OGILVIE, Walter Cobb, A. A. McBEAN, J. CHARLESWORTH, J. CYPHER, W. H. HARTECH, H. G. ALEXANDER, A. DYE, W. H. WHITE, H. A. TRACY, H. BALLANTINE, C. J. LUCAS, and Gurney Wilson.

Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt, Tetbury (gr. Mr. H. G. Alexander), showed the beautiful *Odontoglossum Phoebe* Westonbirt variety, and it appeared even better than on the previous occasion; *O. crispum Muriel*, a very handsome lilac-tinted flower with fringed petals

Mr. W. H. White), sent the rare *Oncidium stramineum*, and two others. (See Awards.)

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), showed *Zygopetalum Clarksonii* (crinitum × Clayi), with chocolate-purple coloured sepals and petals and violet lip; *Odontioda Lutetia* with 10 fine scarlet-blotched flowers on a spike; *Laelio-Cattleya Feronia* (C. Enid × L.-C. Haroldiana), with cream-coloured sepals and petals tinged with rose, and a very fine, bright-purplish, crimson lip.

Messrs. CHARLESWORTH & CO., Haywards Heath, staged a selection of rare and handsome Orchids, including a grand seedling blotched *Odontoglossum crispum* closely approaching *O. c. Leonard Perfect*; several plants of the bright-yellow *Laelio-Cattleya G. S. Ball*, *Brasso-Cattleya Digbyana-Mossiae*, *Odontoglossum ardentissimum xanthotes* of fine shape, pure white with yellow markings on the lip; *Cattleya Empress Frederick*, the rare pure white *Aerides virens Sanderæ*, and *Masdevallia bella*.

JOHN RUTHERFORD, Esq., Beardwood, Blackburn (gr. Mr. Lupton), sent *Odontoglossum amabile* Beardwood variety, a very large white flower heavily blotched with purple; also a small selection of well-grown *Laelio-Cattleyas*, *Cattleya intermedia alba*, *Odontoglossums*, &c.

Messrs. CYPHER & SONS, Cheltenham, staged a

FIG. 130.—SAXIFRAGA CLIBRANII: FLOWERS CRIMSON.
(See R.H.S. Awards)

bearing some red spots; *O. triumphans* Westonbirt variety of fine form and bright yellow colour, heavily blotched with chestnut brown; and the grand *Laelio-Cattleya Dr. R. Schiffman* Westonbirt variety. (See Awards.)

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed *Brasso-Cattleya The Baron* (C. Lord Rothschild × B. Digbyana), for which Messrs. Sander received a First-class Certificate April 3, 1906, and which was fully described and illustrated in the *Gardeners' Chronicle*, April 7, 1906. No flower was available for the painting at that time. The Committee confirmed the Award on consideration of the picture being obtained from Mr. J. GURNEY FOWLER's flower.

The Duke of MARLBOROUGH, Blenheim Palace (gr. Mr. Hunter), showed *Odontoglossum crispum Dinah*, a handsomely-blotched form, and *Cypripedium bellatulum* "His Grace."

De B. CRAWSHAY, Esq., Rosefield, Sevenoaks, again showed his unique *Odontoglossum Theodora*, illustrated and described in the *Gardeners' Chronicle*, April 24, 1909, p. 269; and *Odontioda Charlesworthii* Theodora, a very beautiful flower of a deep Indian-red colour with a shade of orange.

Sir TREVOR LAWRENCE, Bart., K.C.V.O. (gr.

group containing good *Cattleya intermedia alba*, and other *Cattleyas* and *Laelio-Cattleyas*, including two very dissimilar varieties of L.-C. Ganymede. Also forms of *Laelia purpurata*, *Epiphronitis Veitchii*, *Phaio-Cymbidium Chardwarensis*, and a plant of the rare bright-yellow *Bulbophyllum Sillemianum*. (Silver Flora Medal.)

Messrs. HUGH LOW & CO., Bush Hill Park, staged a group of Orchids, in which were good forms of *Cattleya Mendelii*, *Dendrobium barbatulum*, *D. Pierardii*, *D. primulinum*, *D. thyrsoflorum*, various *Odontoglossums*, and a specimen of the curious little *Bulbophyllum tremulum*. (Silver Flora Medal.)

Messrs. J. & A. A. McBEAN, Cooksbridge, staged a group in which were some fine *Odontoglossums*. Among the forms of *O. crispum* were the pretty *O. c. Oakfield Sunrise*, and with the hybrids was a finely-blotched form of *O. Lambeauianum*. Others noted were *Cymbidium eburneo-Lowianum* concolor, a fine flower of yellowish-cream colour; *C. insigne rotundum*, a large and finely-formed white flower tinged with rose and closely spotted on the lip; good *Cattleya Mendelii*, *C. intermedia alba*, &c. (Silver Banksian Medal.)

Monsieur MERTENS, Mont. St. Amand, Ghent, showed a selection of hybrid *Odontoglossums*. (Silver Banksian Medal.)

Mr. A. W. JENSEN, Lindfield, Haywards Heath, showed a magnificent specimen of *Cattleya Mendelii* with 96 flowers.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), sent *Cattleya Mendelii* majestic, a white flower with a pearly-pink tinge, the front of the lip being purplish rose, the tube tinged with yellow; and *C. Mendelii* Thalia, a nearly white flower with a purple pencilling on the front of the lip.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), showed *Brasso-Lælia* Rosslyn (*B. Digbyana* × *L. Latona*), white tinged and veined with rose.

E. de QUINCEY-QUINCEY, Esq., Oakwood, Chislehurst (gr. Mr. G. B. Lees), sent *Lælio-Cattleya* Dorothy Heywood (*L. Pacavia* × *C. Warneri*).

Miss EDITH M. ARGLES, The Vineyard, Peterborough, sent a good specimen of *Dendrobium densiflorum* with 10 spikes, which was originally brought by her from Darjeeling.

Mr. C. RAVENS, Odense, Denmark, showed *Cattleya Luddemanniana* Ravens' variety, white with purple markings on the lip, and very near to *C. L. Stanleyi*.

GURNEY WILSON, Esq., Glenthorne, Haywards Heath, showed *Oncidium sphacelatum*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Lælio-Cattleya Dr. R. Schiffman Westonbirt variety (C. Mendelii × L.-C. callistoglossa), from Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—A noble hybrid of great size, perfect form and charming colour. The broad, flat sepals and large and beautifully-arranged petals are silver-white tinged and slightly veined with rosy-mauve. The handsome labellum, which opens very widely, as in the best forms of *L.-C. callistoglossa*, is purplish-crimson in front, the disc chrome-yellow, and the base reddish-purple with pale yellow lines. Having *Cattleya Mendelii*, *C. Warszewiczii* and *Lælia purpurata* in its composition, this hybrid is a specially good one. It shows the influence of *C. Warszewiczii* strongly, and hence fine features are in the Westonbirt variety which may not appear in others of the same parentage.

BOTANICAL CERTIFICATE.

Brassavola Martiana, from Sir TREVOR LAWRENCE, Bart., K.C.V.O. (gr. Mr. W. H. White).—A very distinct species of the *B. Perrinii* section, bearing short, upright spikes of several small, white flowers with ovate fringed labellums. The flowers are very fragrant.

Epidendrum densiflorum, from Sir TREVOR LAWRENCE, Bart.—A tall-growing species, in habit resembling *E. paniculatum*, the greenish flowers being closely arranged on the inflorescence.

CULTURAL COMMENDATION

to Mr. H. J. Chapman (gr. to NORMAN C. COOKSON, Esq., Oakwood, Wylam) for a very fine example of *Odontoglossum Andersonianum* *Crawshayanum*.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair), and Messrs. J. Cheal, C. G. A. Nix, A. H. Pearson (Vice-chairman), A. R. Allan, W. Barnes, J. Basham, W. Bates, E. Beckett, T. Coomber, A. Dean, C. Foster, J. Harrison, G. Hobday, J. Lyne, H. Markham, F. Perkins, H. S. Rivers, O. Thomas, Jas. Vert, G. Wythes, P. C. M. Veitch, G. Reynolds, H. Hooper, J. Davis, P. D. Tuckett, and W. Poupart.

MESSRS. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, showed several varieties of Apples that had been well kept. The varieties included Bow Hill Pippin, Betty Geeson, Northern Spy, Newton Wonder, Bramley's Seedling, Lord Hindlip, Baxter's Pearmain, Alfriston, Norfolk Beauty, and Barnack Beauty. There were also good fruits of *Bellisima d'Hiver* and *Directeur* Alphan Pears. Messrs. VEITCH also showed varieties of forced vegetables, including Lettuce, Beans, Tomatos, Peas, Turnips, Cabbages, and Radishes.

Messrs. SUTTON & SONS, Reading, showed varieties of forced vegetables, including good examples of Sutton's Market Cucumber, Golden Ball Lettuce, Winter Beauty Tomato, Long Parisian Turnip, Perfection Asparagus, Red

Forcing Radish, Earliest of All Lettuce, Champion Scarlet Horn and April Cabbages. (Silver Knightian Medal.)

Mrs. BISCHOPFSHIEM, Warren House, Stanmore, exhibited pot Strawberries of the Louis Gauthier variety. Each plant had half-a-dozen well-developed fruits.

COMPETITIVE CLASSES.

Classes were provided for Strawberries, Melons and Figs, but only three exhibits of Strawberries were staged, one by Messrs. J. and F. CHATFIELD, Southwick, Sussex, in a class restricted to trade growers for three varieties (Silver Knightian Medal), and two in a class for a box of one variety, the exhibitors being LADY FOLEY, Ruxley Lodge, Claygate, Surrey (Mr. H. C. Gardner), and LORD HOWARD DE WALDEN, Audley End (gr. Mr. J. Vert), who were awarded the 1st and 2nd prizes respectively.

MENDEL'S LAW AND ITS APPLICATION TO HORTICULTURE.

THE following is an abstract of the lecture delivered by Mr. C. C. Hurst at a meeting of the Fellows of the Royal Horticultural Society held in the afternoon of Tuesday last:—

Mendel's Law was founded on simple characters in garden Peas, which behave in breeding as dominants and recessives. In his classical experiments with Peas, Mendel found that round seeds were dominant to wrinkled seeds, which were recessive; similarly, yellow seeds were dominant and green seeds recessive.

Recent experiments have shown that many simple characters in garden plants follow Mendel's Law. For instance, starchy and sugary Maize, palm and fern-leaved Primulas, small and large-eyed Primulas, red and yellow Tomatos, purple and red Sweet Peas, tall and dwarf Peas, etc., all behave as pairs of Mendelian characters, the first of the pair being dominant and the other recessive.

When the Mendelian characters happen to correspond with the horticultural characters, it is a simple matter for the breeder to breed quickly what he wants. For he knows that the recessive character will breed true at once, and that by breeding from several individuals bearing the dominant character one will be found which breeds true. This enables the breeder to dispense with the old and laborious method of so-called "fixing by continuous selection," which, though usually effective in the end, is now recognised as a waste of time. Mendel's Law provides a much quicker and more effective method of achieving the same result.

BREEDING NOVELTIES BY RE-COMBINATION.

The combination of two pairs of simple characters by crossing and the results which follow the self-fertilisation of such crosses are of great utility to the breeder, for in the process of re-combination following Mendelian segregation new forms arise which will breed true in accordance with Mendel's law. Thus Mendel himself crossed a round yellow with a wrinkled green Pea, and obtained in the second generation round green and wrinkled yellow Peas, some of which bred true at once. By following Mendel's Law, Mr. Cuthbertson obtained in the second generation the new and valuable variety of Sweet Pea "Waved King Edward" by simply crossing the plain red "King Edward" with the waved pink "Countess Spencer." In a similar manner Mr. Cuthbertson also raised the new and valuable variety "Primrose Spencer." In my own experiments a few years ago I raised a true stock of the novelty "Black Knight" Cupid in the second generation by crossing Tall "Black Knight" with Pink Cupid. In this case, however, I unexpectedly found three Mendelian characters concerned in the cross, and, consequently, only three plants out of 64 came "Black Knight" Cupid, all of which bred true at once, the characters concerned being all recessive.

COMPOUND CHARACTERS.

In many cases, however, the Mendelian characters do not happen to correspond with the horticultural characters, and interesting complications then arise. For instance, in my experiments with Tomatos, red and yellow fruits behaved as a Mendelian pair of characters, red being dominant. But when the fiery-red "Fireball" was

crossed with "Golden Queen," four distinct forms appeared in Mendelian proportions in the second generation. There were two kinds of reds and two kinds of yellows. This I found to be due to the fact that the fiery-red colour of "Fireball" was really a compound of two distinct Mendelian characters, red flesh and yellow skin, while "Golden Queen" had yellow flesh and white skin. Consequently, in the second generation two new forms arose by re-combination, a carmine or "pink" Tomato, with red flesh and white skin, and a deep yellow Tomato, with yellow flesh and yellow skin. Both these novelties bred true. Similarly, Professor Bateson, by crossing a red Sweet Pea with a cream, obtained whites in the second generation, the white colour being due to a re-combination of the white plastids of the red Sweet Pea with the white sap of the cream.

An even more interesting result of the same nature has also recently been obtained by Professor Bateson, at Cambridge, by crossing the Bush and Cupid forms of Sweet Peas. In the first generation all the cross-breeds were, curiously enough, tall in habit, like the ordinary Sweet Pea. In the second generation, however, there arose in Mendelian proportions, tall, bush, prostrate Cupid, and a new variety called "Erect Cupid," with a peculiar habit of growth something like Box edging. This result has been shown to be due to the compound nature of these horticultural characters, the crossing of which leads to various re-combinations, in accordance with Mendel's Law.

In all, 16 pairs of Mendelian characters have so far been found in Sweet Peas.

Professor Bateson has also found that the red colour of Sweet Peas is due to the presence of two Mendelian characters, in the absence of one or both of which the flower is white or cream. Purple colour in Sweet Peas is due to the presence of a third Mendelian character, which only becomes patent in the presence of the other two, and so on.

From this follows the interesting and important discovery that albinos (white or cream) in Sweet Peas may carry certain colour factors, which may become patent when the albino is crossed with another albino or with a coloured form.

It seems likely that other species of plants behave in a similar way. For instance, *Primula sinensis* "Crimson King" crossed with *P. s. stellata* "Primrose Queen" (an albino form with large, yellow eye) gave in the second generation crimson, pure white, magenta, rose, and tinged white forms: each colour appeared with small eyes and large eyes. All these appeared in *sinensis* and *stellata* forms, there being at least 18 distinct forms, showing the great variety that can be obtained from a single cross. I obtained similar colours by crossing crimson and white *sinensis* forms. In another of my *Primula* crosses, palm-leaved *stellata* with red stems and pink flowers crossed with fern-leaved *sinensis* with green stems and white flowers, I obtained in the second generation 36 distinct forms, of which 34 were new (i.e., distinct from the parents), 14 of which could be bred true, while 20 of the forms were unfixable, being Mendelian hybrids.

ALBINO ORCHIDS.

Recent experiments go to show that, like Sweet Peas and other plants, albino Orchids may carry different colour factors. To the Orchid breeder this is a most important matter, as he naturally wishes to raise new and improved forms of valuable albinos by crossing. Results show that such albinos, for instance, as *Cattleya Mossiae* Wageneri, *C. intermedia* alba, and *C. Gaskelliana* alba are carrying one colour factor alone, and, consequently, breed true albinos inter se. On the other hand, such albinos as *C. Harrisoniana* alba, *C. Schröderæ* alba, and *C. Warneri* alba are carrying a different colour factor, because, whenever the species of these two distinct sets are crossed coloured reversions arise, presumably through the coming together of the two distinct colour factors carried by the albinos. In a similar manner *Paphiopedilum callosum* Sanderæ, *P. Lawrenceana* Hyeunum (and probably *P. insignis* Sanderianum) appear to be carrying one colour factor, while *P. bellatulum* album is carrying a different colour factor, the former species breeding true albinos inter se, whilst giving coloured reversions when crossed with the latter species.

Dendrobium nobile virginale breeds true when selfed, but with D. Wardianum album gives coloured reversions.

Odontoglossum crispum Xanthotes, crossed with O. nobile album, so far has given all albinos. An important point for the Orchid breeder to note is that individual albinos of the same species may vary in their colour factors; thus it might happen that two individuals of the same albino (of different seed origin) might give opposite results in breeding. It is therefore of prime importance for Orchid breeders to adopt some simple method of identification for individual albinos. Once the colour-bearing properties of the albino individual are ascertained by experiment, all future breeding results from that plant (and its many off-shoots) can be foreseen by the aid of Mendel's Law.

"BLOTCHED" CRISPUMS.

Another important matter of great concern to Orchid breeders is the possibility of breeding the valuable "blotched" crispums true from seed, and it seems highly probable that in this respect Mendel's Law can be of assistance.

So far as present results go, it would appear that the "blotched" character in Odontoglossum crispum is a Mendelian dominant to the "plain" character, which is recessive. For instance, "blotched" crispum crossed with "blotched" nobile (Pescatorei) produces from the same seed-pod both "blotched" and "plain" forms of O. X armainvillieriense ardentissimum, and "blotched" forms of this hybrid crossed with the "blotched" X Rolfeae also produce "blotched" and "plain" forms of O. X perculatum from the same seed-pod. On the other hand, "plain" crispums and nobiles bred inter se seem so far to give all "plains." Further, the "blotched" species with yellow grounds, O. triumphans, O. luteopurpureum, and Haryanum, all seem to be dominant to the "plain" crispums and nobiles in primary hybrids.

These facts all point to the dominance of "blotched" character to the "plain."

If this proves to be the correct interpretation of the facts, then "blotched" forms are of two kinds, viz., pure "blotched," which will produce all "blotched" forms, however crossed, and impure "blotched," which will produce both "blotched" and "plain" forms.

The much-to-be-desired pure "blotched" forms may therefore be easily isolated from the impure "blotched" forms by a simple breeding test with a recessive "plain" form. Once proved to be a pure dominant, the pure "blotched" form (and its many off-shoots) may always be relied upon to breed "blotched" forms only. Such a pure "blotched" form—other points being equally good—would, when once tested, become invaluable as a stud plant. Once more Orchid breeders will recognise the absolute necessity of the precise identification of individual plants.

The above are only a few illustrations of the application of Mendel's Law to horticulture, but they may perhaps serve a useful purpose in suggesting to plant-breeders how they may take advantage of recent Mendelian research and apply it to their own advantage, which means the general advantage of horticulture.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

Mr. J. W. LENNOX, for the past 2 1/2 years Land Steward and Gardener to T. N. EDGEWORTH, Esq., Edgeworthstown, Co. Longford, as Gardener to Lewis Goodbody, Esq., Drayton Villa Gardens, Clara, King's County.

Mr. ARNOLD RIX, Fruit Foreman in the Royal Gardens, Sandringham, as Gardener and Forester to T. A. COOK, Esq., Sennowe Hall, Guist, Norfolk. (Thanks for 5s. sent for R.G.O. Fund.)

Mr. H. HALLEY, late Fruit Foreman at Hillingdon Court, Uxbridge, as Gardener to T. WILSON, Esq., Riseholme Hall, Lincoln.

Mr. JOSEPH SMITH, for the last 2 years Gardener to GEORGE S. F. F. WARD, Esq., Nether Warden, Hexham, Northumberland, as Gardener to Mrs. J. C. BROADBENT, Lascelles Hall, Kirkheaton, Huddersfield, Yorkshire.

Mr. E. J. AINSLEY, as Gardener to H. ARKWRIGHT, Esq., Turville Cottage, Henley-on-Thames.

MARKETS.

COVENT GARDEN, May 5.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—E.O.]

Cut Flowers, &c.: Average Wholesale Prices.

— broilers	0 6 —		

REMARKS.—Australian and Tasmanian Apples have advanced in value during the past week. Oranges are dearer and fewer are arriving. French Asparagus is cheaper and increased quantities arrive daily. There has been a good demand for Lemons and prices for them have risen considerably. The Strawberry trade is about the same as last week; there are increased quantities, but a small demand. Vegetables generally are cheaper. Rhubarb is very plentiful. Mushrooms will be much cheaper if fine weather continues. Trade generally is quiet. E. H. R., Covent Garden, Wednesday, May 5, 1909.

REMARKS.—Trade is still very quiet. Supplies are plentiful and prices have a downward tendency.—Edward J. Newborn, Covent Garden and St. Pancras, May 5, 1909.

COVENT GARDEN FLOWER MARKET.

Plants for summer bedding are a leading feature in the market, and these sell readily, for although there is still danger from frost, people in the London suburbs plant tender things as soon as the days are sunny. Pelargoniums are plentiful in all sizes, from those in store boxes up to well-flowered plants in 5-inch pots. Good plants in 60 size pots are worth from 2s. to 2s. 6d. per dozen, extra good plants of Paul Crampel in 60's have sold for 3s. per dozen. Yellow Calceolarias are remarkably good; those in 60 size pots realise from 1s. 3d. to 1s. 6d. per dozen and in 48's from 5s. to 6s. per dozen. Short sturdy Dahlias make from 2s. to 2s. 6d. per dozen. Fuchsias are procurable in 60's also in store boxes, and are quoted at low prices. Single Petunias in flower in 60 size pots sell readily at from 1s. 6d. to 2s. 6d. per dozen. Lobelia is at present only seen in store boxes, but soon there will be good plants in 3-inch and 5-inch pots. Carnations for bedding are much better than usual. Pansies are in demand, and those of the best quality are soon sold. Violas sell fairly well. Marguerites are more in demand than formerly; their prices vary according to the quality, and range from 1s. 6d. to 3s. Sweet Peas, Nasturtiums, and various other annuals in pots are procurable.

POT PLANTS.

Rambler Roses are remarkably fine; some sell for 25s. to 30s. each. Lady Gay, Hiawatha, Cant's Blush and Crimson Rambler are the principal varieties. The dwarf polyantha Roses are also good. Hybrid perennials are not well grown. Supplies of Azaleas hold out well, but they will not be procurable much longer. Pelargoniums are well-flowered. Ivy-leaved varieties in 5-inch pots are very suitable for floral decorations. Fuchsias in various sizes are well flowered. Cyclamen are still procurable but are not selling readily. Genistas vary in quality; some plants are rather far advanced in flowering. Hydrangeas are plentiful. Cinerarias are still of good quality. Mignonette is at its best condition, and rather over plentiful. I noted some good pots of Gypsophila elegans. Stocks, Spiræas, Lilium longiflorum, Ericas (including *E. candidissima*, *E. Cavendishii* and *E. propendens*) are all plentiful. Ferns, Palms and other foliage plants are well supplied.

CUT FLOWERS.

Roses have been very abundant for some time past, but there is a prospect of the supplies falling off. During the past week good forced Roses have sold at prices which could not recompense the growers. The value of Carnations has kept up better, but supplies of these flowers have been excessive. Callas have fallen to the lowest prices. Good Lilliums have also depreciated in value. The glut of Daffodils is not quite over. Gardenias are rather scarce. Tulips are chiefly the Darwin, Cottage-garden and Parrot varieties. Hyacinths have been received from Holland in large quantities, but supplies of imported flowers generally are falling off. Sweet Peas are over plentiful; their prices are considerably lower than when they were first grown for market. *A. H., Covent Garden, Wednesday, May 5, 1909.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending May 5.

Cold nights and sunny days.—During the past week there have been only two unseasonably warm days, but not a single warm night. On the two coldest nights the exposed thermometer registered respectively 6° and 7° of frost. The ground is at the present time at a seasonable temperature, both at 1 and 2 feet deep. Rain, hail or sleet fell on four days, but to the total depth of only half-an-inch. On one day there was a slight fall of snow. Small quantities of rain-water have come through both percolation gauges on most days of the week. The sun shone on an average for 10 hours a day, or for nearly twice the average duration for this period of the year. On one day the sun was shining brightly for altogether 12½ hours. The wind was high on one day, but during the rest of the week light airs alone prevailed. The mean amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by 9 per cent.

APRIL.

Exceptionally warm and sunny, with an average rainfall.—There have been here only four warmer Aprils during the last 23 years. The days were, as a rule, decidedly warm, whereas the night temperatures were, as a rule, only about seasonable. The first few days were very cold, both during the daytime and at night. On the warmest day the temperature in the thermometer screen rose to 72°, which is an exceptionally high reading for the month. On the coldest night the exposed thermometer showed 13° of frost, which is slightly below the average extreme minimum for April. On the 9th, the difference between the lowest and highest readings in the thermometer screen amounted to 41°, which is the greatest range in temperature in any day that I have yet recorded here in April. Rain, hail, or sleet fell on 13 days, to the aggregate depth of 2 inches, which is slightly in excess of the average rainfall for the month. No rain at all fell on the first 11 days. On one day there was, for a few minutes, a light fall of fine snow. The sun shone on an average for 7½ hours a day, or for 2½ hours a day longer than the average duration for April—making this the sunniest April, with one exception, of which I have here any record. The wind was, as a rule, of about average strength, and in no hour did the mean velocity exceed 17 miles—direction W.S.W. The average amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 6 per cent. *E. M., Berkhamsted, May 5, 1909.*

Obituary.

J. G. HILL.—We regret to record the death of Mr. J. G. Hill, for many years in the employ of Messrs. W. Cutbush & Son as traveller, and latterly employed by Mr. L. R. Russell, Richmond. Mr. Hill, who was 59 years of age, passed away at Brecon, on April 21. He leaves a widow and two sons.

* * * The Editor will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

ASPARAGUS: G. B. The annual dressings applied to the beds are not the cause of the bitterness. Good farmyard manure and salt are both valuable stimulants for this crop. Bitterness is generally due to some check during the growing season from such causes as frost, cold nights, or insufficiency of moisture. The condition is generally more noticeable early in the season than later. Good drenchings of farmyard liquid manure, applied once a week during the present month, will do much to improve the quality of the Asparagus.

AURICULA: W. G. S. The variety you send is not far removed from *Primula auricula*, the parent of the florist's Auricula. It has no especial merit, and would not be classed by the Auricula fancier in any section.

BEAUCARNEA RECURVATA: C. G. Blake. We have not heard of this plant flowering in the British Isles. A plant in flower was exhibited by M. Beaucarnea, of Eename, Belgium, at a horticultural exhibition held at Audenarde, near Ghent, in the autumn of 1861. The plant was shown as *Pincenectitia tuberculata*. The origin of this name being uncertain, it was renamed *Beaucarnea*, in compliment to the grower. It was introduced from Mexico about 60 years ago. Like the Agave, the plant lives to a considerable age before flowering. We should be glad to see a photograph.

CARNATION: Old Plants. It is impossible to name your variety merely from a shoot. If you will send a well-developed flower, we will endeavour to identify it. The variety known as Churchwarden belongs to the Souvenir de la Malmaison type, and has bright crimson flowers. If you wish to induce plants of Souvenir de la Malmaison to flower earlier in the season than is natural, the first thing to do is to procure very early layers. When the layers have been rooted, the young plants should be potted on as they require more rooting space, and be thoroughly established in their final pots before the advent of winter. If such plants are cultivated during the winter in a little warmth, they may flower very early. But it must be remembered that this type of Carnation is very uncertain in its results if cultivated for flowering in winter, and there appears less need for forcing varieties of this type since the recent development that has taken place in the perpetual-flowering Carnation. Varieties of this latter type may be so cultivated that they will flower at any season of the year. Their flowers are of varied and attractive colours, and, being borne upon erect stems of considerable length they are adaptable for almost all purposes for which cut flowers are used. The directions for cutting back plants of the "Malmaison" type are as follow: Cut back some of the old rough plants to the hard wood. Place them in a frame close to the glass and withhold water for a short time. Close the frame early in the afternoon, and lightly spray the stems occasionally until they show the formation of young shoots, when syringing should be discontinued. As soon as these young shoots are about 1½ inch in length replot the plants carefully, and cultivate them in the same manner as is adopted for the perpetual-flowering Carnations.

CATTLEYA WARSCWICZII: A. Y. The growth sent is affected with the "spot disease" of Orchids, but the cause of this is not clearly known. Cattleya Warszewiczii is very liable to "spot," and once a plant is attacked, it is probably better to destroy it.

CELERY ROT: W. T. Dress the ground with an acid manure, superphosphate being the best for the purpose. Avoid using alkaline manures, especially lime, as these favour the development of bacteria in the soil.

FRUIT TREES: J. W. S. After a tree has been worked and before it has been trained, i.e., at its first year from the graft, it is termed a "maiden." An Apple tree on the Paradise stock means that it has been grafted on this stock, which has a shallow, fibrous root-system. A tree worked on the Paradise stock may be expected to fruit earlier, and makes a less robust growth than one grafted on the free stock. This latter stock is raised from seeds (pips), and has deeply plunging roots. It is suitable for raising Apple trees of a large size, such as standards. Trees trained on the bush system would be suitable for your purpose; half-standards are also desirable for plantations, especially in the case of Apples and Plums. Pear trees do exceedingly well trained as pyramids, and these could be planted by the sides of the paths.

NAMES OF FRUITS: W. M. B. French Crab.—*D. Morris.* Pile's Russet.

NAMES OF PLANTS: Miss P. Narcissus Johnstonii var. Queen of Spain.—*J. F. J.* *Prunus sinensis flore pleno.*—*J. C. W.* *Pulmonaria officinalis.* *T. S. P.* *Berberis buxifolia* (syn. *dulcis*).—*R. P.* The *Odontoglossum* is not a true *O. crispum*. It is a form of *O. Adrianæ*, a natural hybrid between *O. crispum* and *O. Hunnewellianum*, with a nearer approach to the *O. crispum* than is ordinarily the case. *S. J. M. 1.* The double-flowered form of *Kerria japonica*; 2, *Escallonia* species, send when in flower; 3, *Fuchsia macrostema*.—*Alba.* 1, *Pelargonium Stapletonii*; 2, *P. crispum*; 3, *P. betulifolium*; 4, *P. cordatum*; 5, *Tritonia crocata*; 6, *Saxifraga "Guildford Seedling."*—*Surrey.* The plant is *Cuscuta epithymum*.—*C. F.* 1, *Thuya orientalis*; 2, *Pinus Cembra*; 3, *Picea orientalis*; 4, *Abies Lowiana*; 5, *Cupressus nootkatensis*; 6, *C. macrocarpa*.—*L. Y.* 1, *Polygala chamaebuxus*; 2, *Ionopidium acaule*; 3, *Aubrietia deltoidea* var. *variegata*; 4, *Prunus nana*; 5, *Lathyrus vernus*; 6, *Epimedium rubrum*.—*W. B.* 1, *Oncidium sphacelatum*; 2, *Oncidium flexuosum*; 3, *Oncidium tetrapetalum*; 4, *Pleurothallis macroblepharis*.—*D. Y.* *Arnebia echioides*.—*G. H. B.* 1, *Epimedium diphyllum*; 2, *Epimedium alpinum rubrum*; 3, *Orobanchis sativa*; 4, *Ornithogalum nutans*; 5, *Forsythia viridissima*; 6, *Berberis (Mahonia) Aquifolium* variety.—*W. T.* *Dendrobium chrysotoxum*.

PEACH LEAVES DROPPING: G. S. The plants are affected with the shot-hole fungus, *Cercospora circumscissa*. Spray the foliage at intervals with the ammoniacal solution of copper carbonate, made with 1 oz. of copper carbonate, 5 oz. ammonium carbonate, and 16 gallons of water. Dissolve the chemicals first in a small quantity of hot water.

TULIPS DISEASED: D. H. The plants are affected with *Botrytis cinerea*. Destroy the diseased lulls by burning.

WARTS ON VINE LEAVES: H. J. The warts are not due to disease, but to unsuitable conditions of culture. They form as the result of intumescence or outgrowth of the tissue, and this is caused generally by a too warm and moist atmosphere in theinery. Afford more ventilation and keep the house somewhat drier than formerly.

WARTY GROWTHS ON GOOSEBERRY SHOOTS: F. T. The trouble is not due to disease or insect pests, but is the result of adventitious roots pushing from the stems. Adventitious roots are very common on most plants of the same family, especially in the case of *Ribes alpinum*. Their formation is favoured by dampness and overcrowding of the branches.

A MARKET FRUIT-GROWER'S YEAR.

EXPERIENCE in April showed, not for the first time, that fruit-growing and Potato-growing do not go well together. Especially is this true when the former preponderates greatly, so that only a small staff of horses is necessary. When preparing the land for Potatos and also when harvesting the crop and carting the ware to the station and the seconds and chats to a clamp, the cultivation of fruit plantations is necessarily hindered. Last month is was particularly disadvantageous to devote much time to the Potatos, because March had been so rainy throughout that but little work could be done on the land, but the first three weeks of April, covering the only settled period of that month, had to be devoted to this vegetable crop. The land had been consolidated by the heavy rains in March, and it required extensive tillage to prepare a good seed-bed for the tubers. In the last eight days of the month, after the Planet Junior cultivator had been run through some of the plantations in transverse directions, rain fell on six days or nights, so that the weeds to a great extent were reset almost immediately after being uprooted. It was the same, of course, with the work done by the hand-hoers, who dealt with the small space around each tree and bush left untouched by the cultivator. If these operations had been carried out in the first 18 days of April, when there was very little rain, they would have been more successful. The hand-hoers made good work in the dry period among the nursery stocks, trees, and bushes, and in part

of a plantation of Apples and Gooseberries too much grown out for horse cultivation; but even this work was partly prevented by the necessity of sifting and picking over seed Potatos for sale, and the breaking, mixing, and sowing of artificial manures for the new Potato crop.

GRAFTING.

This has been a fairly satisfactory season for grafting, and the scions, cut in February, had kept well where they were partly buried in the soil. Among the stocks were a few old ones, which had been grafted or budded unsuccessfully more than once, and had to be cut off at the ground level. With these a plan which had proved successful last season was repeated. The grafting was done below the ground level, and the soil was drawn over the union of stock and scion after the raffia fibre had been tied on as usual, no grafting wax being used. This plan answers well, as the soil excludes air from the union, and moisture causes the raffia-fibre to rot soon enough to prevent girdling, though it is advisable to draw the soil away when the scions have started well into growth, and also eventually to cut the ties. The grafting wax used was a very cheap kind, consisting of 1 lb. of common black pitch and 3 ounces of lard. These were boiled together, and applied whilst warm. This mixture is just as satisfactory as the more expensive grafting waxes commonly recommended. A satisfactory tool for applying grafting wax remains to be invented. A thin lath, which some grafters use, is not satisfactory, as much of the wax drops off it in the process of application, and a good deal of time is spent in covering the union entirely, whilst a hair brush often lasts only a few hours before it has been denuded of its hairs by the dragging action of the wax as it is smeared on to the grafts. This season a wire brush sold for cleaning saucepans was used, and even the wires were soon drawn into a wisp, so that it was not until they had been clipped closely that the tool withstood the strain. The recent rainfall has been the one thing needful for starting the scions well. It may be interesting to record that a few scions cut from the trees and grafted at once were used where there was a deficiency of one variety of stored scions. Last year some that were "worked" in this manner were as satisfactory as any. So long as the buds of the scions are dormant, and the sap is running freely in the stocks, there appears to be no danger in this departure from ordinary usage.

At the time of writing, most varieties of Plum, Pear, and Cherry trees are in full bloom, and a splendid appearance they present. Tall and wide-spreading hushes of Rivers's Early Prolific Plum are profusely covered with bloom from 2 feet above the ground level to the tips of the highest branches. The variety Czar is equally full of blossom, but presents less show, as the trees are much smaller: Victoria and Monarch are both well or fairly well furnished with blossom, whilst the flower-buds of Pond's Seedling and Gisborne are only half expanded. Old Greengage and Coe's Golden Drop are as full of beauty as the less choice varieties. As usual, Black Diamond was the first Plum to show blossom, and this was followed quickly by Monarch, Early Prolific and other early blooming varieties. The dates of full expansion of blossom were as follow:—Black Diamond, April 25; Monarch, April 26; Early Prolific and Coe's Golden Drop, April 27; Czar, Victoria, Old Greengage, and Damson, April 29. The earliest flowers

of Czar opened before those of Victoria, but the latter variety soon caught up. It is to be observed that in consequence of the retarding action of the cold weather, the blossoming of the several varieties has been much more nearly simultaneous than in normal seasons. Pear trees are full of blossom, but they often flower profusely in seasons when very little fruit results. Cherry trees also make a good show. No Apple blossom was fully expanded in my plantations by the end of April, though a few flower-buds of Irish Peach, Gladstone, and Bismarck were half open on April 30. Most varieties of Apples here will be well covered with blossom; but there are trees which bore heavily last year that appear to be taking a rest this season. In some districts, it is reported that Apples show only a moderate quantity of blossom-buds. The weather quite recently has been so cold that there is great anxiety lest much of the fine promise among Plums, Pears, and Cherries should be spoiled by frost. This amount of fruit blossoming relates to only one fruit farm in a district not much devoted to fruit-growing.

PREMATURE FRUITING.

Nothing is worse for fruit trees than allowing them to fruit when they are very young. Certain varieties of Apples planted in the autumns of 1905 and 1906 are giving much trouble in this respect, trusses of blossom-buds having been developed quite up to the tips of the young branches, which are being cut back severely to wood buds. Domino and Golden Spire are the worst in this respect, whilst Allington Pippin, and even Warner's King, reputed to be a tardy fruiter, are also offenders. Some particularly well-furnished young trees, left unpruned or only partially pruned at the winter pruning, because they had plenty of sturdy branches, have trusses of flower-buds on their terminals, which must be cut off. Similarly, some of a number of two-year-old Plums, planted last autumn, are covered with blossom, which must be removed to enable the trees to make proper growth.

INSECT PESTS AND SPRAYING.

Fortunately, the Apple sucker does not trouble my trees. A search for the pest has just been made among all varieties of Apples without a specimen being found. This is the case even in a somewhat old plantation in which there was a bad attack four years ago, but none since. The cure may be attributed to summer and winter spraying, and the subsequent immunity possibly to the use of lime, sulphur, and caustic potash as a winter wash, 20 lbs. each of the first two materials and 12 lbs. of the third to 100 gallons of water. Probably this is the best of the winter washes. Equally striking is the almost complete immunity of the same plantation from aphid up to the time of writing. Two years ago the trees were much damaged by this pest, but last year there was very little fly, and the repeated use of the wash already acted as a preventive. On the contrary, there is an attack of aphid and winter moth caterpillars on some varieties of Apples in the young plantation referred to above, which had no winter spraying. They were noticed first on April 26, and on the 27th a trial on a few trees was made with a nicotine wash—6 ounces of a strong nicotine solution (98 per cent.) to 50 gallons of water. A fine day followed and two days after the spraying hardly a live aphid could be found, while many of the tiny caterpillars of the winter moth

were dead on the fourth day. A general spraying of the affected varieties was carried out on April 28, but a considerable downfall of rain followed the operation immediately—indeed, the work was stopped by rain, and probably fewer than half of the aphides and no caterpillars have been destroyed. The operation, therefore, must be repeated, and possibly after the blossom has fallen, treatment with lead arsenate will be necessary to destroy the caterpillars. On April 27 an attack of aphis was found to have begun on two varieties of Plums, and, no doubt, it will be extended to other varieties. It is not advisable to spray the trees whilst they are in full blossom, even

NEW OR NOTEWORTHY PLANTS.

PHALÆNOPSIS GIGANTEA.

THIS extremely rare Orchid, described by J. Smith in *Bul. du Jardin Bot. de Buit.*, was collected two years ago by Dr. Niemoehnis' expedition through Central Borneo. It flowered in the Botanic Gardens at Buitenzorg, Java, some years ago, and also recently. The plant has the same habit of growth as *P. amabilis* and *P. violacea*, but the leaves are much larger, thicker and very glossy. At the present time the plant has six leaves.

THE SETTING OF MUSCAT OF ALEXANDRIA GRAPE:

THE berries of this variety of Grape often set very unsatisfactorily. For the past 14 years I have adopted the following plan with good results. Cold air is not admitted through the ventilators until the thermometer rises to 95° or 100°, and then only a little is permitted at the top of the vinery. As soon as the temperature falls to 90°, the ventilators are closed. The great secret in getting this Grape to set well in a northern climate early in April, when a low temperature prevails out-of-doors, and, as a rule,

FIG. 131.—PHALÆNOPSIS GIGANTEA: FLOWERS WHITISH WITH DARK-BROWN SPOTS.

with a nicotine solution, which is reported to be harmless to foliage or blossom, lest the wash should prevent fertilisation to some extent. As soon as the petals have fallen, all the trees will be sprayed. Nicotine wash is expensive, but this concentrated solution, though costing 12s. to 12s. 6d. per pound, is the cheapest form, except that of denatured Tobacco, which is of various and unknown degrees of strength. This wash is to be recommended because of its efficiency in the destruction of the aphis, as proved at Woburn, and its entire harmlessness to foliage. *A Southern Grower.*

There are six flowers, less conspicuous than those of *P. amabilis*, and resembling those of *P. sumatrana*, being whitish, with many dark brown-coloured spots. This plant, the only specimen known in cultivation, has been treated at Buitenzorg in the same way as other species of *Phalænopsis*, being planted in a basket, partly filled with broken potsherds for drainage, and containing a rooting medium composed of peat, Sphagnum-moss, and a little sand. It is succeeding splendidly. During the period of flowering we apply much water to the roots and syringe the plant overhead at frequent intervals. *C. Daubanton, Buitenzorg.*

brilliant sunshine, is to allow no cold air to reach the bunches when they are in flower either during day or night. The night temperature should never be allowed to fall below 70°. In the daytime, when the temperature is high, say, 90°, damp the surface of the house heavily, but see that no moisture falls on the water pipes, for if these are hot at the time rust will show itself on any berries that have set. To prevent the sun's rays from scorching the foliage, shade the glass with old herring nets, which will allow sufficient light to pass through, to prevent the shoots from becoming drawn and the foliage from burning. After 4.30 p.m.

the nets should be removed. In the morning, as soon as the temperature inside theinery rises to 75°, the foliage will not be safe from scorching unless the shading is placed on and the ventilators opened. Other conditions being suitable, there should be no difficulty in obtaining a good set of the berries if these directions are followed. See that the borders are properly watered before the vines are in flower. Remove all gross bunches, as these seldom set properly; one good bunch to each shoot is ample; never permit more to remain unless the vine is young and growing very vigorously, when an extra bunch may be left for a time to assist as a check to undue growth. This Grape has set its berries well here under this mode of treatment. I have seen many failures where cold air has been admitted with the object of preventing the foliage from becoming scorched on sunny days. Wherever the cold air reached the bunch the berries did not set. I do not believe in using a camel hair brush or rabbit's tail to pollinate the flowers. A tap of the trellis or even slamming the door of the house is quite sufficient to set the pollen in motion. A plan I always adopt is to have a piece of cardboard about 15 inches square tied to a stout stake, and to fan with this gently through the house. I do not believe in pinching the shoots while the vines are in flower, because at that time it is necessary to promote as free a circulation of the sap as is possible. *T. Lunt, Keir Gardens, Dunblane.*

THE JAPANESE DOUGLAS FIR.

YOUNG plants of the rare Japanese Douglas Fir (*Pseudotsuga japonica*, Sargent) have been in cultivation on the Continent for some years past, but it is only recently that this interesting Conifer has been introduced into this country. At Bayfordbury, Hertford, Mr. H. Clinton-Baker last year obtained four healthy specimens from Messrs. Rovelli's nursery at Pallanza, Italy, and plants from the same source are now growing at Kew.

In the Continental nurseries this Fir has been labelled *Abies japonica*, but the structure of the cone shows clearly that it belongs to the Douglas Fir type, and is probably the Japanese representative of the well-known American species.

It is a native of the mountains of Japan, growing at 1,000 to 3,000 feet elevation in the provinces of Ise, Yamato and Kii. It occurs in forests which are difficult of access, associated with *Tsuga*, Oak, Beech and other trees. It is also recorded from Formosa. It was discovered by the Japanese botanist Shirasawa in 1895 between Owashi and Yoshino, about 10 miles from the coast, and described and figured by him in the *Tokyo Bot. Mag.*, Vol. IX., p. 86, t. 3 (1895), as a tree 100 feet high, with a trunk 9 feet in girth. The leaves are pectinately arranged like those of the common Douglas Fir, but are shorter, $\frac{3}{4}$ to 1 inch long, and are eventually distinctly bifid at the apex, by which character and the glabrous shoots this species may be distinguished. The cones are small, $1\frac{1}{2}$ to 2 inches long, and 1 inch in diameter, with about 20 scales; the bracts are strongly reflexed with a long central awn.

The Japanese name of this tree is "Togasawara." The accompanying illustration (fig. 132) is a reproduction of a photograph of a native specimen sent by Mr. C. J. Davidson, of the British Embassy, Tokio. The leaves apparently do not become bifid until the plants are several years old. In a young state they are mucronate or entire, as shown in the figure. Young plants obtained by Capt. L. Clinton-Baker from Japan have since been received at Bayfordbury; these in the older leaves are distinctly bifid.

The plants at Bayfordbury and Kew are now about 2 feet high. It is too early yet to say whether the species is likely to have any cultural value in this country. *A. Bruce Jackson.*

THE ROSARY.

CULTURAL NOTES FOR MAY.

ROSES have grown very freely during the past week or so, and are rapidly making up for lost time. The maiden buds both on the Briar and the Manetti stocks will claim attention as soon as they begin to push forth. When the bud has developed a few inches, tie the tender shoots carefully to cleft briar or hazel sticks, in order that they may not be damaged by strong winds. If it is found that the buds inserted low down on the Manetti and multiflora stocks do not push freely, or are very late in doing so, cut the stock halfway through, a few inches above the bud. This will have the effect of soon

pillars be picked off and destroyed. The trees should be syringed with a mixture of soft soap, tobacco-water and quassia extract. Apply the spray during the evening, and wash it off again the following morning. Keep the hoe at work to destroy the small weeds that are appearing plentifully on beds and borders. The materials of the old mulchings should be removed and a fresh mulch applied. Besides supplying plant foods, the litter will check excessive evaporation, and it is very desirable to retain the moisture in the soil during early summer. Liquid manure and soot water used cautiously and well diluted may be given twice or so each week during the growing season. These manurial stimulants are especially helpful during dry weather.

FIG. 132.—PSEUDOTSUGA JAPONICA: THE JAPANESE DOUGLAS FIR.

starting them into growth. In doing this the head of the stock must be secured to a stake to prevent it breaking. When the growth of the bud is completed in the autumn this upper part of the stock may be cut away entirely. Standard Briars must be made firm in the soil by treading, and it is advisable that all Roses, including cuttings planted this season, should be attended to in this matter, as the action of frost will have tended to loosen them. During the evening time a beetle infests and eats out the shoots of the Standard Briars as they begin to push. The Rose maggot will also begin to show itself during the month curled up inside the leaf. Later the larvæ burrow into the bud. These pests must be guarded against, and all cater-

In looking over the different stocks of Roses, the damage of the past severe weather, though serious amongst the Teas and Noisette sections, has not been excessive amongst those of the hardier kinds which are now growing splendidly. Any vacancies in the beds and borders can be filled by plants turned out of pots. If the weather continues dry, earth up the soil in the rows of Briar seedlings, so as to form a trench, and give sufficient water to thoroughly soak to the roots. All forced Roses of whatever class will, when they have finished blooming, succeed best out-of-doors. Those of the Tea section, if kept partially dry at the roots for about six weeks or two months, will furnish a good supply of bloom in the autumn. The plants should be well

top-dressed with good turfy loam and bonemeal, after taking out the old surface soil to a depth of 2 to 3 inches. See that the drainage is efficient. The latest batch of Dwarf Roses placed under glass last month are making vigorous growth, and some are showing their flower-buds. Fumigate the house as required, and to keep down mildew admit all the fresh air possible, but avoid creating a draught. Maintain a humid atmosphere by a frequent use of the syringe during the day.

The autumn and spring-grafted plants, after being repotted, should be accommodated in a cool, light house, where they will grow freely; during the month, or, as the weather permits, gradually harden them off previously to plunging them outside in beds up to the rims of the pots and 9 inches to 1 foot apart. Any plants at that stage requiring a shift into a larger pot should be attended to and carefully secured by staking. Later, the straggling or leading shoots can be stopped, and they will then make compact plants by the end of the summer. When the plants are all plunged, cover the pots with well-fermented manure. This will obviate excessive watering in the summer, check evaporation, keep the roots cool, and induce active and vigorous growth during the season. Continue the re-potting of spring-struck cuttings into 4½ and 5-inch pots until the work is completed. Return them into a warm frame until they are re-established. The old hot-bed will now give sufficient heat if turned over afresh, or new linings may be put around the frame to keep the temperature at 65°. The early flowering, established plants should be ventilated more freely as the season advances, and by the end of the month or early in June the glass frames may be entirely removed. The pots should be set out wider apart, and the longest shoots stopped from time to time, not later than the end of July, which will give them an opportunity of ripening up their wood and of forming good, bushy plants by the autumn. In the case of Roses planted out under glass, as the plants finish flowering, all the top lights should, if possible, be removed, so as to give the plants a good rest before the autumn.

Autumn-struck cuttings of Roses outside and Rose stocks should have the soil about them kept well stirred and mulched, and, if drought sets in, an abundant supply of water given them. Standard Briars that were worked but failed last year are making fresh shoots, some of which will be sufficiently ripe at the end of the month for budding. Good, ripened scions for this purpose will be found among the pot plants recently turned out-of-doors. With regard to general budding, the Briars and other autumn-planted stocks for this purpose are not ready much before the end of June, and the bulk of them not until July. *J. D. G.*

ROSE FORTUNE'S YELLOW.

This beautiful, yellow Rose grows and flowers splendidly at Wigganthurpe, where it is trained in precisely the same manner as a Grape vine on the short spur system. It has a main stem growing straight up the roof, about 12 inches from the glass inside a cool greenhouse. The roots are planted outside in a south border, a hole being made in the brickwork to admit the stem. At the time of writing (April 24) there are 165 fully developed flowers on the tree, beside several unopened flower-buds. As soon as the flowering is over, all the side growths are pruned back to one eye from the main stem. The new growths which form are trained evenly on either side of the stem, and when sufficiently ripened they are tied to the wires. It is from these that next season's flowers will be produced. Should the side growths become too rampant it is necessary to root-prune in the autumn. Shoots about one-quarter of an inch in diameter are the most desirable, as these become well ripened and suitable for free flowering. *J. Alderman, Wigganthurpe Hall Gardens, York.*

NOTES FROM A "FRENCH" GARDEN.

THE French garden is now in its best condition. Every inch of the ground is occupied by the different crops, which require careful attention. The Carrots grown on the hot-beds are now practically ready for market. They require abundant waterings daily or at least every two days, when a hose is used. The grower can now judge of the value of the strain he cultivates. The Early Parisian variety has a very short stump-like root and small foliage. It is cultivated not only for its precocity, but also for the small amount of space it occupies in the bed. This last point is important when Cauliflowers are grown concurrently with the Carrots.

When pulling the Carrots for market, we remove all the crop at the same time, as the small roots when left never do well. Two bunches are tied together, each bundle containing from 30 to 35 Carrots. The roots are always washed before sending them to market.

The Cauliflowers planted among the Carrots, or in the cold frames of Lettuces, and outside early in April, are now well established and require ample waterings. We are planting another batch among the Passion Lettuces in the open ground. These Cauliflowers were sown at the end of February in a hot-bed and afterwards gradually hardened. When planting Cauliflowers we are careful to reject all plants with a dark spot at the "collar," as this gradually increases till it kills the plant.

We are now sowing in the open the last batch of Cauliflowers for the season. They will be planted amongst the Melons from July 1 as an inter-crop. The seed bed is kept damp by very light and frequent waterings.

Turnips raised from seeds sown on hot-beds late in March require frequent waterings, as the roots are now forming. They will be ready for market within eight or ten days. It is a satisfactory crop, especially when grown in new soil. Turnips require careful attention in the matters of watering and ventilation, especially when they are in their early stages.

We are finishing the Melon beds. The recent weather has been favourable for this work. The Melons are planted three or four days after the beds are made, and mats are kept on the lights for two days after planting, but afterwards the plants are gradually hardened, and in eight or nine days after the planting fresh air is admitted to the frames. The first batch of plants is doing well, and the female flowers should soon appear. Ventilation is given daily; mats are spread over the lights at night-time.

We are planting Tomatos out in the open ground. The plants are showing the first truss of flowers. They are covered with bell-glasses till they are well established. It is well to prepare a system of cropping to follow the Cauliflowers grown on the hot-beds. We generally grow two crops together, e.g.: (1) Cabbage Lettuces and Cos Lettuces; (2) Endives La Rouennaise and Cauliflowers; (3) Cabbage Lettuces or Endive with Celery; (4) Carrots Bellot and Spinach or Radish.

The Lettuces are sown late in May or early in June according to the development of the preceding crops. The Endives are sown now in frames very thinly. The Cauliflowers are sown with the batch to be planted among the Melons. These different sowings must be made in well-prepared ground and receive proper attention. If the seed is sown too thickly the seedling plants must be thinned out as early as possible to have them strong and well hardened early in July.

All the Celery plants should by now be transplanted from the seed bed. On land in the open that will be at liberty early in July a sowing of Endive La Ruffec in the case of heavy soil, or Endive de Meaux for sandy soils, can now be made. Some growers sow for the same purpose Endive Batavian Green, but this salad does better grown later in the season. *P. Aquatias.*

ORCHID NOTES AND GLEANINGS.

CYMBIDIUMS AS CONSERVATORY PLANTS.

IN the gardens of Ludwig Mond, Esq., The Poplars, Avenue Road, Regent's Park, London (gr. Mr. J. O. Clarke), the larger Cymbidiums are much grown because of their suitability for the decoration of the conservatory or other cool houses. The principal species grown are Cymbidium Tracyanum, of which there are some very handsome varieties, and C. Lowianum, together with smaller quantities of C. longifolium, C. eburneum, and other species. At the present time the conservatory, which has fine statuary on one side, has on the other side an arrangement of Orchids in flower, with a fine selection of showy Hippeastrums. The specimens of Cymbidium Lowianum bear about 60 handsome spikes of flower. All are fine varieties, selected some 10 or 12 years ago, and the colouring of the markings on the labellums vary from orange-red to almost scarlet. The plants are always ornamental, and as they last in flower for several months, Mr. Clarke considers them the most useful conservatory plants in the collection. The Orchids from the warm houses are brought in as they flower, and at present with the Cymbidiums are some good Odontoglossum citrosimum, O. crispum, Oncidium papilio, O. Krameri, Lycaste Skinneri, Ansellia nilotica, and several pretty hybrid Cypripediums. Japanese Maples, in great variety, and Lilies are also included in the floral scheme of decoration.

FLORISTS' FLOWERS.

THE PANSY.

WHEN Mr. Eric Drabble, D.Sc., lectured on Pansies before the Fellows of the Royal Horticultural Society, on April 20, it was expected that the garden Pansy, in its various aspects, would have formed the subject of the address: but Mr. Drabble restricted himself to giving descriptions and illustrations of the numerous native species or assumed species of the Viola. He thus laid the grounds on which the florist could build up theories as to the parentage of the modern Pansy. That form of floral evolution, it is hoped, may be expounded to the Fellows by a capable florist at some future time. The Pansy was once a famous and cherished florists' flower, and its various points and merits were well defined. The old Show Pansies were also known as English Pansies, this name being based, no doubt, on the assumption that the old race was derived from Viola tricolor, the wild Pansy of the fields. That description might also have been needed to differentiate them from the larger and more richly and diversely-marked Belgian or Fancy Pansies, which soon became to these flowers what the Japanese Chrysanthemum is to the old Chinese forms. The Show Pansy, in its day, was divided into "belted" and "self" flowers. The belted flowers, generally of good size and substance, had a clearly defined central blotch of some dark hue, and the rounded petals were margined with a colour distinct from the ground of the flower, which was either white or yellow. Naturally, there was in these flowers, because of the precise requirements in marking, much that was monotonous; so also were the selfs of white, yellow, blue, and plum colour, all having deep-hued central blotches. The florist's Pansy attained to a high state of perfection, and it was cultivated with exceeding care. The names of Turner and Bragg, of Slough, in the sixties of last century, are closely associated with the culture of these flowers. From the florist's Pansy originated a race known as bedding Pansies. The famous trio, Cliveden White, Cliveden Blue and Cliveden Purple, doubtless came from this old Show section, and, later, many others followed, including

Blue King, one of the very best bedding Pansies ever seen. But these bedders were superseded by the bedding Violas, which seem to have originated by crossing *Viola cornuta* with *V. lutea*, or with some of the smaller Pansies. We have not yet forgotten the furor and wordy war which grew out of the simultaneous production of *Viola cornuta* Perfection, the most marked advance made with Violas, some 40 years ago. But that was soon followed by Old Blue Bell, a chance seedling in the late Richard Dean's garden at Ealing Dene, which not only became universally grown, but may even now be seen in many public and private gardens. Numerous *Viola* varieties followed, and now there are hundreds of named sorts, all wonderfully floriferous, all beautiful, and furnishing floral colour in infinite variety. The titles of tufted Pansy and bedding *Viola* have been given to these plants. Possibly the designation carpet Pansies fits them best, as they make some of the best surfacing or

colours, and some are blotched, whilst others are diversely coloured. To have these in the finest form a sowing in the open on fine soil should be made in August. The plants should remain in the seed-bed till the spring, then be planted out into good soil. They will form clumps of 10 inches to 14 inches in diameter, and literally smother themselves with flowers. Every garden should possess some Pansies of one type or another. *A. D.*

FRENCH CHRYSANTHEMUMS AT THE N.C.S. SHOW.

IN an audit of blooms shown at the N.C.S. Crystal Palace show last November it is curious to note how the modern French seedlings have been displaced from the position they formerly occupied. The audit appears in the new N.C.S. schedule for 1909, and contains the names of the Japanese and Incurved flowers shown in the board and vases classes only. At the top of the

CYNOCHES PERUVIANUM.

OUR illustration in fig. 133 represents the plant of *Cynoches peruvianum* "Tracy's variety" imported from Peru and shown by Mr. H. A. Tracy, of Twickenham, at the Royal Horticultural Society's meeting on February 23 last, when it was accorded an Award of Merit. The species was shown in 1894 by Messrs. Sander & Sons, St. Albans, and in 1905 by Sir Trevor Lawrence, Bart., K.C.V.O., whose specimen had longer racemes of much more distantly-placed flowers than the one now illustrated. From a botanical standpoint there is little to separate this species and some others from the *C. maculatum* illustrated in the *Gardeners' Chronicle*, January 9, 1909, p. 26, though Tracy's variety of *C. peruvianum* is singular in having the flowers much more densely set than in any others of the genus. Its flowers are greenish-white sparsely blotched with purple, the rayed centre being white.

The *Cynoches* should be grown with the *Catasetums*, suspended in an intermediate house, the method of treatment required being precisely similar to that given to the deciduous *Dendrobiums*. They require copious waterings during the period of growth and a long rest after the leaves begin to wither, when water should be almost entirely withheld until the growing season again comes round.

THE ALPINE GARDEN.

VERONICA BIDWILLII.

BIDWILL'S Speedwell is one of the shrubby *Veronicas* from New Zealand that are held in increasing favour, especially for planting in the Alpine garden. This species is not the most brilliant of the genus, as the growths are slender and the flowers small and not highly-coloured. So far as I have seen plants in this country, the species is represented by white flowers alone, although it is said to possess violet and pink-coloured forms. Although simple and small, the flowers are pretty, and the rather slender, prostrate growths render the plant more suitable for a rock-garden than a border. The small flowers are borne in whorls.

ERIOPHYLLUM CÆSPITOSUM (SYN. BAHIA LANATA).

OF the small group of plants belonging to the genus *Eriophyllum*, which number under a score, few are in cultivation in British gardens, and only two of these are included in the latest edition of the *Kew Hand List of Herbaceous Plants*. *Eriophyllum cæspitosum* is rarely seen under its correct name, being often called in gardens *Bahia lanata*. It forms a suitable plant for the front of a flower border or for the rockery.

If allowed to remain undisturbed it forms a spreading mass of pretty, whitish, woolly leaves, producing bright yellow flowers of the characteristic Composite type.

The whitish leaves and golden flowers hanging over a ledge of the rock-garden or trailing over the ground in the front of the flower border are very attractive. The plant is not hardy in severe winters, and is especially harmed when frost and snows alternate with mild weather. To lessen the danger from these causes the plant should be given a dry soil and a sunny situation. Old mortar or other calcareous matter mixed with the soil is beneficial.

Eriophyllum cæspitosum is easily raised from seeds, and may also be increased by division. In the broad sense it is hardy, but the difficulties caused by our uncertain winters make it advisable to have a few spare plants in a frame.

DIANTHUS PANCICHI.

THERE is a small section of *Dianthus* not very widely known which comprises a few Pinks of erect-growing habit, and having the flowers in

FIG. 133.—A WELL-FLOWERED SPECIMEN OF *CYNOCHES PERUVIANUM*, TRACY'S VARIETY.

carpet plants we have. But the modern Fancies or Belgians have overshadowed all other Pansies. It is possible now to go to any market and purchase strong plants at 2d. each, carrying large flowers of great substance, fine in form and gloriously coloured; they are, indeed, marvellous in their beauty. But it is unfortunate that these plants are usually grown under somewhat forced conditions, therefore they fail to flower so well when purchased and planted in the open. This strain, come from whence it may, produces flowers as fine in size and form and as superbly coloured as are any that are in commerce under name. Our climate in the southern counties seems to be too arid for these splendid Pansies; they thrive better in cooler conditions. But we can raise Pansies from seed, and from them secure masses of bloom of many colours for a long season. These furnish a wide range of selfs in white, yellow, blue, purple, bronze, claret and other

list in the Japanese section comes *F. S. Vallis*, which was shown 102 times, or more than twice as often as the next most frequently shown. *Mme. G. Rivol* was shown 23 times, *Mme. Paolo Radaelli* 20, *Mme. René Oberthur* 12, *President Viger* 10, *Marquise Visconti Venosta* 6, *Chrysanthémiste Montigny* 4, *Mme. C. Nagelmackers* 4, *M. Paul Randet* 4, *Mme. Albertine Bertrand* 3, *Mme. Gustave Henry* 2, *President Loubet* 2, *Mme. Marg. de Mons* 2, *White Venosta (Marquise Venosta)* 2, *Leon Truelle* 1, *Vivian Morel* 1, *Lt.-Col. Ducroiset* 1.

In the classes for incurved flowers, of course, the number was smaller, as has always been the case. *Emblème Poitevine* comes third in the list, being shown 24 times. Then *Triomphe de Montbrun* 12, *Topaze Orientale* 7, *Boccace* 6, *Ma Perfection* 3, *M. de Meulenacre* 3, *Le Peyrou* 2, *Mme. de Verneuil* 1, and *Chrysanthémiste Bruant* 1.

crowded or clustered heads. They have never acquired great popularity, and they are not in the least likely to supersede other well-known kinds. Yet they possess some points of beauty which commend them, and some qualities which will render them serviceable in certain positions. They are excellent to give variety in the flower border and to break up the uniformity of the other plants flowering in the summer season.

Dianthus Pancicii is a tall-growing species, having sturdy, erect flower-stems reaching a height of about 2½ or 3 feet, and bearing closely clustered heads of light crimson blooms. The leaves are broadly Grass-like and grow in a thick tuft at the base of the stems.

Seeds of a new variety of *Dianthus Pancicii* are being offered this year under the name of *D. Pancicii grandiflorus*. The heads and flowers are stated to be larger than those of the type and purple-carmine in colour. It is also asserted that the stems are so stout that they will withstand strong winds without support. This is true as regards *D. Pancicii* upon the whole, yet the stems of my plants have been broken off at the base by wild, whirling winds, such as we sometimes have. *S. Arnott*.

The Week's Work.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Sweet Cherries.—As the trees pass out of bloom they should be examined for black fly. If this pest is present, syringe them thoroughly with Quassia Extract. They may be sprayed even as a preventive method, for the pest is likely to do great damage if a bad attack breaks out. Remove any specially strong shoots that would be likely to interfere with the proper balance of the trees, and pinch all others back to three or four leaves, except such as are required for extending the trees. The shoots must be kept thinly disposed in order that all of them may be perfectly exposed to the sun and air.

Morello Cherries.—Trees of this variety require different treatment from that just described. They should be disbudded in the manner recommended for Peaches and Nectarines. Morellos are sometimes neglected in this matter, but there is no justification for this. If left to themselves, they soon become a thicket of growths stretching out some distance from the wall. When this is the case, they are difficult to keep clean of pests, and there is less opportunity for the fruits to develop satisfactorily. Do not disbud the trees excessively, for if the shoots are still found to be more numerous than is desired, they may be pinched back to three or four leaves, when it becomes necessary to tie the shoots to the wires or wall. Shoots that are pinched will form small spurs, and these will eventually bear fruit-buds. It is important in the cultivation of Morello Cherries to have enough young shoots each year to take the place of those which have borne fruit in the season immediately preceding the pruning. At the same time, the shoots should be kept sufficiently thinned to allow of the access of sunlight to those which remain.

Protecting material.—If canvas coverings, nets, or other materials have been employed for protective purposes for fruit trees, they should be removed and stored for the present, it being unlikely that they will be needed any longer. If the weather, however, takes a turn for the worse, on no account remove them suddenly, for by so doing the trees would probably receive a check and fall an easy prey to insect pests and fungus diseases. Peaches and Nectarines should be the last to be relieved of the protective material, for if these trees have received protection they will be the more susceptible to injury from cold winds.

General work.—Hoe the surface soil of the fruit quarters as often as possible, choosing periods of fine weather for the work, in order that the weeds may perish immediately after each operation. Mulching with partially-decayed manure or with stable litter is exceedingly valuable for hardy fruit trees, especially such as are growing in light soil or on a gravel subsoil. Never apply a mulch, however, until all weeds have been removed from the ground.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Thinning of crops.—One of the commonest mistakes in vegetable growing is that of allowing the plants to remain too thickly together. It is unreasonable to expect good results if six plants are occupying the ground that is needed by one. To sow fairly thickly and thin early is advice that has been given for many a long year, but it is not followed so commonly as it should be. Thinning of the crops should in nearly all cases be done piecemeal, that is, it should be done by degrees at several operations. In no case should the seedlings be allowed to become crowded, even in the earliest stages of growth.

Celery.—Most plants of the second sowing should now be sufficiently advanced for putting into the trenches. Lift them with as much soil as possible adhering to their roots, and plant them in single lines, drawn from 10 to 15 inches apart, according to the variety. Make the soil very firm. Apply a thorough watering after the plants are inserted. Dust the foliage twice a week with soot, applying it early in the morning, or, better still, late in the evening. Further trenches should be prepared for successional crops as opportunities occur or the ground becomes available.

Celeriac, or Turnip-rooted Celery.—Unless this crop is well grown, it is of little value, but, provided that excellent roots are obtained, they are much appreciated as winter vegetables. Celeriac requires a long season of growth, an abundance of moisture, and rich soil. It should therefore be planted in ground which has been deeply trenched and heavily manured. It may be planted at this season on flat beds or borders. Not less than 2 feet should be allowed between the rows, and 18 to 20 inches between the plants. The foliage should be dusted with soot occasionally, as in the case of Celery.

Turnips.—The earliest varieties such as Early Milan and Long Forcing should be thinned severely, and the surface of the ground between the plants should be frequently disturbed with a Dutch hoe. Apply soot and some chemical vegetable manure in small quantities during showery weather, and do everything that is possible to induce a quick, succulent growth. Sow seeds of Snowball or a similar variety in small quantities once a fortnight. Golden Ball, so great a favourite in the north of England and in Scotland, requires a long season of growth to develop. It should be sown in poor soil during the present month.

Broad Beans.—Make two good sowings during the present month of varieties of the Broad Windsor type; the newer green variety is a great improvement on the older white one. Immediately there are any signs of black aphid on the earlier plants, thoroughly syringe them with soft soap and water.

Marrows.—Early plants which were put into portable frames are now fruiting freely, and these require much more ventilation than hitherto. Thin and peg out the growths, and apply a good surface dressing. At the end of the month the frames and lights should be removed. One more sowing may still be made. Put one seed in each pot and place the pots in moderate heat.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Planting young vines.—If it is intended to plant vines which were raised this season from eyes, the soil had better be got in readiness for the borders, placing it under cover in order that it may be in a suitable condition when required for use. One advantage of planting young growing vines is that a crop may be taken from the old vines which are to be replaced, and the young vines become established during the same year. But this depends upon whether the old crop is fit to be gathered by the end of June. In any case, it involves a considerable amount of work in the busy season. If there is any likelihood of the vines becoming pot-bound before they are planted out, they had better be shifted into larger pots.

Treatment of young vines.—In the case of young vines that were planted early this season, every encouragement must be given them to grow freely. Keep the surface of the border moist by damping it with tepid rainwater and, in order that warmth and air may the better permeate

the border, let the surface soil be occasionally loosened. Syringe the vines freely early in the morning and again when closing the ventilators in the afternoon. Do not use more fire heat than is necessary; the water pipes may be slightly warmed at night or during cold and wet weather, because this is necessary to prevent the atmosphere from becoming stagnant. Pinch the side shoots at the second or third leaf, and tie them neatly to the trellis. Stop the leading growths when they have reached one-third the length of the trellis. Vines which have been planted two or three years must on no account be taxed with a heavy crop. Even after vines have become thoroughly established and have acquired the most robust growth, it is possible to injure them by overcropping.

In-arching of vines.—The present time is suitable for in-arching vines, which is a form of grafting. There are some useless varieties and varieties that do not succeed in certain places. These may be replaced easily by others that are more profitable. Perhaps the process of in-arching is the quickest and most convenient way of bringing about this result. Again, there are some varieties which are much improved by being in-arched on to a fresh stock. For instance, at Frogmore, we have Muscat of Alexandria on a stock of Madresfield Court, which is a decided advantage, as the bunches are more compact, the berries are larger, and the flowers set as well as Black Hamburgs. Lady Hutt gives better results when in-arched or grafted on Foster's Seedling; Melton Constable is best on a stock of Alwick Seedling. The Strawberry Grape, which has very small berries when grown on its own roots, produces berries as large as Black Hamburg if grafted on to Black Hamburg. We are making other experiments with different stocks, but an opinion as to their value cannot yet be expressed. The most suitable scions are vines which were rooted last year, and were subsequently cut back, these being more vigorous than any that may have been rooted this present year. To perform the operation of in-arching, first place the scion near to the shoot on which it is to be in-arched. Make a similar cut on each shoot about 2 inches long. Bind the shoots tightly together with raffia, and cover the parts with moss, which should be kept damp. It is, of course, necessary to supply water to the roots of both stock and scion.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORO, Pencarrow, Cornwall.

Cycads.—Few Cycadaceous plants are grown in ordinary gardens. *Cycas revoluta* and, less frequently, *C. circinalis* being the species generally representing this Order. Sufficient room cannot usually be spared for such genera as *Dioon*, *Encephalartos* and *Zamia*, though their cultivation would be interesting where the presence of large houses renders it possible. Cycads have a distinctly ornamental appearance, and are not unlike sturdy-leaved tree Ferns. Their leaves being of firm texture, the plants may be used for decorative purposes in many positions that would prove ruinous to tree Ferns. The season of growth is surprisingly short, but during that season the plants require a great deal of moisture both in the atmosphere and at the roots. If the roots are permitted to become at all dry, even for a short time, the young fronds, being very succulent, quickly show signs of drooping. It often happens that Cycads will remain inactive during a whole year. Any stems which do not show signs of making new leaves should be immersed in tepid water for two or three days. As soon as the growing season has finished and the new fronds have completely developed, less water must be given the roots, and the plants should be moved to a cooler and drier atmosphere. A sharp look-out should be kept for scale insects, as these pests are very difficult to dislodge from the leaves.

Chrysanthemums.—Most of the plants should now be ready for removing into the final pots. This important operation should not be hurried, as the details in the process require careful attention. The best size of pot to be used is a matter for individual opinion. For general purposes, 10-inch pots appear to me quite large enough, and even a size smaller will allow ample rooting space for many varieties. If still smaller pots be used, it causes more labour in watering

and feeding during the summer months. The pots and the crocks used for drainage should be carefully cleaned, and care must be taken in arranging the drainage material in order to get the best possible outlet for water. A thin layer of fibrous loam should be placed immediately over the crocks to preserve them from the finer particles of the soil. The potting soil should have been turned over several times in order that all the constituents may be thoroughly mixed. A useful general compost is one consisting of good pasture loam three parts, and horse manure and finely-sifted leaf-mould one part, adding a quantity of coarse sand, about a 6-inch potful of an approved chemical manure, and a similar quantity of bonemeal. It should be scarcely necessary to say that a plant should not be dry at its roots when it is removed for potting. Let the potting be done as firmly as possible, taking care not to break the rootball. In finishing off, leave a loose layer of fine soil on the surface. After having been potted, the plants should be placed for a few days in a sheltered and partially-shaded position. They may be frequently sprayed with clear water to keep the leaves from flagging, and in order that water may not be needed at the root until the roots have again become active. To each plant should be placed a large-sized label, on which the name of the variety is written legibly. When the plants have been placed in their permanent position for the summer, affix a stout stake to each, and secure these stakes to slightly-strained wires, in order that the plants shall not be swayed by the winds.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Pruning shrubs.—Any shrubs that have passed out of flower should now be pruned into the desired shape. Some species require to be pruned each year. Such, for instance, as *Prunus triloba*, *P. pissardii*, *P. sinensis* fl. pl. and *P. cerasus* James II. Veitch. These species should have their shoots cut back to a good growth more especially if it is necessary that the plants should grow in a limited space, as they flower better on the young wood. *Pyrus floribunda* and *P. f. atro-sanguinea* need to be pruned in order to keep them in character with other plants, unless they are grown as isolated specimens or in avenues. Other plants that require pruning include *Staphylea colchica*, *Cerasus Watereri*, and *C. Sieboldii*, *Xanthoceras sorbifolia*, *Spiraea media* (confusa), *S. prunifolia*, and *Chimonanthus fragrans*. These species and others of a similar nature are benefited if the pruning is done as soon as the flowers have fallen. If a good mulch can be applied over their roots in hot weather, so much the better, for it is desirable to encourage the plants to make growths of considerable length and strength.

Herbaceous plants.—Many of the herbaceous flowering plants are much in need of staking at the present time. Endeavour to affix the stakes in such a manner that they are not conspicuous, and select those most appropriate for the different plants. It will be found that brushwood, such as is obtainable from Hazel or Beech branches, make excellent supports for certain plants, holding the shoots in a natural position and becoming after a time perfectly hidden by the foliage of the plant. For taller plants, single Bamboo or Hazel rods placed at the back of the specimen are useful. Cleanse the borders of weeds, and use the Dutch hoe as often as necessary. Remove the foliage from flowering bulbs as soon as it is ripened and commences to wither. Thin out annuals that have come up too thickly, allowing space for each plant to develop unhindered by contact with others.

Dahlia.—The position for these plants should already have been prepared. Stakes will be required of various heights, and these should be painted or dipped in creosote. It is too early at present for the plants to be put out, but the ground should be rid in the meantime, as far as possible, of slugs and snails.

Roses.—Examine all Roses, and if aphids are detected upon any, spray them with quassia extract two days in succession. Keep a sharp look-out for caterpillars, and remove by hand-picking as many as can be found. By way of stimulant, about two ounces of guano may be sprinkled around the base of each plant.

Sweet Peas.—Any of these plants showing bloom may be given a mulching of manure after

a good dressing of soot has been applied. Guard later plants from slugs and birds, and afford stakes whilst the plants are still dwarf. If a sowing is made now the plants will flower in August, provided that a rich rooting medium is given them.

Alpine garden.—Much weeding needs to be done just now, or many of the smaller plants will be smothered. The weeding must be done by experienced hands, that valuable plants may not be inadvertently removed with the weeds. Apply a top-dressing to Ferns and other plants growing in cool crevices. Shade *Ramondias* from the mid-day sun. Remove the dead flowers from *Primulas* unless seed is required, in which case the seed-vessels should be secured to short stakes. Prune *Ericas* that have flowered, and top-dress them if necessary.

Phlœsia buxifolia.—Give this plant a top-dressing consisting of peat, leaf-mould, and sand. It succeeds best in a sheltered corner in a north aspect where the position is moist. Its *Lapageria*-like flowers are much appreciated.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Phalœnopsis.—Most of these plants are now producing fresh leaves and roots. The grower should ascertain if fresh rooting material is necessary, or if new baskets, pots, or cylinders are required. Those plants that are well established in teak-wood baskets or cylinders, and which need additional space for root extension, are sometimes difficult subjects, as the numerous roots adhere firmly to the wood, and no matter how careful the operator may be, some are sure to be damaged. Where newly-imported plants have been established in small baskets, instead of removing them, additional root room may easily be afforded by dropping the baskets, or even cylinders into larger receptacles, filling the space between with crocks or pieces of broken brick, and afterwards surfacing the whole with a layer of chopped Sphagnum-moss, which should be well incorporated with small crocks. As regards those plants which were similarly treated some years ago, it will be found that the old basket has decayed. The remains may be removed piece by piece without causing the least disturbance to the plant, and the space should be refilled with drainage materials. If the old potting material has decayed, carefully remove it from between the roots, add more crocks, and resurface with fresh Sphagnum-moss. Very little water is required after potting, &c., the principal thing being to induce the moss to grow on the surface and the new roots to cling to the woodwork of the basket. For this purpose apply tepid rain-water by means of the fine sprayer. Keep the surface of the moss and the sides of the basket just moist. On no account saturate the materials. Where no separate house is set apart for the culture of *Phalœnopsis*, the plants should be placed on the shady side of the East Indian house or in the mixed plant stove. Wash the leaves of these plants occasionally with a sponge and clean rain-water, to keep them clean and free from thrip insects.

Anguloa.—The species and varieties of *Anguloa* should be potted either immediately they commence to grow, or directly they have gone out of flower. These plants succeed well in the *Osmunda* and *Polypodium* mixture, with plenty of small crocks added. It is not necessary to employ Sphagnum-moss. Being strong-growing plants they need a moderate amount of rooting space and require to be potted rather firmly. Stand the plants in a light position in the *Cattleya* or intermediate house. Apply water rather sparingly during the first few weeks, but afterwards until the bulbs are thoroughly made up, afford them a plentiful supply of moisture. The large broad leaves of these *Anguloas* should be sponged frequently. Avoid overhead syringing, as the water remains low down in the centre of young growths and eventually causes decay.

Lycaste.—*Lycaste Skinneri* and its varieties, also other plants of the same genus that are starting to grow, should be repotted if necessary. They should be potted in similar compost to that recommended for the *Anguloas*. Give them plenty of root room, thorough drainage, and leave a good space on the surface for holding water. They require a plentiful supply of moisture when well established in the new potting material. Although moisture-loving plants, they

must not be given much water during the early stages of growth. The *Odontoglossum* house is the proper place for them, or a cool, shady corner of the intermediate house. Other species and varieties of *Lycaste*, such as *L. cruenta*, *L. aromatica*, and *L. Harrisonia*, should not be repotted until the flowers have faded.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

Women's Gardens.—At the present moment, when the question of woman's equality with man is receiving so much attention in this country, any suggestion which involves the segregation of the sexes in our public parks will be regarded as a retrograde movement by one section of the community. However, this may be, *The Times* recently reported and favourably commented upon a movement which is now on foot in the metropolis to set aside a small open space in the city for the exclusive use of women. That there is much to be said in favour of such a movement—even though it may not as yet come quite within the range of practical park politics—most park officials will admit, and the time may very well come when one or two such gardens will find a place in the park systems of all our larger towns and cities. Few people other than those intimately connected with public park work realise the annoyances—often petty and trivial, but sometimes of a serious character—that women have to put up with from a certain class of men who habitually frequent public grounds. So long as these individuals do not violate any by-laws by openly making themselves a nuisance to visitors, they are not merely at perfect liberty to enter any public grounds, but have as much right to use the seats as any other citizen. The very presence of unkempt men, whether they occupy the same or an adjoining seat, often mars to a sensitive woman the whole of the pleasure to be derived from a visit paid to a public park. To women in general, and to those of a nervous temperament in particular, a conveniently-situated garden, set aside for the exclusive use of women and young children, would be much appreciated.

Nursemaids and children.—One class of women to whom the "Women's Garden" might prove a great blessing, although she may not herself realise it, is the nursemaid. If many parents who send their children in charge of nurses to the parks (thinking that at such places they are free from all dangers) only knew how their little ones are neglected there, they would, in all probability forbid their maids to enter the parks. The reason for all this is that these grounds are very often the rendezvous of a great number of idle young fellows, who take up the time and attention of the nursemaids to the neglect and even danger of the children. Were women's gardens to become an established fact employers could easily see that their nurses took the children to these places, rather than to an ordinary park—an arrangement which might prove alike beneficial to the young charges and their custodians.

The legal aspect.—Although the general principle underlying the suggestion of the establishment of such gardens has already been recognised by our public libraries in the institution of ladies' reading rooms, yet the question naturally arises whether a park authority can legally set aside any ground which has been gifted or purchased for the purpose of a public pleasure ground for the exclusive use of any section of the public, or whether it has power to spend the rates on the upkeep of such places if they were once in existence. Judging by an analogous case—where the council of a certain town, anxious to give special facilities to women travelling to and from business, ran cars reserved for the use of women, but had to discontinue doing so, as they found they were acting illegally—I fear that before women's gardens are possible a short Act of Parliament would be necessary to enable municipalities to find money for their establishment and upkeep.

Women gardeners.—The park superintendent who may in future have the control of one of these gardens will certainly find himself faced with some delicate problems when working out the details of management. He may find that here at last a suitable opening has arisen for the entrance of the lady gardener into public life.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations. The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, MAY 18—

Roy. Hort. Soc. Coms. meet and Nat. Tulip Soc. Combined Show at Hort. Hall, Westminster (Lecture at 3 p.m. by Mr. A. Clutton Brock, on "Alpines in their Native Homes").

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—53°5'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, May 12 (6 P.M.): Max. 71°; Min. 45°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, May 13 (10 A.M.): Bar. 30.2; Temp. 54°; Weather—Sunshine.

PROVINCIALS.—Wednesday, May 12 (6 P.M.): Max. 63° Bury St. Edmunds; Min. 41° Scotland E.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—

Border Plants and Perennials, Hardy Bulbs and Tubers, &c., at 12; Ornamental Palms, Bays, Ferns, &c., at 1.30; by Protheroe & Morris, at 67 & 68, Cheapside, E.C.

FRIDAY—

Imported and Established Orchids from various sources, Orchids in Flower and Bud, at 12.45; by Protheroe & Morris, at 67 & 68, Cheapside, E.C.

The Orphan Fund.

Among the many schemes that were adopted in 1887 for the purpose of celebrating the Jubilee of Queen Victoria's beneficent reign surely none was better calculated to appeal to human sympathy than the Royal Gardeners' Orphan Fund! The excellent work that it achieves is done more or less silently and without ostentation, and it is only on such occasions as the annual meeting in February or the Festival dinner that the public mind is informed of the amount of poverty and misery which the Fund is the means of relieving. From month to month the Committee carries on the work unceasingly, receiving applications for help, enquiring into every case that is brought before them and making grants in aid of those cases in which immediate help is most needed. All but the actual secretarial work is done gratuitously by men whose sympathies for gardeners' orphans are strong enough to lead them to devote a considerable portion of their time for this purpose. It is one of the most satisfactory features of the social life in this country that there are ever to be found men willing to come forward and take a share in the active management of this and similar institutions. The annual events we have mentioned, therefore, would be useful if they merely served to remind the public of the circumstances that have to be met and to awaken or quicken practical

sympathy with the efforts made to deal with them satisfactorily. As a matter of fact, however, the more showy function that has just taken place has a purpose of even greater importance, for it is one of the chief means by which the Committee is able to raise the money necessary for providing relief. The amount received from annual subscriptions is comparatively small, and although this state of things is not exactly what we ought to accept as a permanent condition, its existence at the present time is sufficient to make the annual Festival and all the work which it entails a necessity of the situation.

It is therefore with satisfaction that we print the report which will be found on another page, inasmuch as it records a result which, if somewhat less than last year, when special efforts were made to make the Coming-of-Age year memorable in the annals of the Institution, is nevertheless of a gratifying character.

A representative gathering of upwards of 120 influential horticulturists was convened, with the Duke of Rutland in the chair, to plead the orphans' cause. A sum of £800 was contributed by those present and other sympathisers who were unable to attend. The Orphan Fund has grown in importance and influence ever since its establishment, and the facts we have mentioned demonstrate unmistakably that it is increasing its hold upon the charitable public. We are confident that the Committee will go on cheerfully fulfilling the duties of their office, relying with confidence on the supporters of the Fund for a continuance of the means that until the present have always been forthcoming. Since its establishment 22 years ago, political and social conditions have altered in many ways, but fortunately in the same period there has been an increased amount of private benevolence, therefore we have every reason to believe that the changes that may yet take place, and to which the Chairman alluded with a certain amount of misgiving, will not operate to the prejudice of such an Institution as the Orphan Fund. Only when there are no longer any orphans to care for will the need for such a Fund cease to exist or the means necessary for its support fail to be forthcoming.

In the meantime, let us remember what Mr. Edward Sherwood, the Treasurer, related in regard to the present number of applicants for relief. Since the election in February, but three months ago, as many as 14 fresh cases have been enquired into and accepted by the Committee, this being an abnormally large number to be registered in such a period. But this is not all, for in every case the Committee have found the circumstances to be so urgent that they have felt compelled to grant temporary relief of two shillings and sixpence a week until the candidates can be put forward for election at the next annual meeting. It looks very much as if there will be a larger number of applicants seeking relief at that election than has ever been the case before. Will gardeners and others be satisfied if any of them are denied the full amount of relief? We think not. But if more than usual are to be elected the income must be proportionately increased. This will not be difficult if all will contri-

bute towards this object. There are many who do all that can be expected of them for this Fund, but there are others who do comparatively little. If these can be induced to come to the aid of the fatherless in their affliction all will be well. It should be an encouragement to them to know that the small amount necessary for the management expenses is more than met by the income derived from invested funds, and that therefore a subscription goes straight to the relief of distress without deduction. A subscription of five shillings a year is less than a penny-farthing a week. How many can afford to give this amount who have in the past thoughtlessly ignored the claims of the Fund?

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place on Tuesday, the 18th inst., in the Hall, Vincent Square, Westminster. At the afternoon meeting a lecture on "Alpines in their Native Homes" will be given by Mr. A. CLUTTON BROCK.

VACANT LANDS AS GARDENS.—In most large cities there are vacant lands awaiting the builder. Not infrequently these neglected areas are eyesores to the public, and remain unprofitable for many years. The VACANT LAND CULTIVATION SOCIETY has for its object the acquisition of such ground without rent charge, until the owner desires to utilise it, in order that men in humble circumstances may cultivate the sites as gardens. The work is already past the experimental stage, for the first Report has been issued, giving particulars of what the society has accomplished in 1908-9. The ground is first prepared for cultivation, and is then let, either free or at a nominal charge, to approved applicants, men with large families being first considered. The society provides the seeds at a cheap rate, and, in some cases, free; whilst a supervisor (Mr. R. LEWIS CASTLE) gives the necessary instruction in tillage. There has been a good response to the appeal for the loan of land. The London County Council has lent various sites, and both the Wandsworth and the Hackney Borough Councils have assisted in this direction. Others have assisted by making presentations of tools, manure, seeds, and other necessaries. At West Ham, when the whole of the land is under cultivation, plots, each containing 20 rods of land, will be provided for about 300 men. The society merits success. The work it is doing has advantages, not only for those who cultivate the gardens, but for the general public. In place of what were little better than rubbish heaps, there are now to be seen gardens. The healthful recreation derived by those who work the gardens may prove an incentive to some to return to the country. The man who becomes a keen gardener seldom abandons his love of cultivating flowers, fruits and vegetables, and should he become dispossessed of his holding, he will be likely to seek another. Thus these men may, in time, become allottees, and we regard an allotment as the finest acquisition a working man can make. Gardening extends its scope every year; the boys in rural districts are taught how to plant and sow, and the men in crowded cities are shown how to make the vacant town lands bring forth plenty. We commend the appeal made by Mr. FELS in our issue of April 24, p. 267, to the sympathy of readers.

THE CULTIVATION OF THE NARCISSUS.—That the home market is no longer chiefly dependent on Holland for the supply of bulbs is well known, though it will be news to some that the South Lincolnshire and Cambridgeshire Fen districts are actively developing an export trade in

FIG. 134.—ANDROCYMBIUM MELANTHOIDES FROM MR. GUMBLETON'S COLLECTION. BRACTS WHITE, WITH GREEN LINES.

(See p. 315)

Narcissus bulbs. In the course of a valuable article by Mr. JAMES WAUGH in the March number of the *Journal of the Board of Agriculture*, attention is drawn to this fact, and it is suggested that bulb cultivation for trade purposes might be adopted with advantage by occupiers of small holdings and allotments. Mr. WAUGH describes the best methods of cultivation, the preparation of the soil, the marketing both of the cut flowers and of the bulbs, and gives figures to show that Narcissus growing may result in a net profit of something over £50 per acre. We commend the article to all interested in the subject, but would add the caution that, before a small holder puts money into this branch of horticultural industry, he shall satisfy himself of the accessibility of a market for his produce and of the cost of carriage.

CALCIUM SULPHIDE AS INSECTICIDE AND FUNGICIDE.—The following method of preparation of this useful material was given by Dr. CONTANT in a lecture to the Société Nationale d'Horticulture de France, published in the February number of the *Journal of the Society*. Prepared in this way, the calcium sulphide (or polysulphide) is said by Dr. CONTANT to be extremely efficacious. A large kettle, capable of holding eight gallons, is set up in the open air over a fire. Three to four pints of water are poured into the kettle and boiled, and then about 3 lbs. of quicklime are added gradually; the kettle is then half-filled with water. Fine sulphur passed through a sieve is dropped in little by little, the liquid being stirred meanwhile. The liquid is then boiled for half an hour; water is added till the kettle is full, and the liquid is allowed to stand for six hours at least. A sediment settles down, leaving a clear orange liquid. The deposit serves as an excellent winter wash for fruit trees, &c. The liquid to be used for spraying is diluted with nine times its volume of water, and is serviceable both for the destruction of fungus pests and also for the aphid of Roses, Peaches, &c. It is particularly useful for vines and makes "sulphuring" unnecessary. It should be noted that the liquid to be kept must be syphoned off into receptacles—such as carboys—which can be corked, since by exposure to air the sulphides become decomposed, forming sulphur and calcium sulphate.

ADVICE IN SPRAYING APPLE TREES.—The following notes are from the Experiment Station *Bulletin* 253 (Michigan State Agricultural College, Horticultural Division), entitled "Can the General Farmer Afford to Grow Apples?": Time to spray Apple orchards: 1. Just before the blossoms open, Paris green or arsenate of lead should be added to Bordeaux ($\frac{1}{4}$ lb. of the first or $1\frac{1}{2}$ lb. of the second to 50 gallons of Bordeaux). 2. Just after blossoms fall: the mixture as before. 3. Two weeks later: as before. 4. Early in August: to destroy the second brood of Codling caterpillars and check Apple scab, use one-half as much copper sulphate, i.e., 2 lbs. instead of 4 lbs.; otherwise as in 1, 2, 3. To use the colloquial language of the *Bulletin*: Do a thorough job; squirting a little mixture on a limb is poor business. Drench the whole tree. Let the wind help you. Spray with it. Finish the work on a still day, or when the wind blows in a direction opposite from that from which it blew during the first spraying. Bordeaux stood overnight is not so good as fresh mixed. A little vinegar will cleanse the hands of Bordeaux. To make Bordeaux mixture: 50 gallons of water, 6 lbs. lime, 4 lbs. copper sulphate; dissolve the copper sulphate in 2 gallons of hot water; make up to 25 gallons in a barrel. Slack the lime to a thin paste; make up to 25 gallons. Pour together. When emptying into the spray-tank strain through a brass wire strainer.

SULPHUR FUMES FOR FRUIT PRESERVING.—

Though the following method for preserving Peaches, Apples, Pears, and Tomatos would not at first sight seem very likely to be successful, yet, according to the *Queensland Agricultural Journal*, March, 1909, it may be adopted with confidence. Peel Peaches, or other fruit, cut in halves, remove seeds, put in a wooden tub having a hole in the centre for the vessel containing the sulphur. If four gallons of fruit are required, prepare enough for six gallons to allow for shrinkage. Place sulphur at the rate of one teaspoonful per gallon of fruit in the tub, ignite the sulphur, and cover the tub for four hours. Remove the fruit, place in stone jars, and cover. According to the journal quoted, fruit preserved in this way keeps fine all winter, and tastes like fresh fruit.

SALE OF AN ESTATE.—The Earl of EGMONT'S estate of Cowdray, including over 13,000 acres, has just been purchased by Sir WEETMAN PEARSON. Cowdray Park lies in the Midhurst country, surrounded by the estates of Lord LECONFIELD, the Duke of RICHMOND, and the Duke of NORFOLK. The present mansion was built in 1875, and stands in a park of 600 acres.

KEW GUILD DINNER.—We are requested to remind our readers that the annual dinner of the Kew Guild will take place at the Holborn Restaurant on the 25th inst., the first day of the Temple Flower Show, at 7.30 p.m., not as heretofore on the eve of that show. The secretary, Mr. W. N. WINN, will be glad to hear before the 18th inst. from those who intend to be present.

NATIONAL CHRYSANTHEMUM SOCIETY.—This Society having decided to hold but one exhibition in 1909, has increased the prize list. The Crystal Palace is again selected for the holding of the exhibition, which has been fixed for November 3, 4, and 5. A conference on Chrysanthemums will be held at the Essex Hall, Essex Street, Strand, W.C., on Wednesday, October 6, 1909, commencing at 3 p.m. Papers will be read on various aspects of Chrysanthemum culture, and discussion will be invited. The annual outing will take place on August 9, when a visit will be paid to Friar Park, Henley-on-Thames. We are requested to notify the secretary's change of address. In future communications should be addressed Mr. R. A. WITTY, 72, Savernake Road, Gospel Oak, London, N.W.

THE WILLIAM WOOD FUND.—We are pleased to learn from Mr. GEORGE MONRO that the sum of £195 13s. has been raised as the result of the appeal made on behalf of Mr. WILLIAM WOOD, of Heathside Nurseries, Dartford Heath. It will be remembered that Mr. Wood's glasshouses were destroyed by a snowstorm in March last.

THE LORD PENZANCE SWEET BRIARS.—We read in the American journals that the demand for varieties of the Penzance Sweet Briars is quite exceptional this year. They are certainly to be classed amongst the most charming plants in the Rose garden.

A PROLIFIC PLANT.—*Cynoches chlorochilens* holds for the present the record for number of seeds per capsule. According to the *Kew Bulletin* (No. 4, 1909), the number of seeds in a capsule of this plant presented to Kew by Messrs. HUGH Low & Co. is, at a low estimate, about 3½ million. Dr. SCOTT, who estimated the number, adds that the weight of each seed is about .0000036 grams—that is about 20,000 seeds to the grain—and that the progeny of the single flower would, if all the seeds came up, be about equal to the population of London.

FLOWERS IN SEASON.—Messrs. BAKER'S, Wolverhampton, have sent four new Saxifrages, including the new variety *S. decipiens Arkwrightii* (see fig. 135), which received an Award of Merit at the meeting of the Royal Horticultural Society on May 2. The flowers of this variety, when expanded, measure 1 inch across and are of great substance; the unopened buds are suffused with a pale rose tint, which disappears almost completely in the mature flowers. From the number of unopened flower-buds the variety is evidently a profuse bloomer. *S. Camposii* has flowers of purer whiteness than those of *S. d. Arkwrightii*, but not nearly such large or vigorous inflorescences. The other varieties include *P. W. Hosier*, a robust variety bearing rich crimson flowers; *A. Lynes*, with rosy-crimson blossoms; and *Lady Dean*, the most vigorous of the quartette, the blossoms being suffused slightly with rose. —Mr. F. FLEETWOOD PAUL, Botley, Hants., who sends varieties of Sweet Peas, writes: "I am sending you herewith a few of my improved Telemly strain of winter-flowering Sweet Peas. The plants from which these blooms were cut commenced flowering at the end of February. Of course, the blooms are not so fine as those of the Spencer type, but they can be had at any season."

—A correspondent sends two new varieties

FIG. 135.—*SAXIFRAGA DECIPIENS ARKWRIGHTII*: FLOWERS WHITE.

of Sweet Peas, one a long-stemmed white variety, the other of a rose-salmon tone of colour. He writes: "I send for your inspection a new Sweet Pea, raised by Mr. James Agate, of Havant. The colour is of the deepest shrimp-pink, after the style of Earl Spencer but more intense. The standard is beautifully waved and of the size of that of the John Ingman variety. The other variety is Agate's White, a long-stemmed flower suitable for market purposes." —Messrs. JAS. VEITCH & SONS have sent us a beautiful bouquet of *Schizanthus*. The strain is described as "Veitch's hybrids," and it is certainly remarkable for the distinct, pretty colours. We hope to see them exhibited at the Temple Show.

MR. W. MARSHALL, V.M.H.—Our readers will extend their congratulations to the Chairman of the Floral Committee of the Royal Horticultural Society on the occasion of his golden wedding. Mr. W. MARSHALL was married on May 10, 1859, at Auchinvaith, Blantyre, N.B., to MARGARET, younger daughter of DAVID BRAND, of Glasgow. It will be remembered that Mr. MARSHALL was successful in first blooming *Odontoglossum crispum* in this country. He was one of the founders of the United Horticultural Benefit and Provident Institution

and the Royal Gardeners' Orphan Fund, two excellent institutions in which he continues to take practical interest. He has been a member of the Royal Horticultural Society's Council for many years past, and Chairman of the Floral Committee for 23 years. His wide knowledge, geniality and firmness are qualities for which he is universally esteemed by those who are associated with him in horticultural work. In every capacity Mr. MARSHALL has worked with distinction to himself and benefit to horticulture. We hope that he and Mrs. MARSHALL have yet many years of happy and useful life before them.

GIFT OF A PUBLIC PARK TO SHEFFIELD.—

It is announced that the Duke of NORFOLK has presented Norfolk Park to the inhabitants of Sheffield. It has been maintained hitherto entirely at the expense of the Duke for the use of the public. The Duke's Sheffield residence adjoins it. The park is about 60 acres in extent, and was laid out by the grandfather of the present Duke in 1841. It is situated on a hill overlooking the town, not far from the Midland Railway Station.

IMPORTS OF FRUIT AND VEGETABLES FROM FRANCE.—

The value of fruit and vegetables imported from France alone reached in 1906 the enormous sum of £2,400,000. In the course of six years (1899-1906) the value of the imports increased from less than one million sterling (23 million francs) to almost three times that sum. According to the *Journal* of the Horticultural Society of France, this increase has been due in considerable measure to the enterprise shown by the French railway companies in establishing express goods trains with properly ventilated trucks at reduced rates. We commend this enlightened policy to the notice of the railway companies of our own country.

BULBOUS FLOWERS IN THE BIRMINGHAM PARKS.—

The planting of bulbs in the municipal parks of Birmingham extends every year. The Cannon Hill Park receives the largest share, but extensive planting is also undertaken at Summerfield, Victoria, Aston, Ward End, Highgate, Calthorpe, and Queen's Parks. The influence of the smoky atmosphere on the blooms in some parts of the town is illustrated by a comparison between the flowers in this park with those in more outlying gardens. One has merely to look at a bed of Hyacinths at, say, Aston, or even Cannon Hill, and compare it with a similar display at Queen's Park, Harborne, which is in comparatively open country, free from the smuts and acid-charged vapours of an industrial centre. Looking at the blooms one can hardly imagine that they are of the same kinds as those planted nearer the centres of industry.

A NEW DISEASE OF CUCUMBERS AND VEGETABLE MARROWS.—

A new disease of Cucumbers and Marrows is described in *Die Gartenwelt*. The disease in question, which has recently appeared in Europe, is due to a fungus, *Pseudoperonospora cubensis*, and like so many other fungal diseases has made its way to Europe from America, where it is endemic on wild members of the Cucurbitaceæ. The symptoms of the disease are:—dry, yellow-brown spots, at first rounded, later angular, on the young leaves; on the underside of the leaf the mycelium of the fungus forms violet to grey, irregular patches. In certain cases, at all events, the diseased plants fail to produce fruits. Spraying with dilute Bordeaux mixture is recommended. Fortunately moisture and warmth do not appear to favour the spread of the disease, so long as ventilation is not neglected.

NARCISSUS CHALLENGER.

THE variety shown in fig. 136 was raised by Mr. E. M. Crossfield, Cossington House, Bridgewater, and exhibited by Messrs. Barr & Sons at the meeting of the Royal Horticultural Society on May 4. The plant belongs to the flat-cupped or incomparabilis (sometimes called Engleheartii) section. The corona is a rich shade of orange, and very broad. The segments of the perianth also are very large and of almost perfect symmetry. The plant is a tall grower and of fine bearing. It is a seedling from the same cross as that which produced the remarkable Pixie variety.

according to the vigour of the plant, and have long sheaths closely investing the underground stem. Nestling in the uppermost leaves are two to eight ovate bracts, which form the most conspicuous feature of the plant, for at least the two innermost bracts are white, with longitudinal green veins, and sometimes $3\frac{1}{2}$ inches long and 2 inches wide, forming an involucre round the flowers as in some species of *Hæmanthus*. The flowers are numerous, but small, and of the true Liliaceous type; they are borne on short stalks, and have six long-clawed segments in the ovate-hooded blades, of which the stamens are fixed and reach to or beyond the tips. The three styles are quite distinct, and

been introduced from South Africa by Mr. Bowie in 1823.

The generic name is derived from *aner*, a man, and *cymbos*, a cavity, in allusion to the stamens nestling in the hooded perianth-segments. *C. H. Wright*.

GROWERS AND THE RAILWAYS.

WIDESPREAD satisfaction has been created amongst the trading community by the withdrawal of the Bill laid before Parliament to sanction the amalgamation of the Great Northern, Great Central, and Great Eastern railways, this withdrawal being necessitated by the storm of opposition raised against the Bill throughout the country.

The attitude adopted by the traders has throughout been perfectly clear. They do not for one moment contend that railways companies shall be compelled to continue their policy of cut-throat competition for the purpose of securing passenger traffic, and they recognise that any reasonable arrangement which would prevent the running of almost empty passenger trains in certain districts, merely on account of the jealousy existing between competing lines, is a policy which is bad both for railway shareholders and for the commercial community, as it involves the unnecessary expenditure of money which might usefully be devoted to encouraging the merchandise traffic of the country, so as to swell the profits available for railway dividends.

The question at issue goes, however, much further than this. Traders find that there is a strong tendency to a retrograde policy when once the spur of competition is removed, and that when they are at the mercy of a single company, or of two or more concerns combined into a single company, it is almost impossible to obtain reasonable treatment for goods traffic; in such cases the efficiency of the service becomes decreased, rates have a tendency to rise higher than ever, and complaints meet with no redress. It is notorious that Kent growers (as well as the shareholders) find themselves even worse off than they were before the amalgamation of the South Eastern and London, Chatham and Dover railways; growers in the Channel Islands have met with the same experience since various "mutual understandings" have been come to between the South Western and other railways as regards goods traffic arriving at ports on the south coast. This is, in fact, the result that may usually be anticipated where anything in the nature of a monopoly arises, and even those who are most strongly opposed to the nationalisation of our railway system are sometimes tempted to ask themselves whether, if they are to be at the mercy of a monopoly, such monopoly would not be safer in the hands of the State rather than in the hands of a limited company. There is the additional factor that the nationalisation of railways (on lines somewhat similar to those adopted in the Postal Service) stands on a different footing to any question of municipal trading. In the latter case, municipalities actually enter into competition with the private citizen, whereas, by the very nature of their undertaking, railways compete with no one but each other (except in the case of sea-borne traffic), although their policy inevitably affects for good or evil the commercial prosperity of the country to an extent which is practically incalculable. If, however, the spur of competition can be maintained, there is undoubtedly much to be said in favour of matters of this kind being left to the energy of private enterprise.

It is, therefore, scarcely to be wondered at that traders should experience a considerable feeling of relief at the success of their efforts to oppose the monopoly which would have been established by the parliamentary Bill referred to above. Their success proves that those who advocated a policy of laissez-faire on the ground that the railways were too strong for the trader, and that

CORONA ORANGE-COLOURED.

ANDROCYMBIUM MELANTHOIDES.

ANDROCYMBIUM MELANTHOIDES, Willd. (see fig. 134) was described as long ago as 1808, and was in cultivation in 1823, but seems to have been lost until its recent re-introduction by Mr. W. E. Gumbleton, who received bulbs of the species from Mr. George Thornecroft, of Barberton, Transvaal. The bulb is like that of a minute Tulip, and very small in proportion to the size of the plant which develops from it. The main part of the stem is underground and very slender, and bears at the ground level two to four lanceolate leaves, which vary in length from 3 to 9 inches,

the capsule bursts septically. This species is not uncommon in the central region of Cape Colony, and extends through the Orange River Colony, Natal, the Transvaal, and Rhodesia, to Nyasaland. Several varieties have been described which differ chiefly with respect to robustness. A pencil drawing of this species by the late Prof. W. H. Harvey, of Dublin, is in the collection at Kew.

Another species, *A. eucomoides*, Willd., appeared as *Melanthium eucomoides* in the *Botanical Magazine*, t. 641, published in 1803, and a coloured drawing is preserved at Kew of a plant which flowered there on March 14th, 1824, having

"the inevitable was bound to happen," were neither wise nor far-sighted; the result also enforces the lesson that "combination must be met by combination," as well as by constant watchfulness and vigorous action on the part of those whose interests are attacked.

It often happens, however, that in the moment of victory danger is greatest. There is always the possibility of "counter-attack" at the moment when the victors are lulled into a false sense of security. In the present instance, it is by no means certain that the companies concerned will accept their rebuff with equanimity, and they may yet take further steps with a view to achieving their desired ends. There is, for instance, the possibility that they may now enter into "mutual understandings" or "tacit arrangements" not to compete with each other in respect of various "reasonable facilities" hitherto granted to traders, and the President of the Board of Trade has already hinted at the possibility of agreements of this kind being "driven underground" in the case of an open request for leave to amalgamate being vetoed. It is obvious, therefore, that the necessity for watchfulness is increased rather than diminished at the present stage of the conflict.

It must also be borne in mind that the only result of the successful opposition to the Bill is that, for the present, traders are relieved from the danger of further encroachment in this particular direction upon their existing rights, and that their many grievances still remain unremedied. For the past 12 months a Conference, originally convened by Mr. Lloyd-George, has been sitting for the purpose of considering the numerous complaints of hardship put forward by traders, but as yet no definite result has been made known. It is, in fact, rumoured in some quarters that the railways experts at the Conference have succeeded in engineering the proceedings in a manner which has been considerably successful from their own point of view. Time is, of course, on their side, and some months ago a highly-placed railway official remarked, in the presence of the writer, that he thought there would be no difficulty in prolonging the proceedings, at all events, beyond the life of the present Government! At the moment of writing, the President of the Board of Trade has announced his intention "of considering the best form and scope of a parliamentary enquiry into the question of railway amalgamations and working agreements." Growers will, doubtless, be able to give useful and, in certain instances, remarkable evidence in such an enquiry, but it is to be hoped that the President of the Board of Trade may realise the necessity of conducting the proceedings with all possible despatch. So far as may be feasible, any such enquiry should be proceeded with from day to day in the same way as actions are tried in the law courts. A commission or committee, which would sit at intervals (sometimes of several weeks), as in the case of the present Conference, would probably prove to be worse than useless if any real attempt at reform is to be made.

In addition to the successful opposition of the Amalgamation Bill above discussed, traders may also take heart from the result of the recent struggle between Messrs. Elders and Fyffes, Ltd. (the Banana merchants), and the combined strength of the railways of the United Kingdom. It is, of course, well known that merchandise conveyed by rail is charged at rates varying according to the "class" in which any particular article is placed by statute. Excluding the classes which deal only with heavy traffic, those which affect the ordinary trader are the classes known as Nos. 1, 2, 3, 4, and 5. Articles in Class 1 pay the lowest rate, and the charges increase through the different classes until Class 5, which pays the highest rate, is reached. Hitherto, unripe Bananas have stood under statute in Class 3. For practical purposes, however, they have been placed in the railway working classification in

Class 2 if sent in minimum loads of one ton per wagon, but in this case they have been subjected to various onerous conditions, as the railways would only consent to carry Bananas loose in bunches, "at owner's risk as regards deterioration, damage, loss by pilferage, or from other causes." Furthermore, the rates charged only entitled the trader to haulage "from station to station," and the companies did not undertake to supply labour for loading or unloading their trucks.

After negotiations extending over several years, Messrs. Elders and Fyffes decided some months ago that the time had come when application should be made to the Board of Trade for an order compelling the railway companies to extend to them lower rates and more reasonable treatment, and accordingly they applied for "unripe Bananas, loose, in minimum loads of one ton per wagon" to be placed in Class 1. In due course, the Board of Trade sat to hear the application, and seven railway rate experts, representing the seven principal companies of the kingdom, attended to oppose. After considering the matter for several days, the Board of Trade notified the parties concerned of their intention to make the order asked for by Messrs. Elders and Fyffes, with the exception that the minimum load to be carried at Class 1 rates should be two tons instead of one ton. To this Messrs. Elders and Fyffes raised no objection, but a chorus of indignation arose from the railway companies, and they promptly applied to the High Court for an order forbidding the Board of Trade to make the order. Mr. Justice Jelf and Mr. Justice Coleridge, however, declined to interfere, and the order of the Board of Trade has now become law by publication in the *London Gazette*. The order in question contains a schedule of the Railway Acts thus affected, and some idea of the complicated state of affairs with which the ordinary trader is faced in his dealings with the railway companies on the question of rates may be gathered from the fact that the Acts affected by the order amount to no fewer than 35 in number. Messrs. Elders and Fyffes are to be congratulated on their courageous stand in the matter, and it is to be hoped that the result may prove to some of the less enlightened railway companies of the kingdom that it is not always a wise policy to drive the trader too far, and that in litigation of this kind it is not necessarily a foregone conclusion that the combined strength of the railway companies must win. H. M. V.

BULBS IN BATTERSEA PARK.

THIS beautiful South London park is now displaying the varied beauties of tree and shrub, of flowering bulbs and other early plants. It is, perhaps, the skilful arrangement of the masses of mixed shrubs and their distribution at suitable points in the landscape, and the garden-like character of the laying-out of this park that are its chief charms. The beauty of the shrubs and trees, which are now clothed with their fresh foliage and flowers, inconspicuous as the latter mostly are, is much appreciated at this season. Willows and Poplars, with their grey young leaves are the most striking. Near the reserve garden by the Albert Bridge are bold beds of Tulips. The adjacent panel garden has four circular beds, which are furnished with crimson Tulips of one variety, with a larger bed, also circular, in the centre. Two squares of a yellow Narcissus and two of *N. bicolor* flank these; the whole making a bold display.

In this part of the park are several showy specimens of *Prunus persica*, old trees, 10 feet high, densely covered with their semi-double flowers of various shades of crimson. Following the diagonal path leading to the Avenue, there are batches of Narcissi in the grass, and a group of Kaiser Kroon Tulips and yellow Wallflowers.

In the sub-tropical garden, two beds are planted with scarlet and yellow Tulips, together

with Mascari (Grape Hyacinth). Other beds of Tulip Cottage Maid and *Arabis albida* produce a pretty effect. Beds are also planted with purple Tulips and Polyanthus of fine quality; with brown-coloured Wallflowers, Daffodil Sir Watkin, and Tulip La Belle Alliance; others contain Hyacinth gigantea, of a light pink colour, and Tulip La Belle Alliance. The large heart-shaped beds at the corner of the grass plot contain variously shaped groups of bulbs and Primula Polyanthus, crimson and yellow Tulips, Hyacinth King of the Blues, Tulip Joost van Vondel, Primula Polyanthus being intermingled with the bulbs with good effect. Hereabouts, a big circular bed displays strong-growing Cinerarias in various colours, and having *Dicentra* (*Dielytra*) spectabilis planted thinly over it. A curious mixture of dull purple and blue Hyacinths is not altogether pleasing to a critical observer.

A quiet effect is made in a bed filled with Mme. Van der Hoop Hyacinth (white) and Primula Polyanthus. One of the most attractive beds is filled with the soft crimson-coloured Tulip La Reve and crimson-flowered Daisies, the latter just showing flower. Tulip Proserpine, with white *Arabis* and yellow Wallflowers is excellent.

The beds of Rhododendrons and Azalea sinensis show great promise for flowering; and so also do bushes of *Magnolia conspicua*. Tulipa fulgens, a late-flowering species, is in full blossom, and amongst its bulbs are clumps of Pyrethrum roseum varieties. By the lakeside, a bed is planted with Azalea sinensis and *Iris germanica*, and if these flower simultaneously the effect should be good. The young growth of *Gunnera manicata* by the lakeside is magnificent. F. M.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

AN INTERNATIONAL HORTICULTURAL EXHIBITION.—The wish suggested in your concluding remarks (see p. 232) on the great International Exhibition at Berlin, that this country may soon see a great international show will find a response in the heart of all who love horticulture. Whilst we have had many good exhibitions, no really great international show has been held in London since 1866. Very few are now alive who saw that display, but it was the finest horticultural show Great Britain had seen. If another international exhibition were held, it would be likely to excel that of 1866, just as that excelled all others which had preceded it. The chief difficulty to overcome in relation to such a show is that of getting a fitting place in London or its suburbs. There is, for choice, doubtless the Crystal Palace, the White City, Earl's Court, the Royal Botanic Gardens, and last, but by no means least, Holland Park. But so much would depend on the time of year at which the show was held. It is unsafe to hold shows here under canvas earlier than the end of May. No one would dream of doing so in April. Probably the most favoured time for canvas would be in June. If it were held much earlier than that, permanent buildings such as are found on some of the sites named would be essential. I do not wish at this moment to discuss the possible suspension of the Temple shows, but it is by no means improbable that the conditions imposed on those shows have become too onerous to be longer endured. The fact that no refreshment other than lawn teas will be permitted there this year affords proof that the Society is to be gradually expelled from the gardens. In any case, much as may have been the prestige of the Temple shows, those at Holland Park are far more enjoyable. If any movement is made in the direction of promoting a great international show in London, necessarily the chief force must come from the Royal Horticultural Society. But that fact need not prevent outside influence being brought to bear on the Council in the matter. The work of organising the exhibition should be, as in 1866, in the hands of a powerful representative horticultural committee. A.

SPRING FLOWERS AT HAMPTON COURT PALACE.—Seldom have spring flowers made so brilliant a display at Hampton Court as this year. Bulbs, especially both early and late Tulips, figure prominently, and of these very many seem to be so new to visitors that note-books are brought into use constantly. The long border which margins the broad promenade on the palace side is a mass of Tulips almost from end to end, early and late varieties being intermingled on carpets of dwarf plants; there is no break, as the succession is well maintained. The broad edging to this border of double Arabis is like a trail of snow. In the beds on the opposite side of the walk masses of various-coloured Polyanthus, wondrously fine Pansies, giant double Daisies, Violas, Wallflowers, yellow Alyssum, and various Aubrietias with the snowy Arabis afford delightful carpets for many diverse double and single Tulips. I have never seen the beds better furnished or more effectively filled A. D.

ACETYLENE GAS REFUSE.—During the past few years we have used a considerable quantity of this material in the gardens here. It is certainly advisable to allow the refuse to be exposed to the atmosphere some time before using, say, 12 months. At first I tried it on land used for Potatos, Peas, and a bed of Godetia, and with no ill-effects. Since then it has been used generally in the kitchen garden, especially for working into the subsoil, which is of a clayey nature. During the winter of 1907 and 1908 we trenched an old disused timber yard, with the intention of adding it to the kitchen garden. The refuse was used very freely for mixing with the staple, with any other available material, such as manure from old hot-beds, leaf-mould, burnt garden refuse and decayed sawdust. One of the finest crops of Potatos I have seen was taken from this land last season. Other crops have succeeded, including Globe and Jerusalem Artichokes, Borecole, Brussels Sprouts, Turnips, Spinach, Beet, Peas, and Spring Cabbage. If the refuse were used whilst fresh it would probably prove injurious, for, on taking charge here, I found the Onion crop useless, and it was attributed to the refuse having been emptied directly on to the land after it had been taken from the gasometer. G. H. Head, Kingsdon Manor Gardens, Taunton.

LAW NOTES.

THE SALE OF POISONOUS COMPOUNDS.

A SUB-COMMITTEE of the Public Health Committee of Edinburgh Town Council recently considered applications by seedsmen for licenses to sell poisonous substances used for horticultural purposes under the Poisons and Pharmacy Act, 1908 (Section II.). Mr. A. E. S. Thomson appeared on behalf of thirteen seedsmen making application. The Edinburgh Chemists' Society opposed the applications.

Mr. Thomson held that the chemists were only rivals in trade. The regulations regarding the sale of poisonous substances were directed, he said, against vendors other than the seedsmen. What the seedsmen wanted was to get the benefit of the statutory authorisations. The seedsmen manufactured those substances, and if they were refused the licenses the trade would pass from the seedsmen to the chemist. This was manifestly unjust. Nineteen such licenses had been granted in Glasgow.

Mr. T. B. Morison said he was informed that no licenses had been granted either in Glasgow or elsewhere in Scotland. He appeared on behalf of the Chemists' Association in Edinburgh, and on behalf of numerous vendors of these poisonous substances. The Act provided that such licenses were to be granted only where there were not in the particular localities facilities sufficient to meet the reasonable requirements of the public. In Edinburgh the facilities were ample. Counsel also argued that the applications from firms were incompetent, as licenses could be granted only to individual persons.

Before the committee rose for lunch, it was decided that the applications be withdrawn, to be amended so as to become applications by individual persons.

Thereafter the committee sat in private and decided after considerable discussion to recommend that the three applications made by individuals should be granted.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

MAY 4.—*Present:* Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Sir Daniel Morris, K.C.M.G., Messrs. J. Fraser, J. W. Odell, H. J. Elwes, J. T. Bennett-Poë, A. Worsley, H. T. Güssow, G. Masee, J. Douglas, F. J. Baker, E. H. Holmes, W. Hales, R. Hooper Pearson, W. Cuthbertson, R. A. Rolfe, F. J. Chittenden (hon. secretary), and W. E. Ledger (visitor).

Hybrid Narcissus.—Mr. J. DOUGLAS showed specimens of a hybrid Narcissus obtained by crossing *N. calathinus* (which is not quite hardy) with the bicolor trumpet Daffodil *Wear-dale Perfection*. The hybrid was a white trumpet Daffodil with a somewhat short trumpet. It has proved hardy.

Variations in Primroses.—Mr. DOUGLAS commented upon the considerable variations often seen in cultivated Primroses in the comparative lengths of the style and the positions of the stamens, and showed specimens to illustrate his remarks. The extreme examples of departure from the normal conditions were seen in a flower in which the anthers and the stigma were both level at the base of the corolla tube, and in another where the style projected much beyond the mouth of the corolla tube.

seen in these Tulips. The exhibit was particularly interesting since it was stated that the branching character had become perfectly fixed when the plants were reproduced vegetatively, and that seedlings give a considerable proportion of plants showing the same character. In the case of Tulips the branching character cannot be due to the union of several flowers, as is usually the case in fasciation, since normally the Tulip is generally one-flowered. It must, therefore, be due to division of the flower-forming tissue at a very early stage of its development.

Hybrid Orchids.—Mr. ROLFE showed flowers of *Epidendrum evectum* (purple) and *E. xanthinum* (yellow), and the hybrid raised by crossing them (= *E. × kewense* of a salmon colour). He also showed flowers of *E. × kewense* crossed with *E. evectum*, producing a hybrid having purple flowers (but not of the same shade as *E. evectum*), and of *E. × kewense* crossed with *E. xanthinum*, this cross bearing flowers resembling *E. × kewense*. When *E. × kewense* was self-pollinated it reproduced flowers of three sorts bearing great resemblance in colour to *E. evectum*, *E. × kewense*, and *E. xanthinum* respectively.

Various plants.—Mr. G. PAUL sent specimens of the two shrubs *Plagiospermum sinense*, an interesting plant belonging to the Rosaceæ, with flowers nearly approaching the Celastraceæ in structure, and bearing thorns a little distance above each of the leaf axils in addition to the

FIG. 137.—BRANCHED TULIPS FROM BULBS IN WHICH THE QUALITY OF BRANCHING IS FIXED.

(See note in "Scientific Committee.")

Hybrid Salices, &c.—Mr. J. FRASER exhibited living and herbarium specimens of the following plants:—

(1) *Salix fragilis × triandra* (alopeuroides Zausch.) gynandrous specimens of the tree, which is normally male. Some of the smaller branches bore female catkins with a few stamens amongst them. The ovary is similar to that of *S. fragilis*, and the stigmas recall *S. triandra*. The posterior gland is often changed into one or two ovaries, separate or combined. The stamens are usually three; in the female catkin there may be one, two, or three ovaries, and sometimes one stamen and one ovary (collateral).

(2) *Salix myrsinites × nigricans* (punctata, Wahlb.).

(3) *Salix arbuscula × herbacea* (simulatrix, F. B. White). Mr. FRASER also exhibited specimens showing sepalody of the petals in Wallflower, and pistillody of the stamens in the same flower, and fasciation of the flower stem of *Cardamine pratensis*.

Branching in Tulips (see fig. 137).—Mr. R. HOOPER PEARSON showed branched stems of Tulips of the Darwin form from Mons. Bouy, Clermont-Ferrand, France, the varieties representing considerable variety in colour. There were usually four flowers, but sometimes as many as seven from a single bulb. The stems showed some degree of fasciation such as is frequently

usual axillary bud, and *Gleditschia Delavayi*, a species from Yunan. Both of these have proved hardy at Cheshunt, but Mr. HALES stated that the latter had been killed by frost at Chiswick.

Mr. WORSLEY showed an inflorescence of *Oncidium verrucosum* var *Rogersii* to illustrate the great amount of variation in the lobing of the labellum seen in this plant.

Mr. ELWES exhibited a number of fine flowers of the recently-introduced *Regelio-Oncocyclus* hybrid Irises raised by Mr. van Tubergen. He found that if kept dust dry for about five months they could be successfully grown in this country, and did not die out as the *Oncocyclus* Irises usually do.

SPILSBY DAFFODIL.

APRIL 29.—The eighth annual exhibition of spring bulbous flowers was held at Spilsby on the above date. The exhibits all round were remarkably good. For a collection of Daffodils in 30 varieties (not to include *Polyanthus Narcissus* nor double varieties), Messrs. Barr & Sons, Covent Garden, London, offered a silver vase, which was won by Mr. C. MILLER, Spilsby, for the second year in succession. The Challenge Cup, given by the late Mrs. Thompson, East Keal, open to residents within the Horncastle Parliamentary Division, for 20 distinct varieties of Daffodils (not including *Polyanthus* varieties),

was awarded to the Rev. H. G. ALINGTON, Candlesby Rectory. Three premier prizes were offered, silver medals being awarded to Mr. J. F. RAWNSLEY, Candlesby, for the best flower of a Magni-coronati variety; to Mrs. POCKLINGTON-COLTMAN, Hagnaby Priory, for the best Medio-coronati variety; and to Mr. T. SIMPSON for Parvi-coronati. The principal prize-winners were Mrs. POCKLINGTON-COLTMAN, the Rev. G. H. HALES, the Rev. H. G. ALINGTON (Candlesby Rectory), Dr. M. C. MOXHAM (Stickney), Messrs. C. MILLER, T. SIMPSON, H. SHARP, P. W. FREEMAN (Spilsby), S. F. STAFFURTH (Freiston), J. F. RAWNSLEY, and H. HAND (East Kirkby). Messrs. R. H. BATH, LTD., Floral Farms, Wisbech, and Mr. A. M. WILSON, East Keal, showed non-competitive exhibits.

KENT, SURREY & SUSSEX DAFFODIL.

APRIL 30.—The exhibition which took place at Tunbridge Wells on this date is the fourth in succession held by these counties. The exhibition, although not the finest of the series, was certainly superior, from a cultural point of view, to that of last year. Trade exhibits greatly contributed in making the show a success. Messrs. BARR & SONS, King Street, Covent Garden, London, and Mr. F. HERBERT CHAPMAN, Rye, Sussex, both staged excellent stands of choice Narcissi, whilst Messrs. GEO. BUNYARD & Co., Maidstone, Mr. G. REUTHE, Keston, and Messrs. G. & A. CLARK, LTD., Dover, showed Alpine and other hardy plants, also cut flowers of spring-flowering subjects. Local exhibitors in Messrs. A. CHARLTON & SONS contributed a grand display of cut flowers of Anemones, Tulips, Narcissi, &c., whilst Mr. A. ASHTON, of Camden Park, showed well-grown Orchids. A collection of Narcissi seedlings not for competition was exhibited by the Rev. G. P. HAYDON.

In the class for a collection of Daffodils in not fewer than 30 nor more than 40 varieties containing representative blooms of three groups, Magni-Coronati, Medio-Coronati and Parvi-Coronati, Mr. G. A. NIX was awarded the 1st prize. Prominent varieties were Lady Margaret Boscawen, Glory of Leiden, Homespun, White Lady, Crown Prince, Weardale Perfection and Pilgrim. 2nd, Mr. C. J. NIX.

The best 12 distinct varieties of Daffodils belonging to the sections mentioned were shown by Mrs. BENSON. Especially good were the blooms of Virgil, Vesuvius, Albatross and Mme. Plemp. 2nd, M. GOURLÉ.

Mrs. BENSON was also awarded the 1st prize in the class for 12 distinct varieties of Trumpet Daffodils (Magni-Coronati), showing Capt. Nelson, Weardale Perfection, J. B. Camm, Mme. de Graaff, &c.; 2nd, Rev. G. P. HAYDON.

This lady also won in the class for 12 distinct single varieties of chalice-cupped Daffodils (Medio-Coronati). The Rev. G. P. HAYDON was again placed 2nd.

Mr. F. H. CHAPMAN won the 1st prize for six distinct Parvi-Coronati varieties with excellent blooms of Cassandra, Barcarolle, Horace, Kingsley, &c., the last-named being a remarkably fine specimen; 2nd, Mr. E. W. NIX.

ROYAL GARDENERS' ORPHAN FUND. (FESTIVAL DINNER.)

MAY 6.—The usual gathering at dinner of those interested in this Charity took place on this date at the Hotel Cecil, London. A large company, representative of all branches of horticulture, assembled under the chairmanship of his Grace the Duke of Rutland. Dinner was served in the handsome and spacious Victoria Hall, which was lavishly decorated with flowers and plants contributed by various friends of the Charity. It was a brilliant and successful function, and we are glad to be able to record that it resulted in a considerable addition to the funds of the Institution.

The former hon. treasurer, Mr. N. N. Sherwood, whose absence through indisposition has been greatly regretted on former occasions, was present, and signalled his return by one of his usual generous gifts.

After the loyal toasts had been proposed, the Chairman proposed that of the Royal Gardeners' Orphan Fund. His Grace asked the indulgence of his hearers, as he was singularly ill qualified to make any serious remarks on the industry which concerned most of those present. He was

gratified to know that in these days, when it is not easy to find any concern which is clear of financial difficulty, the Royal Gardeners' Orphan Fund was in a satisfactory condition. Although he doubted if such a good financial year as 1908, which celebrated the coming of age of the Institution, could be expected, he, nevertheless, appealed for liberal generosity to the Fund, and expressed the hope that the efforts made this year might produce a handsome contribution to the funds of the Society. The members of the gardening craft were exposed to trials and accidents as those in other branches of work. It was gratifying to know that the orphans of those who passed away before they had time to make adequate provision for their children's up-bringing, were assisted by such a Fund. In these days when charitable contributions were not so easily procured as in the past, it was very necessary to bring before the public and gardeners themselves the claims of the Society. Although gardening was one of the most interesting occupations the world had ever known, those occupied in its pursuit were never able to amass large fortunes, and such institutions as the Royal Gardeners' Orphan Fund especially needed generous support by the general public. His Grace expressed the hope that those persons who had come forward to aid it in the past might do so in the future, and that the generosity and goodwill of the public would always be extended to the charity.

The hon. treasurer, Mr. Edward Sherwood, expressed thanks to his Grace for the kind words in which he had couched his appeal on behalf of the Fund. Last year a great effort was made to make the occasion memorable, and he was glad to state that the revenue from all sources for 1908 constituted a record, but the number of applicants seeking relief was also a record. Since February 14 applications for relief had been received, and these were found to be so necessitous as to warrant the committee granting a measure of temporary assistance. At the present time 123 children, of ages ranging from 2 years to 13 years, were in receipt of the full yearly allowance of £13. He appealed for increased annual subscriptions, and thought that gardeners should subscribe more generally to the Fund. In some parts of the country the Institution was looked upon as a London Fund, but this was erroneous, for the candidates were selected from all parts of Great Britain. In several districts the local gardening societies were working in the interest of the orphans, and he appealed to gardeners to support these local funds. The administrative expenses were small, and were more than covered by the income from invested funds, so that all donations received were devoted directly to supplying the needs of the orphans.

The toast of "Gardeners and Gardening" was proposed by Mr. Edward White, who declared that horticulture was responsible for the livelihood of a vast number of persons, and it was remarkable that the members of the gardening world did not exercise more influence in forwarding the interests of this industry. The official mind should be disabused of the notion that horticulture is little more than an appendage to agriculture. He would like the support of a few good speakers in Parliament on matters horticultural. It was regrettable that when an employer felt the pinch of bad times, economy was usually first directed to the garden staff.

Dr. F. Keeble responded. When he regarded the extraordinary and beautiful results of the gardener's skill in producing new forms, he could not but admit that the encomiums passed on gardens and gardeners were well deserved. He was, therefore, able to accept on their behalf—the more readily because they were true and well deserved—the praises which had been that evening lavished upon gardeners and their gardens. It was sometimes said that the English mind was slow to perceive the advantages of co-operation; but for the practice of the noblest co-operation of all—that for the relief of distress—Englishmen, as that meeting testified, showed no lack of aptitude.

The toast of "The Visitors" was given by Mr. N. N. Sherwood, who expressed his pleasure at finding himself again at the dinner after an absence of six years. He was present when the Society was founded, and did not miss one of the dinners for 15 years. He had seen the Institution grow, and he was delighted at its prosperity. It commended itself to all who were charitably disposed. Last year he was pleased to endow the Maybud Campbell Fund,

in commemoration of the birth of his granddaughter: he now wished to provide a similar fund, so that her brother might be able to nominate an orphan to receive the benefits of the Fund. Mr. John Douglas, in a humorous speech, replied on behalf of the visitors.

The toast of "The Press" was proposed by Mr. William Poupart, who emphasised the fact that horticulture in general, and its benevolent aspect in particular, were well served by the horticultural Press. Mr. John Collingridge, in the course of his reply, stated that he was happy to be able to say on behalf of the horticultural Press that all that lay in its power would be done to further the interests of such admirable charitable institutions as the Royal Gardeners' Orphan Fund.

The secretary, Mr. Brian Wynne, announced that as a result of the dinner the Institution had benefited by £800. This was not so large a sum as that of the previous year, but it exceeded that subscribed in former years. Some of the principal subscriptions were as follow:—The Duke of Rutland £10, Mr. N. N. Sherwood and his sons £100, Messrs. N. M. Rothschild & Sons 25 guineas, Baron Schröder 10 guineas, Mr. Leonard Sutton £50, Mr. Reynolds £44 2s. 6d., Mr. David W. Thomson £25 4s., Mr. J. F. McLeod £21, Mr. E. S. Mansfield £20, Mr. R. Hooper Pearson £18 8s., Mr. W. Nutting £15 9s. 6d., Mr. R. Ker £12 10s. 6d., Messrs. Barr & Sons, 10 guineas, Mr. F. Noakes 10 guineas, Mr. J. C. Eno 10 guineas, Messrs. James Veitch & Sons 10 guineas, Mr. H. J. Veitch 5 guineas, and supporters at Covent Garden Market £195 10s. 6d., making a grand total of about £800.

NATIONAL AURICULA & PRIMULA. (MIDLAND SECTION.)

MAY 5, 6.—The tenth annual exhibition was held at the Botanical Gardens, Edgbaston, on the above dates, in ideal weather. Hitherto the Society's shows have been confined to one day, but the present show extended over two. There was a large attendance, and on the evening of the first day visitors were entertained with an excellent promenade concert.

Mr. C. WINN exhibited a grand lot of flowers, including several new seedlings. He beat all his competitors in the local classes, and won the Silver Medal offered by the Birmingham Botanical and Horticultural Society to the most successful exhibitor. The Bronze Medal offered as 2nd prize to the runner-up was awarded to Mr. W. M. SHIPMAN. Messrs. H. W. MILLER and T. STEVENS were successful in the classes reserved for less experienced amateurs. Mr. GEORGE SAVORY is to be congratulated upon winning 1st prizes in both the Show and Alpine classes reserved for maiden growers. First-class Certificates were awarded to seven Auriculas, and one Award of Merit to a new Primrose.

Honorary exhibits were received from Mr. C. WINN, who sent two dozen well-flowered plants of a very good strain of Schizanthus, for which a First-class Certificate was awarded.

Mr. W. A. WATTS contributed a large group of choice yellow and white Polyantheses, together with a small but interesting collection of Daffodils. (Silver Medal.)

SHOW AURICULAS.

Twelve classes were provided for these, and some very good flowers were exhibited. There were two exhibits in the principal class, which was for eight dissimilar varieties. The 1st prize was won by Mr. WALTER M. SHIPMAN, Clovely, Altrincham, with handsome flowers of Eucharis, Harrison Weir, Abraham Barker, Mikado, Acme, Richard Headley, Mrs. Potts, and Shirley Hibberd; 2nd, Mr. C. WINN, Selly Park, Birmingham (gr. Mr. T. T. Sheppard), whose best varieties were Perseverance, Harrison Weir and Eucharis.

Six Show Auriculas, dissimilar.—1st, Mr. C. WINN, with well-developed plants of Olympus, Lancashire Hero, Shirley Hibberd, Gerald, Henry Wilson, and Harrison Weir; 2nd, Mr. W. M. SHIPMAN.

Four Show Auriculas, dissimilar.—Mr. RICHARD HOLDING, Bournville, was awarded the 1st prize for splendid examples of Cleopatra, Diomedé, Mikado, and Acme; 2nd, Mr. J. COLLIER, junr., Ludlow.

Mr. A. J. WADLEY, Aston Manor, had the best pair of Show Auriculas, dissimilar, in Shirley Hibberd and Mrs. Potts.

SINGLE PLANTS.

Green-edged.—1st, Mr. H. W. MILLER, with a superb specimen of Shirley Hibberd; 2nd, Mr. W. M. SHIPMAN, with Prince Charming.

Grey-edged.—1st, Mr. W. M. SHIPMAN, with a sturdy, well-flowered plant of George Lightbody; 2nd, Mr. C. WINN, with Richard Headley.

White-edged.—Mr. W. M. SHIPMAN secured both the 1st and 2nd prizes with splendid plants of Conservative and Acme respectively.

Selfs.—This was a popular class, no fewer than 22 exhibits being placed before the judges, who awarded the 1st prize to Mr. A. LAWTON, Aston, for a grand plant of Mrs. Phillips; 2nd, Mr. RICHARD HOLDING, with Harrison Weir.

Selfs, yellow, primrose, orange or buff.—1st, Mr. W. M. SHIPMAN, with Daffodil; 2nd, Mr. C. WINN, with Joan Peacock.

ALPINE AURICULAS.

Eight Alpine Auriculas, dissimilar.—1st, Mr. C. WINN, with Richard Dean, Mrs. Danks, Argus, Thetis, Golden Acme, J. F. Kew, Majestic and Ettrick; 2nd, Mr. W. H. PARTON, King's Heath.

Six Alpine Auriculas, dissimilar.—Here again Mr. C. WINN was placed 1st with Mrs. Danks, Thetis, Richard Dean, Argus, Ettrick and J. F. Kew; 2nd, Mr. T. M. EGLINGTON.

Mr. A. LAWTON was placed 1st in classes provided for (1) four Alpine Auriculas, and (2) two Alpine Auriculas.

Mr. RICHARD HOLDING had the best plant possessing a gold centre with Majestic; and Mr. W. M. SHIPMAN beat 24 contestants in a class for a variety with a light centre with a splendid specimen of Perseverance; 2nd, Mr. C. WINN, with J. F. Kew. The best unshaded Alpine Auricula was named Unexpected and was shown by Mr. RICHARD HOLDING.

SEEDLING SHOW AURICULAS.

Two Show Auriculas.—1st, Mr. E. DANKS, with two unnamed varieties of much promise; 2nd, Mr. C. W. G. LUDFORD, Sutton Coldfield, with David Copperfield and Charles Dickens. The last-named exhibitor beat seven competitors in a class for a grey-edged variety with a lovely plant of Barnaby Rudge. The best single specimen of a green-edged variety was Charles Dickens, shown by Mr. C. WINN.

SEEDLING ALPINE AURICULAS.—The principal prize-winners in these classes were MESSRS. WINN, COLLIER and HOLDING.

FANCY AURICULAS, POLYANTHUS AND PRIMROSES.—These were not well shown, and competition was meagre. The successful prize-winners were MESSRS. WINN, COLLIER, LUDFORD and WATTS.

AWARDS.

First-class Certificates were awarded each of the under-mentioned Auriculas:—

Charles Winn (green-edged), *Dorothy Westmacot* (gold centre), *Edith Winn* (light centre), all from Mr. C. WINN. *David Copperfield* (self), shown by Mr. C. W. G. LUDFORD, Sutton Coldfield. *Bournville* (gold centre), *Salome* (light centre), *Unexpected* (gold centre), all from Mr. RICHARD HOLDING.

An Award of Merit was awarded to Primrose Miss Watts. This is a strong growing variety, with substantial cream-white, circular flowers nearly 2 inches across. It has a "thrum" eye, and the basal portion of the petals are heavily blotched with lemon-yellow.

PREMIER BLOOMS.

The premier Show Auricula was Richard Headley, shown by Mr. W. M. SHIPMAN. The premier Alpine was Golden Acme, shown by Mr. C. WINN, who also had the premier, seedling, Show in Charles Winn and the premier, seedling, Alpine in Dorothy Westmacot.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

MAY 10.—The monthly committee meeting of the Society was held at the Horticultural Hall, Vincent Square, Westminster, on this date. Two new members were elected and one nominated. Three members over 60 years of age withdrew their interest as per Rule 18. The sum of £45 5s. 5d. was ordered to be paid to the representatives of the late Mr. David James Nightingale. The amount of sick pay for the past month has amounted to £65 7s.

MARKETS.

COVENT GARDEN, May 12.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—E.C.]

REMARKS.—Trade is very bad, and large stocks of tubers have accumulated in the markets. Supplies of new Potatoes from Teneriffe, Lisbon, &c., tend to make the trade for old tubers still worse. Edward J. Newborn, Covent Garden and St. Pancras, May 12, 1909.

COVENT GARDEN FLOWER MARKET.

All the stands in the flower market are fully occupied, and there are in addition many temporary stands under the foreign flower market. Trade was brisk this morning (Wednesday), and yet a considerable quantity of flowers remained unsold. Roses seem to be a drug on the market, and it is disappointing to see so many good blooms unpurchased. I was offered fine blooms at 6d. per dozen. At one time Roses at this season would have sold for 6s. per dozen. The varieties with strong stems are in most demand. The varieties Kaiserin Augusta Victoria, Fran Karl Druschke, and The Bride take the lead. Pink varieties of the Catherine Metmet type have decreased in value since blooms of Mrs. J. Laing, Mrs. Sharman Crawford, and others with good stems have become more plentiful. In red Roses Capt. Hayward is the most prominent, but Richmond is also a favourite. Carnations are plentiful; fairly good prices are sustained for the best blooms. Flowers of the Enchantress variety have been over plentiful, and some blooms are sold at very low prices. Spanish Irises are now taking the place of Daffodils, which are seen in much fewer quantities. There is a great difference in the prices of these Irises; those from the Channel Islands do not make more than from 4s. to 6s. per dozen bunches, while those home grown reach 9s. per dozen bunches. Darwin Tulips are very good, but they do not sell well. Large supplies of Hyacinth blooms have arrived from Holland, but the inflorescences are cut without foliage, and are sold cheaply. Liliums have been extra plentiful; the best blooms can be purchased at about 3s. per bunch. Sweet Peas are abundant and their prices low. The white varieties seen are very fine, and Dorothy Eckford remains the favourite. Miss Willmott and Lady Grisell Hamilton are also popular with market buyers. Stephanotis, Eucharis, and Gardenias are procurable; some growers have considerably reduced their stocks of Gardenias. Callas (Richardias) continue plentiful and cheap.

POT PLANTS.

Pelargoniums are a feature. The Ivy-leaved varieties include Gaillee, Mrs. Hawley, Madamie Crousse, and Chas. Turner. The show or decorative sorts are better than I have seen them for some years past. Amongst the Zonal type Paul Crampel is most in demand. Verbenas, Miss Willmott and Princess of Wales, are very good. Good spring-grown Mignonette is seen, but plants raised from autumn-sown seed are not yet finished. A few good Azaleas are noticed, but they are nearly over for the season. Ericas Cavendishii, candidissima and persolita alba are all good. Cinerarias are becoming scarcer, and Genistas are nearly over. Marguerites in all sizes are good. Other plants include Rhodanthe, Yellow Calceolarias and Intermediate Stocks. Palms are making better prices; Kentia seeds promise to advance considerably in value, which will raise prices still higher. Ferns are well supplied and their prices are low. Aralia Sieboldii and the variety Moseri are plentiful, but some have soft foliage still. Aspidistras are not making such good prices as in previous years. Araucaria excelsa also is cheaper. There is a brisk trade in summer bedding plants. Plants in store boxes are making barely half the prices they did a few years ago. A. H., Covent Garden, Wednesday, May 12, 1909.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending May 8, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—Except in parts of Scotland quite early in the week the condition was dry and almost cloudless over the whole Kingdom.

The temperature was low at the beginning of the week, but afterwards high for the time of year, and in all districts the mean for the period was in excess of the average, the greatest divergence being about 3° in Scotland N. and in Ireland. The highest of the maxima, which were generally recorded between the 6th and 8th, ranged from 75° in Scotland E., and 74° in Scotland W. and England N.W., to 66° in England E. and N.E. Along the east coast the maxima were little above 50°. The lowest of the minima occurred on the 2nd, and ranged from 24° in Scotland E., 25° in Scotland W., and 27° in England S.E. and Ireland N., to 32° in Scotland N., and to 38° in the English Channel. On the grass the thermometer fell to 14° at Llangamarch Wells, 18° at West Linton, 19° at Burnley, 20° at Greenwich, Newton Rigg, and Southport, 21° at Hereford and Markree Castle, and below 25° in several other localities.

The rainfall.—Over the greater part of England the week passed without rain, but on Sunday or Monday a few slight falls were experienced in the west and north of the Kingdom.

The bright sunshine was unusually abundant, the number of hours being twice as great as the average in most parts of England. The percentage of the possible duration ranged from 89 in England S.E., 87 in England E., and about 80 in most other English districts, to 63 in Scotland W., 57 in Ireland N., and to 51 in Scotland N. The greatest number of hours at individual stations were 95 at Worthing and Great Yarmouth, 94 at Southend-on-Sea, Brighton, Hastings, and Jersey, and 93 at Cambridge, Oxford, Wisley, Southampton, Bournemouth, Weymouth, and Cardiff, from 90 to 94 per cent. of the possible.

THE WEATHER IN WEST HERTS.

Week ending May 12.

Cold nights and warm sunny days.—During the past week the days proved warm, and on two days the highest reading in the thermometer screen rose to or exceeded 70°. On the other hand the nights again proved cold, the exposed thermometer on the two coldest nights registering respectively 8° and 7° of frost. On the 11th the difference between the lowest and highest readings in the thermometer screen amounted to as much as 40°, which is the greatest range in temperature in any one day that I have yet recorded here in May. The temperature of the ground is still about seasonable at 2 feet deep, but 1° warmer than the average at 1 foot deep. No rain has fallen for ten days, and no measurable quantity of rain-water has come through either percolation gauge for more than a week. The sun shone on an average for 12½ hours a day, or for more than twice the usual duration at the beginning of May. The first four days of the week proved exceptionally sunny, the record of bright sunshine on each of those days exceeding 13½ hours. The winds proved rather high in the early part of the week, but in no hour did the mean velocity exceed 14 miles—direction E.N.E. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by as much as 15 per cent. A Blenheim Pippin Apple tree growing in my garden first came into flower on the 7th, which is one day later than its average date for the previous 23 years, but nine days earlier than last year. E. M., Berkhamsted, May 12, 1909.

CORRECTION. For *Rhododendron adenopodium* on p. 291 read *Rhododendron adenopodum*.

CUCUMBERS DISEASED: E. A. H. The plants are affected with the blotch disease (*Cercospora melonis*). The best plan is to burn the plants, sterilise the soil, thoroughly cleanse the house (using carbolic acid in the water), and start afresh. Correspondents have stated that carbolic acid diluted with water and placed in pans about the houses has proved effectual in combating the disease.

GOOSEBERRIES: W. M. In order to preserve Gooseberries by bottling, take some bottles with air-excluding stoppers, and nearly fill them with carefully-selected fruits. The fruit should be as nearly perfect as possible. Put them into the oven, and let them remain there for a few minutes, until the fruits show signs of cracking, then pour boiling water over them and seal the bottles at once. This is a very simple method, and there being no sugar used, the fruits remain as nearly as possible in a condition similar to that of fresh fruits. Another plan is to place the berries, after first wiping them on a clean cloth, in a bottle filled almost to the top with cold water. Take a large, deep saucepan or fish-kettle, and stand the bottles in this. Fill the pan with water, and bring to the boil. When the water in the bottles is at boiling point insert the cork or bung. Place a little hay between the bottles in the pan to prevent them knocking together and breaking. This system is that known as sterilising by steam.

GRAPE VINES UNHEALTHY: J. A. There is no disease present in the vines. The cause of the foliage dropping prematurely appears to be due to some cultural error. If the borders are allowed to become dry or, on the contrary, the roots are dosed with strong applications of chemical fertilisers, trouble of this nature generally follows.

GRAPES DISEASED: J. W. and G. R. Your Grapes are affected with Grape-rot, caused by *Gleosporium ampelophagum*. Dredge the bunches and foliage with flowers of sulphur mixed with about one quarter of its volume of quicklime. Remove all diseased fruits and leaves and burn them.

HELIXINE SOLEIROLII: Aquatics. The plant has not been in cultivation for many years, and its name does not appear at the present time in the gardening books. It is a native of Sardinia, and belongs to the Nettle family. The plant resembles *Sibthorpia europaea* in appearance, and is valuable for covering bare spaces in a warm plant-house. It grows with great freedom in the Economic House of the Royal Botanic Gardens, Regent's Park, where it forms a carpet of greenery over large pots and stonework.

INSECTS ON ROSE AND FIGS: G. N. P. The insects on the Rose twig are all females of the common Greenhouse Scale (*Lecanium hesperidum*); the cocoons on the creeper (*Ficus stipulata*) are those of a species of *Ichneumon*. The

latter are harmless, and may have parasitised the larvæ of a moth of some kind, though there is no trace of the host left. The scale is most injurious, and the insects should be removed with a stiff brush at once, as the young are already hatching out from beneath their parents (the brown scale). In the autumn dress the tree with paraffin emulsion.

NAMES OF PLANTS: Aquatics. This may be *Scirpus sylvaticus*, but it is impossible to identify the species with certainty from such a specimen.—G. R. H. 1, *Salix Caprea* (Goat Willow); 2, we cannot name this without better material; 3, *Prunus triloba* fl. pl.; 4, *Cupressus obtusa* var. *nana*; 5, *Sequoia sempervirens*; 6, *Rhododendron myrtifolium*.—T. H. C. Your specimen appears to be the Rough Meadow Grass, *Poa trivialis*.—L. M. No. 1, *Prunus Pseudo-cerasus* James H. Veitch; No. 2, also a form of *P. Pseudo-cerasus*, the varieties of which, in Japan, are almost as numerous as varieties of Apples and Pears in this country.—C. W. W. 1, *Kerria japonica*; 2, *Berberis Darwinii*; 3, *Cephalotaxa drupacea*.—R. T. 1, *Pteris arguta*; 2, *Adiantum hispidulum*; 3, *Selaginella caesia*.—W. C. S. *Lælia Boothiana*, often called *Cattleya lobata* in gardens.—J. L. *Cælogyne ochracea*.—F. G. *Dendrobium albo-sanguineum*.—Constant Reader. *Gardenia florida* and *Ixora coccinea*.—T. C. A species of *Ruscus*, but it is impossible to determine which from the scrap you send. The portion bearing the red berry, which you refer to as a leaf, is a phylloclade or flattened stem.—L. F. 1, *Prunus japonica* fl. pl.; 2, *Berberis Aquifolium*.—Arbor. *Prunus japonica* fl. plena.—Novice. 1, *Asphodelus albus*; 2, *Choisya ternata*; 3, *Tienilla cordifolia*; 4, *Saxifraga* (*Megasea*) sp.; 5, *Skimmia Fortunei*; 6, *Thalictrum flavum*.

PEACH MILDEW: J. H. M. The fruits are affected with mildew—*Oidium leucoconium*. The leaves should be dusted with flowers of sulphur whilst damp, or if the attack is serious, let the pipes be painted with sulphur when they have been made very hot, performing the operation at dusk, and closing the house for an hour afterwards. Guard against a damp atmosphere insufficiently heated; also dryness at the roots.

SOWING CABBAGE SEEDS: Anxious. The best time to sow Cabbage seeds for raising plants for use early in spring is at about July 21. A second sowing may be made in the first week of August. Veitch's Model Broccolis should be sown some time between the third week of April and the end of that month. Unless the ground is exceptionally hard it should not be dug, except for very late plantings, but in all cases the soil should be made very firm about the young plants with a view to promote slow, firm growth; thus the plants will become well hardened before winter.

WHITE WEB FROM VINE: Northants. The web is the nest of the vine-coccus (*Pulvinaria vitis*). The brown scale-like object is the female, the white "web" the egg sac. As the young are now hatching you should lose no time in removing the webs from the vines before the young escape and take up fresh positions among the branches. Give the vines a thorough dressing in the winter with some good insecticide; any scale which may not be destroyed by the spray should be removed in the early spring before the white egg sacs are formed.

WIREWORM ATTACKING TOMATOS: W. C. You appear to have dosed the border with sufficient insecticides to kill all insect life in the soil. Try traps of some vegetable placed near the roots of the Tomatos. Place a Potato or a portion of Carrot below the soil, and mark the spot with a stick; examine the baits at intervals. Bisulphide of carbon may be effectual where the proprietary articles failed. Pour a quarter of an ounce of this liquid into a small hole made not too close to the plants, and cover the hole with a piece of slate. You must not bring a light near to this substance, as it is highly inflammable, and poisonous. The quantity of bisulphide given is sufficient for each square yard of surface.

DAVIDIA.

THE question as to whether there is more than one species of *Davidia* in cultivation has been put to me more than once, and I answered it in detail in the *Kew Bulletin*, 1907, p. 301, though not conclusively. I gave it as my opinion that the differences observed in herbarium specimens and cultivated plants were not sufficient to justify specific segregation. Since then Mr. L. A. Dode has attempted (*Revue Horticole*, September 1, 1908), to define three species, with what success I will endeavour to explain. I have re-examined all the materials previously under observation, and I have seen additional cultivated specimens.

Several articles on *Davidia* have already appeared in the *Gardeners' Chronicle*, the most important being in vol. xxxiii. (1903), p. 235, where there is a full-page representation of flowering and fruiting branches from dried specimens; and vol. xxxix. (1906), p. 346, where the first flowering in Europe is illustrated by a specimen received from Mr. Maurice de Vilmorin.

Dode's differential characters of his species are taken from the leaves:—

1. Leaves silky beneath.—*D. involucreta*, Baillon.
2. Leaves glabrous and glaucous beneath.—*D. Vilmoriniana*, Dode.
3. Leaves glabrous and yellow-green beneath.—*D. læta*, Dode.

The characters given in the foregoing key to the species do not correlate with any others given in the detailed description, so that it is justifiable to say that the "species" are based solely on these differences. True, the author describes the petioles of *D. Vilmoriniana* as green and the bud-scales as red-brown, and those of *D. læta* as red and green respectively; but most persons practically acquainted with the range of variation usual

in plants raised from seed would not accept these shades of differences as of more than individual value. Dode's Latin diagnoses of his species are reproduced below:—

Davidia Vilmoriniana, Dode, species nova, foliis subtus glaucis, glabris vel glabrescentibus, longe setaceo-dentatis, ovario brevius attenuato, fructu magis globoso.

Davidia læta, Dode, species nova, foliis subtus glauco-lutescentibus, glabris vel glabrescentibus, breve setaceo-dentatis, ovario breve attenuato fructuque subgloboso.

To his *D. Vilmoriniana* he refers Dr. A. Henry's dried specimens numbered 5,577, and Mr. E. H. Wilson's specimens numbered 642. He also refers the figure in Hooker's *Icones Plantarum*, t. 1961, to this species, which he states is the one raised by Vilmorin in 1897. To *D. læta* he refers the plants raised by Messrs. Veitch & Sons from the seed sent home by Mr. Wilson when on his first journey, which, he states, is also in cultivation at Barres-Vilmorin and other places in France. He further states that the *Davidia* figured in Veitch's List of Novelties, 1903, is *D. læta*, as well as the germinating seeds in the fruits by the writer in the *Journal of the Linnean Society*, vol. xxxv., p. 556, t. 19; but it is

FIG. 138.—ODONTIODA × ERNEST HENRY.
(Awarded R.H.S. First-Class Certificate on April 6 last.)

difficult to understand how he arrives at these conclusions.

As recorded in the *Kew Bulletin*, Kew possesses fragments of the types of *Davidia involucreta*, Baill., collected near Moupine, Western Szechuen, and Mr. Wilson collected corresponding specimens, n. 3702, in the same district. They differ from all the other specimens collected by Wilson and Henry in the mature leaves being clothed on the under surface with a white tomentum. In other respects the Moupine specimens differ less from the glabrous or glabrescent-leaved specimens than the latter do from each other. I was of opinion at first that there were two species, but as I failed to find any other character to support this view, I held my hand. In this decision I was influenced by the fact that the leaves of seedlings of the Moupine hairy variety sent to Kew by Messrs. Veitch were glabrous, except for the presence on the under surface of some long appressed hairs along the principal veins. I was assured that there could be no mistake about the parentage of these seedlings. If so, the only difference is not hereditary.

With regard to the differences between *D. Vilmoriniana* and *D. læta*, Dode, the descrip-

tions speak for themselves. From communications on the subject with Mr. M. de Vilmorin, I think I am right in saying that he is in accord with me that the variations are individual; and he has also put on record that there is considerable variation in the shape, size, and coloration of the bracts of the inflorescences of the plants he has in cultivation.

After all, the principal point, so far as the potential purchaser is concerned, is that the differences exhibited by the plants at present in cultivation are so slight that one is apparently as good as another. I wish to state in conclusion that I am giving my opinion on the subject without any pretension to superior knowledge as to the limits of species, and I may add that the naming of plants is not a science: it is a means to an end to make clear what we are writing or talking about. *W. Botting Hemsley, Strawberry Hill.*

NEW OR NOTEWORTHY PLANTS.

RHODODENDRON VICTORIANUM.

IN the temperate house at Kew there is now in flower a hybrid *Rhododendron* of extraordinary interest and beauty. It was purchased two years ago from M. Jules de Cock, nurseryman, Meirelbeke, Ghent, under the name of *R. Dalhousiæ Victorianum*, which is the name of a *Rhododendron* figured in *Flore des Serres*, t. 2466 (1879), and described as a hybrid between *R. Dalhousiæ* and *R. Nuttallii*, raised and flowered in 1877 by M. Victor Cavellier, a Belgian amateur, after whom it was named. But as the plant is unquestionably a hybrid between the two species mentioned, the original name is misleading, and both custom and propriety will be satisfied if the name is altered to *R. Victorianum* simply.

The habit of the hybrid is an improvement upon that of either of its parents, which are somewhat straggling and awkward, whereas *R. Victorianum* forms a compact bush with numerous short erect branches. It is also very free-flowering, the flowers are large and lasting, delightfully fragrant and milk-white with a tinge of yellow in the throat.

There are from three to six flowers in each head, and each flower is 4 inches long and the same across; the segments of the corolla are elegantly recurved, and at the base there are five deep depressions as though the tube had been finger-pinched. The charm of all the big-flowered *Rhododendrons* is due quite as much to their fragrance as to their form and colour. We have already a race of *Dalhousiæ × formosum* hybrids, which are grown here and there as conservatory plants, though not nearly as well known now as they were 30 years ago. It is evident that *R. Dalhousiæ* is a good breeder, and it would be quite worth while to turn it to account in the same manner as has been done with *R. Aucklandii*, the hybrids from which have become so popular. *W. B.*

ODONTIODA × ERNEST HENRY.

OUR illustration (see fig. 138) represents a flower of this richly-coloured hybrid, which was raised from seed obtained by crossing *Odontoglossum × Queen Alexandra* (*Harrayanum × triumphans*) and *Cochlidia Noezliana*. The flowers, in general appearance, are nearest to *O. Charlesworthii*, but the colour is of a bright mahogany-red with an orange-coloured tint around the yellow crest of the lip. It was shown by H. S. Goodson, Esq., Fairlawn, West Hill, Putney (gr. Mr. G. E. Day), at the Royal Horticultural Society's meeting held on April 6 last, when the Orchid Committee awarded it a First-class Certificate.

NOTICES OF BOOKS.

* THE SMALL HOLDER'S GUIDE.

THIS pamphlet is useful for those who may be desirous of taking advantage of the Small Holdings Act and becoming cultivators on a small scale. It tells them what they would have to do in managing a small garden and farm, and the capital required for the development of a holding of the usual character. The little work

himself. It is essential that he should possess experience in matters connected with the working of the land and the farming stock. It is this that no work on these subjects can supply. We are constantly being informed of the work requiring to be done, but rarely are we told how it is to be performed. We would, therefore, advise all town-bred men to undergo a two to three-years' course of instruction on a farm of small dimensions before

to adapt himself to the existing conditions of a district, for it is not always easy to obtain land just where it is wanted. The proper course is to ascertain the kind of produce that is saleable in a district, and endeavour to make the land yield that produce. The booklet contains useful advice in regard to common rights, compensation for improvements, the buying and renting of land, the planting of fruit trees and bushes, and on the cultivation of Strawberries, Asparagus and Rhubarb. *M.*

THE JOURNAL OF THE BOARD OF AGRICULTURE.

FROM our occasional references to the subjects dealt with in the *Journal of the Board of Agriculture* our readers are cognisant of the fact that the *Journal* deals not only with matters of purely agricultural interest, but also with those concerning horticulture. We would point out that the *Journal* is issued monthly at the cost of fourpence per month, and would suggest that all interested in the progress of horticulture should both support the *Journal* by becoming subscribers and by bringing it to the notice of others. We learn from the March number that the bound volume of the Board's leaflets, Nos. 101 to 200, is now ready, and can be obtained from the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W., price 6d., post free. The leaflets deal, among other subjects, with insect and fungus pests, and contain brief descriptions of the diseases, illustrations of the appearances presented by the diseased plants, and recommendations as to remedies.

† TREES AND SHRUBS OF THE BRITISH ISLES.

PART II. of the work of the above title, by Messrs. C. S. Cooper and W. Percival Westell, is now published. The work, to be completed in 16 parts, contains brief descriptions and numerous full-page plates, many in colours, of the chief British trees and shrubs. The text, though concise, is brightly written, and many of the illustrations are excellent.

‡ BEAUTIFUL FLOWERS AND HOW TO GROW THEM.

PART 12 of this copiously illustrated work deals with the subject of arches, pergolas, pillars and stumps, beautiful walls and fences, and with Orchids. As in preceding parts of this work, so in the present instalment, a large amount of useful information is conveyed in pleasant form. Of the six coloured plates included in the number, that of Pansies is particularly effective.

CINERARIA FLAVESCENS.

(CINERARIA FELTHAM BEAUTY × SENECIO AURICULATISSIMUS.)

THIS hybrid has been raised by Messrs. James Veitch & Sons, Ltd., and exhibited by them at recent exhibitions of the Royal Horticultural Society. When presented to the Floral Committee at the meeting held on May 4, it received an Award of Merit. The plant has the appearance of a rather compact-growing Cineraria with creamy-yellow flowers, the younger blossoms being of a richer, almost canary-yellow tone. As a new break the cross has considerable promise, and no doubt it will prove the forerunner of a useful race of winter-blooming plants. The greenhouse Cineraria has a wide range of colours in its flowers, but there is always room for greater variety, and the addition of pleasing yellow tones will be acceptable. The peculiar constriction in the middle of the leaf is well shown in Mr. Worthington Smith's sketch (see fig. 139), which is from material kindly supplied by Messrs. Veitch. It may be mentioned that, since Cineraria cruenta is synonymous with Senecio cruentus, the hybrid is properly a Senecio.

† J. M. Dent & Co.

‡ Edited by Horace J. Wright and Walter P. Wright. Complete in 17 parts, each 1s. net. (T. C. & E. C. Jack).

FIG. 139.—CINERARIA FLAVESCENS ×: FLOWERS YELLOW, PASSING TO PALE CREAM COLOUR OR WHITE.

will do good by showing how the small holder can increase the food supply of the country by raising vegetables, poultry, milk from cows and goats, rearing rabbits, pigs, sheep, calves, horses, by bee-keeping, and making butter and cheese.

The most important factor for success or failure is, as the author states, the small holder

taking a farm. There is so much to learn by practical work, under experienced teachers, that is essential to the small holder; moreover, the prudent landowner insists on the persons applying for a holding having a practical acquaintance with gardening or farming. It is usually the lack of this knowledge on the part of the holder which causes his failure, but the need of sufficient capital is another cause. Mr. Sanders advises the prospective small holder to select land of a fertile nature in a locality near to good markets, and

THE WARREN HOUSE, STANMORE.

THE beautiful estate which forms the domain of The Warren House, the residence of Mrs. Bischoffsheim, is in the Metropolitan area, and little more than half-an-hour's journey from London. But the visitor, unacquainted with this fact would scarcely conceive this possible, but, from the sylvan beauty of the place, would imagine himself in some remote part of the country. An important part of the boundary of the estate consists of original woodland, in which some of the old tracks formerly used by the wayfarer still remain. The views through the glades of Oak, Beech, Birch, and Fir trees, with the undergrowth of Hazel, and, occasionally, the more recently-introduced clumps of Rhododendrons, or other flowering shrubs, are charming at all seasons, but at the present time, when the undulating surface of the ground is carpeted with myriads of Bluebells, the tints of blue varying with light and shade and blending with the soft, green tints of the young foliage, the effect is indescribably beautiful. Acres of the bright blue flowers are seen on either side of the woodland

The grounds are studded with fine old Oaks and Conifers, including a grand Cedar and a good specimen of *Araucaria imbricata*. Dense masses of Rhododendrons are about to furnish their magnificent display of flowers. In a sheltered nook is a Deodar planted by his Majesty King Edward VII.

The Dutch garden of clipped Box and Yew, with a few Hollies, is an extensive and well-arranged feature, effective as a whole and also interesting by reason of the quaintness of many of the specimens. Backed by the tall Pines and other trees, this nook is sheltered from cold and heat, and forms a pleasant retreat in summer.

Showy herbaceous perennials are planted in the borders and shrubberies wherever space is available, and an enclosed, herbaceous plant garden, containing the best varieties, is a never-failing source of interest, for a varied succession of flowers appear there during the greater part of the year. On one side are tanks planted with Nymphaeas and other aquatic plants; on the walls of this garden is a variety of flowering climbers.

The glasshouses were constructed a few years

The two large intermediate houses contain fine plants of *Cattleya Mossiæ*, *C. Mendelii*, *C. Dowiana anrea*, *C. Warscewiczii*, *Lælia purpurata*, and other showy species. All are thriving well, and a good show of flowers is made by *Lælia purpurata*, *Cattleya Schröderæ*, *C. Skinneri*, and other *Cattleyas*. With them in flower are *Brasso-Cattleya Digbyano-Warscewiczii*, *Cattleya Parthenia Prince of Wales*, *Lælio-Cattleya highburyensis*, and other *Lælio-Cattleyas*, *Dendrobium Brymerianum*, *D. primulinum*, *Odontoglossum citrosmum*, &c.

Separate glasshouses are devoted to the growing of *Souvenir de la Malmaison* and winter-flowering Carnations; also for Roses, which have furnished a supply of fine blooms for a considerable time and are still flowering abundantly. Stove plants for decorative purposes are grown in batches; one house is filled with *Anthuriums*, the plants being well furnished with their banner-like scarlet spathes. The scarlet-flowered *Clerodendron fallax* (see fig. 141) is especially well grown, and forms an excellent decorative plant when in flower. Various florists' flowers are grown, with a view to keeping up the succession of blooms for decorative purposes. This supply is in succession to forced plants such as Daffodils, Arum Lilies, and Lily of the Valley. The corridors of the plant-houses are brightened by densely-flowered *Schizanthus*, *Cinerarias*, annual *Chrysanthemums*, of which the large canary-yellow variety called "Morning Star" is the most beautiful, and other annuals. In one of the houses *Tritonia Prince of Orange* is very bright, and in others the *Codiaeums* (*Crotons*) and other foliage plants are in good condition.

The long range of fruit houses promises good crops of Peaches, Nectarines, Grapes, Figs, and other fruits. Strawberries in pots have furnished fine fruits for some time past, and there are others for providing a succession.

Mrs. Bischoffsheim takes a personal interest in the gardens, and has herself designed some of its most effective improvements. J.

FIG. 140.—THE WARREN HOUSE, STANMORE, MIDDLESEX.

walks; sometimes in dense patches, forming with their surroundings a natural wild-garden, more lovely than any other part of the grounds. The outlying portions of the grounds are used as golf links, the course measuring four miles, and there is a bungalow for the accommodation of the players. For a considerable distance the links are bounded by an irregular herbaceous border and a grass path at the back, all being in harmony with the woodland surroundings. In a nook, the orchard, with its Apple trees now in full bloom, and the range of forcing-houses are situated. The more modern garden surrounds the residence, and contains a display of flowers throughout the season. At the present time the flower-beds are glowing with the colours of variously-tinted Tulips, each bed having a carpet of dwarf blue Forget-me-not, the latter plants forming a sheet of colour that will continue long after the Tulips are over.

Below the terrace are beds of Roses, and beyond this is a Rose garden, with festoons of rambling and trailing Roses. Roses are similarly trained in other parts of the garden, and by the herbaceous borders (fig. 142).

ago by Messrs. Mackenzie and Moncur. In the Orchid houses are many plants of *Odontoglossum crispum*, and also smaller numbers of most of the showy Orchids. Many plants of fine forms of white and rose-tinted *Odontoglossum crispum* are in bloom, together with others of *O. Hallii*, *O. luteo-purpureum*, *O. Pescatorei*, *O. Andersonianum*, *Cymbidium Lowianum*, a clear white form of *C. eburneum*, a batch of brilliant scarlet *Sophronitis grandiflora*, some clear yellow *Oncidium concolor*, and various other pretty Orchids. But the most striking feature in the cool houses, and one which shows the skill of Mr. Taylor, the Orchid grower, is a batch of about 90 robust plants of the scarlet *Disa grandiflora*, with very stout growths, promising well for flower. These have been propagated and grown from the few original plants at The Warren House, by removing the stronger offsets and potting them as required. The thick, shining, green leaves are in perfect health. Mr. Taylor considers that once the culture of *Disa grandiflora* is understood, the plant gives less trouble than many other Orchids, and yet a large proportion of our best Orchid growers fail to cultivate it satisfactorily.

THE FERNERY.

THE NEWER VARIETIES OF NEPHROLEPIS.

ELEVEN months ago I secured plants of *Nephrolepis exaltata Piersonii*, *N. e. Todeaoides*, and *N. e. Whitmanii*. They were in 5½-inch pots, but have been shifted until now they are in 14-inch pots. The plant of *N. Piersonii* is at the present time more than 7 feet through and 5 feet high, whilst the specimen of *N. Todeaoides* is 5 feet through and 4 feet high. This latter variety forms an excellent specimen plant. The habit is stiff and the fronds are of a pale green colour; they are fringed and beautifully tasselled. The fronds of *N. Whitmanii* are not so densely divided as in *N. Todeaoides*; it is described as a sport from *N. Fosteri*. My specimen of this plant is 5 feet 6 inches wide and 4 feet high. Another Fern worthy a place in gardens is *Nephrolepis exaltata superba*. The compost I use for the Ferns consists of one part turfy loam, one part leaf-mould, a small quantity of bone-meal, and a little of some approved fertiliser, with a fair sprinkling of broken crocks and lime rubble. *Microlepia speluncea* is another fine decorative Fern that soon develops into a large plant. *Davallia braziliensis*, for which Messrs. H. B. May & Sons received an Award of Merit from the R.H.S. in 1907 is an advance in the *Davallia* section. The habit is close, and the fronds finely cut. Amongst other Ferns doing remarkably well in these gardens are *Asplenium Belangeri*, *Polypodium irioides ramo-cristatum*, and *Adiantum polyphyllum (cardiochilana)*. Wm. R. Prince, Norton Manor Gardens, near Taunton.

NOTES FROM COOMBE WOOD.

A visit paid to Messrs. J. Veitch & Sons' branch nursery at Coombe Wood on May 13, was for the purpose of inspecting some of the introductions of Wilson, and, incidentally, those of the late James Herbert Veitch from Japan in 1892. Wilson's introductions from Western China are of great value to cultivators in all the temperate and sub-tropical countries of the world. The following notes, however, are not confined to plants introduced by the explorers I have mentioned.

Quercus acuta (Buergeri) is a half-tree with evergreen foliage of a dark green colour and of large size, and with shoots of an olive tint. It was introduced in 1861 from Japan. *Q. cuspidata* is another evergreen Oak from the same country, and forms a small tree, graceful in habit, with pendant, slender branches. Its leaves measure from 3 to 5 inches in length, and 1 to 1½ inch in breadth; they are bright green above, and glabrous, silvery-white beneath. There is a variegated form of this, differing from the type in that its leaves are smaller and have irregular creamy-white blotches. *Acer vitifolium* is a

midrib and chief veins of a silvery tint. The leaf tints change, as regards the ground colour to red, whilst the veins and midrib remain silvery. Plants of this vine in process of forcing at the present date were perfectly indicating the leaf markings. *V. armata* is a valuable ornamental plant, the dark green leaves of summer changing to bright red tints in the autumn. *V. armata* var. *Veitchii* is one of the best decorative vines. The large leaves acquire in the autumn a rich crimson tinge, whilst in the summer months they present a bright bronzy-green tint. *V. repens* is a self-climbing plant, and a robust grower. The older leaves, about 5 inches in length, are somewhat three-lobed and of a deep, velvety green tint. The young growths are brownish, and the young leaves of a red-brown colour. As objects for covering a wall or clothing pillars, chains, arbours, or such outstanding objects as Fir poles in a flower border, they are finely ornamental. They require the same kind of treatment as the Wild Vine (*Ampelopsis*). *Actinidia chinensis* is a woody climbing plant, having yellow-coloured flowers 1½ inch across and sub-orbicular leaves. It is hardy and flowers with freedom on the

ing flowers pretty freely. *Philadelphus Le-moinei purpureo maculatus* makes a small compact bush of 2 to 3 feet in height, producing, at the end of short axillary shoots, flowers about 2 inches across, white with a light purple spot in the middle. *P. Banniere* is a white-flowered variety, having semi-double, fragrant flowers. A large plant was noted of that rare Japanese plant *Trochodendron aralioides*. It measures 12 feet in height and rather less in diameter. The flowers are greenish and inconspicuous, but the plant grows with rapidity in this country. The leaves on the Coombe Wood plant were about 4 inches in length, dark green and shining. *Berberis acuminata* is an attractive evergreen with arching growths, the rind of which in the young state is of a red tint. The bronzy-yellow flowers come in clusters in the axils of the leaves.

The neat-growing *Ilex Perneyi*, whose mature leaves are 1½ inch long, and pale in tint on the young shoots, become of a very dark green on the older ones.

Clematis montana var. *rubens* is an acquisition, resembling the type in foliage and habit but the flowers are of rosy-red tint, making an effective contrast to *C. montana*.

One of the finest lots of *Sciadopitys verticillata* to be observed anywhere was noted in the peaty soil at the lower end of the nursery; oft-transplanted, symmetrical, healthy plants. The Umbrella Pine is bad to beat as a specimen on the lawn.

Cotoneaster applanata is a free-growing plant, with ovate leaves, dark green in colour, with a greyish felt on the lower surface. The fruits are scarlet, and are produced abundantly. The plant is excellent as a solitary specimen on the turf.

The remarkable *Primula pulverulenta*, which in leaf and habit resembles *P. japonica*, was noted in some quantity in the open ground. The dark, rich purple flowers are larger than those of *P. japonica*. *F.*

FIG. 141.—A FINE PLANT OF CLERODENDRON FALLAX AT THE WARREN HOUSE GARDENS.

(See p. 323.)

handsome half-tree or big bush with leaves now of a greenish yellow tint which changes to red and yellow in the autumn, a specially fine lawn tree. A white-flowering weeping plant is *Cytisus elongatus*, looking at its best worked on stems 8 feet high. *C. × kewensis*, raised at Kew, is a very free-flowering hybrid similarly useful. *Vitis megalophylla* is a remarkable plant with bipinnate leaves 2 to 3 feet in length when full grown; they are glabrous, dark green above, and pale glaucous green beneath. The plant makes growths of 10 feet in one season. I saw some plants being forced, which had leaves 1½ feet long already. The pole to which a plant of this species growing in the open border was fixed was 18 feet high. Other species of *Vitis* being forced or in cultivation in the open ground included *V. leecoides*, with leaves resembling those of *Leea amabilis*; *V. flexuosa* var. *Wilsonii*, a very decorative plant with leaves the upper surface of which is of a dark bronze tint and metallic lustre, whilst the lower surface is bright purple. *V. Henryana*, a most attractive plant with leaves of a digitate form and five serrated leaflets. The leaf is a deep velvety-green, with

matured shoots. *Rubus flagelliflorus* is a showy species having white flowers borne on shoots 7 to 8 feet long. Its chief attraction are its cordate acuminate leaves, which are of a metallic line and irregularly serrate at the edge. Like other *Rubus* species, the underside is covered with a thick tomentum. *Viburnum rhytidophyllum* (see *Gardeners' Chronicle* June 30, 1906, p. 418, fig. 167), is a fine evergreen shrub with broadly lanceolate leaves about 8 inches in length and 2 inches in breadth, dark green, channelled on the upper surface, and having a thick tomentum beneath. Its growths support corymbs of whitish-yellow flowers, which are succeeded by red berries. The plant retains a handsome appearance throughout the winter months. *Jasminum primulinum* (*Gardeners' Chronicle*, March 28, 1903, p. 197, fig. 83) is a native of Yunnan, where it is found in copses and hedgerows at considerable elevation. The flowers bear resemblance to those of *J. nudiflorum* but are larger. So far it has proved hardy at Coombe Wood, but if planted out in the open the species may need some protection. I observed some plants in pots in a forcing-house that were show-

VEGETABLES.

ASPARAGUS.

To have Asparagus in quantity and of the best quality it is necessary to raise fresh plants occasionally. If forcing is practised it becomes necessary to sow seeds annually, sowing is best done in April. Select an open position, with a rather light soil if possible, and draw drills 1 inch deep and 1 foot apart. Sow the seeds wide apart, so that no thinning will be necessary. There is much variation in the seedlings, and if thinned in the rows the chances are that those plants which would otherwise form the best crowns are thrown away. The better plan is to leave all the seedlings, and when planting them in their permanent positions select only the best and strongest crowns. Asparagus is largely grown as a market crop, and it is easily produced, provided the soil be sandy or loamy up to a heavy stage, without being clayey, and fairly moist. There is not the least necessity for trenching the soil and applying large quantities of dung deep down. The plant is not nearly so deep-rooting as is thought by many, and if rotten dung is freely employed in the composition of new beds many of the thick, succulent roots will turn black and die outright during the winter months. At Reading we have two extremes as regards soil: one portion is light and sandy overlying a coarse, red gravel, and the other, a greasy loam, overlying clay. In neither case have animal manures been given to the soil before planting or since, and I question if the results would have been much improved had such been applied. Young roots of this plant grow very freely in quite ordinary field or garden soil; moreover, the produce from young beds is always earlier than that from established beds. For forcing purposes crowns three and four years

old are far superior to those that have yielded crops in the open for a number of years. I have tested planting in single rows 1 yard apart upon the flat; in beds 3 feet wide containing two rows of plants at 18 inches apart, allowing, when the beds are shaped, 9 inches from each row of plants on either side of the beds, and also three rows of plants in a 3-foot wide bed, one row down the centre and the two outer ones a foot on either side, leaving 6 inches to the edge of the bed upon either side. The beds 3 feet across planted with two rows give the best results. In forming a series of beds space is allowed for an alley 18 inches wide, which allows the plants between two beds 3 feet of space, with 18 inches space between the two rows. When planting, no raised bed was formed; a simple flat-bottomed trench was dug out, about 3 inches deep, with a spade in the case of the garden, and with the plough in the case of the farm land. The roots were laid in the trench, being either one or two-year-old crowns. They were planted in April, when growth had started, and covered with 2 inches of soil, the ground being quite flat. Strong stakes were driven in at the end of each row to indicate the lines. These stalks are necessary because catch crops are taken from between the rows and also from between the plants during their first season's growth. As the crowns increase in size a line is stretched across the ground, and alleys are formed by removing soil from the centre to place upon the beds on either side. Thus, raised beds result, and, if this system is tested upon light soil against plants grown upon the flat, it will be found to produce Asparagus nearly a fortnight earlier. According to the soil the grower has to deal with, so should he regulate the raising of his beds. The quantity of earth placed over the crowns will also have some effect upon the earliness or lateness of the produce. I never cover Asparagus beds in the autumn with rotten manure, as is usually done, but as soon as cutting ceases, quickly soluble, stimulating manures are applied to assist the growths to form good crowns for another season. Cow dung applied when growth has practically ceased keeps the air out of the soil, makes it cold and wet, and, in old beds, causes many of the roots to decay. The temperature of the soil is also lowered, and the shoots in consequence are later in developing. Far better give manure from spent hot-beds to light soils when cutting has ceased. I use soot freely and apply it early in the year, because I find in ordinary winters young roots begin to push early from crowns from one year up to 10-year-old plants, after which stage they are later in starting. A light sprinkling of lime given every three years or so in the case of heavy soils and powdered chalk to light, sandy soils are also beneficial. Superphosphate of lime three parts (37 per cent. solubility) and ammonia sulphate one part, mixed and applied at the rate of 2 to 3 ounces per square yard during February or March, will assist the crop. Salt is recognised as a necessity, but from trials made over a number of years its application has no effect upon the yield, although in the case of light soils weeds are less troublesome when it is applied. I have found kainit of value to this crop, and when given there is no necessity to apply other saline matter. Of all potash manures given, none has proved so good as wood ashes. It should be used at the rate of one pound to the square yard. It tends to make light, chalky soils more retentive of moisture. Varieties of Asparagus are few; amongst the best are Perfection, Conover's Colossal and Giant French. In France greater attention is paid to the selection of stocks for planting than in England, although in the Evesham district the growers mark good crowns that produce best sheets with close scales. This selection has been continued for several years, and many of the Evesham nurseries have very uniform stocks. I have had under observation for some years past marked crowns that produce varying quantities of seeds, and, however heavy

the crop may be, it does not appear to influence the general vigour of the stems the following spring. There is doubtless good work to be done yet with regard to further testing the possibilities of this plant. It will grow well in sandy wastes where other plants would perish. *Charles Foster, University College, Reading.*

PEACH CULTURE IN SPRING AND SUMMER.

FAILURE to produce a satisfactory crop of Peaches in spring and summer may generally be traced to improper cultivation, such as allowing the trees to suffer from insect pests, neglect to afford sufficient root waterings, or the improper disbudding of the young shoots. The blossom is usually afforded protection in some shape or another, but this avails little if the trees do not receive the necessary attention afterwards. The blossoming of the trees this season has been all that could be desired, and the weather in this western locality has been favourable for the setting of the fruits, so that with good management one may safely predict a satisfactory crop of Peaches out-of-doors. Mild weather usually favours green and black aphids, the last-named being the worst pest that attacks the Peach and Nectarine. Unless prompt measures are taken to eradicate them, they quickly cripple the young growths upon which next year's crop is developed. In some seasons black aphid appears in clusters around the fruit-buds before they are expanded, at which stage it is most difficult to dislodge them, because the application of liquid insecticides at that period is attended with considerable danger. Tobacco powder is the safest specific to apply, and this should be dusted well amongst the buds. The removal of surplus shoots should afterwards be undertaken, removing a few only at a time, and allowing a week or ten days to intervene between the thinnings. Remove the shoots which develop on the under side of the fruiting branches right and left of the tree, and some of those on the upper side of the same branches, retaining the nearest basal shoot, which will be the fruit-bearing shoot for next year. As a rule, this one growth is sufficient, besides the leading growth on the fruiting branch, if the latter is necessary for the extension of the tree; if not, the point can be nipped out at the fourth or fifth leaf and the old shoot cut clean out close back to the new branch which is to be retained, as soon as the fruit has been gathered. Occasionally a second shoot midway may be left, provided a space can be found for it, but it must be remembered that overcrowding the young wood during summer prevents the proper ripening of the fruiting shoots, an evil that cannot be too strongly condemned. The thinning of the fruits where they have set freely demands attention when they are of the size of Peas. This thinning should also be done at intervals, retaining the most promising and best placed fruits, which should not be closer to each other than 12 inches on a healthy tree. The young shoots should be carefully secured to the wall when they are long enough for training, but I am never in a hurry to do this, as they not only protect the young fruits from frost, but they themselves grow better when left undisturbed for a time. Root waterings must be given whenever necessary, affording a stimulant each time to well-established trees. As young trees usually make very strong growths they are better without manual assistance. Frequent syringings or washings of the foliage are necessary during the active growing season—that is, from early June onwards—evening being the best time for the work. Apply the spray well under the foliage where red spider generally congregates. The border should be covered with a strawy mulch towards midsummer to retain the moisture in the soil; in wet seasons this mulching is best dispensed with. Should leaf-curl put in an appearance, the affected foliage should be picked off at once and burnt. *James Mayne, Bicton.*

THE ROSARY.

ROSE-GROWERS' PROBLEMS.

WE extract the following racy remarks from a paper read before the New York Florists' Club by Mr. William H. Elliott, and reported in *Horticulture*, April 24, 1909.

After emphasising the need for those who take up the cultivation of the Rose for commercial purposes to consecrate their lives to this work, and to put forth every ounce of energy they possess, Mr. Elliott described how to plan an establishment, and indicated the necessity for procuring a level tract of land near a railway station. In respect to size of houses, he went on to say: "My recommendation is the large house. My latest house—60 feet by 1,340 feet—I find none too large. The advantages over smaller houses are many, and are summed up in the fact that they produce better stuff and more of it. We do not find that those who have built the large houses have given them up and gone back to the smaller ones. If they build again they build larger houses.

"The best Roses are not grown by any secret process, but by the most careful attention to every detail. Eternal vigilance is the price of good Roses. . . . If anything has been accomplished by the use of chemicals, I should like to know it. I find plenty of care and cow manure produce much better and surer results. Aim to cut your Roses when the demand is good. The grower that produces a large supply on an overstocked market, and a small supply when the market is short, must not expect to get a very large return. How do you decide which old variety to give up to make room for the new? What are you going to take out to make room for White Killarney? Will you give up The Bride this year? Do you think White Killarney will replace The Bride? Have you given up your Maids, and are you growing Killarneys instead? I have given up Maids; next year I expect to give up Brides. What about the other new varieties? Rhea Reid I shall continue to grow, but not very extensively. This Rose came very near to being one of the best Roses ever produced. Maryland I think very well of, and a good safe one to grow. William B. Smith is a very promising Rose for summer. I intend to grow it, but only to a limited extent. Kaiserine does not give any light-coloured, summer Rose much show. Mrs. Jardine and Queen Beatrice I have discarded."

COMPARISONS OF VARIETIES FOR MARKET PURPOSES.

AT a meeting of the Gardeners' Club, held at Boston, in April, in speaking of Roses, Mr. Reuter said that his plants, with the exception of Chateau and a few of My Maryland, were grafted stock. Regarding the latter, he said that the grafted plants seemed more disposed to take a winter rest than the own-root plants, and for this and other reasons he is disposed to favour the own-root method for this variety. He will, however, try a few more grafted stock in the coming year, with a little higher temperature, and will also give this promising variety a trial for summer flowering. Mr. W. H. Elliott said that, in his experience, Richmond Bride and Bridesmaid had yielded scarcely one-half of the results which Killarney had given him. Rhea Reid had been a disappointment at the finish, but it just narrowly missed being a big success, and he proposed to hold on to it for another trial. Mr. Eber Holmes pronounced Killarney to be the best paying Rose grown, and Bridesmaid better than Bride. Certain people had propagated White Killarney surreptitiously from pieces of stems, therefore the wise man would keep his novelties under lock and key. He estimated that in the hands of a clever propagator, with adequate facilities, a single eye might be increased to a quarter-million rooted cuttings within two years. *F. M.*

The Week's Work.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Thyrsacanthus rutilans.—Cuttings of this plant may be inserted either singly or by putting three or four around the sides of a small pot containing sandy soil. The pots should be plunged in the propagating frame until the cuttings have formed roots, at which stage the cuttings should be potted up singly into 5 or 6-inch pots. Until the plants have become well established in the larger pots they should be grown in the stove, but afterwards they may be removed into an intermediate house.

Camellia.—When it is seen that the new shoots have finished their growth the plants may be given cooler treatment. Gradually increase the ventilation, so that after the lapse of a few weeks the ventilators may be opened to their full extent by night as well as by day. Those specimens which are growing in pots or tubs may then be placed out-of-doors.

Hippeastrum.—Let the plants which have finished flowering be exposed to full sunshine. Do not hasten the ripening of the bulbs, however, by withholding water from the roots, but rather encourage growth as long as it is possible to keep the leaves green. An occasional application of weak manure water will be beneficial until the decay of the leaf. Care must be exercised at all times to avoid excessive watering.

Carnations.—Any plants which are in flower, or that are about to flower, should be lightly shaded from the midday sun. They require a comparatively dry atmosphere and abundant ventilation whenever the weather is favourable. Cuttings that have been rooted in the present spring should be removed to a frame, placing them close to the glass. Keep a sharp look-out for aphids, and destroy them directly they appear.

Selaginella Kraussiana.—This well-known *Selaginella* is most useful for surfacing the pots containing Palms and other plants used for house decoration. It is usual, therefore, to cultivate a considerable stock in small pots which are crocked to one-half their depth. We use a rough, lumpy soil so that when the plants are turned out of the pots the root mass does not fall to pieces, but a little fine soil is necessary for surfacing. Dibble cuttings thickly into the pots, and place them in partial shade in a warm, moist atmosphere. If they are removed to a cool house for a few days before they are needed for the dwelling-rooms they will last all the longer in good condition.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Early-fruiting vines.—As much air as outside conditions will allow must be given the vines during the time the fruit is ripening. If the roots are at all dry, they must be given a moderate watering with clear, tepid water, but the atmosphere should now be kept dry. When the fruits are ripe, let a double thickness of fish netting be placed on the glass. It will break the power of the sun's rays, and the Grapes will therefore keep fresh over a longer period. Keep a sharp look-out for mealy bug.

Grapes to ripen at midsummer.—Examine the vines, and if the berries need to be further thinned, let this be done before they get overcrowded, or there will be a greater danger of some of them getting rubbed. Assuming that there is a sufficient covering of foliage over the trellis, the lateral growths must now be kept constantly pinched out. If the least evidence of red spider is to be seen, let the affected leaves be sponged with a weak mixture of soft soap and sulphur in water. Vines affected with this pest should be syringed with soft water in the afternoon at closing time, but this should be discontinued when the berries commence to colour. After the second thinning has been done, the borders should receive a liberal surfacing of rich, decomposed farmyard manure, and following this a thorough watering with tepid water.

Madresfield Court Grape.—This most excellent, mid-season Grape requires a little extra care and attention during the ripening period, as the berries are liable to cracking. I believe this cracking often occurs as the result of some degree

of drought felt by the roots. It is a mistake to lessen the supply of water at this critical stage, when the vines probably absorb as much moisture as at any other season. When colour commences to develop on the berries, the atmosphere should be kept freely circulating, but the strictest care must be taken to prevent draughts of cold air. It is well to allow the laterals a certain amount of free growth until the danger of cracking is passed. In order to prevent excessive moisture rising from the borders after they have been watered, a surfacing of clean straw is useful. Madresfield Court Grape should be cultivated in a well-drained border of restricted size, and one in which the soil is rammed thoroughly firm.

Cucumbers.—The stopping and regulating of shoots should be carried out at least once each week. As soon as numerous roots are seen on the surface of the border, apply a top-dressing of loam and decomposed horse manure. Open the ventilators a little during the forenoon, but close them again about 3 p.m.; when the house and plants are syringed. Should the Cucumber blotch disease (*Cercospora melonis*) appear on the plants, cut off any affected leaves and burn them. Discontinue the syringing for a time, but maintain the atmosphere moist by frequently damping all the available surfaces in the house. Another

large measure it may be prevented if a mulch of some suitable material is placed on the soil sufficiently early. For all the larger growing vegetables there is nothing better than stable litter, but for smaller growing crops, such as Beet, Onions, Carrots, Lettuces and Turnips, manure obtained from a spent Mushroom or hot-bed, with some leaf-mould, are the best materials. These materials should be passed through a coarse meshed sieve in order that they may be easily worked between the plants and rows. If nothing better is obtainable, the mown grass from the lawns will answer the purpose.

Watering.—It will now be necessary to commence watering in dry weather. Whenever water is applied let sufficient be given to thoroughly saturate the soil as deeply as the roots penetrate. Manure water of some kind is essential to most of the crops if the best results are to be obtained. Ordinary house sewage, if used with care, is an excellent stimulant, therefore, provision should be made for preserving a sufficient quantity for kitchen-garden purposes. Drainings from the farmyard are excellent if care is taken to dilute them sufficiently before applying them to the crop. As far as circumstances will allow, all watering should be done late in the afternoon or during the evening.

FIG. 142.—ROSE FESTOONS IN THE WARREN HOUSE GARDENS, STANMORE.

(See p. 323.)

bunch of plants will be necessary to take the place of those now fruiting when the latter cease to be productive. Excellent Cucumbers may be grown at this season of the year in unheated frames. The recommendations given in a previous Calendar for the cultivation of Melons in frames may be followed in the case of Cucumbers, with the additions that a covering of decayed leaves be placed over the whole of the bed 3 or 4 inches thick, and the young Cucumber plants be planted on mounds composed of loam and leaf-mould in equal proportions.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Mulching.—It would be difficult to overestimate the value of a good mulch to most vegetable crops, whether they are cultivated in light or heavy soil. Contrary to the general belief, I am convinced that a mulch is even more necessary on heavy ground than on light, porous soils. Heavy land contracts during dry weather in summer, and exhibits much cracking and the crops suffer from this condition of the soil. In a

Dandelion.—The Dandelion is regarded by many as one of the best salads obtainable, and by some as one of the best vegetables for cooking purposes. Seeds should be sown thinly in rows 15 inches apart, and the seedlings thinned as early as possible to 1 foot apart.

Potatoes.—Use the flat hoe over the ground between the rows and Potato sets directly the growth appears above the ground level. Whenever there is the slightest fear of frost (and it should be remembered that frost is possible during the whole of the present month), let the tops be either covered with soil or protected with some other material. Examine frequently old tubers which have been stored for use. Rub off any growths that appear upon them and make sure that they are in the coolest place available.

Spinach.—The earliest sowings made this spring should now be affording leaves for consumption. The plants in successional batches should be thinned out to 6 inches apart in order that the finest produce possible may be obtained. Continue to sow small quantities of seed once a fortnight, selecting the sites between rows of Peas or some other partially-shaded situations.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart.,
Leonardslee, Sussex.

Bamboos.—Any varieties of *Bambusa*, *Arundinaria*, and *Phyllostachys* that have been recently planted should be given occasional waterings, as these plants become dry very quickly in the presence of a drying wind. It is useful also to spray the foliage occasionally with clear water. *Arundinaria nitida* and *A. anceps* are greatly affected by dry conditions, the leaves frequently showing signs of shrivelling during an east wind. Large clumps of Bamboos can be improved in condition by applying water from the hose. It must be remembered that the arrangement of the leaves tends to divert much of the water that falls upon them to an area not covered by the roots. If a small jet of water is made to run for several hours in the centre of a plant it will be sure to do that plant good. Any other trees and shrubs that have been moved should be examined for the same reason. First of all make the soil thoroughly firm about the roots and then apply water.

Narcissi.—The foliage of *Narcissus* and all bulbs should be allowed to die naturally. Therefore, if the site where the *Narcissi* are growing is needed for any other plant the *Narcissi* should be lifted carefully and laid in a trench where they may finish the ripening process.

Calceolaria.—Any *Calceolarias* to be used in the scheme of summer bedding not already planted in their permanent position should be removed thereto without delay. They require deeply-dug and richly-manured soil, and planting should be done very firmly or the plants will die suddenly during a period of hot weather.

Hollyhocks.—Turn up a leaf occasionally to see if there are signs of the fungus disease (*Puccinia malvacearum*). If the plants are sprayed sufficiently early with permanganate of potash or sulphide of potassium the disease will be checked. Hollyhocks are noble border plants and their culture is recommended.

Senecio.—*S. japonica*, *S. Veitchii*, and *S. Wilsonianus* are apt to have their leaves disfigured by insects. Therefore sprinkle about the plants a quantity of soot, lime, or kainit, these being distasteful to creeping insects.

Helleborus.—Plants that were shifted at the commencement of the month must be watered from time to time.

Rhododendron.—As *Rhododendrons* pass out of flower, especially the Himalayan species, let the seed vessels be picked off, as this will have the effect of making the plants grow more strongly. Afford any plants water that appear to require it, and apply a mulch to isolated specimens that, having no shade, would be liable to very warm soil about their roots.

Alpine plants.—See that shade is afforded such plants as *Schizocodon Shortia*, and *Ramondia*. Many of the *Saxifragas* do better if shaded from the midday sun. They should be planted in a north-west aspect.

Gerbera Jamesonii.—Plants of this species are now growing freely. Take away a little of the surface soil and apply a top-dressing.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE,
Bart., Burford, Surrey.

Calanthe.—In the warmest house the deciduous *Calanthes* are in various stages of growth. Those which have unfolded their leaves are rooting freely towards the sides of the pot. Such plants must now be afforded more water at the root, and the quantity should continue to be gradually increased as the plants make further progress. Those that are more backward should be set aside by themselves, for great care must still be exercised in watering them. At Burford I find it necessary to give extra shade from sunshine to these *Calanthes* until the plants are thoroughly established, and for this purpose, in addition to the lath blinds, we use thin archangel mats which are half worn out; these are kept on the glass during the hottest part of the day. Such evergreen *Calanthes* as *C. veratrifolia*, *C. Masuca*, and *C. macroloba* should now be opening their flowers, and if the plants are placed in a cool, shady part of the intermediate house, they will remain beautiful for several weeks. Whilst in bloom, the plants only require about half as much water as when they are in full growth—a too liberal supply at

this time will cause the flowers to become spotted and to fall away prematurely. The proper time to repot these plants is when new growth commences, which usually occurs about a month after flowering. Being strong, free-rooting subjects they require rather large pots, which should be one-third filled with drainage. For a compost, use one-half of fibrous loam, one-fourth leaf-mould, one-eighth *Osmunda* fibre cut up rather small, and for the remainder small broken crocks and coarse silver sand. Pot the plants moderately firmly, as when planting an ordinary stove or greenhouse plant, and allow a good space for water on the surface. Brown scale insects and green and yellow aphids often attack these plants just as the flowers commence to open, and if not destroyed at once, they spoil the whole inflorescence.

Thunias.—*Thunias* have grown strong and well. As the flowering racemes commence to appear on the apex of the new growths, afford copious waterings at the root, and weak liquid manure water about once or twice a week until the flowers expand. When in bloom, the flowers will last longer if the plants are arranged in the less warm atmosphere of the *Cattleya* house.

Pleiones.—Such *Pleiones* as *P. maculata*, *P. lagenaria*, and *P. concolor* now suspended to the roof of the *Cattleya* or intermediate house, and others as *P. humilis* and *P. Hookeriana* which are near a ventilator in the cool house, must receive sufficient water to keep them decidedly wet, and a good spraying overhead several times a day so that the foliage will be fresh and clean. When thoroughly established in the potting material, all of these *Pleiones* enjoy exposure to light, and will keep the tips of their leaves green longer than when grown in a shady position. They should not, however, be exposed to strong direct sunshine.

Chysis.—In the *Cattleya* house, plants of *Chysis bractescens*, *C. Linninghii*, *C. aurea*, *C. Sedenii*, and *C. Chelsonii*, &c., are now in full growth. Those that were repotted last year and need no disturbance now, will require abundance of water at the root. If any require repotting the operation should be done at once. The plants grow well in equal parts of *Osmunda* and *Polypodium* fibre cut up moderately fine and with plenty of small crocks intermixed. Pot each plant firmly and suspend it in the lightest position in the house. Instead of the usual shallow *Orchid* pans, we find the ordinary flower-pot more suitable, these having three holes drilled just under the rim, and with copper wire handles they are easily suspended. All through the growing season these plants are extremely liable to the attack of small yellow thrips. When these tiny insects get a footing low down in the funnel-shaped growths, it is difficult to dislodge them. A good plan is to dip the growths in some safe insecticide, afterwards rinsing it off in clean, soft water, then lay the plants down on their sides until the water has drained out of each growth. It is advisable to place the plants in any house whenever it is being fumigated with a vaporising compound.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell
Park, Kent.

Forced Strawberries.—Where the later batches of these have not been too hardly forced, they should be set aside and hardened off gradually, with a view to planting them in the kitchen garden. This class of plant, if well rested, will usually produce a good crop of Strawberries in the autumn, and a heavier crop in the following season. Strawberry plants under glass are very susceptible to red spider and mildew, and sometimes whilst the plants are standing about, previous to being sufficiently hardened for planting, these pests increase in number. As a precautionary measure, it is well to dip the foliage in a strong mixture of sulphur or other insecticide, so as to ensure the plants a clean start in their new quarters. Where this method of cultivation is practised yearly, a piece of ground will have been already prepared, and the soil by this time will have settled down. All that now remains to do is to loosen the top soil, and, before planting, to work in a mixture of soot, lime and wood ashes. Rake the surface level and draw lines at 2½ feet apart. If Strawberry plants grow strongly in the garden as a rule, then allow the plants the same distance in the rows. For some of the more compact or weaker-growing varieties

2 feet will be found sufficient. Thoroughly break the ball and disentangle the roots, or the latter will have some difficulty in establishing themselves in the new soil. Plant firmly and apply a thorough watering afterwards. In the event of a spell of dry weather, watering must be continued till the plants are well established. Where a large number of runners is required for raising plants for forcing, it is a good plan to set apart a bed of late-planted Strawberries, and to use these merely for providing runners. The blooms should be pinched off as soon as they appear. This is a better plan than to depend on a fruiting plantation for the runners—as before the fruit is cleared a considerable time will have elapsed, and the runners may be damaged by the pickers. Where early forcing is done, it is a gain to get the plants established in the fruiting pots early.

Early Strawberries.—If the present dry weather continues, warm borders set apart for the production of early fruit will require frequent waterings, otherwise the plants will be checked in their growth and the fruits prevented from swelling sufficiently. If extra fine fruits are desired, thin them out as soon as the bloom is set, leaving about 12 fruits on each plant. This will be a considerable help to the plants, and will hasten the development of the fruits by a few days.

THE APIARY.

By CHLORIS.

Water for Bees.—Now that the bees are raising large quantities of brood, much water will be required, and where there are no natural supplies of pure water it is necessary to afford a supply. The best and simplest way to provide water for bees is to fill a 3-lb. jam bottle with water, and invert it on a plate in the vicinity of the hives.

Arranging an apiary.—Bright sunshine has a great influence upon the activity of bees, and the hives should be so placed that the entrances catch the early morning sun, that is, facing the south-east. Some protection, such as is afforded by a high hedge, should be given against the north and east winds, but the hives should not be crowded under hedges, although this is often the case. Such a situation prevents easy manipulation of the hives, and causes them to be damp from the constant drip from the trees. The hives should be so placed that a person can easily get behind them. Place the hives about two yards apart; let the alighting board be sloping, and not more than a foot from the ground. If the apiary is in a field keep a space around each hive clear of grass and weeds, so that the bees will be able to enter the hives freely. Should the queen be lost when examining the hive she will be more readily found if the ground around is clear. An apiary should, if possible, be established in the midst of honey-producing flowers.

Plants that furnish honey in quantity.—Many persons imagine that any and every flower will give its share of nectar to the honey bees, but this is not so. There are many blooms which are of no value to the bee because the nectar is situated too far down the corolla for the tongue of the bee to reach it. The following plants are especially valuable for honey producing: All fruit trees, Lime, White Clover, Borage, Mignonette, Mustard, Heather, and plants of the Brassica family, especially when grown in large quantities for seed.

Swarms.—May is one of the best months to commence beekeeping, especially if good swarms can be obtained. One of the readiest means of judging whether a new stock is strong is to weigh it. A good swarm, when just hived, should weigh from 4½ to 5 lbs.; a medium one from 3 to 3½ lbs. Before bees swarm they consume a considerable amount of honey, which they convert into wax for building comb in their new home. When bees are dispatched some considerable distance by rail they consume some of this honey as food, therefore the swarm weighs less on arrival than when dispatched.

Fitting a hive for a swarm.—A swarm generally builds worker comb during the first season after swarming. Fit the frames with starters about an inch and a half deep. Over these frames place zinc queen excluders, and above these place shallow frames containing drawn-out comb. The bees will then have a place in which to store their nectar and thus leave plenty of room for the queen to lay her eggs.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, MAY 24—Anniversary meet. of Linnean Soc.

TUESDAY, MAY 25—

Roy. Hort. Soc. Sh. in Temple Gardens, Thames Embankment (3 days). Ann. meet. and dinner of the Kew Guild at the Holborn Restaurant.

WEDNESDAY, MAY 26—

British Gardeners' Association Annual Meeting at Essex Hall, Strand, London, at 7 p.m. Bath and West and Southern Counties Sh. at Exeter (6 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—55.7°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, May 19 (6 P.M.): Max. 66°; Min. 41°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, May 20 (10 A.M.): Bar. 30.2; Temp. 68°; Weather—Sunshine.

PROVINCES.—Wednesday, May 19 (6 P.M.): Max. 63° Bury St. Edmunds; Min. 54° Scotland E.

SALES FOR THE ENSUING WEEK.

TUESDAY—

Unreserved sale of 150 Magnificent Orchids, including some rare Cattleya Rex, by order of Messrs. Sander & Sons, by Protheroe & Morris, at 67 & 68, Cheapside, E.C., at 2.30.

WEDNESDAY—

Choice and Rare Orchids, many being certificated plants, by Protheroe & Morris, at 1.

THURSDAY—

Hardy Bulbs and Tubers, at 12; Palms, Bays, Ferns, &c., at 1.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Imported and Established Orchids, Orchids in flower and bud, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Blood of Plants.

It has long been known that the blood of animals contains substances—respiratory pigments—which act as carriers of oxygen; that is, which are capable of uniting with oxygen and of yielding it up to the tissues of the body. Such respiratory pigments are contained, for example, in mammalian blood, and to them that fluid owes its characteristic colour. The change of colour which blood undergoes in passing from the arterial to the venous state is due to the change in colour of the respiratory pigment. When united with oxygen it is bright red, and when deprived of oxygen it is of a darker colour.

Again, it is well known that in the process of respiration, both in plants and animals, the energy which this process releases and puts at the disposal of the organism is in part due to oxidations. The raw materials of respiration are complex organic compounds—sugar and also nitrogen-containing bodies: the final "waste" products of the process are fully oxidised substances, such as carbon-dioxide, water and the like.

It has always been a puzzle to physiologists to understand by what chemical course of events the respired substances are oxidised in the cells of the plant or animal.

It has been evident for some time that respiration is not a simple oxidation process, for if it were, then increasing the supply of oxygen should result in increased respiration. This is not the case with plants, for the amount of oxygen in the air supplied to the plant may be varied within extraordinarily

wide limits without increasing the rate of respiration.

That certain processes go on in the plant preliminary to the oxidative processes which constitute the last stage of respiration is evident from the study of fermentation by yeast.

Yeast is a fungus which, as is known to all, converts certain sugars into alcohol and carbon dioxide. Yeast (*Saccharomyces cerevisiae*) is remarkable in as much as it may live in the presence or in the complete absence of oxygen; or, in other words, it can live aerobically or anaerobically.

When oxygen is present yeast, besides fermenting a certain amount of sugar to alcohol, converts some sugar into carbon dioxide and water, that is, it sets up fermentation and also respire like an ordinary plant. When oxygen is absent yeast obtains its supplies of energy solely by breaking sugar molecules into alcohol and carbon-dioxide.

Yeast, as an aerobe, derives the major part of its energy thus:—

as an anerobe, thus:—

and since the energy obtainable from a given weight of fermentable sugar is greater when the oxidation is complete, as in the former case, than when the sugar molecule is split into an unoxidised part (alcohol) and an oxidised part (carbon-dioxide), it follows that, to get the energy necessary for its routine work of living, yeast as an anerobe must decompose considerably more sugar than when it is living as an aerobe. This is confirmed by the experience of brewers, who limit the amount of oxygen available for the yeast during alcoholic fermentation. Till recently the facts of alcoholic fermentation were regarded rather as curious than significant. Two sets of observations have forced them into prominence as throwing light on the chemistry of respiration. The first set of observations indicates that alcoholic fermentation is not confined to yeast and various other micro-organisms, but may be demonstrated to occur among the higher plants. That this is so, anyone may determine very readily by keeping Bean seeds under water for a few days, and then rubbing the seeds between the fingers, when a distinct smell of alcohol is to be recognised. Experiments on the behaviour of the higher plants when deprived of oxygen have led to the conclusion that in these circumstances, though no oxygen is absorbed, carbon-dioxide continues for some time to be evolved; and, as we have just seen, alcohol is also produced. This process of respiration without oxygen is called generally intra-molecular respiration. It agrees in the most exact manner with the alcoholic fermentation of sugar by yeast, and, indeed, only takes place in plants which contain sugar in their tissues. The second set of observations bearing on the chemistry of respiration are due to Buchner, who has succeeded in isolating from the living yeast-cell a definite substance which he terms zymase and which, like the living yeast-cell itself, has the power of decomposing sugar into alcohol and carbon-dioxide.

From these results it would appear probable that in yeast, living in oxygen, respiration takes place in a series of stages, of which the first is the disruption by zymase and similar agents of complex, organic substances such as

sugar (and also nitrogen-containing bodies), and the second the oxidation of the alcohol and other substances, produced by this disruptive action. If this is the probable course of events in the respiration of yeast it is also, for the reasons already given, the probable course of events in the respiration of all plants.

In this scheme the respiratory pigments find a definite place. These pigments consist of readily oxidisable bodies, and, under the influence of special agents of oxidation called oxidases and peroxidases take up oxygen. They act as temporary storers of oxygen. The oxygen, which they hold but loosely, is taken from them and induced to combine with the products of the disruptive process described above, with the consequent production of fully-oxidised substances—the so-called products of respiration—such as carbon-dioxide and water. A respiratory pigment may have different colours according as it is in the oxidised or the reduced state: thus indigo is blue in the former, but colourless in the latter condition. Various fungi, such as species of *Boletus* turn blue when broken and exposed to the air owing to the taking up of oxygen by the respiratory pigment. Many of the common colour changes in vegetables, as, for example, the browning of Apples, may be the visible sign of a similar oxidative process whereby a respiratory pigment is converted from its reduced, colourless state to its oxidised, coloured condition: the oxygen so taken up being destined for respiratory purposes. In as much as bodies, having these peculiar relations to oxygen and exhibiting marked colour characteristics when oxidised, exist in the sap of the most varied kinds of plants, it has been suggested by Palladin, to whom the most recent investigations are due, that the cell-sap of plants, because it contains these respiratory pigments and also the oxidising agents, is to be regarded as fulfilling the same respiratory functions as the blood of animals.

Looking at matters from the standpoint of the plant, the problem which it solves by respiration is how to obtain the energy for doing its work. The complex substances which it manufactures contain potentially great stores of energy. All that is required is that these substances should be oxidised. At the low temperature at which plants work this cannot be done directly. It is done indirectly in two series of operations. First, by special, clastic (decomposing) agents, like zymase, the organic substances are split up into intermediate bodies. In the second set of operations oxygen is brought into close association with the respiratory pigments. In the last place, this store of oxygen is introduced to, and caused to combine with, the decomposition-products of the first stage. Thus more or less fully-oxidised products are evolved, the fulness of oxidation being a measure of the completeness with which the potential energy of the original food substance is liberated. Although it cannot yet be described in simple language, easy of apprehension to the layman, the great problem of the mode of origin of the vital energy of organisms, by virtue of which they live and move and have their being, begins to be intelligible.

OUR SUPPLEMENTARY ILLUSTRATION represents a view of the Rhododendrons in the pleasure grounds at The Beacon, Dormans Land, Sussex. The bushes, many of them 30 feet high, form an undulating hedge on either side of the path known as the "Broad Walk." This path measures 16 feet across and extends a distance of 90 yards. The plants are principally varieties of *R. ponticum*, though here and there are hybrids, some with white flowers. The bushes have been planted for upwards of half a century. The soil varies in texture from a more or less light loam to a stiff clay, being a staple that is not considered very suitable for Rhododendrons. Nevertheless, they flourish and produce annually a grand display of blossoms. Through the kindness of the owner, opportunity to witness the display is extended to all who care to do so, and no permission is necessary. The site is shaded slightly by big trees, which afford protection for the flowers without obscuring the light to any great extent. The group of Rhododendrons shown in fig. 143 is the beautiful variety *Rosa mundi*, growing by the side of the formal lake opposite the Palm house in the Royal Gardens, Kew. This spot is one of the gayest in these famous gardens at all times, and especially in spring, when the large beds which face the Palm house are filled with a beautiful display of bulbous plants, most of them massed in colours. The Tulips have been especially fine this season. The Rhododendron *Rosa mundi* is early in flowering, and, as will be seen from our picture, it is extremely floriferous. Later, when the flowers are over, the dark greenery of the foliage affords a pleasing contrast to the wealth of summer-flowering subjects which take the place of the bulbs in the flower-beds. The stone vases, which appear in relief against the water, are then filled with showy trailing and other plants. The lake is of considerable extent, and numerous and varied water-fowl make it their home. The tiny island seen in the middle of the lake is a favourite spot for a pair of cormorants, which birds, disporting themselves and diving into the water after the food thrown them by their keeper or visitors, provide a constant source of entertainment. On a fine summer's afternoon, and especially on Sundays, the margins of the water are crowded by visitors, the vicinity of this lake and the Palm house being the most frequented spot in the gardens.

FLOWER SHOWS AT BIRMINGHAM.—The Birmingham Botanical and Horticultural Society have decided to hold, in accordance with precedent, two summer flower shows at the Botanical Gardens, Edgbaston, this season. The forthcoming shows will be held on June 9 (Orchids and early summer flowers) and July 21 (Roses and midsummer flowers). Schedules may be obtained from the hon. secretaries, Messrs. HUMPHREYS and WHITELOCK, at the Botanical Gardens.

KENSINGTON GARDENS.—The *Times* on the 13th inst., reports the following questions and answers in the House regarding the management of Kensington Gardens:—Mr. REES asked the First Commissioner of Works whether he would consider the propriety of extending the ride from Hyde Park into Kensington Gardens? Mr. L. HARCOURT: I cannot give any encouragement to this suggestion. It would destroy the amenities of Kensington Gardens, and I am glad to think the cost would be prohibitive. Mr. REES: Will the right hon. gentleman consider the desirability of keeping members of Parliament and others in good health, and the difficulty of getting sufficient exercise at present? Mr. L. HARCOURT: I attach more importance to keeping the children in Kensington Gardens in good health.

THE HURST AND SON MUSICAL SOCIETY AND THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—This society gave a performance of a musical play entitled "In Cyderland" on the 10th inst., at the Cripplegate Theatre, Golden Lane, London. The play was written by Mr. R. CAREY TUCKER, and the music composed by Mr. EDWARD SHERWOOD. There was a good attendance, and the performance was greatly enjoyed. We understand that Mr. EDWARD SHERWOOD will be enabled to make a contribution of £100 to the funds of the Gardeners' Royal Benevolent Institution as a result of the performance.

A PROPOSED NATIONAL VEGETABLE SOCIETY.—A meeting of several persons interested in vegetable culture was held in the Board Room of *Country Life*, Limited, on Tuesday afternoon last. Those present included Mr. A. DEAN (in the chair), and Messrs. O. THOMAS, G. WYTHES, W. POUPART, C. FOSTER, H. MARKHAM, C. HOB-DAY, E. T. COOK, J. T. QUICK, and F. W. HARVEY. The feeling in favour of the formation of a Vegetable Society was unanimous, and it was agreed to convene by circular a meeting of all interested in the project. This will be held in the Essex Hall, Essex Street, Strand, at 4 p.m. on Tuesday afternoon next. At that meeting full opportunity will be given for discussion and proposals will be submitted. Mr. A. DEAN is to preside, and Mr. QUICK will act as hon. sec. pro tem.

MR. H. J. VEITCH.—We have received the following note upon a subject which we are quite sure will have the active sympathy of our readers:—"With the increasing love of plants and gardens it may possibly be forgotten to what a really vast extent the present and succeeding generations are indebted to Mr. HARRY J. VEITCH, V.M.H., not only for his invaluable work amongst plants, but also for the assistance he has invariably rendered, personal as well as financial, to the great gardening charities. A few of his friends and admirers (both amateur and professional) are, therefore, desirous of having his portrait painted by one of our leading artists, in order that it may be hung permanently in the buildings of the Royal Horticultural Society. A sum of 600 guineas will be required. Of this a very substantial sum has already been received, but it is thought that amongst many of his friends there will exist a feeling that an opportunity to subscribe should also be afforded them. It is proposed, should the funds admit, to present each subscriber of one guinea and upwards with an engraving of the portrait. Subscriptions may be sent to either Mr. H. B. MAY, of Stanmore, The Green, Chingford, or to the Revd. W. WILKS, Shirley Vicarage, Croydon."

BRITISH GARDENERS' ASSOCIATION.—The annual general meeting will be held in the Essex Hall, Essex Street, Strand, London, on Wednesday, May 26, at 7 p.m. (the second day of the Temple Show). Mr. E. F. HAWES, Chairman of the Executive Council, will occupy the chair.

THRIPS IN GREENHOUSES.—Experiments made by Mr. A. C. BEALE on the best means of destroying thrips on Cucumbers and published in the *Gardeners' Chronicle of America* (No. 1, vol. ix., April, 1909) have led to the following conclusions: Hydrocyanic acid gas, at the rate of 1 ounce of potassium cyanide per 1,000 cubic feet, is effectual. (This method must not be used unless the operator adopts proper precautions, since hydrocyanic acid gas is extremely poisonous). Spraying with a 40 per cent. nicotine preparation (one teaspoonful to a gallon of water) will keep down thrips on Cucumber without injury to the plant, provided that the nicotine water is washed off, before it has had time to dry on the leaves, by spraying with ordinary water.

BEQUEST TO A GARDENER.—The late Dowager Duchess of MARLBOROUGH (Lady WILLIAM BERESFORD), whose will has just been published, made a number of bequests to her servants, among them a sum of £500 to Mr. F. CHAMBERLAIN, her gardener at Deepdene, near Dorking.

RHODODENDRON PINK PEARL.—Speculations having been advanced in a contemporary as to the parentage and origin of this Rhododendron, Messrs. JOHN WATERER & SONS, LTD., Bagshot, ask us to state that it was raised in their nursery. Messrs. WATERER state that they are making similar crosses to that which produced Pink Pearl, and have hopes of raising even better varieties.

PROTECTION OF WILD PLANTS IN SURREY.—In order to preserve as much as possible the beauties of rural waysides in the area under its administrative authority, the County Council of Surrey has recently passed the following by-law:—"No person shall uproot or destroy any Ferns or other wild plants growing in any road, lane, roadside waste, wayside, bank or hedge, common or other public place, in such a manner or in such quantities as to damage or disfigure such road, lane, or other place. Provided that such by-law shall not apply to persons collecting specimens in small quantities for private or scientific purposes. Any person offending against this by-law shall be liable to a penalty not exceeding £5." Lord FARRER asked that the middle clause be omitted, as members of so-called Nature Study classes uprooted everything. It was decided that as the by-law was identical with that adopted in Devonshire, the proposed rules should be passed, without alteration, to see how they worked.

NITROGEN-FIXING BACTERIA AND NON-LEGUMINOUS CROPS.—In a paper read before the Royal Society on May 6, Professor BOT-TOMLEY gave an account of the results of his experiments on applying to the roots of non-leguminous crops (Oats, Barley, Parsnips, &c.) cultures containing two nitrogen-fixing micro-organisms, viz., *Pseudomonas radicola* and a species of *Azotobacter*. Pot experiments with Oats grown in sand and manured with phosphates, potash, and lime gave:—Treated pots, watered once with the mixed culture solution, average weight for plant = .74 grams; untreated, .42 grams; increase in favour of treated plants = .32 grams, i.e., 76 per cent. Barley: Field experiments on limed plots of 484 square yards. Seed only treated with bacterial culture. Yield of treated, 691 lbs.; of untreated, 608 lbs.; increase, 83 lbs., or 13.6 per cent. With bulbs, *Galtonia candicans*, 250 bulbs in each plot, grown in sandy soil, manured and limed, Professor BOT-TOMLEY obtained the following results:—Weight of bulbs when lifted and dried at end of season: treated, 82 lbs. 1½ oz.; untreated, 69 lbs. 3 oz.; increase, 12 lbs. 14½ oz. = 18.6 per cent. in favour of the treated bulbs. Parsnips, grown in garden soil, manured and limed, half the bed watered once with mixed culture solution, showed, with respect to weight of the roots:—Treated, 65 roots weighed 26 lbs. 10 oz., average per root = 6.55 oz.; untreated, 68 roots weighed 22 lbs. 14 oz., average per root 5.38 oz.; increase per root, 1.17 oz. = 21.7 per cent.

TREE GRUBBING BY STEAM ENGINE.—On an estate near Bulwell, Nottinghamshire, belonging to Messrs. RICHARD SANKEY & SON, LTD., a seven-acre wood has been cleared by means of a powerful traction engine. The soil at the foot of each tree was slightly loosened, a chain placed around the trunk, the engine put in motion, and the tree hauled out of the ground.

A NARROW ESCAPE.—Under the title, "A Warning to Gardeners," the *Hants and Sussex County Press* for May 15 reports a narrow escape from death from nicotine poisoning. It appears that a boy employed at a nursery took home some nicotine preparation used for fumigating purposes, and that his mother employed it on the heads of two little girls. Both children were rendered unconscious by the poison, and only prompt medical aid saved them from death. It cannot be too often insisted upon that all poisonous preparations used by horticulturists should be properly labelled, and, above all, kept under lock and key.

THE EVOLUTION OF THE ORCHIDACEÆ.—Under the above title Mr. R. A. ROLFE commences in the May number of the *Orchid Review* a series of articles on the relations in which the several genera of this most interesting group of plants stand to one another. He points out that the most primitive of existing Orchids is the genus *Newiedia*, with some half-dozen species, and insists that, though the flowers of this genus differ very considerably from those of other genera, *Newiedia* is rightly included in the Orchidaceæ. He describes in brief but adequate fashion the characters of the sub-orders, *Diandra* and *Monandra*. The distinguishing features of the two tribes, *Apostasiæ* and *Cypripediæ*, into which the former sub-order is divided, are given, the classification of the *Monandra* being left for subsequent treatment. We commend Mr. ROLFE's article to the notice of all those who are interested in what DARWIN rightly called "the most singular and most modified forms in the vegetable kingdom."

SCAB ON POTATOS.—It having been observed in Yorkshire that scab is more prevalent in a dry than in a wet season, experiments were instituted by the Agricultural Department of the University of Leeds (*Bulletins* 63 and 70) in order to ascertain whether by treating land with substances capable of holding water the disease might be prevented or reduced. The substances used were:—sawdust, shoddy, Rape meal and peat moss, each of these substances being used with and without salt. The sawdust and peat moss were soaked in water before being applied over the sets at planting time. The best results were obtained by the use of 50 cwts. of wetted sawdust; the addition of salt, however, reduced the yield. Steeping the "seed" in formaline (8 fluid ounces of commercial formaline to 15 gallons of water) reduced the amount of scab in the crop.

COKE FOR KEEPING POTATOS.—According to a German publication, the *Practical Adviser in Fruit Raising and Gardening*, Potatos may be kept and prevented from sprouting by placing them on layers of coke. Though it is not apparent by what properties of coke this effect is produced, the fact would appear to be well vouched for. It is stated that by the use of layers of coke Potatos may be kept in good condition till July.

A NEW METHOD OF PACKING GRAPES.—An improved method of packing Grapes for market, devised by M. BARODY, is described in the *Revue Horticole* (May 1, 1909). A portion of the stem is left attached to the bunch, and the two cut ends of the stem are covered with wads of cotton wool well soaked in water. Pieces of waterproof paper are wrapped over the wool and kept in place by elastic rings. The Grapes are then put up in boxes, with the usual packing between the bunches. *L'Agriculture Commerciale* gives an account of the success which attended an exacting trial of this method. Bunches packed by M. BARODY's method and

others packed in the usual manner were despatched from one part of France to another, and after having travelled over a thousand miles were inspected by competent judges. Those specially packed were found to be as fresh as when cut; the others, packed in the ordinary way, were in a lamentable state. The extra cost of the special packing comes to two or three shillings per 100 lbs.

PUBLICATIONS RECEIVED.—*Insect Pests on Fruit*, by Fred. V. Theobald, M.A., &c. (Published by the author, Wye Court, Wye.)—*Ecology of Plants: An Introduction to the Study of Plant Communities*, by Eug. Warming, Ph.D., assisted by Martin Vahl, Ph.D. (Oxford: Clarendon Press.) Price 8s. 6d. net, cloth; 10s. net, morocco.—*Kew Bulletin*. (No 3.) Containing The Flora of Ngamiland, A Funtumia Disease, The Herbarium Savatier, &c. (London: Wyman & Sons, Ltd., Fetter Lane.) Price 6d.—*Beautiful Flowers and How to Grow Them*, by Horace J. and Walter P. Wright. (Part XII.) (London: T. C. & E. C. Jack.) Price 1s. net.—*Trees: A Handbook of Forest-Botany for the Woodlands and the Laboratory*, by the late H. Marshall Ward, Sc.D., F.R.S. Vol. V.: Form and Habit, with an Appendix on Seedlings. (Cambridge: University Press.)—*The Journal of the Cooper Research Laboratory*, edited by Walter E. Collinge, M.Sc., F.L.S., F.E.S., Director. (Berkhamsted: The Cooper Research Laboratory.) Price 3s.—*Agricultural Bulletin of the Straits and Federated Malay States*. (April) (Singapore: The Methodist Publishing House.)—*The Women's Agricultural and Horticultural International Union Monthly Leaflet*. New series, No. 11. (London: 64, Lower Sloane Street, S.W.) Price 2d.—*The Tropical Agriculturist and Magazine of the Ceylon Agricultural Society*. (March.) (Colombo: A. M. & J. Ferguson.)—*Tenth Annual Report on the Destruction of Charlock*. (London: Spottiswoode & Co., Ltd.)—*Twenty-first Annual Report of the Agricultural Experiment Stations of the Louisiana State University and Agricultural and Mechanical College for 1908 to the Governor*, by W. R. Dodson, Director. (Baton Rouge: *The New Advocate*, Official Journal of the State of Louisiana.)

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

AN IRIS DISEASE.—Growers of *Pogoniris* will welcome Mr. Dyke's timely note (p. 294) on the treatment of the combined fungal and bacterial disease which has been increasingly in evidence during the last few years. It is satisfactory, especially in the case of seedling Irises, to know that it need not necessarily involve the loss of the whole plant. Last season, however, I observed a final stage of the disease, which leads me to suggest that it is important to thoroughly destroy every portion of the rhizome that is actually diseased. Three Iris seedlings that had been attacked, but not entirely destroyed, were left in the ground, and in November I found the rotted main rhizome of each of these swarming with a quantity of small grubs, some of which I sent to the R.H.S. Scientific Committee for identification and advice. I was informed that they were larvae of a two-winged fly, and probably had no connection with the disease. But it seems not unlikely that as they were feeding on the diseased tissue they might act as disseminators of the bacteria, either mechanically, or, perhaps, as migration hosts (as in the case of the trypanosome and the tsetse fly), and that later on, when the mature insect lays its eggs in the Iris rhizome, it may at the same time introduce the bacteria again. Indeed, the way in which single plants are attacked at random here and there throughout a bed of seedlings planted in fresh soil suggests this as one way in which the bacteria may be disseminated. *A. J. Bliss.*

PERPETUAL-FLOWERING CARNATIONS FOR SUMMER BEDDING.—We are so accustomed to see Carnations cultivated near the vegetable quarters that the impression exists that they are only useful as plants to afford flowers for cutting. In the case of the border Carnation this is easily

understood, principally owing to the fact that they require to be planted in the autumn or early spring, thus putting early spring bedding stock out of the question. But in the case of the perpetual-flowering Carnation it is possible to put out the plants in May after the spring bedding has been removed. We plant our Carnations at the same time as the *Pelargoniums* and *Fuchsias*, and they commence to flower very soon afterwards. Cuttings rooted late in the previous spring and wintered in cool or cold frames provide ideal stock for this purpose. If stopped for the last time in September, the growths will be elongating for flower at the time of planting in May, when they should be in 5-inch pots. Plants which have flowered during winter under glass will produce quantities of bloom all summer if planted out during the spring. The superiority of the perpetual Carnation over the border Carnation, from a flowering standpoint, will be apparent to all, for the former commence to bloom in the spring and continue until the autumn. A friend residing at Bournemouth says: "I regularly gather a bunch of perpetual Carnation bloom on Christmas Day from the garden." So, like the Rose, we never quite know which is the last Carnation of summer. The question of varieties is not a perplexing one. For the best reds I would recommend *Britannia* and *Beacon*; pinks, *Enchantress*, *Rose Pink Enchantress*, *Mr. Burnett*, and *Winsor*; white, *White Perfection*, *White Enchantress*, and *Lady Bountiful*; while *The President* is the best crimson flower for the purpose. *Montagu C. Allwood.*

A FINE HARDY PRIMROSE.—Whilst the whole world has been scoured to collect specimens of the great Primrose family, yet of all the numerous forms in cultivation perhaps none excel in attractiveness or beauty the cross-bred products of *Primula Auricula* and *P. vulgaris*, these being our garden *Auriculas*, *Polyanthuses*, and *Primroses*. All of these flowers have been seen this year in many directions in wondrous beauty as ordinary greenhouse or border flowers. But at Wisley, in a retired spot beneath the trees and, oddly enough, quite alone, I saw recently a strong plant, with leaves veiling in luxuriance with the foliage of *P. japonica* which grows so finely, so beautifully, and so naturally here, the finest, richest coloured, single crimson Primrose I have ever observed. How it came there, or what is its origin, perhaps no one can tell, but it is a recent seedling. Such a plant if it seeds, as it is hoped it may, should prove to be the progenitor of a new and superb race of garden Primroses. *A.*

SCHIZANTHUSES AT WISLEY.—In one of the large span-roofed houses at Wisley there is at present a collection of superb plants of *Schizanthus*. The plants are in 6-inch pots, and were raised from seeds sown in August last. Many of the plants range from 24 to 30 inches in height, and are of corresponding breadth. It is unfortunate that such a fine group of this simple, yet beautiful, hardy annual should be so remote as to be seen only by visitors to Wisley. Apart from the merits of the strain, the culture reflects high credit on the Wisley staff. *D.*

TEMPLE SHOW AND REFRESHMENT TENTS.—Referring to your correspondent A.'s remarks, p. 316, I would suggest that the secretaries of the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund ask the permission of the Temple Garden authorities to place collecting boxes in prominent places. If a portion of the amount usually spent in refreshment at this show be contributed to the boxes these deserving charities will be benefited. *An Old Subscriber to Both.*

TRADE NOTE.

MR. JOHN FORBES.

THE well-known and old-established business of John Forbes, nurseryman, Hawick, has been incorporated as a private limited company under the Companies (Consolidation) Act 1908 under the name of "John Forbes, Hawick, Limited." We understand that the shares are all taken up by Mr. Forbes and his family, and that the incorporation is made for family purposes only.

SOCIETIES.

ROYAL HORTICULTURAL.

MAY 18.—The usual fortnightly meeting of the Society was held on Tuesday last in the Horticultural Hall, Vincent Square, Westminster, concurrently with the annual exhibition of the National Tulip Society, a report of which appears on p. 333. The building appeared more crowded than ever with exhibits, and so numerous were visitors that it was at times almost as congested as a Temple Flower Show. The Committees all met in the upper rooms, the annexe, usually utilised as a meeting place for the Orchid Committee, being occupied mainly with the exhibits of the National Tulip Society. From a spectacular point of view, the exhibition was a great success, but there was no feature of exceptional

Floral Committee.

Present: W. Marshall, Esq. (Chairman); and Messrs. Chas. T. Drury, John Green, T. W. Turner, G. Reuthe, J. W. Barr, R. C. Notcutt, W. J. Bean, A. Kingsmill, C. W. Dixon, Arthur Turner, Wm. Cuthbertson, W. P. Thomson, E. H. Jenkins, Wm. J. James, George Paul, Ed. Mawley, F. Page Roberts, W. A. Binney, Geo. Gordon, J. F. McLeod, Wm. Howe, Jas. Hudson, and E. T. Cook.

Messrs. H. CANNELL & SONS, Swanley, Kent, again showed their brilliantly-flowered Zonal Pelargoniums, and some equally attractive Phyllocacti, having exceptionally choice varieties of these latter plants splendidly in bloom.

Messrs. W. CUTBUSH & SON, Highgate, London, N., again staged varieties of the perpetual-blooming Carnation, and a selection of flowering shrubs. (Silver Banksian Medal.)

Mr. CHARLES TURNER, Slough, showed varieties of Lilacs, the double-flowered varieties being very choice; we also noticed a batch of seedling *Athurium Scherzerianum*, elegant little plants of *Primula Sieboldii* in numerous shades, and a row of the pretty-leaved *Saxifraga sarmentosa*. (Silver Banksian Medal.)

Miss WILLMOTT, Warley Place, Great Warley (gr. Mr. J. Preece), exhibited a new Wallflower labelled *Cheiranthus Allionii hybrida*; the inflorescence bears a number of brownish-yellow flowers about the size of those of the Common Wallflower.

Some very pleasing subjects were shown by Messrs. HUGH Low & Co., Bush Hill Park, Enfield, their Roses and Carnations being very attractive, also Hydrangeas, *Meterosideros floribunda*, Acacia, *Schizanthus*, and *Cerbera Jamesonii*. (Silver Banksian Medal.)

FIG. 143.—RHODODENDRON GLORIA MUNDI IN BLOOM IN ROYAL GARDENS, KEW.

(See p. 329.)

[Photograph by A. J. Hartless.]

interest if the exhibit of new Primulas, shown by Messrs. BEES LTD., be excepted, and these were disposed in an out-of-the-way corner in one of the annexes. The exhibits under the jurisdiction of the DAFFODIL COMMITTEE comprised some very showy and extensive groups of bulbous flowers, mainly Tulips, the largest group staged being composed of Tulips in pots. This Committee granted an Award of Merit to a variety of Tulip; the FLORAL COMMITTEE conferred two First-class Certificates and two Awards of Merit. The ORCHID COMMITTEE awarded one First-class Certificate. The FRUIT and VEGETABLE COMMITTEE granted two Awards of Merit to new varieties of Strawberry.

At the 3 o'clock meeting a lecture on "Alpines in their Native Homes" was given by Mr. A. Clutton Brock.

Mr. L. R. RUSSELL, Richmond, Surrey, exhibited a trailing form of *Cytisus scoparius* Andreanus.

A batch of about 40 varieties of the common Hartstongue Fern, *Scolopendrium vulgare*, formed the principal feature in the group displayed by Messrs. H. B. MAY & SONS, The Nurseries, Edmonton. The fronds were serrated, crested and tasselled in the most elegant manner, whilst the splendid culture evinced in the specimens rendered the plants additionally handsome. A row of *Lygodium japonicum* and *Vitis heterophylla* formed a suitable setting at the back. Adjoining the Ferns, Messrs. MAY & SONS showed Verbenas in variety, *Ixoras*, *Pelargonium Clorinda*, and bunches of Zonal *Pelargoniums* in variety. (Silver Flora Medal.)

Messrs. HEATH & SON, Cheltenham, showed about 40 varieties of Fancy *Pelargoniums* and a large assortment of the scented-leaved type. Amongst the newer varieties of the fancy class were *Souvenir de Marie Aldebert* (white, semi-double flowers), *Souvenir de Mme. Royer* (dark crimson), *Monsieur Duvillard* (a very free-blooming kind, the carmine petals having darker spots), *Mons. Gaston Allery* (red and purple), and *Heroine d'Orleans* (a fine white variety). Messrs. HEATH also showed Alpine plants on a rock-garden exhibit.

Sir EDMUND LODER, Bart., Leonardslee, Hordham, Sussex (gr. Mr. W. A. Cook), showed many interesting plants from his noted collection. The *Rhododendrons* were especially choice, the more notable being *R. cinnabarinum*, *R. kewensis*, *R. Collettianum*, *R. yunnanensis*, and *R. Princess*

of Wurtemberg. Other plants of interest were *Larix Griffithii* and *L. microcarpa*, both with cones; *Magnolia Lennei*, *Fendlera rupicola*, *Rubus deliciosus*, *Limonia trifoliata*, *Akebia quinata* and *Ranunculus amplexicaulis*. (Silver Banksian Medal.)

Mr. G. REUTHE showed *Rhododendrons* in variety, also many plants of hardy species. We noticed a fine basket of the crimson-flowered *Primula pulverulenta*. (Silver Flora Medal.)

Messrs. BEES LTD., Liverpool, showed batches of three new *Primula* including *Primula Bulleyana* (see Awards), *P. muscarioides*, a small-flowered species having an inflorescence resembling a purplish blue *Lantana*; *P. cortusoides* var. *lichiangensis*, with rose-red flowers with greenish-yellow "eye." Another interesting plant in this group was *Incarvillea Bonvalotii*, which may be likened to a glorified *L. Delavayi*.

A group of a tall-growing *Calceolaria*, after the type of *C. Burbidgei*, was shown by LEONARD SUTTON, Esq., Reading (gr. Mr. F. Townsend). It was labelled *Calceolaria profusa*; the flowering is free and the plant highly decorative.

Displays of *Roses* were staged by most of the leading *Rose* firms. Mr. GEO. MOUNT, Canterbury, again staged cut blooms of remarkable quality, having well-known varieties in large batches of beautiful flowers. (Silver Flora Medal.)

The most imposing group of these flowers was a bank of pillar varieties staged by Messrs. T. ROCHFORD & Co., Tunford Hall, Broxbourne. The varieties were the best of the class, those that produce a wealth of blossoms forming huge bouquets of flowers. We noticed *Crimson Rambler*, *Dorothy Perkins* (the loveliest of all), *Lady Gay*, *Tausendschon*, *Cant's Blush*, &c. The group had a frontage of 45 feet. High culture was exemplified in a striking manner in this group, which is a feature of this firm's exhibits. Their nurseries were not inappropriately termed by a visitor a "plant factory." (Gold Medal.)

Messrs. WM. PAUL & SON, Waltham Cross, Herts., also showed climbing *Roses* with baskets of H.P.s and others along the front. The new variety *Elsie* is a *Wichuraiana* hybrid with good-sized flowers slightly flushed with rose colour. *Coquina* is a charming single variety with long sprays of beautifully-crippled, rose-pink blossoms. The yellow *Claire Jacquier* was also admired. (Silver Banksian Medal.)

Messrs. BEN CANT & SONS, Colchester, showed *Roses* of the rambling type, with large-flowered varieties in boxes along the front of the group.

Messrs. PAUL & SON, Cheshunt, showed *Roses* and *Rhododendrons*. *White Dorothy Rose* was well shown by this firm.

Messrs. FRANK CANT & Co., Colchester, showed *Roses* as tall plants and cut blooms. Among newer kinds were the red-coloured *Rhea Reid*, *Mme. Maurice de Luza*, and *Austrian Striata*, a cross between *Austrian yellow* and *Austrian copper*. The variety *Lady Roberts* was in fine condition.

Mr. MAURICE PRICHARD, Christchurch, Hants., exhibited *Alpine* and hardy garden plants, including a fine selection of *Bluebells*. Among these last-mentioned we noticed large batches of *Scilla campanulata Excelsior*, a fine shade of blue; *Scilla nutans rubra*, *S. n. rosea maxima*, *S. n. violacea*, *S. n. Rosalind* (blush-colour), and others. (Silver Banksian Medal.)

Mr. H. HEMSLEY, Crawley, Sussex, showed a rock-garden exhibit of considerable pretensions, the stonework being well disposed and planted with a variety of subjects, including, at appropriate spots, dwarf *Conifers* and shrubs. The very dark-coloured *Viola Bowle's Black* was noticed.

Mr. AMOS PERRY, Enfield Chase, Middlesex, set up a good exhibit of bulbous and hardy flowers. It contained a wealth of beautiful subjects arranged with excellent effect. We noticed many choice *Irises*, including *I. longipetala*, *Lithospermum prostratum Heavenly Blue* (a charming carpet plant), the double-flowered *Cardamine pratense*, *Camassia Cuisickii*, *Asphodelus ramosus*, *Helonias bullata*, *Paeonies*, with *Tulips* in numbers and many other spring-flowering subjects. (Silver-gilt Banksian Medal.)

Messrs. GEO. BUNYARD & Co., LTD., Maidstone, Kent, filled a large table with flowering plants and sprays of shrubs and trees in bloom. *Lilacs* in variety, *Azaleas*, the floriferous *Pyrus Malus Scheideckeri*, pink-flowered *Astilbes* (*Spiræas*), large batches of *Tulips*, *Meconopsis*

integrifolia, *Saxifragas pyramidalis* and *McNabiana*, *Irises*, and a large selection of border and *Alpine* plants were included in the display. (Silver Banksian Medal.)

M. HENRY CORREYON, Floirane, Chêne-Bourg Genève, showed a small group of rare *Alpines*. *Matthiola pedemontiana* was nicely in flower, also *Brassica repanda* and *Androsace helvetica*. (Silver Flora Medal.)

Exhibits of *Alpine* plants were staged also by Messrs. WHITELEGG & PAGE, Chislehurst, Kent; Misses HOPKINS, Mere Gardens, Shepperton-on-Thames; Messrs. JOHN PEED & SON, West Norwood (Bronze Flora Medal); Messrs. G. & A. CLARK, LTD., Dover; and Messrs. T. S. WARE, LTD., Feltham, Middlesex. This last-mentioned firm showed finely *Androsace Chumbyi*, *Globularia vulgaris*, *Iberis Garrexiana*, and *Gentiana acaulis*. (Silver Banksian Medal.)

Messrs. J. CHEAL & SONS, Crawley, Sussex, staged an interesting lot of shrubs in flower, having cut branches of *Lilac*, *Magnolias*, *Cherries*, *Caprifolium tartaricum*, *Exochorda grandiflora* (remarkably fine), *Staphylea colchica*, &c. (Silver Banksian Medal.)

Messrs. W. & J. BROWN, Stamford and Peterborough, showed cut shrubs. *Verbenas* in variety, the large-flowered *Gaillardia Lady Rolleston*, *Lotus peliorhynchus*, and *Pelargoniums*.

Messrs. JOHN WATERER & SONS, LTD., Bagshot, Surrey, staged a floor group of the beautiful rose-flowered *Rhododendron Mrs. E. C. Stirling*. (Silver Banksian Medal.)

Messrs. CARTER, PAGE & Co., 52 and 53, London Wall, London, showed *Cactus Dahlias*, a selection of *Violas*, some charming vases of the pretty *Viscaria oculata*, and the showy *Dimorphothea aurantiaca*.

Messrs. DOBBIE & Co., Rothesay, again showed *Violas* and *Pansies* having exceptionally fine blooms of all the leading varieties. The same firm showed vases of *Sweet Peas*, including the varieties *Earl Spencer*, *Mrs. A. Ireland*, *Improved Mrs. H. Bell*, and *The King*. (Silver Banksian Medal.)

Messrs. BAKER'S, Wolverhampton, exhibited their varieties of *Saxifraga decipiens* described on p. 314 in the last issue; also a new one named after *Miss Willmott*, which is described under Awards. This firm also showed a selection of bedding *Violas*.

Mrs. BISCHOFFSHEIM, The Warren House, Stanmore (gr. Mr. E. Anderson), showed large groups of *Chrysanthemum Morning Star* and *C. Lord Beaconsfield*, both admirable subjects for furnishing a supply of cut blooms. The varieties may be raised easily from seeds.

AWARDS.

FIRST-CLASS CERTIFICATES.

Rhododendron Soulici.—A miniature species from China, with relatively large flowers of bright rose colour suffused on a pale ground. The leaves are ovate-cordate and in the young state covered with a glaucous bloom. They are then reddish, as also are the young shoots, but afterwards they become green. The widely-expanded segments are divided not lower than one-third their depth, the blooms being about 4 inches in diameter. The stature of the plant, which was exhibited by Messrs. JAS. VEITCH & SONS, was about 9 inches. The plant has proved perfectly hardy in the Coombe Wood Nursery.

Primula Bulleyana.—Another newly-introduced species from China, where it was collected by Mr. Geo. Forrest, on behalf of Messrs. BEES LTD., Liverpool, who exhibited a batch of plants in flower. The tall inflorescences bear orange-buff-coloured flowers in whorls, sometimes as many as three tiers. The leaves are very like those of the common *Primrose* or *Polyanthus*. The calyx is mealy and the flower-stem is also farinaceous in the upper part. Mr. Forrest states that *P. Bulleyana* is a tall, moisture-loving plant sometimes 3 feet high. In foliage it somewhat resembles *P. serratifolia*. The plant grows in huge colonies covering several acres. Shown by Messrs. BEES, LTD.

AWARDS OF MERIT.

Rose Lyon Rose.—A Hybrid Tea variety of exquisite colouring, being a tone of coral red shaded with chrome. The flower and bud are of charming form. Shown by Messrs. T. ROCHFORD & SONS, Turnford Hall Nurseries, Broxbourne, and Messrs. HUGH LOW & Co., Enfield.

Saxifrage decipiens Miss Willmott.—A variety with flowers as large as those of *S. d.*

Arkwrightii illustrated in the last issue, p. 314, fig. 135, but having a chocolate-coloured base in the interior of the blooms and dark-coloured flower-stems. The variety is very free in flowering, and forms an admirable plant for the rock-garden or as a border subject. Shown by Messrs. BAKER'S, Codsall.

Narcissus and Tulip Committee.

Present: H. B. May, Esq. (Chairman), and Messrs. G. H. Engleheart, F. H. Chapman, W. M. Copeland, H. A. Denison, W. W. Fowler, J. Walker, F. D. Hall, J. D. Pearson, G. W. Leak, J. Jacob, W. T. Ware, E. A. Bowles, Chas. T. Digby, R. Sydenham, W. Goldring, W. Poupard, and Chas. H. Curtis (hon. sec.).

Rarely if ever have so many fine collections of *Tulips* been staged at these exhibitions, and never in a more perfect condition.

One of the finest collections was a magnificent group exhibited by Messrs. SUTTON & SONS, Reading. It was chiefly composed of *Darwin* kinds arranged in bold and effective groups. (Silver-gilt Flora Medal.)

Messrs. BARR & SONS, Covent Garden, showed a large and representative collection of *Tulips*. We noted, in addition to a very fine assortment of the *Darwin* varieties, a large number of *Parrot*, *May-flowering* and *Cottage* sorts. (Silver-gilt Flora Medal.)

Messrs. R. & G. CUTBUSH, Southgate, displayed a very fine collection of the *Darwin* and *May-flowering Tulips* in pots, arranged the whole length of the western end of the Hall. The exhibit was slightly raised above the floor level so that the whole of the varieties were seen to advantage. The method adopted of arranging about half-a-dozen pots in a group was pleasing, the batch taking the form of a massed bed in the open and with a full complement of leafage. All the leading *Darwin* sorts were represented. (Silver-gilt Flora Medal.)

Messrs. ALEX. DICKSON & SONS, Newtownards, also showed a magnificent display of these handsome flowers in a large number of the best sorts. (Silver-gilt Flora Medal.)

A notable group of *Tulips* was shown by Messrs. R. W. WALLACE & Co., Colchester, who arranged a long table with the best of the *Darwin* and *May-flowering* kinds. The rich yellow colour of *Bouton d'Or*, the lovely shades found in the *Inglescombe trio*—yellow, scarlet, and pink, the unique orange colour of *The President*, with the beautiful forms of *Gesneriana*, rendered this a most charming group. (Silver-gilt Flora Medal.)

Messrs. R. H. BATH, LTD., Wisbech, also displayed an excellent collection of *Darwin* and other *Tulips* in many diverse and beautiful varieties. (Silver-gilt Banksian Medal.)

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, brought a representative collection of these flowers, in which *Darwin* and *Cottage* varieties were of excellent quality. (Silver-gilt Banksian Medal.)

Messrs. HOGG & ROBERTSON, Dublin, obtained a Silver Flora Medal for a fine assortment of *Tulips* that embraced *May-flowering* and *Darwin* sorts in considerable quantities.

Lord HILLINGDON, Uxbridge (gr. Mr. Allan), and the Rev. Canon FOWLER, Reading, were each awarded a Silver Banksian Medal for a capital display of these flowers.

Messrs. WM. BULL & SONS, Chelsea, staged an assortment of *Tulips* in many varieties. (Silver Banksian Medal.)

AWARD OF MERIT.

Tulip The President.—A striking and effective variety of the *May-flowering* or *Cottage* class. The flower is of the largest size and coloured a reddish-orange. The expanded blossoms disclose a dark or clouded base. This remarkable *Tulip* appeared unique in its colouring in the large collection of these flowers staged by Messrs. R. W. WALLACE & Co., Colchester.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), Henry J. Veitch, de B. Crawshaw, R. Brooman-White, W. Bolton, Gurney Wilson, H. A. Tracy, F. M. Ogilvie, J. Forster Alcock, R. G. Thwaites, J. Cypher, H. G. Alexander, J. Charlesworth, A. Dye, W. H. Hatcher, A. A. McBean, J. Wilson Potter, W. P. Bound, W. H. White, W. Boxall, H. Little, and Sir Jeremiah Colman, Bart.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), secured the only Certificate of the day, viz., a First-class Certificate for his very handsome *Odontioda Vuylstekeæ* *Crawshayanum*, a very brilliant flower (see Awards). Mr. CRAWSHAY also showed *Odontoglossum Valkyrie* (*Wilckeanum* × *Nevadense*), with deep-brown-blotched sepals and petals and large white-fringed lip, with brown blotches on the lower half; and *O. Nerissa* (*nævium* × *crispum*), elegant in form, white, spotted with red.

HENRY LITTLE, Esq., Baronshalt, Twickenham (gr. Mr. Howard), was awarded a Silver Flora Medal for a fine group of *Lælia purpurata* made up of 36 well-flowered plants. Scarcely two were exactly alike in form or tint, the best noted being the pretty varieties *Russelliana*, *Bella*, *rosea*, and *picta*.

Colonel G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander), showed *Lælio-Cattleya Zoroaster* variety *Rex* (*L. Latona* × *L.-C. Canhamiana alba*), a fine hybrid with the general characters of *L.-C. Canhamiana*. Flowers yellowish-cream colour with a violet-purple lip having a cream-white margin and yellow base. Colonel HOLFORD also sent a fine spike of five flowers of the handsome *Cymbidium Parishii Sanderæ*, the large, ivory-white flowers having the labellum spotted with deep crimson; and a magnificent spike of *Odontoglossum Pescatorei* with 125 flowers.

Baron Sir H. SCHRÖDER, The Dell, Egham (gr. Mr. Ballantine), sent the unique *Cattleya tricolor* described by the late Professor Reichenbach in the *Gardeners' Chronicle*, 1874, p. 126, and which has never been introduced since. It was originally acquired by Messrs. Veitch, but there is no information as to its origin. The flowers are white with a yellow disc to the lip, which has purple markings; they are very fragrant.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), showed a very fine plant of *Cattleya Dusseldorfei* var. *Undine* with eight large, white flowers; and *Odontoglossum illustre* (*Vuylstekei* × *ardentissimum*) with claret-coloured flowers margined with white.

Mr. A. W. JENSEN, Lindfield, Haywards Heath, staged a small group of fine varieties of *Cattleya Mendelii*, *C. Mossiæ*, and *Odontoglossum crispum*.

Monsieur MERTENS, Mont St. Amand, Ghent, showed a selection of hybrid *Odontoglossums*.

J. FORSTER ALCOCK, Esq., Exhams, Northchurch, showed a hybrid *Cymbidium* said to have been raised between *C. Tracyanum* and *C. elegans*. The flowers, of which there were two on an upright spike, were cream-white, and resembled *C. Colmanie*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Odontioda Vuylstekeæ Crawshayanum (*O. Pescatorei* × *C. Noezliana*), from DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables).—A hybridist's surprise and of great beauty, although differing in a remarkable degree from the original form, which had a light ground colour, blotched and tinged with red and rose. The present variety retains all the fine form and breadth of petal acquired through *O. Pescatorei*, but the flowers are of a uniform brilliant scarlet-red, the crest being marked with orange colour. There are varying tints in the glowing colour of the flower, but no indication of the spotting seen in Monsieur Vuylsteke's original form. At the same time, it may be said that Mr. CRAWSHAY's variety is more what might be expected from the cross which gave it than the original, in which probably a blotched form of *O. Pescatorei* was used.

THE LATE MR. COOKSON.

The Chairman spoke of the loss which the Committee had sustained by the death of the late Norman C. Cookson, a vice-president of the Committee. On the motion of Mr. R. Brooman-White, seconded by Mr. James O'Brien, a resolution was passed tendering the deep sympathy of the Orchid Committee to Mrs. Cookson and her family.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair), and Messrs. A. H. Pearson, J. Cheal, H. Somers Rivers, C. Foster, G. Wythes, O. Thomas, J. Davis, H. Markham, W. Pope, E. Beckett, P. D. Tuckett, A. Dean, W. Poupert, A. R. Allan, and J. Vert.

A trial of Strawberries forced in pots having taken place at Wisley, a sub-committee who had seen them recommended two varieties as being much the earliest and best. These were Royal Sovereign and Climax, the latter not previously certificated.

H. STAPLES, Esq., Swanley (gr. Mr. W. G. Sims), sent six plants in pots, and in fruit, of Strawberries "George Munro" and "Sims' Prolific," both seedlings from Royal Sovereign and Sir Charles Napier. They were prolific croppers, but George Munro was the earlier and better. It was decided that both varieties should be tried at Wisley, outdoors and as forced plants in pots.

A collection of four dishes of richly-coloured fruits of Peach Alexander, from a tree forced for 30 successive years, two dishes of fine Royal Sovereign Strawberries, and two fruits of Melon Hero of Lockinge came from P. BRANDT, Esq., Bletchingley, Surrey (gr. Mr. Banks). (Silver Knightian Medal.)

THE JAMAICA AGENCY sent fruits of the large Mango. The flesh was yellow, soft, and very pleasant to the palate. From the same source came some Sapodillas. These fruits were about the size of hen's eggs, but pointed at one end; in colour russet-brown, and with pulpy flesh, sweet like an over-ripe Pear.

Messrs. SUTTON & SONS, Reading, set up a collection of vegetables not merely of excellent quality, but most tastefully arranged. There were 50 dishes and baskets, and the group included Cabbages Flower of Spring and April, Lettuce Golden Ball, Peas Ideal and Early Giant, Carrot Champion Scarlet, Asparagus Perfection, Climbing French Beans Princess of Wales, the Sutton Rhubarb, Market Cucumber, Mushrooms, and numerous Radishes. (Silver-gilt Knightian Medal.)

Messrs. JAS. VEITCH & SONS, Chelsea, also staged a large collection of vegetables, but the group needed more room. Cabbages, Lettuces, Marrows, Broccoli, Carrots in variety, Tomatos, Asparagus, Peas, Kidney Beans, Ashleaf Potatos, Radishes, Rhubarb, Turnips, and other vegetables all contributed to make a very varied and fine display. (Silver Knightian Medal.)

THE STOUR VALLEY GARDENING Co. sent a varied collection of vegetables that would have looked better if more effectively arranged. Some of the vegetables had been cultivated under cloches. (Silver Banksian Medal.)

Countess COWPER, Panshanger (gr. Mr. Staward), staged a collection of Lettuces, the best being *Fermot* and *All the Year Round*.

COMPETITIVE CLASSES.

The classes for collections of vegetables were poorly contested. In the class for nine kinds, the Hon. VICARY GIBBS, Aldenham House (gr. Mr. E. Beckett), was an easy first-prize winner, his products showing superb quality. His selection included Asparagus, with mounds of small Cauliflower on one side, and of Moore's vegetable cream Marrow on the other. Favourite Carrots, supported by Perfection Tomatos and Early Giant Peas, with May Queen Potatos, Matchless Cucumbers, and Canadian Wonder Beans. 2nd, Mr. STAWARD.

There was no entry in the class for six dishes. Mrs. DENNISON, Little Gaddesden (gr. Mr. Gentle), was the only exhibitor in the class for four dishes, having good Record Onions, Heartwell Cabbages, rather drawn Seakale, and small Asparagus. A second prize only was awarded.

AWARDS OF MERIT.

Strawberry "George Munro."—This new variety somewhat resembles Royal Sovereign, but it is a much heavier cropper and the fruits are of excellent flavour. From Mr. Sims (gr. to H. STAPLES, Esq., Swanley).

Strawberry Climax (Laxton).—Also much like Royal Sovereign. The awards were made in both cases for their value as forcing varieties.

NATIONAL TULIP. (SOUTHERN SECTION.)

MAY 18.—The sixteenth annual exhibition of this Society was held in conjunction with the fortnightly meeting of the R.H.S. on this date, when a capital display of the English Tulip in all its phases was brought together. The display of blossoms did not afford much spectacular effect,

but the individual flowers were extremely beautiful. So far as the show itself is concerned, we have it on the authority of the officials that the quality of the exhibits was in all respects good and decidedly above the average of last year.

Twelve dissimilar rectified Tulips, two feathered and two flamed in each class.—Mr. C. W. NEEDHAM, Hale, Cheshire, was awarded the 1st prize in this class, his best flowers being Stockport (feathered), Rosalie (rectified flamed), George Hayward (feathered bizarre), Dr. Hardy (flamed), Mrs. Lea (feathered rose), with Sir Joseph Paxton and Masterpiece. Altogether the display constituted a dozen admirable flowers; 2nd, Miss WILLMOTT, Warley Place, whose best flowers were Wm. Annibal (feathered bizarre), Annie McGregor (rose flamed), Duchess of Sutherland (flamed Bybloemen), and Sir Joseph Paxton; 3rd, Mr. A. D. HALL, Harpenden, who had excellent flowers of Duchess of Sutherland and Samuel Barlow.

Six dissimilar rectified Tulips.—Miss WILLMOTT secured the leading place with Sam Barlow and Wm. Annibal, the latter an exceptionally well-feathered variety. Mr. DUNN, Cambridge, was placed 2nd, displaying in excellent form Sam Barlow and the flamed Annie McGregor; 3rd, Mr. A. D. HALL, Harpenden.

Three feathered Tulips.—Miss WILLMOTT was again placed 1st for flowers of Bessie, George Hayward, and Mrs. Atkins, all of excellent quality. Mr. HALL and Mr. DUNN took the 2nd and 3rd prizes respectively, the latter exhibitor having a fine bloom of Masterpiece.

Three flamed Tulips.—Miss WILLMOTT was again awarded the 1st prize, having good flowers of Sam Barlow, Annie McGregor, and Talisman; 2nd, Mr. DUNN, with Sir Joseph Paxton, Annie McGregor, and Adonis; 3rd, Mr. PETERS, Cambridge.

Six dissimilar breeder Tulips.—Mr. NEEDHAM was placed 1st, Rose Hill, Mabel, and Sam Barlow being his best examples; 2nd, Mr. A. D. HALL, Harpenden, who showed Gleam, Rose Seedling, and Jasper; 3rd, Mr. DUNN.

Three dissimilar breeder Tulips.—The 1st prize was secured by Miss WILLMOTT, who had a very good example of Annie McGregor; 2nd, Mr. HALL, who showed an excellent flower of Linnett Rose breeder.

There were classes for single blooms of each of the following:—Feathered Bizarres, Roses, and Bybloemens, Flamed Bizarres, Roses, and Bybloemens.

Feathered Bizarres.—Miss WILLMOTT was placed 1st with Wm. Annibal; 2nd, Mr. A. D. HALL, with George Hayward.

Feathered Rose.—Mr. A. D. HALL won the 1st prize with Sarah Ann.

Feathered Bybloemens.—Mr. HALL showed the best flower of this section, having Stockport; Miss WILLMOTT followed with Guido.

Flamed Bizarres.—Mr. NEEDHAM won the 1st prize with Sir Joseph Paxton; Mr. A. D. HALL and R. W. HALL winning the 2nd and 3rd prizes respectively with Sam Barlow.

Flamed Rose class.—Miss WILLMOTT won both the 1st and 2nd prizes with Annie McGregor and Mme. St. Amaund respectively.

Flamed Bybloemens.—Miss WILLMOTT won all the prizes with Duchess of Sutherland, Talisman, and Adonis in the order given.

For single blooms of each of the three classes of Breeders, Bizarres, Roses and Bybloemens, Mr. DUNN took the 1st and 2nd prizes with J. Heap in the former class; Miss WILLMOTT being 3rd with Goldfinder. In the Roses, Mr. C. W. NEEDHAM obtained the 1st prize with Loveliness; Mr. A. D. HALL winning the 2nd and 3rd prizes with seedlings. For Bybloemens, Mr. DUNN was placed 1st with a capital bloom of Agnes; 2nd, Miss WILLMOTT with Northern Light.

The "Samuel Barlow" prizes for the best pair of Rectified Tulips was won by Miss WILLMOTT with flamed Annie McGregor and Wm. Annibal (feathered); 2nd, Mr. A. D. HALL with Samuel Barlow (flamed) and Attraction (feathered).

The best three flamed Tulips were shown by Mr. R. W. HALL, Cambridge, the varieties being Rose Hill, Queen of May, and Sam Barlow; 2nd, Mr. W. L. S. LOAT, Oxon.

Miss HARDCASTLE, Hardenden was placed 1st

in the class for three dissimilar breeder Tulips with Goldfinder.

For two rectified Tulips, Mr. R. H. HALL, Cambridge, was 1st, having a good flamed flower of Dr. Hardy.

Mr. W. L. LOAT showed the best twelve varieties of garden Tulips; and Miss WILLMOTT the best twelve varieties of Darwin Tulips.

Premier classes.—Mr. NEEDHAM was placed 1st, with George Hayward (feathered); Miss WILLMOTT with Annie McGregor (flamed), and Mr. A. D. HALL with his handsome seedling Gleam (breeder).

GHENT HORTICULTURAL.

MAY 1.—At a meeting of the Chambre Syndicale des Horticulteurs Belges and the Société Royale d'Agriculture et de Botanique de Gand on the above date the following Awards were made:—

CERTIFICATES OF MERIT to Odontioda Bradshawia (C. Neuziana × O. crispum, from M. LE DR. BALLION; *Miltonia* Bleuana superba, *Sophro-Cattleya* Calypso, *Odontoglossum* crispum Oakfield Sunrise, *Cypripedium* Juliana Princesse d'Orange-Nassau (*Callosum* *Sanderæ* × *Maudie*), *Trichopilia* Backhousiana, *Cattleya* Schröderæ Praetii, all from M. F. LAMBEAU; to *Cattleya* Schröderæ Cæsar, from M. E. PRAET; *Cattleya* Lawrenceana Orchid Villa variety, *Odontoglossum* crispum var. Louis Valcke, and *Cattleya* Schröderæ alba, from M. TH. PAUWELS; C. Schröderæ, *Cattleya* Trianae, from MME. LOUIS DE HEMPTINNE; *Rhododendron* Pink Pearl and R. White Pearl, from M. PYNART-VAN GEERT; *Vriesia* Sceptre d'Or, from M. FIRMIN DE SMET; *Clanthus* Florida alba, from M. JULES DE COCK; *Azaleas* l'Azur, Sultan, and Joseph Kratz, all from M. EUG. DE COCK; *Azaleas* Roi des Blancs and MME. Blommaert, from the SOC. AN. LOUIS VAN HOUTTE PÈRE; *Dracena* Marcellii (seedling 1908), D. Perle de Gendbrugge (seedling 1908), D. Princess Juliana d'Orange-Nassau, all from MM. G. PENNING ET FILS; *Saintpaulia* ionantha var. pulchra, from M. LE COMTE JOS. DE HEMPTINNE; *Anthurium* Rothschildianum striata, A. R. Charles Fraeys, and A. R. Jules de Cock, from LA SOCIÉTÉ AN. HORTICOLE GANTOISE; *Anthurium* Rothschildianum Vulcan and A. R. translucens, from M. LOUIS DE SMET; *Azalea* Souvenir de Rudolf Seidel, from M. RAPHAEL VERVAENE; collection of 30 plants of *Cineraria* polyantha stellata, *Diosma* ericoides alba, *Eriostemon* linearifolium, *Epiphyllum* Mackoyanum, *Grevillea* rosmarinifolia, *Adenandra* fragrans, *Vriesias* magnesiana, flamea, conferta, Gravisii, Leonii, Sparanza, Kitteliana × Floriosa, Poelmanii, Poelmanii × mirabilis, Memoria Moensii, all from M. FIRMIN DE SMET; collection of 12 *Calceolarias*, from M. Alph. Van Kerchove (gr. to M. J. J. DIERMAN; *Ataccia* cristata, from the SOCIÉTÉ AN. LOUIS VAN HOUTTE PÈRE.

L'ASSOCIATION FRANÇAISE DES AMATEURS ET JARDINIERS CHRYSANTHEMISTES.

THIS recently-formed French Chrysanthemum Society, whose headquarters are at Paris, deserves the congratulations of all interested in the flower. Its first balance-sheet has just been published, showing a total on the credit side of about £124; the expenses amount, roughly, to £108 odd, leaving a balance of nearly £16 in hand. The number of members at this date is 651—a most satisfactory result for so young a society, but then, of course, Chrysanthemum exhibiting in France is in full swing, and reminds us of the palmy days of the flower here in England, 20 to 25 years ago.

ROYAL GARDENERS' ORPHAN FUND. (LEEDS BRANCH.)

THE local committee of the above branch recently held a successful spring flower show in aid of the funds of the Charity.

After the necessary expenses have been met a sum of about £10 10s. will be available for the fund. A sum of more than £7 was received from the sale of flowers at the close of the show.

DUTCH BULB-GROWERS.

The following Awards have been given at recent meetings held at Haarlem:—

FIRST-CLASS CERTIFICATES to single early Tulip "Mr. Burger," with pure yellow, globe-shaped flowers, raised from the single early Tulip Verboom; to double-flowered early Tulip Schoonoord, a variety with pure white flowers, raised from the double-flowered early variety Murillo.

AWARDS OF MERIT to *Cyclamen latifolium* (persicum) "Baroness Burdett-Coutts," a variety having large pure white flowers and oblate petals; to double early Tulip Boule de Neige (Purity), with large pure white flowers, resembling the variety Murillo, but of a somewhat rounder form; to single early Tulip "Yoost van Vondel rose striata," with large, long flowers, white, feathered rosy, and raised from the variety "Yoost van Vondel"; to single early Tulip Duchess of Connaught, a variety having rosy-red flowers.

BRITISH GARDENERS' ASSOCIATION. (LONDON BRANCH.)

MAY 13.—The first annual general meeting of this branch of the B.G.A. took place at Carr's Restaurant, Strand, W.C., on the above date. The progress of the branch and the association as a whole was considered satisfactory. The officers were re-elected and Mr. A. C. Barnes was appointed to the new office of treasurer.

After the formal business was concluded, Professor W. B. Bottomley delivered a lecture on "Nitrogen Fixation in Plants." He thought the British Gardeners' Association was capable of doing good work for gardeners. He felt that gardeners and botanists should work together.

The lecturer gave details of the work of bacteria in the soil, illustrating his remarks by means of lantern slides. The extraordinary rapidity by which these organisms multiplied was demonstrated. He stated that experiments had been carried out, which, at no very distant date, would have a far-reaching effect on the culture of plants. Details of the trials with nitro-bacterine conducted at the Royal Horticultural Society's gardens at Wisley were given, and the lecturer appealed to gardeners to undertake practical tests on large plots of ground, to assist in solving the great problem of the fixing of nitrogen in the soil.

The Chairman, Mr. E. F. Hawes, said he was prepared to carry out experiments, and he hoped others would follow the suggestions of the lecturer.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending May 19.

A very cold week.—The last two days have been moderately warm during the daytime, but with these exceptions both the days and nights proved very cold for the time of year. In fact, on two nights the exposed thermometer registered 6° of frost, on one night 8° of frost, and on the coldest night 11° of frost. In no previous May in the last 17 years has such a low temperature as the one last mentioned been recorded here. During the almost constantly recurring cold period in May, 9th-14th, the exposed thermometer this year showed 8° of frost on the coldest night. The ground has become a little warmer the last two days, but is still 1° colder than is reasonable, both at 1 and 2 feet deep. Rain fell on five days, but to the total depth of less than half an inch. There has been no measurable percolation through the bare soil gauge for more than a fortnight, and no percolation at all through that on which short grass is growing for more than a week. The sun shone on an average for 6½ hours a day, or for half an hour a day longer than is usual in the middle of May. The wind has been very variable in direction, and as a rule light. The mean amount of moisture in the air at 3 o'clock in the afternoon fell short of a reasonable quantity for that hour by 8 per cent. The first Rose to bloom in my garden in the open ground was a variety of *Rosa alpina*, which was out on the 17th, or four days earlier than last year, but six days later than in 1907. E. M., Berkhamsted, May 19, 1909.

SCHEDULES RECEIVED.

Hemel Hempstead Horticultural Society's 50th annual floral fête, to be held in the Bury Meadows, Hemel Hempstead, on Wednesday, August 18. Exhibition of Roses and Sweet Peas on Wednesday, July 7. Hon. secretary, Mr. Geo. Burrows, Shendish Gardens, Hemel Hempstead.

Croydon Horticultural Society's 42nd exhibition, to be held in the Park Hill Recreation Ground, Croydon, on Wednesday, July 7. Secretary, Mr. A. C. Roffey, St. Andrew's Villa, 53, Church Road, Croydon.

Chester Paxton Society's annual exhibition of Fruits and Chrysanthemums, on Wednesday and Thursday, November 17 and 18, at the Town Hall, Chester. Hon. secretary, G. P. Miln, Grosvenor Museum, Chester.

Obituary.

NORMAN C. COOKSON.—The news of the death, on the 15th inst., of Mr. Norman C. Cookson, of Oakwood Hall, Wylam-on-Tyne, in his 69th year, will be received with the deepest regret by all interested in the cultivation of Orchids. During Mr. Cookson's residence at Oakwood Hall, extending for 30 years past, he has been an ardent horticulturist in its various branches. But his personal and active interest in Orchid cultivation and cross-breeding was best known to the public. As early as 1880 Mr. Cookson had commenced the crossing of *Calanthes*, amongst some of the best of his earlier hybrids being *Calanthe Alexanderi*, *C. Cooksonii*, *C. Clive*, *C. Bryan*, and *C. Wm. Murray*. The hybrids *Oakwood Ruby*, *Angela* and *Chapmanii* especially indicate what great results may be obtained by skilful breeding, for these flowers, although almost entirely of a ruby-crimson hue, were obtained from the crimson eye of the otherwise white *C. vestita*. Mr. Cookson was equally successful in raising hybrid *Phaius* of extraordinary value, *P. Cooksonii*, obtained from *P. Wallichii*, and *P. tuberosus* appeared in 1890. In 1895 came *P. Cooksonia*, obtained from *P. grandifolius* and

THE LATE NORMAN C. COOKSON.

Humboldtii, *P. Phoebe* was an improvement upon the hybrid just mentioned, and was obtained from *P. Sanderianus* and *P. Humboldtii*. In 1897 *P. Norman* and its beautiful varieties appeared. Of *Dendrobium* hybrids raised by Mr. Cookson, we may mention *D. Sibyl*, *D. Murrayi*, *D. Kenneth*, *D. Venus*, *D. Owenianum*, *D. Harold*, and *D. Doris*. Numerous *Cypripedium* hybrids have been raised at Oakwood, and it will be remembered that Mr. Cookson reproduced from home-raised seeds the coveted *Cypripedium* *Lawrenceanum* variety *Hyeatum*. In *Odontoglossum* Mr. Cookson, assisted by his skilful grower, Mr. H. J. Chapman, has not been less successful than in the genera we have already mentioned. Excellent hybrids from *Odontoglossum* *crispum* *O. Pescatorei*, and other species have been shown from time to time at meetings of the Royal Horticultural Society, at which Mr. Cookson was one of the most frequent visitors, being a member of the Orchid Committee. A few of the crosses effected by Mr. Cookson in other genera include *Lælio-Cattleya* *Clive*, *Cattleya* *Harold*, *C. William Murray*, and the reproduction of the natural hybrid *Cattleya* *Hardyana*. Mr. Cookson had been ill for some little time, and the end was not totally unexpected.

MARKETS.

COVENT GARDEN, May 19.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Anemone fulgens, Azalea, Carnations, Eucharis grandiflora, Freesia, Gardenias, Gladiolus, Gypsophila, Iris, Lilac, Liliolum, Lily of the Valley, Marguerites, Mignonette, and Tulips.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Adiantum, Agrostis, Asparagus plumosus, Berberis, Croton, Cycas, Ferns, and Smilax.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants and their prices, including Acacias, Ampelopsis, Aralia Sieboldii, Araucaria excelsa, Aspidistra, Asparagus, Botania, Calceolarias, Chrysanthemum coronarium, and Grevilleas.

Plants in Pots, &c.: Average Wholesale Prices (Contd.).

Table listing various potted plants and their prices, including Hardy flower roots, Heliotropiums, Hydrangea, Isolepis, Kentia, Latama borbonica, Liliolum longiflorum, Lily of the Valley, Marguerites, Mignonette, and Musk.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples, Bananas, Cherries, Custard Apples, Gooseberries, Grape Fruit, Lemons, Messina, Nuts, Oranges, Pears, Pineapples, and Strawberries.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, Beetroot, Cabbages, Cardoon, Carrots, Cauliflowers, Celery, Chicory, Cucumbers, Endive, Horseradish, Lettuce, Mint, Mushrooms, Onions, Parsley, Peas, Potatoes, Radishes, Rhubarb, Salsafy, Seakale, Spinach, Stachys, Turnips, and Tomatoes.

REMARKS.—English Gooseberries are arriving in slightly increased quantities: the cold weather of the past week has largely checked the development of the berries. Cherries are now being received from France in half sieves as well as in boxes: their quality is still very poor. French-grown Strawberries are received in crates containing four chip baskets. The prices of Australian and Tasmanian Apples remain about the same as those of last week. English

forced Strawberries are still very plentiful, 2s. 6d. being an average price per lb. for best fruits. Vegetables generally are a little firmer in prices. E. H. R., Covent Garden, Wednesday, May 19, 1909.

Table listing various potatoes and their prices, including Kents, Scottish Triumphs, Up-to-Date, Lincoln, Royal Kidney, Maincrop, Evergood, King Edward, Blacklands, Dunbars, and Jerseys.

REMARKS.—Trade is still very slow. Prices are lower and stocks in London are large. Potatoes are arriving from Jersey in increased quantities, and in the course of two weeks the season for Jersey Potatoes will be in full swing. E. J. Newborn, Covent Garden and St. Pancras, May 19, 1909.

COVENT GARDEN FLOWER MARKET.

Trade seems to have revived a little, but it is a difficult matter to give accurate prices. This morning (Wednesday) there was considerable demand for Liliolum longiflorum and the value of this flower advanced considerably. Good blooms of L. lancifolium (speciosum) are rather scarce. Yellow Daffodils are over for the season, and yellow Irises are making better prices. This morning best samples were worth from 10s. to 12s. per dozen bunches; white and mauve varieties were also selling well, but blue kinds were overplentiful. Narcissus poeticus ornatus is plentiful; the double variety is also seen in large quantities. Roses, which were scarce on Saturday, 15th inst., are cheaper again, yet there is a prospect of a considerable advance in the near future, for the indoor crops will be over before flowers from the open are ready. Carnations are fairly plentiful, and their value is low. There is plenty of Stephanotis on the stands, but as several growers have given up the culture of Gardenias and Eucharis supplies of these are not excessive. Callas (Richardia africana) are marketed in large quantities, and many are sold at clearance prices. Of Sweet Peas only those with long stems make good prices; the best varieties for market purposes are Dorothy Eckford, Miss Willmott, and Lady Grizel Hamilton. Gladiolus Colvillei and several other varieties are plentiful. Iceland Poppies are very pretty.

POT PLANTS.

There is not much variation to record in this department. Intermediate Stocks are becoming scarcer. Spring raised Mignonette is good. The yellow Chrysanthemum coronarium (or segetum) is good. Genistas are over for the season, and Cinerarias are nearly finished. Pelargoniums of all sections are plentiful. The only varieties that promise to be scarce are the single white Zonal kinds. Ivy-leaved varieties are remarkably good. Tall Fuchsias and Heliotropes are in demand. There is a considerable trade in bedding plants, for which good prices are obtained. Carpet bedding having largely gone out of favour, suitable plants are not so largely cultivated for market as formerly, consequently care should be taken in accepting orders for such plants. A. H., Covent Garden, Wednesday, May 19, 1909.

BLANCHING CHICORY OUT-OF-DOORS: H. A. The seeds should be sown at once in rows made 12 inches apart on fairly good ground which has been deeply worked. The seedlings should be thinned, after they have developed their second leaf to 9 or 10 inches apart. The best way to blanch this useful vegetable is to lift the roots as required, placing them together rather closely in deep boxes, and standing the boxes in the darkest place available in a temperature of about 50°. The labour of lifting is much less than would be required to blanch it satisfactorily in the open. For late spring use, however, inverted flower-pots covered entirely with soil and ashes may be used for blanching purposes, but it is essential that every ray of light be excluded. The heads should be cut for use precisely in the same manner as Seakale, when it may be used either as a vegetable or as a salad.

FIGS DECAYING: C. A. B. The fruits are affected with "rot" caused by Botrytis cinerea. If growth is too much stimulated by the excessive use of fertilisers the fruit exudes a little sugary juice at the pore, on which the fungus spores germinate.

FORMING A FRUIT PLANTATION: J. W. P. The soil being, as you state, a good deep loam resting on gravel, it should prove suitable, other conditions being equally favourable, for the planting of Apple trees. As you intend to plant the trees next autumn, you should prepare the land beforehand, and the sooner the better, as any manure incorporated will be the better decomposed in the soil. The turves may be removed and used for potting purposes, but you must remember that the top layer, and especially old turf, is the richest in plant food, there-

fore it should be allowed to remain. No system of tillage is so thorough as trenching, and even bastard-trenching is superior to ordinary digging. Work in plenty of farmyard dung as the ground is turned over, but place no manure about the roots when planting. If dug and manured at once, the land may then be utilised for a crop of green vegetables. November will be a suitable month to commence the planting of the fruit trees.

ANEMONE DISEASED: *T. W. C.* The leaves are badly infested with the disease known as "Cluster-Cups." The little cup-like structures (Aecidia) contain the spores of the fungus which is known as *Puccinia fusca*. It is a virulent disease, because when the plant is attacked it remains infected for the rest of its

FIG. 145.—AECIDIAL STAGE OF THE ANEMONE RUST.

life, as the mycelium passes into the root-stock where it is perennial. Diseased plants never produce flowers and should be removed and destroyed directly the complaint is detected. Be careful to burn all these diseased specimens, as the spores will infect healthy adjoining plants, and even those at a considerable distance away.

LOGANBERRY SHOOTS INJURED BY MAGGOTS: *S. B.* The shoots are bored by the larvæ of the Raspberry moth (*Lampronia rubiella*). As long ago as 1853 the late Professor Westwood called attention to the injury caused by this pest in an article published in the *Gardeners' Chronicle*. The life history is briefly as follows: The female lays her eggs in the flowers, these hatch in a few days, and the young caterpillar at once enters the centre of the young fruits without causing any apparent injury. Just before the ripening of the berries the insect crawls away and spins a silken cocoon in some convenient shelter on the canes or stakes, or near the ground on bits of sticks or stones. In such places it passes the winter. In spring the caterpillar leaves its cocoon usually about the end of March, ascends the canes or plants, attacking the partly-opened buds and shoots. The moths appear in May and June, and thus the life cycle is completed. The use of wooden stakes, especially those having rough bark, should be discontinued. Prune the plants back as much as possible; remove all rubbish from them and fork the ground deeply. It has been found a good plan to smear the canes with a band of soft soap early in spring, about the end of April.

NAMES OF FRUITS: *R. S.* The specimens are out of condition, but No. 1 is probably Dumelow's Seedling (Wellington). Can you send fresher fruits? If not, send again earlier next season.—*A. B. Earle.* Lemon Pippin.

NAMES OF PLANTS: *E. S., Scarborough.* *Phacelia tanacetifolia.*—*J. E.* *Ixia speciosa.*—*H. H.* 1, *Zygopetalum rostratum*; 2, *Epidendrum*

ochraeum; 3, *Oneidium triquetrum*; 4, *Broughtonia sanguinea*; 5, *Lælia monophylla*; 6, *Oncidium pulchellum.*—*W. E. S.* *Odontoglossum triumphans*, showing an unusual amount of white in the petals.—*Holyrood.* *Scilla nutans.*—*H. C. S.* Small-flowered *Sophora* (*Edwardsia*) *microphylla*, figured in *Botanical Magazine*, t. 1442. *Sophora tetraptera*, figured in *The Gardeners' Chronicle*, June 8, 1878, p. 729.—*Subscriber.* 1, *Swainsonia galegifolia alba*; 2, *Choisya ternata.*—*Correspondent.* 1, *Tecoma* (*Bignonia*) *jasminioides*; 2, not recognised, send when in flower.—*J. M.* *Anemone coronaria.*—*Novice.* 1, *Polemonium cœruleum*; 2, *Genista pilosa*; 3, *Ranunculus aconitifolius flore pleno*; 4, *Arenaria trinervis*; 5, *Primula cortusoides*; 6, *Asphodelus luteus.*—*W. H. A.* *Cratægus Crus-galli.*—*F. A. F.* *Cardamine pratense flore pleno.*—*S. K.* *Oncidium obryzatum*; *Coronilla* (next week).—*C. B.* 1, *Cardamine pratense*, a Cruciferous plant; 2, *Luzula sylvatica.*—*A. J.* *Spiræa bracteata.*

PLAN OF A CROQUET GROUND: *B. R. C.* For many years a croquet ground was laid out in accordance with the plan given on p. 238 in the issue for May 1, and the game is still played according to these rules where the influence

be not less than 3½ inches or more than 4 inches apart (inside measurement) from the ground upwards. The turning and the winning pegs shall be of wood, of a uniform diameter above the ground of 1½ inches. They shall stand 13 inches out of the ground, and be firmly fixed. The setting of the hoops and pegs shall be in accordance with one of the diagrams following, and the order in which the points are to be made shall be in accordance with the arrows which appear thereon. Measurements:—Setting No. 1: Pegs in centre line of ground 7 yards from nearest boundary; hoops in centre line of ground 7 yards from peg, and 7 yards apart; corner hoops 7 yards from nearer peg and 7 yards from the nearest boundaries. Setting No. 2: The winning peg equi-distant from the corner. Hoops in centre line of ground 7 yards from peg; corner hoops 7 yards from the nearest boundaries." (From *Laws of Croquet* (1909), published for the Croquet Association by Harold Cox, Windsor House, Bream's Buildings, London, E.C., price 6d.). In laying out a croquet ground it is essential to have sufficient room outside the lawn (35 yards by 28 yards) to allow of the roller or mower being turned. This is necessary to avoid unduly wearing the most important part of the turf, viz., that where the "yard line" is situated.

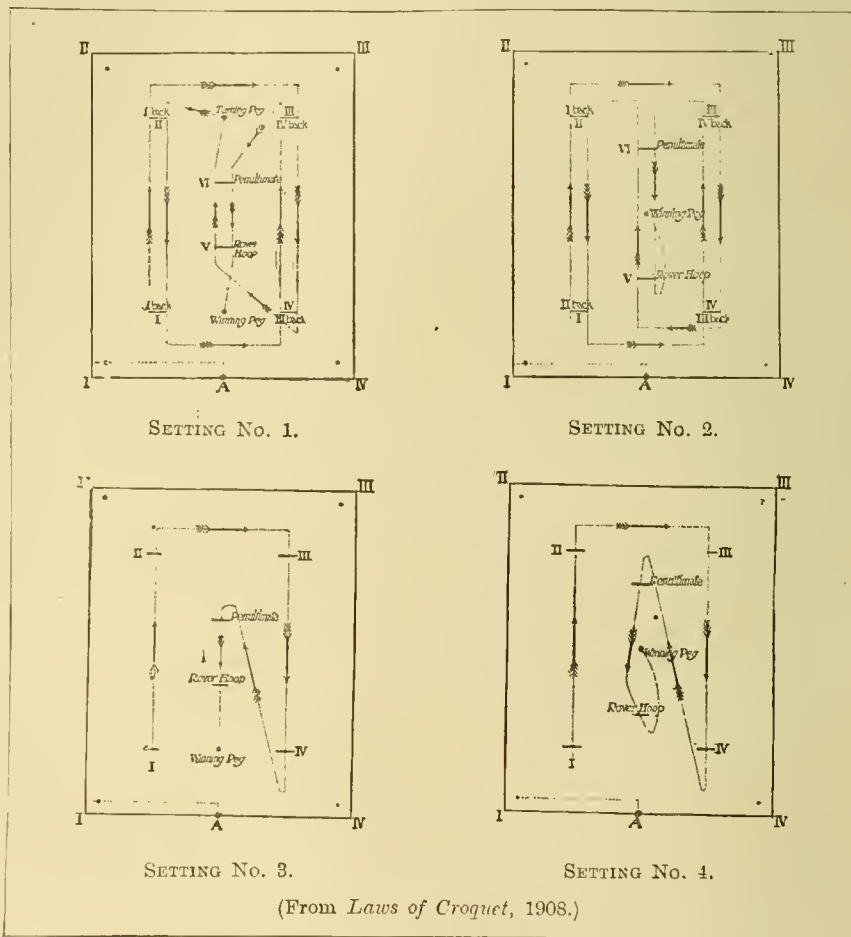

FIG. 146.—THE CROQUET ASSOCIATION'S DIAGRAMS.

of the Croquet Association is not felt. The Croquet Association, however, is the only recognised authority for those who wish to play the game in the approved manner. We are indebted to the courtesy of the hon. secretary, Mr. F. Kenrick, for the following particulars as to the present regulations:—"The ground shall be rectangular, 35 yards in length by 28 yards in width, with a defined boundary. A flag shall be placed at each corner, and corner spots, 3 feet from both boundaries, shall be accurately defined. Points on the boundary 3 feet from each corner flag shall be marked by white pegs, not exceeding three-quarters of an inch in diameter and 3 inches above the ground. The haulk (see diagrams) shall also be defined. The hoops shall stand 12 inches out of the ground, outside measurement, and be firmly fixed. The crown shall be straight, and at right angles to the uprights, which shall

TULIPS INJURED: *H. B. H. L.* Although, in one case, we can detect a slight puncture which may be due to insect pests, we think the unsatisfactory condition of flowering is due to some irregularity in the bulbs themselves. The inflorescence seems so weakened and attenuated as to point to improper flower formation in the bulbs last autumn. We have had several similar cases this season, and we attribute it to the unsuitable weather last autumn for proper bulb ripening.

CACTUS DAHLIAS.

IN the *Gardeners' Chronicle* for October 4, 1879, there is an illustration of Dahlia Juarezii (Mexico), the parent of our modern Cactus Dahlia. It is a fairly double, star-shaped flower, holding its head erect on a fine, long stalk. Its resemblance in colour to *Cereus speciosissimus* was the reason for its being termed a Cactus Dahlia. The plant was introduced into commerce in England by Mr. Henry Cannell in 1880. Seedlings were raised in great numbers by many growers, and such old varieties as Cochineal (crimson), Constance (pure white), and Glare of the Garden (crimson-scarlet) will be remembered by many. Why was the grand, decorative habit of the early plants gradually lost, and why was the ability of the flowers to hold themselves erect on long, upright stems also lost? The answer must be in the case of the Cactus Dahlia—and it holds good regarding many other flowers—the demands of the show bench. There seems to be a period in the life-history of every favourite flower when its virtues as a show flower are considered and developed almost to the exclusion of every other quality. A little reflection will convince everyone of the truth of this remark. At a big show where the Dahlia classes are strong, the stands of 24 single blooms of Cactus are marvellous examples of the cultivator's skill, and so are the stands of flowers in bunches, but the latter are all wired. A revulsion against wiring is entering strongly into the horticultural mind, and the day will come when even Cactus Dahlias set up at the National Dahlia Society

and the Royal Horticultural Society will be "passed" if wired. During the last few years more attention has been paid to this matter of improved habit.

The Royal Horticultural Society has carried out trials in its gardens at Wisley "to discover those varieties possessing the floriferous character and showy habit of holding their flowers well above the foliage, though not losing sight of form and quality in the flowers." These trials have been carried on for four years. In 1905 and 1906 the trials were judged by a sub-committee of the Floral Committee of the Royal Horticultural Society. In 1907 and 1908 the judging was done by a joint committee from the R.H.S. and the National Dahlia Society.

In 1905 the following varieties were highly commended for garden decoration:—Amos Perry, Arab, Aunt Chloe, D. A. Dunbar, Dainty, F. A. Wellesley, Floradora, J. H. Jackson, King of Siam, Mary Service, Mavis, Mrs. John Barker, Mrs. John Goddard, Mrs. J. S. Brunton, Mrs. McKergow, Orion, Peace, Reliable, Spotless Queen, Standard Bearer, Waterloo.

In 1906 the following were highly commended:—A. D. Stoop, Crepuscle, Mont Blanc, Pink Pearl, Prince of Yellows, Reggie, West Hall Scarlet.

In 1907 the following were highly commended:—Beacon, Eclair, Lustre, Meteor, Molly, Primrose.

In 1908 the following were highly commended:—Avoca, Brightness, Flash, Mary Carpenter, Miss Willmott, Stalwart.

The R.H.S. gardens at Wisley are of a very sandy nature, and for this reason Dahlia growing there has never been a conspicuous success.

By way of collecting the opinions of the growers as to the best varieties for garden decoration and cut flowers, I have been in communication with the undernamed, most of whom are growing several acres of Dahlias each season and whose opinions, therefore, are the very best obtainable. They are men who are living among Dahlias and constantly making observations and notes:—Messrs. Bakers, Wolverhampton; Mr. W. Baxter, Woking; Messrs. Burrell & Co., Cambridge; Messrs. H. Cannell & Sons, Swanley; Messrs. Carter Page & Co., London; Messrs. Cheal & Sons, Crawley; Messrs. Dobbie & Co., Rothesay; Messrs. Keynes, Williams & Co., Salisbury; Mr. S. Mortimer, Farnham; Mr. J. B. Riding, Chingford; Mr. Seale, Sevenoaks; Mr. H. Shoesmith, Woking; Messrs. Stredwick & Son, St. Leonards; Mr. Fred Treseder, Cardiff; Mr. J. Walker, Thame; Messrs. Ware, Ltd., Feltham; Mr. J. T. West, Brentwood.

In the lists of varieties kindly supplied to me by the foregoing growers, each of whom I asked to name what they considered the best 12 Cactus Dahlias for garden decoration and cutting, there were over 100 varieties given. In order to arrive at a consensus of opinion, I made an election with the following results:—

Order.	Notes.
1	7 Caradoc, yellow (Keynes).
2	7 Star, yellow and bronze (Stredwick).
3	6 Amos Perry, XXX, R.H.S., crimson (Hobbies).
4	6 Lustre, XXX, R.H.S., bright crimson (Burrell).
5	6 Primrose, XXX, R.H.S., light yellow (Stredwick).
6	6 C. E. Wilkins, salmon pink and yellow (Stredwick).
7	5 Mrs. McMillan, white and pink (Stredwick).
8	4 A. D. Stoop, XXX, R.H.S., crimson (Carpenter-Baxter).
9	4 H. Shoesmith, crimson-scarlet (Shoesmith).
10	4 Harold Peernan, yellow (Stredwick).
11	4 Rev. A. Bridge, rose pink on yellow (Stredwick).
12	4 Thomas Wilson, reddish-fawn (Keynes).
13	3 Alexander, maroon (Mortimer).
14	3 Australian, purple (Kerslake-Keynes).
15	3 Drea brought, crimson-maroon (Dobbie).
16	3 D. licatissima, pale pink (Keynes).

Order.	Notes.
17	8 Flame, orange-scarlet (Shoesmith).
18	3 Ibis, orange (Burrell).
19	3 Mauve Queen, clear mauve (Cheal).
20	3 Mrs. H. L. Brousson, pale salmon (Stredwick).
21	3 Mrs. G. Stevenson, yellow (West).
22	3 Thos. Parkin, terra-cotta (Stredwick).
23	3 Tressie, cardinal (West).
24	3 White Lady, white (Shoesmith).

These varieties having been tested in different parts of the country, one may feel safe in coming to the conclusion that they are likely to prove satisfactory in most localities. This year a number of new varieties are being put on the market having claims to be considered effective for garden and cutting purposes.

Messrs. Stredwick & Sons are offering a new pure white variety named "Snowdon," which has long, wiry stems, and also a yellow and rose variety named "Rev. J. W. Jamieson," with flowers also on perfectly rigid stems. Both varieties have received the National Dahlia Society's First-class Certificate, "Snowdon" also having been honoured by the R.H.S.

Messrs. Keynes, Williams & Co. have two new varieties this year possessing the desired qualities. They are "Miss Hessey," a fine pink, and "Success," beautiful clear yellow.

Messrs. Ware are offering "Vivid," a grand variety equally good for massing or planting out singly, with flowers of bright orange-scarlet.

Messrs. Dobbie & Co. claim for their new introduction, "Sentinel," that it has a dwarf, sturdy habit, throwing its rich, yellow flowers well above the foliage.

Mr. H. Shoesmith sends out "Ideal," bronzy-yellow with lighter centre, and "Splendour," rich crimson, claiming for both that they belong to the improved and desired type.

Mr. J. T. West's "Nellie Riding" is a bicolor, rich crimson with pure white tips. It certainly has a double qualification, having received both the National Dahlia Society's and Royal Horticultural Society's Certificates and having a good, garden habit.

Mr. W. Baxter is sending out "Brightness," a beautiful carmine-red with a bushy and free-flowering habit. This variety stands in the unique position of having received an award from the R.H.S. and N.D.S. at Wisley last year.

Messrs. Hobbies and Mr. S. Mortimer have for many years been persistently working towards the end I have in view in this article, and many of their varieties have received recognition at the hands of the R.H.S. "Amos Perry" (Hobbies) had the honour of receiving Mr. Alexander Dean's Silver Medal offered for the best garden Cactus Dahlia in commerce.

Mr. Mortimer began as far back as 1889 working for erect stems in his flowers, and the R.H.S. has recognised quite a number of his varieties, notably "Mrs. J. S. Brunton" and a fine new crimson variety of last year named "Stalwart."

Messrs. Burrell are offering no fewer than five new varieties for exhibition, all of which they claim to have a remarkably free and erect habit. The names are "Brigadier," bright crimson; "Echo," silvery-rose; "Mercia," amber-shaded salmon; "Monarch," bronzy-red, with yellow centre; and "Una," rose-pink. A garden Cactus variety emanates from the same firm, named "Magnet," salmon-buff.

A word as to cultivation. For the purposes in view plants should only be grown moderately strong to get the best results. Some varieties will want thinning, but this should be done in moderation. My ideal plant should require little or none of it. In the words of a well-known grower, "grow naturally and well and do not poison the plants by over-feeding with either manure or chemicals." *William Cuthbertson.*

FUCHSIA SPLENDENS AND THE ALLIED SPECIES.

THE Fuchsia cultivated in European gardens under the name of *F. splendens* was introduced by the Royal Horticultural Society, through their traveller Hartweg, in 1841. Whether it is the same as *F. splendens*, Zuccarini (*Flora*, 1832, vol. ii., Beiblatt, p. 102), incompletely described from

great elevations up to 10,000 feet, and is one of the most brilliantly coloured in a genus abounding in striking species. The broad, fleshy tube of the flower is of a deep, shining crimson, the erect calyx-lobes and somewhat shorter petals are green, and the shortly exerted stamens are yellow, offering a contrast brilliant rather than beautiful. Although introduced nearly 70 years ago it is seldom seen in cultiva-

of which there is a coloured figure in the *Botanical Magazine*, t. 4174. Coloured figures of the plant here represented in black and white are to be found in the *Botanical Magazine*, t. 4082, and the *Botanical Register*, 1842, t. 67, that in the *Botanical Magazine* being especially characteristic. The closely allied *F. cordifolia*, Bentham, was discovered and introduced by Hartweg in 1840, and there is a coloured figure

FIG. 147.—FUCHSIA SPLENDENS: FROM SPECIMENS IN THE ABBOTSBURY CASTLE GARDENS, DORSETSHIRE.

dried specimens, is uncertain. Indeed, I am of the opinion that *F. cordifolia*, Bentham (*Planta Hartwegiana*, p. 74), is Zuccarini's plant, the flowers of which are described as 2 inches long; but I have not the means at present of clearing up this doubtful point.

F. splendens, as generally understood and as here figured, is a native of Mexico, growing at

tion nowadays, but as exhibited by Mary Countess of Ilchester at a meeting of the Royal Horticultural Society it was a highly attractive object. There has since been received from the same source an even more floriferous specimen, one small branch bearing nearly 20 flowers.

It was exhibited under the name of *F. serratifolia*—a very different South American species,

of it in the *Botanical Register* for 1841, t. 70. It was collected in Guatemala at an altitude of 10,000 feet; it is less brilliantly coloured than the plant now figured. The tube of the flower also is longer and narrower and tapers to the base, and the petals are relatively broader.

A third species, *F. intermedia*, of this affinity, was described by the writer in 1880 (*Biologia*

Centrali-Americana, Botany, vol. i., p. 457), the name being given to express the fact of its being intermediate between *F. splendens* and *F. cordifolia*. This was founded on a specimen, collected by Hartweg in Mexico at an altitude of 10,000 feet, and referred by Bentham to *F. splendens*.

The fruit or seed-vessel of this group of the genus *Fuchsia* is remarkable, being cylindrical and from 1 to 2 inches long, and is, I believe, always green in colour when ripe. I have somewhere seen a record of its being eaten by the natives of Central America. Mr. Worthington Smith, who made the drawing, calls attention to a peculiarity in the shape of the pollen (which is usually trigonal in the *Onagraceæ*, but which in *F. splendens* is bipolar), as represented in the figure.

So far as I know, the early history of cultivated *Fuchsias* contains no record of *F. splendens* being employed in hybridisation. Focke, in his *Pflanzen Mischlinge*, 1887, does not mention it, nor the allied *F. cordifolia*; but I have been told that some interesting results have been obtained recently with these species.

A few years ago, however, Graf von. Sohns Laubach made some experiments in crossing these two species, as he suspected that *F. intermedia*, Hemsley, was a natural hybrid, and he gives the results in the *Botanische Zeitung*, 1907, p. 60. One cross of *F. splendens* (female) with *F. cordifolia* (male), from which seven plants were raised, yielded four near the female parent, two near the male, "and one was exactly the *F. intermedia*, Hemsley." He adds that there could be no mistake, as all possible precautions were taken in conducting the experiment. W. Botting Hemsley.

THE CARRIAGE OF FRUIT AND VEGETABLE PRODUCE BY RAILWAY.

REGULARLY every year, as the seasons come round, there arises in the mind of the market-gardener, the fruit-grower, and the dairy farmer the thought of high rates—rates, that is to say, for the carriage of their produce by railway. In years of plenty the thought becomes somewhat disheartening, because the producer—and especially the small man—foresees, from his experience in previous years, that his profits will be swallowed up by railway charges. A little study, however, will prove that this is a contingency which may, in a large measure, be avoided.

To put the matter briefly, it may be said that salvation lies in both intensive and extensive cultivation and co-operation. On the Continent, such co-operation is carried out to a very high degree. In France, for example, there are more than 600,000 producers banded together in some 2,500 agricultural associations for the collective sale of their products. In Germany there are more than 1,000 societies for the co-operative purchase of agricultural necessaries, and nearly as many for production and sale. Of Denmark's population of 3,000,000, quite 300,000 are members of co-operative societies. That is the policy which must be adopted by the agriculturists in this country. The benefits to be derived therefrom, merely so far as the bulking of produce for conveyance by rail is concerned, will be seen from what follows.

The following are the rates for Plums from the Vale of Evesham:—

Small lots.	10 cwt. lots.	1 ton lots.	2 ton lots.	3 ton lots.
per ton.	per ton.	per ton.	per ton.	per ton.
s. d.	s. d.	s. d.	s. d.	s. d.
28 0	23 9	22 1	20 10	19 7

But the small man finds, when he sends a consignment by rail, that he has to pay at a rate much higher than any of these. Here, for instance, are the railway company's charges for the conveyance of three small lots of Plums from Evesham to London:—

cwts.	qrs.	lbs.	s. d.
0	2	0	@ 23s. per ton = 1 3
1	0	0	@ " " = 1 11
1	2	0	@ " " = 2 8

It will be seen that, although the rate is quoted as 28s. per ton, the sender is actually charged at the rate of 50s. per ton for the first lot, 36s. 8d. per ton for the second, and 35s. per ton for the third lot. These charges are, of course, calculated in accordance with the "small scale"—which, by the way, far exceeds the ordinary scale, but which is perfectly legal, having been authorised by Part 6 of the Railway Rates and Charges Orders Confirmation Acts, 1891 and 1892—hence the apparent overcharge. But now let us see how easily the anomaly can be overcome.

Let us assume, for the purpose of illustration, that 10 Evesham fruit-growers, each having the small quantity of 1 cwt. of Plums to send to London, decide to give the co-operative principle a trial. They bulk their several lots, that is to say, lump them together, and forward them as one consignment, whereupon the railway company is bound to calculate the carriage in this way:—

cwt.	qrs.	lbs.	s. d.
10	0	0	@ 23s. 9d. per ton = 11 11

From this we see that the cost of conveyance of each lot is just under 1s. 2½d., as against 1s. 11d., if sent as a single parcel. Obviously, too, the more there are in the combine, the better it will be for each individual, because, as the weight increases, the rate decreases pro rata.

Take another example. The rates for Apples and Pears between Evesham and London are:—

Small lots.	10 cwt. lots.	1 ton lots.	2 ton lots.	3 ton lots.
per ton.	per ton.	per ton.	per ton.	per ton.
s. d.	s. d.	s. d.	s. d.	s. d.
23 2	17 6	16 8	15 10	15 5

And the cost of conveyance of a small consignment of Apples weighing, say, 2 cwts. (at the "small" scale), would be 2s. 9d.; but if 20 such lots were bulked and sent forward as one lot, the carriage would be charged at 15s. 10d. per ton, total 31s. 8d., or 9½d. per 2-cwt. lot. In other words, there would be a saving of 1s. 11½d. in the carriage on each consignment!

IN SALOP AND KENT.

The same method can be employed with equal effect in any district, and with every class of goods. There are two rates for the conveyance of vegetables from Newport (Salop) to London, namely, 26s. 11d. for 1-ton lots, and 33s. 8d. per ton for smaller quantities. A 2-cwt. consignment between these points would therefore cost 4s.; but 10 such lots lumped together could be sent for 26s. 11d., or, approximately, 2s. 8½d. apiece.

Between Rainham (Kent) and London, too, there are several rates, ranging from 7s. 1d. to 15s. 2d. per ton, and in their "Fruit and Vegetable Tariff" the South-Eastern and Chatham Railway Co. give notice to this effect:—

"When a sender forwards from the same station or siding to the same salesman and market in London, a consignment of fruit or vegetables, or a consignment consisting partly of fruit and partly of vegetables, and elects to lump and tender such consignment at one time, the rate or rates applicable to such consignment will be subject to a reduction of 10 per cent. when the aggregate weight exceeds 2 tons, and to 15 per cent. when the aggregate weight exceeds 4 tons.

"The same allowances will be made when a consignment of fruit or vegetables, or consisting partly of fruit and partly of vegetables, is the property of two or more senders, but in such cases, one of their number is, by arrangement amongst themselves, to be selected as the nominal sender. His name is to appear as such on the consignment note handed to the company, and he is to be authorised by his co-senders to receive, on their behalf, the allowances above referred to."

THE ONLY ALTERNATIVE.

There is no gainsaying the fact that the horticulturist of this country is severely handicapped by high railway rates; but from the foregoing it is perfectly obvious that he can, to say the least of it, considerably lessen his burden by taking an example from his Continental brother, and co-operating with his neighbour for the collective sale of his produce. A suggestion to this effect was thrown out by the Departmental Committee (on Railway Rates) of 1906, which reported that:

"The most effective way in which the home producers can claim and can obtain lower rates is to combine and co-operate with the object of sending their produce in larger quantities, and packed so as to give good loading in the trucks . . .

"The desirability of co-operation seems to be so generally recognised, that it is to be regretted that its adoption should make so little progress . . .

"The committee are of opinion that co-operation affords a practical method of enabling farmers to meet foreign competition and to put themselves in a position to obtain lower railway rates for the conveyance of agricultural produce. Co-operation has the advantage over other suggestions that have been made, of being a remedy which the railway companies have shown themselves ready to welcome and assist."

Seeing, therefore, that co-operation has been tried with beneficial results on the Continent, it but remains for the English horticulturists to embrace the principle and do exactly the same as the railway companies themselves are doing, namely, amalgamate for the good of each other, for, as has been shown, an enormous saving can be effected by this means in the matter of railway charges, often to the extent of 50 and 60 per cent. Geo. B. Lissenden.

HYBRID GERBERAS.

I HAVE been interested so long in Gerberas that I would like to make a few remarks supplementary to the notice of the article in the *Revue Horticole* by Mons. Ph. de Vilmorin, a digest of which has recently appeared in these pages. I received my first seeds of *G. Jamesonii* in January, 1888, and in 1891 a Certificate for an exhibit was awarded me by the Royal Horticultural Society. The flower-heads exhibited on that occasion were gathered from a plant growing at the foot of a south wall, a fine example, flowering for six months at a time, bearing 1½ heads at once (at its best period), and each 4½ inches in diameter. Our interest, however, lies for the present with the hybrids.

GERBERA VIRIDIFOLIA.—Seeds of this very important parent I received in 1894 from Mr. R. W. Adlam, and in the following year the name adopted was given me from the Kew Herbarium. Both parents are therefore as authentic as they can be, and it is possible even that the specimen of *G. viridifolia* I sent to Kew may have been preserved. Authentication now proves important, as the plant used in hybridising was lost, but here I desire to remark that its loss had nothing to do with difficulty of cultivation. The plant, in fact, was easy to grow, and, if *G. Jamesonii* is really difficult, *G. viridifolia* has given a perfect facility of culture to the hybrids. In Herbaria one name is not uncommonly used to cover several plants that are really seen to be different, and which on cultivation are proved to be quite distinct. It may be that this name is used for more than one plant, for, by the courtesy of the Kew authorities, I have another *G. viridifolia*, which is quite distinct, though, no doubt, in Herbaria it would be quite right to include both under the same species. There are numbers of plants which it is impossible to understand without growing them. This plant from Kew is now in flower, and besides having much rounder leaves than the original *viridifolia*, has shorter flower-stems and ray florets distinctly purple below. My *G. viridifolia*, so named for me at Kew, had rather erect foliage, which M. Adnet notes in the hybrids. It was quite a pale-flowered plant, and this may have been advantageous for purposes of hybridising, in making a strong break without interfering too much with other colours, except as a white. I am trying some crosses, however, with the Kew plant.

MENDELIAN RECORDS.—It is much to be regretted that I could not keep a full record of all the crosses I made, and so work with a scientific as well as an ornamental object in view. I went a long distance, however, in doing it, but it became impossible. It is a comfort, however, to know that a great authority does not think that Gerberas are important for Mendelian observations. There are two species, however, still available when wanted, and also some of my first crosses, which I still have. The leaves show *G. viridifolia* strongly, and the flowers are some shade of pink.

GERBERAS IN THE FUTURE.—It is impossible, I think, that there can be other than a great future

for hybrid Gerberas. In *G. Jamesonii* we have a plant that is far finer than the original *Chrysanthemum*, and the hybrids of *Gerbera* have already shown evidence of perhaps all the variations that are now found in the *Chrysanthemum*. In purity, brilliancy, and variety of colour they are already a good match for the *Chrysanthemum*. Moreover, the plants are quite easily grown. They can be had in flower from seed in from seven to nine months. As examples of what I have now in flower, I may mention a pure, clear yellow $3\frac{3}{4}$ inches in diameter, a deep ruby pink, a beautiful Peach colour with two flowers on same small plant, salmon, pink, rich red, orange, each $3\frac{1}{2}$ inches in diameter and all

pinks inclined to "double," and it is curious that doubling should appear in flowers of the same colour but not of quite the same parentage. It has been remarked that the flower-heads of these hybrids are larger than those of either parent. This is not a new thing to happen. I once crossed a *Fuchsia*, I believe, *corallina*, with one of the indoor varieties, and it was remarkably larger in all its parts than either of the parents. Its stalk and sepals were so long as to suggest a great hanging spider.

SELF STERILITY.—I have always held that *Gerberas* were self-sterile, and I still believe them to be so. For on this theory, for a number of years, I was able to supply as many *G. Jamesonii* as I

that *Gerbera Jamesonii* is self-sterile. Under the same conditions pollen from another plant produced seed.

CULTIVATION.—I begin to doubt whether *G. Jamesonii* was ever difficult to grow. Not knowing how to do a thing and the presence of a real difficulty are not quite the same thing. It seemed to be decidedly difficult to grow, but now one never has any trouble. The plant, as seems to be not infrequently the case, is perhaps becoming accustomed to cultivation. Or it may be that attempts were formerly made to grow it without sufficient moisture. Imperfect information of habitat—conditions of wild life being never possible of entire reproduction—has often

FIG. 148.—VIBURNUM CARLESII AS GROWING IN THE ROYAL GARDENS, KEW.

[Photograph by C. P. Raffill.]

(See p. 311.)

in 48 pots. When gardeners get the right idea of cultivation, as they very soon will, there is no doubt that the various selections of colours and forms attracting attention will be grown from seed to order just as are *Primulas*. It is a bold venture to refer to *Primulas* or to *Chrysanthemums*, but neither of them has so brilliant and continuous flowering a progenitor in composition as *Gerbera Jamesonii*. Some of the colours now come fairly true from seed, and there is no doubt that any forms may be fixed. I have one or two not indicated by M. Adnet. I have, for instance, yellow tipped with red, and a salmon with remarkably short ray florets. I have two

wanted for correspondents by pollinating for and saving my own seed. A paragraph in Mons. Ph. de Vilmorin's article may be understood better if I remark that first of all the flower-heads of *Gerbera* are exclusively female, then for a time, while the styles and stigmas are still in perfect condition, the pollen ripens and self-fertilisation of the head would be quite possible—but it does not happen. Later on, the head becomes exclusively male. On the point of fertility as hybrids, it may be remarked here that they are perfectly fertile. Since writing this paragraph, Miss Saunders has kindly informed me of her results, which show conclusively by actual experiment

done very much more harm than good in gardens. Gardening must always be an experimental art, and though information may be valuable, it is sometimes fatal to be influenced by travellers' notes, true though they may be—so far as they go. The cultivation of the hybrids is the same as for *G. Jamesonii*, except that they are easier to grow, and, I believe, likely to be less tender. Of several plants I tried in the open, with slight protection, last winter, two have survived. *G. Jamesonii* under the same conditions was killed. Mons. Adnet has also found that the hybrids are the hardier. While growing, *Gerberas* like a fair amount of atmospheric moisture, occasional use

of the syringe, and a moist surface to stand upon, and they do not like to be dry at the root. Moreover, pot Gerberas certainly like a little shade. It has often been said that Gerberas are liable to rot, but I think it may be that, after being starved for want of water, they are unable to bear contact with it when they do get it. While at rest, Gerberas may be kept on the dry side, but while growing they require moisture. The soil they like is good loam, some peat, and sand, the usual half-and-half mixture suiting them very well. Having command of good loam I have had fine flowers without manure of any kind, but I have no doubt that Gerberas may often benefit by it. They are very liable to the Begonia mite, and this immediately checks growth, but it can be cured by means of liquid XL-All, in which the foliage should be dipped. A check of any kind during growth is distinctly injurious. No one seeing my batch of plants, now in an intermediate house, could suppose that they are any more difficult to grow than weeds. When *G. Jamesonii* was valuable for exchange, it was my custom to raise young plants from seeds in the tropical pit in the early part of the year, and good plants were then ready for planting out in the beginning of June, but seeds of the hybrids have been sown when ripe. Plants now in strong flower for young plants were raised from seed sown last June and July.

GERBERA JAMESONII "CLIBRAN'S ORANGE."
—I may draw attention to this form, and so give it a name. I was going through Clibran's nursery two years ago, and found this fine variety, which differs from typical *Jamesonii* in colour and also somewhat in foliage. *R. Irwin Lynch, Cambridge Botanic Garden.*

P.S.—Since the above note was written I have obtained further evidence in regard to self-sterility. I have pollinated several of the hybrids with their own pollen, and find that good seeds have been formed, so that self-sterility cannot be universal. As this does not agree with the result of Miss Sanders' experiment, it is possible that the hybrids are not so self-sterile as *G. Jamesonii*. Protogyny (a term meaning that the stigmas are ripe before the anthers) in any case is always a pronounced feature in *Gerbera*, and no seeds can be expected without artificial pollination. *R. I. L.*

VEGETABLES.

SOME GOOD EARLY DWARF BEANS.

WHEN the soil is in a cold, wet condition, much can be done to procure an early crop of this vegetable by sowing the seeds under glass, otherwise the seeds germinate slowly, and the seedlings are often much crippled by the cold. For an early supply there is no better plan than to make a sowing in 3-inch pots, raise the seedlings in frames, and, when large enough, to plant them in deep drills. If the soil is heavy in texture, it can be made suitable by adding lighter materials, such as manure from an old hot-bed, or charred refuse. The dwarf Bean is valuable because it can be obtained early in the season, when the supply of vegetables is limited. The plant does not thrive in a cold, heavy, wet soil, therefore the ground should be selected with care, and be prepared in advance. Though I advise a change of site for vegetables as far as is practicable, a change of quarters cannot always be given in the case of early crops of vegetables, because they require a warm, dry border and prepared soil. In the case of dwarf Beans, a change of soil is the less important, as the plant is not a gross grower, does not remain in the soil a long time, and can readily be fed with fertilisers. Even with the earliest varieties, it is not well to crowd the plants.

Of late years there have been some excellent varieties introduced to commerce. The pods of these early kinds are of a medium size, and are freely produced. One of the best in this respect is *Early Favourite*, an early

variety, having long pods of superior quality. It is a cross between the older Mohawk and the small, but early, *No Plus Ultra* varieties. Another even earlier variety, but with pods a little smaller, is *Early Gem*, the result of crossing *Sion House* with *Progress*. This is the earliest Bean I have cultivated, and I have grown all the early kinds. *Progress*, having well-shaped pods of superior quality, is a splendid early Bean, and a variety with robust growth. It is especially valuable in a cold soil, and is not readily affected by drought. One of the dwarfest Beans grown, and, for its size, wonderfully productive, is *Sutton's Forcing*. It is valuable for frame or pot culture. Sown on a warm border, it requires little space. The well-known *Plentiful* is a very fine, early Bean, stringless, and a great cropper. The stringless Beans are much less cultivated in this country than on the Continent, and this is easily accounted for because we do not cook Beans in the same manner as is practised there. Abroad, Beans are cooked when quite young and whole. This system is better than slicing them, for flavour, colour and general appearance are all

VIBURNUM CARLESII.

THIS distinct and handsome species was well shown at the meeting of the R.H.S. on May 4 by Sir Trevor Lawrence, Bart., when it received a First-class Certificate. It flowers at the end of April and early part of May in the open air, and is one of the most beautiful shrubs which bloom at that time. It is a native of Corea, and was raised from seed received from that country by the well-known nurseryman, L. Boehmer, of Yokohama, Japan, by whom it was first introduced to the Royal Gardens, Kew, in 1902, where it flowered for the first time in Europe in May, 1906 (see illustration of flowering spray in *Gardeners' Chronicle*, May 30, 1908, fig. 155). The plant has grown freely, and has proved to be quite hardy, having passed through the severe weather experienced during the early part of this year without any protection, although growing in an exposed position. Writing in the *Gardeners' Chronicle* of October 11, 1902, in regard to this plant, A. Anger stated that it was his belief that it

FIG. 149.—VIEW OF A JAPANESE GARDEN EXHIBITED BY MESSRS. JAS. CARTER AND CO. AT THE TEMPLE SHOW ON TUESDAY LAST.

preserved, and there is less waste of the plant's energies when the pods are gathered young.

A new Bean of excellent merit is *Superlative*. I have not forced it, but for the open ground it is splendid, being a robust grower and a variety that will thrive with less shelter than others, owing to its free growth. As a summer dwarf Bean, it is a splendid introduction, being a very heavy cropper, and bearing long, handsome pods in profusion. I have alluded to the stringless type; another excellent variety is *Stringless Holborn Wonder*, a remarkably prolific variety, excellent for cooking whole, and of very delicate flavour. It is suitable either for forcing or for cropping in the open. Another very distinct type of dwarf French Bean is *Perpetual*. The plant yields pods over a long period, hence its name. In addition to being a remarkable cropper, it bears very early. It requires plenty of room, food and moisture. The haulm is very robust; the pods are long, thin, quite straight, and delicious if cooked whole. *G. W.*

"would be quite as hardy as *Magnolias*, *Pyrus*, *Cydonia*, &c., and that it would form a valuable addition to European gardens." His opinion has been amply verified by the behaviour of the plant at Kew during the last seven years. The flowers are disposed in clusters nearly 4 inches in diameter. They are borne at the ends of the branches, are pink in colour, fading to white, and are half-an-inch in diameter, with a tube half-an-inch long. They emit a delicious odour such as is possessed by few plants, and which alone renders the plant well worthy of cultivation. The habit is that of a rather loose-spreading shrub, with dark green, ovate or orbicular leaves from 1 to 3 inches long, with serrate margins, and densely clothed with stellate hairs. Its early-flowering habit and fragrant flowers should render this plant of considerable service as an early-forcing shrub. It is certainly one of the most promising shrubs of recent introduction, and likely to become a general favourite in the near future. *C. P. R.*

PLANT NOTES.

AN ELEGANT CALCEOLARIA.

In the conservatory attached to Sir William Farrar's residence, Sandhurst Lodge, I saw recently a fine *Calceolaria* some 3 feet in height and having a head of bloom nearly as broad. This is a new or rare *Calceolaria* of which Mr. Townsend, the gardener, did not give me the name, as he said that even the Kew authorities had been unable to identify it. The clusters of bloom are borne on long, slender stems; the flowers are rather long and narrow and of a pleasing straw-yellow colour. The plant has long, lanceolate or pointed leaves, somewhat Sage-like, and the plant is distinct from both the well-known *C. amplicaulis* and *C. Burbidgei*. It has been grown for several years at Sandhurst Lodge. That it is a distinct species seems probable. Can it be identical with the variety now being offered by a Cheshire firm, the description of which seems to fit the Sandhurst Lodge *Calceolaria*? A. D.

SCOTLAND.

A MANSE GARDEN IN MAY.

To the ardent horticulturist and lover of Nature, this is the most interesting and picturesque season of the year. Its greatest glories are, unquestionably, the flowering trees. Seldom have I seen these more luxuriant in their beauty, notwithstanding the cold weather, which has been somewhat modified by bright sunlight. Fortunately, my own garden is protected by Sycamore trees and high Hawthorn hedges from the east and north winds. *Prunus Pissardi*, the Persian Plum, has been especially fine; during the last fortnight its blossoms have been so exceptionally abundant that I am hoping it may, with more favourable atmospheric conditions, be successful for the first time in forming and developing its fruit. This is one of the loveliest of all flowering trees, and would be of the highest value for garden decoration if only in virtue of its exquisite, chocolate-coloured leaves, which are especially conspicuous among those of its fairest contemporaries during the summer months. Two years ago, by way of experiment, I grew *Tropæolum canariense* among its dark branches, with very memorable effect. Another highly ornamental tree, which is extremely profuse with its delicate blossoms at present is *Pyrus Malus florihunda*, a native of Japan. Its flowers resemble somewhat those of the Apple, but they are of a deeper shade of pink, and extremely small. The Almond (*Amygdalus communis*) has flowered in my garden this season for the first time for several years. This may be partly attributable to an application of lime given to all my "stone fruits" during last October, and partly also to the ripening influence of the sunlight of last summer upon the flowering shoots. Both influences are required by Oriental trees in our somewhat too cold and variable climate.

My Plums, Cherries and Damsons are at present exhibiting a gratifying quantity of bloom, especially such familiar varieties as the Early Rivers, Black Eagle, May Duke and Morello Cherries, the Prolific, Czar and Victoria Plums, and the American Superb Greengage. My first flowering Apple, the Irish Peach, showed its bright colour in the blossom on May 1. This variety is usually followed in my garden by Beauty of Waltham and Duchess of Oldenburg, the flowers of the latter, greatly admired by pomologists, being almost pure white. Under such promising floral conditions, it will be nothing short of a calamity if the frost which, for some time past, has prevailed in the early mornings, sometimes to the extent of 10° or 12°, does not soon disappear, and more favourable atmospheric conditions supervene. Otherwise, even our finest Rose trees, on which we rely so

greatly for artistic effects and combinations in the garden, will assuredly suffer. In April of last year we had during one evening 21° of unexpected frost, and the consequence was that all of my Austrian and Penzance Briar Roses lost their entire first flowering shoots, while some of my strongest Hybrid Teas were so seriously affected that, for a very long period, they refused to grow. *Magnolia Watsonii*, which did not flower last season, promises well for this year. David R. Williamson.

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Late Strawberries in pots.—Endeavour to prevent any break occurring between the indoor and the outdoor crops. At this time of the year forced Strawberries need a house devoted entirely to their culture, and, if the roof is fitted with canvas blinds, which can be lowered during the hottest part of the day, it will be beneficial, but, should blinds not be available, syringe a little limewash over the glass. Late batches of Strawberries do very well in cold frames; if the pots are partially plunged in a bed of leaves the plants will not require nearly so much attention in regard to watering as those grown on shelves. If space in the pots permits, a top-dressing of loam mixed with a little appropriate fertiliser should be given the plants, as the roots will have absorbed most of the nourishment from the soil, and Strawberry plants need very liberal feeding to mature a good crop of berries. About 8 or 10 fruits on each plant will be sufficient. The flower trusses should be securely staked to prevent the stems becoming broken. Except when the plants are in flower, the foliage should be thoroughly syringed two or three times a day. The atmosphere of the house must also be kept moist by damping at frequent intervals all bare spaces about the plants, as moisture is necessary to prevent red spider, whilst a humid atmosphere assists the fruits to swell freely. The special plants in the open from which it is intended to secure the runners for next year should have all their inflorescences removed in order that all the nourishment may be devoted to the plantlets. Hoe the soil between the rows and see that all weeds are destroyed. Then apply a mulching of short litter and, if necessary, afford the plants a copious watering.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Calogyne cristata.—This plant, and the varieties *lemoniana* and *hololeuca*, hold a prominent place in Orchid collections, and even in gardens where Orchids are not largely grown *C. cristata* is valued for supplying flowers during the winter. By cultivating a considerable number of plants, a succession of bloom can be maintained if some are placed in various degrees of warmth just at the time when their flower-spikes begin to push from the base of the newly-made pseudo-bulbs. *C. cristata* is too well known to need description. Its variety *lemoniana* is distinguished by its flowers having a lemon-coloured centre, and it blooms several weeks later than *C. cristata*. The pure white variety *C. c. hololeuca* is also later in flowering, and this variety, being a scandent grower, the leading bulbs quickly get beyond the limits of the receptacle. However, these can be easily turned in, and, if pegged down firmly on to the compost, will soon become well-rooted, and make strong-flowering bulbs. *Calogynes* are now beginning to grow; established specimens in good condition not requiring room for further development, should be elevated well up to the roof glass in a cool part of the intermediate house. The span-roofed *Odontoglossum* house will not be found too cool for them during the summer months, provided that they are exposed to sufficient light. If grown in too shady a position, the plants seldom produce their full complement of flowers. When watering, carefully examine each plant, and, if the soil is dry, give it a thorough soaking. Unless the plants are in a

very exposed position, they may not require watering again for another fortnight. Keep the surroundings well moistened by damping between the pots several times every day, and spraying them overhead occasionally with tepid rain-water on warm, sunny days. All the plants should be thoroughly cleaned, and any specimens which have reached an inconvenient size may be divided and repotted. Plants which are to be grown into large specimens should be repotted. It matters little whether they are grown in pots, shallow pans, or baskets, but, whatever the receptacle, it should be filled two-thirds its depth with material for drainage. Over the crocks place a thin layer of rough Sphagnum-moss, and for a compost use good, turfy loam, peat, and *Osmunda* fibre in equal parts. Cut the fibre up moderately small before mixing it with the other materials. A little Sphagnum-moss and plenty of small crocks may also be added. Last year, as an experiment, I potted some pseudo-bulbs of *C. c. hololeuca* in the *Osmunda* and *Polypodium* mixture, with a liberal addition of small crocks intermixed, but no Sphagnum-moss or peat, and at the present time the little specimen is doing well. It will generally be observed after repotting the divided plants that the pseudo-bulbs shrivel slightly. The plants should not be watered heavily with the idea of inducing plumpness, for if kept in a saturated condition the old roots will decay, and the pseudo-bulbs continue to shrivel. A better practice is to afford them occasionally a gentle dewing overhead with the fine sprayer, keeping the atmosphere around them moist, and at the same time carefully shading the plants from all sunshine. Towards the end of the growing season expose the plants to more light and air.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Gooseberries.—We have a splendid crop of this fruit, and the berries are swelling rapidly. Where they have set very thickly a portion of them should be gathered for present use, whilst some may be used for preserves. Gooseberries that are grown especially for dessert purposes should be very freely thinned, and if the work has not already been done a mulching of manure should be applied. To secure extra fine Gooseberries, copious waterings must be given, also manure water and artificial stimulants, the latter in small quantities at intervals of a few days while the fruits are swelling; directly the berries show signs of ripening all feeding should be withheld. The nets must be got in readiness to protect the berries from birds. Guard against caterpillars and other insect pests; up to the present our bushes are very free from these insects. Cordon-trained Gooseberries are suitable for planting by the side of paths, especially when the owner prefers to gather the fruits for consumption on the spot. In planting in this manner and for this purpose be careful to provide for a succession of fruits by having both early and late varieties. Cordon-trained Gooseberries require considerable attention to keep the shoots within proper limits to allow the sunlight and air to reach the fruits. This pruning is best done by pinching when the growths are quite young. Pinch the side-shoots to five leaves, and, if the buds on these growths start, the secondary shoots may be taken off entirely. The leading shoots may be allowed to remain intact, unless the plants have already filled their allotted spaces.

Cherries.—The trees have, in most cases, set their fruits well, although doubtless a considerable quantity will drop during the stoning period. Any shoots not required for extension should be pinched back to four or five leaves.

Raspberries.—The frost in many parts very severely damaged the canes, and, where only a limited number is cultivated, and especially when Raspberries are valued highly, every effort must be made to assist the crop. Allow as much light as possible to reach the fruiting canes and afford a thick mulching of manure about the roots. If, when the fruits are set, the weather is dry, root waterings must be afforded, particularly on light, porous soils.

Loganberries.—The cold of last winter has killed our plants half-way to the ground level. This emphasises the need of having the young shoots thoroughly ripened before winter arrives. Therefore thin the canes early in the season, retaining only those that are absolutely necessary.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Summer bedding.—This work may now be commenced. But the more tender plants, such as Iresine, Alternanthera, and Mesembryanthemum, should be planted after the hardier subjects, such as Pelargoniums, have been put out. The season for summer bedding being very short, the plants should be placed rather thickly together that they may soon produce a good effect. When the planting is complete, sprinkle the plants overhead occasionally with clear water. Before any planting is done, the colour effect and the general design should have been well thought out, in order that the most may be made of the subjects available.

Violas are exceptionally good plants for carpeting the ground beneath tall-growing species such as Palm, Phoridium tenax and tall Fuchsias. If the plants are kept well watered and the old flowers are removed before setting seeds, Violas will flower all through the season. A bed of Marguerites, with a groundwork of blue Violas and dot plants of Lobelia Queen Victoria is a pleasing combination. Salvias, especially the

water or guano dissolved in water are beneficial. Remove all the haws as soon as the petals have fallen.

Half-hardy annuals.—Those that were sown in the open ground should be thinned well apart, and both they and also transplanted plants should be sprayed with clear water late in the day.

Dahlias.—Plant Dahlias 3 feet apart. Before planting ascertain that the soil is moist, and when the operation is finished place a mulching of horse-droppings or cow manure over the soil to keep the roots moist.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Chrysanthemums.—These plants will require very careful attention during the next five or six months, especially in the matter of watering at the present time when the roots are penetrating into the new soil. As growth proceeds, the shoots need to be tied securely to the stakes and unnecessary side growths must be removed. The growing points should be dusted frequently with

Coleus thyrsoides and *Moschosma riparium* are two valuable plants for decoration in late autumn and winter. Cuttings of both these plants make roots and grow very quickly. After they have been potted singly into small pots, the leading shoots should be pinched two or three times. In the case of the Coleus, if plants are required for flowering in small pots, a batch may be grown specially for this purpose, leaving the shoots unstopped.

Cyclamens.—These should now be moved to an unheated frame. Although sunlight is necessary for their well-being, the foliage should not be unduly exposed to bright sunshine. Keep the surroundings moist or thrip will soon infest the leaves.

General work.—The plants in the various houses should be rearranged at intervals of a few weeks. Advantage should be taken when rearranging the plants to cleanse at least the lower portion of the structures such as the stage or shelves and to tidy up the plants themselves. At the same time lightly prick up the surface soil in the pots, and, notwithstanding that they may appear to be clean, scrub the outsides of the flower-pots.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Runner Beans.—Plants which have been raised under glass, if properly hardened, may now safely be planted in trenches out-of-doors. A space of at least 12 inches should be allowed between the plants, and it is best to place two rows in each trench. Insert each plant well up to the seed leaf, and make the soil very firm about the root. When all is finished, apply a thorough watering, and place a little finely-sifted cinder ashes around the collar of each plant. Staking must be done immediately after planting. Insert them firmly into the ground, and apply longer and stouter stakes at intervals to give greater support to the others. On these longer and stouter stakes cords should be stretched. Make a final sowing of seeds out-of-doors some time in June.

Dwarf or French Beans.—Like Runner Beans, these also may be planted out-of-doors. Plants growing in frames should be liberally mulched with half-rotten manure. During dry weather water them liberally at the roots and drench the foliage twice each day with water applied by a syringe.

Maize or Indian Corn.—During a favourable season satisfactory returns may be expected from this crop in this country. It is necessary, however, to raise the plants in heat, grow them on in pots and plant them out into fairly good ground in the most sheltered and sunny part of the garden. For an earlier supply, a few plants might be put out in a hot-bed and covered with frames, but they must not be forced severely.

Asparagus.—Although very late this season, Asparagus is now yielding a good supply. Give the beds a good soaking with farmyard manure water and keep them free from weeds by hand-pulling. The strongest Asparagus growths should be cut every day, severing them with an Asparagus knife. Seedling beds should be thinned until the plants are 6 inches apart. If from any reason the seed has failed to come through the soil, it will be well to sow fresh seeds in 3-inch pots, placing two or three in each, afterwards thinning the plants out to one in each pot. Later the pots should be plunged in ashes, and in autumn they should be covered entirely to a depth of about 4 inches with very fine ashes. Such plants will be in a fit condition for planting into permanent beds early next April. Take care to select only the best varieties.

Lettuce.—Sow seeds of both Cos and Cabbage varieties once each fortnight. Thin out previous sowings whilst the plants are still quite small. Plant a few Lettuces in various parts of the garden, as by this means a supply can be obtained at all times. Lettuces require abundant supplies of water, both at the roots and overhead.

Endive.—Sow seeds of the Batavian and curled-leaved varieties at intervals, but only sufficient for immediate use, as Endive in summer-time quickly runs to seed.

Radishes.—Sow seeds once a fortnight in the shadiest part of the garden, affording protection against birds.

FIG. 150—*SANIFRAGA DECIPIENS* "MISS WILLMOTT": FLOWERS WHITE WITH REDDISH-BROWN COLOURED CENTRE, EXHIBITED BY MESSRS. BAKER'S AT THE TEMPLE SHOW.

(See ante p. 332.)

scarlet kinds, form exceedingly showy beds. *Cosmea bipinnata* and the pink-coloured form, if planted in moderately-rich soil, will make tall and effective plants in the flower-beds.

Vases and boxes.—The colours of the plants should be so blended that they will not clash with plants in the adjacent beds. For climbing and trailing plants Ivy-leaved Pelargoniums and *Tropæolums* are especially suitable. Taller plants for the centre include *Grevillea*, *Fuchsia*, *Abutilon*, and *Canna*. On terraces, where there is a lot of stone work, scarlet flowers are very effective; in fact, flowers of this colour are suitable for almost any vase work. Very tall or tender plants should not be employed in situations exposed to winds.

Roses.—Various insect pests will cause much mischief among these plants unless means are taken to destroy them. The foliage should be syringed with quassia extract at rather greater strength than is recommended by the makers. Roses in flower on walls and other warm situations need to be syringed occasionally with cold water, and if the soil is dry, water should be supplied to the roots. Applications of manure

tobacco powder, applying it in the evening and washing it off again with clear water on the following morning. The tobacco powder will destroy aphids, but the leaf-miner is not very easily combated. If the fly which deposits the eggs of the leaf-miner is seen upon the plants, dust the foliage with fresh soot, and at once pick out with a pointed stick any maggots that are detected in the tissues of the leaves. On dry days sprinkle frequently the outsides of the pots and their surroundings with water.

Reinwardtia tetragyna and *R. trigyna.*—Cuttings of these winter flowering plants should now be inserted in sandy soil, placing the pot in a brisk bottom heat. After the cuttings have rooted, pot them singly into small pots, keeping them in a close and warm atmosphere for a few days, subsequently removing them to an intermediate temperature. The plants should be potted finally into 5 or 6-inch pots filled with fairly light soil, that must be pressed firmly. The foliage should be syringed freely. Pinch out the ends of the growing shoots occasionally. Towards the end of June the plants may be placed in an unheated frame until the autumn.

APPOINTMENTS FOR JUNE.

THURSDAY, JUNE 3—Linnean Soc. meet.
 SATURDAY, JUNE 5—
 Soc. Franç d'Hort. de Londres meet.
 TUESDAY, JUNE 8—
 Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by the
 Rev. Prof. G. Henslow, on "Old Superstitions about
 Plants"). British Gard. Assoc. Ex. Council meet.
 WEDNESDAY, JUNE 9—
 Roy. Cornwall Sh. at St. Columb (2 days).
 MONDAY, JUNE 14—
 United Hort. Ben. and Prov. Soc. Com. meet.
 WEDNESDAY, JUNE 16—York Gala (3 days).
 THURSDAY, JUNE 17—Linnean Soc. meet.
 TUESDAY, JUNE 22—
 Roy. Hort. Soc. Coms. meet. (Masters' Memorial
 Lecture, on "Masters' Vegetable Teratology," by
 Prof. Hugo de Vries at 3 p.m.).
 WEDNESDAY, JUNE 23—
 Gard. Roy. Ben. Inst. Ann. Festival Dinner at Hotel
 Métropole, London.
 THURSDAY, JUNE 24—Midsummer Quarter Day.
 SATURDAY, JUNE 26—Windsor and Eton Rose Sh.
 MONDAY, JUNE 28—Isle of Wight Rose Sh. (provisional).
 TUESDAY, JUNE 29—
 Southampton Roy. Hort. Soc. Summer Sh. (2 days).
 Brighton Fl. Sh. (2 days). Canterbury and Kent Rose
 Show at Canterbury.
 WEDNESDAY, JUNE 30—
 Richmond (Surrey) Fl. Sh. Ipswich Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week,
 deduced from observations during the last Fifty Years
 at Greenwich—57.8°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, May 26 (6 P.M.): Max. 62°;
 Min. 49°.

Gardeners' Chronicle Office, 41, Wellington Street,

SALES FOR THE ENSUING WEEK:

WEDNESDAY—

Gladiolus, Begonias, Lilioms, Carnations and numerous
 other plants and bulbs, at 12; Palms, Bay, Ferns, &c.,
 at 1.30; by Protheroe & Morris, at 67 & 68, Cheapside,
 E.C.

THURSDAY—

Clearance Sale of Greenhouse and Bedding Plants, at
 the Gardens, Effingham Hill, near Dorking, by order of
 the Executors of Czarnikow, Esq.; by Protheroe &
 Morris, at 12.

The
Temple
Show.

As these pages go to press, the twenty-second annual exhibition of the Royal Horticultural Society in the Inner Temple Gardens is drawing to a close. It was opened on Tuesday last amidst a downpour of rain, which gradually decreased until the afternoon, when the weather became fair but dull. On Wednesday the weather was even worse. The month of May, however, has been so uniformly dry, and rain was so badly needed in every part of these islands, that there was some compensation for the inconvenience suffered in consequence of its fall.

The Temple Shows have been so well managed that they have never failed to represent the very best products of British horticulture. On these occasions there are always new hybrid Orchids, new varieties in florists' flowers and other plants. Less often the public is startled by the appearance of some extraordinary novelty, such, for instance, as the first *Odontioda*, which was shown three years ago. There was no such outstanding novelty on the present occasion. The Orchids, whilst filling a space equal to that of former years, appeared even more showy and brilliant than ever; but there were no bi-generic hybrids which we have not previously seen. Perhaps one of the most striking Orchids exhibited was the variety of *Odontoglossum crispum* known as *Solum* in Messrs. Sander's group. This had a magni-

ficient spike of its unique flowers, with pure white segments and claret-red labellum. But it is two years since we first saw flowers of this variety, though never such fine ones as on this occasion. It becomes increasingly difficult to obtain Orchid novelties of superior merit to those already in cultivation, but the magnificent groups contributed by such skilful and enthusiastic amateurs as Sir Jeremiah Colman, Bart., the Duke of Marlborough, and Mr. F. Menteith Ogilvie and such nurserymen as Messrs. Sander & Sons, J. Charlesworth & Co., and G. F. Moore, Ltd., collectively represent most of the choicest varieties in existence. It may be stated here that this year there was no exhibit from Sir Trevor Lawrence or Colonel Holford. The group of *Vanda teres* from the collection of Mr. Leopold de Rothschild, at Gunnersbury Park, was the finest exhibit of this somewhat difficult species that Mr. Rothschild or any other cultivator has ever exhibited. Messrs. Sander & Sons exhibited excellent specimens of most of the new plants which they contributed to the Ghent International Exhibition of last year, but owing to the fact that they have been longer in cultivation, several of these plants were shown in better condition than we have previously seen them. Most of them have been already illustrated in these pages. We now figure *Sansevieria Laurentii*, an interesting and ornamental plant introduced from the Congo by the late M. Laurent.

Messrs. Cannell & Sons showed a new pillar Rose from America in a most enchanting manner in the large group mainly composed of this variety, and staged in the large marquee containing the Orchids. The variety is known as "American Pillar." It is a profuse bloomer, and the flowers, as large again as those of *Hiawatha*, are pink with a white centre. The charm of the flower consists more in the peculiar richness of the shade of pink than in its large size and excellent form.

M. Adnet, from Cap d'Antibes, contributed an exhibit of cut flowers of his extraordinary hybrids of *Gerbera*, which were beautiful and elegant, notwithstanding the fact that they had travelled a distance of 1,000 miles since being cut from the plants. M. Adnet found it impossible to exhibit the flowers in so natural a manner as they were seen at Berlin, or in such great variety, but such as were sent excited great admiration, and there can be little doubt but that *Gerberas* will be largely cultivated in this country. In Sir Trevor Lawrence's garden at Burford, some plants have proved sufficiently hardy to remain in an open position out-of-doors all the winter, although they received but slight protection. At Kew they survive out-of-doors at a distance of about 2 feet from the wall of a heated house. It seems pretty certain that beds or borders might very well be planted with *Gerberas* in most localities, if the plants were covered with temporary frames during winter. Mr. Lynch's article on these plants, printed on another page, deserves to be widely read.

Tuberous Begonias from Messrs. Blackmore & Langdon, Ware, Ltd., and others were as brilliant and as large as ever, and, notwithstanding the great variety now existing in these flowers, we noticed several novelties.

Roses, always one of the prominent features of a Temple Show, were even more

gorgeous and plentiful than usual. Probably many would be inclined to the opinion that the group exhibited by Messrs. William Paul & Son, was one of the finest ever seen, whilst the groups from Messrs. Paul & Son, Chesnut, and others were all remarkable for excellent quality.

Carnations were shown well, and the rich colouring in the corner group of Messrs. W. Cutbush & Son was worthy of special remark. Messrs. Sutton's *Cinerarias*, *Gloxinias* and other florists' flowers showed the highest possible development in cultivation, the *Clarkias* being interesting as showing what excellent specimen plants in pots may be obtained even from this hardy annual under suitable treatment. As for *Rhododendrons*, Messrs. Waterer, Cutbert, and others have added to their tints so much in recent years that, arranged as they usually are on the side of the tent facing the Orchids, they are now not a whit less brilliant than their more aristocratic associates.

Hardy flowering plants appear to receive an increased amount of attention each year, and at no exhibition in this country may they be seen in better condition or in larger numbers than at the Temple Shows. It was unfortunate that during the first day of the exhibition, most of these flowers being staged in the narrow tent, their colours could scarcely be seen, owing to the saturated canvas obstructing the light.

Fruit and vegetables were not more numerous than on previous occasions. Nevertheless, Messrs. Bunyard's Apples were as well preserved as usual, notwithstanding the advanced season. Messrs. Laxton's Strawberries, Messrs. Rivers' magnificently-cropped fruit trees in pots, and Messrs. Sutton & Son's choice vegetables were alike of excellent quality.

A number of visitors present from the Continent declared that the Show contained more variety, more brilliantly-coloured flowers, and represented even better culture than any of its predecessors.

ORCHID SALE.—The sales of Orchids held annually by Messrs. PROTHEROE & MORRIS during the Temple Show week, prove that high prices can still be obtained for exceptionally fine Orchids. In the sale held on Wednesday last, six rare *Cypripediums* from the collection of Colonel G. L. HOLFORD, C.I.E., C.V.O., Westonbirt, caused very spirited bidding, the beauty of the plants being well known and the quality of the specimens sent up by Mr. H. G. ALEXANDER, the Orchid grower at Westonbirt, superb. Lot 201, *Cypripedium nitens* *Leeanum* var. *Hannibal* was purchased by Mr. E. ROBERTS, of Eltham, for 100 guineas; Lot 202, *Cypripedium Moonbeam* (*Thompsonii* × *Sallieri Hyeatum*) fell to Mr. CYPHER's bid of 210 guineas. The next lot, *Cypripedium Sultan* (*Mons. de Curte* × *Milo Westonbirt* variety) was purchased by Mr. WILLIAM BOLTON, of Warrington, for 130 guineas; the same buyer secured Lot 206, *Cypripedium Beryl* (*Mrs. Wm. Mostyn* × *Beekmannii*) for 55 guineas. The other two lots, viz., *Cypripedium Actæus Bianca* (*Leeanum Prospero* × *insigne Sanderæ*) and *Cypripedium Helen II. Westonbirt* variety, were purchased by Messrs. CHARLESWORTH & Co., Haywards Heath, for 110 guineas each. The plants were all duplicates of the original certificated specimens, and were offered without a reserve price.

FUCHSIA SPLENDENS (see p. 333).—Since our front pages were stereotyped we have received the following additional information from Mr. W. BOTTING HEMSLEY:—"I have just had an opportunity of seeing the type of *F. splendens*, Zuccarini at Kew, whither it was sent on loan by Dr. RADLKOFER, the Director of the Munich Botanic Garden. I am now able to say that the plant figured on p. 333 is correctly named. Our

staff took place at the Holborn Restaurant on May 25, the opening day of the Temple Flower Show, Dr. L. C. BURRELL, M.A., presided. Previous to the dinner the annual meeting was held in the same building, there being about 30 members present, a fewer number than usual. This was accounted for by there being only six of the young gardeners present. Mr. WATSON presided. The annual Report

lowing members of the committee have decided to resign: Messrs. W. DALLIMORE, H. SPOONER, W. HALES, W. N. WINN (secretary), and H. H. THOMAS (treasurer)." This part of the Report formed the principal subject of discussion, and it was eventually decided to ask those members of the committee who desired to resign to reconsider their decision, but in the event of any or all declining, Messrs. RAFFILL, HUTCHINSON, MAYHEW, and COLE were nominated to fill the vacancies.

THE TEMPLE SHOW.

FIG. 151.—VIBURNUM UTILE EXHIBITED BY MESSRS. JAS. VEITCH AND SONS: FLOWERS WHITE.

best thanks are due to Dr. RADLKOFER for an opportunity of deciding the point. In his measurements of the flower ZUCCARINI appears to have included the ovary."

KEW GUILD DINNER.—The annual gathering of past and present members of the Kew Garden

staff stated that: "The resolution adopted at the last annual meeting with regard to the *Journal*, &c., was submitted to the whole of the members and the result is recorded in the *Journal* for 1908, p. 410, 'The Forward Movement.' It will be seen that a large majority voted for the resolution. In consequence of this decision, the fol-

A NATIONAL VEGETABLE SOCIETY.—A meeting was held at Essex Hall, London, on Tuesday last to consider the formation of a National Vegetable Society. Mr. A. Dean, V.M.H., presided, and amongst others present were Messrs. Owen Thomas, G. Wythes, J. Harrison, J. Lyne, S. Mortimer, E. Hobday, E. Massey, C. Foster, S. Cole, W. F. Giles (Sutton & Sons), W. Poupert, R. J. Steel, J. Cheal, J. Gibson, D. B. Crane, E. Beckett, V.M.H., E. Molyneux, W. A. Cook, W. H. Young, E. T. Cook, J. C. Newsham, and Walter P. Wright. Letters approving the scheme were read from Messrs. P. C. M. Veitch, J. Bowerman, T. Coomber, R. Sydenham, W. G. Lobjoit, W. P. Wood, W. Barnes, Sutton & Sons, J. Veitch & Sons and J. Basham. After a considerable amount of discussion Mr. E. Beckett proposed that a society be formed. Mr. C. Foster seconded, and the motion was carried. A committee consisting of Messrs. E. Beckett, A. Dean, C. Foster, E. Hobday, O. Thomas, S. Mortimer, W. Poupert, G. Wythes, R. J. Steel, and J. Lyne was formed to draw up the rules.

BATH AND WEST AND SOUTHERN COUNTIES SOCIETY.—The Exeter exhibition of this old-established society was opened on Wednesday last and will continue until Monday next. The horticultural exhibits are accommodated in a pavilion specially constructed for the purpose. There are exhibits illustrating Nature Study, and a section devoted to forestry. Near the forestry gallery demonstrations of tree-pruning will be given.

MR. J. R. JACKSON, who has for 25 years served upon the staff of *Amateur Gardening*, has resigned his position for an appointment with Messrs. CLAY & SON, of Stratford. Mr. JACKSON has received a souvenir from Messrs. COLLINGRIDGE in the form of a gold watch, bearing this inscription upon the dome: "Presented to JOHN RISHTON JACKSON by W. H. and L. COLLINGRIDGE, in appreciation of 25 years of loyal service, 1884—1909."

MR. NORMAN GILL, a former member of the garden staff at Kew and son of Mr. GILL, Tremough Gardens, Cornwall, has been selected by the Government of India to fill the newly-created post of Superintendent, Kumaon Government Gardens, Jeolikote, District Naini Tal, United Provinces, India. Since leaving Kew in 1900, Mr. GILL has had varied experiences in gardening matters in different parts of India.

INTERNATIONAL HORTICULTURAL EXHIBITION AT KASAN, RUSSIA.—An horticultural exhibition will be held at this city from June 1 to August 30 of the present year, to which foreign firms are invited. It is stated that the exhibits, or many of them, can be disposed of readily after the exhibition, more particularly Palms, Araucarias, Azaleas, Camellias and Orchids. Information may be obtained from the Horticultural Company at Kasan, which undertakes to convey the plants from the railway station and to look after their requirements during the time of the exhibition.

PRINCIPLES OF HEREDITY.—The Aldred Lecture of the Royal Society of Arts was given before the members of the Society on May 12. The lecturer, Professor DENDY, chose for his subject "The Principles of Heredity as Applied to the Production of New Forms of Plants and Animals." After a brief account of MENDEL'S work and reference to that of BATESON, HURST and BIFFEN, the lecturer gave an account, based on that in DE VRIES' little book on Plant Breeding, of Mr. BURBANK'S "productions." It is unfortunate that this account was of an uncritical kind and consisted of the usual enumeration of Mr. BURBANK'S creations. Whilst a careful investigation of these productions would be of no inconsiderable value, a mere repetition of the statements of which all practical men have heard so much cannot, in the present state of opinion with respect to certain of those statements, be considered as a useful contribution to knowledge.

MASSACHUSETTS HORTICULTURAL SOCIETY.—Part II. of this Society's *Transactions* contains, among other reports, that of the Librarian, from which we make a few extracts. The Society's library is now in receipt of 150 different periodical publications relating to horticulture published in various countries. Other classes of horticultural literature have not been neglected, and a list of additions to the library is appended. It is worthy of note that, on the occasion of last year's count, the library, one of the finest, if not actually the finest, in the world, amounted to 17,440 volumes. There is also a fine collection of trade catalogues. The report expresses the need for a new and complete catalogue. Such a work would be of great interest to students of horticultural literature the world over, especially as the last printed catalogue issued by the Society was published more than 30 years ago, and, in the meantime, the additions have been enormous. We recommend as a model the admirable catalogue of the National Horticultural Society of France, whose capable and learned librarian, M. GEORGES GIBault, has produced a classified list, such as no other horticultural library possesses. With occasional supplements, such a catalogue would be invaluable.

PUBLICATIONS RECEIVED.—*Adaptations Culturelles et Variations des Solanées Tubérifères.* Extrait du Bulletin des Séances de la Société Nationale d'Agriculture de France, Nos. de Février et Décembre, 1908. (Paris: Librairie Agricole de la Maison Rustique, 26, Rue Jacob.) Price 1 franc.—*The Philippine Agricultural Review.* (January and February.) (Philippine Islands: Bureau of Agriculture.)—*The Journal of Botany.* (May.) (London: West, Newman & Co., 54, Hatton Garden, E.C.) Price 1s. 8d.—*Kew Bulletin.* (No. 4) Containing Diagnoses Africanæ: XXVIII, Peglera and Nectaropetalum, &c.—*Birds Useful and Harmful,* by Otto Herman and J. A. Owen. (London: Sherratt & Hughes.) HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

SCHIZANTHUSES.—During the past few years these useful and decorative greenhouse plants have been much developed and improved. I have been particularly pleased with the qualities of some of the new hybrid varieties under my care, and, being in the neighbourhood of Bristol recently, I paid a short visit to Messrs. Garaway & Co.'s nurseries at Keynsham. There I found a display of plants, which, for profusion of bloom, variety of colour, and symmetry of habit, would be very difficult to surpass. Most of the plants were in 6 and 7-inch pots; the specimens were about 4 feet high and 3 feet in diameter. So sturdy were the growths, that stakes were not needed to support them. Many of these plants were exhibited at the Temple Show, so visitors had the opportunity of seeing the wonderful specimens for which this firm has become noted. I believe that in many gardens several successional sowings are made, with very good results, but here, at Westonbirt, I only have one batch, which is raised from seed sown early in October. The plants are kept in cool quarters during the winter months, and are at their best by Easter time. They continue to flower until June is well advanced. A little feeding in the shape of a chemical fertiliser, when the pots are full of roots, is given, but great care is exercised in the watering. *S. Grahamii*, one of the older kinds, is very useful for house and table decoration. *Arthur Chapman, Westonbirt Gardens, Gloucestershire.*

SCHIZANTHUS AT WISLEY.—On p. 330 there was a notice of the *Schizanthus* now in cultivation at Wisley. May I say that this is a special strain sent to Wisley by myself? *Robert Sydenham.*

A LATE-FLOWERING NARCISSUS.—I saw in Messrs. Pearson's collection on May 17 a bed of *Narcissus* in full flower. The variety proved to be one of Mr. Engleheart's raising, and known as "Steadfast." It has a medium-sized trumpet, which is pale yellow, and broad, white corolla segments, which overlap each other, forming a very firm flower of good shape, and quite as large as the well-known *Sir Watkin*. Its constitution is vigorous, and the flowers stand up well above the foliage. *W. H. Divers.*

ACETYLENE GAS REFUSE.—I have seen refuse lime from the acetylene gas generator used on a garden for two years. I cannot recall a single bad result from its use. As an agricultural student, I feel that the pot cultures (see p. 264) were hardly fair to the lime, as in most cases the dressings were much too high for ordinary applications. The smallest of them would be next to impossible unless the garden was very small and the gas consumption high. I have calculated the following figures for three classes of soil, taking a depth of 6 inches, whereas when possible for all analytical purposes 8 inches is the usual:—

Arable Soil.		Tons required
Per cent. of Lime	Refuse applied.	per Acre.
1 per cent.	...	8.215
10 per cent.	...	82.15
20 per cent.	...	164.3
30 per cent.	...	246.45
50 per cent.	...	410.75
Clay Loam.		
1 per cent.	...	8.605
10 per cent.	...	86.05
20 per cent.	...	172.1
30 per cent.	...	258.15
50 per cent.	...	430.25
Garden Mould.		
1 per cent.	...	6.87
10 per cent.	...	68.7
20 per cent.	...	137.4
30 per cent.	...	206.1
50 per cent.	...	343.5

From these dressings, you will see that 6½ tons per acre is the smallest application—surely a very heavy dressing! I notice a large quantity of leaf-mould was used which would reduce the percentage of lime in the soil, but I think some account of it should have been taken; perhaps

the soil was already rich in lime compounds. Any artificial manures applied at this rate, slaked lime included, would, I am sure, have yielded similar results. Altogether I am afraid it will do much to discourage the use of a cheap source of lime to those who are fortunate enough to have an acetylene gas plant in a garden deficient in lime. I don't wish to say that it is as good as ground lime, because I don't think it is, the ground lime, being finer, mixes more readily with the soil; but I do think that if left on the surface like gas lime for a few weeks before use, it will do no harm. *Frank C. Atkinson.*

A NEW SAXIFRAGE.—In regard to the *Saxifraga decipiens hybrida grandiflora*, which received an Award of Merit at the R.H.S. meeting on April 20th, may I be permitted to say that I had decided to call it *Bathoniensis*, but upon application to the Floral Committee at the instance of some of the largest trade buyers, they decided that *S. decipiens hybrida grandiflora* was the better name. So I must abide by that ruling. *Thos. Kitley, Bath.*

WILDERNESSE PARK, SEVENOAKS.

(See Supplementary Illustration.)

THE county of Kent is called the Garden of England, and, assuredly, the traveller in that county who admires tree life, either of the park, garden, orchard, or hillside, will not long have passed beyond the confines of wide-spreading London before he sees ample to confirm the justness of the phrase. No matter which road is taken, the charm of the varied scenery is soon apparent, and by the time Sevenoaks is reached the conviction is established that it would be difficult to find elsewhere such delightful prospects as have met the eye within the limited compass of about a score of miles. Of the surroundings of the town of Sevenoaks itself it would be impossible to speak too highly. Here are hill and valley, superb woodland and fertile field, and, although I have traversed Kent from end to end many hundreds of times within the past 15 years, I have never seen any more beautiful region. But my present task is not so much to sing the praises of the county as to speak of some features of the garden attached to the residence of Lord Hillingdon at Wildernesse Park.

The mansion of Wildernesse is in every respect worthy of high rank among the stately homes of England, since it conveys the impression of solidity and stability, which are generally accepted as characteristics of our nation. One wing of the mansion is shown in the Supplementary Illustration to the present issue. Immediately around it are the flower gardens and pleasure grounds, and though these are not quite as extensive as might be anticipated, there is ample and suitable space for further extension.

The photographs illustrating Wildernesse Park were taken in the late summer, whereas the visit now described was made in the spring, but the features of to-day and the representations of those of other seasons of the year show that the plan of bedding is bold and striking, and in complete harmony with the mansion itself. Here are no small beds containing a dozen or more kinds of plants, but masses of colour, which make at once for conspicuous effect. Upon the occasion of the latest visit, brilliant red and yellow Wallflowers shone in the sun and diffused a delicious fragrance over the lawns, whilst, in the large border-like beds, May-flowering Tulips in clumps of one variety reared their handsome blooms 2 feet and more in height and swung to the breeze. At the south end of the mansion lies the Rose garden. Though not extensive, it is laid out intelligently, in that there is ample grass walk for comfortable locomotion. Moreover, the beauty of the different varieties is well displayed, the beds containing each but one variety. The walls of the house are freely planted with many distinct kinds of climbers, and at the time of my visit a *Wistaria* was blooming magnificently. *W.*

(To be continued.)

Royal Horticultural Society.

THE TEMPLE SHOW.

MAY 25, 26 and 27.

THIS, the greatest floral event of the year, was held on the above dates, and was another brilliant success, save only in the matter of weather.

As usual, the attendance of visitors was very large, and the tents each day soon became uncomfortably crowded. Everything, however, passed off without a hitch, and for the admirable management the thanks of all are due to the Superintendent, Mr. Wright, and the London officials, including the Secretary, Rev. W. Wilks, M.A., and his assistant, also Mr. Frank Reader and the other members of the office staff.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), de B. Crawshay, R. Brooman-White, Sir Jeremiah Colman, E. Ashworth, G. F. Moore, J. Cypher, W. Boxall, H. J. Chapman, W. H. White, H. G. Alexander, H. Little, A. Dye, Stuart Low, W. Cobb, R. G. Thwaites, F. M. Ogilvie, W. Bolton, H. A. Tracy, J. Wilson Potter, Gurney Wilson, H. Ballantine, W. H. Hatcher, and C. J. Lucas.

Entering the great tent, principally devoted to Orchids, the first section of the central staging on the right hand side was taken up by a very fine group staged by Mr. Collier (gr. to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate). As is customary in groups from Gatton Park, rare species and curious hybrids of Orchids formed a feature. Several of the species secured Botanical Certificates. Of the rare species noted were *Gongora quinquenervis*, *Lissochilus parviflorus*, *Bulbophyllum Lobbi Colossus*, and other *Bulbophyllums*; *Cirrhopetalum pulchrum*, and various *Masdevallias*. Among the showy species were a good selection of varieties of *Odontoglossum crispum*, including the blotched *O. c. Surprise*, *O. c. Duchess of Connaught*, *O. c. Cooksonii*, *O. c. Mrs. F. Peeters*, *O. c. Colmaniae*, and *O. c. Margery Tyrell Giles*. Of *Cattleyas* there was a good selection, the forms of *C. Mossiae* being well furnished with good flowers. *Epidendrum Boundii*, with its orange and scarlet flowers, was very effective in the back of the group; the primrose-coloured form of *Dendrobium Dalhousieanum*, the ivory-white *Cymbidium Colmaniae*, *Spathoglottis* hybrids raised at Gatton Park, *Cattleya Pittiae*, *C. intermedia cœrulea*, good *Miltonia vexillaria*, and other finely-flowered varieties.

Messrs. SANDER & SONS, St. Albans and Bruges, came next with one of the finest and most interesting groups, in which the central figure was a noble plant of the unique *Odontoglossum crispum Solum*, with its milk-white flowers having deep claret-red labellums and an occasional blotch of the same colour on the sepals. The exhibit included several, elevated, smaller groups, with corresponding valley-like arrangements, the whole forming a pretty picture. At the central highest point was a grand plant of *Cyrtopodium Saintlegerianum*, with several strong spikes, around it being the graceful sprays of red *Odontioda Devossiana*, the bright yellow *Oncidium Marshallianum*, and other elegant species, fronted by handsome *Brasso-Cattleyas*. Other lobes were of *Cattleyas* and *Lælio-Cattleyas*, the most beautiful being the pure white *C. Dusseldorfei Undine*, *C. Niobe Sander's* variety, raised at Bruges, with large fleshy-rose and white flowers; *Lælio-Cattleya Aumonier Menley* (*L. purpurata* × *C. Vulcan*), a charming rose, white, and purple flower; and *Sophrolælia Danae superba*, a very handsome dwarf hybrid with large rose and white flowers. *Odontoglossums*, both species and hybrids, were finely represented, some of the home-raised, blotched forms of *O. crispum* running the imported varieties very close in point of beauty. Among the hybrids were several new forms, *O. tigrinum* being a remarkable, yellowish flower evenly spotted with red, and different from any other, though not so handsome as

some. *Miltonia Bleuana Mrs. F. Sander* had fine white flowers, with light rose lines on the lip. *Maxillaria Van Houtteana*, *Vanda Parishii Mariottiana*, the white *Brasso-Cattleya Queen Alexandra*, pretty *Odontoglossums* of Messrs. Sander's *O. Dreadnought* type, and some good forms of *O. Lambeauianum* were also noted.

F. MENTEITH OGILVIE, Esq., The Shrubbery, Oxford (gr. Mr. Balmforth), staged a splendid group, in which were many remarkable varieties; all well grown and quite worthy of the show-stand. The setting of the group was of fine *Odontoglossums*, and in the elevated parts were beautiful arrangements of *Odontoglossum crispum* and hybrid *Odontoglossums*, among which were arranged scarlet *Odontioda Bradshawie*, *O. Charlesworthii*, and other *Odontiodas*, the yellow sprays of *Odontoglossum*

THE TEMPLE SHOW.

FIG. 152.—SANSEVIERIA LAURENTII EXHIBITED BY MESSRS. SANDER AND SONS.

(See p. 351.)

luteo-purpureum Vuylstekei appearing among them. On each side were large batches of the green and white *Cyrtopodium Lawrenceanum Hyeannum*, *C. L. Marjorie*, *C. Maudie*, and *C. callosum Sanderæ*. Prominent features were made in the group by fine specimens of *Cattleya Dusseldorfei Undine*, which is one of the best white *Cattleyas*, *Trichopilia Backhousiana*, a white, fragrant flower which also told well in other groups; *Odontoglossum eximium* and *O. percultum*, of very rich colour; a clear scarlet form of *Odontioda Vuylstekeæ*, *Odontioda Devossiana*, and some specially fine forms of *Lælia purpurata*. Among species *Cattleya citrina*, with its clear yellow, fragrant flowers, and *Epidendrum falcatum* were noted.

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, followed with an effective group, in which was a batch of well-flowered *Cyrtopodium glaucophyllum*, together with *Bulbophyllum barberum*, a very fine scarlet *Eophronitis grandiflora*, and the new *Odontoglossum Armstrongie*, a showy hybrid of unrecorded parentage with white flowers evenly blotched with violet. In a batch of *Brasso-Cattleyas* were

B.-C. Mrs. Francis Wellesley Leyswood variety, with blush-white flowers. Among hybrids, several plants of *Lælio-Cattleya Aphrodite alba* had fine white flowers with ruby-crimson front to the lip; *Cyrtopodium callo-Rothschildianum* had a fine spike of four flowers; *Cattleya Skinneri Temple's* variety showed it to be the finest coloured variety of the best old form of *C. Skinneri*; the pure white specimen shown being also of the same type; *Dendrobium nobile virginale* was shown in several fine specimens; *Odontoglossum crispum roseum giganteum* was a noble flower. A pretty effect was made in the group by the arrangement of scarlet and crimson *Masdevallias* in the grotto-like recesses between the elevated portions.

Messrs. HUGH LOW & Co., Enfield, staged a group in which the forms of *Cattleya Mendelii* and *C. Mossiae* were specially good. With them were *Cattleya Skinneri alba* and other *Cattleyas*, a good selection of *Cyrtopodiums*, the handsomest of which were *C. chrysotoxum Victor* and *C. Lawrenceanum Hackbridge* variety. Others noted were *Oncidium macranthum*, *O. unicolorne*, *O. pulchellum*, *O. phymatocilium*, *Gongora nigrita*, *Spathoglottis aureo-Veillardii*, &c.

Messrs. WILLIAM BULL & SONS, King's Road, Chelsea, finished the side of the central staging with a group of good *Odontoglossum crispum*, the best forms of which were *O. c. Minoru*, white, blotched with purple; *O. c. Empress*, *O. c. Florence*, and *O. c. Diadem*; a good selection of *Cattleyas*, including *C. Mendelii*, *Countess*, *Empress*, and *Diadem*; *C. Mossiae Edward VII.*, a good, bold flower, and *C. M. Coronet*. Messrs. BULL also showed good *Odontoglossum* hybrids, and three plants of their *Odontioda chelseiensis*, with cream-white flowers tinged and blotched with rosy-lilac (see fig. 153).

On the other side of the central staging Messrs. CHARLESWORTH & Co., Haywards Heath, occupied the chief position with a magnificent group, in which the only two plants entered to go before the Committee, viz., *Oncidium Charlesworthii* and *Lælio-Cattleya Eurylochus*, secured First-class Certificates (see Awards). The group contained fine representatives of all the showy species procurable at this season, and a remarkable selection of hybrids and home-raised seedlings, among which the spotted forms of *Odontoglossum crispum* were remarkable. The typical white and rose-tinted forms of *O. crispum* also were fine; *O. Othello*, remarkably rich in colour; *O. percultum* and *O. Lambeauianum* varieties, perfect in form and handsomely marked; and *O. Pescatorei Charlesworthii*, pretty form and very distinct. *Odontioda Charlesworthii*, *O. Bradshawie*, and several varieties gave a scarlet colour; *Cattleya Mendelii* and *C. Mossiae* were shown in many fine forms, including the best white *C. Mossiae Wageneri*; *Lælio-Cattleya Golden Glory*, a very fine set of *L.-C. Fascinator*, *L.-C. Feronia*, and other *Lælio-Cattleyas* were well displayed, and among the numerous good things noted were the pure white and fragrant *Trichopilia Backhousiana*, a floriferous plant and a free grower; *Cymbidium Huttonii*, *C. Devonianum*, *Aërides Houletianum*, *Vanda suavis pallida*, a very rare albino; *Ansellia africana*, *Oncidium O'Brieniana*, and a large number of other plants of interest.

The EXORS. of the late NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr. Mr. H. J. Chapman), showed *Odontioda Cooksoniae* (*C. Noezliana* × *O. ardentissimum*), a pretty flower with the inner parts of the segments orange colour bordered with white, and with rosy margins; *O. Bradshawie Oakwood* variety, prettily tinged and blotched with scarlet; *Odontoglossum percultum Clive*, white blotched with violet; *O. Solon Cookson's* variety and *O. Cooksonianum* (*mirificum* × *crispum*), a large, well-formed, and heavily-blotched flower.

Messrs. JAS. CYPHER & SONS, Cheltenham, staged a good group of *Odontoglossums*, *Miltonia vexillaria*, *Cattleyas*, &c., among which were noted a fine lot of *Odontoglossum crispum*,

O. percultum, a nicely spotted hybrid between *O. cirrhosum* and *O. ardentissimum*, *Ceogyne Dayana*, *Maxillaria Sanderiana*, *Cattleya Dusseldorfei* Undine, *Oncidium Lanceanum*, *Dendrobium clavatum*, *Odontoglossum Wilckeanum rubrum*, of a pretty red-tinted form; *Vanda teres gigantea*, and other uncommon varieties, specially well grown.

Messrs. MOORE, LTD., Rawdon, Leeds, staged one of the best arranged groups in the show and one which contained many good and attractive Orchids. In the centre, high up, at the back were fine plants of the large white Moth Orchid known in gardens as *Phalænopsis amabilis Rimestadtiana*. The sunk effect on either side was very skilfully arranged with *Odontoglossums* of fine quality, a very handsomely-marked *O. Ossulstonii* named Rawdon variety, *O. percultum*, *O. crispo-Harryanum* with two spikes, some spotted *O. crispum* being among them; also brightly coloured *Odontodas*, a fine selection of large-flowered *Cattleyas*, a very handsome form of *C. Mendelii*, with purple feathered lines on the petals, being specially attractive. Others noted in this effective group were scarlet *Renanthera Imschootiana*, the pretty rose and white *Disa Luna*, *Odontioda*

Ghent, staged a selection of hybrid *Odontoglossums*, three of the best of which secured First-class Certificates (see Awards).

Mr. JOHN ROBSON, Altrincham, showed a selection of seedling Orchids, among which were four handsomely blotched *O. crispum*, raised between the varieties *Marie* and *Luciani*; also a bright scarlet *Odontioda* between *Cochlioda Noezliana* and *O. ardentissimum*. Among the other hybrids was a superb form of *O. Lambeauianum*, with very large and finely marked flowers.

RICHARD ASHWORTH, Esq., Ashlands, Newchurch, Manchester (gr. Mr. Fletcher), staged a group in which was a good selection of blotched *Odontoglossum crispum*; that named *Black Prince* having a specially clear white flower with distinct chocolate-purple blotches. *O. crispum* *Rebus*, *O. c. rubrum*, and *O. c. heliotropium* were also well shown, together with some *Cattleyas*, and a very fine plant of the blue *Dendrobium Victoria Regina* with many flowers, for which a Cultural Commendation was awarded.

Mr. Reynolds (gr. to LEOPOLD DE ROTHSCHILD, Gunnersbury Park) arranged most effectively on one side of the large tent a large number of splendidly-grown plants of *Vanda teres*, literally

yellow, the front blotched with brown and suggesting *O. Marshallianum*.

Laelio-Cattleya Eurylochus (*Schofieldiana* × *Lady Miller*), from Messrs. CHARLESWORTH & Co. A pretty novelty, with flowers of good shape and of a glowing orange tint shaded with bronze. The lip is light ruby-crimson and the tube yellow. The spike bore four flowers.

Odontoglossum mirum Emperor of India (*Wilckeanum* × *crispum*).—A large flower of fine shape and substance, white, heavily blotched with purple.

Odontoglossum Aglaon (*Vuyksteke* × *cximum*).—In form and colour nearest to the pretty *O. Vuyksteke*, and with the well-formed, shield-shaped lip of the latter species. The ground colour of the flower is white, but the surface is almost covered with reddish-orange brown blotches, with a crimson glow in places. Lip white, with chestnut-red blotches.

Odontoglossum Princess Victoria Alexandra (parentage unknown).—A handsome variety with flowers of an intense claret-red, with silver-white margins.

The above three *Odontoglossums* were shown by Mons. CHAS. VUYLSTEKE, Loochristy, Ghent.

AWARD OF MERIT.

Cattleya Mossiae Gatton Park variety, from Sir JEREMIAH COLMAN, Bart., V.M.H. A very pretty form of a soft shade of rose-pink, with broad segments, the slightly decurved petals showing remarkable development. Lip broad, marbled with violet-purple, the crimped margin, silver-white.

BOTANICAL CERTIFICATE.

Bulbophyllum lemniscatoides, from Sir JEREMIAH COLMAN, Bart. A singular species from Java, figured in the *Gardeners' Chronicle*, January 30, 1909, p. 68. The flowers are in a nodding raceme, nearly black with silvery, hair-like appendages, which in the plant shown had not had time to develop fully.

Gongora quinquenervis, from Sir JEREMIAH COLMAN, Bart. The flowers are produced in elegant sprays, insect-like in form and of a deep red brown colour.

Sigmatostalix Eliae (Rolfe), from Mr. J. BIRCHENALL, Alderley Edge. A charming new species of small growth, with a slender raceme of yellow flowers spotted with red, the stalked lip with a broad blade being very peculiar.

Oncidium Retemeyerianum.—A dwarf, thick-leaved species, with a straggling spike of fleshy flowers spotted with brown, the curious labellum being claret-coloured. From Mr. J. BIRCHENALL.

BEGONIAS.

Messrs. BLACKMORE & LANGDON, Twerton Hill Nursery, Bath, showed tuberous-rooted Begonias of remarkably fine quality; the plants were not arranged too thickly, and hence their full beauty was displayed. The exquisite shades of colour seen in the varieties are probably unsurpassed in any flowers, tones of pink, salmon and crimson being especially pleasing. The blooms were very large and remarkably fresh in appearance. A selection of the best kinds in the exhibit includes *Marie Nicholas* (salmon), *Duchess of Portland* (orange-red), *Mrs. P. Clowes* (rosy-salmon), *Avalanche* (white), *Pink Pearl*, *Mrs. W. L. Ainslie* (yellow), *Mrs. D. Paterson* (very pale yellow with rose edge), and *Millicent* (salmon). Overhanging baskets contained drooping varieties, the pendant growths terminating with dense bunches of flowers. These included *Gladys* (red), *Mrs. Bilkey* (orange-salmon), and *Carminea* (carmine-rose).

Messrs. JOHN LAING & SONS, Forest Hill, London, also showed a batch of tuberous-rooted Begonias, having many choice kinds in small-flowered but well-coloured examples.

Messrs. T. S. WARE, Feltham, exhibited nearly 300 plants of tuberous-rooted Begonias of their well-known strain. The group, as a whole, was very effective, and although these flowers are somewhat stiff in appearance, their colouring is exquisite, and, viewed in a mass, remarkably effective. There were considerable numbers of seedlings, the majority of excellent quality, and certainly admirable as bedding subjects. Amongst the named kinds we noticed *Miss Fairlie Harmer* (reddish-scarlet), *Mrs. A. P. Brandt* (almost white, with a pale rose suffusion), *Patrick Ainslie* (crimson, and with pretty crimped petals), *Mrs. Whitelaw Reid* (salmony-pink and a white edge),

THE TEMPLE SHOW.

FIG. 753.—ODONTIODA CHELSEIENSIS EXHIBITED BY MESSRS. BULL AND SONS.

(See p. 347.)

Bradshawiae, with its parent the scarlet *Cochlioda Noezliana*, *Trichopilia Backhousiana*, *Oncidium Kramerii*, *O. Batemannianum*, *Epidendrum Wallisii*, *Cypripedium caudatum*, *Vanda pumila*, and *Dendrobium atro-violeaceum*.

His Grace the Duke of MARLBOROUGH, Blenheim Palace, Woodstock (gr. Mr. Hunter), showed a group in which were a good selection of *Laelia purpurata*, *Cattleyas*, finely-flowered *Dendrobium thyrsoiflorum*, a splendid specimen of the pure white *Chysis bractescens* with two spikes, *Miltonia vexillaria*, *Odontoglossums*, &c.

Mrs. WOOD, Moorfield, Glossop (gr. Mr. W. T. Gould), showed a group of well-grown Orchids, the central plant in which was a fine specimen of *Cymbidium Lowianum* with ten spikes. With it were a selection of *Odontoglossums*, *Cattleya Mossiae*, *Laelio-Cattleya highburiensis*, *Laelia Latona*, *L. tenebrosa*, and *Phalænopsis Schilleriana*.

Messrs. STANLEY & Co., Southgate, showed a small group of *Cattleya Mossiae*, which included a fine plant of *C. M. vestalis*, white with coloured lip, and *C. M. Thompsonii*, a pretty, bluish-tinted form; also the white *Laelia purpurata* *The Queen*.

Monsieur CHARLES VUYLSTEKE, Loochristy,

covered with their large, deep rose-coloured flowers. Probably such a fine lot, so well arranged, has not been seen before, and it is highly creditable to Mr. Reynolds that he should for so many years continuously and successfully grow this fine old species.

Messrs. JAS. VEITCH & SONS, King's Road, Chelsea, staged a neat group of *Cattleyas*, including the white *C. Mrs. Myra Peeters*, *Disa Luna* with five spikes, good *Odontoglossum crispum*, *Oncidium Marshallianum*, &c. The Orchids were arranged in the centre of a large group of foliage plants, with handsome-leaved *Bertolonias* interspersed between them.

R. E. CHALMERS, Esq., Aveling, Bromley, sent *Dendrobium lituiflorum*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Oncidium Charlesworthii, from Messrs. CHARLESWORTH & Co., Haywards Heath. A very handsome, large-flowered *Oncidium* of the *O. crispum* section, and probably a natural hybrid of that species. Its broad sepals and petals are of a deep chestnut-brown, with slight, wavy transverse lines, the base of the lip being bright

Mrs. John Brinsmead (cream colour), Mrs. Arthur Hill (crimson-scarlet), and Countess of Dartmouth. All those mentioned were big plants, with large, bold flowers.

Decorative plants of Begonia hybrids were shown by FRANK LLOYD, Esq., Coombe House, Croydon. They were labelled *Begonia Lloydii*. Some were in baskets, for which mode of display they are especially adapted.

CARNATIONS.

In the large Orchid tent a bright corner exhibit was made by Messrs. WM. CUTBUSH & SON, Highgate, London, N., with Carnations in conjunction with Roses (see fig. 154). These highly decorative plants were both finely shown, the Carnations being especially pleasing. These latter flowers were admirably arranged, some in large mounds. Notable varieties were Lady Coventry, Robert Craig, Enchantress, White Perfection, and Lord Rosebery.

Another excellent exhibit of Carnations was made by Mr. W. H. PAGE, Tangley Nurseries, Hampton. He showed them in his usual superb

Mr. C. ENGLEMAN, Saffron Walden, showed popular varieties in excellent condition, trails of Asparagus being freely utilised in the display.

Messrs. HUOH Low & Co., Bush Hill Park, Enfield, exhibited a remarkably fine and varied group, having such beautiful kinds as Winsor, Britannia, Afterglow, Enchantress, and Black Chief in splendid condition.

A fine assortment of well-grown flowers was staged by Mr. A. F. DUTTON, Bexley Heath.

Other exhibitors of Carnations as cut blooms were Messrs. T. S. WARE, LTD., Feltham; Mr. JAMES GREEN, March; Mr. C. F. WATERS, Balcombe, Sussex; Mr. C. H. HERBERT, Birmingham; and Mr. W. H. LANCASHIRE, Guernsey.

CALADIUMS.

Although these plants are not so extensively exhibited at this show as in former years, there were some well-grown plants shown, notably a very fine exhibit by Messrs. JOHN PEED & SON, Norwood. The plants were large and their colouring splendidly developed. Among the more noticeable varieties were Diamantina, green

Viticella type or the smaller-flowered rubella of the Jackmanii class appealed most to us. The double-flowered Venus Victrix was especially effective shown as a climber.

A group of these showy flowering plants was also staged by Messrs. GEO. JACKMAN & SON, Woking Nursery, Surrey. The plants were trained in a pyramidal or globular manner, the growths being entwined, so that the flowers appeared as though on dwarf bushes. The assortment of colours was varied; perhaps the most pleasing was the comparatively small-flowered *G. Jackmanii rubra*; the petals of this variety are of a wine shade. Others of merit were *Ville de Lyons*, carmine-red; *Fairy Queen*, white with rose suffusion; *Nelly Moser*, one of the best of the large-flowered type; *Lord Neville*, heliotrope; and *Marie Boisselot*, the best of the white-flowered kinds.

RHODODENDRONS.

A charming display of Rhododendrons was made by Messrs. JOHN WATERER & SONS, LTD., Bagshot, Surrey. The beautiful *Pink Pearl* was

THE TEMPLE SHOW.

FIG. 154.—MESSRS. CUTBUSH'S GROUP OF CARNATIONS AND ROSES.

style, with tall epergnes of Lilliums and banks of Roses intermixed. The group also contained Pelargoniums and pink-flowered Astilbes.

Messrs. BELL & SHELDON, Guernsey, showed superb examples of the perpetual-flowering Carnation, the colours being exceptionally fine. The arrangement was excellent.

THE AMERICAN CARNATION NURSERY, Sawbridgeworth, staged a bright exhibit of popular varieties, tall stands being requisitioned for their display.

Mr. H. BURNETT, St. Margaret's, Guernsey, made a very bright group, having a selection of the best kinds, all effectively displayed.

An attractive group of Carnations was seen in Messrs. R. H. BATH & Co.'s exhibit of these flowers adjoining their display of Tulips.

Mr. C. W. BREADMORE, High Street, Winchester, showed Carnations in conjunction with their group of Sweet Peas.

Mr. H. MORTIMER, Farnham, had a pleasing group in which the flowers were arranged in tall receptacles.

with rose maculations and silvery blotches; Sir Oswald Moseley, a fine shade of red with green margins; John Peed, one of the largest and most elegant, the colour being rich velvet-green merging to red in the centre and with red veins; Candidum, pure white with green tips; Henry Lovatt, with paler maculations and rose-coloured ribs and centre; a very large plant of Marquis of Camden; Silver Queen, of palest colour, faintly tinted with green; W. E. Gladstone, Mrs. Tilton, Oriflamme, and Triomphe de Comte, the last-named being bright red.

CLEMATIS.

Messrs. RICHARD SMITH & Co., LTD., St. John's Nurseries, Worcester, showed large flowering Clematis, some as balloon-trained and others more naturally growing as climbers on Bamboo supports. A few Rambler Roses at the back of the group showed how pleasingly the Rose and Clematis may be combined for decorative purposes. The showiest variety was the heliotrope-coloured Sensation, but those of the

feature of the group, there being numerous large plants of this peerless variety, all magnificently bloomed. In addition, were other smaller but equally beautiful varieties, such as Marquis of Waterford, shown as a standard plant; and Lady Clementina Walshe, a pale flower of large size, suffused with rose and dotted with yellowish-green.

Messrs. R. & C. CUTBERT, Southgate Nurseries, Southgate, exhibited a large group of hardy Azaleas. Prominent among the group were standards of *R. occidentalis exquisita*, the colour being pale, with lemon-spotted upper petals; Florodora, a large-flowered variety with salmon-red flowers; the single Ghent Azalea Fanny, also Comte de Kerchove; the double Ghent Azalea Raphael de Smet, of blush tone, and Nancy Waterer, yellow.

Mr. CHAS. TURNER, Slough, showed pyramidal-trained plants of Rhododendron (*Azalea*) indicum. The plants were not so well flowered as those seen earlier in the year; still they were very decorative subjects.

MISCELLANEOUS GREENHOUSE PLANTS.

Messrs. H. CANNELL & SONS, Swanley, Kent, staged varieties of Phyllocacti, a row of the pretty, pink-flowered German Empress variety occupying the front. Among the larger kinds were Schlimmii, Henry Cannell, Teutonia (yellow), Dr. Herum (pink), Leopold, and Croisali. Adjoining these plants was a batch of Fuchsia splendens in variety; Begonia nitida alba forming a suitable background to the Fuchsias. Plants of the new American Pillar Rose, with their large bunches of single flowers of a rose-pink shade, were prominent (see fig. 156). Messrs. CANNELL & SONS also showed a magnificent group of Cannas, in all 160 plants, in 50 varieties. Among the more elegant varieties were noticed Ch. E. Hodel (crimson), Frau G. Borsig (deep rose), Goethe (yellow and

(Amaryllis), the plants being in especially good form for so late in the season. A feature of the exhibit was the sturdy, dwarf character of the specimens, all of which showed excellence of culture. Many of the flower-stalks bore four and sometimes five individual blooms. There were over 100 plants in almost as many varieties. Those of the Nestor type—that is, crimson, with white tips—were especially good; others of note were Admiral Togo (rose-cerise), Picotee (the ground of this variety is white, the edge being reddish), Hercules, Empress (crimson), and Chiron (crimson).

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, showed an extensive group of greenhouse flowering plants, in which Cinerarias were the more important subjects, including the variety Feltham Beauty. Hybrid Gerberas

Messrs. JAMES CARTER & Co., High Holborn, London, staged a very pretty exhibit in the long, narrow tent. They furnished the corners on either side of the entrance with bold masses of Calceolarias and Cinerarias. At the back of the Calceolarias were some floriferous plants of Schizanthus, whilst a few of the new coloured Spiraes were utilised at one of the corners. A considerable portion of tabling was utilised by this firm to display greenhouse flowering plants that are usually raised from seeds. They had some remarkably fine Cinerarias, showy Schizanthus, some as basket plants suspended from iron supports, which were entwined with greenery, a pretty feature; also good strains of Petunias and Gloxinias, the latter plants being remarkably well cultivated. The pretty Delphinium "Blue Butterfly" was conspicuous, also a selection of popular varieties of perpetual-flowering Carnations. The whole group demonstrated what a wealth of beautiful flowering plants can be easily raised from seeds.

Messrs. SUTTON & SONS, Reading, had an excellent group in the largest tent, where it occupied the whole of one of the ends. The various subjects were magnificently in flower, and the general design was pleasing, consisting of a large central bay with two smaller ones on either side. Pyramidal-trained plants of Clarkia pulchella were remarkably effective, and we have never before seen this pretty annual better shown. Herbaceous Calceolarias were remarkably fine, as were Schizanthus in variety and Nemesia strumosa. The largest central bay was comprised almost entirely of beautiful Cinerarias, and prominent in the front was an unnamed variety which may prove to be a new species. Two of the bays were devoted to Calceolarias of the large-flowering variety, intermixed with Begonias, and choice Gloxinias. Ferns, Palms, and other foliage plants were freely employed to embellish the group and as relief to an almost unbroken sheet of brilliant flowers.

Several exhibits of herbaceous Calceolarias were shown in the longest tent. VIVIAN PHILLIPS, Esq., Crofton, Orpington, Kent (gr. Mr. T. Hobbs), displayed a group of these plants, and another fine exhibit of these was made by WILLIAM NOAKES, Esq., Selsdon Park, Croydon (gr. Mr. Howarth).

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), displayed a batch of Streptocarpus. The plants were exhibited in batches of mauve, white, pink, heliotrope, blush, &c.

Gloxinias were shown by Messrs. TOOGOOD & SONS, Southampton, and LOUIS VAN HOUTTE PERE, Ghent, Belgium.

Messrs. JAMES GARAWAY & Co., Durdham Down, Clifton, Bristol, displayed plants of their noted strain of Schizanthus, having magnificent specimens, literally smothered with flowers in beautiful shades of orange, rose, purple, &c.

Messrs. HUGH LOW & Co., Enfield, displayed miscellaneous greenhouse plants, making as usual a feature of Metrosideros floribunda.

Messrs. W. & J. BROWN, Stamford, showed the new double-flowered Marguerite "Perfection," also Verbenas, Heliotropes, Spiraes, Pelargoniums, and other flowering plants.

Mr. WM. ICETON, Putney, exhibited two pyramidal groups of Lily of the Valley, set in Adiantum Fern and bordered with the pleasing Caladium argyrites.

Mr. W. J. GODFREY, Exmouth, Devon, displayed varieties of Show and Fancy Pelargoniums. They were a very fine collection, notable varieties being Ruby, Black Prince, Godfrey's Success, rose-pink with dark blotches; H. S. Davy, reddish flowers with darker blotches; and Lady Decis, a very pale rose-coloured variety.

Messrs. WAYERIN & KRUYFF, Sassenheim, Holland, showed plants of the pink-flowered Astilbes (Spiraes), Queen Alexandra and Peach Blossom.

A batch of a Pelargonium named James T. Hamilton and stated to be raised from an ivy-leaved variety ("Charles Turner") crossed with "Ethel Lewis," of the Zonal section, was shown by Messrs. W. H. ROGERS & SON, LTD., Red Lodge Nursery, Southampton.

SOME CUT FLOWERS.

GERBERAS.

It will be remembered that when commenting on the late Berlin Exhibition we referred especially to a magnificent collection of hybrid Gerberas, shown by Mons. R. ADNET, Cap d'Antibes.

THE TEMPLE SHOW.

FIG. 155.—M. ADNET'S EXHIBIT OF GERBERA FLOWERS.

orange), Furst Wied (deep crimson), Niagara (reddish, bordered with yellow), Meteor, Gaikwar of Baroda (a yellow ground, speckled with bright red), Dr. Marcus (reddish, with darker spotting), and Frau E. Kracht (pale salmon).

THE KING'S ACRE NURSERY Co., Hereford, showed Heliotropes in variety. The variety Mme. Marie Andre was displayed as a standard plant. Others of especial merit were Mme. Fillary (a very fragrant variety) and Lord Roberts.

Messrs. P. KER & SONS, Aigburth Nursery, Liverpool, showed their strain of Hippeastrum

showed considerable advance upon those exhibited last season. Kalanchoe flammula was conspicuous with its dense heads of reddish flowers. Another interesting subject was Amphilome Emodi; the flowers of this plant are not unlike those of Streptocarpus; they are coloured a shade of rose, with orange in the throat. A new silver-leaved Pelargonium, with pure white flowers, was labelled "Snow Queen." It should be a serviceable bedding variety. There were also many other plants, including Cannas, Streptocarpus, Lobelia tenuior, Blandfordia nobilis, and Richardia Elliottiana, with Ferns and Palms as greenery.

This gentleman showed a few of his hybrids as cut flowers (see fig. 155), arranging them at the end of the Orchid table in the large tent. The flowers were of many shades of colour, ranging from the deep red of the type through shades of pink, to quite pale forms. (See article by Mr. Lynch on p. 339.)

GROUPS OF PLANTS.

A magnificent group of exotic plants was shown by Messrs. JAS. VEITCH & SONS, LTD., King's Road, Chelsea. The exhibit embraced the finest of ornamental-leaved plants, with a batch of showy Orchids as a centrepiece. The colouring in the leaves of the Caladiums, Codiaëums (Crotons), Cyanophyllum magnificum, Anthuriums, Heliconia illustris rubricaulis, and similar plants was magnificently developed. The arrangement and blending of the various subjects were skilfully carried out, and the exhibit was freely decorated with Palms and Ferns. Among the more notable of the plants may be instanced *Alocasia argyrea*, with a sagittate leaf suffused with a metallic sheen; *A. montefontaineensis*, of dark green colour; *Dieffenbachia Jenmanii*, with zebra-like markings of pale yellow; *Aralia elegantissima* as tall plants; *Caladium Rose Laing*; *C. Louis A. van Houtte*; *Cyanophyllum magnificum*; and *Medinella magnifica*. As foils were tall *Crotons*, *Dracena Sanderiana*, and a branched inflorescence of *Oncidium Marshallianum*.

In the same tent, but on the opposite side to this exhibit, Messrs. VEITCH displayed a group of large dimensions, consisting of showy-flowered plants of a hardier nature. Plants of *Clematis*, *Roses*, *Rhododendrons*, *Wistarias*, and other floriferous subjects formed a blaze of colour, and were interspersed with rarer subjects, such as the pleasing *Clematis montana rubens*, *Andromeda speciosa*, the branches of which were crowded with white, bell-shaped flowers; *Rosa hugonis*, with pale yellow blooms; *Styrax japonica*, a very elegant shrub, shown as a standard; *Vitis flexuosa Wilsonii*, a useful and graceful climber; and *V. Henryana*, *V. armata* and *V. heterophylla variegata*. Huge bunches of blossoms were borne by plants of *Hydrangea paniculata grandiflora*, and there were others of the hortensis type with blue flowers. *Philadelphus Banniere*, as a dwarf shrub, attracted notice with its pure white blooms. We have no room to mention the large number of varieties of *Rhododendrons* and *Clematis*, which embraced some of the choicest in cultivation.

Messrs. SANDERS & SONS, St. Albans, staged a group of new and noteworthy plants, having most of the fine species which were shown by this firm at the last Ghent Exhibition and illustrated at that time in the *Gardeners' Chronicle*. We noticed the unique *Anthurium Laucheum*, *Ptychoraphis Siebertiana*, an elegant *Kentia*-like Palm; *Bilbergia Forgetiana*, the stiff leaves being ribbed with green and yellow, the latter colour predominating; *Anthurium Warocqueum*, having green, velvety leaves, 2 feet or more in length; several Cycads, notably *Bowenia spectabilis serrulata* and *Cycas Micholitzii*; *Furcroya Watsoniana*, like an American Agave, with yellow and green foliage; *Clerodendron Campbellii*, freely in flower; *Ficus australis variegata*; *Anthurium Sanderi*; *Dionea muscipula*; *Dracena Broomfieldii superba*, with elegant silver veining; *Calamus ciliaris*; *Bromelia tricolor*; and *Sansevieria Laurentii* (see fig. 152).

Messrs. WM. BULL & SONS, King's Road, Chelsea, staged a batch of ornamental-leaved plants of exotic species, including *Caladiums*, *Dracena Victoria*, *Aralia Chabrieri*, *Codiaëums* (Crotons), *Bertolonia maculata* in variety, *Filicium decipiens*, a plant with elegant, pinnate leaves, Tree Ferns, &c. In the centre of the group was a batch of *Hippeastrums*, principally scarlet-flowered varieties which attracted much notice.

A showy group of stove and greenhouse plants, all with richly-tinted foliage, was displayed by Mr. L. R. RUSSELL, Richmond. The plants included *Caladiums*, *Crotons*, *Aralia elegantissima*, *Maranta Veitchii*, *M. Van den Heckeii*, *Heliconia illustris* (beautifully barred with rose lines), *Anthurium Scherzerianum*, whose scarlet spathes added additional brightness to the group; *Alocasia argentea*, and *Cyanophyllum magnificum*, quite the handsomest in the collection, with its broad leaf of velvety green, ribbed in the most elegant manner. The assortment of *Caladiums* was varied, especially fine being the pale Silver

Cloud variety. Others shown well were John R. Box, Mrs. L. R. Russell, *L'Automne* and *Marquis of Camden*. At the back of the exhibit were tall specimens of *Dracena Sanderiana*, *Codiaëum Mrs. Luther*, and graceful *Arun-dinarias*. Mr. RUSSELL also showed a number of the handsome-leaved *Bertolonia*s, and *Sonerila argentea*, *Maranta Makoyana*, *Leea amabilis* and *Eranthemum Lindenii*, all similar-habited plants.

FERNS.

Messrs. H. B. MAY & Sons, Edmonton, had a grand exhibit. Larger specimens were employed than usual. In the centre of the group was a fine specimen of *Cibotium Schiedeii*, elevated to a height of fully 20 feet, and another of *Acrostichum aureum* was placed nearly as high. In the foreground was a grand specimen of *Polypodium Knightiae*. *Davallias* included fine specimens of *D. Fijiensis robusta*, *D. braziliense*, *D. epiphylla* and the pretty little *D. alpina gracillima*. Other choice plants noticed included *Polypodium Mayi*, *Nephrolepis Fosteri*, *N. Amerpohlii*, *N. Whitmanii*, *N. superba*, *N. todeoides*; *Platynerium Veitchii*, *P. grande*, *P. alcorni* and *P. Cordreyi* (a garden variety); also *Pteris tricolor*, *P. cretica Summersii*, and *P. Childsii*. Of *Adiantums* were shown *A. Veitchii*, *A. macrophyllum*, and *A. Farleyense*. *Gymnogrammas* included the best silver and golden coloured varieties. Messrs. MAY exhibited as a separate group in the open a number of hardy Ferns; many were elegantly crested. Plants of *Polystichum angulare* included some beautiful varieties, those of the *diversilobum* type being specially good. There were also *Osmundas* in variety, *Ceterach officinarum*, *Pteris Nicholsonii*, a remarkable variety of *P. Aquilina*, and the finest varieties of *Asplenium Filix-femina*. *Scelopendrum vulgare muricato-fimbriatum* should prove a useful garden Fern.

Messrs. J. HILL & Sons, Lower Edmonton, staged a fine group of Ferns. The plants in the background were elevated, and a tall specimen of *Cibotium (Dicksonia) Schiedeii* was one of the finest in the exhibit. A large *Osmunda gracilis*, also *Platynerium grande*, *P. Willneckii*, *P. Hillii*, and *Gleichenias* were well shown. Others of exceptional merit were *Polypodium lepidopteris sepultum*, various *Davallias*, *Onychium auratum*, *Polypodium plesiosorum*, and *Anemia tomentosa*.

Mr. H. N. ELLISON, West Bromwich, showed a number of choice little plants of *Nephrolepis Amerpohlii*, *Pteris scaberula*, *Pteris internata*, *Adiantopsis radiata*, *Lastrea lepida*, *Davilla immersa*, *Osmunda palustris Mayi*, *Davallia ornata*, *Doodia aspera multifida*, *Acrostichum crinitum*, *Goniophlebium glaucophyllum*, and many others. The group exhibited a neat arrangement, which appeared more effective even than the larger groups.

SWEET PEAS.

Several Sweet Pea specialists showed these flowers in considerable numbers. The more conspicuous groups were as follow:—Messrs. ROBERT SYDENHAM, LTD., Birmingham, had good vases of standard sorts and novelties. These included excellent blooms of the white *Spencer* and *George Herbert* varieties. Mr. SYDENHAM also showed some delightful sprays of *Lily of the Valley* from plants grown in fibre.

Another excellent exhibit of Sweet Peas was displayed by Messrs. H. J. JONES, LTD., Lewisham. The varieties represented a large assortment, and they were presented in the best manner.

Very beautiful, too, were Sweet Peas shown by Messrs. E. W. KING & Co., Coggeshall, Essex, who utilised Bamboo stands and vases to elevate the flowers. In this collection we noted *Evelyn Hemus*, *Lord Charles Beresford*, *Mrs. Wm. King*, and *Princess Victoria*, these being the more conspicuous of a very fine display.

Mr. W. BREADMORE, Winchester, had a charming group. *Etta Dyke*, *Audrey Crier*, *Princess Juliana* (pale primrose), *Dazzler*, and *Elsie Herbert* were among the best varieties.

Another fine group of Sweet Peas was made by Messrs. DOBBIE & Co., Rothesay. The flowers were particularly fine and the vases well disposed and arranged. *Dobbie's Mid-Blue*, *Earl Spencer*, *Betty Cantley*, and *Mrs. Ireland* were all conspicuous and good.

Mr. ROBERT CHAPLIN, Waltham Cross, showed a collection of the best kinds in commerce, *White Spencer*, *E. J. Castle*, *George Herbert*, and *Mrs. Collier* being a few of the more notable sorts.

Both Messrs. J. & A. CLARK, Dover, and Messrs. G. STARK & SON, Great Ryburgh, also staged these popular flowers in variety.

ROSES.

The Show was remarkable for the extra large plants of Rambler varieties, which must have been trained for several years. Rarely have finer cut blooms been observed so early in the summer, a fact for which the abundance of sunshine during the present month is mainly responsible. The sunshine has permitted the grower to afford ample ventilation, thereby increasing the substance and enhancing the tints of the petals.

Mr. GEO. PRINCE, Longworth, Oxford, showed a group of thickly-disposed Rambler Roses in pots, of which *Dorothy Perkins*, *Hiawatha*, *Lady Violet Henderson* (a white, semi-double flower), and *Lady Gay* were the more conspicuous plants.

Messrs. W. PAUL & SON, Waltham Cross, Herts., showed a great group of climbing Roses, grown as pillars, columns, weepers, &c. (see fig. 157). We noticed *Fairy* (white), *Coquette* (pink), both single-flowered; *Tausendschön*, *Stella*, *Crimson Rambler*, *Goldfisch*, and many more of the Rambler class beautifully flowered, and grand decorative subjects. The plants stood 5 to 10 feet high, and were profusely bloomed. Among these were placed H.P., H.T., and T. Roses as dwarf plants. We remarked *Lyon Rose*, *Marquis de Sinety*, a globular, canary-yellow variety that opens well, has great substance, and is not too weighty for the stalk; *Margaret*, a fine, flesh-coloured flower of nice shape, when half open it is a grand thing! *Coquina*, a pink, single Rambler, very free; *Elaine* is a prettily-formed, white T.H., and at its best when half open; *Le Progrès*, a good coat flower in colour of an orange shade with a pink suffusion; *David Williamson*, a large crimson flower, and *White Maman Cochet*.

Messrs. H. CANNELL & Sons, Swanley, made a neat display with Rambler Roses as small plants, the brilliant *Baby Rambler M^{me}. N. de Levassieur* making a fine feature as plants of 1 to 2 feet high. The new hardy "American Pillar," the flowers of which are single and of a crimson colour and white in the centre, are 4 inches in diameter. It is very free in flowering (see fig. 156). All the different Rambler varieties were profusely bloomed in this exhibit.

Messrs. W. CUTBUSH & SON, of Highgate and Barnet, employed around and as a group carpet between the plants and cut blooms of *Carnations* shown by them in a large corner group in the great marquee, a large number of Rambler Roses in crimson, white and pink varieties, and numbers of very large *Polyantha*, and *Wichuraiana* hybrids were arranged in a line at the back of the group with pleasing effect. The variety *Veilchenblau* was shown well.

Messrs. PAUL & SON, The Old Nurseries, Chess-hunt, made a great show with *Roses* of the Rambler and *Polyantha* classes, of large-sized plants, and of varied forms. The rest of their group consisted of *Roses* of varying heights and sizes. There were noted well-flowered plants of H.T. J. B. Clark (a flower of a dark crimson tint), H.T. Richmond, H.T. Friedrichsruh, H.T. Marquis de Sinety; H.T. M^{me}. de Luze, H.T. Chateau de Clos Vougeot, H.T. David Harum, H.T. Joseph Lowe, H.T. Queen of Spain (in fine form), H.T. W. Shean, the new Tea Rose *Paula* (a white bloom with a suspicion of green), *Rhea Reid*, *T. Lady Roberts*, the grand H.T. *Mrs. Aaron Ward* (an enormous bloom, very full of creamy-white, with an orange tint in the centre), and H.P. *Frau Karl Druschki* (a grand plant of this variety).

Messrs. R. SMITH & Co., St. John's Nursery, Worcester, had put a fine backing of *Crimson Rambler Roses* to their *Clematis* group.

Mr. CHARLES TURNER, The Royal Nurseries, Slough, arranged an extensive group of *Roses*—H.T.s, T.s, H.P.s and *Ramblers* in variety. We noted fine examples of *Hugh Dickson*, *M^{me}. Jean Dupuy*, *Frau K. Druschki*, *Souvenir de Pierre Notting*, *Mrs. J. Laing*, *J. B. Clark*, *M^{me}. V. Verdier*, *M^{me}. Jules Gravereaux*, and other favourite *Roses*. The display was made with standard plants of varying heights in the case of *Ramblers* and other varieties.

Messrs. FRANK CANT & Co., Braiswick, Colchester, staged many finely-bloomed Rambler *Roses*, as, for example, *Minnchaha*, *Hiawatha*, *Philadelphia*, *Austrian*, and *Copper Briars*, *Tausendschön*, *Dorothy Perkins*, &c.

The cut blooms of H.T.s, H.P.s, and T.s were of fine proportions, and in the best condition.

Mr. G. MOUNT, Canterbury, made a magnificent display of cut blooms, having bold masses of the most effective varieties. Especially good were flowers of the white Frau Karl Druschki variety.

Messrs. HOBBIES, LTD., Dereham, Norfolk, staged a group consisting principally of climbing varieties.

Messrs. BENJAMIN R. CANT & SONS, Colchester, arranged a stand of climbing and Rambler Roses, fronting which were show boxes filled with cut blooms of many of the finer varieties of H.T., H.P., &c. A

character, nor has the quality ever been so high. It is to be noted with satisfaction that the small, meaningless—and, therefore, unnatural—exhibits of rockwork of past years have given place to a more pleasing form of exhibit. The disposal of the rocks and the grouping of the plants, if not of an ideal character in all cases, were decidedly good in the main.

Among the most interesting and suggestive of Alpine and rock-garden exhibits was that from the CRAVEN NURSERY, Clapham, Lancaster. Most prominent among the best things were such species as *Daphne rupestris*, the tufts crowded with rosy blossoms, *Edraianthus serpyllifolius* major, *Haberlea rhodopensis virginalis*, Saxi-

and others. Other plants of note included *Eremuri*, hybrid Irises of several sections, *Calochorti*, *Incarvillea grandiflora*, *Ixias*, and hardy *Cypripediums*.

Mr. HOWARD H. CRANE, Highgate, had a pretty group of the *Violas* and their diminutive sisters the *Violettas*. The plants, arranged in pans, were particularly pleasing and effective.

Messrs. BAKER'S, Wolverhampton, in an extensive exhibit, displayed a large collection of *Violas*, together with a well-arranged Alpine and rock-garden exhibit, including *Dodecatheon*, *Saracenias*, *Cypripediums* in variety, *Irises* and *Saxifragas* were freely and effectively set out.

THE KING'S ACRE NURSERY Co., Hereford,

THE TEMPLE SHOW.

FIG. 156.—MESSRS. CANNELL'S EXHIBITION OF ROSES, INCLUDING THE NEW VARIETY "AMERICAN PILLAR."
(See p. 354.)

neat crimson Rose is King Cole; Prince de Bulgarie is good in tint, but the form is flat; and Mme. A. Chatenay is another flat Rose, but the colour redeems it. The bloom of J. B. Clark was likewise good in this collection.

HERBACEOUS AND ALPINE PLANTS.

Herbaceous and Alpine plants and flowers have for years past constituted one of the leading features of the Temple Show, but probably never before have there been so many exhibits of this

fraga *Aizoon rosca*, *S. a. lutea*, *S. a. flavescens*. perfect carpets of *Iris cristata*, the lovely *Aquilegia glandulosa*, *Eritrichium nanum*, *Myosotis rupicola*, *Androsace villosa*, and sheets of blossoms of *Primula farinosa*.

Of quite another pattern was the sumptuous and extensive group of hardy plants from Messrs. WALLACE & Co., Colchester. Here Lilies were in great force, splendid groups of such species and varieties as *Brownii*, *japonicum colchesteri*, *Hansonii*, *Thunbergianum* Orange Queen,

sent a capital display of hardy plants, including *Ramondias*, *Haberlea rhodopensis*, Alpine *Phloxes*, *Primula Sieboldii* in variety, *Edelweiss*, and other interesting species.

Messrs. LILLEY'S, Guernsey, had a very showy lot of the early-flowering *Gladioli*, *Ixias*, and the so-called Peacock Iris, *I. pavonia*.

Messrs. JACKMAN & SONS, Woking, exhibited an excellent display of many of the best herbaceous plants, a centre being formed of *Cypripediums*, including *C. spectabile*, *C. acaule*, *C.*

Calceolus, and *C. pubescens*. A mass of *Daphne Cneorum* in this group was particularly fine, whilst Irises, Eremuri, Globe Flowers and Lupins were freely displayed.

From Messrs. G. & A. CLARK, LTD., Dover, came a very good exhibit, *Iris tectorum album*, *I. Susiana*, and the single *Pyrethrum John Malcolm*, a fine pink flower, being prominent.

Mr. W. J. GODFREY, Exmouth, had many of his varieties of the Oriental Poppy in shades of crimson, salmon and pink.

The display of Tulips from Messrs. HOGG & ROBERTSON, Dublin, was very fine, the Darwins and May-flowering types being alike represented.

Mr. B. LADHAMS, from Southampton, brought many good hardy plants, a conspicuous feature being made of a brilliantly-coloured *Heuchera* named "Shirley." *Ostrowskia magnifica* and *Aquilegia Stuartii* were excellent.

Mr. WM. ARTINDALE, Nether Green, Sheffield, brought an excellent arrangement of Violas, with *Cypripedium macranthum*, *Mertensia primuloides*, a most distinct plant, also *Primulas* of many kinds and a large number of Alpines.

Messrs. GEO. BUNYARD & Co., Maidstone, had a most effective group of the best perennials, including *Pæonies*, Irises, Poppies, Eremuri, *Pyrethrums*, Darwin and other Tulips and *Saxifraga pyramidalis*. Many Alpine and dwarf-growing plants were staged effectively by this firm.

Messrs. GUNN & SONS, Olton, near Birmingham, had a fine bank of *Viola cornuta atropurpurea*, the mass of blossoms making quite a display. *V. cornuta* type and *V. c. alba* were staged in smaller patches to show their distinctive features.

Some very good hardy plants came from Messrs. J. CHEAL & SONS, Crawley, who had also set up a pleasing and naturally-disposed rock-garden, which was greatly admired. The planting of this left little to be desired, and large numbers of Alpines were arranged with skill.

Messrs. STORRIE & STORRIE, Glencarse, Perthshire, exhibited a capital collection of named *Polyanthuses*, some of them being very fine.

An excellent variety of Perpetual Pink, named Progress, was shown by Mr. C. H. HERBERT, Acock's Green, Birmingham, the variety possessing very long stems and well-formed flowers.

An extensive and interesting exhibit of hardy plants came from Mr. AMOS PERRY'S Hardy Plant Farm, Enfield, the group being particularly rich in Irises, *Daphne Cneorum*, Gerberas, *Phlox canadensis* Perry's variety, and Tree *Pæonies* of many showy kinds. The Cushion Irises and their hybrid allies, the *Regelio-cyclus* varieties, were here in plenty. *Iris pallida* Wm. Marshall is said to attain to a height of 5 feet. There was a remarkable wealth of material in this group and many choice and interesting plants.

Mr. H. HEMSLEY, Crawley, arranged a somewhat extensive rockwork exhibit, usefully employing a number of choice Alpines and flowering and coniferous shrubs, the *Ramondias*, *Saxifraga longifolia*, Alpine *Phloxes*, *Aubrietias*, and a delightful lot of *Iris cristata* being noted among many kinds.

Mr. M. PRICHARD, Christchurch, Hants, brought a particularly showy lot of hardy perennials, the Oriental Poppies, of which *Fringed Beauty*, *Crimson* and *Queen Alexandra* were the best, being very striking in large masses. *Iris filifolia*, a bulbous species like a large Spanish kind, was also good.

From Messrs. BARR & SONS, Covent Garden, came a very striking exhibit of Irises, *Ixias*, Tulips, Early *Gladioli*, hardy *Cypripediums*, *Pæonies*, *Pyrethrums* and Alpines, the very showy Orange Daisy, *Dimorphotheca aurantiaca*, from Namaqua, being of especial merit.

Messrs. DOBBIE & Co., Rothesay, staged in admirable fashion one of their extensive collections of tufted, exhibition and fancy Pansies, among which were many Violas cut from two-year-old plants in Essex, to show their hardness and perennial character. The *Columbines* from this firm were excellent.

Alpines and rock shrubs were nicely displayed on a small rockery contributed by the HARDY PLANT NURSERY, Guildford, the *Edraianthi*, *Anthyllus montana*, *Androsaces*, and Alpine *Phloxes* being particularly good.

Messrs. REAMSBOTTOM & Co., Geashill, King's Co., Ireland, had fine strains of *Anemones* and *Mimulus*.

Mr. G. REUTHE, Hardy Plant Specialist, Keston, surpassed himself on this occasion with a

particularly good, interesting and choice lot of Alpines and *Rhododendrons*, the latter including such species as *R. Dalhousiana*, *R. Keysii*, *R. Falconeri*, *R. Roylei* and others. The Alpines were very numerous, and among novelties we noted *Haberlea Ferdinandi Coburgii*, a pale blue and white form of merit and evidently of good growth; *Anemone sulphurea*, *Tricuspidaria lanceolata*, *Cypripedium macranthum*, *Daphne alpina* (white), *D. caucasica* (white), *Ourisia coccinea*, *Daphne Cneorum*, *Fritallaria camtschatica*, and *Tanakea radicans* were also noted in a very large collection.

Messrs. GEO. MALLET & Co., Cheddar, had a somewhat extensive display, in which Gerberas, Irises, Tulips, *Lithospermum*, and the rather distinct *Aquilegia flabellata alba* were seen.

Mr. R. C. NOTCUTT, Woodbridge, brought a showy collection, such as Globe Flowers, Lupins, Poppies, *Pyrethrums*, and the pretty *Iris Tolmieana*, which is very distinct at this season.

A rocky bank well planted with Alpine and other plants from Messrs. T. S. WARE, LTD., Feltham, contained many good things, the chief of which were *Trilliums*, *Dodecatheons*, *Cypripedium macranthum*, very fine, *Androsace Chumbyi*, *Silene virginica*, *Saxifragas* in many kinds, and *Gentians*.

Messrs. R. H. BATH, LTD., had a very showy lot of Darwin and May-flowering Tulips, each group being well represented.

Messrs. HARKNESS & SONS, Bedale, Yorkshire, had a splendid display of Globe Flowers, which showed superior cultivation, the handsome blossoms and rich colouring being very striking.

BEES LIMITED, Liverpool, had a capital lot of *Primula Forrestii*, *P. Bulleyana*, *P. cortusoides* var. *lichangensis*, and *Incarvillea Bouvalotii*.

Iris pallida dalmatica alba, from Mr. WALTER R. PRICE, Canterbury, appears to be a novelty of merit—it is said to be a sport—but it lacked size through having been brought in too early. We hope to see the plant again.

Mr. N. LOWIS, Bridgewater, showed a capital group of *Anemones*, Poppies, and other plants; Messrs. GILBERT & SON, Bourne, displayed *Anemones* in variety; Messrs. W. BULL & SONS, Tulips; and Mr. J. FORBES, Hawick, Pansies, *Phloxes*, *Pentstemons*, *Delphiniums*, and other species.

EXHIBITS DISPLAYED OUT-OF-DOORS.

Many exhibits were placed on the turf for lack of space under canvas or because of their character. Heavy designs and models of rockeries, garden pools, &c., were features more common than on previous occasions, and these, perforce, could only find a place in the open air.

Messrs. J. CARTER & Co., High Holborn, had thrown up a mound 4 feet high, inserting an imitation of a massive piece of rock at one side, and in front of this a small lake had been made and planted with water Iris, water Lilies, &c. The mound, made a week before the show, was planted over with Conifers, Japanese Maples, and the flat turf plot with Iris in bloom, *Saxifragas*, and various Alpine plants in bloom (see fig. 149).

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, were perhaps the largest exhibitors of hardy flowering plants on this occasion. A large corner group was admirably filled with *Rhododendrons*, with Bay trees in the background, among which were well-flowered Pink Pearl, *R. Memoir*, and other varieties. In front of these there were placed little groups of plants in bloom, among which were *Canna J. D. Isele*, a grand flowering plant with bright crimson flowers. It is of dwarf growth, and the flowers are of great size for those of a *Canna*. As noteworthy among the tribes of dwarf plants, we observed *Eremurus*, *Laburnum Vassi*, *Actinidia chinensis*, *Wistaria sinensis*, *Weigelas*, Japanese *Acers*, *Cytisus*, *Viburnum utile* (see fig. 151), &c. The low-growing plants in the front consisted of new introductions from eastern Asia, Tibet, and Japan. There was a scarlet-flowered *Primula*, a cross between *P. Cockburniana* and *P. × Unique*; *P. sibirica*, with rosy-purple flowers borne high above the leaves; and *P. Veitchii*.

The Misses HOPKINS, Mere Gardens, Shepperton-on-Thames, constructed a rockery of Kentish ragstone, and planted many species of Alpine and other dwarf plants.

Messrs. GUNN & SONS, Olton, Warwickshire, showed the new *Viola cornuta purpurea*, the best purple variety of this plant.

Mr. AMOS PERRY, The Hardy Plant Farm, Enfield, showed boxfuls of *Lithospermum prostratum* "Heavenly Blue," a plant undoubtedly useful for its colour and dwarf habit of growth. The same exhibitor showed *Phormium tenax* in variety, *Bambusas*, *Aralia*, &c.

Messrs. HUGH LOW & Co., Bush Hill Park, Middlesex, showed *Souvenir de la Malmaison* and perpetual-flowering *Carnations* in quantity, arranged in flat hampers, with a surrounding margin of Rambler and other climbing *Roses* in much variety. These plants consisted chiefly of abundantly-flowered standards and dwarfs.

Mr. L. R. RUSSELL, Richmond Nurseries, Surrey, showed a big group of hardy shrubs and half-trees. There were *Azalea rustica*, *Rhododendrons*, green-leaved and variegated *Ivies*, Chinese *Vitis*, *Aralia Mandschurica*, *Acer polymorphum purpureum*, and others, *Clematis*, *Wistaria sinensis*, and variegated trees of many species.

Messrs. W. FROMOW & SONS, Sutton Court Nurseries, Chiswick, exhibited *Acers*, of Japanese and other species, in abundance.

Mr. R. C. NOTCUTT, The Nursery, Woodbridge, was an exhibitor on a rather large scale of flowering and ornamental-foliaged shrubs and trees such as *Azalea mollis*, *Kalmia latifolia*, *Philadelphus Lemoinei Couquete* (a largish white flower and of slender habit), *Weigela Mont Blanc* (white-flowered), *Erica australis*, *Fabiana imbricata*, *Deutzias*, and *Sambucus racemosa serratifolia aurea*, a pretty form of golden Elder.

Messrs. JOHN WATERER & SONS, LTD., Bagshot, exhibited hardy *Rhododendrons* in large numbers, of which mention should be made of the varieties *Duchess of Connaught*, *Lady Hillingdon*, *Baroness Henry Schröder*, *Pink Pearl*, *Lady Clementina Walsh*, *Doncaster*, *Cynthia*, and *Viscount Powerscourt*. Some of the plants were of large size, and every one of them carried fine heads of flowers. This floral display was well set off by the addition of Japanese *Acers*, *Birches*, and a few *Conifers*. Some nice examples of *Viburnum plicatum* in full flower were remarked in the collection. Plants of *Kalmia latifolia* were shown in capital flowering examples.

Messrs. THOMAS CRIPPS & SON, LTD., The Nurseries, Tunbridge Wells, showed a large collection of *Acers*. Good examples of *Rhododendron Pink Pearl* came also from this firm.

Messrs. PULHAM & SON, 71, Newman Street, Oxford Street, W., showed a method of constructing a rockery out of Kentish ragstone, the bold effect of the large masses of this stone and its admirable adaptability for making artificial rockeries were apparent.

Topiary work in Bay trees was exhibited in numerous examples by Messrs. W. CUTBUSH & SON.

Messrs. J. PIPER & SON, Bishops Road, Bayswater, were smaller exhibitors of this sort of garden decoration.

Messrs. PAUL & SON, The Old Nurseries, Chess-hunt, exhibited *Catalpa pulverulenta*, the leaves of which are spotted densely with white; *Magnolia parviflora*, having an expanded flower; *Lilacs Belle of Nancy*, *Marie Legray*, and *Souvenir de Louis Späth*.

Messrs. WALLACE & Co., Colchester, had constructed an Alpine pool with some ponderous masses of sandstone, very realistic and valuable as an example of good workmanship. The sides were planted with quite a number of suitable plants.

Messrs. BARR & SONS, King Street, Covent Garden, showed pigmy trees. Some of these were new in form and treatment.

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, showed some standard-trained *Cape Pelargonium Clorinda*, also *Heliotropes* and *Fuchsias*, and *Verbenas*, *Heliotropes*, *Lobelias*, *Pelargoniums*, *Salvia Zurich*, full of flower; and *Ferns* in pots.

Messrs. J. CHEAL & SONS, Crawley, Sussex, made a large show with variegated-leaved shrubs and trees; *Azalea mollis*, *Rhododendrons*, *Clematis*, *Spiræa*, *Aralia mandschurica variegata*, *Acer palmatum*, and others, various *Lilacs*, *Vitis* from China, &c.

Messrs. H. LANE & SON, The Nurseries, Great Berkhamsted, made an exhibit of *Azalea mollis* *Rhododendrons*, including *Doncaster*, Mrs. Hunnewell, Mrs. W. Bovill, *George Peabody*, *Sefton*, and *Pink Pearl*.

Messrs. W. CUTBUSH & SON, Highgate, had made a large rockery and a pool of irregular shape—all very naturally designed.

Messrs. J. BACKHOUSE & SON, LTD., York, exhibited a specimen on a large scale of their art of rockery construction. The design was pleasing, and the plants employed were such as the artistic gardener would select for this purpose.

Messrs. CARTER, PAGE & Co., London Wall, E.C., showed Violas, Saxifragas, Spargania, Arenaria, Iberis, Erigeron aurantiacus, Sedum, &c. The whole was surrounded on three sides with tall plants of *Clorinda* Pelargonium.

Mr. CLARENCE ELLIOTT, Six Hills Nursery, Stevenage, exhibited rock plants in much variety on a bench covered with pieces of rock.

Mr. MAURICE PRICHARD, Nurseries, Christchurch, had constructed a small table rockery

AWARDS.

AWARDS OF MERIT.

Rose Coquina.—A Wichuraiana variety having large trusses of single flowers with prettily cupped petals. The plant is of vigorous habit, sending forth numerous long pendent shoots from the ends of which the trusses of flowers are borne. The colour is a shade of pink tipped with rose. Shown by Messrs. WM. PAUL & SONS and Messrs. HOBBIES, LTD.

Rose Margaret.—A hybrid Tea variety of large size. The colour is a delicate pink, the tone being deepest in the centre. Shown by Messrs. WM. PAUL & SONS.

Rose Mrs. Taft.—A Polyantha variety, as exhibited, about 2 feet high. The stiff shoots are crowned with bunches of double flowers that are

size and of the type known as rose-centred. Shown by Messrs. BLACKMORE & LANGDON, Twerton Hill Nursery, Bath.

Carnation Carola.—A large, clove-coloured variety, possessing considerable fragrance, the perfume resembling the Clove Carnation. The habit is vigorous and the flower-stems very long. Shown by Mr. C. ENGLEMAN, Saffron Walden.

Ficus australis variegata.—A number of plants, each about 8 inches in height, were displayed in a basket. The foliage is smaller, but shaped similarly to that of *F. elastica*, and it is densely variegated with gold. Shown by Messrs. SANDER & SONS, St. Albans.

Ptychographis Siebertiana.—A Palm resembling an elegant plant of *Kentia Fosteriana*. It

THE TEMPLE SHOW.

FIG. 157.—GROUP OF ROSES SHOWN BY MESSRS. W. PAUL AND SON. (See p. 351.)

about 20 feet long and 6 feet wide, in which there were small rocky pools and "pockets" for holding Alpines. We remarked *Calceolaria plantaginea hybrida*, *Aster alpinus ruber*, *Anthemis Aizoon*, *Thalictrum adiantifolium*, *Scutellaria indica japonica*, *Trillium stylosum* and *T. ternatum*, and *Primula Bulleyanum*.

Floral Committee

Present: W. Marshall, Esq. (Chairman), and Messrs. E. H. Jenkins, Chas. Dixon, Wm. Howe, J. F. McLeod, C. R. Fielder, N. F. Barnes, W. G. Baker, John Green, C. Blick, C. E. Shea, G. Reuthe, R. Hooper Pearson, H. J. Jones, T. W. Turner, W. J. James, Wm. Cuthbertson, F. Page Roberts, J. W. Barr, Herbert J. Cutbush, W. P. Thomson, Chas. T. Drnery, W. Bain, George Gordon, and A. Kingsmill.

a deep shade of rose. Exhibited by Messrs. HUGH LOW & Co.

Rose American Pillar.—A charming pillar variety with relatively large, single blossoms borne in big clusters. The colour is rose-pink, the base of the petals being white. A variety that is sure to become popular. Exhibited by Messrs. H. CANNELL & SONS.

Rose Jessie.—A dwarf Polyantha Rose, somewhat similar to the well-known Mme. N. Levassour variety. The petals are a beautiful crimson tint. The plant is very suitable for pot-culture. Shown by Messrs. HENRY MERRYWEATHER & SONS, LTD., Southwell, Notts.

Begonia Pink Pearl.—An exquisite variety, the petals being soft rose-salmon. The plant was especially vigorous and had no fewer than eight fully-expanded blooms. These are of the largest

is described and illustrated in the issue for April 25, 1908, p. 257. Shown by Messrs. SANDER & SONS.

Marquerite White Perfection.—A double-flowered variety of the common Marguerite. The disc florets are white and elongated slightly, but they retain their tubular form, and give the flower the appearance of an "Anemone" centred flower such as is seen in some Pyrethrums and Chrysanthemums. Shown by Messrs. G. & A. CLARK, LTD., Dover.

Iris hybrida "Sir Trevor Lawrence" (*I. iberica* × *I. pallida dalmatica*).—The standards and falls of this fine plant are of a deep mauve colour, the former segments having very fine-pencilled white markings towards the outer edges. The falls, which are more heavily reticulated, are white near their bases.

Iris hybrida "Sir Dighton Probyn" (I. iberica x I. pallida dalmatica).—A plant of fine stature and distinction. The standards are of a rose-mauve tone, faintly yet freely lined with white. The falls are of purplish crimson with dark signal blotch. The style branches are of a brownish-crimson shade. This, and the preceding variety are hybrids raised by the late Professor Michael Foster. Both were shown by Mr. AMOS PERRY, Enfield.

FRUIT.

Fruit cultivation was represented less extensively than usual. This is unfortunate, since the vast number of persons who visit the Temple shows are too apt to assume that fruit culture is either at a low ebb in this country or that the culture of flowers dominates all other.

Messrs. RIVERS & SON, Sawbridgeworth, had a group of fruit trees in pots, the kinds including Peaches, Nectarines, Cherries, and Grapes. There were 40 trees in all, showing that fine form and abundant fruiting which invariably characterise the products of this firm. The Peaches were Duke of York, practically the best early forcing variety, and Peregrine. The fruits on both were of good size and rich in colour. The Nectarines were Cardinal and Early Rivers, both well-known varieties, and there were six trees of a new variety not yet named, but here numbered Seedling 101. This has large, smooth, and glossy fruits of a rich vermilion hue, and very handsome. The trees fruit freely. The seed parent was Early Rivers, the pollen parent being a white-flowered seedling raised by this firm, but not put into commerce. More will no doubt be seen of this new variety. The Cherries were Early Rivers and Frogmore Bigarreau.

Messrs. G. BUNYARD & Co., Maidstone, staged a large collection of remarkably well-preserved Apples, in all some 60 dishes, a central dish of 12 very fine, richly-coloured Uvedale's St. Germain Pears, and, with these, two trees in pots of the black Cherry, Guigne d'Annonay. Amongst kitchen Apples very fresh were Annie Elizabeth, Tibbett's Pearmain, Belle du Bois, Calville des Femmes, Newton Wonder, Dumelow's Seedling, Smart's Prince Arthur, Lane's Prince Albert, Belle Pontoise, and Bess Pool. Of dessert varieties, specially good were Lord Hindlip, Carmen Seedling, Baldwin, Allen's Everlasting, Ben Davies, Calville Maligre, McDindoe's Russet, Profusion, Fallawater, King of Tompkins County, Wagener, Calville Rouge, and others.

Messrs. LAXTON BROS., Bedford, set up a very attractive collection of forced Strawberries, both plants in fruit and gathered fruit. They had seven large baskets of Royal Sovereign and Bedford Champion exceptionally good; Cropper, a long, narrow fruit, having unripened points; Epicure, much resembling British Queen; and Rival. The pot plants were Bedford Champion and Reward. There were also dishes of Peaches Duke of York and Hale's Early, capital fruits; and Nectarine Cardinal.

Messrs. J. & F. CHATFIELD, Southwick, Sussex, had two baskets, each containing 60 very fine fruits of Royal Sovereign Strawberry, also several fruiting plants.

VEGETABLES.

In this important section the honours of the show rested with Messrs. SUTTON & SONS, Reading, who set up a collection that not only commanded the fullest attention, but came as a welcome change to visitors, whose eyes had been filled with such repeated masses of flowers. The firm, as usual, set up a collection of forced Potatoes, in 40 dishes, pleasingly arranged, each dish being garnished with purple Beech foliage, thus presenting a striking contrast to the white skins of the tubers. The white varieties included Epicure, Centenary, Early Regent, Harbinger, White City, Ninetyfold, Midlothian Early, Abundance, Sharpe's Victor, and Duke of York. Among the coloured varieties were Early Rose, Beauty of Hebron, Lord Tennyson, King Edward VII., The Dean, Flourball, Reading Russet, and Mr. Bresee. The general vegetables, also effectively grouped, included Cabbages Flower of Spring (very fine) and April. Cauliflower Magnum Bonum, Broccoli Late Queen (a centre pyramid), Lettuce Golden Ball (in several baskets), fine Peas Duchess of York, Duke of Albany, Early Giant, and Sutton's Ideal (a blunt-ended pea). The French Beans were of the climbing Princess of Wales; Carrots Champion Scarlet and Favourite; Cucumbers Matchless and Sutton's Market; Tomatos Best of All, Winter Beauty,

and the yellow Sunbeam; Potato May Queen; there were dishes of excellent Twentieth Century Mushrooms; numerous Radishes; and bundles of outdoor stems of the Sutton Rhubarb, very massive and of deep colour.

Mr. S. MORTIMER, Rowledge, Farnham, showed in shallow boxes some superb Cucumbers of the varieties Lord Roberts (from 16 to 18 inches long), Improved Telegraph, Tender and True, Express, and Bountiful (new), fruits very dark green, smooth and handsome, averaging 14 inches in length. Also six dishes of Tomato Sunrise, showing its great productiveness, as well as the beauty of its fruits.

Six large bundles of Giant Asparagus set up on a carpet of Parsley, came from Mr. STEPHENSON, Burwell, Cambridge. The stems were 10 inches long and very fine.

From THE THATCHAM FLOWER FARM, Newbury, Berks., came a collection rather too closely packed to make an effective group. It included long white Turnips, Paris White Cabbage, and green Cos Lettuces; French Breakfast and other Radishes, Early Gem Carrots, Cauliflowers, and Cabbages.

Mr. THEO. F. DAWES, Syderstone, Norfolk, set up a single root—some 2 feet through—of his Giant Rhubarb Dawes's Challenge, carrying a large, solid body of stems 4 feet in length, the whole weighing 168 lbs.; also stems from outdoors of several varieties.

Awards made by the Council.

Gold Medals.

J. Charlesworth & Co., Haywar's Heath; W. Cuthbush & Son, Highgate; Jas. Veitch & Sons, Chelsea; R. Wallace & Co., Colchester; Wm. Paul & Son, Waltham Cross; Paul & Son, Chestnut; H. B. May & Sons, Edmonton; H. Burnett, St. Margaret's, Guernsey; J. Waterer & Sons, Ltd., Bagshot.

Silver Cups.

Sir J. Colman, Bart., Gutton Park, Surrey (gr. Mr. J. Collier); Leopold de Rothschild, Esq., Gunnersbury Park, W. (gr. Mr. G. Reynolds); Mrs. Kershaw Wood, Glossop, Derbyshire (gr. Mr. J. Gould); Armstrong & Brown, Tunbridge Wells; Sander & Sons, St. Albans; J. Veitch & Sons, Chelsea; L. R. Russell, Richmond, S.W.; J. Carter & Co., Holborn, W.C.; Barr & Sons, Covent Garden, W.C.; G. Jackman & Son, Woking; A. Perry, Enfield; G. Reuthe, Keston; H. Cannell & Son, Swanley; J. Cheal & Sons, Crawley; Bell & Sheldon, Guernsey; F. Cant & Co., Colchester; the Craven Nursery, Clapham, Lancaster; G. Mount, Canterbury; American Carnation Nursery, Sawbridgeworth; T. Cripps & Son, Tunbridge Wells; Alex. Dickson & Sons, Newtownards; Hobbies Ltd., Dereham; J. Backhouse & Son, York; R. & G. Cuthbert, Southgate, N.; R. P. Ker & Son, Liverpool; W. Cuthbush & Son, Highgate; Sutton & Sons, Reading; T. Rivers & Son, Sawbridgeworth.

Silver-gilt Flora Medals.

F. Lloyd, Esq., Coombe House, Croydon (gr. Mr. M. Mills); R. Adnet, Esq., Cap d'Antibes, France; J. W. Moore, Ltd., Rawdon, Leeds; M. Prichard, Christchurch, Hants.; Bakers, Wolverhampton; T. S. Ware, Feltham; Blackmore & Langdon, Bath; R. H. Bath, Wisbech; H. Low & Co., Enfield, N.; C. Turner, Slough; B. R. Cant & Son, Colchester; A. F. Dutton, Iver, Bucks; J. Peed & Son, W. Norwood; Mr. C. F. Walters, Balcombe; J. Hill & Son, Lower Edmonton; W. Fromow & Son, Chiswick.

Silver-gilt Knightian Medals.

G. Bunyard & Co., Maidstone; S. Mortimer, Farnham, Surrey.

Silver-gilt Banksian Medals.

Mr. W. H. Page, Hampton; Mr. R. C. Notcutt, Woodbridge; W. Bull & Son, Chelsea; R. Smith & Co., Worcester.

Silver Flora Medals.

The Hon. Vicary Gibbs, Elstree, Herts. (gr. Mr. E. Beckett, V.M.H.); Wickham Noakes, Esq., Selsdon Park, Croydon (gr. Mr. W. Howarth); H. Mathias, Esq., Stubbington, Hants.; Mr. A. R. Upton, Millmead, Guildford; Mr. Piper, Bayswater, W.; the Misses Hopkins, Shepperton; Mr. C. Engelman, Saffron Walden; Messrs. Cypher, Cheltenham; G. & A. Clark, Ltd., Dover; C. W. Breadmore, Winchester; Dobbie & Co., Rothsay; Hogg & Robertson, Dublin; Mr. H. Helmsley, Crawley; H. J. Jones & Co., Lewisham; W. R. Chaplin, Waltham Cross; J. Green, March; E. W. King & Co., Coggeshall; Ladham, Ltd., Shirley; W. H. Lancashire, Guernsey; Geo. Prince, Longworth.

Silver Knightian Medals.

Hughes, Jones & Peers, Thatcham Fruit Farm, Newbury; R. Stephenson, Burwell, Cambridge; J. & F. Chatfield, Southwick, Sussex; Laxton Bros., Bedford.

Silver Banksian Medals.

Stanley & Co.; W. Artindale & Son, Sheffield; G. Mallett & Co., Cheddar; W. H. Page, Hampton; King's Acre Nurseries, Ltd., Hereford; C. Elliott, Stevenage; H. N. Ellison, W. Bromwich; Gunn & Sons, Olton; Frank Lilly, St. Peters, Guernsey; Storrie & Storrie, Perth; Vivian Phillips, Esq., Orpington (gr. Mr. T. Hobbs).

Class 1 B (for Group of Orchids).

1st (Sherwood Cup, value £21), F. Mentieth Ogilvie, Esq., Oxford; 2nd (Silver Cup), Sir Jeremiah Colman, Reigate.

Class 1 C (Group of Orchids not exceeding 75 square feet).

1st (Veitch Memorial Medal and £5), Duke of Marlborough; 2nd (small Silver Cup), Mrs. Kershaw Wood, Glossop.

Class 1 D (for Orchids not exceeding 35 square feet).

1st (Silver Cup), not awarded; 2nd (Silver Flora Medal), R. Ashworth, Manchester.

MARKETS.

COVENT GARDEN, May 26.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

REMARKS.—The demand for Australian and Tasmanian Apples remains good. French Cherries are arriving in increased quantities, but they have not met with a brisk sale. Oranges of best quality are slightly cheaper. English Gooseberries are received in small quantities only. Nectarines are plentiful and fairly cheap. Peaches are a good trade and realising fair prices. Strawberries, both English and French grown, are exceedingly plentiful and very cheap. The vegetable trade is quiet. Green vegetables found a fair

market last Tuesday. English Beans are plentiful. Trade generally is fair. E. H. R., Covent Garden, Wednesday, May 26, 1909.

REMARKS.—The trade for old Potatoes is not very good, owing to the larger quantities of new tubers now arriving. E. J. Newborn, Covent Garden and St. Pauls, May 26, 1909.

COVENT GARDEN FLOWER MARKET.

During the past week the trade in bedding plants has been brisk. A few subjects are difficult to procure, but generally supplies are excessive. Bedding Pelargoniums (Geraniums) have sold well, also most other well-grown plants in small pots, suitable for summer bedding. Plants in store boxes are much cheaper than they were a few years ago.

CUT FLOWERS.

Roses are arriving in large quantities, and although their value advanced a short time ago, prices have fallen again. Carnations also are plentiful, and generally of good quality. The number of persons who cultivate this plant has largely increased, and although the demand for Carnations has also increased it has not been in the same proportion. Lilium longiflorum is good and rather over-plentiful. This morning many of these flowers were unsold. Sweet Peas vary in quality; only the best make more than 3s. to 4s. per dozen bunches; some are sold as cheaply as 1s. 6d. per dozen bunches. Of Callas only those of the best quality are in demand. There is an increased demand for Spanish Irises now that the Daffodils are over. Iris germanica does not sell so readily as the Spanish Irises. Gladiolus Colvillei in its several varieties is good. Iceland Poppies and other hardy flowers are plentiful. English growers now do an extensive trade in Gypsophila elegans.

POT PLANTS.

Fuchsias in various sizes are well flowered. Since these have been used largely for bedding purposes, several growers market them in 3-inch pots. Marguerites are very plentiful. Of Mignonette the greatest demand is for the spring-sown plants, which are backward this season. The single yellow Chrysanthemum is sent by several growers; in most instances the plants are dwarfed than those seen a few years ago. Crassulas are well in flower, but it is only the dwarf hybrid varieties that are seen yet. Saxifraga (Cotyledon) pyramidalis is very pretty. Pelargoniums of all types are well supplied. Ferns and Palms vary but little. Aspidistras are cheaper. A. H., Covent Garden, Wednesday, May 26, 1909.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending May 26.

A most welcome rain.—During the past week there were five very warm days and four moderately warm nights. On the three warmest days the temperature in the thermometer screen rose respectively to 79°, 78°, and 75°. These are all high temperatures for the time of year. In fact, in only four of the last 23 years has such a high reading as 79° been recorded here in May. On the other hand, on the first night of the week the exposed thermometer registered 6° of frost. The ground, which during the last few days has been warm for the time of year, is now, owing to the colder weather of the last few days, only at about an average temperature. Rain fell on two days to the total depth of ½ inch, nearly the whole of which quantity was deposited between 4 and 10 a.m. on the 25th. This rainfall restarted the bare soil percolation gauge, but it had no effect on the gauge on which short grass is growing. The sun shone on an average for 9 ½ hours a day, or for 3 ½ hours a day longer than is usual at this period in May. Light airs as a rule prevailed, and their direction was mostly some point between south and west. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 3 per cent. A selected tree of the Horse Chestnut first showed an open flower on the 8th, which is five days earlier than its average date for the previous 13 years, and 11 days earlier than last year. E. M., Berkhamstead, May 26, 1909.

SCHEDULES RECEIVED.

Cardiff and District Chrysanthemum Society's exhibition of Chrysanthemums and other flowers, also fruit, to be held in the Park Hall, Cardiff, on Wednesday and Thursday, November 3 and 4. Secretary, Mr. J. Mountney, 42, Royal Arcade, Cardiff.

Bath Gardeners' Debating Society's Chrysanthemum show, to be held on November 3 and 4, in the Assembly Rooms, Bath. Hon. secretary, Mr. F. L. Ashman, 17, Prospect Place, Upper Weston, Bath.

Doncaster and District Chrysanthemum Society's 17th annual exhibition, to be held on Wednesday and Thursday, November 3 and 4, 1909, in the Corn Exchange, Doncaster. Hon. secretary, Mr. J. G. Mitchell, 11, High Street, Doncaster.

Great Yarmouth Flower Show, to be held on Thursday, July 15, 1909, in the Winter Gardens, Great Yarmouth. Secretary, Mr. Arthur A. Cash, Winter Gardens, Great Yarmouth.

Abbey Park (Leicester) Flower Show, to be held on Tuesday and Wednesday, August 3 and 4. Superintendent, Mr. J. Burton, Abbey Park, Leicester.

Women's Agricultural and Horticultural International Union's show and sale of garden produce, at the Royal Botanic Gardens, Regent's Park, London, on Wednesday, July 21, 1909. Show secretary, Miss Bull, 64, Lower Sloane Street, S.W.

ANSWERS TO CORRESPONDENTS.

CHRYSANTHEMUMS: H. J. G. For your purpose it will be advisable to pinch the points of Niveum and Queen of the Exe at once, treating the other varieties in a similar manner in a fortnight's time. But do not stop the plants and transplant them at the same time.

COS LETTUCE: W. P. To obtain Cos Lettuces of the variety mentioned by August 11, allow from 10 to 11 weeks from the time the seed is sown. Model Turnip will require from 11 to 12 weeks. To ensure that some will be at their best at that date, make two small sowings of each, one week apart, as so much depends on the weather.

GARDENING BOOKS: A. P. The works you mention are of little value; both are out-of-date, and, being plentiful, have little worth bibliographically.

GRAPES DISEASED: A. B. The spotted berries are affected by the fungus Gloeosporium amplexophagum. Those that have a rusty appearance have suffered some mechanical injury, such as rubbing by the scissors or the operator's hair during the process of thinning. In the case of the spot disease, cut out all the affected berries and burn them. Afterwards spray the bunches with liver of sulphur, using half an ounce in two gallons of water. Be careful not to let the liquid fall on the woodwork, as it turns white paint black.

MARKET-GARDEN BUSINESS: W. J. D. You cannot embark on the business of a market-gardener with the capital you mention with any reasonable prospect of succeeding. To begin with, you would probably be required to pay a quarter's rent in advance, and this would leave you without sufficient working capital. Moreover, you appear to have had no previous experience in market-gardening work, which is very different, even in the methods of production, from that practised in the best private gardens. We would therefore advise you to procure employment for a year or two in a market-garden establishment, in which high-class produce in the way of fruits and flowers is cultivated, making the best possible use in the meantime of the opportunities thus offered you to acquire a practical knowledge of the work, in which you yourself intend to engage. Those who contemplate entering into the business of market-gardener, and who calculate upon the prices which good examples of Grapes, Peaches, Cucumbers, and Tomatoes are likely to realise in certain months of the year, should also try to realise what the probable cost of production would be.

NAMES OF FRUITS: H. P. M. Norfolk Beefing.—Bungay. Newton Wonder.

* INSECT PESTS ON FRUITS.

THE publication of an extensive work on an important section of economic entomology by such an experienced observer as Mr. F. V. Theobald calls for something more than passing congratulation. Mr. Theobald receives some 3,000 appeals for assistance from anxious growers every year, and the material which thus passes through his hands places him in an excellent position for obtaining a varied, accurate, and detailed acquaintance with that branch of zoology which he has made his own. In Scotland a somewhat similar position is occupied by Dr. R. S. MacDougall, and in Ireland by Professor Carpenter, but neither of these countries can be said to present the same intensive field as England, nor have their pests been so systematically and continuously investigated.

It is safe to say that the complete work on economic entomology has yet to be written, and it is difficult to see how it can ever be done by one man. There are two sides to the life of an insect, and the investigation of these embraces points of view so essentially diverse as to be too severe a tax on the versatility of any one individual. The practical man, on the one hand, spending every day amongst

his plants, observes many curious and obscure phases of insect life, and observes them all the more surely and readily because his imagination is unfettered by scientific tradition. The man of science, on the other hand, working mostly in his laboratory, and only at intervals sallying forth into the field, is well equipped, in virtue of his training, to work out complicated life histories, and to determine the physical conditions of insect existence. He has to his credit, for example, our knowledge of the amazing life history of the Grape vine Phylloxera, but none the less he has his limitations. He can work out the development of the mole-cricket from the egg to the adult in every detail, but he fails to observe that the mole-cricket has a fatal weakness for meandering over smooth objects. In this particular instance the small fact to the credit of the practical man is, from the point of view of getting rid of the offender, worth all the remedies based on purely scientific knowledge. In another case, to quote only that of the winter moth, the scientific evidence may be sufficient in itself to suggest a satisfactory remedy.

The point we wish to emphasise is that success in the destruction of insect pests is not the prerogative either of the scientific experimenter or of the practitioner, and that only when the two consent to co-operate may complete knowledge be obtained. Both aspects are essential, but neither complete. At the present time it is to be deplored that the one is apt to discredit explanations based on observations difficult to understand (and often badly presented), and the other to reject evidence simply because he has not, and could not have, collected it himself, or because it is occasionally at variance with his professional tradition. The education of both sides is however, proceeding, and there are signs that the entomological millennium, at any rate, may yet be realised. In this connection we may sympathise with a regret stated by Mr. Theobald that the recent work of Gillanders should not have been less scientific and more a record of his own peculiar and interesting experience, and we can certainly echo the desire, expressed in the introduction to Mr. Theobald's book, for more advice and sympathy from the practical man.

Against Mr. Theobald's book two criticisms will probably be levelled. He states in his preface that "the volume is by no means complete, but it has reached such proportions that it is impossible to give all the information it was hoped to give." The book extends to 550 pages, and, therefore, apart from any question of expense, is too extensive a work to place in the hands of a student, especially as it covers only a portion of the field. But for practical purposes it should be even more detailed, and in certain cases we have found his definitions too condensed for the satisfactory diagnosis of the insect. We should have preferred to see the book twice its size and encyclopaedic in character. Mr. Theobald would have found ample support in the publication of such a monograph. We may, therefore, express the hope that he will consider the expediency of publishing an extended description of his material and results at some future date.

The other point relates to the illustrations. Those drawn by Mr. Horace Knight are admirable, and, to select only a few, we now have

for the first time, in an accessible volume, excellent illustrations of the Apple blossom weevil, the bark beetle, the Raspberry shoot moth, the shot borer and Raspberry beetles, by which these insects may be readily identified. As we take this to be the sole function of the pictures, we differ from the author as to the advisability of using photography so largely for this purpose. It too often illustrates only the perils of the short cut (compare on p. 134 the careful drawing of Aphis sorbi with the photograph of the same species). In spite of some successes, such as the lappet moth (p. 21), the photographic reproductions fail either in the correct rendering of colour value (compare the vapourer moth, p. 39, and the codling moth, p. 71), or on account of the well-known difference between the sensitive plate and the retina of the eye as regards light and shade (compare the buff-tip moth, p. 295, the Pear fruitlets attacked by Pear midge larvæ, p. 344, and the male mealy bugs, p. 486), or because of reflection from the object photographed (compare the goat moth larva, p. 42, the Black Currant mite, p. 233, the slug worm, p. 336, and the cockchafer larva, p. 433). On p. 48 the characteristic feature of the male wood leopard moth does not appear at all. Further, we should have liked to have seen a calendar on the lines of the admirable exhibits one sees in some Continental museums illustrating the entomological year, from the economical standpoint, such a calendar would be of great value to the grower in assisting him to identify his pests. Finally, we hardly think the practical man can be expected to sympathise with the purely academic amusement of juggling with scientific terms which forms so large a part of the labours of the systematic zoologist. It is questionable how long this will be tolerated even in systematic zoology, but it is certain that the man of affairs, failing to see the humour of the game, will brush it aside as the baronet did the tiresome and frivolous accuracy of the antiquary. Therefore, we prefer to think of the mussel scale still as Mytilaspis pomorum.

However, these matters are by the way. Mr. Theobald has produced a great work, and one which will rank with John Curtis's *Farm Insects* as one of the classics of economic entomology. It is a work based essentially on the sound practical experience of many years, and no fruit-grower can afford to disregard so important and helpful a record. The scope of the work may be gathered from the lengthy list of plants dealt with. It includes the Apple, Apricot, Cherry, Currants, Damson, Fig, Gooseberry, Loganberry, Nuts, Peach, Pear, Plum, Pineapple, Quince, Raspberry, Strawberry, and Vine. About 380 species of insect and other pests are mentioned, and many of these are described and figured. They are given, as they should be, under the name of the plant attacked, and not in zoological sequence. Appendices have been introduced on such subjects as the possible spreading of imported pests, beneficial insects, and the composition, manufacture, and makers of insecticides and spraying apparatus. We are glad to find Mr. Theobald taking up a very cautious and judicial attitude on the value of remedial measures. Much harm has been done, and scepticism encouraged, by imperfect observation and worse remedies. For example, to mention only three subjects

* *The Insect and other Allied Pests of Orchard, Bush, and Hothouse Fruits*, by F. V. Theobald. Published by the author, Wye Court, Wye, 1909.

which have come under our notice within recent years, we are told one year that millipedes are very noxious forms, and the next that they do no harm; or that it is vitally necessary to restore the balance of nature by introducing predaceous insects, and again, the futility of that proceeding is dwelt upon; or that mussel scale is destroyed by lime wash and afterwards that that remedy is worthless. On this question Mr. Theobald maintains the thoroughly sound attitude that our present knowledge is wholly insufficient to deal satisfactorily with more than a very few pests, and he urges further research in this important direction. Research in economic biology must be undertaken by thoroughly competent, trained observers, and should, above all things, be refined and accurate. It is imperative that conclusions should be well tested before they are published, or the interests of the class intended to benefit may be sacrificed. The necessity to recant means not only that growers have spent their money on ill-advised remedies, but that their confidence in the trustworthiness of their advisers is destroyed.

We noticed several misprints in reading the work, of which the most important were that *Clisiocampa* and *Orgyia* were wrongly spelt throughout.

Once more we warmly congratulate Mr. Theobald on the publication of this important volume, which brings English work into line with the best achievements of the United States.

HERBACEOUS CALCEOLARIAS.

THE requirements of these plants are simple, and anyone possessing a greenhouse from which frost can be excluded, can cultivate them with success.

We sow the seeds about the middle or end of June, in pans, in a compost of equal parts loam and leaf-mould, with coarse silver sand, the mixture being sifted through a fine sieve.

The soil in the pans should be well watered before sowing the seed. The seeds should be sown thinly, covering them very lightly with soil, and placing the seed-pans in a cold frame. A good plan is to place them on inverted flower-pots standing in saucers of water. The water in the saucers will keep the surroundings moist, which is congenial to the germination of the seeds. In addition it keeps slugs from the plants. If the frame is placed on the north side of a wall, so that direct sunshine cannot reach the seedlings, no shading will be necessary, and the plants will, in consequence, be much stronger. In the course of a few weeks the seedlings will be large enough to be transplanted into pans, which should be filled with the same kind of compost as before. As soon as they are large enough they should be potted singly into small pots and returned to a cold frame having a floor of ashes. Soot should be sprinkled about to keep away slugs. Abundant ventilation should be afforded at all times; indeed, the lights should only be used to protect the plants from rain. As autumn advances the plants make rapid growth and require larger pots. They should be grown in the cold frames until frosts appear, when they should be accommodated in a frost-proof structure. They must be kept cool and placed as close to the glass as possible. Some time in January the final shifting into pots having a diameter of 8½ or 9½ inches should be effected. The compost we use at this stage consists of two parts loam and one part leaf-mould, with dried cow dung and sand added. Grown in this manner, we have never failed to have a fine show of Calceolarias each spring for several years. Some of our plants measure 3 feet through. Aphis sometimes attacks the plants, also a small yellow thrip. These pests can be kept in check by an occasional fumigating with a nicotine compound. *Wilmot H Yates, Rotherfield Park Gardens.*

NEW OR NOTEWORTHY PLANTS.

TILLANDSIA BLOKII.

THIS giant Tillandsia flowered at Glasnevin during the year 1907, and was a conspicuous object for several months.

When in flower the plant measured 6 feet high, the stout, branching inflorescence being 2 feet 3 inches in diameter, and clothed with crimson, sheathing bracts which retained their colouring long after the flowers had faded. The flowers are borne on short stalks in two rows upon the lateral branches. The sepals are crimson, thick and leathery; the three yellow petals, 4 inches long, give quite a contrast in colour.

In the *Gardeners' Chronicle*, vol. xxiii., p. 254, where *T. Blokii* was mentioned among other Bromeliads for exemplary culture at the Ghent Quinquennial Exhibition of 1898, it was said to be in flower and as tall as a man. Mr. F. W. Moore purchased the Glasnevin plant from L'Horticulture Colonial, Parc Leopold, Brussels, in April, 1903, under the name of *Vriesia Blokii*, and was told that it was a seedling of the original shown at the Ghent Quinquennial. At that time it was about 1 foot high; since then it has been growing among other Bromeliads in a minimum temperature of 60° Fahr. After flowering, the whole tuft of leaves dies away. Suckers are produced by some of the Bromeliads at the base stem, but in this case they are very tardy in developing, although a small one has appeared.

FIG. 158.—TILLANDSIA BLOKII IN GLASNEVIN BOTANIC GARDENS. HEIGHT 6 FEET.

The leaves are 6 inches across at the base, gradually tapering upwards until they terminate in an abrupt point. Oblong reddish blotches mark the leaves of this new species, a character not found in the closely-allied *Tillandsia regina*. The illustration (fig. 158) shows the plant in fruit several months after flowering. The capsules are woody, 2 inches in length, tapering to a sharp point; when ripe they split up into three valves containing numerous seeds.

The seeds are curious; they are ¼ to ⅓ of an inch long, brown and slender, with a fawn-coloured tuft of hairs at both ends. The hairs of the lower end are like an inverted pappus of Composite, those at the other end being like a twisted tail, eventually dividing into a pappus-like arrangement.

The larger-growing Tillandsias like a fairly strong soil; a mixture of peat and loam with some manure and sand suits them very well, while the smaller kinds thrive in peat, leaf-mould and Sphagnum-moss.

Under natural conditions most of the smaller plants of this genus are epiphytic on trees. Roots are sparingly developed, but the channelled leaves conduct the moisture downwards to their sheathing bases, which form a number of small reservoirs. The object of this arrangement is seen when one places the epidermis from the base of the leaf under the microscope, for it is covered with numbers of thin-walled, gland-like structures which serve for the absorption of the collected water. *C. F. Ball, Botanic Gardens, Glasnevin.*

ORCHID NOTES AND GLEANINGS.

AN AMATEUR'S EXPERIENCE.

FINDING that certain Orchids not only lived but flowered among my mixed amateur collection of plants, I procured one or two books on Orchids, and then purchased a few plants of *Oncidium varicosum* Rogersii, which flowered freely. I followed the general instructions as to potting material, &c., being careful to have ample drainage, and potting with Sphagnum-moss (of which quantities can be got in this neighbourhood), English Orchid peat and a little charcoal, with sometimes a little Jadoo fibre added. I cannot say I followed any strict rule as to watering, but was careful to see that the potting material did not become sour. *Dendrobiums* were fully exposed to the sun to ripen their growth. *Cypripediums*, in a considerable number of varieties, grew and flowered very freely. *Vanda gigantea*, *Dendrobium speciosum*, and several other Orchids were sent me years ago by a friend in the East. The plants were some years before getting perfectly established, but since that time they have flowered regularly, and I have several young plants, offshoots from *Vanda gigantea*.

So long as they are not allowed to get a chill, my experience seems to indicate that they can live for some time in a fairly low temperature, though no doubt they would not flower if they were permitted to remain in such conditions. In my little house the temperature varies from 55° to 70° in winter, rising to 80° or 90° in summer, and my Orchids are crowded in among Palms, Ferns, Marantas, Caladiums, Hoya, Allamanda, and, in summer-time, Gloxinias, Achimenes and other plants. I append a list of the varieties of Orchids which are crowded into my little place. They seem to thrive, and most of them flower pretty freely. I still have a few which were sent from abroad which have not flowered, although they are quite strong and healthy.

The larger and cooler portion of the house has been very bright with a crowd of *Primula sinensis*, *Cinerarias*, *Chivias*, and some 10 *Hippeastrums*. Most of the *Hippeastrums* we have raised from seed. When these plants ceased to flower their place was taken by Show, Regal, Zonal and Ivy-leaved *Pelargoniums*, *Streptocarpus* (from seed), *Streptosolen Jameonii*, Tuberous *Begonias* (from seed), and later by *Gloxinias*. I get excellent results in August, September and October from *Gloxinias* raised in February.

I have often been struck by letters which I see in gardening papers with regard to growing Orchids. According to these letters, it would be useless for anybody to go in for Orchid growing unless he had some half-a-dozen houses. My experience has been very much the other way. I think there are few plants that stand neglect as they do. Take, for instance, *Pelargoniums*, *Begonias*, *Gloxinias*, &c. Were one to neglect watering these for two or three days the results would be serious; but with Orchids one might neglect watering them for a week or a month without killing the plants. I do not, of course, advocate neglect, but what I do say is that, with any reasonable treatment, a great variety of Orchids may be grown by amateurs with very good results. In summer-time my *Cypripedium* plants are put on the floor, so as to make room for *Gloxinias*, Marantas, Ferns, Caladiums, &c., and I find that they all thrive together in a very friendly manner. My house being a business or official residence, and having no ground attached, seemed to present difficulties in the way of a greenhouse, but I was unwilling to give up the pleasure which I had for years in my previous house, and I therefore managed to get a conservatory erected on the top of a wing of the building opening through what had been a staircase window. It is quite a small house, about 20 feet by 15 feet, with a division cutting off a portion where most of the Orchids are kept, which is about 15 feet by 5 feet.

I think that many writers on Orchids do a great deal to shut out many amateurs from the pleasure of growing these plants, and also do harm to the trade, since, were an amateur to accept all the statements, that this Orchid has to be grown in the *Cattleya* house, and another in the *Odontoglossum* house, &c., &c., he would never undertake Orchid growing.

List of Orchids which thrive with me:—

Cypripedium Spicerianum, *superbiens*, *barbatum nigrum*, *Orphanum*, *Germianum*, *giganteum*, *Leeanum*, *hirsutissimum*, *Charlesworthii*, *polystigmaticum*, *insigne*, *insigne Sanderae*, *Leonidas*, *callosum*, *Lawrenceanum*, *Chamberlainianum*.

Dendrobium aggregatum, *Findlayanum*, *Phalænopsis nobile*, *thyrsiflorum*, *Wardianum*, *June*, *Pierardii*, *crassinode*, *chrysotoxum*, *formosum giganteum*, *melanodiscus*, *Leechianum*, *suavissimum*, *nobile Cooksonii*, *speciosum*, *Apollo grandiflorum*, *Ainsworthii*, *primulinum*, *teretifolium*.

Oncidium varicosum Rogersii, *incurvum*, *unguiculatum*, *ornithorhynchum*, *sarcodes*, *Harrisonianum*, *phymatochilum*.

Aërides odoratum.

Vandas (flowered) *cœrulea*, *gigantea* (unflowered), *Amesiana*.

Odontoglossum crispum, *Schlieperianum*, *Pescatorei*, *grande*, *Rossii majus*.

Oncidium leucochilum.

Cattleyas Trianae, *aurea* and *citrina*.

Cymbidium eburneum, *Lowianum*, *pendulum*.

Laelias superbiens, *cinnabarina* and *pumila*.

Cœlogyne cristata, *Epidendrum O'Brienianum*.

Ansellia gigantea, *Trichopilia suavis*, *Miltonia cuneata*, *Lycaste* (various). *D. Campbell Brown*, *Bank of Scotland House, Oban, N.B.*

AMERICAN NOTES.

SEED CROPS IN CALIFORNIA.

THE past winter was very severe, and there was more rain than has been experienced for 50 years past. On low-lying lands many seed crops have suffered, and in some cases all have been destroyed. This is specially true of the Onion crops in the Sacramento and San Joaquin river district. One seed grower lost 150 acres, and another, 25 acres. These losses were due to the breaking of a level, which flooded the land. In the Santa Clara Valley district the Onions have suffered on the average from the excessive rain, fully 25 per cent., some crops of Onions being wholly destroyed, whilst others are not in the least degree damaged. In the opinion of the writer of the report appearing in *Horticulture*, April 24, there still remain in good condition sufficient bulbs going to seed to supply a reasonable demand of the seed trade for the season of 1910, except in the cases of Red Wethersfield and White Portugal, which will be deficient. Seeds of Lettuces at the present date are being re-sown, and at the best the prospects of any large crops are not promising. Of Carrots there is a very limited area growing in California this season. These crops are looking well, and there is no reason why good crops of seed should not be harvested. Sweet Peas are flourishing; Radishes are promising; Celery, Coleworts, Beetroots, Kohl-rabi, Leeks, Spinach, Parsley, Parsnips, Mustard and Endive all promise good crops.

HORTICULTURE AT THE ILLINOIS STATE FAIR, SPRINGFIELD.

THE horticultural department has secured for the purpose of the next autumn exhibition the whole of the rotunda of the Dome Building, a circular space containing about 13,000 square feet of flooring, exclusive of the main aisle. The walls will be well decorated, and every facility provided for making the finest display ever shown

in the State, outside of the Coliseum in Chicago. There are prizes of more than 2,700 dollars offered in this department.

THE DREER ARBORETUM.

UNDER this name a new experimental garden has been made at Riverton, New Jersey, and its formation will be justified when the large number of new and rare shrubs and hardy plants from all parts of the world are considered. The garden is intended for the testing of plants not generally known or grown in the United States. An experimental section for out-of-door testing of new hybrid Tea Roses was established last year and proved so interesting that it has been largely extended this year. Two hundred varieties, most of them unknown there, are now under observation. An important issue of last year's work was the discovery of *La Detroit*, said to be one of the best bedding Roses extant, having more numerous blooms and being a stronger grower than any other.

MANURES.

THE coming of the motorcar has had many economic issues besides those involved in its manufacture, the most important, from the gardener's point of view, being the shortage of stable manure caused by the general use of motor, in place of horse traction. More particularly does this apply to market gardens and nurseries within easy distance of London, which depend largely on the Metropolis for supplies of manure. A few years ago there was no difficulty in procuring a hundred tons or so of fairly good stable manure from London in the course of a few days, while now one is lucky to get a couple of 10-ton truck loads after giving a week's notice, and the quality is exceedingly bad. Stale fish, decayed vegetables from fruiterers' shops, ashes, and such-like matter mixed with a little of the genuine dung are nowadays contained in a truck of manure. This scarcity of good stable manure is becoming a serious matter to market gardeners and nurserymen generally, and it is hard to say what substitute as good and as cheap can be found to take its place. To firms that have been in the habit of using a thousand tons or more each year this is a grave question that will have to be faced in the near future. There are always various chemical manures that can be used, but it has to be remembered that the cost is an important item where manure is used on a large scale, and that also all manures have two effects on land, viz., chemical and physical. It is easy enough to be mathematically precise as to the actual amount of phosphates, &c., required by the growing crop, but the continued use of inorganic manures on many lands has the effect of leaving the soil very close and stiff, and in some cases almost unworkable. Good stable manure, on the contrary, besides containing plant food, forms after decomposition the rich, black mould so common in old kitchen and market gardens. The mechanical effect, therefore, is important, and on heavy or stiff soils stable manure, with plenty of long straw in it, is a valuable means of keeping the ground open and porous.

Chemical manures may be profitably used in conjunction with stable manure, and on land that has been heavily dressed with natural manures for some years in succession applications of an appropriate artificial manure will be found beneficial. Some of the elements in the chemical manure are capable of combining with constituents in the stable manure that are still present in the soil. In the case of such soil which is sometimes said to contain an excess of organic matter, a dressing of lime does much good. Soot is also beneficial, but it is seldom used.

The amount of plant food in soot, as shown by a chemical analysis, is low in comparison with many artificial manures, but its effect on growing crops is stimulating and persistent. A mixture

of soot, slaked lime and wood-ashes in about equal proportions forms a capital plant food for many crops, more especially Potatoes and other crops in the kitchen garden.

Cow manure is useful on light, dry lands, especially for Rhododendrons and other peat-loving subjects, but it is not obtainable in sufficient quantities to meet the requirements of big firms. Pig manure is hardly worth cartage, as its chemical value is low, it is cold and heavy, and pigs are usually littered down with any rubbish that may be handy, while weeds of all descriptions are thrown to them. In consequence of this a prolific crop of weeds follows its use.

Probably everyone who has had to deal with the growing of various crops has noticed that although a piece of ground has been properly prepared by trenching and manuring in good time, and has seemed an ideal spot on which to grow a certain crop, yet the results have been far below expectations. Everything beforehand has been properly done, the crop has been planted at the right time, no late frosts have occurred to cause any injury, and yet the return has not been anything like what was anticipated. I have to deal exclusively with trees and shrubs, and have noticed this partial failure on several occasions with very different kinds of plants. On the contrary, when necessities of time or space have demanded it and certain subjects have been planted in what has seemed hardly the place for them, they have thriven splendidly. These items of where and what to plant require careful consideration in dealing with anything commercially, and especially with trees and shrubs, as besides the loss incurred through the growth being poor and stunted, there is also the time and labour wasted in planting in the first instance, and afterwards of removal to a fresh piece of ground.

It is an axiom of outdoor gardening nowadays that crops should be planted in rotation, or, in other words, that the same class of plant should not be grown on the same piece of ground twice in succession. This is a good rule, and one that it pays to follow as closely as possible, though limitations of time and space often prevent its strict observance. Then it is that manure has to be used more freely to supply the stimulus necessary for the crop. The recommending of certain manures for certain soils is an invidious task. Variations of climate and soil, a limited area of ground to work on, and the necessity for hurrying matters forward due to a late season: these and similar items call for care and thought, and it is these things that "the man who walks about with his hands in his pockets" has to determine satisfactorily. *J. Clark, Bagshot, Surrey.*

WILDERNESSE PARK, SEVENOAKS.

(Concluded from page 346.)

On the lawns, in addition to a grand Cedar of Lebanon, there are considerable numbers of Conifers, many of which have been so closely planted that they are now crowded, and thinning is needed to allow for further progress and the maintenance of perfect form. The sundial shown in fig. 159 stands on one corner of the terrace near the mansion, and has lawns, trees, and flower-beds near to it. The pleasure grounds are conspicuous for splendid trees. Of the three avenues one, shown at fig. 160, consists of magnificent Lime trees. In the other and smaller avenues the trees are varied, there being Limes, Elms, Chestnuts, and others planted promiscuously. Flowering trees and shrubs may be seen in considerable numbers, thus adding materially to the charm of the grounds in the spring, and, indeed, at all seasons of the year.

Separated from the pleasure grounds by a substantial wall are the vegetable and fruit gardens and houses. The wall area is extensive, since the place is divided into gardens of compara-

tively limited extent, and the walls are utilised to the full for supporting the excellently-trained fruit trees with which they are clothed. All the usual kinds of fruits are trained in greater or lesser numbers, and no one need wish to see finer examples of culture or a superior set of fruits than may be found in the Wildernesse gardens this season. With the exception of Apricots, the trees are clean and healthy. Apricots, however, do not succeed, and Mr. Shelton, the courteous and capable head gardener, explained that he had had some difficulty in getting Cherries established; now, however, there are several trees

tines, as well as Melons, Cucumbers, and Tomatos. The most conspicuous feature throughout the utilitarian department indoors is the scrupulous cleanliness, but it is equally pleasing to see the regular crops that each tree carries.

In addition to the fruit houses, there are several houses devoted to plants and flowers, of which the prime favourites are clearly Carnations, chiefly Souvenir de la Malmaison and Perpetual-flowering varieties. There are many hundreds of grand plants, some of which have given their blooms, others are doing so now, whilst there are yet others that will flower

[Photograph by H. N. King.]

FIG. 159.—SUNDIAL IN WILDERNESSE PARK GARDENS.

which will yield a good account of themselves. Just as satisfactory as the trees on the walls are those in the open quarters, and it will have to be something exceptional that robs these gardens of a bountiful harvest this year.

The culture of fruit under glass is equally extensive and the results are more than gratifying to the grower. Two houses are wholly devoted to Figs and a third is to be planted in due course, as these fruits are in constant demand. Several other large and handsome structures are given up to Grapes, Peaches, and Nec-

later. It is well worth a visit to Wildernesse to see only the Carnations, they are so clean, healthy, and vigorous. Good batches of a variety are the rule, and all the finest of the different sections are represented. It is noticeable as one proceeds round the houses that practically all the plants are such as will provide blooms suitable for decorative purposes, or plants that will adorn the rooms. Among Orchids, for example, *Odontoglossums* are favourites at the moment, while in the autumn and winter a good collection of *Cypripedium insigne* will furnish

blossoms for cutting; there are also small collections of *Cattleyas*, *Thunias*, *Cœlogynes*, and other genera.

All the plant structures are supplied from the numerous pits and frames, which are filled with excellent plants. In these, as in the houses, there is, on the one hand, no waste of space, whilst, on the other, there is no excessive crowding. The vegetable department is conducted with similar skill. *H. J. W.*

TREES AND SHRUBS.

VIBURNUM CARLESII.

THIS species, which was illustrated in fig. 148 in last week's issue, is one of the best of the many *Viburnums* that have been introduced to gardens during the last few years. It was first brought to notice by means of herbarium material collected by Mr. W. R. Carles in Western China. In 1901 Messrs. L. Boehmer & Co., nurserymen at Yokohama, sent specimens, which had been raised from seeds collected in Corea in 1885, to Kew for name, and a year later a living plant was received. Doubts being entertained as to its hardiness, the plant was kept in a cold frame for three winters, but in 1905 it was planted in a bed of hardy Heaths. The protection afforded in this manner proved sufficient to keep it safe through the winter, and the first flowers were produced in the spring of 1906. Each year since it has blossomed well, and last year it developed upwards of 30 inflorescences. This particular plant is now about 2½ feet high and 2½ feet through, whilst another example which originated from a cutting is almost as large. *V. Carlesii* is recognised by means of its oval, serrated leaves, which are hairy on both surfaces and have a greyish tint, and by its rounded heads of *Rondeletia*-like flowers. The flowers are borne in dense heads 2 to 3 inches across and open during early May. They are white in colour, slightly flushed with pink, and are deliciously fragrant. The species appears to thrive best in light, loamy soil with which a little peat has been mixed. Propagation is effected by means of cuttings which root readily in summer. *W. D.*

FORMS OF CYTISUS SCOPARIUS ANDREANUS.

THIS variety of the common Broom was discovered in Normandy by M. Edouard André, the celebrated landscape gardener, and soon became common in gardens.

Not only is it grown as a hardy shrub, but it is cultivated in considerable numbers for flowering under glass early in the year. There are now several forms of *Cytisus scoparius Andreanus* which have been raised by Mr. T. Smith, of Newry, in whose nursery many beautiful and interesting plants are always to be found. As long since as the Temple Show of 1907 one of these forms, *Firefly*, was given an Award of Merit by the Floral Committee of the Royal Horticultural Society, and at the meeting held on April 20 of this year this variety was particularly noticeable in one of the exhibits of flowering shrubs. Its flowers are very richly coloured; indeed, it is described by Mr. Smith as an improved *Andreanus*, the colour of both keel and wings being much intensified.

Other forms distributed at the same time, with the raiser's descriptions, are *Daisy Hill*, an *Andreanus* with white wings; *Butterfly*, bright golden-yellow wings and pale orange keel; *Dragonfly*, the darkest of all, rich, almost black keel, the crimson of which is suffused over the wings; and *Mayfly*, rich orange-yellow wings, and deep bronze or old gold-coloured keel. Up to the present none of the other varieties seem to have attained the same amount of popularity as the variety *Firefly*, which may come in time to supersede to a considerable extent the original form.

When *Cytisus Andreanus* was first introduced it was increased largely by grafting on to the *Laburnum* or common Broom, but the union in many instances was not a lasting one. For this reason plants on their own roots are to be preferred, and the Newry-raised forms can be obtained in this way. *W.*

RIBES SANGUINEUM.

THE typical *Ribes sanguineum* is a native of Western North America, and for its introduction we are indebted to David Douglas, who sent it home in 1826.

R. sanguineum, but it is quite distinct therefrom. It is of hybrid origin, the parents being *R. aureum* and *R. sanguineum*. *R. × Gordonianum* is about midway between its parents in habit and form of foliage, as well as flowers, which are a shade of yellowish red, an uncommon yet pleasing tone. *Ribes × Gordonianum* was raised by Mr. Donald Beaton (of Zonal *Pelargonium* fame) at Shrubland Park, somewhere about 50 years ago, but whether it was the result of a definite, or an accidental cross, I cannot say. The plant is entitled to a place among the most select of the flowering Currants.

[Photograph by H. N. King.]

FIG. 160.—LIME AVENUE IN WILDERNESSE PARK.

(See page 360.)

Among the most marked varieties may be mentioned *albidum*, with flowers blush white, *atrorubens* and *atrosanguineum*, both characterised by deep-coloured blossoms, which are somewhat smaller than those of the type; *carneum*, a pink form, with large blossoms; *flore plena*, with richly-coloured double flowers that are later in expanding than any of the others; and *malvaceum*, a curious lilac-pink form not particularly showy.

Ribes × Gordonianum, also known as *Ribes hybridum*, is sometimes classed as a variety of

Ribes aureum, above referred to as one of the parents of *R. × Gordonianum*, is also a desirable garden shrub, but it is not nearly so sturdy a plant as *R. sanguineum*, and its flowers are yellow. *R. aureum* is also represented by several varieties. The variety *aurantiacum* has flowers of an orange tint, while the blossoms of the one known as *præcox* expand before those of the type.

Apart from their value as outdoor shrubs, these different forms of *Ribes* can be forced into flower very readily. *W.*

The Week's Work.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Salvia.—Pot plants of such species as *S. splendens*, *S. rutilans*, and *S. Bethellii*, which are in cultivation for flowering in autumn and early winter, may be placed in a cool pit or frame for the summer months. They must not be allowed to become root-bound, as the result would be that the lower leaves would fall. Pinch the shoots from time to time, in order to obtain bush-habited plants. Frequent syringings will serve to protect the plants against red spider. Cuttings of *S. splendens* and its varieties, also of *S. rutilans*, may still be inserted. They will furnish useful flowering plants in small pots.

Caladium.—If large specimens are desired some of the best plants should be potted into larger receptacles, using a similar compost to that employed at the last potting. The utmost care must be taken to avoid damaging the leaves. Any plants which are required for decorating dwelling-rooms should be removed from the hot, moist atmosphere in which they are growing, to a drier and cooler structure, in which they may remain for a few days before they are subjected to the ungenial conditions in the dwelling-house.

Richardia africana.—Plants of the common Calla may now be placed in a warm position out-of-doors, where the crowns will ripen. The practice of planting this *Richardia* in trenches similar to those for Celery still obtains in many gardens, but plants thus cultivated are not generally so early or so floriferous as those which are allowed a period of rest during the early summer.

Poinsettia.—The cuttings which were recently potted singly will need to be shifted into 5-inch pots as soon as they have filled the smaller ones with roots. A suitable compost consists of turfy loam two parts, leaf-mould one part, and decomposed cow manure one part, adding to the whole a good sprinkling of silver sand. Pot firmly, and about 10 days afterwards remove the plants into a cool pit for the summer months. Care must be taken in ventilating the pit, as *Poinsettia* is very easily damaged by sudden fluctuations of temperatures. Two common causes of failure in these plants are (1) cold draughts, (2) overwatering. During the middle of sunny days, a slight shading will be beneficial. In the afternoon, when the shading material is removed, the plants should be lightly sprayed with clear water. In the warmer parts of the country it is usual to remove the lights entirely on warm evenings when it is not expected there will be any heavy rain.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

Spring bedding.—For some years past spring bedding has been regarded as quite an institution in municipal gardens, and, for many reasons, it is a form of park decoration highly appreciated by the general public. Owing to the lateness of the present season, which is probably the cause of so many different species and varieties of plants flowering simultaneously, instead of dissipating their blooming period over several months, the spring bedding has been more effective and attractive than usual. In the days when the success of spring bedding displays depended largely, if not entirely, upon the use of so-called Dutch bulbs, this form of garden embellishment was not carried out so extensively, nor with such pleasing effects as are now witnessed. With more numerous and varied plants at command, this phase of gardening has become not only superior in many ways to summer bedding, but much less expensive.

Preparations for next year.—As many of the preparations for next spring's show have to be made just as soon as the current season's display is over, it is necessary to decide the design and arrangement of this work a whole year in advance. The necessity for this forethought has its advantages, for, while the new schemes are being drawn up, the failure and successes of the old are still fresh in the memory, and it is, therefore, the easier to avoid past mistakes. It often happens that plants which are admirably adapted for the mixed spring border, or for beds which can be approached and examined at near range, are

absolutely useless in a design where the object is for each bed to show up at a distance and take a part in giving colour to the whole arrangement. On more than one occasion we have spoiled what have been otherwise pleasing arrangements by using a plant incapable of producing a definite colour effect. Three plants which have disappointed us in this manner are the double red Daisy, *Aubrietia deltoidea* var. *Leichtlinii*, and the Heavenly Blue variety of Grape Hyacinth. While each of these is a delightfully pleasing object when viewed at short range, they one and all failed to show up for any considerable distance, and so spoilt the whole scheme. Again, the slightest difference in the time of the flowering of one kind of plant from another may also tend to weaken the general effect of such an arrangement, for it is almost essential that all the different plants used in it should be at their best at about the same time. For this reason it seems questionable if that remarkably fine variety of *Aubrietia* known as *Dr. Mules*, with all its advantages of habit and colour, will ever take the place of the older forms, *Campbellii* and *Hendersonii*, for bedding purposes. This season it has proved in this district to be almost a fortnight later than those varieties, and it is thus at its best when most beds are required for their summer occupants. For a similar reason *Myosotis alpestris* var. *Victoria* seems better adapted for the spring border than a position in a geometrical design, although even for such work it is a great acquisition.

Isolated beds.—In planting isolated beds or even designs it is not at all necessary to confine oneself to the use of one variety or even species of plant for each bed. Striking effects may be obtained by the use of yellow *Polyanthus* Primroses mixed with a mauve-flowering *Viola*; scarlet Tulips, with yellow *Polyanthus* Primroses; double white *Arabis*, with scarlet Tulips; or *Aubrietia* "*Campbellii*," with double *Arabis*. Where it is intended that each bed shall produce a single tone of colour, there are very few plants to beat double *Arabis* for white, *Viola* "*Bullion*" for yellow, and *Aubrietia* "*Campbellii*" or "*Hendersonii*" for mauve. In combination, these plants are very difficult to beat, and they can always be depended upon to flower at about the same time. Of course, it is as well to remember that all positions in the flower garden are not equally suitable for the successful development of the plants just enumerated. We find, for instance, that the very best results are only obtained from *Aubrietias* when they are growing on a gentle slope, preferably facing south. Where such a position is not at one's command, an equally good effect may be had by the use of *Viola cornuta* var. *Papilio*, which has a colour very similar to the two *Aubrietias* previously named, and is one of the most floriferous varieties of *Viola* known to me.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, Hertfordshire.

The weather.—The welcome change in the weather has done much to improve the crops. Slight applications of artificial manures may now be frequently made with advantage, and the surface soil should be kept frequently moved with the hoe.

Onions.—The general crop which was sown in the open should now be moderately thinned. It is a mistake to do this too severely, as the Onion fly is apt to do serious damage to the outdoor sowings. Provided a good number has been raised in heat and planted out for supplying large bulbs, there will be no necessity to grow the outdoor crop very thinly. Frequent dustings of soot during the evening or very early in the morning act both as a stimulant to the plants and a deterrent to fly. Keep the planted beds well supplied with water and apply plenty of stimulants, damping the growths well every afternoon on fine days. Sow small quantities for salads frequently. The silver-skinned variety may still be sown for pickling purposes.

Vegetable Marrows.—The lights and frames may now be removed from those plants which have been yielding crops during the past six weeks or two months. Thin out the shoots and give a thorough good surface dressing of loam and half-decayed manure. Peg out the growths and keep them well supplied with water, giving occasional doses of properly diluted farmyard

liquid. Under this treatment the plants should continue to bear profusely until the autumn. Later-raised plants may safely be planted in any fairly open part of the garden. They are very useful for covering large rubbish heaps or any unsightly places, but it is advisable to give them a good start by placing a reasonable quantity of good half-decayed manure under the roots when planting.

Gourds and Pumpkins.—These require much the same treatment as Vegetable Marrows, except that in many places the majority are grown for their ornamental fruits, and are trained over pergolas, tripods, and similar supports. They should be liberally fed during the growing season.

Globe Artichokes.—Artichokes require a liberal mulch with some good litter from the stables. If they are well supplied with waterings of properly-diluted farmyard liquid, both the size and quality of the heads will be much improved.

Leeks.—Endeavour to obtain as soon as possible the desired height of blanching in the early Leeks, by gradually raising the collars and working fine soil about the bottoms. Plenty of water must be given at the roots and the tops should be sprayed every fine afternoon. Continue to put out the later sowings as the plants become ready. For late plantings, deep holes may be bored, dropping the young plants in to the depth of about 10 inches and gradually filling up as growth advances.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Peaches and Nectarines.—These having been disbudded as recommended in previous "Calendars"; the young growths should now be tied or nailed in. In most cases, the shoots may be trained to the wood they start from, as this will be removed after the fruit is gathered, but do not train in too many. Pinch out all lateral growths as they appear. Syringe the trees thoroughly on fine afternoons, wetting all parts of the trees, otherwise red spider and other insect pests will make their appearance. Remove any shoots that are growing unduly strong, for they would never be likely to bear well. The first thinning of the fruits may be commenced, for they are developing fast. Remove first those which are badly placed and others that are growing too thickly together. The final thinning must not be done until after the critical stoning period is past. Keep the trees well supplied with water. Young trees that were lifted last autumn should be watched closely and watered occasionally as required. If a good mulch has not been given such trees, let it be applied without delay. Trees in full bearing may be given a mulch of rotten farmyard manure, but for young trees growing strongly, a lighter and less forceful material will be more suitable, being required merely to keep the ground moist and cool.

Apricots.—Continue to pinch back any shoots not required for extension, and secure longer growths to the wires. Give the fruits their final thinning where this is necessary; but in cases under the writer's notice Apricots are only a very moderate crop, and, therefore, the fruits will be unusually valuable. When growing freely, the trees should be assisted by applications of manure water. Fruit trees on walls rarely get the full benefit from the rains at this season, and means should therefore be taken to make good the deficiency.

Plums.—Plum trees need similar attention to Apricots in the matter of the leading shoots and pinching out those not required for extension. Stop all foreright growths at the fourth or fifth leaf, leaving the weaker shoots, which should be stopped later in the season. Examine the trees carefully for aphides, and if these insects are discovered, give the trees a thorough wash first with a good insecticide, and afterwards with clear water from the garden engine. As young trees are apt to grow very strong, do not apply rich manurial stimulants in the watering or mulching, but apply a mulch of some light material. At present Plums are looking well, and the fruits are swelling rapidly.

General work.—Keep the hoe constantly at work, breaking up the ground sufficiently to ensure a fairly fine surface. Where watering has been done, the soil is apt to become caked and hard, and finally to crack, but this can be prevented by frequently stirring.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Cœlogyne.—In addition to the *Cœlogyne*s mentioned last week, there are other species which thrive well in an intermediate temperature, such as *C. elata*, *C. burbata*, *C. speciosa*, *C. odoratissima*, *C. Micholitzii*, *C. conferta*, *C. Rossiana*, *C. ocellata*, *C. Lawrenceana*, *C. Sanderiana*, and the rare *C. Sanderæ*. These are now making their growth and may be repotted. Employ a similar mixture to that advised for *C. cristata*, but containing rather less loam, and more of the two fibres. As *C. Dayana* and *C. flaccida* produce pendulous racemes, they should be grown in baskets or shallow pans, which may be suspended. The warmth-loving *C. Massangeana* and *C. tomentosa* should also be cultivated in baskets. Whilst growth is being made, suspend them in a shady position in the East Indian house, and, during the resting period, in a similar position in the *Cattleya* house. *C. asperata* Lowii also requires stove treatment, and should be repotted, if necessary, directly after flowering. Shallow pans are preferable for the small, dwarf-growing varieties as *C. odoratissima* and *C. Thuiana*. After root disturbance, these *Cœlogyne*s need to be well shaded, and water must be afforded them very carefully around the edge of the pot rather than in the centre. As each plant becomes re-established, it will require an abundance of moisture until the pseudo-bulbs are fully made up. During warm summer weather spray them lightly overhead with clear tepid rain-water several times each day. It will be observed that sometimes the tips of the young growths of several of these plants are covered with a sticky exudation, which, if not carefully washed off, will prevent the young leaves from expanding.

Odontoglossum grande, *O. Schlieperianum* and *O. Inseayi* will now be commencing to grow, and should be repotted into similar compost as advised in a former "Calendar" for *Cattleyas*. The compost should be made extra porous, for although these plants delight in plenty of water when growing, it should pass quickly away, otherwise the least stagnation in the soil will cause the fleshy roots to decay. A critical time is during the early stages of growth, as the young breaks soon damp off if the soil is kept in a wet condition. They are also apt to decay should water be allowed to remain in their centres for any length of time. At Burford, we find that they do best on a high, dry shelf in the cool house. This kind of treatment is also suitable for the rare *O. Williamsianum* now coming into bloom.

Oncidium ampliatum, &c.—Plants that have passed out of flower should be placed in a cool intermediate house. While at rest very little moisture is required to keep the leaves fresh and the bulbs plump. As soon as growth recommences remove the plants to the warmer atmosphere of the East Indian house. Those plants of *O. leucochilum* which have been flowering in the intermediate house should, immediately their spikes are cut, be placed in the cool house. Owing to the great strain of carrying strong-branching flower-spikes, the pseudo-bulbs become more or less shrivelled, but with proper care and attention they return to their normal condition soon after growth recommences. While at rest, keep the plants cool, and do not afford heavy waterings, but merely keep the surface of the compost just moist. At this season there are other *Oncidium*s, such as *O. Marshallianum*, *O. crispum*, *O. concolor*, and *O. pratextum* which are liable to become exhausted after flowering. Therefore, both owner and grower should take the future into consideration and remove the spikes after the flowers have been open a reasonable time. Any of these plants, or others which have not wholly recovered from the effects of last season's flowering, should not be allowed to bloom this year. With a season's rest, and all other conditions being favourable, they will regain their strength. Small, weakly plants should not be allowed to bloom at all. These remarks are also applicable to *Odontoglossum crispum* and its allies. There are many who possess newly-imported plants of these species and who are anxious to see them flower; others, too, who are flowering young seedlings for the first time, and are equally anxious as to the result. It is advisable to leave only one or two flowers to open so as to determine the variety, and then

to grow the plant on for several years without flowering, by which time it will be so thoroughly established as to bring to perfection a strong inflorescence without causing distress to the pseudo-bulbs.

Cattleya gigas.—Strong plants of *Cattleya gigas*, whether showing flower-sheaths in the young growths or not, should at once be elevated close to the roof glass of the house. Afford them plenty of water at the roots. Defer the potting of the plants until after they have flowered and the new pseudo-bulbs have fully developed.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Late vines.—As soon as the flowers are set upon late vines, it will be time to regulate the growths, the laterals must be stopped and shoots tied down to the wires. Much care must be exercised in this latter matter, especially with such varieties as Black Alicante, Appley Towers, and Lady Hutt, for at this stage the shoots are easily broken off. In any case, they must be trained in the right direction and gradually pulled down at intervals of a few days, until ultimately they can be tied to their proper position on the trellis. Remove all surplus bunches as soon as it can be seen which are needed for furnishing the crop. Late vines must not be overcropped, this being one of the chief causes of shanking, and a hindrance to perfect ripening. The thinning of the berries must not be delayed when once they are large enough for the operation to be properly carried out. The free-setting kinds especially swell very quickly at this time of the year, and the berries are therefore liable to get damaged through overcrowding. Late Grapes should be more severely thinned than earlier ones, for they need more room for the berries to mature without unduly pressing each other, a condition which is against their good keeping. At the same time they must not be over-thinned, especially at the top of the bunch. In the case of varieties of compact habit such as Gros Maroc and Gros Colmar, the bunches may be increased in size if the shoulders are carefully looped up. The final thinning must be deferred for a week or two until it can be better determined which berries are going to swell best. If the borders are properly drained and the vines thoroughly well-rooted they must be given copious supplies of liquid manures and occasional sprinklings with some fertiliser. When the final thinning has been done, apply a good mulching of farmyard manure over the roots. Do not employ fire heat when temperatures can be maintained in its absence, and at no time must the water pipes be overheated, as this condition encourages the spread of red spider. If this pest is present, sponge the affected leaves with soft soapy water. Late vines should receive plenty of ventilation; the rods should be trained sufficiently far from the glass to allow a free circulation of air about the foliage. The ventilators at the top of the house should be allowed to remain open just a little all through the night. At the same time draughts of cold air must not be permitted.

The orchard house.—Complete the final thinning of Peaches and Nectarines and other stone fruits as soon as the stoning stage is past. In determining the number of fruits upon each tree, the operator should consider carefully the size and strength of the individual trees. Again, it must be said that overcropping should be avoided, as in all cases prejudicial to good gardening. Apply plenty of water to the roots and give liquid manure water at frequent intervals, increasing the strength of the manure water after the stoning stage is past. Mulch the trees with decomposed horse manure and loam in equal proportions, adding small quantities of some approved fertiliser. Syringe the trees freely on bright days, and damp the surfaces in the house three or four times every day. Pinch the young growths, especially the strong ones.

Tomatos.—Pot plants should be stopped when they have set four or five trusses of fruit, as they are not able to perfect such a large crop as plants which are growing in beds. Remove the side shoots and, where the foliage is obscuring the light and air from the fruits, the leaves must be partly cut away, but not too severely, for the fruits ripen better when partially shaded. Give the plants a top-dressing of some rich material

such as loam and well-decayed horse manure in equal proportions. The roots should be watered and fed more frequently than hitherto. A batch of plants should be raised about the second week in June for supplying fruits in late autumn. When established, these plants should be placed in a sheltered position out-of-doors, and not be brought in again until the autumn frosts are apparent. By that time each plant should have set several trusses of fruits, and these will carry the supply till the end of the year.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir Edmund G. Loder, Bart., Leonardslee, Sussex.

Roses.—Endeavour to keep all the Roses clean of insect pests. Maggots require to be sought often, or they will disfigure the foliage. They are apt to hide themselves in the tip of the leaf, and commence to draw the flower-buds inside. Green fly can be kept under by spraying the plants with extract of quassia or petroleum emulsion. This latter remedy, however, must be applied with caution or the leaves may receive damage. Apply water to any that need it during dry weather. Tie in strong growths in order that they may not be damaged by winds, and remove all decayed flowers from early-blooming varieties. Employ the hoe frequently on the ground amongst the young Rose plants in the nursery. Examine the ties upon standard plants and make any good that require it. *Rosa sinica* Anemone and fulgida flowered grandly during the last fortnight. These are two excellent Roses for early-flowering, the colours being so exquisite.

Summer bedding.—Complete the summer bedding as soon as possible, remembering the season at its best is only a short one. Give every plant all the facilities possible for making a good start. Keep the beds and borders free from weeds, and the edges neatly clipped.

Annuals.—Those which have been planted out should be sprayed every evening with water. *Dimorphotheca aurantiaca* is now flowering splendidly, but it looks as if it will be short-lived.

Seed sowing.—Anemone seed may now be sown on finely-prepared soil. Seed beds should be shaded by placing moss or some similar material upon them. The present time is suitable for sowing seeds of *Aquilegia*, *Dianthus*, *Hollyhocks*, *Polyanthus*, and other species required for spring gardening, if this work has not already been done.

Bog plants and aquatics.—Remove all the old soil and decayed matter from around the plants growing at the edges of lakes and ponds and apply a top-dressing in cases where this is necessary. *Spiræas* and similar plants are much improved by a dressing of soot occasionally, especially *S. palmata*, a variety which succeeds so well in these positions. If any waterside plants have to be planted the work may now be done, as the temperature of the water is now increased. *Richardia africana*, if it has been hardened off, may now be planted in 2 feet deep of water. Some excellent plants for the water-edge include *Lythrum roseum superbum*, *Calla palustris* and *Little Gem*, *Aponogeton distachyon*, *Acorus calamus*, *Hottonia palustris*, *Menyanthes trifoliata*, *Rumex Hydrolopathum*, *Zizania*, the Water Rice, which grows 8 to 10 feet in height, *Gunnera manicata*, and *G. scabra* should now be freed from all protective material which should be spread about over the roots. Give manure as recommended in a former Calendar. If the flower-heads are removed as soon as they are seen the leaves will grow to a larger size. *Kniphofias* are fine plants for the waterside. They should receive heavy top-dressings of manure. *Acanthus latifolius* is a very stately plant with fine large leaves of glossy green and tall spikes of blue and white flowers. This plant should be planted out from pots. *Petasites gigantea* is a fine foliage plant for the margin of a lake or swamp. It is an excellent plant for heavy soils. The plant flowers in spring before the leaves appear. Other good species include *Rodgersia podophylla*, *Saxifraga peltata*, and *Rheum palmatum*.

General work.—Mow and clip the lawns frequently. Attend to watering, weeding, staking, and tying. First in importance is the proper care of the plants themselves.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JUNE 8—

Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by the Rev. Prof. G. Henslow, on "Old Superstitions about Plants"). British Gard. Assoc. Ex. Council meet.

WEDNESDAY, JUNE 9—

Roy. Cornwall Sh. at St. Columb (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—58.2°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, June 2 (6 P.M.): Max. 58°; Min. 50°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, June 3 (10 A.M.): Bar. 30.0; Temp. 60°; Weather—Overcast.

PROVINCES.—Wednesday, June 2 (6 P.M.): Max. 63° Ireland N.W.; Min. 51° Scotland East Coast.

SALES FOR THE ENSUING WEEK.

MONDAY—

The valuable Freehold Horticultural Property, "Vale Nursery," Haywards Heath, Sussex, area 5a. 2r. 14p., with Bungalow, Cottages, Orchard Houses, &c., at The Mart, E.C.; by Protheroe & Morris, at 2.

WEDNESDAY—

Bulbs and Roots in variety, at 1; Palms and Plants, at 1.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Choice imported and established Orchids, and a "Reichenbachia" complete in four vols., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Soil Fertility and Soil Exhaustion.

Two theories as to the cause of soil fertility are in general vogue. According to one, which may be called the chemical theory, a soil is fertile which possesses the chemical compounds such as nitrates, phosphates, and salts of potash, necessary for the growth of plants, in sufficient quantity and proper condition of solubility. The second, or physical theory, holds that the essential factor in soil fertility is its relation to water. Roots of plants require air as well as water. The root has to supply the leaves with large quantities of water. Only when the physical condition of the soil admits of the root of a plant obtaining adequate supplies of water and also of air, can the plant grow properly. On the physical theory alone such soils are fertile in which these conditions obtain.

These two theories are not necessarily mutually exclusive. We may combine them into a chemico-physical theory, and attribute fertility, in part, to the presence in the soil of the essential mineral substances, and, in part, to the proper relations of soil to water.

The extreme adherents of the physical theory go further than this, and are apt to maintain that a soil does not become exhausted by plants in consequence of the removal by the latter of the available, chemical food materials. They urge that as such materials held in solution in the soil-water are

taken up by the roots of plants, corresponding quantities of similar substances pass into solution and thus replace in the water of the soil those absorbed by the plant.

On this view it is not easy to understand how the addition of definite chemical fertilisers produce their well-marked effects on soil fertility. If a soil lacks phosphates, for example, it is easy to understand the beneficial result following on the addition of phosphatic fertilisers. But if a soil does not lack phosphates, how can the addition of these substances produce, as in certain soils, and on some crops it indubitably does produce, an improvement in fertility? The workers in the Bureau of Soils of the United States Department of Agriculture propose to explain such facts as these on a new hypothesis of soil fertility and soil exhaustion. According to this hypothesis, soil fertility is not reduced because of the removal by the crop of mineral food materials, but because the crop forms a definite, chemical poison, which is liberated in the soil and acts adversely on the following crop. The rôle of artificial, chemical manures is to neutralise the poisonous effects of the toxic root excretions. The supporters of the toxic theory, as it may be called, have brought forward a considerable body of evidence in support of the suggestion that plants excrete definite poisonous substances, and they urge that the common practice of rotation of crops lends support to their view. It is too early yet to pronounce definitely either for or against the toxic theory, though that it will replace altogether the chemical theory would seem improbable. It is not unlikely that the toxic substances produced in the soil represent not the excretion of plants but the by-products of the activity of certain races of soil bacteria. A vast and almost untitled field of investigation is presented by the bacteria of the soil, and it is probable that soil fertility will be found to depend on chemical, physical and biological factors, not solely on one of these, and to be the consequence of complex, diverse conditions rather than of one condition only.

Self-Boiled Lime-Sulphur Mixture.

Lime-sulphur washes, made by boiling together suitable amounts of lime, sulphur and water (see our issue May 15, 1909, p. 313), though useful substitutes for the Bordeaux mixture for spraying dormant trees, and often recommended for general spraying purposes, are apt to damage such tender foliage as that of the Peach. Hence the Bureau of Plant Industry of the U.S. Department of Agriculture has instituted experiments to investigate the use of a milder form of lime-sulphur wash, termed "self-boiled." In Circular No. 27 of the Bureau the method of preparation of this spray-material is thus described. The mixture can best be prepared in rather large quantities so as to get enough heat to produce a violent boiling for a few minutes. The quicklime (20 lbs.) is placed in a barrel, and about 3 gallons of water is added in order to start slaking, and to keep the sulphur off the bottom.

As much sulphur as quicklime is sifted in, and then, the mixture being vigorously stirred, enough water is poured in to slake the lime into a paste. When the violent

boiling which accompanies the slaking is over more water is added, in order to stop the cooking. For use, the mixture must be diluted with water in the proportion of 100 gallons for 20 lbs. of lime and 20 lbs. of sulphur.

It is claimed that, when prepared in this way, less sulphur goes into solution, and that, during the slaking, the sulphur is broken up into extremely fine particles, and thus makes with the lime a good mechanical mixture. The self-boiled wash thus obtained should be strained through a sieve of 20 meshes to the inch. The spraying outfit should be provided with a good agitator. Experiments made with the wash on Peach trees affected with scab (*Cladosporium carpophilum* Thüm) and with brown rot (*Monilia fructigena*, Pers.) reduced the amount of diseased fruit from 36.9 to 12.2 per cent. in the case of the former disease and from 93 to 16 per cent. in the case of the latter. The trees, 20 in number, were sprayed three times—once in April and twice in May, the first spraying being about a month after the petals had fallen, the last, three weeks before the fruit was picked. No scorching of the leaves resulted from the use of the self-boiled material. Unfortunately, the wash produces a whitewashing effect on the fruit, but, if the spray is applied about a month before picking time, the stain, in large measure, passes away by the time the fruit is ripe. Experiments were also made on Cherry-leaf spot (*Cylindrosporium padi* Karst), and showed that the defoliation, which is a consequence of the attacks of this fungus, is prevented by the use of self-boiled lime-sulphur wash, as it is also by Bordeaux mixture. In trials on Apple-scab the lime-sulphur wash appeared to give results inferior to those obtained by the use of either Bordeaux mixture or lime-sulphur wash made in the usual manner.

OUR SUPPLEMENTARY ILLUSTRATION affords a view of Syon House, Brentford, the residence of the Duke of NORTHUMBERLAND, K.G., as seen from the banks of the Thames skirting Kew Gardens. The gardens at Syon are almost as famed as the residence, and in the glasshouses and grounds many species of plants have flowered for the first time in this country. The Daffodils on the Kew side, shown in the foreground, are now past, but this portion of the pleasure ground is still charming with the numerous shrubs in flower, the magnificent display of Rhododendrons, and the scene on the river itself. The Grass about the Daffodils is not mown until the leaves of the bulbous plants show signs of withering, generally about the end of June. Some varieties of Narcissi thrive even better in the "wild" garden than when grown in prepared beds or borders. The common double Daffodil *N. Telamonius plenus* is a particularly pleasing variety for effect at a distance; this, with pallidus præcox and the Tenby Daffodil *N. obvallaris* are the earliest to flower. They are followed by Sir Watkin, Emperor, Empress, Stella, Frank Miles, Autocrat, and *N. poeticus præcox*, all valuable varieties for naturalising in Grass land. *N. Johnstonii* Queen of Spain is delightful when thriving in the Grass, but only in some places does this variety succeed. The illustration is further interesting, for whilst the Daffodils are in Surrey, Syon House is in the county of Middlesex, the two counties being divided by the river.

NATIONAL ROSE SOCIETY.—The summer show will be held in the Royal Botanic Gardens, Regent's Park, N.W., on Friday, July 2. The prizes include two champion challenge trophies, also numerous other cups and pieces of plate, and money prizes to the value of £400. Luncheon, tea, and light refreshments will be obtainable in the gardens. Further particulars can be obtained from the hon. secretary, Mr. EDWARD MAWLEY, Rosebank, Berkhamsted.

FORTUNE'S YELLOW ROSE.—We have received a few flowers of this delightful Rose from Mr. G. H. HEAD, Kingston Manor Gardens, Taunton, Somersetshire, who states that a plant is at present flowering very finely on the southern aspect of the Manor House. The distinct colouring of this fragrant Rose makes it a desirable plant in any locality where it can be cultivated with success.

EXHIBITION OF RHODODENDRONS.—Messrs. JOHN WATERER & SONS, LTD., opened their annual exhibition of Rhododendrons at the Royal Botanical Gardens, Regent's Park, on Thursday, June 3. The show, which is beautifully arranged under canvas, consists of upwards of 2,000 plants, varying in height from 2 to 10 feet. About 200 varieties are represented. The exhibition will remain open until the end of the present month.

A NOVEL MOUSE TRAP.—Among the many interesting subjects dealt with in the February number of the *Queensland Agricultural Journal*, we may draw attention to the following ingenious method, quoted from "Popular Mechanics," of catching mice. The materials required for the trap are a piece of an old bicycle tyre and a glass fruit bottle. One end of the tyre is placed in the mouse-hole and the other in the mouth of

quite well in the dilute solution which he recommends. Those who are plagued in summer-time with flies would do well to try this method; for, apart from the nuisance, flies are, by reason of their powers of distributing germs of disease, to be reckoned among the enemies of mankind.

THE DESTRUCTION OF WEEDS BY SPRAYING.—The value of copper sulphate as a means of destroying Charlock is well known, and it is unfortunate that other specifics for other kinds of weeds among growing crops have not as yet been discovered. Extensive experiments have recently been carried out, apparently with success, in the Malay Straits in cleaning land not occupied by a crop by means of spraying with a solution of arsenate of soda. It is claimed that the cost of thus cleaning land about to be brought into cultivation is only 2s. per acre. Up to the present there is no reason, however, for believing

[Photograph by A. E. Smith.]

FIG. 161.—GROUP OF VANDA TERES EXHIBITED BY MR. LEOPOLD DE ROTHSCHILD AT THE TEMPLE SHOW.

(See Report in last issue.)

ROYAL BOTANIC SOCIETY.—At a meeting of the Fellows held last week, it was decided that each Fellow should make a contribution of five guineas towards the fund of the Society. It was explained by the chairman that unless such help was forthcoming within a month, the Society would have to go into liquidation, in which case the Gardens would revert to the Crown.

THE PERPETUAL-FLOWERING CARNATION SOCIETY has decided to hold a trial of perpetual-flowering Carnations in the open ground at the Royal Botanic Gardens, Regent's Park, N.W., in order to test the suitability of varieties for open-air culture. Members of the society are requested to forward plants to Mr. E. F. HAWES, at the above address, who has undertaken to conduct the trials. Plants should be forwarded carriage-paid as early as possible, and a list of varieties sent by each member should be included. The trials will be inspected by the Floral Committee, marks given according to merit, and the results published in due course.

the bottle. The mice run up the tunnel thus formed and so are imprisoned in the bottle without chance of escape. No bait is necessary.

TO KILL FLIES.—Dr. ALEXANDER HILL, writing in a recent issue of *Nature*, states that a dilute solution of formaline (two teaspoonfuls of the commercial 40 per cent. formaline added to a soup plate filled with water) makes an efficient fly-destroyer. Flies go to it to drink, and die, some in the water, others in the neighbourhood of the plate. So dilute a solution as that which suffices to keep down the flies is not enough to produce, by the vapour liberated from it, any harmful effect on people living in the room. Dr. HILL points out that the formaline method is free from the gruesome associations of fly-papers and other traps which hold their struggling victims, and that it may even be turned to ornamental uses, for the dish may be provided with a central wire cage and filled with flowers. Though formaline is poisonous to plants as well as to animals, yet, according to Dr. HILL, cut flowers keep

that the use of arsenate of soda would be possible in the case of land bearing crops.

CUPRESSUS MACNABIANA.—We are asked to state that the Curator of the Botanic Garden, Cambridge, would be grateful to any reader of the *Gardeners' Chronicle* who would be so kind as to send him a plant of *Cupressus Macnabiana*. He would also be much obliged for a branch with cones if possible.

THE CULTIVATION OF THE BANANA IN THE SOUTH OF FRANCE.—Some five years ago young Bananas, introduced from Algeria, were planted in the open in the South of France (Department of Var). The only protection given to the plants was a wrapping of straw during the winter months. This year, according to *Der Handlungsgärtner*, the plants have borne fruit. Hence, it seems not improbable that French-grown Bananas may be put, in course of time, on the market, though it is more likely that, if Banana-growing in France is developed successfully, the market for them will be found in France and Germany rather than in this country.

THE ROYAL INSTITUTION.—Dr. F. F. BLACKMAN will deliver two lectures at the Royal Institution on "The Vitality of Seeds and Plants": 1 (June 5). "A Vindication of the Vitality of Plants"; 2 (June 12), "The Life and Death of Seeds."

THE ARTIFICIAL RETARDING OF PLANTS.—An interesting experiment in retarding the development of plants is published by M. P. NOËL in *Le Naturaliste*. For the following account of the experiment we are indebted to *Der Handlungsgärtner* (May 8):—The owner of a fine exotic species of *Prunus* observed that, though the plant flowered freely every year, it failed, owing to the frosts of early May, to form fruits. He determined therefore to try the effect of ether. To this end he made, in the neighbourhood of the roots, a hole in the ground about 16 inches deep, poured in ether, and closed the hole. As a consequence of this root-etherisation, the *Prunus* flowered two weeks later than usual, escaped the late frosts, and set its fruits. It is curious that etherisation should, when applied to the shoots of plants, as in JOHANNEN'S well-known method of forcing, produce precocity of flowering, and, when applied to the roots, give rise to an opposite effect. More experiments are needed before this retarding effect of ether can be regarded as being of general application.

CLIMATE AND THE CHEMICAL COMPOSITION OF WHEAT.—The influence of environment on the composition of Wheat, both as to nitrogen and ash content, is a question which is receiving much attention from agricultural chemists. Climate appears to be far more potent than soil fertility in influencing the composition of the grain. The researches of LAWES and GILBERT have shown that manuring has but little influence on the composition. The shorter the period which elapses from the formation of the grain until it is ripe, the higher the nitrogen content. High temperatures, long days, and absence of moisture during the ripening process hasten the maturation of the grain and increase its percentage of gluten. Recent researches of Mr. F. T. SHUTT, carried out at the Canadian Experiment Station, Southern Alberta, have been devoted to the study of the influence of the moisture-content of the soil on the Wheat crop. A larger amount of moisture in the soil prolongs the vegetative processes and delays the maturation of the grain. Early ripening tends to the production of a hard, glutinous Wheat. Prolonged vegetative growth induced by excessive moisture defers ripening and allows of the further deposition of starch. Whilst, however, the amount of gluten is a product of the season, the character of the gluten depends on the variety of the Wheat.

PLANT POISONS.—Among the most remarkable of the occasional constituents of plants are those substances known to chemists as cyanogenetic glucosides. These glucosides are complex substances, which split up readily into a sugar (glucose) and other compounds, among which is the highly-poisonous prussic acid. Inasmuch as such glucosides occur in various fodder plants, it is not surprising that instances of poisoning occur occasionally among cattle which have fed upon these plants, e.g., Sorghum, Millet, &c. Within the past few years three new cyanogenetic glucosides have been isolated from plant tissues, viz., sambunigrin from the leaves of the Common Elder *Sambucus nigra*; prulaurasin, from the leaves of the Cherry-Laurel *Prunus Laurocerasus*, and amygdonitrile glucoside from the young twigs of *Prunus Padus*, and more recently from the bark of the Wild Cherry *Prunus serotina*. The last-mentioned glucoside is peculiarly interesting, inasmuch as it is a constituent of amygdalin, the active principle of bitter almonds, and was, indeed, prepared from amygdalin in the

laboratory in 1895, 12 years before its discovery as a natural product of plants. The work of the chemists in isolating and examining the constituents of plants must lead ultimately to the goal so much desired of botanists, the discovery of the chemical course of events whereby the inorganic nitrogen taken in by the plant in the form of nitrates is built up into organic nitrogen.

A NEW PARAFFIN EMULSION.—Paraffin, made into an emulsion with soft soap, has long been used as an insecticide, but one drawback to its use is the tendency of the paraffin to separate out from the emulsion. Mr. MACCOUN, horticulturist to the Canadian Department of Agriculture, finds that when flour is substituted for soft soap the emulsion obtained is finer and more permanent. By mixing 1 gallon of paraffin, 2½ lbs. of flour (the poorest quality serves), and 9 gallons of water, and whipping the mixture vigorously for five minutes, an emulsion is obtained which remains good for 14 hours. If it is not required to keep the emulsion so long, half the quantity of flour suffices. It is best to add the flour to the paraffin, and then to pour in about four gallons of water, to beat the mixture vigorously till the emulsion is obtained, and then to make up with the rest of the water (five gallons).

NOTES FROM A "FRENCH" GARDEN.

ONE of the most important items in hot weather is that of watering, and this should be done in a thorough manner. For crops growing in the open, the hose is usually employed, but for the young seedlings, as well as for plants under the lights, cans will be found most suitable. Although it is preferable to water early and late in the day, yet on some occasions the grower is obliged to apply water all through the day. Cauliflowers and Carrots will not suffer any injury if watered in the middle of the day, but in the case of salads, especially Lettuces and Endives, water should not be given to these plants when the sun is not powerful.

The beds will soon be cleared of Carrots, and the ground must then be hoed and thoroughly cleansed before the Cauliflowers spread their leaves over the beds. Cauliflowers will be showing their inflorescences in a few days, and must not be allowed to become dry, otherwise the heads will not develop well. The young seedlings of this plant require light waterings daily. Thin them out if they are too numerous.

Endives planted at the end of April are now ready for blanching. As the hearts of these plants decay if tied up too long, it is advisable only to tie sufficient batches to meet requirements.

The first batch of Melons is now fruiting. Great care and knowledge are required in selecting the fruit to ripen; as a rule, it should be selected as far as possible from the main stem, on a strong and healthy shoot. The shape of the young fruit must be perfect. The plants make but little growth during the time the fruits are swelling. They require plenty of water (three gallons per light daily) when the weather is fine, and the lights should be opened wide whenever possible, closing them again towards evening. The main batch is now growing freely, and the side shoots are stopped to the second leaf. Occasionally small shoots break away from the main stem at the base of the side shoots, but these must be removed. Although these plants will not require much water, they must be allowed ample ventilation so as to ripen the shoots. At the present time it is necessary to grow Melon plants hardy, for this will facilitate the setting of the flowers later on. All Melons must be watered early in the morning. The grower should examine the plants in the course of the day and shade any which flag.

We are now cutting the "Passion" Lettuces which were planted early in the spring. They do well in our garden, which is of a clayey nature. Cos Lettuces, planted late in March and early in April, are hearting. These plants require heavy waterings, at least three times a week. Examine them from time to time, as the heart is liable to decay when the watering is done late in the morning. *P. Aquatias, May 20.*

THE ALPINE GARDEN.

ANEMONE PATENS LUTEA.

THERE are few yellow-flowered Windflowers; they include the yellow varieties of *Anemone patens*, the Spreading Windflower, which is a near ally of *Anemone pulsatilla*, the native Pasque Flower. The type flowers of *A. patens* are purple, but there is a North American form (by some authorities regarded as a species) which has also purple flowers, and of which there is a cream-coloured variety. The European plant gives, however, a form with pale yellow flowers, and this is called *A. patens lutea*.

Anemone patens prefers a rather calcareous soil; it thrives in that which suits *A. pulsatilla*, and delights in a similar situation. Pot plants should be purchased if possible, as these tap-rooted Anemones are difficult to establish, and it is not advisable to disturb the roots more than is necessary. *S. Arnott.*

THE CARRIAGE OF VEGETABLE AND FRUIT PRODUCE BY RAILWAY.

THE article in last week's issue of the *Gardeners' Chronicle* by Mr. G. B. Lissenden on the subject of combination among growers for the purpose of the carriage of goods by rail raises once again a question which is well worthy of serious consideration. Undoubtedly lower rates can be obtained for the carriage of large lots than can reasonably be demanded in the case of smaller lots, and it might be well worth while for growers to consider how far the principle of co-operation might in certain instances be extended in this direction.

At the same time it has to be borne in mind that the conditions in France and Germany are not quite identical with those which obtain in England. In Germany, for instance, rates are,

to urge that if he were to send his goods in the first instance to some forwarding agent, possibly some miles away, for the purpose of having the goods bulked with those of other growers, considerable time would be lost owing to the extra handling involved. Furthermore, the English grower usually prefers to place on the market high-class goods which will tend to enhance his trade reputation, and he objects to have his consignments mixed up with those of other growers who may choose to adopt a somewhat lower standard of quality. As Mr. Lissenden rightly points out, the railway companies will not make a reduction on consignments of various growers "lumped together" unless one only of the growers is, by arrangement, selected as the nominal sender on behalf of all. The name of the selected grower has to appear on the consignment note, and he has to be authorised by

home trader are (a) that a Departmental Committee has already reported against the contention that foreign traders are granted better terms than home traders, and (b) that most, if not all, of the trader's present complaints would be disposed of if he would consent to co-operate. These are, in fact, the two herrings which railway companies always seek to draw across the trail of enquiry into the peculiar difficulties with which home traders are faced, and it may, therefore, be worth while to examine them a little more closely.

FOREIGN PREFERENCE

Dealing with the first point, it is perfectly true that in 1906 a Departmental Committee appointed by the Board of Agriculture sat to enquire into the question of whether preferential treatment is in fact given by home railways to foreign pro-

FIG. 162.—GROUP OF ORCHIDS EXHIBITED BY MESSRS. SANDER AND SONS AT THE TEMPLE SHOW.

(See Report in last issue.)

generally speaking, far more favourable to the trader than those which are granted by the various English companies. In Germany also the work performed by the railway companies usually consists of haulage from station to station, the work of collection and delivery (for which an extra fee is charged in England) being done by separate companies which act as forwarding agents. In Germany, goods consigned for export to England meet with specially favoured treatment at the hands of a paternal Government and are rushed through to the coast in special trains at specially low charges. The English grower, on the other hand, who (under existing conditions) caters mainly for the home market, finds it necessary to send small daily consignments to London and elsewhere. For him the question of time is often of vital importance, and he is wont

his fellow growers to receive on their behalf the special allowances made. It is therefore not altogether difficult to understand the reluctance of the high-class grower to have his goods bulked in this way, whereas a large number of lower-grade growers, who combine in Germany for the purpose of carriage of their goods by rail, are not affected by similar considerations. These, it is understood, are the contentions usually put forward by English growers which the writer does not profess to criticise from the practical point of view, but upon which it would be highly interesting to have the comments of growers themselves.

In discussing this question it must, however, be borne in mind that the two stock arguments with which the English railway companies always attempt to meet complaints from the

duce. It is also the fact that the majority of this Committee eventually reported that the complaints had not been substantiated. Traders, however, have always contended that for many reasons the enquiry thus held was most unsatisfactory. In the first place Sir C. J. Owens and one or two other railway magnates were members of the Committee, and, while they doubtless endeavoured to bring an open and unbiassed mind to bear upon the questions on which they were asked to adjudicate in a semi-judicial capacity, it may well be imagined that they must have found considerable difficulty in forming an impartial decision upon matters in respect of which they had entertained a lifelong conviction that the railway companies with which they were associated were necessarily in the right; and it may well be that the great force of their expert

[Photograph by A. E. Smith.]

knowledge and experience exercised an unperceived influence over the minds of other members of the Committee who were less well acquainted with the practical side of the questions involved. Then again the railway companies, recognising the danger with which they were threatened, brought into play all the heavy artillery of which they were possessed in the shape of the special figures which were necessarily at their disposal and to which traders had, of course, not the same means of access, either for purposes of comparison or investigation. Naturally it was well worth the railway companies' while to spare no expense in getting up their case at a cost with which the comparatively less rich and less organised traders could not hope to compete.

On this Committee, however, there was one member who possessed a special knowledge of the difficulties with which the agriculturists and horticulturists in this country have to contend, namely, Mr. Haygarth Brown, a superintending inspector of the Board of Agriculture and Fisheries; this gentleman found himself under the necessity of making a separate report to which, curiously enough, the railway companies always omit to refer when urging that the report of the Departmental Committee was in their favour. Having regard to the special position occupied by Mr. Haygarth Brown, his views are well worthy of serious consideration. Some of the conclusions to which he was driven were as follow:—

(1) That the report of the Committee dealt principally with the question whether certain differences in rates favourable to the foreign producer amounted to *undue or illegal* preference, so that this question was merely of a legal nature, and in his opinion was outside the terms of the reference.

(2) That the term "preferential treatment" ought to be taken to include not only the question of rates, but also the question of whether more or better facilities for the carriage of foreign produce were not offered to the detriment of home produce.

(3) That the evidence was directed more particularly to "rates" rather than "facilities."

(4) That in some instances the railway companies admitted that the rates granted to foreign produce were lower than those granted to home produce, but alleged that this was due to differences in the services rendered in each case.

(5) That in no case did the railway witnesses succeed in demonstrating that the difference in the rates complained of was proportionate to the difference in the cost of the services rendered.

(6) That in one or two cases the railway witnesses admitted the growers' contention that certain competitive rates charged for foreign produce were lower even in proportion to the cost of the services rendered than the corresponding non-competitive rates for home produce.

(7) That in his opinion the evidence showed that "preferential treatment" is in some cases accorded to foreign produce, in the sense that rates are charged for such produce lower even in proportion to the cost of the services rendered than the corresponding rates for home produce.

(8) That no practical and effective means exist at present by which agriculturists can check the correctness of the decisions of the officials of the railway company on the question whether a rate for foreign agricultural produce is lower in proportion than a rate for home produce.

(9) That where through rates from a foreign port to an English urban centre are charged by a railway company owning steamships, it is necessary, in order to check the justice of the rates, to know what proportion of the total rates is charged for the sea journey and what proportion is charged for the land journey in England; but it appeared from the evidence that different companies adopt different systems of allocation, and it was stated by the witnesses that the allocations are not based on any statistics, but is a matter of their own judgment, and that the allocation can be altered at any time. (This simply means that where the rate charged for the land portion of the journey is challenged as unfair, the railway companies can, it is true, be compelled to say how much of a through rate is charged for overland transit and how much for the sea journey, but there is nothing to prevent their juggling these figures in any manner they think fit, as they can state the proportion in any manner that suits their purpose for the moment without the justice of the proportion being challenged.)

(10) That in tackling the railway companies on questions of this kind, although the interests involved to agriculturists collectively are probably very large, the interests involved to the individual agriculturist are not sufficiently large to justify him or his association in undertaking the expensive proceedings involved.

(11) That work of this nature ought, therefore, to be undertaken by the Board of Agriculture and Fisheries on behalf of agriculture generally.

Before leaving this subject it may perhaps be instructive to note that this question was made the subject of legal proceedings in an action

which the Mansion House Association brought against the London and South Western Railway a few years ago. In that action the Court decided that the allegation that preference was being shown to the foreign producer was not justified in certain instances, but that, on the other hand, in some cases the home traders' complaint was well founded, and the railway company was accordingly ordered to stop granting unfair preference to foreign produce, such as Hops, Hay and fresh Meat. This, therefore, shows that in certain instances railway companies do grant illegal preference to the foreign producer, and that it actually requires an order of Court to stop them doing so! H. M. V.

(To be continued.)

VEGETABLES.

BROCCOLI MODEL.

WE have to-day (May 18) dug up and heeled in under a north wall the remaining plants of a splendid crop of this fine Broccoli.

On inspecting the bed on April 22, which was before we began to cut, I found no harm had accrued to the plants from the severe winter, although a few of the plants at the end of one row had their leaves torn, I believe, by pheasants.

The Broccoli were planted, as is our usual practice, in August, on the site of an old Strawberry bed.

From now till the end of May is the best time to sow this Broccoli. *Edwin Platt, Borden Wood Gardens, Liphook, Hants.*

BUTTER BEANS.

THE Golden Waxpod or Butter Bean is by no means common in gardens. It forms an excellent summer vegetable, and is especially valuable where good vegetables in variety are in demand; on the Continent the Butter Bean is a common dish. There are numerous varieties, both dwarf and runner kinds, and the climbing varieties are plentifully cultivated in the United States of America. The older Mont d'Or is one of the best-known varieties in this country; but there is a newer or improved form that is stringless, and a good Bean on account of its earliness in cropping and its large productive quality. The Waxpod or Butter Bean should be cooked whole, as the pods in a young state are very fleshy, and most of them stringless and very tender. The Golden Waxpod, a dwarf grower, is an abundant cropper, and worthy of cultivation in all gardens. It is quite distinct from the ordinary green Beans, and, when sent to table as a second course, or as a dressed vegetable, it is much appreciated. The Centenary Golden-Podded is a fine dwarf variety, largely cultivated on the Continent for its good flavour. This is earlier than the older Golden Scimitar. The earliest Butter Bean I have grown is the Flageolet Wax. In addition to its earliness, this variety is exceedingly productive, bearing numerous pods of great length. The Golden-Eyed Wax variety, an American introduction, is an excellent Bean, bearing early and freely; the habit is dwarf. There is a distinct, round-podded variety of the Golden Scimitar type, called Henderson Wax. This also is a fine addition. It bears a round, fleshy, remarkably solid pod, and is one of the best as regards cropping qualities and freedom from rust or mildew. Improved Golden Wax is a form of the older Golden variety, but of more vigorous growth. The pods are large, and are borne early in the season. They are broad, very thick, with a solid flesh, stringless, and of a dark golden colour. This variety ranks as one of the best of all the wax-podded Beans. The old Mont d'Or variety I have alluded to is a good variety for general culture. The pods are stringless, and the plant is a good cropper. Perfection Wax, a variety much grown in the Erfurt district, and also for the Paris markets, is a most useful, summer Bean. The pods are yellow when

cooked, and the plant is a free bearer. There are many other kinds in commerce, but those I have noted are the best. The plants should be afforded ample room; if crowded, the pods are less fleshy. They require similar culture to other Beans, and enjoy a rich soil and ample manure. The Butter Bean does best sown in drills so that moisture can be given in hot weather. For a succession, seed should be sown in May, June and July, and the pods will be available from July to September. For the latest summer crops in the southern part of the country a cool border should be chosen. *G. Wythes.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

TULIPS.—A variety, named Jenny, imported from the Continent, is similar in style to Isabella, but the colour is brighter and more regularly defined. The flowers are very large, and the habit dwarf and sturdy. A large collection of the older varieties was growing near this and other new sorts in Messrs. Pearson's nursery at Lowdham on the occasion of a recent visit. A bright scarlet variety called Flame was noticed for its large, finely-shaped flower. Many of the varieties are grown in enormous quantities. Inglescombe Scarlet occupied several very large beds, and I was informed there were 20,000 bulbs of this variety which had been raised in about 15 years from three dozen bulbs—a wonderful rate of increase. The colour of Inglescombe Scarlet was only just showing on May 17, while King Harold, Gipsy Queen, Glow, Donders, Pride of Haarlem, Clara Butt, and many others were in full bloom. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

DAMAGE BY THUNDERSTORM.—Considerable damage was done here on Wednesday, May 26, by hail and torrential rain which accompanied a thunderstorm. On the day after the storm the tiny Apples, Pears and Cherries covered the ground thickly. Irish Peach and Keswick Codlin Apples promised a magnificent crop, which will now be a complete failure; later varieties of Apples have not fared so badly. A promising crop of Gooseberries was also spoiled; the fruits were torn from the branches, and in many cases the shoots were broken off also. The young top-growths of Wallflowers were all cut off. Bedding plants, which were in their summer quarters, have been torn to pieces and many of them washed out of the ground. Nasturtiums were completely riddled as if with shot. Between one and two o'clock in the day vivid flashes of forked lightning, accompanied by a deluge of rain, washed up many of the paths. A flock of sheep belonging to a neighbouring farmer was struck by lightning; five ewes and five lambs were killed and many others injured. *Thos. Francis, Gardener and Instructor, The Walsall and West Bromwich District Schools, Wigmore, Staffs.*

ONIONS FOR MARKET (see pp. 217, 234).—If *A. D.* cultivated Onions year by year for market I do not think he would find it quite so easy to realise an average profit of £40 per acre per annum as he does to estimate it on paper. Beginners may be led to think that they can see their way to make a fortune in a few years. On the contrary, they will find it difficult to make even a small profit. If we could be certain that the prices would continue somewhere near the figures—viz., 4s. to 6s. per bushel—obtained during the past season, then there is no doubt that a crop of Onions would pay well. But we need go no farther back than the previous season to find that 1s. 9d. or 2s. was as much as could be obtained: whence then would come the £40 profit? There is, moreover, the question of size. If your correspondents, who advocate growing market Onions of 2 lbs. each, would enquire of the salesmen at Covent Garden or of the London greengrocers, they would find, I think, that Onions weighing three or four to the pound are far more saleable. I scarcely think that we are likely to oust the Spanish bulb by growing large Onions in England. As to the method of growing, I agree with *S. J. Martin* (see p. 234), assuming that the soil is of the right kind, but

1 foot from row to row is as well for convenience of hoeing, and 5 or 6 inches is then quite sufficient space from plant to plant. In this way I get quantities of Onions from 4 to 5 inches in diameter, which I think are sufficiently large for general purposes. As to varieties, I have discarded nearly all others in favour of the "Improved Reading." With this variety I obtain abundant crops by sowing late in February or early in March. *E. Webber, Cumberland Lodge, Windsor.*

SEAKALE AS A GREEN VEGETABLE.—A few days ago I was induced to try a few heads of Seakale as a green vegetable. Although not possessing epicurean tastes, I must say it was one of the most delicious green vegetables I ever tasted. In a season such as the past, when green vegetables were very scarce, anything fresh is valuable. I might say it was cooked in precisely the same manner as Kale or Cabbage. It is possible to have Seakale for at least five months of the year, and, by utilising the top, another month can be added; what other vegetable can compare with it? I enclose a few heads for you to judge its merits. *S. G. Smallridge, Holfield Grange Gardens, Coggeshall, Essex.* [The shoots were cooked according to Mr. Smallridge's direction, but when served they were found to be not sufficiently boiled; otherwise they promised well.—ED.]

SEEDING OF THE TRUE ENGLISH ELM.—As Elms are seeding profusely in most parts of England this year, it is possible that some fertile seeds may be found in the warmer parts of England (though I have never seen any) on the true English Elm. I should therefore be obliged if any of your readers will look out for such and send me a few. I do not want seed of the smooth-leaved Elm *U. glabra*, of which the Cornish or Jersey Elm and the Hertfordshire Elms are probably varieties, or of the Dutch or corky-barked Elm, commonly known as English Elm in many parts of England, especially in the north; but only from old hedgerow Elms, *certainly grown from suckers*, and of which the foliage turns to a bright golden colour in November, when the other Elms have lost their leaves. And I don't want seeds from any foreign seedling or nurserymen's Elms, which for a century or more have been grafted or budded on the stock of Wych Elms, and usually have a very inferior habit, colour, and timber to the true English Elm of the Thames and Severn valleys. *H. J. Elwes, Colesborne, Cheltenham.*

LAW NOTES.

BREACH OF CONTRACT.

AT West Bromwich County Court on May 18, a market gardener of Biggleswade, Bedfordshire, was sued by a Potato salesman, of Oldbury, who claimed £13 15s. damages for breach of contract.

Mr. Wylie, for the plaintiff, said defendant contracted to supply plaintiff with 10 tons of Parsnips at £2 5s. a ton. Half of the quantity of Parsnips was delivered, and defendant then wrote that he could not supply the remainder. In the meantime Parsnips had risen in price, and plaintiff was compelled to buy five tons at £5 a ton. He now sued to recover the extra amount he had to pay in consequence of defendant's breach of contract.

Defendant pleaded that he only bargained to send five tons at a time, payment to be made as soon as they were placed on rail. Owing to the plaintiff's delay in forwarding the money for the first five tons, and in sending the bags back, he (defendant) was unable to buy the Parsnips he had agreed to deliver.

Judgment was given for the plaintiff for the amount claimed with costs.

DEBATING SOCIETY.

BRISTOL AND DISTRICT GARDENERS'.—The first meeting of the new session was held on May 27, at St. John's Parish Rooms, Mr. W. E. Budgett presiding over a large attendance of the members. Mr. Brooks gave a lecture upon "Fads and Fancies of Gardeners and Gardening." The lecturer gave reminiscences of his visits to gardens, and mentioned some peculiarities of the gardeners. An interesting part of the proceedings was the presentation of silver medals to three young members who had made the maximum number of attendances during the past session. Three new members were elected.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

MAY 18.—*Present*: E. A. Bowles, Esq., M.A., F.E.S. (in the Chair); Prof. A. H. Church, F.R.S., Dr. A. B. Rendle, F.R.S., Dr. A. Voelcker, F.L.S., Messrs. R. H. Curtis, H. J. Veitch, W. Cuthbertson, A. W. Sutton, W. Hales, A. Worsley, G. Gordon, J. T. Bennett-Poe, H. T. Güssow, F. J. Baker, L. H. de Barri Crawshaw, W. Fawcett, F. J. Chittenden (hon. secretary), and E. H. Wilson (visitor). The committee heartily welcomed Mr. E. H. Wilson on his return from his journey of botanical exploration in Western China.

Rose with foliar sepals.—Lt.-Col. J. W. CURRIE, Norwich, sent a specimen of the Rose *Niphetos* having one of the sepals developed into a perfect leaf with five leaflets and stipules well developed. While the peculiarity is not rare, so perfectly developed a specimen as this is seldom met with.

Ranunculus auricomus.—Dr. RENDLE showed specimens of the depanperate form of *R. auricomus* with one or two petals only in some flowers, and in others the petals scarcely developed. This species often has very imperfect flowers.

Salix pentandra.—Mr. J. FRASER showed specimens of the flowers of *Salix pentandra* in which the posterior gland had proliferated and given rise to two or three small pistils in addition to the normal one. He pointed out that in the genus *Populus* belonging to the same family as *Salix* there is a perianth, and that Bentham had regarded the gland in *Salix* as homologous with the perianth of *Populus*. He found on examination of the frequent cases of abnormal development of this gland or disc in *Salix pentandra*, considerable grounds for believing Bentham's view to be the correct one. Frequently the gland became so much developed that it grew almost three parts round the pedicel of the ovary.

Viola lutea and V. lutea amana.—Mr. FRASER also showed specimens of these two *Violas* collected in meadows at considerable elevations in Scotland. He said that the Scotch raisers of the garden *Violas* had used this species in their formation, and from it had been derived the perennial habit of these varieties. Mr. CUTHBERTSON corroborated the statement, saying that this had been the case in 1859 and 1860, but he thought that little good would be likely to arise by recrossing the species with the *Violas* of the present day since they were so generally hardy and perennial. He had planted over 100 varieties in an Essex garden in October, 1907, and had found that a very large proportion of them had survived even the severity of the past winter, the varieties Royal Sovereign and Bullion being particularly noticeable in this respect.

Frost injury.—Mr. F. J. BAKER showed leaves of Peas having white patches upon them from Cambridgeshire. They seemed to show signs of albinism, but were also injured by frost. It is possible that the latter was connected with former phenomenon, since, as Prof. CHURCH pointed out, the albino spots upon a leaf always contain a larger percentage of water than the green parts, and thus are probably more liable to injury by frost than the green parts. There is also always less lime and potash in the white parts of a variegated leaf than in the green.

Primula hybrids.—Mr. H. J. VEITCH showed a series of crosses between *Primula pulverulenta* and *P. Cockburniana*. These are both native of Western China, the former being of a rich purple colour and perennial and the latter orange. The series was as follows:—

P. pulverulenta ♀ × *P. Cockburniana* ♂ gave *P. × "Unique"* (cerise), while the reciprocal cross gave *P. × "Unique Improved,"* differing somewhat in colour from "Unique," being somewhat darker, but of similar habit. These hybrids are perennial.

P. Cockburniana ♀ × *P. × "Unique"* ♂ gave a plant bearing terra-cotta flowers nearly the colour of *P. Cockburniana*, but with the habit of *P. pulverulenta*, to which the foliage

bore a great resemblance. This would appear to be perennial, since the plant which flowered last year is again in bud.

P. pulverulenta ♀ × *P. × "Unique Improved"* ♂ and *P. × "Unique"* ♀ × *P. pulverulenta* ♂ were almost identical in colour of flowers, just a little brighter than *P. pulverulenta*, while when the plant raised by crossing *P. Cockburniana* and *P. × "Unique"* was fertilised from that raised by crossing *P. × "Unique"* and *P. pulverulenta*, the colour of the flower showed a greater variation from *P. pulverulenta*, and was of a warm cerise.

Abnormal Tulip (new seedling variety).—A correspondent sent specimens of abnormal Tulips, which were in all respects normal florists' breeders, except that the three inner petals of each possessed a couple of small spurs near the base pointing inwards. The malformation is constant, and recurs each year; it is found in all the offsets that have arisen from the original seedling, and is evidently characteristic of the variety. Both plants were normal, as were all the other seedlings raised from the same parents. No similar structures in a Tulip bloom have fallen under the raiser's observation either among Tulip species or some 1,500 other seedlings of florists' Tulips. Somewhat similar formations to these are sometimes met with among Tulips, but no member of the committee had before seen specimens where the abnormality was so regularly and symmetrically developed.

Orchid hybrids.—Mr. G. WILSON sent flowers of seedlings of the cross *Dendrobium nobile album* × *D. Findleyanum* (= *D. × "Cybele"*). All the seedlings which had flowered (about sixty) had borne coloured flowers approaching *D. nobile*, with one exception, where the flowers were white with a faint pink tinge.

Pisum sp., &c.—Mr. A. W. SUTTON showed plants in flower of the wild Pea collected in Palestine, which he had before exhibited, and of *P. quadratum*, to demonstrate the fact that the two were not identical. The seeds of the two are very similar to one another, but the mature plants differ particularly in the amount of serration of the leaves.

Mr. SUTTON also showed the plant of *Asparagus* which had been collected in the Himalaya, but the committee desired to see it again when it was in flower.

Impatiens × comoricoma.—Mr. H. J. VEITCH showed on behalf of Messrs. CAYEUX & LE CLERC, of Paris, plants of the hybrid *Impatiens × comoricoma* raised from *I. comorensis* and *I. auricoma*, the former with rose-coloured flowers, the latter with yellow, those of the hybrid being "rouge chandron éclairé de jaune sombre, stries de carmin sur les bords intérieurs des pétales latéraux." The anterior sepal of *I. comorensis* is white, and of *I. auricoma* yellow, while in the hybrid it is yellow striped in the lower part with carmine. A table comparing the hybrid with its parent is given along with an account of the raising of the hybrid in the *Revue Horticole*, September, 1908, pp. 427-428.

Uncommon Conifers.—From Sir EDMUND LODER, Bart., Leonardsllee, came branches with cones of *Larix Griffithii* and *L. americana*.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

MAY 13.—*Committee present*: Messrs. E. Ashworth (Chairman), and R. Ashworth, Ashton, Cowan, Cypher, Holmes, Keeling, Leemann, Parker, Smith, Thorp, Ward, Warburton, Rolfe (by invitation), and Weathers (hon. sec.).

J. T. CLIFTON, Esq., Lytham Hall, Lytham (gr. Mr. Float), staged a group of well-grown plants, including *Odontoglossum* in variety. *Dendrobium Bronckhardtii* was exhibited for the first time at these meetings, and received an Award of Merit, as also did *Angraecum infundibulare*. Botanical Certificates were awarded to *Bulbophyllum Lobbii* var. *claptonense*, *B. tremulum*, *Masdevallia triaristata*, and *Cirrhopetalum picturatum*. (Silver Medal.)

E. ROGERSON, Esq., Didsbury, exhibited *Odontoglossum eximium* var. *Rogersonii*; for this plant and for *O. × Stanley* Awards of Merit were granted.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Fletcher), was awarded a Silver Medal for a

group of Odontoglossums. Awards of Merit were given to Odontoglossum X Agasilau, O. crispum xanthotes var. Queen of the Snow, and O. crispum var. "Sweetness."

H. J. BROMLOW, Esq., Rainhill (gr. Mr. Morgan), had a large exhibit of Cypripediums, although so late in the season. (Silver-gilt Medal.)

Mr. A. J. KEELING, Westgate Hill, Bradford, was awarded a Bronze Medal for a group which contained Brasso-Cattleya X Digbyano X Mossia and Cattleya X Dusseldorf var. Undine.

A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), obtained a Silver-gilt Medal for Cattleyas and Laelias and for a miscellaneous display. Cattleya Schrödera var. "White Lady" received an Award of Merit. Odontoglossum crispum var. "Queen of the Earth" received a First-class Certificate. Odontoglossum X Triumph, parentage unknown, and O. Pescatorei Warburton's var. also received First-class Certificates.

H. ARTHUR, Esq., Blackburn, was awarded a Silver Medal for a group which contained many Cymbidiums.

Mrs. ARMITAGE, Waterside, Windermere, staged for the first time at these shows a charming group, the central feature of which was a magnificent collection of Cypripedium bellatum, for which a Cultural Commendation was awarded. A First-class Certificate was voted to Cypripedium X Alabaster var. Godfrey, and Awards of Merit to Brasso-Cattleya X Schrödera X Digbyano and Odontoglossum X Adriaue Waterside var. (Silver Medal.)

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherley), was awarded a Silver Medal for a display of Odontoglossums in variety. Odontoglossum X Brightness and O. X amabile var. Harris were voted Awards of Merit.

J. McCARTNEY, Esq., Bolton (gr. Mr. Holmes), was awarded a Silver Medal for Cattleyas and Laelias. Cattleya Mossia var. aureum, C. Mendelii var. Princess Alexandra, and C. Mendelii var. Excelsior were given Awards of Merit.

J. E. WILLIAMSON, Esq., Stretford, made a pleasing display of Dendrobiums. (Bronze Medal.)

Mr. J. ROBSON, Altrincham, exhibited a group which contained a number of choice hybrid Odontoglossums. (Silver Medal.)

Other exhibitors included Mr. J. BIRCHENALL, Alderley Edge; Messrs. OWEN & Co., Hartford, Northwich; Mr. W. SHACKLETON, Great Horton, Bradford; and O. O. WRIGLEY, Esq., Bury. P. W.

BRITISH GARDENERS' ASSOCIATION.

MAY 26.—The annual meeting of this association was held on the above date at the Essex Hall, Essex Street, Strand. Mr. E. F. Hawes presided. The Report of the Executive Committee was adopted. The vacancies on the Executive Council were filled by the election of Messrs. A. E. Cresswell, C. Taylor, J. Wood, W. H. Aggett, A. J. Hartless, C. Blake, W. Newberry, R. J. Frogbrook, and F. J. Cole.

Mr. C. P. Raffill was elected treasurer, Mr. Jno. Weathers secretary, and Messrs. J. Harrison Dick and G. F. Tingley auditors. Several alterations of rules were considered and adopted.

CATALOGUES RECEIVED.

- JAMES STRENDWICK & SON, Silverhill Park, St. Leonards-on-Sea—Dahlia.
MOORE, LTD., Rawdon, via Leeds—Orchids and Burmese Lilies.
YOUNG & Co., Hatherley, Cheltenham—Perpetual-flowering Carnations.
DORRIS & Co., Rotherham—"Ideal" flower-vase.
CLIBRANS, Altrincham and Manchester—Bedding plants; plants for walls, pergolas, &c.; shrubs; border plants; Violas, &c.
H. N. ELLISON, 5 & 7, Beall Street, West Bromwich—Bulbs; Cacti; Ferns.
GEORGE BUNYARD & Co., LTD., Maidstone, Kent—Hardy climbing plants, with cultural and pruning notes.

COLONIAL.

DUPUY & FERGUSON, 38, Place Jacques-Cartier, Montreal —Hardy perennial and climbing plants, Roses, fruit trees, &c.; also poultry requisites.

FOREIGN.

- CARL TCHLISSMANN, Kastel-Mainz, Germany—Arches, pergolas, screens, arbors, &c.
G. J. ALBERTS & Co., Boskoop, Holland—Nursery stock (wholesale).
YOKOHAMA NURSERY CO., LTD., 21-35, Nakamura, Yokohama, Japan—Bulbs, plants, seeds.
J. CHANTRIER FRERES, Mortefontaine, par Plailly (Oise), France—Plants, &c.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending May 29, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather was much less bright over the Kingdom generally than during the preceding weeks of the month, and showers or periods of steady rain were experienced in all districts. Thunderstorms occurred in various parts of the country some time during the week, but they were not, as a rule, severe.

The temperature exceeded the average in all districts, the divergence being greatest (4.3°) in England N.E. The highest of the maxima were experienced on the 23rd or 24th at nearly all stations, and ranged from 80° in England E. and the Midland Counties, and 79° in England S.E. to 65° in Ireland N., and to 63° in Scotland N. The lowest of the minima, which occurred on rather irregular dates, varied from 33° in Ireland S. and 36° in England S.W. to 42° in England N.E. and N.W., and to 43° in the English Channel. The lowest grass readings reported were 22° at Llangamarch Wells, 23° at Burnley, 23° at Birmingham, 30° at Cambridge, and 31° at Greenwich.

The mean temperature of the sea.—On most parts of the coast except the south-west of England the water was rather colder than during the corresponding week of last year. The actual means for the week ranged from 55.5° at Margate, 55° at Newquay, and about 54° at Salcombe, Teelin, and Seaford, to about 47° at Scarborough, and to about 46.1° at Lerwick and Burnmouth.

The rainfall was considerably more than the average in all districts excepting the English Channel, where the excess was slight.

The bright sunshine slightly exceeded the normal in the east and south-east of England, but was below it elsewhere. The percentage of the possible duration ranged from 50 in England S.E., 49 in the English Channel, and 46 in England E., to 29 in Ireland N., and to 22 in Scotland N.

THE WEATHER IN WEST HERTS.

Week ending June 2.

A remarkably heavy rainfall.—It was cold at first, but as the week advanced the weather during the daytime gradually became warmer, whereas the night temperatures remained, as a rule, about average. On the warmest day the temperature in the thermometer screen rose to 73°, and on the coldest night the exposed thermometer fell to 37°. The ground is now 2° warmer at 2 feet deep, and, on the other hand, 1° colder at 1 foot deep, than is seasonable. Rain fell on five days to the aggregate depth of over 2 1/2 inches, which is more than the average rainfall for the whole of either May or June. On May 26, during a thunderstorm in the middle of the day, the rain was falling for 20 minutes at the average rate of 1 1/2 inch an hour. On the 1st inst. there was another heavy downpour, which was more remarkable for its duration than for any exceptional heavy fall at any one time. This rain began at 9 a.m. and lasted without intermission until 10 p.m., during which period over 1 1/2 inch was deposited. Only twice before in the last 24 years has there been here such a heavy fall of rain as this in any one day or night, or in any 24 hours. Of the rainfall of the last nine days 7 1/2 gallons have come through the bare soil percolation gauge, and 2 1/2 gallons through that on which short grass is growing. The sun shone on an average for seven hours a day, which is three-quarters of an hour a day longer than the average duration at this period of the year. During the week light airs and calms as a rule prevailed. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 5 per cent. Rosa pimpinellifolia, the Scotch Burnet Rose, came first into flower on May 23, or five days in advance of its average date in the previous eleven years, and eight days earlier than last year. E. M., Berkhamsted, June 2, 1909.

SCHEDULES RECEIVED.

Horticultural Exhibition in conjunction with the Southport Agricultural Show, to be held on July 29, 30, 31, and August 2. Manager of the Horticultural Section, Mr. Peter Blair, Trentham Gardens, Stoke-on-Trent.
Horticultural Exhibition in conjunction with the Royal Agricultural Show at Gloucester, to be held from Wednesday to Saturday, June 23 to 26. Horticultural manager, Mr. Peter Blair, Trentham, Stoke-on-Trent.

Floral Competitions in connection with King's College Hospital Carnival, to be held at the Crystal Palace on July 1, in aid of the removal of King's College Hospital to South London. Particulars may be obtained from Miss Stacey, Crystal Palace, Sydenham.

Newmarket Horticultural Society's annual show, to be held on Thursday, July 8. Secretary, Mr. Geo. A. Sarvent, 62, St. Philip's Road, Newmarket.

County Borough of Hanley Horticultural Fete (13th annual show), to be held on July 7 and 8. Secretary Horticultural Fete, Mr. Wm. Poulson, Town Hall, Hanley, Staffs.

GARDENING APPOINTMENTS.

- Mr. JAMES HEBDEN, for nearly 20 years Gardener at Welham Hall, Retford, as Gardener to E. E. HARCOURT VERNON, Esq., Grove Hall, Retford.
Mr. C. L. BRANSON, for the last 12 years Gardener to Mrs. J. D. WINGFIELD-DIGBY, Coleshill Park, Coleshill, Birmingham, as Gardener to G. HANBURY, Esq., Blythewood Hitcham, near Burnham, Bucks.
Mr. W. R. FREEDY, late Foreman at Paxhill Park Gardens, Lindfield, Sussex, as Gardener to C. FEARN, Esq., Holmsted Place, Cuckfield, Sussex.
Mr. EDWARD GRIFFIN, until recently Gardener to the Hon. Mrs. CECIL HOWARD, Eastcote Lodge, Pinner, Middlesex, as Gardener to E. HUNTLEY HOOPER, Esq., Shelly Hill, Christchurch, Hants.

MARKETS.

COVENT GARDEN, June 2.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

Cut Flowers, &c.: Average Wholesale Prices.

Table with columns for flower names, quantities, and prices. Includes items like Anemone fulgens, Carnations, Freesias, Gardenias, Gladiolus, Gypsophila, Iris, Lilac, Lilies, and Tulips.

Cut Foliage, &c.: Average Wholesale Prices.

Table with columns for foliage names, quantities, and prices. Includes items like Adiantum, Agrostis, Asparagus, Berberis, Croton, Cycas, Ferns, and Smilax.

Plants in Pots, &c.: Average Wholesale Prices.

Table with columns for plant names, quantities, and prices. Includes items like Ampelopsis, Aralia, Erica, Fuchsia, Geranium, and Hydrangea.

REMARKS.—The prices of Australian and Tasmanian Apples remain about the same as last week; there is a good demand for these Apples. French Cherries are arriving in a rather damaged condition, and are sold very cheaply. English Gooseberries are received in large quantities. Strawberries are very plentiful: the berries are not in the best condition. Nectarines are plentiful and much cheaper. Both English and Guernsey grown Beans and Peas are plentiful. English Tomatoes, also Cucumbers, are being marketed in larger quantities. Trade generally is quiet. E. H. K., Covent Garden, Wednesday, June 2, 1909.

Potatos.

Blacklands ...	2	3-2 6			

REMARKS.—Trade in old Potatos is very slow, and each day sees larger arrivals of new tubers from St. Malo and Jersey. E. J. Newborn, Covent Garden and St. Pancras, June 2, 1909.

COVENT GARDEN FLOWER MARKET.

The first week in June is usually a busy one with growers of bedding plants, and this morning (Wednesday) there were large stocks of such plants in the market, but the weather being wet and cold little business was done. Earlier in the season it seemed that Pelargoniums, such as are used for summer bedding, might be scarce, but they are plentiful and cheaper than they were earlier in the season. It is difficult to estimate what may occur during the next week. The nurserymen endeavour to dispose of their stocks early, and they will not be safe to depend on obtaining any special subjects later unless ordered in advance.

CUT FLOWERS.

After the market was closed this morning I visited the stores outside the ordinary Flower Market. Some of these remain open until late in the day. This is an advantage to the florists who may require flowers at short notice. Roses are still plentiful, but many of the blooms are small. Carnations also are abundant, and large quantities of splendid blooms were unsold. I never saw so many good cut flowers unsold as there were this morning.

POT PLANTS.

The trade in pot plants is not brisk. At closing time I noticed many Rambler Roses which had failed to find purchasers. These Roses are remarkably good this season. Supplies of Lilliums are excessive and their prices vary. The pink-flowered Astilbes (Spiraeas) are of much better quality than they were earlier in the year. The white kind is also good. Of Hydrangeas I have rarely noticed so many of poor quality as are seen this season; some, however, are well grown. Some market growers endeavour to get the blue shade in the flowers, but in most instances they fail to do so. In ordinary seasonable flowering plants there is not much that is new to record, except that supplies are more than equal to all demands. Foliage plants vary but little; imported Bay trees are cheaper. Aspidistras have depreciated in value, but Palms are dearer. I learn from reliable sources that Palm seeds have advanced in price, and are likely to be very scarce, particularly Kentias. Asparagus of various sorts are good. A. Sprengeri is now much appreciated. The best type of A. plumosus nanus sells well, but there are many intermediate varieties which growers should avoid. A. tenuissimus is propagated from cuttings, consequently the plants vary little. A. H., Covent Garden, Wednesday, June 2, 1909.

Obituary.

FREDERICK BOXALL.—The death of this gardener occurred on the 22nd ult. The deceased had been employed in the nursery of Mr. Robert Neal, Wandsworth, London, for fifty years, and during the greater part of that time filled the position of foreman.

WILLIAM BAKEWELL.—We regret to announce the death, on May 23, of Mr. William Bakewell, for 40 years head gardener and sub-agent to the Earl of Denbigh, Downing, Holywell. Mr. Bakewell was a native of Warwick, and was engaged for several years in the gardens at Newnham Paddox, the Warwickshire seat of the Denbigh family. He went to Downing in the year 1866, as head gardener, thus serving three generations of the Earls of Denbigh. For over twenty years he discharged the duties of estate bailiff and sub-agent of the Downing estate. In addition to estate duties, Mr. Bakewell took an active interest in local affairs. From the establishment of Parish Councils he had been a member of the Whitford Council, and had for several years occupied the chair. To the Whitford-Mostyn Cottage Garden and Agricultural Society his death will be a great loss. For a number of years he acted as the general secretary, and until latterly as joint secretary of the agricultural section. The funeral took place on Wednesday, the 26th ult., at Whitford Churchyard.

FREDERICK WILLIAM CRUMP.—We regret to learn that the eldest son of Mr. and Mrs. Wm. Crump died on the 31st ult. at Madresfield Court Gardens, Malvern. Deceased was 25 years of age, and a marine engineer. The cause of death was cancer of the liver.

ENQUIRY.

LILIUms RUBELLUM and WASHINGTONIANUM.—Has anyone succeeded in England in thoroughly establishing LiliuMs rubellum and Washingtonianum (the Oregon form), sometimes, I think, called L. purpureum? And do they ever increase? Here (Burton-on-Trent) they begin poorly and seem to increase in vigour every year, planted deep in good sandy loam in a wood. B. L.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the Publisher; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the Editors. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

ASTERS DISEASED: H. & Co. The plants are affected with Aster disease—Erysiphe cichoracearum. Destroy by burning all the affected plants; spray the remaining ones with a weak solution of permanganate of potash.

AUSTRALIAN TREE FERNS: K. & S., New York. You had better insert a small advertisement for these.

AZALEA WITH GALL: W. H. A. The galls are caused by a fungus—Exobasidium rhododendri. Pluck off the affected leaves and burn them before the spore-bearing organs develop.

CARNATION MRS. TRELAWNEY: G. H. The malformed flower exhibits proliferation, a condition in which the central axis continues to develop after the flower has formed. It is common in many other flowers, and especially Roses. It is the result probably of excessive feeding.

CATERPILLARS INJURING FRUIT TREES: G. W. W. & Co. The caterpillars are those of the winter moth (Cheimatobia brumata). The males of this moth are winged, but the females are wingless. Spraying with arsenate of lead (Swift's) is all that you can do at this date. But you should apply grease bands to all the trees in the autumn. These are made of strong grease-proof paper tied round the trunk of the tree securely with string. The grease is applied to this. We would recommend that the best proprietary grease be used; poor kinds dry quickly, and the wingless female moths can then pass over them.

CUCUMBERS FAILING: H. P. The root has been completely hollowed out by some maggot, which was not present in the specimen.

DARWIN TULIPS: D. C. The flower-stalks are long, but not abnormally so for this species. The vigour is due, no doubt, to a satisfactory rooting medium.

DWARF JAPANESE CUPRESSUS: G. O. P. Turn the plant out of the pot or tub in which it has been during the last eight years, prick the ball of earth and roots round with a pointed stick, removing as much of the exhausted soil as possible without subjecting the plant to any appreciable check, and repot it into a pot or tub 2 inches larger in diameter than that which it previously occupied. Place 2 or 3 inches deep of potsherds at the bottom, the smallest being put above the larger fragments, and then cover with pieces of thin turf, in order to secure perfect drainage. As a rooting medium use a compost consisting of about four parts good sandy loam, one part of leaf-mould, a double handful of bonemeal and a like quantity of fine potsherds which have been passed through a sieve with a quarter-inch mesh, the

whole being mixed well together before being used. In potting, ram the soil firmly in the space between the ball of roots and the sides of the pot or tub with a flat rammer, using a blunt rammer for firming the soil on the top. This done, afford sufficient water to moisten the ball of roots and the new soil, and then stand the plant in a shady place for a fortnight or three weeks, to allow of the roots taking hold of the new soil and of the plant re-establishing itself. Syringe the plant overhead with clean water three times a day during bright weather, morning, mid-day, and late in the afternoon. When the plant has become thoroughly re-established at the roots it can be exposed again to sunshine.

FIGS WITH BROWN MARKINGS ON FOLIAGE: *G. C.* Our mycologist reports that no disease is present, and that the trouble is due to some external trouble, which only those on the spot can determine.

GERMAN FLOWER-BED: *A. Rix.* We know of no flower-bed specially so called. In German gardens raised beds are sometimes made of tiers of earthen beds one above the other, and each some 2 feet smaller than the one below it. Stout, thick turf is used for forming the retaining sides, and these slope towards the top slightly. Sometimes rockwork takes the place of turf. The methods of planting are as varied as other kinds of beds, but subjects having a long duration of flowering are the best for such beds. Foliage plants are effective if chosen with care. Sometimes a simple mound is raised and given an erect or a sloping wall of turf. This kind of bed answers well for lowly plants such as Violas, Pansies, Pelargoniums, &c.

GLOXINIAS KILLED: *J. P.* As you suspect the manure to be contaminated with petrol, your best plan will be to avoid using it. If you wish to have it analysed, send to Dr. Voelcker, M.A., 22, Tudor Street, London, E.C., who will require a fee, which will be small if you are a Fellow of the Royal Horticultural Society.

GOOSEBERRIES: *B. L.* The damage has been caused by the Gooseberry midge—*Cecidomyia grossulariæ*. It is now too late to do anything this season. The damaged berries should be collected and burned, otherwise the injury will be repeated next season.

GRAPES: *B. H.* We find no disease present in the examples you send. The damage has been caused by some wrong treatment such as allowing a cold draught to enter the vinery. Unless we know more of the treatment the vines have been given we cannot assist you further.—*Galtee.* The damage is not caused by disease, and must be attributed to some cultural defect, which only those in charge of the vinery will be able to determine.

LABURNUM WITH THREE FORMS OF INFLORESCENCES: *F. N.* *Cytisus purpureus*—the small purple form—has been grafted on the common Laburnum. The influence of the stock has so acted on the graft that some of the flowers are intermediate in form, size, and colouring between those of the parents. It is the classical example of what is termed a graft hybrid. You will find it described and illustrated in the *Gardeners' Chronicle* for September 24, 1904, p. 217.

MELONS DISEASED: *A. A.* The plants are affected with a bacterial rot. Clear out the old soil and start afresh. Before planting again sprinkle lime freely on the staging where they were grown, or, better still, select a fresh house for the new crop.—*E. H.* The plants are affected with the Melon-leaf blotch. Spray them with dilute Bordeaux mixture, or, if mature fruit is present, with sulphide of potassium, using one ounce of the chemical in three gallons of water. The soil is infected, and should not be used for Melon culture again.

NAMES OF PLANTS: *W. S. O. P.* *Prunus japonica*, double-flowered variety.—*S. K.* *Coronilla emerus*.—*A. E. C.* 1, *Acer platanoides*; 2, *Pyrus floribunda*.—*R. H. P.* *Cratægus orientalis*.—*W. B. & Son.* 1, *Cerastium Biebersteinii*,

2, *Tragopogon porrifolius*.—*W. F.* 1, *Saxifraga peltata*; 2, *Asphodeline liburnica*; 3, *Mimulus cupreus*; 4, *Cytisus purpureus*; 5, *Spiræa arguta*.—*H. S.* 1, *Escallonia punctata*; 2, *Omphalodes linifolia*; 3, *Berberis Darwinii*; 4, *Atriplex halimus*; 5, *Justicia* sp. (?), specimen too withered; *Diervilla rosea*.—*F. N. H.* *Rhododendron Falconeri*.—*C. B.* 1, *Prunella vulgaris* (Selfheal); 2, *Nepeta Glechoma* (Ground Ivy); 3, *Capsella Bursa-pastoris* (Shepherds' Purse).—*F. T.* 1, *Hæmaria discolor*; 2, *Epidendrum lanipes*; 3, *Oncidium spillopterum*; 4, *Eria stricta*; 5, *Aerides odoratum*.—*W. B.* 1, *Zebrina pendula*, generally known as *Tradescantia Zebrina* in gardens; 2, *Tradescantia repens variegata*; 3, *Pilea microphylla* (muscosa); 4, *Selaginella viticulosa*; 5, *Selaginella Mertensii*; 6, *Fraxinus Ornus*.—*L. P.* 1, *Euphorbia Peplis*; 2, *Geranium Robertianum*; 3, *Stellaria holostea*; 4, *Veronica Chamædryd*; 5, *Nepeta Glechoma*; 6, *Geum urbanum*.—*A. N.* *Eccremocarpus scaber*.—*J. S. S.* *Brunfelsia macrantha*.—*A. A.* *Magnolia acuminata*.

NECTARINES WITH MARKINGS: *Peaches.* There is no disease present in the fruits, the damage is connected with some fault in culture. Your suspicion as to over-feeding may be the correct one. In any case, add some lime or old mortar rubble to the soil. This will neutralise any acidity and be of use in other respects.

PEACH AND NECTARINE LEAVES: *A. B. C.* The trouble is caused by the "Shot-hole" fungus. See reply to *G. S.* in the issue for May 8, p. 304.

PEACHES AND NECTARINES: *W. G.* The Peaches are attacked with mildew *Oidium leucoconium*. Spray the plants with some fungicide such as liver of sulphur. The cracking in the Nectarines is caused by an excess of moisture either in the atmosphere or the soil. In these circumstances the leaves are unable to transpire as rapidly as water is carried to them. The cells thus become gorged with water, and, swelling, burst the skin, as is seen in your specimens.

PEACH LEAF BLISTER: *Wales.* (1) This disease is due to the fungus *Exoascus deformans*. It is a well-known fact that trees growing in much exposed positions suffer most from "blister," and that the fungus shows itself extremely active after a period of cold weather in spring and a visitation of east or north-east winds. As the best preventive measure, Peach trees should be planted against walls facing to the south and in the most sheltered part of the garden available. Any diseased leaves should be removed to the fire as soon as detected, and branches bearing diseased leaves be pruned back beyond the point of infection. Spraying with dilute ammoniacal solution of copper carbonate when the leaf-buds are beginning to expand, and again after an interval of three weeks, would be beneficial as a safeguard against inoculation from wind-borne spores. (2) *The Book of Garden Pests*, by R. Hooper Pearson, price 2s. 9d. post free of our publishing department.

PEACH TREES: *Perplexed.* It is impossible for us to offer a definite opinion as to what has caused the shedding of the leaves each year. This could only be done after a thorough examination of the trees in the border, unless there is something in the leaves themselves which indicates the presence of disease. If you will send some leaves, we will examine them. It is obvious, however, that there are two conditions which might cause the leaves to fall, namely, (1) an exceedingly low temperature with frost, (2) drought at the roots. You will best know whether either of these probable causes explain your trouble.

PEACHES GUMMING: *W. V.* Three pounds of common salt, scattered over the soil as far as the roots extend, at intervals during a year, has proved beneficial in similar cases.

PEAS DISEASED AT THE "COLLAR": *C. S.* *Spondylocladium atrovirens*, a fungus, is causing the injury. Watering with a solution of sulphate of potash may check the complaint, but the soil is infected, and should be well limed as soon as practicable.

PLANT FROM BABENO: *D. C. B.* We cannot trace such a name as you mention. If you will

send a specimen of the plant we will endeavour to assist you.

PROFESSIONAL AND AMATEUR EXHIBITORS: *H. C.* The term amateur at a flower show bears more than one interpretation. It is often used to designate a person other than a trader, whilst in another case it may mean one who is not a nurseryman or florist, and who employs no professional gardener. It is the duty of those responsible for the compilation of the schedule to see that the term is properly defined in the rules of the show. According to the *Code of Rules for Judging* issued by the Royal Horticultural Society, "no person shall be allowed to compete as an amateur who sells plants (except when giving up possession of the place where they grow, or in the case of new seedlings or sports), grafts, cuttings, or buds for budding, nor any person in the employ of a nurseryman. Any objection raised as to the qualification of an exhibitor shall be referred to the committee or other authority for arbitration, and their decision shall be final and binding on both parties. The term 'Amateur' is here employed in its broadest sense, that is, in contradistinction to 'nurseryman.' In some schedules the word is used more strictly, denoting an amateur gardener, i.e., one who employs no professional help whatever in the cultivation of his garden, in contradistinction to an amateur owner, who cultivates by means of professional gardeners in his employment." A person who employs professional help in his garden cannot be regarded as a cottager in an exhibition sense.

STOCKS DISEASED: *A. G.* The young plants are killed by *Thielavia basicola*, a fungus which infests the soil. The ground should be dressed with quicklime.

STRAWBERRY: *G. V. P., Teneriffe.* The fruits were quite decayed when received.

STRAWBERRY BLOSSOMS INJURED: *A. H. L.* There was no trace of injury in the examples forwarded to us; but they had dried up during transit. Send us a fresh supply packed in a tin box.—*Straus.* No disease is present: the flowers have not been fertilised. The cold, windy weather when they expanded prevented insects from visiting them.

TOMATOS: *H. L., Chortsey.* If you will send specimens, we will examine them for evidence of disease.—*J. H.* Disease is not responsible for the trouble. No doubt the burying of the stems has been done too deeply. Tomatos should be planted in their fruiting pots with a small quantity of soil only at first, adding more as it is needed. In this way the first bunches of fruits are had low down the stem.—*W. L.* The disease is "Black Stripe." Spray the foliage at intervals of four days until the complaint is checked with a solution of sulphide of potassium, using it at the strength of one ounce in three gallons of water.

TULIP: *Birmingham.* No disease is present in the plants. The leaves of certain varieties of Tulips suffer from the effects of the slightest frost or scorching.

VINE MILDEW: *G. W.* Spray the vines thoroughly with liver of sulphur, using 1 ounce in three gallons of water every fourth day, or oftener if necessary, until the fungus is checked.

WILD PARSLEY: *F. W.* The best remedy is to cut down the Parsley before it seeds, and continue to cut it down as often as may be necessary. We do not know of any preparation that can be used for exterminating Parsley that would not injure Primroses and Violets.

YEW HEDGE: *H. H.* Loosen the ground with a fork for a distance of about 3 feet on both sides of the hedge, and apply a good watering, then give a top-dressing of old leaf-mould, turfy loam, or manure. The top growth should be kept moist by frequent sprayings, especially in sunny or windy weather.

A MARKET FRUIT-GROWER'S YEAR.

WITH May begins the rush of work on a fruit farm, to last without intermission until the completion of Apple-picking. At least, this is the case where spraying is carried on systematically, for this operation takes up an immense amount of time, and interferes with the important work of hoeing, unless additional hands are employed. Before the end of the month, moreover, Gooseberry picking begins on a small scale, and in young plantations extra work is required.

In my last article (May 15) the blossoming of certain varieties of fruit trees was noticed, and Apple blossom came out in the course of the first fortnight of May, though that of the latest Royal Jubilee—was not full before the 24th of the month. During nearly the whole period of blossoming the wind was from a cold quarter, and very strong at times. This appears to have interfered with the setting of fruit on certain delicate varieties, including Cox's Orange Pippin and Allington Pippin, particularly on the sides of trees exposed to the north, north-east, or east. As a rule, however, the setting of fruit is fairly good with Apples, and decidedly so with Plums and Pears. No damage was done by frost on my farm, as the temperature, registered 4 feet from the ground, did not fall below freezing point while any fruit was in blossom. Monarch is the only Plum which is not at least fairly set in my plantations, and that is because it did not blossom freely. Until the stoning period has been passed, however, no certainty as to the yield of Plums can be entertained.

Insect pests have proved exceedingly damaging this season. On Plums, particularly Rivers's Early Prolific and Czar, there is one of the worst attacks of aphid that I have known. Spraying with nicotine wash was, apparently, a serious waste of money, although it was carried out immediately after the attack began. Three days after the operation I searched in vain for a dead aphid. None was to be found, even in the partially-curved leaves. That this wash will kill the aphid when it is made to run all over the inside of curled leaves by opening them and pouring it on was proved on two or three occasions; but a mere spraying has not the same effect. Still, it is very remarkable that not a single dead aphid could be found. Nicotine is a very expensive wash, and it seems, in practice, to be no more efficacious than the good old mixture—soft soap and quassia. But my experience is that no spraying of Plum trees after the leaves have curled is of any considerable use. Though a small proportion of aphid is killed, there are plenty left to bring the pest up to its original strength in the course of a day or two. This season a search was made at frequent intervals for the mother queens, the intention being to spray as soon as any of them were found. None could be found up to about three days before a bad attack was shown by multitudes of curled leaves. Truly the Plum aphid is a difficult foe to encounter. It is more difficult to reach by spraying than the Apple aphid, because Plum leaves curl more suddenly and completely than Apple leaves, and the insect itself appears to be less susceptible to insecticides. A young plantation of home-raised Plums has escaped the attack of aphid, and this fact seems to indicate that the older trees, which were purchased, and have been attacked badly from the first, were infested with eggs when they were received.

There was also an attack of winter moth caterpillars on some varieties of Plums; but this has been rendered comparatively harmless by adding arsenate of lead to the nicotine wash for these varieties.

When last month's Notes were written no attack of the Apple sucker had appeared. A few weeks later, however, a slight infestation, after two years' immunity, was detected. This has been met effectually by drenching the trees with a strong solution of soft soap and quassia, 12lb. of each to 100 gallons. Numbers of dead suckers, and hardly any live ones, were found a couple of days after the spraying. In the same plantation winter moth and other leaf-eating caterpillars were doing damage to a few varieties; and, for these, arsenate of lead was added to the wash, while the Woburn-Bordeaux paste was also added for a few varieties particularly liable to scab. No aphid worth notice has appeared at present in this plantation.

In a young plantation of Apple trees there has been the worst attack of leaf-eating caterpillars, especially those of the winter and the bud moth, that I have ever had; aphid also has been troublesome on some varieties, particularly Allington Pippin and Beauty of Bath. When the trees were first sprayed the caterpillars were inside the folded leaves, and there they fed on unpoisoned food until they had reduced many clusters of leaves to ribbons. The extreme slowness with which the bunches of leaves unfolded, in consequence of the coldness of the weather in the first three weeks of May, caused the damage to be greater than usual. A second spraying in the last week of May proved more effi-

cient than the earlier one, soft soap, quassia, and arsenate of lead being used in the later spraying. But perhaps the best result was attained by squeezing the terminal unopened clusters of leaves when the trees were gone over for the removal of blooms where wood growth was desired, and for trimming some of them. Some varieties had a caterpillar in nearly every terminal cluster of leaves. At the same time curled leaves infested with aphid were stripped off and crushed. These operations are practicable only on quite young trees.

It remains to notice an insect pest which is not recognised in any text-book in my possession, and I have Mr. Theobald's admirable work, as well as the late Miss Ormerod's publications. This is a dark purple aphid, apparently black to the naked eye, infesting Currants. It is a curious fact that this aphid has not been noticed by entomologists in this country, although it is probably common enough. Specimens sent to one high authority have elicited a reply to this effect. It has troubled me ever since I grew Black Currants, and two distant growers are also troubled by it. The presence of this pest is made obvious by the curling of the terminal leaves of branches or of young sucker shoots. But the aphides are not on these leaves; they are on the stems just below, and in some cases in the bunches of Currants below curled leaves. As only about one in a hundred bushes was affected, or fewer still, in the hope of eradicating the pest from a young plantation of Boskoop Giant, the affected ends of branches have been taken off and destroyed. This is a remedy applied with reluctance, as it checks extensive growth; but a sacrifice may be faced with the prospect of ultimate advantage. Spraying is of comparatively little use in this case.

FUNGAL PESTS.

Brown rot has appeared to a troublesome extent on Monarch, Czar, and Pond's Seedling Plums. The dead fruits and terminals have been taken off one variety and burned; but time has not yet been found to treat the other two varieties likewise. The same disease is showing on some fruits of Cox's Orange Pippin, and to a less extent on two or three other varieties, as shown by the withering of branches of blossom or embryo fruit. The attack is chiefly on the spurs on the top portions of branches. Powdery mildew is also in evidence on a few varieties, particularly Bismarck and Allington Pippin. Scab has not yet been found on the leaves of any variety, but is expected on sorts which have been affected in previous years. A second spraying against it will be carried out a fortnight after the first operation.

THE EXTENSION SYSTEM.

Of all the fads which fruit-growers have been induced to entertain, perhaps that known as the extension system has done the greatest amount of mischief when practised on young trees. Reference has been made on previous occasions to premature blossoming, to the prevention of wood growth, caused by leaving long shoots uncut on young trees. At my last pruning time some well-furnished young Worcester Pearmain trees were left almost or entirely uncut. The result is that blossoms appeared nearly or quite up to the tips of the shoots, from which many emerged feebly without any leaves around them. Cutting back severely has been necessary. It is not my intention to defend the continuous cutting-back of trees; but in the first four seasons after planting, at any rate on land that is not in high condition, my experience is that pruning can hardly be too severe. *Southern Grower.*

NEW OR NOTEWORTHY PLANTS.

*DENDROBIUM SANDERÆ, ROLFE, N. SP.

THIS is a handsome *Dendrobium*, introduced by Messrs. Sander & Sons, St. Albans, of which photographs, dried flowers, and a living plant have been sent to Kew. It is an ally of *D. Dearei*, Reichb. f., and has tall, striate, copiously-leafy stems, from a foot and a half to 3 feet long, somewhat thickened below the middle, and narrowed upwards. The leaves are oblong, slightly bilobed at the apex, and under 2 inches long. The short racemes are borne on the upper part of the stems, and produce 3 or 4 large and beautiful flowers, whose general aspect can be seen in fig. 163, which is reproduced from one of the photographs. The collector describes the flowers as large and very effective, the sepals and petals as pure white and of good substance, and the lip, white lined with green, the side lobes lined with blackish purple, and the throat and inside of the spur blackish violet. Traces of these colours are retained in the dried flowers. The plant is said to be free-growing and flowering, and is certainly very beautiful. The petals are large and well displayed. In the dried flowers they are an inch and a half long by an inch broad, while the expanded lip measures over an inch across. The spur tapers to a fine point, and measures over an inch and a quarter long from its junction with the pedicel. The second photograph sent shows the plant much reduced, including a stem bearing about 40 leaves. The plant bears a considerable general resemblance to *D. Dearei*, Reichb. f., and *D. parthenium*, Reichb. f., the latter a handsome Bornean species, which has been lost sight of. It is, however, quite distinct from either. *R. A. Rolfe.*

THE ROSARY.

CULTURAL NOTES FOR JUNE.

THE frosts of May and the cold easterly winds have brought in their train many insect pests, which have wrought considerable damage to the young shoots. Remedial measures, in the form of a syringing with a strong solution of soft soap, quassia extract, and nicotine, should be resorted to at once. The liquid should be warmed to about 90°, and applied preferably in the evening. The spray should be rinsed off with clear water early on the following morning. It is advisable before spraying the plants to pick out any grubs which have hidden themselves in curled leaves, or which have eaten into the flower-buds. In some cases the growths have been injured by cold since the April pruning; these should be cut back to sound wood at a spot where there is a prominent bud. A watch must be kept for the beetle that infests and eats the young shoots of Standard Briars. The pest commits its depredations in the evening, at which time it should be sought.

Budding operations will be late this season. Under ordinary conditions, this work should be well in hand by the end of June. It is not advisable to commence budding before the shoots have obtained some degree of hardness, and the branches from which the buds are to be taken are well ripened. Above all, the bark should run freely in both stock and scion.

* *Dendrobium Sanderæ*, Rolfe.—Caulis elongati, infra medium paulo incrassati, 40-80 cm. alti., foliosi, striati, internodi 2-2.5 cm. distantes. Folia oblonga vel elliptico-oblonga, apice minute biloba, 4-5 cm. longa, circa 1.1-1.5 cm. lata. Racemi laterales, prope apicem ramorum producti, 1.5-2.5 cm. longi, 3-4-flori, basi vaginis ocreatis brevibus obtecti. Bracteæ late ovato-oblongi, subacuti, membranacei, 2-3 mm. longi. Pedicelli circa 4 cm. longi, teretes. Flores magni, albi, labelli disco et lobis lateralibus striatis. Sepalum posticum lanceolatum, acutum vel acuminatum, carinatum, circa 3-5 cm. longum, sepala lateralia oblongo-lanceolata, acuta vel acuminata, carinata, circa 4 cm. longa, basi obliqua, in mentum conicum acuminatum 2 cm. longum producta. Labellum trilobum, 4 cm. longum, lobi laterales rotundati vel subtruncati, 1 cm. lati; lobus intermedius obovatus, truncatus vel obtuse bilobus, creolatus, 2-2.5 cm. latus. Columna lata. *R. A. Rolfe.*

As soon as last year's buds commence to push into growth they must be secured to sticks fastened to the main stem. If it is desired, the points of the shoots may be pinched when they have made about 5 or 6 inches of growth; but if the plants are intended to furnish blooms for exhibition purposes, it is best to leave the shoots unstopped. The best exhibition blooms are often produced from maiden-buds. The quality of the flowers will be much improved if liquid manure is applied to the plants, and this feeding should be alternated with the application of some phosphatic manure, at intervals of a few days. Any manurial stimulant should be applied first in a very diluted form; the strength can be increased until the bud is developing its colour, when feeding should be discontinued; at

Manetti and De la Grifferae stocks prefer a sandy loam. Roses of the Hybrid Perpetual type do best on the Briar and Manetti stocks. Strong-growing varieties, and especially climbers of the Hybrid Tea and Noisette types do best on the De la Grifferae stocks, whilst, in the case of varieties of moderately vigorous growth, and also the weaker-growing kinds of the Hybrid Perpetual and Tea sections, the seedling Briar stock is best.

Cuttings inserted in the open last October have made very few roots. They need protection from hot sunshine during the middle of the day until they are better rooted. Apply mulchings and in dry weather copious waterings.

Grafted plants that are plunged in the open

FIG. 163.—DENDROBIUM SANDERÆ, A NEW SPECIES ALLIED TO *D. DEAREI*.

that stage soft water only should be applied to the roots. All growths from the stock itself, other than one shoot beyond the bud, which will cause the sap to circulate past the bud, should be removed. This applies to buds on the standard and half-standard Briars. Those on the Manetti and De la Grifferae stocks are generally later in developing, so that the stock can be denuded of its shoots gradually. When the bud is growing freely the stock above the graft may be removed.

STOCKS FOR ROSES.

Standard, seedling, and dwarf Briar stocks succeed best in a stiff, loamy soil, but the

are now growing freely. Any that need re-planting should be attended to without delay. It is advisable to stop the longest shoots about twice during the season. Their further requirements throughout the summer will consist of stopping, tying and staking the shoots, and in watering.

Plants on their own roots in pots will require similar attention, but instead of plunging them in the ground it is better to plunge them on an old hot-bed.

Indoor Roses should be syringed occasionally. Prick up the surface of the borders lightly with a fork and dust some lime over it. After this apply a layer of well-rotted manure as a

mulch. Remove all weak and useless shoots and endeavour to keep the plants as vigorous and healthy as possible, so that they may flower well next autumn and winter. *J. D. G.*

FORTUNE'S YELLOW ROSE.

THE proper pruning of this plant, apart from the necessary vigour of growth, is the crux of the whole question of success in flowering. Like Marechal Niel, Lamarque, and others of this type of growth and flower, close cutting back of the old flowering wood after blossoming is over, with a view to inducing further vigorous shoots to form and grow luxuriantly during the summer, is an absolute necessity. From the nodes of these strong growths an abundant crop of flowers may reasonably be expected. The great charm of the variety is the gorgeous and unique tint of colour which shows so effectively in artificial light, when the colour is a beautiful yellow, flaked with carmine and tinted with bronze. *E. M.*

NOTICES OF BOOKS.

* TREES AND THEIR LIFE-HISTORIES.

THE practice of issuing scientific books in serial parts may be convenient for the publisher and popular with the public, but it is certainly embarrassing to the reviewer, for either he must wait till all the parts have appeared before offering an opinion on the work—in which case his comments are belated—or else he must endeavour to judge of the bulk by the sample. In the book under review, the risk run by adopting the latter course would appear to be but small. Dr. Groom has devoted many years to the study of trees, and no one in this country is better qualified to write upon their life-histories. The plan which the author adopts is set forth in the opening words of the preface, "to consider the tree, not as a mere object to be identified, but as a living being whose struggling life is to be watched, whose wants are to be studied, and whose changing lineaments are to be observed."

Part I. consists of an introduction dealing with the activity of the tree, its nourishment, the root and shoot systems, the leaves, stem, and flowers. Though the author states that the introduction is superfluous to those acquainted with botany, it will prove, by reason of the broad manner in which these subjects are treated, well worth the attention of those who have already some knowledge of botanical science. The author adopts a wise, middle course in the use of technical terms. Where such terms are necessary, he does not hesitate to employ them, but where they may be dispensed with he leaves them alone. Thus he avoids the common alternative errors of, on the one hand, giving an appearance of easiness at the expense of precision, and, on the other hand, of rendering his text repellent by the introduction of an unduly large number of ugly and obscure words to describe beautiful and evident things.

The work, which is to be completed in 13 parts, is illustrated in the most admirable manner by photographs by Mr. Henry Irving. Part I. contains nearly 50 figures depicting trees, their leaves, buds, and other parts. The completed work will contain upwards of 500 illustrations. As evidence of the fascination of the pictures, it may be mentioned that already the review copy has been claimed several times by a youthful student of Nature, who has only consented under very definite pressure to yield it up, and then subject to the explicit condition that it should be returned immediately.

* *Trees and their Life-Histories*, by Percy Groom, D.Sc. Illustrated from photographs by Henry Irving. (Cassell & Co., Ltd., 1903. In 13 fortnightly parts. Part I., 1s. net).

NURSERY NOTES.

MESSRS. CHARLESWORTH & CO.

THIS firm's new establishment at Haywards Heath, Sussex, embodies the best appointments which experience could suggest, and will worthily supersede the extensive Orchid establishment which has been given up at Heaton, near Bradford. First, as to the selection of a site. This was not determined upon until it had been proved that the part of Sussex in which the new nursery has been established was one of the best possible for Orchid culture. An estate of considerable extent was purchased, and Mr. Harris, of Ealing, was given a commission to erect the houses on Mr. J. Charlesworth's own plan in regard to the more important details. The work was commenced in February, 1908, and the houses were used for the accommodation of the stock brought from Heaton, Bradford, by the end of November of the same year. The houses are in two blocks. No. 1 block, called the commercial department, consists of 12 houses, each 100 feet in length, four sets of three being 12 feet, 13 feet, 20 feet, and 21 feet 6 inches wide respectively. These houses

lath blinds are used, for in this locality the unusual amount of sunlight which is so beneficial in winter, early spring and autumn, has to be toned down in summer.

The houses have span roofs, they are not lofty, and the arrangements of the interior are very simple. The whole of the floor area is allowed to remain as the natural earth, the surface being turned over occasionally. The paths are of stout woodwork trellis, except in the corridors, where they are of ornamental tiles. A carefully-restricted system of top-ventilation has been adopted. The ventilators beneath the staging on the outer walls are furnished with iron levers, which extend beneath the staging to the edge of the central path, where they may be used to regulate the ventilation from inside the house. The staging is of the usual kind, a close staging with an open woodwork above it. Here the close staging is of York stone slabs, with broken coke for holding and giving off moisture. The whole establishment is lighted by electricity, an installation for the purpose having been set up.

The heating is done from two centres, and is so arranged that any of the houses can be shut off or controlled, and that, when additions are made, the new structures can be heated without inter-

FIG. 164.—PERSPECTIVE VIEW OF MESSRS. CHARLESWORTH'S NEW NURSERY AT HAYWARDS HEATH.

extend right and left of a broad corridor 250 feet long, leading from the offices to the packing and potting sheds at the other end. The packing shed is 75 feet by 20 feet, the potting shed 80 feet by 20 feet, and the photographic studio 20 feet by 20 feet. The "seedling" block, which also has its corridor connecting the ends of the houses, consists at present of eight houses 100 feet long by 10 to 11 feet in width; one house 100 feet by 18 feet; two houses at the end of the potting shed 35 feet by 18 feet; the potting shed itself, which is used solely for the earlier stages of the hybrid Orchids and things on trial, being 50 feet by 18 feet, with a small room in which Mr. Charlesworth carries out some of the more delicate operations in testing and sowing seeds.

At the entrance is an important block, consisting of private and general offices, artists' room, &c.

The houses are shaded to suit the requirements of the plants grown in them by lath roller-blinds made on the place; in some cases a stippling of white is placed on the glass in addition to the lath blind. In other houses two sets of

fering with the existing sets of houses. Each set of three houses has its own flow and return to the boiler.

Three large Senior Robin Hood boilers, supplied by Messrs. Foster and Pearson, are working on one block, and two on another, with spaces left for two more in each stoke-hold.

Anthracite coal is used, and it is found that economy is effected and the life of the fire-bars prolonged by keeping water in the ash-way beneath the fires.

THE PLANTS.

In the commercial block it is pleasant to find that, although hybrid Orchids are the speciality, the imported species receive due attention, for each of the showy species, such as the large-flowered Cattleyas, is well represented, and pretty things of botanical interest are plentiful. We can only name a few which attracted our attention during our inspection of the houses.

Trichopilia Backhousiana, with its large, pure white fragrant flowers, made a good display; *Odontoglossum hastilabium*, *Miltonia vexillaria*,

Brassia brachiata, *Oncidium crispum*, including one magnificent dark form; *Epidendrum vitellinum*; a very interesting and showy lot of *Masdevallias*, the favourite *Cochlioda Noezliana*, a lot of brilliant scarlet *Sophranitis*, *Vanda cœrulea*, and *V. tricolor*, including the albino *V. tricolor pallida*; *Cymbidium Huttonii*, *Renanthera Imshooiana*, and a fine selection of *Cattleya Mendelii*, *C. Schröderæ*, *C. Skinneri*, *Lælia purpurata*, and other handsome species. Of *Phalænopsis* there is a large houseful, *P. Schilleriana* being specially good.

Odontoglossums fill several houses, and make a good show of flowers of fine quality. *O. crispum* is the favourite both for growing and for

hybrid, bears a fine spike of large, dark chestnut-red flowers with yellow base to the lip.

THE "SEEDLING" HOUSES

contain a collection of crosses of all kinds, including secondary crosses which are expected to give grand results; and wide crosses, which are "facts accomplished," although only a few years ago such combinations would have been considered impossible. These might be enumerated by the score, but it must suffice to mention a few of which we saw healthy little batches. *Cochlioda Noezliana* is found to be most receptive in crossing with other genera, and it has been used freely. Strong plants have been obtained between it and

are *Odontioda Charlesworthii*, *O. Bradshawæ*, *O. Lutetia*, and other scarlet-tinted *Odontiodas*, and crosses of *Odontoglossum Edwardii*, scarlet and crimson *Sophræ-Lælias* and *Sophræ-Cattleyas*, and *Odontoglossums*. House after house of small plants of these and other fine crosses are to be seen, and the readiness with which the seeds germinate in some cases is exemplified by one healthy little batch of which the seeds were only sown in February this year. Mr. Charlesworth is an enthusiast who is never content to "let well alone," so long as better may be accomplished. He is constantly experimenting in order to secure even better results than have yet been obtained. *J. O'B.*

[Photograph by A. E. Smith.]

FIG. 165.—A GROUP OF ORCHIDS FROM MESSRS. CHARLESWORTH'S NURSERY EXHIBITED AT THE TEMPLE SHOW.

hybridising, but only the best varieties are retained, and of these the large, round-flowered, white varieties are preferred. Blotched varieties of *O. crispum* raised from seeds are flowering well, and display the coveted features of size, shape and good colour in the highest degree.

Several houses contain *Lælio-Cattleyas*, hybrid *Cattleyas*, and *Brasso-Cattleyas*. *Cypripediums*, both species and hybrids, have each a good show of flowers. A batch of hybrid *Odontoglossums* has in flower *O. Watsonianum* (*loochristense* × *crispum*), some very fine *O. amabile*, *O. Fascinator*, *O. crispo-Harryanum*, *O. Lambeauanum*, *O. Wilckeanum*, home-raised, some of them far surpassing the best imported forms; *O. Othello*, *O. Ossulstonii*, and others, including several of the pure white *O. ardentissimum xanthotes* (*crispum xanthotes Charlesworthii* × *Pescatorei album*), which is one of the most beautiful *Odontoglossums* yet raised, and remarkable in that the whole batch are true to the albino character. Among new plants the handsome *Oncidium Charlesworthii* (fig. 166), probably a natural

various *Oncidium*s, including *O. concolor*, *O. Forbesii*, and *O. incurvum*; *Odontoglossum cirrhosum* × *Oncidium incurvum*, and again with *O. Forbesii*; and *Oncidium tigrinum* with *O. lamelligerum*. Various crosses have been made with *Odontoglossum Uro-Skinneri*, that with *Cochlioda Noezliana* resulting in perfectly healthy progeny. Most other crosses of *O. Uro-Skinneri* exhibit spotted, unsightly leaves on otherwise perfectly healthy plants, probably due to the difference in the cellular tissues and substance in the leaves of the species used, or in some other structural peculiarity in *O. Uro-Skinneri*, which clashes with that of the other parent, and which may disappear when the resultant hybrids are crossed again. *Odontoglossums* of the finest type have been intercrossed in every way, and an advance on the standard of excellence now common is not improbable. *Miltonia* seedlings are specially interesting, and a little batch of *Odontoglossum Rossii rubescens* × *O. ardentissimum* should be good.

In flower, and intended for further crossing,

* FIXATION OF NITROGEN BY BACTERIA.

THE fixation of nitrogen by bacteria, though a somewhat well-worn subject, is one of the most fundamental problems of agriculture and one which is constantly receiving new light from one source or another. Nitrogen is not only an essential element in the nutrition of the plant, but the fertilising substance most costly to purchase, although in its free, gaseous state it constitutes four-fifths of the atmosphere. Our ordinary plants, however, are incapable of drawing upon this stock of free nitrogen, and hence they must obtain combined nitrogen from the soil. This fact—the subject of long controversy—may be said to have received its crowning demonstration by the experiments of Lawes, Gilbert, and Pugh at Rothamsted in 1857-8. Despite these and other experiments, it became evident that some factor in the situation had been overlooked, because from many sources—the Rothamsted field experiments among others—it was shown that leguminous crops not only took away

* Lecture delivered on March 11, 1909, by Mr. A. D. Hall, Director of the Rothamsted Experimental Station.

an exceptional amount of nitrogen but left the ground richer in nitrogen compounds than it was before their growth. These difficulties were cleared up by Hellriegel and Wilfarth in 1886-7, when they showed that leguminous plants were susceptible to the infection of an organism which produced nodules upon their roots, whereupon they became able to draw upon the atmospheric nitrogen.

The nodules contain in vast numbers a bacterium which effects the fixation of nitrogen; the combined nitrogen is passed on to the host plant, which in its turn supplies the bacteria with the carbohydrates they require. The nodule bacteria, which have only latterly been isolated in a pure state directly from the soil, exist in the soil in what is called the neutral condition, because they are ready to infect many different species of leguminous plants indifferently. They are very small, about 0.8 μ long by 0.2 μ broad, and are in active motion, each possessing a single cilium. Because of this activity they are sometimes said to be in the "swarm" stage, and in this form they infect the host plant by entering through the root-hairs.

it would not grow as well (in the absence of soil nitrogen) as if it were inoculated with bacilli from a nodule obtained from another French Bean plant. However, when the organisms from the Clover nodule had been for one generation in a French Bean, they then became as effective on the latter as the original French Bean organisms which had had no known connection with Clover. Thus we may consider as established the existence of distinct races of the nodule organism, capable, however, of acclimatisation.

Very soon after Hellriegel and Wilfarth's discovery, attempts were made to utilise it by artificially introducing the organisms into soil on which leguminous plants grew badly. Salfeld, in Hanover, engaged in reclaiming waste heath land by ploughing in successive crops of Lupins, &c., found it of advantage to bring soil from fields where such crops had grown previously and to sow 6 to 8 cwt. per acre before the first leguminous crop was taken. Between 1888 and 1892 he had achieved many successes in this way on the barren heath land manured only with basic slag and potash salts; the crop nodulated and gathered carbon and

gress, but their development has been remarkably rapid during the last fortnight. The great Lily of Mount Caucasus and Northern Persia, *Lilium monadelphum* var. *Szovitzianum*, has been especially conspicuous in the rapidity of its development, and in my own garden will probably attain, as in many former seasons, to a height of 8 feet. I can well believe that many prefer this majestic Lily to the great Himalayan *L. giganteum*, for, in the first place, it does not take nearly the same length of time to build up adequately its flowering bulb, and, in the second place, it grows to an almost equally commanding size, and is even more beautiful, from a floral point of view. Another grand Lily of rapid and massive growth is *Lilium Henryi*. *Lilium Henryi* has some of the vigorous and floriferous characteristics of *Szovitzianum*, while in aspect it resembles the *speciosum* family. As much cannot be said of such delicate introductions as *Kramerii* and *rubellum*, which may flower exquisitely for one, or even two, successive seasons, and then

FIG. 166.—ONCIDIUM CHARLESWORTHII, FOR WHICH MESSRS. CHARLESWORTH RECENTLY RECEIVED A FIRST-CLASS CERTIFICATE FROM THE ROYAL HORTICULTURAL SOCIETY. (See p. 376.)

Once they have entered the root-hairs, they begin to secrete slime and extend into the cells of the root, near the nuclei of which they begin to multiply rapidly as bacilli, rods about four times the size of the bacteria free in the soil.

Finally, after two or three weeks, the bacilli begin to form still larger entities, termed bacteroids, protoplasmic bodies, which after the fourth week show a granular structure and later still disintegrate to allow the bacilli to fall out. The bacteroids show typical Y shapes in the nodules of Clover, Peas, Beans, and Vetches; in some Clovers they are also club or dumb-bell shaped, but only of late has it been possible to get bacteroids to develop in artificial cultures. With the formation of bacteroids begins the growth of the nodules and the fixation of nitrogen; when in certain cases abnormal nodules have been found containing only bacilli no fixation has taken place.

The important question then arises as to whether there is only a single species of the nodule-forming bacterium, or whether each leguminous plant does not possess, if not a corresponding species, at least a race specialised to co-operate with it. It was early shown that certain leguminous plants—notably *Seradella*, *Lupins*, and *Lucerne*—could not always be infected by soil which would inoculate Clover. It was also shown that, if a particular species like the French Bean were inoculated with bacilli from a Clover nodule,

nitrogen from the air, out of which a fertile soil was eventually built up. In order to save the trouble attached to sowing such quantities of soil, Nobbe and Hiltner in 1896 introduced artificial cultures of the nodule organisms, growing on a jelly made from an extract of the plant stiffened by gelatine. But in such a medium, rich in nitrogen, the nodule organism grows very slowly and becomes inert, so that for practical purposes this "nitragin" proved a failure.

Little by little, however, the methods of growing the bacteria artificially were improved, chiefly by the introduction of media containing little or no nitrogen, and in 1903-4 Hiltner put on the market a very effective series of cultures grown on agar-agar containing a little plant extract.

(To be continued.)

SCOTLAND.

THE PROSPECTS OF THE LILY SEASON.

THE growth of Oriental and American Lilies in northern gardens has of late been stimulated greatly by heavy rains after a somewhat protracted drought. For a long period they seemed, notwithstanding the brilliant sunshine, greatly modified by cold winds, to be making little pro-

gress, but their development has been remarkably rapid during the last fortnight. The great Lily of Mount Caucasus and Northern Persia, *Lilium monadelphum* var. *Szovitzianum*, has been especially conspicuous in the rapidity of its development, and in my own garden will probably attain, as in many former seasons, to a height of 8 feet. I can well believe that many prefer this majestic Lily to the great Himalayan *L. giganteum*, for, in the first place, it does not take nearly the same length of time to build up adequately its flowering bulb, and, in the second place, it grows to an almost equally commanding size, and is even more beautiful, from a floral point of view. Another grand Lily of rapid and massive growth is *Lilium Henryi*. *Lilium Henryi* has some of the vigorous and floriferous characteristics of *Szovitzianum*, while in aspect it resembles the *speciosum* family. As much cannot be said of such delicate introductions as *Kramerii* and *rubellum*, which may flower exquisitely for one, or even two, successive seasons, and then

wholly disappear. Such extremely unreliable varieties as these would almost require to be treated like annuals, and planted every year. Not much more enduring are the various and exceedingly beautiful forms of *Lilium longiflorum*, of which the most vigorous has been named *giganteum*. The members of this species are caused frequently to fail to flower well by too much being attempted in the way of bulb division. *L. auratum* (whose finest and strongest representatives in Scottish gardens this year are the great *platyphyllum* and *rubro-vittatum*) is a Lily of much greater reliability. Such varieties as those to which I have just alluded have flowered in my own garden in the same position for ten successive seasons, without exhibiting any signs of deterioration. Hardly less worthy of confidence are the *speciosums*.

Of American Lilies my supreme favourites are *Humboldtii*, a richly-spotted variety of the widely-distributed *Martagon* family, and the delicately beautiful *Washingtonianum*, with its charming, woodbine fragrance. These Californian Lilies, when once firmly established in congenial soil, will flower for many years. *David R. Williamson*, *Manse of Kirkmaiden, Wigtownshire*.

THE CARRIAGE OF VEGETABLE AND FRUIT PRODUCE BY RAILWAY.

(Concluded from page 368.)

THE REMEDY OF COMBINATION.

DEALING with the second contention which is so often put forward on behalf of railway companies, namely, that, if the trader would combine, most, if not all, of his grievances would disappear, growers will no doubt support the writer's contention that this statement is absurd on the face of it. Want of space forbids any detailed examination of the argument, but it may be useful to remind growers of the report of another Departmental Committee to which railway companies never refer, viz., that issued in 1905 on "The Fruit Industry in Great Britain." This report unanimously recommended the following reforms, none of which has yet been adopted by legislation:—

(a) That it is highly desirable that a more simple and uniform system of rates for fruit be introduced by the railway companies. This can be done without a statutory re-classification, with assistance of the Board of Trade.

(b) That railway companies should make greater efforts for ensuring the prompt delivery of perishable fruit.

(c) That it is most desirable that all fruit be consigned at company's risk, and that the so-called owner's risk rates be abolished: the rates at company's risk being reduced to a figure approximating to those now in force at owner's risk, but providing the companies with just a sufficient margin for the extra liability incurred. *That 5 per cent. would be a fair margin.*

(d) That, in the event of owner's risk rates being retained, the liability of the railway companies should not be confined to cases of wilful misconduct only, but to those where *culpable* negligence can be proved.

(e) That, in view of the recent tendency to combine among the railways, it would be an advantage if the Government were to appoint an official or a Department to watch over the companies' actions, and to report to Parliament.

(f) That in years of glut, railway companies should be urged to temporarily lower their rates for fruit, just as excursion passenger fares are lowered on special occasions, and that, if this cannot be done by agreement, it is desirable that the Railway and Canal Traffic Act of 1894 should be amended for that purpose.

(g) That jam made wholly or in part from foreign fruit be so labelled.

(h) That the Government should undertake the inspection of imported fruit and fruit pulp at the ports of entry.

(i) That it would be an advantage to fruit growers and to the public generally if the Local Government Board collected statistics of the fruit seized and condemned as unfit for food.

It will be obvious that for none of these grievances would "co-operation among growers" provide a remedy. The Joint Railway and Parliamentary Committee forwarded to the Board of Trade a year ago a short Bill dealing with some of these reforms, but discussion of the matter has been blocked by the leisurely sittings of the Railway Conference, whose report is still patiently awaited.

The writer has endeavoured to show that although co-operation amongst growers and the grievances of growers are both subjects which are well worthy of serious consideration, yet the two questions should not be allowed to confuse each other, and it only remains to be hoped that discussion may eventually be followed by decisive action. Signs are not wanting that in the near future traders will have to fight for their rights with even greater pertinacity than hitherto. The history of railway legislation shows that, every decade or so, Parliament has had to come to the assistance of the trader in the unequal fight, with the result that although for the time being his troubles are ameliorated, yet the effect of each successive Act of Parliament is slowly worn away by the persistent ingenuity of the wealthy and well-organised railway companies. The fact that another Act of Parliament is now overdue in the ordinary course of events will serve to account for a good deal of the discontent which is at present being made manifest. *H. M. V.*

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Early Peaches.—After gathering all the fruit from the trees, the borders must be thoroughly watered with clear water. Examine the foliage carefully, and if red spider or thrip is present, syringe the trees with an insecticide several times at intervals of two or three days. It is necessary to thoroughly cleanse the trees of these pests to keep the foliage in a healthy condition as long as possible. The surface of the borders must be kept moist and the trees sprayed late in the afternoon with clear water. Remove all the old fruiting wood from the trees with the exception of that which is needed for extension or to replace old worn-out branches. Young shoots may be loosened from the trellis to enable the sun and air to ripen the wood. Keep the ventilators wide open.

Mid-season trees.—Fruits approaching maturity should be exposed to light and air, but during the ripening process some varieties need a little protection from direct sunshine to prevent the fruits from being scalded. Trees on which fruits are nearing the ripening stage should be well watered, as it is important that water should be withheld whilst actual ripening is in progress, otherwise the flavour of the fruits will be impaired. At this stage the house must be kept quite dry and a free circulation of air encouraged.

Late trees.—The fruits may now be safely thinned to the number necessary for furnishing the crop. No hard and fast lines can be laid down as to the exact number a tree should be allowed to carry, but young trees which are inclined to be too strong will mature a much larger crop than old-established ones, and this without suffering any harm. Old trees should be given liberal waterings with stimulants, and the borders should be mulched with decomposed manure. Keep the laterals pinched, and cut out any extra strong growths. Thoroughly syringe the trees morning and afternoon with rain-water and create a moist atmosphere in the house by frequently damping the walls and paths. Admit plenty of air to the trees, and, unless it is desired to hasten the ripening of the fruits, the house should never be closed.

Early Muscat vines.—Now that these are colouring, the leaves should be drawn aside so that the bunches will be only partially shaded from the sun. This is necessary to assist them to colour and finish perfectly. Pinch all laterals as they appear. In some districts it is necessary to shade the foliage of Muscat of Alexandria, and should there be the least sign of scorching this must be done immediately. This can be effected by syringing a little weak lime-wash over the glass. The borders will still require attention in the matter of watering, and, if not already mulched, see that this is done before the Grapes are ripe so that a dry atmosphere can be maintained without injury to the roots.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Pears.—The side growths on cordon trees should now be pinched back to the fourth or fifth leaf, leaving the leader its full length for the present. In stopping the shoots of fruit trees, it is always well to do it in two or three separate operations so as not to give the trees a serious check. Commence on the upper part of the tree and work downwards at intervals of a week or so. Thin out the fruits where the trees are too heavily laden, and bear in mind that, in the first place, heavy crops rarely finish well, and, secondly, they cause the trees to be impoverished for a year or two afterwards. The grower should be guided in his thinning by the state of the individual tree. Strong, healthy, young trees in full vigour may be cropped fairly heavily, as this tends to keep them from making a too rank and unfruitful growth. The earlier varieties, such as Citron des Carmes, Clapp's Favourite, Doyenné d'Été, Jargonelle, and Williams's Bon Chrétien, should be dealt with first. Take care to leave the fruit evenly disposed all over the tree, and exposed to the sun as much as possible. In dealing with young fan, or horizontally-trained trees, the shoots required for

extension should be fastened in their places and not stopped; the remaining shoots should be stopped at the fourth or fifth leaf. On light, porous soil Pears require much water in hot weather, and in the case of trees carrying good crops, it is advisable to apply an occasional dressing of artificial manure. Before applying this manure the mulch from around the trees should be removed. Apply only light dressings, according to the directions issued with the particular manure, water it well in, and replace the mulch around the tree in order to prevent too rapid evaporation after watering.

Figs.—Figs are now growing freely. In cases, however, where the ends of the shoots were damaged by the severe frosts of last winter, the injured shoots should be cut back to a healthy growth, tying the latter in to fill up vacant spaces. Where Figs are growing with their roots restricted to a limited space, the growth will not be so strong, and in this case the shoots should not be stopped, but the trees can be kept moderately thin by entirely taking out any shoots which are not required to furnish the wall space. In this way the shoots left will ripen well in the autumn and will rarely fail to give a good crop. If Figs are grown in rich vegetable borders, they are seldom successful, for they make rampant growth, and pruning merely aggravates the evil. In such instances steps should be taken next autumn to restrict the roots. This operation will also check the growth, causing it to ripen better.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardlee, Sussex.

Climbing plants.—Climbers require considerable attention at this season. The growths should be carefully supported by ties, especially if they are covering fences or buildings. If the roots need water let it be given them, and in many cases a liberal mulching will help the plants during the summer weather. Some of the plants on south aspects may require to be sprayed with clear water occasionally. I may mention that *Ahutilon megapotamicum* (*vexillarium*) has withstood the frosts of the past winter at Leonardlee and is thriving well on a south aspect. The plant flowers very freely, and the pretty blooms of crimson sepals, yellow petals, and brown stamens are exceedingly attractive, lasting until October or even November. Other good climbing plants include the new *Actinidia chinensis*, *A. Kolomikta*, *Akebia quinata*, *Aristolochia Siphio*, *Berberis stenophylla*, *Berberidopsis corallina*, *Cantua dependens*, *Carpenteria californica*, *Cassia corymbosa*, and *Ceanothus* are other species which may be recommended. *Bignonia grandiflora* is a fine sight when in flower and will grow very well on a wall. It produces inflorescences 2 feet long in a hot season. Then there are such species as *Magnolia grandiflora*, *Solanum crispum*, *S. jasminoides*, *Pistacia atlantica*, *Mitrasia coccinea*, *Mandevilla suaveolens*, *Lonicera tragaphylla*, *Leptospermum bullatum* and *L. grandiflorum*, *Ephedra altissima*, *Edwardsia species* and *Choisya ternata*. Most of these species may be planted at the present season if the plants in pots are procurable.

Clematis.—*C. montana* has been very good this season. The new variety *rubens* should be so planted that the growths may intertwine with those of *montana* itself, when the two together will produce a very fine effect. *Ville de Lyon* is a beautiful, free-flowering variety, and the flowers last a considerable time. It produces a succession of flowers in August and September. Remove the seed vessels from all the early-flowering varieties of *Clematis* for the purpose of inducing them to bloom again.

Flowering shrubs.—Continue to prune these as they pass out of flower. Gather the seed vessels at an early stage, except in cases where the seed is required for stock purposes. This is particularly necessary in the case of *Rhododendrons* and *Azaleas*.

Iris.—Apply a top-dressing to Japanese *Iris* and to *Liliums* of the type of *Lilium auratum*. Stout stakes will be necessary for these *Lilies*.

Sweet Peas.—Pick all the old flowers from the plants or the development of seeds will cause the flowering season to be a short one. If properly treated, Sweet Peas will continue to bloom for two months.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Fuchsias.—Transfer into larger pots plants which have become well rooted. They should be allowed plenty of space on the staging of a greenhouse, and syringed freely twice daily. Pinch frequently the shoots of plants required for training as large standards or pyramids. Large-trained *Fuchsias* required for exhibition purposes in August may be placed out-of-doors in a sheltered and partially shaded position on a cinder-bed. The pinching of the shoots should cease about six or seven weeks before the plants are required for exhibiting.

Perpetual-flowering Carnations.—Plants in small pots will be sufficiently rooted for shifting into their flowering pots. As a rule, receptacles 7 to 8 inches in diameter are large enough, but the cultivator must be guided in this matter by the vigour of the plant. It is unwise to over-pot these plants; they can be fed with concentrated manures later on should they need it. The various ingredients of the potting soil should be the best obtainable, and should consist of rich loam, with a little leaf-mould, bonemeal, a sprinkling of sharp sand, and a little soot dusted over the heap. The whole should be thoroughly mixed together, and the potting should be done firmly. After the potting is finished, return the plants to their old quarters. For some time to come their principal requirements will be care in watering, ventilating, and staking. Keep the plants and their surroundings tidy.

Medinilla magnifica.—Large examples of this stove plant make a striking display whilst in flower. As the flowers commence to expand, all stimulants should be withheld for a time. If during the flowering period the plants can be accommodated in an intermediate house their period of attractiveness will be greatly prolonged; under these conditions, water must be given with even more care than when the plants are in a stove temperature. Side growths, having short internodes, usually root freely when firmly inserted in sandy soil and plunged in a hot-bed. After they have rooted the plants should be afforded a moist, hot atmosphere, and, if potted on, as often as increased root room is required, they will quickly become fine specimens.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Peas.—In order to obtain a constant supply of Peas until late into the autumn, it is now necessary to select varieties that are known to succeed well during hot weather. Among the many varieties I have tried for summer sowing, Autocrat and Masterpiece have proved the best. Each of these has a strong constitution, very free-bearing, and produces Peas of first-class quality. Fresh sowings should be made every 10 days until the end of June. For this purpose make deep trenches, break up the soil in the base of the trenches, and fill them partly with half-rotted manure. Sow the seeds thinly and apply a thorough watering directly afterwards. Afford protection against birds and mice. Attend to the staking of the earlier Peas, putting stakes to them when they have attained the height of 3 inches. Apply a liberal mulch of short litter at the same time. The Pea crop in this locality is very late this season, and, therefore, plants which were forwarded under glass before planting out are of exceptional value. It is necessary to pinch out the points of the leading growths to cause the earlier pods to mature quickly. At the same time remove all the side growths and keep the roots well supplied with water.

Broad Beans.—It is time to make the final sowing of this vegetable in trenches which have been liberally manured. Select only the Windsor varieties. Earlier plants will need supporting, therefore stretch some stout tar cord to stakes placed at intervals along the rows. Pinch out the points of the growths immediately a satisfactory number of flower-buds have formed. Apply a mulch if this has not been done already. If black aphid appear on the points of the shoots, syringe them thoroughly with soft soap and water.

Mushrooms.—Continue to make up beds in the coolest places available. A thatched shed on the

north side of a wall is to be preferred, but, failing this, beds may be made up in any cool, shady position out-of-doors. After the beds have been spawned and soiled over, they should be covered with long litter from 4 to 6 inches deep. Beds now in bearing in the Mushroom house should be kept as cool as possible. The interior of the structure should be syringed two or three times each day. Any beds which, having been in bearing for some time, show signs of exhaustion, should be watered with liquid manure from the farmyard. They may then crop profitably for some time longer.

Aubergines.—Continue to grow these in heat, and feed them liberally immediately a sufficient number of fruits has set. Syringe the plants twice each day at least, and maintain a moist atmosphere.

Winter Greens.—Many of these should now be planted into their permanent quarters. Every bit of ground available should be utilised at this season, and in places where space is limited it may even be necessary to plant between other crops, such as Peas, Beans and Potatoes. In all cases, however, sufficient space must be allowed for the plants to develop perfectly.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Thunias.—Among Orchids now in bloom there are none more attractive than the *Thunias*, some of which were enumerated in the Calendar for March 20. When the plants have opened a few flowers, they should be removed from the East Indian house to a cool, shady position in the Cattleya house, where the flowers will last for a longer time. As the plants pass out of bloom, remove them to a cool, well-ventilated house, where the stems and leaves may be gradually inured to full sunlight, so that they may mature before the resting season commences. The plants should be watered occasionally till the leaves begin to change colour, but not after they assume a yellowish hue; at that stage they should be placed in a light, dry position, where the temperature does not fall below 50°. It frequently happens that when the plants are exposed to full sunlight they become infested with red spider, but this may easily be prevented by laying the plants down on their sides once a week and syringing them with some weak insecticide, or with warm rain water and soft soap in strong solution. Any *Thunias* that fail to flower should, in a few weeks time, have the terminal leaf pulled out from each growth, or the stem will continue to grow to a great length. The plants may afterwards be treated in the same way as those that bloomed. *Thunias* are among the very few Orchids that may be propagated easily. This is effected by taking off the back stems nearly to their base, and cutting them at the joints into lengths of about 4 to 6 inches. The pieces are then inserted firmly as cuttings into small, well-drained pots, filled with a mixture of chopped Sphagnum-moss, small crocks, and coarse silver sand. When the young shoots are seen pushing up, grow them along quickly in a stove-like temperature, and on the completion of growth treat them just as the older examples.

Odontoglossum citrosimum.—Plants of this Mexican species, when well grown, look very beautiful with their long racemes of wax-like blossoms, and when in full flower few plants have a more distinct appearance. The flowering season being over, the plants may be repotted if this is necessary. Owing to the flower-spikes being pendulous, shallow teak-wood baskets or pans are preferable to pots; the plants make but few roots, therefore the receptacles should be of the smallest size. Plenty of drainage, however, must be afforded, and over this a layer of rough Sphagnum-moss should be placed, which will keep the lower roots moist during the growing season. The plants thrive well in a mixture of *Osmunda* and *Polypodium* fibres in equal parts, to which some small crocks are added. Each plant should be potted firmly, as by so doing the pseudo-bulbs retain their plumpness longer without water during their season of rest than they would if the materials were loose. For a week or two after repotting keep the compost rather on the dry side, then for another similar period merely afford water around the edge of the pot or

basket, by which time growth will have recommenced, when water must be afforded more copiously until the new growths are matured. Suspend the plants in a light position in the Cattleya or Mexican house, and where as much ventilation as possible is admitted at all times. *O. citrosimum* enjoys a cool position at night-time, but requires a fair amount of warmth during the day, especially during the growing season.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

Summer bedding.—By this period of the year the planting-out of the summer bedding plants has been completed in the majority of public parks, and only the necessary rain and heat are required to bring them quickly to perfection. As "bedding-out" is, in the nature of things, rather apt year after year to become stereotyped in character, most of those who have to deal with such work are usually only too pleased for an opportunity of introducing some novelties into it, whether in the form of new kinds of plants suitable for the purpose or merely by different methods of grouping and arranging old-time subjects. Taking it as a general rule, one finds more variety and greater boldness of treatment in the bedding arrangements as practised in public parks, and the number of different kinds of plants used invariably greater than in private gardens. On the contrary, the public gardener is very often indebted to his confrères in private service for many useful ideas in modes of arrangement and design, and so in this, as in many other ways, the members of the two different branches of the profession are mutually helpful the one to the other.

Novelties.—So far as novelties in the way of plants suitable for bedding purposes are concerned, two of the best that have come under my notice for the past two years are the dwarf bedding *Asters* and *Salvia splendens* var. *Star of Zurich*, or *Fireball*. The latter plant has a bright-scarlet inflorescence, which is quite equal in colour to some of the best scarlet *Pelargoniums*. Last season it was used with considerable success as a bedding plant, and will no doubt be in still greater evidence during the current year. Most gardeners who had an opportunity of seeing the dwarf bedding *Asters* growing in the ornamental grounds at the Franco-British Exhibition last autumn could hardly fail being impressed by their value as showy bedding plants.

The "dot" system.—It is now customary to use two or three different kinds of plants mixed together or as "dot" plants and groundwork in beds, where at one time only a single distinct variety would have been used. Where brilliancy and spectacular effect are not the objects in view, these mixtures are good in their way, but they undoubtedly give a sombreness to some present-day bedding arrangements which was altogether unknown under the old style.

Two important points in connection with summer bedding to which park officials usually endeavour to give attention are, first, to have the plants as large and well developed as possible, and secondly, to allow them, when once put into the beds, to remain intact until the end of the season. The possibility of giving these matters the necessary consideration largely depends upon the question of room. Where there is plenty of glass available, and the plants used are amenable to such treatment, it is well to grow them on from time to time into large-sized pots. *Fuchsias*, *Pelargoniums*, *Heliotropes*, and the various plants used for sub-tropical planting all repay any extra attention expended upon them in this way by giving more immediate effects. With regard to the second point, it is the general experience in the case of *Pelargoniums* that, just as they are at their best, it becomes necessary to take cuttings from them for the following year's plants, and, as a rule, beds filled with this class of plant look very shabby before the season closes. Where there is plenty of space to grow on surplus plants during the winter, and ample nursery ground in which to develop them into stock plants during the summer, no necessity exists for disturbing those used in beds or borders, and the result is that much better cuttings are obtained from which to raise new plants.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, JUNE 14—

United Hort. Ben. and Prov. Soc. Com. meet.

WEDNESDAY, JUNE 16—York Gala (3 days).

THURSDAY, JUNE 17—Linnean Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—58.9°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, June 9 (6 P.M.): Max. 64°; Min. 51°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, June 10 (10 A.M.): Bar. 30.0; Temp. 54°; Weather—Raining.

PROVINCES.—Wednesday, June 9 (6 P.M.): Max. 59° Oxford; Min. 51° Scotland North West.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—

Bulbs and Roots at 1; Palms, Bays, Ferns, &c., at 1.30, at 67 & 68, Cheapside, by Protheroe & Morris.

FRIDAY—

Imported and Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Utilisation of Atmospheric Nitrogen.

The problem of bringing the inert nitrogen of the air into combination, and thereby increasing the supplies of nitrogen-containing fertilisers, has been solved during the past few years. Nitrate of lime, which will take rank as a fertiliser with nitrate of soda and sulphate of ammonia, is now prepared on a commercial scale by the Birkeland-Eyde process, the essential of which consists in the oxidation of atmospheric nitrogen by means of the energy of the electric arc. The details of the process were described in a lecture given by Herr Eyde before the members of the Royal Society of Arts on May 26. The possibility of oxidising atmospheric nitrogen was demonstrated more than 100 years ago by the English chemists Priestley and Cavendish, and more recently Sir William Crookes and Lord Rayleigh have extended our knowledge of the subject. The fundamental novelty claimed for the new process consists in the utilisation of large quantities of energy in the electric arc employed to effect the initial combination between the nitrogen and oxygen of the air. The first product formed in the electric furnace, in which a temperature of over 3,000° C. is developed, consists of oxide of nitrogen, which is further oxidised in oxidation tanks to form dioxide of nitrogen. This gas is driven by centrifugal fans into absorption towers, which are filled with broken quartz to increase the surface, and

down which streams of water run. The water, absorbing the nitrogen dioxide, gives rise to weak nitric acid. The acid is led over limestone, and, liberating the carbon dioxide, combines with the lime to form nitrate of lime. On evaporation the nitrate of lime yields a brittle, crystalline mass, which crushing mills reduce to a granular state. The now finished product is put up in paper-lined barrels. Herr Eyde quoted, in the course of his lecture, the results of large numbers of trials of nitrate of lime in many different countries. All the trials indicate that nitrate of lime is, for manurial purposes, at least the equal of nitrate of soda and sulphate of ammonia. In the course of the discussion which took place after the lecture, Mr. Hall, the Director of Rothamsted Experimental Station, confirmed this conclusion, and pointed out that on certain soils, for example, those of a clayey nature, nitrate of lime might well prove the superior of nitrate of soda. In the hope that this new rival to the older nitrogenous fertilisers may reduce the price of combined nitrogen, and thus cheapen to the agriculturist and horticulturist the cost of cultivation, the advent of nitrate of lime is to be welcomed.

Botanical Teaching.

Like the first two volumes, which have been reviewed already in these pages, Volume III. of *The Book of Nature Study** is admirably printed and illustrated. Of the numerous full-page figures, not a few are in colour, and all represent pleasingly and faithfully the plants which they portray. The volume is divided into two parts. Part I., by Miss Charlotte L. Laurie, takes as its subject "Plant Life," and Part II., by Dr. Lang, deals with "Some Common Flowering Plants." With respect to Part I. we would suggest that the title is somewhat too comprehensive and that, perhaps, its scope would be better designated by "Some Aspects of Plant Life." The subjects dealt with are the life and growth of seedlings, the growth of the shoot from the bud, the growth of plants independently of seeds, and the importance of hairs in plant life. The general reader will find in these chapters much that is both interesting and instructive, and the teacher, who is not a specialist, will gain from them considerable help in planning Nature Study courses. Miss Laurie insists very properly that information gained first-hand has far greater value than that which is taken slavishly from books. She shows no ordinary resource in the choice of material which she selects to illustrate the various plant processes. Another excellent feature of the part of the work for which she is responsible is the continuous attempt which she makes to link on scientific facts with gardening practice; but at the same time it cannot be said that the attempts, of which we praise the intention, are always successful. Maxims (on p. 53) on watering, though they may be individually sound enough when grouped together, scarcely provide a helpful or satisfactory philosophy of the use of the watering-can. A similar criticism applies to the remarks on pruning on p. 27, where there is no indication in the context as to what

plants the directions refer. On the contrary, the descriptions of modes of germination, of buds, and of bulbs, tubers, corms, and like organs are excellent, and will serve teacher and scholar alike as trustworthy guides to the study of the forms of plants. The difficult task of introducing physiological experiments into a work of this kind has been attempted by Miss Laurie, though we think that in this respect she has not been so successful as in those other parts of her subject to which already reference has been made. The descriptions of apparatus and of method of experiment require, to be adequate and serviceable, more space than they receive; and a perusal of the experiments of Part I. leaves us with the impression that it would have been better either to omit the experiments altogether or to give fuller explanations as to the details to be observed in performing them.

If Part I. is, as we have indicated, very good, Part II. is excellent. Dr. Lang, in dealing with common flowering plants, has treated his subject with admirable judgment. In clear, simple style he gives an account of the life-histories of the commoner British plants, and we do not know of any book in which this subject is better dealt with. If we had the opportunity of using Volume III. of *The Book of Nature Study* we should certainly try the experiment of making our pupils work through Part II. before Part I. The subject is simpler and more uniform. When the pupils had learned to know their common plants they would be in a better position to profit by the more varied exercises provided by Part I.

In conclusion, we congratulate Professor Farmer on the judgment which he has shown in the choice of authors, both in this and in preceding volumes. Those interested in Nature Study are under a deep debt of gratitude to him and to his collaborators for providing such a valuable series of volumes as that which makes up *The Book of Nature Study*.

* *RHOODENDRON SOULIEI* (Supplementary Illustration and fig. 167) has been introduced to Europe by Messrs. JAS. VEITCH & SONS, through their late collector, Mr. WILSON, who sent seeds from China in the late autumn of 1905. Plants raised from these seeds flowered for the first time, in Coombe Wood Nursery, in May last. These plants have stood out in the open ground unharmed by the severe winter, and the young growths have withstood the late spring frosts, so there is every promise of this species proving hardy in this country. The specimen, which received a First-class Certificate when exhibited before the R.H.S. Floral Committee on May 18 last, was only about a foot high, and bore two trusses of rather flattish, rose-pink coloured flowers, some 3 to 4 inches across. *R. Souliei* is a native of the neighbourhood of Tchien-lu, Western China, at altitudes of from 9,000 to 11,500 feet. Like all the Chinese Rhododendrons, it is local in its distribution, and within its altitudinal limit forms dense thickets, often an acre or more in extent. In height, the bushes vary from 3 to 12 feet, and the flowers, which are borne in great profusion, vary from pale to deep rose. The leaves are medium-sized, ovate, with cordate base, and when young have a very pronounced glaucous-metallic lustre.

* *The Book of Nature Study*, edited by Prof. J. Bretland Farmer, D.Sc. Vol. III. (London: The Caxton Publishing Co.) Pp. 228, with seven coloured and nine black and white plates. Price 7s. 6d.

* *R. Souliei*. Franch. in Morot, *Journ. de Bot.* ix. (1895), p. 333.

THE JUBILEE OF THE FRUIT AND VEGETABLE AND FLORAL COMMITTEES.—It will be remembered that the approaching jubilee of these two Committees of the Royal Horticultural Society formed the subject of a leading article in our issue for November 21, 1908. We understand that the double event will be celebrated by a dinner which will take place shortly.

R.H.S. GARDENS CLUB.—The second annual meeting of this club will be held at the R.H.S. Gardens, Wisley, on Saturday, July 10. Members will travel by the train which leaves Waterloo at 2.28 p.m. and arrives at Weybridge at 3.9 p.m. Conveyances will take them to the gardens, and tea will be arranged for at the Hut Hotel. Members who can attend are asked to communicate as early as possible with the secretary to the club, R.H.S. Gardens, Wisley, Ripley, Surrey, in order that the arrangements may be completed.

BURNHAM PARK.—Mr. and Mrs. HARRY J. VEITCH have again this season extended an invitation to the members of the Royal Horticultural Society's Committees to visit their interesting garden at Burnham Park, Burnham Beeches. The visit will most likely take place on Thursday, July 1, and a friendly cricket match will be arranged between members of the Committees. Those able to make this visit may confidently look forward to spending a very enjoyable day.

ROYAL APPOINTMENT.—Messrs. JOSEPH BENTLEY, LTD., of Barrow-on-Humber, Hull, inform us that they have been granted the Royal Warrant of Appointment as horticultural chemical manufacturers to the KING.

HUGH LOW & CO., CLAPTON.—The firm of Messrs. HUGH LOW & Co., of Bush Hill Park and Enfield Nurseries, has been dissolved, and in future Mr. STUART LOW will carry on the business as heretofore under the name of STUART LOW & Co. Mr. STUART LOW is a son of the late STUART H. LOW and nephew of the late Sir HUGH LOW. All the members of the staff, including Mr. HARRY BARNARD and Mr. MAYES, will continue in their present positions.

FLOWERS IN SEASON.—Several uncommon shrubs have been sent us by Messrs. PENNICK & Co., Delgany, Co. Cork. Amongst several Deutzias sent the finest is *D. Lemoini* Avalanche, the shoots being densely covered with white blossoms. A large spray of *Sophora grandiflora* was covered with its yellow, pendent blooms, the tiny leaves being just about to unfold. *Chamaecerasus mundensis* is a shrubby species, bearing small, violet-coloured flowers. Amongst Rhododendrons, the variety *Cynthia*, with deep rose flowers, and *R. Keysii*, bearing small, reddish tubular flowers not larger than those of *Eccremocarpus scaber*, were noteworthy. *Genista alba* is represented by a rose-coloured variety. *Berberis Knightii* has relatively large leaves and equally large spines. *Drimys Winteri*, with its pale yellow flowers, and *Pittosporum viridiflorum* were also included.

THE NOMENCLATURE OF ORCHID HYBRIDS.—The Joint Committee appointed by the Scientific and Orchid Committees to consider a scheme for the naming of Orchid hybrids between genera sat for the last time on Tuesday last. A report will be presented to the Committees in due course. It will be found that the Joint Committee recommend the employment of specially-made names for the multi-generic hybrids, with the constant termination of *ara*, which will serve to distinguish such names from those of botanical genera and species.

"THE BOTANICAL MAGAZINE."—The issue of this magazine for June contains illustrations and descriptions of the following plants:—

PINUS JEFFREYI, tab. 8257.—This Californian species was mentioned by Sir JOSEPH HOOKER in the *Gardeners' Chronicle* for 1884, vol. xxii., page 813, with a sketch of the Californian plant also by Sir J. HOOKER. A figure of a cone, with details and a note by the late Dr. MAXWELL T. MASTERS, was published in the *Gardeners' Chronicle*, 1889, vol. v., pages 360 and 369, figs. 65, 68. *P. Jeffreyi* is nearly allied to *P. ponderosa*, and by some it has been considered to be merely a variety of that species.

BEGONIA MODICA, tab. 8258.—This West African species is described by Dr. STAFF in the *Kew Bulletin* for 1908, page 259. It is a

that the species was first introduced into European collections in 1820. Dr. STAFF states that the species is somewhat uncertain in its behaviour under cultivation. After growing quite well for a number of years it will, without any ostensible cause, and sometimes in the middle of the active growing season, suddenly droop and soon afterwards die. As a garden decorative tree, it is in some respects the finest of all the Whitebeams in cultivation, especially in regard to the size of its foliage and flowers. The flowers are white and the fruit reddish-green.

PRUNUS JAPONICA, tab. 8260.—This species is distinguished from *P. humilis* by the glabrous branches, larger leaves, and entire petals. The double-flowered form has been for a very long

FIG. 167.—RHODODENDRON SOULIEI, A NEW CHINESE SPECIES: COLOUR, A SHADE OF ROSE.

(See p. 380.)

member of the section *Scutobegonia*, the members of which are small herbs, mostly with peltate leaves and yellow flowers. Tubers were received at Kew in 1907 from Mr. J. ANDERSON, Curator of the Botanic Station, Kumasi, who found them growing in the Gold Coast Colony on rocky ground at an altitude of 600 feet above sea level. The plant is almost stemless, with somewhat fleshy, bright green leaves, slightly crenate and undulate, and faintly reddish margins. The flowers are bright yellow and produced in umbels.

SORBUS CUSPIDATA, tab. 8259.—This is the Nepalese Whitebeam, and is sometimes known as *Sorbus nepalensis* or *Pyrus nepalensis*. It is found throughout the temperate Himalaya at elevations from 8,000 to 10,000 feet above sea level, from Garhwal to Sikkim. LOUDON states

time past the favourite flowering shrub and one employed for forcing for greenhouse decoration. At first it was imagined that this double-flowered Cherry was a form of *P. humilis*. This impression was dispelled when the typical variety now figured in the magazine was introduced to Europe in 1835. Kew, however, did not succeed in getting a plant until 1902, and this plant, although growing in a sunny border, in loamy soil, is only 3 feet in height. The fruits are brilliant red Cherries, which are very attractive.

CORNUS MACROPHYLLA, tab. 8261.—Of all the Cornels that are hardy in Great Britain this species is the largest. It is represented in the Kew Arboretum by several young trees, the largest of which, however, is not more than 19 feet high. Mr. W. BOTTING HEMSLEY states that on the Continent and in America

C. brachypoda has been adopted for a species with opposite leaves, and *C. macrophylla* has been erroneously applied to that which has the leaves and branches alternate. It is the species with alternate leaves and branches grown in English collections under the erroneous name of *C. brachypoda* and in the collections of other countries under the equally erroneous name *C. macrophylla* that stands in need of a distinctive name. For this alternate-leaved *Cornel* Mr. HEMSLEY proposes the name *C. controversa*. The plant now figured in the magazine has yellow flowers and purple fruits. It thrives best in good loamy soil in a sunny position. The lower branches should be pruned away so that a clean trunk of 5 or 6 feet high may form.

THE HARRY VEITCH PORTRAIT FUND.—We wish to draw the attention of our readers to the list of subscribers to this fund, printed on one of our advertisement pages. The response to the appeal which has been made is extremely satisfactory, and the fund will be closed in the course of a few days. It is understood that Mr. VEITCH will be entertained at dinner after the completion of the portrait, in accordance with the wishes of many subscribers to the fund.

MR. R. WILSON KER, V.M.H.—The Council of the Royal Horticultural Society, on Tuesday last, conferred the Victoria Medal of Honour on Mr. R. WILSON KER, senior partner in the firm of Messrs. KER & SON, Aighurth Nurseries, Liverpool. Most of our readers are familiar with the exemplary culture always to be seen in the Aighurth Nurseries, and this is particularly observable in the plant stoves. Some of the finest specimen *Codiaeums* we have seen were cultivated in these nurseries, and, in former days, when the plants were more popular than they now are, KER'S *Crotons* were known all over these islands. In recent years, Mr. KER has done excellent work with *Hippeastrums*. His novelties have secured awards at the Temple Shows, at Ghent, and other important Continental exhibitions. It is universally regretted that Mr. KER has for some time past suffered from ill-health. Our readers will be grateful to the R.H.S. Council for the honour which they have conferred upon one of the most esteemed of British nurserymen.

MR. JOHN MELVILLE.—The many friends of Mr. MELVILLE will learn with pleasure that the serious operation which he underwent recently at St. Peter's Hospital, Covent Garden, was a complete success, and that his recovery to health and strength is now merely a question of time. Mr. MELVILLE has been with the London County Council for many years, and during the time that he has had charge at Finsbury Park this pleasant North London park has become widely celebrated for the charm and variety of its spring and summer bedding and for the excellence of its general upkeep.

LINNEAN SOCIETY.—A meeting will be held on Thursday, the 17th inst., at 8 p.m., when the following papers will be read:—"On the Growth of a Species of *Battarea*," by Mr. J. G. O. TEPPE; "The Deposits in the Indian Ocean," by Sir JOHN MURRAY, K.C.B., F.R.S.; "The 'Sealark,' *Perseidea*, *Stenopidea*, and *Reptantia*," by Mr. L. A. BORRADAILE; "The 'Sealark,' *Polychæta*," Part II., by Mr. F. A. POTTS; "The 'Sealark,' *Lepidoptera*," by Mr. T. BAINBRIDGE FLETCHER; "New Species of Malesian and Philippine Ferns," by Dr. H. CHRIST; "The African Species of *Triumfetta*, Linn.," by Messrs. T. A. SPRAGUE and J. HUTCHINSON; "The Acanthoid Species of *Malvastrum*, A. Gray," by Mr. A. W. HILL, M.A. Exhibitions:—"Plants in Britain introduced by the Romans," by CLEMENT REID, F.R.S.

THE NATIONAL VEGETABLE SOCIETY.—At a meeting of the Provisional Committee, held at the Hotel Windsor on Tuesday last, certain rules and regulations, which had previously been drafted and circulated for consideration, were, with a few amendments, adopted. The objects of the Society were thus defined:—"To promote the wider cultivation of vegetables as food products, to encourage their consumption as food, to promote exhibitions of such products, whether competitive or otherwise, and to hold trials under such conditions as may offer with a view to finding the best varieties to commend for general culture, and to ascertain commercial value when grown under ordinary conditions." The Society will not concern itself at first with the holding of shows until it is in a position to do so effectively. At first it proposes to conduct commercial trials both in reference to varieties and to methods of cultivation. A list of some 30 vice-presidents was adopted, inclusive of the amateurs, seedsmen, and market-growers. Mr. GEORGE WYTHES, V.M.H., was elected treasurer, and Mr. E. J. QUICK, of 20, Tavistock Street, Covent Garden, hon. secretary. A committee of 24 members was also elected. The next meeting will take place on the 22nd inst.

PRESENTATION TO AN ABERDEEN GARDENER.—Aberdeen florists and gardeners have presented Mr. ALEXANDER PATERSON, market gardener, Ruthrieston, with a gold watch on the occasion of his leaving Aberdeen for Glasgow. Mr. JAMES SMITH, in making the presentation, referred to the keen interest that gentleman had taken in horticulture in the city as an office-bearer of the Horticultural Society and the Aberdeen Chrysanthemum Society respectively, and as a competitor at the local shows. Mrs. PATERSON was the recipient of a gold and pearl brooch.

PRIX 'ACADEMIQUE EMILE LAURENT.—At the last meeting of the Royal Academy of Belgium (Division of Science) the jury announced the award of the Emile Laurent Prize to Mr. T. DURAND, the eminent Director of the Brussels State Botanic Garden, and to his daughter, Miss HELEN DURAND, for his work *Sylloge Floræ Congolanae*. The Emile Laurent Prize, instituted to perpetuate the memory of the genial professor, is to be given alternately every two years: first, to the best work on the flora of the Congo Free State; second, to the best work on agriculture and horticulture of the Congo. The first prize is consequently given to *Sylloge Floræ Congolanae*, an excellent scientific work, which is published under the auspices of the Board of Colonies. The value of the prize is £36. It is particularly interesting to note that the prize goes to a personal friend of EMILE LAURENT, and to the botanist who studied first in Belgium the flora of the Congo (1890). We offer our congratulations to Mr. and Miss DURAND.

THE NATURE STUDY EXHIBITION.—A Nature Study Exhibition was held at the Gardens of the Royal Botanic Society, Regent's Park, on June 4th and 5th, under the auspices of the Nature Study Society. Only one particular branch of the work was dealt with, namely, those animals which can be studied more particularly under town conditions. Aquaria and vivaria were therefore well represented, together with breeding cages for caterpillars and flight cages for butterflies. There were also microscope-preparations and photographic illustrations. Birds—and especially insectivorous birds—should be encouraged for economic reasons, and the plan of the well-known bird sanctuary maintained by the Brent Valley branch of the Selborne Society was appropriately included in the exhibition.

The plan indicated the nesting boxes which have been put up. Flag labels recorded what the occupiers are, and also showed the nests of the more important birds which had built in natural situations. The exhibition was held with a special object, as well as a general one. Mrs. WINIFRED DE LISLE, who acted as honorary secretary to the Exhibition Sub-Committee, has brought forward a scheme for establishing a permanent collection of aquaria and vivaria in the Gardens of the Royal Botanic Society, such as is seen in the Stepney Borough Museum and at the Horniman Museum. It would be especially attractive and useful educationally to the children of the Fellows who constantly visit the Gardens.

PHYLLOXERA IN THE TRANSVAAL.—The announcement is made in the current number of the *Journal of the Transvaal Agricultural Department* that this dreaded disease of the Grape vine has made its appearance in the Transvaal as an immigrant from Cape Colony. All who know of the misery caused by the destruction of the vineyards of France by *Phylloxera vestatrix* will learn the news with profound regret. The only consolation is that the colony has one of the best-organised agricultural departments in the world, and one whose staff may be trusted to adopt the most drastic and progressive methods for dealing with this pest.

"THE COUNTRY HOME."—Among the articles in the June number of *The Country Home* is one on *Rhododendrons* and *Azaleas*. The various duties to be carried out in the garden in June are clearly outlined; the "Cows of a Small Holder" are dealt with by H. S. M. BUCHANAN; and Prof. TÉRASSE discusses the Culture of *Melons* on the principle of intensive cultivation.

THE COUNTY EXPERIMENTAL GARDEN AT DROITWICH.—The thirteenth annual report on this garden and the ninth annual report of the County Instruction Garden, issued by the Worcestershire County Council for 1908, are before us. The experimental garden was established in 1896, and is at the present time nearly 6 acres in extent. In 1908 one acre was set apart for experiments inaugurated by the Board of Agriculture and Fisheries in connection with fruit cultivation on lines similar to those already in operation at the Board's experimental station at Long Ashton, near Bristol. The number of visitors has steadily increased from 981 in 1897 to 4,531 in 1908. The garden is purely experimental, and is not conducted with a view to profit. At the same time, the experiments have a distinctly commercial value, and were begun and continued with that object in view. They are intended to show the results of various methods of pruning and non-pruning, spraying and non-spraying, effects of lime on the growth of fruit trees, the effects of different kinds of manures on fruit trees and vegetables, and the prevention and destruction of insect and fungal pests. The differences between properly pruned, slightly pruned, and non-pruned Apple trees have not proved to be very marked. In the case of the properly pruned trees the crop was only 1 lb. better, but the fruits were large, whilst those from the others were small and less marketable. Observations are being made with respect to early and late-flowering Apples, Pears and Plums, but the 12 years' records do not justify Mr. J. UDALE in publishing them till he has gone more fully into the subject and obtained greater experience of the behaviour of trees under various conditions. The trials of Potatoes in 1908, grown with various kinds of manures, will be of interest to cultiva-

tors. The race in this case is mainly between stable dung supplemented by inorganic manures and stable dung alone, all other manures giving inferior results. Insect and other pests have a short chapter to themselves.

PUBLICATIONS RECEIVED.—*Bulletin du Jardin Imperial Botanique de St. Petersburg.*—*Royal Botanic Gardens, Peradeniya, Ceylon, Report.* Part IV. that in former years was merely a greensward and mixed shrubberies. Hardy flowers and flowering shrubs were at one time scarcely represented, but they have been increased every year for a long time past, until now the grounds are interesting at any season, particularly in the spring and early summer. Nevertheless, the formal flower garden of somewhat congested beds immediately under the windows of the house and near to the magnificent purple Beech is maintained just as it was laid out 46 years ago for one of the Earls of Clifden.

In the fruit houses the most striking features were the extraordinary crops of Melons and Tomatos. The Melons are cultivated in small

each. It would be impossible to obtain a more even or satisfactory crop. The third batch was one of the same variety of equal merit, but a little later in development.

The Tomato plants were in 12-inch pots, and bore such crops as could hardly be expected so early in the season in a London establishment. Many of the flowers must have set during a time when the amount of daylight was scarcely sufficient for such a crop. Mr. J. F. McLeod informed us that as these plants were grown during the winter for early fruiting, they became so spindly through cultivation in the dull season of the year that the stem was twisted round and round again in the pots, and that therefore there

DOVER HOUSE GARDENS.

AMONG the principal attractions in Mr. J. Pierpont Morgan's gardens at Roehampton on the occasion of a visit made a few days ago was a bed of Rhododendron Pink Pearl. In this bed were planted during last autumn a considerable number of plants acquired at different times, some of them being as much as 4 feet in height. The natural soil of the bed was removed to 3 feet deep, and in its place was used a compost containing Kettering loam, peat, road-scrappings, cow manure and other materials. The effect of the plants in full flower can scarcely be described. The trusses of bloom were so exceptionally large that they were unequalled by those of any other Rhododendron, whilst the flowers themselves were not only large, but possessed extraordinary substance of petal. There was much variety in the shades of pink, from the rich tint of the freshly-expanded buds to the almost pure white of the fading petals. In a companion bed the rich scarlet variety, known as Doncaster, made a brilliant show. The bed contained upwards of 100 plants of this new and floriferous variety. Doncaster is certainly one of the richest and brightest of Rhododendrons, but it is somewhat dwarf-habited. It would be more effective if the plant could be induced to make more elongated growths than it does at Dover House, notwithstanding the liberal treatment afforded this and all other plants. A third bed of similar size contained the variety John Walter in full bloom, but as this variety was only planted last autumn, the plants are of dwarfer dimensions than those to which we have referred. Lord Palmerston, a rosy-crimson variety with a large yellow blotch, in other beds appeared very pretty, and Rhododendron sinense (Azalea mollis), Anthony Koster, with its orange-yellow-coloured flowers in profusion, created a distinct and pretty picture on the opposite side of the mansion. The Rhododendron beds are situated in a portion of the grounds

FIG. 168.—DORYANTHES EXCELSA VAR. GUILFOYLEI.
(See page 384.)

hip-span structures, with Cucumbers at the back of the house, and there were three different crops in as many houses. In the first, was the variety Hero of Lockinge. There were 12 plants, which bore 54 fruits of an average weight of about 3 lbs. each. They were extraordinary in their even size and quality, and formed an example of good cultivation of which any gardener might reasonably be proud. In the other two houses the variety grown is one raised upon the place. It has a very fine netted exterior and white flesh. In the first batch there were nine plants, bearing together 46 fruits of an average weight of 4 lbs.

were, in each plant, 3 or 4 feet of stem buried in the soil. In Tomatos the stem so easily produces roots that it is not altogether improbable that the burying of the stem, though at the time merely an act of convenience, has had a material influence in the production of the heavy crop. The variety is Earliest of All, having been selected for its free-setting characteristics even in winter. Succession batches are of the variety AI, and still later plants represent the variety Lister's Prolific—still one of the best cropping varieties of the Perfection type. Indoor Peach trees have set crops as satisfactorily as usual. ▲

young tree of moderate proportions, planted in November, 1907, of the variety Duke of York, with 52 finely-coloured fruits upon it, was a striking object. Another Peach tree of unusually large dimensions—it covers an area of 33 by 15 feet—was developing a crop of fruits. The vines looked well, and the crop of Muscat of Alexandria is better than usual. There were plenty of Grapes ready for consumption. In the large orchard-house, the centre of which is given up to the cultivation of Fig trees in pots, the trees are developing as liberal a crop as they could be expected to bear under any circumstances.

In the plant-houses, the Carnations are the outstanding feature. The large specimen plants of Souvenir de la Malmaison appeared even larger and in better condition and more floriferous than ever. These and the perpetual-flowering Carnations indoors exhibited such vigour and freedom from disease as is rarely seen. In the Orchid-

soils as that at Dover House, but it would have been more satisfactory if it had not been accompanied by excessively low temperatures and high winds. Apples have set a good crop. Pears are not quite so plentiful, but Plums have set well, and Cherries promise to be the most abundant crop in the hardy fruit garden.

DORYANTHES EXCELSA VAR. GUILFOYLEI.

It is of comparatively rare occurrence for this noble Amaryllidaceous plant to flower in this country, for it takes many years liberal treatment for the plant to acquire sufficient size and strength. The plant shown in fig. 168 was exhibited at the recent Temple Show from the Royal Gardens, Kew, where it has been flowering in the Temperate House for the past six weeks. The flower-stem is 9 feet high and bears its flowers in a pyramidal spike, mea-

FIG. 169.—GROUP OF SCHIZANTHUS IN ONE OF THE PLANT-HOUSES AT WISLEY.

[Photograph by C. W. Sillince.]

houses there was a splendid display of Cattleyas, and all the plants appeared uncommonly healthy, the leaves having a better green colour than Orchids, especially Cattleyas, sometimes have when cultivated in districts of such gravelly soil as that at Roehampton. There was also a good show of bloom in the Odontoglossum-house. In addition to the ordinary greenhouse flowering plants, which are grouped together in the show-house, another house contained a very choice display of Gloxinias. Some of these are seedlings, but others are varieties which, having proved of superior merit in previous years, have since been propagated by leaf-cuttings. There is an excellent collection of Nerines here; indeed it is probably the finest in cultivation in a private establishment in this country.

Out-of-doors, the vegetable crops were extremely satisfactory. The rain which fell a fortnight ago was just what was needed on such

surroundings 2 feet high by 1 foot through. The individual flower is 2 inches in diameter, of a bright red colour, with a light centre. Clusters of six and seven flowers are borne in the axil of a large leafy bract. The dark green, recurved leaves measure 6 feet long by 6 inches broad, forming a tuft at the base of the plant. Doryanthes requires greenhouse treatment, and a compost consisting of three parts fibrous loam to one part of leaf-soil, with sufficient sand added to keep it in a porous state.

After the flowering period the plant dies away, but numerous suckers are then produced at the base, this being a means by which the species may be increased. Plants may also be raised from imported seeds. *D. e. Guilfoylei* is a native of Queensland, and is sometimes described as the Queensland Lily. It has been looked upon by some as a distinct species, but is now referred to as being a variety of the better-known *D. excelsa*, which inhabits New South Wales. W. T.

SCHIZANTHUS AT WISLEY.

I WAS pleased to read *D.*'s appreciative note in the *Gardeners' Chronicle* for May 22 on the collections of Schizanthus at Wisley. Having had the opportunity of seeing them two or three times during the season, I may say that they were one of the finest batches of annual plants that I have ever seen. It is a pity they were not exhibited at the Vincent Square Hall. Apart from the excellence of culture, one could not but admire the many beautiful forms of the flowers, some of them being good, bold, self-coloured flowers of rose, purple or white, whilst others were remarkable for their delicacy of marking. In nearly all cases the individual blooms were from 1 to 1½ inches in diameter. A portion of the seed was supplied by Mr. Robert Sydenham and a portion by Mr. Turnbull, whilst a great part of it was from a strain that has been selected for the past three or four years by Mr. Smith. The seeds were sown on August 31, 1908, and the plants were grown as hardy as possible through the winter. They were not pinched, and only one stake was used to each. Yet they averaged about 4 feet in height and from 2 to 2½ feet in diameter. They have been in good bloom for about two months. *Thomas Stevenson, Woburn Place Gardens, Addlestone.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

DISTINCTNESS IN EXHIBITS.—Reading through the classes for which prizes are offered at the fortnightly meetings of the Royal Horticultural Society, I notice that at the meeting for June 22 the competition is for six dishes and three dishes of Tomatos, all to be "distinct." A similar condition is required in the classes for twelve, six and three dishes of Peas at the same meeting. What is meant by the term distinct? Does it refer to name or appearance? Tomatos are apt to be very much alike, and this applies to both those of the red and those of the yellow types. Competitors may find themselves saved from trouble if they recognise this before they stage their exhibits. Peas offer more variation, but in the case for 12 varieties some considerable similarity of pods is inevitable. *Grower.*

RANUNCULUS AURICOMUS.—At a recent meeting of the Scientific Committee of the R.H.S., it is reported that Dr. Rendle showed specimens of the depauperate form of *R. auricomus*, with one or two petals only in some flowers, and in others the petals scarcely developed. It was stated that this species often has very imperfect flowers. It would be interesting to know if many of your readers have ever seen perfect flowers of this plant. I, for one, do not remember having done so. *H. S. Thompson.*

LARGE SEA BUCKTHORN.—Probably the largest specimens of the Sea Buckthorn (*Hippophae rhamnoides*) in this country are growing in the flower garden, Regent's Park. They are 40 feet high, the largest having a stem girth of 46 inches at three feet from the ground level. Seven others are over 36 inches in girth. *A. D. Webster.*

ONIONS FOR MARKET.—I think those who advocate the cultivation of garden subjects for market—Onions, for example—purely from theory, are giving wrong advice. I would draw the attention of those interested in this subject to an article that appeared in the *Daily Telegraph*, June 3, on the subject of French gardening, in which the writer warns intending cultivators to be moderate in their expectations. I know from experience that it is much wiser to give such advice than it is to make an estimate by weighing up a few bulbs, multiply number and weight, and then to tell persons of the enormous profits that can be made from Onion growing. I have heard leading exhibitors of vegetables, who have at their disposal an abundance of cold frames, pits and handlights, argue that great profits can be made by growing Onions. Of course they have never

counted the cost of such an outlay as frames, pits, &c., to begin with. Put these advisers on a bare patch of ordinary soil and then see what they would turn out without these appliances, to say nothing of the cost of trenching and manure. An instance of the fallacy of such advice came under my notice recently. An owner of half an acre of land was anxious to turn it to a profitable account and suggested Apple culture. An expert advised him to plant the trees (bushes) 15 feet apart. Under no pretext whatever was he to plant anything between the trees, but to keep the ground between free from weeds, and to expect a net profit of £40 per year! The gentleman consulted his gardener, who strongly advised the planting of Potatoes between the rows, which was done, with the result that £9 was obtained for this crop. This sum helped to pay for the labour of planting the orchard and did not injuriously affect the trees. I mention this to show how careful persons should be in advising those who are ignorant of how to proceed on commercial lines. *E. Molyneux.*

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 8.—At the meeting held on Tuesday last the Hall was well filled with exhibits, even the annexes being utilised for accommodating some of the groups of plants. The exhibits included showy flowering plants, mostly of popular subjects such as Carnations, Roses, Gloxinias, Irises, Lupins, Pæonies, Aquilegias, and other garden subjects. Orchids also were freely represented, and a noteworthy exhibit of forced fruits was exhibited by the Duke of PORTLAND. Novelties amongst flowers were numerous: the FLORAL COMMITTEE granted 10 Awards of Merit and the ORCHID COMMITTEE one First-class Certificate and three Awards of Merit.

At the afternoon meeting in the lecture-room an address on "Old Superstitions about Plants" was given by Rev. Prof. G. Henslow.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. C. T. Drury, Henry B. May, W. A. Bilney, Jno. Green, T. W. Turner, G. Reuthe, C. R. Fielder, W. Howe, Chas. Dixon, Chas. E. Pearson, J. T. Bennett-Pöe, Jas. Douglas, W. P. Thomson, E. H. Jenkins, W. J. James, Herbert J. Cutbush, George Gordon, R. W. Wallace, Jas. Walker, W. J. Bean, Jas. Hudson, Jno. Jennings, and R. Hooper Pearson.

Messrs. STUART LOW & CO., Enfield, showed greenhouse flowering plants, including *Gerbera Jamesonii*, *Tremandra verticillata*, *Metrosideros floribunda*, *Pimelia Hendersonii*, a selection of Carnations principally of the *Souvenir de la Malmaison* type, a brightly-flowered, Ivy-leaved *Pelargonium* named *Red Crousse*, and a number of Ferns, Palms, and other foliage plants. A new garden Pink named *Progress* has very pleasing rosy-mauve flowers. (Silver Flora Medal.)

Messrs. JAMES VEITCH & SONS, King's Road, Chelsea, exhibited a magnificent collection of Gloxinias, the plants having numerous flowers arising from a wealth of vigorous foliage. Some with spotted flowers were especially pleasing; others in shades of rose, crimson, scarlet, lavender, white and other tones were equally fine. Perhaps more interesting than these were hybrids raised from varieties of Gloxinias crossed with *Gesnera reginae*, a mauve or lilac-flowered species with small zygomorphic flowers. The influence of the latter parent was the more pronounced in all the progeny, which had flowers generally of some shade of lilac and purple, notwithstanding that some of the Gloxinias used as parents had rich crimson blossoms. Messrs. VEITCH also showed a large selection of showy and uncommon flowering shrubs. Chief of these were *Magnolia parviflora*, the centre of red stamens being very attractive; *Jamesia americana*; *Amygdalus dulcis purpurea*, an ornamental-leaved Peach; *Cornus Kousa*; *Styrax obassia*, with numbers of its pretty, white flowers in racemes; *Philadelphus Lemoinéi* rosaceae, the white flowers being as large as a multiflora Rose; *Fendlera rupicola*, *Berberis elegans*, and *Trochodendron aralioides*. (Silver-gilt Flora Medal.)

Messrs. WM. CUTBUSH & SONS, Highgate, London, N., exhibited a showy group of well-

grown Carnations, another of miscellaneous greenhouse plants, and a large, floor group of hardy subjects. Amongst these latter plants, which were arranged with great skill, we noticed the soft lemon-coloured *Anemone sulphurea*, several species of *Eremuri*, including *E. Warei* × and *E. Bungei auranticus*; *Lupinus Mørheimii*, *Primula capitata*, a fine batch of *Lilium Grayi*, also an assortment of *Pyrethrums*, *Rhododendrons*, *Lupins*, and other garden flowers. (Silver-gilt Flora Medal.)

A charming exhibit of white and pink flowers was shown by Mr. W. H. PAGE, Taingley Nurseries, Hampton. The subjects were Carnations, *Liliums*, Ivy-leaved *Pelargoniums*, and *Astilbes* (*Spiræas*). The group was staged in an artistic manner, the various subjects being blended with fine effect. The groundwork was composed of a new Ivy-leaved *Pelargonium* labelled *Countess de Gray*; it is best described as an improved *Mme. Crousse*. *Lilium longiflorum* and *White Lawson Carnations* were especially attractive. (Silver-gilt Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, made a beautiful exhibit with varieties of *Cannas* such as they displayed so effectively at the recent Temple Show. The group contained most of the newer varieties, including the best of Continental origin. (Silver Flora Medal.)

A large group of the floriferous *Andromeda speciosa* was set up by Mr. H. L. RUSSELL, Richmond, Surrey. The shoots of this showy shrub were covered with the white racemes, set off by the green of the foliage.

An exhibit of *Gloxinias* arranged on a circular platform in the centre of the hall was shown by Messrs. JAMES CARTER & CO., High Holborn, London. The plants were excellent specimens of this useful greenhouse subject, and all were freely flowered, the range of colours being pleasing. (Silver Flora Medal.)

Messrs. CLIBRANS, Altrincham, showed their hybrid *Calceolaria C. Clibranii*. The plant has yellow blooms and is very free in flowering.

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, showed various greenhouse plants in flower, also a number of elegant Ferns. Amongst the flowering plants were *Oleanders*, some with golden variegation in the foliage. Small plants of *Hydrangea Mariesii* bore very large panicles of their pretty rose-coloured flowers. *Abutilon triumphans* is a large pink-flowered variety. *Swainsonia galegifolia* was shown with both red and white flowers. Amongst the Ferns were many *Gymnogramme*—the gold and silver Ferns. *G. elegantissima* planted on the stump of an old tree Fern was a novelty. *Gymnogramme schizophylla superba* is an elegant species that produces the so-called bulbils on its fronds. There were several fine *Nephrolepis*, *Adiantums*, *Platy-ceriums*, and others, but perhaps the most interesting was the Whip Fern, *Acrostichum decurrens*, in which the mid-rib only is developed in the spore-bearing leaves. (Silver Flora Medal.)

Mr. GEO. MOUNT, Canterbury, staged choice blooms of *Roses*, of well-known varieties, such as *Ulrich Brunner*, *Joseph Low*, *Mildred Grant*, and *Mrs. John Laing*. (Silver Flora Medal.)

Mr. GEO. PRINCE, Oxford, displayed garden *Roses* in variety. We noticed a fine stand of the Austrian Copper variety, also *Carmine Pillar*, *Fortune's Yellow*, *Lady Battersea*, *Irish Elegance* and many others. (Silver Banksian Medal.)

Messrs. B. R. CANT & SONS, Old Rose Nurseries, Colchester, staged bunches of *Roses*, many being climbing varieties. *Tausendschon*, *Blush Rambler*, *Philadelphia Rambler*, *Morgenroth*, a large, single-flowered variety, of a rich shade of rose colour; *The Garland* (white), and *Edmund Proust*, a *Wichuraiana* variety with pale pink-tinted blossoms, were prominent. (Bronze Banksian Medal.)

Messrs. PAUL & SON, The Old Nurseries, Cheshunt, showed vases of garden *Roses*, principally of the older kinds, such as *Austrian Yellow*, *Trier*, *Buttercup*, a single variety of a shade of yellow in the bud, but when fully open almost white; *Double Blush Scotch*, *Albertii*, a fine yellow single, *Altaica*, &c.

Miss HEMUS, Holdfast Hall, Upton-on-Severn, showed a charming group of *Sweet Peas*, most of the varieties of her raising. The beautiful variety named *Evelyn Hemus*, one of the finest of *Sweet Peas*, was conspicuous. There was also a fine purple and heliotrope variety named *Helio Paradise*; *Lavender Paradise* is also excellent in its colouring, size and form. *Primrose Paradise* is

one of the best yellow *Sweet Peas*. All were gathered from the open ground from autumn-sown plants. (Silver Flora Medal.)

A pretty exhibit of *Carnations* and *Sweet Peas* was shown by E. J. JOHNSTONE Esq., Burrwood, Groomsbridge (gr. Mr. A. T. Paskett). The *Sweet Peas* included such notable kinds as *St. George*, *Elsie Herbert*, *Helen Lewis*, *Primrose Spencer*, *Princess Victoria* and *Audrey Crier*. These, with *Carnations* and well-grown plants of *Nephrolepis* in variety, made a very pleasing display. (Silver-gilt Banksian Medal.)

Mr. H. BURNETT, Guernsey, showed many varieties of the perpetual-blooming *Carnation*. *Marmion* was especially fine; this variety has its petals flaked with rose and white. *Winona* is a bright shade of rose-cerise. *Beacon* is an excellent scarlet variety. (Silver Flora Medal.)

Mr. C. F. WATERS, Balcombe, Sussex, displayed *Carnations* of excellent quality, the scarlet-flowered varieties, *Britannia* and *Victory* being especially fine, as also were *Nell Gwynne* (white), *Afterglow* (cerise), and *Calypso* (pale pink). (Bronze Flora Medal.)

Messrs. WM. PAUL & SONS, Waltham Cross, showed large plants of *Rhododendron Glory of Waltham*, a red-flowered variety, one of the best garden *Rhododendrons* of its class. Also a row of the elegant *Aemichen Müller Rose*.

A very large display of hardy plants in flower was made by Messrs. R. WALLACE & CO., Colchester, in which *Irises*, *Oriental Poppies*, hybrid *Heucheras*, and *Liliums* were conspicuous objects. (Silver Flora Medal.)

Another excellent exhibit of hardy flowers was presented by Mr. AMOS PERRY, Enfield Chase, Middlesex. Here again *Irises*, *Poppies*, *Heucheras*, and *Liliums* were prominent, also *Pyrethrums* in variety, *Eremuri*, and many other subjects. (Silver Flora Medal.)

Mr. CHAS. TURNER, Slough, displayed varieties of *Papaver orientalis* and seedling *Heucheras*.

Messrs. BARR & SONS, King Street, Covent Garden, showed many *Irises*, a selection of *Pyrethrums*, also *Eremuri*, *Lupins*, *Poppies*, *Gladioli*, *Ranunculi*, and other hardy flowers. *Iris sibirica superba* is a charming shade of deep blue. (Silver Banksian Medal.)

Messrs. T. S. WARE, LTD., Feltham, Middlesex, showed *Alpines* arranged on a rock-garden. *Saxifraga longiflora* was afforded a prominent place, the plants being finely in flower. We also noticed the dwarf *Asperula hirta*, *Verbascum Wiedmannianum* (with purple flowers), *Calceolaria polyrhiza*, *Anthemis macedonica*, and *Campypanula Portenschlagiana bavarica*. (Silver Banksian Medal.)

Mr. GEO. REUTHE, Hardy Plant Nursery, Keston, Kent, displayed hardy flowers and *Himalayan Rhododendrons*. A pan of *Edelweiss*—*Leontopodium alpinum*—was conspicuous. *Anthemis Biebersteinii* is a fine yellow-flowered Composite that does well on a dry bank. *Dianthus callizonus* is most elegantly marked in its petals, which resemble somewhat the wings of a butterfly; *Leschenaultia biloba* has a flower of lovely blue, like a *Gentian*. *Saxifraga Brunoniana* is a novelty; it sends out numerous runners, at the ends of which tiny plants are developed. (Silver Banksian Medal.)

A very large bank of hardy flowers was staged by Messrs. G. & A. CLARK, LTD., Dover, Kent, in which varieties of border *Pyrethrums* were a feature. There were also *Irises*, *Lupins*, *Eremuri*, *Heucheras*, and similar subjects in great assortment. (Silver Banksian Medal.)

Messrs. BAKER'S, LTD., Wolverhampton, displayed fine pans of *Aubrietias*, a large number of *Aquilegias*, *Poppies*, *Lupins*, &c.

Messrs. KELWAY & SON, Langport, Somerset, showed *Pyrethrums*, *Pæonies*, *Lupins*, and a tall hybrid *Linaris* with yellow flowers.

Other exhibitors of hardy flowers included THE GUILDFORD HARDY PLANT NURSERY; Misses HOPKINS, Mere Gardens, Shepperton-on-Thames; H. & W. EVANS, Llanishen, near Cardiff; Mr. MAURICE PRICHARD, Christchurch, Hants. (Silver Banksian Medal); Messrs. GEO. BUNYARD & CO., Maidstone, Kent (Silver Banksian Medal); Messrs. J. CHEAL & SONS, Crawley, who also displayed many interesting shrubs and trees (Silver Banksian Medal); Mr. CLARENCE ELLIOTT, Stevenage; Mr. A. J. HARWOOD, Colchester; Messrs. GEO. JACKMAN & SON, Woking; and Mr. W. J. GODFREY, Exmouth, Devon. Mr. GODFREY showed mainly varieties of the large-flowered *Poppy*.

Messrs. CARTER, PAGE & Co., London Wall, London, showed varieties of Cactus Dahlias and many kinds of Violas.

A fine batch of plants of *Viola cornuta purpurea*, together with a selection of ordinary Violas, were shown by Messrs. GUNN & SONS, Olton, Birmingham.

Mr. A. L. GWILLIM, Cambria Nursery, New Eltham, Kent, showed varieties of tuberous-rooted Begonias, having a wide range of colouring. (Silver Banksian Medal.)

G. CADBURY, Esq., Northfield (gr. Miss Cope), exhibited a seedling *Calceolaria* with spotted flowers having a yellow ground.

Mr. JAMES DOUGLAS, Great Bookham, Surrey, showed hybrid *Dianthus* raised from Uriah Pike Carnation and *Dianthus barbatus* (Sweet William); others shown were raised from a garden Pink crossed with the Sweet William, the characters of the hybrid partaking largely of the Pink.

AWARDS OF MERIT.

Aquilegia.—Messrs. DOBBIE & Co. were awarded an Award of Merit for a first-rate strain of long-spurred *Aquilegias* shown in an excellent group, in which the shades of colour were very numerous. A Silver Floral Medal was awarded the group.

Araucaria excelsa Silver Star.—Four plants were shown, in which the growing points for about 1 inch length were white. It may be assumed that these will ultimately acquire a green colour, and that future growth will again exhibit the white tips. (Shown by Messrs. THOS. ROCHFORD & Co.)

Geum coccineum Mrs. J. Bradshaw.—This is a large, double-flowered variety of bright crimson colour. (Shown by Messrs. G. & A. CLARKE.)

Iris Ed. Michel.—This is a fine variety of the germanica section, with probably something of *I. pallida* in it, judging by the peculiar shade of purple. The flowers are prettily marked, and they are held rigidly erect. (Shown by Messrs. WALLACE & Co.)

Lithospermum prostratum "Heavenly Blue".—A very desirable variety, the flowers being rather larger than those of the type, and paler and brighter—nearly sky-blue. The plants are stated to be less woody and much more easily cultivated than the type. In Mr. E. A. Bowles's garden the variety has proved very valuable for many years past. (Shown by Mr. A. PERRY.)

Polypodium glaucum crispum.—This plant reminds one of *P. Mayi*, but the fronds are less smooth, and the plant is said to grow less tall. (Shown by Messrs. ROCHFORD & Co.)

Schizanthus "Beauty of Trent".—A few cut flowers of this variety were shown by Mr. H. PARR, Trent Park Gardens, Barnet. An Award of Merit was recommended for the strain, but only one variety was shown, and this had orange and rose-coloured flowers.

Scolopendrium vulgare crispum multifidum.—A variety with exceedingly large, divided crests at the end of the fronds. (Shown by Messrs. H. B. MAY & SONS.)

Scolopendrium vulgare crispum muricato fimbriatum.—This extraordinary name has been applied to an exceedingly pretty variety of the common Hartstongue Fern, having much-waved fronds with an unusual degree of fimbriation. (Shown by Messrs. H. B. MAY & SONS.)

Sweet Pea Paradise Apple Blossom.—This is a very pretty flower of white and pink, the pink being generally at the margins of the standard and wings and at the back of the standards. The flower is of the Spencer type, and its size is fairly good. (Shown by Miss HEMUS.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), de B. Crawshay, Harry J. Veitch, F. Sander, H. G. Alexander, R. G. Thwaites, Walter Cobb, W. H. White, J. Charlesworth, H. A. Tracy, W. H. Hatcher, A. A. McBean, C. H. Curtis, Gurney Wilson, J. Forster Alcock, W. Boxall, F. J. Hanbury, R. Broomwhite, Stuart Low, and W. P. Bound.

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, were awarded a Silver Flora Medal for a fine group, tastefully arranged, in the centre being graceful *Oncidiums*, *Odontoglossums*, &c. The body of the group was comprised of fine

forms of *Cattleya Mendelii*, *C. Mossiae*, and *Lælia purpurata*. Among the *Odontoglossums* we noticed a pretty variety of *Odontoglossum illustre*, with flowers of a glowing tone of bronzy hue, and *O. laudatum*, a finely-blotched flower. Other plants of merit were *Oncidium bifrons*, *O. cornigerum*, *Sobralia macrantha alba*, *Coelogyne Dayana*, and some varieties of *Spathoglottis*.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for an effective group, in the centre of which were fine specimens of the beautiful *Cattleya Warszewiczii Sanderiana*. The group also contained a good selection of *Odontoglossums*, several plants of the finely-coloured *Cypripedium Gowerianum Schofield's* variety; some fine specimens of *Lælio-Cattleya Canhamiana Rex*, and *L.-C. Aphrodite*, including the handsome variety *plumosa*, with purple feathered markings on the petals; a handsome plant of *Odontoglossum harvengtense*, and other hybrids; various *Masdevallias*, *Bulbophyllums*, &c.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for a select group, which contained exceptionally fine specimens of *Odontoglossum Lambeauianum* and *O. amabile*, *Odontioda Bradshawie*, *O. heatonense*, the showy and fragrant *Lælio-Cattleya Fascinator*, one plant bearing six flowers, a plant of the singular *Stelis tristyla*; others of *Vanda cœrulescens*, and its rare variety *Boxallii*, *Bulbophyllum Reinwardtii*, and *B. saurocephalum*.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was awarded a Silver Flora Medal for a group containing many fine varieties. *Odontoglossums* included a noble plant of the blotched *O. crispum* President Fallieres, with 18 flowers and flower-buds, *O. c. The Czar*, a very richly-coloured variety, and *O. c. Xanthotes*. Others noted were *Cattleya Mossiae Princess Juliana*, a good white flower, with a tracing of colour on the lip; *C. Dusseldorfei Undine*; a good selection of coloured *Masdevallias*, *Dendrobiums*, &c.

Messrs. JAS. VEITCH & SONS, Chelsea, were awarded a Silver Banksian Medal for an effective group comprising *Cattleya Mendelii*, *C. Mossiae*, good forms of *Odontoglossum crispum*, a grand specimen of the handsome rose-purple *Disa Luna*, with five flower-spikes, *Lælio-Cattleya Ithone*, and other hybrids.

Mr. A. W. JENSEN, Lindfield, Haywards Heath, received a Silver Banksian Medal for a selection of his type of *Cattleya Mossiae*; also *C. Mendelii* and *Odontoglossum crispum*. The last-named included some pretty spotted forms. *Oncidium Kramerianum* and *Miltonia vexillaria* were also well shown by this exhibitor.

Messrs. J. & A. A. McBEAN, Cocksbridge, were awarded a Silver Banksian Medal for a group of *Odontoglossums*, among which were several forms of *O. crispum*, of fine shape and substance, one having very broad segments, and, in some respects, resembling *O. Beauté Celeste*, but of finer form and substance. A form of *O. crispum Xanthotes* had better flowers than the type. *O. harvengtense* and other hybrids were also included in the exhibit.

Messrs. MOORE, LTD., Rawdon, Leeds, were voted a Silver Banksian Medal for an effective and interesting group, in which were noted some fine specimens of *Lælio-Cattleya Aphrodite*, the variety *alba* having pure white sepals and petals, with a bright violet-purple front to the lip; *Cattleya Dusseldorfei Undine*, some showy *Odontoglossums*, including *O. ardentissimum album*, *O. Rolfeæ*, a good form of *Cirrhopetalum Collettii*, a pretty claret-purple *Gongora*, *Cochlioda sanguinea*, *Miltonia vexillaria leucoglossa*, a good white-lipped variety, *Angraecum modestum* and *Disa Luna*.

Mr. H. A. TRACY, Twickenham, displayed a finely-blotched *Odontoglossum eximium*, *Cattleya Mossiae Roehrs'* variety, and *Oncidium Batemanianum*.

Monsieur MERTENS, Ghent, staged a small group of hybrid *Odontoglossums* and *Vanda cœrulea*.

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, showed *Odontoglossum crispum cristatum*, in which the markings, as on the labellum, are shown at the bases of the petals.

WALTER COBB, Esq., Normanhurst, Rusper (gr. Mr. C. J. Salter), showed *Odontoglossum Cobbianum*.

The Hon. Mrs. FOLEY, Packham, Fording-bridge, sent a species of *Lissochilus* near to *L.*

arenarius. The plant was received from tropical Africa. It has a tall inflorescence of pretty rosy-lilac flowers.

EUSTACE F. CLARK, Esq., Chamonix, Teignmouth, sent two flowers of *Lælio-Cattleya Marlburia* (*L. Boothiana* × *C. Schröderæ*), a pretty rosy-lilac variety, and an improvement on *L. Boothiana*.

Mr. F. McBEAN, Plumpton, showed good *Cattleyas* and *Odontoglossums*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Lælio-Cattleya Mikado (parentage unrecorded), from Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—One of the finest of yellow-petalled hybrids, the flower being of good size and shape and very bright in colour. The sepals and broad petals are canary yellow colour; the front of the well-expanded lip is ruby-crimson with a narrow yellow margin.

AWARDS OF MERIT.

Cattleya Mossiae var. A. Dimmock, from Col. G. L. HOLFORD.—One of the finest and most distinct forms of *C. Mossiae* of the Reineckiana section. The sepals and petals are both very broad and of blush-pink tint; the large labellum is blush-white at the base, the disc being chrome-yellow, and in front is a large marbled blotch of a bright violet colour, the broad, crimped margin, about half an inch wide, being white, forming a marked feature in the flower.

Lælio-Cattleya Feronia (C. Enid × L.-C. Haroldiana), from Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White).—A showy hybrid with flowers equal in size to those of *L.-C. Canhamiana*. The sepals and petals are creamy-white, tinged with gold colour, and with a pink tint on the petals; the lip is of a bright ruby-claret colour.

Odontoglossum amabile Fowlerianum, from J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis).—A fine hybrid with large, broad-petalled flowers, the outer parts of which are tinged with rose, the inner surface being heavily blotched with red-brown; the front of the lip is pure white.

BOTANICAL CERTIFICATE.

Cirrhopetalum vaginatum, from Sir TREVOR LAWRENCE, Bart.—A pretty plant, with numerous umbels of cream-white flowers.

Angraecum expansum, from Sir TREVOR LAWRENCE, Bart.—An upright-growing species with leathery, distichous leaves. The short inflorescence bore two white flowers of thick texture and peculiar form, the spur, longer than the other segments, being curved back.

CULTURAL COMMENDATION.

To Mr. W. H. White, Orchid grower to Sir TREVOR LAWRENCE, Bart., for a fine plant of the rare *Dendrobium Jerdonianum* with many spikes of narrow-petalled, orange-coloured flowers.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair), and Messrs. J. Cbeal, J. McIndoe, W. Bates, H. Parr, H. Markham, A. R. Allan, C. Hobday, G. Wythes, G. Woodward, A. Dean, W. Poupart, O. Thomas, J. Harrison, E. Beckett, P. D. Tuckett, J. Gibson, and J. Jaques.

The most noteworthy exhibit was a superb collection of fruit shown by the Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson). The collection was artistically arranged with numerous graceful plants and foliage. It included 50 fine Melons, placed on branched fruit-stands, these alone forming a striking display. The varieties were Hero of Lockinge, Sutton's Ringleader, Royal Jubilee, Best of All, and Superlative. Flat baskets contained fine fruits of Peaches Bellegarde and Hale's Early; and Nectarines Cardinal and Early Rivers. There were eight of these baskets, containing in all 120 fruits. Cherries were shown in dishes. These comprised: of black kinds, Bigarreau de Schrecken, Black Tartarian, Bigarreau Jaboulay, and Early Rivers; and of white varieties, Governor Wood, Frogmore Early, and Emperor Francis. Oullin's Golden Gage Plums, Brown Turkey Figs, Lady Sudeley Apples, and Royal Sovereign and Leader Strawberries completed the display. (Gold Medal.)

Miss C. M. DIXON, Elmcroft Nursery, Chichester, staged a group of 17 Melons of the variety Elmcroft Beauty. (Cultural Commendation.)

Messrs. J. & F. CHATFIELD, Southwick, showed Strawberries—a basket of superb fruits of Royal Sovereign, and small samples of La Grosse Sucrée, Bedford Champion and Leader, the last-named shown under the name of Kentish Favourite. There were also pot plants of Bedford Champion in fruit.

Messrs. SUTTON & SONS, Reading, set up a pyramidal group of fine, solid, white heads of Latest in All Broccoli.

E. W. DIXON, Esq., Oakfield, Berks., sent several clusters of fruit of the Loquat.

Several new Melons were presented, but none was of sufficient merit to warrant an award.

COMPETITIVE CLASSES.

The only competitor in the several classes for collections of fruit was E. S. HANBURY, Esq., Poles Park, Herts. (gr. Mr. F. W. Church), who showed in the class for six kinds. A 2nd prize only was awarded. Hale's Early Peaches and Early Rivers Nectarines were good. Foster Seedling Grapes were unripe, and the Melons and Strawberries small.

ROYAL COUNTIES AGRICULTURAL.

JUNE 8, 9, 10, 11.—The Royal Counties' show at Reading contained many features of interest to horticulturists. The BERKSHIRE, OXFORDSHIRE, and BUCKS. EDUCATION COMMITTEES each had extensive exhibits of Nature Study objects. In some instances the dried and living specimens were well mounted with roots, stems, and flowers complete.

Messrs. SUTTON & SONS, Reading, showed, in an ornamental building devoted exclusively to their exhibits many fine specimens of fruit, vegetables, and flowers. They had fine pods of Albany, Early Giant, and Defiance Peas, good early Potatos, including May Queen, Gladiator, and Ringleader; also a large collection of tubers of the second early and maincrop types. They also showed Hero of Lockinge Melons, Favourite and Champion Horn Carrots, Cucumbers, and some 40 varieties of other kinds of vegetables. Outside the building were flower-beds planted with annuals. This firm was responsible for the floral decorations about the president's tent and the council's offices. Messrs. SUTTON also arranged a "French" garden, showing how two and three crops are grown at the same time under similar conditions.

Grasses and mixtures of lawn seeds, a collection of forage plants, natural Grasses and Clovers, with growing plots to illustrate the various mixtures for producing temporary or permanent pastures, were all of interest.

Messrs. WEBB & SONS, Stourbridge, also displayed horticultural exhibits. They showed exceptionally large Melons, good, frame-grown Cauliflowers, Prizewinner Carrots, Emperor Cabbages, and other vegetables. Calceolarias, Gloxinias, and Sweet Peas all added to the effect of this stand, which contained many of the firm's cereals that have a reputation in agricultural circles. Their new standard Red and White Queen Wheats are two of the best varieties in cultivation.

Messrs. TOOGOOD & SONS, Southampton, had a finely-arranged group of Salpiglossis in pots, also Spanish Irises, Gladioli in the best early-flowering forms, and other popular flowers. This firm also showed seasonable vegetables, including excellent Peas, Tomatos, Cabbages and Potatos.

The Agricultural and Horticultural Departments of UNIVERSITY COLLEGE arranged in the laboratories of the College various interesting exhibits. Grain in pots that had been fed with varying amounts of fertilisers admirably illustrated the influence of these different manures upon the plants' growth. There were others showing the influence of phosphates, potash, and nitrates in the colouring of the ripened grain. The College also displayed apparatus for seed testing and for making a mechanical analysis of soils. Budded and grafted fruit stocks, fruiting trees to illustrate the effects of pruning and pinching the shoots, the best types of vegetables as grown for market, and the manner of preparing and marketing them, with many other exhibits of an educational character were included in the College exhibit.

Appliances for spraying Potatos, Charlock, fruit trees, &c., were shown by Messrs. BURLAND.

Other exhibits of horticultural interest included examples of boilers, glasshouses, instruments, and the like.

BRITISH GARDENERS' ASSOCIATION.

At the recent, annual, general meeting it was decided, after full consideration, that employers of gardeners and others in sympathy with the aims and objects of the Association should be allowed to join as honorary members, paying a minimum subscription of 20s. per annum. The main object of this resolution, writes Mr. J. Weathers, the hon. secretary, is to bring owners of gardens and their gardeners more closely together for mutual benefit. The employer will be assured of having a gardener who knows his work, and the gardener of an employer who will recognise in him a skilled workman. Anyone wishing to join as a honorary member should apply to the secretary, B.G.A., Talbot Villa, Isleworth, for further particulars.

GLOUCESTERSHIRE ROOT, FRUIT, AND GRAIN.

A SPECIAL meeting of the members of this Society was held recently for the purpose of presenting the orchard pruning prizes and of considering a suggested alteration in the conditions governing these competitions.

Mr. H. W. Bruton said the competition began in 1906, when there were 11 competitors for three prizes. Subsequent alterations in the conditions excluding landowners reduced the number of com-

THE LATE JAMES SHANKS.

petitors in 1937 to 10 for five prizes. In 1908 there were eight competitors for five prizes, and in the present year seven competitors for five prizes. As the winner of the 1st prize was not allowed to compete with the same orchard for three years, this to some extent explained the reduction in the number of competitors.

The 1st prize was awarded to Mr. JOSEPH ROUND, of Selseley Park Farm, Stroud.

After a short discussion, it was decided to alter the conditions governing the competition, so that the owners of two acres, being part of a larger orchard, should be allowed to compete instead of those with whole orchards of not less than two acres, as now.

Obituary.

JAMES SHANKS.—We regret to record the death on May 31, of Mr. James Shanks, general manager and director of Messrs. Alexander Shanks & Son, Ltd., Arbroath, the well-known firm of engineers and makers of the celebrated lawn mowers which bear their name. The deceased gentleman, who was 78 years of age, is survived by a wife and family of four sons and three daughters. Three of his sons are connected with the business at Bens Iron Works. The funeral took place on Friday, June 4, at the Western Cemetery, Arbroath.

ENQUIRIES AND REPLIES.

ACETYLENE GAS REFUSE.—In reference to the article (see *Gardeners' Chronicle*, April 24) on "Acetylene Gas Refuse as a Manure," I should like to ask one or two questions: (1) Was the residue new lime or old? If new, it might account for a great deal, as it might be far too caustic. (2) What colour was it? Pure white it should have been; if it was patched with yellow or green it is proof that the charge of carbide had been overheating locally during generation and that a quantity of the gas had again been altered into other hydrocarbons, the discoloration of the residue being caused by the presence of these tarry compounds and benzene products, which cannot be said to be beneficial to plant life. The residue of some generators often contains compounds of sulphur and ammonia which would in time evaporate if left in the open. *A. M. Broadbent.*

The material used had been exposed to the air not less than three weeks, so probably was not thoroughly carbonated. There was no sign of the discoloration of the residue described above. Is there any direct evidence that injurious, tarry hydrocarbons are formed during the production of acetylene gas? If so, this offers a good explanation of the injurious effect of the refuse. The correspondent also mentions compounds of sulphur and ammonia. These, together with phosphorous compounds (e.g., phosphides), I consider, offer a more likely explanation. However, analyses of the refuse, fresh and after keeping, would go a long way towards settling these points. *The writer of the article.*

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

APPLE LEAVES: *J. E.* The foliage has been caused by a fungus, *Macrosporium commune*. Two or three sprayings with weak Bordeaux mixture, at intervals of about four days, just when the leaf-buds are expanding, will prove effectual in most cases.

BOTANICAL REQUISITES: *R. D.* Paper for mounting herbaria specimens may be obtained from Messrs. Gallenkamp & Co., Finsbury Circus. Messrs. Baker & Co., High Holborn, and Messrs. Swift & Co. are the makers of good, serviceable microscopes for students' purposes. The best work on the British flora is Bentham & Hooker's *British Flora*. This work may be obtained from our publishing department.

CATERPILLARS INFESTING FRUIT TREES: *W. W. D.* These are the larvæ of the winter moth (*Cheimatobia brumata*). The "Winter Wash" is of no avail against this pest. See reply to *G. W. W. & Co.*, p. 371, in the last issue.

CUCUMBER PLANT UNHEALTHY: *B. T. A.* No disease is present in the plant. The mottled appearance of the foliage is due to some cultural defect.

EUPATORIUM ODOBATUM. *A. Gooden.* In favourable positions in the south and south-west of England, the west of Scotland, and in Ireland this South American plant, although generally considered a cool greenhouse subject, is often seen doing well out-of-doors. In time it forms a good-sized bush, and is a striking feature when clothed with the white flowers. The correct name of this plant is *E. Weinmannianum*.

MANGELS INJURED: *Pillinger's*. The damage has been caused by the Beet-fly, *Anthomyia betæ*. Dust the plants with soot when the leaves are damp.

MEALY-BUG ON VINES: *J. H.* We think that by white scale you must mean mealy bug. If this is correct, the only thing you can do at the present is to prevent the bugs from entering the bunches of fruit. Carefully examine the young growths and kill all the bugs that can be found: they usually secrete themselves in the axils of the leaves. The spurs should also be painted with methylated spirit, especially near the base of the young shoots. If you do this about once a week till the crop is ripe it should ensure the bunches being clean. After the Grapes are cut, the rods and spurs should be thoroughly washed with strong soft-soapy water. When the winter pruning has been done all the loose bark must be removed and the rods again thoroughly washed with the mixture already described. This should again be repeated just before the vines break into growth. If the vines are growing in a house, the woodwork, glass and trellis must also be thoroughly washed, and, if possible, the house should be painted and the brickwork limewashed. Afterwards there should be no difficulty in keeping the vines clean.

MILDEW ON VINES: *A. F. W.* The most effective way to deal with an attack of mildew at this stage is to dust the affected parts with flowers of sulphur. This can be washed off the bunches with rain-water when the Grapes commence to colour, as the mildew will not spread after that stage. The muslin should be removed from the ventilators; its presence is favourable to the development of the mildew. If the Ferns you mention are in any way obstructing air from reaching the roots in the border they should be removed. The surface of the border should also be lightly pricked up with a fork.

NAMES OF PLANTS: *D. P.* *Spiræa confusa* and *Polygala vulgaris*.—*R. R.* *Spiræa confusa*.—*Roebuck*. *Dendrobium crassinode*.—*J. R.* 1, *Podocarpus chilina*; 2, *Cassinia fulvida*; 3, *Leiophyllum buxifolium*; 4, *Arenaria montana*; 5, *Cistus corbariensis*; 6, *Gaultheria Shallon*.—*C. F.* *Picea orientalis*.—*Cor.* A *Magnolia*, probably a hybrid of *M. conspicua* and *M. obovata*, but flowers badly decayed on arrival.—*G. H. G.* 1, *Halesia tetraptera*; 2, *Solanum Dulcamara*; 3, *Spiræa hypericifolia*; 4, *Berberis vulgaris*; 5, please send another specimen; 6, *Camassia esculenta*.—*J. T.* *Primula capitata*.—*Pine.* 1, *Pinus Laricio*; 2, *Abies concolor*; 3, *Pinus ponderosa*; 4, *P. Laricio*; 5, *Abies concolor*; 6, *A. Lowiana*; 7, *Pinus Laricio*.—*A. W. T.* *Exochorda grandiflora*.—*H. F.*, *Mylor Bridge*. *Pyrus lobata*.—*G. W.* *Eucharis Sanderi* Baker, *Bot. Mag.*, t. 6676, *Gard. Chron.*, March 17, 1883, p. 349 fig. 53. —*R. G.* *Euphorbia Lathyrus* (Caper Spurge).—*E. W. B.* *Cytisus purpureus*.—*A. J. C.* 1, *Weigela hortensis rosea*; 2, *W. hortensis aurea*; 3, *Cornus alba* variety *aurea*; 4, send when in flower; 5, *Spiræa arifolia*; 6, *Magnolia acuminata*.—*Pillingers*. 1, *Spiræa confusa*; 2, *Celsia cretica*.—*C. W. B.* 1, *Veronica Chamædryis*; 2, *Lychnis Flos-cuculi*; 3, *Conopodium denudatum* (Pig-nut).—*W. G.* *Dendrobium pulchellum*, more commonly known in gardens as *Dendrobium Dalhousieanum*.—*R. A.* 1, *Epidendrum virens*; 2, *Oncidium cornigerum*; 3, *O. pubes*; 4, *Gongora quinquerivis*; 5, *Cochloda sanguinea*; 6, *Odontoglossum odoratum*.—*A. J. W.* 1, *Aerides odoratum majus*; 2, *Epidendrum fragrans*; 3, *Rhynchosyris retusa*, generally called *Saccodidion Blumei* in gardens. The others are *Odontoglossum Pescatorci*, and *Dendrobium crystallinum*, both exceptionally good varieties. —*L. E. W.* *Odontoglossum citrosimum*, of ordinary value for garden purposes. —*C. M.* We do not undertake to name varieties of Roses. Send to some grower of these plants.

OATS INFESTED WITH INSECTS: *W. N. B.* The insects submitted for examination are, with one or two exceptions, the common European grain weevil (*Calandra granaria*), and this insect is the sole cause of the injury to the Oats. It was, in all probability, introduced in the way you have suggested in your communication. Its life-history is, briefly, as follows:—

The female drills, by means of her proboscis (snout), a minute hole in the grain, after it is harvested, and lays an egg in it; from this is hatched a legless grub, or maggot-like larva. The larva feeds on the interior of the grain, and, in the case of Wheat, Oats, Rice, etc., leaves practically nothing but the thin, empty shell. In all cases the larva passes the whole of its existence within the grain, and, when mature, changes to a chrysalis (pupa); no feeding takes place in this stage. In a few days the pupa gives rise to a perfect beetle, and the insect effects its escape by cutting a circular orifice in the cuticle or hull of the grain, having the appearance of a small shot hole. The adults also feed extensively on the grain, and thus cause considerable damage. The time required for the completion of the cycle varies with the season and climate, and the number of generations produced in a season is consequently dependent upon temperature. In the tropics, the minimum period for one

FIG. 171.—BLADDER PLUMS, CAUSED BY A FUNGUS.

cycle is about 21 days; but in colder latitudes the period may extend to six weeks, or even months. It is a prolific species, and egg-laying may be continued over a long period. Each female deposits about 250 eggs, and Curtis estimated that one pair of weevils, during a period of five months in Southern France, are capable of producing 6,000 individuals. This insect does not feed upon wood, but you are probably correct in assuming that it has got amongst the old timber in the granary. One of its favourite resorts, however, is the space between the flooring-boards and the ceiling below, especially if—and this is likely to be the case—the space is filled with grain. For the present we recommend (1) that you continue to sift the grain over from time to time and burn the siftings; (2) spread the grain out into as thin a layer as space will admit; and (3) ventilate the granary night and day as much as possible. The cooler the place is kept the less rapid will the insect breed. When the Oats are finished, remove one or two flooring-boards, and if grain is found to have accumu-

lated beneath them, it must be removed and burnt. Afterwards thoroughly spray the whole of the interior—roof, walls and floor—with a strong paraffin and soap emulsion applied as hot as possible, care being taken to thoroughly saturate every part with the spray. An ordinary syringe will do quite well, and the operator should grip the barrel with a piece of cloth to prevent the instrument burning the hands. Fumigation with hydrocyanic acid gas is the method usually adopted in the United States; but as the granary is an old one, it is very doubtful if this treatment would prove successful, unless the building can be rendered practically airtight. We have found it useless in a similar instance in this country. Bisulphide of carbon is also used as a fumigant with good results, but, like the former, it is a poison, and, in addition, also inflammable, and would need to be used with great care.

PEACHES FALLING WHEN UNRIPE: *Mrs. B.* The fruits have no doubt fallen because of some wrong cultural treatment. The splitting of the stones suggest the presence of too much water in the soil and also in the atmosphere of the Peach-house. It may also be due to over-cropping in previous years, or improper ripening of the wood last autumn. Apply a small quantity of lime in the form of old mortar to the border.

PELARGONIUMS UNHEALTHY: *W. B.* The plants are free from fungus disease. The trouble is due to improper root formation owing to the cuttings being too woody when inserted. As soon as genial weather sets in, they will soon make satisfactory growth.

PLUMS: *J. M.* The fruits are attacked by a fungus, *Exoascus deformans* (see fig. 171). They are called bladder Plums, from their inflated appearance. Burn all the diseased fruits and spray the trees with a weak solution of the Bordeaux mixture.

SHOW PELARGONIUM: *A. H. P.* We do not undertake to name varieties of Pelargoniums or other florists' flowers.

TOMATOS DECAYING AT THE ROOTS: *A. S. R. & Co.* The roots are perfectly free from disease caused either by insects or fungi, yet the outer tissue is destroyed. It suggests damage from some strong fertiliser, which need not necessarily be applied directly to the roots; a solution in water is sufficient to cause the injury.

VINE LEAVES WITH WARTS: *H. C. R.* The irregularities on the leaves are not due to disease, either of insect or fungus. They are tiny outgrowths of tissue, caused by excessive moisture in the atmosphere. The disfigurement generally occurs in vinerias that are not sufficiently ventilated and where the atmosphere is stagnant.

WEEDS ON A LAWN: *M. L. E.* Large weeds such as Docks, Plaintains, Thistles, &c., are often destroyed by some strong acid applied to the crown of the plant. But if the sward is infested with smaller weeds the best plan is to apply some nitrogenous manure which favours the development of the grasses, and these will in time crowd out the intruders. The preparation known as lawn sand contains manure which acts on the turf in a similar manner. Make up a compost of fine soil and either nitrate of soda or sulphate of ammonia. Apply the mixture sparingly as a top-dressing.

YOUNG OAK LEAVES: *S. G. E.* It is a very common occurrence for young Oak foliage to assume a brown tone, and in an Oak wood many of the young shoots are beautiful from this reason. It is also seen in the young foliage of other plants, especially those whose natural habitat is in the tropics. The colouring, due to a pigment called anthocyanin, has a physiological value, inasmuch as it serves to screen the young chloroplasts (chlorophyll grains) from intense sunlight.

SPRING FLOWERS IN THE SOUTH-WEST.

THE past spring was very backward on account of the prevalence of cold easterly winds, and vegetation has been, in consequence, generally retarded. The winter temperature varied considerably in Devon and Cornwall, for while at Kingswear the greatest frost registered during the past winter was 6½°, at Tregothnan 12° were recorded on two successive nights, and at Trewidden, near Penzance, the thermometer showed 14° of frost. The winter with us was much milder than the two preceding ones, when 10° and 12° of frost were registered. *Arctotis aureola*, which in 1907 and 1908 was cut to the ground and only threw up again from the base in the following spring, was uninjured this year and commenced to flower in March. *Iris stylosa* has been marvellously prolific of bloom through the winter, a neighbour having cut over 5,000 flowers from 18 large clumps. The delightful little Violet Cress (*Ionopsisidum acaule*), which seeds itself freely all over the garden, even on the tops of walls, and has carpeted a bed of early spring Irises such as *I. Histrio*, *I. histrioides*, *I. Bakeriana*, *I. Danfordii*, *I. reticulata* and others, was in flower from December

to April, and spread a mantle of soft lavender colour over the border. *Clethra arborea*, which was badly cut in 1907 and 1908, was quite uninjured during the past winter, and it is hoped will flower in the coming August. Another plant that was badly injured by the frost in the two preceding winters, namely, the New Zealand *Arthropodium cirrhatum*, which flowered well in 1906, but, owing to its loss of foliage, did not bloom in 1907 or 1908, is unhurt and shows signs of perfecting flower-spikes. The rare and delicate *Romulea pylea*, with satin-white, golden-centred, Crocus-like blossoms, which produced dozens of blooms, was a lovely sight in the early spring, and the larger *R. nivalis*, with white flowers faintly feathered with blue, was also pretty. The blue Chilean Crocus (*Tecophilæa cyanocrocus*), with its deep gentian-blue blossoms, was very beautiful. This charming little plant appears to be somewhat capricious, for in some gardens it dies out, and it is only in a very few that it is at home and reproduces itself. *Hardenbergia monophylla alba*, after being flowerless for five years, surprised us by showing bloom in February, and through March and April it was covered with white flowers, which lasted well in the cold weather. *Correa cardinalis* was in flower before Christmas, and is still carrying many perfect blooms. The American *Erythronium* often prove exceedingly difficult to grow satisfactorily, but in a few gardens in the south-west they appear happy. In a certain garden near Truro they presented a beautiful picture in the month of April, several hundreds of vigorous plants being in bloom. The flower-stems were in many cases from a foot to 18 inches in height and bore numerous blossoms. The owner stated that the majority were self-sown seedlings. They were growing in pure leaf-mould collected from beneath a rookery. *Genista monasperma*, which, it was asserted, would not flower in England, was covered with bloom in May, and *Leptospermum scoparium* is now a sheet of white. *Fritillaria persica* has produced a sheaf of flower-stems nearly 3 feet in height, and the rare *F. obliqua* has perfected its almost black blossoms. *Manettia bicolor* is in fine blossom, and both the crimson and white varieties of *Clianthus puniceus* are covered with blossom, which, however, is now past its best. The first flowers were cut from the open wall on Christmas Day. *Semele (Ruscus) androgyna* is making growths that promise to be over 15 feet in length, and its leaves, or cladodes, are already becoming furnished along their edges with tiny greenish-white buds. At Christmas-tide the soft colouring of a large colony of *Crocus Imperati* presented a lovely sight, and was followed by *C. Korolkowii*, *C. Sieberi*, and others. *Jasminum primulinum* has produced its golden bloom in profusion, and *Deutzia kalmiaeflora*, the loveliest of its family, has been covered with blossom. *Buddleia Colvillei* is evidently going to flower copiously, every spray being terminated by a cluster of buds. This *Buddleia* never seems to flower in a small state, and, indeed, it is not until the bush has attained a height of 8 or 10 feet that it begins to bloom with any freedom. *Celmisia coriacea* is in full flower and *Olearia insignis*, which was obtained direct from New Zealand, is showing several broom-buds. The yellow Californian Tree Poppy (*Dendromecon rigidum*) is doing wonderfully

well and is throwing up strong shoots over half an inch in diameter. It commenced to flower in May, and will continue to bloom until well on in November, thus having a far longer blossoming period than its relative *Romneya Coulteri*. The South African *Anemone Fanninii*, the queen of its family, which bears large, snow-white flowers over 4 inches across, is throwing up its bloom-buds, and *Watsonia coccinea* is about to perfect several flower-spikes, which are already showing scarlet. *Neviusia alabamensis* has been in profuse bloom, and the new *Lilium Ghehni* is making strong growth, while *L. sulphureum* is shooting up well from its peat bed. *Ranunculus Lyallii* is alive, but has made but little growth. Every endeavour was made to obtain this plant through English nurserymen, but not a plant could be heard of, and eventually one was procured from New Zealand. It has, I believe, been flowered several times in this country, but apparently has been lost. It has been said that the winter temperature in the native habitat of this species registers 15° below zero, a state of affairs impossible of realisation in South Devon. It is, however, such a beautiful plant that one can but do one's best to succeed with it. *S. W. Fitzherbert.*

NOTES FROM ISLEWORTH.

NOTWITHSTANDING the inclement weather of this spring-time, the orchards promise to yield a good all-round crop. The small fruits also promise well, and both Strawberries and Black Currants will be plentiful. Apples are very variable and difficult to estimate, some trees being crowded with fruit, and others (even of the same variety) standing near them absolutely bare of fruit. This eccentric setting seems to be general in the district, and I note how very shy setters (such as the Improved Gravenstein) are loaded, whereas the long-keeping cookers (such as Lane's Prince Albert and Norfolk Beefin), upon which one generally gets a fair crop, are rather thin this season. I think the explanation is that the early-flowering sorts, for once in a way, had a more propitious blooming period than the later kinds. The general result, however, promises to give about an average crop. Pears are a heavy crop, and the fruit is very well distributed over the trees. Most kinds will require severe thinning. *Marie Louise* is not a good crop, but this is the only exception that I have noted. Plums are again a grand lot as far as the cooking kinds are concerned, and Damsons are also good, but among dessert kinds only the Gages promise well. I have a sprinkling on some Japanese Plums which have hitherto been barren in my garden. Great benefit has accrued to those prolific sorts, such as Victorias, which so often exhaust themselves in carrying one huge crop and then take two years to recover, by heavy dressings of manure alternated with dressings of lime, salt, and soot mixed, and thin dressings of sulphate of iron. Some trees thus treated have carried enormous crops for three successive years and shows no signs of exhaustion. For some unascertained reason dressings of sulphate of iron have also proved beneficial to the Strawberry beds in this district, although I believe it was first applied by mistake. Quinces are about an average crop. Cherries are very plentiful, but will probably be undersized on account of the very cold weather now prevailing. The wall fruit is all splendid in this district. Undoubtedly the fine, warm, and sunny autumn ripened the wood to an exceptional degree. Unfortunately those who grow early vegetables for the market have had a very unsatisfactory time this spring, but in many cases the product of the orchards will probably redress their losses. *A. Worley, June 11.*

OURISIA MACROPHYLLA, Hook.

THE genus *Ourisia* is best known in gardens through the South American scarlet-flowered *O. coccinea*, a plant introduced by Messrs. Veitch so long ago as in 1862, and figured in the *Botanical Magazine* of the same year. Few of the New Zealand or of the other South American species have come into horticulture, and this not because they are undeserving of cultivation as fig. 172, illustrating *O. macrophylla*, will show. *Ourisia macrophylla*, a New Zealand species, of which Mr. Cheeseman (*Flora of New Zealand*) writes, "In its fully developed state this is an exceedingly handsome plant," gives promise in its growth at Edinburgh of satisfying the description. It forms a spreading tuft of basal, dark green leaves 6 inches or so long—with a purple tint on the petiole spreading into the veins and around the margin. Flowering stems rise freely from the base and bear stalked flowers, white, or white streaked with purple, in whorls, several of which may be superposed. The bud before opening has a beautiful pink tinge. The figure shows only the beginning of elongation of the flower axis to give a second whorl, at a later stage of its growth the plant figured had three whorls. Seed is produced abundantly. The plant figured was raised in the Royal Botanic Garden, Edinburgh, from seed received from New Zealand in 1907. It was grown in a cool frame and flowered in mid-March this year, remaining in bloom for nearly six weeks. The species should be a useful hardy one in gardens where New Zealand plants thrive.

* FIXATION OF NITROGEN BY BACTERIA.

(Concluded from page 377.)

MOORE, of the United States Department of Agriculture, began about the same time to send out cultures in a dry form, prepared by dipping cotton wool into an active liquid culture of the nodule organism and slowly drying it. When required for use, a fresh preparation was made by putting the wool into a solution of sugar and potassium phosphate, in which the bacteria would begin to grow. Into this active liquid the seeds could be dipped before sowing. Moore's preparations turned out unsatisfactory because the bacteria did not remain alive for long after drying. However, since that time, various improvements have been made in the methods of growing the nodule bacteria in artificial media, and cultures which retain their activity for a considerable time are now obtainable from all the bacteriological laboratories concerned with agricultural work. Whether solid or liquid, they require to be diffused in a considerable bulk of water or separated milk, which can then be distributed over the land. A better method is to tie the seed in a bag of butter muslin, dip it in the fluid, and then allow the seed to dry somewhat before sowing. The seed should not, however, be allowed to dry for long, or the bacteria are apt to perish. The question now arises whether any practical benefit is to be obtained from such an inoculation of the seed of leguminous crops, and two cases must at the outset be considered. Some soils exist, especially in new countries coming under cultivation for the first time, from which the nodule organism is absent; in such cases inoculation may be of the greatest possible value and may make the difference between obtaining a crop or none at all. Even in these cases, however, the soil is often without nodule bacteria because in some way its condition is unfit for their survival, so that it is of no use to introduce the organism unless at the same time the soil is made a suitable medium for their growth. Soils entirely without nodule organisms are rarely met with in the British Isles, but not infrequently soils are found on which such special crops as Lucerne, which requires a race of bacteria considerably differentiated from that which is found in Clover nodules, fail to nodulate and grow properly. In such cases a preliminary inoculation of the Lucerne seed may prove very effective in establishing the crop, which otherwise fails, although Clover will grow freely on the same land. Examples have been observed of the value of inoculating Lucerne seed when that crop is being sown in a district in which it has not hitherto been grown.

* Lecture delivered on March 14, 1909, by Mr. A. D. Hall, Director of the Rothamsted Experimental Station.

But in most of our soils, where Clover, Beans, and Peas have been cultivated in the regular way, the nodule organism is present, and the leguminous crop nodulates and begins to fix nitrogen without any artificial inoculation. In these cases the gain from inoculation is not likely to be large, 10 to 20 per cent. at the outside—a quantity only perceptible by careful experiment—and its existence must depend either upon some advantage to be derived from early inoculation or upon the establishment of an improved race of bacteria, more active in fixing nitrogen than those normally in the soil. Neither of these propositions has been established, and, though the work is still being actively pursued, a practical return for inoculation on ordinary field or garden soils is not yet to be expected. The nodule bacteria, either pure or mixed with other organisms, have not been induced to enter into partnership with the ordinary

but, having been isolated at Rothamsted from virgin soils obtained from all parts of the world. In order to fix nitrogen it must be supplied with some form of carbohydrate, by the oxidation of which it derives the energy necessary to bring the nitrogen into combination. Carbonate of lime as a base in the soil is also necessary for its growth.

The history of a certain piece of land illustrates the dependence of nitrogen-fixation by *Azotobacter* on supplies of carbohydrates in the soil at Rothamsted. The land in question has been allowed to run wild for the last 25 years, and has been gaining nitrogen during that period at the rate of nearly 50 lbs. per acre per annum, whereas the adjacent arable land has lost rather than gained nitrogen. On the "wild" land the vegetation every year is allowed to die back, thus the soil is continually supplied with compounds of carbon by the oxi-

FIG. 172.—OURISIA MACROPHYLLA FLOWERING IN THE ROYAL BOTANIC GARDEN, EDINBURGH.

non-leguminous plants, which is not to be wondered at, considering the unlimited opportunities the latter have had in ordinary soil of trying the experiment for themselves. An extensive experiment tried upon Tomatos seemed to give an increased yield after inoculation, but this was shown to be due to the nutrient salts introduced by the culture medium, for a similar increase was produced when the same culture medium was given to the plants after it had been first sterilised by boiling.

Turning now to other soil bacteria which fix nitrogen without the intervention of leguminous plants, mention must be made of the organism discovered by Beijerinck and called by him *Azotobacter*. This organism is widely distri-

butation of which *Azotobacter* is enabled to fix nitrogen; on the arable land, however, where the crop is almost wholly removed, there is no return of carbon compounds to the soil.

Certain pot experiments have shown that the application to soil of sugar, a carbon compound containing no nitrogen, is followed by a gain of nitrogen, of great benefit to succeeding crops, but attempts to obtain similar results in the field at Rothamsted have so far yielded negative results. In the Mauritius, however, the treatment of the soil with Molasses has been found beneficial to the following crops, and *Azotobacter* has been also shown to be abundant in the soil.

The piece of "wild" land at Rothamsted supplies the clue to the accumulations of nitrogen

in such virgin soils as the black lands of the North-west of America, the Russian Steppes, the Argentine Pampas, &c., which are naturally occupied by a luxuriant, grassy vegetation. However long such land has been growing grass, the plants themselves could not increase the stock of nitrogen; they could only take up what was originally in the soil and restore it again. But when the carbonaceous matter they have assimilated from the atmosphere falls back to the soil, material is provided by means of which Azotobacter, present in all these soils, can proceed to fix nitrogen. The low ratio of carbon to nitrogen in the organic matter of these virgin soils is

NOTES ON IRISES.

CHANGE OF COLOUR FROM YEAR TO YEAR.

For some time past I have been inclined to suspect that Iris flowers vary from year to year on the same plants, even when the latter remain undisturbed in the same spot. Last year I made careful notes of some dwarf yellow seedlings, with a view to eliminating muddy colours and keeping only the purest. This year the notes do not correspond in the least, and those plants which seemed the best last year have this year

flowers. Last autumn the plants were left undisturbed, and this year the two batches produced blue and yellow beards respectively, as I arranged them in the autumn of 1907!

Can anyone suggest an explanation?

IRIS STRAUSSII.

I SHOULD like to draw attention to a good example of this plant, which I received from Mr. W. Müller, of Nocera Inferiore, Italy, with a note to the effect that it was collected in Persia, on the borders of Beluchistan. The first flower opened on April 22, and agreed with the description given in Mr. Lynch's *Book of the Iris*, except that the head consisted of three flowers within the same outer spathe valves.

Curiously enough, within a few days, a seedling bloomed for the first time and was identical with this Persian I. *Straussii*. It was a plant that I raised from seed of a yellow Iris offered in the trade about four years ago as *I. suaveolens*. Among a dozen plants, four came clear yellow and three others had the curious dull purple of *I. Straussii*. Of these latter, two had beards, in which the yellow-white hairs of the beard were not tipped with blue, as in *I. Straussii*.

All these plants agree in having standards that are noticeably larger than the falls and which project beyond the falls in the unopened bud. The texture of the segments is extremely delicate in all cases, quite unlike that of the European *pumila* or *chamæiris*, and it would seem that we have in *I. Straussii* a dwarf Persian Iris of varying colour which corresponds to the South European *chamæiris* and *olbiensis* with their various colour forms. This Persian Iris is also remarkable in that the base of the haft of the standards often, but not always even on the same plant, bears a few hairs of the same colour as the beard, a phenomenon which is also frequent among the *Oncocyclus* Irises, and occurs, moreover, in *I. florentina*.

COLD STORAGE FOR ONCOCYCLUS SPECIES.

OWING to the folly of a gardener, who during last August copiously watered my cold-stored *Oncocyclus* plants because he thought "they looked rather dry," I was not able to lift and store the rhizomes for a second winter. However, I stored another batch of newly-imported rhizomes until the middle of February. Then for a week or two they lay in a frame in boxes of cocoanut fibre and sand—an excellent medium for encouraging root growth in dry or shrivelled plants. They soon began to send out roots, and I planted them early in March in a sheltered spot in sandy soil well enriched with old cow manure and leaf-mould. Throughout April and May they were kept well watered, and I have had five flowers of *I. lupina* and *I. Elisabethæ*. Four flowers of *I. Haynei* are now open, and *I. Lortetii* and *I. Bismarckiana* are in bud. The plants, too, are making vigorous growth, and will, I hope, provide good rhizomes for storing again in August. W. R. Dykes, Charterhouse, Godalming

PLEUROTHALLIS BIRCHENALLII.

THE illustration in fig. 173 represents this new species, which was imported by Mr. Birchenall, of Alderley Edge, Cheshire, and shown by Messrs. Charlesworth & Co. at a meeting of the Royal Horticultural Society on April 20 last, when it was accorded a Botanical Certificate. The species seems to be closely allied to *Pleurothallis scapha*, figured in the *Botanical Magazine*, tab. 7451, but *P. Birchenallii* is darker in colour. The flowers are whitish, with claret-purple coloured lines. It is an elegant plant, like many of the larger species of *Pleurothallis*.

FIG. 173.—PLEUROTHALLIS BIRCHENALLII.

in itself evidence that very active oxidation of the vegetable debris had been going on: in this respect the organic matter of the virgin soils resembles that which had accumulated on the "wild" plot at Rothamsted, but differs from that which is found in soils devoid of Azotobacter. The gain in fertility of land laid down to grass, where a mass of stubble and roots accumulate, is also probably in part the work of this nitrogen-collecting micro-organism.

only produced flowers in which purple streaks occur. *I. Talischii*, too, was last year distinctly streaked with purple; but this year no purple appeared in the falls.

More striking still is the variation of the colour of the beards of Irises *vaga* and *Leichtlinii*. In 1907, I carefully labelled and separated all blue beards (*vaga*) from yellow beards (*Leichtlinii*). In 1908, in the two batches, there was not a single yellow beard among 50 or 60

ASHBOURNE, CO. CORK.

(See figs. 174 and 175, and Supplementary Illustration.)

ASHBOURNE, the residence of Mr. Richard H. Beamish, is at Glounthaune, nearly opposite the little railway station of Queenstown Junction, Co. Cork.

It is only some seven years or so since Mr. Beamish formed his garden at Ashbourne, with the help of Mr. Hume, his gardener. The residence is not a large one, but it is very beautifully situated, and its walls are clothed with Macartney Roses and other climbers.

Mr. Beamish and his gardener conducted me through the gardens on the occasion of a summer visit. Amongst the first plants I saw of interest was *Eucoma ulmoides*, the new hardy Rubber plant. *Broussonetia papyrifera*

In a warm part of the grounds is a little pond planted with Blue Water Lilies. It presents a sight probably unique in the United Kingdom, as the plants flower entirely in the open, without any protection from the time they are put out in May. There were many fine flowers expanded on the day of my visit, principally of the Berlin variety of *Nymphaea stellata*. The tubers are lifted in autumn, and kept under glass; the young growths or tubers only are replanted, not the old. From the time of their planting-out no protection is afforded these *Nymphaeas*. In addition to the Berlin variety, Mr. Hudson's beautiful form is also found at Ashbourne.

In another pond are a number of the hybrid and other *Nymphaeas*, such as *N. gloriosa*, *N. Froebelii*, *N. Ellisiana*, *N. Marliacea albida*, and *N. M. rosea*.

Caltha polypetal, by the side of the pond, was

moisture from a small rivulet flowing on one side. The plants were doing splendidly, and were producing very large blooms. Thence we passed to a water garden by the side of a little stream (see Supplementary Illustration). Here were many good plants well grown, such as the graceful *Stenanthemum robustum*, a North American member of the Liliaceæ, which was now coming into favour, and of which a good group a little above the water level was charming. The flowers are creamy white. *Achusa italica* succeeds splendidly in the boggy ground. It is shown in full flower in the illustration. The delightful little *Linnaea borealis* flourishes in a way seldom seen, as do *Campanula phytidocalyx*, a large group of the pretty apricot-coloured *Dimorphothea aurea*, and masses of *Primula capitata* and other species of *Primula*. The success of *P. deorum* in moisture here would indicate that it is a moisture lover, and that this treatment will probably be more successful with this scarce Primrose than any other. *Rhododendron kamschaticum* also was greatly enjoying the moisture. Here, again, one of the Castillejas, kept dry at the roots in winter, but apparently revelling in the summer moisture, was bright with its scarlet flowers. Equally flourishing was *Corydalis cheilanthifolia*; the distinct *Saxifraga tellimoides*, with several *Spiræas* and *Astilbes*, and *Astilbe Davidii* looking finer in the surroundings here than anywhere I have seen it, for the colour of the flowers does not always harmonise with other subjects. *Stokesia cyanea*, the fine *Podophyllum Emodii major*, *Roscoea purpurea*, *Geranium Wallichianum* Buxton's variety, and *Geranium Lowii* were also very good indeed; whilst a group of *Primula obconica* had remained in the open unprotected for two years. Some of the older Primroses of worth are also grown. Amongst other plants noted were many *Thalictrums*; a collection of the best species of *Meconopsis*, including *M. integrifolia* and *M. grandis*; *Shortia galaciflora* and *S. uniflora*, with *Galax aphylla*, and doing splendidly in a pool; the fine *Nymphaea tuberosa Richardsonii*; nearly all the *Eremuri*, although their flowering was over; and many other good plants suitable for the water or its banks. Two good annual *Tropæolums* looked well among the shrubs by the side. These are *Isola Bella*, a single, and the fine, double variety called Darmstadt.

Passing from here, among shrubs and trees I observed *Indigofera Gerardiana*, and such *Andromedas* as *A. leucantha*, *A. Catesbæi*, and other good species and forms. The deciduous *Ilex verticillatus* is an excellent and beautiful Holly, and *Jacaranda mimosæfolia*, *Olea fragrans*, *Benthamia fragifera*, and several *Pittosporums*, the lovely *Leptospermum bullatum*, with a number of other good things, were among those which attracted my notice. With *Juglans mandshuricus*, the experience of Mr. Beamish is the same as my own—that it is tender, and apt to be cut back by frosts in spring, but that it breaks away later. One of the most charming of the *Philadelphuses* here is one of *M. Lemoine's* raising, and is called *hybridus erectus*.

Mr. Beamish is fond of *Verbascum*s, the best being *V. pannosum longifolium*. Near by is a little "Lavender garden," with its quiet beauty and fragrant growths.

In a long stretch by the house lies the flower garden proper, where beds and borders of *Roses* and hardy flowers of the best species and varieties looked quite brilliant, although the early flowers were over and the later had not come into bloom. Another feature here is the pathway lined with *Yews* and spanned with arches of *Roses* at intervals.

Although many other features have remained unmentioned, the remainder of my space must be devoted to a brief notice of the rock-garden, which was worth a long journey to see. It is a tasteful combination of natural and artificial rock-work, and provision is made for plants that are not always accommodated properly on natural rocks. The rock-garden is most extensive,

FIG. 174.—VIEW OF PORTION OF THE ROCKERY IN ASHBOURNE GARDENS, CO. CORK.

was also seen, and the distinct *Beschornia de-kosteriana* was doing admirably in a group on the grass. Here, also, were observed several *Cordylines*, including *C. indivisa*, *C. Banksii*, and *C. australis*, with several hardy *Palms*, Ashbourne being well protected from the north winds. *Rhaphithamnus cyanocarpus*, from Chili, with its blue berries; *Cercocarpus breviflorus*, *Ptelea fastigiata*, *Mallotus japonicus*, the distinct *Feijoa Sellowiana*, *Stuartia pseudo-camellia*, the beautiful *Cryptomeria selaginoides*, *Hovenia dulcis*, and, although rather tender, the beautiful *Myoporum serratum* were also noticed. *Cocos australis* withstood the severe winter of 1908, and appeared in a perfect condition of health. A number of *Kniphofias* were very fine.

Some of these were seedlings raised at Ashbourne, and allied to *K. Northia*, of which species there is a small stock in these gardens.

also very fine; whilst *Gunneras*, as elsewhere in Ireland, grow magnificently.

Miscanthus japonicus, a plant allied to *Eulalia*, is also represented by the waterside. *Tricuspidarias* are represented by good specimens of *T. lanceolata* and *T. dependens*. The true *T. dependens* is inferior to the species which was formerly recognised by that name, but which is now known as *T. lanceolatus*. *Decaisnea Fargesii* was cut down by the frost, but it recovered and was bearing fruit. Another plant which is worthy of special mention is the beautiful *Grevillea rosmarinifolia*. I was also pleased to see *Embothrium coccineum*, which, in some Irish gardens, succumbed to last winter's trials. The plant was thriving.

A large break of *Iris Kämpferi*, in the finest varieties, attracted my notice. The land in which they are planted is supplied in summer with

and is full of many features worth noting. Thus, on a steep rock face, there is a splendid plant of *Mandevilla suaveolens*, clambering up and giving plenty of its fragrant, white flowers. Some noble plants of the true *Kniphofia Northiæ* were magnificent. As is proper with such an extensive rock-garden, the plants are generally in masses, which is the best way to produce effect when the rock-garden is of a considerable size. It is impossible to specify in detail the plants, but I may mention masses of the Italian form of *Campanula pulla*; the pinkish-white *Eriogonum racemosum*; a mass of *Umbilicus chrysanthus*; *Lotus peliorynchus*, trailing over the rocks; *Campanula velutina*, a biennial, but very pleasing; *Aquilegia Sturtii*; *Anemone Fanninii*, the showy *Haplocarpha scaposa*; a group of the fine *Rosa sericea pteracantha*; *Campanula G. F. Wilson*; *Campanula isophylla*, very pleasing against the rocks; *Erica tenuifolia*; *Vitis armata*; a number of *Sempervivums*, some not seen as a rule elsewhere; bold groups of the silvery or encrusted *Saxifrages*, a good selection of *Androsaces*, and several forms of *Zauschneria*. There were also observed *Iris stylosa*; *Hypericum reptans*, a splendid specimen; *Ramondias* and *Haberleas*, including the rare *Haberlea virginialis*, doing well, with greater sunshine than they receive in my garden; *Cistuses*, *Helianthemums*, and, in brief, a wonderful collection of old, new, or rare Alpine flowers, as well as some which, in smaller gardens, would

MR. BURBANK AND THE WONDERBERRY.

I ENCLOSE herewith an extract from the *Rural New Yorker*, issue of May 29, regarding Mr. Burbank and the Wonderberry. There is much discussion of this plant here, and we shall know more about it at the end of the season.

Regarding the well-known *Solanum nigrum*, which, I believe, is always regarded as dangerous in Northern Europe, it is used in the north-western States, but, I believe, only in a cooked form, as a sauce or in pies. It is called Stubbleberry, as it grows quite freely in Wheat stubble. It is only used in new districts where there is no other fruit, or where there is difficulty in growing other fruit, just as green Tomatos are used by American housewives to make pies where there is a famine in "pie timber." Prof. Hanson, of the Dakota Experiment Station, expressed his surprise at finding the Black Nightshade thus used in Dakota, but, in addition to the effect of cooking, it is quite possible that climate modifies the poisonous property. It is *Solanum nigrum* that was disseminated by some American seedsmen of recent years under the name of Garden Huckleberry. *Emily Toplin Royle, Maywood, New Jersey.*

Extract from the *Rural New Yorker*.
THE WONDERBERRY AND THE WIZARD
BURBANK.

The "Wonderberry" appeared this season as one of the "novelties" which are sprung upon the public without official test or preparation. We had no chance

most pestiferous weeds, which is also known to be a deadly poison, because we are advised to do this by some seedsmen in America?"

A man in New York bought seed of the Wonderberry, naturally expecting that "Burbank's creation" would prove a prize indeed. A sea captain from England had read the article in the *Gardeners' Chronicle*, and he told our friend what is printed above. This man wrote Luther Burbank about it, and received the following reply:

It is very kind of you to inquire at headquarters about the "Wonderberry." The name "Sunberry" is the one which I rather preferred when I sold my rights in it to John Lewis Childs. As you probably know, newspaper reporters are not always as well posted as they should be.

I am ready to make an offer of ten thousand dollars (\$10,000) cash, cold coin, if any living person on earth proves that the "Wonderberry" is the black Nightshade or any other berry ever before known on this planet until I produced it.

I have seen some criticisms, especially in the *Rural New Yorker*, of New York City, where they simply show their ignorance of the whole matter.

Now, I have made a good offer and it would please me very much if you would publish it in the *Rural New Yorker* and in the English publication you mentioned, the *Gardeners' Chronicle*, as it is not in good taste for me to meet these statements personally, and, furthermore, they will find out how mistaken they are. (Signed) LUTHER BURBANK.

If Mr. Burbank would make as sure of his novelties as he makes safe in his offers little fault could be found with him or them. We name Burbank himself as the "living person on earth," who is well qualified to finger that \$10,000. He proves by his own statements that the "Wonderberry" resulted from crossing *S. villosum* and *S. guineense*. As the *Gardeners' Chronicle* states above, the result of this cross must be Nightshade! Mr. Burbank should at once hand himself that \$10,000, for he has earned it. If, however, he does not consider it good taste to have money or honours thrust upon himself, the *R. N. Y.* will put in a modest plea for the amount. We have a plant of the "Wonderberry" in bloom and with the fruit formed. Botanists declare that it has all the characteristics of *S. nigrum*. Readers in Louisiana have compared the "Wonderberry" with the wild plant and declare that they are the same! As proof we shall print the pictures of these plants. If Mr. Burbank desires further proof will he kindly state what will satisfy him? When we demonstrate the true character of this "Wonderberry" Mr. Burbank will no doubt realise how the American public has been held up for petty plunder on the reputation which goes with his name. Let us now see what this "good offer" is good for!—*Rural New Yorker.*

NOTICES OF BOOKS.

* A FIRST BOOK OF BOTANY.

Now that natural history has obtained a definite place in the school course of study, it has become a matter of great importance to provide suitable text books to aid the teacher by indicating which of the manifold aspects of Nature are most suited for his purpose. All teachers of natural history recognise that plants offer an infinite variety of material for such study: but they also know by experience that it is not altogether easy to select from this variety subjects which serve to build up in the scholar's mind a good general knowledge of the life and work of plants. The little book under review makes this attempt, and, on the whole, makes it with success. The descriptions of the common objects treated of are well done, and the illustrations are none the less useful from being somewhat diagrammatic. We would suggest, however, that the photographs, for example, that of the female catkins of the Willow (p. 88), might well be replaced by careful drawings, or, if that is not possible, in the case of the representation of British trees, omitted altogether. The suggestions for practical work which are made at the end of each chapter are workmanlike, and should prove of great assistance to the teacher as well as to the scholar. In extending a cordial welcome to this little book, we would venture on the criticism that, in the attempt to present a bird's-eye view of the subject, too much ground is covered, and subjects dealt with which, in our opinion, would be best omitted altogether from a *First Book of Botany*. The educational value of frequent observations on a few plants in the various stages of their development is greater than that of more cursory examinations of larger numbers of plants. Nevertheless, we recommend with confidence this little book to the teacher for use in the school.

* By Elizabeth Healey. Pp. 142, price 1s. 6d. (Macmillan & Co. 1909.)

FIG. 175.—AUBRIETIA "DR. MULES" IN ASHBOURNE GARDENS, CO. CORK.

be relegated to the border, but which are quite suitable for such a large garden as that at Ashbourne. Mr. W. E. Gumbleton is enthusiastic in praise of this rock-garden of Mr. Beamish, and it was on his recommendation that I had the pleasure of seeing it. *S. Arnott.*

FOREIGN CORRESPONDENCE.

SOLANUM NIGRUM.

SOLANUM NIGRUM has a wide distribution in Eastern Equatorial Africa, and is used by the natives as a potherb. The plant is very common in cultivated plots, and, although I have never observed artificial plantations of it, yet, wherever it grows spontaneously amongst other crops, it is never uprooted, but tended with the other occupants of the garden.

The young shoots and leaves are gathered and used as a Spinach. The black fruits are never eaten, either raw or cooked, and even small fruits are picked off the Spinach before cooking. I cannot find that the plant has a reputation as a bearer of poisonous fruits here, but its fruits are said by the natives to be "not nice." *E. Brown, Mabira Forest, Uganda.*

to test it, but botanists of high reputation were sure it was in no wise different from the well-known *Solanum nigrum*. We think there are too many half-baked novelties put before the public, and that a thorough roasting will either prove their value or their worthlessness. A correspondent at of the *Gardeners' Chronicle*, of London, England, examined the seeds and made this report:

"The seeds looked ordinary and the given origin excited curiosity, so I proceeded to look up the history of the two reputed parents. They proved to be nothing other than forms of *S. nigrum*, a weed in every country; therefore, the Wonderberry is *S. nigrum* also. The seeds, on careful comparison, proved it beyond doubt. Then I remembered that this same story had been found in another form about two years ago, but the name given then was Huckleberry, instead of Wonderberry. We grew some plants of it and they turned out to be simply Nightshade—*S. nigrum*. What does it all mean? Every intelligent child shuns the fruits of this weed of waste land and manure heaps, the poisonous properties of which are undoubted. Children who have eaten the fruit have died soon after from its effects, which are very distressing—vomiting, colic, convulsions, &c. Mr. N. E. Brown informs me, however, that in some countries the fruits of *Solanum nigrum* are not only innocuous, but they are actually eaten, and on consulting various books I found several records to that effect. A Russian chemist who had investigated the question as to the berries being poisonous in some countries and harmless in others concluded that the difference was not due to any difference in the plants, but to variations in the climatic conditions under which the fruits were grown, the narcotic principle being either undeveloped, or finally dispelled under the influence of certain conditions, of which heat and light were probably the most important. It is, therefore, quite possible that the Nightshade is poisonous in Great Britain and harmless in America. After all, are we so hard up for fruit as to be forced to turn to one of our

MARKET GARDENING.

THREE CHOICE ANNUALS.

Cut flowers of the tall-growing section of the Sweet Scabious are much appreciated by florists for decorative purposes. The three best varieties are as follow:—Pompadour with double flowers, claret-purple in colour, edged with white, and borne on long stems which render the flowers most suitable for arranging in glasses, &c.; Azure Fairy, with large, well-formed, pale blue flowers, a very valuable acquisition to the Sweet Scabious family; and Fire King, the flowers of which are of a rich crimson colour and of fine shape. This variety is of recent introduction. The plants are best raised under glass in order to secure early supplies of cut flowers. They should be transplanted out-of-doors in May in rows 18 inches apart and at the same distance from plant to plant in the rows. Seed of the dwarf and late-growing varieties, sown in flower borders out-of-doors will yield supplies of cut flowers considerably later in the season.

Statice is another flowering annual that has come to be in great request lately. The three following species are the best for yielding supplies of cut flowers, namely, *S. australis* (sinensis), which produces arching spikes of canary-yellow-coloured flowers. The inflorescences are from 15 to 24 inches long, according to the depth and fertility of the soil. *S. sinuata*, which produces fairly long, branching spikes of blue flowers; and *S. Bonduellii*, a free-growing, yellow-flowering variety. These plants continue to bloom into late autumn. They are what is termed "ever-lasting," and on this account, as much as by reason of their habit of growth and colour, are greatly in demand, especially during the early autumn months.

The Sweet Sultan (*Centaurea*) is another grand cut-flower annual. The best varieties for supplying cut blooms include those undermentioned:—The magnificent-flowered *C. imperialis* alba, with pure white blooms, very fine in size and shape; *C. odorata* Marguerita, pure white; *C. Cbameleon*, yellow and rose-coloured; and *C. purpurea*. The Sweet Sultan may also be had in nine separate colours: delicate lilac, bright rose, dark lilac, lilac, purple, rose, dark purple, and white-shaded rose; but the four first-mentioned varieties are the best to cultivate for the purposes indicated above. The globular-shaped flowers are borne on long, stoutish stems, which, in addition to the delicate perfume of the flowers, render them admirably suited for all kinds of cut-bloom arrangements. To obtain an early and prolonged supply of these popular flowers, sow the seed in boxes under glass, afterwards transferring them into 3-inch pots, placing three in each pot, and grow them on in the usual way near the glass in a pit or frame. Transplant out-of-doors in May, placing them in rows, the same distance apart as recommended for Sweet Scabious, allowing the same distance each way for the Statice plants, and afterwards applying water to all the plants to settle the soil about the roots. H. W. W.

The Week's Work.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Herbaceous Calceolarias.—If it is intended to make only one sowing of seed, then July is perhaps the best time for the operation, but if several batches of plants are required, the seed may well be sown at intervals from the present time until the latter part of August. The seeds should be sown thinly and evenly in well-drained pans nearly filled with light, sandy soil. The surface of the soil should be made firm and level. It is not advisable to cover the seeds with soil, but they may be pressed into the surface with a piece of dry, flat wood. As cool conditions at all times are essential to the successful cultivation of these showy plants, the seed pans should be

placed in a shady part of the cool greenhouse or in an unheated frame. The soil should be moist so that water will not be required until the seeds have germinated. A piece of glass laid over the seed pans will prevent excessive evaporation; the glass must, of course, be removed for a time daily, be tilted as soon as the seeds germinate, and finally be removed altogether.

Humea elegans.—Well-grown plants of *Humea elegans* have considerable decorative value, and the scent of the leaves is pleasing to many persons. Seeds may be sown at any time during the next three or four weeks, in pans of moderately light soil. Too high a temperature sometimes prevents germination, therefore the pans containing the seeds must only be placed in a warm house. As soon as possible after the seedlings appear above the soil, they should be potted singly into small pots, exercising care not to injure the roots.

Primula.—These plants require to be kept steadily growing, and as soon as the seedling plants have filled their pots with roots they should be given a shift into others of larger size. Throughout the summer these and the double-flowered varieties should be given cool frame treatment, allowing ample room between each plant. During warm nights, after the plants have become established, the lights may be removed, but judgment must be exercised, as *Primulas*, and especially the double-flowered varieties, are checked by exposure to cold rains and sudden changes of temperature.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Carnations.—A final top-dressing of manure and afterwards a good watering should be given to these plants. Keep the flowers neatly tied up to thin stakes. It is better to do some disbudding, as the buds near to the main flower are of no value and serve merely to retard the development of that flower. As a rule, one flower to each stem is sufficient, but for the purpose of securing a late supply it may be desirable to leave an additional flower-bud near the base of the spike.

Irises.—In some districts Irises may require watering. Manure water obtained from cow manure is very beneficial to them. I. *Kempferi* usually does best in a moist position, but I have known it to succeed on what would be termed a dry border.

Flowering shrubs.—*Deutzia discolor* grandiflora, *D. kalmiaeflora*, *D. Wilsonii*, and *D. Vilmoriniana* have flowered abundantly. Let such plants be pruned directly they have finished flowering. Otherwise the branches, becoming long and weak, will droop to the ground. The beautiful *Rubus deliciosus* requires pruning and top-dressing after flowering. There are many other shrubs that will be all the better for being pruned at this season. Lilacs, for instance, if it is necessary that they should be kept dwarf and bushy, should be pruned at the present time.

Roses.—Trailing Roses should be neatly, but not tightly, trained, and the young, vigorous shoots which start from the base should be carefully secured. Gather the old seed vessels from early-flowering varieties. If Roses are syringed thoroughly each week, it helps to keep them clean and in a healthy condition. Remove all suckers from Briars as soon as they appear.

Herbaceous plants.—Remove the weeds and decaying foliage from herbaceous borders. Much work will be required now in the tying and staking of various plants. Let both operations be carried out before the growths become so tall that they fall about and acquire a bad shape. Vacant spaces in the borders may be filled with annuals and such plants as Dahlias. Plants which have recently been put into the ground must be watered if the weather is dry at the time. A plant may die very quickly after removal unless attention is given it. Reduce any excessively large stumps in the borders, as these may interfere with the space required for other plants.

Alpine garden.—Keep the Alpine garden perfectly free from weeds. Sow seed of early *Primulas* as soon as ripe seeds can be obtained. Prick out *Ramondias* into pans. *Primula sikkimensis* is doing well this season, although the

plants were very small when they were put out last autumn. It is a species to be recommended. Keep the soil about *Sarracenias* moist and free from weeds. The plants are now showing their flowers. *Trilliums* that have flowered may require root waterings. The foliage should be allowed to die away very gradually. *Trilliums* succeed well in a partially-shaded position amongst Himalayan *Rhododendrons*.

Romneya Coulteri.—If this plant is cultivated close to walls or in any dry position, it will need a good soaking with water occasionally.

General work.—Keep the beds and borders free from weeds and all dead leaves. Thin the grass verges and mow the grass frequently. Let the gravel paths be rolled at frequent intervals. Prick out *Polyanthus* and *Primroses* on a cool border. Water Sweet Peas in warm positions. Sow seeds of *Myosotis*, also *Silene*, for spring flowering. If the Wallflowers or any other spring-flowering plants have failed, let another sowing of seed be made at once.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Coleworts.—Two sowings of this useful vegetable should be made during the present month. Scatter the seeds thinly broadcast on beds of suitable size. These seeds must be carefully protected against birds. Coleworts should be cultivated in every garden whether large or small, as they are amongst the most hardy of green vegetables, and their quality is good. The Improved Rosette Colewort and London Hardy Green are the two best varieties.

Turnips.—Make frequent sowings of Turnip seed, selecting as far as possible the more shady parts of the garden. Red Globe is one of the finest summer Turnips. It possesses a robust constitution capable of withstanding drought, and its flavour is excellent. Plants from previous sowings should be thinned to the required distance. Let soot and wood ashes be dusted over them occasionally. Stir the surface soil frequently with a hoe. Where the Turnip fly usually gives much trouble let the young plants be dusted thoroughly every morning with road sweepings. These are very distasteful to the pest.

Celery.—All side growths and split leaves should be removed from the earlier plants, the surface soil should be stirred frequently and an abundance of both liquid manure and clear water applied to the roots. Let the tops be sprayed with clear water every afternoon. Celery is a moisture-loving plant and can scarcely be given too much water. Keep a sharp look-out for attacks of the Celery fly, and destroy the maggots whilst quite small by pressing them between the thumb and the finger. Apply a good dusting of fresh soot once a week, early in the morning or late in the evening. The latest plants should be put into the trenches as quickly as possible. In gardens where space is limited it is a good plan to take out trenches between the rows of Peas if the Peas are sufficiently wide apart. The presence of the Peas will be a help rather than a hindrance to the Celery, as they will afford the plants a little shade from sunshine during the time they are getting a hold of the ground. When the Peas are removed, the ground between the Celery should be broken up, and will provide excellent sites for Endive, Lettuces or Spinach.

Cucumbers.—Plants growing in pits or frames should now be yielding good crops of fruits. Let the growths be frequently thinned out. Apply surface dressings to the roots. Thin out the young fruits in order to avoid overcropping and keep the growths perfectly clean. The plants should be syringed early in the afternoon and the lights closed. At every other watering liquid manure should be employed in the place of clear water. If any sign of thrip or aphid be present fumigate the plants with a nicotine vaporising compound. Make another sowing in small pots.

Tomatos.—Strong plants which were put out in the open will now have started vigorously into growth. Keep all side growths removed, and should the plants be extra strong the lower leaves may be shortened. No manure of any kind must be given the plants until the crop of fruits is set.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Bush Apple trees.—These are now growing quickly, and require attention both in the matter of thinning the fruit and shortening the side growths. The latter operation is necessary in order to expose the fruit to the influence of the sun. The trees, too, can be kept cleaner than if all the shoots were allowed to grow to their full length. Treat the early varieties first. Among the best dessert kinds are Irish Peach, Beauty of Bath, Mr. Gladstone, and Lady Sudeley. The newer Langley Pippin, the result of a cross between Mr. Gladstone and Cox's Orange Pippin, is a valuable Apple. Here it grows moderately strong and crops freely. The smaller varieties, such as Yellow Ingestrie, should not be thinned severely, because the fruits never attain to a large size. Yellow Ingestrie is an excellent little Apple, but it does not appear to be planted now so frequently as formerly. Kitchen varieties require to be thinned much more severely. Many of them crop far too freely. Such, for instance, as Lord Grosvenor and various Codlins. If the trees are allowed to go unthinned there will probably be a quantity of useless Apples, owing to their small size, and the trees will be crippled for some time to come. By judicious thinning the cultivator may obtain fruits of greatly-increased value, and by regulating his crop according to the strength and character of the tree, he will do what is possible to ensure continuous cropping.

Cherries.—The earlier varieties on walls are now ripening. Let the trees be examined, and if necessary apply a final washing by means of the garden engine before placing the nets in position. Shoots required to fill up blanks or for extending the tree should be neatly tied in, and all others stopped as advised in previous Calendars. When water is required, give a thorough soaking to the roots, as frequent dribbles are useless. The mulching material should be drawn away from the trees before applying water, but should be replaced when the operation is finished. As the fruits become fit for dessert, select the ripest and gather them very carefully in order not to injure the buds.

General work.—The netting of the main crops of Strawberries must not be longer delayed. Birds are apt to attack the fruits even before they change colour, and if once the attack is commenced, they will be most persistent in their efforts to reach the fruits, even after the application of nets. In this locality there is every prospect of a very heavy Strawberry crop. Later varieties grown under the shade of a north wall to prolong the season must be given water and occasional applications of liquid manure, should dry weather occur. If these late plants should be allowed to get very dry, the fruits will ripen prematurely and be of little value.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Miltonia.—In many collections, *Miltonia vexillaria* will have passed its flowering stage, and entered upon its short period of rest. It is, therefore, essential that nothing should be done that will induce growth, for the longer period of rest which this species enjoys the stronger will be the new breaks when the season of activity recommences. For the next six or eight weeks it will only be necessary to keep the surface of the compost just moist. This will preserve the pseudo-bulbs fairly plump and the foliage healthy till new growth appears. While at rest, *M. vexillaria* enjoys a cool atmosphere and as much fresh air as *Odontoglossum crispum*. August is the best month for repotting the plants. The later-flowering varieties, such as *M. v. rubella* and *M. v. Leopoldii* should be kept in the intermediate house till they bloom, after which they may also be removed to the cool house. The hybrid *M. Bleuana* and its variety *nobilior* must always be given a position in the intermediate house. This plant begins to make growth at this season, and it is therefore a good time for repotting, should this be necessary. The *Osmunda* and *Polypodium* fibres well mixed together, with plenty of small broken crocks to keep the mixture porous, make an excellent compost for this plant. It is important that the pots should be rather more than half-full of drainage

materials, and the potting should be done with moderate firmness. *M. Phalaenopsis* may be repotted, as the young shoots will now be rooting freely. Be careful to avoid overpotting. Should small yellow thrips attack the foliage of these *Miltonias*, let the plants be dipped occasionally in some safe insecticide, and the leaves afterwards rinsed thoroughly clean in tepid rain-water. The Brazilian *Miltonias* such as *M. spectabilis* and *M. Moreliana*, are at present in full growth. They require plenty of water at the root, and should not be exposed to much strong light during summer, otherwise the leaves will become infested with red spider, and often more yellow than is desirable. Woodlice do much damage to the young roots of *Miltonias*. If the plants are examined immediately after each watering, numbers of woodlice may be destroyed on the surface of the compost. Baits of Apple or Potato should also be laid for them.

Cymbidium.—Examine the species and hybrids of this genus and carry out any necessary repotting, especially in the case of those plants requiring additional pot room. It is not always advisable, however, to repot the plants as soon as they become pot-bound, as in this condition they produce larger spikes and finer flowers. Specimens requiring larger pots should be shifted on with as little root disturbance as possible; others that have become exhausted may be broken up and potted separately. Rather small pots should be used for this purpose, as the pieces establish themselves quicker than when placed in larger receptacles. Established plants in good health should be placed in pots of sufficiently large size to contain them for several years. The pots should be clean and well-drained and the compost should consist of good fibrous, turfy loam, one half, and turfy peat, leaf-mould and Sphagnum-moss the other half, adding some small broken crocks and a little coarse silver sand. Make these materials moderately firm, but not so hard as to hinder percolation of the water. Instead of elevating the plants above the rim of the pot, keep the soil at least half-an-inch below. For several weeks after repotting very little water at the root will be necessary. Cultivate the plants in a cool, shady position in an intermediate temperature the whole year round. The plants require ventilation at all times; if grown in too warm an atmosphere the leaves will soon become infested with insect pests. Damp the stages and other surfaces around the pots several times each day.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

The layering of Strawberries.—Preparations must now be made for layering plants which will form the earliest batch for forcing next season, it being essential that strong, well-ripened crowns shall be obtained by the end of the autumn. The variety *Royal Sovereign* still holds its own as the best forcing Strawberry, at any rate this is the case where large quantities of fruit are in demand. Unless there be some favourite variety which the gardener is desired by his employer to grow, I would recommend him to force *Royal Sovereign* to the exclusion of all others. There are several methods of layering the young plants. The one that we employ here for raising 10,000 plants each year for forcing is as follows. We fill a number of 3-inch pots with rich loam and no other ingredients. The loam is made moderately firm, and rough pieces of turf are placed in the bottom of the pots, these being sufficient to provide what drainage is necessary. The pots are carried to the Strawberry beds and placed closely together between the rows. They are partly plunged in the ground in order to protect them from the full glare of the sun. Owing to the extra trouble thus taken, the plants do not require nearly so much attention in watering as they would if they were exposed to the direct influence of the sun. Moreover, the plants root more readily into the new soil when treated in this manner. Do not select any but the best runners for layering. Any which have become already firmly rooted into the ground should be rejected. The most suitable layers are those which are just beginning to produce roots. Only one crown on each runner should be layered. The young plants must be fixed securely on the surface of the soil in the pots by pegs or pieces of raffia pressed firmly into the soil. The layers should be sprayed with a rose-

can each morning and afternoon during bright weather. When they are fairly well rooted into the soil they may be detached from the mother plants and be placed in the shade for a few days, when they will be ready for shifting into 5-inch pots. By that time it will be found that the old plants have produced plenty of runners for furnishing later batches of layers.

The early vinery.—When all the Grapes have been cut from the vines the borders must be given a thorough soaking with clear water. If red spider is discovered on the foliage let it be syringed with a strong mixture of soft soap and sulphur in water. Choose a dull day for this operation, or, failing this, let it be performed late in the afternoon. During sunny weather the vines should be syringed with clear water every afternoon. The ventilators may now be left wide open at all times.

THE APIARY.

By CHLORIS.

The honey season.—At best the honey season is very short, and the beekeeper must be alert if he wishes to reap the full harvest. The beekeeper himself must settle whether the honey shall be extracted or sectional, and this, of course, according to the facilities for sale of one or both classes. Generally speaking, it is well to aim at sections if the honey is of a kind which will not easily granulate. When the sections or shallow frames have been placed on the hives, many beekeepers feel they have done all that man can do, and then feel disappointed when the bees swarm. When the honey flow is good, a close watch must be kept, and when the racks are about two-thirds full of honey, then it is time to add another rack. This is necessary, because the bees cannot proceed at once to seal over the cells, for the honey must have time to ripen, that is, for the surplus water to evaporate, before it can be sealed. A third rack may often be placed under, and before these additional racks are full the top lot will be ready for removal. By this time the honey flow will have slackened, and it will be well to give strong colonies those sections or frames which the weaker ones will not complete.

Taking off frames or sections.—Many beekeepers have spoiled well-filled sections by not being able to remove them without a great deal of unnecessary commotion and trouble. Much annoyance, both to the owner and neighbours, may be avoided if a super clearer with a "Porter bee escape" in the centre be used. This can be purchased from any maker of bee appliances for about eightpence; and if a board be cut the size of a rack of sections and the escape fixed in the centre, all will be ready for use. Round the top edge (the one containing the circular opening of the escape) it will be best to nail pieces of wood about an inch wide and quarter of an inch thick, so as to leave a clear space below the crate in which the bees may move about. The clearer should be placed at night, under the rack which is to be removed, then by the morning it will be clear of bees. If it be put on during the day the operation will require a few hours.

Removing sections from racks.—It is not uncommon to find many beautifully-filled sections spoiled by careless and inexperienced people. First remove the piece of wood at the end which has been used as a block. If the sections are then difficult to remove, because of the propolis, place three pieces of wood, just the length of the spaces between the bars and nearly the same width, and then press the rack evenly on them. This will raise the sections without any danger of injuring them. Perform all operations with perfectly clean hands, for nothing spoils the wood of sections more than finger stains.

Cleansing and storing sections.—When the sections are removed from the rack, it is well to scrape the wood of the full ones to remove the propolis and stains, and to make them look appetising. When this has been done, store them in a place free of dust and where bees or other insects cannot reach them. The imperfectly-filled sections should be replaced in the rack, and when the requisite number to fill it has been collected, it may be placed on a hive requiring more storing space. In the case of frames, the cappings should be cut off at once and the frames placed in the extractor, for the honey runs from the combs more freely when it is of the hive temperature, thus saving much waste and labour.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JUNE 22—

Roy. Hort. Soc. Coms. meet. (Masters' Memorial Lecture, on "Masters' Vegetable Teratology," by Prof. Hugo de Vries at 3 p.m.).

WEDNESDAY, JUNE 23—

Gard. Roy. Ben. Inst. Ann. Festival Dinner at Hotel Metropole, London.

THURSDAY, JUNE 24—Midsummer Quarter Day.

SATURDAY, JUNE 26—Windsor and Eton Rose Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—60.8°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, June 16 (6 P.M.): Max. 66°; Min. 51°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, June 17 (10 A.M.): Bar. 30.3; Temp. 57°; Weather—Cloudy.

PROVINCES.—Wednesday, June 16 (6 P.M.): Max. 63° Cambridge; Min. 52° Scotland North East.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—

Bulbs and Roots, at 12.30; Palms, Plants, Ferns, &c., at 1.30; Dwarf Japanese Trees and Flowering Plants, Bamboo Hats and Twig Baskets, at 3, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Unreserved Sale of the whole of the Collection of Orchids, by order of the Exors. of Col. W. E. Brymer, deceased, at 12.45; nearly new Pantechnicon Van, at 2, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

The Covering of Ripening Fruit.

Though it does not follow necessarily that a practice which has been found to be good in one country will prove equally successful in another where climate and conditions of cultivation may be very different; yet the success which, according to French horticulturists, follows from the wrapping of ripening fruit of the Apple, Pear, and Grape is worthy of the attention of growers in this country. According to an article entitled "De l'Enschage des Fruits," by M. Lochot, published in *Le Jardin*, the advantages which result from enclosing fruits in bags are numerous, and include the protection of the ripening fruit from various insect and fungus pests, as well as from damage by weather, the hastening of maturity (particularly in the case of out-door Grapes), and the increase, by preserving the delicacy of their bloom, in the commercial value of the fruits. M. Lochot recommends two types of paper bag for this purpose; the one made of a non-transparent paper and the other of semi-transparency, the former to be used in hot, dry regions, the latter in more temperate places, where, indeed, if the intensity of the light is but low, a yet more transparent paper should be employed.

In using the bags, it is recommended that aeration of the enclosed fruit should be secured by means of a number of small holes made in the paper by means of a stout needle or awl. The bags should be secured by the use of a piece of lead-wire to the branch to which the fruit is attached.

For Grapes, instead of a bag, a paper covering in the form of a cloche may be employed. In the case of Pears ripening in summer, the bottom of the bag should be torn off about a fortnight before the fruit is gathered; in that of later Pears the bag should be torn and then four or five days afterwards removed altogether. Pears ripening in late autumn should have the covers removed about a month before gathering. Apples with coloured fruits colour well when enclosed in transparent bags, but the colouring is enhanced if the bags are removed a little while before the fruit is ripe. It is, however, Grapes which, in M. Lochot's experience, repay best the expense of covering. In this country, where Grape culture is carried on almost exclusively under glass, no further covering is required, but in the out-door vineyards of France it is claimed that by this practice the maturing is advanced and the appearance of the fruits enhanced. The cloche form of cover which is recommended is made by the use of semi-transparent stiff paper rolled up funnel-wise and secured in that shape by means of two pieces of soft wire, one at the base and another at two-thirds the height of the cloche; a third wire at the apex serves to fix the bunch to its stem. These methods of enclosure are, of course, not novel. They have been tried by many gardeners in this country, especially in cases where hardy fruits of extra size and quality are required for exhibition or other special purposes, and it would be interesting if those who have made experiments in this direction would give others interested in the production of fruit of finest quality the benefit of their experience.

The Late Blight of Potatoes.

In the course of an admirable and beautifully-illustrated account of the prevalent plant-diseases in New Zealand, Mr. Cockayne, assistant in the Division of Biology and Horticulture, makes some interesting observations on the origin and mode of distribution of late blight of Potatoes (due to *Phytophthora infestans*). According to Mr. Cockayne (Annual Report. New Zealand Department of Agriculture, 1908), no precise record exists as to the date of introduction of the *Phytophthora* disease into New Zealand, though it would appear to be of comparatively recent importation. At the time of the severe epidemic in 1904, Professor Thomas stated that the disease had appeared, though in a less virulent form, 20 years earlier.

Mr. Cockayne adopts the view that the fungus *Phytophthora infestans* hibernates in the resting tuber, and when conditions are favourable spreads therefrom to the leaves, where it gives rise to spore-bearing branches which bear the well-known spores. Whether the tubers are infected through the stem or by means of spores germinating in the earth, the writer is not prepared to say, though he inclines to the view that both modes of infection

occur. Mr. Cockayne draws attention to the fact that tubers infected with *Phytophthora* may become rotten rapidly or may show no sign of rot. In the absence of readily recognisable symptoms of disease (as in the latter case), such infected tubers are doubtless used for "seed" and provide so many centres for spore-manufacture, and hence for the dissemination of the disease. If, again, climatic conditions remain unfavourable, no external sign of disease is given, though the tubers of the plant formed from the infected "seed" in turn contain the hibernating mycelium. That some such course of events takes place is rendered probable by the well-known fact of the rapidity with which the disease declares itself whenever a spell of moist, warm weather coincides with the later period of the growth of the Potato. More thorough-going investigation of the obscure phases in the life-history of this fungus pest is much to be desired.

Experiments in spraying with Bordeaux mixture might be given a rest for a time—since the efficacy of Bordeaux mixture as a check to the disease has been demonstrated a hundred times—and in place of such unnecessary repetitions some of our horticultural institutions might turn their attention to the elucidation of the modes of perpetuation of this pestilent late blight.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We would remind our readers that the 70th anniversary festival dinner in aid of the funds of this institution will be held at the Hotel Metropole on Wednesday, June 23 next, when LIONEL DE ROTHSCHILD, Esq., will preside. Contributions to be placed on the chairman's list are earnestly solicited, and may be sent to LIONEL DE ROTHSCHILD, Esq., New Court, St. Swithin's Lane, E.C., or to the Secretary, at 175, Victoria Street, Westminster, S.W. We hope this event will be attended with conspicuous success.

HORTICULTURAL CLUB.—The next house dinner of the club will take place on Tuesday, June 22, 1909, at the Hotel Windsor. Mr. ALEXANDER DEAN will speak on "The Importance of Vegetable Culture and Cooking." The date fixed for the summer excursion is Thursday, July 15, when, at the kind invitation of LEOPOLD DE ROTHSCHILD, Esq., the members will visit his beautiful garden at "Ascott," Leighton Buzzard. Particulars as to trains and other arrangements will be announced later.

MR. A. W. BENTON, a member of the gardening staff of the Royal Botanic Gardens, Kew, has been appointed gardener for Government House, in the Falkland Islands.

TIFLIS.—The Director of the Botanic Garden at this town, M. A. ROLLOV, intends to establish in the elevated zone of the Lower Caucasian Mountains two research stations as branches of the Botanic Gardens at Tiflis. One will be formed at a height of 5,000 feet above sea level, and the other at a height of 7,000 feet.

TO DESTROY MOSS ON LAWNS.—The results of experiments conducted by *Der Kgl. Gärtnerlehranstalt* at Dablen, and reported in *Der Handelsgärtner* (March 13), indicate that a 5 per cent. solution of sulphate of iron is effective in ridding lawns of moss. After the application of the green vitriol solution, the Grass should be sprinkled several times with a weak (3 per cent.) solution of nitrate of soda.

JUBILEE OF THE FRUIT AND FLORAL COMMITTEES.—The President and Council of the Royal Horticultural Society have issued invitations to the members of these Committees, and others, to be present at a jubilee commemorative dinner, to be held at the Hotel Windsor, on Wednesday, July 7, at 7 p.m.

JUBILEE EXHIBITION, HAARLEM, 1910.—The complete programme for this exhibition forms a book of 80 pages in the Dutch language. It contains lists for the four coming exhibitions, and of the prizes accompanying them. There are, besides the prizes of honour from Royalty and important authorities, 75 gold medals and

and, lastly, cut flowers. The second special exhibition consists of 300 programme numbers, and will be held from April 15 to 24. It will in its general features resemble the first, while the third special exhibition from May 4 to 12 will consist chiefly of Orchids and objects of the florist's art. The usual judging of novelties will take place in the exhibition halls during the duration of the exhibition.

CARNATIONS AT BOSTON, MASS.—The Union of the Park Street Wholesale Flower Market for traders and gardeners held this year's show in the Massachusetts Hall. All the exhibitors being wholesale cultivators, only

autumn freely after repotting. Of the novelties shown by Messrs. F. R. PIERSON & Co., New York, may be mentioned the white sport Mrs. Thomas W. Lawson, similar in colour to Prosperity: a light rose sport from the variety Winsor, and a deep rose sport from the same variety.

THE RESULTS OF EXPERIMENTS WITH VARIOUS NITROGENOUS ARTIFICIAL MANURES.

—Extensive experiments, including both pot-cultures and field-trials, carried out, during 1905-7, by Prof. SCHNEIDEWIND, Director of the Experiment Station at Halle, and reported in the *Arbeiten der Deutschen Land. Gesell. Heft. 146*, have given the following, amongst other results:—The average relative values of nitrate of soda and sulphate of ammonia were as 100:90. Nitrate of lime (Norwegian) gave average results equal to those obtained by the use of nitrate of soda. Calcium cyanamide was not found to be a satisfactory manure on sandy soils or on sandy loams, but in heavier soils it gave good results, except in the case of roots. The plants used in the series of experiments were Rye, Wheat, Barley, Potatoes and Sugar Beet.

THE FLORA OF NGAMILAND.—An interesting report on the flora of Ngamiland is published in No. 3 of the *Kew Bulletin*, 1909. The plants from this almost unknown region of S. Africa were collected during the years 1896-1898 by Major and Mrs. E. J. LUGARD and Sir F. LUGARD at the request of the authorities at Kew, little or no information being previously available as to the flora. The specimens have since been determined by Mr. N. E. BROWN, and include 92 new species out of a total of 373—a striking testimony to the unknown character of the vegetation. The list of plants, catalogued and classified by Mr. BROWN, is accompanied by a preface by Major LUGARD, who gives a brief but striking account of the physical characters and climate of the country, with a general summary on the flora and fauna. Ngamiland is the most remote province of the Bechuanaland Protectorate and is cut off from the civilised parts of S. Africa by the Kalahari Desert, a country practically waterless during eight months of the year, and, for that reason, almost uninhabited. Lake Ngami, which forms the northern limit of this rainless tract—"a fine-looking sheet of water" in Livingstone's day—is now almost dry, being in the intermediate stage between a lake and one of the salt pans common in certain parts of the desert. The physical features of the country north of the lake are peculiar. Ngamiland consists of reed-grown swamps, traversed by a network of rivers and streams, all forming part of the same river system which drains a country of greater rainfall further north. These streams ultimately lose themselves in the sand of the desert, but have no outlet to the sea. The plants were collected in the neighbourhood of the Kwebe Hills, a low range 20 miles south of the lake. This part of the Kalahari Desert has well-marked dry and rainy seasons, although the rainfall is limited and is sometimes known to fail. The dry season lasts from April to the end of November, and rain, during these months, is almost unknown. The rainy season, corresponding as it does with the warm season of the year, is responsible for the abundant vegetation which appears with extraordinary rapidity after the first rains. Almost all the plants collected flowered during the rainy season from December to March. Among the more interesting of these are two new species of *Ceropegia*, several unrecorded species of *Stapelia*, and a new species of *Crinum*, *C. rhodanthum*, with very brilliant flowers. Trees are not numerous, no valuable timber tree occurring, and plants of economic value are poorly represented.

FIG. 176.—REMOVAL OF A CEDAR AT PADDOCKHURST.

(See p. 398.)

about 2,500 prizes. Only Dutch exhibitors may compete for these, though the juries are international throughout. The permanent exhibition in the open air, to be held from March 23 to May 16, 1910, consists of 200 classes. The first special exhibition, which lasts from March 23 to 31, containing 275 programme numbers, will chiefly consist of Hyacinths, Tulips, Narcissus, Crocus, Amaryllis and other bulbs and tubers in pots. A special division is set apart for retarded tuberous plants; and other important programme items include Rhododendrons, Roses, Lilacs, other shrubs, stove and greenhouse plants,

such plants were shown as can be cultivated with profit. Entry was free to all, so that the public, rich and poor, had the opportunity to see what excellence in commercial wares meant; and the cultivator could observe the novelties in Carnations and Roses, which next season will be of great worth. Among the chief plants exhibited were Carnations, Roses, Sweet Peas, Violets, Cyclamens and some flowering bulbs. Perpetual Carnation Georgia, a white flower, was deserving of special notice. The flower is of great beauty and endurance. It bears carriage well, the calyx does not split, it is a free bloomer and grows on in

THE LATE FIRM OF HUGH LOW & Co.—In connection with the dissolution of this firm, which was announced on p. 381, we are informed by Mr. EDWARD V. LOW that the old firm has ceased to exist as from June 2, 1909, and by agreement entered into between the partners, neither of them is entitled to represent himself as the successor of the said firm. Mr. STUART H. LOW, having purchased the general nursery and ordinary Orchid stocks, together with a three years' tenancy agreement, remains at the Bush Hill Park Nurseries, Enfield, whilst Mr. EDWARD V. LOW, who has acquired part of the collection of Orchids, has removed to Vale Bridge Nursery, Haywards Heath.

CUSTOMS DUES TO THE MAURITIUS.—For horticultural purposes seeds and tubers, and also living plants and products of the same for botanical studies, are now admitted free of duty. Fresh fruit and fresh vegetables are liable to an import duty of 100 cents = 4s. per 100 kg. The importation of vines and vine cuttings is not permitted.

THE GENEVA INTERNATIONAL HORTICULTURAL EXHIBITION.—The programme and regulations of the thirty-fourth International Exhibition, organised by the Société d'Horticulture de Genève, announces that the exhibition will take place from September 8 to 14, 1909, and will be held in the Electoral Buildings and the surrounding grounds. The exhibition will consist of seven principal sections, including novelties or recently-introduced plants, floriculture (greenhouse, open air, and "floral art"), vegetable cultivation, ornamental and fruit trees, scientific horticulture, horticultural arts and industries. Full information may be obtained from the general secretary, Mr. JOHN WOLF, Grand Saconnex, Geneva.

THE SOUTH AFRICAN BAMBOO.—The Kew *Bulletin of Miscellaneous Information* (No. 2, 1909) contains an interesting article by Dr. OTTO STAFF on the South African Bamboo *Arundinaria tessellata* Munro. According to Dr. STAFF, the existence of a Bamboo in Cape Colony has been known for more than 70 years. Discovered by DEECE on high mountains (4,000 to 7,000 feet) in 1832 or earlier, and found also by other travellers, it was originally ascribed by NEES to the genus *Nastus* and named *N. tessellata*. MUNRO gave it its present name of *Arundinaria tessellata* in 1868, though in the absence of its flowers its proper generic position remained dubious. An examination of flowering specimens which were sent to Kew in December of last year proved that MUNRO was right in assigning the Bamboo to the genus *Arundinaria*. Dr. STAFF refers to the economic value of *A. tessellata* and concludes with a description of the inflorescence and flowers.

MR. CHARLES FOSTER.—At the annual reunion of old students at Reading University College last week the Associateship of the College was conferred on Mr. CHARLES FOSTER, Assistant Director of the Department of Agriculture, on his leaving to take up a position as director of Lord NORTHCLIFFE'S model farm.

PUBLICATIONS RECEIVED.—*Holidays Abroad.* An illustrated booklet of tours in Holland, North Germany, the side valleys of the Rhine, the Belgian Ardennes and the Tyrol, published by the Great Eastern Railway.—*Proceedings of the Academy of Natural Sciences of Philadelphia.* Vol. LXI., Part I., January, February, March, 1909. (Philadelphia: The Academy of Natural Sciences).—*Garden Cities and Town Planning.* (May.) (London: Garden City Association, 31-32, Birkbeck Bank Chambers, Holborn, W.C.) Price 3d.—*Beautiful Flowers and How to Grow Them.* by Horace J. and Walter P. Wright. (Part XV.) (London: T. C. & E. C. Jack.) Price 1s.—*The Estate Magazine.* (June.) Price 6d.—*The Forest Flora of New South Wales.* by J. H. Malden. Vol. IV., Part IV. (Sydney: Forest Department of New South Wales).

TRANSPLANTING A LARGE CEDAR AT PADDOCKHURST.

NUMEROUS instances are recorded in the *Gardeners' Chronicle* of the shifting of large trees, a notable instance being the removal of the celebrated Buckland Yew, near Dover, an account of which is given in the issue for April 25, 1891, p. 324, figs. 107, 108. Fig. 176 illustrates the removal of a large tree of *Cedrus deodara* by Messrs. J. Cheal & Sons, at Paddockhurst, Sussex. This Cedar stood in the forecourt of the mansion, but additions to the building have necessitated the removal of the tree a distance of some 20 yards. The tree, with the ball of roots and soil, weighed from 70 to 75 tons. The work of preparation was laborious. The huge tree had to be tunnelled under, and supported by great baulks of timber, leaving a big open space. All the preparations having been made, and a strong platform erected, the tree was gradually moved into its new bed. Messrs. Cheal inform us that the principal point in moving the tree was the tunnelling under it in order to place a platform of large baulks of oak timber in position, and to bolt these together with rollers beneath, the rollers being then laid on another platform to facilitate the moving. The tree in its new position appears as fresh as though it had not been moved.

INDIA.

HAILSTORM IN UDAIPUR.

ON April 20 a hailstorm of unusual severity visited Udaipur. It travelled in a north-westerly direction over the Pichola lake and down the Jarden valley, destroying everything in its wake. The storm commenced about 2 o'clock p.m.; the hailstones were from the size of a pea to that of an ordinary fowl's egg. Some of them, measured at the garden office, were 3 inches in circumference, and of a flat, irregular shape, but the majority of the stones were round.

The storm travelled over the fruit garden and completely destroyed the fruit crops. All the grafted Mangos suffered, as well as the common variety (*Mangifera indica*). The fruits, which were of a fair size, were most of them knocked off. A few that had been hit by the hail, but which had remained attached to the tree, soon turned black and dropped, thus depriving the garden, for this year at least, of one of its most delicious fruits and a large source of revenue. Plums and Apples suffered in the same way. The fruits of the Pippin variety were collected in mounds under the trees. Peaches, too, suffered, very few of them being left on the trees. Carica Papaya presented a sad sight: the umbrella-like heads were shattered to shreds. The crop of Plantains (*Musa*) was destroyed. The beautiful leaves, which only a few minutes before were a treat to look on, were so torn that nothing was left but the upright stems, with a smashed bunch of fruit here and there. Pears were just setting and were destroyed. The Quinces and Figs, being situated in a sheltered position, did not suffer so badly. Pomegranates suffered, but, owing to their stiff, thorny branches and thick-rinded fruit, were not damaged so badly as the more delicate fruits. Sapodilla fruits were of a good size, but were knocked off, leaving nothing but bare barked stems.

The vegetable garden was, as it were, between the two seasons. The cold weather English vegetables were just getting finished. Drum-head Cabbages raised from Messrs. Sutton & Sons' seed, and most of them quite 20 lbs. in weight, solid and pure white, which were the admiration of all visitors to the vegetable garden, were smashed to pieces, with holes knocked right into them. Brussels Sprouts that were just coming into season were reduced to shreds. Broad Beans were destroyed; Early Gem Carrots, Beet, Lettuce and Scotch Kale were all

broken in an unrecognisable form. A fine crop of Potatoes was badly injured; large tubers on the tops of the drills were smashed to pieces. It was most extraordinary how the hail penetrated the soil. The hot weather Indian vegetables, that were in a very promising condition, such as Cucumbers and Pumpkins, were destroyed, and, as the season is far advanced, it will be difficult to meet the demand.

A jungle fire in a night sweeps a whole forest away; but this hailstorm was quite as destructive in another form. The flower-garden, which includes bulbous plants grown in pots, suffered. The pots were broken to pieces, and the bulbs, lying exposed to the storm, were badly injured. *Eucharis* were torn to shreds, *Dahlias* broken, *Achimenes* were badly damaged, and the young shoots—they were just showing—were all cut down; also *Polianthes tuberosa* was badly injured. Beautiful clumps of *Begonias* were all torn to shreds, and everything in the flower-garden beds was broken down. Roses were completely stripped of flowers and foliage, and in many places the stems barked badly. *Poinciana regia* was coming into flower and was severely damaged, only a flower here and there remaining. The beautiful avenue of *Amaltas*—*Cassia Fistula*—was quite stripped of its Laburnum-like flowers. *Hibiscus* and *Lagerstromias* of sorts suffered, hardly a flower being left. *Murraya exotica* was in full flower, and was completely cut to pieces.

However, most of the trees and shrubs are throwing out new shoots and leaves, though the flowers, for this year at least, are all lost. The Doopgrass (*Cynodon Dactylon*) all over the gardens was much improved by the hail and rain; in fact, this was the only part of the gardens that derived any benefit.

One inch and 77 cts. of rain was registered after the fall of hail. Birds of various kinds were found killed in all parts of the garden. The garden covers an area of 150 English acres. There are 10 miles of carriage drives, exclusive of footpaths. The storm seems to have broken right over the garden, and a little distance from it, on the south side, the storm ceased altogether among the hills, where no harm was done at all. Again, on the north, the rain was very trifling in comparison; the hailstones were very small, and did little or no harm to the beautiful gardens there. *Thos. H. Storey, Superintendent Sajjan, Niwas Gardens, Udaipur, Rajpootana, India, May 10, 1909.*

NOTES FROM A "FRENCH" GARDEN.

THE damp weather of the past fortnight has been detrimental to Melons now fruiting; this is especially noticeable in gardens where the beds were not prepared with warm, strawy manure. It has been necessary to exercise great care with regard to the ventilation, but we were obliged to open the lights daily in order to prevent decay in the stems or in the stalks of the young fruits. The first batch planted in April have proved healthy plants, and, provided the temperature improves, the fruits will soon ripen. The only Melons that are covered at night are those which were planted late in May. We are anxious to gradually harden the older plants so as to be able in July to plant Cauliflowers amongst them.

The Cauliflowers planted on the hot-beds in March are now ready. The earliest was the variety "Driancourt," which has also given the largest heads. Those planted among the Cos Lettuces on hot-beds are not likely to be satisfactory, as the drought in May and the damp weather in June have forced the plants to bud prematurely. The Cauliflowers, Endives and Celery that will replace the Cauliflowers are growing rather too freely; it will be advisable, should the weather become fine, to keep them somewhat dry, and harden them off for transplanting in July.

We have disposed of the Passion and Cos Lettuces planted outside early in the spring, and although we had a fine lot of plants, unfortunately the prices were very low. We have hoed and mulched the Cauliflowers which occupied the same bed. The main batch of Endives "La Ruffec" or "La Meau," or the Batavian Green will be sown within a fortnight, and they should be ready by August 15.

Although it is premature to map out a programme for next season, we generally plant the Endives where the ground will not be required before Christmas, as these salads are usually ready in October and November, when gardeners are busy preparing for the Lettuce season the following spring. *P. Aquatics.*

ANGRÆCUM SESQUIPEDALE.

THE excellent specimen of this well-known Orchid, illustrated in fig. 177, has been cultivated by Mr. G. Carpenter, The Gardens, West Hall, Byfleet, who furnishes the following details in regard to its culture. The plant has been growing here for 11 years, but previously never bore more than two flower-spikes at the same time. This year it produced five spikes, and four of these spikes bore three flowers each, whilst the other had four, making a total of 16 flowers. The plant has always had the same treatment, and always appeared healthy. It has been grown with a mixed collection of Orchids, such as Cattleyas, &c. I do not know why it should have flowered more this year than any other. It is interesting to note that three of the spikes came out above the last year's old flower-spike—which, of course, is quite natural—two breaking out under the last year's old flower-stems, a thing that I have not seen before. The photo is by Mr. Thomas Stevenson, Woburn Park Gardens, Addlestone, Surrey.

LILIES AT THE TEMPLE SHOW.

AMONG the many items of interest at the recent Temple Show were the fine masses of different members of the Lily family. They were especially well shown in the collection of flowering subjects arranged by Messrs. R. Wallace & Co., of Colchester. A notable feature was the large number of the different members of the Martagon group. Included among them was that beautiful Japanese species, *Lilium Hansonii*, whose yellow blossoms are as massive as if carved out of wax. The segments, however, do not reflex to quite the same extent as some others of the Martagon section. Magnificent bulbs of *Lilium Hansonii* have been sent to this country from Japan during the last two or three winters. Unlike several members of the Martagon section, this species can be depended upon to flower well the first season after planting. The blooms are much less strongly scented than are some others. Such cannot be said of the Caucasian Lily, *Lilium monadelphum*, for the flowers have a strong perfume which, in a confined space, is not at all agreeable. It is, however, one of the most beautiful of Lilies.

The Nankeen Lily (*Lilium testaceum*), which is also known as *L. excelsum* and *L. Isabellinum*, is a tall, stately species. The drooping flowers are supported by almost horizontally-disposed pedicels, so that each stands clear of its neighbour. The clear nankeen tint of the petals, with the conspicuous red anthers, are pleasing, and the flower possesses a fairly strong but agreeable perfume. This Lily, as well as *L. monadelphum*, succeeds better in loamy soil than in one containing peat.

Of the true Martagon (*Lilium Martagon*), the white-flowered variety was shown in good condition, as well as its three hybrids, namely, *L. Dalhansonii*, whose parents were *L. Hansonii* and the dark-coloured Martagon known as *dalmaticum*; *L. Marhan*, a cross between *L. Mar-*

tagon album and *L. Hansonii*; and *L. Ellen Willmott*, a particularly fine form of *L. Marhan*.

The Siberian *L. tenuifolium*, an elegant little member of the Martagon group, is, when seen in a mass, particularly effective, by reason of the bright red colour of its elegantly-reflexed blossoms.

The trumpet-flowered Lilies corresponding to the sub-genus *Eulirion* include some of the most popular of these flowers for flowering under glass. The best is *L. longiflorum*, its long, silvery trumpets being always admired. The supply of bulbs is principally kept up by immense importations from Japan. Conspicuous at the Temple were large masses of the varieties gigan-

is, in *L. japonicum Colchesteri*, of a cream tint. *L. Brownii* is chiefly propagated in Holland, but *L. japonicum Colchesteri* is obtained from Japan.

Lilium speciosum, which is now so popular as a market plant, was represented on many stands. Some of the flowers were particularly rich in colour, and contrasted markedly with the white variety *Krätzeri*.

Belonging to the same section as the preceding is the Golden Rayed Lily of Japan (*L. auratum*), which I have seen more fully represented than at the last show.

Lilium Henryi, though scarcely seen at its best so early in the season, arrested attention by reason of its distinct colour. Though this has

FIG. 177.—ANGRÆCUM SESQUIPEDALE AS CULTIVATED IN WEST HALL GARDENS.

teum and *Takesianae*, this last being characterised by dark-coloured stems, although the flowers, when fully expanded, are pure white.

A great deal of confusion exists between *L. Brownii* and *L. japonicum Colchesteri*, or *L. odorum*, as it is sometimes called. In Messrs. Wallace's group a mass of each was shown in close proximity, so that an opportunity was afforded of comparing the two. In *L. Brownii* the leaves are long, slender, and gracefully recurved; whereas, in *L. japonicum Colchesteri*, they are shorter, broader, and much thinner. The flowers, too, of *L. Brownii* are longer and more heavily suffused with chocolate on the exterior, whilst the inside is ivory white, which

been known for the last 20 years, it must still be looked upon as one of the newer Lilies. A great recommendation is the manner in which it has become established in this country.

Lastly, mention may be made of the representatives of the *Isolirion* group, a class with upright flowers that are more or less cup shaped. *Lilium elegans* or *Thunbergianum*, an extremely variable species, includes some of the dwarfiest of all Lilies. At the Temple I noticed a fine mass of the variety *Orange Queen*, while particularly noticeable among the others were *venustum macranthum*, of an orange-apricot colour, and the deep-tinted *L. elegans atrosanguineum*. II.

TOWN-PLANTING.

PRUNING OF TREES AND SHRUBS.

THOUGH timely and judicious pruning should never be neglected, yet the annual trimming to which many of the town trees and shrubs are subjected cannot be too strongly denounced. To annually prune and elbow in such noble forest trees as the Lime and Plane, in order that the restricted growth may render them suitable for the cramped positions in which they have been unwisely planted, is unreasonable. The Lime and Plane perhaps suffer most in this way, for as soon as they have overgrown the allotted space an annual system of hacking and hewing is resorted to, the result being the formation of great mop-headed protuberances at the points where amputation took place, which not only rob the tree of its natural appearance, but render it readily susceptible to disease and insect pests. Glaring examples of badly-pruned trees may be seen at Kensington, on the Chiswick Road, at Cricklewood, and along many of our streets, and in our public parks and gardens. Some excuse might be offered for planting our largest-growing forest trees in cramped and unsuitable positions were there no other species of smaller growth available, but the various kind of Pyrus, Mulberry, Catalpa, Dwarf Acacias, Sumach, Prunus, Cratægus, and others are all well suited for town planting. Where ample space is available, such as on the Thames Embankment, and other wide promenades and streets, or where interlacing of the branches is not a serious drawback, by all means let the larger-growing trees be planted, but where the streets are narrow and necessity compels planting within a few yards of buildings, the smaller-growing species are preferable. Numerous instances could be pointed out, as at Gray's Inn Road, London, in which Plane trees have been planted within 9 or 10 feet of houses and other buildings, the result being that in a few years heavy pruning becomes a necessity, and the natural beauty of the trees is destroyed, and, worse still, a repetition of the trimming must be carried out at frequent periods. A point, of the greatest importance in town planting, is suiting the trees to the positions they are to occupy. The Lime is perhaps one of the most cruelly treated of all suburban London trees, for the lopping and beheading to which it is annually subjected, and which it tries bravely to support, strikes every lover of the natural with feelings of regret and shame that so beautiful and noble a tree should be so tortured and disfigured. For the first ten years after being planted in its restricted space, it looks everything that could be desired, but when the confined boundary limit is attained—the windows darkened, the patch of garden rendered useless by the overhanging branches, and the pedestrian on the footpath annoyed—then comes the retribution, and the saw and the pruning-knife being brought into request, the stalwart, beautiful sapling is elbowed in; it becomes mop-headed, or contorted into some other unnatural or ungraceful shape. By planting at the first such moderate-sized trees as the Robinia viscosa, the Mulberry, Mountain Ash, and Beam Tree, Indian Bean (Catalpa), or the beautiful flowering Almonds, Cherries and Thorns, all this would be avoided. The Plane tree, too, is badly managed in many of the London thoroughfares, and when, through indiscriminate planting, pruning of the branches has to be resorted to, this operation is usually performed in the most slovenly and unscientific manner, and has in not a few instances led to a diseased and unhealthy state of the trees operated upon. There are cases, however, where pruning is justifiable, and the abuse of a system should furnish no argument against its legitimate use. In the public parks and gardens the removal of weighty branches from such trees as the Elm and Poplar, that frequently break during even still weather and endanger the lives

of visitors, is not only admissible, but a duty that should never be neglected by those in charge. This also applies with equal force to diseased and hollow branches and stems, which are fraught with danger to the public. As to whether or not dead wood should be removed in quantity from our old Oaks and other trees there is a diversity of opinion, though it cannot be denied that the careful pruning of such is highly beneficial, whether from the point of the health of the trees or safety of the public, who may frequent their shade. It is certain that in some of our town parks and gardens there exists an undue quantity of dead and dying wood which may be attributed to natural decay, the poor quality of the soil in which the trees are growing, or to long-standing neglect in the matter of non-attention to wounds which have been caused by wind-broken limbs and branches or other injuries. Such trees would be greatly improved, both in health and appearance, by the removal of the dead branches and attention being paid to old wounds in order to prevent the ingress of water, the decay and death of not a few trees being directly attributable to this cause. That dead and dying wood will also induce the attacks of injurious insect pests, such as the goat and wood leopard moth, which attack healthy trees, is well known, and was exemplified in some of our London parks lately where Thorns and various species of Pyrus were attacked and injured by the caterpillar of the leopard moth, which was bred in the adjoining old Chestnut trees. The latter part of May or beginning of June is perhaps the best season for pruning the majority of hard-wooded trees, as during that time the motion of the sap is most vigorous, and, in consequence, the wounds caused by amputation heal quickest. There are a few exceptions—the Birch, Maple and Sycamore—where, on account of profuse bleeding, pruning is best postponed till after the leaves have developed. In cutting or shortening small branches a sharp pocket-knife will be found most convenient, but when large and weighty limbs have to be removed, they should first be cut through at any convenient distance from the main stem, and then close to the trunk, undercutting by a few draughts of the saw in order to prevent the bark and wood from tearing when the severed branch falls away. In order to prevent water lodging on the freshly-cut surface, the face and edge of each wound should be neatly dressed and made quite smooth by a sharp knife or adze, and then painted or tarred over. When cutting over an upright growing branch never cut on the horizontal, but always in a sloping direction, so that the rain may pass off quickly. Much mischief has been done by the pruning knife and saw in the hands of inexperienced workmen—a fact that will be patent to every interested person who watches the operation as being carried out by the workmen of some of the city and suburban councils. When conducted with care, on sound principles, the effect of pruning on standard trees should be rather beneficial than otherwise, whereas when done by inexperienced workmen the operation has disastrous results.

Generally speaking, shrubs are pruned with little or no consideration as to whether they will be benefited by the operation. While symmetry and regularity of outline are to be admired in a shrub, these qualities should never be gained at the expense of natural grace and production of flowers. The judicious pruner will, therefore, aim at preserving the peculiar habit of each shrub as far as possible, while interfering as little as possible with the production of flowers. The various species of Deutzia, Forsythia, Philadelphus, and Weigela flower on the wood of the preceding year's growth, therefore such shrubs should be pruned immediately after the flowering season—say in June, but never in spring or winter—at least, if the production of flowers is to be taken into account. Again, the various species of Syringa, Spiræa, Lonicera, and Hibis-

cus may safely be pruned during winter, the flowers being produced on the young wood, while Hydrangea paniculata grandiflora must be severely pruned in early spring, for only by doing so will the greatest wealth of flowers be produced. Chimonanthus fragrans should be pruned in February; while the various species of Ceanothus should not be touched till all danger of frost is past. Kerria japonica should be pruned in autumn, when old wood may be cut away.

All pruning operations should be carefully carried out with a sharp knife and not with the pruning shears, the point of amputation being always close to an eye or bud. Too severe pruning should be avoided, a judicious thinning out of the branches being far preferable to indiscriminate shearing and cutting back. A. D. Webster.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

THE SUPPLY OF ANIMAL MANURE (see p. 359).

—That there may come in the course of time a comparative famine of animal manure is certainly possible and may well arouse interest in the subject. We, as human beings, create an enormous quantity of vegetable plant food in the form of sewage, but we are so uneconomical that this, for the most part, is wasted in the sea. Sewage farms seem not to be cultural successes, and the dried product of sewage sludge is but a moderately fertilising compound. Street sweepings which usually have had considerable manurial value, now contain so much of tar or petrol waste, that their benefit to vegetation is of an exceedingly doubtful kind. But no form of locomotive change can prevent us getting late autumn-sown crops of Tares, Oats, Rye, or Rape, which when dense, yet short, can be dug into the soil in March and, so treated, become almost immediately decomposed or soluble. These green crops are most valuable manures and of the cheapest kind, yet strangely enough are little used in gardens. The farmer who makes due provision for rich crops, folds his sheep over them, and afterwards ploughs in the remaining vegetable fibre and the animal excrement, thus providing succeeding crops with capital manure. Even the ploughing in of corn stubble has great value. If to these fibre crops a light dressing of artificial manures be added, crops benefit greatly. But the gardener has a resource which is not that of the farmer or usually of the market grower. The farmer seldom breaks up his soil deeply. Trenching would not suit his corn crops. Generally, his land is broken by the plough to a depth of but 10 inches, thus leaving the soil below that depth hard and impervious to roots. Much of this soil, if only broken up, would show wonderful productiveness. The market grower generally relies on the plough as his soil cultivator, but because his crops have to be forced into growth rapidly, he uses heavy dressings of animal manure. This is not buried deeply, and crops of field vegetables having a very shallow root run, the manure is soon exhausted. An enormous quantity of this manure, from 30 to 40 per cent., is lost, owing to the fermenting and wasting to which it is exposed before being applied to the soil. Compare this form of culture with what may be seen on thousands of workers' allotment plots, cultivated and cropped by men not permanently engaged in the occupation of gardening. These plots are deeply trenched so that the soil, from 24 to 30 inches in depth, provides root-room for the plants. Allotment holders can only provide the soil with very moderate manure dressings, yet with such limitations they secure marvellous produce, and in their small way illustrate the wonderful productive capacities of the soil when intelligently cultivated. But the very foundation of such success lies in the deep working of the soil. A. D.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JUNE 8.—Present: Mr. E. A. Bowles, M.A., F.L.S. (in the Chair); Sir J. T. D. Llewelyn, Prof. G. S. Boulger, Messrs. W. E. Ledger, R. A. Rolfe, W. Hales, J. Fraser, L. Crawshay, G. Gordon, R. Hooper Pearson, J. Douglas, W. Fawcett, G. S. Saunders, H. T. Güssow, J. T. Bennett-Poë, E. M. Holmes, A. W. Hill, J. S. Arkwright, and F. J. Chittenden (hon. secretary).

Impatiens × *comoricoma*.—The award of a Certificate of Appreciation was unanimously recommended to Messrs. CAYEUX in acknowledgment of work done in raising the hybrid *Impatiens* shown at the last meeting, and the careful notes thereon contained in the *Revue Horticole*.

Hybrid Dianthus.—Mr. DOUGLAS exhibited flowers of hybrid *Dianthus*. One has been raised by crossing *Dianthus barbatus* with a double pink (*D. plumarius*). This had rather glaucous foliage, leaves about $\frac{3}{4}$ in. broad, and pink flowers with about a dozen petals lacinated at the margins, borne on branched stems carrying about 8 or 10 flowers. The second was the hybrid between *D. barbatus* and *D. caryophyllus* var. *Uriah Pike*, known as *Lady Dixon*, a form which never produces seeds but flowers very profusely.

Variiegated Laurel.—Mr. CRAWSHAY showed foliage of a much variegated form of the Common Laurel, *Prunus lauro-cerasus*. The bush from which this was cut was an old one and the variegation had proved constant.

Alpine plants.—Mr. J. FRASER, F.L.S., showed cultivated specimens of a very dwarf form of *Salix herbacea* which he had collected at an elevation of 3,984 feet on Ben Lawers. The height to which it attained in the wind-swept situation in which it was growing was only from $\frac{1}{4}$ inch to $\frac{1}{2}$ inch. He also showed *Draba rupestris* from the same locality, and *Tofieldia palustris* from an altitude of 2,800ft. in Perthshire, with fruit. These had all been grown in pots, and were somewhat taller than when collected. Mr. FRASER also showed flowers of *Rosa spinosissima*, which is still found growing wild within the county of London, though it does not now fruit. The flowers exhibited were very small, and had been picked from a wild specimen.

Lonicera Standishii.—Mr. E. M. HOLMES exhibited ripe fruit of this *Lonicera*, which rarely fruits in Britain.

Aquilegia double.—Mr. HALES drew attention to the doubling of *Aquilegia* where, somewhat as in the hose-in-hose *Primrose*, the petals are packed one within the other. Mr. CHITTENDEN pointed out that the additional petals were modified stamens, of which the filament became the claw of the petal, while the spur and the limb of the petal were developed from the anther; in specimens in which the modification had not gone far the two anther lobes could be seen around the mouth of the spur.

Malformed Orchid.—Mr. ROLFE exhibited an *Odontoglossum* in which the petals had acquired somewhat the coloration of the lip.

Primroses flowering.—Mr. A. W. HILL said that there was at present flowering at Kew a common *Primrose* which had been brought from Shetland last year, and had thus retained its normal time of flowering.

Trachycarpus excelsus monocius.—Mr. BOWLES exhibited an inflorescence of *Trachycarpus excelsus*, and remarked that although most of the flowers were staminate in the inflorescence for some years, a few pistillate flowers had developed and had produced fruit. This was most evident in the inflorescences which had developed late in the season.

NATIONAL VEGETABLE.

JUNE 8.—We are informed that a meeting of the Provisional Committee of the newly-constituted National Vegetable Society was held at the Hotel Windsor, on the above date. It was decided to ask His Grace the Duke of Portland to accept the office of President. Twenty-seven gentlemen and 17 firms were proposed as vice-presidents

RANUNCULUS AURICOMUS.—In answer to Mr. H. S. Thompson (see p. 384), I can state that the perfect form of *R. auricomus* is plentiful in the neighbourhood of Sevenoaks (Kent), and, as far as my experience goes, the variety *depauperata* is somewhat uncommon. In Hanbury and Marshall's *Flora of Kent*, 1899, it is stated, "Petals occasionally imperfect, especially in hill-woods." My own observations are quite in accordance with this, but I have hardly ever noticed the imperfect form in a moist situation, or upon good soil. There is one large patch of several hundred plants, which I have observed carefully for about eight years, and during that time have never found a single imperfect flower amongst them. All the plants are also very constant in their time of flowering, and the form of the radical leaves. I should be interested to hear if other readers have consistently observed this species, and if they have found any correspondence between the nature of the soil and the condition of the flowers. *Lionel Crawshay*.

NITROGEN OF THE AIR.—Will Mr. Hall kindly tell us in what way nitrogen, pure and simple, can be restored to the air? In the process of photosynthesis plants give us back the oxygen, which all living beings consume; but as nitrogen has also an important part to play in the atmosphere, one would like to know how it is to be restored after the air has been robbed of it in making nitrate of lime. It is said that the gas which bubbles up in the baths of Buxton is pure nitrogen; but how it has become isolated I do not know. Is any other source of pure nitrogen known in nature? Four-fifths may seem to be a large proportion now; but a time may come when the making of nitrate of lime on a large scale—perhaps in many countries and perpetually, for centuries—may reduce that proportion and render the amount insufficient to check the too active properties of pure oxygen. *Geo. Henslow, Leamington*.

Unfortunately there are all too many agencies breaking up the compounds of nitrogen and returning it to the atmosphere in the form of gas. When any vegetable matter is burnt the greater part of the nitrogen it contains is lost as gas, and the same is true of coal and other fossil forms of bygone vegetation. Then the soil is full of wasteful bacteria, which as they oxidise the organic matter are always evolving some of the nitrogen as gas. In very rich soils the wastage is considerable; we estimate that about one-half of the combined nitrogen which has been put on the Wheat plot at Rothamsted in the shape of farmyard manure every year for the last sixty years has been thus lost, for it is to be found neither in the soil nor in the crops that have been harvested from the plot. Again, all our explosives depend for their action on the liberation of free nitrogen gas from one or other of its combined forms, and one item in the wastefulness of war is the enormous destruction of combined nitrogen which follows a modern battle. Mr. Henslow need not fear for the world's stock of free nitrogen: it was the combined nitrogen which seemed likely to run out until we learnt latterly something of the powers of bacteria to regenerate the supply. *A. D. Hall*.

EARLY SWEET PEAS.—I am sending you a box of Sweet Peas. The seeds were sown early in October in 4-inch pots, six seeds in a pot, and placed in a cold frame, where the plants remained during the winter. Air was admitted freely on all favourable occasions. The plants were potted on into 7-inch pots in the first week of January. At about the middle of March they were placed out-of-doors under the shade of a south wall. They were planted out early in April in a south-west corner of the kitchen garden, each potful being placed at distances of 2 feet. At the present time they are 3 feet in height, and they meet in the rows. The foliage is strong and healthy. We commenced cutting flowers for Whitsuntide, and have since had a continual supply. Upwards of 100 spikes were sent away this morning. I have usually sown out-of-doors in autumn with very good results, but the system adopted this year has given earlier blossoms and less trouble. Owing to this late season it will be quite another fortnight in this locality before we can cut flowers from plants raised from spring-sown seeds. *G. Hatch, Carenham Park Gardens, Mildenhall, Suffolk, June 10*. [The flowers were excellent.—ED.]

It was further resolved to ask the following gentlemen to accept places on the Executive Committee:—B. Ashton, Gardener to the Earl of Lathom, Lathom House, Ormskirk; N. F. Barnes, Gardener to the Duke of Westminster, Eaton Hall; E. Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House; E. T. Cook, Editor of *The Garden*; W. A. Cook, Gardener to Sir Edmund Loder, Bart., Leonardslee; A. Dean, Horticultural Instructor, Surrey Education Committee; C. Foster, Horticultural Director to Lord Northcliffe, Sutton Place; G. Gibson, Gardener to the Duke of Portland, Welbeck Abbey; G. Gordon, V.M.H., Editor of the *Gardeners' Magazine*; F. W. Harvey, Sub-Editor of *The Garden*; G. Hobday, Romford; R. Hooper Pearson, Managing Editor, *Gardeners' Chronicle*; J. Harrison Diek, Sub-Editor of the *Journal of Horticulture*; J. Jaques, Horticultural Director, White City; J. Lyne, Gardener to H. F. Tiark, Esq., Foxbury, Chislehurst; H. Markham, Gardener to Viscount Enfield, Wrotham Park; S. Mortimer, Market Grower, Rowledge, Farnham; W. Poupart, Market Gardener, Twickenham; R. J. Steel, Market Garden Salesman; Owen Thomas; H. H. Thomas, Editor of *The Gardener*; J. Vert, Gardener to the Rt. Hon. Lord Howard de Walden, Audley End; G. Wythes (Treasurer); E. G. Quick (Hon. Sec.), Kelmescott, Harrow View, Wealdstone, Harrow.

OBJECTS AND RULES OF THE SOCIETY.

1. The title of this Society shall be the National Vegetable Society, and its object shall be to promote the wider cultivation of vegetables as food products, to encourage their consumption as food, to promote exhibitions of such products, whether competitive or otherwise, and to hold trials under such conditions as may offer with a view to finding the best varieties to commend for general culture, and to ascertain commercial values when grown under ordinary conditions.

2. Membership shall be open to all persons who will pay an annual subscription of not less than 5s., and who are in entire agreement with the objects above stated.

3. Executive body.—The governing body of the Society shall be a president, vice-presidents, treasurer, and secretary, who, together with an executive committee, not exceeding 24 members, shall be elected annually.

4. Annual meeting.—An annual general meeting of all members shall be held in the month of January each year, when the report of the committee's work for the previous year shall be read, and a duly audited balance-sheet of accounts presented. The annual election of officers and committee shall also then be held. Two auditors shall be elected at such meetings.

5. Meetings of the committee shall be convened by the secretary from time to time as the business of the Society may require, as the committee itself shall determine, or on the request of any four members of the committee, such request to be made in writing to the secretary. The committee shall elect its own chairman and vice-chairman at its first meeting immediately following the annual general meeting.

6. Subscriptions become due on the first day of the month of January in each year, and should be paid through the treasurer, who shall forward an official receipt to the member for same at the earliest possible date. All cheques shall be made payable to the National Vegetable Society.

7. All members will be entitled to vote at the general meetings, and also be eligible for election on the executive committee. Members will also be entitled to receive copies of any reports or publications issued by the Society, and to exhibit at any show or in any classes arranged by the Society.

8. All trials conducted by the Society shall be thoroughly impartial and designed to elicit useful information. They shall be under the control of a special trial sub-committee of not less than three members, who shall be responsible to the general committee.

BIRMINGHAM BOTANICAL AND HORTICULTURAL.

JUNE 9.—The annual Orchid and early summer flower show was held at the Botanical Gardens, Edgbaston, on the above date. Orchids, miscellaneous plants and cut flowers were

YORKSHIRE GALA.

extensively and well shown, and, as the weather was fine and warm, an unusually large number of visitors were present, who pronounced the show to be not only the biggest but the best of the special shows held under the auspices of the Society.

The premier award—Gold Medal—was worthily given to W. WATERS BUTLER, Esq., Southfield, Norfolk Road, Edgbaston (gr. Mr. R. H. Jones), who filled a space of 180 square feet with a meritorious collection of well-flowered plants nicely arranged over a groundwork of Ferns and backed by tall white Lilioms and foliage plants. This interesting exhibit contained splendid examples of Cattleya Mossiae Waterloo, C. M. Gloire de France, C. Lawrenceana Hyeana (very large deep flower), C. intermedia White Queen, Lælia Iona, Lælio-Cattleya Canhamiana, Oncidium amphiatum majus, Odontoglossum crispum Empress of India, O. c. Lindenii, O. c. Harryanum grande (extra good), Cypripedium callosum Sandera, C. bellatulum, Trichopilia Wagneri, Miltonia vexillaria, and many others.

The Right Hon. JOSEPH CHAMBERLAIN, M.P., Highbury, Birmingham (grower Mr. John Mackay), had an extensive display of grandly flowered Miltonias, Cattleyas, Lælias, and Lælio-Cattleyas, together with Anguloas, Phalænoopsis, Angraecum Sanderianum, Cochlioda Noezhana, Disa Premier, and Odontoglossums. (Silver-gilt Medal.)

Alderman G. H. KENRICK, J.P. (Lord Mayor of Birmingham), Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), contributed a small, but choice group consisting principally of Vanda teres (well-flowered), Dendrobiums, and Odontoglossums. (Bronze Medal.)

RICHARD FENWICK, Esq., J.P., Plough and Harrow Road, Edgbaston, had an artistically-arranged group of Odontoglossums, Cattleyas, Dendrobiums and Epidendrums. (Bronze Medal.)

From Messrs. MOORE, LTD., Rawdon, Leeds, came an effective group, in which many curious and beautiful species and hybrids were noted, including Disa Lana, Odontoglossum Rolfeæ, Cattleya Dusseldorferi Undine, Dendrochilum Cobianum, Gongora Wilsonii, Lælio-Cattleya Aphrodite alba, L.-C. Fascinator, Vanda suavis, Trichopilia tortilis, Renanthera Imschootiana, Cirrhopetalum Collettii, and Miltonias. (Silver Medal.)

MISCELLANEOUS PLANTS AND CUT FLOWERS.

MESSRS. GUNN & SONS, Olton, Birmingham, showed a very fine assortment of hardy flowers and Sweet Peas, together with a representative collection of Roses as bush, standard, weeping and pillar varieties. (Silver-gilt Medal.)

MESSRS. BAKERS, Codsall, Wolverhampton, sent a selection of Pyrethrums, Lupins, Violas, Irises, Columbines and Oriental Poppies. (Silver Medal.)

W. BYNG KENRICK, Esq., Metchley House, Somerset Road, Edgbaston (gr. Mr. Jas. Webb), sent twelve well-flowered plants of Pelargonium Achievement. (Vote of Thanks.)

ROBERT SYDENHAM, LTD., Tenby Street, Birmingham, contributed a pleasing group of Spanish Irises and Gladiolus. (Bronze Medal.)

RICHARD PEYTON, Esq., Augustus Road, Edgbaston (gr. Mr. W. Young), showed a very nice group of Gloxinias, Hydrangeas, Caladiums and ornamental grasses. (Bronze Medal.)

Mr. H. N. ELLISON, Bull Street, West Bromwich, showed upwards of eighty species and varieties of Ferns, mostly in small pots suitable for table decoration. (Bronze Medal.)

MESSRS. BICK BROS., Olton, Birmingham, sent a collection of Violas, which were much admired. (Vote of Thanks.)

Mr. C. H. HERBERT, Hazlewood Road, Acock's Green, sent plants of his new perpetual-flowering Pink "Progress," bearing large, shapely, fragrant purple flowers. Mr. HERBERT also showed Violas and Columbines. (Bronze Medal.)

MESSRS. JAS. SIMPSON & SONS, Court Oak Road, Harborne, sent a group of hardy ornamental-foliaged shrubs in pots, including several Rhododendrons in flower. (Vote of Thanks.)

New Violas were sent by Councillor T. BROWN, Olton, and by Mr. W. MARPLE, Summer House, Penkridge.

AWARD OF MERIT.

Lælio-Cattleya Eudora magnifica, from Messrs. MOORE, LTD., Rawdon, Leeds. This differs from the type by reason of its large, rich-coloured flowers.

JUNE 16, 17, 18.—The exhibition held on these dates will rank as one of the best held in Bootham Park. Last year's show was bigger, but that was an exceptional year, and certainly in point of quality the display which opened on Wednesday last was not inferior. The entries were only three fewer than those of the Jubilee Gala, so that good competition was seen in the numerous classes. The rock-garden exhibits, always a feature at these shows, were carried out on an imposing scale; very fine, also, were the groups of flowering and foliage plants, and beautiful displays of garden plants were seen on all sides. As being exceptionally fine from a cultural point of view, we may instance Begonias, Gloxinias, and Calceolarias. A regrettable accident happened to the exhibits of Mr. SHARPE, Almondbury, Huddersfield; one of the railway vans containing his plants took fire, and thus prevented him from exhibiting. Numerous trade groups contributed to the success of the show. The secretary, Mr. Fred. Arey, and the management are to be congratulated on the general results.

GROUPS OF PLANTS.

The largest class for a group of miscellaneous plants arranged for effect was represented by six exhibits. Each exhibitor was allotted a space of 300 square feet. The 1st prize was awarded to J. PICKERSGILL, Esq., Bardon Hill, Westwood, Leeds (gr. Mr. J. Donoghue). The group was a bizarre of beautiful colours furnished by flowers and foliage. A magnificent Kentia, half-hidden with Dorothy Perkins Rose and Liliom longiflorum, dominated the background, while the body of the display was of Codiaums (Crotons), beautiful in their colouring; elegant Coeos Palms, Vitis with variegated leafage, Begonias of the Rex type, Alocasias, Caladiums, Ferns, &c., with Orchids, Roses, Kalosanthe, and Lilioms. 2nd, Mr. W. A. HOLMES, West End Nurseries, Chesterfield. A flatter group than the preceding, but very effective, the groundwork of Codiaums, Dracænas, Caladiums, Abutilons, Begonias, Colens, and the like, being admirably disposed. Taller plants of Codiaums, Roses and Palms, with sprays of Odontoglossums, served as foils for the general display. 3rd, Mr. JAMES BLACKER, Thorpe Villas, Selby (gr. Mr. W. Curtis). Pillar Roses were admirably shown in this group.

A similar but smaller class for a group of flowering and ornamental-leaved plants brought four good exhibits. The space allowed was 200 square feet. The 1st prize was again secured by Mr. PICKERSGILL (gr. Mr. J. Donoghue), whose splendid Crotons contributed largely to his success. These, with Roses, Cattleyas, Odontoglossums, Ericas, and Crassulas, with fine foliage plants intermixed, formed a group of considerable beauty. The 2nd prize was awarded to the adjoining group, put up by Mr. W. A. HOLMES, West End Nurseries, Chesterfield. The groundwork, as in the other group from this competitor, was remarkably effective; the background was perhaps a trifle weak, otherwise there was not much to choose between this and the 1st prize display. 3rd, Mr. W. VAUSE, Leamington Spa.

Very large plants were staged in the classes for specimen stove or greenhouse plants. In that for nine examples there were only two entries. Messrs. JAMES CYPHER & SONS, Cheltenham, had much the better plants. They showed a grand specimen of *Darwinia tulpifera*. Others of note were *Bougainvillea Cypheri*, *Pimelia diosmæfolia*, and *Stactia intermedia*. 2nd, Mr. W. VAUSE, Leamington. Two growers also contested the class for six plants, and again Messrs. CYPHER won the 1st prize, their showiest example being *Azalea Modele*, covered with its elegant salmon-pink blooms. 2nd, Mr. W. VAUSE.

Messrs. CYPHER & SONS also showed better than two other competitors in the class for three plants.

Mr. VAUSE was the only exhibitor of a single specimen stove plant, taking the 2nd prize for a poor plant of *Anthurium Scherzerianum*.

The best specimen greenhouse plant in bloom was *Erica ventricosa magnifica*, shown by Messrs. CYPHER, Mr. VAUSE winning the 2nd prize with *Erica eximia minor*.

The best half-a-dozen ornamental foliage

plants, to include two Codiaums, were staged by Mr. W. VAUSE. 2nd, Messrs. R. SIMPSON & SON, Selby. Mr. VAUSE was again placed 1st in the class for three ornamental-leaved plants; and Messrs. SIMPSON excelled in the class for three Codiaums (Crotons), Mr. VAUSE following. The best single plant of a Codium was shown by the last-named exhibitor.

There were two groups in a class for 20 Alpine and herbaceous plants. Much the better of the two staged was put up by Mr. WALTER PYBUS, Monkton. This exhibitor showed as his best examples *Lupinus*, *Mimulus Sillingii*, *Saxifraga pyramidalis*, variegated-leaved *Funkias*, and *Sedum Sieboldii*. 2nd, Mr. J. NICHOLSON, 22, Whitecross Road, York.

A collection of decorative plants and cut flowers.—This was a very pretty class, and, there being seven exhibitors, the displays occupied a considerable space. Each group was limited to 12 feet frontage and a depth of 5 feet. The competition for the premier position was keen between Mrs. WHITEHEAD, Deighton Grove, York (gr. Mr. G. W. Richardson) and JAMES BLACKER, Esq., Thorpe Villas, Selby (gr. Mr. W. Curtis). The former exhibitor won the premier award. Both exhibited choice examples of conservatory and greenhouse plants arranged in the most pleasing manner.

BEGONIAS.—Exhibits of these showy flowering plants were exceptionally choice, a magnificent group shown by Mr. T. WINN, 14, Ratcliffe Street, York, taking the 1st prize. Such excellent plants as were shown by this gentleman would be hard to surpass, the flowers being large, exquisitely coloured, and having a wealth of fine healthy foliage. The 2nd prize was awarded to Mrs. AKENHEAD, Acomb Park, York (gr. Mr. R. W. Leadhill) for a group of much merit.

GLOXINIAS.—Five exhibitors competed in a class for a group of Gloxinias in bloom arranged with foliage plants and Ferns. The 1st prize was worthily won by Sir J. GRANT LAWSON, Bart., Middlethorpe Lodge, York (gr. Mr. J. Dobson). Nothing finer could be desired than the splendid specimens shown in this group, the plants having 20-30 finely-developed flowers and equally good foliage. 2nd, J. A. DUNKERLY, Esq., 7, St. Mary's Terrace, Beverley (gr. Mr. G. Bush). This also was a fine display of the cultivator's skill. 3rd, Capt. WALKER, Mill Mount House, York (gr. Mr. H. Clark).

CALCEOLARIAS.—As in the case of Gloxinias and Begonias, some splendid plants of Calceolarias were staged. The competition was between seven exhibitors, and all showed excellent plants, the best being staged by P. STANCLIFFE, Esq., Solbergh, Northallerton (gr. Mr. George Jarvis). Exceedingly large flowers, bright and fresh in appearance, with a galaxy of other plants as foils, characterised the exhibit. 2nd, J. W. COULHURST, Gargrave House, Gargrave, Leeds (gr. Mr. Skinner). 3rd, W. T. AGAR, Esq., Brockfield Hall, York (gr. Mr. W. Barnes).

CARNATIONS.—A group of Carnations, principally of the Souvenir de la Malmaison type, shown by Mr. JOSEPH PICKERSGILL, Bardon Hill, Westwood, Leeds, was adjudged the best of three exhibits. A few Tree Carnations were grouped at the back of the group. 2nd, Messrs. WALSHAW & SON, Scarborough.

SHOW PELARGONIUMS.—A good group shown by Mr. GEORGE LEE, 49, Surtees Street, York, was placed 1st, and another local exhibitor, Sir GRANT LAWSON, Bart., Middlethorpe Lodge, York, followed.

The best pot plants of Calceolarias were shown by S. LEETHAM, Esq., Elm Bank, York (gr. Mr. Geo. Skill). 2nd, Rev. Canon ARGLES, St. Clement's Rectory, York (gr. Mr. W. Ettey).

Tuberous-rooted Begonias in pots were best shown by Mr. T. WINN, Ratcliffe Street, York: they were beautifully flowered specimens and very large. 2nd Mrs. A. AKENHEAD, Acomb Park, York (gr. Mr. R. W. Leadhill).

For eight Gloxinias in pots the 1st prize was awarded to Dr. R. APPLETON, The Bar House, Beverley. 2nd, Sir J. GRANT LAWSON, Bart. (gr. Mr. J. Dobson).

PELARGONIUMS.—Large trained specimens of these plants were shown in considerable numbers; gaunt, ungainly examples of most

unnatural training. For six plants of the show section Mr. JOHN WEDGEWOOD, 159, Burton Lane, York, was 1st. For 12 Zonal Nosegay or Hybrid Nosegay Pelargoniums Mr. HENRY PYBUS, Monkton Moor, Wormald Green, led, and for six plants of the same types Mr. HENRY PYBUS was again placed 1st. Other winners in the classes for Pelargoniums were Mr. J. W. CLARKE, 13, Skelton Street, Clifton, York, and Mr. F. W. CROWTHER, York.

Large Fuchsias were very freely flowered, especially those shown by Mr. JOHN CLARK, 13, Skelton Street, Clifton, York. The plants were pyramidal trained and of well-known kinds. 2nd, Mr. W. KETTLEWELL, Horner Street, York.

ROCK-GARDEN EXHIBITS.

These are always an important feature at the York shows, and on this occasion there were five exhibitors, the displays occupying the whole length of one of the largest tents. The main contest lay between three competitors, but Messrs. JAS. BACKHOUSE & SON, York, had no difficulty in securing the premier award. Their group was a splendid representation of a rock-garden, large blocks of sandstone, many weighing two hundredweight, being admirably disposed and the planting was carried out with suitable subjects. A jutting portion in the centre divided two large receding bays, and at one end—rather higher than the other parts—a stream trickled down a gully from which Ferns peeped out, the water falling into a basin planted with Nymphaeas. The background was of Rambler Roses, *Acer californica*, Bamboos, with *Eremuri* interspersed. The rockery proper had bright patches of *Aubrietias*, Saxifrages, *Aquilegias*, *Incarvillea Delavayi*, *Dianthus caesus grandiflora*, *Edraianthus pumilio*, *E. serpyllifolius*, *Aster alpinus speciosus*, *Primula sikkimensis*, *P. japonica*, *Cypripedium spectabile*, *C. acaule*, *C. hirsutum*, and *C. montanum*. There was also a wealth of *Azaleas*, *Gerbera Jamesonii*, *Rhododendrons*, *Lupins*, *Wistaria*, &c. It was a boldly-designed scheme, and very effective; perhaps the stonework was a trifle obtrusive. It was a keener fight for the 2nd prize, but the judges decided in favour of Messrs. W. ARTINDALE & SON, Sheffield. Their exhibit was a capital representation of a rock-garden, boldly designed and planted effectively. A pool, with rustic bridge entwined with Ivy, was a pleasing feature, and especially fine was the background of *Eremuri*, *Rhododendrons*, *Roses*, *Acer Negundo* and other tall plants. Disposed in crannies and nooks were Ferns, Saxifrages, *Irises*, very fine pink-flowered *Spiraeas*, *Campanulas*, *Anemones*, *Primulas*, *Liliums*, and many others. 3rd, Mr. S. PICKERING, Rosslyn Street, Clifton, York. This group had a large water basin at the foot of the stonework, a stream of water supplying it from one corner of the group, flowing past Ferns, Saxifrages, *Myosotis*, *Mimulus*, and overhung with *Acers*, *Lupins*, *Aquilegias*, &c. In the exhibit were also *Irises*, *Poppies*, *Paeonies*, some very choice *Aquilegias*, *Pyrethrums*, Bamboos, Conifers, *Acers*, *Prunus pissardi*, and numerous other elegant shrubs.

ROSES.

Exhibits of Roses were plentiful and generally of good quality, especially in the more important classes for cut blooms.

Several good groups were seen. The best collection staged for effect was shown by Mr. WM. TODD, Haxby Road, York, mainly of well-known varieties of Hybrid Perpetual kinds and taller pillar plants as foils. 2nd, Mr. J. E. SKAIFE, 60, Clarence Street, York.

Another class was for a group of pot Roses with decorative plants, including Ferns. The premier prize was taken by Mr. LANGSTAFFE, 16, Sydney Street, York, a fine row of the *Polyantha* variety, *Mme. N. Levasseur*, forming a pleasing border. 2nd, Mr. J. E. SKAIFE, Clarence Street, York, who utilised Rambler kinds at the back and in the centre of the display.

The largest class for cut Roses was for 72 blooms. There were three exhibitors, and many choice flowers were shown. Mr. G. MOUNT, Canterbury, showed the finest blooms, having well-known kinds, such as Richmond, Mrs. John Laing, Kaiserin A. Victoria, *Mme. Constance Soupert*, Frau Karl Druschki, Liberty, &c. 2nd, Mr. GEO. PRINCE, Oxford, who had many good flowers, Lady Ashtown, Anna Olivier, Mrs. Ed. Mawley, and Betty being noteworthy

In the class for 48 blooms, the most successful exhibitors were Messrs. W. & J. BROWN, Stamford and Peterborough. 2nd, J. D. HUTCHINSON, Esq., Crown Square, Kirby Moorside.

Mr. GEO. MOUNT was 1st for 24 blooms, followed by Mr. ELISHA J. HICKS, Twyford, Berks; but the names were reversed in the class for 18 blooms. There were numerous other classes for Roses.

ORCHIDS.

MESSRS. JAMES CYPHER & SONS, Cheltenham, were the only exhibitors in a class for a table of Orchids measuring 12 feet by 5 feet. The exhibitors were allowed to employ dwarf plants and cut blooms, either in baskets, glasses, or from a base of moss, the object being the obtaining of an effective display. The group was admirable both in its composition and staging, and worthily received the 1st prize. Among the best plants were displayed *Miltonia vexillaria* in number, light and dark-coloured varieties; *Lælio-Cattleya Canhamiana*, *Odontoglossum crispum*, *Cypripedium bellatulum*, *C. callosum*, *Sanderæ*, *Dendrobium Dalhousieanum luteum*, *Epidendrum prismatocarpum*, *Lælia purpurata*, &c.

Messrs. JAMES CYPHER & SONS, Cheltenham, carried off the premier prize for a collection of 10 Orchids of distinct varieties, having *Thunia Marshalliæ*, with 12 fine flower-spikes; *Miltonia vexillaria*, bearing 30 flowers; *Lælio-Cattleya Canhamiana*, with 10 flowers; a nice specimen of *Anguloa Clowesii*, with four blooms; *Epidendrum prismatocarpum*, &c. 2nd, W. P. BURKINSHAW, Esq., The West Hill, Hessele (gr. Mr. J. T. Barker). This gentleman had *Miltonia vexillaria* Hessele variety, *Odontoglossum crispum*, *Brassia-Cattleya Maronii*, *Cattleya-Mossia Reineckiana*, &c. 3rd, Mr. W. VAUSE, Leamington.

The best six Orchids in bloom were staged by Messrs. JAMES CYPHER & SONS. They were *Miltonia vexillaria*, with 30 flowers; *Lælio-Cattleya Canhamiana*, with 10 blooms; and *Lælia tenebrosa*, carrying 10 flowers. Mr. BURKINSHAW was awarded the 2nd prize, with *Cypripedium Schillerianum* as his finest specimen.

For the best three Orchids in bloom Messrs. JAMES CYPHER & SONS were placed 1st with *Lælio-Cattleya Canhamiana* (16 flowers), *Miltonia vexillaria* (50 flowers), and *Thunia Marshalliæ* (10 flower-spikes). 2nd, Mr. BURKINSHAW.

In the remaining three classes for Orchids Mr. BURKINSHAW won all the 1st prizes.

CUT FLOWERS.

Collections of cut flowers from the open garden occupied considerable tabling in one of the largest tents. One class was for a group measuring 15 feet by 6 feet. Four exhibitors entered, all nurserymen, and their flowers made a fine display in their bright patches of scarlet *Poppies*, *Pyrethrums*, *Heucheras*, *Lupins*, *Polemonium*, *Irises*, and the many other subjects now in season. The best display was adjudged to be that shown by Messrs. HARKNESS & SONS, Bedale, Yorkshire. 2nd, Messrs. WM. ARTINDALE, Nether Green, Sheffield.

For a smaller collection, restricted to 24 bunches, Messrs. HARKNESS won very easily, and they were followed by Messrs. G. GIBSON & Co., Leeming Bar, Bedale.

The best 12 bunches of hardy flowers were put up by Mrs. PROUD, East Layton Hall, Darlington (gr. Mr. G. Finlay). 2nd, Marquis of NORTHAMPTON (gr. Mr. Searle).

FRUITS AND VEGETABLES.

The most important class in this section was one for a table arranged with flowers and fruits. The schedule allowed 14 dishes, including Grapes, Peaches, Nectarines, Figs, Plums, Strawberries, Cherries, and one each of Melon and Pineapple. The Grapes were to include two bunches each of black and white varieties. Beauty of flowers and foliage and the general effect were to be considered by the judges when making their awards. Three exhibitors competed, viz. Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson); Marquis of NORTHAMPTON, Castle Ashby, Northampton (gr. Mr. A. R. Searle); and Earl of HARRINGTON, Elvaston Castle (gr. Mr. Goodacre), the prizes being awarded in the order of the names. It was possible to obtain 136 points, and of this number the 1st prize-winner obtained 113. The fruits were remarkably fine produce. *Bigarreau de Schrecken* Cherries, *Bellegarde*

Peaches, Lord Napier Nectarines, large Brown Turkey Figs, Jefferson Plums, and a magnificent Melon of the Hero of Lockinge variety being the more notable. The floral arrangement was rather heavy, although a free use of greenery served to throw the fruits into greater relief. The 2nd prize group was a great success from a decorative point of view. *Odontoglossums*, lightly intermixed with *Selaginella* and *Lælio-Cattleyas* in small vases, were very pretty. Early Rivers Cherries, Brown Turkey Figs, Stanwick Elruge Nectarine, *Grosse Mignonne* and other Peaches, and an excellent Melon are a selection of the best fruits. The Earl of HARRINGTON (gr. Mr. J. H. Goodacre) was a close 3rd, his exhibit being only half a point inferior to the 2nd prize group.

A collection of fruits to include ten kinds.—The better of two exhibits was from the gardens of Baron DE FOREST, Londesborough Park (gr. Mr. J. C. McPherson). A very choice Melon, Cardinal Nectarines, Barnack Beauty Apples, and a Queen Pine were the best dishes. 2nd, the Earl of HARRINGTON (gr. Mr. Goodacre). A large seedling, yellow-skinned Melon was prominent; also good Black Hamburg Grapes, Rivers' Early Nectarines, and Hale's Early Peaches.

In the class for a collection of six kinds, Mr. J. BRENNAND, Baldersley Park, Thirsk (gr. Mr. J. E. Hathaway), led, having some well-finished bunches of Buckland Sweetwater Grapes, good Royal George Peaches, &c. 2nd, Baron DE FOREST.

Mr. BRENNAND was also 1st in the class for a collection of four kinds of fruits.

GRAPES.—The best black Grapes were shown by Lady HAWKE, Wighill Park, Tadcaster (gr. Mr. H. Bray), the variety being Black Hamburg. 2nd, Lady BEAUMONT, Carlton Towers, York (gr. Mr. Wm. Nicholls), with the same variety. The best white Grapes were large-berried, but rather green bunches of Buckland Sweetwater, shown by Lord HOTHAM, Dalton Hall, Beverley (gr. Mr. W. Jackson). 2nd, J. BRENNAND, Esq. (gr. Mr. J. E. Hathaway), with Buckland Sweetwater.

MELONS.—The best scarlet-fleshed variety was shown by the Earl of HARRINGTON (gr. Mr. Goodacre). 2nd, Duke of PORTLAND (gr. Mr. J. Gibson). The best fruit of green flesh was staged by W. D. CLIFF, Esq., Meanwood Towers, Leeds (gr. Mr. Wm. Hague); and the best of the white-fleshed kinds by W. C. GRAY, Esq., Tunstall Manor, West Hartlepool (gr. Mr. T. Pattison).

VEGETABLES were plentifully exhibited. In a class for a collection, the prizes being given by Messrs. Webb & Son, Wordsley, Stourbridge, the Marquis of NORTHAMPTON (gr. Mr. A. R. Searle) was an easy 1st prize-winner, and he also won in Messrs. Backhouse's class, having a splendid exhibit. In Messrs. Sutton's class this exhibitor was beaten by the Duke of PORTLAND (gr. Mr. Gibson), but both had excellent produce. Mr. Gibson's Cauliflowers and Peas were very fine. Mr. Searle showed some of the best Tomatos in the exhibition; also good Cucumbers and Carrots.

NON-COMPETITIVE EXHIBITS.

Messrs. SUTTON & Sons, Reading, had a very attractive group of Melons, Tomatos, herbaceous *Calceolarias*, *Clarkia pulchella*, *Nigella Miss Jekyll*, &c. (Gold Medal.) Mr. CHAS. W. BREADMORE, Winchester, staged Sweet Peas and Carnations. Mr. C. F. WATERS, Balcombe, Sussex, showed Carnations. Messrs. LANTON BROS., Bedford, showed Bedfordshire Champion and Royal Sovereign Strawberries, also Peaches and Nectarines. Messrs. BEES, LTD., Mill Street, Liverpool, showed *Primula Bulleyana* in numbers. Messrs. WEBB'S, Stourbridge, exhibited Melons, Tomatos, *Gloxinias*, *Coleus*, Sweet Peas, &c. (Gold Medal.) Messrs. W. & J. BROWN, Stamford and Peterborough, showed Roses and greenhouse plants. Messrs. R. H. BATH, LTD., Wisbech, had a fine display of herbaceous plants and Carnations. Messrs. WM. CUTBUSH & Sons, Highgate, London, showed Carnations, *Eremuri*, *Coleus Cordelia*, *Ericas*, Rambler Roses, &c. (Gold Medal.) Messrs. CLIBRANS, Altrincham, had a big group of their new *Calceolaria*, which received a First-class Certificate. Messrs. JAS. BACKHOUSE & SON, York, staged greenhouse flowering plants, also floral devices, and in the open park ornamental trees, shrubs and hardy flowering plants. (Gold Medal.) Messrs. KELWAY & SON, Langport,

Somerset, showed Pæonies, Pyrethrums, and a yellow-flowered Lupin. Messrs. MOORE, LTD., Rawdon, Leeds, were awarded a Silver-Gilt Flora Medal for a group of Orchids, including *Phalenopsis Rimestadtiana*, *Odontoglossum Rolfei*, *Brasso-Cattleya Thorntonii*, and *Angraecum Sanderianum*. Messrs. JOHN FORBES, LTD., Hawick, showed hardy flowers, including *Pentstemons*, *Phloxes*, *Pansies*, and *Antirrhinums*. Messrs. DOBBIE & Co., Rothesay, displayed *Aquilegias*; also *Violas*, *Pansies*, and show *Pelargoniums*. Mr. H. N. ELLISON, West Bromwich, showed Ferns in variety. Messrs. ROBERT SYDENHAM, LTD., Tenby Street, Birmingham, showed Sweet Peas and a table decorated with *Carnations*. Mr. THOS W. DARLINGTON, Warton, Carnforth, had Sweet Peas. Messrs. LADHAMS, Shirley, Southampton, exhibited *Pinks*, *Scabious*, *Heucheras*, *Gaillardias*, *Lupins*, &c. Messrs. JARMAN & Co., Chard, showed Zonal *Pelargoniums* and a new Sweet Pea. Messrs. DICKSONS, Chester, staged herbaceous plants and *Carnations*. Messrs. WM. ARTINDALE & SON, Nether Green, Sheffield, showed *Violas*, *Carnations*, and *Poppies*. Sweet Peas were shown by Miss HEMUA, Holdfast Hall, Upton-on-Severn. Messrs. FRANK LILLEY & Co., Guernsey, staged bulbous flowers. Messrs. THOS. RIVERS & SON, Sawbridgeworth, Herts., put up a group of fruit trees in pots, showing excellent *Peaches*, *Nectarines*, *Cherries*, *Plums*, and *Oranges*. (Gold Medal).

GHEENT HORTICULTURAL.

JUNE 7.—At the monthly meeting of the Chambre Syndicale des Horticulteurs Belges et la Société Royale d'Agriculture et de Botanique de Gand, held on the above date, the following awards were made to new plants:—

CERTIFICATES OF MERIT to *Lælio-Cattleya Endora* (*Lælia purpurata* × *Cattleya Mendelii*) and *Cattleya Withei*, both exhibited by M. VERDONCK; *Odontoglossum crispum Prince d'Orange*, *O. crispum* var. *Bemel*, *Miltonia vexillaria striata*, *Odontoglossum Lambaeanum splendidissimum*, *O. crispum maximum*, *Miltonia vexillaria gigantea*, all from M. F. LAMBEAU; *Brassovola flagrans* × *C. Mendelii*, *Odontoglossum crispum* "Alma," exhibited by M. le Dr. BALLION; *Ansellia Congoensis*, shown by M. F. DE BIEVRE; *Miltonia Bleuana nobilior*, exhibited by M. le Comte J. DE HEMPTINNE; *Cattleya Schröderæ* var. *Mont Blanc* and *Vanda cœrulea* var. *Rex*, exhibited by M. E. PRAET; *Cattleya Mendelii* (blue lip), exhibited by Messrs. STUART LOW & Co., London; *Rhododendrons* Mdle. *Marguerite Nanot*, Mdle. *Albert Moser*, M. *Auguste Pellerin*, *Comtesse E. de Dreux-Brezé*, Mme. *Fritz Benary*, and *Marquise de Chasseloup-Laubat*, all shown by M. PYNART-VAN GEERT; *Ficus australis* fol. var., exhibited by M. L. DE SMET-DUVIVIER; *Anthurium* Mme. *Dallière* var. *eximium*, exhibited by Mme. DALLIÈRE; *Anthurium Scherzerianum* *superbissimum* and *A. Rothschildianum Goliath*, both exhibited by LOUIS DE SMET; a strain of *Gloxinia*, shown by M. le Comte J. DE HEMPTINNE; *Strelitzia Regine*, from M. V. HEURSEL; *Codiaeum* M. *Banse*, *Anthurium Hookeri*, *Codiaeum* Mme. *Lucien Linden*, *Livistona altissima*, and *Anoëtochilus Petola*, exhibited by the SOCIÉTÉ ANONYME HORTICOLE GANTOISE; *Fejtoa Sellowiana*, exhibited by M. V. HEURSEL; *Bougainvillea glabra Sanderiana*, exhibited by Mme. DALLIÈRE; *Anthurium Andreanum*, *Souvenir de M. Hardy*, exhibited by M. LOUIS DE SMET; *Phœnix Roebelini*, exhibited by MM. DURIEZ FRÈRES; *Polypodium albo-punctatum*, *Tectaria Coriaceræ*, both exhibited by M. DUQUESNOY, and to a collection of 40 cut blooms of *Iris*es exhibited by M. le Dr. BALLION.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

JUNE 14.—The monthly committee meeting of this society was held at the Horticultural Hall, Vincent Square, Westminster, on the above date, Mr. Chas. H. Curtis in the chair.

Seven new members were elected, making a total of 34 for the six months this year.

Sickness among the members has been somewhat lighter, £37 4s. having been paid since the last meeting, against £65 7s. for the previous month. Several amounts of interest were paid to members over 60 years of age.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are mis-directed.

BEECH LEAVES: *Beech*. The *Beech* leaves arrived in a very unsatisfactory condition, with few living insects on them that could be identified. The trouble, however, is green fly, the cast skins of which cover the leaves. The sticky substance is honey dew from the green fly. There are also some honey fly larvæ present, but these are beneficial, and feed on the green fly. The remedy in this case is to spray with a paraffin emulsion. Green fly is unusually prevalent this year. You should have sent a fresh twig with the leaves and insects alive.

CHRYSANTHEMUMS: *W. Brown*. The variety *Nellie Pockett* should be pinched on June 20, *W. Duckham*, *Mrs. Barkley*, and *Mrs. E. Thirkell* on June 15, and *General Hutton* on June 20. *Lady Hanham* should be flowered on the second natural crown, and *Godfrey's King* on the first natural crown. In the case of *Baron Hirsch*, "take" the second crown bud. *Souvenir de W. Clibran* requires to be stopped early in April and then flowered on the second crown bud. You had better "take" the natural crown bud.

FIG: *W. G.* There is no disease present. The injury is in some way due to the treatment the trees have received.

FLOWERING STOCK: *E. W.* There is no disease present. Something in the soil, such as an irritant fertiliser, has destroyed the roots.

GARDEN ROCKERY: *W. C. D. O.* The best type of rockery for your area would be either a stone-supported bank or winding shallow trench. If you decide upon a stone-supported bank, let its width be twice as great at some points than others, in order to diversify the surface. Throw up soil into hillocks and connect each by graduated declivities, then support the soil in position by stone or other material. If you decide to have a winding trench, let this be V-shaped and twice as wide at some point or points as at others. This arrangement will give you sharp slopes and others less abrupt—stone being used to form ledges and to retain the soil in position. You would do well to start with plants of easy growth, and as you gain experience, add to the collection. To begin with try *Arabis*, *Aubrietia*, *Lithospermum prostratum*, *Primula farinosa*, *Arenarias*, *Alpine Wallflowers*, *Muscari*, bulbous *Iris*es of the *reticulata* group, *Phlox setacea* and *Stellaria* in variety, *P. divaricata* and *canadensis*, *Helianthemums*, particularly the double scarlet "coccinea," *Gypsophila repens* and *cerastioides*, *Sedums* and *Saxifragas* of the encrusted section. Try also *Waldsteinias*, *Omphalodes verna*, *Bellis sylvestris*, *Geum montanum*, *Dianthus* in several "cushiony" species, *Ethiopia Arendsii* and *eximea*, *Arnebia echioides*, *Potentilla fulgens* and *formosa*, *Plumbago Larpentæ*, *Nepeta Mussinii* and *Linarias alpina* and *rosea*. The 12 plants last named are effective from June onwards.

HAWTHORN: *J. T.* Most of the buds have failed to expand. Fork the ground over as far as spread of roots and apply manure. We cannot find evidence of any disease.

LILIAM: *Zebra*. The plants are affected with the Lily disease (*Botrytis cinerea*). It cannot be said that any remedy for this disease has been

found. The plants may be sprayed very early in the spring with a weak solution of potassium sulphide, or dusted with flowers of sulphur, but the results hitherto have not been very satisfactory. Attempts have been made to treat the bulbs with sulphur before planting them, in order to kill any fungus infecting them, but it is not known that such treatment has had the effect of converting diseased bulbs into bulbs capable of making satisfactory growth. Cultivators, therefore, are advised to burn infested plants, and after procuring fresh stock from an uncontaminated source, to plant in a fresh situation as far from the old site as circumstances will permit.

NAMES OF PLANTS.—Enquirer. 1, *Aristolochia Siphio*; 2, *Jasminum humile*; 3, *Iris neglecta* "Hannibal"; 4, *Iris*, flower too withered for identification. — *S. Leucothoë racemosa*. — *W. J. Pyrus Aria*. — *H. F. G.* 1, *Spiræa nudiflora*; 2, *Jasminum fruticosum*; 3, *Spiræa media*. — *F. H. H.* 1, *Oncidium sarcodes*; 2, *Oncidium pubes*; 3, *Oncidium flexuosum*, 4, *Oncidium excavatum*; 5, *Pteris tremula*; 6, *Selaginella involvens*. — *R. T. H.* 1, *Dendrobium clavatum*. Thanks for sending a good specimen with part of a pseudo-bulb. 2, *Dendrobium transparens*. — *Constant Reader*. 1, *Acerides odoratum*; 2, *Muscari comosum* variety *monstrosum*, a remarkable instance of fixed abnormal characters. — *A. E. S.* 1, *Coleogyne ochracea*; 2, *Lonicera involucrata* (*Ledebourii*). — *P. T. G.* A *Stanhopea*, but which species it is impossible to tell without seeing a flower. — *F. H.* 1, *Odontoglossum Coradinei*; 2, *Odontoglossum Wilckeanum*; 3, *Odontoglossum mulus*; 4, would probably be called a spotted *Odontoglossum crispum*, and it is very near to true *O. crispum*, although it is more likely to be an imported plant of *O. Fascinator* (*crispum* × *Adriane*) from the district in which both grow together. The others you send also have peculiar features.

PEACH LEAVES: *W. E. W.* These are attacked with the Peach leaf blister disease, caused by the fungus *Eoascus deformans*. See reply to *Wales*, in *Gardeners' Chronicle* for June 5, p. 372.

ROSES: *H. E. W.* The trouble has probably been caused by cold winds and ungenial weather. If the condition continues we shall be glad to examine fresh specimens.

TOMATOS: *Worried*. If you will send specimens of the caterpillars we will endeavour to help you. — *B. T. A.* The fungus *Ascochyta* is present. It is a destructive parasite. Destroy diseased plants and spray the lower part of the stem of the remaining plants with the Bordeaux mixture, soaking the soil with the same mixture.

TOMATOS DISEASED: *F. W. and Anxious*. The fruits are affected with *Macrosporium solani*. The fungus gains admittance through the style, and when once the berries are affected the damage is done. Burn all diseased fruits.

WATER GARDENS: *Aqua*. There are water gardens at the Botanical Gardens at Birmingham, Glasgow and Edinburgh, and at such private country seats as Rufford Abbey, Worksop, Carberry Towers, Musselburgh, and many others. The plants grown in these Midland and Northern water gardens do not differ materially from those cultivated in the south, but such tender plants as *Nymphaea odorata* and pygmæa in their many forms do not succeed. *Mariae's* hybrid Water Lilies (excluding the odorata group) are successful, whilst many of the water-loving *Primulas*, *Polygonums*, *Spiræas* and *Astilbes*, *Cimicifugus*, *Dodeca-theons* and *Iris*es are often seen in stronger growth than in southern gardens. *Iris Kämpferi* excepted. The use of many ponds for winter sports in the North, Midlands and Scotland has not helped water gardening to attain the popularity it enjoys in the south. The climate is not by any means the principal deterrent.

DARWIN.

WHILE our number has been passing through the press the University of Cambridge has celebrated the centenary of Charles Darwin's birth and the jubilee of the publication of the *Origin of Species!* When a century has rolled by with three generations of men since an illustrious man was born and his memory is still venerated by his fellow-countrymen, he has received such measure of immortality as it is in the power of mankind to bestow. And the jubilee of a book stamps it with the mark of permanent vitality which makes it a classic. Although Darwin's university and college were the natural seat of the celebration, it was no local one. With a splendid enthusiasm every country in the civilised world has sent delegates to carry its sympathy and respect. For Darwin's place in the affection of mankind has been earned by something more than scientific achievement. The supreme nobility of his character, as revealed to us in the *Life* which we owe to the pious labour of his son, is an ethical message to the human race. Where shall we find so earnest and lifelong assiduity in work, so patient and uncomplaining submission to ill-health, such modest diffidence, so serene an indifference to praise or blame, so lofty a communion with Nature in its more intimate secrets?

The hearts of the readers of this journal will go out to Cambridge. Those of an older generation will remember that Darwin was a not infrequent contributor to its pages. But all may remember with some natural pride that, more than elsewhere, he found in them an almost inexhaustible store of observation which he could use to test, to support and to illustrate his conclusions.

Much will be said, much has already been said, as to the illuminating insight with which Darwin broke new ground in every part of the biological field as well as in geology. This is not the place to discuss so vast a theme. But we may dwell with gratitude on what he accomplished in the study of plant life and inci-

dentally for horticultural science. The note that runs through all this, as through the rest, is its absolute originality, freedom from prepossession and from the trammels of traditional theory. The scientific, like every other mind, is apt to get into a groove and to be surprised and hurt when required to leave it. This was the continual difficulty which Darwin had to face in obtaining a hearing. In the conclusion of the *Origin* he says rather sadly:—"I by no means expect to convert experienced naturalists' . . . but I look with confidence to the future to young and rising naturalists." *Securus judicat orbis terrarum*, and to-day the world replies that his confidence was not misplaced.

Darwin, and in this respect he may be compared with Faraday, always looked Nature squarely in the face and with gentle persuasion extorted her secrets. He would not have succeeded had he not been gifted with great intellectual power; and this he inherited from a family of more than average ability. But it would have availed little without qualities which were personal to himself. With a perfectly open mind, he possessed a fertile imagination which he learnt to keep in severe discipline and an incomparable industry "in the observation and collection of facts." He tells us in his autobiography:—"I have steadily endeavoured to keep my mind free so as to give up any hypothesis however much beloved (and I cannot resist forming one on every subject), as soon as facts are shown to be opposed to it."

When a problem proved intractable he was fond of attacking it by what he would call "a fool's experiment." This has been found a hard saying. But great discoveries have sometimes been made in a haphazard way when the observant eye was present to note them. And the response to an extreme change of conditions may sometimes reveal an unexpected clue. Perhaps behind there was a half-humorous hope of catching Nature napping.

How to educate is a question that still baffles us. When Darwin was sent to Cambridge with the intention of taking orders he tells us that his "probable destination" had seemed to be that of "an idle sporting man." In the flush of youth and of health that had not then deserted him, he hunted and shot and, like thousands before and since, spent a happy time, to which, in his later years, he still looked back with "much pleasure." It was human that he should do so. But as he tells us himself, there must have been something in him "a little superior to the common run of youths." And though academic routine yielded him nothing but a creditable pass degree, out of this "something" Cambridge built the foundations of the Darwin that we know. The interest of the process lies in the fact that it was due to personal influence and contact, and that this is only possible in the atmosphere and easy intercourse of a university. Darwin obtained the friendship, never relaxed in faithfulness, of Henslow, "my master in natural history," and through him made the acquaintance of Adam Sedgwick and of the omniscient Whewell. Mere physical enjoyment did not stand in the way of his receiving the most inspiring impulses perhaps available anywhere at the time. Geology, through Sedgwick, had got a firm grip of him. He was bent on visiting Teneriffe when Henslow secured for him the post of volunteer naturalist on board the "Beagle."

Darwin sailed with the ordinary traditional belief in the immutability of species. That they must "gradually have become modified" seems to have first suggested itself to him when he observed in South America that the fossil animals were obviously allied to, though different from, the existing animals. When he visited the Galapagos Archipelago and found that the animals and plants in the different islands were closely related but distinct, he says, "I fancied myself brought near to the very ace of creation." And the idea flashed across his mind that the explanation was to be found in descent with modification. This, of course, was evolution. A distinguished German, Professor Witt, has recently called it "the flaming truth . . . given to humanity by one of the greatest minds that ever stood up amongst men."

There is often an inclination to assert that it was all that Darwin actually achieved. This was far from his own opinion: it would eliminate Darwin from Darwinism. While at Cambridge he had read Paley's *Natural Theology*, which gives copious examples of adaptive structures. It is interesting to note that Paley had been a member of his own college. Darwin tells us that until adaptations "could be explained it seemed to me almost useless to endeavour to prove by indirect evidence that species have been modified." The explanation came to him in 1838, as it did subsequently to Wallace, on reading Malthus, and he saw that "natural selection was the inevitable result of the rapid increase of all organic beings."

The next 20 years were spent with indefatigable labour in testing the theory by applying it to all the facts of organic nature. The results were to have been given to the world in three large works, of which only one, *Animals and Plants under Domestication*, was ever published. Their place was taken in 1859 by the *Origin*, an abstract which, "as my health is far from strong," he had been "urged to publish." This was fortunate for science. For, as Darwin tells us, it "is one long argument from the beginning to the end, and it has convinced not a few able men." Huxley's reflection was:—"How extremely stupid not to have thought of that." It is the merit of a great idea that as soon as it is announced it seems obvious. The extended works might possibly not have gripped men's minds in the same way.

The essential point in Darwin's theory is that the modification of species is produced by the accumulation of inherited small favourable variations. The organism is thus kept in adjustment to the surrounding conditions and changes with them. Some have thought, like De Vries, that the process is too slow and that species must be produced by sudden and abrupt variations. But, as Darwin pointed out, it is improbable that these would be always favourable, and though they undoubtedly occur in Nature, they are rarely able to maintain themselves. Under cultivation we are familiar with them, but they are only perpetuated by the art of the cultivator. To call small inherited variations "mutations" is a mere question of words.

Darwin was not a technical botanist, but he had been a pupil of Henslow's and his love of plants was profound. "It has always pleased me," he says, "to exalt plants in the scale of organised beings." There is a passage of great beauty in his *Journal of Researches*, in which he describes the

impression made on him by a tropical forest. But his thoughts were fixed upon the plant world for another reason. Writing to Romanes about another investigator, he said he "makes, I think, a gigantic oversight in never considering plants; these would simplify the problem for him."

We need not be surprised therefore that in the *Origin* he dwells with constant emphasis on the facts presented by the vegetable kingdom. Incidentally he gave for the first time a rational theory of plant distribution, "that grand subject, that almost keystone of the laws of creation," as he called it; he vastly increased our knowledge of the means of seed dispersion; he showed that classification is founded on descent, and that the sterility of hybrids is independent of affinity. Towards the end of his life he became more and more occupied with botanical problems. This was partly a recreation from more laborious work, partly to show how cases otherwise difficult of explanation could be brought under the theory.

At a very early period Darwin was led to attend to the cross-fertilisation of flowers by the aid of insects, as it seemed probable to him that crossing played an important part in keeping specific forms constant. Through Robert Brown he became acquainted with the forgotten work of Sprengel, who was the first to show the part played by insects in pollination. Darwin rescued for him a belated fame. For his own part he showed that Orchids for the most part exhibit the most elaborate adaptations to cross-fertilisation. Ultimately he was led to the result that "it is a general law of Nature that flowers are adapted to be crossed, at least occasionally, by pollen from a distinct plant." And he further made the discovery, the importance of which cannot be exaggerated, that seedlings of self-fertilised parentage are inferior in vigour to those of cross-fertilised. On the other hand he was able to show that if it is desired to fix a fleeting variety this can only be done by repeated self-fertilisation. The impulse Darwin gave to the study of the subject has been enormous. There was little before but Sprengel, and he had been neglected. Knuth's recently published handbook enumerates 3,792 papers.

The investigation of the meaning of thrum-eyed and pin-eyed Primulas was a masterpiece of investigation. Darwin regarded it with not unnatural pride. "I do not think anything in my scientific life has given me so much satisfaction." But the theoretical significance of the result went much further. For the two forms of the same species behave exactly as if they were species of different genera. It is a conclusive proof that sterility or fertility have no relation to affinity. This was a stumbling block both to Huxley and Romanes, who could not rid their minds of the belief that sterility was a specific criterion. Orchid growers have now shown us that things as diverse as three genera can be combined in one hybrid.

The species problem, as it presented itself to Darwin at the start, was to account for differences of external form. But as soon as he grasped the explanation that these were adaptive, i.e., useful to the organism, it became necessary to show in what way. His standpoint shifted insensibly from the morphological to the physiological. The transition is seen in his researches on climbing plants. The advantage to a climber of being able to reach the light with the least expenditure of

material is obvious. Darwin traces in a masterly way the adaptation of the most diverse organs to the purpose. But this brings him face to face with response to stimulus and spontaneous movement, things which we had been accustomed to regard as peculiar to animal life. He opened a path which has been followed with no small success by his son, Dr. Francis Darwin, and already it promises to carry us very far indeed.

Pangensis was one of Darwin's more remarkable speculations. It was a bold induction from facts such as could only be arrived at by a mind of genius, but the microscopical knowledge of the time was insufficient to give it corroboration. Yet it contained the fundamental conception that hereditary characters are carried over by particles which can multiply by division. Darwin's hypothesis that these could be transferred to the reproductive cells from the general body of the organism is now abandoned. But that he conceived a material mechanism for heredity will remain everlastingly to his credit.

It must always remain a matter of regret that Mendel's memorable discoveries remained dormant during Darwin's lifetime, and never came to his knowledge. The separation of unit characters in hybrids implies their transmission by material particles. That this is of much importance in Nature seems improbable, but of its occurrence in cultivated plants the evidence is overwhelming. Darwin was obliged to assume variation and heredity as facts, leaving their explanation to the future. Terrestrial conditions are now stable whatever they may have been in the past, and the process of variation in Nature mostly eludes observation. But cultural conditions unlock the bonds, and it is in our gardens that the secrets of variation and heredity will be revealed.

Darwin was attracted to insectivorous plants partly by adaptive structures of a singularly striking kind, but most of all by the underlying physiological problem. In showing that plants possessed a digestive ferment similar to that of animals, he once more drew closer the vital phenomena of the two kingdoms, and opened a new field of investigation which has been fertile of results of the deepest significance.

Darwin's grave lies by that of Newton, Cambridge's other greatest son. As Wallace has justly said, "he was the Newton of natural history." The one introduced a rational order into the inorganic, the other into the organic world. But Darwin did more: he created Biology, the intelligent study of living things. We no longer regard a plant in Nature as a whimsical creation, but see in it the perfect adjustment of form and function, brought about by natural agencies.

Looking back on this great chapter of scientific history, it is interesting to note that it all belongs to Cambridge. Paley and Malthus sowed the seed: Darwin grasped the flower. For the germ of the whole matter is in Paley's conclusion, "no organ will be formed for the purpose of causing pain or doing an injury to its possessor." *W. T. Thiselton-Dyer.*

DARWIN AND THE "INDEX KEWENSIS."

THE last work initiated by Darwin was that which is known under the above title. It was begun when the great exponent of evolution had entered upon the last few months of life. Though he did not live to

see even the early stages of a long and arduous task, his wishes were known to his family and were most scrupulously carried out.

It was early in December, 1881, that Sir William Thiselton-Dyer first broached the matter to me, saying that if I could undertake the work of compiling a new edition of Steudel's *Nomenclator*, Mr. Darwin would be willing to devote a certain sum annually for its fulfilment. The magnitude and character of the prospect were alluring, so, after a few days' consideration, I explained my plans to Sir Joseph Hooker, and before the new year dawned the methods of procedure were broadly outlined and were approved by Darwin. Although a new edition of Steudel was all that was proposed, that is, with the new genera and species of 40 years from 1840 added, yet, from the very first I dwelt upon the absolute necessity of supplying references to the place of first publication. This plan, though favourably received by Sir Joseph Hooker as "quadrupling its value," he thought likely to hinder the progress of the work, but happily this was not allowed to stop the way, and after several weeks of preparation I began the actual work in February, 1882, with two young clerks as assistants.

For a work of this character there are two methods of procedure, (a) by intercalation of new matter, or (b) by writing separate slips and sorting into sequence. In this particular case I had no difficulty in selecting the better one to adopt, for at Kew there happened to be in the Library of the Herbarium a copy of Steudel's *Nomenclator* laid down in folio, with copious additions in manuscript. It was therefore possible to set out from this admirable base on the modified plan occasioned by our making the *Genera Plantarum* of Bentham and Hooker the groundwork as regards genera. Accordingly, specially-ruled half-sheets of foolscap paper were headed with the names of the genera retained, followed by those genera included in them, in every case with the references. The synonymic genera simply had their references, and a cross-reference to the retained genus.

When these sheets had been copied out they were alphabetically sorted, and placed flat in boxes which opened in front. The next step was to enter up all the species printed or written in the Kew Steudel. When this was begun the last part of the *Genera Plantarum* had not been published, so for monocotyledonous genera Steudel was the temporary guide. In due course, in 1883, when the last part of Bentham and Hooker came out, our sheets were collated and regulated with it.

After this came the insertion of references to the species. Whilst my assistants were busy on the work just described, I was hard at work searching the literature and drawing up lists of new species to be entered on our sheets. In this manner many false references were rectified. Beginning with Linnaeus, Richter's *Codex Botanicus Linnæanus* was of great use, though, as it contains no pagination suitable for our use, Linnaeus's actual volumes had to be used to complete the entries of the original place of publication.

By this time the manuscript had grown to its full proportions. Each genus was enclosed in a strong paper wrapper (or portfolio if thick), and laid flat in the boxes previously described, of which 168 were used and housed in a special stand in the Herbarium at Kew.

For revising these lists, certain authorities were used, relying upon the great experience

of Professor Daniel Oliver. After the first few years, a consultative committee used to meet every few weeks or months, consisting of Sir Joseph Hooker, Prof. D. Oliver, Mr. John Ball, the alpinist, and latterly Mr. W. B.

geographical distribution, so that by the autumn of 1891, after preliminaries, the work began to be printed by the delegates of the Clarendon Press, at Oxford. In round numbers 65,000 sheets were sent to press.

with the help of one to seven assistants, as the work needed it. The cost of compilation was wholly borne by the family of Mr. Darwin, and it was ever a matter of regret on my part that his life ended before any progress had been made on the last work originated by him, with the object of helping others in a field in which he had himself sometimes vainly sought for information.

I have endeavoured in the limits of a brief article to give a rapid and discursive account of an undertaking which at the time though hard and exhausting and apparently unending, can now be looked back upon, with all its imperfections, as a piece of work in the service of the botanic world on which I gladly spent the best years of my life. *B. Daydon Jackson.*

ORCHID NOTES AND GLEANINGS.

EULOPHIELLA ELISABETHÆ.

THE illustration (see fig. 178) of this beautiful Orchid is from a photograph sent by Mr. John Easter, gardener to Lady St. Oswald, Nostell Priory, Wakefield. Mr. Easter writes: "The plant has been grown from a single pseudo-bulb which was purchased some years ago. It has been grown in company with *Phalænopsis*, and has flowered regularly every season." It is pleasing to hear it thus well spoken of as a cultivated plant, for there are few who could give it such a good character. Since it was first imported in quantity from Madagascar in 1893 by Messrs. Sander and Sons, it has generally proved to be unmanageable for any great length of time, although occasionally a thriving plant of it is recorded. Nevertheless, it is clear that *Eulophiella Elisabethæ* may be grown satisfactorily, provided it receives proper conditions and treatment. It always does best in a warm, moist house having a uniform temperature throughout the year. In Mr. J. Gurney Fowler's collection a plant of this species has occupied the same sheltered corner for many years, and it continues to increase in vigour. The collector's original account of its habitat in Madagascar showed that it grows up the stems of trees, most frequently on tree Ferns. A healthy specimen in cultivation is an ornamental plant, even when not in flower, and when in bloom it is one of the most beautiful Orchids of its section, being totally distinct from any other. The large plicate green leaves are very graceful. The stout flower-scapes, which are tinged with purple, are sometimes 2 feet in length. The flowers last a considerable time in perfection. The segments are thick in texture and pure white, the reverse side of the sepals being tinged with purple, while the callus on the hinged labellum is yellow. A plant was first shown by Sir Trevor Lawrence, Bart., K.C.V.O., at the meeting of the Royal Horticultural Society on April 10, 1894, when a First-class Certificate was awarded it.

CATTLEYA MOSSIÆ "THE KING-EMPEROR."

A FLOWER of great size, fine shape, and very bright colour is sent us by Francis Wellesley, Esq., Westfield, Woking (gr. Mr. Hopkins), under the above name. It is a noble flower of the typical *C. Mossiæ* class. The petals measure 8 inches from tip to tip, and they are 2½ inches wide, both sepals and petals being of a warm rosy-mauve colour. The lip is large, and in a great degree it resembles that of *Cattleya Warszewiczii*, the front lobe being elongated and finely crimped. The base has yellow lines on a red ground; the front is mottled with violet-crimson and margined with lavender colour.

FIG. 178.—EULOPHIELLA ELISABETHÆ: FLOWERS WHITE, TINGED WITH PURPLE.

Hemsley, when difficulties were discussed and progress noted.

Comparatively early in the compilation it became evident that the departure from the plan of Stendel's *Nomenclator* was so great that the new work was simply an *Index*, for in addition to its register of references there was no attempt to transfer species from included genera, but only to enumerate those names which botanical writers had already ranged under the retained genera.

The revision, naturally, could not be critical; the amount of work to be got through did not permit of pausing for long over any one species. Time was running on, and the estimated period of compilation had extended from six years to ultimately nine and a half

From that date the routine was proof-reading in the forenoon, with collation of Sir Joseph Hooker's corrections from his proof sheet, and in the afternoon revising manuscript in advance. Two sheets weekly were passed through all their stages until, in 1893, the first fasciculus was issued, extending from *Aa* to part of *Dendrobium*. This partition, which called forth some criticism, was solely the work of the printers without consultation; besides dividing a genus, it made the next fasciculus unduly small. The proper division would have been that page 632 should have closed the part, as it came exactly midway in the volume and ended with *Cranichis*, page 633 beginning with *Craniorhiza* and a new signature.

FIG. 179.—HAVERING PARK, THE RESIDENCE OF MRS. CHARLOTTE MCINTOSH. (See p. 408.)

years. Mr. Ball gave certain notes he had made out, Mr. C. B. Clarke read through all the Cyperaceæ, Sir Joseph Hooker read through the manuscript and revised it for

The work was completed in 1895, and with the issue of the fourth fasciculus ended the period of 13 years and five months, the greater part of my time being devoted to it,

HAVERING PARK.

THE delightful residence of Mrs. Charlotte McIntosh is situated on a high elevation in one of the prettiest parts of Essex, at a distance of about three miles from Romford station. It commands extensive views to the south across the Thames on to Shooters Hill, and on the north to Epping Forest. The picturesque country church of Havering, which has a peal of six bells, is situated within a few minutes of the mansion. Havering Park is famous for its fine herd of Jersey cattle, of which Mrs. McIntosh is a successful exhibitor. The park consists of about 400 acres, is splendidly timbered and beautifully undulated. The principal trees include Oak, Elm, Chestnut, Beech, Scotch Firs, and Cedars. Extensive plantations have been made during the past 50 years, both for effect, shelter and game preserve.

The gardens, and particularly the pleasure grounds, are large, but much work is still in progress for extending and improving them. A magnificent avenue of *Sequoia gigantea*, about half a mile in length, which was planted about 50 years since, is a very striking and beautiful feature, many of the trees being extremely handsome specimens (see fig. 181).

Rhododendrons succeed remarkably well. Large

luna vulgaris, *Alportii*, *Ericas mediterranea*, *hybrida*, *vagans* and its variety *alba*, *vulgaris pilosa*, *mediterranea nana*, *vulgaris Serleii*, *cinerea rosea*, *cinerea alba*, and *carnea*. I may here mention that, although the surrounding land consists of a stiff clay, this particular part consists chiefly of sand and gravel.

Rock plants in large numbers find homes here in suitable positions. In the flower garden spring bedding is made a feature, and the plants were little the worse for the severe frosts experienced. The plants employed consist chiefly of Wallflowers of sorts, *Polyanthus*, *Aubrietias*, *Arabis*, *Pansies*, *Myosotis*, and large quantities of bulbs.

Many of the fruit houses have been replanted during the past three or four years. There are four good-sized vineries, the early house being planted with Black Hamburg, which was started early in the new year. The second and third houses were devoted entirely to Muscat of Alexandria. The latest house contains Black Alicante and Gros Colmar. All the borders had been renovated by the gardener, Mr. J. A. Cox, who has had charge of these gardens for the past three years. He has made great improvements generally, and especially in the fruit garden.

A large centre house in the same range con-

drons; especially fine were Countess of Haddington, Lady Fitzwilliam, R. Fosterianum and Princess Royal.

A Peach case, 160 feet in length, contained trees in a most promising condition. Other smaller houses were devoted to Cucumbers, Melons, Tomatos, French Beans and similar crops. A number of pits and frames were well filled with a good assortment of plants.

A long north house is found to be exceedingly useful for retarded plants, during the summer months especially. A large conservatory adjoins the house, in the centre of which was a very fine plant of *Kentia Belmoreana*, fully 30 feet high, and many other fine Palms.

The kitchen garden is not an extensive one, but a large portion of ground for vegetable culture is situated on another part of the estate. A particularly good lot of cordon Pears were to be seen here. Mrs. McIntosh takes a keen interest in all appertaining to the garden, and her wishes are well carried out by her gardener. B.

GROWERS AND THE BUDGET.

THE proposals for the taxation of land, as contemplated by the Budget now before Parliament, cannot fail to interest the horticulturist, and as the matter is somewhat complicated, a short explanation of the clauses which touch specially on this point may possibly be of use, although any discussion of either a political or a technical nature would be out of place in these columns.

From the horticultural point of view the three most important branches of the Finance Bill now before Parliament are those which seek to impose further taxation on land by means of (a) a tax on unearned increment; (b) a tax on undeveloped land, including (c) a tax on gardens exceeding one acre in extent, all of which are quite distinct in their effect and must be separately considered.

INCREMENT TAX.

It is proposed in the first place to levy a duty of 20 per cent. on all capital profit accruing to any person having an interest in land (i.e., either freehold or on lease for seven years or more), by reason of any increase in the value of such land. The occasions on which the tax is to be levied are as follows: (a) when such person sells his interest or grants a new lease for a term of seven years or more; (b) when such person dies (this being in addition to the increased death duties); and (c) in the case of a limited company (which of course cannot die) this tax is to be levied every 15 years, the first payment to be made in 1914.

In assessing the value of the land for this tax the value of all "permanent works" is to be deducted if used for any trade, business or industry except horticulture and agriculture. The latter industries do not escape, although the cost of removing their buildings, trees and bushes may be considered. (See clause 14, section 4, which must not be confused with clause 2.) Though it is true that any value due solely to the special capacity of the soil for agricultural purposes is not to be taken into account; yet the fact remains that "permanent works" for nurseries are hit although those for factories or shops are not.

It is submitted that nurserymen might well be exempted from this tax. They already have to pay very high rents as tenants, and it is as much necessary for a nurseryman to have at least one branch of his business within the precincts of a town as it is for the vendor of any other retail article to have a shop in a populous district. Consequently the rent which a horticulturist has to pay is not only much higher than that which falls upon the agriculturist, but, owing to the extent of premises required, the rent is also much larger in proportion to the amount of the turnover than that which is paid by most other tradesmen.

In the case of a nurseryman who has bought the freehold of his land the tax might bear even more hardly. For the reasons stated above, he has to pay a heavy price (often as great as if he proposed to cover the area with bricks and mortar) in order to obtain a suitable site upon which to carry on his business, and the interest on the capital thus sunk constitutes a heavy

Photograph by Mrs. Deives Broughton.

FIG. 180.—VIEW IN THE BULB GARDEN AT HAVERING PARK.

beds and borders containing many very fine specimens and varieties have been established on the south side of the house. They contain beside Rhododendrons, *Kalmias*, *Azaleas*, and a magnificent show of *Pieris floribunda*. The principal part of the planting operations was carried out about 40 years ago. As before stated, large additions are still being made, and Mrs. McIntosh is wisely grouping together large beds of many of the most beautiful shrubs, both for summer and winter effects. They include Brooms, *Rhododendron sinense*, *Sea Buckthorn* (*Hippophae rhamnoides*), large quantities of the *Wichuraiana* *Roses*, *Spiræas canescens* and *Douglasii*, *Hydrangea paniculata grandiflora*, *Cornus* of sorts, *Rhus typhina*, *Poplars* in bush form, *Pernettyas*, *Rubus odoratus*, large beds of *Lavender*, *Veronica Traversii*, and *Mahonias*.

A striking novelty, especially for this part of Essex, is a large portion set apart for the cultivation of the hardy *Ericas*. These are grouped together in masses, and particularly well they looked, all being in the best possible condition. Among the varieties I noticed were Cal-

tained fine specimen Palms, and many other both flowering and foliage plants, all in good condition. Adjoining this is a small stove, used principally for growing decorative plants for house decoration. The early Peach house had been entirely replanted, and the trees were in excellent condition. The varieties I noticed were:—Nectarines: *Cardinal*, *Early Rivers* and *Lord Napier*; and Peaches: *Royal George*, *Gros Mignonne* and *Hale's Early*.

One small house was principally devoted to *Rose* culture, and another house to *Carnations*. Fine batches of the following varieties of *Carnations* are cultivated:—*Mercia*, *Mrs. Martin Smith*, *Lady Grimston*, *Maggie Hodgson*, *Princess of Wales*, *Old Blush* and *Horace Hutchinson*. Most of the plants were in 8 and 10-inch pots. A large span-roofed house was devoted entirely to *Ferns*, and some were specimens growing in tubs over 5 feet in diameter. Particularly fine were *Davallia Mooreana*, *Microlepia hirta cristata*, *Davallia elegans*, *Adiantum formosum*, *A. cuneatum* and *A. Williamsii*. Another large greenhouse contained some greenhouse *Rhododen-*

addition to his annual cost of trading, quite apart from the working capital required. Frequently, also, he has to raise part of the purchase price by means of a mortgage, and if the Budget proposals should cause the value of land to fall, most mortgages will either call in their loan or require the amount already advanced to be very substantially reduced. The exemption of permanent works for horticulture from this tax should be urged.

Nurserymen have sometimes been able, on removal, to reconp a portion of the heavy expenditure referred to above by selling their nursery land at a higher price than they originally gave for it. With the profit thus obtained they are able to meet to some extent the

UNDEVELOPED LAND TAX.

In addition to the above, it is also proposed to levy every year a further tax, at a present rate of one halfpenny in the pound, on the "capital value of undeveloped land." "Undeveloped land" means, for the purposes of the Budget, any land which: (a) has not been developed by being built upon, or (b) has not been developed by being used bona fide for any business, trade or industry, with one single exception—agriculture (which term for the purposes of this Act includes nurseries, market gardens, and allotments). Nurserymen therefore will have to pay the tax although other tradesmen will not. The Bill, however, extends to the horticulturist and agriculturist two slight concessions, namely:—

house, a depository, a slaughter house, or for the erection of factories, or for building speculation.

This proposed tax, if applied to nurseries and market gardens, will bear especially heavily upon small growers who cater solely for the English market. It is essential for them to be in or near the outskirts of a town, not only so as to be near their local customers but also so as to be within the "collection and delivery" area of a railway station.

Parliament has already recognised the difficulties which await a grower who is forced to remove. The Agricultural Holdings Act, which came into force on January 1 last provides that "if a landlord without good and sufficient cause and for reasons inconsistent with good estate management" gives notice to quit or refuses to grant his tenant a new lease, either at all or except at an increased rent, then the landlord must repay to the tenant the whole of the cost of removing or selling his household goods, his implements of husbandry, his produce and his farm stock. It is hoped the Government will bear this point of view in mind.

GARDEN TAX.

By this time most readers will probably be aware that it is also proposed to impose the "undeveloped land tax" on the owner of every garden which exceeds one acre in extent. It is impossible to discuss the pros and cons of this tax here, but if it is to be adopted it is submitted that the Government might possibly see its way to make some concession on this point.

The question of "increment" taxation is one which will probably be decided on general principles, but the neglect to treat nurseries as equivalent to shops for this purpose and the question of the "undeveloped land" tax, including the "garden" tax, are matters in which the position of horticulturists might well be brought to the notice of the Government. H. M. V.

FLORISTS' FLOWERS.

GLOXINIAS.

In recent years Gloxinias have shown wonderful development in regard to colour and habit. The flowers range from pure white, pink and pale blue to deep reds, purples and blues, while the newer French spotted hybrids, though less robust in habit and more delicate in flower than the older type, are a most valuable addition. They are marked and spotted with colours varying from pink and mauve to dark blue, red, and even chocolate.

The cultivation of Gloxinias is not, perhaps, simple, but any gardener, provided he has a warm glasshouse at his disposal, by selecting seed of a good strain, and by following the few hints given below, should be able to produce a brilliant display of blooms within about seven months of the date of sowing the seed. The seed is best sown in mid-winter, in deep, well-drained pans of fine peat and sand. The pans should be placed in a propagating frame having a temperature of about 75°, covering the surface of the soil with a piece of glass until germination has taken place. The glass must be turned and dried night and morning, as Gloxinias at all stages are liable to suffer from damp. As soon as the first seed-leaves develop the plants should be pricked off into shallow pans. This is best done by means of small tweezers, as the seedlings are too small to be handled. When established they may be removed from the frame into a fairly moist atmosphere of 65° to 70°, and when large enough transplanted into boxes and ultimately potted off into small pots, using peat, sand and leaf-soil, as fibrous and rough as possible.

Careful watering is one of the most important points during the stages of growth. The water should be slightly warmer than the temperature of the house, and never applied unless really necessary. The atmosphere must be kept moist by frequent damping, and the plants lightly syringed morning and evening.

In the final potting into 6-inch pots a good mixture of equal parts of peat, leaf-soil, yellow loam and sand should be used, with a little charcoal and good manure added. The soil, when mixed, should be warmed to the temperature of the house before potting. When potted, the plants may be grown on in a night temperature

FIG. 181.—AVENUE OF SEQUOIA GIGANTEA AT HAVERING PARK.

(See p. 408.)

expenses which fall upon a nurseryman in building greenhouses on the fresh site, and in rendering the new soil suitable for the special purposes required by horticulture. It certainly seems hard on the horticulturist to demand under these circumstances one-fifth of any increase on the original site value—that is to say, £20 out of every £100 profit realised. In the case of a limited company the land has to be revalued every 15 years, and this 20 per cent. increment tax will have to be paid upon any increase in value which has accrued in the meantime.

(1) The tax is not to be imposed on any land which does not exceed a selling value of £50 an acre, and (2) in assessing the value of the land no special charge is to be made in respect of whatever special value it may bear for agricultural or horticultural purposes.

This will protect agricultural land to some extent, but some further protection for nurserymen appears to be urgently necessary. The value of the land for any other purposes must be taken into account, even on the assumption, for instance, that it might be required for some other trade, such as a shop, a brickfield, a ware-

of not less than 60°, giving them all the light possible, but at all times shading them from strong sunshine. Further feeding is not necessary during the first season.

The established tubers are best started towards the end of December, in shallow boxes of cocconut fibre. They should be allowed to start gently, 65° to 70° being quite sufficient heat. Pot them on when started into small pots, and later into the flowering pots, using a similar mixture as before. The pots must be well drained, and the plants should not be potted deeply or firmly. When the blooms appear, a little weak manure water will be beneficial, but this may easily be overdone. It is often advisable when the plants are flowering to remove some of the centre leaves, which sometimes cramp and smother the opening blooms.

The worst pest of Gloxinias is the white thrip, which, if once allowed to get a foothold, is very troublesome. It is, therefore, advisable to spray with an insecticide or to fumigate the plants at intervals as a preventive. *C. H. Middleton.*

The Week's Work.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Hæmanthus Katherine.—This is the most showy of the greenhouse plants in flower at the present time. While the flowers remain fresh, let the plants stand in the cooler end of the structure, but remove them to the intermediate house as soon as the blooms fade, to complete and mature their growth. After this has been effected, a period of rest is necessary. Propagation is best done by potting up the offsets and keeping them in moist conditions until roots have formed. Many species of *Hæmanthus* produce most showy flowers, and they might very well be cultivated more often in private gardens.

Callistemon lanceolatus.—This greenhouse shrub is better known by the name of *Metrosideros floribunda*. Like many species of the nearly-allied genus *Melaleuca*, it is a showy, flowering shrub needing the conditions of a cool greenhouse or conservatory. The culture is comparatively easy, but, as with most hard-wooded plants, care must be exercised in watering. Propagation may be effected by seeds, which are freely produced on large plants, but seedling plants do not flower so quickly as plants raised from cuttings. The cuttings should be made of nearly-matured shoots and inserted in sandy soil, placing the cutting pots under a bell-glass. When the cuttings have rooted they should be firmly potted in loam, peat and sand. Whilst young, the shoots should be freely pinched to induce a bushy habit.

Mignonette.—No flowers are more highly appreciated than those of the *Mignonette*. For pot-culture the "tree" kinds are more often selected, but the dwarf-branching varieties are also very useful as pot plants or for furnishing flowers. Whatever kind is required, seeds should be sown at intervals from now onwards. *Mignonette* requires a compost of good loam and leaf-mould, firm potting, and cool treatment at all times. The seeds should be sown shallowly in 3-inch pots, and as soon as the seedlings are well through the soil they should be thinned out to one plant if for pyramids, and to three plants if dwarf, bushy plants are required. When the small pots have become filled with roots, the plants should be potted into 5 or 6-inch pots, using similar soil. Make the soil as firm as possible, exercising care not to break the ball of the root.

FRUITS UNDER GLASS.

By E. HARRIS, Fruit Foreman, Royal Gardens, Frogmore.

Pincapples.—The earliest plants of the Queen variety, now fast maturing their fruits, must receive attention in order that the fruiting season may be extended over as long a period as possible. Those fruits that have commenced to colour should be removed to a house where the plants can be kept cool and dry, and, if necessary, shaded during the hottest part of the day with tiffany. Manurial stimulants must be withheld and clear water given sparingly. Later

fruiting plants, however, should still be liberally supplied with both diluted liquid manure and guano water. Maintain a moist atmosphere in the pit and close the ventilators about 3 o'clock in the afternoon, after first spraying the plants with tepid rain-water. All weak suckers not required for stock purposes should be removed from the parent plants from which the fruits have been cut. Those which are bearing suckers, required for propagation, should be placed in a position near to the glass and be syringed and watered with care, as it is important to have a batch of strong suckers for potting next month.

Successional plants.—Young Pines intended for fruiting next year will have filled their pots with roots, and they should be encouraged to develop into strong, healthy plants. On no account allow them to suffer drought at the roots; at the same time, water must not be applied until it is required, when sufficient should be given to soak the soil through. Manure water may be applied more frequently than hitherto. Weak soot-water should be given occasionally, both at the roots and in the water when syringing in the afternoon. Whenever the weather is warm and sunny, dispense, as far as is possible, with fire heat, for excessive warmth will cause the plants to grow weakly and often to fruit prematurely. A little fresh air should be admitted by the top ventilators early on fine mornings, and the amount may be increased as the temperature rises; but close the house sufficiently early in the afternoon to allow the temperature to reach 95° or 100° after syringing and charging the atmosphere with moisture. Young plants which require re-potting must be attended to before they become pot-bound. Plunge them in a moderately warm hot-bed near to the glass, and allow them to grow as fast as is consistent with the development of strong, healthy foliage.

Planted-out Pines which are ripening their fruits must not be over-watered, nor must the atmosphere of the pit be overcharged with moisture. Should the crowns on the later-fruiting plants show signs of becoming too large, they should be carefully stopped. Pines planted out last spring should now be well rooted; they will require water at least once a week, but need not be given stimulants at present. Ventilate the house early in the mornings of fine days, but take full advantage of the sunshine by closing the structure early in the afternoons, after well syringing the plants with rain-water.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GILES, Aldenham House, Elstree, Hertfordshire.

Asparagus.—The heads should now be cut very sparingly, and the plants should be given every encouragement to assist them in building up strong crowns. It is a good plan, especially where the beds are situated in an exposed position, to provide some means of support to the shoots to prevent them being blown about by wind. The beds should be hand-weeded, it being impossible to use a hoe without damaging the *Asparagus*. On light soils, a moderate sprinkling of salt and applications of liquid manure from the farmyard will be beneficial.

Capiscums intended for fruiting in pots may now be placed in cold frames. Afford frequent applications of manure water, and syringe the foliage copiously with clear water twice each day. Do not overcrowd the plants, but let the air circulate freely amongst them. Remove the lights entirely on hot days. Spare plants may be placed in a sheltered, sunny position in the open, where they will produce satisfactory results if the season is favourable.

Cauliflowers.—The foliage should be tied up immediately after the heads are set, to keep them perfectly white. Keep the plants well supplied with moisture, affording liquid manure at intervals. Immediately they are ready for cutting, lift the plants and place them in a cold shed or cellar, where they may be suspended with their heads downwards. They will remain in a good condition for several days. Successional batches of later varieties should have the soil about the plants stirred with a draw-hoe. Work the soil well around the stems, and afterwards apply a liberal mulching of manure. Continue to plant *Cauliflowers* raised from late sowings in open positions in the garden. Such late plants

are often useful for planting in frames in the autumn.

Brussels Sprouts.—The hoe should be frequently and thoroughly worked between the rows. In the case of poor soils, slight applications of some concentrated manure should be dusted over the roots in showery weather. They will also be benefited by a mulching of farmyard manure, especially if the weather is dry. Make a final planting of the later-raised plants, selecting a piece of good land for this crop. The variety *Dwarf Gem* is a very suitable one for planting at this season.

Endive should be sown in small quantities about once a fortnight. Thin the plants to 12 inches apart, and keep them well supplied with moisture. Both the curled and the plain-leaved varieties should be grown.

Autumn-sown Onions.—To ensure large, well-developed bulbs of both *Naples* and *Giant Rocca* varieties, the soil should be frequently stirred with a hoe, and copious applications of moisture, including liquid manure, should occasionally be given this crop during the present month. Those which show signs of flowering prematurely should be used for present consumption.

Watering.—Many of the kitchen-garden crops will need to be supplied with water, both at the roots and overhead. Much water is not only of value in increasing the quantity of the crop, but it also improves the quality.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

The Children Act, 1908.—On April 1 last, when the *Children Act, 1908*, came into force, new powers were given to park officials the like of which had never before been exercised by them. Before this Act came into operation, park-keepers were primarily employed to protect park property and otherwise prevent any infraction of park by-laws, but except in quite an indirect way, they were not generally regarded as having any special powers outside of public parks Section 40 of the *Children Act* provides:—

"That it shall be the duty of a constable and of a park-keeper, being in uniform, to seize any cigarettes, or cigarette papers in the possession of any person apparently under the age of 16 years whom he finds smoking in any street or public place, and such constable or park keeper shall be authorised to search any boy so found smoking, but not a girl."

From these words it will be seen that the official existence of the park-keeper is now recognised by law and his services enlisted for work which is quite beyond his special park duties. Having thus become recognised as fit to carry out some of the provisions of this Act, one hardly knows what other duties of a like nature may not sooner or later be thrust upon him. So far, however, whilst this legislation has considerably increased the responsibilities of park-keepers, it has not added to their actual labours, for, whereas before April 1 the juvenile smoker was, unfortunately, frequently in evidence, he has since that date almost entirely disappeared from public view, and consequently gives no trouble.

There are two facts about this Act that it is well to impress upon the minds of park-keepers. The first is that they are compelled to exercise the powers conferred upon them by Section 40 of the Act and when they see a boy smoking in any public place it is as much their duty to take action in the matter as it would be were the boy stealing flowers or damaging property in a park. The other fact is that no park-keeper—and, for that matter, no constable either—unless attired in uniform is permitted to interfere with young smokers, and if they do so they will probably get into trouble. This stipulation is a very reasonable one, as without it in all probability many persons would become self-constituted constables or park-keepers whenever an opportunity arose for appropriating some youngster's tobacco.

Possible effects of the innovation.—No doubt some park officials may feel that their staff have quite enough to attend to in carrying out park work and therefore do not require extraneous duties put upon them by the State. Others may welcome the addition of these and similar duties in the hope that the time may come when the Exchequer will see fit, on account of these services, to contribute towards the maintenance of that somewhat expensive institution, the park police.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Red and White Currants.—The bushes have made a considerable amount of growth, and this must be thinned in order that the sun and air may reach the fruits. Stop the side-shoots at the fourth leaf, but leave the leading growths un-stopped for another week or two, when the tops may be taken off according to the amount of space which the bushes are required to furnish. Very fine fruits may be obtained from cordon plants allowed to cover small spaces on fruit walls. Currants planted against north or north-west walls will furnish a supply of fruits late in the season. Red Currants will hang for several weeks in excellent condition on plants cultivated against north walls. On light and porous soils much water must be given to the roots. The cordon Currants should have the side growths stopped as recommended above in the case of bushes, allowing the leading shoots to grow unchecked for the present. Where wall space is limited, cordon Currants may be trained to a wire trellis, or they may be planted as small standards by the side of the paths, where they are very attractive when laden with fruit. The fruits on such small bushes can be protected easily from the birds. An excellent plan of using Red Currants is to mix them with Raspberries.

growths are pinched as recommended and at once burned this will destroy most of them. A thorough washing with the garden engine afterwards will generally suffice to make the bushes perfectly clean. Every effort should be made to cleanse them before the fruit commences to ripen, ripen, or many of the berries will be spoiled.

Weeding.—Keep the hoe constantly at work where it can be used. In the case of Strawberry beds or other beds or borders which have been mulched or littered with clean straw, it will be necessary to practise hand-weeding.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Sowing seeds of perennials.—Seeds of Dianthus should now be sown. Rake the ground very smoothly and sow in drills made 9 inches apart. It is necessary to shade the seed-bed during the germination period, but when the seedlings are well through the ground the shading material should be removed. The plants, when of a suitable size, may be either transferred direct to their flowering positions, or be pricked out for transplanting in the autumn.

If Hollyhock seeds are not already sown, no time should be lost before doing this. The drills should be drawn 1 foot apart and 2 inches deep.

sown at once. This is also advisable with Soldanella and Haberlia. Insert cuttings of Arabis and any other plants that are required to be propagated from cuttings. Remove the old flower-spikes and all dead foliage from early-flowering, bulbous plants, and in order to denote their position should all the foliage be removed, place a label or a stick on the spot where they are planted. Weeds must be destroyed early; be careful not to allow any of them to seed.

Herbaceous border.—A considerable amount of work will be required to keep the border smart and tidy. The plants will need staking and tying very frequently, and the hoe must be freely used to keep down weeds and loosen the soil. Any blank spaces should be planted, but do not overcrowd the subjects. Guard against insect pests, especially in places where the ground is heavy.

Conifers.—Attend to newly-planted trees, affording stakes to any that need them. See that no tree is injured by the string being too tight. Should any specimen have lost its leading branch, train up another shoot to take its place. Many newly-planted trees, and especially Conifers, are checked in their early stages by an insufficiency of moisture at the roots. Old Conifers are often benefited by a mulching of cow manure. Do not place the material close to the stem of a tree, but at a little distance away, where the most active roots are to be found. After the manure is applied, a soaking of water will be the more beneficial.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Cypripediums.—Many of the species and hybrids of the warm-growing Cypripediums such as *C. Stonei*, *C. Curtisii*, *C. Maudiae*, *C. macrochilum*, *C. grande*, *C. Rothschildianum*, *C. superciliosum*, *C. Lawrenceanum*, *C. L. Hycanum*, *C. L. hackbridgensis* and others, should be examined as to pot room as soon as they have recovered from the effects of flowering. None of these free-growing plants should be left long in a root-bound condition, and the present is a suitable time to give them a shift, and to divide large, unwieldy specimens. The best compost is one consisting of three-fifths good fibrous loam, one-fifth Osmunda fibre (cut up moderately small) and one-fifth Sphagnum-moss, adding small broken crocks and a little coarse silver sand. Fill the pots to about half their depth with clean crocks and cover these with a layer of rough Sphagnum-moss. In the process of potting the soil should be made moderately firm about the roots, keeping the base of the plant and the surface of the compost just below the rim of the pot. After root disturbance, keep the compost only just moist until the roots are again growing freely, when the plants will require an abundance of water. Place them on the shady side of the house and let the surroundings be kept always moist. When the weather is bright, a fine spraying overhead, both in the morning and early afternoon, is beneficial. The dwarf-growing species such as *C. niveum*, *C. concolor*, *C. bellatulum*, and their hybrids, including such beautiful plants as *C. Lawrebel*, *C. Olenus*, *C. Godefroyae*, *C. Chapmanii*, *C. Arnoldiae*, *C. Helen II.*, *C. Rolfei*, *C. Venus*, *C. Muriel Hollington*, *C. Vipani*, and many others equally fine and rare but too numerous to mention, may also be repotted if necessary. For this purpose the same kind of compost as advised for the stronger-growing varieties is suitable, but the potting should be done rather more firmly, as the roots have a decided tendency to cling and ramble among hard substances. At Burford, all the species and hybrids of this dwarf-growing section thrive best when suspended in a light position in the Cattleya house. The plants need plenty of moisture when growing freely, but care must be taken to prevent water lodging in the growths or axils of the leaves. Small yellow thrips are exceedingly fond of the young foliage, therefore, whether these insects be present or not, it is advisable, whenever any of the houses are being vaporised, to place these plants there during the operation. The foliage, too, should occasionally be carefully sponged over. It is necessary to caution those who do the work not to raise the leaves too high, for this causes the mid-rib to crack and the plant afterwards suffers disfigurement.

[Photograph by Mrs. Delves Broughton.]

FIG. 182.—PIERIS FLORIBUNDA AT HAVERING PARK.

(See p. 408.)

Place alternate layers of each fruit and another of white sugar in a glass dish, which should be stood in a refrigerator on a block of ice for 24 hours before being required for the table. By many this is considered the best manner of preparing these fruits for the dessert.

Black Currant bushes.—Do not stop the shoots of these bushes until after the fruits are gathered, when all unnecessary growths should be removed and any other thinning done which is required.

Gooseberries.—Gooseberries should be stopped in the same manner as advised for Red Currants. If the berries were thinned, those now on the bushes will develop rapidly. The finer dessert varieties should be afforded copious supplies of water during dry weather, and the foliage should be well syringed in order to prevent red spider. After the watering is finished the ground should be mulched, if a mulch has not already been applied. See that the fruits are properly netted from the birds. There are heavy crops of all small fruits in this locality. Green Gooseberries have proved very useful for culinary purposes. Aphid has recently appeared on the shoots in great numbers, but if the young

Sow the seeds a quarter of an inch deep. Thin the plants as soon as they are large enough. Pansies, Polyanthuses and Primroses may be also sown now. The Primroses and Polyanthuses will make fine plants for flowering in the spring of 1911. There is still time for the sowing of Wallflowers, although I prefer to sow them earlier in the season, in order to obtain large plants. *Campanula pyramidalis* and *C. media* (Canterbury Bell) should also be sown. *C. pyramidalis* does better in every respect when cultivated under quite cool conditions. Even for pot purposes the plants are best grown quite hardy, and may be lifted from the border for the purpose. Choose a rather warm spot for sowing the seeds. Brompton Stocks may now be sown in the open, where they will do quite well, especially if sown on a cool border.

Alpine garden.—Many subjects may now be propagated, and it is advisable to raise fresh stocks to replace any subjects which have become too large for their positions or that may have died. Freshly-raised plants are always better than portions of old plants. Continue to prick out seedlings into pots and pans. Seeds of *Ramondia* should be collected when ripe and

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, JUNE 28—Isle of Wight Rose Sh. (provisional).

TUESDAY, JUNE 29—

Southampton Roy. Hort. Soc. Summer Sh. (2 days).
Brighton Fl. Sh. (2 days). Canterbury and Kent Rose Show at Canterbury.

WEDNESDAY, JUNE 30—

Richmond (Surrey) Fl. Sh. Ipswich Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last fifty years at Greenwich—61.6°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, June 23 (6 P.M.): Max. 63°; Min. 51°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, June 24 (10 A.M.): Bar. 29.4; Temp. 60°; Weather—Cloudy.

PROVINCES.—Wednesday, June 23 (6 P.M.): Max. 60° Corwall; Min. 50° Scotland North East.

SALES FOR THE ENSUING WEEK.

FRIDAY—

Choice Imported and Established Orchids, Orchids in variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Darwin Commemoration. The past week has witnessed, in the commemoration ceremonies at Cambridge, the tribute of the world to the genius of Darwin. From all parts of Britain and the Empire, from every State of Europe, and from the uttermost parts of the earth, men have assembled to celebrate the centenary of Darwin's birth and the fiftieth anniversary of the publication of the *Origin of Species*.

They have met in Cambridge to acknowledge on behalf of mankind the debt which it owes to the great naturalist. The magnitude of this debt has formed the subject of eloquent addresses by distinguished delegates, but no more adequate appreciation of Darwin's life and work has been offered than that which we print to-day from the pen of Sir William Thiselton-Dyer. Horticulturists will rejoice that the great and special services which Darwin rendered to their science should be recorded and appreciated in such a manner. The present generation may be reminded, moreover, that on former occasions these pages have served for high authority to pronounce its emphatic conviction of the supreme importance of Darwin's contribution to the sum of human knowledge. So long ago as December, 1859, Sir Joseph Hooker, as he himself recently reminded us, wrote, in the course of a review of the *Origin of Species*, the following words:—

"We have risen from the perusal of Mr. Darwin's book much impressed with its import-

ance, and have, moreover, found it to be so dependent on the phenomena of horticultural operations, for its facts and results, and so full of experiments that may be repeated and discussed by intelligent gardeners, and of ideas that may sooner fructify in their minds than in those of any other class of naturalists, that we shall be doing them (and we hope also science) a service by dwelling in some detail upon its contents. Thus much we may premise, that it is a book teeming with deep thoughts on numberless simple and complex phenomena of life; that its premises in almost all cases appear to be correct; that its reasoning is apparently close and sound, its style clear, and, we need hardly add, its subject and manner equally attractive and agreeable; it is also a perfectly ingenious book, bold in expressions as in thought where the author adduces what he considers clear evidence in his favour, frank in the statement of objections to the hypotheses or conclusions founded on its facts and reasonings; and uniformly courteous to antagonistic doctrines. In fine, whatever may be thought of Mr. Darwin's ultimate conclusions, it cannot be denied that it would be difficult in the whole range of literature of science to find a book so exclusively devoted to the development of theoretical enquiries, which at the same time is throughout so full of conscientious care, so fair in argument, and so considerate in tone."

We quote the passage with particular pleasure, because, as readers of the *Life of Darwin* will remember, Darwin himself valued Sir Joseph Hooker's reviews above all others.

Turning again to the Cambridge celebrations, it is not enough to say of them that they were successful. They were triumphantly successful. Men engaged in following up the lines of investigation indicated by their great master, left their gardens and laboratories, their microscopes and geological hammers, and their Mendelian hybrids and devoted their united labours to the perfecting of the organisation of this Darwin festival. The colleges opened their sometimes exclusive doors to welcome and to entertain the visitors. The Chancellor, Lord Rayleigh, received the delegates in the Fitzwilliam Museum on Tuesday evening. On Wednesday the addresses from Universities, colleges, academic and learned societies were presented to the University in the Senate House. Darwin's own college (Christ's) entertained the guests in the afternoon, and in the evening, at the great banquet, members of all the important Universities of the world dined together at the invitation of the University of Cambridge. In addition to other receptions, a conferment of honorary degrees was held on Thursday, whilst in the afternoon of the same day took place the most charming and, in some respects, the most impressive of all the ceremonies—the garden party given by the members of the Darwin family. As the envoys of the world of learning were received in the Fellows' Garden of Trinity by the living representatives of Charles Darwin, they could not but reflect that, beside what the world owes to Darwin for his own work and his own noble interpretation of life, it owes another and not a light debt to him for giving to the world a group of children who, like the father, have shed lustre on British science. The University hospitality was generous to a degree that would have delighted the heart of Darwin himself, who was wont to say to children visiting at his house: "Be good and eat large mouthfuls." Nor was the hospitality in material things alone; for the intellectual delectation of its visitors the University had

made most liberal provision. As memorials of the Commemoration there had been prepared, by Francis Darwin, a new edition of the first draft of the *Origin of Species* and a volume, edited by Professor Seward, entitled *Darwin and Modern Science*, containing essays by the most distinguished men of science.

Laden with gifts and charged with grateful memories, the guests will return to their near or distant homes, united by the common bond of love and reverence for the name of Darwin.

Acidity in Soils.

Important as are the nitrogen-fixing bacteria, they form only a small part of the microflora of the soil; other groups of organisms prepare the food of plants; some break down the nitrogenous compounds constituting manure or humus into simpler nitrogen compounds and finally oxidise them into the nitrates, in which form most plants obtain the nitrogen they require. Other bacteria are, from the point of view of the horticulturist, wasteful in that they convert the nitrogen compounds into free nitrogen; others, again (particularly certain microfungi), compete with the crop for the plant food in the soil, and perhaps produce substances which are injurious to plant life. The relative predominance of particular groups of organisms, useful or injurious, can be affected by the farmer or gardener, because the various species of micro-organisms are very sensitive to minute changes in the soil, for example, its acidity or alkalinity.

Soils that are distinctly acid in their reaction are not infrequently met with in nature; when they are in grass they may be recognised by the generally rusty aspect of the vegetation, which consists mainly of shallow-rooting grasses growing in tufts, and by the absence of Clover; when they are under arable cultivation their acidity may be revealed by the presence of such weeds as Spurrey, Sheep's Sorrel, and Corn Marigold, and by the "clubbing" of cruciferous crops.

Similar acid soils have been produced artificially by the long-continued use of sulphate of ammonia as a fertiliser. The best example is afforded by the continuous Wheat and Barley plots on the farm of the Royal Agricultural Society at Woburn; where ammonium salts have been used as the source of nitrogen the land is now almost sterile, Barley refuses to grow at all, and the whole plot becomes covered by a growth of Spurrey. At Rothamsted, where the arable land is sufficiently furnished with carbonate of lime, acidity has not set in, but on the grass plots it has become very marked.

In order to determine the cause of this acidity experiments have been made to see if any purely chemical or physical interactions would take place between the constituents of the soil and solutions of ammonium salts, which would split off a free acid from the latter, but with negative results. The action was found to be a biological process; the soil is rich in certain moulds and other microfungi which rapidly attack solutions of ammonium salts, and, by withdrawing ammonia from their own nutrition, set free the acid. It was shown that the degree of acidity thus produced was approximately equal to the

soluble acidity of the Rothamsted plots soon after the ammonium salts had been applied as manure. At the same time, in the soils there was also a very much larger quantity of comparatively insoluble humic acid, which had accumulated year by year as a result of the attack of the mineral acids split off from the ammonium salts upon the neutral humus of the soil.

The first consequence of the acidity of the soil on these plots has been the cessation of the nitrification process, because the bacteria bringing about that change will only work in a neutral medium. Some of the falling off in the yield of these acid plots is thus due to the fact that the grass is driven to obtain its necessary nitrogen from ammonia instead of from the more usual nitrates; at the same time, the mass of micro-fungi with which the soil is permeated competes successfully with the grass for the manure. Whether these fungi also excrete substances more or less poisonous to the grass has not yet been definitely settled. The remedy for this acid condition of the soil lies in the use of lime, which, applied at the rate of 2,000lb. per acre to portions of the Rothamsted grass plots, has effected a great improvement both in the yield and the character of the herbage.

Another problem of the same order—the secondary effects of certain fertilisers upon the soil—is afforded by the well-known fact that the use of large quantities of nitrate of soda upon heavy soils always makes them very wet and sticky after rain and causes them to dry with a hard, intractable crust. This has been attributed to the attraction of nitrate of soda for moisture, but the amount of water absorbed by the few hundredweight per acre of nitrate of soda which are ever applied is insignificant and could not cause the effects observed. Some of the Rothamsted plots, which have been receiving nitrate of soda every year for the last half century, show these effects to a marked degree, and on examination the clay on these plots was found to be in its most "deflocculated" condition. Clay consists essentially of excessively fine particles, and when a clay soil is in good tilth these particles are largely bound together in loose aggregates, thus giving the soil as a whole a coarser texture. Any working of the soil when wet, or the "puddling" which a potter or brick-maker gives to his clay, breaks down these loose aggregates, and, by giving the clay its most finely-grained condition, markedly increases its typical properties of impermeability to water, and shrinkage on drying. It is also found that a trace of any soluble alkali, such as carbonate of soda, will loosen these aggregates and deflocculate the clay.

By further experiments it has been shown that a growing plant fed with nitrate of soda gives rise to a little carbonate of soda, because it takes up more of the nitric acid than the soda base with which it was combined, leaving the latter in the soil combined with the carbonic acid excreted from the root. It was found possible to extract free carbonate of soda from the plots which had long received nitrate of soda as a manure; one of the grass plots yielded as much as 175lb. per acre down to a depth of 3 feet. This alkali then, by deflocculating the clay, is the source of the bad tilth resulting from the use of nitrate of soda.

The bad tilth, which is a serious trouble to many market gardeners who manure heavily

with nitrate of soda, cannot be rectified by the use of lime, which, being itself an alkali, only exaggerates the trouble. The use of acid manures like superphosphates, and liberal applications of soot, will improve matters, but the best plan is to use, instead of nitrate of soda alone as a nitrogenous fertiliser, a mixture of it with sulphate of ammonia. Since the one tends to set free acid and the other alkali in the soil, jointly they would leave it unchanged, and they would also come into action successively as sources of nitrogen.

These and other cases of the same character go to show that we must study more closely the chemical and biological actions of fertilisers upon our soils if we are to obtain full value from them and avoid some of the disadvantages long recognised by farmers as attending their use.

FLOWERS IN SEASON.—We have received a few flowers of a new variety of Pink named *gloriosa*, from Messrs. STUART Low & Co. It is of light purple colour, of considerable size, and very fragrant. Novelties in Pinks are not numerous, as is the case of Carnations, and therefore this variety, which is very effective when seen in gaslight, may be recommended.

—Messrs. KELWAY & SON have sent us flowers of a number of varieties of their double and single-flowered Pyrethrums. *P. roseum* is one of the most showy border plants, and the best varieties exhibit varied colours that should appeal to every taste. —From Mr. EDWIN MOLYNEUX, Swannore Park Estate, we have received a bouquet of varieties of *Papaver orientale* in such brilliant colours as would defy description. These flowers, received as perfectly hard and closed buds, have expanded in water, and their colours appear just as bright as if they had opened whilst still exposed to sunshine.

NATIONAL ROSE SOCIETY.—The summer exhibition to be held at the Royal Botanic Society's Gardens, Regent's Park, on July 2, promises to be very successful. Notwithstanding the trying weather experienced during both the winter and spring, and also throughout the first half of June, there is likely to be an unusually large and fine display of blooms. Early in the month the prospects looked very gloomy, but, as the late Rev. D'OMBRAIN used to say, "When the time of Roses comes there is sure to be plenty of Roses." The classes number more than 100, and there are numerous valuable challenge cups and other trophies offered as prizes. Those who intend to exhibit should apply to the hon. secretary, Mr. ED. MAWLEY, Rosebank, Berkhamsted, not later than June 28.

SIR JOSEPH DALTON HOOKER.—At a meeting of the Linnean Society, held on the 17th inst., a letter congratulating Sir JOSEPH HOOKER on his approaching 92nd birthday was read from the Chair, and signed by the Fellows present. Sir JOSEPH HOOKER was born on June 30, 1817.

ROYAL BOTANIC SOCIETY.—We are informed that the following resolution will be moved by Mr. J. S. RUBINSTEIN at the Fellows' meeting of this Society to be held on Friday, June 25, at 4.15 p.m.:—"That this meeting desires to place the following views on record:—(1) That the objects for which the Society was established in 1840 are as material to-day as when the charter was granted, such objects being the promotion of botany and its application to medicine, arts, and manufactures. (2) That the gardens are pre-eminently calculated to promote these objects,

and it is accordingly of the utmost importance that the gardens should be maintained, and because they secure an ideal, and the only really suitable place in London, for the holding of floral and horticultural exhibitions and for outdoor shows and receptions organised by public authorities and by recognised societies and institutions. (3) That if the gardens are closed, or cease to be available for the purposes mentioned, the loss to London will be irretrievable. (4) That the Society cannot, in view of its liabilities, continue with advantage the control of the gardens. (5) That the Royal Horticultural Society possess a constitution and organisation enabling it to take over the gardens with the greatest advantage, and it is therefore highly expedient that the gardens should be immediately transferred to that society. (6) That in arranging a transfer provision should be made for (a) the payment of a sum of money representing the value of the Royal Botanic Society's assets, to be applied towards discharging its liabilities, and (b) an option to the Fellows to become Fellows of the Royal Horticultural Society."

THE POISONS AND PHARMACY ACT, 1908.—

London has given the provinces a very satisfactory lead in connection with the granting of licenses to nurserymen for the sale of poisonous compounds to be used for horticultural purposes. Twenty-one applicants applied to the London County Council for these licenses, and the usual opposition was offered by the Pharmaceutical Society. This society suggested that the Act was not intended to apply to populous towns such as London (on the ground that there are already over 2,000 chemists in London, though these know little of horticulture and plant diseases). The committee, however, rightly took the view that such a construction of the Act would be erroneous, and decided that each application should be dealt with on its merits. In the result they recommended that 18 of the 21 applications for licenses should be granted, and this recommendation was adopted by the London County Council late last Tuesday evening without a single dissident. Although the decisions of the London County Council are, of course, not binding on provincial councils, yet they naturally carry considerable weight by reason of the fact that the L.C.C. has special means of obtaining reliable information and expert advice on all matters coming before it. The nursery trade may be congratulated upon the useful precedent which has now been created, and its thanks are due to the Horticultural Trades Association who, recognising the importance of the matter, furnished the applicants with legal assistance at its own expense, and also co-operated with Mr. RICHARDS.

DISEASE OF BEES.—The Board of Agriculture and Fisheries desire to warn all bee-keepers that an outbreak of disease, believed to be identical with the Isle of Wight bee disease, has occurred in several hives in Buckinghamshire. This disease, which has destroyed almost all the bees in the island from which it takes its name, is due to a bacillus closely resembling the bacillus of plague, and no remedy for it is known. It is of the utmost importance, therefore, that bee-keepers should take every precaution to prevent the disease spreading, and they are strongly advised to keep a careful watch for any signs of its appearance. A full description of the disease was published in the *Journal* of the Board of Agriculture for February, 1909, and bee-keepers who find symptoms of disease corresponding to the description there given should communicate with the Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W.

ROYAL SOCIETY OF ARTS.—The annual conversazione of the Royal Society of Arts will be held in the galleries of the Natural History Museum on Tuesday, June 29, from 9 to 12 p.m. The reception by Sir WILLIAM H. WHITE, F.R.S., the chairman, and the members of the council will take place in the central hall from 9 to 12 p.m.

THE EXPORT OF MANGOS.—All who have tasted the fruit of the Mango are agreed that it is the king of tropical fruits. It is, therefore, good news to learn from the *Bulletin of the Department of Agriculture of Jamaica* (Vol. 1, No. 1, New Series, 1909) that experimental shipments of Mangos from Kingston to England have proved successful—the produce of a single tree having realised £70—and that the Director of Agriculture, Mr. H. H. COUSINS, is encouraging the extensive planting of Mango trees in the island. According to Mr. COUSINS, the "Bombay" Mango, introduced to Jamaica by Sir JOHN PETER GRANT, is the most promising variety; it is a hardy tree, of prolific bearing, and has the further advantage of fruiting frequently out of season, when, in all probability, higher prices are to be obtained than during the normal fruiting season. The Mango may be raised from seed or propagated by budding, and it is proposed to carry out budding on a large scale on the many thousands of Jamaican Mango trees which now bear inferior fruit. We are in full agreement with the concluding sentence of Mr. COUSINS' article. "The choice East Indian Mango is not only a most grateful fruit to the palate of any normal person, but it also possesses a fascination for those who have acquired a taste for the fruit that bespeaks an ever-growing demand when this, the most luscious fruit of the tropics, is made accessible to the peoples of America and of Europe."

INTERNATIONAL EXHIBITION AT FLORENCE, 1911.—The City of Florence, and the Royal Tuscan Horticultural Society will hold an international exhibition of horticulture in 1911, on the occasion of the fiftieth anniversary of the proclamation of the Kingdom of Italy. The programme contains six classes: ornamental foliage or flowering plants, either new, or of recent introduction; fruit-bearing plants; vegetables and kitchen-garden plants; seeds; bulbs and tubers; Colonial plants; flower decoration; horticultural arts and industries; horticultural literature and instruction; packing and preserving; history of horticulture. Besides numerous cash prizes and medals to the value of 25,000 lire, objects of art will be offered for competition. At the same time as the horticultural exhibition, a portrait exhibition will take place in the artistic rooms, which have recently been restored in the historical municipal palace (Palazzo Vecchio) besides other shows and amusements.

DETERMINATION OF THE FEEDING HABITS OF BIRDS.—Our attention was recently directed to an interesting case which illustrates how difficult it is to determine the feeding habits of birds. An important contribution to this subject by Mr. NEWSTEAD was recently published in the *Journal of the Board of Agriculture*, and it is there stated that every species of bird must be taken not merely on its merits, but it must also be considered with regard to the amount of available food in its district. Many a bird which, under ordinary conditions, may be regarded as beneficial, becomes noxious if there is a scarcity of its normal food. The present case concerns the jackdaw. Our correspondent writes as follows:—"Herewith I am sending you a jackdaw I shot this morning on my Barley. These birds have been most persistent in their attacks on this particular field, so much so that

I have had a man to keep them off. This morning I happened to get close to this particular bird unobserved, and shot it whilst busy, as I thought, pecking up Barley. My surprise was great when I picked it up to find, not Barley, as I expected, but its bill full of some kind of fly. It is an object-lesson for me. The bird had pulled some Barley up, but no doubt to get at the fly which was attacking the young plant, and whose ravages will be perceived later on." On examination of the fly we find it to be a very common and perfectly harmless insect, so that the jackdaw can receive no credit for destroying it. But, further, whilst the crop of the bird was absolutely empty, its gizzard was full of fragments of Barley, on which it had undoubtedly been feeding. There were also a few of the flies there. The bird, therefore, was, in this case, seriously damaging the crop, and we see how important it is not to form any conclusions as to the food of any bird without a thorough investigation of every attack.

PEACH FRECKLE OR BLACK SPOT.—Peaches cultivated in Europe, America and South Africa are subject to a disease which has for its first effect the spotting and discolouring of the fruit, and for its final effect a checking of growth and cracking of the fruit, which fails to ripen. According to Mr. I. B. POLE EVANS, Plant Pathologist to the Transvaal Department of Agriculture (*Trans. Agric. Journal*, Vol. VII., No. 27, 1909), the disease, which affects also Apricot, Almond, Cherry, Nectarine, and Plum, is due to the fungus *Cladosporium carpophilum* (Thuem). Small, round, dark green spots make their appearance on the stalk end of the young Peaches. The spots increase in number, spread, and coalesce to produce dark patches. The affected parts of the fruits harden, shrivel and, finally, crack. Mr. EVANS finds that winter spraying with Bordeaux mixture, applied three weeks before the buds begin to burst, is the most effective means of prevention. The formula recommended is that used for Peach leaf-curl, viz.: Copper sulphate, 5 lbs.; lime, 5 lbs.; water, 45 gallons. He recommends subsequent sprayings, one when the fruit has set and another when it is half-grown. For these latter sprayings the proportions should be: Copper sulphate, 6 lbs.; lime, 4 lbs.; water, 100 gallons.

TREES AND SHRUBS.

CASTANOPSIS CHRYSOPHYLLA (THE GOLDEN-LEAVED CHESTNUT).

THIS evergreen tree is closely allied to the Sweet Chestnut, and was included in the genus *Castanea* by Sir Joseph Hooker, when it formed the subject of a plate and description in the *Botanical Magazine* (t. 4953). In this description it is named *Castanea chrysophylla*, but that name is now discarded in favour of *Castanopsis chrysophylla*, of de Candolle. It is a native of North America, and was discovered by David Douglas in 1830 growing in hilly regions about the Grand Rapids of the Columbia (Oregon), Cape Orford, and near Mount Hood. It was subsequently observed by Burke and Hartweg in California, and they are reported to have sent the first seeds of the tree to Europe. It is curious that, although seeds were sent to Kew by Burke nearly 60 years ago, and plants in that establishment are recorded as having fruited in 1856, no old specimens exist at Kew, whilst very few fine examples are recorded from other parts of this country. One of the finest specimens in Great Britain is found on the estate of Earl Ducie at Tortworth Court, Gloucestershire, and this was probably one of the earliest introductions. Travellers describe *Castanopsis chrysophylla* in its natural habitat as a tree, but it varies considerably in stature, being sometimes less than 20 feet high when mature, whilst at other times it reaches 70 feet in height with a trunk of considerable proportions. The leaves are very like those of the Holm Oak, except that the under surface is of a pretty golden colour. The fruits resemble in form those of the Sweet Chestnut, but are much smaller. The nuts, nearly half an inch in diameter, are similar in flavour to those of the Sweet Chestnut. The plant fruits when only a few years old, and in favourable seasons the fruits mature in this country. At Kew it is found to thrive best in sandy soil with which a little peat has been mixed. Trees raised from seeds exhibit remarkable differences in habit; some grow freely with long leading shoots, whilst others form stunted bushes. This was very noticeable in a batch of plants raised at Kew from seeds received from Earl Ducie in 1900. The dwarfest examples are from 2½ to 3½ feet high, whilst the tallest is 15 feet in height, with a trunk girth of 9¼ inches at 2 feet from the ground. The tree is valuable as affording variety for planting, and the golden colour of the undersides of the leaves is very pleasing. It is doubtful whether this tree would succeed in cold or exposed situations. W. D.

MUTISIA CLEMATIS.

THIS beautiful climbing plant (see fig. 185) has recently flowered in the nurseries of Messrs. Robert Veitch & Son, Exeter, to whom we are indebted for specimens. The species is rarely to be seen in gardens, although it has been known to cultivation since the time of the younger Linnæus, who first described it. Messrs. Veitch's plant has flowered in an unheated greenhouse, having a north aspect, and, consequently, unexposed to sunshine. The plant belongs to the Compositæ, and is found wild on the Andes in tropical South America. The pinnate leaves have a long terminal tendril, by means of which the plant climbs. The flowers are terminal, about 2½ inches long, and with involucreal scales, having a whitish downy covering. These scales are a prominent feature in the flower, and increase in length from below upwards. The ray florets are structurally female, the stamens being vestigial. The disc florets are hermaphrodite and tubular, about 1½ inches long, five-toothed at the top, the five segments separating above the base and forming slits, through which the filaments and style partly protrude. In some cases the flowers are cleistogamous.

THE BOTANICAL GARDENS AND PARK AT BATH.

In the prettily undulating park, hemmed in by the hills which surround the town, can be seen remarkably fine specimens of many trees. Thus:—*Arbutus Andrachne*, introduced in 1724 from the Levant; the Tulip tree (*Liriodendron*

Pinus halepensis (one of the few specimens in England); *Catalpa bignonioides*, from U.S.A., introduced in 1726; *Cerasus serrulata*, from China in 1822; *Planera Richardii*, from W. Asia in 1760; and very large specimens of *Quercus Ilex*.

Among the more interesting shrubs in the gardens may be mentioned *Magnolia Kobus* and

with pale yellowish racemes; and the "Chusan Palm" (*Trachycarpus excelsus*). The specimen of *Potentilla fruticosa* at Bath has smaller leaves and larger flowers than is usual, but I am unaware if it has a varietal name.

The Alpine garden was formed in 1877, and designed by Mr. J. W. Morris, F.L.S., who published in 1893 (2nd edition, 1897) a catalogue

FIG. 183.—*MUTISIA CLEMATIS*: FLOWERS ORANGE-SCARLET.
(See p. 414.)

tulipifera), introduced in 1688 from "Canada to Florida"; *Aesculus flava*, from U.S.A. in 1711; *Aesculus rubra*; *A. californica* (the only specimen which has fruited in Britain); *Tilia petiolaris* (one of the finest specimens of this Lime in Europe); a fine example of the rare *Cornus brachypoda variegata*; *Sequoia sempervirens*:

the common *Magnolia stellata*, with its brown, woolly calyx; *Forsythia suspensa*, from China; *Berberis Wallichiana*, from the Himalayas; *Fatsia (Aralia) japonica*; a very fine specimen of the Double Sloe; *Daphne Mezereum*, with cream-coloured flowers; *Genista aethnensis*; *Nuttallia cerasiformis*, resembling a *Ribes*,

of the original plants which were given by Mr. C. E. Broome, F.L.S., to start the garden. The rock-gardens were laid out with care and knowledge, so that the result is both natural and pleasing to the eye. A good supply of local carboniferous limestone forms the staple foundation of the rockwork.

Visitors to Bath will be well rewarded if they visit these pretty gardens so close to the city. The collection of Saxifragas is particularly fine, and comprises the rare *S. Griesbachii*, from the Balkans, with its spike of red, mucronate leaves, which almost hide the blossoms; *S.*

small white-flowered *S. cordifolia*, from Siberia; the hybrid *S. apiculata*; the bright yellow *S. sancta*, from Macedonia, and the weed-like *S. Sibthorpii*, which is not given too much license in these neatly-kept gardens, so that it does not come up on damp gravel paths as we have seen

ginata, from Dauphiné and Piedmont, but somewhat duller and bluer in colour than in its natural state, and *P. Clusiana*, from the Tyrol, with its large flowers and entire, shiny leaves. *P. scotica* was only just appearing above ground.

Several interesting cruciferous plants are now in bloom, such as *Draba hirta*, from the Arctic regions; the ubiquitous *D. aizoides*; *Morisia hypogæa*, peculiar to Corsica and Sardinia; *Dentaria digitata*; a pale yellow *Dentaria*, which is probably *D. diphylla*; *Arabis rosea*, and *A. aubretioides*. I noticed also the following among the more interesting plants in blossom, viz., *Helleborus odorus purpurascens*; *Corydalis cheilanthisifolia*, with its elegant leaves somewhat like those of Milfoil; *C. cava*, both purple and white forms, from the Jura; *Pulmonaria saccharata*; *P. angustifolia* var. *azurea*, a beautiful patch of this small *Pulmonaria* with flowers quite as brilliant a blue as those I have seen at the head of Val Touranche and elsewhere in Piedmont; the white *Daphne Blagayana*; the blue *Synthryis reniformis*, from N.W. America; *Sanguinaria canadensis*, and *Erythronium grandiflorum giganteum*, a beautiful cream-coloured form with yellow eye. *Ruscus hypoglossum* was stunted in growth and of a yellowish-green colour, perhaps from frost. In addition to being only 8 inches high, the leaves were narrower and longer than those of this plant as it grows luxuriantly in some of the gardens at Hyères in the south of France, where formerly it was found wild, though possibly only naturalised. There is a good clump of the handsome and valuable *Pæonia Whittmannia*, on one of the rockeries.

The Victoria Park, with its numerous fine specimens of native and foreign trees, and the botanical gardens, are under the direction of Mr. Halliburton, recently of Kew Gardens. *H. S. Thompson.*

A BEAUTIFUL HARTSTONGUE.

THE beautiful frilled and fringed form of *Scolopendrium vulgare* illustrated in fig. 184 was raised by Messrs. H. B. May & Sons, Lower Edmonton. It affords a vivid idea of what this normally simple-fronded Fern is capable of in the way of variation. In one variety or another of *Scolopendrium vulgare* every normal character has diverged in numerous directions, the bluntly-pointed frond tip producing tassels round or flat, dense or fimbriate, simple or branched. The flat frond has assumed both frills and fringes as the example now illustrated demonstrates; in some varieties it has disappeared entirely, bearing crests on bare stalks. The smooth surface has broken up into ridges and roughnesses, and the heart-shaped base has diverged into a sagittate or barbed form, these barbs going yet further in several varieties and bearing tassels on their own account on assuming an independent frond form. Under selective culture, this Fern has proved peculiarly amenable to cross fertilisation, and Messrs. May's example is a case in point, since it undoubtedly presents a combination of three types, viz., the frilled or crispum section, the fimbriate and the muricate, the murication or roughening of the surface appearing along the centre near the midrib. *Chas. T. Drury, V.M.H., F.L.S.*

FIG. 184.—SCOLOPENDRIUM VULGARE MURICATO FIMBRIATUM.

juniperifolia, from the Caucasus; *S. Aizoon rosea*; *S. Boydii*, both yellow and the variety *alba*; *S. marginata*, from Central Italy; *S. Fergusoni*; *S. cochlearis*, looking nearly as healthy on the Somerset limestone as it does on that of the Maritime Alps; *S. Cotyledon*; *S. Stracheyi*, from the Himalayas, resembling a

it on the Continent. Incidentally, if I remember rightly, the two Sibthorps were buried in Bath Abbey.

A good many Primulas are scattered about the Alpine garden, conspicuous among those in flower at Easter were *P. denticulata* and var. *alba*, *P. viscosa*, *P. rosea* var. *grandiflora*, *P. mar-*

SWEET PEA MASTERPIECE.

THIS new variety of Sweet Pea (see fig. 185) is one of the finest of the lavender-coloured varieties having a waved standard. As will be seen from the illustration, the floral segments are very large, and, there being four blooms on the spike, it has most of the desirable qualities a Sweet Pea is required to possess, at any rate, by those who do not admire an erect standard. Our illustration is from a photograph supplied us by Messrs. Dobbie & Co., Rothsay

AMERICAN NOTES.

ANTIRRHINUMS.

WE learn from *Horticulture* that a member of the Gardeners' and Florists' Club at Boston stated that he raised his Antirrhinums from cuttings in the month of June, taken from seedlings which he had been selecting for a period of seven years, and kept at a temperature of 40° to 45° Fahr. during the winter. He left four or five spikes on each plant. These spikes were of extraordinary size—nearly 2 feet of flowers and buds. Doubtless, this extraordinary vigour in his plants was due to the exercise of selection in regard to the seed-bearing plants.

CEMENT BENCHES IN ROSE GROWING.

IN America Carnations and Roses are extensively grown on benches made of stone, bricks, and cement. Owing to their durability Americans are generally adopting this method of constructing what we should call a flat stage or shelf.

In a paper on Roses read by Mr. Badgeley at a recent meeting of the Morris County Gardeners' and Florists' Society, it was mentioned as a fact not hitherto stated in the gardening journals, that the Rose American Beauty, grown on cement benches, has proved almost a failure.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

NIGHT-FLOWERING CEREUS.—This season we have had a fine display of flowers of this plant, and there are others to follow. We recently cut several fully-expanded blooms; they opened about 7.30 in the evening. Next morning one flower was quite open, whilst another was partially expanded, and they remained in that condition all day; the others faded the morning after being cut. The species is *Cereus grandiflorus*. Perhaps some of your readers may be able to explain why they did not close in the usual way. This is the first time they have lasted fresh for more than one night. *D. S. Melville, Pottaloch Gardens, Lockgilthead, N.B.* [There is nothing remarkable in this. The flowers sometimes remain open nearly two days when the weather is dull.—Eos.]

ANTHUSA ITALICA VARIETIES.—This season will remove any doubt that existed as to the value of *Anchusa italica* "Opal" and its distinctness from the now well-known "Dropmore variety." Large groups of the two plants in flower here shew that the light blue of "Opal" is very different from the deep, rich blue of "Dropmore." When viewed from a distance, so that the two patches can be taken in at one glance, the effect is very fine and such as can never be obtained in the show-tent. Which is the better plant must remain a matter of taste. To describe "Opal" as "like Delphinium Belladonna in colour" is hardly correct. It being brighter and less pale than that plant, I do not know any flower that has just the same shade of blue. In constitution, habit, and length of flowering period "Opal" is identical with "Dropmore." *Harold Evans, Llanishen, Cardiff, June 21.*

OURISIA COCCINEA.—The illustration of *Ourisia macrophylla* in the *Gardeners' Chronicle* of June 19 reminds one of the difficulty many experience in flowering *O. coccinea*, a native of Chili. *O. coccinea* is a handsome plant, which has been widely distributed, but is rarely seen in good condition. In many gardens it dwindles away, and in others in which it grows well it flowers in the sparsest possible manner, and causes much disappointment to its owners. A study of the plant under various conditions leads me to think that it is akin to the *Gentianella* in its uncertainty, and that it frequently fails to respond in one garden to the treatment in which it

flourishes in another. It has often been stated that it does best in a moist and peaty soil with a considerable amount of shade. I have seen it flower well enough in such conditions, but have also met with it in an equally happy state in totally different circumstances. The other day I saw a fine clump of *O. coccinea* in full flower in Sir Herbert Maxwell's garden at Menreith, in Wigtownshire. Here the conditions were not precisely in accord with these frequently advocated. The plant was in the open

however, be said to be really moist. This is the best plant I have seen, excepting those I saw at Straffan, Co. Kildare, some years ago. There the soil seemed more peaty and moister than at Monreith. This *Ourisia* also succeeds well in one part of the garden of General Stewart, at Carruchan, near Dumfries, where it is in a border facing almost north, and therefore shaded from the mid-day and afternoon sun. There it has flowered well, but not so strongly as at Monreith; while at Carruchan it appears

FIG. 185.—SWEET PEA MASTERPIECE: COLOUR LAVENDER.
(See p. 416.)

border, with a fairly open exposure, mainly to the east, although it seemed as if shaded from the afternoon sun by trees and shrubs behind. The foliage of this clump was remarkably healthy, and the plant bore many spikes of the handsome scarlet flowers. The border looked dry, but underneath there was a good depth of soil of a free kind, and not so dry as the appearance of the surface indicated. It could not,

to resent removal to another part of the garden. In my own garden I have a plant obtained from that at Carruchan, and in a low-lying part of the rock-garden and with a north exposure it does not bloom. I recollect trying it more than once in my former garden, with an eastern exposure, and in a more peaty and a moister soil than that at Carruchan, and there it flowered fairly well for a short time, but eventually rotted

off at the base of the stock. Mr. Reginald Farrer has an interesting record of his experiences with this species. He states that he found it to succeed well in borders and on rockwork, preferring to be started in rich, moist soil in a rock-shaded spot. He adds: "Some people tell me of *Ourisia* making a weed of itself as a sun-plant; here, certainly, all my success has been in cool corners under walls or in rocky dells." My own advice to those who want to try this fine plant is to cultivate it in several positions. One may suit when others fail. *S. Arnott.*

STUDENTS AT CAMBRIDGE BOTANIC GARDEN.

—In the Cambridge Botanic Garden for several years past unpaid student gardeners have been employed from time to time, until at last the practice has become a regular one. It arose from the impossibility of finding places for certain applicants who wished to learn. At present there are three young men who are having valuable experience; whilst their services are valuable to the Botanic Garden. They have facilities and privileges that are not possible for those who are paid. They have had, for instance, during the past year the advantage of attending the whole of Professor Seward's botanical lectures without payment of fees; and, for practical observation, the curator himself has taken them to all the principal gardens in the neighbourhood. They have time, too, for private study in the garden when lectures are not going on, and it may be worth mention that, by the kindness of the professor, attendance at these lectures will continue to be permitted. In the Botanic Garden they have had very good work to do. The scheme is now supplementary to the paid staff, and it has been found to work extremely well. The only stipulation made is that these young student gardeners must be under the same rules and regulations as the paid men, certain special facilities that may be given them being understood. *C.*

RANUNCULUS AURICOMUS.—This species, referred to by your correspondent Mr. H. S. Thompson (see p. 384), is by no means uncommon in the perfect state: were it otherwise, it would hardly have gained its English name of "Goldilocks." I have often seen it in hedges and woods in Somersetshire, with numerous well-formed flowers. I remember Portishead Wood was a locality for it; but it looks its best in hedge-banks of a thicket character. A few years ago I found two young plants on the same day about a mile apart, some 20 miles from York, one on a limestone ledge, the other in the middle of a wood. They interested me greatly, as I was unable to determine them. I planted both, and one survived. It is now in fruit. On reading your correspondent's note, I immediately examined the plant again, and found the carpels in their downy, ventricose character and hooked stigma, to agree with *R. auricomus*. It is the only specimen I have ever found with depauperate flowers. A leaf was shown to a distinguished member of the British Association, at that time meeting here, and he was unable to identify it. It is remarkable that your correspondent's enquiry has settled the point after such a lapse of time. *Frank Gunning.*

THE PERPETUAL-FLOWERING CARNATION SOCIETY.—The schedule for the December show just completed, offers largely increased prizes to amateurs and gardeners. Lord Howard de Walden's magnificent challenge cup (value 40 guineas) is accompanied by a money prize. I would like to remind readers that plants for this show should now be in their flowering pots, and it is not advisable to stop any after the end of this month excepting the quickest-growing varieties. *Laurence J. Cook, hon. treasurer, 92, First Avenue, Bush Hill Park, Middlesex.*

A LARGE MELON.—I have this day cut a Melon fruit weighing 14 lbs. The variety is Messrs. Sutton & Sons' Universal. It is a white-fleshed variety and beautifully netted. It would be interesting to know the heaviest weight recorded for a Melon. *H. J. Bloxham, The Gardens, Tongswood, Hawkhurst.* [Our "record" book has many entries of large Melons, including fruits weighing 24½ lbs., 24 lbs., and 20 lbs., but these are all varieties of the Cantaloupe type. There is also a record

of a very large fruit which weighed as much as 32 lbs., but the variety is not stated. Mr. Phillips, who gave the information on this one (see *Gardeners' Chronicle*, November 14, 1857, p. 174), wrote as follows:—"One of your correspondents has asked whether a Melon 16 lbs. in weight is not the heaviest that has been grown in this country? I am sorry I cannot find the memorandum taken at the time, but I have a very distinct recollection of a fruit (the plant was raised by myself) grown by a neighbour of mine, which weighed 32 lbs., and measured fully 3 feet 6 inches in circumference. The same plant produced another fruit of 14 lbs. It was a red-fleshed variety, having a rather smooth skin, and very fair flavour. I believe I took the seed from a fruit served at a table d'hôte in Switzerland. This was about 20 years since. I have since grown a fruit 14 lbs. weight, a green flesh, something like the Ispahan, but flatter in shape and beautifully netted. The flavour of this was excellent. I do not, however, now grow any variety but one called after my gardener, Austen's Incomparable, which is a most delicious fruit, and I think superior to any other; it is of a medium size, green flesh, of the hybrid Persian kind, and most exquisite flavour. I can strongly recommend it." Amongst named varieties the following entries in our book are the more noteworthy: *Victoria*, 12½ lbs., July 2, 1870; *Hoosainee*, 10 lbs., August 1, 1843; do., 12 lbs. 3 ozs., July 2, 1844; *Ispahan*, 13 lbs. 7 ozs., August 8, 1846; *Monro's Green Fleshed*, 9 lbs. 3½ ozs., August 7, 1849; and *Lady Emma*, August 24, 1837.—Eds.]

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 22.—At the meeting held on Tuesday last the principal exhibits were groups of hardy-flowering plants; indeed, there was much repetition in the displays of *Pæonies*, *Pyrethrums*, *Irises*, *Lupins*, *Eremuri*, and similar subjects. Sweet Peas were numerous, and there were also *Roses*, *Carnations*, *Pelargoniums*, a unique collection of *Nephrolepis*—both species and varieties; and a considerable number of greenhouse flowering plants. Orchids were fewer than usual, whilst the exhibits in the fruit and vegetable section were almost negligible.

The FLORAL COMMITTEE granted eight Awards of Merit to novelties; but neither the ORCHID COMMITTEE nor the FRUIT AND VEGETABLE COMMITTEE granted an Award.

At the afternoon meeting in the lecture room, the first of the "Masters" Memorial Lectures was given by Prof. Hugo de Vries, the subject being "Masters' Vegetable Teratology."

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. C. T. Druery, Henry B. May, Chas. E. Shea, Jno. Green, W. Bain, W. P. Thompson, W. J. James, E. H. Jenkins, W. Cuthbertson, Chas. E. Pearson, Chas. Dixon, J. T. Bennett-Poë, F. Page Roberts, H. J. Jones, Jas. Douglas, Chas. Blick, Herbert J. Cuthbush, J. F. McLeod, W. Howe, J. Jennings, G. Reuthe, W. J. Bean, E. A. Bowles, R. Hooper Pearson, Ed. Mawley, R. C. Notcutt, James Hudson and E. T. Cook.

The Hon. VICARY GIBBS, Elstree, Herts. (gr. Mr. Ed. Beckett), showed a comprehensive collection of scented-leaved *Pelargoniums*. The one labelled tetragonum has succulent, angular stems; others of especial interest were *betulinum*, the Birch-leaved *Pelargonium*; *tomentosum*, smelling of Peppermint, Old Unique, and *saxifragoides*, the last-named having foliage resembling small Ivy leaves. In another part of the hall this exhibitor showed very large plants—standard trained—of the variety *Clorinda*, a groundwork of white-flowered *Astilbe* (*Spiræa*) being employed. (Silver Banksian Medal.)

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, showed miscellaneous greenhouse flowering plants. *Kalanchoe flammea* was finely exhibited, the red flowers being very attractive; *Medinilla magnifica* was exceedingly handsome, the large inflorescences of pink blooms showing prominently against the broad coriaceous leaves; *Exacum macranthum*, with flowers of the deepest blue; *Hydrangeas*—both blue and pink

flowered; *Cannas* in variety; *Lobelia tennior*, *Anthuriums* and *Calceolaria Clibranii*, all contributed to a well-arranged and very effective exhibit. Adjoining the greenhouse plants the same firm showed *Alonsoa Warszewiczii*, *Brachycome iberidifolia*, *Candytuft*, *Nemesia*, and other annuals. (Silver-gilt Banksian Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, exhibited bunches of Zonal *Pelargoniums* in about 40 varieties, representative of the best kinds. A selection includes King of Spain (scarlet), Princess Feodar de Wyzeway (pink, with white centre), Miss Ashworth (double flowers, white), Mr. B. W. Currie (pink), and Vicomtesse de Vogue (salmon). Adjoining the *Pelargoniums* was a group of Ferns. These were varieties of *Nephrolepis*. Especially handsome were *N. exaltata superba*, *N. canaliculata*, *N. Amerpholii*, *N. Duffii*, *N. cordifolia tessellata*, *N. Bausei* and *N. Mayi cristata*. (Silver-gilt Flora Medal.)

Mr. HOWARD H. CRANE, Highgate, London, N., displayed varieties of *Violas* and the miniature type known as *Violettas*. The beautiful blue *Viola* named Archie Grant was charming, as also were *Duchess of Fife* (yellow, with blue margin), *Bessie* (very faintly suffused with lavender), *Sultan* (purple), *Acme* (plum colour), and *Miss E. M. Cam* (yellow). The flowers were very fresh and bright in appearance, and were staged in pans of sand.

Sir EDMUND LODER, Bart., Leonardslee, Horsesham, Sussex (gr. Mr. W. Cook), staged interesting plants from the open. There were many finely-developed blooms of *Sarracenia purpurea*, intermixed with them being spikes of *Eriophorum* (Cotton). Other plants of interest were *Abutilon vitifolium*, *Magnolia Watsonii*, *M. parviflora*, and *Philadelphus Falconeri*. (Silver Banksian Medal.)

Messrs. BAKERS, Wolverhampton, staged *Aquilegias*. The flowers were of many shades of colours, and represented an excellent strain. (Bronze Banksian Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, also staged some fine *Aquilegias* having blooms of numerous colours and with long-spurred sepals. (Silver Flora Medal.)

Mr. JAMES DOUGLAS, Edenside, Great Bookham, Surrey, exhibited a collection of garden *Pinks*, showing in all some 210 plants in about 27 varieties. *Snowdrift* is an excellent white variety, the blooms being large and full. *Border Chief* is a beautiful laced flower, the markings being pink and with crimson-coloured centre. *Adonis* is very free in flowering. One named *The Duke* has a clove-coloured centre and rose lacing. Mr. DOUGLAS also showed varieties of German *Irises*.

Mr. H. BURNETT, Guernsey, displayed choice *Carnations* of the perpetual-flowering section, having vases of most of the prominent varieties, pleasingly arranged with *Smilax* and other greenery. (Silver Banksian Medal.)

A fine, new, white *Carnation* of the perpetual-flowering type, named *Stirling Stent*, was shown by REDLANDS Co., Emsworth, Hants.

Messrs. PAUL & SON, Old Nurseries, Cheshunt, arranged a floor group of hardy flowers, and, as a centre plant, a tall specimen of *Goldfinch Rose* with numbers of its pretty yellow blooms. Messrs. PAUL also showed garden *Roses* in variety. (Silver Flora Medal.)

Bunches of *Roses* were also shown by Messrs. BEN. R. CANT & SONS, Colchester (Silver Banksian Medal); another exhibit of *Roses* was made by Messrs. F. CANT & Co., Colchester, who had bunches of excellent blooms of well-known varieties. (Silver Flora Medal.)

Messrs. W. CUTBUSH & SON, Highgate, London, N., showed a large group of hardy flowers, including some magnificent spikes of *Eremuri*, arranged in a setting of *Maples* and *Bamboos* with a groundwork of *Campanula glomerata*. *Gladiolus Prince Henry* of the ramosus section is one of the earliest of these flowers. *Papaver Prince of Orange* is a beautiful variety of the Oriental *Poppy*, the name being indicative of the colour. (Silver-gilt Banksian Medal.)

Mr. G. REUTHE, Keston, Kent, showed Alpine and border flowers, also flowering shrubs and *Rhododendrons*. (Silver Banksian Medal.)

Mr. AMOS PERRY, Enfield, Middlesex, staged a large exhibit of garden flowers. Hybrid *Heucheras* were a feature, the colours in the flowers ranging from pure white to shades of red. Other subjects noticed were *Dictamnus Fraxinella*, *Drimys Winteri*, fine spikes of *Eremuri*, *Liliums* in variety, *Achillea alpina*, *Oriental Poppies* (on

named after Mrs. Perry is a delicate shade of pink), and Irises in variety. (Silver Flora Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, London, staged large batches of Pæonies, Irises, Lupins, Liliams, Campanulas, and other garden flowers.

GUILDFORD HARDY PLANT NURSERY showed interesting Alpines in small pots, also bunches of Pæonies, Pyrethrums, Liliams, Heucheras, &c.

Messrs. GEO. BUNYARD & Co., Maidstone, staged a very large exhibit of hardy flowers, embracing most of the best kinds in season. A considerable portion of the display was of varieties of Pæonies, but Poppies, Heucheras, Gaillardias, Lupins, &c., were also shown in great assortment. (Silver-gilt Flora Medal.)

Messrs. WM. BULL & SONS, King's Road, Chelsea, exhibited varieties of Spanish Irises. Ophir (pale yellow), Cyrus (darker yellow), Bronze King, Alexander von Humboldt (blue with a yellow blotch), Flora (pale lavender, white, and yellow), Darling (deep blue), and British Queen (white) are a selection.

Pæonies were well shown by Mr. CHAS. TURNER, Royal Nurseries, Slough. Single-flowered varieties were very beautiful, including such handsome flowers as Queen of Singles (white), Enchantress (pink), and Leonora (rosy-red); several were exhibited for the first time.

A large floor group, principally composed of Pæonies, was set up by Mr. MAURICE PRICHARD, Christchurch, Hants. A batch of the beautiful Dropmore variety of *Anchusa italica* was prominent. The group was outlined in sprays of *Gypsophila*, varieties of *Heucheras*, and other light inflorescences. (Silver Banksian Medal.)

A large number of Pæonies was displayed by Messrs. R. H. BATH, LTD., Wisbech. (Silver Flora Medal.)

Messrs. G. & A. CLARK, LTD., Dover, arranged a pleasing exhibit of hardy flowers in great variety, including many Pæonies, *Lychnis viscaria*, *Inula grandiflora*, Lupins, and Pinks. Messrs. CLARK also staged several vases of Sweet Peas. (Silver Flora Medal.)

Messrs. T. S. WARE, LTD., Feltham, staged garden flowers, amongst which *Eremuri* were conspicuous, also *Delphinium Persimmon* of beautiful pale blue colour, *Lilium Davuricum*, Pæonies in variety, Campanulas, and Phloxes. (Silver-gilt Banksian Medal.)

Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, staged sprays of flowering shrubs and trees. *Quercus nigra* has almost black foliage, whilst *Q. concordia* is a shade of golden green. *Crataegus Carrieri* has large bunches of white flowers; the plant retains its foliage until Christmas. *C. × Leana* has a globular inflorescence and sweet-smelling flowers. It is a free grower, and forms a valuable stock for more delicate kinds. *Kalmia latifolia* was very showy. There were numerous *Rhododendrons*, including *R. punctatum*, *R. ovatum*, *R. myrtifolium*, and others of the Alpine section. Messrs. CHEAL also showed hardy flowers in variety.

Messrs. GEO. JACKMAN & SON, Woking Nursery, Surrey, put up a group of hardy flowers. We noticed a choice Iris named Snow Queen; *Delphinium Belladonna* and *Dracocephalum Ruychiana* are two lovely blue-flowered plants; *Betonica nivea* was also shown finely in this group. (Silver Banksian Medal.)

Messrs. KELWAY & SON, Langport, Somerset, showed, as at the last meeting, large numbers of Pæonies and Pyrethrums. Queen Alexandra (white) and Princess Beatrice (pink) are two choice varieties of these latter flowers. (Silver Flora Medal.)

The Misses HOPKINS, Mere Gardens, Shepperton-on-Thames, arranged a rock-garden exhibit with seasonable Alpine plants in flower.

Mr. CLARENCE ELLIOTT, Six Mills Nursery, Stevenage, showed pans of Alpine plants and a small rock-garden exhibit.

Messrs. JOHN PEED & SON, West Norwood, London, S.E., arranged seasonable Alpine flowers on a rather extensive rock-work exhibit. It was pleasing to notice in the arrangement there was no crowding of the subjects, so that a natural effect was produced.

Other exhibitors of hardy flowers were Mr. A. J. HARWOOD, St. Peter's Nursery, Colchester; Mr. R. C. NOTCUTT, Woodbridge (Silver Banksian Medal); and Messrs. MAWSON BROS., Windermere, who showed *Papaver orientale* Jennie Mawson, the flower being a pleasing tone of salmon.

Messrs. E. W. KING & Co., Coggeshall, Essex,

displayed Sweet Peas in great assortment. (Silver Banksian Medal.) Another large exhibitor of these popular flowers was Mr. W. J. UNWIN, Histon, Cambridge, who showed beautiful blooms of Heston Favourite (orange-scarlet), Cambridge Pride (light ground, heavily edged with pink), Gladys Burt (cream, suffused slightly with pink), Frank Unwin (lavender), Nancy Perkins (orange-salmon), &c. (Silver Banksian Medal.)

Mr. CHAS. BLICK, Warren Nursery, Hayes, Kent, showed new Carnations. One received an Award of Merit (see below). Another, named John Ruskin, is a fine, light-edged flower, with a yellow ground. Mr. BLICK also showed well-grown blooms of the beautiful Carnation named after Lady Hermione.

AWARDS.

AWARDS OF MERIT.

Aster mesa grandiflora.—An excellent border plant growing about 2 feet high. The neat, well-formed flowers are of a bright tint of satiny-purple. The plants are said to flower from June to September. (Shown by Messrs. W. CUTBUSH & SONS.)

Campanula phlytidocalyx.—Inflorescences of this species were shown by Sir TREVOR LAWRENCE, Bart. (gr. Mr. Bain). The flowers measure about 1 inch across, and they are of deep purple colour. The plants grow from 1 foot to 2 feet high.

Carnation "Her Majesty".—A yellow-ground flower with very deep purple edge. It is of excellent form, and one of the best heavy-edged varieties raised. (Shown by Mr. CHAS. BLICK, Warren Nursery, Hayes.)

Delphinium Moerheimeii.—This is a lax-flowered variety obtained from a cross between *D. Belladonna* and *D. sinensis*. The flowers are white, except for touches of green. (Shown by Messrs. W. CUTBUSH & SONS.)

Pæonia "Leonora".—A very handsome, single-flowered variety, with large, crimson flowers.

Pæonia "Queen of Singles".—A pure white variety of very large size. The white petals and yellow stamens are very effective. (Both these Pæonies were shown by Mr. C. TURNER, Slough.)

Sweet Pea Blanche Stevens.—This is a very large, pure white variety, with broad, erect standard. There were three flowers on a stem. (Shown by Mr. H. J. JONES.)

Sweet Pea Sterling Stent.—A very bright-looking, salmon-red variety of good size. (Shown by Mr. J. AGATE.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. secretary), Harry J. Veitch, de B. Crawshay, W. Boxall, W. Thompson, F. Sander, F. J. Hanbury, R. G. Thwaites, Walter Cobb, C. H. Curtis, J. Charlesworth, W. P. Bound, W. H. Hatcher, W. H. White, H. A. Tracy, Gurney Wilson, J. Wilson Potter, R. Brooman-White, W. Bolton, A. Dye, Stuart Low, A. A. McBean, J. Forster Alcock and Elijah Ashworth.

There was the smallest display of Orchids which has been staged at Vincent Square for a considerable time, and only three plants were entered to go before the Committee, who made no awards.

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, staged an effective group of considerable extent, and containing many pretty species, the group securing a Silver Flora Medal. Some very fine *Cattleya Mendelii*, *C. Warszewiczii*, and other *Cattleyas*, including the very large *C. grandis*, were in the group, in which also were noted many other species.

Mr. A. W. JENSEN, Lindfield, showed a small group of very fine forms of *Cattleya Mendelii*, *C. Warszewiczii* and *C. Mossiae*, including a plant of the blush-white *C. M. Arnoldiana aurea*, with little other colour than yellow in the lip. (Silver Banksian Medal.)

Messrs. STANLEY & Co., Southgate, staged a group in which the varieties of *Cattleya Mossiae Reinckiana* were well displayed, showing great variation in the colour of the lips in the different forms. White-petalled forms of *C. Gasckelliana* were also included. (Silver Banksian Medal.)

Monsieur MERTENS, Ghent, showed a selection of hybrid *Odontoglossums*, *Odontiodas* and *Cattleyas*.

J. G. BERGHEIM, Esq., Belsize Court, Hampstead (gr. Mr. Page), sent a singular-looking *Megaclinium* from tropical Africa.

R. G. THWAITES, Esq., Chessington, Streatham (gr. Mr. Black), showed *Odontoglossum crispum Trianae majesticum*, a grand white variety with large flowers of fine shape and substance.

Baron Sir H. SCHRÖDER, The Dell, Egham (gr. Mr. Ballantine), sent *Odontoglossum Black Prince*, a showy hybrid densely blotched with dark claret-red, showing the white ground colour at the margins and between the blotches.

Fruit and Vegetable Committee.

Present: A. H. Pearson, Esq. (in the Chair); and Messrs. J. Cheal, W. Bates, W. Poupart, J. Willard, A. Dean, J. Perkins, P. C. M. Veitch, J. Lyne, H. Hooper, J. Davis, H. Parr, J. Vert, E. Beckett, O. Thomas, C. Foster, W. Barnes, A. H. Allan, T. Hobday, C. G. A. Nix, J. McIndoe, G. Wythes, J. Jaques and S. T. Wright (secretary).

The only exhibit of importance was a collection of Cabbage Lettuces and early Cauliflowers, shown by Messrs. JAMES VEITCH & SONS, Chelsea, for which a Silver Knightian Medal was awarded. The best of the Lettuces were Passion, Unique, a brown-leaved variety; Imperial, New York, the largest shown; Palatine, with neat, compact heads, and well-hearted; Rudolph's Favourite, a fine variety for garnishing and salads, the colour being golden-green; Best of All, and Early Cold Frame. The Cauliflowers were sown on January 2, and planted out on April 16. The variety was Early Forcing.

Messrs. KELWAY & SON, Langport, showed a basket of Harbinger Cauliflower.

COMPETITIVE CLASSES.

There were three classes for Tomatos, but only one was contested, that for three dishes of distinct varieties grown by an amateur. The 1st prize was awarded to the Hon. VICARY GIBBS, Elstree, Herts. (gr. Mr. Ed. Beckett), who had good fruits of Perfection, Golden Perfection, and Sutton's A1; 2nd, Lord FOLEY, Ruxley Lodge, Claygate, Surrey (gr. Mr. H. C. Gardner), with Hipper's 1st, Dwarf Red, and Winter Beauty; 3rd, Lord HOWARD DE WALDEN, Audley End, Saffron Walden (gr. Mr. J. Vert).

THE FIRST "MASTERS" LECTURE.

THIS was the first of a series of lectures designed to commemorate the name of Dr. Maxwell T. Masters, for so long a period Editor of the *Gardeners' Chronicle*. The selection of Professor Hugo de Vries as the deliverer of the lecture was peculiarly fitting. The modesty of the great Dutch botanist prevented those who saw him—in the majority of cases for the first time—in the Lecture Room at the Horticultural Society on Tuesday afternoon from knowing how appropriate the selection had been. For it is by Professor de Vries that the most considerable advances in the scientific study of teratology have been made since the ground was first broken by the publication, in 1869, of Masters' *Vegetable Teratology: An Account of the Principal Deviations from the Usual Construction of Plants*.

Professor de Vries paid a just tribute to the painstaking work of Dr. Masters, stating that although the book was to a very great extent a narration of observed facts, nevertheless on most of its pages there were evidences of the philosophical mind possessed by the author. Mainly through the influence of Dr. Masters, English horticulture had developed upon a sound and scientific basis. The study of abnormalities has a strange history. This is primarily due to the basis on which Linnaeus founded his system of classification. Before Linnaeus's day the genera were regarded as the units of the natural system; but he elevated the sub-divisions of the genera—the species—to this rank: this elevation meant that the species were believed to have been created. The abnormalities which could be observed to arise in one's own garden from normal parents had obviously not been created in the beginning, and were, therefore, in the opinion of Linnaeus, not worthy of the attention of the serious botanist. It is, indeed,

recorded that Linnæus forbade his students to pay any attention to such abnormalities. It seems not unreasonable to suggest that this ruling out of court of all "deviations from the usual construction of organism" may have contributed largely to the persistence in a belief in the immutability of species. So long as permission to pay attention to, and much less to devote a lifetime to the investigation of deviations from the normal, was withheld by those who directed the course of biological enquiry, it was impossible that any progress could be made with the study of evolution, except by those who disregarded the injunctions of their professors.

If it may be said that, before the general acceptance of a theory of evolution, too little attention was paid to the study of abnormalities, it certainly may be urged, not without some justice, that since a belief in evolution has become general, abnormalities have assumed a prominence which is not commensurate with the share which they have had in the evolutionary process. The theory of evolution demands the existence of variations; and in the search for these, which this demand necessitated, many kinds of abnormalities were collected and recorded, which, in all probability, have little to do with the main lines of differentiation. What we have said merely refers to abnormalities in their direct bearing on evolution. What we really want is some criterion which will enable us to distinguish between normal abnormalities (if the expression may be permitted), which are the variations to which evolution is due, and abnormal abnormalities, or monstrosities, which have nothing to do with evolution. The only hope of obtaining such a criterion is to work on the lines laid down by Masters; to record with detailed figures the structure of any abnormality of whatever kind that may appear, and, what is equally important, to find out whether the abnormality is repeated in the offspring of the monster. Such investigation, as Professor de Vries pointed out, has been made possible by the work of Masters, which enables the enquirer to find out whether an abnormality of a similar kind has been recorded before, and to fit it into a scheme which, as Masters admits, is only an approximation to a natural one.

Teratology may often succeed, as Professor de Vries told us, where the investigation of normal form has failed, in affording a clue as to the primitive structure of organs. The study of monstrosities is, further, likely to throw a great deal of light on the question of the symmetry of distribution of organs in the plant body. And, lastly, we cannot yet guess what problems, which have not yet taken shape in men's minds, may not be solved by a proper acquaintance with these curious phenomena. These are merely illustrations of the truth that the surest road to a knowledge of the normal is the investigation of the abnormal.

ROYAL AGRICULTURAL.

R.H.S. DEPUTATION TO HORTICULTURAL SHOW.

JUNE 23 to 26.—The general show at Gloucester was of great extent and complete in every class. The weather on Tuesday, the opening day of the agricultural or main section, was stormy, but there was a large attendance.

The horticultural exhibition in connection with the show, under the management of Mr. Peter Blair, of Stoke-on-Trent, as opened on Wednesday afternoon. It was undoubtedly the best ever held in connection with the Royal Agricultural Society, the visit of his Majesty King Edward VII. inducing the best efforts of all engaged. The horticultural show under canvas was arranged in one of the largest marquees procurable in the country, with two smaller tents, one at each end, the commodious walks for the visitors being arranged so that the whole of the show could be inspected without leaving the tent space. The King congratulated Mr. Blair on his efforts, and expressed great satisfaction.

The R.H.S. deputation included Sir Trevor Lawrence, Bart., K.C.V.O. (President), the Rev. W. Wilks (Secretary), Mr. Henry B. May, and Mr. A. E. Bowles.

In their inspection of the exhibits they were assisted by Mr. Jas. O'Brien, V.M.H. Sir Trevor Lawrence, Bart., K.C.V.O. (President of

the R.H.S.), formed one of the deputation to receive the King, and took lunch in the Royal Pavilion. The other members of the deputation partook of the hospitality of the Mayor.

Certain Awards were made by the R.H.S. deputation in addition to the Schedule Awards made by the judges.

The Nature Study Section, in which Sir W. T. Thiselton-Dyer has taken such interest, and the Forestry Department, in which Mr. H. J. Elwes has taken a prominent part, were good educational displays, which would require much space even to refer to briefly.

In front of the main entrance on the central stage was the grand group of Orchids from Colonel G. L. HOLFORD, C.I.E., C.V.O., Westonbirt, which undoubtedly gave the superlative character to the show, the arrangement being cleverly and artistically carried out by Mr. H. G. Alexander, who may well claim to be not only England's best Orchid grower, but a decorative artist of the highest order of merit. The plan of the arrangement consisted in the middle being well carried up at the back, fine *Lælio-Cattleya Canhamiana* and *L.-C. Aphrodite* being chiefly used. On each side were masses of very fine white *Odontoglossum crispum*, with handsomely-coloured *Cattleyas* and hybrid *Lælio-Cattleyas* continuing to the ends at each side. In the front and middle distance, and forming the most striking feature in the group, were many marvellous specimens of *Miltonia vexillaria*, so densely set with flowers that the foliage was almost hidden. Among the best noted were the bright magenta-rose variety *Empress Augusta Victoria*, with 20 spikes bearing 105 flowers; a pair of the white-lipped variety *virginale*, with 75 flowers and 77 flowers respectively; *M. vexillaria superba*, with 23 spikes of 103 flowers; *M. v. chelsiensis*, and other varieties grandly flowered. *Odontoglossum crispum* were represented by over 100 spikes, the spotted and best named varieties being *Norah*, *Zoroaster*, *Westonbirt* variety and *Trianae*. Among the hybrids were very dark-coloured *O. Othello*, *O. amabile*, *O. Wilckeanum imperiale* and others. Among the *Cattleyas* were many fine *C. Mossiæ*, the best white variety *Wageneri*, and *Countess Grey* being charming plants. *C. Dusseldorferi Undine*, which was raised at Westonbirt, like most of the hybrids shown, shows up as one of the best white *Cattleyas*, and *C. intermedia alba*, good *C. Warneri*, *C. Warszewiczii* and *C. Mendelii* were noted. *Brasso-Cattleyas* made a telling feature in this excellent group, a true albino of *Brasso-Cattleya Digbyano-Mossiæ*, *B.-C. Siren superba*, and some finely-coloured *B.-C. Digbyano-Warszewiczii* being specially good. *Lælio-Cattleyas* raised at Westonbirt and displaying the most varied colours were effectively arranged, *L.-C. Ganymede*, *L.-C. Lustre*, *L.-C. Elva* *Westonbirt* variety and the numerous varieties of *L.-C. Canhamiana* being very effective. Other good things well displayed in batches were *Vanda teres*, *Phalenopsis Rimestadtiana*, *Sophrolaelia leta Orpetiana*, fine forms of *Lælia purpurata*, *Dendrobium illustre*, *D. formosum*, and other *Dendrobiums*. The Lawrence Gold Medal for the finest exhibit of the year was made by the R.H.S. deputation.

Messrs. JAS. CYPHER & SONS, Cheltenham, arranged their fine exhibit of specimen stove and greenhouse plants next, and which included two noble specimens of *Darwinia tulipifera*, each 6 feet across, a still larger *Erica Cavendishiana*, the bright magenta-rose *Bougainvillea Cypheri*, certainly the best as an exhibition plant, large *Pimelia diosmaefolia*, *Erica verticosa magnifica*, *Clerodendron Balfourii*, and the whole effectively set up with scarlet *Clerodendrons* intermixed. Messrs. CYPHER & SONS also arranged a most effective group in Class 1, group of miscellaneous plants not exceeding 350 square feet, their group having tall *Kentias* at the back, with pillar *Roses* beneath them, salient points being made with handsome *Codiaeums*, the body being effectively filled in with good Orchids, comprising *Cattleyas*, *Lælio-Cattleyas*, *Odontoglossums*, &c. Very pretty effects were made by an elegant specimen of *Oneidium divaricatum*, with yellowish-bronze flowers; slender yellow *O. flexuosum*, and an unusually elegant feature in a tall, graceful plant of *Cyperus papyrus* (*Papyrus antiquorum*). (Gold Medal.) The same firm staged a beautiful group of Orchids, well arranged for effect, made up of showy *Lælio-Cattleyas*, *Cattleyas*, *Brasso-Cattleyas*, *Odontoglossums*, &c. *Lælia tenebrosa* (with many flowers), *Lælia purpurata* (in fine

variety), *Lælio-Cattleya Canhamiana* (with 10 flowers), a selection of showy *Masdevallias*, two distinct varieties of *Bulbophyllum Lobbiai*, good *Miltonia vexillaria*, *Vanda cœrulea*, *Odontoglossum cordatum*, *Cœlogyne pandurata*, finely-flowered yellow *Anguloa Clowesii*, graceful *Epidendrums*, &c., were also included. For this and the fine specimen stove and greenhouse plants, the R.H.S. Gold Medal was given.

Other fine exhibits in Class I. (not exceeding 350 square feet) were shown by the following exhibitors:—

Mr. W. A. HOLMES, West End Nursery, Chesterfield, had fine *Kentia* Palms, *Codiaeums*, *Roses Hiawatha* and *Lady Gay*, *Caladium argyrites* being effectively used as an edging. (Silver-gilt Flora Medal.)

J. BLACKER, Esq., Selby, Yorks. (gr. Mr. Curtis), had *Roses Pink Rambler*, *Hiawatha*, and *Delight*, fine *Codiaeums*, and *Humea elegans*. (Small Silver Cup.)

Mr. SHARP, Almondbury, Huddersfield, *Roses*, *Abutilon Savitzii*, and *Odontoglossums*. (Silver gilt Banksian Medal.)

Mr. VAUSE, Leamington, *Codiaeums*, *Ferns*, *Odontoglossums*, &c. (Silver-gilt Banksian Medal.)

Class II. (Amateurs).—This was for a group arranged on a space of 200 square feet. There was only one entry, Sir JOHN DORINGTON, Lypiatt Park, Stroud (gr. Mr. Savegar), cleverly occupying the end space with one of the prettiest exhibits in the show, a tastefully-arranged group of foliage plants and Orchids, in which *Cattleyas*, &c., *Hippeastrums*, scarlet and white *Anthuriums*, and many interesting plants were shown to advantage. (Silver Cup.)

Other very fine exhibits in the large tent included a large collection of fruits in pots from THE KING'S ACRE NURSERIES, Hereford, the same firm staging an extensive and artistically-arranged exhibit of showy herbaceous perennials, *Ferns*, foliage plants, &c. (Silver-gilt Banksian Medal.)

On one side of the main entrance Messrs. WM. CUTBUSH & SONS, Highbury, had a cleverly-arranged group of *Carnations*, *Roses*, &c., with tall *Eremurus robusta* at the back. Specially fine were *Carnation Lady Coventry* (large red), *Enchantress* (both white and blush), *Winsor* (salmon pink), and *Victory* (scarlet). The charming dwarf decorative *Rose Mrs. Wm. Cutbush* also was very effective. (Silver-gilt Banksian Medal.)

MESSRS. HEATH & SONS showed *Carnations* and scarlet *Pelargoniums*. (Silver Cup.)

HUGH ANDREWS, Esq., Toddington Manor, Winchcombe (gr. Mr. Tooley), good *Carnations* and *Eremurus*. (Silver Flora Medal.)

MESSRS. YOUNG & CO., Hatherley, Cheltenham, *Carnations*. (Silver Flora Medal.)

Mr. GODFREY, Exmouth, decorative plants, in which Godfrey's very handsome varieties of *Papaver orientale* were prominent. Also *Pelargoniums*, pink *Spiræas*, *Solanum Wendlandii*, &c. (Silver Banksian Medal.)

MESSRS. J. JEFFRIES & SONS, Cirencester, *Carnations*, *Roses*, &c. (Silver Flora Medal.)

BAKER'S, Wolverhampton, herbaceous plants. (Silver Flora Medal.)

At the entrance of one of the end tents Colonel G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. Chapman), staged a very fine group of the superb *Westonbirt Hippeastrums*, the large flowers varying from white to the most intense scarlet, with intermediate white forms prettily striped with rose and red. (Gold Medal.)

Messrs. STUART LOW & CO., Bush Hill Park, Enfield, filled one side, extending 75 feet, with an extensive group of Orchids, the forms of *Cattleya Mendelii* including two new varieties, the one with slate-blue lip, and the other with rose-feathered petals, being good. *Odontoglossums*, including spotted *O. crispum*, the pretty *O. Adrianae* Low's variety, and some hybrids, were also noted. The firm continued with fine *Carnations*, the new *Pink gloriosa*, a batch of blue *Hydrangeas*, the new *Ampelopsis Lowii*, scarlet *Gerberas*, &c. (Silver-gilt Flora Medal.)

MESSRS. BLACKMORE & LANGDON, Bath, had a grand group of *Begonias*, chiefly double. (Gold Medal.)

MESSRS. DICKSONS, Chester, a fine show of *Pæonies*, *Delphiniums*, &c. (Silver Flora Medal.)

Mr. H. W. EVANS, Llanishen, Cardiff, showy herbaceous plants.

Mr. H. N. ELLISON, West Bromwich, a nice selection of exotic *Ferns*. (Silver Banksian Medal.)

Supplement to the "Gardeners' Chronicle."

CHARLES DARWIN.

Messrs. JARMAN & Co., Chard, the fine blue and white Sweet Pea Mrs. Townsend, Roses, Pelargoniums, &c.

Messrs. GEO. MALLETT & Co., Cheddar, fine herbaceous plants.

Messrs. GUNN & SONS, Birmingham, had a fine exhibit of Roses, Gladioli, and the handsome bell-shaped *Viola cornuta purpurea*. (Silver Banksian Medal.)

Mr. R. H. BATH, Wisbech, a very extensive show of Carnations, Pæonies, Delphiniums. (Silver Flora Medal.)

Messrs. KELWAY & SONS, Langport, a fine lot of Pyrethrums and Pæonies.

In the tent at the other end of the main tent Messrs. DOBBIE & Co., Rothesay, had a grand show of hardy flowers—Violas, Aquilegias, Iris, &c. (Silver-gilt Banksian Medal.)

Competitive groups of herbaceous plants were also here arranged.

Messrs. RICH & Co., Bath, showed fine hardy plants; and Mr. A. A. WALTERS, Bath, Roses and White Pæonies. (Silver Banksian Medal.)

The very fine competitive groups of Sweet Peas were also well displayed.

Mr. MOUNT, Canterbury, showed Roses; Messrs. J. H. WHITE & Co., Worcester, herbaceous plants; Messrs. GEO. COOLING & SONS, Bath, Roses; Mr. C. F. WATERS, Balcombe, a fine lot of 40 varieties of Carnations, the good, salmon-red decorative Carnation Edith Waters being very handsome. (Silver Flora Medal.)

In the open ground Messrs. SUTTON & SONS, Reading, had a very interesting exposition of intensive vegetable culture on the French system, showing how different crops may be grown together. (Silver Knightian Medal.)

Messrs. JEFFRIES had a good show of fine hardy trees and shrubs.

Messrs. PULHAM exhibited a very pretty rock and water-garden.

Messrs. HEATH & SONS, Cheltenham, an extensive Alpine garden.

Messrs. WHEELER, of Gloucester, made a beautiful floral decoration in front of the Royal Pavilion and other buildings.

Messrs. WEBB, Messrs. CARTER, Messrs. SUTTON, and other seedsmen also had their stands tastefully decorated with flowers. Messrs. SUTTON had also a fine display of Gloxinias, Begonias, Schizanthus, &c.

AWARDS.

R.H.S. FIRST-CLASS CERTIFICATES.

Cattleya Mossiae Countess Grey, from Colonel G. L. HOLFORD, C.I.E., C.V.O.—A most charming flower of the typical *C. Mossiae* class, with enormous magenta rose blooms, with large, violet-marbled lip.

BRITISH GARDENERS' ASSOCIATION.

At the last meeting of this association, the new Executive Council met for the first time. Mr. Geo. Hemming was elected chairman for the ensuing year, and Mr. John H. Witty vice-chairman. The question of editing and enlarging the *Journal* of the association was considered, but no decision was arrived at pending further information in regard to the financial aspect. It was decided by a majority that the monthly committee meetings shall be held on Tuesdays at 4 p.m. as usual. The secretary was instructed to prepare a form and draft a letter to be sent out inviting the attention of those wishing to become honorary members. It was also decided to obtain samples and specimens of a badge. Seventeen new members were elected, bringing the total up to 1,517. J. W.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

JUNE 25.—The seventieth annual festival dinner of the friends of this charity was held on Wednesday evening (as these pages were being prepared for press) in the handsome Whitehall Room of the Hotel Metropole. The chair was occupied by Lionel de Rothschild, Esq., the sixth member of his family to preside at these annual gatherings. In proposing the toast of "Continued Prosperity to the Gardeners' Royal Benevolent Institution," the Chairman said there were no fairer gardens than those of England, and those who derived pleasure from them owed a duty to those who had made them fair.

Mr. Harry J. Veitch, in responding, made a fervent appeal for funds. He said the society disbursed yearly to its pensioners nearly £4,320. During the society's 70 years' existence the sum of £124,000 had been expended in relieving necessitous cases. There were 239 pensioners receiving relief, and six of the recipients were more than 90 years of age. The Secretary announced that £2,099 had been subscribed at and in consequence of the dinner, including 100 guineas from the Chairman, a similar sum from Messrs. Rothschild, £100 each from Messrs. Hurst & Son, Sutton & Sons, and Mr. Ed. Sherwood. Friends at Covent Garden Market had collected a total of £236 15s., including £176 5s. gathered by Mr. Geo. Munro. The total sum was nearly £100 more than that subscribed at the last festival dinner.

Mr. Sherwood, in proposing the health of the Chairman, stated that £4,000 had been subscribed to the charity by members of the Rothschild family.

DEBATING SOCIETIES.

STIRLING & DISTRICT HORTICULTURAL.—The members visited Cronlix, Dunblane, the seat of Arthur Hay Drummond, Esq., on June 12. The party was met by the gardener, Mr. Pratt, and after tea was partaken inspected the rock-garden, lawns, shrubberies, the wild garden in a glen, lily ponds, kitchen gardens and glass structures.

GUILDFORD AND DISTRICT GARDENERS'.—A meeting of the association was held on Tuesday, June 15. Mr. Nicholls, of Merrow, presided, and matters concerning the annual show were discussed. Three new members were elected. At the invitation of the president, Mr. F. Wellesley, J.P., a party of over 20 members visited his garden at Westfield Common. Owing to the lateness of the hour only a few members were enabled to take advantage of Messrs. Jackman's invitation to visit their nurseries at Woking.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending June 19, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—Over the United Kingdom generally the weather was dry, and in Scotland and the western counties of England it was often bright, but in the eastern and central parts of England the sky was mostly cloudy or overcast. Local thunderstorms were experienced in the south of England on Wednesday.

The temperature was slightly above the average in Ireland, but more than a degree below it in most parts of Great Britain. The highest of the maxima were recorded on somewhat irregular dates, and ranged from 73° in Scotland E., Scotland W., and England S.W., to 70° in England E. and the English Channel. The lowest of the minima occurred generally on the 18th, and varied from 30° in England S.W. (at Llangamarch Wells on the 14th), and 31° in Scotland E., to 39° in Ireland S., and to 42° in the English Channel. Frost was recorded on the grass in several localities, the lowest readings reported being 28° at Crathes and Llangamarch Wells, 25° at Birmingham, and 23° at Newton Rigg and West Linton.

The mean temperature of the sea.—Except on the east and south-east coasts of England the temperature of the water was higher than it was during the corresponding week of last year. The actual values ranged from 57.7° at Margate and Newquay, and 57.3° at Seafield to 49.2° at Burmouth, and to 48.1° at Lerwick.

The rainfall amounted to considerably less than the average in all districts. At several stations in England the week was quite rainless.

The bright sunshine exceeded the average in the east and west of Scotland and the north-west and south-west of England, as well as in Ireland N. and the English Channel. Elsewhere, however, it was below the normal. The percentage of the possible duration ranged from 65 in the English Channel, 56 in Scotland W., and 55 in England N.W. to 26 in England N.E., and to 24 in England E.

THE WEATHER IN WEST HERTS.

Week ending June 23,

Another cold week.—The last three weeks have all been cold, but the past week the least cold of the three. Since the present month began there has not been a single unseasonably warm day, and only five warm nights, four of these being in the past week. The ground is at the present time one degree colder at two feet deep, and two degrees colder at one foot deep than is reasonable. Rain fell on three days, but to the total depth of only a quarter of an inch. This small quantity was, however, sufficient to restart the bare soil gauge, through which there had been no measurable percolation for over a week, but it had no effect on the gauge on which short grass is growing, which has been dry for eight days. The sun shone on an average for 4½ hours a day, or for 14 hours a day less than is usual at this period of June. The atmosphere remained very calm throughout the first three days of the week, but since then the wind has been at times moderately high. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 7 per cent.—E. M., *Berkhamsted*, June 23, 1909.

MARKETS.

COVENT GARDEN, June 23.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It is not to be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

REMARKS.—Strawberries from Kent and the Southampton District are arriving in large quantities, but most of the fruit is lacking in colour. Green Gooseberries are selling at about the same price as last week. Kentish Cherries are being received, principally of the varieties Crown Heart and Baumann's May. French Cherries are much cheaper owing to larger supplies. The demand for Oranges and Lemons remains good. Supplies of English hothouse Strawberries have finished after a poor season, their prices remaining low throughout. English Peaches are a better trade, especially those of good quality. Nectarines being very plentiful are consequently cheaper. Trade generally is fairly good. E. H. R., Covent Garden, June 23, 1909.

REMARKS.—The trade for old Potatos is nearly finished, most business being in new tubers from Jersey, St. Malo, and Cherbourg. The demand, even for new Potatos, is not brisk. Edward J. Newborn, Covent Garden and St. Pancras, June 24, 1909.

COVENT GARDEN FLOWER MARKET.

There are still large supplies of bedding plants on sale. Yesterday (Tuesday) morning, after the market was closed, I found there were large quantities of plants and also of cut flowers unsold.

CUT FLOWERS.

Roses from the open are arriving from all quarters and their prices are very low. Blooms of the best quality of Mrs. J. Laing have sold for 3s. per dozen, but those of second quality are sold at from 9d. to 1s. or even less. The same remarks apply to all other sorts. Moss Roses have been sold as cheaply as 4s. to 6s. per dozen bunches. The many blooms of Carnations purchased by hawkers is evidence of bad trade, or over supply. The new white variety, shown on Tuesday last at the R.H.S. meeting, should prove a valuable market variety, because of its powerful scent: it is named "Stirling Stent." The grower informed me it is one of the most prolific varieties he has grown. Lilioms have fallen to very low prices except for flowers of the best quality. Good blooms of L. longiflorum were obtainable at 1s. 6d. per bunch, but this must not be regarded as the ordinary market value.

Hardy flowers are seen in large quantities, including Paeonies of the best varieties, and they are all cheap. The pink and the pure white Paeonies are most in demand. Of Pyrethrum the single-flowered kinds are most appreciated. Iceland Poppies are so cheap that their culture can hardly be profitable. Centaurea Cyanus (Cornflower) in various colours is good, but it is only those flowers of the best blue and pink shades that are appreciated. Irises include those of the Spanish, German and English types. Achillea alpina is extensively grown, and is a good substitute for Gypsophila. Some of the hardy Grasses are now extensively used for florists' work, and supplies of these are large.

POT PLANTS.

At this season supplies of pot plants are variable, but up to the present they have been excessive. The growers have not lowered their prices for Rambler Roses, but there must be a considerable waste in these plants. Hydrangea Mariessii, some with flowers of blue tint and others with the natural rosy pink shade, are good. H. hortensis varies; few growers produce a good blue shade in the flowers. Supplies of Ericas are not quite finished; both E. Cavendishii and E. ventricosa magnifica are good. Boronias are nearly over for the season, but plants of B. elatior are procurable. Pelargoniums of all sections are plentiful, also Fuchsias, Marguerites, yellow Chrysanthemums, Heliotropes, and Spiraes. Verbenas in several colours are good, but only for the pink variety, Miss Willmott, is there much demand. A. H., Covent Garden, Wednesday, June 23, 1909.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the Publisher; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the Editors. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

CATERpillars ON APPLE TREES: T. W. Spray the trees with some arsenical compound, such as Paris Green.

GOOSEBERRIES: F. J. T. The foliage is injured by red spider. Spray the bushes with some insecticide.

MELONS: Worried. The trouble is due to a destructive disease caused by a fungus, Ascochyta. Remove the diseased plants, and spray the bases of the stems of the remaining plants, also the soil, with the Bordeaux mixture.

NAMES OF PLANTS:—H. C. 1, Veronica Teucrium; 2, Hypochoeris erecta; 3 and 4, hybrids of Saxifraga Hostii x Aizoon; 5, Saxifraga trifurcata var. ceratophylla; 6, S. trifurcata.—S. F. S. Statice Suworowii.—G. W. Miller. Anthericum Liliago.—A. J. Keen. 1, Sanicula europaea; 2, Galium cruciata.—Alba. 1, Pelargonium capitatum var.; 2, P. citriodorum major; 3, P. c. "Prince of Orange." We do

not undertake to name varieties of Carnations.—E. S., Scarborough. Prunus Padus; Bird Cherry.—S. J., Stroud Green. Viola species, probably V. cornuta. The specimen is insufficient to determine accurately.—H. Y., Ireland. 1, Pyrus Aria var.; 2, Diervilla florida variegata.—W. C. U. 1, Rubus, species near nutkanus, send when in fruit; 2, Pieris japonica; 3, Nemophila insignis; 4, a variety of the common Box, Buxus sempervirens, probably the form known as myrtifolia.—Pillingers. 1, Spiraea bracteata; 2, Neillia opulifolia, has been named Spiraea opulifolia; 3, Diervilla japonica var. hortensis.—H. C. 1, Lonicera involucrata var. Ledebourii, 2, Pyrus Aucuparia.—H. F. Penryn. 1, "The Cockspur Thorn," Crataegus Crus-galli; 2, Veronica Lyallii.—J. R. B. Climbing White Niphetos.—G. S. 1, Lælia tenebrosa; 2, Vanda suavis; 3, Masdevallia coriacea. The others are Maranta Massangeana, and some varieties of Adiantum cuneatum. Your numbers are not readable.—A. R. T. 1, Oncidium flexuosum; 2, O. pulvinatum; 3, Ada aurantiaca; 4, Ocotemora Loddigesii; 5, Stelis micrantha; 6, Masdevallia trichate.—Foreman. 1, Pteris tremula; 2, Asplenium lucidum; 3, Pteris cretica; 4, P. serrulata cristata; 5, P. cretica.—A. G. 1, Aloe socotrina; 3, A. verrucosa; 3, Metrisoderos floribunda (Bottle-brush); 4, Jacobinia (Justicia) carnea.—E. A. 1, Nerium Oleander fl. pl.; 2, Impatiens Sultanii.—S. G. 1, Codiaem (Croton) majesticum; 2, C. Mortii; 3, C. interruptum; 4, Begonia fagifolia and the Orchid Brassia verrucosa.—E. R. S. 1, Not found; 2, Ornithogalum longibracteatum; 3, Pachyphytum hybridum; 4, Adiantum hispidulum; 5, Aspidium (Nephrodium) molle; 6, Athyrium filix-femina pulcherrima.

NEW ZEALAND AND TASMANIAN BEECHES: J. C. Nothofagus (Fagus) cliffortioides is in cultivation in the temperate house at Kew, Messrs. Veitch's at Coombe Wood (outside), at Enys, Cornwall, and no doubt in several other gardens in that county and Ireland. Perhaps the most notable specimen of N. Cunninghamii in England is at Osborne, Isle of Wight; it may also be seen at Fota and Kilmacurragh, in Ireland. It is grown in the temperate house at Kew. N. fusca is in cultivation at Kew, in one or two Cornish gardens, and at Castlewellan, in Ireland. N. Menziesii is at Kew; we do not know any other place where it is cultivated. N. Moorei grows out-of-doors at Kilmacurragh and in the temperate house at Kew. Two other Australasian Beeches (N. Blairi and N. Solandii) do not appear to be in cultivation. Nothofagus is a very distinct group of Beeches, confined to the Southern Hemisphere. Some authorities, including Elwes and Henry, keep them apart as a distinct genus, as we think, with ample reason. The above species are all more or less tender. N. cliffortioides is perhaps the hardiest, as a fine specimen has lived out-of-doors for many years at Coombe Wood. N. Cunninghamii, also, used to be grown out-of-doors in the garden of the late Mr. Mongredien, at Heatherside, in Surrey. But it is only in the milder counties and in exceptionally favoured gardens that any of them can be expected to thrive permanently. We are not aware that any of them are kept in stock by the trade, but you might write to Messrs. Veitch, of Chelsea, Messrs. Gill, of Falmouth, and Messrs. Gauntlett, of Chiddingfold. No special treatment is necessary; they thrive in any moist, deep soil provided it is not too heavy.

PEACH LEAVES: F. J. T. The damage has been caused by drip. No disease is present.—F. F. Red spider is present in quantity, and this pest is responsible for the trouble.

TOMATO DISEASED: F. S. The plants are affected with "Black stripe." Spray the foliage, at intervals of four days until the complaint is checked, with a solution of sulphide of potassium, using one ounce in three gallons of water.
